A Few of the Leading Articles in Volume Eight

WRITTEN AND SIGNED BY SPECIALISTS.

GREGORIAN CHANT.........Joseph Otten
Organist Epiphany Church, Pittsburg, Pa.

GREIG, EDVARD.........Henry T. Finck
Musical Director New York 'Evening Post'

GROUPS, THEORY OF.........Frank Nelson Cole
Professor of Mathematics, Columbia University

GUATEMALA; GUIANA; HONDURAS.........Marrion Wilcox
Authority on Latin-America

GUNCOTTON; GUNPOWDER.........Charles E. Munroe
Professor of Chemistry, Columbian University

GUNNERY.........Philip R. Alger
U. S. Naval Academy, Annapolis

HANDWRITING.........Persifor Frazer
Docteur ès-Sciences Naturelles, Univ. de France

HARDWARE TRADE.........E. C. SIMMONS
Simmons Hardware Company, St. Louis

HARMONIC ANALYSIS.........William E. Byerly
Professor of Mathematics, Harvard University

HARTMANN, K. R. E. von; HEDONISM.........Grace Neal Dolson
Professor of Philosophy, Wells College

HAWAII; HONOLULU.........W. D. Alexander
Formerly Surveyor-General Hawaiian Islands

HAWTHORNE, NATHANIEL.........Edward Everett Hale, Jr.
Professor of English, Union College, Schenectady, N. Y.

HEART.........William W. Gannett, M.D.
Visiting Physician to the Massachusetts General Hospital, Boston, Mass.

HEAT.........Ernest R. von Nardroff
Head Science Department Erasmus Hall High School, Brooklyn, N. Y.

HEATING AND VENTILATION.........Henry C. Meyer, Jr.
Consulting Engineer, New York City

HEBREWS, EPISTLE TO THE.........David Foster Estes
Professor of New Testament Interpretation, Colgate University

HEGEL, GEORGE WILLIAM FRIEDRICH.........Josiah Royce
Professor of History of Philosophy, Harvard University

HEINE, HEINRICH.........Gustav Karpeles
Author of 'Jewish Literature and Other Essays', Berlin, Germany

HERBART, JOHANN FRIEDRICH.........Charles DeGarmo
Professor of the Science and Art of Education, Cornell University

HERBERT, GEORGE; HERRICK, ROBERT.........John Erskine
Assistant Professor of English, Amherst College

HEREDITY; HONEY-BEE; INSECTS; INSTINCT.........Alpheus S. Packard
Late Professor of Zoology, Brown University

HIGHER CRITICISM.........Sylvester Burnham, D.D
Dean of Hamilton Theological Seminary, Colgate University

HISTORICAL SOCIETIES OF THE U. S.........Sydney H. Carney, Jr., M.D.
Historian of the Society of Colonial Wars

HISTORY, ANCIENT.........George Willis Botsford
Adjunct Professor of Ancient History, Columbia University

HISTORY, MEDIÆVAL.........Dana Carleton Munro
Professor of History, University of Wisconsin

HISTORY, MODERN.........Willis Mason West
Professor of History, University of Minnesota

HISTORY, LOGIC OF.........Hugo Münsterburg
Professor of Psychology, Harvard University

HOBBES, THOMAS.........Mary Whiton Calkins
Professor of Philosophy and Psychology, Wellesley College

HOME EDUCATION.........Melvil Dewey
Formerly Director New York State Library

HOMŒOPATHY.........Pemberton Dudley, M.D.
Professor of Institutes of Medicine, Hahnemann Medical College, Philadelphia

HORACE.........John C. Rolfe
Professor of Latin Language and Literature, University of Pennsylvania

HORSE, CARE AND DISEASES OF THE.........James Law
Director of New York State Veterinary College, Cornell University

HORTICULTURE .... B. T. Galloway
U. S. Department of Agriculture

HYDRAULIC ENGINEERING .... J. J. R. Croes
Past President American Society Civil Engineers

HYDRODYNAMICS .... Arthur Gordon Webster
Professor of Physics, Clark University

HYDROPHOBIA; HYSTERIA; HYDROTHERAPY .... Smith Ely Jelliffe, M.D.
Editor of 'Journal of Nervous and Mental Diseases'

HYPERSPACES; INDUCTION, MATHEMATICAL .... Cassius J. Keyser
Adrain Professor of Mathematics, Columbia University

HYPNOTISM .... Hamilton Osgood, M.D.
Boston, Mass.

ICHTHYOLOGY .... David Starr Jordan
President Leland Stanford Jr. University

IDIOCY; IMAGINATION; INSANITY .... James Hendrie Lloyd
Formerly Neurologist Philadelphia Hospital

ILLINOIS .... Adlai E. Stevenson
Formerly Vice-President of the United States

IMITATION .... John Grier Hibben
Professor of Philosophy, Princeton University

IMMORTALITY .... William A. Hammond
Professor of Ancient and Mediæval Philosophy, Cornell University

INCARNATION .... Frederick L. Anderson
Professor of New Testament Interpretation, Newton Theological Seminary

INDIA .... Thomas P. Hughes
Author of 'Dictionary of Islam'

INDIAN, EDUCATION OF THE .... William N. Hailman
Ex-Superintendent Indian Schools

INDIANA .... Jacob Piatt Dunn
Secretary Indiana Historical Society

INDIANS, AMERICAN .... Alexander F. Chamberlain
Clark University, Worcester, Mass.

INDIVIDUAL PSYCHOLOGY .... James R. Angell
Professor of Psychology, University of Chicago

INDULGENCE .... Thomas E. Judge, S.T.P.
Editor 'The Catholic Review of Reviews'

INFANCY .... Linnæus E. LaFétra, M.D.
Instructor in Diseases of Children, Vanderbilt Clinic, Columbia University

INSCRIPTIONS .... Edwin W. Fay
Professor of Latin, University of Texas

INSURANCE, CASUALTY .... Edwin W. DeLeon
Vice-President Casualty Company of America, New York

INSURANCE, CREDIT .... J. A. Taylor
President Wilmington, N. C. Board of Trade

INSURANCE, FRATERNAL .... Frederick Gaston
President of Grand Fraternity

INSURANCE, INDUSTRIAL .... Haley Fiske
Vice-President Metropolitan Life Insurance Company

INSURANCE, LIFE .... Walter S. Nichols
Editor 'Insurance Monitor'

INSURANCE, LIFE, STATISTICS .... Clifford Thomson
Editor 'The Spectator'

INSURANCE, SCIENCE AND ECONOMICS OF .... Frederick L. Hoffman
Statistician Prudential Insurance Company of America

INTERNATIONAL LAW .... E. W. Huffcut
Late Dean Cornell University College of Law

INVARIANTS AND COVARIANTS .... Edward Kasner
Instructor in Mathematics, Columbia University

INVENTIONS .... Frederick C. Beach
Editor 'The Scientific American'

IOWA .... Johnson Brigham
Librarian Iowa State Library

IRON FOUNDING, CHEMISTRY OF .... Herbert E. Field
Pittsburg, Pa.

IRON MANUFACTURE; IRON AND STEEL, METALOGRAPHY OF. Albert Sauveur
Professor of Metallurgy, Harvard University

IRRIGATION .... F. H. Newell
U. S. Geological Survey

ISAIAH .... Charles Rufus Brown
Professor of Hebrew and Cognate Languages, Newton Theological Seminary

THE ENCYCLOPEDIA AMERICANA

Great-crested Flycatcher, a large flycatcher (*Myiarchus crinitus*), which is a summer visitor to all parts of temperate North America, and is noted for its shrill, yet musical scream, and for its habit of entwining one or more cast-off snake-skins in its large tree-lodged nest. It is olive-brown above, with an ashy head surmounted by a tall brownish crest, and the lower parts delicate yellow. Several other species belong to the southwestern States and Mexico, and are often called crested kingbirds.

Great Dane, a breed of large, smooth-coated dogs, the modern equivalent of the ancient boar-hound. See DOG.

Great Divide, The. See DIVIDE, THE GREAT.

Great Eastern, a British iron steamship, before the Celtic the largest vessel constructed, built (1854–8) at Milwall, on the Thames, for the Eastern Steam Navigation Company, by Scott Russell, from plans by I. K. Brunel; length 680 feet; breadth, 82½, or, including paddle-boxes, 118 feet; height, 58 feet (70 to top of bulwarks). She had 6 masts, 5 of iron and 1 of wood, and could spread 7,000 yards of sail, besides having 8 engines, divided between her screws and paddles, and capable of working at 11,000 horse-power. From the first her career was unfortunate, the launching process alone lasting three months and costing $300,000. After several unremunerative trips to New York she was employed first as a troop-ship, and then as a cable-laying ship, for which her size and steadiness specially qualified her. Various attempts were afterward made to utilize her, but she at last came to be a mere holiday spectacle, and was broken up in 1888.

Great Expectations, a novel by Charles Dickens, published in 1861. As in 'David Copperfield,' the hero tells his own story from boyhood. Owing to the simplicity of the plot, and to the small number of characters, it possesses great unity of design. These characters, each drawn with marvelous distinctness of outline, are subordinated throughout to the central personage "Pip," whose great expectations form the pivot of the narrative.

Great Falls, Mont., city, county seat of Cascade County; on the Missouri River, the Great Northern, and the G. F. & C. Railways; 120 miles northeast of Butte. South and nearby is a great mining region and north is an agricultural and grazing section. It has large gold, silver, and copper smelters, and bituminous coal, lead, iron, and sandstone are found in the vicinity. The excellent water power which the city possesses is an inducement to manufacturers to establish works in Great Falls. The water-power, at medium low water, is equal to over 350,000 horse-power, and this, together with the unusual wealth of minerals, has largely aided the rapid growth of the city. There are a number of falls here; one, Great Falls, gives name to the city. Its rapid growth has been largely the result of its natural resources. Its chief manufactures are flour, furniture, mining and agricultural instruments, wagons, carriages, and woolen goods. The first settlement was made in 1884, and in 1888 Great Falls was incorporated. Municipal affairs are administered by a mayor, elected biennially, and a city council of two chambers. Minor officials are nominated by the executive and confirmed by the council. The water-works are owned and operated by the city. The population increased from (1890), 3,979 to (1900) 14,930.

Great Fish, or **Black River**, a river in Mackenzie and Keewatin territories, Dominion of Canada. It rises in a small lake near the northern shore of Lake Aylmer, flows in a northeasterly direction through lakes Beechy, Pelley and Garry, and enters the Arctic Ocean by a wide estuary. King William Land is near its mouth. The Great Fish River is about 500 miles in length. Sir George Back, the Arctic explorer (1796–1878), explored the river in 1834-5 and followed it to the ocean. He described Ah-hel-Dessy, or Parry Falls, on one of the tributaries, as more grand than Niagara in splendor of effect. See Back 'Narrative of the Arctic Land Expedition to the Mouth of the Great Fish River' (1833-5).

Great Fish River, a river in Cape Colony, South Africa, which rises in the Sneeuwberg, or Snowy Mountains, and after a southeasterly course of 230 miles, enters the Indian Ocean at lat. 33° 25′ 5″, and long. 27° 8′, about five miles northeast of Port Alfred.

Great Horned Owl. See EAGLE OWL.

Great Island. (1) A small island at the entrance to Portsmouth Harbor, N. H. It has a lighthouse 90 feet high. (2) An island in Bass Strait, between Tasmania and Australia. It is about 40 miles long and 12 miles broad. Pop. 42,100.

Great Kanawha, ka-nä'wa, a tributary of the Ohio River, has its rise between the Blue Ridge and Iron Mountains in the northwestern part of North Carolina, flows northeast by north through the southwestern part of Virginia, then changes its course northwest and west into West Virginia, and flows into the Ohio River at Point Pleasant. It receives the Gauley River in Fayette County, West Virginia, and from thence to its mouth is known by the name of Great Kanawha. The river, at a cost of over $4,000,000, has been made navigable from the Ohio to Great Kanawha Falls, about three miles from the mouth of the Gauley River. It is about 450 miles in length.

Great Kanawha, Battle of. See POINT PLEASANT.

Great Lakes, the name given to the chain of lakes on the northern border of the United States. They include Lakes Superior, Michigan, Huron, Saint Clair, Erie, and Ontario; Michigan only lying wholly within the United States, and no one of the lakes wholly within the territory of the Dominion of Canada. Their area is about 90,000 square miles; elevation, Lake Superior 600 feet above the sea, and Lake Ontario 250 feet. The fall of Lake Superior to Lake Erie is about 40 feet. No large river flows into the Great Lakes; the Saint Lawrence River is the outlet. The basin of the Great Lakes averages in width about 100 miles north and south of the north and south shores respectively. The combined coast lines in the United States have a shore line of about 3,075 miles. These great inland seas constitute the largest body of fresh water in the world. Like all large bodies of water they affect the climate of the surrounding country. Good farms, extensive forests, and valuable minerals are found along the coast. On the southern shore of Lake Superior (q.v.) are found masses of ore and low mountains apparently of eruptive origin. The Great Lakes have been the means of developing to a considerable extent the Northwest, as they are the main thoroughfares by which the products of the large farms, the cattle ranches, the mines, and the forests have been brought to eastern markets. Coal and manufactured products of the east pass over the lakes to western markets. The bituminous coal tonnage of the lakes for [illegible] was 9,000,000 tons. In the same year the net freight tonnage of Sault Ste. Marie's Falls canal was over 25,000,000 tons, or three times the amount which passed through the Suez Canal. The iron ore tonnage for 1900 was 20,[illegible] tons. There are 20 individual ports on the Great Lakes which have a registered tonnage ranging from 1,000,000 to over 5,000,000 tons. Cleveland's tonnage alone, in 1902, was 5,037,[illegible]82 tons; and the same year New York's tonnage was 8,[illegible]2,707 tons. The line of cities around the Great Lakes are (1903) increasing in commercial importance and population with more rapidity than any group of cities in any other part of the world. Some of these lake ports, all terminals of railroad trunk lines, are Toledo, which increased [illegible] per cent from 1890 to 1900; Chicago, which increased in the same time 54 per cent; Cleveland, 46 per cent; Milwaukee, 39 per cent; and Buffalo, 37 per cent. The question of locating a dam at the outlet of Lake Erie so as to benefit navigation has been under consideration, and efforts are being made (1903) to have commissioners appointed by the governments of the United States and Great Britain who will work together, and report upon the conditions and uses of the waters adjacent to the boundary lines between the United States and Canada. In June 1903, the Congress of the United States took action regarding the matter, and empowered the President to appoint three American Commissioners; one to be an engineer officer of the army; another, a civil engineer, "well versed in the hydraulics of the Great Lakes;" the third, a lawyer "of experience in questions of international and riparian law." The necessity of such a commission to examine even the variations in the levels of the waters of this great thoroughfare is manifest when the levels of Detroit River, Lake Saint Clair, Saint Clair River, and Saint Mary's River have been lowered by the Government twenty-one-foot channels from Duluth and Chicago to Buffalo. The Chicago Drainage Canal (see Chicago) has helped to lower Lake Michigan. The Consolidated Lake Superior Company is taking water out of Saint Marys River. Other causes are making a change of level, and the increased transportation on all the lakes, will mean better channels to the ocean. For canals connecting the Great Lakes with rivers and the two around water-falls, see articles on the respective lakes.

Great Meadows, Pa., Engagement at, 28 May 1754; Washington's first fight. When the French built Fort Duquesne (now Pittsburg), driving off an English force which had begun to fortify the same spot, it was evident that the decisive struggle for mastery of the American "hinterland" was to begin; and the commander of the nearest English force, a Virginia militia officer of 22, named George Washington, at once sent a messenger to Gov. Dinwiddie and wrote letters to the governors of Pennsylvania and Maryland, urging all to send troops and expel the French. Meantime he set out with his force to build a fort on the Monongahela where Brownsville, Pa., now stands. Constructing a road as he went, he halted at the Great Meadows of the Youghiogheny, a bushy field at the foot of Laurel Hill,— a good camping-place and defensible position. Hearing from his scouts that the French had learned of the English activity, and sent out a party to engage any English band they met, he cleared the field of bushes and threw up an intrenchment behind a ravine crossing the field, but instead of waiting an attack, took 40 men for a night surprise of the French, guided by Indian allies. It was raining hard, the path was often lost, and he did not reach the French camp till morning. They were an advance party of 32, sent out to reconnoitre and, hearing of Washington's advance, they had hidden in a rocky hollow and sent back for reinforcements, but attempting defense when surprised, the commandant — Ensign Jumonville — and nine men were killed, and the rest captured and taken to the camp at Great Meadows. Washington lost one killed and three wounded. The sequel is told under FORT NECESSITY.

Great Pacificator, a name given Henry Clay (q.v.), on account of his efforts to reconcile the conflicting interests of North and South, especially in connection with the Missouri Compromise.

Great Pedee, a river which has its rise in the mountains of the northwestern part of North Carolina, flows south and east across the State, and enters South Carolina at Marlboro County, in the northeastern part of the State, then flows southeast into Winyaw Bay, an inlet of the Atlantic. In North Carolina the river is called Yadkin. About where the Little Pedee joins the Great Pedee, and south to its mouth, there are several quite large islands. The river is navigable for a distance of about 150 miles from Winyaw Bay.

Great Salt Lake, a body of water in the northwestern part of Utah, the principal drainage centre of the Great Basin (q.v.); bounded on the east by the Wasatch Mountains, on the west by the Great Salt Lake Desert. It is about 4,200 feet above sea-level, 80 miles long and from 20 to 32 miles wide. Its chief inlets are the Bear, Ogden, and Weber, and the Jordan which brings the fresh waters of Lake Utah. Great Salt Lake has no apparent outlet save evaporation. In 1850 the amount of saline matter held in solution was 22.4 per cent, in 1869 only 14.8 per cent. Between these dates the amount of water flowing in annually exceeded the evaporation, and the lake increased in area from 1,700 to 2,360 square miles. Since 1869–70 the lake has been receding. One cause of the water diminishing in volume is the amount used for irrigation; but the amount of water contributed by the inlets has decreased since 1870. At one time Great Salt Lake was much larger than it is now. The bars, cliffs, and beaches formed by the waters of the ancient lake (called Lake Bonneville) are plainly visible along the base of the mountains. Lake Bonneville had an area of 19,800 square miles and a depth of 1,100 feet. Its depth near where the great Mormon Temple now is was about 850 feet. Its dry bed is now occupied by nearly 200,000 people. The waters of Lake Bonneville reached the ocean through Columbia River. Geological investigations show that there have been at least two moist periods with intervening and subsequent periods of dryness. A change from the present dry climate and scant rainfall to a moist climate would result in a great increase in area of the waters in the lakes and rivers and a return to former water areas. Great Salt Lake has several islands, the largest of which Antelope, is 18 miles long. No fishes seem to exist, but several species of insects and brine-shrimps have been found in the waters; and water-fowls in large numbers frequent the shore. The first mention of Great Salt Lake appeared in a report made by the Franciscans, in 1776. Father Escalante and companions seem to have traveled from Mexico to this region. A report made also by the Franciscans early in the 17th century mentions the large rivers and lakes and the mineral wealth of this section. In 1843 Fremont explored and described this region, and a thorough survey was made in 1849–59 by Howard Stansbury, captain in the United States Army. (See UTAH.) Consult: 'Jesuit Relations'; Bancroft, 'Utah'; U. S. Reports and Surveys.

Great Slave Lake, a body of water in the Canadian Northwest Territory, lat. 62° N.; greatest length about 300 miles, greatest breadth 50 miles. Estimated area, 10,100 square miles. By the Great Slave River it receives the waters of Lake Athabasca; and the outlet is the Mackenzie River which flows into the Arctic Ocean.

Great Slave River, in Canada, is the outlet of Athabasca Lake and flows into Great Slave Lake (q.v.), by two mouths, near Fort Resolution. A number of falls and rapids are in its upper course, but the descent becomes more gradual near its mouth. Length about 300 miles.

Great South Bay, an arm of the Atlantic Ocean on the southern coast of Suffolk County, Long Island, N. Y.; 50 miles long, from one and one-half to five miles wide. Great South Beach, which is about 35 miles long, has Fire Island lighthouse on the western extremity, and separates the bay from the ocean.

Great Stone Face, one of Hawthorne's short stories relating to the "Old Man of the Mountain" in the White Mountains, in 'Snow Image and Other Twice Told Tales' (1852).

Greatorex, grāt'ō-rěks, **Eliza Pratt,** American artist: b. Manor Hamilton, Ireland, 25 Dec. 1819; d. Paris, 9 Feb. 1897. She studied art in New York and Paris. Her work began in landscape painting, but pen and ink work and etching subsequently absorbed her efforts. In 1868 she was elected associate of the National Academy. In 1870 she visited Germany and in 1871 published 'The Homes of Oberammergau.' Her principal works are 'Summer Etchings in Colorado' (1873) and 'Old New York from the Battery to Bloomingdale' (1876).

Grebes, grēbz, a well-defined group of water-bird (*Colymbidæ* or *Podicipidæ*) comprising 25 species, spread over practically the whole world. The grebes are peculiar in having the legs placed very far back, in their flattened tarsi and lobed (not webbed) toes, each digit being flattened and bordered by an extension of horny skin. They are expert swimmers and preeminent as divers. They nest in secluded ponds and bogs, piling up a mass of vegetable matter upon some floating foundation, and deposit chalky white eggs. When the female leaves the nest she usually covers the eggs over with vegetable matter. The little grebes are expert swimmers and divers from the time they are hatched, and in their soft downy plumage are exceedingly beautiful. During migrations grebes are found frequently along our rivers and sea coasts, and are often shot by duck hunters in the autumn and winter. Though they have no stiffened tail feathers, and have relatively very small wings, they are able to fly long distances. The body plumage is soft and compact, and that of the under surface is a beautiful silvery white, which makes "grebe-breasts" a very desirable article in the millinery trade. The best-known species in eastern North America are the horned grebe (*Colymbus auritus*) which has a peculiar ruff of black and rusty feathers about the head; and the pied-billed grebe (*Podilymbus podiceps*) a rather more heavily built bird without a ruff and with a thicker and shorter bill. Both are popularly known as "hell-divers." In Europe the common species are the horned grebe, the great crested grebe (*C. cristatus*) and the dabchick (*C. fluviatilis*).

Greece, Ancient, the European peninsula which was bounded on the north by Macedonia and Illyria; on the east and southeast by the Ægean and Myrtoan, and on the west, and southwest, by the Ionian seas. Its length from the borders of Macedonia to Cape Tænarum was about 250 miles. The name of Græcia originated in Italy, and was probably derived from Pelasgian colonists, who, coming from Epirus to Magna Græcia, in southern Italy, and calling themselves Græci, occasioned the application of this name to all the people who spoke the same language with them. In earlier times, for example in the time of Homer, Greece had no general name among the natives. Aristotle was the first Greek to call his countrymen Γραικοί, Greeks. It afterward received the name of *Hellas*, and still later, after the country was conquered by the Romans, it was divided into two provinces: the Peloponnesus being known as Achaia, and the remaining regions to the north as Macedonia. The Greek tribes were so widely dispersed that it is difficult to determine with precision the limits of Greece, properly so called. The name perhaps is properly applied only to the country lying to the south of Macedonia, with the adjacent islands; but it has sometimes been given in a modern sense by geographers to the whole territory lying to the south of Mount Hæmus, Mount Scomius, and the Illyrian Alps, or the whole series of mountains now called the Balkan, so as to include regions inhabited by some Thracian, Macedonian, and Illyrian tribes. The area of the mainland of the more limited region to which the name of Hellas is properly confined is above 55,000 square miles. The whole of Greece naturally divides itself into three parts: Northern Greece, including Epirus and Thessaly; Central Greece, which comprises what was known as Hellas; and the Peloponnesus.

Physical Features.— The first thing which strikes the eye on looking at a map of Greece is the comparatively great extent of its coast-line, formed by numerous gulfs which penetrate into it in all directions, and give it a remarkably broken and rugged appearance. Proceeding round the coast from the northwest to the northeast we are presented in succession with the Ambracian Gulf (now Gulf of Arta), Corinthian Gulf (the mouth of which is now called the Gulf of Patras, while the name of Gulf of Corinth is reserved for the inner part of it), the Cyparissian (now Arcadia) Gulf, and the Messenian, Laconian, Argolic, Saronic, Malian, and Pagasæan gulfs, now called respectively Koron, Marathon, Nauplia, Athens, Lamia, and Volo. The Corinthian Gulf on the west, and the Saronic Gulf on the east, which nearly meet at the Isthmus of Corinth, divide Greece into a continental and a peninsular portion, the latter called the Peloponnesus (now Morea). Another striking feature is the mountainous character of the interior. The whole country was bounded on the north by a range of mountains, the western half of which was called Mount Lingon and the eastern half the Cambunian Mountains, with Mount Olympus at their eastern extremity. From about the middle of this range a lofty chain called Mount Pindus strikes southward and runs almost parallel to the eastern and western coasts of Greece. At a point in this chain called Mount Tymphrestus (or Typhrestus, now Mount Velukhi), two chains proceed in an easterly direction, the northernmost of which, Mount Othrys, runs almost due east, and attains at some points a height of from 7,000 to 8,000 feet, while the southern one runs rather in a southeasterly direction, attaining at one point a height of [illegible] feet, and terminates at the celebrated pass of Thermopylæ. The Cambunian Mountains on the north, the range of Pindus on the west, and Othrys on the south, enclose the large and fertile vale of Thessaly, forming the basin of the Peneus (now Salambria), and the ranges of Othrys and Œta enclose the smaller basin of the Spercheus (Hellada). Another range of mountains branches off from Mount Œta and runs still more to the south. This is the celebrated Parnassus, which, at its highest point, exceeds 8,000 feet. The peaks of Cithæron, Parnes, Pentelicus, and Hymettus lie in the same direction, but are more distinguished for their classic celebrity than for their height. The range in which these peaks are found is continued to the southeast point of continental Greece, and the islands of Ceos, Cythnos, Seriphos, and Siphnos (now Kea, Thermia, Serpho, and Siphanto) may be regarded as continuations of it. This range on the south and that of Œta on the north enclose the basin of the Cephissus, with Lake Copais (now Topolia). Another chain of mountains strikes southwestward from the central range of continental Greece, under the names of Corax and Taphiassus. The chief rivers on the west side of the Pindus chain are the Arachthus (now Arta) and the Achelous (now Aspropotamo).

The chief feature in the mountain system of the Peloponnesus is a range or series of ranges forming a circle round the valley of Arcadia in the interior, having a number of branches proceeding outward from it in different directions, dividing the rest of the Peloponnesus into several other valleys. The loftiest part of the mountainous circle round Arcadia is that lying to the north, with the peak of Cyllene (Ziria), 7,789 feet high, at its eastern extremity, and Erymanthus (Olonos), 7,297 feet high, at its western. The southern part consists rather of a series of heights than a chain of mountains. The highest range which branches off from the circle around Arcadia, and, indeed, the highest range in the Peloponnesus, is Mount Taygetus (Pentedactylon), which strikes southward, separating the ancient divisions of Messenia and Laconia, and terminating in the promontory of Tænarum (now Cape Matapan). The other ranges are of no importance. The only rivers in the Peloponnesus of any consequence are the Eurotas (Iri), draining Laconia on the southeast, the Pamisus (Pirnatza), draining Messenia on the southwest, the Alpheus (Ruphia), draining Arcadia and Elis, and the Peneus (Gastuni) draining Elis on the west.

The rock most largely developed in the mountains of Greece is limestone, which often assumes the form of the finest marble. Granite and gneiss are found only in the north, in the central ramifications of the Pindus. Tertiary formations prevail in the northeast of the Peloponnesus, and in the northwest, along the shores of Elis, are considerable tracts of alluvium. Volcanic rocks are not seen on the

mainland, but form considerable masses in some of the islands. Attica was rich in silver and marble. The quarries of Pentelicus and the mines of Laureium were famous. Gold and serpentine were found in Siphnos; there was tin in Ceos, and copper near Chalcis in Eubœa. In many of the islands iron abounded.

Divisions.— On the northwest of the mainland of Greece was the mountainous region of Epirus, which was never more than half Greek; and to the east of that district, separated from it by the chain of Pindus, lay Thessaly, a region of fertile plains. To the south, lay a series of small independent states. Reckoned from west to east, there were Acarnania, Ætolia, Doris and Locris, Phocis with Mount Parnassus, the seat of the Muses, and the sacred Delphi, regarded by the Greeks as the navel of the earth; Bœotia, with Helicon, another mountain sacred to the Muses, and with the cities of Thebes and Platæa; Megaris, containing the city of Megara; and Attica with its capital Athens, Piræus, the port of Athens, and the city of Eleusis, the seat of the mysterious worship of Demeter. In the middle of the Peloponnesus was Arcadia, with the towns of Mantinea, Tegea, and Megalopolis, the last founded by Epaminondas. In the north lay Sicyon and Corinth, the latter situated on the isthmus connecting the Peloponnesus with the rest of Greece; and to the west of that Achaia. To the southwest of Achaia lay the rich province of Elis, with the plain and sacred grove of Olympia, celebrated on account of the Olympic games, which were held here every fourth year. To the south of Elis, in the southwest corner of the Peloponnesus, lay the province of Messenia, with the famous stronghold of Ithome, "one of the horns of the Peloponnesus," the fort of Pylos, and later the capital town of Messene, founded by Epaminondas 369. Separated from Messenia by the range of Taygetus was the province of Laconia, occupying the southeast corner of the Peloponnesus, and containing the renowned city of Sparta, long the rival and ultimately the conqueror of Athens. Lastly, to the north of Laconia, the east of Arcadia, and the south of Sicyon, lay the province of Argolis, with the capital Argos, and the cities of Mycenæ and Tiryns, all remarkable for the remains of gigantic works of masonry, commonly known as Cyclopean works.

The islands of Greece are partly scattered over the Ægean Sea and partly contained in the Ionian Sea on the southwest of the mainland. The Greeks applied the names Cyclades and Sporades to two groups of islands in the Ægean, the former name (from *kuklos*, a circle) to those which they believed to form a circle round the sacred island of Delos, and the latter (from a Greek root meaning scattered, sporadic) to those which were scattered over various parts of the sea. Some islands were sometimes said to be in the one group and sometimes in the other, and several were sometimes excluded from both. The following, however, are the principal of those which may most properly be considered as belonging to the Cyclades: Andros, Tenos, Myconos, Naxos (now Naxia), Paros (celebrated for its marble), Amorgos, Anaphe, Thera (now Santorin), Pholegandros (now Polykandro), Sicinos, Ios (now Nio), Melos, Syros, and Gyaros (Jura), Siphnos, Seriphos, Cythnos, and Ceos. The name Sporades may be applied to all the other islands in the Ægean. The Sporades will thus include the following islands on the northeast of the mainland of Greece: Eubœa (Negropont), the largest of all the Greek islands, separated from the continent only by the narrow strait of Euripus, and containing the ports of Chalcis and Eretria; Sciathos, Scopelos, Halonesus (Kilidromi), Eudemia (Sarakino), and Scyros; the following off the coasts of Thrace and Asia Minor: Lemnos, Thasos, Imbros, and Samothrace (in very remote times the seats of a mysterious religious worship) Lesbos (with the flourishing and luxurious town of Mitylene), Chios, Samos, Cos, etc.; and the following in the Saronic Gulf, or between it and the Argolic Gulf: Salamis (now Salamis or Koluri), Ægina, Calauria (Poros), Hydrea (Hydra), and Pityussa (Spetsæ). The islands in the Ionian Sea are Corcyra (Corfu), celebrated in the most ancient times for its wealth and culture, and at a later period colonized by Corinthians; Paxos, Leucas or Leucadia (Santa Maura), at one time connected with the mainland; the "rocky" Ithaca (now vulgarly called Ithaki), the home of Ulysses; Cephallenia (Cephalonia), Zacynthus (Zante), and Cythera (Cerigo), one of the seats of the worship of the goddess Aphrodite.

Soil, Productions, Etc.— Greece was in ancient times more fertile than it is now, which is accounted for by the fact that the forests have been to a large extent cleared away, the springs thus dried up, and the soil deprived of moisture. The most fertile districts were Thessaly, Bœotia, and some parts of the Peloponnesus; the least fertile Attica and Arcadia. The principal objects of cultivation were the vine and the olive, but flax and the commoner cereals were also cultivated more or less. Among the domestic animals were horses, asses, mules, oxen, swine, sheep, goats, and dogs. Swine were very numerous everywhere, and mules were much used in the Peloponnesus; but there were comparatively few horses, as the mountainous character of the country was not conducive to their being reared; the best horses of Greece were reared in Thessaly. Bears, boars, and wolves are mentioned among the wild animals anciently found in Greece, and it may perhaps be inferred from the legend of the Nemean lion that even lions at one time existed in this country. Herodotus, indeed, expressly states that lions were found between the Nestus in Thrace and the Achelous in Acarnania.

Climate.— The climate of ancient Greece is highly commended by ancient Greek writers, as by Herodotus, Hippocrates, and Aristotle, on which account it seems fair to infer that the malaria which now infests the air in summer did not then prevail to the same extent, a circumstance that is easily accounted for by the fact that in those times the country was more thickly populated and better cultivated. In respect of temperature the same differences resulting from the inequalities of the surface must have existed then as exist now, long and severe winters being experienced in the highlands of the interior, while the lowlands, exposed to the sea, enjoyed warm and genial weather all the year round.

History.— Greece has never at any period formed a single and independent state. As long as it remained independent it was divided into a number of separate states, and during the only period when it was administered as a single territory it was subject to a foreign power. A general sketch of the history of ancient Greece must therefore touch only upon those leading events which belong to the common history of the Greek states, or which at least affected the Greek people as a whole, even although they may belong more especially to the history of an individual state.

The earliest inhabitants of Greece of whom anything is known are called by Greek writers Pelasgians. The ethnological affinities of these have often been discussed, but the most recent authorities believe that they were an Indo-Germanic or Aryan people. They occupied Greece before the influx of Ionians, Æolians and Dorians. They seem to have been agricultural in pursuits, dwelt along the fertile valleys, built strong cities, walls of the so-called cyclopean masonry, and among their most famous seats were Dodona in Epirus, Thessaly, Orchomenos in Bœotia, Mycenæ in Argolis, Sicyon, etc.

In religion they abhorred both polytheism and anthropomorphism. Their name afterward became changed to Hellenes and under this appellation they amalgamated with the Ionians, the Achæans, the Æolians and the Dorians. The early relations of Greece with the East are perhaps reflected in the legends of Oriental colonists — Cadmus, Pelops, Cecrops, etc. — who settled in Greece in very remote times. The reality of an early connection between Greece and the East is established by the fact that the Greeks derived the greater part of their alphabet from the Phœnicians.

The Hellenes, or Greeks properly so called, entering the country probably from the northwest, subdued and partly displaced the Pelasgians. They are usually represented as having been divided into four chief tribes — the Æolians, occupying the northern parts of Greece (Thessaly, Bœotia, etc.); the Dorians, occupying originally only the small region in the neighborhood of Mount Œta; the Achæans, occupying the greater part of the Peloponnesus; and the Ionians, occupying the northern strip of the Peloponnesus and Attica. The middle part of the Peloponnesus was still mostly inhabited by a Pelasgic population. The warlike and enterprising character of these Hellenic invaders is evidenced by the poetic legends of their achievements in the heroic ages, such as the tale of the Trojan War, of Theseus, of Jason and the Argonauts, etc. From all these we may gather at least that the Hellenes early distinguished themselves by building towns, making long voyages, planting distant settlements, and carrying on foreign wars. As in later times, they were divided into numerous states, each consisting of a single city with the surrounding territory. These states were governed by kings who were the heads of the supreme families, and who traced their descent from Zeus. By the side of the kings stood the heads of the other leading families of the state, who in Homer are also called kings, and likewise boasted of a descent from Zeus. In the public market place (agora), where all the affairs of the state were transacted, these subordinate kings gave their opinions on every subject of deliberation, and advised the supreme ruler as to the course he should pursue, but beyond that they had no authority. Their influence, however, was very great, especially where the rightful head of the state did not possess the abilities of a ruler.

The distribution of the Hellenic tribes which we have just indicated is not that which continued throughout the main period of Greek history. It was entirely altered by an event called the Dorian migration, or sometimes the return of the Heracleids, which is placed by Thucydides about 80 years after the fall of Troy, and thus about the year 1104 B.C., according to the ordinary system of chronology. Before the great migration several smaller ones had taken place. One tribe, finding its territory too circumscribed, would move to another, expelling the inhabitants already settled there, who thus found themselves compelled to remove to some other district, where they treated the original inhabitants in the same way that they had been treated themselves. In this way there arose a general disturbance, till at last the hardy Dorian inhabitants of the mountainous region about Mount Œta began a migration on a greater scale than had hitherto been attempted, and thus brought about a series of changes which resulted in an entirely new settlement of the Greek territory. They first conquered a large part of northern Greece, and then entered and subdued the greater part of the Peloponnesus, driving out or subjugating the Achæans, as the Achæans had driven out or subjugated the Pelasgians. The Dorians are also said to have invaded Attica, where, however, they were baffled, according to the legend, by the self-devotion of Codrus, the king of that territory. It is said that an oracle had pronounced that in this war whichever side lost its king would be victorious, on which account strict orders were given to the Dorian soldiers to spare the life of the king of the enemy. But Codrus disguised himself in the dress of a common herdsman, and going into the enemy's camp provoked a quarrel in which he met his death, on learning which the Dorians despaired of success and withdrew. In the legend in which this series of events has come down to us the Dorians are represented as having entered the Peloponnesus under Temenus, Cresphontes, and Aristodemus, three descendants of Heracles, who had come to recover the territory of which their ancestors had been unjustly deprived by Eurystheus. Hence the name of the Return of the Heracleids, sometimes given to this event.

The Achæan inhabitants of the Peloponnesus whom the Dorians found there had a threefold fate. One part of them sought for new homes, and turned their steps toward the part of the Peloponnesus occupied by the Ionians, whom they expelled, keeping for themselves their territory, which hence received the name of Achaia. Another part voluntarily submitted to the invaders, who imposed tribute upon them and excluded them from all share in the government; while a third part resisted to the last, and were in the end reduced to the condition of slavery. In Laconia the former received the name Periœci (dwellers round), and the latter were called Helots.

The Ionians who were driven out of the Peloponnesus found at first a refuge among their kindred in Attica, but when this district did not suffice for all the inhabitants, old and new, large numbers of them left it and founded

Ionic colonies on several of the islands of the Ægean Sea and on the middle part of the coast of Asia Minor, where they built 12 cities, which formed an Ionic Confederacy. The principal of these were Ephesus and Miletus. About the same time as the Ionians are said to have colonized the middle part of the seaboard of Asia Minor, another body of Greeks, proceeding from Thessaly and Bœotia, are said to have founded the Æolian colonies on some of the northern islands of the Ægean, and on the northern part of the western coast of Asia Minor. The Æolic colonies of Asia Minor also formed a confederacy of 12 cities, but the number was afterward reduced to 11 by the accession of Smyrna to the Ionic Confederacy. While Ionians and Æolians thus colonized the middle and northern islands of the Ægean and coasts of Asia, the southern islands and the southern part of the west coast of Asia Minor were in like manner colonized by Dorian settlers. The six Doric towns in Asia Minor, along with the island of Rhodes, formed a confederacy similar to the Ionic and Æolic ones.

In considering the subject of Greek colonization we are brought face to face with the fact that in settling in foreign lands, the Greek races kept distinct from each other. One of the great keys to an understanding of Greek history is a right understanding of the relation between the two great races of the Greek name, the Dorians and Ionians. The Dorians were inland mountaineers, the Ionians were of the seacoast. The former, as represented in the institutions of Sparta, were a practical, and conservative race, living in public, simple and unimaginative. Their poetry was the public ode, accompanied with the dance in the market-place, often carried on under arms. The Ionians were versatile, imaginative, impressible. They were devoted to the maritime life, were travelers, and fond of welcoming strangers to their cities. They were traders. Moreover, they were keenly intellectual and reached the summit of excellence in art, literature, and philosophy. Their poetry was the epic narrative; and they invented the drama, in which the Ionian tale of personal adventure was united with the Doric ode. These two contrasted races between them swayed the fate of Greece. Their relations were complicated by the different colonies which they established at different points on the Mediterranean and Euxine coasts. In the course of time new Greek settlements were made on the coasts of the Hellespont, the Propontis (Sea of Marmora), and the Black Sea by both Dorians and Ionians. The most important of these were Byzantium (Constantinople) (Dorian), Sinope (Ionian), Cerasus (Ionian), and Trapezus (Trebizonde) (Ionian). Further, there were flourishing Greek colonies on the coasts of Thrace and Macedonia; for example, Abdera, Amphipolis, Olynthus, Potidæa, etc., which were all Ionian; and the Greek colonies in Lower Italy were so numerous that the inhabitants of the interior spoke Greek, and the whole region received the name of Greater Greece. The most famous of the Greek colonies in this quarter were Tarentum, Sybaris, Croton, Cumæ, and Naples. The island of Sicily also came to a great extent into the hands of the Greeks, who founded on it or enlarged many towns. By far the largest, most powerful, and most highly cultured of the Greek colonies was the Dorian colony of Syracuse, founded in the 8th century B.C. On the north coast of Africa the Dorian colony of Cyrene rivaled in wealth and commerce the city of Carthage; and on the south coast of Gaul Ionian Massilia (Marseilles) presented a model of civilized government to the inhabitants of the surrounding districts. All these towns kept up a commerce in the products of the land in which they were planted. They exerted a most important and beneficent influence on the manners of the neighboring inhabitants. They preserved the customs and institutions of their mother city, which they regarded with filial reverence; but otherwise they were perfectly free and independent.

Although ancient Greece never formed a single state, the various Greek tribes always looked upon themselves as one people, and classed all other nations under the general name of *Barbaroi* (foreigners). There were four chief bonds of union between the Greek tribes. First and chiefly they had a common language, which, though it had considerable dialectic peculiarities when spoken by different tribes, was yet understood throughout every part of Greece and in all the Greek colonies. Secondly, they had common religious ideas and institutions, and especially in the oracle of Delphi (q.v.) they had a common religious sanctuary, which was held by all the states in equal reverence, and was resorted to from all parts of Greece, alike by communities and individuals, for advice in circumstances of difficulty, and not unfrequently for indications as to the future. Thirdly, there was a general assembly of the Greeks called the Amphictyonic League (q.v.) in which the whole nation was represented by tribes (not by states), and the chief functions of which were to guard the interests of the sanctuary of Delphi, and to see that the wars between the separate states of Greece were not carried on in too merciless a manner. When any of the ordinances of the league were violated it was its duty to see that the violators were punished, and to entrust the infliction of the punishment to some one of its members. The fourth bond of union between the tribes of Greece consisted in the four great national festivals or games, the Olympian, Isthmian, Nemean, and Pythian (qq.v.) which were held at different intervals in four different parts of Greece, in which all Greeks, and none but Greeks, were allowed to participate, and which slaves were not allowed even to witness. At these games contests took place in foot-racing and chariot-racing, boxing, wrestling, and throwing with the quoit (or discus), and prizes were also awarded for works of art, poems, dramas, histories, etc. The prize was a simple wreath of olive or pine branches, or of parsley; but such a prize brought glory not only on the winner himself, but on his whole family and kindred, and even on the state to which he belonged. The victor was welcomed home by a triumphal procession, and his victory was celebrated in odes sung on the occasion, and sometimes composed by such poets as Simonides and Pindar. The Olympic games were the most celebrated of these festivals. They were held in the summer once every four years at Olympia, in Elis; the month in which they were held was considered as sacred, and during it no acts of hostility were allowed to take place between any of the Greek states. Originally, the only contest was a foot-race, and so high was the honor of a victory in this race esteemed, that from that of Corœbus in 776 B.C. the whole of Greece reckoned the time. The year in which any event happened was styled the first, second, third, or fourth year of a certain Olympiad, the name given to the interval elapsing between each celebration.

The various small states of Greece may be divided, according to the form of their constitution, into the two great classes of aristocratic and democratic. Sparta or Lacedæmon, the chief town of Laconia and of the Dorians, was the leading aristocratic state; and Athens, the capital of Attica and the chief town of the Ionians, was the leading democratic state; and as a rule all the Doric states, and subsequently all those under the influence of Sparta, resembled that city in their constitution; and all the Ionic states, and those under the influence of Athens, resembled it. These two races are the only ones that come into prominence during the earlier part of Greek history subsequent to the Doric migration. Sparta is said to have derived its form of government, and all its institutions, near the close of the 9th century B.C., from Lycurgus, who made minute regulations as to the course of education and the mode of life among the Spartans. He had but one object, that of training the Spartan youth for war, and developing a hardy and warlike spirit among the people. The immediate results of this training were seen in the conquests which the Spartans effected over the surrounding states, especially over the Messenians in the 8th and 7th centuries B.C. Many of the vanquished Messenians left their native country and founded the city of Messana in Sicily. Those who remained were reduced to the condition of Helots (q.v.).

The constitution of Athens was not originally democratical, but monarchical. Afterward it became aristocratic, and first received a more or less democratic constitution from Solon at the beginning of the 6th century B.C. This was followed about 50 years later by a despotic monarchy under the celebrated "tyrant" Pisistratus, and his sons, Hippias and Hipparchus, the last survivor of whom, Hippias, reigned in Athens till 510 B.C. Hipparchus had been assassinated four years before, and the last four years of the reign of Hippias were distinguished by violence and cruelty. His enemies drove him from Athens, after which the republic was restored in a more purely democratic form than at first.

Hippias found refuge at the court of the king of Persia, with whose aid he hoped to be able to return and rule once more in Athens. The Persian monarchy had been established about 30 or 40 years before by Cyrus the Great, and its sway extended not only over the whole of Persia, Media, and Babylonia, but also over Egypt and Asia Minor. With the rest of this last-mentioned territory the Greek colonies on the coast had been brought under the yoke of this empire, and although they chafed under the foreign dominion, they were kept in subjection by the native princes or tyrants whom the Persian monarch imposed on them as governors. One of the most powerful of these governors was Histiæus of Miletus, whose behavior had excited the distrust of Darius, the Persian king, for the latter, on the pretence of rewarding him for a signal service invited him to his court and kept him at Susa in practical captivity. Histiæus secretly incited his relative, Aristagoras of Miletus, to get up a rising among the Greek colonies of Asia Minor, in the hope that he might, during the disturbance, find an opportunity of returning to his home. The endeavors of Aristagoras were successful; all the Greek towns on the coast were soon in arms, and assistance was asked from the mother country. Only Athens, which feared lest Darius should re-establish Histiæus, and the small Ionian town of Eretria in Eubœa, furnished any aid. The Greeks, in 496 B.C., conquered and burned the town of Sardis, the capital of Asia Minor, whereupon the rebellion extended over the whole of Ionia. But the superior forces of the enemy, and the want of union among the insurgents, led in the following year (495) to the loss of a naval battle, and soon after to the destruction of Miletus, the inhabitants of which were partly put to death and partly made captives.

Darius now determined to avenge himself on the Athenians and Eretrians for the part that they had taken in the rising. In 492 he sent out an expedition against them under his son-in-law Mardonius, but the Persian fleet was wrecked off the promontory of Mount Athos. Darius had at the same time despatched heralds to the islands and states of Greece to demand earth and water in token of submission. Most of the islands and many of the smaller states yielded, but Athens and Sparta indignantly refused the demand, and even went the length of putting the heralds to death. Enraged at this insult Darius equipped a second fleet and placed it under the command of Datis and Artaphernes. But this met with no better fate than the first. The Persians landed on the island of Eubœa, and after destroying Eretria, crossed the Euripus into Attica; but here they were met (490 B.C.) on the plain of Marathon by 10,000 Athenians and 1,000 Platæans, under Miltiades, and, although 10 times as numerous, were totally defeated and pursued to their ships. This battle put an end to the second Persian expedition, but Darius at once began to make preparations for a third expedition, and this time on a far greater scale than before. In the midst of these preparations he died, but his son Xerxes, collected an army of 1,700,000 men and a fleet of 1,200 large ships besides a number of smaller ones, crossed the Hellespont in 481 by means of two bridges of boats, and led his army through Thrace, Macedonia, and Thessaly, while his fleet followed the line of coast. Thessaly had surrendered without a stroke, and Xerxes at once pursued his march in the direction of Phocis. But before he could enter this territory he had to make his way through the narrow and difficult pass of Thermopylæ, and this had previously been occupied by 300 Spartans under Leonidas, along with several thousand allies. Here Xerxes in vain attempted to force a passage against a mere handful of Greeks; thousands of his troops were slain; and it was only after Ephialtes had betrayed to the Persians a foot-path which led over the heights of Œta to the rear of the defenders of the pass, that the Persian king effected his purpose. Leonidas allowed all the allies to depart, while he himself and his 300 Spartans, along with 700 Thespians who voluntarily remained with them, held out until they were completely annihilated (480 B.C.).

The way through Phocis and Bœotia was now open to the Persians, who advanced into Attica, and laid the city of Athens in ruins, putting to death the small garrison. The women and children belonging to Athens had by this time, on the advice of Themistocles, been removed to Salamis, Ægina, and Trœzen, while all the men capable of bearing arms served in the fleet. It was to Themistocles that the deliverance of Greece was now chiefly due. The united fleet of the Greeks had already contended with success against that of the Persians off the promontory of Artemisium, in Eubœa, and had then sailed into the Saronic Gulf, whither it was followed by the enemy. In this confined arm of the sea, where there was no room for the manœuvring of the numerous ships of the enemy, a decisive battle between the two fleets took place with the result that Themistocles had anticipated, the total defeat of the Persians. This battle is known as the battle of Salamis, from the name of an island in the Saronic Gulf, and was fought in the same year as Thermopylæ (480 B.C.). Xerxes himself had been an eyewitness of the battle and at once began a speedy retreat with his land army through Thessaly, Macedonia, and Thrace, a retreat which Themistocles had hastened by causing the false report to reach Xerxes, that it was the intention of the Greeks to destroy the bridges of boats over the Hellespont. Xerxes left behind him only 300,000 men in Thessaly. In the spring of the following year (479) these advanced into Attica and compelled the citizens once more to seek refuge in Salamis; but in the battle of Platæa the Greeks, under the command of Pausanias, obtained so complete a victory, that only 40,000 of the Persians reached the Hellespont. On the same day the remnant of the Persian fleet was attacked and defeated by the Greeks off Mount Mycale, near Samos on the Ionian coast of Asia.

By the brilliant part which the Athenians under Themistocles had played against the Persians, the influence of Athens had greatly increased throughout Greece; and this was further strengthened by the fact that the war aginst Persia, which still continued, was chiefly conducted by sea, where Athens was much more powerful than Sparta. From this date then begins the period of the leadership or *hegemony* of Athens in Greece, which continued to the close of the Peloponnesian war, 404 B.C. Athens now exerted her influence to form a confederacy including the Greek islands and maritime towns as well as Athens herself, the object of which was to provide for the continuance of the war by the payment into a common treasury at Delos, of a fixed sum of money, and by furnishing ships for the same purpose. In this confederacy Athens of course had the lead, and gradually was able to render tributary many of the islands and smaller maritime states. In 469 B.C. the victories won by the Athenians over the Persians was crowned by the double victory of Cimon, the son of Miltiades, over the fleet and army of the Persians on the river Eurymedon, in the south of Asia Minor; and this victory was followed by the Peace of Cimon, which secured the freedom and independence of all Greek towns and islands. Shortly after followed the brilliant administration of Pericles, during which Athens reached the height of her political grandeur, while at the same time she flourished in trade, in arts, in science, and in literature.

The position of Athens, however, soon raised up a number of enemies. Sparta regarded her prosperity with jealousy; and the arrogance of Athens had produced a pretty general feeling of indignation and hatred. Two hostile confederacies were formed in Greece. At the head of one of these confederacies was the city of Athens, which was joined by all the Ionian states of Greece, and more or less supported by the democratic party in every state. At the head of the other confederacy stood Sparta, which was similarly joined by all the Dorian states, and supported by the aristocratic party everywhere. At last in 431 war was declared by Sparta on the complaint of Corinth that Athens had furnished assistance to the island of Corcyra in its war against the mother city; and on that of Megara, that the Megarean ships and merchandise were excluded from all the ports and markets of Attica.

In the first part of the Peloponnesian war the Spartans had considerable successes, while a great calamity befell the Athenians, who had collected all the inhabitants of the country districts of Attica within the walls of the city; and in consequence a pestilence broke out which carried off thousands of the inhabitants, and among them Pericles himself. From this blow, however, the city soon recovered, and in 425 the early successes of the Spartans in Attica were compensated by the capture of Pylos in Messenia by the Athenian general Demosthenes, who at the same time succeeded in shutting up 400 Spartans in the small island of Sphacteria, opposite Pylos, where they were ultimately starved into surrender. The person to whom the surrender was made was the demagogue Cleon, who, in consequence of his military successes, obtained the command of an army which was sent to operate against the Spartan general Brasidas in Thrace. But in 422 he was defeated by Brasidas before the town of Amphipolis, and himself slain, after which the opposite party in Athens got the upper hand, and concluded the peace with Sparta known as the Peace of Nicias (421 B.C.).

The effect of this peace was to divide the Spartans and the Corinthians, who had hitherto been allies. The latter united themselves with Argos, Elis and some of the Arcadian towns to wrest from Sparta the hegemony of the Peloponnesus. In this design they were supported by Alcibiades, a nephew of Pericles, a man of handsome figure and great personal accomplishments. The war which was now waged between Sparta and Corinth with her allies resulted, however, in favor of the former, whose arms were victorious at the battle of Mantinea in 418.

Soon after this the Athenians resumed hostilities, fitting out in 415 B.C. a magnificent army and fleet, under the command of Alcibiades, Nicias, and Lamachus, for the reduction of the Dorian city of Syracuse in Sicily. This undertaking, which renewed the race hatred between Sparta and Athens, was a complete failure. Alcibiades was accused in his absence of several offenses against religion and the constitution, and deprived of his command. Thirsting for revenge, he betook himself to Sparta, and exhorted the city to renew the war with Athens. By his advice one Spartan army was despatched to Attica, where it took up such a position as prevented the Athenians from obtaining supplies from Eubœa, while another was sent under Gylippus to assist their kindred in Sicily. These steps were ruinous to Athens. Lamachus fell in the siege of Syracuse, and the Athenian fleet was totally destroyed. The reinforcements sent out under Nicias and Demosthenes were defeated (413 B.C.) by the combined Spartan and Syracusan armies. All the Athenians who escaped death were made captives and compelled to work as slaves in the quarries of Sicily, although it may be mentioned as an interesting fact that many of these captives obtained their liberty by being able to recite fragments of Euripides.

After this disaster many of the allies of Athens joined the Spartans, who now pressed on the war with greater energy. The Athenians recalled Alcibiades, who returned in 407, and was received by his fellow-citizens with enthusiasm as their expected deliverer. A few months later he was again an exile, having been deprived of the command because one of his subordinates had lost a naval battle fought off Ephesus in his absence. During the rest of the war the Athenians had only one success, the naval victory won off the islands of Arginusæ over the Spartan Callicratidas in 406. In the following year (405) the Spartans made themselves masters of the whole of the Athenian fleet except nine vessels, while the majority of the crews were on shore at Ægospotamos on the Hellespont. The Spartans now easily subdued the islands and states that still maintained their allegiance to the Athenians, and laid siege to Athens itself. In 404 B.C. the war was terminated by the Athenians' surrender. Sparta immediately imposed upon Athens an aristocratic form of government, placing the supreme power in the hands of the Thirty Tyrants. Only a year later, however (403), Thrasybulus was able to overthrow this hated rule and re-establish the democracy.

The fall of Athens resulted in Sparta's leadership or hegemony in Greece, which lasted till the battle of Leuctra, 371 B.C. The Spartans now abused their power and speedily roused the hatred and jealousy of the other states. The Greek states which had up to this time been, and still continued to be, leaders, had now lost almost entirely their manliness and independent spirit, and no longer maintained the hereditary war against Persia, but each sought the aid of that power for its own purpose. The Spartans did indeed send an expedition into Asia Minor, but it came to nothing; and the states of Greece, the Spartans included, at last, in 387, agreed to the disgraceful Peace of Antalcidas, by which the whole of the west coast of Asia Minor was ceded to the Persians, and the Greek colonies there thus deprived of the independence that had been secured to them by the Peace of Cimon.

An act of violence committed by a Spartan general in Thebes in 380 in the end led to the complete downfall of that city. The aristocratic party in Thebes, when the Spartan army happened to be in the neighborhood, prevailed upon the general to give his assistance in overthrowing their opponents and establishing an aristocratic government. A number of the less prominent members of the defeated party, among them Pelopidas, made their escape to Athens, where they got the support and assistance of the democratic party there. They soon returned in disguise to their own city, surprised and murdered the leaders of the aristocratic party, expelled the Spartan garrison, and again set up a democratic government. These circumstances give a good idea of the fury of party strife which was then general in the Greek cities. The immediate result of this counter-revolution in Thebes was a war with Sparta, the heroes of which were Epaminondas and Pelopidas, who were then at the head of affairs in Thebes. In the course of the war the Spartans invaded Bœotia, but were so completely defeated at Leuctra in 371 B.C. that they never fully recovered from the blow.

With this victory Thebes won hegemony in Greece, which she maintained during the lifetime of Epaminondas, whose policy it was to keep down the power of Sparta by strengthening the surrounding states. From him the Messenians recovered their freedom, and by his advice the cities of Arcadia formed themselves into a confederacy, and built the city of Megalopolis. This policy was at first successful, but in a few years the confederacy began itself to strive after the supremacy, and joined themselves with this object to the Spartans. Epaminondas then invaded the Peloponnesus, but although the Thebans totally defeated the Spartans and Arcadians in the battle of Mantinea (362), yet the victory being won with the loss of their great general, the Thebans could no longer boast with justice of supremacy in Greece. Pelopidas had died two years before.

Two years after the death of Epaminondas, Philip, the father of Alexander the Great, became king of Macedonia. He was a man of great ability as a soldier and a ruler, an admirer of the Greek character, and a lover of Greek art and literature. He perceived, however, the weakness of the Greeks, arising from their want of unity, and waited for an opportunity of interfering in the affairs of their country, with the view of ultimately making himself master of it. An occasion for interference was furnished him by the Sacred war (355–46). The Phocians having taken possession of some of the land belonging to the sanctuary of Delphi, the Amphictyonic League condemned them to pay a fine and restore the land they had taken. This was refused and the league imposed upon the Thebans the task of forcing the Phocians to submit, but in their rocky strongholds the Phocians were able to resist all the efforts of their assailants, who at last called in the aid of Philip of Macedon. With his help the Phocians were subdued, they themselves expelled from the league, and their place given to Philip.

It was not, however, till the Locrian war (339–8) that Philip acquired a firm hold in Greece. The Locrians had committed the same offense as that of the Phocians, and when they likewise refused to pay the fine imposed upon them by the league, Philip, as one of the members, received the charge of punishing them. The advance of Philip was at first witnessed with comparative indifference by the states of Greece, but when his real designs became apparent the Athenians, on the advice of Demosthenes, hastily concluded an alliance with the Thebans, and an army was sent out to oppose him. The battle of Chæronea (338) turned out, however, disastrously for the Greeks, who saw their whole country laid at the feet of Philip. But the conqueror treated his new subjects with mildness, wishing to reconcile them to the Macedonian yoke, and to win their co-operation in his projected invasion of the rotten empire of Persia. He collected a large army, of which he got himself declared commander-in-chief by the Amphictyonic League in an assembly held at Corinth in 337 B.C.; before he was able to start he was assassinated 336 B.C.

The design of Philip on Persia was taken up and carried out by his son Alexander the Great, during whose absence Antipater was left behind as governor of Macedonia and Greece. Soon after the departure of Alexander, Agis III. of Sparta headed a rising against Antipater. He was defeated, however, in the battle of Megalopolis in 330 B.C., and no other attempt was made by the Greeks to recover their liberty for nearly 100 years. At the close of the wars which followed the death of Alexander, and which resulted in the division of his empire, Greece remained with Macedonia.

The last efforts of the Greeks to recover their independence proceeded from the Achæans, who held the northern strip of the Peloponnesus. This tribe is frequently mentioned by Homer as taking a very prominent part in the Trojan war; but during the historical period of Greece they for the most part kept aloof from the quarrels of the other states, and did not even furnish assistance in repelling the Persian invasion. They had taken part, though reluctantly, in the Peloponnesian war on the side of Sparta, and had shared in the defeat of Megalopolis in 330 B.C. In the course of the first half of the 3d century B.C. several of the Achæan towns expelled the Macedonians, and revived an ancient confederacy, which was now known as the Achæan League. About the middle of this century the league was joined by the town of Sicyon, the native city of Aratus, who soon after became its leading spirit. Through his influence it was joined also by Corinth, and then it began to aim at acquiring the supremacy throughout the Peloponnesus, and even throughout the whole of Greece, as well as at delivering Greece from the Macedonian yoke. In following out the first of these aims Aratus and the league came into collision with Sparta, which at that time happened to be governed in near succession by two kings, Agis IV. (244–240) and Cleomenes (236–220), who had both something of the old Lycurgan spirit in them. These, then, naturally looked with jealousy on the efforts of Aratus, and during the reign of Cleomenes a war broke out between Sparta and the Achæan League. The league was at first worsted, and was only finally successful when Aratus, forgetting the ultimate end of his efforts in the pursuit of that which he had more immediately in view, called in the aid of the Macedonians. In the battle of Sellasia, in 222 B.C., Cleomenes was defeated and compelled to take to flight, and the Macedonians became masters of Sparta. Aratus died in 213, and his place was taken by Philopœmen, "the last of the Greeks," who roused the league once more to vigorous efforts, and gradually succeeded in making it in some degree independent of Macedonia.

About this time the Romans, who had just come out victorious from a second war with Carthage, in which they had had to contend with Hannibal, found an occasion to interfere in the affairs of Greece. Philip V. of Macedon had allied himself during this war with Hannibal, and, accordingly as soon as the war was concluded, the Romans sent over Flamininus to punish him for so doing, and in this war with Philip the Romans were joined by the Achæan League. Philip was defeated at the battle of Cynoscephalæ in 197 B.C., and was in consequence obliged to agree to a peace, in which he recognized the independence of Greece. To gratify the Greek vanity Flamininus proclaimed the deliverance of Greece from the Macedonian yoke at a celebration of the Isthmian games in 196 B.C.; but the Greeks soon felt that they had only exchanged masters, that they were in reality, although not in name, as much in subjection to them as they had ever been to the Macedonians. On this account the Ætolians, who had formed a league similar to that of the Achæans, appealed for assistance against the Romans to Antiochus the Great, king of Syria, one of the kingdoms which had been formed out of the empire of Alexander. The appeal was listened to; but the help afforded was useless, for Antiochus was defeated in a bloody battle at Magnesia in Asia Minor in 190 B.C. The Ætolians were compelled to pay a money indemnity, and to sacrifice some of their art treasures.

By this time the Achæan League was unquestionably supreme over all other powers within Greece, having been joined by all the states of the Peloponnesus. But the league itself was in reality subject to Rome, the senate of which assumed the right of regulating its proceedings; and on one occasion, in 168 B.C., on the conclusion of a war waged by the Romans against Macedonia, the former carried off into Italy 1,000 of the noblest Achæans, on the pretext that they had furnished assistance to the Macedonians. Such was the condition of affairs until 147 B.C., when the league openly resisted a demand made by the Roman senate, that Sparta, Corinth, Argos, and other cities, should be separated from it, in consequence of which a war ensued, which was concluded in 146 B.C. by the capture of Corinth by the rude consul Mummius.

The independence of Greece was virtually gone with the fall of Corinth. From this date the prosperity of her cities rapidly declined, and the last sparks of the ancient Greek patriotism and love of independence became extinguished. The various cities still retained, however, something of the qualities for which they had been remarkable at the height of their glory. Athens was still one of the centres of culture, and the cradle of all kinds of new speculations. Many Athenians left their native city and made a livelihood, although they gained little esteem, among the Romans, as artists and scholars, actors and dancers, poets and wits. The citizens of Sparta continued to gratify their thirst for warfare as well as their covetousness by serving as mercenaries in foreign armies. Corinth was still the home of luxury and vice.

From the date above mentioned Greece remained attached to the Roman empire. On the division of the Roman empire it fell of course to the eastern or Byzantine half. From 1204 to 1261 it formed a part of the Latin Empire of the East, and was divided into a number of feudal principalities. In the latter year it was reannexed to the Byzantine empire, with which it remained till it was conquered by the Turks between 1400 and 1473. In 1099 the Morea was ceded to the Venetians, but was recovered by the Turks in 1715. (For the history of the present kingdom of Greece, see GREECE, MODERN.) Consult: Thirlwall, 'History of Greece'; Grote, 'History of Greece'; Bury, 'History of Greece' (1900).

Cosmogony and Religion.— Nowhere did polytheism develop itself into a brighter and more beautiful system than among the ancient Greeks. It was this circumstance no doubt that led the Romans, when they became acquainted with the literature and religion of the Greeks, to blend the Greek system with that of the ancient Italians, identifying the Greek deities with those of their own pantheon. In this way the Greek and Italian deities came to be confounded.

According to the view of the origin of all things which in course of time grew up among the Greeks, the universe was in the beginning a formless mass, Chaos (confusion), from which arose the "broad-bosomed" Earth (Greek, *Gaia, Gē;* Latin, *Tellus*), the Lower World (Tartarus), the darkness of Night (Greek, *Nux;* Latin, *Nox*), the parent of Light, and the formative principle of Love (Greek, *Erōs;* Latin, *Amor*), all of which were regarded as independent divinities. From the womb of the Earth proceeded the Heaven (Greek *Ouranos;* Latin, *Cœlum*) and the Ocean, and afterward the Titans, creatures of superhuman size and strength, who formed the first dynasty of gods. The Titans were succeeded by a more genial race of divinities endowed with intellectual as well as physical qualities, who subdued the Titans, and subsequently the Giants, another race whom the Earth produced after the loss of her first brood. In this second dynasty of gods the supreme ruler was Zeus (Jupiter or Juppiter), the son of Kronos (Saturn), who after the subjugation of the Titans and Giants ruled in Olympus over "the middle air," while his brother Pluto reigned over the dark kingdom of the lower world (Hades, Tartarus, Orcus), and Poseidōn (Neptune), armed with his trident, ruled in the sea. Like reverence was paid to Hēra (Juno), the sister and wife of Zeus, and the queen of Heaven, the virgin Pallas Athēnē (Minerva), a goddess armed with helmet and shield, and worshipped as the patroness of all intellectual employments and useful inventions, to the two children of Lētō (Latona), Apollo, the leader of the Muses (hence called Musagētēs) and the protector of the fine arts, and his sister, the chaste huntress Artemis (Diana), the goddess of the moon, to the daughter of Zeus, Aphroditē (Venus), the goddess of love, Ares (Mars), the god of war, Hermēs (Mercury), the herald of the gods, and others besides. In addition to these there was an innumerable host of inferior deities (Nymphs, Nereids, Tritons, Horai, Sirens, Dryads and Hamadryads, etc.), who presided over woods and mountains, fields and meadows, rivers and lakes, the seasons, etc. There was also a race of heroes or demigods (Heracles or Hercules, Perseus, etc.) tracing their origin from Zeus, and forming a connecting link between gods and men, while on the other hand the Satyrs formed a connecting link between the race of men and the lower animals. According to a plausible theory, now less generally held than formerly, these gods and demigods are nothing else than the personified objects of nature (the Sky or Upper Air, the Sun, the Ocean, the Air in Motion, etc.), and were originally not conceived as personified, in the strict sense of the term, that is, as clothed in a human form, but simply as the objects themselves, to which the earliest races everywhere attributed a conscious existence like their own, and that the mythological tales relating to these deities and heroes were in their simplest form the natural expression of what human beings in their infancy believed to be done and felt by the very things which they saw. Such is the theory of Max Müller, Mr. Cox, and others; but it will be more appropriately expounded in the article Mythology (q.v.).

With regard to the inculcation of religious beliefs, and the practice of religious duties among the Greeks, the most striking thing to remember is that they had no separate class appointed to perform these functions. The priests were in no sense preachers of doctrines, but merely hierophants, or exhibitors of sacred things, of rites, symbols, and images. They showed how the gods were to be worshipped, or more usually how a particular god was to be worshipped; but it was not their office to teach theological doctrine.

Greek Language and Writing.— The language which we call Greek belongs, as is well known, to the Indo-European or Aryan family of tongues, being akin to the Sanskrit, Persian, Latin, Celtic, Slavonic, and Germanic languages, including of course English. Out of Greece it was spoken in a great part of Asia Minor, of the south of Italy and Sicily, and in other regions which were settled by Grecian colonies. From the great number of Hellenic tribes of the same race it was to be expected that there would be different dialects, the knowledge of which is the more necessary for becoming acquainted with the Greek language, since the writers of this nation have transmitted the peculiarities of the different dialects in the use of single letters, words, forms, terminations, and expressions, and that not merely to characterize more particularly an individual represented as speaking, but even when they speak in their own person. It is customary to distinguish three leading dialects, according to the three leading branches of the Greeks, the Æolic, the Doric, and the Ionic, to which was afterward added the mixed Attic dialect; besides these there are several secondary dialects. Akin to the Ionic is the so-called Epic dialect, that in which the poems of Homer and Hesiod are written, and which was afterward adopted by other epic writers. The Doric was rustic and harsh; the Ionic was the softest and most liquid. The Attic was the neatest, clearest and most precise in sound literation and idiom. The Æolic was spoken on the north of the Isthmus of Corinth (except in Megara, Attica, and Doris), in the Æolian colonies of Asia Minor, and on some of the northern islands of the Ægean Sea. The Doric was spoken in the Peloponnesus, in the Doric Tetrapolis, in the Doric colonies of Asia Minor, of Lower Italy (Tarentum), of Sicily (Syracuse, Agrigentum), and most purely by the Messenians; the Ionic in the Ionian colonies of Asia Minor, and on the islands of the Archipelago; and the Attic in Attica. In each of these dialects there are celebrated authors. The Ionic dialect is found pure in some prose writers, especially Herodotus and Hippocrates. The Doric is used in the poems of Pindar, Theocritus, Bion, and Moschus. Little Doric prose remains, and that is mostly on mathematical or philosophical subjects. In Æolic we have fragments of Alcæus and Sappho. After Athens had obtained the supremacy of Greece, and rendered itself the centre of all literary cultivation, the masterpieces of Æschylus, Sophocles, Euripides, Aristophanes, Thucydides, Xenophon, Plato, Aristotle, Isocrates, Demosthenes, etc., made the Attic the common dialect of literature. Grammarians afterward distinguished the genuine Attic, as it exists in those masters from the Attic of common life, calling the latter the *common Greek* or *Hellenic* dialect: and even the later Attic writers, posterior to the golden age of the literature, were designated *Hellenes* or *common Greeks*. In this latter class are Theophrastus, Apollodorus, Polybius, Plutarch, and others. Many of the later writers, however, wrote genuine Attic, as Lucian, Ælian, and Arrian. Except the dramatists, the poets by no means confined themselves to the Attic; the dramatists themselves assumed the Doric, to a certain degree, in their choruses, for the sake of giving them additional solemnity, because the antique ode was of Doric tradition. They also used the epic or Æolic dialect in narrative passages of the drama where it recalled the recitations of the ancient Ionian rhapsode. Undoubtedly the Greek dialects were not, in the earliest times, so distinct from each other as they afterward became; and on this subject we may quote the words of Prof. Bury (Hist. of Greece, chap. i.): "There can be little doubt that the mixture of the Greeks with the native peoples had a decisive effect upon the differentiation of the Greek dialects. The dialects spoken by the first settlers in Thessaly, in Attica, in Arcadia, have some common characteristics which tempt us to mark them as a group, and distinguish them from another set of dialects spoken by Greek folks which were to appear somewhat later on the stage of history. We may conjecture that the first set of invaders spoke in their old home much the same idiom; that this was differently modified in Thessaly and Bœotia, in Attica and Argolis, and the various countries where they settled; and that many of the local peculiarities were developed in the mouths of the conquered learning the tongue of the conquerors." It results that to have a thorough knowledge of the Greek language we must follow out historically as far as possible the course of its formation, extending our view over all the varied forms of the dialects — a labor which this language, so rich in classic models of every kind, so perfect, so flexible, so expressive, so sweet in its sound, so harmonious in its movements, and so philosophical in its grammatical forms and whole structure, merits, and richly rewards.

When the Greeks became acquainted with the art of writing we do not know. In Egypt hieroglyphics were used more than 3,000 years before the Christian era, and the cuneiform writing of Assyria and Babylonia had a similar antiquity. In Crete writing was practised more than 2,000 years before Christ, it is believed, and among the Asiatic Greeks it was probably introduced 9 or 10 centuries before Christ. According to the writer above quoted: "Perhaps the earliest example of a Greek writing that we possess is on an Attic jar of the 7th century; it says the jar shall be the prize of the dancer who dances more gaily than all the others. But the lack of early inscriptions is what we should expect. The new art was used for ordinary and literary purposes long before it was employed for official records. It was the great gift, which the Semites, who themselves derived it from Egypt, gave to Europe." According to the legend it was Cadmus the Phœnician who introduced the alphabet into Greece; and it is an undoubted fact that the most of the Greek letters are derived from the Phœnician ones. The Greek alphabet possesses the following 24 letters. Α, α (alpha), a; Β β (beta), b; Γ, γ (gamma), g; Δ, δ (delta), d; Ε, ε (epsilon), ĕ; Ζ, ζ (zeta), z; Η, η (eta), ē; Θ, θ (theta), th; Ι, ι (iota), i; Κ, κ (kappa), k; Λ, λ (lambda), l; Μ, μ (mu), m; Ν, ν (nu), n; Ξ, ξ (xi), x; Ο, ο (omicron, i. e. small o), ŏ; Π, π (pi), p; Ρ, ρ (rho), r; Σ, σ, ς (sigma), s; Τ, τ (tau), t; Υ, υ (upsilon), u, commonly transliterated by y; Φ, φ (phi), ph; Χ, χ (chi), ch guttural; Ψ, ψ (psi), ps; Ω, ω (omega, or great *o*), *ō*. There are also marks indicating accent, a rough and a smooth "breathing," the former equivalent to *h* initial before a vowel; but no *j*, *v*, *w*, etc. The alphabet originally introduced into Greece is said to have consisted of but 16 letters; 4 (Θ Ξ Φ Χ) are said to have been invented by Palamedes during the Trojan war, and 4 more (Ζ Η Ω Ψ) by Simonides of Ceos. That the 8 letters mentioned are more modern than the others is certain, partly from historical accounts, partly from the most ancient inscriptions. It remains to remark that the Greeks originally wrote from right to left; then *boustrophedon*, that is, alternately from right to left and left to right; and finally always from left to right.

Greek Literature.— The origin of Greek literature, that is, of the intellectual cultivation of the Greeks as contained in written works, is lost in an almost impenetrable obscurity. Though there existed in Greece, in earlier times, no actual literature, there probably was by no means a want of what we may not improperly call *literary cultivation*, if we free ourselves from the prejudice that a literature must of necessity be embodied in written alphabetical characters. The *first period* of Grecian cultivation which extends to the movement known as the invasion of the Peloponnesus by the Heraclidæ and Dorians, and the great changes produced by it, and which we may designate by the name of the *Ante-Homeric period*, was no doubt utterly destitute of literature; but it may be questioned whether it was also destitute of all that culture which we are accustomed to call *literary*. The fables which are told of the intellectual achievements of this period may have a certain basis of truth. Among the promoters of literary cultivation in this time we must distinguish three classes: (1) Those of whom we have no writings, but who are mentioned as inventors of arts, poets, and sages: Amphion, Demodocus, Melampus, Olen, Phemius, and Prometheus. (2) Those to whom are falsely attributed works no longer extant: Abaris, Aristeas, Chiron, Epimenides, Eumolpus, Corinnus, Linus, and Palamedes. (3) Those to whom writings yet extant, which, however, were productions of later times, are attributed: Dares, Dictys, Horapollo, Musæus, Orpheus, and the authors of the

Sibylline oracles. This is not the place to inquire whether any and how much of these writings is genuine. It is enough that the idea of such a forgery proves a belief in the existence of earlier productions. And how could the next period have been what it was without previous preparation? If we may thus infer what must have been in order that the succeeding period should be what it was, we learn also from the various traditions of the Ante-Homeric period that there existed in it institutions which, through the means of religion, poetry, oracles, and mysteries, had no small influence on the civilization of the nation and the promotion of culture; for the most part, indeed, in Oriental forms, and perhaps of Oriental origin; and that these institutions, generally of a priestly character, obtained principally in the northern parts of Greece, Thrace, and Macedonia. We must here remark that intellectual cultivation did not prosper at once in Greece, nor display itself simultaneously among all the tribes; that the Greeks became Greeks only in the process of time, and some tribes made more rapid progress than others.

About 80 years after the Trojan war new commotions and a new migration began within the borders of Greece. A portion of the inhabitants emigrated from the mother country to the islands and to Asia Minor. This change was in the highest degree favorable to Grecian genius; for the new settlements, abounding in harbors, and destined by nature for commerce and industry, afforded them not only a more tranquil life, but also a wider field for refinement, and gave rise to new modes of life. The ancients ascribed to the colonies in Ionia and the rest of Asia Minor the character of luxury and voluptuousness. The blue sea, the pure sky, the balmy air, the beautiful prospects, the finest fruits, and most delicious vegetables in abundance, all the requisites of luxury, here united to nourish a soft sensuality. Poetry and philosophy, painting and statuary, here attained their highest perfection; but great and heroic deeds were oftener celebrated than performed. Near the scene of the first grand national enterprise of the Greeks — the Trojan war — it was not strange that the interest this event excited should be lively, and that it should take a powerful hold of the imagination. Poetry thus found a subject, in the treatment of which it necessarily assumed a character entirely distinct from that of the former period. Among all nations heroic poetry has flourished with the spirit of heroism. The heroes were here followed by the bards, and thus the epopee was formed. We therefore call this *second period* the *epic age* of the Greeks. The minstrel (*aoidos*) now appears separated from the priest, but highly honored, particularly because the memory of the heroes lived in his verse; and poetry was the guardian of all the knowledge of preceding times, so long as traditions were not committed to writing. From its very nature the epopee must be historical, in an enlarged sense. Under such circumstances it is not strange that regular schools for poets were established; for the imagination of the first poet fired the imagination of others, and it was then, perhaps, believed that poetry must be learned like other arts — a belief to which the schools for priests, on which the schools for minstrels were probably modeled, contributed not a little. But they were minstrels in the strictest sense, for their traditions were sung, and the poet accompanied his verses on a stringed instrument. On every important occasion minstrels were present, who were regarded as standing under the immediate influence of the gods, especially of the Muses, who were acquainted with the present, the past, and the future. The minstrel, with the seer, thus stood at the head of men. But among the many minstrels which this age undoubtedly possessed, Homer alone has survived, whose name has always been associated with the two great epic poems, the 'Iliad' and 'Odyssey,' although in modern times the theory first promulgated by Wolf in 1795, that neither of these poems is the work of one man, has been accepted either entirely or with modifications by many scholars, and many others who contend for the unity of each of the two poems are yet inclined to believe that they were not both composed by the same individual. The latter opinion is not of modern origin, but divided also the Homeric scholars of ancient times. Several hymns, and a mock heroic poem called the 'Batrachomyomachia,' or the 'Battle of the Frogs and Mice,' are also ascribed to Homer, but on altogether insufficient grounds. From him an Ionian school of minstrels takes its name — the *Homeridæ* — who probably constituted at first, at Chios, a distinct family of rhapsodists, and who preserved the old Homeric and epic style, the spirit and tone of the Homeric verse. Much that was attributed to Homer may reasonably be assigned to them. A certain class of the followers of Homer are known by the name of the Cyclic poets, who began, however, to deviate materially from the Ionian epos, the historical element predominating more and more over the poetical. By Cyclus we understand the whole circle of traditions and fables, and not merely the events of the Trojan war. Cyclic poetry comprehended the whole compass of mythology; and we may, therefore, divide it into: (1) a cosmogonical; (2) a genealogical; and (3) a heroic Cyclus; in the latter of which there are two separate periods: (1) that of the heroes before; and (2) that of those after, the expedition of the Argonauts. To the first class belong the battles of the Titans and giants; to the second, the theogonies and herogonies. To the first period of the third class belong the Europia, several Heracleia and Dionysiacs, several Thebaids, Argonautics, Theseids, Danaids, Amazonica, etc. In the second period the poetry generally related to the Trojan war. To this belonged the Nostoi, which treated of the return of the heroes from Troy. The earliest of these Cyclic poets appeared about the time of the first Olympiad. A history of the gradual formation of their poetry cannot be given, because we have only very general accounts respecting them. But what we do know justifies us in concluding that between these historic poets and the Ionian school of minstrels something intervened, making, as it were, the transition. And we actually find this in the *Bœotian-Ascrean* school, which arose in European Greece, it is said, in the 8th century B.C. It derived its name from Ascra in Bœotia, the residence of Hesiod, who stood at its head, and by whom poetry was probably conducted back again from Asia Minor (for he was originally of Cyme in Æolia) to Greece. His works also were at first preserved by rhapsodists. They were not arranged till a later period, when they were augmented by foreign additions; so that, in their present form, their authenticity is as doubtful as that of the poems ascribed to Homer. Of the 16 works attributed to him there have come down to us the 'Theogony,' the 'Shield of Hercules' (the fragment of a larger poem), and 'Works and Days' (a didactic work on agriculture), the 'Choice of Days,' intermixed with moral and prudential maxims, etc. The works of Homer and Hesiod acquired a canonical importance among the Greeks, and constituted, in a certain degree, the foundation of youthful education.

In the *third period*, the age of lyric poetry, of apologues and philosophy, our knowledge of Greek history gradually acquires a greater certainty. About the beginning of the epoch of the Olympiads (776 B.C.) there ensued a true ebb and flood of constitutions among the small states of Greece. After numerous vicissitudes of power, during which the contending parties persecuted each other for a long time with mutual hatred, republics, with democratical constitutions, finally sprang up, which were in some measure united into one whole by national meetings at the sacred games. The spirit prevalent in such a time greatly favored lyric poetry, which now became an art in Greece, and reached the summit of its perfection at the time of the invasion of the Persians. Next to the gods, who were celebrated at their festivals with hymns, their country, with its heroes, was the leading subject of this branch of poetry, on the character of which external circumstances seem to have exercised no slight influence. The mental energies of the nation were roused by the circumstances of the country; and the numerous wars and conflicts, patriotism, the love of freedom, and the hatred of enemies and tyrants, gave birth to the heroic ode. Life, however, was at the same time viewed more on its dark side. Thence there was an intermingling of more sensibility in the elegy, as well as, on the other side, a vigorous reaction, in which the spirit of ridicule gave rise to the iambus (satire). In everything there was a more powerful impulse toward meditation, investigation, and labor for the attainment of a desired condition. The Golden Age, the gift of the gods, was felt to have departed. Whatever man discovered in future was to be the fruit of his own efforts. This feeling showed that the age of manhood had arrived. Philosophy had become necessary, and attained continually a greater development. It first spoke in maxims and gnomes, in fables and in dogmatic precepts. Lyric poetry next gave utterance to the feelings excited by the pleasures of earth. Of those who gained a reputation in this way, as well as by the improvement of music and the invention of various forms of lyric poetry, history presents us the names of Archilochus of Paros, inventor of the iambus; Tyrtæus, author of war songs; Callinus of Ephesus, inventor of the elegiac measure (all of whom flourished in the 7th century B.C.); Terpander of Antissa, in Lesbos (675 B.C.); Simonides of Amorgos (664), the second of the three principal iambic poets of Greece; Alcman the Lydian, and Arion of Methymna, said by Herodotus to have invented the dithyrambus (both flourished about 630 B.C.): Sappho, Alcæus, and Erinna, all natives of Lesbos, the first two of Mitylene, and all of whom flourished about 610 B.C.; Mimnermus of Colophon (flourished from about 634 to 600 B.C.); Stesichorus of Himera (600); Ibycus of Rhegium (lived about 540 B.C. at the court of Polycrates of Samos); Anacreon of Teos (lived first at the court of Polycrates, afterward at that of Hipparchus at Athens); Hipponax of Ephesus (540–520), the third great iambic poet; Lasus of Hermione (520); Simonides of Ceos (fl. 500); his contemporary, Timocreon of Rhodes; Corinna of Tanagra (490), the friend and instructress of Pindar (522–442). As gnomic writers, Theognis of Megara and Phocylides of Miletus deserve to be named (both of whom flourished about 540 B.C.); as a fablist, Æsop (570 B.C.). In the order of time several belong to the following period, but are properly placed here, on account of their connection.

In the period of 550–500 B.C. traditions were first committed to writing in prose, and Cadmus of Miletus (540), Acusilaus the Argive, Hecatæus of Miletus (500), Hellanicus of Mitylene, and Pherceydes of Scyros, are among the oldest historical writers (450). These are known as the logographers (*logographoi*), a name given to them by Thucydides. After them appeared Herodotus (born 484), the Homer of history. His example kindled Thucydides (born 471) to emulation, and his eight books of the history of the Peloponnesian war make him the first philosophical historian, and a model for all his successors. If his conciseness sometimes renders Thucydides obscure, in Xenophon (born about 444), on the contrary, there prevails the greatest perspicuity; and he became the model of quiet, unostentatious historical writing. These three historians are the most distinguished of this period, in which we must, moreover, mention Ctesias (400), Philistus (363), and Theopompus (340).

An entirely new species of poetry was created in this period. From the thanksgiving festivals, which the country people solemnized after the vintage, in honor of Dionysus (Bacchus), with wild songs and comic dances, arose, especially in Attica, the drama. By degrees variety and a degree of art were given to the songs of the village chorus, and by and by an intermediate speaker was introduced, who related popular fables, while the chorus varied the eternal praises of Bacchus by moral reflections, as the narration prompted. These games of the feast of the vintage were soon repeated on other days. Solon's contemporary, Thespis, who smeared his actors, like vintagers, with lees of wine, exhibited at the cross ways or in the villages, on movable stages, stories sometimes serious with solemn choruses, sometimes laughable with dances, in which satyrs and other ridiculous characters excited laughter. Their representations were called tragedies (*tragōdiai*), that is, songs of the goat (so called either because the exhibition of a tragedy was in the earliest times accompanied by the sacrifice of a goat, or because a goat was the prize, or because the actors were clad in goat-skins) comedies (*kōmōdiai*, meaning either village songs, from *kōmē*, a village, or songs of revelry, from *kōmos*, revelry), festive dances and satirical actions (*drama satyricum*). These sports were finally exhibited, with much more splendor, on the stages of the towns, and acquired a more and more distinct character by their peculiar tone and morality. Instead of an intermediate speaker, who related his story extemporaneously, Æschylus (525-456) first substituted actors, who repeated their parts by rote; and he was thus the actual creator of the dramatic art, which was soon carried to perfection; tragedy by Æschylus, Sophocles (495-406) and Euripides (480-406); comedy by Cratinus (519-422), Eupolis (fl. 440), Crates, but especially by Aristophanes (about 444-380). Under the government of the Thirty Tyrants the freedom which comedy had possessed, of holding up living characters to ridicule, was restricted, and the middle comedy was thus gradually formed, in which the chorus was abolished, and, with delineations of general character, characteristic masks were also introduced. The mimes of Sophron of Syracuse (460-420), dramatic dialogues in rhythmical prose, formed a distinct species, in connection with which stands the Sicilian comedy of Epicharmus (about 540-450).

Eloquence, the necessary outcome of the democratic institutions of many of the Greek states, likewise flourished during this period, and was speedily elevated to the rank of a fine art. Antiphon (440), Lysias (458-378), Isocrates (436-338), Isæus (420-348), Demosthenes (about 385-322), Æschines (389-314), were renowned masters of this art. We still possess the admired masterpieces of several of these orators. How near rhetoric was then to triumphing over poetry is manifested in Euripides, and there is no question that it had a considerable influence on Plato and Thucydides. Mathematics was now cultivated, and geography served to illustrate history. Astronomy is indebted to the Ionic school, arithmetic to the Italic, and geometry to the Academic school for many discoveries. As mathematicians, Meton, Euctemon, Archytas of Tarentum, Eudoxus of Cnidus, were celebrated. Geography was particularly enriched by voyages of discovery, which were occasioned by commerce; and in this view Hanno's voyage to the western coast of Africa, the Periplus of Scylax (a description of the coasts of the Mediterranean), and the discoveries of Pytheas of Massilia in the northwest of Europe, deserve mention. The study of nature was likewise pursued by the philosophers; but the healing art, hitherto practised by the Asclepiadæ in the temples, constituted a distinct science, and Hippocrates (about 460-357) became the creator of scientific medicine.

The following period is usually called the *Alexandrine*, and might be characterized as the *systematizing* or *critical period*. Athens did not, indeed, cease to sustain its ancient reputation; but during the greater part of the period Alexandria was in reality the leading Greek city. From this and other causes the spirit of Grecian literature necessarily took another turn. Greece was now under a foreign yoke; great creative geniuses no longer arose either in the home country or in the colonies; and the use of an immense library tended to make erudition triumph over the free action of mind, which, however, could not be immediately overborne. In philosophy, Plato's acute and learned disciple, Aristotle (384-322), appeared as the founder of the Peripatetic school, which gained distinction by enlarging the territory of philosophy, and by its spirit of system. He separated logic and rhetoric, ethics and politics, physics and metaphysics and applied philosophy to several branches of knowledge; thereby producing economics, pedagogics, and poetics. He invented the philosophical syllogism, and gave philosophy the form which it preserved for centuries. His disciple Theophrastus (died 287 B.C.) followed his steps in the investigation of philosophy and natural history. But the more dogmatic was the philosophy of Aristotle, the more caution was requisite to the philosophical inquirer, and the spirit of doubt was salutary. This was particularly exhibited in the system of skepticism which originated with Pyrrho of Elis (330). A similar spirit subsisted in the middle and new academies, of which Arcesilaus (241) and Carneades (155) were the founders. The Stoic school, founded by Zeno of Citium in Cyprus (342-270), and the Epicurean, of which Epicurus (2[illegible]-270) was the founder, were chiefly remarkable for the effect that they had in the development of moral speculation in opposite directions, which gradually brought about a great difference in the practice of the adherents of the opposite schools. Mathematics and astronomy made great progress in the schools at Alexandria, Rhodes, and Pergamus. And to whom are the names of Euclid (323-283), Archimedes (287-212), Eratosthenes (276-196), and Hipparchus (160-145) unknown? The expeditions and achievements of Alexander furnished abundant matter to history; but, on the whole, it gained in extent, not in value, since a preference for the wonderful over the actual had now become prevalent. The more gratifying, therefore, is the appearance of Polybius of Megalopolis (204-122), who is to be regarded as the author of the true method of historical exposition, by which universal history acquired a philosophical spirit and a worthy object. Geography, which Eratosthenes made a science, and Hipparchus united more closely with mathematics, was enriched in various ways. To the knowledge of countries and nations much was added by the accounts of Nearchus Agatharchides and others. With respect to poetry many remarkable changes occurred. In Athens the middle comedy gave place not without the intervention of political causes to the new which approaches to the modern "comedy of manners." (See DRAMA.) Among the many poets of this class Menander (342-291) and Philemon (330) were eminent. To this period also belong the celebrated idyllic poets Theocritus (270), and his contemporary Bion, as well as Moschus, who lived about 20 years later. The other kinds of poetry did not remain uncultivated; we may mention the learned poetry of Callimachus and of Lycophron, the epic of Apollonius Rhodius, the didactic of Aratus and Nicander; but all these others, as well as the criticisms of poetry and the fine arts, point to Alexandria; and we shall therefore pass them over in this place. (See ALEXANDRIAN SCHOOL.) The Septuagint (q.v.) or Greek translation of the Old Testament was a work of scholars of the Alexandrian school. The period subsequent to 146 B.C. is known as the Græco-Roman. Polybius may be placed here as well as the other historians, Diodorus Siculus and Dionysius of Halicarnassus; while in the Christian era we have Josephus, Arrian, Appian, Herodian; the biographies of Plutarch, Diogenes Laertius, and Philostratus, the geographies of Strabo and Pausanias; the astronomy and geography of Ptolemy;

the informatory works of Athenæus, Ælian, and Stobæus; the medical works of Galen; the satirical works of Lucian; and the Greek romances best represented in Heliodorus, Achilles Tatius, and Chariton. See BYZANTINE LITERATURE.

The following are among the best works on Greek literature: K. O. Müller's 'Geschichte der griechischen Litteratur' (4th ed. 1882–4); Bergk's 'Griechische Litteraturgeschichte' (1892–4); Bernhardy's 'Grundriss der griechischen Litteratur' (new ed. 1892); Mure's 'Critical History of the Language and Literature of Ancient Greece' (1854–60); Mahaffy's 'Classical Greek Literature' (1890); Jevons' 'History of Greek Literature' (1890): Croiset's 'Histoire de la littérature grècque (1889–95); Susemihl's 'Geschichte der griechischen Litteratur in der Alexandrinerzeit' (1891–2).

Greece, Modern (Greek *Hellas*), a kingdom in the southeast of Europe, bounded on the north by Turkey, and on all other sides by the sea — the Ionian Sea on the west, the Mediterranean proper on the south, and the Ægean Sea on the east. The mainland forms two chief portions, united by the narrow Isthmus of Corinth; a northern, called Northern Greece or Livadia, and a southern peninsula, called the Peloponnesus or Morea. By far the largest island is Eubœa, only separated from the mainland of Livadia by the narrow channel of Euripo. The other islands form several groups: The northern Sporades on the northeast of Eubœa including Skiathos, Skopelos, Khiliodromia, Pelagonisi, Sarakinon or Peristeri, and Skyros; the western Sporades, chiefly in the Gulf of Egina, or between it and the Gulf of Nauplia, including Hydra, Spetsæ, Poros, Egina, and Salamis or Koluri, the Cyclades; and the Ionian Islands. (See GREECE, ANCIENT.) The capital and largest town is Athens.

Physical Features.— See GREECE, ANCIENT.

Divisions.— Greece is politically divided into 16 nomarchies, which are again subdivided into eparchies, and these again into demes. The following table gives the names of the nomarchies, with the area of each of them, and the population according to the returns for 1896:

NOMARCHIES		Area in sq. m.	Pop. 1896.
Northern Greece:	Attica and Bœotia...	2,472	313,069
	Phocis and Phthiotis.	2,044	147,297
	Acarnania and Ætolia	3,013	170,565
Peloponnesus:	Argolis and Corinth.	1,442	157,578
	Achaia and Elis.....	1,901	236,251
	Arcadia	2,020	167,092
	Messenia	1,221	205,798
	Laconia	1,670	135,462
Islands:	Eubœa and Sporades.	2,216	115,515
	Cyclades	923	134,747
	Corfu	431	124,578
	Zante	277	45,032
	Cephalonia	302	83,363
Thessaly:	Arta	395	39,144
	Trikkala	2,200	176,773
	Larissa	2,478	181,542
	Total..............	25,014	2,433,806

By the law of 17 July 1899 there is a new division into 26 nomarchies, namely: Attica, Bœotia, Phthiotis, Phocis, Ætolia and Acarnania, Eurytania, Larissa, Magnesia, Trikkala, Karditsa, Arta, Achaia, Elis, Eubœa, Cyclades, Kerkyra (Corfu), Leucas, Kephallenia (Cephalonia), Zacynthos (Zante). These are subdivided into 69 districts and 442 communes.

Climate.— In general the first snow falls in October and the last in April. During the summer rain scarcely ever falls, and the channels of almost all the minor streams become dry. The air is then remarkably clear, and a month will sometimes pass away without a cloud being seen. A sudden change, however, takes place toward the end of harvest. Rain becomes frequent and copious; and the streams which had been dried up not only fill their channels, but frequently overflow them, and lay considerable tracts under water. In this way stagnant pools and marshes are occasionally formed, which give rise to intermittent fevers. Compare GREECE, ANCIENT (*Climate*).

Vegetation, Agriculture, etc.— The cultivated land in Greece has recently been estimated at rather more than 5,563,100 acres. There are besides 5,000,000 acres of pasture land, and 3,000,000 acres of waste land. The draining of Lake Copais redeems 60,000 acres of land, which the company divides into holdings of from 5 to 50 acres. English agricultural machinery is being introduced, but still agriculture is in a backward state.

Thessaly is the richest portion of Greece agriculturally. The condition of the agricultural population is said to be very satisfactory. The principal cereal crops are wheat, barley, and maize, but the quantity raised is not sufficient, and much grain is imported. All the fruits of the latitude are grown — figs, almonds, oranges, citrons, melons, etc.— in abundance and of excellent quality, without receiving any great share of attention. The vine also grows vigorously, and considerable quantities of wine are made, some of the sorts being of high quality. But a much more important product of Greece, especially on the coasts of the Peloponnesus, and in the islands of Cephalonia, Zante, Ithaca, and Santa Maura, is the Corinthian grape or currant, the export of which has increased in value from $7,558,350 in 1898 to $8,238,118 in 1900. Another important object of cultivation is the olive, for which both the soil and the climate are alike favorable. The culture of the mulberry for the rearing of silk-worms is carried on to some extent. Some good tobacco is grown. The forests contain, among other trees, the oak (*Quercus Ægilops*) which yields the valonia of commerce. The live stock are neither numerous nor of good breeds. The raising of artificial grasses for their maintenance may be said to be unknown, and the scanty herbage which natural pasture affords must be of little avail. Asses and mules are more numerous than horses; cattle are comparatively few; and the chief animals from which dairy produce is obtained are the sheep and the goat. The quantity of wool produced is considerable, but most of it is of a coarse description.

Manufactures, Trade, Communications, etc.— The manufactures are limited, but with all other branches of industry in Greece are increasing, and are furthered by high duties on imported goods. The employment of the steam-engine in manufacturing industries dates from about 1868, and is yet only developed to a small extent. Piræus is the chief industrial centre, having spinning and weaving factories for cotton, silk, and wool, machine-shops, paper-works, dye-works, etc. Other centres are Syra, Corinth, Nauplia, Patras, Larissa. Still, cottons and other textiles form by far the most important part of the imports of manufactured goods. Leather manufactures form an important branch of industry. Marble has been worked from the most ancient period in the quarries of the island of Paros. In 1871 the working of the ancient argentiferous lead mines of Laurion in Attica was resumed with good success; and quantities of manganese iron ore and zinc ore are also raised in this district. The most important branch of manufacturing industry is ship-building, which is carried on at various places. Much of the trade carried on is merely coasting, but the foreign trade also is of considerable extent. A large part of the foreign shipping of Greece is that which deals with the import of the manufactures of England, Germany, etc., into Greece, Turkey, and the Levant generally. In regard to this branch, the peculiar advantages which the Greeks possess in their knowledge of the languages, and acquaintance with the habits and wants, of the people of these countries, have been greatly in their favor. The chief ports of Greece are Piræus (population 42,169, the port of Athens), Syra, and Patras (population 37,958). The principal export is currants (very largely to Britain); but wine, olive-oil, dried figs, raisins, silver, lead, zinc ore, and manganese iron ore, tobacco, sponges, and other articles are also exported; the principal imports are cereals, coals, and cotton and woolen goods. The imports in 1891 were $27,800,200, the exports $21,497,040; in 1901 the imports were $27,773,010. The greatest hindrance to the development of Greece is the want of good roads, which are peculiarly necessary in so mountainous a country. Attention, however, has been directed to the supplying of this want, and there are now over 2,043 miles of roads. Among other public works which have engaged the energies of the Greeks are the construction and restoration of harbors, the erection of lighthouses, the execution of drainage works, etc. In 1883 there were only 58 miles of railways open, but in 1901 603 miles were open, and 300 were under construction. A ship canal across the isthmus of Corinth (4 miles) was opened in 1893.

Weights, Measures, and Money.— The French metric system of weights and measures has been introduced into Greece by the government, but the people still adhere to the old system. In the latter the standard lineal measure was the *pikē*, equal to three quarters of an English yard; the standard square measure was the *stremma*, nearly equal to .242 of an English acre; the standard weight was the *oke* = 2.80 pounds avoirdupois; 44 *okes* were equal to 1 *cantar*, or about 122 pounds avoirdupois. The weights and measures of the metric system are called royal, to distinguish them from the old weights and measures. In this system the French measures of length, millimetre, centimetre, decimetre, and metre are called respectively *gramma*, *daktylos*, *palamē*, and *pēcheus* (cubit). The kilometre is called a *stadion*, and the myriametre *skoinis*. The new or royal measures of surface are the square *pecheus* = the square metre, and the *stremma* = the are. The measures of capacity are the *kybos*, *mystron*, *kotyle*, *litra*, and *koilon*, respectively equal to the millilitre, centilitre, decilitre, litre, and hectolitre. The weights for gold, silver, and precious stones are the *kokkos*, *obolos*, and *drachmē*, respectively equal to the centigramme, decigramme, and gramme. The commercial unit of weight is the *mna* = 1,500 *drachmēs* = 1½ kilogramme. The *talanton* is equal to the quintal, and the *tonos* equal to the tonneau.

In 1875 Greece entered the monetary league of which the other members are France, Italy, Switzerland, and Belgium, and all the members of which have a monetary unit equal to the franc in value. The name of the Greek unit is the *drachma*, divided into 100 *lepta*, nominally equal to a franc but varying considerably in value.

Government and People.— As settled by the present constitution the throne is hereditary according to the law of primogeniture in the family of King George. The king must be a member of the Greek Orthodox Church. He attains his majority at the age of 18. The legislative authority is vested in a single chamber, called the Boulē, the members of which (proportioned in number to the amount of the population) are elected for four years by ballot by manhood suffrage. It meets every year on 1 November, unless called at an earlier date for special business. The executive power is exercised by the king through a responsible ministry. The Greek Orthodox Church alone is established, but all other forms of religion enjoy toleration. The highest ecclesiastical authority, subject to the king, is vested in a permanent synod, which sits at Athens, and consists of five members appointed by the king from the highest dignitaries of the Church. There is 1 metropolitan, who has his seat at Athens, 21 archbishops, and 29 bishops, who are presented and ordained by the synod, and confirmed and invested by the king. Justice is administered, on the basis of the French civil code, by a supreme court (*Areios Pagos*), which has its seat at Athens; five higher courts, one at Athens, one at Nauplia, one at Patras, one at Larissa, and one at Corfu; and a number of courts of primary resort (*Protodikeia*), in the principal towns. The public revenue, derived chiefly from direct taxes, customs, stamps, excise, monopolies, the rent of national property, etc., was estimated for 1900 at $18,510,755, and the expenditure at $17,687,135. Revenue for 1902 was estimated at $23,021,075, and expenditure at $23,021,080. Greece has a very large public debt. In 1899 the amount of this debt was about $152,500,000. A considerable portion of the debt incurred in recent years has been in the way of raising loans for the making of railways. Of the foreign debt one loan is guaranteed by Great Britain, France, and Russia, which have latterly had to pay the dividends on it, and which are now accordingly heavy claimants on Greece. The payment of the interest on its public debt has long been with Greece a matter of difficulty. Every male Greek on attaining the age of 21 years is liable to military service, his term being 2 years with the colors, 10 with the reserve, 8 in the national guard, and 10 in the national guard reserve. The army in 1900 numbered about 25,000 on a peace footing, expanding easily to 82,000 in time of war. The navy in 1903 consisted of 3 armor-clad ships, 10 torpedo-boats, besides several unprotected gun-vessels and cruisers. The population contains a considerable intermixture of foreign stocks, among which the Albanese, or Arnauts, are the most numerous; but the great

majority, though not without some taint in their blood, are of genuine Greek extraction, and, both in physical and mental features, bear a marked resemblance to their celebrated forefathers. It is true that the degrading bondage to which they were subjected for centuries has sunk them far below their natural level, and too often substituted sycophancy and low cunning for the intellectual superiority which, in earlier and better times, displayed itself in immortal productions of the chisel and the pen; but that the original elements of greatness still exist has been proved by the noble struggles which they have made for independence. The educational system of Greece, organized in 1834 by George Gennadius, one of the leaders of the war of independence, is very complete. There are three grades of schools, the demotic or primary national schools, the Hellenic or secondary grammar schools, and the gymnasia, in which, it is asserted, the range and the level of the teaching are much the same as in a German gymnasium or in the upper parts of our public schools. In all three grades of schools education is gratuitous, and in the primary schools it is compulsory on all children between 5 and 12. There is a university at Athens, attended by nearly 3,000 students, many of whom come from districts under the rule of the Sultan. Thus far, however, education seems to be actually diffused among the people only to a limited extent, though the numbers that receive a university education are so great that many such young men find themselves without any proper sphere of employment, and are obliged to adopt the career of politician and place-hunter. Many of these are now, however, said to be finding better ways of turning their education to account through the rapid development of trade and industry. The national dress of the Greeks resembles the Albanian costume. In the men it consists of a tight jacket, generally scarlet, a white linen kilt in numerous folds, a bright-colored sash round the waist, and embroidered gaiters; in the women it consists of a vest or jacket fitting close to the shape, and a skirt, on the head a kind of fez or skull-cap.

History.— From the year 1715 (see preceding article) till 1821 the Greeks were subject to the domination of the Turks. In 1770, and again in 1790, they made attempts at insurrection, which, however, were speedily frustrated. In the early years of the 19th century a secret society was formed for the purpose of effecting their liberation from the galling yoke, and in 1821 they found an opportunity of breaking out into another insurrection, which in the end proved successful. In that year Ali, the pasha of Janina, revolted against the Sultan Mahmoud II., and secured the aid of the Greeks by promising them their independence. The rising of the Greeks took place on 6 March, under Alexander Ypsilanti, and on 1 Jan. 1822 they published a declaration of independence. In the same year Ali was assassinated by the Turks, but the Greeks nevertheless continued the struggle that they had begun, and in which they were encouraged by the sympathy of nearly all the nations of Europe. Among the most distinguished of their leaders were Marcos Bozzaris, Capo d'Istria, Constantine Kanaris, Kolocotroni, Miaulis, Mavrocordato, Mavromichaelis, etc. In 1823 they were joined by Lord Byron, who, during the last year of his life, did all in his power to further their cause by his wealth, as well as by his active efforts on their behalf. Unfortunately he died in April of the following year. In 1825, the Turks having called to their aid Mehemet-Ali, the pasha of Egypt, the latter sent his son, Ibrahim Pasha, whose talents secured them the success that they had hitherto been unable to attain. Tripolitza, the capital of the Morea, was taken, as was also Missolonghi, in spite of the valor of the Suliote mountaineers. It was about this time that the Greek patriots received the aid of the English admiral Lord Cochrane, who organized their fleet, and of the French colonel Fabvier, who instructed their army in the system of European tactics. In spite of this, however, the Turks continued to triumph everywhere, and resisted all the pressure that was put upon them by other European powers to make concessions. A treaty was then concluded at London (6 July 1827) between Britain, France, and Russia, for the pacification of Greece, and when the mediation of these three powers was declined by the Sultan, their united fleets, under Admiral Codrington, attacked and annihilated the Turkish fleet off Navarino, 20 Oct. 1827. In the beginning of the following year (1828) Count Capo d'Istria became president of the state, and later on in the same year Ibrahim Pasha was forced to evacuate Greece. At last, on 3 Feb. 1830, a protocol of the allied powers declared the independence of Greece, which was recognized by the Porte on 25 April of this year. The new member of the states of Europe received from the allies a monarchical form of government, and offered the crown to Leopold, Prince of Saxe-Coburg, and when he refused it, to Otho, a young prince of Bavaria. The latter accepted the offer, and was proclaimed king of the Hellenes at Nauplia, on 30 Aug. 1832. The power of the king was at first almost absolute, and his arbitrary measures, and more especially the preponderance which he gave to Germans in the government, soon made him unpopular. At the same time the finances of the kingdom were in a very embarrassed condition, and a general uneasiness prevailed. In 1843 a rebellion took place, after which a constitution was drawn up. But Otho was after that no more popular than before, and after the outbreak of another rebellion in February 1862, he saw himself compelled to abdicate the throne (24 October). A provisional government was then set up at Athens, and the National Assembly after declaring that the throne had been forfeited by Otho, offered it in succession to Prince Alfred, of England, and Prince William George, of Denmark. The latter accepted it, and 30 March 1863 was proclaimed as King George I. At the end of that year a constituent assembly was elected for the purpose of framing a new constitution, and the result of its labors was the constitution which is still in force. In 1864 an addition was made to the small kingdom by the annexation of the Ionian Islands, which had hitherto formed an independent republic under the protection of Britain. From the first Greece has been watching for an opportunity of extending its frontier northward, so as to include the large Greek population in Thessaly and Epirus. In January 1878, during the Russo-Turkish war, Greek troops were moved into Thessaly and Epirus to the assistance of their brethren who had risen there, but on the remonstrance of England these troops were withdrawn. The Treaty of Berlin made no definite provisions for any extension of Greek territory, but in 1881 Turkey had to cede about 5,000 square miles of Thessaly to Greece. After the union of eastern Roumelia with Bulgaria, in 1885, war with Turkey was only prevented by the great powers. In 1890 an insurrection of the Christians in Crete led to the interference of Greece and to war with Turkey. The Turks speedily drove back the Greeks from the northern frontier and overran Thessaly; and Greece was enabled only through the efforts of the great powers to obtain reasonable terms of peace. The recent internal political history of Greece relates mainly to her financial obligations. After the expulsion of the Turkish troops from Crete in 1898 Prince George was appointed high commissioner of the island.

Modern Greek Language and Literature.— The Greek language seems to have preserved its purity longer than any other known to us; but a deadly blow was inflicted when the Greeks were enslaved by the fall of Constantinople (1453 A.D.). All the cultivated classes, who still retained the pure Greek, the language of the Byzantine princes, either perished in the conflict or took to flight, or courted the favor of their rude conquerors, by adopting their dialect. In the lower classes only did the common Greek survive (the *koinē, dēmodēs, haplē, idiōtikē dialektos*) the vulgar dialect of the polished classes, the traces of which occur, indeed, in earlier authors, but which first appears distinctly in the 6th century. This Greek *patois* departed still more from the purity of the written language — which took refuge at court, in the tribunals of justice, and the halls of instruction — when the Frank crusaders augmented it by their own peculiar expressions, and the barbarians in the neighborhood engrafted theirs also upon it. This popular dialect first appears as a complete written language in the chronicles of Simon Sethos, in 1070–80. After the Ottomans had become masters of the country all the institutions which had contributed to preserve a better idiom perished at once. The people, left to themselves, oppressed by the most brutal despotism, would finally have abandoned their own dialect, which became constantly more corrupt, had not the Greeks possessed a sort of rallying-point in their Church. But even here, owing chiefly to the ignorance and corruption prevailing among the clergy, little could be found to prevent the further debasement of this fine dialect, which continued till the middle of the 18th century. About this time many of the Greeks began to resort for instruction to the universities of the West, whence they returned to their native country to animate their fellow-countrymen with the desire of making nearer approaches to the more civilized nations of Europe, so as not to remain behind in the general progress. One consequence of this was that the Greeks began to pay more attention to their mother tongue, and this tendency was increased by intercourse with the more refined West, by means of more frequent visits from intelligent men of that quarter to the ruins of Grecian greatness. The Patriarch (Samuel Eugene Bulgars Theotokis) of Corfu, and the unfortunate Rhigas, may be mentioned as eminent at this period.

At first a large part of the literature of awakened Greece consisted of translations from the French, but the country now furnishes original writers in every department of literature. Among the theological works of modern Greece perhaps the most remarkable is that on 'Truth,' by Pharmakidis (1852), which is one of the most important works in the modern Greek language. The philosophical and mathematical sciences are all well represented. For these branches of knowledge much has been done by the University of Athens, many of the professors of which have published manuals (some of which have no inconsiderable scientific value) on the subjects on which they lecture. With the exception of poetry, history is perhaps the department which has attracted most writers in the modern Greek language. On this head the long and learned dissertations prefixed by Spiridion Zampelios to his 'Popular Songs of Greece' (Corfu 1852), and 'Studies on Constantinople' (1858), affording valuable and interesting materials for the history of Greece in the Middle Ages, deserve to be particularly mentioned. In the department of philology and scholarship Coray has performed important services by collecting a large mass of materials for acquiring a more thorough knowledge both of ancient and modern Greek; and after him Doukas, Darbaris, Asopios, and Rhangabe, ought to be noticed for their editions of the ancient classics with commentaries in modern Greek. At the head of the orators of the time of the struggle for independence stands Trikoupis, some of whose speeches were collected and published in 1829, and a second and enlarged edition of them in 1860. In the department of poetry a distinction must be made between that of the people and that of the cultivated classes. The former is represented chiefly in the songs of the Klephts and other songs dating from the war of independence, which are a faithful mirror of the public life at the time to which they belong. At this period the war-songs of Rhigas were caught up by the whole nation and sung with enthusiasm. At a later period the two Soutsos, Panagios and Alexander, Calvos, Solomos, and others, earned distinction in the same kind of poetry. The Soutsos were distinguished also as dramatists and novelists, and Alexander also as a satirist. Among the other leading dramatists are Rizos Nerulos and Zampelios. The most distinguished recent author, both a poet and a scholar, is A. R. Rangabé, while Demetrius Bikelas is the chief novelist.

Modern Greek, as spoken by the uneducated classes, is called Romaic, from the fact that it took on its special character at the time when the Greeks considered themselves as natives of the Roman empire, and hence called themselves *Romaioi*, or Romans. The Greek of the educated classes, that used in the newspapers and other literature of the present day, is distinguished from it by a greater resemblance to the Greek of antiquity, which renders it easy for any one who has a satisfactory acquaintance with ancient Greek to read the literary Greek of the present day. The domain of the Romaic comprises not only the whole of the present kingdom of Greece (including Thessaly), but also part of Roumelia, Albania, and Anatolia, the islands of Crete and Cyprus, as well as the islands of the archipelago not belonging to Greece. The purest Romaic is spoken in the less frequented isles of the archipelago, and in some of the mountainous districts of the interior. It is in these districts particularly that modes of expression are still found belonging to the most classical antiquity. At Megara the language is less corrupt than at Athens, where it is mixed with a considerable number of Italian words. In the northern provinces it is mixed chiefly with Albanian. Besides the foreign words which have been introduced into northern Greek, a pretty large number of words are found which have changed their original signification although they have retained their original form. Ancient words are most commonly found in significations the most remote from the original or derivative sense. The grammar has also undergone considerable modifications. For example, the numbers have been reduced to two by the suppression of the dual; and the cases to four, by the disappearance of the dative, the signification of which is now expressed by means of a preposition with the accusative. The first of the cardinal numerals is now used as an indefinite article. The degrees of comparison are sometimes expressed by the ancient inflexions, but at other times by the use of *pleon* (more). The past tenses of the verb are formed by the aid of the verb *echō* (I have), and the future tenses by the aid of *thelō* (I will). The infinitive mood, which has fallen out of use, has its place supplied by a periphrasis, in which the verb is put in the subjunctive. The middle voice has disappeared, and what remains of the old conjugation is of so little consequence that it may be regarded as an irregularity. The ancient orthography of the language is still preserved, but considerable changes appear to have taken place in the pronunciation. The vowels η, ι, and υ, and the diphthongs ει, οι, and υι, are all pronounced like *ea* in the English word *mean*. Β is now pronounced as *v*, and the sound of *b* is expressed by μπ. Δ is pronounced like *th* in *thus*, and θ like *th* in *think*.

Greek Architecture. *First*, that which has existed in Greece, that is the land of the Hellenes, which, for art purposes, includes everything south of Mount Olympus on the east coast and the Island of Corfu on the west. This architecture is of several very distinct epochs. *Second*, the architecture identified with the Greek spirit at the time of the highest intellectual development of the race — viz. from about 500 B.C. to the Roman Conquest; and which is in architecture represented by the famous styles called Doric and Ionic, with the Corinthian just appearing at the time when the freedom of Greece was at an end. Each of these definitions of the term requires separate treatment.

First.— The architecture of the land of Greece is known to us in its earliest form by certain tombal chambers, in which a circular or polygonal room is enclosed and roofed with stone by one operation, that is, by laying the stones in courses continually projecting inwards, and so decreasing the size of the chamber within, until at last a single cap-stone closes the aperture at the top. These stone structures had passages leading to them, enclosed and roofed with stone; and these passages allowed of the covering in of the whole stone edifice with earth, perhaps in huge, high mounds. In this way, as in northern Europe and also in the peninsula of India, a great funereal monument was erected which cost nothing but the labor of transporting many thousand tons of earth and rough stone in addition to the comparatively slight building of the stone chamber and passage. The largest of these is among the ruins of Mycenæ, and has been known for many years as the Treasury of Atreus. More elaborate buildings are of what is known as the Mycenæan epoch (see MYCENÆAN) which is not accurately fixed, but which it is customary now (1904) to place at about 1700 B.C., lasting perhaps for 500 years. The name Mycenæan comes from the city of Mycenæ, explored first by Dr. Schilemann in 1876. We know only its remains, painting upon walls, inlays of metal, pottery and the like, and something is known of the plan of the royal palace and its accessory buildings; but no part of this enables us to fix the date. If we assume that this artistic civilization lasted until about 1200 B.C. there is less a lapse of time before the Homeric conditions began; for the palaces and fortresses described in the Iliad are generally accepted as of about 1,000 B.C. Again a blank occurs, and the earliest buildings of the Proto-Doric may be thought to begin about 600 B.C.

For the classical art of Greece, that is the building of the celebrated and beautiful temples, see the second part of this paper. This classical epoch lasts until the Roman conquest, and even beyond it in a modified form. Thus the gateway of the Agora in Athens is Doric of a style not used until the Roman control had begun; and it is extremely curious to compare this with the Doric of 500 years earlier. The Roman governors and generals built memorial buildings, porticoes and temples in a curiously modified style, partly pure Greek, partly of that Romanized Greek which was beginning to be recognized as the Imperial art for the whole Mediterranean world. Under the reign of Hadrian an attempt was made to return to a purer taste, but this was of brief duration. Greece was not to have an art of her own again until the Byzantine style was well established (see ARCHITECTURE and BYZANTINE ARCHITECTURE). The Byzantine style in the land of Greece was singularly characterized by very small proportions; there has never been an interesting style of which the monuments are so diminutive; important churches exist in Athens and other cities which would not hold two hundred persons and which are delicately built in a refined shape, and prettily if not richly decorated. The architecture of modern times in Greece is not more intelligent than that of the rest of Europe, while it is very simple and inexpensive. The country is small and poor, and even a royal palace cannot have much costly treatment; moreover the buildings in Athens are mostly of German design, according to the taste of the first dynasty established there after the freeing of Greece in 1823.

Second.— Grecian architecture in the sense of the classical style begins with what we call the Proto-Doric style as exemplified by the temple at Corinth, a building with low, thick columns and a comparatively high entablature, as far as can be ascertained. It is thought by some that the Heraion (that is the temple of Hera) at Olympia, is a still older building, and in that case the earliest piece of classical Greek architecture. It is curious in form, as it has six columns at each end with sixteen on each side, the corner columns being counted twice, that is to say, there are forty columns in all. The peculiarity of this will be seen when we speak below of the perfected type of Doric temples. In the Olympia building the columns are of different sizes, varying even more than a foot in their thickness, and the capitals also differ. The common explanation, that the columns were originally of wood and were replaced by stone, one at a time, at all events points to the extreme irregularity of the structure. The Doric buildings of accepted and permanent type may thus be thought to appear first at the beginning of the 5th century B.C. The Greek colonies in southern Italy and Sicily were flourishing at this time and we find some of the earliest Doric temples of classical form in Pesto (the Roman Paestum, the Greek Poseidonia), in Campania and in Selinunte and Girgenti in Sicily. The style rapidly took definite form and was reduced at an early date to a very definite set of rules. Thus it became a recognized arrangement that the columns on the flank of the peristylar temple should be twice as many as those on the front and one more: the corner column being always counted twice. Thus the hexastyle temples at Athens, in Pesto and elsewhere, having 6 columns in front, have 13 on the side; and the only two octostyle Doric temples known — the Parthenon at Athens and the great temple at Selinunte — have 17 columns on the side. But all temples were not peristylar; on the contrary by far the greater number had porticoes only at the east front or at the east and west end. The essential parts of the temple are, of course, the closed naos or, as the Romans called it, the cella, in which the statue of the divinity was preserved, together with certain treasures, consecrated gifts and the like. There must have been thousands of these little shrines in Greece, the Greek islands and the colonies. A somewhat larger temple would have a second chamber, the treasury (opisthodomos) at the rear or west end of the cella, and this would have its own portico. The Temple of Theseus (so called) at Athens seems to have had a single chamber and two porticoes, one at either end, these being deep and sheltered and affording place for certain sacred statues and the like. Larger temples, like the Temple of Zeus at Olympia, the Parthenon at Athens, and the one at Pesto, called the Temple of Neptune, have the interior of the cella divided into a nave and aisles by two rows of columns; but just what the connection was between these columns and the carrying of the roof is not rightly understood. Some archæologists associate them with the assumed arrangement for admitting daylight into the interior through the roof (see HYPÆTHRAL THEORY).

The style of design was this — the columns were thick in proportion to their height and tapered from bottom to top, but not as a cone tapers, for the diminution of thickness follows a decided and even visible curve which is called the entasis. These columns are channeled from top to bottom by grooves, usually twenty in number, each having an elliptical curve or nearly so and meeting one another at sharp arrises. These shafts carried capitals made of one or two blocks of stone but always in two architectural parts. The lower part is what is called the echinus. It is a circular slab of stone projecting all round as much as half the diameter of the shaft in the earliest examples, perhaps a quarter of that diameter in the later ones; and this projection is rounded in a very subtle way, becoming flat below near the shaft and rounding more rapidly above. The curve of some of these echinus capitals is of extraordinary beauty. The uppermost member of the capital is a thick square block, or die, or plinth, sharp-cornered, without ornament of any sort except for the painting. These columns carry the epistyle or architrave, which, in the Doric style, is usually plain. Upon this rests what is known as the frieze, which consists of a series of upright blocks of stone perhaps half as high again as they are wide, and their height increased in appearance by grooves running vertically. These triglyphs carry, or seem to carry, the third or crowning member, the cornice, but between the triglyphs are the spaces called metopes, which are commonly filled by slabs or blocks of stone, the outer surface of which was always a favorite place for ornamentation. The cornice projected very much beyond the frieze, and its under side was cut with a drip moulding so that rain-water would not back up and run down the entablature, that being the name given to the three parts taken together, that is, to the whole horizontal superstructure laid upon the columns. There was nothing above this cornice except at the two ends the rising gable which marks the slope of the roof (see PEDIMENT), and on the side a gutter for rain-water with spouts or scuppers in its outer space.

The building of the temple was in this way as simple as possible — square cornered, oblong, roofed with a simple gable-roof, without arches or windows or chimneys. Its decoration was largely in the extreme refinement of the parts. The proportion of height to width, the spacing of columns and their shape and character were helped out by an extraordinary system of curves by which a grace was added to the building which the eye could hardly follow in its cause or character, but which changed the whole aspect very greatly. Thus the entablature was cut with an upward curve toward the middle and in this way the whole building had a lighter aspect than if it had been strictly horizontal. The same upward curve was repeated in the stylobate or stone floor on which the columns stood. The columns themselves were curved in outline as above stated, and they were set so as to slope inward, the outer ones the most, this for the obvious purpose of making the building seem more solidly set upon its base. To the building so carefully designed there was often added a great deal of elaborate sculpture (see below) and, apparently in all cases, rich chromatic decoration. For this subject see POLYCHROMY: but it may be mentioned here that the modern world has no very clear notion of what was the effect of brilliant painting in red and blue, with gilded metal, applied to a marble building standing high upon a prominent rock in the heart of a town, the recognized centre of interest and the chief religious shrine. No living man has ever seen anything at all like that; and it is probable that no imagination can reproduce it in thought.

To the modern student, the Doric style as described above, is much the most important part of Grecian architecture; but to a Greek of the time of Alexander the Great the Ionic temples along the shore of Asia Minor would have seemed the more grand and costly, the more recent, and therefore the more identified with advanced civilization. Those great temples have disappeared with a strange completeness. While there are Doric temples nearly complete except for the roof — which has, of course, disappeared,— while there are many others of which large and most interesting remains exist, many columns standing erect and some parts of the superstructure,— there is almost nothing remaining in complete condition of all the great Ionic temples. It is on this account that the exquisite building on the Acropolis at Athens, the Erectheum, contains in itself almost all our modern notions of the style. Very near it on the Acropolis is the little square amphiprostyle temple, known as the Temple of Athenæ Nike, or as the Temple of the Wingless Victory, and this shrine may also be considered an unchanged Greek building, because, though it was entirely destroyed, the stones of it were found built into a Turkish fortification and the whole structure was piled up again by the engineers of the first European king of Greece, Otho of Bavaria, who reigned from 1832 to 1862.

We learn from these buildings what the style really was. The shafts of the columns are much more slender than those of the Doric style and are fluted with circular grooves which are separated from one another by narrow fillets instead of meeting at a sharp edge. There is a base composed of mouldings running around the column. The capital is very peculiar, having volutes or scrolls at either side so that each capital has a front and a back precisely alike, and two ends alike, differing from all other capitals in not being alike on at least four sides. The members of the entablature are the same as those of the Doric style, but there are important differences in them. Thus the epistyle, instead of being a plain smooth block, is divided into three parallel surfaces, each one slightly overhanging the one below; the frieze is continuous and not broken by triglyphs; the cornice is more richly sculptured. Figure sculpture is applied in a somewhat different way. Thus as the frieze has no triglyphs it may be carved continuously; and in the Erectheum the sculpture is in the form of statuettes in white marble secured to a gray marble ground. It is not quite decided whether this color effect was helped out by painting or gilding, and how far the other parts of the temple were painted in bright colors. Again in the famous temple of Artemis (Diana) at Ephesus, the lower part of the shafts of the columns was in some cases very richly sculptured. The term *columna cælata* is applied to one of these columns and in any one of them is found this unique device:— the base is rather unusually high and is divided up by many mouldings; beginning about four feet from the pavement is a circle of figures larger than life surrounding the lowermost of those blocks of marble which make up the shaft proper; the flutings then begin above the band of sculptured figures and stop beneath the capital in the usual way. Not all the columns were arranged in this way, apparently only about one fourth of the whole number. The ancient Temple of Artemis which existed before the later magnificent structure was built had the same singular arrangement of sculptured shafts. Near Ephesus there have been found some capitals in which the head and shoulders of a bull project on either side beyond the volutes of the capital; and on the Island of Delos there are capitals made up entirely, so far as their decorations are concerned, of the heads of bulls. In the Erectheum of Athens there is that wonderful Portico of the Maidens in which an entablature made up of peristyle and cornice alone, without frieze, is supported on the heads of six caryatides, that is, draped female statues. In the National Museum at Athens are some caryatides of another portico. In the Incantada, a ruined Greek building in Salonica, there is a row of caryatides high up in the wall. The pilasters are treated with capitals of a curious style of Asiatic sculpture in the temple of Miletus. If to this we add the extraordinary capitals which some few monuments possess, monuments which must be called Grecian, but which are quaint and barbaric in appearance and almost grotesque, it appears that the Ionic was not as disciplined a style as the Doric but was influenced by the highly decorative sense of the Asiatic peoples and allowed of great variety of decorative design.

The Corinthian style is so little known to us as of Greek invention and use that it is almost always considered as a Roman or at most a Greco-Roman style; but the unquestionably Greek building, the little choragic monument of Lysicrates in Athens is Corinthian and the equally unquestioned and much more splendid round building at Epidaurus, was absolutely Greek, of pure type, and possessed a Corinthian order: the capitals completely developed. The dates are approximately, of the Athens building, 335 B.C.; of the Tholos, about the middle of 4th century B.C. The Athenian monument stands tolerably complete. The round building at Epidaurus is ruined and the capitals much scattered, but a single capital was found in a cellar or a chamber built for that purpose, and evidently intended to preserve it as a pattern, and this is intact. It is also one of the most beautiful Corinthian capitals known to us. The style, however, is almost identified with Roman work and will be treated in connection with ROMAN IMPERIAL ARCHITECTURE.

RUSSELL STURGIS.

Greek Art. Modern students of Grecian archæology do not doubt that the Greeks of different epochs were as successful in painting of stately and religious subjects and of painting and drawing in a slighter and more popular way as they were in sculpture; but this is merely an inference. Absolutely nothing remains to us of Greek painting of high class. We can study the figures on Greek painted vases and notice their admirable disposition and the beautiful designs made of their combinations, and we can note the technical system followed, sometimes by drawing on the clay with a hard point, sometimes without that help and drawn evidently with the brush alone. The use of pigment, too, generally black but sometimes of other colors, can be perfectly understood; but this is all of the simplest character, nor can we draw any conclusions at all about the wall-paintings or panel-paintings of the Greeks. In the houses of Pompeii there are many wall-paintings which seem to have had a non-Italian and probably Greek origin, and furthermore it is known that Pompeii was a town of Greek settlement and retained much Grecian influence even under the Roman Empire. Some portrait heads have been found in Egypt painted on panel (that is, thin boards) and these are certainly non-Egyptian; they may be assumed to be Greek, of the Alexandrian epoch. In these, however, there is no background, no added incident, which might guide us to a knowledge of Greek design in Graphic art. Finally, some paintings discovered in Rome, though belonging to houses of late date, are altogether Greek in design; and these may well be reduced copies, or imitations, of famous originals three hundred years earlier. None of these paintings are of great importance. None of them give us an exalted idea of the painting which stood for their original impulse. The statements made by ancient writers with regard to the paintings of their own time and those who were then famous as having belonged to earlier times, are of very little use, because we have no standard with which to compare their critical remarks, and furthermore because no one of the books remaining to us from antiquity seems to be the work of a man greatly interested in fine art. For this reason the paintings on the vases are worthy of the most minute examination. The earliest style in which the subjects represented are at all elaborate are of the undetermined epoch which we call the Mycenæan. Those vases are rich in patterns of scrolls, bands, zigzags and spots with, somewhat rarely, animal forms introduced in bands and (as in Crete and Cyprus) as a principal subject and covering a large part of the body of the vase. The painting is generally in brownish red on a dull yellow ground, which is the natural color of the clay. The famous Warrior Vase found at Mycenæ and now in the Central Museum at Athens and which we must suppose to date from 1000 B.C., has much of that grotesque indifference to form and perfect satisfaction with an indication of meaning which we associate with barbaric art in all ages; the human form is drawn without any comeliness or grace and without any success in getting control of gesture; but the purpose is clear, viz., the displaying of a procession of warriors wearing large helmets, carrying great shields of the curious kidney shape long afterward associated with certain Asiatic influences, and carrying spears in the right hand, which spears have sometimes two heads or what seem to be heads.

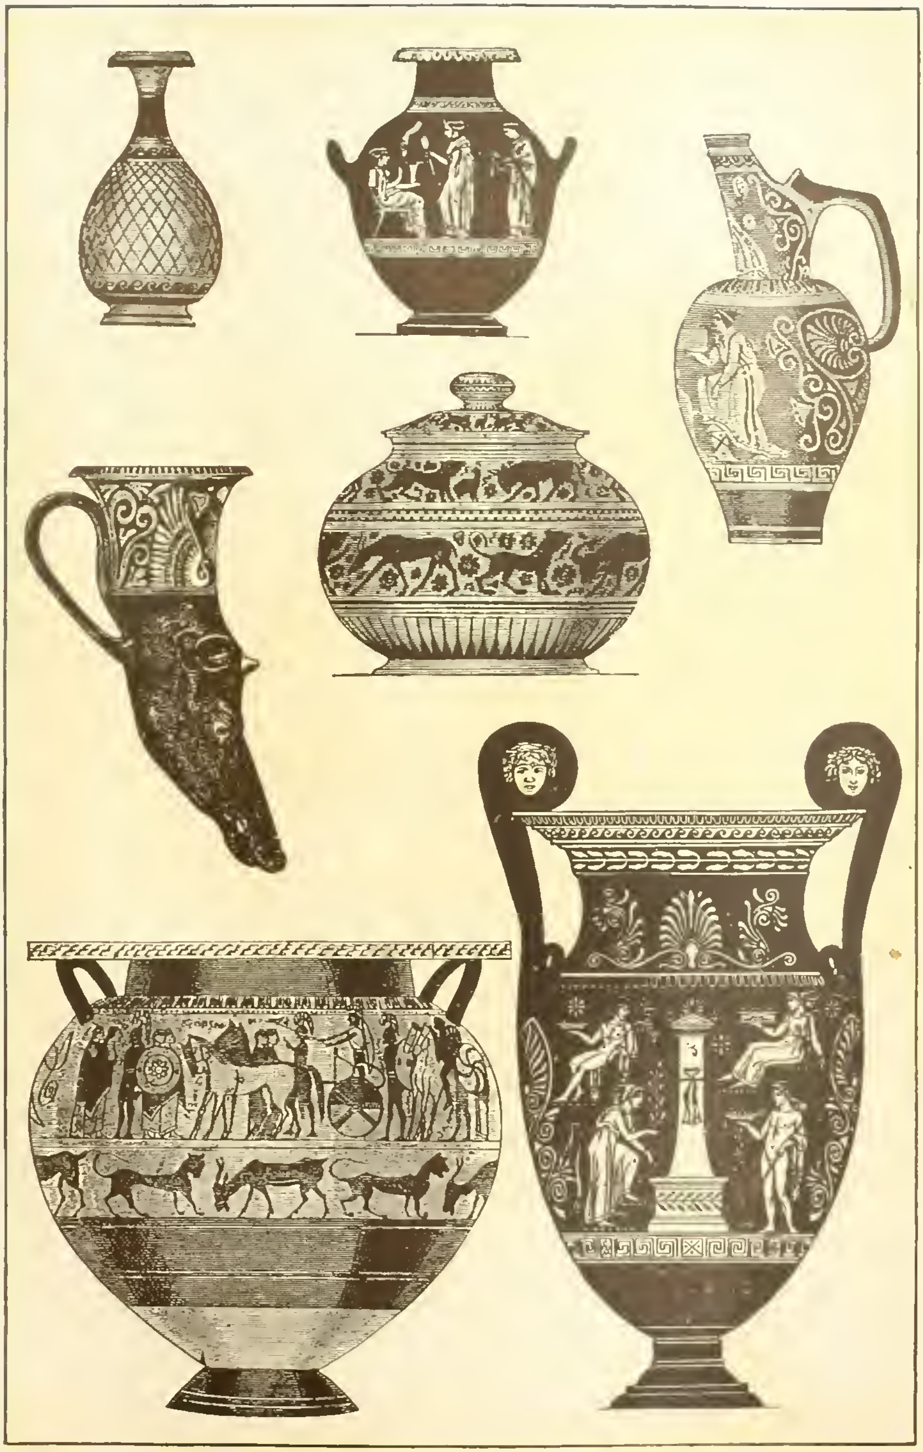
The paintings on pottery which are of the most interest are those of the period beginning about 600 B.C. and ending about 150 B.C. The earlier pieces are, of course, difficult to date even approximately. They represent warriors engaged in battle, the scene forming a broad band running around the vase; lions, bulls and stags arranged again in horizontal bands; figures draped in long garments, men as well as women carrying stringed instruments, weapons, baskets and the like; occasionally a scene which can be identified, as where Hercules brings the Erymanthian boar to show to his brother, king Eurystheus, or where Peleus is about to carry off Thetis from among her attendant nymphs; or they represent a feast, with men reclining on couches and others acting as attendants bringing pitchers and vases to fill the cup held by the reclining guest. The beautiful black glaze of the vases is used sometimes as the pigment for the figures and sometimes to work the background around the figures. These two styles are known as the black-on-red or black-figure style, the other as the red-on-black or red-figure style, and this latter style is known as the later of the two. There is still another form which is generally the latest of all. In this the black glaze is worked over the whole vase except for a panel or medallion or even a band around the vase, which is left in the red color of the pottery, and upon this the figures are painted in black. From the 5th century on the drawing is extremely vigorous and significant. It is grotesque sometimes, as where the muscles are given excessive prominence or where the attitude is exaggerated in the attempt to make it tell the story; but everywhere the drawing of the outline and the filling in with color shows singular mastery.

In a few cases the drawing itself is faultless; but in by far the greater number of cases, even of a good time, it is rather the evidently slight and swift work of a man familiar with nature and with the best traditions of art but not using his whole strength in the slight painting of the earthenware. The use of pigments other than the black glaze is not very frequent; but a red somewhat brighter than the color of the clay is used, also a kind of violet, more rarely a green, and in some cases gilding is applied — especially in late and very elaborate work. A small class of vases, identified with the city of Athens, has the body covered with a solid coat of white, upon which figures are painted in various bright colors; but this work is perishable.

In close connection with the drawing and painting applied to pottery is the engraved work on the backs of bronze mirrors, on pieces of armor, and on cists (*cistæ*). Even as in modern times some of the most elaborate and precious drawing is that of the engraver working on copper-plate (though he proposes to take prints on paper from his engraving), so the Grecian draughtsman put some of his finest work on those engravings meant for pure decoration. As we have no free drawing on paper or plaster or wood — nothing that shows how the Greek drew with a free hand — we can only reason backward from the firm and resolute setting down of lines drawn on the resistant material with the sharp point, and infer the vigor and daring of the more unfettered design.

Sculpture in its different forms is, after all, that which Greece has left us which is most important. We have the marble reliefs carved upon temples, tombs, and the walls of sacred enclosures, and also a great number of slabs which, when more than two or three feet in either dimension are generally tombstones, but which, when small, are frequently mere records carved upon a boundary stone or a memorial, or else a votive slab dedicated at the shrine of some divinity. In all of these the propriety and the freedom of design are wonderful and, in relief sculpture at least, the Greeks have set an example which has never been equalled since, neither in the actual beauty of the form nor in the intelligence shown in the composition. The

GRECIAN ART



GREEK VASES

most wonderful of the low reliefs are those of the famous frieze which forms the crowning member of the wall of the Parthenon within the screen of columns, the wall of the naos or cella. The well-known fact that this whole composition was painted in bright colors changes at once our ideas as to its decorative effect as a part of the building, but modern students can form no correct idea of the appearance of elaborate sculptures painted in an artistical fashion because they have never seen anything of the kind. One special reason why the reliefs are peculiarly important to modern students is their undoubted originality. The sculptures found at Phigalia, at Halicarnassus, at Xanthos, and at Gjolbaschi in Asia Minor are the undoubted work of the 4th and 5th centuries, and moreover they were designed for the places in which we now find them. This is not so with statues and busts, for of all the great world of Grecian statuary only three or four undoubted originals of the first rank remain. The Hermes of Praxiteles was found as Pausanius saw it in the 2d century A.D.; the Winged Victory of Paionios also; and these two were found in the excavations at Olympia in Greece. Statues of somewhat less importance have been found in the islands of the Greek archipelago and in specially protected underground chambers in the mainland of Europe, and a number of splendid bronzes, were found in a single great country house at Herculaneum near Naples; but as a general thing it has to be settled by internal evidence whether the piece discovered is of unmingled Greek character or of a less simple and perfect later style. The statues of the pediments, however, those which once stood at either end of the Parthenon, the Temple of Zeus at Olympia, the great temple of Ægina, and those which seem to have been placed between the columns of the Nereid Monument at Xanthos, are almost as certainly of their apparent epoch as are the bas-reliefs of the same buildings. In this way we have a score of fairly complete marble statues, two or three bronze statues of the highest rank, and a dozen less important ones, a score of life-size busts, and many smaller bronzes, all of which are assuredly of the best time of Greek art. Our knowledge of this subject is greatly helped by the study of engraved gems ,and coins. The gems were used for seals, or set in finger rings worn hung by a string, and the materials used were, of course, very hard stones, such as chalcedony and sardonyx; though glass was used also, and some seals are engraved in gold. The figure engraved in intaglio can be seen as if in relief when the stone is transparent and is looked at from the back. But commonly the student takes a cast in plaster or wax and studies that relief together with the original hollow sculpture of the gem. The number of these gems in our public and private collections is very great, even if we consider only those of undoubted Grecian origin. The coins are, in art, of the same character as the gems, because they are struck from a die, which die has been engraved in the same way in which the intaglio in hard stone is engraved; that is, the artist in either case keeps in mind the future relief and carves his hollow or sunken design rather with a view to its utility as a die than as to its own appearance. Greek coins are the subject of much and careful study among modern students. Greek sculpture includes also the earthenware figurines which have been found in great number in the neighborhood of Smyrna, in Sicily and the other islands of the Mediterranean, and especially in the neighborhood of Tanagra in Greece.

The years since 1850 have been rich in books on the subject of Grecian archæology, which archæology is, in great measure, the study of the existing works of art; books on Grecian vase-painting, gems and coins are to be counted by scores and hundreds. The latest are generally the best to begin with. The student will find in them the best means of judging what earlier books he may need; and at the same time he will find the latest discoveries and the most mature opinions of archæologists. The same remark applies to the periodicals, of which there are many and very valuable, for indeed much of the comparative study of this subject has been carried on in the columns of German, French and English periodicals, often issued by learned societies.

Russell Sturgis.

Greek Church, or Holy Oriental Orthodox Apostolic Church, that section of the Christian church dominant in Eastern Europe and Western Asia, especially in Turkey, Greece, Russia, and some parts of Austria. In the first ages of Christianity numerous churches were founded by the apostles and their successors in Greek-speaking countries; in Greece itself, in Syria, Egypt, Mesopotamia, Asia Minor, Thrace, and Macedonia. These were subsequently called Greek, in contradistinction to the churches in which the Latin tongue prevailed. The removal of the seat of empire by Constantine to Constantinople, and the subsequent separation of the eastern and western empires, afforded the opportunity for diversities of language, modes of thinking, and customs to manifest themselves, and added political causes to the grounds of separation. During the earliest period the chief seats of influence in the Eastern Church were Jerusalem, Antioch, and Alexandria, the seat of that mystical philosophy, by which the oriental church was distinguished. In 341, soon after the synod of Antioch, the rivalry between the Bishop of Rome and the Bishop of Constantinople began to assume importance, and before the year 400 differences of doctrine with respect to the procession of the Holy Spirit appeared. The Council of Chalcedon in 451 reaffirmed the "pre-eminence of honor" after Rome, which had been granted Constantinople by the Second General Council in 381, but also accorded to its bishop supremacy, not only over Thrace, but over Pontus and Asia. This canon, the famous 28th, Rome refused to confirm. The title of *Œcumenical Patriarch* was assumed by John, bishop of Constantinople, in 588, and in the following year the phrase 'Filioque' ('and the Son') was added by the Latins to the Nicene Creed (which now read 'proceeding from the father and the son'), an addition to which the Greek Church was opposed. In 648 Pope Theodore deposed Patriarch Paul II.; but a reconciliation of the churches was effected at the Council of Rome (680). The doctrines of the Greek Church were defined by John Damascenus in 730. The disruption was hastened by the banishment of Ignatius by Michael the Drunken, and the consecration of Photius (858). Pope Nicholas I. refused to sanction the usurpation of Photius and excommunicated him. The schism was temporarily healed after the death of Photius, but Michael Cerularius reopened it by charging the Latins with heterodoxy. He was excommunicated by Leo IX. in 1054, since which the Greeks have been severed from the Roman communion, though the Russo-Greek Church was not separated until the 12th century. The presence of the Crusaders in the East aggravated the quarrel; Latin patriarchates were established in Antioch and Jerusalem, and, though on the capture of Constantinople by the Crusaders a Latin patriarchate was set up there (1204), the schism was revived there as soon as the Latin empire fell (1262). Reunion was proposed in 1273 by Patriarch Joseph, and effected, with the acknowledgment of the pope as primate, at the Council of Lyons (1274). The union, however, was annulled in 1282 by Emperor Andronicus II., and in 1283 and 1285 by synods of Constantinople. It was again effected under John Palæologus at Florence in 1439, but was repudiated in 1443 by the Patriarchs of Alexandria, Antioch, and Jerusalem. In 1453, when the patriarch fled from the Turks, a schismatic, Gregory Scholarius, was chosen in his place. In 1575 unsuccessful negotiations were commenced with a view to union with the Lutherans, and in 1723 the English bishops even proposed that the Greek and Anglican churches should unite, a proposal revived by the archbishop of Moscow in 1860. The claims of the czar in 1853 to the protectorate of the Greek churches in Turkey was one of the causes of the Crimean War.

The Greek Church is the only church which holds that the Holy Ghost proceeds from the Father only; the Roman Catholic and Protestant Churches deriving the Holy Ghost from the Father and the Son. Like the Roman Catholic Church it has seven sacraments — baptism; chrism; penance, preceded with confession; the eucharist; ordination; marriage; and unction. But it is peculiar (1), administering baptism by threefold immersion, the chrism (confirmation) following immediately after it; (2), in adopting, as to the eucharist, the doctrine of the real presence and transubstantiation; but in ordering the bread to be leavened, the wine to be mixed with water, and both elements to be distributed to every one, even to children; (3), the parochial clergy are required to be married, but only once and to a virgin, and marriage must take place before ordination; widowed clergy are not permitted to retain their livings, but go into a cloister, where they are called *hieromonachi*. Rarely is a widowed bishop allowed to preserve his diocese. The Greek Church grants divorce in case of proved adultery, but it does not allow even the laity a fourth marriage. It differs also from the Roman Catholic Church in anointing with the holy oil, not the dying but the sick, for the restoration of health, forgiveness, and sanctification. It rejects the doctrine of purgatory, works of supererogation, indulgences, and dispensations, but admits prayers for the dead, whose condition appears to be considered undetermined until the final judgment. It recognizes no visible vicar of Christ on earth, but the spiritual authority of patriarch is little inferior to that of the pope. It allows no carved, sculptured, or molten image of holy persons or subjects; but the representations of Christ (except in the crucifix), of Mary, and the saints, must be merely painted, and at most inlaid with precious stones. In the Russian churches, however, works of sculpture are found. In the invocation of the saints, and especially of the Virgin, the Greeks resemble the Latins. They also hold relics, graves, and crosses sacred; and crossing in the name of Jesus they consider as having a wonderful and blessed influence. Among the means of penance, fasts are particularly numerous with them. They fast Wednesday and Friday of every week, and besides observe four great annual fasts, namely forty days before Easter; from Whitsuntide to the days of Sts. Peter and Paul; the fast of the Virgin Mary, from the 1st to the 15th of August; and the apostle Philip's fast, from the 15th to the 26th of November; besides the day of the beheading of John the Baptist, and of the elevation of the cross. The calendar of the Greek Church is in the old style, their New Year's Day falling on 13 January.

The services of the Greek Church consist almost entirely in outward forms. Preaching and catechizing constitute the least part of it. Instrumental music is excluded altogether. The Mass is considered of the first importance. The convents conform, for the most part, to the strict rule of St. Basil. The Greek abbot is termed *hegumenos*, the abbess *hegumenē*. The abbot of a Greek convent which has several others under its inspection is termed *archimandrite*, and ranks next a bishop. The lower clergy in the Greek Church consist of readers, singers, deacons, etc., and of priests or popes and protopopes or archpriests, who are the first clergy in the cathedrals and metropolitan churches. The members of the lower clergy can rise no higher than protopopes, for the bishops are chosen from among the monks, and from the bishops are selected the archbishops, metropolitans, and patriarchs. In Russia there are twenty-four dioceses. With which of them the archiepiscopal dignity shall be united depends on the will of the emperor. The seats of the four metropolitans of the Russian Empire are St. Petersburg, Kiev, Kasan, and Tobolsk. In the Turkish dominions the dignities of Patriarch of Constantinople, Alexandria, Antioch, and Jerusalem still subsist. The Patriarch of Constantinople still possesses the ancient authority of his see; the other three patriarchs exercise a very limited jurisdiction, and live for the most part on the aid afforded them by the Patriarch of Constantinople.

The United Greek Churches comprise those Churches of Greek rite which are in communion with the See of Rome; the adherents of these Churches are commonly styled Uniates, and the Churches Uniate Churches. There are five such Uniate Greek Churches, namely, those of the Melchites, of the Ruthenians, of the Greek Catholics of Italy, of the Græco-Rumanic rite, and of the Bulgarians. These several Churches retain their several Greek or Oriental liturgies and sacramental rites and most of the usages and ceremonies of the Eastern schismatical Churches from which they are sprung.

The Melchites represent those Churches of Syria and Egypt which, in 1680 and later, seceded from jurisdictions of the Monophysite patriarchs of Antioch, Jerusalem, and Alexandria. Their number is small, perhaps not exceeding 50,000 souls, but they have three patriarchs, with bishops subordinate to them.

The Ruthenian United Church is an offshoot of the Russian Greek Church by secession; the membership of this Church in Russian Poland and in the Austro-Hungary monarchy comprises probably 1,000,000 souls.

The United Greeks of Italy, mostly in Calabria, are estimated at 30,000.

The Græco-Romaic Church of Hungary and Transylvania has about 1,000,000 adherents.

The United Bulgarian Church dates from 1860, when several bishops with a considerable following of their people were received into the communion of the Church of Rome.

All these Churches retain the ancient Greek liturgies of the Eastern Churches from which they seceded, and to a great extent their ancient systems of discipline. The priest, as in the Greek orthodox and in the Russian orthodox Church, must be married, and the bishops must be celibates; hence the bishops are usually chosen from the monastic order. The widowed priest is not permitted to contract a second marriage. In short, these Churches retain, of the religious practices and of the discipline of the several Eastern Churches from which they seceded, whatever is not inconsistent with allegiance to the supreme pontiff in matters of doctrine.

The language of the Ruthenian United Church's liturgy is Old Sclavonic, and translated from one of the ancient Greek liturgies. The liturgy of the Melchites is that of St. John Chrysostom, and on certain occasions that of St. Basil, both in the original Greek. The liturgy of the Bulgarian Church is also of Greek origin, but translated into an ancient Sclavic idiom.

Greek Fire, a combustible composition made probably of naphtha, sulphur and nitre, which was first used in 673 A.D. by the Greeks of the Byzantine Empire against the Saracens. Its invention has usually been ascribed to Callinicus of Heliopolis, and to the year 668 A.D. The mixture appears to have been highly inflammable, and to have been difficult to extinguish; was poured out, burning, from ladles on besiegers, projected out of tubes to a distance, or shot from balistæ, burning on tow tied to arrows. At Constantinople the process of making Greek fire was kept a secret for several centuries: but the knowledge of its composition and the use of it, gradually spread to the West. It was in use for a short time after the invention of gunpowder. Combustibles of a similar kind were used at the siege of Charleston in 1863, composed of sulphur, nitre, and lampblack; and naphtha in shells was also tried.

Greek-letter Societies, or **College Fraternities,** are found in nearly all leading educational institutions, particularly the great universities, in the United States. Branches of the various societies are known as "chapters," and are found in nearly every college as well as in every large city in the country. No society has more than one chapter in any one college. While these societies are secret in character there is neither ritual nor mystery in their conduct, the protection of meetings, constitution and mottoes being all the secrecy involved. The Greek alphabet is generally used in naming a fraternity, or a chapter. There are three types of badges worn by members, the name badge, monogram badge, and symbol badge. In the latter a key, skull, or scroll is usually employed.

The oldest of these literary and social brotherhoods was established as early as 1776, and continued the sole society of its kind for 50 years. There were in 1902 more than 800 chapters of these societies in American colleges, with a membership including the alumni, of more than 100,000. It has become quite the practice for students of a particular fraternity to reside together during their college course in their "chapter" house. In 1901 there were 70 such houses in the United States owned by the "chapters," and 200 other houses rented by them. Princeton is the only prominent college in the country where the fraternal society is prohibited, and the fact that all the other leading institutions permit these organizations to exist affords strong presumption that they are regarded with favor, and that their influence is for good rather than for evil. In 1902 there were 25 of these societies for men and 8 for women, in the universities and colleges of the United States.

Phi Beta Kappa.— This, the oldest organization, is composed of 53 college chapters, and was founded 5 Dec. 1776, at William and Mary College, Williamsburg, Va. A chapter was formed at Yale, in New Haven, in Dec. 1779, and soon after at Harvard, Dartmouth, Bowdoin and Amherst. The society in 1902 had a membership of 11,000. The national council meets triennially. The badge of the society is a golden key. Among prominent members are T. W. Higginson, Seth Low, Joseph H. Choate, and H. W. Mabie.

Kappa Alpha.— Founded in 1825 at Old Union College by four members of the Phi Delta Kappa. It likewise had a golden key as a badge design. The first branch of this society was established at Williams College. The society had 1,000 members in 1902, prominent among them being Wheeler H. Peckham, John Boyd Thatcher, L. Clark Seelye, and Edward S. Bragg.

Sigma Phi.— Founded at Union College, Schenectady, N. Y., 4 March 1827, the society established branches at Hamilton, Williams, Hobart, Lehigh, Cornell and the Universities of Michigan and Vermont. It had a membership of 1,400 in 1902. The badge of the society is of the monogram type; the colors are light blue and white. Among its members are Elihu Root, Andrew D. White, and John H. Post.

Delta Phi.— Founded at Union College, 17 Nov. 1827, this society established branches at Columbia, Rutgers, Harvard, Johns Hopkins, Cornell, and other colleges. The badge is in the form of a Maltese cross; colors blue and white. There are several thousand members, among them John Jacob Astor, Ernest Howard Crosby, and R. O. Doremus.

Alpha Delta Phi.— Founded at Hamilton College, Clinton, N. Y., in 1832, the society established chapters in 10 other colleges and had a membership of 8,400 in 1902. There are 10 houses owned by the society and 24 active chapters. The badge is of green and white, with the star and cresent as symbols. Among prominent members are W. R. Day, Bartow S. Weeks, Henry Clews, Jr., Jas. K. Hackett, and H. E. Lippincott.

Psi Upsilon.— Founded at Union College, 24 Nov. 1833, this society had 4 of its original founders still living in 1902. The membership of the organization is over 10,000, with 22 chapters in various colleges. The badge is of gold, diamond-shaped; colors garnet and gold. Among its members are Chauncey M. Depew, Wm. C. Whitney, G. R. Schieffelin, and Herbert L. Bridgeman.

Delta Upsilon.— Founded at Williams College in 1834, the society has chapters in 34 colleges and universities, with a membership of 8,000. It is an open, non-secret organization and owns 24 chapter houses. Among its prominent members are David Starr Jordan, Rossiter Johnson, W. H. P. Faunce, and Rev. Charles M. Sheldon.

Beta Theta Pi.— Founded at Miami University, Oxford, Ohio, in 1839, this was the pioneer society of the Middle West. It has a membership of 12,500, with 54 active chapters. The badge is a shield with 8 sides curved inward; the colors are light pink and blue. Among its prominent members are Foster L. Backus, Paul Wilcox, and W. R. Baird.

Chi Psi.— Founded at Union College, in 1841, this was the first Eastern society to establish chapters in the West, extending its organization to the Universities of Michigan and Minnesota. It had a membership in 1902 of 4,500 with 19 active chapters. The chapter house at Cornell is the finest fraternity house in this country. The society is more secret than most of its fellows. The badge is a jeweled monogram. Among its members are Willis J. Abbot, Francis M. Scott, and Allan Lee Smidt.

Delta Kappa Epsilon.— Founded at Yale College, New Haven, Conn., 22 June 1844, by 15 members of the junior class. The society has established 48 chapters and had a membership in 1902 of 13,548, being the strongest numerically of any college fraternity. Among prominent members of the society are President Roosevelt, John D. Long, Whitelaw Reid, Howard Gould, Julian Hawthorne, Cyrus C. Adams, John DeWitt Warner, M. G. Hyde, Julius Chambers, and G. R. Hawes.

Zeta Psi.— Founded at the New York University, 1 June 1847, this society established 21 chapters, and had a membership in 1902 of 5,330. The badge is a monogram; the color white, with which each chapter blends its college colors. Among prominent members are Augustus Van Wyck, Wm. Shrady, Harrison Grey Fiske, and H. W. Bookstaver.

Delta Psi.— Founded at Columbia College, New York, in Jan. 1847, has 11 chapters and a membership of 3,000. The badge of the society is a St. Anthony cross, bearing a shield of blue enamel. Among its prominent members are Thomas Nelson Page, W. Seward Webb, F. W. Vanderbilt, Brander Matthews, Wm. E. Curtis, and D. S. Appleton.

Theta Delta Chi.— Founded like several of its predecessors at Union College, this society was organized in 1848, and has 22 chapters and 4,000 members. The badge is a monogram; the colors black, white and blue. Among its members are John Hay, J. W. Griggs, H. H. Hanna, S. Fred Nixon, and Rev. David Gregg.

Phi Gamma Delta.— Founded at Jefferson College, Canonsburg, Pa., in May 1848, this society has established 57 chapters and has a membership of 8,753. The badge is a diamond-shaped shield on a field of black, bound by a golden cord; the color royal purple. Among its members are Gen. Lew Wallace, Edward Eggleston, S. S. McClure, Leigh H. Hunt, and R. Lloyd Jones.

Phi Delta Theta.— Founded at Miami University, Oxford, Ohio, 20 Dec. 1848, this society has established 68 chapters and has a membership of 12,000. The badge is a shield, bearing a scroll; the fraternity colors are argent and azure. Among its members are C. P. Bassett, Irving R. Bacon, C. P. Van Alen, and Rev. E. A. Dent.

Phi Kappa Sigma.— Founded at the University of Pennsylvania, 16 Aug. 1850, has established 15 chapters and has a membership of 1,000. The badge is a gold Maltese cross, with a skull and crossbone centre; the colors are old gold and black. Its membership includes H. C. King, J. R. Paxton, M. J. Asch, Geo. G. Battle, and Wm. McClure.

Phi Kappa Psi.— Founded at Jefferson College, Canonsburg, Pa., 19 Feb. 1852, has established 40 chapters and had, in 1902, over 8,000 members. The badge is a shield of gold; the colors pink and lavender. Prominent among its members are Henry T. Scudder, F. E. Hamlin, W. L. Stoddard and Thos. A. Nelson.

Chi Pi.— Founded at Hobart College, in Dec. 1854, has organized 19 chapters with a membership of 4,700. The fraternity was reorganized in 1890. The badge is a monogram. Geo. S. Hobart, H. C. Platt, F. A. Mandeville, and F. C. Weber are among its prominent members.

Sigma Chi.— Founded at Miami University, Oxford, Ohio, 20 June 1855, has organized 50 chapters and has 8,000 members. The badge is a cross of gold and white enamel; the colors are blue and gold. Among its members are Thos. Ewing, Jr., Wm. E. Quimby, H. W. Chatfield, and Henry A. Potter.

Sigma Alpha Epsilon.— Founded at the University of Alabama in 1856, has organized 59 chapters and has 7,000 members. Among its prominent members are Charles B. Harvey, F. K. Knowlton, T. W. Beach, and H. P. Nash.

Delta Tau Delta.— Founded at Bethany College in 1860, has organized 37 chapters and has a membership of 1,200. The colors are purple, gold and white.

Alpha Tau Omega.— Founded at the Virginia Military Institute, 11 Sept. 1865, has organized 45 chapters and has a membership of 6,000. Among its prominent members are Irving Bacheller, Hugh S. Thompson, E. B. Southworth and Walter H. Page.

Kappa Sigma.— Founded at the University of Virginia in 1867, has established 49 chapters and has a membership of 3,500. The badge is a crescent and star; the colors old gold, maroon and blue.

Sigma Nu.— Founded at the Virginia Military Institute, 1 Jan 1869, has organized 46 chapters and has a membership of 5,000. The badge is designed after that of the Legion of Honor of France; the colors are black, white and gold.

Phi Sigma Kappa.— Founded at the Massachusetts Agricultural College, 15 March 1873, has organized 14 chapters and has a membership of 1,050. The colors of the society are silver and magenta. Among its members are Wm. H. Bishop, S. C. Thompson, J. W. Goff, Jr., and M. C. Valentine.

Among the Greek-letter Societies of women are the Alpha Chi Omega, Alpha Phi, Chi Omega, Delta Delta Delta, Delta Gamma, Kappa Alpha Theta, Kappa Kappa Gamma, and Pi Beta Phi. The Alpha Phi was founded in 1872, has 10 chapters and 1,100 members. The Delta Delta

Delta was founded in 1888, has 17 chapters and a membership of 1,000.

In October 1903 there was organized at the Indiana University the first negro Greek-letter society in the United States. It is known as the Alpha Kappa, with a charter membership of 10.

Greek Music, the theory and practice of melody and harmonics among the ancient inhabitants of Hellas. The subject of Greek music is an obscure and difficult one, but there are enough data extant to afford us a general idea of the Greek musical scale, of the use of instruments, and employment of the voice in solo and chorus among the Greeks. The earliest notion of music was derived from the necessity of keeping time in the dance. This at first would be effected by merely clapping the hands. The use of instruments of percussion would follow, and the drum and cymbal came into use. The cymbal originated in Egypt, and reached Greece as a permanent element in the practice of music. The rustle of the wind through the reeds, sometimes with a shrill whistling vibration, suggested the application of the human breath to hollow pipes, and what is still called the Pan's pipes was invented. Wind instruments of various kinds came afterwards into vogue, the flute, and the double flute were employed, and seem generally to have been blown as accompaniments to the elegy and the love song. These pipes were of various kinds and were considered as good accompaniments to the recitations of the poet, as well as for regulation of movement in a dance. They were employed in the ceremonies of the mysteries, and Plato speaks of an often recurring thought as resembling «the sound of the flute in the ear of the mystic.»

Instrumental music attained its highest development in the invention of the lyre. The Egyptians attributed this invention to their god Thoth. In Greece Hermes is celebrated as the inventor of the lyre, which became henceforth the instrument of the epic poet and the rhapsode or reciter. It had originally four strings, which it is said were suggested by the tendons stretched over the shell of a tortoise. The first Greek philosopher to attempt a scientific theory of musical scales and intervals appears to have been that profound and versatile man Pythagoras (585 B.C.). The Greeks did not use the word music in application to the art which we so name. Music to them comprised everything which the Muses inspired, and even history and astronomy as well as poetry were music. What we mean by the term was called by the Greeks harmonics, which means the art of fitting, that is, adjusting the intervals in a scale, in the strings of a lyre. The scale of Pythagoras had seven notes, corresponding with the seven strings of his lyre, and he professed to derive his idea of music from the music of the spheres. The sun revolving round the earth was to him the chief planet, and was represented by the middle string of the lyre which was considered the key-note, corresponding with A in the modern scale. On one side were strings representing Mercury, Venus and the Moon, on the other side three more corresponding with Mars, Jupiter and Saturn. It is said that Pythagoras discovered the ratios of the perfect intervals from hearing blacksmiths striking an anvil with hammers of different weights. Aristoxenus (B.C. 300) discovered the difference between the major and minor tones and has been called «the father of temperament.» Claudius Ptolemy (B.C. 150) demonstrated the musical axiom which obtains in modern times that the major tone should be below the minor.

The Greeks had four modes or scales, the Dorian, the Phrygian, the Lydian, and the Mito-Lydian. The Dorian was set in the key of F natural, and the rest were distinguished by analogous differences.

The ancient Greeks were passionately fond of music, and elaborate treatises were written by them on the science and art. They did not understand harmony, and Aristotle (384 B.C.) speaks of the only chorus singing known as that of men singing a melody an eighth lower than it was sung by boys, which of course would be unison. Music was employed at Athens by wandering epic minstrels; it was also common in religious ceremonies, and to regulate the movements of the army. It formed part of the drama. We are told that Æschylus, the father of tragedy, composed the music for his own dramas and that Sophocles accompanied on the lyre the performance of one of his plays.

Greek Philosophy, the various speculations of the ancient Greeks with regard to the origin of things. This is but a partial description of the intellectual efforts made by the keen and powerful minds of the ancient world to solve those problems which science now-a-days is so eagerly investigating. The origin of Greek philosophy was the gradual disbelief that had seized men's minds as to the truth of the ancient poetical cosmogonies, and antique mythologies of religion. Faith was dead and reason had awakened. In the 7th century before our era, in the flourishing city of Miletus, capital of the Ionian colony, the first Greek philosopher propounded the question which is still being put, What is the basic substratum of all phenomena? In our own days Huxley called it protoplasm; Herbert Spencer said it was force. Thales of Miletus (636 B.C.) declared it was water, which to him seemed to permeate and give life to all things. Thales was the first of the Greek physicists, or materialists, and was considered one of the Seven Wise Men of Greece. He was the founder of the Ionian School of Philosophy. He was succeeded in the long line of philosophical inquirers by Anaximenes (529 B.C.): who looking for the first element, the first cause, found it in air. Air was universal and must be the parent of all things. It was the breath of life and must therefore be the source of it. Diogenes of Apollonia (460 B.C.) fixed upon a higher notion as the first cause of things. He saw the ruling race of mankind prevailed over nature by their intelligence. He decided that intelligence was the cause and foundation of all things. In these speculations as to the nature of the universe and its origin we come upon two remarkable men, Anaximander of Miletus (610 B.C.) and Pythagoras, who invented the word philosophy. The former taught that all existence came from the infinite — a vague term, which did not mean the infinite intelligence but the infinite existence. Pythagoras said that number was the first thing, from which all else proceeded — a metaphysical abstraction, which almost defies analysis. Aristotle says the Pythagoreans «taught that number was the beginning of things, the cause of their material existence, and of their modifications and different states."

The school of Eleatics is chiefly represented by the poet Xenophanes (620 B.C.). His philosophic creed is thus described by Aristotle: "Casting his eyes upward at the immensity of heaven, he declared that *The One* was God." Reason and imagination led this thinker to become at once a Monotheist and a Pantheist. Parmenides who was born (536 B.C.) at Elea, a city which gave its name to Eleatics, was the first to make the great distinction between truth and opinion, between the deductions of reason and the impressions of sense. He made being the basis of things, for non-being was impossible — a discovery which at that stage in philosophical speculation was of great importance. Zeno, another Eleatic, b. 500 B.C., who was the inventor of logic, was persecuted and put to death for free-thinking, and was a follower and disciple of Parmenides. Plato says that the master proved the existence of the one; the disciple established the non-existence of the many. He preserved his master's distinction between truth and opinion. "Your senses," he would say, "tell you that there are many things existing; reason avers that there is but one."

A contemporary of Zeno was a man who began at Ephesus those speculations as to the origin of the universe to which as preliminary he added a theory on the origin of knowledge. This was Heraclitus (503 B.C.). He was a disciple of Xenophanes, and taught that fire is the origin of everything, and there is no existence, but only change; things cannot be said to be, but only to be becoming; processes and not states formed the mode of existence. We cannot know or name anything with truth, for as we look at it, it changes, and is something different from what we thought it.

Anaxagoras came from Clazomenæ to Athens just when the age of Pericles was dawning: he had indeed Pericles, Euripides, and Socrates as his pupils. He attacked the patriotic religion of the proud city and was banished to Lampsacus. He thought that all sense — knowledge — was delusive until corrected by reason. He believed that intelligence was the creative and regulating influence of the universe. Things as they are were brought about by the concourse of infinite atoms; but these atoms were of all sorts, and that like was united to like in an infinite series of movement and combination; gold by the union of gold atoms that had existed from eternity, fires from fire atoms, air from atoms of air. These atoms were the famous homœomeriæ spoken of and condemned by Aristotle. Empedocles (444 B.C.) was of the great city of Agrigentum; in his views of knowledge he belonged to the Eleatics, and maintained that the senses were fallible, while reason was a sure guide to truth. He was a poet and declaimed against anthropomorphic ideas of deity. He gathered in one the doctrines of the Ionian physicists declaring the primary elements were four, namely, earth, air, fire and water. Love was the formative principle of things, hate the dissolver and destroyer. One was harmony, the other discord, and God is the One, "a sphere fixed in the bosom of harmony, rejoicing in calm rest."

Democritus of Abdera (460 B.C.) was a rich man who entertained Xerxes at his house. He went one step further than Anaxagoras, and almost entered the circle of our modern science by teaching the atomic theory, namely that everything in the world is the result of a fortuitous concourse of atoms, all of the same substance, but making various things through the various forms they take in uniting. Color, sweetness, cold, are the result not of substances essentially differing; all is form.

All attempts had so far failed to solve the problems of the material world, and of human knowledge. Many theories were put forth, none were universally accepted, although they were each discussed. This brought the Sophists on to the stage of philosophy — men who taught the arts of discussion, not of investigation. One of the greatest of them was Protagoras. He was a disciple of Democritus, and taught that opinion was everything. "Man, the individual man, each for himself, is the measure of all things." The Sophists were the first skeptics, but a new epoch rose with Socrates (469 B.C.). He was the most remarkable man in all the Greek world; for his love of disputation he was classed by some with the Sophists, for his ridicule of traditional views in religion and physics, he was condemned to death — yet he succeeded in substituting morals for physics as the subject of philosophy. He first gave to philosophical methods the definition and the inductive argument, or reasoning by analogy. One of his disciples, Aristippus of Cyrene, while he followed the method of his master, founded the Cyrenaic school which taught that pleasure was the criterion of the true; Socrates had taught that the good as judged by the individual conscience was that criterion. Then followed the Cynics, under Antisthenes, who went to the opposite extreme to Aristippus, became an ostentatious ascetic, and in this was followed by Diogenes of Sinope, who made his home in a cask or tun, and tried to set the example of a rugged virtue, which is misanthropic, but triumphant over bodily appetite. It was left to Plato to exhibit the complete adoption and application of the Socratic method. He believed that in each man resided the power of detecting the truth, from having seen the perfection of things, in an ideal world during a previous state of existence; he could judge of the good and the beautiful here from his memory of what their perfect archetypes were. His voluminous writings enable us to judge both of his ethical and political system, but they both fail in practicality. His most famous pupil was Aristotle (384 B.C.), a man of encyclopedic mind, the first scientific observer, the inventor of the syllogism. Plato was an idealist and a rationalist; Aristotle a materialist and an empiric. The one trusted to reason, the other to experience. Aristotle always argued against the ideal theory of his master, and deduced his conclusions from things as he saw them. He invented grammar as well as logic, and was in himself an epitome of the philosophic learning of his predecessors. But by reasoning from experience he had opened the way for the skeptics, of whom the first was Pyrrho, who taught that there is no criterion of truth. Phenomena are mere appearances, how can we prove they are anything else? This was what in modern times is called agnosticism, for we cannot prove and therefore cannot know the truth of anything we see. But after this suicide of philosophy in the school of Pyrrho, she revived again as a moral mentor in the person of Epicurus, of Samos (342 B.C.). He taught the highest good is pleasure; this is the moral end of existence. He was controverted by the Stoics. Zeno was their leader, a man of stern unbending character and abstemious life, whose aim was to show that virtue consisted in manhood, and manhood in the power to endure hardness and to despise the body. Skepticism, indifference, sensuality and epicurean softness were not to be combated by the vague dreams of Plato, or the cumbrous system of Aristotle. The Stoic attempted to meet the growing decadence by an exactly opposite self-denial and impassive reserve. But Stoicism was egotistic; its aim was the repression of feeling, it was apathy, death in life. The last struggle of Greek philosophy to dominate the mind of society was witnessed in the rise of the New Platonists and their New Academy. Carneades (213 B.C.) was their most illustrious representative, and he was the type of a school that took up the doctrines of Plato, expanded and enlarged them until the time when Christianity appeared, and faith, not reason, as in the old days seven hundred years before, dominated the world of opinion. See PHILOSOPHY, HISTORY OF.

Greek Theatre, First in America, the gift of William R. Hearst to the University of California, is exactly similar in its proportions to the famous theatre of Dionysus at Athens.

The structure was used for the first time at the University of California commencement 1903 when President Roosevelt was the orator of the day. It was then learned that every one of the 8,000 spectators seated in the theatre could hear with perfect distinctness.

No roof shuts out the sunlight or starlight from the audience. Situated right in the heart of magnificent scenery, tall trees towering up above the walls on all sides and the building itself being an architectural gem, it will readily be seen that very little stage scenery will be needed when presenting the early plays which will be given by university students and the leading actors of the world as soon as all is ready.

The entire structure is white; the hangings will be a blending of the Greek and Roman colors; but there will be very few decorations used aside from architectural carvings, the splendor of the place being in its dimensions and simplicity.

Though this theatre is modeled in a general way after the ancient classic buildings of a similar character, no single historic example has been literally followed. The theatre at Epidaurus, in Greece, however, offers many points of similarity, notably in the difference of slope between the upper tiers of seats and the inner and lower portions of the auditorium. The new theatre is of approximately the same size as the larger theatre at Pompeii.

The building is, as a whole, made up of two separate and distinct parts, namely, the stage, corresponding to the ancient logeion, and the auditorium.

The floor of the stage is 133 feet wide and 28 feet deep. It is entirely open toward the auditorium and surrounded on the other three sides by a wall 42 feet in height. This wall, which corresponds with the ancient skene, is enriched by a complete classic order of Greek Doric columns with stylobate and entablature, the ends of the side walls toward the auditorium forming two massive pylons. Five openings pierce the wall, the entrance in the centre of the back of the stage being the most important — the so-called royal door of the ancients. This is flanked by two minor doors to the right and left the two remaining openings occurring on the return walls at either end of the stage.

The auditorium or theatre proper is semicircular in form, 254 feet in diameter, and is divided into two concentric series or tiers of seats. The first series is arranged about a level circle 50 feet in diameter and 5½ feet below the stage, which corresponds to the space anciently devoted to the chorus, orchestra, etc.

From this circle the receding rows of seats step up gradually until the stage level is reached at a circle corresponding in diameter with the terminal pylons of the stage wall. This line is marked architecturally by a passage, anciently named the diazoma or diodos, running around the semicircle of seats midway between the orchestra and the topmost circle. The diazoma is protected on its outer side by a wall, beyond which the seats step up more steeply, approximately at an angle of 30 degrees with the horizontal, to the outer limit of the theatre.

It is estimated that more than 7,000 persons can be seated in the theatre proper. The stage will accommodate some 600 more, a number which can be readily added to by the temporary extension of the stage floor toward the auditorium.

Greeley, Horace, American journalist: b. Amherst, N. H., 3 Feb. 1811; d. Pleasantville, N. Y., 29 Nov. 1872. More than 30 years after his death, Horace Greeley's name remains at the head of the roll of American journalists. Successors in the primacy of current discussion may surpass him, as doubtless some of them already have, in consistency and learning, but hardly in the chief essentials of a journalistic style; others may exert a more salutary influence, if not so personally diffused: but in the respect of high ideals, courage, intellectual force, and personal magnetism, the qualities which impel a man of letters to be also a man of action, Horace Greeley was of heroic mold. He was no pop-gun journalist firing from a sky-sanctum, but a face-to-face champion in the arena of public affairs, laying about him with pen and speech like an ancient Bayard with his sword. The battles he fought for humanity, and the blows he gave and received, have made him for all time the epic figure of the American press.

Born in rural New Hampshire, of English and Scotch-Irish descent, he epitomized his heritage and his attainment in the dedication of his autobiography "To our American boys, who, born in poverty, cradled in obscurity, and early called from school to rugged labor, are seeking to convert obstacle into opportunity, and wrest achievement from difficulty."

Though physically a weak child, his intellect was strong, and when near his tenth year his father removed to Vermont, the boy took with him the reputation of a mental prodigy; so, with little schooling and much reading, he was thought when 14 to be a fit apprentice to a printer, setting forth four years later as a journeyman. His parents had moved to western Pennsylvania, and he followed; but after a desultory practice of his art he came to the metropolis on August 17, 1831, with $10 in his pocket, and so rustic in dress and manners as to fall under suspicion of being a runaway apprentice. Later in life, at least, his face and his figure would have lent distinction to the utmost elegance of style: but his dress was so careless even after the long period of comparative poverty was passed, that the peculiarity became one of his distinguishing features as a public character; and to the last there were friends of little discernment who thought this eccentricity was studied affectation: but manifestly his dress, like his unkempt handwriting was the unconscious expression of a spirit so concentrated on the intellectual interests of its life as to be oblivious to mere appearances.

After 18 months of dubious success in New York as a journeyman, in his 21st year, he joined a friend in setting up a modest printing-office, which on March 22, 1834, issued the 'New Yorker,' a literary weekly in the general style of Willis' 'Mirror,' under the firm name of H. Greeley & Company. For four years the young printer showed his editorial aptitude to such good effect that in 1838 he was asked to conduct the 'Jeffersonian,' a Whig campaign paper. This was so effective that in 1840 he was encouraged to edit and publish the 'Log-Cabin,' a weekly which gained a circulation of 80,000, brought him a reputation as a political writer, and active participation in politics with the Whig leaders, Gov. Seward and Thurlow Weed. It contributed much to the election of Gen. Harrison, but very little to the purse of the ambitious editor. On April 10 of the following year, 1841, he issued the first number of the New York *Tribune*, as a Whig daily of independent spirit. He was still editing the 'New-Yorker' and the 'Log-Cabin,' both of which were soon discontinued, the 'Weekly Tribune' in a way taking their place. Though the 'New-Yorker' had brought him literary reputation, it had not been profitable, because of uncollectible bills which at the end amounted to $10,000. Still, at the outset of the *Tribune* he was able to count $2,000 to his credit in cash and material. He was then 30 years of age, and for 30 years thereafter the paper grew steadily in circulation, influence, and profit, until, a few weeks after his death, a sale of the majority interest indicated that the "good-will" of the *Tribune*, aside from its material and real estate, was held to be worth about a million dollars. The Greeley interest was then small, since he had parted with most of it to sustain his generous methods of giving and lending.

He had great capacity for literary work, and when absent for travel or business was a copious contributor to his paper. To his rather delicate physical habit was perhaps due his distaste for all stimulants, alcoholic or otherwise, and his adherence through life to the vegetarian doctrines of Dr. Graham; another follower of the latter being his wife, Mary Young Cheney, also a writer, whom he married in 1836. His moderate advocacy of temperance in food and drink, coupled with his then unorthodox denial of eternal punishment, helped to identify him in the public mind with most of the "isms" of the time, including Fourierism and spiritualism; when in fact his mind and his paper were merely open to free inquiry, and were active in exposing vagaries of opinion wherever manifested. Protection to American industry, and abolitionism, were the only varieties which he accepted without qualification: and while the pro-slavery party detested him as a dangerous agitator, it is possible at this day even from their point of view to admire the moderation, the candor, and the gentle humanity of his treatment of the slavery question. In all issues concerning the practical affairs of life, like marriage and divorce, he was guided by rare common-sense, and usually his arguments were scholarly and moderate: but in matters of personal controversy he was distinctly human, uniting with a taste for the intellectual fray a command of facts, and a force and pungency of presentation, which never seem admirable in an opponent.

He was in great demand as a lecturer and as a speaker at agricultural fairs, his addresses always being distinguished by a desire to be helpful to working humanity and by elevated motives. Though not a jester, genial humor and intellectual exchange were characteristic of his social intercourse. His books, with one or two exceptions, were collections of his addresses and newspaper articles. His first book, 'Hints Toward Reforms,' appeared in 1850, and was followed by: 'Glances at Europe' (1851); 'A History of the Struggle for Slavery Extension or Restriction' (1856); 'The Overland Journey to California' (1859); 'An Address on Success in Business' (1867); 'Recollections of a Busy Life,' formed on a series of articles in the New York 'Ledger' (1869); 'Essays Designed to Elucidate the Science of Political Economy' (1870); 'Letters from Texas and the Lower Mississippi, and an Address to the Farmers of Texas' (1871); 'What I Know of Farming' (1871); and 'The American Conflict,' written as a book, the first volume appearing in 1864 and the second in 1867. This work on the Civil War is remarkable, when considered in the light of his purpose to show "the inevitable sequence whereby ideas proved the germ of events"; but it was hastily prepared, and while strikingly accurate in the large sense, will not bear scrutiny in some of the minor details of war history.

Neither his political friends, nor his party, nor the causes he espoused, could hold him to a course of partisan loyalty contrary to his own convictions of right and duty. As a member of the Seward-Weed-Greeley "triumvirate," he was often a thorn in the flesh of the senior members; his letter of Nov. 11, 1854, dissolving "the political firm," being one of the frankest documents in the history of American politics. During the Civil War he occasionally embarrassed Mr. Lincoln's administration by what seemed then to be untimely cries of "On to Richmond!" immediate emancipation, and peace. On the whole, his influence for the Union cause was powerful; but when, the War being over, he advocated general amnesty, and finally as an object lesson went on the bail bond of Jefferson Davis, he lost the support of a large body of his most ardent anti-slavery admirers. The clamor against him called forth a characteristic defiance in his letter to members of the Union League Club, who were seeking to discipline him. Having further alienated the Republican party by his general attitude in "reconstruction" matters, he became the logical candidate for the Presidency, in 1872, of the Democrats at Baltimore and the Liberal Republicans at Cincinnati, in opposition to a second term for Gen. Grant. Though personally he made a brilliant canvass, the influences at work in his favor were inharmonious and disintegrating, and the result was a most humiliating defeat. This he appeared to bear with mental buoyancy, despite the affliction of his wife's death, which occurred a week before the election, he having left the stump in September to watch unremittingly at her bedside. On November 6, the day after his defeat, he resumed the editorship of the *Tribune*, which six months before he had relinquished to Whitelaw Reid. Thereafter he contributed to only four issues of the paper, for the strain of his domestic and political misfortunes had aggravated his tendency to insomnia; on the 12th he was seriously ill, and on the 29th he succumbed to inflammation of the brain. The last few months of his eventful career supplied most of the elements essential to a Greek tragedy. On December 23, the *Tribune* having been reorganized, with Mr. Reid in permanent control, there first appeared at the head of the editorial page the line "Founded by Horace Greeley," as a memorial to the great journalist and reformer. A bronze statue has been erected in the portal of the new *Tribune* office, and another statue in the angle made by Broadway and Sixth Avenue, appropriately named "Greeley Square," after the man who was second to no other citizen in establishing the intellectual ascendency of the metropolis. CLARENCE CLOUGH BUEL.

Greeley, Colo., city, county-seat of Weld County; on the Cache la Poudre River, the Union P. and the C. & S. Railroads; about 50 miles north of Denver. The place was settled in 1870 by the "Greeley Colony" (named after Horace Greeley), made up mainly of New England people. By irrigation they have made of the almost barren region an excellent agricultural country. It is the seat of a State Normal School. The chief manufactures are flour, beet-sugar, and lumber. Its trade is in its manufactured articles, also sheep, cattle, grain, and vegetables. Pop. (1900) 3,023.

Greely, Adolphus Washington, American Arctic explorer: b. Newburyport, Mass., 27 March 1844. After receiving a high school education he enlisted as a private in the 19th Massachusetts volunteer infantry, serving in the Civil War from 1861 to 1865. He entered the regular army in 1867 as second lieutenant and was appointed to the signal service. In 1881 he was put in command of an Arctic expedition, organized to carry out the plan of establishing circumpolar stations in accordance with the recommendations of the International Geographical Congress held at Hamburg in 1879. The exploring party made their headquarters for two years at Discovery Harbor, Grinnell Land. In an expedition made by a detailed party, the highest point north attained up to that date, 83° 24′, was reached. On his way back he reached Cape Sabine with great difficulty, and during the winter of 1883 lost, through cold and famine, all but seven of his twenty-five companions. Meanwhile Com. Winfield S. Schley had been despatched on a relief expedition, and in June 1884 rescued them at Cape Sabine. From his services to geographical science Lieutenant Greely was awarded the Founder's Medal of the Royal Geographical Society, and the Roquette Medal by the Société de Géographie of Paris. He was promoted to the rank of captain in the United States Army, and in 1887 succeeded Gen. W. B. Hazen as chief signal officer, with the rank of brigadier-general. Consult: Greely, 'Three Years of Arctic Service' (1886); Schley, 'The Rescue of Greely' (1885).

Green, Alice Sophia Amelia (STOPFORD), English historian: b. Kells, Ireland, 1849. She was privately educated. In 1877 she was married to J. R. Green (q.v.) the well-known historian. She collaborated with him in 'A Short Geography of the British Islands' (1879), edited his 'Conquest of England' (1883), prepared a revised edition (1888) and, with Miss K. Norgate, a finely illustrated edition (1892) of the 'Short History of the English People.' Her original works are 'Henry II.' (1888) and 'Town Life in the Fifteenth Century' (1894).

Green, Andrew Haswell, American lawyer: b. Worcester, Mass., 6 Oct. 1820; d. 13 Nov. 1903. He studied law, practised his profession in New York, and was there president of the board of commissioners of education, and comptroller (1871–6). In the latter capacity he re-established the municipal credit, seriously impaired by the embezzlements of the Tweed ring. He originated in 1868 the plan for Greater New York, executed in 1897, and also devised the plan for the consolidation of the Astor, Lenox, and Tilden foundations as the New York Public Library. He also assisted in establishing the American Museum of Natural History and the Metropolitan Museum of Art, and founded and became president of the New York Zoological Society. He was shot by Cornelius M. Williams, a negro, pronounced insane. It developed that he lost his life through resemblance to another against whom the assassin had a supposed grievance.

Green, Anna Katharine. See ROHLFS, ANNA K. G.

Green, Ashbel, American Presbyterian clergyman: b. 6 July 1762; d. 19 May 1848. He was graduated from the College of New Jersey (now Princeton University) in 1783, and appointed tutor and subsequently professor of mathematics and natural philosophy in that institution, which latter position he held for a year and a half. In 1786 he was licensed to preach and took up ministerial work in Philadelphia. From 1792 to 1800 he was chaplain to Congress, and in 1809 took a prominent part in forming the Philadelphia Bible Society, the earliest institution of the kind in the United States. He drafted the constitution of the Princeton theological seminary, of which he was one of the originators, and in 1812 was elected president of Princeton College. In 1822 he resigned this office and returned to Philadelphia to edit the 'Christian Advocate,' a religious monthly. For half a century he was one of the leading men in the Presbyterian Church. Among his many writings are 'Discourse Delivered in the College of New Jersey, with a History of the College' (1822); 'History of Presbyterian Missions', 'Lectures on the Shorter Catechism.'

Green, Bartholomew, American publisher: b. Cambridge, Mass., 1666; d. 1732. He published the first newspaper that appeared in the American colonies, and succeeding to his father's business at Cambridge extended it at Boston, where the office of the 'Boston News Letter' was situated. The proprietor and editor was John Campbell, postmaster of Boston. He eventually bought in the paper, which became notable for outspokenness on topics of religion and politics.

Green, Beriah, American abolitionist: b. New York State 1794; d. 1874. He was educated at Middlebury College, Vermont; became professor of sacred literature in Western Reserve College in 1821, but was compelled to resign in a few months through the opposition aroused by his anti-slavery views. He was for many years president of the Oneida Institute, Ohio. He was a great friend of William Lloyd Garrison, and exerted a wide influence in abolitionist circles. Among his writings are 'History of the Quakers' (1823).

Green, Duff, American politician and journalist: b. Woodford County, Ky., 1791; d. Dalton, Ga., 1875. He served with the Kentucky militia in the War of 1812; after the admission of Missouri as a State was appointed State Senator (1823), and became editor and proprietor of the St. Louis *Enquirer.* In 1825 he removed to Washington, D. C., where he purchased the United States *Telegraph.* This became the administration organ and Green rose to high favor with President Jackson. He was a member of the 'Kitchen Cabinet.' After the rupture between Calhoun and Jackson the *Telegraph* as the organ of the nullificationists bitterly attacked Jackson. After some years spent in Europe he returned to the United States (1844) and edited a short-lived newspaper in New York. During the latter years of his life he was actively engaged in promoting the development of the South, and was one of the founders of the town of Dalton, Ga.

Green, Hetty Howland Robinson, American financier: b. New Bedford, Mass., 21 Nov. 1835. She is the richest woman in America and probably the boldest and ablest woman financier of her time. Although she has an interest in nearly every large corporation and important enterprise in the world, she manages personally her own property in stocks, bonds, and real estate in Chicago, New York and elsewhere.

Green, Jacob, American Presbyterian clergyman: b. Malden, Mass., 1722; d. 1790. He became president of the College of New Jersey in 1757, and in 1775, as a member of the New Jersey Provincial Congress, was chairman of the committee chosen to prepare a State Constitution. He suggested in print a scheme for the redemption of the Continental currency, closely resembling that which Congress later adopted.

Green, John Cleve, American merchant and philanthropist: b. Lawrenceville, Mercer County, N. J., 14 April 1800; d. New York 28 April 1875. He entered a counting-house in New York, went as supercargo to South America and China, and in 1833 became a member of the firm of Russell & Co. at Canton. In 1839 he returned to New York, where he continued in the Chinese trade. For many years he was a director of the Chamber of Commerce, and was actively connected with numerous public and charitable institutions. He was liberal in his gifts, particularly to New York University, and Princeton University. At Princeton he established (1873) the John C. Green School of Science by the gift of $50,000, subsequently increased by the residuary legatees. In this school instruction is given in general science, civil engineering, and electrical engineering. The courses are four years in length and lead to the degrees of bachelor of science, civil engineer and master of science. In 1902-3 the number of students in this department was 305. The endowed proprietary school for boys at Lawrenceville, N. J., was re-established in 1882 upon a gift from the executors of his estate known as 'The John C. Green Foundation.'

Green, John Richard, English historian: b. Oxford 1837; d. Mentone, France, 7 May 1883. He was graduated in 1859 from Jesus College, Oxford, where, since the study of modern history had not yet taken any considerable place in the university, the officers failed of sympathy with his preference for Matthew Paris to the classics. In 1860 he was ordained deacon and became curate of St. Barnabas, London, in 1863 was appointed to Holy Trinity, Hoxton, and in 1866 to St. Philip's, Stepney. Failing health and increasingly liberal views caused him to withdraw from clerical life, and from 1869 he was librarian at Lambeth. His first literary work of importance consisted of articles, especially brief essays on historical subjects, in the 'Saturday Review.' In 1874, after having been twice rewritten, his 'Short History of the English People' appeared. This work unified English history as no other had yet done. 'What Macaulay had done for a period of English history,' says Creighton, 'Green did for it as a whole.' Green's purpose was to exhibit the development of popular life by a description of the leading manifestations of social progress. The book was skilful in arrangement and artistic in style, and met with an instant and large success. The author expanded it into his 'History of the English People' (1877-80) not only to secure greater fulness but also to defend views merely stated in the smaller work. He then attempted a history for scholars, of which but two parts were published — 'The Making of England' (1882), which extends from Britain as left by the Romans to the consolidation under Egbert, and secured his fame as a critical historian, particularly through his method of employing archæology for the purposes of history; and 'The Conquest of England' (1883), which continued the narrative to the arrival of the Normans. Green's influence on historical studies in England was very great, and his 'Short History' and 'History' still hold a foremost rank. The Oxford Historical Society and the 'English Historical Review' were originally suggested by him; and he further published 'Stray Studies in England and Italy' (1876), a reprint of early papers; 'Readings from English History' (1879), a series of extracts; 'A Short Geography of the British Isles' (1880); and an edition of Addison's 'Essays' (1881). His 'Letters' were published in 1901.

Green, Joseph, American poet: b. Boston, Mass., 1706; d. London, England, 11 Dec. 1780. He was graduated at Harvard 1726, and was famous for his wit and satirical powers. During the War of the Revolution he was prominent on the Loyalist side. His works include: 'The Wonderful Lament of Old Mr. Tenor' (1744); 'Poems and Satires' (1780).

Green, Seth, American pisciculturist: b. Irondequoit, N. Y., 19 March 1817; d. Rochester, N. Y., 20 Aug. 1888. He learned the natural history necessary for his profession from observation and private reading, and began his life's work by the artificial hatching of trout roe. He was looked upon as the leading expert in this department of fish culture, but his first great triumph in new fields came with his success in the reproduction of shad. The Seth Green shad-hatching box was invented in 1867, and, although it has been superseded, by this device shad culture was first demonstrated to be possible and its inventor must be looked upon as the pioneer in this difficult department of pisciculture. The Connecticut River was restocked by means of this invention. In 1868 he was made fish commissioner for the State of New York, and the following year undertook the artificial reproduction of whitefish. He was successful in his experiments, and was acknowledged as one of the fathers of fish culture in the United States. From 1870 until his death he was superintendent of the state hatchery at Caledonia, N. Y.

Green, Thomas Hill, English philosopher: b. Birkin, Yorkshire, 7 April 1836; d. Oxford, 15 March 1882. He was educated at Rugby and Oxford; was elected fellow at Balliol in 1862, the first lay tutor on that foundation (1867), and in 1878 Whyte professor of moral philosophy in the university. His principal work as a philosopher was the foundation of the so-called Neo-Hegelian School. He is supposed to have been taken by Mrs. Ward as a model for her Mr. Gray in 'Robert Elsmere'; but the resemblance is by no means complete, as Mr. Gray's work is undoubtedly, as he appears in 'Robert Elsmere,' rather that of a destructive literary critic than a constructive philosopher. His works include: 'Introduction to Hume's Treatise of Human Nature' (1874); and 'Prolegomena to Ethics' (1883.)

Green Bay, Wis., a city and county-seat of Brown County, situated at the head or southern point of the bay of the same name, and at the mouth of the Fox River, on the Chicago & Northwestern, Chicago, Milwaukee & St. Paul, the Green Bay & Western R. R.'s.

Commerce and Industry.— Green Bay has an extensive commerce. Twenty-four passenger trains arrive daily over the four railroads entering the city. An extensive lake traffic is also carried on, the harbor, through government appropriations, having been made accessible to the largest vessels upon the Great Lakes. Coal constitutes the largest single import, Green Bay being an advantageous distributing point. The largest export by way of the lakes is grain, although much lumber has hitherto been shipped out. A line of excursion steamers is also run to nearby summer resorts and to Mackinac and the "Soo." The city is provided with a complete electric railway system, including an interurban line up the Fox River valley to Kaukauna, where a junction is made with another electric line passing through Appleton, Neenah, Oshkosh and Fond du Lac. A light and power plant furnishes gas for lighting and heating and electricity for light and power, many electric motors now being in use. There are a number of manufacturing plants — 3 large breweries, 2 paper mills and 1 sulphite mill, 2 large saw mills, 2 planing mills, 1 very large canning factory, 1 shoe factory, 1 glove factory, 1 pure milk factory, 1 furniture factory, 2 woodenware factories, 3 machine shops, 1 candy and biscuit factory, 1 pickle factory, 1 coffin factory, 1 carriage factory, 1 cornice factory, 1 paper-box factory. Several jobbing and wholesale houses do a large business, the most important being a grocery house, a hardware house, and a crockery house. An extensive fish-shipping business is also carried on. Water is supplied from artesian wells by a private company.

Educational Institutions, Etc.— Green Bay has a number of fine public buildings, the Kellogg library, the Federal Buildings, Saint Joseph's Academy, three Hospitals, and just outside the city limits the State Reform School. The public school system consists of 2 high schools and 13 ward schools, employing 84 teachers. There are also several parish schools, graded in the same manner as the public schools. There are 6 Roman Catholic churches, 2 Baptist 2 Congregational, 1 Episcopal, 2 Evangelical, 2 Lutheran, 4 Methodist, 2 Moravian, 2 Presbyterian, and 1 Christian Scientist.

History.— Green Bay, the oldest town in Wisconsin, was first visited in 1634 by Jean Nicollet, who had been sent by Champlain, governor of New France, to find the rumored short route to China. The site was a favorable one for an Indian village as well as a landing place for explorers and missionaries. It is known that Marquette, Joliet, Allouez, and Tonti spent considerable time here. The town was therefore settled by the French, who impressed their character upon it for over 200 years, although it fell into the hands of the English at the close of the French and Indian war in 1763. In 1816 the Americans established a fort on the opposite side of the river, known as Fort Howard, around which a prosperous town of the same name grew up. In 1895 Fort Howard was annexed to Green Bay, and is now known as the West-Side.

Government, Etc.— The government of the city is administered by a mayor and common council, the latter consisting of sixteen members, elected for two years, two from each ward. Assessed valuation: Lots exclusive of buildings, $4,150,235; buildings, $4,279,740; personal property, $2,827,140; total, $11,257,115. Pop. (1903 est.) 20,142.

A. W. Burton,
Superintendent of Schools.

Green Bay, an arm of Lake Michigan, on the southwestern coast of the upper peninsula of Michigan and the eastern coast of Wisconsin. It is 120 miles long, from 10 to 20 miles wide, has an average depth of about 100 feet. Fox River, the outlet of Lake Winnebago, enters the bay at its head, at the city of Green Bay. The bay is navigable for the largest lake steamers. The largest cities on the bay are Green Bay and Marinette, in Wisconsin, and Menominee and Escanaba in Michigan.

Green Cove Springs, Fla., town, county-seat of Clay County; on the St. John's River, the Jacksonville, T. & K. W. railroad. It contains a warm sulphur spring noted for its medicinal properties. The trade is chiefly in fruits, vegetables, and lumber. Pop. 1,015.

Green Island, N. Y., a village of Albany County, on an island in the Hudson River opposite Troy, on the Delaware & H. and the New York C. & H. R. R.R.'s. It is connected with Watervliet and Troy by bridges; and has iron manufactories, machine shops and railroad car shops. Pop. (1900) 4,770.

Green Manuring, the agricultural practice of plowing under crops while succulent in order that they may enrich the surface layer by their decay. It is of ancient origin and wide popularity, especially in mild climates; less in tropical than it should be. The objects gained are the opening of the soil and especially the subsoil by the roots of deep feeding plants; the raising of plant food from the lower strata to the surface layer and the saving of available plant food in the surface layer, material that would leach away beyond the reach of shallow-rooted plants; the addition of humus to the soil by the decay of the plants; and, with certain crops, the addition of nitrogenous foods obtained from the air. As the plants decay they also act upon insoluble plant food in the soil and make it available. They belong to two classes: (1) shallow-rooted plants such as rye, buckwheat, mustard, rape, etc., which are specially useful on hard and poor soils open the way for more exacting crops; (2) deep-rooted plants such as clover, cow-pea, velvet bean, vetch and other leguminous plants which are still further useful because of their power of obtaining nitrogen from the air. See CLOVER; FERTILIZERS; LEGUMINOUS PLANTS; MANURES AND MANURING; ROOT-TUBERCLES; SOIL, and articles on the crops mentioned.

Green Monkeys, three similar species of small African monkeys, often seen in menageries, and representing the genus *Cercopithecus*, may properly be called green monkeys because of the prevailing tint of their fur. The one most commonly seen is *C. callitrichus*, the size of a cat, and remarkable for its unbroken silence. The vervet (*C. lalandi*) is smaller, grayish green, reddish white on the cheeks, throat and underparts, while the face, paws and end of the tail are jet black. It is common all over South Africa, where no other species of its large genus are found. The grivet (*C. griseoviridis*) is speckled olive-green, with a whitish forehead, chin and rump; it dwells in Abyssinia and is not numerous. All these monkeys, at least when young, are exceedingly docile and good-natured in captivity.

Green Mountain Boys, the regiments of Vermont settlers raised to defend the New Hampshire grantees against the efforts of New York to oust them or collect quit-rents, and later for service in the Revolution. See ALLEN, ETHAN.

Green Mountain State, a popular name for the State of Vermont, from its being crossed by the Green Mountains. See GREEN MOUNTAINS; VERMONT.

Green Mountains, a range belonging to the Appalachian system properly extending from near Long Island Sound through the western part of Connecticut and Massachusetts, into Vermont and Canada. In the State of Vermont the range is known as Green Mountains; but south, in Massachusetts and Connecticut, it is called by the names Berkshire Hills, Taconic Mountains, and Hoosac Mountains. The peaks of this range, one of the oldest in North America, have been worn down by erosion and weathering, until in many places they have become low, round hills. Their greatest elevation is in Vermont; Mounts Killington, Mansfield, Camels Hump, Lincoln, and Jay being the highest. Summit, a hamlet in the town of Mount Holly, in Rutland County, is the highest point crossed by a railroad. Some of the best building stone in the country is obtained from the Green Mountains. Granite and marble exist in large quantities, and on the western slope are layers of red sandstone. Iron and slate abound, and copper and manganese are found in several places. The range forms the divide between the basin of the Connecticut on the east and the Lake Champlain and Hudson River basins on the west. The rivers rising in the Green Mountains are short streams, but their water-power is abundant. In the fertile valleys are rich farms, and sheep and cattle are raised on the uplands. The hemlock, spruce, pine, and other evergreens which form striking parts of the forests, have given the name to this range. Hard wood trees and the sugar maple are found on both the east and west slopes of the mountains. The beauty of the scenery and the climate make the Green Mountains a place much frequented in summer by tourists.

Green River, in Kentucky, has its rise in Lincoln County, flows south and west to Adair County; west, a very irregular course, to Butler County; then northwest to the Ohio River which it enters a few miles above Evansville, Ind. It is about 350 miles long, and is navigable for small steamers for a distance of about 200 miles from the Ohio; but for a part of this distance artificial means have been used to make it navigable. In Edmonson County this river passes within 80 feet of the mouth of Mammoth Cave. The subterranean stream called Echo River, which is seen in connection with the Mammoth Cave, flows into Green River.

Green River, in Utah, has its rise in the western part of Wyoming, flows south and east into Colorado, south and west into Utah, then in a southern direction to the southeastern part of the State where it unites with the Grand to form the Colorado River. Major Powell (q.v.) and other explorers have passed through several of the remarkable cañons of this river. Its length is about 525 miles.

Green Snake, in the United States, a very slender, agile, harmless, grass-green, yellow-bellied serpent (*Liopeltus vernalis*), which is not only common in grassy places but in bushes, its color concealing it well in both places. It feeds mainly on insects. Several poisonous serpents of the far East, are called "green snakes" by English-speaking residents on account of their color.

Green Springs, Va., Battle of, 6 July 1781. Lafayette, reinforced by Steuben, was pressing close on Cornwallis' rear down York peninsula; and the advance-guard under Wayne came unexpectedly upon an entire division of the British at Green Springs, on the James River. Immediate retreat meaning destruction, he charged them so fiercely that Cornwallis, thinking the entire American army was upon him, merely repulsed the assaulting party and drew off his men, while Wayne retreated in the other direction. The American loss was 145.

Green Vitriol. See COPPERAS.

Green'away, Kate, English artist: b. London 1846; d. there 8 Nov. 1901. She studied at Heatherley's, South Kensington, and the Slade School, and first exhibited in 1868 at the Dudley Gallery. For many years her work regularly appeared in the exhibitions of the Water Color

Society and the Academy. Her illustrations were widely published and popular in the United States as well as in Great Britain. She became especially famous for her pictures of child life, characterized by individuality of design, skilful coloring, and humorous touches. Her books include 'A Painting Book for Boys and Girls' and 'Kate Greenaway Birthday Book.'

Greenback-Labor Party, or **National Party.** The workingmen during the "panic years" (1874-8) increasingly resorted to political activity to right their grievances, and in Ohio in 1877 began to call their local organization the "National Party." In Massachusetts and Pennsylvania they fused with the Greenback Party (q.v.). On 22 Feb. 1878, at Toledo, Ohio, they held a convention which organized the fusion as the "National Party;" but the popular name for it was the old fusion name "Greenback-Labor." Their platform was the Greenback one, with planks against prison contract labor and in favor of legislation for shorter hours. The new organization awakened hopes in the hopeless minorities in several States where the majority, Republican or Democratic, could not be overturned: and they organized fusions with it, which raised it at once to a popular vote (apparently) of over 1,000,000, and elected 14 Congressmen. In the close States each old party kept its own vote, with a slight falling off to the new one. The party proper elected but two representatives, five of the 14 being really Republicans and seven Democrats. In 1880 (9-10 June) it held a national convention at Chicago, and nominated James B. Weaver of Iowa, and B. J. Chambers of Texas, for President and Vice-President; Chambers declined, but no substitute was nominated. The platform had all the old planks in substance, and new ones against Chinese immigration, land-grants to railroads, and favors to corporations and bondholders, and in favor of sanitary regulations for manufactories. The fusions had largely disappeared, and the popular vote sunk to 306,867, and the Congressmen to eight; four from Missouri, two from Maine, one from New York, and one from Texas. It retained its organization till 1884, when it fused with the Anti-Monopoly Party (q.v.) and nominated Benjamin F. Butler for the Presidency, polling in all 175,380 votes. It then practically disappeared.

Greenback Party (its own name INDEPENDENT PARTY), 1874-6. The prosperity of western agriculture during the War, due largely to the heavy government purchases and the payability of mortgages in depreciated paper, was attributed by a large section there to the plentifulness of the paper by itself; hence, when hard times had succeeded, it was believed that a fresh inflation of greenbacks would reproduce the same conditions. The chief obstacle to this was thought to be the eastern banking interests, which, having bought government bonds in greenbacks, had obtained the act of 1869 making them payable in coin whether so specified or not; and should have been forced to take what they gave, the more since paper was now at par and their bonds were not taxed. By 1868 the Ohio Democrats, led by George H. Pendleton, were insisting on the payment in greenbacks of all bonds not specifically payable in coin, as the 5-20's; this was called the "Ohio Idea." Western Democratic conventions placed this plank in their platforms for three or four years, but the nomination of Greeley put an end to that in 1872. The revival of greenbackism is often attributed to the silver demonetization act of 1873; but in fact silver was above par at that time, the act drew no general attention, and but for the later fall in silver probably never would have done so. The real cause was the bringing forward of the Resumption Act, passed 14 Jan. 1875, to take effect 1879. On 25 Nov. 1874 a Greenback convention was held to protest against it, and adopted three resolutions — (1) that all bank and corporation currency should be withdrawn; (2) that no currency be allowed except government paper "based on the faith and resources of the nation," and exchangeable on demand for 3.65 per cent bonds; (3) that coin should be paid only for interest on the national debt, and for that part of the principal which promised it. Several Democratic conventions indorsed these; but in 1876 the prospect of the hard-money Tilden being the next Presidential candidate, led the party to form an organization of its own. At a convention at Indianapolis, 17 May, they nominated Peter Cooper of New York and Newton Booth of California for President and Vice-President; Booth declined, and Samuel F. Cary of Ohio was substituted. The platform, besides the three points above, demanded the repeal of the Resumption Act. The ticket polled 81,737 votes, over half of them in Michigan, Illinois, Indiana, Iowa, and Kansas. In the State elections the next year the party polled 187,095 votes, but the main strength continued to be in the West. The next year it was absorbed in the Greenback-Labor Party (q.v.).

Greenbacks (as printed in green ink), the current name, from the first, of the legal-tender notes first issued by the government during the Civil War. (See DEBT, NATIONAL.) The authorizing act was signed by Lincoln 25 Feb. 1862; it was the first ever passed by Congress making anything but coin legal tender, and nearly all the Democrats and many Republicans declared it unconstitutional. But war necessities were too exigent, and the bill authorized $150,000,000 of the notes, not receivable for import dues nor payable by the government as interest on its obligations. On 11 June 1862 and 3 March 1863 further issues were authorized; and on 3 Jan. 1864 they reached their maximum amount of $449,338,902. The great inflation, the uncertain fortunes of the War, and the belief that even if victorious the United States neither could nor would pay its enormous debt at face value, but would repudiate or scale it, combined to depreciate the value of the notes; throughout 1864 they were worth on an average only about 45 cents on the dollar, and on one day, 11 July, when Early was threatening Washington, they dropped in panic to about 35 cents — or as currently expressed, the "premium on gold" was 285. The legal-tender acts had always been understood to be temporary war measures only, and a choice of evils; the secretary of the treasury (McCulloch) in his report for 1865, expressed the opinion that they ought not to be in force a day longer than was necessary to prepare for a return to the gold standard. The House passed a resolution of cordial concurrence, 144 to 6; and on 12 March 1866 both houses agreed on a reducing act, by which on 31 Dec. 1867 the volume of greenbacks stood at $356,000,000. But the demoralization of economic sentiment and judgment wrought by them, which afterward issued in the Greenback party, was already at work: many attributed the prosperity of the time to the currency inflation, and even in Congress a majority had determined to make the paper currency a permanent feature of our finance. On 4 Feb. 1868 any further reduction was prohibited, and the volume stood at this mark till October 1872, when it began to increase, amounting on 15 Jan. 1874 to $372,979,815. On 20 June 1874 the maximum was fixed at $382,000,000. Meantime a test case had been made up to try the question of their constitutionality (Hepburn v. Griswold: see LEGAL TENDER CASES), and in 1869 the Supreme Court, by five to three, headed by Chief-Justice Chase, decided against them. The fiercest political opposition was roused by this, however, and it became a party question. The Supreme Court, in May 1871, reversed its decision by one majority. This experience has led the Supreme Court to be excessively cautious about taking jurisdiction in any case where strong political feeling is involved. The question of legal tender has become unimportant since the passage of the 'Gold Standard Bill' (q.v.), under which no depreciation in value is possible.

Green'brier, any of various prickly vines of the genus *Smilax* (q.v.), commonly the catbrier (*S. rotundifolia*), which grows all over the eastern half of the United States and is especially numerous in the Southern Alleghanies, where it designates various mountain-ranges, streams, etc.

Greenbrier Mountains, a range of mountains in the eastern part of West Virginia, lying west of the main part of the Alleghanies and parallel to the Greenbrier River (q.v.). Their average height is about 2,000 feet, the highest point being about 3,500 feet.

Greenbrier River, a river of West Virginia, rising in the Rich Mountains, Randolph County, flowing southwest into New River; length 150 miles.

Greenbrier White Sulphur Springs, W. Va., the name sometimes given the White Sulphur Springs in the Greenbrier Mountains to distinguish them from less important springs of similar character. See WHITE SULPHUR SPRINGS, W. VA.

Green'bush, N. Y., formerly a town now a part of the city of Rensselaer in Rensselaer County on the Hudson River and the Boston & A. and the New York C. & H. R. Railroads. See RENSSELAER.

Green'castle, Ind., city and county-seat of Putnam County, on the Cleveland, C., C. & St. L., the Louisville, N., A. & C. and the Vandalia Line R.R.'s; 35 miles northeast of Terre Haute. It is the seat of De Pauw University, with her 9 large buildings. She has excellent public schools and a fine library building containing 7,000 volumes. It was settled in 1822 and incorporated in 1849. The form of government is by a mayor and a municipal council elected every two years. Greencastle contains lumber-mills and manufactories of lightning rods, pumps, and one of the largest and best equipped tin-plate factories in the world. Pop. (1904) 4,200.

Greene, Aella, American journalist and poet: b. Chester, Mass., 1838; d. Springfield, Mass., 1903. He was the author of: 'Rhymes of Yankee-Land'; 'Into the Sunshine' (1881); 'Stanza and Sequel' (1884); 'Gathered from Life.'

Greene, Albert Gorton, American lawyer and poet: b. Providence, R. I., 10 Feb. 1802; d. Cleveland, Ohio, 4 Jan. 1868. Graduated from Brown University 1820, he was admitted to the bar in 1823; in 1832 became clerk of the town and of the municipal court of Providence, and in 1858 judge of the court. From 1867 he was in Cleveland, Ohio. He was at one time president of the Rhode Island Historical Society, was a founder of the Providence Athenæum, began the Harris collection of American verse (now at Brown University), and wrote some well-known poems, such as 'Old Grimes' and 'The Baron's Last Banquet.'

Greene, Charles Ezra, American engineer: b. Cambridge, Mass., 12 Feb. 1842; d. Ann Arbor, Mich., 17 Oct. 1903. Graduated from Harvard in 1862 and from the Massachusetts Institute of Technology in 1868, he was United States assistant engineer in 1870–1, city engineer of Bangor, Maine, in 1871–2, and in 1872 became professor of civil engineering in the University of Michigan. He also practised as consulting engineer, and in 1876–7 was associate-editor of the 'Engineering News.' His writings include: 'Graphical Method of Analysis of Bridge Trusses' (1875), 'Structural Mechanics' (1897), and other technical works.

Greene, Christopher, American soldier: b. Warwick, R. I., 1737; d. Westchester County, N. Y., 13 May 1781. He was among the first to take the field on the American side after the engagements at Lexington and Concord. Subsequently, as colonel of a Rhode Island regiment, he participated in the campaign in Canada under Arnold. In 1777, while in command at Fort Mercer at Red Bank, on the Delaware, he sustained an attack from a large force of Hessians under Col. Donop, who were repulsed with great slaughter. For these services a sword was voted him by Congress, and a monument commemorative of the battle and of the valor of the American commander was erected in the neighborhood of Fort Mercer in 1820.

Greene, Edward Lee, American botanist: b. Hopkinton, R. I., 20 Aug. 1843. After studying at Albion College, Wis., he took orders in the Protestant Episcopal Church (1871); but in 1885 entered the Church of Rome. He has been professor of botany at the Roman Catholic University in Washington since 1895, and has published 'Illustrations of West American Oaks' (1889); 'Flora Franciscana' (1891); and 'Pittonia' (1890).

Greene, Francis Vinton, American soldier: b. Providence, R. I., 27 June 1850. He was graduated at West Point with the rank of second lieutenant of artillery. In 1876 he was made military attache at St. Petersburg and remained at the headquarters of the Russian army during the Russo-Turkish War (1877–8), in the course of which he was twice decorated for bravery. Obtaining his captaincy in 1883 he was three years later appointed instructor in military engineering at West Point, but left the service to join the Barber Asphalt Company, and was president of the National Asphalt Company when the trust went into the hands of receivers. He entered the National Guard in

1889 on the staff of Gen. Louis Fitzgerald and was elected colonel of the Seventy-first regiment in 1892. In the Spanish-American War he was commissioned major-general of volunteers and served principally in the Philippines. In 1902 he was appointed police commissioner of New York. He has written: 'The Russian Army and its Campaign in Turkey' (1879); 'Army Life in Russia' (1880); 'The Mississippi' (1882); 'Life of General Nathanael Greene' (1893).

Greene, George Sears, American civil engineer and soldier: b. Warwick, R. I., 6 May 1801; d. Morristown, N. J., 28 Jan. 1899. He was graduated at West Point in 1823 and was for several years one of the professors there, but in 1836 adopted civil engineering as a profession, after sending in his resignation as an officer in the United States army. He was engaged subsequently in railway construction in many eastern States, and in 1856 the Croton Aqueduct Department of New York city commissioned him to execute several important works. He designed and constructed the reservoir in Central Park, widened High Bridge, and built a water tower and reservoir at its western extremity. At the beginning of the Civil War he took command of the Sixtieth New York Volunteers, and was put in command of a brigade at Cedar Mountain and a division at Antietam. He took part in many other important events of the war and was severely wounded in an engagement near Chattanooga, in 1863. In 1866 he retired from the army and the following year was appointed commissioner and chief engineer of the Croton Aqueduct Department, and in 1871 was called to Washington, D. C., as chief engineer of public works. During his three years' incumbency of that office he planned the sewer system of the national capital.

Greene, George Washington, American historian: b. East Greenwich, R. I., 8 April 1811; d there 2 Feb. 1883. He was a grandson of Gen. Nathanael Greene (q.v.) of Revolutionary fame. After study in Brown University, he traveled extensively in Europe, was United States consul at Rome in 1839–45, and from 1848 until his resignation in 1852 was professor of modern languages at Brown University. He was appointed non-resident professor of history at Cornell in 1872. His publications include several historical works, such as: 'Historical View of the American Revolution' (1865), 'Life of Nathanael Greene' (1867–71), 'The German Element in the War of American Independence' (1876), and a 'Short History of Rhode Island' (1877).

Greene, Homer, American author and lawyer: b. Ariel, Pa., 10 Jan. 1853. He was graduated from Union College in 1876, from the Albany Law School in 1878, was admitted to the bar in 1879, and entered practice at Honesdale, Pa. In Pennsylvania politics he has been active as a Republican. He has contributed much verse and prose to the magazines, and published: 'The Blind Brother,' 'Burnham Breaker,' 'Coal and the Coal Mines,' and 'The Riverpark Rebellion.'

Greene, Nathanael, American soldier: b. Patawomut, Warwick County, R. I., 7 Aug. 1742; d. Mulberry Grove, Ga., 19 June 1786. His father, a leading preacher among the Quakers, was the owner of an anchor forge and a grist mill. He was brought up as a Quaker, and trained from childhood to work on the farm and at the forge. Resolute perseverance in the midst of many obstacles gave him in the course of time a more than ordinary familiarity with ancient and English history, geometry, law, and moral and political science. In 1770 he was chosen a member of the general assembly for Coventry, whither he had removed to take charge of another forge; and from that time continued to take an active part in public affairs. He was one of the first to engage in the military exercises which prepared the way for resistance to the encroachments of the mother country, and this open renunciation of the principles of his sect was promptly followed by formal excommunication. In 1774 he joined the Kentish guards as a private; in July of the same year was married to Catharine Littlefield of Block Island, and in 1775 was appointed by the general assembly to command as brigadier-general the Rhode Island contingent to the army before Boston. He joined his command at Roxbury on 3 June and from that time remained in active service without a day's furlough till the final disbandment of the army in 1783. At Boston his brigade was distinguished by its discipline, and after the evacuation he was entrusted with the defense of Long Island. He distinguished himself in the battle of Harlem Heights, later commanded a portion of Washington's army near Ft. Washington on the Hudson, and in September he was made major-general, and appointed to the command in New Jersey. At Trenton he led the division with which Washington marched in person, and, with Knox, was for following up the advantages of that brilliant surprise by advancing directly upon the other detachments of the enemy. He took an equal part in the battle of Princeton, and was entrusted by Washington during the winter with a confidential communication to Congress. At the Brandywine he commanded a division, and by a rapid march and successful stand preserved the army from utter destruction. At Germantown he commanded the left wing which penetrated into the village. On 2 March 1778, he accepted the office of quartermaster-general, which he held till August 1780, fulfilling its arduous and complicated duties in such a manner as to call forth from Washington when he left it the declaration "that the States have had in you, in my opinion, an able, upright, and diligent servant." On 23 June 1780, he checked with two brigades and a small body of militia the advance of a corps of 5,000 of the enemy in the brilliant battle of Springfield. He was in command of the army during Washington's visit to Hartford in September 1780, when Arnold's conspiracy was discovered, and sat as president of the court of inquiry upon Major André. In October of the same year, he was appointed to the command of the Southern army, which he found on his arrival, in December, in a state of utter disorganization and want. He soon advanced to a well-chosen camp on the banks of the Pedee, and began a series of operations which in less than a year stripped the enemy of nearly all their hard-won conquests in the two Carolinas and Georgia, and shut them up within the narrow limits of Charleston and its immediate neighborhood. Among the events of this active year were the battle of the Cowpens, won by Gen. Morgan at the opening of the campaign; a brilliant retreat from the Catawba to the Dan; the battle of Guilford Court House in which he lost the field, but gained the end for which he fought: the pursuit of Cornwallis to the Deep River: the daring advance into South Carolina; the battle of Hobkirk's Hill, a second defeat followed by the results of victory: the siege of Fort Ninety-six, raised by the advance of Lord Rawdon, but followed by the immediate evacuation of the post and the retreat of the enemy toward the west: the drawn battle of Eutaw Springs, and the advance upon Dorchester, spoken of by Washington as another «proof of the peculiar abilities» of Gen. Greene. Congress presented him with a medal for services in the battle of Eutaw Springs, and North and South Carolina and Georgia made him valuable grants of property. He removed to the estate of Mulberry Grove, on the Savannah River, Georgia, where he died of a sunstroke. Consult G. W. Greene, 'Life' (1867-71); F. V. Greene, 'General Nathanael Greene' (1893).

Greene, Nathaniel, American journalist: b. Boscawen, N. H., 20 May 1797; d. Boston, Mass., 29 Nov. 1877. At 12 he entered the office of the *New Hampshire Patriot*, published at Concord, and at 15 became editor of the *Concord Gazette*. After editing papers at Portsmouth, N. H., and Haverhill, Mass., he removed to Boston, where he established a new Democratic paper known as the *Boston Statesman*, and published semi-weekly, its first appearance being on 6 Feb. 1821. During the administration of J. Q. Adams it was opposed to the almost unanimous sentiment of the city and State; but in 1829, when the general government passed into the hands of the Democratic party, President Jackson appointed Greene postmaster of Boston. He held the office for 12 years without interruption, and, although removed in 1841, was reappointed to it by President Tyler in 1844, and held it until 1849. In 1836 he translated a 'History of Italy' from the Italian of Sforzozi, which was followed by the translation of two volumes of 'Tales from the German' (1837). In 1843 he published 'Tales and Sketches from the French, German, and Italian.'

Greene, Robert, English writer: b. Norwich, 1558?; d. London, 3 Sept. 1592. Though little is known of his early life, Robert Greene was probably born in 1558; his father may have been a saddler. The greater part of his career is conjectured from his more or less autobiographical novels and pamphlets. He entered Saint John's College, Cambridge, in 1575, and took his B.A. in 1578. Already in his college years, perhaps earlier, he had entered heartily into the dissipation for which he was notorious, though perhaps his own record of himself and that left by his enemy Gabriel Harvey, may both be exaggerated. Upon leaving college he seems to have traveled extensively abroad, learning, from his own account, far more evil than good. Shortly after his return to England he heard a sermon in Saint Andrew's Church, Norwich, which strongly moved him to repentance, but he soon recovered his usual recklessness. The incident, however true, is characteristic of him; his excesses alternated with highly emotional confessions of penitence, which were probably quite sincere. The original fineness of his spirit was little harmed by his wild courses: his writing throughout is remarkably pure-minded. In 1580 'Mamilia,' his first novel, was registered; it was published three years later. It seems that he was then studying medicine at Cambridge, where he took his M.A. in 1583. Within two years afterward he married a woman of good family. After their one child was born, Greene deserted her, and gave himself up to a wild life in London. It has been pointed out that the character of the patient, deserted wife recurs through his writings, as though the woman he had wronged was always in his mind.

Greene's first occupation in London was the writing of prose romances, varying between the type of Sidney's 'Arcadia' and Lyly's 'Euphues.' His success in this kind of writing was immediate. He had a better narrative faculty than either Sidney or Lyly, and in addition to an unusual facility in composition he had something of the journalist's skill in finding the interest of the moment. Before 1590 he had written 'Penelope's Web,' 'Euphues, his Censure to Philautus,' 'Alcida,' 'Greene's Metamorphosis,' 'Perimedes the Blacksmith,' 'Orpharion,' 'Pandosto,' 'The Spanish Masquerado,' 'Menaphon,' and 'Tullies Love.' He had also made many good friends. Nash he had known before; now he met Lodge and probably Marlowe. But at the same time he was living a strangely profligate life, among thieves and outcasts, his special comrade being their chief, Ball, who ended his career at Tyburn. Ball's sister was Greene's mistress, the mother of his son Fortunatus.

In 1590 appeared 'The Cobbler of Canterbury,' a collection of six coarse tales, ascribed to Greene. Greene repudiated the book in a pamphlet, 'Greene's Apology,' announcing his intention to write no more such romances as might make him seem the likely author of 'The Cobbler.' As further expressions of this characteristic repentant mood appeared in the same year his 'Mourning Garment' and 'Never Too Late,' and in 1591 'Farewell to Follie.' Within the next year he wrote his five pamphlets on «cosenage» or «coney-catching»—descriptions of the lives and methods of thieves and cutpurses; for his material he drew on his own experience and observation, and the pamphlets present pictures of astonishing realism. His old companions whom he had now turned on, are said to have tried to kill him.

In a satire on the social evils of the times, 'A Quip for an Upstart Courtier' (1592), Greene took occasion to insult Gabriel Harvey and his two brothers, one of whom, Richard, in a pamphlet on the Martin Marprelate Controversy had spoken harshly of Greene and his friends. The wrath of the Harveys was turned upon Greene, and pursued him even after his death, in Gabriel Harvey's 'Four Letters and Certain Sonnets especially touching Robert Greene'—a cruel account of Greene and of his last hours.

The first play of Greene's, according to the most recent scholarship, was 'Alphonsus,' about 1591, an imitation of Marlowe's 'Tamburlaine'; the second was probably the 'Looking Glass for London and England,' in which some of the material of the «coney-catching» pamphlets is reflected. Before 1592 he had written the 'Orlando Furioso,' 'Friar Bacon and Friar Bungay,' and 'James IV. of Scotland,' probably in that order.

At the end of the year 1592 Greene fell ill, and with death at hand, his better nature reasserted itself. On his deathbed he wrote or completed his 'Groatsworth of Wit Bought with a Million of Repentance,' and 'The Repentance of Robert Greene,' which were published shortly after his death. His affecting letter to his wife, whom he now remembered; the pathetic squalor of his death scene in the shoemaker's house; his ironical request to be crowned with bays—complete one of the romances of literary biography.

Greene is an important figure in the history of the English novel, drama, and lyric. His amorous romances are in the Euphuistic style, and their subject-matter is Arcadian; but Greene's vital interest in life at first hand and his humor tend to humanize the artificial manner, and to bring the content of the stories out of the pastoral glamour into a natural world. The pastoral habit of beauty is perilously near shipwreck in the passage in 'Menaphon' where the shepherd and his jealous mistress, Pesana, begin to quarrel with true rustic energy and frankness; and the same genius for realism found its opportunity in the later «coney-catching» pamphlets, which, though formless, practically have the interest of the picaresque tale. The delicacy of his feminine characters, however, proves Greene's sympathy with the courtly world of beauty that his realistic power helped to supplant.

Greene's dramatic work, with the exception of 'Friar Bacon and Friar Bungay' and 'James IV. of Scotland,' is unimportant, but in the first of these better known plays he is clearly a forerunner of Shakespeare; as in the romances, he represents a transition, from the serious drama, religious or heroic, to a realistic mingling of moods and themes; and his country folk belong to England, not to Arcadia.

His real fame rests on the lyrics in the romances. These songs, like those in the 'Arcadia,' all highly wrought, are quite without Sidney's pedantry; they are at times stately, as in «Doron's Description of Samela,» or pathetic, as in «Sephestia's song to her child,» or metrically ingenious, as in Menaphon's song, «Some say love»; but they all have a certain silvery music, a tone of dignity without heaviness, which in its peculiar quality is found only in Greene. Lodge's lyrics are the only examples that can be compared with his. In 'Rosalind' the famous «Love in my bosom like a bee» is perhaps smoother than anything in Greene; and «Rosalind's Description» is the best example of Lodge's rich, pictorial coloring. But Lodge's art, though finer, is less directly human than Greene, whose lyrics, like the account of his career, stir one with a sense of the actual man.

Bibliography.—The best complete edition is that by Grosart, 'The Huth Library'; the best edition of the plays and poems is that by Churton Collins. For biography and criticism, consult 'Introductions' to above.

JOHN ERSKINE,
Associate Professor of English in Amherst College.

Greene, Samuel Dana, American naval commander: b. Cumberland, Md., 11 Feb. 1840; d. Portsmouth, N. H., 11 Dec. 1884. Graduated at the Naval Academy in 1859, he volunteered in January, 1862, to serve as executive officer of the Monitor, whose capabilities were then untested, and during the engagement of the Monitor with the Confederate ram Merrimac, in Hampton Roads, he commanded the vessel on account of an accident to Captain Worden, his superior. After the war he was a professor at the Naval Academy for 10 years.

Greene, Sarah Pratt McLean, American novelist: b. Simsbury, Conn., July 1856. She was educated at South Hadley Seminary and for several years taught school in Plymouth, Mass. In 1887 she was married to F. L. Greene. She has published 'Cape Cod Folks'; 'Towhead, the Story of a Girl' (1884); 'Lastchance Junction' (1889); 'Leon Pontifex' (1897); 'The Moral Imbeciles' (1898); 'Vesty of the Basins' (1900); 'Flood Tide' (1901); 'Winslow Plain' (1902); etc.

Greenfield, Ind., city, county-seat of Hancock County, on the Pittsburg, C., C. & St. L. R.R., 20 miles east of Indianapolis. It has foundries, machine shops, and manufactures of glass, paper, stoves, etc. It is the birthplace of James Whitcomb Riley (q.v.). Pop. (1900) 4,489.

Greenfield, Mass., town, county-seat of Franklin County; on the Connecticut River, the Boston & M. R.R.; about 34 miles north of Springfield. Greenfield was once a part of Deerfield; but in 1738 it petitioned for a separation which was not granted until 1743. Greenfield and vicinity has many famous historic associations. The massacre of Deerfield occurred in the winter of 1704, and a monument marks the place where an Indian struck down Eunice Williams, the wife of the parson, John Williams, on 1 March, 1704. The chief manufactures are machinery, cutlery, shoes, paper, boxes, wooden-ware, bricks, toys, children's carriages. Pop. (1900) 7,927.

Greenfinch, or **Greenlinnet,** one of the most common and beautiful of European finches (*Ligurinus chloris*). The general color of the male is olive-green; primaries grayish-black, with bright yellow edges; under parts yellow; female brownish. Although its song is uninteresting it is a favorite cage-bird in Germany. In Texas a greenish towhee bunting (q.v.) is locally called «greenfinch.»

Greenhouse, any glass-roofed house used for plant growing. The term excludes cold frames and hot-beds, but in America includes many structures known in Europe by special names, such as stove-houses, graperies, conservatories, etc. Greenhouses may be divided according to the temperature maintained in them; for example, cool-house, used for such plants as violets, pansies, daisies, etc.; conservatory, used for plants displayed but not propagated or forwarded in growth; the forcing house in which plants are rapidly pushed to marketable condition; the warm-house, used for tropical and heat-loving plants. Then there are houses designed for special crops and known as rose-, carnation-, palm-, orchid-, asparagus-houses, etc.

Since the beginning of the 19th century, and especially during the latter half, improvements in greenhouse construction, heating, ventilation, and management have made remarkable progress. In place of the heavy shade-casting roof of large wooden rafters and small panes is the large-paned, small iron-raftered roof; steam and hot water have supplanted the old flue systems; and the carefully pitched roof which favors the entrance of light in winter and not in summer, has replaced the roof of scarcely considered slant. Much attention is also given to location, some points considered being exposure to the sun, shelter from prevailing winter winds, adequate water supply, proximity to market, etc.

An idea of the importance of greenhouses may be gained from the knowledge that during the first quarter of the 19th century there were almost no greenhouses except the few cumbersome ones upon some private places, and that in 1899 there were about 9,000 commercial florists' establishments averaging about 2,500 square feet, valued at 50 cents a square foot, and a producing capacity of $1.00 a square foot — totals of $11,250,000 and $22,500,000, respectively. Besides these are hundreds of private establishments, many of which would have been considered very extensive as commercial houses 75 or even 50 years ago.

Consult: Taft, 'Greenhouse Construction' (New York 1893); Leuchars, 'Hot-Houses' (1850); Hunt, 'How to Grow Cut Flowers' (Terre Haute, Ind., 1893); Taft, 'Greenhouse Management' (New York 1898); Scott, 'Florists' Manual' (Chicago 1899); Bailey, 'Forcing Book' (New York 1897); id., 'Cyclopedia of American Horticulture' (New York 1900–02).

Greenhouse Insects. Plants cultivated under glass are as subject to insect depredations as are those growing in the garden and orchard, unless the greatest care is exercised. In addition to many species of foreign origin, such as numerous kinds of scale-insects (q.v.) and aphides which are constantly being imported with exotic plants, we have native insects firmly established as indoor pests. One of the commonest and most destructive is the black scale (*Lecanium oleæ*), which is also a pest of importance in groves of citrus fruits and olives. The related hemispherical scale (*Lecanium hemisphæricum*) is still more distinctively a greenhouse pest; and several injurious orchard scales and mealy bugs (q.v.) are likely at any time to become so, but all may be controlled by fumigation with hydrocyanic-acid gas. The "white fly" (q.v.), which name, as used by florists, covers a number of species of *Aleyrodes*, is to be similarly treated.

Many plants grown artificially are attacked also by omnivorous greenhouse pests, such as the red spider (*Tetranychus bimaculatus*) and the greenhouse leaf-tyer, and by general field and garden pests such as cutworms, wireworms, and white grubs (qq.v.). The greenhouse leaf-tyer (*Phlyctænia ferrugalis*) is less affected by fumigation than most insects, and, with other caterpillars, can be successfully controlled only by hand picking, clipping off and destroying the affected leaves, and by spraying with arsenical mixtures.

Roses are peculiarly subject to insect injury, and there are several specific indoor rose pests, such as Fuller's rose beetle (*Aramigus fulleri*), which also attacks azaleas, begonias, lilies, primrose, geranium, canna, and others. It appears to be nearly immune to insecticides in the adult condition; one must, therefore, employ hand methods, collecting and destroying the beetles, preferably in November and December, when they congregate on various plants. Injured plants should be pulled out, and the larvæ about them destroyed with kerosene emulsion or bisulphid of carbon. Numerous leaf-rollers, bud-worms, and leaf-tyers (qq.v.) are very injurious to the rose, by eating into the buds just before blossoming. Roses are seriously injured at times by gall-flies and by the rose-scale (*Aulacaspis rosæ*), and other scale insects. Violets cultivated under glass are much injured by insect pests, principally by the black or brown aphis (*Rhopalosiphum violæ*), violet gall-fly (*Diplosis violicola*), violet saw-fly (*Emphytus canadensis*), and the red spider, and greenhouse leaf-tyer. The black aphis is still restricted and dependent on commerce for carriage from one greenhouse to another, but has caused losses of thousands of dollars to single firms. It may be controlled by fumigation with hydrocyanic-acid gas, which also destroys the saw-fly and the gall-fly (properly a gall-gnat, q.v.), which attacks the leaves while they are young, the larva or maggot developing in folds, incorrectly termed "galls." Tobacco preparations and buhach insect-powder are also useful against these minute pests.

Green'land, an extensive island belonging to Denmark; on the northeast of the continent of North America, from which it is separated by Davis Strait, Baffin Bay, and Smith Sound; area 46,740 square miles. A great part of its north and precipitous east coast is yet unknown; but it does not extend farther than about lat. 83° N. Like the northern parts of North America generally, Greenland is colder than the corresponding latitudes on the eastern side of the Atlantic. In June and July the sun is constantly above the horizon, the ice on the coast is broken up and a few small lakes are opened; but the short summer is followed by a long and dreary winter. The interior, which is lofty, is uninhabitable, and all the villages are confined to the coasts, which are lined with numerous islands and deeply penetrated by fiords. The Danish colony extends to the Bay of Disco, in lat. 69° N. Cultivation is confined to the low shores and valleys, where grassy meadows sometimes occur with stunted shrubs and dwarfed birch, alder, and pine trees. Attempts to raise oats and barley have failed, but potatoes and turnips attain the size of a pigeon's egg, and cabbages grow very small. The radish is the only vegetable which grows unchecked.

The inhabitants of Greenland (see ESKIMOS) are of the Eskimo race, more or less mixed with European blood. The individuals of the mixed race hardly differ as to language and habits from the genuine Eskimo. Besides the natives, about 250 Europeans usually reside in the country, 30 to 40 of whom have married native women. The inhabitants are largely dependent on hunting and fishing. Whale blubber and seal oil

1. Blue Passion-flower (P. cœrulea). 2. Pomegranate, with opened fruit and flower. 3. An Orchid (Cattleya). 4. Abutilon (A. insigne). 5. Monkshood (Tropælium). 6. Anthurium (A. scherzerianum). 7. Begonia (B. bolivensis). 8. Pitcairnia (P. furfuracea). 9. Ladies' Slipper (Cypripedium venustum).

are used as fuel. The land animals are the Eskimo dog, the reindeer, the polar bear, the Arctic fox (blue and white), the ermine, the Arctic hare, and the musk ox. Among the amphibia the walrus and several species of seal are common. The seas abound in fish, the whale and cod fisheries being of special importance. Seafowl are abundant in summer, and largely killed. The chief mineral product is cryolite, but graphite and miocene lignitic coal are also found. Oil, eider down, furs, and cryolite are exported. For administrative purposes Greenland, or rather its coast, is divided into two inspectorates of North and South Greenland. The residences of the inspectors are at Disco Island and Godhaab, but the most populous district is Julianehaab.

Greenland was discovered by an Icelander named Gunnbjörn about 876 or 877, and was colonized from Iceland about the end of the 10th century. In the reign of Elizabeth Frobisher and Davis rediscovered the coast, but nothing was done to explore it till the Danish government in 1721 assisted Hans Egede, a clergyman, to establish a European mission settlement, Good Hope (Godhaab), which was successfully carried on by him and his son. Whale fisheries were established on the coast by the English and Dutch about 100. The interior of the country was first crossed by Nansen in 1888. There are 12 chief stations for trading and the Danish Mission; the southernmost is Julianthaab, the northernmost Upernavik. At Godhaab there is a seminary for training native catechists; of late, too, natives have been appointed pastors. Pop. (1901) 67,681.

Greenland Whale, or **Bowhead**, the largest and most restricted of the "right" or whalebone whales of the genus *Balæna* (*B. mysticetus*), which is absolutely confined to the arctic region, reports of its occurrence on other coasts originating in mistaking for it the almost cosmopolitan southern right whale. It grows occasionally to a length of 70 feet, but is usually considerably less; and is black, except a white patch on the under side of the jaw. This whale may yield 275 barrels of oil, and 3,000 pounds of whalebone. It has become comparatively rare through constant pursuit. Its general habits agree with those of its family (*Balænidæ*), for which see WHALEBONE WHALES.

Greenleaf, Simon, American jurist: b. Newburyport, Mass., 5 Dec. 1783; d. Cambridge, Mass., 6 Oct. 1853. He commenced the practice of law in 1806 at Standish, afterward practising at Gray and Portland. He was a reporter of the Supreme Court 1820–32; professor of law at Harvard University 1833–48, succeeding Judge Story in the Dean professorship in 1846; and upon his resignation in 1848 was made professor emeritus. Beside nine volumes of reports of the Maine Supreme Court proceedings he published: 'Treatise on the Law of Evidence' (1842–53); 'Principles of Freemasonry' (1820); 'Examination of the Testimony of the Four Evangelists by the Rules of Evidence, as administered in Courts of Justice, with an Account of the Trial of Jesus' (1846). He also edited Cruise's 'Digest of the Laws of England respecting Real Property' (1849).

Greenlings, a family (*Hexagrammidæ*) of coast-fishes allied to the rose-fishes, many species of which occur abundantly from northern California to Bering Sea, including several excellent and of local importance as food-fishes. They are brilliant in color, yellow and green being prominent; are carnivorous; and seek their food among keip and about rocks.

Greenock, grĕn'ŏk, Scotland, in Renfrewshire, on the south shore of the Firth of Clyde, 22½ miles by rail west-northwest of Glasgow. The Watt Institution contains a marble statue of Watt by Chantrey. The harbor works date from 1707, and have cost upward of $7,500,000. Ship-building has been carried on since 1760; sugar refining began in 1765, and there are also manufactures of steam-engines, anchors and chain cables, ropes, sailcloth, paper, wool and worsted, etc. Besides being the birthplace of James Watt (q.v.), famous because of his work on steam-engines, of Spence the mathematician, and of Principal Caird, it has memories of Rob Roy, John Wilson, and Galt, and contains the grave of Burns' "Highland Mary." Pop. (1901) 67,645.

Gree'nockite, or **Cadmium Blende**, a native sulphid of cadmium, having the formula CdS, and crystallizing in hemimorphic forms belonging to the hexagonal sytem. It is transparent, or nearly so, and yellow, with a vitreous or resinous lustre. It turns carmine when heated in a closed tube, returning to its original color upon cooling; and it dissolves in hydrochloric acid, with liberation of sulphuretted hydrogen. Greenockite is brittle, and has a hardness of from 3 to 3.5, and a specific gravity of about 5.0. In the United States it is found in Marion County, Ark., in the zinc-bearing districts of southwestern Missouri, and in a zinc mine in Lehigh County, Pa.

Greenough, grēn'ō, **Horatio**, American sculptor: b. Boston 6 Sept. 1805; d. Somerville, Mass., 18 Dec. 1852. When he entered Harvard at 16 he had already modeled in clay and attempted sculpture. A French sculptor named Binon, resident in Boston, was his first master. During his college career he enjoyed the friendship and advice of Washington Allston, and produced the design from which the present Bunker Hill monument was erected. He was graduated in 1825, and went to Rome with letters to Thorwaldsen. He returned to Boston in 1826, and after modeling busts of John Quincy Adams, Chief Justice Marshall, and others, again went to Italy and established his studio in Florence. His first commission was from James Fenimore Cooper, for whom he executed his 'Chanting Cherubs,' suggested by a portion of one of Raphael's pictures. This was the first original group from the chisel of an American sculptor. To Cooper, also, he was indebted for the commission from Congress to execute his colossal statue of Washington, finished in 1843, after many years' labor, and now in the national capital. During this time he executed, among other original works, the 'Medora,' the 'Angel Abdiel,' and the 'Venus Victrix' (Gallery of the Boston Athenæum). In 1851 he returned to the United States to superintend placing in its destination in Washington his group of the 'Rescue,' in which the triumph of civilization is symbolized. Many vexatious delays prevented the arrival of the work from Italy, and Greenough, unaccustomed by long absence to the turmoil of American life, and the variations of the American climate, was attacked by brain fever, soon after he had commenced, in Boston, a course of lectures on art. He published a volume of 'Essays' on art topics. Consult: Tuckerman, 'Memorial of Horatio Greenough' (1853).

Greenough, James Bradstreet, American Latin scholar: b. Portland, Me., 1833; d. Cambridge, Mass., 11 Oct. 1901. He was graduated from Harvard College in 185[illegible], for some time practised law in Michigan, in 1865 was appointed tutor in Latin at Harvard, in 1874 assistant professor of Latin, and in 1883 professor. In 1872 he began at Harvard a course in Sanskrit and comparative philology, and until 1880, when a chair of Sanskrit was founded, gave instruction in those subjects. He became widely known through a series of Latin text-books, particularly a 'Latin Grammar,' prepared in collaboration with J. H. Allen; and wrote also a 'Special Vocabulary to Virgil' verse in both Latin and English, and, with G. L. Kittredge, 'Words and Their Ways in English Speech' (1901).

Greenough, Richard Saltonstall, American sculptor: b. Jamaica Plain, Mass., 27 April 1819; d. Rome, Italy, 23 April 1904. Among works by him are the notably fine bronze statue of Franklin in front of the City Hall, Boston; the marble statue of Governor Winthrop at Mount Auburn cemetery, Cambridge; 'The Shepherd Boy and the Eagle' at the Boston Athenæum.

Greenough, Sarah Dana Loring, American author: b. Boston 19 Feb. 1827; d. Franzensbad, Austria, 9 Aug. 1885. She was the wife of R. S. Greenough (q.v.). Her works include: 'Treason at Home,' a novel (1865); 'Arabesques' (1871); 'In Extremis, a Story of a Broken Law' (1872); and 'Mary Magdalen,' a poem (1880).

Greenport, N. Y., village of Suffolk County, on the eastern end of Long Island, on the Long Island R.R.; 90 miles east of Brooklyn. It has an excellent harbor and shipyards, and the chief industries are fishing and shipbuilding. It is also a popular summer resort. Pop. (1900) 2,366.

Greens, Pot-herbs. Any plant whose foliage and succulent stems are prepared for the table by boiling. The former term is less applied to the plants themselves than to the dish prepared from them; the latter is often applied to the living plants, but rarely to the culinary preparation. Greens are eminently a spring dish; by proper management they may be obtained long before spring-sown vegetables grown from seed planted out of doors, thus arriving at a time when the appetite is jaded with the usual winter vegetables. Comparatively few (for example, basella and New Zealand spinach) are useful during the hot summer months, but then other vegetables and many fruits take their place. Some (for example, mustard, witloof) are obtainable in the autumn, and a few (kale, endive) even during winter.

In general these plants should all be grown upon rich, moist, well-drained, friable, loamy soil, since upon such they grow quickly, to a large size, and remain succulent and edible longer than upon poorer or drier soils. A soil containing abundant available nitrogenous plant food is particularly desirable. The ground should be thoroughly prepared by deep plowing or digging and the surface made as fine as possible by harrowing or raking. For earliest crops of such hardy plants as spinach and corn salad, the seed may be sown in autumn, and, where the winters are severe, and especially if snowless, protected with a mulch of marsh hay or other material free from weed seeds. They may also be sown as early in the spring as the ground can be worked. Tender plants such as basella, and those that require a high temperature for the germination of their seeds, for instance, purslane, should be sown only after the ground becomes warm. Beyond keeping the surface of the soil loose and free from weeds, the crops need practically no further care. To be best appreciated, greens should be gathered while very succulent and within as few minutes of meal time as are possible to wash and cook them. Since most of them occupy the ground for only a few weeks in earliest spring, they are usually planted by market gardeners between the rows of other slower growing crops or as precursors to the main crop.

Besides the cultivated pot-herbs (in America a rather small list), there are several scores of plants known mostly widely as weeds. Several of these are superior in some ways to the cultivated kinds. There is no reason why they should not be cultivated; indeed, they deserve cultivation. When to be grown in the garden, and when seed cannot be purchased, seed should be selected from those plants that most nearly meet the intending grower's ideal. Probably the best known and most frequently used weeds or wild plants are the following, several of which are more or less cultivated: Lamb's quarters or Goosefoot (*Chenopodium album*), Pigweed (*Amarantus*, various species), Pokeweed (*Phytolacca decandra*), Marsh marigold, "Cowslip Greens" (*Caltha palustris*), Mustard (*Brassica*, various species), Dock (*Rumex*, various species), Quinoa (*Chenopodium Quinoa*), Sorrel (*Oxalis*, various species), Purslane (*Portulacca oleracea*), Plantain (*Plantago*, various species), Chicory (*Cichorium Intybus*), Cress (*Cardamine, Spilanthes, Barbarea, Senebiera, Gynandropsis, Nasturtium* — various species in each genus), Peppergrass (*Lepidium*, various species), Mercury or markery (*Chenopodium Bonus-Henricus*), Nettle (*Urtica*, various species), Winter purslane (*Montia perfoliata*), Rocket salad (*Eruca sativa*), Salad-burnet (*Poterium Sanguisorba*).

Of the cultivated pot-herbs the following are probably the best known and the most widely cultivated: Spinach, corn salad, chard, borage, dandelion, collards, mustard, kale, orach, marigold, [illegible], chicory, endive, nasturtium, unheaded cabbage and cauliflower, young beets and turnips, whole or only the leaves, and rape are frequently used also.

Green'sand, in geology, the name given to two series of cretaceous formations, the Upper and Lower Greensand. The Upper Greensand is a subdivision of the Upper Cretaceous rocks, and is situated immediately below the chalk marl, and just above the gault. The beds of which it is composed have in them green particles of a mineral called glauconite. Among the fossils peculiar to it are various ammonites, two pteropods, two species of fusus, etc. Some are of opinion that the so-called Upper Greensand from which these fossils came is itself gault. The Lower Greensand is a series of beds constituting the Lower Cretaceous rocks and the lowest member of the cretaceous group. It is called in Europe Neocomian, a name adopted by Lyell, he considering the term greensand peculiarly inapplicable, as in the district where these strata were first observed sand of a green color was rather the exception.

Greens'boro, Ala., town, county-seat of Hale County; on a branch of the Southern R.R.; about 72 miles southwest of Birmingham. It was settled in 1816, and is in a cotton-growing section. The chief industries are the cultivation of cotton and corn. It is the seat of Greensboro Female Academy and of the Southern University. The latter was established by the Methodist Episcopal Church, South, and was opened in 1859. Pop. (1900) 2,416.

Greensboro, Ga., city, county-seat of Greene County; on the Georgia R.R.; 70 miles west of Augusta. It is the trade centre for a thriving agricultural region, and it has a large creamery, a cotton-mill, cotton-gin, and a cottonseed-oil mill. Pop. (1900) 1,511.

Greensboro, N. C., city, capital of Guilford County, on the Southern R.R.; 81 miles northwest of Raleigh; named in honor of Gen. Greene, who commanded the Continental army in the battle of Guilford Court House 15 March 1781. Here are the Greensboro Female College, Bennett School for Colored Youth, Guilford College, and the State Normal and Industrial College. Greensboro is the centre of a tobacco, fruit, and grain region, which has gold, copper, and iron mines, and contains a blast furnace for the manufacture of Bessemer steel; cotton-mills and other industries. The growth of the city has been marvelous and shows the rapid development of the New South. Pop. (1880) 2,105; (1890) 3,317; (1900) 10,035; (1903) 22,000.

Greensboro Female College, a non-sectarian educational institution for women in Greensboro, N. C.; founded in 1826 as the Edgeworth Female Seminary; reported at the close of 1900: Professors and instructors, 15; students, 250; volumes in the library, 7,000; income, $25,000; number of graduates, 692.

Greensburg, Ind., city, county-seat of Decatur County; on the Cleveland, C. C. and St. L. R.R.; about 55 miles northeast of Cincinnati. Nearby are large stone-quarries; it is surrounded by a good agricultural region, and is supplied with natural gas. Its chief manufactures are flour, furniture, farm implements, and carriages. Pop. (1900) 5,034.

Greensburg, Pa., borough, county-seat of Westmoreland County; on the Pennsylvania R.R.; 31 miles east-southeast of Pittsburg. It is in a coal-mining, coking and natural gas region; and contains a steam-heating apparatus factory, steel works glass works, nut and bolt works, and has three National banks. It is the seat of St. Joseph's Academy. In Hanna's Town, which was near the present Greensburg, was held (1773) the first regularly organized court of justice west of the Alleghany Mountains. Hanna's Town was destroyed by the Indians in 1782. Pop. (1900) 6,508.

Green'shank, a large species of sandpiper (*Totanus glottis*) breeding in the northern parts of the Old World, and migrating far southward. Several allied species of similar habits occur in America, of which the greater and lesser yellow-legs (q.v.) are familiar to gunners.

Greens'let, Ferris, American writer: b. Glens Falls, N. Y., 30 June 1875. He was educated at Wesleyan University and beside contributions to reviews has published 'Joseph Glanville: a Study in English Thought and Letters of the 17th Century' (1900).

Green'stick Fracture, the name given to a fracture of a bone when continuity is not entirely severed one portion of the bone remaining unbroken or bent. The leg and arm bones of children are particularly liable to this fracture.

Green'stone, formerly a granular rock, consisting of hornblende and imperfectly crystallized feldspar, the feldspar being more abundant than in basalt, and the grains or crystals of the two minerals more distinct from each other. It was called also dolorite. Sir Charles Lyell included under the term greenstone those rocks in which augite was substituted for hornblende, the "olorite" of some writers, and those in which albite replaced common feldspar. This was sometimes termed andesite. The term is now used the same as diorite, which is an essentially crystalline granular admixture of triclinic feldspar and hornblende. It is not now held to be the equivalent of dolorite. In geology, volcanic rock, occurring in dykes, tabular masses, etc.

Green'ville, Ala., city, county-seat of Butler County; on the Louisville & N. R.R.; about 77 miles northeast of Mobile. Its chief manufactures are lumber and furniture; it has a cotton-gin, and its trade consists principally in cotton and lumber. Pop. (1900) 3,162.

Greenville, Ill., city, county-seat of Bond County; on the Vandalia & T. H., and the Louisville J. & St. L. R.R.'s; about 42 miles east of Alton. It is the seat of Greenville College, under the auspices of the Free Methodist Church. The chief manufactures are flour, lumber, wagons, and carriages, bricks, and in addition to its manufactured articles, it has considerable trade in coal, from the coal-fields of the vicinity, and in the agricultural products of the surrounding country. Pop. (1900) 2,504.

Greenville, Mich., city, in Montcalm County, on the Flat River, the Toledo, S. & M. and the Pere M. R.R.'s; about 42 miles northeast of Grand Rapids. Its chief manufactures are lumber, flour, agricultural and lumbering implements, refrigerators and furniture. Its trade is in its own manufactured products and in the agricultural products of the surrounding country. Pop. (1900) 3,381.

Greenville, Miss., city, county-seat of Washington County; on the Mississippi River, the Southern and the Yazoo & M. V. R.R.'s; about 130 miles south of Memphis. It contains several cottonseed-oil-, saw-, and planing-mills, a national bank, and has steamboat connection with all important ports on the river, and a large cotton trade. Pop. (1900) 7,642.

Greenville, Ohio, city, county-seat of Darke County; on Greenville Creek, and the Cincinnati, J. & M. the Dayton & U., and the Pittsburg, C., C. & St. L. R.R.'s; 35 miles north of Dayton. It is noted as the site of Anthony Wayne's treaty with the Indians, 3 Aug. 1795.

In the early part of the 19th century Tecumseh (q.v.) lived here, in a little Indian village. It has a foundry, lumber mills, and machine shops, and is the trade centre for a large agricultural section. Pop. (1900) 5,501.

Greenville, Pa., borough, in Mercer County; on the Shenango River, the Erie, the Pennsylvania, and the Pittsburg, B. & L. E. R.R.'s; about 52 miles southeast of Erie. The Shenango furnishes an abundance of good water-power. The chief industrial interests are flour-mills, woolen-mills, saw- and planing-mills, foundries, machine-shops, railroad-shops, carriage and wagon works, tube-mills, machinery for oil-wells, and coal-mining. The coal and oil fields and the stone-quarries in the vicinity add to the industries of the town. The trade of the town is considerable, as it is the commercial centre of a large section of Mercer County and places nearby in Ohio. Greenville was formerly the seat of Thiel College, opened in 1870 under the auspices of the Lutheran Church. Pop. (1890) 3,674; (1900) 4,814.

Greenville, S. C., city, county-seat of Greenville County; on the South Carolina & G., the Southern, the Atlantic C. L. R.R.'s.; 153 miles northwest of Columbia. It is the seat of Furman University (Baptist), Greenville College for Women, Chicora Female College (Presbyterian), Greenville Female College (Baptist), a military institute, and a business college. It has cotton mills, carriage and wagon works, iron works, and flour mills. Pop. (1900) 11,860.

Greenville, Texas, city, county-seat of Hunt County; on the St. Louis Southwestern, the Texas Midland, and the Missouri, Kansas & Texas R.R.'s; about 235 miles north of Houston and 51 miles northeast of Dallas. Greenville was settled in 1844 and incorporated in 1875. It is situated in an agricultural and stock-raising section. The chief industrial interests are connected with cotton and live stock. It has cotton-compresses, cotton-seed-oil mills, flour mills, machine-shops, stock-yards, and brick-yards. It is the trade centre for a large extent of country and has a large cotton trade. It is the seat of Burleson College, under the auspices of the Baptist Church, and of Holiness College. Its executive officers are a mayor and a municipal council who hold office for two years. The electric-light plant is owned and operated by the city. Pop. (1890) 4,330; (1900) 6,860.

Greenville (Ohio), Treaty of, 3 Aug. 1795. A treaty between the United States and all the Northwestern Indian tribes; the former represented by Anthony Wayne, who had defeated the Indians in the campaign of 1794, especially at the battle of the Fallen Timbers (q.v.). A full delegation was present from every hostile tribe, the whole numbering 1,130. They surrendered to the whites all southern Ohio and southeastern Indiana, with lands around Fort Wayne, Fort Defiance, Detroit, Michilimackinac, and the French towns, and 150,000 acres near the Falls of the Ohio (Louisville) which had been allotted to George Rogers Clark and his soldiers. The United States acknowledged the Indian title to the remaining territory, and agreed to pay annuities of $9,500 in all to the tribes. All prisoners on both sides were restored. This peace secured quiet to the borders for 15 years. But the guaranty of the lands to the Indians enabled the British to use the latter to desolate the borders in the War of 1812; and after the war (see TREATY OF GHENT) Great Britain attempted to make this treaty boundary a permanent one, forbidding United States settlement beyond it. See GREENVILLE, O.

Greenway, Thomas, Canadian statesman: b. England, 1838. In 1844 he came with his father to Ontario. He took up land in Manitoba, and in 1887 became the Liberal leader and Prime Minister in the provincial government, when his party came into power in 1888. He has always studied the well-being and progress of his province; has attempted to abolish French as an official language, and to do away with the separate school system.

Greenweed. See DYEWEED.

Greenwich, grĕn'wich, Conn., town, in Fairfield County, on Long Island Sound, the New York, N. H. & H. R.R., about 28 miles northeast of New York. The town was founded in 1640 as a part of the province of New York and remained within the jurisdiction of the Dutch colony from 1642 to 1650, when, by agreement between the English and Dutch, it became a part of Connecticut. In order to preserve the charm of its country life, it has retained the old form of town meeting government, with three selectmen as agents, as it was over 250 years ago, except in the central part of the town, where a borough government, a warden and six burgesses, has charge of affairs. There are five residential centres within its area of 50 square miles; namely, Byram Shore, Belle Haven, Greenwich village, Riverside, and Sound Beach. It is the seat of Greenwich Academy, Brunswick School, and Rosemary Hall. Pop. (1900) 12,172. Consult: Mead, 'History of the Town of Greenwich.'

Greenwich, grĭn'ĭj, England, metropolitan borough of London, in Kent, five miles from St. Paul's Cathedral and six miles southeast of London Bridge. It has many noted institutions, one of which is the Greenwich Royal Observatory, founded in 1675 by Charles II.; its first astronomer-royal was Flamsteed. Geographers of all countries reckon longitude from the meridian of Greenwich, although the local geography of many countries may be reckoned from their respective capitals. Greenwich Hospital, founded by Queen Mary, for disabled seamen "who protected the public safety in the reign of William and Mary, 1694," is located on the site of the palace where Henry VIII and his daughters Mary and Elizabeth were born, and where Edward VI. died. The hospital consists of four distinct buildings, one of which was designed by Inigo Jones (q.v.), and the other three by Sir Christopher Wren (q.v.). James Stuart made the designs for the restored portion of the chapel; and the statue of George II., in the central square, is by Rysbrack. In 1873 Greenwich Hospital became the college for the Royal Navy. The Royal Hospital School, for boys who may enter the navy, and the Blue-Coat School, are liberally endowed. Pop. (1901) 95,120.

Greenwood, Grace. See LIPPINCOTT, SARAH JANE (CLARKE).

Greenwood Cemetery, N. Y., the principal burial place of New York and neighborhood, in South Brooklyn, near Gowanus Bay; area 475 acres. It occupies a picturesque site, and is laid out so handsomely as to make it almost without a rival in the world. From its heights the waters of New York Bay may be seen on the one hand, and the broad expanse of the Atlantic on the other. There are 20 miles of roadway and more than 25 miles of footpaths. Many distinguished men and women are buried here. The main gateway is adorned with four magnificent sculptures in *alto relievo*, representing four scenes in the resurrection. The number of interments up to 1901 exceeded 300,000.

Greer, David Hummell, American clergyman: b. Wheeling, W. Va., 20 March 1844. He was graduated from Washington College, Washington, Pa., in 1862, and studied theology in the Episcopal Seminary at Gambier, O. From Brown University and Kenyon College he received the titles of Doctor of Divinity and Doctor of Laws. His first ministry was at Covington, Ky.; from there he was transferred to Clarksburg, W. Va., and in 1871 he was called to Grace Church, Providence, R. I. In 1885, Dr. Greer became rector of St. Bartholomew's Parish, the most fashionable and richest of New York Episcopal parishes. In 1890 he established the St. Bartholomew's Parish House, at 42d street and 3d avenue, at a cost of $400,000, built largely through the liberality of Cornelius Vanderbilt. This parish house embraces a wide field of charitable, missionary and educational work.

In 1903 Dr. Greer was elected coadjutor to Bishop Potter of the New York Episcopal diocese. He had previously declined three bishoprics, that of coadjutor-bishop of Rhode Island, bishop of Pennsylvania, and bishop of Massachusetts to succeed Phillips Brooks.

Greer, James Augustin, American rear-admiral: b. Cincinnati, O., 28 Feb. 1833; d. Washington, D. C., 17 June 1904. Entering the navy in 1848, he was promoted lieutenant in 1855, and was on board the San Jacinto when that vessel intercepted the English steamer Trent, on which were Mason and Slidell, the Confederate commissioners. He commanded the ironclad Benton in the fleet that passed the Vicksburg batteries; and in 1873 was in command of the Tigress in its search of the polar seas for the Polaris. He became rear-admiral in 1892 and was retired in 1895.

Greey, grē, **Edward,** American writer: b. Sandwich, Kent, England, 1 Dec. 1835; d. New York 1 Oct. 1888. After spending several years in Japan, he came to the United States in 1868, became a citizen, and engaged in commercial pursuits in New York. He published 'Young Americans in Japan' (1881); 'The Wonderful City of Tokio'; 'The Golden Lotus' (1883); 'The Captive of Love,' founded on a Japanese romance; 'The Loyal Ronins,' a translation from the Japanese, etc.

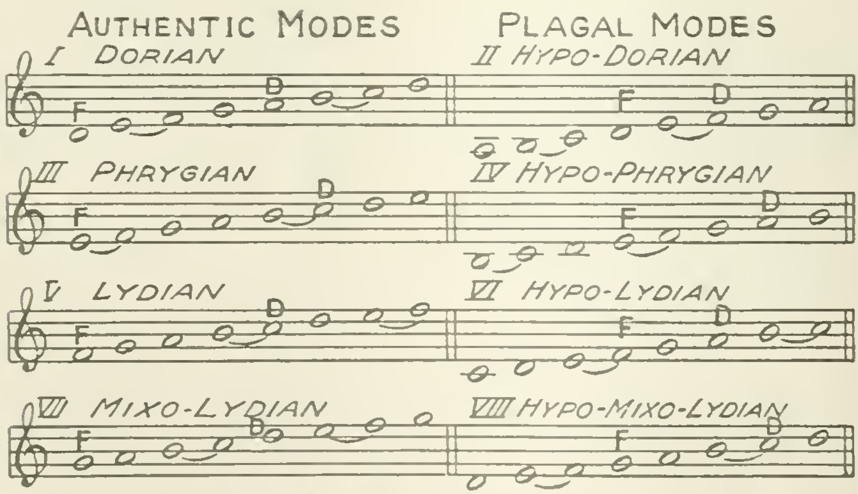
Greg'arine, a parasitic sporozoan (see SPOROZOA) dwelling in the intestines of many insects, crawfishes, and other arthropods.

Gregg, David, American Presbyterian clergyman: b. Pittsburg, Pa., 25 March 1846. He was graduated at Washington and Jefferson College in 1865. He has been pastor in several places, and since 1889 has preached in Lafayette Avenue Presbyterian Church, Brooklyn, N. Y. He is editor of 'Our Banner,' and among his many published volumes may be mentioned: 'Makers of the American Republic' (1896); 'Ideal Young Men and Women' (1897); 'Facts that Call for Faith' (1898); 'Things of Northfield and Other Things' (1899).

Grégoire, Henri, ŏṅ-rē grä-gwär, COUNT, French churchman and statesman: b. 4 Dec. 1750; d. Paris 28 May 1831. In 1789, while curé of Emberménil, in the district of Nancy, he was sent by the clergy of Lorraine as their representative to the States-General. As one of the secretaries of the constituent assembly he joined the extreme democratic section, and in the convention voted for the condemnation, though not for the death, of the king. Although extreme in his democratic opinions, he was an unflinching Jansenist. He was a member of the Council of Five Hundred, of the corps législatif, and of the senate (1801). On the conclusion of the concordat he resigned his bishopric of Blois. He voted against the establishment of the imperial government, and alone in the senate resisted the restoration of titles of nobility. He himself afterward accepted the title of count, but in the senate always opposed Napoleon, and in 1814 was one of the first to vote for his deposition. He left numerous works, among them 'Ruines de Port Royal' (1801); 'Essai Historique sur les Libertés de l'Eglise Gallicane'; 'Historie des Sectes Religieuses depuis le Commencement de ce Siècle'; 'Annales de la Religion' (1795–1803).

Gregorian Chant (Latin, *cantus gregorianus, cantus planus, cantus firmus;* Italian *canto fermo;* French, *chant gregorien, plain-chant;* German, *gregorianischer Choral*) is as old as the Church itself. As an integral part of the liturgy, music has its origin in the celebration of the Last Supper. According to the evangelists, Matthew and Mark, after the consecration and breaking of bread, our Lord and the apostles *sang* a hymn, which is commonly accepted to have been the "Great Hallel" of the Jewish passover celebration, that is, the Psalms, cxii.–cxvii. (Douai version), inclusive. The first Christian communities of Jerusalem in Palestine and Antioch in Syria were founded by newly converted Jews. Consequently it is more than probable that, although the converts from paganism were soon in the majority, melodies in use in the temple and in the synagogues continued to be sung at their religious meetings. This hypothesis is all the more reasonable because the recruits from paganism could offer nothing either in the way of poetry or music which would have been acceptable to the new cult. As to how the chant came to Rome and concerning its early development, archæology has so far been unable to ascertain any definite information. Conjecture and probability are the most we have to go by. Without doubt Greek music, which was known to the Romans, as was every other form of Hellenic culture, had its influence on the formation of the Christian worship music. It is certain also that there was a constant development and that singing played an ever greater role in the early liturgy. There were hardly any religious functions of which the singing of psalms, responsories and hymns did not form a part. From the fruitful soil of the early Church sprang with great exuberance a new hymnology, which in turn, as its logical complement, was translated into melodies. Many of the latter were spontaneous improvisations, the children of ardent hearts and imaginations illumined by the New Light. At first the whole religious community participated in the singing, but as the liturgy became more elaborate and the assemblies more numerous, this participation on the part of all the faithful had to be restricted to certain portions of the service. Other, more particular parts were performed by the Primicerius, Præcentor or Monitor, who also had general charge of the singing and whose office it was to see that the faithful were well prepared for their allotted task. After emerging from the catacombs at the beginning of the 4th century the Church displayed its ever-growing vitality in the unfolding of her liturgy and the increasing splendor of her cult. At this period the chants used must have been numerous and varied. Popes and bishops fostered the liturgical music in every manner. Pope Sylvester (314) and Hilarius (461) founded schools for its cultivation. Saint Ambrose, Archbishop of Milan (367), took a step which was of greater importance than anything which had been done up to that time. He gave system and order to the melodies and chants in use in his archdiocese by giving them a theoretic basis. This he accomplished by adopting four modes or scales, each one of which had as its initial one of the four notes of the Tetrachord (sequence of four notes), D, E, F, G. The four modes adopted by Saint Ambrose were consequently: (*a*) (Dorian) D, E,F, G, a, b,c, d; (*b*) (Phrygian) E,F, G, a, b,c, d, e; (*c*) (Lydian) F, G, a, b,c, d, e,f; (*d*) (Mixo-Lydian), G, a, b,c, d, e,f, g. All the melodies and chants used had some one of these modes for their foundation. Saint Ambrose originated the custom of singing hymns and psalms antiphonally.

When 200 years later, Gregory the Great, the man who gave the music of the Church its permanent character and from whom it is named, ascended the papal throne, the number of feasts and consequently of liturgical chants had increased to such an extent that the four modes fixed by Ambrose were no longer sufficient. Many of the new melodies did not belong to any one of the scales enumerated above. They had grown beyond the original frame. As Gregory partly reformed and, at least in outline, gave shape to the ecclesiastical year as we now know it, he was compelled also to rearrange existing chants, reject inferior ones, adapt old ones to new texts and add new ones of his own creation. In order to carry out this vast plan he found it necessary to enlarge the tonal system then in use. He retained the four Ambrosian modes, which were henceforth designated as the *authentic* modes, and added thereto four more which he called *plagal*. Gregory formed the new modes by transposing the last four notes of the existing — authentic — scales an octave lower, so that each plagal mode began a fourth below the *authentic* from which it sprang. Thus the tonal system as completed by Saint Gregory was as follows:



[N. B. — The letters F and D in the above diagram stand respectively for *final* and *dominant*. The *final* is the tone on which a melody finds repose, or a satisfactory ending. As will be observed, the *final* for any given authentic mode and its derived plagal are identical. The *dominant* is that tone which occurs oftenest or predominates in any melody.]

Four more modes were added to these in later centuries, but they are not different in essence from the eight named above. By means of various signs — dots, strokes, bars or hooks, collectively called neums — all of which had a conventional meaning, and which were placed over and alongside the words of the texts, Saint Gregory indicated the melodies to which these texts were to be sung. The book containing the chants for the numerous offices was called "Antiphonarium centonum." It was deposited near the altar of St. Peter so as to convey that the pontiff wished it to be considered as the norm for the whole Christian world.

In order to gain an insight into and an appreciation of the nature and character of the Gregorian melodies, it will be well to examine a little more closely the tonal material out of which they are constructed. We will notice that all the scales are diatonic, that is to say that each one has five whole tones or steps and two half-steps or semi-tones; furthermore that the half-steps or semi-tones occur in a different place in each scale, according to what the initial note happens to be, and, finally that only one of them has a *leading tone* or half-step between the seventh step and the octave or repetition of the initial note. It is these three features which differentiate the Gregorian modes so markedly from our modern scales and which give them that impersonal and objective character so marvelously suited to the purpose they serve, namely, that of expressing the ideas and sentiments conveyed by the sacred texts. In other words, these modes, or tonalities, lend themselves to the expression of a mental attitude of objectivity as against the modern scales which, on account of their chromatic character, are more pliable vehicles for conveying the emotions springing from subjectivism and introspection. If we remember, in addition to the general character of the Gregorian, or Church modes — as they are often called — the rule which permits the use of six intervals only in the formation of Gregorian melodies, namely: the major and minor second, the major and minor third, the perfect fourth and the perfect fifth, we realize that this tonal system is better adapted for the expression of reverence, humility, peace, and joy, whereas the modern chromatic system is more suited for the expression of passion and dramatic conflict.

Saint Gregory used every means at his command to propagate the chant and have it universally adopted. He established schools for its proper interpretation. At one of these he is said to have taught in person. Missionaries who were sent from Rome into foreign lands took with them a copy of the antiphonarium, and, of course, a knowledge of how the melodies it contained should be sung. Thus, Saint Augustine brought the melodies to England at the command of St. Gregory himself. The great pope's successors continued the process of propaganda during the following centuries. In the 8th century Saint Boniface introduced the chant in Germany, and by him several "scholæ cantorum" were established on German soil. Through Pepin and after him through Charlemagne, it found its way into Gaul and into the whole territory under the emperor's sway.

It is held by many historians that the original chant was, in the main, syllabic, that is to say, that only one note was sung to each syllable and that only the word "alleluja" was ever extended over several notes. Be that as it may, it is certain that it gradually developed into a melismatic system, syllables being often extended over smaller and greater groups of notes.

From the time of Saint Gregory until the advent of Guido d'Arezzo (995–1050?) the primitive means of determining the melody, the neums described above, remained in use. As has been pointed out, these signs were intended to assist the memory of the singers in reproducing the melodies which they had learned by oral transmission. It is not to be wondered at that, in the course of time, many of the melodies were altered and modified in the many places where they were in use. There were frequent variations and modifications due to local habits, different temperaments, but, above all, to the insufficiency of the means employed to indicate with precision the form of the melodies. Careless copyists and finally the arbitrariness and caprice of singers in the various countries led to confusion. Before the time of Guido d'Arezzo, attempts had been made to fix with more precision the intervals of the melodies. He found in use two lines, a red and a yellow one, drawn across the page. Upon the red line was placed the F, and C was put upon the yellow one. Above, below and between these two lines the neums were written. By placing a black line between the two already existing and adding another above or below these three as the *ambitus* or range of the melody might require, Guido created the four line staff which has been used ever since for the chant, and made it possible to indicate precisely the form of a melody for all time to come. Guido and his pupils transcribed the existing chants into the new system of notation. Copies of these transcriptions found their way into the cathedrals and monasteries of many countries where they took the place of the books formerly in use. Though the neums as a *system of notation* were superseded by the more precise invention of Guido, they continued nevertheless to be employed to indicate the manner of *interpretation*. Although Guido's invention was epoch-making and of incalculable importance in the history of music, it must not be inferred that it was at once universally adopted. Neums as a means of notation continued in use in many places and institutions far into the 13th century. Nor must we imagine that because of the introduction of the new system of notation no further modifications of the chant took place. As new saints were canonized and new feasts instituted by the Church, offices and chants were necessarily created. Then the growing skill of professional singers gave rise, especially in the Alleluja following the gradual, to improvisations, elaborations and displays of virtuosity which often exceeded the limits of good taste and appropriateness.

As the melodies comprising ecclesiastical music grew out of the sacred texts and were never performed without being wedded to these texts, it is but natural to assume that the melodic construction partook of the rhythmical form of the texts. Especially must this have been the case when the chant was still largely syllabic. Some maintain that the ancient chant had a definite — artificial — rhythm, as in our modern music, in contradistinction to the natural, or that dictated by the rhythm of the text. Whatever the prevailing rhythm was at the beginning of the 10th century, it was now to undergo a gradual change. The monk Hucbald invented the *organum* or diaphony, that is, the practice of having a second voice sing the melody a fifth above or a fourth below the original, or add to the fifth also the octave, the first voice meantime maintaining the original melody. By this step Hucbald paved the way for the polyphony which was soon to develop and find its culmination in the wonderful creations of Palestrina and his school in the 16th century. Sulzer in his 'Allgemeine Theorie der Künste' in the article on harmony, points out that polyphony was latent in the unison singing of the Gregorian melodies by old and young, men and boys, each class of voice, soprano, alto, tenor, baritone, and bass, having a different pitch.

Hucbald's system of parallel motion of fifths and octaves was soon succeeded by attempts at contrary motion, and counterpoint as we know it, that is, point against point (or note against note) was born. To the Gregorian melody which now became "cantus firmus," that is, unchangeable melody, were added one or more others. In giving birth to the new system and continuing to be its foundation and the source whence polyphony drew its life and being, the Gregorian chant lost its most distinguishing characteristic, that is, its natural rhythm. The themes taken from the chant and used by contrapuntists as "canti fermi" were forced into the rhythmical straight-jacket. Each note of the cantus firmus had now to assume a definite value in order that the added melodies simultaneously sung might harmonize with it. Polyphony, or the new school of music, increased in favor very rapidly to the detriment of the old chant. Instrumental music, which was gradually developing, also had a deteriorating influence on the execution and cultivation of the ancient music of the Church. Counterpoint in many instances lost its original purpose and degenerated into artificiality. Composers used it to display their skill rather than to give expression to the ideas and emotions latent in and suggested by the text to which it was wedded. A reform movement toward primitive simplicity set in toward the end of the 15th and the beginning of the 16th century. The Council of Trent enacted laws concerning the abuses that had crept into the chant as well as against the extravagances which the display of skill for its own sake had brought about and which in fact almost caused the total exclusion of figured music from the Church. In a brief dated 25 Oct. 1577, Pope Gregory XIII. directs Giovanni Perluigi Palestrina and Annibale Zoilo (Palestrina was at the time director of the papal choir and Zoilo a member of the same) to revise the chants contained in the "Antiphonaria," "Gradualia," and "Psalteria," and "eliminate" therefrom "all barbarisms, obscure passages, contradictions, and superfluous additions which, through the ignorance, neglect, and also through the malice of composers, copyists, and singers, have crept into these books." A pupil of Palestrina, Giovanni Guidetti, had, a few years previously, edited the various chants for the celebrant contained in the Missal, which had been newly revised by a commission of cardinals appointed for this purpose after the Tridentine Council. Palestrina, Zoilo, and Guidetti in their labors of revision acted upon the principle which had been lost sight of for a time, but which was now generally accepted by musicians in Rome, "that the words of the texts should be sung to the notes as they ought to be spoken or declaimed without notes." This principle in its application brought into universal use the three different kinds of note-values: the longa, the brevis, and the semibrevis. The work of revision, of the Graduale only, which was continued and completed after Palestrina's death (2 Feb. 1594) by Felice Anerio and Francesco Suriano involved many excisions and abbreviations; reduced many chants which had been elaborately melismatic to a syllabic form. This revised edition derived its name "editio medicea," from the fact that it was printed by the "stamperia" or press of that name established in Rome by Cardinal Ferdinand de Medici. The Congregation of Sacred Rites, in 1595, appointed Giovanni Maria Nanino, Giovanni Andrea Dragoni, Luca Marenzio, and Fulgentio Valesio to edit, in accordance with the principles stated above, the 'Pontificale Romanum.' The revised books were now printed and published with the approbation of Pope Paul V. (1605–21) and that of the prefect of the Congregation of Sacred Rites. This approbation did not carry with it the prohibition of the use of the old, more elaborate, now called traditional, versions of the chant. No doubt because of the latitude thus permitted, the abbreviated version did not make much headway outside of the papal territory. Besides this, monody (solo singing) and the theatrical style in general came into vogue in Italy at the beginning of the 17th century. It took such a hold of public taste that even the works of Palestrina and the masters of his school were temporarily forgotten for the trashy and trivial products which now had the upper hand. This being the case with regard to the polyphonic style, it was natural that the austere, chaste, and simple Gregorian melodies should suffer even greater neglect. While in Italy and in some other parts of the world the chant was for a time neglected, there were countries, such as France, Belgium, Spain, and the Catholic parts of Holland, where it never ceased to be cultivated according either to the traditional or the abbreviated version. Many different editions came into use, notably in France, where many dioceses had their own versions. Toward the middle of the 19th century the plan entertained by Gregory XIII., Clement VIII., and Paul V., of having uniformity for the whole Catholic world in everything pertaining to the liturgy, including the chant, was revived with new vigor. Pope Pius IX., in 1868, appointed a commission to whom he entrusted the task of editing, in accordance with existing requirements, the "editio medicea," which Pius IX. and his successor, Leo XIII., repeatedly declared to be the official version of the Gregorian chant for the whole Church. During the past 30 years or more, however, archæologists — notably the Benedictines of Solesmes, A. Dechevrens, S. J. of Paris, the Belgian savant, G. A. Gevaerts, Dr. Peter Wagner of Freiburg, Switzerland, and others — have made exhaustive studies of the manuscripts dating from the 9th century (the oldest so far discovered) up to the Renaissance. The results of these studies have induced the present Pope, Pius X., to appoint (1904) a commission for the purpose of preparing what is to be called the "editio vaticana," which will embody the fruits of the researches and labors of learned men for many years past. Whatever may be the differences between this latest version and the many that have gone before, they will in no sense change the essential character of the chant. This character has its root primarily in the nature of the scales or modes used, as has been shown above, and, secondly, in the intervals in the construction of the melodies. As has been pointed out, the melodies sprang from the sacred texts of the liturgy: they were their complement and splendor. The Church has always declared the chant to be her own music par excellence. Other forms of music which she admits in her cult, the Palestrina, or polyphonic, and the modern styles, are to be judged as to their fitness in the light of the Gregorian chant, which is the norm and standard of excellence because it best expresses the attitude of prayer.

Bibliography.—Some of the works on the Gregorian chant which may be profitably consulted are: Haberl, 'Magister Choralis'; Kienle, 'Choral-Schule'; Gietmann, 'Kunstlehre' (Vol. III.); Kornmüller, 'Lexikon der Kirchlichen Tonkunst'; Gevaert, 'La Melopée Antique dans le Chant de l'Église Latine'; the Benedictines of Solesmes, 'Paléographie Musicale'; Dechevrens, Études de Science Musicale.'

JOSEPH OTTEN.

Gregorian Liturgy, the ritual which Pope Gregory I. introduced after 590 in the Roman Catholic Church in the administration of the Eucharist, as exhibited in the book entitled 'Gregorianum Sacramentarium.' St. Gregory made a new arrangement of the liturgy of Gelasius, which was previously in use, expunging from it what seemed to him useless and adding a very few new prayers. The celebration of the mass is still essentially the same as it was then.

Greg'ory, Saint, or **Gregory of Armenia**, surnamed "THE ILLUMINATOR," founder of the Armenian Church: b. Valarshabad, Armenia, 257; d. Mount Sebuh, Upper Armenia, 332. He was conveyed by a Christian nurse from his home in Armenia, when but two years old, to Cæsarea in Cappadocia to escape being slain with his family for the crime of his father Prince Auak, who had assassinated Chosrov I., king of Armenia. When he reached manhood he married a Christian lady of Cæsarea, who after bearing him two sons retired to a monastery. Thereupon Gregory entered the service of Tiridates III., son of Chosrov, who, with the help of the Romans, had recovered his father's throne. Tiridates imprisoned him for 14 years in a deep pit, for refusing to perform an act of idolatrous worship, whereupon the tyrant was punished by a horrible temper, of which Gregory cured him and converted him to Christianity. After the baptism of Tiridates Gregory was appointed bishop and patriarch of Armenia and consecrated by Leontius of Cæsarea. Tiridates established Christianity as the national religion of Armenia, a measure afterward imitated on a larger scale by Constantine the Great. Gregory spent the last year of his life in a hermitage on Mount Sebuh.

Gregory, Saint, of Nazianzus (GREGORIUS NAZIANZENIUS), Greek Church Father: b. Arianzas, near Nazianzus, Cappadocia, about 330; d. about 390. Receiving baptism, he retired for some time with St. Basil to Pontus. He began to preach in 362 and between 365 and 374, chiefly at Nazianzus. He went to Constantinople about 378 or 379 to oppose the Arians, and was appointed patriarch of that see in 380. The election was confirmed by the Council of Constantinople in 381, but during the same year he resigned and retired to his former charge of Nazianzus. We possess a number of sermons by him, a large number of letters and many poems. His eloquence is said to have placed him nearly on a level with Basil and Chrysostom. His festival is celebrated on 9 May.

Gregory, Saint, of Nyssa, Greek Church Father: b. Sebaste Pontus, about 332; d. about 398. By the influence of his brother St. Basil (q.v.), he was made bishop of Nyssa, in Cappadocia. He took a prominent part in the Councils of Constantinople from 381 to 394. He was less of an orator than Gregory of Nazianzus, but was more distinguished than any of the Greek fathers for a philosophical spirit, and for his acquaintance with the writings of the Greek philosophers. He also exhibited a liberality in his views uncommon in his day. His festival is on 9 March. His works consist of dogmatic treatises, Scripture commentaries, sermons, letters, etc.

Gregory, the name of 16 popes, as follows:

Gregory I., called the "GREAT": b. Rome about 540; d. 12 March 604. The death of his father put him in possession of great wealth, which he expended in the foundation of monasteries and charitable institutions. Disgusted with the world, he took the monastic vows himself and became a member of one of his own establishments. On the death of Pope Pelagius in 590 he was chosen his successor, an honor which he very unwillingly accepted. He displayed great zeal for the conversion of heretics, the advancement of monachism and the rigid enforcement of celibacy among the clergy: and there was nothing in which the Church was concerned that he deemed too small to lie beyond the sphere of his personal interest and action. (See GREGORIAN LITURGY, GREGORIAN MUSIC.) During his pontificate the pretension of John, patriarch of Constantinople, to the title of ecumenical patriarch, which Gregory repudiated, contributed to bring about the schism between the Greek and Latin Churches (see GREEK CHURCH). The works ascribed to him are very numerous, and have been frequently published. His genuine writings consist of a treatise on 'Pastoral Duty' (translated by King Alfred), 'Letters,' 'Scripture Commentaries,' etc. Consult: Snow, 'St. Gregory the Great' (1892); Mann, 'Lives of the Popes in the Early Middle Ages' (1903).

Gregory II.: b. Rome; d. 10 Feb. 731. He was elected pope and his pontificate is specially noticeable as forming an epoch in the progress of the territorial pre-eminence of the Roman See in Italy. Gregory II. was distinguished by his zeal for the evangelization of heathen lands; it was under his auspices that the famous Winfried or Boniface entered on his missionary work in Germany.

Gregory III.: b. Syria; d. 28 Nov. 741. He succeeded Gregory II. in 731. The encroachments of the Lombards in Italy during his pontificate became so formidable that as the eastern emperors still remained powerless or indifferent to the protection of the Italian provinces, the Romans charged Gregory to send a deputation to Charles Martel, which promised him the title of patrician and consul of Rome in return for his help against the Lombards. Charles Martel's preoccupation with the Saracens made it impossible for him to respond to this plea. But the fact that Gregory was authorized by the Roman primus to approach Charles on this subject and in this way shows how Rome was breaking away from the East, and so marks an epoch.

Gregory IV.: b. Rome; d. 27 Jan. 844. He succeeded Valentine in 828, and was greatly esteemed for his learning and piety. During his pontificate the observance of the feast of All Saints was made general.

Gregory V.: b. Germany; d. 18 Feb. 999: sometimes styled BRUNO OF CARINTHIA. He was nephew of the Emperor Otto III. and through his influence was chosen first German pope and at the age of 24 succeeded John XV., in 996. An anti-pope, named John XVII., was set up against him by Crescentius, a consul of Rome, but was expelled by the emperor.

Gregory V., Ecumenical patriarch of the Greek Church: b. Dimitzana, Arcadia, Greece, 1739; d. Constantinople, 1821. His original name was Georgios Angelopulus, and he took his ecclesiastical name on entering the monastery on Mount Athos where he received his theological training. He was appointed archbishop of Smyrna in 1784 and patriarch of Constantinople in 1795. When the French invaded Egypt in 1798, the national spirit of Greece was aroused by hopes of deliverance from the Turkish yoke. Suspicions of conspiracy fell upon Gregory, and the Turks clamored for his head. Sultan Selim therefore banished him to Athos, but he was soon afterwards reinstated in his see. In 1821 the Greeks of the Morea revolted, and 21 March banishment was proclaimed against all who took part in the rebellion. Gregory had been put in charge of the family of Prince Murusi, who without the patriarch's connivance had been permitted to escape by the Russian ambassador. On Easter morning, 22 April, 1821, by command of the sultan Gregory with three bishops and eight of the clergy were hanged in front of the basilica. Three days later the Jews threw his body into the sea, where it was recovered by Greek sailors and carried to Odessa. The Greeks looked upon their murdered archbishop as a martyr, his bones were placed by the government in the cathedral at Athens, and his statue was raised in front of the university. Among his writings is a translation of St. Paul's epistles into modern Greek, with a commentary.

Gregory VI.: b. Rome; d. Cologne 1048. He succeeded John XIX. Finding the lands and revenues of his church much lessened by usurpations, and the roads infested by robbers, he acted with such vigor that a powerful party was raised against him by those accustomed to live by plunder. At a council, held at Sutri, in 1046, Gregory abdicated the pontificate.

Gregory VII. (HILDEBRAND): b. Soana, Tuscany, about 1015; d. Salerno, 25 May 1085. He became a monk at Cluny, and when Bruno, bishop of Toul, was elected pope by the emperor and diet in 1048 Hildebrand accompanied him to Rome, having persuaded him, it is said, to lay aside the insignia of the pontificate until he should receive the free suffrages of the clergy and people of Rome. Henceforth Hildebrand became the ruling spirit of the papacy. Leo IX. (Bruno) and his successors, Victor II. (1055), Nicholas II. (1058), Alexander II. (1061), confided in his counsels. He influenced the election of several of these popes, and procured the expulsion of the anti-popes Benedict and Honorius, who were opposed to Nicholas and Alexander. Under Nicholas II he succeeded in changing the mode of election to the pontificate. Hitherto the clergy and the people of Rome had a voice in the election He gave the power of nomination to the cardinals alone, leaving the clergy and people only a right of concurrence, of which they were subsequently deprived. On the death of Alexander II. (1073) Cardinal Hildebrand was raised to the Papal chair. His efforts were directed to free the Church from the interference of temporal rulers, which had become quite an abuse in his day, and reform the numerous irregularities which had crept in among the clergy, especially in relation to the violation of the law of celibacy. In 1074 he issued his edicts against simony and the marriage of priests, and in 1075 an edict forbidding the clergy, under penalty of forfeiting their offices, from receiving the investiture of any ecclesiastical dignity from the hands of a layman, and at the same time forbidding the laity, under penalty of excommunication, to attempt the exercise of the investiture of the clergy. The Emperor Henry IV. refused to obey this decree, and Gregory, in 1076, issued a new decree summoning the emperor before a council at Rome, to defend himself. Henry then caused a sentence of deposition to be passed against the pope by a German council assembled at Worms. The pope, in return, excommunicated the emperor, and released all his subjects and vassals from their oath of allegiance. To escape being deposed by the pope, Henry hastened to Italy, where he submitted at Canossa (1077) to a humiliating penance, and received absolution. In the meantime his friends again assembled round him, and he then caused the pope to be deposed by the Council of Brixen, and an anti-pope, Clement III., to be elected in 1080, after which he hastened to Rome and placed the new pope on the throne. Gregory now passed three years as a prisoner in the castle of St. Angelo, but could never be induced to compromise the rights of the church. The character of Gregory was ardent and unyielding. In the pursuit of his ends in guarding the liberties of the Church he spared neither friend nor foe. The long dispute he began with Henry IV. about investitures survived both pope and emperor. The same subject involved him in disputes with France and England. He carried out his ecclesiastical reforms with an unbending rigor. He vigorously prosecuted those of the clergy who broke the law of celibacy, and in his contests with the emperors vindicated the spiritual authority of the Church as independent of the secular power. To the last he refused to withdraw the excommunications he had launched against the emperor, the anti-pope, and their adherents. The words which have been put into his mouth in dying, whether authentic or not, do no injustice to his inflexible spirit, "I have loved justice and hated iniquity; therefore I am left to die in exile." See Milman' 'Latin Christianity' (Vol. III.); Giesebrecht, 'Geschichte der deutsch-Kaiserzeit' (Vol. III.); Bowden, 'Life of Gregory VII.' (1840); Voigt, 'Hildebrand als Papst' (2d ed. 1846); Gfrorer, 'Papst Gregor VII.' (1859–61); Stephens, 'Hildebrand and his Times' (1888); and the studies by Soltl (1847), Villemain (1872; Eng. trans. 1873), Langeron (1874), and Meltzer (1876).

Gregory VIII.: b. Benevento; d. Pisa 17 Dec. 1187 He succeeded Urban III. in October 1187, and died the same year, after having exhorted the Christian princes to undertake a new crusade, and absolved Henry II. of England for the murder of Becket.

Gregory IX. (UGOLINO, COUNT OF SEGNI), b. Campania about 1147; d. Rome 21 Aug. 1241. He became a bishop of Ostia and cardinal, and in 1227 succeeded Honorius III. The principal events of his pontificate were the various incidents of his contest with the great Emperor Frederick II., whom he four times excommunicated, absolving his subjects from their allegiance, and proclaiming a crusade against him. The 'Decretals,' which he published in 1234, form the basis of the canon law of the Church.

Gregory X. (TEBALDO VISCONTI), d. Arezzo, 10 Jan. 1276. He was elected Pope in 1271, after an interregnum of two years. He convened a council at Lyons in 1274, the chief purpose of which was to promote a union between the Eastern and Western Churches.

Gregory XI. (PETER ROGER), b. Maumont, Limoges, France, 1329; d. Avignon, 30 Dec. 1378. He was a nephew of Clement VI., and succeeded to the pontificate in 1370, after the death of Urban V. He was a patron of learning, and endeavored to reconcile the princes of Christendom and to reform the religious societies. He transferred the papal see from Avignon to Rome.

Gregory XII. (ANGELO CONARIO), b. Venice about 1325; d. 18 Oct. 1417. He became pope in 1406, during the great schism of the West, Benedict XIII. being the other pope. Both were deposed by a council held at Pisa, and Alexander V. elected in their stead. Gregory abdicated at the Council of Constance in 1415, and thenceforward held the rank of cardinal-bishop of Porto.

Gregory XIII. (UGO BUONCOMPAGNO), b. Bologna 7 Jan. 1502; d. 10 April 1585. He was one of the theologians of the Council of Trent; on his return thence was created cardinal in 1565. On the death of Pius V. Gregory was elected pope in 1572. Not one among the post-Reformation pontiffs has surpassed Gregory XIII. in zeal for the promotion and improvement of education; a large proportion of the colleges in Rome were wholly or in part endowed by him. The most interesting event of his pontificate, in a scientific point of view, is the correction of the calendar (q.v.), which was the result of long consideration, and was finally made public in 1582. Under his care was published also a valuable edition of the 'Decretum Gratiani' with learned notes. He was a zealous patron of the Jesuits, and supported the League in France against the Huguenots. He strongly supported Philip II. of Spain in his designs against England; and left the mark of his energy on almost every department of church life and work.

Gregory XIV. (NICHOLAS SFONDRATE), b. Cremona 1535; d. 15 Oct. 1591. He was made a cardinal in 1583 and succeeded Urban VII. in 1590.

Gregory XV. (ALESSANDRO LUDOVICO), b. Bologna 9 Jan. 1554; d. 8 July 1623. He became a cardinal in 1616 and succeeded Paul V. in 1621. He was the founder of the College of the Propaganda, and in 1622 canonized Ignatius Loyola, Francis Xavier and Philip de Neri.

Gregory XVI. (BARTHOLOMMEO CAPELLARI) b. Belluno 18 Sept. 1765; d. Rome 1 June 1846. He was made prefect of the Propaganda in 1826 and was in effect minister of foreign affairs. He succeeded Pius VIII. in 1831. His rule was a period of no ordinary interest and difficulty in the history of the Church, and in the relations of the Vatican with the temporal powers of Christendom. Of simple habits he was very active in his conduct of affairs. His 'Triumphs of the Papacy' (1790) has been translated into both German and French.

Gregory, Casper René, American scholar: b. Philadelphia, Pa., 1846. Was graduated at the Universities of Pennsylvania, Princeton and Leipsic (1864–76). He has done important work in New Testament criticism, and has been professor of New Testament exegesis in the theological faculty at Leipsic. In addition to translations of critical works from the German, he has written 'Les Cahiers des Manuscrits Grecs' (1885); and the 'Prolegomena to Tischendorf's Editio Octava Critica Major of the New Testament' (1893).

Gregory, Edward John, English painter: b. Southampton, 1850. He first exhibited at the Royal Academy in 1876, and became known as a genre painter of distinction, whose lightness and refinement, combined with rare technique, were almost more French than English. His most characteristic pictures are 'A Rehearsal' (1882); 'The Swans of the Thames'; and 'Is it a Mouse?'

Gregory, Eliot, American painter and author: b. New York 13 Oct. 1854. He studied at Yale, obtained his education in art at Rome, and at Paris as a pupil of Cabanel and Carolus-Duran, and exhibited both sculpture and painting at the Salon. His pictures include genre works and portraits, among the latter being those of Admiral Baldwin, Ada Rehan and August Belmont. His books, published under the pseudonym "AN IDLER," are: 'Idler Papers'; 'Worldly Ways and By-Ways' (1898); and 'The Ways of Men' (1900), containing satirical observations on American life, especially that of plutocratic society.

Gregory, Francis Hoyt, American admiral: b. Norwalk, Conn., 1789; d. 1866. He was appointed midshipman in the United States navy in 1809, and during the war of 1812 was attached to the command of Commodore Chauncey on Lake Ontario. He was captured by the English in 1814 and confined till the close of hostilities. He saw service in repressing the Algerine pirates (1815–16) and the buccaneers of the West Indies (1821–23); took part in the Mexican War and commanded the African squadron (1849–52). He retired with the rank of rear-admiral in 1862.

Gregory, John Milton, American educator: b. Sand Lake, N. Y., 16 July 1822; d. Washington, D. C., 20 Oct. 1898. After graduation at Union College in 1846, he entered the Baptist ministry, but soon relinquished preaching for teaching. He was State superintendent of public instruction in Michigan in 1858–63; president of Kalamazoo College 1863–67; and president of the Industrial University in Champaign, Ill., in 1867–80. He published 'Compend of the School Laws of Michigan'; 'Handbook of History' (1866); 'A New Political Economy' (1882); 'Seven Laws of Teaching' (1883); etc.

Gregory of Tours (GREGORIUS FLORENTIUS), historian of Gaul, b. Averni, now Clermont, France. 538; d. Tours 17 Nov. 593. He lived some time at the court of Austrasia, and became bishop of Tours in 573. His 'Historia Francorum,' though destitute of style or method, contains an invaluable collection of facts bearing on the manners of the Franks and Gallo-Romans, and the historical events of the period, and has caused him to be ranked as the Herodotus of Gaul. He also wrote lives of fathers, ecclesiastics and martyrs, etc. His complete works are contained in Migne's 'Patrologia' (Vol. LXXI.), and his history is included in the first volume of the 'Monumenta Germaniæ Historica' (1884–85).

Grenada (grĕn-ā'da) and **Grenadines,** grĕn-a-dēnz', islands of the West Indies. Grenada is the most southern of the Caribbean chain, and may be characterized as the most British and the most beautiful of all the British Antilles. Its length is 18 miles, its width 7, and its area 33 square miles. Lofty volcanic craters rise high above fertile and well-watered valleys. The volcanic character of the island is perhaps more marked, and is certainly regarded by geologists as being more recent than that of the northern Caribbees. A lake two miles in circumference lies among the mountains just mentioned, at an altitude of 3,200 feet. St. George, the capital, has a good harbor, a fort, and pretty houses and churches. The island is headquarters of the government of the Windward group (which includes with this the Grenadines, St. Vincent and St. Lucia), and has excellent schools, roads, waterworks, etc. The chief product is cocoa. Population about 54,000, of which number four-fifths are negro peasants. The Grenadines are long, low islands "of quaint forms and euphonious names," lying between Grenada and St. Vincent. The largest of them is less than 8,000 acres in extent, and their total area is approximately 87 square miles. They have in all more than 6,000 inhabitants, who raise and export cattle and provisions.

Marrion Wilcox,
Authority on Spanish America.

Grenade, grẹ-nād', a small hollow ball, cylinder, or cube, of metal, glass, or paper, about two and one half inches in diameter, which is filled with some explosive, and burst by means of a fuse when it falls among the enemy. Until about the end of the 17th century trained soldiers called grenadiers threw grenades by the hand. Grenades have been delivered from mortars, to repel the close attacks of besiegers sheltering themselves under the besieged walls. They have been found useful also in repelling boat attacks. At the siege of Mafeking in 1899–1900 dynamite grenades are said to have been thrown by the besieged. Grenades were one of the earliest forms of explosive projectiles. The gradual disuse of hand-grenades in war dates from the battle of Steinkerque in 1690. Hand-grenades are in use at the present time as fire extinguishers, chemicals being used to fill hollow glass balls, which are thrown into a burning mass. Many hotels, hospitals and public buildings are equipped with hand-grenades.

Gren'fell, George, English missionary and African explorer: b. Penzance, Cornwall, England, 1848; d. Basoko, Congo Free State, 1 July 1906. In 1874 he was despatched to Kameroon, Central Africa, where he founded the settlement of Victoria. He later reached the Congo, and rendered good services to science by his hydrographic survey of the Congo valley during his voyage in the steamboat "Peace." Notable was his exploration of the Ubangi (1885) whose identity with the Welle Makua he convincingly established. The geographical societies of Germany, France and England, published valuable communications from this intrepid traveler, who shares with Livingstone the reputation of a missionary who did much to promote an accurate scientific knowledge of interior Africa.

Gren'ville, George, English statesman: b. 1712; d. 13 Nov. 1770. He became treasurer of the navy in 1754, secretary of state in 1762, and first lord of the treasury and chancellor of the exchequer in April, 1763. In 1765 the Commons accepted his scheme for stamp-duties to be levied in the American colonies, which was one of the proximate causes of the American War of Independence. In 1766 he defended the stamp act in Parliament; in 1769 opposed the expulsion of Wilkes from the House of Commons, and in 1770 brought in the Controverted Elections Bill, which was passed. He was able, hard-working and honest, but narrow-minded and obstinate, wanting in tact and foresight. The 'Grenville Papers,' edited by W. J. Smith (1852–53), contain interesting information on the politics of the day.

Grenville, Sir **Richard,** English naval officer: b. about 1541; d. September 1591. In 1585 he commanded a fleet of seven vessels intended to aid in the colonization of Virginia. His most brilliant exploit occurred in 1591, when he attempted to cut his way through a Spanish fleet of 53 ships. His ship while becalmed was attacked by 15 of the largest Spanish vessels. Not till after 15 hours of battle and when only 20 out of his 150 men were left alive did he strike his colors. He died from wounds received in the engagement. It is upon this incident that Tennyson has founded his spirited ballad, 'The Revenge.'

Grenville Act, 6 April 1764. An act passed by the English Parliament on the proposal of George Grenville, a member of Lord Bute's ministry. Its purpose was more effectively to protect English trade and manufactures from foreign competition, to raise better revenues from the colonies. It was based on the act of 1733, which, to protect the British West India sugar industry, laid prohibitory duties on the import of French West India sugar and molasses into the colonies, and which, if enforced, would have ruined New England commerce. The new act made the duty on molasses a heavy revenue one instead; increased the duty on sugar, and laid new duties on wines; decreased the drawbacks on foreign articles exported to America; imposed regulations on manufacturers, and attempted to enforce the navigation acts more thoroughly; and prohibited all trade between the colonies and the French islands St. Pierre and Miquelon.

Gresh'am, Walter Quinton, American jurist and statesman: b. near Lanesville, Harrison County, Ind., 17 March 1832. His family originated in Kentucky, from which State his grandfather had removed to Indiana. There his father met with success as a farmer, and also exercised the art of cabinet-making. He was elected sheriff and was murdered in the performance of his duties. The son was educated at the local school, and the State University, Bloomingdale, Ind. After leaving the latter he went to Corydon, Ind., and began the study of law, while filling the office of deputy clerk (1854). In 1860 he was elected to the State legislature. When the Civil War broke out he was commissioned in the Federal service as lieutenant-colonel of the 38th Indiana regiment. He was promoted under Grant, and at Vicksburg had charge of a brigade with the rank of brigadier-general of volunteers. He joined Sherman's forces in the expedition against Atlanta, Ga., where he commanded the 4th division of the 17th Army Corps. At Leggetts Hill, in January, 1864, he was severely wounded and disabled from service, and in the following year was retired as major-general of volunteers. He chose as his home New Albany, Ind., and began an active life as law practitioner. In 1866 he was put forward by his friends as Republican candidate for Congress, but was defeated at the polls, and for the two following years resided in New York, as the financial agent of his State. His next field of activity was as a jurist, for in 1869 President Grant appointed him judge of the United States circuit court for Indiana. He had previously declined an appointment as collector of customs at New Orleans, which would have necessitated his removal from Indiana. He had also declined the position offered him as district attorney. But his great abilities and high character had pointed him out as fitted for some important employment, and in 1882 no surprise was felt, but rather general expectation was satisfied when he received an appointment to the cabinet with the portfolio of postmaster general (1882). In 1884 he was called to the secretaryship of the treasury, in the discharge of whose duties he would doubtless have increased his reputation as a financier, had he not been appointed a few months later as United States circuit judge for the 7th judicial district. He made himself conspicuous as favoring the third term of his old friend Gen. Grant (1880). His own name had been put forward with some enthusiasm as presidential candidate in 1884, and again in 1888. There were many who thought that he had good claims to be invested with the office of the chief magistrate. Subsequently he changed his convictions on the most important question of the hour, and ranged himself on the side of views of tariff legislation with which the Republican party had no sympathy. The Populists, however, looked upon him with favor as his judicial decisions had in many cases been to their advantage. Had he consented, they would have nominated him for the presidency at the national convention of that party held at Omaha, Neb., in July 1892. He declined the honor and made a public statement announcing his purpose of supporting Grover Cleveland's nomination. He was afterward named by President Cleveland as secretary of state.

Gresham's Law, a principle in finance and political economy formulated about the middle of the 16th century by Sir Thomas Gresham, founder of the London Royal Exchange. It may be thus stated and expounded. Bad money drives out good money from the circulation. The good coin of full weight and purity in circulation with worn, light, or depreciated coins, will be hoarded or used for exportation, where it will buy more abroad than the worn out coins, which will be left to pass as counters at home. This law is still a living principle, and especially applicable in controverting the position of those who wish the United States, single-handed, to issue a currency of the double standard.

Gres'well, William Henry, English Anglican clergyman and author. He was educated at Oxford and has been rector of Dodington, Somerset, from 1888. As a writer he is known by 'Our South African Empire' (1885); 'Imperial Federation' (1887); 'History of the Canadian Dominion' (1890); 'Geography of the Canadian Dominion' (1891); 'Geography of Africa South of the Zambesi' (1892); 'The British Colonies and Their Industries' (1893); 'Growth and Administration of the British Colonies' (1897).

Gretna, La., town, capital of Jefferson Parish; on the Mississippi River and the Southern Pacific railroad; opposite New Orleans. A number of the Mississippi River packet lines take on and discharge shipments at Gretna. It was founded in 1835, and has now many of the advantages of a suburb of New Orleans. It manufactures cottonseed oil and its trade is chiefly in cotton and cottonseed oil. Pop. 3,875.

Gretna Green, or Graitney, Scotland, village in Dumfriesshire, on the Solway Frith, eight miles north of Carlisle. It was for nearly a century notorious as the place of celebration of the marriages of runaway couples from England. To conclude a lawful marriage in Scotland, it was then only necessary for an unmarried couple to go before witnesses and declare themselves man and wife. The English marriage service was usually read at these marriages by a pseudo-priest, said to be the blacksmith of the village, who has become in consequence a historical character in fiction. Gretna Green marriages are now at an end, in consequence of a statute which enacts that no irregular marriage contracted in Scotland shall be valid, unless one of the parties resides in Scotland, or has done so, for 21 days next preceding such marriage.

Grétry, André Ernest Modeste, äṅ-drā ėr-nā mō-dĕst grā-trē, French composer: b. Liège 8 Feb. 1741; d. Ermenonville 24 Sept. 1813. After completing his studies at Rome he settled at Paris and there his reputation was made. He was the most prolific composer of his age. He produced forty comic operas, most of which with the exception perhaps of 'Raoul' and 'Richard Cœur de Lion' are now forgotten. His 'Memoires' 1796, and his life by Gregoir and Brenet give the main incidents of his career.

Grev'ille, Henry. See DURAND, ALICE MARY.

Grevy, François Paul Jules, fräṅ-swä pōl zhül grā-vē, French statesman: b. Mont-sous-Vaudrey, Jura, 15 Aug. 1807; d. 9 Sept. 1891. He studied law in Paris, and became prominent as the defender of republican political prisoners. In 1848 he was returned to the Constituent Assembly, where his ability as a speaker soon made him distinguished. After the *coup d'état* he retired from politics, but in 1869 again entered the Assembly as deputy for the Jura. In February, 1871, he was elected president of the National Assembly, and re-elected in 1876, 1877, and 1879. When Marshal MacMahon resigned in 1879 Grevy was elected president of the republic for seven years. In December, 1885, he was elected president for a second term of seven years, but, hampered by ministerial complications, resigned in December 1887.

Grey, Albert Henry George, Fourth Earl, English statesman: b. Howick, Northumberland, England, Nov. 28, 1851. His grandfather, the second earl, was prime minister of England, and influential in securing the passage of the Reform Bill of 1832. The present earl was graduated from Trinity College, Cambridge; in 1880 he was elected to Parliament, as a Liberal, and supported Gladstone in the House until 1886 when the Liberals declared in favor of home rule. He then became a Liberal Unionist, but lost his seat in Parliament. In 1894, as his uncle died childless, he succeeded to the estate and title, and entered the House of Lords. He was a personal friend of Cecil Rhodes, was one of the promoters of the South African Company, and in 1896–97 served as governor of Rhodesia. As an executor of the Rhodes will, he is now one of the trustees of the scholarship fund. He has been an active worker in reform movements, especially in the cause of co-operation and of temperance. On his estate he has organized a co-operative system which has worked successfully; and in 1901 he organized a system for the management of public houses in the interests of the public, known as the Public House Trust. In 1904 he was appointed governor-general of Canada to succeed the Earl of Minto.

Grey, Lady Jane, English princess: b. Bradgate, Leicestershire, 1537; d. Tower Hill, London, 12 Feb. 1554. She was the daughter of Henry Grey, marquis of Dorset, afterwards duke of Suffolk. She displayed much precocity of talent; possessing an acquaintance with the classic and oriental languages, as well as French and Italian. She was married to Lord Guildford Dudley, fourth son of the Duke of Northumberland, in May 1553. Edward VI. was induced at his death 5 July 1553 to settle on her the succession to the crown. The council endeavored to keep his death secret, with a view to secure the persons of the princesses, Mary and Elizabeth. Mary apprised of their design, wrote expressing her surprise that she had not been advised of her brother's death, and commanding them on their allegiance to proclaim her title. The council replied, exhorting her to be quiet and obedient, and proclaimed Lady Jane on the 10th. On the approach of Mary the council, unsupported in their usurpation, meanly deserted their victim Lady Jane, and joined in proclaiming Mary queen on the 19th, and on the 20th Lady Jane was confined to the Tower. On 13 Nov. she and her husband were arraigned, and pleaded guilty of high treason; but they might, perhaps, have been allowed to expiate their imprudence by a temporary confinement, but for the ill-advised insurrection under Sir Thomas Wyatt, in which the Duke of Suffolk, Lady Jane's father, was weak enough to participate. The suppression of this rebellion was followed by the execution of Lady Jane Grey and her husband on Tower Hill.

Greyhound. A long, tall, slender hound, the standard features of which are described under Dog. It hunts by sight, is fitted for the swiftest running and leaping, and is used in the sport of coursing (q.v.). In the United States greyhounds are kept mainly as pets; yet in the West are used in chase of jack-rabbits, prong-horn antelopes and coyotes. Few horses are able to keep up with them, even in a level country, and on an irregular surface they distance horses easily. The modern thin, smooth-haired type, to which the name is now popularly restricted, is a development from a form which arose in western Asia before the Christian era, and was adopted and esteemed in Syria, Egypt and Rome, during the classic period. It was taken west with the Romans in their conquest of Europe, and later became the favorite dog of the nobility, an accompaniment of falconry. At that time black, or black-and-white were the approved colors. There seems to have been little essential change of form or qualities during this prolonged history, and literature and art abound in commemoration of the dog's grace, kindliness and exploits in the field. There arose at an early time a diminutive variety not half the size of its namesake (about 7 pounds in weight) fragile, delicate, and of no use save as an ornamental pet, which is now known as the Italian greyhound. It is of almost any whole color,— black, mouse-grey, fawn or rarely white. Besides these satin-coated "long-dogs," others arose in the colder parts of Europe which differed from the greyhound only in having a "rough," that is long-haired, coat. These are the Irish wolfhounds (see Wolfhound), the Scotch stag or deerhound (see Deerhound), and the Russian wolfhound or psovie (see Borzoi).

Greytown, old name San Juan de Nicaragua, destroyed in 1854 by the United States. (For the general situation, see Clayton-Bulwer Treaty.) In May 1854 the captain of an American steamship had a quarrel with a negro, and shot him dead; the mayor of the city ordered him arrested, and the passengers on the ship, as well as Solon Borland, the United States minister to Nicaragua, took the captain's part and resisted the arrest. The native inhabitants were indignant and mobbed Borland, whereupon the United States war-vessel Cyane, Commander Hollins, was sent to exact reparation. Hollins espoused the cause of an American transit company who were making excessive claims, and ordered the mayor to pay them at once; on their refusal he bombarded and burnt the place. This outrage embroiled the United States with Great Britain.

Gridley, Charles Vernon, American naval officer: b. Logansport, Ind., 24 Nov. 1845; d. Kobe, Japan, 5 June 1898. A graduate (1863) of the United States Naval Academy, he served during the Civil War in the West Gulf blockading squadron, subsequent to the war was on various ships, and in 1875–79 was stationed at the Naval Academy. He was navigation officer in the Boston Navy Yard in 1882–84, was lighthouse inspector in 1887–91 and 1895–97, in 1897 attained the rank of captain and was ap-

ALBERT HENRY GEORGE, THE FOURTH EARL GREY,

GOVERNOR-GENERAL OF CANADA.

pointed to the command of the Olympia, then flagship of the Asiatic squadron. This vessel he commanded in the battle of Manila Bay 1 May (1898). He died at Kobe.

Gridley, Richard, American soldier: b. Boston, Mass., 3 Jan. 1711; d. Stoughton, Mass., 20 June 1796. He served in the British army as lieutenant-colonel of engineers under Pepperell at the capture of Louisburg in 1745; as chief engineer and colonel of infantry in 1755; took part in the expedition to Crown Point under Winslow in 1756; under Amherst in 1758; and under Wolfe at Quebec in 1759. He was appointed chief engineer and commander of the artillery of the American army upon the outbreak of the Revolution, constructed the fortifications on Breed's Hill before the battle of Bunker Hill, and later fortified Dorchester Heights. He was commissioned major-general by Congress on 20 Sept. 1775, and commanded the Continental Artillery till November of that year.

Grieg, Edvard, ĕd'värd grēg, Norwegian composer: b. Bergen 15 June 1843; d. there 4 Sept. 1907. His great-grandfather, Alexander Greig, was a Scotchman who emigrated to Norway after the battle of Culloden (1745) and changed his name to Grieg. Edward's father was British consul at Bergen; he married the Norwegian Gesine Judith Hagerup, a descendant of Kjeld Stub; from her, Edvard inherited his musical gifts; she was a good musician and gave him lessons. By the advice of Ole Bull, Edward was sent to the Leipsic Conservatory at the age of 15; he remained there three years, studying with Plaidy, Wenzel, Moscheles, E. F. Richter, Hauptmann, Reinecke. Their lessons, and the music he for the most part heard and studied, impressed a German stamp on his mind, which characterizes his first compositions. His studies were interrupted by an illness, a severe case of pleurisy, which destroyed one of his lungs and left his health impaired for life. On his return to the North he came under the influence of three Scandinavian musicians: the composer Gade, who gave him many useful hints; Ole Bull, an ardent musical patriot, who made him familiar with the charming folk-tunes of Norway, which he played so entrancingly; and Richard Nordraak, who encouraged him in his natural inclination to get out of the maelstrom of German music and steer into the fjords of Norway. From 1866 to 1873 he lived at Christiania, conducting the Philharmonic concerts and giving lessons. He also gave subscription concerts, with the aid of his cousin, Nina Hagerup, whom he married on 11 June 1867; she was an excellent vocalist, whose art was a great aid in winning favor for his songs. In 1868 Liszt accidentally came across Grieg's first violin sonata (Op. 8), and was so much impressed by the evidence of creative power it gave that he invited him to come and spend some time in his studio. It was in consequence of this flattering letter that the Norwegian Government gave Grieg a sum of money which enabled him to visit Rome. There he repeatedly met Liszt, who became more and more impressed by the boldness and the national traits of his genius; he urged him to persevere in his original course and not to let the critics intimidate him.

In 1874 Henrik Ibsen asked Grieg to write the music for a stage version of his 'Peer Gynt.' The offer was accepted and the play was produced, with much success, in 1876. It is often given in Scandinavian cities; elsewhere it has not succeeded, because of its untheatrical, fantastic character and its grotesque local coloring; but the music, arranged for the concert hall in the form of two suites, soon made Grieg one of the most popular composers in al countries. In the same year that Ibsen invited him to compose the music for 'Peer Gynt,' the Norwegian Government honored him with an annuity of 1600 crowns for life. This relieved him of the drudgery of teaching and enabled him to devote most of his time to composing. For several years he lived at Lofthus, on the Hardanger Fjord. At Bergen, 1880–1882, he conducted a musical society called the 'Harmonien.' In 1885 he built the elegant villa Troldhaugen, overlooking the fjord, about 8 kilometers from Bergen; there he lived till his death. After his fame was well established, about 1880, he left his home frequently for concert tours in Germany, France, and England. Everywhere he was acclaimed as one of the most individual and enchanting of pianists (he played only his own pieces), and usually all the seats for his concerts were sold long before their dates. Sometimes he conducted his orchestral compositions. "How he managed to inspire the band as he did and get such nervous thrilling bursts and such charming sentiment out of them I don't know." wrote Sir George Grove, in 1888. In 1893 a writer in the Paris Figaro said: "Among the most famous living musicians there is none I know of whose popularity equals, with us, that of M. Grieg" In 1899, Colonne invited him to Paris to conduct a Grieg concert; but it was just after the verdict in the Dreyfus case, which had made Grieg so indignant that he refused the invitation. When it was repeated, four years later, he accepted. There was a tremendous crowd; cries of "apologize, you have insulted France!" were heard; but the vast majority was with him, and the concert proved one of his biggest triumphs.

Grieg did for Norway what Chopin did for Poland, Liszt for Hungary, Dvorák for Bohemia: he created a new national art. This great achievement, unfortunately, stood in the way of the full recognition of his superlative genius. It is still commonly assumed that he did little more than transplant to his garden the wild flowers of Norwegian folk-music, whereas, in truth, ninety-five hundredths of his music is absolutely his own. He ranks with Schubert and Chopin both as a melodist and a harmonist. His persistent ill-health prevented him from writing operas and symphonies; most of his works are songs and short pianoforte pieces. The songs, 125 in number, are of striking originality and depth of feeling. The equally numerous short pieces for piano (including 66 "lyric pieces" in one vol.) are as idiomatic as Chopin's. There are also 5 sonatas; one for piano alone, three with violin, one with 'cello, beside a string quartet. The orchestral list includes: Overture, 'In the Autumn'; 'Holberg' suite; 2 'Peer Gynt' suites; 'Sigurd Jorsalfar'; arrangements of Grieg songs and Norwegian dances. Choral works: 'At the Cloister Gate'; 'Landsighting'; 'Olaf Trygvason.' Bergliot' is a poem for declamation, with orchestra. The only books on Grieg and his works are by Schjelderup, in Norwegian, and by the author of this article, in English. The latter contains a list of pamphlets and magazine articles on Grieg.

HENRY T. FINCK,
Musical Director, New York Evening Post.

Griesbach, Johann Jakob, a noted German New Testament scholar, biblical critic and theologian: b. Butzbach in Hesse-Darmstadt, 4 Jan. 1845; d. Jena, 24 March 1812. He was educated at Frankfort-on-the-Main: later studied theology at Tübingen, Halle, and Leipzig; during 1769–70 traveled extensively in England, France and Holland; in 1771 became docent and in 1773 professor extraordinary in theology at Halle; and from 1775 till his death was professor ordinary at Jena. Griesbach's most important work — to which he devoted the best years of his life — was the collecting and classifying of the ancient manuscripts and versions of the Greek text of the New Testament. His critical researches, the result of which appeared in his edition of the Greek New Testament (Halle, 1775–7) one of the first ever printed, are valuable and in the main correct. It was he who first divided the authorities for the text of the Greek New Testament into the three great families — Alexandrine, Latin or Western, and Byzantine or Eastern.

Griffin, Charles, American soldier: b. Licking County, Ohio, 1826; d. Galveston, Texas, 5 Sept. 1867. He was graduated at West Point (1847) and served through the Mexican War. In the Civil War he commanded the 5th artillery at the first battle of Bull Run, and on 6 May 1864 was brevetted lieutenant-colonel in recognition of gallant and meritorious services in the field. He was one of the commissioners to carry out the condition agreed upon by Gens. Grant and Lee.

Griffin, Gerald, Irish novelist: b. Limerick, Ireland, 12 Dec. 1803; d. Cork, 12 June 1840. He will be longest remembered for his novel 'The Collegians' (1829), upon which Boucicault's popular play, "The Colleen Bawn," is founded. Griffin was a poet as well as a writer of tales and the author of various lyrics popular with his countrymen.

Griffin, SIR Lepel Henry, English diplomatist: b. 1840. He entered the Bengal Civil Service in 1860 and since then has been administrator of the civil government in several places, especially in the Punjab. In 1885 he was nominated by Lord Salisbury's government as Envoy Extraordinary to Pekin. He has written 'The Punjab Chiefs' (1865); 'The Rajahs of the Punjab' (1870); 'The Great Republic' (1884).

Griffin, Ga., city, county-seat of Spalding County, on the Southern and the Central of G. R.R.'s. It is the centre of a cotton and fruit region, the chief fruits being grapes and peaches. The city contains cotton-mills, a foundry, and furniture factories; wine is also manufactured. The State Agricultural Experiment Station is located in the vicinity. Pop. (1900) 6,857.

Griffin, or **Gryphon**, in mythology, a fabulous animal, usually represented with the body and legs of a lion, and the head and wings of an eagle, signifying the union of strength and agility. Figures of griffins are frequently used as ornaments in works of art. It is employed as an emblem of vigilance, the animals being supposed to be the guardians of mines and hidden treasurers. Figures of it are met with in tombs and sepulchral lamps, as guarding the remains of the deceased.

Griffis, William Elliott, American clergyman and author: b. Philadelphia 17 Sept. 1843. He was graduated from Rutgers College in 1869, and 1870 went to Japan to organize schools after American methods in the province of Echizan, made a study of the Japanese feudal system, and was professor of physics in the Imperial University in 1872–74. In 1874 he returned to the United States, where he was graduated from the Union Theological Seminary in 1877. He was pastor of the First Reformed Church, Schenectady, N. Y. (1877–86), of the Shawmut Congregational Church, Boston (1886–93), and of the First Congregational Church of Ithaca, N. Y. (1893–1903). In 1891 he was a delegate to the International Congregational Council at London. From 1903 he turned his attention wholly to literary work. An authority on Japan, he also studied the Dutch origins of America and the influence of the Dutch in the formation of the United States. His published works include 'The Mikado's Empire' (1876), his best known volume, which has appeared in many subsequent editions; 'Japanese Fairy World' (1880); 'Corea: the Hermit Nation' (1882); 'Corea, Without and Within' (1884); 'Matthew Gailbraith Perry: a Typical American Naval Officer' (1887–90); 'The Lily Among Thorns' (1889); 'Honda the Samurai' (1890) 'Sir William Johnson and the Six Nations' (1891); 'Japan in History, Folklore and Art' (1892); 'Brave Little Holland' (1894); 'Townsend Harris: First American Envoy in Japan' (1895); 'The Romance of Discovery' (1897); 'The Pilgrims in their Three Homes' (1898); 'The Romance of American Colonization' (1898); 'The Romance of American Conquest' (1898); 'The American in Holland' (1899); 'The Pathfinders of the Revolution' (1900); 'In the Mikado's Service'; 'A Maker of the New Orient'; 'Sunny Memories of Three Pastorates' (1903).

Griffiths, Arthur George Frederick, English soldier and author: b. Poonah, India. He served in the Crimean War, was inspector of prisons 1878–96, edited 'The Fortnightly Review' (1884), and is editor of 'The Army and Navy Gazette.' He is the author of 'The Queen's Shilling' (1872); 'Memorials of Millbank' (1875); 'Lola: a Tale of the Rock' (1878); 'Chronicles of Newgate' (1883); 'A Prison Princess' (1890); 'Secrets of the Prison House' (1893); 'Criminals I Have Known' (1895); 'The Rome Express' (1896); 'Wellington and Waterloo'; 'Mysteries of Police and Crime' (1898); 'A Girl of Grit' (1898); 'Ford's Folley, Ltd.' (1899); 'The Brand of the Broad Arrow' (1900); 'A Set of Flats' (1901); 'A Duchess in Difficulties'; 'Tales by a Government official'; etc.

Griffon, or **Bassett-griffon**, a large grayish-red field-dog, combining the qualities of both pointer and setter, but having a thick hard coat enabling it to work readily in thickets and rough country. It originated in Germany at the end of the 19th century.

Griggs, Edward Howard, American lecturer: b. Owatonna, Minn., 9 Jan. 1868. In 1889 he was graduated from Indiana University (Bloomington), and later studied at the University of Berlin, and was successively instructor in English literature and professor of literature in Indiana University. Subsequently he became professor of ethics, and upon the combining of the departments, professor of ethics and education, in the Leland Stanford, Jr., University. From 1899 he was active as a public lecturer, particularly in connection with the courses of the Brooklyn (N. Y.) Institute of Arts and Sciences. He wrote 'Moral Education' (1905).

Griggs, John William, American politician: b. Newton, N. J., 10 July 1849. He was graduated at Lafayette College in 1868, and was admitted to the bar in 1871, practising in Paterson, N. J. He was a member of the New Jersey General Assembly, 1876–77; a state senator, 1882–88; and president of the state senate in 1886. He became governor of New Jersey 1 Jan. 1896, resigning 31 Jan. 1898 to become attorney-general in President McKinley's cabinet. He resigned in April, 1901.

Grijalva, Juan de, hoo-än' dā grē-häl'vä, Spanish navigator: b. Cuellar 1489 or 1490; d. Nicaragua, 21 Jan. 1527. He was intrusted by his uncle, Don Diego Velasquez, the first governor of Cuba, with the command of a fleet of four vessels, which, on 1 May 1518, sailed from St. Jago de Cuba, to complete the discoveries which Fernandez de Cordova had made in Yucatan the year preceding. Rounding the peninsula of Yucatan, he extended his explorations as far as the province of Panuco, giving his name and that of his companion, Alvarado, afterward famous in the expedition of Cortes, to two rivers on the coast. His communication with the Aztecs was friendly, and so profitable that he was enabled to send back one of the ships well freighted with gold, jewels, and other treasures, the acquisition of which was one of the main objects of the expedition. On his return to Cuba he found an expedition organizing for the conquest of Mexico, with Cortes at the head, and was received by Velasquez with reproaches for having neglected to plant colonies on the coast. Grijalva, a man of integrity and prudence, had, however, acted strictly in conformity with his instructions, and against his own judgment. In the latter part of his life he settled in Nicaragua, and was slain in an outbreak of the Indians in the valley of Ulancho.

Grillparzer, Franz, fränts grĭl'pärt-sĕr, German poet and dramatist: b. Vienna 15 Jan. 1791; d. there 21 Jan. 1872. In 1813 he entered the service of the imperial court, retiring to private life with the title of Hofarth (court councillor), in 1856. In 1861 he was appointed member for life of the imperial council. He became known as a dramatist in 1816 by his 'Ahnfrau,' a tragedy of the fatalistic school, which still keeps the stage. It was followed by the dramas 'Sappho' (1819); 'Das Goldene Vliess' (1822); 'Des Meeres und der Liebe Wellen' (1840), an adaptation of the legend of Hero and Leander. Perhaps the finest of Grillparzer's products is the historical drama of 'König Ottokar's Glück und Ende' (1825).

Grilse, a young salmon (q.v.).

Grimes, James Wilson, American politician and legislator: b. Deering, Hillsboro County, N. H., 20 Oct. 1816; d. Burlington, Ia., 7 Feb. 1872. He was graduated at Dartmouth College (1836), and went west, where he began the practice of the law, was appointed secretary of a commission instituted to negotiate the transfer of lands from the Sac and Fox Indians, and after the organization of Iowa Territory in 1838, he was elected to its legislature. He was elected governor of Iowa in 1854, and after completing his term, was sent to Congress as a Republican Senator. He voted for the acquittal of President Johnson at his impeachment trial.

Grimké, grĭm'kē, **Archibald Henry,** American lawyer: b. Charleston, S. C., 17 Aug. 1849. He was graduated from Lincoln University in 1870, from the Harvard Law School in 1874, and in 1883–85 was editor of the 'Hub,' a Boston newspaper. In 1891–92 he was a special writer for the Boston *Herald* and *Traveller,* and in 1894–98 United States consul at Santo Domingo. His writings include a 'Life of William Lloyd Garrison' (1891), a 'Life of Charles Sumner' (1892), and numerous contributions in periodicals, dealing chiefly with various questions pertaining to the American negro.

Grimké, Thomas Smith, American lawyer and scholar: b. Charleston, S. C., 26 Sept. 1786; d. near Columbus, Ohio, 12 Oct. 1834. He was graduated at Yale College in 1807, studied law at Charleston and rose to eminence at the bar and in the politics of his State. He became widely known by his addresses in behalf of peace, religion, and literature. An early and prominent advocate of the American Peace Society, he held the opinion that even defensive warfare is wicked. Though a superior classical scholar, he maintained that neither the classics nor mathematics should enter into any scheme of general education in this country. In some of his pamphlets he introduced a new system of orthography of the English language. A volume of his addresses was published at New Haven in 1831.

Grimké Sisters, The, Sarah Moore, and Angelina Emily: b. Charleston, S. C., 1792 and 1805; d. Hyde Park, near Boston, 1873 and 1879. They were sisters of Thomas Smith Grimké (q.v.). They liberated their slaves, removed to Philadelphia, entered the Society of Friends, and became known in connection with the Anti-slavery movement. They went to New York in 1836 and in the year following to Boston; were leaders in the American Anti-Slavery Society, and appeared as platform speakers on slavery. In 1854 they established a successful coeducational academy at Eagleswood (near Perth Amboy), N. J. Sarah lectured also on woman's rights. Angelina wrote 'An Appeal to the Christian Women of the South'; Sarah an 'Epistle to the Clergy of the Southern States.'

Grimm, Jakob Ludwig, yä'kōb lood'vĭg grĭm, German philologist: b. Hanau, Hesse-Cassel, 4 Jan. 1785; d. Berlin, 20 Sept. 1863. In 1806 he became librarian to Jerome Bonaparte, king of Westphalia, and from 1816 to 1829 occupied the post of second librarian at Cassel. From 1830 to 1837 he resided at Göttingen as professor and librarian, lecturing on the German language, literature and legal antiquities. Having, with six other professors, resisted the unconstitutional encroachments of the King of Hanover, he was banished, and after his retirement to Cassel, he was, in 1841, called to Berlin as a professor and member of the Academy of Sciences. He sat in the National Assembly of 1848, and in that of Gotha in 1849. From that time till his death, he occupied himself only with his various publications. He wrote on German mythology, German legal antiquities, the history of the German language, and published old German poems, etc. His two greatest works, both unfinished, are his 'Deutsche Grammatik' (1819–37), and his 'Deutsches Wörterbuch' commenced in 1852, in conjunction with his brother Wilhelm (q.v.), and gradually completed by eminent scholars. He also published, in company with his brother, the 'Kinder und Hausmärchen,' one of the most popular collections of juvenile fairy tales.

Grimm, Wilhelm Karl, vĭl'hĕlm kärl, German philologist: b. Hanau, 24 Feb. 1786; d. Cassel, 16 Dec. 1859. He was the companion in study of his brother, Jakob Grimm (q.v.), at the Lyceum of Cassel, the University of Marburg, and again at Göttingen, where in 1830 he was appointed under-librarian and supernumerary professor of philosophy. He joined his brother in the protest against the King of Hanover, shared his exile, and also his call to Berlin. There they labored together, and were commonly known as the Brothers Grimm. Under that name also they have a certain immortality in the affections of the civilized world. His earliest independent work was a German translation of the Danish 'Kœmpe-Viser' (1811–13). He edited many old German texts and collaborated with his brother Jakob in several of his works. His own most important book is 'Die deutsche Heldensage' (1867), and 'Kleinere Schriften,' (1881–86).

Grimm's Law is the name given to the rule which regulates the *Lautverschiebung*, or permutation of certain primitive consonants, which takes place in the Teutonic languages. The law, as finally formulated by Jakob Grimm, is that if the same roots or words exist in Sanskrit, Greek, and generally in Latin, Celtic, Lettic, and Slavonic, and also in Gothic, English, Dutch, and other Low German dialects on the one hand, and in Old High German on the other, the following correspondences are to be expected: (1) Gothic has a soft mute, and High German a hard mute, in place of the corresponding aspirate in Sanskrit and Greek; (2) Gothic has a hard mute, and High German an aspirate, in place of the corresponding soft mute in Sanskrit and Greek; (3) Gothic has an aspirate, and High German a soft mute, in place of the corresponding hard mute in Sanskrit and Greek. Thus, a primitive *th* becomes *d* in Low German, and *t* in High German, as in the words *th*ugatēr, *d*aughter, *t*ochter. A primitive *d* becomes *t* in Low German, and *z* in High German, as in *d*uo, *t*wo, *z*wei; or *d*ens, *t*ooth, *z*ahn; or *d*ecem, *t*en, *z*ehn. A primitive *t* becomes *th* in Low German, and *d* in High German, as in *t*res, *th*ree, *d*rei; or *t*u, *th*ou, *d*u; or *t*enuis, *th*in, *d*ünn. Similar changes affect the labials and gutturals, as in *p*ecus, *f*ee, *v*ieh; *p*ater, *f*ather, *v*ater; *f*agus, *b*eech, *p*uocha; and in *o*culus, *e*ghe ("eye"), auge; *qu*is, *w*ho, *w*er; or *kh*ortos, garden, *k*orto. The normal changes are set forth in the following table:

	Labials			Dentals			Gutturals		
Greek, etc.	p	h	ph	t	d	th	k	g	kh
Gothic, etc.	f	p	b	th	t	d	(h)	k	g
Old High German	b(v)	f	p	d	z	t	g(b)	ch	k

The credit of the discovery of the *Lautverschiebung* is not wholly due to Jakob Grimm. Ihre and Rask had discovered, as early as 1818, the law of the transmutation of consonants in Greek and Gothic, while Grimm, in the second edition of his 'Deutsche Grammatik'; which appeared in 1822, added the corresponding changes in Old High German, and formulated the law as it now stands.

Grimm's Law may be interfered with by the action of other laws, especially by the position of the accent, as formulated in Verner's Law (q.v.). Thus *fráter* is accented on the first syllable and *patér* on the second, consequently, though we have *brother* and *father* in English, we find *bruder* and *vater* in High German. The accent in *patér* has interfered with the regular action of the *Lautverschiebung*, and prevented the normal change of *t* to *d* from taking place.

Thus Grimm's Law may be defined as the statement of certain phonetic facts which happen invariably unless they are interfered with by other facts. The great use of Grimm's Law, in addition to the identification of words in different languages, is in the detection of loan words. Any etymology which violates Grimm's Law, as qualified by other phonetic laws, must be rejected unless it can be explained as a loan word.

The causes which brought about the changes formulated in Grimm's Law are obscure. They are probably due to the settlement of Low German conquerors in central and southern Germany.

See Douse, 'Grimm's Law: a Study of Lautverschiebung' (1876), Max Müller, 'Lectures on the Study of Language,' 2d series, lecture v. (1864), Morris, 'Historical Outlines of English Accidence,' chap. ii. (1872).

Grimsel (grĭm'zĕl) **Pass**, a mountain pass in the Bernese Alps, leading from Meiringen, canton of Bern, to Obergesteln, canton of Valais. It was in this pass that the French repulsed the Austrians in 1799.

Grim'shaw, Robert, American engineer: b. Philadelphia, Pa., 25 Jan. 1850. He is lecturer in the Franklin Institute of his native city and has done much literary work. He has published: 'Saws' (1880); 'Steam-Engine Catechism' (1887); 'Records of Scientific Progress' (1891); 'Hints to Power Users' (1891); 'Fifty Years Hence' (1892).

Grim'thorpe, Edmund Beckett Denison, Lord, English barrister and author: b. Carlton Hall, Nottinghamshire, England, 12 May 1816; d. 29 April 1905. He took much interest in architecture, and designed many churches and houses, but he will be longest remembered for his restorations and rebuildings at St. Albans Cathedral, works which were carried out at his own expense, but from their iconoclastic character met with almost universal disapproval from architects and excited much discussion both in England and America. His works include: 'Origin of the Laws of Nature' (1879); 'A Book on Building' (2d ed. 1880); 'Should the Revised New Testament be Authorized?'

(1882); 'Astronomy Without Mathematics' (7th ed. 1883); 'Treatise on Clocks, Watches, and Bells' (7th ed. 1883).

Grinding, a mechanical process in which certain effects are produced by the attrition of two surfaces. This process is of extensive use in various mechanical arts, as in grinding corn, ores, colors, in which cases the object is to reduce the materials by crushing to a fine powder; or in grinding the metals, glass, and other hard substances for the purpose of giving them a certain figure or polish, or a sharp cutting edge. In the first case the grinding or crushing is effected by passing the material between rough stones, as in the common flour-mill, or as in crushing ores between heavy metal cylinders, smooth or fluted, according to the degree of fineness required, or by a heavy stone or iron cylinder revolving upon a smooth plate. Chicory, chocolate, plumbago for pencils, and a variety of other substances are ground by iron or stone rollers, revolving on a slab in such a manner that they not only merely roll but also rub on the surface of the slab. A knife or scraper follows one roller and precedes the other, scooping the paste into the position required to come fairly under the roller which follows it. Colors are ground in small quantities with a muller and slab. The muller is a heavy piece of stone of conical shape, and which rests its base on the slab and is grasped by the hands; the color is mixed to a pasty consistence with the desired medium of oil or water, and rubbed between the two surfaces until smooth and impalpable. The grinding of cutlery and tools is effected by means of the grindstone; glass lenses and metal specula are ground to shape with emery-powder laid on a metal tool. Ornamental glass is ground into facets or otherwise by means of stones and lap-wheels. Diamonds and other precious stones are cut or ground with diamond dust embedded in soft iron. Large flat surfaces are obtained by first working two pieces of the material nearly flat and then laying the one upon the other and grinding their surfaces together with sand, emery, or other cutting powder. Plate-glass is flattened in this way; also surfaces of cast-iron, where accurate fitting is required. Sockets and other bearings which require to be fitted with great nicety are usually finished by being ground together. For brass or bell-metal pumice-stone is employed in such cases, as emery is apt to embed itself in the metal and give it a permanent abrading action on the bearings. Dry grinding is the term applied to the grinding of steel with dry grindstones. The points of needles and forks are produced by this means, also the finishing of steel pens and the surface of gun barrels. The men and women engaged on this kind of work suffer painfully from irritation of the throat and nostrils caused by the fine, dust-like particles that fly off from the work. These difficulties have been mitigated in recent years by the use of mouth-pieces of damp cloth, and the provision of air-blasts to dispose of the dust. Sand-jet grinding is a remarkable process, in which abrasion is effected by the percussion of small hard particles on a plain surface. Sharp silicious sand, varying in hardness and fineness according to the kind of work to be done, is employed in most cases. This sand is impelled by a blast of steam or of air. A hole 1½ inch in diameter by 1½ deep, has been bored through a solid piece of corundum (the hardest mineral known except the diamond) in 25 minutes by sand driven with steam-power at 300 pounds pressure on the square inch. A diamond has been sensibly reduced in weight, and a topaz altogether dissipated by a sand-jet in one minute. These results are obtained by causing a sand-stream to mix with a steam jet. The sand passes through a central tube, and the steam through an annular tube which surrounds it; a kind of suction acts at the end of the concentric tubes, which draws the sand into the steam jet, and both dash with great force against the stone or other substance to be acted upon, which is placed at about an inch from the mouth of the tube. By the use of flexible jointed connecting tubes the jet can be turned in any direction, and grooves, moldings, letters, etc., can be produced instead of merely straight cuts or cavities. By using an air jet instead of steam, and varying the pressure, a design can be engraved on glass, the parts not to be acted upon being covered with the pattern, made of paper, lace, india-rubber, or oil-paint.

Grindstone Island. (1) A small island lying off the southeastern coast of New Brunswick, Canada, at the head of the Bay of Fundy. It has a number of sandstone quarries, from which a fine quality of sandstone is exported, chiefly to the United States, for the manufacture of grindstones. (2) One of the most important of the Magdalen Islands, belonging to Quebec, in the gulf of St. Lawrence, northeast of New Brunswick.

Grinnell, grĭn-ĕl', **George Bird,** American writer and ornithologist: b. Brooklyn, N. Y., 20 Sept. 1849. He has been an editor of 'Forest and Stream' from 1876. His works deal principally with Indian life and folklore and among them are: 'Pawnee Hero Stories and Folk Tales' (1889); 'The Story of a Prairie People'; 'The Story of the Indian' (1895); 'The Indians of To-day' (1900); 'Jack Among the Indians' (1900).

Grinnell, Henry, American patron of arctic exploration: b. New Bedford, Mass., 1799; d. New York, 30 June 1874. In 1828 he settled in New York and amassed a fortune in business as a ship-owner. This gave him an opportunity to fit out at his own expense the ship which in 1850 sailed from New York in search of Franklin. He also bore a large part of the expense of Kane's arctic voyage (1853–55), as well as of the later American expedition under the command of Hayes and Hall. In recognition of his services to geographical science the American Geographical Society elected him their president and the coast which stretches to the north of Smith Sound was named Grinnell Land.

Grinnell, Josiah Bushnell, American clergyman and politician: b. New Haven, Vt., 22 Dec. 1821; d. Marshalltown, Iowa, 31 March 1891. After studying at Auburn Theological Seminary, he entered the Presbyterian ministry and held pastorates successively at Union Village, N. Y., Washington, D. C., and New York. In 1854 he founded the Congregational Church in Grinnell, Iowa, a town named for him, and preached there several years. Later he became known as a wool grower, sat in the Iowa senate 1856–60, and in Congress as a Republican 1863–67. He frequently aided fugitive slaves and at one time a reward was offered for his head on this account by slave-holders. He gave much assistance to Grinnell University, of which he was president, and laid out five Iowa towns. He was the author of 'The Home of the Badgers' (1845); 'Cattle Industries of the United States' (1884).

Grinnell, Iowa, city in Poweshiek County; on the Chicago, R. I. & P., and the Iowa C. R.R.'s; 115 miles west by north of Davenport. It is the principal trade centre for the county, and manufactures flour, carriages, gloves, and some farming implements. It is the seat of the Iowa College, founded in 1848 and under the auspices of the Congregational Church. In 1882 the city was nearly swept away by a cyclone. Pop. (1900) 3,860.

Grinnell Land, a large tract of land in the Arctic Ocean, separated from Greenland by Kennedy and Robeson channels. The northern part of the explored portion is called Grant Land and the southern part Ellesmere Land. The coast is irregular, and the interior is hilly. The climate of the valleys is mild in summer; in many places there is no snow for several weeks, and vegetation grows rapidly. The fox, wolf, musk-ox, ermine, and hare are found in quite large numbers. Lieut. De Haven, an American, in charge of the Grinnell expedition in search of Sir John Franklin, first saw this land 22 Sept. 1850 and named it after Henry Grinnell (q.v.). Eight months later it was visited by Capt. Penny of the British vessel, Lady Franklin. He not knowing of the previous visit called the country Prince Albert Land. A British expedition under Narses visited it 25 years after De Haven, Greely in 1881, Lockwood in 1882, and Peary in 1898–99.

Gripe. (1) A brake applied to the wheel of a crane or derrick; it generally consists of an iron hoop under the control of a lever, and is drawn closely around the wheel to check its motion. (2) As a nautical term: (a) The fore-foot of a ship, on to which the stem is fastened; the forward end of the keel. It is scarfed to the stem piece and false keel, and is secured by a horseshoe or ring to the stem. (b) A broad plait of rope or bars of iron, with lanyard rings and claws, passing over a large boat, and by which it is secured to the ring bolts of the deck. (c) One of a pair of bands passing round a boat near the stem and stern when suspended from the davits, to prevent the boat from swinging about.

Grippe. See INFLUENZA.

Griqualand (grē'kwa-lănd) **East**, a district of Cape Colony, Africa, lying south of Natal, between Pondoland and Basutoland; area, 7,594 square miles. The capital is Kokstad. Pop. (1891) 152,618.

Griqualand West, a district of Cape Colony, Africa, bounded north by Bechuanaland, east by the Orange River colony, south by Orange River, and west by Orange River and Bechuanaland; area, 15,197 square miles. It is noted for its diamond fields which in 1870 began to attract people from other countries. The country was then claimed by the Orange Free State and by Waterboer, the Griqua chief. In 1871 Waterboer ceded all his rights to the British government, and in 1876 the Orange Free State relinquished all claim for the sum of about $440,000. In 1880 Griqualand West was incorporated as a part of Cape Colony. The chief centre of the diamond mining industry is Kimberley (q.v.), the capital. Pop. (1891) 83,375. Consult: 'Statesman's Year Book'; Reports (British) 'On the Cape and Griqualand West Diamond Mining:' Reunert, 'Diamonds and Gold in South Africa'; Williams, 'The Diamond Mines of South Africa' (1902).

Gris'com, John, American educator: b. Hancock's Bridge, Salem County, N. J., 27 Sept. 1774; d. Burlington, N. J., 26 Feb. 1852. After pursuing his studies at the Friends' Academy in Philadelphia, established by William Penn, he took charge of the Friends' monthly meeting school in Burlington, with which he was connected 13 years. In 1807 he removed to New York, and began there a career of 25 years as a teacher. In connection with his school he lectured on chemistry with much success. He took a prominent part in the formation of the society for the prevention of pauperism (1817), of which he prepared the constitution and an elaborate first report on the causes and remedies of pauperism. He was an organizer of the Rutgers Medical College, in which he occupied the chair of chemistry and natural philosophy, and after the suspension of the college was widely known as a general lecturer on those subjects. Horace Mann quoted him as one of the eight educational authorities for the changes which Mann planned to introduce into the Massachusetts school system.

Grisons, grē-zôṅ (German, *Graubünden* or *Bünden*), the largest canton of Switzerland; area, about 2,773 square miles. It is a mountainous country, more than 20 peaks being above 9,000 feet. The valleys are generally narrow, Upper and Lower Engadine are the broadest. Its chief drainage streams are the Inn, branches of the Adige and the Adda, and the Vorder and the Hinter Rhine which have their rise in this canton, and which belong to the Rhine basin. There are a large number of small lakes. Snow rests on the mountains until the last of May and sometimes into late July, but the climate of the valleys is warm or temperate nearly all the year. Agriculture in the valleys and the raising of cattle and sheep on the mountain sides are the chief occupations. Pop. (1900) 104,510.

Griswold, grĭz'wōld, **Alexander Viets**, American Protestant Episcopal bishop: b. Simsbury, Hartford County, Conn., 22 April 1766; d. Boston, Mass., 15 Feb. 1843. After studying for the ministry he was ordained in 1795. He was rector of St. Michael's Church, Bristol, R. I., 1804–30 and of St. Peter's, Salem, Mass., 1830–35. When what was known as the eastern diocese of the Episcopal Church was organized he was consecrated its first bishop in 1811. He published 'The Reformation and the Apostolic Office' (1843). See Stone, 'Memoirs of Bishop Griswold' (1844).

Griswold, John Augustus, American manufacturer: b. Nassau, Rensselaer County, N. Y., 1822; d. 1872. At Troy, N. Y., he was active successively in the hardware, drug, and iron trades, and established the Albany and Rensselaer Iron and Steel Company. He was a leader in the introduction of Bessemer steel manufacture into the United States, and with C. H. Delamater built the Monitor of Civil War fame. In 1855 he was elected mayor of Troy, in 1863 a Democratic representative in Congress, and subsequently was twice re-elected as a Republican. In 1868 he was nominated for the governorship of New York, but defeated by the Democratic nominee, J. T. Hoffman.

Griswold, Matthew, American jurist: b. Lyme, Conn., 25 March 1714; d. there 28 April 1799. Besides being lieutenant-governor of Connecticut 1771–84, he was governor 1784–85 and became judge of the supreme court in 1769. He also presided over the convention which ratified the Federal Constitution.

Griswold, Roger, American politician: b. Lyme, Conn., 21 May 1762; d. Norwich, Conn., 25 Oct. 1812. He was graduated from Yale College in 1780, and afterward studied and entered on the practice of law. He was a member of Congress, 1795–1805, and became judge of the Connecticut supreme court in 1807. He was lieutenant-governor of his native State, 1809–11, and governor 1811–13. He was a son of Matthew Griswold (q.v.).

Griswold, Rufus Wilmot, American author and compiler: b. Benson, Rutland County, Vt., 15 Feb. 1815; d. in New York 27 Aug. 1857. He was apprenticed to the printing trade, but afterward studied divinity and became a preacher in the Baptist Church. He soon became associated in the editorship of literary periodicals in Boston, New York, and Philadelphia, among which were the 'New Yorker,' 'Brother Jonathan,' and the 'New World.' In 1842–43 he edited 'Graham's Magazine,' in Philadelphia, to which he attracted contributions from some of the best writers in the country, and in 1850 projected the 'International Magazine,' published in New York, and edited by him till April, 1852. The works by which he is chiefly known are collections of specimens from American authors, accompanied by memoirs and critical remarks. His published works include: 'Poets and Poetry of America' (1842); 'Prose Writers of America' (1846); 'Female Poets of America' (1849); 'Sacred Poets of England and America' (1849); 'Poets and Poetry of England in the Nineteenth Century' (4th ed. 1854); 'Curiosities of American Literature,' 'Washington and the Generals of the American Revolution,' with Simms, Ingraham, and others (1847), 'Napoleon and the Marshals of the Empire,' with Wallace (1847); 'Republican Court, or American Society in the Days of Washington' (1854). He edited the first American edition of the prose works of Milton (1845), and was one of the editors of the works of Edgar A. Poe, for whose bad repute Griswold's 'Memoir' is partly responsible.

Griswoldville, Battle of. When General Sherman marched from Atlanta to the sea, his right wing, commanded by Gen. Howard, was under instructions to threaten Macon and strike the Savannah Railroad at Gordon, about 20 miles east. Upon his arrival at Clinton, the cavalry advance made a demonstration on Macon, and 21 Nov. 1864, his entire cavalry force took up an advanced position covering all the roads to Macon, and that day and the next all the troops and trains were closed up toward Gordon, except C. R. Woods' division, which was directed to take up a strong position on the Irwinton road and demonstrate on Macon and Griswoldville, eight miles east. The demonstration was made on the 22d by Walcutt's brigade of 1,513 men and two guns, in co-operation with Kilpatrick's cavalry on the different roads. Some of Kilpatrick's cavalry were in advance of Walcutt and were fiercely attacked by Wheeler; but with Walcutt's assistance Wheeler was driven from the field, and followed by Walcutt beyond Griswoldville. Walcutt was then recalled to a position a little east of Griswoldville, where two miles in advance of his division, he formed line along a slight rise of ground, with his flanks well protected by swampy ground, and with an open field in front. Kilpatrick's cavalry was on either flank. Walcutt had scarcely thrown up a rail barricade, in view of another attack of Wheeler's cavalry, when he was fiercely assailed by infantry. That morning, under Gen. Hardee's order, Gen. G. W. Smith, in command of a considerable body of Georgia militia that had been concentrated at Macon, directed Gen. Phillips, with a division of infantry and a battery, to march from Macon to Gordon and take trains for Augusta. Phillips had been instructed to halt before reaching Griswoldville and wait for further orders, and was cautioned not to engage an enemy if met, but to fall back to the fortifications at Macon. But when he heard of Walcutt's position he moved through Griswoldville and, with more courage than discretion, threw his four brigades against Walcutt, at the same time opening destructively with his artillery. At 2 o'clock, in three compact lines, his militia charged to within 75 yards of Walcutt's line, and were repulsed. The assaults were repeated in front and on both flanks, and continued until sunset, when, everywhere repulsed, he abandoned the field, leaving his dead and wounded. During the action Walcutt was severely wounded by a piece of shell. The Union loss was 13 killed, 69 wounded, and 2 missing. The Confederate loss was 51 killed and 472 wounded. Consult: 'Official Records,' Vol. XLIV.; Cox, 'The March to the Sea'; the Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. Carman.

Griv'et. See Green Monkeys.

Groesbeck, groos'běk, **William Slocomb,** American politician: b. New York, 1815; d. 1897. He was graduated from Miami University, Oxford, Ohio, in 1835, studied law and began practice at Cincinnati. In 1851 he was a member of the Ohio State constitutional convention, and in 1852 a member of the commission appointed for the codification of the State laws. From 1857 to 1859 he was a Democratic representative in Congress, in 1872 was nominated for the Presidency by the Liberal Republicans but met no recognition in the ensuing campaign, and in 1878 was United States delegate to the International Monetary Congress at Paris. He defended Andrew Johnson in the latter's impeachment trial (1868).

Groin, the region where the front of the thigh joins the body. The abdominal muscles end below in a strong tendon which makes a fold across the front of the bony pelvis. The large nerves, arteries, and veins pass through folds of this ligament, and portions of the abdominal contents in case of rupture pass into the scrotum or form a tumorous swelling in the groin.

Gronlund, grōn'lŭnd, **Lawrence**, American socialist: b. in Denmark 1847; d. 1899. He studied in the University of Copenhagen, in 1867 came to the United States, practiced law for a time, but became a writer and speaker on socialism. Among his publications are 'The Coming Revolution' (1880), a forecast of the peaceful changes which he believed might be effected by a national organization operating in every community; 'Ça Ira,' a rehabilitation of Danton (1888); and 'The New Economy' (1898).

Gronovius, grō-nō'vĭ-ŭs (properly Gronov, grō'nōv), the name of several Dutch classical scholars:

(1) Johann Friedrich, yō'hän frēd'rĭh: b. Hamburg 8 Sept. 1611; d. Leyden, 28 Dec. 1671. He studied at Leipsic and Jena, and law at Altdorf, was appointed professor of history and eloquence at Deventer (1642), and, after the death of Heinius, succeeded him as professor of belles-lettres at Leyden (1658). His editions of Livy, Statius, Justin, Tacitus, Aulus Gellius, Phædrus, Seneca, Sallust, Cicero, Terence, Pliny, and Plautus, 'Observationes' (1639), and edition of Hugo Grotius' work, 'De Jure Belli et Pacis' (1642) are justly valued on account of the notes.

(2) Jakob, yä'kōb, son of the preceding: b. Deventer, 1645; d. Leyden, 21 Oct. 1716. He studied at Deventer and Leyden, and published, in 1676, an edition of Polybius, which met with great applause. He received from the grand duke of Tuscany a professorship at Pisa, which he relinquished in 1679 to become professor of Greek literature and history at Leyden. This learned critic edited Tacitus, Polybius, Herodotus, Pomponius Mela, Cicero, Ammianus Marcellinus and other classical writers, and compiled the valuable 'Thesaurus Antiquitatum Græcarum' (1698–1702). He also promoted the publication of the collections of Grævius. He was a violent controversialist.

Groot, grōt, **Groete**, or **Groote**, **Gerhard** or **Gerardus**, founder of the Brothers of the Common Life (q.v.): b. Deventer 1340; d. there 20 Aug. 1384. Educated at Paris, he there became a teacher, later took deacon's orders and was successful as a traveling preacher. He advocated general reading of the Scriptures, assembled a company for the preparation of copies of the Bible, and thus began the formation of the Brothers of the Common Life. To this order, which obtained papal sanction in 1418, belonged Thomas à Kempis (q.v.). Groot was the author of several works.

Gros, Antoine-Jean, aṅ-twän zhōṅ grō, Baron, French historical painter: b. Paris 16 March 1771; d. near Paris, 26 June 1835. At 14 he became a pupil of David, and in 1794 left Paris for Rome. His means, however, were not sufficient for the journey, and he had to depend on what he could earn as a portrait-painter in the various towns he passed through. At Genoa, in 1796, he was drawn for the French army, and soon became a staff-officer. Josephine, afterward empress of France, saw and admired several portraits by the young officer, and he was called upon to paint that of Bonaparte. The result was a picture representing Napoleon leading his troops over the bridge of Arcola. In 1804 he produced his 'Peste de Jaffa,' considered by many to be his masterpiece. He painted the 'Bataille d'Aboukir' (1806); 'Bataille d'Eylau' (1808); 'La Prise de Madrid,' 'Wagram,' and 'La Bataille des Pyramides' (1810). In France his chief work is considered by some to be the cupola of St. Geneviève at Paris, exhibiting the saint protecting the throne of France, represented by Clovis, Charlemagne, St. Louis, and Louis XVIII. This picture covers an immense space, and is correct in design but defective in color and expression. The artist received for it 100,000 francs and the title of baron. The rise of the romantic school bore away from him the tide of popularity, and his last work 'Hercule et Diomède,' was a failure. Adverse criticisms upon it brought on a fit of despondency and he drowned himself in the Seine.

Gros Ventres, grō väntr (Fr. «big bellies»). (1) The Minnetari or Hidatsa Indians, on the Missouri River. (2) A band of the Arapaho, who separated from the main body about 1800; the name was a misunderstanding of their own term, which meant «hungry men» or «beggars.» After conflicts with the Sioux, and being plundered by the Crows, whom they had joined, they settled among the Blackfeet near Milk River about 1824; prospered, and were very hostile to the whites. About 1830 they had some 400 lodges and 3,000 souls. But about 1866 they were decimated by the measles, and thus weakened, received a terrible defeat from the Piegans; reduced to about 1,300 by smallpox in 1870, they were plundered and many killed by the Sioux. Later they were joined by the main body of Arapaho and Cheyennes. In 1868 they were settled among the Blackfeet in Montana.

Grosbeak, grōs'bēk, any of various birds whose beaks seem disproportionately large. They are mainly finches such as the hawfinch and bullfinch in Europe, and their relatives in the Orient. Bird-dealers call «grosbeaks» a great number of African, Asiatic and American line cage-birds, some of which are weaver-birds, or tanagers, etc. The term is more exactly given to certain North American fringilline birds with big swollen bills, such as the cardinal (q.v.), the evening grosbeak (q.v.), and the pine, blue, rose-breasted, and black-headed grosbeaks. The pine grosbeak (*Pinicola enucleator*) is a greenish yellow finch which dwells exclusively in the coniferous forests of northern Europe and America, and is only seen in the United States when forced southward by hard winters; it feeds on the seeds of the pine, spruce, etc., wrenching open the cones with its powerful beak. The blue grosbeak (*Guiraca cærulea*) is a large, richly blue southern and western bird, nearly related to the indigo-finch, which makes its nest in a bush, and lays pale blue eggs, wholly unmarked. The rose-breasted and black-headed grosbeaks represent the genus *Zamelodia*, the former (*Z. ludoviciana*) in the Eastern States, and the latter (*Z. melanocephala*) in the Rocky Mountain region. Both are birds of brushy places, making large, rude nests in bushes and laying greenish, heavily marked eggs; and in the breeding-season both are among the loudest and most brilliant of American song-birds. As in nearly all the grosbeaks the females of these species are inconspicuous in brown tints, while the males are dressed in gay colors. The male rose-breasted has the head, neck and upper parts mostly black, with the rump, wings, tail and abdomen, white; while the breast and lining of the bend of the wing are exquisite rose-red, which the bird is fond of displaying. The male black-head has a wholly black head and upper parts, set off by a collar and other marks of dull orange, which color also suffuses the whole lower parts.

Grose, grōs, **William**, American soldier and politician: b. Dayton, Ohio, 1812; d. 1900. He resigned his position as judge of the court of common pleas in 1861 to recruit and take command of the 36th Indiana regiment of infantry, and commanded a brigade in the battles of Murfreesboro, Chickamauga, and Chattanooga. He was commissioned brigadier-general 30 July 1864 and at the battle of Nashville, 15 and 16 Dec. 1864, he commanded the Third brigade in General Thomas's army. In 1865 he was brevetted major-general of volunteers. He was State senator from 1879 to 1883.

Gross, grōs, **Charles**, American historian: b. Troy, N. Y., 10 Feb. 1857. After graduating from Williams College in 1878, he pursued his studies at Göttingen, and was engaged in literary work in England 1884–87. Since 1888 he has been instructor and professor of history at Harvard University. A frequent contributor to the 'American Historical Review' and other historical journals, he has published: 'Gilda Mercatoria' (1883); 'The Exchequer of the Jews of England in the Middle Ages' (1887); 'The Gild Merchant' (1890); 'Select Cases from the Coroner's Rolls' (1896); 'Bibliography of British Municipal History' (1897); 'Sources and Literature of English History' (1900). In addition he has translated: Lavisse's 'Political History of Europe' (1891); Kayserling's 'Christopher Columbus' (1893).

Gross, Samuel D., American physician and surgeon: b. Northampton County, Pa., 8 July 1805; d. 6 May 1884. He began the practice of medicine in Philadelphia, devoting his leisure to study and to the translation of French and German medical works. His first original work was a treatise on the 'Diseases and Injuries of the Bones and Joints' (1830), in which occurs the first account of the use of adhesive plaster as a means of extension in the treatment of fractures. In 1835 he became professor of pathological anatomy in the medical department of the Cincinnati college, where he delivered the first systematic course of lectures on morbid anatomy that had ever been given in this country, and composed the first systematic treatise upon the subject ever published in the United States, 'Elements of Pathological Anatomy (1839). In 1840 he became professor of surgery in the University of Louisville. Besides the works already mentioned, he was the author of a monograph on 'Wounds of the Intestines' (1843): 'Diseases, Injuries, and Malformations of the Urinary Organs' (1851); 'Foreign Bodies in the Air Passages' (1854); 'System of Surgery, Pathological, Diagnostic, Therapeutic, and Operative' (2 vols. 1859).

Grosse, Julius Waldemar, German poet, dramatist, and novelist: b. Erfurt, Prussia, 25 April, 1828; d. 1902. After obtaining his education at Halle, he entered the field of journalism, for 16 years (1854–70), being associated with the *Neue Münchener Zeitung* (afterward known as the *Bayrische Zeitung*), and in 1870 becoming secretary of the Schiller-Stiftung, at Weimar. His writings are various, including novels, dramas, epics, songs, and ballads, the most important of which are his war songs, 'Wider Frankreisch' (1870); 'Das Volkramslied' (1889); 'Gundel von Königssee,' and 'Das Mädchen von Capri,' all epic poems; 'Pesach Pardel' (1871); 'Hilpah und Shalum,' and 'Der Wasunger Not' (1872), comic epics; the dramas, 'Tiberius' (1875), and 'Fortunat' (1895); the novels, 'Ein Revolutionär' (2d ed. 1871), and 'Tante Carldora,' and several tales and romances, among which is 'Die Novellen des Architekten' (1896).

Grosseteste, Robert, English Roman Catholic prelate: b. Stradbrook, Suffolk, about 1175; d. Buckden, 9 Oct. 1253. He studied law, physics, and theology at Oxford and Paris, and, upon his return to England, attained an enviable reputation as a theologian, so much so that in 1214 he became archdeacon of Wifts, and in 1224 received the directorate of theology and became first *rector scholarum* of the Franciscan school at Oxford. In 1232 he took up the cause of the Jews against the king, defending them with great vigor, and in 1235 was elected Bishop of Lincoln, whereupon he undertook to make radical changes in his diocese and eliminate some of the many abuses prevalent there, the result of which was that though he was possessed of great force of character, his high temper and lack of tact and diplomacy led him into innumerable controversies. The most famous of these was with Pope Innocent IV., who, desiring to fill the lucrative positions in the church with Italians and Provençals, in 1253 sent the Bishop a request that he appoint his (the Pope's) nephew to the first vacant canonry in the cathedral of Lincoln. This Grosseteste flatly refused to do, and, as his clergy stood by him in his fight against this abuse, the matter was finally dropped and it is mainly upon this incident that his fame rests. He was, though, a man of great scholarly attainments, Hebrew, Latin, Greek, French, mathematics, medicine, and music being numbered among them, beside which he was one of the most learned preachers of his time and a voluminous writer. Consult: Perry, 'Life' (London 1871); Luard (editor), 'Roberti Grosseteste Episcopi quondam Lincolniensis Epistolæ' in the Rolls Series (1862).

Grossi, Tommaso, Italian poet and novelist: b. Belluno, on the Lake of Como, 20 Jan. 1791; d. Milan, 10 Oct. 1853. He studied law at Pavia and settled in Milan, where he passed the remainder of his life as a notary, but his political ideas prevented his rise in his profession. His first attempt at poetry was 'La Principe,' written in the Milanese dialect, and this was followed in 1816 by two shorter poems, 'La Fuggitiva' and 'La Pioggia d'Oro,' and in 1820 by 'Ildegonda,' a romance in verse. This poem became popular and set the fashion for that style of writing, the success which it attained encouraging him to write 'I Lombardi alla Prima Crociata' in 1826, a poem remarkable for its patriotic sentiment. Despite the fact that Manzoni gives praise to this last poem in his novel 'I promessi sposi,' and that the cost of printing was defrayed by a generous subscription, it was soon forgotten. This did not dishearten him, however, and in 1834 he published his 'Marco Visconti,' which at once excited public approval and became the pioneer of the historical novel in Italy. His only other work of note was 'Ulrico e Lida,' published in 1837.

Grosso, Matto, mä'tō grō'sō, Brazil (q.v.), a western central state bordering on Bolivia, Argentina, and Paraguay. It has an area of 532,500 square miles and an estimated population in 1900 of 157,000. Capital Cuyabá (q.v.).

Grosvenor, grō'vē-nôr, **Edwin Augustus**, American educator and author: b. Newburyport, Mass., 30 Aug. 1845. He was graduated at Amherst College in 1867 and at Andover Theological Seminary in 1872, was professor of history at Roberts College, Constantinople, in 1873–90; and of European history at Amherst College in 1892–9. In 1899 he was appointed to the newly established chair of modern governments and their administration. His publications include translations from the French of Victor Duruy's 'Modern Times' (1894) and 'General History' (1898); 'The Hippodrome of Constantinople' (1889); 'Constantinople' (1895); 'The Permanence of the Greek Type' (1897); and 'Contemporary History' (1899), extending from 1848 to the present time.

Grote, George, English historical writer: b. Clayhill, Kent, 17 Nov. 1794; d. London, 18 June 1871. After having studied at the Charterhouse, in 1809, he became a clerk in his father's banking house. He kept on with his studies, particularly with philosophy, and his liberal trend of thought gradually drew him into politics. He had written and spoken much in favor of the Reform Bill which was passed in 1832, and in that year he was elected to the House of Commons from London, which seat he continuously occupied until 1841. During all these years he had steadily worked upon his 'History of Greece,' the idea of which was suggested to him by the spirit of partiality displayed in Mitford's 'History of Greece' and which he had severely criticised in an article in the *Westminster Review* (April 1826). He had as early as 1823 devoted himself to the study of Greek history, for a sympathetic interpretation of which his extreme liberality made him admirably suited, and though to a certain extent the spirit of democracy is evident in the 'History of Greece,' yet the facts are placed before the reader with the idea that he will form his own conclusion. His private and public duties had prohibited literary work and it was not until he retired that he completed the first two volumes which appeared in 1845, the last volume of the set, the twelfth, appearing in 1856. Grote also wrote 'Plato and the Other Companions of Socrates' (3 vols., 1865); 'Minor Works,' edited by Alexander Bain (London 1873), and 'Aristotle,' which he left unfinished (2 vols., 1872). He had taken an active interest in educational matters, in 1860 becoming vice-chancellor of the London University, and in 1869 president of the University College, and also was elected a trustee of the British Museum. Consult: Mrs. Grote, 'Memoirs' (London, 1873); Alexander Bain, 'Character and Writings of G. Grote,' prefixed to his 'Minor Works' (London, 1873).

Grotefend, Georg Friedrich, German archæologist and philologist: b. Münden, near Cassel, Prussia, 9 June 1775; d. Hanover, 15 Dec. 1853. He received his early education at Hanover and Ilfeld, and completed his studies at the University of Göttingen (1795–7). He became prorector and later conrector of the gymnasium at Frankfort-on-the-Main (1803–21), and for nearly 30 years (1821–49) was director of the lyceum at Hanover. His research in the field of Latin philology was of great value, but his importance is chiefly due to the fact that he first deciphered the old Persian inscriptions of Persepolis, presenting the results of his labors in a paper before the Academy of Science at Göttingen, 4 Sept. 1802. Chief among his publications are: 'Rudimenta linguæ Umbricæ' (1835–8); 'Neue Beiträge zur Erläuterung der babylonischen Keilinschrift' (1840); 'Zur Geographie und Geschichte von alt-Italien' (1840–2); 'Rudimenta Linguæ Oscæ (1839), etc.

Grotius (gro'chi-us), or De Groot, Hugo, Dutch scholar and statesman: b. Delft 10 April 1583; d. Rostock 28 Aug. 1645. He was a pupil of Joseph Scaliger at the University of Leyden, conducted his first lawsuit in his 17th year; and in his 24th was appointed advocate-general. In 1613 he became syndic, or pensionary, of Rotterdam. In 1615 he was sent to England in order to arrange the difficulties arising from the claims of the English to exclude his countrymen from the Greenland whale-fishery. He declared himself on the side of Barneveldt (q.v.) in the struggle between the Remonstrants and their opponents, and was sentenced to imprisonment for life in the fortress of Loevenstein. He succeeded in escaping by concealing himself in a chest, and after wandering about for some time in the Catholic Netherlands escaped to France, where Louis XIII. gave him a pension of 3,000 livres, withdrawn in 1631. He returned to Holland, but by the influence of enemies, was condemned to perpetual banishment. He later went to Hamburg, and in 1634 to Stockholm, where he was appointed counsellor of state and ambassador to the French court, in which post he remained for ten years. On his return to Sweden by way of Holland he met, in Amsterdam, with a distinguished reception. Most of his enemies were dead, and his countrymen repented of having banished the man who was the honor of his native land. With the talents of the most able statesman, Grotius united deep and extensive learning. He was a profound theologian, excellent in exegesis, his 'Commentary on the New Testament' being still esteemed; a distinguished scholar, an acute philosopher and jurist, and a judicious historian. His writings have had a decisive influence on the formation of a sound taste, and on the diffusion of an enlightened and liberal manner of thinking in affairs of science. As a critic and philologist he seizes the genius of an author with sagacity, illustrates briefly and pertinently, and amends the text with facility and success. His metrical translations from the Greek are executed with the spirit of a poet. Among the modern Latin poets he holds one of the first places, and he also tried his powers in Dutch verse. But the philosophy of jurisprudence has been especially promoted by his great work on natural and national law, 'De Jure Belli et Pacis,' which represented the study of twenty years and laid the foundation of the new science of international law; besides which he wrote 'Annales et Historiæ de Rebus Belgicis' (1657); 'Annotationes in Vetus Testamentum'

(1644); 'Annotationes in Novum Testamentum' (1641–46). 'De Veritate Religionis Christianæ, and Poemata' (1617). See Butler, 'Life of Hugo Grotius' (1826); Hély, 'Etude sur le Droit de la Guerre et de la Paix de Grotius' (1875).

Gro'ton, Conn., town in New London County; on the Thames River, the New York, N. H. & H. railroad; opposite New London. In 1637 Capt. Mason stormed the fortress held by the Pequots, and many lives were lost, both whites and Indians. A more disastrous fight occurred here 6 Sept. 1781, when 800 British troops under Benedict Arnold attacked Fort Griswold (q.v.), which was garrisoned by 150 soldiers. The Americans heroically resisted, but were overwhelmed by numbers, and Arnold and his force entering the fort butchered 85 men and wounded 65. Soon after 35 of the 65 died from the effects of their wounds. This battle is known in history as the "Massacre of Fort Griswold." Groton contains ship-building yards, several manufactories, and the Bill Memorial Library. Consult: Caulkins, 'The Stone Records of Groton' (1903); 'History of New London County'; 'Magazine of American History,' 'The Massacre of Fort Griswold.'

Grouchy, groo-shē, **Emmanuel**, Marquis de, French marshal: b. Paris 23 Oct. 1766; d. St. Etienne 29 May 1847. He acquired distinction in the revolutionary armies, and in the campaign of 1800 fought in the army of the Rhine under Moreau, and rendered important service at the battle of Hohenlinden. In the war with Prussia in 1806, and with Russia in 1807, he acquired new fame, and was sent to the army of Italy under Prince Eugene. At the battle of Wagram his masterly manœuvres contributed greatly to the victory. On the restoration he was banished, but allowed to return in 1815. On Napoleon's return from Elba he immediately joined him, was made a marshal, and obtained first the command of the army of the Alps, and then the command of the cavalry in the grand army. After the battle of Ligny he was sent on the following day with 34,000 men and 100 cannon to follow the retreat of the Prussian army under Blücher. While he here on the 18th engaged with Thielemann, Napoleon gave battle at Waterloo, the disastrous issue of which has been sometimes laid to Grouchy's charge, from having failed to observe how three divisions of the Prussian army were advancing to Waterloo to take Napoleon in flank and rear, while Thielemann alone remained at Wavres. Being again banished, he came to the United States, where he lived five years, but was permitted to return in 1819. After the July revolution he was elected to the chamber of deputies by the department of Allier, supported the new dynasty, and was appointed in 1831 marshal, and in 1832 a peer.

Ground Beetles. The family *Carabidæ*, predatory beetles of various sizes and appearance. It contains upwards of 1,200 described species, nearly all of nocturnal habit, and, consequently, dark, mostly black in color. Some species, however, are metallic green or blue, or beautifully variegated. The family contains many beneficial species, which roam fields, meadows and gardens, destroying many injurious pests. They fly freely at night, and seek concealment in the daytime under stones and logs and in other convenient hiding-places. Most species are terrestrial, but a few forms, such as species of *Calosoma*, known as 'caterpillar-hunters,' climb the trunks of trees in search of noxious caterpillars which they destroy. A remarkable genus is that of the bombardier beetles (q.v.). A very few are occasionally injurious, among them *Agonoderus pallipes*, which burrows into newly planted seeds of corn; and two species of *Harpalus* which are destructive to strawberries. These latter insects are interesting because of their dual habit of being carnivorous as well as herbivorous. They attack, in the beetle stage, the seeds of Ambrosia, and also eat insects of various kinds.

Ground-cherry, herbaceous plants of the potato family, constituting the genus *Physalis*, scattered through most of the world. About 35 species are natives of the United States, and some are known as 'tomato strawberries,' and are cultivated for the sake of their berry-like fruit, which is hidden within a persistent red calyx.

Ground Cuckoo, a coucal (q.v.).

Ground-dove, any of various species of pigeons which live mainly on the ground and seek their food there. The name is especially given to the genus *Columbagallina*, small birds of the warmer parts of America, of which one gentle and familiar species (*C. passerina*) is well known in the South Atlantic States, along the coast. The bronze-wing pigeons of Australia, and the large pigeons of the genus *Goura* (q.v.) are also so called.

Ground Ivy, a familiar European labiate plant (*Glechoma hederacea*), allied to mint, with a creeping stem and purple flowers. The leaves are crenate-reniform and the flowers are in threes. It was formerly employed to flavor ale and also medicinally.

Ground-nut, a climbing plant (*Apios apios*) of the pea family, which puts out dense clusters of dull purple flowers after most other plants have stopped blooming; these are velvety within and sweetly fragrant. The tuberous rootstock is edible, whence the name.

Ground-rent, in law, is the rent paid to the landlord by a person for the use of ground on which he intends to build. The usual arrangement is for a specified time, generally for a period of ninety-nine years. On the expiry of this period the whole of the building becomes the property of the ground-landlord. The ground-landlord is able, when his rent is in arrear, to distrain all the goods and chattels found on the premises, to whomsoever they may belong; and as the ground-rent is generally a small sum compared with the furniture of a tenant, he is always certain of recovering its full amount. This power of distress exists whether the tenant has paid his house-rent to his landlord or not, but the tenant may deduct the amount from the next rent he pays. See Landlord; Rent; Tenant.

Ground-sloths, a family (*Megatheriidæ*) of extinct edentates, related to the modern sloths, but of terrestrial habits, and, in respect to many of them, of gigantic size, which are of special interest because some survived into the human period. They exhibit the head and teeth of a sloth, associated with the vertebræ, limbs and tail of an ant-eater. They were chiefly South American, but spread as far as North America in the Pliocene and Pleistocene epochs, and became extinct in very recent, but probably prehistoric times. *Megatherium* (q.v.) is the largest and most familiarly known genus: it almost equalled an elephant in size, and surpassed one in its massive proportions. *Lestodon*, *Mylodon* (q.v.), *Scelidotherium*, and *Megalonyx* were smaller but more common forms. The discovery of part of the hide of one of these animals, genus *Glossotherium*, in a cave at Last Hope Inlet, Patagonia, showed that their skin was thick, studded with small embedded bony nodules, and thickly covered with long, coarse, yellowish-brown hair, as well preserved as are the feathers of the moas in New Zealand. The skin, says the discoverer, Dr. Moreno, of Buenos Ayres, shows patches of red color, suggesting of course blood-stains; and when small bits were chemically analyzed they yielded serum and the substances of glue. In view of this it seems impossible to believe that the skin can be of any great age, for bacteria would have finished their work upon the serum and gelatine long ago. An equally fresh-looking skull was found, as though in a small stone enclosure, and wounded in such a way as only man could have inflicted; and there are legends among the Indians that such creatures were known to their ancestors. Dr. Moreno is of the opinion, from evidences found in this cave and elsewhere, that these animals had been domesticated by man, but to what extent and for what purposes is unknown.

Consult Beddard, 'Mammalia' (1902), where further references are cited.

Ground-snake, one of the little, burrowing worm-shaped snakes of the genus *Carphophiops*, which abound in tropical America. One species (*C. amœnus*) is numerous under stones and logs in the Southern States, and is glistening chestnut in color above and salmon-yellow beneath. A larger, more purplish species (*C. vermis*) is called "ground-worm" in Louisiana. These snakes are perfectly harmless, and are the least specialized of the *Colubridæ*.

Groupers (Anglicized form of Spanish name "Garrupa"). Tropical and semi-tropical sea-bass of the genera *Epinephelus*, *Promicrops*, *Mycteroperca* and their allies. All are valuable food-fishes and most of them of large size, bright coloration and high quality as game-fishes. About a dozen species enter the waters of the Southern States or California, the most common along the Atlantic coast being the red grouper (*E. morio*), called "Cherna" and by many other local names. It is a large fish (20 to 40 pounds), is particularly abundant on the west coast of Florida, keeps near the bottom and is a voracious carnivore, consuming large quantities of small fishes, as well as crabs, etc. It is a favorite with market-fishermen, because it bears so well the hardships of transportation. The yellow-finned grouper or rockfish (*M. venenosa*); yellow grouper (*M. olfax*); and black grouper of the Florida Keys (*M. bonaci*), are also large and important; while another black grouper (*Promicrops*) is the famous jewfish (q.v.) of sportsmen. Several other species are elsewhere described under particular names, as CABRILLA, MERO, SCAMP, etc. Consult 'American Food and Game Fishes,' by Jordan and Evermann (New York 1902).

Groups, Theory of. Everywhere in mathematics are encountered systems of *operations*, possessing definite laws of combination. Thus, two geometric motions compound into a single motion, two algebraic transformations into a single transformation, under laws as definite as the primordial 2×2 of arithmetic but otherwise capable of infinite variety of simplicity and intricacy. Consider, for example, the 12 rotations of a regular tetrahedron into itself. Any two of these rotations compound into a third one among them, easily identified on a model. By a simple convention, these various combinations can be registered in algebraic form. The several rotations may be designated by the marks $a, b, c, \ldots$; the symbol ab may indicate that a is followed by b, and at the same time designate their resultant effect. This resultant ab is called the *product* of a and b in the order written: it is itself one of the 12 rotations, say c, and we write $ab = c$. It is an instructive exercise to tabulate the products of two or more of the 12 rotations, identifying each product with one of the 12 original rotations. It is possible to express all the 12 rotations as products of two of them, say of the rotation a through 120° about an axis through one of the four vertices of the tetrahedron and the rotation b through 180° about an axis joining the middle points of two opposite edges. It may be noted that the products ab and ba are here not the same rotation: a and b are not *commutative* as in ordinary algebra. On the other hand aa, which is a rotation through 240° about the axis of a, is conveniently denoted by a^2; a^3 and b^2, both of which restore every point to its initial position, may appropriately be equated to 1 (identity), which is included among the 12 rotations. The three rotations b_1, b_2, b_3 about the (trirectangular) axes joining the middle points of opposite edges of the tetrahedron will be found to be commutative: in fact $b_1b_2 = b_2b_1 = b_3$, $b_2b_3 = b_3b_2 = b_1$, $b_3b_1 = b_1b_3 = b_2$; $(b_1^2 = b_2^2 = b_3^2 = 1)$.

The tetrahedral rotations furnish a simple instance of an *algebra of operations*. Any system of operations possesses such an algebra, of greater or less extent. And as many different systems of operations, taken from widely separated mathematical fields, often present one and the same algebra, these algebras are worthy of study by themselves, as generalizing and unifying instruments. Since each algebra is completely defined by the laws of combination of the symbols $a, b, c, \ldots$, we may abstract the idea of operation entirely and deal with the pure algebra. This position having been reached, it is inevitable to the mathematical mind to reverse the order of thought and to devise algebras *à priori*, leaving their concrete interpretation for secondary consideration. In constructing such algebras, choice among the infinite possibilities will be dominated by the two principles of generality and usefulness. The two qualities are combined in high degree in the algebra of *groups*.

Definition of Group.—A system of symbols, or *elements*, $a, b, c, \ldots$ (finite or infinite in number), conceived as capable of multiplication with each other, is said to form a *group* if the following conditions are fulfilled:

(1) The product of any two elements of the system is a third element of the system.

(2). The multiplication is associative: $(ab)c=a(bc)$, (but not necessarily commutative: ab and ba need not be equal).

(3). Equalities $ab=ab'$ or $ab=a'b$ require $b=b'$ or $a=a'$, respectively.

(Conditions (2) and (3) evidently hold for any ordinary kind of *operations;* (1) traces a significant boundary).

The *order* of a group is the number n of its elements. A group is briefly called finite or infinite, according as its order is finite or infinite.

The defining conditions (1)–(3), classic in their simplicity, possess a most extraordinary fecundity. From them alone proceed, by pure logical deduction, the vast and intricate systems which make up the algebra of groups.

As a primary deduction it may be noted that every finite group G contains one and only one element, identity (denoted by 1), such that for every element x of G $1x=x1=x$. A proper power x^m of any element x of G is equal to this element 1; the lowest exponent m for which this is true is called the order of x; every power of x is equal to one of the m powers $x, x^2, x^3, \ldots, x^{m-1}$, 1. The *inverse* x^{-1} of x is defined by $x^{-1}x=1=x^{m-1}x$, whence by (3) $x^{-1}=x^{m-1}$; then $x^{-2}=(x^2)^{-1}=x^{m-2}$, etc. The analogy to ordinary algebra (of mth roots of unity) is here perfect. These elementary principles may be illustrated by reference to the tetrahedral group G of order 12 above.

An infinite group does not necessarily contain the element 1 nor the inverse elements. Thus all the motions of a point along a line in *one* direction form an infinite group, but this does not contain the reverse motions nor the case of no motion. The prevailing tendency is, however, to restrict the name group to systems which contain the inverse of their elements, and consequently the element 1.

A part of the elements of a group G, taken by themselves, may form a group H, which is then called a *subgroup* of G. Thus the powers of any element x of G form a cyclical group H which is either G itself or a subgroup of G. The tetrahedral group has a subgroup of order 4 composed of b_1, b_2, b_3 and identity. The order h of a subgroup H of G is always a divisor of the order g of G. If p^i, where p is a prime number, is a divisor of g, G has one or more subgroups of order p^i, and the total number of these subgroups is of the form $kp+1$, where k is an integer. If p^a is the *highest* power of p that divides g, $kp+1$ is also a divisor of g. These theorems of Sylow and Frobenius are of great assistance in the analysis of groups of finite order. Thus a group of order pq, where p and q are prime numbers, has a single subgroup of order p; it has also a single subgroup of order q, unless p is of the form $kq+1$. Thus the order $15=5.3$ presents only one case, while the order $21=7.3$ presents two. For a further example, the icosahedral group of rotations, which is of order 60, contains subgroups of orders, 2, 4, 3, 5, and also 6 and 10. The 15 lines joining middle points of opposite edges of the icosahedron form five sets of trirectangular axes, each of which sets is converted into itself by a tetrahedral group contained as subgroup in the icosahedral group. There are no subgroups of orders 15, 20, or 30 present.

Isomorphism and Transformation.—Groups which have the same algebra are called isomorphic. Written in the same symbols, isomorphic groups are by definition identical. But in the practice the isomorphism requires to be detected, being veiled under dissimilarity of notation. Once detected among groups derived perhaps from quite different mathematical fields, isomorphism constitutes the unifying principle already mentioned. For example, the tetrahedral group is isomorphic with the group of 12 substitutions (rearrangements) which it produces among the four vertices of the tetrahedron; and the icosahedron group is isomorphic with the corresponding group of substitutions of the five trirectangular axis systems mentioned above. These isomorphisms contribute materially to the theory of equations of degrees four and five.

One instance of isomorphism is expressible by a universal formula. Let G be any group, with elements $a, b, c, \ldots$, and let t be any element whatever capable of combination with $a, b, c, \ldots$, under conditions (1)—(3); then the elements $a'=t^{-1}at$, $b'=t^{-1}bt$, $c'=t^{-1}ct, \ldots$ form a group $G'(t^{-1}Gt)$, and this group G' is isomorphic with G. For if $ab=c$, for example, then $a'b'=t^{-1}at \cdot t^{-1}bt=t^{-1}abt=t^{-1}ct=c'$, so that not only a', b', c' form a group, but the algebra of this group is identical with that of G. The process of deriving G' from G is called *transformation* of G by t; G' is called the *transform* of G by t. All transforms of a group G (by $t, s, \ldots$) are isomorphic with G and with each other.

Transformation has a very simple concrete significance. Suppose that G is a group of *operations*, $a, b, c, \ldots$ performed on a field of objects A, and that t converts A into a second field of objects B; then $t^{-1}Gt$, *i. e.*, t reversed, followed by G, followed by t, produces among the objects B an effect precisely parallel to that produced by G on the corresponding objects A. For example, if A is a plane, G a group of operations in A, t a projection of A on a second plane B, then $t^{-1}Gt$ is the projection of the group G on B. Or again, if G is a group of rotations about an axis A, and t a rotation which moves A into the position B, then $t^{-1}Gt$ is a second group of rotations, precisely similar to G, performed about the new axis B. In general, transformation in the present sense is the concomitant, for operations, of transformations in the ordinary sense as affecting objects.

Group Analysis.—If G is any group and H any subgroup of G, all the transforms of H with respect to the elements of G are contained in G. These transforms are called the conjugates of H in G. Thus the subgroups of order 3 of the tetrahedral group are conjugate in that group. A noteworthy general example is that of the subgroups of order p^a (a a maximum) of a group G; these $kp+1$ subgroups are always conjugate. The number of conjugates of any subgroup H of G is a divisor of g. In the important case where its conjugates all coincide, H is an *invariant* subgroup of G. Every group G has two invariant subgroups, itself and the identical operation. If it has no other invariant subgroups, G is *simple;* otherwise G is *compound.* Thus the four rotations $1, b_1, b_2, b_3$ of the tetrahedral group form an invariant subgroup, this being in fact the only subgroup of order 4, of the tetrahedral group.

A *maximum* invariant subgroup H of G is not contained in any larger invariant subgroup of G. A *principal series of composition* of G consists of G and a series of subgroups, H, I, J, ..., 1 of G, each of which is a maximum invariant subgroup of the preceding one. The ratios of the orders g, h, i, j, ..., 1 of these subgroups is a principal series of *factors of composition* of G. Apart from their order of succession, these factors of composition remain the same for every principal series of composition of G. They play an important part in the theory of algebraic equations.

Every compound group G is reducible to a sequence of simple groups, whose orders are the factors of composition of G. Only simple groups present new problems. The chief problem of the pure theory of groups is therefore the determination of all simple groups. This problem awaits solution. All groups of prime order are simple. Simple groups of composite order are of rare occurrence, the only cases below order 2000 being one group for each of the orders 60, 168, 360, 504, 660, 1092. The number of different prime factors in the order of a simple group not of prime order is at least three, and the total number of prime factors is at least six (orders 60, 168, 660, 1092 being the only exceptions). No simple groups of odd order have as yet been found. Several series of orders of simple groups are known, for example, $\frac{1}{2}n!(n \neq 4)$, $\frac{1}{2}p^n(p^{2n}-1)$, $(p^n>3)$, etc.

A group whose elements are commutative is called an *abelian* group. Every subgroup and every element of an abelian group is invariant. The factors of composition are here the prime factors of the order.

Example of Group Construction.—Let a and b be two elements of prime orders p and q $(a^p = 1 = b^q)$ and subject to the further condition $b^{-1}ab = a^i$. We find successively $b^{-1}a^2b = b^{-1}ab \cdot b^{-1}ab = a^i \cdot a^i = a^{2i}$, $b^{-1}a^3b = a^{3i}$ .... $b^{-1}a^jb = a^{ji}$; $b^{-2}a^jb^2 = b^{-1}(b^{-1}a^jb)b = b^{-1}a^{ji}b = a^{ji^2}$, $b^{-3}a^jb^3 = a^{ji^3}$, ..., $b^{-k}a^jb^k = a^{ji^k}$, ..., $b^{-q}a^jb^q (= 1a^j1) = a^j = a^{ji^q}$, ... $i^q \equiv 1 \pmod{p}$. If $p-1$ is not divisible by q, i must be 1, $b^{-1}ab = a$, $ab = ba$, that is, a and b are commutative, and their various products ab form an abelian group of order pq. (This group consists of the powers of one element, say ab.) But if q divides $p-1$, the congruence $i^q \equiv 1$ has roots i different from 1. Any one of these roots i having been chosen, the conditions $a^p = 1 = b^q$, $b^{-1}ab = a^i$ are consistent and lead again to a group of order pq composed of the distinct products a^kb^l; the last group is non-abelian. For $p = 3$, $q = 2$, the second group presents the *multiplication table*

1	1	a	a^2	b	ab	a^2b
a	a	a^2	1	ab	a^2b	b
a^2	a^2	1	a	a^2b	b	ab
b	b	a^2b	ab	1	a^2	a
ab	ab	b	a^2b	a	1	a^2
a^2b	a^2b	ab	b	a^2	a	1

Substitution Groups.—The permutations or *substitutions* of n given letters x_1, x_2, ..., x_n form a group (the symmetric group) of order $n!$. The order of any group of substitutions of n letters is a divisor of $n!$. An individual substitution is written in cycles: thus $(x_1x_2x_3)(x_4x_5x_6x_7)$, or simply $(1\,2\,3)(4\,5\,6\,7)$, signifies that x_1, x_2, x_3 are to be replaced by x_2, x_3, x_1, and x_4, x_5, x_6, x_7 by x_5, x_6, x_7, x_4. Every finite group is expressible as (isomorphic with) a substitution group. Thus in the case of the group of order 6 above, if we denote the elements $1, a, a^2, b, ab, a^2b$ for convenience by $x_1, x_2, \ldots, x_6$, the six lines of the table are obtained from the first line by the six substitutions 1, (123)(456), (132)(465), (14)(26)(35), (15)(24)(36), (16)(25)(34), which form a substitution group isomorphic with the original group.

Those substitutions of n letters $x_1, x_2, \ldots, x_n$ which leave a given function of $x_1, x_2, \ldots, x_n$ unchanged in form, form a group. Thus the function $\phi_1 \equiv x_1x_2 + x_3x_4$ is unchanged by the eight substitutions G_1 : 1, (12), (34), (12)(34), (13)(24), (14)(23), (1324), (1423). The substitution t : (23) converts ϕ_1 into $\phi_2 \equiv x_1x_3 + x_2x_4$ and *transforms* the group G_1 of ϕ_1 into the group $G_2 = t^{-1}G_1t$: 1, (13), (24), (13)(24), (12)(34), (14)(23), (1234), (1432) of ϕ_2.

Interesting examples of substitution groups may also be obtained by determining those substitutions of n letters $x_1, x_2, \ldots, x_n$ which transform the substitution $(12\ldots n)$ into its powers. If n is a prime number, the order of this (metacyclic) group is $n(n-1)$.

For further discussion of substitution groups see the article GALOIS THEORY OF EQUATIONS.

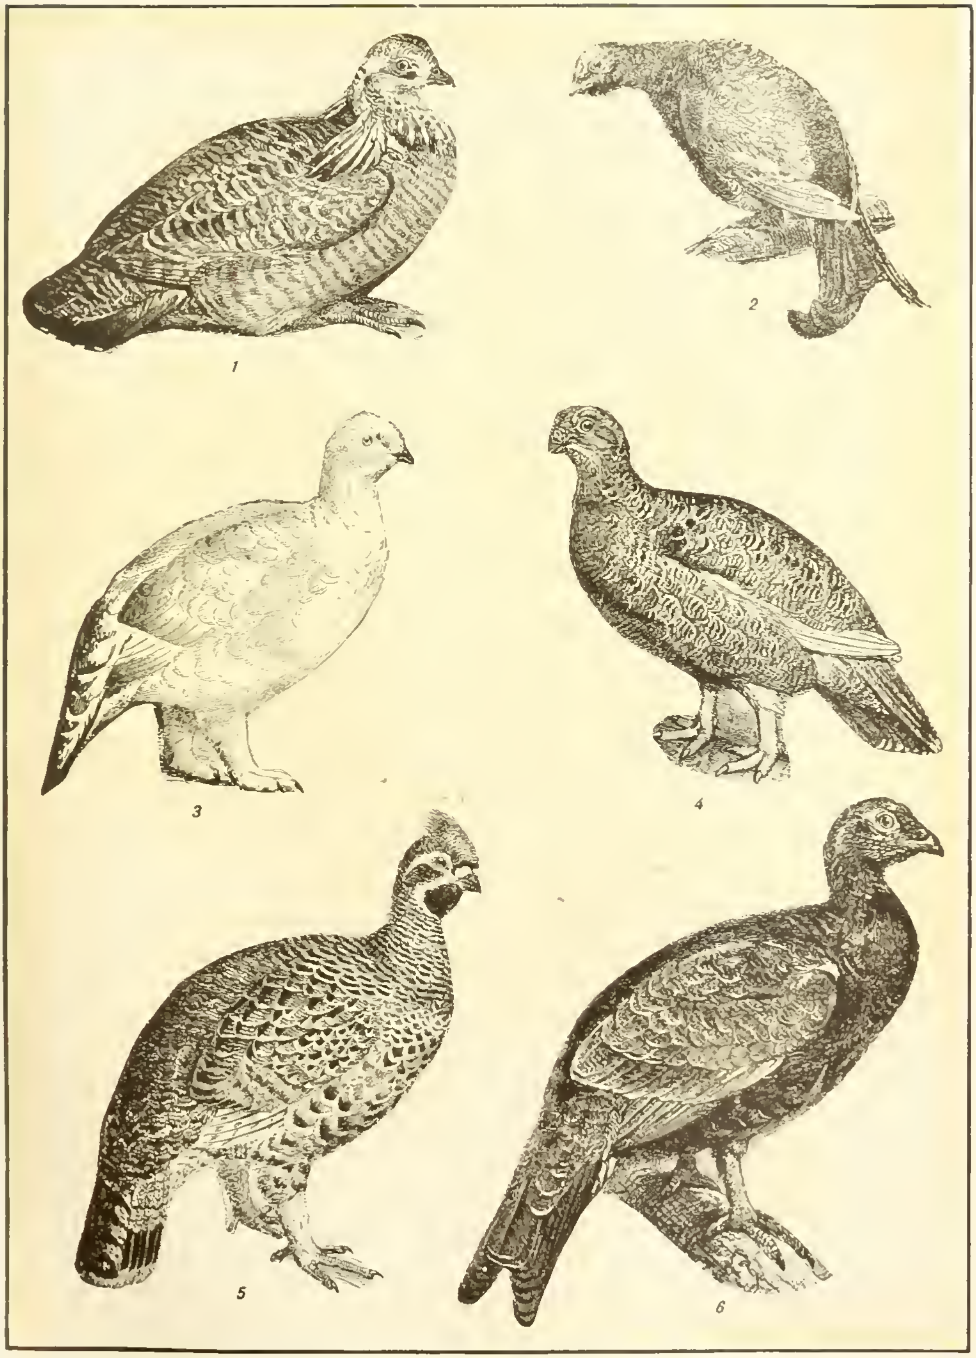
Groups of Linear Transformations.—All the linear transformations of a complex variable z, $z' = (\alpha z + \beta)/(\gamma z + \delta)$, for which $\alpha\delta - \beta\gamma \neq 0$, form a group. For two of them in succession evidently amount to a third linear transformation. Thus $S: z' = 1/z$ and $T: z = 1 - z$ give $ST: z' = 1 - 1/z = (z-1)/z$, $TS: z' = 1/(1-z)$. The group of all linear transformations of z is both infinite and *continuous*. If $\alpha, \beta, \gamma, \delta$ are restricted to integral values, the resulting group is still infinite but discontinuous. The *modular* group is subject to the still further condition $\alpha\delta - \beta\gamma = 1$; this is the group connecting the values of the ratio ω of the two periods ω_1, ω_2 of the elliptic integral $u = \int (4z^3 - g_2z - g_3)^{-\frac{1}{2}}dz$.

There exist only a finite number of non-isomorphic types of finite groups of linear transformations of z. If z is represented on a spherical surface, every rotation of the sphere produces a linear transformation of z. Those rotations of the sphere which convert into itself a regular solid inscribed in the sphere, or a regular polygon of n sides inscribed in a great circle (equator), form a group. These groups are of orders 60 (icosahedron, dodecahedron), 24 (octahedron, cube), 12 (tetrahedron), $2n$ (dihedron), n (cyclical). They give all the non-isomorphic types of finite groups of linear transformations of z. The octahedral group is also isomorphic with the symmetric substitution group of four letters, the tetrahedral and icosahedral groups with (alternating) substitution groups of four and five letters, respectively.

A simple example of a (dihedral) group of order 6 is generated by the transformations $S: z = 1/z$ and $T: z' = 1 - z$ above.

The linear transformations of z written in homogeneous form $z'_1 = \alpha z_1 + \beta z_2$, $z'_2 = \gamma z_1 + \delta z_2$ furnish *homogeneous* linear groups. Increasing the number of variables, we arrive at the general homogeneous linear groups $z_1' = a_{11}z_1 + a_{12}z_2 + \ldots + a_{1n}z_n$, $z_2' = a_{21}z_1 + a_{22}z_2 + \ldots + a_{2n}z_n$, ..., $z_n' = a_{n1}z_1 + a_{n2}z_2 + \ldots + a_{nn}z_n$ identified, for example, with projective geometry. Curves, surfaces, etc., frequently

GROUSE.



1. Prairie Hen (Tympanuchus Americanus).
2. Blackcock (Tetrao urogallus).
3. Moor-hen or Ptarmigan (Lagopus albus) in winter dress.
4. Scotch Red Grouse (Lagopus scoticus).
5. Ruffed Grouse (Bonasa umbellus).
6. Hybrid between Blackcock and Capercailzie.

have linear transformations into themselves, these always forming a group. Thus a plane cubic curve has in general such a group of order 432. Linear *congruence* groups should also be mentioned. An example is the *simple* group of order $\frac{1}{2}p(p^2-1)$ $(p>4)$ composed of the linear transformation $z' = (\alpha z + \beta) / (\gamma z + \delta)$ when $\alpha, \beta, \gamma, \delta, z', z$ are integers taken mod. p

Continuous Groups.—These are groups of transformations involving continuous parameters, such as the entire group of linear transformations of z, or the entire group of motions in a plane or in space. The theory of these groups, which has been extensively developed by Sophus Lie and his followers since 1870, has important applications to geometry, and especially to the theory of differential equations.

Historical.—The theory of groups was originally developed by Galois, Cauchy, and their successors under the particular guise of substitution groups. It was with Sylow's memoir in the 'Mathematische Annalen,' Vol. V. (1872) that the theory began to assume its independent abstract form. Among those who contributed to this movement are Cayley, Klein, Dyck, and others. But it is to Frobenius, above all others, that we owe the great developments of the pure theory which have been accomplished in the last fifteen years. The theory of group *characteristics*, recently created by Frobenius, is destined to produce brilliant results in the near future.

Other historical elements are traceable in the accompanying bibliography.

Professor of Mathematics, Columbia University.

Grouse, a family (*Tetraonidæ*) of gallinaceous game birds with feathered feet or tarsi, inhabitants of the northern hemisphere. In North America our best known species is the ruffed grouse (*Bonasa umbellus*); the "partridge" of New England and the "pheasant" of the Middle States. This bird, in one or other of its races, ranges all across the continent from Canada to Washington and southward in the higher ground, and is one of our best esteemed game birds. The rumbling drumming of the male is a familiar sound in the woods in early spring, and is effected by rapidly beating the wings against the body. On the prairies of the central and western States are several varieties of pinnated grouse or prairie chickens (q.v.). In the northwest occur the blue or dusky grouse (*Dendragapus fuliginosus*) and the sage hen (q.v.). In Canada and the northernmost part of the United States occurs the Canada grouse or "spruce partridge" (*Canachites canadensis*) with the allied Franklin's grouse (*C. franklini*) in the northern Rocky Mountains. The species to which the name grouse was originally applied, namely the red grouse or moorfowl (*Lagopus scoticus*) of England, is the only bird absolutely restricted to the British Isles. It is plentiful in suitable parts of Wales and northern England, but is especially numerous in the highlands of Scotland, where it is bred and preserved on moorlands of great extent, large areas of which are kept barren of other occupation for this purpose. This, then, is the bird whose shooting, permitted for a period following the 12th of August, attracts so large numbers of sportsmen annually to Scotland for the "grouse-shooting." The sport may be followed in the ordinary method of shooting on the wing over dogs; but in many places is conducted as a battue. Grouse-moors are owned and rented in large numbers, and have a status similar to that of deer-forests (q.v.). This grouse is a ptarmigan, other species of which exist in the artic regions (see Ptarmigan). Other European grouse of importance are the blackcock and capercailzie (q.v.). Among works dealing especially with grouse and grouse-shooting are Lloyd, 'Game Birds and Wildfowl of Sweden and Norway' (London, 1867); the volumes on 'Shooting' in the 'Badminton Library' (London, 1889); Alflalo, 'Sport in Europe' (London, 1901); Sandys and Van Dyke, 'Upland Game Birds' in the Sportsman's Library (New York, 1902); Coues, 'Birds of the Northwest' (Washington, 1874).

Grove, Sir **George**, English engineer, author, and musical critic: b. Clapham, near London, 13 Aug. 1820; d. Sydenham 28 May 1900. After completing his studies in the grammar schools of Clapham, he learned civil engineering, and for two years worked in Napier's factory near Glasgow. In 1841 he went to the West Indies, erecting in that year the Morant Point lighthouse in Jamaica, and in 1845 the Gibb's Hill light in Bermuda. He was appointed secretary to the Society of Arts in 1849, and in 1852 to the Crystal Palace. While in the latter position he exerted all his influence toward giving the music-loving public the best music obtainable, and endeavoring especially to create a taste for the compositions of Beethoven and of the German Romantic School. From 1868–83 he was editor of 'Macmillan's Magazine,' and from 1878–89 edited the famous 'Dictionary of Music and Musicians.' In 1882 he was made the first director of the Royal College of Music, at the same time being knighted, and in 1894 was made a Commander of the Bath. He contributed to Smith's 'Dictionary of the Bible' (1864), and to Stanley's 'Sinai and Palestine' (1865).

Grove, Sir **William Robert**, English physicist; b. Swansea, 1811; d. 1896. He was graduated at Oxford in 1832, began the practice of law in 1835, but eventually applied himself to the study of physics. He was elected professor of experimental philosophy to the London Institution, 1840–47, and received the Royal medal from the Royal Society for his paper on the 'Gas Voltaic Battery.' Returning to the law he was knighted and made a judge of the High Court of Justice. He was one of the first to grasp the law of the "conservation of force." He is the author of 'The Correlation of Physical Forces' (1846).

Grove City, Pa., borough in Mercer County, on the Pittsburg, B. & L. E. railroad; 58 miles north of Pittsburg. It is the seat of the Grove City College, a coeducational school opened in 1884. The chief manufactures are carriages, brooms, gas-engines, and machinery. Pop. 1,015.

Grover, Cuvier, American army officer: b. Bethel, Me., 24 July 1829; d. Atlantic City, N. J., 6 June 1885. He was graduated at the United States Military Academy in the class of 1850, and on the outbreak of the Civil War was appointed captain of the 10th infantry. Returning East, in April 1862, brigadier-general of volunteers, was assigned to duty with the Army of the Potomac, with which he participated in the various battles of the Peninsular campaign in Virginia, and in the second battle of Bull Run. In 1864 he commanded the 19th corps, and in the Shenandoah campaign was engaged in the battles of Opequan, Fisher's Hill, and Cedar Creek. He was mustered out of the volunteer service in 1865, and in 1875 became colonel of the 1st cavalry.

Grover, Lafayette, American politician: b. Bethel, Me., 29 Nov. 1823. He was admitted to the bar in Philadelphia in 1850, and settled in Salem, Ore., in 1851, where he became prominent in his profession, and was made prosecuting attorney of the second judicial district, and auditor of public accounts. In 1853 he was elected to the territorial legislature, serving there three years, and being speaker in his last term (1856). He fought in the Indian wars in 1853 and 1855–6, and was later made United States commissioner to audit spoliation claims. In 1857 he was a member of the Oregon constitutional convention, and when Oregon was admitted as a State, he was member of Congress (1858–9). He was chairman of the Democratic State committee (1866–70); served as governor of the State 1870–7; and was United States senator 1877–83.

Groves. See Ashera.

Groveton, Va., Battle of. See Bull Run, Second Battle of.

Grow, Galusha Aaron, American statesman: b. Ashford (now Eastford), Windham County, Conn., 31 Aug. 1823; d. Glenwood, Pa., 31 March 1907. He was graduated from Amherst College in 1844, was admitted to the bar of Susquehanna County, Pa., in 1847, was elected to Congress in 1850, and was six times re-elected. During his first three terms he was a Free-Soil Democrat, during the last three a Republican. He was chairman of the committee on the Territories in the Thirty-fourth and Thirty-sixth Congresses, and speaker of the Thirty-seventh Congress, whose five-weeks' session of 4 July — Aug. 6 1861 largely defined the government attitude toward the Confederacy and voted $500,000,000 for war purposes. He introduced the Homestead bill (see Homestead Laws) into the House, fought for it 10 years, finally obtained its enactment, and signed it as speaker. In 1879 he declined the mission to Russia, in 1894 was elected from Pennsylvania as congressman-at-large, and was successively re-elected to the Fifty-fourth, Fifty-fifth, Fifty-sixth and Fifty-seventh Congresses. His plurality in 1896 was 207,446, the largest given up to that time in any State of the United States to a candidate for any office. He was also a delegate to the national Republican convention of 1864, 1884, and 1892, and chairman of the Pennsylvania State Republican committee in 1868. In 1871–6 he was the president of the International and Great Northern railway company of Texas. His long record of conspicuous service is almost unparalleled in the political annals of the United States.

Growth, increase in size or volume. It may be divided into inorganic and organic growth. As an example of the former is the increase in size of minerals. Living beings or organisms grow by adding to the substances (protoplasm, etc.) forming their bodies similar matters as food, which are digested, assimilated, and thus taken into the body of the plant or animal by interstitial deposit. Organic growth is thus fundamentally a physico-chemical process together with a form of constructive energy as yet quite incomprehensible to us. The result of this absorption of food is that the body increases in size, that is, grows. All growth is attended by movement; and growth-movements are, as Verworn states, common to all living bodies, but they take place so slowly that they can scarcely be followed with the eye. Growth goes on more freely and the size of the body increases most rapidly in those organisms in which the body presents a large raying surface, in distinction from the microscopic bodies of the one-celled plants or animals. The simplest phenomenon of growth is seen in cells, which during growth rapidly multiply by self-division, which causes the increase in volume in the embryo.

The physical agents or factors in the growth of plants and animals are abundance of food, together with the influences exerted by heat, light, etc. During growth the simple molecule of living proteid continually attracts elements to itself from the food (Hatschek). Growth is most rapid in a well-fed plant or animal. The health, size, and stature of children depend on good nutritious plain food and plenty of fresh air.

Food and Chemical Agents.— As digestion and assimilation are chemical processes, they require certain materials to work with. These are called food. The elements which constitute food and which occur in protoplasm and flesh are carbon, oxygen, nitrogen, lime, phosphorus, potassium, sodium, chlorine, magnesium, sulphur, silicon and iron. All or any of these enter the body in various combinations, each playing a definite part in growth. Phosphorus is especially abundant in the tissues of embryos; potassium appears to be of great importance in imbibition, while iron is essential in the early processes of cell-division. Besides these inorganic substances, organic food, as flesh or vegetables, are essential to the growth of animals. Water is also essential, and embryos develop most rapidly in moist places or in water.

Light.— Without light there would be no growth, indeed no life. Light may retard or hasten growth, under different circumstances. Young growing plants and embryos of animals need to be protected from too direct sunlight.

Temperature — Organisms need sufficient heat in order to grow. The requisite amount for normal, maximum growth is called the optimum temperature, for at such a degree of warmth growth takes place faster than at any other. If the temperature be lowered, the rate of growth gradually diminishes; if the temperature be raised too much above the optimum, the rate of growth diminishes more rapidly. Excess of cold dwarfs both plants and animals.

Space and Movement.— If too much crowded, plants become slender and weak; snails become dwarfed if reared in too small vessels; mankind when confined to too narrow quarters in large cities tend to become undersized, from not having sufficient space and good air to live in; small trout live in small brooks and large ones in larger streams. All organisms need room to move or at least to grow.

Heredity.— Besides the factors already mentioned heredity has its share as an agent. Growth, development and reproduction are now in the plant and animal world proceeding as it were in grooves, or along more or less definite paths, in accordance with long established laws or relations, and the mechanism of growth is subject to heredity.

Growth and Longevity.— The elephant and whale attain a colossal size because they grow throughout life and live long. The large size of man as compared with many other mammals, is due to the fact that he grows for a longer period; while many mammals get their growth in one, two or three years, man does not stop growing until he is thirty.

It is to be observed that individual growth is not only dependent upon a suitable amount of food, but on proper environment and favorable conditions of life, and all these agencies also are the primary factors of organic life. It is the changes in the conditions of life, coupled with heredity and selection, that have caused the evolution of the world of plants and animals. Thus we see that the fundamental causes of the evolution of species are the same as those which determine the growth of any individual organism; we by no means understand all the phenomena of simple growth; there are unexplained laws and causes, as there are in general evolution; both in this respect are of a piece and are similar in their nature and results. The origin of species is as natural a process as the growth of the individual, and both in many respects are alike inexplicable by the science of the present day.

Growth and Development of the Human Being. In this article growth refers to an increase in size, and development to an increase in capacity. The body begins in a microscopic cell, and passes through the various stages of birth, growth, development, decline, and death.

The life of an individual may be studied in various periods, the embryonic and fœtal (which do not concern us at this time) and those of infancy, childhood, youth, maturity, and old age. The above division is convenient, but not physiologically exact. The various periods are not sharply limited. From birth to maturity, with a gradual increase in size of various organs, there are progressive modifications of functions. Toward old age, decline begins and the modifications retrogress.

The Period of Infancy is variously limited by different writers, extending from birth to the end of the fourth, fifth, or even the seventh year, the last considered by law as the beginning of responsible life. Probably the best limitation is from birth to the end of the first dentition, about the end of the second year. At birth, connection with the mother suddenly ceases, and a new existence begins with the first inspiration. Then the vegetative functions, digestion, circulation, respiration, secretion, excretion, and assimilation, are soon established. The infant performs all the functions of adult life except reproduction and volition. But in order to have them at their best they should be intelligently supervised by the parents. The young baby is the most helpless and dependent of all creatures. The care it receives influences its future life. With no care it must perish.

The period of infancy is characterized by frailty, active nutrition, rapid growth, and commencing development. It is especially prone to convulsions from improper food, or from high body temperature, whatever the cause, to rickets and scurvy from improper nourishment, to spasmodic affections such as false croup, to hydrocephalus, meningitis, whooping cough, diphtheria, diarrhœa, bronchitis, pneumonia, and to the eruptive diseases, measles, chicken-pox and scarlet fever.

The rate of infantile mortality is very high. From one fourth to one half of the children born in our large cities die within the first year; in small towns and in the country the rate is much lower. Many of the new-born are enfeebled by vices of formation, such as cyanosis, spina bifida, hydrocephalus, or meningocele, by an hereditary syphilitic, scrofulous, or tuberculous taint, or by chronic affections in the mother. All infants are exposed to the risks of an improper dietary, impure air, and the extremes of heat and cold.

The bones of the infant are very vascular, quite elastic, have but little firmness, and their epiphyses are cartilaginous. They are therefore readily inflamed, as in scurvy, may be distorted by pressure, or incompletely broken by apparently slight injuries, or the epiphyses may be separated by such injuries. To forcibly lift a young child by one arm is always dangerous. The skull at birth is not fully ossified and can be readily compressed. The anterior fontanelle begins to close about the 9th month and is usually closed about the 18th. Depression of this fontanelle is one of the evidences of general debility. Premature closure of the skull is a cause of epilepsy or idiotism. The vertebral column is straight, lacking the curves of later life, and is quite flexible, but this flexibility tends to backward, forward, or lateral distortions of the spine, as the result of rickets, inflammation (caries) of the vertebræ, or of sitting, standing, or reclining in strained positions. Allowing infants (especially feeble ones) to sit, stand, or walk too early tends to produce bow legs and knock knees, as well as spinal deformities. It is many weeks before a baby can hold up its head. Even by the twelfth week it is not properly balanced. It may be at the sixteenth. The first attempt to sit is about the sixteenth week, and sitting is accomplished about the fortieth. About the thirty-eighth week, the child attempts to stand, and should be able to stand alone by the eleventh or twelfth month, and to walk unaided by the fifteenth or seventeenth month. Some children never creep. If they do, the attempt is made about the ninth month.

The muscles of an infant are soft and not capable of great effort. Not till after the sixth month are they felt firm and resisting. To develop them the clothing should be loose, and the child, in a nude state, should at times be allowed free play of them. To swathe the feet and limbs in bandages "to make the child straight" is hurtful.

The abdomen and chest (in its lower portion) are prominent, due to the very large liver, the small pelvis, and the distention of the stomach by food, and to large size of the heart and lungs. All of these organs must have free movement, in order to carry on their important functions. Tight bandaging of chest or abdomen hampers movement and compresses important blood vessels. The size and weight of the heart of the new-born explains the rapid growth of the body and those organs in most direct communication with the heart, especially the brain. The small size and the vertical position of the stomach account for the ease with which infants throw up their food when the stomach is distended. Repeated acts of vomiting are injurious. The practice of jolting babies tends to produce vomiting. Each child must be studied by itself as to its powers of digestion, and what is the proper food for each. The substitution of artificial feeding for maternal nursing, and the indiscriminate use of baby foods are responsible for much sickness and many deaths. But natural feeding is not always possible, owing to the dictates of fashion or the poor health of mother or child.

The nervous system of infants is very excitable, especially toward the end of the first year, and is out of proportion with the slow development of the inhibitory centres. Convulsions and spasmodic affections are therefore readily produced by various causes, such as undigested food, eruptive fevers, impure air, fright, or excessive heat. Most of the movements and actions of early infancy are reflex, such as stretching, crowing, and sighing, for example. About the fourth month evidences of will power appear and gradually increase. Good habits, as to regular times for feeding, sleep, etc., can often be inculcated at this early age, or even before, to the advantage of both mother and child. The brain is relatively large at birth and grows rapidly up to the seventh year, and after that time more slowly.

During this formative period care should be observed not to excite the brain unduly, else nervous disorders may result. Repeatedly urging a young child to "show off" is, to say the least, very unwise.

The senses of taste and smell seem to be partially developed at birth. After the third month the quick closure of the eyes on the approach of an object seems to indicate the establishment of true vision. A very bright light may be appreciated by the second or third day, or may be followed by the eyes, if moved slowly, after the sixth week. It is usually weeks before there are associated movements and convergence of the eyes. The eyes of the new-born frequently move independently of each other, producing "squint," but squinting in the course of a severe disease is a bad sign. As to colors, yellow, red, pure white, gray, and black, in the order named, are said to be the first recognized, gradually after the sixth month.

All children are born deaf, but may notice sharp sounds six hours after birth, though usually not until a number of days. Toward the end of the first year the infant begins to imitate vocal sounds in its attempt to speak.

The circulation of blood is very rapid; the blood vessels are large and thin. Congestions, inflammations, and hemorrhages, therefore, are quite common. The pulse is irritable and slight causes disturb its rate and sometimes its regularity. The rate in the new-born is 130–140, during the first year 105–150 per minute, during the second 110–120, then gradually diminishes until at the fifth year it is about 90; from the seventh to the fourteenth year 80–90, and afterward 70–80. The respirations of the new-born are from 30 to 50 per minute, and at the end of the first year from 25 to 35. The breathing of healthy children is noiseless and through the nose. The habit of mouth breathing usually caused by enlarged tonsils and by adenoid growths, is productive of deafness, change in facial expression and distortion of the chest (pigeon breast). The relatively small size of the pharynx, larynx, and trachea frequently cause throat affections to be serious ailments in infants.

The average temperature of the infant is 100° F., but it is subject to many fluctuations. It is raised by ingestion of food, struggling, crying, etc., and lowered by sleep, inactivity, and insufficient food. Sponging with cool water or oiling the skin will frequently lower a high body temperature, which, if unchecked, might cause convulsions.

In man there are two sets of teeth. The first or temporary teeth are 20 in number, 10 in each jaw. The first tooth appears about the seventh month, the last about the twenty-fourth month. The dangers of dentition are much exaggerated. Well-nourished children of healthy parents cut their teeth earlier, easier, and more regularly than do feeble children. If the first tooth is not cut before the 14th month there is some serious defect. About the 6th year (and before the temporary teeth are shed) the jaws contain all the temporary teeth and all the rudimentary permanent teeth except the wisdom teeth. At birth, when the teeth have not appeared and in old age when they have disappeared the lower jaw is obtuse. During the growth of the teeth, the lower jaw increases in depth and length. To admit of these changes, the temporary as well as the permanent teeth should be taken care of, and filled if need be. Food requiring mastication should not be given until there are several teeth. The permanent teeth are 32 in number, 16 in each jaw. The first one appears about the 6th year, the last from the 18th to the 24th or later. The thymus gland appears in the new-born, attains its full size by the end of the 2d year, then gradually diminishes until at puberty it has almost disappeared. It is supposed to be one of the sources of the red blood corpuscles.

For the first few months of life tears and perspiration are rare. After three months they are freer. In rachitic infants perspiration is often profuse. Up to the end of the first year the sebaceous glands are very active, especially upon the scalp. The saliva and pancreatic juice are small in amount until about the third month and therefore starchy foods cannot safely be given to young infants. The gastric secretion at birth can as a rule readily digest the casein of mother's milk, but has difficulty in disposing of other food. Mucus in the infantile intestines is copious, often ferments and may neutralize the feebly alkaline intestinal juices, and the pancreatic juice and saliva.

Both the small and large intestine are comparatively long, and digestion and peristaltic action are rapid. These facts together with the small size of the stomach and the rapid growth of the body, require that the young baby be fed every 2 or 3 hours. The great length of the sigmoid flexure of the colon impedes the passage of fæces and induces constipation, which should be relieved by *light* laxative medicines or, better still, by change in the diet.

The lymphatic glands are numerous and large in the infant and the communication between them and the general system is more marked than at any other period of life. They are readily congested and enlarged in affections of the throat, scalp, etc., and in scrofulous and syphilitic ailments.

The average weight of the male new-born child is 7 lbs. 11 oz.; of the female 7 lbs. 4 oz. For the first few days there is a loss in weight, then the weight gradually increases. Generally it is doubled by the 5th month and trebled by the 12th in breast-fed infants; in hand-fed, later. Usually a healthy child gains 20 lbs. in weight and 10 inches in height in first 2 years of life; in the 3rd year 4 lbs. and 4 inches. During next 6 years there is an annual increase of 4 lbs. and 2 or 3 inches; after the 10th year about 8 lbs. a year. About the 9th year in girls and the 11th in boys there is a diminution in the rate of growth, and at puberty (13th year in girls and 16th in boys) the activity of growth is the greatest. Between 12 and 15, girls grow heavier and taller than boys, but at 15 the boys again lead and maintain it through life. Growth usually continues to about the age of 25 in males and there may be a slight increase for 5 or 10 years afterwards. Girls usually attain adult stature at about 21 years. Weight usually increases in the male and frequently in the female to the 50th or 60th year, due to an accumulation of fat.

The Period of Childhood may be said to extend from the end of the second year to puberty or youth. By the end of infancy, the anterior fontanelle is closed, the temporary teeth are cut and the child is beginning to talk and walk, to use judgment and memory and to display independence. Childhood is characterized by active growth and development of the body and mind. Arrest of growth and loss of weight indicate malnutrition. On the other hand, while a very thin baby is abnormal, a very fat child or youth is, as a rule, one whose nutrition is at fault, or whose diet is too rich or generous.

The preparation of boys and girls for the duties and responsibilities of manhood and womanhood, requires especially that their brains, muscles, and digestive apparatus shall be strong. Nerve force must be stored not dissipated, and coddling is wrong. Their nervous systems are normally very active and sensitive to impressions, hence nervous disorders and exhaustion are readily induced by over-stimulation of the brain, through excitement, too much study, etc. Physical and mental training must go together. A vigorous child is almost constantly in motion, either at work or play, and this is as it should be. The same amount of exercise would exhaust an adult. It is well understood that systematic muscular exercise besides hardening the muscles improves the mental strength, that well developed children take a higher rank in school than those of the same age less developed. Abundant out of door exercise also develops the co-ordinating power of muscles and the special senses, induces a greater respiratory range, better oxidation, and an increased power of the heart. Thus nutrition is stimulated and a symmetrical development obtained. And this is just as necessary for girls as for boys. Children need sleep oftener and longer than adults. A healthy young baby sleeps nearly two thirds of the time and a healthy child of seven will often sleep quietly for twelve hours or more. Disturbed sleep and sleeping with the mouth open indicate some nervous gastric or intestinal disturbance or the presence of enlarged tonsils.

After the first few years of life the special senses seem to acquire an acuteness, more marked than in later life when the perceptions are associated with more complex mental processes. Children require much food and the diet should be nutritious, but overloading the stomach, especially with sweets and fruit, may excite general convulsions, vomiting, diarrhœa and alarming fever. A vigorous, healthy boy often eats, and may require about as much food as the average man. A variable appetite or the habit of eating mainly one class of foods is indicative of innutrition. A properly mixed diet is necessary for health. Sugar (candy, etc.), valuable in reasonable amount, should not be eaten in such quantity as to interfere with the appetite for regular meals. Children, especially those who eat but little sugar, should be taught to eat fat. In childhood the lymphatic system is still active, the glands readily enlarge as the result of irritation or of general disease, especially scrofula. The respiration in early childhood as in infancy is mainly diaphragmatic — the abdomen moves freely. The temperature normally is about 100° F. A sudden high temperature is much less significant than in the adult, so also is an increase in the rapidity of the pulse. Young children lose heat readily from the surface of the body, and are susceptible therefore to "taking cold" when insufficiently clad. The line should be carefully drawn between overdressing and the "hardening" process, and woolen garments except in the hottest weather are advisable.

Owing to the large amount of food consumed and the detritus resulting from the activities of the body — a free discharge of waste by the skin, kidneys and bowels should be facilitated by frequent bathing, the drinking of considerable pure water and the use of fruit, graham bread and green vegetables.

The stomach in children is straighter and more vertical than in adults, but less so than in infants. Vomiting is still easily produced. The small intestine is relatively much longer than in adults, due to the fact that much nourishment is to be digested.

Children are susceptible to nervous disorders such as chorea and certain forms of paralysis, and to whooping cough, mumps, measles, etc., which last are often classed as "children's diseases." Spinal deformities are readily induced. Certain diseases, such as tuberculosis, are likely to affect a large number of organs at the same time. The recuperative power of a normally healthy child is very great, even in severe diseases.

The mortality of young children in general is enormous but decreases with age. It is greatest among those whose hygienic conditions are bad, who suffer from poor or insufficient food, impure air, etc. Diphtheria, scarlatina, measles, croup, pneumonia and intestinal disorders are the chief causes of death.

The Period of Youth, Adolescence or Puberty, is that period of life between childhood and maturity: in law, "that period from 14 in males and 12 in females till 21 years of age." It occurs earlier in hot climates than in cold, is hastened by luxurious living and habits of idleness and is retarded by severe labor, hardship, privation and ill health. It is that period when the individual becomes fitted for reproduction by the development of the sexual organs. The voice is unsettled, due to a rapid general enlargement of the laryngeal cartilages and a lengthening of the vocal cords. Hair appears in the pubic region, in the axillæ and on the face in the male. In the female particularly, fat is rapidly deposited in the subcutaneous cellular tissue of the breast and extremities, adding to the comeliness of the form. The function of menstruation is established, preceded in a varying degree by headache, backache, physical and mental lassitude, palpitation, bleeding from the nose, nervous irritability and hysteria. Sexual maturity is evidenced by awakened sensibilities towards individuals of the opposite sex, of attraction, of repulsion or of timidity and shyness. In youth there is a pronounced development of the limbs, an increase in the size of the chest and a diminution in the size of the head and abdomen. The spine now forms a double curve, and the pelvis widens especially in the female. Mental faculties mature. A girl becomes a woman earlier than the boy a man.

Inasmuch as the rapid nutritive changes are prone to be attended by more or less grave disturbances of the nervous functions, it is essential, in order to have a sound mind in a sound body (that is, health), to carefully regulate physical and still more, mental exertion. The habit of self control must be encouraged, and exaggerated language discouraged. School duties should not be imposed beyond, or even up to the limit of tolerance of the individual, and social functions should not interfere with an abundance of sleep and outdoor exercise, else the result will be a wreck of the nervous system, and prolonged nervous and muscular prostration. Recklessness as to the laws of health are responsible for much of the sickness at this period of life Purity of thought and action are great safeguards against the temptations which beset growing youth, which if yielded to they impair or destroy both mind and body. Animal impulses are to be subordinated to aspirations of the mind The continued fevers such as typhoid, severe inflammations, as pneumonia and acute rheumatism, tuberculosis and heart affections, are the principal diseases of youth Scarlet fever, measles and other eruptive diseases may affect the individual, but not commonly. Alcoholism is a dangerous condition, easily acquired. Neurotic conditions, especially in the female, too frequently occur

The Period of Maturity begins at about the end of the 21st year, and extends in men to about the 60th, when the power of reproduction wanes, and in women to about 40 or 45, when the menopause occurs: the breasts and reproductive organs diminish and ovulation ceases. In women, at this time (as in the onset of puberty), the organic functions may be irregular: dyspepsia, palpitation, sweating, vertigo, neuralgia, irritability and melancholy may occur. The "change of life" is in reality therefore attended with a severe nervous shock. Manhood and womanhood begin when the individual has reached the full stature, when the skeleton is firmly ossified, the jaw is square, the chest fully expanded, and the limbs well developed. Gradually from this time onward in most instances fat begins to accumulate, especially upon the abdomen, towards the end of maturity.

Popularly it is believed that man is in the "prime of life" from 35 to 50, but there are many instances of farmers, professional and business men and women being successful and at active work and in good health at 60 or more. The fact is, that the ability to do hard work, mental or physical, at an advanced age, depends upon habits of industry and method, and upon the care of the health which have been inculcated in earlier life, and are continued into and through adult life.

Gradually as adult life advances, the inclination and sometimes the power for active exercise fails. These are evils to be guarded against. Out-door games, horse-back riding, and vigorous walking, for example, may be pursued advantageously as a rule to 45 or 50 years of age. At about this time degenerative changes occur in the body and care is necessary that the heart and blood vessels be not overstrained. During the prime of life the body enjoys a maximum of vigor and power of endurance, and there is reason to believe that this is also true of the mind. But the self-consciousness of power that the individual possesses is frequently a menace, for it induces him to struggle for wealth or fame in the turmoil and bustle of modern life, to neglect recreation, to resort to alcoholics and other stimulants to keep up his energy, and to indulge in general high living. It is especially true at this time of life that no one should work up to the full measure of his ability. Such work is dangerous and has been responsible for the "breaking down" of the health and the death of many otherwise intelligent persons. The principal diseases of adult life are alcoholism, gout, cancer, urinary and venereal diseases, rheumatism, pneumonia, tuberculosis, affections of the brain and nervous system, of the heart and blood vessels and of the digestive system.

The Period of Old Age or Senility usually commences about the 60th year and is characterized by a waning of the vital powers and by atrophic and degenerative changes, the natural consequences of decay. While death frequently results from local accidents of the brain and nervous system (apoplexy, sclerosis, etc.) and of the heart, blood vessels and urinary organs irredeemably damaged in the course of decay, it is normally but the ending of a natural life, and not a pathological fact as in earlier life. The stature of the old is less, the shoulders rounded, bones are more fragile, the cartilages are hardened, the lower jaw resembles that of the infant, the chin is prominent, the skin is wrinkled owing to the absorption of fat, and loses its elasticity, the teeth decay and fall out, urination is frequently difficult, the respirations and heart beats are reduced in frequency, the arteries have a tendency to ossify, the veins to dilate. The muscles fail in their tension, the voice becomes a "childish treble," the digestion is weakened, the eye no longer sees clearly, and hearing is dulled. The mind may preserve its freshness for a long time. Usually the senses fail first, next the faculties of memory, reason and volition. Towards the close of life the organic or vegetative phenomena prevail. The natural death occurs when the breath becomes fainter and fainter and the heart beats are weaker and fitful — and then gradually cease.

Old people require an abundance of sleep. They need also to be kept warm, for heat is generated in them in smaller amount than in robust health. Hence they are easily chilled. Food should be plain, largely liquid, and that which is easiest digested. Exercise in the open air every day is desirable but it should be gentle in character. With these precautions old age may be made comfortable. JEROME WALKER, M.D.,
Author of 'Walker's Physiology.'

Grub, the larva of an insect, especially of a beetle or fly. In reference to cattle it usually means the maggot of a flesh-fly or warble. See BOT-FLY; LARVA.

Grubb, SIR **Howard**, Irish optician and telescope-maker: b. Dublin 28 July 1844. The largest telescope of his construction is the 27-inch of the Vienna Observatory. He was the first to suggest a movable floor for an observatory dome, which has been adopted in the dome of the great 36-inch telescope of the Lick Observatory. He has been vice-president of the Royal Dublin Society from 1893, and was knighted in 1887.

Grübel, grü'bel, **Johann Konrad**, German poet: b. Nuremberg 3 June 1736; d. Nuremberg 8 March 1809. He was a saddler and harness-maker, and passed his youth in privation; but he possessed genuine poetic gifts, as shown in the pictures he has given of the lives and manners of his countrymen in the three volumes of 'Poems in the Nuremberg Dialect' (1802). Another volume appeared in 1808.

Gruber, grö'ber, **Johann Gottfried**, German author: b. Naumburg, on the Saale, 29 Nov. 1774; d. 7 Aug. 1851. He studied at Leipsic, and in 1811 was appointed professor at the University of Wittenberg, and in 1815 professor of philosophy at Halle. His chief work was that of editing, first with Ersch, and after his death, alone the first section of the 'Universal Encyclopædia.' His independent works include: 'Herder's Characteristic' (1805); 'History of the Human Race' (1805); and Lives of Wieland (1815–16), and Klopstock (1832); he also edited 'Wieland's Complete Works' (1818–28).

Grün'berg, Germany, capital of the circle of Grünberg in the Prussian province of Silesia; on the Oder, 15 miles east of Giessen. It is surrounded by vineyards, and large quantities of wine are made here and in the vicinity. Pop. 21,268.

Grundtvig, groont'vig, **Nikolai Frederic Severin**, Danish theologian, historian and poet: b. Udby, island of Seeland, 8 Sept. 1783; d. Copenhagen 2 Sept. 1872. He was educated at the University of Copenhagen, and in 1822 went to Copenhagen as chaplain. He made a fierce attack on the rationalism of the time in his 'The Answer of the Church' (1825), a reply to Professor Clausen, and for the violent expression of opinion in this work was severely censured and resigned his position. For a time he devoted himself to literary work, and through his writings exercised a great influence on the religious and political thought of Denmark. In 1839 he became pastor at the hospital church of Vartov, Copenhagen, and held that position till his death, being made a bishop in 1861. He was for a time a member of the Danish diet, and took an active part against Germany and German influence. His most important work is 'Northern Mythology'; he also wrote a number of poems, among them some very popular national songs, and translated 'Beowulf.'

Grundy, Felix, American jurist: b. Berkeley County, Va., 11 Sept. 1777; d. Nashville, Tenn., 19 Dec. 1840. Studying law, he was admitted to practice in 1798, and soon acquired a high reputation as an advocate in criminal cases. He was a member of the Tennessee legislature 1799–1806, and in the latter year was appointed one of the judges of the supreme court of errors and appeals. In 1811 he was elected representative to Congress, and re-elected in 1813. In 1829, and again in 1833, he was elected to the senate of the United States, where he was among the most prominent of the supporters of President Jackson. In 1838 President Van Buren appointed him attorney-general of the United States; but in 1840 he resigned that office, and was re-elected to the senate.

Grundy, Sydney, English dramatist: b. Manchester 23 March 1848. He was called to the bar in 1869 and practised till 1876, but has since become known at home, and in the United States, as a successful and popular playwright. Among his very numerous plays are: 'The Glass of Fashion' (1883); 'A Fool's Paradise' (1890); 'A White Lie' (1893); 'Sowing the Wind' (1893); and 'The New Woman' (1894); 'Slaves of the Ring' (1894); 'The Degenerates' (1899); 'Frocks and Frills' (1902).

Grundy, Mrs., a personage constantly appealed to in the phrase, 'But what will Mrs. Grundy say?' in Morton's play, 'Speed the Plough' (1800), but who never appears among the *dramatis personæ*. The phrase has now come to stand for the judgment of society in general upon actions or conduct.

Grunt, or **Croaker**, a drumfish (q.v.).

Gruson, groo'sōn, **Hermann**, German inventor and manufacturer: b. Magdeburg 13 March 1821; d. 1895. He studied at Berlin; became chief engineer of the Wöhlert machine shops in Berlin in 1851, and in 1854 went to Buckau as director of the Hamburg-Mecklenburg steamship company. There he established a shipyard of his own and built a small iron foundry, where he invented a process of chilled cast iron, which was much used in the manufacture of machinery, as well as for armor. His establishment consequently grew rapidly, and in 1886 was incorporated, manufacturing armor for most of the states of Europe. Gruson was manager of the company until July 1891, when he retired and devoted himself mostly to study and experiments in physics. In 1893 the works were sold to Krupp.

Grützner, Eduard, ed'oo-ärd grüts'nĕr, German painter: b. Gross Karlowitz, Schlesien, Germany, 26 May 1846. He began the study of art without a master, and his talent having been recognized by the architect, Hirschberg, he was taken by the latter to Munich, 1864. He was there admitted to the school of Piloty. He first appeared before the public as a humorous painter, Shakespeare's Falstaff being his favorite subject. He is, however, known all over the world for his pictures of monks, in the cellar, tailor's shop, kitchen, etc. Well-known also is his 'Mephistopheles Behind the Scenes in the Dressing Room of a Ballet Dancer.'

Gryllidæ, gril'ĭ-dē, a family, the crickets, of saltatorial orthopterous insects, distinguished from the grasshoppers and locusts by the fact that the tarsi are three-jointed and the ovipositor, when exserted, is spear-shaped; the wings, when present, fit closely to the body. The family includes three types: (1) the true crickets, such as the common field cricket, or the hearth cricket of Europe, which are of the genus *Gryllus*; (2) the burrowing, curiously modified mole-crickets (q.v.); (3) the tree-crickets, pale-colored nocturnal forms which lay their eggs in the twigs of different plants, and which sometimes are so abundant that by their egg-laying alone they do considerable damage to vineyards and to raspberry and blackberry plantations. The black field-crickets, of which the commonest American species is *Anabrus simplex*, inhabit burrows in the ground and come abroad to feed on grass and herbage at night, and sometimes in daylight. They deposit eggs in the ground in the autumn, but these do not hatch until the following spring.

Gryphon. See GRIFFIN.

Guadalajara, gwä-dä-la-hä'rä, Mexico, capital of the State of Jalisco, and second only in population and importance to the City of Mexico, from which it is 380 miles distant by the line of the Mexican Central railway. Its altitude above sea level is 5,054 feet. The city possesses a great advantage in the nearby Falls of Juanacatlan which supply electric energy for its industries, street railway and lighting. In recent years Guadalajara has become a very important mining centre or headquarters for a district in which are many valuable properties, now being developed. Guadalajara is noted for its beautiful pottery and skilfully wrought "retratos" or figures in clay, and its drawn work. In the immediate vicinity is an inexhaustible deposit of clay the elastic qualities and pleasing color of which especially adapt it to the two purposes first above mentioned. Among other industries are manufactories of cotton goods, twine, and cordage, paper and leather articles. The hospitals include a Civil Hospital for both sexes, a Military Hospital, the Hospital of the Sacred Heart, for women, the Hospital Guadalupano, also for women, and the Beata Margarita Hospital, and Santissimo Trinidad Hospital for men. The city's educational facilities include a college of law, a college of medicine, a normal school, a young ladies' seminary, a lyceum, a high school, and a number of primary schools. The Cathedral, or most notable church of the city, is one of the grandest in the Republic, architecturally and in its dimensions, decorations, and ornamentation. The penitentiary of the State, an imposing structure, is located here, as also the various other public institutions. Located in the city are two public libraries,— the State Library, with over 50,000 volumes,— and the Seminary Library with over 12,000 volumes; an Industrial Museum, a theatre, and the Governor's Palace. The principal public parks, some of which are exceptionally beautiful, are the Alameda, Plaza de Armas, Botanical Garden, Alcalde Park, and the Calzada de San Pedro. The banking facilities are supplied by the Bank of Jalisco, a local institution with a capital of $6,000,000, the Guadalajara Banking Company, and branches or agencies of the National Bank, and the Bank of London and Mexico, of Mexico City; the Bank of Aguascalientes, and the Central Bank, of Mexico City. Pop. (1906) 102,000.

Guadaloupe-Hidalgo, gwä-dä-loo'pä-ē-däl'-gō, a village of the federal district of the United States of Mexico, at the foot of the Guadalupe Mountains, three miles north of the city of Mexico. The treaty of peace between the United States and Mexico was signed here 2 Feb. 1848.

Guadalupe-Hidalgo, Treaty of, 2 Feb. 1848; the treaty which closed the Mexican War. While the war was in progress, Polk sent Nicholas P. Trist of Virginia, then chief clerk of the State Department, to negotiate a treaty of peace; the conditions to include the cession of Upper and Lower California and New Mexico and the Rio Grande for boundary between Mexico and the United States. Trist went to Scott's headquarters, an armistice was arranged, and in August 1847 the three Mexican commissioners and Trist met and exchanged proposals. The former would not yield to such terms, demanded the Nueces as the boundary (giving them Corpus Christi and a large triangle at the south), and offered much less other territory. Trist was recalled, but remained at headquarters; Santa Anna declared that he was tricked in the proposals, war operations went on, and the city of Mexico was captured not long after. In January 1847 negotiations were resumed, Trist still acting as principal, and the treaty above was agreed on. The Senate, however, refused to accept it, and insisted on harsher terms; Mexico was forced to accept them, and the Senate ratified the treaty 10 March. Formal proclamation was made 4 July 1848. The land cession was of Upper California and New Mexico, and the Rio Grande was made the boundary. The United States paid Mexico $15,000,000, and assumed $3,250,000 of claims made by United States citizens against Mexico prior to the treaty, besides any claims to which under the conventions of 1839 and 1843 Mexico was adjudged liable. Of the 252 claims put in under this treaty, 182 were finally allowed. See MEXICAN WAR.

Guadeloupe, gä-da-loop' (Fr. gwäd-loop), West Indies, an island of the inner chain of the Caribbees. (See ANTILLES.) It lies in lat. 16° N. and lon. 61° W. and, with its dependencies, has an area of 583 to 600 square miles. A strait divides it into two parts, called Basse-Terre and Grande-Terre. The former is very mountainous, and its volcanic character has been manifested most impressively by the eruption of La Soufrière in 1797 and the disastrous earthquake in 1843. The eastern division, or Grande-Terre, on the contrary, is a calcareous plain, which at no point attains an elevation of more than 450 feet. The mean temperature of Guadeloupe is 78° F., the maximum being 101° and the minimum 61°. The dependencies referred to above are the adjacent islands, Maria Galante, Les Saintes, and Désirade. The chief products are sugar, coffee of the finest quality, and cocoa. Revenues amount to about $1,300,000 to $1,400,000 annually; expenditures, including the appropriations made by France from time to time, are somewhat in excess of that sum. Guadeloupe is a department of France, represented in the French chambers by one senator and two deputies. Its local interests are directed by a governor and a general legislative assembly of 30 members, the jurisdiction embracing one half of St. Martin, besides the islands which have been mentioned. There are nearly 100 elementary schools, with 11,000 pupils, and one *lycée,* with 350 pupils. The chief seaport, Point-à-Pitre, with about 17,000 inhabitants, is situated on the eastern side of Basse-Terre. Several times its buildings have been destroyed or severely damaged; in 1903 minor earthquakes were reported to be of frequent occurrence; and a fresh outbreak from La Soufrière was thought to be not improbable. Le Moule, the principal town of Grande-Terre, resembles Point-à-Pitre in size and situation. After the discovery, Guadeloupe belonged to Spain until 1635; in that year it was taken by the French; in 1794 England seized it, freed the slaves, and retained possession until 1802; then it passed again into French hands, together with Martinique, England taking St. Lucia in exchange; the restoration of slavery by the French was resisted by the negroes, and was attended with great suffering and loss of life; for a brief period in 1810 England once more held Guadeloupe, but returned it to France; emancipation was declared in 1848. The inhabitants are largely French mulattoes, with perhaps 15,000 coolies. Total population, including dependencies, about 167,000. Consult Hill, 'Cuba and Porto Rico, with the other Islands of the West Indies.'

Marrion Wilcox,
Authority on Spanish America.

Guadiana, gwä-thē-ä'nä, a river of Spain and Portugal, which rises in the plateau of New Castile, flows first northwest, then circuitously southwest into and across Estremadura, and on reaching Badajoz turns southwest and forms part of the boundary between Spain and Portugal. Entering Portugal it flows past Monsaraz, Moura, and Serpa, to Mertola, again forms the boundary between the two kingdoms, and falls into the Atlantic between Castro Marim on the Portuguese, and Ayamonte on the Spanish side. Its course is about 515 miles, of which only 35 are navigable. Its chief tributaries are the Gigüela, Bullaque, Valdehornos, and Rubial on the right, and the Azuel and Jabalon on the left.

Guagua, gwä'gwä, Philippines, a pueblo of the province of Pampanga, island of Luzon, on one of the main channels of the Pampanga delta, 3 miles southwest of Bacolor. It is the port for Bacolor, has steamboat communication with Manila, and has an extensive business in groceries and drugs. Pop. 10,700.

Guaiacum, gwī-a-kŭm, a genus of trees of the natural order *Zygophyllaceæ,* natives of tropical America, remarkable for the hardness and heaviness of their wood, known as *lignum vitæ,* or Brazil-wood; also the peculiar resinous product of the common species (*G. officinale*). This is a tree 30 or 40 feet high, usually growing with crooked stem and knotty branches. The wood and resin have been obtained chiefly from Cuba, Jamaica, and San Domingo, but the tree is becoming scarce there. Guaiacum-wood is remarkable for the direction of its fibres, each layer of which crosses the preceding diagonally. It sinks in water. It is much valued and used for pulleys, casters, mortars, bowling balls, and other purposes requiring an extremely firm and durable wood. It is pale yellow on the outside but blackish brown near the heart, where it abounds in resin. Stimulative and other medicinal properties reside in the bark, leaves and resin of this tree.

Guaira, La, lä gwä-ē'rä, Venezuela, a seaport on the Caribbean Sea, five miles in a direct line (29 miles by rail) north of Caracas, of which it is the port. It is situated on a narrow coast strip between high mountains and the sea, and has an unhealthful climate. There are modern harbor works including a breakwater, and a considerable export and import trade is carried on. In 1901 the exports of coffee amounted to 7,290 tons; of cocoa, 3,776 tons; and of hides, 782 tons; the imports include manufactured goods, provisions, wines, etc. The town dates from an ancient Spanish settlement in 1588. In 1903 the port was blockaded by British and German fleets to enforce a settlement of commercial claims. Pop. 14,000.

Gual, gwäl, **Pedro**, South American patriot: b. Caracas 31 Jan. 1784; d. Guayaquil, Ecuador, 6 May 1862. He was graduated from the University of Caracas; joined the patriots in 1810, and was elected as a member of the legislature in 1811. In 1812, when the republicans surrendered, he escaped to New York, but in a few years returned, was made governor of Cartagena, and later sent as ambassador to the United States. He was admitted to the bar in Washington, and began the practice of law, but in 1816 joined Bolivar, was made governor of some of the conquered provinces, and was for a time minister of finance and foreign affairs. In 1858 he joined the revolt against Monagas, and was made president of the provisional government; in 1859 he was elected vice-president of Venezuela, and in 1860 became president, but resigned the next year, retiring to private life.

Gualeguay, gwä-lā-gwī', Argentine, South America, city in the province of Entre Rios; on the Gualeguaychu River. It is a trade centre for a region in which cattle raising is the chief industry. Pop. 7,810.

Gualeguaychu, gwä-lā-gwī-choo', Argentine, South America, city in the province of Entre Rios, on the Gualeguaychu River, 11 miles from its mouth. Its chief industries are connected with the raising and shipping of cattle and wheat. Pop. 14,000.

Guam, gwäm or goo-äm', or **Guajan**, gwä-hän', one of the Ladrone Islands, the southernmost and largest, and the only one with much population; east of the Philippines; occupied by the United States in 1898, the remainder of the group belonging to Germany. It is 29 miles long by 3 to 10 wide, and about 150 square miles in area; high and precipitous on the eastern side, and forming a low plateau in the northern part, but mountainous in the south. About half the soil is arable, but only about one per cent cultivated. Except for the native clearings, most of it is thick and pathless jungle. Some of the trees are valuable hardwoods for ship-building or ornamental cabinet-work; others are useful for food, as the cocoanut (the finest here of all the tropics), pineapple, breadfruit, sour-sop and custard-apple, etc.; the hau (*Hibiscus tiliaceum*) makes strong cordage, not affected by water; the pandanus' long leaves are braided into mats and hats; and the ylang-ylang is famous for perfume. Rice, sugar, tobacco, hemp, coffee, cacao, bananas, melons, etc., have been introduced and are cultivated. The only native mammals are rats, flying foxes, and bats; but the deer and wild goat, of European origin, have thriven plentifully, and cows and pigs are raised. There are no snakes; there are centipedes and scorpions, but none dangerous. The climate is very rainy, but mild except in midsummer, when the conflict of trade-winds produces a dead calm, oppressive heat, and storms, with some hurricanes. Earthquakes are frequent. The island is volcanic, with bordering coral reefs. The east side has but two good harbors, Pago and Tarofofo; the latter is the only one, except San Luis d'Apra on the west, which is safe for vessels all the year round. The island contains about 9,000 people; Chamorros with a mixture of Tagal and Malay, and some Anglo-Saxons from whaling ships, producing half-breeds with copper skins and light hair. They are nearly all in the villages; those with ranches build rough huts on them, where the family spend part of the time. Agaña (San Ignacio d' Agaña) is the only large town; it is a neat place with houses half of stone and half of wood or bamboo, and contains 6,400 people. Its best port is Apra (above), on a deep bay formed by a peninsula; its own harbor being dangerous in a storm from the anchors dragging on the coral bottom, and the landing bad from breaking reefs. There is a mission school, endowed in the 17th century by Maria Ana, queen of Philip IV of Spain. Umata, on the west, was the former capital. Agat, 400 people, is next in importance to Agaña; but the next largest in size are Suwai, 000, and Ynarajan, a fair port on the southeast, 550. Merigo has 300. (Wheeler, Report on Guam, 1900, War Dept. doc. 123.)

Guan, gwän, a gallinaceous bird of the family *Cracidæ*, genus *Penelope*, characterized by the front of the throat being naked and wattled, specifically *P. cristata*. It is about 30 inches long, nearly half of which is due to the tail. The color is a shining reddish-green, with rump and belly chestnut, neck and chest white-spotted, and the feet and throat red; the female is of a more reddish tint, with the crest, neck and mantle bordered with white. Though the guans have most of the habits of the curassow (q.v.), they are far less gregarious, noisy and restless. They take to trees when alarmed, roost there at night and often make their nests among the branches. They inhabit the American tropics, one species, the chachalaca (*Ortalis vetula*) ranging into Texas. Guans have long been domesticated in South America.

Guanabacoa, gwä-na-bä-kō'a, Cuba, a town well situated on high ground near the city of Havana. The number of its inhabitants shown by the United States War Department census of 1899 was 13,963 (that is, 8,232 native white; 1,091 foreign white; 2,173 negro; 2,408 mixed; and 61 Chinese). The total population of the district of Guanabacoa was 20,080.

Guanaco, gwa-nä'kō. See Huanaco.

Guanahani, gwa-nä-ä-nē. See Cat Island.

Guanajay, gwä-na-hī', Cuba, town in the department of the same name in the province of Pinar del Rio, about 30 miles west of Havana. It is situated in a hill region of much salubrity, and is a popular health resort. Here is the terminus of the Havana and Guanajay Railroad. Pop. about 9,000.

Guanajuato, gwä-nä-hoo-ä'tō, Mexico, a state bounded by the states of San Luis Potosi, Queretaro, Michoacán, and Jalisco. Area 20,276 square kilometres, or 7,806.26 square miles. The principal cordilleras traversing the state are the Sierra Gorda, in the northeast, and the Sierra de Guanajuato in the centre, which are formed by the junction of the Codorniches, San Antonio, and Santa Rosa mountain ranges. The highest peaks are the Gigante (2,346 metres) and the Llanitos (2,815 metres). In the south and west are the valleys of San Judas, San Felipe, and Santiago, and the fertile plain of El Bajo Rivers are: the Lerma, with its affluents the Laja and the Turbio, the Irapuato, and a number of smaller streams. There are many mineral springs, and one lake, 37 1-3 square miles in extent, called the lake of blood (Yuririapundaro). Five mining districts merit special mention; namely, the Sierra Gorda, Allende, Santa Cruz, Guanajuato, and Leon, the principal mines being those which produce silver and gold, silver, mercury or cinnabar, tin, iron, lead or argentiferous lead, and copper or argentiferous copper. On 31 Dec. 1897 there were 550 claims registered, of which number 80 were in process of development. (See statistics given in connection with the department and city of Guanajuato.) The climate, except in the higher parts of the mountain ranges, is not unfavorable (mean annual temperature about 70°). The rainy season extends from the middle of May until the beginning of July. During those months the rainful is heavy in the valleys, but only moderate in the mountains. See Mexico — The States of.

Guanajuato, Mexico, capital of the State of the same name. Elevation 6,830 feet above the sea. Distance from the city of Mexico 252 miles, and 1,000 miles by the Mexican Central railway from the United States border at El Paso, Texas. It is situated in the heart of the Guanajuato mountains, in a picturesque ravine, six miles from the main line of the above named railway and overlooking a rich and beautiful region, while itself surrounded and honeycombed by mines hundreds of years old, which have produced unknown millions of precious metals and are still productive. Mining began here 300 years ago, developing as it proceeded, some of the richest deposits ever discovered. Over $600,000,000 of gold and silver have been mined under and in the immediate vicinity of the city, fully two-thirds of which was gold. The buildings of the business centre are quite commodious and imposing and are very substantial, unlimited quantities of very superior building stone being immediately at hand. Among the prominent public buildings are the Government Palace, or State House, in which the legislature holds its sessions and the State officers have their offices, and the Opera house or Theatre, a magnificent stone structure copied from the Grand Opera House of Paris. In a remote part of the city are the famous Catacombs, wherein are stored the mummified remains of some 30 or 40 human beings representing both sexes, and several tons of human skulls and bones. At the opposite extremity of the city is the great dam of modern construction which contains the community's water supply. Another notable structure is the principal church of the city, built of the peculiar colored stone or marble which exists in great quantities in the immediate vicinity. It is surmounted by a dome of large proportions and exceptional beauty. There are several other churches, the ancient Mint, the State College, the Market de la Reforma, and the Castle of Granaditis. There is a street railway, and a thorough system of electric lighting. The Bank of Guanajuato, a local institution of $3,0000,000 capital, and branches of the National Bank and the Bank of London & Mexico compose the financial institutions of the city. There are a State College and a Normal School for young women; two museums,— one connected with the State College and devoted to natural history and mineralogy, and the other — the Museum of Ramon Alcazar — devoted to "Antiquities, Minerals, and Precious Objects." Two public libraries contain over 13,000 volumes. In 1905 the city was flooded and much valuable property destroyed. Pop. about 40,000.

Guanare, gwä-nä'rā, Venezuela, city, capital of the State of Zamor, near the Guanarito River, about 220 miles southwest of Caracas. Coffee and sugar-cane are some of the chief agricultural productions; but the city is the centre of an extensive cattle trade. Pop. about 11,500.

Guanes, gwä-nās', or **Guane**, Cuba, town in the province of Pinar del Rio; about 10 miles from the sea, and 120 miles southwest of Havana. The district court holds its sessions here. The trade in the products of the surrounding country, cotton, tobacco, and cattle, is extensive. There is also a large trade in lumber. Pop. (1899) 14,760.

Guan'idin, a basic organic substance, having the empiric formula CH_5N_3, and the constitutional formula $H.:C(NH_2)_2$. It may be prepared by heating an alcoholic solution of cyanamide and ammonium chlorid to 212° F. Guanidin is a crystalline, deliquescent substance, with strongly alkaline properties, and it absorbs carbon dioxid from the air. It forms numerous salts, and urea is evolved in many of its reactions. In fact, it is this close relation with urea that gives guanidin its chief interest, many authorities holding the opinion that guanidin is an intermediate product in the formation of urea from proteid bodies, in the normal physiological chemistry of the body.

Guanin, gwä'nĭn, a yellowish-white, amorphous substance, which derives its name from being a constituent of guano; but it also forms the chief constituent of the excrement of spiders, has been found attached to the scales of fishes, and seems to be a normal constituent of the mammalian liver and pancreas. With regard to its occurrence in guano, as it has not been found in the recent excrement of sea-birds, there is every reason to believe that it is formed by slow oxidation (from atmospheric action) of uric acid, much as uric acid can be made to yield urea and oxalic acid. And in the pancreas and liver it probably represents one of those transitory stages of disintegrated nitrogenous tissue which are finally excreted by the kidneys in the more highly oxidized form of urea. Guanin is a diacid base, but also forms salts with metals, and combines with salts. When heated with hydrochloric acid and potassium chlorate, it is oxidized to carbon dioxide, guanidin, and parabanic acid.

Guano, gwä'nō, Spanish *guano huano*, from Peruvian *huanu*, dung, is the name for deposits of the partially decomposed and dry excrementitious matter of sea-birds, but it has been also extended to accumulations of a similar kind from land-birds, and even from bats in caverns. Deposits from sea-birds are got wherever there is good feeding-ground in the neighborhood of unfrequented islands and rocky cliffs, and such may be seen around many shores. But to render them of practical utility atmospheric conditions are requisite which are only found in certain localities, and all the great guano deposits exist in the hottest and driest parts of the tropics, as on the islands of the South Pacific Ocean. The most important of all were the deposits on the Chincha Islands off the coast of Peru, which for years yielded a considerable revenue, but are now quite exhausted. The guano which was found there was from 60 to 80 or 100 feet in thickness, and was entirely due to the droppings, accumulated for many ages, of the innumerable sea-birds which make these islands their resting-place and breeding-ground. The excrement which is at first pasty, rapidly dries by exposure to the sun in a part of the world where a fall of rain takes place once in a lifetime, and is looked upon as an historical event, and thus, while putrefaction is almost entirely arrested, the soluble salts of which guano to a great extent consists are retained. This guano, called technically Peruvian, is the most highly prized, and is regarded as a type of the substance; but quantities are or have been got from other localities, as Patagonia, various points of Bolivia, Mexico, and Chile, Malden Island and numerous other Pacific islands, new deposits being opened up as the older become less productive.

Guano varies extremely in composition, even in the same deposit considerable differences will be found; and when deposits from different localities are compared, there is sometimes no analogy except in the kind of substances present. Thus, some consist mainly of phosphate of calcium and other fixed salts, while others contain much volatile matter, with a large proportion of ammonia. To the latter belongs Peruvian guano, which is a very light, dry, non-cohesive pale-yellow powder, with a characteristic ammoniacal odor, and sometimes containing lumps, made up of different salts. It is a very complex mixture, containing the urate of ammonium, the oxalates of ammonium and calcium, the phosphates of sodium, ammonium, calcium, and magnesium, the sulphates of potassium, sodium and ammonium, the chlorides of sodium and ammonium, and the carbonate of calcium. There is always some moisture, organic matter of different kinds, sand from the rock on which the deposit lies, and this is sometimes considerable. These may be regarded as the possible constituents of guano, but the ingredients which are especially prized are the ammoniacal salts, the phosphoric acid, in combination with the alkalies and alkaline earths, and the alkalies themselves, particularly the potash. It is the remarkable abundance of these constituents and their fine intermixture which makes genuine Peruvian guano so much esteemed as a manure. It contains almost all the inorganic matter required by a plant, and that in a highly available form, so that it is one of the best of all fertilizing agents for different crops. Its use as a manure was known to the native Peruvians centuries ago, but no attention was paid to the accounts by modern travelers of its wonderful efficacy until A. von Humboldt took some to Europe, in 1804, and had it analyzed. It was not exported on a large scale till about 1850, and from that time the quantity sent to foreign countries, including large shipments to the United States, was very great, but the supply has latterly much fallen off.

As a substitute for ordinary guano, what is known as fish-guano has been in use for a considerable number of years. This consists essentially of fish and fish offal dried and powdered. In the case of oily fish, such as herrings, it is necessary to extract as much of the oil as possible before the operation of powdering; and it will thus be understood that different kinds of fish differ greatly as regards their value for manurial purposes. But all sorts of fish-guano contain a large percentage of ammonia and phosphate of lime, and are thus valuable as fertilizers.

Guanta, gwan-tä', **Venezuela**, a modern seaport on the north coast, in the state of Bermudez, 12 miles west of Barcelona, by rail.

Guantanamo, gwän-tä'nä-mō, Cuba, a town in the province of Santiago, situated at the head of the most important harbor east of the city of Santiago on the southern coast. Its surroundings were favorably known before 1898, for the beauty of the groves of lime-trees and lemon-trees, the coffee plantations, and the residences of wealthy planters, who made the heights overlooking the bay a favorite place of resort. Since the Spanish-American war, Guantanamo has been famous as the scene of certain military operations. On 19 May 1898 an unsuccessful attempt to cut the cable in the bay was made by the St. Louis and the Wompatuck. On 10 June a force of 600 marines landed from the transport Panther on the eastern shore of Guantanamo Bay, and undertook to make the outer harbor a secure place for the use of American vessels when coaling, or as a rendezvous and a refuge in stormy weather. The marines established their camp ("Camp McCalla") on a small hill, where they sustained the attacks of the Spanish troops for several days, and the courage and endurance displayed at this time must be regarded as memorable features of the war. The Marblehead and Texas lent assistance, the latter on 12 June sending 40 marines with two automatic guns. In the course of that week the camp was protected by earthworks; other warships arrived and shelled the thickets in which the Spaniards were concealed, the forts, and the town; the garrison was strengthened by accessions of bluejackets and Cuban insurgents familiar with the country; and thus, when ten days had passed, the outer harbor was practically in the possession of the American forces. In July 1901 the United States government selected Guantanamo for one of the four naval stations on the Spanish coast. The number of inhabitants of the town of Guantanamo, according to the United States War Department census of 1899, was 7,137. The total population of the district was 28,063, comprising native white, 7,028; foreign white, 1,843; negro, 8,988; mixed, 10,025; and Chinese, 179.

Marrion Wilcox,
Authority on Spanish America.

Guaporé, gwä-pō-rā', or **Itenez**, ē-tä-nāz', a South American river which rises in the Serra Aguapehi, in the state of Matto Grosso, Brazil, flows south, nearly parallel to the Jauru, passes the town of Matto Grosso, whence it is navigable downward for light draught vessels, then with a northwesterly trend forms part of the boundary between Brazil and Bolivia, and finally after a course of over 900 miles, unites with the Mamoré to form the Madeira.

Guarana, gwä-rä'nä, a dried paste consisting chiefly of the crushed or pounded seeds of *Paullinia sorbilis*, a climbing shrub, native of South America. The seeds are obtained largely from the cultivated plants, and in South America guarana is used much as tea or coffee is used in other countries. It is the staple drink of millions of people. Guarana is found in the drug market in the form of flattened cakes or cylinders of a dark reddish-brown color and showing on fracture numerous coarse angular fragments of seeds. The taste is astringent and somewhat bitter, becoming sweet on chewing. Guarana contains four to five per cent of caffeine, making it twice as strong as coffee. Its action, however, resembles more closely that of tea because of the high percentage of tannic acid it contains. In medicine it has been used in the treatment of sick-headache.

Guarana-bread, the seeds of the *Paullinia sorbilis* (a South American tree), pounded, made into cakes, and dried in the sun. It is extensively used in Brazil and other parts of South America as a stimulant and restorative, and as a material for making a refreshing beverage. The active principle of guaranine, is said to be identical with theine or caffeine (q.v.); and no known substance yields it so abundantly. Other species of *Paullinia* possess poisonous properties.

Guarantee, gär-an-tē', or **Guaranty**, in law, an undertaking to answer for the failure of another. The statute of frauds provides that no person shall be liable on any special promise to answer for the debt, default, or miscarriage of another person, unless a written agreement, or some memorandum in writing for such purpose, shall be signed by the promisor or some other party lawfully authorized by him. In the construction of a guarantee it is a general rule that the surety shall not be bound beyond the express words of the engagement. By the mercantile Law Amendment Act (England and Ireland), no special promise made to answer for the debt, default, or miscarriage of another is deemed invalid to support an action, by reason that the consideration for such promise does not appear in writing, or by necessary inference from a written document. By a similar statute applying to Scotland, and passed in the same year, all such guarantees must be in writing, and if for a firm will cease upon a change of the members, unless intended by the parties by express stipulation or implication to be binding notwithstanding the change in the firm. Every person who becomes surety for the debt or obligation of another, and discharges his liability, is entitled to the assignment of all securities held by creditors. In the United States the common law on the subject of guarantee or suretyship was the same as that of England and a guarantee was equally forcible whether written or oral, but see SURETYSHIP.

Guard, National. See MILITIA.

Guardafui, Cape. See CAPE GUARDAFUI.

Guardi, Francesco, frän-chĕs'kō gwär'dē, Italian painter: b. Venice 1712; d. there 1793. He was a pupil and follower of Canaletto; his work shows less exactness in detail than his master's, but is superior in use of color. His paintings are mostly of scenes in Venice; they include 'Procession of the Doge'; 'Fete of Corpus Domini'; 'Grand Hall of the Palazzo Ducale' (in the Louvre, Paris); 'Church and Piazza of San Marco' (National Gallery, London); and 'The Rialto' (Metropolitan Museum, New York).

Guardian Angel, an angel who watches over a particular individual. It is the general belief, in the Roman Catholic and Greek Churches that every man has a guardian angel who defends him from evil, suggests good thoughts and wise counsels, and helps him in prayer. This belief is based on the words of Christ in Matt. xviii. 10: "Their angels do always behold the face of my Father which is in heaven"; the Fathers of the Church strongly inculcate it, and in the lives of the saints instances are given of the active interference of guardian angels. The belief is shared by some Anglican high churchmen. The Roman Catholic Church celebrates the Feast of Guardian Angels on 2 October. See also ANGEL; GUARDIAN SPIRIT.

Guardian Spirit, a spirit that watches over the welfare of an individual or household. The belief in guardian spirits finds expression in some form in all primitive religions, and in many which have reached a higher stage of development. The Australian native believes that when a warrior kills his first foe the spirit of the slain enters the body of the slayer, and becomes his guardian; in Tasmania a native has been heard to ascribe his deliverance from danger to the care of his deceased father's spirit; and the most important religious rite of a North American Indian is to obtain a patron genius. In Asia, in Africa, and among the Indians of South America, the belief in guardian spirits obtains, as it did formerly among the Aryans of Northern Europe. Greeks and Romans believed that each individual was under the protection of a spirit who prompted him to good deeds, and guided him throughout his life; gradually there arose a belief in an evil spirit who was at war with the good spirit, and instigated every evil deed. These spirits were called in Greece, Dæmons, in Rome, Genii. The Romans also believed that the spirit of the founder of each family was the guardian spirit (the Lar) of the family and worshipped the Lares with special rites. For the Christian form of the belief see GUARDIAN ANGEL.

Guards. A guard, in the primary sense, is one who watches or protects a person or persons, a place, property, etc., against loss, danger, or harm; as a body-guard, a prison-guard, etc. Body-guards have been an inseparable accompaniment of monarchy from the earliest ages; the Assyrian and Persian kings employed them, and the corps of "Argyraspides," or silver-shields were selected by Alexander out of the bravest men of his army. The Roman emperors had their Prætorian guard. Napoleon I. first created a small troop of bodyguards, with the title of Guides, while he was yet only general, in his first Italian campaign. From this arose by degrees, the great institution of the Imperial Guard, consolidated in 1804, which 10 years later comprised 102,708 men, and after being disbanded by Louis XVIII. in 1815, was restored by Napoleon III. in 1854. It consists of infantry, cavalry, and artillery. In England, the Guards, otherwise called household troops, consist of two regiments of Life Guards, the royal regiment of Horse Guards, and three regiments of Foot Guards. Many of the European sovereigns before the French Revolution had small corps of foreign troops which served in this capacity. Thus the French had, in former times, the Guard of Scottish Archers, and at a later period, a body of Swiss guards, called the Cent Suisses. The Cent-Gardes formed by Napoleon III. are founded upon the latter. The Pope still retains his Swiss guards. In Prussia there is both infantry and cavalry of the guard, and the Russian imperial guard forms an entire corps d'armée 50,000 strong.

In general military use the term guard is of various distinct applications and denotes functions of great importance. It means a sentry on duty, and also a body of soldiers assigned, under the proper officer or officers, to the duty of guarding or protecting a camp, post, or any place where military control is established. Company and regimental details for guard duty are made according to circumstances — the number of men required or available, etc.,— rank of officers being also regarded as far as convenient. Guard-mounting or inspection and review before the old guard is relieved, is a ceremony of much detail and is usually carried out with strict military observance.

Guasa, gwä'sä, or **Warsaw,** a name given in the Gulf of Mexico and West Indian region to various large groupers (q.v.), especially the jewfish (q.v.). "Warsaw" is an anglicized form of the Spanish word.

Guatemala, Republic of (República de Guatemala), the largest country in Central America; bounded on the north by Mexico, British Honduras, and the Gulf of Honduras; on the east and southeast by British Honduras, the Gulf of Amatique, Honduras, and Salvador; on the south and southwest by the Pacific Ocean; and on the west by Mexico. Its area is estimated at 47,810 or 48,290 square miles; its territory extending from lat. 13° 42' to 17° 49' N., and from lon. 88° 10' to 92° 30' W.

Political Divisions.— Guatemala is divided into 22 departments, and each department subdivided into municipal districts, the total number of the latter being 331. Again, for electoral purposes, the whole republic is divided into 38 *distritos electorales.* The following list of the departments and chief towns shows the population and altitude of the latter. The figures given for the number of inhabitants are those of 1903 in the case of Guatemala City, Cobán, and Totonicapam; otherwise the statement is based upon a table carefully prepared in 1897.

Northern departments are: Baja Verapaz (chief town Salamá, population 10,608, altitude 2,827 feet); Alta Verapaz (chief town Cobán, population 24,475, altitude 4,047 feet); El Petén (chief town Flores, population 1,671, altitude 482 feet); El Quiché (chief town Santa Cruz, population 11,914, altitude 5,543 feet); and Izabal (chief town Livingston, population 1,978).

Central departments are: Guatemala (chief town Guatemala City, population 72,102, altitude 4,854 feet); Sacatepéquez (chief town Antigua, or Antigua Guatemala, population 10,150, altitude 4,464 feet); and Chimaltenango (chief town Chimaltenango, population 3,749, altitude 5,666 feet).

Eastern departments are: Jutiapa (chief town Jutiapa, population 11,023, altitude 2,847 feet); Jalapa (chief town Jalapa, population 12,246, altitude 4,625 feet); Chiquimula (chief town Chiquimula, population 12,562, altitude 1,167 feet); and Zacapa (chief town Zacapa, population 11,964, altitude 511 feet).

Southern departments are: Escuintla (chief town Escuintla, population 12,343, altitude 1,269 feet); Amatitlan (chief town Amatitlan,* population 8,408, altitude 3,614 feet); and Santa Rosa (chief town Cuajiniquilapa, population 3,062, altitude 3,254 feet).

Western departments are: Huehuetenango (chief town Huehuetenango, population 10,270, altitude 7,118 feet); Totonicapam (chief town Totonicapam, population 25,196, altitude 7,067 feet); San Marcos, chief town San Marcos,* population 6,036, altitude 7,216 feet); Quezaltenango (chief town Quezaltenango,* population 22,265, altitude 7,419 feet); Retalhuleu (chief town Retalhuleu, population 6,327, altitude 977 feet); Suchitepequez (chief town Mazatenango,* population 6,970, altitude 1,005 feet); and Sololá (chief town Sololá,* population 7,027, altitude 5,940 feet).

The Capital.— Guatemala City, or New Guatemala, which was built after the destruction of Antigua Guatemala in 1776, has a temperate climate, owing to its elevation above the level of the sea. It is a well-planned town, covering a large area; the streets are wide and straight, lighted by electricity, and have lines of street railways. Principal buildings: the palace of the president, city hall, court-house, post and telegraph office, artillery barracks, custom-house, liquor and tobacco bureau, national theatre, college of medicine and pharmacy, university, school of arts and trades, polytechnic school, palace of the archbishop, the cathedral and several other fine churches, the penitentiary, and the hotels. The city has public gardens, telephone and telegraph service, and is connected by rail with the port of San José. Pop. 74,527.

Topography and Physical Geography.— The mountains of Guatemala are commonly referred to as "Cordillera of the Andes," "Guatemalan Andes," or simply "Andes," though there is no propriety in those names. The Andes terminate in northern Colombia, and have no genetic connection with the mountains of Central America. In order to understand the independent character of the latter (so far as the great continental ranges are concerned), we must realize that they are also in their geologic history totally distinct from the Rocky Mountain system, or North American Cordilleras, which terminate in southern Mexico. If the trends of the Andean and Rocky Mountain systems were protracted from their termini (in 70° W. and 97° W., respectively), they would not connect with each other, but would pass the latitude of Guatemala in parallel lines nearly 2,000 miles apart. (See CARIBBEAN SEA; CENTRAL AMERICA; and consult: Hill, 'Cuba and Porto Rico,' Chap. I.). The Guatemalan mountains belong to the Antillean system, which lies between the termini just referred to; its ranges, composed of folded sedimentaries, in eastern Guatemala have an east-and-west trend. But the ranges near the Pacific coast of the republic, crossing the western ends of the Antillean corrugations diagonally, or with a northwest-and-southeast trend, must be assigned to still another class; they form a part of the volcanic chain which extends along the entire western coast of Central America, and is continued in Mexico. The Sierra Madre is the principal range of the west and south; in the central and eastern districts are the Sierra de Chama, Sierra de las Minas, Sierra de Santa Cruz, and the Sierra de Copán — the last named on the frontier of Honduras. The highest points of the Cordillera are given as: Tajumulco volcano (12,600 feet), Tacaná volcano (12,400 feet), both in the southwest; Acatenango volcano (11,100 feet), south-central; and the volcano de Fuego (11,400 feet), also south-central.

Hydrography.— Rivers emptying into the Gulf of Mexico are: the Usumacinta, on the Mexican frontier, and the Cuilco and Salequa, which are also tributaries of Mexican streams. The following empty either into the Gulf of Honduras or Izabal Lake (Golfo Dulce): the Montagua, Rio Hondo, the Dulce, the Belice, the Sarstoon, and the Polochic. Those which flow into the Pacific are: Rio de los Esclavos, Rio de Paz, the Michatoya, Guacalate, Coyelate, Patulul, Nagualate, Samalá, Tilapa, Naranjo, and Suchiate. Steamship navigation has been established on the Dulce and Polochic rivers; seven or eight of the others are navigable for small boats. The most important lakes are: Atitlán and Izabal (both navigated by steamers), Petén, Amatitlán, Ayarza, and Güija (on the frontier of Salvador). Ports on the Caribbean side of the republic are: Puerto Barrios, Livingston, and Santo Tomás — the first two being ports of entry and delivery, while the last is a "minor port," at which importation and exportation are restricted to certain articles. On the Pacific coast the most important ports are: San José, 74½ miles from Guatemala City; Champerico, and Ocós — all ports of entry and delivery, provided with iron piers, etc.

Geology.— The calcareous formations of the Antillean ridges and, generally, the eastern and

*Towns damaged or destroyed by earthquakes in 1902.

central regions, deserve special mention. Volcanic products characterize the Pacific slope and Sierra Madre, where they occur in connection with granitic rocks, porphyries and trachytes. See also CENTRAL AMERICA.

Mineral Resources.— Gold and silver are found near the Montagua River and elsewhere: salt in the departments of Alta Verapaz and Santa Rosa. Other minerals reported to exist are: coal, lignite, manganese, lead, tin, cinnabar, copper, kaolin, opals, slate, alum, antimony, marble, alabaster, sulphur, ochre, asbestos, plumbago, chalk, and bitumen. A belt of country extending from the coast range of mountains on the western frontier, near the Pacific, across the Sierra Madre to the coast range of the Caribbean slope, is regarded as essentially a mineral territory, in which there has been comparatively little exploiting or prospecting, though enough to reveal the presence of the precious and base metals.

Climate.— The lowlands of the Pacific and Atlantic coasts are torrid; interior table-lands, at an altitude of 2,000 to 5,000 feet, have an agreeable climate; and the high districts, where the elevation is more than 5,000 feet, are decidedly cool. As is shown in the list of places given under "Political Divisions," the larger towns are built in the temperate or cool zones. The rainy season, beginning in May, lasts until October in the interior, but sometimes until December, on the coast. December and January are the coldest months; March and April the hottest. Snow sometimes falls (in December or January) on the uplands of the cool zone.

Flora and Fauna.— The very name of the country signified in the Indian language "the land covered with trees." The rich soil and varying climatic conditions favor a wide range of products in the vegetable kingdom; no systematic classification of these, however, has yet been made. The extent of the forest land, which abounds in mahogany, is estimated at 1,300,000 acres. The fauna and avifauna resemble those of Costa Rica in general, but especially characteristic of Guatemala are the aquatic birds on its rivers and lakes, and the quetzal. Mexican deer are quite numerous. The tapir, honey-bear, armadillo, wild pig, cougar, jagua, etc., are found as in other parts of Central America. The over-abundance of insect life is particularly noteworthy.

Land Tenure.— The most interesting provisions of the Guatemalan laws, to be considered under this heading, are those which relate either to the public lands or more particularly to the aid which the government desired to extend to the cultivators of certain crops. The latter will be stated in the paragraph entitled *Agriculture.* As for the former, the agrarian law of 1894 provided for the sale, lease, and gratuitous concession of the public lands, and created a board of government engineers to survey the said lands and divide them into lots of not more than 15 caballerias each. (One caballeria in Guatemala = 113⅝ acres.) These lots can be purchased from the government at prices ranging from $250 to $500 per caballeria, but no alien is allowed to hold lands situated on the frontier of the republic; or they may be leased (under certain restrictions as to area, duration of lease, and use of the lands) at a rental not to exceed 5 per cent of the selling price; or they may be granted by the president of the republic, in tracts not larger than two caballerias each, to poor persons applying for them, to immigrants, to educational institutions, as a reward for the construction of new roads, etc. Real estate, the value of which does not exceed $1,000, is exempted from taxation. Transfers of unimproved city lots, or of real estate in the country the price of which does not exceed $100, cannot be taxed; and no foreigner can be required, during the first year of residence in the country, to contribute money or personal service for making or repairing roads.

Agriculture.— Coffee grows in the regions between 1,000 and 6,000 feet above the sea-level; sugarcane, between sea-level and 6,200 feet; cacao in the lowlands or those regions having an altitude of less than 3,000 feet. Tobacco, wheat, maize, and beans, are also produced in large quantities. Coffee exports in one year have amounted to 85,373,223 pounds, with a value of $7,390,477 gold. The ordinary annual yield of tobacco is given as 1,000,000 pounds; of cane-sugar, 41,000,000 pounds; bananas, 1,000,000 bunches; and cacao, 200,000 pounds. Stock-raising has been encouraged in the departments of Izabal, Zacapa, Petén, and Alta Verapaz, by decrees authorizing the political chiefs of those departments to make grants of land to persons who establish ranches. Money premiums have been offered to cultivators of india rubber, cacao, sarsaparilla, and hemp; grants of land to those who engage in the cultivation of wheat and bananas. Proprietors of large cotton or tobacco plantations, and reliable day laborers on large plantations of coffee, sugarcane, bananas, or cacao, are exempted from military service. No tax of any kind is levied for 10 years upon plantations of hemp, flax, ramié, cotton, grapes, and one or two other products. Large cash premiums to encourage the production of grapes, hemp, cotton, flax, wheat, and tobacco were offered, particularly during the decade 1886–96; in 1899 the government offered 113⅝ acres of the public lands as a reward for every 20,000 rubber-plants, four years old, planted after 14 Jan. 1899.

Commerce.— Exports to the United States in the fiscal year ending 30 June 1902 were valued at $2,600,000; imports from the United States at $1,680,000. The principal exports for 1901 were: Coffee, 673,344 hundred-weight, sent to Germany, the United States, and Great Britain; sugar, 55,200 hundred-weight, sent to other Central American countries and to the United States; bananas, 262,691 bunches, sent to the United States; hides, 7,018 hundred-weight, sent to Germany and the United States; india rubber, 4,420 hundred-weight, sent to the United States and Germany; timber, 2,155,696 feet, sent to Great Britain and the United States; and other articles valued at $55,000. Of the imports, about one half in value are supplied by the United States, and one quarter by Great Britain, the chief imports being flour, cotton goods, machinery and manufactured iron, and preserved meats and other articles for food. Both exports and imports have increased in value during recent years.

Manufactures.— For the partial supply of local needs a number of small establishments are maintained, the chief industries being the preparation of ramié fibre and the manufacture of coarse textiles, hats, shoes, pottery, cigars, foundry products, musical instruments, furniture, agricultural implements, and liquors.

Shipping and Navigation.— Steamers of the Pacific Mail Steamship Company call at San José three times each month on the voyages from San Francisco southward. From New York to Puerto Barrios (via Haiti and Jamaica) passengers and freight are carried by two steamship lines. The steamers of the American Fruit Company ply between New Orleans and Puerto Barrios; and in 1903 announcement was made of a new steamship service, the "Guatemala Northern Steamship Line," to operate chiefly between ports on the gulf coast of the United States and Puerto Barrios.

Railways, Roads, Telegraph, etc.— The Central Railway, the first line built in the republic, was completed in 1882. It connects the port of San José with Guatemala City. The Champerico Railway runs from the Pacific port of that name to Retalhulen and San Felipe, a distance of 41 miles. The Ocos Railway, 15 miles in length, connects the wharf at Ocos with the town of Ayutla, near the Mexican frontier. The Ixtapa Railway connects Overo with the old port of Ixtapa (12 miles). The Patulul-Mazatenango Railway has as its terminal points Santa Maria station, on the Central, and San Felipe, passing through Patulul and Mazatenango. The Northern Railroad, which is to connect Puerto Barrios with Guatemala City (and thus, in conjunction with the Central, to supply railway transportation from coast to coast), had completed 159 miles of its road in March 1902. An important highway from Sanarate has been completed, giving access to the northern agricultural districts. The republic has in operation more than 3,000 miles of telegraph wires, 137 kilometres having been added in 1901-2; and the telephone system extends over 250 miles. Receipts from telegraph and telephone lines were greater by $130,042.97 in 1902 than in 1901. The operation of the postal system in 1902 left a considerable surplus in the treasury.

Weights, Measures, and Money.— The French metric system is used, concurrently with the old Spanish system of weights and measures. The latter has: *Onza* (ounce), *libra* (pound, strictly 1.043 pounds), *arroba* (25 *libras*), *quintal* (100 *libras*), *tonelada* (ton 20 *quintals*), and *fanega* (1½ bushels). The monetary unit is the silver *peso* (value in United States gold or silver, $0.384). The money in actual use is paper currency and fractional nickel coins.

Banking.— Six banks are authorized to issue paper, namely: International Bank of Guatemala (Banco Internacional de Guatemala), Columbian Bank (Banco Colombiano), Western Bank (Banco de Occidente), Commercial Bank of Guatemala (Banco Comercial de Guatemala), American Bank (Banco Americano), Guatemala Bank (Banco de Guatemala). All of these, except the Banco de Occidente, have their headquarters in Guatemala City.

Government.— The legislative power is vested in the National Assembly (a single house), whose members (deputies) number one for every 20,000 inhabitants, and are elected for four years by popular vote. The executive power is vested in a president, elected for six years by direct vote of the people. He is responsible for his acts to the assembly, and cannot be re-elected until after an interval of at least one term. The administration is carried on, under the president, by six "secretaries of state," each of whom has charge of a separate department (*ministerio*). These departments are: Government and Justice, Foreign Relations, Public Instruction, Promotion of Public Welfare (*Fomento*), Finance and Public Credit, and War. The council of state is an advisory board, of which certain members are chosen for the assembly and others appointed by the president.

Finances.— The national revenue in 1901 is shown in the following table:

Customs	$8,513,260.88	
Expenditure	7,855.85	
		$8,505,405.03
Liquor excise and government monopolies........	$3,775,892.98	
Expenditure	117,687.15	
		$3,658,205.83
Taxes	$1,651,246.55	
Expenditure	72,588.45	
		$1,578,657.10
Total		$13,742,268.96
Deficit from post-office....	$110,617.48	
Deficit from telegraph office	193,541.32	
		$304,158.80
Net total.................		$13,438,110.16
Revenue in 1900...........		7,974,435.40
Increase in revenue....		$ 5,463,674.76

The sum of $14,547,246.72 was appropriated for administrative expenses in the fiscal year extending from 1 July 1902 to 30 June 1903, with the following distribution: Government and justice, $1,874,392; foreign relations, $256,180; treasury, $1,199,980; public credit, $6,000,000; development, $1,458,279; war, $2,006,154.40; public instruction, $1,442,900; other expenditures, $309,376.32. The revenue for the year was estimated at $14,555,000. The total amount of the foreign debt liquidated to 30 June 1902, according to an official statement, was:

Principal on 30 June 1898.................	$7,216,046
Half of interest from 1898 to 1901, convertible in bonds..........................	432,063
Half of interest to 30 June 1901...........	288,642
Interest for 1901 to 1902..................	288,642
Total	$8,226,293

On 31 Dec. 1900 the outstanding amount of the gold debt was $9,231,202, and of the currency debt $27,700,666.

Army.— The army consists of about 7,000 men in regular service; effective army, 56,900 men between the ages of 18 and 30; reserve, 30,000 men from 30 to 50 years of age.

Population.— Full-blooded Indians are much more numerous in Guatemala than in other Central American countries; in fact they, with the Indians of mixed blood, *ladinos* and *mestizos* make up the bulk of the population. The natural increase among these people is indicated in the report of the secretary of public works for 1901, which shows 66,728 births in that year against 35,618 deaths, a gain of 31,110 persons. The total number of inhabitants in 1903 was about 1,700,000, including 11,000-12,000 foreigners.

Education.— Public instruction, supported by the government, is secular and gratuitous; primary instruction is obligatory; free education is guaranteed by the Constitution. In 1901 there were 1,030 schools in the republic, 455 being for males, 379 for females, 146 mixed, and 50 night schools. In Guatemala City there were 53 schools, of which number 25 were public, under government inspection; and among the private institutions was a school for boys and girls of the German colony only, endowed by the German government. Higher instruction was given in the capital at the National Institutes (one for men and one for young women), to which normal departments were attached; and similar institutes existed at Quezaltenango (before its destruction) and Chiquimula. There is a separate normal school for young women at Guatemala City, and normal schools for young men at Antigua, San Marcos, and Mazatenango. Schools of law, medicine, and engineering are mainly supported by private funds, but receive aid from the public treasury. Education in music is supplied at the National Conservatory and a number of local schools. There are also trade schools (including one for women) a commercial college, and an art school. The national library contains 30,000 volumes and many valuable unpublished documents. Other libraries accessible to the public are those of the professional schools, the supreme court, national institute for men, and academy of teachers. Public libraries are maintained in the larger towns. The national printing-office at the capital is regarded as one of the best establishments of its kind in Latin-America. More than 30 daily papers and other periodicals are published in the country.

Religion.— The Constitution guarantees liberty of conscience. The government recognizes no creed. The prevailing religion is Roman Catholicism.

Judiciary.— The supreme court of justice consists of a chief justice and four associates, elected by the people. There are six courts of appeal, each consisting of a chief justice and two associates, also elected by the people. Courts of the first instance are 29 in number: their judges are selected by the president among the candidates approved by the chief justice of the supreme court.

Local Government.— The "Political Chief" (*Jefe Politico*) of each department of the republic is appointed by the president, whose authority he exercises in provincial matters. The local officials locally elected are: the *Alcaldes* (one or more for each municipal district) and the *Regidores* (members of the municipal council). *Alcalde* and *Regidor* correspond to mayor and alderman; the *jefe politico* takes the place of a governor, and his relation to the chief executive in a centralized republic fairly indicates the limits within which local self-government is permitted.

History.— Pedro de Alvarado, one of the lieutenants of Cortés, in 1523-4 conquered the country, and on 25 July 1524 proclaimed the sovereignty of Spain at Almolonga, the native town which was afterward to be known as Santiago de los Caballeros. The important fact in connection with this conquest is that it did not lead to the extermination of the natives. Two explanations of this circumstance are offered. Mr. Bancroft says that the Indians, after fighting desperately in defense of their homes, maintained a sullen resistance, and therefore both here and in the adjoining state of Chiapas "the natives probably retain to the present day their original traits with fewer modifications than elsewhere in the Pacific States." But this theory is at variance with the Central American records in general. A suggestion which may be preferred is that the natives of Guatemala were essentially peace-loving agriculturists, not uninfluenced by that civilization which had survived here, as in southern Mexico and Honduras, from very ancient times; that they were allowed to remain undisturbed after the first resistance ceased, while the more warlike tribes, such as those inhabiting Costa Rica and Veragua, were gradually being exterminated. And their descendants in great numbers still possess the land. After the conquest all of the territory now divided up among the Central American countries was included in the captain-generalcy of Guatemala. Independence was proclaimed 15 Sept. 1821; annexation to the Mexican empire under Iturbide followed (5 Jan. 1822). An assembly of representative citizens of Guatemala and the other Central American provinces on 1 July 1823 declared the whole country to be independent, with reference to Mexico, Spain, and all other nations, "whether of the Old or of the New World." Accordingly the United Provinces of Central America came into existence. Guatemala seceded from this union 17 April 1839. The name República de Guatemala was assumed 21 March 1847. Between 1839 and 1851 there was a series of bitter struggles with Salvador for supremacy, fortune favoring the smaller republic; but in the year last mentioned Guatemala began to be successful, and, under the leadership of Rafael Carrera (president until 1856, and subsequently life-president or dictator), carried the war into Salvador (1863) and regained the controlling position in Central America. Carrera appointed his own successor, and died in 1865. The next significant administration was that of Gen. Justo Rufino Barrios, who was put in office by the Liberals, after their onslaught upon the Jesuits. Barillas was elected to the presidency in 1886. In 1890 and 1891 the progress of the country was checked by epidemics of cholera and smallpox. On 15 March 1892 José Maria Reina Barrios was inaugurated as president, and by a decree of the National Assembly (30 Aug. 1897) his term was extended to 15 March 1902 — in direct violation of the Constitution, which was proclaimed in 1879 and modified in 1885, 1887, and 1889. He was assassinated 8 Feb. 1898 by a British subject of German origin. Dr. Manuel Estrada Cabrera was proclaimed acting president, and received the support of the army. An insurrection begun under Gen. Castillo's leadership 28 July was put down, but only to be quickly followed by another revolutionary movement. Insurgent forces commanded by Morales offered a stubborn resistance in the southwest, until Morales was captured. When peace had been restored, Cabrera was the only candidate for the presidency, and his election was announced 25 Sept. 1898. In the following year the government of Guatemala made a proposition which was equivalent to repudiation of a part of its foreign debt, but yielded to Germany's protest — or threat to use force — and withdrew the discreditable suggestion. Earthquakes which occurred in April 1902 caused great damage in several districts. Amatitlan, Mazatenango, San Marcos, Sololá, and San Felipe suffered severely, and Quezaltenango, in importance the second city of the republic, was totally destroyed. An eruption of the volcano Santa Maria followed on 24 October, and there were outbursts from new craters in November. Several thousand persons lost their lives through these disasters, and the injury to property (plantations, buildings, machinery, and cattle) has been estimated at $5,000,000 to $10,000,000. Taxes for the relief of the earthquake sufferers were imposed by the Legislative Assembly 24 April 1902. A convention between the United States and Guatemala relating to the tenure and disposition of real and personal property was signed 27 Aug. 1901, and ratifications exchanged at Guatemala 16 Sept. 1902.

H.), 'History of the Pacific States of North America' and 'Native Races'; Bureau of American Republics, 'The Republic of Guatemala' (1897); same, 'Monthly Bulletins' (1902 and 1903); Frobel, 'Aus Amerika'; Squier, 'The States of Central America'; Vreeland and Bransford, 'Antiquities at Pantaleone,' Smithsonian Inst Rept. 1884, Pt. I.; Ximenez, 'Las historias del origen de los Indios de Guatemala, traducidos de la lengua Quiché.'

MARRION WILCOX,
Authority on Spanish America.

Guava, gwä'vä, the name of several tropical plants of the myrtle family which yield delicious fruits. The common guava (*Psidium guava*, or *pyriferum*) is a low bushy tree, bearing long, fragrant white flowers on solitary axillary stalks, from each of which develops a fruit larger than a hen's egg, roundish or pear-shaped, smooth, yellow; the rind thin and brittle; the pulp firm, full of bony seeds, aromatic, and sweet. The jelly or preserve made from it is highly esteemed, and pleasantly mingles tartness with sweetness. The rind is stewed with milk, and is also made into marmalade. This fruit is rather astringent than laxative. Guava buds, boiled with barley and licorice, make a useful astringent drink in diarrhœa. This guava is now naturalized in all the warmer parts of the world, and in many, especially Ceylon, has run wild. Two cultivated varieties are known, the preferable "white," and the more showy but less agreeable "red." Several other species are cultivated; as the mountain guava of the West Indies (*P. montanum*) and the marangaba, a dwarf species (*P. pygmæum*) of Brazil, with fruit no larger than gooseberries.

Guaviare, gwä-vē-ä'rä, or **Guayabero**, gwī-ä-bä'rō, a river of Colombia, South America, which rises in the Cordillera Oriental near Bogota, flows eastward for 750 miles, forms the boundary between the departments of Cundinamarca and Cauca, and joins the Orinoco near San Fernando de Otabapo. It is navigable for nearly five hundred miles.

Guayama, gwī-ä'mä, Porto Rico, town in the southeastern part of the department of Guayama; five miles from the sea. Pop. 5,400.

Guayaquil, gwī-a-kēl', Ecuador, a seaport city, the capital of the province of Guayas, on the river Guayaquil, 25 miles above its mouth in the Gulf of Guayaquil, on the Pacific Ocean. The site is low and unhealthful, but the sanitary conditions have been improved by a modern system of waterworks, and of drainage. Other modern improvements include street railways, gas-lighting, and telephone service, while a railroad connects with the interior. The chief buildings are the custom-house, town-hall, a college, technical school, and the cathedral. Vessels of 18 feet draught reach the town, and the river and its tributary, the Daule, are navigable for smaller vessels, a considerable distance above the town. The export trade averages $6,500,000 annually, cocoa representing nearly five-sixths, the rest being, coffee, ivory-nuts, rubber, hides, and specie. Cottons, hardware, and other manufactured articles are imported. The industrial establishments include steam saw-mills, foundries, machine-shops, ice factories, and a large brewery. The town was founded 25 July 1531 on St. James' day, whence its official title Santiago de Guayaquil. It has had an eventful history, being attacked by pirates, Dutch, French and English, and suffering from disastrous conflagrations, on the last occasion in 1896. Pop. (1903) 55,000.

Guayaquil, a gulf of the Pacific, in the republic of Ecuador. It has a wide entrance, narrowing as it extends inland, and receiving at its head the Guayaquil River. It contains a number of islands.

Guaymas, gwī'mäs, Mexico, city in the state of Sonora; on the Gulf of California, the terminus of the Sonora Railroad, and the chief Pacific port of Mexico. The principal exports are gold, silver, and hides. Pop. 6,100.

Guayrá (gwī-rä') **Falls**, Brazil and Paraguay, a cascade of the Paraná River, on the boundary between the countries mentioned; the result of a contraction of the river-bed from a width of 4,470 yards into a narrow gorge, 65 yards wide, the waters making a plunge of 56 feet. "These falls, situated in the midst of a desolate region, far from human habitation, and rendered almost inaccessible by virgin forests, rapids, and other obstacles, have been visited by very few, though they are said to form one of the grandest spectacles in the world. The volume of water which passes over them is twice that of Niagara." Consult 'Paraguay' (2d ed. revised by J. S. Decoud, Honorary Corresponding Member of the International Union of American Republics; Washington: Government Printing Office, 1902).

Gubat, goo'bät, Philippines, a pueblo of the province of Sorsogon, Luzon, on the east coast of the Bay of Gubat, 11 miles southeast of the provincial capital Sorsogón. The waters of the bay were formerly infested by pirates, who terrorized the surrounding region. Pop. 13,300.

Gubernatis, Angelo de, än'jä-lō dā goo-bĕr-na'tēs, Italian Orientalist: b. Turin 7 April 1840. He founded the Italian Asiatic Society in 1886 and has written much in various departments. Among his works are 'The First Twenty Hymns of the Rig-Veda' (1865); 'Death of Cato' (1863), a metrical drama; 'King Nala,' an Indo-Brahmin play; 'Gabriel,' a novel; 'Zoological Mythology' (1872); and 'Dictionnaire International des Ecrivains du Jour.'

Gudgeon, gŭj'ŏn, a small European freshwater fish (*Gobio fluviatilis*) of the carp family. It swims in shoals, and affords great sport to anglers from its greediness in seizing upon any bait presented. Its name has therefore come to mean a person easily "fooled" to his hurt.

Gudrun, goo-droon', or **Kudrun**, an old German epic, built up out of the popular songs and traditions of the seafaring people who lived on the shores of the North Sea between the Elbe and the Seine. It was put into permanent form by an unknown poet of Austria in the latter part of the 12th or early 13th century; and ranks second to the 'Nibelungenlied' in the history of early German literature. It relates the history of three generations of the kings of the Hegelings or Frisians, and in the third part tells how Gudrun, the daughter of Hetel, king of the Hegelings, was carried off from her home by Hochmut, son of the king of Normandy, how she preferred to work like the lowest maidservant in the house of Hochmut's mother, and endure the greatest indignities, rather than break her troth pledged to Herwig, king of Zealand, and how finally she was rescued by her brother and her betrothed.

Guebers, gē'bėrz, also **Ghebers, Gabers, Ghavers, Gebirs** (Turkish Ghaur or Ghiaur, infidel, generally but probably wrongly derived from the Arabic kâfir), a name applied by Mohammedans to the adherents of the ancient religion of Zoroaster, who reside in Persia. They originally were subjected by the Mohammedans to much cruelty, but are now permitted a great degree of religious freedom. Those who fled to India are known as Parsis (q.v.).

Guelder (gĕl'dėr) **Rose,** or **Snowball,** a cultivated variety of the *Viburnum opulus,* or water elder, of the order *Caprifoliaceæ.* In the European wild form, the inflorescence is a dense cyme whose outer flowers are barren and enlarged, but in the cultivated form all the flowers are neuter and consequently the plant can never set seed. A yellow dye is obtained from it, and the wood is sometimes employed in making tobacco-pipes and other articles.

Guelders, gĕl'dėrz, or **Guelderland.** See Gelderland; Netherlands.

Guelfs, gwĕlfs, or **Guelphs,** and **Ghibellines,** names of rival political parties in Italy during the Middle Ages. The words are of German origin, derived respectively from Welf, the name of a princely family in Bavaria (from which is descended the royal Brunswick line and the line of Este), and Waiblingen, the name of a castle in Würtemberg belonging to Conrad of Hohenstaufen, the German emperor. In the great battle of Weinsberg, 1140, the war-cry of the partisans of Conrad was "Hie Waiblingen," that of the adherents of the Duke of Saxony (of the house of Welf) was "Hie Welf." Some years after when the effort was made by the popes and various states and princely houses of Italy, among them the house of Este, to consolidate opposition to the Emperor, the two German words, changed to Guelfo, Guelfi (plus), and Ghibellino, Ghibellini, were adopted as party designations by the Italians. At first and for a long time after the assumption of these names by the great parties in Italy, Guelf and Ghibelline, did really designate two opposing national policies — the policy of the dependence of the several states of the Peninsula on the Empire, and the policy of Italian independence of Germany, and of resistance to imperial absolutism. The states of northern and of central Italy were divided in their allegiance and they were continually passing from one side to the other, but they were predominantly Ghibelline; the states of southern Italy were always Guelf. The popes were the mainstay of the Guelf party and thus were the assertors of the policy of Italian independence and home rule. As usual with party designations, "Guelf" and "Ghibelline" continued in use as the names of factions in no wise concerned with the question of imperialism.

Guell y Rente, Jose, hō-sā' goo-ely' ē rān-tā', Cuban author: b. Havana, Cuba, 14 Sept. 1818; d. Madrid 20 Dec. 1884. He studied law in Havana and Barcelona and practised his profession in his native city. In 1848 he went to Spain where he married Josepha de Bourbon, sister of the king. Besides several novels he published 'Philippe II. et Don Carlos devant l'histoire' (1878), and other works.

Guelph, gwĕlf, Canada, city and county-seat of Wellington County, Ontario; on the river Speed, and on the Grand T. and Canadian P. Rys., 48 miles west of Toronto; founded by John Galt (q.v.). The river affords abundant water power and the city, in a rich agricultural and cattle-raising district, enjoys a large trade. It is an inland port of entry and is the seat of a United States consulate. It has breweries, large flour, saw, and planing-mills, and manufactories of foundry products, machinery, pipe and tubing, musical instruments, sewing-machines, agricultural implements, woolen goods, carpets, furniture, carriages, leather, soap, boots and shoes, etc. Good building stone is quarried in the vicinity. Guelph has in addition to the county buildings, 4 colleges, 16 churches, substantial business blocks, banks, a library and reading-room, and daily and weekly newspapers. The city owns and operates its electric light, gas and power, its water-works and street railway. It is the seat of the Ontario Agricultural College (q.v.) and the Provincial Experimental Farm. Pop. (1901) 11,496; (1904 est.) 12,500.

Guelphs, Order of, frequently styled the **Guelphic Order,** an order of knighthood instituted for the kingdom of Hanover in 1815 by the prince-regent of England and Hanover, afterward George IV. of England, and conferred by the kings of Hanover until the absorption of that kingdom by Prussia in 1866.

Guemal, gwā'mäl, either of two species of small Andean deer (*Cervus chilensis* or *C. antisensis*), whose antlers have only one forking — a long brow-tine projecting straight forward; which have tusks in the upper jaws in both sexes; and whose fawns are not spotted.

Guerber, Helene Adeline, American author. Her books include: 'Empresses of France'; 'Legends of the Middle Ages'; 'Legends of the Rhine'; 'Myths of Greece and Rome'; 'Myths of Northern Lands'; 'Story of the Thirteen Colonies'; 'Story of the Great Republic'; 'Story of the Greeks,' etc., etc.

Guercino da Cento, gwĕr-chē'nō dä chĕn'tō, Italian painter: b. Cento, duchy of Ferrara, 1590; d. Bologna 1666. His proper name was Giovanni Francesco Barbieri, and he was called Guercino from a squint in his eyes. In 1621, having already acquired renown as a painter, he was invited by Pope Gregory XV. to Rome, but the premature death of this pontiff induced him to return to his native town two years after. About 1642 he went to Bologna, where Count Aldovrandi received him in his palace and entertained him with the most magnificent hospitality. Guercino adopted three different manners of painting, the first in imitation of Caravaggio, which being very dark, he quitted for that of the Caraccis, and latterly for a style still more light and sketchy; but his middle style is his best. His chief pictures are at Rome. The most celebrated is that of the 'Martyrdom of Saint Petronilla,' which has been copied in mosaic to adorn one of the panels in Saint Peter's between the 'Transfiguration' by Raphael, and the 'Communion of St. Jerome,' by Domenichino. His other chief pictures include a 'St. Anthony' at Padua; an 'Annunciation' at Milan; 'St. Peter' at Modena; 'Cephalus and Procris,' and a scene from the 'Pastor Fido' in the Dresden gallery; the 'Parting of Priam and Hector' at Marseilles. The galleries of Bologna, Florence, and Paris, besides some of those of England and Germany, also possess specimens of this master.

Guereza, gĕr'ē-za, or **Guerza,** gĕr'za, (*Colōbus guerza*), an Abyssinian monkey remarkable for its beauty. Short, glossy, jet-black fur covers its limbs, back and head, while a long fringe of silky white hair depends from the flanks. It frequents lofty trees and is much sought for the sake of its valuable fur.

Guérin, Eugénie de, ē-zhā-nē dė gā-răṅ, French writer: b. Cayla, Languedoc, 1805; d. 31 May 1848. She was a sister of G. M. Guérin (q.v.) and much of her life was devoted to taking care of him. Her 'Journals and Letters,' of which an English translation appeared (1865–6), have been widely read in America, both for their charm of style and their devotional spirit. See Parr, 'Maurice and Eugénie de Guérin' (1870).

Guérin, Georges Maurice, zhŏrzh mō-rēs, French poet: b. Languedoc 4 Aug. 1810; d. Paris, 19 July 1839. He was for a time a member of a religious house in Brittany, but in 1833 went to Paris and taught in the Collège Stanislas. His verse has been greatly admired by critical readers. Sainte Beuve in 1860 edited his 'Reliquæ' with critical notice, and the poet forms the subject also of one of Matthew Arnold's 'Essays in Criticism' (1865). See Parr, 'Maurice and Eugénie de Guérin' (1870).

Guernsey, gĕrn'zĭ, **Alfred Hudson,** American editor: b. Vermont, 1825; d. 17 Jan. 1902. He was for several years editor of 'Harper's Magazine,' and he was also associate editor of the 'American Cyclopædia' (1872–6). With Henry M. Alden he was author of 'Harper's Pictorial History of the Great Rebellion,' writing the Eastern campaigns (1862–5); and 'The Spanish Armada' (1882).

Guernsey, Egbert, American physician: b. Litchfield, Conn., 8 July 1823; d. Fishkill Landing, N. Y., 19 Sept. 1903. He was graduated from the medical department of New York University in 1846, founded the Brooklyn *Daily Times*, and in 1872 became editor of the 'Medical Times.' He was also president for many years of the Metropolitan Hospital of New York, and published 'Domestic Practice' (1855), which has passed through 11 editions.

Guernsey, the second largest and westernmost of the Channel Islands (q.v.), 46 miles southwest of Cherbourg, France, and 68 miles from Start Point, Devonshire, England. It is triangular in form, nine miles long and from three to four miles broad. The picturesque south coast is lofty and abrupt, the island sloping towards the north which is low and level. Guernsey is noted for its healthful climate, for the fertility of its soil, for its horticultural and floricultural products grown chiefly under glass, and for its magnificent breed of cattle. The chief towns are St. Peter Port (q.v.), the capital, and Saint Sampson, the latter with an important export trade in blue granite. With the adjacent islands of Sark, Alderney, Herm and Jethow, Guernsey forms an autonomous bailiwick. Pop. (1903) 41,000.

Guerrero, Teodoro, tā-ō-dō'rō gĕr-rā'rō, Cuban dramatist: b. Havana 9 Nov. 1824. He was educated in Spain, returning to Cuba in 1845, in which year his first volume of poems, 'Teordorelas,' was published. His comedy, 'La Cabeza y el Corazon' ('The Head and the Heart'), was successfully performed at Havana in 1861, and 'Lecciones do Mundo' ('The Lessons of the World'), didactic verse, reached many editions. The author published other dramas and several works of fiction and was active in Cuban educational affairs.

Guerrero, Mexico, a state bounded by the states of Morelos and Mexico on the north, Puebla on the northeast, Oaxaca on the east and southeast, and by the Pacific Ocean on the southwest. Its area is given as 64,756 square kilometres, or 24,926 square miles. It is mountainous throughout almost its entire extent, the northern section being occupied by the spurs of the ranges of Morelos and Mexico, and the southern by the Sierra Madre del Sur (highest peaks 2,800 metres). Between these two sections runs the Mexcala or Balsas River, to which all the streams of the state are tributary. The principal lakes are Pazahualco, Chantengo, San Marcos, and Nexpa. The Pacific coast line is low and sandy, and has excellent harbors. The bay of Acapulco, the chief port, is deep and spacious. The mineral resources of the state have been as yet very imperfectly developed. Gold, silver, lead, mercury, iron, coal, sulphur, marble, granite, opals, topazes, and diamonds are mentioned among its products. The climate is unhealthy. On the coast the heat (from 95° to 96.80° F.) and rainfall are both excessive; and in the belt above 6,500 feet, the cold is sometimes severe. Fevers, leprosy and affections of the respiratory and digestive organs are the prevailing diseases. The annual value of the agricultural products is about $2,200,000, and the total value of live stock is estimated at $3,000,000. Manufactures are limited to sugar-cane products, mescal wine, palm-oil, cotton fabrics, and leather. Plans for a number of railways have been made, but have not been carried out. There are, however, telegraph and telephone lines, and a few wagon roads. Steamers of the Pacific Mail and the Mexican International Company touch at Acapulco. The state is divided into 14 districts: La Unión, Mina, Alarcón, Hidalgo, Alvarez, Zaragoza, Morelos, Abasolo, Allende, Tabares (chief town Acapulco de Juarez, with population of 5,780), Galeana, Chilpancingo (principal town and capital of the state Chilpancingo de los Bravos, with population of 6,321), and Guerrero. Total population of the state 420,336.

Guerrilla, gė-rĭl'la, an irregular mode of carrying on war by means of small independent bands of armed men, self-constituted and un-connected with the regular army. The name originated in the Spanish war for independence (1808–14), when the term guerrillas was applied to the bands of Spanish peasants, organized to harass the French armies that then occupied Spain. Guerrilla warfare was carried on to some extent during the Revolution and also in the Civil War, particularly by the Confederates. Guerrilla methods were also effectively used by the Cuban patriots in Cuba's war for independence.

Guesclin, Bertrand du. See Du Guesclin.

Guest-bees, a large genus (*Nomada*) of little bees of both Europe and America, which lay their eggs in the nests of burrowing bees of the genera *Andrena* and *Halictus*, where the young share the food gathered for the young of their hosts, and the adults live harmoniously together,— apparently a case of partnership rather than of parasitism. Compare Cuckoo-Bee.

Gug'genheimer, Randolph, American lawyer and politician: b. Lynchburg, Va., 20 July 1848; d. Elberon, N. Y., 12 Sept. 1907. He studied at New York University and began his business career as clerk in a woolen goods house in New York. He later entered a law office, studied law, was admitted to the bar, and became the head of a law firm, which was particularly successful in important negotiations with English syndicates, investing capital in American industries. He also was active in the political life of the city as a Democrat; was a member of the board of education for three years; and was also president of the board of aldermen, in which capacity he served as acting mayor of Greater New York.

Guiana, ge-ä'nä, the name applied to all that tract of country in South America bounded by the Atlantic Ocean, the Amazon River and its branches, and the Orinoco River and its branches. It lies between lat. 8° 40' N. and lat. 3° 30' S., between lon. 50° and 60° W. Its greatest extent east and west is 1,090 miles; its greatest breadth, from Punta Barima, to the confluence of Rio Negro with the Amazon, is 710 miles. The total area is more than 800,000 square miles. The western districts belong to Venezuela; the southern and eastern districts to Brazil. The three European colonies, the British, Dutch, and French Guianas, extend from the seacoast to the frontiers of those republics.

Early voyages to this part of South America are mentioned in the article Discoveries, etc. The first settlements on the northern coast lay much farther toward the west, and exploration and colonization east of the Orinoco began when European adventurers continued in this new field their search for Eldorado. Spanish and Portuguese expeditions into Guiana during the 16th century were very numerous, but always disastrous. The English undertook its conquest, believing, in the words of Sir Walter Raleigh, "that whatever prince shall possess it, that prince shall be lord of more gold, and of a more beautiful empire, and of more cities and people, than either the king of Spain or the great Turk." Capt. Laurens Keymis, sent by Raleigh in 1596 to explore the region, reported that "the like occasion seldom happeneth in many ages." In the articles, Dabaiba and Eldorado, it is shown that the birthplace of the Eldorado myth was the region now known as Colombia, and that the time of its birth was near the beginning of the 16th century; but in the course of 100 years the site of Eldorado was transferred to central Guiana, and Schomburgk asserts that the possibility of its existence in that locality continued to occupy the imagination and attention of adventurers until the close of the 18th century. Humboldt was the first to prove that a lake "like unto Mare Caspium," as Raleigh described it, no longer existed, and it was erased from the maps; Schomburgk identified the locality where it was sought with the small lake Amucu near an Indian village named Pirara. Raleigh led several armaments from England with the hope of conquering the golden capital. When these undertakings ended in disappointment, Capt. Keymis committed suicide, and Raleigh "paid the forfeit of his illusions with his life upon the scaffold." Dutch traders, who arrived about 1580, settled on the Pomeroon and Essequibo rivers; and after the establishment of the Dutch West India Company land on the Berbice River was granted to van Peere. The Pomeroon colony was abandoned owing to attacks by the English in 1666 and by French privateers. In 1740 English planters from the West Indies established themselves on the Essequibo, as a result of the "open door" policy adopted by the Dutch with respect to that region alone. Next, the overflow of immigration settled in the Demerara district; and in 1781 all three colonies, Essequibo, Demerara, and Berbice, were taken by the British. Recaptured before the year was out by the French (who were then allies of the Netherlands), they were again taken by the British in 1796. The peace of Amiens restored the original status; but English troops interposed once more, and the colonies were ceded to Great Britain by the treaties of 1814–15. They were united in 1831, forming British Guiana.

In the region east of Berbice, a few English people attempted to form a colony at the village of Paramaribo (1626), but abandoned the project. Ten years afterward the French invested Paramaribo, but relinquished it, proceeded to Cayenne, and there founded what is now known as French Guiana. In 1652 a body of English settlers again arrived at the Coma River, and succeeded in establishing themselves. This colony was granted in 1662 by Charles II. to Lord Willoughby, who changed the name Coma River into Surryham, in honor of the Earl of Surrey. Hence we have "Surinam," the name often used instead of Dutch Guiana. The British crown bought the colony from the heirs of Lord Willoughby, but it passed into the hands of the Dutch about the time when Holland gave up the attempt to keep New Amsterdam, now New York. The statement often repeated, that Surinam was "exchanged" for New Amsterdam is incorrect.

1. British Guiana is situated approximately between lat. 1° and 8° 40' N. It is bounded on the north and northeast by the Atlantic Ocean, on the east by Dutch Guiana, on the south by Brazil, and on the west by Brazil and Venezuela. Its area is 104,000 square miles. The old settlements of Essequibo, Berbice, and Demerara form counties with the same names. Of these, Demerara contains the capital of the colony (see Georgetown); Essequibo, the town

of Bartica, the point of departure for miners going to the gold-fields; and the capital of Berbice County is New Amsterdam. One of the chief points on the new boundary line with Venezuela, Mount Roraima, is an immense sandstone mass rising with perpendicular sides 2,000 feet above the slopes (themselves 6,000 feet above sea-level) which form its base. Some of the neighboring mountains resemble it in form, but are less imposing. Midway between this group and the Atlantic coast is the Imataca range, extending east-southeast to the confluence of the Cuyuni and Essequibo. The latter with its tributaries drains nearly the whole interior of the colony; the Demerara, though much smaller, is more important, because it flows through the region which has become the centre of population; the Corentyne is the boundary between British and Dutch Guiana.

Geology and Mineral Resources.— The original sea beach is found far inland, where it now appears as long stretches of white sand reefs, the sand being derived from a barrier of primary, volcanic and metamorphic rocks, which impedes the navigation of the rivers. The strip between this barrier and the ocean front — composed of layers of soft mud, clay, sand, broken shells, and decomposed vegetable matter — is really an enormous mud-flat, about 100 feet in depth, and covered with a rich, heavy loam, and in places, with a kind of peat called pegass. The whole interior of the country, between the agricultural coast-strip and the range culminating in Roraima, is an auriferous region. The gold is commonly found in combination with silver. Quartz-mines have been worked in upper Demerara, but placer-mines in the beds of former streams or the channels of existing ones are more usual. Other mineral products are iron, sapphires, diamonds, mercury, garnets, antimony, and plumbago. A sandstone formation characterizes the southwest, from Mount Roraima to the Potaro and Essequibo rivers, thence extending eastward across the Demerara, Berbice, and Corentyne. The sandstone is interbedded with volcanic rocks. In many parts of the colony there are red, yellow, and blue clays; and fine white clay, suitable for the manufacture of porcelain, is also found.

Soil and Climate.— The surface of the coast alluvium is so fertile that alternation of crops is not required; it is, however, very heavy and hard to cultivate. The thermometer ranges generally from 70° to 80° F., with little difference in this respect between day and night. Rainfall in some years 130 inches, in others not more than 70 inches. The year is divided into two rainy seasons (November–February and May–July), and two dry seasons. Neither destructive earthquakes nor hurricanes occur. There has been only one serious outbreak of yellow fever during 50 years. Death rate of the colony about 35 per 1,000.

Flora and Fauna.— Characteristic forest products are exceedingly hard and heavy woods. The greenheart, mora, and wallaba are valuable for building; the simaruba, letter-wood, and cralwood, for making furniture, etc. Vegetation in Guiana is remarkable on account of the altitude of the trees and the great size of leaves and flowers. The gigantic water-lily, Victoria Regia, is very common. Some of the orchids form large masses, with flower-stems 12 feet high. Common mammals are sloths, deer, ant-eaters, tapirs, armadillos, peccaries, jaguars, cavies, and ring-tail monkeys. Monkeys belong to two families which are entirely confined to this region, and bats develop here their most extraordinary specializations. In some parts of the forest vampires are "ready to suck the foot or even the cheek of the unwary traveler." The manatee (*vulgo* "mermaid" or "water-mamma"), inhabiting some of the large rivers, and coming to the surface at intervals to breathe or to graze on the plants which line the banks, owes its popular designations to the circumstance that it suckles its young at the breast. The representative families of birds are, with few exceptions, peculiar to this region, the list of such birds including greenlets, tanagers, hang-nests, sugar-birds, tree-creepers, manakins, and cotingas. Alligators and boa constrictors both attain to great size in this region; iguanas and smaller kinds of lizards are numerous. Among the insects, the variety of genera and species can, it is thought, scarcely be equaled in any other part of the world. Uncommon brilliance of coloring is characteristic of both the birds and the insects.

Agriculture.— About 80,000 acres are under cultivation, or, say, one acre out of every 100 available for the purpose; and of this amount 71,700 acres are in sugar plantations. Only a very small portion is devoted to coffee and cocoa.

Commerce, Shipping, Railways, etc.— The chief imports in 1901–2 were tissues, flour, machinery, manures, rice, fish, hardware, coal, and tobacco, cigars, and cigarettes. The total value of imports (principally from Great Britain and British possessions) was $7,073,845. The chief exports in the same year, with their values: Sugar, $5,190,815; gold, $1,857,460; rum, $804,230; balatta, $118,205; timber and woods, $105,605; diamonds, $95,275; charcoal, $35,930; and molasses, $24,015. The total value of exports was $9,108,120. In 1901 the registered vessels belonging to British Guiana numbered 48, comprising 32 sailing vessels (1,497 tons), and 16 steamers (2,213 tons). Total tonnage entered and cleared, in 1901–2, was 725,867. (See also routes of vessels under GEORGETOWN.) There are 108 miles of railways, 264 miles of good roads, and 12 miles of the larger sort of canals, used for navigation. Smaller canals, to carry off superfluous water from the plantations, intersect each other in every direction. The heavy rainfall and the flatness of the coast region oblige the planters to maintain these canals to provide drainage, and by means of the larger draining trenches the sugarcanes are taken to the mills in punts. There are 73 post-offices, 46 telegraph offices, 9 traveling post-offices, about 559 miles of telegraphs and cables, and telephone services (677 miles) in Georgetown and New Amsterdam.

Money and Banking.— British gold and silver are used. There are 25 savings banks, with 21,200 depositors, and 2 banks with note circulation.

Government.— The governor is assisted in executive and administrative matters by an advisory council, composed of 3 colonists and 3 officials, all appointed by the king of England; in legislative matters by the Court of Policy (7 officials beside the governor, and 8 elective members, chosen from inhabitants by constituency of 2,070 voters qualified by income or property). The governor has a casting vote, and can decide

any question against the votes of the representative members. The colonists are in the majority, however, in the Combined Court, which votes the taxes and public expenditures.

Finances.— Total revenue for the year 1901–2 was $2,657,535, derived mainly from customs, licenses, duty on rum, and royalty on gold. Public expenditures in the same year amounted to $2,613,155. The public debt in 1901 was $4,960,600.

Population, Schools and Judiciary.— The census of 1891 showed: Negroes, 115,588; East Indians (Hindu coolies), 105,465; aboriginal Indians, about 17,463; Portuguese from Madeira, 12,166; whites of other nationalities, 4,558; Chinese, 3,433; mixed races, etc., 29,376. The total number of inhabitants was therefore 288,049. In 1901–2 the schools, numbering 213, had 26,684 pupils. There are three judges, and, in the several districts, a number of magistrates. The criminal law is based on that of England; in civil cases the Roman-Dutch law is applied, with certain modifications.

History (including the boundary dispute with Venezuela).— Prohibition of the slave trade checked the agricultural development of the colony, and emancipation of the slaves (1838) ruined many planters, the freed negroes demanding higher wages than the planters could afford to pay. This crisis led to the introduction of large numbers of laborers from Madeira, the East Indies, China, and Malta. Immigrants of a different class began to arrive about 1886 in consequence of the rediscovery of gold; but serious difficulties arose precisely on account of the enhancement in the value of the auriferous regions, some of the most promising of which were located in the territory west of the Essequibo claimed by both Venezuela and Great Britain. The inland limits of the Spanish (afterward Venezuelan), the British, the Dutch, the French, and the Portuguese (afterward Brazilian) Guianas were undetermined. In 1841 Schomburgk surveyed the boundary line of British Guiana for the British government, and made two maps; the second or revised map placing the boundary with Venezuela much farther toward the west than the first. Subsequently Venezuela and Great Britain agreed not to encroach upon the territory in dispute, pending a settlement of the boundary question, but both countries offended against the spirit of this compact. The proposal for arbitration in 1887 was met by England's prompt refusal to admit any doubt as to her title to the lands east of the revised Schomburgk line, and, a little later, by the establishment of British posts, and the declaration that the region drained by the Barima River was hers by right. It is necessary to bear in mind that if England had accepted the views of Venezuela and Brazil as to the boundaries of British Guiana, that colony would have disappeared from the map. Brazil claimed all but about 12,000 square miles; Venezuela nearly the whole of the old Essequibo colony, the Pomeroon and the unsettled interior districts. When President Cleveland, in 1895, called to the attention of the British government the bearing of the Monroe doctrine upon the question at issue, his suggestion was at first not accepted. His message to Congress went much farther. It advised Congress that a commission should be appointed for the determination of the true boundary, and declared in effect that any attempt to extend British territory beyond the true boundary should be resisted by the United States, by force, if necessary. It was a threat of war. Pursuant to the act of Congress 21 Dec. 1895, a commission was appointed 1 Jan. 1896. But before their report was submitted a treaty providing for the reference of the matter to a tribunal of arbitration had been signed at Washington (2 Feb. 1897). Arbitrators were: Chief Justice Fuller and Justice Brewer of United States Supreme Court; Lord Herschell (and, after his death, Lord Russell of Killowen), and Justice Sir R. H. Collins; and as president, Prof. Martens. The tribunal met at Paris in 1899. The award, given 3 October, determined the boundary nearly in correspondence with the second or revised Schomburgk line, assigning to Great Britain a region about 60,000 square miles in area which Venezuela had claimed. On the other hand, Point Barima, at the principal mouth of the Orinoco, and certain gold-fields near the headwaters of the Cuyuni, were awarded to Venezuela. The territory of British Guiana, thus defined, extends along the seacoast to Point Playa, and includes the whole valley of the Barima and that of the Cuyuni east of the Wenamu — the larger part, though not the best part, of the mining region.

2. Dutch Guiana or Surinam is bounded on the north by the Atlantic Ocean, on the east by French Guiana, on the south by Brazil, and on the west by British Guiana. It extends from lat. 2° to 6° N., and from lon. 53° 50′ to 58° 20′ E. Area 46,060 square miles. The political divisions are districts, 16 in number, and communes; the capital, Paramaribo, has about 31,817 inhabitants. Chief products are: Cacao (75 plantations), sugar (7 plantations), coffee, bananas, rice, maize, rum, molasses, and gold (output valued at about $480,000 in 1900). The mining experience of this colony resembles that of British Guiana: the metal has been sought hitherto in beds of streams, etc., but is now being taken also from mines which require crushing machinery. Imports regularly exceed in value the exports; thus in 1901 imports amounted to $2,831,112, and exports to $2,146,224. During the years 1897 to 1901 the value of exports remained almost stationary, while that of imports steadily increased. Executive authority is vested in a governor. The representative assembly, called the Colonial States, is composed of members chosen for 6 years by a limited number of electors. The council consists of 5 members, including the governor himself as president, and represents the sovereign. The revenues of the colony fall short of the expenditures. The military force is about as follows: Garrison, 20 officers and 351 men; militia, 27 officers and 411 men; and civic guard, 59 officers and 1,061 men. There are a few guard ships and vessels of the royal navy. The number of inhabitants in 1902 was somewhat more than 69,000. Educational institutions are: A normal school; schools maintained by the Moravian Brethren and the Roman Catholics; 33 private schools, with 4,822 pupils; and 20 public schools, with 2,342 pupils. The judicial system comprises a court of justice (all the officers appointed by the queen), two circuit, and three district courts. Slavery was abolished 1 July 1863, but the authorities imposed the con-

ditions that for 10 years the emancipated negroes should remain upon the plantations of the districts in which they had formerly lived, and should perform the same kind of work for wages that they had been accustomed to while in bondage. After 1 July 1873, the importation of laborers to replace the freedmen became a matter of life and death in Surinam as in the neighboring colonies, for agriculture was almost ruined.

3. French Guiana, lying between the Atlantic Ocean, Brazil, and Dutch Guiana, has an area of about 30,500 square miles. Besides Cayenne, capital of the colony, and its only port (population, according to the latest census, 12,612), there are 13 communes. Mineral productions are gold, silver, marble, phosphates, and iron. In 1901 the exports of gold amounted to 94,147 ounces. Agricultural productions are varied (including sugarcane, cocoa, coffee, rice, indigo, tobacco, maize, and manioc), but laborers are few, the area under cultivation is small, and the total value of the crops insignificant. Here, as in Dutch Guiana, the value of exports is much less than that of the imports, the difference in 1901 being about $689,750. Colonial interests are entrusted to a governor and privy council of 7 members, and one deputy represents the colony in the French Parliament. There is also an assembly called the Council-General, composed of 16 members. Revenue and expenditures for 1902 were each estimated at $657,261; but the cost of maintaining the penal establishment ($1,139,122, according to the budget of 1903), is borne by the French republic. Between 300 and 400 French soldiers are kept in the colony. The total population, including convicts and Indians, was given as 32,908 in 1901. Cayenne has a superior court, court of first instance, and two justices of the peace: a college, a library, and a museum; in the entire colony there are 27 primary schools

From the first, the French undertaking in Guiana has been unsuccessful. On 11 Dec. 1653, the survivors of the original colony abandoned the fort and sailed away, after suffering from hunger and disease. A new company formed for the colonization of Cayenne in 1663 was scarcely able to hold its own against hostile neighbors in Brazil. The deportation of political prisoners to Guiana at the end of the 18th century completed the ruin which Portuguese attacks had begun; for the exiles ascribed the death of their companions to the climate; and French Guiana was completely discredited in the eyes of the world. In January 1809, the colony surrendered to the Portuguese and English. It was restored to France by the treaties of 1814–15. Since 1855 it has been used as a penal settlement. In 1902 the number of convicts in residence there was 10,075, including 240 women. The boundaries with Brazil were determined 1 Dec. 1900, by the Swiss court of arbitration.

Guicciardini, Francesco, frän-chĕs'kō gwē-chär-dē'nē, Italian historian: b. Florence 6 March 1483; d. there 23 May 1540. He studied at Padua, and became an advocate and professor of law at Florence. In 1512 he was appointed ambassador to the court of Ferdinand the Catholic of Spain. At a later period he was invited by Leo X. to his court, and entrusted with the government of Modena and Reggio. This office he discharged also under Adrian VI., to the general satisfaction; and afterward, when Clement VII. (de' Medici) ascended the papal chair, Guicciardini was sent as lieutenant of the pope to Romagna. He contributed here to the public good by restoring civil order, constructing roads, erecting public buildings, and founding useful institutions. Having been appointed lieutenant-general of the pope, he, in 1521, defended Parma when besieged by the French. In 1534 he began his great work 'Istoria d'Italia' (1561–4) extending from 1490 to 1534. In 1537 he contributed greatly to the elevation of Cosmo de Medici to the office of grand-duke, but when later he attempted to impose constitutional limitations upon the grand-ducal power, he lost his influence. The 'History' was translated into English by Goddard, and the translation published between 1753 and 1761. The reader of Guicciardini is sometimes offended by a want of method, and his statements cannot always be depended on as derived from the best sources.

Guide-birds, or Honey-guides, certain small, mainly black and yellow birds, allied to the barbets, and constituting a genus inhabiting the tropical regions of the Old World, which have the curious habit of attracting the attention of men, and of honey-loving quadrupeds, to bees' nests, profiting by the disturbance which follows. They are fond of bees, grubs, and honey, but cannot often get them without assistance; sometimes, also, they show equal zeal in leading a person to a snake, leopard, or something else which has attracted their notice. Although the genus is known in India and Malaya, it is in South Africa that its traits are most noticeable and the books of travelers and explorers there abound in accounts of its guiding habits. Sir John Kirk contributed the following exact description of the work of *Indicator minor* to the 'Ibis' (1864):

"The honey-guide is found in forests, and often far from water, even during the dry season. On observing a man it comes fluttering from branch to branch in the neighboring trees, calling attention. If this be responded to, as the natives do by whistling and starting to their feet, the bird will go in a certain direction and remain at a little distance, hopping from one tree to another. On being followed it goes further; and so it will guide the way to a nest of bees. When this is reached, it flies about, but no longer guides; and then some knowledge is needed to discover the nest, even when pointed out to within a few trees. I have known this bird, if the man after taking up the direction for a little then turns away, to come back and offer to point out another nest in a different part. But if it do not know of two nests, it will remain behind. The difficulty is, that it will point to tame bees in a bark-hive as readily as to those

1. Guide-bird (Indicator sparrmanni).
2. Garden Warblers (Sylvia curruca and S. rufa).
3. Guinea Hens (Numida cristata and N. meleagris).
4. European Golden Oriole (Oriolus galbula).
5. Grakle (Eulabes religiosa).

in the forest. This is natural, as the bee is the same; the bark-hive, ‹musinga› as it is named, being simply fastened up in a tree and left for the bees to come to. The object the bird has in view is clearly the young bees. It will guide to nests having no honey, and seems equally delighted if the comb containing the grub be torn out when it is seen pecking at it."

Guido Reni. See RENI, GUIDO.

Guidon, gī'don, a swallow-tailed flag, such as is carried by a regiment of cavalry or mounted artillery. In the United States cavalry the regimental guidon is half red and half white, dividing at the fork. The red above has "U. S." in white. The white is below and has the letter of the company in red. The fly is 3 feet 5 inches to the end of the tail; the head is 27 inches. The lance is 9 feet long, including spear and ferrule.

Guienne, gē-ĕn', or **Guyenne**, ancient Aquitania (q.v.), a former southwestern province of France, now divided into the departments of Gironde, Lot, Lot-et-Garonne, Dordogne, Aveyron, and part of Landes and of Tarn-et-Garonne. The capital was Bordeaux.

Guija, gwē'hä, a lake in the republics of Guatemala and San Salvador, in Central America. It is in a volcanic region, and contains two small volcanic islands.

Guikowar, gīk'wär, the native title of the Mahratta prince, ruler of the province of Baroda (q.v.) in British India. The ruling Guikowar in 1874 was tried for attempting to poison the British resident and was deposed. Since 1802, when the province lost its independence to the English, the authority of the Guikowar has been merely nominal.

Guild, Curtis, American journalist: b. Boston, Mass., 1827. After several years devoted to reporting for the Boston *Journal*, he became one of the owners of the Boston *Traveller* and in 1859 established the Boston *Daily Commercial Bulletin*, of which he became the editor. He has published ‹Over the Ocean› (1867); ‹Aboard Again› (1873); ‹Britons and Muscovites› (1888); ‹A Chat About Celebrities›; ‹From Sunrise to Sunset› (verse).

Guild, Curtis Jr., American journalist and politician: b. Boston, Mass., 2 Feb. 1860. He was graduated at Harvard in 1881 as class orator, and entered the employ of the *Commercial Bulletin* of Boston, conducted by his father, Curtis Guild (q.v.). He interested himself at once in local politics, was Republican delegate-at-large to the St. Louis convention in 1896; and active in securing the gold plank in the national platform. In the following campaign he made a political tour of 10 States. He was appointed brigadier-general of Massachusetts militia and inspector-general of rifle practice by Gov. Roger Wolcott. At the outbreak of the Spanish war he was appointed lieutenant-colonel and inspector-general, United States Army, serving in the Seventh Army corps under Gen. Fitzhugh Lee. In 1900 he accompanied Gov. (now President) Roosevelt on a tour of political speaking through the West. In 1902 he became sole owner of the *Commercial Bulletin*. He was elected, 4 Nov. 1902, lieutenant-governor of Massachusetts, with John L. Bates, governor-elect; and was inaugurated 10 Jan. 1903. In 1905 and 1906 he was elected governor.

Guild, Reuben Aldridge, American librarian and author: b. West Dedham, Mass., 4 May 1822; d. 1899. His published works include: ‹Biographical Introduction to the Writings of Roger Williams› (1866); ‹History of Brown University with Illustrative Documents› (1867); ‹Chaplain Smith and the Baptists› (1885).

Guild, a fraternity, society or company, formerly active in commerce and mechanics. Guilds played an important part in public affairs in the Middle Ages. The Romans had various mechanical fraternities, but these seem to have been merely religious and political societies; while the associations of workmen in the arsenals that existed under the empire were regular hereditary castes, enjoying certain privileges and bound to certain duties. In Italy, the cradle of the class of free citizens in the Middle Ages, and particularly in the Lombard cities, those connecting links between the ancient and modern civilization, some remains of these Roman institutions, or recollections of them, probably contributed to revive the guilds, which naturally presented themselves as an excellent means of supporting the citizens against the nobility by uniting them into powerful bodies. It is certain that small societies existed as early as the 12th century, which appear, in the following century, to have been in the possession of important political privileges. When the advantages of these associations became known and felt they rapidly increased; and in the struggles of the citizens and the nobility the principal resistance against the latter was made by the corporations. As soon as the citizens acquired an influence on the administration the guilds became the basis of the municipal constitutions, and every one who wished to participate in the municipal government was obliged to become the member of a guild. Guilds in Germany possessed no political importance before the 13th century. At this time they acquired the right of bearing arms for the defense of their own interests, and when a struggle arose between them and the citizens belonging to ancient families the guilds were victorious, and became so powerful that even persons of "free occupations" joined these associations as the allodial possessors of land sometimes placed themselves under feudal lords. The by-laws of the German guilds contained regulations as to the training of apprentices, the practice of one's trade in different towns as a journeyman, and the requirements of a master. At an early period these workmen's associations met with opposition, but the opposition was not at first directed against them on account of the obstacles they threw in the way of commercial intercourse, and the other evil consequences of their monopoly, but simply on account of their political influence. In the 18th century several edicts were made in Germany against the abuses of the guilds, and at different dates in the 19th century freedom was granted in most of the states of Germany to all to practise any trade without being admitted into a guild. In Austria this was done in 1860, and in 1868 it was done for all the states of the North German Confederation.

In Great Britain the societies of mechanics were important principally in a political respect, on account of their connection with the democratic element of the constitution. These societies originated at the time of the development of the importance of the cities. In the towns where they long existed they had an important influence in the election of representatives, and in the municipal administration. These guilds, in England, had no legal right to prevent any man from exercising what trade he pleased. The only restriction on the exercise of trades was the statute of Elizabeth, requiring seven years' apprenticeship. The guilds of the city of London (among the oldest of which are the weavers, founded in 1164; the parish clerks, in 1232; the saddlers, in 1280; the fishmongers, in 1284; the goldsmiths, in 1327; the skinners, in 1327; and the grocers, in 1345) are still very important corporations, still continuing to fulfil the chief object for which they were founded — that of giving relief to poor and decayed members, and also having in many cases the management of vast funds bequeathed for benevolent purposes by persons who selected one or other of the guilds as trustees. Sometimes these funds are bequeathed for specific purposes, which the guilds, as trustees, are of course bound to carry out; but in other cases, where they are available for general purposes, the guilds have usually shown great discretion in the manner in which they have employed them. Besides the secular guilds or mechanics' associations there were from a very early period, in Great Britain, religious guilds, resembling the religious societies of modern times. From the time of Henry II. all such guilds were required to have a charter from the crown. In 1388 a return to these guilds was ordered to be made, and it was then found that that of Corpus Christi, York, numbered 14,800 members. Some of the most objectionable features of the ancient guilds have again been developed by some of the trades unions, their modern representatives.

In France guild-privileges were sold by the state from the 10th century till the revolution of 1789, and the position of the artisan had come to be a most pitiable one; but at that date every restriction on the exercise of any trade was removed. This was done also at a later period in Belgium, Holland, Italy, Sweden (1846), and Denmark (1862). An account of guilds in America will be found under LABOR UNIONS. See also TRADE UNIONS for the modern European history of guilds.

Guildhall, the usual designation in England for the mediæval city halls, the most famous of which is the London Guildhall, King Street Cheapside, first built in 1411, all but destroyed in the fire of 1666, and rebuilt in 1669. The façade dates from 1789. The great hall used for the famous city feasts, the election of city officers and members of Parliament, and for the public meetings of the livery and freemen, is 153 feet long, 48 feet broad, and 55 feet high. It is decorated by statues of various celebrities, and in the common council room there is a collection of valuable paintings.

Guilford, Conn., a town and borough of New Haven County, on Long Island Sound, and on the New York, N. H. & H. R.R., 14 miles east of New Haven. It was settled as Menunkatuck by English colonists in 1639, and one of the ancient stone buildings of that date is now used as a State museum. Farming, canning, iron working, and some woolen manufactures are the chief industries. Halleck the poet was a native and resident of Guilford. Pop. of town and borough (1900) 2,785; of town, 1,512.

Guilford (gĭl'fŏrd) **College**, N. C., a town of Guilford County, on a branch of the Southern R.R., six miles west of Greensboro. It was incorporated in 1895 and derives its name from Guilford College, a coeducational establishment controlled by the Friends, and founded in 1837. The income of the college is $20,000, and it has a library of over 6,000 volumes.

Guilford Court House, Battle of, 15 March 1781; in results one of the decisive battles of the Revolution. Cornwallis at Hillsboro proclaimed that he had conquered North Carolina, and called on the well-disposed to rally around him; Greene, awaiting reinforcements near the Virginia border, perceived the necessity of showing the patriots they were not abandoned, and advanced across the Dan. After some days of fencing and recruiting, Greene halted for battle at Guilford Court House. He had about 4,400 men, but 3,000 were militia; and of his Continental regulars, only the Virginians and the First Maryland were veterans, the Second being new. Cornwallis had 2,213 trained troops. Greene posted his first militia line in an open field, to thin the British front before giving way; the second in a wood 300 yards back; the regulars on a rise 400 yards to the rear, near the court-house. Their front was convex; the Virginians on the right, then in succession Singleton's artillery, Gunby and Howard's First Maryland, and Ford's Second Maryland on the left. Lee's Legion and Campbell's riflemen guarded the left flank; William Washington's cavalry, Lynch's rifles, and the remnant of the Delaware regiment, the right flank. The British routed the first militia after it fired one or two volleys; but only drove the second from the wood after an obstinate and murderous combat. Advancing against the hill, their left was riddled by a withering fire, and then broken by a bayonet charge of the First Maryland; but their right crushed the Second and captured two cannon. The First faced about and checked it; Washington in turn pierced the British line and retook the pieces. The First steadily crowded back their opponents with the bayonet; and Cornwallis only stayed the tide of defeat by ordering his artillery to open on the Marylanders through his own ranks, checking the pursuit at heavy loss to himself. Reforming, the British moved forward; and with double the number of real troops, carried the hill and held it against every assault. Toward evening Greene, after five hours' conflict, withdrew, leaving his artillery on the field because the horses were killed. The American loss was 79 killed and 184 wounded; and about 1,000 militia dispersed to their homes. Cornwallis lost 93 killed, 413 wounded, and 26 missing — 532 in all, or a quarter of his entire force. He announced a victory to Parliament, but Fox declared that "another such victory would destroy the British army"; and, in fact, Cornwallis had to fall back on Wilmington, abandoning his hold on the

Carolinas, except two or three places on the coast, and shortly going to Virginia and capture.

Guillaume, gwĭ-yōm', **Eugene,** French sculptor: b. Montbard, France, 4 July 1822; d. Rome, Italy, 28 Feb. 1905. He opened his first studio at Dijon, and subsequently became a pupil of Pradier at Paris. In 1845 he carried off the Grand Prix de Rome. It was during studies at Rome that he manifested that mastery of the human form which appears in his 'Reaper,' which he modeled at Rome. It was subsequently cast in bronze, and is now in the Luxembourg. In 1852 he produced in marble the sitting figure of Anacreon with the dove of Venus. He was, however, less successful in ideal creations than in portrait busts. His statues of Napoleon I. as lieutenant of artillery and as emperor, his bust portraits of Archbishop Darboy, of F. Baloz, Ferry, and Thiers are characteristic and dignified, but he is perhaps best known for his sculptures on the façade of the New Opera House, Paris (1869); 'The Fount of Poetry' (1873); 'Aopheus' (1878); 'Two Hermes'; 'Anacreon with Eros'; and 'Sappho with Eros and Andromache.' He was the designer of the medals given at the expositions of 1867 and 1878.

Guillemet, Jean Baptiste Antoine, zhŏn băp-tēst an-twän gwĭ-yĭ-mā, French painter: b. Chantilly 1842. After studying under Corot and Oudinot he exhibited for the first time in 1865. He chooses for his subjects the scenery of Normandy, and the Seine valley, and is faithful in his transcripts from nature, but his work lacks the color and subtility as well as the imagination of the Barbizon school. His 'View of Bercy' and 'View of Paris' are in the Luxembourg.

Guillotine, gĭl'ō-tēn, a machine for beheading, so called from Dr. Joseph Ignace Guillotin, and introduced during the French revolution. It consists of two posts united at the top by a cross beam, and furnished with grooves, in which a broad steel blade heavily weighted with lead descends by the impetus of its own weight on the neck of the criminal, fastened to a plank beneath. The certainty and speed with which this instrument separates the head from the body gives it an advantage over the axe or sword wielded by the hand. Machines of a similar description have been in use among many nations. In Italy, from the 13th century, it was the privilege of the nobility to suffer capital punishment by an instrument called the *mannaia*, closely resembling the guillotine. In Germany, likewise, during the Middle Ages, an instrument resembling the guillotine was made use of, though the blade did not fall upon but was thrust through the neck of the criminal. There was formerly employed in Great Britain, also, and more especially in Scotland, an instrument of decapitation called the «maiden,» said to have been introduced by Regent Morton, who himself afterward suffered by it. It differed from the guillotine in this, that while the blade of the guillotine falls upon the neck of the criminal, in the maiden the blade is fixed with its edge upward, and the neck of the criminal is forced down upon it by the fall of a heavy weight. Such an apparatus was also known and used at an early period in France. The Dutch likewise formerly made use of a decapitating machine.

Dr. Guillotin was not the inventor of the instrument which bears his name, and had only a secondary share in its introduction into France. As a member of the constitutional assembly he proposed to that body to abolish all class distinctions in the method of inflicting capital punishments, and with that view to have some instrument invented which might do the work more quickly and certainly than the hand of the headsman. The establishment of a new penal code having now become the subject of deliberation, a vote for a uniform system of capital punishment was, on the motion of Dr. Guillotin, passed on 21 Dec. 1789, with a recommendation that the least painful method of inflicting it should be adopted. It was not till 1792, however, that this special machine was selected after a report from Dr. Ant. Louis, secretary to the College of Surgeons. The guillotine was first erected in the Place de Grève at Paris, and the first execution performed by it on 25 April 1792, on a highwayman. Shortly afterward, in remembrance of Guillotin's original proposition, it received the name of «guillotine,» both popularly and in official language, and it was introduced wherever the penal code of France has been adopted.

Guimaras, gē-mä-räs', Philippines, an island lying west of Negros and south of Panay, forming with Panay the strait of Iloilo. The east coast is mountainous, the west coast, open and fertile; an excellent road follows the entire coast, except for a distance of 10 miles, and the most important towns are on this road. The products include rice, corn, cotton, and tobacco, and there are important fishing interests. The island is a part of the province of Panay.

Guimbal, gēm-bäl', Philippines, a pueblo of the province of Iloilo, island of Panay, situated on the southeast coast, at the mouth of a river, 17 miles west of the town of Iloilo. Pop. 10,950.

Guinaan, gē nä'an, a Malay tribe of the Philippines, inhabiting the watershed of the Rio Abra and the Rio Grande de Cagayan, island of Luzon, and the neighboring region of Isabela and Abra. They are a heathen, head-hunting tribe, and have a distinct language.

Guinea, gĭn'ē, an English gold coin, first issued in 1663; by a proclamation issued 22 Dec. 1717, the guinea was declared current at 21*s.* sterling. Its true value, as derived from the market values of gold and silver at that time was 20*s.* 8*d.*, about $4.96. It has not been coined since 1817, when the sovereign supplanted it, but the fashion still prevails of quoting prices of some things in guineas, and subscriptions are frequently recorded in the same denomination.

Guinea-corn, a name given to durra, *Sorghum vulgare*, cultivated in the United States under the name of broom-corn. See DURRA; BROOM-CORN.

Guinea-fowls, a family of gallinaceous birds (*Numididæ*) allied to the pheasants and turkeys, natives of Africa and Madagascar. Twenty-three species are known, the most familiar being the common guinea-fowl of our poultry yard (*Numida meleagris*). This bird ranges in a wild state from Senegambia to the Niger

River, and is found also on the Cape Verde Islands. It is supposed to have been first brought to Europe by Portuguese explorers in the 16th century; but these fowls were domesticated in Rome during the classic period. Of the other species the vulturine guinea-fowl (*Acryllium vulturinum*) is one of the handsomest, being striped with brilliant blue; while the black guinea (*Phasidus niger*) and the turkey-like guinea (*Agelastes meleagrides*) are peculiar in possessing spurs.

Guinea-grass, a kind of grass (*Panicum maximum*), often 6 or 10 feet in height, a native of western Africa, which has been naturalized in South America and the West Indies, and is largely cultivated for fodder.

Guinea, Gulf of, that portion of the Atlantic on the coast of Africa, between Capes Lopez and Palmas. Two of its arms are the bights of Benin and Biafra. The Niger flows into this gulf south of the bight of Benin. A number of small streams enter from French Kongo and Kamerun. It contains a number of islands, chief of which are St. Thomas, Fernando Po, and Prince's Island. The gulf has two currents, one setting eastward into the bights of Biafra and Benin, and the other coming from the south; they meet in the bight of Biafra, and unite in one stream which gradually expands as it flows northwest, then west and southwest.

Guinea-pig, or Cavy, a small, variable domesticated race of the restless cavy (see CAVY), bred in all parts of the world as a children's pet. It is about six inches long, and exists in several races, some short-haired, others with long, curiously ruffled hair. The colors are greatly varied, white, black and a mixture in quaint pattern of white and tan being preferred. It is a restless, grunting little creature, showing a small amount of intelligence, but gentle and amusing. It feeds on vegetables, bread, parsley, lettuce, etc., and is exceedingly cleanly in its habits. It begins to breed when five or six months old, the period of gestation being from 6 to 10 weeks, and the litters averaging from 4 to 5; and this extreme fecundity seems to be its only means of defence against extinction. The name is probably a corruption of 'Guiana-pig,' referring to its native home and its pig-like form and grunting. English children call them "cavies." They are bred by fanciers for show purposes, and clubs exist for the improvement of standard breeds.

Guinea-worm, a nematode worm (*Filaria medinensis*), the female of which may be three feet long, and as thick as a knitting-needle. It is a parasite in the feet and toes of residents of the East Indies and African coast, forming abscesses beneath the skin in which the worm is coiled up. It produces the disease known to the Greeks as dracontiasis, and one of those now called filariasis (q.v.). To extract the worm it must be slowly wound upon a roll of paper, a little at a time, care being taken not to break the worm, as if a portion is left in the abscess, the young will develop and be scattered under the skin. Although formerly confined to the Old World, the guinea-worm has recently been found in the tropics of America, but is very rarely seen in northern parts.

Guinevere, gwin'ē-vēr, the wife of King Arthur in the Arthurian legends (q.v.). In the first accounts of the Arthurian court, she plays a very unimportant part, and her character is not clearly portrayed. It is in the 13th century that the personality of the queen and the story of her love for Lancelot are first developed. The most vivid and powerful picture of Guinevere is that given by Tennyson in the 'Idylls of the King,' in which her sinful love for Lancelot is made the real cause of the downfall of the Round Table and Arthur's kingdom.

Guiney, Louise Imogen, American poet: b. Boston 7 Jan. 1861. She began to write for publication in 1880 and was a frequent contributor to 'The Pilot,' Boston. Her published works include 'Songs at the Start' (1884); 'The White Sail and Other Poems' (1887); 'A Roadside Harp' (1893); 'Martyr's Idyl and Shorter Poems' (1899); and in prose she has also published: 'Goose-Quill Papers' (1885); 'Brownies and Bogies'; 'Monsieur Henri' (1892); 'A Little English Gallery'; 'Lovers' Saint Ruths'; 'Patrins' (1897); 'The Secret of Fougereuse'; etc. She has edited an edition of Mangan's poems.

Guinness, SIR Benjamin Lee, Irish philanthropist: b. 1 Nov. 1798; d. 19 May 1868. He was a member of the great Dublin brewing firm, the largest in the world. In 1865–8 he was M. P. for Dublin. He restored St. Patrick's Cathedral, Dublin, at a cost of $700,000. His business in 1886 was placed in the control of a limited liability company, employing 3,000 persons and having a capital of £6,000,000.

Guinness, SIR Edward Cecil, Irish philanthropist: b. 10 Nov. 1847. He was the son of Sir B. L. Guinness (q.v.). In 1891 he became Baron Iveagh. He gave $1,250,000 for the purpose of erecting sanitary dwellings for working people at a low rent. Of this sum $1,000,000 was to be given to London, and the remainder to Dublin. The income obtained on the capital is to be employed in the same fashion.

Guinobatan, gē-nō-bä'tän, Philippines, a town in the province of Ambos Camarines, island of Luzon, on the Quinali River. Pop. 10,000.

Guise (gü-ēz or gēz) **Family, The**, French ducal house, a branch of the family of Lorraine. The founder was Claude, a younger son of René II., duke of Lorraine, who in 1506 became naturalized in France, and in 1513 married Antoinette de Bourbon, the daughter of the Count of Vendôme. In his favor the county of Guise (one of his numerous possessions in France) was erected in 1528 by Francis I. into a duchy. He died in 1550, leaving behind him five daughters (the eldest of whom, Marie, married James V. of Scotland, and was the mother of Mary, queen of Scots) and six sons — François, who succeeded him in the duchy of Guise and his other dignities; Charles (usually known as Cardinal of Lorraine), Louis (Cardinal of Guise), Claude, François, and Rene, all persons of note. The family acquired great political importance on the accession of Francis II., who was married to Mary, queen of Scots. François, the second duke of Guise, was assassinated in 1563, and left three sons, Henri who inherited his father's titles; Louis, cardinal of Lorraine and archbishop of Rheims (both put to death in 1588 on the command of Henry III.); and Charles, duke of Mayenne. Henri, third duke of Guise, was succeeded by his son Charles, who died in Italy in 1640, and was succeeded by his second son Henri. Henri died without issue in 1664, when he left the title to his nephew, Louis Joseph, duke of Joyeuse and Angoulême. His son and succesor, François Joseph, died in 1671, leaving only one son, who died at the age of five in 1675, when the direct line of the house of Guise became extinct. In 1704 the title was revived for the house of Condé.

Guise, France, a town in the department of Aisne, on the Oise, 25 miles by rail northeast of St. Quentin. It is an ancient city, mentioned as early as 1050, and has interesting remains of the 16th century castle of the famous Dukes of Guise. The town is noted for the ironworks of Dequerème et Cie founded by Jean Baptiste André Godin, and conducted on a profit-sharing plan. The workmen are provided with dwellings on the associated plan; the first portion of the *familistère* was erected by Godin in 1859–60 at a cost of $400,000. In connection with the workman's colony is a *phalanstère*, or common dwelling-house accommodating 400 families, a theatre, library and reading-room, schools, nursery, covered playgrounds, and a co-operative store. Pop. (1901) 7,300.

Guitar', a stringed musical instrument, with an oval body, and a neck like that of the violin. The modern or Spanish guitar has six strings, the three highest of gut, the three lowest of silk covered with fine wire, and tuned to the E in the second space of the bass staff, A, its fourth, and the treble D, G, B, and E The intermediate intervals are produced by bringing the strings, by the pressure of the fingers of the left hand, into contact with the frets fixed on the key-board, while those of the right pluck or twitch the strings. The Spaniards are supposed to be the inventors of the guitar, and it is most widely used in Spain, though its use is quite general in other countries.

Guiteau, gē-tō', **Charles Julius,** American assassin: b. about 1840; d. Washington, D. C., 30 June 1882. He became a lawyer in Chicago, and in 1880, after the election of James A. Garfield to the presidency, went to Washington, presumably to secure the office of United States consul at Marseilles, but did not succeed. Owing to this and the fact that the new President was opposed to the Stalwarts, led by Roscoe Conkling, Guiteau became greatly incensed. On 2 July 1881, he shot the President in the waiting room of the Baltimore and Potomac Railroad station in Washington; and on 19 Sept. the President died from the effect of his wound. Letters taken from Guiteau after his arrest showed that he had planned to «remove» the President. He was indicted for murder on 7 October, was found guilty on 25 Jan. 1882 after a sensational trial in which insanity was the only plea offered for the defense, and was hanged in the District of Columbia jail, 30 June following. See GARFIELD, J. A.

Guiuan, gē'wän, Philippines, a pueblo of Sámar, on the extreme south coast, 78 miles southeast of Catbalogan, having a good harbor. On the edge of a reef near the town are several sulphur springs, which though covered by the sea at high tide, are never brackish. Pop. 11,300.

Guizot, François Pierre Guillaume, fran-swä pē-är gē-yōm gē-zō, French historian and statesman: b. Nimes 4 Oct. 1787; d. Valricher near Paris, 13 Sept. 1874. His father, a lawyer, having in 1794 perished by the guillotine, his mother and her three sons retired to Geneva, where François was gratuitously educated at the gymnasium. In 1805 he commenced the study of law at Paris, but gradually drifted into the literary profession. In 1812 he married Mlle. de Meulan, editor of the 'Publiciste,' and became professor of history at the Sorbonne On the fall of the empire he obtained several public offices, such as councillor of state, and director-general of the departmental and communal administration. In 1816 he published 'Du Gouvernement Représentatif et de l'Etat Actuel de la France,' and 'Essai sur l'Instruction Publique.' In 1820 the Duc de Berry was assassinated, and Guizot's party fell before an ultra-royalist reaction. In 1825 he lost his chair on account of the political character of his lectures, but regained it in 1828. In 1829 he again became councillor of state, and after the July revolution was appointed minister of the interior, but resigned in 1831. After the death of Périer, Guizot, along with Thiers and De Broglie, formed a coalition ministry, and rendered great service as minister of public instruction. He became ambassador at the British court in 1840, and next year was the real head of the government of which Soult was the nominal chief. He retained the office of minister of foreign affairs until 1848, and during that period opposed all measures of reform. After the fall of Louis Philippe, Guizot escaped, fled to England and though he returned the next year he henceforth practically retired from public life. Born of a Calvinist family, he always remained a stern Protestant of the orthodox type, although he zealously supported the temporal authority of the pope. Among his numerous works may be mentioned, 'Histoire de la Civilisation en France' (1830); 'Histoire générale de la Civilisation en Europe' (1828); 'Histoire de la Civilisation d'Angleterre' (1827); 'Washington'; 'Discours sur la Révolution d'Angleterre'; 'Méditations et Etudes Morales'; 'Guillaume le Conquérant'; 'Mémoires pour servir à l'Histoire de mon Temps' (1858–68); 'Méditations sur l'Etat Actuel de la Réligion Chrétienne' (1865); 'Mélanges Biographiques et Littéraires'; 'Histoire de France Racontée à mes Petits Enfants' (1870); etc.

Gujarat, gŭzh-rät', or **Guzerat, India,** a region bordering on the Arabian Sea, comprising part of the northern section of the presidency of Bombay and some native states. Area of the whole, about 70,000 square miles; pop. about 11,000,000.

Gulf of Saint Lawrence. See SAINT LAWRENCE, GULF OF.

Gulf-stream. See CURRENTS, MARINE.

Gulfport, Miss., city in Harrison County, on the Gulf of Mexico, and the Gulf & Ship Island and the Louisville and N. R.R.'s. Gulfport has grown in 5 years from a seacoast hamlet to a thriving city. The keynote of its success is the fact that it has one of the best harbors on the Gulf of Mexico. Prominent among its public buildings is the «Great Southern» hotel, with its 250 rooms, intended as a winter resort for Northerners and as a summer resort for the people of the South, especially those of New Orleans. It is situated directly on the shore and is undoubtedly the finest resort hotel between Tampa and New Orleans. Other prominent buildings are the county courthouse and those of the First National bank and of the Gulf & Ship Island railroad. The latter is used for the offices of the company. The First National bank is now the largest bank in the State of Mississippi, having a capital of $250,000. The most important manufacturing plants are oil and fertilizer factories, the Gulfport Packing Company and the shops of the Gulf & Ship Island railroad. There are, also, numerous smaller concerns, such as iron foundries and wood-working plants. Pop. (1900) 1,020; (1903) 3,500.

Gulfweed, a genus (*Sargassum*) of seaweeds of the sub-order *Fucaceæ*, which grow in deep water along all warm coasts, and becoming easily detached, are found floating in immense quantities in the middle of all oceans, where they accumulate in vast eddies, as it were, of the oceanic currents. The North Atlantic species (*S. bacciferum*) is the best known, and takes its popular name from its presence in long yellow lines in the Gulf Stream; and its specific name from the berry-like appearance of its air-vessels. The frond is very long, and is furnished with distinct, stalked, nerved leaves, and simple axillary stalked air-vessels; and its structure approaches that of the higher plants. Where the Gulf Stream is deflected from the banks of Newfoundland eastward, and sends off its more southern branch toward the Azores, is situated the Sargasso Sea, "that great bank of weeds, which so vividly occupied the imagination of Christopher Columbus, and which Oviedo calls the seaweed meadows" (Humboldt). The quantity of floating seaweed is often such as to impede the progress of ships. Multitudes of small marine animals accompany it, with fishes ready to prey on them, constituting a distinct and considerable fauna. The gulfweed is eaten in China, and in other parts of the East also it is used in salads and as a pickle.

Gulick, John Thomas, American clergyman: b. Kauai, Hawaii, 13 March 1832. He was graduated at Williams College in 1856, studied theology at the Union Theological Seminary, went to China as a missionary, and subsequently to Japan. He is a well-known writer on topics relating to evolution and natural history. He contributed to the 'Journal' of the Linnæan Society of London: 'The Diversity of Evolution under One Set of External Conditions' (1872); 'Divergent Evolution Through Cumulative Segregation' (1887); 'Intensive Segregation' (1889); and other monographs.

Gulliver's Travels, a famous satire by Jonathan Swift anonymously published in 1727. It is one of the most brilliant and profound of satires, became immediately popular, and has never lost its interest for both young and old. It begins with Gulliver's account of himself and his setting forth upon the travels. A violent storm off Van Diemen's Land drives him, the one survivor, to Lilliput, where he is examined with curiosity by the tiny folk. His next voyage is to Brobdingnag, where he is a Lilliputian in comparison to the size of the gigantic inhabitants of this strange land, in which he becomes a court toy. The next adventure is a voyage to Laputa, where the inhabitants are absorbed in intellectual and scientific pursuits, and "taken up with intense speculations," and their conduct is most eccentric; this is probably a satire upon pedantry. The last voyage takes the traveler into the country of the Houyhnhnms, where the horses under this name have an ideal government,— Swift's Utopia,— and are immensely superior to the Yahoos, the embodiment of bestial mankind.

Gulls, a large group of sea-birds found throughout the world and constituting, together with the terns (q.v.), skimmers (q.v.), and skuas or jaeger-gulls, the family *Laridæ* (q.v.). Some 53 species of gulls are known, ranging in size from that of a pigeon to that of a goose. The prevailing color is pure white below and pearl gray above, while some species have a gray or blackish head, and a few are dull gray all over. The young birds of all species are dusky during the first year. They walk with tolerable ease, and swim well, but are incapable of diving. They keep much on the wing, and their flight is rapid, strong, and long sustained, even in heavy gales. In sitting they contract their necks and rest on one foot. They nest along the shores in the grass, on rocky cliffs or rarely in small trees, forming the nest of dry grass, sedges, etc., and invariably in colonies, creating a great uproar when their nesting-grounds are visited. The wild characteristic note is, in the bigger species, harsh and querulous, in the smaller a "laughing" or screaming; the lesser skuas give vent to a curious mewing cry and the great skuas to a similar but deeper sound. At the breeding-quarters the utterances are naturally more agitated and shrill, and the parents hang excitedly above a visitor's head. "The food," says Evans, "consists mainly of fish, mollusks, crustaceans, and worms, but is varied in the stronger forms by small mammals, young birds, and eggs; the great black-backed gull undoubtedly attacks lambs and weakly ewes; carrion is not uncommonly devoured; and *Larus maculipennis* acts as a scavenger at Buenos Ayres, besides clearing the country of grasshoppers, and robbing the Cayenne lapwing of its insect booty. Skuas give chase to their smaller kin, and force them to disgorge the fishes they have just caught, while even solan geese are sometimes victimized; *Larus scopulinus*, moreover, which robs the oyster-catcher of New Zealand, is a further instance of parasitic habits. Insects and their larvæ, turnips, berries, and grain are also eaten by these omnivorous but useful creatures."

Most gulls are migratory and scatter far along the coasts during fall and winter in search of food. On the eastern coast of the United States are five species. The large herring-gull (*Larus argentatus*) breeds on the coast of Maine and winters to the southward, being abundant about all harbors and along tidal rivers from October to April. Associated with them are sometimes seen the larger black-backed gull (*L. marinus*). In summer are present the smaller black-headed or laughing gull (*L. atricilla*) which nests plentifully on the salt marshes of the Middle and Southern States. The Bonaparte's and ring-billed gulls (*L. philadelphia* and *L. delawarensis*) breed on our northern coasts. In the interior Franklin's gull (*L. franklini*) inhabits the lake shores and marshes of the upper Mississippi Valley; while on the Pacific coast occur several other species. In the arctic regions the most abundant gull is the great Burgomaster (*L. glaucus*), one of the largest species, which wanders some distance southward in winter. Two other species peculiar to the far north are the pure white ivory gull (*Pagophila alba*) and Ross's rosy gull (*Rhodostethia rosea*). The latter is one of the rarest of birds and one of the most beautiful, the whole under surface being suffused with pink and the neck surrounded by a dainty collar of gray. It has been seen in numbers only by the arctic explorers Murdoch and Nansen. The Kittiwake (*Rissa tridactyla*) is another species of circumpolar distribution, peculiar in lacking the hind toe. Several of these species are known on the coasts of Europe or Asia; and the gulls of other parts of the world present little that is peculiar. Large areas of coastal beaches and islands formerly inhabited by gulls in various parts of the world, but especially along the eastern coast of the United States, have been wholly depopulated of these beautiful and useful birds by the incessant robbery of their nests for the sake of the eggs — which are conical in form, and white or greenish, heavily blotched with purple and brown in color; — or for the sake of their plumage to be used in millinery trimmings. Protective laws now prevent this waste of life.

Consult Evans, 'Birds' (1900); Coues, 'Birds of the Northwest' (1874); Baird, Brewer and Ridgway, 'North American Water Birds' (1884).

Gum Arabic, a gum of the *Acacia arabica*, which grows in India and Arabia. Gum arabic can be obtained also from *Vachellia farnesiana* of India, a small tree closely allied to the true acacias. Gum arabic occurs in transparent white tears, which are often colored yellow or brown by impurities; it cracks on exposure to the air on the surface; it is brittle, and has a bland, mucilaginous taste. It dissolves in water, and the solution gives a precipitate of arabin on the addition of hydrochloric acid. Gum arabic contains about 70 per cent. of arabin, $2C_6H_{10}O_5+H_2O$, and 17 per cent of water; the rest consists of potash and lime, which are combined with the arabin.

Gum-boil, an abscess in the gum caused by inflammation, generally the result of toothache or of the presence of decayed teeth. The carious tooth or stump, if the inflammation proceeds from this cause, should be removed. When matter has formed it should be evacuated by a free incision, and the mouth should be frequently washed with tincture of myrrh and water. See DENTISTRY; TEETH.

Gum-resins are complex mixtures obtained from plants. They contain both a gum, which is soluble in water, and a resin, which dissolves in spirit. There are usually present in addition essential oil, coloring and extractive matter, and a variety of impurities. The gum-resins have frequently a strong and characteristic taste and smell. They are solid, opaque, and brittle. The common gum-resins are aloes, ammoniacum, asafœtida, euphorbium, galbanum, gamboge, myrrh, olibanum, opoponax, sagapenum, and scammony.

Gum-trees, a name for several different trees: (1) those of the Australasian genus Eucalyptus (q.v.); (2) in the United States, the pepperidge or tupelo, various species of which are called black, sour, cotton-gum, etc. (see TUPELO); (3) the liquid amber (q.v.).

Gumbinnen, goom-bĭn'nĕn, Prussia, the capital of a government with an area of 6,125 square miles. The town is on the Pissa, 22 miles by rail southwest of Edytkuhnen on the Russian frontier. It is comparatively modern, its municipal charter dating from 1722. There are manufactures of woolens and linens, and a trade in cattle and agricultural produce. Pop. (1903) 14,000.

Gumbo. See HIBISCUS; OKRA.

Gumma, gŭm'a, a tumorous deposit that occurs in the tertiary stage of syphilis (q.v.). It affects most frequently the bones, cartilages, skin, and periosteum. They are made up of a hard connective tissue which tends to undergo softening, causing destruction of the part and deep ulceration if near the surface. The periosteum of the cranial bones is particularly liable to be affected, causing dangerous pressure on the brain.

Gumming, or Gumosis. See DISEASES OF PLANTS.

Gums, various mucilaginous substances, generally obtainable from the sap of trees. They are soluble either in cold water or in alcohol. Many aromatic products such as are employed in making perfumes and incense are to be classed as gums. Gum Arabic is the best known among such products. It is obtained from the Senegal Acacia in Western Africa. There are no less than eight or nine varieties of this gum. Gum tragacanth comes from the *Astragalus gummifer*, in Western Asia. Cherry-tree gum, whose name tells its origin, is used for stiffening felt, as in hat making. There are some gums which might perhaps more properly be classed as resins, and are sometimes styled gum-resins; many of which are used in medicine.

Gun, a strongly-constructed metal tube, from which destructive projectiles are expelled by the gradually increasing pressure of gas evolved from fired gunpowder or other explosive. The term comprehends every description of firearm, from cannons, mortars, and other heavy pieces of ordnance, to the fowling-piece, rifle, and pocket-pistol. See ARMS; ARTILLERY; FIRE-ARMS; ORDNANCE.

Gunboat, a term originally applied to small craft mounting usually a single gun, and employed exclusively in the defense of coasts and rivers. Experiences in the Crimean war suggested the extension of the use of gunboats to offensive warfare. One of the main objects of a ship of war being to carry guns, it was thought that a vessel large enough to carry only a single gun of the largest size would, from the rapidity with which it could be manœuvred, and its comparative immunity from shot, have great advantages in attack against large vessels carrying a heavy armament, and requiring much room and time to manœuvre. About 1860 the British government constructed about 200 gunboats upon this principle. They were about 100 feet long, with 22 feet beam, and a draught at load-line of 6½ feet. Each was armed with one deck-gun a 68-pounder, which, by turning on a pivot, could be used either ahead, astern, or in any other direction; while the facility of manœuvring was further enhanced by the rapidity with which the vessel itself could be turned almost in her own length. Experience soon proved that there were serious defects in this species of armament. One of these was, that from being obliged to carry their guns constantly on deck the gunboats were liable to be top-heavy and untrustworthy in a heavy sea.

A new gunboat was designed in England in 1868 by G. Rendel, the chief peculiarity of which was the placing of the gun on a platform, which could be raised to the deck or lowered to the hold by a donkey-engine. The gun did not turn on a pivot, the manœuvring being effected entirely by the turning of the vessel, to effect which it was fitted with twin-screws worked by independent engines. Other types of gunboat have since been constructed for the British navy. One of a recent and powerful type is 165 feet in length, with a breadth of 31 feet, and a displacement of 805 tons. It draws 11 feet 7½ inches of water, and has triple-expansion engines, working up to 1,200 horse-power, with a speed of 13 knots an hour. It carries six 4-inch steel breech-loading guns, besides two quick-firing guns and machine-guns, and is bark-rigged. A number of what are known as torpedo gunboats have been constructed for the British navy. One boat of this class is 200 feet in length, with a beam of 23 feet, and a depth of 13 feet. It is built entirely of steel, has a torpedo-tube through the bow and another through the stern in a fore-and-aft line, and one on each broadside forward, a 4-inch 25-cwt. central-pivot breech-loading gun, and six 3-pounder, quick-firing guns. It has two sets of triple-expansion engines, working up to 2,700 horse-power, and enabling the vessel of 450 tons to steam over 18 knots an hour. Several first-class gunboats of a more recent type are twin-screw vessels, 180 feet long, of 700 tons displacement, armed with two 4-inch guns and four 12-pounder quick-firing guns.

In the United States the gunboat figured to a very considerable extent in coast and lake warfare in our first two wars. They were first used on the Delaware River, in 1775–6, and drove the British frigate Reliance out of the roads. In December 1807 there were 69 of them in United States service, and the Congress ordered 188 more built, as an auxiliary to the embargo declared a few days later, making 257 in all. Improved ordnance has made them valueless, and they had a bad effect on the service, but there was strong opinion in their favor at the time, and they did good service in the War of 1812. The theory was that these movable batteries could act in water where large vessels could not, could be concentrated against the latter so as to afford as large an armament, yet present only a number of small targets, while their antagonist presented only one large one; that shots aimed too high would do no harm to gunboats, but would injure masts and rigging of frigates; that loss of rudder and sailing gear, the most crippling of accidents to a ship, could not happen to the gunboats, propelled and steered by sweeps; that nearness to the water level gave the guns more accurate aim; and that 75 gunboats could be built for the cost of one 36-gun frigate.

In 1903 the United States navy had 20 of the ordinary gunboats in commission and about 60 torpedo-boats and destroyers of the gunboat type. Great Britain in 1902 had 33 torpedo gunboats, Germany 3, and France 15. In most countries the gunboat has been superseded by modern torpedo-boats and destroyers.

Gun-carriage, or **Gun-mounting**. See Artillery; Fortification; Ordnance.

Guncotton is the name originally assigned to the material produced by Schoenbein, of Basle, Switzerland, in 1845 by treating cotton with a mixture of strong nitric and sulphuric acids. The discovery that starch, woody fibre, and similar substances give rise to the formation of highly combustible bodies when acted upon by concentrated nitric acid is attributed to Braconnot in 1832, and he styled the bodies so produced generically *xyloidine*. Six years later Pelouze took up this subject and extended his investigations to the behavior of cotton, paper and vegetable substances generally, and later Dumas prepared from paper by this means the substance which he called *nitramidine*. No practical result followed these observations until the discovery by Schoenbein of the advantages which followed the use of the acid mixture; a discovery which was also independently made by Boettger, of Frankfort, in 1847 and by Knop, of Hanover, and Taylor, of England, in 1847. The discovery aroused the liveliest expectations which were stimulated by the facts that the explosive was much more powerful than gunpowder and that when used as a propellant, it gave little or no smoke. Experiments and tests were begun shortly after with the new explosive in Germany, France, Austria, England, Russia, and the United States with a view of utilizing it as a substitute for gunpowder in guns. Unfortunately the material, as manufactured, was found to be not only so irregular in action that it was likely at any time to burst the piece, but also so unstable as to give rise to numerous accidents so that, especially after the serious and, at the time, inexplicable explosions at Vincennes and Bouchet in France, and Faversham in England, the experiments were discontinued except in Austria, where Baron von Lenk gave the matter close and long-continued study and came to the conclusion that the grave defects noted were not inherent in the material, but were due to the imperfect and irregular methods of manufacture, the failure to purify the cotton before treatment with the acid, and the failure to purify the guncotton and free it completely from acids after treatment. Following these convictions he improved the method of manufacture to such an extent that in 1862 the Austrian army had 30 batteries provided with guncotton cartridges made up by twisting the fibre into yarns which were braided together, but the spontaneous explosions at the magazine at Simmering in 1862 and at Steinfeld in 1865, together with the fact that the guncotton cartridges still gave at unexpected times abnormal pressures led to its further use in Austria being interdicted.

Von Lenk's process of manufacture was patented in England in 1862 and the Prentice Brothers began manufacturing under this process in 1864. In 1865 Abel patented an improvement of the process which was so successful in use that it gave guncotton a prominent and permanent place among explosive substances, and this process is followed to-day. The cotton when treated with the acid is in the fibrous condition which so well characterizes it, and under the microscope these fibres are seen to be hollow so that each is really a capillary or hair-like tube. Von Lenk had shown that cotton contains not only cellulose as the main component of its structure but that there were smaller and variable quantities of other substances naturally present besides foreign bodies accidentally present, and that it was necessary to get the cellulose in a pure and dry condition before treating it with acid. He, too, with others, had proved that the purity, strength and proportions of the acids used and the time and temperature of immersion of the cotton in the acid mixture affected very materially the character of the substance produced, while it was essential that every trace of free acid should be removed from the product, since a most minute quantity of sulphuric acid acts continuously and cumulatively on the guncotton and causes a progressively increasing rate of decomposition. Yet von Lenk and all others up to this time produced the guncotton in the same long staple form as the cotton from which it was made. It was evident to Abel's mind that as the dry cotton was immersed in the acid mixture the capillary tubes, of which it was composed, would suck up the liquid acid and retain it with such force and in such a manner as to make its removal by wringing, or washing with or in water or by neutralization with alkalies, extremely difficult and uncertain, and to remedy this Abel proposed to pulp the guncotton through which the fibres would be cut into such short lengths that the acids could be completely and readily removed from the interiors of the tubes while furthermore this pulped material could by molding and pressure be shaped into any desired forms and dimensions.

Abel's process for the manufacture of military guncotton as carried out at the United States naval torpedo stations was as follows: The cotton used was what is known as "cop" or weaver's waste, which is the tangled clippings from the spinning room of a cotton mill; the thready form of this material being preferred to the fluffy form of the unworked cotton. This was first hand-picked to remove the larger foreign bodies present and to open out after baling. It was then boiled in 200-pound lots in caustic soda solution to remove grease, oils and the incrusting substances on the fibres, then wrung out in a centrifugal wringer and dried in a heated closet. It was then put through a cotton picker to open up the fibre and remove foreign bodies which had been overlooked in the hand-picking, and was then dried in a second closet at 225° F. until it contained not over one half per cent of moisture, when it was stored in small lots in hermetically sealed metal vessels to cool. It was then dipped in lots of one pound each in 150 pounds of acids, consisting of 1 part by weight of nitric acid, 1.5 specific gravity, to 3 parts by weight of sulphuric acid, 1.845 specific gravity, contained in a large iron trough about which cold water circulated so as to maintain a temperature of 70° F. throughout the dipping. The cotton was plunged rapidly under the acid, allowed to remain immersed for 10 minutes, removed to a shelf above the acid dipping trough, where it was squeezed to remove the excess of acid, and then at once transferred to a two-gallon crock made of acid-proof earthenware. As transferred to this digestion crock the cotton carried with it from 10 to 12 pounds of the acid mixture, and by pressing the mass down in the crock with an iron tool, the cotton was forced to the bottom and covered with a layer of the acid mixture which was squeezed from it. The crock was then covered and placed in a wooden trough where it was partly surrounded with cool water, which was kept in constant circulation, and where it was allowed to remain, so that the cotton could "digest" the acid, for 24 hours. Then the contents were thrown into a steel centrifugal wringer by which the greater part of the acid was removed. The guncotton was then thrown into a tub holding 800 gallons of water through which a large stream of water was continually flowing and in which a large paddle-wheel was in revolution so as to very quickly bring the acid guncotton into contact with so large a volume of cold water as to prevent its becoming heated. The guncotton was then boiled twice for eight hours each in a dilute solution of soda, wrung out and washed with fresh water and put in the pulper. This was an ordinary "beater," "rag-engine," or "Hollander," such as is used in the paper-making industry, and the guncotton, suspended in water, was subjected to the action of the machine for two days in charges of from 300 to 350 pounds, where, by the shearing action of the knives, the fibres were cut into short lengths and the guncotton was reduced to the fineness of cornmeal, and mixed into a pulp with the water present. This was drawn into a large tank, known as the poacher, where the powdered guncotton was allowed to settle and the supernatant water drawn off. Fresh water was added and, by means of a revolving paddle in the poacher, the guncotton was mixed with it and washed by it, and this washing was repeated six or seven times until the chemical test of a sample showed that the acid had been completely removed. Then it was treated with a solution of lime containing a small quantity of caustic soda and also of precipitated chalk, and the mass was ready for molding.

As shown above the first use to which guncotton was put was as a propellent in guns, and Abel devised means for making powder grains from the pulped guncotton, but he soon pointed out the advantages which it possessed, when compressed, for use in military and naval mines and torpedoes and for engineering operations in times of war, and these are the chief uses to which it has been put. To compress it the alkaline solution from the poacher, containing the finely divided guncotton in suspension, was pumped up to a stuff-chest, which is a cylindrical tank containing a vertical shaft armed with paddle-blades which, by revolving, keeps the guncotton in suspension. From here, by means of a wagon, the pulp was run into a hydraulic press where it was subjected to a pressure of 100 pounds to the square inch and thereby molded into blocks. These blocks were then transferred to another press where they were subjected to a pressure of from 6,000 to 6,800 pounds to the square inch. As made at the United States naval torpedo stations the blocks from the molding press were prismatic, with the vertical edges chamfered, 2.8 inches in diameter by 5¼ to 5½ inches high, with a circular hole ½ inch in diameter, produced by a mandrel in the press, running vertically through the centre of the prism. After final pressing the blocks were 2.9 inches in diameter by 2 inches high, the hole remaining practically unchanged, and they still contained from 12 to 16 per cent of water, though as sent out into the service as "wet guncotton" they were soaked in water until they contained 35 per cent. In the final press by means of steel dies, inscriptions in letters and figures, such as the place and date of manufacture and factory lot, were placed upon each block.

In the fibrous condition guncotton appears like the cotton from which it is made, but it has a harsher feel and it becomes electrified by friction when dry. When dry if rubbed in the dark it becomes phosphorescent. Under the microscope by polarized light it exhibits colors, while cotton is colorless. Pure guncotton is without odor or taste and is insoluble in water. The gravimetric density before pulping is 0.1, after pulping 0.3, and after compression from 1.0 to 1.3, but by excessive pressure it has been raised to 1.4. The real specific gravity of guncotton is 1.5. When dry, compressed guncotton is detonated by inserting a detonator in the hole in the block and firing it. Wet guncotton is detonated by the detonation of a block of dry guncotton fired in contact with it. The violence of the explosion of guncotton when thus detonated is comparable with, if not superior to, that of nitroglycerin. Dry guncotton may be set on fire and, when compressed, it burns so slowly in the open that the fire may be extinguished by pouring water upon it. Wet guncotton, thoroughly saturated with water, can be shaped by a tool without taking fire or exploding. In forming the cylindrical and conical charges for the torpedoes thrown from the pneumatic guns of the United States steamship Vesuvius at Santiago, the prismatic blocks above described were sawn with a band saw, turned in a lathe and cut with chisels as wood is treated, but care was used to keep the blocks and dust wet throughout the process.

Pure cotton is composed of cellulose having a formula which chemists believe to be some multiple of $C_6H_{10}O_5$. When it is acted upon by nitric acid or mixtures of nitric with sulphuric acid, under the proper conditions, cellulose nitrates are produced, through, it is believed, the replacement of hydrogen atoms in the molecule by NO_2 groups, thus forming esters or organic salts. Views differ as to the number of cellulose nitrates existing but, following Vieille, who is the most widely accepted authority on this point, taking the formula of cellulose as $C_{24}H_{40}O_{20}$, we may have the following:

Cellulose Nitrates	Percent of Nitrogen	Weight obtained from 100 parts of Cellulose
Cellulose endecanitrate ..	13.47	176.4
Cellulose decanitrate....	12.75	169.4
Cellulose enneanitrate...	11.96	162.5
Cellulose octonitrate....	11.11	155.7
Cellulose heptanitrate...	10.18	148.6
Cellulose hexanitrate....	9.15	141.7
Cellulose pentanitrate...	8.02	134.7
Cellulose tetranitrate....	6.76	127.8

There are probably existing also isomers of many of the nitrates given in the table. Following their differences in composition these different cellulose nitrates have different properties especially as regards their solubility in organic solvents. Thus all except the endecanitrate, if properly made, are soluble at ordinary temperatures in a mixture of one volume of alcohol and two volumes of ether. Such cellulose nitrates are called *pyroxyline, nitrocotton, soluble guncotton*, and *collodion, cotton* or *guncotton*. The decanitrate is also called *pyrocellulose*. All the cellulose nitrates are by some called *nitrocellulose*. The material produced by the Abel process described above is partly soluble, but mostly insoluble in the ether-alcohol mixture, and to this material the name *guncotton* or better *military guncotton* is applied. In addition to guncotton, the cellulose nitrates are used in the manufacture of smokeless powder, explosive gelatine, pyroxylin plastics, pyroxylin varnishes, photographic films and collodion. For smokeless powders and explosive gelatine the deca- and enneanitrates are most largely used. For varnishes, collodion and photographic films the octonitrate is generally employed. And the heptanitrate, which is of low nitration, is preferred for the pyroxylin plastics. This last nitrate may be made by dipping one pound of pure dry cotton or tissue paper in 100 pounds of a mixture of 66 parts of sulphuric acid, 17 parts of nitric acid and 17 parts of water, and continuing the immersion at 30° C. for 20 to 30 minutes. The acid is then wrung out and the nitrate washed and neutralized. The higher nitrates are made by using stronger acids, longer exposures and higher temperatures. In making pyroxyline varnishes, which are largely used in coating metals, artificial leather and in waterproofing, the pyroxylin is dissolved in ethyl acetate, amyl acetate and similar organic solvents.

Collodion, which is used in surgery, is made by placing 30 grams of pyroxylin in a suitable bottle, pouring upon it 750 cubic centimetres of ether, corking the bottle and allowing the whole to stand 15 minutes. Two hundred and fifty cubic centimetres of alcohol are then added and the bottle shaken until the pyroxylin is dissolved. On allowing to stand the solution becomes clear, and if poured upon a flesh wound the solvents evaporate and a continuous film of pyroxylin is formed which protects the wound from the air and which also, by contracting as it dries, brings the edges of the wound together. Substances such as cantharides, tannic acid and the like, by which to produce blistering, styptic and other effects, may be added to the collodion. See EXPLOSIVES.

CHARLES E. MUNROE,
The Columbian University, Washington, D. C.

Gunnery is the science and art of using guns. As a science it treats primarily of the motion of projectiles, and has three branches, "interior ballistics," "exterior ballistics," and "effects of projectiles."

"Interior ballistics" considers motion within the gun, and seeks to determine the fluid pressure caused by the combustion of a given charge of powder and the velocities thereby imparted to the projectile and to the gun itself.

From the middle of the 14th century until some 20 years ago, a practically unchanged mixture of nitre, sulphur, and charcoal, called gunpowder, was universally used as the propelling agent in firearms. At first, as the name implies, it was used in the form of dust; later the superior effects produced by granulation were discovered, and a powder in the form of small irregular grains was used in all kinds of guns; early in the 19th century powders were divided into two classes, the finer-grained "musket powder" being used in all shoulder pieces, and the coarser "cannon powder" in all artillery; about 1860 Gen. Rodman, U. S. A., proposed and developed the manufacture of powders of regular granulation and very large grains for use in the 15- and 20-inch smooth-bore guns; with the advent of large rifled cannon, the practice became general of molding powder into separate grains of a size and density suited to the particular gun in which it was to be fired; a slower burning gunpowder, called brown, or cocoa, powder from its color, and made from underburned charcoal, next came into use for large guns; and, finally, the discovery that the high explosives can, by suitable treatment, be made to burn progressively in guns made smokeless powders practicable, and these have now entirely superseded gunpowder.

The explosion of the powder charge of a gun begins with "ignition," which is the setting on fire of a portion of it; "inflammation," or the spreading of the fire from grain to grain, throughout the charge, follows; and "combustion," or the burning of each grain from surface to centre, completes the phenomenon. Meanwhile the gaseous products of the combustion, filling the powder chamber, develop a fluid pressure which starts the projectile from its seat and gives it an accelerated motion along the bore. Evidently the gas pressure at any instant depends upon the quantity of powder consumed at that instant and the space which the products of its combustion occupy, and the latter depends not alone upon the volume of the powder chamber, but also upon the displacement of the projectile. It might well be thought that the periods of time required for the inflammation and combustion of a charge of gunpowder are so small as to be negligible, yet much of the superiority of modern over ancient ordnance comes from proper regulation of those time intervals. The ballistic power of granulated was much greater than that of dust powders because the interstitial spaces between the grains greatly increased the rapidity of inflammation, and the use of large charges of grained powders without inadmissible strains upon guns was made possible only by so diminishing the rapidity of combustion that the burning of the powder was not complete till the projectile had traversed a considerable portion of the bore of the gun. Robins, Hutton, and Count Rumford were the pioneers in the experimental determination of the force of fired gunpowder and in measuring, by means of the former's "ballistic pendulum," the velocities which it imparted to projectiles, but Rodman was the first to directly measure the pressures developed in guns by the explosion of their charges. In 1861 he published the results of experiments made for the United States government, and described his pressure gauge, a modification of which is still universally used for measuring powder pressures. The Rodman gauge consists of a piston contained in a small cylinder inserted in the gun wall so that the inner end of the piston is exposed to the bore of the gun, while its outer end, which carries a knife edge, presses against a disk of soft copper; on firing the gun the gas pressure forces the piston outward and the knife edge makes a cut in the copper which, by comparison with cuts made by known forces, measures the gas pressure which produced it. Rodman measured the pressures in guns not only at the bottom of the bore, but at intervals to the muzzle, thereby determining the necessary thickness of metal to withstand them, and he showed that by making the size of the powder grains vary with the size of guns, their ballistic power could be increased without increase of strain upon their walls.

The first exhaustive investigations of the phenomena attending the explosion of gunpowder were those of Noble and Abel, communicated to the Royal Society in 1874 and 1879. They measured velocities with the electric chronograph, and powder pressures with the Noble "crusher" gauge, which differs from the Rodman gauge in using the extent to which a copper disk is shortened by crushing, instead of the dimensions of a cut, to measure the force. They found that the products of explosion consisted of 57 per cent by weight of solid or liquid matter and of 43 per cent by weight of permanent gases; that the gases, reduced to 32° F. and atmospheric pressure, would occupy about 280 times the volume of the original powder; that the pressure produced if the powder filled the space in which it was exploded was about 43 tons per square inch; and that the temperature of combustion was about 4000° F. They also deduced formulæ for the pressure at any point in the bore of a gun and for the work per pound of powder which its charge would do, both based on the assumption that the solid and liquid residue gave up its heat to the gases during their expansion; and these formulæ were very generally used until gunpowder was replaced by smokeless powders, it being only necessary to apply to the calculated work of any powder charge a "factor of effect" based upon experience in order to predict with reasonable accuracy the muzzle energy of the projectile and thence to deduce its velocity. By far the most important and complete study of the questions of interior ballistics has been made by the engineers of the French "Service des Poudres et Salpêtres" during the past 20 years, and it is to their experimental investigations that we owe almost all of the latest knowledge upon this subject. Sarau was the first to take into account the progressive combustion of the powder charge under the varying pressure in a gun, and by assuming that the velocity of combustion is proportional to the square root of the pressure he deduced his now classic formulæ for the muzzle velocity and maximum pressure resulting from firing a given gun with any given charge of a powder of previously established characteristics. He, like all previous investigators, assumed that the powder grains burned progressively from the surface in parallel layers, but Vieille, by registering the movement of the piston of a crusher gauge while it was compressing a copper disk under the action of powder pressure, measured the rate at which the pressure was developed and, having thus determined the law of combustion of various explosives, proved that progressive burning from the surface was a characteristic only of the modern smokeless powders and did not occur in the case of the older black and brown gunpowders in the forms in which they were actually used in guns. Vieille found that the velocity of combustion of pure guncotton smokeless powders was proportional to the two thirds power of the pressure, varying from about 1.4 inches per second under a pressure of two tons per square inch to about six inches per second under 20 tons per square inch; while in the case of smokeless powders containing from 40 per cent to 50 per cent of nitroglycerine, such as cordite and ballistite, the velocity of combustion was about three times greater and varied about as the five ninths power of the pressure. He also established the fact that the pressure caused by the combustion of any explosive in a closed chamber is accurately given by the expression $p = \frac{f\Delta}{1 - \alpha\Delta}$ in which Δ is the "density of loading" or the ratio of the weight of the explosive to the weight of water which would fill the chamber; f is the "force" of the explosive, varying from about 22 tons per square inch for gunpowder, to as much as 67 tons per square inch for some smokeless powders; and α is the "covolume" of the explosive, having a value from 0.5 to 0.6 for gunpowders and not differing greatly from unity in the case of high explosives and smokeless powders.

Notwithstanding his somewhat erroneous assumptions, Sarau's formulæ gave very accurate results for gunpowder, and when put in the slightly modified form which follows they are still the most reliable for use with smokeless powders. As originally used, Sarau's formulæ contained factors depending upon the form of the powder grain and its time of combustion in free air; but with smokeless powders these may be displaced by a single factor, namely, the "least dimension" of the grain, since with true progressive burning it is this, which, for any given powder, fixes its time of combustion.

These formulæ, as modified, are

$$V = A\frac{w^{3/8}\,u^{3/8}}{e^{1/8}\,p^{1/4}\,c^{1/4}\,s^{1/4}}\left(1 - B\frac{p^{1/2}\,u^{1/2}}{e\,c}\right) \text{ and } P = K\frac{w\,p^{1/4}}{e\,c^{2}\,s},$$

in which V is muzzle velocity of projectile in feet per second.

u is travel of projectile in the bore, and c is the calibre, in inches.

p is weight of projectile, and w that of powder charge, in pounds.

s is volume of powder chamber, in cubic inches.

e is the least dimension of the powder grain, in inches.

P is maximum pressure in gun, in pounds per square inch.

A, B, and K are constants, having the following values as determined by experiment for the guncotton smokeless powder used in the United States:

$A = 373.08$; $B = .00035133$; $K = 98555$.

The following practical formulæ give approximately the changes in muzzle velocity and maximum pressure (dV and dP) due to small changes in the weight of projectile or of powder charge (dp and dw).

$$\frac{dV}{V} = -0.43\frac{dp}{p};\ \frac{dP}{P} = 0.3\frac{dp}{p};\ \frac{dV}{V} = \frac{5dw}{8w};\ \frac{dP}{P} = \frac{7dw}{4w}.$$

Similarly, the change in muzzle velocity, due to a change in the length of bore, is $\frac{dV}{V} = k\frac{du}{u}$ where k has a mean value of about five sixteenths, varying from three eighths for slow to one fourth for quick powders.

Among modern practical ballistic instruments are Sébert's "projectile register" and "velocimeter." The former directly measures the acceleration of a projectile during the first part of its motion in the gun, and thus determines the pressure on its base; but the difficulty of stopping the projectile in a butt without injuring the recording apparatus contained in it has prevented the extensive use of this device. The velocimeter is an apparatus for the simultaneous registering of the time and the distance moved by a gun in free recoil, whence the pressure on the bottom of the bore is calculated.

DIAGRAM 1.

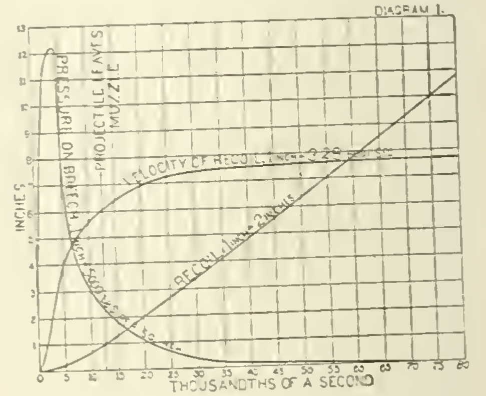

Diagram 1 gives the information obtained by means of the velocimeter from the firing of a United States army 8″ rifle. The projectile weighed 300 pounds; the charge was 52 pounds of a guncotton nitroglycerine smokeless powder; and the total recoiling weight was 34,573 pounds. The maximum pressure of 61,500 pounds per square inch was attained in .0045 seconds from the beginning of motion, and at that time the gun had moved 0.20 inches to the rear, and acquired a velocity of 10.76 f.s.; while the projectile had moved 27.54 inches and acquired a velocity of 1,140 f.s. The projectile left the muzzle in .013 seconds with a velocity of 2,072 f.s., having traveled 204.87 inches;

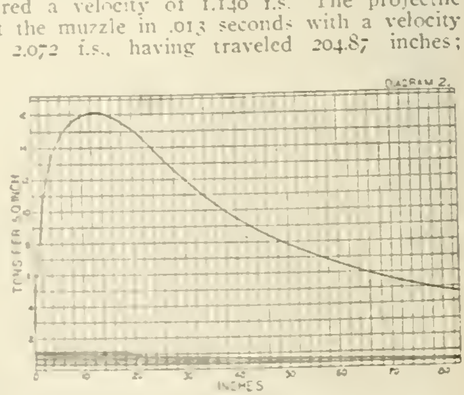
DIAGRAM 2.



while at the same instant the gun had moved 1.9 inches and had a velocity of 10.78 f.s., and the pressure had fallen to about 11,000 pounds per square inch. Spring gauges, capable of giving a continuous record of the varying pressures in a gun and registering them as the gun recoils, have also been successfully used in recent years, and diagram 2 gives the information obtained by such means from the firing of a French 10 c.m. (3.97 inches) gun. The projectile weighed 31 pounds, and the charge was 4.4 pounds of French guncotton smokeless powder. The maximum pressure of 18.6 tons per square inch was developed when the gun had moved 0.14 inches in free recoil, and the projectile 12.0 inches; when the projectile left the muzzle the gun had recoiled 0.95 inches and the pressure had fallen to about 5.3 tons per square inch.

It will be seen from diagram 1 that the velocity of recoil increases from about 20 f.s. to 25 f.s. after the projectile has left the muzzle. This is due to the reaction of the escaping powder gases. If u and W are the maximum velocity of free recoil and the total recoiling weight, p and w being the projectile and powder-charge weights, and v the muzzle velocity, then $Wu = vp + nvw$, where nv is the mean velocity of exit of the powder gases. With gunpowders n has a value of about three halves, but with smokeless powders it is probably somewhat larger.

The energy of rotation of the projectiles of modern guns is about 2 per cent of their energy of translation, and is allowed for in ballistic calculations by a suitable increase of the assumed value of the weight of the projectile. About 1 per cent of the available energy developed by the discharge is absorbed in the recoil of the gun: from 10 per cent to 12 per cent is taken up in giving energy of translation to the powder charge itself; and about 5 per cent goes to heat the gun walls.

Exterior Ballistics treats of the motion of projectiles after they have left the gun, and investigates the laws which govern their flight in air. The ancient artillerists supposed that the trajectory was composed of three distinct parts, of which the first, or "violent" part, was a straight line, the middle a circle, and the last, or "natural" part, again straight. Nicholas Tartaglia, who may well be called the father of ballistics, invented the quadrant for measuring a gun's angle of elevation, and in 1537 published a treatise on the flight of projectiles, in which he showed that no part of a trajectory is straight, and that the range increases with the angle of elevation up to 45°, where it is greatest. Galileo, who also neglected the resistance of the air, showed that the path of a projectile is a parabola with vertical axis. Newton, assuming that the resistance of the air is proportional to the square of a projectile's velocity, demonstrated that the trajectory consisted of two dissimilar branches, one ascending and the other descending, and that the latter would become vertical if sufficiently prolonged. Robins was the first to measure experimentally with any degree of accuracy the velocity of projectiles. In 1742 he published his famous 'New Principles of Gunnery,' and described his invention, the "ballistic pendulum," which consisted of a heavy bob suspended from a tripod and arranged to receive the impact of a projectile and to register the resulting swing: the velocity imparted to the bob by the impact could then be calculated, and thence, by the principle of the equality of the quantities of motion before and after the impact, the striking velocity of the projectile could be determined. Robins measured velocities as high as 1,700 f.s., and determined approximately the loss of velocity due to air resistance for distances up to 250 feet from the gun: he also suggested using the gun itself as a pendulum and calculating the velocity of the projectile by observing the swing of the gun when it was fired, and Count Rumford soon afterward experimented with this device. Dr. Hutton made extended experiments in England from 1775 to 1791 with both the ballistic pendulum and the gun pendulum, but there was no further great advance in knowledge of ballistics until the French government experiments were made at Metz in 1839 and 1840, from the results of which it became possible to roughly construct trajectories and to calculate, by empirical formulæ, approximate ranges and times of flight for any given elevation of a gun. In 1840 Wheatstone suggested measuring the velocity of a projectile by causing it to cut successive wire screens, each of which formed part of an electric circuit, and in following years many instruments for measuring projectile velocities by electricity were perfected, of which the Boulengé chronograph is to-day the most widely used. This instrument consists of two electro-magnets, the magnetizing currents of which pass through wire screens at a carefully measured distance apart in the path of the projectile, and from one of which is suspended a long cylindrical rod, called the chronometer, while from the other is suspended a shorter rod, called the registrar. A spring trigger carrying a knife edge is so arranged that when the registrar drops it strikes and releases it, causing it to fly forward and make a cut on the side of the chronometer. When released by hand the trigger makes a mark on the suspended chronometer called the origin: when the circuits are simultaneously broken by a device called the disjunctor the chronometer and registrar fall freely side by side until the released trigger makes a second mark on the chronometer at a distance above the origin called the disjunctor reading: when a projectile is fired it cuts the first screen, releasing the chronometer, then it cuts the second screen, releasing the registrar, and thus a mark is made whose distance above the origin is the velocity reading: then the time of falling freely the velocity reading less the time of falling freely the disjunctor reading is the time it took the projectile to travel from the first to the second screen, and the distance between the screens divided by this time is taken to be the velocity of the projectile when midway.

The perfection of a means of accurately measuring the velocity of a projectile at any desired point in its path made it practicable to experimentally investigate the laws governing the resistance of the air. Bashforth, in extensive experiments (1865-70 and 1878-80), showed that the resistance was proportional to the square of the projectile's diameter, and for flat, hemispherical, and ogival-shaped heads, varied in ratios about as 1.5, 1.0, and .80; his earlier experiments, however, were vitiated by his use of studded projectiles having insufficient rotation for smooth flight. Mayevski's deductions, published in 1883, and founded upon Krupp's experiments, are probably the most reliable. Expressing the retardation $\left(\frac{dv}{dt}\right)$ in the form $A\frac{d^2}{w}v^n$, in which d is diameter in inches, and w is weight in pounds of the projectile, v is its velocity, and $\frac{dv}{dt}$ its retardation in f.s.s., he found the following values for A and n:

v between 2800 f. s. and 1375 f. s.;	$n=2$;	log A =	6.119244(−10)
v " 1375 " " 1230 " ;	$n=3$;	"	2.980883(−10)
v " 1230 " " 970 " ;	$n=5$;	"	6.801844(−20)
v " 970 " " 790 " ;	$n=3$;	"	2.773423(−10)
v " 790 " " 0 " ;	$n=2$;	"	5.669876(−10)

These values of the consonants n and A are for projectiles having ogival heads of two calibres radius, and for a standard condition of the atmosphere. For other conditions the retardation found as above must be multiplied by a coefficient of form (i), and by the ratio of the actual density of the air to its assumed standard density $\left(\delta=\frac{\Delta 1}{\Delta 0}\right)$. Thus we have for a general formula $\frac{dv}{dt}=i\,\delta\,A\frac{d^2}{w}v^n$, in which i depends upon the form of the projectile, and is unity for most modern projectiles, and δ depends upon the temperature, barometric height and humidity, and is unity for ordinary atmospheric conditions.

Since the retardation is inversely proportional to $\frac{w}{i\,d^2}$, that factor, which is called the "ballistic coefficient" and denoted by C, measures the "ranging power" of a projectile. With spherical projectiles C could only be increased by increasing the calibre, but with rifled guns it became possible to greatly increase its value for any calibre of gun by lengthening the projectile and sharpening its point, and it is this fact which largely accounts for the immense superiority in ballistic power of rifled over smooth-bore guns.

Assuming that the axis of a projectile coincides with the tangent to its path, as is practically the case with modern rifled guns, the resultant action of the resistance of the air will likewise coincide with the axis, and the trajectory will be the same as if the mass of the projectile were concentrated at its centre of gravity and moved under the action of two forces, one the constant vertical force of gravity w, and the other the variable resistance $\frac{w}{g}\frac{dv}{dt}=A\frac{i\,\delta\,d^2}{g}v^n$ acting in the tangent. Under these circumstances the differential equation to the trajectory is readily obtained, and, though its form prevents direct integration, its approximate solution has been effected by several different methods, of which Siacci's is the simplest and the one almost universally used. By Siacci's method the two co-ordinates, the inclination, the time, and the velocity at any point of the trajectory are given as functions of a new variable, called the pseudo-velocity, and, by means of tabulated values of those functions all the problems of exterior ballistics may be accurately solved.

As shown by Mayevski's formulæ, we may consider the air resistance to be proportional to the square of the velocity, so long as the velocity exceeds 1,375 f.s., which is the case throughout the trajectories of modern naval and coast defense guns (excepting mortars), when they are fired at the moderate elevations with which alone they are practically used. Within these limits the equation to the trajectory in air, the gun being the origin, is $y=x\tan a-\frac{g\,x^2}{2V^2\cos^2 a}\left(1+\frac{2kx}{3}\right)$, the first two terms of which represent the trajectory in vacuo, and in which a is the angle of departure of the projectile, V is its initial velocity, and k is the constant in the expression for the retardation $\frac{dv}{dt}=kv^2$. Thus, for example, taking the case of a 12″ projectile of standard form, 880 pounds weight, and 2,800 f.s. initial velocity, we have, under standard atmospheric conditions, $k=A\frac{d^2}{w}=\frac{d^2}{w}(6.119244-10)=.000021534$, and, supposing we wish to determine the proper angle of elevation for a range of 3,000 feet, putting $y=0$, we get $\sin 2a=\frac{g\,X}{V^2}\left(1+\frac{2kX}{3}\right)=0.0128$; whence $a=22'$. By the same formula the elevation for a range of 15,000 feet will be found to be $2°-09'$, which agrees with the published range table for the latest pattern United States naval 12-inch gun.

Representing the ratio of the range of any projectile in vacuo (P) to its range in air (X) by n, so that n is the $1+\frac{2k}{3}X$ of the preceding formula, it can be shown that n, while always greater than unity, cannot exceed 3, and that for flat trajectories the following relations are quite approximately true: the angle of fall (ω), which in vacuo equals the angle of projection (a), in air is given by $\tan\omega=\left(2-\frac{1}{n}\right)\tan a$; the abscissa of the highest point (X_1), which in vacuo is half the range (X), in air is given by $X_1=X\frac{\sqrt{3n^2-3n-1}-1}{3(n-1)}$ and cannot exceed $0.57X$; the time of flight (T), which in vacuo would be $T_1=\frac{X}{V\cos a}$ or very closely $\frac{X}{V}$, in air is given by $T=\frac{2.(3n-2)^{\frac{3}{2}}-1}{9\quad n-1}.\frac{X}{V}$, or still more roughly by $T=n\frac{X}{V}$, and cannot exceed $1.05T_1$; the striking velocity (U), which in vacuo would be the same as the initial velocity V, in air is given by $U=\frac{V}{\sqrt{3n-2}}$ and cannot be less than $0.38V$.

Experience shows that the projectiles of rifled guns, when fired in a still atmosphere, deviate from the plane of fire (a vertical plane through the axis of the gun) to an extent approximately proportional to the square of the time of flight and in the direction toward which the upper surface of the projectile moves in its rotation. This deviation is called "drift," and for all United States guns is to the right, since they are so rifled that their projectiles, viewed from the rear, turn with the hands of a watch. With modern high-velocity guns drift is only important at very long ranges, being, for example, in the case of the 12-inch rifle already cited about 1½ yards at 2,000 yards range, and about 100 yards at 12,000 yards range. The cause of drift is that soon after the projectile leaves the gun the line of action of the air resistance ceases to coincide with the axis (on account of the curvature of the trajectory), and, meeting that axis obliquely between the point of the projectile and its centre of gravity, tends to raise the point, which action, combined with that of rotation, causes the point to move first to one side (the right for right-handed rotation), and then downward: this movement, by virtue of which the axis of the projectile tends to describe a cone about the tangent to the trajectory, is called precession, and its result, in combination with the angular motion of the tangent caused by the curvature of the trajectory, is to keep the point of the projectile always on that side of the plane of fire toward which it was first deflected. Thus with right-handed rifling the projectile, during its flight, always points very slightly to the right of the plane of fire, and consequently the resistance of the air has a component normal to that plane which carries the projectile bodily to the right with increasing velocity.

For many reasons, among others the fact that the drift caused by rotation is affected by lateral wind pressure, it is difficult to determine accurately the deviation of a projectile which will result from a side wind. Hélie's formula, $D = WT - \frac{X}{V \cos \alpha}$ in which W is the velocity component of the wind at right angles to the line of fire, T is the actual time of flight, and $\frac{X}{V \cos \alpha}$ is the time the projectile would take to traverse the range (X) if its original horizontal velocity ($V \cos \alpha$) remained unchanged, is usually relied upon; but, while reasonably accurate for light projectiles, it gives much too great results for modern projectiles of large calibre, especially at moderate ranges. Assuming that in the short time of flight the projectile can acquire but little lateral velocity, the wind effect is a practically constant lateral pressure, and the deviation caused by it will be $D = k \frac{W^2 T^2}{d}$ in which, d being the diameter of the projectile, W the wind velocity at right angles to the plane of fire, T the time of flight, and D the deviation, k will be a consonant whose value must be found by experiment. The increase or decrease in the range caused by the wind is approximately $\Delta X = 2WT\left(\frac{VT}{X} - 1\right)$, in which W is the velocity component of the wind in the plane of fire.

The Effects of Projectiles depend not only upon their own characteristics, but also upon the nature of the objects attacked. «Cannister,» the balls of which spread on leaving the gun and rapidly lose their velocity, are only effective at ranges within 300 or 400 yards and against exposed men or very light vessels, such as torpedo boats. The «shrapnel,» burst by the action of a time fuse, produces a cone of balls and fragments whose axis is the trajectory and whose angle of dispersion depends upon the violence of the explosion, and can be used effectively against exposed men at any range, provided the point of burst can be properly adjusted: with field artillery, which uses shrapnel almost exclusively, it is usual to adjust the fuses with a view to causing the burst to occur when the height of the shrapnel above the point of attack is about one two hundredth of its distance from the gun. «Common shell» are sometimes used like shrapnel, but as a rule they are fitted with percussion fuses to cause them to explode on impact, in which case they are effective against unarmored ships and fortifications, and against any structures not protected by armor sufficiently thick to cause them to break up without penetration. If made of steel, and with thick walls, a common shell may be capable of penetrating steel plating of a thickness equal to half its own calibre, but as a rule the shell walls are thin and the power of penetration much less than this. It requires a resistance at least equal to that of a quarter-inch steel plate to actuate the fuse of a 6″ shell, and after penetrating such a plate it will range 10 or 15 feet before bursting. The larger the shell the more the resistance required to burst it, and the farther it travels after impact before bursting. From the point of burst the fragments spread in a cone, the angle of dispersion depending upon the relation between the velocity of the shell as a whole at the instant of bursting and the velocity imparted to the fragments by the explosion. The greater destructive effect of shell loaded with high explosives than of those loaded with gunpowder is primarily due to the much wider angle of dispersion of the former. «Armor-piercing shell» have been so perfected as to be capable of penetrating, unbroken and undistorted, a thickness of wrought iron or steel only limited by their striking energies. Against hard-faced armor, however, these projectiles require the aid of soft steel caps in order to penetrate even a moderate thickness without being shattered. The formulæ of Jacob de Marre, based upon French experiments, are considered the most reliable for calculating the velocity necessary for the perforation of oak, wrought iron, or homogeneous steel by projectiles of the usual form and of such quality as not to be broken or seriously distorted by the impact. When a projectile is distorted, or is broken, by impact, the velocity necessary for perforation increases very rapidly with the amount of distortion, or the number of fragments.

These formulæ are as follows:

For oak $\quad v = \frac{e^{.6} a^{.9}}{p^{.5}}$ (log 2.20987)

For wrought iron $\quad v = \frac{e^{.65} a^{.75}}{p^{.5}}$ (log 2.96162)

For steel $\quad v = \frac{e^{.7} a^{.75}}{p^{.5}}$ (log 3.00941)

In which e is the thickness to be perforated and a the diameter of the projectile, both in inches; p is weight of the projectile, in pounds; and v is its striking velocity in feet per second.

For capped projectiles and Harveyized armor, the Davis formula, based upon experiments at the United States naval proving ground, is $v = \frac{e^{.8} a^{.5}}{p^{.5}}$ (log 3.25312), and the same formula will serve as well as any yet proposed for Krupp armor, if to the calculated velocity be added from 50 to 100 f.s., the amount added increasing with the thickness of the plate.

The above formulæ are all for normal impact. When the angle which the axis of the projectile makes with a normal to the plate is less than 30°, provided the projectile remains whole, and if its velocity component normal to the plate exceeds the velocity required for perforation with normal impact, it will perforate the plate: with greater angles of incidence than 30° the projectile is deflected unless it very greatly overmatches the plate.

Experiments show that a projectile which will penetrate a distance unity into oak will penetrate slightly less than one half into concrete, about one half into good masonry, about three halves into sand, about four into common earth, and about seven into clay.

The Art of Gunnery is concerned with the actual use of guns, and primarily with pointing them so that when fired their projectiles shall hit the target. If a great number of rounds be fired from a gun under as nearly as practicable the same conditions, and the impacts are received upon a vertical screen, the average of their distances above or below the mean point of impact is called the mean vertical error of the gun: their average distance to right or left of the mean point of impact is called the mean horizontal error: and the trajectory from gun to mean point of impact is called the mean trajectory. Theory, as well as practical experience, indicates that only about 2 per cent of the projectiles fired will deviate from the centre of impact more than three times the mean error, and with modern guns the mean errors are so small that we may reasonably expect practically all the shots fired on any occasion, from a stationary platform, and at a fixed angle of elevation, to strike within a vertical rectangle 9 feet high by 6 feet wide at a distance of 2,000 yards. It is only necessary, therefore, to point a gun so that its mean trajectory intersects the target at the latter's centre in order to obtain a large percentage of hits: the accomplishment of this, however, is not easy and constitutes the principal part of the gunner's art. Guns are pointed by directing what is called the "line of sight" at the target. Originally the upper surface of the gun itself was used as the line of sight: this was called "sighting by the line of metal," and resulted in the gun having an elevation corresponding to the difference in thickness of the metal at breech and at muzzle, which elevation determined the range. Later a piece of wood or metal, called a dispart, was secured to the muzzle so as to give a line from breech to muzzle parallel to the gun's axis: such a line of sight had to be directed more or less above the target according to the range. Early in the last century the present method of having one fixed and one movable sight, so that the line between them, which is the line of sight, can be adjusted at any desired angle with the axis of the gun, came into use. It is customary to make the rear sight the movable one, and to put range marks on it so that if, for example, it is set at the mark 2,000 yards, the angle between the line of sight and the axis of the gun is the angle of elevation necessary to give the projectile a range of 2,000 yards. Besides the movement of the rear sight up or down, to insure the gun's having proper elevation, it is also usual to have means of moving it sidewise, so that the line of sight can be adjusted to make any desired small angle, in the horizontal plane, with the axis of the gun, and thus the drift of the projectile may be allowed for by causing the gun to point the proper amount to one side of the target at which the line of sight is directed.

If now gun and target are stationary, if there is no wind, if the air is of standard density, if the sight is set for the correct distance of the target, and so as to compensate for the drift at that distance, and if the line of sight is accurately pointed at the centre of the target, then the mean trajectory will pass through that centre and the chance of hitting will be a maximum. The first difficulty is that the line of sight cannot be accurately directed, since to do so requires the eye to determine when three objects at different distances (rear sight, front sight and target) are exactly in line: with the telescope sights now coming into general use this source of error is practically eliminated. In the next place the distance is never exactly known: there is always some movement of the atmosphere; the density of the air may readily be as much as 9 per cent greater or less than on the average: the target is usually in motion: and in the case of naval guns the gun is always in motion. The skill of the gunner, then, consists, first, in estimating the total lateral deviation which will result from wind and motion of gun and target at right angles to the plane of fire, and pointing sufficiently to one side of the target to compensate therefor: and second, in so adjusting the elevation of his gun as to compensate for the vertical deviation due to wind and motion of target in the line of fire, to angular motion of the gun if such exists, and to abnormal air resistance. With modern guns, mounted on shore, where the platform is stationary and the distance of the target can be measured with comparative accuracy, the percentage of hits upon a target of ordinary size should be very large, even at long range, if the gunners are well practised. Under the conditions of naval actions it is not surprising that in the past the percentages of hits have been extremely small, and it is not to be expected that they will ever be large, at least during such parts of actions as are fought at long range.

Philip R. Alger,
U. S. Naval Academy, Annapolis.

Gun'nison, a river of Colorado formed at Almont by the junction of the Taylor and East Rivers, flows southwesterly to Gunnison, near Cimarron enters the Grand Cañon of the Gunnison 15 miles long, and continuing in a northwesterly direction past Delta unites with the Grand River at Grand Junction after a course of nearly 200 miles. See Uncompahgre Valley Project.

Gunny, a jute (see Jute) cloth, also a bag or sack. Gunny-bags are very largely exported from India to various parts of the world. American cotton is largely packed in these. They can be manufactured at a low price, hence the great demand for them. The name gunny is applied to the cloth as well as to the made-up bags. About 1850 the peasant hand-looms of Lower Bengal met both the home and the foreign demand for Indian-made gunny-bags — indeed the making of these was then the great domestic industry of that portion of India. At the present time the number made at the great steam-factories, of which there are now 23 in India, far exceeds what is produced by hand-looms. For example, in one year 82,-779,207 gunny-bags were exported from India, of which only 5,000,000 were woven by hand.

Gunpowder, an explosive substance formed by mixing saltpeter, charcoal and sulphur together. The mixture may vary in composition between quite wide limits, and yet possess explosive properties; but the proportions adopted by the United States governmental authorities are saltpeter, 75 per cent; charcoal, 15 per cent; and sulphur, 10 per cent. The saltpeter used is the India saltpeter or niter, which is known to chemists as potassium nitrate, and although found native as an incrustation on the soil in India it is to-day largely made from Chile saltpeter, or sodium nitrate, by reacting on the latter with potassium nitrate. It is carefully purified, finely ground and thoroughly dried for use, in the manufacture of gunpowder. The charcoal most suitable for gunpowder is that variety which is mostly readily ignited, most quickly burned and gives the least quantity of ash. Such charcoal is produced from dogwood, willow or alder, by heating the air-dried woods in closed iron cylinders or retorts out of contact with air so that they undergo destructive distillation and leave the charcoal as a residue, this method of manufacture having been invented in England by Bishop Landloff and adopted in that country in 1797. The dogwood, which is really the alder-buckthorn, *Rhamnus Frangula,* is cut when one inch in diameter; the willow and alder when four inches; though these dimensions vary in practice. The wood is cut in the spring when in full sap, stripped of its bark and seasoned by an exposure of two to three years; the dogwood being stacked under shelter, but the other woods in the open so that the rain may wash the sap from the wood and the sun's rays and the air may destroy the spiral cells. The charring is effected by fires outside the retorts or by passing superheated steam or hot carbon dioxide gas through the retorts. The character and yield of the charcoal produced varies with the temperature to which the wood is exposed and the time of exposure. When the wood is heated to 290° C. red charcoal is formed; when heated to 350° C. or above, black charcoal is produced. When the heating is done quickly the yield of charcoal is much larger than when the heating is slow. Red charcoal is much more easily ignited and burns faster than black charcoal. Charcoal for the manufacture of gunpowder is ground to a fine powder by rotation in a drum with a quantity of brass or bronze balls. Sulphur of commerce is purified for use in this manufacture by fusion and distillation; being eventually obtained in the form of roll brimstone, which is then crushed to a fine powder by heavy rollers. It must be free from sulphuric and sulphurous acids, as well as solid impurities, and should consist entirely of that modification of sulphur which is completely soluble in carbon disulphide.

The dry, finely ground and sifted saltpeter, charcoal and sulphur are weighed into the mixing machine, which consists of a gun-metal drum arranged to make 40 revolutions a minute and provided with hollow bearings through which a shaft is passed which carries 44 arms or fliers of such length as to just clear the interior surface of the drum. This shaft revolves in an opposite direction to and with twice the speed of the drum. After the ingredients are put in the drum the mixing is carried on for five minutes and then the mixture goes to the incorporating or wheel mill. The process of incorporation is of the greatest importance i. this manufacture. It consists in the long continued grinding together of the ingredients in order to mix them so intimately that the product appears to the naked eye as a homogeneous mass, for, unless this be done, complete reaction between the components of the powder by combustion cannot be expected. The finished gunpowder depends for its excellence largely upon the completeness and thoroughness of the incorporation. The incorporating mill consists of a circular bed of iron or stone on which the mixture is placed. A vertical shaft rising through the centre of this bed carries a horizontal one, on the two ends of which heavy stone or iron wheels, called edge runners, are hung. These wheels rotate about the horizontal shaft and, as the vertical shaft revolves, they travel at the same time in a circle around the bed so that, at the points on the bed where the edge runners touch, the motions of rotation and translation are converted into a twisting motion, like that of a muller, and the material beneath is thus overturned and very intimately mixed. The edge runners weigh from three to seven tons, are from four to seven feet in diameter, and are so movable on the spindle that they can accommodate themselves to varying thicknesses of powder on the bed. One of the edge runners is a little nearer the vertical shaft than the other, so that they travel in different paths and they are followed by a scraper which throws toward the centre of the bed the material that has been forced to the exterior by the edge runners. To incorporate, 50 pounds of the mixture are spread out on the mill-bed and slightly moistened and the wheels are set in motion. If the wheels are of stone weighing 3½ tons and making 7½ revolutions per minute, the incorporation is completed in 3½ hours. If the wheels are of iron weighing 4 tons and making 8 revolutions per minute, 2½ hours are required for cannon powder. The operator does not remain constantly in the mill but goes in occasionally to wet the charge, from 2 to 10 pints of water being used in accordance with the weather. The chief danger from accidental explosions during the manufacture of gunpowder is found in the incorporating mills; fortunately there is less explosive material here at any time than there is at any other part of the works. To render the damage done by an explosion as slight as possible, the buildings in which these operations are conducted are built with a strong framework covered with light boards, or else with three sides of stone and the fourth and roof of light wood, so that when an explosion occurs the framework or the stone walls remain. These mills are usually built in groups, and to prevent an explosion in one being communicated to the others, each is provided with a drenching apparatus which automatically wets and protects the charges in the mills adjacent to the one which is blown up. The communication of fire or explosion is also arrested by means of barricades built about the mills which consist of masonry filled with earth, or simple earth mounds or sometimes wooden structures built in the shape of a letter A.

When the incorporation is completed the mill cake, as the mixture is now called, is removed from the bed and runners by means of a copper chisel and wooden mallet. It is partly in the form of a compact cake and partly fine meal and in this condition it is put into the press. This is a powerful hydraulic press with a rectangular box which is divided into compartments of the desired width by means of copper or gun-metal plates. When the spaces between the plates have been filled with mill cake, pressure is applied which causes the particles to cohere, and the gunpowder is taken from the press in sheets having an area equal to that of the plates and a thickness dependent on the width of the filling space, the amount of the pressure applied and the duration of its application. Sometimes the press plates are corrugated like waffle irons, as for instance, in the manufacture of waffle and of hexagonal powders, and sometimes they are replaced by a press block filled with molds in each of which a separate grain is pressed, as in the manufacture of cocoa or prismatic powder. The operation of pressing is a most important one, since the density of the finished powder depends upon it and, as it is markedly affected by even slight changes in atmospheric conditions, it is a very nice one.

The press cake passes to the corning or granulating machine, where it is cut into grains. This machine consists of a hopper into which the charge is fed, an elevating band, an endless revolving table, four pairs of rollers and several sets of screens for sorting the grains according to size into boxes placed to receive each different size. The rollers, which are of gun-metal, are corrugated or provided with teeth, the upper two being coarser than the lower, and they are adjusted to the size of grain required. When the hopper has been emptied a clutch is relieved which stops the machine and at the same time rings a bell which notifies the operator of the fact for, as the machine is self-feeding, the workmen are not obliged to be present while it is at work. The grains are now freed from dust by passing through horizontal cylindrical sieves such as are used in flour-mills and they are then glazed by rotation in wooden barrels where, by the friction of the grains against each other, their angles are rounded off and a hard polished surface is imparted to them whereby they become better able to bear transportation and are less likely to absorb moisture. Sometimes the grains are coated with graphite which is put in the glazing barrel with them. Though but 4 ounces of graphite are used to 1,200 pounds of gunpowder it is considered objectionable for use with fine grain regulation powder as it delays ignition and fouls the piece, yet it improves powder to be used in fixed ammunition, in that it enables the grains to readily pack close together. As more dust is formed during the glazing process the grains are again put through the dusting reels and are then exposed for a day in the drying house to a temperature of from 125° to 130° F. The finished powder is packed in 1-pound tins or 25-pound kegs, though other sized packages are produced to some extent. According to the size or form or structure of the grains gunpowder is known as *mealed powder, superfine*, designated by the mark *F.F.G.; fine grain, F.G.; large or coarse grain, L.G.; large grain for rifles, R.L.G.; mammoth, pebble, pellet, cubical, hexagonal, sphero-hexagonal, waffle, Fassano* or *progressive*, and *cocoa* or *brown prismatic powder*. Mealed powder is in the form of dust and is used for driving fuses for ammunition and in pyrotechny. Fassano or progressive powder is formed by pressing mill cake to a density of 1.79, then breaking this press cake into 1/8 to 1/4 inch grains, mixing these grains with a prescribed quantity of fine grain powder, pressing this mixture to a mean density of 1.76 and breaking this press cake into grains about 2½ inches square by 1¾ inches thick. By this means a grain of varying density was obtained which burned progressively. This feature was introduced into powder-making by Prof. R. Ogden Doremus of New York, but was developed in Europe. Cocoa or brown prismatic powder is the final stage of development of the compressed perforated grain invented by Gen. Rodman of the United States army. In experimenting with the 15-inch and 20-inch smooth-bore guns invented by him, Gen. Rodman found that he could reduce the initial pressures, while securing the desired velocities, by using perforated disks of compressed powder which were of a diameter equal to the calibre of the gun and between 1 and 2 inches in thickness. He styled this charge a "perforated cake cartridge" and in his 'Properties of Metals for Cannon and Qualities of Cannon Powder,' published in Boston, Mass., in 1861, he mathematically demonstrated that at the beginning such disks presented the minimum of free surface to combustion but as the powder burned there was a constant enlargement of the perforations, whereby the area of surface exposed to combustion was constantly increased and that therefore the volume of evolved gases increased as the volume of the chamber, due to the travel of the projectile, increased, in consequence of which the pressure was more uniformly distributed along the bore than it had been with the granulated powders hitherto employed. Owing to difficulties in manufacture and use, Rodman later found it convenient to build up his charges with perforated hexagonal prisms of comparatively small size. The Civil War prevented the further development of this novel idea in powder-making in this country at that time, but a Russian military commission, which visited the United States during the Civil War, was so impressed by what Rodman had accomplished, that on its recommendation the manufacture was taken up and carried on in Russia on an extensive scale, and it soon spread to other countries. About 1880 Germany adopted cocoa powder, which was a brown prismatic powder with a single canal, the grains having the form of an hexagonal prism, 1 inch in height by 1.36 inches in diameter, and a density of 1.86. This powder, however, differed from ordinary gunpowder both in the kind of charcoal used and in the proportions of the components. The charcoal was underburned or red charcoal made from rye straw, and the composition was saltpeter 80.50 per cent, charcoal 16.00 per cent, sulphur 2.50 per cent, and moisture 1 per cent. Cocoa powder was so successful for use in modern high-powered rifle guns that it was sought for by all military nations and the want was met in this country by substituting for the rye straw charcoal red charcoal from wood and carbohydrates, such as sugar, and this brown prismatic powder

FRANK W. GUNSAULUS, D. D.

President Armour Institute of Technology.
Chairman Advisory Board, American School of Correspondence.

was used in our modern large calibre guns until displaced by smokeless powder.

Although very great care is exercised in the manufacture of gunpowder, yet there are so many opportunities for variations to occur in each of the many steps of the process that even the best powder-makers cannot regularly produce powder that will always give the same pressure and velocity in the same gun. Since, in order to ensure accuracy of fire, the successive powder charges used must possess the same ballistic properties this result is secured by proving a number of factory runs by firing trials and then mixing these together in the proportions required to produce the desired result. This process is called blending. It was practised by Benvenuto Cellini and has been in vogue ever since.

Good black gunpowder should have a perfectly uniform slate color and it should show no difference in color when crushed. If it is bluish or quite black it contains too much charcoal or is too damp, while the presence of bright points or bluish-white spots indicates that the saltpeter has effloresced. If the powder soils the hand or a sheet of paper when run over them it contains too much moisture or else meal powder. On pressing the powder in the hand it should not crackle or be easily crushed and when crushed the grains should not fall at once to dust, but should first split into angular fragments. Three different densities are determined for gunpowder, each of which furnishes valuable information. These are the gravimetric density which is the weight of a unit volume of powder grains including the air between and enclosed in them; the relative density, which is the weight of a unit volume of powder grains excluding the air between them but including that contained in the pores of the grains; and the absolute specific gravity, which is the weight of the powder exclusive of all air.

Since smokeless gunpowder has been perfected and adopted for use in guns of all calibres it has been declared that it would supersede black gunpowder altogether; yet the census of the United States for 1900 shows that there were over 25,000,000 pounds of black gunpowder made in this country in that year and the production bids fair to be large for many years to come, because in ordnance it is necessary to use a priming charge of black gunpowder with which to fire the smokeless gunpowder; because smokeless powder cannot be efficiently substituted for black gunpowder in the older forms of small arms that are widely scattered over the country; because black powder is most suitable for use in fuses and in pyrotechny; and because smokeless powder is too expensive and inferior for use in saluting.

Gunpowder was formerly used in blasting as well as for a propellent, but usually a special mixture containing as little as 60 per cent of saltpeter was prepared for this purpose. In 1857 Lamotte Dupont of Wilmington, Del., invented *blasting powder* which differs from gunpowder chiefly in that Chile saltpeter is used in place of India saltpeter. Though cruder materials are used and less care is taken the methods pursued for its manufacture are in general similar to those used for gunpowder.

Charles E. Munroe,
The Columbian University, Washington, D. C.

Gunpowder Plot, a famous conspiracy formed in England in 1604 by Robert Catesby, and a small band of other Roman Catholics, who, goaded into excitement by the penal laws directed against their faith and its professors, aimed to blow up the Houses of Parliament by gunpowder 5 Nov. 1605. An anonymous letter of warning, sent to Lord Monteagle, led to the discovery of the plot, and the various conspirators were arrested and executed. Among those put to death was Guy Fawkes, who had been caught in the vault below the House of Lords with matches ready to fire the train. Since 1605 all places connected with the Houses of Lords and Commons where explosives could be stowed away are annually searched at the opening of Parliament.

Gunsaulus, gŭn-sâ'lŭs, **Frank Wakeley**, American clergyman and educator: b. Chesterville, Ohio, 1 Jan. 1856. He was graduated at the Ohio Wesleyan University in 1875, was ordained to the Methodist ministry, but became a Congregationalist. He was pastor of Congregational Churches at Columbus, Ohio (1879–81), Newtonville, Mass. (1881–5), and Baltimore, Md. (1885–7). In 1887 he became pastor of Plymouth Church, Chicago, and from 1899 of the Central Church of that city. For some years he was also president of the Armour Institute of Technology, Chicago, resigning in 1901. He is well known as a platform lecturer, and has published: 'Monk and Knight' (1891); 'Phidias' (1893); 'Gladstone' (1898); 'The Man of Galilee' (1899), and other works.

Gunshot Wounds are wounds caused by missiles projected from firearms by the explosion of gunpowder, etc. Such wounds present great diversity of form, depending on the kind of missile. All show more or less contusion and laceration of the tissue, particularly beneath the surface. Of the two wounds usually caused, that of entrance and that of exit of the missile, the latter is usually the larger. Deflection of the missile from the straight line by hard tissue is common. Thus a ball striking the front of the chest may pass around the ribs, emerging at the back. Infection of the bullet itself, particularly when driven at high speed, is not common; and as the presence of a bullet in the body is not of itself dangerous, the error of much probing along the track is evident. A bullet readily located (the X-rays are now largely used for this purpose) is ordinarily extracted, and where signs of infection become evident the conversion of the punctured wound into a free large open wound is necessary.

Gun'ter, Archibald Clavering, American author: b. Liverpool, England, 25 Oct. 1847; d. New York, 23 Feb. 1907. He was a mining and civil engineer in the West from 1867 until 1875, when he became a stock broker at San Francisco. From 1878 he devoted himself to writing plays and novels. The best known of the former are: 'Courage'; 'Prince Karl'; and 'The Deacon's Daughter.' His works of fiction, sensational volumes, largely without literary merit, include: 'Mr. Barnes of New York' (1887); and 'Mr. Potter of Texas' (1888); both successfully dramatized; 'That Frenchman' (1889); 'Miss Nobody of Nowhere' (1890); 'Baron Montez of Panama and Paris' (1893); and 'Adrienne de Portalis' (1900).

Günther, gün'tĕr, **Siegmund**, German geographer and mathematician: b. Nuremberg 6 Feb. 1848. Educated at several German universities he became professor of geography in the School of Technology at Munich, in 1886. Among his many valuable professional works may be named 'Lehrbuch der Determinatentheorie' (1875); 'Parabolische Logarithmen und parabolische Trigonometrie' (1882); 'Die Meteorologie ihrem neuesten Standpunkt gemass dargestellt' (1889); 'Lehrbuch der physikalischen Geographie' (1891).

Gun'ton, George, American economist: b. Cambridgeshire, Eng., 8 Sept. 1845. He came to the United States in 1874, and until 1880 was a writer on economic subjects. He then turned his attention to sociological and economic work, and in 1890 became president of the Institute of Social Economics and editor of the 'Social Economist,' which in 1896 became 'Gunton's Magazine.' His publications include 'Wealth and Progress' (1887); 'Principles of Social Economics' (1891); 'Trusts and the Public' (1899).

Guntown, Battle of. After Gen. Forrest's capture of Fort Pillow, 12 April 1864, Gen. Sturgis was ordered to march from Memphis to intercept him, but before the expedition got fairly under way it was ascertained that Forrest had fallen back to northern Mississippi. On 1 June Sturgis started from White's Station, near Memphis, with about 5,500 infantry and artillery, under Col. McMillan, and 3,400 cavalry, under Gen. Grierson, to defeat Forrest and prevent his interference with Sherman's advance on Atlanta. Moving southward, Sturgis reached Ripley, 80 miles from Memphis, on the 8th, and on the 10th struck the Mobile & Ohio Railroad near Guntown, Miss., where Grierson, in advance with the cavalry, met Forrest's cavalry near Brice's Cross-roads, and became immediately engaged. Sturgis, who was six miles in rear with the infantry, moved on the double-quick, followed by a train of 250 wagons and, coming to where Grierson was engaged, without giving his exhausted men a moment's rest, and badly handling them, threw them into the fight. In three hours' time Forrest routed him, drove him from the field in confusion, captured prisoners, guns, and wagons, and closely pursued him to near Ripley. There, early in the morning of the 11th, his rear-guard, taking advantage of a small stream, after a sharp fight checked Forrest, and Sturgis continued his retreat to Memphis, having lost 23 officers and 594 men killed and wounded, 1,623 prisoners, 14 guns, and his entire train of 250 wagons, with 10 days' rations and a large supply of ammunition. Forrest's engaging force did not exceed 4,000 men; his loss was 492 killed and wounded. Consult: 'Official Records' Vol. XXXIX.

E. A. Carman.

Gur'don, Lady Eveline Camilla Wallop, English writer d. 1894. She was the second daughter of the fifth Earl of Portsmouth, and was married to Sir William Gurdon in 1888. Her contributions to periodicals were collected after her death in a volume entitled 'Suffolk Tales' (1896), in certain respects one of the most noteworthy English collections of short stories, both as regards style and sympathetic treatment.

Gurhwal, gŭr-wăl', India. See Garhwal.

Gurjun (gĕr'jŭn) **Balsam, or Wood Oil,** the juice or liquid of the *Dipteraceæ* which grow in the Andaman Islands. It resembles copaiba balsam, and has at various times been sold as such. Its chief use in the East is as a varnish for boats and for preventing the attacks of ants on timber. It was used for the checking and alleviating of leprosy by the late Father Damien among the lepers of Molokai, in Hawaii.

Gurkhas, goor'kaz. See Ghurkas.

Gurko, goor'kō, **Ossip Vladimirovitch,** Russian soldier: b. 15 Nov. 1828; d. 28 Jan. 1901. He took part as captain in the Crimean war and as lieutenant-general commanded the Russian advance-corps which at the beginning of the war with Turkey crossed the Danube and seized Tirnova (July 1877). In the same year he captured Gorny Dubnik and Telish, and on 15–17 Jan. 1878 defeated Suleiman Pasha at Philippopolis. He was governor-general of St. Petersburg in 1879–80, of Poland in 1883–94, and in 1894 was retired with field-marshal's rank. He was among the foremost Russian generals of recent times.

Gurnards, gĕr'nardz, a family of teleost fishes (*Triglidæ*) occurring in all warmer seas, resembling somewhat the sculpins in the rough spiny bones of the skull, but differing in having the body regularly scaled or covered with bony plates. The fantastic sea-robins (*Prionotus*) are common representatives on our coasts. Closely allied are the flying-gurnards (family *Cephalacanthidæ*) of the warmer seas, in which the pectoral fins are very long, enabling the fish to flutter a short distance in the air.

Gurney, gĕr'nĭ, Sir **Goldsworthy**, English inventor: b. Cornwall, England, 1793; d. 1875. He built a steam carriage in 1827, and was the first to devise and use the high-pressure steam-jet in locomotion. He invented the oxyhydrogen blow-pipe, and the Drummond light.

Gurney, Joseph John, English Quaker philanthropist: b. Earlham Hall, near Norwich, England, 2 Aug. 1788; d. there 4 Jan. 1847. He was a banker in Norwich and in 1818 became a preacher in the Society of Friends, and the same year accompanied his sister, Mrs. Elizabeth Fry (q.v.), on her tour to Scotland, having warmly taken up the benevolent cause to which she had devoted herself — the amelioration of the condition of prisoners. In 1827 the two made a journey to Ireland with the same object, and in 1837 Gurney visited the United States and Canada, where he was absent for nearly three years. He went with Mrs. Fry in 1841 to Holland, Belgium, and Germany, and in 1842–4 visited France and Switzerland. The object of these journeys was to reform prison management, and effect the abolition of slavery in the French colonies, for which purpose he had interviews with Louis Philippe and M. Guizot. He was the author of 'Notes on Prisons and Prison Discipline' (1819); 'Observations on the Religious Peculiarities of the Society of Friends' (1824); 'Essays on the Evidences, Doctrines, and Practical Operation of Christianity' (1827); 'Winter in the West Indies Described in Familiar Letters to Henry Clay of Kentucky' (1840).

Gurowski, goo-rŏf'skē, **Adam de,** Count, a Polish scholar and author: b. Kalisz 10 Sept.

1805; d. Washington, D. C., 4 May 1866. In early life he was a leading Polish patriot, and an instigator of the revolution of 1830. Later he became an advocate of Panslavism, and was employed in Russia. In 1841 he left the latter country and in 1849 came to the United States, and from 1861 to 1863 was a translator in the State Department at Washington. Among his works, several of which were written in French and German, are: 'Civilization and Russia' (1840); 'Panslavism' (1848); 'Russia as It Is' (1854); 'The Turkish Question' (1854); 'America and Europe' (1857); 'My Diary: Notes on the Civil War' (1862–6).

Gur'teen, Stephen Henry Villiers, American Protestant Episcopal clergyman and sociologist: b. near Canterbury, England, 9 June 1840; d. 1898. He was educated at Jesus College, Cambridge, and was ordained in 1875. He was professor of Latin at Hobart College, Geneva, N. Y., was successively rector of Trinity Church, Buffalo, and Trinity Church, Toledo, Ohio, and dean of St. Paul's Cathedral in Springfield, Ill. He interested himself in charity organization, and was instrumental in forming the Order of Associated Charities. He wrote: 'Phases of Charity' (1877): 'Provident Schemes' (1879); 'What is Charity Organization?' (1879); 'Handbook of Charity Organization' (1882); 'How Paupers are Made' (1883); 'Beginnings of Charity Organization in the United States' (1894).

Güssfeldt, Paul, powl güs'fĕlt, German explorer: b. Berlin 14 Oct. 1840. He studied science and mathematics between 1859 and 1865 in Heidelberg, Giessen, and Bonn. The German African Company sent him out on an expedition in 1872 to explore the Loango coast. He was shipwrecked near Freetown (14 Jan. 1873), and landed at the mouth of the Kongo. He has given an account of this expedition in the work 'The Loango Expedition' (1879), which he wrote in collaboration with his fellow travelers Falkenstein and Pechuel-Loesche. In 1876 he explored the Arabian Desert, and in September 1882 he visited South America. Among the Andes he discovered a vast area of glaciers, in lon. 34° 30' S. He climbed the highest peak of the volcanic range of the Andes (21 Feb. 1882) and reached the edge of the crater of Maipó, and during April and May of the same year explored the lofty plateaus of Bolivia. He has published 'In den Hochalpen' (1893); 'Reise in den Anden von Chile und Argentinien' (1887); 'Der Mont Blanc' (1894).

Gustavus (gŭs-tā'vŭs) **I.** (commonly called Gustavus Vasa), king of Sweden: b. Lindholmen 12 May 1496; d. Stockholm 29 Sept. 1560. He studied at the University of Upsala, and entered the service of Sten Sture the younger, administrator of the kingdom, in 1514. Sweden had, by the union of Calmar, become subject with Norway to the crown of Denmark. The country was at this time divided into two parties. There was a Danish party headed by the Archbishop of Upsala, and a Swedish party, which upheld the independence of the country, headed by the administrator whom it had raised to power. Gustavus fought with distinction under Sture against the Danes in 1517 and 1518. He was one of six hostages sent by Sture as guarantee of the safety of King Christian II., but effected his escape, and reached Lübeck in 1519. After wandering about for some time as a proscribed fugitive he took refuge in the mines of Dalecarlia, where he worked as a common laborer. After various adventures he attempted open resistance. Christian II. was crowned at Stockholm on 4 Nov. 1520. On the 8th the leaders of the Swedish party, among whom was Gustavus' father, were executed. By the beginning of 1521 Gustavus had raised a considerable force, driven the Danes from several positions, and excited a general insurrection in Dalecarlia. In April he defeated the Danes at Westeraas; in July he seized Upsala, and in August was named administrator of the kingdom by the states which had assembled at Wadstena. On 6 June 1523 he was elected king by the Diet of Strengnäs. In 1527 he obtained the exclusion of the bishops from the senate, and their subjection to the civil power. He now openly professed Lutheranism, and was crowned by a Protestant archbishop of Upsala on 12 Jan. 1528. The Lutheran religion was formally established at a diet held at Orebro in 1529. In 1544 the states assembled at Westeraas declared the kingdom hereditary in his house. A war broke out with Russia in 1555, which was concluded by the Peace of Moscow, 2 April 1557.

Gustavus II. (Gustavus Adolphus), king of Sweden, grandson of Gustavus Vasa: b. Stockholm 9 Dec. 1594; d. Lützen, Saxony, 16 Nov. 1632. He was trained to war under experienced generals, and at 16 took his place in the state council. Charles IX., the father of Gustavus, had been declared king to the exclusion of his nephew Sigismund, who, on accepting the crown of Poland during his father's lifetime, had abjured the Protestant religion. On the death of Charles, Gustavus succeeded him, with the consent of the states, as king-elect. Sweden was at this time at war with Denmark, and Gustavus was in command of the army. He chose for his chancellor and first councillor Axel Oxenstiern, a man 10 years his senior, and already eminent for his ability, who eventually proved himself to be one of the greatest of European statesmen. The war with Denmark was concluded through the mediation of England in 1613. A new enterprise at this time presented itself to the ambition of Gustavus — the throne of Russia was vacant and contested. A party favored the election of Charles Philip, the brother of Gustavus, and was supported by a Swedish invasion under Gen. de la Gardie, who had penetrated to Novgorod; while the Poles, who had also invaded Russia, had reached Moscow. Michael Romanoff was, however, elected czar. Gustavus took a personal share in the Russian war, which continued for about four years after this election, and had made considerable conquests in Livonia and the neighboring provinces when peace was concluded at Stolbova in 1617. In 1620 he married Eleanora, sister of the elector of Brandenburg. The war with Russia was followed by war with Poland, which lasted nine years, and was concluded on advantageous terms for Gustavus by a six years' truce in September 1629. He had made important conquests, which he was allowed to retain, in East Prussia.

His attention was now diverted from northern wars by the affairs of Germany. The oppression of the Protestants by Ferdinand II.

excited his sympathy. He was alarmed by the progress of Wallenstein, which threatened to extend the empire to the Baltic, and by leaguing himself with the Protestants of Germany he might hope for easier and more extensive conquests than by struggling single-handed against the northern powers. He named his daughter Christina heiress to the throne, embarked for Germany in May 1630, and landed with an army of 13,000 men in the island of Usedom on the coast of Pomerania. (See THIRTY YEARS' WAR.) After repeatedly defeating the imperial generals, and conquering a great part of Germany, he was killed in the battle of Lützen. Gustavus differed from some other great commanders in preferring a small well-ordered army to a large one, asserting that all over 40,000 men were an encumbrance. His character made him beloved by his soldiers, and he was served with a devotion which enabled him to effect great things with small means. The discipline he imparted to the Swedish army, and the prestige of success derived from his victories, lasted long after his death. His body was taken to Sweden. See Droysen, 'Gustav Adolf' (1879); Stevens, 'History of Gustavus Adolphus' (1885); Fletcher, 'Gustavus Adolphus' (1891); Dodge, 'Gustavus Adolphus' (1890).

Gustavus III., king of Sweden: b. Stockholm 24 Jan. 1746; d. there 29 March 1792. He was the eldest son of Adolphus Frederick, duke of Holstein, who had been called to the Swedish crown in 1743, and succeeded his father on 12 Feb. 1771. He found the country divided between two aristocratic factions, the adherents of France and Russia, known respectively as the Hats and Caps. He resolved to give the country a new constitution, and to increase the power of the crown. He instituted a new military order of Vasa, in order to gain the goodwill of the officers; and effected his purpose by means of a sham revolt, which enabled him to assemble troops, wherewith he surrounded the assembly of the states-general, and forced them to accept his constitution, which, as it only circumscribed the privileges of the nobility, was generally popular. In 1788, when war had broken out with Russia, the nobles revenged themselves by inducing the states-general to refuse himself supplies. The fidelity of the Dalecarlians enabled him to repulse the enemy. To free himself from the hostility of the nobles he determined on another coup d'état, which he executed on 3 April 1789, by causing the leaders of the opposition to be arrested, and then passing a law extending the royal prerogative. He concluded peace with Russia by the Treaty of Varela in August 1790. The Swedes were opposed to an alliance with Russia, and a diet which Gustavus assembled at Gefle for the purpose of procuring supplies, though surrounded with troops, proved so refractory that he was obliged to dismiss it. The nobles long before this had formed a conspiracy against him, and resolved on his death. Three of them took an oath to murder him, and drew lots which should carry out their intention. The lot fell on Captain Ankarström, who shot the king in the back at a masquerade given at the opera house at Stockholm, 16 March 1792. See Bain, 'Gustavus III. and his Contemporaries' (1895).

Gustavus IV., Adolphus, king of Sweden: b. 1 Nov. 1778; d. Saint Gall, Switzerland, 7 Feb. 1837. He succeeded on the death of his father, Gustavus III., and, on assuming power, showed that he had inherited his father's hatred of the principles of the French revolution, which he carried to the extent of fanaticism. In 1803 he made a journey to Germany to promote a union of the German princes against Napoleon. He was at Karlsruhe when the Duke D'Enghien was seized, and sent his aide-de-camp to Paris to protest against that act of violence. After the Peace of Tilsit he exposed himself to a war with Russia while he was at war with France, by refusing to join the continental blockade and opening his ports to England; and in 1808 he quarreled with England, his only ally. His internal policy was as bad as his external. His subjects were oppressed with taxes to support his wars, and had in return the humiliation of finding Pomerania in the possession of France, and Finland in that of Russia. A conspiracy was formed against him; he was deposed, and the diet by a decree of 10 May 1809 declared his family forever incapable of succeeding to the crown of Sweden. His uncle, the duke of Sudermania, was proclaimed king, under the title of Charles XIII., and in the following year adopted as his successor, Bernadotte, prince of Ponte Corvo. Gustavus died in poverty. He took the title of Colonel Gustafson, and has left, among other writings, 'Memoirs of Colonel Gustafson' (1823). See Kleinschmidt, 'Die Irrfahrten Gustavus IV. Adolf von Schweden' (1888).

Gutenberg, goo'tĕn-bĕrg, **Johannes or Henne**, German inventor of printing with movable types: b. Mainz about 1400; d. there 23 Feb. 1468. Little or nothing is known of his early life. In 1434 he was living in Strasburg, and in 1439 entered into a contract with one Andreas Dryzehn or Dritzehn and others, binding himself to teach them all his secret and wonderful arts, and to employ them for their common advantage. The death of Dryzehn, which happened about the end of 1438, broke off the undertaking of the company. About 1448 he returned to Mainz, and soon formed a copartnership with Johann Fust or Faust, a rich goldsmith who furnished money to establish a press, in which the Latin Bible was first printed. This, the Mazarin Bible, begun about 1450 and finished about 1455, is the first book known to have been printed with movable types. After some years this connection was dissolved. Fust had made large advances, which Gutenberg was now called upon to repay; and as he either could not or would not do it, the subject was carried before the tribunals. The result was that Fust retained the press, which he improved, and continued to use in company with Peter Schöffer of Gernsheim. By the patronage of a counsellor of Mainz, Conrad Hummer, Gutenberg was again enabled to establish a press the following year, from which there issued the fine 'Catholicon' of 1460, and also the 'Letters of Indulgence' of 1454 and 1455. Gutenberg's name does not appear in any production of his press, nor do any of his friends and patrons mention him in connection with the invention of printing. See Van der Linde, 'Gutenberg' (1878), and 'Geschichte der Erfindung der Buchdruckerkunst' (1886); Hessels, 'Gutenberg: Was He the Inventor of Printing?' (1882); 'Haarlem the Birthplace of

Printing, not Mentz' (1887); Gordon Duff, 'Early Printed Books' (1893).

Guthrie, Thomas, Scottish clergyman and philanthropist: b. Brechin, Forfarshire, 12 July 1803; d. Saint Leonard's, Sussex, 24 Feb. 1873. He was educated at the University of Edinburgh, and was licensed as a preacher in connection with the Church of Scotland in 1825. He accepted a call to Greyfriars, Edinburgh, in 1837, where he soon became very popular with all classes. In 1843 the Disruption took place, and Guthrie was active with Chalmers and Candlish in organizing the Free Church, becoming minister of Free St. John's, Edinburgh. The work with which his name is chiefly identified out of Scotland, was the establishment of ragged schools, of which he was the earliest advocate. He was widely known for his gifts as an orator, and on retiring from the ministry in 1864 was editor of 'The Sunday Magazine' till his death. Among his published works are: 'The Gospel in Ezekiel' (1855); 'A Plea for Ragged Schools' (1847); 'The City: its Sins and Sorrows' (1857); 'Autobiography' (1874-5). See Smeaton 'Thomas Guthrie' (1900).

Guthrie, Thomas Anstey ("F. Anstey"), English humorist: b. Kensington, London, 8 Aug. 1856. He was graduated from Cambridge in 1875, and called to the bar in 1880, but never practised and has devoted himself to authorship, his books having been extremely popular both at home and in the United States. He is the author of 'Vice Versa' (1882); 'The Giant's Robe' (1883); 'The Black Poodle' (1884); 'The Tinted Venus' (1885); 'A Fallen Idol' (1886); 'The Pariah' (1889); 'Tourmalin's Time Cheques' (1890); 'Voces Populi' (1890); 'Mr. Punch's Pocket Ibsen' (1893); 'Puppets at Large' (1897); 'Love Among the Lions' (1898); 'The Brass Bottle' (1900); 'A Bayard From Bengal' (1902); etc.

Guthrie, William Norman, American Episcopal clergyman and author: b. Dundee, Scotland, 4 March 1868. He was graduated from the University of the South in 1889 and was professor of modern languages there 1889-90, and at Kenyon College, Ohio, 1892-3. He entered the Episcopal ministry in 1893, and has since been rector of several Cincinnati churches. He has published: 'Love Conquereth' (1890); 'Modern Poet Prophets: Essays Critical and Interpretative' (1897); 'Songs of American Destiny' (1900).

Guthrie, Okla., the capital of the Territory of Oklahoma and the county-seat of Logan County, on the Cottonwood River and on the Atchison, Topeka & Santa Fe, the Chicago, Rock Island & Pacific, the Oklahoma Eastern, the Missouri, Kansas and Texas, the Fort Smith & Western, Denver, Enid & Gulf, and the St. Louis, El Reno & Southern Rys.

Industries, Etc.— Guthrie has a very large trade, and is especially noted as a wholesale distributing centre. It has planing, flour and cotton-seed oil mills, furniture and carriage factories, a foundry and machine shops, a broom works, a plow factory, creamery, railroad repair shops, novelty works, book bindery, etc.

Buildings, Educational Institutions, Etc.— Guthrie's chief buildings are the capital, Federal court and post-office building, the city hall, the Scottish Rite temple, Carnegie Library, and the Federal prison. The Carnegie Library (costing $25,000) is a noteworthy institution. The city possesses an excellent public school system, including a high school, Saint Joseph's Academy, and many private schools add to the city's educational facilities. A $50,000 county high school has just been built, and the Capitol University is located on a height overlooking the city on the west.

Government.— The city is governed by a mayor and a council of ten members elected biennially. The chief of police and all other city officers are chosen by the people. The city has electric lighting and owns and operates its own water-works, has several miles of paved streets, large gas plant and work has begun on a street railway.

History.— Guthrie dates its existence from the opening of the territory in 1889, and it was made the capital city one year later, in 1890. The city has had a rapid development and has had a rival in Oklahoma City, about 30 miles south. Pop. (Federal census of 1900) 10,006; (territorial census of 1904) 23,000.

Gut'ta Per'cha, a substance which has been known generally and used in Western countries only since about 1845, though travelers and residents in the East were acquainted with it long before, and had seen various articles made of it, but without knowing the nature of the material. It is the inspissated milky juice of several large trees belonging to the order *Sapotaceæ*, the principal being *Isonandra gutta*, and is obtained by felling the large and old trees, cutting off rings of bark at intervals along the stem, collecting the juice which issues, and concentrating by evaporation, if necessary. The result of this terribly wasteful process is, that the gutta percha tree has been exterminated from various districts in which it was formerly abundant. The tree is found in the Malayan peninsula, and in some of the neighboring islands, in great numbers and of very large size; but if these trees be also cut down, instead of the juice being tapped by incisions (a method which has now come into use), gutta percha will become one of the rarest of substances.

The crude substance is gray or reddish, and is mixed with fragments of bark, leaves, and other impurities, from which it is separated by washing with cold and then with warm water. This softens the gutta percha, and the impurities can be easily picked out. When pure it has a brown color; at the ordinary temperature it is hard and tough, and in not too thick pieces is flexible like leather. It is elastic only to a very slight extent, and cannot be beaten out. It has little or no adhesion for other bodies, but its own cohesiveness is remarkable, a thin strip of it bearing a very considerable weight. When warmed it gradually softens, and then can be drawn into fine fibres, rolled into sheets, or molded. For the latter purpose it is admirably adapted, as when warm and soft it takes the finest impressions, which it retains after it has become cold and hard. When heated to a sufficiently high temperature in the air it catches fire, and burns with a bright flame; heated in close vessels it gives off oily hydrocarbons and an acid liquor, so that gutta percha seems to consist mainly of carbon and hydrogen, with some oxygen, while nitrogen is absent, or present only in very minute quantities. Attempts have been made to resolve gutta percha into proximate constituents, and accordingly three substances extracted from it have been described. These are named respectively gutta, which is the chief constituent, and when pure is white and opaque; alban, a white oxygenated crystalline substance; and fluavil, also oxygenated, and of a yellow color. These two are said to be formed from the first by oxidation, but there is a considerable diversity of opinion on the nature of these bodies. Ordinary gutta percha is insoluble in water, partially in alcohol and ether, readily and completely in chloroform, turpentine, benzol, bisulphide of carbon, and naphtha. It is also dissolved to a slight extent by oils. It is not attacked by solutions of alkalies, nor by hydrofluoric acid; but it is acted on by sulphuric, nitric, and hydrochloric acids — being darkened in color, oxidized, rendered brittle, or altogether disintegrated — and by chlorine, which transforms it into a white substance like ivory. It is also affected by the oxygen of the air, especially in light, becoming brittle, resinous, and acid; it combines with sulphur and, like caoutchouc, can be vulcanized. Gutta percha is employed for a great variety of purposes, especially for insulating electric wires, being invaluable for submarine telegraph cables because, as a natural insulator of electricity, it is not affected by water, is very pliant, and forms a uniform and close-fitting coating to the wires. It is much prized for making certain kinds of surgical instruments, and in sheets for surgical dressing, and is used for making water-pipes and tubes of various kinds, hose, machine-belting, soles for shoes, golf-balls, overshoes, buckets, picture-frames, and many other articles in general use.

Guy, Thomas, English philanthropist: founder of Guy's Hospital, London: b. about 1645; d. December 1724. His principal income arose from the disreputable purchase of seamen's prize tickets in Queen Anne's war, and from his dealings in South Sea stock in 1720. By these speculations, aided by most penurious habits, he amassed a fortune of nearly half a million pounds sterling, of which he spent upward of $1,000,000 in building and endowing his hospital in Southwark. He also erected almshouses at Tamworth, furnished three wards of St. Thomas' Hospital, and benefited Christ's Hospital and various other charities. He was member of Parliament for Tamworth 1694–1707.

Guy Mannering, a novel by Sir Walter Scott. It was the second of his novels, appearing anonymously in 1815, seven months after 'Waverley.' It is said to have been the result of six weeks' work, and by some critics is thought to show the marks of haste. Its time is the middle of the 18th century, its scene chiefly Scotland. There are fewer than two-score characters in 'Guy Mannering,' and the plot is not very complicated. Meg Merrilies, and Dominie Sampson, the uncouth, honest pedant, are the only great creations it contains.

Guy of Warwick, a metrical romance belonging to that Anglo-Danish cycle from which the Norman trouvères drew so much material. The earliest existing manuscripts of this romance are in French; though it is supposed to have been written by Walter of Exeter, a Cornish Franciscan. It consists of about 12,000 verses, iambic measure, arranged in rhymed couplets.

Guyon, Jeanne-Marie Bouvier de la Motte, zhän mä-rē boo-vē-ā dē la mōt gē-ōn, Madame, French mystic: the introducer in France of the system of Quietism, b. Montargis 13 April 1648; d. Blois 9 June 1717. At the age of 16 she was married to Jacques Guyon, after whose death in 1676 the tendency to mystic enthusiasm which had characterized her younger years again acquired ascendency. She published numerous works, such as 'Le Cantique des Cantiques interprété selon le Sens Mystique' (1685); 'Poésies Spirituelles' (1685); 'Discours Chrétiens et Spirituels' (1716); etc. At last the archbishop of Paris thought it necessary to take steps against the spread of Madame Guyon's mystical doctrines, and through his influence she was shut up in the convent of the Visitation, but afterward released at the instigation of Madame Maintenon, who herself became for a time a convert to the new doctrines, and allowed Madame Guyon to preach in the seminary of St. Cyr, where she made a convert and disciple of Fenelon. A commission of ecclesiastics, chief among whom was Bossuet, now sat in judgment, and the doctrines of Madame Guyon were condemned (1695). This led to her being imprisoned for some years, latterly in the Bastille, whence she was liberated in 1702. The rest of her life was spent in retirement and in works of charity. See Upham, 'Life, Religious Opinions, and Experiences of Madame Guyon' (1870); Guerrier, 'Madame Guyon, sa vie, sa doctrine, son influence' (1881).

Guyot, gē-ō, **Arnold**, American geographer: b. near Neuchâtel, Switzerland, 28 Sept. 1807; d. Princeton, N. J., 8 Feb. 1884. He studied theology at Neuchâtel and Berlin; but later turned his attention to natural science, and in 1835 took the degree of doctor in the University of Berlin. He then went to Paris, where he resided five years, passing the summers in scientific excursions through France, Belgium, Holland, and Italy, examining the characteristic physical features of those countries. In a tour of Switzerland, in 1838, he ascertained and announced in a communication to the Geological Society of France several of the most important laws concerning glaciers. He first discovered the laminated structure of the ice, and showed that the motion of the glacier is due to the displacement of its molecules. These discoveries were fully confirmed and illustrated by the investigations of Agassiz, Forbes, and others. He next investigated the distribution of erratic boulders, in order to solve the question of the mode of their transportation. During seven summers he traced them on both sides of the central Alps, in Switzerland and Italy. Their vertical limits and the laws of their descent were determined by means of more than 3,000 barometrical observations; and the characteristic species of rock of each basin were tracked step by step to their source, often in the midst of the highest regions of ice and snow. A collection of more than 6,000 specimens of rocks was made as vouchers for the results. The full details of these investigations were announced to form the second volume of the 'Système glaciaire' by Agassiz, Guyot, and Desor, the first volume of which was printed in

Paris in 1848; but the political disturbances of that epoch and the removal of Guyot to the United States prevented its publication. The main results, however, are to be found in the 'Bulletin de la Société des Sciences Naturelles de Neuchâtel,' and in D'Archiac's 'Histoire de la Géologie'; and have since passed into various scientific manuals. In the College of Neuchâtel, which numbered Agassiz among its professors, Guyot occupied, from 1839 to 1848, the chair of history and physical geography. In the latter year a political revolution in Neuchâtel broke up the institution, and he was induced by Agassiz to remove to the United States. He resided for several years at Cambridge, Mass., occupying himself with the study of the physical geography of the American continent, and first became extensively known in this country by a course of lectures delivered in Boston in the winter of 1848–9 in the French language, on the relations between physical geography and history. These were translated and afterward collected into a volume entitled 'Earth and Man' (1849). The work had a large circulation in the United States, where it was extensively used as a text-book. For several years Guyot was employed by the Massachusetts board of education to deliver lectures in the normal schools of the State and before teachers' institutes, and in this way, addressing annually 1,200 or 1,500 teachers, he exercised an important influence in reforming the method of teaching geography. From 1855 until his death he was professor of geology and physical geography at Princeton. His meteorological observations, undertaken for the government, were the basis of the present United States weather bureau. Among his further works are 'Treatise on Physical Geography' (1873); 'A Memoir of Agassiz' (1883); and 'Creation, or the Bible Cosmogony in the Light of Modern Science' (1884).

Guyot, Yves, ēv, French publicist: b. Dinan, France, 6 Sept. 1848. He began his studies at Rennes, and early interested himself in social and economic problems of international importance. He took part in the revolution of 4 Sept. 1870, which, after the surrender of Sedan, established the third Republic. He is an ardent reformer, but not a socialist, a free-trader and member of the Cobden Club. In 1885 he was elected to the French Parliament, and in 1889 made minister of public works. He has for years been editor of the *Siècle*, a Liberal paper of a staid, old-fashioned style. He took a prominent part in the defense of Dreyfus, and waged a successful war for the abolition of the continental sugar bounties. Among his writings may be noted 'La Tyrannie Socialiste' (1893); 'Les Principes de '89 et le Socialisme' (1894); 'L'Economie de l'Effort' (1896); 'Le Bilan de l'Eglise' (1901); and 'La Question des Sucres' (1901).

Guzerat, gŭz-ĕ-rät'. See GUJARAT.

Guzman Blanco, Antonio. See BLANCO, ANTONIO GUZMAN.

Gwin'nett, Button, American patriot, one of the signers of the Declaration of Independence: b. England about 1732; d. Georgia 27 May 1777. He emigrated from Bristol to America in 1770, purchased a tract of land on St. Catharine's island, Georgia, and devoted himself to agriculture. He became conspicuous in 1775 by his maintenance of the colonial rights, was elected a representative to Congress in Feb. 1776, and re-elected for the following year, and in 1777 became president of the provincial council, the highest station in Georgia. He planned a military expedition against East Florida, which he refused to entrust to his rival Gen. McIntosh, whose official rank entitled him to command it, and which resulted disastrously. This event, aggravated by other disturbances, led to a duel between him and McIntosh, in which he was mortally wounded. See Dwight, 'Lives of the Signers' (1895).

Gwynn, Eleanor, commonly Nell Gwynn, English actress: b. Hereford, England, 1650; d. London 1687. She was at first an orange girl, and also gained her bread by singing from tavern to tavern. She became the mistress of Hart and Lacy, the actors, before going in her 16th year upon the stage, where she distinguished herself in light comedy. About 1667 she became the mistress of Lord Buckhurst, who surrendered her to the king. She caused much embarrassment to the Duchess of Portsmouth, who deemed herself too refined for such a rival. It is said that in her elevation she showed her gratitude to Dryden, who had patronized her in her poverty; and, unlike the other mistresses, was faithful to her royal lover. From her are sprung the dukes of St. Albans.

Gymkhana, jĭm-kä'na, a term of Hindu origin, presumably derived from *gend-khana*, that is, ball-house, and associated by Anglo-Indian soldiers and civilians with "gym" or gymnasium, whence its introduction into the English language. It is applied to a building or grounds arranged for athletic recreation, and signifies also the open air meetings for athletic and other mixed sporting events, including horse racing, which are the annual features of almost every military cantonment throughout India.

Gymnastics, History of. The development of gymnastics began in an early period of Grecian and Roman history. Systematic exercise received the stamp of approbation from the most eminent educators of ancient times, and has the endorsement of all teachers to-day. Such exercise has had its periods of decline in popularity, due to the development of professionalism, stimulated by the conferring of extravagant honors and rewards which caused the ranks of the athletes to be filled by a professional class of low extraction, who made their art a trade. But through these periods of decline there have been those who have kept in mind the true value and aim of regularly and systematically conducted exercise; and these advocates have outlived and lived down these evils. So that we find that the scientifically conducted gymnastics have never entirely lost their hold upon educators and those interested in the betterment of mankind.

Modern gymnastics differ considerably from the exercises of the ancients, which at first consisted of athletic feats performed by each individual according to his own notion, and were encouraged among the youth as combining amusement with exercise. They were at length reduced to a system which, in Greece, formed a prominent feature in the state regulations for education. In fact the period for gymnastics was equal to the time spent on art and music combined. Public games were consecrated to the gods, and were conducted with the greatest ceremony. The earliest mention we can find of gymnastic sports is in Homer's 'Iliad,' Book II., and again in Book XXIII., when Achilles instituted games in honor of Patroclus, and distributed prizes to the victors for boxing and wrestling. Plato tells us that just before the time of Hippocrates gymnastics were made a part of medical study, because they were suited to counteract the effects of indolence and luxurious feeding, and that at length they became a state matter reduced to a system and superintended by state officers. The first public gymnasia were built by the Lacedæmonians. These were imitated at Athens, where, in one called the Academy, Plato instructed his pupils, and in another, the Lyceum, Aristotle taught. These buildings were superintended by a chief officer. The athletics were in charge of a director, and medical officers were in attendance to prescribe the kind and extent of exercise. Baths were attached to the gymnasia, and a hot bath, followed by a cold plunge, was recommended. Plato and Aristotle considered that no republic could be deemed perfect in which gymnasia, as part of the national establishment, were neglected.

The Spartans were the most rigid in exacting for their youth a gymnastic training; even the girls were expected to be good gymnasts. The exercises for pupils in the gymnasia consisted of a sort of tumbling, war-dances, running — for both sexes — leaping, climbing ropes; of jumping or springing from the knees, with weights attached to the body, maintaining the equilibrium while jumping on slippery skins filled with wine; and of wrestling for the throw. Riding, driving, swimming, rowing, and swinging supplemented the indoor work.

During the Middle Ages the knightly amusement of the tournament absorbed nearly every other sport except foot-racing and wrestling, so that gymnastics fell into disuse till Basedow (q.v.) in 1776, at his institution in Dessau, united bodily exercises with other instruction. This example was followed by Salzmann at his institute and, from this small commencement, the practice gradually extended. In the latter part of the 17th century gymnastics were extensively introduced into Prussian schools by Guts Muths, who wrote several works on the subject. In 1810 the system was still more widely spread by Jahn, who is regarded as the founder of the present Turnverein (q.v.). Prussia at that time was impatient under Napoleonic rule, and Jahn conceived the idea of bringing together the young men for the practice of gymnastic exercises, and, at the same time, indoctrinating them with patriotic sentiments which might be made available to expel the French from Germany. The Prussian government favored the plan, and, in 1811, a public gymnastic school, or Turnplatz, was opened at Berlin, and was quickly imitated all over the country. In 1813 the citizens were called to arms against the French, and Jahn himself commanded a battalion of Lutzow's volunteers. When, however, there was no longer any reason to dread the French, the government of Prussia, regarding the meeting of patriotic young men as a means of spreading liberal ideas, closed the gymnastic schools and Jahn was imprisoned. In other countries, however, the system introduced by Jahn was eminently successful, especially in England, Switzerland, Portugal, and Denmark. It was first introduced into female education under the name of calisthenics when systematic exercises were added to hoop-trundling, skipping-ropes, etc., and to riding, archery, and other healthy outdoor exercises practised among the women.

The masculine sports of cricket, football, quoits, boxing, wrestling, leaping, foot-racing, etc., have been for centuries enjoyed by the boys of England in the playgrounds attached to the schools. In 1848 the political condition of Europe enabled the Turnvereine to be reorganized and the German emigration to the United States has brought these institutions with it. The first society was formed in New York. The organization, as first established, was confined to the practice of bodily exercises; but soon assumed a higher scope. Libraries were collected, schools established, a newspaper ('Turnzeitung') founded; and various arrangements were made for the diffusion of useful knowledge, and for mental culture as well as physical training. Much credit must be given to Ling for his efforts to develop educational gymnastics. He has many followers, and his publication on 'Educational and Curative Gymnastics' has much merit. Ling has been severely criticised by English writers for his claims to originality. They go so far as to say that he simply used the works of authors of his time and of an earlier period, and took his *holus-bolus* from Dr. Francis Fuller in the 'Medicina Gymnastica.' The first edition was published in 1728, and it ran through eight others. It is also claimed that he borrowed in its entirety without acknowledgment, the work of one John Pough, 'A Physiological, Theoretic, and Practical Treatise on the Utility of the Science of Muscular Exercise for Restoring the Power of the Limbs,' with such materials and German gymnastics as had previously found their way through Denmark and Sweden. Through the exertions of such men as Salzmann, Jahn, and others, together with certain English authorities as, Fuller, Pough, Croft, Chas. Thomas and John Graham it was not difficult to establish a system. In fact Salzmann's gymnastics for youth needs only what Pough supplies to give all that Ling calls his system which is only adapted to beginners. The quality of the Ling exercises is stilted, and there is little scope for variety. The fact is, the system sticks too closely to automatic movements, which undoubtedly produce precise and studied monotony in drill.

Turning now to the Dio Lewis period, we see that it marks an epoch in the introduction of an American system of physical training formed in a small measure upon the Swedish and largely upon the German system. This system incorporated free-arm exercises, the use of dumbbells, clubs, rings, wands, together with what was then called the Pangymnastikon, but which was nothing more or less than a pair of flying rings equipped with a pair of detachable stirrups from which swinging, jumping, and stretching exercises were performed. Dio Lewis' work took up the matter of the school-desk, criticised the faulty position of the ordi-

SWISS GYMNASTS, AT BERN,

nary desk, and the poor school-room ventilation. In 1861 the Normal Institute for Physical Education was incorporated and located in Boston. Its directors included many of the most distinguished educators of New England, and its departments of anatomy, physiology, and hygiene were in charge of able teachers. Dr. Dio Lewis gave the work in gymnastics. The aim of the institute was and is to furnish competent advocates and teachers of physical training.

Next follows the work of Dr. Sargent, with his American system of gymnastics. Dr. Sargent was born in Maine. He was fond of all kinds of outdoor sports and physical exercise, and joined a gymnasium club while attending high school; but as he had to work out of school hours to support his family, he could only attend to his exercising at odd moments as time permitted. On one occasion he broke a piece of apparatus and was expelled from the club. Piqued and aroused, he improvised an apparatus of his own in a barn. Shortly afterward the club gave a display and, after the members had finished, Sargent and a friend came forward and easily surpassed the athletic feats performed by the others. This event is said to have been the direct cause that led Dudley Sargent to become an ardent physical educator. He was graduated from high school in 1867, was invited to become teacher of gymnastics in Bowdoin College in 1869, and entered the college as a freshman in the regular course and conducted the physical work. In an endeavor to arouse the faculty and the public to the necessity for physical training, he was successful to the exent that, in 1871, gymnastics became a part of the regular curriculum, and Mr. Sargent, though a student only 22 years of age, was placed at the head of the department, and filled the position with credit. About this time he brought out his system of chest-weights. In 1872 he accepted a position as director of the Yale College gymnasium, and for three years had charge of both Yale and Bowdoin, spending part time in each place. It was while at Yale that he fully developed the "individual apparatus" for which he is so well known. At the solicitation of friends he went to New York and started a gymnasium on Fifth Avenue, which at once sprang into popularity. In 1879 he accepted the appointment of director of the Hemenway Gymnasium and assistant professor of physical training at Harvard University. This promotion of the department of physical training to a rank equal to the scholastic departments of the university was a great stride forward, and stamped the new system with the mark of public approval. To Dr. Sargent is the credit due for the invention of the chest-weight, the intercostal machine, quarter-circles, leg and finger machine, and other appliances to the number of 30 or more. He also elaborated a system of anthropometric measurements which enable an examiner to ascertain at once the physical condition of a student, and which guided a director in prescribing proper exercises for the development of deficient parts. Dr. Sargent believes in special work for individuals, and will not allow a man or woman to go into the gymnasium and take the drills and work with the apparatus indiscriminately. Health, harmony, and symmetry are the results aimed at.

About the same time, physical training was taken up by and introduced into the Young Men's Christian Association, whose local gymnasia have done much to give the work a moral tone. We owe a great deal to such men as R. J. Roberts of Boston, whose name has been associated with the advancement of physical education since 1875, and whose dumb-bell drill and book of exercises has long been a standard in the association's work. The organization of the physical work under the auspices of the Y. M. C. A.'s has been practically responsible for the systematization of the American system of gymnastics, and for the establishment of a universal nomenclature of gymnastics. Among those who have done most for physical training along educational lines, I would mention Dr. Hartwell of Boston, Dr. Gulick of New York, and Dr. Seaver of Yale.

To-day, practically, all private schools have a well-equipped gymnasium under the direction of a man who has had special training in the application of exercise, the theory and practice of gymnastics, and who is, in many cases, a medical graduate. Systematic progressive courses of work are conducted, which aim to develop and strengthen, to give co-ordination and grace, and to make the individual self-reliant and resourceful. The equipment required to obtain this result is necessarily extensive, consisting of a gymnasium, say 50 x 100 feet, with clear floor space, high-vaulted roof, a fine system of ventilation, and with every variety of apparatus which the ingenuity of the specialists, and the energy and resourcefulness of the manufacturers, can provide. The equipment consists of light apparatus — dumb-bells, Indian clubs, bar-bells, wands; heavy apparatus — German horse, parallel bars (suspended and floor), horizontal bars (high and low), buck, flying rings, traveling rings, horizontal and vertical ladder, climbing ropes, rope ladders, spring-boards beat-boards, floor-mats, wrestling and tumbling mats, Swedish stahl bars, booms, serpentine ladder, and balance-beams; as well as special apparatus — chest-weights, intercostals, quarter-circle, chest-expander, traveling parallels, wrist-machine, long inclined plane, sculling-machine, paddling-machine, leg-machine, neck-machine, bicycle-trainer, and so on through an almost endless variety. No plant is complete without its swimming-tank, varying in size from 15 x 45 up; its shower-baths, needle-baths, tub-baths; and some have steam-rooms and massage-tables. An indoor running track is an almost indispensable adjunct to all well-equipped gymnasia; and there should also be the equipment for indoor athletics during the winter months. Provision for indoor games is also essential — basket-ball, baseball, and ring-hockey. Each school has adjacent athletic grounds with tennis-courts, quarter-mile track, football and baseball fields, and golf course. See Physical Culture.

The college physical departments surpass those of the preparatory schools only in size and extent of equipment. Harvard University probably excels all others in point of variety of equipment for special work. The summer work in the public parks and school playgrounds must also be noted. These out-of-door gymnasia are equipped with extensive apparatus for all outdoor work. Preparatory school work in gymnastics is, by general consent, made to consist of a system of corrective, body-building exercises, made up of free-arm work and light calisthenics in the lower grades, followed by heavier calisthenics, dumb-bells, clubs and wands, light apparatus, intermediate and advanced apparatus, boxing, wrestling, and fencing, interspersed with periods for recreative games, competitions, and contests of skill and strength.

J. MARTIN VOORHEES,
Director of Gymnasium, Pratt Institute, Brooklyn, N. Y.

Gymnophiona, jĭm-nō-fī'ō-na. See CÆCILIANS.

Gymnosperm, jĭm'nō-spėrm, a plant with a naked seed. Among the gymnosperms are the cycads, gingkos, conifers, and *Gnetaceæ*. The last group is represented by a single extraordinary tree or plant of West Africa (*Welwitschia mirabilis*), the stem of which, looking like a huge wood-fungus, may, when mature, be a little over a foot high but several feet across. It bears but two leaves, the cotyledons, which sometimes grow to be 5 or 6 feet long and 2 or 3 feet wide, ultimately splitting into strips. The plant is said to live over 100 years.

Gymnotus, jĭm-nō'tŭs. See ELECTRIC FISHES.

Gynæcology, in medicine and surgery, the science which treats of the physical organization of women and of the diseases peculiar to them.

Gyp, pseudonym of SIBYLLE GABRIELLE MARIE ANTOINETTE DE RIQUETTI DE MIRABEAU, COMTESSE DE MARTEL DE JANVILLE. See MARTEL DE JANVILLE.

Gypsophila, jĭp-sŏf'ĭ-la (BABY'S BREATH). A genus of European and Asiatic annual and perennial herbs of the natural order *Caryophyllaceæ*. They are highly valued and widely planted for their small flowers which, being upon branchy stems, give a pleasing effect to bouquets and a mist-like grace to flower-borders. They are of simplest culture upon somewhat dry soils, especially among rocks and in sunny situations. The perennial species are hardy. Six or more species and a few varieties are cultivated in American gardens and greenhouses.

Gyp'sum, a native hydrated sulphate of calcium, having the formula $CaSO_4 + 2H_2O$; the water of crystallization being the only thing that differentiates it, chemically, from the orthorhombic mineral anhydrite. Gypsum is usually colorless or white. It crystallizes in the monoclinic system, contact twins and penetration twins being very common; and it also occurs in massive forms. The pure crystals have a hardness of from 1.5 to 2.0, and a specific gravity of about 2.32. Gypsum is an exceedingly abundant substance, and is met with in many parts of the earth, and in a variety of forms. When found in the form of clear, transparent crystals, it is known as selenite; when the mineral is finely fibrous, and the fibres are parallel to one another so as to form a mass with a pearly opalescence, the mineral is called satin spar; when it occurs in uniform, fine-grained, translucent masses, it is known as alabaster; and when it occurs in large beds of massive rock, often mixed with clay, calcium carbonate, and other impurities, it constitutes the earthy gypsum, or rock gypsum, of commerce. Gypsum is soluble in from 400 to 500 parts of water at ordinary temperatures, but it dissolves more freely in hydrochloric acid. When heated, it loses part of its water of crystallization, though it retains the power of recombining with water to form a hard, non-crystalline mass, if the temperature to which it is exposed does not exceed 500° F. It is this property of recombining with water, which gives to dehydrated gypsum much of its industrial value. (See PLASTER OF PARIS.) When heated with charcoal, gypsum is converted into calcium sulphide, which dissolves readily in dilute acids, with evolution of sulphuretted hydrogen gas. In this way the sparingly soluble sulphate of calcium may be converted into the soluble chloride or nitrate of calcium. Gypsum, when pulverized, is used as a fertilizer, its efficiency in this respect being apparently due in large measure to the fact that it facilitates the decomposition of rocks containing alkaline silicates.

The production of gypsum in the United States, in 1901, was 1,246,649 short tons, valued at $1,577,493. Texas, Michigan, New York, and Iowa were the principal producing States. The United States ranks second in the world's production of gypsum, France being first, and Canada third.

Gypsy. See GIPSIES.

Gyra'tion, Radius of. The energy required to set a body in rotation in any given manner depends on the arrangement of the mass of matter to be rotated. Thus, a mass made into a ring like a wheel with very light spokes requires the expenditure of more energy in order to set it to rotate once per second on its axis than would be required if the same amount of matter were made into a uniform circular plate of the same radius. The energy required to set any given body in rotation about any given axis depends, in fact, on the "moment of inertia" of the given body about that axis; and the mass of the body being given, the moment of inertia depends on the way in which the mass is disposed about the axis of rotation. The radius of gyration about a given axis is the distance from that axis at which the whole of the matter of the given body might be concentrated without altering the moment of inertia. The moment of inertia and radius of gyration for any given body about any given axis may be calculated mathematically. The two magnitudes are evidently of great importance in the theory of rotating bodies.

Gyroscope, jī'rō-skōp, from the Greek *guros,* a circuit, *skōpéo,* I see. An instrument used in experimental physics for exemplifying the various properties of rotation and the composition of rotations. Its invention is ascribed to Jean Bernard Léon Foucault (1819-1868), whose famous experiments with pendulum and gyroscope proved and measured the diurnal motion of the earth. The application of the gyroscopic principle, however, was made many years previously to Foucault's experiments, and the instrument in some of its forms originated probably in Germany or France, towards the end of the 18th century. A form of the instrument is popular as a toy, in the familiar gyroscopic top. Since 1907 the gyroscopic principle has been adapted to the practical purposes of railroad transportation.

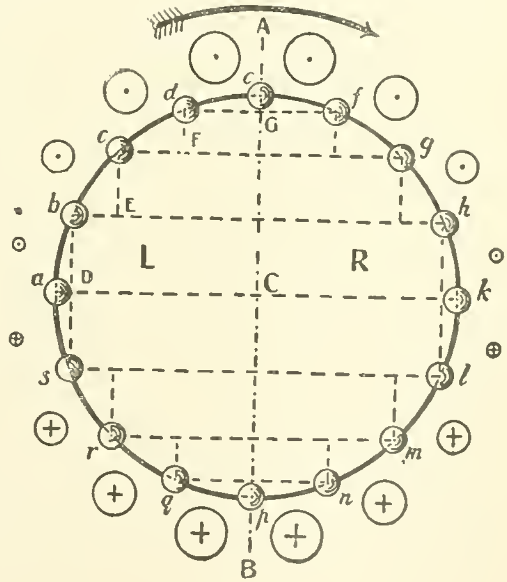
Freely supported on gimbals in a frame or in a box, the gyroscope consists of two interjointed wheels which revolve in opposite directions. As a rotating body will not alter the direction in which its permanent axis points, unless gravity intervenes, the action of gravity is eliminated by the opposing rotation within a rotation, of the central metallic disk, the middle point of whose axis constantly remains the centre of gravity of the machine. Upon this principle is explained the rotation of the earth on its axis, and the gyroscope thus affords a notable illustration of the harmony among physical laws. The gyroscope is so constructed that the axis of rotation can be made to point to some star in the sky. Then, as the heavy disk whirls round, it is found that the axis continues to point to the moving star, though, in consequence of this, apparently altering its direction relatively to bodies on the earth. If, again, the axis be pointed to the celestial pole, which is fixed, no alteration in its position relative to bodies on the earth takes place.

The following lucid and elementary exposition of the principles governing the action of the gyroscope is given by Dr. S. Tolver Preston in an article on 'The Mechanics of the Gyroscope' reproduced from *Technics* in the *Scientific American Supplement* of 8 Oct. 1904:

«According to the Newtonian system of dynamics (a system which is now universally recognized and accepted), the velocity of a particle can only be increased in any given direction by the application of a force acting in that direction; conversely, its velocity in a given direction can only be diminished by the application of a force acting in an opposite direction. The magnitude of the applied force is proportional to the rate of increase or decrease of the velocity of the particle.

Let us suppose that a series of equal heavy particles are arranged around the circumference of the circle in Fig. 1. These particles may be supposed to be rigidly connected one with another, the whole being connected by massless spokes, with an axle passing through *C*, the center of the circle; this axle being at right angles to the plane of the paper. This arrangement constitutes an ideal flywheel, and may be considered typical of an ordinary gyroscope disk.

Let the flywheel be set in rotation in the direction indicated by the arrow. The problem before us is to determine the nature of the forces which must be applied to the rotating flywheel in order to deviate the axis of rotation. Let us suppose that the flywheel, while still rotating about its axle, is constrained in addition to turn about the line *A B*, at right angles to the axle. Looking in the direction *A B*, let the flywheel turn about that line in a clockwise direction, so that the side *L* moves downward through the plane of the paper, while the side *R* moves upward through the same plane. The particles at *e* and *p* being, at the given instant, on the axis of rotation *A B*, will possess no velocity of rotation about that axis. So far as concerns other particles, their velocities of rotation about *A B* will be proportional to their perpendicular distances from that line. Sixteen equidistant particles on the circumference of the circle have been indicated. The rotational velocities of these particles, about



the line *A B*, will be proportional to the respective perpendiculars let fall on *A B*.

In a certain interval of time the disk will complete a revolution about its axle. In one-sixteenth of this interval of time, the particle *a* will move round the circle so as to attain the position previously occupied by the particle *b*. In doing so, the particle *a* will acquire the velocity previously possessed by the particle *b*, i. e., its velocity will be diminished, since *b* is nearer than *a* to the axis *A B*. The diminution of velocity will of course be proportional to *a D*, where *b D* is a line drawn from *b* perpendicular to *C a*. But since the velocity of the particle *a*, in a direction passing vertically downward through the plane of the paper, is diminished as the particle moves from *a* to *b*, this particle must have been acted upon by a force directed vertically upward through the plane of the paper, and proportional to *a D*. This force is indicated by a small circle containing a dot at its center. The dot indicates the pointed end of an arrow supposed to be directed vertically upward through the paper; while the diameter of the small circle is drawn proportional to *a D*, or to the magnitude of the force.

While the particle *a* moved to *b*, the particle *b* moved to *c*. In this time the velocity of the particle *b*, perpendicular to the plane of the paper, must have been diminished by an amount proportional to *b E*. A small circle containing a dot at its center, and of a diameter proportional to *b E*, indicates the magnitude and direction of the force which must have been applied to the particle as it moved from *b* to *c*.

The force which acted on the particle *c* as it moved to *d*, and that which acted on the particle *d* as it moved to *e*, are represented in a similar manner.

Owing to the rotation about the line *A B*, all particles on the right-hand side of the disk are moving upward through the plane of the paper; thus it follows that the particle *e*, in moving to the position *f*, must have acquired a velocity, directed vertically upward through the paper, proportional to *G f*. It must, therefore, have been acted upon by a force, proportional to *G f*, directed vertically upward through the paper. The forces acting on the particles *f*, *g*, *h*, can be determined in a similar manner.

It is obvious that the velocity of the particle *k*, directed upward through the plane of the paper, is diminished as that particle moves to the position previously occupied by the particle *l*. Consequently, it must have been acted upon by a force, of which the magnitude is determined in the manner previously explained, acting downward through the plane of the paper. A circle, of which the diameter is proportional to this force, while the cross at its center represents the feathered end of an arrow directed downward through the paper, indicates the magnitude and direction of the force acting on the particle *k* as it moved to *l*. The forces acting on the particles, *l*, *m*, *n*, *p*, *q*, *r*, *s*, are determined similarly, and represented by circles containing crosses, to indicate that the forces act downward through the plane of the paper.

A glance at Fig. 1 shows that all forces acting on the part of the flywheel above the line *a k*, are directed upward through the plane of the paper; while all forces acting on the part of the flywheel below the line *a k*, are directed downward through the plane of the paper. All the forces acting above the line *a k* might be replaced by a single resultant force, acting upward through the paper at some point on the line *C e*; while all the forces acting below the line *a k* might be replaced by a single resultant acting downward through the paper at some point in the line *C p*. These two resultant forces, acting parallel to each other, but in opposite directions, constitute a couple, and produce a torque or turning moment about the line *a k*. Thus, in order to turn the revolving flywheel about the diameter *e p*, we must apply a torque which, if it acted on the stationary flywheel, would turn it about the perpendicular diameter *a k*. Conversely, if we apply a torque tending to turn the flywheel about a diameter *a k*, it will turn, not about *a k* (as might have been expected), but about the perpendicular diameter *e p*.

The torque necessary to deflect the flywheel might be produced by forces acting directly upon it, as for instance, by blowing air on the upper half of the flywheel from the back, and on the lower half from the front. Generally, however, it is more convenient to act on the axle, the end above the plane of the paper being urged in the direction *C B*, while the end below the plane of the paper is urged, by an equal force, in the direction *C A*.

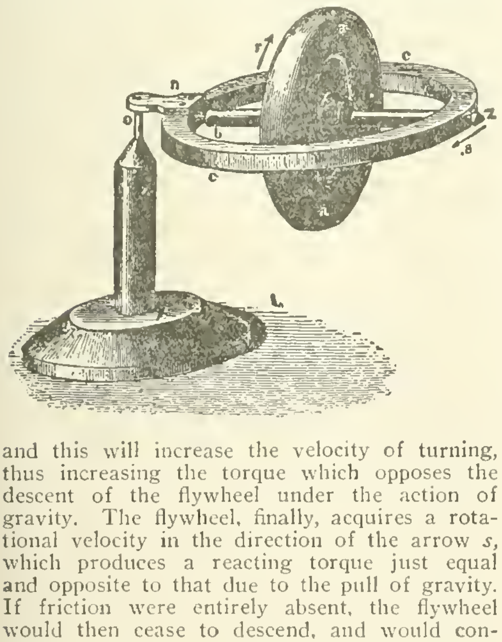
Some further points should be noted. Any force acting to the right of the line *A B*, is equal, both in magnitude and direction, to a corresponding force acting to the left of the same line. Consequently as the flywheel turns about the axis *A B*, no work will be performed by the forces producing this rotation. This follows from the circumstance that whereas one force acts in the direction of motion (so far as relates to rotation about the axis *A B*) the other equal force is opposed to that motion.

The actual behavior of a gyroscope can now be easily understood. The flywheel *a a* (Fig. 2) having been set in rapid rotation in the direction indicated by the arrow *r*, the frame carrying it is supported from a projection *n* at one end, on a pivot *o*. Instead of falling to the ground, as it would do if it were not rotating, the gyroscope remains with its axis *b z* horizontal; but the axis turns in a horizontal plane about the point of support *o*, in the direction indicated by the arrow *s*. The torque produced by the pull of gravity is easily seen to be that required to turn the flywheel *a a* about a vertical diameter in the direction mentioned. The fact that the flywheel, besides rotating about a vertical axis, also revolves in a circle about the point *o* as center, is merely due to the circumstance that, under the conditions of the experiment, the rotation cannot occur without the revolution.

It is instructive to consider the same problem from a somewhat different standpoint. We have already determined the nature of the applied forces required to turn the ideal rotating flywheel (Fig. 1) about the axis *A B*, in a clockwise direction when viewed from *A*. We found that a torque must be applied which tends to urge the end of the axle above the plane of the paper in the direction *C B*, and the opposite end of the axle in the direction *C A*. It will now be proved that the reaction of the rotating flywheel, when it turns as above, about the axis *A B*, produces a torque which tends to urge the end of the axle above the plane of the paper in the direction *C A*, and the other end of the axle in the direction *C B*.

Under the given conditions, the component velocities, downward through the plane of the paper, of the particles *a*, *b*, *c*, *d*, are all being diminished; and the consequent reactions tend to turn the axle in a clockwise direction, about the line *k a*, when viewed from the side *k*. The component velocities, upward through the plane of the paper, of the particles *e*, *f*, *g*, *h*, are all being increased, and the consequent reactions tend to turn the axle in the same direction. It is easily seen that the reactions due to the alterations in the velocities of the particles *k*, *l*, *m, n, p, q, r, s,* all tend to turn the axle of the flywheel in the same direction. Thus the torque due to the reaction of the rotating flywheel when turning about the axis *A B,* is of the character specified above.

«The precise way in which the gyroscope (Fig. 2) acts can now be readily followed. When the frame carrying the rotating flywheel *a a* is first supported on the pivot *o,* the initial tendency is for the whole to descend toward the earth, under the action of gravity. But the pivot *o* prevents the end *b* of the axle from descending, so that an incipient rotation about a horizontal diameter commences. The reaction due to this rotation produces a torque which tends to turn the flywheel about a vertical diameter in the direction of the arrow *s.* As the flywheel is free to turn in this direction, it at once commences to do so, and in so doing generates a reacting torque opposing the incipient rotation produced by gravity. The action of gravity being opposed, the rate of (incipient) descent of the flywheel is diminished; but so long as descent continues, a torque acting in the direction of the arrow *s* will be produced,



and this will increase the velocity of turning, thus increasing the torque which opposes the descent of the flywheel under the action of gravity. The flywheel, finally, acquires a rotational velocity in the direction of the arrow *s,* which produces a reacting torque just equal and opposite to that due to the pull of gravity. If friction were entirely absent, the flywheel would then cease to descend, and would continue to turn at a uniform rate in the direction of the arrow *s.* In this process, the work performed is that due to the incipient descent of the flywheel; this work is just sufficient to supply the kinetic energy due to the rotation of the flywheel and its supporting framework about the axis *o.* When the permanent condition outlined above has been attained, no further work is done in the absence of friction. If there is friction between the supporting lug *n,* and the pivot *o,* the gyroscope will slowly descend, at such a rate that the work performed by gravity is just equal to that needed to overcome the frictional drag.

«In the absence of friction, it is obvious that the gyroscope turns about *o* as center merely by virtue of its own inertia, after the final state has been reached; in this respect the motion resembles that of a planet around the sun. The torque due to gravity, though necessary, only serves the purpose of neutralizing the reacting torque which the turning of the flywheel about a vertical diameter produces.»

Mr. C. M. Brownall also, in a treatise on 'The Gyroscope, an Explanation without Mathematics,' published in the *Scientific American Supplement* of 10 Aug. 1907, summarizes the action of the gyroscope force as follows:

«I. The gyroscopic force always acts at right angles to the plane of motion of the axis, neither accelerating nor retarding it and only tending to change its direction. The gyroscopic force is of the nature of a couple, and can only be balanced by an equal couple.

II. The gyroscopic force is greater, other things being equal, as the velocity of motion of the axis is greater, as the velocity of rotation of the wheel is greater, as the mass of the wheel is greater and as this mass is more distantly situated as regards the center of the wheel.»

In May 1907, with a gyroscopic monorail car Mr. Louis Brennan, C. B., the inventor of the Brennan torpedo used by the British government, demonstrated before the Royal Society of Great Britain that he had discovered a practical application of the gyroscope which will probably revolutionize railway transportation.

The invention is, briefly, a system by which a vehicle or a train of vehicles supported by a single row of wheels may travel on a single rail and at all times maintain perfect equilibrium, whether in motion or stationary, and regardless of the distribution of the load, wind pressure and other conditions. Automatic stability mechanism carried by the vehicle itself endows it with this power. The mechanism consists essentially of two flywheels rotated directly by electric motors in opposite directions at a very high velocity, and mounted so that their gyrostatic action and stored up energy can be utilized. These flywheels are mounted on high-class bearings and are placed in exhausted cases, so that both air and journal friction is reduced to a minimum, and consequently the power required to keep them in rapid motion is very small. The stored up energy in the flywheels when revolving at full speed, is so great and the friction so small that if the driving current is cut off altogether they will run at sufficient velocity to impart stability to the vehicle for several hours, while it will take from two to three days before they come to rest. The model car, while running on a curved monorail, leans forward and so automatically balances the effect of centrifugal force, while a single wire hawser stretched across a river or ravine is all that is necessary in the shape of a bridge. The adoption of the gyroscopic principle to the practical purposes of steamship transportation is also in an advanced experimental stage, while it is considered probable that the crucial problem of the aeronaut, how to keep an automatic balance, may be solved by a simple application of the gyroscope.

H

H the eighth letter of the English and other alphabets derived from the alphabet of the Latins. It was borrowed by the Latins from the alphabet of the Greeks, and in early Greek represented an aspirate consonant sound, but in the Greek of classical times it stands for the prolonged vowel sound of *e*, as omega (ω) stands for the prolonged sound of omicron (o). The H is evidently a character borrowed from the Phœnician alphabet, where its form was 𐤇 and its sound guttural aspirate, like that of the corresponding Hebrew letter *cheth* or like *ch* in German and in Scotch. In Greek, after H was adopted as a vowel sign, the aspirate was represented by ‘ or ‘ either prefixed to a letter (ʽo) or written above it (ὁ): it was previous to this change that H was introduced into the Latin alphabet. It is probable that in early Latin this letter, occurring between two vowels, as in *nihil, mihi, traho, veho*, represented a guttural sound, as the *h* in *nihil* and *mihi* does still in the Italian pronunciation of Latin. But evidence exists that in the classical usage of ancient Latin speech initial *h* was of little account and was "silent" as in modern Italian and French: this is certain as regards the pronunciation of the vulgar; and that even the educated often "dropped the h's" we know from the fact that in ancient monuments we find Hannibal and Annibal, Hadria and Adria, herus and erus, haruspex and aruspex.

In Anglo-Saxon and earliest English speech *h* represents a guttural aspirate like German and Scotch *ch* in *ach, loch*: for example, in *niht* (night), *thoht* (thought) the *h* stood for the same sound as *ch* in the German words *nacht, gedacht*. In earliest English speech *h* was prefixed to *l, n*, and *r*, to represent a gutteral aspirate which is now entirely lost: examples, *hlaf* (loaf), *hnecca* (neck), *hring* (ring): the initial guttural in such words has been dropped, as in the names of the early Frankish kings Hlodowig became Ludovicus and Louis, and Hlothar became Lothair. The original guttural *h* in old High German *hros* is completely eliminated in the modern German *ross*, but is represented by the aspirate *h* in Old English *hors* (horse). The *h* after *w* in many words as wharf, what, when, etc., represents an initial aspirate in Old English hwarf, hwaet, hwaenne, etc.

H is added to various consonants to form digraphs for representation of various sounds, for example, *ch* as in chin, *sh* as in shy, *gh* as in gherkin, *th* as in thin, then; or even to represent sounds for which there is already a proper consonant in the alphabet, for example *ph* and *gh* for the sound of *f* (philter, rough), *ch* for the sound of *k* (chyle); in very many cases the digraph *gh* is employed simply as a memorial of an ancient etymology, as in plough, and not seldom for no discernible purpose at all, as in ghost; the form *rh* usually occurs in words of Greek origin, and recalls the Greek etymology (rhapsody), but again it is employed to suggest false Greek etymology (rhyme).

H. H. See JACKSON, HELEN MARIA FISKE HUNT.

Haarlem, hār'lĕm, Holland, the capital of the province of North Holland, 11 miles by rail west of Amsterdam, and five miles from the North Sea. The city is intersected by canals bordered by tree-lined avenues, and communicates with the Zuyder Zee by the Spaarne and the Ij. Its chief municipal building is the town hall, a 17th century palace of the counts of Holland, containing a library, art, and historical collections. In Haarlem wood a favorite pleasure resort is the Pavilion housing the Society for the Promotion of Industry, and containing the colonial and industrial museums. Chief among numerous educational institutions is the Teyler Museum, for the study of theology, natural science, and the fine arts. The finest ecclesiastical structure is St. Bavo's or the Groote Kerk, a 15th century late Gothic basilica, one of the largest churches in Holland, noted for its tower 260 feet high, and its large organ. Haarlem was important commercially as early as the 12th century, and although its manufacturing industries have declined, has cotton-mills, linen bleacheries, type foundries, breweries, etc. The town suffered during the revolt of the peasantry in 1492 and was deprived of its privileges by Albert of Saxony. During the war of independence it sustained a siege of seven months (1572–73) by the Spaniards, and capitulated only after a display of the noblest heroism and courage. It was retaken by the Prince of Orange in 1577. Pop. (1899) 64,069.

Haas, häs, **Johannes Hubertus Leonardus de**, Dutch painter: b. Hedel, North Brabant, 23 March 1832. A pupil of Jan van Os at Haarlem, he established his studio at Brussels in 1857, and attained an excellent reputation by his finely-colored animal studies and animal groups with background of Dutch landscape. In 1869 he received a gold medal at Munich for his 'Trio of Donkeys.' Others of his works are: 'The Three Comrades'; 'In the Dunes'; 'On the Bank of the Yssel'; 'Cattle at Pasture.'

Habakkuk, ha-băk'ŭk or hăb'a-kuk, the eighth of the twelve minor prophets. He was of the tribe of Levi, and flourished about 600 B.C. His prophecy commences with a lamentation for the corruption and social disorganization which the prophet sees around him. He cries to God for help, and is answered by threatenings of swift vengeance. The prophet is commanded to write the vision of God's retributive justice as revealed to his prophetic eye. The doom of the Chaldæans is first told in general terms and the announcement is followed by a series of denunciations pronounced upon them by the nations whom they had oppressed. The whole concludes with a magnificent psalm (chap. iii.), 'Habakkuk's Pindaric Ode,' as it is called by Ewald, a composition unrivaled for boldness, sublimity, and majesty of diction.

Hab'berton, John, American author: b. Brooklyn, N. Y., 24 Feb. 1842. At first a printer he subsequently served in the Federal army, and later undertook editorial work in New York. His best-known book, 'Helen's Babies' (1876), attained great popularity both in America and in Europe. He has published also 'The Barton Experiment' (1877); 'Other People's Children' (1877); 'The Worst Boy in Town' (1880); 'Who was Paul Grayson?' (1881); a humorous 'Life of Washington' (1883); 'One Tramp' (1884); 'Brueton's Bayou' (1886); 'The Chautauquans' (1891); 'A Lonely Lover' (1893); 'The Tiger and the Insect' (1902); 'The Bowsham Puzzle'; 'Country Luck'; 'Little Guzzy'; 'Caleb Wright'; etc.

Habeas Corpus, hā'bē-as kôr'pŭs, an ancient English writ addressed to him who has another in custody, and commanding him to produce the body of the person named at a certain place and time. One of the purposes for which it was used was to recover freedom when wrongfully taken away. Personal liberty was asserted by the common law from its earliest ages, and it was always assailed by kings who would be absolute, and with an earnestness proportionate to their tyranny. Hence it became imperatively necessary, if subjects were to retain the control and disposition of their own persons, that they should demand a recognition of this principle from their sovereign, and in England the principle was declared in the most solemn manner in Magna Charta. It is there said that "no man shall be taken or imprisoned but by the lawful judgment of his peers, or by the law of the land." It became necessary, however, in the course of time to put down the abuses by which the government's lust of power, and the servile subtlety of crown lawyers, had impaired so fundamental a privilege; and this was effected by the Habeas Corpus Act passed in 31 Charles II. (1679). Of the political and social effects of this measure Blackstone writes: "If once it were left in the power of any, the highest magistrate, to imprison arbitrarily whomever he or his officers thought proper, there would soon be an end of all other rights and immunities."

The provisions of the act may be stated generally thus: (1) That on complaint or request in writing, by, or on behalf of, any person committed and charged with any crime (unless committed for treason or felony expressed in the warrant; or as, or on suspicion of being accessory before the fact to any felony, or upon suspicion thereof, plainly expressed in the warrant; or unless committed or charged in execution by legal process), the lord-chancellor, or any of the judges in vacation, upon viewing a copy of the warrant or affidavit that a copy is denied, shall (unless the party has neglected for two terms to apply to any court for his enlargement) award a habeas corpus for such prisoner, returnable immediately before himself, or any of the judges; and upon the return made shall discharge the party, if bailable, upon security being given to appear and answer to the accusation. (2) The writ shall be returned, and the prisoner brought up within a limited time, according to the distance, not exceeding 20 days. (3) Officers and keepers neglecting to make due returns, or not delivering to the prisoner, or his agent, within six hours after demand, a copy of the warrant of commitment, or shifting the custody of a prisoner from one to another, without sufficient reason or authority (specified in the act), shall for the first offence forfeit £100; for the second £200, to the party grieved, and be disabled to hold their office. (4) No person once delivered by habeas corpus shall be recommitted for the same offence, on penalty of £500. (5) Every person committed for treason or felony may insist on being tried at the next assizes, or admitted to bail, unless the crown witnesses cannot be ready in that time; and if not tried at the second assizes or sessions, he shall be discharged from the imprisonment. (6) The prisoner may apply either to the Court of Chancery, or to the Courts of Queen's Bench, Common Pleas, or Exchequer, and any judge denying such writ is liable to a fine of £500. As the Habeas Corpus Act extended only to cases where persons are imprisoned on criminal, or supposed criminal charges, the other cases being left to the operation of the common law, which was found defective, the statute 56 George III. was passed, which extended the writ to other cases. Under this last act any person confined, or restrained of his liberty (otherwise than for criminal matters, and except persons imprisoned under a judgment or decree for debt), may apply to any judge of the common law courts for a habeas corpus, on showing by affidavit that there is a reasonable and probable ground for complaint.

In times of great political excitement, and suspected treasonable conspiracies, the operation of the Habeas Corpus Act has been suspended, as in Ireland in 1866, by 29 Vict. But such suspension does not enable any one to imprison without cause or valid pretext for so doing. It only prevents persons who are committed from being bailed, tried, or discharged during the suspension, leaving to the committing magistrate all the responsibility attending on illegal imprisonment. It is not uncommon therefore to pass an act of indemnity subsequently, for the protection of those who either could not defend themselves in an action of false imprisonment, without making improper disclosures of the information on which they acted, or who have done acts not strictly defensible at law, yet apparently justified by the necessity of the moment. The English statute has been copied in the United States without essential change.

In the Constitution of the United States it is provided that "the privileges of the writ of habeas corpus shall not be suspended unless when, in cases of rebellion or invasion, the public safety may require it." The scope of this provision came under discussion during the Civil War when the President of the United States authorized Lieut.-Gen. Scott, where in his judgment it seemed necessary, to suspend the writ. When on one occasion the general refused to obey the writ, Chief Justice Taney, who had issued it, uttered an opinion in which he declared that it was only in the power of Congress, and not of the President, to proclaim such suspension, a view which legal authorities seem inclined to agree with.

It has been decided by the Supreme Court, in view of possible conflicts of jurisdiction between State and Federal courts, that no State judge has a right to issue a writ of habeas corpus for the release of a person held under the authority of the Federal government. On the other hand the United States courts are more restricted in the power to issue such writs than the State courts. A Federal court may issue a writ of habeas corpus in cases coming within Federal jurisdiction. The circuit court may decide whether the person ought to be discharged, but cannot do this even in cases where the writ has been suspended There are also several provisions made by which an imprisoned person, whose testimony in a court of law is required, may be released by a writ of habeas corpus in order to appear before the judge. The Supreme Court has not the power to issue this writ, excepting in response to an appeal. Consult: Blackstone, 'Commentaries'; Hurd, 'Habeas Corpus.'

Haberstich, Samuel. See BITTER, ARTHUR.

Hack'berry, an American tree of the elm family and genus *Celtis*, growing in dry woods throughout the eastern United States and Canada. It is small or middle-sized, with the aspect of an elm. The fruit (a globular drupe) is sweet and edible, as large as the bird-cherry, and ripening in autumn. Two species exist.— *C. occidentalis*, the northern hackberry, sugar-berry or nettle-tree; and a southern one (*C. mississippiensis*). The soft, coarse-grained yellow wood is of little value. It is affected by the same insects as injure the elm (q.v.).

Häckel, Ernst H. See HAECKEL.

Hack'ensack, N. J., city, county-seat of Bergen County, on the Hackensack River, and on the New York, S. & W., and Erie R.R.'s, 16 miles from New York. It is a residential city, but has brick, silk, and other manufacturing interests. It has a public library, high school, gas and electric light, waterworks, electric street railways connecting with surrounding towns and cities and with New York, and an assessed property valuation of over $5,000,000. Hackensack was settled by the Dutch in the latter part of the 17th century, and during the Revolution was occupied in turn by the British and American armies. Pop. (1900) 9,443.

Hacker, Arthur, English artist: b. London 25 Sept. 1858. He studied at St John's College, London, was a pupil in art of the Royal Academy and of Léon Bonnet at Paris (1880–1), set up his studio in London, and painted, besides several portraits: 'Pelagia and Philammon'; 'By the Waters of Babylon'; 'Væ Victis'; 'Syrinx'; 'Sir Percival'; and other works.

Hack'ett, Horatio Balch, American Baptist clergyman and educator: b. Salisbury, Mass., 27 Dec. 1808; d. Rochester, N. Y., 2 Nov. 1875. He was professor of biblical literature at Newton (Mass.) Theological Seminary 1839–70, and of Greek at Rochester Theological Seminary, from the latter date. He was one of the committee of New Testament revision, and with Ezra Abbot (q.v.) edited the American edition of Smith's 'Bible Dictionary' (1868–70). His chief work was a 'Commentary on Acts' (1851); and he also wrote 'Memorials of Christian Men in the War' (1864); 'Tour in the Holy Land' (1860); etc.

Hackett, James Henry, American actor: b. New York 15 March 1800; d. Jamaica, L. I., 28 Dec. 1871. He went on the stage in 1826 and was particularly successful in impersonating Yankees and Westerners, but was best known by his Falstaff, which he played first about 1832. He was widely popular in the United States as well as in England. He published 'Notes and Comments on Shakespeare' (1863).

Hackett, James Keteltas, American actor: b. Wolfe Island, Ontario, Can., 6 Sept. 1869. He is the son of J. H. Hackett (q.v.). He was graduated from the College of the City of New York in 1891, made his début in 1892, became leading man of the Lyceum, New York, in 1896, and appeared in 'The Prisoner of Zenda,' 'Rupert of Hentzau,' 'The Pride of Jennico,' 'Don Cæsar's Return,' and 'The Crisis.'

Hackettstown, N. J., town in Warren County; on the Musconetcong River and on the Delaware, L. & W. railroad and the Morris Canal; about 59 miles from New York city, and 50 miles west of Newark. It is about 800 feet above the sea and within half a mile of the highest point in the State. Its chief manufactures are silk goods, carriages and wagons, and agricultural implements. The waterworks are owned and operated by the town, and the supply comes from springs on Schooley's Mountain, distant from the town about two and one half miles. It is the seat of the Centenary Collegiate Institute, under the auspices of the Methodist Episcopal Conference of Newark. Pop. (1900) 2,427.

Hackländer, Friedrich Wilhelm von, frēd'rĭн vĭl'hĕlm fōn häk'lĕn-dėr, German novelist and writer of comedies: b. Burtscheid, near Aix-la-Chapelle, Prussia, 1 Nov. 1816; d. Leoni, near Munich, 6 July 1877. After serving for a time in the Prussian artillery he began a literary career with 'Pictures of Soldier Life' (1841), followed by 'Soldier Life in Peace' (1844). Other works of this period were 'Daguerreotypes' (1842); and 'Pilgrimage to Mecca.' In 1849 he went to Italy, where he was present with Radetzky's army during the campaign in Piedmont, and afterward published 'Soldier Life in War' (1849–50). Among the best of his longer novels are 'Trade and Traffic'; 'Eugene Stillfried' (1852); and 'Anonymous Histories' (1851). His best comedies are the 'Secret Agent' (1850), translated into several European languages, and 'Magnetic Cures' (1851). With Zoller, in 1855, he started the illustrated weekly 'Over Land and Sea.'

Hackley, Charles Henry, American capitalist: b Michigan City, Ind., 3 Jan. 1837; d. Muskegon, Mich., 10 Feb. 1905. In 1856 he went to Muskegon, Mich., and worked in a lumber-mill as laborer and foreman; then attended a commercial school and was given a position as bookkeeper and later came to be partner with a mill firm. In 1880 he founded the firm of which he is the head, which is one of the most important in the State, and he has also been interested in many other industries. He has been a member of the board of education, and was elected regent of the University of Michigan, but declined the office. He has made large gifts to the city of Muskegon. In 1888 he gave a public library, which he endowed in 1891; in 1889 he had a park made in a central part of the city in which he erected a soldiers' and sailors' monument and other statues; in 1891 he built and endowed a manual training school; in 1901, he provided for the erection of a hospital with a training school for nurses, and erected a statue of McKinley, the first statue of the late President to be unveiled. The total value of his gifts is $1,380,525.

Hackmatack, hăk'ma-tăk, the American larch. See LARCH.

Hackney, England, a metropolitan borough in the northeast of London, three miles north-northeast of St. Paul's. It has a fine modern town hall. Hackney was formerly noted for its boarding-schools for young ladies. It is supposed that hackney-coaches were first established between this place and London, and derived their name from it. It has manufactories of chemicals, india rubber, etc.; and had formerly extensive silk-mills. Pop. (1901) 270,535.

Hackney Carriage or **Coach,** a four-wheeled enclosed vehicle drawn by two horses and seating four persons exclusive of the driver. They are usually let out for hire. The carriage derives its name from Hackney (q.v.).

Haddam, Conn., a town and one of the county-seats of Middlesex County, 26 miles southeast of Hartford, on the New York, New Haven & Hartford R.R., and on the west bank of the Connecticut River, 29 miles above its mouth. Among its educational institutions is Brainerd Academy. It has important granite quarries, lumber and saw-mills, and a paper mill. Pop. (1900) 2,015.

Haddock, a fish (*Melanogrammus æglefinus*) of the same family (*Gadidæ*) as the cod, and much resembling it in general appearance. From the cod it may be easily distinguished by the black lateral line and suprapectoral blotches, and the swollen bones of the shoulder girdle. The haddock scarcely exceeds a weight of 15 pounds, and is usually about 3 or 4 pounds. It is restricted in its range to the North Atlantic. The food is extremely varied, consisting of every kind of bottom-living invertebrate. Spawning occurs in late winter and early spring, according to locality, and the eggs are essentially like those of the cod. Haddock associate with cod on the Banks, but the principal American fisheries are in Massachusetts Bay, on the Nantucket shoals and other points off southeastern New England, where immense numbers are taken on trawl and hand lines, especially during the summer. Philadelphia and Boston furnish the best markets for fresh haddock, but the demand from the interior is constantly growing. Though considerable quantities are salted at Provincetown, the haddock when so prepared is much inferior to the cod. The Scotch method of drying and smoking produces the much superior "Finnan Haddies," and is largely practised at Portland and Boston.

Had'don Hall, an old English baronial mansion, the seat successively of Avenells, Vernons, and the Rutland family, stands on a slope overlooking the Wye in Derbyshire, 23 miles north-northwest of Derby. The styles of architecture range from Norman to the 16th century. Reference is made to it in Scott's 'Peveril of the Peak.' Although it is not inhabited it is in fine condition and remarkable as one of the most interesting extant examples of the country house of a great land owner in the late Middle Ages.

Haddonfield, N. J., a borough of Camden County, five miles southeast of Camden, a junction of two branches of the Camden and Atlantic railroad. Its industries are mainly agricultural; and it has also manufactures of stoves, tinware, watchcases, etc. Pop. (1900) 2,776.

Ha'den, SIR **Francis Seymour,** English etcher and surgeon: b. London 16 Sept. 1818. He studied at the Sorbonne and in the Paris and Grenoble medical schools, and in 1857 became a Fellow of the Royal College of Surgeons. The 'Etched Work of F. S. Haden' contains 185 plates by him and still others have been published in 'Études à l'Eau Forte' (1865–6). His work as an etcher is noted for both vigor and breadth. He is president of the Society of Painter Etchers, was knighted in 1894, and has written 'Rembrandt True and False'; 'Etched Work of Rembrandt' (1879–80); 'Lectures'; 'About Etching' (1881).

Hades, hā'dēz, the Greek name of a god, in large measure corresponding to the Roman Pluto, who reigned over the infernal regions. Both Greeks and Romans supposed the infernal regions to be in the centre of the earth. To enter these, the river Styx had to be crossed by the dead in the wherry of Charon. If, by any chance, the body lay unburied, the shade was detained 100 years on the banks of the Styx before crossing.

The Greek word Hades is rendered in the authorized version by the ambiguous term hell (q.v.). Expressions, most of them obviously figurative, used of Hades, represent it as subterranean; as having gates with keys in the hand of Christ, and as having, in a portion of it, souls in torment.

Had'is, or in Arabic plural, AHADIS, narrations or traditions, which relate to the Prophet Mohammed, and are not found in the Koran. There are numerous collections of these floating traditions, anecdotes and legends. A search for such data was first undertaken by Abdul Malik ibn Juraisch (d. 772 A.D.). Others consider that the collection of Imam Malik (d. 801) is the earliest extant. The following six Hadis collections are considered by the Sunnite Moslems to be canonical scriptures: 1. The Hadis of Mohammed Ismail al Buchari (d. 878). 2. Of Muslim ibn ul Hajaj (d. 883). 3. Of Abu Isa Mohammed al Tirmisi (d. 901). 4. Abu Daud al Sajistani (d. 897). 5. Of Abu Abd ur Rahmân al Nasâi (d. 925). 6. Of Abu Abdallah Mohammed Ibn Wajah (d. 895). None of these have ever been printed.

Hadley, Arthur Twining, American college president: b. New Haven, Conn., 23 April 1856. A son of James Hadley (q.v.), he was graduated from Yale in 1876, and took graduate studies in political science at Yale and the University of Berlin. In 1879–83 he was a tutor at Yale, and during that time wrote for several journals, including the 'Railway Gazette' and the 'Financial Chronicle.' He was commissioner of labor statistics for Connecticut (1885–7), and was in 1885 a witness before the Cullom State committee which prepared the Interstate Commerce Law. In 1886 he became professor of political science at Yale, and in 1899 was made president of the university. He was president of the American Economic Association for two years. In 1885 he published 'Railroad Transportation: Its History and Laws,' which is everywhere recognized as one of the chief authorities on the subject, and has been translated into French and Russian; his other works include 'Report on the Labor Question' (1885); 'Economics, an Account of the Relations between Private Property and Public Welfare' (1896), presenting the theories of political economy in accordance with the most modern research and thought; and 'The Education of the American Citizen' (1901). His writings show him to be not only a scholar, but also a man of affairs well acquainted with the business world, and in this regard he is one of the best representatives of the modern type of university presidents.

Hadley, Henry K., American composer: b. Somerville, Mass., 1871. He was a pupil of S. A. Emery and G. W. Chadwick in Boston, studied also in Vienna, and in 1895 returned to the United States and was appointed instructor in music at St. Paul's School, Garden City, L. I. His symphony, 'The Four Seasons,' received the prizes given by the Paderewski Fund and the New England Conservatory of Boston. His works further include a concert overture 'Hector and Andromache'; a symphony, 'Youth and Life'; a cantata, 'In Music's Praise'; a festival march; trios, quartettes, and more than 150 excellent songs and pianoforte compositions.

Hadley, James, American philologist: b. Fairfield, N. Y., 30 March 1821; d. New Haven, Conn., 14 Nov. 1872. When a boy he suffered an injury to his knee, which developed seriously, and crippled him for life. He was graduated from Yale in 1842, took graduate studies in mathematics and also a theological course. In 1844 he was tutor at Middlebury College, Vt., and in 1845 became a tutor at Yale. In 1848 he became assistant professor of Greek there, and in 1851, professor of Greek. He was familiar not only with Greek, Latin, and the chief modern languages, but also with Hebrew, Arabic, Armenian, Gaelic, Irish, Sanskrit, Gothic, and Old English, and won a high reputation as a linguist distinguished for exactness and thoroughness in detail, united with breadth of view; he also was successful and influential as a teacher. He published a 'Greek Grammar' (1861), based on Curtius, and wrote the 'Brief History of the English Language' in the 1864 edition of Webster's 'Dictionary'; after his death, his 'Introduction to Roman Law' (1873) and 'Philological and Critical Essays' (1873) were published.

Hadley, John, English mathematician and astronomer: b. 1682; d. 14 Feb. 1743. He became a Fellow of the Royal Society in 1717, and was the inventor of Hadley's quadrant (see SEXTANT) and of a reflecting telescope (1723). The credit of having invented the sextant is claimed for Hadley, Godfrey, and Newton, but each seems, nevertheless, to have made his own discovery independently. Hadley described his instrument, which he called an "octant," to the Royal Society in May 1731.

Hadley, Mass., town, which includes several villages, in Hampshire County; on the Connecticut River and on the Boston & M. Railroad; three miles northeast of Northampton and four miles southwest of Amherst. It was settled in 1659, and was first called Norwottack; but in 1661, when it was incorporated it was given the name Hadley, from Hadley in England. William Goffe and his father-in-law Whalley, who fled from England to America in 1660, and who lived for a time near New Haven, sought concealment in Hadley, in 1664, where Goffe died in 1679. According to tradition, when Hadley was at one time attacked by Indians, and the people were called from the meeting-house, they stood helpless until Goffe appearing, took the lead and repelled the enemy. Hadley is an agricultural region, and its industries are chiefly connected with farm products. Pop. (1900) 1,789.

Hadramaut, hā-drā-mât'. Arabia, the name given to the coast region from Aden to Cape Ras-al-Hadd. It consists of a plateau, parted from a mountain chain, the barrier of the interior desert, by a complex of valleys. Commerce, agriculture, cattle-breeding, and the chase are the chief occupations. The climate is dry but healthy. Pop. about 150,000.

Hadrian, ha'drĭ-an (PUBLIUS ÆLIUS HADRIANUS), Roman emperor: b. Rome 24 Jan. 76; d. Baiæ 10 July 138. For his ardor in the study of Greek he earned the nickname of Græculus. A nephew of Trajan, he was adopted by that emperor, fought under him against the Dacians with some glory, and, having been entrusted with the praefecture of the East and the command of the Roman armies in the East early in 117 when Trajan left the field, Hadrian, upon Trajan's death later in the same year was made emperor by his soldiers. He quickly realized that he could make no forcible head against the simultaneous attacks of the Parthians and, in Dacia and Moesia, of barbarian foes, to say nothing of revolt in Syria and Egypt. With the true insight of a diplomat he foresaw that the extreme East must be either surrendered voluntarily or lost, and chose the former alternative as the least costly. Hence he gave up Armenia, Mesopotamia, and Assyria, all comparatively new Roman provinces, to the Parthian power, and withdrew the Roman eagles to the west of the Euphrates. In 119, for the purpose of becoming acquainted with the state of the provinces, he began his celebrated journey, which he is said to have performed chiefly on foot, marching bareheaded 20 miles a day and sharing cheerfully the hard fare of the humblest soldier. He visited Gaul, Germany, Britain, where he built the famous wall extending from the Solway to the Tyne, Spain, Mauritania, Egypt, Asia Minor, and

ARTHUR TWINING HADLEY,

PRESIDENT YALE UNIVERSITY.

Greece, whence he returned to Rome after his circuit of the empire in 126 or 127 A.D., and received the title of «Pater Patriæ.» Hadrian spent the years 132 and 133 in Athens, which city he adorned with splendid and costly buildings. After once more visiting Syria and crushing a desperate Jewish revolt, he returned to Italy, and spent the last years of his life at Rome and his villa. During his reign the army was vigorously disciplined and reorganized. As a civil ruler he merits high praise for the just and comprehensive view he appears to have taken of his duties as a sovereign. Hence to him is attributed, more than to any other, the consolidation of the monarchical system of Rome. Hadrian also divided Italy into four parts under four consuls, to whom was entrusted the administration of justice. Hadrian had a passion for building: his most splendid edifices were a famous villa at Tibur (now Tivoli), and in Rome the Aelian bridge, built in 136, and now styled the Pont Sant' Angelo. This bridge leads to the emperor's splendid mausoleum, the Moles Hadriani. He likewise laid the foundation of several cities, the most important of which was Adrianopolis. He was a lover of the fine arts and set a high value on Greek literature. No fragment of ancient literature has been more famous than the verses attributed to the dying Hadrian:

Animula vagula, blandula
Hospes comesque corporis
Quæ nunc abibis in loca
Pallidula, rigida, nudula,
Nec ut soles dabis jocos?

David Johnston, in his ‹Translations, Literal and Free, of the Dying Hadrian's Address to his Soul› (1877), gives no fewer than 116 translations of all degrees of excellence. Among well-known writers, Byron, Prior, Pope, and Merivale have attempted renderings. Consult: Gregorovius, ‹Der Kaiser Hadrian› (1884); Durr, ‹Die Reisen des Kaisers Hadrian› (1881).

Hadrian's Wall, a wall in the north of England, called also the Roman Wall and the Wall of Severus. Before Agricola advanced into Scotland he established forts between the estuary of the Tyne and the Solway Firth, to protect him from attack in his rear. He adopted the same precaution before leaving the Lowlands of Scotland for the Highlands, placing encampments between the firths of Forth and Clyde. Afterward walls were constructed on these two lines. On the English side of the Border is a stone wall with a ditch on its north side. Attached to it are stationary camps, mile-castles, and turrets for the accommodation of the soldiery who manned it. To the south of the stone wall is a series of ramparts generally called the *vallum*. This fortification consists of three aggers or mounds and a ditch. The military way along which the soldiery moved lies between the *murus* or stone wall and the vallum. The wall was not intended as a mere fence to block out the Caledonians, but as a line of military strategy. Hadrian is now generally believed to have been the builder of the whole structure. Severus, however, repaired it before he advanced into Scotland. Agricola came to Britain in 78 A.D. Hadrian came toward the close of 119 A.D. Severus died in 211 A.D. Considerable portions of Hadrian's Wall yet remain. In two places the wall stands nine feet high. See Collingwood Bruce, ‹The Roman Wall› (1851); and ‹Handbook to the Roman Wall› (1863); Neilson, ‹Per Lineam Valli› (1891); Creighton, ‹Carlisle› (1889).

Hadrosaurus, hăd-rō-sâ'rŭs, or **Trachodon**, a genus of duck-billed dinosaurs of the Cretaceous rocks of North America. Compare CLAOSAURUS.

Haeckel, hĕk'ĕl, **Ernst**, German naturalist: b. Potsdam, Germany, 10 Feb. 1834. He studied at Berlin, Würzburg, and Vienna, taking his medical degree in 1858 and practising that profession a short time in the former city. During 1859 and 1860 he made a journey through Italy and Sicily in the interest of science, his work on ‹The Radiata› (1862), being a result. Later portions were added in 1887 and 1888. In 1861 he settled in Jena for the study of comparative anatomy, but soon turned to the specific investigation of zoology, and after holding subordinate positions, was appointed in 1865 full professor at Jena. His researches had to do especially with the lower ranks of marine animals, and above all, with deep-sea life in its simplest forms. The material for such study was gathered from many and extended experiences in the North Sea, the Mediterranean, the Canary Isles, and the Indian Ocean. These travels and researches were the basis of works like the ‹History of the Development of the Siphonophora› (1869); and ‹Biological Studies› (1870). These, however, were introductory to greater representative works on natural philosophy and the development theory, such as ‹Calcareous Sponges› (1872); ‹Natural History of Creation› (1868), — which has received the honor of translation into twelve languages, — and his master work ‹General Morphology of Organisms› (1866). More popular writings, making him known to a public much wider than the biologist ever addresses, are those ‹On the Division of Labor in Nature and Human Life› (1869), ‹On the Origin and Genealogy of the Human Race› (1870), ‹Life in the Great Marine Animals›; ‹The Arabian Corals› (1873); ‹The System of the Medusa› (1880); and ‹A Visit to Ceylon.› For many years he has devoted his attention to the deep-sea exploration of H. M. S. Challenger expedition, of which he has written voluminous reports in English. His general biologic conclusions regarding the life and growth of deep-sea organisms are given in his ‹Plankton Studies› (1890), while his ‹Monism as the Link between Religion and Science› may be considered as in a certain sense his confession of faith.

Hæmatemesis, hē-ma-tĕm'ĕ-sĭs, vomiting blood, which comes from the stomach, or œsophagus. It may result from alcoholism, poisoning, or cirrhosis of the liver. It is more frequent in later life than hæmoptysis (q.v.) but may occur in the acute perforating ulcers of the stomach in young women. It is frequently associated with cancer, but it results also from external violence.

Hæm'atin, or Hem'atin. See HÆMOGLOBIN.

Hæmatoxylin, hē-ma-tăx'ō-lĭn ($C_{16}H_{14}O_6$), the coloring matter of logwood, or *Hæmatoxylon Campechianum*, got from the extract by allowing it to stand some days in contact with ether, decanting, removing the ether, and adding water. Hæmatoxylin gradually deposits, and the crystals by pressure and recrystallization from water containing a little ammonium sulphite can be got nearly colorless. Combined with three molecules of water it forms dimetric, with one of water trimetric crystals. The crystals are large, transparent, and brilliant, and have a sweet taste. Hæmatoxylin dissolves sparingly in water, but it is taken up very freely by solution of borax, by hypo-sulphite of sodium, phosphate of sodium, and some other salts. It is also soluble in ether and in alcohol. By acids it is not readily affected, but it reacts at once with alkalies, forming colored solutions, and with metallic oxides forming precipitates of various colors. By joint action of air and bases hæmatoxylin is oxidized and becomes transformed into hæmatein.

Hæmaturia, hem-a-tū'rĭ-a, the presence of blood in the urine, which points to disease of the kidney or bladder. It is a symptom of some gravity. The treatment of the cause will probably remove this affection: in all cases complete rest is very important. See TREMATODA.

Hæmoglo'bin, or **Hemoglo'bin**, an organic coloring matter, which constitutes about nine tenths of the weight of dried red blood corpuscles, and serves as a carrier of oxygen from the lungs to the general tissues of the body. It is an exceedingly complex substance, and its formula is not certainly known. Zinoffsky gives it as $C_{712}H_{1130}N_{214}S_2FeO_{245}$; but this can hardly be regarded as more than a guess. According to many authorities, hæmoglobin is not a definite chemical compound, but a more or less variable mixture of simpler substances. It gives all the general reactions of the proteids, but, unlike most of the proteids, it may easily be obtained in crystalline form, its crystals commonly occurring in rhombic plates or prisms, varying somewhat in shape, according to the source from which the substance is prepared. The exceeding physiological importance of hæmoglobin depends upon the fact that it readily combines with oxygen to form a very unstable compound known as oxyhæmoglobin. The combination takes place as the blood corpuscles containing the hæmoglobin pass through the lungs; and the loosely-combined oxygen is given off again as the corpuscles pass through the capillaries, the oxyhæmoglobin being thereby again reduced to hæmoglobin. Hæmoglobin also combines with carbon monoxid to form a similar but far more stable substance known as carboxyhæmoglobin. In poisoning by the inhalation of coal-gas the carbon monoxid present in the coal-gas combines with the hæmoglobin in the lungs, and the carboxyhæmoglobin so formed does not break up again. As the absorption of the coal-gas proceeds, a continually increasing quantity of hæmoglobin is therefore destroyed, so far as its utility as an oxygen-carrier is concerned. In extreme cases of such poisoning, transfusion of blood is resorted to, in order that the patient may have a sufficient supply of hæmoglobin to transport the requisite quantity of oxygen from the lungs to the other tissues of the body.

The preparation of pure hæmoglobin is a difficult operation, and for its details reference should be made to Gamgee's 'Physiological Chemistry.' One of the best methods that have been proposed consists in adding to defibrinated blood about one sixteenth of its own volume of ether, and shaking the mixture. This treatment causes the red corpuscles to break up, and the fluid becomes lake-colored. After a time, varying from a few minutes to three days, according to the source of the blood, a heavy deposit of minute crystals of oxyhæmoglobin is thrown down. This may be purified by washing with 25 per cent alcohol, and subsequent recrystallization. Crystals of hæmoglobin itself have also been prepared. Pure hæmoglobin has a purplish color, which gradually passes into a scarlet or a yellowish red, as the substance absorbs oxygen and becomes thereby converted into oxyhæmoglobin. Carboxyhæmoglobin is even more brilliantly red than oxyhæmoglobin. All three of these substances exhibit marked absorption spectra when in solution, and very small quantities of them can be easily detected by the spectroscope. It is said that the presence of one part of hæmoglobin in ten thousand parts of water can be distinctly demonstrated by this means.

When oxyhæmoglobin is acted upon by acids or alkalies, or by the gastric juice, it is resolved into a proteid substance and a definite compound which has the probable formula $C_{68}H_{70}N_8Fe_2O_{10}$ and is known as hæmatin. Hæmatin may be best prepared by extracting blood clot, directly, with hot alcohol to which a small quantity of sulphuric acid has been added. The extract is next agitated with chloroform, which takes up the hæmatin. The chloroform is then separated, washed with water to remove the acid, and allowed to evaporate, when the hæmatin is deposited in the form of a bluish-black powder. Hæmatin is a very stable compound, and may be heated to 350° F. without decomposition. At higher temperatures it burns with evolution of hydrocyanic acid, leaving an ash composed chiefly of oxid of iron. It is insoluble in water, ether, dilute acids, and pure alcohol; but it dissolves readily in solutions of the caustic alkalies, and in alcohol to which a small quantity of sulphuric acid has been added. Consult Gamgee, 'Physiological Chemistry.'

Hæmophilia, a congenital inherited disease characterized by a tendency to obstinate bleedings. Women are very rarely affected, but transmission of the disease seems to be from the father through the daughters to the grandsons, and from father to son. The disease usually makes itself evident in early life, a slight wound being followed by abnormal hemorrhage, whereby the child becomes known as a "bleeder." The exact fault in nature's ordinary method in plugging blood-vessels has not been discovered: the shed blood will clot naturally. Besides the liability to excessive hemorrhage, these subjects are frequently afflicted with trouble in the joints, probably a chronic inflammation, the result of repeated small hemorrhages. Death is always imminent, as nothing can stop the flow of blood where large areas of the body are injured. Chlorides are used with some success for those mildly afflicted with the disease, particularly the chloride of calcium.

Hæmop'tysis, expelling blood from the lungs, larynx or bronchial tubes by coughing, which may be a symptom of phthisis. Morphine is useful immediately after such hemorrhages, but modern medicine rejects the use of styptics.

Hæmorrhoids (Greek, *haima*, blood, and *rheo*, to flow), literally, a flow of blood. Until the time of Hippocrates this word was used, conformably to its etymology, as synonymous with hemorrhage. It was afterward used in a narrower sense, to indicate the flux of blood at the extremity of the rectum, and in some other cases which were considered analogous to it; thus it was applied to the flow of blood from the nostrils, the mouth, the bladder, and the uterus. It is at present used to signify a particular affection of the rectum, although the disease is not always attended with a flux; in this sense the affection is also called piles. Certain general causes may produce a predisposition to this disease; in some cases, it appears to be the effect of a hereditary disposition; in general, it manifests itself between the period of puberty and old age, although infants and aged people are not entirely exempt from its attacks. Men are oftener affected than women, in whom it is sometimes produced by local causes. It often shows itself in subjects who pass suddenly from an active to a sedentary life, or from leanness to corpulency. Any circumstance which produces a tendency to pressure on the venous return of blood in the pelvis is to be reckoned as a local cause. The accumulation of fæcal matter in the intestines as in habitual constipation; efforts to expel urine; the pressure produced by polypi; the obstruction of any of the viscera, especially of the liver; worms; use of drastic purges, particularly of aloes; long continuance in a sitting posture; riding on horseback; pregnancy; the accumulation of water by ascites;— such are some of the ordinary causes of hæmorrhoids.

Several varieties of hæmorrhoids are distinguished. They are known as external when apparent at the anus; internal when concealed within the orifice; blind or open, regular or irregular, active or passive, periodical or anomalous, etc. There is also a great difference in the quantity of blood discharged; it is usually inconsiderable, but in some cases is so great as to threaten the life of the subject. The quality, color, etc., of the blood, also differ in different cases. The number, seat, and form of the hæmorrhoidal tumors likewise present a great variety of appearances. When the disease is purely local it is cured more readily; but in the greatest number of cases it is connected with some other affection, or with the constitution of the subject. In these cases, if the piles are not troublesome on account of their size, or if the bleeding is not very considerable, cure of the primary affection should be attempted. The best mode of treatment is then to recur to hygienic rather than medicinal influences. The subject should avoid violent exercises, but moderate exercise will be found beneficial. The standing position is to be avoided as much as possible, especially following defecation. The constipation (q.v.) with which the subjects of this disease are liable to be affected should be remedied by hygienic dieting. If the pain is considerable, recourse should be had to sedatives and local application of hot water. If the disease appears under a more severe form, more violent remedies will become necessary. If the discharge of blood becomes excessive, particular care must be taken to regulate it. If the tumors acquire a considerable volume, surgical operations are necessary. At the present time the operative treatment of persistent hæmorrhoids is both safe and efficacious.

Hafiz, hâ-fĭz', the pseudonym of Mohammed Shems ed dîn, Persian poet: b. Shiraz in the beginning of the 14th century; d. 1388. The surname Hafiz was given him because he knew the Koran by heart. He was also called *Shakarlab* (Sugar-lip), from the flowing melody of his ghazals or short lyrics; and *Lissan Elghaïb* (the Mysterious Voice), from the deep mystic meaning said by his warmest admirers to be contained in many of his poems. He preferred independent poverty as a dervish to a life at court, whither he was often invited by Sultan Ahmed. He became a sheik or chief of a fraternity of dervishes, and died at Shiraz where a monument was erected to him, still frequently visited by pious Moslems. He is the greatest lyrical poet of Persia, and he furnishes the safest guide to Persian thought and manners. The songs of Hafiz were collected into a *Divan* (a Persian word for a collection of poems) after his death, which was first published at Calcutta in 1791, and translated into German by the celebrated orientalist Hammer-Purgstall (1812–13). A complete English translation by Clarke appeared in 1891. A critical edition of the Persian text, with scholia, etc., was published by Hermann Brockhaus (1854–61). Consult Horn, 'Geschichte der persischen Litteratur' (1901).

Hag-fish, a name given to the species of the families *Heptatremidæ* and *Myxinidæ Myxine*, and *Bdellostonia* of the class of Cyclostomi (q.v.). They are eel-like in shape, lack all paired fins, have a suctorial mouth, without jaws; a single nostril at the tip of the head and either one (*Myxine*) or from 6 to 14 (*Polistotrema*) gill openings along the sides of the body. Around the mouth are eight barbels, and the nostril connects with the cavity of the mouth. The skin contains numerous mucus-glands and also numerous pockets of "thread cells," the protoplasm of which is converted into long threads, which, when discharged, unwind and, together with the mucus, form a jelly-like mass protecting the animal. The eggs are large, oval in shape and enclosed in a horny case provided with hooks on each end by which they are anchored to sea weed, etc., on the bottom. Where abundant the hag-fishes are among the greatest pests of the fishermen. They attach themselves to other fishes in the neighborhood of the gills or on the eyes, and thence work themselves rapidly into the interior of the body, devouring the viscera, muscles, etc., so that there remains "a living hulk of head, skin and bones." The California hag-fishes (*Polistotrema Stouti*) will devour a fish of 10 or 15 pounds in a single night, and it is believed that they enter the fishes after they are taken in the nets. The hag-fish of the eastern coast (*Myxine glutinosa*) ranges north of Cape Cod, and in the European seas, south to the English Channel. Other species occur in other parts of the world.

Hagar, hā'gar, an Egyptian handmaid in Abraham's house. She was presented by her mistress Sarah to Abraham, in order that Abraham might not die without descendants, Sarah herself being barren. Hagar bore Ishmael; but Sarah soon became jealous of her, and treated her severely. When Sarah bore Isaac, Hagar was sent away by Abraham, who, the Bible informs us, had received a divine order to dismiss her. She suffered much distress in the desert, but was relieved by an angel, and married her son to an Egyptian woman.

Hagen, Gotthilf, gŏt'hilf hä'gĕn, German hydraulic engineer: b. Königsberg, Prussia, 3 March 1797; d. Berlin 3 Feb. 1884. He studied at the University of Königsberg; in 1816 observed at Kulm the total eclipse of the sun, but later turned his attention from astronomy to engineering, and from 1831 to 1849 was professor of hydraulic engineering in the School of Engineering. The naval harbor of Wilhelmshafen, one of the strongest on the German Ocean, was built from his designs. In 1869 he became director of the Prussian building department. His most important work is his 'Handbuch der Wasserbaukunst' (1841–65), besides which he published numerous other volumes, including: 'Die Kanalisierung der obern Saar' (1866), and 'Untersuchungen über die gleichförmige Bewegung des Wassers' (1876).

Hagen, Theodor, tā'ō-dōr, German painter: b. Düsseldorf 24 May 1842. He became known through his landscapes of the Eifel Mountains and Westphalia, in 1871 was appointed professor in the Weimar art school, of which he was also director from 1877. In 1881 he resigned both posts and returned to Düsseldorf. He obtained a gold medal at the Berlin exposition of 1891. Among his works, distinguished by their forceful drawing and excellence of aërial perspective, are: 'The Kanderthal in Switzerland'; 'Sunset in the Siegenthal'; 'Spring Weather'; 'Swiss Landscape, with the St. Gothard Pass'; 'Town on the Lower Rhine — Evening.'

Ha'gerstown, Md., city, county-seat of Washington County, on Antietam creek, and on the Baltimore & O. the Cumberland V., the Norfolk & W. and the Western M. R.R.'s. Here are extensive manufactures of knit goods, bicycles, machinery, steam engines, lumber, etc. It is the trade centre of western Maryland and contains a court-house, high school, Bacon's School for boys and girls, electric light and street railways, three national banks, and an assessed property valuation of $7,000,000. Pop. (1900) 13,591.

Haggadah, ha-gā'da, one of two rabbinical biblical interpretations forming the Midrash (q.v.).

Haggai, hăg'ī, the tenth of the minor prophets, and first of those who prophesied after the captivity. He was born in Babylon, and joined the first band of exiles who, on the issue of the decree of Cyrus (536 B.C.) returned to their own land. He was buried among the priests at Jerusalem, as belonging to the family of Aaron. The book of Haggai consists of four distinct prophecies and has but one theme, the building of the second temple. The brevity of the several prophecies is so great, and the poverty of expression which characterizes them so striking, as to give rise to an idea that in their present form they are but the outline or summary of the original discourses. They were delivered in the second year of Darius Hystaspes (520 B.C.), at intervals from the first day of the sixth month to the twenty-fourth day of the ninth month in the same year. The closing prediction foreshadows the establishment of the Messianic kingdom upon the overthrow of the thrones of the nations.

Haggard, hăg'ard, **Andrew Charles Parker**, English novelist: b. Bradenham Hall, Norfolk, 7 Feb. 1854. He is a brother of H. R. Haggard (q.v.) and besides serving with distinction in the English army has published 'Dodo and I'; 'Polyglot Poems'; 'Under Crescent and Star'; 'Love Rules the Camp,' and other books.

Haggard, Henry Rider, English novelist: b. Bradenham Hall, Norfolk, England, 22 June 1856. At 19 he went as secretary to Natal, and served on the staff of Theophilus Shepstone during his mission to the Transvaal in 1877. In 1884 he was admitted to the bar of Lincoln's Inn, but has devoted his time mainly to authorship and agriculture. His novels of South African life have attained a wide popularity both at home and in the United States. Among his works are: 'Cetewayo and His White Neighbors' (1882); 'Dawn' (1884); 'The Witch's Head' (1885); 'King Solomon's Mines' (1886); 'Jess' (1887); 'She' (1887); 'Allan Quatermain' (1888); 'Colonel Quaritch, V. C.' (1888); 'Cleopatra' (1889); 'Beatrice' (1890); 'Montezuma's Daughter' (1894); 'Doctor Therne' (1898); 'History of the Transvaal' (1900); 'Lysbeth' (1901); 'Rural England' (1902); 'A Gardener's Year' (1905); etc.

Haghe, Louis, loo-ē hāg, Belgian painter and lithographer: b. Tournai 17 March 1806; d. London 9 March 1885. At first an architect, he turned to landscape painting, in 1832 went to London, there as a lithographer entered partnership with William Day, then became interested in water-color painting, and in 1873–84 was president of the New Water Color Society. He painted by preference old Flemish interiors, such as 'Audience Chamber at Bruges,' but also scenes from English history ('Cromwell with the Letter of Charles I.'), and other subjects. In oils he was less successful. He worked entirely with his left hand.

Hagiographa, hā-ji-ŏg'ra-fa, a Greek word, signifying sacred writings, first introduced by Epiphanius as the rendering of the Hebrew word *Ketubim* = writings. The third and last great division of the Old Testament books, the others being Torah (the Law) and Nebiim (the Prophets). The three-fold division is alluded to in the New Testament, the several parts being described as "the law" or "Moses," "the Prophets," and "the Psalms" (Luke xxiii. 44). In this passage the Psalms are the Hagiographa. When the division is twofold, the Law and the Prophets, the Hagiographa are merged in the second category (Matt. v. 17, xi. 13). In our present Hebrew Bibles the Hagiographa consist of 13 books thus arranged: Psalms, Proverbs, Job, Song of Solomon, Ruth, Lamentations, Ecclesiastes, Esther, Daniel, Ezra, Nehemiah, and I. and II. Chronicles, but the list is otherwise drawn up by many authorities.

Hagonoy, hā-gō-noi', Philippines, a pueblo of the province of Bulacán, island of Luzon, on the Grande de la Pampagna River, about three miles from Manila Bay, seven miles southwest of Malolos. Lake Hagonoy is partly within the precincts of the town; this lake dries up in the summer season, so that the lake bed can be cultivated. Pop. 20,100.

Ha'good, Johnson, American soldier: b. Barnwell, S. C., 21 Feb. 1829; d. there 4 Jan. 1898. At the beginning of the Civil War he entered the Confederate army and in 1862 became a brigadier-general. He fought against Gillmore at the siege of Charleston (1863), and was commander of Battery Wagner. With his brigade he participated in the battle of Cold Harbor, and subsequently was in the trenches at Petersburg. He took part also in the operations north of the James after the surrender of Fort Harrison, and commanded Bragg's rear guard at Fort Fisher.

Hague, hāg, **Arnold**, American geologist: b. Boston 3 Dec. 1840. He was graduated at the Sheffield Scientific School of Yale (1863); studied three years at the universities of Göttingen and Heidelberg, and in 1867 was appointed assistant geologist on the United States geological exploration of the 40th parallel. His published works are: 'The Volcanoes of California, Oregon, and Washington Territory' (1883); 'The Volcanic Rocks of the Great Basin' (1884); 'The Volcanic Rocks of Salvador' (1886); 'Crystallization in the Igneous Rocks of Washoe'; 'Geology of the Yellowstone National Park' (1899).

Hague, George, Canadian financier: b. Rotherham, Yorkshire, Eng., 1825. In 1854 he went to Canada, where in 1856–76 he was connected with the Bank of Toronto. Subsequently he became general manager of the Merchants' Bank. He was also elected first president of the Canadian Bankers' Association and of the Montreal Good Government Association, and made generous gifts to various charities.

Hague, The (Holland), one of the chief towns, practically the capital of the kingdom, 33 miles southwest from Amsterdam, 16 miles northwest of Rotterdam, within 3 miles of the sea. It is the residence of the queen and of the foreign ambassadors, and the seat of the States-General of the Netherlands, and of the principal part of the central administration of the kingdom. Among the most important structures are the royal palace, in the Nordeinde, the palace of the Prince of Orange, the palace of Prince Frederick of the Netherlands; the Binnenhof, a large irregular building, founded in 1249, and containing the hall of assembly of the States-General, and various government offices, the provincial government-house, a large roomy edifice; the town-hall; the ministry of justice; the municipal museum, containing pictures and antiquities; the royal library, containing 500.000 volumes, besides valuable collections of medals and cameos; a cannon foundry, one of the largest and most conspicuous buildings in the town, colonial office, war office, the national monument, erected to commemorate the restoration in 1813 of Dutch independence. There are many other monuments to attract attention, particularly the equestrian statue of William I. of Orange, in front of the royal palace, and the figure of Shinoya, placed opposite the house in which he lived, etc. The royal collection of pictures, in the Prins Mauritshuis, embraces a picture gallery chiefly confined to Dutch masters. The parks, gardens, markets and suburbs of the city are famous for their beauty and interest. The special educational facilities of the city are excellent, and there are good public schools. There are also many learned societies in the city, among which may be mentioned The Hague Society for the Defense of the Christian Religion, the Witte Society, the Physics Society and the Netherland-India Institute. The Hague is not a manufacturing or commercial city, its chief revenue being derived from the throngs of foreigners who visit the city and watering place on the coast.

The origin of The Hague may be traced to the building of a hunting seat here of the counts of Holland in 1250. It is the birth-place of William II., prince of Orange, and William III., prince of Orange and king of England. Here were held the International Peace Congresses in 1901–2 and 1907. Pop. (1900) 199.285.

Hague Court, The, a permanent tribunal for international arbitration established as a result of The International Peace Conference, held in May, June, and July 1899 at The Hague, the governmental seat of the Netherlands.

The Hague International Peace Conference was one of the most important events which marked the close of the 19th century, and has been justly styled "the first great parliament of Man". The Conference assembled in response to a rescript issued by Czar Nicholas II. of Russia, 24 Aug. 1898, inviting to a conference all governments with representatives accredited to the Imperial Court. The Conference was to occupy itself with the great problem of universal peace, especially through the international diminution of armaments by land and sea, and the prevention of armed conflicts by pacific diplomatic procedure. The invitation was accepted by all the governments to whom it was tendered, and the first meeting for the Conference was fixed for 18 May 1899 at The Hague,—the capital of the Netherlands being selected, as stated by the Russian minister of foreign affairs, because "His Imperial Majesty considered it advisable that the Conference should not sit in the capital of one of the Great Powers where so many political interests centre that might impede the progress of a work in which all the countries are equally interested". The Conference was held at the celebrated Huis ten Bosch — House in the Wood,— the members assembling in the historically decorated Orange Hall. Each nation was represented by prominent diplomats, jurists, men of affairs, soldiers, and sailors, the representatives of the United States being Ambassador Andrew D. White, Minister Newel, General Crozier of the army, Captain Mahan of the navy, Seth Low, mayor of New York, and F. W. Holls of the New York bar. The president of the Conference was Baron de Staal of the Russian delegation.

Three committees were formed to deal respectively with disarmament, regulations in warfare, and mediation and arbitration. The final act of the Conference, signed 29 July 1899, comprised three conventions or treaties embodying the results arrived at by the committees. The first and most important was the Convention for the Peaceful Adjustment of International Differences by the permanent institution of a Court of Arbitration in the midst of the independent powers, accessible to all. The second convention dealt with the laws and usages of war on land, and the third convention provided for the adaption to naval warfare of the principles of the Geneva Convention of 1864. Regulations also prohibited the throwing of projectiles and explosives from balloons; the use of projectiles intended solely to diffuse deleterious and asphyxiating gases (this was not accepted by the United States and Great Britain); and the use of soft expansive bullets. The last two conventions embodied the wisest and most humane principles of military conduct resulting from a study and discussion of these matters during the half-century preceding, and which had their first codification in the "Instructions for Guidance of the Armies of the United States" issued at the beginning of the Civil War.

The Convention for the Peaceful Adjustment of International Differences, however, was the crowning work of the Conference, and was a source of much gratification to the advocates of international arbitration, as bringing to fruition a sentiment which for centuries had hoped for the establishment by the nations of the earth of some permanent form of congress or court, which should be vested with functions to insure the preservation of peace and to deliver the world from the strife and carnage with which it had been afflicted in all the past ages.

During the last decade of the 19th century peace advocates had been persistent in their advocacy of a permanent court of arbitration. In 1894, at its meeting in Holland, the Interparliamentary Union, a voluntary organization of members of the national legislative bodies of the nations, adopted a declaration in favor of a permanent court of arbitration; and in 1896 resolutions to the same effect were unanimously adopted in the United States at the annual Mohonk Conference on international arbitration, and by the New York State Bar Association, the latter presenting to the President of the United States a memorial setting forth a permanent tribunal as the essential feature of any general scheme of arbitration. The honor of presenting such a proposition in The Hague Conference fell to Lord Pauncefote, chairman of the British delegation; Germany was antagonistic, but the sentiment was so strongly in its favor that the German delegates were induced to withdraw their objection, and provision was made for its consummation. The fourth division of the Convention in 47 articles provides for the creation of the Court, defines its jurisdiction and the principles which are to guide it, specifies the manner in which its members are chosen, the rules governing its procedure, its awards, and other necessary details. The Convention provides that each of the 26 signatory powers shall appoint for a term of six years as members of the Permanent Court not more than four persons "of recognized competence in questions of international law, enjoying the highest moral reputation." These persons constitute a Permanent Court of Arbitration, accessible at all times and acting in accordance with the prescribed rules of procedure; they do not, however, sit as a collective body, but when two or more nations have a case to submit to arbitration, they select by mutual agreement one, three, or five members, who will act as the tribunal to try the case. Thus it happens some members of the Court may never be called upon to discharge the functions of a judge. Also, although The Hague is designated as a place where the Court shall hold its sessions, another place may be designated by agreement of the litigant parties. Under the presidency of the Dutch minister of foreign affairs, the diplomatic agents of the signatory powers, in residence at The Hague, constitute a permanent council which serves as the office of the Permanent Court of Arbitration. The first cases adjudged by the Court were the Pious Fund Claim between Mexico and the United States in 1902, and the difficulties of Venezuela with the United States and various European nations in 1903.

For the erection of a Temple of Peace comprising a comprehensive library of international law, and a courthouse which could be used as a meeting place for the Permanent Court of Arbitration, Andrew Carnegie on 25 April 1903 donated the sum of $1,500,000 to be administered by the Government of the Netherlands as trustee for the other signatory powers of The Hague Convention of 29 July, 1899. Consult Foster, "Arbitration and The Hague Court" (1904); Holls, "The Peace Conference at The Hague" (1900); Penfield, "Some Problems of International Arbitration" (1904).

Hahn, hän, **August**, German Protestant theologian: b. Grossosterhausen, Saxony, 27 March 1792; d. Breslau, 13 May 1863. He studied at Leipzig, and was appointed in 1819 professor extraordinary of theology at Königsberg. In 1826 he became professor of theology at Leipzig, and in 1833 was called to Breslau, and in 1844 became general superintendent of the Province of Silesia. Among his best known works are his Hebrew Bible (1831) and his 'Bibliothek der Symbole und Glaubensiegeln der Apostolisch-Katholischen Kirche' (1842, 2d ed. 1878).

Hahnemann, hä'nĕ-män, **Samuel Christian Friedrich**, German physician: founder of the homœopathic system: b. Meissen 10 April 1755; d. Paris 2 July 1843. In 1775 he went to Leipsic, where, against his father's will, he studied medicine, and found the means chiefly by the translation of English medical works. At a later period he went to Vienna, and after some years he returned and completed his studies at Erlangen. He afterward practised medicine at various places, but gave it up for a time, until, in 1789, by the translation of Cullen's 'Materia Medica,' he was led to adopt a new method of cure. His system was fully explained in his 'Organon der rationellen Heilkunde' (1810). In 1820 the government prohibited him from dispensing medicines, and thereby, from his inability to have them prepared by druggists, obliged him to give up his practice. Duke Ferdinand of Anhalt-Köthen, however, gave him an asylum at Köthen, and conferred upon him the title of Hofrath. Here he remained till 1833, when he proceeded to Paris, where he hoped to find a wider sphere for his operations. The result equaled his expectations; and a royal decree issued in 1835 authorized him to practise homœopathy. Among his works should be named 'Dictionary of Materia Medica,' his 'Essays on Poisoning by Arsenic, and on the Effects of Coffee,' and his treatise on 'Chronic Affections.' Consult: 'Life and Letters,' by Bradford (1895). See HOMŒOPATHY.

Haidarabad, hī-da-ra-bäd'. See HYDERABAD.

Hail, small masses of ice or frozen rain falling from the clouds in showers or storms, varying in their form, being either angular, pyramidal, or stellated; as well as in their consistency, being sometimes as hard as ice and sometimes as soft as snow. The theory that the formation of hail is dependent on the presence of whirlwind phenomena in the upper atmosphere, has gained considerable acceptance. The formation of the alternate coatings of ice and snow is, on this theory, produced by a series of vertical ascents and descents to and from an upper snow region and a lower region where the temperature is rather higher.

Hail Columbia, a national song of the United States. The words written during a period of great political excitement in 1798, by Judge Joseph Hopkinson, were set to the melody of the 'President's March,' composed the same year in honor of President Washington, by Pfyles, orchestral leader at the John Street Theatre, New York. The composition first sung at a theatrical benefit attained great popularity, and on account of its patriotic sentiments has become a representative national song.

Hail Mary, Ave Maria, or **Angelical Salutation**, a prayer consisting of three parts: the first, the words by which the angel addressed the Blessed Virgin (Luke i. 24) with the word Mary after "Hail"; the second, the words by which Elizabeth addressed Mary (Luke i. 42), to which has been added the word Jesus; the third, the words: "Holy Mary, Mother of God, pray for us sinners now and at the hour of our death — Amen." The name, "Angelical Salutation," comes from the first part of the prayer, which is the salutation of the angel. The first and second parts, taken from the Bible, were in use in their present form in early times; but the words of the third part were varied until the 16th century when the present form was approved and adopted by Pope Pius V. The prayer is in general use among Roman Catholics and is found in many Anglican books of devotion.

Hailes, Lord. See DALRYMPLE, SIR DAVID.

Haileybury College, England, an institution at Hailey, near Hertford, 20 miles north of London, founded by the East India Company in 1806, as a training school for admittance to the service of the company. It attained a high reputation, and numbered among its alumni, the most distinguished names connected with the Indian administration of the 19th century. After the Indian Mutiny of 1857–8, and the government reorganization of the Indian Civil Service, the college was closed for four years. It was reopened under a royal charter in 1862 as a public school, and while maintaining many of the traditions of its famous predecessor is no longer an Indian service training ground. Handsome modern buildings have been added to the old college quadrangle, built in 1809; the surrounding grounds cover nearly 100 acres. Consult: Lowell, 'Colonial Civil Service' (1900); Monier-Williams, 'Memorials of Old Haileybury College' (1894).

Hailmann, hāl'man, **William Nicholas**, American educator: b. Canton Glarus, Switzerland, 20 Oct. 1836. He studied at the medical college of Louisville, Ky., was director of the German-American Seminary at Detroit in 1878–83, in 1894–8 was national superintendent of Indian schools, and in 1898 became superintendent of instruction at Dayton, Ohio. Among his writings are: 'History of Pedagogy' (1870); 'The Application of Psychology to Teaching' (1887); 'Place and Development of Purpose in Education' (1899).

Hair, strictly speaking, the peculiar epidermal covering of the body in mammals, although by analogy the term is loosely applied elsewhere, as to the setæ of annelids, the slender modified spines of caterpillars, etc. Hair is present in every mammal, although the amount may be greatly reduced so that in certain whales it occurs only in the fœtal stage, in others is limited to two bristles on the lips. The structure is best understood by following the development. In the earliest stage (Fig. 1) there is merely a thickening of the Malpighian layer of the epidermis (see SKIN) at the points where the hair is to be found. This thickening increases in amount, and thus forms a solid plug (Fig. 2) which projects into the underlying

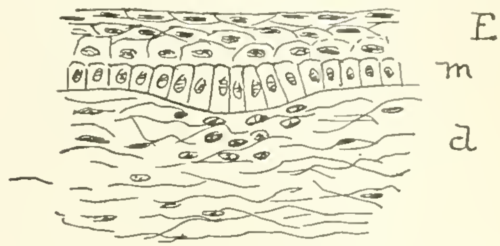


FIG. 1.—SECTION THROUGH THE EARLIEST STAGE OF HAIR FORMATION.

E, epidermis, showing in *m*, the Malpighian layer, the elongation of the cells; *d*, derma, with proliferation of cells to form the papilla shown in Fig. 2.

derma. At the same time the cells, which are scanty in most parts of the derma, become abundant beneath the ingrowing plug, and form the basis of the future papilla. Next a ring-shaped pit appears on the outer surface of the plug and gradually becomes deeper, cutting the epidermis into two parts, an outer root-sheath and an inner rod-like part, the hair itself, while

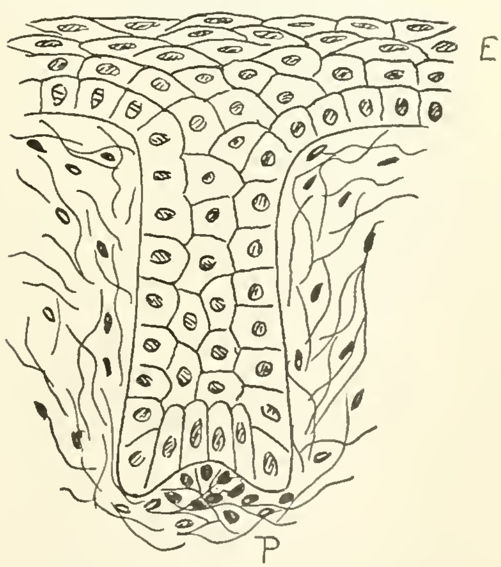

FIG. 2.— SECOND STAGE IN HAIR FORMATION.

The epidermis, *E*, has now formed a solid plug extending down into the derma; the papilla, *P*, has begun to form at the apex of the epidermal ingrowth.

the pit forms the follicle (see Fig. 3). The papilla grows into the base, bearing blood-vessels, while the Malpighian layer at this point forms the tissue from which the hair grows. In the hair itself several parts are recognized — a central pithy axis, the medulla; next, a layer of cells, the cortex, and outside this, forming the outer surface of the hair, the cuticle. Farther down in the follicle is the inner root-sheath, formed of two layers of cells known respectively by the names of the two anatomists, Henle and Huxley, who first described them. The Malpighian cells, at the base of the follicle, divide continually, and the new cells thus formed are pushed outward and are transformed into the hair. From this it will be seen that the hair is not a secretion but is composed of cornified cells. It is also apparent that the hair is not hollow.

The differences between the different kinds of hair are largely those of shape and of the amount of the various parts present. Thus in many animals two kinds of hair occur, longer and coarser hair on the outside, and beneath this a closer and softer under-fur. The coarser hairs may be enlarged into bristles, or still more enlarged to form spines, like those of the porcupines and hedgehogs. Again the hairs may become united to each other, the result being the formation of scales like those of the pangolins or horns like those of the rhinoceros. In some

cases the hair is perfectly straight, again it may be curly. The straight hairs are circular in section, the curly are flattened, the amount of curl being proportional to the amount of flattening. Certain hairs (wool of sheep, etc.) have the property of felting. This depends upon the scale-like projections of the cells of the cuticular layer. The color of the hair is due to the presence of pigments belonging to the group of melanins.

Several accessory structures (Fig. 5) are connected with the hair: sebaceous glands which empty an oily substance into the follicle to keep the hair in a moist, soft condition; nerves which are distributed to the wall of the follicle and thus render the hairs to a certain extent organs of touch, as in the whiskers (*vibrissæ*) of cats; and muscles for the erection of the hair (*erectores pili*). This erection may be to increase the warmth of the body by entangling a layer of air among the hairs, or it may have the purpose of protection against injury, either by terrifying some enemy or by affording a loose envelope around the body some distance from

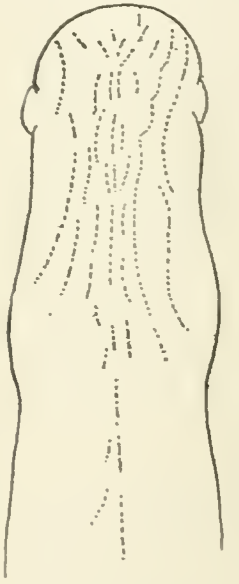

FIG. 4.— Hair tracts on the back of an embryo cat (after MAURER).

the flesh. Usually the hair is shed (molted) at regular intervals, but there are exceptions, as in the mane and tail of horses, as well as in the case of man.. The hair is not scattered irregularly over the body but occurs with more or less regular arrangement. In the early embryos it is not uncommon to find it distributed in regular lines (Fig. 4). Later the lines become broken up into groups of hairs, the arrangement being characteristic of the species, but without any broad morphological significance. It should be noted that although hair and pin-feathers closely resemble each other in general appearance they are very distinct structures, hair originating in a thickening of the epidermis, while feathers (q.v.) like scales are dermal in origin. Most of the literature relating to the hair is in German. Consult the writings of Maurer, Meigerle, Weber, and Poulton, 'Quarterly Journal of Microscopical Science,' Vol. XXXVI. (1894).

J. S. KINGSLEY,
Professor of Zoology, Tufts College.

Hair-dressing. As the hair is the greatest ornament of the human body, the arrangement of it has always been one of the most important duties of the toilet. The ancient Hebrews esteemed fine hair a great beauty, as several passages of Scripture show. The Hebrew women plaited their hair, confined it with gold and silver pins, and adorned it with precious stones. Herodotus informs us that the ancient Egyptians let the hair of the head and beard grow only when they were in mourning. Even in the case of young children they were wont to shave the head, leaving only a few locks on the front, sides, and back. The women, however, wore their natural hair long and plaited, often reaching down in the form of strings to the bottom of the shoulder-blades. A practice the very opposite seems to have prevailed among the ancient Assyrians, as regards men at least. In the Assyrian sculptures the hair always appears long, combed closely down upon the head, and shedding itself in a mass of curls on the shoulders. The beard was also allowed to grow to its full length. To the Greeks the hair was an object of great importance, and they devoted much time to it. Homer regularly applies to the Greeks an epithet denoting that they had ample flowing locks.

The Athenians curled their hair, and fastened it up with small golden ornaments shaped like grasshoppers, in token of their being "sons of the earth." Gold, pearls, precious stones, flowers, and ribbons were employed to ornament the tresses, and nets were also worn. False hair seems to have been latterly used, and in great quantities, both curled and frizzled. Married women were distinguished from the unmarried by the manner in which the hair was parted in front. The Romans generally wore no covering on their heads except at sacred rites, games, festivals, and in war. Women in later times wore great quantities of false hair, and dyeing the hair was common. They were particularly addicted to frizzling and curling their hair, raising it into stories of curls, some of great height. Long hairpins were used to fix the curls. Arranging the hair was a matter of great importance. Slaves frizzled and adjusted it, and a number of females learned in the art of the coiffeur superintended the process, while the fair dame herself watched the growing edifice of curls, gold, precious stones, crowns of flowers, in a mirror of polished steel, brass, tin, or silver.

On the introduction of Christianity the apostles preached against the prevailing fashion of dressing the hair. St. Paul regarded it as a shame for a man to have long hair, though the reverse for a woman. It then became common for men to cut the hair short; hence the clergy soon wore the hair quite short, and afterward even shaved their heads in part. In the time of Francis I., king of France, long hair was worn at court; but the king, proud of his wound on the head, himself wore short hair, in the Italian and Swiss fashion, which soon became general. In the reign of Louis XIII. the fashion of wearing long hair was revived, and as it became desirable to have the hair curling, the wigs were also restored.

Among the Anglo-Saxon women the custom prevailed of parting, curling, and turning the hair over the back. Anglo-Saxon men wore their hair long at the time of the Norman invasion, while the conquerors adopted the singular fashion of shaving the back of the head. Under Elizabeth, false hair was greatly worn, padded with cushions, under-propped, with forks, wires, etc., and adorned with gold, pearls, and precious stones. It is well known that the gallants of Charles I.'s time wore their hair in long flowing locks, while the closely-cropped hair of the Puritans brought the name of Roundheads down upon them. In the Queen Anne era, while the ladies wore their hair long, they generally tied it in a knot, and almost completely covered it up by extravagant head-dresses of wire and paste-board, or feathers and ribbons. At that time, and for long after, the coiffure of a lady was such a serious affair, and the hair-dressers were so fully employed, that fair wearers were often compelled to have that part of their toilet done two days before a ball, and pass the night on a chair for fear of disturbing the elaborate arrangement. This was the period of the prevalence of whitening the head with hair-powder, a preparation of pulverized starch and perfume. The custom of wearing it was introduced from France into England in the reign of Charles II. To make the powder hold, the hair was usually greased with pomade. In 1795 a tax was put upon the use of hair-powder in Great Britain, and at one time yielded $100,000 per annum, but the result was that hair-powder fell out of general use, and the French Revolution, which overturned so many antiquated customs, further contributed to throw it into disfavor. The chignon was introduced and had its day of popular favor in the 19th century, bringing back the fashion of false hair and padding to a greater or less extent. With respect to men's hair, short cutting is now universal, long hair being considered as a sign of slovenliness or eccentricity.

Hair Manufactures, the industries by which the hair of animals is employed in the production of commercial articles of ornament or utility. The strongest and most durable of haircloth is woven from the tails of horses. The horsehair from the mane is twisted into ropes and after being boiled and then dried in an oven is untwisted and in a half-matted condition employed for stuffing beds and cushions. The hair of cows is employed as a binder for plaster; in Europe it is sometimes woven into carpets, or hose. The Chinese use pig's hair for the same purposes. The stiff hair, or bristles from the ridge of the hog's back, are made into brushes, for the hair, teeth, or nails; as well as into brooms, and the larger painting and whitewashing brushes. Human hair is used for wigs, toupees and frisettes. See WIG.

Hair Pencil, in painting, a fine brush made of the hairs of the camel, sable, badger, squirrel, marten, raccoon, goat, etc. The various sizes require the quills of the crow, pigeon, goose, turkey, or swan. Hair pencils are used by artists in water colors, and by house and sign painters in fine work.

Hair-tail. See SCABBARD-FISH.

Hair-worm. See EELWORM.

Hairless Dogs. Several races of domestic dogs are bred in the warmer parts of the world, whose skins are nearly hairless. In China and Farther India a large dog of this description, called polygar, is used in hunting. Central Africa has a breed resembling a small black greyhound. A hairless dog is found mummified in prehistoric Peruvian tombs, and others were formerly prevalent in the West Indies, or is still known in Mexico. These have been cultivated by fanciers in the United States, and constitute a recognized show class. They are small and terrier-like, brownish or bluish-black, wrinkled, and have only a few straggling hairs on the body, with sometimes a tuft on the head.

Haiti, Hayti, or Santo Domingo, the second largest island of the West Indies, lying between Cuba and Porto Rico, the principal adjacent islands being La Gonave, at the entrance of Port-au-Prince, Tortuga Island, before Port de Paix, and Vache Island, before Cayes. The whole island is about 638 kilometres long with a surface of 75,074 square kilometres. It comprises two republics: the Republic of Haiti in the west and the Dominican Republic (q.v.) in the east, with a total population of 1,700,000. The land is very fertile, being irrigated by 47 rivers; 14 mountain chains are spread over the island. The mines are still to be worked and there is a large field for investment. Haiti is healthful. From June to September it is hot in the lowlands; but regular land and sea breezes moderate the temperature. In the mountains it is always cool. There is a dry and a wet season. There are no poisonous snakes or insects. The sanitary condition is excellent.

When, on 6 Dec. 1492, Columbus discovered Haiti, the island was divided into five states or "cacicats." The inhabitants, called Indians, had an easy life and were ruled by chiefs whose title was "cacics." The natives could not stand the hard work imposed on them by the Spaniards; they died rapidly. Then began the import from Africa of the black slaves. The Spaniards enjoyed alone their new possession until 1630, when the French adventurers known as "buccaneers" and "freebooters," after occupying Tortuga Island, undertook the conquest of what became St. Domingue.

From the intercourse between white and black, resulted in St. Domingue an intermediary class, the mulattoes. Most of the latter, on account of their relationship, were not slaves; and their black mothers, their relatives, and other slaves who could own enough money to redeem themselves, little by little obtained their freedom. These free colored people were not allowed any political rights. They at first did not resent it. They endeavored to become land-owners.

When the French Revolution broke out in 1789 these free men or "affranchis," who by that time had accumulated wealth, asked for equality of political rights. The Assemblee Nationale granted them those rights. But the French landlords or "colons" were not at all pleased to have the colored people for their fellow citizens. A hard struggle began. The "colons" called the English to their rescue.

At the end of the year 1793, the English took possession of a part of the island. St Domingue was considered lost to France, being occupied partly by the Spaniards, partly by the English, when Toussaint Louverture (q.v.) espoused the cause of France. This extraordinary man, who, up to 40 years of age, was a slave, revealed himself a great general and a first-class statesman. He succeeded in ridding the country of the Spaniards and in expelling the English, who, after an occupation of about five years, were compelled to abandon their prey. The French government rewarded him by appointing him major-general and governor of the island. Later on, Napoleon I. thought that Toussaint Louverture was too powerful. In 1801 he appointed his brother-in-law, Gen. Leclerc, governor of St. Domingue, and sent a formidable army to reduce the authority of Louverture. Toussaint Louverture, after a few skirmishes, surrendered and retired on one of his properties. Nevertheless, Gen. Leclerc caused him to be arrested and deported to France in June 1802; to that end the French general resorted to treachery.

The colored people took up arms against the French domination in September 1802 under the leadership of Gen. Dessalines. The fight was very severe. And at the end of the year 1803, Rochambeau, who, at the death of Gen. Leclerc, was in command of the French army, hard pressed in the city of Cape Haiti by the black troops, was compelled to capitulate. And on 1 Jan. 1804 Haiti proclaimed its independence, with Gen. Dessalines as its first ruler. Slavery was abolished. Haiti was then the first country to rid humanity of such a sad practice.

In 1822 the Spanish part came under the administration of Haiti; and the whole island was ruled by one government. But in 1844 the Spanish part seceded and established an independent government, known to-day as the Dominican Republic.

The Republic of Haiti is administered by a president, elected for seven years, by the House of Representatives and the Senate assembled in "Assemblée Nationale." The president is assisted by six ministers or secretaries of state. The House of Representatives is elected by the people for three years, and the Senate is elected by the House of Representatives for six years; but every two years the third part of the Senate is renewed.

The judiciary organization consists of a supreme court (Tribunal de Cassation) of civil, criminal, correctional courts, and of justices of the peace.

Education is compulsory and gratuitous. The primary as well as the high schools are freely open to all. Haiti devotes now a sixth of its revenues to education.

French is the language of Haiti, though the country people speak a patois called "creole."

The religion of the people is Roman Catholic. There are an archbishop, three bishops, and in every commune at least a priest. The pope entertains a diplomatic representative, a legate, at Port-au-Prince, and Haiti has a minister accredited to the Holy See. Freedom of conscience is, however, guaranteed; and all cults are protected. Haitian citizens only can own real estate. Any foreigner may easily be naturalized.

Haiti produces coffee, cocoa, logwood, mahogany, and cotton; tortoise-shells, all kind of cabinet wood, hides, honey, bees-wax, etc., are also exported; for home consumption, they make sugar, rum, soap, straw hats, pottery, matches, artificial ice, etc. There is a railroad from Cape Haiti to Grande Rivière and another one from Port-au-Prince to "L'Etang." These railroads are managed by Haitian companies; so are the inland telegraph and telephone lines. The area of the Republic is estimated at 26,000 square kilometres and the population (1900) 1,294,400.

J. N. LÉGER,

Envoyé Extraordinare et Ministre Plénipotentiaire d'Haïti aux Etats-Unis.

Hake, Alfred Egmont, English journalist and author. He is a son of Thomas Gordon Hake (q.v.) and cousin of General C. E. Gor-

MAIN STREET, PORT-AU PRINCE, HAITI

don (q.v.), whose life he has written in 'The Story of Chinese Gordon' (1883). Other works by him are: 'Paris Originals' (1878); 'Flattering Tales' (1882); 'The Unemployed Problem Solved' (1883); 'Events in the Taiping Rebellion' (1891); 'Suffering London' (1892); 'Gordon in China and the Soudan' (1896); 'Irish Finance' (1897).

Hake, Thomas Gordon, English poet and physician: b. Leeds 1809; d. London 11 Jan. 1895. He took his medical degree at Glasgow University in 1831, and practised his profession in East Anglia, later becoming the physician and friend of Dante Gabriel Rossetti. His poetry is thoroughly original, but very subtly philosophical. His works include: 'Poetic Lucubrations' (1828); 'Vates: A Prose Epic' (1839); 'Madeline with Other Poems and Parables' (1871); 'New Symbols' (1875); 'Maiden Ecstasy,' verse (1880); 'The Serpent Play, a Divine Pastoral' (1883); 'Memoirs of Eighty Years' (1892).

Hakes, Fishes of the family *Gadidæ* and chiefly of the genera *Phycis* and *Merluccius,* distinguishable from the cod and haddock by having only two dorsal fins. *Phycis* has a chin barbel and filamentous ventral fins, both of which are lacking in *Merluccius.* The squirrel-hake (*Phycis chuss*) and white hake (*P. tenuis*), both also called ling or codling, are common bottom fish on our Atlantic coast from Virginia northward. The silver hake or whiting (*Merluccius bilinearis*) has a similar range, but is less common in shallow waters and leads a roving life in search of herrings and other smaller fishes. Various other species occur in the North Atlantic and Pacific Oceans. The hake fishery is of considerable extent, and the product is salted and sold chiefly as boneless cod. The dried air-bladders are utilized in the manufacture of isinglass.

Hakim, ha-kēm', a Turkish word, signifying lord and frequently in the Koran applied to Allah, God, as in the Greek and English versions of the Jewish Scriptures the word Lord is used for Jehovah. It is now-a-days especially given as a title of honor to the imperial physician of the Sultan, who is Hakim bashi, that is to say, the chief of the physicians, always a Turk; whilst the physicians in the seraglio under him are western Europeans, Greeks and Jews.

Hakluyt, hăk'loot, **Richard,** English geographer: b. about 1553; d. London 23 Nov. 1616. He entered Christ Church College, Oxford, in 1570, and became so eminent for his acquaintance with cosmography that he was appointed public lecturer on that science. In 1582 he published a small collection of voyages and discoveries, forming the basis of a subsequent work on a larger scale. In 1584–88 he was in Paris as chaplain to Sir Edward Stafford. On his return he published (in 1589) his famous collection of 'The Principal Navigations, Voyages, and Discoveries of the English Nation, made by Sea, or over Land, within the Compass of these 1500 Years.' The first volume of a new edition of his great work was published in 1598, the second and third in 1599 and 1600. In 1602 he became prebendary, and in 1603 archdeacon, of Westminster, and next year he was appointed a chaplain of the Savoy. He was interred in Westminster Abbey. He published several other geographical works, among them 'Virginia Richly Valued, etc.' (1609), a translation from the Portuguese. An edition of his chief work appeared in 16 vols. 1885–90. The manuscript papers of Hakluyt were used by Purchas in his 'Pilgrims.'

Hakluyt Society, of Great Britain, organized in December 1846, for the purpose of printing and distributing among its members rare volumes on voyages and travels, and geographical records. Between 1847 and 1900 fully 100 volumes were issued under the editorial supervision of eminent authorities. Among these publications were: 'Select Letters of Columbus' (1849); Raleigh, 'Guiana' (1848); and 'Danish Arctic Expedition' (1897).

Halbig, Johann, yō'hän häl'bĭg, German sculptor: b. Donnersdorf, Lower Franconia, 13 July 1814; d. Munich 29 Aug. 1882. He studied at the Munich Academy, and elsewhere, finally establishing himself at Munich, where he became a professor in the Polytechnic School in 1845. His most important work is the quadriga with four colossal lions for the triumphal gateway, Munich. He also executed the Platen memorial at Ansbach, the bronze statue of Fraunhofer at Munich, the 'Emancipation' group in New York, the 'Crucifixion' group for Oberammergau, and numerous busts.

Haldeman, hâl'dĕ-man, **Samuel Stehman,** American naturalist: b. Locust Grove, Pa., 12 Aug. 1812; d. Chickies, Pa., 10 Sept. 1880. He was educated at Dickinson College, Pa., was professor of natural sciences at the University of Pennsylvania in 1851–5; and of comparative philology there 1869–80. He published 'Fresh-Water Univalve Mollusca of the United States' (1840); 'Zoological Contributions' (1842–3); 'Elements of Latin Pronunciation' (1851); 'Affixes in Their Origin and Application' (1865); 'Pennsylvania Dutch' (1872); 'Outlines of Etymology' (1877); 'Analytic Orthography' (1858); etc.

Hal'dimand, Sir **Frederick,** Swiss soldier in the English service: b. Canton of Neuchâtel, Switzerland, October 1718; d. Yverdun, Switzerland, 5 June 1791. He served in the army of Sardinia and in that of Prussia under Frederick the Great, later became a member of the Swiss guard at The Hague, and was there stationed when with Henry Bouquet (q.v.) he enlisted in 1756 in the British army for service in America. He organized, largely from Pennsylvania, a regiment composed of Swiss, Germans, and others and known as the 'Royal Americans,' and became its commander. In 1759 he won distinction by his successful defense of Oswego against the attack of 4,000 French and Indians, in 1767–73 commanded the garrison at Pensacola, Fla., and assisted Gage in the siege of Boston. From 1778 to 1784 he was governor of Canada, severely repressed Canadian sympathy with the Revolution, and offered an asylum to royalist refugees. His valuable official correspondence is in the possession of the British Museum. Upon his return to England actions for false imprisonment were successfully brought against him.

Hale, Charles Reuben, American Protestant Episcopal bishop: b. Lewiston, Pa., 14 March 1837; d. Cairo, Ill., 25 Dec. 1900. He was graduated at the University of Pennsylvania in 1858; entered the Episcopal ministry and in 1892 was made assistant bishop of Springfield, Ill., with the title of Bishop of Cairo. He was an authority upon matters pertaining to the Greek Church and his writings, all of a very scholarly cast, mainly relate to the history, liturgies and customs of that communion.

Hale, Edward Everett, American Unitarian clergyman and author: b. Boston, Mass., 3 April 1822. His father was Nathan Hale (q.v.), the first editor of the Boston *Daily Advertiser,* and the son was educated at the Boston Latin School and Harvard College. Later he studied theology and after being licensed to preach in 1842 was pastor of the Church of the Unity, Worcester, Mass., 1846–56. He then became pastor of the South Congregational Society in Boston, a Unitarian Church, and has been its pastor emeritus from 1901. In the Unitarian body he has long been one of its foremost men, and of a radical rather than a conservative type, while yet strongly loyal to the Unitarian faith. As a preacher he has always been popular, and his talents for organization have borne fruit in such humanitarian societies as the Harry Wadsworth Clubs, King's Daughters, Look Up Legions, and others. For several years he edited 'Old and New,' a magazine afterward merged in 'Scribner's Monthly,' and has edited 'Lend a Hand,' a journal of organized charity, since 1886. Since his retirement from active pastoral work he has been active in various denominational and other religious and social enterprises, and still continues to preach and lecture at frequent intervals. His 80th birthday was celebrated by a gathering in Symphony Hall, Boston, composed of representative persons from all denominations in his native city, as well as of civic and state officials, assembled to testify to the regard in which he was held, irrespective of creed or race. To Americans in general, however, he is best known as an author, and in spite of his countless clerical labors he has been one of the most voluminous of American writers. Much of his work is from necessity ephemeral in its nature, but when he has consciously wrought with an artistic end in view his level of attainment has been high. His short story, 'The Man Without a Country,' has long been accounted an American classic, and even more skilful in construction and perfect in finish, 'My Double and How he Undid Me,' and 'In His Name' have been almost equally popular. In extravaganzas like 'The Brick Moon,' such an absolute air of verisimilitude is preserved that the absurdest conceptions of the tale appear more than half credible. 'The Man Without a Country' was indeed accepted as a record of fact by many readers on its first appearance in 1863, although the theme is in its conception most improbable, and its author was obliged to state at a later date that it had no foundation in fact. The list of his published works is a long one, including nearly 70 titles and besides those already named may be cited 'Margaret Percival in America' (1850); 'Elements of Christian Doctrine' (1860); 'If, Yes, and Perhaps' (1868); 'Sybaris and Other Homes' (1869); 'The Ingham Papers' (1869); 'His Level Best and Other Stories' (1872); 'Philip Nolan's Friends' (1876); 'The Fortunes of Rachel' (1884); 'Boys' Heroes' (1886); 'Life of George Washington Studied Anew' (1887); 'They Saw a Great Light' (1889); 'The Story of Christopher Columbus' (1891); 'The Story of Massachusetts' (1891); 'The New Harry and Lucy' (1892); 'East and West or the New Ohio' (1892); 'A New England Boyhood' (1893); 'Fifty Years: Poems' (1893); 'If Jesus Came to Boston' (1894); 'Susan's Escort' (1895); 'Historic Boston' (1898); 'Lowell and His Friends' (1899); 'Memories of a Hundred Years' (1900). With his sister Susan Hale (q.v.) he has written a series of travel books entitled 'Family Flights through France, Germany, etc.,' and he has also edited numerous volumes from 'The Rosary' (1848) to 'Unpublished Essays of Emerson' (1895).

Hale, Eugene, American politician: b. Turner, Oxford County, Me., 9 June 1836. After study of law he was admitted to the bar in 1857, began practice at Ellsworth, Me., and was a member of the Maine legislature in 1867, 1868 and 1880. In 1868 he was elected representative to Congress, and in that capacity served until 1878, acting on the committee on appropriations, and during his last term being chairman of the Republican congressional committee. In 1868, 1876 and 1880 he was a delegate to the Republican national conventions of those years, in 1874 was offered the post of postmaster-general and in 1877 that of secretary of the navy, but declined both. He was a member of Grant's commission appointed for canvass of the Louisiana presidential vote in 1876. He succeeded Hannibal Hamlin in the United States Senate in 1881, and was re-elected in 1887, 1893, 1899 and 1905. In the Senate he became known as a Republican leader, interesting as a speaker and skilful in matters of legislative routine.

Hale, George Ellery, American astronomer: b. Chicago 29 June 1868. He was graduated from the Massachusetts Institute of Technology in 1890, studied also in the Harvard observatory and at Berlin, was professor of astrophysics at Beloit College in 1891–3, lecturer in astrophysics in Northwestern University, 1891–3, associate professor of astrophysics in the University of Chicago 1892–7; director of the Yerkes Observatory (Williams Bay, Wis.) of the university 1895–1905, professor of astrophysics 1897–1905, and in 1905 director of the Solar observatory of Carnegie Institution at Mt. Wilson, Cal. He edited the 'Astrophysical Journal' from 1895, and published papers on astronomical subjects.

Hale, Horatio, American ethnologist: b. Newport, N. H., 3 May 1817; d. Clinton, Ontario, 29 Dec. 1896. He was a son of Sarah J. Hale (q.v.). He was graduated from Harvard in 1837 and the next year was appointed philologist to the government exploring expedition under Captain Wilkes, and was thus enabled to study the languages of the Pacific Islands, North and South America, Australia, and Africa. The results of his observations were published in 'Ethnography and Philology' (1846). He then studied law, was admitted to the Chicago bar, and removing to Canada in 1855 practised law at Clinton. His other works are: 'Indian Migrations as Evidenced by Language' (1883); 'The Iroquois Book of Rites' (1883); 'A Report on Blackfoot Tribes' (1885). He was classed among the foremost philologists of his

EDWARD EVERETT HALE

time and was a member of learned societies at home and abroad.

Hale, Irving, American soldier and electrician: b. North Bloomfield, N. Y., 28 Aug. 1861. He was graduated from the United States Military Academy in 1884, was assigned to the engineer corps, was instructor in engineering at the Military Academy in 1888–9, and in 1890 resigned from the army. He became manager of the General Electric Company for the district comprising Utah, Wyoming, Colorado, and New Mexico, with headquarters at Denver; upon the outbreak of the Spanish-American war was appointed colonel of the 1st regiment of Colorado volunteers, was promoted brigadier-general for distinguished service in the Philippines, and later brevetted major-general. In 1899 he was honorably discharged from the volunteer service. His writings include papers on electrical subjects in scientific and engineering journals and in the proceedings of the Colorado Scientific society.

Hale, John Parker, American legislator and diplomat: b. Rochester, N. H., 31 March 1806; d. Dover, N. H., 19 Nov. 1873. After graduation from Bowdoin in 1827 and study of the law at Rochester and Dover, he was admitted to the bar in 1830, in 1832 was elected a Democratic representative in the State legislature, and in 1834-41 was United States district attorney. In 1842 he was elected to Congress, where, though remaining a Democrat, he stoutly opposed the "gag-rule" which sought the exclusion of anti-slavery petitions. He was renominated; but previous to the election the annexation of Texas was made a plank of the Democratic platform, and the State legislature of New Hampshire directed its congressmen and senators to support the measure. Hale in a public statement refused to do this and the Democratic State Convention was then reassembled and his name stricken from the ticket. Hale ran as an independent Democrat, but no candidate received a majority. In 1846, after a spirited canvass known as the "Hale storm of 1845," he was elected to the lower house of the legislature, and became its speaker. In 1847 he was elected to the United States Senate, where he was the first, and, until joined by Salmon P. Chase in 1849, the only avowed anti-slavery member. He was an orator of fine abilities, and besides opposing the slave system, secured laws abolishing flogging and grog-ration in the navy. He was nominated for president by the Free-Soil Democrats in 1852, and received 157,685 votes. In 1855 he was elected to the Senate for the four years of the unexpired term of C. G. Atherton, deceased, and in 1858 for a full term. During the Civil War he supported the Lincoln administration. He was United States minister to Spain in 1865–9.

Hale, Lucretia Peabody, American author, sister of E. E. Hale (q.v.): b. Boston, Mass., 2 Sept. 1820; d. there 12 June 1900. She was very popular as a writer for young people, and in addition to 'The Lord's Supper and Its Observance' (1866); 'The Service of Sorrow' (1867); 'The Wolf at the Door' in the 'No Name Series' (1877), she published for young readers 'The Peterkin Papers' (1882), and 'The Last of the Peterkins' (1886). She also wrote 'The New Harry and Lucy' (with E. E. Hale). She will be longest remembered as the creator of the Peterkin Family, who have become widely recognized types of character.

Hale, Sir Matthew, English jurist: b. Alderley, Gloucestershire, 1 Nov. 1609; d. there 25 Dec. 1676. He was educated at Oxford and Lincoln's Inn, and is said to have studied 16 hours daily, extending his researches to natural philosophy, mathematics, history, and divinity, as well as the sciences more immediately connected with his profession. He was called to the bar before the commencement of the civil war; and in the conflict of parties which took place his moderation, accompanied as it was by personal integrity and skill in his profession, secured him the esteem of both royalists and parliamentarians in his own time. In 1654 he became a judge of the Common-bench (the former King's-bench), in which station he displayed firmness of principle sufficient to give offense to the Protector. He was a member of the parliament which restored Charles II., and one of the members most active in passing the Act of Indemnity. In 1660 he was knighted, and made chief baron of the Court of Exchequer. He was the last English judge who sanctioned the conviction of culprits for witchcraft. He was raised to the chief-justiceship of the King's-bench in 1671. After his death appeared his 'History of the Pleas of the Crown'; 'Jurisdiction of the Lords' House'; and 'The History of the Common Law of England. He also wrote several works on scientific and religious subjects.

Hale, Nathan, American revolutionary officer: b. Coventry, Conn., 6 June 1755; d. New York 22 Sept. 1776. He was graduated at Yale in 1773, and engaged as a teacher, first at East Haddam, and afterward at New London. His parents intended him for the ministry; but on the Lexington alarm in 1775 he wrote to his father, in a Connecticut regiment, saying "that a sense of duty urged him to sacrifice everything for his country," and soon after entered the army as lieutenant (1775) and in a few months was promoted to be captain (1776). While with the troops near Boston he was vigilant and faithful in every point of duty; and according to a tradition of doubtful authenticity, in September 1776, when in New York, he, with an associate, planned and effected the capture of a British sloop laden with provisions, taking her at midnight from under the guns of the man-of-war Asia, and distributing her prize goods to the American soldiers. After the retreat of the army from Long Island, when it was all-important to understand the plans of the enemy, Washington applied for a discreet and practised officer to enter the enemy's lines and procure intelligence, and Hale volunteered for the service. He passed in the disguise of a Dutch schoolmaster to the British camp and made full drawings and memoranda of all the desired information, but on his return was apprehended and taken before Howe, by whom he was ordered to execution the next morning. He was denied a Bible and the aid of a clergyman; and was hanged, saying with his last breath: "I only regret that I have but one life to lose for my country." A statue of Hale is in City Hall Park, New York. Consult the 'Life' by Johnston (1901); Holloway, 'Nathan Hale, the Martyr Hero' (1899).

Hale, Nathan, American journalist: b. West Hampton, Mass., 16 Aug. 1784; d. Brookline, Mass., 9 Feb. 1863. He was a nephew of the patriot Nathan Hale (q.v.) and father of E. E. Hale (q.v.). He was graduated from Williams College in 1804, and after studying law was admitted to the Boston bar in 1810, in 1811–4 was editor of the Boston 'Weekly Messenger,' and in 1814 purchased and became editor of the *Advertiser*, established in 1813 and the first New England daily. At first Federalist in politics, the *Advertiser* became successively Whig and Republican and was at all times very influential. In 1820 it opposed the Missouri bill, in 1854 the Kansas-Nebraska bill, and it was the first newspaper to advocate the settlement of Kansas by "Free-Soil" colonists. Hale was a founder of the 'North American Review' (1815), served at various times in both houses of the Massachusetts legislature, published a series of stereotyped maps after a method invented by himself (1830), and wrote pamphlets on topics of internal improvement.

Hale, Philip, American music critic: b. Norwich, Vt., 5 March 1854. Graduated from Yale in 1876, he was admitted to the bar in Albany (1880), studied music under Dudley Buck and later in Europe with Haupt, Bargiel, and Guilmant (1885–7), and was organist successively of Saint Peter's, Albany (1879–82), Saint John's, Troy (1887–9), and the First Unitarian Society of Roxbury, Mass. (1889). In 1889–97 he contributed music criticism to the Boston press, from 1891 was critic of the *Journal*, in 1897 became editor of the 'Musical Record,' and in 1901 of the 'Musical World.' He is known as one of the most discriminating and interesting of American writers on musical subjects.

Hale, Salma, American politician: b. Alstead, Cheshire County, N. H., 7 March 1787; d. Somerville, Mass., 19 Nov. 1866. He was early apprenticed to a printer of Walpole, N. H., in 1805 became editor of the 'Political Observer,' a Republican journal of Walpole, held various local offices, and in 1828 and 1844 was a member of the New Hampshire house of representatives, and in 1824 and 1845 of the State senate. In 1845 he was appointed secretary of the commission for the determination of the northeastern boundary line of the United States. He was elected to Congress in 1816 as a Republican (Democratic) representative, but declined a re-election. His 'History of the United States' (1821) won a prize of $400 and a gold medal, offered by the American Academy of Belles-Lettres, and appeared in many subsequent editions. He published also 'The Administration of J. Q. Adams' (1826); and 'Annals of the Town of Keene' (1826).

Hale, Sarah Josepha Buell, American author and editor: b. Newport, N. H., 24 Oct. 1788; d. Philadelphia 30 April 1870. Her husband dying in 1822 leaving her with five small children, she supported her family by literary work. She was editor of the Boston 'Ladies' Magazine' 1828–37, and when in 1837 this was consolidated with 'Godey's Lady's Book,' published in Philadelphia, she became editor of the latter also, continuing in the position for forty years. She retired from literary life in 1877. Her efforts in behalf of the Bunker Hill Monument fund, her interest in seamen, in foreign missions, and in the higher education of women, were untiring and successful. For many years she advocated the keeping of Thanksgiving Day as a national festival, as it has been observed since 1864, when President Lincoln adopted her suggestion. Her most enduring publication is 'Woman's Record: or Sketches of All Distinguished Women' (New York 1874).

Hale, Susan, American author and water-colorist: b. Boston 5 Dec. 1833. She has published 'Life and Letters of Thomas Gold Appleton' (q.v.) (1885), and with her brother, E. E. Hale (q.v.) has written the popular 'Family Flight' series of travel books for young people.

Hale, William Bayard, American writer: b. Richmond, Ind., 6 April 1869. He was graduated from Harvard and the Episcopal Theological School (Cambridge, Mass.), and was rector at Middleborough, Mass., 1892–9, and subsequently at Ardmore, Pa., retiring from the ministry in 1901. He has published 'The Making of the American Constitution'; 'The Eternal Teacher' (1895): 'The New Obedience' (1898); 'Phillips Brooks'; etc.

Hale, William Thomas, American writer: b. Liberty, Tenn., 1 Feb. 1857. He practised law for several years and has since been connected editorially with St. Louis and Tennessee journals. He has published 'Poems and Dialect Pieces' (1894); 'Showers and Sunshine,' verse (1896); 'The Backward Trail' (1899); 'An Autumn Lane and Other Poems' (1899); 'Great Southerners' (1900).

Halévy, Jacques François Fromental Elie, zhăk frän-swä frō-mōṅ-täl ā-lē ä-lä-vē, French composer: b. of Jewish parentage, Paris 27 May 1799; d. Nice, France, 17 March 1862. He studied counterpoint under Cherubini for five years, and in 1819 was sent to Italy to finish his education. The first of his pieces performed was a little comic opera, 'L'artisan,' given at the Théâtre Feydau, in 1827. His chef d'œuvre, 'La Juive,' appeared in 1835, and rapidly obtained a European celebrity, and has been frequently sung in the United States. Among his other works are 'L'Eclaire'; 'Guido et Ginevra'; 'La Reine de Chypre'; 'Le Val d'Andorre'; 'La Fée aux Roses.' The melodies of Halévy are always soft and flowing, the harmony correct and pleasing; but his works display on the whole more talent than genius.

Halévy, Joseph, zhō-zĕf, French Orientalist and traveler: b. Adrianople, Turkey, 15 Dec. 1827. In 1868 he traveled in Abyssinia; and for the Academie des Inscriptions he traversed (1869–70) Yemen, where he obtained copies of not less than 680 inscriptions, largely Himyaretic and Sabæan. He was appointed assistant librarian of the Asiatic Society, and adjunct-professor of Ethiopic in the Ecole des Hautes Etudes. Well known also as a Biblical critic and Assyriologist, he founded (1893) the 'Revue Sémitique d'épigraphie et d'histoire ancienne,' and published numerous works, including: 'Archæologic Mission to Yemen' (1872): 'Journey to Nedjran' (1873): 'Sabæan Studies' (1875); 'The Origin of Babylonian Civilization' (1876); 'Miscellany of Criticism and History Regarding Semitic Peoples' (1883).

Halévy, Ludovic, lü-dō-vēk, French dramatist and novelist: b. Paris, France, 1 Jan. 1834

He is a nephew of J. Halévy (q.v.) and, unsuccessful at first, he finally worked his way into public favor, especially after associating his pen with that of Henri Meilhac. In collaboration with the latter, he wrote many of the librettos of Offenbach's most brilliant and satiric operettas, including 'The Perichole,' 'The Brigands,' the 'Belle Hélène,' and 'The Grand Duchess of Gérolstein.' Several serious librettos of high excellence are from the same hands, including that for Bizet's 'Carmen.' In spoken drama, 'Frou-Frou' and 'Tricoche and Cacolet' are among the most popular plays the two dramatists produced together. In 1881 he ceased writing for the stage, and turned to fiction. 'L'Abbé Constantin,' the first of his novels, is also the most popular, and opened to him the French Academy. It was for more than one season the French story of the day. It is a charming story, full of fresh air and sun, simply and skilfully told. It presented a view of American character and temperament not usual in French fiction; and irreproachable in its moral tone, has become a sort of classic for American schools and colleges. 'La Famille Cardinal' (The Cardinal Family) and 'Crichette' are studies in fiction of aspects of Parisian life. 'Notes and Souvenirs' embody observations during the Prussian invasion of 1871. They are interesting, as giving faithful pictures of the temper of the people during those days. Among his short stories, 'Un Mariage d'Amour' (A Marriage for Love) is one of the best.

Half Blood, in law, the relationship of persons born of the same father but not of the same mother, which is called a consanguinean relation; or of those born of the same mother but not of the same father, which is termed uterine. In the succession to real or landed property a kinsman of the half blood inherits next after a kinsman of the whole blood in the same degree, and after the issue of such kinsman when the common ancestor is a male, but next after the common ancestor when such ancestor is a female. So that brothers consanguinean inherit next after the sisters of the whole blood and their issue; and brothers uterine inherit next after the mother.

Half-breeds, the children of parents of different races; a term usually confined to whites and American Indians. There are two tribes of Indian half-breeds, at Red River Settlement, chiefly employed in agriculture and hunting. The rise of independent half-breed tribes is "the first step toward the evolution of a distinct race."

Half-caste, a person born of a European father and a Hindu or Mohammedan mother, or more rarely of a Hindu or Mohammedan father and a European mother; an East Indian.

Half-crown, a British silver coin of the value of two shillings and sixpence (60 cents).

Half-dollar, a silver coin of the United States of the value of 50 cents. Authorized in April 1792, its coinage at a weight of 208 grains was begun in 1794; its issue was suspended from 1798 to 1800 inclusive and in 1816. In 1853 its weight was reduced to 192 grains. The half-dollar is legal tender to the amount of ten dollars.

Half-eagle, a gold coin of the United States of the value of five dollars, so called from the national emblematic bird which figures upon the reverse. Authorized in 1792 the coinage was begun in July 1795; there was no issue in 1816 and 1817.

Half-King, the name given by the English to a Seneca Indian, chieftain of an Ohio tribe, who accompanied Washington during his expeditions in 1753–54, and was present at the defeat of the French at Great Meadows. His summary of the prowess of the respective combatants was that "the English acted like fools and the French like cowards."

Half Moon, the name of the vessel commissioned by the Dutch East India Company in 1609, and commanded by Henry Hudson for a voyage of exploration in search of a Northwest Passage. In this ship he entered New York Bay and explored the river which bears his name.

Half-tones, pictures produced by printing from plates made by the half-tone process, which will here be described. Except that used in line-drawing, until early in the eighties there was no process by which paintings, wash-drawings, or photographs could be done into the form of a surface printing-block for the press, and the introduction then of the half-tone block marked a revolution in the history of photographic illustration. The development of the process was the result of a kind of evolution of Bullock's (1866). Meisenbach of Munich patented a half-tone process in 1882.

The American Frederic Eugene Ives and others have since experimented and published results, and by them within a few years the process as it now exists was practically established. Americans were first in the field with an improved device for breaking up the image into dots, which was so much superior to anything invented in Europe that almost every other method was dropped in its favor. The diamond-ruled screen, which was introduced in this country by Max Levy, is essential to advanced work in half-tone. To make one of the screens, a sheet of the finest plate-glass is coated with a varnish of asphalt and wax, and placed on the bed of an automatic ruling-machine capable of ruling lines of any fineness up to 500 to the inch. The cutter is diamond-pointed and gauged to cut lines of any desired width. The lines are ruled diagonally at 45° across the glass, the number to the inch varying as required. The ruled surface is treated with hydrofluoric acid, which eats into or etches the lines laid bare by the diamond and forms a channel which is filled up with an opaque pigment. This enamel is baked in the lines in an oven, and then the surface is polished until the lines are perfectly level and the spaces represented by the clear glass are bright and transparent. Two of these ruled glasses are required for each screen, laid together with the lines crossing at right angles and cemented with Canada balsam.

To produce a half-tone block from a picture, wash-drawing, or photograph, this ruled grating is placed in front of the sensitive plate, not in contact with it, but at a distance which must be nicely determined by experience. Everything is represented by dots so accurately graded in relation to the light and shade of the original that the eye scarcely detects them, and the half-tone picture appears as a practical *facsimile* of the original from which it was photographed.

Most half-tone blocks are now etched on copper, and the sensitizing solution generally employed for this metal is a compound of fish-glue, albumen, chromic acid, water, and bichromate of ammonia. The copper is cleaned with tripoli and washed; the sensitizing solution is flowed over it two or three times; it is placed on a revolving table and rapidly whirled to spread the coating thinly and evenly; the coating is dried by gentle heat in a yellow-lighted room, and the plate is now ready for exposure under the half-tone negative. Three to ten minutes' exposure to an electric arc-light completes the printing, then the plate is given a bath in cold water, and is soaked and washed under a spray of water until the compound not acted upon is dissolved out. The image on the metal at this stage is almost invisible. To facilitate an examination of the film, the plate is dipped into a solution of methyl-violet, which stains the film and brings the picture into view. If all is right, the surface is dried either by flowing it with methylated alcohol or by gentle heat. The next operation is the hardening of the glue-picture into a substance resembling enamel — hence the "enameline process." The plate is highly heated over the flame of a large Bunsen burner; during the progress of this "burning in" or enameling, the blue picture gets pale, then gray, and vanishes; as the plate gets hotter, the image appears as a faint brown, and increases in strength to a rich chestnut-brown tint, when the heat must be withdrawn, and the plate cooled off. The plate has now upon it a picture formed of a strong, hard, impermeable coat of enamel which will bear any reasonable etching without further protection.

The etching-bath is made up of neutral perchloride of iron dissolved in water, and of a strength which registers 35° with a Baumé's hydrometer. The plate is first subjected to a general etching, so that it may be inked over with a printer's roller, and a first proof of the photo-etched picture be pulled in the press. The dulling of the general effect caused by the interposition of the necessary screen-grating has to be removed as far as possible, and this is done by artists who are specially trained for the work. The parts of the picture which are in shadow and are usually correctly rendered by a properly exposed negative are covered over with varnish, and the next tones are etched again; then these tones are covered up and the high lights are treated until the resulting picture, when proofed, correctly represents the original. The plates are then trimmed by engravers, beveled to admit of being riveted to the wood-mounts, and are mounted type-high for use in the printing-press.

Invention and experiment are now active toward the next great step in half-tone work, the production of surfaces without the mechanical smoothness hitherto so persistent. What is aimed at is the making of pictures which are free from mechanical effect, and are yet sufficiently delicate in texture to retain the finer details.

Half-way Covenant, a concession in church requirements made by the New England Synod convened at Northampton in 1657, whereby persons who had been baptized in their infancy, who assented to the doctrines of faith, entered into covenant with the church, and led decent and respectable lives, were admitted to the privileges and prerogatives of church-membership with the exception of the Lord's Supper, although they might give no evidence of conversion and had neither the ability nor willingness to make profession of religious experience. This "half-way covenant" as it came to be called aroused bitter controversy which did not die out until the 19th century; among its most strenuous opponents were Jonathan Edwards and his followers. The contention is baseless that it entailed certain civil privileges in relation to the State franchise, its chief aim being to admit children to baptism and to transmit to them the same degree of church membership as their parents. Consult Walker, 'Creeds and Platforms of Congregationalism' (1893).

Haliburton, hăl'ĭ-bėr-tŏn, **Thomas Chandler**, Canadian humorist: b. Windsor, Nova Scotia, December 1796; d. Isleworth, near London, 27 Aug. 1865. He practised law in Halifax, and in 1842 became judge of the supreme court of Nova Scotia, but subsequently gave up his profession, and went to live permanently in England. His first work was a 'Historical and Statistical Account of Nova Scotia' (1829). In 1835 he contributed a series of letters to a Halifax newspaper, under the pseudonym of "SAM SLICK," clock-peddler. These were published with considerable alterations and additions, in a collected form in 1837, under the title of 'The Clockmaker, or Sayings and Doings of Samuel Slick of Slickville,' and became very popular. A second series followed in 1838, and a third in 1840. In 'The Attaché, or Sam Slick in England,' his hero is represented as attaché of the American embassy at the court of St. James, and again appears in 'Sam Slick's Traits of American Humor' (1852). Another work of his of some importance is 'Rule and Misrule of the English in America' (1851). In 1859 Haliburton was elected member of parliament for Launceston.

Hal'ibut, the largest of the flat fishes (*Hippoglossus vulgaris*), and one of the most important and highly prized food-fishes. It occurs in all Northern waters, south to France, New York and San Francisco. It reaches a weight of 400 pounds, and is characterized by having the eyes on the right side, the ventral fins and mouth symmetrical, and the lateral line arched in front. It is dark brown on the right side, and white on the left or lower side. It was formerly very abundant along the whole eastern coast of the United States, at times proving a nuisance from its numbers to the cod-fishers. It has gradually become scarcer, and at the same time the appreciation of it as a food-fish has increased, so that the halibut fishers have gone farther and farther for it until now a good proportion of the catch comes from the waters around Iceland. A second species, the Greenland halibut (*Reinhardtius hippoglossoides*) occurs in the Arctic Atlantic, but is not very common. It is yellowish brown and has a straight lateral line. In the trade this is not distinguished from the common species. Halibut are taken with hook and line (or trawls) using fresh fish (herring, etc.) for bait.

Hal'ifax, Charles Montague, EARL OF, English politician: b. Horton, Northamptonshire, 16 April 1661; d. 19 May 1715. He first attracted notice by his verses on the death of Charles II.;

1. City of Halifax from the Citadel

2. North West Arm

and in 1687, in conjunction with Matthew Prior, wrote 'The Town and Country Mouse,' a parody on Dryden's 'Hind and Panther.' He became a lord of the treasury in March 1692, in 1694 was made chancellor of the exchequer; in 1695 carried out the much needed re-coinage, appointing Newton warden of the mint; and in 1696 he devised the system of exchequer bills. His administration was distinguished by the adoption of the funding system, and by the establishment of the Bank of England. In 1700 he was raised to the peerage, under the title of Baron Halifax. In the reign of Anne he remained out of office, but he actively exerted himself to promote the union with Scotland, and the Hanoverian succession. George I. created him an earl, and bestowed on him the order of the Garter. The 'Life and Miscellaneous Works of Lord Halifax' were published in 1715, and his poems were included in the edition of 'English Poets' by Dr. Johnson.

Halifax, Canada, the capital of the province of Nova Scotia, and county-seat of Halifax County, a city and port of entry on Halifax Harbor, on the Intercolonial and Dominion, and Canadian Pacific R.R.'s. The harbor, originally known as Chebucto, "chief of havens," is one of the best in the world. It is 16 miles long from north to south, with an average width of a mile, and terminates in Bedford Basin, a beautiful sheet of water four miles wide, affording 10 square miles of safe anchorage. The North West Arm, an inlet on the west of the city, is a charming bay, on the shores of which are many of the villa residences of the wealthier Haligonians. The harbor is protected by 11 forts and batteries. A citadel crowns the hill, on the slopes and at the base of which the town is built. The streets are regularly laid out on a rectangular plan, are lighted by gas and electricity, and have electric street-car lines. The public buildings are built chiefly of freestone; the houses of wood. The most notable structures include Government House, the official residence of the lieutenant-governor, the armories, the post-office, the custom-house, the Province building, court-house, city-hall, Masonic Temple, Academy of Music, the Admiralty House, the Wellington barracks, several hospitals, and other charitable institutions, the Roman Catholic and Anglican cathedrals, and Saint Paul's church, the oldest Protestant church building in British North America. Among the higher educational institutions are the non-sectarian Dalhousie University and College (q.v.), the Roman Catholic College of Saint Mary, the Presbyterian Theological College, the Halifax Ladies' College and Conservatory of Music, and a high school. The city maintains a free library, an excellent waterworks system, and fine parks, including Point Pleasant Park, and the handsome public gardens covering 17 acres. Halifax is the chief British naval station in North America, and has extensive dockyards; besides Esquimalt it is the only military post in Canada garrisoned by British imperial troops; in 1901 the garrison amounted to 1,784 soldiers. Halifax has railroad communications with all parts of the Dominion and the United States, and steamship lines connecting with Great Britain, the West Indies, Boston, and New York. A United States consul-general is resident in Halifax. The chief occupations of the inhabitants are commerce and fisheries. The city has considerable West Indian trade, exporting lumber, fish, and agricultural products, and importing sugar, rum, molasses, and other sub-tropical products; most of the commerce of the province is carried on through Halifax. The principal manufactures are iron castings, machinery, agricultural implements, nails, paints, gunpowder, cordage, leather, boots and shoes, clothing, soap and candles, cotton and woolen goods, and woodenware; there are also sugar refineries, distilleries, and breweries.

Halifax was founded in 1749 by the Hon. Edward Cornwallis, and named in honor of the Earl of Halifax. The following year it was made the capital of Nova Scotia, then including New Brunswick, in place of Annapolis; in 1817 it was declared a free port; in 1842 it was incorporated as a city. It is governed by a mayor, elected annually, and by 18 aldermen, elected triennially. The city and county send two members to the Canadian House of Commons, and three to the Provincial Legislature. Pop. (1901) 40,832.

John Forrest,
President Dalhousie College.

Halifax Commission, the designation for the commission of representatives of Great Britain and the United States which met at Halifax, Nova Scotia, in 1877, to determine the amount of compensation to be paid by the United States for the privileges which under the provisions of the fisheries treaty of 1871 between the two countries, had allowed the fishermen of the United States to take fish along the shores of Canada and Newfoundland. The great value of the British fishing waters was admitted and the sum of $5,500,000 was awarded Great Britain. The ten-year treaty which went into operation in 1873 was terminated by the U. S. government in 1885, and an attempt to renew it by the Chamberlain-Bayard Treaty in 1888 was frustrated by the rejection of the United States Senate. A *modus vivendi*, however, was arranged for, which the Dominion Parliament enacted as a law in 1890.

Hal'ite, the mineralogical name for native common salt, rock salt, or sodium chlorid, NaCl. Halite crystallizes in the isometric system, usually in cubes. It has a hardness of 2.5, and a specific gravity of 2.135 when pure, though it often occurs mixed with calcium sulphate, and with the chlorids of calcium and magnesium, the specific gravity being modified accordingly. Halite is usually colorless or white, though it is sometimes colored by impurities. Its refractive index for yellow sodium light is 1.5442, and transparent crystals of it are used somewhat in the manufacture of prisms and lenses, since the mineral is far more transparent than glass to the infra-red rays of the spectrum. Tyndall made extensive use of it in this way, for example, in his researches on radiant heat. (Consult his 'Contributions to Molecular Physics in the Domain of Radiant heat.') See Salt; Sodium.

Hall, Alexander Wilford, American editor and author: b. Bath, N. Y., 18 Aug. 1819; d. 1902. He became known as an evangelist especially through attacks on Universalist doctrine and the theory of evolution presented by Darwin, Huxley, and Haeckel. In 1881 he established

'The Microcosm,' and in 1893 became president of the Society for Philosophical Research. In 1891 he was elected fellow of the Philosophical Society of Great Britain. His works include: 'Universalism Against Itself'; 'The Problem of Human Life'; 'The Immortality of the Soul'; and 'The Hygienic Secret of Health.'

Hall, Anna Maria Fielding, British novelist: b. Dublin, Ireland, 6 Jan. 1800; d. East Moulsey, Surrey, England, 30 Jan. 1881. In her 15th year she went to London, where she was married to the well known writer, S. C. Hall (q.v.). She published 'Sketches of Irish Character' (1828); 'The Buccaneer' (1832); 'Tales of Woman's Trials' (1834); 'The Outlaw' (1835); 'The French Refugee,' a drama; 'Uncle Horace' (1837); 'Lights and Shadows of Irish Character' (1838); 'Marian' (1839); 'Midsummer Eve' (1843); 'The Whiteboy' (1845); etc. Her 'Stories of the Irish Peasantry' appeared originally in 'Chambers's Journal.' Besides assisting her husband in writing 'Ireland: its Scenery, etc.' (1841–3) and other works, she assisted in the establishment of a hospital for consumptives, and the Nightingale Fund, which resulted in the endowment of a training-school for nurses.

Hall, Arthur Crawshay Alliston, American Protestant Episcopal bishop: b. Benfield, Berkshire, England, 12 April 1847. He was graduated from Christ Church, Oxford, in 1869, took orders, entered the Society of St. John the Evangelist (Cowley Fathers), in 1874 became assistant minister of the Church of the Advent, Boston, and from 1882 to 1891 was there minister of the mission church of St. John the Evangelist. In 1894 he was consecrated bishop of Vermont, after release from the Cowley order. His publications include: 'Confession and the Lambeth Conference' (1879); 'Meditations on the Creed' (1880); 'Meditations on the Collects' (1887); and other doctrinal and devotional works.

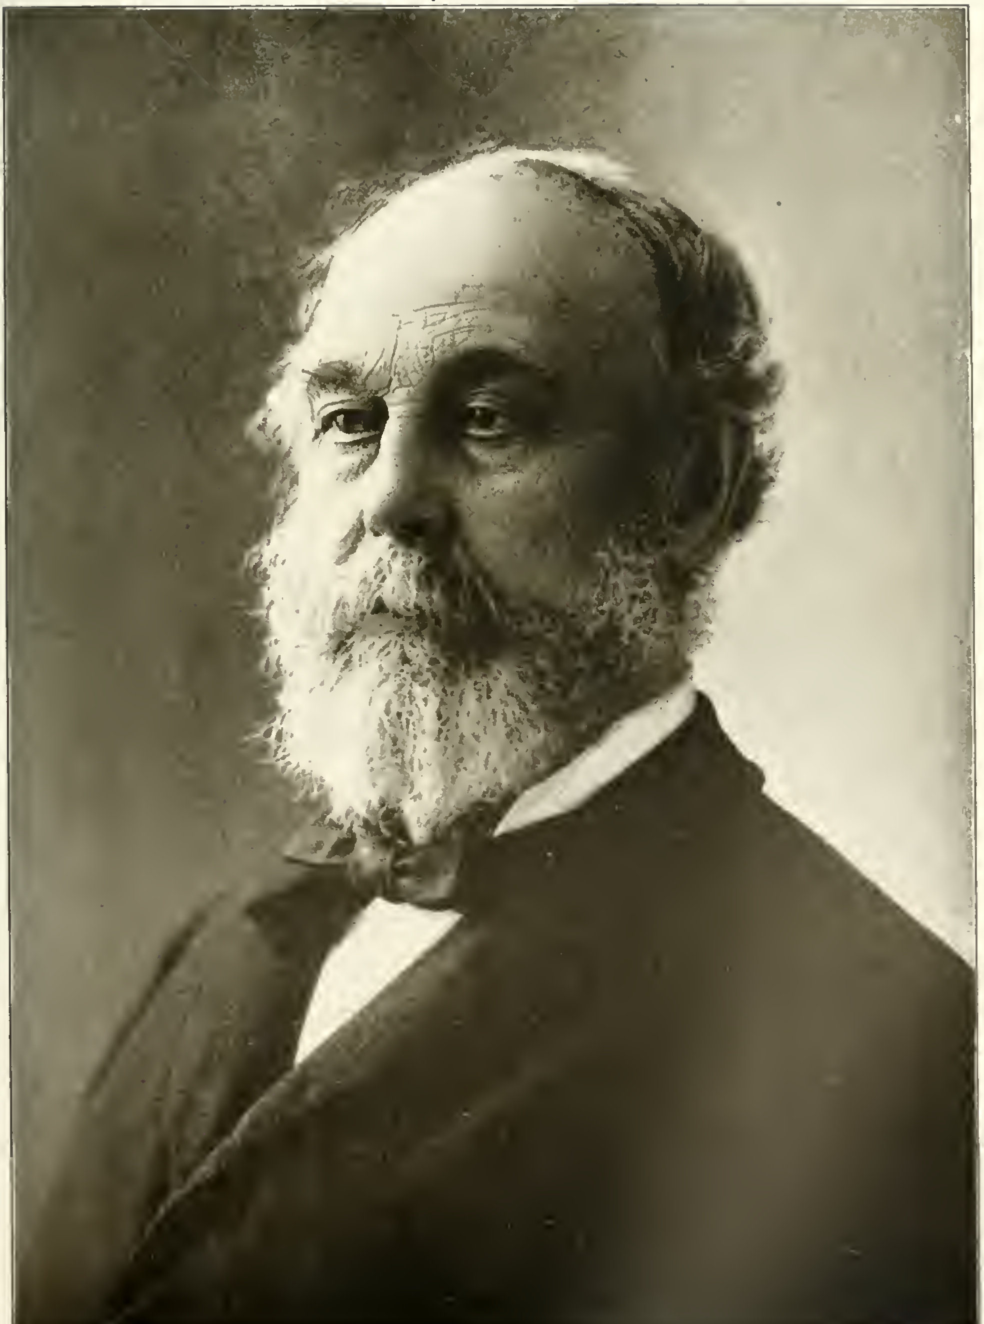
Hall, Asaph, American astronomer: b. Goshen, Litchfield County, Conn., 15 Oct. 1829. He learned the carpenter trade but after private study attended Central College, McGrawville, N. Y., in 1854–5, was for a term a pupil of Francis Brünnow at the University of Michigan, taught at Shalersville, Ohio, and later was appointed assistant to Bond in the Harvard observatory. He became assistant in the Naval Observatory at Washington in 1862, and in 1863 professor of mathematics in the navy, with relative rank of captain. He continued in the government service until 1891, when he was retired on account of age, with relative rank of captain. While at the Naval Observatory, he was despatched on several expeditions, including those for observation of solar eclipses to Bering Strait in 1869, to Sicily in 1870, and to Colorado in 1878. He was also in charge of the American party sent to observe the transit of Venus at Vladivostock, Siberia, in 1874, and chief astronomer of the expedition to San Antonio, Tex., for the transit of 1882. Among his many discoveries the most important is that of the moons of Mars (August 1877), which he named Deimos and Phobos, and whose orbits he calculated. Among his later work is a valuable study of double stars. In 1895–1901 he was professor of astronomy at Harvard. He received the Lalande prize of the French Academy of Sciences in 1878, its Arago medal in 1895, and the gold medal of the Royal Astronomical Society in 1879. In 1902 he was president of the American Association for the Advancement of Science.

Hall, Basil, British naval officer and writer: b. Edinburgh 31 Dec. 1788; d. Portsmouth, England, 11 Sept. 1844. He entered the navy in 1802, accompanied Lord Amherst's expedition to China in 1815, a trip which supplied him with the materials of his first work, 'A Voyage of Discovery to the West Coast of Corea, and the great Loo Choo Island in the Japan Sea.' This work, first published in 1818, had a very extensive circulation. In 1827 he made a tour in Canada and the United States, and published his 'Travels in North America' (1829), a work which excited much adverse criticism in the United States by reason of its outspoken and somewhat supercilious comments and observations. 'Fragments of Voyages and Travels' appeared in 1831–33, and was followed by 'Schloss Hainfield, or a Winter in Styria' and 'Patchwork' (1841).

Hall, Bolton, American lawyer and lecturer: b. Ireland 1854. A son of John Hall (q.v.), he was graduated from Princeton in 1875, became known as a writer and lecturer in connection with various reforms, and has been identified with the University extension movement. Among the causes advocated by him are the cultivation of vacant lots by the unemployed, and the restoration of the land to the people. His publications include: 'Even as You and I.'

Hall, Charles Cuthbert, American Presbyterian clergyman: b. New York 3 Sept. 1852. He was graduated from Williams College in 1872, studied theology at the Union Theological Seminary 1872–3, and at the Presbyterian College in London and the Free Church College, Edinburgh. He was pastor of the Presbyterian Church, Newburg, N. Y., 1875–7, and of the 1st Presbyterian Church, Brooklyn, N. Y., 1877–97. In the year last named he was elected president of Union Theological Seminary. He has published 'Into His Marvellous Light: Studies in Life and Belief' (1891); 'Does God Send Trouble?' (1894); 'The Children, the Church and the Communion' (1895); 'The Gospel of the Divine Sacrifice' (1896).

Hall, Charles Francis, American Arctic explorer: b. Rochester, N. Y., in 1821; d. Thank God Harbor, Greenland, 8 Nov. 1871. Becoming interested in the fate of the Franklin expedition, he devoted his leisure to gathering information about Arctic America, and made two search expeditions, in 1860–2 and 1864–9, living alone among the Eskimo, and bringing back relics of the Franklin expedition and the supposed bones of one of Franklin's company. Natives whom he encountered in 1869 near the southern shore of King William Land gave him a report of the fate of 79 of the 105 who perished by starvation in that region. He thus contributed much to the details of the expedition's final history. In 1871 he sailed in command of the government ship 'Polaris,' on an expedition to the North Pole. On 29 August he reached 82° 11′ N., at that date the highest north latitude ever reached. Then turning south he went into winter quarters at Thank God Harbor, Greenland (81° 38′ N.). Here he was taken suddenly ill, and died. Over his grave a grateful epitaph was placed by the British polar expedition in 1876. His compan-



ASAPH HALL,

PROFESSOR OF ASTRONOMY, HARVARD UNIVERSITY.

ions left Thank God Harbor in August, 1872, but in October, through the ice-anchor slipping, 19 men were left with stores on a floe, and only after five months of severe sufferings were they rescued by a sealer off the Labrador coast in the following April. The 'Polaris' drifted to the coast of Greenland, at a point not far south of Smith Sound, and thence in the spring the party set out in boats and was rescued by the Scotch whaler 'Ravenscraig,' off Cape York. Among the valuable results of Hall's work were the exploration of Kennedy channel, the discovery of Robeson Channel and Hall Basin, and the extension of Greenland and Grinnell Land 1½° N. Hall was less a scientist than a fearless and resourceful explorer. He published 'Arctic Researches, and Life among the Esquimaux' (1864); and mainly from his papers was compiled the 'Narrative of the Second Arctic Expedition' (1879).

Hall, Charles Winslow, American lawyer and author: b. Chelsea, Mass., 2 Nov. 1843. He was admitted to the Suffolk bar in 1866 and besides editing various New England journals has written: 'Arctic Rovings' (1861); 'Twice Taken' (1867); 'Adrift in the Icefields' (1877); 'Drifting Round the World' (1881); 'Legends of the Gulf'; 'Cartegena, or the Last Brigade'; 'Regiments and Armories of Massachusetts.'

Hall, Chester Moor, English inventor: b. Leigh, Essex, England, 9 Dec. 1703; d. Sutton, Essex, 17 March 1771. He was a large landowner in Essex, and convinced from study of the human eye that achromatic lenses were possible, he discovered two varieties of suitable glass in 1729, and in 1733 made several telescopes later declared by experts to be achromatic. Indifferent to his claims of priority, he did not appear at the trial of Dollond *v.* Champness. Later his invention of the achromatic telescope in the year 1733 was adjudged by Lord Mansfield conclusively proven.

Hall, Christopher Newman, English Congregational clergyman: b. Maidstone, England, 22 May 1816; d. London 18 Feb. 1902. He was educated at Highbury College and ordained in 1842, his first charge being at Hull. In 1854 he was made pastor of Surrey Chapel, Blackfriar's Road, London, from which place he moved with his congregation into Christ Church, Westminster Bridge Road, erected mainly through his exertions, and of which he became pastor emeritus in 1893. During the Civil War he did much by tongue and pen to give his countrymen correct ideas of the nature of the struggle in the United States. In 1865 he visited this country and again in 1873 when he delivered lectures in the principal cities. He was the author of 'The Christian Philosopher'; 'Land of the Forum and the Vatican'; 'Lectures in America'; and of a famous tract 'Come to Jesus' (1840) of which millions of copies have been issued, etc.

Hall, Edward Henry, American Unitarian clergyman and author: b. Cincinnati, Ohio, 16 April 1831. He was graduated from Harvard in 1851, ordained to the Unitarian ministry in 1859, and was pastor at Plymouth, Mass., 1859–67; Worcester, Mass., 1869–82; and at Cambridge, Mass., 1882–93. His writings include, besides a volume of 'Discourses'; 'Orthodoxy and Heresy in the Christian Church'; 'Lessons on the Life of St. Paul'; 'Papias and his Contemporaries: a Study of Religious Thought in the 2d Century' (1899).

Hall, Fitzedward, American philologist: b. Troy, N. Y., 21 March 1825; d. Marlesford, England, 1 Feb. 1901. He was graduated from Harvard in 1846; spent many years in India; made a thorough study of its tongues, and contributed to its local journals original translations and original articles. In 1850 he became tutor, in 1853 professor, in the government college at Benares; in 1855 was transferred to Ajmere as inspector of schools for Ajmere and Maiwara; and in 1856 to a like post in the Central provinces. In 1862–79 he was professor of Sanskrit, Hindustani, and Indian jurisprudence in King's College, London; in 1864 became examiner in Hindustani and Hindu to the civil-service commission; in 1880 examiner in Sanskrit to succeed Max Müller; and in 1887 also examiner in English. He was the first American to edit a Sanskrit text—'The Atmabodha, with its Commentary, and the Tattvabodha' (1852). He prepared also an edition of the 'Vishnupurâna,' containing numerous quotations from manuscripts owned by him; and editions of many other Sanskrit books. His collection of 1,000 Oriental manuscripts and 1,000 works on special subjects, he gave to Harvard. He wrote further: 'Modern English' (1873), 'Doctor Indoctus' (1880), and other works on English philology, and contributed to the 'New Oxford Dictionary.'

Hall, Florence Marion Howe, American author and lecturer: b. Boston 25 Aug. 1845. She is a daughter of Julia Ward Howe (q.v.). Prominent in the women's club movement, she became vice-president of the General Federation of Women's Clubs, and chairman of the educational department of the New Jersey State federation of women's clubs. In 1893–1900 she was president of the New Jersey Women's Suffrage Association. Her writings are: 'Social Customs' (1887); 'The Correct Thing' (1888).

Hall, Francis J., American Episcopal theologian: b. 24 Jan. 1856. He was graduated from Racine College, Wis., and the General Theological Seminary, New York, and has been professor of dogmatic theology in the Western Theological Seminary from 1886. He has published 'Theological Outlines' (1892–5); 'Historical Position of the Episcopal Church' (1896); 'The Kenotic Theory' (1898).

Hall, George Henry, American artist: b. Boston 1825. He studied art at Dusseldorf, Paris, and Rome; established his studio in New York; and became known as a still-life and figure painter. In 1868 he was elected a national academician. Among his works are 'April Showers'; 'Studies of Grapes'; 'The Seasons'; and 'Bric-a-Brac of Damascus'.

Hall, Gertrude, American writer: b. Boston 8 Sept. 1863. She has written 'Far from To-day,' a collection of short stories; 'Allegretto,' a book of verse; 'Foam on the Sea, and Other Tales'; 'The Hundred and Other Stories' (1898); 'The Age of Fairy Gold,' verse (1899); 'April's Sowing' (1900). Her work, both in verse and prose, is distinctively original.

Hall, Gordon, American missionary at Bombay: b. Tolland, Mass., 8 April 1784; d. Bombay 20 March 1826. He was graduated at

Williams College in 1808 and having studied theology, offered himself as a missionary to the American board of commissioners for foreign missions. Ordained at Salem in February 1812, he sailed the same month for Calcutta and arriving at Bombay in 1813, spent 13 years in missionary labors. No missionary in western India has been more respected among the Brahmins and higher classes than he. Beside publishing several missionary tracts he revised the Mahratta New Testament.

Hall, Granville Stanley, American psychologist and college president: b. Ashfield, Mass., 6 May 1845. He was graduated from Williams College in 1867, studied also at Berlin, Bonn, Heidelberg, and Leipsic, was professor of psychology in Antioch College (Ohio) in 1872–6, and lecturer on psychology at Harvard and Williams in 1880–1. From 1881 to 1888 he was professor of psychology in the Johns Hopkins University: and in 1888 became president of Clark University, then newly founded at Worcester, Mass., and professor of psychology in the institution. He soon became known as an authority on education and a leader in the "new psychology." As editor of the 'Pædagogical Seminary' and the 'American Journal of Psychology,' he published: 'Aspects of German Culture' (1881); 'Hints toward a Select and Descriptive Bibliography of Education' with Mansfield (1886); 'Methods of Teaching History'; 'How to Teach Reading'; etc.

Hall, Isaac Hollister, American Oriental scholar: b. Norwalk, Conn., 12 Dec. 1837; d. Mount Vernon, N. Y., 2 July 1896. Graduated from Hamilton College in 1859, he was there tutor until 1863, in 1865 was graduated from the Columbia Law School, and until 1875 was a practitioner in New York. In 1875–7 he was professor in the Syrian Protestant College at Beirut, and later at Cyprus aided Gen. di Cesnola, then United States consul, in the arrangement of the Cypriote collection now in the Metropolitan Museum of New York. From 1884 until his death he was curator of sculpture and archæology in the Metropolitan Museum. He also lectured on New Testament Greek at the Johns Hopkins University; published (1884) an account, with facsimile pages, of the Syrian manuscripts of the Gospels, Acts, and the larger part of the Epistles, discovered by him (1876) at Beirut; and compiled a 'Critical Bibliography of the Greek New Testament' (1884).

Hall, Sir James, English geologist and chemist: b. 1761; d. Edinburgh 23 June 1832. Early interested in geological questions, he made the acquaintance of James Hutton (q.v.) and Playfair, and himself states that he came to adopt Hutton's system after three years of almost daily discussion with its founder. In the examination of this system, whose leading principle explains the conformation of the earth's crust by the action of constant natural changes, he traveled in Scotland, the Alps, Italy, and Sicily. Hall was the first geologist directly to apply chemical laboratory tests to the hypotheses of geology, but published no results of his work in this field until after the death (1797) of Hutton who objected to the judgment of the vast operations of nature through "having kindled a fire and looked into the bottom of a little crucible." He was elected president of the Royal Society of Edinburgh, invented a machine for the regulation of high temperatures, and in 1807–12 represented Michael (or Mitchell), Cornwall, in Parliament. He wrote various scientific memoirs.

Hall, James, American lawyer and author: b. Philadelphia 19 Aug. 1793; d. near Cincinnati, Ohio, 5 July 1868. He served in the army 1812–18, and subsequently studying law became judge of the circuit court of Illinois, and also State treasurer. In 1833 he took up his residence in Cincinnati, and devoted himself to banking and literature. His chief works are: 'Legends of the West'; 'Harpe's Head, a Legend of Kentucky' (1833); 'Sketches of the West' (1835); 'Tales of the Border' (1835); 'Notes on the Western States' (1838); 'History of the Indian Tribes' (1838–44) with McKenney; 'The Wilderness and the War-Path' (1845); 'Romance of Western History' (1859).

Hall, James, American geologist and palæontologist: b. Hingham, Mass., 12 Sept. 1811; d. near Bethlehem, N. H., 7 Aug. 1898. He studied at the Rensselaer Polytechnic School for six years, and was subsequently professor of geology there, and in 1837 was appointed to a position on the New York Geological Survey. In 1855 he was appointed State geologist of Iowa. In 1850 he was elected by the Royal Geographical Society of London one of its 50 foreign members, and in 1858 received the Wollaston Medal from that scientific body. He was a distinguished member of many scientific societies at home and abroad and was held in the highest esteem for his attainments in geology and palæontology. Among his publications may be named 'Geology of New York' (1843); 'Palæontology of New York' (1847 *et seq.*); 'Graptolites of the Quebec Group' (1865); as well as parts of the Geological Reports of Iowa (1858–9); and Wisconsin (1862).

Hall, John, American Presbyterian clergyman: b. near Armagh, Ireland, 31 July 1829; d. Bangor, County Down, Ireland, 17 Sept. 1898. He was educated at Belfast College and after holding several pastorates in Ireland, in 1867 became pastor of the Fifth Avenue Presbyterian Church, New York. He was chancellor of the University of the City of New York 1882–90, and was also trustee of Princeton University, Union Theological Seminary, and of Wellesley College. He was noted for his simple eloquence and impressive sincerity and was one of the most prominent clergymen in his denomination. He wrote 'Family Prayers for Four Weeks' (1868); 'Papers for Home Reading' (1871); 'Questions of the Day' (1873); 'God's Word through Preaching' (1875); 'Foundation-Stones for Young Builders' (1879); 'A Christian Home: how to Make and how to Maintain It' (1883).

Hall, John M., American railroad president: b. Willimantic, Conn., 16 Oct. 1841; d. New Haven, Conn., 27 Jan. 1905. He was graduated from Yale in 1866 and from the Columbia Law School in 1868. He took up the practice of law in his native town and became a judge of the superior court in 1889, resigning in 1893 to become vice-president of the New York, New Haven and Hartford Railroad Company. On the death of President Clark in 1899, Judge Hall succeeded him as president.

Hall, Joseph, English prelate: b. near Ashby-de-la-Zouch, Leicestershire, 1 July 1574; d. near Norwich 8 Sept. 1656. While yet in college he published his 'Virgidemiarum,' a series of poetical satires, remarkable for elegant and energetic versification, strong and lively coloring, and masterly traces of genuine humor. Having taken orders he obtained the rectory of Halsted, near St. Edmund's Bury, where he published a very popular work, 'A Century of Meditations.' In 1617 he became dean of Worcester, and was raised to the see of Exeter in 1627. After the open rupture between the king and Parliament, he came forward in defense of the liturgy and discipline of the church, against the views which the leading Nonconformists had published, in a treatise called, after the initials of the names of its authors, 'Smectymnuus' (q.v.). In the end of 1641 Bishop Hall was translated from the see of Exeter to that of Norwich, but was later imprisoned in the Tower with the other prelates who had protested against their expulsion from the House of Peers. In 1643 he was specially named in the ordinance passed for sequestering what were called "notorious delinquents." His prose works edited by Philip Wynter were published in 1863. Among the latter, the best known and most popular is his 'Contemplations,' which still finds many readers.

Hall, Lyman, American patriot: b. Wallingford, Conn., 12 April 1724; d. Burke County, Ga., 19 Oct. 1790. He was graduated from Yale in 1747, studied medicine, and began practice in Wallingford, Conn., but finally settled near Sunbury, Ga., where he became a leading physician. The settlers in this locality were from New England, and on the outbreak of trouble with England, they with Hall as leader took active part in the rebellion, though Georgia was slow in joining the patriot cause. Hall was sent by them as a representative to the Continental Congress, where he was admitted by a unanimous vote, and took part in all debates, but did not vote when the vote was taken by colonies, until Georgia was represented as a colony. In 1776 it was so represented, and Hall continued a member of the Congress till 1780, being one of those who signed the Declaration of Independence. He was elected governor of Georgia in 1783, and in an energetic administration of one year, he did much to repair the damage done by the war, established land offices and schools, and then retired from public life. Consult: Dwight, 'Signers of the Declaration' and an article, 'Lyman Hall' in the 'Magazine of American History,' XXV. 35.

Hall, Marshall, English physician and physiologist: b. Basford, near Nottingham, 18 Feb. 1790; d. Brighton, England, 11 Aug. 1857. In 1809 he commenced the study of medicine at the University of Edinburgh, and took his degree in 1812. In 1817 he commenced practice at Nottingham, and soon rose to eminence. In 1826 he settled in London, where he carried on a most successful practice. He paid especial attention to the symptoms of illness and in 1817 published 'Diagnoses of Diseases,' and in 1824 his 'Medical Essays' appeared. His 'Essay on the Circulation of the Blood' (1831) contained an account of his discovery of the so-called "caudal heart" in the tail of the eel. The more important of his other writings are: 'Lectures on the Nervous System and its Diseases' (1836), 'Theory and Practice of Medicine' (1837); 'Theory of Convulsive Diseases' (1848). His services to the cause of humanity were numerous and valuable, and among these one of the most widely known is the method which he invented of restoring suspended respiration, now generally adopted in the case of persons partially drowned. It is known as the "Marshall Hall Method." See DROWNING.

Hall, Robert, English Baptist clergyman: b. Arnsby, Leicestershire, England, 2 May 1764; d. Bristol, England, 21 Feb. 1831. He studied at the Baptist College at Bristol and King's College, Aberdeen, and entered the Baptist ministry, becoming in a few years not only the most prominent minister in his denomination but one of the very foremost of English orators. He was also widely known as a master of prose style, his most noted writings being 'Apology for the Freedom of the Press' (1793); 'Modern Infidelity' (1800); 'Reflections on War' (1802). He was subject to attacks of insanity but in spite of this misfortune accomplished a vast amount of intellectual work and was a tireless student. His complete works in six volumes reached an 11th edition in 1853.

Hall, Robert Henry, American soldier: b. Detroit, Mich., 15 Nov. 1837. He was educated at West Point and served in the Federal army during the Civil War, and was in command of a brigade during the war in the Philippines. He became a brigadier-general in the United States army in 1901. He has published 'Register of the United States Army 1789–98'; 'History of the Flag of the United States'; 'History of United States Infantry Tactics.'

Hall, Ruth, American novelist: b. Schoharie, N. Y., 10 April 1858. Besides more or less journalistic work she has written: 'In the Brave Days of Old' (1898); 'The Boys of Scrooby' (1899); 'The Black Gown,' a novel of colonial Albany (1900); 'The Downrenter's Son,' a novel of the anti-rent troubles in New York State (1902); 'The Golden Arrow' (1903).

Hall, Samuel Carter, English miscellaneous writer: b. Topsham, Devonshire, England, 1801; d. 16 March 1889. For over 40 years he was the editor of the 'Art Journal,' which he founded in 1839. With his wife (Anna Maria) (q.v.) he published: 'Ireland, its Scenery and Character' (1841–3); 'Book of Royalty' (1838); 'A Woman's Story' (1857); 'The Book of the Thames' (1859); 'A Companion to Killarney' (1878); and others. His separate works were: 'A Book of Memories'; 'Book of British Ballads'; 'Baronial Halls'; 'Retrospect of a Long Life' (1883).

Hall, Thomas, American inventor: b. Philadelphia 4 Feb. 1834. He was educated at the University of Pennsylvania, and subsequently studied mechanics in Europe, and at the Paris exposition in 1867 placed a keyed typewriter on exhibition. His numerous inventions include a mechanism for printing by touching keys; a keyed typewriter, the Hall typewriter, first offered for sale in 1881; several sewing-machines, as well as drill-grinding and other machinist tools, etc.

Hall, Thomas Cuming, American theologian: b. Armagh, Ireland, 25 Sept. 1858. He was graduated from Princeton in 1879, from the Union Theological Seminary in 1882, studied also in Berlin and Göttingen, and was a pastor in

Omaha and Chicago. In 1898 he became professor of theology in the Union Seminary. Among his works are: 'The Power of an Endless Life' (1893); 'The Social Significance of the Evangelical Revival in England' (1899); and 'The Synoptic Gospels' (1900).

Hall, a large room or apartment, the term having its origin in the castles and mansions of the Middle Ages. Here the king or the lord of the manor gave audience, administered justice, and received and entertained his retainers and guests. At one end of the hall was a raised platform or dais, on which the table of the lord of the manor and his honored guests was placed. This end of the hall was usually lighted with large oriel windows, and communicated with a building which contained the lords' solar, or bedroom and parlor, on the upper floor, and the wine cellar below. The retainers sat at a table which ran along the lower part of the hall. The entrance was at the lower end of the hall, where a passage gave access to the kitchen, pantry, and buttery. Above the passage a gallery for musicians was frequently constructed. Survivals of such mediæval dining halls may be found in the Oxford and Cambridge colleges; also in the halls of the Inns of Court and of some of the London guilds. The hall partook of the style of architecture prevailing at the time when it was built, and being a large and important apartment was generally ornamental in its character. The hall of the king's palace, now known as Westminster Hall, built by William Rufus and restored by Richard II., is the finest example in England, being 300 feet long and 100 feet broad. In the United States Nassau Hall, Princeton; Carnegie Hall, New York; Faneuil Hall, Boston; Independence Hall, Philadelphia, are examples of the modern hall.

Hall-marks. See PLATE-MARKS.

Hall of Fame, a memorial to famous Americans, at the New York University. The institution received a gift of $100,000 with which it built a colonnade 500 feet long on University Heights, a beautiful site in upper New York, overlooking the valleys of the Harlem and the Hudson. Large panels to the number of 150, two feet by eight, will bear simple inscriptions of the names and dates of birth and death of the famous native Americans who are chosen as the 150 greatest men. Of these, 50 were chosen in 1903, and five every five years thereafter till the year 2000. The public was invited to make nominations; and such nominations as were seconded by the Senate of the University were submitted to 100 judges, representing every State in the Union. These judges were university and college presidents, professors of history, scientists, publicists, editors, authors, and judges of the supreme court, national and state. Ninety-seven of these sent in their votes, and 29 great men, native and 10 years dead, chosen by this vote, and thereafter ratified by the Senate of the University, are the first of these immortals.

Naturally George Washington headed the list, with Abraham Lincoln second, and Daniel Webster came third. The names of Bryant, Poe, and Cooper are likely to be added hereafter. Lowell was not dead 10 years and was not yet eligible. Bryant failed by three votes, Greeley by five, Motley by nine. The most animated discussion was provoked by the selection of General Robert E. Lee. But since only a minority of the judges were Southern men, the vote for him was at least not sectional. The names of 21 other great men will be added to the list. The following shows the roll of names chosen for the Hall of Fame, and the number of votes that each received:

George Washington	97
Abraham Lincoln	96
Daniel Webster	96
Benjamin Franklin	94
Ulysses S. Grant	92

Hall of Odin, a tradition among the Scandinavian peoples, which tells of the rocks from which the Berserkers, when tired of life, flung themselves into the sea; so named because they were regarded as the portals of the Scandinavian Valhalla.

Hallam, hăl'am, **Arthur Henry**, English essayist: b. London 1 Feb. 1811; d. Vienna 15 Sept. 1833. He was a son of Henry Hallam (q.v.), and was graduated in 1832 from Trinity College, Cambridge, entered the Inner Temple and later the office of a conveyancer of Lincoln's Inn; and died during a visit to the Continent. At Cambridge he met Alfred Tennyson, whose 'In Memoriam,' through which he is best known, employs his sudden and untimely death as a basis for the exposition of a poet's philosophy. His 'Remains in Prose and Verse' (1834), largely justify the high hopes entertained for him, especially in the critique of Rossetti's 'Disquisizione sullo spirito antipapale,' and the essay on Cicero.

Hallam, Henry, English historian: b. Windsor 9 July 1777; d. Penshurst, Kent, 21 Jan. 1859. He was educated at Oxford, and in 1818 made his appearance as an author by his 'View of the State of Europe during the Middle Ages,' which at once established his reputation, and is acknowledged as a standard work. His next work, the 'Constitutional History of England' (1827), is justly regarded as a model at once of laborious research and scrupulous impartiality — an impartiality so scrupulous, that his readers are sometimes perplexed to discover to which side his judgment inclines. His 'Introduction to the Literature of Europe' (1837–9), if it could not add to his reputation, certainly did not detract from it. His eldest son, Arthur Henry (q.v.), died in early manhood; the great hopes buried with him may be gathered from a most affecting 'Memoir' printed by his father for private circulation, while Tennyson's

'In Memoriam,' of which Arthur Hallam is the subject, has raised to him a durable monument.

Hallé, häl-lā, Sir **Charles**, Anglo-German pianist: b. Hagen, Westphalia, 11 April 1819; d. Manchester, England, 25 Oct. 1895. He studied first at Darmstadt, and afterward at Paris, where his reputation was established by his concerts of classical music. But the revolution of 1848 sent him to England, and he made his home in Manchester. There he established in 1857 a series of subscription orchestral concerts which did much to raise the popular standard of musical taste by familiarizing the British public with the great masters of classical music. The orchestra which he conducted some forty years was the most finely trained body of musicians in the United Kingdom. He was knighted in 1888, and married the same year the famous violinist, Madame Norman-Neruda.

Hallé, Wilma Maria Francesca Neruda, Lady, Austrian violinist: b. Brunn, Moravia, 1840. She made her debut at Vienna in 1846, exciting the greatest enthusiasm by her wonderful execution. Her first husband was a Swedish musician, Ludwig Norman, and as Madame Norman-Neruda she was famous in England and America long before her marriage to Sir Charles Hallé (q.v.) in 1888. After the death of the latter she visited the United States on a concert tour.

Halle, häl'lĕ, or **Halle an der Saale**, än-dĕr-zä'lĕ, Germany, a town and important railway junction of six lines, in Prussian Saxony, about 20 miles northwest of Leipsic, on the river Saale. It consists of the mediæval town with narrow, crooked streets and ancient dwellings, separated by boulevards on the site of the old ramparts, from extensive and handsome suburbs. Among notable public buildings are the restored mediæval Rathaus; the "Red Tower" in the market place, a 15th century clock-tower; the decaying Moritzburg, formerly a citadel and archiepiscopal residence; the modern Gothic Ratskeller; the extensive buildings of the University (q.v.); a deaf and dumb asylum; a lunatic asylum; the 12th century Moritzkirche with fine wood carvings; the 16th century Protestant cathedral; and the 16th century Gothic church of the Virgin, with four towers and noted for its handsome interior. In the suburb of Glaucha the Waisenhaus, "orphan house," or institution founded by the Rev. Francke about 1693 forms a small town in itself. Besides the orphan asylum it includes different grade schools, attended by between 3,000 and 4,000 pupils; a printing and publishing establishment; and a laboratory where medicines are prepared and sold. The trade and manufactures of Halle are extensive. The latter include starch, beet-root sugar, chemicals, oil, machinery, etc., besides the celebrated ancient salt works. The salt workers form a distinctive colony with special exemptions and privileges and are known as "Halloren." Halle is mentioned as Halla as early as 806; in the 12th century it had developed considerable trade, and in the next two centuries was an important member of the Hanseatic League. In 1806 it was taken by the French; in 1813 it was annexed to Prussia. Pop. (1900) 156,661.

Halle, University of, Germany, a celebrated institution founded in 1694 by King Frederick I. in the interests of the jurist Thomasius, when he was followed to Halle by several students after his retirement from Leipsic owing to the envy of his fellow professors. It attained a high degree of prosperity, but owing to its strong Prussian proclivities was suppressed by Napoleon in 1806 and in 1813. It was re-established in 1815 and in 1817 was united with the University of Wittenberg. Its buildings which are very extensive, especially those accommodating the medical faculty, date from 1832. There are faculties of theology, law, medicine, and philosophy. From its foundation Halle was recognized as one of the principal schools of Protestant theology, and has numbered among its professors some of the most eminent names of Germany. Connected with the university is an ever-increasing library of over 220,000 volumes and MSS., a medical and surgical clinical institute; a maternity hospital; an observatory; a theological and normal seminary; and a botanical garden; especial attention is devoted to agriculture. In 1903 the university had nearly 2,000 students.

Halleck, hăl'ĕk, **Fitz-Greene,** American poet: b. Guilford, Conn., 8 July 1790; d. there 19 Nov. 1867. At 18 he became a clerk in a New York bank, in which employment he remained for 20 years. For a long period after this he was the confidential agent of John Jacob Astor, and was named by him one of the original trustees of the Astor Library. In 1849 he retired to his native town. He wrote verses in his boyhood, but these early effusions were excluded from the collected editions of his poems. In 1819 he assisted Joseph Rodman Drake (q.v.) in the humorous series of 'Croaker' papers, contributed to the New York *Evening Post.* Drake's death in the succeeding year was commemorated by Halleck in a most touching poem. In 1819 was published Halleck's longest poem, 'Fanny,' a satire, in the measure of Byron's 'Don Juan,' on the fashions, follies, and public characters of the day. From the variety and pungency of the local and personal allusions it enjoyed a great but fleeting popularity. In 1827 he published an edition of his poems in one volume, two of the best in the collection, 'Alnwick Castle' and 'Burns,' having been suggested by scenes and incidents of foreign travel. This edition also included the spirited lyric, 'Marco Bozzaris,' by which he will probably be longest kept in mind. Consult Wilson, 'Life and Letters of Fitz-Greene Halleck' (1869).

Halleck, Henry Wager, American soldier: b. Westernville, N. Y., 16 Jan. 1815; d. Louisville, Ky., 9 Jan. 1872. He was graduated at the United States Military Academy in 1839, was assistant to the Board of Engineers at Washington 1840–1, and in 1841–6 assistant engineer in the repair of the New York harbor fortifications. In the Mexican War he was on the Pacific coast, and in 1847–9 was secretary of State for California under the military government. After service as inspector and engineer of lighthouses (1852–4) and as engineer of the board for fortifications on the Pacific coast (1853–4), he resigned from the service in 1854, and practised law in San Francisco. On the outbreak of the Civil War he re-entered the army, and in November 1861, was appointed commander of the department of the Missouri, then in a state of thorough disorganization. He quickly reduced the department to order, outlined the western campaign of 1862, directed this campaign in person from 11 April, and took Corinth, with its 15 miles of entrenchments, on 30 May. In July he became general-in-chief of the armies of the United States; and henceforth directed from Washington the movements of the generals in the field, till, in March 1864, he was superseded by Gen. Grant. Halleck was chief of staff till 1865, commanded the military division of the James in 1865, that of the Pacific, 1865–9, and that of the South from 1869 until his death. He wrote a work on 'The Elements of Military Art and Science' (1846), largely used as a manual in the Civil War; 'Bitumen' (1841); 'A Collection of Mining Laws of Spain and Mexico' (1859), and other volumes.

Halleck, Reuben Post, American educator: b. Rocky Point, L. I., 8 Feb. 1859. He was graduated from Yale in 1881, was instructor in the Male High School, Louisville, Ky., 1883–96, and principal from the latter date. He has published: 'Psychology and Psychic Culture' (1895); 'The Education of the Central Nervous System' (1890); 'History of English Literature' (1900).

Hallelujah, hăl-e-loo'ya, **Halleluia,** or **Alleluia** (Hebrew), "Praise ye the Lord"; an expression which occurs often in the Psalms, and which was retained when the Bible was translated into the various languages, probably on account of its full and fine sound, which, together with its simple and solemn meaning, so proper for public religious services, has rendered it a favorite of musical composers. The Roman Catholic Church does not allow it to be sung on the Sundays during Lent, on account of the mournful solemnity of the season; and in that church it is not sung again before Easter. It is no longer sung in masses for the dead as formerly. In the time of Augustine the African Church used this doxology only from Easter to the feast of Pentecost. The Greeks made an earlier or more common use of the Hallelujah than the Latin Church. The Jews call the Psalms cxiii.-cxvii. the Great Hallelujah, because they celebrate the particular mercies of God toward the Jews, and they are sung on the feast of the Passover, and on the feast of Tabernacles.

Haller, Albrecht von, äl'brĕʜt fōn häl'lĕr, Swiss anatomist, botanist and poet: b. Bern 16 Oct. 1708; d. there 12 Dec. 1777. Having chosen the medical profession, he went to the University of Tubingen, where he studied comparative anatomy under Duvernoy; and in 1725 removed to Leyden, then the first medical school in Europe. After extensive travels in England and France he went to Basel in 1828 to study mathematics under Bernoulli. Here he first imbibed a taste for botany, and composed his poem 'Die Alpen', followed by various ethical epistles and other pieces, which gave him a reputation in Germany. In 1729 he returned to his native city, and entered on his professional career as a public lecturer on anatomy. In 1736 he became professor of anatomy, surgery, and botany, in the newly founded University of Göttingen, and through his influence the university was enriched with a botanical garden, an anatomical theatre, a school for midwifery, and a college of surgery. In 1747 appeared the first edition of his 'Primæ Lineæ Physiologiæ,' which, long after the death of the author, was used as a text-book in schools of medicine. In 1752 he first advanced his opinions on the properties of sensibility and irritability as existing in the nervous and muscular fibres of animal bodies; doctrines which attracted much attention, and excited great controversies in the medical world. Disagreements with his colleagues induced him to return, in 1753, to Bern, where his countrymen received him with the respect due to his fame and talents. Having been elected a member of the sovereign council of the state, he soon obtained by lot one of its magistracies, and entered with zeal on the duties of a citizen, though he did not neglect his scientific pursuits. He was elected in 1754 one of the foreign associates of the Paris Academy of Sciences. In 1758 he became director of the public salt-works at Bex and Aigle, and in the course of his superintendence introduced many improvements in the manufacture of salt. His later published works include: 'Elementa Physiologiæ Corporis Humani' (1757–66); 'Bibliotheca Botanica' (1771); 'Bibliotheca Anatomica' (1774); 'Bibliotheca Chirurgica' (1774); 'Bibliotheca Medicinæ Practicæ' (1776–88).

Haller is considered one of the greatest German poets of the 18th century. His philosophical and descriptive poems display depth of thought and richness of imagination. His 'Elegiac Poems' (Die elegischen Gedichte) are still frequently republished in Germany. He wrote in prose three philosophico-political romances — 'Usong,' 'Alfred the Great,' and 'Fabius and Cato' — designed to exhibit the respective advantages of different forms of government, and corresponded in German, Latin, Italian, English, and French with all parts of Europe.

Hal'lett, Benjamin Franklin, American statesman: b. Barnstable, Mass., 2 Dec. 1797; d. Boston 30 Sept. 1862. Graduated from Brown University in 1816, he studied law, was admitted to the bar, and was connected with the Providence (R. I.) press, but later went to Boston, and there became editor of the Boston *Advocate*, the official mouthpiece of the Anti-Masonic party. From 1827 to 1831 he edited the Boston *Daily Advertiser*, which he made extremely unpopular through his vigorous enunciation of his views on masonry, temperance, and emancipation. He afterward became a Democrat and an influential factor in his party. For years he was chairman of its national committee, and it was he who drafted the Cincinnati platform of 1856. President Pierce, whose nomination he had helped to secure, appointed him United States district attorney in 1853.

Hal'lettsville, Texas, city, county-seat of Lavaca County; on the San Antonio & A. P. railroad; about 100 miles southwest of Houston. It is in an agricultural and stock-raising region, and special attention is given to cotton and cattle. It has a cotton-seed oil mill and a number of cotton-gins. Large shipments are made each year of live-stock, cotton, and cotton-seed oil. Pop. (1900) 1,457.

Halley, hăl'ĭ, **Edmund,** English mathematician and astronomer: b. Haggerston, near London, 29 Oct. 1656; d. Greenwich, Kent, 1742. Before he was 19 he published 'A Direct and Geometrical Method of Finding the Aphelia and

Eccentricity of Planets,' which supplied a defect in the Keplerian theory of planetary motion. By some observations on a spot which appeared on the sun's disk in July and August 1676, he established the certainty of the motion of the sun round its own axis. August 21, the same year, he fixed the longitude of the Cape of Good Hope by his observation of the occultation of Mars by the moon. In 1679 he published 'Catalogus Stellarum Australium, sive Supplementum Catalogi Tychonici,' etc., and in 1683 his 'Theory of the Variation of the Magnetical Compass,' in which he endeavors to account for that phenomenon by the supposition of the whole globe of the earth being one great magnet, having four circulating magnetical poles or points of attraction. For the purpose of making further observations relative to the variation of the compass he set sail on a voyage in 1699, and having traversed both hemispheres arrived in England in September 1700. The spot at St. Helena where he erected a tent for making astronomical observations is still called Halley's Mount. As the result of his researches he published a general chart, showing at one view the variation of the compass in all those seas with which English navigators were acquainted. He was next employed to observe the course of the tides in the English Channel, with the longitudes and latitudes of the principal headlands, in consequence of which he published a large map of the channel. In 1703 he was elected Savilian professor of geometry at Oxford, and in 1720 he received the appointment of astronomer-royal at Greenwich, where he afterward resided, devoting his time to completing the theory of the motion of the moon. In 1721 he began his observations, and for the space of 18 years scarcely ever missed taking a meridian view of the moon, when the weather was not unfavorable. In 1752 appeared his 'Astronomical Tables,' and he was the author of a great number of papers in the 'Philosophical Transactions.' For the comet called by his name, see COMET.

Halliwell-Phillipps, hăl'ĭ-wĕl-fĭl'ĭps, **James Orchard**, English antiquary and Shakespearian scholar: b. Chelsea, London, 21 June 1820; d. Hollingsbury Copse, near Brighton, 3 Jan. 1889. He was educated at Cambridge. In 1839 he was elected Fellow of the Royal and Antiquarian Societies. Gradually he came to concentrate his studies on Shakespeare alone, and more particularly on the facts of the poet's life, discrediting the internal evidence of the plays and sonnets, and devoting his attention to a minute and patient study of local tradition and the records of 32 towns besides Stratford. The successive editions of his 'Outlines of the Life of Shakespeare' (1848; 8th ed. 1889) recorded the growing results of his discoveries. Apart from Shakespeare, his 'Nursery Rhymes and Nursery Tales of England' (1845), and 'Dictionary of Archaic and Provincial Words' (1847; 6th ed. 1868) will keep his name from being forgotten. His magnificent folio edition of the 'Works of Shakespeare,' probably the richest storehouse extant of Shakespearian criticism (1853–65), was published at a price prohibitive to most students. To the Smithsonian Institute he gave (1852) a collection of accounts, inventories, and bills illustrative of the history of prices current in the years 1650–1750.

Hal'lock, Charles, American journalist and author: b. New York 13 March 1834. He was graduated from Amherst in 1854, was editor of the New Haven *Register* in 1855–6, of the New York *Journal of Commerce* in 1856–61, of the St. John (N. B.) *Telegraph and Courier* in 1863–5. In 1873 he founded 'Forest and Stream,' and in 1896–7 was editor of the 'Northwestern Field and Stream.' In 1874 he founded the International Society for the Protection of Game. He did field-work and collecting for the Smithsonian Institution, and published numerous works, such as: 'The Fishing Tourist' (1873); 'Camp Life in Florida' (1876); 'Vacation Rambles in Michigan' (1877); 'Dog Fanciers' Directory' (1886); 'The Salmon Fisher' (1890). He was a son of Gerard Hallock (q.v.).

Hallock, Gerard, American journalist: b. Pittsfield, Mass., 18 March 1800; d. New Haven, Conn., 4 Jan. 1866. He was graduated from Williams College in 1819, in 1824 founded the Boston *Telegraph* (united with the *Recorder* in 1825), in 1827 purchased a part interest in the New York 'Observer,' and in 1828 became associated with David Hale on the *Journal of Commerce*. A leader in journalistic enterprise, he started (1833) a pony-express between Philadelphia and New York, and operated the Evening Edition, a schooner which met incoming ships at Sandy Hook, and brought foreign news. A pro-slavery man, he was a founder of the Southern Aid Society (1854), intended to succeed the American Home Missionary Society when the latter refused support to slave-holding congregations. In 1861 the *Journal of Commerce* was forbidden the use of the United States mails, and Hallock thereupon sold his interest, and never afterward wrote for the press. He was a founder of the Associated Press.

Hallock, Joseph Newton, American Presbyterian clergyman and religious journalist: b. Franklinville, N. Y., 1834. He was graduated from Yale in 1857 and from the Yale Theological Seminary in 1860, and after holding pastorates of several Presbyterian churches became editor and proprietor of 'The Christian at Work.' Among other works he has published 'The Christian Life' (1890); 'Family Worship' (1892); 'What is Heresy?' (1894); 'Mormonism' (1896); 'Life of D. L. Moody' (q.v.) (1900).

Hallowe'en, hăl-ō-ēn', or **Hallow-Even**, the evening of 31 October, so called as being the eve or vigil of All Hallows, or festival of All Saints, which falls on 1 November. It is associated in the popular imagination with the prevalence of supernatural influences, and is clearly a relic of pagan times. In the north of England, hallowe'en is known as Nutcrack Night. In Scotland the ceremonies of the eve were formerly regarded in a highly superstitious light, and Burns' 'Hallowe'en' gives a humorous and richly imaginative presentment of the usual ceremonies as practised in Scottish rural districts in his day. The principal object of curiosity in consulting the future was to discover who should be the partner in life. Popular belief ascribed to children born on hallowe'en the faculty of perceiving and holding converse with supernatural beings.

Hal'lowell, Richard Price, American author and wool merchant: b. Philadelphia 16 Dec. 1835; d. Medford, Mass., 5 Jan. 1904. He was prominent in the abolition movement, was appointed by Gov. Andrew of Massachusetts special agent to recruit negro regiments, and subsequently was vice-president of the New England Woman Suffrage Association. He published 'The Quaker Invasion of Massachusetts' (1883), etc.

Hallowell, Me., city in Kennebec County, on the Kennebec River, and on the Maine Central railroad; two miles south of Augusta and four miles north of Gardiner. The first permanent settlement was made in 1754. It was incorporated as a township in 1771, and chartered as a city 29 Aug. 1850. At the time of its becoming a chartered city it included within its limits Chelsea, Manchester, and Farmingdale. The city is governed by a mayor and a council of seven members elected annually. It has two banks with a combined capital of $150,000. The industries of the city include granite works, shoe manufactories, glue works, cotton goods, machinery, etc. The Hubbard Free Library and the Maine Industrial School are public institutions. Pop. (1904) 3,000.

Hall'statt Epoch, a name taken from the necropolis of Hallstatt, Upper Austria, not far from Salzburg, and applied to that culture in Europe — parts of Germany, France, Italy, and in Switzerland, Bohemia, etc. — distinguished as the last bronze and first iron stage, dating back at least as far as 1000 B.C. According to some ethnologists in the eastern highlands of the Alps this culture was of a higher evolution than that of a partially Oriental cast in the west during the Neolithic epoch.

Hällström, Ivar, ē'vär hĕl'strĕm, Swedish composer: b. Stockholm 5 June 1826; d. there 11 April 1901. He studied law at Upsala, then turned his attention to music, in 1861–72 was director of the institute founded by Lindblad, and from 1881 instructor to the Royal Opera. His works include the operas 'Den Bergagna' ("The Mountain King" 1874); and 'Neaga' (libretto by Carmen Sylva, 1885); cantatas, numerous songs, and an 'Idyle' for orchestra, chorus, and solo voices, for which he received (1860) a prize from the Stockholm Musical Union.

Hallucina'tions, are morbid conditions of mind in which the patient is conscious of a perception without any impression having been made on the external organs of sense. Hallucinations are to be distinguished from delusions, for in these there are real sensations, though they are erroneously interpreted. All the senses are not equally subject to hallucinations; the most frequent are those of hearing; next, according to many, come those of sight, smell, touch, and taste; and hallucinations of several senses may exist simultaneously in the same individual. They may also be complicated with certain delusions. Often even the hallucination of one sense is confirmed by the delusion of another, so that it is neither possible nor necessary always to distinguish hallucinations from delusions. The simplest form of hallucinations of hearing is the tingling of the ears; but the striking of clocks, the sounds of musical instruments and of the human voice are often heard, and in these instances, as in those of the perturbations of the other senses, there must be a diseased sensorium, though there should be no structural derangement of the nerves. Hallucinations are not confined to those whose mental faculties have been alienated, but occasionally assail and torment even the sane. The second Earl Grey was haunted by a gory head, but he could dismiss it at will. Swedenborg had a similar faculty; and Bernadotte, king of Sweden, was besieged in his rides by a woman in a red cloak, being perfectly conscious of the hallucination under which he labored. Lord Brougham proposed that the existence of hallucinations should be established as an authoritative test for the existence of insanity; but, as will have been seen, this would be no test at all. The proportion of the hallucinations of the various senses has been by some tabulated thus: — hearing, 49; vision, 48; taste, 8; touch, 3; smell, 1. All are more frequent in mania than in monomania, and in mania errors of vision are more numerous than those of hearing. See APPARITIONS; DREAMS; GHOSTS; INSANITY.

Hallux Valgus, a deformity of the great toe consisting of a turning of the toe toward its neighbor, with a marked enlargement of the head of the bone. The synovial sac on the inner side of the toe is often chronically inflamed from constant pressure, forming a bunion. Advanced cases may require the excision of the bony outgrowths, but early cases may be relieved by a properly adjusted shoe.

Halmahera, häl-mä-hä'rä. See GILOLO.

Halo, the name given to colored circles sometimes seen around the sun or moon, and to other connected luminous appearances. Sometimes as many as three circles are seen round the sun. A white band across the sun, parallel to the horizon, is also sometimes seen; and sometimes a second white band, perpendicular to the first. These bands form a cross, and stretch out so as to cut the circles of the halo. It is on these bands that parhelia or mock suns are formed. The explanation of halos is complex and difficult. Marriotte attributed the colored rings to refraction of light through small crystals of ice in the air, and calculation appears to confirm his hypothesis. The third circle is probably due to refraction of light that has undergone internal reflection in the crystals in a way similar to that which occurs in the formation of the rainbow. On the other hand, the white bands crossing the sun must be due to reflection of light from the surfaces of the crystals. See LIGHT; PARHELION; SUN.

Halogen, hăl'ō-jĕn, in chemistry, an element, or inorganic radical, which unites directly with a metal to produce a saline substance, such as common salt. The term is usually confined to the elements fluorin, chlorin, bromin, and iodin, and the compound known as cyanogen.

Halophytes, hăl'ō-fīts, a group of plants considered with reference to their habitat, and including those which inhabit salt marshes, and by combustion yield barilla, as *Salsola*, *Salicornia*, and *Chenopodium*. For further examples see BEACH-PLANTS and DESERT PLANTS

Hal'pine, or Halpin, Charles Graham, American soldier and author: b. Oldcastle, County Meath, Ireland, 20 Nov. 1829; d. New York

3 Aug. 1868. After study at Trinity College, Dublin, he came to Boston, Mass., in 1851, was there assistant editor of the *Post*, and with B. P. Shillaber began the 'Carpet Bag,' an unsuccessful humorous periodical. Later Washington correspondent of the New York *Times*, he then went to New York, where he was connected with the *Herald*, and wrote much ephemeral matter for magazines. Upon the outbreak of the Civil War he enlisted in the 69th New York volunteer infantry, and was afterward on the staff of Hunter as assistant adjutant-general, of Gen. Halleck with the rank of colonel. In 1864 he resigned from the service and was brevetted brigadier-general of volunteers. He was best known for his burlesque verses, written in the character of an Irish private, "MILES O'REILLY," over which pseudonym they appeared. 'Life and Adventures, Songs, Services, and Speeches' was published in 1864, and his complete 'Poetical Works' in 1869.

Hals, häls, **Frans**, Dutch painter: b. Anwerp about 1584; d. Haarlem 7 Sept. 1666. When young he went to Haarlem, where he studied painting under Karel van Mander, and he was one of the civic guard, director of an art school, and chief of the painters' guild. His first dated work is a portrait belonging to the year 1613, his next, the 'Banquet of the Officers of the Haarlem Corps of Arquebusiers of St. George' (1616), one of the earliest pictures belonging to the Dutch school of genre painting, of which Hals is sometimes regarded as the founder. He executed 'The Jolly Trio,' 'Herring Vender,' and 'Fool Playing a Lute,' and seems to have found in genre painting a scope and a possibility of humor much to his taste. He executed also many single-figure pieces, as 'Hille Bobbe' (National Gallery, Berlin; replica in the Metropolitan Museum), and numerous portraits, all of high value artistically. Hals is ranked among the foremost of portrait artists, being notably successful in illuminating the character of the face. Adrian van Ostade, Wouwerman, and Adrian Brouwer were among his pupils. He is said to have been improvident in his habits, and latterly received a pension from the municipality of Haarlem. His brother DIRK, d. Haarlem May 1656, and his son, FRANS HALS, THE YOUNGER, b. about 1620; d. about 1669, were also excellent painters.

Hal'sey, Francis Whiting, American journalist: b. Unadilla, N. Y., 15 Oct. 1851. He was a member of the editorial staff of the New York *Tribune* 1875–80, and was attached to that of the New York *Times* 1880–1902, editing the *Times* 'Saturday Review' from 1896. He has published 'Two Months Abroad' (1878); 'The Old New York Frontier' (1901); 'American Authors and their Homes'; 'Essays'; 'Our Literary Deluge' (1902).

Hal'stead, Murat, American journalist: b. Ross, Butler County, Ohio, 2 Sept. 1829. At 18 he began writing for newspapers, studied at Farmers' College, near Cincinnati, and did local newspaper reporting on several Cincinnati papers. In 1853 he became manager of a department on the Cincinnati *Commerciol*. The following year he acquired a pecuniary interest in the paper, which began rapidly to increase in circulation and influence, so that in a few years it was considered one of the most influential newspapers in the West. The *Commercial* combining with the *Gazette*, its rival, the Cincinnati *Commercial-Gazette*, became the recognized organ of the Ohio Republicans. In 1890 he removed to Brooklyn, N. Y., where he edited the *Standard Union*. Later he was a contributor to magazines and special correspondent, and in the latter capacity went to the Philippines during the Spanish-American War. He wrote: 'The Story of Cuba'; 'Life of William McKinley'; 'The Story of the Philippines'; 'History of American Expansion'; 'Life of Admiral Dewey'; 'The Boer and British War.'

Halsted, George Bruce, American mathematician: b. Newark, N. J., 25 Nov. 1853. He was graduated from Princeton in 1875 and since 1884 has been professor of mathematics in the University of Texas. He has published 'Mensuration' (1881); 'Elements of Geometry' (1885); 'Elementary Synthetic Geometry' (1892); 'Pure Projective Geometry' (1895).

Ham, one of the three sons of Noah, from whom the earth after the Deluge was peopled. He is first mentioned between the other two — Shem, Ham, and Japheth; but afterward is expressly designated the younger son of Noah, that is, relatively to the other two. He had four sons — Cush, Mizraim, Phut, and Canaan. The three first traveled southward, and from them chiefly sprang the tribes that peopled the African continent, as Canaan became the father of the tribes that principally occupied the territory of Phœnicia and Palestine. Ham is also used as a designation of Egypt, probably on account of its population having sprung from a son of Ham, and the name Ammon, by which the chief god of the northern Africans was often called and worshipped, may very likely derive its origin from the same source.

Ham, the joint which unites the thigh and the leg of an animal, but more generally understood to mean the cured thigh of the hog. Ham-curing is now an important branch of business, especially in Great Britain and America, and the details of the process are generally the same everywhere. The meat is first well rubbed with salt, and a few days after it is rubbed again with a mixture of salt, saltpetre, and sugar, though sometimes the saltpetre is omitted. After lying in the tub for eight or ten days it is ready for drying. Wet-salting requires three weeks, and dry-salting four. The smoking of hams is carried on in smoke-houses, the meat being hung as high as possible, and subjected to the smoke of a fire kindled on the ground-flat, and which ascends through holes in the flooring. The process of smoking is for the most part carried on in winter, the fire being kept in a smouldering state for five or six weeks. Wood is used in preference to coal in the process of smoking. See PORK.

Ham-beetle, or Paper-worm, a small clerid beetle (*Necrobia rufipes*), sometimes a pest of considerable importance because of the occurrence of its larvæ or "worms," the paper-like cocoons and beetles on hams in such numbers as to render them unmerchantable. Its injuries are generally confined to the exterior and are due to carelessness in packing and to the cracking of the ham coverings. This is one of three cosmopolitan species of the same genus, all of which are carnivorous scavengers.

Ham-fly, a name of the cheese-fly (q.v.), due to the occasional appearance of its maggots or «skippers» in the fatty exterior portions of preserved hams.

Hama, hä'mä, or **Hamah**, Syria, the Biblical HAMATH, a very ancient city, on the El-Asi (Orontes), 110 miles northeast of Damascus. It is surrounded by gardens, and has narrow, crooked streets, with houses built of timber, and sun-dried bricks. There are manufactures of yarn and coarse woolens, and a general domestic and caravan trade. Hamath is frequently mentioned in Old Testament history as in conflict with the Assyrians; first as early as 854 B.C. After the Græco-Macedonian conquest it became known as Epiphania. In 639 it was captured by the Moslems. Abulfeda, the Arabian geographer, was prince of Hama from 1310–31. In 1812 Burckhardt here discovered the four Hittite stones, the inscriptions of which are still undeciphered. Pop. (est.) 45,000.

Hamadryad, hăm'a-drī-ăd. (1) A baboon (q.v.). (2) The king-cobra (*Naja bungarus*), one of the Oriental cobras, found from Southern India to China and the Philippines, and closely allied in structure, markings, and habits to the cobra di capello, but much larger, reaching the length sometimes of 13 feet, making it the longest of venomous serpents. It is also the most fierce in disposition, but fortunately is nowhere common, and feeds wholly on other snakes. Consult Fayrer, 'Thanatophidia of India' (1874).

Hamadryads, in Greek mythology, the eight daughters of Hamadryas. They received their names from trees, and are the same as the Dryads (q.v.). They were conceived to inhabit each a particular tree, with which they were born, and with which they perished.

Hamame'lis. See WITCH HAZEL.

Haman, hā'man, a minister of the Persian king Ahasuerus. Because Mordecai the Jew refused to pay him homage, he resolved on the destruction of all the Jews in the Persian monarchy. By falsehood and intrigue he succeeded in obtaining a decree for this purpose; but Esther, the Jewish consort of Ahasuerus, interposed for their deliverance, and Haman was hanged on the very gibbet he had caused to be prepared for Mordecai. His history is contained in the book of Esther.

Hamath, hā'măth. See HAMA.

Ham'blin, Joseph Eldridge, American soldier: b. Yarmouth, Mass., 1828; d. New York 3 July 1870. Not long after the commencement of the Civil War, he became adjutant of the 5th New York, later was transferred to the 65th, whose commander he soon became, and with which he participated in Sheridan's victorious movements in the Shenandoah. For services at Cedar Creek he was brevetted brigadier-general, and was mustered out in 1866 with full rank of brigadier and brevet of major-general. Subsequently he was active in the affairs of the New York State National Guard.

Hamblin, Thomas Sowerby, American actor: b. Pentonville, near London, England, 14 May 1800; d. New York 8 Jan. 1853. He was early a member of the corps of the Sadler's Wells and Drury Lane theatres, was a tragedian at Bath, Brighton, and Dublin, came to the United States in 1825, appeared at the Park Theatre, New York, and acted in leading American cities. He was manager of several New York theatres, and among his rôles were those of Macbeth, Hamlet, Othello, Rolla, Pierre, Virginius, and Coriolanus. He was esteemed second only to Forrest and the elder Booth, and made the standard drama a feature of his management, under which the Bowery Theatre saw its historic days.

Hamburg, hăm'bėrg (Ger. häm'boorg), Germany, a free city and state of northwestern Germany, the city occupying 30 square miles of the state's total area of 157.18 square miles. The city is the greatest commercial port on the European continent, the chief of the three Hanse towns, and the seat of the upper Hanseatic court. It is situated at the junction of the Alster and the Bille, on the right bank of the northern branch of the Elbe, about 93 miles from the North Sea. With its connecting suburbs Altona and Ottensen it has a river frontage of over five miles. The river is spanned by two fine bridges, and there are numerous bridges across the canals which intersect the east and lower part of the city in all directions, and across the Alster which flows through the city and forms two ornamental pieces of water, the Aussen-Alster and the Binnen-Alster or Alster-Bassin. The latter is surrounded by fine quays, the Alter Jungfernstieg and the Neuer Jungfernstieg, lined with handsome residences, hotels, and stores, and constituting the chief thoroughfare in the city. The harbor accommodation is extensive; the principal quays along the Elbe where the ocean steamships lie are the Kaiser-Quai and the Sandthor-Quai. The boulevards or Anlagen occupy the site of the ancient encircling walls, removed since 1815. The modern portion of the city, rebuilt since the destructive fire of 1842 in a magnificent and expensive style, is in striking contrast to the older low-lying portion, with its back streets, bordered by warehouses, and the meaner class of dwelling houses. The most important public buildings are the Exchange, a noble edifice consisting chiefly of a magnificent hall surrounded by a fine colonnade and containing a large commercial library; the modern Rathaus in Renaissance style, and the Deutsches Schauspielhaus. Among ecclesiastical structures are the 19th century Gothic church of St. Nicholas with a tower and spire 473 feet high; the 18th century Renaissance church of Saint Michael's, with a spire 426 feet high, the 15th century church of St. Catherine's, the 14th century church of St. James, and a fine Jewish synagogue. Besides the numerous private and public schools the educational institutions include the Johanneum institution founded in 1528, containing a college, museums, and the city's extensive library; the Kunsthalle with a large art collection; and zoological and botanical gardens, etc. Among the many charitable and benevolent institutions are well endowed hospitals, orphan, and insane asylums, and there is also an organized system of municipal poor relief. The sewerage system has been modernized, and the general sanitary conditions improved, especially since the severe choleraic epidemic of 1892. The municipal waterworks, dating from 1531, have been added to at various dates and a modern filtering plant installed since 1893; municipal bath and wash houses are maintained; food adulteration is keenly looked after; the gas and electric lighting plants are civic property; and a large revenue is obtained from the electric street railroads, which are operated by private companies, paying state subventions.

The importance of Hamburg is due to its great marine commerce, which has been facilitated by the engineering enterprises of the inhabitants in deepening the bed of the river, cutting canals, and since 1890 in the construction at Cuxhaven, at the mouth of the river, of enormous docks. Seven railroad lines enter the city, which is connected also by rivers and canals with nearly all parts of the German empire. In 1900, 12,912 vessels with a net tonnage of 8,148,218 tons entered, and 14,030 with a net tonnage of 8,293,252 cleared the port. The exports by sea in 1901 amounted approximately to 4,695,469 tons, valued at $454,886,750; the imports by sea in the same year were approximately 9,701,346 tons, valued at $540,177,750. Raw materials, foodstuffs, especially coffee, and manufactured articles are the chief imports, the last item constituting also the bulk of the exports. The city's manufacturing interests, though large, are less important, including ship-building, iron-founding, tobacco and cigar making, sugar refining, distilleries, breweries, and numerous other domestic industries. The banking, exchange, and marine assurance business of Hamburg has been on an extensive scale since the establishment of the Hamburg giro-bank in 1619, and is one of the most important in the world.

The city-state has a democratic constitution and is administered by an executive senate of 18 life-members, including a first and a second burgomaster elected biennially among the members, and by the legislative House of Burgesses composed of 160 members elected every six years, one half of whom retire every three years. The population of the city is second to that of Berlin in the German empire; in 1900 it was 705,738.

The city was founded by Charlemagne, who, between 808 and 811, built a citadel and a church on the heights between the Elbe and the east bank of the Alster as a bulwark against the neighboring pagan Slavs. In 831 it became an episcopal see. It was frequently devastated by Danes and Slavs, but in the 12th century had become an important commercial city, and in 1241 and 1249 combined with Lübeck and Bremen in forming the Hanseatic League. It was declared an imperial city by Maximilian in 1510, but was not formally acknowledged until 1618. During the Thirty Years' War its population and prosperity increased owing to the immunity of its position, and in the following century extensive commercial relations with North America were developed. In 1810 it was incorporated in the French empire as the capital of the department of the Mouths of the Elbe, but was occupied by the Russians in 1813. They were driven out by the French under Davoust, two months later, and the city underwent severe financial spoliation at the hands of the conqueror and extensive depopulation. In 1815 it became an independent state of the German federation, forming with Lübeck, Bremen, and Frankfort, the curia of the free cities. Its trade and importance have increased ever since. In 1871 it united with the German empire as a free city-state; but did not join the Zollverein or German Customs Union until 1888.

Hamburg Fowls. See Poultry.

Hamilcar, hă-mĭl'kar, a name of common occurrence at Carthage, and borne by several of its most distinguished citizens, among whom the chief was Hamilcar Barca ("lightning"): b. Carthage; d. Spain 228 B.C. He was the father of the celebrated Hannibal. While a young man he was appointed to the command of the Carthaginian forces in Sicily, in the 18th year of the first Punic war, 247 B.C. He established himself with his whole army on Mount Hercte (now Monte Pellegrino), where he not only succeeded in maintaining his ground, but sent out squadrons to plunder the coasts of Sicily and Italy. In 244 he quitted his strong position, and, landing at the foot of Mount Eryx, converted the town of that name into a fortified camp for his army. For two years he defied all the efforts of the Romans to dislodge him; but the Carthaginian admiral, Hanno, having been totally defeated off the Ægate Islands, 241 B.C., he reluctantly consented to withdraw from Sicily. His inability to perform the promises which, to keep them in obedience, he had made to his mercenary troops, brought about their revolt after returning from Sicily, and as they were joined by almost all the native Africans, Carthage was brought to the brink of ruin. The incapacity of Hanno, who had been entrusted with the suppression of the revolt, led all parties to concur in the appointment of Hamilcar. He defeated the enemy with great slaughter, reduced their towns to subjection, and after several alternations of fortune, and the appointment of Hanno to a share in the command, the war was brought to a successful close, 238 B.C. Hamilcar now projected the formation of a new empire in Spain, to be a source of strength to Carthage, and the point whence hostilities might be renewed against Rome. This policy was ably prosecuted after his death by Hasdrubal and Hannibal. Hamilcar penetrated into the heart of the country, reduced some cities and tribes, and acquired vast wealth. He passed nine years in Spain, and fell in a battle against the Vettones.

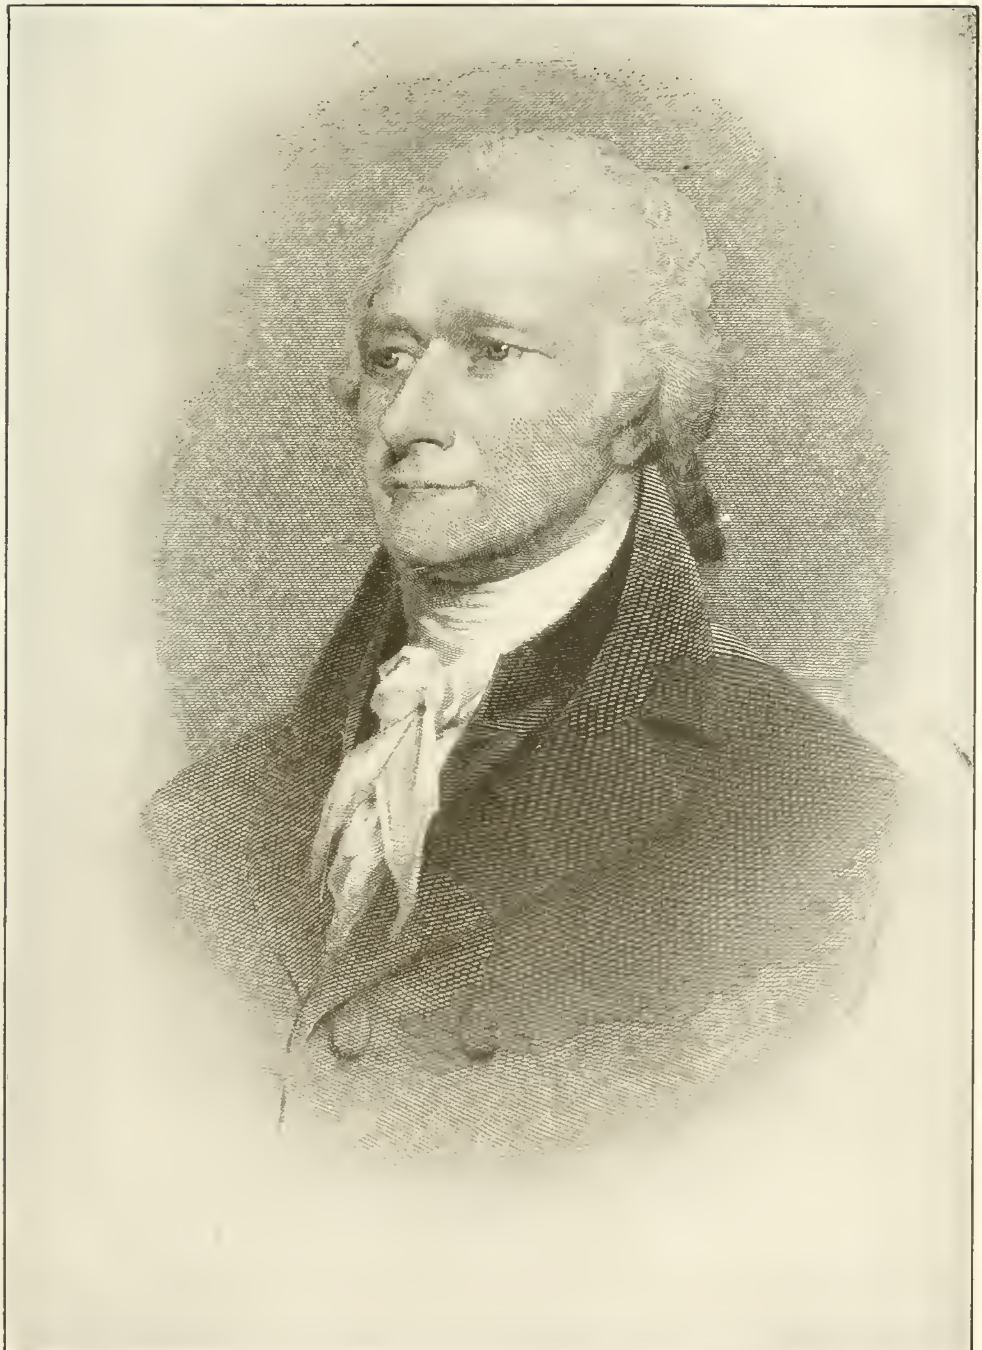
Hamilton, Alexander, American statesman and soldier: b. Charles Town, in the island of Nevis, W. I., 11 Jan. 1757; d. New York 12 July 1804. His parentage is uncertain, but it is generally accepted that he was the son of James Hamilton, a Scotch merchant in Nevis, and Rachel Levine, the daughter of a French physician. Hamilton's father was unfortunate in his business ventures, and having become a bankrupt it was necessary for Alexander, at the age of 12 years, to earn his own living. He secured a position as clerk in the counting-house of Nicholas Cruger of Saint Croix. His "genius for affairs" was soon apparent, and after two years we find him entrusted with the full management of the business. But ambition for something more than a commercial career had already taken hold of the young man's mind, and he began to write for the local press. A very strong and vivid description of a West Indian hurricane, which had devastated the islands, attracted general attention and aroused the lad's friends to provide the necessary funds to enable him to come to America to complete his education. He arrived at Boston in 1772, and was put in a school at Elizabethtown, N. J., where he industriously prepared himself for college, and in 1774 he entered King's College (now Columbia University), and made a brilliant record as a student. The friction between England and the American colonies was constantly growing more serious, and after studying the question and being convinced that the colonists were right, Hamilton began the advocacy of their cause in a speech at a public meeting, 6 July 1774. The meeting assembled to discuss the calling of a general congress and was held in the fields (now City Hall Park). He also published two pamphlets, asserting the colonists' position in relation to the Crown and to Parliament, and justifying their appeal to arms. The pamphlets were at first thought to be productions of well-known leaders, and when their authorship became known it gave Hamilton a national reputation. Hamilton now turned his attention to preparation for military service in the Revolution. He secured a commission as captain of the first Continental artillery company and entered the patriot service in March 1776. His natural aptitude for organization and command soon made the company a model of discipline and efficiency. He participated in the battles of Long Island, White Plains, Trenton and Princeton, and won the commendation of his superiors for his skill and courage. On 1 March 1777 Hamilton was appointed lieutenant-colonel and aide-de-camp on the staff of Washington, whose entire confidence he secured, becoming the general's confidential secretary. He took an active part in his chief's battles, assisted in planning campaigns and in devising means for the support of the army, and was entrusted with the important and delicate mission of going to Albany to obtain troops from Gen. Gates (who had previously been ordered to send troops to Washington and had failed to do so) — a duty which Hamilton performed with skill and success. It was while on this mission that he first met Elizabeth Schuyler, the daughter of Gen. Philip Schuyler of New York, whom he afterwards married (14 Dec. 1780). Having received a reprimand from Washington for a supposed delay he took offense and resigned from the staff 16 Feb. 1781. He had no intention, however, of resigning from the Continental Army, and becoming the head of an infantry regiment, he took part in the siege of Yorktown, heading a storming party and capturing one of the strongest British redoubts. The war was now practically ended, and there being no further opportunity for success in the army, Hamilton returned to civil life. He was yet but 24 years old, but by his natural abilities and capacity for leadership he had attained a foremost place among the great men of his day.

The activity of Hamilton's mind is seen in the fact that while still in active military service he found time to study the great questions of government and finance. In a letter to James Duane he clearly set forth his views on the Constitution, that: "Congress should have complete sovereignty in all that relates to war, peace, trade, finance, and to the management of foreign affairs." A letter to Morris on the establishment of a national bank induced him to offer Hamilton the place of receiver-general of Continental taxes, which he accepted and originated a new system of national taxation. The receiver's office did not prove congenial, and he was relieved of its duties by his election to the Continental Congress from New York 1 Oct. 1782. Congress proved a disappointment. Such were the deplorable conditions then prevailing, the looseness of the Constitution and the financial chaos of the government, that Hamilton's efforts to carry through reforms utterly failed. He resigned from Congress in 1783 and returned to the practice of law in New York, where his melodious voice, dignified deportment and unanswerable logic of reasoning, soon placed him in the highest rank of his profession.

The condition of the States at this time is graphically depicted by Senator Lodge in his 'Life of Hamilton': "Divided among themselves, with no army, no navy, no cohesion, floundering wilfully and helplessly in a sea of unpaid debts and broken promises, bankrupt in money and reputation alike." To secure some relief the Annapolis Convention (q.v.) was held 11 Sept. 1786, five States only being represented — New York, New Jersey, Pennsylvania, Delaware and Virginia. Hamilton was one of the delegates from New York. This convention adopted an address, drafted by Hamilton, reciting the intolerable conditions and calling for a convention to meet the following May in Philadelphia to form a Federal Constitution. (See CONSTITUTION, FRAMING OF THE.) Upon his return to New York he was elected to the State Legislature which convened in January 1787, and began a fight to induce the State to send delegates to the Philadelphia convention. In this he succeeded, and three delegates were appointed, of which Hamilton was one: but the other two were Anti-Federalists, bitterly opposed to Hamilton's idea of a strong general government. When the convention met the vote of his own State was cast against him on every question: the Anti-Federalists withdrew from the convention, leaving New York without a vote. Hamilton, however, presented his views of a plan of government to the convention — an aristocratic republic, with a president and senators chosen for life, and the State governors appointed by the Federal government. After the presentation of this plan, which found no support in the convention, Hamilton withdrew, only returning to engage in the final debates, and at the close he heartily embraced the work of the convention and signed the Constitution as actually adopted.

The Constitution was still to be ratified by the States. New York was opposed to its adoption. There were numerous internal strifes and jealousies, but with great power and determination, Hamilton combated and won over all opponents in the legislature, and by his essays in the 'Federalist,' assisted by Madison and Jay, he successfully fought the great battle for the Constitution, winning a hostile majority to its support. Of these essays George William Curtis declared they 'gave birth to American constitutional law, which was thus placed above arbitrary construction and brought into the domain of legal truth."

Washington was inaugurated President in April 1789. In September 1789 Congress passed an act establishing a Treasury Department, and Washington at once made Hamilton the first



ALEXANDER HAMILTON.

Secretary of the Treasury. His creative, constructive and practical mind was now confronted with the problem of giving to his country a workable system of national administration. With a master's hand he organized the Treasury Department; reduced the confused finances to order; provided for a funded system and a sound system of national taxation; induced Congress to assume the State debts; authorized methods for the establishing of a national bank and a mint, the raising and collection of internal revenue, the management of the public lands, and the purchase of West Point by the government. In 1791 his Report on Industry and Commerce appeared, wherein he discussed with profound ability and clearness the economic problems of his time, and inaugurated, in a very moderate way, the protective tariff system. His methods to strengthen the national government were vigorously opposed by those antagonistic to centralization, chief among whom was Thomas Jefferson (q.v.), and the controversies that then divided parties have been continued by the rival political parties to the present. Engrossed as he was with the home affairs of the government, Hamilton was nevertheless a deep student of foreign relations and advocated a position of strict neutrality on the part of the American government with regard to the difficulties of nations. He ably sustained Washington in his proclamation of strict neutrality between France and England, both in the cabinet and in the public press, and when M. Genêt, the ambassador of the French republic, tried to involve this country in a war with England, Hamilton was vigorous in his condemnation. It was at this time that Jefferson, then Secretary of State, took sides with editor Freneau of the Philadelphia 'National Gazette,' in his criticism of the administration and especially of the treasury department. Hamilton replied and the controversy became typical of the two great political parties — the Federalists and the Republicans. Jefferson's position in the cabinet was most uncomfortable and he resigned 1 Jan. 1794. In 1794 the Whiskey Insurrection (q.v.) occurred in Pennsylvania in opposition to the excise laws passed by Congress. Hamilton advised a vigorous policy and when troops were sent by Washington against the insurgents, Hamilton accompanied them and the «rebellion» quickly faded away.

Desiring to give more attention to his private interests Hamilton resigned from the Cabinet 31 Jan. 1795. He declined the office of Chief Justice of the United States Supreme Court and returned to his law practice in New York city where he was at once acknowledged the leader of the bar. But he still continued to take an active interest in political affairs. In 1794 Chief Justice John Jay (q.v.) was nominated by Washington as envoy extraordinary to negotiate a commercial treaty with Great Britain. With Lord Granville a treaty was drawn up known as Jay's Treaty (q.v.), the terms of which were so hard and unjust that when the treaty was published there was a violent outburst of indignation. Hamilton, however, in a series of essays signed «Camillus,» defended the treaty as the best obtainable and after a severe struggle in Congress it was ratified. Washington thoroughly appreciated the judgment and genius of Hamilton, often consulted him on important matters, and received much help from him in the preparation of his messages and speeches. The «Farewell Address would have been less perfect as a composition,» says Renwick, «had it not passed through the hands of Hamilton.»

Hamilton had supported John Adams (q.v.) for the Presidency, but Adams was jealous of the power and influence of Hamilton over members of the Cabinet, and made war upon him, expelling his friends from office and assailing him personally. Hamilton blamed Adams for the loss of the elections in New York State, and denounced him bitterly. Adams was renominated in 1800 for the Presidency, but he was beaten by Jefferson, and the Federalist party never won another election. Owing to a defective clause in the Constitution (see JEFFERSON-BURR IMBROGLIO) the election was thrown into the House of Representatives, Jefferson and Burr having received an equal number of votes Hamilton exerted his great influence with the Federalists and Jefferson was elected.

In 1804 the Federalists nominated Aaron Burr (q.v.) for Governor of the State of New York. The contest was a bitter one and again Hamilton was instrumental in Burr's defeat, and the latter challenged him to a duel on the ground of an alleged insult. Under the idea that the continuance of his personal influence and the peculiar condition in which the affairs of the country were at the time demanded his acceptance of the challenge, he consented to meet Burr, and the duel was fought at Weehawken, N. J., 11 July 1804. Hamilton was wounded and died the following day, universally mourned by his countrymen.

American history presents no more striking character than Alexander Hamilton. He was not popular, nor did he strive after popularity, but after 100 years his name still holds a noble eminence. He lived for the public good. Eloquent and refined, able and brilliant, the embodiment of devotion, integrity and courage, he has left as deep a mark upon our political institutions as any other statesman our country has produced. Hamilton's works were published by H. C. Lodge in nine volumes (1885–6). Consult: Hamilton, 'History of the Republic of the United States as Traced in the Writings of Alexander Hamilton and His Contemporaries' (4th ed. 1879); Morse, 'Life of Alexander Hamilton' (2 vols. 1876); Lodge, 'Alexander Hamilton' (1882). For his writings, etc., consult 'Bibliothica Hamiltonia' (1886).

GEORGE EDWIN RINES,
Editorial Staff 'Encyclopedia Americana.'

Hamilton, Andrew, American lawyer: b. Scotland about 1676; d. Philadelphia 4 Aug. 1741. His early career is unknown. He was for a time called Trent, and it is not certain at what period he took the name of Hamilton. About 1697 he appeared in Accomac County, Virginia, where he opened a classical school. In 1716 he went to Philadelphia, the next year became attorney-general of Pennsylvania. From 1721 to 1724 he was in the provincial council, and in 1727 was elected from Bucks County to the provincial assembly, continuing to hold his seat, with a year's exception, until 1739, and in 1729 was speaker. He is best known for his gratuitous defense of John Peter Zenger, a New York printer, who was charged with libel in publishing in a newspaper owned by him statements regarding the interference by the governor with the process of the law-courts. Hamilton's defense was based on the truth of the statements in the alleged libel. He was successful, was granted the freedom of New York, and, having thereby secured a freer discussion of public officers, was termed by Morris the "day-star of the Revolution." He became judge of the vice-admiralty court of Pennsylvania in 1737.

Hamilton, Anthony, COUNT, English courtier, and man of letters: b. probably Roscrea, Tipperary, Ireland, 1646; d. St. Germain-en-Laye, France, 6 Aug. 1720. He was descended from a younger branch of the family of the dukes of Hamilton in Scotland. His parents were Catholics and Royalists, and removed to France after the death of Charles I., and young Hamilton became domiciliated there. He, however, made frequent visits to England in the reign of Charles II. His sister was married to Count Grammont (q.v.). On the ruin of the royal cause he accompanied James to France, where he passed the rest of his life. Hamilton is chiefly known as an author by his 'Memoirs of Count Grammont,' a lively and spirited production, exhibiting a free and, in the general outline, a faithful delineation of the voluptuous court of Charles II. It is an admirable chronicle of the frivolous life of the French and English courts of that time. His other works are 'Poems' and 'Fairy Tales,' which, as well as the 'Memoirs,' are in French, and are really masterpieces of grace and sprightliness.

Hamilton, Edward John, American educator: b. Belfast, Ireland, 29 Nov. 1834. He was graduated at Hanover College, Indiana, in 1853, and at Princeton Theological Seminary in 1858; was professor of mental philosophy at Hanover College in 1868–79, and of philosophy at Hamilton College, Clinton, N. Y., in 1883–91. In 1895 he became professor of philosophy in the State University of Washington. He is the author of what is known as 'Perceptionism' (a system of metaphysical philosophy), and has published 'A New Analysis of Fundamental Morals' (1870); 'The Human Mind' (1883); 'The Modalist' (1883); 'The Perceptionalist or Mental Science' (1899).

Hamilton, Frank Hastings, American surgeon: b. Wilmington, Vt., 10 Sept. 1813; d. New York 11 Aug. 1886. He was graduated from the medical department of the University of Pennsylvania in 1833; in 1861 went to the war as surgeon of the 31st New York volunteers, was made brigade surgeon after the battle of Bull Run, and surgeon of Gen. Keyes' corps in 1862. A year later he became medical inspector of the United States army. He was one of the founders of Bellevue Hospital Medical College in 1861, and was professor of surgery there till he resigned in 1875. Dr. Hamilton was associated with Drs. Agnew and Bliss in the care of President Garfield. He wrote on the principles and practice of surgery three works, regarded as standard on the subjects treated: 'Treatise on Fractures and Dislocations' (1860); 'Practical Treatise on Military Surgery' (1861); and 'The Principles and Practice of Surgery' (1872).

Hamilton, Gail. See DODGE, MARY ABIGAIL.

Hamilton, Gavin, Scottish painter: b. Lanark, Scotland, 1730; d. Rome, Italy, 1797. Sent when very young to Rome, he there devoted himself during the remainder of his life to historic painting. One of his greatest works was his 'Homer,' consisting of a series of pictures representing scenes taken from the 'Iliad.' He published in 1773 'Schola Picturæ Italiæ,' composed of a number of fine engravings by Cunego, making part of the collection of Piranesi; he there traces the different styles from Leonardo da Vinci to the Carraccis; all the drawings were made by Hamilton, and this admirable collection now forms one of the principal treasures in the first libraries in Europe. He spent the latter part of his life in conducting archæological excavations in various localities near Rome.

Hamilton, Lord George Francis, English politician: b. Brighton 1845. He was a Conservative member of Parliament for Middlesex in 1868–85, for Ealing division in 1885–1902, in 1874–8 was under-secretary of state for India, and in 1878–80 vice-president of council. In 1885–6, and again in 1886–92 he was first lord of the admiralty, and from 1895 until his resignation in 1903 was secretary of state for India. His naval reconstruction plan of 1889 was the most extensive of the kind ever adopted by Great Britain. As secretary for India he displayed great ability in dealing with the numerous difficulties which arose during his administration.

Hamilton, James, American statesman: b. Charleston, S. C., 8 May 1786; d. at sea 15 Nov. 1857. He was educated for the bar, but entered the army and served with credit as a major in the Canadian campaign of 1812. At the end of the war he resumed the practice of law in Charleston. For several successive years Hamilton was chosen mayor, or, as it was then termed, intendant of Charleston. To his vigilance and activity was chiefly due the detection of a formidable conspiracy in 1822 among the negro population, led by Denmark Vesey, a free mulatto from Haiti. In the same year he was elected to the State legislature, and was also chosen a representative in Congress, of which he soon became a prominent and popular member. He became noted for intense and energetic opposition to the protective system and favored direct taxation, regarding all indirect processes for raising revenue as frauds upon the people, and as disparaging to the popular intellect, as well as popular morals. He quitted Congress to become governor of South Carolina in 1830, at a period when the State had resolved upon nullifying the tariff laws of the federal government. On the settlement of this question by Clay's compromise, Hamilton retired from public life for a time. Later he became interested in the cause of Texas, to which he devoted his personal services, and a large portion of his private fortune. In 1841, while Texas was an independent republic, he was her minister to England and France, where he procured the recognition of her independence. On the death of Calhoun in 1852, he was appointed his successor in the United States Senate, but declined the office.

Hamilton, John Church, American biographer and historian, son of Alexander Hamilton (q.v.): b. Philadelphia 1792; d. 1882.

Besides editing his father's works (1851), he wrote: 'Memoirs and Life of Alexander Hamilton' (1834–40): 'History of the Republic' (4th ed. 1879); 'The Prairie Province' (1876), sketches of travel.

Hamilton, John Taylor, American Moravian clergyman: b. Antigua, W. I., 30 April 1859. He was graduated from the Moravian College, Bethlehem, Pa., in 1875, and from the Moravian Theological Seminary there in 1877. He was pastor of the Second Moravian Church in Philadelphia, 1881–6, and has been a resident professor at the Moravian College and Seminary from the latter date. He has published 'History of the Moravian Church in the United States' (1895); 'History of the Moravian Church during the 18th and 19th Centuries' (1900); 'History of Moravian Missions' (1900).

Hamilton, John William, American Methodist bishop: b. Weston, Va., 18 March 1845. He was graduated from Mount Union College (Ohio) in 1865, and from Boston University in 1871, was ordained an elder of the Methodist Church in 1870. He was subsequently pastor of various congregations, including that of the People's Church, Boston, founded by him. In 1900 he was appointed bishop. He was corresponding secretary of the Freedmen's Aid and Southern Education Society (1892–1900), and has published 'Memorial of James Lee' (1875); 'Lives of the Methodist Bishops' (1883); 'People's Church Pulpit' (1884): and other works.

Hamilton, Kate Waterman, American novelist: b. Schenectady, N. Y., 12 Nov. 1841. Since 1870 she has lived in Bloomington, Ill. She is the author of 'We Three'; 'Vagabond and Victor' (1879); 'Rachel's Share of the Road' (1882); 'Tangles and Corners' (1882); 'The King's Seal' (1887); 'The Parson's Proxy' (1896); 'The Kinkaid Venture' (1900); 'How Donald Kept Faith' (1900); etc.

Hamilton, Patrick, Scottish reformer and martyr: b. probably Glasgow about 1504; d. St. Andrews 29 Feb. 1528. Adopting during a short residence on the Continent, the principles of the Reformation, when he settled at St. Andrews in 1523 he naturally cherished his new convictions, and in 1526 announced them with a decision that attracted the notice of Archbishop Beaton, who proceeded to have him formally summoned, and put on his trial. Hamilton had meanwhile fled to Germany, where an intimacy formed with Luther and Melanchthon deepened his convictions, and after an absence of six months he returned to Scotland. He openly preached in the neighborhood of Linlithgow, and Beaton, under pretense of a friendly conference, contrived to allure him to St. Andrews in January, 1528. The early stages of the conference were marked by a conciliatory spirit, but he was led into damaging avowals of opinion, and the result of his trial, on the last day of February, was that he was convicted of divers heresies, and delivered over for punishment to the secular power, by which he was condemned the same day. In the afternoon he was hurried to the stake in front of the gate of St. Salvador's College, his martyrdom, in the 24th year of his age, having done more to extend the principles of the Reformation in Scotland than his life could have done.

Hamilton, Schuyler, American soldier: b. New York 25 July 1822; d. there 18 March 1903. He was a son of J. C. Hamilton (q.v.) and a grandson of Alexander Hamilton (q.v.). He was graduated from West Point in 1841 and served in the Mexican War and in the Civil War also, becoming a major-general of volunteers in 1862. He was subsequently hydrographic engineer to the department of docks. In 1854 he published 'A History of the American Flag' and in 1877 'Our National Flag, the Stars and Stripes, its History in a Century,' delivered as an address before the New York Historical Society in June of that year.

Hamilton, Sir William, Scottish metaphysician; b. Glasgow 8 March 1788; d. Edinburgh 6 May 1856. Having studied with distinction at Glasgow, in 1807 he entered Balliol College, Oxford, where he gained first-class honors, and in 1813 he was admitted to the Scottish bar. His taste lay in a different direction, and while he diligently applied himself to almost every branch of literature, mental philosophy became his favorite study. In 1820 he became a candidate for the chair of moral philosophy in Edinburgh, rendered vacant by the death of Thomas Brown, but was defeated by Professor John Wilson. He was appointed professor of universal history in the University of Edinburgh in 1821, and in 1826 became a contributor to the 'Edinburgh Review,' and enriched it with a series of articles afterward published in collected form, with large additions, as 'Discussions on Philosophy and Literature, Education, and University Reform.' Of these the most celebrated was his 'Critique of Cousin's Cours de Philosophie,' in which was developed that philosopher's doctrine of the unconditioned. Many of these contributions were translated into the leading European languages, and attracted much attention from continental speculators in philosophy. In 1836 he became a candidate for an Edinburgh professorship, and succeeded in gaining the chair — which of all men living he was perhaps the best fitted to adorn — of logic and metaphysics. His zeal and ability in discharging its duties were rewarded by the number of ardent students whom he gathered around him. The fame of the Scottish school of metaphysicians, which had begun to wane, was gradually re-established; and his influence would have been felt to even a higher degree had he not been struck with paralysis in 1844, from which he never recovered so far as to undertake the full duties of his position. His mind, however, retained its vigor, and he endeavored to carry out literary designs he had previously formed. In 1846 he published an annotated edition of the works of Thomas Reid, and in 1854 the commencement of a similar edition of the works of Dugald Stewart. His lectures were published in 1859–61, under the editorship of Mansel and Veitch. His views are chiefly expounded in the 'Discussions' and in the 'Dissertations' appended to his edition of Reid, and are attacked in Mill's 'Examination.' See Veitch, 'Memoir of Hamilton' (1869); 'Hamilton: the Man and his Philosophy' (1883); Seth, 'Scottish Philosophy' (1890).

Hamilton, Sir William Rowan, Irish mathematician: b. Dublin 3 Aug. 1805; d. there 2 Sept. 1865. He knew Greek and Latin when only 6, and before he had completed his 14th year had made himself acquainted with 13 languages, among which were Arabic, Persian, Hindustani, Sanskrit, and Syriac. When 10 years old he began the study of mathematics, and at 17 presented a paper to Brinkley, the Irish astronomer-royal, which exhibited such a profound knowledge of mathematics, that the latter declared the author of it to be already the first mathematician of his age. In 1827, the chair of astronomy in Trinity College, as well as the post of astronomer-royal, becoming vacant, Hamilton obtained both appointments, though then only in his 23d year. His life henceforth was exclusively devoted to abstruse studies. He was knighted in 1835; in 1837 was elected president of the Royal Irish Academy, and was an honorary or corresponding member of the principal scientific academies of Europe and America. In 1828 his 'Theory of Systems of Rays' was published. In this his celebrated prediction, on theoretical grounds, of the existence of conical refraction of a ray of light was given to the world. Reasoning on the properties of light, he came to the conclusion that under certain circumstances a ray, instead of being refracted in the ordinary way, should split up into a cone of rays; a phenomenon afterward proved experimentally by Lloyd to take place under proper conditions. In 1834 his 'General Method in Dynamics' was published. In this work and that on 'Systems of Rays' the whole of any dynamical problem is made to depend on a single function and its differential coefficients. Another important treatise of his is 'Algebra looked on as the Science of Pure Time.' He published also 'Memoirs on Discontinuous Functions, or Equations of the Fifth Degree, etc.' But the foundation on which his fame most securely rests is the discovery or invention of the calculus of quaternions, an instrument of extraordinary power in the solution of intricate problems in mathematics and physics. His 'Lectures on Quaternions' appeared in 1853, and in 1866 a posthumous work on the same subject entitled 'Elements of Quaternions.' See Life of Sir William Rowan Hamilton,' by Graves (1883–9), with an Addendum (1892).

Hamilton, Bermuda, a seaport town, the capital of the Islands on Great Bermuda, Long, or Hamilton Island. It has a fine landlocked harbor. Founded in 1790. Pop. (1901) 2,246.

Hamilton, N. Y., a village of Madison County, 29 miles southwest of Utica, on the New York, O. & W. R.R. It is the seat of Colgate University (q.v.). It is in a good agricultural region, contains a lumber yard and canning factory, and has a stone quarry, from which the stone for the construction of most of the University has been taken. Hamilton was first settled in 1792, was separated from the township of Paris in 1795, and named in honor of Alexander Hamilton; the village was incorporated 12 April 1816; in 1895 a fire destroyed the business portion of the town, in which the village records were lost. Later in the same year, waterworks and an electric lighting plant were established, which are owned and operated by the town. In 1903 a free library was opened by the Library Association, and it is intended to make it a public library supported by the village corporation. (Pop. 1900) 1,627.

Hamilton, Ohio, city, county-seat of Butler County, on the Great Miami River, the Miami & Erie Canal, the Pittsburg C., C. & St. L., and the Cincinnati, H. & D. R.R.'s; about 15 miles north of Cincinnati, and 32 miles southwest of Dayton. Gen. Arthur Saint Clair established here a fort, in 1791, and called it Fort Hamilton, in honor of Alexander Hamilton. It was incorporated as a town in 1810. The excellent water-power has been of great advantage in the developement of the city, as manufacturing is its chief industry, although it is located in an agricultural section. The canal has also contributed to the water-power available for manufacturing purposes. Its chief manufactures are paper, flour, beer, woolen goods, agricultural implements, machinery, tools, and iron. The trade is in the manufactured articles and in tobacco, hay, grain, and vegetables. The government is vested in a mayor, who holds office three years, and a board of control composed of five members, each one of whom is the head of a department of the city's government. They are elected for five years. The city owns and operates the electric light plant, the waterworks, and the gas plant. Pop. (1900) 23,914.

Hamilton, Ont., Canada, city and capital of Wentworth County, situated on the shores of Burlington Bay at the western extremity of Lake Ontario, 40 miles from Toronto, 42 miles from Niagara Falls, and 70 miles northwest of Buffalo. It was laid out and settled in 1813 by G. Hamilton, and is built on a plateau of slightly elevated ground extending around the front of a hilly range from Niagara Falls. Hamilton is connected with a large system of Canadian and American Railways,— the Canadian Pacific, Grand Trunk, Toronto, Hamilton & Buffalo, the Michigan Central, the New York Central, and the Lehigh Valley and Wabash Railways. Hamilton's geographical position at the head of Lake Ontario affords the best shipping facilities to the Northwest Provinces and European markets by water, while her railway facilities are not excelled by any city in the Dominion. She has also become a centre of a complete electric railway system. There are 19 miles of street railway, 110 miles of streets, 60 miles of sewers, and 465 street electric lights. Hamilton is the chief manufacturing city in Canada and is in the centre of a fine fruit-growing district. It manufactures very largely, some of the chief industries being agricultural implements, air brakes, and electrical supplies, belting, boots and shoes, carriages, cigars, tobacco, clothing, drugs, elevators, emery wheels, engine packing, fertilizers, files, fireworks, furnaces, gasoline engines, harness, glue, mats, paints, pottery, soaps, spices, silverware, nails, wine, vinegar, mattresses, wringers, washing machines, and musical instruments. It has 2 cathedrals, 62 Protestant churches, 7 Roman Catholic churches, 15 banks, 18 public schools, 7 separate schools, 2 art schools, 2 convents, a public library, 26 charitable institutions, 4 hospitals, 2 incline railways, 4 theatres, a large insane asylum, 7 parks, a wireless telegraph station, 200 groceries, 5 bands, 2 sewage disposal works, 3 reservoirs, capacity (main) 11,000,000 gallons; 50 social and athletic clubs, about 200 national and secret societies, 100 hotels and 3 daily papers. Pop. (1904) 60,000.

J. Castell Hopkins,
Editor 'The Canadian Annual Review of Public Affairs.'

1. The Gore, King Street 2. View of Hamilton from Mountain

Hamilton College, an institution located at Clinton, Oneida County, N. Y.; founded by Samuel Kirkland, a Congregational missionary, in 1793, as an academy for both white and Indian children. The school was not opened until 1797, although Gen. Frederick William Steuben laid the cornerstone in 1794. Lack of funds prevented the completion sooner, and to the untiring efforts of its founder was due, in a great measure, the success of the undertaking. It was first called Hamilton Oneida Academy, so named in honor of one of its trustees, who was also a benefactor. In 1812 it was chartered by the University of the State of New York as Hamilton College. The school has grown steadily in facilities, keeping well ahreast of the times. Two courses are offered: the Latin-Scientific and the Classical. It has fine scientific collections, an astronomical observatory, and well-equipped laboratories. The college has at its disposal 1 fellowship, 55 scholarships, 4 prize scholarships (yielding $200 each), and a number of valuable prizes. The campus, nearly 100 acres, has many notable improvements, gifts from graduates. In 1906–7 there were connected with the school 20 professors and instructors, and 181 students. The library contained about 47,000 volumes.

OREN ROOT,
Late Registrar.

Hamilton Inlet, Labrador, the estuary of the Hamilton or Grand River. It is 150 miles long and has a maximum width of 30 miles. On its north shore is Rigolet, a Hudson's Bay Company trading-post.

Hamilton, Mount. See LICK OBSERVATORY.

Hamilton Series, a series of rocks, including the Hamilton and Marcellus stages and constituting the Middle Devonian. The name is from the town of Hamilton, 29 miles south of Utica, N. Y., where the series is typically developed. It consists there of shales and sandstones with a few beds of limestones, the most prominent being the topmost member of the series. The Hamilton like the other Devonian formations, was laid down along the Atlantic shores of what was then the American continent and in a great interior sea, sedimentation being heaviest in a northeast gulf of this sea. The sea extended from eastern New York to western Iowa. In the west the series is largely calcareous. The series is about 1,500 feet thick in eastern New York and reaches a maximum of 2,000 to 5,000 in Monroe County, Pa. It rapidly thins westward, and the south end of Lake Huron is only 20 to 50 feet thick. At the falls of the Ohio above Louisville, the series is represented by 20 feet of hydraulic limestone. The rocks forming the high cliffs along the Delaware River south of Port Jervis, Pa., are of Hamilton Age. Outside of the interior basin rocks of Hamilton Age have been determined in the Gaspe region of Canada, where they reach a thickness of 7,040 feet. In the Eureka district, Nevada, is a great but undetermined thickness of Hamilton limestone, and in the Mackenzie River valley in Northwest Territory is a deposit of fully 500 feet of fossiliferous limestone, partly at least of Hamilton Age. See DEVONIAN PERIOD; DEVONIAN SYSTEM and EQUISETÆ.

Hamilton Stage, the upper division of the Hamilton series of rocks, consists chiefly of shaly sandstone and fine shales with a few thin seams of limestone. In Ulster, Albany, and Green counties, N. Y., the thick-bedded shales are known as North River flagstone, and are quarried on the Hudson River near Kingston, Saugerties, and Coxsackie. Some of the thicker layers of these flagstones are known as bluestone.

Hamites, hăm'īts (descendants of Ham), the name given to several races in North Africa, who are regarded as of kindred origin and speak allied tongues. They include the ancient Egyptians and their modern descendants, the Copts, the Berbers, Tuaregs, Kabyles, the Gallas, Falashas, Somali, Dankali, etc.

Hamlet, the hero of Shakespeare's most famous tragedy, a personage who appears in history, yet is half mythological, but has been transformed by the genius of the English poet into one of the most dominating figures of literature. It is allowed that Shakespeare's Hamlet was suggested by the Hamleth, or Amleth, of Saxo Grammaticus. The latter's 'History of Denmark' had been published in Paris (1514). François de Belleforest included the tale of Hamlet in his 'Tragic Histories' (1570), an English translation of which appeared in 1608. Shakespeare's drama was written earlier than this last date and must have derived its plot either from de Belleforest's work, or a translation executed before the end of the 16th century, unless the poet, who, we know, was a great reader of histories, took the incident direct from Saxo Grammaticus. According to the Danish historian Hamleth was Prince of Jutland; his father, the King of Jutland, had been murdered by his own brother Fengo, who took the throne and queen of the dead man. Hamleth feigned madness to save his own life. He stabbed one of Fengo's courtiers sent to spy upon him, and had for this purpose concealed himself under a truss of straw. He reproached his mother with her shameful second marriage to such effect that she promised to help him in avenging his father by putting Fengo to death; a promise which she kept.

Hamlet Case, the designation of the first recorded action in 1850 under the Fugitive Slave Law (q.v.) of that year. It is named after Hamlet, a free negro with a family, who was surrendered after a cursory examination, as a fugitive slave of Mary Brown of Baltimore. He had been arrested by a deputy United States marshal in New York, and the whole circumstances of the case so aroused public opinion that Hamlet was finally redeemed.

Ham'ley, SIR **Edward Bruce**, English general: b. Bodmin, Cornwall, 27 April 1824; d. London 12 Aug. 1893. Entering the army in 1843, he served through the Crimean war, was professor of military history at Sandhurst 1858–64, and commandant there 1870–77; and division commander in the Egyptian war of 1882. His 'Operations of War' (1866) is a recognized text-book for military examinations. Among his other publications are: 'The Story of the Campaign' (1855), a narrative of the Crimean War; 'Wellington's Career' (1860); 'Voltaire' (1877); 'The War in the Crimea' (1890). He was also the author of a popular novel, 'Lady Lee's Widowhood,' and the admirable sketch entitled 'Shakespeare's Funeral.'

Ham'lin, Alfred Dwight Foster, American architect: b. Constantinople, Turkey, 5 Sept. 1855. He is a son of Cyrus Hamlin (q.v.). He was graduated from Amherst in 1875, studied architecture in the Massachusetts Institute of Technology in 1876–7 and at the Beaux Arts of Paris in 1878–81, and in 1883 became special assistant in Columbia University. In 1889 he became assistant professor of architecture at Columbia, and in 1891 adjunct professor. His published works include: 'A History of Architecture' (1896); and a 'Handbook of the History of Ornament.'

Hamlin, Augustus Choate, American surgeon: b. Columbia, Maine, 28 Aug. 1829: d. Bangor, Me., 19 Nov. 1905. He was graduated from Bowdoin in 1851, from the Harvard Medical School in 1855, was appointed assistant surgeon to the 2d Maine infantry in 1861, and from 1863 until mustered out in 1865, lieutenant-colonel and medical inspector, United States army. Subsequent to the War he practised in Bangor, of which he was twice mayor, and in 1882–6 was surgeon-general of Maine. Among his works are: 'Martyria' (1866); 'The Tourmaline' (1873); 'Leisure Hours among the Gems' (1884); and treatises on 'Transfusion' (1868); 'Tetanus' (1868); and 'The Transmission of Disease' (1870).

Hamlin, Cyrus, American missionary: b. Waterford, Maine, 5 Jan. 1811; d. 8 Aug. 1900. He was graduated from Bowdoin College in 1834 and from Bangor Theological Seminary in 1837; and was missionary of the American Board of Missions in Turkey 1837–59. From 1860 to 1876 he was president of Robert College, established after long controversy with the Turkish government. In this position he did much in molding the character of modern Bulgarian leaders, and producing autonomy for Bulgaria. Returning to the United States in 1877 he became a professor in the Theological Seminary in Bangor; and was president of Middlebury College, Vermont, 1880–5. Some of his works are in the Armenian language; those in English include 'Among the Turks' (1877); and 'My Life and Times' (1893).

Hamlin, Hannibal, American statesman: b. Paris Hill, Oxford County, Maine, 27 Aug. 1809; d. Bangor, Maine, 4 July 1891. Though prepared for college, he did not enter, but became the editor of 'The Jeffersonian,' a weekly of Paris, Maine; studied law, was admitted to the bar in 1833, and began practice at Hampden, Maine. He was active in Democratic politics, was elected to the lower branch of the State legislature in 1835, served by re-election until 1840, and was speaker in 1837, 1839, and 1840. Nominated for Congress in 1840, he was defeated by the Whig candidate, but in 1842 was elected, and in 1844 re-elected. Chosen to the Senate in 1848 to fill a vacancy, he was again elected in 1851, but in 1856 resigned his seat to accept the governorship of Maine to which he had been elected as a Republican. In less than a month, however, he re-entered the Senate for a full term. In 1860 he was elected vice-president on the ticket with Lincoln, and in 1861–5 was president of the Senate. He was thereafter successively collector of the port of Boston (1865–6), United States senator (1869–81), and minister to Spain (1881–3). Hamlin's separation from his party was due to his strong anti-slavery convictions. During the absence from the House of David Wilmot, he introduced the bill now known as the "Wilmot proviso," and obtained its passage in the House by 115 to 106. As vice-president he was a highly valued counsellor of Lincoln. Consult: C. E. Hamlin, 'Life and Times of Hannibal Hamlin' (1899).

Ham'line, Leonidas Lent, American Methodist bishop: b. Burlington, Conn., 10 May 1797; d. Mount Pleasant, Iowa, 23 March 1865. He was educated for the ministry, but afterward studied law, was admitted to the bar at Lancaster, Ohio, was licensed to preach by the Methodist Church, and was a traveling minister in the Ohio conference. When in 1844 the Methodist Church divided on the slavery question, he was one of the members of the general conference, and drafted the plan for the separation of the northern and southern branches. He was a bishop from 1844 to 1852, when he was retired at his own request. His 'Works' were edited by F. G. Hibbard (1869). Hamline University of Minnesota (q.v.) was named in his honor.

Hamline University, a coeducational institution at Hamline, Minn., between Minneapolis and Saint Paul. The school was established, under the auspices of the Methodist Episcopal Church, at Redwig, Minn., but it was closed in 1869. In 1880 it was reopened at Hamline. In 1903 there were connected with the school 21 professors and instructors in the college of liberal arts and 50 in the medical department. In the preparatory school there were about 125 students, in the college of liberal arts about 210, and in the medical department 161 students. There were 6,500 volumes in the library, and the endowment was $200,000.

Hammer, a tool for driving nails or wedges and for beating malleable materials. (See MALLET.) There are hand hammers, steam hammers and electric hammers. The ordinary hammer of to-day is essentially an American product. Exactly when the hammer came into use is not told in history, but it is certain that some rude form of the instrument must have been used in the earliest days of handicraft. Of the hammers made in America to-day there is no end. There is the little tack hammer which weighs only a few ounces, and is indispensable in house, store or factory. Then there is the twenty and thirty ton hammer, driven by steam and used for making immense forgings. The numberless effects which are due to its remarkable force of impact have made the hammer a necessity in all trades. Immense manufactories, employing thousands of men, are grinding year in and year out making hammers, while ten times as many wholesale houses are busy putting the product on the market. The industry has advanced to such a stage that many general hardware firms in the United States have thrown out the hammer, leaving it to the houses that deal in tools exclusively.

Hammers are made in a variety of shapes, the most in demand being the claw hammer. This and the shoemaker's hammer have retained their shapes for hundreds of years. One gold beating firm relies on them entirely. The sheets or leaves of gold are hammered to such exceeding thinness that two hundred and fifty thousand are required to make up the thickness of an inch.

Another odd product of the hammer factory is the butcher's hammer, used for killing cattle. It is capable when properly wielded of carrying a very heavy blow. Then there are the stone-cutter's hammer, the carpet layer's hammer, the wood carver's mallet and the plumber's odd implement. All of these have a good sale in the markets of the world, because they possess a «something» which users cannot find duplicated in the output of other countries.

The modern hammer is made to fit every requirement of a driving tool. One individual of the family, the magnet hammer, has a load-stone in its head, and every little tack jumps at it. The magnet hammer is very useful where canvas is being tacked on the walls. It saves the user the trouble of holding the tack and taking chances at smashing his fingers. The magnet hammer is much in use in tacking tin signs on trees. It is necessary to secure the advertisement at a height beyond the reach of the small boy and the magnet hammer answers the requirement. A clip on the side holds the card or sheet of tin while the tack is retained in position by the magnetized head. One firm blow drives the tack through the tin into the fence or tree trunk and secures the sign. A great variety of power hammers are used. These, for the most part, are masses of iron raised by steam or electricity, and then allowed to fall by their own gravity on the work. The «helve» or «shingling» hammer, used for compressing the mass of iron drawn from the puddling-furnace, and the «tilt» hammer, used in the manufacture of shear-steel, are important examples of such hammers. The first is a heavy bar of cast iron about 10 feet long, weighing 3 or 4 tons or more, to which is attached a head of wrought iron faced with steel, weighing nearly half a ton additional. It works on an axis at the end of the bar farthest from the head, and is raised by cams attached to a heavy wheel set in motion by steam or water power. These cams strike or «lick» a projection extending beyond the head, and thus raise it about 18 or 20 inches at the rate of 70 to 100 times per minute. The tilt hammer is similar, but much lighter, and is adapted for striking more than 300 blows per minute.

Hammer-head Sharks, sharks of the genus *Zygæna*, in which the head is produced on either side into a broad lobe, so that the whole has somewhat the appearance of a double-headed hammer; the eyes on the outer ends of the lobes. Five species are known, two of which (*Z. tiburo and Z. malleus*) occur in the warm American seas, and the latter reaches a length of 15 feet or more.

Hammer-toe, a deformity most frequently affecting the second toe, in which the first bone is sharply extended or pulled back and the other two are flexed at a right angle with the first. It is usually due to the long continued pressure of short shoes, particularly in early life. Amputation of the toe may be necessary in severe cases, as the discomfort becomes unbearable.

Hammer-Purgstall, Joseph, yō'zĕf hăm'-mĕr-poorg'stăl, Freiherr von, Austrian Orientalist: b. Gratz, Styria, 9 June 1774; d. Vienna 24 Nov. 1856. In 1799 he accompanied as interpreter to Constantinople the internuncio Freiherr von Herbert, who afterward entrusted him with a mission to Egypt, where he collected various antiquities and manuscripts for the Imperial Library. In 1810, on the occasion of the marriage of Napoleon with Maria Louisa of Austria, he accompanied the latter to Paris, where he became intimate with Sylvestre de Sacy and other Orientalists. In 1817 he was appointed imperial councillor at the court of Austria, where he also held the post of interpreter. In 1835 he received the title of Freiherr. Among his numerous literary works may be mentioned: 'Constitution and Administration of the Ottoman Empire' (1815–16); 'Constantinople and the Bosporus' (1821); 'History of the Ottoman Empire' (1835–6); 'History of the Assassins'; 'History of the Golden Horde in the Kiptshak'; 'History of the Ilkhans'; 'History of Persian Eloquence'; 'History of Turkish Poetry' (1836–8); 'History of Arabic Literature' (1850–7); besides numerous translations from Oriental authors, and contributions to various periodicals.

Hammock, from the Spanish, *hamaca*, originally used in Peru to denote a couch or bed of canvas or grass-netting, suspended from the branches of a tree. A sailor's hammock, common on ship-board, is generally made of hempen cloth or cotton canvas, six feet long and about three feet in width. It is gathered together at each end by means of a cord and a clew, and fastened to hooks in the ceiling of the cabin or deck. On a ship-of-war hammocks are hung about three feet apart and in the morning are taken down and stowed away in the hammock netting. The man-of-warsmen use the hammocks for their clothing and bedding during the day time. In former times when a warship entered battle the hammocks were taken on deck to form a barricade against musket balls. In recent times the hammock has become very popular for domestic use, especially in the United States, being hung on verandas and balconies and under the trees on the lawns of private estates during the summer months. These hammocks for home use are made of various materials, but usually of cotton card or manila hemp. They are dyed in bright colors and are made very attractive and picturesque.

Ham'mond, Edward Payson, American evangelist: b. Ellington, Conn., 1 Sept. 1831. He was graduated at Williams College in 1858; studied theology at Union Seminary, New York, and afterward at the Free Church Seminary, Scotland. He was ordained to the Presbyterian ministry in 1862, and was long prominent as an evangelist in Great Britain and the United States. He wrote: 'Children and Jesus'; 'Jesus the Way'; 'Golden Gleanings'; 'Early Conversion'; etc.

Hammond, Henry, English prelate: b. Chertsey, Surrey, England, 18 Aug. 1605; d. Westwood, Worcestershire, 25 April 1660. He was educated at Eton and Oxford, took orders in 1629, and in 1633 was rector of Penshurst in Kent, in 1643 archdeacon of Chichester. He was an adherent of Charles I., and took part in the unsuccessful rising of Tonbridge. He served as chaplain to the king 1645–7, and was in 1648 made sub-dean of Christ Church. In 1649 he removed to Westwood. Among his works are: 'A Practical Catechism' (1644); 'Paraphrase and Annotations upon the New

Testament' (1653). His 'Miscellaneous Theological Works' were published at Oxford, together with the 'Life' by Fell (1847–50, 3 vols.).

Hammond, James Henry, American politician: b. Newberry, S. C., 15 Nov. 1807; d. Beach Island, S. C., 13 Nov. 1864. He studied law, was admitted to the bar in 1828, and in 1830 became the editor of a political journal in Columbia, which maintained the doctrine of state rights and advocated nullification in respect to the tariff act of Congress. He entered zealously into the nullification contest which then divided the State, and took an active part in organizing the military force which South Carolina raised in 1833 to resist the Federal government. He was elected to Congress, and took his seat in 1835, but declined a re-election on account of ill health. In 1841 he was elected general of brigade, and in 1842 governor of South Carolina. While governor he published in 1844 a letter to the Free Church of Glasgow on slavery in the United States, and in 1845 two others in reply to an anti-slavery circular issued by Thomas Clarkson, the English abolitionist. These, in connection with other essays on the same subject, were published in 1853, in a volume entitled 'The Pro-Slavery Argument.' In November 1857 he was elected to the United States Senate, remaining there till 1860.

Hammond, John Hays, American mining engineer: b. San Francisco, 31 March 1855. He was graduated from the Sheffield Scientific School of Yale in 1876, studied at the Royal School of Mines, Freiburg, Saxony, and became an expert on the United States Geological Survey and mineral census, with the duty of examining gold mines in California. In 1882 he was appointed superintendent of silver mines in Sonora, Mexico, but later was again in California as consulting engineer at mines in Grass Valley, and as consulting engineer to the Union Iron Works at San Francisco, and to the Southern and Central Pacific railway companies. In the capacity of consulting engineer he visited many portions of North and South America and Mexico. In 1893 he went to South Africa as consulting engineer to the mining companies operated there by Barnato Bros. of London. He was associated with Cecil Rhodes in the latter's numerous mining interests, and consulting engineer to the Randsfontein Estates Gold Mining Co., the British South African Co. (chartered), and the Consolidated Gold Fields Co. He was one of the four leaders in the reform movement in the Transvaal and for his connection with the well-known Jameson raid, with which, however, he did not sympathize, was sentenced to death by the Boers. This sentence was later commuted to 15 years' imprisonment, and then to the payment of a fine of $125,000. He resides in New York, with offices there and in London, and is general manager and consulting engineer of the Guggenheim Exploration Co., one of the largest mining companies in the world. His reputation as a mining expert is world wide.

Hammond, Samuel, American soldier: b. Richmond County, Va., 21 Sept. 1757; d. Horse Creek, near Augusta, Ga., 11 Sept. 1842. His impulses led him, while a mere boy, to volunteer in the wars of the Virginia frontier with the Indians, where he is said to have greatly distinguished himself, and to have acquired that skill in stratagem which marked his subsequent military performances. In 1775 he raised a company, and took part in the battle of Longbridge; and in 1779 he was at the battle of Stono Ferry, S. C. After the fall of Charleston he kept the field with a small cavalry force, pursuing the active partisan warfare which alone maintained the revolutionary cause in South Carolina. He subsequently settled in Georgia; in 1802 was elected to Congress from Georgia; in 1805 was appointed by Jefferson to the civil and military command of upper Louisiana; and in 1824 removed to South Carolina, where he became surveyor-general of the State in 1827, and secretary of state in 1831.

Hammond, William Alexander, American surgeon: b. Annapolis, Md., 28 Aug. 1828; d. Washington, D. C., 5 Jan. 1900. He was graduated from the University of the City of New York in 1848; and entering the United States army in 1849 as assistant surgeon, became surgeon-general in April 1862. After the Civil War he practised his profession in New York for some years and in his later life took to writing fiction. Among his publications are included: 'Military Hygiene' (1863); 'Sleep and Its Nervous Derangements' (1869); 'Diseases of the Nervous System' (1871); 'Neurological Contributions'; etc., and the novels, 'Robert Severne'; 'A Strong-Minded Woman'; 'A Son of Perdition'; 'Doctor Grattan' (1884); 'Mr. Oldmixon'; etc.

Hammond, Ind., city in Lake County; on the Grand Calumet River, on the Baltimore & O., the Erie and the Michigan Central, and other R.R.'s; about 19 miles southeast of Chicago. It was settled in 1869 and incorporated in 1883. It is situated in an agricultural region, and its railroad facilities make it of considerable commercial importance. It has a number of manufactories, the principal of which are chemical works, steel-spring, starch, glue, carriage, nail, and flour-mills. It has a large distillery, a slaughtering and meat-packing plant, brick-yards, tanneries, and foundries. The city owns and operates the waterworks. The government is under the charter of 1883. The officers are a mayor, who holds office for four years, a city council, and administrative officials elected by the city council. The industrial growth of Hammond has been rapid, and the population has more than doubled in the last decade. Pop. (1890) 5,428; (1900) 12,376.

Ham'mondsport, N. Y., town in Steuben County, on the Erie, and the New York, O. & W. R.R.'s; about 55 miles southeast of Rochester and 50 miles southwest of Auburn. The town is in a fertile agricultural section, noted especially for the large number of vineyards. The chief manufactures are wine, fruit-boxes, flour, cigars, barrels, wire hoods, and baskets. Hammondsport has a large trade in wine, and in grapes and other fruits. It contains a high school, and several other good public buildings. Pop. 1,230.

Ham'monton, N. J., town in Atlantic County; on the Philadelphia & R. and the Camden & A. R.R.'s; about 27 miles southeast of Camden and 28 miles northwest of Atlantic City. It is situated in a region noted for its rich farms and abundance of fruit. The chief manufactures are shoes and cigars; but it is the trade centre for the northeastern part of the county, and from Hammonton a large amount of small fruits are shipped to New York and other cities. Pop. (1900) 3,481.

Hammurabi, hăm-moo-rā'bē, **The Code of**, a recently discovered code, instituted by Hammurabi, king of Babylon, about 2200 B.C. The code is a thousand years older than the Mosaic age; older than the laws of either Manu, or Moses. It is engraved on a pillar of black diorite, eight feet high, which was finally unearthed, January 1902, in the acropolis mound at Susa. The obverse of the column is surmounted by a bas-relief which represents the god Bel, the lawgiver, before whom the king stands to receive the law. The inscription which covers this stately monolith is the longest Babylonian record ever discovered. It contained originally about three thousand lines of writing, divided into forty-nine columns; but five columns on the front have been erased by some Elamite king, probably Sutruk Naknunti, who served the stele of Naram-Sin in a similar manner. The writing is a very beautiful type of the best archaic script, a kind of black-letter cuneiform, long used by kings for royal inscriptions. The code is divided into about 280 clauses, and opens with the words, «Law and justice I established in the land, I made happy the human race in those days.»

Character of the Code.— The code shows a most careful and systematic order, beginning with witchcraft, which connects it with a religious code: it passes through all grades of social and domestic life, ending with a scale of official wages for all classes of workmen, even the lowest in the scale. Hammurabi's laws of witchcraft preserve the «ordeal of water.»

«If a man has placed an enchantment upon a man, and has not justified himself, he upon whom the enchantment is placed to the Holy River (Euphrates) shall go; into the Holy River he shall plunge. If the Holy River holds (drowns) him he who enchanted him shall take his house. If on the contrary, the man is safe and thus is innocent, the wizard loses his life and his house.»

The same ordeal was applied to a wife for unfaithfulness or extravagance, or to a wine-seller who sold drink too cheap.

The three essential features of the code may be clearly defined. First it is based on personal responsibility and the *jus talionis*. Thus: «If any one destroys another's eye, his own eye shall be destroyed. If any one breaks another's bone, his own bone shall be broken. If any one knocks out the tooth of his equal, his own tooth shall be knocked out.» Next the belief in the sanctity of the oath before God, as in the Hebrew code, and also the absolute necessity of written evidence in all legal matters, as became a nation of scribes. Judgments in the law courts required a «sealed» document; an agent must take and give receipts for all money or goods entrusted to him; bonded goods required a deposit note. One of the most interesting series of clauses relates to officers or constables employed on active service; the estate of such a person could be entrusted to management, must not be sold or mortgaged, but he must depute a representative, or three years' absence and neglect forfeited fief. Substituted service was not allowed. As might be expected in a land so rich in cultivation, the agricultural laws are most explicit. Land must be cultivated, and if neglected the owner had to pay the same as neighboring land. Damage to crop by storm excused the payment of interest on loan. There are very stringent laws as to the tending of the irrigation canals and ditches, and any damage to adjacent land by neglect had to be made good. The commercial laws are extremely important, as showing a highly developed system. Noticeable are the clauses relating to agents or peddlers, commercial travelers of the period.

«If on the road on his business, the enemy have caused him to lose the property he bore, the agent by the name of God shall swear and he shall be quit. If a merchant gives goods to an agent to trade with, the agent shall write down the money, and to the merchant he shall render; the agent a sealed (receipt) for the money he gave to the merchant shall take.»

Monetary Transactions.— Money for which no receipt was taken was not to be included in the accounts. In case of dispute all witnesses and documents must be produced. Among the commercial laws are some of much interest at the present time relating to licensed premises. It is curious to note that all wine merchants were females.

«If riotous persons assemble in the house of a wine merchant and those riotous persons she seizes not and drives to the palace that wine merchant shall be put to death.»

Curious, too, is the following, which seems to reflect the Hebrew Nazarite law: «No votary or woman residing in the cloister may open a wine shop or enter one for drink on pain of being burned.»

In the code's domestic legislation, the most striking feature is the high position and legal protection extended to women. If a man causes a votary or the wife of a man «to have the finger (of scorn) pointed at her and has not justified himself» he is to be branded on the forehead.

To justify herself from scandal a woman could claim the ordeal of plunging in the sacred river. The mere formula of marriage «taking to wife» was not sufficient, for «if a man married a woman and executed not her deeds that woman is no wife.» Divorce law is most fully given — a childless woman could be divorced. If divorced without cause the husband must allow alimony and custody of her children, and a portion of the estate equal to a son, and the woman was free to marry. The woman could get a divorce, but must justify her right to do so. Thus we read:

«If the wife of a man who dwells in the house of that man has set her face to go forth, and has acted the fool, and wasted his house, and impoverished his house, they shall call her to account. If the husband shall say, I put her away, he shall put her away. She shall go her way; for her divorce he shall give her nothing.»

If the husband insisted, such a wife could be drowned. There is, however, a kindlier tone in the law as to a sick wife. «If a man has married a wife, and sickness has seized her, he may take a second wife, but the sick wife he shall not put away; in the home she shall dwell; as long as she lives he shall sustain her.»

Laws of Property.— The laws of property are most full and based on a most equitable system, one clause relates to the remarriage of a widow with young children, and might be present-day law:

"If a widow whose children are young has set her face to enter into the house of another, without the consent of the judge she shall not enter. When she enters into the house of another, the judge shall inquire regarding the house of her former husband. The house of her former husband to that woman and her future husband he shall entrust and cause them to deposit a deed. They shall keep the house and rear the little ones, but furniture for money they shall not sell. A purchaser that has bought any furniture from the children of the widow shall forfeit his money and return the property to its owner."

Here we have all the essential features of the modern ward in chancery. In the conclusion of this code Hammurabi repeatedly calls himself "King of Righteousness," as did his contemporary Melchisedek of Jerusalem, and enjoins upon all of his successors upon the throne to observe this code and its laws.

Hamon, Jean Louis, zhŏn loo-ē ā-mŏn, French genre artist: b. Plouha, Cotes-du-Nord, France, 8 May 1821; d. St. Raphael, Var, France, 29 May 1874. His work though not strong exhibits grace in drawing and has been popular. His most important work in the United States is 'Among the Flowers,' to be seen in the New York Metropolitan Museum.

Hamp'den, John, English statesman: b. London 1594; d. Thame, Oxfordshire, 24 June 1643. He was educated at Oxford and possessing an ample estate, led for several years the usual career of country gentlemen. He was cousin-german, by the mother's side, to Oliver Cromwell. He entered Parliament in the beginning of Charles I.'s reign as member for Grampound, and continued to sit in the House of Commons three times in succession as member for Wendover, and finally for Bucks. In 1636 his resistance to Charles' demand for ship-money made him the argument of all tongues, especially as it was after the decision of the judges in favor of the king's right to levy ship-money, that Hampden refused to pay it. Being prosecuted in the Court of Exchequer, he himself, aided by counsel, argued the case against the crown lawyers for twelve days before the twelve judges; and although it was decided against him by seven of them to five, the victory, as far as regarded public opinion, was his. From this time he received the title of the "patriot Hampden." In the following year (1637) he was one of those who meditated emigration to America, which they were prevented from carrying out by an order in council detaining them. Henceforward he took a prominent part in the great contest between the crown and the Parliament, and was one of the five members whom the king, in 1642, attempted, in person, to seize in the House of Commons. When civil war broke out Hampden acted with his usual decision, took command of a regiment in the parliamentary army, under the Earl of Essex. Prince Rupert having appeared near Thame, in Oxfordshire, Hampden joined a few cavalry that were rallied in haste, and in the skirmish that followed on Chalgrove Field, received a wound which proved fatal six days after its infliction. His death was a great subject of rejoicing to the royal party, and of grief to his own. His character and conduct, from first to last, evince his conscientiousness, and he has taken his rank by acclamation on the one side, and tacitly on the other, high in the list of English patriots. Consult: Nugent, 'Memorials of John Hampden' (1831); Forster, 'Life of Hampden' (1837); Gardiner, 'History of the Great Civil War,' Vol. I. (1880).

Hampden, Renn Dickson, English Anglican bishop: b. Barbadoes, W. I., 29 March 1793; d. London, England, 23 April 1868. Although a man of moderate abilities both as philosopher and theologian, it was his fortune to precipitate one of the most notable controversies in the English Church. As Bampton lecturer for 1832 he lectured on 'The Scholastic Philosophy Considered in its Relation to Christian Theology,' which brought upon him the charge of Arianism, and when he became regius professor of divinity at Oxford, in 1836, opposition to the appointment was very bitter and widespread. He was accused of heresy and all the leading men in the Anglican Church took sides in this theological war of words. In 1847 he was nominated by Lord John Russell for the see of Hereford and the strife of ten years previous was renewed in organized fashion, many bishops uniting in remonstrance and the dean of Hereford openly resisting. He was nevertheless consecrated in March 1848, and his episcopate of 20 years was quiet and uneventful, the echoes of the great controversy having ceased long before his death.

Hampden, Maine, town in Penobscot County; on the Penobscot River; about five miles southwest of Bangor. The chief manufactures are flour and lumber. There is an extensive river trade, chiefly in lumber and food products. The town is one of the oldest in the State, but recently it has grown steadily in industries and population. Pop. 2,484.

Hampden-Sidney College, in Hampden Sidney, a village near Farmville, in Prince Edward County, Va. The school was founded by the Presbyterian Church of Hanover, in 1776, and in 1783 was incorporated by the legislature of Virginia. The land was donated by Peter Johnston, but the acreage has been increased by gifts and purchases, and the college now owns 250 acres. Among the incorporators were Patrick Henry, James Madison, Nathaniel Venable, Paul Carrington, William Cabell, Sr., and many other famous Virginians. Rev. John Blair Smith, the first president of Union College, New York, had previously been president of Hampden-Sidney, also Rev. Archibald Alexander, a founder of Princeton Theological Seminary. It grants the degrees of bachelor of arts, bachelor of science, and bachelor of literature. In 1902 there were in attendance 107 students. The library contained 15,000 volumes.

Hampton, Wade, American general: b. South Carolina 1754; d. Columbia, S. C., 4 Feb. 1835. During the Revolutionary War he served under Sumter and Marion. He was a Democratic representative in Congress from South Carolina 1795–97, and again from 1803 to 1805. In 1809, he was promoted to be brigadier-general, subsequently was stationed in command at New Orleans, was superseded; in 1813 he was raised to the rank of major-general and appointed to command the force stationed at Norfolk, whence he was shortly afterward ordered to the northern frontier and placed in command of the army on Lake Champlain, with directions to threaten Montreal. The attack on Montreal, for which 12,000 men had been concentrated near Lake Champlain, was frustrated by Hampton's unwillingness to co-operate with his colleague General Wilkinson, with whom he had been long at enmity. Hampton resigned his commission 6 April 1814, and passed the rest of his life in agricultural pursuits. He was considered the wealthiest planter in the United States, and was reputed to be the owner of 3,000 slaves.

Hampton, Wade, American soldier: b. Columbia, S. C., 28 March 1818; d. there 11 April 1902. He was graduated from the University of South Carolina, studied law but never practised, managed extensive plantations in South Carolina and Mississippi, served in both houses of the State legislature, but, as a Union Democrat, was not popular among South Carolinians. At the beginning of the Civil War, he formed and equipped at his own expense the command of cavalry, infantry, and artillery known as 'Hampton's legion.' With this he won distinction at the first Bull Run and at Seven Pines, where half his troops were killed and himself severely wounded. Having been made brigadier-general of cavalry and assigned to J. E. B. Stuart's command, he took part in Lee's advance northward (1863), was prominent at Gettysburg, and later brilliantly opposed Sheridan's progress in the Shenandoah valley. He attained the rank of lieutenant-general in 1864, and was placed in command of Lee's entire cavalry forces. In 1865 he commanded J. E. Johnston's cavalry, and endeavored to prevent Sherman's northward advance from Savannah. After the war he was an active reconstructionist; in 1876 was nominated as the Democratic candidate for governor, and, after a contest regarding the election with D. H. Chamberlain, the Republican nominee, served until 1878, when he entered the United States Senate. He was in the Senate until 1891, and in 1893–7 was United States commissioner of railroads.

Hampton, Iowa, city, county-seat of Franklin County; on the Chicago G. W., and the Iowa C. R.R.'s; about 29 miles by rail south of Mason City and 60 miles north by west of Marshalltown. It is situated in an agricultural and stock-raising region. The chief industrial establishments are cigar factories and aluminum works; and its principal trade, in addition to the manufactured articles, is in grain, tobacco, live stock, and horses. Pop. (1900) 2,727.

Hampton (formerly HAMPTON COURT-HOUSE), S. C., village, county-seat of Hampton County; on a branch of the Atlantic C. L., and the Hampton & Branchville R.R.'s; about 67 miles southeast of Augusta. The village is in the yellow pine section, but cotton, sweet potatoes, and Indian corn are the staple products of the surrounding farm lands. Its chief manufactured article is lumber. Pop. 320.

Hampton, Va., town, county-seat of Elizabeth City County; on the north shore of Hampton Roads, on the Chesapeake & O. R.R.; about two and a half miles from Fortress Monroe and 15 miles north by west from Norfolk. In the last of the 16th and first of the 17th centuries the Indian village Kiquotan occupied the site of the present town of Hampton. John Smith and Lord Delaware mention (1608–10) the peaceful friendly Indians of Kiquotan, the hunters and fishermen; but before 1610 there were whites living along the shore and in this Indian village which retained its Indian name for some time after it became a white settlement. In the first session of the Virginia House of Burgesses or Colonial Legislature (1619), the borough of Hampton was represented. In the war of 1812 the town was attacked by the British and a large part was burned. In 1861 it was again burned by the Confederates. The Church of Saint John, Protestant Episcopal, built 1660, is still in good repair. Hampton contains a National Soldiers' Home, which has 2,000 resident veterans; a National Cemetery which contains 3,323 graves of soldiers, 600 of them of unknown dead. It is the seat of Hampton Normal and Agricultural Institute (q.v.). It has some manufactures; brick, fish-oil, and canned crabs. It has considerable trade in fish, especially oysters, and in fruits and vegetables. It has excellent bathing facilities and is a popular resort. Pop. (1890) 2,513; (1900) 3,521.

Hampton Court, England, a royal palace situated near Hampton, a village of Middlesex, 15 miles southwest of London. The palace is about one mile from the village. The original edifice consisted of five quadrangles, of which two remain; it was built by Cardinal Wolsey in 1525, and presented in 1526 to Henry VIII., by whom it was subsequently enlarged, and who formed around it a royal park or chase, which he enclosed and stocked with deer. A third quadrangle was added by Sir C. Wren for William III., who laid out the gardens and park in Dutch style. Hampton Court contains many valuable pictures by Holbein, Lely, Kneller, West, etc. The gardens comprise about 44 acres, and contain a famous "maze" and "wilderness." Hampton Court was inhabited by successive monarchs and their families until the reign of George II. Suites of apartments in Hampton Court palace are now set apart for persons of rank in reduced circumstances. The state apartments, picture gallery, gardens, and home park are open to the public. In 1886 the palace suffered considerable damage by fire.

Hampton Court Conference, a meeting at Hampton Court (q.v.), on the 14th, 15th, and 16th of January 1604, which was convened on the petition of the Puritan ministers to King James I. for moderation and tolerance on religious questions. By the composition of the conference,— on the episcopal side being the Archbishop of Canterbury, eight bishops, five deans, and two doctors, and on the Puritan side only four representatives,— the king sufficiently indicated his attitude toward the aims of the Puritans, and the proceedings consisted chiefly of adulation of James on the part of the episcopal party, and lecturing of the Puritan members by King James. A few alterations were made in the Prayer Book, and a new version of the Bible was agreed upon, the result being the authorized version of 1611.

Hampton Normal and Agricultural Institute, a school for negroes and Indians, opened in 1868, in Hampton, Va., under the auspices of the American Missionary Association. It was chartered by the State in 1870. The school is owned and controlled by a private corporation, administered by 17 trustees. The charter gives the trustees power to choose their own successors, and to hold property without taxation to the amount of $800,000. In 1875 the General Assembly of Virginia passed an act giving the Institute one third of the agricultural college land-grant of Virginia (see COLLEGES, LAND-GRANT) amounting to 100,000 acres, which was sold for $95,000 and which pays regular annual interest. The school was first opened in an old barracks (used during the Civil War), with two teachers and 15 pupils. It now (1903) owns 185 acres on Hampton River, upon which have been erected dormitories, a library, class-room buildings, a church, gymnasium, saw and planing-mill, shops, hospital, domestic-science school, trade school,— in all numbering 55 buildings. The Institute owns also a stock farm of 600 acres, about five miles from the school. The farm land, and the workshops where trades are taught, furnish occupation for the boys and young men. The girls are instructed and employed in sewing and cooking classes, in all the domestic work of the school, and wherever possible learning trades side by side with the boys. In 1896 the Armstrong and Slater Memorial Trade School was opened. (See NEGRO, EDUCATION OF THE.) In this school is taught the theory and practice of blacksmithing, carpentry, house painting, tailoring, and general repairing. The pupils are taught also, mechanical, civil, electrical, and mining engineering. On the farms they are taught how to care for stock, how to raise different crops, and the theory and practice of farming in general. The students are charged $10 a month for board, which is largely paid in labor. They are expected to provide their own books and clothing, and for the tuitions, buildings, furniture, and the implements used on the farms and in the shops, the school is dependent on the charity of the country. In 1878, 15 Indians, who had been prisoners of war at Saint Augustine, Fla., and in charge of Capt. R. H. Pratt, were admitted as students. Since then the Indian department has increased steadily, the pupils being chiefly from the Sioux tribe, of whom two thirds make a fair or good record. The young men of the school are organized into six military companies, all forming one battalion. This places the young men under military discipline. The 'Southern Workmen,' a monthly school periodical, is edited, printed, and managed by the pupils with only a general supervision by one of the teachers. The vacation is from June to October for all except the pupils in the industrial departments, which continue work all the year. During the regular long vacation a large number of the colored teachers of the South assemble here for a summer school. For the past ten years the average attendance at these summer schools has been nearly 500. The graduates number about 1,000, more than half of whom are teaching in the colored schools of the South. In 1902 the number of pupils in the Hampton Institute was 1,161, about 90 per cent of whom were in the industrial and preparatory departments, the remainder in the college department. The same year there were 82 instructors in the school. The library contains about 12,000 volumes. Many of the graduates are engaged in farming or working at trades; some are teaching. Booker T. Washington (q.v.), of the class of 1875, is the most noted graduate. Hampton's endowments amount to about $1,100,000. The annual income is about $170,000, and comes from the Government Indian Funds, the Slater and Peabody Funds, the State land-grant and agricultural funds, and from private donations.

Hampton Roads, Va., a broad deep channel which connects the estuary of the James River with Chesapeake Bay; really a part of the estuary which is at the mouths of the James, Elizabeth, and Nansemond rivers. Some of the good harbors along the shore are Norfolk and Portsmouth on the south; Hampton, on the Hampton Creek, an arm of the Hampton Roads, on the north. At the entrance are Forts Monroe and Wool. On the north side of the entrance is Thimble Shoal light, at lat. 37° 42′ N. and lon. 76° 14′ 5″ W. A large number of railroads have terminals on Hampton Roads, especially at Norfolk. This estuary, or channel, is considered of great military importance. During the Civil War its advantages as a military station were demonstrated. On Hampton Roads occurred the battle of Hampton Roads (q.v.), the first engagement between ironclads.

Hampton Roads, Battle of. Hampton Roads was the rendezvous of several important naval and military expeditions during the war, and the scene of two memorable encounters. On 8 March 1862 the Confederate ram Merrimac (or Virginia) left her anchorage at Norfolk, 12 miles from Fort Monroe, steamed down Elizabeth River and, with her consorts, five in number, attacked the Union fleet of five vessels in the roads, destroying the Congress and Cumberland, which lost over 250 men, and then retired to the mouth of Elizabeth River. Next morning the Merrimac returned to the roads to complete the destruction of the Union fleet, but was met by the Monitor, which had arrived the night before from New York, and a novel naval battle ensued, resulting in the return of the Merrimac to Norfolk and the saving of the remainder of the Union fleet. See MONITOR AND MERRIMAC.

E. A. CARMAN.

Hampton Roads Conference, an informal conference held 3 Feb. 1865, between President Lincoln and Secretary of State Seward, representing the United States government, and Vice-President Alexander H. Stephens, Senator Robert M. T. Hunter, and Assistant Secretary of War John A. Campbell, representing the Confederate States. The meeting took place on board the River Queen, near Fort Monroe, and its object was the arrangement of a peace between the North and South. The originator of this conference was Francis P. Blair (q.v.) who thought a combination of North and South against Maximilian in Mexico, in enforcement of the Monroe doctrine, would bring in peace by a diversion. President Lincoln refused to join the conference excepting with a view to the restoration of union, and on the understanding that the Emancipation Proclamation was to stand without qualification. He disapproved of a joint action against the French in Mexico. The conference lasted for four hours, but broke up without reaching any definite conclusion.

Han-yang, hän-yäng'. See HANKOW.

Han'aford, Phebe Ann Coffin, American Universalist minister: b. Nantucket, Mass., 6 May 1829. In 1849 she was married to J. H. Hanaford, a teacher. She was the first woman ordained to the ministry in New England and since her ordination in 1868 has held pastorates in Hingham and Waltham, Mass., New Haven, Conn., and Jersey City. She has been industrious as a writer, among her many published works being 'Life of Abraham Lincoln'; 'Life of George Peabody'; 'Lucretia the Quakeress'; 'Leonette, or Truth Sought and Found'; 'The Best of Books and its History'; 'Frank Nelson, the Runaway Boy'; 'The Soldier's Daughter'; 'Field, Gunboat, and Hospital'; 'Women of the Century'; 'From Shore to Shore, and Other Poems'; etc.

Han'cock, John, American statesman: b. Braintree, Mass., 23 Jan. 1737; d. Quincy, Mass., 8 Oct. 1793. He was graduated at Harvard College in 1754, but shortly after entered the counting house of an uncle, on whose death in 1764 he received a fortune of £80,000. After 1766 he was several times elected to the Massachusetts General Court. It was the seizure of his sloop, the Liberty, that occasioned the riot in 1768, when the royal commissioners of customs narrowly escaped with their lives. After the so-called "Boston massacre," in 1770, he was a member of the committee to demand of the royal governor the removal of the troops from the city, and at the funeral of the slain delivered an address which greatly offended the governor, who now endeavored to seize the persons of Hancock and Samuel Adams. Both were members of the Provincial Congress at Concord and later of that at Cambridge, and Hancock was president of each. This arrest is said to have been one of the objects of the expedition to Concord which led to the first battle of the revolution after which Gage offered pardon to all the rebels except these two, "whose offences," he added "are of too flagitious a nature to admit of any other consideration but that of condign punishment." In 1775 Hancock was chosen president of the Continental Congress, and in 1776 signed the Declaration of Independence. He resigned from the presidency in 1777, but was a member of the Congress until 1780, and again in 1785–6. With rank of major-general, he commanded the Massachusetts forces in the Rhode Island expedition, in 1780 was a member of the Massachusetts constitutional convention, and under that constitution was in 1780 chosen first governor. To this office, with an interval of two years (1785–7) he was annually re-elected till his death. Hancock was a man of strong common sense and great decision of character, of polished manners, easy address, affable, liberal, and charitable. His personal vanity, and his jealousy were at times conspicuous, but he was a sincere patriot, and of much ability. John Adams said of him: "He was by no means a contemptible scholar or orator. Compared with Washington, General Lincoln, or Knox, he was learned." See A. E. Brown, 'John Hancock: his Book' (1898).

Hancock, Winfield Scott, American soldier: b. Montgomery Square, Pa., 14 Feb. 1824; d. Governor's Island, New York harbor, 9 Feb. 1886. He was graduated from the United States military academy in 1844, and after frontier service in the Sixth infantry fought with credit in the Mexican war, was successively regimental adjutant and quartermaster in 1848–55, and briefly assistant adjutant-general to the Department of the West. Appointed assistant-quartermaster with rank of captain in 1855, he was stationed at Fort Myers, Fla., during the Seminole disturbances, and in 1857–8 was in Kansas, whence, after service, in the border troubles, he was ordered successively to Utah and California. In 1859–61 he was chief quartermaster of the southern district of California, with headquarters at Los Angeles. At the beginning of the Civil War, he was commissioned brigadier-general of volunteers, and assigned to the command of a brigade in Smith's division, Fourth corps, Army of the Potomac. He distinguished himself at Williamsburg and during the second day's fight at Antietam (17 Sept 1862) was placed in command of the 1st division, Second army corps. Promoted major-general, U. S. V. (November 1862), he commanded his division at Fredericksburg in the attack on Marye's Heights, on which occasion he lost 2,013 from a total of 5,006 troops. He largely saved the day at Chancellorsville (2–4 May 1863), and shortly afterward was assigned to the command of the Second corps. In July 1863, he was ordered by Meade to proceed to the field of Gettysburg, take command, and report whether battle should be given at that point. He reported Gettysburg as the suitable place for the ensuing battle, reorganized the Federal lines, on 2 July commanded the left wing, and on the next day the left centre, against which was directed a Confederate charge in the course of which the Second corps lost about 4,000 killed and wounded out of less than 10,000 troops and Hancock was shot from his horse. In 1866 he was appointed major-general, U. S. A., in 1866–8 commanded successively the departments of Missouri, and of Texas and Louisiana, in 1868–9 the military division of the Atlantic, in 1869–72 the department of Dakota. He was again assigned to the division of the Atlantic in 1872. In 1880 he was Democratic candidate for the presidency, but was defeated by Garfield by a vote of 4,454,416 to 4,444,952. He was a brilliant leader, known as "Hancock the Superb," — "the most conspicuous figure," says Grant, "of all the general officers who did not exercise a separate command." Consult the 'Life' by Walker (1894).

Hancock, Mich., village in Houghton County; on Lake Portage, and on the Duluth, S. S. & A. railroad; opposite Houghton (q.v.). Although the northern part of Michigan and this region had been explored by missionaries in the 17th century, the first permanent settlement was made in Hancock in 1859, and the village was incorporated in 1863. It is situated in a section rich in minerals, the Lake Superior copper belt. The Calumet and the Hecla copper mines are nearby, and the village has foundries, machine-shops, smelters, stamp-mills, lumber and brick yards. A ship-canal to Lake Superior brings a large portion of the lake traffic to and from Duluth and Superior through the "short cut," by way of Hancock. It is the seat of a Finnish college. The government is vested in a president, whose term of office is one year, and a village council who are elected by the people. The village owns and operates the waterworks. Pop. (1890) 1,772; (1900) 4,050.

Hancock, N. Y., village in Delaware County; at the junction of the two branches of the Delaware River, on the Erie and the New Y., O. & W. R.R.'s. Nearby are bluestone quarries, which add to the industrial wealth of the village. Hancock has flour-mills, tanneries, a wood alcohol factory, and large lumber-yards. It is a trade centre for an extensive agricultural region. Pop. (1900) 1,283.

Hancock, Mount, a peak of the Big Game Range, in the southern part of the Yellowstone National Park, on the boundary between the Park and Wyoming. It is on the western border of Two Ocean Plateau, a portion of the continental divide. The Snake River (q.v.) has its rise on the east side of Mount Hancock, flows north by west, then south by west around and almost circling the mountain. Mount Hancock is 10,235 feet in height.

Hand, Edward, American revolutionary soldier; b. Clyduff, King's County, Ireland, 31 Dec. 1744; d. Rockford, Lancaster County, Pa., 3 Sept. 1802. In 1774 he came to America as surgeon's mate in the 18th Royal Irish regiment, but he later resigned and entered medical practice in Pennsylvania. At the outbreak of the Revolutionary War, he became a lieutenant-colonel in Gen. William Thompson's brigade, participated in the siege of Boston, and in 1777 was appointed brigadier-general. In 1778 he succeeded General Stark in the command at Albany, and later took part in General Sullivan's expedition against the Iroquois. He sat in Congress in 1784–5, and signed the Pennsylvania constitution in 1790.

Hand. The human hand is composed of 27 bones, namely eight bones of the carpus or wrist arranged in two rows of four each, the row next the fore-arm containing the scaphoid, the semilunar, the cuneiform, and the pisiform, and that next the metacarpus, the trapezium, the trapezoid, the os magnum, and the unciform. The metacarpus consists of the five bones which form the palm, the first being that of the thumb, the others that of the fingers in succession. Lastly, the fingers proper contain 14 bones called phalanges, of which the thumb has but two, all the other digits having three each. These bones are jointed so as to admit of a variety of movements, the more characteristic being those by which the hand is flexed backward, forward, and sideways, and by which the thumb and fingers are moved in different ways.

The chief muscles which determine these movements are the "flexors," which pass down the fore-arm, are attached by tendons to the phalanges of the fingers, and serve to flex or bend the fingers; and the "extensors" for extending the fingers. There are two muscles which flex all the fingers except the thumb. The thumb has a separate long and short flexor. There is a common extensor for the fingers which passes down the back of the fore-arm and divides at the wrist into four tendons, one for each finger, each being attached to all three phalanges. The fore-finger and little finger have, in addition, each an extensor of its own, and the thumb has both a short and a long extensor. The tendons of the muscles of the hand are interlaced and bound together by bands and aponeurotic fibres, and from this results a more or less complete unity of action. It is sometimes difficult to make a movement with a single finger without the others taking part in it, as in executing instrumental music, for instance; but practice gives to these movements perfect independence.

Of all the movements of the hand the opposition of the thumb to the other fingers, alone or united, especially characterizes the human hand. This action of the thumb results from its length, from the first metacarpal bone not being placed on the same plane as the other four, as is the case in the monkey, and from the action of a muscle — the long flexor of the thumb — peculiar to the human hand. This muscle completes the action of the other motor of the thumb and permits man to hold a pen, a graver, or a needle; it gives to his hand the dexterity necessary in the execution of the most delicate work. Properly speaking then, the hand, with its highly specialized muscles, belongs to man alone. It cannot be considered, as in the ape, as a normal organ of locomotion. It is essentially the organ of touch and prehension. It molds itself to a body to ascertain its form; it comes to the aid of the eye in completing or rectifying its impressions. The functions of touch devolve principally on its anterior or palmar face, the nervous papillæ abounding specially at the ends of the fingers. A layer of adipose tissue very close in texture protects, without lessening its power or its delicacy, the network of muscles, vessels, and nerves with which this remarkable organ is equipped.

Hand'ball, a popular game of ball, the bare hand only being used. The game is indigenous to Ireland, but has been transplanted to America, where are the most expert players. Two or four men can play, one or two on a side. As far as is known the game of handball came to the United States about 1840, and has since become one of the sports under the regulations of the Amateur Athletic Union. The game consists of scoring the ball against a single back wall, with a lined-out space of 60 feet in front. The ball coming from the wall must fall between these two lines to be in play. The game is simply to strike the ball on the rebound with the hand.

Han'del, George Frederick, (properly Georg Friedrich Haendel), English composer; b. Halle, Saxony, 23 Feb. 1685; d. London 20 April 1759. His father, intending him for the law, discouraged the strong passion which he evinced early in life for the science of music. But although forbidden the use of musical instruments, the young musician contrived to hide a small clavichord in a garret, where he amused himself during great part of the night after the rest of the family had retired, and made such progress that, when at seven he accompanied his father to the court of Saxe-Weissenfels, he played on the church organ with such power and effect that the duke, who accidentally witnessed his performance, used his influence successfully with his father to permit him to follow his inclination. He was accordingly placed under

Zachau, organist of the cathedral, and was soon so far advanced in the practical part of the science as to officiate occasionally as deputy to his instructor. At 14 (1698) he went to Berlin, where at that time the opera under the direction of Buononcini and Attilio was in a very flourishing condition. Attilio became his teacher and friend. In 1703 he went to Hamburg, and procured an engagement in the orchestra at the opera there. On 30 Dec. 1704, he brought out his first opera, 'Almira,' in the February following succeeded by his 'Nero,' and subsequently by 'Florindo' and 'Daphne.' He then went to Italy, where he composed the operas 'Rodrigo' and 'Agrippina,' and the first form of the serenade 'Acis and Galatea.' On his return to Germany in 1710 he entered the service of the Elector of Hanover, afterward George I. of England, as chapel-master; but having received invitations to visit London, he set out for England, where he arrived in the latter end of 1710. On the occasion of his first visit to England he composed the opera 'Rinaldo.' He soon returned to Hanover, but at the end of two years again received permission to visit England. At the time of his arrival in London the negotiations for the Peace of Utrecht were just about to be concluded, and Handel was invited by Queen Anne to compose a 'Te Deum' and 'Jubilate' in celebration of the peace. But this act was so distasteful to the Elector of Hanover that Handel did not venture to return, but remained in England on an income of £200 a year allowed him by the queen. He was, in consequence, on the accession of his royal patron to the throne of Great Britain in 1714, in much disgrace, till Baron Kielmannseck restored him to favor. From 1715–18 Handel resided with the Earl of Burlington, and then quitted that nobleman for the service of the Duke of Chandos, who entertained him as chapelmaster to the splendid choir established at his seat at Cannons. For the service of this magnificent chapel Handel produced those anthems and organ fugues which alone would have been sufficient to immortalize him. When the Royal Academy of Music was instituted by some of the leading noblemen of England, Handel, whose fame had now reached its height, was placed at its head; and this, for a short period, may be considered as the most splendid era of music in England. The warmth of his own temper, however, excited by the arrogance and caprice of some of his principal Italian singers, caused many violent quarrels; and public opinion becoming enlisted in favor of his opponents, and especially of his rival, the musician Buononcini, his popularity waned somewhat and the Academy was dissolved (1728). Handel then started a new operatic company. But a rival company to his was afterward started, and the result was that much money was lost by both. The operas which he had composed up to this date (1735), from the institution of the Academy of Music, were 'Radamisto'; 'Ottone'; 'Giulio Cesare'; 'Floridante'; 'Flavio'; 'Tamerlano'; 'Rodelindo'; 'Alessandro'; 'Scipione'; 'Ricardo I.'; 'Tolomeo'; 'Siroe'; 'Lotario'; 'Parthenope'; 'Poro'; 'Orlando'; 'Sosarme'; 'Ariadne'; 'Ezio'; 'Ariodante'; and 'Alcina.' Among other works should be mentioned his first English oratorio, 'Esther', and his delightful pastoral 'Acis and Galatea.' In 1736 his famous setting of Dryden's ode, 'Alexander's Feast,' was performed with brilliant success. His last opera was performed in 1741. Handel had by this time begun to devote himself chiefly to music of a serious nature, especially the oratorio. The approval which his first works of this kind 'Esther,' 'Deborah' (1723), 'Athalia' (1733); had met with encouraged him to new efforts; and he produced in succession 'Saul,' 'Israel in Egypt,' and 'The Messiah.' The last-mentioned, his chief work, was brought out at Dublin in 1742. This sublime composition had been composed the previous year, in the incredibly short period of twenty-three days. When Handel returned to London his oratorios were received at Covent Garden Theatre with the greatest approbation by overflowing audiences — 'The Messiah' in particular increased yearly in reputation. Before it was given, however, a new oratorio, 'Samson,' was produced (1743), and there next followed 'Joseph and his Brethren' (1744), 'Belshazzar' (1745), 'Judas Maccabæus' (1747), 'Joshua' (1748), 'Solomon' (1749), and 'Jephthah' (1752). Some time before his death he was afflicted by nearly total blindness; but he continued not only to perform in public but even to compose. His own air, however, 'Total Eclipse,' from the oratorio of 'Samson,' is said always to have affected and agitated him extremely after the loss of his sight.

Handel's habits of life were regular; his appetites were coarse, his person large and ungainly, his manners rough, and his temper even violent; but his heart was humane, and his disposition liberal. His musical powers can hardly be estimated too highly. In boldness and strength of style, and in the combination of vigor, spirit, and invention in his instrumental compositions he has never been surpassed. His choruses have a grandeur and sublimity which have never been equaled. Yet a singular fact in regard to him as a musician is that in some of his works he shows himself as an unscrupulous plagiarist — a fact of which various explanations and palliations have been attempted. He was buried in Westminster Abbey, where a monument by Roubillac was erected to his memory. See 'Lives by Chrysander' (1858–67); and Rockstro (1883); Whittingham, 'Life and Works of Handel' (1882); the articles in the 'Dictionary of National Biography' and Grove's 'Dictionary of Music.'

Han'dicap, Brooklyn. See HORSE-RACING.

Handicapping, a term used in racing: The allowance of time, distance, or weight made to the inferior competitors in a race with the object of bringing all as nearly as possible to an equality; the extra weight imposed on a superior horse in order to reduce his chance of winning to an equality with that of an inferior animal. The handicap is framed in accordance with the known previous performances of the competitors, and in horse-racing also with regard to the sex and age of the animals engaged. The principle is the same in other contests, as in billiards a superior player is handicapped by having to allow his inferior competitor a start of a certain number of points.

Handies (hăn'dĭz) **Peak,** in the southeastern part of Colorado, in the San Juan Range; about 12 miles northeast of Silverton. Rich deposits of silver ore are found in all the mountains of this vicinity; the range is known as the 'Silver San Juan.' The altitude of Handies Peak is about 14,000 feet.

Handwriting, Expert Analysis of. A mental image may be made either consciously and with attention to every detail, or with varying degrees of consciousness amounting in some cases to almost complete automatism, but it must in any case be largely influenced by the machine which produces it. No matter what care may be employed to make two objects alike, a sufficiently minute inspection will always discern differences between them. It is from this fact we are able to distinguish a particular tone of a bell, a particular face, etc. All things, and notably those which owe their existence to organic life, are resultants of very complex forces acting simultaneously or in sequence, and in comparing similar resultants it is ever found that quantitative or qualitative differences of the constituent forces employed in fashioning them have occasioned differences in the objects themselves. These differences may be indiscernible to the casual view, but will never fail to reveal themselves to an examination sufficiently searching.

The factors employed in making marks may be roughly divided into: A, the model in the mind which it is the intention to reproduce; and B, the mechanism by which the act is to be accomplished. Under the latter head there is to consider not only the permanent structure of the individual, which necessarily limits his performance, but also the manner of employing this structure, which becomes a habit, and the fluctuations, due to disease, drugs, variations of mood, increasing age, etc., in the motor impulses controlling it.

The basis of any sound judgment on the authorship of designs such as pictures or handwriting, depends upon the recognition of sorts of differences; which it is essential to distinguish from each other. In general, designs by different authors differ in kind, while those of the same author differ in degree. The methods for distinguishing these two sorts of differences will be more particularly treated hereafter.

The general subject of the study of those characteristics which distinguish each handwriting from every other has been called *Grammapheny;* the study of methods for detecting frauds relating to handwriting either in imitating, altering, or suppressing a record, is called *Plassopheny;* and the general study of the records of human thought including their forms, their purport, and the tools and materials by means of which they are produced is called *Bibliotics.*

Ever since the more or less permanent records of human thought have had a value they have been the objects of falsification. It is not known to how great an extent this may have been practised in the hieroglyphic and ideographic carvings on stone, but doubtless interpolations were frequent in recording the deeds of their kings, and the sculptors imitated each other's style with a view of bettering their own; or each other's peculiarities to convey false impressions as to the narrator.

But with the introduction of writing in pigments on parchment and papyrus the greater facility with which alterations and erasures could be made immediately attracted the attention of the unscrupulous. According to historians the Greeks, Romans, Egyptians, Assyrians, and others practised garbling and forgery by erasing, resurfacing, and bleaching manuscripts to change their purport, or give false impressions of their age and authorship. These depredations, then as now, were chiefly made upon manuscripts of persons absent or, more commonly, deceased; whole compositions which they never saw being ascribed to them. As an example may be cited the interpolation in the text of Josephus with which Eusebius has been charged. A host of epistles, papal decrees, productions of the Fathers, and dogmatical treatises were in early times altered, erased in part, and falsified from the original text, sometimes by learned and reverend scholars for the greater glory of the Church, and sometimes by obscure copyists from ignorance, or trifling incentives. Erasmus declared he knew not a single important old manuscript which was not tainted by this kind of fraud. The methods of effacing the writing of a parchment multiplied in proportion to the increase of manuscripts and the cost of parchment. The practice of using such effaced parchments for other writings was common in the time of Cicero, as a letter from him to Trebatius testifies. Such writings were called palimpsests; and the custom of producing them gave dangerous experience to perpetrators of fraud in the art of effacing written characters by mechanical and chemical means. Plutarch speaks of this practice as one well known. As the price of parchment rose it began to be the habit in the early libraries to efface the letters from parchments «of little value» in order to replace them by more valuable compositions. Dangerous as was such a rule at any time it became fatal to learning when the choice was in the hands of ignorant monks inflamed against their adversaries in controversy, and against all «pagans,» in which class almost all the great authors of our classics were included, and willing to sacrifice the choicest thoughts of the Greeks and Romans in favor of the fanatical dissertations of those they were pleased to call the «faithful.»

When the Caliph Omar put an end to the manufacture and sale of papyrus he caused a wholesale destruction of the writings in the libraries throughout the world. Michelet states that «the fatal patience of the monks» accomplished more ruin than the conflagrations of Omar, of the hundred Spanish libraries, and of the Inquisition. (Consult Gustave Itasse, 'Le Faux devant l'histoire,' etc., from which much of the preceding is taken.) According to Adolphe Bertillon ('Revue Scien.' 25; 4 Ser. Vol. VIII. 18 Dec. 1897) the first recorded student of bibliotics was François Demelle in 1609, and the first writer on the subject one Raveneau (1656). In his treatise the latter deplores the lack of science of his colleagues, which however did not prevent their landing him in jail for forgery.

The methods employed in judging the authorship of handwriting by these and almost all later writers on the subject are the same as those relied upon by connoisseurs of painting. They deal exclusively with the pictorial and apparent peculiarities, and the undefined effect these produce upon the mind. The most daring of these methods is the so-called

"Graphology," described in a pamphlet of the Abbé Michon in 1880, which has many conscientious supporters and partial government recognition in Germany and France. This curious study has for its object the revelation of the character and peculiarities of a writer by his handwriting. It would lead to too long a digression should the various claims of the advocates of graphology be reviewed. It must suffice here to say that some of these not content with finding in the manuscript of an unknown writer personal peculiarities which he already possesses, have imagined they could detect the lurking tendencies to virtuous or vicious deeds such as self-sacrifice, kleptomania, murder, etc., which he has never developed. These are deduced from the pen habits which they think they detect in the writing: such as deliberation, precipitancy, economy of paper, or of effect, etc., etc. M. Bertillon thinks "To the public no proof is so decisive as that of personal identification of individuality, yet how many mistakes are made?" He believes with the exception of the advance in photography the art of handwriting judgment is just where Raveneau left it in the reign of Louis XIV. He forgets the aid he himself has rendered to the art of differentiating and identifying handwriting by the application of his anthropometrical measures for the identification of criminals. The former art without such methods is in precisely the state in which Bertillon found the latter before his demonstration that exact measurements of different parts of the body and the relation to each other of the results of such measurements entirely removed the chance of error in identification, whereas there have been many instances of mistaken identity, or denial of identity by a wife or other near relative of the person in question. The history of this minute branch of research resembles that of other and larger branches. Subjective impressions such as those supplied by the feelings, indicating supposed relative amounts or intensities of emotions or sensibility, which were the only guides to the pioneers of inductive research, gave way to exact methods by employment of instruments of precision recording facts in intelligible units, in estimating, for example, degrees of acidity, pitch of sounds, height of temperatures, intensity of lights. One after the other the old subjects of research were furnished with these unequivocal means of recording phenomena, and all the new subjects were required to find such means or forfeit recognition. Thus through mathematics astronomy, already in the van of exact sciences, was enabled to make enormous enlargements of our view of the universe in the last two centuries, and even those objects of research which seemed to defy such treatment were provided with mathematical methods. Psychology became a science admitting experimentation of which the results can be expressed in units, and chemistry is becoming as loyal a subject of that science of relation — mathematics — as its sisters, physics and mechanics.

The purpose of the investigation of a handwriting will determine the kind of examination that is made. If the object be to ascertain whether a particular signature has been legitimately placed as an authentification of a writing, it is necessary to scrutinize the paper on which it is written for evidence of scratching, erasing, or other tampering; the ink for peculiarities of constitution which may be inconsistent with its use at that time and in that place. The question of superposition of lines may show that the writing it validates was made after the signature. In numerous criminal trials each of these and of many other unmentioned demonstrable facts have at once stamped documents as fraudulent and obviated the necessity of the more particular study of the character of the writing. (Thus a water-mark in a paper on which was written a statement bearing date 1868 represented the German Eagle which was not adopted till after 1870, and this of course showed the whole instrument to be a fraud. A similar conclusion is forced in the case of traced characters purporting to have been written before Hofmann's discovery of the aniline colors yet demonstrably produced by aniline ink.) The value of a signature as authenticating a contract is forfeited if it is clear that parts of the body of the document were written after the signature was written. These and other problems in the domain of plassopheny are too numerous to treat in this place and attention will be directed exclusively to the grounds for deciding two specimens of writing to be by the same or by different hands.

The first and most obvious method is to compare their respective features; large or fine writing; perfect or imperfect shaping of the letters; slant or angle of the stems and tails of letters with the line of writing; peculiarities (of which there are always a number) in the forms of individual letters or in the manner of connecting or grouping them; alterations in pressure producing shading in certain directions, and many other similar details. These peculiarities are pictorial. In all genuine writing they arise from the limitations of the writer, first in forming a mental picture of what he wants to produce, and secondly in producing it. Any one of these peculiarities can be easily imitated by another, and indeed all the visible details together can be drawn or traced by a skilful artist, yet in the latter case not without revealing to one using a magnifying glass that the lines have been slowly and carefully drawn and not dashed off with ease. Even if words are photographed or traced from an original and afterward inked, an ordinary magnifying glass will show a difference in the pen marks from the current facility of the original writer. The careful study of such details constituted the entire basis of judgment of the expert till within recent years, and usually they will suffice; for though the forger should know all the minute peculiarities which are disclosed to the patient study of a handwriting, yet he could not reproduce many of them without betraying in the result a painstaking, labored use of the pen which would excite suspicion. Where the same word or signature occurs twice or more in a document the forger must avoid exact repetition of all the minutiæ and at the same time not make such deviations as are inconsistent with the habits of the writer. The most important of these habits for purposes of identification are not pictorial nor immediately apparent to the eye.

Proportions.— Among the most important kinds of characteristics which insensibly influence the judgment in forming a conclusion as to identity of authorship of two specimens of handwriting are the proportions between certain parts of a letter, or word, or group of these, which often occur together. Especially is this the case with a signature, which is written so frequently that the act becomes almost automatic and therefore one in which the peculiarities due to the hand and arm making it, and to the brain furnishing the pattern, are most prominent because without the interference of voluntary effort. The result in fact resembles typewriting where the defects in the levers and type-faces of a type-writing machine can be detected; but with this difference that in handwriting they are still recognizable even when from lack of space or other causes the signature is written smaller or larger than usual. In such cases there is found a greater conformity to the established relations of parts of the signature than any foreign hand could make without a pantograph or other artificial aid. These proportions of parts may be detected either individually by carefully noted measurements, or by composite photographs of genuine signatures. Each method has some advantages over the other. In employing composite photography one attains to an ideal signature because all the possible characteristics of relation in every signature have been introduced, but on the other hand by this means only a form has been evolved — a graphic average — which must then be made the standard for comparison.

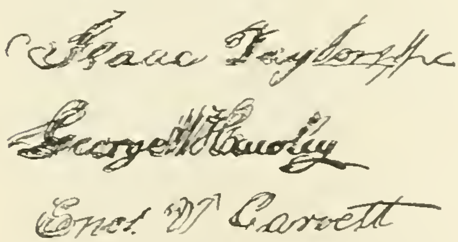

Fig. 1.— Composites of genuine signatures.

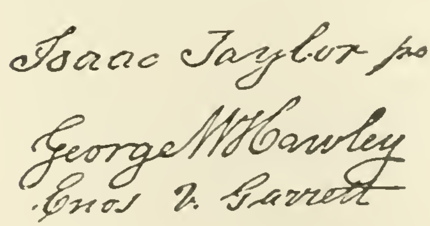

Fig. 2.— Forgeries of the above signatures.

In the case of the method by actual measurements although only a small fraction of the total number of relations is noted, yet these are in numerical form and can be averaged and the results compared directly.

The principle on which the method by investigation of proportions of parts rests is that the spaces between various distinctive points of a signature bear numerical relations to each other, and to the heights of certain letters, which are constant within comparatively narrow limits whether the signature be written small or large.

The following illustration (Fig. 3) represents a small part of a letter written with pen and ink and photographed at an enlargement of 30 diameters:

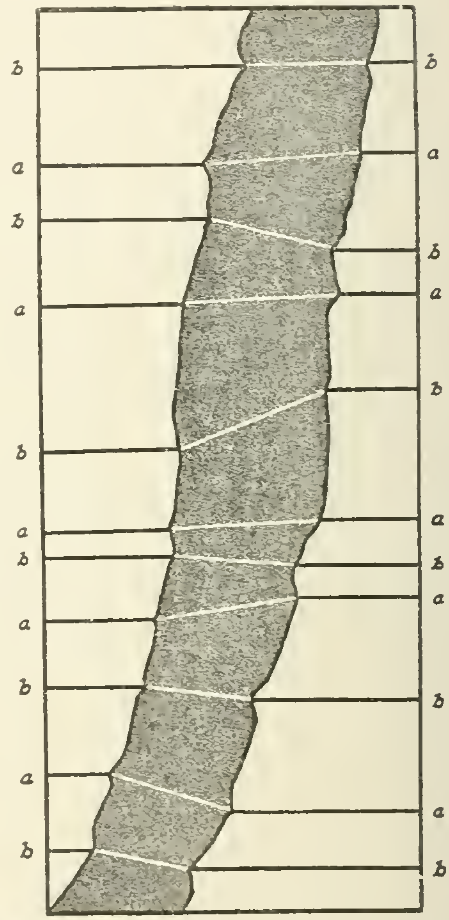

Fig. 3.— The points *a* show the widest and *b* the narrowest parts of the ink lines. It is to be noted that the maxima and minima of the two margins are not always opposite to each other, but show a tendency to oscillate about a horizontal line so that the *a*'s and *b*'s of one margin will be observed alternately above and below such line in following the ink mark downward, while those of the other margin will be found in opposite phase. This is made clearer by the white lines uniting the *a*'s and *b*'s of the opposite margins. This can be accounted for by the simultaneous operation of lateral and vertical movements which are not coincident in period.

Tremograms.— Another valuable individuality in writings executed by means of pen and ink are the irregularities observed in the margins of the lines when examined under a sufficiently high power of the microscope (about 120 diameters). How far this examination will enable one to identify an individual is not yet known, but it has been established that there are characters in the general disposition, number, arrangement, and position of these serrations, which remain comparatively constant in the writings of the same individual with different pens, ink, and paper, and under different mental and physical conditions, and which therefore cannot have other source than peculiar motions imparted to the writing instrument and writing fluid by the writer.

Inks.—Tables for the determination of the characters of inks by qualitative chemical tests have been published by Robertson, Hofmann and others. To the same end special devices have been made to solve questions relating to the composition of inks without affecting the document or writing fluid: Doremus by means of the spectroscope. Frazer through absorption of light admitted to and reflected by the ink through colored prisms. Sharples has shown that an otherwise invisible record may be made visible through shorter or longer exposure to the sensitive plate of the photographic camera, etc.

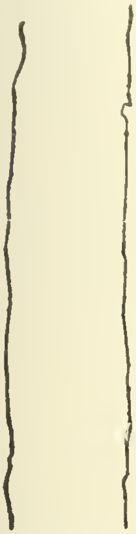

FIG. 4.—A tracing by camera lucida of the margins of an ink line drawn by a pen fixed to a ruling machine. It is enlarged 60 diameters. There is an absence of the irregularities always found in the margins of ink lines made by the human hand.

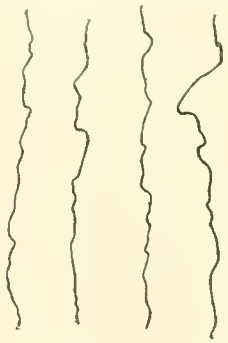

FIG. 5.—Camera lucida tracings of the margins of two ink lines by the same hand made at an interval of fifty-two days. The similarity of character of the serrations in both is noticeable.

Bibliography.— Chabot, 'The Handwriting of Junius Professionally Investigated,' with a preface and collateral evidence, by the Hon. Edward Twisleton (1871); Cross & Bevan, 'A Text-Book of Paper-Making' (1888); S. Weir Mitchell, M. D., 'Mary Reynolds: a Case of Double Consciousness' (with a letter on the handwritings peculiar to each of the two states by Persifor Frazer). Transactions of the College of Physicians of Philadelphia (April 4, 1888); Galton, 'Decipherment of Blurred Finger-Prints' (1893); Persifor Frazer, 'Bibliotics or the Study of Documents' (1894); Hagan, 'Disputed Handwriting' (1894); Bertillon, 'La comparaison des écritures et l'identification graphique,' Revue Scientifique (December 18, 1897 and January 1, 1898); Itasse, 'Le faux devant l'histoire, devant la science, et devant la loi' (1898); Persifor Frazer, 'Des faux en écriture et de l'écriture. Traduit par M. L. Vossion et Mme. H. Bouett' (1899); Minovici, 'Les faux en écriture et la photographie au service de la justice'; Ames, 'Forgery, its Detection and Illustration' (1900).

PERSIFOR FRAZER,
Docteur ès-Sciences Naturelles Univ. de France.

Handy Andy, a novel by Samuel Lover, published in 1842. It is a broadly humorous tale of life among the Irish gentry and peasantry in the first half of the 19th century, by an accomplished author who not only could illustrate his own narrative, but could write songs for it and furnish music for them as well.

Han'ford, Cal., city and county-seat of Kings County; on the Southern Pac. and Santa Fe R.R.'s, about 30 miles southeast of Fresno, and 250 miles south of San Francisco. It was first settled in 1871 and was made a city in 1891. Its chief industries are agriculture, fruits, raisins, and livestock. It has also flour and planing mills, milk condensing factory, butter and cheese factories, etc., and is a distributing centre for food products and clothing sent to mining sections in the vicinity. The city government is by a Board of Trustees, the board choosing its own chairman. The city has six banks, and a Carnegie Library. Pop. (1903) 3,000.

FRED A. DODGE,
Editor 'The Hanford Sentinel.'

Hanfstängl, Franz, fränts hänf'stengl, German lithographer: b. Rain, Germany, 1804; d. 1877. He studied art at the Munich Academy, and in 1826 went to Dresden where he began his series of lithographic copies of pictures in the Dresden Gallery, which he completed in 1852. During the latter part of his life he devoted himself to photography and kindred processes.

Hang-Chow, häng'chow, China, the capital of the province of Che-kiang, on a plain at the southern terminus of the Imperial Canal, and within two miles of the head of the estuary of the Tsien-tang River, about 40 or 50 miles from its mouth, nearly 100 miles southwest of Shanghai. It is a strongly fortified city of oblong form, surrounded with high well-built walls about eight miles in circuit, enclosing many large vacant spaces. The streets are well paved and clean, and there are numerous triumphal arches, monuments to great men, and gorgeous Buddhist temples. The stores and warehouses are noted for their size and the quantity and quality of the goods displayed. More than 100,000 persons are employed in silk manufactures, and among other industries are the weaving of cotton, manufacture of tapestries, carving in ivory, the making of lacquered ware, fans and screens, etc. The houses generally are one story high. A large portion of the inhabitants reside in the suburbs, and in boats on the waters around them. The governor-general of Che-kiang and Fe-kien resides in this city, and also the governor of the province. With their courts and troops, in addition to the great trade passing through, and its activity as a centre of literary and ecclesiastical life, Hang-Chow is one of the most important and richest cities in China. The river, opposite the city, is about four miles broad at high-water, and is crowded with vessels of all descriptions, being the channel by which vast quantities of merchandise are received from and exported to the southern provinces. The extensive Lake of Si-hou, "West Lake," close by the city, is celebrated for its natural and artificial beauties. Chapu, the seaport of Hang-Chow, is 20 miles down the river. Hang-Chow is the celebrated "Kinsai" of Marco Polo — the capital, in his time, of Southern China. It was captured by the Taiping rebels in 1861, and deserted by all its rich or respectable inhabitants. A disciplined force of Chinese, under the command of French officers, united with the Imperialist troops, recaptured the city on 31 March 1864. By the Treaty of Shimonoseki (1895) it was opened to foreign trade, and a district platted for a foreign settlement. Pop. estimated at 700,000.

Hanging, a form of capital punishment inflicted under the common law; also a mode of death sometimes lawlessly visited upon a person, or occurring from accident, or by suicide. In cases of hanging, death seldom results from pure asphyxia, but is usually in some degree owing to apoplexy and injury to the spinal cord. In attempted suicide, bleeding from the jugular vein and artificial respiration may be tried for resuscitation. In difficulty of inducing artificial respiration, laryngotomy and tracheotomy should be performed, and the lungs inflated through the opening in the neck. In judicial hanging, the noose ought to be so adjusted as to produce immediate dislocation of the spinal column, death in that case being instantaneous. In New York State electrocution as capital punishment is substituted for death by hanging, and it has to some extent been tried in other States. (See ELECTRICITY, CAUSE OF DEATH BY.) In several American States infliction of the death penalty is forbidden by law. Hanging, drawing, and quartering were once the punishment of treason in England. See CAPITAL PUNISHMENT.

Hanging Rock, Battle of, fought 6 Aug. 1780. It occurred on Hanging Rock Creek, S. C., between Col. Sumter's Americans, some 800 in number, and about as many Loyalists commanded by Maj. Carden. After driving back the Loyalists, the Americans, becoming disorganized while plundering the enemy's camp, were in turn put to flight. The American loss is unknown; that of the Loyalists, in killed, wounded, and missing, is recorded as 209. Consult Lossing, 'Field-Book of the American Revolution.'

Hankow, hän-kow' ("Mouth of the Han"), China, a town and river-port in the province of Hu-peh, at the junction of the Han with the Yang-tse-kiang, 688 miles above the mouth of the Yang-tse, which is navigable for large vessels up to the town. On the opposite bank of the Han is Hanyang, on the other side of the Yang-tse is Wuchang, the three together forming one immense city. In addition there is a large floating population, the Han being densely crowded with junks for about half a mile above its mouth. In 1857 the city was almost totally destroyed by the Taipings. The port was opened to foreign trade by the Treaty of Tientsin, ratified in 1860; and soon became the chief emporium for the tea trade of the central provinces. A concession of about 90 acres of land apart from Chinese jurisdiction is laid out like an English town. The residents of the British concession are formed into a municipality, with a council empowered to levy taxes. There are also German, French, and Russian settlements. The foreign trade of this port is one of the most important in China. The imports are brought almost exclusively from Chinese ports (about one half from Shanghai), and consist partly of foreign produce, such as cottons, woollens, and opium; partly of native produce, such as tea, silk, cotton, etc. Pop. about 850,000.

Han'na, Marcus Alonzo, American politician: b. New Lisbon, O., 24 Sept. 1837; d. 15 Feb. 1904. In 1852 his family moved to Cleveland, where he was educated in the public schools and he also took a year's course of study in Western Reserve University. He left college to enter the grocery trade with his father, and later had entire control of the business. In 1867 he became a partner with his father-in-law in the firm of Rhodes & Co., engaged in handling coal and iron; he soon mastered the details of the business, greatly extended the work of his firm, and was the first to build steel steamships for the lake trade. In 1877 he became the controlling partner of the firm, the name of which was changed to M. A. Hanna & Co., and acquired large interests in lake navigation. He also was for a time manager of a theatre, and president of the Union National Bank of Cleveland, and of the Cleveland City Railway Co. In 1880 he organized a business men's political club, and from that time was active in politics. In 1884 he was sent as a delegate to the Republican National Convention, and in the next convention (1888) was John Sherman's political manager. He first gained a national reputation, when he obtained the nomination of McKinley for President at the Convention of 1896, and as chairman of the Republican national committee, conducted the Presidential campaign, which resulted in a large plurality for McKinley. In this campaign he adopted the methods which had made him successful in business, studying the situation and its needs, and carefully attending to details. In 1897 he was appointed United States Senator to succeed Sherman, who resigned before the completion of his term of six years. In 1898 he was elected to a full term, and in 1904 re-elected, but died before taking his seat. In 1900 he again conducted the Presidential campaign. As a large employer of labor, Senator Hanna had a number of questions to settle with his own employees, and as a rule won their respect and confidence by his fairness and willingness to listen to their claims. He was a firm believer in arbitration between labor and capital, and was active in the organization, in 1901, of the National Civic Federation, a non-partisan organization formed to consider such topics as trusts, tariffs, taxation, etc., becoming its president, and a member of a permanent committee appointed to consider and settle labor disputes.

Han'nay, James, Canadian historian and journalist: b. Richibucto, N. B., 22 April 1842. After many years of editorial work upon influential Canadian journals, he was chief editorial writer on the Brooklyn, N. Y., *Daily Eagle* (1885–7), and editor of the St. John, N. B., *Daily Gazette* (1888–92), and St. John *Daily Telegraph* (1892–1900). Since 1902 he has been official reporter of the New Brunswick Provincial Parliament. Besides reports of the New Brunswick Supreme Court, he has published 'Nine Years a Captive' (1875); 'History of Acadia' (1879); 'The History of the Loyalists' (1893); 'The Story of the Queen's Rangers in the American Revolution' (1883); 'Life and Times of Sir Leonard Tilley' (q.v.) (1897); 'The History of the War of 1812'; 'New Brunswick: its Resources and Advantages' (1902).

Han'nibal, Carthaginian soldier: b. 247 B.C.; d. probably 183 B.C. He was the son of Hamilcar Barca (q.v.) and at the age of nine his father made him swear at the altar eternal hatred to the Romans. He was a witness of his father's achievements in Spain; but Hamilcar having fallen in battle in Lusitania, in 228 B.C., and his son-in-law Hasdrubal having been appointed to succeed him, Hannibal returned home. At 22 he returned to the army at the request of Hasdrubal. The soldiers perceived in him the spirit of Hamilcar, and in three campaigns his talents and his courage were so conspicuous that the army, on the murder of Hasdrubal in 221, conferred on him the chief command by acclamation. In 219 B.C. he laid siege to Saguntum, a town which had concluded an alliance with Rome. In eight months Saguntum fell. The Romans, alarmed by this, sent ambassadors to Carthage to demand that Hannibal should be delivered up. The demand being refused, they declared war. Hannibal raised a powerful force, and conceived the design of attacking the Romans in Italy. After providing for the security of Africa, and having left his brother Hasdrubal with an army in Spain, he began his march with 90,000 foot-soldiers, forty elephants, and 12,000 horsemen, traversed Gaul in the depth of winter with incredible rapidity, and reached the foot of the Alps. In nine days he crossed these mountains, probably by the pass leading over the Little St. Bernard. The conquest of the Taurinians and the capture of their chief city encouraged the people of Cisalpine Gaul to join him. These auxiliaries would have been still more numerous had not Publius Scipio approached at the head of a Roman army, which had landed at Pisa. On the banks of the Ticinus the armies engaged, and a charge of the Numidian horse left Hannibal master of the field (218 B.C.) Scipio avoided a second battle, and retreated beyond the Trebia, leaving the strong town of Clastidium in the enemy's hands. Meanwhile Sempronius arrived with a second army, but Hannibal soon provoked his impetuous adversary to an engagement, disposed an ambuscade near the Trebia, and surrounded and destroyed the Roman forces. The Romans lost their camp and 26,000 men. Hannibal now retired to winter quarters among his allies in Cisalpine Gaul; and at the opening of the next campaign (217) found two new armies awaiting his approach in the passes of the Apennines. He determined to engage them separately, and destroy Flaminius before the arrival of his colleague. He deceived him, therefore, by feigned marches, crossed the Apennines, and traversed the Clusian marsh. He then employed every means to compel Flaminius to a battle. He wasted the whole country; feigned a march to Rome; but suddenly formed an ambush in a narrow pass surrounded by almost inaccessible rocks. Flaminius, who followed him, was immediately attacked. A bloody engagement took place near the Lake Trasimenus. Assailed on every side, the Roman legions were cut in pieces. Hannibal now armed his soldiers in the Roman manner, and marched into Apulia, spreading terror wherever he approached. Rome, in consternation, entrusted her safety to Fabius Maximus, the dictator, who determined to exhaust by delay the strength of the Carthaginians. He attacked Hannibal with his own weapons, and hung upon him everywhere without attempting to overtake him, convinced that the Carthaginians could not long hold a desolated territory. Hannibal marched into the plains of Capua, with the design of separating the terrified cities from their alliance with the Romans, and drawing down Fabius from the mountains. But suddenly he found himself in the same toils in which Flaminius had perished. Shut up between the rocks of Formiæ, the sands of Liternum, and impassable marshes, he was indebted for his safety to a stratagem. Having collected a thousand oxen, and fastened burning torches to their horns, he drove the animals at midnight into the defiles guarded by the Romans. Panic-struck at the terrible sight, the Romans abandoned the heights, and Hannibal forced his way through their ranks. Minutius Felix, master of the horse, was then made colleague of Fabius in the dictatorship. Eager for combat, he fell into an ambush at Geronium, and would have perished but for the aid of Fabius. After this campaign the other Roman generals seemed unwilling to trust anything to chance, and imitated the delay of Fabius. Hannibal saw his army slowly wasting away, when the new consul Terentius Varro, an inexperienced and presumptuous man, took the command of the legions. Hannibal had occupied Cannæ, and reduced the Romans to the necessity of risking an engagement (216), Æmilius Paulus, the colleague of Varro, wished to put off the battle, but Varro chose the day of his command, and directed the attack. The Roman army was destroyed, and Hannibal now marched to Capua, which immediately opened its gates. In 215 Hannibal sustained, at the hands of Marcellus, a repulse before Nola — the first check which he had received in the open field — but in 212 B.C. made an important acquisition in the capture of Tarentum. Capua, however, was invested by two consular armies, and was on the point of surrendering. Hannibal marched to Rome, and encamped in sight of the capitol, 211 B.C.; but the Romans were not thus to be discouraged; Capua fell. This success gave the Romans a decided superiority, and nearly all the people of Italy declared in their favor. Held in check by the consul, Claudius Nero, Hannibal could not effect a union with his brother Hasdrubal, who had set out from Spain with reinforcements, but after having passed the Apennines was attacked and defeated by Nero on the Metaurus in 207. Hasdrubal himself fell, and his bloody head was thrown into the camp of Hannibal. The latter then retired to Bruttium, where, surrounded with difficulties, he yet maintained the contest with inferior forces against victorious armies. But Scipio now carried the war into Africa, and Hannibal was recalled to defend his country. He reluctantly embarked his troops, and in 203 left the country which for 16 years he had held in spite of all the efforts of Rome. He landed at Leptis, gained over a part of the Numidians, and encamped at Adrumetum. Scipio took several cities, and reduced the inhabitants to slavery. Pressed by his countrymen to come to a decisive engagement, Hannibal met Scipio at Zama, and was defeated with 20,000 loss. Peace was concluded in 201 B.C. Hannibal, accused by his enemies of stirring up Antiochus the Great to war against the Romans, went to Ephesus, to the court of Antiochus. In the ensuing struggle with Rome, Antiochus was signally defeated, and obliged to conclude a peace, one of the terms of which was that Hannibal should be delivered up. Hannibal, again obliged to flee, went to the court of Prusias, king of Bithynia. Prusias, to whom the senate had sent ambassadors to demand the person of Hannibal, was on the point of complying with the requisition, when Hannibal prevented the disgrace by swallowing poison, which he always carried about in his ring.

Hannibal, Mo., city in Marion County, on the Mississippi River, and on the Missouri, K. & T., the Chicago, B. & Q., the Wabash, and the Saint Louis, K. & N. W. R.R.'s; about 90 miles northwest of St. Louis and 15 miles south of Quincy, Ill. Hannibal was settled in 1819 and incorporated in 1839. It is situated in an agricultural region. The chief manufactures are foundry and machine-shop products, flour, lumber, cigars, lime, cement, stoves, car-wheels, shoes, and furniture. It is an important trade centre, as it has the advantages of several railroads and steamboat connection with the cities and towns on the Mississippi. A steel bridge for railroad cars and wagons crosses the river from Hannibal to East Hannibal, Ill. The trade is principally in tobacco, lumber, flour, potatoes, ready-made clothing, dairy products, and the city manufactures. It has a free circulating library, public and parish high schools, the Douglas colored high school, and a number of fine public buildings. The city charter of 1845, revised in 1873, provides for the annual election, by the people, of a mayor and a certain number of the members of the school board. The officials of the administrative departments are under the control of the mayor. The electric-light plant is owned and controlled by the city. Pop. (1900) 12,780.

Hanno, hăn'ō, or **Anno,** German mediæval prelate: b. not earlier than 1000; d. Siegberg, near Bonn, 1075. The emperor, Henry III., made him his chancellor, and presented him to the archbishopric of Cologne, to which he was consecrated in 1056. After the death of Henry III., Hanno made himself master of the person of Henry III.'s young son Henry IV., and secured for himself the administration of the empire (1062). His energetic government and his holy life, his paternal care for his see, his zealous reformation of monasteries and foundation of churches, gained him the character of a saint. The hymn in his praise is by some thought to have been written soon after his death; by others about 1183. It is one of the most important monuments of the early German national literature. The best version of it is to be found in Müllenhoff and Scherer's 'Denkmäler deutscher Poesie und Prosa' (1864).

Hanotaux, Albert Auguste Gabriel, äl-bâr ō-güst gä-brē-ĕl ä-nō-tō, French politician: b. Beaurevoir, Aisne, 18 Nov. 1853. He chose for himself the profession of the law, took a scientific course in the Ecole des Chartes, and afterward became a teacher in the Ecole des Hautes Etudes. In 1879 he received an appointment in the French foreign office; in 1881 became a member of the cabinet, and was sent to Constantinople as ambassador in 1885. From 1886 to 1889 he was republican deputy; and in May 1894 received a portfolio in the second Dupuy cabinet. He has published: 'Les Villes Retrouvées' (1880); 'Origines de l'Institution des Intendants des Provinces' (1884); 'Henri Martin, Sa Vie, Ses Œuvres, Son Temps' (1885); 'Etudes Historiques sur le XVIe. et le XVIIe. Siècle en France' (1886); 'Histoire du Cardinal de Richelieu' (1893).

Han'over, Germany, the northwesternmost province of Prussia, prior to 1866 an independent kingdom. It borders on the North Sea, and has an area of 14,870 square miles. In the south the Harz mountains attain an altitude of over 3,000 feet; the rest of the country is an alluvial plain with a gentle slope to the sea. The Elbe on the northeast boundary, the Ems, and the Weser, with its tributaries, the Leine and Aller, are the principal rivers. Coal and lignite, rock salt, iron, copper, zinc, silver, and gold, are found in the mountainous districts, and there are large peat beds in the north. Over one fourth of the area is arable land, producing large quantities of grain and flax. The keeping of bees is generally practised on the moors, and a breed of superior cattle is raised along the marshy coast land. Forests of hardwood and pine, extensively used in smelting, occupy one sixth of the surface. The manufactures are extensive, and include iron goods, machinery, woolens, linens, cottons, leather, paper, beet-root sugar, beer, spirits, and numerous domestic commodities. Hanover has over 1,500 miles of railroads, numerous canals, and an extensive traffic is carried on at its several ports, among which are Geestemünde, Emden, and Harburg, although practically its chief port is the free city and port of Bremen (q.v.). The capital is Hanover (q.v.). For administrative purposes, the province is divided into the six districts of Hanover, Hildesheim, Lüneburg, Stade, Osnabrück and Aurich. The highest court is in Celle. The province sends 36 members to the Prussian Chamber of Deputies, 10 to the Upper House, and 19 to the German Reichstag. Education is compulsory and free: chief of the higher institutions of learning is Göttingen University. The majority of the inhabitants are Lutheran Protestants. Roman Catholics inhabiting Hildesheim and Osnabrück constitute about one seventh of the population. Hanover was long connected with the Brunswick family, a scion of which, Ernest Augustus, in 1692, became the first Elector of Hanover. He married the daughter of the Elector Palatine, granddaughter of James I., and niece of Charles I. of England. He was succeeded in 1698 by his son George Louis, who in accordance with the Act of Settlement (q.v.), became George I., king of England, at the death of Queen Anne in 1714. The connection with England continued during four reigns, and in 1814 the Congress of Vienna raised Hanover to the rank of a kingdom, George IV. and William IV. thus being kings of Great Britain and of Hanover. On the accession of Queen Victoria, however, by the Salic law, the Hanoverian crown passed to the nearest male heir, Ernest Augustus, Duke of Cumberland, and at his death in 1851 to his son George V. In 1866 Hanover sided with Austria in the Austro-Prussian contest; the capital was occupied by Prussian troops; the king lost his throne, his estates were sequestrated, and Hanover was annexed to the Prussian dominions. Pop (1900) 2,590,336.

Hanover, Mass. (1) Village in the town of Hanover in Plymouth County; on a branch of the New York, N. H. & H. railroad; about

10 miles east by north from Brockton and 25 miles southeast of Boston. It is the seat of Hanover Academy. It is situated in an agricultural region, and the chief industries are connected with agricultural products. Its chief manufactures are tacks and nails. (2) The town of Hanover contains several villages, and the chief manufactures are shoes, nails, tacks, and dairy products. Pop. of the village is about 420; of the town 2,200.

Hanover, N. H., town in Grafton County; on the Connecticut River, and on the Boston & M. railroad, about 72 miles northwest of Concord. It is situated in an agricultural region and its industries are connected chiefly with farm products and lumbering. It is a summer resort, but is known principally as a college town, being the seat of Dartmouth College (q.v.). It contains also the Mary Hitchcock Memorial Hospital. Pop. (1900) 1,884.

Hanover, Pa., borough in York County; on the Western Maryland and the Pennsylvania R.R.'s; about 32 miles south of Harrisburg. It was settled about 1729 and incorporated in 1813. It is in a rich agricultural section of the State, and nearby are iron-ore mines. The chief manufactures are shoes, machine-shop products, cigars, carriages and wagons, gloves, and leather. Hanover is the commercial centre of a considerable part of York County; the trade is largely in agricultural and dairy products, the manufactures of the borough, and in live stock. The government is vested in a burgess and borough council. Pop. (1890) 3,746; (1900) 5,302.

Hanover, Prussia, the capital of a province, and formerly of the kingdom of Hanover, in an extensive plain northeast of and dominated by Mount Linden, at the confluence of the Ihme with the Leine, 44 miles by rail west by north of Brunswick. It consists of an old town, intersected by the Leine, and of various modern suburbs. The old town is unattractive, but the new quarters are regular and well built. The principal features are the Markt church, of antique appearance; the Kreuz church; Schloss church, a handsome structure, with an altar-piece by Cranach, and some curious relics collected by Henry the Lion; several handsome modern churches; the palace (1636–40, rebuilt since 1817), now a royal Prussian residence; the former palace of King Ernest Augustus (in government occupancy); the royal library; the museum of art and science; the restored town-house (1439–55); the new town-house (formerly palace of George V.); the Kestner museum of antiquities; the provincial assembly house; the Franco-German war monument; the Waterloo monument; various schools, among which is the technical high-school, a remodeled building of great extent, formerly the Welfenschloss (palace of the Guelfs), and the Schloss-Herrenhausen, formerly a royal residence. Trade and industries are important, the latter including railway works, machinery, iron castings, cotton, linen, tobacco, lacquered wares, lamps, glass, chemicals, etc.; breweries and distilleries. The city has electric street railroads.

Hanover is first mentioned in 1163. It joined the Hanseatic League in 1481, and received the Reformation in 1533. It became the residence of the Dukes of Brunswick-Lüneburg, and the capital of the principality in 1636. In 1866 the kingdom was absorbed by Prussia, and since 1890 the city has held the position of a royal residence and capital. Sir William Herschel, the two Schlegels, and Iffland were born here. Pop. (1900) 235,649, with suburbs, 302,054.

Hanover, Pa., Cavalry Action at. During the Gettysburg campaign Gen. Stuart, commanding the Confederate cavalry, was ordered by Gen. Lee to observe the movements of the Army of the Potomac and harass its rear should it attempt to follow the Confederate army and pass into Maryland. Leaving two brigades south of the Potomac, to guard the passes of the Blue Ridge, Stuart, with the rest of his command, crossed the Potomac at Seneca Creek, 20 miles north of Washington, on the night of 27 June 1863 and, learning that Hooker had crossed the river, marched north by way of Rockville, captured a train of 125 wagons and 400 prisoners between Rockville and Washington, struck the Baltimore & Ohio Railroad at Sykesville and Hood's Mills, and, ascertaining that the Union army was marching from Frederick northward, endeavored to get ahead of it, reaching Westminster at 5 P.M. of the 29th, where he struck a squadron of the First Delaware cavalry, which offered a stubborn resistance, but was finally dispersed, and Stuart, continuing his march, bivouacked at Union Mills, about midway between Westminster and Littlestown. Hearing that Union cavalry was at Littlestown, and that Early was on the Susquehanna, he marched by crossroads for Hanover, on the morning of the 30th and, at 10 o'clock, his head of column reached that place, 16 miles east of Gettysburg, and attacked the rear and flank of Kilpatrick's cavalry division, as it was passing through the town from Frederick and Littlestown, in advance of Meade's central column. His first attack threw the rear of Farnsworth's brigade into confusion, but Farnsworth rallied his men, Custer's brigade was recalled and thrown into action and, after two hours' fighting in and around the town, Stuart was driven back on the Littlestown road, having lost nearly 100 men. Kilpatrick reports his own loss as 59 killed and wounded, and 123 missing.

Stuart was now in a perilous position; he had thrust himself unwittingly between Kilpatrick's cavalry and Meade's main body; Gregg's cavalry division was moving north or his right, but he extricated himself by marching all night over a circuitous route through Jefferson to join Early at York. The latter, however, was on his way to Gettysburg, and Stuart passed almost within sight of him, without knowing it. Finding that Early was not at York, Stuart continued his march to Carlisle, hoping to find Lee's main body there, but found the place occupied by Union troops, and heard that Lee was concentrating at Gettysburg, where by marching night and day, he joined him in the afternoon of 2 July. See GETTYSBURG, CAMPAIGN AND BATTLE OF. E. A. CARMAN.

Hanover College, at Hanover, Ind.; founded in 1828, under the auspices of the Presbyterian Church, as Hanover Academy. It was chartered as a college in 1833. Women have been admitted since 1880. The regular departments are letters, arts, science, law, philosophy, and divinity; also a course for teachers. No charges are made for tuition. In 1903 the college reported 14 instructors, 160 students, and about 17,000 volumes in the library. The endowment fund is over $200,000, and the annual income is about $15,000.

Hanover Court House, Engagement Near. On 21 May 1862 Gen. McClellan had marched the Army of the Potomac up the York peninsula to the banks of the Chickahominy, 7 to 12 miles distant from Richmond. On the 26th he heard that R. H. Anderson's Confederate brigade and Stuart's cavalry were near Fredericksburg, and that another body, Branch's brigade, was in the vicinity of Hanover Court House, 17 miles north of Richmond, to his right and rear. These bodies threatened his communications, and were in position to reinforce Jackson, in the Shenandoah valley, or to oppose McDowell, whose advance was then eight miles south of Fredericksburg. Gen. Fitz-John Porter was ordered to clear the enemy from these positions and destroy the bridges over the South Anna and Pamunkey rivers. Warren's small brigade had been already detailed to destroy the bridges, had destroyed all means of communication over the Pamunkey as far as Hanover Court House, and was then posted at Old Church. On the morning of the 27th Warren moved toward the court house, on a road running parallel to the Pamunkey. Porter left New Bridge at 7 A.M. with Morell's division and Emory's cavalry brigade and, marching by way of Mechanicsville northward toward the court-house, about noon his cavalry and the Twenty-fifth New York infantry, encountered a portion of Branch's brigade, supporting two pieces of artillery, attempting to hold the road leading to the court-house. A Union battery was brought up and Butterfield's brigade deployed, which charged and drove the Confederates from the field, capturing one gun. A part of the Twenty-fifth New York was captured by the Confederates. Supposing that the Confederates had all retreated in the direction of Hanover Court House, Porter pursued, the cavalry, under Emory, and the Seventeenth New York, overtaking and capturing a large number of the Twenty-eighth North Carolina. Upon nearing the junction of the Ashland and the Court House roads, a part of Martindale's brigade was sent toward Ashland to guard that flank against an approach from Richmond and to destroy the railroad running to that city. Near Peake's station Martindale ran into Branch's brigade, was immediately attacked, and was driven back some distance. When Porter, whose advance had reached Hanover Court House, heard that Martindale had been attacked, he faced about his entire column, reached Martindale, struck Branch on his left and rear, and routed him. Branch retreated to Ashland and formed a junction with Anderson's brigade, which had fallen back from McDowell's front. After destroying the railroad in several places and opening the way for McDowell's advance from Fredericksburg, Porter returned to his old camps on the night of the 29th. The Union loss in the engagement of the 27th, was 62 killed, 223 wounded, and 70 missing. The Confederate loss was 73 killed, 102 wounded, and 730 prisoners, of whom about 150 were also wounded. Consult: 'Official Records,' Vol XI.; Webb, 'The Peninsula'; 'McClellan's Own Story'; Allan, 'The Army of Northern Virginia'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.

E. A. CARMAN.

Hanover, Treaty of, an alliance between England, France, and Prussia, made in September 1725, for the purpose of mutual assistance, in opposition to that between Austria and Spain.

Hansa, or **Hanse.** See HANSEATIC LEAGUE.

Hanseatic (hăn-sē-at'ĭk) **League, Hansa,** or **Hanse,** a confederacy of certain cities of northern Germany for mutual protection, especially in matters of commerce; for the extension of trade, and of rights and immunities received from sovereigns, and which had suffered curtailment. The union was formed in the 13th century, at a time when sea and land swarmed with pirates and robbers, and German trade, no longer guarded by the privileges of armed attendants, was exposed to many dangers, while government had degenerated into a power for extorting taxes without giving protection.

The first alliances known to have been concluded are those between Hamburg and Lübeck (1241 and 1255) to keep open the road across Holstein connecting the North Sea with the Baltic, and between Lübeck, Rostock, and Weimar in 1259 for defending themselves against the pirates. About the same time a similar league was concluded between the Westphalian towns, Münster, Dortmund, Soest, and Lippstadt. When a wider union came to be formed for like purposes, the name of *Hansa*, signifying a league, which was at first applied to any such confederacy, survived exclusively as the name of that influential league. During its most flourishing period it embraced 90 towns, scattered over the whole length and breadth of Germany, including Holland. Its organization was very loose, the towns of which it was made up being at first divided into three and, after the 16th century, into four provinces, each with a chief town. These divisions had, however, little more than a geographical significance. The town of Lübeck, which already held an important rank, from the fact that it was the highest court of appeal for all those towns which were governed by the Lübeck law, was recognized as the chief town of the league. Here assembled the deputies of the other Hanse towns to deliberate on the affairs of the confederacy; the decrees of the diet had no effect unless they received the sanction of the separate towns.

In the 14th century the league everywhere attained a high political importance, and gave rise to the development of that commercial policy which has since become intimately connected with all political relations, but of which the sovereigns of that time had little idea. Kings and princes were, in reality, more dependent on the league than it was on them. The extensive carrying trade of the Hanseatic League was a great source of wealth and at length there was no mart in Europe which was not gradually drawn within the circle of its influence. England, Denmark, and Flanders concluded treaties with the league for the extension of their commerce. It undertook to provide for the security of commerce on the Baltic and North seas. In the country under its immediate influence it constructed canals, and introduced a uniform system of weights and measures.

But the prosperity of the Hanse towns was naturally dependent on the continuance of the circumstances which gave rise to it, and when circumstances changed, the league was destined to decline. When the routes by land and sea were no longer insecure; when princes learned the advantages of trade to their own states, and turned their attention to the formation of a naval force of their own, and the encouragement of navigation; when the inland members of the confederation perceived that the great seaport towns had a separate interest of their own, and used them principally to promote their own ends; then the dissolution of the Hanseatic League was evidently approaching. There remained at last as active members of it only Hamburg, Lüneburg, Lübeck, and the towns in the neighborhood (Wismar, Rostock, Greifswald, Stralsund, whose interests were identified with those of Lübeck. The league existed no longer as a political power, but merely as a loose association of towns for commercial purposes.

In England, during the reign of Queen Elizabeth, the league lost its privileges by its refusal to grant complete reciprocity. About 1614 there remained only 14 towns which contributed to the support of the league, and had a voice in the management of its affairs. These were: Lübeck, Wismar, Rostock, Stralsund, Greifswald, Stettin, Danzig, Magdeburg, Brunswick, Hildesheim, Lüneburg, Hamburg, Bremen, and Cologne. The Thirty Years' war, which destroyed the prosperity of the German towns generally, gave the death-blow to the league. At the diet of 1629 it was entrusted to the cities of Lübeck, Bremen, and Hamburg to consult for its general interests, and in 1630 these towns concluded among themselves a closer union, which was renewed in 1641. After the Peace of Westphalia (1648) repeated but vain attempts were made to bring the league together again, and a last diet was held in 1669. Hamburg, Lübeck, and Bremen still retain their independence, and now form separate constituents of the German empire.

Hansen, hän'sĕn, **Gerhard Henrik Armauer,** Norwegian physician: b. Bergen, Norway, 1841. He was educated during boyhood in the cathedral schools of his native city, afterward entered upon the study of medicine, and was eventually appointed resident physician in the Rigs Hospital of Christiania. He was afterward government medical officer for the Lofoten fisheries, but did not reach the field of his fame until he was appointed in 1868 to the post of assistant physician at the Bergen Leper Hospital. From this time forth he devoted himself to the study of leprosy, and following the lines laid down by Virchow, traveled from one to another university of Europe, continuing his investigations. On his return to Norway the Medical Society of Christiania voted a sum of money to pay the expenses of his further researches. He at last was enabled to demonstrate the fact that leprosy was contagious. Continuing his investigations he discovered at last the leprosy bacillus in unstained preparations. Later it was stained and became known as Hansen's bacillus (1873). He was not successful in employing the bacillus for purposes of inoculation with a preventive object; but on the basis of his contagion theory, legislation has been enabled to check to a considerable extent the spread of the disease.

Hansom, or Hansom Cab. See CARRIAGE.

Han'son, Alexander Coutee, American journalist and politician: b. Maryland 1786; d. 1819. After being graduated at St. John's College, Annapolis, he adopted journalism as a profession, and in 1812 his office was wrecked by a mob on account of an article attacking the Madison Administration which appeared in the 'Federal Republican,' of which he was editor. He was elected to the lower house of Congress in 1813, and from 1817 until his death had a seat in the Senate.

Hanus, Paul Henry, American educator: b. Hermsdorf-unter-dem-Kynast, Prussia, 14 March 1855. He came to the United States in childhood, was educated at the University of Michigan and has been professor of the history and art of teaching at Harvard from 1891. He has published 'Elements of Determinants' (1886); 'Geometry in the Public School' (1893); 'Contemporary Educational Problems' (1899).

Hap'good, Isabella Florence, American author and translator: b. Boston, Mass., 21 Nov. 1851. She has written 'The Epic Songs of Russia'; 'Russian Rambles,' etc., and is widely known by her translations from the Russian of Tolstoy, Gogol, etc., and she has also made important translations from the French and Spanish.

Hapgood, Norman, American journalist: b. Chicago 28 March 1868. He was graduated from Harvard in 1890, and the Harvard Law School in 1893, and has since become well known as a keen, discriminating essayist and dramatic critic. He has published 'Literary Statesmen and Others' (1897); 'Daniel Webster' (1899); 'Abraham Lincoln' (1899); 'The Stage in America' (1901).

Hapsburg, hăps'bėrg (Ger. häps'boorg) (properly HABSBURG), the imperial house of Austria-Hungary, so named from the ancestral castle, in the canton of Aargau, Switzerland, on the right bank of the Aar. The castle was built in the 11th century by Bishop Werner, a descendant of Ethico I., a count of Alemannia, in the 7th century. It stands on the Wüpelsberg, a steep rocky situation, whence the name *Habichtsburg* (Hawk's Castle). The proprietors of Hapsburg became at a later period counts of Hapsburg and gradually extended their territories. Werner II., who died in 1096, is said to have been the first to assume the title. After the death, about 1232, of Rudolph II., the fourth in succession from Werner II., the family divided into two branches, the founder of one of which was Albert IV., and that of the other Rudolph III. The latter is known as the Hapsburg-Lauffenburg line, which became extinct in the direct male line in 1408. A younger son of Rudolph, called Eberhard, founded the Kyburg branch of the Hapsburg-Lauffenburg line, which did not become extinct till 1415, and Godfrey, a grandson of Rudolph, who settled in England in the 13th century, there became the founder of the Fielding family, to which the Earls of Denbigh belong, and of which the novelist Fielding was a member. The line descended from Albert IV. is that to which the historical celebrity of the house is almost entirely due. In 1273 Rudolph, the son of Albert IV., was chosen emperor of Germany or Holy Roman Emperor. He is the founder of the reigning house of Austria, which is of the line of Hapsburg-Lorraine. From Rudolph to Charles VI. the Austrian monarchs were of the Hapsburg male line. Maria Theresa, who succeeded Charles VI., married Francis Stephen of Lorraine, who in 1745 was chosen Emperor of Germany. Francis II., the third emperor of Germany of the line of Hapsburg-Lorraine, was the last who bore that title till the establishment of the new empire, the last of the so-called "Holy Roman Emperors." He changed it in 1806 for that of Emperor of Austria, and the present imperial house of Austria continues to represent that line. From the Emperor Rudolph was also descended a Spanish dynasty which began with the Emperor Charles V. (Charles I. of Spain), and terminated with Charles II. in 1700.

Haraforas, or **Alfures**, names applied in Celebes, the Moluccas, Mindinao, and the adjacent islands to certain native tribes, particularly of the interior, which differ from the Malays, and have been thought to be perhaps pre-Malayan aborigines.

Hara-kiri, hăr'a-kĭr'ē, or **Seppuku**, a mode of inflicting death upon themselves allowed in Japan to criminals of the Samurai or two-sworded class as more honorable than public execution. It consists in cutting open the body so as to disembowel it, by means of a wound made with one sword perpendicularly down the front and another with the other sword horizontally. Till recent times Japanese of the two-sworded class who had been guilty of any crime frequently resorted to this mode of killing themselves before their guilt had been proved, and it was regarded as honorable in them to do so, indicating a strong sense of shame. Sometimes they were commanded to put themselves to death in this manner. Consult: Mitford, 'Tales of Old Japan' (3d ed. 1876); and Chamberlain, 'Things Japanese' (1891).

Harald. See HAROLD.

Haran (Assyrian *Kharranu*, road), the name of a district of northern Mesopotamia and of a town situated therein, on the stream called Jullab, southeast of Edessa. The name is probably derived from the fact that at this town the trade-routes from Media, Assyria, and Babylonia met to proceed along the same highway to the coast of Cilicia. Haran is mentioned in the Old Testament in Gen. xi. 31–32, and Ezekiel xxvii. 23. To the Assyrians it was a strategic post of great importance. In the inscriptions references to it appear as early as the reign of Tiglath-pileser I. (about 1100 B.C.). An extensive commerce centred here. To the Greeks and Romans it was known as Carræ (Gk. κάρραι or Χάρα). Crassus, the Roman commander, was here defeated and slain by the Parthians during his eastern expedition (53 B.C.), and Caracalla assassinated by the soldiery of Macrinus (217 A.D.). It was of importance even in the time of Arab supremacy, but the geographer and historian Abulfeda (d. 1331) speaks of it as in ruins in his day. It was the seat of an episcopal see in the 4th century. Consult Metz, 'Geschichte der Stadt Harran' (1892).

Harar, or **Adari**, a Semitic dialect spoken in the Abyssinian province of Harar (q.v.). It includes some Hamitic words. For an account of it, consult an article by Pratorius in the 'Zeitschrift der Deutschen Morgenländischen Gesellschaft,' Vol. XXIII. (1869).

Harar, **Harrar**, or **Adari**, capital of the province of Harrar in eastern Abyssinia, south of the Gulf of Aden, about 180 miles from the coast. It is situated at an elevation of 5,500 feet above the level of the sea. The surrounding district is very fertile and produces chiefly coffee. Cotton is also a large crop, and excellent in quality. There is a brisk trade in gums, ivory, and fruits. Harar was formerly the capital of a small, independent country, ruled by an emir. In 1876 it became a dependency of Egypt, and later was under Italian protectorate. After the Italian defeat at Adowa in 1896, it passed with the province to Abyssinia. Its first European visitor was Sir Richard F. Burton, who obtained admission there as an Arab in 1855, and described it in his 'First Footsteps in East Africa, or An Exploration of Harar' (1856). Pop. (1900) 40,000. Consult further the 'Bulletin de l'Etat Major-Général de l'Armeé Egyptienne' (1876), and Paulitschke, 'Harar, Forschungsreise nach den Somal- und Galläländern' (1888).

Harar, **Harrari**, or **Harrur**, the most easterly of the Abyssinian provinces; bounded on the east and north by British and French Somaliland, and on the south and southeast by British East Africa and Italian Somaliland. The country is a table-land, with a maximum elevation of nearly 11,000 feet. Previous to the insurrection of the Mad Mullah (q.v.) it was a part of the Egyptian Sudan. It was captured by Italy in 1891, but after the severe defeat of the Italian forces by the Abyssinians at Adowa 1 March 1896 it passed to Abyssinia. The foreign trade of Abyssinia is conducted largely through Harar.

Haraucourt, **Edmond**, French poet and novelist: b. Bourmont (Haute-Marne) 1857. His first work appeared in 1883 and was entitled 'La légende des sexes, poëms hystériques.' A collection of his verses was published in 1891. He also published 'Amis' (1887); 'Shylock' (1889); 'Don Juan' (1894); 'Elizabeth' (1894). He was awarded the Academy prize for his poem 'Les Vikings' (1890).

Harbaugh, **Henry**, American clergyman of the German Reformed Church in America: b. near Waynesborough, Pa., 24 Oct. 1817; d. Mercersburg, Pa., 28 Dec. 1867. He studied at Franklin and Marshall College (Mercersburg) and at the Mercersburg Seminary, was ordained in 1843, and in 1843–64 held pastorates successively at Lewisburg, Lancaster, and Lebanon, Pa. In 1864 he was appointed professor of theology in the Mercersburg Seminary. He was one of the leading exponents of the "Mercersburg theology" (q.v.), and belonged to the high-church school of his denomination. From 1850 to 1866 he was editor of the 'Guardian,' and in 1866–7 of the Mercersburg 'Review.' Besides a collection of poems in the "Pennsylvania Dutch" dialect, he published: 'Heaven' (1843–53); a 'Life of Michael Schlatter' (1857); 'Christological Theology' (1864), and other works.

Harben, William Nathaniel, American novelist: b. Dalton, Ga., 5 July 1858. He has contributed many short stories to magazines, and his published novels include: 'White Marie' (1891); 'Almost Persuaded' (1890); 'A Mute Confessor' (1891); 'The Land of the Changing Sun' (1894); 'From Clue to Climax' (1896); 'The Caruthers Affair' (1898); 'The North Walk Mystery' (1899); 'The Woman Who Trusted' (1901); 'Westerfelt' (1901); 'Abner Daniel' (1902); 'The Substitute' (1903). He is also the author of 'Northern Georgia Sketches' (1900).

Harbin, Manchuria, a city on the Sungari River at the point where the Manchurian branch of the Trans-Siberian railway crosses that stream. The Chinese eastern branch of the railway, running to Dalny (Talienwan) (q.v.) and Port Arthur (q.v.) begins here. Prior to the Russian occupation in 1900 (see MANCHURIA), Harbin was a small Chinese village. On account of its geographical and strategical position it was chosen as a military centre, and very quickly it became also headquarters for railway and governmental affairs. Commerce and manufacture have also greatly developed, although not originally considered in the promotion of Harbin; and here more than elsewhere Russia gradually asserted its intention of becoming an active industrial force in the Orient. Every system of protection that could be devised has been employed by the government to advance its commercial prestige. Harbin consists of the old town, three miles distant from the central dépôt; Prestin, the river town, the present commercial portion; and the administration town, about the railway. Only Russians and Chinese are allowed to hold land, construct buildings, or enter any permanent enterprise. The territory for many miles surrounding has been secured so as to make it impossible for any foreign interest or influence to obtain a foothold or profit near to the city. The principal railway engineer is the chief administrative official. A census of 1903 showed a population of 60,000 exclusive of soldiery; of these all but 700 were Russians.

Harbor, a recess or inlet of the sea, a lake, or other large body of water, either landlocked or protected from winds and waves by artificial means, so as to be a secure haven for vessels in all weathers. In selecting or constructing a harbor regard is also had to convenience in loading and unloading vessels. The two chief classes are harbors of refuge and commercial harbors. Often the latter are merely tidal, only to be entered by vessels as the tide serves, and where with the tide they rise and fall. Harbors of refuge or shelter are accessible in all conditions of tide. Sometimes there is a combination of the harbor or haven with a capacious protected roadstead outside of it, as at Cherbourg, France, and other places.

Construction.—In the construction of harbors the great desiderata are sufficient depth of water and perfect security for the vessels likely to frequent them, together with the greatest possible facilities for ingress during any weather, while the chief obstacles to be surmounted are the action of the waves upon the protecting piers and breakwaters, and the formation of sand-banks and bars, which diminish the depth of water at the entrance and also within. All good harbors should possess the following characteristics: A deep, broad entrance-channel, which can be kept by ships of all kinds in all sorts of weather; an ample anchorage, free from rocks and shoals, with good holding-ground, and protected from winds and waves. Commercial harbors should also be supplied with adequate constructions and appliances for loading and discharging vessels.

Ground-plan.—In designing the ground plan of harbors, some rules should be kept in view: (1) the entrance should always be kept seawards of the works of masonry, care being taken that the direction of the piers does not throw the sea across the entrance; (2) there should be a good "loose," or point of departure free of rocks or a lee shore; (3) spending-beaches inside should be provided to allow the waves that pass in to break and spend themselves (a harbor-basin surrounded with vertical quay-walls becomes a "boiling pot"), but this is a point frequently overlooked by engineers; (4) the relation of the width of entrance to the area of a harbor should be a matter of careful study, as upon this depends the tranquillity of the interior.

Anchorage.— The anchorage of a harbor should be large enough to afford shelter to the maximum number of vessels seeking it. The space required by a vessel at anchor is, roughly, a circle whose radius is six times the depth of water plus the vessel's length. First-class harbors should have a depth of at least 40 feet, to admit and give secure anchorage to the largest ships now existing. An available depth of 25 feet is sufficient for ordinary transatlantic freight and passenger steamers. Coasting vessels rarely have a draft of more than 20 feet.

Natural Harbors.—Some of the best known natural harbors are those of Queenstown, Ireland; Rio de Janeiro, Brazil; Portland, Me.; Boston, Mass.; Narragansett Bay, R. I.; New York, N. Y.; Old Point Comfort (Norfolk), Va.; Port Royal, S. C.; Havana, Cuba; San Francisco, Cal.; Puget Sound, Wash.; King George's Sound, and Princess Royal Harbor, in southwestern Australia.

Artificial Harbors.—These are as old as naval warfare, and may almost be said to date from the birth of commerce. The Phœnicians protected their little strip of the Levant coast. Tyre and Sidon were well provided with harbors, having effectual breakwaters, mainly built of loose rubble. Carthage, Greece, and Rome, each in its own way, utilized their harbors for commercial and warlike purposes. That of Carthage was artificial, those of Greece but slightly so, nature having provided so many navigable inlets that little remained to be done by man. The great harbors of Rome, constructed in the solid and workmanlike manner of her practical race, may still be studied with profit, for the coasts of Italy yet show how well the Romans understood both the principles and the practice of this branch of marine engineering. One of their finest and most complete constructions of this nature was the port of Ostia, at the mouth of the Tiber, now more than two miles inland. The Romans were distinguished in harbor-making by the open or arched mole or enclosing work, which gave full play to the currents, preventing the deposit of sand or mud. 'The foundations of Nero's port," says Addison, 'are still to be seen. It was altogether artificial, and composed of huge moles running round it, in a kind of circular figure, except where the ships were to enter." Harbor-making came to an end with the decay of commerce and civilization consequent upon the fall of the empire, to be revived by the Italian republics of the Middle Ages. The rich traffic of Venice and Genoa soon led to the construction of suitable ports at those places, and the moles of the latter city and the works in the lagoons of Venice remain to this day. France was next in the field, embanking, protecting, and deepening the mouths of the rivers along her northwestern shores, as at Havre, Dieppe, Dunkirk, etc. In 1627, during the siege of Rochelle, Metezeau constructed jetties of loose rubble-stone, to prevent access to the city.

British Harbors.— Great Britain, whose ocean commerce is of comparatively recent date, lagged far behind her Continental rivals. With few exceptions her ports were absolutely unprotected, or rather uncreated; and this state of things continued until late in the 18th century. Two of the few exceptions were Hartlepool, where a harbor was formed about 1250, and Arbroath in 1394; in the 17th century at Whitby and Scarborough rough piers were thrown out, protecting the mouth of the port; at Yarmouth a north jetty, and subsequently a south one, were formed; an ancient mole existed at Lyme Regis; but the chief efforts of the early English engineers were directed against the shoals and waves of Dover. When, however, John Smeaton (q.v.) rose to vindicate the engineering talent of England, things took a different turn, and now few countries surpass Great Britain in the number of artificially improved commercial harbors. In Great Britain the construction and regulation of harbors is primarily under authority of the crown, but Parliament now usually names commissioners and boards with powers of ownership or management specially conferred by that body. All individual owners are required to manage harbors subject to the rights of public use, while final government control of them is practically absolute.

Harbors in the United States.— In this country all harbor-making in a public sense has been done since the beginning of the 19th century. The date of its first undertaking is 1802, when the project of building public piers in Philadelphia received government aid by an appropriation of $30,000. Twenty years later, for a harbor of refuge in Delaware Bay, $22,700 was appropriated; and in 1826 appropriations aggregating about $150,000 were made for river and harbor improvements at many places. From this time river and harbor bills have steadily increased the Congressional appropriations, which now amount in the aggregate to hundreds of millions.

Federal control over the ports of the United States, including all the important harbors, is exercised under the constitutional power of the government to regulate commerce; but in most of the details of harbor management — such as ownership and use of wharves, docks, warehouses, and the provision and disposal of facilities generally — management is left to the States. Pilot laws, the appointment of harbor-commissioners, harbor-masters, etc., and all other harbor regulations are made and enforced by the States, subject in certain things — as, for example, quarantine rules — to the jurisdiction of the Federal government. Consult: Rennie, 'Harbors'; Stevenson, 'Design and Construction of Harbors'; Moore, 'History of the Foreshore and the Law Relating Thereto'; Harcourt, 'Harbors and Docks'; Birdseye, 'Laws of the State of New York' (Navigation Law and New York Harbor); United States Revised Statutes, Secs. 5244–5255. See BREAKWATER; DOCKS AND DOCK YARDS; JETTIES; LIGHTHOUSES.

Harbor Grace, Newfoundland, a port of entry on Conception Bay, 27 miles west by north of St. John's, 84 miles by rail. It has a large but exposed harbor, with an inner secure port, a patent slip, and a lighthouse with a revolving light. It is the see of a Roman Catholic diocese with a handsome cathedral and convent. Its commerce is second to that of St. John's. Pop. (1901) 5,184.

Harbor Seal, or Hair-seal, the common small seal (*Phoca vitulina*), once common on both sides of the North Atlantic, down to Virginia in the United States, but now only occasionally seen south of Cape Cod. See SEAL.

Harbor Springs, Mich., village, county-seat of Emmet County; on Little Traverse Bay, an arm of Lake Michigan, and on the Grand Rapids & I. R.R. The landlocked harbor is much used by lumber vessels. The village is in a part of the State where the large forests make lumbering the chief industry. The chief manufactures are flour and lumber. The cool climate in summer makes Harbor Springs a favorite resort during July and August. Pop. (1900) 1,643.

Harby, Isaac, American dramatist and journalist: b. Charleston, S. C., 1788; d. New York 14 Nov. 1828. In 1822 he conducted the Charleston *City Gazette* and later the *Mercury*. His plays were 'The Gordian Knot'; 'Alexander Severus'; and 'Alberti.' He was vice-president of the Hebrew Orphan Asylum of Charleston and leader of the reformed movement among the Jews of that city — the first of its kind in the United States. In 1828 he removed to New York and engaged in journalism, until his death the same year.

Harby, Levi Charles, American naval officer: b. Georgetown, S. C., 21 Sept. 1793; d. Galveston, Tex., 3 Dec. 1870. While a midshipman in the United States navy in 1812, he was taken prisoner and confined in Dartmoor Prison, England, until the end of the war. He served under Gen. Jackson in the Creek war, and participated in the Texas struggle for independence and the conflict with Mexico. Subsequently he fought in South America under Bolivar. On the secession of South Carolina, he resigned his commission in the United States service and joined the Confederate forces as commander of the fleet at Sabine Pass.

Harcourt, här'koort, SIR **William George Granville Venables Vernon,** English statesman: b. 14 Oct. 1827; d. Malwood, Hampshire, 1 Oct. 1904. He began his education in a private school at Salisbury, and then studied at Trinity College, Cambridge, whence he was graduated with high honors in 1851, receiving the degree of M.A. He then studied law, being called to the bar in 1854, and in 1866 he became queen's counsel. In 1858 he made an attempt to enter Parliament as an Independent Liberal, but was defeated. During these years he wrote largely for the 'Saturday Review' and other journals, and in 1860 attracted considerable attention by a series of letters on international law and kindred subjects contributed to *The Times* over the signature of "Historicus," and which he continued throughout the American Civil War. In 1868 he entered Parliament as Liberal member for Oxford, serving his constituents at that post till 1880, when he was defeated for re-election. He was, however, selected to represent Derby and continued in that position until 1895, when, having been defeated at the general election, he found a seat in West Monmouthshire. In 1869 he was elected Whewell professor of international law at Cambridge; at the same time he was appointed a member of the royal commissions for amending neutrality laws and for amending the naturalization laws. He was appointed solicitor-general in 1873, but held the office only three months, and in the same year was knighted by the queen. Although he had not supported Mr. Gladstone during his retirement from power, yet upon that statesman's return to the office of prime minister in 1880, he was appointed secretary of state for the home department, continuing in that capacity until the Liberal party went out of power in 1885. At that time his name became famous through his connection with the 'Ground Game Act' (1880), the 'Arms (Ireland) Act' (1881), and the 'Explosives Act' (1883), the last one being pushed through all its stages in the shortest time on record. In 1884, his bill for unifying the municipal administration of London was introduced. Upon the return of the Liberals to power in 1886, he was made chancellor of the exchequer, holding that position only a short time, as the fortunes of politics again took him from office. During the years 1880 to 1892 he was Gladstone's lieutenant in political life, and his services were of immense value, especially on account of his brilliant oratorical powers. Again in 1892 he was made chancellor of the exchequer, acting as such until 1895. It was during this term, in 1894, that he introduced and carried his famous tax budget, in which the income tax became more graduated and the "death duties" on real and personal property were equalized, thereby giving the government much aid in solving their financial problems. Upon Gladstone's retirement in 1894, Harcourt was looked upon as his successor, but his title was ignored and Lord Rosebery appointed in his stead. Sir William then became leader of the Liberals in the House of Commons, and it became evident that he and the new prime minister did not agree as to party policy, and, though their differences were from time to time patched up, it was clear in his defeat at Derby in 1895 that the party was divided on many issues, and the effect was then seen of Sir William's Local Veto Bill, not only in the utter rout of the Liberals, but in the setback given to temperance legislation. From 1895 to 1900 he represented West Monmouthshire in the House of Commons, but the task of leadership of the Liberal party became particularly onerous because of the tendency of the various sections to break away from control. In the session of 1896, against the overwhelming Unionist majority, he scored several successes, but was severely criticised by his own party for concurring in the majority report of the special committee, of which he was a member, appointed in 1897 to investigate the Jamieson Raid and the British South Africa Company. The internal dissensions in the Cabinet became more marked as time went on, and the divided counsels manifest among the leaders of the Liberals led to his decision to retire from the leadership of the party on the floor of the House of Commons, and in 1898 with John Morley he retired from active work and thereafter sat as a private member. As a private member, he no longer restrained his attacks on the government, paying not the least deference to Liberal imperialism. He actively opposed the government's policy with regard to the sinking fund, their attitude in the negotiations with the Transvaal, and the financing of the South African war, and throughout the war he lost no opportunity in criticising the South African developments. In 1898–1900 he became prominent, both on the platform and in his letters to *The Times*, in advocating active measures against ritualistic practices in the Established Church. The general election of 1900 found him full of fight, favoring the official Liberal programme as distinct from that of the imperialistic section which favored the return of Lord Rosebery to the leadership, and when the new Parliament met his attitude signified that his former claims would not be dropped. Sir William had refused twice to enter the peerage, and in a speech delivered at the National Liberal Club on 28 July, after announcing his determination to retire at the close of the session, said: "It is not because I am weary of the fight or am lukewarm in the cause that I intend to retire. It is because I do not think it for the public advantage that persons should attempt to fulfil duties that they are unable to perform." And yet after this announcement he vigorously attacked Joseph Chamberlain, whose weightiest political antagonist he was, for his fiscal proposals, in a lengthy speech, delivered in his familiar Homeric style. It has been written of him: "Sir William Vernon-Harcourt is one of the few public men whose addresses out of Parliament are printed in full by the London journals. His reputation has steadily improved while his party has been in the minority, and his caustic wit, polished satire, and brilliant epigrams have stung and irritated the conservative peers time and again. He has Lord Beaconsfield's trick of giving phrases the stamp of his own originality, so that there is no one on the Liberal side whose speeches are quoted more frequently. It has been aptly said that Sir William's distinguishing characteristic is his cleverness. His platform speeches are not only rattling and rollicking, but are generally brimful of witty and happy phrases. He has a great gift of lucid exposition and on rare occasions, when he condescends to be serious, commands a flexible and sinuous prose." Sir William Harcourt was married in 1859 to Lady Thérèse Lewis, widow of Sir George Cornwall Lewis, and daughter of T. H. Lister, and again in 1876 to Mrs. Elizabeth Ives, widow of J. P. Ives, and daughter of John Lothrop Motley, the historian, and at one time United States minister in London.

Hard Labor, in law, compulsory work, mechanical or other, sometimes judicially imposed upon criminals in addition to imprisonment or other punishment. It is a provision of statute law both in this country and Great Britain. Its first English adoption was secured through the demand for some adequate penalty in cases where penal servitude and transportation were for any reason inexpedient. In the United States the punishment of hard labor (which, however, is generally looked upon by humanitarians and sanitarians as being rather a healthful and merciful privilege) can only be imposed by a court on the authority of statute, the mode of applying the punishment being in some cases prescribed by State or Federal laws, and in others left to prison regulation.

Hardecanute, hār-dē-ka-nūt', **Harthacnut**, or **Hardacnut**, king of England and Denmark: son of Canute: b. about 1019; d. 8 June 1042. At the time of his father's death in 1035 he was in Denmark, where he was immediately recognized as king. His half-brother, Harold, however, who happened to be in England at the time, laid claim to the throne of that part of their father's dominions. For a time the mother of Hardecanute succeeded in holding Wessex in his name, while Mercia and Northumbria were held by Harold, such an allotment having been made by a witenagemote held at Oxford. Hardecanute was about to make an armed descent upon England, when Harold died (1040), and his brother peacefully succeeded him. He reigned till 1042, but his reign was not marked by any important event. He left the government almost entirely in the hands of his mother and the powerful Earl Godwin (q.v.), while he gave himself up to feasts and carousals.

Har'dee, William Joseph, military officer: b. Savannah, Ga., 10 Oct. 1815; d. Wytheville, Va., 6 Nov. 1873. He was graduated at West Point in 1838; served with distinction in the Mexican War; and in the Civil War entered the Confederate army with the rank of colonel. He commanded a corps at Shiloh; and was promoted lieutenant-general in 1862. At Perryville he commanded the left wing of the Confederate army and in December 1864 defended Savannah against General Sherman.

Harden, William, American historian: b. Savannah, Ga., 11 Nov. 1844. He left his studies in the schools of Savannah to join the Confederate army, serving throughout the Civil War in the 54th Georgia infantry and in the signal corps. After the war he studied law and was admitted to the bar in the early 70's. He was assistant librarian of the Georgia Historical Society from 1866 to 1869, when on 5 August he was appointed librarian, a position he still occupies. He has been a member of the board of managers of Telfair Academy of Arts and Sciences since 1882, and custodian since 1884; organizer and secretary of the Georgia Society of the Sons of the Revolution since 1891; and was a Democratic member of the Georgia House of Representatives from 1900–4. He has written much on historical subjects in magazines and journals.

Hardenberg, Georg Friedrich Philipp von, gā-ōrg frēd'riн fē'lēp fōn här'dĕn-bĕrg, "Novalis," German poet: b. Wiedenstadt, Prussia, 2 May 1772; d. Wessenfels, Prussia, 25 March 1801. He made himself well acquainted with law, natural philosophy, mathematics and philosophy, but was most eminent for his poetical talents. In the works of "Novalis" there is a singular mixture of imagination, sensibility, religion and mysticism. He was the gentlest and most amiable of enthusiasts. His novel, 'Heinrich von Ofterdingen', was left unfinished. His 'Hymns to Night' and the 'Geistliche Lieder' are greatly admired. With the Schlegels and Tieck he assisted in founding the romantic school in Germany. Consult: Schubart, 'Novalis Leben' (1887); Bing, 'Friedrich von Hardenberg' (1893).

Hard'hack, or **Steeple-bush**, an erect species of American *Spiræa* (*S. tomentosa*), common in pastures and low grounds, and celebrated for its astringent properties, which cause it to be used medicinally. It is distinguishable by the dense woolly tomentum, which covers its stem and the underside of its leaves; and bears in late summer "a compact, steeple-shaped panicle of peach-blow pink."

Har'die, James Allen, American soldier: b. New York 5 May 1823; d. Washington, D. C., 14 Dec. 1876. He was graduated from the United States Military Academy in 1843, entered the artillery, during the Civil War served on the staffs successively of Generals McClellan and Burnside, was judge-advocate-general of the Army of the Potomac on Hooker's staff, became brigadier-general of volunteers in 1862, and inspector-general with rank of colonel in 1864. He was brevetted major-general, United States army, in 1865. His writings are largely confined to military reports.

Hardie, James Keir, English labor leader: b. Lanarkshire 15 Aug. 1856. He worked in the coal mines until 1879, when he was blacklisted on account of his activity in organizing the miners; he was then appointed paid secretary of the miners' union. In 1886 he organized the Ayrshire miners, and in 1887 attended his first Trade Union Congress. He was one of the founders of the Independent Labor Party, and was elected member of Parliament in 1888, 1892, and 1900. He is proprietor and editor of a weekly paper, the 'Labour Leader.'

Hardie, Robert Gordon, American portrait painter: b. Brattleboro, Vt., 29 March 1854; d. Brattleboro, Vt., 9 Jan. 1904. He studied drawing at the Cooper Union Institute, the Academy of Design, and the Art Students' League, N. Y., and at Paris became a pupil of Gerôme. He exhibited at the Salon in 1880 and following years, and in 1882 studied under Cabanel. A picture of his appeared at the Exhibition of the National Academy of Design in 1888, and he exhibited a portrait of his wife at the World's Columbian Exposition in 1893.

Harding, Chester, American portrait painter: b. Conway, Mass., 1 Sept. 1792; d. Boston 1 April 1866. As an artist he was self-taught, his trade being that of a turner. He fought as a soldier in the War of 1812, and found employment on his discharge as a sign-painter in Pittsburg, Pa. Crossing the ocean he became a favorite portrait painter in London and found patronage among the royal family. His 'Portrait of Daniel Webster' is owned by the New York Bar Association, while his 'Portrait of John Randolph' is in the Corcoran Gallery, Washington.

Harding, Karl Ludwig, German astronomer: b. Lauenburg 29 Sept. 1765; d. Göttingen 31 Aug. 1834. Called to be a tutor to the son of the illustrious Schröter, he became inspector and observer in Schröter's observatory. In 1805 he was appointed professor of astronomy in the University of Göttingen, and remained in this position till his death. He discovered the asteroid Juno, the third of the planetoids, in 1804, and independently, the second comet of 1813 credited to Pons. His 'Atlas Novus Cœlestis' (1808–23; new ed. 1856) was for years the best of its sort.

Hardness, Scale of. In mineralogy, the hardness of a mineral is estimated by observing which of certain standard minerals will scratch a smooth surface of the given mineral, and which will not. On Mohs' scale (which is usually adopted), ten such standard minerals are selected for the establishment of the scale, their hardness being arbitrarily defined as 1, 2, 3, etc., up to 10. The minerals that are commonly used for this purpose are as follows:

1. Talc.	6. Feldspar.
2. Gypsum.	7. Quartz.
3. Calcite.	8. Topaz.
4. Fluorite.	9. Sapphire.
5. Apatite.	10. Diamond.

A mineral which will neither scratch apatite nor be scratched by it, for example, has a hardness of precisely 5; and the same may be said of one which will both scratch apatite and be scratched by it. A mineral which feldspar will scratch but apatite will not, has a hardness intermediate between 5 and 6. The decimal expressing the precise degree of hardness in such a case must be assigned by guess; but there is little use in attempting to determine a hardness more closely than to the nearest half-degree on the scale given above.

Hardware in America during the past century. The term "hardware," like everything else in our country, has suffered a great deal of expansion during the past hundred years, particularly as regards its application. Originally restricted to necessary articles of steel and iron, it has come to embrace in its technical and business understanding a great variety of goods which have no relation at all to the original meaning of the word.

One of the potent causes of this sweeping change has been the steady reduction in the price of hardware for a long series of years. This reduction has not been altogether continuous, but with occasional up-lifts during prosperous times or due to manipulation and control of the products — but on the average the trend has been steadily downward, particularly as compared with a period of 50 years ago. There are innumerable articles whose present cost is only from one third to one half as much now as then. It became necessary for all who were interested in hardware — manufacturers, jobbers, and retailers — to consequently largely increase the volume of their business in dollars and cents, since the mere tonnage output was so much less in value, thus recognizing one of the elementary principles of business — that the larger the output, within certain limits, necessarily the smaller the average cost of doing business.

Because of the discovery and exploitation of enormous ore bodies of iron, copper, and lead, among which may be instanced the great mines of Lake Superior — both iron and copper — the copper deposits in Montana and Arizona, and the lead and zinc ores in Missouri and the Southwest, and also because of the steady multiplication and increased efficiency of machinery, it became possible to produce the finished product at a steadily decreasing cost.

Experience soon showed that the field of legitimate hardware was not itself sufficiently comprehensive to enable the jobber and the retailer to transact a large enough volume of business commensurate with the cost of doing this; therefore, kindred fields were invaded and occupied, and have now become practically incorporated as part of the hardware business. Thus it has been that the great number of articles which are known as house-furnishing goods, and embrace such lines as refrigerators, ice cream freezers, and innumerable other items which go to make up the objects needed in every household — and that the line of tinware and sheet iron, and what also have come to be known as sporting goods — not only guns, rifles, and pistols, but athletic supplies — have become part and parcel of the hardware business in addition to the line of cutlery, and quite a number of other items in lines that were once entirely separate in themselves and had no relation to the hardware business. Thus the hardware retail dealer has practically reverted to the original type, in the sense of going back to the plan of the old general store and keeping pretty much all that his customers need outside of such lines as drygoods, groceries, and drugs.

Hardware is, to a large extent, naturally the business of a new country because of the great amount of building and the clearing of land, though it is equally true that in the modern civilized, progressive communities of this country the use of hardware is in equal proportion to the demand caused by new countries, and much more complex and complicated in its nature.

The history of hardware is naturally the history of this country, and it can be safely said that there is no other department of mercantile business that has so kept pace with the progress of the United States, nor which to-day depicts so thoroughly all the characteristics of modern American character in all its varied details. Beginning in the crudest way with the manufacture of hand-made implements, and depending almost entirely upon importation from the Old World for what was needed — even in the way of necessities of life — it has grown by giant strides, more especially since the end of the Civil War, and in many instances largely because of the protection afforded by the tariff, until to-day American hardware is practically independent of the foreigner, save in those rare instances where we have not as yet learned the mysteries of manufacture or succeeded in procuring sufficiently skilled workmen to answer the purpose. The manufacturers of hardware in America have been original in their ideas and methods and have adapted themselves absolutely to the necessities of their environments.

not slavishly following the copies of Old World tools, but being guided solely by common sense and necessity. It has followed thus, particularly in edge tools, that there has been such advancement in the way of appropriateness to purposes intended and improvement in appearance, finish, and design as can be scarcely equalled in any other line of business. The artistic sense has not been lost sight of, but has been appealed to as well as the sense of utility. Cutting tools are made just heavy enough and to avoid the clumsiness of the Old World items in this regard. Originality has been shown in the incessant improvement of existing models and the devising of entirely new conceptions. The manufacturer has not been content to follow the custom of ages — has had little respect for tradition or inheritance, but has set himself solely to the task of producing an effective tool at the lowest possible cost.

It is true that in no country in the world does merit in hardware command the price and popularity as in the United States, and the history of manufacturers who have been successful has been the history of merit, and not because of cheapness in quality or price. The only manufacturers who have been successful for any length of time have been those who have based their products primarily on quality and who have had the faith and courage to maintain this quality in the face, often, of discouraging circumstances. It may be stated as an axiom that no hardware item of the day survives for any length of time on any other basis. The temptation to deteriorate the quality after the reputation is established and built upon its quality has always met with sure and permanent disaster.

The blacksmith of the smaller town and of the country was among the earliest makers of tools and implements, and even to this day in many localities there still survives a call for his hand-made products. The hardest fight which the manufacturers of machine-made articles have had to face has been to overcome the feeling, and often prejudice, in favor of the tool that was made by hand and that seemed consequently superior — and, as a matter of fact, the reverse has usually been the case.

Appearance counts for much — probably more in America than in any other country; attractive packages, handsome labels, and beautiful finishes are as much a part of hardware to-day as the adaptability and merit of an article. There have been numerous strides in this regard, particularly when one contemplates the old-fashioned method of tying up the hardware in heavy paper with string, a package that was both clumsy and unsightly. The question of the size and nature of the package is one of great moment in the appeal to the public, and the general tendency has been to pack the goods in smaller and smaller boxes all the time, to insure their ready sale and prevent breaking the packages, which is always so detrimental to the goods themselves, and so expensive to the dealer.

The importation of hardware is almost at an end, being confined, as before stated, to some few specialties which are slowly but surely losing their hold upon the public of this country; but, on the other hand, the exportation of American hardware — and particularly American edge tools — to all parts of the world is a large and growing business, and one of great value to the home manufacturer. The foreign business has been obtained entirely by the merit of the American article; its attractiveness, its novelty, its merit, and its adaptability to the purpose intended have, after much opposition, opened the way for American hardware in all parts of the world, so that it has steadily gained ground at the expense of the foreign article.

The steady substitution of machinery for hand labor has been the most potent cause of the great success that hardware has made in the United States. The American manufacturer is never content with present conditions, but is always endeavoring to find a more efficient and more economical method of producing the finished article, and consequently endeavors to substitute machinery for hand labor. American hardware has, therefore, been placed within the reach of all, and has largely contributed to the comfort and welfare of the people.

The production and the use of hardware cannot be intelligently considered without reference to some of the leading conditions of the country — conditions of soil and climate, as well as the temperament and nature of the people. The most far-reaching and enduring change has been the substitution of what is known as mild steel for wrought iron, due to the invention of Sir Henry Bessemer. It has rendered possible the production of hardware in all brands at very much lower prices and much more numerous forms since the production of open hearth and of Bessemer steel, which thus supplanted those of cast iron and of wrought iron.

On the other hand, hardware has been very adversely affected by this change because of the consequent substitution of steel for wood, and this is most marked in the erection of the modern sky-scraper, as it is known, where there is but comparatively little hardware used, either in the erection of the building or in its subsequent finishing. These buildings having practically little or no wood in them have small use for either the carpenter or his various tools, and all that is left of hardware is a small amount of locks and trim to decorate the building and to give it security. This process has gone on in many ways until apparently it must seriously affect the continued use of hardware in all branches of life; but, on the other hand, the growth of the population has been so great that this can be safely set down as a discussion of only academic interest at present.

In a country so diversified as to soil and climate, there is a necessity of great diversity of hardware, and the goods used in the different parts of the country invariably reflect the nature and temper of the people. The South is much more conservative than the North and clings longer to old-fashioned articles of well-known reputation some time after they have been superseded in the North by more modern things. Because of the comparative poverty of the South in the past, and the fact that the negro is the principal laborer, the demand, until lately, has been rather for price than for quality. Again, in the extreme East very much the same conditions prevail, owing to the natural economy of the people and their extreme conservatism. The West — by which is also meant the Southwest and the Northwest — is a great consumer of hardware, and within its bounds are the great distributing hardware centres.

The steady and rapid destruction of the

forests has had a far-reaching effect upon the hardware business, and one that is destined to, in many cases, permanently alter the use and nature of many hardware implements. In the beginning the country had to be cleared of forests, which created an enormous demand for all edge tools and stimulated the ingenuity of the manufacturers to produce articles fitted for the different needs — not alone for the different sections of the country, but also for the various kinds of wood. Now that the white pine forests have practically been destroyed, it is necessary to have edge tools that are more and more adapted for use of the hard woods which are still fairly abundant; and the question also presents itself to the manufacturers as to how long it will be possible to keep up the present production of such items as axes and cross-cut saws, in view of the fact that the forests are steadily disappearing.

It is impossible within the limit of this article to more than briefly mention some of the leading branches of the hardware business and tell in a few words of their nature and history.

Wire Industry.— One of the most prominent to-day is that of the wire industry, because it ramifies and affects almost every part of the hardware business. It early felt the impetus of the advantages offered by the Bessemer steel process, since it was possible to produce in wire made from steel many items which could not be drawn from wrought iron. It is difficult to state with exactness — because of its largely conflicting with other branches of iron and steel manufacture — but it has probably invested in its manufacture more than $200,000,000, and its output in 1905 was something like 15,000,000 tons. Few things have been of greater interest than the story of barbed wire and its enormous growth since its introduction. It is probably the cheapest fencing ever placed upon the market, and exactly met the demands of the new country where thousands of acres had to be fenced in at a time. It is still a product of great tonnage, but its place is being slowly but surely taken by the woven-wire fencing which, though higher in price, is more effective and is better suited now for the country, which is gradually being cut up into smaller farms.

Nail Industry.— The nail industry is a conspicuous example of the chance and changes in manufacture, for in the beginning the iron cut nail, first as made by hand and afterward by machinery, had behind it the prestige of centuries, and seemed to be enduring as an article of every-day use. It was found, however, that with the growth of the Bessemer steel business, the steel cut nail could be made cheaper, although it was not in any way a better article. Its place, in turn, is being very fastly taken by the wire nail, which is much more comprehensive in its uses than the steel cut nail, though the latter style prevails in certain sections and for certain purposes, but the decline of the steel cut nail is as marked in its way as the rapid increase in the use of the wire nail.

Tacks.— The kindred industry is that of tacks, but it has been seriously hurt by the expansion of the wire nail since it is possible to make the latter in many forms and sizes that are substitutes for tacks. This industry was founded in Taunton about 75 years ago, and for a great number of years was practically confined to New England. It spread gradually westward to Pittsburg; there it almost died out, and has since taken some hold further west in Cleveland and Chicago. Owing to the encroachment of the wire nail it has declined rather than advanced, and the number of manufacturers has been greatly decreased. The product is not large — probably not more than 15,000 tons per annum.

Farming Tools.— The making of farming tools and what are known technically as "steel goods" is one of the most important industries in the hardware line, since with these tools the crops are cultivated and gathered. The steady progress of the American manufacturer has been in the direction of producing items which were light, strong, and handsome in appearance. The diversity of soil and climate mean great diversities of various items used in cultivating the ground, and the number grows each year. The business does not keep pace with the growth of the country owing to the steady increasing use of labor-saving machinery — the mower and the reaper have taken the place of the snath, the cradle, and the scythe — the corn binder of the corn knife, and the corn planter and the cultivator have gradually diminished the use of hoes. The amount of capital invested is not exactly known, but does not probably exceed $3,000,000. The absolute importance of these tools to the country is rather striking contrasted with the small annual output in dollars and cents. See AMERICAN FARM IMPLEMENTS.

Builders' Hardware.— The builders' hardware business is often considered the centre of the hardware trade, because of its great importance as related to the hardware industry as a whole. Builders' hardware is an exceedingly comprehensive term and does not admit of exact definition. It is ordinarily used in reference to locks (see LOCKS) and trim and to all the various items which find employment in the building of a house. It is a business of immense complexity and has a most interesting history. It began far back in New Haven and New Britain, Conn., as early as 1834, and the first goods were naturally crude and rough. Shortly, however, the ingenuity of the American manufacturer produced a new article in the shape of the cast-iron lock, thus departing entirely from the wrought lock, which was formerly known to England, Germany, and France. The cheapness of the cast-iron lock and its actual efficiency soon caused it to entirely displace the foreign article. Since that time the sheet steel lock has been made in this country, but in a much smaller and more condensed form than the wrought lock of Europe.

Builders' hardware has a most interesting history since it is in part the story of the development of taste in America. The Centennial Exposition of 1876 did much to educate the people of this country in the way of good taste and high artistic ideals. There gradually became a demand for things of daily use which should have beauty as well as utility, and particularly of late years this feeling has spread to locks and trim, and all forms of builders' hardware, with increasing emphasis. The leading manufacturers have innumerable designs which are suitable for the different schools of architecture, such as Gothic, Renaissance, and Colonial, or any of the variations of the standard schools. All high-grade builders' hardware is now gotten up in shape and design to match appropriately not alone the building, but each separate room where the rooms are finished and ornamented differently. It is, therefore, largely a thing of ornament as well as of use, and the ingenuity of the manufacturer and the salesman has been taxed to keep pace with the demands of the consumer for novelty and appropriateness. It is difficult to more than approximate the annual production, but it is probably something like a matter of $25,000,000 in value. The finest grades of hardware are still made largely in the East, principally in Connecticut, but the business is slowly but steadily drifting west in keeping with the general trend of hardware manufacture.

Shovels.— The first shovels in this country were produced as far back as 1776 by Captain John Ames, who made them by hand in competition with the English article. The business then established was carried on there for the succeeding 27 years, and constituted the nucleus of the present large concern of the Oliver Ames & Sons corporation, whose headquarters are in Northeaston, Mass. Mr. Oliver Ames, the son of Captain John Ames, established in 1803 a shovel plant where he soon produced shovels that were superior to those imported from England. In 1797 Thomas Rowland commenced the manufacture of shovels at Cheltenham, Pa., and this plant has been in continuous operation ever since. Business gradually crept westward and is now spread over the country as far west as the Mississippi river. By 1854 there was something like 80,000 dozen shovels produced annually, but with the growth of the country this product has been largely increased until the annual output is now about 600,000 dozen. As with all other hand tools, the demand for shovels has been seriously affected by the introduction and improvement of labor-saving machinery — such as the steam shovel, the coal and ore conveyor, and other mechanical devices for loading and unloading. It is interesting to note that the original machinery for making shovels has not been greatly improved upon so far as the actual efficiency is concerned, although the variety of shovels has been greatly increased to meet the wants and tastes of the different parts of the country. It is difficult to approximate with any reasonable degree of accuracy the amount invested in this business, but it is probably in the neighborhood of $7,000,000.

Saws.— There are few things more difficult to make than saws, and they have been the subject of study of some of the most talented and ingenious manufacturers of the country. They were manufactured as far back as 1806 in Philadelphia, though in a very small way. In 1820 a factory was established in Bristol, Conn., by Irenus and Rollin Atkins, Rollin Atkins being the father of E. C. Atkins, the founder of E. C. Atkins & Company, of Indianapolis, who now have one of the largest saw plants of the world. It was necessary to import the first saw makers from England.

In 1840 Henry Disston, an Englishman by birth, really made the great beginning of the saw-making industry in Philadelphia, and soon produced saws that had no equal in the world. It was only a short time before the Disston saws drove out the English brand entirely from this country, and to-day this firm have not only achieved a world-wide reputation for merit but send their products all over the globe. The annual output of all saws amounts to between $10,000,000 and $12,000,000, and there is about that amount of capital invested in the business. The tonnage of steel used in the manufacture of saws varies from 15,000 to 20,000 tons per annum.

American saws, particularly hand saws, are pre-eminent in America and have no equal abroad. Outside of the Disston factory there are several very large and prominent makers, among them E. C. Atkins & Company, of Indianapolis, Ind., and the Simonds Manufacturing Company, who make their headquarters at Fitchburg, Mass. The saw business has been notable because of the genius shown by the manufacturers, and in this respect Henry Disston is pre-eminent. There are probably something like between 5,000 and 6,000 people employed permanently in the business. See Saws and Sawing.

Axes.— Axes have always been among the most important items in the hardware business because of the great need of them in felling the forests with which the country was covered in the early days. They are of innumerable sizes and shapes to suit the needs of the lumbermen and the users. The production has not increased of late years, due not only to the deforestation of the country, but also to the fact that the place of axes is being largely taken by cross-cut saws. The annual output is somewhere between 350,000 and 400,000 dozen. As in other lines of business, there have been great consolidations, so that a few large concerns have taken the place of innumerable small ones. The use of natural gas has had a most important effect on the manufacture of axes, since with it a very much superior tool can be made, and it is also of great advantage in tempering. It is noticed as regarding the matter of tempering — a thing of vital necessity in all edge tools — that practically there has been no improvement in this regard for several centuries. Not alone did many of the implements of the ancients equal in temper the best that can be produced now-a-days, but in many cases they were much superior. The difficulty seems to lie in the fact that tempering is purely a thing of experiment and not of scientific development, the reason for it not being known, nor why some metals can be tempered and others cannot. In the beginning axes were originally made by hand as were all the other hardware implements, but later the tendency developed to establish small factories on available water powers throughout the country, as at Pittsburg, Pa., Lewistown, Pa., East Douglas, Mass., and Collinsville, Conn. With the enormous demand for the goods, this industry soon outgrew its "leading strings" and established itself at more available locations.

Edge Tools. — The item of edge tools is a very large one, and next to builders' hardware, probably the most important in the whole range of hardware proper. It embraces practically everything with a cutting edge such as hatchets, chisels, drawing knives, planes, and the like, and space forbids any attempt at more than generalities. It is interesting to note that on such small items as chisels, drawing knives, adzes, and hatchets, the advance within a period of 1,000 years has been rather of attractiveness of form and appearance than in actual adaptability or merit. Some tools dug up from the Roman camp of Salzburg are, so far as adaptability goes, quite equal to any that are made up now-a-days. The simplicity of the articles mentioned has largely rendered them impossible of any great improvement. In the more complicated lines such as planes and the like there have been very great changes and improvements, and the plane industry, particularly, is one of enormous proportions. The manufacturers who have attained a reputation in edge tools have done so purely on the score of merit and because of the fact that each manufacturer made only one particular line, no one thus having a complete line of edge tools of uniform excellence, design, and efficiency; and one of the great causes of the demand for American hardware abroad — particularly since the Spanish War — has been the fact of the assembling of a complete line of high grade tools under one brand, so that the foreigner realized that anything that bore that particular trade-mark could be depended upon as being uniform in quality and efficiency. Among the somewhat lesser items in the tool line have been the interesting developments in auger bits of innumerable designs and patterns, with varying adaptability for different kinds of work. See TOOLS.

Files.— There are few things of greater and more growing importance to the hardware dealer than that of files, and it is an interesting story of development and of the genius of the manufacturer. They are articles which have to be made with the greatest care and go through a great number of processes before they reach perfection and are fitted for use. The five leading operations requisite are forging, annealing, grinding, cutting, and hardening. They were formerly made entirely by hand, and even to this day, there still exists among a few, the preference for the hand-made file. The history of the business really dates from the practical use of a machine to cut files, patent for which to all intents and purposes was first issued to William Nicholson in 1816. There are records of file-cutting machines in France as far back as 1699, and several since that time up to the 19th century, but none of them apparently of any practical value. The first really important attempt to manufacture files was soon after 1850 at Ramapo, N. Y., a company being organized under the name of the American File Company, with large capital. The life of the attempt was short, however, and the business was soon discontinued. Various attempts were made shortly after that — both in this country and England — to manufacture files by machinery, and none of them had any extended experience.

About 1863, Mr. William T. Nicholson, of Providence, R. I., gave the matter of file cutting by machinery his personal thought and attention. He had long training as a mechanic and practical experience in the finest branches of machinery. At that time the great source of supply of files for this country were the hand-made files of England, and the story of attempts to cut files by machinery had been one of sunken capital, ruined hopes, and dismal failures. From this beginning grew the great present firm of the Nicholson File Company, which largely dominates the file trade in this country and has an enormous export business. They have produced better and cheaper files than it is possible to cut by hand, and have carried the business apparently to the point of perfection. The importation of files has fallen to about $75,000 per annum, while the total output of American files does not fall short of $6,000,000, and is represented by total investments of approximately $12,000,000. See FILES AND FILEMAKING.

Rasps.— Few things have been more marked than the determination of the American manufacturer to successfully produce a machine-cut horse rasp. It followed a long ways in the wake of the machine-cut file, and after many discouragements — the principal difficulty being to overcome the inveterate prejudice of the blacksmith. To-day hand-cut horse rasps are a thing of the past.

Bolts and Nuts.— The manufacture of bolts and nuts dates as far back as 1798, a patent for screw machinery at that time being issued to David Wilkinson, a celebrated mechanic of Rhode Island. There were various other patents granted and these gradually developed in later years into the present slotters, threaders, pointers, and tapers. By slow growth and by innumerable inventions and improvements this industry has attained its present enormous proportions and is represented to-day by about 15 prominent makers, who manufacture all of the various kinds and styles of bolts, the yearly product being something like 1,000,000,000 bolts.

Screws.— The manufacture of screws — or, as they are technically known, wood screws — is one of the important developments of this country, though the demand does not keep pace with the growth of the country owing to the continued substitution of steel for iron, and consequently of bolts and rivets for screws. Screw machinery is of the highest type of automatic efficiency and almost equals human intelligence in its working. Patents for various devices on screw machinery date back into the latter part of the 18th century, and innumerable patents have been issued since that time. The real beginning of successful manufacture was in 1838 when the Eagle Screw Company was incorporated in Providence, R. I., the leading spirit being Mr. William G. Angel. In 1846 Mr. Angel finally perfected the machine for making what is known as the gimlet point on a screw — up to that time it had a blunt point. From this time dates the prosperity and growth of his company, which grew into the present American Screw Company. There are now some 13 large concerns engaged in the manufacture of screws and scattered from New England to the Mississippi river. See SCREWS.

Tin Plate.— The tin plate and sheet iron industry has kept pace with the general growth of the iron industry all over the country, and has been greatly fostered by a protective tariff since the time of what has been known as the McKinley Bill. Its production in this country has grown at an enormous rate, as may be seen by the statement that in 1892 there were only about 18,000 tons of tin plate produced in this country as against about 458,000 tons in 1904. The industry is chiefly represented by what are known as black sheets, galvanized iron, and tin plates — all of which have now become integral parts of the hardware business. See TIN PLATE.

Tinware.— Among the lines which were originally independent, but which have practically become now incorporated with the hardware business, is that of the tinware industry in all its various ramifications. The retail hardware shop has practically absorbed the tinners' shop and because of the fact that hand-made tinware is fast being supplanted by the product of the stamping company, the hardware retailer has gone into the handling of tinware in all shapes and varieties.

Enameled Ware.— Coincident with this is the development of what is known as enameled ware, being a coating on the sheet steel in place of the tinning. It is of all colors and varieties and has grown to be a business of great importance. It illustrates distinctly the general desire of the people for something more tasteful and artistic in appearance than the old-fashioned tinware.

Mechanics' Tools.— The American manufacturer has shown to great advantage in the manufacture of high grade mechanics' tools for exceedingly fine measurements. In this respect the Brown & Sharpe Manufacturing Company, of Providence, R. I., occupy a commanding position and their products to-day are sought for all over the world where exceeding accuracy is necessary. As an example, the micrometer caliper will measure with absolute accuracy the 250,000th part of an inch. For an attainment of such results, the finest tools made by any other nation cannot be compared with those of America.

Cutlery.— Few things are more interesting than the history of cutlery-making in the United States, as it has suffered many "ups and downs," not alone from various foreign competition, but from the difficulty of procuring sufficiently skilled labor to produce the proper article. The manufacture of scissors and shears — which are always treated as a part of the cutlery business — has been unique in the fact that it was a Yankee genius who first solved the problem of welding a high grade steel blade to a soft casting of iron backing made to fit the hand, this being the invention of Seth Boyden in 1826. The actual manufacture of shears in this country seems to have been commenced by R. Heinisch in 1825 at Elizabethport, N. J. This was followed by others until at present the American shears have been developed and improved as to be far ahead of any in the world. Prior to 1832 table cutlery was imported very largely from England. From that year American manufacturers began in a small way to produce these goods, and by 1865 they had practically taken the business unto themselves. There is a large export trade business in table cutlery owing to the superior quality of the goods made in this country.

The making of pocket cutlery is one of the most interesting things connected with the hardware business in America. It was started at Lakeville, Conn., by the Holley Manufacturing Company about 1845. The total annual capacity was probably less than $50,000. The business was gradually extended in a small way and finally a co-operative colony was established at Walden, N. Y., and since then this line of American industry has largely centred in the two States of New York and Connecticut. Innumerable factories have been started and have failed, largely owing to the lack of foresight on the part of the manufacturers in attempting to compete with the cheap labor of Europe in producing goods both cheap in quality and finish as they were in price. The co-operative colony spoken of grew by slow degrees and economical management, having the advantage of large water power at Walden, until they finally became one of the leading makers, not alone of this country but of the world, and were enabled to show at the recent Louisiana Purchase Exposition products superior to those made abroad, for which they received the highest award. It is an interesting case of development in the way of quality and of merit by patience and skill. There are something like 10 or 12 makers now in the field and their annual product is roughly set in the neighborhood of $2,000,000.

E. C. Simmons.

Har'dy, Arthur Sherburne, American novelist: b. Andover, Mass., 13 Aug. 1847. After a single year at Amherst College he entered the West Point Military Academy, graduating in 1869. He became a second lieutenant in the 3d Artillery regiment, saw some service during 1869 and 1870, and then resigned to become a professor of civil engineering at Iowa College for a brief time. In 1874 he went to Paris to take a course in scientific bridge-building and road-constructing, returning to take a professorship in that line of instruction at the Chandler Scientific School, connected with Dartmouth College. He assumed a similar professorship in Dartmouth College in 1878. This position (in connection with which he published 'Elements of Quaternions' (1881), followed by his translation of 'Argand's Imaginary Quantities,' by his own 'Analytical Geometry'; and 'Elements of the Calculus'; 'Imaginary Quantities'; and 'Methods in Topographical Surveying') he held until 1893, when he became editor of 'The Cosmopolitan Magazine.' He was United States minister to Persia, 1897–9, and envoy extraordinary and minister plenipotentiary to Greece, Rumania and Servia, 1899–1901, to Switzerland, 1901–3, and to Spain since 30 Jan. 1903. His works include: 'But Yet a Woman' (1883); 'The Wind of Destiny' (1886); 'Passe Rose' (1889); 'Songs of Two,' poems (1900); 'His Daughter First' (1903). He also wrote the 'Life and Letters of Joseph Hardy Neesima' (1890).

Hardy, Edward John, English author and clergyman: b. Armagh, Ireland, 7 May 1849. He took orders in the English church, became an army chaplain, in 1903 was stationed at Hong Kong, and in 1905 in Egypt. He is known the world over as the author of 'How to be Happy though Married' (1884), which has been translated into many languages. Other work by him are: 'Manners Makyth Man' (1885); 'Faint yet Pursuing' (1886); 'Uncle John's Talks with his Nephews' (1886); 'The Five Talents of Women' (1888); 'The Love Affairs of Some Famous Men' (1897); 'Mr. Thomas Atkins' (1900); 'Concerning Marriage' (1901); 'Love, Courtship and Marriage' (1902); 'Pen Portraits of our Soldiers' (1902); 'Love Rules the World' (1905); 'John Chinaman at Home' (1905).

Hardy, Iza Duffus, English novelist, daughter of Sir Thomas Hardy, the English historian. Among her numerous novels are: 'Glencairn' (1877); 'Only a Love Story' (1877); 'A Broken Faith' (1878); 'The Love that He Passed By' (1884), an American novel; 'A Woman's Loyalty' (1893); 'The Lesser Evil'; 'Man, Woman, and Fate'; 'A Butterfly' (1903), etc., and two volumes of transatlantic reminiscences, 'Between Two Oceans' (1884), and 'Oranges and Alligators: Sketches of South Florida Life' (1886).

Hardy, Thomas, English novelist: b. Dorsetshire, England, 2 June 1840. He was educated as an architect and practised his profession 1862–73. He then turned to literature and is now recognized as the first of living English novelists. His published works include 'Desperate Remedies' (1871); 'Under the Greenwood Tree' (1872); 'A Pair of Blue Eyes' (1873); 'Far from the Madding Crowd,' which first established his fame (1874); 'The Hand of Ethelberta' (1876); 'The Return of the Native' (1878); 'The Trumpet-major' (1880); 'A Laodicean' (1881); 'Two on a Tower' (1882); 'The Mayor of Casterbridge' (1886); 'The Woodlanders' (1887); 'Wessex Tales' (1888); 'A Group of Noble Dames' (1891); 'Tess of the D'Urbervilles' (1891); 'The Three Wayfarers' (1893); 'Life's Little Ironies' (1894); 'Jude the Obscure' (1895); 'Wessex Poems' (1898); 'Poems of the Past and Present' (1901). Consult: Johnson, 'The Art of Thomas Hardy' (1894); Macdonnell, 'Thomas Hardy' (1894); Windle, 'The Wessex of Thomas Hardy' (1901); Sherren, 'The Wessex of Romance' (1902).

Hare, Augustus John Cuthbert, English descriptive writer: b. Rome, Italy, 13 March 1834; d. St. Leonards, Sussex, 22 Jan. 1903. He was a nephew of J. C. Hare (q.v.). His life was spent mainly in travel, on descriptions of which his fame chiefly rests. Among his many works may be cited 'A Winter at Mentone' (1861); 'Walks in Rome' (1870); 'Wanderings in Spain' (1872); 'Memorials of a Quiet Life' (1872); 'Days near Rome' (1874); 'Walks in London' (1877); 'Days near Paris' (1887); 'Sussex'; 'The Story of My Life' (1895); 'Shropshire.'

Hare, John, English actor: b. London 16 May 1844. He made his first appearance in Liverpool, then going to London played at the Prince of Wales theatre, and later was manager of the Court theatre, the Garrick theatre, and the Globe theatre. He became distinguished as a comedian, and visited the United States, playing in the chief cities. The plays he has brought out include 'A Scrap of Paper'; 'Still Waters Run Deep'; 'A Bachelor's Romance'; and 'Gay Lord Quex.'

Hare, John Innes Clarke, American jurist: b. Philadelphia 17 Oct. 1817. Graduated from the University of Pennsylvania in 1834, he was admitted to the bar in 1841, was successively associate and presiding judge of the Philadelphia district court (1851–75), and in 1875–95 presiding judge of the court of common pleas. He was also for a time professor of the institutes of law in the University of Pennsylvania, and published: 'American Leading Cases' (1847; with Wallis), 'The Law of Contracts' (1887), 'American Constitutional Law' (1889), eleven volumes of chancery reports, and other works.

Hare, Julius Charles, English Anglican clergyman and author: b. Valdagno, Italy, 13 Sept. 1795; d. Hurstmonceaux, Sussex, 23 Jan. 1855. He was vicar of Hurstmonceaux from 1832 and published 'Vindication of Luther' and other works, but is much more widely known as co-author with his brother A. W. Hare, of 'Guesses at Truth' (1827), a work which still enjoys popularity.

Hare, Robert, American scientist: b. Philadelphia 17 Jan. 1781; d. there 15 May 1858. He was professor of chemistry in the University of Pennsylvania 1818–47. He will be longest remembered for his discovery of the oxyhydrogen blowpipe to which he gave the name "hydrostatic blowpipe," but he also invented the valve-cock, the calorimeter and a process for denarcolizing laudanum. He wrote 'Brief View of the Resources of the United States' (1810); 'Chemical Apparatus and Manipulations' (1836); 'Memoir on the Explosiveness of Nitre'; etc.

Hare, William Hobart, American Protestant Episcopal bishop: b. Princeton, N. J., 17 May 1838. He studied at the University of Pennsylvania, was ordained priest in 1862, was minister of St. Luke's, St. Paul's (Chestnut Hill) and other churches of Philadelphia, and in 1873 was consecrated missionary bishop of Niobrara. In 1883 his diocese, having been enlarged so that its limits were identical with those of the territory of South Dakota, was renamed that of South Dakota. He became known as an authority on the Indian question, and wrote pamphlets on mission work in the western United States.

Harebell, or **Bluebell,** a familiar species of bell-wort (*Campanula rotundifolia*), common throughout the northerly parts of the whole northern hemisphere (see Bluebell; Campanula), growing in dry and hilly pastures, on waysides, and open lands generally. It is, however, rare in America south of Canada, although other species are to be found here. It is perennial, with a slender stem 6 to 14 inches high, bearing a loose raceme of a few drooping flowers, on very slender stalks; the flowers, generally bright blue, but sometimes white, bell-shaped, and about half an inch long, appear in summer and autumn. The juice of the flowers yields a fine blue color, and may be used as ink.

Harel, Paul, pōl ä-rĕl, French innkeeper-poet: b. Echauffour (Orne) 1854. He became landlord of the "Croix Saint-André," an inn at Echauffour, and within a modest range of subject wrote picturesque verses in an excellent lyric style. He was elected to the Caen Academy, and on the recommendation of Sully-Prudhomme received a prize from the Académie Française. Among his works are: 'Sous les Pommiers' (1879); 'Rimes de Broche et d'Epée' (1883); 'Aux Champs' (1886); and 'L'Herbager,' a three-act poetic drama (1891).

Harelip. A fish. See Cutlips.

Ha'rem, or **Hareem'** (Ar. "the prohibited"), is used by Mussulmans to signify the women's apartments in a household establishment, forbidden to every man except the husband and near relations. The women of the harem may consist simply of a wife and her attendants, or there may be several wives and an indefinite number of concubines or female slaves, with black eunuchs, etc. The greatest harem is that of the sultan of Turkey. The women of the imperial harem are all slaves, generally Circassians or Georgians. Their life is spent in bathing, dressing, walking in the gardens, witnessing the voluptuous dances performed by their slaves, etc. The women of other Turks enjoy the society of their friends at the baths or in each other's houses, and appear in public accompanied by slaves and eunuchs; but the women of the sultan's harem have none of these privileges.

It is of course only the richer Moslems who can maintain harems; the poorer classes have generally but one wife.

Hares. In the United States the names hare and rabbit are used indiscriminately for various species of rodents of the family *Leporidæ*. Hare is the generic term, while rabbit is applied properly to a single short-legged species of essentially burrowing habits whose naked, blind, and helpless young are nurtured in underground nests (see RABBIT). None of the native American species have these characteristics. The second pair of upper incisors are small, non-functional and placed directly behind the large gnawing teeth, a peculiarity which distinguishes the hares and a few allied forms from all other rodents. The ears are always large, the tail short, bushy, and upturned, the forelimbs short and five-toed, the hind ones long and four-toed, and the soles of the feet densely hairy. Hares are exclusively vegetarian. They are extremely timid, alert and have keen senses. They move with peculiar erratic leaps and with great speed for short distances, and walk with a peculiar shuffling gait by placing the entire sole of the hind foot on the ground. A favorite attitude is that of resting on the haunches with the head erect; but the forelimbs lack altogether the prehensile powers of the squirrels. None of them are arboreal or aquatic. The older catalogues enumerate from 20 to 30 species from all parts of the world except Australasia, but chiefly belonging to the northern hemisphere. With a very few exceptions all the hares are included in the single genus *Lepus*.

The gray rabbit, wood rabbit or cottontail (*L. floridanus* or *L. sylvaticus*) is very plentiful throughout eastern North America north to Ontario. It frequents thickets and brier patches on the borders of woods, multiplying excessively in the more thickly settled regions and replacing the more retiring varying hare. All kinds of succulent herbage, bark, berries, and buds, the latter especially in winter, form the rabbit's food, which it seeks to a large extent along regularly established runways, not infrequently leading to the farmer's truck-patch. Although it does not itself burrow, the cottontail frequently escapes its pursuers by retreating into the holes of woodchucks, skunks, etc., in this respect and some others resembling the true European rabbit more closely than any other American species. Several broods of four to six young are raised each year. At birth they are blind and helpless, and are protected in a nest built in a depression in the ground of dried grass or weeds lined with the rabbit's own fur.

The varying hare or white rabbit (*L. americanus*) is a larger species with longer hind legs, taking its name from the alternating brown and white color of summer and winter respectively, a change which is less complete southward. Much difference of opinion has prevailed regarding the manner in which this change occurs, the latest competent view being that the white coat is due to the growth of new white-tipped hairs among the soft short fur, the brown tint of which again appears with the loss of the white ends of the hairs in the spring. In one or other of its varieties it ranges from Virginia northward to Hudson Bay, and is common in the hemlock forests northward. This is a typical hare, which depends for its safety from foxes, lynxes, weasels, hawks, owls and numerous other enemies solely upon its quick senses and great speed. It never enters burrows, but lives by day and night with no other shelter than that afforded by thickets. Feeding chiefly by night it travels along regular runways used in common by several individuals, a fact which is sometimes taken advantage of by foxes and other enemies to compass their destruction. A favorite winter food is the bark and buds of the birch tree. Scarcely any nest is formed for the young, which are fully active a short time after birth. A somewhat similar species is the polar hare (*L. arcticus*), a pure white species of high northern latitudes.

The jack-rabbit or prairie hare (*L. campestris*) is representative of a group of large, long-legged, big-eared hares which inhabit the western plains, and whose lives are spent mostly "on the jump." For short distances they are perhaps the swiftest quadrupeds known. Their lives are spent among the bushes, upon the twigs of which they feed, and where their young are dropped and within a short time required to shift for themselves. In cultivated districts the jack-rabbits increase enormously and become great pests. As a consequence they are much hunted, not only with dog and gun and snare, as are the eastern species, but by the organization of extensive "drives" which result in the destruction of thousands, the bodies of which are shipped to the markets. Coursing them with greyhounds after the English fashion (see COURSING) is an exciting and favorite sport.

The marsh hare (*L. palustris*) and water hare (*L. aquaticus*), of the Southern Atlantic seaboard and the Mississippi valley respectively, are rather short-legged species, which differ from the others in the readiness with which they will enter water.

In Europe the common hare (*L. timidus*), the mountain hare (*L. variabilis*) and the rabbit (*L. cuniculus*), from which the domestic races have been derived, are the principal species. Consult: Coues and Allen, 'Monographs of the Rodentia' (1877); Thompson, 'Wild Animals I have Known' (1898); Stone and Cram, 'American Animals' (1902).

Hargreaves, här'gravz, **Edmund Hammond**, English discoverer of the gold-fields of Australia: b. Gosport, England, 1815; d. Sidney, N. S. W., October 1891. When 18 he settled in Australia, but attracted to California in 1849, he there tried his luck as gold-digger, and detecting a similarity in the geological formation of California and Australia, inferred that gold would be found in the latter, also on his return established the correctness of his surmise by finding gold on the west slopes of the Blue Hills in New South Wales in 1851. He was appointed commissioner of crownlands, and received from the government of New South Wales a reward of $50,000. In 1855 he published 'Australia and Its Gold-fields.'

Hargreaves, här'grēvz, **James**, English inventor: b. Stanhill, near Blackburn, Lancashire; d. Nottingham, England, April 1778. In 1760 he invented a machine consisting of a revolving cylinder with cards or combs set round it as a substitute for the hand-cards formerly in use in combing out cotton. Some years after this he invented the spinning-jenny, by which he was able to spin with several spindles at once. With his new machines he succeeded in turning out a much greater amount of yarn than his neighbors, which excited their jealousy, and they accordingly broke into his dwelling, and destroyed his machine. In consequence of repeated persecution of this kind Hargreaves removed in 1768 to Nottingham, and in 1770 obtained a patent for his invention. Here, however, he reaped scarcely any more benefit from it than before. After refusing £3,000 offered him by a private company for his patent, this was declared invalid on the ground that he had sold several of the machines before taking out the patent. For the rest of his life he carried on business as a cotton manufacturer in partnership with Mr. James. The only public recognition this invention ever obtained was in the form of a bounty of £250 granted by Sir Robert Peel, nearly 70 years after Hargreaves' death, to his last surviving daughter.

Häring, Wilhelm, vĭl'hĕlm hā'rĭng, "Alexis Wilibald," German historical novelist: b. Breslau 29 June 1798; d. Arnstadt 16 Dec. 1871. His work was suggested by the 'Waverley Novels' and in fact, his first two important works, 'Walladmor' and 'Avalon Castle,' purported to be translations from Scott. His works are historical tales of Prussia, with Frederick the Great for hero: among these may be cited 'Cabanis'; 'The False Waldemar'; 'Peace is the First Civic Duty.' He was very fertile in plot and incident, but his style is mannered; the tales are still popular, however, from their patriotic fervor.

Harivanśa, hă-rĭ-văn'sha, a Sanskrit epic poem, later than the Mahâbhârata, to which it forms a sort of sequel or epilogue. It has been translated into French by Langlois (1834).

Hark, Joseph Maximilian, Moravian clergyman: b. Philadelphia 4 June 1849. Graduated from the Moravian College and Theological Seminary in Bethlehem, Pa., he entered the Moravian ministry and was successively pastor of Moravian churches in Lebanon, Philadelphia and Lancaster, Pa. Since 1893 he has been principal of the Moravian Seminary at Bethlehem, Pa., the oldest girls' boarding school in America. He has been a frequent contributor to 'The Outlook' and other periodicals, and has published 'The Unity of the Truth in Christianity and Evolution.'

Hark'ness, Albert, American Latinist: b. Menden, Mass., 6 Oct. 1822; d. Providence, R. I., 26 May 1907. He was graduated from Brown University in 1842, and in 1855 was appointed professor of Greek in that institution. He was a founder of the American Philological Association, and its president in 1875–6. In 1884 he was elected director of the American School of Classical Studies at Athens, Greece. His best-known works were a series of Latin text-books widely used and of much influence; including a first book, readers, a manual of prose composition, editions of Cæsar, Cicero, and Sallust, and an excellent 'Latin Grammar' (1881), revised and enlarged as 'A Complete Latin Grammar' (1898).

Harkness, William, American astronomer: b. Ecclefechan, Scotland, 17 Dec. 1837; d. 1903. He was graduated from Rochester University in 1858, studied medicine, was a surgeon in the Federal army for a time, in 1862–5 was an aid in the United States naval observatory, and during the total eclipse of 7 Aug. 1869 discovered the line K. 1474 of the solar corona. He is best known for his theory of the focal curve of achromatic telescopes, and for his invention of the spherometer caliper, the most nearly accurate device for the measurement of the inequalities of pivots in astronomical instruments. In 1894–9 he was astronomical director of the Naval Observatory, and in 1899 was retired with relative rank of rear-admiral. He published 'The Solar Parallax' (1891).

Harlan, här'lan, **James,** American legislator: b. Clarke County, Ill., 25 Aug. 1820; d. Mount Pleasant, Iowa, 5 Oct. 1899. He was graduated from Indiana Asbury (now De Pauw) University in 1845, in 1853 was elected president of Iowa Wesleyan University, in 1855–65 served as United States senator, in 1865–6 was secretary of the interior, and then served a third term (1866–72) in the Senate. Subsequently he was editor of the Washington *Chronicle*, and in 1882–5 presiding judge of the court of commissioners of Alabama claims.

Harlan, John Marshall, American jurist: b. Boyle County, Ky., 1 June 1833. He was graduated from Centre College, Kentucky, studied law at Transylvania University, and entering upon the practice of his profession at Frankfort, became county judge in 1858, and was Whig candidate for Congress in 1859, but was not elected. In the Civil War he served in the Union army as colonel of a Kentucky regiment, and in 1863–6 was attorney general of his State. He was Republican nominee for governor in 1871 and 1875, but was defeated on both occasions. In the Republican National Convention of 1872 his name was presented by the Kentucky delegation for the nomination for vice-president of the United States. In 1877 he was appointed a member of the commission to investigate the troubles in Louisiana; and in November of that same year he was appointed associate justice of the United States Supreme Court, of which he is considered one of the most able and independent members. He supported the constitutionality of the income tax clause of the Wilson Tariff Bill.

Harlan, Iowa, city, county-seat of Shelby County; on the West Nishnabotna River, the Chicago, R. I. & P., the Chicago & N. R.R.'s; about 90 miles west of Des Moines. The chief manufactures are foundry products, agricultural implements, flour, bricks, gasoline engines, and furniture. Its shipping trade is in agricultural products and the manufactures of the city. Pop. (1900) 2,422.

Harland, här'land, **Henry,** pseudonym 'Sidney Luska,' Anglo-American novelist: b. St. Petersburg, Russia, 1 March 1861; d. San Remo, Italy, 21 Dec. 1905. He was educated at Harvard and after being in the surrogate's office in New York 1883–6 removed to London, where he edited the 'Yellow Book.' He published 'As It Was Written' (1885), a musician's story; 'Mrs. Peixada' (1886); 'The Land of Love' (1887); 'My Uncle Florimond' (1888); 'The Yoke of the Thorah' (1887); 'Mr. Sonnenschein's Inheritance' (1888); 'A Latin-Quarter Courtship'; 'Comedies and Errors' (1898); 'Cardinal's Snuff-box' (1900); etc., books which have been extensively circulated in both America and England.

Harland, Marion. See Terhune, Mary Virginia.

Harlech, här'leн. Wales, an ancient town, the former capital of Merionethshire, situated on the coast, 10 miles north of Barmouth. On a steep hill overlooking the sea is the castle, which held out for the Lancastrians in the wars of the Roses, and later for Charles I. The 'March of the Men of Harlech' commemorates its capture by the Yorkists in 1468.

Harlem, a part of New York city above 106th street, between the East and Harlem Rivers and Eighth Avenue. See NEW YORK CITY.

Harlem, Ill., village in Cook County; on the Illinois C. and the Chicago & N. W. R.R.'s; about seven miles from Chicago and near Oak Park. The first permanent settlement was made in 1854, and the village of Harlem was incorporated in 1883. It is a residential suburb of Chicago, and is noted for its race track (see HORSE-RACING). Waldheim and Forest Home cemeteries are in Harlem. A monument to the men executed as anarchists who were connected with the Chicago riots of 1886 is in the Waldheim cemetery. The government is vested in a president and board of trustees elected annually. Pop. (1900) 4,085.

Harlem Plains, Battle of, in the Revolutionary War, a conflict on 16 Sept. 1776, which followed Howe's occupation of New York and Manhattan Island. On the Harlem Plains or Flats an advance guard of British troops came into contact with a body of Virginian and Connecticut troops commanded respectively by Majors Leitch and Knowlton. In attempting to flank the enemy Knowlton was killed, and by Washington's orders the Americans retreated, with a loss of 60 killed and wounded.

Harlem River, the name given to the tidal channel north of the island of Manhattan, which separates the boroughs of Manhattan and the Bronx, in New York. The Harlem is connected with the Hudson River by Spuyten Duyvil Creek, and extends south by east about seven miles to East River. Randall's Island is at its entrance to East River. In 1895 a ship-canal was opened which connects the Hudson and the Harlem south of the Spuyten Duyvil channel. A number of bridges span the Harlem, the finest being High Bridge, an aqueduct bridge, and Washington Bridge which crosses the river a little north of a point opposite Fort Washington on the Hudson. Along the western shore is the excellent roadway called the Speedway, and on the same side of the river are the polo and ball grounds, the High Bridge park and a number of fine public and private buildings.

Harlequin, här'lē-kĭn or -kwĭn (French *arlequin*, Italian *arlecchino*), a word of doubtful origin, but probably from old French *Hellequin*, *Herlequin*, the name of a demon figuring in mediæval legends; this again is supposed to be of German origin, its elements corresponding to English "hell" and "kin." Riccoboni conjectures ('History of the Italian Theatre') that the dress of the harlequins is no other than the *centunculus* of the old Roman *mimi* or mimes, who were players in ridiculous pieces or farces of a loose character. The character of the ancient harlequin was a mixture of extravagant buffoonery with great bodily agility. But in the middle of the 16th century his character was essentially changed. He became a simple, ignorant servant, who tries very hard to be witty, even at the expense of being malicious. He is a chameleon, who assumes all colors, and can be made, in the hands of a skilful actor, the principal character on the stage. He must excel in extempore sallies. This account applies more particularly to the Italian harlequin. The gallant, obsequious French harlequin is an entirely national mask. In the vaudeville theatre he is silent, with a black half-mask, and reminds one throughout the representation of the grace and agility of the cat. In Great Britain, in the Christmas pantomimes, he becomes a lover and a magician; and in exchange for the gift of language, of which he has been deprived, he has been invested with a wonder-working wand. With this wand he protects his mistress, the columbine, against the clown and pantaloon, who pursue and endeavor to capture her, until the pursuit is brought to a termination by a good fairy. The harlequin wears a tight dress of bright colors, and glittering with spangles.

Harlequin Cabbage-bug. See CABBAGE-INSECTS.

Harlequin Duck. See DUCK.

Harlequin Snake. See CORAL SNAKE.

Har'ley, Robert, 1st EARL OF OXFORD, English statesman: b. London 5 Dec. 1661; d. 21 May 1724. After the accession of Anne he and his colleague St. John, afterward Lord Bolingbroke, became leaders of the Tories. The former was chosen speaker of the House of Commons in 1702, and was chief secretary of state 1704–8. After the fall of Marlborough Harley became chancellor of the exchequer in 1710 and next year was created Earl of Oxford. He and Bolingbroke secured the Treaty of Utrecht (1713), but afterward quarrelled. Early in the reign of George I. he was impeached of high treason on the ground of his alleged Jacobite intrigues, and was kept in the Tower for two years, but owing to the inability of the Peers and the Commons to agree about the mode of procedure, was acquitted. His patronage was extended to Swift, Pope, and other literary men, and he made a valuable collection of books and MSS., which latter are preserved in the British Museum, where they form the 'Bibliotheca Harleiana.' Those which have been printed constitute the 'Harleian Miscellany.'

Harlow, här'lō, **George Henry**, English painter: b. London 10 June 1787; d. there 4 Feb. 1819. After studying under other masters, he entered the studio of Sir Thomas Lawrence, who used to employ him to dead color. In 1818 he visited Rome, where he astonished the artists there by completing an effective copy of the 'Transfiguration' of Raphael in 18 days. This gained him the friendship of Canova, who procured his election as a member of the Academy of St. Luke. His best original works are two designs from Shakespeare, 'Hubert and Prince Arthur,' and the 'Trial of Queen Catharine.' The principal characters in the latter are portraits of members of the Kemble family; and the figure of Queen Catharine is a likeness of Mrs. Siddons (q.v.). He was eminent as a portrait painter, and his portrait of Fuseli is regarded as a work of great merit.

Harlowe, Clarissa, a novel published by Samuel Richardson in 1748. The story is told by means of letters, and while somewhat prolix for modern taste, is an accurate record of many of the manners and ideals of the 18th century.

Har'maline and **Harmine,** two alkaloids which occur, probably in the form of phosphates, in the seed-coatings of the harmel or Syrian rue (*Peganum harmala*), a plant growing in the Mediterranean region and in southern Asia. The seeds are extracted with dilute acetic or sulphuric acid, and the hydrochlorids of the two alkaloids are precipitated by the addition of common salt. The precipitate is washed with salt solution, and afterward with water, in which the hydrochlorids dissolve. The filtrate is clarified by animal charcoal and heated to 140° F., after which ammonia is added. Harmine is precipitated first, and by the continued addition of ammonia the harmaline is thrown down subsequently. Harmine has the formula $C_{13}H_{12}N_2O$. It is practically insoluble in ether, and is but slightly soluble in water. It dissolves in alcohol, from which it crystallizes in colorless monoclinic prisms, melting at 495° F. Harmaline is the hydrid of harmine, and has the formula $C_{13}H_{14}N_2O$. It is somewhat soluble in water, ether, and cold alcohol, and dissolves freely in hot alcohol. It crystallizes from solution in alcohol in the form of octahedra belonging to the trimetric system, and melts at about 460° F. The salts of harmine are mostly colorless, while those of harmaline are yellow; and the salts of both of these bases exhibit marked fluorescence. The name «harmaline» is also applied to the coloring matter now more commonly known as fuchsine.

Har'mar, Josiah, American soldier: b. Philadelphia 1753; d. there 20 Aug. 1813. He entered the patriot army as captain, became colonel in 1777, served with Washington (1778–80) and with Greene in the South. In 1784 he brought to France the ratification of the final treaty. In 1789 he was made brigadier-general in the United States army, and was general-in-chief of the army from 1789 to 1792. He conducted an expedition against the Miami Indians, which suffered a severe defeat, and shortly afterward resigned his commission. From 1793–9 he was adjutant-general of Pennsylvania.

Harmattan, här-măt'an, a land-wind, very dry and hot, blowing upon the coast of Africa between Cape Verde, in lat. 14° 43′ N., and Cape Lopez, lat. 0° 36′ S., during December, January, and February. It is generally attended by fog, through which the sun shines red. It hurts vegetation and injuriously affects man, drying up the eyes, the mouth, etc., even peeling off the skin. On the other hand, it tends to terminate fever and dysentery, and to mitigate cutaneous diseases. It corresponds to the sirocco of Italy and, to a certain extent, to the Indian and Australian hot wind.

Harmodius (här-mō'dĭ-ŭs) and **Aristogiton,** ā-rĭs-tō-jī't'n, two Athenian youths who in 514 B.C. killed Hipparchus, the younger brother of the tyrant Hippias, partly because of an insult offered to the sister of Harmodius, and partly with a view to the overthrow of the Pisistratidæ. Harmodius was slain by the soldiers of Hipparchus, while Aristogiton fled, but was afterward taken and executed. Subsequently they came to be regarded as patriotic martyrs, and received divine honors from the Athenians, and had statues raised to their memory. They were strongly attached to each other, and are sculptured in a group in the Museo Nazionale, Naples, copied from the bronze originals which once adorned the Acropolis at Athens.

Har'mon, Judson, American jurist: b. Hamilton County, Ohio, 3 Feb. 1846. He was graduated at Denison University, 1866, and at Cincinnati Law School, 1869. He was judge of the common pleas court (1876–8); judge of the superior court of Cincinnati, 1878–87; and attorney-general of the United States, 1896–7. He is president of the Ohio Bar Association, and a member of the faculty in the law department of the University of Cincinnati.

Harmonic Analysis, The. «The Harmonic Analysis» is the name first given by Thomson and Tait in their 'Natural Philosophy' to a method extensively and fruitfully employed in investigations in many branches of Mathematical Physics, and first used by Daniel Bernouilli and Euler in the middle of the eighteenth century in studying the musical vibrations of a stretched elastic string.

From the physical side it is described by J. Clerk Maxwell as «a method by which the solution of an actual problem may be obtained as the sum or resultant of a number of terms, each of which is a solution of a particular case of the problem.» The method is applicable to physical problems where the actual complicated state under investigation can be regarded as due to the superposition of a number of simpler states that can coexist without interfering with one another.

For example, in dealing with the small oscillations of a musical string it is known that the string is capable of sounding a variety of so-called pure notes, known as the fundamental note, the first harmonic or octave of the fundamental note, and the higher harmonics of the fundamental note, and that the forms of vibration giving these various notes may coexist, so that the string may be sounding at once its fundamental note and its various harmonics and thus be giving a note quite distinguishable from its pure fundamental note though of the same pitch. If we are dealing with the problem of the motion of a string sounding such a complicated note, the harmonic analysis enables us to obtain and to express its solution as a sum of the terms expressing the motions which separately would give the separate pure notes actually present.

From the mathematical side the problems to which the harmonic analysis is applicable are those in which it is necessary to find a solution of a homogeneous linear differential equation which shall satisfy a set of given initial or boundary conditions sufficiently numerous to make the problem determinate. It is well known that if a solution of such a differential equation has been obtained, it may be multiplied by any constant and will still be a solution; and that if several solutions have been obtained, their sum will be a solution. In using the harmonic analysis we attempt by a skilful use of these two principles to so combine simple particular solutions of the differential equation involved in the problem as to form a solution of the equation which satisfies all the given conditions. This usually makes it necessary to analyze some one of the given conditions into a sum or series of simpler so-called harmonic terms, or in other words to develop some function of one of the independent variables, or of a set of the independent variables into a series whose terms are of specified form.

For instance, suppose a harp-string of length l initially distorted into a curve whose equation referred to the position of equilibrium of the string as the X-axis and to one end of the string as origin is $y=f(x)$, and then released, and that it is required to solve the problem of the subsequent motion of the string, the initial displacement being small.

Here we have to solve the differential equation

$$\frac{\partial^2 y}{\partial t^2}=a^2\frac{\partial^2 y}{\partial x^2}, \qquad (I)$$

subject to the conditions $y=0$ when $x=0$; $y=0$ when $x=l$; $\frac{\partial y}{\partial t}=0$ when $t=0$; $y=f(x)$ when $t=0$. It is known and is easily verified that $y=\sin\beta x\cos a\beta t$ is a particular solution of (I) if β is any constant. If we take $\beta=\frac{m\pi}{l}$, where m is any whole number, $y=\sin\frac{m\pi x}{l}\cos\frac{m\pi at}{l}$ is a solution of (I) which satisfies our first three conditions; and so is

$$y=a_1\sin\frac{\pi x}{l}\cos\frac{\pi at}{l}+a_2\sin\frac{2\pi x}{l}\cos\frac{2\pi at}{l}$$
$$+a_3\sin\frac{3\pi x}{l}\cos\frac{3\pi at}{l}+\ldots, \qquad (1)$$

where a_1, a_2, a_3, ... are any constants. When $t=0$ (1) reduces to

$$y=a_1\sin\frac{\pi x}{l}+a_2\sin\frac{2\pi x}{l}+a_3\sin\frac{3\pi x}{l}+\ldots, \qquad (2)$$

and if we can choose a_1, a_2, etc., so that the series in (2) is equal to $f(x)$ for all values of x between 0 and l, (1) becomes our required solution. This calls for the development of $f(x)$ into a Trigonometric Series of somewhat peculiar form known as a Fourier's Series, and when that is accomplished our solution is complete.

Fourier's Series.—It was first shown by Fourier in his researches into the Conduction of Heat in 1812 that

$$f(x)=\frac{1}{2}b_0+b_1\cos\frac{\pi x}{c}+b_2\cos\frac{2\pi x}{c}+b_3\cos\frac{3\pi x}{c}+\ldots$$
$$+a_1\sin\frac{\pi x}{c}+a_2\sin\frac{2\pi x}{c}+a_3\sin\frac{3\pi x}{c}+\ldots, \qquad (3)$$

where $\qquad a_m=\frac{1}{c}\int_{-c}^{c}f(x)\sin\frac{m\pi x}{c}dx,$

and $\qquad b_m=\frac{1}{c}\int_{-c}^{c}f(x)\cos\frac{m\pi x}{c}dx,$

for all values of x between $-c$ and c.

If $f(-x)=-f(x)$, that is, if $f(x)$ is an odd function, (3) reduces to

$$f(x)=a_1\sin\frac{\pi x}{c}+a_2\sin\frac{2\pi x}{c}+a_3\sin\frac{3\pi x}{c}+\ldots, \qquad (4)$$

where $\qquad a_m=\frac{2}{c}\int_0^c f(x)\sin\frac{m\pi x}{c}dx.$

If $f(-x)=f(x)$, that is, if $f(x)$ is an even function, (3) reduces to

$$f(x)=\frac{1}{2}b_0+b_1\cos\frac{\pi x}{c}+b_2\cos\frac{2\pi x}{c}$$
$$+b_3\cos\frac{3\pi x}{c}+\ldots, \qquad (5)$$

where $\qquad b_m=\frac{2}{c}\int_0^c f(x)\cos\frac{m\pi x}{c}dx.$

If the development need hold good merely for values of x between 0 and c, any one of the forms given above may be employed.

Harmonic Functions.—Laplace's Equation,

$$\frac{\partial^2 V}{\partial x^2}+\frac{\partial^2 V}{\partial y^2}+\frac{\partial^2 V}{\partial z^2}=0, \qquad (II)$$

in the numerous forms it assumes in different systems of coordinates plays a larger part in the various branches of mathematical physics than any other differential equation, and the harmonic analysis is required in a large proportion of the physical problems that obey the law it expresses.

A function which together with its first space derivatives is continuous within a specified region and which satisfies Laplace's equation at every point within the region is said to be *harmonic* in the region in question.

The form to which a harmonic function reduces on one of the level surfaces of the appropriate coördinate system is called a *Surface Harmonic.*

Zonal Harmonics.—The coefficient of z^m in the development of $(1-2\mu z+z^2)^{-\frac{1}{2}}$ in ascending powers of z, where $\mu=\cos\theta$, is represented by $P_m(\mu)$ and is called a *Surface Zonal Harmonic* of the mth degree, or a *Legendre's Coefficient* or *Legendrian.*

It can be shown that $V=r^m P_m(\cos\theta)$ and $V=\frac{1}{r^{m+1}}P_m(\cos\theta)$ are particular solutions of Laplace's equation in spherical coördinates,

$$\frac{r\partial^2(rV)}{\partial r^2}+\frac{1}{\sin\theta}\frac{\partial\left(\sin\theta\frac{\partial V}{\partial\theta}\right)}{\partial\theta}+\frac{1}{\sin^2\theta}\frac{\partial^2 V}{\partial\phi^2}=0. \quad (III)$$

They are called *Solid Zonal Harmonics.* The first form is harmonic within the sphere whose centre is at the origin of coordinates and whose radius is unity, and the second form is harmonic in all space outside of that sphere. They are appropriate functions to use in solving problems where a solution of (III) is required, if it is evident from considerations of symmetry that the solution is independent of the coordinate ϕ.

$$P_m(\mu)=\frac{1\cdot3\cdot5\cdot\ldots(2m-1)}{1\cdot2\cdot3\cdot\ldots m}\left[\mu^m-\frac{m(m-1)}{2(2m-1)}\mu^{m-2}\right.$$
$$\left.+\frac{m(m-1)(m-2)(m-3)}{2\cdot4\cdot(2m-1)(2m-3)}\mu^{m-4}\ldots\right],$$

whence

$P_0(\mu)=1,\qquad P_2(\mu)=\frac{1}{2}(3\mu^2-1),$

$P_1(\mu)=\mu,\qquad P_3(\mu)=\frac{1}{2}(5\mu^3-3\mu),$

$P_4(\mu)=\frac{1}{8}(35\mu^4-30\mu^2+3),$

$P_5(\mu)=\frac{1}{8}(63\mu^5-70\mu^3+15\mu).$

. . . .

A very important property of the Surface Zonal Harmonic $P_m(\mu)$ which follows readily from its definition is $P_m(1)=1$. That is, the function reduces to unity at all points on the polar axis.

If, in a problem where V must satisfy Laplace's Equation and there is symmetry about the polar axis, the value of V on the axis is represented by a convergent series $a_0+a_1z+a_2z^2+\ldots$, z being the distance of the point from the origin, then the series formed by writing $r^mP_m(\cos\theta)$ instead of z^m in the given series gives the value of V at any point in space at which the new series is convergent. If the value of V on the axis is represented by a convergent series $\frac{a_1}{z}+\frac{a_2}{z^2}+\frac{a_3}{z^3}+\ldots$, then the series formed from the given series by replacing $\frac{1}{z^{m+1}}$ by $\frac{1}{r^{m+1}}P_m(\cos\theta)$ gives the value of V at any point in space at which the new series is convergent.

For instance, if a charge M of statical electricity be placed on a conductor in the form of a thin circular disc of radius a, it is known that the charge will so distribute itself that the surface density σ at any point of the disc at the distance s from its center will be $\sigma=\frac{M}{4a\pi\sqrt{a^2-s^2}}$.

If the axis of the disc is taken as the polar axis, the value of the Potential Function V due to the charge, at a point of the axis at the distance x from the centre is $V=\frac{M}{2a}\cos^{-1}\left(\frac{x^2-a^2}{x^2+a^2}\right)$. This can be developed into the series

$$\frac{M}{a}\left[\frac{\pi}{2}-\frac{x}{a}+\frac{x^3}{3a^3}-\frac{x^5}{5a^5}+\ldots\right] \quad\text{if}\quad x<a,$$

$$\text{or}\quad \frac{M}{a}\left[\frac{a}{x}-\frac{a^3}{3x^3}+\frac{a^5}{5x^5}-\frac{x^7}{7a^7}+\ldots\right] \quad\text{if}\quad x>a.$$

Hence

$$V=\frac{M}{a}\left[\frac{\pi}{2}-\frac{r}{a}P_1(\cos\theta)+\frac{1}{3}\frac{r^3}{a^3}P_3(\cos\theta)\right.$$
$$\left.-\frac{1}{5}\frac{r^5}{a^5}P_5(\cos\theta)+\ldots\right] \quad\text{if } r<a, \text{ and } \theta<\frac{\pi}{2};$$

and

$$V=\frac{M}{a}\left[\frac{a}{r}-\frac{1}{3}\frac{a^3}{r^3}P_2(\cos\theta)+\frac{1}{5}\frac{a^5}{r^5}P_4(\cos\theta)-\ldots\right]$$
$$\text{if}\quad r>a.$$

If, in a problem where V must satisfy Laplace's Equation and there is symmetry about an axis, the value of V on the surface of the sphere $r=a$ is given and can be expressed as a sum or as a series of Surface Zonal Harmonics, the value of V at a point not on the sphere will be obtained by replacing the Surface Zonal Harmonics by the appropriate Solid Zonal Harmonics.

To take a very simple example: If a charge of electricity is placed on a spherical conductor of radius a, it is known that it will so distribute itself that all points on the surface will be at the same potential $\frac{M}{a}$.

Now $\frac{M}{a}=\frac{M}{a}P_0(\cos\theta)$ and is a Surface Zonal Harmonic. Hence any point at the distance r from the centre of the conductor is at potential $\frac{M}{a}\frac{r^0}{a^0}P_0(\cos\theta)$ or $\frac{M}{a}$ if $r<a$, and at potential $\frac{M}{a}\frac{a}{r}P_0(\cos\theta)$ or $\frac{M}{r}$ if $r>a$.

If the value of V on the surface of the sphere had been less simple, say $V=F(\theta)=f(\cos\theta)\equiv f(\mu)$, then $f(\mu)$ would have had to be expressed in the form $a_0P_0(\mu)+a_1P_1(\mu)+a_2P_2(\mu)+\ldots$ before we could have used the simple method illustrated above. This can be done by the aid of the formula

$$f(\mu)=a_0P_0(\mu)+a_1P_1(\mu)+a_2P_2(\mu)+a_3P_3(\mu)+\ldots,$$

where $a_m=\frac{2m+1}{2}\int_{-1}^{1}f(x)P_m(x)dx$, the development in question holding good when $-1<\mu<1$.

For instance, let one half of the surface of a homogeneous sphere be kept at the temperature zero and the other half at the temperature 1; to find the stationary temperature u of any internal point. Here $f(\mu)=1$, $0<\mu<1$, and $f(\mu)=0$, $-1<\mu<0$. Consequently

$$a_m=\frac{2m+1}{2}\left[\int_{-1}^{0}0\cdot P_m(x)dx+\int_{0}^{1}P_m(x)dx\right]$$
$$=\frac{2m+1}{2}\int_0^1 P_m(x)dx.$$

Letting $m=0, 1, 2, \ldots$, successively, and using the corresponding values 1, x, $\frac{1}{2}(3x^2-1)$, etc., of $P_m(x)$, we get $a_0=\frac{1}{2}$, $a_1=\frac{3}{4}$, $a_2=0$, $a_3=-\frac{7}{8}\cdot\frac{1}{2}$, $a_4=0$, $a_5=\frac{11}{12}\cdot\frac{1}{2}\cdot\frac{3}{4}$, ... and $f(\mu)=\frac{1}{2}P_0(\mu)+\frac{3}{4}P_1(\mu)-\frac{7}{8}\cdot\frac{1}{2}P_3(\mu)+\frac{11}{12}\cdot\frac{1}{2}\cdot\frac{3}{4}P_5(\mu)-\ldots$

If a is the radius of the sphere, the required temperature

$$u=\frac{1}{2}+\frac{3}{4}\frac{r}{a}P_1(\cos\theta)-\frac{7}{8}\cdot\frac{1}{2}\frac{r^3}{a^3}P_3(\cos\theta)$$
$$+\frac{11}{12}\cdot\frac{1}{2}\cdot\frac{3}{4}\frac{r^5}{a^5}P_5(\cos\theta)\ldots$$

Tables giving the numerical values of the Surface Zonal Harmonics have been computed and are accessible, and by their aid numerical results can be obtained in such problems as those we have been considering as readily as if we were using simple trigonometric functions. The following is such a table carried only to three places.

TABLE 1.—SURFACE ZONAL HARMONICS.

θ	$P_1(\cos\theta)$	$P_2(\cos\theta)$	$P_3(\cos\theta)$	$P_4(\cos\theta)$	$P_5(\cos\theta)$
0°	1.000	1.000	1.000	1.000	1.000
10	.985	.955	.911	.853	.784
20	.940	.824	.665	.475	.272
30	.866	.625	.325	.023	−.223
40	.766	.380	−.025	−.319	.420
50	.643	.120	−.300	−.428	.254
60	.500	−.125	−.438	−.289	.000
70	.342	−.324	−.413	−.004	.328
80	.174	−.455	−.247	.266	.281
90	.000	−.500	.000	.375	.000

Legendrians were first used by Legendre in a paper published in 1785 on the attraction of solids of revolution.

Laplace's Coefficients. — $P_m(\cos\gamma)$, where $\gamma\equiv\cos\theta\cos\theta_1+\sin\theta\sin\theta_1\cos(\phi-\phi_1)$, and is the angle made by the radius vector with a fixed line through the origin whose direction is given by the angles θ_1 and ϕ_1, is called a Laplace's Coefficient or Laplacian, the fixed line being called the Axis and its intersection with the unit sphere the Pole of the Laplacian. A Surface Zonal Harmonic $P_m(\cos\theta)$ is merely a Laplacian whose axis coincides with the axis of coordinates. $r^m P_m(\cos\gamma)$ and $\frac{1}{r^{m+1}}P_m(\cos\gamma)$ are solutions of Laplace's Equation (III). The first is harmonic within and the second without the unit sphere.

Laplacians may be used in problems symmetrical about an axis if the axis does not coincide with the axis of coordinates just as Zonal Harmonics are used when the problem is symmetrical about the polar axis.

Laplacians were first used by Laplace, in one of the most remarkable memoirs ever written, in determining the attraction of a Spheroid. The paper in question was published in 1782.

Spherical Harmonics.—A Surface Spherical Harmonic of the mth degree Y_m may be most simply defined as the function obtained by dividing a rational, integral, homogeneous, algebraic polynomial of the mth degree in x, y, z which satisfies Laplace's Equation (I), by r^m, that is, by $(x^2+y^2+z^2)^{\frac{m}{2}}$. For example, $\frac{1}{r}(x+y+z)$, $\frac{1}{r^2}(x^2+xy+y^2)$, $\frac{1}{r^3}(2x^3-3xy^2-3xz^2)$ are Surface Spherical Harmonics of the first degree, of the second degree, and of the third degree, respectively.

It is clear that $r^m Y_m$ satisfies Laplace's Equation. The same thing can be shown of $\frac{1}{r^{m+1}}Y_m$. The first is harmonic within, the second without, the unit sphere. They are known as Solid Spherical Harmonics.

It is clear that if the value of V on the surface of a sphere whose centre is the origin can be expressed as a sum of terms each of which is a surface Spherical Harmonic, its value at any point not on the surface is the sum of the appropriate corresponding Solid Spherical Harmonics.

It can be shown by transforming from spherical to rectangular coördinates that the Surface Zonal Harmonic $P_m(\mu)$ or $P_m(\cos\theta)$ and the Laplacian $P_m(\cos\gamma)$ are Surface Spherical Harmonics, and by the reverse transformation that the general Surface Spherical Harmonic Y_m can be formulated as

$$Y_m = A_0 P_m(\mu)$$

$$+\sum_{n=1}^{n=m}\left[(A_n\cos n\phi + B_n\sin n\phi)\sin^n\theta\frac{d^nP_m(\mu)}{d\mu^n}\right].$$

A function given arbitrarily on the surface of the unit sphere, i.e., a function of θ and ϕ, if expressed as a function of $\cos\theta$ and ϕ can be developed into a series of Surface Spherical Harmonics by the formulas

$$f(\mu,\phi) = \sum_{m=0}^{m=\infty}\left\{A_{0,m}P_m(\mu) + \sum_{n=1}^{n=m}\left[(A_{n,m}\cos n\phi\right.\right.$$

$$\left.\left.+B_{n,m}\sin n\phi)\sin^n\theta\frac{d^nP_m(\mu)}{d\mu^n}\right]\right\},$$

$$A_{0,m} = \frac{2m+1}{4\pi}\int_0^{2\pi}d\phi\int_{-1}^{1}f(\mu,\phi)P_m(\mu)d\mu,$$

$$\frac{2\pi}{2m+1}\frac{(m+n)!}{(m-n)!}A_{n,m}$$

$$=\int_0^{2\pi}\int_{-1}^{1}f(\mu,\phi)\cos n\phi\sin^n\theta\frac{d^nP_m(\mu)}{d\mu^n}d\mu,$$

$$\frac{2\pi}{2m+1}\frac{(m+n)!}{(m-n)!}B_{n,m}$$

$$=\int_0^{2\pi}d\phi\int_{-1}^{1}f(\mu,\phi)\sin n\phi\sin^n\theta\frac{d^nP_m(\mu)}{d\mu^n}d\mu.$$

The following theorems concerning the integration of Spherical Harmonics are important. We give them without proof.

The integral of the product of two Surface Spherical Harmonics $Y_m Y_n$ of different degrees taken over the surface of the unit sphere is equal to zero.

The integral over the surface of the unit sphere, of the product of a Surface Spherical Harmonic by a Laplacian of the same degree, is $\frac{4\pi}{2m+1}$ multiplied by the value the Spherical Harmonic assumes at the Pole of the Laplacian.

These theorems enable us to solve many problems in the theory of Gravitation and the theory of Electrostatics by direct integration.

Bessel's Functions.—A Bessel's Function or Surface Cylindrical Harmonic of the nth order $J_n(x)$ may be defined as the coefficient of z^n in the development of $e^{\frac{x}{2}\left(z+\frac{1}{z}\right)}$ into an ascending Power Series in z. It can be shown that

$$V=\cosh(\mu z)(A\cos n\phi + B\sin n\phi)J_n(\mu r)$$

and

$$V=\sinh(\mu z)(A\cos n\phi + B\sin n\phi)J_n(\mu r),$$

where μ is any constant, are solutions of Laplace's Equation in Cylindrical Coördinates

$$\frac{\partial^2 V}{\partial r^2}+\frac{1}{r}\frac{\partial V}{\partial r}+\frac{1}{r^2}\frac{\partial^2 V}{\partial\phi^2}+\frac{\partial^2 V}{\partial z^2}=0. \qquad \text{(IV)}$$

The Bessel's Functions most used are $J_0(x)$ and $J_1(x)$, which are appropriate when the problem has axial symmetry about the Axis of Z.

$$J_0(x) = 1 - \frac{x^2}{2^2} + \frac{x^4}{2^2\cdot 4^2} - \frac{x^6}{2^2\cdot 4^2\cdot 6^2} + \ldots,$$

and is convergent for all values of x.

$$J_1(x) = -\frac{dJ_0(x)}{dx}.$$

Important properties are given by the formulas

$$\int_0^x xJ_0(x)dx = xJ_1(x)$$

and

$$\int_0^x x\{J_0(x)\}^2dx = \tfrac{1}{2}x^2[\{J_0(x)\}^2+\{J_1(x)\}^2],$$

and the following formulas for development in Cylindrical Harmonic Series, the development holding good for values of r between 0 and a.

$$f(r) = \Sigma A_\kappa J_0(\mu_\kappa r),$$

where μ_κ is a root of the transcendental equation in μ, $J_0(\mu a)=0$, or of $J_1(\mu a)=0$, or of

$$\mu a J_1(\mu a) - \lambda J_0(\mu a) = 0,$$

and

$$A_\kappa = \frac{2}{a^2[\{J_0(\mu_\kappa a)\}^2 + \{J_1(\mu_\kappa a)\}^2]} \int_0^a r f(r) J_0(\mu_\kappa r) dr.$$

For the important case where $f(r) = 1$,

$$A_\kappa = \frac{2}{\mu_\kappa a[\{J_0(\mu_\kappa a)\}^2 + \{J_1(\mu_\kappa a)\}^2]} J_1(\mu_\kappa a).$$

As an example in the use of Bessel's Functions let us find the stationary temperature of any point (r, z) in a homogeneous cylinder of radius a and altitude b if the convex surface and one base are kept at the temperature zero and the other base at the temperature 1.

Here we seek a solution V of equation (IV) which reduces to zero when $z = 0$, and when $r = a$, and to 1 when $r = b$. By the aid of the formulas above this is easily formed and is

$$V = \frac{2}{\mu_1 a J_1(\mu_1 a)} \frac{\sinh(\mu_1 z)}{\sinh(\mu_1 b)} J_0(\mu_1 r)$$

$$+ \frac{2}{\mu_2 a J_1(\mu_2 a)} \frac{\sinh(\mu_2 z)}{\sinh(\mu_2 b)} J_0(\mu_2 r)$$

$$+ \frac{2}{\mu_3 a J_1(\mu_3 a)} \frac{\sinh(\mu_3 z)}{\sinh(\mu_3 b)} J_0(\mu_3 r) + \ldots$$

If numerical results are desired, tables for $J_0(x)$ and $J_1(x)$ are needed. Such tables have been computed and are accessible. We give here a small three-place one.

TABLE II.—BESSEL'S FUNCTIONS.

x	$J_0(x)$	$J_1(x)$	x	$J_0(x)$	$J_1(x)$
0.0	1.000	0.000	5.0	−.178	−.328

Bessel's Functions of the zeroth order were first used successfully in the Harmonic Analysis by Fourier in 1812, in dealing with the flow of heat in a right circular cylinder.

Other more complicated Harmonic Functions are Lamé's Functions or Ellipsoidal Harmonics, Conal Harmonics, Toroidal Harmonics, etc. Each set is adapted to dealing with Laplace's Equation expressed in a suitable system of Curvilinear Coördinates.

Bibliography.—For general treatises on the Harmonic Analysis and on the Harmonic Functions the reader is referred to Heine, 'Handbuch der Kugelfunktionen' (second edition, 1878); Todhunter, 'The Functions of Laplace, Lamé, and Bessel' (1875); Thomson and Tait, 'Natural Philosophy' (Appendix B, 1879); Ferrers, 'Spherical Harmonics' (1881); Byerly, 'Fourier's Series, and Spherical Harmonics' (1895); Gray and Matthews, 'Bessel's Functions' (1895). An excellent account of the history of the subject with detailed references to the early papers, memoirs, and other publications, prepared by Professor M. Bôcher, will be found at the end of Byerly's above-mentioned treatise. For the contemporary literature see the recent volumes of the 'Jahrbuch uber die Fortschritte der Mathematik' under the heading Kugelfunktionen und verwandte Funktionen.

WILLIAM E. BYERLY,
Professor of Mathematics, Harvard University.

Harmon'ica, a musical instrument invented by Benjamin Franklin in 1762. It is formed of a number of glasses of water, and is played by touching them with the dampened finger. The less the quantity of water, the lower the tone of the scale. The name is also applied to a small wind instrument, or mouth-organ, which has a series of holes to conduct the breath to free reeds, like those of an accordion.

Harmon'icon, a chemical apparatus consisting of an open glass tube, the air in which may be made to give a sound resembling a musical note, when held over burning hydrogen. The note depends upon the size of the flame and the length of the tube.

Harmon'ics, the accessory or collateral sounds accompanying the primary, fundamental, or predominant tone of any string, pipe, or other sonorous body, and constituting in varying degrees what in English is known as «quality,» in French as «timbre,» and in German as «Klangfarbe.» No purely simple sound—one whose vibrations are all in the same period—is producible. When a sound is produced by the vibration of an open string, the whole string vibrates as a unity, giving rise to a tone called the fundamental. The string, however, further divides into various sections, which vibrate separately and more rapidly, and produce sounds—the harmonics—differing from the fundamental, but bearing certain fixed proportions to it. By whatever vibrating body a musical sound is evoked harmonics also are produced; and although some of the harmonics are suppressed by modifying circumstances, some are always present. There is a regular succession of intervals in which the harmonics naturally accompany a fundamental sound, which is represented in the following scale of vibrations: 1 2 3 4 5 6 7, etc. These also are the intervals which produce the successive chords in harmony, although the natural harmonics when produced further go beyond the range of harmony which human ears can recognize or musical instruments produce at the will of the performer. (See illustration.) 1 is the interval of the octave; 2 is the fifth; 3 is the fourth; 4 is the major third; 5 the minor third; from 6 to 7 is already beyond the range of production on a keyed instrument, but is recognized by musicians as the complement of a four-part simple chord, and is represented approximately on the pianoforte, by E flat, for example, for the key of F.

A musical tone, then, is always complex, but the harmony which attends it is not always the same. The different structure of different instruments suppresses now some, now others, of the succession of harmonics, and a different body of tone is thus produced, distinguishing a note in one instrument from the same note in another. Hence the distinctive construction of the pianoforte in which dissonant harmonics are suppressed, and on the other hand, the use in the organ of mutation and mixture stops—the thirteenths and fifteenths — whereby the consonant harmonics of a given tone are much emphasized. Again, many of the higher harmonics are strongly dissonant both with the fundamental tone and with each other, whence arises the discordant quality of such instruments for instance as the cymbals. Harmonics are also called «overtones,» and all the primary and secondary tones constituting an actual tone are frequently termed «partials» or «partial tones,» the fundamental tone being the first partial, and the harmonics, the upper partials. See HARMONY.

Harmonics, Spherical. See HARMONIC ANALYSIS.

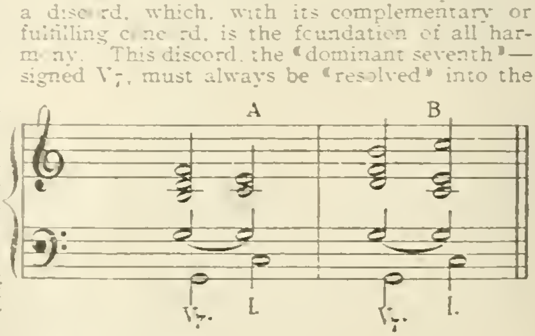
Har'monists, also called RAPPISTS and ECONOMITES, a religious-socialistic community founded in 1757 by George Rapp (1757–1847), a German of Würtemberg. The peaceable and spiritual tenets of the organization aroused antagonism and persecution, and in 1803 they emigrated to America, settling in the Connoquenessing Valley, where the Harmony Society was established on a working basis. By 1808, houses, churches, mills, and manufactories had been built, and the settlement had a population of 750 persons. In 1815 they removed to Posey County, Ind., where they founded New Harmony (q.v.); 10 years later, however, they returned to Pennsylvania, and built the township of Economy, in Beaver County, on the Ohio, 20 miles north of Pittsburg. In 1832, a German adventurer, Bernhard Muller, settling among them, caused dissensions and a split in the society; a separation and apportionment of the property was agreed upon, and 250 members retired. They held all property in common, believed in the second coming of Christ, the near advent of the millennium, and practised celibacy. As a result of the latter condition, the membership in 1902 was reduced to eight, and the valuable estate will pass finally into the hands of the last survivor. Consult Hinds, 'American Communities' (1902). Nordhoff, 'The Communistic Societies of the United States' (1874).

Harmon'ium, a modern musical instrument which produces sounds resembling those of the organ. The invention is ascribed to Alexandre Debain of Paris; but he has at the most merely the credit of perfecting an instrument previously known, called the *orgue expressif*, a kind of organ furnished with an apparatus of free vibrating reeds, intended to increase or diminish the intensity and volume of the sound, by regulating the pressure of the wind, by the aid of which the sounds were produced. The instrument has a keyboard like that of a piano, and when one of the keys is pressed down a valve is opened, which allows the wind from the bellows to rush through one of the wind-boxes and act on the vibrator. There are also several stops, like organ stops, by means of which the performer can direct the stream of wind into the wind-boxes, which produce a flute, clarinet, or any other sound, according to the number of stops which the instrument possesses. Such is the harmonium which was patented by Debain in 1840, but since that time various other improvements of more or less value have been made. The chief of these are the addition of a knee action, which either serves as an expression stop, or brings all the stops of the instrument into play at once, and what is called the percussion action, the invention of Kaufmann of Dresden, which consists in the application of a small hammer, which strikes the vibrator as soon as the key is pressed down and thus aids the action of the wind.

Harmony, (from the Greek *ἁρμόζειν*, to join or fit together), in music is the science which controls the relationship of chords, and decides that of the dissonant elements in a discord to the fundamental concord; the fundamental law being that discord is an unfinished design which requires concord for its completion.

A chord, or combination of tones, in any scale or key may be a concord or discord. The one concord in a major key consists of the keynote or tonic with its major third and fifth. This means of course the tonic triad; but in every major key there are two other major triads, absolutely equal in consonance with the tonic triad—those founded on the dominant and subdominant. In a minor key the triad on the keynote consists of the tonic with a minor third and perfect fifth. The major third and fifth are the notes which produce, naturally, a perfect sound in combination; they are called «consonances,» and any foreign element is a «dissonance.» They can be inverted, that is, any tone of a chord can be in the bass or lowest part. (See FUNDAMENTAL NOTE, TONE, OR BASS.) This, the «common chord» or «major triad» makes a starting point and a point of finality, from which the harmonies proceed, diverge and converge, and into which they resolve themselves finally.

The seventh harmonic of nature (see HARMONICS), which is one semitone less than the seventh consecutive note in an ascending major scale, constitutes a minor seventh, and produces a discord, which, with its complementary or fulfilling concord, is the foundation of all harmony. This discord, the «dominant seventh»—signed V_7, must always be «resolved» into the



chord of the tonic (1) of the key to which it belongs. (See illustration.)

A is an example of «close,» B of «open» or «extended» harmony. The discord on G instinctively demanding the chord of C as its resolution, the note G, or the similar fifth degree in any scale, is called the «dominant»—signed V, of that key, and the chords and discords built on it constitute the dominant harmonies. Position B is the most satisfactory to the ear, because of the effect of finality induced by the resolution to the first position of the triad. The two chords together form the dominant or authentic cadence — the most important of those terminal phrases which serve the same purpose in music as the marks of punctuation in literary composition. "My country, 'tis of thee" exhibits examples of two other important cadences, showing at the same time how these mark the completion of more or less final musical periods.

I. V

V_7. vi

V_7. I.

The first period is closed at A by a "half" or "imperfect" cadence — that is, the order V.—I. is reversed; the second at B by a "false" or "deceptive" cadence — that is, the dominant chord, instead of proceeding to the tonic, "deceives" the ear by proceeding to another chord; the third period is brought to a close by the authentic cadence at C.

The dominant chord can also bear the more elaborate dissonances of the 9th, 11th, and 13th, as well as the 7th, but it is impossible here to enter into the varieties of discord — "suspensions," "double-root chords," etc., into the analogous discords which may be built on the tonic as a ground-note, or the chords belonging to the minor scale. Suffice it to say the effects which can be evolved from the almost innumerable inversions and involutions of single chords and combinations of chords are subject to stringent natural laws, and the possibilities of variety are infinite.

An important branch of harmony, however, must be mentioned, that is "modulation" or change from one key (or "mode") to another. Modern scales have had the relation of their intervals so modified (see Temperament) as to be approximately alike. By the addition of a single sharp or flat any melody can proceed from the key of C to G (with F♯), F (with B♭), or A minor (with G♯). These — the dominant, subdominant (next below the dominant), and the minor of the sixth degree — are the keys of the first relation, as out of the seven notes which constitute each scale six are present in the scale of C, thus providing as it were six more or less convenient bridges by which to pass from one key to the other. The conventionality of these modulations makes them inadequate to convey the more passionate coloring of modern music, and more striking changes to remoter keys are necessary. A favorite device with modern composers is to take advantage of the "tempered" system, and by using one note in two significations (for example, F×E♯) to secure means of startling and also of very tender effects in modulation.

Harmony comparatively is of modern growth. In counterpoint (q.v.), the science which preceded harmony, attention was given altogether to the correct progression of the individual voices or parts, while the combinations made by the voices at any moment were regarded as merely accidental. But unconsciously the ear of musicians was being cultivated, and in the richness of Palestrina's simpler writings was shown the possibility of obtaining undreamt-of effects from chords as integral units in a march of harmonies, rather than accidental combinations of independent melodies. One of the fundamental rules of counterpoint was that a dissonance must either be "prepared"— that is, it must appear as a consonance in the previous chord — or else it must be approached very gradually. This rule of the old science was disregarded by Monteverde (1608), who used unprepared discords, and at one blow released the new feeling for chords from its bondage to counterpoint.

Only those who understand counterpoint and harmony can appreciate the full importance of the new departure. It meant that discords were no longer mere variations of concords, but individual creations with an individual's rights and duties. The discord most easily used was the dominant seventh, the first discord produced by nature's harmonics; and so the relation of dominant to tonic — the central idea of all harmony — developed from an increasingly general tendency into a recognized rule. During the 17th century many experiments were made by Monteverde's followers, until at the end of the century Rameau's famous treatise called attention to the fact that all chords are derived from some note which is the generator or root, and the relationships of these roots govern the progressions of the harmonies. The less known, but hardly less important, researches of Tartini formed a good supplement to Rameau's theory; and the basis of scientific harmony established by these two works was not seriously disturbed even by the thorough investigation and the astonishing discoveries of Helmholtz, who extended the foundation and built a complete superstructure thereon. In the meantime, notwithstanding that theorists fought each other with great fierceness, the science made extraordinary progress under such practical harmonists as Bach, Mozart, and Beethoven, while Wagner, who handled any number of parts as easily as did Bach himself, so enlarged the possibilities of harmony that it is difficult to conceive of any further advance. Consult the manuals by Bannister, Bowman-Weitzmann, Jadassohn, Macfarren, Ouseley, Richter, and Riemann.

Harmony of the Spheres, a hypothesis of Pythagoras and his school, according to which the motions of the heavenly bodies produced a music imperceptible by the ears of mortals. He supposed these motions to conform to certain fixed laws, which could be expressed in numbers, corresponding to the numbers which give the harmony of sounds.

Harmotome, här'mō-tōm, a mineral of the zeolite family; a hydrous silicate of aluminum and barium, invariably occurring in twin crystals of various colors from white to red-brown.

Harms'worth, Alfred Charles, English newspaper proprietor: b. Chapelizod, County Dublin, Ireland, 15 July 1865. He is the principal proprietor of the London *Daily Mail*, and *Evening News*, as well as some 30 other English journals, and equipped the arctic expedition under F. G. Jackson in 1894.

Harnack, här'näk, **Adolf**, German theologian: b. Dorpat 7 May 1851. He began his studies in his native town in 1869 and in 1874 took up his residence at Leipsic, for the purpose of pursuing a course in church history, and was made extraordinary professor there in 1876, and ordinary professor of theology, first at Giessen in 1879, and eventually at Berlin 1889. In 1890 he was made a member of the Berlin Academy. He has been a prolific writer, both in theology and church history, and some of his books have given rise to much controversy; among his works are: 'Lehrbuch der Dogmengeschichte' (1894); 'Die Ueberlieferung und der Bestand der altchristlichen Litteratur' (1893); etc.

Har'ned, Virginia, American actress: b. Boston 1868. She became a member of a traveling company about 1884, in 1895 appeared as Trilby in P. M. Potter's dramatization of Du Maurier's story, and subsequently took various roles, including Alice Rousillon in 'Alice of Old Vincennes,' and the title-part in A. W. Pinero's 'Iris.' She was married to E. H. Sothern (q.v.) in 1896.

Harness and Saddlery Trade, The. It is extremely difficult to trace the history of the harness and saddlery industry in America as far back as the days of the colonies, for in that period of our existence as a nation oxen were so generally used for purposes of plowing and carting that harnesses were in small demand. Those were the days in which roads were so poor that driving could scarcely be regarded as a pleasure, and the equipments required in saddle riding were chiefly imported from England.

The first attempt to make saddlery hardware, one of the most important accessories to the saddlery trade, was inaugurated by Seth J. and Alvin North, at New Britain, Conn. Originally engaged in the blacksmithing business, they began to extend the facilities of their shop until they were finally making bridle-bits, and other harness equipments, including shoe-buckles, and rings to be used for a variety of purposes. All these articles were originally produced from wire drawn out by hand. Later, horse-power was introduced for this purpose, but it was many years before all the finishing work on these products, the polishing, the welding, etc., ceased to be a matter of manual labor. The discovery of a more rapid method of polishing was made by a blacksmith at Middletown, Conn., to whom Alvin North paid $25 to learn the process, which simply consisted in taking an old woolen stocking, which, after all the holes had been darned, was filled with the articles to be polished. A number of small pieces of soap were added, after which the stocking was dipped in a pail of warm water and was rubbed briskly between the hands. This method of polishing was finally improved by the substitution of canvas bags for the stockings, but, with this exception, no better process was found until the tumbling-barrels were introduced.

The advent of better roads, and the corresponding increase in the popularity of driving and riding, was the means of creating a greater demand for both saddlery and harness. To meet these requirements of the trade, factories were established at Newark, N. J., Hartford, Conn., St. Louis, Mo., Wheeling, W. Va., Louisville, Ky., and Cincinnati, O., but the greater part of the harness made in those days was suitable only for the heavy stages and wagons, which were then so generally utilized both for the transportation of passengers and in business traffic. At that period in our history the movement for the betterment of roads had been confined almost exclusively to the more populous sections of the East, and as the black soil of the western prairies made the use of wagons practically impossible during certain seasons of the year there was an insistent call for heavy riding saddles. Those that were made in foreign countries had proved to be utterly unsuited, either for the rough frontier life of the West, or for the hard usage which they received in the South, and, as the result of these conditions the manufacturers of saddlery, with the characteristic inventive genius of the Yankee, devised the tree made of wood, and covered with rawhide, with long skirts and fenders to act as a protection, both from the elements and the many deep quagmires which the rider was quite certain to encounter.

It was in 1828 that the Franklin Institute presented a medal to Seth Boyden for his achievement in inventing the first buckles and bits made of annealed cast iron. The discovery had been made by putting a few pounds of cast iron into an ordinary cooking stove, in which, in the process of baking, it became annealed, a process which was largely responsible for the early success of the manufacture of saddlery hardware in this country. About the same time, Peter Hayden, then 22 years of age, began to manufacture hames and saddlery at Auburn, N. Y. His shop was a small one, and as there was little demand for such goods in his neighborhood, he extended his trade by loading his sleigh or wagon with his stock and peddling it through Central New York and Canada. By these methods his business became so well established that, in 1835, he entered into a contract with the State of Ohio, by which he agreed to furnish employment for its convict labor in the making of hames, saddle-trees, saddlery hardware, and chains. At times he employed upward of 300 convicts, to say nothing of a large force of free labor, and he was soon able to open connections for the sale of his product with the largest mercantile houses in Chicago, St. Louis, Cincinnati, Detroit, Galveston, San Francisco, and New York. Thus, from a small beginning, for Hayden's business netted but a few thousand dollars during the first years of its existence, he increased his trade until it reached millions, while it was largely due to his control of the domestic market that the importations of foreign saddlery almost entirely ceased.

The first horse-collars regularly manufactured in this country were made by Timothy Deming, in East Hartford, Conn., in 1828. Prior to this time the making of horse-collars had been the work of itinerant laborers, who traveled from place to place, hiring themselves to make collars for individuals who were in need of several, or to any local harnessmaker whose stock might need replenishing. When Deming invented and patented his short-straw collar and the block upon which it was made, the event marked the first stage in the development of collar-making in America.

Although the wax-thread, chain-stitch sewing-machine was invented by a New England concern, as early as 1853, it was three years later before it had attained such practicability that it could be used in the sewing of boots and shoes, and fully 10 years before it was applied to the making of harness Even then the prejudice against machine-stitching was so great that such products were not easily disposed of, and it was only the enormous reduction in cost that ultimately brought it into favor. Another important improvement came in 1858, when W. K. Thornton, of Niles, Mich., perfected the invention of the creasing-machine, but so slow was the trade of those days in the matter of adopting any process which necessitated a radical departure from the old-time and traditional methods that the inventor found that the only way in which he could introduce his machines was to leave them on three months' trial at such shops as would accord him this privilege. A few years later, he entered into partnership in Cincinnati, under the firm name of Thornton & Perkins. In 1865 the business was sold to Randall & Company, the concern which is now engaged in the manufacture of similar, but vastly improved machinery. In fact, the sewing-machine and the creasing-machine were such important inventions that they may be said to have practically revolutionized the industry of harness-making. Other inventions have been patented, but few of them have been of lasting benefit to the trade. The most important, perhaps, was the iron gigtree which was patented by Samuel E. Thompkins, of Newark, N. J., in 1872, the radical change which this invention heralded being indicated by the fact that all buggy saddles up to this time had been made on wooden trees imported from England, but only a few years elapsed after the introduction of the iron gigtree before the wooden tree was entirely discarded.

It was about this time that the harness industry began to enjoy a period of almost phenomenal progress. The invention of labor-saving devices enabled manufacturers to produce goods at a cost which naturally tended to increase the demand for such articles.

Among the inventions which were patented at about this time one must mention the Bosworth lock-stitching, wax-thread sewing-machine, which first appeared in 1872, as well as the Campbell lock-stitching machine, patented first in 1880. With the introduction of these inventions, hand-sewed harness largely disappeared, for these stitches, which were interlocked, made the sewing alike on both sides, which gave the appearance of hand work, a great improvement upon the product of the old harness-sewing machines which produced a sometimes unsatisfactory chain-stitch. The other kinds of harness machinery which have proved themselves such great labor-saving inventions that they are now regarded as indispensable in all well-equipped factories are the tubular riveting-machines, which entirely dispensed with the old processes of hand riveting; the box-loop sewing-machines, which now sew up all the long loops formerly sewed by hand; the quilting-machines, by means of which pads, gig and riding saddles are quilted; the power trace-trimmers, and trace-polishers; the power splitters, and the dieing-out machines. The first factory for the making of harness thread in this country was established at Paterson, N. J., by Barbour Brothers, in 1863, prior to which time such thread had been imported from Ireland, while the hard-rubber-covered harness trimmings were invented by Andrew Albright, of Newark, N. J., in 1867.

The great development in the making of horse-collars dates only from 1883, for it was in that year that William Fogelsong, of Dayton, O., invented a machine for the stuffing of collars. Some 10 years later R. Brownson, of St. Paul, Minn., perfected a metal-staple machine for sewing collars, and, with these two practically recent innovations, one set of machinery will now do the work which formerly required the labor of some 20 men. It was by means of such machinery, practically all of which is due to American push and enterprise, that the trade of saddlery and harness-making has been advanced from a position of inferiority to a commanding place among the great industries of the United States. To comprehend the extent to which this business has progressed it is only necessary to glance at the following table in which the figures prepared by the census bureau are recapitulated:

SADDLERY AND HARNESS, 1880–1900.

	1880	1890	1900
Establishments	7,999	7,9[illegible]1	12,934
Capital	$16,508,019	$35,346,620	$43,354,136
Wage earners	21,446	23,672	24,123
Wages	$ 7,997,752	$10,908,918	$10,725,647
Cost of materials	$19,968,716	$24,674,225	$32,127,926
Value of products	$38,081,643	$52,970,801	$62,630,902

The fever for the organization of combinations, "trusts," and other associations had its natural effect upon some of the saddlery manufacturers, and, in 1890, the first move was made toward the establishment of an organization for conference and mutual improvement. This initiative was taken by the Western manufacturers who called a meeting of the trade to be held at St. Louis, Mo., and it was at this time that the organization known as "The National Wholesale Saddlery Association of the United States," was formed. According to the terms of the constitution adopted at this first gathering, the objects of the association were to correct abuses, adopt uniform terms, and encourage a more fraternal feeling among competitors, but, although its annual meetings and elections have been held, and men prominent in the trade have been elected as officials, its effect upon the growth of the industry is entirely problematic. See CARRIAGE AND WAGON INDUSTRY.

Harnessed Antelopes. See BUSHBUCK.

Har'nett, Cornelius, American statesman: b. England 20 April 1723; d. North Carolina 1781. He came in early life to America, and was one of the earliest to denounce the stamp act and kindred measures. In 1770–1 he was representative of Wilmington, N. C., in the Provincial Assembly, and chairman of the most important committees of that body. In 1772 he was appointed with Robert Howe and Maurice Moore, to prepare a remonstrance against the appointment, by the royal governor Martin, of commissioners to fix the southern boundary of the province. Josiah Quincy, who visited him in 1773, called him "the Samuel Adams of North Carolina"; and, as the Revolution approached, he was its master spirit throughout the Cape Fear region. He was elected to the Provincial Congress in 1775, and drew up the instructions to the North Carolina delegates in the Continental Congress. When in 1776 Sir Henry Clinton appeared with a British fleet off Cape Fear, Harnett and Howe were excepted, as arch-rebels, from the terms of a general pardon. As member of the Continental Congress he signed the articles of confederation. When in 1780–1 the British held possession of the country around Cape Fear, Harnett was made prisoner, and died while a captive.

Har'ney, John Hopkins, American journalist: b. Bourbon County, Ky., 1806: d. 1867. He was educated at Oxford University, Ohio; became professor of mathematics at the University of Indiana and at Hanover College, and was president of a college at Louisville, Ky. He was for a number of years editor of the Louisville *Democrat*, a paper which took a radical attitude during the Civil War.

Harney, William Selby, American soldier: b. Haysboro, Tenn., 27 Aug. 1800; d. 9 May 1889. He entered the army in 1818; served as colonel in the Mexican War and was brevetted brigadier-general for gallantry at Cerro Gordo, and promoted to that rank in 1858. While commanding the department of Oregon, in 1859 he took possession of the island of San Juan, which was claimed by the English government. He was in consequence recalled. He retired in 1863 and was brevetted major-general in 1865.

Harney's Peak, the highest point of the Black Hills, South Dakota, named in honor of Gen. W. S. Harney; height 7,215 feet.

Haro Islands. See SAN JUAN ISLANDS.

Harold I., surnamed HAREFOOT, king of England: d. Oxford 17 March 1040. He succeeded his father Canute in 1035, notwithstanding a previous agreement that the sovereignty of England should descend to the sons of Canute by his second wife, the Norman princess Emma. Hardecanute, who was about to invade England at the time of Harold's death, dug up his body and beheaded it. See Freeman, 'The Norman Conquest,' Vol. I.

Harold II., king of England, second son of Godwin, earl of Kent: b. about 1022; d. Senlac, near Hastings, Sussex, 14 Oct. 1066. On his father's death in 1053 he succeeded him in the earldom of Wessex and other great offices, and upon the death of Edward the Confessor, 5 Jan. 1066, who had named him his successor, he was chosen king by the nobles, notwithstanding the claim of Edgar Atheling, or the asserted bequest of Edward in favor of William, duke of Normandy. The latter called upon him to resign the crown, and upon his refusal prepared for invasion. He also instigated Harold's brother, Tostig, to invade the northern coasts of England in conjunction with the king of Norway. The united fleet of these chiefs sailed up the Humber and landed a numerous body of men, who defeated the opposing forces of the Earls of Northumberland and Mercia; but at Stamford Bridge, on the river Derwent, in Yorkshire, were totally routed by Harold, whose brother Tostig fell in the battle. A day or two later he heard of the landing of the duke of Normandy at Pevensey, in Sussex. Hastening southward with all the troops he could muster, a general engagement ensued at Senlac, near Hastings, in which Harold was slain with an arrow, and the crown of England was passed to William. See SENLAC. Consult: Freeman, 'The Norman Conquest,' Vols. II. and III.; Tennyson, 'Harold' (1876).

Harold, or Harald I., surnamed HAARFAGER (Fair-haired), king of Norway, son of Halfdan the Black: d. Trondjhem 933. He succeeded to the throne in 860. While he reduced the lesser kings he left them with the title jarl, the administration of their territories, and the third part of their income; but many of them emigrated, and founded Norwegian colonies. Hrolf or Rollo emigrated to Neustria (France). Others, with their followers, established themselves in Iceland, the Shetland Isles, the Faroes, and the Orkneys, then uninhabited. When Harold found that the emigrants often extended their incursions into his dominions he embarked with a naval force to subdue them, conquered the Orkneys, etc., and returned.

Harold, or Harald III., surnamed HAARDRADA, king of Norway: d. Stamford Bridge, England, 25 Sept. 1066. The date of his birth is unknown. During a great part of his youth and prime he served in the imperial bodyguard at Byzantium, returning to Norway about 1045. He persuaded his nephew Magnus to divide the supreme power with him, in return for a share of his treasures, and two years later (1047) his nephew died, when he himself became sole king of Norway. In 1066 he joined Tostig, the brother of Harold II. (q.v.) of England, in an invasion of that country, having been promised half of it in case of success; but he was slain at the battle of Stamford Bridge.

Haroun-al-Rashid. See HARUN-AL-RASHID.

Harp, the oldest of stringed instruments. The Bible mentions Jubal as the inventor. It has been used by all nations in one form or another. The modern instrument is nearly triangular and the strings are extended from the upper part to one of the sides. It stands erect, and is played with both hands, the strings being struck or pulled with both fingers and thumbs. The improvements which have rendered the modern harp an efficient musical instrument are due to Sebastian Erard, who in 1794 took out a patent for a harp with seven pedals, and again in 1808 for a double-action harp with the same number of pedals, each of which effects two changes in the pitch of the strings. The harp thus constructed contains 43 strings tuned according to the diatonic scale, every eighth string being a replicate in another

WILLIAM RAINEY HARPER,

PRESIDENT UNIVERSITY OF CHICAGO.

octave of the one counted from. Various improvements over Erard's harp were made during the 19th century.

Harp, or Saddleback, Seal. See SEALS.

Harp-shell, a genus (*Harpa*) of gasteropodous mollusks of the whelk family (*Buccinidæ*), having the last whorl of the shell large, and covered with numerous sharp smooth ribs, resembling the strings of a harp. The foot is large, and there is no operculum. These shells are elegantly marked, and much prized for their beauty. Nine species are known, all of them tropical, and living in deep water, on soft, sandy, or muddy bottoms.

Har'per, Charles G., English artist and author: b. 1863. He is one of the best-known of English book illustrators, and his own books, mainly lively, entertaining descriptions of pedestrian and bicycle tours in England illustrated by himself, have been popular in the United States as well as in his own country. Among them are: 'Some English Sketching Grounds'; 'From Paddington to Penzance'; 'The Brighton Road'; 'The Great North Road'; 'The Norwich Road'; 'Cycle Rides Around London.'

Harper, Ida Husted, American journalist and author: b. Fairfield, Ind. She attended the University of Indiana for two years; entered journalism when about 18, conducted a woman's department in the Terre Haute 'Saturday Evening Mail' and in the 'Firemen's Magazine,' and was a contributor to many papers, including the Cleveland *Leader*, San Francisco *Chronicle*, and Washington *Post*. She was managing editor of the Terre Haute *Daily News*, for a year, has written for the McClure syndicate, and since January 1899 has been on the editorial staff of the New York *Sun*. She was a member of the International Congress of Women in London in 1899, and was appointed chairman of the international press committee for a five years' term. She prepared the Indiana State monograph for the World's Fair at Chicago under the title 'Organized Work of Indiana Women,' and has written 'Life and Work of Susan B. Anthony' (1898) and 'History of Woman Suffrage to the Close of the Nineteenth Century' (1901).

Harper, John Murdock, Canadian educator: b. Johnstone, Renfrewshire, Scotland, 10 Feb. 1845. He was graduated from Queen's University (Kingston, Ont.), later was appointed superintendent of education for Prince Edward Island, but declined the appointment, and became successively rector of Quebec High School, and inspector of superior schools for the province of Quebec. Among his publications are text-books and various pamphlets.

Harper, Robert Goodloe, American lawyer and statesman: b. near Fredericksburg, Va., 1765; d. Baltimore, Md., 15 Jan. 1825. In his 15th year young Harper joined a troop of horse, and under Gen. Greene served during the latter part of the southern revolutionary campaign. He was graduated from Princeton College in 1785, while there acting for a time as tutor to lower classes. Sailing from Philadelphia for Charleston, with the intention of studying law, he arrived at his destination nearly penniless, but was assisted by the father of a former pupil, who obtained a position for him in a lawyer's office. In one year he was qualified to practise, and soon established a reputation, and became well known by a series of newspaper articles on the proposed change in the State constitution of South Carolina. He was soon after elected to the State legislature, and in 1794 to the national Congress. In this position he showed marked ability, supported the administrations of Washington and John Adams, and was regarded as one of the leaders of the Federal party. On the election of Thomas Jefferson as President in 1801 he retired from Congress, and resumed the practice of his profession in Baltimore. At the Maryland bar he attained great eminence, at the period too of its highest renown. He was associated with Joseph Hopkinson as counsel for Judge Chase of the United States Supreme Court, when under impeachment. In 1815 he was elected United States senator from Maryland.

Harper, William Rainey, American college president and Hebrew scholar: b. New Concord, Ohio, 26 July 1856; d. Chicago, Ill., 10 Jan. 1906. He was graduated at Muskingum College in 1870; was professor of Hebrew at the Baptist Union Theological Seminary, Chicago, in 1879–86; and of Semitic languages in the graduate faculty of Yale. From 1889 he was also professor of biblical literature. He was principal of the Chautauqua College of Liberal Arts in 1885–91, and in 1891 was appointed director of the Chautauqua system. In 1891 he was chosen first president of the new University of Chicago, where he was also head of the department of Semitic languages and literature. He was a founder and editor of 'Hebraica' and the 'Hebrew Student,' was an editor of three of the publications of the University of Chicago — the 'Biblical World,' the 'American Journal of Theology,' and the 'American Journal of Semitic Languages and Literature.' His administration was noted for its rapid development of the facilities of the university. Among his works are: 'Elements of Hebrew' (2d ed. 1890), 'Hebrew Method and Manual' (1885), and 'Elements of Hebrew Syntax' (1888), 'The T[illegible] in Higher Education' (1905); 'Th[illegible] Element in the Old Testament' (1[illegible]

Harper, William Saint John, American artist: b. Rhinebeck, N. Y., 8 Sept. 1851. He studied painting at the National Academy of Design, New York, and afterward became pupil of Munkacsy and Bonnat at Paris. He has done much successful work both as a painter and book illustrator.

Harper and Brothers, the designation of a noted firm of New York publishers. It consisted originally of James (1795–1869), John (1797–1875), Joseph Wesley (1801–70), and Fletcher (1806–77). The first two commenced to publish in 1818, as J. & J. Harper. The firm of Harper and Brothers, established in 1833, is now managed by descendants of the founders. It not only publishes books but 'Harper's Magazine' (monthly, since 1850), 'Harper's Weekly' (since 1857), 'Harper's Bazar' (fashions, social life, etc.; since 1867), and 'Harper's Round Table' (started in 1881 as 'Harper's Young People' and recently consolidated with 'St. Nicholas').

Harper's Ferry, W. Va., is situated in Jefferson County, 55 miles northwest of Washington, on the Baltimore & O. railroad. It is at the confluence of the Potomac and Shenandoah rivers, where the former breaks through the Blue Ridge, presenting one of the most picturesque scenes in America. Attracted by its fine water-power, Washington, in 1790, chose it as a site for a United States arsenal and armory, and up to 1860 $1,800,000 had been expended for land and improvements. Here 10,000 muskets were made annually, and over 75,000 small arms were usually in store. It is the seat of Storer College and of a normal school for colored pupils. Pop. (1900) 896.

Harper's Ferry came into great prominence in 1859 through the acts of John Brown (q.v.), and was the scene of noteworthy military events during the Civil War. When Virginia seceded, Harper's Ferry was held by Lieut. Roger Jones, with 45 men. On the night of 18 April 1861 a large body of Virginia militia, hastily assembled from the surrounding country, appeared before the place. Jones set fire to the arsenal, destroyed as much public property as possible, and retreated across the Potomac to Hagerstown, Md., and thence to Carlisle, Pa. The Virginia militia occupied the place, and troops were hastened to it from other States of the Confederacy. The Confederate government attached much importance to the place as a strategical point, but it was abandoned by Gen. J. E. Johnston, 15 June 1861, when he heard that Gen. Patterson, marching from Chambersburg, Pa., was threatening to cross the Potomac at Williamsport. The place was then occupied by the National forces. When Gen. Lee invaded Maryland early in September 1862, Harper's Ferry was held by Col. Dixon S. Miles with a large garrison, and there were strong outposts at Winchester and Martinsburg. Lee supposed that his presence at Frederick, Md., would cause the evacuation of Harper's Ferry and its outposts, and thus open his communications by way of Shenandoah Valley, but as it was still held by the National forces it became a necessity to dislodge them. On the morning of 10 September he set three columns in motion from Frederick to surround the place and capture its entire garrison. Gen. Jackson, with 14 brigades, marched rapidly over the South Mountain, crossed the Potomac at Williamsport on the 11th, drove the garrison from Martinsburg into Harper's Ferry, and appeared before Bolivar Heights on the 13th, thus investing the place from the west. Gen. McLaws, with 10 brigades, marched through Brownsville Gap, and, after a severe engagement with Col. Thomas H. Ford on the 12th and 13th, drove him from Maryland Heights and into Harper's Ferry. Gen. Walker, with his division, crossed the Potomac at Point of Rocks, 12 miles below Harper's Ferry, and on the 13th seized Loudoun Heights beyond the Shenandoah. Miles was now completely surrounded, the Confederates occupying high ground, commanding his position. Artillery fire was opened from all these points on the 14th, and late in the afternoon Jackson moved upon Bolivar Heights, drove in Miles' skirmish lines, and gained an advantageous position on the left of the Union line. During the night 1,500 Union cavalry crossed from Harper's Ferry to the Maryland side and escaped. During the same night Jackson crossed 10 guns to the right bank of the Shenandoah and established them on a plateau at the foot of Loudoun Heights, enfilading Miles' entire position on Bolivar Heights. Early on the 15th the Confederate guns on Maryland Heights, Loudoun Heights, and in front of Bolivar Heights opened fire, which was responded to for more than an hour, but the direct and plunging flank-fire from the Confederate batteries partially silenced the Union guns and created some disorder in the Union ranks. Jackson had advanced his lines to within 150 yards of the Union works on Bolivar Heights, and was about to assault, when Miles ordered a white flag displayed on his works and directed Gen. Julius White to arrange terms of capitulation, soon after which Miles was mortally wounded by a shell from a battery that had not seen the white flag. The Union loss during the siege was 44 killed and 173 wounded, and the number of prisoners surrendered and paroled 12,520. The Confederates captured 70 guns, 13,000 small arms, 200 wagons, and a large amount of quartermaster and commissary stores. The Confederate loss was 41 killed and 247 wounded, the greater part of whom were lost in the engagement on Maryland Heights. The Confederates abandoned Harper's Ferry on the 20th, and it was again occupied by the Union forces on the 22d. Consult: 'Official Records,' Vols. II. and XIX.; Allan, 'Army of Northern Virginia in 1862'; The Century Company's 'Battles and Leaders of the Civil War,' Vols. I. and II.

E. A. Carman.

Har'pies (Greek, *Harpuiai*, swift robbers), the goddesses of storms. Their ages, appearance, names and number are so differently given by the poets that it is difficult to say anything definite concerning them. In the Homeric poems they are represented as personified storm-winds. The later poets and artists vied with each other in depicting them under the most hideous forms. One has given them the head of a fowl, with wings and a body covered with feathers, human arms with claws, a white breast, and human legs which terminate in the feet of a fowl. Others have given them the face of a young woman with the ears of a bear. See Furies.

Harpignies, Henri Joseph, ŏn-rē zhō-zĕf är-pēn-yē, French landscapist: b. Valenciennes 28 July 1819. He studied at Paris with Achard, first exhibited at the salon of 1853, and in 1861 attracted attention by his 'Edge of a Wood beside the Allier.' His landscapes, done with equal success in oils or water-colors, evince a skilfulness of drawing and a coloristic truthfulness marred only occasionally by a harshness in matters of technique. His works number: 'View of Capri,' 'Le Saut du Loup,' 'Banks of the Rhone' (Metropolitan Museum, N. Y.), and 'Garden of the Villa Medici.'

Harp'sichord, a stringed instrument formerly in use, in appearance and construction similar to a grand pianoforte. In the front the keys were disposed, the long ones being the naturals, and the short ones the sharps and flats. This instrument, called by the Italians *clavicembalo*, by the French *clavecin*, was an improvement upon the clavichord, which was borrowed from the harp. Both are now superseded by the pianoforte. See Pianoforte.

Harps'well, Maine, a township including the post village of Harpswell Centre, and comprising a peninsula and some islands in Casco Bay, 14 miles east of Portland. It has agricul-

VIEW OF HARPERS FERRY, VA.

tural interests and grist-mills, but is chiefly noted as a summer resort. Pop. (1900) 1,750.

Harpy-eagle. See EAGLE.

Har'raden, Beatrice, English novelist: b. Hampstead, London, 24 Jan. 1864. She took her degree at London University at 21, and subsequently traveled extensively in the United States and on the Continent. Her first novel, 'Ships that Pass in the Night' (1893), was instantly successful and was widely circulated. It has been followed by 'In Varying Moods' (1894); 'Hilda Strafford, a Californian story' (1897); 'The Fowler' (1899).

Harrier, a small mottled hound used in Europe in ancient times, and up to the end of the 18th century for chasing hares, the sportsmen following on foot. The old breed has disappeared except a few bred for show purposes by fanciers, its place being taken in sport by a small kind of foxhound followed on horseback.

Harrier. See MARSH-HAWK.

Har'rigan, Edward, American actor and playwright: b. New York 1845. He entered upon the stage as a variety performer and was a partner of Tony Hart (1871–85), when they opened in New York their first Theatre Comique (1876). Among his dramas, which are strong in character drawing, but of little value in a literary sense, are: 'Squatter Sovereignty'; 'Cordelia's Aspirations'; 'Old Lavender'; and 'Reilly and the Four Hundred.'

Harrild, Robert, English inventor: b. London 1780; d. 1853. He was the inventor and manufacturer of composition rollers for inking type, the introduction of which alone rendered cylinder presses practicable. He began the manufacture of printers' materials in London in 1809 and the printing-press with which Franklin worked in London was owned by him before it was brought to the United States in 1841 and put into the Patent Office at Washington, where it now stands.

Har'riman, Tenn., city in Roane County; on the Emery River, the Southern, the Tennessee C., and the Queen & C. R.R.'s; about 78 miles northeast of Chattanooga, and 37 miles west of Knoxville. It was founded in 1890 and received its city charter in 1891. The charter was revised in 1899. It is situated in an agricultural region which contains rich deposits of coal and of iron ore, and some timber land. Its chief manufactures are foundry and machine shop products, leather, farm implements, iron, flour, lumber, cotton goods, and furniture. It is the seat of an industrial school for colored children, and of the American University, established in 1893. Its trade in agricultural and mining products and in its own manufactured articles is rapidly increasing. The waterworks and electric-light plant are owned and operated by the city. Pop. (1900) 3,442.

Harriman Alaska Expedition, an American scientific and artistic expedition which visited the southern coast of Alaska during the summer of 1899. The party was organized by Edward H. Harriman, and consisted of the members of his own family, a few friends, and 50 gentlemen interested in science, art and literature. Among them were Messrs. Henry Gannett, W. H. Dall, C. H. Merriam, R. Ridgway, G. K. Gilbert and F. V. Calville of Washington; D. G. Elliot of Chicago; William Trelease of St. Louis; John Muir and W. E. Ritter of California, and several professors from Eastern institutions of learning. Messrs. L. A. Fuertes, R. Swain Gifford and F. S. Dellenbaugh represented the literary and artistic contingent. These gentlemen made good use of their opportunities in investigating the geography, geology, glacial phenomena, and fauna and flora of the region visited.

The results so far as announced (1904) are over 300 species and sub-species of animals and plants, records of observations of 25 "tidal" glaciers, those which discharge icebergs directly into the sea, and of 100 "land" glaciers, those whose fronts do not reach the sea. A new chart was made of the part of the coast explored. (See HARRIMAN FIORD.) Some of the new animal species found are two of foxes, five species and sub-species of shrews, five of voles, one crab, a shrimp, and 25 sea-worms. One of the sea-worms is about six feet long and of a deep vermilion color; another about the same size is blood-red with a white head. In no other part of the world have been found sea-worms of such varied and striking forms and colors. Among the plants found were a large number of new species and sub-species. Each department of science was represented by one or more experts who made critical observations and accurate reports. Consult: 'Reports of the Harriman Alaska Expedition'; 'The World's Work' (1900); 'Discoveries in our Arctic Region.'

Harriman Fiord, on the southern coast of Alaska, at about lat. 61° N. and lon. 148° W., is an arm of Prince William Sound, 15 miles in length. This fiord was discovered by the Harriman Alaska Expedition (q.v.) in 1899. The finding of this fiord is described by John Burroughs, a member of the Expedition, as follows: "Later in the afternoon we ascended an arm of Port Wells more to the westward and entered upon a voyage of discovery. We steamed up to a glacier of prodigious size that reared its front across the head of the inlet and barred further progress in that direction — the Barry Glacier. According to the United States Coast Survey map we were at the end of navigation in these waters; but we went on under a good head of steam down this new inlet where no ship had ever before passed. Glaciers hung on the steep mountain sides all about us. One of these was self-named the Serpentine by reason of its winding course down from its hidden sources in the mountains — a great white serpent with its jaws set with glittering fangs at the sea. Another was self-named the Stairway, as it came down in regular terraces or benches. As we neared the front of this glacier the mountains to the left again parted and opened another new arm of the sea, with more glaciers tumbling in mute silence from the heights, or rearing colossal palisades across our front. Another ten-mile course brought us to the head of this inlet, which was indeed the end of navigation in this direction. Subsequently this inlet was fitly named the Harriman Fiord, and the glacier at the head of it, Harriman Glacier."

Har'rington, Mark Walrod, American astronomer: b. in Sycamore, Ill., 18 Aug. 1848. He was educated at the University of Michigan, and in 1870–1 assisted in the United States Coast and Geodetic Survey of Alaska. He was professor of astronomy and director of the observatory at the University of Michigan, 1870–91. In 1884 he established the 'American Meteorological Journal' and was its managing editor until 1892. In 1891 he became chief of the Weather Bureau at Washington, D. C., which post he held till 1895, and was president of the Washington State University 1895–7.

Harriot, Thomas, English mathematician: b. Oxford 1560; d. London 2 July 1621. He entered Saint Mary's Hall, Oxford, and was graduated in 1580. In 1585 he was sent by Sir Walter Raleigh as surveyor on the Grenville expedition to Virginia, and on his return he published an account of Virginia, later printed in Hakluyt's 'Voyages.' He gained the favor of the Earl of Northumberland, who gave him an annual pension, and thereafter devoted himself entirely to mathematical and scientific research. His chief work, 'Artis Analyticæ Praxis ad Equationes Algebraicas Resolvendas,' published in 1631, embodied the most important results of his mathematical work. He practically gave to algebra its modern form, improving the notation, being the first to equate all the terms of an equation to zero, and announcing the principle that every equation has as many roots as its dimension. He also did important work in astronomy. See ALGEBRA, HISTORY OF THE ELEMENTS OF.

Harris, Amanda Bartlett, American writer: b. Warner, N. H., 15 Aug. 1824. She is a popular writer for young people and has published: 'How We Went Bird-Nesting' (1880); 'Wild Flowers, and Where They Grow' (1882); 'American Authors for Young Folks' (1887); 'The Luck of Edenhall' (1888); etc.

Harris, George, American college president: b. East Machias, Maine, 1844. He was graduated at Amherst, 1883; and at Andover Theological Seminary 1860. After taking several pastoral charges he became professor of Christian theology at Andover 1883, from which position he passed in 1899 to the presidency of Amherst, which he now holds. He was one of the editors of the 'Andover Review,' 1884–93. Among his works are 'Moral Evolution' (1896); 'Inequality and Progress' (1897).

Harris, James Rendel, English scholar. He was graduated at Cambridge University, where he was fellow and librarian of Clare College. He was professor at Johns Hopkins University and at Haverford College, and is now university lecturer in palæography at Cambridge, England. He has written many volumes on philology, palæography and kindred subjects, his latest work being 'Annotators of the Codex Bezæ' (1901).

Harris, Joel Chandler, American journalist and author: b. Eatonton, Ga., 8 Dec. 1848. He began his career as a printer's apprentice on the Forsyth (Ga.) 'Countryman' and was on the staff of the Savannah *Daily News*, 1871–6. He has been connected with the Atlanta *Constitution* from 1876 and became its editor in 1890. The series of "Uncle Remus" sketches and songs which have given him an international reputation were first printed in the *Constitution*. His published books include: 'The Folk-Lore of the Old Plantation' (1880); 'Nights With Uncle Remus' (1883); 'Mingo and Other Sketches' (1883); 'Daddy Jake, the Runaway' (1889); 'Free Joe and Other Stories' (1887); 'Balaam and his Master' (1890); 'Mr. Rabbit at Home' (1895); 'The Story of Aaron' (1896); 'Stories of Georgia History' (1897); 'Sister Jane,' a novel (1897); 'Minervy Ann' (1899); 'On the Wing of Occasion' (1900); etc.

Harris, Joseph, American agricultural writer: b. Shrewsbury, England, 1828; d. 1892. He began his scientific study of agriculture with Lawes and Gilbert at Rothamsted and in 1864 emigrated to the United States, and began to contribute to the agricultural press. His 'Walks and Talks on the Farm' was a series of articles which appeared partly in the 'Genesee Farmer,' and partly in the 'American Agriculturalist,' in which the former had become merged. Among his other writings are: 'Harris on the Pig' (1883); 'Talks on Manures' (1883); and 'Gardening for Young and Old' (1882).

Harris, Miriam Coles, American novelist: b. Dosoris, L. I., 7 July 1834. She was married to Sidney S. Harris in 1864 and has since lived in New York. She wrote: 'Rutledge' (1860); 'The Sutherlands' (1862), both widely read, and among many later and almost equally popular works of hers are: 'A Perfect Adonis' (1875); 'Missy' (1880); and 'An Utter Failure' (1891).

Harris, Samuel, American theologian: b. East Machias, Maine, 14 June 1814; d. Litchfield, Conn., 25 June 1899. He was graduated from Bowdoin College and from Andover Theological Seminary. He was a teacher for a time and held Congregationalist pastorates in Conway, Mass., 1841–51. In 1855 he was appointed professor of systematic theology in Bangor Seminary; was president of Bowdoin 1867–71; and then became professor of systematic theology in the Yale Divinity School. His writings include: 'Zaccheus or the Scriptural Plan of Benevolence'; 'Kingdom of Christ on Earth' (1874); 'Philosophical Basis of Theism' (1883); 'Self-Revelation of God' (1887); 'God, Creator and Lord of All' (1897).

Harris, Thaddeus William, American naturalist: b. Dorchester, Mass., 12 Nov. 1795; d. Cambridge, Mass., 16 Jan. 1856. He was graduated at Harvard College in 1815, studied medicine and practised his profession in Milton, Mass., until appointed librarian of Harvard in 1831. This position he occupied until his death. Early in life he exhibited a fondness for natural history, and though plodding alone, attained to a scientific eminence which secured for him the fellowship of all the principal learned societies of America, and of many abroad. For several years he gave instruction in botany and general natural history in the college, and originated the Harvard natural history society for the students. He was chiefly distinguished, however, as an entomologist, and has been surpassed as such by no one in the United States. He was one of the founders of the Massachusetts Horticultural Society. In 1837 he was appointed one of the commissioners for a zoological and botanical survey of Massachusetts, the result of which was his 'Systematic Catalogue of the Insects of Massachusetts' (1832), in which 2,350 species are enumerated. He also published: 'A Treatise on some of the Insects of New England which are Injurious to Vegetation' (1842), a work of permanent value.

DR. WILLIAM T. HARRIS,

UNITED STATES COMMISSIONER OF EDUCATION

Harris, Thomas Lake, American socialistic and religious reformer: b. Fenny Stratford, England, 15 May 1823. He accompanied his father to the United States in childhood, was for a time a Universalist pastor, and founded an 'Independent Christian Society' in 1850; but became a lecturer upon spiritualism. He lectured abroad in 1858, and on his return to the United States organized the society of the "Brotherhood of the New Life." This was established at Wassaic, Dutchess County, N. Y., 1861–7, but removed to Brocton, Chautauqua County, N. Y., in the last named year. Its nature was co-operative rather than communistic, and farming and industrial occupations were engaged in by his followers, numbering at one time about 2,000 in the United States and Great Britain, among them Lady Oliphant and her son, the well-known writer, Laurence Oliphant (q.v.). Harris removed to California in 1887, and retired to private life in 1895, residing in New York city. He published many works in prose and poetry, among which are 'Wisdom of Angels' (1856); 'Arcana of Christianity' (1857); 'Modern Spiritualism' (1860); 'God's Breath in Man' (1891).

Harris, Townsend, American merchant and diplomatist, of Welsh descent and of Revolutionary stock, the youngest of five children: b. Sandy Hill, N. Y., 4 Oct. 1804; d. New York city 25 Feb. 1878. He received his education at the village school and academy. From 1817 to 1848 he was in business in New York city, continuing his self-culture by continuous and critical reading of the best literature, learning also the French, Spanish, and Italian languages; was member of the Board of Education and in 1846–7 its president. He was the practical founder of the New York Free Academy, now the College of the City of New York, and in many ways was a typically useful citizen. He never married. In 1848 he went to California and during the following six years made trading voyages to China and the Dutch and English Indies, becoming thoroughly acquainted with the manifold Oriental varieties of human nature. He acted for a time as American vice-consul at Ningpo. He was appointed Consul General to Japan and on the U. S. S. S. San Jacinto arrived at Shimoda, his future dwelling place (and now noted for its stone quarries), where the flag of the United States was hoisted 4 Sept. 1856. From the first Mr. Harris spoke the truth as against the constant deceit and prevarication of the corrupt officials of the Yedo Shogunate, demanding the courtesies due to an accredited envoy of a civilized power and refusing to deliver the President's letter to any one but the Shogun in Yedo and to him personally. Unbacked by a single ship or man, and with his secretary only, after prolonged negotiations lasting 18 months, he made a triumphal progress to Yedo, and standing erect received personal audience of the Shogun in the palace. Then began four months' instruction of these political hermits in the methods of modern international law and procedure. He concluded the treaty and received the promise of signature by the premier, without regard to anything happening in China. Nevertheless the arrival of Commodore Tatnall with two American men-of-war, bringing news of the humiliation of the Chinese emperor and court, undoubtedly had its influence on the Japanese. Mr. Harris urged the importance of having the treaty signed without a moment's delay, and the premier Ii despatched commissioners to affix their signatures and soon after an embassy to the United States, for which reason chiefly, Ii was assassinated in Yedo, 23 March 1860. The Harris treaty secured the right of trade, residence, and of missionary operations and teachings. He was buried in Greenwood cemetery, Brooklyn, N. Y. Mr. Harris has always been very highly thought of by the Japanese, and is still the subject of much praise and appreciative writing by Japanese writers. His journals with comment and biography were published in 1896.

William Elliot Griffis,
Author of 'Townsend Harris, First American Envoy in Japan.'

Harris, William Torrey, American educator and metaphysician: b. North Killingly, Conn., 10 Sept. 1835. He studied at Yale in the class of 1858 but was not graduated, and after teaching in the St. Louis public schools, 1857–67, was superintendent of the schools of that city 1867–80. While in St. Louis he founded in 1867 the 'Journal of Speculative Philosophy,' which he still edits. He removed to Concord, Mass., in 1880 and aided in founding the Concord School of Philosophy at which he lectured on metaphysical themes. From 1889 to 1906 he was United States Commissioner of Education. He has edited Appleton's School Reader and Appleton's Educational Series and is the author of 'Hegel's Logic: a Critical Exposition' (1890); 'The Spiritual Sense of Dante's Divina Commedia' (1891); 'Introduction to the Study of Philosophy'; 'Psychologic Foundations of Education.'

Harrisburg, Pa., city, State capital; county-seat of Dauphin County, on the Susquehanna River, the Pennsylvania canal, and on the Northern Cent.; Pennsylvania; Cumberland Valley, and Philadelphia & R. R.R.'s., and is situated 105 miles northwest of Philadelphia. This is an important railroad, agricultural, industrial and commercial centre, and is the home of a system of municipal reform known as "the Harrisburg Plan" which has attracted widespread attention throughout the United States. The Susquehanna River is nearly a mile in width at this point, and is crossed by numerous bridges.

History.—The site of the future city was selected by John Harris in 1785, and the settlement was incorporated as a borough in 1791. Harris was an adventurous English trader who built the first house here in 1726, and secured a grant of 800 acres. His son established a ferry here in 1753, and the place was known for many years as Harris Ferry. The town became the capital of the state in 1812, and was chartered as a city in 1860. The Harrisburg convention (q.v.), famous in American political history was held here in 1828, and Harrison and Tyler were nominated here in 1839.

Topography.—The city has a most picturesque location on the left bank of the Susquehanna, which is spanned here by five bridges, three of them modern steel structures. The old historic "Camel-back Bridge," a part of which was burned during the middle of the 19th century, has been removed (1902). There is an extensive and beautiful park of 10 acres, well-made streets, an abundance of shade, and a fine sewage system with natural drainage.

Commerce and Industry.— The iron, steel, lumber and railroad interests of Harrisburg are of great importance. The roundhouses and repair shops of the Pennsylvania Railroad are located here and give employment to thousands of workmen. There are extensive manufactories of machinery, malt liquors, boilers, castings, brooms, cars, coaches, tanned leather, lumber, cotton goods, beds, mattresses, coffins, silk goods and a large number of rolling-mills, tin-mills, blast furnaces, nail-works, typewriter works and boot and shoe factories. The city has two morning and two evening newspapers and many weekly and monthly publications.

Public Buildings.— Prominent among the public buildings is the new State capitol, erected at a cost exceeding $4,000,000. It is built of brick and steel, with facings of marble and granite. At the main entrance is a fountain 78 feet wide, from which the water leaps down an incline in many cascades. On each side of the fountain rises a granite stairway 48 feet wide, broadening at the top into an esplanade and widening at the corners of the building to the proportions of a reviewing ground for troops. The lesser approaches to the grounds are ornamented with statues of the animals native to Pennsylvania. The State Library here, founded in 1790, contains over 100,000 volumes. In State Street stands the Dauphin County soldiers' monument, 110 feet high, in memory of the soldiers who died in the Civil War. There is also a statue here of Gen. John F. Hartranft, and a monument erected to the memory of the soldiers who fell in the Mexican War adorns the Capitol Park. Among other points of interest are the State Arsenal, the court-house, lunatic asylum, executive building, post-office, Harris Park, and Harrisburg Cemetery. The educational institutions include the high school, Harrisburg academy, St. Genevieve's academy, and the Young Ladies' Seminary. Harrisburg is the seat of a Roman Catholic bishop, and its charitable organizations include several hospitals, the Home of the Friendless, and the Children's Industrial Home.

Transportation.— Harrisburg has in operation one of the most extensive and perfect electric street railway systems in the United States. Every part of the city, and suburbs, and the neighboring towns and city are reached by electric trolley lines. The suburban railway service of the Pennsylvania and other railroads is unusually advantageous in extending the outlying residential sections of the city.

Municipal Administration.— The city government is vested in a mayor, elected every three years, with no second term, and a bicameral and select council. The highway commissioner, police officials, building inspector, fire department and sanitary officers are selected by the select council. The city solicitor, board of tax revision and appeals, water commissioners, city engineer, city clerk, 3 members of the board of public works and 5 members of the board of park commissioners, are selected by the common council. The treasurer, controller, school directors, supervisors and assessors are elected by vote of the citizens.

Banks and Finance.— Harrisburg has four national banks and a dozen other banking institutions and building and loan associations. The assessed property valuation is $26,000,000, the tax rate of course constantly changing. The municipal income amounts to $600,000 and the expenditure to $530,000. The principal items of expense are: Fire department, $15,000; waterworks, $30,000; street lighting, $30,000; police, $35,000; schools, $185,000. Public improvements involving an expenditure of $1,000,000 were begun in 1902, for the development of a new sewer system, water filtration, park development and street paving.

Municipal Reform.— Harrisburg through the progressiveness and enterprise of her citizens in the municipal improvement of the city, has been called "the model city," and the plans of 1902, for an expenditure of $1,000,000 have created an improvement system now known as "the Harrisburg plan." In May 1901, a citizen wrote a letter to a daily paper offering $100 toward a fund of $5,000 to engage expert engineers to examine the city and to report a plan of improvement. The proposal met instant approval. In a few weeks the $5,000 was pledged by 60 citizens. An organization and an executive committee soon followed, and these included the mayor, civil engineer and other officials elected by a reform element in local politics. Three noted engineers were employed, and their reports published in October 1901, included plans and estimates for the immediate improvement of the city. The subject was presented to the people at the annual election, 18 Feb. 1902. "The Harrisburg League for Municipal Improvements" carried on an aggressive campaign, proposing a million dollar expenditure. Objections were raised and to overcome these a board of public works was formed (under the laws of the State), composed of citizens who would serve without pay, and to have entire control of the improvements. An ordinance authorizing this board and providing for its appointment before the election was passed by councils immediately after an ordinance had been passed submitting to the voters the question of increasing the city's debt for the following purposes:

"The sum of $310,000 for the extension, improvement and filtration of the water supply; $305,000 for the extension and improvement of the sewerage system; $65,000 for the construction of a dam in the Susquehanna River to form part of the improved sewerage system; $250,000 for acquiring land and property for parks and for making park improvements; and $100,000 for the creation of a fund out of which the city may defray the cost of paving the intersections of streets hereafter authorized to be paved."

Upon this board three leading citizens of high character were appointed, the campaign was opened, the newspapers supported the movement, and even the women formed a civic league and aided in the work. Pamphlets, maps and diagrams were issued and a booklet, 'The Plain Truth About the Proposed Improvements for Harrisburg,' was widely circulated. The result of the election was a casting aside of party lines, and out of a total of 11,048 ballots, the "improvement" party had a majority of 3,590 votes. It was a mixed ticket selected for reform that won the election, the mayor being a Democrat (in a city naturally Republican), the treasurer, also a Democrat, while the controller was a Republican. Of the six candidates for the board of assessors, an important body, fixing the tax valuation of the city, the best three (two Republicans and one Democrat) were selected. Harrisburg in 1904 with her $1,000,000 improvements well advanced, is on the high road to remarkable prosperity. The State construction of a capitol building costing over $4,000,000, and the local railroads projecting improvements involving the expenditure of several millions, add additional strength to the movement toward municipal reform. Pop. (1900) 50,167; (1903) 52,951.

Harrisburg Convention, the assembly convened in 1828 at Harrisburg, Pa., by the protectionist faction of the New England and Middle States, consequent on the rejection of the high tariff "Woolen Bill" in the Senate, by the casting-vote of the Vice-President. The forcible presentation of the cause of protection, and the demands of the convention for an increased duty on several manufactured articles, resulted in the passage of the high tariff bill of 1828.

Har'rison, Benjamin, American statesman: b. Berkeley, Va., about 1740; d. April 1791. While a very young man he was elected to the House of Burgesses of which he was twice Speaker, and in 1773 was chosen a member of the committee which united the colonies against Great Britain. He was a member of the Continental Congress, 1774–7, and on 4 July 1776, reported, as chairman of the committee of the whole House, the Declaration of Independence, of which he was one of the signers. He was opposed to the ratification of the Federal constitution, but after its adoption, supported the national government. His brother, Charles, was a noted general in the American army during the Revolution, and his son, William Henry, became ninth President of the United States.

Harrison, Benjamin, 23d President of the United States: b. North Bend, Ohio, 20 Aug. 1833; d. Indianapolis, Ind., 13 March 1901. He was a great-grandson of Benjamin Harrison, signer of the Declaration of Independence (q.v.), and grandson of William Henry Harrison, ninth President (q.v.) He was graduated from Miami University (Oxford, Ohio) in 1852, studied law in Cincinnati, was admitted to the bar in 1853, and in 1854 began in Indianapolis the practice of his profession. In 1860 he was elected reporter of the supreme court of the State. At the time of his election to the Presidency (1888) he was one of the foremost leaders of the State bar. At the outbreak of the Civil War he assisted in recruiting the 70th regiment of Indiana Volunteers, of which he became colonel (August 1862). He was an exceedingly efficient commander. For some time he was detailed to guard railways in the West; and in the campaign from Chattanooga to Atlanta the regiment was in the 20th Army Corps, the commander of which was Gen. Joseph Hooker. Harrison commanded a brigade at Peach Tree Creek, where he served with especial distinction, and also at Nashville. He was present at Johnston's surrender at Durham Station, N. C., in 1865 was brevetted brigadier-general for his services in command of the brigade, and in June of that year was mustered out. The supreme court of Indiana had declared that Harrison by his enlistment vacated his office of reporter, and a Democrat was elected by default to fill that office for the unexpired term. At the election of 1864 Harrison, while still in the field, was rechosen. In 1867 he refused a renomination, and recommenced his legal practice, in which he was largely retained in both the Federal and State courts. In 1876 he became, on the retirement of the original candidate, the Republican candidate for the governorship, and though he ran about 2,000 votes ahead of his ticket, he was defeated by a Democratic plurality of 3,000. He was appointed a member of the Mississippi River commission in 1879, and in 1880 was chairman of the Indiana delegation in the Republican national convention. At that convention, where he cast nearly the entire vote of the State for Garfield, he was himself mentioned in connection with the Presidency. From 1881 to 1887 he was in the United States Senate, in which he took rank as a prominent debater. He opposed Cleveland's vetoes of the pension bills, urged increase in the navy and civil service reform, and as chairman of the committee on territories demanded the admission as States of North and South Dakota, Montana, Washington, and Idaho. In 1884 he was a delegate to the Republican national convention. At the convention of 1888 (Chicago, Ill.) he was presented by the solid Indiana delegation as a candidate for the nomination to the Presidency; and on the eighth ballot he received the nomination by a vote of 544. The campaign was a vigorous one, and Harrison made many excellent speeches. He was elected, receiving in the electoral college 233 ballots to 168 for Grover Cleveland. His administration was broadly characterized by a firm defence of American interests in foreign affairs and a general promotion of industry and governmental effectiveness. During this time the 55th Congress passed the tariff act known as the McKinley law; the reciprocity system was introduced; the new navy was extended; civil-service reform was promoted; and the Pan-American congress with representatives from all Central and South American countries was held at Washington in the winter of 1889–90. The Bering Sea arbitration respecting the seal fisheries was also organized between Great Britain and the United States. The Samoan difficulties were adjusted; and the Chile affair, concerned with an attack on American sailors either connived at or permitted by Chilean authorities, was promptly and satisfactorily settled by enforced reparation on the part of Chile. At the Minneapolis convention of 1892 Harrison was renominated without serious opposition. He was a second time opposed by Cleveland, and his defeat by 276 electoral votes to 145 was an occasion for some surprise. Upon his retirement from office, he returned to the practice of law, and in 1893–4 delivered a course of lectures on constitutional law at Stanford University. In 1899 he appeared as council for Venezuela in the Anglo-Venezuelan boundary arbitration commission. He was appointed a member for the United States of the Peace Conference held at The Hague in 1899, and became one of the International Board of Arbitration. He wrote 'This

Country of Ours' (1897). A complete collection of his public addresses from 1888 to 1892 was edited by Hedges (1892). A posthumous collection of articles, 'Views of an Ex-President,' was published in 1901. Consult the campaign life by Lew Wallace (1888), and Wilson (editor), 'The Presidents of the United States' (1894). GEORGE EDWIN RINES.

Editorial Staff, 'Encyclopedia Americana.'

Harrison, Burton Norville, American lawyer: b. New Orleans 1836; d. Washington, D. C., 29 March 1904. He was graduated from Yale in 1859, shortly afterward became professor of mathematics and astronomy in the University of Mississippi, and at the outbreak of the Civil War was appointed private secretary to Jefferson Davis, president of the Confederate States. Captured with Davis, he remained in imprisonment until January 1866, when his release was effected by the intervention of F. P. Blair and President Johnson. Subsequent to the war he followed the law in the north with much success.

Harrison, Mrs. Burton. See HARRISON, CONSTANCE CARY.

Harrison, Carter Henry, American politician: b. Elk Hill, Fayette County, Ky., 15 Feb. 1825; d. Chicago 28 Oct. 1893. He was graduated from Yale in 1845, from the Transylvania University law school (Lexington, Ky.), in 1855, and in the latter year was also admitted to the bar and removed to Chicago. There he invested in real estate, in 1869 was defeated as a candidate for State senator on the Democratic ticket, but in 1871 was elected county commissioner of Cook County, and in 1874 was sent to Congress from the 2d Illinois district, and in 1876 re-elected. In 1879 he was elected mayor of Chicago, and again in 1881, 1883, 1885, and 1893. He was also an unsuccessful independent candidate in 1891. In 1891 he purchased the Chicago *Times*, in the direction of which he was active until his election as mayor in 1893. In several instances his mayoralty contests assumed national interest, particularly so that of 1893 — the "World's Fair year" — when the success of the great exposition was thought to depend much upon the occupant of the mayor's chair. He was opposed by the united Citizens' and Republican forces and by nearly the entire press of Chicago, but after a vigorous campaign of public meetings was elected by more than 21,000 majority. He wrote: 'A Race with the Sun'; and 'A Summer Outing.'

Harrison, Carter Henry, American politician: b. Chicago 23 April 1860. He is son of the preceding. He graduated from St. Ignatius College, Chicago, in 1881, and from the Yale Law School in 1884. He practised law in Chicago, was later engaged in the real estate business, and in 1891 became editor of the Chicago *Times*, a position which he held for two years. He has been active in Chicago politics as a Democrat, and has been four times elected mayor of the city, in 1897, 1899, 1901, and 1903.

Harrison, Constance Cary, American novelist and miscellaneous writer: b. Vaucluse, Va., 25 April 1846. She was married in 1867 to Burton N. Harrison (q.v.) and has since lived in New York. She is one of the most popular of American authors and among her published books are: 'Woman's Handiwork in Modern Homes' (1881); 'Old-Fashioned Fairy-Book' (1884); 'Bar Harbor Days' (1887); 'The Anglomaniacs' (1887); 'Sweet Bells Out of Tune' (1893); 'An Errant Wooing' (1895); 'A Bachelor Maid' (1894); 'A Son of the Old Dominion' (1897); 'A Merry Maid of Arcady' (1897); 'Good Americans' (1898); 'A Princess of the Hills' (1901); a play, 'The Unwelcome Mrs. Hatch' (1901); etc.

Harrison, Frederic, English philosopher and historian: b. London 18 Oct. 1831. He was educated at Oxford; was called to the bar at Lincoln's Inn in 1858, and for a time practised as a conveyancing and equity lawyer. In 1877 he was appointed professor of jurisprudence and international law at the Inns of Court, a post which he held till 1889. He is the chief living representative in England of Positivism and the Religion of Humanity. He has been widely read in the United States, which he visited on a lecturing tour in 1901. He is a master of English style and his literary judgments command the fullest respect. Among his publications 'The Meaning of History' (1862); 'Science and Humanity' (1879); 'The Present and the Future' (1880); 'Byzantine History in the Early Middle Ages' (1900), his Rede Lecture. The volume entitled 'The Religious Systems of the World' (1893) includes an account by him of the Religion of Humanity.

Harrison, Gabriel, American author and artist: b. Philadelphia 25 March 1825; d. Brooklyn, N. Y., 15 Dec. 1902. He began life as a photographer and an actor and in 1845 supported Charles Keane at the Park Theatre, New York, and later taught elocution, and wrote dramatic and art criticism. Among his works are: 'Life of John Howard Payne' (1873); dramatization of 'The Scarlet Letter' (1878); etc.

Harrison, James Albert, American philologist: b. Pass Christian, Miss., 21 Aug. 1848. He was graduated at the University of Pennsylvania in 1868; and has since been professor of Latin and modern languages at Randolph-Macon College, Va., 1871–6; of English and modern languages at Washington and Lee University 1876–95, and of English and romance languages at the University of Virginia. He is a prominent member of the American Philological Association and the founder and editor of the 'Library of Anglo-Saxon Poetry.' Among his works are: 'Group of Poets and Their Haunts' (1881); 'Story of Greece' (1885); 'Dictionary of Anglo-Saxon Poetry' with Baskerville (1886); etc.

Harrison, Joseph, American engineer: b. Philadelphia 20 Sept. 1810; d. there 27 March 1874. In 1834 he began the construction of locomotives, and in 1840 designed for the Reading railway an engine which was copied and introduced into Russia with such success that he was invited to Russia, and there with two other American engineers concluded a contract with the Russian government to build the rolling-stock and locomotives of the St. Petersburg and Moscow railway. He executed also other important contracts with that government, and in 1852 returned to the United States, where he subsequently patented a safety-boiler and received both the gold and silver Rumford medals from the American Academy of Arts and Sciences. In 1860 he published a folio containing his autobiography, incidents of his Russian ex-

BENJAMIN HARRISON,

TWENTY-THIRD PRESIDENT OF THE UNITED STATES.

perience, and his poem, 'The Ironworker and King Solomon.'

Harrison, Lowell Berge, American artist: b. Philadelphia 28 Oct. 1854. He studied with Alexander Cabanel in Paris, became known for his landscapes, especially snow-scenes, and obtained medals at the Paris Salon of 1887 and the Columbian Exposition (1893). His works include: 'Friends, or Foes?'; 'A Waif from the Sea'; 'Calling Home the Cows'; and 'November,' purchased by the French government for the Marseilles Museum.

Harrison, Mary Saint Leger («Lucas Malet»), English novelist: b. Eversley, Hampshire. She is a daughter of Charles Kingsley (q.v.) and was married to Rev. William Harrison, rector of Clovelly, who died in 1897. She inherits the talent of the Kingsleys and her novels published under the pseudonym of «Lucas Malet» have been as widely popular in America as in England. They are marked by vigorous characterization and skilful construction, and include: 'Mrs. Lorimer' (1882); 'Colonel Enderby's Wife' (1885); 'Little Peter' (1887); 'A Counsel of Perfection' (1888); 'The Wages of Sin,' a notably strong tale (1891); 'The Carissima' (1896); 'The Gateless Barner' (1900); 'Sir Richard Calmady' (1901).

Harrison, Thomas, English regicide: b. Newcastle-under-Lyne 1606; d. London 13 Oct. 1660. He was a soldier of Parliament in the civil war and commanded the guard that carried King Charles from Hurst Castle to London, sat among his judges, and signed his death warrant. He fought at Worcester, but his uncompromising attitude in religion and politics was unacceptable to Cromwell and he was deprived of his commission, and later imprisoned for his share in some of the plots devised by the extremists. At the Restoration, he was seized, tried, and condemned to death.

Harrison, Thomas Alexander, American painter: b. Philadelphia 17 Jan. 1853. He studied painting under Gérôme in the Ecole des Beaux Arts at Paris, and first exhibited in the Salon of 1881. He was awarded the gold medal by the Pennsylvania Academy of Fine Arts in 1894 and elected an associate of the National Academy in 1898. His best known works are: 'Coast of Brittany'; 'Little Slave'; 'The Sea-Shore.'

Harrison, Susan Frances Riley, Canadian author: b. Toronto 24 Feb. 1860. She was at one period literary editor of the Toronto 'Week' and has been a frequent contributor to American and English periodicals. She has written 'Crowded Out and Other Sketches' (1889); 'Pine, Rose, and Fleur-de-Lis' (1891); 'Down the River and Other Poems' (1891); and edited an anthology, 'French and English Native Writers' (1889).

Harrison, William Henry, 9th President of the United States: b. Berkeley, Charles County, Va., 9 Feb. 1773; d. Washington, D. C., 4 April 1841. He studied at Hampden and Sidney College, later pursued a course in medicine, and was about to be graduated as a practitioner, when the sudden death of his father gave him the liberty to disengage himself from a profession for which he had no natural bent nor aptitude. He received from Washington a commission in the army, and was soon on his way to Cincinnati, making the journey from Philadelphia to Pittsburg on foot, to join the regiment to which he had been assigned. He arrived at Fort Washington just after the defeat of General St. Clair's army. His first military service was to command a company of twenty men as an escort for a train of pack-horses to Fort Hamilton, a military post on the west bank of the Big Miami River from which the seat of Butler County was named. In 1793 he joined the new legion under General Anthony Wayne who made him an aide-de-camp, and in December of that year he took part in the expedition which repossessed General St. Clair's field of battle, and erected thereon Fort Recovery. He participated in all the engagements with the Indians and their British allies during this campaign, and displayed conspicuous gallantry at the Battle of Fallen Timbers. Shortly after the close of this campaign Harrison was advanced to the rank of captain and placed in command of Fort Washington. The position was largely a confidential one. The conduct of the Spaniards on the Mississippi was exasperating. French citizens and agents were engaged in exciting the people of Kentucky into a war with the Spanish of Louisiana with the object of thus embroiling our government with Spain and of forcing it into a league with France. Captain Harrison was instructed to prevent the passage down the river of boats laden with military stores belonging to the French agents. The English posts on the northern frontier, which had been held so long in violation of good faith, were now evacuated by the English in obedience to the Jay Treaty of 1794; the new garrison and supplies were sent to Fort Washington and forwarded thence through the wilderness under the supervision of the commandant of that post. In the spring of 1798 Harrison resigned his commission in the army and settled on a tract of land at North Bend about 16 miles from Cincinnati, but was immediately appointed by President John Adams as secretary of the Northwest Territory under Gen. Arthur St. Clair as governor. A year later he resigned this position to take his seat in Congress as the first delegate from the Territory. Up to this time the public lands had been sold in such vast tracts that none but men of wealth could buy them. Harrison secured the division of the land into small tracts and made it possible for the poor man to obtain a homestead. During that session of Congress a part of the Northwest Territory was formed into the Territory of Indiana. It included the present States of Indiana, Illinois, Michigan, Wisconsin, and a part of Minnesota, and contained a civilized population of nearly five thousand souls. Harrison was appointed its first governor by President Adams, and so satisfactory was his administration, he was successively reappointed by President Jefferson and President Madison. He was also made superintendent of Indian affairs. Governor Harrison organized the new government at Vincennes. Many difficult questions demanded his attention, but the most difficult and delicate was the restless and finally hostile attitude of the savages under the leadership of Tecumseh, and the preaching of Tecumseh's brother, «the Prophet.» The beginning of open warfare by the Indians was averted many times by his calmness and courage. He made in all thirteen treaties with the Indians, and secured the cession from several tribes of more than three million acres of land on the Wabash and White Rivers. Tecumseh condemned these treaties on the ground that the land belonged to all of the Indians, and that a single tribe could not give a legal title without the consent of every other tribe. Harrison invited Tecumseh to Vincennes for a conference, and directed that he should bring with him not more than thirty warriors; but he came with four hundred completely armed. There were many evidences that treachery was intended, and but for the conciliatory methods of the governor, the council would have terminated in bloodshed. Nothing was accomplished by this interview, nor by a second in the following summer. Meanwhile, frequent depredations by the Indians made it evident that conciliatory measures could no longer be employed, and on 26 Sept. 1811 Harrison set out with 900 men to punish them. On 6 November, when the army was within a short distance of Tippecanoe, it was met by messengers demanding a parley. A council was agreed upon for the next day, but at 4 o'clock on the following morning, the treacherous savages fiercely attacked the camp of Harrison in an endeavor to take it by surprise. The fighting continued till daylight when the Indians were routed with great loss. In the war of 1812 Harrison was appointed to the chief command of the Northwest, and given a major-general's commission. He urged upon the government the importance of creating a navy on the Lakes. That advice was heeded, and the splendid achievement of Commodore Perry on 10 Sept. 1813, was made possible by the military sagacity of this accomplished soldier. Six days after Perry's victory General Harrison embarked his artillery and supplies for a descent on Canada. The British general, Proctor, burned the fort and navy-yard at Malden and retreated, closely pursued by Harrison who overtook him and his Indian allies led by Tecumseh near the river Thames. Within five minutes almost the whole British force was captured, and shortly afterward the Indians were completely routed, and their leader Tecumseh was slain. The battle of the Thames and Perry's victory ended the war in Upper Canada, and gave the United States undisputed possession of the Great Lakes excepting Lake Ontario.

The years between the War of 1812 and the presidential campaign of 1840 Harrison devoted in part to the service of his country, and in part to the life of a country gentleman. He was in turn a member of Congress, state senator in the general Assembly of Ohio, presidential elector, United States senator from Ohio, and minister to the United States of Colombia. In 1820 he retired to his farm at North Bend In December 1839, he was nominated by the National Whig convention for the Presidency of the United States, with John Tyler of Virginia for vice-president. The campaign which followed was one of the most exciting in the history of the country. Political mass meetings and processions were introduced for the first time, and party watchwords and emblems were employed with telling effect. That canvass has commonly been called the 'log-cabin and hard cider campaign.' The eastern end of General Harrison's home at North Bend consisted of a log cabin covered with clapboards, and his table was reputed to be well supplied with good cider, instead of wines. Log cabins and hard cider thus became party emblems typifying republican simplicity. "Tippecanoe and Tyler too' was shouted and sung and emblazoned from one end of the country to the other. Nothing could stem the tide of wonderful popular enthusiasm for the hero of Tippecanoe and the Thames. Van Buren, the Democratic candidate, received only sixty electoral votes out of two hundred and ninety-four. The death of the President occurred only thirty-one days after his inauguration. Consult Bostwick in Wilson's 'Presidents of the United States' (1894).

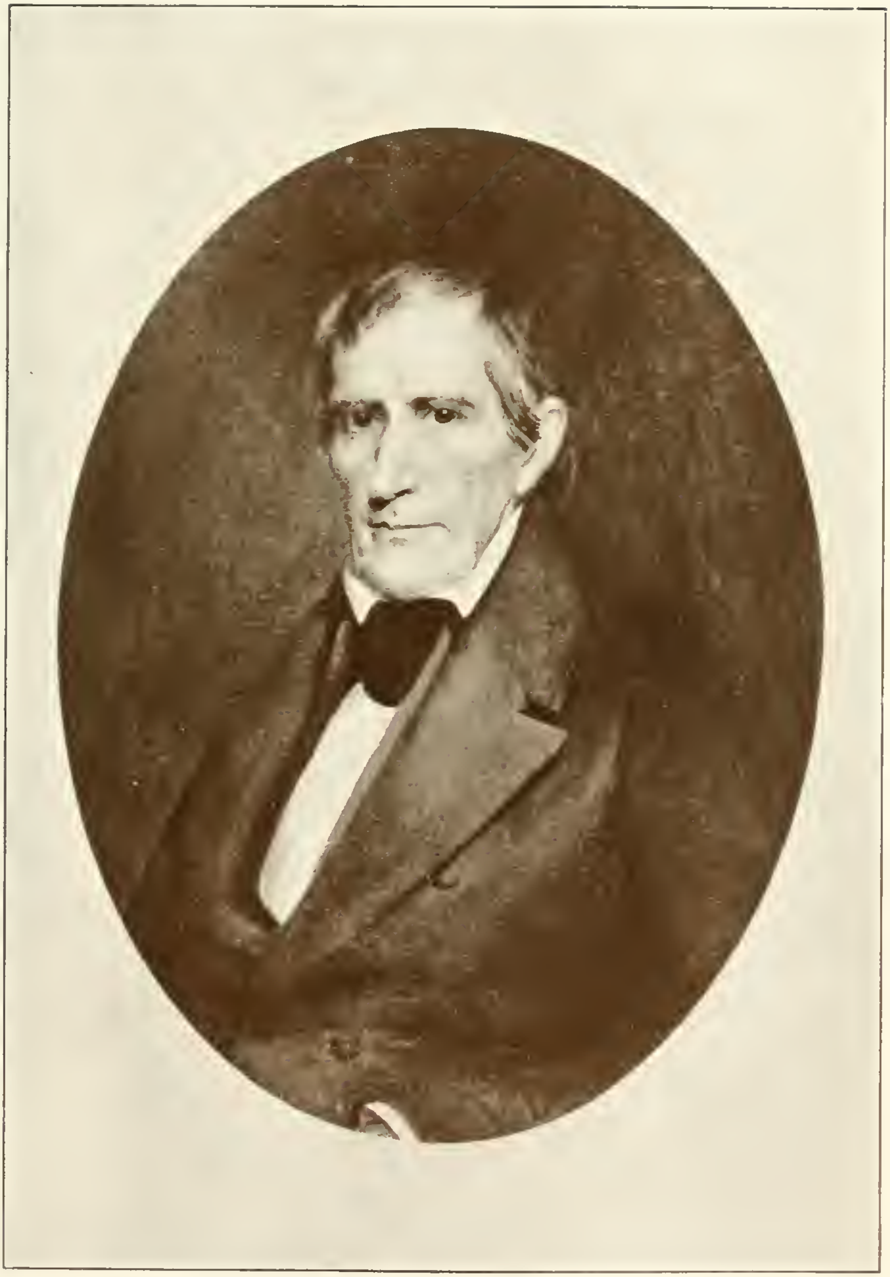
Harrison, Ark., town, county-seat of Boone County; on the St. Louis & N. A. railroad; about 120 miles northwest of Little Rock. It is in the lead and zinc section, and its industries are chiefly connected with mining. Considerable fruit is grown in the vicinity, and it has flour-milling and dairy interests. It is the seat of a collegiate and normal institute for women. The United States government building cost about $80,000. Pop. 1,603.

Harrison, N. J., city in Hudson County; on the Passaic River, the Pennsylvania and the Erie R.R.'s. It is a suburb of Newark, and a sub-station of the Newark post-office, but has an independent municipal government. It was settled in 1668 and incorporated in 1873. The charter of 1873 is still in force, and by it the government is vested in a common council elected by wards. The chief manufactures are wire-cloth, marine-engines, steel, machinery, tubes, refrigerators, ink, beer, and leather. The water-plant is owned and operated by the city. Pop. (1900) 10,596.

Harrison, Ohio, village in the township of Harrison, Hamilton County, on the boundary between Ohio and Indiana, and on the Cleveland, C., C. & St. L. railroad, 23 miles by rail west-northwest of Cincinnati. The village situated on the north bank of the Whitewater River, a tributary of the Great Miami, in a fertile farming section, has manufactures of furniture, sashes, blinds, brushes, bricks, shoes, a corn-drill factory, a cannery, and lumber, flour, and roller mills. Its public buildings include a high school and six churches. Pop. (1900) 1,456.

Har'risonburg, Va., town, county-seat of Rockingham County; on the Chesapeake & W., the Southern, and the Baltimore & O. R.R.'s; about 100 miles northwest of Richmond. It is in the Shenandoah Valley, and is surrounded by a rich agricultural country. Its chief manufactures are flour, staves, saw and planing mill products, foundry and machine shop products, and pottery. It is the trade centre for the greater part of the county. The town owns and operates the water-works. Pop. (1900) 3,521.

Harrisonburg, Engagement Near. Harrisonburg, Va., on the Great Valley Turnpike, 22 miles north of Staunton, and 122 miles northwest of Richmond, was the scene of many stirring events in the Civil War. The place was occupied by Gen. Banks late in April 1862, and abandoned when Jackson forced Banks down the valley in May. When Jackson, in turn, was forced up the valley by the combined armies of McDowell and Frémont, he abandoned the main valley, moving from Harrisonburg to Cross Keys and Port Republic, his rear-guard, two regiments of Virginia cavalry, under Gen. Turner Ashby, halting about two miles southeast of Harrisonburg. On 6 June 1862 Col. Wyndham, with the First New Jersey cavalry and a battalion of the Fourth New York, moving from Harrisonburg, attacked Ashby and



WILLIAM HENRY HARRISON.

NINTH PRESIDENT OF THE UNITED STATES.

was defeated and followed to within one mile of the town, with the loss of several men killed and wounded, and about 60 taken prisoners, including Wyndham himself. Gen. Bayard then pushed forward with cavalry and infantry and Ashby fell back and called for infantry support. Jackson sent him Stuart's brigade — First Maryland, Forty-fourth, Fifty-second, and Fifty-eighth Virginia. A few miles beyond Harrisonburg Bayard attacked with the Pennsylvania «Bucktails» under command of Lieut.-Col. T. L. Kane, and in the engagement Ashby was killed, and Kane was wounded and captured. While this was happening on the right, the Sixtieth Ohio infantry and First Pennsylvania cavalry, on the left, drove in the Confederate skirmish-line, without loss on either side. As soon as the wounded could be removed the Confederates fell back in the direction of Port Republic, and the Union forces retired to Harrisonburg. The Union loss in the engagement was 65 killed, wounded, and missing. The Confederate loss including Ashby, was 18 killed, 50 wounded, and 3 missing. Consult: 'Official Records,' Vol. XII.

E. A. Carman.

Har'risonville, Mo., city, county-seat of Cass County; on the Missouri, K. & T., and the Missouri P. R.R.'s; about 30 miles southeast of Kansas City. It is situated in an agricultural and stock-raising region and the trade and manufactures are connected chiefly with the products of the surrounding farms. The shipping consists mostly of grain, live stock, lumber, and dairy products. Pop. (1900) 1,844.

Harrisse, hăr-ēs', **Henri,** American critic, bibliographer, and historian: b. Paris 1830, of Russian-Hebrew parentage. He became a citizen of the United States, and for several years practised law in New York. He has published 'Bibliotheca Americana Vetustissima' (1866); 'Christopher Columbus' (1884–5); 'John and Sebastian Cabot' (1883); 'The Discovery of North America'; etc.

Har'rodsburg, Ky., city, county-seat of Mercer County; on a branch of the Southern railroad; about 45 miles southwest of Lexington and 58 miles southeast of Louisville. It is the oldest permanent settlement in the State, and was founded by James Harrod in 1774. Two years later Kentucky was incorporated as one of the counties of Virginia and Harrodsburg was made the county-seat. Stock-raising and farming are the principal occupations in the surrounding country. It has flour and planing mills, a distillery, brick-yard, and ice factory. The climate, scenery, and the Greenville Springs nearby make it a pleasure and health resort. It is the seat of Beaumont College, an institution for women, opened in 1894. Pop. (1900) 2,876.

Harrow School, England, an academic institution situated at Harrow-on-the-Hill, a town of Middlesex, 12 miles northwest of London. It is one of the famous public schools of England and was founded by John Lyon in 1571. The original red brick school house, now the Fourth Form School, was built 1608–15. New buildings were added in 1819 and since, the chief of these being the Vaughan Memorial Library (1863), and the semi-circular speech-room (1877). The school was primarily intended to afford free education to 30 poor boys of the parish; but provision was also made for the admission of 'so many foreigners as the place can conveniently contain.' The age of admission is 12 to 14; and there are six entrance scholarships of from $150 to $400 per annum, offered every Easter. The most valuable learning scholarships are Baring's three of $500 a year for five years to Hertford College, Oxford. Among the distinguished alumni of Harrow are Dr. Parr, Theodore Hook, Sheridan, Byron, Palmerston, Anthony Trollope, and Cardinal Manning. Under the Public Schools Act of 1868 the governing body comprises six members, elected respectively by the Lord Chancellor, the universities of Oxford, Cambridge and London, the Royal Society and the undermasters.

Hart, Albert Bushnell, American historian: b. Clarksville, Pa., 1 July 1854. He was graduated from Harvard in 1880, subsequently becoming professor of history there. He has written: 'Coercive Powers of the United States Government' (1885); 'Formation of the Union'; 'Introduction to the Study of Federal Government' (1890); 'Studies in American Education' (1895); 'Life of Salmon P. Chase' (1899); 'Practical Essays on American Government' (1893); etc. He has also edited 'American History Told by Contemporaries' (1898–1901); 'American Citizen Series' (1899); and since 1895, the 'American Historical Review.'

Hart, James McDougal, American painter: b. Kilmarnock, Ayrshire, Scotland, 10 May 1828. He came to the United States in 1831, and studied art under his brother William (q.v.), and at Düsseldorf in the studio of Schirmer (1851). He was elected a member of the National Academy in 1859, and devoted himself principally to American forest scenery with a preference for autumnal effects. His 'Landscape with Cattle' is in the New York Metropolitan Museum, and his best known pictures are 'On the Croton'; 'Morning in the Adirondacks'; and 'Oaks in Autumn.'

Hart, James Morgan, American scholar: b. Princeton, N. J., 1839. He was the son of John S. Hart (q.v.). He was graduated from Princeton in 1860, studied in Göttingen, and took the degree of A. M. from Princeton in 1863. He was professor of modern languages at Cornell (1868–72); professor of modern languages and English literature in the University of Cincinnati (1876–90); returning to Cornell as professor of rhetoric and English philology in 1890. He has written: 'German Universities' (1874); 'Syllabus of Anglo-Saxon Literature' (1887); 'Hand-book of English Composition' (1895); has revised and edited his father's 'Manual of Composition and Rhetoric' (1897); and has translated 'German Classics' and 'Goethe Prose Selections.'

Hart, Joel T., American sculptor: b. Clarke County, Ky., about 1810; d. Florence, Italy, 2 March 1877. He was of humble parentage, and in 1830 entered a stone-cutter's establishment in Lexington. He was induced to attempt modeling busts in clay, and among others, Gen. Jackson and Cassius M. Clay (q.v.) sat to him, the latter giving him his first commission for a bust in marble. This when completed proved so satisfactory that Hart was commissioned to execute a marble statue of Henry Clay. He began this, but various delays prevented its completion, and it was not set up in Richmond, Va., till 1859. Other important works by Hart are 'Woman Triumphant' in the court-house, Louisville, Ky., and 'Il Penseroso.' He was particularly well known for his portrait busts.

Hart, John, American patriot: b. Hopewell, N. J.; d. there, at an advanced age, 1780. Frequently elected to the colonial assembly he was prominent especially in the legislation for local improvements. In 1774 he was chosen to the general Congress at Philadelphia, where he was noted for his sound judgment and inflexible determination; was re-elected in the two following years, and was one of the signers of the Declaration of Independence. New Jersey was soon invaded by the British army, his estate devastated, and special exertions were made to take him prisoner. The capture of the Hessians by Washington permitted his return home.

Hart, John Seeley, American educator: b. Stockbridge, Mass., 28 Jan. 1810; d. Philadelphia 26 March 1877. He was for many years principal of the New Jersey State Normal School, at Trenton, and subsequently professor of English literature at Princeton College. His text-books on English and American literature had a wide circulation, and in the long course of his career as educator he did much to stimulate a taste for good literature among students.

Hart, Sir Robert, English diplomatist, director of the Chinese imperial maritime customs: b. Portadown, County Armagh, Ireland, 1835. He was educated at the Taunton Wesleyan School, and was graduated at Queen's College, Belfast. He entered the British consular service in China in 1854, was appointed inspector-general of customs in 1863 and accepted his present position in 1885. During the Boxer outbreak in 1900, he underwent the siege in the British legation, at Peking, and since then has published his views on the position of things in China in a very remarkable work, 'These From the Land of Sinim' (1901). He attributes the disturbances in China to the arrogance of foreigners and the unyielding pride of the Chinese. He discusses China's army, law, transportation, communication, currency, education, administration, and religion in a highly optimistic vein, and shows that the Chinese government does a great deal better than it gets credit for. He is a firm believer in the Chinese plans for reform. He is certainly deeply trusted by the Chinese authorities and is one of the best oriental administrators that England has ever been blest with in China.

Hart, Samuel, American Episcopal clergyman: b. Saybrook, Conn., 4 June 1845. He was graduated from Trinity College in 1866, and was ordained priest of the Episcopal Church in 1870. He was at Trinity College as assistant professor of mathematics (1870–3), professor of mathematics (1873–83), and professor of Latin (1883–99). In 1899 he became vice-dean and professor of doctrinal theology at Berkeley Divinity School. In 1886 he was appointed custodian of the Standard Prayer Book of the Episcopal Church of the United States, in 1892, secretary of the House of Bishops, and in 1896, historiographer of the church He is a member of several learned societies, including the American Historical Society, the American Oriental Society, and the Society of Biblical Literature and Exegesis. He is editor of 'Satires of Juvenal,' 'Satires of Persius,' and Bishop Seabury's 'Communion Office.'

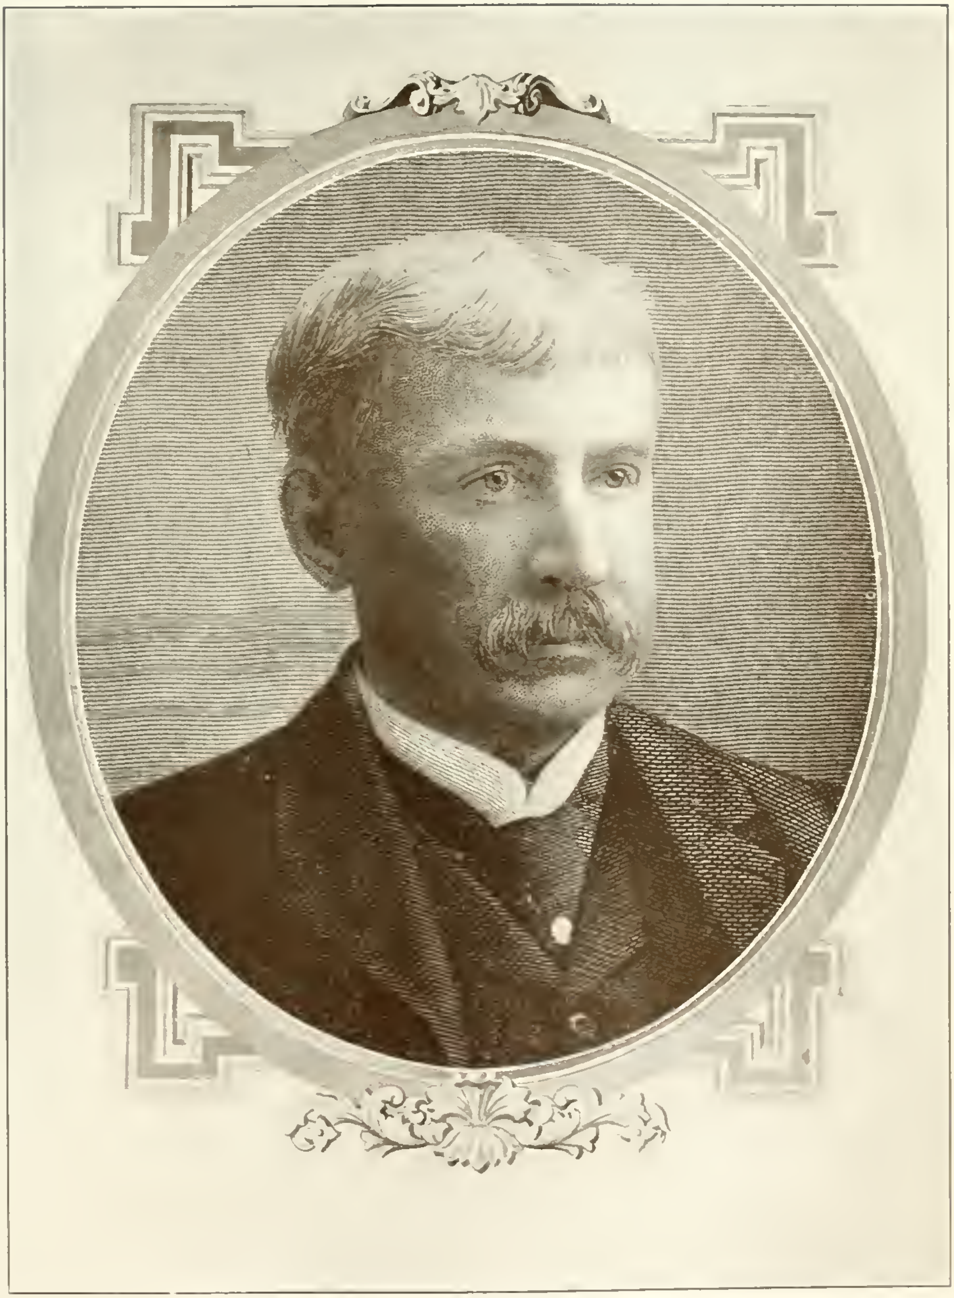
Hart, Thomas Norton, American merchant and politician: b. North Reading, Mass., 20 Jan. 1829. He entered business in Boston as partner in a mercantile firm, later founding a firm under the name of Hart, Taylor & Co. When he withdrew from this business, he became president of the Mount Vernon National Bank, and was connected with many eleemosynary institutions. He has also been active in politics, was a member of the common council, and of the board of aldermen; was nominated for mayor of Boston in 1887 and 1888, but defeated at the election; was, however, elected in 1889, 1890, 1900 and 1901.

Hart, William, American painter: b. Paisley, Scotland, 31 March 1823; d. Mount Vernon, N. Y., 17 June 1894. Emigrating with his parents to the United States in 1831, he settled in Albany, and was at first apprenticed to a firm of coachmakers, in Troy, by whom he was employed to paint the panels of coaches. He subsequently painted landscapes, portraits, and even window shades. In 1848 he became a regular exhibitor at the National Academy of Design, of which in 1858 he was elected as academician. He was president of the American Water Color Society 1870–3. He was a brother of James McDougal Hart (q.v.).

Hart, a hunting term, applied to the male, or stag, of the red deer after it has completed its full antlers at the age of six or seven years.

Hartbeest, härt'bēst, one of the large African antelopes of the genus *Bubalus*, specifically the caama (*B. cama*), formerly excessively numerous on the South African plains. They have long narrowing heads, doubly-curved, ringed horns, cow-like tails, and usually are of a grayish or reddish color, with decided markings on the face, especially in the bontebok (*B. pygargus*), blesbok (*B. albifrons*) and sassaby (*B. lunata*). All were noted for swiftness. Other very distinctive species are the konzi, tora, korigum and hunter's antelope. Most of these have become greatly diminished in numbers since about 1870.

Harte, Francis Bret, American novelist and poet: b. Albany, N. Y., 25 Aug. 1839; d. Aldershot, England, 6 May 1902. In 1854 he went to California, attracted there by the gold excitement. He was first a teacher at Sonora, then tried mining, in which he was unsuccessful. He next entered a printing-office, and in 1857 was compositor on the San Francisco 'Golden Era.' At that time he began to write short sketches, which appeared in the 'Golden Era,' and soon attracted attention; he was invited to join the staff of the 'Californian,' to which he contributed a series of clever parodies on famous contemporary writers of fiction, later published as 'Condensed Novels.' In 1864 he was appointed secretary to the United States branch mint; in 1868 became editor of the 'Overland Monthly,' for which he wrote 'The Luck of Roaring Camp' and others of his most successful stories of frontier life. In 1871 he went to New York and became a regular contributor to the 'Atlantic Monthly.' In 1878 he was appointed United States consul in Crefeld, Germany, and in 1880 received the consulship at Glasgow, Scotland. In 1885 his tenure of office as consul came to an end, and he settled in London, devoting his whole time to literary



BRET HARTE.

work. He was a prolific writer, and continued for the most part to deal with California themes. Among his shorter stories the following may be mentioned: 'Miggles'; 'The Outcasts of Poker Flat'; 'M'Liss' (1872); 'The Twins of Table Mountain' (1879); 'An Heiress of Red Dog' (1879); 'Flip' (1882); 'On the Frontier' (1884); 'By Shore and Sedge' (1885); 'Devil's Ford' (1887); 'A Phyllis of the Sierras,' and 'A Drift from Redwood Camp' (1888); 'The Heritage of Dedlow Marsh' (1889); 'A Sappho of Green Springs' (1891); 'The Bell-Ringer of Angel's' (1894); 'A Protégé of Jack Hamlin's' (1894); 'Barker's Luck' (1896); 'Tales of Trail and Town' (1898); 'Stories in Light and Shadow' (1898); 'Mr. Jack Hamlin's Mediation' (1899); and 'From Sand Hill to Pine' (1900), a collection of short stories. His longer stories and novels include: 'Gabriel Conroy' (1876); 'Thankful Blossom: A Romance of the Jerseys' (1877); 'In the Carquinez Woods' (1883); 'Maruja' (1885); 'Snowbound at Eagle's' (1886); 'The Crusade of the Excelsior' (1887); 'Cressy' (1889); 'A Waif of the Plains' (1890); 'A Ward of the Golden Gate' (1890); 'A First Family of Tasajara' (1892); 'Colonel Starbottle's Client, and Some Other People' (1892); 'Clarence' (1895), dealing with incidents in the American Civil War; 'In a Hollow of the Hills' (1895); and 'Three Partners' (1897). He has also written much verse comprised in volumes entitled 'Poems' (1871); 'East and West Poems' (1871); 'Echoes of the Foot-Hills' (1874); and 'Some Later Verses' (1898).

In estimating Harte's work it must be remembered that it was his rare good fortune to break new ground, and to become the first literary interpreter of a life which with its primitive breadth and freedom, its striking contrasts of circumstance and character, offered singular opportunities to the novelist. That he ever did anything quite so good as his first group of stories and poems cannot be said, for his later volumes are marked, as a whole, by the repetition of well-worn motives and by declining spontaneity and power. Still, the average quality of his output remained high; and when the circumstances of its production are borne in mind, it may perhaps seem remarkable that it should have preserved so many traces of the writer's youthful freshness and vigor. Among qualities of his work those which perhaps most constantly impress the critical reader are his dramatic instinct, his keen insight into character, his broad sympathy, and his subtle and pervasive humor. Dealing for the most part with large, strongly marked, elemental types, as these develop and express themselves under conditions which give free play to instinct and passion, he does not indulge in lengthy analyses or detailed descriptions. His men and women are sketched with a few strokes, and left to work out their own personalities in speech and deed; and yet, such is the skill with which this is accomplished that they stand out before us as creatures of real flesh and blood. He did not purposely soften the shadows in his pictures; the sin and wretchedness of frontier life are frankly portrayed; none the less, there can be little doubt that consciously or unconsciously he contrived to throw an idealizing glamor over the mine and the camp, and that many of his most lifelike and successful characters are wrought in the imagination, though out of the stuff of fact. But it is here that we touch upon what is perhaps one of the finest qualities of his work,— a quality not to be separated from his tendency toward idealization. Though he dwelt habitually upon life's unexplained and inexplicable tragic complexities, he nevertheless suffused his stories with an atmosphere of charity, clear, sweet, and wholesome. The weakness of his writing is closely connected with some of its main elements of strength. A master of condensed and rapid narration, he produced many stories which are too sketchy in method to be completely satisfactory; while in his desire to achieve terseness he occasionally sacrificed clearness of plot. This is particularly the case with his more ambitious efforts, especially with his long novel 'Gabriel Conroy,' an elaborate study of the culture conditions of early California civilization, which, though it abounds in memorable descriptions and vivid character sketches, lacks wholeness and proportion. As a writer of verse, he is unequal: some of his poetry shows the originality and power of his earlier prose, while much is of too temporary a character to find a lasting place in literature. Consult: Pemberton, 'Life of Bret Harte.'

Hartford, Conn., State capital, seat of Hartford County, port of entry, and head of navigation on the Connecticut River, 60 miles from Long Island Sound. By the main line of the New York, N. H. & H. railroad it is 110 miles from New York and 124 from Boston (a midway position which has enhanced its business development), 36 from New Haven, and 26 from Springfield, Mass.; the Highland Division (old N. Y. & N. E.) connects it with Fishkill on the Hudson (110 miles) and Providence, R. I. (90 miles); the Valley Division extends down the river to its mouth, the Connecticut Central to Springfield east of the river. The Central New England runs to Poughkeepsie and beyond. Pop. (1903) about 86,000.

Hartford lies on the west bank of the river, on rolling ground; Prospect Avenue in the west and Fairfield Avenue in the south afford a superb view across the entire Connecticut Valley, some 20 miles wide. It extends about 5½ miles north and south to Windsor and Wethersfield lines, by 3½ west to West Hartford line, about 18 square miles in all; the town and city are conterminous. It is divided about equally by the little Park River, which joins the Connecticut just south of the centre and is crossed by many bridges, and through whose bed runs the great main sewer into the Connecticut. The chief business street is Main, following the river line along the first high ground back from its shore, the latter frequently overflowed in the spring freshets; next Asylum, west past the railroad station, and State east to the steamer landing with the chief wholesale warehouses; Pratt and Pearl parallel to Asylum, and Central Row opposite Pearl across Main. It is a place of great beauty; and from its age, early and continuous business importance, and consequent accumulated wealth and generations of inherited incomes, is of noted social and intellectual cultivation,— more like the old European provincial capitals in a mingling of metropolitan advantages with those of moderate numbers and country roominess than any other American city. There are several costly residence districts: the most notable are Washington Street with its magnificent arch of old elms, Asylum Avenue. and a portion of Farmington, and Woodland Street, with some handsome places on Wethersfield Avenue. One of the finest streets, Prospect Avenue, is the West Hartford boundary, and built up only on that side: and fine places extend well into West Hartford. The street-railway system is very extensive and well managed: it runs in all directions for many miles. The Connecticut is spanned by a wooden bridge to East Hartford: but work has begun on a splendid stone bridge, to be completed by the end of 1904, at a cost with handsome street approaches of nearly $2,000,000.

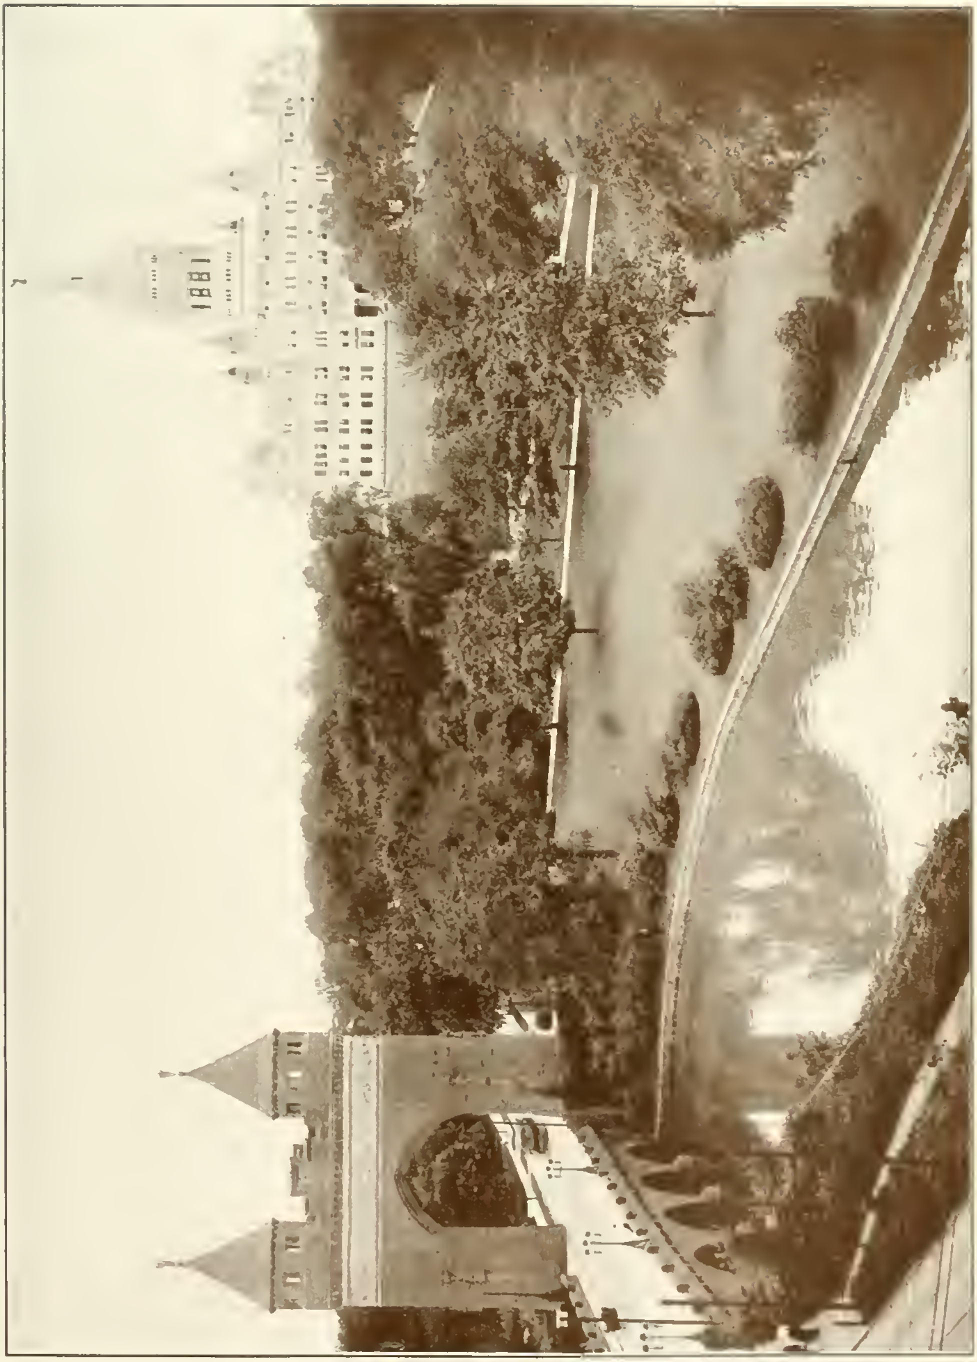
The park system contains some 1,200 acres: within the past few years the munificence of several citizens has endowed the city with a ring of beautiful parks, which with the city's help will ultimately encircle it entire. The oldest is Bushnell Park, in the heart of the city, 48½ acres, crowned by the State capitol and containing monuments to Israel Putnam and Horace Wells. The largest is Keney Park in the extreme north, extending into Windsor, 663.4 acres: next Goodwin Park in the extreme south, some 200 acres. Elizabeth Park in the extreme west, largely in West Hartford, 90 acres, is the nursery for the other parks: Pope Park southwest of the centre has 73 acres, ultimately to be 92 with city additions: and Riverside Park is a reclamation and beautifying of the formerly squalid river front north of the East Hartford bridge. There are also smaller squares and spaces.

The city has a remarkable number of handsome and architecturally notable buildings. Foremost is the State capitol, of white marble, towering over Bushnell Park; the handsomest in the country except the one at Albany, and architecturally surpassing that in many ways. It was completed in January 1880, at a cost of $2,534,024.46; land and other expenses made the total $3,342,550.73. The general plan was of 13th-century Gothic, but modern needs forced very much change in this. Each side is an individual and separately beautiful design: and the interior is as notable as the exterior. Its extreme length is 295 feet 8 inches; depth of centre part, 189 feet 4 inches: depth of wings, 111 feet 8 inches; height from ground line to top of crowning figure, 256 feet 6 inches. It is fireproof, the only known fireproof capitol. The red-sandstone Cheney Building was designed by H. H. Richardson. Trinity College (q.v.) has fine buildings on high ground in the south part, ultimately to form a quadrangle. The homes of the Connecticut Mutual Life, the Ætna Life, the Phœnix Mutual Life, and the National Fire, are the finest insurance buildings; the Phœnix Bank and the First National, of the bank buildings. The white granite government building (post-office and custom-house) may be noted: and the Wadsworth Athenæum is pleasing and dignified. Of several handsome church structures, St. Joseph's Cathedral (R. C.) is most notable. Of interest historically is the city hall, formerly the state house, completed May 1796: the famous Hartford Convention (q.v.) was held here in 1814. Of the city monuments, the two most notable are the Soldiers' Memorial Arch, forming a gateway into Bushnell Park across the Park River: and the superb Corning fountain in that park, a bronze with symbolical figures.

The educational institutions are widely famed. At their head stands Trinity College noted above. The Hartford high school is the most completely equipped in the country; it has cost in buildings, land, and equipment, $598,500. The pupils from surrounding towns are admitted on payment of a fee. A manual-training department was added in a new wing in 1897. The city schools are operated on the district system; several attempts to consolidate them have been heavily defeated. There are nine districts, with 18 buildings altogether. The school expenses are about $400,000 a year. The school tax is assessed with the city taxes, but each district by itself. Hartford has also a theological seminary managed by the Pastoral Union (Congregational) of Connecticut. There are 71 church societies, of which the Congregational (13), Roman Catholic (10), Baptist (9), Episcopal (8), and Methodist (7), are the chief denominations. Hartford is the seat of a Roman Catholic bishop. Its charitable institutions are renowned; it was the earliest seat of attempts to instruct the deaf and dumb in the United States, through Gallaudet and Clerc; and the School for the Deaf, formerly Deaf and Dumb Asylum (whence Asylum Street, where it is located), carries on the work. The Retreat for the Insane, the Hartford Hospital, the Hartford Orphan Asylum, the Y. M. C. A., the City Mission and Open Hearth, and the Union for Home Work, are only part of its overflowing charities. The Connecticut Humane Society also has its head office here.

The library facilities of the city are very large for its size, and far more varied in contents than if they had been collected by a single institution. In the Wadsworth Athenæum are housed the Hartford Free Public Library with 79,000 volumes, the Watkinson Library (reference only) with 59,000, and the Connecticut Historical Society with about 25,000, besides as many pamphlets, and toward 50,000 MSS. The libraries of the Theological Seminary (81,000, and about 40,000 pamphlets) and Trinity College (43,000) contain many valuable specialties: and the State Library in the capitol (40,000, and some 50,000 MSS.), with its great collection of statutes, law reports, public documents, Hansard, etc., is of extreme value.

Hartford, as the head of navigation and therefore distributing point for the Connecticut Valley, early gained an importance as a centre of wholesale trade which it has never lost: to accommodate this, the Hartford Bank, the fifth in the United States, was organized in 1792. But its largest importance is now as one of the leading insurance centres in the world, and third in the United States. This business developed from the marine insurance on its West India cargoes, added fire insurance as a branch, and in 1840 life insurance. The loans of its insurance companies with their vast assets, not restricted by law as are those of New York, have been one of the greatest agencies in developing the West, amounting to several hundred millions of dollars. There are now six life companies, two of which also have accident branches — the latter being the original and chief department in one; five fire companies besides a county mutual, and the United States branches of three foreign companies: and a



THE STATE CAPITOL AND SOLDIERS AND SAILORS MEMORIAL BRIDGE AND ARCH,
IN BUSHNELL PARK.

steam-boiler insurance company. There are 7 national and 5 other banks of discount, 4 savings-banks, and 4 trust companies. The manufacturing interests are heavy and varied. Fire-arms, including Gatling guns, at the famous Colt Works; electric machinery and vehicles; bicycles, of which it is the centre in the United States; cyclometers; woven-wire mattresses; horse nails; screws; steam-engines and boilers; typewriters; leather belting; and special machinery of all kinds, besides knit goods, furniture, carriages, harness, and many other things are manufactured here. It has also one of the largest printing houses in New England, which has manufactured many famous works; four daily papers, one of them the oldest newspaper in the United States (The *Courant*, 1764), and a number of weeklies, monthlies and quarterlies.

The mayor holds office for two years, and the representative body is two-chambered. The assessed valuation of property is about $81,000,000, making it *per capita* one of the richest cities in the United States. The tax rate is under 2 cents on the dollar.

The first white settlement of Hartford was by the Dutch in 1633, at the junction of the Park and Connecticut, still called Dutch Point (though the original point is now out in the Connecticut). They built there a fort called the "House of Hope." (For the settlement by the Newtown men in 1635–6, and the adoption of the first written constitution of modern times, whence Hartford is called the "birthplace of American democracy," see CONNECTICUT.) Hartford was first named Newtown, changed to the present name from Samuel Stone's English birthplace. From here in 1637 sailed the first organized military expedition in the English colonies, John Mason's against the Pequots. The Dutch were ejected from their fort in 1654; they had never really made a settlement. (For the attempt of Andros to seize the charter, in 1687, see CHARTER OAK.) In 1701 Hartford became joint capital with New Haven. In the Revolution, Hartford, as the head of the one rich store of food which the British could not seize, became of prime importance; the second commissary-general of the United States army, Jeremiah Wadsworth, was a Hartford merchant. Gov. Trumbull was also a strong reliance of Washington, who came to Connecticut to consult him; and in 1780 Washington and Rochambeau planned the Yorktown campaign here. The Hartford Convention (q.v.) of 1814 sat here. In 1873 Hartford became the sole capital of the State.

Its native and adopted citizens have made the city one of the literary glories of New England. It was the birthplace of Noah Webster, Frederick Law Olmsted, and John Fiske, with others of note; had the services of George D. Prentice, John G. Whittier, Joel Barlow, and others; and was the long or permanent residence of Harriet Beecher Stowe, Mark Twain, Charles Dudley Warner, and Horace Bushnell, besides John Trumbull and Lydia H. Sigourney. In the business world, both Edwin D. Morgan and Junius S. Morgan began their career as Hartford merchants.

Population.— 1800, 5,347; 1810, 3,955; 1820, 4,726; 1830, 7,074; 1840, 9,468; 1850, 17,966; 1860, 29,152; 1870, 37,180; 1880, 42,015; 1890, 53,230; 1900, 79,850. Of these 23,758 were of foreign birth: 8,076 in Ireland, 3,364 in Germany, and Austria, 2,260 in Russia, 1,952 in Italy, 1,714 in Sweden, 2,073 in England and Canada (English).

FORREST MORGAN,
Of Connecticut Historical Society.

Hartford, Mich., village of Hartford Township, Van Buren County, 15 miles west of Paw Paw on the Paw Paw River, and 17 miles northeast of Benton Harbor, on the Chicago & M. L. S. R.R. It has a graded school and five churches. It carries on a considerable traffic in agricultural produce and stock, has grain elevators, flour, saw-, and planing-mills, canneries, electric light plant, and manufactures staves, cigars, cheese, vinegar, etc. Pop. (1900) 1,077.

Hartford, Vt., town of Windsor County, on the White River, about one mile above its junction with the Connecticut River, and 60 miles south of Montpelier, on the Central Vt. and on the Woodstock R.R.'s. It has woolen, saw, and grist mills, and manufactures of agricultural implements and furniture. Pop. (1900) 3,817.

Hartford City, Ind., city, county-seat of Blackford County; on the Pittsburg, C. C. & St. L. and the Lake E. & W. R.R.'s; about 45 miles southwest of Fort Wayne, and 60 miles northeast of Indianapolis. The natural resources which contribute to the industrial and commercial interests are the products from the surrounding agricultural country, the natural gas supply, and the oil fields. The chief manufactures are iron, glass, flour, pulp, and paper, strawboard, and wagons. The city owns and operates the waterworks. Pop. (1900) 5,912.

Hartford Convention, of 1814: a gathering of New England Federalists to discuss measures for securing New England interests against the South and West; especially in relation to the War of 1812. The convention opposed the war on several grounds,— the vital objection being that it was destroying all American commerce in order to punish Great Britain for crippling a part of it. It was believed by the delegates that the agricultural States were sacrificing New England, whose life-blood was commerce, from ignorance mingled with sectional malice (see EMBARGO). All through the war, the New England Federalists, impoverished and excluded from the national councils, harassed and hampered the government in conducting it; the government retorted by leaving the whole section to its fate; the British inflamed the discord by exempting the New England coast from blockade, and the government countered by laying a new embargo which did the same work. All the New England States and New York were swept by the Federalists on this issue. In November 1813 the governor of Vermont recalled a brigade of militia from garrison duty; the government threatened prosecution, the Massachusetts legislature threatened to use the State power to support him. In the autumn of 1814 the destruction of New England industries had become intolerable; the coast was undefended, the British were occupying that of eastern Maine, and Congress was proposing a conscription so severe as to enlist minors without the consent of their parents; whereupon the Connecticut legislature ordered the governor to call a special session to protect its citizens if the measure were adopted. On 18 October the Massachusetts legislature proposed a convention of the New England States, to take action "not repugnant to their obligations as members of the Union," and "lay the foundation of a radical reform in the national compact" through a future national convention. Connecticut and Rhode Island accepted the proposal with similar qualification; New Hampshire was divided politically and Vermont was excited over Macdonough's victory at Plattsburg, but certain counties sent delegates. The war was a growing and alarming failure. England was demanding the renunciation of the whole Northwest as the price of peace, national bonds were at 25 per cent discount. The government sent a regular army officer to oversee the convention, and use force if it attempted disunion; deputed secret agents to see if it was true that there was a plot to make New England an English grand-duchy under a prince of the blood; and appointed the succeeding 12th of January a national fast-day. The convention met at Hartford, Conn., 15 Dec. 1814, with 12 delegates from Massachusetts, 7 from Connecticut, 4 from Rhode Island, 2 from New Hampshire, and 1 from Vermont,— 26 in all. George Cabot of Massachusetts was chosen president, Theodore Dwight of Connecticut, secretary. A secret session of three weeks was held, a report to the New England legislatures prepared, and 5 Jan. 1815, the convention adjourned. The report stated the before-mentioned grievances, and charged the government with making naturalizations too easy and with destroying the balance of sections by forming new States at will out of the western territory; but denied any present intention to dissolve the Union. It was proposed that Congress should confide the defense of each State to the State itself, and return a share of its taxes for the purpose; and recommended seven changes in the Constitution, namely: abolition of the three fifths slave representation, the requirement of a two thirds vote for the admission of new States, the limitation of embargoes to 60 days, the requirement of a two thirds vote to sanction the prohibition of commercial intercourse, or to declare war or hostilities except in case of invasion; the exclusion of naturalized foreigners from civil offices or a seat in Congress, and prohibition of a President's re-election. They proposed also that two Presidents in succession should never be elected from the same State. They also recommended that another convention should be held at Boston the following June if affairs did not mend or the amendments were rejected. The Massachusetts and Connecticut legislatures adopted the report and sent commissioners to Washington; but before they arrived a satisfactory peace was made, all disasters forgotten in the blaze of the battle of New Orleans, and the promoters of the convention detested as traitors preparing to secede. They were in fact killed for public life. But in 1819 Cabot deposited the journal of the convention with the Massachusetts secretary of state as a permanent testimony that nothing treasonable was attempted; in 1833 Dwight wrote its history.

Hartford Fern. See *Filicales* (2), under FERNS AND FERN ALLIES.

Hartford Theological Seminary, an institution founded in 1834 for the education of Congregational preachers, at East Windsor Hill, Conn. It was formerly called the Theological Institute of Connecticut, and took its present name on its removal to Hartford in 1865. Its control is vested in a board of trustees elected by the Pastoral Union, an association of 200 ministers who have subscribed to the creed of the Union. The aim of the institution is to train ministers for pastoral work on the broadest lines of intellectual and spiritual life. The seminary has always been a leader in theological pedagogy. In 1903 its faculty comprised 12 professors and 12 lecturers, and the number of students was between 80 and 90. It has a library of 81,000 volumes, and nearly 45,000 pamphlets. Hosmer Hall, the main building, was erected 1880 by James B. Hosmer, and as it is estimated, at a cost of $150,000. In 1902 the Case Memorial Library was built by Newton Case at a cost of $100,000. Since 1890 the faculty have issued their valuable theological quarterly, 'The Hartford Seminary Record.'

Harting, James Edmund, English naturalist: b. London 29 April 1841. He was a solicitor until 1878, since when he has devoted himself to zoological research. Among his numerous publications are: 'The Ornithology of Shakespeare' (1871); 'Handbook of British Birds' (1871); 'Rambles in Search of Shells' (1875); 'British Animals Extinct within Historic Times' (1880); 'Essays on Sport and Natural History' (1883).

Har'tington, Spencer Compton Cavendish, MARQUIS OF. See DEVONSHIRE, SPENCER COMPTON, DUKE OF.

Hartington, Neb., city, county-seat of Cedar County; on Bow Creek, and on the Chicago, St. P. & O. R.R.; about 42 miles west by north of Sioux City, Ia., and 18 miles south by east of Yankton, S. D. It is in a fertile agricultural region and is the commercial centre of a large part of Cedar County. Large shipments of wheat and live stock are made annually. Pop. (1900) 971.

Hart'ley, SIR Charles Augustus, English civil engineer: b. Heworth, County of Durham, England, 1825. After being employed on several important engineering works he served in the Crimean war as captain of Turkish engineers, was knighted in 1862, and in 1867 was awarded, against 20 competitors, the prize for plans for extending the harbor of Odessa. He was appointed by President Grant a member of a board of engineers to report on the improvement of the lower Mississippi and recommended the improvement of the South Pass of its delta. He has been consulting engineer on many other notable engineering projects and has received many medals and decorations from home and foreign societies. He has published 'The Delta of the Danube'; 'Public Works of the United States and Canada'; 'Inland Navigation in Europe'; 'History of the Engineering Works of the Suez Canal.'

Hartley, David, English philosopher and physician: b. Armley, Yorkshire, 30 Aug. 1705; d. Bath, Somerset, 25 Aug. 1757. He practised medicine at Newark, Bury St. Edmund's, and London, and is remembered for his 'Observations on Man' (1749) in which is stated his hypothesis of nervous vibration and of the association of ideas.

Hartley, Jonathan Scott, American sculptor: b. Albany, N. Y., 23 Sept. 1845. After spending several years in studying art in England, Rome, and Paris, he established himself in New York where he was professor of anatomy in the schools of the Art Students' League, 1878-84, and president of the league, 1879-80. Among important works by him are: 'King René's Daughter'; 'The Whirlwind'; the Miles Morgan statue at Springfield, Mass.; Daguerre monument, Washington, D. C.; Ericcson monument, New York; statue of Alfred The Great, for Appellate Court building, New York (1900); statue of Thomas K. Beecher, Elmira, N. Y. (1901); etc.

Hart'man, Sadikichi, American author and artist: b. Nagasaki, Japan, 1867. He was educated in Germany. He has published 'Schopenhauer in the Air' (1899); 'Shakespeare in Art' (1901); 'Modern American Sculpture' (1901); etc.

Hartmann, Karl Robert Edouard von, b. Berlin 23 Feb. 1842; d. 6 June 1906. He was educated for the army, but an injury to his knee compelled him to leave the service in 1865. He then began the study of philosophy, and for many years lived the retired life of a student. His most important publications are: 'The Philosophy of the Unconscious' (1869); 'The Phenomenology of the Moral Consciousness' (1879); 'The Religious Consciousness of Mankind in the Stages of its Development' (1881); and 'The Religion of the Spirit' (1882). Among his other works are: 'Critical Grounds of Transcendental Realism'; 'The Crisis of Christianity in Modern Theology' (1880); 'Judaism in the Present and the Future' (1885); 'Lotze's Philosophy' (1888); 'The Ghost Theory in Spiritism' (1891); 'The Fundamental Social Questions' (1894); and many other works on society, religion, etc.

Von Hartmann's philosophy is called by its author a transcendental realism, because in it he professes to reach by means of induction from the broadest possible basis of experience a knowledge of that which lies beyond experience. A certain portion of consciousness, namely sense-perception, begins, changes, and ends without our consent and often in direct opposition to our desires. Sense-perception, then, cannot be adequately explained from the ego alone, and the existence of things outside experience must be posited. Moreover, since they act upon consciousness and do so in different ways at different times, they must have those qualities assigned to them which would make such action possible. Causality is thus made the link that connects the subjective world of ideas with the objective world of things. An examination of the rest of experience, especially such phenomena as instinct, voluntary motion, sexual love, artistic production, and the like, makes it evident that will and idea, unconscious but teleological, are everywhere operative, and that the underlying force is one and not many. This thing-in-itself may be called the Unconscious. It has two equally original attributes, namely, will and idea. Hegel and Schopenhauer (qq.v.) were both wrong in making one of these subordinate to the other; on the contrary, neither can act alone, and neither is the result of the other. The will is illogical and causes the existence, the *Das* of the world; the idea, though not conscious, is logical, and determines the essence, the *Was*. The endless and vain striving of the will necessitates the great preponderance of suffering in the universe, which could not well be more wretched than it is. Nevertheless, it must be characterized as the best possible world, for both nature and history are constantly developing in the manner best adapted to the world-end; and by means of increasing consciousness the idea, instead of prolonging suffering to eternity, provides a refuge from the evils of existence in non-existence.

The original state of the Unconscious is one of potentiality, in which by pure chance the will begins to strive. In the transition state, called that of the empty will, there is no definite end; and to avoid the unhappiness of aimless desire the will realizes the ideas already potentially present and the Unconscious becomes actual. The existence of the universe is the result, then, of the illogical will, but its characteristics and laws are all due to the idea and are, therefore, logical. The history of the world is that given by natural science, and particular emphasis is laid upon the Darwinian theory of evolution (q.v.). Man is developed from the animal, and with the appearance of the first human being the deliverance of the world is in sight, for only in man does consciousness reach such height and complexity as to act independently of the will. As consciousness develops, there is a constantly growing recognition of the fact that deliverance must lie in a return to the original state of non-willing, which means the non-existence of all individuals and the potentiality of the Unconscious.

The one foundation for ethics is pessimism, for no other view of life recognizes that evil necessarily belongs to existence and can cease only with existence itself. The essential feature of the morality built upon this basis is the realization that all is one and that, while every attempt to gain happiness is illusory, yet before deliverance is possible, all forms of the illusion must appear and be tried to the utmost. Even he who recognizes the vanity of life best serves the highest aims by giving himself up to the illusion, and living as eagerly as if he thought life good. It is only through the constant attempt to gain happiness that men can learn the desirability of nothingness; and when this knowledge has become universal, or at least general, deliverance will come and the world will cease. No better proof of the rational nature of the universe is needed than that afforded by the different ways in which men have hoped to find happiness and so have been led unconsciously to work for the final goal. The first of these is the hope of good in the present, the confidence in the pleasures of this world, such as was felt by the Greeks. This is followed by the Christian transference of happiness to another and better life, to which in turn succeeds the illusion that looks for happiness in progress, and dreams of a future made worth while by the achievements of science. All alike are empty promises, and known as such in the final stage, which sees all human desires as equally vain and the only good in the peace of Nirvana.

The relation between philosophy and religion lies in their common recognition of an underlying unity, which transcends all the apparent differences and divisions due to individual phenomena. Many changes must take place in the existing religions before they will be suited to modern conditions, and the resulting religion of the future will be a concrete monism.

The Philosophy of the Unconscious has been the subject of many different estimates, but is regarded as having less intrinsic than historical value. Its influence upon other thinkers was especially marked during the years following its first appearance, but at present that influence has much decreased.

Bibliography. — Schneidewin, 'Lichtstrahlen aus Edouard von Hartmanns sanuntlichen Werken'; Koeber, 'Das philosophische System Edouard von Hartmanns'. Consult also Erdmann, 'History of Philosophy', and Falckenberg, 'History of Modern Philosophy'.

GRACE NEAL DOLSON,
Professor of Philosophy, Wells College.

Hartmann, Moritz, Austrian poet and novelist: b. Duschnik, Bohemia, 15 Oct. 1821; d. Vienna, 13 May 1872. He was educated at Prague and Vienna and taught in Vienna till 1844, when he left the country on account of his political liberalism. Upon his return to Austria he was imprisoned but released by the revolution of March 1848. He sat in the Frankfort Parliament of 1848 but fled from Vienna to escape imprisonment and took part in the "Rump Parliament" at Stuttgart. From 1849-68 he was in voluntary exile in foreign countries; was Paris correspondent of the 'Kölnische Zeitung' and represented it in Crimea during the Russo-Turkish war; in 1860 lectured on German history and letters in the Academy at Geneva; and in 1865 became one of the editors of the 'Neue Freie Presse'. He wrote: 'Kelch und Schwert' (1845); 'Neure Gedichte' (1847); 'Reimchronik des Pfaffen Marizius' (1849); 'Der Krieg um den Wald' (1850); 'Schatten' (1851); 'Adam and Eve' (1851); 'Tagebuch aus der Provence und Languedoc' (1853); 'Briefe aus Irland'; 'Der Gefangene von Chillon' (1863); 'Die letzen Tage eines Königs' (1866); 'Nach der Natur' (1866); 'Die Diomanten der Baronin' (1868); etc. His select poems were edited in 1874 and his works in 1873-74 (10 vols).

Hartranft, här'tränft, **Chester David,** American educator: b. Frederick Township, Montgomery County, Pa., 15 Oct. 1839. He was graduated at the University of Pennsylvania in 1861 and at the New Brunswick Theological Seminary in 1864; was pastor of the Dutch Reformed church at South Bushwick, N. Y., in 1864-6, and of that in New Brunswick, N. J., in 1866-78. In 1879 he was appointed professor of ecclesiastical history at the Hartford Theological Seminary; in 1888 was elected its president, and held the chair of Biblical theology 1892-7 and of ecclesiastical dogmatics from 1897 to 1903. He resigned the presidency in 1903 to engage in literary work in Germany. He was at one time president of the Conservatory of Music at New Brunswick, N. J.

Hartranft, John Frederick, American soldier: b. New Hanover, Pa., 16 Dec. 1830; d. Norristown, Pa., 17 Oct. 1889. He was graduated at Union College in 1853, and in 1859 was admitted to the bar. At the outbreak of the Civil War he organized the 51st Pennsylvania regiment, was made its colonel, and with it participated in Burnside's expedition to North Carolina (1862). He also commanded the regiment in a charge at Antietam, and at Fredericksburg. In March 1865, he commanded a division of the Ninth corps in their assault on Fort Steadman, and was brevetted major-general. He was elected auditor-general of Pennsylvania in 1865, and re-elected in 1868. From 1872 to 1878 he was governor of Pennsylvania, and thoroughly reorganized the Pennsylvania militia, which from 1879 he commanded, with rank of major-general.

Hart's-horn, the horn of the common stag and its decomposition products. The substances derived from the horns were the volatile liquor, salt, and oil, and the ash which remains when the horns are calcined in the air. The fluid portions are got by destructive distillation in a convenient still, and are separated, the salt mechanically, and the others, after washing with water, by repeated rectification either alone or with quicklime, by which the more volatile portions are got free from the tarry matter and heavier oils. The salt which is formed in this operation is ammonic carbonate, which in part condenses the neck of the retort, in part is washed over by the acqueous vapor into the receiver; and when the ammonia is got pure from the distillate and is condensed in water it constitutes the spirit of hart's-horn. The volatile alkali or spirit of hart's-horn is now no longer obtained from that source, except in special circumstances; the ammonia of commerce is now obtained from gas-liquor, from blast-furnaces, or from other sources.

Hart'suff, George Lucas, American soldier: b. Tyre, Seneca County, N. Y., 28 May 1830; d. New York 16 May 1874. He was graduated from West Point in 1852, entered the artillery, was on duty on the frontier and in Florida in the Civil War became assistant adjutant-general, with rank of captain, in 1861, and major in 1862. Later appointed major-general of volunteers, he was one of the board for revision of the rules and articles of war and the preperation of a code for the government of the armies in the field. He was mustered out of the volunteer service in 1865, and in 1871 was retired from the regular army with rank of lieutenant-colonel and brevet major-general.

Hartsville, Engagements at. Hartsville, Tenn., on the north bank of the Cumberland River, about 35 miles northeast of Nashville, is an important crossing and connected by good roads with Lebanon on the south and Gallatin on the northwest. In August 1862 Gen. John H. Morgan, with his Confederate command, was operating north of the river and Gen. R. W. Johnson, with a cavalry command, was sent to drive him back. Johnson, approaching on the Gallatin road, attacked Morgan 21 August, near Hartsville, and was defeated with a loss of 80 killed and wounded, and 75 prisoners.

On 6 Dec. 1862 Hartsville was held by Col. A. B. Moore, with a Union force of three regiments of infantry, a regiment and a company of cavalry, and a section of artillery, in all about 2,100 men. Morgan had been instructed by Gen. Bragg to operate on Gen. Rosecrans' lines of communication in rear of Nashville and, learning that Moore was isolated, with no supports near, resolved to capture him. While two infantry brigades of Cheatham's division and Wheeler's cavalry demonstrated on Nashville, Morgan, with four regiments and a battalion of cavalry, two regiments of infantry, and a battery, set out from Baird's Mills, 25 miles south of Hartsville, on the morning of 6 Dec. 1862, marched through Lebanon, crossed the Cumberland below Hartsville, during the night, disposed his forces so as to cut off Moore's retreat on the roads leading to Gallatin and Castalian, posts occupied by other Union commands, and early in the morning of 7 December, closed in on the Union camp, surprised it, attacked the troops, who were being hastily drawn up to receive him and, after a stubborn fight of an hour and a half, defeated and captured the entire command. Col. John M. Harlan, in command of a small Union brigade at Castalian Springs, nine miles away, hearing the noise of battle, marched to Hartsville and attacked Morgan's rear-guard as it was recrossing the river, recapturing some of the wagons taken. The Union loss was 58 killed, 204 wounded, and 1,834 captured and missing. The Confederate loss was 21 killed, 104 wounded, and 10 missing. Consult: 'Official Records,' Vol. XX.

E. A. Carman.

Hartt, Charles Frederick, American geologist: b. Fredericton, N. B., 23 Aug. 1840; d. Rio de Janeiro, Brazil, 18 March 1878. He was a pupil of Agassiz in the Museum of comparative anatomy at Harvard, and accompanied the great naturalist as geologist of a Brazilian expedition (1865). During this expedition he explored the coast from Bahia to Rio, made extensive zoological collections, and by his researches made himself a leading authority on the natural history of South America. In 1875 he was appointed chief of the geological surveys of the empire of Brazil. He was also from 1876 director of the National Museum at Rio, where are deposited his collections, the most complete of South American geology in existence. He published: 'Geology and Physical Geography of Brazil' (1870), and 'Contributions to the Geology and Physical Geography of the Lower Amazon' (1874).

Hart'well, Ga., town and county-seat of Hart County, the terminal of a branch of the Southern railway, 50 miles northeast of Athens. Its educational institutions include a high school. There are cotton, flouring, and sawmills, and a fruit cannery. Pop. (1900) 1,672.

Hartwell, Ohio, village of Hamilton County, 11 miles north of Cincinnati, on the Cincinnati, H. & D. and on the Cleveland, C. & C. R.R.'s. It has manufactures of wagons and carriages and a general retail and agricultural trade. Pop. (1900) 1,833.

Harty, Jeremiah J., American Catholic prelate: b. St. Louis 1853. He was graduated from the St. Louis University in 1872, and took a theological course at St. Vincent's College, Cape Girardeau, Mo. He was ordained priest in 1878, and appointed assistant pastor of St. Bridget's parish in St. Louis, holding this position until 1888, when he was commissioned to build the church and organize the parish of St. Leo in the same city. His organizing work has been most successful, and in 1902 he built a school accommodating over 700 children. In 1903 he was appointed archbishop of Manila, the most important see in the Philippines.

Hartz'ell, Joseph Crane, American Methodist bishop and missionary: b. Illinois 1 June 1842. He was graduated from Wesleyan University and Garrett Biblical Institute (Evanston, Ill.), and in 1896 was elected missionary bishop to Africa where he has since been actively engaged in organizing missions. In June of 1903 he sailed from New York on his seventh missionary tour of inspection in Africa.

Harugari, hā-roo-gä'rē, a social and benevolent order established in the United States in 1847. It had in 1903 over 300 lodges with a total membership of 30,000. Its purpose is largely the preservation of German language, customs, and traditions.

Harun-al-Rashid, hä-roon'äl-răsh'ĭd, or **Haroun-al-Rashid,** caliph of Bagdad: b. Rhey about 765 A.D.; d. Thous 2 April 809. (See Caliph.) The popular fame of this caliph is by the 'Arabian Nights' Entertainments,' in which Harun, his wife Zobeide, his vizier Giaffar, and his chief eunuch Mesrur, are frequent and conspicuous characters. He was the fifth caliph of the dynasty of the Abbassides, and the most powerful monarch of his race. In 786 he succeeded his elder brother Hadi, who had vainly attempted to exclude him from the throne, and by his conquests and vigorous internal administration raised the caliphate of Bagdad to its greatest splendor, and made his reign esteemed the golden era of the Mohammedan nations. His favorite ministers were Yahia and his son Giaffar, of the ancient Persian family of the Barmecides, whose ancestors had for many generations been hereditary priests at the fire temple of Balkh, and who now rapidly exalted the family to the highest dignities under the caliphate.

Harus'pices. See Aruspices.

Har'vard, John, American clergyman, founder of Harvard University: b. England, probably in Middlesex; d. Charlestown, Mass., 24 Sept. 1638. He was entered as a pensioner at the university of Cambridge in 1628, was graduated B.A. in 1631–2, and M.A. in 1635, and having emigrated to America was made a freeman of the colony of Massachusetts, Nov. 2, 1637. The following year, as appears from the town records, a portion of land was set off for him in Charlestown, where he exercised the ministry. In April 1638, he was appointed one of a committee "to consider of some things tending toward a body of laws." These are the only particulars known of his life. His property at his death was worth about £1,600, one-half of which he gave for the erection of the institution which bears his name; but part of this bequest, it is said, was diverted from its original purpose. He also left to the college a library of more than 300 volumes, indicating in their selection the taste and skill of a scholar. A monument to his memory was erected in the burial ground of Charlestown by the alumni of the university, and inaugurated with an address by Edward Everett, 26 Sept. 1828. See Harvard University.

Harvard, Ill., a city and important railway junction in Chemung Township, McHenry County, at the intersection of three divisions of the Chicago & N. railroad, 63 miles northwest of Chicago. It has railroad repair shops, a malt house and brewery, manufactures of agricultural implements, wagons, and carriages, and grist and woolen mills. Pop. (1900) 2,602.

Harvard University, the oldest institution of learning in the United States, was founded in Cambridge, Mass., in 1636. At a meeting of the general court of the Colony of Massachusetts Bay, convened on 8 September, 6 years after its first settlement, it was voted to give £400 toward a "schoale or colledge," for the purpose of educating the "English and Indian youth in knowledge and Godliness." The ensuing year 12 of the eminent men of the colony, including John Winthrop and John Cotton, were authorized "to take order for a college at New Towne." The name Cambridge was adopted soon afterward in recognition of the English University where many of the colonists had been educated. In 1638 John Harvard, a young nonconformist minister, died in Charlestown, leaving to the college £750 and his entire library of 300 volumes. The institution was opened soon after and was named Harvard in honor of its first benefactor.

In 1637 the first building was erected. The first president was Rev. Henry Dunster, who was elected in 1640. The first graduating class was in 1642, and consisted of nine members. This same year a change was made in the government of the college; a board of trustees was created, the members of which were the governor, the deputy governor, the teaching elders of the "5 next adjoining towns"— Boston, Cambridge, Charlestown, Dorchester, and Roxbury — the magistrates, and the president of the college. The college was established as a corporation in 1650, with power of control over the educational and financial concerns of the institution. The members of the corporation were the president, the treasurer, and 5 fellows. In 1657 the corporation charter was changed so that the overseers had practically no control over the internal management of the college, although a final appeal might be made to them if necessary. Now there were two governing bodies; the overseers and the corporation, at times working in harmony and again antagonistic to each other. In 1780 the board of overseers consisted of the governor, lieutenant-governor, senate, and council of the commonwealth, the president of the college, and the ministers of the Congregationalist churches of the "6 adjoining towns" already mentioned. In 1810 a further change was made in the board of overseers, and instead of the senate and the ministers of certain churches, there were substituted 15 Congregationalist ministers, 15 laymen, the president of the senate, and the speaker of the house, all to be inhabitants of the State. The members constituting the senate were restored as overseers in 1814. A still further broadening of the spirit of the board was shown by the act of 1834, but not ratified until 1843, when clergymen of all denominations were made eligible for membership to the board, and in 1851 an act was passed in which no mention was made of clergymen, but the clause that made only inhabitants of the State eligible was retained. It was not until 1880 that Harvard was freed from all sectional lines, and non-residents of the State of Massachusetts became eligible for membership to the board of overseers.

During the 17th century Harvard had to contend with serious obstacles, many of which had their origin in religious differences or shades of differences; but the desire to give the youth of Massachusetts an opportunity to learn the things taught to their fathers in the schools of Europe never faltered. It required heroic courage then to persevere in such a work, which at present seems a comparatively easy task. The religious controversies continued even after donations and endowments had come to the aid of the institution and had made its success seem almost certain. Under the presidency of Rev. Increase Mather, the college was placed under the control of the Calvinists (1692), but in 1707 the liberals gained the ascendency. An English merchant, Thomas Hollis, in 1721, founded a chair of divinity, and directed that no religious test should be given to the candidate for the professorship. The gift was refused by the overseers, but the corporation urged its acceptance, and the latter finally prevailed. However, the first candidate for a professorship was really subjected to a religious test, for a confession of faith on various disputed points was exacted of him. The religious controversies were carried so far that at one time there was a strong effort made by the orthodox friends of learning to found another college in the colony; but Governor Bernard refused them a charter.

In 1764 the college met with a serious loss by fire; the first Harvard Hall, containing the library and apparatus, was entirely destroyed, but the loss was repaired to some extent by the generous aid of the Colonies. Harvard was loyal to the American cause during the Revolutionary period; even going so far in the readjustment of its financial affairs as to suffer considerable loss. The alumni and students have ever been patriotic, ready to contribute their best to the needs of their country. The fine building, Memorial Hall, was erected by the alumni in memory of their dead who fell in the Civil War. Harvard has always followed a conservative course when parties were agitating questions of government.

Between 1636 and 1782 Harvard College conferred only the degrees of bachelor and master of arts, but in 1780 the term university was applied to it in the Constitution of the State of Massachusetts. The class of 1768 evidently gave some attention to dress, as they voted to wear homespun at their graduating exercises, although their action on the matter is often quoted to prove their democratic simplicity. In 1782 and 1783 three professorships of medicine were established, and the first degree of bachelor of medicine was conferred in 1788. In 1810 the lectures in medicine were transferred to Boston, and there the first medical college was built. The law school was established in 1817, and it has the distinction of being the earliest school of law in the country connected with a university and authorized to confer degrees in law. The divinity school was a gradual outgrowth of the college; the Hollis professorship of divinity, which has been mentioned, was established in 1721, but the divinity faculty was not formally organized until 1819. It is now undenominational, no assent to the special doctrines of any sect or denomination of Christianity being required of any instructor or student. The schools of medicine, law and divinity are the three oldest additions to the college proper, and it was de-

THE YARD, HARVARD UNIVERSITY.

cided that such an institution, having 4 schools and several departments, justified the title, university.

In about 1822, a number of the friends of education and of the institution thought the time had come when further changes should be made in the work required of the students. George Ticknor (q.v.), professor in the department of modern languages, urged that some division of studies should be made whereby students might be permitted to pursue special courses or specialize on certain subjects. A committee, with Joseph Story as chairman, was appointed to investigate the wisdom of such a change, and how best to meet the needs of the students. The committee reported (1824) the advisability of instituting two lines of study — the one a course necessary for a degree, the other a scientific and mechanical course for those not intending to take degrees, but who desired to fit themselves for certain departments of work. The departure from old customs as recommended by the committee was opposed by many, but in 1825 changes were made and the special students were admitted. Prof. Ticknor and later his successor, Henry W. Longfellow, introduced to some extent elective courses in the department of modern languages, but not until a number of years later did they become popular in other departments.

Charles William Eliot (q.v.) was elected president in 1869. At this time the departments were almost independent schools, to which no entrance examinations were required; but the students were largely from classical preparatory schools, the majority of which were located in New England. The college required certain courses, and all demanded good work and a high degree of scholarship before graduation. In four years, so rigorous and thorough had been the work of President Eliot, that practically a reorganization had been made, the departments had been correlated, and individual work had been given recognition.

To Harvard much credit is due for the conservative manner in which it has dealt with the question of higher education of women. The Society for the Collegiate Instruction of Women was the name of an organization which began the work (1869) of providing ways and means for giving young women an opportunity to obtain a collegiate education. The name of the organization was changed, in 1894, by the general court of Massachusetts to that of Radcliffe College (q.v.). Systematic collegiate instruction is now given in this college, under the professors and teachers of Harvard University. The requirements are the same as for admission to the university. The schools and departments of Harvard University now comprise: (1) Harvard College, the Lawrence Scientific School, and the Graduate School, established in 1872 for students making original research. The Scientific School was established in 1847 as an advanced school in science and literature; later the name was changed to Lawrence Scientific School, in honor of Abbott Lawrence who presented it with $50,000. Those three schools, which include 14 departments offering elective courses, were placed, in 1890, under the charge of the faculty of arts and sciences. In 1904–5 there were in attendance 2,905 students under the faculty of arts and science. Of this number 366 were in the graduate school and were engaged in original research. For the students of this school who are engaged in original investigations there is available a number of fellowships, at present 58, which are from $200 to $1,000. The Edward Austin Fellowship and the Austin Teaching Fellowship are given only to resident graduate students. Some of the fellowships may be given to persons pursuing their studies in other parts of the country or abroad; but non-resident appointments are given only to persons who have been resident students in some department of the university. (2) The law school has been mentioned. The attendance in 1904–5 was 758. (3) The divinity school, already noticed, has an attendance of 43. (4) The medical school, founded in 1782, and the dental school, established in 1867, were united in 1899 and are in charge of the faculty of medicine. The school is located in Boston. The attendance in 1904–5 was, in the medical school, 307; in the dental school, 106. The new buildings for the medical school (1903), in process of erection, promise to be second to none other in the world. There will be seven separate buildings, the central structure and two of the side pavilions are provided for by the gift of $1,000,000 from J. Pierpont Morgan, and $1,000,000 from other friends. The site comprises 26 acres, in Brookline, about three miles from the main buildings of the university in Cambridge (5) The Bussey Institute, a school of agriculture and horticulture, was established in 1870 in accordance with the will of Benjamin Bussey. It is at Jamaica Plain, in the southwestern part of Boston. (6) The Arnold Arboretum, established in 1872, is devoted to scientific research in forestry, dendrology, and arboriculture. It was founded under the will of James Arnold. It is practically a large park containing about 220 acres, and is located in West Roxbury. (7) The astronomical observatory was established in 1843 by means of a public subscription. The Sears Tier was built in 1846, and two years later Edward Bromfield Phillips bequeathed to the university the sum of $100,000 for the observatory; this early bequest has since been supplemented by many others, so that the observatory now has an endowment of about $900,000. It has a director and four other professors and 40 assistants. A branch station is established on a mountain 8,000 feet high, near Arequipa, Peru. The annals of the observatory fill about 50 volumes. Among the more important instruments are the 15-inch and 6-inch equatorial telescopes, the 8-inch transit-circle, the 11-inch Draper photographic telescope, the 8-inch photographic telescope, and the meridian photometer. A grant has recently (1903) been made by the Carnegie Institution, for the study of the collection of photographs at the Harvard Observatory. The amount of material, including photographs and photographic charts of the sky that has been collected in this department, requires a special building for its accommodation. (8) The university library, including the libraries of the schools and departments, contains about 673,394 volumes and 393,892 pamphlets. (9) The Gray Herbarium, so named because it contains the Herbarium of Asa Gray (q.v.), presented to the university in 1864. (10) The university museum is made up of the following collections:

the Peabody Museum of American Archæology and Ethnology; the Museum of Comparative Zoology, established in 1859 by private subscription, State aid, and the collection of Louis Agassiz, and valuable gifts from his son; the Mineralogical Museum, established in 1890–1; the Semitic Museum, completed in 1902; the William Hayes Fogg Art Museum, completed in 1895; and the Germanic Museum, established in 1902. (11) The botanical garden, established in 1809, covers about seven acres and contains thousands of plants for scientific study.

Great credit is due Harvard for its leadership in the movement to better the teaching of the English language and literature in the schools of the country. Harvard mentioned the subject in its catalogue of 1865–6; an announcement was made, in the catalogue of 1869–70, that «Students would be examined, as early as possible after their admission, in English.» In 1874, for the first time, every applicant for admission to Harvard was required to present English composition. The report of the committee who visited the preparatory schools to ascertain what they were doing with the subject of English, the discussions by educators on the «new demands of Harvard,» the progress of the movement, the grand results, all now are parts of the «History of Education» of America.

The university summer school gives short courses of study under the charge of a committee of the faculty of arts and sciences, and is held in the college buildings during the summer vacation. The school is popular and has had a large attendance each year. In 1904 the students numbered about 1,007. Athletics are provided for — two fields of 24 acres each and the Hemmeniday gymnasium furnish opportunities for physical training The stadium erected on Soldiers' Field has a seating capacity of about 30,000. It is shaped like the letter «U,» with the open space toward the Charles River. It is of steel and concrete construction. The mezzanine floor under the seats, the promenade above the seats, the stairs, the perfect arrangement of all the parts make this stadium a model of construction. It was built under the auspices of the class of '79. A club house, called the Harvard Union, was donated by Henry Lee Higginson in 1901. The Phillips Brooks house is used for religious meetings. In 1903 Harvard received a valuable collection of plaster replicas of Germanic art; a number of them were given by Emperor William III. of Germany. Among them is a replica of the equestrian statue of the Great Elector, by Schülter, one of Frederick the Great, by Schadow, a cast of the golden gate of the Cathedral of Freiburg, the bronze door of Hildesheim Cathedral, on which the Biblical story of Creation, the wood screen of Naumburg Cathedral, and several other reproductions of great value.

The university has now about 60 buildings. In 1904–5 the number of members of the corporation was 6; of overseers, 30; of professors and instructors composing the faculty, 525; of students in all the schools and departments, 5,143. In 1904 the invested funds of the university amounted to $16,755,753.10; and the grounds, buildings, and apparatus were estimated to be worth about $21,000,000: the annual income was $1,572,-539.50; and bequests and gifts amounted to $1,509,563.76. Harvard has had 22 presidents, including the present incumbent (1903), Charles William Eliot. There are 13 periodicals which represents the interests of the university as a whole, and of special schools and departments.

Harvest Bug or Mite. See MITES.

Harvest-fish. See BUTTERFISH.

Harvest-fly. A cicada (q.v.).

Harvest-moon, the full moon nearest to the autumnal equinox, when the earth's satellite, almost full, rises for several nights in succession about the same hour. This phenomenon is less plainly seen in the United States than in higher latitudes, and is not met with in the tropics. It is due to the fact that at the time of the autumnal equinox the full moon, being exactly opposite the sun, is in that part of her orbit which makes a small angle with the horizon at the point of moon-rise.

Harvestman, or Harvest Spider. See DADDY-LONGLEGS.

Harvey, George Rossiter McClellan, American publisher and editor: b. Peacham, Vt., 16 Feb. 1864. After a secondary education, he became a reporter successively for the Springfield (Mass.) *Republican,* the Chicago *News,* and the New York *World,* was for a time managing editor of the *World,* and later a constructor and president of various electric railways. He purchased and became editor of the 'North American Review' in 1899, and in 1900 received the presidency of the reorganized firm of Harper and Brothers, publishers.

Harvey, Moses, Newfoundland historian: b. Armagh, Ireland, 25 March 1820; d. St. John's, Newfoundland, 3 Sept. 1901. He was graduated at Queen's College, Belfast, in 1840; later studied theology; and was ordained in the Presbyterian Church. He was pastor of the Free Presbyterian Church, St. John's, Newfoundland, 1852–78, when he retired from the ministry and devoted himself to literary and scientific studies, and became popular as a lecturer. He published 'Thoughts on the Poetry and Literature of the Bible' (1853); 'Lectures on the Harmony of Science and Revelation' (1856); 'Newfoundland, the Oldest British Colony' (1883); 'Text-Book of Newfoundland History'; etc. He also contributed articles to the Encyclopædia Britannica on Newfoundland, St. John's, Labrador, and the seal fisheries of the world.

Harvey, William, English physician: b. Folkestone, Kent, April 1578; d. Hempstead, Essex, 3 June 1657; he was graduated at the University of Cambridge in 1593, and later at Padua. He is famous as the discoverer of the circulation of the blood.

Harvey, William Hope, American author: b. Buffalo, Putnam County, W. Va., 16 Aug. 1851. He was educated at Marshall College

THE GREAT ELECTOR,

THE STATUE PRESENTED BY EMPEROR WILLIAM II, TO HARVARD UNIVERSITY.

(W. Va.), and practised law in 1871–84. He appeared as an author under the pseudonym "COIN" in 'Coin's Financial School' (1894), in advocacy of bimetallism as a currency standard. Other works by him are: 'A Tale of Two Nations' (1894); 'Coin's Financial School Up to Date' (1895); 'Patriots of America' (1895); and 'Coin on Money, Trusts, and Imperialism' (1899).

Harvey, Ill., city in Cook County; on the Cleveland, C., C. & St. L. and the Illinois C. R.R.'s; south of Chicago, about seven miles from Blue Island. It was founded in 1891 and incorporated in 1892. Its proximity to Chicago gives it the advantages of a residential city and its railroad facilities are an aid in the development of its manufactories. Some of the chief industrial establishments are railroad supply shops, an automobile factory, gas-stove factories, machine-shops in which are manufactured ditching and mining machinery. The trade is principally in its manufactures and agricultural products. Pop. (1900) 5,395.

Harveyized Steel. See STEEL.

Harwood, Andrew Allen, American naval officer: b. Settle, Pa., 1802; d. Marion, Mass., 28 Aug. 1884. He was a great-grandson of Benjamin Franklin (q.v.). In 1818 he entered the navy and served in the suppressing of the slave trade and piracy in the West Indies; in 1835–7 was with the Mediterranean squadron; in 1848 was given the command of the Cumberland, and in 1855 promoted to the rank of captain. In 1862 he was appointed chief of the bureau of ordnance and hydrography; in 1863 he was made commandant of the Washington navy yard and Potomac flotilla, having the rank of commodore, and retired in 1869 with the rank of rear-admiral. He published 'Law and Practice of United States Navy Courts-Martial' (1867), and 'Summary Courts-Martial.'

Harz (härts) **Mountain** (Ger. *Harzgebirge*), the northernmost mountain range of Germany, extending about 60 miles through Prussia, Brunswick, and Anhalt, between the rivers Weser and Elbe, and occupying an area of about 786 square miles. The range, composed chiefly of Devonian and Lower Carboniferous formations, broken through with granite, is divided into the Upper and Lower Harz, with average elevations of 2,100 and 1,000 feet, respectively, the maximum altitude, 3,745 feet, being reached in the Brocken (q.v.). Woods and fine pastures abound; silver, iron, lead, copper, and zinc are mined, and marble, alabaster, and granite quarried. Traversed by fine roads and accessible by railroads, the range is a favorite touring ground, its interest enhanced by the traditions and weird legends which had their birth in this romantic region.

Has'call, Milo Smith, American soldier: b. Le Roy, Genesee County, N. Y., 5 Aug. 1829; d. Oak Park, Ill., 30 Aug. 1904. He was graduated from West Point in 1852, resigned from the army, practised law in Indiana, entered the Federal army as a private at the outbreak of the Civil War, rose to the grade of brigadier-general of volunteers, distinguished himself at the battle of Stone River, where he saved the day; was present at the siege of Atlanta, and resigned his commission in 1864. Subsequently he was a banker at Goshen, Ind., and a real estate dealer in Chicago.

Hasdrubal, häs'droo-bal, Carthaginian general. He was the son of Hamilcar Barca, and brother of Hannibal (q.v.), and, on the departure of the latter for Italy 218 B.C., was left in command of the army in Spain. Hanno, who had charge of the province north of the Iberus, was defeated and dispossessed by Cn. Scipio before Hasdrubal could come to his aid. Scipio, reinforced by his brother, now crossed the Iberus, and in 216 defeated Hasdrubal near that river. The Carthaginians then sent a force, intended for the assistance of Hannibal, to the relief of Hasdrubal under the command of his brother Mago. In 212 Cn. Scipio was defeated and killed by the Carthaginians. Publius Scipio was sent into Spain in 211, and after seizing New Carthage defeated Hasdrubal in his camp at Bæcula in 209. Hasdrubal withdrawing to the northern provinces, determined to proceed to Italy, leaving his colleagues, Hasdrubal, the son of Gisco, and Mago, to make head against Scipio. He crossed the Alps in 207, accompanied by Gallic allies, and descended into Italy, and sent messengers to concert a junction with Hannibal in Umbria, but his despatches fell into the hands of the consul, Claudius Nero, who joined his colleague, M. Livius, at Sena, and forced Hasdrubal to give battle on the right bank of the Metaurus. Being outnumbered, and ill-supported by his Gallic allies, he was defeated, after an obstinate engagement, in which both sides suffered severely. When he saw the battle irretrievably lost he rushed into the midst of the enemy, and perished fighting sword in hand. Nero hastened back to Apulia, and is said to have announced to Hannibal the defeat of his brother by causing Hasdrubal's head to be thrown into his camp, 207 B.C.

Haseltine, hā'zĕl-tīn, **William Stanley,** American artist: b. Philadelphia, 11 Jan. 1835. He was graduated from Harvard in 1854, studied art in Düsseldorf and Rome, and has been a member of the National Academy from 1861. Among paintings by him may be named 'Indian Rock, Nahant'; 'Castle Rock, Nahant'; 'Bay of Naples'; 'Ruins of a Roman Theatre.'

Hashish, hăsh'ēsh, an eastern narcotic preparation, made from the tops and tender parts of the cultivated hemp, the variety known as *Cannabis Indica* being chiefly employed. The resin picked from the hemp is kneaded together, or sometimes the drug is obtained by decoction or infusion of the leaves. The resin is taken in the form of pills or pellets, and the leaves are chewed, or smoked in conjunction with tobacco. It is called bhang in India, where it is mixed with sugar and eaten as confectionery. It is as powerful as opium and produces intoxication and hallucinations; sometimes transporting the hashish-eater into an ecstacy, or lulling him into somnolency or torpor. Its after-effects are not so depressing as those of opium, and it is often prescribed medicinally as a soporific or anti-spasmodic.

Haskell, Edwin Bradbury, American publisher and editor: b. Livermore, Maine, 24 Aug. 1837. He entered the office of the Portland (Maine) *Advertiser* in 1854, was a reporter for the *Journal* (1857–60) and *Herald* of Boston, bought an interest in the *Herald* in 1865, and was editor of that paper 1862–87. He still holds an interest in the *Herald*, as well as in the Minneapolis *Journal*, the St. Joseph (Mo.) *News*, and the Los Angeles *Express*.

Haskell Institute. See INDIAN, EDUCATION OF.

Has'kins, Charles Homer, American historical scholar: b. Meadville, Pa., 21 Dec. 1870. He was graduated from the Johns Hopkins University in 1887, studied also at Paris and Berlin, was instructor in history at Johns Hopkins in 1889–90, and in the University of Wisconsin was successively instructor in history (1890–1), assistant-professor (1891–2), and professor of European history (1892–1902). In 1899–1900 he was a lecturer in history at Harvard, and in 1902 was appointed professor of history there.

Has'sall, Arthur, English historian: b. Bebington, Cheshire, England, 23 Sept. 1853. He was educated at Oxford, where he has been at various times since lecturer, tutor, and examiner. He is one of the recognized authorities upon European history, his published books including 'Life of Bolingbroke' (1889); 'Louis XIV.' (1895); 'Handbook of European History' (1897); 'The Balance of Power 1715–89' (1896); 'Class-book of English History' (1901); 'History of France' (1901); 'The French People' (1901).

Has'sam, Childe, American artist: b. Boston 1859. He studied art in Boston and Paris; he is a member of Ten American Painters, of New York, and of the Societé National des Beaux Arts of Paris. He is one of the freshest in style and most original of the American impressionists, and has gained medals at Paris, Munich, Chicago, and Philadelphia.

Hassen Ben Sabbah, the founder of the sect of the Assassins (q.v.).

Hasselquist, hās'sĕl-kwist, **Frederick,** Swedish naturalist: b. Ostrogothia 1722; d. Smyrna 9 Feb. 1752. In 1741 he went to the University of Upsala, where his talents and industry drew the attention of Linnæus. In 1747 he published a dissertation 'De Viribus Plantarum.' Wishing to make researches on the spot into the natural history of Palestine he spent some time at Jerusalem, and afterward visited other parts of the country. Returning to Smyrna he brought with him a collection of plants, minerals, fishes, reptiles, insects, and other natural curiosities. The Swedish queen, Louisa Ulrica, purchased the whole of Hasselquist's acquisitions, which were deposited in the castle of Drottningholm. Linnæus, from the papers and specimens of natural history collected by his pupil, prepared for the press the 'Iter Palestinum, or Travels in Palestine, with Remarks on its Natural History' (1757), which has been translated into English and other European languages.

Hassler, hās'lĕr, **Ferdinand Rudolph,** Swiss-American scientist: b. Switzerland, 6 Oct. 1770; d. Philadelphia, Pa., 20 Nov. 1843. After serving on the trigonometrical survey of Switzerland, he emigrated to the United States. He was appointed acting professor of mathematics at West Point in 1807, and held the post for three years. He was superintendent of the United States Coast Survey in 1815, and from 1832 worked on the same commission until his death.

Hassler Expedition, a scientific expedition of great importance despatched by the United States Government. In 1871 the steamship Hassler was fitted out for coast survey and marine exploration. The personnel of the expedition included Prof. Louis Agassiz, and Mrs. Agassiz; Dr. F. Steindacher, ichthyologist; Dr. Thomas Hill, botanist; Count L. F. de Pourtales, Mr. J. A. Allen, and others. The party left Boston 4 Dec. 1871 and reached San Francisco, August 1872. Deep-sea dredging was carried on at several points in the West Indies and South Atlantic. The glaciers in the neighborhood of the Straits of Magellan were explored. Collections were made at every point of the voyage; the results of the expedition have been published by Agassiz, Lyman, and Pourtales, and much valuable material, zoological, geological and botanical, deposited in the Museum of Comparative Zoology, Cambridge.

Hastings, hās'tĭngz, **Francis Rawdon,** 1ST MARQUIS OF HASTINGS and 2D EARL OF MOIRA, English soldier and statesman: b. 9 Dec. 1754; d. off Naples 26 Nov. 1826. He entered the army as an ensign, served in America during the Revolution, and on 25 April 1781 gained the battle of Hobkirk's Hill, which Lord Cornwallis described as the most splendid of the war. In 1781 he was elected a member of the Irish House of Commons, and two years later he was promoted to the English House of Lords with the title of baron. He was in command of a force which sought to aid the royalists of Brittany in 1793, and in the following year co-operated with the Duke of York in the Netherlands. In 1812 he was appointed governor-general of Bengal and commander-in-chief of the forces in India. His administration was distinguished by successful wars against the Ghurkhas of Nepaul and the Pindarees of Central India, but in 1821 he resigned because certain charges had been brought against him in connection with a banking firm in which he was interested. In 1824 he was appointed governor of Malta.

Hastings, Thomas, American musician: b. Washington, Conn., 1787; d. 1872. He early made sacred music the subject of his careful study; from 1823 to 1832 he edited a religious paper, 'The Recorder,' in Utica, but removed to New York, where he made his fame as a musical instructor and composer. His works include: 'Mother's Hymn Book' (1849); 'History of Forty Choirs' (1854); and 'Dissertation on Musical Taste' (1853).

Hastings, Warren, English soldier and administrator: b. Churchill, Oxfordshire, 6 Dec. 1732; d. Daylesford, Warwickshire, 22 Aug 1818. An uncle in London sent him at 10 years of age to Westminster School. On the death of his uncle he obtained an appointment in the East India Company's service, and he arrived at Bengal in October 1750. He was appointed to the factory at Cossimbazar, and was taken prisoner by Surajah Dowlah (1756). On obtaining his freedom he joined Clive, under whom he served with distinction as a volunteer in his campaign of 1757. In 1758 he was appointed resident agent of the company at Moorshedabad, in which capacity he continued to act till 1761. It is recorded to his honor that he did not avail himself of the opportunity of making his fortune in the mode then common among the servants of the company, by "presents" (forced) from the native princes. In 1764 he returned to England, but as a result of a bad investment of his fortune was compelled again to ask for employment from the company; and sailed for India in the spring of 1769. In 1771 the East India Company were contemplating extensive changes in the government of India. The government of Bengal was still carried on in the name of the nabob, although he had become a mere cipher, all his officers being appointed by the company, and they cast their eyes upon Warren Hastings as a fitting instrument to carry out their policy. Clive strenuously supported his appointment to the Calcutta council (1772), with succession as president of the council and governor of Bengal. He now received instructions from the directors to deprive of his offices Mohammed Reza Khan, who had exercised under the company the complete control of the revenues and administration of Bengal, and to bring him to trial for corruption. Mohammed bore a high character, and he was accused by Nuncomar, a man of notoriously bad reputation. Shitab Roy, dewan of Behar, was subjected to similar charges. After a protracted inquiry both Mohammed and Shitab were fully acquitted of all the charges against them. The object of these charges — the reorganization of the judicial and financial administration of the province under the direct control of the company's officers, had in the meantime been carried out by Hastings to the entire satisfaction of the directors. Another important step taken by him was to enter into a treaty with the Nabob of Oude (Treaty of Benares, 7 Sept. 1773), by which he ceded to him the districts of Corah and Allahabad for fifty lacs of rupees, and engaged to hire out the company's troops to him for the reduction of the Rohillas, whose territory the nabob coveted. By the subsequent act of 1773, Hastings was appointed first governor-general of India, and a supreme council was named, of whom three formed a majority unfavorable to Hastings. The natives were encouraged to bring charges against him, and Nuncomar, his old ally, came forward with various charges of bribery. A supreme court of justice had been appointed at the same time with the supreme council of Calcutta. The chief-justice, Sir Elijah Impey, its head, was a friend of Hastings. Nuncomar was brought before this court, charged with forgery, convicted, and executed. This stretch of jurisdiction, which Hastings could easily have prevented, alienated from him public sympathy in England. The directors of the company petitioned the crown on 8 May 1776 for his removal from the council. Hastings had deputed Colonel MacLean, who returned to England in 1776 to insist on certain conditions or tender his resignation. It was accepted, and a successor appointed to take his place in the council, 23 Oct. 1776. General Clavering assumed the title of governor-general, which Hastings still insisted on retaining, as the change had been made without the conditions he had appended to his resignation. The supreme court, which was appealed to, decided in favor of Hastings. To end a dispute between the council and the supreme court of Calcutta, and to bring the chief-justice under the influence of the council, Hastings now appointed Sir Elijah Impey superintendent of the native courts with a salary of £8,000 a year, an appointment regarded by some as equivalent to a bribe. He involved himself in disputes with the Madras government, made demands for a large war contribution upon the Rajah of Benares, and when the rajah resisted arrested and deposed him. He caused the "begums of Oude," mother and grandmother of the Nabob of Oude, to give up extensive estates in land and a large amount of treasure. The House of Commons had passed a resolution (30 May 1782) requiring the directors to pursue all legal and effectual means for his removal. In November 1784 he resigned his post, and in February 1785 elft India. In 1786 articles of impeachment were brought in by Burke against him. The preliminary forms were gone through from 13 to 14 February, and Burke opened the charges against him in a speech of three days' duration, begun on the 15th. He was supported by Fox, Sheridan, and Grey. Hastings began his defense on 2 June 1791, and on 17 April 1795 was acquitted by large majorities on all the charges. His acquittal met with general approval. The legal expenses of his trial amounted to £76,080. The company in 1796 settled on him an annuity of £4,000 a year for 28½ years, and lent him £50,000 for 18 years free of interest. He passed the remainder of his life in retirement. In 1813 he received the degree of LL.D. from the University of Oxford, and in 1814 was created a privy-councillor.

Hastings, Mich., city, county-seat of Barry County; on the Thornapple River, and on the Chicago, K. & S. and the Michigan C. R.R.'s; about 38 miles west by south of Lansing and 32 miles southeast of Grand Rapids. The city is in a fertile agricultural region. The chief manufactures are furniture, pumps, wagons and carriages, hose-reels, car-seats, flour, cigars, felt boots and lumber camp supplies. The principal buildings are the library, the city hall, jail and courthouse. The city owns and operates the waterworks. Pop. (1900) 3,172.

Hastings, Minn., city, county-seat of Dakota County; on the Mississippi River at the mouth of the Vermilion River, and on the Chicago, M. & S. P. railroad; about 15 miles southeast of Saint Paul. Its chief industrial establishments are breweries, a malt-house, flour-mills, grain-elevators, saw and planing-mills, sash, door, and blind factories, carriage and wagon factories, furniture factories, lumber and brick yards. In addition to the trade in manufactured articles, grain, lumber, and live stock are among the important shipments. Pop. (1900) 3,811.

Hastings, Neb., city in Adams County; on the Missouri P., the Burlington & M., the Fremont, E. & M. V., the Saint J. & G. I. R.R.'s; about 25 miles south of Grand Island and 95 miles west of Lincoln. Its first settlers were Eastern people who availed themselves of the benefits of the government "Homestead Act," but the city was not incorporated until 1874. It is in a fertile agricultural section. The chief manufactures are flour, wagons, and agricultural implements. The trade is principally in wheat, corn, and live stock. It is the seat of Hastings College, under the auspices of the Presbyterian Church, and opened in 1882, and of the State asylum for chronic insane. The government is vested in a mayor, who holds office two years, and in a city council. The present charter is that of 1891. The city owns and operates the electric light plant and the waterworks. Pop. (1890) 13,584; (1900) 7,188.

Hastings-upon-Hudson, N. Y., village in the town of Greensburg, in Westchester County; on the Hudson River, and the New York Central & H. R. railroad; about three miles north of Yonkers and 20 miles from New York. It is largely a residential village; but in the vicinity are marble quarries which add to the industrial wealth of the place. It has some manufactures, chiefly chemicals and cigars; it has a large trade in coal and lumber. It is the seat of the Hastings Commercial and Collegiate Institute, and has several churches and good schools. Pop. (1900) 2,002.

Hastings, Battle of. See SENLAC.

Has'well, Charles Haynes, American engineer: b. New York 22 May 1809; d. 12 May 1907. His practical education as marine and mechanical engineer was learned in a steam-engine factory. In 1836 he was appointed chief engineer in the United States navy. He built the first practical steam-launch in 1837 and was the first to use zinc to protect the hulls of iron vessels and boilers from the galvanic action of salt water and copper. After 1898 he was the consulting engineer of the board of public improvements in New York city. His published works include 'The Mechanics' and Engineers' Pocket Book' (1901); 'Mechanics' Tables' (1854); 'Reminiscences of an Octagenarian' (1895).

Hatch, John Porter, American general: b. Oswego, N. Y., 29 Jan. 1822; d. 12 April 1901. He was graduated at West Point and rose through successive grades to lieutenant-colonel of cavalry in 1873. He served in the Mexican War from Palo Alto to the capture of the city of Mexico; and in the Civil War was appointed brigadier-general of volunteers in September 1861, and commanded a cavalry brigade in the Shenandoah Valley and Northern Virginia. He subsequently commanded various districts in the South; and was brevetted major-general.

Hatch, Rufus, American banker: b. Wells, York County, Maine, 1832; d. 1893. He began life as clerk in a grocery store, in Rockford, Ill., in 1854 entered the grain commission business in Chicago, and amassed a fortune. He managed the Chicago and Northwestern railroad combination in 1868 and made a financial failure in the Northern Pacific collapse of 1883.

Hatch, William Henry, American lawyer: b. Georgetown, Ky., 1833; d. 1896. He was admitted to the bar in 1854; served through the Civil War in the Confederate army, and was a member from Missouri in the United States House of Representatives from 1870 to 1895. The Hatch Act which distributed Federal aid to agricultural experiment stations in all the States and Territories was inspired by him.

Hatchee, or Big Hatchee, a river which has its rise in the northeastern part of the State of Mississippi, flows north by west into Tennessee, then northwest and west joining the Mississippi River about 30 miles in direct line above Memphis. It is navigable for small steamboats as far as Bolivar, about 100 miles from its mouth, or half its whole length. The area drained by the Hatchee, about 4,000 square miles, is excellent cotton land.

Hatcher's Run (BOYDTON ROAD), Battle of. On 27 Oct. 1864, Gen. Grant, with the intention to extend his lines to the South Side railroad, and under the belief that the Confederate works around Petersburg extended only to the Boydton road crossing of Hatcher's Run, and were but feebly manned, moved parts of the Ninth, Fifth, and Second corps, together with Gregg's cavalry division, in all about 38,000 men, in three columns to the left. Gen. Parke, commanding the Ninth corps, moving to surprise the right of the Confederate works, found them strongly held, and made no attack. The Fifth corps, on the left of the Ninth, crossed Hatcher's Run and endeavored to seize the bridge by which the Boydton road crossed that stream, and was repulsed. The Second corps and Gregg's cavalry succeeded in forcing a passage over Hatcher's Run by the Vaughan road, and reaching the Boydton road, moved down it to Burgess' Tavern, near the bridge over Hatcher's Run, some four miles above Armstrong's Mill, where the infantry was checked. Hancock's Second corps having effected the passage of Hatcher's Run, by the Vaughan road, Warren was ordered to cross Crawford's division of the Fifth corps at Armstrong's Mill and, sweeping up the right bank of the stream, endeavor to recross and assault the Confederate line in the rear, while Griffin's division assaulted in front. Hancock was advised of the orders given Warren and authorized to make the attempt to carry the bridge in his front and gain some high ground beyond. At 4.30 P.M., when Hancock was extending his right to connect with Crawford, and was about to assault the bridge, Gen. Heth, with his own division and a part of Mahone's, having crossed Hatcher's Run and penetrated the interval between Hancock and Crawford, vigorously attacked Hancock's right and rear, throwing it into some confusion and capturing many prisoners, but Heth was finally repulsed. At about the same time Hampton, with five cavalry brigades, attacked Hancock's left and rear and Gregg's cavalry, but was repulsed. Crawford, who had crossed at Armstrong's Mill, found great difficulty in moving up the bank of Hatcher's Run, and failed to make connection with Hancock. The object of the entire movement failed, with Hancock still six miles from the South Side railroad. The Union troops were withdrawn during the night and, next day, moved back to the line of entrenchments. The Union loss, the greater part of which fell upon the Second corps, was 1,194 killed and wounded, and 564 missing. The Confederate loss is unknown. Consult: 'Official Records,' Vol. XLII.; Humphreys, 'The Virginia Campaign of 1864–5'; Walker, 'History of the Second Army Corps'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Hatcher's Run (DABNEY'S MILL and ARMSTRONG'S MILL), Battle of. It was on 5 Feb. 1865 that Gen. Grant put in motion an expedition to interrupt the Confederate line of communication by the Boydton road, running through Dinwiddie Court House to Petersburg. Gregg's cavalry division was directed to march early in the morning by way of Ream's Station to Dinwiddie Court House and strike the road; Warren's Fifth corps was to cross Hatcher's Run and support Gregg; Gen. Humphreys, commanding the Second corps, was ordered with two divisions to the crossing of the Vaughan road over the Run, and to Armstrong's Mill, to hold these two points and to keep up communication with Warren, four miles distant, on the one side, and with Miles' division in the Union entrenchments, three or four miles distant, on the other side. After severe skirmishing, Humphreys pushed Motts' division to the south side of Hatcher's Run, and established Smyth's division at Armstrong's Mill on the north side, about 1,000 yards from the Confederate works, where two brigades were brought to Smyth's support. At 5 P.M. parts of A. P. Hill's and Gordon's corps came out of their works and, under cover of the woods, attacked Smyth, but were repulsed. Smyth's line was now further strengthened by Hartranft's division of the Ninth corps and Wheaton's of the Sixth. Gregg captured some wagons and prisoners on the Boydton road, and in the evening fell back to Malone's Bridge on Rowanty Creek, from which he moved up to the Vaughan road crossing, where he arrived early in the morning of the 6th, with Warren, who had been ordered to support Humphreys. About 1 P.M. Warren, with two divisions, moved along the Vaughan and Dabney's Mill roads; Gregg, supported by one of Warren's divisions, going down the Vaughan road to Gravelly Run to observe the left. Gregg was attacked by a part of Pegram's division, but held his ground and, with the support given him by part of Griffin's division, drove Pegram's men back. Warren's leading division (Crawford's) moving on the Dabney's Mill road, also encountered part of Pegram's division, which was forced back to Dabney's Mill, where Evans' division came to Pegram's support, and Crawford in turn was driven back. Three Union brigades were now brought up to Crawford's support and, at the same time, Mahone's division arrived and took position between Evans and Pegram, and the whole Confederate line advanced, driving Warren back in great disorder, but some of his men rallied upon Wheaton's division, which had crossed from the north bank of the stream, and the Confederates were checked. On the morning of the 7th Warren made a reconnoissance, but did not find the enemy in force. The Union works were now extended to Hatcher's Run at the Vaughan road crossing. The Union loss was 1,352 killed and wounded, and 187 missing. The Confederate loss was about 1,500, among the killed being Gen. John Pegram. Consult: 'Official Records,' Vol. XLVI.; Humphreys, 'The Virginia Campaign of 1864–5'; Walker, 'History of the Second Army Corps'; Powell, 'History of the Fifth Army Corps.'

E. A. CARMAN.

Hatch'ettite, Adipocerite, or Mineral Adipocere, a native hydrocarbon, probably of the nature of a paraffin, occurring in certain parts of England and Scotland, mainly in connection with bogs and coal measures. It is wax-like, and melts at about 115° F. The specific gravity of the natural mineral is about 0.61, but after melting the specific gravity rises to 0.92 or even higher, owing to the elimination of air bubbles. Hatchettite is without odor, and when fresh it is commonly translucent and yellowish. Upon exposure, however, it blackens and becomes opaque.

Hatchie River, or Davis' Bridge, Battle of. After Gen. Van Dorn's defeat at Corinth, Miss., 4 Oct. 1862, he retreated and bivouacked for the night at Chewalla. Early on the morning of the 5th he continued his retreat on Pocahontas, but when his advance had crossed Hatchie River, at Davis' Bridge, he was met by Gen. Hurlbut's division, which had been sent by Gen. Grant from Bolivar, Tenn., to Pocahontas to intercept his retreat. Van Dorn's advance was driven back across the bridge, his main body came up, and Gen. Ord, who had arrived on the field from Jackson, took command of Hurlbut's division and attacked Van Dorn vigorously. A severe engagement ensued, in which Ord was severely wounded, and Hurlbut resumed command of the Union troops. Van Dorn, not closely followed from Corinth by Rosecrans, who was 12 miles away, held his position before Hurlbut the greater part of the day and, cut off from his route through Pocahontas, continued his retreat on the east bank of the Hatchie for six miles to Crum's Mill, where he crossed his army on a bridge during the night and continued his retreat to Ripley and thence to Holly Springs. Rosecrans followed as far as Ripley, when Grant ordered him to return to Corinth and Hurlbut to Bolivar. See CORINTH, ADVANCE ON AND BATTLE OF.

E. A. CARMAN.

Hatch'ment (a corruption of achievement, coat of arms) a funeral escutcheon, the arms of a deceased person within a black lozenge-shaped frame meant to be placed on the front of his home. If the deceased was unmarried or a widower or widow, the whole field of the escutcheon is black. In the hatchment of a married person the arms of husband and wife are impaled, and only that part is black which adjoins the side of it occupied by the arms of the deceased. Thus, in the hatchment of a husband the dexter side is black, the sinister white; in that of the wife the reverse. In a bishop's hatchment his arms being impaled with that of the see, those of the see have a white background. When the deceased is the last of his race a skull is set above the shield in place of a crest.

Hat'field, James Taft, American German scholar: b. Brooklyn, N. Y., 15 June 1862. He was graduated from the Northwestern University in 1883, from the Johns Hopkins University in 1890; was appointed professor of German language and literature at Northwestern in 1890, and became contributing editor of 'Americana Germanica.' During the Spanish-American War he served from seaman to chief yeoman on board the cruiser Yale. His publications include 'Materials for German Composition' (1896), editions of Freytag's 'Rittmeister von Alt-Rosen' and Goethe's 'Hermann und Dorothea,' and various articles and monographs on subjects of German literature.

Hath'amite, an explosive invented in 1902 by G. M. Hathaway, of Wellsboro, Pa., and remarkable not only for the enormous energy liberated by its explosion, but also for the safety with which the substance may be handled. Hathamite may be pulverized on an anvil with a sledge hammer without exploding, and rifle balls may be fired through it without effect. Lighted matches may also be thrown into it with impunity, and when poured upon a fire it burns quietly, with the evolution of immense quantities of smoke. Apparently, explosion can be induced only through the agency of a dynamite percussion cap. Hathamite is a coarse powder, of a bluish-gray color, whose composition has not yet been divulged. It explodes with exceeding violence when fired with a suitable percussion cap. In one test a charge of an ounce and a half blew a two-inch hole through a piece of quarter-inch boiler plate, when merely laid upon the plate, and detonated in the open air. In another test a little over eight ounces of the explosive was actually melted and poured into a six-pound shell; and when the charge was afterward detonated, the shell was thoroughly fragmented. One marked advantage of hathamite is, that it will explode even when frozen.

Hath'away, Anne, the wife of Shakespeare. See SHAKESPEARE.

Hats and Hat-making. It is difficult to state just when hats were first worn, but it is a fact that fur-felt hats now form part of the attire of civilized man the world over. There is no record as to when or where the first hat was made. We find head covering in one form or another in vogue in the earliest times referred to in history. The first modern hat, as we now know this article of men's wear, was made in Paris about 1404 by a Swiss manufacturer, but it was not until 49 years afterwards that the French adopted any sort of a head covering. Charles XII., upon his entry in triumph into the city of Rouen in 1453, wore a huge hat made of fur, lined with red velvet, from which protruded a great feather. With royalty as its sponsor the hat at once became a necessary detail of man's wardrobe. The hat is distinguished from the cap or bonnet by its continuous brim. It has been traced back to the "petasus" of ancient Greece, just as the cap has been regarded as the descendant of the brimless "Pileus," also a form of Grecian head attire. These articles, as far as we know, were made almost exclusively of felt.

Felt hats became popular in England during the Norman occupation. In Queen Elizabeth's reign great beaver hats, usually black, were the favorite among the nobility, and they remained in vogue for more than 300 years. About the middle of the 17th century an effort was made to encourage this industry in America. In 1662 the assembly of Virginia, to stimulate activity among the colonists, offered, by special enactment, to give 10 pounds of tobacco for every good wool or fur hat produced in that colony from materials taken from animals native thereto. Hats were then made by hand, and no effort of any consequence was made to improve the primitive conditions until 1820, when the energy of the American inventor produced the first labor-saving machine. Improvement now followed improvement, each one, in its way, tending to economize the cost of making.

In 1810 the silk hat appeared. It was made by hand, and failed in its purpose to supplant the tiled beaver. It was not until 1830 that the silk plush hat was manufactured upon a paying basis.

In 1840 the soft felt hat made its bow in the United States. Its sponsor was the famous Hungarian patriot, Kossuth, who visited America in that year. He was given tremendous receptions everywhere, and won the heart of the great American republic. His great hat seemed to be typical of the vigorous character of the man, and it was not surprising that the "Kossuth" became a general favorite. From that time the soft hat has steadily gained friends, and to-day in many sections it is a predominant type.

While the industry in this country, prior to the Civil War, kept pace with progress in other lines, it was not able to hat the heads of thousands of Americans, and the foreign manufacturer found the States a very profitable territory. But to-day America has become a great exporter of hats. By far the largest share of this foreign trade is controlled by the city of Philadelphia, where the finest grades of hats in the world are made. The other well-known hat centres in America are Orange and Newark, N. J., Danbury, Bethel, and Norwalk, Conn., Brooklyn, N. Y., and Reading, Pa.

The kinds of hats now made are so numerous as to be almost beyond the possibility of listing. There are, however, three principal classifications: the felt hat, which includes the soft and the stiff or derby shape, the silk hat, and the straw hat. All other kinds are but variations in some way of these three. In this article the writer will deal exclusively with the felt hat, concerning which there is the greatest interest. But few people have any conception of the numerous perplexing details and methods which enter into the construction of the hat.

The furs most generally used in manufacturing felt hats are the beaver, which is found in the northwestern part of the United States and Canada; the coypou or nutria, known as the South American beaver; the Saxony and the Russian hare; the Scotch, English and French coney, and muskrats. The finest furs are taken from the nutria, beaver and otter, all water animals, that portion which is taken from the belly being regarded as the choicest. The others are land animals, the fur from the back being regarded as the best. In the more common grades of hats sheep's wool is used, while in the inferior grades wool is mixed with cotton and other vegetable fibres. These, however, cannot be properly termed felt hats, because the materials used are not felted together. They are cemented and are then stiffened by shellac.

Furs for the higher grade hats require the most exhaustive preparation. Upon their arrival at the factory the pelts are first washed with whale-oil soap to remove the superficial fatty matter which clings to the fur. A further purification is necessary, however, and for this purpose "carrotting" is employed. A solution of mercury and nitric acid is applied to the pelts. This chemical, deposited in the cellular tissues, absorbs and thoroughly destroys all animal fats and gives to the fur its felting properties.

After a thorough brushing the fur is next cut from the pelts and is then stored away to mellow and season, for the reason that, like good wine, it strengthens and improves with age. When these furs have become properly seasoned, and are in prime condition, they are subjected to an interesting process for the purpose of removing the hair; a machine, known as a "blower," containing powerful air blasts, accomplishes this work in a very thorough manner. The hair is blown from the fur without harming the latter. This is repeated over and over again, until all foreign matter has been removed. The by-products obtained through these preliminary operations are extensive. Many of them are used for other purposes than hatting; for instance, the shreds of the skins are used in the manufacture of the highest grades of glue.

The task of selecting the furs and of combining them in proper proportion to produce the best results in a high-grade hat demands the most careful attention of the experienced experts. Many years of experiment have been necessary, in order to learn just how these furs should be mixed, and just what would constitute the correct proportion. The strength and perfection, as well as the beauty of the completed hat, depend largely upon the efforts of those intrusted with this portion of the work.

The next stage in the life of the hat is the forming. Until recently this was a business in itself. Few hat-making firms engaged in it. To-day, however, many of the larger manufacturers are successfully doing their own forming. This work can be accomplished only by experts. It is one of the most interesting features of hat making. The exact quantity of properly mixed fur is carefully weighed and placed upon an endless apron at one end of a box-like machine. At the other end of the machine there is a large perforated cone of sheet copper, revolving rapidly over a funnel, under which there is a powerful suction fan at work. As the attendant carefully feeds the fur to the machine in the proper quantity it is carried by the apron toward the cone. The suction of air attracts this fur and causes it to adhere to the surface of the cone. This continues until the cone is covered with a sufficient quantity of fur to make the hat. The whole operation requires only two or three minutes. As soon as the cone has accumulated the necessary fur a wet cloth is thrown over it, and a second cone, larger in dimension, is placed over that. Both are immersed in a tank of hot water for a few moments. This is the first stage of the felting. It causes the perfect adhesion of the various fibres. The operator slips this conical body from the cone. It is now several times larger than its ultimate size. It has assumed the primary form.

Sizing, as the felting is termed, is the next process. The body, which has just been removed from the cone, is placed in a sizing kettle, where it is shrunk in hot water. Continuous rubbing and rolling reduces it in size almost one-quarter. It still retains its cone shape, but it is now firmly felted. Care as well as skill is required to insure the even shrinking and the uniform distribution of the stock. Failure in any detail will cause streaks and weak spots in the finished article. The hat is now ready for dyeing. It is immersed in a great color vat and dyed to meet the prevailing fashion. Great improvements have been made in this detail during the past few years. The old wood colorings have been discarded, and coal-tar products are now used because they have been found more serviceable and increase the durability of the hat. Up to this point the manufacturing of stiff and soft hats has been along similar lines, but from this time on different methods are used. After dyeing the next step is to stiffen slightly the brim of the soft hat by the application of "water stiff," a solution of shellac. The body is now beginning to assume a definite form. It is stretched, blocked and pulled, and, with the aid of hot water, steam and ingenious machinery, it is given stability of shape and form The rough surface must now be cut off. This operation requires great care. If too much of the fur is removed all the previous skilled manipulation becomes valueless and the hat is ruined. This operation is known as "pouncing." It was formerly accomplished with a great deal of hand labor. It is now done by a machine and emery paper. This machine is a great time saver, and greatly facilitates the production of the plant. The crown is next given its shape, as demanded by the style. It is stretched over wooden blocks, ironed and re-ironed. It must then be carefully pounced by hand and steamed to tighten the felt. The brim must be treated exactly the same way, although it is not given shape at this time. Only men of skill and experience can engage in this portion of the work. There is a knack about pouncing by hand that can be acquired only by experience.

The hat is next flanged, or, rather, the brim is given its shape. The brim is placed upon a flange of metal or wood so as not to affect the crown. The entire hat resting on the flange is then placed under a huge receptacle containing heated sand and having on the under side a heavy cotton fabric, which comes in direct contact with the felt. After remaining in this position for several minutes the brim of the hat has its correct shape and trimming is in order. The turning up and edging each play an important part in the final process of shaping. In trimming artistic treatment is a necessity. Care must be taken in attaching the bands and bindings to preserve the neatness as well as the character of the design. The insertion of the sweat leather must be carefully done. All these and other details add greatly to the appearance and durability of the finished product.

The stiffening of the derby, better known as "the stiff hat," because of the character of the felting, is an interesting process. The hat body is impregnated with a solution of shellac and alcohol of given density. This substance is carefully worked into the heart of the body, and as a result the felting attains a condition of firmness. The hat is then placed on a wooden block, is immersed in hot water, and is given the proper proportion and shape before the final pressing. At the conclusion of this operation the superfluous gum is cleared away by a soda bath. When dry the hat is rigid throughout. It is then placed in an oven and kept there until it becomes pliable. A mould, to which tremendous pressure is given by mechanical or hydraulic means, completes the pressing after the derby has been pounced or finished. The pouncing of a derby is done upon a lathe. It is placed on a wooden block similar to the moulds used in pressing. Should the operator cut off too much of the surface fur, thus destroying the nap, the stiffening will be exposed and the work of the skilled men who preceded him loses its value. Curling or shaping of the brim is done with a variety of small tools, heat, steam, deftness of fingers and a good eye. The work of some of the experts who develop the stiff hat brims by the eye is little less than marvelous. The trimming, binding, etc., of stiff hats require even greater care in their selection and adjustment than in the case of soft hats.

Among American hat makers Charles Knox was one of the early specialists in beaver and silk hats in New York. Robert Dunlop, of New York, has also an eminent name in the hat trade of America. The history of the John B. Stetson Company, of Philadelphia, is to a large degree the history of hat making in the United States for the last 39 years. From the small beginning of one room and two mechanics the Stetson factories have been developed to nine immense plants, having a floor space of over ten acres and a force of more than 2,500 employees. When John B. Stetson, in 1865, determined to manufacture hats he was known as the foremost expert in the mixing of furs and as one of the best hat finishers in the trade. He determined to avoid the cheap hat and to make only the highest grade of goods and to make them better than any other manufacturer. His output the first year did not exceed one hundred dozen hats. His capital was not more than $1,000. In 1903 the John B. Stetson Company, with its great force of employees, supplemented by improved machinery, most of the patents for which are owned by the company, produced 105,800 dozens of hats. This company has introduced new machinery, which cheapens the cost of production without a sacrifice in quality, and has carried the fame of the city of Philadelphia to every quarter of the globe. A process has also been perfected whereby pure nutria and beaver fur may be successfully utilized in superfine hat making.

Another important improvement in hat making is that known as the «Boss» raw-edge kettle finished hat. This was introduced in the early seventies. Prior to this time all soft hats were made with bands and bindings, the latter being used to hold the brim in shape. The «Boss» raw-edge hat, as its name indicates, has no binding around the edge. It is shaped in hot water by frequent immersions and by the skillful hand work of an expert. The brim curling is a feature that cannot be accomplished in any other factory. This hat is, beyond question, the most remarkable specimen of headwear the world has ever seen. The John B. Stetson Company has been awarded the grand prize or gold medal at nearly every world's fair since 1876, but it holds as of almost equal value an order which it received from the British government for 10,000 hats for the South African constabulary during the Boer war. Prior to this war a number of American miners and cattlemen drifted into South Africa wearing Stetson's hats. They came in contact with General Baden-Powell, who admired the hats they wore and made inquiries about them. They were made of nutria fur, were better in quality than those produced anywhere in Europe. General Powell requested his government to order 10,000 of these hats, and the Stetson factories made and delivered them within six weeks of the receipt of the order. In 1876 the Stetson Company was awarded a gold medal by the Philadelphia Centennial Exposition. In 1879 it won a medal at Paris. In 1889 and in 1900 it won the grand prix at Paris. The official report making the award at the Paris Exposition in 1900 said, concerning the Stetson exhibit: "The products displayed here are, from every point of view, absolutely remarkable, but very especially the manufacture of soft hats, which is incontestably the acme of perfection of this epoch." WILLIAM F. FRAY,

First Vice-Pres. John B. Stetson Company.

Hat'teras, Cape. See CAPE HATTERAS.

Hatteras Inlet, Capture of. In the forenoon of 26 Aug. 1861, a Union fleet of 7 vessels carrying 143 guns, under command of Flag-officer Silas H. Stringham, and 3 transports, carrying 930 men and a light battery, under command of Gen. Butler, set sail from Hampton Roads. Next afternoon the fleet arrived off Hatteras Inlet, the entrance to Pamlico Sound, which was guarded by Forts Hatteras and Clark, built by North Carolina on the south end of Hatteras Island, and mounting respectively 25 and 5 heavy guns. The forts, which were garrisoned by over 700 men, were under command of Maj. Andrews. At 10 A.M. of the 28th Stringham began the bombardment of the forts, and a little later about 300 troops, with two howitzers, were landed on the island above the forts. Fort Clark was silenced before noon, the greater part of its garrison retreating to Fort Hatteras, some escaping from the island by boats. At night the fleet withdrew, but renewed the attack upon Fort Hatteras early in the morning of the 29th, drove the gunners from their guns to the shelter of the bomb-proofs, and before noon the fort surrendered, after a loss of 30 killed and wounded. The Union loss was one wounded. Stringham and Butler returned to Hampton Roads, leaving three vessels as a sea-force and detachments of the Ninth and Twentieth New York and the Union coast-guard, under Col. R. C. Hawkins, to garrison the captured forts. The immediate results of the expedition were the capture of the two strong forts with their garrisons of 715 men, 31 heavy guns, 1,000 stand of arms, and the possession of the best sea entrance to the inland waters of North Carolina. Consult: The Century Company's 'Battles and Leaders of the Civil War,' Vol. I.; Maclay, 'History of the Navy,' Vol. II.

E. A. CARMAN.

Hatti-Sheriff, the Turkish name of an edict signed by the sultan, who subscribes it usually with these words: «Let my order be executed according to its form and import.» These words are usually edged with gold, or otherwise ornamented. An order given in this way is irrevocable. The firman of 18 Feb. 1856, called usually Hatti humayun, «exalted writing,» is the constitutional charter of the Turkish empire. It is a long document, undivided into articles, and prescribing various reforms administrative and financial, etc., but its chief importance consists in its explicit recognition of the principle of religious liberty, already admitted by the hatti of Gulhana, 3 Nov. 1839.

Hattiesburg, Miss., city, county-seat of Perry County; on the Leaf River, and on the Gulf & S. I., the New Orleans & N., the Mobile, J. & K. C., and the Pearl & L. R. R.R.'s; about 65 miles north of Biloxi and 84 miles southeast of Jackson. The Gulf & Ship Island railroad is the shortest route to the Gulf of Mexico. Hattiesburg is the trade centre of a large fertile agricultural region in which an excellent quality of cotton is extensively cultivated. The industries are growing rapidly and its good railroad facilities mean good markets. The chief industrial establishments are saw-mills, planing-mills, cottonseed-oil mills, a cotton compress, a foundry, machine-shops, boiler works, brick-yards, a naval store factory, railroad shops, an ice-plant, and the electric light and power plant. It has three banks, a number of fine public buildings. Pop. (1900) 4,175; (1903) 7,000.

Hatto, hät'tō, the name of two archbishops of Mainz, both somewhat conspicuous in the history of Germany. The first was chosen archbishop of Mainz in 891, d. 913. The second Hatto (d. 970) was a monk of the monastery of Fulda, and succeeded the celebrated Rabanus Maurus as abbot of the monastery of St. Boniface, about the year 942 and in 968 was raised to the see of Mainz, and continued one of the chief advisers of the emperor. Of his after-life and of his personal character most opposite accounts have been given. By some he is represented as an upright and successful administrator; by others as a selfish and hard-hearted oppressor of the poor; and the strange legend of his being devoured by rats, which Southey has perpetuated in his well-known ballad, is represented as an evidence of the estimate that was popularly formed regarding him. It is quite possible that this legend is of much later date, and that its real origin is to be traced to the equivocal designation of the tower on the Rhine, Mäusethurm, near Bingen, which has been selected as the scene of the occurrence. *Mäusethurm*, "Mouse-tower," is possibly only a corrupted form of *Mauth Thurm*, "Toll-tower," a sufficiently descriptive name: but the modified form of the word might readily suggest a legend of mice or rats. The date at which the Mäusethurm was built is unknown, and it is far from certain that it is not much later than the time of Hatto. See Baring-Gould, 'Curious Myths of the Middle Ages' (1869); Max Beheim, 'Die Mäusethurmsage' (1888).

Hat'ton, Sir Christopher, English statesman: b. at Holdenby about 1540; d. 1591. Lord chancellor of England, a favorite of Queen Elizabeth; was entered a gentleman commoner at Saint Mary Hall, Oxford, but removed without taking a degree, to the Inner Temple in 1560. He was introduced at court some time previous to the middle of the year 1564, and it is said Queen Elizabeth was so much struck with his graceful person and dancing that an introduction to her favor was the result, and gained him the name of "the dancing chancellor." He was a furious enemy of the Jesuits, and did not hesitate to accuse Parry, their defender in Parliament, and secure his execution. He was elected a member of Parliament in 1571, became captain of the Queen's Guard in 1572, vice-chamberlain and a privy-councillor in 1577, lord-chancellor in 1587. He was one of the commissioners for the trial of Mary Queen of Scots, in 1586. His artful speech to the unhappy queen, "If you are innocent you have nothing to fear: but by seeking to avoid a trial you stain your reputation by an everlasting blot," is supposed to have been mainly influential in inducing her to submit to trial. Spenser, whose patron he was, dedicated to him 'The Faerie Queen.'

Hatton, Frank, American journalist: b. Cambridge, Ohio, 28 April 1846; d. Washington, D. C., 30 April 1894. He served through the Civil War in the Army of the Cumberland, being commissioned and was subsequently partner with Robert J. Burdette (q.v.) in the proprietorship of the Burlington *Hawkeye*. He was assistant postmaster-general (1881-4); postmaster-general (1884-5); editor of Chicago *Mail* (1884-8); and editor of the Washington *Post* (1888-94).

Hatton, John Liptrot, English composer: b. Liverpool 1809; d. Margate, Kent, 20 Sept. 1886. Removing to London in 1832 he became famous for his many operas, cantatas, overtures, entr'actes, etc., and was musical director of the Princess Theatre 1853-9. He is now, however, remembered chiefly for his admirable settings of English songs, such as 'Good-bye, Sweetheart,' 'The Tar's Song,' 'The Bait,' etc.

Hatton, Joseph, English journalist, novelist, and playwright: b. Andover 3 Feb. 1841; d. London 31 July 1907. Beginning journalism on the Derbyshire *Times*, he went to London, where he edited the 'Gentleman's Magazine' (1868-74); and became a newspaper correspondent for the New York *Times* and other journals. Among his numerous novels are: 'Clytie' (1874); 'Queen of Bohemia' (1877); 'John Needham's Double' (1885), dramatized for E. S. Willard; 'By Order of the Czar,' a novel of Russian life; 'Princess Mazaroff'; 'Under the Great Seal'; 'When Greek Meets Greek,' a novel of the French Revolution successfully dramatized; 'When Rogues Fall Out' (1899). Among his miscellaneous publications the best-known are: 'Journalistic London'; 'The New Ceylon'; 'Henry Irving's Impressions of America'; 'Old Lamps and New'; while among his plays may be cited a version of 'The Scarlet Letter' successfully acted in the United States; 'The Prince and the Pauper'; 'Liz'; and 'A Daughter of France.'

Hauck, hâk, **Minnie**, American vocalist: b. New York 16 Nov. 1852. She appeared in concert in New Orleans at 13, afterward studied with Errani in New York and made her début as an opera singer in 'La Sonnambula' in 1868. She has been uniformly successful both in the United States and Europe, but is best known in the title role of Carmen. She is married to the Chevalier de Hesse-Wartegg.

Haupt, howpt, **Herman**, American engineer: b. Philadelphia, Pa., 26 March 1817; d. 14 Dec. 1905. He was graduated at West Point in 1835, but became a civil engineer, and joined the staff engaged on the public works of Pennsylvania. For three years he was professor of civil engineering and mathematics in Pennsylvania College but in 1847 became consulting engineer of the Philadelphia Railroad. He was afterward chief engineer of the Hoosac Tunnel and during the Civil War chief of the United States Bureau of Military Railroads. The Royal Polytechnic Society of Great Britain gave him their highest prize for the drilling machine which he invented, and he first made practicable the transportation and distribution of oil from the well side. He wrote 'Hints on Bridge Building' (1840); 'General Theory of Bridge Construction' (1852); 'A Consideration of the Plans Proposed for the Improvement of the Ohio River' (1855); 'Military Bridges' (1864).

Haupt, Lewis Muhlenberg, American engineer: b. Gettysburg, Pa., 21 March 1841. He was educated at Harvard and West Point. From 1872 to 1892 he was professor of civil engineering in the University of Pennsylvania, and for the year ending 1886 edited the 'Engineering Register.' From 1897 to 1899 he was a member of the Nicaraguan and the Isthmian Canal Commissions. His published works include: 'Working Drawings and How to Make and Use Them' (1881); 'Canals and Their Economic Relation to Transportation' (1890).

Haupt, Paul, American Assyriologist: b. Görlitz, Germany, 25 Nov. 1858. He was graduated at the Gymnasium Augustum, Görlitz, in 1876; studied in Leipsic and Berlin, and settled in Göttingen where in 1883 he was appointed extraordinary professor of Assyriology. In the autumn of the same year he accepted the chair of Semitic languages at Johns Hopkins University, Baltimore, Md. He projected and continued to edit the so-called Polychrome Bible. (See BIBLE, POLYCHROME.) Among his many writings in periodical, pamphlet and book form, the most important volumes are 'Das babylonische Nimrod-Epos' (1891); 'Akkadische und sumerische Keilschrifttexte' (1882); 'Prolegomena to a Comparative Assyrian Grammar' (1888).

Hauptmann, howpt'män, **Gerhart**, German dramatist: b. Salzbrunn, Silesia, 15 Nov. 1862. After study at the Breslau Art School, he attended the universities of Jena and Berlin, traveled in Italy and Switzerland, and first appeared in literature with his epic, 'Promethidenlos' (1885). This he followed by a swift succession of dramas — 'Vor Sonnenaufgang' (1889), frankly socialistic and provocative of violent discussion; 'Das Friedensfest' (1890); 'Einsame Menschen' (1891); and 'Die Weber' (1892), a story of an unsuccessful uprising of the Silesian weavers, typifying the hopeless condition of the proletariat. In these works Hauptmann reveals the influence of Tolstoi and Ibsen, and a strong revolt against the conditions imposed, particularly upon the working-class, by a military and plutocratic regime. To this motif he returns in 'Fuhrmann Henschel' (1898). But he strikes a different note in 'Hanneles Himmelfahrt' (1893), a mystic 'dream-poem' as the author styles it, and 'Die versunkene Glocke' (1897; Eng. trans. by Meltzer 1900), which harks back to an indefinite period of the Middle Ages and makes artistic use of the primitive Germanic fairy-lore. In 'Kollege Crampton' (1892), 'Der Biberpelz' (1893) with its inferior sequel 'Der rote Hahn' (1901), and 'Schluck und Jan' (1900) he displays gifts of humor and satire. Other works are 'Florian Geyer' (1895) and 'Michael Kramer' (1900). Hauptmann is the chief figure in modern German drama. He excels less in dramatic structure than in art of characterization, and despite crudity and occasional lawlessness attains genuine poetic value.

Hauptmann, Moritz, German musician: b. Dresden 13 Oct. 1792; d. Leipsic 3 Jan. 1868. He studied at Gotha; was violinist at the court in Dresden in 1812; in 1815–20 was employed as music teacher in the family of a Russian prince; in 1842 he was appointed cantor of the Thomasschule in Leipsic, and the next year became professor of counterpoint at the Leipsic Conservatory, where he was very successful and popular as a teacher. His compositions include motettes, an offertory, and sonatas for violin and piano. In 1853 he published his 'Die Natur der Harmonik und Metrik,' a very important theoretical work.

Haus'mannite, a native manganate of manganese, having the formula $MnO.Mn_2O_3$, and crystallizing in the tetragonal system, with octahedral habit. It is brownish black in color, and opaque with a submetallic lustre. It has a hardness of from 5 to 5.5, and a specific gravity of from 4.72 to 4.86. Hausmannite dissolves in hydrochloric acid, with evolution of chlorine gas. It occurs in Germany, Sweden, and elsewhere, usually in connection with porphyry. It was named in honor of the German metallurgist, J. F. L. Hausmann.

Haussa, how'sä. See HOUSSA.

Haussmann, Georges Eugène, zhŏrzh ė-zhān ōs-mān, BARON DE, French municipal officer: b. Paris 27 March 1809; d. there 11 Jan. 1891. He studied law, and under Louis Philippe was sous-prefect of various places. The February revolution of 1848 caused the forfeiture of his office, but Louis Napoleon in 1853 made him prefect of the Seine, and he applied himself to the improvement and adornment of Paris with such energy that the city became transformed under his administration.

Hautboy, hō'boi (French *hautbois*, "high wood," alluding to its tone); a wooden wind-instrument of two-foot tone, played with a double reed. Also an organ stop, consisting of reed pipes slightly conical, and surmounted by a bell and cap of eight feet pitch. The tone is thin and soft.

Haüy, René Just, rė-nā zhüst ā-ü-ē or ā-wē, French mineralogist: b. St. Just, Oise, 28 Feb. 1743; d. 3 June 1822. He was trained for the Church and took priest's orders, but turned to mineralogy, and acquired a great reputation by a series of important discoveries. Among the chief of these is the geometrical law of crystallization, according to which a given mineral uniformly contains the same primary form as its basis of crystallization. From that time, according to Herschel, mineralogy first ceased to be "a mere laborious cataloguing of stones and rubbish." In 1794 Haüy became keeper of the cabinet of the School of Mines, and in 1802 professor of mineralogy in the Museum of Natural History. His works include 'Traité de Mineralogie' (1801), and 'Traité de Crystallographie' (1822).

Haüynite, hä'win-īt, or **Haüyne**, hä'win, a mineral of the sodalite group, occurring in certain igneous rocks, and notably in the lavas of Mt. Vesuvius. It is a silicate and sulphate of sodium, calcium and aluminum, crystallizing in the isometric system. It is usually translucent with a vitreous lustre, a hardness of from 5.5 to 6, and a specific gravity of about 2.45. Haüynite is commonly blue or green, though red and yellow specimens are also known. It was named in honor of the French mineralogist, R. J. Haüy.

Havan'a (Sp. LA HABANA, lä häbä'nä), Cuba, its capital and the commercial centre of the West Indies, second city of Spanish North America; pop. 242,055. It occupies nine square miles on the west side of the Bay of Havana on the north coast, one of the noblest

HAVANA.

1. Cathedral of Havana. 2. Colon Park, Havana.

harbors in the world, with deep water up to the quays; entered by a narrow channel ⅜ of a mile long, protected by Punta Castle on the west and Morro Castle and La Cabaña on the east. It is in two sharply distinct sections. The old city, the commercial quarter, was built on the small western peninsula dividing the sea from the harbor, a low plain cut by a small stream on the west, strengthened by a city wall only torn down a generation ago. It is largely, and was entirely till the American occupation, a maze of narrow, crooked lanes traversed by one or two broader streets; the chief of which are the Calle O'Reilly, the main business street, running from the governor's palace to the city wall, and the Calle Obispo (Bishop Street). The new city is on a ring of hills 150 feet high south and west of the old, with the castle of El Principe on the crest, and has a wealth of broad and finely shaded macadamized streets, drives, promenades, parks, plazas, flower-gardens, fountains, statues, etc., which make it one of the handsomest cities in the world. There is no "West End" in Havana, the houses of the wealthy being scattered through every part, usually of classic pattern, with an inner courtyard or patio surrounded by marble or stucco columns, containing a garden of tropical vegetation and a central fountain. The handsomest residence street, next to the new suburb Vedado, is the Cerro, a long thoroughfare running up a hill at the farther end, and bordered by immense old villas in the midst of splendid gardens. The finest drives and promenades are the Malecon, a new thoroughfare along the water front from Prado to the Vedado, the Prado, a boulevard with a double row of shade-trees in the middle, running from Punta Castle outside the old wall, and ending in the largest park in the city, Colón Park or Campo Marte, and the Calle de la Reina (Queen Street) starting west from this park and continued as the Paseo de Tacón to the citadel of El Principe. The Alameda de Paula along the bay is also a favorite promenade.

Among buildings, the most interesting are the palace of the old captains-general, facing the Plaza de Armas near the harbor front, the cathedral, built 1764, and supposed to contain the ashes of Columbus in an urn till it was removed to Spain in 1898 (but the San Domingans claim they have his authentic bones), and the Tacón Theatre, perhaps the largest in the world. There are several other theatres and opera-houses, and many clubs, etc. The chief educational institutions are the University of Havana, founded 1670 by the Dominicans; the Jesuit boys' college de Belén, with a museum, observatory, a library rich in old Cuban history, etc.; College of American Augustinian Fathers, founded 1901. Famous among benevolent institutions are the Casa de Beneficencia, founded by Las Casas for infants. There are three general hospitals, a great lazaretto for lepers, and an insane hospital in the city and vicinity. Over 100 newspapers, etc., are published in the city.

The water supply of the city was installed by a Cuban engineer, Albear, some 40 years ago, and is considered a remarkable specimen of good workmanship. It comes from the Vento by an aqueduct 12 miles long, known as the Canal of Albear. In all other respects the Americans at the conquest found an undescribable state of filth and disease. The city was the prey of yellow fever, the sewers had seldom been cleaned since they were laid down, and some of them were choked with generations of rottenness, the buildings were pest-holes; and in that dungeon of horrors, the military hospital, 70 per cent of the inmates died. The United States forces in their short stay transformed this reeking home of pestilence into one of the healthiest cities in America. In systematic order streets were cleaned, repaved, widened; squads of cleaners were sent from house to house, emptying the Augean stables under them, whitewashing and disinfecting them, and where they were shanties that were nests of infection, tearing them down; the hospital was cleaned, disinfected, and covered deep with whitewash, and turned into a schoolhouse. New business streets were made by widening old lanes; parks were cleared up, and a fine sea-wall along the ocean to the north was built. The average deaths from yellow fever 1887–98 were 440; in 1896 they were 1,262; in 1901, for the first time in its history, only three or four. A Cuban physician of Irish descent, Dr. Carlos Finlay, now chief sanitary officer of Havana, was the originator of the mosquito theory of the yellow fever. Gen. Wood and the American army surgeons, however, deserve much credit for making the theory of practical use.

The climate is not severe. The mean annual temperature is 77°; the range from hottest to coldest 82° to 71°; the highest recorded, 100.6°, the lowest 49.6°. The mean rainfall is 54 inches.

Havana is the market of western Cuba, the head of the island's banking and commercial interests, and the emporium of the West Indies. Besides being the centre of the island railway system and of a great domestic shipping trade, especially with Santiago, it is the focus of a vast foreign commerce with Spain, France, England, and the United States, regular ocean lines running weekly to the first three and semi-weekly to the latter, besides others to the other West Indies. It has excellent covered wharves and a capacious dry-dock to aid this. Regla, on the opposite side of the bay, contains the sugar wharves and railway termini. In 1902 it had exports of about $60.000.000, $43.000.000 to the United States, an increase of $11.000.000 in three years, mainly ours; but its imports had shrunk from $57.000.000 to $45.000.000, most of the reduction from this country, owing to unfavorable customs laws. The entrances and clearances of ocean vessels in that year were over 1,500.000, and of domestic vessels nearly 3.000, with an average tonnage of about 935. The exports are chiefly of sugar, tobacco, cigars, and cigarettes; the imports, flour, rice, lard, and other foods, cotton, and metals. Its manufactures are mainly tobacco products; its cigar factories, of which there are over 100 of the first rank, are the largest in the world, one covering an entire square. It also manufactures confectionery, perfumes, rum, etc. The new electric street railway system is one of the finest of its kind, with 36 miles of track.

Population.— In 1899 it was 242.055, 52.000 being foreign; in 1887 it was about 180.000. About one third were unable to read; and about one third from 5 to 17 attended school.

History.— Havana was founded here (transferred from an older site) by Diego de Velasquez in 1519, and called by him "the key of the

New World." Burnt by buccaneers in 1528, it was rebuilt and made the chief naval station of Spain in this hemisphere, twice sacked in 1555 and 1563, it was a storm centre of wars and piracies for two centuries. In 1762 the English captured it, but restored it to Spain the next year. In 1802 it was partly burnt, but under the famous Governor Tacon, its second founder, commemorated at every turn, it was rebuilt from a straw-thatched wooden town to a city of brick and stone. For its late history, see CUBA. Consult: Norton's 'Handbook of Havana and Cuba' (1900).

Havana, Ill., city, county-seat of Mason County; on the Illinois River, and on the Chicago, P. & St. L. and the Illinois C. R.R.'s; about 39 miles northwest of Springfield. It is situated in an agricultural region and is the trade centre for a large extent of country. The chief manufactures are flour, agricultural implements, drills, gasoline engines, and some factory supplies. Its trade is chiefly in grain, fruit, vegetables, and dairy products. The waterworks are owned and operated by the city. Pop. (1900) 3,268.

Havelock, hăv'ē-lŏk, SIR **Henry**, English soldier: b. Bishop-Wearmouth, near Sunderland, 5 April 1795; d. Dilkusha, India, 24 Nov. 1857. Entering the army, he served with distinction in the Burmese war (1824–6); in 1829 married, became a Baptist, and was distinguished during the remainder of his life by his earnest religious zeal. He participated in the Afghan war, and in the defeat of Mohammed Akbar, 1843. He took part in the Mahratta war, and distinguished himself in the Sikh war of 1845. He commanded a division in the Persian war (1856–7) and on the outbreak of the Indian mutiny was despatched to Allahabad in order to support Sir H. Lawrence at Lucknow and Sir H. Wheeler at Cawnpore. On arriving at Cawnpore he found that Nana Sahib had massacred the prisoners. Pursuing his march to Lucknow, he defeated the rebels at Bithoor, and finally won the battle of Alumbagh. Having captured Lucknow, Havelock and Outram were shut up there until relieved by Sir Colin Campbell 17 Nov. 1857. He was raised to the rank of major-general, made a K. C. B., and (before his death was known) created a baronet. Consult lives by Brock (1858); Marshman (1860); Forbes (1890).

Havemeyer, hăv-ē-mī'ėr, **William Frederick**, American banker: b. 31 March 1850. He received his education in private schools and entered into commercial business, and as a successful financier became vice-president and director of the National Bank of North America, and of the Queens County Bank of Long Island, and took a place in the board of directors of numerous railroad and banking corporations.

Ha'ven, Alice Bradley, American author: b. Hudson, N. Y., 1828; d. 1863. Her maiden name was Emily Bradley, and while a school girl she sent under the pseudonym of "ALICE G. LEE' many sketches to the Saturday 'Gazette,' then recently established by Joseph C. Neal in Philadelphia. She was married to Mr. Neal in 1846, and at his request assumed and retained the name of Alice. On the death of her husband in 1847, she conducted the 'Gazette' for several years. She published in 1850 'Gossips of Rivertown, with Sketches in Prose and Verse,' and became widely known by her series of juvenile stories, as 'Helen Morton,' 'Pictures from the Bible,' 'No such Word as Fail,' 'Patient Waiting no Loss,' 'Contentment Better than Wealth,' 'All's not Gold that Glitters,' 'Out of Debt Out of Danger,' etc. In 1853 she was married to Mr. Samuel L. Haven.

Haven, Erastus Otis, American Methodist bishop and educator: b. Boston, Mass., 1 Nov. 1820; d. Salem, Ore., 3 Aug. 1881. He was graduated at the Wesleyan University, Middletown, Conn., in 1842, soon after entered the ministry of the Methodist Episcopal Church, was appointed teacher of natural science in the Amenia Seminary, N. Y., and in 1845 was elected principal of that institution. He was professor of Latin and Greek in the University of Michigan 1854–6; editor of 'Zion's Herald' 1856–63, and sat in the Massachusetts Senate 1862–3. He was president of the University of Michigan 1863–7, and of Northwestern University, Evanston, Ill., 1869–72. He was subsequently chancellor of Syracuse University and was elected bishop in 1880. He published 'The Young Man Advised' (1855); 'Pillars of Truth' (1866); 'Rhetoric' (1869).

Haven, Gilbert, American Methodist bishop: b. Malden, Mass., 19 Sept. 1821; d. there 30 Jan. 1880. He was an able writer, and a forceful preacher. In the Civil War he was the first commissioned chaplain in the Federal army. He was editor of 'Zion's Herald' 1867–72, and was elected bishop in the latter year. He published 'The Pilgrim's Wallet, or Sketches of Travel in England, France, and Germany' (1865); 'National Sermons' (1869); 'Life of Father Taylor, the Sailor Preacher' (1871); 'Our Next-Door Neighbor, or a Winter in Mexico' (1875); etc.

Hav'erford College, under the auspices of the Society of Friends founded in 1833 in Haverford, Pa. It was first known as Haverford School, but in 1845 it was suspended for the purpose of collecting an endowment, and in 1856 it was made a college. It was the first collegiate institute in the United States which was founded and conducted entirely within the Society of Friends. Others besides the sons of Friends have been admitted as pupils since 1849. It is well equipped in laboratory requirements and in its library facilities. In 1903 the college reported 20 professors and instructors and 130 students. There were in the library about 37,100 volumes.

Havergal, hăv'ėr-gal, **Frances Ridley**, English hymn-writer: b. Astley, Worcestershire, 14 Dec. 1836; d. Swansea, Wales, 3 June 1879. She was a frequent contributor to 'Good Words,' and the chief English religious periodicals, and her musical harmonies were praised by the German composer Hiller. Her poems and hymns were collected in several volumes, 'The Ministry of Song' (1870) being the first. Her 'Poetical Works' (1884) appeared under the editorship of M. V. G. Havergal. Of her hymns, which contain her best work and are found in all collections, the most familiar is 'Take my Life and Let it Be.'

capacious wet-docks, lined with fine quays and extensive warehouses. Havre commands the greater part of the import and export trade of Paris, and of the more important towns in the north of France; importing vast quantities of colonial and other produce, among which cotton holds a most important place; and exporting numerous articles of French manufacture. It is the second port in France. The manufactures consist of paper, starch, lace, oil, refined sugar, cables, and other marine cordage, sulphuric acid, earthen and stone-ware. There are also breweries, gun factories, and electrical works. A government tobacco factory employs 300 workmen; and from the building-yards a great number of sailing vessels and steamers are annually fitted out. In the 15th century Havre became of importance to form a new harbor in consequence of the silting up of that of Harfleur. The project was conceived, and some progress made in it, by Louis XII.; but Havre continued little more than a fishing village till the time of Francis I., who erected numerous works, and at immense expense gained the greater part of the present site of the town from the sea. A citadel was afterward built; and Havre, as a place of strength, became the object of repeated contests between French and English. Pop. (1901) 130,196.

Havre de Grace, hăv'ĕr dė gräs, Md., city in Harford County; on the Susquehanna River, near its entrance into Chesapeake Bay; and on the Philadelphia, W. & B. and the Baltimore & O. R. R.'s; about 36 miles east-northeast of Baltimore. It is the south terminus of the Tidewater canal. A small settlement was made here in about 1670. The chief manufactures are flour, sash, doors and blinds, lumber, and canned fruits. The fisheries, especially shad and herring, are important. The trade is principally in the manufactured articles, coal, and fish. A government fish hatchery is located on Battery Island. Pop. (1900) 3,423.

Haw, Battle of the, in the Revolution, 21 Feb. 1781. Henry Lee had been commissioned by Greene to prevent Tory reinforcements coming to Cornwallis, who had taken position at Hillsboro, and in the course of the movement attempted to surprise Tarleton. Tarleton had moved; but hearing that about 400 Tories under Col. Pyle were on their way to join him, Lee determined to pass off his own "legion" as Tarleton's and capture them all. Forcing two captured British officers to keep up the deception, he moved forward, with Pickens' and Oldham's companies following, and met two young men who had been sent by Pyle to find Tarleton's camp; he was presented to them as Tarleton, and directed them to have Pyle's men drawn up beside the road while his "weary veterans" passed,—his object being to capture and disarm them all. The plan succeeded perfectly till, just as he had taken Pyle's hand, part of the Tories discovered Pickens' militia and saw the trap, and at once fired on the American rear; the latter poured in a volley that killed 90 of the enemy at the first fire, and in the melée, despite appeals for quarter, a great number of the rest were killed and the majority wounded. Pyle escaped badly hurt, and the rest of the body dispersed unpursued.

Hawaii, a Territory of the United States; geographically, the HAWAIIAN (formerly SANDWICH) ISLANDS, the northeasternmost group of the Pacific, lying near the northern edge of the Tropics (lat. 18° 54′ to 22° 15′ N.; long. 154° 50′ to 160° 30′ W.), 2,100 miles southwest of San Francisco. It consists of eight inhabited islands, *viz.*, Hawaii, Maui, Kahoolawe, Lanai, Molokai, Oahu, Kauai, and Niihau besides several rocky islets. They extend from Hawaii on the southeast, 390 miles to Kauai on the northwest, and are continued in a chain of islets, sand banks, and shoals 1,200 miles farther to Midway Island. The total area of the group is 6,454 square miles, of which Hawaii contains nearly two-thirds or 4,015 square miles; the next island, Maui, 728; the third, Oahu (which takes the lead in wealth and population, and contains the capital and chief seaport), 598; and the fourth, Kauai, 547 square miles.

Topography.—The islands are entirely volcanic, consisting in fact of the summits of a gigantic submarine mountain chain rising from the bottom of the ocean, which is three miles deep within 30 to 50 miles from the shores. The volcanic action seems to have moved from northwest to southeast, Kauai being the oldest island.

The last but one, Maui, contains the vast extinct crater of Haleakala, which is at its highest point 10,032 feet above sea level, 20 miles in circumference, and 2,000 feet deep; while Hawaii is made up of four volcanic mountains, Mauna Kea (White Mountain), 13,805 feet high, the loftiest peak in the Pacific; Mauna Loa (Long Mountain), 12,675 feet; Hualalai, 8,273 feet; and Kohala, 5,490 feet high. Of these Hualalai has been dormant since 1801, but Mauna Loa is still active at intervals, having an oval summit crater, 9.5 miles in circumference, with nearly vertical inner walls 500 to 600 feet high. Twenty miles to the southwest is the famous crater of Kilauea, eight miles in circumference and 4,000 feet above the sea, which is almost constantly in action.

The windward sides of Oahu and Molokai, and the northwest side of Kauai, present precipices 2,000 feet in height, while the northeast slopes of Hawaii and Maui end in bluffs several hundred feet high, furrowed by deep and narrow canyons cut by the streams. "In West Maui and Kauai may be found valleys that almost rival Yosemite" (Dutton). Coral reefs line the greater part of the shores of Kauai, Oahu, and the southern shore of Molokai, but are nearly absent from Hawaii and Maui.

The best harbors are found in Oahu at Honolulu, and at Pearl Harbor, seven miles west, but Hilo Bay, Hawaii, only needs a breakwater to make a commodious harbor. The only rivers worthy of the name are found in the island of Kauai. Several of them were formerly crossed by ferries.

Climate and Rainfall.—The climate of the islands is much cooler than that of other countries in the same latitude. This is due not only to the northeast trade winds, which blow nine or ten months in the year, but also to the return ocean current from the region of Bering Straits. At sea level the mean temperature is 73° F., the maximum and minimum being 89° and 52°, respectively. The islands are entirely exempt from the cyclones which so often make havoc in the central and western Pacific. The contrast in climate between the windward and leeward sides of each island is very striking, the

northwest slopes being rainy and heavily wooded, while the opposite coast has a warm and dry climate. From the differing elevations and exposures there is an extraordinary variety in the rainfall even within narrow limits. Thus the annual rainfall in the district of Hilo, Hawaii, averaged 136 inches in 20 years, from 1880 to 1900, while in Honolulu it averaged 30.9 inches, and at Luakaha, in the valley back of Honolulu, 128.9 inches.

Production and Industries.—The Hawaiian Islands, from the lack of coal and metals, are an agricultural country, and about the only manufacture is that of sugar. The Honolulu iron foundry in 1890-1900 turned out $1,107,030 worth of work, and is now making sugar mills for Mexico, Formosa, and the Philippines. One plantation, near Pearl Harbor, is refining its own sugar.

The soil of the islands in general is poor, with the exception of the valleys and some of the coast plains, which are of limited extent. The greater part of the interior consists of rugged, barren mountain sides, extensive tracts covered with lava, and forest land, which needs to be protected for the preservation of the water supply. Extensive tracts of formerly barren land, however, have been made productive by irrigation and the use of fertilizers. On Oahu there are over 200 artesian wells, yielding daily from 250 to 300 million gallons, and on some plantations pumps are employed which raise over 10,000,000 gallons of water a day, and in some places to an elevation of 350 feet.

In Kauai electricity generated by water-power in the Wainiha Valley is carried 30 miles by wire to run the pumps of the McBryde plantation. Extensive aqueducts have been made in western Kauai, Maui, and northern Hawaii, consisting largely of tunnels driven generally through solid rock. Numerous reservoirs have also been formed by damming the canyons. The Planters' Association employs a large staff of experts in chemistry, entomology, and scientific agriculture, with the result that the yield of sugar per acre is the highest in the world. The average annual yield is 4½ tons per acre, but the average for irrigated plantations is six tons to the acre. The total crop for 1906 was 429,213 tons. The value of the sugar exported to the United States for the year ending 30 June 1906, was $25,495,427. At the close of that year there were about 200,000 acres cultivated in cane. Only Java and Cuba have a greater gross product. The power for the sugar mills is obtained entirely from burning the bagasse or cane refuse. The sugar is so completely extracted from the juice that no molasses is made, the remainder being thrown into fertilizers. The total number of employees on the sugar plantations in 1905 amounted to 48,229, including: Japanese, 31,735; Koreans, 4,683; Chinese, 4,409; Portuguese, 3,005; other whites, 1,006; Hawaiians, 1,452; Porto Ricans, 1,907; Negroes, 32.

The first importation of Chinese took place in 1852. In 1878 their number had risen to 5,916, and in 1886 to 21,000, at which time a strict exclusion act was passed. In 1878 the first Portuguese immigrants arrived from the Azores, and during the next ten years about 7,000 of these people came to the islands, where they have given great satisfaction as industrious and law-abiding citizens. In 1886 a labor convention was concluded with Japan and a stream of immigrants set in, which increased the number of Japanese in the Islands from 116 in 1884, to 24,400 in 1886, and 61,111 in 1900. Porto Ricans were imported in 1901 to the number of about 2,500. Both as laborers and as citizens they have proved to be very unsatisfactory. Beginning with the year 1903, up to 31 Dec. 1905, about 7,000 Koreans arrived in the Territory, who have done well as laborers. In the spring of 1907 several thousand immigrants were imported from Spain and the Azores, with the understanding that they should be given small freeholds of their own by the planters.

The danger of depending upon a single crop has long been recognized, and persistent efforts have been made to develop minor industries. The culture of rice was commenced in 1860, and it soon became the second crop in importance, amounting in 1904 to 14,000 tons of cleaned rice, most of which is consumed in the Territory. The quality of Hawaiian coffee is equal to that of Mocha, but the industry is depressed by the competition of Brazilian and Central American low-grade coffees. The crop in 1903 amounted to 300,000 lbs. The amount exported in 1906 was valued at $248,618. There were four pineapple canneries that year, which put up 40,000 cases. There are several sisal plantations, and two promising rubber plantations. Experiments with tobacco have been successful. The castor oil bean grows wild, but the manufacture of the oil has not yet been profitable. Nearly all the fruits of the tropical and some of the temperate zone, grow well in the islands, and yet the total export in 1905 of fruit, not canned, was valued at only $131,806. The native staff of life is the taro root, or Colocasia, reduced to a paste called poi. There are about twenty stock and sheep ranches, which exported $45,883 worth of wool in 1906. The export of honey and wax amounts to about $40,000 a year.

Commerce.—The total exports in 1904 were $26,275,438, and in 1906, $26,994,824. The imports in 1904 were $15,481,034 and in 1906, $15,639,874. Nearly three-fourths of the imports are from the United States. In 1905, 452 vessels cleared from Hawaiian ports, aggregating 973,279 tons, five-sixths of which were under the American flag.

Transportation.—For steamship lines see article on Honolulu. There are 20 steamers and as many schooners engaged in the inter-island trade. There are about 150 miles of railroads on the islands, the principal line being on Oahu, and others on Maui and Hawaii. The principal islands are connected by wireless telegraph, each island being encircled by telephone lines. The trans-Pacific submarine cable laid in 1903 connects the islands with both continents.

Finances.—The bonded debt assumed by the United States on annexation was $4,000,000, leaving $951,000 to be paid by the Territory of Hawaii. The debt of the Territory had increased by 30 June 1904 to $2,185,000, and by 1 Jan. 1907 to $3,722,000. The assessed valuation of taxable property had increased by 1 Jan. 1906 to $131,175,015. The taxes are 1 per cent. on property, and 2 per cent. on incomes above $1,000 a year. The current receipts of the government aside from loans, during the year 1906, were $2,354,813. The receipts from customs and internal revenue, which are remitted to Washington, average about $1,200,000 a year.

Education.—There is a good free-school system, graded, with compulsory attendance from 6 to 15, with an excellent normal training school, besides industrial and high schools. The school law requires that the English language shall be the basis and medium of instruction in all schools.

The department is administered by a superintendent and six commissioners, aided by three travelling inspectors.

On 31 Dec. 1906 the numbers were as follows: Public schools, 151; 443 teachers; 16,051 pupils. Private schools, 62; 261 teachers; 5,230 pupils. Total: 213 schools; 704 teachers; 21,800 pupils.

The total cost of the government schools is about $350,000 per annum. The private schools are mostly endowed, as Oahu College and the Kamehameha Schools, founded by the late Mrs. Bernice Bishop; or managed by missionary boards or religious orders as Saint Louis College.

Charitable Institutions.—Among these may be mentioned the Lunalilo Home for aged and indigent Hawaiians, the Asylum for the Insane, the numerous hospitals, eight of which are under the Board of Health, but the most important is the leper settlement established in 1866 on a peninsula of Molokai, shut off from the rest of the island by a precipice 2,000 feet in height. The number of lepers has decreased from 1,200 to 833. The territorial government provides them comfortable homes, food, clothing, and medical attendance free of cost, aided by the devoted Franciscan sisters and the Brothers of the Sacred Heart.

Population.—The census of 1900 divides the population as follows: Hawaiians, 29,787; Part-Hawaiians, 7,848; Americans, 7,283; Portuguese, 15,675; other Caucasians, 3,294; Chinese, 25,762; Japanese, 61,115; Polynesians, 653; other foreigners, 2,584; total, 154,001. Of the islands, Hawaii had 46,843; Oahu (including the city of Honolulu, 39,306), 58,504; Maui, 25,416; Kauai and Niihau, 20,734; Molokai and Lanai, 2,504.

Government.—The new territorial government was inaugurated at Honolulu 14 June 1900, and the first territorial legislature began its sessions at Honolulu 20 Feb. 1901. The legislature is composed of two houses—the senate of 15 members, holding office four years; and the house of representatives of 30 members, holding office two years. The legislature meets biennially, and sessions are limited to 60 days.

The executive power is lodged in a governor, a secretary, both appointed by the President, and holding office four years, and the following officials appointed by the governor, by and with the consent of the senate of Hawaii: an attorney-general, treasurer, commissioner of public lands, commissioner of agriculture and forestry, superintendent of public works, superintendent of public instruction, auditor and deputy, surveyor, high sheriff, and members of the boards of health, public instruction, prison inspectors, etc. They hold office for four years, and must be citizens of Hawaii.

The judiciary of the Territory is composed of the supreme court with three judges, the circuit court, and such inferior courts as the legislature may establish. The judges are appointed by the President. The Territory is a federal judicial district, with a district judge, district attorney, and marshal, all appointed by the President. The district judge has all the powers of a circuit judge.

The Territory is represented in congress by a delegate, who is elected biennially by the people.

History.—According to documents in the Spanish archives, the islands were discovered in 1555 by Juan Gaetano, who named Hawaii "La Mesa." They were rediscovered by Capt. James Cook in 1778, and named the Sandwich Islands. In 1792 Capt. Vancouver visited the islands, and introduced the first cattle and sheep. Kamehameha I., a chief of northern Hawaii, after nine years of war, became master of the whole island in 1791. In 1795 he conquered Maui and Oahu, the decisive battle being fought in Nuuanu Valley back of Honolulu. Having united the group under one strong government, he died 8 May 1819. His son, Kamehameha II., abolished the ancient tabu system in the following September. The first American missionaries arrived at Kailua, Hawaii, 4 April 1820, and met with remarkable success. The first Catholic missionaries arrived 7 July 1827. In the same year the first written laws were printed. The first constitution was proclaimed 8 Oct. 1840. On 25 Feb. 1843, the native government was compelled by Lord Paulet to make a provisional cession to Great Britain, but its independence was restored 31 July of the same year by Admiral Thomas. The feudal tenure of land was abolished in 1848, and a liberal constitution was adopted in 1852. The Kamehameha dynasty ended with the death of Kamehameha V., 11 Dec. 1872. David Kalakaua was elected by the Legislature 12 Feb. 1874. In 1876 a reciprocity treaty was ratified with the United States, which assured prosperity to the islands. The King, however, labored to build up a reactionary party, and to restore autocratic government, until he was compelled by the civilized element to sign a revision of the constitution, which limited his powers, in 1887. A Royalist insurrection was put down in 1889. His sister, Liliuokalani, succeeded him in 1891, and in January 1893 undertook to abrogate the constitution, and establish an absolute monarchy. Upon this the constitutional party dethroned her, and established a provisional government. During the following year the Republic of Hawaii was organized with S. B. Dole as President. An annexation treaty was negotiated with President Harrison, which was withdrawn by President Cleveland in April 1893, but brought up again on the accession of President McKinley. After long delays, Hawaii was admitted into the Union by a joint resolution passed 7 July 1898. It was finally organized as a Territory 14 June 1900, with S. B. Dole as Governor, who was succeeded by Geo. R. Carter 23 Nov. 1903, and by Walter F. Frear in 1907. Consult Bishop, 'Hawaiian Archipelago' (New York 1894); Twombley, 'Hawaii and Its People' (London 1900); Musick, 'Our New Possessions' (New York 1897); Whitman, 'Hawaiian America' (New York 1899); Young, 'The Real Hawaii' (London 1899).

W. D. ALEXANDER,
Formerly Surveyor-General Hawaiian Islands.

Hawes' Shop, Cavalry Engagement Near. Gen. Grant had crossed to the south bank of the North Anna, in Virginia, and finding Gen. Lee too strongly posted to be attacked, and his own army in a false and critical position, he withdrew, on the night of 26 May 1864, to the north bank, and moved down the north bank of the Pamunkey to turn Lee's right. Torbert's and Gregg's divisions of cavalry, under Sheridan, together with the Sixth corps, led the advance. Torbert crossed the Pamunkey at Hanover Ferry on the 27th, after considerable skirmishing in which he took about 60 prisoners, and the two cavalry divisions, supported by Russell's division of infantry, pushed on to Hanover Town and bivouacked for the night. On the morning of the 28th Sheridan was directed to make a demonstration and discover the enemy's position. Gregg's division, advancing on the Mechanicsville road, encountered the two cavalry divisions of Wade Hampton and Fitzhugh Lee and Butler's South Carolina cavalry brigade about a mile beyond Hawes' Shop. The Confederate cavalry was dismounted and had thrown up a barricade of rails covering the road. Gregg attacked, and there ensued one of the most severe cavalry engagements of the War, which continued several hours, neither side yielding ground. Finally, late in the day, Custer's brigade of Torbert's division came up, dismounted, took position in the centre of Gregg's line, formed in close column of attack, the whole line charged and, after a hard struggle at close quarters, the Confederates were driven from position and retreated upon their infantry at the Totopotomoy. Gregg's loss was 256 killed and wounded; the entire Union loss was 44 killed and 306 wounded. The Confederate loss is not known. Consult: 'Official Records,' Vol. XXXVI.; Humphreys, 'The Virginia Campaign of 1864–5'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. Carman.

Hawesville, hâz'vĭl, Ky., city, county-seat of Hancock County; on the Ohio River, and on the Louisville, H. & S. T. L. railroad; about 65 miles above Evansville, Ind.: and 80 miles west by south from Louisville. It is situated in an agricultural and coal-mining region. Its chief manufactures are flour, lumber, and furniture. It has a number of tobacco factories or stemmeries, and its trade is chiefly in tobacco, coal, articles of home manufacture, and agricultural products. Pop. (1900) 1,041.

Haw'finch, one of the largest of European finches (*Coccothraustes vulgaris*), so called in England from the belief that it subsisted principally on the fruit of the hawthorn. It resembles the chaffinch in color, but is distinguished by its enormous beak and larger size. It feeds on all kinds of berries.

Hawk, a general name for diurnal birds of prey not eagles or vultures. See Falcon, and the names of various groups and species, as Hen-hawks, Sparrow-hawk and the like: also Falconry.

Hawk-moths, a family of large moths forming the family *Sphingidæ*. They have stout bodies, large heads with prominent eyes, and thick spindle-shaped antennæ, ending in a hook. The fore-wings are long, narrow, more or less pointed, and always much longer than the hind-wings. They are insects of rapid flight, and dart about in the twilight; some species also during the day. Their caterpillars are hairless, smooth, often green, with transverse stripes on the sides and nearly always a horn on the back of the second last segment, and always have ten prolegs. They are leaf-eaters and often greatly destructive to cultivated plants, the tomato-worm (q.v.) being a prominent example. They change to pupæ either on the surface of the ground or in a cell underground, but make no cocoon. Some of the South American species resemble humming-birds so closely, especially when poising before a flower on whirring wings and sucking its nectar, that they can hardly be distinguished, and popular belief asserts that the one is transmutable into the other. A great number of forms exist in all parts of the world, the United States having about 100 species. All are plainly dressed in grays and browns, and one of the most remarkable is the death's-head (q.v.).

Hawkbit, a genus (*Leontodon*) of composite plants closely related to the dandelion, from which they differ in having feathery pappus. The name is due to the peculiar shape of the lacerations of the leaves. Several species are natives of Europe and Russian Asia.

Hawke, Edward, Lord, English sailor: b. London 1705; d. Sunbury-on-Thames 17 Oct. 1781. Early in 1720 Hawke entered the navy and was appointed in 1733 to the command of the Wolf. Being promoted to the command of a squadron in 1847 he totally defeated the French fleet off Belle Isle. In 1759 he was sent in pursuit of the Brest fleet, which he came up with in Quiberon Bay, and signally defeated. He now received a pension of £2,000, and in 1768 became admiral of Great Britain and commander-in-chief of the fleet. From 1766 to 1771 he was first lord of the admiralty. In 1776 he was advanced to a seat in the House of Lords by the style of Baron Hawke of Towton.

Haw'ker, Mary Elizabeth, English novelist: b. 1865. Under the pseudonym of "Lanoe Falconer" she has written the well known novel 'Mademoiselle Ixe' (1890); which was followed by 'The Hotel d'Angleterre' (1891) and 'Cecilia de Noel' (1891).

Hawkesbury, hâks'ber-ĭ, Canada, village in Prescott County, Ontario; on the Ottawa River, and a terminus of a branch of the Canada Atlantic Railway, 50 miles west of Montreal. It has ferry communication with Grenville, across the river. Its chief industrial establishments are flour mills, a woolen factory, and large saw and planing mills. It has an extensive lumber trade. Pop. (1901) 4,150.

Hawk'eye State, Iowa — so named after a famous Indian warrior.

Hawking. See Falconry.

Haw'kins, Anthony Hope, English novelist, known by the pen-name "Anthony Hope": b. London 9 Feb. 1863. He was educated at Balliol College, Oxford, was admitted to the bar at the Middle Temple in 1887, and practised until 1894 on the London and Midland circuit. He contested South Bucks as a Liberal in 1892, but unsuccessfully. In 1894 he achieved a striking literary success with his 'Prisoner of Zenda,' with scene in an imaginary independent state of South Germany. Other books of his are: 'The Dolly Dialogues' (1894), cited as models of keen if somewhat shallow repartee;

'The Chronicles of Count Antonio' (1895); 'Rupert of Hentzau' (1898); and 'The Intrusions of Peggy' (1902).

Hawkins, Hamilton Smith, American military officer: b. South Carolina 1834. He entered the army in 1861, was made captain in the 6th infantry in 1863, and brevetted major in October 1865. In 1888 he became commandant at West Point, and in 1892 was promoted colonel. When war was declared against Spain (1898) he went to the front as a brigadier-general of volunteers. He led the desperate and now historic charge at San Juan, Cuba, 2 July 1898, and was made major-general of volunteers, 8 July 1898.

Hawkinsville, Ga., village, county-seat of Pulaski County; on the Ocmulgee River, at the head of navigation, and on a branch of the Macon & B. railroad; about 48 miles south of Macon. It is situated in a fertile agricultural region. It has a cotton factory, cotton compresses, cotton gins, cottonseed-oil mills, barrel factories, carriage and wagon works. Its trade is chiefly in cotton, lumber, fruits, and vegetables. Pop. (1900) 2,103.

Hawksbeard, a perennial composite plant allied to hawkweed, but of the genus *Crepis*, about 150 species of which are known in the northern hemisphere. Several are European weeds which have become naturalized in the United States, and there are several native species. The flowers are dandelion-like and yellow or orange.

Hawksbill, a great marine turtle (*Chelone imbricata*) allied to the green turtle, but which has the plates of the shell overlapping; and these plates form the tortoise-shell (q.v.) of commerce. The flesh is not good for eating, but the eggs are good. The animal inhabits the Indian Ocean, the Pacific, and the warmer parts of the Atlantic. This is one of the sea-turtles called "caret," but that term belongs more properly to the loggerhead. See TURTLE.

Hawkweed, or Rattlesnake Weed, a genus (*Hieracium*) of composite plants with mottled, radical leaves, tall hairy stems and yellow or orange flowers. One species, the European orange hawkweed (*H. aurantiacum*) is frequently cultivated for the sake of its fine orange flowers. The name "hawkweed" in English, and various similar names in use among the peasants of continental Europe, are based on an ancient belief that birds of prey used the juice of the species to strengthen their vision. Several species grow numerously in the United States, where they are called "rattlesnake weeds" and are believed to be of value in curing the poison of snakes.

Hawkwood, Sir John de, English soldier: b. Hedingham Sibil, Essex; d. Florence, Italy, 17 March 1304. He was styled by Hallam the first distinguished commander who had appeared in Europe since the destruction of the Roman Empire. It is said that he fought at Crécy and Poitiers, and for his bravery was knighted by Edward III. However that may be, in 1350 he was the leader of a troop of free lances, preying upon France and northern Italy. With this band, the "White Company," he served the Marquis of Montferrat, later the Republic of Pisa, and still later Florence, upon whose side he oftenest fought in the civil disturbances of Italy. As commander-in-chief he directed the successful war against Milan (1390-2). He was pensioned by the Florentines and entombed with great ceremony in the Duomo.

Hawley, Gideon, American missionary to the Indians: b. Stratfield, now Bridgeport, Conn., 5 Nov. 1727; d. Marshpee, Mass., 3 Oct. 1807. He was graduated at Yale College in 1749, and commenced his labors at Stockbridge in 1752, opening a school at that place, in which he instructed a number of Mohawk, Oneida, and Tuscarora families. In 1754, under the patronage of Sir William Johnson, he began a mission among the Iroquois, or Six Nations, on the Susquehanna River; but in 1756 was obliged by the disturbances of the French war to leave that region, when he became a chaplain in the army marching against Crown Point. The campaign being over, he re-engaged in his missionary work at Marshpee, where he was installed as pastor in 1758, and there passed the remainder of his life in his benevolent labors.

Hawley, Joseph, American statesman: b. Northampton, Mass., 1724; d. 10 March 1788. He was graduated at Yale College, and followed the profession of law at Northampton, in which he rose to eminence. At the time of the disputes between Great Britain and America, he took a prominent part in advocating the cause of the colonies. "We must fight," he wrote to the delegates of Massachusetts, "if we cannot otherwise rid ourselves of British taxation. The form of government enacted for us by the British parliament is evil against right, utterly intolerable to every man, who has any idea or feeling of right or liberty." He was several times elected a member of the council, but declined, preferring to enter the State legislature, of which he was a member 1764-6.

Hawley, Joseph Roswell, American politician and legislator: b. Stewartsville, N. C., 31 Oct. 1826; d. Washington, D. C., 17 March 1905. He was graduated at Hamilton College, Clinton, N. Y., 1847, and began the practice of law at Hartford, Conn., in 1850. The Republican party in Connecticut was organized in the office of the *Charter Oak*, of which he was the editor. He afterward became editor of the Hartford *Evening Post*, the new Republican paper. When the Civil War broke out he recruited the first company of volunteers raised in the State — Company A of the 1st Connecticut regiment — of which he took command. He saw service throughout the whole war and was mustered out in 1866 with the brevet rank of major-general. He was elected governor of Connecticut the same year. In 1872 he was elected to Congress, at the end of the term, 1875-81, was sent to the United States Senate, to which he was re-elected 1887, 1893, and 1899.

Hawley, Pa., borough in Wayne County; on the Lackawaxen River, and on the main line or branches of the Pennsylvania, the Delaware & H., and the Erie R. R.'s; about nine miles south-southeast of Honesdale. Its chief manufacturing establishments are a glass-factory, a glass-cutting factory and a silk-factory. In addition to its trade in home manufactures, it has an extensive coal trade, and ships a considerable quantity of farm products. Pop. 2,128.

Haworth, Adrian Hardy, English naturalist: b. at Hull in 1767; d. there 16 Jan. 1833. He was educated for the law, but did not practice, devoting his time to entomology and botany. He was the founder of the Entomological Society of London, a member of the Linnæan Society, and the Hull Botanical Gardens were planned by him, and laid out under his direction. His collections were large and important and his works are still standard. He wrote: 'Observations on the Genus Mesembryanthemum' (1794); 'Prodromus Lepidopterorum Britannicorum' (1802); and 'Synopsis Plantarum Succulentarum' (1812); and many minor papers.

Haworth, hâ'wėrth, **Joseph,** American actor: b. Providence, R. I., 1855; d. 29 Aug. 1903. His first appearance was as a member of Ellsler's stock company at Cleveland, Ohio, and subsequently he supported Edwin Booth, Lawrence Barrett, and John McCullough. From 1883 he toured for several years as a star in 'The Bells,' 'The Leavenworth Case,' 'Hamlet,' and other productions; in 1896–8 was Macbeth to Modjeska's Lady Macbeth, and later Storm in Caine's 'Christian,' Vinicius in Stange's adaptation of Sienkiewicz's 'Quo Vadis,' and Cassius in the Mansfield presentation of 'Julius Cæsar.'

Hawser, a manila or wire rope used in mooring or towing boats, etc., over four or three inches in circumference respectively. The name is now usually applied to all large ropes, though formerly it signified ropes "hawser-laid," that is, with three "plain-laid," three-stranded ropes laid up left-handed, now usually called a cable-laid rope.

Hawthorn, or **White Thorn** (*Cratægus oxyacantha*), a small spiny European tree, rising sometimes to the height of 20 to 25 feet, much admired for the beauty of its foliage. The leaves are smooth, shining, more or less deeply lobed, and of a beautiful green color; the flowers are white, sometimes with a reddish tinge, disposed in corymbs, and possess an agreeable perfume. The species of *Cratægus* are about 50 in number, all shrubs or small trees, spiny, with red fruit resembling in miniature that of the apple, from which plant they are distinguished chiefly by their seeds, and are arranged with it in the family *Rosaceæ*. Fifteen species are recognized in North America. When young the hawthorn springs up rapidly, a shoot of a single year being sufficient for a walking-stick. It thus, if well pruned and kept down, quickly grows into a thick and intricately woven hedge.

Hawthorne, hâ'thôrn, **Julian,** American novelist and journalist, son of Nathaniel Hawthorne (q.v.): b. Boston, Mass., 22 June 1846. He was graduated from Harvard University in 1867 and afterward studied civil engineering in Dresden, but soon forsook this occupation for literature. His first successful story was 'Bressant' (1872), the forerunner of a long list of novels, of which may be particularized 'Garth' (1875); 'Sebastian Strome' (1884); 'Archibald Malmaison' (1884); 'A Fool of Nature' (1896). He has also published 'Saxon Studies' (1876); and 'Nathaniel Hawthorne and His Wife' (1885). His best work suggests more than one element that distinguishes his father's stories. There is a psychologic accent, the touch of mystery, and the avoidance of the stock properties of romance.

Hawthorne, Nathaniel, American novelist: b. Salem, Mass., 4 July 1804; d. Plymouth, N. H., 19 May 1864. The founder of the family in America was William Hathorne (as the name was then spelled), a typical Puritan and a public man of importance. John, his son, was a judge, one of those presiding over the witchcraft trials. Of Joseph in the next generation little is said, but Daniel, next in descent, followed the sea and commanded a privateer in the Revolution, while his son Nathaniel, father of the romancer, was also a sea captain. This pure New England descent gave a personal character to Hawthorne's presentations of New England life; when he writes of the strictness of the early Puritans, of the forests haunted by Indians, of the magnificence of the provincial days, of men high in the opinion of their townspeople, of the reaching out to far lands and exotic splendors, he is expressing the stored-up experience of his race. His father died when Nathaniel was but four and the little family lived a secluded life with his mother. He was a handsome boy and quite devoted to reading, by an early accident which for a time prevented outdoor games. His first school was with Dr. Worcester, the lexicographer. In 1818 his mother moved to Raymond, Maine, where her brother had bought land, and Hawthorne went to Bowdoin College. He entered college at the age of seventeen in the same class with Longfellow. In the class above him was Franklin Pierce, afterward 12th President of the United States. On being graduated in 1825 Hawthorne determined upon literature as a profession, but his first efforts were without success. 'Fanshawe' was published anonymously in 1828, and shorter tales and sketches were without importance. Little need be said of these earlier years save to note that they were full of reading and observation. In 1836 he edited in Boston the 'American Magazine for Useful and Entertaining Knowledge,' but gained little from it save an introduction to 'The Token,' in which his tales first came to be known. Returning to Salem he lived a very secluded life, seeing almost no one (rather a family trait), and devoted to his thoughts and imaginations. He was a strong and powerful man, of excellent health and, though silent, cheerful, and a delightful companion when he chose. But intellectually he was of a separated and individual type, having his own extravagances and powers and submitting to no companionship in influence. In 1837 appeared 'Twice Told Tales' in book form: in a preface written afterwards Hawthorne says that he was at this time "the obscurest man of letters in America." Gradually he began to be more widely received. In 1839 he became engaged to Miss Sophia Peabody, but was not married for some years. In 1838 he was appointed to a place in the Boston custom house, but found that he could not easily save time enough for literature and was not very sorry when the change of administration put him out of office. In 1841 was founded the socialistic community at Brook Farm: it seemed to Hawthorne that here was a chance for a union of intellectual and physical work, whereby he might make a suitable home for his future wife. It failed to fulfill his expectations and Hawthorne withdrew from the experiment. In 1842 he was married and moved with his wife to the Old Manse at Concord just above the historic bridge. Here chiefly he wrote the 'Mosses of an Old Manse' (1846). In 1845 he published a second series of 'Twice Told Tales': in this year also the family moved to Salem, where he had received the appointment of surveyor at the custom house. As before, official work was a hindrance to literature; not till 1849 when he lost his position could he work seriously. He used his new-found leisure in carrying out a theme that had been long in his mind and produced 'The Scarlet Letter' in 1850. This, the first of his longer novels, was received with enthusiasm and at once gave him a distinct place in literature. He now moved to Lenox, Mass., where he began on 'The House of Seven Gables,' which was published in 1851. He also wrote 'A Wonder-Book' here, which in its way has become as famous as his more important work. In Dec. 1851 he moved to West Newton, and shortly to Concord again, this time to the Wayside. At Newton he wrote 'The Blithedale Romance.' Having settled himself at Concord in the summer of 1852, his first literary work was to write the life of his college friend, Franklin Pierce, just nominated for the Presidency. This done he turned to 'Tanglewood Tales,' a volume not unlike the 'Wonder-Book.' In 1853 he was named consul to Liverpool: at first he declined the position, but finally resolved to take this opportunity to see something of Europe. He spent four years in England, and then a year in Italy. As before, he could write nothing while an official, and resigned in 1857 to go to Rome, where he passed the winter, and to Florence, where he received suggestions and ideas which gave him stimulus for literary work. The summer of 1858 he passed at Redcar, in Yorkshire, where he wrote 'The Marble Faun.' In June 1860 he sailed for America, where he returned to the Wayside. For a time he did little literary work: in 1863 he published 'Our Old Home,' a series of sketches of English life and planned a new novel, 'The Dolliver Romance,' also called 'Pansie.' But though he suffered from no disease his vitality seemed relaxed: some unfortunate accidents had a depressing effect, and in the midst of a carriage trip into the White Mountains with his old friend, Franklin Pierce, he died suddenly at Plymouth, N. H., early in the morning, 19 May 1864.

The works of Hawthorne consist of novels, short stories, tales for children, sketches of life and travel, and some miscellaneous pieces of a biographical or descriptive character. Besides these there were published after his death extracts from his notebooks. Of his novels 'The Scarlet Letter' is a story of old New England: it has a powerful moral idea at bottom, but it is equally strong in its presentation of life and character in the early days of Massachusetts. 'The House of Seven Gables' presents New England life of a later date: there is more of careful analysis and presentation of character and more description of life and manners, but less moral intensity. 'The Blithedale Romance' is less strong: Hawthorne seems hardly to grasp his subject. It makes the third in what may be called a series of romances presenting the molding currents of New England life: the first showing the factors of religion and sin, the second the forces of hereditary good and evil, and the third giving a picture of intellectual and emotional ferment in a society which had come from very different beginnings. 'Septimius Felton,' finished in the main but not published by Hawthorne, is a fantastic story dealing with the idea of immortality. It was put aside by Hawthorne when he began to write 'The Dolliver Romance,' of which he completed only the first chapters. 'Dr. Grimshaw's Secret' (published in 1882) is also not entirely finished. These three books represent a purpose that Hawthorne never carried out. He had presented New England life, with which the life of himself and his ancestry was so indissolubly connected, in three characteristic phases. He had traced New England history to its source. He now looked back across the ocean to the England he had learned to know, and thought of a tale that should bridge the gulf between the old world and the new. But the stories are all incomplete and should be read only by the student. The same thing may be said of 'Fanshawe,' which was published anonymously early in Hawthorne's life and later withdrawn from circulation. 'The Marble Faun' presents to us a conception of the old world at its oldest point. It is Hawthorne's most elaborate work, and if every one were familiar with the scenes so discursively described, would probably be more generally considered his best. Like the other novels its motive is based on the problem of evil, but we have not precisely atonement nor retribution, as in his first two novels. The story is one of development, a transformation of the soul through the overcoming of evil. The four novels constitute the foundation of Hawthorne's literary fame and character, but the collections of short stories do much to develop and complete the structure. They are of various kinds, as follows: (1) Sketches of current life or of history, as 'Rills from the Town Pump,' 'The Village Uncle,' 'Main Street,' 'Old News.' These are chiefly descriptive and have little story; there are about twenty of them. (2) Stories of old New England, as 'The Gray Champion,' 'The Gentle Boy,' 'Tales of the Province House.' These stories are often illustrative of some idea and so might find place in the next set. (3) Stories based upon some idea, as 'Ethan Brand,' which presents the idea of the unpardonable sin: 'The Minister's Black Veil,' the idea of the separation of each soul from its fellows: 'Young Goodman Brown,' the power of doubt in good and evil. These are the most characteristic of Hawthorne's short stories: there are about a dozen of them. (4) Somewhat different are the allegories, as 'The Great Stone Face,' 'Rappacini's Daughter,' 'The Great Carbuncle.' Here the figures are not examples or types, but symbols, although in no story is the allegory consistent. (5) There are also purely fantastic developments of some idea, as 'The New Adam and Eve,' 'The Christmas Banquet,' 'The Celestial Railroad.' These differ from the others in that there is an almost logical development of some fancy, as in case of the first the idea of a perfectly natural pair being suddenly introduced to all the conventionalities of our civilization. There are perhaps twenty of these fantasies. Hawthorne's stories from classical mythology, the 'Wonder-Book' and 'Tanglewood Tales,' belong to a special class of books, those in which men of genius have retold stories of the past in forms suited to the present. The stories themselves are set in a piece of narrative and description which gives the atmosphere of the time of the writer, and the old legends are turned from stately myths not merely to children's stories, but to romantic fancies. Mr. Pringle in 'Tanglewood Fireside' comments on the idea: "Eustace," he says to the young college student who had been telling the stories to the children, "pray let me advise you never more to meddle with a classical myth. Your imagination is altogether Gothic and will inevitably Gothicize everything that you touch. The effect is like bedaubing a marble statue with paint. This giant, now! How can you have ventured to thrust his huge disproportioned mass among the seemly outlines of Grecian fable?" "I described the giant as he appeared to me," replied the student. "And, sir, if you would only bring your mind into such a relation to these fables as is necessary in order to remodel them, you would see at once that an old Greek has no more exclusive right to them than a modern Yankee has. They are the common property of the world and of all time" ('Wonder-Book,' p. 135). 'Grandfather's Chair' was also written primarily for children and gives narratives of New England history, joined together by a running comment and narrative from Grandfather, whose old chair had come to New England, not in the Mayflower, but with John Winthrop and the first settlers of Boston. 'Biographical Stories,' in a somewhat similar framework, tells of the lives of Franklin, Benjamin West and others. It should be noted of these books that Hawthorne's writings for children were always written with as much care and thought as his more serious work. 'Our Old Home' was the outcome of that less remembered side of Hawthorne's genius which was a master of the details of circumstance and surroundings. The notebooks give us this also, but the American notebook has also rather a peculiar interest in giving us many of Hawthorne's first ideas which were afterwards worked out into stories and sketches.

One element in Hawthorne's intellectual make-up was his interest in the observation of life and his power of description of scenes, manners and character. This is to be seen especially, as has been said, in his notebooks and in 'Our Old Home,' and in slightly modified form in the sketches noted above. These studies make up a considerable part of 'Twice Told Tales' and 'Mosses from an Old Manse,' and represent a side of Hawthorne's genius not always borne in mind. Had this interest been predominant in him we might have had in Hawthorne as great a novelist of our everyday life as James or Howells. In the 'House of Seven Gables' the power comes into full play: 100 pages hardly complete the descriptions of the simple occupations of a single uneventful day. In Hawthorne however, this interest in the life around him was mingled with a great interest in history, as we may see, not only in the stories of old New England noted above, but in the descriptive passages of 'The Scarlet Letter.' Still we have not, even here, the special quality for which we know Hawthorne. Many great realists have written historical novels, for the same curiosity that absorbs one in the affairs of everyday may readily absorb one in the recreation of the past. In Hawthorne, however, was another element very different. His imagination often furnished him with conceptions having little connection with the actual circumstances of life. The fanciful developments of an idea noted above (5) have almost no relation to fact: they are "made up out of his own head." They are fantastic enough, but generally they are developments of some moral idea and a still more ideal development of such conceptions was not uncommon in Hawthorne. 'Rappacini's Daughter' is an allegory in which the idea is given a wholly imaginary setting, not resembling anything that Hawthorne had ever known from observation. These two elements sometimes appear in Hawthorne's work separate and distinct just as they did in his life: sometimes he secluded himself in his room, going out only after nightfall; sometimes he wandered through the country observing life and meeting with everybody. But neither of these elements alone produced anything great, probably because for anything great we need the whole man. The true Hawthorne was a combination of these two elements, with various others of personal character, and artistic ability that cannot be specified here. The most obvious combination between these two elements, so far as literature is concerned, between the fact of external life and the idea of inward imagination, is by a symbol. The symbolist sees in everyday facts a presentation of ideas. Hawthorne wrote a number of tales that are practically allegories: 'The Great Stone Face' uses facts with which Hawthorne was familiar, persons and scenes that he knew, for the presentation of a conception of the ideal. His novels, too, are full of symbolism. 'The Scarlet Letter' itself is a symbol and the rich clothing of Little Pearl, Alice's posies among the Seven Gables, the old musty house itself, are symbols, Zenobia's flower, Hilda's doves. But this is not the highest synthesis of power, as Hawthorne sometimes felt himself, as when he said of 'The Great Stone Face,' that the moral was too plain and manifest for a work of art. However much we may delight in symbolism it must be admitted that a symbol that represents an idea only by a fanciful connection will not bear the seriousness of analysis of which a moral idea must be capable. A scarlet letter A has no real connection with adultery, which begins with A and is a scarlet sin only to such as know certain languages and certain metaphors. So Hawthorne aimed at a higher combination of the powers of which he was quite aware, and found it in figures and situations in which great ideas are implicit. In his finest work we have, not the circumstance before the conception or the conception before the circumstance, as in allegory. We have the idea in the fact, as it is in life the two inseparable. Hester Prynne's life does not merely present to us the idea that the breaking of a social law makes one a stranger to society with its advantages and disadvantages. Hester is the result of her breaking that law. The story of Donatello is not merely a way of conveying the idea that the soul which conquers evil, thereby grows strong in being and life. Donatello himself is such a soul growing and developing. We cannot get the idea without the fact, nor the fact without the idea

This is the especial power of Hawthorne, the power of presenting truth implicit in life. Add to this his profound preoccupation with the problem of evil in this world, with its appearance, its disappearance, its metamorphoses, and we have a clue to Hawthorne's greatest works. In 'The Scarlet Letter,' 'The House of Seven Gables,' 'The Marble Faun,' 'Ethan Brand,' 'The Gray Champion,' the ideas cannot be separated from the personalities which express them. It is this which constitutes Hawthorne's lasting power in literature. His observation is interesting to those that care for the things that he describes, his fancy amuses, or charms or often stimulates our ideas. His short stories are interesting to a student of literature because they did much to give a definite character to a literary form which has since become of great importance. His novels are exquisite specimens of what he himself called the romance, in which the figures and scenes are laid in a world a little more poetic than that which makes up our daily surrounding. But Hawthorne's really great power lay in his ability to depict life so that we are made keenly aware of the dominating influence of moral motive and moral law.

Bibliography.—Hawthorne's life has been written by G. P. Lathrop (library edition of his works), by Henry James ('English Men of Letters'), and by Moncure D. Conway ('Great Writers' Series'). Consult also: 'Memorials of Hawthorne,' by Rose Hawthorne Lathrop. Criticism will be found in G. W. Curtis, 'Literary and Social Studies'; T. W. Higginson, 'Short Studies of American Authors'; Leslie Stephen, 'Hours in a Library'; W. D. Howells, 'My Literary Passions'; J. T. Fields, 'Yesterdays With Authors'; R. H. Hutton, 'Essays in Literary Criticism.'

EDWARD EVERETT HALE, JR.,
Professor of English, Union College, Schenectady, N. Y.

Hawtrey, Charles Henry, English actor, playwright, and manager: b. Eton, 1858, son of Rev. John Hawtrey. He was educated at Rugby and Oxford, becoming an actor when he was twenty-three years old. His greatest success was in 'The Private Secretary,' adapted from Von Moser's 'Der Bibliothekar,' first produced in Cambridge in 1883, and played 844 consecutive times. Other plays in which he has been unusually successful are 'Jane,' 'Mr. Martin,' 'A Message from Mars,' and 'The Man from Blankley's.' With the last two plays he several times visited the United States. For several years he has controlled the Comedy and Avenue theaters in London.

Haxo's System, a style of fortification introduced by Baron François Nicolas Benoît Haxo, a French military engineer, employed by Napoleon and put in command at the siege of Antwerp in 1832. His casemated batteries have earthen parapets along their front, and their arches are mantled with earth. The apertures in front of the guns open into embrasures formed in an extension of the parapet at these points beyond its ordinary retired position. Being open in the rear the circulation of air obviates the inconvenience of confined smoke. This method of construction is now pretty generally adopted.

Hay, George, Scottish artist: b. Edinburgh. At 17 he entered the architectural profession, which he afterward abandoned for painting, and has been a prolific genre painter since he first attracted attention by his 'Barber's Shop in the Time of Elizabeth' (1863). Other works by him are: 'A Visit to the Spaewife' (1872); 'Caleb Balderston's Ruse' (1874); and 'A Scene at Chatsworth' (1899).

Hay, John, American statesman: b. Salem, Ind., 8 Oct. 1838; d. near Newbury, N. H., 1 July 1905. He was graduated from Brown University in 1858, and on leaving college entered the office of Abraham Lincoln in Springfield, Ill., to study law. In 1861 he was admitted to the bar, but did not practise, as in that same year he went with Lincoln to Washington as one of the President's private secretaries. During the Civil War period he was also Lincoln's adjutant and aide-de-camp, and served in the field for some time under Generals Hunter and Gillmore. He was brevetted lieutenant and lieutenant-colonel.

After the death of Lincoln he was made secretary of legation at Paris, remaining there till 1867, when he became *chargé d'affaires* at Vienna. After holding this post for a year he resigned and returned to the United States, but was sent almost immediately to Madrid as secretary of legation, where he remained till 1870.

During his service abroad he gained a valuable knowledge not only of the language and literature of the chief European nations, but also of foreign diplomacy and politics. On his return to the United States he took up journalism, was for a time on the editorial staff of the New York *Tribune,* and published, mostly in its columns, his 'Pike County Ballads.' After about five years of service on the *Tribune,* he married a daughter of Amasa Stone of Cleveland and went to that city to live. He devoted himself mainly to literary work, and occasionally took part in politics, writing and speaking in presidential campaigns. In 1879 he accepted an offer from President Hayes to become first assistant secretary of state under Mr. Evarts. He held this position till the end of the Hayes administration in March 1881; then he took charge of the *Tribune* during Whitelaw Reid's absence in Europe, and conducted it with marked success through the trying period of Garfield's assassination and death.

In March 1897 President McKinley appointed him United States minister to England, and the selection was declared by all without distinction of party, to be most suitable. In London he was well received, and did much to bring about friendly understanding between England and the United States. His London experience was also most valuable training for the important position to which he was appointed in August 1898, when he became secretary of state. Very few of those who had been at the head of the State Department had dealt with so many important questions as Secretary Hay, and probably none had been more thoroughly trained diplomats. At the time of the Boxer outbreak in China, he was successful in obtaining justice for the Chinese, and preserving the integrity of the Chinese Empire. in 1899 he directed the United States ambassadors at London, Berlin, St. Petersburg, and Paris to propose that each of these governments make a declaration in favor

JOHN HAY.

of the «open door» policy in China. They were invited to give assurances: first, that there would be no interference with any treaty port or vested interest; second, that the existing Chinese customs tariff would be continued without discrimination and administered by Chinese officials; third, that there would be no discrimination in harbor dues and railroad rates. Italy and Japan were afterward included in the negotiations. No treaties were exchanged, but all the governments approached pledged themselves by definite promises to the "open door" policy. He also negotiated and signed the Hay-Pauncefote treaty (q.v.), and several reciprocity treaties, including one with Cuba; gave support to The Hague Conference (q.v.), and induced the Powers demanding indemnity from Venezuela to refer the question to The Hague tribunal; and, in 1903, signed within forty-eight hours of each other a treaty with the Colombian government granting right of way for the Panama canal, and a treaty with Great Britain providing for the submission of the Alaskan boundary question to arbitration. During McKinley's first administration, also, Secretary Hay's position was of peculiar significance, because, owing to the death of Vice-President Hobart, Hay would have become McKinley's successor had the President died or resigned before the end of the term.

Secretary Hay was known as an author also, his publications including 'Pike County Ballads' (1871) and other poems; 'Castilian Days,' one of the best books on Spain in the English language, and 'Life of Abraham Lincoln' (1890), written in collaboration with J. G. Nicolay (q.v.), and ranking as the most comprehensive and authoritative biography of Lincoln.

Hay-Pauncefote Treaty, signed 18 Nov. 1901, which replaced the Clayton-Bulwer Treaty (q.v.) as an Anglo-American agreement of policy regarding an isthmian canal, then supposed to be fixed as across Nicaragua. It was drawn up by John Hay, secretary of state, and Sir Julian Pauncefote, ambassador from Great Britain. Public feeling for some years had been growing so sore over the Clayton-Bulwer Treaty's restriction on the independent action of the United States, that there was grave fear lest Congress might abrogate it by open violence, a great blow to future amicable action. President McKinley voiced the feeling by the declaration, in his annual message for 1898, that the canal had become a national necessity. Fresh negotiations were opened with Great Britain; that country had no wish beyond that of neutralizing the canal, and sent one of her best diplomats with very liberal instructions, to concede whatever did not nullify that essential principle. The draft treaty was sent to the Senate by the President 5 Feb. 1900. It provided that a canal might be constructed by the United States, or under its direction; should be permanently neutralized on the basis of the Suez Canal agreement — to be kept open at all times, either of war or peace, to all vessels, without discrimination, and no fortifications to be constructed commanding the canal or the waters adjacent, and that other powers should be invited to join in this guaranty of neutrality. The provisions excited intense hostility, and Senator Davis offered an amendment adopted by the committee on foreign affairs, canceling the very features for which it was drawn up, and which made the spirit of the previous one. It provided that the neutralization clause should not prevent the United States from any measures it thought needful for its own defense or the preservation of order, declared the Clayton-Bulwer Treaty specifically abrogated, and struck out the third clause inviting the concurrence of other powers. In this form it was ratified by the Senate 20 Dec. 1900, but Great Britain refused to accept the transformed treaty, and it expired by limitation on 5 March 1901. Undiscouraged, the two diplomats set to work on a compromise, which was signed by them 18 Nov. 1901, sent to the Senate by President Roosevelt, and ratified by them 16 December. The chief differences were in dropping as far as possible all specific guaranties, requirements, or prohibitions, leaving its interpretation and application to the chapter of fate and the certainty that the strong hand would decide in any event. The neutrality of the canal is not guaranteed at all except by the terms of the agreement, the Clayton-Bulwer Treaty is abrogated by name, and the United States is not forbidden to construct fortifications, nor required to keep the canal open in time of war.

Hay, or Forage, the stems and leaves of grasses and other plants cut for fodder and dried in the sun. In haymaking the object of the farmer is to preserve the hay for winter use in the condition most nearly resembling the grass in its natural state. Of the various ingredients which compose grass, those portions which are immediately soluble in water are the most fitted for the purposes of nutrition; and therefore the mowing should be done when the plants contain the largest amount of sugar and other soluble matter. During the latter part of the process of fructification, when the seeds have arrived at maturity, the stem and leaves begin to decay; so that if the grass is not cut when in flower, a great amount of nutriment will be wasted. On the third day after mowing, if the weather is fine, the newly-made hay will be ready for gathering into large windrows for carrying and stacking; but otherwise it will have to be put up into large cocks, and the carrying deferred until the next day. It is not desirable that grass should be too rapidly made into hay under a burning sun, as it is liable to scorch and lose its nutritive value. Great care must also be taken to preserve the hay from dew and rain, as water washes away the soluble salts and other matters, and when in the stack will cause fermentation, which, if excessive, destroys some of the most valuable properties of the hay. Some farmers salt their hay in stacking; others do not. Salt is generally commended. A good plan, when the hay harvest has been accompanied by wet weather, is to place a few layers of straw in the stack at intervals to absorb the moisture from the heating hay. On large farms the spreading out of the hay after it is cut down is performed by a haymaking machine drawn by a horse, which will do the work of twelve or fifteen haymakers, and distribute the grass more thinly and evenly as it crosses the field. It is only for the haymaking of the true grasses, however, that it is adapted, as clover must not be shaken so violently. To be transported to markets at a distance, hay is now compactly pressed into bales by presses worked by hand or power. In fact baled hay has increased the importance of haymaking, owing to the readiness with which it can be transported by rail or water. On the Pacific Coast, especially in California, hay cut from alfalfa grass is very productive and profitable, and as many as three crops a year are frequently obtained. In the United States 61,691,166 acres of land were utilized in cultivating hay and forage in 1900, the entire crop amounting to 84,011,299 tons, valued at $484,256,846.

The average value per acre of the hay and forage crop is $8. Included in the above estimate were 4,750,353 tons of cornstalks which were cut from fields cultivated mainly for the grain. These figures for 1900 show an increase in area since 1889 of 8,742,369 acres, or 16.5 per cent, and in production of 12,420,466 tons or 18.6 per cent.

Of this total area, 6.7 per cent was devoted to clover, 50.7 per cent to tame and cultivated grasses other than clover, 6.3 per cent to grains cut green for hay, 5.1 per cent to forage crops, 3.4 per cent to alfalfa or lucerne, 2.8 per cent to millet and Hungarian grasses, and 25.1 per cent to wild, salt, and prairie grasses.

The North Central division contained 57.8 per cent of the total hay and forage acreage of the country, the North Atlantic 21.0 per cent, the Western 11.4 per cent, the South Atlantic 3.5 per cent, and the South Central 6.3 per cent.

The rate of increase in area devoted to hay and forage since 1889 was greatest in the South Central division, being 103.0 per cent. The Western division shows an increase of 91.4 per cent, the South Atlantic of 12.2 per cent, and the North Central of 10.7 per cent. The North Atlantic division shows a decrease of 2.2 per cent.

The total value of the hay and forage crop of 1900 averaged $135 per farm. The average yield per acre, exclusive of cornstalks, was 1.28 tons, and the average value per ton $6.11. The average yield per acre of the various classes was as follows: Forage crops, 2.62 tons; alfalfa, or lucerne, 2.49 tons; millet and Hungarian grasses, 1.64 tons; grains cut green for hay, 1.28 tons; clover, 1.26 tons; tame grasses other than clover, 1.14 tons; and wild, salt, and prairie grasses, 1.12 tons. In 1902, the United States exported hay to the value of $2,580,622.

Hay Fever, a nervous affection of the mucous membranes of the eyes, nose, mouth, pharynx, larynx, and bronchi, characterized by a profuse flow of secretion from the nose, and of tears from the eyes, and accompanied in some cases by asthma. It is induced by the inhalation of the pollen of the *Gramineæ*, is prevalent during the hay season, but subsides at its close, and varies in its severity according to certain atmospheric conditions and the amount of pollen in the air. The occurrence of catarrhal symptoms in summer separates it from an ordinary "cold in the head"; while their combination with difficulty of breathing prevents it being mistaken for spasmodic asthma, in which there is seldom any catarrh. There are three combining causes of this affection, which is largely nervous: First, a predisposing cause in some nervous disease, with a probable lesion in the fourth ventricle of the brain. Second, deformity, such as a deviating septum, in the nasal region. Third, inhalation of a special pollen. Removal to the seashore or the mountains is beneficial in some cases. Arsenic, iodides, bromides, and other nerve specifics benefit others. For the asthma, iodide of potash, 5 grains with 5 minims of tincture of belladonna in syrup of orange-peel should be taken every two hours. Inhalations of nitre-paper, stramonium leaves, etc., with wine of cocoa internally, are also useful.

These remedies are, however, merely palliative, and scientific men have been for some time making investigations which may eventually lead to the discovery of a radical cure.

Prof. Dunbar, of Hamburg, who has been studying the subject for seven years, is one of those who hold out the hope of curing hay fever by a rational treatment.

According to him, the disease is caused by the pollen of grasses, but not by mechanical irritation. He has extracted from the pollen a poison, or toxin, which is insoluble in ether and alcohol, but soluble in water and weak saline solutions, tears, the mucus of the nose and the serum of blood. A solution of this toxin dropped into the eye or nose at once produces the characteristic symptoms of hay fever. The same symptoms in an aggravated form occur when the solution is injected hypodermically.

This discovery suggested treatment by the serum method and Dr. Dunbar set to work to produce a curative serum by inoculating animals with pollen toxin, and a serum was eventually obtained which, when dropped into the eye or nose together with pollen toxin, completely prevented the attack which the latter alone would have caused.

Experiments looking to the cure of the disease began in the latter part of January of 1903, and there is good reason to believe that the disease can be checked in its earliest stage by applying the serum to the external mucous surfaces. Hypodermic injection of the serum would probably be necessary if considerable quantities of pollen toxin had already passed into the blood.

It is noteworthy that rye, barley, wheat, rice, maize, and every kind of grain and grass which Dr. Dunbar has investigated yield a toxin which causes hay fever, while, on the other hand, he has not succeeded in obtaining such a toxin from any plant not of the grass family (*Gramineæ*).

Hay River, a stream which rises in the Rocky Mountains in Athabasca, Canada, and flows northeast into Great Slave Lake. It is navigable for about 140 miles from its mouth; its entire length is about 360 miles. The two Alexandra Falls (named after Princess Alexandra, now Queen Alexandra of England) are found in the upper course; they average about 250 feet in height and 900 feet in width.

Hay-worm, the caterpillar of a medium-sized pyralid moth (*Pyralis costalis*), injurious to clover hay, and to other hay when mixed with clover. Its depredations can be prevented by keeping the hay dry and well ventilated, as the insect preferably breeds in moist or matted material such as is to be found in the lower parts of stacks; here the hay becomes filled with webbings of the "worms" and their excrement, rendering it unfit for feeding. The webbed material should be burned, and the place thoroughly cleaned.

Hay'den, Ferdinand Vendeveer, American geologist: b. Westfield, Mass., 7 Sept. 1829; d. 22 Dec. 1887. He was graduated from Oberlin College, Ohio, studied at the Albany Medical College, and during the greater part of 1853–62 was employed in surveys in the northwest. He served as surgeon in the Union army during the Civil War, and was professor of mineralogy and geology in the University of Pennsylvania 1865–72. In 1867–9 he made a geological survey of Nebraska, and was afterward director of the geological survey of the Territories of the United States, until in 1879 the various national surveys were combined in the geological survey of the United States. Till 1886 he remained at the head of the Montana division. He published many papers, besides numerous and valuable government reports, and was a member of many scientific societies at home and abroad.

Haydn, hā'dn (Ger. hī'dn), **Franz Joseph**, Austrian musical composer: b. Rohau, on the borders of Hungary and Lower Austria, 31 March 1732; d. Vienna 31 May 1809. He was sent to school at Hamburg at 6, where he learned reading, writing, singing by note, and to play on such instruments as his childish strength would admit of his handling. His voice attracted the notice of the parish priest, who recommended him as a choir-boy to the chapel-master of St. Stephen's in Vienna, and at 8 Haydn was received into the choir. With exception of some Latin and much practical music he seems here to have been taught nothing; in the theory and science of the art he received but two lessons from his master in eight years. At last in his 16th year, his voice began to break, and he lost his place and took up his abode in an attic in the Austrian capital, intending to live by his art. At that time the first six sonatas of Emmanuel Bach fell into his hands. "I could not leave my instrument," he said in his old age, "until I had played them through; and any one who knows me must perceive how much I owe to Emmanuel Bach, that I studied him carefully, and comprehended him." After a time he became acquainted with Metastasio, the greatest operatic librettist of the time. The poet had charge of the education of a Signora Martinez, and Haydn was employed to give her elemenary instructions in music. This afforded him an opportunity for mastering Italian, and what was of more immediate importance, procured him board and lodging. Metastasio introduced the struggling young artist to Porpora, a celebrated Italian musician, then in Vienna. As Porpora's accompanist he attracted the attention of Gluck and other masters, and his prospects from this time onward grew steadily brighter. He was often engaged to play at the musical entertainments given by the Austrian nobles, was appointed organist of two churches, sang tenor parts in the choir of another, and pupils became rapidly more numerous. He wrote a short comic opera, 'Der hinkende Teufel' (The Limping Devil), which was given three nights with applause, but owing to the satirical character of the libretto was forbidden by the police. Having now the means, Haydn purchased and studied the theoretical works of Emmanuel Bach, Mattheson, and Fux. In 1759 Count Morzin engaged him as music composer and director at a salary of 200 florins, with free lodgings and table with his secretaries and other officials. In 1761 he was appointed "chapel-master" or musical director to Prince Nicholas Esterhazy, in whose service he remained 30 years. Anything like a catalogue of his compositions during this time is impossible; much was destroyed on three separate occasions when his house was burned down, and much was scattered; but we know of 163 pieces for the baryton, an obsolete instrument in size between the viola and the violoncello; about 120 symphonies for full orchestra; more than 100 works of chamber music of the higher forms; and 12 Italian operas performed in his patron's private theatre. On the death of Esterhazy, in 1790, Haydn visited London, where the musical world received him with the greatest enthusiasm, and where he stayed 18 months. Here he produced an opera, the 'Orfeo,' nine symphonies, six quartettes, 11 sonatas, several songs and canzonets, and the accompaniments to more than 100 Scotch songs. He visited London a second time in 1794, his stay lasting a like period, and on his return to Vienna set about composing the music of an oratorio, the 'Creation,' the words adapted by Linley from Milton's 'Paradise Lost.' Haydn thought the text too long, and being not thoroughly acquainted with English, had it translated and curtailed by Baron von Swieten. It was produced 19 March 1799, when its author was in his 66th year. It obtained a great success, and he was induced to undertake the music of another text prepared from Thomson's 'Seasons.' This work wants the freshness and vigor of the previous work; which may have resulted in some measure from the barren unpoetical text. Consult: Pohl, 'Joseph Haydn' (1875); 'Mozart and Haydn in London' (1867); Karajan, 'Joseph Haydn in London' (1861); Reissmann, 'Joseph Haydn' (1879).

Haydn, hā'dn, **Hiram Collins**, American clergyman: b. Pompey, N. Y., 11 Dec. 1831. He was graduated from Amherst in 1856, from the Union Theological Seminary in 1859, held pastorates at Meriden, Conn., and Painesville, Ohio, was pastor of the First Congregational Church of Cleveland, Ohio, in 1874–80 and again from 1884. He was also president of Western Reserve University in 1888–90, and published 'Lay Effort'; 'Death and Beyond'; 'The Bible and Current Thought'; 'The Face Angelic,' and other works.

Haydon, hā'dǒn, **Benjamin Robert**, English painter: b. Plymouth 26 Jan. 1786; d. London 22 June 1846. He had a passion for great historical subjects, and covered immense areas of canvas, but seldom rose beyond mediocrity excepting by exaggeration. His work was, however, admired by many of his contemporaries, including the poet Keats. Among his pictures may be mentioned: 'Judgment of Solomon' (1814); 'Christ's Entry into Jerusalem' (1820), now in Philadelphia; 'The Raising of Lazarus'; 'The Mock Election in the King's Bench'; 'Napoleon at St. Helena'; 'Alexander and Bucephalus'; 'Alfred and the Trial by Jury'; 'Uriel and Satan'; 'The Burning of Rome.' See Life by Taylor (1853).

Hayes, Augustus Allen, American chemist: b. Windsor, Vt., 1806; d. Brookline, Mass., 21 June 1882. He began his studies under Dana, and was successful throughout his career in improving the resources of applied chemistry to a remarkable extent. He was the first to extract the alkaloid sanguinarin from the blood root, *Sanguinaria Canadensis*. He also improved the common method of reducing pig to malleable iron and discovered new processes in copper-smelting. His researches led him also to a new rail or water. On the Pacific Coast, especially in California, hay cut from alfalfa grass is very productive and profitable, and as many as three crops a year are frequently obtained. In the United States 61,691,166 acres of land were utilized in cultivating hay and forage in 1900, the entire crop amounting to 84,011,299 tons, valued at $484,256,846.

The average value per acre of the hay and forage crop is $8. Included in the above estimate were 4,759,353 tons of cornstalks which were cut from fields cultivated mainly for the grain. These figures for 1900 show an increase in area since 1889 of 8,742,369 acres, or 16.5 per cent, and in production of 12,420,466 tons or 18.6 per cent.

Of this total area, 6.7 per cent was devoted to clover, 50.7 per cent to tame and cultivated grasses other than clover, 6.3 per cent to grains cut green for hay, 5.1 per cent to forage crops, 3.4 per cent to alfalfa or lucerne, 2.8 per cent to millet and Hungarian grasses, and 25.1 per cent to wild, salt, and prairie grasses.

The North Central division contained 57.8 per cent of the total hay and forage acreage of the country, the North Atlantic 21.0 per cent, the Western 11.4 per cent, the South Atlantic 3.5 per cent, and the South Central 6.3 per cent.

The rate of increase in area devoted to hay and forage since 1889 was greatest in the South Central division, being 103.0 per cent. The Western division shows an increase of 91.4 per cent, the South Atlantic of 12.2 per cent, and the North Central of 10.7 per cent. The North Atlantic division shows a decrease of 2.2 per cent.

The total value of the hay and forage crop of 1900 averaged $135 per farm. The average yield per acre, exclusive of cornstalks, was 1.28 tons, and the average value per ton $6.11. The average yield per acre of the various classes was as follows: Forage crops, 2.62 tons; alfalfa, or lucerne, 2.49 tons; millet and Hungarian grasses, 1.64 tons; grains cut green for hay, 1.28 tons; clover, 1.26 tons; tame grasses other than clover, 1.14 tons; and wild, salt, and prairie grasses, 1.12 tons. In 1902, the United States exported hay to the value of $2,580,622.

Hay Fever, a nervous affection of the mucous membranes of the eyes, nose, mouth, pharynx, larynx, and bronchi, characterized by a profuse flow of secretion from the nose, and of tears from the eyes, and accompanied in some cases by asthma. It is induced by the inhalation of the pollen of the *Gramineæ*, is prevalent during the hay season, but subsides at its close, and varies in its severity according to certain atmospheric conditions and the amount of pollen in the air. Hayes, **Augustus Allen**, American chemist: b. Windsor, Vt., 1806; d. Brookline, Mass., 21 June 1882. He began his studies under Dana, and was successful throughout his career in improving the resources of applied chemistry to a remarkable extent. He was the first to extract the alkaloid sanguinarin from the blood root, *Sanguinaria Canadensis*. He also improved the common method of reducing pig to malleable iron and discovered new processes in copper-smelting. His researches led him also to a new formula for the production of chloroform. He was for many years employed by the State of Massachusetts as assayer.

Hayes, Isaac Israel, American arctic explorer: b. Chester County, Pa., 5 March 1832; d. 17 Dec. 1881. He was graduated in medicine at the University of Pennsylvania in 1832, and began his arctic experiences as surgeon in the second Grinnell expedition sent out under Captain Kane in 1853, in search of Franklin. Becoming convinced of the existence of an open polar sea, he was enabled to obtain funds for the expedition on which he sailed in the ship United States from Boston in 1860. He had two astronomers on board and according to their observations reached lat. 81° 35′ N., lon. 70° 30′ W., the farthest point north hitherto recorded in any voyage. In 1869 he made a voyage to Greenland. He received gold medals from the geographical societies of Paris and London. His published works comprise 'An Arctic Boat Journey' (1860); 'The Open Polar Sea' (1867); 'Cast Away in the Cold' (1868); and 'The Land of Desolation' (1872).

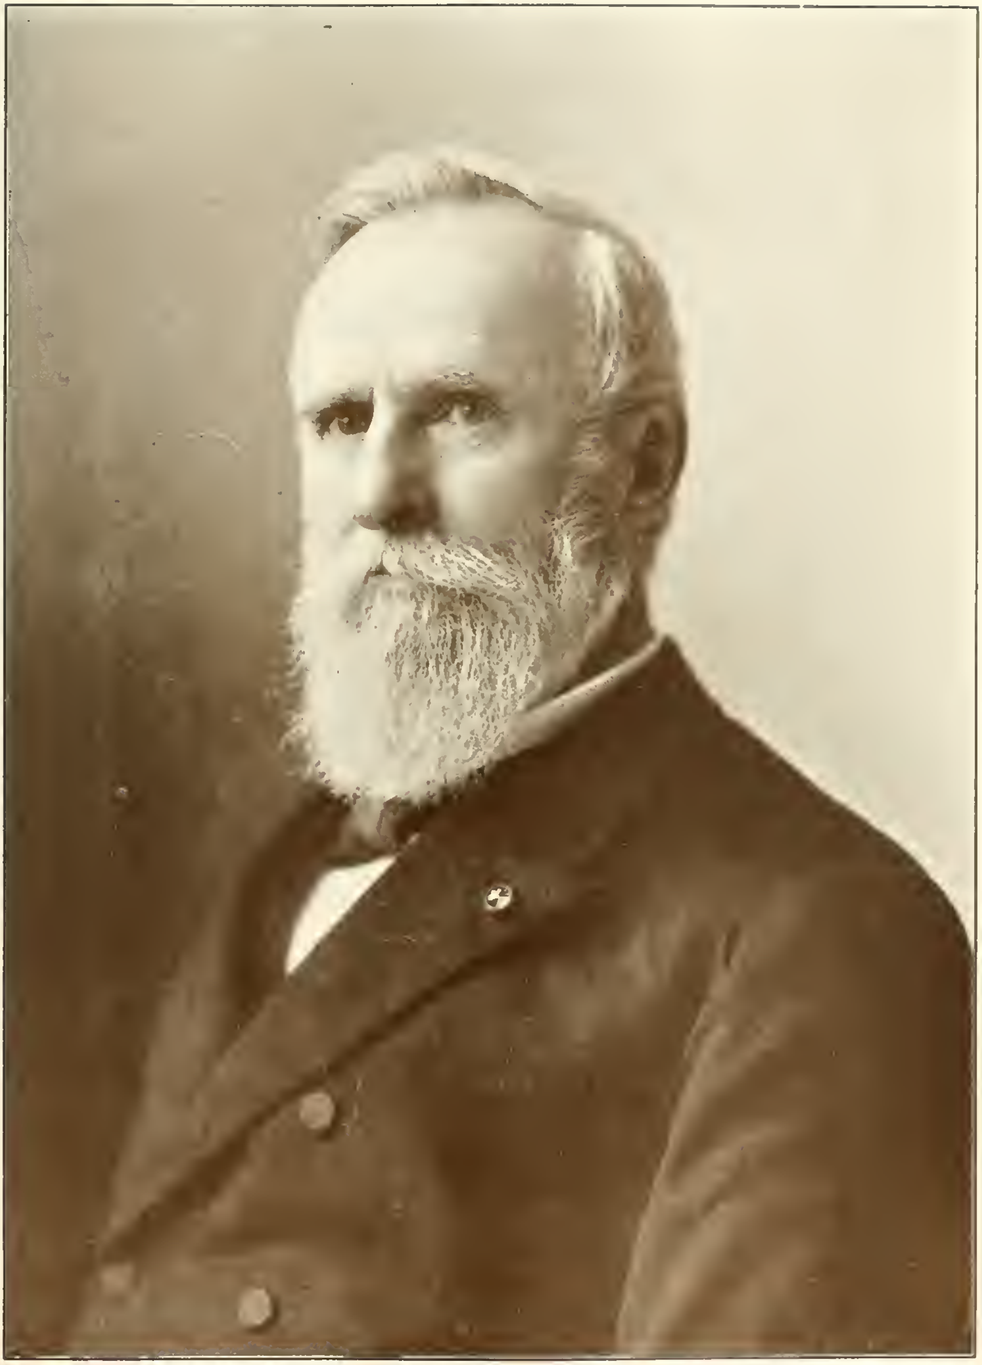
Hayes, Rutherford Birchard, 19th President of the United States: b. Delaware, Ohio, 4 Oct. 1822; d. Fremont, Ohio, 17 Jan. 1893. His early education was obtained in the common schools of Fremont and the academy at Norwalk, Ohio. At 16 he entered Kenyon College, from which he was graduated in 1842 as the valedictorian of his class. In 1843, he entered the law school of Harvard University and completed the course in 1845. He was admitted to the bar at Marietta, Ohio, and opened an office at Fremont; but, his health failing, he was compelled to go South, establishing himself later at Cincinnati (1849). His ability and industry soon gained recognition and secured him an excellent practice. He was city solicitor of Cincinnati from 1858 until April 1861, an office which brought him prominently before the people.

Hayes' military career began at the outbreak of the Civil War, when he was elected captain of a company formed from the old Literary Club of Cincinnati. A few months later, June 1861, he was appointed major in the 23d Ohio Volunteer Infantry, of which W. S. Rosecrans was colonel and Stanley Mathews, lieutenant-colonel. After the promotion and transfer of these two officers, the regiment was put under his command, and ordered at once to West Virginia; it took part in all of the important battles of Sheridan's campaign. In the battle of South Mountain he was severely wounded in the arm but soon recovered and returned to duty again. At the battle of Winchester, he made the famous charge across the swamp and saved the day. Many fell in that charge, but the day was won. He was no less courageous at Fisher's Hill and Cedar Creek. For meritorious service he was promoted to the rank of brigadier-general of volunteers and later brevetted major-general. He was nominated for Congress in his home district at Cincinnati, and in the fall of 1864, elected by a majority of 2,400; in 1866 he was re-elected. In 1867 he was nominated for governor of Ohio, by the Republicans; at that time a strong reaction against many of the policies of this party was felt in several States of the North, and the party itself in Ohio was divided into two factions. Hayes was one of the few men who could unite these factions, and he was elected by a small majority; and again chosen governor in 1869. At the close of his second term, he returned to Cincinnati determined to retire from public life; and in 1873 he moved to his old home at Fremont. In 1875, however, he was nominated for governor, and was with difficulty induced to accept the nomination. The great issue of the campaign was the money question, which though properly a national issue had been forced into State politics. There were those who believed and publicly contended that all that was needed to make money was the stamp of the government of the United States, that it was not necessary to have back of it any intrinsic value. Hayes, however, stood for "sound money," and after an active campaign won the election, thus becoming governor of Ohio for a third time.

When the National Republican Convention met at Cincinnati in 1876, a number of prominent leaders were candidates for the presidency. It soon became evident that none of the recognized candidates could be nominated and a "dark horse" was looked for. Thus it happened that Governor Hayes was nominated on the seventh ballot. The campaign which followed proved to be one of the most hotly contested in the history of the nation. The results were uncertain, and for the first time in our national life, a commission was created to pass upon the validity of the certificates which had been returned by the different States. This commission refused to go behind the returns of the different governors; and the votes of the Republican electors were therefore admitted from all of the doubtful States. This gave Mr. Hayes a majority of one in the electoral college, and he became the nineteenth President of the United States. (See ELECTORAL COMMISSION.) Two things were uppermost in his mind: the one, the improvement of the political condition of the South; the other, "the restoration of the civil service to the system established by Washington and followed by the early Presidents." In both of these, he was opposed by the machine politicians of his own party. In spite of this opposition, however, the troops were gradually withdrawn from the South and self-government re-established; the people were slow to see the need of civil service reform, and without effective support, the President could do little. He preserved his attitude in regard to sound money, and by his veto prevented dangerous financial legislation.

At the close of his administration, Mr. Hayes returned to private life. His interest in education was shown by the work done as a member of the boards of trustees of the Ohio Wesleyan University at Delaware and the Ohio State University at Columbus. Hayes' Hall at the latter institution bears his name because of his devotion to the cause of manual training. He was also president of the John F. Slater Educational Fund and gave much time to its proper distribution. As president of the National Prison Reform Association he did much to educate the public to a more humane way of thinking about the treatment of convicts, many of his public utterances have become maxims in prison management, and his work along these lines has been exceedingly valuable and permanent in its results.

Hayes River, called Hill River in the upper part of its course, rises near Lake Winnipeg, in Canada, and flows northeast through



RUTHERFORD BIRCHARD HAYES.

NINETEENTH PRESIDENT OF THE UNITED STATES

Oxford or Holy Lake, Knee Lake, and several other lakes, into James Bay, near the mouth of the Nelson River. The largest tributaries are the Shamattawa and the Fox. The length of the Hayes is about 300 miles.

Hayesine, hā'zīn, a hydrous borate of calcium, occurring as a sediment consisting of snowy-white, silky flakes, in the waters of hot springs in Chile. It is a somewhat uncertain species, and is perhaps to be referred in part to bechilite, and in part to ulexite. In the United States, specimens are reported from Bergen Hill, N. J. (Named in honor of A. A. Hayes (q.v.), an American chemist.)

Hay'good, Atticus Green, American Methodist bishop: b. Watkinsville, Ga., 19 Nov. 1839; d. Oxford, Ga., 19 Jan. 1896. He was educated at Emory College, Ga., of which he was president 1876–90, becoming in the last named year bishop of the Methodist Church South. He became bishop in 1890. He wrote: 'The Monk and the Prince,' a study of Savonarola and Lorenzo de Medici; 'Our Brother in Black' (1881); 'Pleas for Progress' (1889); etc.

Hay'market Square Massacre, the murder of several policemen in Chicago, 4 May 1886, by a bomb thrown by an anarchist. The labor troubles had long been exploited by the "practical" anarchists (with whom the philosophic anarchists disclaim connection), who denounced the efforts for shorter hours and better wages as tending merely to aggravate capitalistic slavery, and urged instead the general seizure of property and the murder of its owners. In February 1886 the McCormick Reaper Works had been closed on account of a demand for the expulsion of some non-union men, but had reopened. Meantime a great eight-hour strike had left some 50,000 unemployed workmen in the city, and in view of an almost certain conflict with the police, George Engel proposed at a meeting in Bohemian Hall on 2 May, and the meeting indorsed, a plan to blow up the police stations, shoot the emerging police, cut the telegraph wires, fire buildings to engross the service of the fire department, and make a general jail delivery, that the prisoners might aid in a social revolution. The next day August Spies and others incited a meeting of the Lumber-shovers' Union, 16,000 or more, principally Germans and Bohemians, to assail the McCormick Works in order to furnish an opportunity for carrying out this plan, though the works had no connection with this union. The mob attacked the works with stones and revolvers, but were driven off. No one was fatally injured, but Spies immediately issued a circular headed "Revenge!" asserting that six workingmen had been killed, and calling their brethren to arms. He also published a fierce article in his paper, the *Arbeiter Zeitung*, repeating the falsehood, and declaring that there had been a "massacre" to terrorize the workingmen, who should have had dynamite bombs instead of stones. In the evening a meeting was held at Greif's Hall, at which Engel's plan was adopted. Spies, Albert R. Parsons, Samuel Fielden, and Oscar W. Neebe spoke for a mass-meeting to further the plan above mentioned; at Adolf Fischer's suggestion it was fixed for next evening in Haymarket Square, that the dusk and the room for a great crowd might furnish more confusion and better means of escape. Rudolph Schnaubelt wished to have all socialists in other cities notified, so that there might be a general revolution. The signal was to be "Ruhe" (Peace), which was printed in next afternoon's *Arbeiter Zeitung*. Meantime Louis Lingg and others worked all day preparing bombs, of which the newspaper office was found to be an arsenal, along with firearms, and with a confederate carried a satchel of them to a place where others helped themselves. The air was full of rumors of intended violence, and the mayor (Carter Harrison, Sr.) ordered the police to mix with the meeting, and disperse it if incendiary language were used, and 176 were concentrated at the nearest station. Spies and Parsons spoke first, but the mayor was in the crowd, and they used mild language, till his suspicions were lulled and he left. Then Fielden began a frenzied and bloodthirsty harangue, calling for the "extermination" of the capitalists. The crowd grew so wild that shortly after 10 the police in four divisions appeared and covered the street, and while Fielden was speaking, Capt. Ward ordered the crowd to disperse. Fielden called out "We are peaceable" (curiously like "Peace"), and a bomb was at once thrown into the midst of the police, which exploded and caused frightful carnage, killing or mortally wounding eight policemen and injuring a great number more. The mob instantly followed it up with a volley from rifles and revolvers, proving that they had been expecting the signal, but the police, with a nerve as fine as that of trained soldiers, at once rallied and charged the mob, dispersing it in disorder. Most of the leaders who had been urging destruction either did not attend or ran away. Of the police, besides those killed, 68 were wounded by shot or bombs, many maimed for life. Spies, Parsons, Fischer, Engel, Lingg, Fielden, Michael Schwab, and Neebe were arrested and tried as accessories before the fact: the first four were hanged 11 Nov. 1887; Lingg shattered his jaw in prison with a bomb and died; Fielden and Schwab were sentenced to prison for life, and Neebe for 15 years. The last three were pardoned by Gov. Altgeld in 1893, many prominent men of Chicago and throughout the country having petitioned for their release on the ground that the evidence did not connect them with the actual throwing of the bomb, which was true, the evidence pointing strongly to Schnaubelt.

Hayne, Isaac, American patriot: b. South Carolina 23 Sept. 1745; d. Charleston, S. C., 4 Aug. 1781. He was a wealthy planter who took up arms after the invasion of the colony by the English forces, and after the capitulation of Charleston was paroled with the proviso that he might not be ordered to bear arms against his countrymen. He was summoned, however, to the English standard and refusing compliance as a violation of the compact, hastened to the American camp. Being shortly after taken prisoner by the English, he was tried and hanged.

Hayne, Paul Hamilton, American poet: b. Charleston, S. C., 1 Jan. 1830; d. Grovetown, Ga., 6 July 1886. He was a nephew of R. T. Hayne (q.v.) and was educated at the Charleston College, studied law and engaged in journalism. He served in the Confederate army till forced to resign on account of ill health, and lost nearly all his property through the bombardment of Charleston and the subsequent pillage. With the little left to him he retired to Copse

Hill, Grovetown, Ga., where he spent the rest of his life, a partial invalid. His verse is marked by grace and melody and he ranks almost the first among distinctively southern poets. He published 'Poems' (1855); 'Sonnets and Other Poems' (1857); 'Legends and Lyrics' (1872); etc. A complete edition of his poems appeared in 1882.

Hayne, Robert Young, American statesman: b. Colleton District, S. C., 10 Nov. 1791; d. Asheville, N. C., 24 Sept. 1839. After studying law he was admitted to the bar in 1812; and served in the second war with Great Britain, returning at its close to his practice in Charleston. He was a member of the State legislature 1814–18, and became Speaker, was attorney-general of the State in 1818–22, and a United States senator 1823–32. He vigorously opposed protection, and in 1832 boldly supported in Congress the doctrine of nullification. Daniel Webster's reply to Hayne upon this theme is classed among the former's ablest speeches. In November 1832 South Carolina adopted an ordinance of nullification, in December Hayne was elected governor, and the State prepared to resist the Federal power by force of arms. A compromise, however, was agreed to, and the ordinance was repealed. Hayne was mayor of Charleston in 1834.

Hayne, William Hamilton, American poet: b. Charleston, S. C., 11 March 1856. He is the son of Paul Hamilton Hayne (q.v.). He received a secondary education, from 1879 contributed extensively to various periodicals, and published 'Sylvan Lyrics and Other Verses' (1892).

Haynes, hānz, **Arthur Edwin**, American mathematician: b. Van Buren, N. Y., 23 May 1849. After graduation from Hillsdale College, Mich., in 1875 became instructor of mathematics and physics there in the same year: and was professor, 1877–90. He held the same position in Michigan Mining Schools in 1890–3, and was professor of mathematics at the University of Minnesota, 1893–6, and in its engineering department 1896–1901. He has published 'The Desirability of Uniformity in the Use of Mathematical Symbols and Terms': etc.

Haynes, John, American colonial governor: b. Old Holt, Essex, England: d. Hartford, Conn., 1 March 1654. He came with Hooker and his company to Boston in 1633, was soon after chosen assistant, and in 1635 governor of Massachusetts. In 1636 he removed to Connecticut, being one of the prominent founders of that colony. In 1639 he was chosen its first governor, and every alternate year afterward, which was as often as the constitution permitted, till his death. He was one of the five who in 1638 drew up a written constitution for the colony, which was finished in 1639, the first ever formed in America, and which embodies the main points of all our subsequent state constitutions, and of the Federal constitution.

Hays, Isaac, American physician and editor: b. Philadelphia 5 July 1790; d. there 12 April 1879. He was graduated from the University of Pennsylvania in 1816 and from its medical school in 1820. In addition to his long service as general practitioner he was for 52 years on the staff of the 'American Journal of the Medical Service.' In 1843 he established a monthly, the 'Medical News,' and in 1874 the 'Monthly Abstract of Medical Science.' He edited: 'Wilson's American Ornithology' (1828); 'Hoblyn's Dictionary of Medical Terms' (1846); 'Lawrence on Diseases of the Eye' (1847); and 'Arnott's Elements of Physics' (1848). He was president of the Philadelphia Academy of Natural Sciences (1865–9) and connected with many scientific societies at home and abroad.

Hays, William Jacob, American painter: b. New York 8 Aug. 1830; d. there 13 March 1875. He studied art under John Rubens Smith, and his 'Dogs in a Field,' exhibited in the Academy of Design in 1850, won him the reputation of an animal painter of remarkable fidelity to nature and spirit in design. He studied the bison in the upper waters of the Missouri and the deer in Nova Scotia. His 'Bison Bull at Bay' and 'Herd of Caribou in Nova Scotia' are characteristic pictures.

Hays, William Shakespeare, American song-writer and composer: b. Louisville, Ky., 19 July 1837; d. 23 July 1907. In 1857 he became a reporter for the Louisville *Democrat*, subsequently was clerk and captain of steamboats on the Ohio and Mississippi, and became marine editor of the Louisville *Courier Journal* and *Times*. He wrote and composed more than 300 songs, among them 'Nora O'Neil,' 'Write Me a Letter from Home,' and 'Shamus O'Brien'; and published 'Poems and Songs.' His songs sold very extensively.

Hays, Kan., city, county-seat of Ellis County; on Big Creek, and on the Union P. railroad; about 222 miles west of Topeka. It is in a fertile agricultural region. The chief manufactures are flour, dairy products, and machinery. It has grain-elevators, and there are large annual shipments of grain, flour, and live stock. It is the seat of a Normal school and of a State agricultural experiment station. The experiment station is connected with the State Agricultural College, which owns near Hays 2,000 acres of land. Pop. (1900) 1,136.

Hayti. See Haiti.

Hayward (properly "haw-ward," keeper of the haws or hedges, and still so pronounced, or rather as "howard," in country districts; the family name Howard as well as Hayward is from this), a town officer in old New England, whose duty was to keep the cattle on the roads from breaking through the hedges or fences into enclosed grounds and to impound them if they did so. The title came to be generic for a cattle-ward, and the hog-reeve was frequently known as a "hog howard."

Hayward, Wis., town, county-seat of Sawyer County; on the Namakagon River, and on the Chicago, St. P., M. & O. railroad; about 63 miles by rail southwest of Ashland. It is in the vicinity of the lumber region of the State, and the chief industry is lumbering. It has a government Indian school, a public library, and four churches. Pop. (1900) 2,720.

Hazard, hăz'ard, **Caroline**, American college president: b. Peacedale, R. I., 10 June 1856. She was educated in Providence and in Europe, and in 1899 was appointed president of Wellesley College, Mass., receiving the degrees of M. A. and Litt. D. from the University of Michigan and Brown University the same year. She is a granddaughter of R. G. Hazard (q.v.) and has published 'The Narragansett Friends' Meeting in the 18th Century' (1899); 'Thomas Hazard: a Study of Life in Narragansett in the 18th Century.'

Hazard, Ebenezer, American author: b. Philadelphia 15 Jan. 1744; d. there 13 June 1817. He was graduated from Princeton in 1762, in 1782–9 was postmaster-general, and from 1791 was in business in Philadelphia, where he assisted in the establishment of the North American Insurance Company. He published 'Historical Collections' (1792–4) and 'Remarks on a Report Concerning Western Indians.'

Hazard, Rowland Gibson, American manufacturer and philosopher: b. South Kingston, R. I., 9 Oct. 1801; d. Peacedale, R. I., 24 June 1888. He was a successful business man, being long engaged in the woolen manufacture in Peacedale. He also wrote on philosophical subjects; his works including 'Language, its Connection with the Constitution and Prospects of Man' (1836); 'Essays on the Resources of the United States' (1864); 'Causation and Freedom of Willing' (1869).

Haze, a condition of the atmosphere which deadens the blueness of the sky, and obscures the sharp outlines of distant objects. Haze is due to fine dust in the air or to extreme heat, the latter being known as heat-haze. In certain parts of China the haze is like a thin fog. Extensive forest fires create a smoke-haze, of a dense, blue color, which drifts like rain clouds hundreds of miles from the scene of the fire. Volcanic eruptions throw fine dust into the air in enormous quantities, forming a haze which is carried many hundreds of miles. See Dust.

Hazel-nut, or **Filbert,** a genus (*Corylus*) of shrubs and trees of the order *Cupuliferæ*, confined to the northern hemisphere. The male flowers are in long cylindrical aments or catkins; and the fruit, a nut, is marked at its base with a large cicatrix. The inflorescences of the hazel are developed in the year preceding their appearance; the male flowers last over the winter, naked; the female inflorescence is enclosed in a bud. In early spring the male catkins elongate and produce an abundance of dry pollen, while the female inflorescences are distinguishable from the leafbuds only by their larger size and projecting red stigmas. The nut is enveloped at the base by a sheath of succulent bracts.

The European hazel (*C. avellana*), from cultivation, has produced several varieties, differing in the size, shape, and flavor of the nuts, which are commonly known under the name of filberts. It grows in all situations, and is easily cultivated, but a light and tolerably dry soil is the most suitable. The best nuts come from Spain, where they are baked in large ovens before export, in order to ensure their preservation. Other species occur in southern Europe and Asia. The American hazel (*C. americana*) very much resembles the European, but is lower in stature. It is common in most parts of the eastern United States, but has not been cultivated. A second species (*C. rostrata*) occurs in California.

The oil which is obtained from hazel-nuts by pressure is little inferior in flavor to that of almonds, and chemists employ it as the basis of fragrant oils artificially prepared and used by perfumers, because it easily combines with and retains odors. In many parts of England hazels are planted in coppices and hedge-rows for several useful purposes, but particularly to be cut down periodically for charcoal, poles, fishing-rods, etc. In brewing, the dried twigs were used as a substitute for yeast when they were soaked in fermenting liquor. Being extremely tough and flexible, the branches are used for making hurdles, crates, and springles to fasten down thatch. They are formed into spars, handles for implements of husbandry, and when split are bent into hoops for casks. Charcoal made from hazel is much in request for forges, and when prepared in a particular manner is used by painters and engravers to draw their outlines. The roots are used by cabinet-makers for veneering; and in Italy the chips of hazel are sometimes put into turbid wine for the purpose of fining it. Finally forked twigs of the European hazel were formerly used by diviners to determine the position of water, gold, etc.

Hazeltine, hā'zĕl-tĭn, **Mayo Williamson,** American journalist and literary critic: b. Boston, Mass., 24 April 1841. He graduated from Harvard, studied also at Oxford, practised law until 1878, and was then appointed literary editor of the New York *Sun*. He became widely known as a critic for his reviews in the *Sun*, and has published in book-form: 'Chats about Books' (1883); 'British and American Education'; 'The American Woman in Europe.'

Ha'zen, Marshman Williams, American lawyer and author: b. Beverly, Mass., 1845. He was graduated from Dartmouth in 1866, from 1873 was a manager for the publishing firms successively of Ginn & Company and D. Appleton & Company, in 1882 was admitted to the Massachusetts bar, and in 1885 began the practice of law in New York. His publications include, besides a series of 21 school text-books: 'Observation, Thought, and Expression'; a 'History of the United States'; and 'Government.'

Hazen, William Babcock, American soldier: b. West Hartford, Vt., 27 Sept. 1830; d. Washington, D. C., 16 Jan. 1887. He was graduated at West Point in 1855, went to the front in the Civil War in command of 41st regiment of Ohio volunteers, which he himself had recruited in 1861, served actively in Ohio, Kentucky, and through the Atlanta campaign and in Sherman's march through Georgia, and in 1865, took command of the Fifteenth army corps. He observed the Franco-Prussian war on French territory, and was at Vienna as military attaché to the United States legation during the Turko-Russian war. Appointed chief signal officer in 1880, with the rank of brigadier general, he employed scientists as observers, introduced "cold wave" signals, and suggested the standard-time meridians at present in use. He published: 'The School and the Army in Germany and France, with a Diary of Siege Life at Versailles' (1872); 'Our Barren Lands' (1875); and 'A Narrative of Military Service' (1885).

Ha'zleton, Pa., a city situated in Luzerne County; on the Pennsylvania and the Lehigh Valley R.R.'s; about 24 miles south of Wilkes-Barre. The city was settled in 1820, incorporated as a borough in 1840, and chartered as a city in 1890. It is situated in the anthracite coal region, and its industrial interests are largely connected with the mining and shipping of coal. Its chief manufactures are foundry and machine-shop products, carriages, lumber, beer, baking-pans, cattle-powder, cigars, coffins and caskets. It has knitting mills, silk mills, three daily and eight weekly newspapers. It contains a State hospital for miners, 30 churches, three banks, a convent, high school, and Saint Gabriel's Academy. The government is vested in the mayor, who holds office three years, and in the council. The subordinate officials are appointed by the mayor, subject to the approval of the council. Some are elected by the council. Pop. (1890) 11,872; (1900) 14,230.

Hazlitt, hăz'lĭt, **William**, English critic and essayist: b. Maidstone, Kent, 10 April 1778; d. Westminster 18 Sept. 1830. In 1793 he became a student in the Unitarian College at Hackney. He devoted more time, however, to literature and art than to theology, and upon leaving college resolved to become a painter. He painted portraits with only tolerable success, and finally renounced art, and in 1805 opened his literary career with an essay 'On the Principles of Human Action,' in which much metaphysical acumen was displayed. In 1811 he settled in London, deriving his principal support from his contributions of political articles and theatrical and art criticisms to the newspapers, and his occasional lectures and publications. In 1813 he delivered at the Russell Institution a course of lectures on 'English Philosophy,' and subsequently delivered courses of lectures on the English poets generally, the comic poets, and the Elizabethan poets. Later in life he contributed to the 'Edinburgh Review' and some smaller magazines. He was a good art critic, but his tendency to prejudice and paradox, and his almost contemptuous regard for the productions of contemporary genius, render him a less safe authority than his knowledge and talents would lead us to expect. It is as a literary critic and essayist that Hazlitt achieved his chief success. Saintsbury has said that "long before Sainte-Beuve, Hazlitt had shown a genius for real criticism." He has probably not been surpassed by any English critic. Yet his recognition, in view of this fact, has been singularly inadequate to his merits. His judgment was, it is true, often marred by prejudice and by his paradoxes. But in the main it was discriminating and duly appreciative. His equipment might not now be thought adequate, but it was almost certainly in most respects superior to that of his Georgian contemporaries. He was able to write interestingly of a wide range of topics. He was bitterly attacked, after the custom of the times, by writers, particularly journalists, of adverse political views. But as a controversialist he was more than the equal of any of these, bold in epigram and invective. His style has been highly praised for its combination of vigor and ease, its rhythm, its clearness, and the aptness of its epithets. Not only in critical analysis, but as well in narrative and description it is excellent. Hazlitt also lectured in 1818–21 at the Surrey Institute. Northcote states that had he continued his art work he would have become a great painter. The best of his essays for the 'Examiner' appeared in 1817 under the title 'The Round Table.' The 'Spirit of the Age, or Contemporary Portraits,' also a significant work and by some critics considered his best, was published in 1825. Further essays are grouped in 'The Plain Dealer' and 'Sketches and Essays.' Among other well-known works of Hazlitt are: 'Characters of Shakspere's Plays' (1817); 'A View of the English Stage' (1818); 'Lectures on the English Poets' (1818); 'Lectures on the English Comic Writers' (1819); 'Lectures on the Elizabethan Age' (1821); 'Life of Napoleon Bonaparte' (4 vols. 1828). There is an edition of the 'Works' by Henley (1902); and a 'Life' by Berrell (1902).

Hazlitt, William Carew, English author: b. London 22 Aug. 1834. He is a grandson of William Hazlitt (q.v.). He was at first a civil engineer, relinquished that profession for journalism, and finally took up that of literature. Among his works are: 'History of the Venetian Republic' (1860); 'Bibliographical Collections and Notes' (1876–92); 'Memoirs of William Hazlitt' (1897); 'Four Generations of a Literary Family' (1897); 'Leisure Intervals,' poems (1897); 'Ourselves in Relation to a Deity and a Church' (1897); 'Coins of Europe' (1893–7).

Hazor, or **Chazor** (Heb., enclosure), the name of several places in ancient Palestine, the best known of which was the seat of Jabin, a Canaanitish king of considerable power, who, with his allies, was defeated by Joshua (Josh. xi. 1–13). Though it recovered and oppressed Israel, it was conquered a second time by Barak (Judges iv.) and remained in the possession of Israel until the invasion of Tiglath-pileser. Solomon made it a northern frontier fortress (1 Kings ix. 15). Its site has been variously placed, by many at Tell Hara, 2½ miles southeast of Kadesh. Consult the 'Journal of Sacred Literature' for 1866, p. 245.

Hazzard, David, American politician and jurist: b. Broadkiln Neck, Sussex County, Del., 18 May 1781; d. 8 July 1864. He served as an ensign in the War of 1812, was elected governor on the American Republican ticket in 1829, and subsequently was State senator and an associate judge. During his administration as governor, a constitutional convention was held at Dover, Del., by which among various revisions, the governor's term was changed from three to four years. Hazzard was a member of the constitutional convention of 1852.

Head, Barclay Vincent, English numismatic scholar: b. Ipswich, Suffolk, 2 Jan. 1844. In 1864 he became an assistant in the British Museum, where in 1893 he was made keeper of the department of coins and medals. He was also appointed joint-editor of the 'Numismatic Chronicle.' His chief work is the 'Historia Nummorum' (1887), a valuable study, and the standard one in its department. Among further publications by him are: 'History of the Coinage of Bœotia' (1881), and 'Guide to the Coins of the Ancients' (1881).

Head, Sir Edmund Walker, English colonial administrator and author: b. near Maidstone, Kent, 1805; d. London 28 Jan. 1868. He was educated at Oriel College, Oxford, became a fellow of Merton, studied law, was a poor-law commissioner in 1841, and in 1847–54 lieutenant-governor of New Brunswick. From 1854 to his retirement in 1861 he was governor-general of Canada. During his administration Ottawa was chosen as the capital of Canada, the Victoria bridge at Montreal was constructed, and the seigniorial tenures (see CANADA — SEIGNIORIAL TENURE) and the clergy reserves (see CANADA — THE CLERGY RESERVES) were abolished. In 1863 he was appointed a civil-service commissioner and in 1867 a privy councillor. He was an art critic of some importance, and published a 'Handbook of Painting of the German, Dutch, Spanish, and French Schools' (1848), and other works. His poetical contributions to 'Fraser's Magazine' appeared in 1868 in book-form.

Head, SIR Francis Bond, English colonial administrator and author: b. near Rochester, Kent, 1 Jan. 1793; d. Croydon, Surrey, 20 July 1875. Educated at Woolwich, he became first lieutenant of engineers in 1811, was at Waterloo and at Fleurus, retired from the army in 1825, and went to South America as a prospector in gold and silver mines. Of some of his experiences there he gave an account in 'Rough Notes of a Journey in the Pampas and Andes' (1828). In 1835 he was appointed lieutenant-governor of Upper Canada. His administration was a decidedly unfortunate one. Unfamiliar with the political status of the country, he opposed the union of the provinces, and endeavored to conduct the government without the assistance of a council. This state of affairs may be regarded as the chief cause for the part taken by Upper Canada in the insurrection of 1837. His numerous publications include: 'Bubbles from the Brunnen of Nassau' (1833); 'The Defenceless State of Great Britain' (1850); 'The Horse and His Rider' (1860); 'The Royal Engineer' (1869).

Head, SIR George, English writer of travels, etc.: b. Higham Parish, Kent, 1782; d. 1855. He held various posts in the army, and was present at most of the great battles of the Peninsular. In 1814 he proceeded to Canada to be chief of the commissariat of a proposed navy on the Canadian lakes, and subsequently published his experiences in 'Memoirs of an Assistant Commissary-General' and 'Forest Scenes and Incidents in the Wilds of North America.' He was knighted in 1831 by William IV. He also wrote 'Rome, a Tour of Many Days'; 'A Home Tour Through the Manufacturing Districts of England,' and 'A Tour Through Various Parts of the United Kingdom' and other works.

Head, Natt, American politician: b. Hookset, N. H., 20 May 1828; d. there 12 Nov. 1883. He became a railroad and general building contractor, sat in the State legislatures of 1861 and 1862, was adjutant-general of the State in 1864–70, and in that capacity published a four-volume military record of New Hampshire during the Civil War. In 1876 and 1877 he was elected to the State senate and in the latter year was its president. He was governor in 1879–80.

Head, the anterior part of the body of an animal when it is marked off by a difference in size, or by a constriction. The presence or absence of a head was formerly much used as a character in classification. But this line of classification is artificial. The mouth and principal nervous organs are the guides to the anterior end of the body, where the head, when recognizable, is situated. In the protozoa, infusoria, and cœlenterates, such as the hydra and corals, there is no nervous ganglion, and the mouth is not surrounded by special structures. In the inferior vermes the anterior end becomes marked by the presence of ganglia. The so-called head of parasitic animals, such as the tapeworms, is only the end of attachment, but neither mouth nor ganglia exist in it. In the polyzoa, lampshells, ascidians, and lamellibranch mollusks mouth and ganglia exist, but they are not surrounded by special structures. But in the worms proper, the articulated animals, the land and fresh-water gasteropods and the cuttlefishes a head proper is found. That is, the mouth and the anterior nervous ganglia are placed in a segment of the body which, by structure, is different from the rest. Thus in the worms and articulated animals some of the rings or articles of which the body is made up are fused together, the appendages being not walking limbs, but modified into jaws or jaw-like organs. Thus the common shoreworms possess a structural head, though it is not apparent. The head is best defined in the insects. The snail's head has its cavity shut off by a diaphragm from the rest of the body cavity. The cuttlefishes have, in addition, a remarkable cartilaginous box, which, like a skull, protects the ganglia and gives support to the muscles. The head of the vertebrated animals presents a regular series of increasing complexity from the amphioxus upward. In that fish the most anterior part of the nervous cord is lodged in a canal scarcely distinct from that which contains the rest of it. Ascending in the series, it becomes evident that as the anterior nervous mass enlarges, and its ganglia increase in complexity, the anterior vertebræ change their character; as the brain becomes specialized, so does the brain-case or skull. In man the brain attains its highest development and the head its greatest complexity, the difference between skull and face being now most pronounced. The vertebrate theory of the skull, first propounded by Goethe, is now accepted to this extent, that the skull or cranium consists of three vertebræ, which are recognizable in the fish, and that the facial bones are not vertebræ, but developed from cartilage which did not form an original part of the vertebral column. A vertebra consists of a body or centre, from which two processes arch upward and close in the spinal canal with its contents, the spinal cord. The posterior cranial vertebra is the occipital, consisting of a centre, two lateral pieces, and a superior, the next is the parietal, of which the basisphenoid is the centre, and the great wings of the sphenoid and the parietals the lateral arches; the most anterior is the frontal, with its centre, the presphenoid, and its arch, formed by the orbital plates of the sphenoid and the frontals. The centres of the spinal vertebræ are ossifications around a fibro-cartilaginous rod, the *chorda dorsalis*, which ends in the basisphenoid. So far spinal column and skull have a common base; but the spinal vertebræ were preceded by and are in fact modifications of primitive vertebræ, and no representatives of these appear in the development of the skull. It is therefore open to question whether the three divisions just mentioned are really vertebræ, or should not rather be called cranial segments. There is the more reason for this that in fishes the basisphenoid and presphenoid are represented by a single bone, the parasphenoid, which underlies the skull, but disappears in the higher vertebrates, and that the presphenoid is not properly connected with the chorda dorsalis, but rather belongs to the series of facial bones. The pituitary body which projects from the lower surface of the brain lies in front of the end of the chorda dorsalis: from this latter rod and its surroundings a plate of cartilage passes forward on either side of the pituitary body, and these (the *trabeculæ*) meeting in front of that body, form the cartilaginous axis around which the vomer, ethmoid, and other facial bones are developed, while the presphenoid is an ossification in this axis just where the two portions meet in front of the pituitary. The sense organs, the ear and the eye, are, so to speak, lodged in capsules of bone which are inserted, the ear between the occipital and parietal, the eye between the parietal and frontal segments. They are accidental, not essential parts of the cranium. The hyoid apparatus and the lower and upper jaws are developed from the cartilaginous walls of the embryonic skull, and the jaws come in a secondary manner to take part in the composition of the face. (See RESPIRATORY ORGANS.) The increasingly globular form of skull in the vertebrates is due to the greater increase of the cerebral hemispheres relatively to that of the base of the brain and axis of the skull; hence the brain comes in man to overhang the face. Of course it is to be remembered that while in the vertebrated animals the head is divided by its axis (commencing at the middle line of the upper jaw, and passing backward through the basisphenoid to the vertebral centres) into an upper chamber, lodging the brain, and a lower, lodging the first part of the alimentary canal; in the lower animals the cavity is a single one, the œsophagus piercing the nervous system so as to reach the surface of the body, and thus coming to be surrounded by a pair of ganglia above and a pair below, with the filaments connecting these ganglia. In the vertebrate the head is curved downward, the basisphenoid being the pivot point, so that the mouth is pushed to the lower surface: in the lower animals the under surface of the body curves upward, so as to carry a part of the nervous system past the mouth toward the upper surface. The eyes and feelers of a crab are in fact modified limbs which are thus carried upward: the jaws and sense organs of a vertebrate are entirely distinct from the limbs and other appendages of the trunk.

Head-hunting. See DYAKS.

Head Money, an immigration tax of 50 cents levied by act of Congress 3 Aug. 1882 on every foreigner brought to the United States. Before the passage of this act the State of New York levied a "head tax" on all immigrants arriving at New York, the funds going to the support of the State board of immigration. A test of the legality of the tax being made in the courts, a decision was rendered that the New York statute was void because it infringed on the prerogatives of national government. Subsequently the act of Congress imposing the tax was questioned in the United States Supreme Court, and a decision affirming the constitutionality of the law was made. The national act provides that the tax shall be paid by the master or owner of the vessel bringing the immigrants, to the collector of the port, and by him turned over to the treasury of the United States, to be used by the secretary to defray the expenses of regulating immigration and to relieve immigrants in distress. See IMMIGRATION.

Headache, pain in the head, the result of a variety of causes. It may arise from overfulness of blood, from deficiency of blood or debility, from excited or inflammatory action, from the nerves, etc. If a person who suffers from headache is of full habit generally; if he is sleepy, dull, the vessels of his face full; overfulness is the probable cause, and reduction of the diet, with occasional doses of saline medicine, exercise, bathing the head with cold water, will be beneficial. If the urine is deficient, cream of tartar in some form may be taken with advantage. The above species of headache may also be occasioned by whatever impedes the circulation, such as affection of the heart or liver; when the latter is the case, the pain is frequently most severe at the back of the head. When, on the other hand, headache occurs in a person of weak constitution; when it is produced or aggravated by mental over-exertion; when there is listlessness both of mind and body rather than oppression — the face pale, the pulse weak — debility is the probable cause. This form of headache is often accompanied with indigestion, and is common in students and anxious men of business. Anything like abstraction of blood will certainly prove injurious. Exercise, attention to the state of the bowels, care in diet, rest, and change of scene and air, will be most useful. Headache from excitement or inflammatory causes is such as occurs in the first stages of inflammation of the brain and in some forms of fevers, or it follows violence to the head. Of all kinds of headache that arising from some disorder of the stomach is, however, the most common. The presence of indigestible food in the stomach almost certainly causes dull pain in the forehead; and too acid a condition of the contents of the organ produces the same effect. The various symptoms of indigestion will generally point to the cause. In the first some aperient, such as a saline draught, will probably remove the disorder. When acid eructations, heartburn, etc., indicate the presence of superabundant acid, a dose of soda, potash, or magnesia will correct the cause. There is a form of headache which consists in throbbing and pain of one part, or sometimes over one side of the head. This is called hemicrania (the migraine of French and the megrim of old English writers), and is often of a distinctly intermittent character. For its permanent cure quinine is in common use; a mustard poultice on the nape of the neck is also of service; and antipyrin has proved of value in affording relief. It should be well understood that the habitual use in headache of strong and swiftly working drugs is likely to undermine the nervous system, and increase liability to attack. Exercise, moderation and cheerfulness are the best preventives.

Headley, hĕd'lĭ, **Joel Tyler,** American historian: b. Walton, N. Y., 30 Dec. 1813; d. Newburg, N. Y., 16 Jan. 1897. Graduated from Union College in 1846, he took a course in theology at the Auburn Seminary, was pastor at Stockbridge, Mass., and in 1846 became assistant editor of the New York *Tribune*. In 1856–7 he was secretary of state for New York. His works, written in a popular vein, had great currency in their day, and include: 'Napoleon and his Marshals' (1846); 'Washington and his Generals' (1847); 'The Adirondacks' (1849), said to be the first book to advocate that region as a health-resort; 'Grant and Sherman, their Campaigns and Generals' (1865); and 'The Great Rebellion' (1864).

Headley, Phineas Camp, American Congregational clergyman: b. Walton, N. Y., 24 June 1819; d. Lexington, Mass., 1903. He was a brother of J. T. Headley, the historian (q.v.). He was admitted to practice at the bar in 1847, but studied theology at Auburn Seminary, held pastorates in various Presbyterian and Congregational churches, and contributed to the New York 'Observer' and *Tribune*, and many other newspapers and magazines. Among his works are: 'Women of the Bible' (1850); biographies of the Empress Josephine (1851), Kossuth (1852), Lafayette (1853), Mary, Queen of Scots (1856), Ericsson (1863), Farragut (1864), and others; 'Half-Hours in Bible Lands' (1867); 'Court and Camp of David' (1868); and 'Public Men of To-day' (1882).

Healy, George Peter Alexander, American painter: b. Boston 15 July 1808; d. Chicago 24 June 1894. He went to Paris about 1836, where he remained several years, alternating his residence there with occasional visits to the United States. Among works executed by him abroad are portraits of Louis Philippe, Marshal Soult, and Gen. Cass. At home he painted Calhoun, Webster, Pierce, and other prominent American statesmen. He occasionally produced large historical pictures, of which 'Webster's Reply to Hayne,' illustrating a well known scene in American legislative history, completed in 1851, now hangs in Faneuil Hall in Boston. At the exhibition of Paris in 1855 he exhibited a series of 13 portraits and a large picture representing Franklin urging the claims of the American colonies before Louis XVI., for which he received a medal of the 2d class. Portraits by him of Buchanan and Lincoln are in the Corcoran Gallery at Washington.

Healy, Timothy Michael, Irish political leader: b. Bantry, County Cork, Ireland, 17 May 1855. He was elected to Parliament for Wexford in 1880, County Monaghan in 1883, South Londonderry in 1885, North Longford in 1887, and County Louth, North, in 1895. In 1884 he was called to the Irish bar. He became known as a leader of the Irish Nationalist party, was a founder of the Dublin 'National Press' (later combined with the 'Freeman's Journal'), and was repeatedly in difficulties because of his public utterances on political matters. He made a lecture tour of the United States with Dillon and Parnell in 1880, and in 1881 participated in the Land League convention at Chicago, when $250,000 were contributed to the Irish cause. The 'Healy Clause' of the Land Act of 1881, providing that no tenant should pay rent on improvements made by him, was introduced by him. He wrote 'A Word for Ireland' (1886).

Heap, David Porter, American engineer: b. San Stefano, Turkey, 24 March 1843. He studied at Georgetown (D. C.) College, was graduated from the United States Military Academy in 1864, served in the Civil War with the engineer corps of the Army of the Potomac, and was brevetted captain for his services. In 1895 he attained the grade of lieutenant-colonel of engineers. He was for years employed in the construction of fortifications and the improvement of harbors, and in 1881 was military representative of the United States at the Paris congress of electricians. In addition to a 'Report on the International Exhibition of Electricity at Paris' (1884), he published: 'Ancient and Modern Light-Houses' (1889); 'Electrical Appliances of the Present Day'; 'Engineer Exhibit, Centennial Exhibition' (1882); and 'History of the Application of Electricity to Lighting the Coasts of France' (1885).

Heard, Franklin Fiske, American jurist: b. Wayland, Mass., 17 Jan. 1825. He was graduated at Harvard in 1848; was admitted to the bar in 1850; and practised in Middlesex County and later in Boston. He attained a reputation as an authority on pleading, and in 1861–6 was an editor of the 'Monthly Law Reporter.' His publications include: 'Libel and Slander' (1860); an edition of 'Stephen on Pleading' (1867); standard books on 'Criminal Pleading' (1879) and 'Civil Pleading' (1880); 'Heard on Criminal Law' (2d. ed 1882); 'Shakespeare as a Lawyer' (1883); 'Precedents of Equity Pleadings' (1884); 'Precedents of Pleadings in Personal Actions in the Superior Courts of Common Law' (1886).

Hearing, one of the five senses, the physical organ of which is the ear. (See Ear, Acoustics.)

Hearn, hėrn, **David William,** American Roman Catholic clergyman and educator: b. Boston, Mass., 21 Nov. 1861. He was graduated at Boston College in 1880; took post-graduate courses in literature, science and philosophy for five years, and theological courses for four; entered the Society of Jesus, and was ordained priest of the Roman Catholic Church. He was successively professor in Georgetown University, vice-president of Boston College, and vice-president of the College of Saint Francis Xavier, New York. In 1900 he became president of Saint Francis Xavier.

Hearn, Lafcadio, American author: b. Santa Maura (Leucadia), Ionian Islands, 27 June 1850; d. Tokio, Japan, 26 September 1904. Educated in England and France, he came to the United States in 1869, was a journalist in Cincinnati and New Orleans, in 1887–9 was at Saint Pierre, Martinique, French West Indies, and in 1890 went to Japan. He became a Japanese subject with the name Yakumo Koizumi, and was appointed lecturer in English literature at the Imperial University of Tokio. His 'Stray Leaves from Strange Literature' (1884), and 'Some Chinese Ghosts' (1887), were succeeded by 'Chita: A Memory of Lost Island' (1889), story of the destruction of "L'Ile Dernière," once the watering-place of Louisiana fashion, which attracted attention by its descriptive powers; and 'Two Years in the French West Indies' (1890), which gained new interest through the Martinique disaster of 1902. Among his further works, dealing almost exclusively with things Japanese and revealing a thorough comprehension of and sympathy with the art, myth, tradition, and philosophy of the Orient, are: 'Out of the East' (1894); 'Glimpses of Unfamiliar Japan' (1895); 'Kokoro' (1896); 'Gleanings in Buddha-Fields' (1897); 'Exotics and Retrospections' (1898); and 'Kottō, or Japanese Curios' (1902).

Hearst, Phoebe Appersin, American philanthropist: b. 1840. She was for a time a teacher, and in 1861 married George F. Hearst of California. She has been active in charitable and philanthropic enterprises and has given largely, especially to educational institutions. In San Francisco she has established kindergarten classes for the children of the poor, and a manual training school, and has organized a number of working girl's clubs. She has also given money to build a National Cathedral School for girls; has made donations to the American University at Washington; has established and given largely to public libraries in the mining towns of the West; and maintained a school for mining engineers at the University of California. In 1896 she offered to pay the expenses of an international competition of architects to obtain a suitable plan for a campus and buildings for the University of California, and to erect two buildings in accordance with this plan. See CALIFORNIA, UNIVERSITY OF.

Hearst, William Randolph, American newspaper publisher: b. San Francisco. He was graduated from Harvard, and on leaving college took charge of the publishing of the San Francisco *Examiner*, formerly owned by his father, Senator Hearst of California. In 1895 he bought the New York *Journal*, the name of the morning edition of which he later changed to the *American*; in 1900 he started the Chicago *American*; in 1904 the Boston *American* and the Los Angeles *Examiner*. In 1902 he presented the Greek Theatre to the University of California. He represented the 11th Congressional District (New York) in the 58th and 59th Congresses. In 1905 he was defeated for the office of Mayor of New York City and in 1906 for Governor.

Heart, The. The heart and the blood-vessels constitute the mechanical means for maintaining the circulation of the blood. In many respects this system is the most readily understood of any in the body, in that it is largely mechanical. There are, however, certain factors not existing in an ordinary system of hydraulics which, while essential to the proper performance of the function in the human body, render the understanding of the subject more difficult. The heart is merely a pump, or rather two pumps fused, for convenience, into one. It derives its power through contraction of the red muscle which forms its wall. It is hollow, alternately filling and emptying, receiving blood from one set of tubes filling its cavities, then emptying its contents into other tubes by contraction of its walls and momentary obliteration of its cavities. The action is analagous to that of the ordinary bulb syringe. The proper direction of the flow of the blood is maintained by valves, similar in structure and like in function to the valves in an ordinary pump.

The heart is about the size of the closed fist. The average dimensions of the adult organ are: length 85–90 millimetres in the male, 80–85 mm. in the female; breadth, 92–105 mm. in the male, 85–92 mm. in the female; thickness, 35–36 mm. in the male, 30–35 mm. in the female. The average weight in men is 300 grams; in women 250 grams. The heart is cone-shaped with the base uppermost. It lies within the cavity of the bony chest, a small portion of its anterior surface being in contact with the chest-wall, the rest covered by the overlapping lungs. The apex of the cone, or "apex," as it is technically called, is in the space between the fifth and sixth ribs on the left side, about 2 centimetres to the inside of a vertical line drawn through the left nipple. The heart reaches no lower and no farther to the left than this. From this point it reaches upward to the second rib, two thirds of its mass being to the left of the middle line of the body, one third to the right. Its long axis is neither vertical nor horizontal but is inclined to an angle of about 30 degrees to the horizontal, hence 60 degrees to the vertical. Therefore it is nearer horizontal than vertical. The position of the apex of the heart can be readily determined by placing the finger in the interspace mentioned and feeling the beat. In the healthy individual when not under excitement of the emotions or exercise no motion of the heart can be felt by the finger upon the chest-wall except at the apex.

Of secondary importance only to the heart is the system of tubes conveying the blood: arteries, capillaries, veins. The arteries are thick-walled, elastic tubes, dividing and subdividing into smaller tubes, but the total sectional area increases as the vessels become smaller in diameter. These end in a fine network of very small, thin-walled tubes called from their resemblance in size to hairs, capillaries. These in turn become veins, enlarging their diameter and diminishing their number, thus reversing the process in the arteries. Veins have very thin walls in proportion to the diameter of the bore and are provided with valves to prevent a back flow of blood.

This arrangement of the blood-vessels may be likened to two cones, base to base, one apex representing the largest artery leaving the heart, the other apex the largest vein entering the heart, and the bases of the cones the wide capillary system. The flow of blood will be naturally fastest in the larger arteries and veins, slower in the smaller arteries and veins, and slowest in the capillaries, due to the fact already mentioned that as vessels divide although the branches are smaller in diameter the combined sectional area is larger. The condition is quite like that of the flow of water in a river, the current being swiftest where the banks approach each other, slowest where the river widens into a lake or pond, again to become swifter as the width of the stream lessens.

The two pumps which compose the heart as a single whole are called the right heart and left heart. This designation takes its origin from the fact that one is more to the right side of the body, the other to the left side. Ordinarily the two parts are spoken of as the right side and the left side. The left side is by far the more powerful pump, having a very thick wall, its function being to force the blood under considerable pressure through most of the body, the so-called systemic circulation. The right heart has merely to force the blood through the lungs, a relatively short distance and under low pressure.

Each half of the heart has two cavities, a thin-walled one called the auricle for receiving the returning blood poured into it from the veins, and a thick-walled one called the ventricle which receives the blood from the auricle through an orifice guarded by a valve. The function of the ventricle is to force the blood by contraction of its muscular wall into the arteries through a connecting orifice also guarded by a valve. These four chambers are called the right auricle, right ventricle, left auricle and left ventricle. The walls of the auricles are composed of red muscle and are quite thin, the work required of them being but slight, that is, they force the blood under slight resistance. The walls of the ventricles are also made up of red muscle fibres, the outer surface being smooth, the inner surface crossed by a network of beams of muscle called the trabeculæ. The thickness of the wall of the right ventricle between the trabeculæ is from 2 to 3 millimetres; of the left ventricle 7 to 10 millimetres. The capacity of each ventricle is about 100 cubic centimetres, that is, it forces out about this amount at each contraction.

The function of the valves is to permit the flow of liquid in one direction and to prevent its flow in the opposite direction; in other words, their presence enables a pump to maintain a flow of liquid in one direction with little or no back flow.

The heart has four valves, one between each auricle and ventricle, and one in each ventricle at its point of connection with its outgoing artery. The valve between the auricle and ventricle of the left heart is called the mitral, from its resemblance to a bishop's mitre; that between the right auricle and right ventricle is called the tricuspid from its having three folds or cusps. The left ventricle is connected with the systemic circulation by the great artery called the aorta, its guarding valve is called the aortic valve. The right ventricle is connected with the circulation through the lungs by the pulmonary artery, its valve is called the pulmonic valve. The aortic and pulmonic valves are each composed of three cups of thin, flexible tissue fastened to the inner wall of the blood-vessel, their edges hanging free, and capacious enough to meet in the middle of the orifice they guard. When the ventricles contract, the blood within them under pressure tends to escape through any orifice, it presses upon these cups, forcing them against the walls of the orifice leading to the aorta and pulmonary artery respectively, leaving an opening of full size. In other words they offer no obstruction to the flow of blood in this direction. When, however, the muscle-wall by its contraction has emptied itself of blood through the orifices just mentioned it begins to relax, thus enlarging the cavity of the ventricle. Were there nothing to prevent, the blood just forced into the aorta and pulmonary artery under considerable pressure would flow back again into the relaxing ventricle, and so it does to a very slight degree, but this very back flow fills these three cups with blood, causing them to meet in the middle of the orifice, thus completely blocking it so far as any return of blood is concerned, and what blood has been forced into the aorta and pulmonary artery remains there to be carried on still further with the next contraction of the heart.

The mitral and tricuspid valves are simply flat folds or curtains attached to the edges of the orifices between auricles and ventricles. They are thrown back upon the inner walls of the ventricles while the blood is flowing from the auricles into the ventricles, offering little or no resistance to the flow, but when the flow of blood is in the opposite direction, that is, when the ventricles contract, they are floated upward till the free edges come in contact, thus blocking the orifice. The flaps are prevented from going too far by delicate tendinous cords attached to the free edge of the valves at one end and to the inside of the heart wall at the other end. They play the same part that sheets do for a sail. It will thus be seen that while one set of valves — mitral and tricuspid — is closed, the other set — aortic and pulmonic — will be open, and vice versa.

The period of active contraction of the ventricles is called the systole, and its time is often spoken of as the systolic period. The period of dilatation of the ventricles, the time during which they fill with blood from the auricles, is called the diastole or diastolic period. In time the two are nearly equal, the diastole being somewhat longer.

The cause of the heart beat is a matter of great interest. Inasmuch as the skeletal muscles require for contraction a stimulus carried to them through nerves, it was thought that heart muscle required a similar nerve impulse. It was known to physiologists that the heart of a frog severed from its connections went on beating in spite of there being no nerves attached to it to convey an impulse from without. Then certain nerve ganglia were found in portions of the heart wall and it was inferred that these gave out the necessary stimulus. But finally it was found that isolated portions of the heart wall in which there were no nerve ganglia continued to beat if they had a blood supply. Hence it was concluded by Gaskell that the beat of the heart must be due to an inherent rythmical power of the ventricle; the stimulus to the muscle probably residing in some chemical substance in the blood coming to the part. At any rate the ganglion theory is no longer held, while the latter is considered the probable one.

The sounds associated with the periods previously described are readily heard by anyone placing the ear over the heart of another person, or with a stethoscope the individual may hear his own heart sounds. The contraction of the ventricles occurs at the time the impulse is seen and felt over the apex of the heart in the fifth interspace. It is associated with a booming sound, loud and distinct. Then comes a short period of silence corresponding to the time when the heart muscle ceases its contraction and begins to relax. Then comes a very short, sharp, flapping sound due to the closure of the valves which prevent the return of the blood from the aorta and pulmonary artery to the ventricles. Then follows a longer period of silence and again a repetition of the same set of sounds. The time from the beginning of the first sound to the beginning of the second sound, that is, the time of the "boom" and its short silence, is the systole of the ventricle. The time from the beginning of the second or short, sharp sound through the period of silence following it is the diastole of the ventricle. The whole period occupied from the beginning of the first of the sounds described to its repetition is called a cycle of the heart. Of these there are on an average in an adult 72 per minute. When the successive cycles occupy the same length of time the rhythm is said to be "regular." When the times are unequal the term "irregular" is used. When a beat is dropped the term "intermittent" is applied.

If, when the ear is placed over the heart, the finger be placed over the artery in the wrist, an impulse or beat will be felt in the latter, occurring at a slightly later time, about one sixth of a second, than the apex beat. This is the pulse wave corresponding to that individual heart beat. It varies in frequency, in volume and in tension according to the number of heart beats, the volume of blood thrown into the arteries from the heart, and the tension or tone of the arterial wall. The latter point will be explained later.

The course of the blood after leaving the left ventricle is through the aorta and its branching arteries to the arms and legs and to all the organs of the body, except the main supply to the lungs, through capillaries; thence it is returned by the veins to the right auricle, from there it goes to the right ventricle, from which it is pumped through the lungs for purification to the left auricle and thence to the left ventricle again. The length of time required for any portion of blood to make the complete circuit in the human being is not known with absolute accuracy, but it is probably not less than 15 seconds nor more than 30 seconds.

The work done by the heart may be expressed in units. Assuming the pressure in the left ventricle during contraction to be 130 millimetres of mercury, each square centimetre will receive a pressure of 175.5 grams. Assuming further that the left ventricle forces 100 cubic centimetres of blood at each contraction, the work done will equal 17,880 gram centimetres. The right ventricle does a third as much work as the left, giving a total of 23,840 gram centimetres. The total work of the heart per diem equals 24,000 kilogram metres, equivalent to 50.6 kilo-calories.

The relatively high pressure required of the heart in maintaining the circulation is due to the fact that it has to force the blood into arteries having elastic walls that offer a considerable resistance to stretching. The stream from the heart into the arteries is intermittent, the elastic arterial walls are stretched by the incoming blood absorbing the force during systole and tending to again give out this force when the heart ceases during diastole to supply fresh blood. Even during diastole the pressure within the arteries remains considerable. Hence the heart has to force the blood against the elastic tension of the arterial wall and against the blood already in the vessel from previous heart beats. This force stored up in the arterial wall tends to drive the blood along to the capillaries and veins, making in the capillaries and veins a constant flow, just as a single-cylinder pump provided with an air-chamber delivers a constant stream. The circulation, then, in the arteries is intermittent, in the capillaries and veins constant.

An element of much interest as well as of great importance to the proper maintenance of the circulation in the arteries and to the nutrition of the organs supplied by them with blood is what is called "vascular tonicity," by which is meant the peculiar property inherent in the arterial walls of maintaining a relatively constant blood pressure with varying amounts of blood contents. In an ordinary system of hydraulics maintained through elastic tubes the walls of which are stretched by the circulating contents, the pressure falls if some of the contents escape. In animals, on the contrary, a considerable quantity of blood may be withdrawn from the blood-vessels, yet the blood pressure, after a fall of very short duration, returns to the normal. This tonicity is due to the fact that the walls of the arteries have circular muscle fibres, under control of nerves, that contract down upon the blood remaining in the vessel and so maintain the pressure, a matter of great importance, as an equal pressure in organs is necessary for the proper physiological function.

The muscle in the arterial walls is supplied with two sets of nerves called vasomotor nerves, having opposite actions. One set called vasoconstrictors has the power when stimulated of contracting the vessel, the other set called vasodilators enlarges the vessel. Under normal conditions a certain equilibrium is established between the two sets of nerves and the artery is said to possess "tone." Increased action of one over the other will produce increased amount of blood in the part, as in the familiar example of blushing, or on the other hand pallor as seen in fright. Certain drugs have a powerful effect upon these nerves.

Before considering the diseases of the heart a word may be said of the historical development of the subject. That the blood circulated was not known until Harvey demonstrated it in 1628. Auenbrugger, a Viennese physician, in 1761 invented percussion, the method by which the position, size, and in a measure the changes in organs may be determined by the sound produced when the surface of the body over them is struck or "percussed," as it is technically called. His invention remained unheeded until 1806, when Corvisart, body physician to Napoleon, used it in mapping out the heart in healthy and in diseased conditions. Laennec, the founder of auscultation as used to-day, by means of his newly invented stethoscope, gave to the world in 1819 the first accurate description of the characteristics of the heart sounds and the significance of changes in the sounds in the diagnosis of diseases of the heart. Bouillaud in France and Hope in England were also pioneers in this work, practically all that has been done since then being an elaboration along lines laid down by them.

By percussion the size and position of the heart can be accurately determined, and by auscultation variations from the normal sounds and the presence of abnormal sounds enable one to determine what special derangement of the heart exists.

To understand the abnormalities of the heart it should be borne in mind that the work of this organ is done by the muscle of which it is composed; that the nerve stimulus for the muscular contraction comes from within the heart wall, and that the regulatory action, that is, whether it beats faster or slower, depends upon two nerves of opposing action, the vagus and the sympathetic; stimulation of the former slowing the heart, stimulation of the latter increasing the rapidity of action. Under ordinary conditions an equilibrium is established between them, somewhat analagous to the equilibrium in a balance when equal weights are placed in the scale-pans; an equilibrium that is at once disturbed if weights are added to or taken from either pan. Furthermore intact valves are necessary for the proper function of the heart.

Hence changes in the action of the heart are due to changes in the nerve stimulation; changes in the muscle; changes in the valves. They may exist alone or in combination. Changes affecting the nerves are more commonly functional or temporary; while those affecting muscles and valves are organic and usually, though not always, permanent.

Diseases of the valves are the most frequent, the most important and of the greatest interest. A valve to perform its duty properly must be so flexible that it is readily thrown back against the walls of the heart so as not to hinder the passage of the blood through the orifice it should go. It should also quickly fall back into place and meet its fellows, so as to block the passage and prevent the flow of blood in the direction it should not go. Unfortunately these delicate valve segments are prone to inflammation, rheumatic fever being the commonest cause. This inflammation is associated with the formation of new tissue much like that formed in the scar of a wound. It leads to thickening, rigidity, retraction and deformity of the valves, and also frequently to adhesion of the cups along the edges of closure.

These changes affect the function of the valve, causing on the one hand narrowing of the orifice so that the passage of the blood is obstructed, hence the technical use of the term "obstruction," or "stenosis"; on the other hand the segments of valves may be so shortened and puckered that they do not meet each other, and so leakage results. To this condition the term "insufficiency" or "regurgitation" is applied. Either obstruction of a valve orifice or leakage through a valve calls upon the muscle of the heart for more work. In the former case the blood is forced under a greater resistance; in the latter more blood must be forced to make up for the leakage. The muscular wall thickens and the cavity of the heart behind the leaky valve enlarges to "compensate," as the expression is for the valvular defect. This compensation may remain effective for years, the patient having but little inconvenience from the disease.

Sooner or later the heart muscle feels the effect of the prolonged overwork, it weakens, becomes stretched, the cavity enclosed by it enlarges, and the condition known as "broken compensation" follows. The heart can no longer supply a sufficient amount of blood for the needs of the body, the circulation is slowed, stagnation results with the associated symptoms of distress in breathing and frequently dropsy. There is marked impairment in the functions of the organs of the body due to imperfect blood supply. Valvular disease is very common and may occur at any age, but it usually involves the valves of the left heart, mitral and aortic.

With care on the part of the patient life may often be prolonged with comfort for many years. Apart from the benefit derived from rest, the drug digitalis by prolonging diastole and stimulating the heart muscle to better contraction gives the best results. When properly used it is a great boon to the patient.

The muscle of the heart undergoes a degenerative change in acute infective diseases associated with fever, like typhoid fever, pneumonia, and diphtheria, by which its contractile power is lessened. It may reach such a degree as to lead to death from paralysis of the heart wall. If the patient recovers from the disease the heart muscle in time recovers its normal tone.

An important disease of the heart muscle is one occurring usually in males after middle life, frequently associated with the symptom known as angina pectoris. It is a degeneration of the heart wall due to partial occlusion, by thickening of the walls, of the two coronary arteries which supply the heart muscle with blood, thus disturbing the nutrition of the muscle and the nerve ganglia. Angina pectoris is characterized by the sensation of great constriction and pressure and often of a violent tearing of the heart, with intense anxiety and a feeling of impending death. The suffering is often very great, and while the attack may be of short duration the prostration following one is marked.

Fatty degeneration of the heart muscle occurs, but it cannot be diagnosticated with exactness during life. Although the term is often heard its use should be reserved as an anatomical and not as a clinical diagnosis. That is, one can be sure of it only when one sees the exposed heart. On the other hand, collection of fat between the muscle-fibres and around the heart such as occurs in fat people may seriously embarrass the heart by not allowing enough space for it to move freely.

Extreme muscular effort as in lifting or carrying a heavy load or a prolonged march or climbing a mountain may overstrain the heart and lead to feeble action. Rest usually repairs the damage, although sometimes it is permanent.

Prolonged overwork and certain forms of disease of the kidney may lead to marked enlargement of the heart, due mainly to thickening of muscle wall of the left ventricle, to which the term "hypertrophy" is applied.

Disturbances of the heart function, due to some action through its nerves, are of great importance. Such may be physiological or functional, or they may be due to diseased conditions. Among the former are examples familiar to all. The increased frequency and force of the heart beat due to the emotions, to alcohol, to tea, to coffee, to tobacco, belong in this category. If not used to excess the effect of the above may be merely temporary, the heart resuming its usual frequency and quiet action when the effect of the stimulation has ceased. Prolonged abuse of such substances or long continued nerve worry or excitement may lead to a more permanent disturbance of the heart functions, indicated by palpitation, either permanent or after a trivial cause, or by irregularity in the rhythm. The "tobacco heart" of the milder form is an irritable one, with increased frequency of the beat; in the severer grade marked irregularity is characteristic. In the nervously tired person palpitation is common, while the uncomfortable sensations about the heart due to disturbed digestion with fermentation in the stomach often lead the individual to consult a physician feeling that heart disease exists.

A nervous disorder of the heart of considerable interest is one associated with greatly increased frequency of its beat, but with a regular rhythm, combined with a marked prominence of the eyeballs, enlarged neck (goitre) and tremor of the hands. This complex has received the name of exophthalmic goitre, a neuropathic disturbance associated with irritation of the sympathetic nerve leading to the rapid heart action.

Still more uncommon and as yet unexplained is the condition called Tachycardia (rapid heart) characterized by paroxysmal attacks of very rapid beating of the heart, lasting but a short time and followed by normal frequency. During an attack it may be impossible to count the heart or pulse beats, owing to the rapidity.

Wm. Whitworth Gannett, M.D.,
Visiting Physician to the Massachusetts General Hospital, Boston, Mass.

Heart of Midlothian, The, a romance by Sir Walter Scott, published anonymously in 1818. It takes its name from the Tolbooth or old jail of Edinburgh (pulled down in 1815), where Scott imagined Effie Deans, his heroine, to have been imprisoned. The book is notable for having fewer characters than any others of Scott's novels. It has also a smaller variety of incidents, and less description of scenery.

Heart-urchin. One of a group of sea-urchins (see Echinoidea) of elongated form and cordate outline from a lateral point of view. The group is best represented by the genus *Spatangus*, common in Europe, but heart-urchins occur elsewhere, and are known as fossils.

Hearts-ease, a violet (q.v.), especially the common yellow violet of Europe, or a pansy.

Heat. Until the early part of the 19th century, it was generally believed that heat was a substance devoid of weight (imponderable), and diffused through the mass of bodies. This hypothetical substance was called *caloric*. Many phenomena seemed to be explained by the assumption of the existence of caloric, but finally, through the experiments of Davy and Rumford, in which heat was actually created from mechanical energy, the old caloric theory was abandoned. In its place we now have the molecular motion theory. According to this theory heat is nothing but a violent agitation of the molecules of matter. These molecules are extremely minute, but have a definite size and weight for each definite substance. It has been estimated that a molecule of water has a diameter of about one fifty-millionth of an inch. Though molecules are small in size, their velocity, even at ordinary temperatures, is very great. In air, where the molecules dart about in straight lines until they encounter other molecules, they attain a speed of 1,470 feet a second at the freezing temperature. The average length of their path between two encounters — the *mean free path* — is about 1-277,000 inch, and the number of molecules in a cubic inch of air is about 10 raised to the 21st power. Each molecule experiences about 5,000,000,000 collisions a second.

Expansion of Solids, Liquids, and Gases.— The molecules of every substance attract one another with a force called cohesion. It is cohesion that prevents a wire from breaking when it supports a heavy weight. The pressure of the atmosphere also helps to hold the molecules of a body together. Opposed to both of these forces is heat. The effect of the agitation of the molecules is to make them jostle one another apart. Thus it is that in general an increase of temperature results in expansion. In solids, where the cohesion is enormous, the expansion for a given increase of temperature is very slight, especially when the test is made at low temperatures. At higher temperatures, when the molecules have somewhat weakened their mutual hold through having moved further apart, an increase of temperature equal to the previous increase generally results in a somewhat greater expansion. To express such ideas technically we employ the expression *coefficient of linear expansion*, which means the fraction of its length that a bar expands when heated one degree centigrade. As the length varies with the temperature, the length at the freezing point, 0° C., is taken as the standard length. Using then this expression we may say that the coefficient of expansion of a solid generally increases with the temperature. The coefficient of linear expansion of a number of substances will be found in the following table:

COEFFICIENTS OF LINEAR EXPANSION OF SOLIDS.

Aluminium	0.0000233	Wood (soft)	0.000003
Gold	0.0000144	Wood (hard)	0.000006
Iron	0.0000121	Vulcanite	0.000067
Lead	0.0000293	Paraffin	0.00034
Platinum	0.0000090	Quartz	0.0000013
Copper	0.0000168	Rock salt	0.00003
Zinc	0.0000292	Ice	0.00005
Silver	0.0000193	Glass	0.0000083
Steel	0.0000123	Granite	0.0000087
Guillaume's nickel steel (36 per cent nickel)	0.00000087	Porcelain	0.0000025

Two notable cases may be remarked. It is seen from the table that the coefficient for glass is very close to that for platinum. This fact is taken advantage of in the construction of incandescent electric lamps, and of those scientific instruments where it is necessary to have a wire pass through glass and leave an air-tight joint. In making the joint, the glass around the hole is softened by heat until it gathers closely around the hot platinum wire. In cooling, if the coefficient for platinum were higher than that for glass, the platinum would contract more rapidly than the glass and leave a leaky joint. The second case to be noted is that of Guillaume's nickel steel. The coefficient of expansion of this metal is so extremely small that it is eminently suited to the construction of clock pendulum rods, of surveying instruments, and of standard scales of length, and to many other purposes where much expansion now proves an annoyance. Unfortunately the high cost of nickel will preclude the employment of this wonderful alloy in some cases.

The influence of expansion is seen in railroad tracks. On a cold day 60-foot rails may contract so as to draw apart one half of an inch. The cables of the Brooklyn Bridge support the slightly arched roadway. When they sag down in hot weather through expansion, they tend to make the roadway buckle. This tendency is increased by the expansion of the roadway itself. However, both tendencies were overcome through the foresight of the engineers, who provided a telescoping joint in the roadway at the middle of the span. The parts of this joint play in and out about a foot. On hot days clock pendulums grow longer, and so the clocks lose time. Glass when suddenly and hence unevenly heated, expands more at one point than at another, thus introducing internal strains that cause fracture, but vessels made of vitrified quartz are strong enough to resist this tendency to crack; they will endure without injury the sudden application of a blowpipe flame.

In liquids the molecules are so far freed from cohesion that they are able to roll around one another and to wander from one position to another. The small remaining cohesion is assisted by the pressure of the atmosphere or by any other pressure to which the liquid may be subjected and so the molecules in the body of the liquid are prevented from flying directly apart. It is on account of this small resistance to expansion that we find liquids very much more expansible than solids. The term *coefficient of cubical expansion* is employed to express the degree of expansibility of a liquid. It means the fraction of its volume that a liquid expands when its temperature is raised one degree centigrade. The cubical coefficient of a substance is three times as great as its linear coefficient, because we measure the effect of expansion in length, breadth, and thickness, instead of merely noting the expansion in length. Of course a liquid confined in a tube of unchanging dimension could only expand in length, but the effect in this one direction would be three times as much as it would be if the liquid were allowed to expand proportionally in all three dimensions.

COEFFICIENTS OF CUBICAL EXPANSION, LIQUIDS.

Ethyl alcohol	0.00106	Petroleum (heavy)	0.00090
Methyl alcohol	0.00114	Mercury	0.00018153
Acetone	0.00135	Aniline	0.00118
Ether	0.00148		
Olive oil	0.00080		

The expansibility of water is strikingly irregular. Starting at the freezing point, water contracts as the temperature rises until at about 4° C. it has assumed its maximum density. A further increase of temperature now causes the water to expand, which it does at an increasing rate until it begins to boil at 100° C.

Gases surpass even liquids in their expansibility. Because in gases the molecules are relatively very far apart, cohesion counts for nearly nothing, leaving external pressure as almost the sole force restraining expansion. It appears that the coefficient of expansion of a gas is nearly independent of the external pressure, for though a greater pressure tends to restrain expansion more, the greater crowding of the molecules resulting from this pressure causes more frequent blows among the molecules, and makes the expansive force increase in nearly the same proportion as the external pressure. This law is not perfectly complied with because the molecules in a gas are not quite free from cohesion, especially when much compressed, and because the diameter of the molecule is an appreciable fraction of the distance between two molecules. Another law, fulfilled only approximately for the same reasons, is that all gases have the same coefficient of expansion, as will be seen in the following table, which gives the cubical coefficient referred as a standard to the volume the gas has at 0° C.

COEFFICIENTS OF CUBICAL EXPANSION, GASES AT A PRESSURE OF FROM 300 TO 500 MM.

Air	0.003667	Carbon dioxide	0.003710
Hydrogen	0.003661	Nitrous oxide	0.003719
Nitrogen	0.003661	Cyanogen	0.003877
Carbon monoxide	0.003667	Sulphur dioxide	0.003903

The Convection of Heat.—When the air in contact with a hot stove becomes warmed, it expands and grows lighter than the other air. Owing to unbalanced forces the hot air rises to the ceiling and then spreads out to the walls. It there becomes cooled, and therefore contracts and becomes dense. As a result it descends at the walls and finally returns to the stove only to start again on the journey. During this process, called *convection,* heat is carried by the air from the stove to the most distant parts of the room. Winds consist of convection currents in the atmosphere. Some parts of the earth's surface become more highly heated by the sun than others. The air over the hot areas expands and becomes specifically lighter than the surrounding air. The general result is that the hot air is forced to rise giving place to the surrounding cooler air which blows toward the hot area as a surface wind. The hot air risen aloft spreads away toward the cool regions as an upper wind. Corresponding to the ascent of air over the hot areas is a descent of air over the cool areas. Much heat is brought from the tropical regions to temperate regions by regular winds.

Convection phenomena also occur in liquids. A large vessel of water supplied with heat at one side of the bottom becomes through the action of convection currents uniformly heated throughout. Much heat is conveyed from the equator toward the poles by means of the Gulf Stream and other ocean currents. It is probable, however, that with ocean currents differences of temperature have little to do with the motion of the water, but that the motion is caused chiefly by the action of winds that blow with great steadiness in a westerly direction across the equatorial portions of the great oceans. Difference in salinity of the ocean at different latitudes may possibly be a partial cause of the phenomenon.

Thermometry.—Before proceeding further in the discussion of heat phenomena, it will be necessary to describe some of the methods employed for measuring temperature or the degree of hotness of a body. Most commonly the methods depend upon the property of expansion. In ordinary thermometers the expanding body is either mercury or colored alcohol. The liquid, say mercury, is held in a glass tube having a fine bore and at one end a spherical or cylindrical bulb, the other end being simply closed. Above the mercury, which fills the bulb and part of the stem, is a space that is free from air and contains only a small amount of mercury vapor. When the thermometer is warmed, the mercury rises in the tube because the cubical expansion of mercury is greater than the cubical expansion of glass. The glass tube is provided with a scale, sometimes engraved directly on the tube, and sometimes engraved on some other material and mounted at the back of the tube. For a Fahrenheit scale division number 32 is placed opposite the mercury level when the thermometer is placed in pure crushed melting ice, and division number 212 is placed opposite the mercury level when the thermometer is placed in saturated steam over boiling water. As the temperature of the boiling point depends upon the atmospheric pressure, which is ever varying, the standard boiling point is taken to correspond to the average atmospheric pressure, which is measured by a barometric column of 760 millimetres. The space between these marks, the freezing and boiling points, is divided into 180 equal divisions, and then divisions equal to these are extended above the boiling point and below the freezing point. For the centigrade scale, which is generally employed in scientific work, the freezing point on the thermometer is marked 0° and the boiling point 100°. For the Réaumur scale, much used for household purposes in Germany, these points are marked 0° and 80° respectively, and finally for the De Lisle scale, which is used in Russia, the direction of the graduation is reversed, the boiling point being marked 0° and the freezing point + 150°. With this last thermometer, the greater the intensity of the *cold* the higher the number representing the temperature. Mercury thermometers permit of the measurement of rather high temperatures, mercury not boiling until the temperature of about 357° C. (674.3 F.) is reached. Still higher temperatures with mercury thermometers may be reached by checking the vaporization of the mercury through the introduction into the upper part of the tube of a compressed gas such as nitrogen. With such a thermometer the only limitation is the softening of the glass at high heats, and even this trouble is largely lessened by the use of vitrified quartz for the material of the bulb. On the other hand, mercury freezes at about —39° C. (—38.2° F.) and so becomes useless for indicating temperatures lower than this. For these lower temperatures alcohol may be employed as the thermometric substance because it resists freezing until temperatures far below any met with in nature are encountered. In addition to this advantage alcohol expands much more rapidly than mercury, thus permitting a much larger bore for the same length of degree. However, for very high temperatures alcohol is not available, as it boils at the moderate temperature of 78.3° C. (173° F.).

In practical work thermometry fairly bristles with errors. For several months after a thermometer is made the bulb gradually shrinks, probably owing to some molecular instability in the glass caused by the excessive heating employed in the process of blowing the bulb. This causes the thermometer to read too high. After each time a thermometer is used for a very high temperature the bulb on cooling fails to contract promptly to the volume proper to the new temperature, and so now the thermometer for a while reads too low; however, prolonged heating at the temperature of boiling mercury tends to put the glass into a more stable state. Also such troubles are much reduced by the use of hard glass instead of soft glass for the bulbs. Errors also arise from the following causes: non-uniformity of the bore; variations of atmospheric pressure, which cause a yielding of the bulb; failure to have the stem of the thermometer at the same temperature as the bulb; the hydrostatic pressure on the bulb due to the liquid being tested, especially when the thermometer is sunk to great depths; a variation in the internal pressure of the mercury itself on the bulb when the thermometer is inclined from the vertical position to the horizontal; a peculiar jerking motion of the mercury when it ascends a very fine bore; the fact that equal volumes of the bore marked off on the tube do not represent equal expansions of the mercury, since at high temperatures the volume of the bore indicating a degree has increased (this is quite distinct from the matter of the relative expansion of glass and mercury); irregularities in the expansion of the glass of the thermometer; and lastly irregularities in the expansion of the fluid itself, be it mercury, alcohol, air, or any other substance. This last source of error is worth much consideration because two thermometers otherwise perfect but containing different liquids, as alcohol and mercury, fail to agree in their indications. Further, we have no right arbitrarily to select any particular fluid as a standard and yet feel that our temperature scale has anything more than an empirical value. It will, however, be explained in the last section how a theoretical definition for temperature measurement can be formulated (the thermodynamic scale), agreeing fairly with ordinary thermometers, very closely with the hydrogen or nitrogen thermometer, and perfectly free from ambiguity.

In the hydrogen thermometer advantage is taken of the increase of pressure of a gas attending an increase of temperature, the volume of the gas being kept constant. The hydrogen is confined in a glass bulb about two inches in diameter which is connected by a thick-walled capillary tube with the top of one side of a U-shaped apparatus consisting of two vertical glass tubes connected by a rubber hose at their lower ends and partly filled with mercury. When the hydrogen in the bulb is warmed it tends to expand and push the mercury down its side of the U and to cause it to rise on the other side, which is open to the atmosphere. This effect is counteracted by raising the glass tube on the open side, the rubber tubing allowing this to be done The extra back pressure of the mercury forces the hydrogen back to its former volume. In measuring the pressure to which the hydrogen at any time is subjected, the difference in level of the mercury columns must have added to it the length of the barometric column measured at the time. For each degree centigrade added to the temperature, the hydrogen is found to increase in pressure about 1/273 of its pressure measured at 0° C. Similarly for each degree subtracted, the pressure decreases 1/273 of the pressure at 0° C.

If this law held to the limit, we would conclude that at —273° C. the hydrogen would lose all its pressure, thus indicating the cessation of all molecular motion — a veritable absolute zero of temperature. However, at extremely low temperatures the perfect working of this law is interfered with through the dominance of cohesion which reduces unduly the pressure of the hydrogen, and may cause it to assume the liquid or even the solid state. Nevertheless, this limiting temperature as predicted by the hydrogen thermometer agrees almost exactly with the true absolute zero of the thermodynamic scale referred to above. On this absolute scale the temperature of freezing water is approximately + 273° Abs., and temperature of boiling, + 373° Abs.

Other methods of measuring temperature depend upon change in the electrical resistance of platinum, and upon the electromotive force created when the juncture of two dissimilar metals as platinum and rhodium is heated. Very high and very low temperatures may be measured by such methods.

Conduction of Heat.—When a sterling silver spoon is placed in a cup of hot tea, the handle of the spoon soon becomes uncomfortably warm to the hand. Heat has been conducted through the silver. The molecules in the bowl of the spoon are the first to have their motion accelerated by contact with the tea. This extra motion is communicated to their neighbors which in turn pass it on until, step by step, the motion reaches the molecules in the handle. It appears that in some substances the character of connection between the molecules is more favorable to conduction than in others. As we might have expected, from the mutual grip of the molecules found in solids, that class of bodies furnishes the best conductors; but in gases, where the molecules are very loosely distributed, we naturally find the poorest conductors. Liquids as conductors occupy a position intermediate between solids and gases. Metals surpass all other materials in conducting power, silver standing at the very head of the list, while near the foot of the list of solids are found organic materials and mineral substances especially when in the porous or fibrous state, such as horn, leather, magnesia brick, asbestos fibre, sand, cotton wool, cowhair felt, and down. Great value is attached to poor conductors of heat. They are called insulators. Bone is used in joining the handles to silver tea pots. Our clothes are made of organic material woven so as to leave a multitude of fine pores, a condition favorable to insulation and met with in the fur of animals and in the feathers of birds. Saw dust and mineral wool for the same reason are made to serve as insulators of heat in the outer casing of ice boxes.

In the following table of conductivities the better conductors have the higher numbers. These numbers, called the *coefficient of conductivity*, indicate the amount of heat energy measured in calories (a *calorie* is the amount of heat energy required to raise the temperature of a gram of water one degree centigrade) conducted from one face to the opposite face of a centimetre cube of the substance when one of the faces is maintained one degree hotter than the other. The amount of heat energy conducted is proportional to the difference in temperature between the opposite faces.

Specific Heat.— In the last section the expression "heat energy" was employed, and the "calorie," its unit, was defined. If thin glass vessels containing equal weights at equal temperatures of different materials, mercury and water for example, be placed over equal gas flames so as to receive in a given time equal amounts of heat energy (equal numbers of calories), it will be found that the water will require nearly 30 minutes to get as hot as the mercury does in one minute. The water is said to have a greater capacity for heat than the mercury has. Making allowance for the heat capacity of the glass vessels and for radiation and conduction it is found that the heat capacity of mercury is 0.034 that of water. We say that the *specific heat* of the mercury is 0.034, for water is taken as the standard and its heat capacity is assigned the value 1.0. The value of the specific heat of a number of solids and liquids is given in the following tables:

SPECIFIC HEAT OF SOLIDS.

Substance	A Atomic Weight	B Specific Heat	$C = A \times B$ Atomic Heat
Aluminum	27.04	0.2022	5.45
Bismuth	207.5	0.0298	6.17
Copper	63.18	0.09232	5.82

SPECIFIC HEAT OF LIQUIDS.

Acetone	.53	Glycerine	.55
Alcohol, Ethyl	.65	Mercury	.034
Benzol	.44	Carbon disulphide	.24
Bromine	.46	Turpentine	.46
Ether	.54		

In the first table the atomic weights (the weight of the atom as compared with the weight of an atom of hydrogen) of some of the elements in the solid state are also given. The product obtained by multiplying the specific heat by the atomic weight is given in the last column. It will be observed that these products are approximately equal. This equality indicates that if we took as our standard of comparison equal numbers of atoms of a solid instead of equal weights, all elements in the solid state would have the same heat capacity. It takes about as much heat energy to raise the temperature of an atom of gold one degree as it does for one atom of aluminium. This law of Dulong and Petit also applies with some degree of approximation to compounds in the solid state — not equal heat capacity for the molecules, but for the atoms.

In the cases of gases we have two specific heats according as on the one hand the gas is confined to constant volume while being heated, or as on the other hand the gas is allowed to expand so as to keep the pressure constant. This is shown in the accompanying table where it will be seen that the specific heat at constant pressure is greater than the specific heat at constant volume.

SPECIFIC HEATS OF GASES.

Substance	Symbol	Constant volume equal weights	Constant pressure		Ratio of specific heats, equals col. 4 ÷ col. 3
			Equal weights	Equal volumes	
Air	......	.1692	.2374	.2374	1.403
Mercury vapor	Hg	......	......	......	1.666

Ether	C_4H_4O	.467	.4810	1.2296	1.03

This difference in specific heat in the same gas is due to two causes. When the gas expands not only do the molecules acquire greater kinetic energy, but in pushing each other farther apart against the attractive force of cohesion, they require a further amount of energy of the potential sort, and in pushing back the restraining pressure of the atmosphere still another large supply of energy is needed. It appears from several independent considerations that in gases far removed from their liquefying points the cohesion effect is exceedingly small, and so we conclude that the excess of specific heat of an expanding gas is almost entirely due to work done on the external pressure applied to the gas.

In the last column of the table the ratio of the two specific heats of the gases is given. This ratio is found to vary, decreasing from simple gases like mercury vapor, the molecules of which have single atoms, to complex gases like ether vapor, the molecules of which have 15 atoms. With complex molecules a large part of the energy is internal, much being stored up in the rotating motion of the individual molecules, and in the relative motion of their atoms, leaving the energy of translation of the molecules and the energy due to the pushing back of the external pressure about the same as before. It follows then that the energy associated with the external pressure is a smaller fraction of the whole energy, and that therefore, as observed, the ratio between the heat energy imparted to an expanding gas and the energy imparted to a non-expanding gas must be smaller for such complex molecules. The value of this ratio is the principal means of judging of the number of atoms in a molecule of an element in the gaseous state.

Before leaving this subject it should be remarked that the specific heat of water varies slightly with the temperature, and so it is convenient to take as the value of the calorie one hundredth the heat required to raise the temperature of a gram of water from 0° C. to 100° C.

Latent Heat.—If heat energy be imparted to a mass of ice at the point of melting, the ice will proceed to melt, but will not grow any warmer as it does so. The heat energy thus added without increasing temperature is called *latent heat*. Latent heat is devoted only to shaking the molecules of ice asunder, not to increasing their speed. Temperature depends upon the energy of motion (kinetic energy) of the molecules; latent heat only stores up energy of position (potential energy) of the molecules, and so does not produce an increase of temperature. Again, when water is being boiled, a large amount of heat energy becomes latent. The latent heat of vaporization and of melting for a variety of substances is given below.

LATENT HEAT OF VAPORIZATION.

	Calories		Calories
Water	536	Mercury	62
Acetone	126	Carbon disulphide	90
Ethyl alcohol	206	Sulphur	362
Methyl alcohol	264	Ether	91
Liquid air	47		

LATENT HEAT OF MELTING.

	Calories		Calories
Ice	80	Silver	21.07
Sulphur	9.37	Mercury	2.82
Paraffin	35.10	Iron	35.
Phosphorus	5.	Platinum	27.
Bees'-wax	42.	Tin	14.
Zinc	28.13	Bismuth	13.
Lead	5.86	Copper	30.

It should be remarked that the latent heat devoted to converting a liquid into vapor besides increasing the internal potential energy of the molecules also does work in pushing back the atmosphere, but with water this external work bears a very small ratio to the internal work against cohesion, namely, a little more than one twelfth.

Heretofore we have supposed the energy for melting or for vaporization to be derived from some external source of heat. It is, however, possible to secure a change of state through the consumption of the heat energy of the body itself. If water be left in an open vessel it will presently have evaporated entirely away. During the progress of this vaporization a thermometer placed either in the water or in the moist air above the water will show a temperature lower than that of the surrounding air. The reason of this is as follows: At the surface of the liquid, with all the irregularities of position and velocity possessed by the molecules, some of them find opportunity to fly off from the liquid surface. On the average it will be the faster going molecules that spring away first, thus leaving the more slowly going ones behind, which is the same as saying that the remaining liquid is cooler. Also in going away, the molecules fly against the back pull of cohesion, and so their velocity is checked. Indeed many are entirely stopped and drawn back into the liquid, though others escape quite beyond the range of cohesion of the liquid and diffuse among the molecules of the air. The reduced motion of these escaping molecules causes the low temperature referred to above of the vapor. Common illustrations of cold by evaporation are frequently met with. The function of perspiration is a means of regulating the temperature of the human body. In the healthy state when we are overheated the skin becomes very moist and the evaporation of this moisture, assisted by a breeze or by fanning, cools the surface. In disease the proper action of the skin may be interfered with, and becoming dry, may fail through lack of evaporation to provide the normal cooling effect. An exalted temperature of the body ensues; in other words, a fever. Certain drugs tend to promote perspiration and thus reduce the temperature of the patient. Another large factor in the temperature regulation of the body is in the water evaporated from the lungs in the process of breathing. The evaporation of ammonia that has been liquefied by pressure furnishes the cold employed in some ice machines. In the case of liquefaction the necessary latent heat may be derived from the body itself. This occurs when a salt is dissolved in water, a process that is generally accompanied by a fall of temperature, though occasionally a rise in temperature is noted. The factors governing the result in such cases are rather complicated. We have to take account of the work done by the solvent in tearing molecules away from the solid lump and in some cases the tearing of these molecules apart into electrically charged parts called ions. On the other hand a certain amount of kinetic energy is furnished by the attraction of the molecules of the dissolving substance by the molecules of the solvent. According as the back pulls or the forward pulls predominate, will the temperature of the solution be lowered or raised. If much chemical action takes place between the substance and the solvent, the solution is almost always warmed.

The temperature at which melting takes place depends upon external pressure. When a solid like paraffin expands on liquefying high pressure, which resists expansion, stops melting until a temperature slightly higher than the ordinary melting point is reached. Paraffin that under ordinary conditions melts at 46.3° C. melts at 49.9° C. when subjected to the additional pressure of 100 atmospheres. In the case of ice, which contracts on melting, melting is favored by pressure. The addition of one atmosphere of pressure lowers the melting point of ice by 0.0072° C. This fact accounts for the slipperiness of ice especially when being skated upon. The sharp edge of the skate exerts great pressure on the ice below it, which melts and furnishes a lubricating film of water. This film of water is cooler than the ice furnishing it, some of the heat of the ice having become latent, and as soon as the skate has passed over, the water immediately resumes the solid state. This process of freezing again is called regelation. Regelation is an important factor in glacier motion. The ice as it follows down a tortuous valley is continually being cracked. After the settling following this cracking, the great pressure from the upper ice fields melts the ice at the points of contact of opposite sides of a fracture, and the escaping undercooled water freezes again, thus healing the fracture. In this way the glacier appears to follow down the irregularities of a valley as would a very viscous mass.

MELTING POINTS.

	Degrees Centigrade		Degrees Centigrade
Paraffin	55	Bismuth	270
Ice	0	Cadmium	318

Antimony	440		

Saturated and Unsaturated Vapors.—When a liquid, water for example, is placed in a vacuous enclosure kept at constant temperature by artificial means, it immediately begins to evaporate, the vapor presently attaining a maximum density and pressure. The vapor as well as the space occupied by it is then said to be *saturated.* Before this maximum pressure was reached the vapor was unsaturated. If the temperature of the whole apparatus be now raised, more water will commence to evaporate, and the vapor will increase in density and pressure before it is again saturated. Had the saturated vapor formed in the first place been shut off from the water surface before raising the temperature, it would not become as dense as when it had the water evaporating into it, and so we would then pronounce the heated saturated vapor as unsaturated. On the other hand if a mass of unsaturated water vapor be cooled, the density of the vapor will at a certain temperature be sufficient to cause saturation. Below this particular temperature, called the *dew-point,* some of the moisture will condense. In some cases, however, when there are no nuclei in the form of dust particles, free ions, etc., the vapor may cool appreciably below the dew-point without immediate condensation. The vapor is then said to be supersaturated. The presence of air has only a very small influence on the density and pressure of saturated water vapor in contact with water, especially when the temperature is not high.

When the temperature of water or other volatile liquid is raised so high that the pressure of the saturated vapor becomes as great as that of the atmosphere, bubbles of the vapor begin to form in the body of the liquid. This constitutes the process of boiling. The temperature at which a liquid boils is much influenced by the external pressure. The boiling point is the same as the temperature at which the pressure of the saturated vapor equals the external pressure on the bubble. In the following table these temperatures with their corresponding pressures are given for water.

PRESSURE OF WATER VAPOR.

Temperature degrees centigrade	Pressure in millimetres of mercury	Temperature degrees centigrade	Pressure in millimetres of mercury

A saturated vapor in contact with its liquid offers a beautiful instance of dynamic equilibrium. We conceive that molecules are ever leaving the surface of the water, adding themselves to the vapor. At the same time molecules of the vapor coming near to the liquid surface or plunging into it are caught by the cohesion of the liquid, thus subtracting themselves from the vapor. A less dense vapor would lessen the latter process and would allow the vapor to grow denser; a denser vapor would increase it and allow the vapor to fall to a state — the saturated state — when the rate of evaporation is just equal to the rate of condensation.

The degree of moistness of air is expressed by the phrase *hygrometric state*. The hygrometric state does not express the density of the water vapor present, but instead expresses the quotient obtained by dividing the density of the vapor present by the density of the vapor required to saturate the air. If pressures were employed instead of densities in getting the quotient, substantially the same result would be obtained. Still another common way of defining hygrometric state is to take the quotient obtained by dividing the pressure of the vapor corresponding to the dew-point by the pressure of vapor saturated at the temperature of the air, a method closely agreeing with the former ones.

The Critical State.—When the temperature rises, the density of a saturated vapor in contact with its liquid becomes denser, while the liquid itself expands and becomes less dense. If the heating of the liquid and vapor takes place in a strong closed vessel containing not too much or too little of the liquid, after a while a temperature is reached at which the saturated vapor becomes as dense as the liquid. At this point they become identical in their physical properties; the line of demarkation of liquid and vapor fades away, and the two fluids begin to mix. The temperature at which this phenomenon occurs is called the *critical temperature*, the corresponding pressure is called the *critical pressure*, and the liquid is said to be at the *critical state*. Above the critical temperature it is impossible to distinguish between a liquid and its vapor. No matter how great the pressure, a gas or vapor cannot be forced into the state of a liquid that is obviously distinct from the vapor unless the vapor be cooled below the critical temperature.

CRITICAL TEMPERATURES AND PRESSURES.

Ethylene	+ 10.	51.7

Radiation.—We have described two methods by which heat energy may be transferred from one place to another — by conduction and by convection. A third method remains to be studied. How does the heat of the sun reach us? By means of waves in the luminiferous ether. Go to a quiet pond in which a piece of wood may be floating. Standing on the shore, vibrate your hand up and down in the water. Waves run from your hand over the surface of the water to the wood and cause it to vibrate up and down. Energy from the hand has been transferred to the wood by means of waves. These waves consist of the successive vibration of successive particles of water, each particle receiving energy from behind and passing it on to the front. It is much the same with heat waves. The ether, which fills all space, is capable of being set into vibration by vibrating molecules and of handing this vibration on step by step in the form of waves. Molecules acted upon by these waves are themselves set into vibration. The vibrating molecules of the sun generate ether waves, and the ether waves generate vibration of the molecules of bodies on the earth. These ether waves are called *radiant heat*. We now have a very wide range of ether waves under experimental control. From the large waves generated by electrical oscillations used in wireless telegraphy and sometimes a quarter of a mile long we may pass by insensible gradations with only two breaks to the extremely minute waves supposed to constitute Roentgen's X rays. Dark heat waves or infra-red rays, ordinary light, and ultra-violet light belong to the middle of the series. Quite recently Blondot has discovered a peculiar radiation which he designates as *n rays*. There are indications that n rays are ether waves about one fifth of a millimetre in length. All of these waves behave very much like light. They all have the same velocity as light, namely, 186,300 miles a second (n rays not tested yet). All except Roentgen rays may be reflected, refracted, polarized, and absorbed by transmission to a degree depending upon the substance used for transmission and the particular wave-length of the rays.

Thermodynamics.—The most cogent reason for discarding the caloric theory of heat is that heat may be generated from that which is not in any sense substance — heat may be derived from mechanical energy. Heat is generated when a brass button is rubbed on the carpet, when a bullet is struck with a hammer, and when two pieces of ice are rubbed together, a process resulting in their melting. The relation between mechanical energy and the heat energy generated by its consumption was first carefully investigated by J. P. Joule before 1850. One pound-calorie of heat energy is obtained from 1,400 foot-pounds of mechanical energy. That is to say, the energy due to the fall of 1,400 pounds through the distance of a foot is sufficient if transformed into heat to raise the temperature of a pound of water through one degree centigrade. This number of foot-pounds is called the *mechanical equivalent of heat*, for it has been found that the process is reversible. When by means of an air-engine or a steam-engine one pound-calorie of heat is consumed in generating mechanical energy, 1,400 foot-pounds of the latter are obtained. *The first law of thermodynamics* states that when mechanical energy is converted into heat, or when heat is converted into mechanical energy, the quantity of mechanical energy is equivalent to the quantity of heat energy. *The second law of thermodynamics* states that it is impossible for a machine without the consumption of external energy to make heat pass from a body at a low temperature to one at a high temperature. When external energy is supplied, the transfer of heat becomes possible through the use of a reversible engine. A reversible engine is one that while it may on the one hand take heat from a high temperature source and transfer it to a low temperature escape with a conversion of a definite portion of the heat into mechanical energy, may, on the other hand, when its operation is reversed by the application of external mechanical energy equal in amount to that generated in the first operation, take back the same heat from the low temperature escape and transfer it together with an amount of heat equal to that lost in the first operation to the high temperature source. The fraction of the heat leaving the high temperature source converted into mechanical energy, or when the engine is reversed, the fraction of the heat entering the high temperature source obtained from the mechanical energy applied has been shown by Carnot to be the same for all reversible engines of whatever nature and working with any substance whatsoever, provided they work between the same temperatures. This fraction may be called the *thermodynamic efficiency* of the engine. The thermodynamic efficiency of good steam-engines occasionally exceeds 20 per cent. This means that 20 per cent of the heat energy supplied to engine is transformed into mechanical energy, the remaining 80 per cent escaping unused at the condenser or exhaust.

Using the provisional absolute scale as indicated by a hydrogen thermometer experiment shows that the efficiency, W/H, is roughly represented by the following equation in which W stands for the mechanical energy realized, H for the heat (measured in the equivalent foot-pounds) leaving the high temperature source, T for the temperature of the source, and T^1 for the temperature of the cooler escape.

$$\frac{W}{H} = \frac{T - T^1}{T}$$

This suggests a new definition for a temperature scale, namely that numerical values of temperatures be so adjusted as to fulfil exactly the above formula. Since the formula only fixes a ratio between the temperatures T and T^1 corresponding to a given efficiency, an infinite number of sets of numerical values for these temperatures could be found to satisfy the formula. But if it be decided that a definite numerical range, say one hundred degrees, be comprised between the freezing and boiling points of water, only one set of values becomes possible. This decision makes the value of the freezing point very nearly $+273°$ Abs., and the value of the boiling point $+370°$ Abs. Lord Kelvin was the first to propose this *thermodynamic scale*. Theory shows that its indications would correspond exactly to a thermometer containing a perfect gas. Hydrogen is not quite a perfect gas, for its molecules attract each other slightly and they occupy an appreciable fraction of the space holding the gas. Hence there are small deviations of the hydrogen thermometer from the thermodynamic scale, especially at low temperatures. It should be added that the practical realization of the thermodynamic scale, though much aided by very ingenious mathematical considerations relating to careful experiments made by Regnault on the expansion and the increase of pressure observed when hydrogen and other gases are heated, and by Joule and Kelvin on the temperature changes suffered by gases in expanding through a porous plug, still that realization is far from complete. Nevertheless, the thermodynamic scale offers us a theoretical ideal which is absolutely independent of the thermal properties of any particular substance, but is only related in a definite way to a fixed universal law.

When a *small* amount of heat is transferred from or to a gram of a substance, the heat transferred (measured in calories), divided by the average absolute temperature of the substance at the time of the transference is called the *change of entropy* of the substance. For convenience, the zero of entropy is generally taken to correspond to water at the freezing point and under the normal atmospheric pressure. It may be shown that when two bodies at different temperatures are placed in contact and their temperatures become equalized, the average entropy rises, for from the above definition of entropy, the heat leaving the hotter body must reduce its entropy less than it increases the entropy of the cooler body into which the heat enters. Consequently the average entropy of the universe is constantly rising and tending toward a maximum. At the same time the availability of the energy of the universe is tending toward zero.

ERNEST R. VON NARDROFF, E. M., D. Sc.,
Head Science Department Erasmus Hall High School, Brooklyn, N. Y.

Heath, Daniel Collamore, American publisher: b. Salem, Maine, 19 Jan. 1857. He was graduated from Amherst in 1868, became junior member of the firm of Ginn and Heath, publishers of Boston, and in 1886 established in Boston the house of D. C. Heath & Company, publishers of text-books for schools and colleges, with branch offices in New York, Chicago and London.

Heath, Francis George, English writer: b. Totnes, Devon, 15 Jan. 1843. He entered the civil service as a clerk of the higher division in the customs department in 1862, and was transferred as surveyor to the outdoor division of that department in 1882. In 1896 he founded and in 1897 became editor of the Imperial Press, in connection with which he directed from 1896 the publication of the Imperial library. He was for several years prominent in his activity for the preservation and extension of open spaces in and about London; and published: 'The «Romance» of Peasant Life' (1872); 'The Fern World' (1877; 10th ed. 1902); 'Our Woodland Trees' (1878); 'Where to Find Ferns' (1881), and other volumes.

Heath, Perry Sanford, American journalist and politician: b. Muncie, Ind., 31 Aug. 1857. He learned the printer's trade, in 1877 became a newspaper reporter, in 1878–80 was editor of the Muncie *Times,* and in 1881 established the *Pioneer* at Aberdeen, S. D. In 1881–93 he was a correspondent at Washington, D. C., in 1894–6 president and general-manager of the Cincinnati *Commercial-Gazette* (now the *Commercial-Tribune*), and in 1897–1900 was first assistant postmaster-general of the United States. In 1900 he was elected secretary of the Republican National committee.

Heath, William, American soldier: b. Roxbury, Mass., 7 March 1737; d. there 24 Jan. 1814. When the Massachusetts congress in 1774 voted to enroll 12,000 minute men, volunteers from among the militia, Heath, then a farmer in Roxbury, was commissioned as one of the generals. In June 1775 he received the appointment of brigadier in the Continental army, and in August 1776 was created major-general. When the troops moved to New York Heath was stationed in the highlands near King's Bridge, with orders to throw up fortifications for the defense of that important pass. In 1777 he was transferred to Boston, and the prisoners of Saratoga were entrusted to him. In June 1779 he was again in New York, at the Highlands, with four regiments, and was stationed near the Hudson till the close of the war. He was the last surviving major-general of the war. Consult: 'Memoirs of Maj.-Gen. Heath, containing Anecdotes, Details of Skirmishes, Battles, etc., during the American War' (1798).

Heathcock, Heath-hen. See BLACKCOCK.

Heath'cote, Caleb, American merchant: b. Chesterfield, Derbyshire, England, 6 March 1665; d. New York 28 Feb. 1721. He was successful in a mercantile career in New York from 1692, save for the years 1698–1701, was a councillor of the province, was a petitioner for a license to build Old Trinity, was mayor of New York in 1711-14, and held other posts, among them those of judge of Westchester County; commander-in-chief of the military of the colony; surveyor-general; and receiver-general of customs for North America. His letters and despatches afford interesting glimpses of the history of his time.

Heaths, or Heather, a group (*Ericoideæ*) of the order *Ericaceæ.* The leaves of the heaths are simple and entire; their flowers oval, cylindrical, or even swelled at the base; the anthers of many with horn-like appendages. From 400 to 500 species are known, 12 or 15 of which inhabit Europe, and have small flowers, while all the remainder are natives of South Africa, many of them bearing brilliantly colored flowers, and forming one of the most characteristic genera of that region of dry plains. The common heath of Europe (*Calluna vulgaris*), a low shrub, often covers exclusively extensive tracts of dry land, and is used in domestic economy; mixed with oak-bark it is employed in tanning; and also, when tender, for fodder. This species forms the «heather» of British moorlands; but in Scotland are two other species, whose flowers are the «heather-bells» of Scottish song and story. Many South African species, remarkable for the size and beauty of their flowers, are much cultivated in greenhouses, and have been so improved and hybridized that they exhibit a wonderful richness of color.

Heating and Ventilation. Generally speaking, the methods of heating buildings may be divided into two general classes — the direct and the indirect system, or a combination of the two. Heating by means of an open fire, by a stove, and by radiators placed in the rooms to be warmed are examples of the former method, while furnace-heating and heating by means of a current of air warmed by indirect steam or hot-water coils are examples of the latter method. When a direct radiator is fitted with a connection to the outer air, it is said to be arranged on the direct-indirect principle. Hot water, steam, or electricity may be the vehicle used for conveying heat to radiators. Ventilation is only obtained by supplying air, and in some systems of heating and ventilation the air is made so hot that part of it is available for heating purposes. This is the case in furnace-heating.

It is well known that when two bodies of different temperature exist, heat passes from the warmer to the cooler body until their temperatures are equal. If a building be of a temperature of 70° F. and the outer air of a lower temperature, heat will be transmitted by the walls, windows, and other exposed surfaces, and the temperature of the air in the building will be lowered. It is only by supplying to the building an amount of heat equivalent to that transmitted by the walls and windows that it is possible to maintain the building at constant temperature. If we supply more heat than is transmitted by the walls, the temperature of the room rises.

Heat is measured in units which have as exact a value as a ton of coal or a pound of sugar. British physicists have selected as the unit of heat that quantity which will raise the temperature of one pound of water one degree on the Fahrenheit scale when the water's temperature is near 39° F. This unit is designated as the British thermal unit. It is known with reasonable accuracy just how many heat-units are transmitted by each square foot of wall, window, and other exposed surfaces of the various materials used in building construction, under such extreme conditions as to building and outside temperature as may exist. With these data and the plans of a building, calculation will show the heat-loss from a building or a room, and the heating-apparatus should be proportioned to supply this amount of heat. Allowances are made for various conditions that may exist, depending upon the judgment and experience of the designer. The heat required can be supplied by radiation from an open fire or from a stove, but this is an unsatisfactory method. Direct radiators supplied with steam or hot water can be placed in a room to furnish the heat necessary, or the heat may be supplied by hot air from a furnace, or by air heated by indirect radiators supplied with steam or hot water.

Heating by hot air is a slightly more expensive method than heating by direct radiation, for to be effective the air must be taken in from outdoors, sometimes at very low temperature, and heated above the temperature of the room to be warmed. If cold air at 40° F. is heated to 100° F., and is supplied to a room at this temperature, it is evident that as soon as this air is cooled from 100° to 70° no more heat can pass from the air to the room if the temperature of the latter remains at 70°. Under these conditions only one-half of the heat that has been supplied to the air is available for heating the room. This will tend to show why heating by hot air is more expensive, estimated from the cost of fuel, than the direct system. When the advantages of the air supply that accompanies indirect heating are taken into account the increased fuel cost becomes insignificant.

Direct heating is usually obtained by steam and hot-water radiators. Although manufacturers have greatly improved the appearance of direct radiators, at best they are unsightly and objectionable from an artistic point of view. This objection may be overcome by concealing the radiators in boxing beneath windows, when the walls of the building are thick enough to permit the boxing to be built in without projecting into the room. A screened opening is provided in the front of the boxing near the floor, and one at the top over the radiator, to permit a circulation of air, so that the radiators can be effective.

In residence-heating it is frequently the custom to heat the first floor by the indirect method and the upper stories by the direct. When an owner will pay for it, the indirect method is used throughout the building. Such a system is much to be preferred to the direct.

The simplest method of connecting steam-radiators is by the gravity system, and it is usually employed unless steam exhausted by engines is available for heating. This system comprises distributing-mains connecting with the top of the boiler, and with vertical riser-pipes from which horizontal branches lead to the radiators. Usually a return pipe is connected to the opposite end of the radiators from that at which steam is admitted, this return connecting, through return risers and mains, with the boiler at a point below the water-line. As the steam in the radiators condenses, the resulting condensation flows back by gravity through the return pipes to the boiler. The flow and return pipes are made sufficiently large to insure a practically uniform pressure throughout the system. The system is simplicity itself, as the fire only needs attention. When the boiler is once filled, no more water is required.

It is only recently that the steam exhausted by engines and pumps has been used for heating. Before this time steam direct from the boilers was used in direct radiators for heating mills and factories. The radiators consisted of coils of pipe suspended from the walls or ceilings. Sometimes the condensation was returned to the boilers by a pump or other device; sometimes it was allowed to go to waste. As the steam exhausted by engines, pumps, etc., contains a very large percentage of the heat that it contained upon entering the engine, someone conceived the idea of utilizing this steam for heating buildings, thereby saving the steam direct from the boilers that would otherwise have to be used. This practice is now almost universal where exhaust-steam is available, and the saving that it has occasioned is very great. By placing what is known as a back-pressure valve in the exhaust-pipe, sufficient pressure is maintained to cause the exhaust-steam to circulate through the pipes and radiators of the heating-system, the latter being connected to the exhaust-pipe between the engine and the back-pressure valve. The condensation that occurs in the heating system can be collected and returned to the boilers by various methods. Usually a pump or similarly acting device is employed.

A hot-water system arranged on the gravity-principle has flow and return pipes similar to the gravity-system of steam-heating described. The entire system is filled with water. As the water is warmed in the boilers it becomes lighter in weight per cubic foot, making a difference in pressure between the flow and return pipes and causing a circulation to begin. The water rises in the flow pipes to the radiators and is there cooled. On its return to the boiler the water is again heated, and so the circulation is maintained. As the difference in weight between the water in the flow and return pipes is very slight, the motive power producing the circulation is very slight also. Hence the pipes have to be relatively larger than for steam-heating and very carefully connected to avoid excessive friction, which would stop or retard the circulation. As large pipes are costly, in some large plants heated by hot water, a circulation is brought about by pumps.

Direct steam-radiators emit about 250 British thermal units per square foot of radiating surface per hour, and hot-water radiators about 180 heat-units per square foot. Consequently about one third more radiating surface is necessary with hot water than with steam. The pipes also must be larger, hence the hot-water system is the most expensive in first cost. Hot water, however, is cheaper to operate, for water will circulate with a very low fire and supply the small amount of heat required to warm a building in mild weather.

With direct steam-heat, operating on the gravity-system, it is impossible to vary to any appreciable extent the temperature of steam in a radiator; hence with this system the alternative is, all the heat the radiator will supply or none at all. This is the principal objection to heating by means of direct steam. Air warmed by the relatively cooler hot-water radiators is thought by some to be more agreeable than air heated by steam-radiators.

With indirect heating the lack of means of regulating the steam-temperature is not of so much moment, for the air-supply can be partly shut off by partly closing a register in mild weather; or else, if the full air-supply is required at all times, arrangements can be made for passing part of the air-supply around the indirect radiators, which is called "by-passing" them. Another method is to divide the indirect radiator into independent sections and place some of the sections under the control of a regulator that automatically shuts off the supply of steam when the room becomes too warm. The method of "by-passing" the radiator, or subdividing it, is used mainly with the fan-system of supplying air.

The cost of indirect hot-water heating is greater than that of indirect heating by steam, as the radiators and pipes must be larger, the same as in direct heating. Hot water is, however, cheaper to operate. The principal objection to its use in indirect heating is the possibility of damage to the indirect radiators through the freezing of the water in them in severe weather, if the circulation should from any cause be arrested.

The direct-indirect system consists of direct radiators connected with the outer air by means of an opening in the building-walls beneath the window-sill, the radiator being set under the window opposite the opening. With this system there is always the possibility of getting too much air when the wind blows strongly. Furthermore, in situations where the air is smoke-laden or dusty, it is not easy to keep the smoke and dust from entering a building supplied with air by this means.

As has been said, a supply of air may be brought about by the gravity-method or by means of fans. In the gravity-method the heated column of air in the flue is lighter than the outdoor air; hence it rises. As in the case of hot-water heating, the motive power is very slight, and it becomes less as the outdoor temperature increases. For this reason the gravity system is not a positive one, and it cannot be depended upon to supply much air in mild weather. Its use for schoolhouse ventilation is therefore to be deprecated. An important advantage of this system is its simplicity, as no machinery is required with it.

With the fan-system some type of fan is employed, to give a positive supply of air. The air is blown over coils, usually steam, and delivered to the room at a temperature slightly above that of the room, if the air-supply is intended to ventilate only, or at a higher temperature if the air-supply is to carry with it the heat necessary to balance that transmitted by the walls and windows. In the former event the indirect coils act as tempering-coils, being sufficient only to raise the air to about 70° F. If the air-supply is to furnish heat for warming the rooms, additional coils, known as supplementary coils, are provided. These raise the air-temperature from 70° to from 100° to 120° F. Sometimes the supplementary coils are combined with the tempering coils, the whole being divided into several independently controlled sections. In some instances the supplementary coils are divided into a number of small coils, one being placed at the base of each air-supply flue, and so arranged that, by adjusting dampers controlled by hand or automatically, the temperature of the air supplied to any room can be regulated independently of that supplied to other rooms. If all of the air is passed through one group of coils, independent regulation of the temperature of the air in the branch ducts and flues is impossible. This independent regulation can be obtained, however, by the double-duct system. The coils are divided into two groups, one for tempering and one for supplying additional heat. All of the air is passed through the tempering coils, but only part of it through the supplementary coils, the balance "by-passing" the latter coils and flowing through a system of ducts, usually located below the system conveying the air of higher temperature, to the base of the flues. At the junction of the two ducts a mixing-damper is provided, so arranged as to open in one duct as it closes in the other. By adjusting this damper the air can be mixed to give the resultant temperature required.

In situations where direct radiators can be used, either exposed or concealed, it is becoming the practice to provide sufficient heat by means of direct radiation to balance the heat transmitted by walls, windows, etc., also a supply of tempered air for ventilation only. As previously explained, when heat is supplied by means of air, the fuel-cost is greater than with direct heating; so that a building can be warmed with less coal with the direct than with the indirect system. Furthermore, with the combined system, heating can be done at night, and at other times when air-supply is not required, at minimum cost. This system is particularly adapted for schoolhouse heating and ventilation.

The withdrawal of impure air from rooms is effected by fans connected to a system of vent-flues extending upward to an attic space, or downward to a cellar or basement, if the latter is more convenient. Another method of accelerating the outflow of air through flues rising to the roof of a building is by the use of aspirating coils. These are simply coils of pipe, or radiators, placed in the vent-flues as low down as possible, the coil heating the air and thus causing it to rise. Theoretically the aspirating-coil is a more expensive method of moving air than the mechanical method, as far as fuel-cost is concerned. It is simpler, however, than the fan-system.

Fans are of two general types — the disk or propeller fan, and the centrifugal blower. The former is constructed somewhat like a ship's propeller, and the current of air that it produces is mainly in a direction parallel with the shaft of the fan. The centrifugal blower, as usually designed, consists of a wheel with blades, something like a ship's paddle-wheel, enclosed in a casing. The air enters at the axis of the fan, and when the fan-wheel is revolved the air is discharged radially to the casing by the action of centrifugal force. Relatively speaking, the propeller-fan will move a large volume of air with small expenditure of power, but the pressure at which it will deliver air is limited. The centrifugal fan will deliver air under a greater pressure and the power required is therefore greater. In some buildings, where the system is of ducts and flues, is long, and the cross-sections are comparatively small, to save space, quite a pressure is required to force the necessary amount of air through them. For such situations the centrifugal blower is best adapted. When the ducts are short and of ample area, it is best to use the propeller type of fan.

Fans are driven usually by small steam-engines or by electric motors. Sometimes gas-engines have been used with success. Where an engine is used, it is necessary for the boilers to operate under a sufficient pressure to drive the engine, or at least under a higher pressure than is commonly used with the gravity-system of connecting radiators. If the steam exhausted by the engine is condensed in the heating-system, as it usually is, a pump is necessary to return the condensation to the boilers. In large office buildings, public buildings, theatres, etc., where a skilled engineman is employed to care for the plant, the use of a pump, an engine, etc., does not present an objection. On the other hand, in the case of schoolhouses, large residences, churches, etc., which are apt to be looked after by less skilled attendants, an engine, pump, and other apparatus that must go with them are open to objection. In such cases electric motors can be used if current can be obtained from an electric-supply company. The entire heating system can then be operated on the simpler gravity-system. Of course the current must be paid for, but in many locations its cost will be more than offset by the greater simplicity of the motor-driven system.

Heating by electricity is not done to any great extent, on account of the excessive cost. When coal is burned under a steam-boiler, it is not uncommon for 60 per cent of the heat in the fuel to be realized in the steam which can be used for heating. If the heat in coal be transformed into electrical energy, and this again transformed into heat, less than 10 per cent of the heat in the fuel will be realized for heating.

Hea'ton, Augustus George, American artist: b. Philadelphia, Pa., 28 April 1844. He was the first pupil from the United States to study at the Paris Beaux-Arts, where he was trained by Cabanel. Later (1878–80) he was in the studio of Léon Bonnat, and exhibited considerably at the Salon. Among his paintings are: 'Washington at Fort Duquesne'; 'The Recall of Columbus,' engraved on the 50-cent Columbian Exposition stamp of 1893; a portrait of Bishop Bowman; and 'Hardships of Emigration,' engraved on the 10-cent Omaha Fair stamp. He wrote 'The Heart of David — the Psalmist King' (1900).

Heaton, John Henniker, English publicist: b. Rochester, Kent, England, 1848. He was for some time prominent in Australian journalism and has sat in the House of Commons for Canterbury from 1885. He carried the Imperial Penny Postage Scheme in July 1898, introduced telegraph money orders into England, the parcel-post to France, and has been connected with other progressive schemes. He has published: 'Manners and Customs of the Aborigines of Australia'; 'Australian Men of the Time'; etc.

Heaton, John Langdon, American journalist: b. Canton, N. Y., 29 Jan. 1860. He was graduated from St. Lawrence University in 1880, entered journalism as a member of the Brooklyn *Times* staff in 1881, and in 1897 became assistant editor of the New York *World*. His publications are: 'The Story of Vermont' (1889); 'Stories of Napoleon' (1895); 'The Book of Lies' (1896); 'The Quilting Bee' (1896).

Heaven, in a physical sense, is the azure vault which spreads above us like a hollow hemisphere, and appears to rest on the limits of the horizon. Modern astronomy has taught that this blue vault is, in fact, the immeasurable space in which earth, sun, and planets, with the countless host of fixed stars, revolve. The blue color of the heavens is due to the action of minute particles in the air upon the blue rays in sunlight.

In ancient astronomy, heaven denoted a sphere or circular region of the ethereal heaven. The ancient astronomers assumed as many different heavens as they observed different celestial motions. These they supposed to be all solid, thinking they could not otherwise sustain the bodies fixed in them; and spherical, that being the most proper form for motion. Thus they had seven heavens for the seven planets: the moon, Mercury, Venus, the sun, Mars, Jupiter, and Saturn. The eighth was that of the fixed stars, which was particularly denominated the firmament. Ptolemy adds a ninth heaven, which he calls the *primum mobile*. But others admitted many more heavens, according as their different views and hypotheses required: Eudoxus supposed 23; Regiomontanus 33; and Fracastoro no less than 70.

In theology, this word denotes the upper and nobler region of God's universe, in contrast with the earth, the lower part assigned to men for their habitation. Of the belief in the existence of some special scene of the presence of Deity, the majority of the known religions of the world bear ample evidence. According to Aristotle all men, whether Greeks or barbarians, had a conception of God; and all united in placing the residence of the gods in the most elevated regions of the universe. This idea runs through the Persian, Egyptian, German, Scandinavian, and indeed of all the ancient religions in which the belief in a supreme being assumes any other form than the pantheistic; and even though the pantheistic philosophers may have denied that any peculiar locality could be regarded as the peculiar habitation of the Deity, we find that the popular belief and worship of the sect is evidently grounded upon a contrary opinion. In addition, however, to its being the special seat of the Deity, heaven also denotes the place, or the state or condition of blessed spirits, and of the souls of just men either immediately after physical death or at some certain period subsequent to it. All the religious systems which include the immortality of the soul involve, at least in substance, the idea of a future state of happiness as a reward for a virtuous life. The delights of the heavens of the various creeds differ greatly in kind. The pleasures of the classical Elysian fields were to a great extent pleasures of sense; the German warrior believed he would be transferred to a region where he would be able to pursue his old fierce enjoyments, and the American Indian cherishes the notion that he quits this world for a happier hunting-ground. Among Christians the general opinion is that heaven is the residence of the Most High, the holy angels, and the spirits of just men made perfect, that this abode is eternal, its joys entirely spiritual; it is believed also by many that the just who are free from sin are admitted into heaven immediately after death; also that the souls of the patriarchs, prophets, and in general the good, were detained, before the new dispensation, in a temporary abode till the coming of the Redeemer. See IMMORTALITY.

Heaves, or Broken Wind, a disease of the horse generally described as unsoundness of the respiratory organs. The disease is not well understood by veterinarians and the treatment is unsatisfactory. It is generally conceded that the disease is incurable. The characteristic symptoms are labored breathing, dilated nostrils, bloodshot eyes and dependent belly. Horses with this disease often drop down while at work and succumb to congestion of the lungs, hemorrhage or suffocation, the direct result of the heaves. Upon post-mortem examination the stomach is found distended and to have thinner walls than in the normal horse.

Hebe, hē'bē, according to Greek mythology, the goddess of youth, and the cup-bearer on Olympus until replaced by Ganymede. She was a daughter of Zeus and Hera, who gave her as a wife to Heracles, in reward of his achievements. At Rome she was worshipped as Juventas. She is described by some authorities as a divinity who had it in her power to make old persons young again. In the arts she is represented with the cup in which she presents the nectar, under the figure of a charming young girl, her dress adorned with roses and wearing a wreath of flowers. An eagle often stands beside her, which she is caressing.

Heber, hē'bėr, **Reginald,** English Anglican bishop and poet: b. Malpas, Cheshire, 21 April 1783; d. Trichinopoli, India, 1 April 1826. He was educated at Brasenose College, Oxford, distinguished himself by the English prize poem —'Palestine,' was elected to a fellowship in All Souls' College, traveled in Germany, Russia, and the Crimea, entered holy orders in 1807, and became the incumbent of Hodnet, Shropshire. In 1812 he was appointed prebendary of St. Asaph, in 1815 Bampton lecturer at Oxford, in 1822 preacher at Lincoln's Inn. From 1822 until his death he was bishop of Calcutta, at that time constituting one very extensive diocese, in all parts of which he traveled to the furtherance of the mission work in progress. He completed the establishment of Bishop's College, Calcutta, begun by Bishop Middleton. Heber is best known for his hymns, 58 of which, including the familiar 'From Greenland's Icy Mountains,' 'Brightest and Best,' and 'Holy, Holy, Holy!' appear in 'Hymns Written and Adapted to the Weekly Church Service of the Year.' In prose he wrote 'A Life of Bishop Jeremy Taylor' (1822), and 'A Journey Through India' (1828). Consult the 'Life' by Smith (1895).

Hébert, Jacques René, zhāk rē-nā ā-bār, French journalist and politician: b. Alençon, Orne, 15 Nov. 1755; d. Paris 24 March 1794. At the beginning of the French Revolution Lemaire published a journal supporting constitutional principles under the title 'Père Duchesne.' The Jacobins soon established a rival 'Père Duchesne,' of which Hébert became editor. The journal owed its success to the cynical virulence with which it advocated the popular cause, and abused the court and the monarchy, and soon had the field to itself. He was a member of the Revolutionary Commune that approved the massacres in the prisons in September 1792, was soon after substitute attorney of the commune, and employed all his influence in forwarding a project to establish the authority of the commune on the ruins of the national representation. The Girondists, who were at that period contending against the Mountain, had credit enough to procure the arrest of Hébert 24 May 1793. Again restored to liberty, he assisted with all his power and influence in the proscription of the Brissotins. Their downfall hastened his own. With Chaumette he established the 'Feast of Reason,' and afterward accused Danton of having violated the nature of liberty and the rights of mankind. This terrified both Danton and Robespierre, who suspended their mutual jealousies to accomplish his destruction; and Hébert, with the greater part of his associates, was arrested and guillotined.

Hébert, Louis Philippe, Canadian sculptor: b. Sainte Sophie d'Halifax, Quebec, 27 Jan. 1850. He studied for several years in Canada, and later in Paris, where he established his studio. In 1894 he won the Confederation medal awarded by the Canadian government. Among his works are historical subjects executed for public buildings in Quebec, Ottawa, and Montreal.

Hebrew Language and Literature, the tongue in which the ancient Jews spoke and wrote, and the books produced by that people during their settlement in Palestine as an independent nation; these latter constitute the Hebrew Scriptures and are looked upon by the Hebrews as containing the inspired word of God. See JUDAISM—HEBREW LANGUAGE; JEWISH LITERATURE; JEWISH PHILOSOPHICAL WRITERS; THE JEW IN ART, SCIENCE, AND LITERATURE; THE TALMUD; THE MASORAH; THE CABALA.

Hebrews, one of the canonical books of the New Testament, usually spoken of as "The Epistle to the Hebrews." The fact that it lacks the introductory formula naming author and recipients, to be expected in every ancient letter, has led some to deny that this writing is a letter. But this form may in this case, as often, have been placed on a separate sheet and become lost, or for some other reason have failed to be copied. At any rate many expressions show that it really was a letter addressed by some individual to a definite group of early Christians. In the King James version it was styled "The Epistle of Paul the Apostle," and thus has been perpetuated an early Alexandrian tradition, which later became the universal opinion for many centuries. But this view was at first unknown in Rome and the West, where are the earliest traces of the use of this writing, and it differs from the acknowledged epistles of Paul in both style and thought. The language is here more idiomatic and choice; clauses and sentences are connected by an array of conjunctions largely different from those used by Paul; instead of his abrupt, almost disconnected course of expression, earnest to vehemence, we find in Hebrews a series of balanced periods, flowing smoothly even when most emphatic, and a style abounding in almost artificial devices of rhetoric. There is no less difference in the theological conceptions and their presentation. While not antagonistic to Paul's doctrines, being rather complementary, the doctrinal teachings here are yet variant, as, for example, the teachings as to the divine Sonship of Christ; the nature of faith, and the value of the law of Moses.

While the Pauline authorship is now set aside as out of the question by the practically unanimous judgment of critics of every school, there is no general agreement as to who did write the book. Clement of Rome and Luke have been urged for no reasons except valueless suggestions made by Clement of Alexandria and his pupil Origen. Harnack has conjectured that it may have been written by Priscilla in association with her husband Aquila, but this view can satisfy only such as regard it as addressed to Roman Christians. The conjecture of Luther that Apollos was the author has been widely accepted, while the later suggestion that it was written by Barnabas has met with the approval of many scholars of the highest rank. The latter view has in its favor, to be sure, the only ancient testimony of real weight, that of Tertullian, but it must be allowed that either Barnabas or Apollos would meet all the requirements of the case so far as they are now known, and consequently that the authorship cannot be positively decided.

There is no less uncertainty in naming the persons to whom it was originally addressed. The title prefixed very early, though in all probability not originally, was "To Hebrews," and the view that it was addressed to Jewish Christians is nearly universal. Not a few scholars, however, have lately declared in favor of the view that it was written rather to Gentile Christians. The decision hinges on the answer to the question whether the danger against which the author warns his readers is relapse into heathenism or relapse into Judaism. On the one side it is urged that relapse into Judaism could not properly be designated "apostasy from the living God," while on the other side it is urged that, while Judaism was in the author's mind good as compared with heathenism, yet its acceptance at cost of a surrender of all that was distinctively Christian might reasonably be styled apostasy. It has certainly seemed to most that the fact that the whole thought of the book is the superiority of Christianity over Judaism proves that the danger against which the first readers were warned was relapse into what the author regarded as relatively worthless because an outgrown and outworn stage of divine revelation, and that the opinion that apostasy into heathenism was the readers' danger is only "an ingenious parodox," even though "an amount of ingenuity has been expended in support of this hypothesis, sufficient to render it plausible."

To some extent the questions as to place and date depend for their answer upon the conclusion as to the character of the first readers. If addressed to Hebrew Christians, it is scarcely possible that its date can be later than 68, just before the Jewish war which resulted in the destruction of Jerusalem, and the final removal of the danger of relapse into Judaism, while the fact that it is addressed to a second generation of believers and the references to the lapse of considerable time make it necessary to set the date as late as possible. If addressed to Gentile Christians, it might be dated as late as 85 or even 90. But that in any case it is a first-century production is guaranteed by the use made of it by Clement of Rome before the year 100.

Where the first readers are to be looked for hangs as completely on their character as does the question of date. If Gentile, most would think it probable that they were to be found at Rome, where they may have constituted only a single group of many among the Christians in the city. If, however, they were really Hebrews, it is, if not impossible, at any rate less likely that they were at Rome. The reference to "those from Italy" is ambiguous, but it would seem plausible that Timothy had been imprisoned at Rome rather than that on release he should hasten hither. If the core of the book is a warning against Judaism, it would be natural to look for those needing such a warning nearer the Temple than was Rome. While it is generally regarded as improbable that the letter was addressed to the church at Jerusalem, there may have been many communities within easy reach of that city where such a group of Christians as these "Hebrews" could have been found. Syrian Antioch and Jamnia have been named among other places.

The author very fitly styled his work "a message of appeal." Such it is throughout. To be sure, the first ten chapters consist largely of argument skilfully marshaled and stated, but all is to strengthen appeal, and exhortation is constantly inwoven with demonstration. The great theme is the superiority of Christianity over Judaism. While this is developed in many phases, it may be briefly summed up in saying that in chapters i-vi the stress is laid on the personal superiority of Christ, as compared with angels, Moses, Aaron, and then (vii. 1-x. 18) the superiority of the work of Christ is set forth. But the whole is one plea for persistence in the Christian profession and life, and while the changes of the centuries have made much in this book peculiarly hard to understand and have robbed other arguments of some of their original force, yet, when understood, this plea for the value of Christianity remains cogent as well as earnest. DAVID FOSTER ESTES,

Professor of New Testament Interpretation, Colgate University.

Hebrides, hĕb'rĭ-dēz, **The**, or **Western Islands**, Scotland, an archipelago off the west coast, extending from lat. 55° 35′ to 58° 32′ N.; the most southern island being Islay, and the most northern, Lewis. The group is politically divided between the shires of Ross and Cromarty, Inverness, and Argyll, very nearly in the line of their coincidence with the coasts of the respective counties. They number about 400 in all, but many are inconsiderable islets and rocks, and only about 90 are inhabited; area, about 2,800 square miles; pop. (1901) 79,159. They are usually divided into the Outer Hebrides, of which the principal are Lewis and Harris (forming a single island), North Uist, Benbecula, South Uist, and Barra; and the Inner Hebrides — Skye, Mull, Islay, Jura, Coll, Rum, Tiree, Colonsay, etc. The Outer are separated from the Inner, and from the mainland, by a strait or channel called the Minch, which at its narrowest part, between Harris and Skye, is about 12 miles broad.

The climate is mild and salubrious, but variable, tempestuous, and humid. Snow and frost are almost unknown in the smaller islands, and are but little felt in the larger. There is comparatively little wood in the Hebrides, and on many of the islands none at all. In Lewis, Skye, Islay, Mull, and several of the other islands, however, both forest and fruit trees have been planted to a considerable extent, with great success. Oats and barley are almost the only cereal crops raised. Potatoes are extensively cultivated. Cattle constitute the staple product. The native breed are small but handsome. Cheese and butter of good quality are produced. The breed of horses is also small, but hardy and docile. The native breed of sheep is very small, but Cheviots have been introduced with success. The productive land is partly occupied as sheep-farms; much of it is held by "crofters," who occupy holdings usually of a very few acres, sometimes with a right of pasturage in common attached. There are also "cotters" who occupy houses, with or without a patch of ground, on the land of the crofter, the farmer, or the landlord, and who are often mere squatters paying no rent. Grouse-moors and deer ranges cover a considerable area. Owing to the minute division of the arable land there is in many places an excess of population. The condition of the crofters and cotters, especially in the Outer Hebrides and Skye, is very depressed, their dwellings miserable, and their living poor, consisting chiefly of potatoes, milk, and oat or barley bread, and in bad harvests it is often insufficient in quantity. The fisheries are not developed to the extent they might be. Whiskey is manufactured in Skye, Islay, and Mull. Gaelic is the universal language of the Hebrides, which in remote times were subject to the kings of Norway, but in 1264 were annexed to the crown of Scotland. They were held by various native chieftains, in vassalage to the Scottish monarch; but subsequently fell into the hands of one powerful chief, who thereupon (1346) assumed the title of "Lord of the Isles," and began to affect an entire independence of his sovereign. The abolition of hereditary jurisdictions in 1748 secured to these islands for the first time the peace and safety afforded by a just and powerful government. Little was known about the Hebrides until the publication of Johnson's 'Journey to the Western Islands of Scotland' (1775), and of Scott's 'Lord of the Isles,' which invested them with a popular interest which has been increased by the facilities afforded to tourists by the steamers of the Clyde.

Hebron, hē'brŏn (originally KIRJATHARBA, now EL-KHALÎL), Asiatic Turkey, a town of great antiquity in Palestine, 18 miles southwest of Jerusalem, 2,830 feet above sea-level. It lies in the narrow valley of Mamre, has narrow streets, high well-built stone houses with flat roofs, extensive covered bazars, with well-furnished shops, exhibiting glass manufactures, consisting of lamps, colored rings, etc., for which the place has long been celebrated. The chief mosque, El-Haram, built around the Cave of Machpelah, from which Christians are rigorously excluded, is esteemed by Mohammedans one of their holiest places. Hebron is one of the oldest existing towns, having been built seven years before Zoan (Num. xiii. 22), and it is mentioned prior to Damascus (Gen. xiii. 18). Abraham resided here, and acquired the Cave of Machpelah as a sepulchre for Sarah and his family. It was David's royal city for seven years. There is a German Protestant mission here. Pop. about 19,000.

Hebron, Neb., city, county-seat of Thayer County; on the Little Blue River, and on the Chicago, R. I. & P., and the Burlington & M. R.R.'s; about 63 miles southwest of Lincoln. It is situated in an excellent agricultural and stock region. It has a large flour-mill, a creamery, and a planing-mill. There are five churches, a high school, three banks, and three weekly newspapers. The shipments of wheat and live stock are extensive. Pop. (1900) 1,511.

Hecatæus, hek-a-tē'ŭs, distinguished Greek historian and geographer: fl. about 500 B.C. He was a native of Miletus, and the son of Hegesander, a member of an ancient and illustrious family. Of his public life the only event of which we have any definite knowledge was the part he took in the insurrection of the Ionians against the Persians. Being well acquainted with the resources of Persia, he vainly attempted to dissuade Aristagoras, the planner of the revolt, from his undertaking. Later he went as ambassador to Artaphernes, and prevailed on the satrap to win the confidence of the Ionians by lenient treatment. His two great works were his 'Tour of the World,' and his 'Genealogies.' The latter is little more than a prose version of the legends already given in versified form. He improved the map of the world made by Anaximander; and his writings were highly esteemed by Herodotus. The fragments of his works were published by Müller (1841-70).

Hecate, hĕk'ā-tē, in Greek mythology, a goddess, whose parentage is variously given.

Homer does not mention her. She appears to have been originally a Titan who ruled in heaven, on the earth, and in the sea. She could bestow or withhold at pleasure the blessings of wealth, victory, and wisdom to mortals, and was the only Titan who retained power under the rule of Zeus. She was subsequently confounded with several other divinities, and at length became a mystic goddess having all the magic powers of nature at her command. She was identified with Demeter and Artemis, and was regarded as the mystic Persephone. Magicians and witches prayed particularly for her aid. Sacrifices used to be offered to her at places where three ways met (whence her epithet Τριοδῖτις, or in Latin, *Trivia*), and these consisted of dogs, honey, and black female lambs. Her mysterious festivals were celebrated annually at Ægina. Her appearance was frightful. She had three bodies or three heads, and serpents hung hissing around her neck and shoulders.

Heck, Barbara, one of the founders of American Methodism: b. Ballygarry, County Limerick, Ireland, 1734; d. near Augusta, Ont., 1804. She was one of a colony of German immigrants in Ireland who were among the first to be influenced by Wesley's preaching. In 1760 she came to America with her husband, Paul Heck, and Philip Embury (q.v.). In 1766 she was very active in the organizing of a Methodist society which met at Embury's house, and she also did much toward the building of the Old John Street Methodist Church. Later she and her family removed to the northern part of New York State, and when the Revolution broke out went to Ontario, where they founded another Methodist society.

Heck'er, Friedrich Karl Franz, German-American soldier: b. Eichtersheim, Baden, 28 Sept. 1811; d. St. Louis, Mo., 24 March 1881. After studying law in Heidelberg, he abandoned his profession for political life. In 1842 he was elected to the Chamber of Deputies of Baden. On the outbreak of the revolution in Germany in 1848 he endeavored to convert the preliminary convention into a permanent republican assembly. Frustrated in this attempt, he put himself at the head of a band of revolutionists, and invaded Baden from the south. He was defeated at Käudern 20 May 1848, and fled to Switzerland. In the following year he removed to the United States, and became a farmer near Belleville, Ill. On the outbreak of the Civil War he raised a regiment of Germans, serving in General Fremont's division as colonel; and afterward for a time commanded a brigade.

Hecker, Isaac Thomas, American Roman Catholic clergyman: b. New York 18 Dec. 1819; d. there 22 Dec. 1888. In early life he was a member of the Brook Farm community, near Boston, where for nearly a year he officiated as baker for the establishment. In 1845 he became a Roman Catholic; went to Germany to study for the priesthood, and joined the Redemptorist Fathers in Belgium in 1847. He was ordained priest in London by Cardinal Wiseman in 1849. Returning to New York he founded the order of the Paulists (1858), became their superior; and established the 'Catholic World' (1865), of which he was editor till his death. An anonymous French version of Elliott's 'Life of Father Hecker' led to the noted "American" controversy. He wrote: 'Questions of the Soul' (1855); 'The Church and the Age' (1888); etc. Consult: Sedgwick, 'Father Hecker' (1900).

Heckewelder, hĕk'ĕ-wĕl-dėr, **John Gottlieb Ernest,** American Moravian missionary: b. Bedford, England, 12 March 1743; d. Bethlehem, Pa., 21 Jan. 1823. At the age of 12 he came with his father to Pennsylvania. He accompanied Post in 1762 in his expedition to the Indian tribes on the Ohio, and in 1771 took up his residence among them as a missionary. After some 40 years' missionary service, he went to Bethlehem, the principal establishment of the Moravians in America, and there remained till his death. He wrote several memoirs upon the Delaware and Mohegan Indians: 'Account of the History, etc., of the Indian Nations' (1818); 'Narrative of the Mission of the United Brethren' (1820).

Hec'la, or Hekla, Iceland, an isolated volcano in the southwest, about 20 miles from the coast. It is of comical shape, terminating in three perpetually snow-clad peaks, the central and loftiest of which, Heklufjall, is 5,110 feet high. The circumference at the base is about 12 miles. It is composed chiefly of columnar basalt, and of lava, mostly covered by stones, scoria, ashes, and other loose volcanic matter. Since the 10th century there are 43 eruptions on record. One of the most tremendous occurred in 1783, after which it remained quiescent till 2 Sept. 1845, when it again became active, and continued with little intermission for 15 months to discharge itself from three craters, its effects being felt as far as the Orkney Islands, 400 miles distant. The last outbreak was in 1878.

Hectic Fever, a type of fever which is intermittent, and is distinguished by an afternoon or evening quickening of the pulse, and rise of temperature. The eyes of the patient brighten, his cheeks flush, and there is some nervous and cerebral excitement. The fever is succeeded by a profuse perspiration. This affection is frequently associated with phthisis, abscess, or septicæmia, and is of dangerous significance.

Hector, in Homeric narrative, the son of Priam and Hecuba, and the bravest of the Trojans, whose forces he commanded. His wife was Andromache, the daughter of Aëtion. He encountered the Grecian heroes in battle, and often gained advantages over them. By his presence Troy was invincible; but when he had slain Patroclus, the friend of Achilles, the latter, forgetting his dispute with Agamemnon, resumed his arms to avenge the death of his beloved companion. Pierced by the spear of Achilles, the body of Hector was dragged at the chariot wheels of the conqueror; but afterward, at the command of Zeus, was delivered to Priam for a ransom, who gave it a solemn burial.

Hector, Annie French ("Mrs. Alexander"), Irish novelist: b. Dublin, Ireland, 1825; d. London 10 July 1902. She began to write at an early age and was a prolific and popular writer. Among her books, all of which enjoyed a wide popularity in the United States, are: 'The Wooing O't' (1873); 'Ralph Wilton's Weird' (1875); 'Her Dearest Foe' (1876); 'The Frères' (1882); 'A Golden Autumn' (1897); and 'A Winning Hazard' (1897).

Hec'uba, in Greek legend, the second wife of Priam, king of Troy, to whom she bore Hector, Paris, Cassandra, Troilus, and other children. After the fall of Troy she was given as a slave to Odysseus, and, according to one form of the legend, in despair leaped into the Hellespont.

Hed'ding, Elijah, American Methodist bishop: b. Dutchess County, N. Y., 7 Jan. 1780; d. Poughkeepsie, N. Y., 9 April 1852. At 19 he entered the Methodist ministry, and was appointed successor of Lorenzo Dow. He extended his travels to Canada, and preached the Gospel in various parts. He became a member of the New York annual conference in 1801, and was made a bishop in 1824. He was instrumental in the establishment of the 'Zion's Herald' at Boston, the first journal published by the Methodist Church in the United States.

Hedge, Frederick Henry, American scholar: b. Cambridge, Mass., 12 Dec. 1805; d. there 21 Aug. 1890. He studied in Germany 1815–23, was later graduated from Harvard and Harvard divinity school, and after holding Unitarian pastorates in Bangor, Maine; Providence, R. I., and Brookline, Mass.; was professor of German at Harvard University (1872–81). Deeply read in philosophy, ecclesiastical history, and German literature, he was a finished writer and a much admired orator, and ranked as perhaps the foremost German literary scholar in the United States. Among his writings are: 'Reason in Religion' (1865); 'The Primeval World of Hebrew Tradition' (1870); 'Martin Luther and Other Essays' (1888); etc. His 'Prose Writers of Germany' (1848) is a standard work. He translated poems from the German and wrote numerous hymns for the Unitarian Church.

Hedge, a fence formed of living trees or shrubs. Hedges are generally composed of one or more of the following species: Hawthorn, crab, blackthorn, holly, privet, beech, hornbeam, maple, barberry, furze, broom, alder, poplar, willow, yew, box, arbor-vitæ, sweet-briar, etc. When there are so many different species to select from, plants may be found suitable for almost all kinds of soil — such as wet or boggy, and dry or sandy; for all situations, whether sheltered or exposed; and for all purposes, such as fences against cattle, or simply as ornaments for garden and pleasure grounds.

Hedge'hog, a small insectivorous mammal of the Old World family *Erinaceidæ*, and especially of the genus *Erinaceus*, characterized by its coat of stiff spines. The family inhabit temperate Europe and Asia, but are not known on sea-girt islands. The best known of the score of species is the common hedgehog (*E. europæus*). It has a long nose, the face, sides, and rump covered with strong, coarse, yellowish hair, the back with sharp, strong spines; and is about nine inches long plus a very short tail. Hedgehogs, as their name indicates, reside under hedges and in thickets, where they turn over the leaves and root in the mould for insects (especially beetles), snails, lizards, roots, fallen fruit, etc.; they are, indeed, omnivorous. The hedgehog defends itself against attack by rolling itself up, and thus exposing no part of its body that is not furnished with a defense of spines. It may be rendered domestic to a certain degree, and has been employed in Europe to destroy cockroaches, which it pursues with avidity. In the winter, in cold climates, the hedgehog wraps itself in a warm nest, composed of moss, dried hay and leaves, and remains torpid till the return of spring. The female produces four or five young at a birth, which soon become covered with prickles. These animals are sometimes used as food, and are said to be very delicate. The long-eared hedgehog (*E. auritus*) of the East is smaller than the common, and is distinguished by the great size of its ears and shortness of tail. Fossil forms as far back as the Miocene differ little from existing species. No true hedgehogs exist in America; the animals often so called being the very different porcupines (q.v.).

Hedge-hyssop. See GRATIOLA.

Hedge-sparrow, a small brown warbler (*Accentor modularis*), with a sweet plaintive song, very common in Europe about gardens and roadsides in summer. It is not a sparrow at all, but nearly related to the American water-thrushes (*Seiurus*). In Great Britain it goes by many names, as dunnock, etc., and is one of the birds most frequently mentioned in books.

Hedin, Sven Anders, svĭn ān'dĕrz hĭ-dēn', Swedish geographer and explorer: b. Stockholm 19 Feb. 1865; was educated at Stockholm, Upsala, Berlin, and Halle, at the latter university receiving the degree of doctor of philosophy. In 1885 he began his first journey of exploration through Persia and Mesopotamia. In 1890 he went to Persia as a member of King Oscar's embassy to the Shah, and the next year journeyed through Khorassan and Turkestan. In 1893 he set out on a remarkable journey from the Russian frontier to Peking, through Tibet and the Lob-nor region. He arrived at his destination in 1897, having experienced four years of exciting and harrowing adventures. His second expedition to Central Asia began in 1899. In 1901, writing from Narkhlik, Dr. Hedin tells of finding the ruins of a beautiful Buddhist temple, some rare specimens of wood carving and 12 complete letters written in Chinese on paper and marvellously well preserved. Dr. Hedin has written five books, four in English: 'A Journey Through Persia and Mesopotamia' (1887); 'King Oscar's Embassy to the Shah of Persia' (1891); 'A Journey Through Khorassan and Turkestan' (1892); and 'Through Asia' (1898). He wrote also a scientific treatise in German, 'The Results to Geographic Science of My Travels in Central Asia.'

Hedonism is the name applied to any system of ethics which regards pleasure or happiness as the chief good; as the good, that is, which makes all other goods desirable and to which they are all means. Not only money, health and the like are valuable merely as sources of happiness, but virtue itself has no better claim to independent worth. In fact, for most hedonists, virtue is the name given to that kind of action which long experience has shown to conduce to happiness. The most important of the many subdivisions of the theory is that which distinguishes psychological from ethical hedonism. According to the first, pleasure is the inevitable content of every choice. Even in those instances of self-sacrifice which seem the most radical contradiction of such a view, the exception is apparent rather than real. For the martyr, death is preferable to denial. If it were not pleasant to him, he would not and could not choose it. Ethical hedonism, on the other hand, makes the choice of pleasure a duty rather than a fact. The two have sometimes been regarded as incompatible, on the ground that what necessarily regulates choice cannot be exalted into an ideal; but the frequent inclusion of both in the same system may have a partial justification in the necessity for the rejection of certain pleasures and the acceptance of certain pains, if the greatest possible happiness is to be attained in the end.

A second division of the forms of hedonism is that between individual and universal, and is based upon the number of persons whose happiness constitutes the good. Individualistic hedonism regards the happiness of the man concerned as his own chief good, while that of other people is either a matter of indifference to him, or else is of importance merely because it forms one of the elements of his own happiness. Evidently psychological hedonism is necessarily individualistic, although its combinations with ethical hedonism have often made it present an appearance of universality not strictly compatible with its original assumptions. Although there are plenty of modern instances of individual hedonism, these do not differ in essentials from the classical forms presented by the Cyrenaicism of Aristippus (cr. 435–356 B.C.) and the Epicureanism that sprang from it (Epicurus 342 or 341–270 B.C.). Both Aristippus and Epicurus taught that individual enjoyment was the supreme good, but they differed in their conception of the nature of enjoyment and of the means by which it was to be obtained. Aristippus advocated seizing the pleasure of the moment, untroubled by regret for the past or dread of the future. Epicurus, while he also preached against fear and regret, maintained that the object of desire was a happy life rather than a succession of pleasant moments, an organized whole, not a mere sum. Another distinction between the conception of the two is found in the nature of the pleasurable state as described by each. For Aristippus its chief characteristic was excitement; for Epicurus, tranquility; a difference that undoubtedly was largely responsible for the different means advocated by them. The later modifications of both theories show the well-known tendency of hedonism toward pessimism.

Universal hedonism was first brought markedly into notice by the Utilitarians, who found the supreme good, not in each man's own happiness, but in happiness in general, usually expressed by the formula «the greatest good of the greatest number.» The moral worth of an action must be judged by the amount of happiness it will tend to bring about in the long run; and the consideration of all the different elements of intensity, length of time, certainty, possible complicating pain, and so forth, known as the hedonistic calculus, is associated with the name of Jeremy Bentham (1748–1832). John Stuart Mill (1806–1873), to whose clear and persuasive mode of statement the theory owes much of its popularity, added to it the distinction between quality and quantity in pleasure. With the exception of Mill, both ancient and modern hedonists have almost invariably regarded pleasures as differing from one another in quantity alone, he, on the contrary, maintained that their differences were primarily qualitative, and that quality must be considered in the conception of the chief good. An action is to be judged, not only from the amount, but from the kind of happiness it causes. Mill's view has met with much adverse criticism, based upon the contention that with qualitative differences in pleasure a non-hedonistic criterion has been introduced, which is inconsistent with the initial assumption of hedonism. The adoption of hedonism by the evolutionists, especially by Spencer, has given it a scientific basis, to which its present currency is partly due. Although the end in such systems is preservation, either of the individual or of the species, or of both, yet the actions best adapted to that end are accompanied by pleasure, and the animal to whom useful actions are painful, does not perform them and is in course of time eliminated. Actions found desirable in the history of the race come to have a feeling of obligation attached to them; and although at present end and means may to the individual consciousness seem incompatible, yet as man becomes better adapted to his environment, all virtuous, that is, useful actions will bring pleasure directly as well as indirectly.

As a theory of ultimate value hedonism can, of course, be neither proved nor disproved. Its chief advantages are: (1) It provides a simple and self-consistent account of moral action. (2) It makes possible a closer union between ethics and natural science than that allowed by any other theory, and is able to make use of the constantly growing store of knowledge in biology, anthropology, and ethnology. The most important objections brought against it are: (1) It confuses origin with value. (2) In regarding the moral end as constituted by feeling alone, it is psychologically inadequate, and psychologically false in so far as it views pleasure as the exclusive object of choice. See also ETHICS; UTILITARIANISM.

Professor of Philosophy, Wells College.

Heel-Fly. See BOT-FLY.

Heer, hār, **Oswald,** Swiss naturalist; b. Nieder-Utzwyl, Switzerland, 31 Aug. 1809; d. in Lausanne, 27 Sept. 1883. He was educated at the University of Halle; entered the ministry in 1831; as privat docent in botany in the University of Zurich 1834–52 and from 1852 professor of botany at the University and at the Polytechnicum, and from 1835–83 was director of the botanical gardens at Zurich. His most important works were: 'Flora Tertiaria Helvetiæ' (1854–6); 'Tertiary Climates in Their Relation to Vegetation' (1860); 'Die Urwelt der Schweiz' (1865–79); 'Flora Fossilis Helvetiæ' (1877); and 'Flora Fossilis Arctica' (1865–83).

Heeren, hā'ren, **Arnold Hermann Ludwig,** German historian and philologist; b. Arbergen, near Bremen, 25 Oct. 1760; d. Göttingen, 6 March 1842. He was educated at the cathedral school of Bremen and the University of Göttingen; in 1794 was appointed professor of philosophy and in 1801 professor of history at Göttingen. His chief works are: 'Ideen über Politik, den Verkehr und den Handel der vornehmsten Völker der alten Welt' (1793-6, 4th ed. 1824-6); 'Geschichte des Studiums der Klassischen Litteratur seit dem Wiederaufleben der Wissenschaften' (1797-1802); 'Hanbuch der Geschichte der Staaten des Alterthums' (1828); 'Geschichte des europäischen Staatensystems und seiner Colonien' (4th ed. 1822); 'Versuch einer Entwickelung der Folgen der Kreuzzuge' (1808); and 'Vermischte historische Schriften' (1803-8).

Heer'mans, Forbes, American dramatist: b. Syracuse, N. Y., 25 Oct. 1856. He was graduated from Cornell University in 1878, and is author of the dramas: 'Love by Induction' (1889); 'The Silent Witness' (1890); 'Between Two Foes' (1899) 'The Vagabond' (1893); 'Jess of the Bar Z Ranch' (1896); 'Down the Santa Fé Trail;' and the novels 'Thirteen Stories of the Far West' (1887); 'The Rancho of Heavenly Rest' (1892); 'The Investigators;' etc.

Hegel, George William Friedrich, philosopher, especially famous as the most systematic and historically influential of the post-Kantian German idealists, was born in Stuttgart, 27 Aug. 1770, and died as professor of philosophy at the University of Berlin, 14 Nov. 1831. He attended as a boy and as a youth the Gymnasium of his native city, and in 1788 was matriculated at the University of Tubingen, where he studied theology, and where he finished his course of study in 1793. From 1793 to 1796 he was private tutor in Switzerland, devoting his leisure, meanwhile, to theological and historical studies. In 1797 he accepted a private tutorship in Frankfurt, and remained there until 1800. During this period he wrote out the earliest sketch of his philosophical system, and, resolving to devote himself to philosophy, went, in November 1800, to the University of Jena, as Privatdocent. Here he lectured on philosophy until the troubles which followed the battle of Jena in October, 1806, interrupted for a time his scholarly work. During the years between 1800 and 1806 Hegel's philosophical teachings had assumed a much more highly organized form; he had published a number of important essays; and at the moment of the battle of Jena was just completing his first great systematic treatise, the 'Phänomenologie des Geistes,' i.e. the 'Phenomenology of Mind.' Unable to obtain, for the time, satisfactory opportunity as an academic teacher, Hegel thereafter passed a year as editor of a journal in Bamberg; and then obtained a position as rector of a gymnasium in Nürnberg, in 1808. He married the daughter of a distinguished Nürnberg family in 1811. Thereafter, while still at Nurnberg, he wrote his most important and finished philosophical treatise, the 'Logik,' in the years 1812-16. In 1816 he was appointed to a professorship of philosophy at the University of Heidelberg. In 1818 he accepted a call to the University of Berlin, where he rapidly won a position of the greatest influence, gathered about him many hearers and disciples, and became the head of a school of philosophy whose influence upon contemporary German thought was of the greatest. During his life he published, in addition to the works already mentioned, a summary statement of his whole system of philosophy entitled 'Encyclopädie der Philosophischen Wissenschaften,' and a treatise on the 'Philosophy of Law.' His lectures on the 'Philosophy of Religion,' on the 'History of Philosophy,' on 'Æsthetics,' and on the 'Philosophy of History,' were published posthumously. His complete works, including his letters, fill 19 volumes, which were edited by a group of his friends, in the years immediately following his death (excepting only the letters, which in their definitive edition, were published as Volume XIX of the works by his son, the historian, Karl Hegel, in 1887).

Hegel's philosophical position can only be understood in the light of his relation to Kant. Immanuel Kant (q.v.) (1724-1804), became, by the publication of his 'Critique of Pure Reason,' in 1781, the leader in the movement of modern German philosophical thought. In an age when the guidance of "Reason" was especially glorified by all the leading liberal and progressive teachers and parties of the day, Kant undertook a systematic inquiry into the nature, the limits, and the scope of the human reason. Previous philosophers, in the 17th and 18th centuries, had been especially divided in opinion regarding the question whether experience or reason is the source of our knowledge. Kant undertook to reconcile the conflicting views regarding this problem, and at the same time to map out, in a systematic way, the whole field which is accessible to human science. His result was, in substance, as follows: Human knowledge depends upon two factors, experience, and our own intelligence. Both factors are equally necessary for knowledge. Experience, when viewed apart from our intelligence, is a collection of mere data of sense, which are given, but which, in so far as they are *merely* given, are meaningless. The data of sense get their coherence solely through the active work of our intelligence. Our intelligence, whose manner of acting is spontaneous, is indeed awakened to reaction only through sense, and can give us knowledge only with reference to the facts of experience; but the data of sense get all their form, coherence, structure, meaning, only through the fact that our intelligence is guided in its activity by certain "categories," and formative principles, in terms of which we interpret these data, view them as due to coherent "objects of experience," and connect these objects so that the latter form the "world of experience.' Without the intelligence, then, with its "forms," no coherent experience is possible. Sense shows us, by itself alone, no objects, no connections of objects, no laws, no facts, no world. That we appear to find, in our world of perception, connected things, subject to laws, is due to the more or less hidden work of our intelligence, which gives form to the otherwise incoherent sensations. That we all have the same phenomenal world to deal with is due to the fact that intelligence is common to us all, in the same forms.

In consequence, what we know, and what our sciences of experience study, is neither a

GEORGE WILHELM FRIEDRICH HEGEL.

world of things simply given to us as brute facts from without, nor yet a world of mere sensations. On the contrary, what we know is the world of experience as our active intelligence inevitably *interprets* experience. Hence we know, not "things in themselves," but "phenomena," and not mere "data" of experience, but experiences as interpreted by the active constructive work of our intelligence.

Meanwhile, our intelligence, upon its higher levels, is indeed not content with this mere interpretation of the contents of sense, but,—still in its own spontaneous way,—defines ideals of objects and of laws which far transcend,—according to our own conception,—the facts of experience. The "Reason" proper, as distinct from the "Understanding" (that is, from the intelligence which merely interprets and renders coherent our experience), is the part or aspect of our intelligence which is concerned with these other and "transcendent" objects. The objects of the "Reason" proper, are objects which no human experience can reach or exemplify, and which we therefore conceive as lying beyond any possible experience. Such objects are God, the human ego itself, in its true nature, the cosmos in its entirety, and the moral law. Such objects we cannot, in any scientific sense, "know," just because our knowledge is limited to our interpretation of experience,—an interpretation due to the functions and to the categories of our lower intelligence, *i.e.* of our "understanding." Yet if the "transcendent" objects of the "pure Reason" cannot be "known," they nevertheless can be and must be "postulated," by virtue of a certain active and spontaneous "faith" which the Reason warrants. For these "transcendent" objects have for us a moral value, and give a meaning to life.

We, "know," then, "phenomena." Our "Reason," meanwhile, gives us "faith" in certain "Ideas" which relate to the "transcendent" objects. This faith is not knowledge, but is rationally warranted. It is the office of philosophy to bring to consciousness the "categories" in terms of which we inevitably interpret phenomena, and so organize our experience and get our science. It is also the office of philosophy to discover and define the "Ideas" in terms of which we just as inevitably organize our moral conduct, and give meaning to our practical life.

So, for Kant, this view of philosophy differs from the view of older philosophy in limiting our inquiries to the business of *interpreting experience* and *organizing life*. The philosopher then, is above all concerned with the universe, as the human Self, that is, as the Self which is, in type, the same in all of us, sees the universe, acknowledges it, and gives to it, in the form in which we experience its presence, the type of rational coherence. Any world which is not the world as the Self views it, is unknowable, and is a world of "things in themselves."

Hegel, in common with the other post-Kantian German idealists, builds upon the basis of this Kantian analysis of knowledge and of reason. His dependence upon Kant is shown by the very fact of his frequent and persistent criticism of that philosopher's positions. That Hegel's results are in one sense far removed from those of Kant becomes obvious upon a very brief consideration. But that, however much Kant's doctrine is transformed in Hegel's system, it is still Kant whose views are the principal ones thus transformed, is also certain. The relation can be made more explicit by the following statement of the contrast between Kant and Hegel:

1. The result of Kant's philosophy is that the accessible world is the world as the rational nature of the human Self requires us to interpret it. This result lies at the basis of Hegel's doctrine. But Hegel transforms it by dropping out of consideration, the adjective "accessible," as being superfluous. It is useless to talk of a world of unknowable or inaccessible "things in themselves," as Kant does. The world of reason is simply the world. There is nothing to know except what the nature of our intelligence requires us to acknowledge. Discover the secret of reason, and you have discovered the secret of the universe. This is the first characteristic thesis of Hegel's idealism. "Behind the curtain which is said to hide the inner nature of things," says Hegel in the 'Phenomenology,' "there is nothing, unless we ourselves go behind that curtain."

2. Kant furthermore divides the work of our intelligence between the activity of the "Understanding," which interprets special experiences, and the "Ideas" of that "Reason," which "postulates" our relations to ultimate reality. Hegel accepts this distinction as valid within its limits, but not as any absolute distinction. Our intelligence may and often does fix its attention upon fragments of knowledge. In that case it "abstracts" from the whole meaning of its own life, and thereby becomes *ipso facto* an "abstract thinking" or "understanding" of this or that object or law. Such abstractions are useful, and inevitable. But they are not final. The truth, however, is in Hegel's phrase, simply "the whole." Only that form of reason therefore which is concerned with the *whole* meaning of life is genuinely philosophical. But since this meaning is, after all, our own meaning, the meaning of the Self, it need not be simply a matter of "Postulates." It can be known to us.

3. Kant limited our knowledge to "phenomena." But this "limitation" loses its significance if once we see that there are no "things in themselves" to know. The world is for us a world of mere "phenomena" only in so far as we do not grasp the principle of which our experience is the expression. But, for Hegel, this principle is simply the absolute principle which lies at the basis of our own nature. As this absolute principle is not foreign to the Self the Self can grasp the principle. When it does so, it sees phenomena as the inevitable expression of the meaning of its own life. And then its phenomena become once more "actualities," as real as any finite facts could be. What we know then is not a *mere* world of phenomena. It is a world of absolute Truth.

4. Our ethical ideals form, for Kant, a world of their own, which we can never *know* to be real, but which we can, and must, *believe* to be real. This contrast of ideal and real, of knowledge and faith, Hegel believes to be founded only in a historical difference of cer-

tain stages of our own self-development. Faith, if once brought to a clear self-consciousness, becomes a knowledge as to what the absolute Self is and determines. And this knowledge philosophy can attain. Such a knowledge is *ipso facto* a knowledge of truth. For all truth is in and of the true Self, i.e. the Absolute

5. Kant, in trying to define the categories which lie at the basis of our interpretation of the world, had simply accepted those categories which he observed to be in use in our daily thinking, and in science. He treated them as a fixed set of principles. Regarding the origin and the mutual relations of these categories he has no extended theory. The categories are, for him, ultimate facts of our intelligence, determining its constitution, but of unknown source. Hegel, on the contrary, regards it as one of the principal tasks of philosophy to show why and how we come by just these categories which we use in the interpretation of experience, and in the ordering of life. His principal work, the 'Logic,' is devoted to such a treatment of the categories. And in fact, since, from Hegel's point of view, the world of "Thought" is the only real world, or, in other words, since the constructions of that absolute process which embodies itself in our thought and in our life are constitutive of *all* truth, this Logic, which is to show the true genesis and nature of the Categories, takes the place of all that, in the older philosophical systems, had been called Metaphysics. For the theory of the absolute constructive process which expresses itself in our experience and in our thinking is simply the theory of the universe. There is no other world to know than this world which thought constructs, which experience observes, and which constitutes our life and its meaning.

6. For Kant, nothing absolute is knowable. All our knowledge is relative. For Hegel, absolute knowledge is possible: for whoever knows the principles that determine the true nature of our thought and of our life, finds these principles, as the expression of the true Self, absolute.

This contrast of the positions of Kant and of Hegel may help to give the Hegelian philosophy its proper historical setting, without which it inevitably appears to be a presumptuous attempt to transcend the natural limits of human reason. For Hegel, these limits are not what they seem. That is, they are not absolute limits. For what we have to consider, when we philosophize, is not a foreign world, but is rather the whole truth with regard to the meaning of the very life which we ourselves are experiencing and are living

In his first great work, the 'Phänomenologie,' Hegel gave an account of the various successive stages through which the human mind, as it appears in history, passes, in its transition from a naïve dependence upon the senses to the stage of philosophical reflection. In his 'Logik,' as has just been stated, Hegel undertakes to describe the way in which philosophical reflection leads us to the categories. The categories themselves are successive stages or phases of our interpretation of absolute truth. Their succession itself is determined by a certain "dialectical" procedure, whereby the lower categories are, through an immanent development, transformed into the higher categories. In the system of Hegel, as he planned the order of its parts, the 'Logik' is next followed by the 'Naturphilosophie,' or 'Philosophy of Nature.' The only connected treatment which this portion of the system ever received is the mere compend contained in the second part of Hegel's 'Encyclopadie.' The 'Naturphilosophie' consequently remained, from Hegel's point of view, imperfectly worked out. The third portion of the system was the 'Philosophy of Mind.' This also was left without adequate working out by the philosopher, although in his 'Rechtsphilosophie,' in the third section of his 'Encyclopädie,' and in his posthumously published lectures, there is a very extended treatment of various parts of this concluding portion of his undertaking Under the 'Philosophy of Mind' Hegel included, first the whole range of psychology, and the philosophical theory of the relations between nature and mind; secondly, ethics and the philosophical theory of the state; thirdly, philosophical aesthetics, or the theory of the beautiful; and finally the philosophy of religion.

The range and general intention of the Hegelian doctrine are thus suggested although, owing to the vast range of his undertaking, this can here be done only in a very inadequate way. Further characteristic of the philosopher are especially (1) his "dialectical method," and (2) his theory of the Absolute.

By the dialectical method Hegel means a procedure of which some of the dialogues of Plato give us classical instances, and which Kant's "Antinomies" as well as Fichte's method of procedure in philosophy had exemplified, although the systematic use of the method in Hegel's way is due to his own initiative. Truth, according to Hegel, comes to us, in the first place, through the medium of "immediate" experience. Without such experience, we could indeed proceed no further on the way toward insight; and this is the permanent justification for "empiricism" in philosophy, if only we observe that this barely immediate experience, although indispensable, remains meaningless unless we transform experience through the activity of our thought. Thought begins by observing that immediate experience, taken merely as it comes, is, so far, not yet intelligible. The first work of our thought is therefore to classify, to divide, to fix upon distinct aspects of facts, to form generalizations and so to convert what comes to us as immediate into the abstract form of our various *Gedanken*, or conceptual constructions. This is, so far, the work of "the Understanding." Such work first results in our regarding truth as something which, on the one hand, is fixed, *universal*, and abstract, while, on the other hand, this world of truth also appears to us to be a world of infinitely *various* special truths, which relate now to this and now to that individual thing, or fact, or law So far as our understanding dwells upon the fixity, the universality, the abstract generality of its truths, it finds, or endlessly seeks to find *unity* in the world. But so far as the understanding, even in this very effort to discover unity, singles out now this and now that fact or law, it is confronted by the *variety* of the results which it reaches. There results the well-known problem of "the One and the Many." In consequence, the understanding is involved in contradictions which are simply inevitable. In the world of the understanding, "everything is self-contradictory," and is so just *because* the understanding makes formal consistency the one test of truth, even at the very moment when it expresses its search for truth in the form of an effort (1) to divide what is inseparable, and (2) to substitute abstractions for life.

The forms which the resulting contradictions assume are well known in the history of philosophy. The interest in abstract unity is shown in extreme form in the Eleatic reduction of the whole world to a simple One Being, by contrast with which all variety is illusory. The Atomistic thesis, which reduces all the qualitative variety of nature to quantitative differences, the material substance of Descartes, whose only attribute is extension, the sole substance of Spinoza,— these are also consequences of the tendency to understand variety by reducing it to an abstract and lifeless unity. On the other hand an equally abstract pluralism, in all the earlier stages of philosophical thought, has emphasized variety, with the result of making it inconceivable how the facts, when regarded as thus mutually isolated, could conspire to make a world at all. Views of one type have, by their very contradictions, led over to views of the opposed type.

The solution of all such difficulties lies in reducing the contradictions to their "ground," which lies in the very "movement" of thought itself. For the truth of such views lies in their synthesis, not in their mere conflict. Such a synthesis is furnished by the discovery that the search for unity and the interest in diversity and variety are but "aspects" or "moments" of that life of self-comprehension in which the very nature of reason consists. When thought, by virtue of a deeper reflection upon the contradictions of the understanding, has reached this higher stage of the reason proper, it therefore views the successive opposing views as inevitably one-sided expressions of different aspects of our rational interest. Our world is indeed one; and in order to bring this fact to our consciousness, we have, upon the stage of the understanding, to emphasize this very aspect of Being and of the life of our own thought to such an extent as to isolate, by our abstraction, the unity upon which we then dwell, from the very variety of which it is the unity. Now unless we passed through the stage of doing this we should never bring the unity of things to light at all, but should leave this aspect of the "immediate" lost in the original obscurity in which, apart from thought, all experience is involved. But so long as we remain upon this stage of abstract reflection, we nevertheless inevitably contradict both experience and ourselves. For experience is of the many, as well as of the unity. And an abstract unity, which is the unity of nothing, is indeed a self-contradiction.

But while our world is indeed also many, and while, in order to bring this aspect of things to light, we must emphasize pluralism, yet the resulting views, taken in their abstraction, are as contradictory as are those of mere monism. The many could never coöperate in one world were they not also one.

Thus we cannot reach truth without passing through contradictions. For the truth is a synthesis of various points of view. No one of these can be appreciated unless it has first been emphasized. If once emphasized it becomes, however, in its isolation, self-contradictory, just because it has its truth not in its isolation, but in its relations to the other points of view. But in order to be able to see that these very relations are necessary, and are not merely adventitious and empirical, we must see *how* the isolated point of view contradicts itself. The sequence of these isolations of special categories (followed by the resulting contradictions, and by the necessary synthesis), constitutes the "dialectic movement of thought," by which the "immediate" experience, with which we begin, is transformed into the system of truth, wherein all the elements appear in necessary interrelations to one another. The principle of this method is what Hegel calls the "Negativity" of thought. *The denial, or sublation of imperfect stages of insight is the only means whereby the perfect stage can be made explicit.* This is the principle of the dialectical method.

The Hegelian theory of the Absolute is the correlate of this theory of the process whereby truth is acquired. For the dialectical method is not only a method of acquiring insight; but, since thought is, in principle, identical with the very life of the universe, the method by which we come to insight is also the very method by which the life of the world is developed. Man is simply the world come to self-consciousness, — the Spirit explicitly aware of its own life. This is the obverse aspect of the thesis that the true Self is the world. Viewed objectively, the Hegelian doctrine accordingly is that the world-ground, or "the Spirit," also called the Absolute, has a life, or activity, whose forms are expressed in the categories of the 'Logic.' This life has first to manifest itself in experience as a world of immediate facts. This immediately given outer world constitutes what we call Nature. Such a world has to exist, and to be found by us, in order that the forms of thought should be, not *mere* forms, but forms expressed in a concrete and immediate way. In live, and especially in rational beings, the thought which is everywhere present in nature reaches a still higher expression, which at last becomes identical with our own insight, as this insight developes through the historical evolution of humanity. The entire world-process is therefore the complete expression of a rational spirit, which indeed eternally possesses self-consciousness, but which, when viewed historically, appears to us as attaining such self-consciousness, in individual form, in the religious and in the philosophical consciousness of man.

This must suffice as an outline of Hegel's main thoughts. Owing to the interest which he had in viewing the entire course of human history as a series of movements determined by the dialectical processes of which all our life, according to him, consists, Hegel took great interest in the philosophy of history. The influence of his school has been, in consequence, of great importance in affecting the spirit of a great number of modern historical inquiries. The highly ambiguous relations of the Hegelian system to traditional theology proved very momentous for the development of the critical study of religious dogma, and of religious history, during the generation after his death. While the original Hegelian school ultimately lost its direct influence in Germany, the indirect influence of the Hegelian system still remains very great, and is especially noticeable in English and American thought since 1865.

JOSIAH ROYCE,
Professor of the History of Philosophy, Harvard University.

Hegira, hĕj'ĭ-ra, **Hejra**, or **Hijra**, an Arabic word meaning 'going away,' commonly used to indicate Mohammed's flight from Mecca, in 622 A.D. In 639 Caliph Omar instituted a new Moslem calendar, to begin with the first day of the first month of the year in which the flight took place. The Mohammedan year, as a lunar year, is shorter than ours by ten days, 21 hours, and 14 2-3 seconds. A rough and ready method for finding the year in our calendar corresponding to a given year in the Mohammedan is to subtract from the latter 1-33 of itself and add 622 to the remainder. To find the precise year and day, multiply the year of the Hegira by 0.970224, strike off from the product six decimal figures and add 621.5774: this will give the year of the Christian era; and the day of the year is got by multiplying the decimal figures by 365.

Heidelberg, hī'dĕl'bĕrg, Germany, an old university town in Baden, on the left bank of the Neckar, here spanned by two bridges, 12 miles by rail east-southeast of Mannheim. It stands on a narrow strip between the river and the rock on which the castle is built, and chiefly consists of the Hauptstrasse, the long main street, and less important steeply-sloping cross and parallel streets. The city has an electric street railway system. The imposing castle, on a height above the town, an immense ivy-clad ruin begun in the 13th century, exhibits elaborate examples of early and late renaissance architecture. In the town itself the principal buildings are: the Gothic church of St. Peter, the Gothic church of the Holy Ghost, the Roman Catholic Church, the university (q.v.), the town-house, the post-office, gymnasium, real-schule, and other schools. The manufactures, comparatively unimportant, include cement, tobacco, cigars, fire-extinguishing apparatus, chemicals, scientific, medical and surgical instruments, leather, etc., and there are also several breweries. One of the curiosities of the place is the well-known Heidelberg great tun, kept in the cellar under the castle, and long ranking as the largest wine cask in the world, being [illegible] feet in length, 26 feet in diameter, and capable of holding 800 hogsheads. Heidelberg has fine public walks. The gardens around the castle are well laid out, and at every turn present the finest views of the Neckar and the fertile and richly wooded valley through which it winds to join the Rhine. Behind the town and castle, a carriage-road leads by easy ascent to the top of the Königstuhl, the loftiest hill of the district, from which an extensive view is obtained of surpassing beauty. Heidelberg arose around its 13th century castle and was until 1719 the capital of the Palatinate. In 1622, 1688, and in 1693 the French captured and pillaged the city. In 1802 it was united to the Grand Duchy of Baden. Pop. (1900) 40,121.

Heidelberg Catechism, a religious work published at Heidelberg in 1563 by Zachariah Ursinus for the use of the Reformed Church, and published in the Palatinate. It was approved by the Synod of Dort, and was the model on which the Westminster Assembly framed the Shorter Catechism.

Heidelberg University, Germany, a renowned institution founded by Elector Rupert I. in 1386. It was organized by Marsilius von Inghen on the model of the University of Paris, and at the Reformation, from a Catholic became a Protestant stronghold of learning. It flourished till the period of the Thirty Years' War when it declined. In 1802 under the administration of the Grand Duke of Baden, a new era was inaugurated and the university rapidly became famous. It is very complete in its details, and comprises faculties of theology, law, medicine and philosophy; the famous library has over 500,000 volumes and 4,700 MSS. There are 150 professors and instructors, while the average annual attendance of students in all departments is over 1,450. Many of the most famous German scholars have been professors here — Melanchthon, Ursinus, Olevianus, Reuchlin, Œcolampadius, Spanheim, Puffendorf, Voss, Schlosser, Creuzer, Gervinus, Paulus, Kuno Fischer, Helmholtz, Bunsen, Bluntschli, etc. The quincentenary of the university was celebrated with elaborate ceremonial in 1886.

Heidelberg University, Ohio, a coeducational institution at Tiffin, founded in 1850, under the auspices of the Reformed Church in the United States. It has departments of theology, commerce, oratory, art, and music, and preparatory and summer schools. In 1905 it had 24 professors and instructors; 356 students; a library of over 25,000 volumes; the grounds and buildings were valued at $125,000; the productive funds amounted to $275,000, and the income to $20,000.

Heidenmauer, hī'dn-mow-ĕr. (1) A name given in Germany to the remains of old German and Roman fortresses and ramparts, some of which still exist, especially at Ottilienberg, a hill of the Vosges, in Alsace. (2) The title of a novel by James Fenimore Cooper, who laid the scene of his story in the Vosges during the Middle Ages.

Heights, Measurement of. See HYPSOMETRY.

Heilprin, hīl'prĭn, **Angelo**, American naturalist: b. Satoralja-Ujhely, Hungary, 31 March 1853; d. New York city 17 July 1907. He came with his parents to the United States in 1856, but received his education later in Europe, making a special study of natural history. On his return to America, his scientific ability was speedily recognized and he became successively professor of invertebrate paleontology and geology (1880–1900), and executive curator ([illegible]) at the Academy of Natural Sciences, Philadelphia. From 1885 to 1890 he was professor of geology at the Wagner Free Institute. He was for five years president of the Geographical Society of Philadelphia, was leader of the Peary Relief Expedition in 1892 and made a journey of research to investigate the cause of the Mont Pelee (q.v.) diaster in 1902. His published works include: 'Contributions to the Tertiary Geology and Palæontology of the United States' (1884); 'Town Geology'; 'The Lesson of the Philadelphian Rocks' (1885); 'Geographical and Geological Distribution of Animals' (1887); 'Explorations on the West Coast of Florida and in the Okeechobee Wilderness' (1887); 'The Geological Evidence of Evolution' (1887); 'The Animal Life of our Seashore' (1888); 'The Bermuda Islands: a Contribution to the Physical History and Zoology of the Somers Archipelago' (1889); 'Principles of Geology' (1890); 'The Arctic Problem and Narrative of the Peary Relief Expedition' (1893); 'The Earth and Its Story' (1896); 'Alaska and the Klondike' (1899); 'Mont Pelée and the Tragedy of Martinique' (1903); 'Tower of Pelée' (1905).

Heilprin, Louis, American scholar: b. Miskolcz, Hungary, 2 July 1851. He is a brother of Angelo Heilprin (q.v.). In 1856 he came to the United States, where he was privately educated, and where he was connected with various works of an encyclopædic character. He published a valuable 'Historical Reference Book' (1884; 6th ed. 1899) in 'The Concise Knowledge Library.'

Heilprin, Michael, American author: b. Piobrkow, Russian Poland, 1823; d. New York 19 May 1888. Carefully educated by his father, in his 20th year he emigrated to Hungary, chafing under Russian conditions. For a time he had a book-store at Miskolcz and was on intimate terms with Kossuth and his party. When the Revolution was quelled, he went to London, there meeting Kossuth, who advised him to go to America. In 1859 he and his family emigrated to New York, where his literary activity was continuous for nearly 30 years. As coeditor of Appleton's 'Annual Encyclopedia' and reviewer on 'The Nation,' he won a distinct rank for his exact and versatile scholarship, especially in the line of Semitic literature. On the arrival of the Russian Jewish refugees in 1881–2, he took a prominent part in their welfare and personally supervised the colonization of many families. His published works include: 'The Historical Poetry of the Ancient Hebrew,' Vols. I. and II. (1880); 'Bibelkritische Notizen' (1893).

Heimburg, hĭm'boorg, **Wilhelmine.** See Behrens, Bertha.

Heine, Heinrich, German poet: b. Dusseldorf, 13 Dec. 1797; d. Paris, France, 17 Feb. 1856. His father, Samson Heine, of Hanover, was a merchant of honorable family, which sprang from Bückeburgo. He was good natured but without marked intellectual gifts and of little business ability. The mother, Peira (Betty) van Geldern, came from one of the oldest and most prominent Jewish families on the Rhine. Her father, Gottschalk, was one of the first Jewish physicians who graduated as Med.D. from a German university; her brother, Joseph, was also a graduate. Her uncle, Simon van Geldern, was a strange, adventurous, enthusiastic man. He journeyed through all Europe, went to Jerusalem, and returned from there to Germany after a varied and checkered experience. His diary of travel and other writings are still preserved. The fate of this strange relative made a deep impression on the mind of the mature and gifted boy, who first was sent to a private school and then to a lyceum in charge of priests until the year 1814. The greatest influence on his education was exercised by his intellectually gifted mother, who read Rousseau and Goethe and was an enthusiastic German patriot, while his father was just as enthusiastic for Napoleon. Between these contrasts Heine, in his youth, swayed constantly in both directions. The whole life of the poet can be described in one sentence: He was a German, who was born of Jewish parents in a Roman Catholic city on the Rhine in the period of Napoleon's supremacy on the one hand and of flourishing Romanticism on the other. In these words lies the entire biography of Heine, everything which uplifted and hampered, all his defects and excellences, and all the deep contrasts and dissonances with which his life was filled.

When he left the gymnasium, he was ready with his companions to volunteer in the struggle against Napoleon. His first poems glorify German custom and loyalty, German patriotism. But this spirit soon changed, and soon, like so many eminent Germans of the time, he became one of the most enthusiastic supporters of the Emperor's heroic figure, whose fame then filled the entire world. His most ardent wish at that time was to study. But his parents, whose business was already in decline, could not gratify this desire; and even his rich uncle, the celebrated banker, Solomon Heine, in Hamburg, on whose bounty the whole family in reality lived, preferred to have the youth become a clever merchant. So his father in 1815 took him to the Frankfort Fair (Messe) and placed him there with the banking firm of M. G. Rindskopf. But the position was not long to Harry's taste nor was a grocery more endurable. After a short time he returned to Dusseldorf. The attempt was now made to have him settle in Hamburg, first in his uncle's counting-house and then in an independent concern of his own, which was a branch of his father's business. But he showed little talent as a merchant and in 1818 his firm failed.

First Effort as Poet.— In the three gloomy years at Hamburg, however, Heine became a poet. Under the pseudonym "Sy Freudhold Riesenharf" appeared in those days in a Hamburg magazine his first 'Traumbilder' and poems. A luckless love for his rich uncle's fair daughter Amelia filled his heart and aroused those lamentations of deep sorrow, which formed the basis of his poetry. The well known poem, 'A youth loves a maiden, who chose another' contained almost literally his entire heart's romance. After it was shown that Heine had absolutely no mercantile ability, his uncle finally consented that he might study law.

His University Career.— In October 1819 he entered the University of Bonn, which had just been reopened. A fresh and stimulating spirit prevailed at this university both among teachers and pupils. Men like August Wilhelm v. Schlegel, who interested himself very much in the young poet; E. A. Arndt, and others, belonged to the teaching staff. Among the students we find names like Wolfgang Menzel, Hoffmann v. Fallersleben, Hengstenberg, etc. His special friends were Friedrich Steinmann, J. B. Rousseau, and Josef Neunzig. In the vacation, after the first year of study, Heine resided in the little town Beuel, near Bonn, and there he worked on his first tragedy, 'Almansor,' the plot of which was placed in the period of Moorish decline in Spain. In the poem, however, Heine wished to present a picture of the battles which Judaism in Germany had to endure. 'Almansor' is a lamentation of crushed and persecuted Judaism. From Bonn Heine went to Göttingen, whose faculty of law was quite famous at that time. But he did not enjoy its instruction very long, for he had to leave the university on account of a duel, and in February 1821 came to Berlin.

Life at Berlin.— His choice of Berlin was fortunate for the young poet. A vigorous intellectual atmosphere prevailed in that era in the Prussian capital. Before everything else he was attracted by the best salon in which Rahel Varnhagen von Ense had her special circle with Goteht (q.v.) and Fichte together with a coterie of brilliant spirits. Both she and her husband quickly recognized the poetical power in Heine, and admitted him to close intimacy. Her brother Leopold Robert, who was also a poet, was exceedingly friendly to him, and his wife Friedricka aroused Heine's enthusiastic admiration in sonnets and songs. The second coterie which fascinated Heine was a round table of young poets who gathered in Lutter and Wegener's restaurant, made famous by Ludwig Devrient and E. T. A. Hoffmann, which was to become the scene of more than one carouse. These men were Christian Dietrich Grabbe, Friedrich v. Uechtritz, Karl Kochy, L. Gustorf, and others. A third circle formed the greatest possible contrast to the others and in this, perhaps, Heine felt most at home. It was a small body of young men who in a time of general apostasy from Judaism, assumed as their task the reform and development of Judaism which then was regarded as in its decline. At the head of these resolute workers stood Eduard Gans, the celebrated jurist, Moses Moser, a merchant, whom his friend Heine called a living epilogue to Lessing's 'Nathan,' and Leopold Zunz (q.v.), the immortal founder of that branch of critical research called the science of Judaism. Heine took the deepest interest in the labors, hopes, and disappointments of this society. A monument of his love for the general cause which was abandoned by them, is embodied in his romance, 'The Rabbi of Bacharach,' which was then begun but unfortunately remains a torso.

Literary Activity.— In Berlin, too, the university fairly fascinated him. In particular the philosopher Hegel (q.v.) made a deep impression on the young poet, whose first poems were issued by a Berlin firm in 1823 and aroused general interest and he was termed a successor of Byron, the first poet of 'Weltschmerz' in Germany. Varnhagen v. Ense and Karl Immermann, both famous writers of the time, showed special ardor in directing the public's attention to the young poet, the new star on the literary horizon, who was already arousing general comment by his 'Tragedie' (Almansor and Ratcliffe) as well as by his 'Lyrical Intermezzo' which appeared in a volume at the same publishers'. When Heine in 1824 went for a second time to Göttingen, in order to undergo his doctor's examination, he was already a well-known personality in literary circles. During this period of his second stay in Göttingen occurred an act on his part which is wholly unintelligible, judged by his previous labors, his writings, and letters, and which can only be explained by the sad conditions of the time — on 28 June 1825 at Heiligenstadt, near Göttingen, he embraced the Protestant religion. Clearly this act was done only to promote his professional career, for his sympathies in increased degree remained on the side of his coreligionists. Heine regretted the step his entire life.

His Choice of Literature as Profession.— After his graduation as doctor of law he returned to Hamburg. But all his efforts to maintain his hold there or in Berlin were unavailing despite his baptism. The failure was due either to the prejudices of the time or to other drawbacks. So Heine devoted himself wholly to literature. Two years earlier he made a journey from Gottingen to the Harz Mountains, in the course of which he visited Goethe at Weimar, but met a rather cool reception. This journey he now described in his 'Harzreise,' which had many readers who were delighted with the new and fresh tone in which the varied and picturesque experiences were narrated. In the years 1826–1831 Heine's rank as poet was firmly established. That period forms the crown of his life and activity — his high-water mark of achievement. The four volumes 'Reisebilder' ('Pictures of Travel') published 1826–1831, showed him from an entirely different point of view. His 'Buch der Lieder' ('Book of Songs'), gave on the other hand, a faithful picture of his lyrical skill, which also struck entirely new paths. Heine had emerged from romanticism. He knew its mysteries and magic spells. Close thereby, or rather far above it, stood the well of German popular poetry, out of whose depths he drew such wealth as no other German poet had accomplished. Goethe and Uhland, Brentano and Wilhelm Müller were not without their influence on the matter as well as the metrical form of his poems; yet he was original and his songs, aroused a practical revolution in the world of German poesy.

His Genius and Its Influence.— The secret of his originality and of the marvelous influence which he exercised not only on his contemporaries, but also on every age, lies in the peculiar charm which characterizes these songs, as they sound the tenderest tones of the heart, and then in cutting dissonances shatter the sentimental quality which is at their basis, thus producing a humorous-poetical effect incomparable in its way. The subjectivity, with which Heine wove his sorrows, whether trivial or serious, in the warp and woof of his verse, was something unheard of in the history of German poetry. There was as little hypocrisy in his feeling of sorrow (Weltschmerz) as in that of Lord Byron, but it was truer and deeper, because it was blended with the Jews' sorrow from gray antiquity. His pictures and thoughts, his Oriental sensuousness, and his German sensitiveness, all this in its combination formed

HEINRICH HEINE.

a poetical *ensemble* which was to destroy romanticism, with its fairyland of legends, and to construct the poetry of a new age and a new generation. The verse included a mass of new poetical material; for instance, the description of sea in the splendid-colored North Sea pictures. In marked contrast was the wonderful effect produced by the form of the poems, which, apparently somewhat careless, was really intentional and just adapted to elevate the mood. With his 'Book of Songs' Heine became at once the first German poet of his time. His prose writings exercised in those days a similar influence. Heine loosened the tongue of the modern man of culture; he taught him what and why he suffers. In an age which was gloomy, depressed, and poor in deeds, he unfurled the banner of freedom and announced to the young generation the dawn of new days which had to come. While much in his 'Pictures of Travel' was of transient worth and importance for the history of civilization, of permanent value was the blending of humor and sentiment, wit, and earnest reflection, wherein following his great predecessors, men like Laurence Sterne, Jean Paul, and others, he created an entirely new *genre*. The modern Feuilleton rest wholly on Heine's prose. The "Young Germany" school which gave the death-stroke to romanticism in the 30's of the past century followed in his steps. His travel picture and sketch remained for decades a model for young German writers after which to pattern their prose.

Further Activity.— Despite his popularity, however, Heine could never attain a life of entire self-reliance in the conditions of his age. His steady dependence on his rich uncle, who let his nephew feel his power, embittered his stay in Hamburg. Accordingly in 1827 he accepted the offer of Cotta, the publisher, to assume the editorship of the Munich 'Political Annals.' But he continued at this work only one winter; then he undertook a journey to Italy, which he described in his incomparable fashion in his 'Pictures of Travel.' He expected to receive on his return a professorship at the Munich University, which the Bavarian minister Eduard v. Schenck desired to secure for him from the king; but owing to the intrigues of the clericals all efforts in Heine's behalf were unavailing.

In 1828 he was recalled from his Italian trip by the news of his father's death — a man whom Heine had most tenderly loved. The following years were occupied in violent attacks on the poet August v. Platen and his followers, whom Heine regarded as his worst foes, besides literary labors and traveling. When the intelligence of the July Revolution in Paris reached him, the poet could no longer endure the home atmosphere, while the powerful Austrian chancellor Mettenich, who found refreshing youth "in the melancholy waters of his lyric" warned him that he was not entirely secure from persecution. It was on a May day in 1831 when Heine forsook his fatherland, of course of his own accord, but in the firm conviction that sooner or later he would suffer the fate of all those who were leaders of freedom in Germany.

His Life in Paris.— In Paris Heine labored from the very start at the great task of his life — to promote an understanding between the French and the Germans. His correspondence in the 'Augsburger Allgemeine Zeitung,' his book on 'The Romantic School,' his contributions to 'The History of Religion and Philosophy in Germany,' are devoted to this great purpose. The first appeared in 1832 as 'French Conditions'; the others — with literary sketches, reflections on the drama and art, poems, etc., as 'Salon' (4 vols. 1832-36). The persecutions which the German Diet (Bundestag) set in motion against the "Young Germany" school of writers, leading to the ban against their works, this act of mediævalism affected the poet deeply, and other unpleasantness was added thereto. His only compensation was his recognition in his fatherland, the esteem in which he was held in France, and the love of a beautiful young Frenchwoman, Mathilde Creszentia Mirat, whom he married in 1841, after having lived with her many years. Despite many storms and although his wife had no idea of her husband's eminence, the marriage was a happy one. The heavy material burden which she obliged Heine to assume, forced him in 1836 to receive from the French Government, when Guizot was head of the Ministry, a pension of 4,800 francs—a charity which France at that time bestowed on all prominent fugitives. It is to be understood, however, that Heine incurred thereby no obligation to praise or defend the political administration. Nevertheless, later he was violently attacked for this step.

His Illness and Last Works.— The death of his rich uncle from whom he received an annual sum of 4,000 francs threw him into a terrible state. He was not mentioned in the will, and anxiety was added lest his cousin Carl Heine would refuse the further payment of his stipend unless he would submit his writings to a rigid censure by the family. Violent conflicts followed that cost the poet his rest and his health, which last had long been undermined. A severe nervous trouble had tortured him from his youth, and now as added illness came paralysis of the eye.

In 1843-4 Heine visited his old mother in Hamburg. The poetical description of his journey in the winter tale 'Germany,' which appeared in 1846 with his 'New Poems,' and the epic poem 'Atta Troll,' which was issued in 1837, showed an entirely new line of poetical genius; for both these satirical epics are pearls of poesy. Since 1848 Heine was practically chained to his bed of illness — his famous "mattress grave." He bore his sufferings, however, with true heroism; his intellectual power was not weakened. But a great religious change took place which led him back through the Bible to belief in God and to the memories of his race. The two great works of the last period of his life, 'Romancero' (1851) and 'Confessions' (in Lutetia, 3 vols. 1854), are proofs of this great change, both in poetry and prose. Once more did the poet reveal himself to his admirers in agonizing strains of sorrow, in classical ballads, in Hebrew melodies, in profound lamentations of vivid effectiveness. Once more steps the great writer before us, and in prose of the loftiest beauty and strength he seeks to answer the most vital questions of our human existence.

On 17 Feb. 1856 he died after much suffering. He rests at Montmartre, next to his wife. His grave is adorned with a monument, the work of the sculptor Hasselriis. An artistic memorial was erected by an enthusiastic admirer, the late Empress Elizabeth of Austria, at her country palace Achilleion, near Corfu in the Ionian Sea, with its classic memories. The continued efforts, however, made to place a memorial to the poet in his home on the Rhine have so far been fruitless, and have but led to bitterest conflicts between clericals and anti-Semites on the one side, and the large body of his admirers on the other. It is not without significance that the Loreley fountain which could find no lodgment in Germany, has been placed in New York, the metropolis of the United States, a country where Chas. G. Leland's translation of the 'Pictures of Travel' appeared in 1855, and where the poet's works have appeared in numerous editions and translations. The poet's body of admirers grows from day to day, and with this vast congregation of thoughtful men and women in every land the history of literature, judging without prejudice, gladly recognizes Heine as the greatest German lyric poet, after Goethe, and as one who is and will remain among the most illustrious poets in the world's literature.

GUSTAV KARPELES,
Author of 'Jewish Literature and other Essays.'

Heinemann, hī'ne-man, **William**, English publisher and author: b. Surbiton 18 May 1863. He founded the publishing house which bears his name in 1890. He has published under the pen name of "KASSANDRA VIVARIA": 'Via Lucis': 'The Garden of Olives': 'The First Step,' a play (1895): 'Summer Moths,' a play (1898): 'War,' a play (1901).

Heinrich, H. H., American horologist: b. Granz, Germany, 1822; d. Brooklyn, N. Y., February 1903. He was apprentice to a Hamburg watchmaker, studied with Martin Zeller of Vienna, in Switzerland became a manufacturer of watches and escapements, and there taught for 10 years in a horological school which he had established. He became known as one of the foremost European chronometer-makers, came to the United States and finally set up in business for himself in New York. In 1880 his time-recording instruments excelled all others at the tests held in Washington. He also received highest awards from the expositions at Berne 1885, Paris 1889, and Chicago 1893.

Heintzelman, hīnt'sĕl-man, **Samuel Peter**, American military officer: b. Manheim, Pa., 30 Sept. 1805; d. Washington, D. C., 1 May 1880. Graduated at the United States Military Academy 1826, and served during the Mexican War. In 1861 he commanded a division at Bull Run, where he was wounded 21 July. Afterward promoted brigadier-general of volunteers, Heintzelman, during the organization of the army in the winter of 1861–2, held command of a division. On the moving of the Army of the Potomac, in March 1862, the 3d Army Corps was placed under his command. His corps formed the right wing of Pope's army at the second battle of Bull Run 30 Aug. 1862. During the Maryland campaign he commanded the defenses at Washington, and was afterward appointed to the command of the Department of Washington, and of the 22d Army Corps, which he held during the battles of Chancellorsville and Gettysburg, in May and July 1863. He retired in 1869, with the rank of major-general.

Heir (Lat. *heres*), in law, one entitled by descent and right of blood to lands, tenements, or other hereditaments. Hence it is an ancient apothegm, that "God only can make an heir." An heir is really one who is born or begotten in lawful wedlock, and on whom the law casts the estate, in lands, tenements, or hereditaments immediately on the death of his ancestor. The rights of heirs in most of the United States are determined by the principles of the common law unless specially modified by statute. It is a matter of judicial decision that the rights of heirs in the United States are statutory only. Hence they cannot plead, for instance, that an inheritance tax is unconstitutional. An heir presumptive is one who will be the heir at the death of the owner, as the elder son of a deceased brother in England, or all the children of a brother in the United States, where the owner has no children: for they will be heirs if he dies without issue. As an heir presumptive may lose his heirship by a change of circumstances, he does not become an heir apparent so long as this change is legally probably, though physically or naturally impossible. Thus the nephew of the owner can never be his heir apparent, however aged or feeble or near to death the owner may be: for in contemplation of law it is always possible that a son may be born to him, who would be an heir apparent, and who would therefore supersede an heir presumptive. An heir apparent is one who must be the heir if he survive the owner, as the eldest son in Great Britain, or all the children in the United States.

Heiss, his, **Michael**, American Roman Catholic prelate: b. Pfahldorf, Bavaria, 12 April 1818; d. Milwaukee 26 March 1890. He studied at the University of Munich and at the Catholic seminary at Eichstädt, and was ordained in 1840. In 1843 he came to the United States, and was first assigned to a church in Covington, Ky.; he next went to Milwaukee as missionary priest and secretary to the bishop. In 1868 he was consecrated as the first bishop of La Crosse, Wis.; in 1880 he was appointed coadjutor to the archbishop of Milwaukee, with the right of succession, and two years later became archbishop of Milwaukee. He has taken an important part in American councils, and was a member of the Vatican Council (1869–70). He has written:

'The Four Evangelists,' and a treatise on marriage (in Latin).

Heistand, Henry Olcot Sheldon, American soldier: b. near Richwood, Ohio, 30 April 1856. He was graduated from West Point 1878, and was assigned to 11th United States infantry as 2d lieutenant. He was appointed government inspector and instructor Ohio National Guard in 1892, and during the presidential campaign of 1896 was confidential secretary to McKinley. He was promoted lieutenant-colonel in 1900, and became adjutant-general and chief of staff in the China expedition for relief of Peking 1900. He has written: 'Alaska, Its History and Description' (1898).

Hejra, or Hijra. See HEGIRA.

Helen, in Greek legend, the most beautiful woman of Greece, daughter of Zeus by Leda. By advice of Ulysses her numerous suitors were bound by oath to respect her choice of a husband, and to maintain it even by arms. She chose Menelaus, but was afterward carried off to Troy by Paris, the Trojan war arising from the claim made by Menelaus for the fulfilment of the oath. After the death of Paris she married his brother Deiphobus. On the fall of Troy she returned to Sparta with Menelaus, but at his death was driven from the country, and was murdered at Rhodes by the queen of that island.

Helena, hĕl'ĕ-na, **Saint,** the mother of the Emperor Constantine the Great. She was of humble origin, probably the daughter of an innkeeper of Bithynia. She captivated Constantius Chlorus, and became his wife; but when Diocletian elevated him to the dignity of Cæsar, in 292 A.D. he was compelled to repudiate her. The succession of her son, and the influence she had exercised in educating him as a Christian, compensated her for previous humiliations, while her piety and zeal for the propagation of Christianity have made her a saint in the Roman Catholic calendar.

Helena, hĕl'ĕ-na or hĕ lē'na, Ark., city, county-seat of Phillips County, on the Mississippi River, and on the St. Louis, I. M. & S., the Yazoo & M. V., the Arkansas M. R.R.'s., and is the terminus of the Arkansas Central; about 75 miles below Memphis and 95 east by south from Little Rock. It has boat communications with all important river-ports. A conflict between the Federal and Confederate forces took place here 4 July 1863. The Union army, about 4,500, was under Gen. Prentiss, the Confederate, about 9,000, under Gen. Holmes. The Confederate loss was about 1,800, including killed, wounded and prisoners. Helena is in an agricultural and lumbering region; the chief manufactures are lumber, cottonseed-oil, and foundry products. It has cotton-compresses, a shingle-mill, brick-yards, and large lumber-yards. Some of its educational institutions are the Jefferson High School, and the Sacred Heart Academy; it has a public library, nine churches, and three banks. Pop. (1900) 5,500.

Helena, Mont., city, capital of the State, and county-seat of Lewis and Clarke County; on the Northern Pacific and the Great Northern R.R.'s; about 70 miles north by east of Butte. The city is surrounded on all sides by the Rocky Mountains; on the south and west the mountains are within two miles of the city, while to the north there is a wide valley between the city and the foothills, and the same condition exists on the east. The city is protected from severe wind storms, and in the winter season there is a difference in temperature between the city and the mountain country of from 10 to 20 degrees. The country tributary to the city is rich in both mineral and agricultural resources. The mines are principally gold-producing, while the products of the farms are cereals and the ordinary vegetables. Tributary to the city are large areas devoted to the raising of cattle and horses, but this industry is gradually being replaced by diversified farming.

Helena is noted as the richest city per capita not only in Montana, but in the entire Rocky Mountain country. It is principally a city of homes; cattlemen, miners, and others engaged in industries elsewhere in Montana have their residence in Helena because of its church, school, and social attractions. It is the best built city in the State; its hotels, office buildings, mercantile establishments and private residences being equal to any found in cities of 100,000 in the east.

The geographical situation of Helena has made it a great distributing centre. Before the days of the railroads, when stage lines and freight wagons drawn by oxen were the only means of transportation, the geographical position of the city brought to it many travelers and great stores of merchandise. From Helena the people and the goods were distributed to other settlements. The Northern Pacific Railroad, the first to reach the city, following the trend of business, built branch lines from Helena, and thus it retained its commercial supremacy. Later the Great Northern was also extended to the capital city, and it likewise reached out for trade in the surrounding country by building branches. The original of Helena was "Last Chance Gulch"; the town came into existence as a result of discoveries of placer gold. The first discovery of gold was made in 1864, by four prospectors, John S. Cowan, John Crab, D. J. Miller, and Robert Stanley. These four men started early in the spring of 1864 from Alder Gulch, now Virginia City, in the southern part of the State, to search for placer gold. They went first to western Montana, and finding nothing there started east, prospecting the streams. They finally found what is now known as Prickly Pear Creek, running through the valley north of Helena, and here they discovered a few traces of gold, but they continued their journey north. Provisions becoming scarce they retraced their steps, intending to return to Virginia City, and again they came to Prickly Pear Creek where they noticed a little gulch. One of them said: "Boys, this is our last chance to strike it. If we do not find gold here we must strike straight for Alder." On 16 July 1864, they sunk two holes to bedrock, and in each they found gold. It was the "last chance" that turned out favorably, and that was the name of the camp until 30 October of the same year. The news of the find spread, and soon there were 500 men in the camp. At the meeting to name the town, Pumpkinville, Squashtown, Tomahawk, and Tomah were suggested. Finally John Somerville suggested Saint Helena. This was amended to Helena, and on a ballot Helena won by two votes over Tomah.

The educational institutions are public and parish schools, the Montana Wesleyan University (M. E.), opened in 1890, Saint Vincent's Academy, and the State, city, and other libraries.

Among the principal buildings at Helena are the Government building, costing $500,000; State capitol, costing $400,000; the county courthouse, costing $100,000; the high school building, costing $150,000, and seven graded school buildings valued at $200,000. There are also Saint John's Hospital, Saint Joseph's Orphanage, and several fine churches. Twelve miles from Helena, on the Missouri River, is located the plant of the Missouri River Power Company. This company furnishes electrical power for operating street cars and lighting the city of Helena, and for manufacturing purposes. It also transmits electrical power to Butte for use in the mines, a distance of 100 miles. Four miles from Helena is located the smelter of the American Smelting and Refining Company. The principal gold mine now operated in the vicinity of Helena is the Big Indian, located in a gulch four miles south of the city. Marysville is the largest mining camp tributary to the city. Here is located the Drum Lummon mine, owned by an English company, and in the near vicinity are other mines which are large gold producers.

In the 20 years after the opening of the "Last Chance Gulch," gold to the amount of $25,000,000 was taken out of the gulch and the town grew to a city of 20,000 and became the capital of the State.

From the discovery of gold until 22 Feb. 1881, when the city government was organized under a charter from the State government, the government of the city was by a committee representing the merchants and bankers.

The government is now vested in a mayor, who holds office two years, and a council. The executive appoints, subject to the approval of the council, all the subordinate officials except the city treasurer and police magistrate, both of whom are chosen at a popular election. The assessed valuation of property in 1903 was $13,000,000.

Helena has been the capital of Montana since 1869. In that year the capital was removed by popular vote from Virginia City. After Montana was admitted as a State two elections were held for the permanent location of the capital, and in 1894 Helena was chosen.

The altitude of Helena is 4,200 feet. The climate is not severe, the average temperature in January and February, the two coldest months in the year, being 20 above zero, with no moisture in the air. In summer the average temperature is 75. The growth of the city from now on may not be as rapid as in the early days; but it promises to be a healthy, steady development. Pop. (1900) 10,770.

Charles D. Greenfield,
Editor 'The Helena Independent.'

Helena, Battle of. Helena, Ark., is on the west bank of the Mississippi River, about 82 miles below Memphis. Since 13 July 1862, when Gen. Curtis arrived there from western Arkansas, it had been occupied by Union troops, and on 4 July 1863, was held by a division of the Thirteenth corps, under Gen. Salomon, and a brigade of cavalry, in all 4,129 effective men, under command of Gen. B. M. Prentiss. The place is surrounded by hills, and those nearest the city were occupied by strong redoubts; Graveyard Hill in the centre, Fort Righter on the north or right, and Fort Hindman on the south or left, were all connected by a line of bastions and rifle-pits, both ends of which rested on the river. In the river lay a gunboat. Toward the middle of June it was determined by the Confederates to take the place, whereby it was hoped to raise the siege of Vicksburg or, if Vicksburg fell, still to keep the river closed. Gen. Holmes was ordered to move from Little Rock with about 7,600 men, Price's and Marmaduke's divisions, Fagan's brigade of infantry, and Walker's brigade of cavalry. Holmes bivouacked about four miles from Helena on the evening of 3 July, and at midnight advanced to within a mile of the outer works. The assault was ordered at daylight. On the Confederate right Fagan with 1,770 men advanced on Fort Hindman, carried all the outer entrenchments, and made a desperate attempt to take the fort, but was repulsed with a loss of over 400 men. On the Confederate left, Marmaduke's division of infantry and Walker's cavalry brigade, aggregating 2,780 men, attacked Fort Righter and were repulsed. Price, in the centre, with 3,100 men, made a strong assault, carried all the entrenchments in his front, seized Graveyard Hill, and ordered one brigade to move on the town and another to assault Fort Hindman in the rear, but the Union troops checked the advance of the two brigades and drove them back and, the attacks on the right and left being repulsed, the fire of the forts, rifle-pits, and gunboat was concentrated on Price, and at 10.30 A.M. Holmes gave the order to withdraw, and led his troops back to Little Rock. The Union loss was 57 killed, 146 wounded, and 36 missing; the Confederate loss was 173 killed, 687 wounded, and 776 missing. Consult: 'Official Records,' Vol. XXII.; Greene, 'The Mississippi'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III.

E. A. Carman.

Hel'enin, a chemical substance extracted by hot alcohol from the root of the elecampane (*Inula helenium*). It has the formula C_6H_8O, and is nearly insoluble in water, but very soluble in alcohol. The first crystals obtained from the root-extract contain considerable quantities inula-camphor; but this may be removed by repeated crystallization from alcohol. Pure helenin crystallizes in white prisms or needles, melting at 232° F.

Helicidæ, hē-lĭs'ĭ-dē, the family of terrestrial pulmonate mollusks which includes most of the land and many fresh-water snails. See Snails.

Heligoland, hĕl'ĭ-gō-lănd, or **Helgoland,** hĕl'gō-länt (Dan. "holy land"), a small island and popular sea-bathing resort in the North Sea, belonging to Germany, situated about 40 miles northwest of the mouth of the Elbe. It is about a mile long and one third of a mile broad, and has an area of about one quarter of a square mile. It consists of two parts, the Oberland, a flat-topped rock 206 feet high, affording a little soil for pasture and the growth of potatoes, etc., and communicating with the Unterland, a small stretch of shore at its foot, by 192 steps and an elevator. Most of the houses stand on the Oberland. The Unterland gives partial shelter to the shipping. Steamboats ply between the island and Hamburg. The principal buildings are the church, lighthouse, and a royal Prussian biological station for the study of the fauna and flora of the North Sea. The bathing facilities, which attract so many visitors, are found in a dune or sand-bank separated from the main island by a channel about a mile wide. This Sandy Island, as it is called, is slowly being reduced in size by the inroads of the sea. The inhabitants are chiefly employed in fishing, and speak a Friesian dialect. The island is well fortified, and has cable communication with Cuxhaven and Wilhelmshaven. Christianity was first preached here by St. Willibrod in the 7th century. Taken from the Danes in 1807, it was ceded to Great Britain in 1814, but was transferred to Germany in 1890. Pop. (1900) 2,307, in the bathing season increased by several thousand visitors.

Heliocentric, hē″lĭ-ō-sĕn′trĭk, "having the sun as centre," a term applied to the Copernican system, as in opposition to the Ptolemaic system, which was geocentric, that is, "having the earth as centre" of the solar system. In modern astronomy the word is applied to calculations in which the sun is referred to as centre of the planetary system. Thus the heliocentric place of a planet is the position it would occupy at a given time when calculated from a point of view in the centre of the sun.

Heliodorus, hē-lĭ-ō-dō′rŭs, the earliest of the Greek writers of romance: b. Emesa, Syria, and lived near the end of the 4th century. He became a believer in the Christian religion, and bishop of Tricca in Thessaly. His youthful work, 'Æthiopica (that is, Æthiopic Affairs), or the Loves of Theagenes and Charicleia,' is a tale in poetical prose, with an almost epic tone. It is distinguished by its strict morality from the other Greek romances, and interests the reader by the wonderful adventures it recounts. One of the best editions is that of Hirschig in the 'Erotici Scriptores' (1856). An English translation by R. Smith appeared in 1855.

Heliogab′alus. See ELAGABALUS.

He′liograph, an instrument invented by De la Rue for obtaining photographs of the sun. Also an apparatus for telegraphing by means of the sun's rays. See HELIOSTAT; MILITARY TELEGRAPH.

Heliogravure, hē″lĭ-ō-grā′vūr. See PHOTOGRAVURE.

Heliom′eter, an instrument for measuring small distances on the sky, particularly the apparent diameters of the sun and of the moon. The heliometer of Bouguer is an astronomical telescope provided with two object-glasses, one of which is movable, and which form two distinct images of the same object, visible through the same eye-glass. A single object-glass cut into two parts, which are relatively movable by a screw, is always employed now. If, in contemplating a celestial body, the object-glasses are placed so as to bring the images to touch each other, the distance of the centres of the glasses gives the diameter of the image. In this manner the instrument gives, for instance, the difference of the diameter of the sun in perigee and apogee.

Heliopolis, hē-lĭ-op′ō-lĭs ("City of the Sun"), Egypt, the On of the Hebrew Scriptures, on a site now partly occupied by Matarieh, six miles northeast of Cairo, was one of the most ancient and extensive cities during the reign of the Pharaohs, and so adorned by monuments as to be esteemed among the first sacred cities of the kingdom. During the flourishing ages of the Egyptian monarchy the priests and scholars acquired and taught all the learning of the Egyptians within the precincts of its temples. It may be regarded as having been the university of the land of Misraim, and at the time of Strabo, who visited this town 24 B.C., the apartments were still shown in which, four centuries before, Eudoxus and Plato had labored during 13 years to learn the philosophy of Egypt. Solon and Thales were also reputed to have visited its schools. Here Joseph and Mary are said to have rested with the infant Jesus. Near the village stands the Pillar of On, a famous obelisk, supposed to be the oldest monument of the kind existing in Egypt. Its height is 67½ feet, and its breadth at the base 6 feet. Hieroglyphical characters are sculptured upon it, but are partly illegible. A fierce battle was fought here, 20 March 1800, between the French under Kleber and the Turks, when the latter were defeated.

Heliornithidæ, hē-lĭ-ôr-nĭth′ĭ-dē, a family of tropical birds, the fin-foots or sun-birds, placed by some ornithologists among the *Cecomorphæ*, and by others, more probably, with the rails. They are about a foot long, mottled brown and white, with long pointed wings and long stiff tails; and frequent the borders of forest streams and ponds, in which they spend much of their time swimming and diving well. They feed on small fish, crustaceans, insects and seeds. The best-known species is *Heliornis fulica* of southern South America.

Helios, hē′lĭ-ŏs, in mythology, the god of the sun (Latin, *Sol*) in the Greek mythology: son of Hyperion and Theia, and brother of Eos (Aurora, the dawn) and Selene (Luna, the moon). He is frequently called by the name of his father. He dwells with Eos in the ocean behind Colchis. From the portals of the morning he rides through the air in an oblique curve to the gates of evening, and after having cooled his horses in the ocean, he drives his chariot into a self-moving golden vessel, made by Hephæstus (Vulcan), which with wonderful rapidity bears him during the night along the northern shore of the ocean back to Colchis, where he bathes his horses in the lake of the Sun, and rests till the dawn of the morning. Other accounts represent him as making this nightly passage while slumbering in a golden bed. His horses and chariot are first mentioned in the Homeric hymn on Helios. Among events in the history of Helios the poets relate his contest with Poseidon for the Isthmus of Corinth, his revealing the secret amours of Ares and Aphrodite, and his disclosure to Demeter of Pluto as the ravisher of her daughter. This idea of his omniscience seems to have been the reason why he was confounded and identified with Apollo, though they were originally quite distinct. As he was descended from the race of the Titans he is often called Titan. The famous Colossus of Rhodes was a representation of Helios.

He′lioscope is a telescope behind which the image of the sun is received upon a plane surface. An astronomical telescope is drawn out a little farther than is necessary for common use, and directed toward the sun, and the image which is formed is received in a dark place. For this purpose a dark chamber is employed, or the telescope is placed in a dark funnel-shaped enclosure, the bottom of which is covered with oiled paper or closed with ground glass, on which the sun's image is formed. Upon the paper or glass a circle is described equal to the image, and it may be divided by concentric circles into rings. With this instrument the spots on the sun, eclipses, etc, may be observed.

Heliostat, hē'lĭ-ō-stăt, an instrument used in optical experiments with sunlight for keeping a beam always falling in the same direction in spite of the motion of the sun. It consists of a mirror mounted equatorially, and carried round by clock-work in such a way as to neutralize the apparent motion of a beam of sunlight reflected from it. This instrument has been employed among other purposes as a means of signaling. A beam of light being directed to the point to which it is intended to convey the signals, the dot-and-dash alphabet is made use of by the device of exhibiting and obstructing the light for longer or shorter periods. A short flash represents one letter, a long flash another, a short quickly followed by a long a third, and so on. As adapted to this purpose the heliostat has received the name of heliograph.

Heliotherapy (Gk. ἥλιος, sun — θεραπεία, service), the treatment of disease by the action of sunlight. See PHOTOTHERAPY.

Heliotrope, hē'lĭ-ō-trōp, a genus (*Heliotropium*) of plants of the borage family, characterized by the undivided ovary prolonged into a style, many of whose species have vanilla-scented blossoms. The one most in repute is a small shrub (*H. peruvianum*), originally South American, which has small fragrant flowers growing compactly together in the spikes. Cuttings taken from the young branches grow readily, and come soon into blossom. The *H. europæum*, or common heliotrope, is a flowering herb indigenous in the south and west of Europe. The heliotropes are natives of warm climates, and very numerous, several growing wild in the United States. Many delightful varieties have been produced as garden and greenhouse flowers.

Heliotrope, the bloodstone, is a variety of quartz partaking of the character of jasper and of chalcedony. It is of a deep green color, and is covered with red spots like drops of blood. Many fine antique Greek and Roman intaglios and cameos, also seal rings carved in bloodstone, are preserved in the great gem collections. It is found in Tartary, Persia, Siberia; in the island of Rum, Scotland, and many other places. It received the name heliotrope, or as some of the older writers give it, elitropia, because it was said that if the mineral be put into water contained in a basin rubbed with the juice of the plant heliotrope, and be exposed to the sun, the water will appear red and the sun blood-like, as if it was eclipsed.

Heliotropism, hē-lĭ-ŏt'rō-pĭzm, or **Phototropism**, the influence and effect of sunlight on organisms. When a seedling plant is placed in a transparent vessel of water within reach of the light of a window, the stem and leaves gradually bend toward, and the roots from, the light. The former phenomenon is termed positive, and the latter negative, heliotropism. The shoots and leaves of nearly all plants turn toward the light, and the turning of the sunflower toward the sun is familiar to every one. In the case of organs which are positively heliotropic the growth of the side next the light is retarded, and that of the opposite side increased; the result of these combined actions is a concavity on the former, and a convexity on the latter, thus causing a curvature toward the light. In the case of roots these actions are reversed. That these results are brought about by the action of light is evident; the cells on the concave side become less, while those on the convex side become more, turgid, thus forcing the organ to bend; but the cause of turgescence is unknown.

In animals a similar heliotropism is operative and is plainly manifested in some low forms, as hydra, where it is of great service in their almost automatic food-getting. Heliotropism is closely allied to, and much modified by chemotropism (q.v.) and other influences.

Heliozoa, hē''lĭ-ō-zō'a, the "sun animalcules," an order of rhizopods (q.v.) with or without silicious skeletons, and having slender and radiant pseudopodia, stable and rarely interlaced. The majority live in fresh water, but some are marine. A common and widespread example is the genus *Actinophrys*.

Helium, a gaseous element, known to be present in the atmosphere and in certain minerals, and, like argon, characterized by a singular chemical inertness. The discovery of helium was a consequence of the discovery of argon, and on account of the close chemical, physical and historical relations of the two, reference should be made to the article ARGON, and to the references there given. Helium was known to exist in the sun many years before it was discovered upon the earth. During a total eclipse of the sun, in 1868, Jannsen observed a brilliant yellow line in the spectrum of the solar chromosphere, very close to the D lines of sodium, and yet not identical with either of them. The new line was assumed to be due to a previously unknown element, and in the same year Lockyer proposed the name "helium" for this hypothetical element, from the Greek word "helios," meaning the sun. No evidence of the existence of helium upon the earth was adduced until 1882, when an Italian scientist named Palmieri announced that he had obtained the spectrum of helium from certain of the lavas given off by Mt. Vesuvius. He made no attempt to isolate the new body, however, and while it is quite possible that his observations were correct, he can hardly be credited with the actual discovery of helium. No further progress was made in this direction until 1895. When argon had been discovered, and its chemical inertness had been established, Mr. Miers, mineralogist of the British Museum, pointed out that the mineral cleveite (q.v.) had been shown to contain nitrogen gas, apparently in the free state, and made the suggestion that part of what had been assumed to be nitrogen might in reality prove to be argon. Professor William Ramsay examined the gas from this source, and found that while it undoubtedly did contain argon, it also showed a brilliant yellow line, which did not appear to coincide with either of the sodium lines, though it was very close to them. He sent a specimen of the gas to Sir William Crookes for a more careful examination, and Crookes promptly reported that the new line was identical with the helium line. It was therefore proved that helium, which had previously not been certainly known except as a constituent of the solar chromosphere, is also a terrestrial element. Subsequent study revealed the presence of helium in several other minerals. It is given off from cleveite when that mineral is heated to about 400° F. in an exhausted tube, or when the mineral is treated with sulphuric acid, or with acid sulphate of potassium. All the minerals which contain any considerable quantities of helium also contain uranium, yttrium or thorium. It is not certainly known whether the helium is chemically combined with the mineral, or whether it is merely occluded by it. The latter supposition would appear to be the more probable, judging from the chemical inertness of the gas, and from the fact (presently to be noted) that radium appears to be generating helium continuously. Certain observations upon the mineral fergusonite, however, appear to give some color to the hypothesis that the helium is present in a state of chemical combination. Helium has also been found in solution in the waters of certain hot springs.

The presence of helium in the earth's atmosphere was established by means of subjecting the apparently pure argon that had been obtained from this source to a process of diffusion through a series of porous partitions of baked clay. Helium, being much lighter than argon, diffuses far more rapidly, and a mixture in which the two gases exist together may be partially separated into its constituents in this manner.

Helium, when pure, has a density of only 1.98, that of oxygen being taken as 8. Its atomic weight cannot be directly determined, because helium has not yet been made to combine with any other substance, although it has been subjected to the same experimental attempts as were tried in the case of argon (q.v.). It has been found, however, that the ratio of the specific heat of the gas at constant pressure to the specific heat at constant volume is about 1.65, and this indicates that helium is a monatomic gas (see GASES, KINETIC THEORY OF), and that its atomic weight is about $2 \times 1.98 = 3.96$; the atomic weight of oxygen being taken as 16. It therefore has the smallest atomic weight of any of the known elements except hydrogen. The chemical symbol He has been assigned to helium, although, as has been already noted, no compounds of it have as yet been obtained.

Dewar thought he had liquefied helium at the temperature of melting hydrogen (about 436° F. below zero), but this was not confirmed by subsequent experiments, and it is now believed that the liquefaction of helium is a problem still reserved for the future. Its critical temperature is probably still nearer to the absolute zero than that of hydrogen, and for this reason the gas is well adapted for use in thermometers intended for the measurement of exceedingly low temperatures. It has, in fact, been used for this purpose with success, in studying the properties of hydrogen.

A most remarkable and previously unparalleled fact in connection with helium remains to be recorded. It has been known for some time that helium occurs in cleveite, and in other minerals in which the newly discovered element radium is found; but whether this was to be regarded as a mere coincidence, or whether it has some actual physical and chemical significance, has been a subject of considerable discussion. The most striking experiment bearing upon this matter, is one that is due to Huggins, who caused the radiation from radium to pass through a spectroscope provided with a quartz prism, and to fall upon a sensitive photographic plate. Upon developing the plate after a prolonged exposure, he found that cold radium gives a line spectrum when treated in this manner; and he made the further discovery that nearly all of the lines in the spectrum so obtained are apparently coincident with lines in the spectrum of helium. The full significance of this fact is not yet known; but when taken in connection with the observations of Soddy and Ramsay, which indicate that helium occurs in the gaseous emanation that is given off by radium, it is considered by no means impossible that we have here an instance in which one element is being slowly but continuously transformed into another one. If this inference is corroborated by future experiments, it will throw an altogether new light upon the nature of the chemical elements, and upon their relation to one another. The case is the more noteworthy, since helium has a smaller atomic weight than any other element save hydrogen, and radium has a greater atomic weight than any other element save uranium and thorium. Radium, moreover, appears to be metallic in nature, while helium, by its chemical inertness, resembles nitrogen.

Helix, hē'lĭks, a curve generated by winding a line around in a coil of gradually increasing radius. (1) In anatomy, a prominent and incurved margin surrounding the thinner and larger portion of the pinna in the ear. (2) In architecture, the small volute under the abacus of a Corinthian column. Of these there are in every perfect capital 16: two at each angle, and two meeting under the middle of each face of the abacus. (3) In geometry, a curve the tangents to which make, with the horizontal plane, a constant angle. The edge of the path of a screw is a helix, as is also the path described by any point of the surface of the thread when moved in the nut. (4) In zoology, the typical genus of the snail family. See SNAILS.

Hell (A. Saxon, *hel*, from *helan*, to cover), signifies originally the covered or invisible place. In the Bible the word is used to translate the Hebrew *Sheol* (grave or pit), and *Gehenna* (properly the valley of *Hinnom*), as well as the Greek *Hades* (the unseen). In the Revised Version of the New Testament, hell is used only to translate Gehenna, Hades being left where it stands in the Greek. In common usage hell signifies the place of punishment of the wicked after death, its earlier meaning being lost. The distinctive Scriptural term for the place of future punishment of the wicked is Gehenna. The belief in a state of punishment after death for the finally impenitent is held by almost all sects of Christians, as an analogous belief in the future punishment of unexpiated guilt is a tenet of nearly all religions ancient or modern. The nature of the punishment of hell, its locality, and its duration, have given rise to interminable controversies among Christian writers. The early Christian writers sometimes apply the word hell to a place of temporary purgation, in which the soul is freed from the stains of guilt contracted on earth preparatory to its enjoying the pure bliss of heaven. In this sense it corresponds in some degree with the Roman Catholic purgatory, and with the pagan idea of purification, as illustrated by Virgil in the sixth Æneid. Sometimes it is applied to the place of waiting of the just under the old law, till the coming of Christ should secure for them the completion of their reward; sometimes to the place where unbaptized children are detained because of unremitted original sin; and more frequently to the place of final and everlasting punishment for impenitent sinners. As to the locality of the scene of final punishment none at the present day makes a formal declaration. The terms above and beneath, as applied to heaven and hell, are merely relative, and though conventionally accepted convey no information. The Churches are not fully agreed as to the nature of hell-punishment. The prevailing idea among modern theologians is that the «fire» and the «worm» are significant emblems to give us the most correct and living conceptions of the reality that we can possibly attain in our present circumstances. They are fit emblems of anguish, and as such had laid hold of the Jewish imagination in connection with the word Gehenna, the term used in Mat. v. 22, 29, 30; Luke xii. 5. Gehenna, unlike Sheol and Hades, has never any intermediate signification, but is invariably applied to the place of punishment of the wicked after death. See IMMORTALITY.

Hell Gate, a narrow part of the East River between Long Island and Manhattan and on the east and west sides of Ward's Island. The passage between Ward's and Randall's Island is called Little Hell Gate. The rocks which were in Hell Gate were of such form and so situated as to make navigation dangerous, and the difference in the times and heights of the two tides which enter East River increased the dangers. The East River receives at one extremity the Sound Tide and at the other the tide from off Sandy Hook. "One sailing vessel out of every fifty" was the proportion damaged seriously when trying to pass through the channel between the reefs. Much had been said and written about the necessity of doing something to remove or at least lessen the dangers of Hell Gate, and officials of the United States navy, Lieutenants Davis and Porter, made a survey of Hell Gate in 1848. They reported the necessity of making the channel safe, and suggested the destruction of some of the most dangerous rocks; but nothing was done until the year 1851, when the work of destroying the rocks was begun. The process used was that of surface-blasting introduced by Maillefert. A portion of some of the rocks was removed, but this method of overcoming the dangers to navigation was found practically useless. In 1866 another survey was made by Brevet-Maj.-Gen. John Newton of the United States Engineer Corps, and in 1867 he submitted his report, in which he advised the removal of the reefs — the work to be done by blasting, and the drilling of the surface to be made from a fixed platform. Soon after the work of making Hell Gate safely navigable was resumed and placed in charge of John Newton. For the work Newton invented a steam-drilling cupola scow, which served as a transport and a working platform from which the drilling-engines were operated. The new machine proved satisfactory. A new system of explosion had to be devised in order to protect Ward's and Randall's Islands and Astoria. Diamond, Coenties, and Ways reefs were removed, also Pilgrim Rock, before operations were begun on Hallet's Point Reef. The last mentioned was an obstacle to both large and small vessels. The excavations, begun in October 1869, were completed in June 1875. The drilling was completed 25 March 1876. The area operated upon was about three acres. The method of explosion was most successful. No damage was done to the windows of buildings near; it had no perceptible effect on the air, but little on the water, and the underground shock was slight, but was perceptible on Manhattan and the western part of Long Island. The removal of Flood Rock, which was in the middle of Hell Gate, made the navigable capacity of the channel more than double. The work of removing this most formidable obstruction was begun 7 June 1875. Lack of funds caused delay, and the explosion did not take place until 10 Oct. 1885. For the removal of Flood Rock about nine acres were tunneled and drilled; and the aggregate length of the tunnels was 21,670 feet, and of the drill-holes, 113,102 feet. The object sought to be gained by removing the rocks and reefs was to make a channel of the uniform depth of 26 feet and of sufficient width for the largest steamers. The work as planned and designed by Gen. Newton has not been completed (1904).

Helladotherium, hĕl″a-dō-thē′rĭ-ŭm, an extinct genus of giraffes, found fossil in the upper Miocene (Pikermi) rocks of Attica. Its body was about as large as that of the existing giraffe, but the legs were of nearly equal length, and the skull was hornless.

Hellas, hĕl′as, the abode of the Hellenes, was first a town, and afterward, under the name of Phthiotis, a district in Thessaly. The ancients applied this name to the whole of Thessaly. With the spread of the Hellenic people the term embraced a gradually increasing territory, till it came to denote the whole of Middle Greece, and then the whole of Greece, with its islands and colonies. The Hellenes received this name in the belief that they were descended from Hellena, a mythical personage, a son of Deucalion and Pyrrha, or, according to others, of Zeus and Doripпe, and the father of Æolus, Dorus, and Xuthus, was said to have been king of Phthia. See GREECE.

Hell′bender, a large salamander (*Cryptobranchus alleghaniensis*) found chiefly in the streams emptying into the Great Lakes and those draining the western slope of the Appalachian Mountains. The hellbender is an ugly looking but perfectly harmless creature from 18 to 24 inches long; with the head and body much flattened and a prominent wrinkled fold of skin along the sides. Although entirely aquatic, no gills are present in the adult, and only a single pair of small pores represents the gill-clefts; the lungs are simple sacs. The limbs are functional, the anterior with four, the posterior with five digits, and the tail is provided with a wide fin. A wide mouth with teeth in both jaws, very small eyes and a slimy skin of a deep mottled brown color are further external characteristics. The giant salamander (*Megalobatrachus maximus*) of Japan is the only known closely related form. The hellbender is a sluggish animal, active chiefly at night, when its voracity causes great annoyance to fishermen whose bait and fish it devours. It is extremely tenacious of life, and hibernates during cold weather. Although very common, its breeding habits are yet unknown.

Hellebore, a genus (*Helleborus*) of the crowfoot family (*Ranunculaceæ*), consisting of perennial erect herbs with scanty, palmately divided leathery leaves, and yellowish, greenish, or white terminal flowers. They are of interest on account of their poisonous and medical properties. About 10 species are natives of Europe and Asia, one of which (*H. viridis*) has become naturalized in the eastern United States. The Christmas rose (*H. niger*) is the source of the black hellebore of modern pharmacopœias, but the ancient black hellebore, a famous remedy for insanity, was probably obtained from other species. *H. viridis* and *H. fœtidus* have emetic and purgative properties, and the latter, which is poisonous, has become a common introduced weed along the eastern American seaboard. These plants are closely allied to the aconites.

White Hellebore is a very different plant, a species (*V. album*) of the genus *Veratrum* of the lily family, which contains several poisonous plants allied to colchicum. They are profusely leaved tall herbs growing in rich woods, and their roots contain the peculiar alkaloids veratroidin and jervin, to which their poisonous properties are mainly due. North America has a widespread species in the Indian poke (*V. viride*), which, like the European species, enters into the pharmacopœia, while its rootstocks are ground into the powder used as an insecticide.

Hellenes, hĕl'ēnz, a native name for the ancient Greeks.

Hell'enists, a name given the Jewish colonists who settled in Egypt after the destruction of the kingdom of Judah, about 600 B.C. Their number was increased by the many colonies of Jews planted by Alexander the Great (336 B.C.), and later by Ptolemy Lagus. Under the reign of the Emperor Augustus they amounted to nearly 1,000,000. They laid the foundation of a new epoch of Græco-Jewish literature, which, from its prevailing character, received the name of the Hellenistic. The Alexandrian Jews were the most influential in developing Hellenizing tendencies, and to them chiefly is to be referred the formation of the peculiar dialect termed the Hellenistic. In their literature the systems of Pythagoras and Plato were strangely combined with those Oriental phantasies which had been reduced to a system in Egypt, and with which the mystical doctrines of the Gnostics were imbued. The most noted Jewish Hellenistic philosopher was Philo of Alexandria, and the chief of the learned labors of the Alexandrian Jews was the Greek translation of the Old Testament.

Hellespont, hĕl'es-pŏnt. See Dardanelles.

Hellgrammite, hel'gra-mīt, the large black aquatic larva of the insect Corydalus (q.v.), much used as bait for black bass and other game fish. It lives in streams, preying upon smaller animals, and just before pupation crawls under large stones, where it can be found at about the same time as the bass are biting. It is also called «Dobson» after a maker of artificial baits.

Helm, Israel, Swedish colonist in America: b. 1615; d. 1695. He settled on the Delaware River, in 1649; was collector of customs at Philadelphia 1659, and became a member of Captain Carr's council 1668. He was chief interpreter between the colonists and Indians, and rendered valuable service at the meeting of the New Jersey Indians, Governor Andros, and the Swedish authorities, in 1675.

Helmet-shell, a large gasteropod of the genus *Cassis*, family *Cassidæ*. Most of the species inhabit tropical shores, but a few are found on the coast of the Mediterranean. The shells of *C. rufa*, *C. cornuta*, and *C. tuberosa* (the queen conch), are the material on which shell cameos are usually sculptured.

Helmholtz, Hermann Ludwig Ferdinand von, hĕr'män lood'vĭg fĕr'dē-nänd hĕlm'hōlts, German scientist: b. Potsdam 31 Aug. 1821; d. Charlottenburg 8 Sept. 1894. He studied medicine in Berlin, and received the appointment of assistant-surgeon in the Charité Hospital there in 1842. Next year he went to Potsdam as a military surgeon, but in 1848 he returned to Berlin to assume the duties of teacher of anatomy at the Academy of Art and assistant in the Anatomical Museum. He was called to the chair of physiology at Königsberg in 1849, and six years later went to Bonn as professor of anatomy and physiology. In 1858 he was appointed professor of physiology at Heidelberg, whence he returned in 1871 to Berlin as professor of physics. In 1888 he was appointed to the post of president of the new Physikalisch-Technische Reichsanstalt (Imperial Physico-Technical Institute) in Charlottenburg. Helmholtz was distinguished alike in physical science, in mathematics, and in physiology; but his most valuable and most original work was done in those departments of physics which stand in intimate relations with physiology, especially acoustics and optics. He had an eminently philosophical mind, and his works are no less valuable for their masterly exposition of the methods of experimental science than for the important results contained in them. His scientific fame was securely established as early as 1847, when he published 'Über die Erhaltung der Kraft' (On the Conservation of Energy). This subject was pursued further in 'Über die Wechselwirkungen der Naturkräfte' (On the Interactions of Natural Forces) (1854). His greatest works are the 'Handbuch der Physiologischen Optik' (Handbook of Physiological Optics) (1856–66); and 'Die Lehre von den Tonempfindungen' (1862; 5th ed. 1896), translated into English by Ellis under the title 'Sensations of Tone as a Physiological Basis for the Theory of Music' (1875). A collection of 'Vorträge und Reden' reached a fourth edition in 1896, and has been translated into English as 'Popular Lectures on Scientific Subjects' (1873–81). An edition of his scientific treatises was published at Leipsic in three volumes (1882–95), and in 1897 his 'Lectures on Theoretical Physics' appeared in one volume. In his 'Beschreibung eines Augenspiegels' (1851) he described the ophthalmoscope he had recently invented. In 1883 he was ennobled by the German emperor.

Hel'mont, Jan Baptista van, Flemish physician and chemist: b. Brussels 1577: d. near Brussels 30 Dec. 1644. He devoted his attention to scientific research, and although he put forth some visionary theories on the constitution of man, and on diseases, made some genuine discoveries in chemistry. He was probably the first to introduce the term "gas" into science, and was the earliest observer of the acid reaction of the gastric juice. He published 'Ortus Medicinæ' (1648): and 'Opuscula Medica Inaudita' (1644), works which still possess interest for students.

Hel'muth, William Tod, American physician: b. Philadelphia 30 Oct. 1833: d. New York 15 May 1902: graduated Homeopathic Medical College, Philadelphia, 1853: Hahnemann College, San Francisco, 1866. In 1877 he became professor of surgery and dean of the New York Homeopathic College and Hospital. He was an officer in numerous medical associations and a member of the Société Medicale Homeopathique of France. Among his published works were: 'Treatise on Diphtheria'; 'Medical Pomposity': 'System of Surgery': 'Scratches of a Surgeon': 'Suprapubic Lithotomy.'

Heloderma, hē-lō-dėr'ma. See GILA MONSTER.

Heloïse, ā-lō-ēz, or **Eloise.** See ABELARD.

Helots, hē-lōts, were the lowest of the four classes into which the population of ancient Sparta was divided. They are generally supposed to have been the aboriginal population of the country, and to have been reduced to bondage by their Dorian conquerors, their numbers being swelled from time to time by the addition of peoples conquered in war. The name is generally derived from the town of Helos, the inhabitants of which were carried off and reduced to slavery by the Heraclidæ about 1000 B.C., though a more probable derivation is the Greek *helein*, to take, making the name signify captives. They were the property of the state, which alone had the disposal of their life and freedom. The state assigned them to certain citizens, by whom they were employed in private labors, though not exclusively, as the state still exacted certain services from them: and they were attached to the soil — that is, each citizen received the number that belonged to his allotment, without any power to sell or free them. Agriculture and all mechanical arts at Sparta were in the hands of the Helots, since the laws of Lycurgus prohibited the Spartans from all lucrative occupations. But the Helots were also obliged to bear arms for the state, in case of necessity. Their dress, by which they were contemptuously distinguished from the free Spartans, consisted of sheep's skin and a leather cap of a peculiar shape. They were sometimes liberated for their services or for a sum of money: but they were not admitted to the full dignity of citizenship. In 424 B.C. 2,000 of the Helots, who had conducted themselves with distinguished bravery in war, were treacherously put to death. They several times rose against their masters, but were always and finally reduced.

Helper, Hinton Rowen, American author: b. near Mocksville, N. C., 27 Dec. 1829. He published in 1857 'The Impending Crisis of the South,' which the Republican party used as a campaign document with great effect. Later works by him are: 'The Three Americas' Railway' (1881): 'Nojoque' (1867): 'The Negroes in Negroland' (1868): 'The Land of Gold'; 'Oddments of Andean Diplomacy.'

Helps, SIR Arthur, English essayist and historian: b. Streatham 10 July 1813: d. London 7 March 1875. He was educated at Eton and Cambridge: became private secretary to Lord Monteagle as chancellor of the exchequer, and was afterward commissioner of French, Danish, and Spanish claims. In 1860 he was appointed clerk of the privy council, and held this post till his death. He was created K.C.B. in 1872. As an essayist he was one of the most popular writers of his day, and his historical works had an extended reputation. He possessed very wide and general culture and sound judgment, was painstaking and accurate in details, and in his historical works displayed considerable breadth of view. His principal works are: 'Thoughts in the Cloister and the Crowd' (1835): 'Essays Written in the Intervals of Business' (1841); 'Friends in Council' (1847–57); 'Conquerors of the New World and their Bondsmen' (1848–52); 'Companions of my Solitude' (1851); 'History of the Spanish Conquest of America' (1855–61): 'Oulita the Serf, a Tragedy' (1858): 'Life of Pizarro' (1869): 'Realmah' (1869): 'Casimir Maremma' (1870); 'Brevia, Short Essays and Aphorisms' (1870): 'Life of Hernando Cortes and Conquest of Mexico': 'Thoughts upon Government' (1871): 'Life and Labors of Mr. Brassey' (1872): 'Social Pressure' (1874).

Helsingfors, hĕl'sing-fōrs, Russia, a seaport town, capital of Finland, on a small peninsula in the Gulf of Finland, 180 miles by rail west-northwest of St. Petersburg. It is defended by the fortress of Sveaborg about three miles distant, and is the residence of the governor of Finland, the seat of important courts and public offices. Its university, removed from Abo in 1827, has a library of over 190,000 volumes. There are manufactures of linen, sail-cloth, tobacco, etc., and an important trade is carried on. Pop. (1903) 94,000.

Helve'tian Republic, the designation of the republic established in Switzerland by France in 1798. See SWITZERLAND.

Helvet'ic Confession, the name of a document drawn up by Martin Bucer in 1536 to settle the controversy between the Lutherans and the Zwinglians; and also of one drawn up by Bullinger (1566) at the request of Friedrich III., elector of the Palatinate, and adopted in Switzerland, the Palatinate, France, Hungary, Poland, and Scotland.

Helvetii, hĕl-vē'shĭ-ī, a former Gallic or Celtic nation living between the Rhone and the Rhine, the Jura, and the Rhætian Alps. They were more numerous and warlike than the neighboring Gallic tribes. They first appear in history 107 B.C., but were not known to the Romans until the time of Julius Cæsar, who, as governor of Gaul, prevented their intended emigration, and

HERMANN LUDWIG FERDINAND VON HELMHOLTZ.

after many bloody battles, in which even the Helvetian women fought, pressed them back within their frontiers. The story of their meditated irruption into and seizure of southern Gaul is circumstantially related in the First Book of the Commentaries of the Roman general, who not only repulsed them with terrible slaughter, but almost exterminated them. Not a third of those who left their homes on this ill-fated expedition ever returned. Helvetia, which was less extensive than the present Switzerland, was divided into four districts, which had an entirely democratical constitution. Cæsar subjected the country to the dominion of the Romans, who established several colonies there. After the death of Nero, the Helvetii, for refusing to acknowledge Vitellius as emperor, were mercilessly punished by Cæcina, one of his generals, and thenceforth they almost disappear as a people.

Helvétius, Claude Adrien, klōd ä-drē-oṅ ĕl-vā-sē-ŭs, French metaphysician: b. Paris Jan. 1715; d. there 26 Dec. 1771. At the age of 23 he obtained the lucrative post of farmer-general, where he was distinguished by his mildness and indulgence from his colleagues, whose base practices filled him with indignation. He therefore resigned his office, and purchased the place of *maître d'hôtel* to the queen. Aspiring after literary fame he first directed his efforts to mathematics, then attempted to rival the dramatic fame of Voltaire by writing a tragedy. In 1758 he published 'De l'Esprit,' the materialism of which drew upon him many attacks. It was condemned by the doctors of the Sorbonne, and publicly burned in accordance with a decree of the Parliament of Paris. Helvétius went in 1764 to England, and the year afterward to Germany, where Frederick the Great and other German princes received him with many proofs of esteem. A complete edition of his writings was published at Paris in 1795.

Hem'ans, Felicia Dorothea Browne, English poet: b. Liverpool 25 Sept. 1793; d. near Dublin, Ireland, 16 May 1835. She displayed the bent of her genius when a mere child, and wrote some tolerable poetry in her 9th year. She first appeared as an author, in 1808, in a volume entitled 'Early Blossoms,' but it was subjected to harsh criticism, which she took very seriously to heart. A second volume, published in 1812, 'The Domestic Affections,' was much more successful. The same year she married Captain Hemans, from whom she was separated in 1818. She then resumed her literary pursuits, made herself acquainted with Latin and modern languages, and wrote much in the periodicals of the time. At the suggestion of Reginald Heber, afterward bishop of Calcutta, she wrote a tragedy entitled 'The Vespers of Palermo,' which, owing partly to Sir Walter Scott, who wrote an epilogue for it, was favorably received at the Edinburgh theatre, though it had previously, in 1823, proved unsuccessful at Covent Garden. Before this time she had added greatly to her popularity by her poems entitled 'The Restoration of the Works of Art to Italy'; 'The Skeptic'; 'Modern Greece'; and 'Dartmoor.' Later works were 'Lays of Many Lands'; 'Forest Sanctuary'; 'Records of Woman'; and 'The Songs of the Affections' (1830). She visited Sir Walter Scott at Abbotsford, and Wordsworth at Rydal Mount, and left with each the impression of a singularly graceful and gifted woman. Her poetry is essentially lyrical and descriptive, and is always sweet, natural, and pleasing. In her earlier pieces she was imitative, but she ultimately asserted her independence, and produced many short poems of great beauty and pathos. Mrs. Hemans had no dramatic power, her effusions being always intensely subjective.

Hem'atin, or **Hæmatin.** See Hæmoglobin.

Hem'atite, native sesquioxide of iron, Fe_2O_3, a mineral widely distributed, and constituting a valuable ore of iron. It crystallizes in the rhombohedral system, and also occurs in massive form, sometimes forming beds of great thickness. It has a hardness of from 5.5 to 6.5, and a specific gravity ranging from 4.9 to 5.3. It is usually dark gray or black in color, with a metallic lustre, and is sometimes slightly magnetic, occasionally even showing magnetic polarity. Hematite occurs in the rocks of every age. The extensive masses that occur in metamorphic rocks are believed to have been deposited, originally, in marshes, undergoing metamorphosis at the same time as the rocks with which they are now associated. Fibrous and columnar forms of the mineral, brownish-red or black in color, are also known, and to these the name «red hematite» is sometimes applied. In crystalline and metamorphic rocks a variety known as «specular iron» is met with, which is distinguished by the presence of crystals having a splendent lustre. Hematite occurs in vast quantities in various parts of the United States, notably in upper Michigan, in the Marquette district, and in Menominee and Gogebic counties; in Northern Wisconsin; and in St. Louis County, Minnesota. Iron Mountain, Missouri, is a hill about 200 feet high, the surface of which consists of loose blocks of hematite, many of which weigh as much as 10 or 20 tons. The name «hematite» is from a Greek word signifying «blood,» and was given to the mineral by the ancients from its fancied resemblance to coagulated blood. Hematite is sometimes called «bloodstone» at the present time, though that name is more properly applied to a green variety of quartz, which contains small spots of red jasper. An allied mineral, consisting of hydrated sesquioxide of iron and known to mineralogists as limonite, is often popularly called «brown hematite.»

Hemianæsthesia, hĕm-ĭ-ăn-ĕs-thē'sĭ-a, loss of sensation on one half of the body, right or left.

Hemiplegia, hĕm-ĭ-plē'jĭ-a (lit. «half a stroke,» that is, of paralysis), paralysis of one side of the body. It is usually caused by hemorrhage in the brain cavity, commonly known as apoplexy; often a local accumulation of serum, or a tumor is the cause. The paralysis falls on the side of the body opposite to the lesion in the pyramids of the brain, unless the lesion occurs below the decussation of brain fibres. The treatment of hemiplegia requires the services of a physician. It is amenable to timely remedies, and a cure is generally obtained after the first attack, if it result from apoplexy; but the patient is liable to subsequent attacks.

Hem'ipode. See Button-quail.

Hemiptera, hē-mĭp'te ra, an order of insects. It contains two leading groups, the *Homoptera* and *Heteroptera.* In the former the two pairs of wings when present are applied in rest pent-house fashion to the sides of the body. Several families are wingless. Cicadas, plant-lice (*Aphis*) and the like come here. In the second group the wings, when at rest, placed horizontally across the body, the second pair covered by the upper, which are *hemielytra,* that is, the basal half is leathery, the distal portion membranous. See BUG.

Hemlock, one of various plants. (1) A highly poisonous umbelliferous herb of the genus *Conium,* one species of which is European and the other African. The well-known officinal European one (*C. maculatum*) has become extensively naturalized as a weed in the United States. It is easily recognized by the wavy, crenate ridges of its short, laterally compressed fruit, and also by the disagreeable mouse-like odor when bruised (see CONIUM). (2) The water hemlocks or cowbanes of the closely allied genus *Cicuta,* which is also both European and American. The common American species is *C. maculata,* which grows in swamps and wet places, and is also dangerously poisonous, especially in its turnip-like cavernous root. See CICUTA.

Hemlock-spruce, an American coniferous tree of the genus *Abies* (or *Tsuga*) of which two species are recognized, the common northern one (*T. canadensis*), and a lesser one of the Southern Alleghanies (*T. Caroliniana*). The wood is too soft, weak, and brittle to be of extensive use as lumber, but the bark is of great importance in tanning. See FIR.

Hemlock, Water. See HEMLOCK.

Hem'meter, John Cohn, American physician: b. Baltimore, Md., 25 April 1864. He studied at the Royal Gymnasium, Wiesbaden, Germany; Baltimore City College; and University of Maryland; and became clinical professor of medicine in the last named institution, and director of the clinical laboratory. He is associate editor of 'Archives for Digestive Diseases,' Berlin, and author of: 'The Special Pathology and Treatment of Diseases of the Digestive Organs' (1896); 'Diseases of the Stomach' (1897); 'Diseases of the Intestines' (1901); 'Theodore Billroth, a biography' (1900). He is also a composer, and has composed 'Hygeia' (cantata); 'Prelude and Choral Music to the 23d Psalm' and other works.

Hemorrhage. See BLEEDING.

Hemp. The hemp plant proper, or "common hemp," is *Cannabis sativa,* an annual shrub belonging to the *Urticaceæ.* The term hemp, however, is used to designate many other kinds of fibre which are in no way related to the species of common hemp, such as Manila hemp, from a plantain, sisal hemp from an agave, bowstring hemp, from a liliaceous plant, and 30 or more other kinds. The different kinds of common hemps are also specially designated, with prefixes, as Breton hemp, Piedmontese, Russian, English, Chinese, and Japanese hemps, and many others, some of these being trade names, or the names of varieties. The hemp plant proper is a native of that part of Asia which includes India and Persia, though, like flax, its culture has been extended to many portions of the world in both temperate and tropical climes. It was used by the Scythians 2,500 years ago, and it was probably known to the Chinese and Europeans many centuries earlier. The Romans used it for sails and cordage, but not until after the dawn of the Christian era. It grows wild in many parts of India, where it is regarded more for its product known as chang or hasheesh than for its fibre. It flourishes on both the east and west coasts of Africa, and has been naturalized in Australia, as well as in several South American countries. In Europe it is cultivated chiefly in France, Italy, Germany, and central and southern Russia, and it will grow in Great Britain and Sweden. The plains of Hungary are peculiarly adapted to its culture. It is a favorite textile in China and Japan, the fibre from the last named country being particularly strong and fine, and at the same time, better prepared than many European hemps. The plant is an annual shrub, the fibre being produced in the bark of the straight stiff stalks or stems, and is therefore a bast fibre. In the experiments of Roxburgh and others, Russian hemp is taken as the standard of comparison for all other fibres. The stems vary from 3 to 20 feet long, dependent upon the variety and the soil in which grown. The best kinds have a hollow stem, the wood of which breaks down readily when cleaned for the fibre. While hemp is produced commercially in very few localities of the United States, it will thrive from ocean to ocean, and from the Gulf to Canada. Its cultivation as a fibre crop is confined chiefly to Kentucky, Illinois, Missouri, Nebraska, and California, though considerable hemp, in past time, has been produced in New York. Lately it has been experimented with in the South, notably in Mississippi and Texas. The bulk of the crop is grown at the present time in Kentucky and California.

The Kentucky hemp industry is very old, for the fibre was cultivated in the early part of the last century. The annual production, in 1859, reached a total of 75,000 tons, but 20 years later it had fallen off to such an extent that 5,000 tons only were recorded for the entire country. Since that time it has fluctuated between 5,000 and 12,000 tons as the total crop of the country, the annual production at the present time being less than the smaller figure. In late years the price has ruled at about 3½ cents per pound, though now it is quoted at 4½ cents. American hemp was at one time used to some extent for the rigging of vessels, although its largest use was for bagging. As early as 1824 it was employed in the navy, and efforts were made later by the government toward the production of better grades of hemp by water retting. The fibre has also been used for twines, and for woven fabrics. In late years the demand has been largely for a low grade fibre that could be manufactured into binder twine, though the bulk of the binder twine is made from manila and sisal. Very recently there has been a demand for a better grade of fibre, which has resulted in more careful methods, particularly on the Pacific coast, where a fibre has been produced fit for fine twines and cordage. Kentucky, Illinois, and Nebraska hemps are coarse, dark in color, and are not carefully prepared, which is the reason for the low price of 3½ cents against 8 and 10 cents per pound for finer imported hemps. The best hemp comes from Italy, chiefly from the provinces of Bologna and Ferrara, the fibre being very white, very well prepared, and of superb strength. Breton hemp from France is almost as good, but rarely imported. Russian comes in several grades, some light, but not as light as the Italian, some dark like the native fibre, and low in grade. Some good hemp comes from Austria-Hungary, and a trifle from other portions of Europe. Little if any of the Japan fibre reaches this market, though the best Japanese is as good as the Italian. We consume annually less than 10.000 tons, including both the native and imported.

There are many varieties of the hemp plant, four or five having been grown in the United States, though it is said that the bulk of the seed at present sown is the China hemp and a Japanese variety. Five varieties are cultivated in Europe, a common form reaching a height of 5 to 7 feet; Piedmontese or Bologna, an Italian variety that averages 12 feet in height; China hemp, introduced in 1846; a small hemp found in the valley of the Arno, and around Tuscany, and Arabian hemp, cultivated for the resinous principle or drug.

Limestone soils and the alluvial soils of the river bottoms are best adapted to hemp culture, and the seed bed should be almost as carefully prepared as for flax. One to three bushels of seed are sown per acre broadcast, and lightly covered. The planting, in Kentucky, usually begins in April, and the crop may be harvested in 100 days. For further particulars regarding the culture and preparation of this fibre, see Special Reports Nos. 1, 8, and 11, office of Fibre Investigations of the Department of Agriculture, and Hemp Culture in the United States, Year-book of Agriculture for 1901. See also the 'Dictionary of the Economic Products of India.'

While some 300 patents have been issued in this country for hemp machines, the bulk of the fibre is extracted by means of the old-fashioned, clumsy wooden "slat brake" that has been employed from time immemorial and without improvement or change. With one of these brakes a Kentucky negro can extract perhaps 150 pounds of fibre in a day. The brakes used in European hemp countries are little better, though they are smaller and less clumsy. The best foreign hemps are water retted, the stalks dried with great care, often in kilns, and therefore are more evenly prepared, and the fibre soft, strong, and light in color — almost white as in the Italian and French hemp. On the contrary most of the American hemps are dew retted, and are exposed to alternate freezing and thawing, as the stalks lie on the ground, giving an inferior product, uneven, and very dark in color, often a slate gray. See CORDAGE; CORDAGE INDUSTRIES; FIBRE; FLAX; MANILA HEMP; RAMIE; SISAL.

CHAS. RICHARDS DODGE.

Hemp-agrimony. See EUPATORIUM.

Hemp-nettle, a genus (*Galeopsis*) of European plants of the mint family, two species of which have become naturalized as weeds in the eastern United States.

Hemp'hill, James C., American journalist: b. Due West, Abbeville County, S. C., 18 May 1850. Was graduated at Erskine College in his native town in 1870 and entered journalism as editor of the Abbeville, S. C., 'Medium' in 1871. In 1880 he joined the staff of the Charleston *News and Courier*, of which since 1888 he has been manager and editor.

Hempl, George, American philologist: b. Whitewater, Wis., 6 July 1850. He was graduated at the universities of Michigan in 1879 and of Jena in 1889, and was appointed instructor in German at Johns Hopkins University in 1884. After spending three years abroad (1886–9) in study at Gottingen, Tubingen, Strasburg, and Berlin, he became junior professor of English in the University of Michigan, where he has been professor of English philology and general linguistics since 1897. He has been a voluminous writer, and among his technical works may be mentioned 'German Orthography and Phonology' (1897): 'German Grammar' (1901).

Hemp'stead, N. Y., village, in the town of the same name, in Nassau County; on the Long Island Railroad; about 15 miles east of the borough of Brooklyn, and 10 miles from the ocean. The village was settled in 1643 by people from New England. The Presbyterian Society of Hempstead claim the oldest Presbyterian organization in the country, dating their beginning in this village in 1644. Hempstead is located in a section of Long Island in which there are many summer homes. During the war with Spain an encampment for State troops was located at Hempstead; it was called Camp Black after the then governor of the State. The chief industrial interests are market gardening, farming, and the manufacturing of cork insoles, phosphates, and carriages. Pop. (1900) 3,582.

Hempstead, Texas, town, county-seat of Waller County; on the Houston & T. C. railroad; about 50 miles northwest of Houston and 113 miles east by south of Austin. It is situated in a fertile agricultural region, noted for its cotton fields and its vegetable products. It has a cottonseed-oil mill, cotton-gins, and its trade is chiefly in cotton, grain, fruits, and vegetables. Pop. 1,978.

Hems, or Homs, hōms (Lat. *Emesa*), Syria, an ancient city, near the Orontes and the Lake of Homs, 86 miles northeast of Damascus. Its temple of the sun-god Elagabalus was famous, and one of its priests became emperor of Rome, assuming its title, in 218. Here in 272 Zenobia was defeated by Aurelian, and in 1832 the forces of the sultan of Turkey by Ibrahim Pasha. The town is still surrounded by its ancient walls now in a ruinous condition. It has some manufactures of silk goods and gold ornaments, and a trade in oil and agricultural produce. Pop. est. 30,000.

Hem'street, Charles, American journalist and author: b. New York 20 Sept. 1866. He entered the profession of journalism as a reporter in 1886, and was connected with the City Press Association until 1900, when he resigned to devote himself to literature and historical research. He has published: 'Manhattan' (1888); 'Nooks and Corners of Old New York' (1899); 'The Calendar of Old New York' (1900); 'History of New York City' (1901); 'When Old New York was Young' (1901).

Hem'yng, Bracebridge, English author: b. London 1832; d. 1891. In early life a journalist he began at the age of 35 a series of sensational tales for boys known as the 'Jack Harkaway' stories, which for a dozen years had great vogue in Great Britain and the United States. He wrote not only some 20 serial stories having to do with the adventures of 'Jack Harkaway,' but upward of 40 volumes of sensational fiction, none of which, however, found readers in America.

Hen-hawk, or **Chicken-hawk**, any kind of hawk which attacks poultry, or is supposed to do so. Two or three large buzzard-hawks are popularly so called in the eastern United States, and at least two smaller falcons. In the West, and in other parts of the English-speaking world, are other species of the same repute, more or less well-deserved. In England the analogue of the American marsh-hawk (q.v.) is known as "hen-harrier." Certain owls everywhere kill much poultry where it is not safely housed at night. In North America the best known hen-hawks are the broad-winged, red-tailed, and red-shouldered (q.v.; also BUZZARD). They are comparatively harmless to poultry, however, feeding mainly on squirrels, mice, frogs, etc. The broad-wing (*Buteo pennsylvanicus*) is one of the most familiar of our hawks, breeding numerously in the woods all over the country. It is 16 inches long, with the tail 7 inches, and the wing 11 inches. The upper parts are dull umber-brown, the tail almost black, crossed by two to four pale brown bands; the lower parts are dull rufous brown, nearly unbroken on the breast. It is rather sluggish in temperament, though capable of swift and bold action, and feeds mainly on mice, but will now and then seize young chickens, ducklings, etc. On the whole, as in the case of the other buzzard-hawks, it is of more service than injury to the agriculturist. The real culprits are two small, swift, agile falcons, Cooper's (*Accipiter cooperi*), and the sharp-shin (*A. velox*). The former is nearly two feet long, grayish-brown on the upper parts and white below, with the sides and breast barred with dusky red-brown, and tail barred with blackish. The sharp-shin has much the same colors, but is little more than half as large, and is further distinguished by the triangular shape of the tarsus, giving it an edge in front. These bold and active falcons live mainly on birds, and on farms prey largely on chickens and house-sparrows, compensating somewhat for the former by killing the latter. Consult Fisher, 'Hawks and Owls of the United States' (Washington 1893).

Henbane, a dangerous plant (*Hyoscyamus niger*) of the order *Solanaceæ*, which contains the tobacco, stramonium and other plants abounding in narcotic poisons. The black henbane (*Hyoscyamus niger*) represents some 15 species of the Mediterranean region, and springs up in waste places throughout Great Britain and the eastern United States, where it has become naturalized. It is an annual, somewhat bushy, about two feet high, with large sinuated or sharply lobed leaves without leaf-stalks, and large dingy yellow flowers with purplish veins. The whole plant is covered with unctuous hairs, and has a nauseous smell. The seeds contain in largest quantity the specific alkaloid hyoscyamin, which crystallizes in stellated acicular crystals of a silky lustre. The symptoms of poisoning by henbane are similar to those produced by other narcotic poisons, and the proper treatment is the same as in cases of poisoning by opium. In medicine henbane is employed both externally and internally. The leaves are the part commonly used; they are gathered and quickly dried when the plant is in full flower. Fomentations of henbane are applied to painful glandular swellings, parts affected with neuralgia, etc., and are often found to afford relief. An extract of henbane is sometimes employed instead of belladonna to dilate the pupil of the eye. Tincture and extract of henbane are often administered in cases of annoying cough, spasmodic asthma, and other diseases requiring sedatives and anti-spasmodics. For many cases it has one great advantage over laudanum, in not producing constipation. The other species of henbane possess similar properties. The dried stalks of *H. albus* are used by smoking in Greece to allay toothache.

Hen'derson, Charles Hanford, American educator and author: b. Philadelphia 30 Dec. 1861. He was graduated from the University of Pennsylvania in 1882, was lecturer at the Franklin Institute 1883–5, 1885–6; lecturer on education at Harvard 1897–8; and director of Pratt Institute, Brooklyn, 1898–9. He has published 'Elements of Physics' (1900); 'John Percyfield: the Anatomy of Cheerfulness' (1903); 'The Children of Good Fortune' (1904).

Henderson, Charles Richmond, American educator: b. Covington, Ind., 17 Dec. 1848. He was graduated from the University of Chicago in 1870, and has been professor of sociology there since 1892. He was president 26th National Conference of Charities 1898–9, and vice-president National Prison Association. He has published 'Social Spirit in America' (1896); 'Social Settlement' (1897); 'Social Element' (1898).

Henderson, David Bremner, American statesman: b. Old Deer, Scotland, 14 March 1840; d. Dubuque, Iowa, 25 Jan. 1906. He was educated in the public schools and Upper Iowa University; in 1861 entered the army as lieutenant of the Twelfth Iowa regiment; lost a leg at Corinth (1863), and was discharged from the service. He then became commissioner of the board of enrolment in the 3d Iowa district, but re-entered the army as colonel in 1864. He studied law and was admitted to the bar in Iowa in 1865, and was United States district attorney in the northern division of Iowa 1869–71. He early became prominent in the local politics of his district, and was a delegate to three Republican national conventions. In 1882 he was elected to the House of Representatives, and was re-elected biennally till 1902. He was for many years one of the leaders of the Republicans in the House, served on the committee of appropriations for 10 years, and was chairman of the judiciary committee and a member of the committee on rules in the 54th and 55th Congresses. He assisted Speaker Reed (q.v.) in the making of the "Reed rules," was consistently an advocate of sound money, and a strong supporter of President McKinley's Cuban policy. At the organization of the 56th Congress in 1899 he was chosen speaker of the House, and re-elected in 1901; he was an impartial presiding officer and took important part in shaping the legislation made necessary by the Spanish war and the acquisition of new territory. In 1902 he declined a unanimous renomination from his district, because he could not support the policy of tariff revision then made a prominent issue by Iowa Republicans.

Henderson, Isaac, American journalist and novelist: b. Brooklyn, N. Y., 13 Feb. 1850. He was graduated from Williams College in 1872, and the same year joined the staff of the New York *Evening Post*, of which journal he became publisher in 1876. He sold his interests in 1880, and went abroad in 1888, making his home in London and Rome. Author of 'The Prelate' (1898); 'Agatha Page' (1900).

Henderson, James Pinckney, American soldier and politician: b. Lincoln County, North Carolina, 21 March 1808; d. Washington, D. C., 4 June 1858. He practised law in Mississippi; went to Texas in 1836, and became secretary of state of the Texan Republic 1837–9. In the latter year he was sent as a minister to England and France to secure the recognition of Texan independence, and went to Washington in 1844 to secure annexation. He was a member of the Texas constitutional convention 1845, and the following year was elected first governor of the State. In 1857 he was appointed senator from Texas as a State Rights Democrat. Henderson fought in the Mexican War and Congress gave him a sword for his gallantry.

Henderson, Mary N. Foote, American writer on domestic science: b. New York 1842. She was married to J. B. Henderson, and in 1876 organized the St. Louis School of Design. She is the author of 'Diet for the Sick,' 'Practical Cooking and Dinner Giving.'

Henderson, Peter, American horticulturist: b. Porthead, Scotland, 1823: d. Jersey City, N. J., 17 Jan. 1890. He came to America in 1843, and opened a seed-store in New York city in 1862. He has been called "the father of horticulture and ornamental gardening in the United States." He published 'Practical Floriculture' (1867); 'Gardening for Profit' (1866); 'Gardening for Pleasure' (1875); 'Garden and Farm Topics' (1884); 'How the Farm Pays' (1884).

Henderson, Richard, American pioneer: b. Hanover County, Virginia, 1734; d. North Carolina 1785. He studied law and in 1769 was appointed associate justice of the superior court of North Carolina. After the adoption of the Declaration of Independence he declined re-election to the bench, in order to participate in the scheme of the Transylvania Land Company. By this scheme the company organized as a political community with president, legislature, and judges, all the territory lying between the Cumberland River, the Cumberland Mountains, and the Kentucky River. The State of Virginia annulled the deed of sale of this tract of territory which the Cherokee Indians had given to the Transylvania Land Company, but as a reward for the pioneer work of the company, granted them an area 12 miles square on the Ohio River, below the mouth of the Greene River.

Henderson, William James, American musical critic and author: b. Newark, N. J., 4 Dec. 1855. He was graduated from Princeton College in 1876, and joined the staff of the New York *Tribune*, the following year becoming musical critic of the New York *Times*. He was associate editor of 'The Standard Dictionary' (1892–4), and has published: 'The Story of Music' (1889); 'Preludes and Studies' (1891); 'Sea Yarns for Boys' (1894); 'Afloat with the Flag' (1895); 'Elements of Navigation' (1895); 'The Last Cruise of the Mohawk' (1897); 'What is Good Music?' (1898); 'How Music Developed' (1899); 'The Orchestra and Orchestral Music' (1899); 'Richard Wagner' (1901).

Henderson, Ky., city, county-seat of Henderson County; on the Ohio River, and on the Illinois C., the Louisville & N., the Louisville, H. & St. L. R.R.'s; about 10 miles below Evansville, Ind., and 103 miles, in direct line, southwest of Louisville. It has regular steamboat connection with Louisville, Evansville, Memphis, and other river ports. It is one of the oldest settlements on the Ohio River, but it was not incorporated until 1797. It is situated in a fertile agricultural region, rich in timber and coal. The chief manufactures are cotton and woolen goods, flour, hominy, lumber, tobacco products, furniture, carriages and wagons, foundry products, car-works, and agricultural implements. Large shipments are made of corn, wheat, and tobacco. It has large coal and lumber yards, grain-elevators, tobacco-stemmeries, fine fairgrounds, and Atkinson Park, the area of which is about 100 acres. It has a sanatorium and a number of well-built churches and schools. The charter of 1893 provides for a mayor, who holds office four years and is not eligible for re-election, and a common council. The city owns and operates the electric-light and gas plants and the waterworks. Pop. (1900) 10,272.

Henderson, N. C., town, county-seat of Vance County, on the Southern and the Seaboard A. L. R.R.'s; about 12 miles east of Oxford and 42 miles north of Raleigh. Henderson was settled in 1820, but was not incorporated until 1842. It is situated in a cotton and tobacco region of the State. The chief industrial establishments are cotton-gins, cotton-seed oil mills, cotton-mills, knitting-mills, tobacco warehouses, wagon-factories, flour-mills, and lumber-yards. Its chief trade is in cotton and tobacco. Pop. (1890) 4,191; (1900) 3,746.
