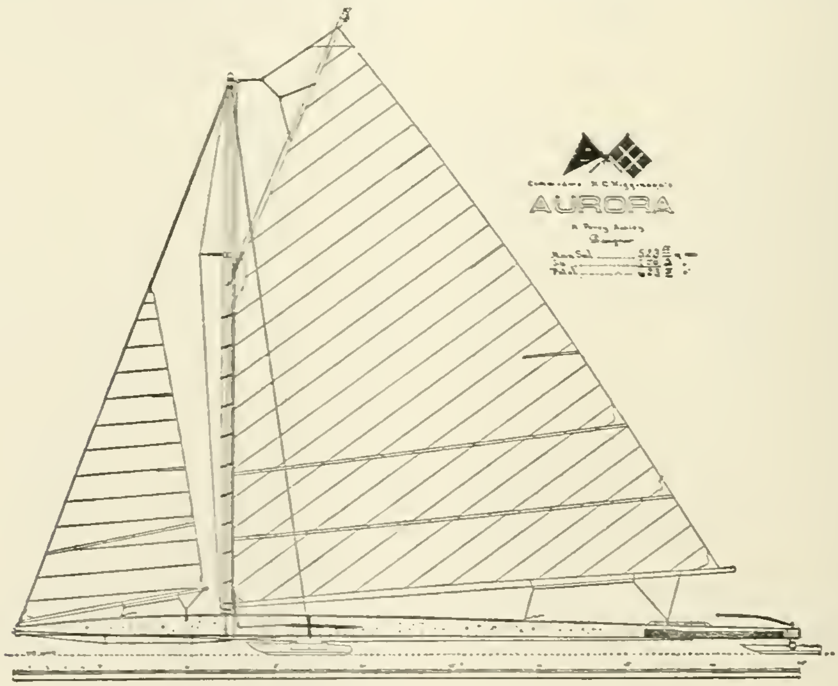
Ice Yachts and Ice Yachting. The amusement or sport of sailing yachts over the ice has reached its highest development in the United States. The sport abroad is confined to Russia, Sweden and Norway. Boats of the Russian River Club are sailed over a portion of the Gulf of Finland. In 1901 the Stockholm Ice Yacht Club of Sweden built a fleet of fast-racing ice yachts from American designs by Ashley.

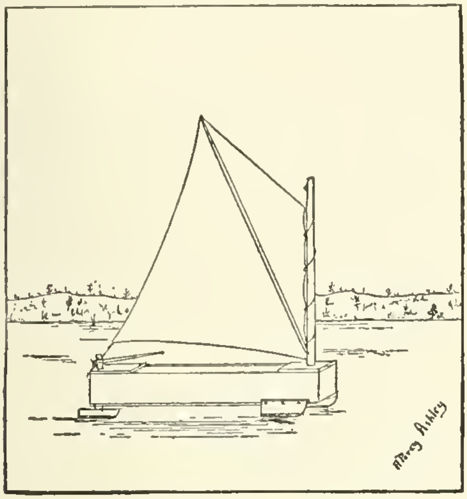
The first authentic ice boat in the United States was built by Oliver Booth, at Poughkeepsie, N. Y., in 1790. It was a square box mounted on three runners, shod with rough iron; with a rudder post and tiller of wood. In 1850 on the Shrewsbury River, in New Jersey, George D. Allaire, constructed an ice yacht of the box order, equipped with rough square iron bars for runners, sharpened with cutting edges. In 1855, on the same river, Nathan B Clark built a three-cornered platform boat, having sharpened runners, and added a jib to the sprit sails previously carried. The type of side-rail boat came into use about 1871 Jacob Buckhout of Poughkeepsie was the pioneer designer of this type, and at the Centennial Exhibition (1876) exhibited the side-rail yacht Whiff, built for Commodore Irving Grinnell of the New Hamburgh, N. Y., Ice Yacht club. She carried 347 square feet of canvas and measured 40 feet from the top of the bowsprit to the end of the main-boom. The sloop-rigged Icicle built on these lines carried 1,070 square feet of sail, but this excess of canvas was found impracticable and the building of large boats was abandoned. The revolution in ice yachting began in 1879, when H. Relyea of Poughbkeepsie built the Robert Scott, having a single backbone and an elliptical steering box. This boat carried 499 square feet of canvas and easily outsailed boats of twice her size. In 1883 the Jack Frost was built by Commodore Archibald Rogers of Hyde Park-on-the-Hudson and the famous racing yacht Haze was built the same year. The Jack Frost won the world's pennant in 1883 and the Haze in 1884. About this time the Shrewsbury Ice Yacht club of Red Bank, N. J., built a large lateen rigged boat, the Scud, carrying over 600 square feet of duck in a single sail. The Orange Lake, N. Y., club built at the same time the catboat Shadow, carrying 800 square feet of sail, and said to be the strongest ice yacht ever constructed. Both of these vessels proved unsuccessful as prize or pennant winners. In 1903 the "sloop" remained the fastest rig in the world, but in reality it is merely a catboat rig with a small jib. The 1903 model of the first class, carrying about 650 square feet of canvas, is capable of sailing a mile a minute, and costs to construct anywhere from $1,200 to $1,600.



The Most Modern and Expensive Ice Yacht (1902).

Racing Rules.— For class racing, ice yachts are divided into four classes: (1) Yachts carrying 600 square feet of sail area and over. (2)

Yachts carrying 450 square feet and under 600. (3) Yachts carrying 300 square feet and under 450. (4) Yachts carrying less than 300 square feet. Handicap or time allowance for mixed classes is made as follows: One second per square foot for every foot of canvas carried over the smaller boat, providing the race is sailed in one hour. If the race is sailed in 30 minutes ½ second per square foot is allowed, and proportionately in accordance with the time of the race.



Ice Boat of 1790.

The course is usually a triangle sailed over as required to make the number of stated miles; or a straight course to windward and return or to leeward and return. The standard distances for ice-yacht races are 20 miles, 15 miles or 5 miles. The larger the yacht the longer the course. Time limit: 20 miles, 1 hour 15 minutes; 15 miles, 35 minutes; 5 miles, 20 minutes.

In the United States and Canada there are 45 ice-yacht clubs. The challenge pennant of America is open to any American or foreign built yacht. It was held in 1903 by Jack Frost the Second, owned by Commodore Archibald Rogers of the Hudson River Ice Yacht club.

The record of leading American ice yachts are given in the following table.

It will be noted that the fastest time recorded in this table was made by the Jack Frost, 9 Feb. 1893, for 20 miles; time 49 minutes 30 seconds. In 1902 these records were excelled by the Joker, owned by Commodore D. C. Olin of the Kalamazoo, Mich., club, which sailed 20 miles on Gull Lake in 36 minutes 59 seconds. Ice yachts have actually sailed short distances at the rate of 85 miles an hour.

Ice Yacht Construction.—In the modern ice yacht the centre timber or backbone may be made of two pieces, one solid stick or a hollow truss

RACES FOR THE ICE-YACHT CHALLENGE PENNANT OF AMERICA.

NAME OF WINNING YACHT	Club	Date	Distance between buoys in miles	Number of times sailed over	Total Length of course in miles	Calc'lated distance sailed in miles	Time H. M. S.

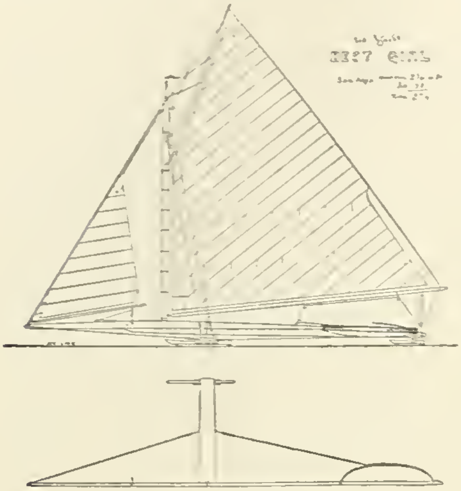
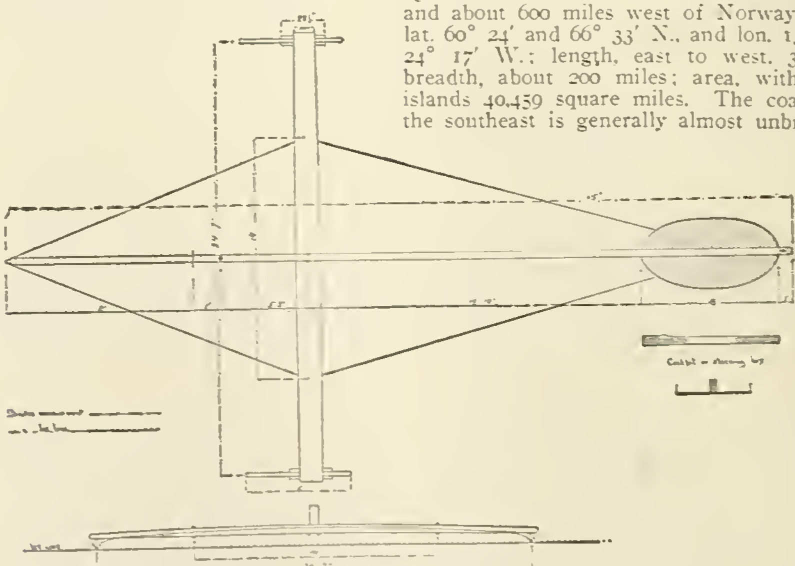
* Best two out of three races — all other races single races. All races sailed off Hyde Park, on the Hudson River, New York.

backbone. To this is joined at right angles the running plank, and a steering box or cockpit is attached at the aft extremity of the backbone. The best material is seasoned basswood, which



Side-guyed Ice Yacht, 1901.

is very light and stiff. The central objects in construction are lightness and strength and adaptability for perfect handling. The centre of sail balance should agree with the centre of balance of the hull.



Plan of The Aurora.

The fastest ice yachts are of the sloop pattern with about one-fifth of their sail area in the jib.

Commodore H. C. Higginson's ice yacht Aurora, of Orange Lake I. Y. C., carrying 623¾ square feet of sail, and equipped with hollow spars and backbone, weighs a total of 1,554 pounds, divided as follows:

	Lbs.
Hollow backbone (45 feet long)	489
Solid runner plank (26 feet long)	417
Hollow mast (32½ feet long)	118
Hollow boom	55
Hollow gaff	28
Runners and steel steering gear	225
Sails	71
Rigging	151
Total weight	1,554

The cost to build an ice yacht of the first class, carrying about 650 square feet, is $1,200, and of the fourth class, carrying 300 square feet, about $350.

Sailing.— Racing on a lake is preferred to river racing, as there are neither tides nor ice cracks to interfere. In sailing a yacht the sheets are trimmed flat. The closest a boat will go to the wind is 30° or 2⅔ points. The best course, or the one that will take the yacht farthest to windward, is 60° or 5⅓ points from the wind, when the advance to windward should be at the rate of half the velocity of the wind, while the actual velocity is equal to that of the wind. The yacht encounters the greatest velocity of the wind when her course is 90°, or 8 points from the wind, when the apparent wind is twice the actual velocity. The greatest speed of the boat is attained at 120°, or 10⅔ points from the wind, when her speed is twice that of the wind. The most rapid progress to leeward is made at 150°, or 13⅓ points from the wind, when the apparent velocity of the wind will equal its true velocity.

H. Percy Ashley,
Ice Yacht Architect.

Icebergs. See Ice.

Iceland, an island dependency of Denmark, 250 miles from the southeast coast of Greenland, and about 600 miles west of Norway; between lat. 60° 24′ and 66° 33′ N., and lon. 13° 31′ and 24° 17′ W.; length, east to west, 301 miles; breadth, about 200 miles; area, with adjacent islands 40,459 square miles. The coast-line on the southeast is generally almost unbroken, but on all other sides presents a succession of bays or fiords and promontories. The best harbors are those of Reykjavik and Eyrarbakki on the southwest, and of Akureyri on the north. The interior of the island has for the most part a desolate appearance. Lofty mountains of volcanic origin rise crowned with snow and ice, which stream into the intervening valleys and form immense glaciers. Glaciers cover a surface of upward of 4,000 square miles, and appear in all the mountains above 4,000 feet in elevation. These icy mountains, which take the common name of Jökul, have their culminating point near the southeast coast in Oræfa Jokul of 6,409 feet in height. Next to it in height are the Snæfell, near the east coast, 5,965 feet; and Eyjafjalls Jökul, in the south, 5,579 feet. The structure of these mountains is volcanic; in several of them the volcanic agency is still active, and eruptions have occurred within the last four centuries. Lava covers a large portion of the island. Of volcanic origin and agency are the numerous hot springs or geysers scattered throughout the island, but found more especially in the southwest, to the northeast of Reykjavik, where, from one of the principal geysers, jets of water are thrown to heights varying from 100 to 200 feet. (See GEYSERS.) The general effects of the volcanic agency and the geological formations exhibited on a magnificent scale in Mount Hecla, 5,095 feet high; lat. 63° 59′ N.; lon. 19° 44′ 15″ W. The hot springs are sometimes used for economical purposes; food is dressed over them, and in some places huts are built over small fountains, to form steam baths.

The immense reservoirs of snow and ice furnish supplies to numerous lakes and rivers. Of the former the most important are the Thingvalla Vatn, Hvitar Vatn, and Arnar Vatn in the southwest, and the My Vatn in the northeast.

The most valuable mineral product is sulphur, of which the supply appears to be inexhaustible, and surturbrand or lignite is also worked to some extent. The other minerals are chalcedonies, rock-crystals, and the double-refracting spar, for which the island is famous. On many parts of the coast, particularly the west, basaltic caves occur; that of Stappen is not unworthy to be compared with Fingal's Cave in Staffa.

The climate is mild for the latitude. At Reykjavik, on the southwest coast, the mean temperature of the year is 40°, that of summer 56°, and that of winter about 29° 30′. The air is damp and misty, the weather is extremely variable, and storms and hurricanes frequent. The prevailing winds are north and northeast. In the southern part of the island the longest day is 20 hours, and the shortest 4 hours, but in the northernmost extremity the sun at midsummer continues above the horizon a whole week, and of course during a corresponding period in winter never rises.

Vegetation is sparse and confined within narrow limits. Almost the only tree is the birch, which is stunted, hardly exceeding 10 feet in height. Heath and whortleberry cover the surface. Among flowering plants are saxifrages, sedums, etc. The want of fuel is sometimes supplied by sheep's dung or by drift-wood brought by the Gulf Stream and the polar currents; and the island furnishes a fine turf. Grain appears to have been at one time cultivated, but is not now grown; cole, potatoes, turnips, radishes thrive tolerably well. But the most valuable crop is grass, on which numbers of live-stock are fed. Flocks and herds have been estimated at 750,000 sheep, 20,000 cattle, and 40,000 horses. The last, though small, are strong and active and numbers of them are exported. Some of the sheep are four-horned. Reindeer were introduced about 1770, but all that now remain are a few living in a wild state. Wild fowl, including the eider-duck, are abundant; the streams teem with salmon, and on the coast fisheries of cod, haddock, herrings, etc., are carried on.

Manufactures are entirely domestic, almost every family possessing within itself the means of supplying its wants, and occasionally furnishing a surplus, of coarse woolens, mittens, stockings, etc., to be disposed of at the markets. The exports are wool, oil, fish, horses, feathers, worsted stockings and mittens, sulphur, and Iceland-moss. The inhabitants are Scandinavians, and speak a Scandinavian dialect, the original Norse. They are of a tall manly form, open countenance, florid complexion, and flaxen hair. They are simple in manners and customs, having no distinctions of rank, pure in morals, and hospitable. Their houses are chiefly composed of drift-wood and lava; fresh meat and bread seldom appear at their tables, but fish, butter, milk, and preparations of milk constitute their staple food. Their intellectual capacity is superior, education is diffused, and it is rare to meet with an Icelander who cannot read and write.

In religious profession they are Lutherans, the whole island forming a single bishopric. The civil division is into three bailiwicks — Süderamt, Westeramt, and Norderamt with Osteramt — subdivided into 20 smaller districts called Sysler. The governor takes the name of Stiftsamtmann, and presides over the althing or parliament (from "thing," a public assembly), which meets twice a year at Reykjavik, the capital and only town in the island, and consists of 36 members, of whom 30 are chosen by popular suffrage, and 6 (2 spiritual and 4 temporal) are nominated by the king. In response to petitions and complaints Iceland was granted home rule in 1874, and now has the entire management of all matters concerning the island particularly. A minister for Iceland, nominated by the king, is at the head of the administration, but the highest local authority is vested in the governor.

Christianity was introduced in 981, and legalized in 1000; when schools and two bishoprics, those of Holar and Skalholt, were established. The Latin language and the literature and learning of the West, introduced by Christianity, were warmly received in Iceland where poetry and history had been cultivated more than elsewhere in the north. Previously to this the Icelanders had discovered Greenland (983) and part of America (about 1000), and they were now led to make voyages and travels to Europe and the East. The most flourishing period of Icelandic history as regards church and state, — the period too when its intercourse with the outside world abroad was most active — was from the middle of the 12th to the beginning of the 13th century.

Early History.— In 1264 Magnus VI. of Norway united Iceland with his own kingdom, with which it passed to Denmark in 1380, remaining with the latter in 1814, when Norway was joined to Sweden. Toward the end of the 14th century science and art, which had begun to decay with the introduction of the Norwegian rule, sank to the lowest ebb, but they gradually recovered their position during the following century. In the 17th century the island was ravaged by Algerian pirates, who in 1627 murdered or carried off a large number of the inhabitants. In the 18th century the island suffered from 43 years' failure of crops and 18 famines. In 1707 about 18,000 persons died of smallpox. Between 1783 and 1785 volcanic eruptions, failure of crops, and famine reduced the population from 48,668 to 38,142. Famine raged again in 1824-5, principally through violent volcanic outbreaks; and a deadly epidemic scourged the country in 1827. In the beginning of the last century the althing, which had existed for about 900 years, was abolished, but it was reorganized in 1843. As already mentioned, a new constitution was granted in 1874, and in August of the same year the 1000th aniversary of the colonization of the island was celebrated, the king of Denmark being present.

Language and Literature.— The Icelandic language is the most northerly of all cultivated tongues. It is rich in roots and grammatical forms, soft and sonorous to the ear, being free from gutturals and excess of hissing sounds. There are 28 letters, namely, all the English except *w*; also *æ*, *ö* (the German *ä* and *ö*), and a character for English *th*. Icelandic literature may be divided into an ancient period, extending to the fall of the republic, and a modern, extending from that date to the present time. Poetry was early cultivated, and among the most important works in Icelandic literature is the collection of ancient heathen songs called the elder or poetic Edda, compiled soon after the introduction of Christianity. (See EDDA.) Many other poems, especially songs of victory, elegies, and epigrams, belong to the ancient period of the literature. Histories and romantic works, known by the name of Sagas, were also numerous. Among these we may mention the Volsunga Saga, the most important of all, the Vilkina Saga, the Saga of Hrolf Kraka and his companions, the Saga of King Ragnar Lodbrok, Frithiofs Saga, and the younger or prose Edda. Some of these are partly historical, but there is a larger and more valuable class that are altogether historical in their character, consisting of local and family histories and biographies. Among these we may mention the Islendingabók; the Landnamabók, an account of the settlement of the island; the Kristni Saga, an account of the introduction of Christianity; Njáls Saga (translated into English by G. W. Dasent); Viga Glums Saga; Egils Saga, the biography of a well-known poet and chief; Eyrbyggja Saga, an abstract of which was published by Sir Walter Scott; the Sturlunga Saga, a history of the important Icelandic race of the Sturlungar; the Orkneyinga Saga, a history of the jarls of Orkney (an English translation of which was published in 1873); the Færeyinga Saga, on the Faroe Islands; the Knytlinga Saga, a history of the Danish kings from Harold Blaatand to Canute VI.; and lastly, the famous Heimskringla or Chronicle of the Norwegian Kings, by Snorre Sturlason. Many of these works are materpieces of style, and are still read with delight by the people of Iceland. The early portion of the second period was barren of anything worth mention in the way of literature, nor can the modern period boast at all of works possessing the interest of those belonging to the ancient. In the 17th century there was a considerable revival of literary activity, the principal names being those of Arngrimur Jonsson (1568-1648), Gudmundur Andræ (died 1654), Runolfur Jonsson (died 1654), Arni Magnusson (died 1730), and Thormodur Torfason or Torfæus. The first complete edition of the Icelandic Bible was issued under the direction of Gudbrandur Thorlaksson (died 1627). The true revival of letters may be said to date from the middle of the 18th century, since which time there is scarcely a department of literature in which Icelandic writers have not done something, not to mention works on various branches of science. Many of the most valuable works of Europe have been translated into Icelandic even the poems of Milton. Pop. (1895), 73,449; (1903), 78,470.

Consult: Von Toil, 'Letters on Iceland' (1772); Poestion, 'Elsland, das Land und seine Bewohner' (1889); Burton, 'Ultima Thule, a Summer in Iceland'; Horn, 'History of the Literature of the Scandinavian North.'

Iceland Moss, a lichen (*Cetraria islandica*), found in all the northern parts of the world. It is valued for its nutritious and medicinal properties, and as an article of commerce is collected in Iceland and Norway. In the extreme north it grows even near the sea-level; farther south, only on the mountains. In Iceland it often thickly covers great tracts, and the gathering of it is a summer industry. It grows about 1½ to 4 inches high, consists of an almost erect thallus, and is of a substance leathery and rather cartilaginous. It has a bitter principle which is reduced by steeping in water, and the moss is prepared as food either by pounding and making it into bread or by boiling, with water or milk, till it makes a jelly, in which form it is an agreeable and beneficial diet in some forms of disease, especially in pulmonary disorders. It is also utilized in dressing the warp in weaving, and for sizing paper, being mixed in the vat with pulp.

Icelandic Language and Literature. See ICELAND.

Icer'ya, a genus of scale insects, containing the fluted scale. See SCALE INSECTS.

Ichneumon-fly, ĭk-nū'mŏn, the name of a large family (*Ichneumonidæ*) of insects of the order *Hymenoptera*. As the species of this family are very numerous (more than 1,100 genera had been described before 1903) so their manners are extremely diversified; but, in the general outlines of their character, they all agree, particularly in their depredations among the insect tribes. In some the female has the ovipositor in the form of a boring instrument, with which she is capable of perforating the hardest substances. Tht larvæ of wasps are the devoted prey of these insects, who no sooner discover one of their nests than they perforate the material of which it is constructed, and deposit their eggs within it. Others glue their ova to the skin of a caterpillar, while others again penetrate through it, and lay their eggs in its body. In all these cases the young, as soon as they are hatched, prey on the caterpillar or larva, without, however, destroying it at once, as upon the life of its victim that of the spoiler appears to depend. The caterpillar, in fact, seems healthy until the larvæ of the ichneumon have spun their cocoons, and entered the chrysalis state.

1. (1) Exenterus marginatorus attacking the larva of the pine-tree moth. (2) the cocoon of the latter as left by an ichneumon-fly; (3) as left by its rightful occupant: (4) Bassus albosignatus attacking the larva of the syrphus-fly; (5) male of the same. (6) Banchus falcator stealing upon a caterpillar; (7) larva of the ichneumon-fly.

2. Anomalon circumflexum attacking a caterpillar; and Ophion undulatus thrusting its ovipositor into

3. Spathius clavatus, in a window.

4. Pimpla instigator, preying upon a willow-moth.

5. Pupa-case of an Ophion.

6. Larva of Microgaster nemorum emerging from an infested caterpillar of the pine-tree moth.

7. Ichneumon pisorius the left-hand figure being that of a female depositing eggs in a boring in the trunk of an oak.

These carnivorous insects are of various sizes; some are so small that the aphis, or plant-louse, serves as a cradle for their young; others again, from their size and strength, are formidable even to spiders, destroying them with their stings. They are, as a whole, highly beneficial to humanity, as a large part of their prey consists of insects which are injurious to crops and valuable vegetation.

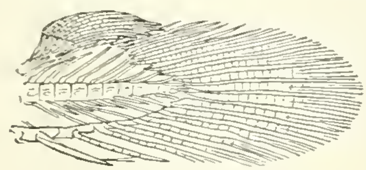
Ichneumons, small carnivorous animals of the civet family (*Viverridæ*) and sub-family *Herpestinæ*, which are distinguished from the true civets by the straight non-retractile claws, and various skeletal characters. While there are a number of genera the typical and most important is *Herpestes*, many species of which inhabit Africa, southern Asia, and the neighboring islands. The teeth are numerous, usually 40; the head is elongated, with short rounded ears; the limbs are short; and the body and stout tail are covered with long hairs. They vary in size from that of a squirrel to a cat. Their food consists of all kinds of small animals; rats and mice, birds and their eggs, snakes, lizards, etc., which they pursue chiefly on the ground but also in trees. The Egyptian ichneumon (*H. ichneumon*) or Pharoah's rat, is famous as one of the many animals venerated by the ancient people of that country, and because of its reputation as a destroyer of crocodile's eggs. While the eggs of this reptile may be occasionally devoured, the importance of the ichneumon in this respect is purely mythical. The Indian ichneumon or mungoose (*H. mungo*) is still better known. It lives in a semi-domesticated state, and performs an invaluable service as a destroyer of venomous serpents, whose fangs it generally manages to escape by its wonderful agility. This species has been introduced into Jamaica for the purpose of destroying rats, and has multiplied exceedingly and become a serious pest, though of late years it has been held in check by a great increase in the number of ticks.

Ichnology, ĭk-nol'ō-jĭ, that department of palæontology which treats of the foot-prints petrified in sedimentary rocks and made by extinct animals; the science of fossil foot-prints. Such foot-prints frequently occur in all formations, and have sometimes been the first and most instructive intimation of the existence of the animals that made them. This was particularly true of the foot-prints of dinosaurs (q.v.) so numerous and sharply marked in the brown sandstones of the Connecticut Valley; and they have greatly assisted in arriving at a true realization of those reptiles, which were at first regarded as birds. The tracks, trails, burrows, outlines of bodies, feathers and appendages of a vast variety of animals occur in the rocks and interest the ichnologist.

Ichthyol'ogy (Gr. ἰχθὺς, fish; λογὸς, a discourse), is the science of fishes. It is that branch of human knowledge which treats of the aquatic gill-bearing vertebrates, popularly known as fishes to English-speaking people.

Classification of Fishes.— In different treatises on fishes there appear very great differences in the classification proposed or adopted. Often in two works of parallel scope scarcely a group will appear in both with the same boundaries or under the same name. For this condition there are several causes. First, the tendency in some minds toward the extreme of subdivision, and in others toward the extreme of aggregation; second, the various values assigned by different authors to different sorts of characters, the actual value of each only to be determined by the final judgment of palæontology; third, the tendency of many writers to give new names to old groups. On this account a single class order may have half a dozen virtually synonymous names. Thus the terms *Chondropterygii, Elasmobranchii, Plagiostomi, Selachii, Placodii, Antacea*, and other less known names have been applied to the group of sharks and skates. Again various authors, recognizing the validity of a given group, may find it necesssary at times to change its boundaries. In such case a new name may be proposed, or a new definition be given to an old one. Either arrangement may lead to confusion. Thus with some writers, the groups of sharks, under various names, may include the order of *Chimæroids*, or, under the same names, the *Chimæroids* may be excluded from it.

The Chordata.— The great branch of chordate animals finds its origin probably in worm-like forms. It differs essentially from the invertebrate branches in the presence of a more



A Diphy-cercal Tail.

or less developed notochord (which in the higher forms gives place to a backbone), and in the presence of gill-slits, connected with respiration. These gill-slits and accompanying gill-structures are persistent in fishes, while in the higher vertebrates they are mostly relegated to the embryonic stages.

The *Chordata* include several classes of marine animals leading up to the true fishes, as follows:

Enteropneusta.— Balanoglossus (q.v.).
Tunicata.— Ascidians (q.v.).
Leptocardii.—Lancelots (q.v).
Cyclostomi.—Hag-fishes and Lampreys (qq. v.).
Cycliæ.— Extinct (palæozoic) fish-like forms.
Pisces.— Fishes, properly so called; the various primary divisions of which are usually called sub-classes.

But in view of the uncertainty attached to the mutual relations and origin of these groups, we may follow recent American custom in regarding the elasmobranchs, ostracophores, arthrodires, and teleostomes as distinct classes, the last named group containing the typical or true fishes. On anatomical grounds we must regard the *Elasmobranchii* (sharks) as the most primitive of these classes. As to this, palæontology gives no certain answer. There is no doubt that fishes existed and that some of the classes were well differentiated at a period long antecedent to the deposition of the oldest known remains. The earliest remains of fossil fishes now known occur in the Ordovician or Lower Silurian deposits at Cañon City, Colorado. Among the broken fragments are apparently parts of shields of ostracophores, scales of crossopterygians and vertebræ of a possible chimæroid. It is probable that primitive sharks existed still earlier than this, but no definable remains precede the Devonian.

The class or sub-class of *Elasmobranchii* (also called *Chondropterygii*, *Antacea*, etc.) agrees with the higher fishes in the presence of lower jaw, shoulder-girdle, pelvic girdle, paired fins, well developed skull, brain, and viscera. The gills are well developed, and the general structure and anatomy may be described as fish-like.

In distinction from the true fishes, the gills are differently formed, adnate by their outer margin, there are no membrane bones about the head, the ova are very large, the ventral fins are provided with claspers, there is no trace of air-bladder, the arterial bulb has three series of valves, there is a spiral valve in the rectum, the upper jaw is formed of palatal elements, the typical jawbones of the fish being undeveloped. The lower jaw is also different in structure from that of the true fishes.

The existing elasmobranchs are known as sharks, rays and chimæras. The vast majority of the known species are extinct. There are two strongly marked sub-classes among the elasmobranchs, the *Selachii* or sharks and rays, and the *Holocephali* or chimæras. In the *Selachii* there are five to seven gill-openings, the jaws are distinct from the skull, and the teeth are distinct. In the *Holocephali* there is but one external gill-opening, the jaws are coalescent with the skull, and the teeth are united to form bony plates or lamellæ. Both groups are very old in geologic times, having been separated at least since the Devonian. For this and other reasons some writers prefer to regard the sharks and chimæras as separate and coordinate groups.

We may without serious violence divide the sharks and rays into six orders; namely, *Pleuropterygii*, *Acanthodii*, *Ichthyotomi*, *Notidani*, *Asterospondyli*, and *Tectospondyli*, the first three of these being confined to Palæozoic time. We may regard the *Pleuropterygii* or the allies of *Cladoselache* as the most primitive, and therefore as standing first in an ascending series.

In this group the pectoral and ventral fins are broad and fold-like, the notochord is apparently not segmented, the tail is short and keeled, well specialized, its tip abruptly turned upward. There are no spines, the teeth are small, with many cusps. There is probably but one family, the *Cladoselachidæ* (extinct), *Cladoselache fyleri*, a large elongate shark from the Devonian of Ohio, is the best known species.

The *Acanthodii* are small sharks with a spine at the front of each fin except the caudal. The teeth are minute or wanting, and the skin is covered with small checker-like plates. There are three families, *Acanthœssidæ* (extinct), with one dorsal fin, *Diplacanthidæ* (extinct), with two, and the *Ischnacanthidæ* (extinct), small sharks found from the Devonian to the Permian.

The *Ichthyotomi* have the pectoral fin developed as an archipterygium or jointed limb with a fringe of rays on one or both sides. The dorsal fin extends along the back, and on the head is a first dorsal preceded by a long spine. There are two well-marked families, *Pleuracanthidii* and *Cladodontidæ*, abundant in the Carboniferous and Permian, but now extinct.

The *Notidani* or *Diplospondyli* have the notochord imperfectly segmented by vertical partitions, and the gill-clefts are six or seven in number instead of five, as in other sharks. Most of the species are extinct, the teeth being found in the rocks from the Jurassic to the present time. Two families are represented, the *Hexanchidæ* and the *Chlamydoselachidæ*, the latter eel-shaped sharks of the open sea, chiefly about Japan.

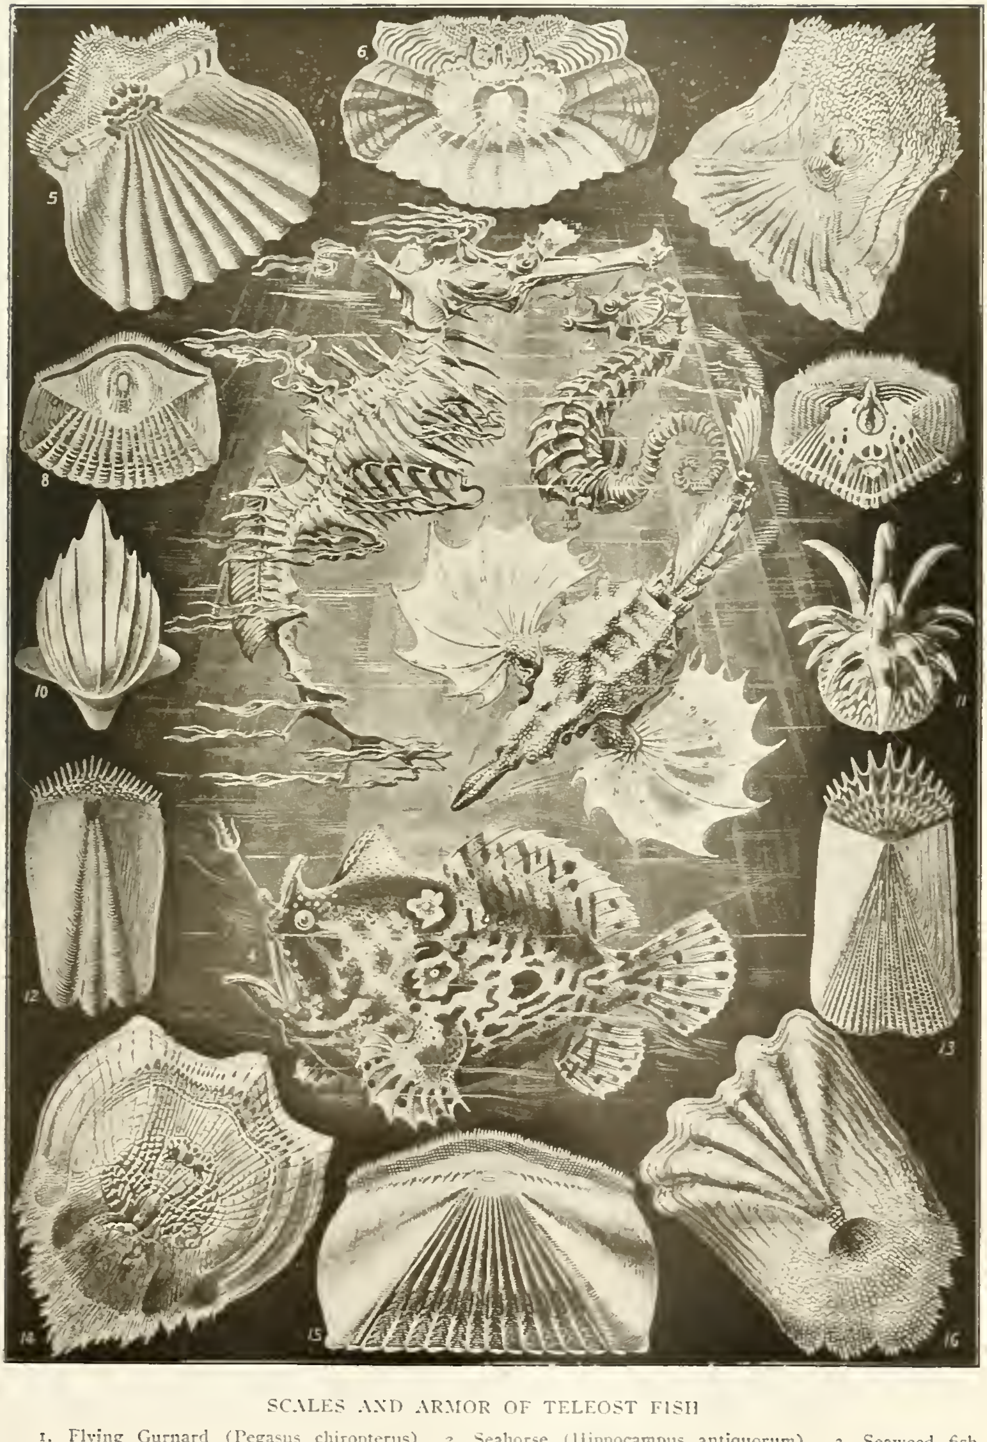
In the large order of *Asterospondyli* the vertebræ are strengthened by secondary plates of calcified tissue, which radiate outward from the small primitive cylinder. In these typical sharks there are five gill-slits, two dorsal fins, and one anal fin.

In the most primitive group, the sub-order *Cestraciontes*, the dorsal fins are each armed with a spine, the numerous teeth are small and mostly blunt, differing in form in different parts of the jaw, and the vertebræ are imperfectly formed. A curious fact in geological distribution is that a multitude of early types of shark disappear in the Permian or toward the end of Palæozoic time. Only cestraciont sharks are known to have any representatives in the Triassic, and this group may be ancestral to all modern sharks.

A Lancelet (*Amphioxus*).

Of the *Cestraciontes* the Palæozic families of *Cochliodontidæ* (extinct) and *Orodontidæ* (extinct), known mainly by the teeth, occur in the Lower Carboniferous. In some and probably all of these forms the dorsal fins were each armed with a spine. The *Edestidæ* (extinct), known only from coiled whorls of fused teeth, are doubtless closely related to these forms. These are found in the coal measures. The principal family of *Cestraciontes*, the *Heterodontidæ*, begins in the Permian, and is represented by five living species all in the Pacific Ocean, the longest known being the Port Jackson shark of Australia (*Heterodontus philippi*). We may here mention two families of sharks of uncertain relationship, the species confined to the Carboniferous Age. These are the *Petalodontidæ* (extinct), with blunt teeth, and some of them with broad fins like rays, and the *Psammodontidæ* (extinct), known from the blunt teeth only. Still more uncertain is the group of *Tamiobatidæ* (extinct) from the Devonian of Kentucky, resembling a ray, but probably a primitive offshoot from the sharks.

The remaining asterospondylous sharks from a sub-order, *Galei*, without dorsal spines, and with the vertebræ more perfectly calcified. The principal family is the *Carchariidæ*. Others are the *Sphyrnidæ* or hammer-heads, *Scyliorhinidæ* or cat-sharks, *Ginglymostomidæ*, *Hemiscylliidæ*, *Orectolobidæ*, *Lamnidæ* or man-eater sharks,



SCALES AND ARMOR OF TELEOST FISH

1. Flying Gurnard (Pegasus chiropterus). 2. Seahorse (Hippocampus antiquorum). 3. Seaweed fish (Phyllopteryx eques). 4. Tentacle fish (Antennarius tridens). 5—16. Characteristic forms of scales among teleost fishes: 5. 6. 7. Sparidæ (sea-breams); 8—9. Percidæ (perches); 10, Centriscidæ (snipefish); 11, Siluridæ (catfish); 12, Fistularidæ (flutemouths); 13, Pleuronectidæ (soles); 14, Labridæ (wrasses); 15. Pristipomidæ (fossil); 16, Sparidæ (Cantharus)

Odontaspididæ, or sand-sharks, *Alopiidæ,* or thresher-sharks, *Mitsukurinidæ* or spoon-bill sharks, *Cetorhinidæ* or basking-sharks, *Pseudotriakidæ* and *Rhincodontidæ.* Of the *Lamnidæ* and related families fossil teeth are very numerous from the Jurassic to modern times.

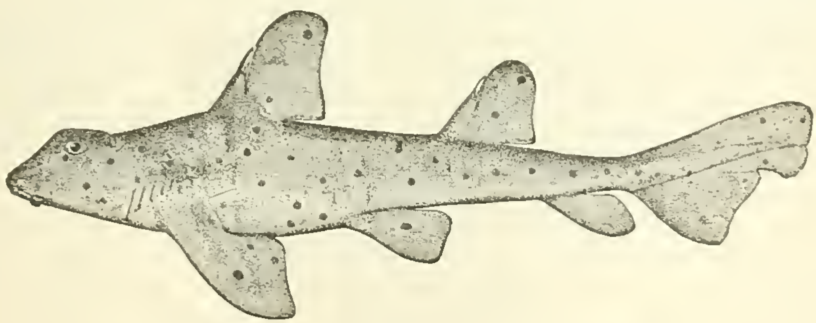
The *Tectospondyli* have the vertebræ each provided with secondary plates of calcified tissue concentrically arranged in one or more series. In these sharks there is no anal fin. To these belong the *Squalidæ* or dog-fishes, *Dalatiidæ, Oxynotidæ,* and *Echinorhinidæ* or bramble-sharks, these families forming together the sub-order *Cyclospondyli,* having the vertebral centrum a simple constricted cylinder pierced by the notochord. To the *Tectospondyli* proper we may refer a few families of sharks, the *Squatinidæ* or monk-fishes, and *Pristiophoridæ* or saw-sharks. A third sub-order, *Batoidei,* includes all the skates or rays. These agree with the true *Tectospondyli* in having a number of series of concentric plates within the vertebræ. The body is, however, more or less depressed, the broad pectoral fins outlining a body disk, and the gill-openings lie underneath instead of being lateral, as in all the sharks. The rays are first certainly known from the Jurassic, although several of the Carboniferous sharks have ray-like teeth, and have been referred to the group of rays.

The recognized families of rays are the *Pristididæ* or saw-fishes, the *Rhinobatidæ* or guitar-fishes, the *Narcobatidæ* or torpedos, the *Rajidæ* or skates, the *Dasyatidæ* or sting-rays, the *Myliobatidæ* or eagle-rays, the *Mobulidæ* or devil-fishes, and the *Ptychodontidæ* (extinct) of the Cretaceous. The earliest of these groups, the *Rhinobatidæ,* date from the Jurassic.

In the sub-class of *Holocephali* or *Chimæroids* the upper jaw or pterygoquadrate arcade is immovably joined to the skull. The teeth are coalesced into broad plates, and a fold of skin covers the gill-clefts so that there is but one external opening. The vertebral axis is imperfectly segmented, and the notochord is surrounded by partially calcified rings. In all recent genera, and in most others, there is a strong spine in the first dorsal, and in the male the forehead has a singular cartilaginous hook with a brush of spines at the end.

There are fragments referred to the skeleton of a chimæroid found in the Lower Silurian at Cañon City, Col. Numerous forms appear in the Devonian. Four genera, representing three families, are now extant, the *Rhinochimæridæ* (*Rhinochimæra* and *Harriotta*) in the deep seas, *Chimæridæ* or elephant-fishes (*Chimæra*) in the north and south temperate seas, and *Callorhynchidæ* (*Callorhynchus*) in the seas of the southern hemisphere only. Extinct families are the *Ptychodontidæ* (extinct), the *Squaloriidæ* (extinct), and the *Myriacanthidæ* (extinct). Numerous extinct genera are referred to the *Chimæridæ.* Fossil fin-spines of many species of sharks and chimæroids, fishes otherwise unknown, occur in the rocks. These are called ichthyodorulites, and their proper classification is often a matter of much uncertainty. The earliest of these are known as *Onchus,* occurring in the Upper Silurian.

Class Ostracophori.— The earliest vertebrates actually recognized as fossils are known as ostracophores (ὄστρακον, a box; φορέω, to bear). These are most extraordinary creatures, which may be described as jawless, limbless, enveloped in a coat of mail. While they have been called mailed lampreys, the likeness to lampreys is almost wholly negative, resting in the total absence of jaws, limbs, and limb-girdles. What the mouth was like can only be guessed, but no trace of jaws has yet been found in connection with it. The most remarkable distinctive character is found in the presence of a hard shell, made of bony plates covering the anterior part of the body, while the backbone is developed as a persistent notochord, imperfectly segmented. The entire absence of jaw structures, as well as the character of the armature, at once separates them widely from the mailed arthrodires of a later period.



Bullhead Shark of California (*Gyropleurodus francisci*).

This group was originally called *Ostracodermi,* a name preoccupied for the group of bony trunk-fishes (*Ostraciidæ*). The names *Protocephali* and *Aspidoganoidei* have also been used for them. The still earlier name *Placodermi* included the *Arthrodires* as well.

The ostracophores are found in the Ordovician, Silurian, and Devonian rocks, after which they disappear. The species are very numerous and varied. Their real affinities have been much disputed. Traquair regards them as much modified allies of ancient sharks, which view of the case is supported by features in the structure of the most shark-like of the orders, *Anaspida.* The absence of jaws and limbs separates them widely from true fishes, and there is no clear evidence in the structure of the fins and fin-supports that these structures are homologous with the fins and fin-supports of true fishes, or even of sharks. In this group are four well-marked orders, *Heterostraci, Anaspida, Aspidocephali,* and *Antiarcha.*

The *Heterostraci* (ἕτερος, different; ὄστρακον, box) have no bone-corpuscles in the coat of mail. This order includes the *Pteraspidæ* (extinct), *Thelodontidæ* (extinct), *Drepanaspidæ* (extinct), and *Psammosteidæ* (extinct).

The *Anaspida* are more fish-like in appearance, having the armature of the head not plate-like, but formed of tubercles. There are two families, all of recent discovery, *Birkeniidæ* (extinct) and *Euphaneropidæ* (extinct).

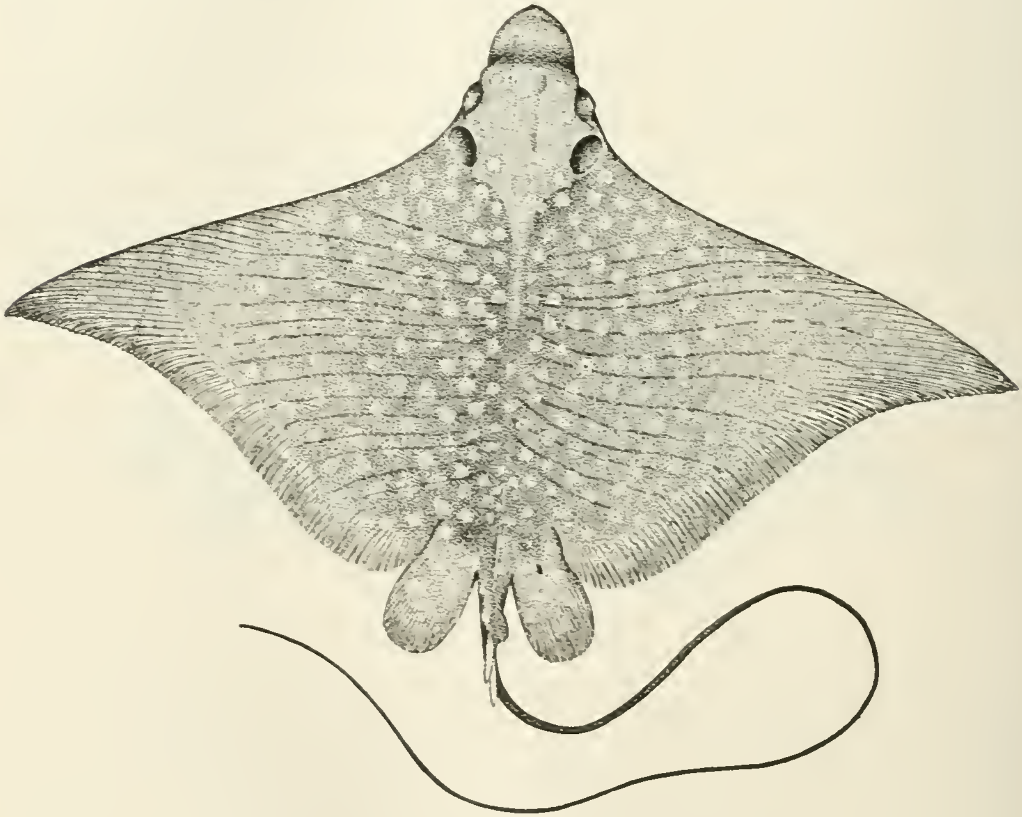
The *Aspidocephali* (also called Osteostraci) have bone-corpuscles in the shields, and the shield of the back is of one piece, without lateral line-channels or sense-organs. The order includes four families, *Ateleaspidæ* (extinct), *Cephalaspidæ* (extinct), *Thyestidæ* (extinct), and *Odontodontidæ (Tremataspidæ)* (extinct), with many genera and species.

The *Antiarcha* have also bone-corpuscles in the plates, which are also enameled. The sense-organs occupy open grooves, and the dorsal and ventral shields are of many pieces. The head is jointed on the trunk, and jointed to the head are paddle-like appendages covered with bony plates and resembling limbs. There is no evidence that these erectile plates are real limbs. They seem to be rather jointed appendages of the head-plate, erectile on a hinge like a pectoral spine.

There is but one family, *Asterolepidæ* (extinct). *Pterichthyodes milleri*, named by Agassiz for Hugh Miller, from the Lower Devonian, is the best-known species.

Class Arthrodires.— Another group of extinct mailed fishes is known as *Arthrodira* (ἄρθρον, joint; δειρή, neck). In this group jaws are developed, but of peculiar character, the mandibles being regarded as mere dermal elements, not forming part of the skeleton. The head in all the species is covered with a great bony helmet. Behind this on the nape is another large shield, and between the two is typically a hinge-joint, which has been compared to the hinge of a spring-beetle (elater). Some of these plates are traversed by sensory grooves. Nothing whatever is known of the internal structure, and as the skeleton is soft, the backbone notochordal, there is no trace of shoulder-girdle, nor any certain evidence of limbs, although peculiar structures have been interpreted as such. The presence of a peculiar type of jaws separates the group from the mailed ostracophores, from which the arthrodires differ also widely in the character of the armature.

Dr. Woodward and several other recent writers have regarded the arthrodires as armored, widely modified offshoots of the primitive *Dipneusta*. But the evidence does not seem to justify the union of the arthrodires with the latter group, and it would seem as reasonable to regard them as derived directly from the sharks or the ostracophores. The arthrodiran fishes occur in abundance from the Silurian times to the Mesozoic. In the Devonian their gigantic size and thick armor gave them the leading position among the hosts of the sea, ranging in



Spotted Sting-ray (*Aetobatus narinari*).

size "from that of the perch to that of the basking-shark."

The class, called by Dr. Dean *Arthrognathi*, is divided by him into two sub-classes, *Arthrodiro*, with a hinge at the neck, and *Anarthrodira*, without hinge. In the first of typical sub-class are two orders, *Temnothoracici*, with the single family *Chelonichthyidæ* (extinct), *Arthrothoraci*, with the families *Coccosteidæ*, *Dinichthyidæ* (extinct), *Titanechthyidæ* (extinct), *Mylostomidæ*, and *Selenosteidæ* (extinct). To the *Chelonichthyidæ* belongs the noted species *Homosteus milleri*, celebrated by Hugh Miller under the name of "the Asterolepis of Stromness," in his 'Footprints of the Creator.'

The arthrodires without joint at the neck constitute the order *Stegotholami*, with the families of *Macropetolichthydiæ* (extinct), and *Asterosteidæ* (extinct).

The best known of the many genera of arthrodires is *Coccosteus*, found in the Scottish Devonian.

Class Teleostomi.— We may unite the remaining groups of fishes under a single class for which the name *Teleostomi* (τέλεος, true; στόμα, mouth), proposed by Bonaparte in 1838, may be retained. The fishes of this class are characterized by the presence of a suspensorium to the mandible, by the existence of membrane-bones (opercles, suborbital, etc.) on the head, by a single gill-opening, leading to gill-arches bearing bilamellate gills, and by the absence of claspers on the ventral fins. The skeleton is more or less ossified in all the *Teleostomi*. More important as a primary character distinguishing these fishes from the sharks is the presence typically and primitively of the air-bladder. This arises at first as a diverticulum from the ventral side of the œsophagus, and develops as a lung, but in later forms it becomes degraded to a swim-bladder, springing from the dorsal side of the alimentary canal, and in very many forms it is altogether lost with age. The group comprises the vast majority of recent fishes, as well as a large percentage of those known only as fossils. In these, the condition of the lung can be only guessed.

The *Teleostomi* are doubtless derived from sharks, their relationship being perhaps nearest to the *Ichthyotomi* or to the primitive chimæras. The lowest *Teleostomi* retain the shark-like condition of the upper jaw, made of palatal elements which, as in the *Chimæro*, may be fused with the cranium. In the lower forms also the primitive diphycercal or protocercal form of tail is retained, as also the archipterygium or jointed axis of the paired fins, fringed with rays on one or both sides.

We may divide the teleostomes or true fishes into three sub-classes, the *Crossopterygii* or fringe-fins, the *Dipneusti* or lung-fishes, and the *Actinopterygii* or ray-fins. Of these, recent writers are disposed to consider the *Crossopterygii* as most primitive, and to derive from this, by separate lines, each of the remaining sub-classes, as well as the higher vertebrates.

Sub-class Crossopterygii.—The earliest teleostomes constitute the class called after Huxley, *Crossopterygii* (κροσσός, fringe; πτερόν, fin). Its essential character is the retention of the jointed pectoral fin or archipterygium, its axis fringed by series of soft rays. This character it shares with the *Ichthyotomi* among sharks, and with the *Dipneusti*. From the latter it differs in the hyostylic cranium, the lower jaw being suspended from the hyomandibular — and by the presence of distinct premaxillary and maxillary elements in the upper jaw. In these characters it agrees with the ordinary fishes. The skeleton is more or less perfectly ossified. Outside the cartilaginous skull is a bony coat of mail. The skin is covered with firm scales or bony plates. The tail is diphycercal, straight, and ending in a point. The shoulder-girdle, attached to the cranium, is cartilaginous, but overlaid with long, bony plates, and the branchiostegals are represented by a pair of gular plates.

In the single family represented among living fishes the heart has a muscular arterial bulb with many series of valves on its inner edge, and the large air-bladder is divided into two lobes, having the functions of a lung, though not cellular as in the lung-fishes.

The fossil types are very closely allied to the lung-fishes, and the two groups have no doubt a common origin in Silurian times. It is now usually considered that the crossopterygian is more primitive than the lung-fish, though at the same time more nearly related to the ganoids, and through them to the ordinary fishes.

From the primitive *Crossopterygii* the step to the ancestral amphibia, which are likewise mailed and semi-aquatic, seems a very short one. It is true that most writers until recently have regarded such dipneustans as the *Ceratodontidæ*, as representing the parents of the amphibians. But the weight of recent authority, Gill, Boulenger, Dollo, and others, seems to place the point of separation of the higher vertebrates with the crossopterygians.

Cope and Woodward divide the *Crossopterygii* into four orders or sub-orders, *Haplistia*, *Rhipidistia*, *Actinistia*, and *Cladistia*. To the last belong the existing species (*Polypteridæ*) alone. In all these the pectorals are narrow with a single basal bone, and the nostrils, as in the dipneustans, are below the snout.

In the *Haplistia* the notochord is persistent, and the basal bones of dorsal and anal fins are in regular series, much fewer in number than the fin-rays. The single family *Tarrossiidæ*, regarded as lowest of the crossopterygians, are small fishes of Carboniferous Age.

In the *Rhipidistia* the basal bones of the median fins are found in a single piece, not separate as in the *Haplistia*. Four families are recognized, *Holoptychiidæ* (extinct), *Rhizodontidæ* (extinct), *Osteolepidæ* (extinct), *Onychodontidæ* (extinct), the first of these being considered as the nearest approach of the crossopterygians to the dipnoans.

In the *Actinistia* there is a single fin-ray to each basal bone, the axonosts of each ray fused in a single piece. The notochord is persistent, causing the backbone in fossils to appear hollow, the cartilaginous material leaving no trace in the rocks. The genera and species are numerous, ranging from the Subcarboniferous to the Upper Cretaceous, and belonging to the single family *Cœlacanthidæ* (extinct).

In the *Cladistia* the axis of the pectoral limb is fan-shaped, made of two diversified bones joined by cartilage. The notochord is restricted and replaced by ossified vertebræ. The axonosts of the dorsal and anal are in regular series, each bearing a fin-ray. The order contains the single family *Polypteridæ*, represented by numerous species in the Nile, Senegal, and Kongo rivers. In this group the pectoral fin is formed differently from that of the other crossopterygians, being broad, its base of two diverging bones with cartilage between. This structure, more specialized than in any other of the crossopterygians or dipneustans, has been regarded by Gill and others, as above stated, as the origin of the fingered hand (chiropterygium) of the frogs and higher vertebrates. The base of the diverging bones has been identified as the antecedent of the humerus, the bones themselves as radius and ulna, while the intervening, non-ossified cartilage breaks up into carpal bones, from which metacarpals and digits ultimately diverge. This hypothesis is at least a reasonable one. The nostrils, as in true fishes, are superior. The body in these fishes is covered with rhombic enameled scales, as in the garpike, the head is similarly mailed, but in distinction from the garpike, the anterior rays of the dorsal are developed as isolated spines.

The young have a bushy external gill, with a broad scaly base. The air-bladder is double, not cellular, with a large air-duct joining the ventral surface of the œsophagus. The intestine has a spiral valve.

The cranium is remarkable for its generalized form, this forming a trait of union between the ganoids and the primitive *Amphibia* or *Stegocephali*. Without considering *Polypterus*, it is not possible to interpret the homologies of the cranium of the amphibians and the sharks.

Sub-class Dipneusti or Lung-Fishes.— The *Dipneusti* (δίς, twice; πνέω, to breathe) are a group characterized by the presence of paired fins consisting of a jointed axis with or without rays. The skull is autostylic, the upper jaw being made, as in the *Chimæra*, of palatal elements fused with the cranium and without premaxillary or maxillary. Dentary bones little developed. Air-bladder cellular, used as a lung, in all living species. Heart with many valves in the muscular arterial bulb. Intestine with a spiral valve. Teeth usually of large plates of dentine covered with enamel on the pterygopalatine and splenial bones. Nostrils concealed, when the mouth is closed, under a fold of the upper lip. Scales cycloid, mostly not enameled.

This group has been usually known as *Dipnoi*. But this term was first taken by Leuckart, in 1821, as a name for amphibians, before any of the living *Dipneusti* were known

The *Dipneusti* agree with the crossopterygians by the presence of lungs, a character which separates them from all the earlier orders of fishes. In its origin the lung or air-bladder arises as a diverticulum from the alimentary canal used by the earliest fishes as a breathing-sac, the respiratory functions lost in the progress of further divergence. Nothing of the nature of lung or air-bladder is found in lancelet, lamprey, or shark. In none of the remaining groups of fishes is it wholly wanting at all stages of development.

In the Dipneusti or dipnoans, as in the crossopterygians and higher vertabrates, the trachea or air-duct arises from the ventral side of the œsophagus. In the more specialized fishes, yet to be considered, it is transferred to the dorsal side, thus avoiding a turn in passing around the œsophagus itself. From the sharks these forms are further distinguished by the presence of membrane-bones about the head. From the *Actinopteri* (ganoids and teleosts) dipneustans and crossopterygians are again distinguished by the retention of the fringe-fin or archipterygium as the form of the paired limbs. From the crossopterygians the dipnoans are most readily distinguished by the absence of maxillary and premaxillary, the characteristic structures of the jaw of the true fish. The upper jaw in the dipnoan is formed of palatal elements attached directly to the skull, and the lower jaw contains no true dentary bones. The skull in the dipnoans is in the *Chimæra* is autostylic, the mandible articulating directly with the palatal apparatus, the front of which forms the upper jaw, and of which the pterygoid hyomandibular and quadrate elements form an immovable part. The shoulder-girdle, as in the shark, is a single cartilage, but it supports a pair of superficial membrane-bones.

In all the dipnoans the trunk is covered with imbricated cycloid scales and no bony plates, although sometimes the scales are firm and enameled. The head has a roof of well-developed bony plates made of ossified skin and not corresponding with the membrane-bones of higher fishes. The fish-like membrane-bones, opercles, branchiostegals, etc., are not yet differentiated. The teeth have the form of grinding-plates on the pterygoid areas of the palate, distinctly shark-like in structure. The paired fins are developed as archipterygia, often without rays, and the pelvic arch consists of a single cartilage, the two sides symmetrical and connected in front. There is but one external gill-opening, leading to the gill-arches, which, as in ordinary fishes, are fringe-like, attached at one end. In the young, as with the embryo shark, there is a bushy external gill, which looks not unlike the archipterygium pectoral fin itself, although its rays are of different texture. In early forms, as in the ganoids, these scales were long and enameled, but in some recent forms, deep sunken in the skin. The claspers have disappeared, the nostrils, as in the frog, open into the pharynx, the heart is three-chambered, the arterial bulb with many valves, and the cellular structure of the skin and of other tissues is essentially as in the *Amphibia*.

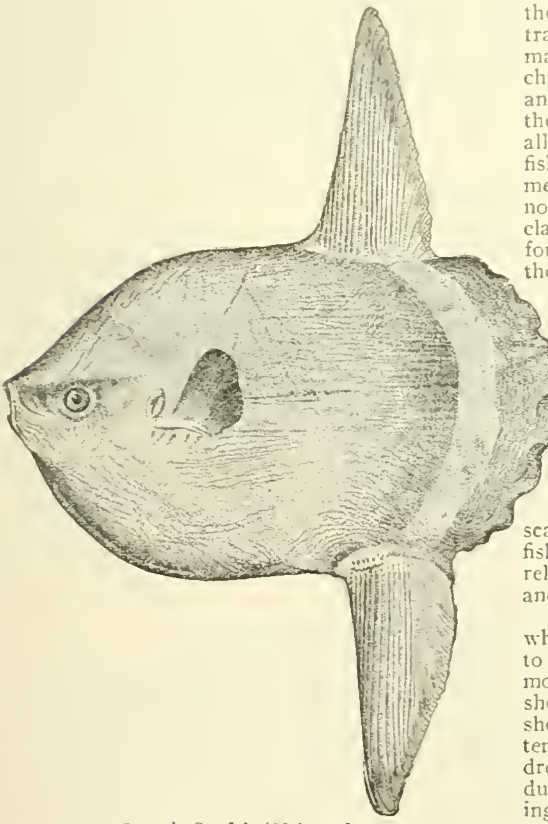
The developed lung, fitted for breathing air, which seems the most important of all these characters, can, of course, be traced only in the recent forms, although its existence in all others can be safely predicated. Besides the development of the lung we may notice the gradual forward movement of the shoulder-girdle, which, in the dipneustans, as in the crossopterygians, is attached to the head. In the fishes generally there is no distinct neck, as the post-temporal, the highest bone of the shoulder-girdle, is articulated directly with the skull.

We may divide the dipnoans into two orders, *Ctenodipterini*, with the families *Uronemidæ* (extinct), *Dipteridæ* (extinct), and *Ctenodontidæ* (extinct). These families occur from the Devonian to the Mesozoic. The more specialized order of *Sirenoidei* includes the families of *Ceratodontidæ* and *Lepidosirenidæ*, each of these represented by living forms. Most of the *Ceratodontidæ* are extinct, occurring in the Mesozoic; but two species, *Neoceratodus forsteri* and *N. miolepis*, live in rivers of Australia. No fossil *Lepidosirenidæ* are known. *Lepidosiren paradoxus* lives in the swamps of southern Brazil and *Protopterus annectens, P.*

dolloi, and *P. æthopicus*, in those of the Nile region.

Sub-class Actinopteri.—After setting off from the great group of fishes primitive or archaic types, one after another, we are left at last with only those having fish-jaws, fish-fins, and in general the structure of the typical fish. For all these in all their variety, as a class or subclass, we adopt the name of *Actinopteri*, suggested by Prof. Cope. The name (ἀκτίς, ray; πτερόν, fin) refers to the structure of the paired fins. In all these, the bones supporting the fin-rays are highly specialized, and at the same time concealed by the general integument of the body.

In general, two bones connect the pectoral fin with the shoulder-girdle. The hyperacoracoid is a flat square bone, usually perforated by a foramen lying above, and parallel with it the irregularly formed hypocoracoid. Attached to these is a row of bones, the actinosts or pterygials, short, often hourglass-shaped, which actually support the fin-rays. In the higher forms the actinosts are few (four to six) in number, but in the lower types they may remain numerous, a reminiscence of the condition seen in the crossopterygians and especially in *Polypterus*. Other variations may occur; the two coracoids are sometimes imperfect or specially modified, and the actinosts may be distorted in form or position. Among the lower *Actinopteri* many archaic traits still persist, and by its earlier representatives the group is joined very closely to the *Crossopterygii*. The great class may be divided into two series or sub-classes, the *Ganoidei*, which retain the ancient traits, and the *Teleostei* or bony fishes, in which most of these have disappeared.



Oceanic Sunfish (*Mola mola*).

Even among the *Ganoidei*, as the term is here restricted, there remains a great variety of form and structure. The group constitutes several distinct orders, and as a whole does not admit of perfect definition. All of the species known have the tail strongly heterocercal. Most of them have the skeleton still cartilaginous, and in some it remains in a very primitive condition. Most of them have an armature of bony plates, diamond-shaped with an enamel like the surface of teeth. All of them have the air-bladder highly developed, usually cellular and functional as a lung, but connecting with the dorsal side of the gullet, not with the ventral side, as in the dipnoans. In all these remain more or less perfectly developed the optic chiasma, the many valves of the arterial bulb, and the spiral valve of the intestines found in the more archaic types. But traces of some or all of these structures are found in some bony fishes, and their presence in the ganoids by no means justifies their separation with sharks, dipnoans, and crossopterygians as a great primary class, *Palæichthyes*. All forms of body may be found among the ganoids. In the earlier seas they were scarcely less varied and perhaps scarcely less abundant that the teleosts in the seas of to-day. So far as fossils show, the characteristic actinopterous fin, with its reduced and altered basal bones, appeared at once without intervening gradations.

The name *Ganoidei* (γάνος, brightness; εἶδος, resemblance), alluding to the enameled plates, was first given by Agassiz to those forms, mostly extinct, allied to the garpike, and covered with bony scales or hard plates. As originally defined, catfishes, sea-horses, *Agonidæ*, and other wholly unrelated types were included with the garpikes and sturgeons as ganoids.

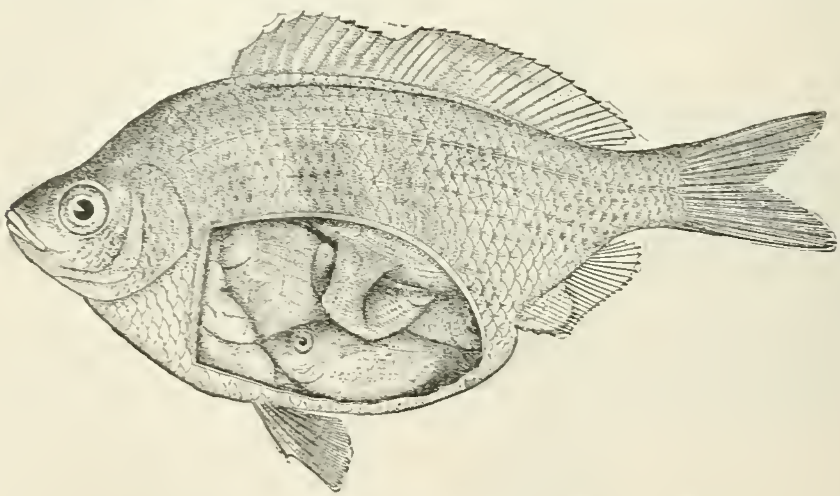
These were eliminated by Johannes Müller, who recognized the archaic characters common to the existing forms. Still later Huxley removed the crossopterygians, and others have shown that the *Ostracophori* and *Arthrodira* should be placed far from the garpike in systematic classification. Cope and Woodward have dropped the name ganoid altogether as productive of confusion through the many meanings attached to it. Others have retained it as a convenient group name for the orders of archaic *Actinopteri*. For these varied and more or less divergent groups it seems convenient to retain it.

The order *Lysopteri* (λύσις, a loosing; πτερόν, fin) comprises the earliest ganoids, beginning in the Devonian, covered with enameled scales. The families are *Palæoniscidæ*, *Platysomidæ*, *Dictyopygidæ*, and *Dorypteridæ*. The order *Chondrostei* (χόνδρος, cartilage; ὀστέον, bone) includes a great variety of forms, characterized by the less cartilaginous skeleton, the distinctly heterocercal tail, and the presence of bony plates, rather than scales, on most parts of the body. These represent a degenerate offshoot from the *Lysopteri*, the form being less like that of the typical fishes. The earliest members of this group appear in the Tertiary, the most primitive family being the *Chondrosteidæ* (extinct). Another family is that of *Belonorhynchidæ* (extinct). The *Acipenseridæ* (sturgeons) are well represented among living fishes. The order *Sclachostomi* (σέλαχος, shark; στόμα, mouth) includes the paddle-fishes (*Polyodontidæ*). two living species. and one extinct, in the Eocene. The order *Pycnodonti* including the family of *Pycnodontidæ* (extinct), consists of a deep-bodied, compressed fishes with small mouths and a peculiar physiognomy. The order *Lepidostei* (λεπίς, scale; ὀστέον, bone) includes numerous families with rhombic enameled scales. The families are *Semionotidæ*, *Lepidotidæ*, *Isopholidæ*, *Macrosemiidæ*, *Pholidophoridæ*, *Aspidorhynchidæ*, and *Lepisosteidæ*, all extinct save the *Lepisosteidæ*, represented by four species known as garpike in the rivers of North America. The earliest fossil garpikes occur in the Eocene. The *Halecomorphi* (*halec*, herring; μορφή, form) comprise the *Pachycormidæ*, *Protosphyrænidæ*, *Liodesmidæ*, *Oligopleuridæ*, and *Amiidæ*. All these have perished, except the *Amiidæ*, which group is represented by a single species, the Bowfin, *Amia calva*, in the waters of the eastern United States. In these forms there is a gradual transition from diamond-shaped scales. covered with enamel, to the cycloid scales of the ordinary soft-rayed fishes. The line separating the *Lepidostei* and *Halecomorphi* from each other and from the *Isospondyli* is a very narrow one.

Sub-class Teleostei or Bony Fishes. — The fishes which still remain for discussion constitute the great sub-class or series of *Teleostei* or bony fishes. They lack wholly or partly the ganoid traits, or show them only in the embryo. The tail is slightly if at all heterocercal. the fulcra disappear. the actinosts of the pectoral fins are few and large. rarely if ever over five in number. the air-bladder is no longer cellular in most species, nor does it assist in respiration. The optic nerves are separate, one running to each eye without chiasma. The skeleton is almost entirely bony, the notochord usually disappearing entirely with age. The valves in the arterial bulb are reduced in number, and the spiral valve of the intestines disappears. Traces of each of the ganoid traits may persist somewhere in some group. but as a whole we see a distinct specialization and a distinct movement toward the fish type with the loss of characters distinctive of sharks. dipnoi, and ganoids. In a general way the skeleton of all teleosts corresponds with that of the striped bass. and the visceral anatomy is in all cases sufficiently like that of the sunfish.

The mesocoracoid or præcoracoid arch, found in all ganoids. persists in the less specialized types of bony fishes. although no trace of it is found in the perch-like forms. With all this, there is found among the bony fishes, an infinite variety in details of structure. For this reason the *Teleostei* must be broken into many orders, and these orders are very different in value and in degrees of distinctness. the various groups being joined by numerous and puzzling intergradations.

Order Isospondyli.— Of the various subordinate groups of bony fishes there can be no question as to which is most primitive in structure or as to which stands nearest the orders of ganoids. Earliest of the bony fishes in geological time is the order of *Isospondyli* (ἴσος, equal; σπόνδυλος. vertebra), containing the allies recent and fossil of the herring and the trout. This order contains those soft-rayed fishes which have the ventral fins abdominal, the mesocoracoid or præcoracoid arch developed (sometimes lost in degeneration), and the anterior vertebræ unmodified, essentially similar to the others.

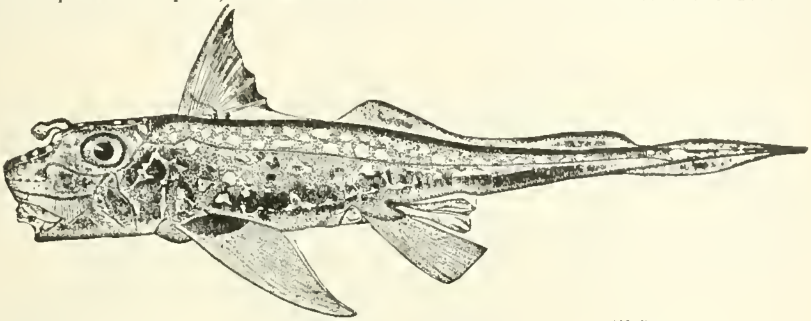


Sparada, or Viviparous Perch of California (*Cymatogaster aggregatus*).

The ganoids pass by degrees into the *Isospondyli*, and the soft-rayed fishes pass again by imperceptible gradations into those more specialized forms having spines in the fins, structures which are again lost in the most modified members of the same group.

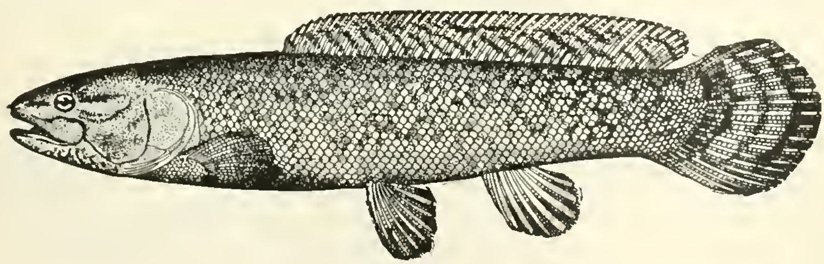
Ganoid traits are present in certain families of *Isospondyli*. Among these are the gular plate (found in *Amia* and the *Elopidæ*), presumably derived from the similar plate in the earliest ganoids, additional valves in the arterial bulb in *Albulidæ*, the cellular air-bladder of *Notopterus* and *Osteoglossum*, the spiral intestinal valve in *Chirocentridæ*, and the ganoid scales of the extinct *Leptolepidæ*. From these characters it is inferred that the soft-rayed fishes are descended from the *Lepidostei* or *Halecomorphi*. The more primitive *Isospondyli* approach more nearly to these ganoid forms than to their later descendants, the catfishes, the eels, or the pikes.

Most ancient of the *Isospondyli* is the extinct family of *Leptolepidæ* of the Triassic. Families mostly still extant, but nearly all of them more or less represented in fossils from the Jurassic on, are the *Elopidæ* or tarpons, the *Albulidæ* or



Rat-fish or Elephant-fish of California (*Hydrolagus colliei*).

lady-fishes, the *Chanidæ* or milk-fishes, the *Hiodontidæ* or moon-eyes, the *Spaniodontidæ* (extinct), the *Pachyrhizodontidæ* (extinct), the *Thryptodontidæ* (extinct), the *Pterothrissidæ*, the *Chirocentridæ*, the *Notopteridæ*, the *Enchodontidæ* (extinct), the *Ichthyodectidæ* (extinct), the *Osteoglossidæ*, the *Pharcodontidæ* (extinct), the *Clupeidæ* or herrings, the *Dussumieriidæ* or round herrings, the *Dorosomidæ* or gizzard-shad, the *Engraulididæ* or anchovies, the *Alepocephalidæ*, the *Pantodontidæ*, the *Salmonidæ* or salmon and trout, the *Thymallidæ* or graylings, the *Argentinidæ* or smelt, the *Microstomidæ*, the *Salangidæ* or ice-fish, the *Galaxiidæ* or New Zealand trout,



The Bowfin (*Amia calva*).

the *Haplochitonidæ*, *the Gonorhynchidæ*, the *Notopteridæ*, and a host of other forms, mostly from the deep seas, constituting (sub-order *Inomiæ*) the families of *Aulopidæ*, *Ctenohirissidæ* (extinct), *Synodontidæ* or lizard-fishes, *Benthosauridæ*, *Bathypteroidæ*, *Ipnopidæ*, *Rondeletiidæ*, *Cetomimidæ*, *Myctophidæ* or lantern-fishes, *Rhinellidæ* (extinct), *Dercetidæ* (extinct), *Chirothicidæ* (extinct), *Exocoetoididæ* (extinct), *Maurolicidæ*, *Chauliodontidæ* or viper fishes, *Gonostamidæ*, *Astronesthidæ*, *Stomiatidæ*, *Malacosteidæ*, *Plagyodontidæ* or lancet-fishes, *Evermannellidæ*, *Paralepididæ*, *Sternoptychidæ*, and *Idacanthidæ*.

The order of *Lyopomi* (λύω, loose, πόμα, opercle), contains a few deep-sea fishes, without mesocoracoid and with the opercular bones distorted. One family, the *Halosauridæ*, with fossil allies.

A series of soft-rayed fishes descended from the *Isospondyli* are grouped together to form the super-order or series called *Ostariophysæ*. These differ from the *Isospondyli* in having the four anterior vertebræ much modified, the air-bladder being connected, by a series of ossicles called the Weberian apparatus, with the auditory organ.

This series includes the orders of *Eventognathi*, *Heterognathi*, *Nematognathi*, and *Gymnonoti*, immense groups comprising the vast majority of the fresh-water fishes of the world.

The *Eventognathi* and *Heterognathi* have the mouth-parts normal, the maxillary not rudimentary, and the body usually covered with ordinary scales. In the order *Heterognathi* (ἕτερος, differing; γνάθος, jaw) the lower pharyngeals are not especially modified, and the jaws usually with teeth. This group comprises most of the river-fishes of South America and Africa. It includes the families of *Characidæ* and *Erythrinidæ*, the former with and the latter without the adipose fin characteristic of catfishes and salmon.

The order *Eventognathi* εὖ, well; ἐν, within; γνάθος, jaw) is characterized by the absence of teeth in the jaws, and by the high degree of specialization of the lower pharyngeals, which are scythe-shaped, and in typical forms are armed with a relatively small number of highly specialized teeth of peculiar forms and arranged in one, two, or three rows. In all the species the gill-openings are restricted to the sides, there is no adipose fin, and the broad flat branchiostegals are but three in number. In all the species the scales, if present, are cycloid, and the ventral fins, of course, abdominal. The modification of the four anterior vertebræ and their connection with the air-bladder are essentially as seen in the catfishes. The families of *Eventognathi* are the *Kneriidæ*, *Homalopteridæ*, *Cobitidæ* or loaches, *Catostomidæ* or suckers, and *Cyprinidæ* or carp, dace and minnows. The last is the largest family recognized in ichthyology, comprising over 2,000 species, almost all confined to the north temperate zone.

The order of *Nematognathi* or catfishes is characterized among the *Ostariophysæ* by the fact that the maxillary bone is rudimental, forming the base of a long barbel. There are no true scales, the body being naked or mailed, and about the mouth are always fleshy feelers. The multitude of species inhabit chiefly the rivers of the tropics, only the typical catfishes of the principal family of *Siluridæ* occurring in waters of the United States and Europe. The families are *Diplomystidæ*, *Siluridæ*, *Bunocephalidæ*, *Plotosidæ*, *Chacidæ*, *Chlariidæ*, *Hypophthalmidæ*, *Argidæ*, *Sisoridæ*, *Pygidiidæ*, *Loricariidæ*, and *Calliththyidæ*, the members of the last three groups armed with a bony coat of mail.

The order *Gymnonoti* contains elongate eel-like fishes without dorsal fin and with the tail excessively long. The vertebræ are modified, as in the preceding orders, but there is no mesocoracoid arch. The families are *Electrophoridæ* and *Gymnotidæ*, all river-fish of South America.

The order *Scyphophori* contains river-fishes of Africa in which the small mouth is at the end of a long snout. There are no pharyngeal teeth, and the opercular bones are considerably modified. In all there is a deep cavity on each side of the cranium, covered by a thin bony plate, the supertemporal bone. The families are *Mormyridæ* and *Gymnarchidæ*.

Next we may place a long series of more or less related families, known collectively as eels. In all these the upper jaw is more or less degenerate, the ventral fins are wanting, and the shoulder-girdle has typically lost its connection with the skull. The earliest fossil eels have traces of scales, the caudal fin separate, and, according to Dr. O. P. Hay, abdominal ventral fins. These characters are lost in all or most of the living forms.

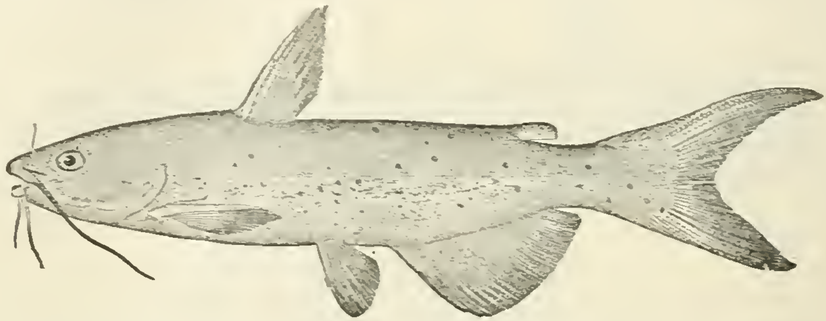
The eels may be distributed among different orders. The *Symbranchia* (σύν, together; βράγχος, gill) — *Ichthyocephali*, and *Holostomi* — have normal fish-like jaws, and the shoulder-girdle is sometimes joined to the skull. The families are *Monopteridæ* or rice-field eels, *Symbranchidæ*, *Amphibnoidæ*, and *Chilobranchidæ*.

The true eels or apodes have the shoulder-girdle free from the skull, the premaxillaries more or less coalesced with the vomer, and the body elongate and of many vertebræ. The families are *Anguillavidæ* (extinct), with distinct caudal and sometimes with ventral fins, *Anguillidæ*, or true eels, *Leptocephalidæ* or conger-eels, *Simenchelidæ*, *Murænesocidæ*, *Nettastomidæ*, *Nemichthyidæ*, *Ophichthyidæ*, *Ilyophidæ*, *Heterocongridæ*, *Dysommidæ*, *Euchelidæ* (extinct), *Murænidæ* or morays, *Myrocongridæ*, and *Moringuidæ*.

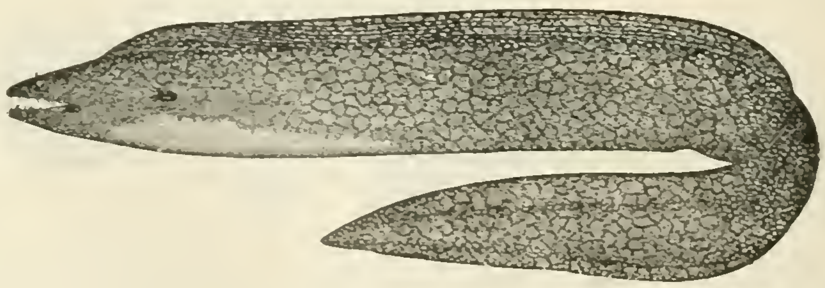
The small order of *Carencheli* contains one family, *Derichthyidæ*, characterized by the snake-like neck and the structure of the jaws.

The order *Lyomeri* includes deep-sea eels of enormous gape, with the parts of the head very loosely joined, and with the fifth gill-arch not modified to form a pharyngeal. There are two families, *Saccopharyngidæ* and *Eurypharyngidæ*.

Still more aberrant is the small order of *Heteromi* (ἕτερος, differing; ὦμος, shoulder), the spiny eels, elongate fishes, having the shoulder-girdle detached from the head and the coracoids united in an imperforate plate. This group includes eel-like fishes of the deep



Channel Cat-fish (*Ictalurus punctatus*).



Muræna.

sea, with spines in the dorsal fin — the families, *Protonotocanthidæ* (extinct), *Notacanthidæ*, and *Lipogenyidæ*.

Another order of uncertain relationship is that of *Opisthomi*, with normal coracoids, spines in the dorsal fin, and the shoulder-girdle remote from the skull. It contains one family, the *Mastacembelidæ*, small fishes from the streams of tropical Asia and Africa.

Another small order, the *Xenomi* (ξένος, strange; ὦμος, shoulder), has the coracoids rudimentary and cartilaginous, with no basal bones or actinosts to the pectoral fin. One family, *Dalliidæ*, characterized by the black-fish of the marshes of Alaska and Siberia.

In the order *Haplomi*, the mesocoracoid arch is wholly undeveloped, as is the case in all of the other groups remaining to be enumerated.

In common with the soft-rayed fishes in general, the air-bladder has a persistent air-duct, the fins are without spines, the ventral fins are abdominal, and the scales are cycloid.

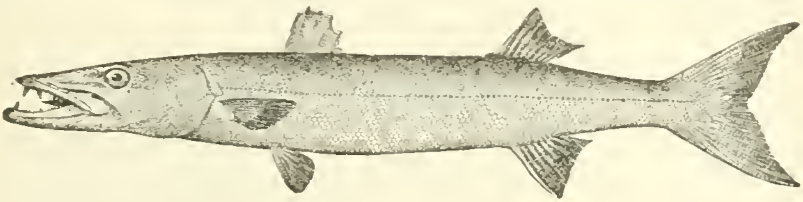
There is no adipose dorsal in the *Haplomi*, the dorsal is inserted far back, and the head is generally scaly. Most, but not all, of the species are of small size, living in fresh or brackish waters, and they are found in almost all warm regions, though scantily represented in California, Japan, and Polynesia. The families are *Esocidæ* or pikes, *Umbridæ* or mud-minnows, *Poeciliidæ* or killifishes, and *Amblyopsidæ* or blind-fishes of the caves. The *Gonorhynchidæ* and the extinct families of *Crossognathidæ* and *Cobitopsidæ* may be doubtfully added to this group.

Order Acanthopterygii.— The most of the remaining bony fishes constitute a natural group for which the name *Acanthopterygii* (ἄκανθα, spine; πτερόν, fin or wing), may be used. This name is often written *Acanthopteri*, a form equally correct and more euphonious and convenient. These are characterized, with numerous exceptions, by the presence of spines in the fins, by the connection of the ventral fins to the shoulder-girdle, by the presence, in general, of more than one spine in the anterior part of dorsal and anal fins, and as a rule of one spine and five rays in the ventral fins, and by the absence in the adult of a duct to the air-bladder. Minor characters are these: The pectoral fins are inserted high on the shoulder-girdle, the scales are often ctenoid, and the edge of the upper jaw is formed by the premaxillary alone, the maxillary being always toothless.

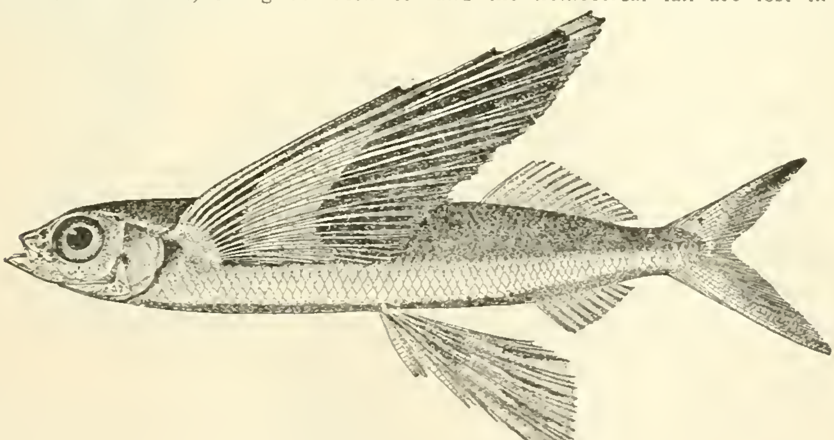
But it is impossible to define or limit the group by any single character or group of characters. It is connected with the *Isospondyli* through the *Haplomi*, on the one hand, by transitional groups of genera which may lack any one of their characters. On the other hand, in the extreme forms, each of these distinctive characters may be lost through degeneration. Thus fin-spines, ctenoid scales, and the homocercal tail are lost in the codfishes, the connection of ventrals with shoulder-girdle fails in certain peculiar forms, and the development of the air-duct is subject to all sorts of variations. In one family even the adipose fin reappears.

The *Acanthopterygii* or preferably *Acanthopteri*, the *Physoclysti* of Müller, the *Thoracices* of older authors, and the *Ctenoidei* of Agassiz, include substantially the same series of forms.

Among the many subordinate groups, suborders or super-families, a few stand out as susceptible of definition. Among these is the



Barracuda (*Sphyræna barracuda*).



A Flying-fish (*Exocœtus volitans*).

group of *Salmopercæ*, composed of perch-like fishes, with spines in the fins and with ctenoid scales, yet retaining at the same time the abdominal ventrals and the adipose fin of the salmon. This constitutes the family of *Percopsidæ*, trout-perches or sand-rollers. The extinct *Erismatopteridæ* and *Asineopidæ* probably belong here.

The sub-order *Symentognathi* agree externally with the *Haplomi*, but have the lower pharyngeals solidly united, and the air-duct lost in the course of development. The families are *Belonidæ*, the gars, *Scombresocidæ*, the sauries, *Hemiramphidæ* or half-beaks, and *Exocœtidæ* or flying-fishes. This order and the *Haplomi* are joined by Hay under the name of *Mesichthyes*, the groups forming a perfect transition from soft-rayed to spiny-rayed fishes.

The group of *Percesoces* has the general traits of the spiny-rayed fish, with the ventral fins abdominal. Here belong the *Sphyrænidæ* or barracudas, the *Atherinidæ* or silversides, and the *Mugilidæ* or mullets. Another sub-order, *Rhegnopteri*, includes the *Polynemidæ* or thread-fins. Other transitional forms, with the ventrals abdominal, and spines usually present in the fins, constitute the sub-orders of *Hemibranchii*, *Lophobranchii* and *Hypostomides*. In all of these the bones of the gill-arches are reduced in number, and the gill-structures are distinctly degenerate. For this reason Dr. Hay has proposed to unite them as a distinct order, *Phthinobranchii* (φθίνων, waning). The *Hemibranchii* include the families *Gasterosteidæ* (sticklebacks), *Protosyngnathidæ* (extinct), *Aulorhynchidæ*, *Fistulariidæ* (cornet-fishes), *Aulostomidæ* (trumpet-fishes), *Urosphenidæ* (extinct), *Rhamphosidæ* (extinct), *Marcorhamphosidæ* (snipe-fishes), and *Centriscidæ* (shrimp-fishes). The more degenerate sub-order of *Lophorbranchii* includes the *Solenostomidæ*, the *Syngnathidæ* (pipe-fishes), and the *Hippocampidæ* or sea-horses. The singular order of *Hypostomides* includes the *Pegasidæ* (sea-moths or sea-dragons).

In another sub-order we may place the *Berycoidei*, fishes perch-like in general structure and usually well armed, with the ventral fins thoracic, but their number of rays never I, 5, the typical number in all perch-like forms. The berycoids are especially characterized by the presence of the orbitosphenoid bone, a structure wanting in all perch-like families; are the earliest in time of the fishes of this pattern, appearing in the Cretaceous or earlier. The families are *Berycidæ*, *Trachichthyidæ*, *Holocentridæ* or soldier-fishes, *Polymixiidæ*, and *Monocentridæ* or pine-cone fish.

Another group or sub-order *Zeoidei*, agrees well with the beryces in the presence of more than five soft rays in the ventral fins and in the armature of the fins. It differs, however, in the character of the skeleton, the post-temporal, especially being adnate to the skull, as in the butterfly-fishes or *Chætodontidæ*.

One family, *Zeidæ*, the John-dories, belongs here. In the same group we may place provisionally an extinct family, *Amphistiidæ*. Dr. Boulenger has suggested that to fishes allied to the *Amphistiidæ* we may trace the origin of the John-dories, and of the great group of flounders as well. This is an interesting suggestion, but the actual line of descent is as yet not proved.

The sub-order *Selenichtyes* includes the family of *Lampridida* or opahs. In this group is a single species, a huge fish almost as deep as long, with the hypercoracoids greatly developed and the ventral fin with many soft rays, an archaic character unknown in other spiny-rayed fishes.

In this neighborhood belongs the sub-order of *Heterosomata*, or flounders, characterized by the twisting of the cranium, an arrangement which permits the fish to lie flat on one side on the sand, while both eyes are turned to the upper or colored side. In this group there are no fin-spines. The young flounder when first

A Sea-horse (*Hippocampus*).

hatched has the skull and eyes symmetrical, and the modification of the head proceeds by degrees.

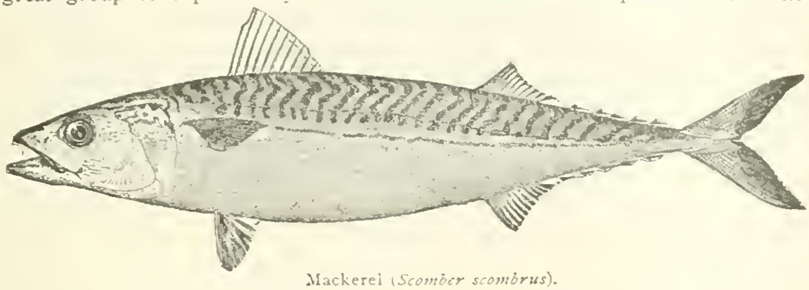
There are two families, *Pleuronectidæ* or flounders, and *Soleidæ* or soles.

To the group or super-family *Scombroidea* belong a great variety of fishes, usually swift in motion and with thin soft scales, the ventral fins, if present, having a spine and five soft rays.

The families are *Rachicentridæ*, the sergeant-fishes, *Pomatomidæ* or bluefishes, *Carangidæ* or Cavallas, *Nematistiidæ* or papagallos, *Scombridæ* or mackerels, *Palæorhynchidæ* (extinct), *Lepidopidæ* or scabbard-fishes, *Trichiuridæ* or cutlass-fishes, *Istiophoridæ* or sail-fishes, *Xiphiidæ* or sword-fishes, *Coryphænidæ* or dolphins, *Bramidæ* or pomfrets, *Pteraclididæ*, *Stromateidæ* or harvest-fishes, *Icosteidæ* or rag-fishes, *Acrotidæ*, *Zaproridæ*, *Luvaridæ* or Lowars, *Menidæ*, *Leiognathidæ*, *Steinegeriidæ*, and *Tetragonuridæ* or square-tails. The *Grammicolepidæ* perhaps belong in this neighborhood.

The imperfectly known families, *Bathyclupeidæ*, *Stephonoberycidæ*, and *Pempheridæ* have some resemblance to berycoids, but the ventral rays are I, 5.

The great group or super-family *Pericoidea* agrees with the mackerel-like fishes in general structure, but the scales are usually coarser and rougher, and the structure less adapted to swift movement. Many members of this group are confined to the fresh waters. The families are *Centrarchidæ*, the sunfishes, *Kuhliidæ*, the silver-bass, *Elassomidæ*, the pigmy-perch, *Aphredoderidæ*, the pirate-perch, *Percidæ*, the river-perch and darters, *Apogonidæ*, the beardless mullets, *Scombropidæ*, *Acropomidæ*, *Serranidæ*, the bass, *Lobotidæ*, the flashers, *Rypticidæ*, the soap-fishes, *Kyphosidæ*, the chopas, *Scorpididæ*, *Theroponidæ*, the slave-fishes, *Hæmulidæ*, the grunts, *Lutianidæ*, the snappers, *Sparidæ*, the porgies, *Cæsionidæ*, *Gerridæ*, the majorras, *Mænidæ*, the picarels, *Sciænidæ*, the drums, *Centropomidæ* (or *Oxylabracidæ*), the robalos, *Polycentridæ*, *Nandidæ*, *Oplegnathidæ* or stone-wall perch, *Sillaginidæ*, *Pentacerotidæ*, *Priacanthidæ*, the catalufas, *Mullidæ*, the surmullets. Remotely allied to the percoid fishes are the *Pseudochromididæ*, the *Opisthognathidæ* or jaw-fishes, the *Malacanthidæ*, the *Latilidæ* or tile-fishes, and possibly the *Cepolidæ* or band-fishes.



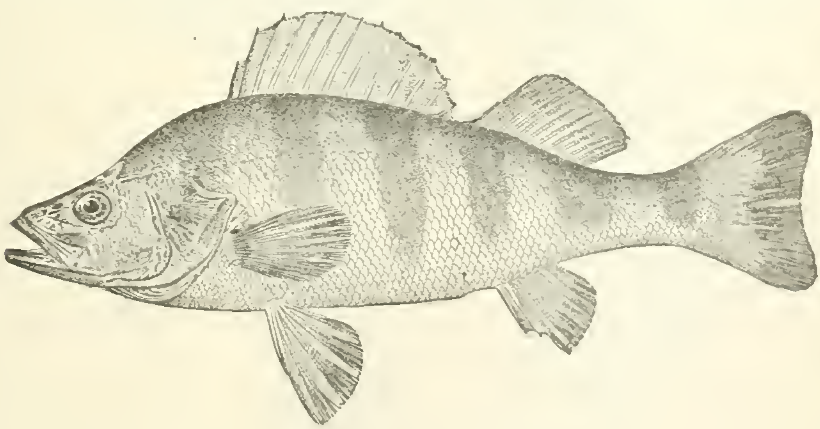
Mackerel (*Scomber scombrus*).

The group or sub-order of *Labyrinthici* comprises fresh-water fishes of the Indian region, with a peculiar apparatus for storing water connected with the gills. The families are *Osphromenidæ* or gouramies, *Anabantidæ* or climbing perch, *Helostomidæ*, *Luciophalidæ*, and *Ophiocephalidæ* or snakehead fishes.

Another group, called *Pharyngognathi* by Müller, is characterized by the complete union of the lower pharyngeals, a character developed independently in the *Synentognathi* and in some *Sciænidæ*. It contains three sub-orders or super-families. The *Chromides* have a single nasal opening on either side. Of these there are two families, the *Pomacentridæ* or damsel-fishes, chiefly beautiful inhabitants of the coral reefs, and the *Cichlidæ*, river-fishes of the tropics of both continents.

The *Holconoti* comprise the viviparous perch or surf-fishes of California and Japan; one family, *Embiotocidæ*.

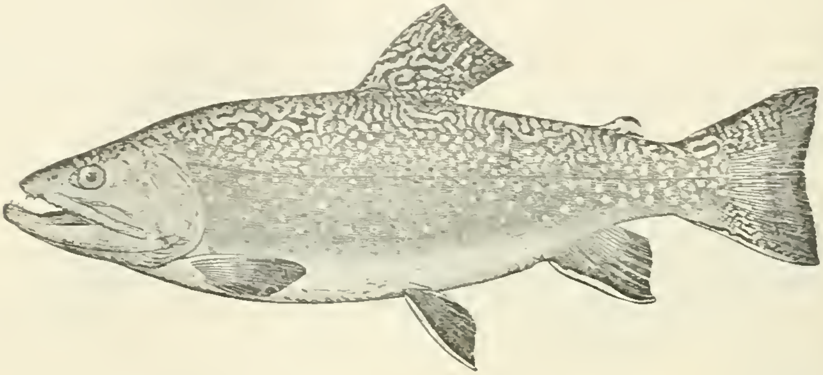
The *Pharyngognathi* proper, having two nostrils on either side, smooth scales and the gills three and one half, constitute four families, *Labridæ*, wrasse-fishes or doncellas, *Odacidæ* *Siphonognathidæ*, and *Scaridæ* or parrot-fishes, in which the teeth are united to form a bird-like beak.



Yellow Perch (*Perca flavercens*).

A large group of more or less related forms, perhaps derived from ancestors of the *Zeoidea* is known as *Squamipinnes* or *Chætodontoidea*. These are characterized in general by the union of the post-temporal or uppermost bone of the shoulder-girdle with the skull. The ventral fins in these fishes have one spine and five (rarely fewer) rays. The scales are small and often rough. The presence in the more primitive forms of 24 vertebræ and five soft rays in the ventrals indicates the common origin of these fishes with the members of the scombroid, percoid, and labroid groups. While the more primitive of the chætodontoid series much resemble primitive members of the other series, the extremes of the former represent a wide divergence, specialization, and degeneration.

known collectively as *Plectognathi*, the bones of the jaws being more or less consolidated. Three sub-orders exist among these forms, *Sclerodermi*, with separate rough scales and separate teeth, the *Ostracodermi*, with the body enclosed in a bony box, and the *Gymnodontes*, with the teeth coalescent into one or two plates in each jaw.

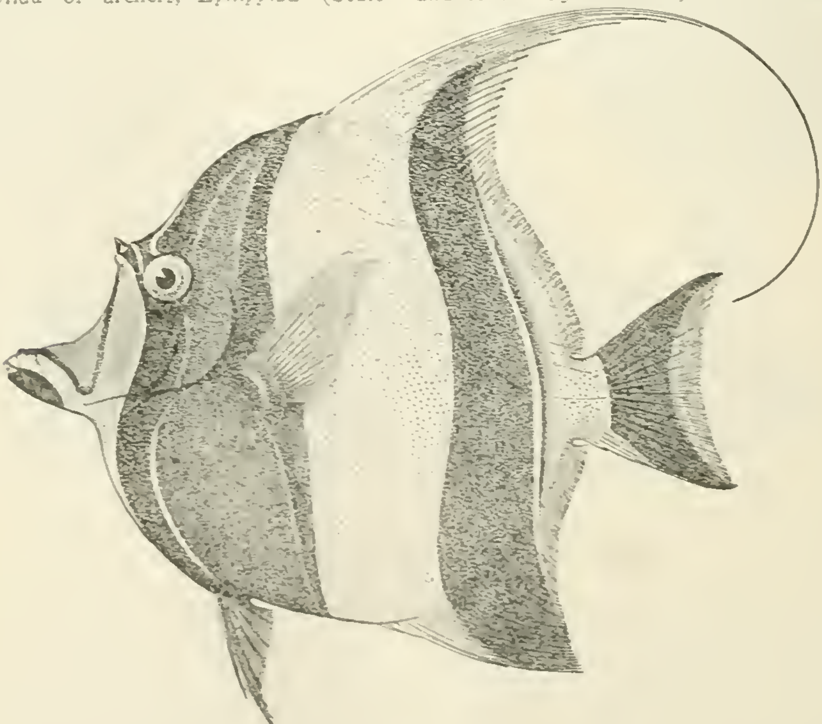


Brook or Speckled Trout (*Salvelinus fontinalis*).

The typical families are the *Ilarchidæ* or spade-fishes, the *Chætodontidæ* or butterfly fishes, characteristic of coral reefs and the *Zanclidæ* or Moorish idols. Aberrant types are the *Toxotidæ* or archers, *Ephippidæ* (*Scatophagidæ*), *Antigoniidæ* or boar-fishes, and *Drepanidæ*. Still more aberrant are the *Acanthuridæ*, tangs or surgeon-fishes, the *Siganidæ*, with the last ventral ray spinous like the first. From the tangs are descended the degenerate types

To the *Sclerodermi* belong the three families, *Triacanthidæ*, *Balistidæ* or trigger-fishes, and *Monacanthidæ* or file-fishes. To the *Ostracodermi* belong the *Ostraciidæ* or trunk-fishes, and to the *Gymnodontes*, the *Triodontidæ*, the *Tetraodontidæ* or globefishes, the *Tropidichthyidæ*, the *Chonerhinidæ*, the *Diodontidæ* or porcupine fishes, the *Heptadiodontidæ* (extinct), and the *Molidæ* or head-fishes.

A small group known as the super-family



Moorish Id[illegible] *cornutus*).

Cirrhitoidea is characterized by the thickened and unbranched character of the lower pectoral rays, the third suborbital being at the same time not enlarged. Here belong the *Cirrhitidæ*, the *Aplodactylidæ*, the *Latrididæ*, and possibly the *Trichodontidæ*. This group seems to mark a direct transition from the perch-like fishes to those with mailed cheeks.

The sub-order of mailed-cheek fishes, *Pareioplitæ*, is characterized by the presence of the suborbital stay, a process extending backward from the third suborbital to or toward the upward limb of the preopercle. This stay is subject to great exaggeration in some forms, while in others it is much reduced. It is, however, always present in these fishes and in no others. In the more primitive types, the ventrals have one spine and five rays. There are 24 vertebræ, and the scales are normally developed. In the extremes there are remarkable cases of specialization on the one hand and of degeneration on the other.

The families of mailed-cheek fishes are the *Caracanthidæ*, the *Hexagrammidæ*, or greenfishes, the *Anoplopomidæ*, or skil-fishes, the *Scorpænidæ* or rose-fishes and sea-scorpions, the *Platycephalidæ*, the *Bembridæ*, the *Hoplichthyidæ*, the *Cottidæ* or sculpins, the *Cyclopteridæ* or lump-fishes, the *Liparididæ* or sea-snails, the *Rhamphocottidæ*, the *Agonidæ*, sea-poachers or alligator-fishes, the *Triglidæ* or sea-robins, the *Peristediidæ*, and the *Cephalacanthidæ* or flying gurnards. The last three families differ considerably in osteology, and are segregated by Dr. Gill as the sub-order *Craniomi*.

In the sub-order *Discocephali* the spinous dorsal fin is modified to form a sucking disk. This is placed on the head, and is made of two series of flat plates. There is one family, the *Echineididæ* or remoras.

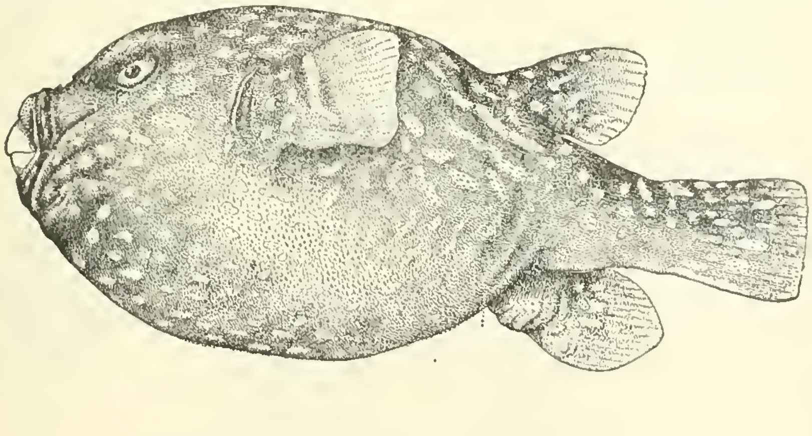
The large family of *Gobiidæ* forms a super-family called *Gobioidea*. The gobies are distinguished by numerous minor traits, the restricted gill-openings, the short spinous dorsal and usual connection of the ventral fins among others. With the gobies may be associated the small family of *Oxudercidæ*.

To the sub-order *Jugulares* we may refer many families which agree in having the ventral fins inserted before the pectorals. The superfamily *Trachinoidea* for the most part retain the normal number of ventral rays, the spine, and five soft rays. To this group belong the *Trachinidæ* or weavers, the *Uranoscopidæ* or stargazers, the *Percophidæ*, *Nototheniidæ*, *Pteropsaridæ*, *Harpagiferidæ*, *Chænichthyidæ*, *Champsodontidæ*, *Bovichthyidæ*, the *Draconettidæ*, *Callionymidæ* or dragonets, the *Platypteridæ*, and perhaps the *Chiasmodontidæ* and *Hemerocœtidæ*.

Other divergent or aberrant families in this neighborhood are the *Comephoridæ*, or Baikal-fishes, the *Bathymasteridæ* or ronquils, and the *Gadopsidæ*. The *Batrachoididæ* or toad-fishes represent the group *Haplodoci*.

The group *Xenopterygii*, without spinous dorsal and with a large sucking disk between the ventral fins, contains the *Gobiesocidæ* or cling-fishes.

The super-family *Blennioidea* contains the blennies and their relatives, with the ventrals jugular and always few-rayed. Here belong the *Blenniidæ*, *Pholididæ*, *Stichæidæ*, *Xiphasiidæ*, *Cryptacanthodidæ* or wry-mouths, *Anarrhichadidæ* or wolf-fishes, *Ptilichthyidæ*, *Cerdalidæ*, *Patæcidæ*, *Gnathanacanthidæ*, and the extinct family of *Blochiidæ*.



A Californian Globefish (*Ovoides setosus*).

Very closely allied to the blennoid series, and also belonging to the *Jugulares*, is the super-family *Ophidioidea*, differing in the absence of fin-spines. Here belong the *Zoarcidæ* or eel-pouts, the *Ammodytidæ* or sand-launces, the *Bleekeriidæ*, the *Brotulidæ*, the *Brotulophidæ*, the *Ophidiidæ* or cusks, the *Fierasferidæ* or pearl-fishes, the *Xenocephalidæ*, *Scytalinidæ*, *Congrogadidæ*, and *Bregmacerotidæ*.

A sub-order of uncertain relations, characterized by the absence of foramen in the hypercoracoid, by the peculiar form of the tail, by the jugular insertion of the ventrals and the absence of spines, is the *Anacanthini*. Here belong the *Gadidæ* or codfishes, the *Merlucciidæ* or hakes, the *Macruridæ* or grenadiers, the *Ateleopodidæ* and *Bathyonidæ*.

Still more uncertain are the relationships of the sub-order *Tæniosomi*, ribbon-shaped fishes of the deep sea, soft in body and often reaching an immense size. The families are *Trachypteridæ* or deal-fishes, *Regalecidæ* or oar-fishes. The *Lophotidæ* or crest-fishes show some resemblance to these.

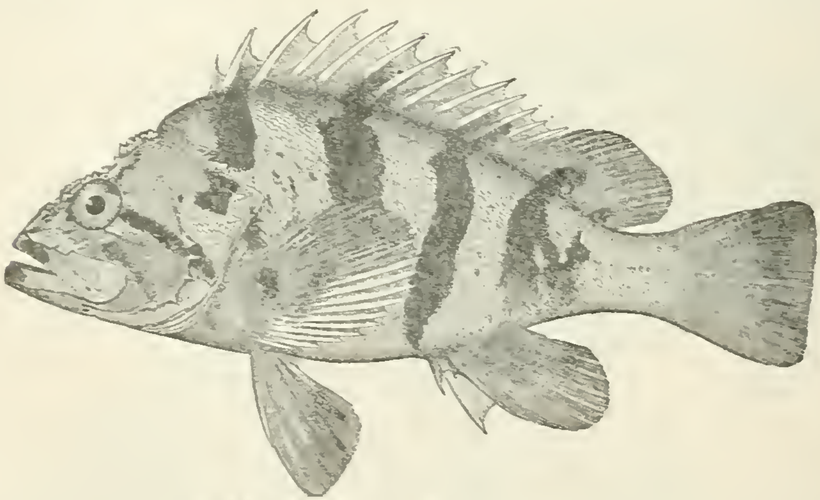
Finally we may close the long series with the order of *Pediculati*. These are jugular fishes, degenerate in structure, the small gill-opening *behind* the pectoral fins. The families are *Lophiidæ*, the anglers, *Antennariidæ* or walking-fishes, *Ceratiidæ* or sea-devils, and *Ogcocephalidæ* or sea-bats.

History of Systematic Ichthyology.— The title of "Father of Ichthyology" is justly given to Petrus Artedi, a Swede, associate and intimate friend of Linnæus. Artedi was the first to recognize the meaning of genus and species in ichthyology, and to supply the outlines of a classification. After Artedi's untimely death (by drowning in a canal in Holland), Linnæus edited his manuscripts, publishing them in 1738, in five parts, as follows: (1) Ichthyological biography; (2) Ichthyological philosophy; (3) Genera of fishes, involving a complete classification of the forms he knew, his genera corresponding to the groups now called families; (4) Synonymy of all species recorded by authors, and (5) Description of all the species actually examined by Artedi. Of true fishes (exclusive of whales) 228 species are recorded by Artedi — a small portion of the 12,000 species now actually known (1903).

But the work of Artedi is masterly in its method and shows a stronger touch than that of any of his successors in ichthyology until the time of Cuvier. In the 'Systema Naturæ' Linnæus did little more for fishes than to substitute binomial names for the descriptive phrases of Artedi.

With the 'Règne Animal' (1817–28) of Cuvier, a new era in zoology began. In this epoch-making work the "Animal kingdom," as the title indicates, was "arranged according to its organization." Comparative structure finds its reflection in the schemes of classification. The application of the principles of morphology was carried out in detail with the fishes in the great 'Histoire Naturelle des Poissons' (1828–49) of Georges Dagobert Cuvier and Achille Valenciennes, long the most valuable general work on fishes. The only general work on fishes since Cuvier and Valenciennes is the monumental 'Catalogue of the Fishes of the British Museum' (1859–70) by Dr. Albert C. L. G. Günther. In this work 6,843 species are described and 1,682 doubtful species are mentioned in foot-notes, the number of species known in 1870 being estimated at 9,000. Since that date about 3,000 have been described, the number of living species at present, according to an enumeration made by Dr. Boulenger, being about 12,000. The number of fossil species known may be estimated at 3,000 to 4,000.

The systematic arrangement of Cuvier was extended and modified by Louis Agassiz to include the multitude of fossil forms made known in his 'Poissons Fossiles.' Still more important corrections and changes in the general scheme of classification were suggested by Johannes Müller, the greatest comparative anatomist of the 19th century. Other valuable contributions to taxonomy have been made by Dr. Günther, Dr. Edward Drinker Cope, and especially by Dr. Theodore Gill, a critical writer who ranks with the first of taxonomists of the age, and whose views have been accepted in substance if not in name as representing our best present knowledge of the origin and relationship of forms among the vertebrate animals.



Black-banded Rock-fish (*Sebastodes nigricinctus*).

The contributions of Geoffroy Saint-Hilaire, Pieter van Bleeker, Carl Gegenbaur, Ramsay H. Traquair, George Albert Boulenger, Louis Dollo, Bashford Dean, Karl Zittel, Arthur Smith Woodward to the systematic arrangement of the higher groups of fishes have also been of great value.

In modern times the students of systematic ichthyology have been very numerous. The local faunal work in various nations has been very extensive. In Great Britain we may note Parnell's 'Natural History of the Fishes of the Firth of Forth' (1838); William Yarrell's 'History of British Fishes' (1859); the earlier histories of British Fishes by Edward Donovan and by William Turton, and the works of Jonathan Couch (1862), and Dr. Francis Day (1888), possessing similar titles. H. G. Seelye has also a useful 'Synopsis of the Fresh-water Fishes of Europe.' William Swainson studied the fishes of Sicily, W. Thompson those of Ireland, and Rev. Richard T. Lowe and J. Y. Johnson have done excellent work on the fishes of Madeira.

In Germany and Austria the chief local works have been those of Heckel and Kner on the fresh-water fishes of Austria (1858), and C. Th. von Siebold on the fresh-water fishes of Central Europe (1863). The two memoirs of Eduard Ruppell on the fishes of the Red Sea and neighboring parts of Africa, 'Atlas zu der Reise im nördlichen Afrika' (1828), and 'Neue Wirbelthiere' (1837), rank with the very best of descriptive work.

In Italy, Charles Lucien Bonaparte, Prince of Canino, has published an elaborate 'Fauna Italica' (1838), and numerous minor papers. O. G. Costa published (about 1850) a Fauna of Naples.

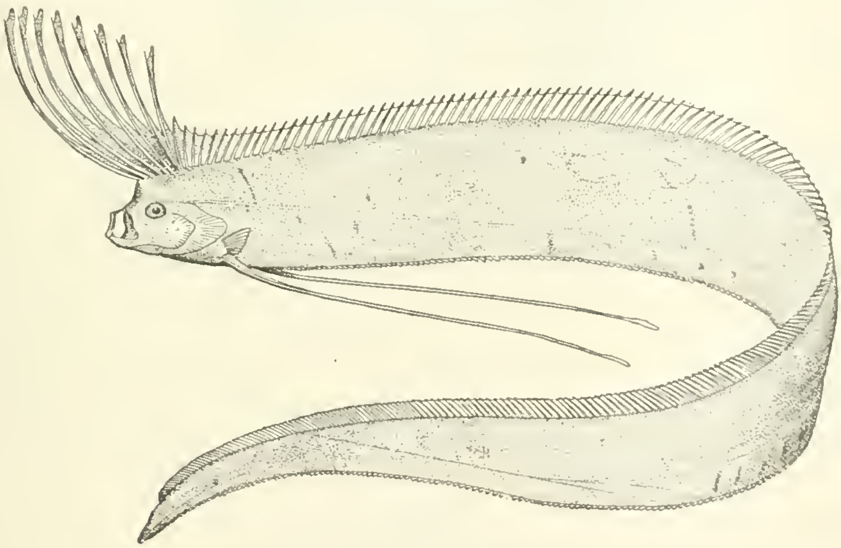
In France, the fresh-water fishes are the subject of works by Emile Blanchard (1866), and Emile Moreau. Léon Vaillant has written on various groups of fishes. The 'Mission Scientifique au Mexique,' by Vaillant and F. Bocourt, is a most valuable contribution to our knowledge of the fishes of Mexico.

In Holland the chief great works have been those of Schlegel and Pieter van Bleeker. Professor Schlegel, of the University of Leyden, described in 'The Fauna of Japonica' the fishes collected about Nagasaki in Japan by Ph. Fr. de Siebold and Bürger.

Pieter van Bleeker (1819–78), a surgeon in the Dutch East Indies, is the most voluminous writer in ichthyology. His chief work is the 'Atlas Ichthyologique des Indes Orientales Néerlandaises,' illustrated by colored plates. The writings of Dr. Bleeker constitute the chief source of our knowledge of the fauna of the East Indies. Dr. Van Lidth de Jeude, of the University of Leyden, is the author of a few descriptive papers on fishes.

The fish fauna of Cuba has been the lifelong study of Dr. Felipe Poey y Aloy (1799-1891), a pupil of Cuvier, for a half century or more the honored professor of zoology in the University of Havana. Of his many useful papers, the most extensive are his 'Memorias sobre la Historia Natural de la Isla de Cuba,' followed by a 'Repertorio' and an 'Enumeratio' on the same subject. Before Poey, Guichenot of Paris had written on the fishes collected in Cuba by Ramon de la Sagra. Philip H. Gosse (1810–88) wrote on the fishes of Jamaica. Much earlier, Robert Herrmann Schomburgk (1804–65) wrote on the fishes of British Guiana. Other papers on the Caribbean fishes were contributed by Johannes Muller and F. H. Troschel, and by Richard Hill and J. Hancock.

Besides the work in South America of Marcgrave, Agassiz, Reinhardt, Lütken, Steindachner, Jenyns, Boulenger, and others already named, we may note the local studies of Dr. Carlos Berg in Argentina, Dr. R. A. Philippi in Chile, and special records of Humboldt, Garman, J. F. Abbott, and others in recent times. Carl H. Eigenmann and also Jordan and Eigenmann have studied the great collections made in Brazil by Agassiz. Steindachner has described the collection of Johann Natterer and Gilbert those made by Dr. John C. Branner. The most recent extensive studies of the myriads of Brazilian river-fishes are those of Dr. Eigenmann.



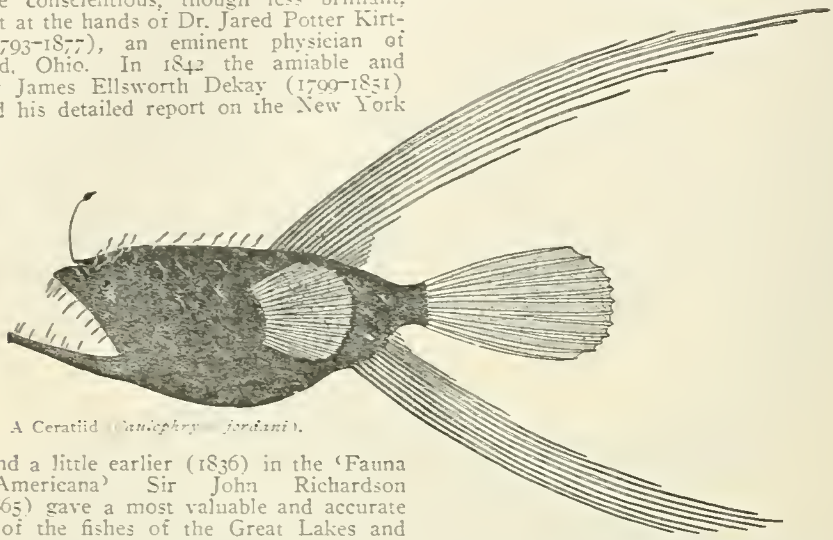
A Ribbon-fish or Oarfish (*Regalecus*).

In New Zealand, F. W. Hutton and J. Hector have published a valuable work on the fishes of New Zealand. Later writers have given us a good knowledge of the fishes of Australia. Notable among them are W. Macleay, James Douglas Ogilby, and Edgar R. Waite. Clarke has also written on 'Fishes of New Zealand.'

The most valuable work on the fishes of Hindustan is the elaborate treatise on the 'Fishes of India,' by Francis Day.

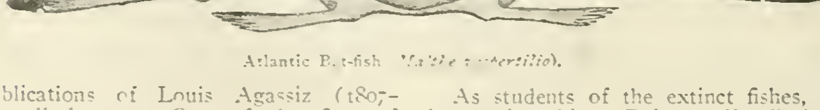
The most recent as well as the most extensive studies of the fishes of Japan were made in 1900 by the present writer and his associate, John Otterbein Snyder.

The scanty pre-Cuvieran work on the fishes of North America has already been noticed. Contemporary with the early work of Cuvier is the worthy attempt of Professor Samuel Latham Mitchell (1764–1831) to record in systematic fashion the fishes of New York. Soon after followed the admirable work of Charles Alexandre Le Sueur (1780–1840), artist and naturalist, who was the first to study the fishes of the Great Lakes and the basin of Ohio. Constantine Samuel Rafinesque (1784–1842), the third of this remarkable but very dissimilar trio, published numerous papers descriptive of the species he had seen or heard of in his various botanical rambles. This culminated in his elaborate but untrustworthy 'Ichthyologia Ohiensis.' The fishes of Ohio received later a far more conscientious, though less brilliant, treatment at the hands of Dr. Jared Potter Kirtland (1793–1877), an eminent physician of Cleveland, Ohio. In 1842 the amiable and scholarly James Ellsworth Dekay (1799–1851) published his detailed report on the New York



A Ceratiid (*Caulophryne jordani*).

fauna, and a little earlier (1836) in the 'Fauna Boreali-Americana' Sir John Richardson (1787–1865) gave a most valuable and accurate account of the fishes of the Great Lakes and Canada. Almost simultaneously, Rev. Zadock Thompson (1796–1856) gave a catalogue of the fishes of Vermont, and David Humphreys Storer (1804–91) began his work on the fishes of Massachusetts, finally expanded into a 'Synopsis of the Fishes of North America' (1846) and a 'History of the Fishes of Massachusetts' (1867). Dr. John Edwards Holbrook (1794–1871), of Charleston, published (1860) his invaluable record of the fishes of South Carolina. The monograph on Lake Superior (1850), and



Atlantic Bat-fish (*Malthe vespertilio*).

other publications of Louis Agassiz (1807–73) are well known. One of the first of Agassiz's students was Charles Girard (1822–95), who came with him from Switzerland, and in association with Spencer Fullerton Baird (1823–87) described the fishes from the United States Pacific Railway Surveys (1858) and the United States and Mexican Boundary Surveys (1859).

Most eminent among the students and assistants of Professor Baird was his successor, George Brown Goode (1851–99), whose greatest work, 'Oceanic Ichthyology,' published in collaboration with Dr. Tarleton Hoffman Bean, was barely finished at the time of his death. The work of Theodore Nicholas Gill and Edward Drinker Cope has been already noticed.

The present writer began a systematic 'Catalogue of the Fishes of North America' in 1875, in association with his gifted friend, Herbert Edson Copeland (1849–76), whose sudden death, after a few excellent pieces of work, cut short the undertaking. Later, Charles Henry Gilbert (1860—), a student of Professor Copeland, took up the work, and in 1883 a 'Synopsis of the Fishes of North America' was completed by Jordan and Gilbert. Dr. Gilbert has since been engaged in studies of the fishes of Panama, Alaska, and other regions, and the second and enlarged edition of the 'Synopsis' was completed in 1898, as the 'Fishes of North and Middle America,' in collaboration with another of the writer's students, Dr. Barton Warren Evermann.

As students of the extinct fishes, following the epoch-making 'Poissons Fossiles' of Louis Agassiz, some of the notable names are those of Pander, Asmuss, Heckel, Hugh Miller, and Ramsay H. Traquair. An indispensable 'Handbuch der Palæontologie' is that of Karl A. Zittel, translated by Charles R. Eastman. The most valuable general work is the 'Catalogue of the Fossil Fishes in the British Museum' in four volumes, by Dr. Arthur Smith Woodward, a worthy companion of Günther's Catalogue of the living fishes.

In America Dr. John Strong Newberry, and Professor Edward W. Claypole have studied the fossil fishes of Ohio. Edward Drinker Cope and Dr. Joseph Leidy have written on the Eocene and Cretaceous fishes of the Rocky Mountains. Numerous recent papers of importance have been published by Dr. Bashford Dean, of Columbia University, Dr. Charles R. Eastman, of Harvard, and Dr. Oliver Perry Hay of New York. Other important records are due to Orestes St. John, A. H. Worthen, Charles D. Walcott, J. F. Whiteaves, S. W. Williston, and the Redfields, father and son.

Besides all this there has risen, especially in the United States, Great Britain, Norway, Canada, and Australia, a vast literature of commercial fisheries, fish culture, and angling, the chief workers in which fields we may not here enumerate even by name.

See FISHES, GEOGRAPHICAL DISTRIBUTION OF.

DAVID STARR JORDAN,
President Leland Stanford Jr. University.

Ichthyopsida, ik-thī-ŏp'sĭ-da. See HERPETOLOGY.

Ichthyopterygia. See ICHTHYOSAURIA.

Ichthyornis, ik-thĭ-ôr'nĭs, a genus of fossil carinate birds constituting an order *Ichthyornithes* and family *Ichthyornithidæ*. They were about the size of, and presumably had much the habits and appearance of, rather large gulls, but they had extremely large heads, and both mandibles of the long pointed beak were studded with sharp, backward pointing, snake-like teeth, each set in a distinct socket. These sea-birds fished in the great inland sea which during the Cretaceous Age covered so much of the present western half of the United States, and the remains of two species and of some allied forms, as *Aptornis*, are found in western Kansas, but they became extinct at the end of the period.

Ichthyosauria, Ichthyopterygia, or **Fish-lizards**, an order of reptiles, embracing primitive marine forms with a fish-like body, long head and tail, and no distinct neck, whose remains are found exclusively in the Mesozoic, and most plentifully in the Lias. They varied in length from 3 to about 30 feet, and, as shown by their numerous coprolites (q.v.), fed upon fishes and cephalopods (squids). "The members of this order," remarks Zittel, "differ conspicuously from all living reptiles and are distinguished chiefly by their fish-like form of body, paddle-shaped limbs with numerous oval or polygonal phalanges, large head with elongated rostrum, short amphicœlous vertebræ, and naked integument." They had no dermal armament like crocodiles, but the snout was prolonged, narrow like that of a gavial or a dolphin, the teeth were acutely conical, crocodile-like, and thickly set in a groove without separate sockets; as many as 400 have been counted in a single mouth. The eyes were surrounded by a circle of wedge-shaped sclerotic plates. That they breathed air is plain from the absence of branchial arches, the shape of the hyoid bones, and other evidences of pulmonary respiration; and their viviparous habit is demonstrated by several well-preserved skeletons embracing embryonic remains in the abdominal cavity,— as many as seven young in one case. As regards external form and adaptation to a marine existence, the ichthyosaurus "depart as widely from other reptiles as whales do from land mammals, and occupy as isolated a position." Their composite character is most puzzling to the phylogenist, and nothing is certainly known as to their origin or descent, except that they certainly were modified from terrestrial ancestors. The only family is *Ichthyosauridæ*, which existed from the Lias to the Cretaceous periods, and contains the small-sized and primitive genus *Mixosaurus*, the typical and exclusively Old World genus *Ichthyosaurus*, *Baptanodon* (q.v.), and *Shastasaurus*, the last two being American in their distribution. Consult: Zittel-Eastmann, 'Text-book of Palæontology,' Vol. II. (New York 1902); Gadow, 'Amphibia and Reptiles' (London 1901).

Ichthyosis, ĭk-thĭ-ō'sĭs, a congenital, chronic disease of the skin characterized by dryness, harshness, and a scaly appearance suggestive of the skin of fish. Nothing is known of its causation; it is not dangerous to life; its cure is impossible.

Iconoclasts, ī-kŏn'ō-klăsts (image-breakers), that Christian party in the Church of the 8th and 9th centuries who would not tolerate images in the churches or places of worship. The Byzantine emperor, Leo the Isaurian, issued an edict in 726 ordering the people to abstain entirely from paying religious reverence to sacred images and a second edict soon after ordered the destruction of the images. This order occasioned commotions, first in the islands of the Archipelago; and as the Popes Gregory II. and III., as well as Germanus, the patriarch of Constantinople, declared the veneration of sacred images to be in consonance with the Church's doctrine and constant practice, and the Emperor Leo refused to recall his edict on their command, they excommunicated him, and his subjects in Italy threw off their allegiance. Thence arose two parties, the Iconolatræ (image worshippers) and the Iconoclasts. Leo's son and successor, Constantine Copronymus, held the same views as his father. He convened a council at Constantinople (754), in which the use as well as the worship of images was condemned. Constantine's son, Leo IV., who ascended the throne 775, followed the same course, but proceeded with more clemency and moderation. On the death of Leo IV., in 780, he was succeeded by his son Constantine, under the guardianship of Irene, mother of the latter, and widow of Leo. Irene favored the orthodox party, and on attaining this position of authority openly avowed her sentiments, and summoned a council to be held in 787, under her protection at Nicæa (Nice) in Bithynia, to pass upon the question at issue. This council condemned the Iconoclasts. Among the Greeks the controversy concerning images broke out anew after the banishment of Irene (802), and lasted about half a century. Her successor, Nicephorus, did not, indeed, remove the images from the churches, but he forbade the adherents of the images from persecuting their adversaries. Finally the Empress Theodora, by a council held at Constantinople (842), restored the worship of images among the Greeks, which was confirmed by a second council, held 869–70, in the same place.

Icteridæ, ĭk-tĕr'ĭ-dē, a family of birds, the American orioles, or hangnests, and blackbirds (qq.v.).

Icy Cape, Alaska, a promontory so named on account of the immense masses of ice by which it is usually surrounded on the north coast, and projecting into the Arctic Ocean west of the Otukah River, about midway between Capes Lisburne and Barrow. It was discovered by Cook in 1778, and was the farthest point that he reached north of Bering Strait.

Ida, (1) the classical name of Kaz-Dagh, a mountain range of Asia Minor, 30 miles southeast of the plain of Troy, with its highest peak, Gargaron (4,650 feet), near the head of the Gulf of Adramyti. In mythology it is famous as the range where Ganymede was stolen; where Paris pronounced judgment on the beauty of the rival goddesses and where the celestials stationed themselves to witness the battles for Troy on the nether plain. (2) The classical name also of a mountain (now Psilotri) in Crete (q.v.), the loftiest (7,500 feet) of the range which traverses the island. The most celebrated legends connected with it are those relating to the infancy of Zeus.

Ida Grove, Iowa, a town, the capital of Ida County, 28 miles north of Denison, on the Maple River, and on the Chicago & N. W. railroad. Farming and stock-raising are carried on largely in the vicinity, and the town has flour mills, grain elevators, and manufactures of machinery, harness, brooms and bricks. Among the municipalized installations is a heating-plant. Pop. (1900) 1,967.

Idaho (Indian, «mountain gem»), a Rocky Mountain State of the United States, next east of Oregon and Washington: its slender northern prong abutting on British Columbia; Montana and Wyoming lie on the east, Nevada and Utah on the south. Capital, Boisé. Length, 485 miles; breadth, 50 to 300; area, 84,800 square miles, 510 water. Pop. (1903) est. 177,000.

Topography.— Idaho is part of the high plateau known as the Great Basin, the main Rockies bounding it on the east and the Cascade Range on the west: it has a mean elevation of some 4,700 feet, but the Bitter Root range in the northeast, extended north by the Cœur d'Alène and Cabinet, and the Salmon range in the centre, have snow-capped peaks rising in the latter to 12,000 feet, of rugged grandeur. These send out spurs extending west entirely across the State. The Saw Tooth range in the west centre, and the Goose Creek and Bear River ranges in the south, are the other chief ranges, the last two stretching across the State. The river system belongs almost entirely to Columbia, with a basin of some 60,000 square miles within the State: the Snake or Lewis Fork winding across its whole southern breadth and up much of the west boundary for some 850 miles, navigable from Salmon Falls, in the centre, to the entrance of the Powder River from Oregon. The chief Idaho affluents are the Salmon and Clearwater; others are the Boisé and Payette. In the north are the Spokane, Pend d'Oreille, Kootenai, and others, all flowing into the Columbia. A large area in the southern part is drained by streams which sink into the earth not far from the mountains (the «lost river» drainage system), and some reach the Snake River by subterranean channels. A small part of the south drains into Salt Lake by the Bear River. The chief lakes are Cœur d'Alène, Pend d'Oreille, and Kaniksu, all in the extreme north, and Bear Lake, in the extreme south, half in Utah. The State has many beautiful waterfalls; four of them are on the Snake,— the 210-foot Shoshone Falls, the Twin, Salmon, and American.

Geology.— The most conspicuous physical and geological feature is the vast barren lava plain, some 400 miles by 40 to 60, and about 20,000 square miles in extent, stretching along the Snake River. This is a relatively recent (Tertiary) overflow, which in enormous volume flooded the Pacific Slope to the ocean. The but recent quiescence of the volcanic activity is shown by the geysers, steam and soda springs, and hot pools, still plentiful in this region. It is rich in fossils, including those of the elephant and mastodon, tapir, simiads, and saurians.

Forests.— The timber region occupies about 11,000 square miles, mostly in the northern part, but somewhat in the upper Boisé, Payette, and Weiser valleys; a dense growth mostly of conifers,— white and yellow pine, red cedar, spruce, hemlock, etc. Of the Bitter Root Timber Reservation, 5,400 square miles are in Idaho; the loftier regions, the Alpine Fir district, produce a poor quality. The forest products were over $1,000,000 in 1892.

Climate, Soil, and Agriculture.— The upper levels have the severe winters of the northern latitudes, and heavy snowfalls from the abundant moisture; the lower ones and the sheltered valleys have a very agreeable and equable climate. The rainfall is light and the soil consequently arid in the southern parts, as in the Great Basin generally, the mountains cutting off the vapors from either side; but in the mountainous districts rain is abundant, and agriculture can be carried on without irrigation. Here, however, the sandy and clayey soil makes it less profitable than ranching. In the mountain valleys and along the rivers, where irrigation can be brought into play, and the soil from lava decomposition is exceedingly rich, production is abundant. The chief districts irrigated are those near swift streams with shallow channels, as the headwaters of the Snake in the east and the district around the Boisé and Payette in the west. Over 600,000 acres were irrigated in 1900. In 1902 a great effort was made to increase this by nearly one half, irrigating 276,000 acres in the Snake Valley by two great canals, with power developed at Shoshone Falls. The chief crop is hay, which in 1902 amounted to 955,676 tons, valued at $5,256,218. Next to this was wheat, 6,021,946 bushels, valued at $4,215,362; other cereals, as oats and barley, produced several million bushels, but wheat made about three fourths of the total. The State raised some $4,000 worth of flaxseed. The raising of vegetables to supply the mining towns is assuming importance, and the fruits for which the Pacific Slope is becoming noted are shared by Idaho, chiefly apples and prunes, grown mainly in the Boisé basin,—

the fruit product being about $400,000 a year. The stock-raising interest is very important, nearly half the surface of the State being pasture; but the long severe winters and deep snows make it precarious and costly in precisely the sections best adapted to it, and the northern packers and cattlemen generally winter their stock and draft animals in the Snake and adjoining valleys, where they can live and forage in the winter. The most important item is sheep, which are increasing with great rapidity; from 1,956,467 in 1899–1900, they numbered 4,541,815 in 1902, fourth in the United States. Idaho ranks third in the wool clip, which was 21,639,387 pounds in 1902. The sales of wool and mutton together in 1902 were $4,775,000. There are some 60,000 dairy cows in the State, and nearly half a million meat cattle.

Mining.— Idaho ranks high as a mining State, having rich deposits not only of gold, silver, copper, and lead, but of iron, coal (several new mines opened in 1903), salt of excellent quality, and other minerals. Its lead is the purest in the country, the Cœur d'Alêne district producing about one third of all in the United States. The gold is distributed all through the State; not only in the quartz, but in the gravels of the rivers, especially the Boisé (the most noted), the Salmon, and the Snake. Dredging from the Snake River bed is carried on; but the great event of the last year (1902) was the discovery of immense new quartz ledges in the Thunder Mountain district, which are expected to raise production to the old level of the days before the partial exhaustion of the placers. The yield of metals in 1902 was 92,750 ounces of fine gold, valued at $1,917,150; 5,591,734 ounces of silver, valued at $2,577,789, and 68,953 long tons of lead, besides about 300,000 pounds of copper. The production is restricted by the American Smelting and Refining Company, in order not to glut the market.

Manufactures.— The production of lumber is the chief industry, and flour milling next. Railroad cars, harness and saddlery (always needful in a ranching country), foundry and machine-shop products, furniture, and cigars are also of some importance. There are about 1,600 persons employed in the various manufactures, earning about $1,000,000 yearly in wages; the annual output is about $4,800,000 in value.

Railroads.— The mountainous character of the State, and its slight development, have retarded the construction of means of transportation; the Oregon Short Line through the Snake Valley in the south, and the Great Northern and Northern Pacific through its extreme northern tip, furnish what it has, except a Northern Pacific branch along the Clearwater and a short distance north. There are about 1,400 miles of main track in the State.

Banks.— In 1901 there were 13 national banks in Idaho, with $650,000 of capital stock, $223,354 in outstanding circulation, and $231,650 in United States bonds. There were also ten State banks, three private banks, and a loan and trust company.

Education, Charities, Religion, etc.— The State has over 750 school buildings, and 1,100 teachers, and spends over half-million dollars annually on the schools. Besides ten public high schools, and as many private academies, there are two State normal schools, at Albion and Lewiston, the University of Idaho at Moscow, State Academy at Pocatello, and an agricultural and technological school at Idaho Falls; with two industrial schools at De Smet for the Cœur d'Alêne Indians, academies at Lewiston, Boisé, Genesee, and Pocatello. The State has an insane asylum at Blackfoot, and a State prison at Boisé. In religion, it is predominantly Mormon, with the Catholics next; Methodists, Baptists, and Presbyterians follow in that order.

Indians.— There were 4,226 Indians in the State in 1900, at four reservations, Cœur d'Alêne, Fort Hall, Lemhi, and Nez Percé. But in 1902 the Fort Hall reservation was thrown open to settlement, and about 3,000 settlers took up claims. The Indians at Cœur d'Alêne and Nez Percé are self-supporting.

Government and Finances.— The governor and legislature are elected biennially; sessions are limited to 60 days, except at the members' expense. There are 21 members in the Senate and 46 in the House. The State has one Representative in Congress. After admission as a State a Republican governor was elected until 1897, when the Democrats and Populists united. Until 1902 the Fusion candidates for governor were elected, but in 1902 a Republican governor was elected, and the State is now Republican. The assessed valuation of property (1902) is about $52,000,000, and the bonded debt $443,-500.

Population.— 1870, 13,999; 1880, 32,610; 1890, 84,385; 1900, 161,772. There were about 25,000 more males than females, as natural in a mining and ranching State. Only 24,604 were foreign born. The chief place was Boisé, with 5,957 inhabitants; next Pocatello, 4,046. The only others over 2,000 were Moscow, 2,484, and Lewiston, 2,425. There were 21 counties, as follows, with their capitals: Ada, Boisé; Bannock, Pocatello; Bear Lake, Paris; Bingham, Blackfoot; Blaine, Hailey; Boisé, Idaho City; Canyon, Caldwell; Cassia, Albion; Custer, Challis; Elmore, Mountainhome; Fremont, St. Anthony; Idaho, Mt. Idaho; Kootenai, Rathdrum; Latah, Moscow; Lemhi, Salmon; Lincoln, Shoshone; Nez Percé, Lewiston; Oneida, Malad City; Owyhee, Silver City; Shoshone, Wallace; Washington, Weiser.

History.— Idaho was first explored by Lewis and Clark in 1805 (See LEWIS AND CLARK'S EXPEDITION), and was part first of Oregon Territory, then of Utah, Washington, and Nebraska successively. The Jesuit, Father De Smet established a mission at Cœur d'Alêne in 1842, but till the discovery of gold in 1882 it was visited only by hunters and trappers. On 3 March 1883 it was organized as a Territory, but included the present Montana and most of Wyoming. In 1864 Montana was set off, and in 1868 Wyoming with other territory. When gold was discovered at Cœur d'Alêne, in 1882, a great migration set in, and in 1889 a convention framed a constitution and petitioned for admission to the Union. In 1883 all Mormons were disfranchised, a law held constitutional by the United States Supreme Court; but in 1893, on the Mormon Church disclaiming polygamy, the law was repealed. Miners' strikes in 1892 and 1899 caused great disturances: in the latter year the United States soldiery were compelled to intervene and imprison a great body of miners.

Consult: Bancroft, 'Washington, Idaho, and Montana'; Ouderdonk, 'Idaho, Facts and Statistics Concerning Its Mining, Farming, and Industries.' LAWRENCE H. GIPSON,
University of Idaho.

Idaho Springs, Colo., town in Clear Creek County; on the Colorado & S. railroad; about 30 miles west of Denver. It is situated in the plateau region of the Rocky Mountains at an elevation of about 7,600 feet. The hot and cold soda springs tend to make it a famous resort for health seekers. In 1859 gold was discovered at Jackson's Bar, now a part of the town of Idaho Springs. This district has been most productive in its yield of gold. The chief industrial establishments are concentrating mills, lumber-yards, and machine-shops. Pop. (1900) 2,502.

Idaho, University of, the State university situated at Moscow. Work was begun in 1892; it is open to both men and women, and there is no tuition for residents of the State; a small fee is charged to non-residents. The government is by a board of regents; the courses offered include the classical course, general science, civil and mining engineering, and agriculture. The university is also active in organizing farmers' institutes. The annual income, derived mostly from State appropriations is about $71,000; in 1905 the number of students was 376; the number of professors and instructors 28.

Iddesleigh, ĭdz'lĭ, EARL OF. See NORTHCOTE, STAFFORD HENRY.

Ide, Fannie Ogden, "RUTH OGDEN," American author: b. Long Island 1853. She has written various juvenile stories, among them 'A Loyal Little Red-Coat' (1889); 'A Little Queen of Hearts' (1892); 'Little Homespun' (1896); 'His Little Royal Highness' (1897); 'Tattine' (1900); 'Loyal Hearts and True' (1900); Friendship (1904); 'The Good and Perfect Gift' (1904).

Ide, Henry Clay, American jurist: b. Barnet, Vt., 18 Sept. 1844. He was graduated at Dartmouth in 1866. He was a member of the Vermont State Senate in 1882–5, and a delegate to the National Republican Convention of 1888. In 1891 he was appointed United Commissioner in Samoa, and later (1893–7) was chief justice of Samoa under the joint appointment of the United States, Germany, and England. He became in 1900 a member of the Taft commission; secretary of finance and justice of the Philippines, Sept 1901; vice-governor 1 Feb. 1904; and in 1906 governor-general.

Idealism. This word is not easy to define briefly, as it is used in many connections where the common element in the various significations it takes on are not at first sight apparent. We may say at once, however, that idealism is a fundamental attitude or point of view from which men interpret the world, or some special phase of human experience. Its essential characteristic is found in the fact that it interprets the reality with which it deals as having a meaning, an idea, apart from its sensible appearance, and assumes that in this inner significance its truth and ultimate essence consists. Not the outward show of things, not the fact of coexistence and sequence among sensible phenomena, but the meaning or "idea" is for idealism the point of primary importance in understanding either the world as a whole, or any of its various parts. Now, as Plato perceived, this inner idea of anything is ultimately identical with its "good," *i. e.* what it is good for, its purpose or function in a rational system of things. Accordingly, the essence of idealism is found in its teleological mode of explanation. This point of view, when logically carried out, implies further that what is real is rational or intelligible, since its idea can be grasped. That means, in other words, that mind or intelligence is the ultimate principle in which things find their explanation. Moreover, it of course follows that the material world with its mechanical laws is in some sense secondary and derivative. Idealism is thus directly opposed to materialism and mechanism (q.v.), which take matter or energy or some unintelligent form of existence as the *prius* from which everything else is derived. Realism, as a philosophical theory, affirming the existence of a reality apart from subjective experience, is not properly contrasted with idealism; though, as we shall see later, these terms are used to denote opposing tendencies in literature and art. It is, however, a mistake to suppose that idealism denies objective reality and reduces the world to sensations and ideas in the mind of the individual. On the contrary, the more adequately the principle of idealism is grasped, the more completely is justice done to the objective side of experience.

Science, including philosophy, religion, art, and literature, are all different ways of interpreting life and existence, involving, indeed, varying attitudes of the self toward reality, and varying degrees of explicitness. Religion, art, and literature differ from science and philosophy in not being reasoned interpretations of reality, but primarily expressions of the emotional or feeling aspects of experience. Yet the various sides of experience are not independent and isolated, but act and react on one another as parts of a functional unity. Consequently, the interpretations of religion, art, and literature presuppose more or less explicit theories about the nature of things. These, however, exist in the form of unexamined assumptions and uncritical standards of value. With regard to these interpretations, we can at once say that all forms of religion which rise above mere fetichism necessary presuppose an idealistic view of the world. This is obviously true of a religion like Christianity. But even if a religion denies individual immortality and the doctrine of a personal God, it cannot exist without assuming that the universe is to some extent governed by the ideas and purposes of a superhuman power (or plurality of powers), and that it is not therefore a mere play of mechanical phenomena. Art and literature, too, are naturally — at least in their highest forms — affiliated with idealism. For the emotional and æsthetic satisfaction at which they aim can be fully attained only on the assumption that the ultimate nature of things is in harmony with the demands of the human spirit, and that therefore these ideals are not vain illusions. There are, however, two causes which at certain periods bring about a reaction against idealism in these fields, and give rise to what is known as realistic art and realistic literature. In the first place, the conceptions of science and philosophy are at certain periods so prevailingly mechanical and naturalistic as to fetter the wings of imagination and render impossible any idealistic interpretation on the part of art and literature. If the world is demonstrably unmeaning and mechanical, there is no permanent artistic satisfaction in a false idealism. The imagination cannot be divorced from reason, but must find its satisfaction in representing things in harmony with their true nature and known laws of action. But, again, realism in art and literature may be the result of a onesided idealism, which, by ignoring the aspect of things that science emphasizes, gives rise to the same divorce between the truth of fact and the truth of art. It is clear that if idealism is to prevail in these fields it must not ignore the facts and laws of the natural world, or run counter to them, but must do justice to these facts while it transcends, through its interpretations, the scientific standpoint. Mere idealism, then, is an unsatisfactory standpoint in art and literature, and the reaction toward realism to which it gives rise is justifiable and necessary. In a somewhat similar sense, "idealist" is used popularly as a term of reproach to denote a person who ignores the facts and practical conditions of any situation, construing it in a onesided way in terms of his own ideas of what ought to be. But idealism, to be adequate, must go beyond the uncritical ideas of the individual. The true idealist is the man whose ideas are adequate to the situation in all its complexity and concreteness, whose interpretation of what is and ought to be is derived from a penetrating analysis of all the objective conditions.

What of the relation of natural science and philosophy to idealism? It is obvious that the very task of the natural sciences necessitates the adoption of conceptions which are fundamentally different in character from those employed by idealism; for science is primarily concerned with the relations of particular phenomena. It is always concerned with the mechanism of the parts, and knows nothing of the ideal purpose or significance of wholes. As Kant said, "where mechanism ceases there ceases also the possibility of scientific explanation." This is the ground of the long-standing quarrel between natural science on the one side, and idealistic philosophy and religion on the other; the former can interpret the world only in mechanical terms, while the latter must read it in terms of teleology.

The history of thought shows that both these methods of explanation have steadily confronted each other in philosophy. Idealism and materialism were developed almost simultaneously in Greece — the former by Plato, and the latter by Democritus — and the division between these opposing principles under one form or another persists until the present day. Although philosophical systems necessarily vary with the changing intellectual and social conditions of different periods, yet it remains true, as Fichte said, that in principle "there are and can be only two systems of philosophy, idealism, and materialism, and that neither one can directly refute the other, since they are constructed upon totally different planes." Materialism, as philosophy, adopts the conceptions and methods of the natural sciences, and differs from the latter only in the greater scope and generality of its problems. It aims to be (in Spencer phrase) "completely unified science." Idealism, as we have already seen, has a different problem from that set by science, and states its conclusions in terms that are quite foreign to the latter.

It is usual to distinguish between subjective and objective idealism. The former is an incomplete and undeveloped form, and finds its best representative in Berkeley (q.v.). It resolves material existence into a series of ideas in the mind of the individual, holding, in Schopenhauer's phrase, that "the world is my idea." The proof that it offers for this position is based mainly on the epistemological thesis that we know and can know nothing but our own ideas. The difficulties and inconsistencies of this view are now generally recognized, and the idealism of the present day is known as objective idealism. This does not deny the existence of external reality, but finds implicit in it the same principles of reason and purpose that are present in the individual mind. Indeed, this is true of the great idealistic thinkers of all times — of Plato and Aristotle, no less than of Schelling and Hegel. As a philosophical system, idealism has, of course, to formulate its conclusions in a series of logical propositions, and to furnish proofs of their validity. In doing this it does not depend upon the Berkeleian argument mentioned above, but rather proceeds by way of a criticism of the standpoint and categories of natural science. That is, idealistic philosophy attempts to show that the scientific standpoint, when taken as philosophy, *i. e.* as an ultimate account of the nature of things, is in itself incomplete and inconsistent, and that when the necessary supplementations and corrections are made it points the way to a view of the world as a rational and purposive system. To make our view of the world completely consistent, many idealists maintain, we are obliged to hold that all its parts are included in an all-embracing system of experience, which finds its unity and its utimate reality in the ideas and purposes of an Absolute Mind.

Ides, one of the threefold divisions of the Roman month. See Calendar.

Idiocy, that state of permanent mental deficiency which arises from an affection of the brain either before or at the time of birth or at an early period of life. It is thus distinguished from insanity, which is a condition of mental derangement occurring in the developed brain. Idiocy is a term of very wide applicability owing to the fact that very many grades of arrested development occur. In a general sense it is applied chiefly to the worst of these forms, while the term Imbecility is used to denote the milder forms. The distinction between idiocy and imbecility is thus a somewhat arbitrary one, for the two conditions shade into each other by almost imperceptible degrees.

Causes.— The causes of idiocy and imbecility are often very obscure. A large proportion of cases are congenital; that is, they arise from causes acting *in utero.* The child is born with a brain already hopelessly impaired. Heredity is thus a very evident cause; defects in the ancestral stock and vices in the parents and near progenitors are doubtless very active. Alcoholism, syphilis, and other toxæmias are certainly among these causes; as well as consanguinity and various diseases in the parents. Injuries to the mother while pregnant may be responsible. The subject of ante-natal disease is still a very obscure one, but evidence is not lacking to show that the fœtus may suffer from disease; and in the critical stage of development of the brain before birth this organ may suffer irreparable damage. The same may be said of the infant and very young child. Injury and disease may act most disastrously upon the undeveloped brain. Thus blows upon and injuries to the head may cause idiocy; also injuries at the time of birth, due to difficulties in the labor, may act. The various infectious diseases of childhood are responsible for some cases; thus scarlet fever, measles, whooping cough, and cerebro-spinal fever have been noted as causes of permanent arrest of development. No doubt in many cases it is difficult or even impossible to detect the active cause.

The following are the most universally recognized varieties of idiocy:

Microcephalus.— In this form the brain and its enveloping skull-case remain abnormally small. In extreme grades the deformity is very striking. These are among the lowest and worst forms of idiocy, and in some cases there is scarcely a spark of intelligence. The patient cannot be said to do more than vegetate. The original cause probably acts in these cases at a very early period in the ante-natal life, and determines an almost complete arrest of brain development.

Hydrocephalus.— In this form the natural cavities or ventricles of the brain become enormously distended and the skull is correspondingly enlarged. The mental impairment varies within wide limits. In some cases the idiocy is almost if not quite as great as in microcephalus, but in other cases a fair degree of intelligence is preserved. There may be also various forms of paralysis, speech defect, epileptoid seizures, and impairment of the special senses. Hydrocephalus probably depends upon closure of one or other of the outlets for the cerebro-spinal fluid between the ventricles of the brain.

Porencephalus — Occlusion or stoppage of one of the main arteries of the brain at an early period of development, not necessarily antenatal, may cause such an arrest of development of a portion of the brain-mass that a cavity results, and this is called porencephalus. Such a stoppage of an artery may be caused presumably by injury or by one of the infectious diseases. The symptoms are usually arrest of development of the mental faculties in various degrees, speech defects, paralysis, such as hemiplegia, athetoid movements, and epilepsy.

Mongolian Idiocy.— In some cases the patient bears a real or fancied resemblance to certain racial types, as the Negroid, Mongolian, etc. The latter of these is the best marked, and is now included (after Langdon Down) in most descriptions. The patient's head is deficient in the posterior region; he is of short stature, has oblique and widely separated eyes, and a flattened nose. The attempt is made by some writers to construct special mental features for the Mongolian idiot, but with not very great success. He is simply an idiot, with varying degrees of mental power, and his resemblance to a Calmuck is only accidental.

Paralytic Idiocy.— In the fœtus and in the infant and very young child certain accidents or diseases may cause cerebral hemorrhages, which, just as in the adult, cause in turn various kinds of paralysis. The most common are hemiplegia or paralysis of the arm and leg on one side; diplegia, or paralysis of both arms and legs; and monoplegia, or paralysis of one limb. Such an accident in early life is apt to cause more or less idiocy or imbecility in addition to the paralysis. Some of these patients are also epileptic.

Epileptic Idiocy.— A rather large proportion of feeble-minded children are epileptic. This symptom may be associated with paralysis of various kinds, as already said, or it may not be complicated in any way with marked physical defects. It is only too likely, however, to induce a progressive mental deterioration; or, to speak more accurately for some cases, to prevent a normal brain development. The epileptic child is usually feeble-minded — some more, some less.

Sensorial Idiocy.— In some cases the organs of sight or hearing, or both, may be defective, or undeveloped, and the child's brain does not develop normally merely because it is deprived of these important avenues of sensation. Such children may have more brain capacity than at first appears, and they can be educated. In some cases, however, as in some deaf-mutes, the mental faculties remain more or less undeveloped.

Genetous Idiocy.— Ireland, a well known authority, proposes this term for a certain class of congenital idiots, but it is not very distinctive. It includes feeble-minded children, usually of a rather low grade, who are born with undeveloping brains. The term really applies to many members of the other groups already referred to.

High and Low Grade Idiots. — These terms and intermediate ones are often applied merely to designate feeble-minded children according to the approximate degree of their lack of development. While lacking in scientific precision, such terms denote conveniently various grades of idiocy. There are many idiots who are not microcephalic, nor hydrocephalic, nor Mongolian, nor paralytic, nor epileptic, nor in fact to be included in any usually accepted class, and yet they are unmistakably idiots, and often of low grade. The truth is, that all classifications must remain unsatisfactory until we know more about the causation and pathology of the various forms.

Cretinism.— A highly specialized form of idiocy is cretinism. This is always associated with defect in the thyroid gland; sometimes this gland is entirely absent, at others it is immensely hypertrophied, and thus practically destroyed. Cretinism is endemic in some countries, as in and about the Alps and Pyrenees. The cretin is both physically and mentally stunted. He is of low stature, of peculiar and characteristic physiognomy, of pale and unhealthy skin, usually beardless, sometimes sexually undeveloped, and with many defects in the skeleton and muscular system. Mentally he is usually an imbecile at least, and in some cases even quite idiotic. Cases vary widely, however, in the degree of feeble-mindedness. In the United States cretinism is only sporadic.

Pathology.— As already indicated, idiocy is due to a wide variety of causes, and therefore its pathology also varies extensively. Among the processes found in the brains of idiots are sclerosis, atrophy, porencephalic defects, old inflammations, occluded and destroyed blood vessels, distended ventricles, and thickened membranes.

Treatment.— In recent years the effort has been made to train and educate the feeble-minded child, and to develop in it as far as possible the defective mental faculties. Training schools for these patients now exist in this country and in Europe, and the most humane and enlightened efforts are being put forth to ameliorate the condititon of these unfortunates, and to render the more hopeful of them useful members of society. It is needless to say, however, that not much can be accomplished with feeble-minded children of low grade, and with the very lowest nothing whatever can be done. With the imbecile and demi-imbecile, however, the results obtained sometimes justify the pains and expense. For the vast majority of feeble-minded children asylum treatment is desirable, even indispensable. These unfortunate patients cannot associate with healthy children, and they require a special environment. The prospect for cure in most cases is quite hopeless. See also INSANITY.

JAMES HENDRIE LLOYD,
Formerly Neurologist Philadelphia Hospital.

Idol, in a sense now obsolete, or nearly so, an image (Greek εἴδωλον) or likeness of anything; in later and chiefly present signification, any image or likeness of a deity used or designed as an object of worship. By extension the term has also come to be applied to anything which is an object of adoration or of supreme affection or regard. (See next article.)

Idol'atry, the worship of idols in any sense; in the restricted usage ordinarily observed, it is the worship of the Deity or of a deity under a visible form; and from the point of view of the Christian, or any other religion which rejects the worship of images, consists in worshipping as God what is not god. With regard to the origin and character of idolatry, there is a wide divergence of opinion. The Christian religion conceives idolatry as a declension from the one true God, sees in the various forms of heathen worship only more or less complete degradations of an original revelation, and ascribes to it the same origin as to sin. Some philosophical and historical writers, on the other hand, see in idolatry an innate searching after God, and accordingly the first stage of human development, the necessary beginning of a knowledge of God. Idolatry may assume various forms. One nation seeks its god in the powers of nature, worships the heavenly bodies and the elements, and creates for itself a nature-worship; another develops a hero-worship, and a third has merely an animal and image worship, the lowest form of which is fetishism (q.v.). To this last and rudest form of idolatry, that consisting in animal and image worship, the name of idolatry is sometimes confined. See IMAGE WORSHIP.

Idrisi, ĭd'rē-sē, or **Edrisi, Abu-Abdallah Mohammed,** Arabian geographer: b. about 1100; d. about 1180. He studied at the Moorish University of Cordova, traveled through various countries bordering on the Mediterranean, visited France and England, and was then invited to the court of Roger II. of Sicily, where he resided under the patronage of Roger and his successors till his death. He constructed at the request of Roger a terrestrial globe of silver, on which the figure of the earth was shown with as much accuracy as the state of geographical knowledge then permitted. He accompanied this with a descriptive treatise bearing the title 'Nuzhat Almushtâk,' completed about 1150. An old manuscript of this work was discovered at Paris in 1829, and published in a French translation by Jaubert.

I'dyl, or Idyll (from a Greek diminutive meaning a "little form or image"), the name originally and still most usually applied to a short and highly finished descriptive poem, especially if it treats of pastoral subjects. This last circumstance is not, however, an essential character of the idyl. All that is necessary to constitute a poem of this class is that it presents to view a complete picture in small compass, and accordingly the idyl may refer to a great variety of subjects, and the fact that the subjects of idyls are usually pastoral is due to this, that pastoral life, at once simple and picturesque, affords the best material for such short descriptive poems. The term idyl is sometimes used even more extensively but in a manner so capricious as to be incapable of definition.

Iglesias, José Maria, hō-sā' mä-rē'ä ē-glā'-sē-äs, Mexican historian and publicist: b. City of Mexico, 5 Jan. 1823. He studied law in the University of Mexico, was appointed professor of jurisprudence there, became secretary of justice in 1857, and, after service as head of the treasury department, again held the post in 1853–67. In 1868 he was elected to Congress, in the same year was appointed secretary of the interior, in 1873 chosen president of the supreme court. After the fall of Lerdo de Tejada, he established a government which soon yielded to the superior power of Diaz. His publications include: 'Apuntes para la Historia de la guerra entre Méjico y los Estados Unidos' (1852); and 'Revistas históricas sobre la Intervención Francesca' (1870).

Igloo'lik, Canada, a small island in the Arctic Ocean, near the east end of Fury and

Hecla Strait in lat. 69° 21' N. and lon. 81° 55' W. It is noted as the place where Parry wintered in 1822–3.

Ignacio (ēg-nä'sē-oo) **Islands**, Mexico, a chain of islands in the Gulf of California, off the Bay of Topolobampo, in the State of Sinaloa. The chief are Macapule and Altamura.

Ignatius, ĭg-nā'shĭ-ŭs, **Father.** See Lyne, Joseph Leycester.

Ignatius, Saint, bishop of Antioch, said to have been a disciple of the Apostle John, and on that account reckoned among the number of the apostolic fathers. According to the most trustworthy tradition he was appointed bishop of Antioch 69 A.D., and thrown to wild beasts in the circus of Antioch by the command of Trajan, about the time of that emperor's expedition against the Armenians and Parthians. Another account places his execution at Rome. The year of his death is variously stated: by some 107 A.D. is given as the date, by others placed so late as 116 A.D. By the Greek Church his festival is celebrated on 20 December, by the Latin on 1 February. In the literature of the early Christian church Ignatius holds an important place as the reputed author of a number of epistles. These have come down to us in three forms. In the longest text they are 13 in number, but since the discovery of a shorter text containing only seven (addressed respectively to the Ephesians, Magnesians, Philadelphians, Trallians, Smyrniots, Romans, and to Polycarp), the first has been universally recognized as in great part spurious, some of the letters entirely so, and others containing interpolations. But even in this shorter form the genuineness of the Ignatian epistles has been disputed by numerous scholars. Both of these texts are in Greek, but a still shorter text in the Syriac language, containing only three letters (to the Romans and the Ephesians, and to Polycarp), and even these in a shorter form, was published in 1845 by Cureton. There has been much discussion as to the genuineness of these shorter collections. At present the prevalent belief is that the seven are genuine, and the Syriac an abridgment of them. An edition of the Greek text of the seven epistles was published at Amsterdam by Voss in 1646. An English translation by Archbishop Wake was published in 1693. Lightfoot's edition of the Greek text in his 'Apostolic Fathers, Part II.' (St. Ignatius and St. Polycarp, 1889), supersedes all others, and presents a complete discussion of the subject.

Ignatius of Loyola. See Loyola, Ignatius of.

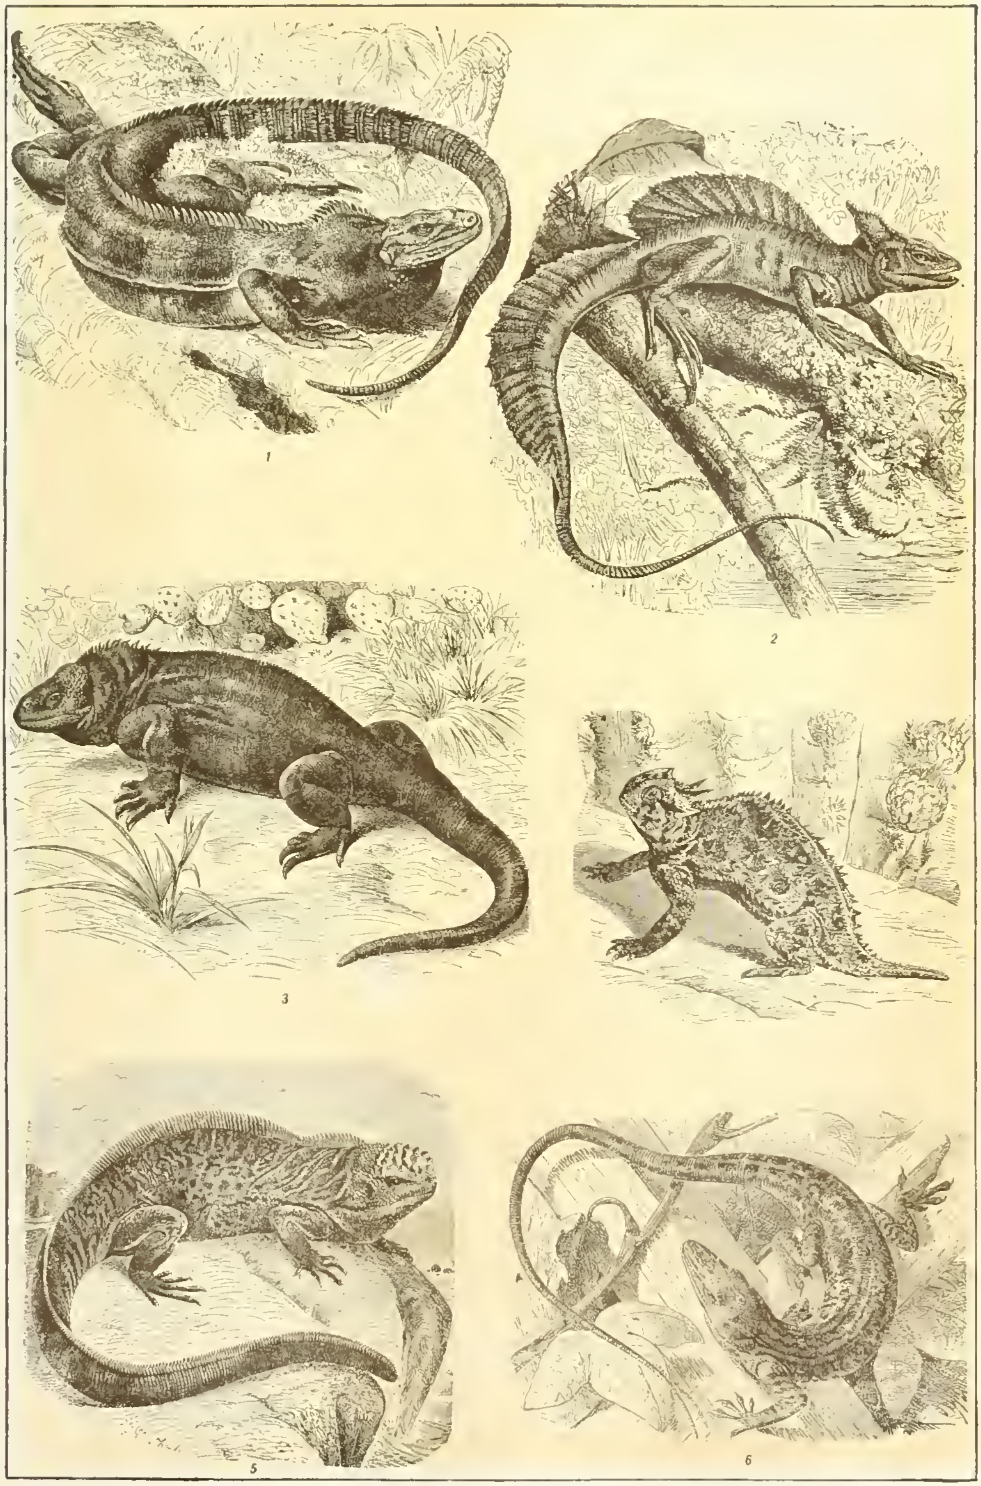
Igneous (ĭg'nē-ŭs) **Rocks,** the term applied in geology to those rocks the special structure of which is due to their having been once in a molten state, from which they were solidified into their present character. They include lava, basalt, granite (qq.v.), etc. Such rocks are not stratified, and may occur in connection with sedimentary rocks of any age, as the igneous rocks have usually been erupted from the heated interior of the earth and forced up toward, sometimes to, the surface. In petrological classification igneous rocks may be grouped under two heads — crystalline and fragmental — although petrography has not yet provided any method of classifying them which can be called complete or systematic. Many of the rocks considered as crystalline are rather to be classed as vitreous or glassy, while some others are partly of non-crystalline materials. Among the crystalline rocks, some of those called orthoclase contain much free silica (see Quartz). Most of the crystalline rocks called plagioclase contain less silica than the last-mentioned and a basalt to which close resemblance is found in nepheline and leucite rocks. Of the other crystalline rocks, the olivine and serpentine are generally rather basic, the former often showing much alteration into the latter. The fragmental igneous rocks consist of loose material which has been ejected from volcanic orifices. These rocks are frequently consolidated and, when fine-grained, it is sometimes difficult without the help of the microscope to distinguish them from compact crystalline igneous rocks.

Ignis Fatuus, ĭg'nĭs făt'ū-ŭs (Latin *ignis*, fire, *fatuus*, foolish), an atmospheric light or a luminous appearance sometimes seen in swamp-lands, in churchyards, and over stagnant waters. The light usually appears shortly after sunset; it is common in the north of Germany, in Italy, in the south and northwest of England, and the west of Scotland, and has been noticed in many other countries in undrained marshy districts.

The appearance generally resembles a flame; seen closely, the color appears as bluish, reddish, greenish, or yellowish, merging into purple, but never a clear white. Sometimes the flame seems fixed in position, shining steadily close to the ground or a few feet above it; again, it appears in rapid motion, sometimes rising high in the air, at others separating into smaller flames, which are seen advancing, retiring, recombining, etc.

Some supposed appearances of the ignis fatuus are probably due to luminous insects, or to the phosphorescence of decaying vegetable matter. By setting all such possible cases aside, both fixed and moving ignes fatui have been proved to exist, although the spectrum of the light seems not to have been fully observed. The common hypothesis that ignis fatuus is the flame of burning marsh-gas, CH_4, is untenable, for although this gas is produced abundantly in many marshy places, it cannot ignite spontaneously. The more plausible suggestion that phosphoretted hydrogen, PH_3, which is spontaneously inflammable, might be produced in churchyards or marshes where there is decaying animal matter does not account for some of the effects observed. The early supposition of a phosphorescent vapor is more reasonable, although excepting that of free phosphorus, which could not occur in nature, no such vapor is known to exist. The phenomenon was undoubtedly more common a century ago than it is now, and its disappearance in many localities may be directly traced to the draining of fens and marshes.

Popular names for the ignis fatuus — Will-o'-the-Wisp, Jack-a-Lantern, Spunkie, etc.— abound in folklore, and the superstitions regarding it are connected with many stories of travelers mistaking the marsh-lights for those of cottage windows, and with tales of evil spirits decoying men into dangerous places, often to their doom.



REPRESENTATIVE IGUANID LIZARDS.

1. Ring-tailed Iguana (Cyclura carinata).
2. Helmeted Basilisk (Basilicus americanus).
4. Horned toad Lizard (Phrynosoma cornutum).
5. Galapagos Sea lizard ([illegible]

Ignorance of the Law. Every person is presumed to know the laws of his own country, and what is termed ignorance of the law is a lack of understanding of those laws. Such want of understanding furnishes no excuse for their violation, and cannot be pleaded even in extenuation of their infraction. But this presumption does not extend to the municipal laws of countries or States other than that in which a person resides. Such laws are regarded as foreign and a knowledge of them on the part of one who disregards them must be established by proof in the same manner as any other facts are proved. This applies only to a non-resident of such foreign state, and as soon as a person becomes even a temporary resident thereof he is presumed to know its laws and to yield obedience to them. He cannot plead his want of opportunity to become acquainted with them.

Igorrote, ē-gôr-rō'tā, a name given to various wild tribes of Luzon, especially to a people of mixed blood and language living mainly in Venguet province. The name is also more loosely applied to other wild Filipinos.

Igor's (ē'gŏrz) **March, Song of,** an antique battle song, associated with the name of Igor, Prince of Novgorod, son of Prince Swajatoslaw II. of Tchernigof. Igor, in his fifty-first year is recorded to have engaged in an unsuccessful war with his neighbors (1202), and from that time has been looked upon as the national poet of old Russia, on account of a lyrical epic poem, or ballad, called in Russian, 'Slavo o Polku Igoreve' ('The Song of Igor's March'). It has come down to modern times, somewhat like the songs of Ossian. The poem was probably produced by one of the followers of Igor, and in 1795 was found by Count Alexis Mussin-Putchkin in a cell of a monastery in Jaroslav. It was discovered among some 14th century MSS., and was first published by the Count at Moscow in 1800. The original was lost in the fire of the Napoleonic campaign (1812), which destroyed the Count's fine library. Another copy with many variants was found in 1864 among the papers of Katharine II. and published at St. Petersburg the same year. It has been translated into several European languages. Consult: Wolfsohn, 'Schönwissenschaftliche Litteratur der Russen' (1843); Wjasemski, 'Bemerkungen zum Igorlied' (1875).

Iguana, ĭ-gwä'nä, a large lizard of the typical genus of the family *Iguanidæ*. This family is distinguished by having pleurodont teeth, a thick, villous, nearly immobile tongue, a round pupil, and by various skeletal characters. The 350 species belong to about 50 genera and, with the exception of a few in the Fiji Islands and Madagascar, are confined to America, in the warm parts of which they fairly swarm. Only one species (*Sceloporus undulatus*) reaches as far north as the Middle States. They vary greatly in appearance and habits; most are arboreal, many terrestrial, and one, the Galapagos *Amblyrhynchus*, is even marine; the majority eat insects, but some are herbivorous. The true iguanas, of which *I. tuberculata* is the best known, are rather widely distributed through the West Indies, Central and South America. Owing to the high crest or fringe which extends along the back and tail, the deep, fringed, gular pouch, and the loose-fitting skin, these animals present a remarkable appearance. The trunk and tail are covered with small granule-like scales, and the head with larger plate-like ones; the feet are large and powerful; the tail very long, slender, and compressed; and the teeth high and finely serrated. A length of five feet or more and a weight of 25 pounds is commonly attained. The iguanas are arboreal, their mottled green color serving admirably to conceal them among the foliage; but when alarmed they have the habit, remarkable in a lizard, of retreating into the water of the streams along which they live. The 20 or 30 large eggs are deposited in a burrow usually dug in the bank of a stream or sometimes in a hollow tree. Notwithstanding its formidable size and aspect, the iguana is a timid, harmless creature, and the stories sometimes told of its ferocity are pure fabrications; moreover it is purely vegetarian in its diet. The flesh is a favorite article of food with the natives, and many travelers have pronounced it to be white, tender, and sweet, and is regularly brought to the markets. Consult Wallace, Müller, Bates, Belt, Gosse, and other authorities on South and Central America. See LIZARD.

Iguan'odon, a dinosaur (q.v.).

Iguvium. See EUGUBINE TABLES.

Ik Marvel. See MITCHELL, D. G.

Ilagan, ē-lä'gän, Philippines, pueblo and capital of the province of Isabela, Luzon, situated on the Grande de Cagayuan River, 84 miles from its mouth at its junction with the Pinacanauan, 275 miles northeast of Manila. It has road and water connections with Bayombong and Manila; it is the trade centre for a large agricultural region, and also the industrial centre of the province. Pop. 13,800.

Iles, George, American author: b. Gibraltar 20 June 1852. He received a secondary education in Montreal, and from 1887 was employed in literary work in New York. His original works include: 'A Class in Geometry-Lessons in Observation and Experiment' (1894), and 'Flame, Electricity, and the Camera' (1900). He also edited: 'The Reader's Guide on Economic, Social and Political Science' (1891; with R. R. Bowker); 'A List of Books for Girls and Women and their Clubs' (1895; with A. H. Leypoldt); and 'A Bibliography of Fine Art' (1897), and gave $10,000 to the American Library Association to defray the cost of 'The Literature of American History' (1902), a bibliographical guide which appeared under the direction of the publishing board of the association.

I'lex, a tree often mentioned in the Latin classics, the evergreen oak or holm-oak (*Quercus ilex*). It is a native of the Mediterranean region, and often attains large dimensions. In general it grows singly or in small groups, and especially near the sea. Its leaves vary much in size, and from being very spiny at the edge to perfect evenness. Where it is indigenous, its astringent bark is used for tanning hides. Its wood is hard, heavy, and durable, and is useful for axles, pulleys, screws, etc. In modern botany Ilex is the generic name of the holly. See AQUIFOLIACEÆ.

Ilfracombe, ĭl'frá-kōm, England, a seaport and fashionable health-resort in North Devon, on the Bristol Channel, 41 miles by rail northwest of Exeter. It has a fine harbor and promenade, and the town built in terraces on a hill, is noted for its picturesque situation and the beauty of the surrounding scenery. Pop. (1901) 8,557.

Ili, il'ē, a river of Central Asia, flowing partly in China and partly in Russia. It is formed in Chinese Kuldja by two streams, the Tekes and Kunges, rising in the Thian-shan Mountains, and flows west, falling into Lake Balkash by several mouths after a course of 800 or 900 miles, half of which is navigable.

Iliad, in Greek literature, a celebrated epic poem, consisting of 24 books. Its composition is generally ascribed to Homer, of whose parentage, birth, and life nothing is known for certain. It is, however, a matter of dispute as to whether the poem is a homogeneous whole, or a series of ballads or rhapsodies on different episodes in the Trojan war, united into a continuous poem. It is further doubtful whether, in the latter case, the union was made by Homer himself, or by some person after his time. It is said that Pisistratus, tyrant of Athens, first collected and arranged the 'Iliad' and 'Odyssey' in the form in which we now have them. The chief subject of the poem is the wrath of Achilles, and the consequent troubles thence arising, whence we have the phrase *Ilias malorum* = an Iliad of woes or troubles, a world of disasters. The reader of the poem is assumed to know that the beautiful Helen has been carried off by Paris from her husband Menelaus. The action of the poem is confined to the 10th and last year of the siege of Troy. See HOMER.

Il'ion, N. Y., village, Herkimer County; on the Mohawk River, the Erie Canal, and on the West Shore and the New York C. & H. R. R.R.'s; about three miles west of Herkimer and 12 miles southeast of Utica. Ilion is in the vicinity of the locations of some of the old "castles" of the Indian tribes who inhabited the Mohawk valley. White people lived here in the early part of the 19th century, but no permanent settlement was made until 1828. It is situated in an agricultural county, but the village is noted for its manufacturing industries. The chief manufactures are typewriters, firearms, sewing-machines, filing-cases, bicycles, knit goods, flour, and some dairy products. Its export trade consists chiefly of the manufactured articles and farm products. It has a public library containing about 11,500 volumes, and a number of fine public buildings. Pop. (1890) 4,057; (1900) 5,138.

Iliniza, or **Ilinisa**, a mountain of Ecuador, [illegible] miles south-southwest of Quito. It is crowned by two peaks, the southernmost, as determined trigonometrically by Reiss and Stübel, being 17,400 feet high. Iliniza is presumably an extinct volcano, but there is no record of an eruption. The upper portion is covered with perpetual snow, and usually cloud-capped.

Ilissus, i-lis'us, a small river in Greece, flowing through Athens, famous in the classical age, but now unimportant and often wholly dry.

Ilithyia, il-ith-i'ya, in Greek mythology, the goddess who assisted women in childbirth. In after times she was almost identified with Artemis.

Ilium, or **Ilion**, a name of Troy, in Greece, which was founded by Ilus.

Iliyats, il'ē-yats, a nomadic Mohammedan race of Persia, Khiva, and Turkestan. The name Iliyat is the plural of *iel* (eel), a tribe equivalent to the Arabic *kabilah*. The Iliyats are mostly of Turkish, Arabic, and Kurdish descent, and form an important portion of the population of Persia and adjacent countries; their actual numbers are not known, but it is said that the Iliyat tribes tributary to Khiva number 195,000. They live in tents and have no settled habitations. They are of the Sunni sect, but are not very strict. The women are said to be chaste, and many of the best families in Persia are of Iliyat origin.

Illampu, or **Sorata**, a mountain of Bolivia, in the eastern Cordillera, overlooking Lake Titicaca; 50 miles north-northwest of La Paz. It is 21,484 feet in height, and is believed to be the highest mountain of the Bolivian Andes, though this distinction is also claimed for Illimani (q.v.); it is probably exceeded by the Cerro de Huascan in Peru and by Aconcagua in Chili. Illampu is a magnificent mass, with three principal peaks. Seen from Titicaca it is the grandest mountain in America. It has never been scaled.

Ille-et-Vilaine, ē-lā-vē-lān', France, a maritime department, formed out of the northeast portion of the old province of Brittany; area, 2,596 square miles; pop. 622,039, mostly of Celtic race. It is watered chiefly by the Vilaine and its tributary, the Ille, which unite near Rennes, the capital of the department. Ille-et-Vilaine consists of a granite plateau traversed by ranges of low hills. It is agricultural, cultivation having been greatly improved during recent years. The cider of this district is the best in France; the butter of Rennes is celebrated; the horses of the department are noted for their endurance, and are in great request for the army; and bee keeping is prosecuted. Iron is mined; slates are quarried; and salt is extracted. Saint Malo is the principal seaport.

Illegit'imacy, the legal status of children born out of wedlock, is a subject discussed under three points of view, moral, legal, and economic. As to what constitutes illegitimacy, is variously defined in different countries where great variety exists both in theory and practice. As to the legal status of illegitimate children from the moral point of view, see BASTARD.

Only in a few European countries are statistics available to show the extent of illegitimacy, and there are no statistics in Canada. In the United States there seems no efficient national system of registration of marriages and births. Some of the individual States record the illegitimate births, but the figures are misleading, because incomplete. Thus, the State of Indiana a few years ago, returned 38,370 legitimate and 560 illegitimate births — the illegitimate being only about 1.46 of the whole.

In the following table is shown the comparative prevalence of illegitimacy in the principal European cities:

ILLEGITIMATE BIRTHS TO EVERY 1,000 BORN.

Vienna	449	Leipzic	211	Ghent	144
Prague	439	Dresden	208	Hamburg	138
Munich	439	Milan	204	Frankfort	132
Stockholm	396	Rome	194	Turin	132
Moscow	300	Venice	189	Antwerp	129
Budapest	299	Breslau	186	Cologne	124
Copenhagen	279	Bucharest	175	Palermo	101
Paris	268	Liège	174	The Hague	99
St. Petersb'g	236	Christiania	162	Naples	86
Trieste	211	Berlin	154	Rotterdam	70

None of the above figures are presented as absolutely accurate. They can only be approximate in the best case, for in every country there must always be a large number of bastards who either are not registered at all, or who are registered as legitimate. But as far as they go the figures are instructive. They do not, however, enable one to form any conclusion as to the causes of illegitimacy in respect either of religion, of education, of industrial occupation, or of distribution of population. Neither can any theory be well evolved from a racial basis.

From the only available statistics the following table has been prepared showing illegitimacy in various countries, from 1881 to 1900:

	Per cent of illegitimates to total births.		Per cent of illegitimates to total births.
England and Wales	4.6	Portugal	14.00
Scotland	8.34	Roumania	5.00
Ireland	2.9	Russia	3.00
Austria (average)	14.89	Spain	5.40
Lower Austria	26.00	Sweden	14.88
Upper Austria	20.00	Norway	7.90
Dalmatia	3.50	Switzerland	4.80
Hungary	8.00	Brazil	25.00
Belgium	9.30	Canada	....
Denmark	10.00	Costa Rica	24.00
France	8.20	Guatemala—Whites	50.00
Germany (average)	9.47	Indians	25.00
Upper Bavaria	15.67	New South Wales	4.65
Prussia	8.24	Victoria	4.78
Alsace-Lorraine	8.10	Queensland	3.97
Greece	1.60	West Australia	3.95
Holland	3.22	Tasmania	3.40
Italy	7.45	New Zealand	3.12

In Scotland, where education is general, and thrift national, the rate of illegitimacy is notoriously high. And, as regards morals, it should be remembered that a high percentage of illegitimacy may mean that there is little or no prostitution. In Europe, generally, although not universally, there seems a tendency to decrease in the rate of illegitimacy; but how far that appearance may be due to moral causes it is impossible to say.

Illimani, ēl-yē-mä'nē, Bolivia, a volcanic mountain mass of the East Andean Cordillera, about 20 miles south of La Paz. It is a serrated ridge with four principal peaks, the loftiest of which, Condor Blanco, is 21,149 feet above sea-level. Illimani signifies "snow-mountain"; the line of perpetual snow commences at 15,000 feet, and there are glaciers on the north side at an elevation of 16,350 feet. At an altitude of 15,950 feet there is a considerable lake also bearing the name of Illimani. Among the first Europeans to make the ascent of the highest peaks are Wiener, Grumbhow, and Ocampo in 1877 and Sir Martin Conway in 1898.

Illinois, ĭl-lĭ-noi' or -noiz', the name given to a confederacy composed of five distinct Indian tribes, who at one time occupied what is now the State of Illinois and parts of Wisconsin, Missouri, and Iowa. The tribes were the Michegamia, Peoria, Cahokia, Kaskaskia, and Tamaroa. The confederacy was most powerful and many attempts were made to secure by war the lands of the Iroquois. In 1675 Marquette visited the Illinois tribes and established missions among them. In 1769 a member of the Kaskaskia tribe murdered Pontiac, the Indian chief, for which offense the Lake tribes destroyed the Kaskaskia and killed many of the members of the other tribes of the confederacy. In 1840 the remnant of the Illinois tribes was removed, by the government, west of the Mississippi. The few now in existence are in the Indian Territory.

Illinois, the eighth State admitted into the Federal union, and since 1890, the third in population. It is bounded upon the north by Wisconsin, upon the east by Indiana, upon the south by Kentucky, and upon the west by Iowa and Missouri. It is separated from the two last named States by the Mississippi River; by the Wabash and the Ohio from Indiana; and by the Ohio from Kentucky. Its water courses flow generally from the north and northeast, to the southwest and south. Its soil consists of a rich black loam, or mold, underlaid by drift deposits in many places of great depth.

Topography.— By the enabling Act of Congress by virtue of which the State was organized, its boundaries were fixed as follows: "Beginning at the mouth of the Wabash River, thence up the same, and with the line of Indiana, to the northwestern corner of said State; thence east with the line of the same State to the middle of Lake Michigan; thence north along the middle of the lake to north latitude 42° and 30'; thence west to the middle of the Mississippi River, and thence down along the middle of that river to its confluence with the Ohio River, and thence up this latter river along its northwestern shore to the beginning" The total land area of the State is 56,000 square miles — 35,840,000 acres; its extreme length 385 miles, and extreme breadth 218 miles. With the exception of Georgia its area is greater than that of any one of the original States of the Union. It comprises a territory larger than England; larger than Belgium, Switzerland and Holland united. Illinois is no longer in the class of States denoted "western" upon the old maps, but is now chief of the great interior States of the Union. With two exceptions — Louisiana and Delaware — it is the most level of the States. Its greatest elevation is 1,150 feet above the sea, and its mean elevation 550 feet. The greater part of Illinois consists of level or slightly undulating prairies; a portion of the extreme northwestern part of the State is hilly, and there are occasional bluffs upon the Illinois and Mississippi rivers. The counties lying between East St. Louis and the Wabash River are the great apple growing region, and thence southward to its border other fruits are grown in large quantities. Of its total population in the year 1900, 2,459,638, or 51 per cent reside in its seventy principal cities and towns.

Population.— In 1810, one year after its organization as a territory, the population of Illinois was 12,282; in 1820, two years after its admission its population was 55,211, and in rank it was the 24th State in the Union; in 1830, population 157,445 and its rank the 20th; in 1840 population 476,183, and rank the 14th; in 1850 population 851,470, and rank the 11th; in 1860, population 1,711,951, and rank the fourth; in 1870 population 2,539,891, and rank the fourth; in 1880 population 3,077,871, and rank the fourth; in 1890 population 3,826,351, and rank the third; in 1900 population 4,821,550, and its rank still remains the third. Of the aggregate population given for the year 1900, 85,078 are negroes, 1,538 Mongolian, and 16 Indian; 3,854,803 of the population of the State are natives, and 966,747, foreign born. The excess of the male over the female population of the State as shown by the last census is 124,014. The population above the age of 10 years is, 3,727,745; of this number 1,804,040 are engaged in gainful occupations; 462,781 in agricultural pursuits; 96,321 in rendering professional service; 366,342 in domestic or personal service; 397,046 in trade or transportation; and 481,550 in manufacturing or mechanical pursuits. The total number of dwellings in the State is 845,836, and of families 1,036,158.

Cities.— The following cities of the State have each a population exceeding 10,000, viz.: Chicago, 1,698,575 (as shown by census of 1900, now exceeding 2,000,000 as appearing by local census reports of later date); East St. Louis, 29,655; Joliet, 29,353; Peoria, 56,100; Quincy, 36,252; Rockford, 31,051; Springfield, 34,159; Alton, 14,210; Aurora, 24,147; Belleville, 17,489; Bloomington, 23,286; Cairo, 12,566; Danville, 16,354; Decatur, 20,754; Elgin, 22,433; Evanston, 19,259; Freeport, 13,258; Galesburg, 18,607; Jacksonville, 15,078; Kankakee, 13,595; La Salle, 10,446; Moline, 17,248; Ottawa, 10,588; Rock Island, 19,493; Streator, 14,079. Fifty-seven other cities in the State have a population each, exceeding 3,000. The land surface in square miles of the largest county in the State, McLean, is 1,166; while that of the smallest, Putnam, is 176.

Manufactures.— The development of manufacturing in the State is unprecedented. This is due in large measure to its transportation facilities. There were 10,997 miles of railroad in the State in the year 1900, a mileage greater than that of any other State. Illinois now ranks third in the value of its manufactured products — the gross value thereof for the last mentioned year being $1,259,730,168. The greatest number of wage earners employed in manufacturing establishments at any one time in the year 1900, was 528,099, or 11 per cent of the total population of the State. As tersely stated in the last census report: "The communication with the East afforded by Lake Michigan and its connecting waters early made Chicago the great distributing centre for eastern products to all points in the West and Southwest, while the Mississippi River bordering the western portion of the State afforded communication with the entire Mississippi Valley. Superior railroad facilities were a direct result of the trade routes established by these operations for water transportation; for when railroad building began Chicago was the natural focusing point, and to reach that city all sections of the State were traversed and opened up to settlement." It holds the first place in the States of the Union in the manufacture of agricultural implements; its proportion of the entire capital invested in this industry in the United States being 39 per cent. It leads in the production of alcoholic liquors; the output in 1900 was 32,508,435 gallons. This industry is concentrated in a few large establishments located principally in the city of Peoria. An important factor to be considered in this connection, is the abundant supply of bituminous coal in many parts of the State. In 1900, the 24 leading industries of the State embraced 8,209 establishments; capital used $477,485,672; wage earners employed, 219,415; value of their products for the year mentioned was $810,636,482.

Agriculture.— Illinois takes high rank as an agricultural State; 32,794,728 acres — or something over 91 per cent of its total land area — are included in farms. The total number of farms in the State as shown by the last official report is, 264,151; the estimated value being $1,765,581,550; of this amount 14 per cent represents the value of buildings, and 8.6 per cent the value of the land, and other improvements; the value of farm implements and machinery in June 1900 was $44,977,310, and of live stock $193,758,037. The total value of farm products for 1899 exceeds that of the year '89 by $160,890,598. The average size of farms for the State is 124 acres. The larger farms are generally in the north and the smaller in the extreme southern portion of the State. The value of all live stock on farms in June 1900 was $193,758,037; of this amount 36 per cent represents the value of horses; 24 per cent that of neat cattle other than dairy cows; 17 per cent that of dairy cows, and 12 per cent that of swine. Twenty-eight counties each reported more than $1,000,000 received from the sale of live animals for the year last named. Of the total area of cereals in the year 1899, 61 per cent was devoted to corn, 27 to oats, 10 to wheat, and the residue principally to rye, barley and buckwheat. Some idea of the enormous yield of what is known as "the corn belt" can be gleaned from the following: for the year 1899 the corn product of the county of Iroquois exceeded 12,000,000 bushels; that of the counties of La Salle and Livingston, each exceeded 13,000,000, while the counties of Champaign and McLean each produced over 15,000,000 bushels. Twenty-seven other counties produced from 5,000,000 to 10,000,000 bushels of corn each. In the decade 1890 to 1900 the apple trees in the State increased 100 per cent in number, and of some other varieties of fruit the increase was even greater. Of the total number of fruit bearing trees in the State in 1900, 74 per cent were apple, 13 per cent peach, and 5 per cent pear trees. Apples were grown generally throughout the State, but the four counties of Clay, Jefferson, Marion, and Wayne produced one fifth of the entire amount. The entire vegetable product for the year 1899 exceeded $10,000,000 in value; of this amount 45 per cent represents the value of potatoes. The small

fruits were grown upon 56,763 farms. Of late years there has been a steady decrease in tobacco production; in the year 1899 the total in tobacco being 2,242 acres; the total value of the production being $85,411; Saline County in the extreme southern part of the State taking the lead and producing near one third of the entire amount. During the last decade the broom corn product of the State has increased almost four fold; the total value of this product for the year 1899 was $2,357,066; five sixths of the amount produced was in the east central part of the State in the five counties of Coles, Douglas, Moultrie, Edgar, and Cumberland. Sugar beets were grown in 15 counties in the year 1899, 1,370 acres being devoted to this production, and the value of the total product being $36,223. The value of nursery stock sold in the last named year was $578,306; area in cultivation 7,760 acres, its valuation $1,442,220. The area devoted to the cultivation of ornamental plants and flowers for the year 1899 was 679 acres; the value of the product $1,894,960. The total expenditure for labor on farms in Illinois for the year 1899 was $22,182,550; this included the value of board furnished and averaged $84 per farm. The gross value of the agricultural products of the State for 1900 was $345,649,611 — placing it second in rank.

Rivers.— The Illinois, the principal river of the State is formed by the junction in Grundy County, 40 miles southwest of Chicago, of the Kankakee and Des Plaines. The last named river takes its rise in Wisconsin and flows in a southerly direction, while the head waters of the Kankakee are in northern Indiana. The Illinois empties into the Mississippi after a somewhat tortuous flow of near 500 miles, at a point 40 miles above the city of St. Louis. The Illinois is navigable for 245 miles, and is connected by the Illinois and Michigan canal with Lake Michigan. Other rivers in the State are the Kaskaskia, which flowing in a southwesterly direction empties into the Mississippi near the ancient village of Kaskaskia, the first capital of the State; Rock River, which flowing in a southwesterly direction from Wisconsin empties into the Mississippi not far from the city of Rock Island; of other smaller streams, are the Little Wabash and the Embarras, which flow into the Wabash in the southeastern part of the State, and the Vermilion and the Fox, tributaries of the Illinois.

Education.— Illinois has an excellent public school system. The number of persons in the State between the ages of 6 and 21 years 30 June 1902, was 1,601,175; of these, 811,724 were males, and 789,451 females. The number of persons enrolled in the schools during the year ending as above was 971,841; of these, 489,109 were males, and 482,732 females. The average daily attendance was 765,057. The number of school houses 12,865. The estimated value of the school properties is $52,764,922; this includes buildings, grounds, libraries and apparatus. The number of male teachers employed in the common schools in 1902 was 6,800; of female teachers 20,386; total 27,186. The amount expended for the years 1901–2 for the salaries of teachers and superintendents was $12,132,075. The Normal Universities of the State, five in number, are located as follows: the State Normal University at Normal; the Southern Illinois State University at Carbondale; the Northern Illinois Normal School at De Kalb; the Eastern Illinois Normal School at Charleston, and the Western Illinois Normal School at Macomb. These universities are appropriately located for the convenience of their patrons, and the attendance is large. The first to be organized was the State University at Normal, and the total number of students in attendance there for the years 1901–2 was 1,529. In addition to the above is the Chicago Normal School, which has since 1896 been maintained by appropriations made by the Chicago Board of Education. In large measure the teachers in the public schools of the State have received their training in some one of these Normal Schools. The purpose of the Normal Schools of the State will appear from the following clause in the organic act of one of the last to be organized: "The object of the said Northern Illinois State Normal School shall be to qualify teachers for the common schools of this State by imparting instruction in the art of teaching in all branches of study which pertain to a common school education, in the elements of the natural and of the physical sciences, in the fundamental laws of the United States and of the State of Illinois, in regard to the rights and duties of citizens." The University of Illinois (q.v.) is located at Urbana, and has in its various departments a total of near 3,000 students.

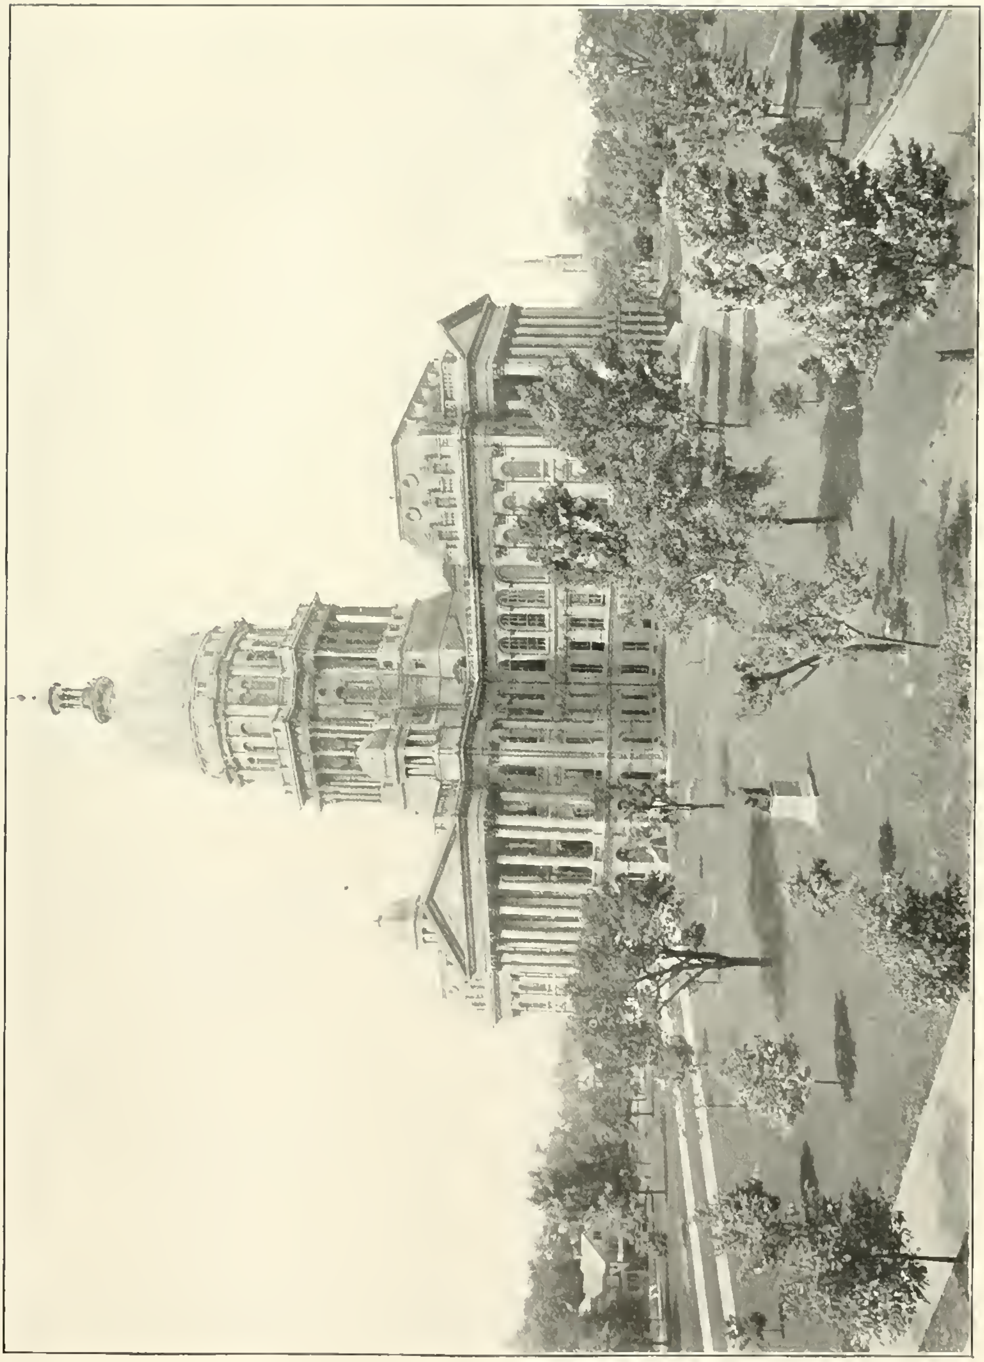
Charities.— The State charitable institutions, 16 in number, are as follows: Northern Hospital for the Insane at Elgin; Eastern Insane at Kankakee; Central Insane at Jacksonville; Southern Insane at Anna; Western Insane at Watertown; Incurable Insane at Bartonville; Criminal Insane at Chester; Deaf and Dumb at Jacksonville; Blind at Jacksonville; Feeble Minded at Lincoln; Soldiers and Sailors at Quincy; Soldiers Orphans' Home at Normal; Soldiers Widows at Wilmington; Eye and Ear at Chicago; Girls Training School at Geneva; Boys Home at St. Charles. The sums appropriated by the General Assembly for the two years ending 30 June 1903 for these institutions aggregated $4,438,024.92.

Penal Institutions.— The Illinois State Reformatory is located at Pontiac, has excellent buildings and appointments for the care of its inmates. The total number of inmates confined in this institution during the 21 months ending 30 June 1902 was 2,352, of whom one fifth had reached the age of 19 years. Under the law no one could be admitted who had reached the age of 21 at the time of the commission of the offense for which he was sentenced. Trade schools, and a farm are provided for in the act creating this institution, and every effort practicable made to reform its inmates. The total amount appropriated by the General Assembly for the support of this institution for the two years beginning 1 July 1901 was $400,000. The State penitentiaries, two in number, are located as follows: The Illinois State penitentiary at Joliet and the Southern Illinois penitentiary at Chester. The number of inmates in the former is about 1,300; and in the latter about 900.

History.— The name of the State is derived from "Illini," an Indian word signifying "men." The euphonic termination added by the early French explorers gives the name "Illinois." The veritable history of Illinois begins with the coming of the French explorers Marquette and Joliet.

Their names are inseparably interwoven with the early history of the great Mississippi Valley. In June 1673 they landed upon the east bank of the Mississippi upon the soil of what is now Illinois. Their first visit was to one of the villages of the "Illini," the ancient and once powerful tribe from which the State takes its name. It is said that upon the first appearance of Marquette and Joliet at the door of the principal wigwam of the village they were greeted by an aged chieftain with the words: "The sun is beautiful Frenchmen when thou cometh to visit us; thou shall enter in peace into all our cabins."

Upon this historic expedition Marquette and Joliet bore the commission of the French Commandant at Quebec — the seat of authority of France in the New World. The narrative of the adventures and discoveries of Marquette and Joliet savors rather of the romantic than of the real. But it was theirs to add the vast domain under the name "New France" to the empire of the Grand Monarch. After descending the Mississippi to a point possibly within 400 miles of the Gulf, these bold voyagers reluctantly turned their faces to the northward. After his separation from Joliet, Marquette visited the Indian villages near the Mississippi and established a mission of his church at the ancient village of the Kaskaskias. He died upon the banks of a small stream within the present limits of the State of Michigan and was buried at Saint Ignace in that State. The city of Joliet in northern Illinois, was named in honor of his daring fellow-voyager, while his own statue has been given place in the great historic hall in the Capitol at Washington. The names of Hennepin and La Salle likewise are associated with these events and times. The first was the scholarly historian and priest, the latter the knightly adventurer. Much, indeed, that is romantic surrounds the entire career of La Salle (q.v). Severing his connection with a theological school in France, his fortunes were early cast in the New World. From Quebec, the ancient French capital of this continent, he projected an expedition which was to add empire to his own country and to cast a glamor about his own name. It has been said, that his dream was of a western waterway to the Pacific Ocean. In 1669 with an outfit that had cost him his entire fortune, with a small party, he ascended in canoes, the Saint Lawrence, and a few weeks later was upon the broad Ontario. Out of the mists that envelop much of his subsequent career, it is impossible, at all times, to gather that which is authentic. It is enough, that with Hennepin as one of his fellow-voyagers, he reached the Ohio and in due time navigated the Illinois, meantime visiting many of the ancient villages. But his great achievement — and that with which abides his imperishable fame — was his perilous descent of the Mississippi from the falls of St. Anthony to the Gulf of Mexico. On 9 April 1682 upon the east bank of the lower Mississippi, with due form and ceremony, and amid the solemn chanting of the Te deum and the plaudits of his comrades, La Salle took formal possession of "the Louisiana country," in the name of his royal master, Louis XIV. of France. For the period of 92 years, beginning with the coming of Marquette and Joliet, Illinois was a part of the French possessions. Sovereignty over the vast domain of which it was a part, was exercised by the French king, by his commandant and his subordinate officers. First, the dependency of Canada, "the Illinois country," by decree of the Royal Council in 1717 passed under the government established for Louisiana. Subsequently in 1721 it became, by virtue of the same authority, one of the separate provinces into which the Louisiana country was then partitioned. A commandant and judge were duly appointed, and the seat of authority transferred to Fort Chartres. Population meanwhile gradually increased in the great American bottom, then embracing the French settlements in Illinois. Cahokia and the other villages were, in a measure, prosperous. In the words of one of our own historians: "The early history of the French settlements reads in these days of a higher civilization and broader culture, like a romance of Arcadia. The wants of the people were few and simple. In each hamlet was a rude chapel, with its attendant priest, who was not only in matters of religion, but in all the affairs of everyday life, 'the guide, philosopher, and friend, of his rude parishioners.'" The same writer referring to this period of foreign domination, truly said: "The French sought and claimed more than they had the ability to hold or possess. Their line of domain extended from the Saint Lawrence around the Great Lakes and through the valley of the Mississippi to the Gulf of Mexico, a distance of over 3,000 miles." Truly a magnificent domain, but one destined soon to pass forever from the possession of the French monarch and his line. Upon the North American continent, the ancient struggle for supremacy between France and her traditional enemy was to find bloody arbitrament. Great Britain claimed as a part of her colonial possessions in the New World, the territory bordering upon the Great Lakes and the rich lands of the Ohio and the Mississippi Valley. As to the merits of the French and English contention as to superior right by discovery, or conquest, it were idle now to argue. Our concern is with the marvelous results of the long continued struggle which for all time determined the question of race supremacy upon this continent. Passing rapidly the minor incidents of the varying fortunes of the stupendous struggle which had been transferred for the time from the Old World to the New, we reach the hour which was to mark an epoch in history. The time, 13 Sept. 1759 — the place, the Heights of Abraham at Quebec. Here and then, was fought out one of the pivotal battles of the ages. It was the closing act in a great drama. The question to be determined: whether the English speaking race, or their hereditary foe, was to be master of the continent. It was literally a struggle for empire — the magnificent domain stretching from the Saint Lawrence to the Gulf of Mexico. The incidents of the battle need not be told. Never were English or French soldiery led by more knightly captains. The passing years have not dispelled the romance or dimmed the glory that gathered about the names of Wolfe and of Montcalm. Dying at the self-same moment — one amid the victors, the other amid the vanquished — their names live together in history. By the treaty of Paris which followed, France surrendered to her successful rival, all claim to the domain east of the Mississippi River. In accordance with the terms of the treaty, Gage, the commander of the British forces in America,



STATE CAPITOL AT SPRINGFIELD.

took formal possession of the recently conquered territory. Proclamation of this fact was made to the inhabitants of the Illinois country in 1764 and a garrison soon thereafter established at Kaskaskia. Here the rule of the British was, for the time, undisputed. British domination in the Mississippi Valley was, however, to be of short duration. Soon the events were hastening, the forces gathering, which were in turn to wrest from the English crown no small part of the splendid domain won by Wolfe's brilliant victory at Quebec. An event of transcendent interest and one of great consequence is now reached. While our Revolutionary War was in progress, General George Rogers Clark planned an expedition whose successful termination has given his name to the list of great conquerors. Partly to mete out punishment to the savage bands whose depredations upon the sparse white settlements in Kentucky were unrestrained by the British commander at Kaskaskia, and partly for the purpose of reducing to possession territory claimed by an ancient charter of the colony of Virginia — the famous expedition was undertaken. Bearing the commission of Patrick Henry, governor of Virginia, with 200 followers equally brave as himself, the heroic Clark crossed the Ohio River and began his perilous march. After enduring great hardships, the undaunted leader and his little band reached Kaskaskia. The British commander and his garrison were surprised and quickly captured. This was on 4 July 1778, 15 years after the Treaty of Paris. The British flag was lowered — and the Illinois country taken possession of in the name of the commonwealth whose governor had authorized the expedition. Thus on the anniversary of our historic day, the symbol of British authority disappeared forever from the Illinois country. In the month of October following the capture of Kaskaskia, the House of Delegates of Virginia extended civil jurisdiction over what had previously been known as the Illinois Country. A law was enacted creating "the county of Illinois," and a commandant was appointed by Patrick Henry, who has, by one of our historians been called "Ex-officio the first Governor of Illinois." Courts were established at Cahokia and Kaskaskia and an election held for civil officers. This was the first election held in Illinois. The history of the next few years is enveloped in much obscurity. Evidently there was but little progress until the close of the Revolutionary War and the ratification of the treaty of peace between the colonies and Great Britain in 1783. The event now to be mentioned, was one of deep consequence and has been called the genesis of Illinois history — the cession by Virginia of the vast territory of which Illinois was a part, to the general government. The claim of Virginia to the vast area mentioned was controverted by some of the other colonies. In fact, this claim was for a time an obstacle to the ratification of the Articles of Confederation. Pending the ratification, the Continental Congress resolved: "That it be earnestly recommended to those States who have claims to the Western country, to pass such laws as may remove the only obstacle to the final ratification of the Articles of Confederation." This important resolution was, a few days later, supplemented by one declaring, "that the lands ceded to the United States pursuant to the above recommendation, shall be disposed of for the common benefit of the United States, and shall be formed into distinct republican States, which shall become members of the Federal Union, and have the same rights of sovereignty, freedom, and independence, as the other States." In response to the above, the House of Delegates of Virginia in January 1781, proposed to cede to the general government the lands mentioned upon the conditions named. After much discussion and delay the proposition of Virginia was accepted by the Congress and in time a deed of cession was duly executed. To this famous instrument — by virtue of which Illinois became a part of the United States — are attached as commissioners upon the part of Virginia, the historic names of Thomas Jefferson, Arthur Lee, and James Monroe. In the manner indicated, the territory out of which Illinois has since been carved became part and parcel of the Federal Union. The daring and successful expedition of George Rogers Clark and the subsequent act of Virginia, form a bright page in our history. As has been truly said "The timely campaign of Colonel Clark was the outgrowth of Virginia foresight, enterprise, and valor. But for this conquest, the Northwest, at the close of the Revolution, would have been in possession of the British and would have doubtless so remained as did Canada; and the western line of the United States would have been the ridge of the Alleghanies and the Ohio River, instead of the channel of the Mississippi.

Another milestone is now reached on the pathway of "the Illinois country," to the dignity and sovereignty of statehood; reference is had to what is well-known in our political history as the Ordinance of 1787. Not inaptly has it been called "the second Magna Charta." On the historic day, 1 March 1784 that Virginia ceded to the United States the domain stretching from the Mississippi to the Ohio, Mr. Jefferson proposed to the Continental Congress a plan for its government. His far-seeing statesmanship is unmistakably evidenced by two provisions in the plan he formulated. One, that slavery should not exist in the territory after the year 1800; the other, that the States to be carved from the territory were to remain forever members of the American Union. This plan failed to receive the sanction of that Congress — and in later days and by other hands, the great ordinance was destined to come into being. Antedating the Federal Constitution, the ordinance for the government for the Northwestern Territory was enacted 13 July 1787. As this was indeed the genesis of Illinois history under the Federal government, it may be well to note briefly some of the provisions of the great ordinance. By its terms, a government was established for the territory and a governor, secretary and judges duly appointed, with power to adopt such laws of the original States as were most convenient; a Legislature was authorized when the territory should have five thousand free male inhabitants; religious freedom and civil rights — not to depend upon religious belief — were guaranteed; likewise the writ of habeas corpus and trial by jury, and judicial procedure according to the common law; private property to be taken for public use only after just compensation; and provision to be made for the encouragement of education. Two of the provisions of the famous ordinance possessed a value that cannot be measured by words. One, the States to be formed from said territory, were to remain forever a part of the United States of America; the other, that neither slavery nor involuntary servitude should exist in the territory, otherwise than for crime whereof the party should have been duly convicted. The value of the great ordinance to that generation and to the millions who have since found homes within the limits of the vast area embraced within its provisions, cannot be overstated. In pursuance of the recommendation of Mr. Hamilton, Secretary of the Treasury, a General Land Office was established for the new territory and a surveyor-general, registers, and receivers duly appointed, and provision made for the sale of the public lands to actual settlers, in small holdings, and at nominal prices. The commission of General Arthur Saint Clair, the first governor of the Northwest Territory, bears date 1 Feb. 1788, and soon thereafter judges and other officers were appointed, and the new government duly organized. The first visit of Governor Saint Clair to Kaskaskia was in 1790, the county bearing his name meanwhile having been established. Five years later out of its territory, the county of Randolph was created and Kaskaskia established as its county-seat; Cahokia being that of the county of Saint Clair. Thus was the beginning of the historic counties — out of which so many have since been carved — and whose history is, in so large a degree, that of the two first decades of Illinois. Pursuant to the provision of the ordinance of 1787, the Northwest Territory having attained the requisite population, a General Assembly was convened in Cincinnati in February 1799. Illinois was now, for the first time, represented in a legislative chamber. In May 1800 the Congress of the United States provided by law for the division of the Northwest Territory, and the creation of a political division to be known as the "Indiana Territory." The new territory embraced the present States of Indiana and Illinois, and the seat of government was established at Vincennes. The first governor was General William Henry Harrison, at a later day the President of the United States. Of his wise and efficient administration of the affairs of the territory, too much cannot be said. By judicious treaties with the Indian tribes, peace was maintained and cession obtained of valuable grants which in time became the homes of the white emigrants. It is an interesting fact, that the fierce hatred of the great Shawnee chief, Tecumseh, to the whites, was at a later day, in a measure, the result of the grants already mentioned. His own tribe allied with the Pottawattomies and the Kickapoos failed to exterminate — as was the intention of Tecumseh — the white settlers, and ended in his own disastrous defeat at Tippecanoe in 1811, by which the power of these tribes was forever broken. Events were now leading up to the separation of Illinois from Indiana and its own organization as a territory. From the time of the presentation of the first petition to that end in 1806, the legislative chamber at Vincennes and the entire territory in fact, was the theatre of exciting controversy. Its culmination, however, was in February 1809, when by Act of Congress, "the territory of Illinois" was duly organized. The seat of government was established at Kaskaskia — and henceforth Illinois has a history, separate and apart. A wave of emigration from the older States had now reached the new territory, and additional counties were organized by the Territorial Assembly. The people were, in a measure, prosperous, and the question of statehood soon became the theme of earnest discussion. By the year 1818 the population of the Territory was near 40,000 and the General Assembly in January of that year forwarded a petition to Congress, praying the necessary legislation preparatory to its admission to the Union. The people were, indeed, fortunate in having as their Territorial delegate, Nathaniel Pope, eminent at a later day, as a United States judge. The bill providing for the legislation indicated, was introduced into Congress in April 1818. The valuable service rendered by Judge Pope to the future State, will now appear. The bill as reported back to the House of Representatives, by the committee to which it had been referred, fixed the northern boundary of the new State on the north parallel of 41°, 39′. Pending the consideration of the bill, Judge Pope offered an amendment to that part fixing the boundary, containing the significant words: Thence north along the middle of Lake Michigan to north latitude 42° and 30′. This amendment was adopted and became part of the bill. Thus amended, the bill became a law, under it a convention was held at Kaskaskia, a constitution framed, and in December 1818, Illinois was duly admitted as a State of the Federal Union.

During the first decade which followed the organization of the State, the habits of the people, in the main, were simple and their wants few. Barter in a large measure supplied the place of a medium of exchange. Commerce, in so far as it had an existence with the outer world, was by wagons across the Alleghenies, and by flat boats down the Ohio, and the Mississippi. The log cabin furnished protection to the pioneer from the winter's storm. With rude implements of his own construction, he cultivated his fields, and with his rifle defended his loved ones from the incursions of the savage. At the time of its admission, there were but 23 post-offices within the limits of the entire State. At the period indicated and for years afterwards, the frontiersman regarded himself as especially favored if located within a dozen miles of a post-office. The mails reached the settlements weekly or monthly upon horseback or by stage-coach. The log cabin with its puncheon floor supplied the double purpose of temple of learning, and place for public worship. Articles of apparel, were, with rare exception, of home manufacture. Railroads, colleges and universities were unknown. Less than 10,000 persons within the entire State were engaged in agricultural pursuits. Chicago had hardly a place upon the map. The rapid emigration which immediately followed its admission soon rendered the selection of a capital nearer the centre of population a necessity. The commissioners designated by the legislature, for this purpose, having in view the possible flow of emigration northward, chose a site for the new location, 140 miles north of the Ohio River, to which was given the name Vandalia — then a wilderness, but now a beautiful and prosperous city. During the two decades which followed the location of the capital at Vandalia, the population of the State increased to 476,000. The drift of emigration was to the Wabash, to the Sangamon, to the Vermillion, to "the Military Tract," to the rich lands drained by the Kankakee and the Fox, and to the grand prairies stretching northward and westward to Wisconsin and to the Mississippi. In 1836 Springfield became the seat of government. Then a village of but a few hundred inhabitants, it is now a splendid city and an honor to the commonwealth. Its nearness to the geographical centre of the State; its accessibility and the erection of a superb State House, renders the present location, for our time at least, permanent.

Constitution.— Three constitutions have been in force in Illinois since its admission as a State. The first was formulated by a convention of 32 delegates — representing the fifteen counties of the territory — which assembled in Kaskaskia in August 1818. This constitution — under which the State was admitted — remained the organic law of Illinois for 30 years, and until the adoption of the constitution of 1848. Meanwhile the State had gradually increased in wealth and in population. Many new counties had been organized and the northern boundary of actual settlement extended from the county of Madison to the Wisconsin line. Chicago and other cities unknown to the framers of the first constitution, had sprung into being. An attempt to procure the calling of a convention to frame a constitution to supplant the first, was made in 1823. By Article 7 of the latter, the legislature was empowered, by a two thirds vote thereof, to submit to the electors of the State, the question of calling a convention to alter or amend the existing constitution. By the legislature of 1823 there was such submission under the above provision. The purpose of the originators of this movement unquestionably was to secure by constitutional provision, the introduction of slavery into the State. For more than a year this was the all-absorbing topic of debate. Political leaders and newspapers were divided and fierce personal antagonisms engendered. The discussions at the fireside, in the public press and upon the hustings, touched all phases of the question from the standpoint of material advantage, as well as from the high plane of right. The verdict of the people was rendered 2 Aug. 1824 against the proposed convention and the introduction of slavery into Illinois. The question of calling a convention was again submitted by the legislature in 1846; the returns showed a large majority favorable, and delegates were chosen in April 1847. This convention consisting of 162 members assembled in Springfield in June of that year and its deliberations were concluded 31 August. Unlike the first constitution, this was submitted to the people. It met popular approval and by its terms went into operation on the first Monday of April 1848. This remained in force until the adoption of the present constitution. The latter was formulated by a convention consisting of 85 members which assembled in Springfield 13 Dec. 1869. The constitution it framed was submitted to popular vote and approved, and has since August 1870 been the fundamental law of the State. The existing constitution is in large degree an improvement upon both of those which preceded it. Some of its most important provisions are: the division of the powers of the government of the State into three departments — the legislative, the executive, and the judicial; vesting the legislative power in a General Assembly to consist of a Senate and House of Representatives, both to be elected by the people; senators required to be 25, and representatives 21 years of age; also to be citizens of the United States, and five years resident of this State; no person convicted of infamous crime or a public defaulter to be eligible as senator or representative or to any office of profit or trust in the State; in addition to the ordinary official oath each senator and representative is required to swear in substance that his election has in no manner been secured by bribery; the number of senators was fixed at 51, and of representatives at 153; minority representation was provided for in the election of members of the House; senators to be elected for four years and members of the House for two years; a majority of the members elected to each House shall constitute a quorum; bills may originate in either House subject to amendment in the other; upon the final passage the yeas and nays shall be taken upon each bill separately; every bill to be read at large upon three different days in each House; no act to embrace more than one subject and that to be embraced in its title; no money to be drawn from the treasury except in pursuance of an appropriation made by law; the General Assembly permitted to make appropriations for expenditures incurred in suppressing insurrection, or repelling invasion; compensation of senators and members fixed at $5.00 per day during the session; the General Assembly prohibited from releasing the indebtedness, liability or obligation of any corporation or individual to the State, or to any municipal corporation therein; to have no power to authorize lotteries or gift enterprises for any purpose. Two important mandatory provisions upon the General Assembly were incorporated in the constitution: one requiring legislation protecting coal miners, and the other the passage of liberal homestead and exemption laws. Under the former constitution, the State and people had suffered from special legislation. To the end that such legislation be discontinued and general laws when necessary enacted, the General Assembly was prohibited from passing local or special laws in any of the following cases, viz.: for granting divorces; changing the names of persons or places; laying out, opening, altering and working roads or highways; vacating roads, town plats, streets, alleys and public grounds; locating or changing county seats; regulating county and township affairs; regulating the practice in courts of justice; regulating the jurisdiction and duties of justices of the peace, police magistrates and constables; providing for changes of venue in civil and criminal cases; incorporating cities, towns or villages or changing or amending the charter of any town, city or village; providing for the election of a board of supervisors; summoning and impaneling grand or petit juries; providing for the management of common schools; regulating the rate of interest on money; the opening and conducting of any election or designating the place of voting; the sale or mortgage of real estate belonging to minors or others under disability; the protection of game or fish; chartering or licensing ferries or toll bridges; remitting fines, penalties, or forfeitures; creating, increasing or decreasing fees, percentage or allowance of public officers during the term for which said officers are elected or appointed; changing the law of descent; granting to any corporation, association or individual the right to lay down railroad tracks or amending existing charters for such purpose; granting to any corporation, association or individual, any special or exclusive privilege, immunity or franchise whatever.

Government.— The supreme executive power of the State is vested in a governor, "who shall take care that the laws be faithfully executed"; his term of office fixed at four years: he is required to be 30 years of age and for five years next preceding his election, a citizen of the United States, and of this State: he is required at the commencement of each session to give to the General Assembly, information by message of the condition of the State, and recommend such measures as he shall deem expedient: he can, by proclamation, convene the General Assembly upon extraordinary occasions: may remove officers of his appointment for incompetency, neglect of duty or malfeasance in office: may grant reprieves, commutations, or pardons after conviction for all offenses: shall be Commander-in-Chief of the Military and Naval forces of the State — except when they are called into the service of the United States; is vested with a qualified negative upon all bills passed by the General Assembly, but bills can be passed over his veto by a two-thirds vote of each House: in case of his death, resignation, or conviction upon impeachment, the duties of his office devolve upon the lieutenant-governor: the last named officer is president of the senate, and is, with the secretary of state, auditor of public accounts, treasurer, superintendent of public instruction, and attorney-general, elected in the same manner, and except the treasurer, for the same length of time as the governor: two years is the term of the treasurer. The judicial powers of the State are vested in a supreme court, circuit courts, county courts, justices of the peace, police magistrates, and in such courts as may be created by law for cities and incorporated towns; the supreme court consists of seven judges, and their term of office is nine years; the terms of the circuit judges fixed at six years, inferior appellate courts of uniform organization and jurisdiction to be composed of circuit judges, to be created.

Suffrage.— One year's residence in the State necessary to its exercise: voting to be by ballot; persons convicted of infamous crimes to be excluded from the right of suffrage.

Revenue.— The General Assembly to provide for needed revenue by levying a tax, by valuation, so that every person and corporation shall pay a tax in proportion to the value of his, her, or its property; certain property, religious, charitable, etc., may by general law be exempt from taxation.

Corporations.— No corporation to be created by special laws, except those for charitable, educational, penal, or reformatory purposes, and these to be under State patronage and control: the General Assembly to provide by general laws for the organization of all corporations hereafter to be created: no State Bank hereafter to be created, nor shall the State own any stock in any corporation for banking purposes; every stockholder in a banking corporation to be individually liable to its creditors for double the amount of his stock; the rolling stock and all other movable property of all railroads in the State, to be considered personal property, and subject to execution for the debts of such company: railroad corporations prohibited from consolidating with parallel or competing lines; all railroads in the State declared to be public highways, and free to all persons for the transportation of their persons and property thereon, under such regulations as may be prescribed by law — the General Assembly to establish reasonable maximum rates of charges for the transportation of passengers and freight: the right of eminent domain by the State against such corporations never to be abridged: the General Assembly by appropriate legislation to prevent unjust discrimination and extortion in the rates of passenger and freight tariffs on all railroads in the State; appropriate legislation authorized for the protection of producers, shippers and receivers of grain and produce. By a two thirds vote in each House the General Assembly may submit to the electors, the question of calling a convention to alter or amend the Constitution, to be voted upon at the next general election: by the same vote in the General Assembly proposed amendments to the constitution (without the intervention of a convention) may be submitted to the electors for adoption or rejection. The General Assembly prohibited from releasing the Illinois Central Railroad Company from its charter obligation to pay the State the agreed percentage of the gross earnings of said company; no county, city, town or township permitted to become a subscriber to the capital stock of any railroad, or private corporation, or to make donations to, or loan its credit in aid of any such corporation.

Politics.— Under the recent apportionment by virtue of the 12th census of the United States, Illinois has 25 representatives in Congress. The electoral vote of the State at successive Presidential elections, since its admission has been cast as follows, viz.: In 1820, for Monroe; in 1824 one vote for Adams and two for Jackson: in 1828 and 1832 for Jackson: in 1836 and 1840 for Van Buren: in 1844 for Polk; in 1848 for Cass: in 1852 for Pierce: in 1856 for Buchanan: in 1860 and 1864 for Lincoln: in 1868 and 1872 for Grant: in 1876 for Hayes: in 1880 for Garfield: in 1884 for Blaine: in 1888 for Harrison: in 1892 for Cleveland: in 1896 and 1900 for McKinley. The vote of Illinois in the electoral college during the 85 years of its existence as a State, has increased from 3 to 27. The Black Hawk war of 1831–2 and the Mormon war of 1844 are chief among the interesting historical events of the State. As the result of the first, Indian depredations ceased, and the remnants of once powerful tribes disappeared forever from the State. What is known in local history as "the Mormon War" occurred in Hancock County on the Mississippi River. Nauvoo in the last named county was the Mormon city, the home of Joseph Smith, "the prophet" and head of the church; it was the seat of Mormon authority, and the site of a splendid temple. The assassination of Joseph Smith by an anti-Mormon mob in 1844 was soon thereafter followed by the complete exodus of his followers from the State.

Bibliography.— Ford, 'History of Illinois'; and a 'History of Illinois' by Davidson and Stuve; Moses, 'History of Illinois'; the twelfth census of the United States; the several official reports of State officers published by authority of the General Assembly.

Adlai E. Stevenson,

Illinois Central Railroad. The history of the Illinois Central Railroad embraces many interesting episodes, some of which bore directly in their effect on the building up of the nation, of the State of Illinois and of the city of Chicago. Prior to the incorporation of this line, the State of Illinois had vainly endeavored to establish an effective and profitable central railroad. In doing this, a large State debt accumulated and the outlook for wiping out that debt was not at all promising when the act to incorporate the Illinois Central Railroad Company was approved by Governor French, on 10 Feb. 1851. As events have proved, this act produced results more momentous in the history of the State and of the United States than any act approved by an Illinois Executive before or since.

The inception of this important enterprise dates back to 1835, when two of the State's most famous men, Hon. Sidney Breese and Hon. Stephen A. Douglas, first discussed publicly the advisability of penetrating the centre of the State by means of a railroad and thus opening up a vast territory which at that time was an uninhabited and partially unexplored wilderness. On 16 Jan. 1836, the State Legislature passed an act incorporating "The Illinois Central Railroad Company." Two years later an attempt was made to start this road, which was intended to run 457 miles. The sum of $3,500,000 was appropriated for the route, but within a few months the difficulties surrounding the situation in the matter of actual track-laying became so great that, after an expenditure of $506,000, principally on surveys and preliminary work, the plan was abandoned.

In 1843, a private corporation entitled "The Great Western Railroad" secured a charter and began work, but soon became discouraged and surrendered their charter. In 1849 this charter was renewed, only to be again surrendered to make room for the road now operating and known as The Illinois Central Railroad. At the time the road was commenced by the present corporation, it was estimated that the aggregate cost would be about $15,000,000. The actual cost for construction, including all extension up to the present time, has been nearly $50,000,000.

Original Charter Directors.— The twelve directors selected in 1851, under the charter and known as the "Charter Directors" included nine prominent New York men and three well-known citizens of Boston. The directors from New York were Robert Schuyler, George Griswold, Governeur Morris, Jonathan Sturges, Thomas W. Ludlow, John F. A. Sanford, Henry Grinnell, Joseph W. Alsop and Leroy M. Wiley. Those from Boston were Franklin Haven, Robert Rantoul, Jr., and David A. Neal.

Population.— In 1850, shortly before the chartering of the railroad, Illinois stood 11th in population and 17th in wealth among the States. The marked difference during the following 10 years is worthy of note as showing the direct effect of improved and extended railroad accommodation. In 1860, Illinois stood fourth in population among the States, also fourth in wealth.

Railroad Conditions in 1851.— In 1851, when the charter of the present road was granted, the population of Chicago was 30,000. That city had no railroad connection with the east nor in any other direction. In the same year the Hudson River Railroad, 140 miles, from New York to East Albany, was opened. Other events of importance during 1851 were the extension of the Baltimore and Ohio Railroad to Cumberland and the opening of an Erie Railroad line from Pierpont on the Hudson to Dunkirk on Lake Erie. Wisconsin had 20 miles of railroad at that time. The railroad mileage of Indiana was 228 miles, and of Kentucky, 78 miles. Just prior to the chartering of the Illinois Central there were 111 miles of railroad track in the State. When the 50th anniversary of the road was held at Chicago in 1901, it was announced that the company was then operating railroads in 13 States.

Development.— The first section of the road, covering 705.50 miles, and running from Chicago to Cairo and from Centralia to Dubuque, was opened on 27 Sept. 1856, being about five and one half years after the issuing of the charter. Since the opening of this main line other lines have been purchased, including part of the Saint Louis, Peoria and Northern railroads from Springfield to East Saint Louis, Illinois, in 1900. This purchase was followed by a number of other purchases and absorptions.

Roads Acquired by Purchase, etc.— From Springfield to East Saint Louis, Ill. (part of the Saint Louis, Peoria and Northern); Indiana Division of the former Peoria, Decatur and Evansville, extending from the Illinois State line to Evansville, Ind., with a branch to New Harmony, Ind.; Evansville and Mattoon, from the State line to Mattoon, Ill. This was formerly a division of the Peoria, Decatur and Evansville; Chicago, Madison and Northern; Kankakee and Southwestern; Chicago and Springfield; Saint Louis, Alton and Terre Haute; Chicago, Havana and Western; Mound City; Chicago and Texas; Riverside and Harlem; the parts of the Rantoul and Illinois and Indiana railroads lying in the State of Indiana, extending from West Lebanon to State line and from Switz City to State line.

Leased Lines.— The leased lines of the Illinois Central Railroad are Chicago and Eastern; South Chicago; Blue Island; Peoria, Decatur and Mattoon; Peoria and Pekin Union; Dubuque and Sioux City; Chicago, Saint Louis and New Orleans, and the Canton, Aberdeen and Nashville railroads.

Mileage.— The corporation now controls one of the most important groupings of railroad lines in the United States. The total mileage operated, according to the latest official report available, is 4,374.04, exclusive of the Yazoo and Mississippi Valley Railroad (1,209.91 miles). The length of the main line, from Chicago to Cairo, Illinois, is given as 364.73 miles; Omaha Division, from Chicago to Council Bluffs, Iowa, 513.96 miles; New Orleans Division, from Cairo to New Orleans, Louisiana, 547.79; Louisville Division, from Memphis, Tennessee, to Louisville, Kentucky, 398.12 miles; other lines owned or leased operated in the system, 2,549.12.

Additional Tracks.— The length of line having two tracks is 654.33 miles; third and other additional main tracks, 72.56 miles; sidings, etc., 1,514.04. The gauge of this system is 4 feet 8½ inches. The average weight of steel rails is 72.78 lbs

Charter Tax.— The charter of the company, reserved to the State of Illinois, calls for payment, in lieu of taxes, of 7 per cent of the gross receipts of the 705.50 miles of road originally built under that charter. The total amount paid to the State of Illinois under the provisions of this charter, from the opening of the road in 1855 to 30 June 1904, was $22,359,316.21.

Dividends.— Between the beginning of operations in 1851 and 30 June 1904, the stockholders received $118,403,601.59 as dividends out of the earnings of the company.

Rolling Stock.— The rolling stock of the company, 30 June 1904, included 1,086 locomotives, 444 passenger and chair cars, 14 cafe dining cars, 148 baggage, mail and express cars, 42 postal cars (3 of these partly owned), and 52,957 freight cars, making a total, with minor items under this head, of 55,809 cars.

Earnings.— The earnings of the road, for the year ending 30 June 1904, amounted to $46,831,136, or $10,789.72 per mile. These earnings were divided as follows: Passenger traffic, $9,554,743; freight traffic, $31,692,575; mail and express service, $1,694,280; miscellaneous earnings, $3,889,538. For 1905, the total earnings were $49,508,649.

Net Earnings, Receipts and Dividends.— The net earnings of the road for the year ending 30 June 1904, were $14,037,885, or 29.48 per cent; for 1905, $14,396,943; net receipts from land sales, $41,053; investments and miscellaneous profits, $2,675,495.72; surplus dividend fund (30 June 1903), $1,178,186.92; surplus dividend fund, 30 June 1904, $1,225,766.92.

Expenses.— The total expenses of the road for the year ending 30 June 1904, amounted to $32,793,251.31, or $7,555.44 per mile; for 1905, $35,111,706. The amount paid for taxes, rents, interest and sinking fund during the same period was $7,888,506; in dividends at 6 per cent, $5,702,400.

Bonded Debt.— The bonded debt of the road, including 25 investments, aggregates $137,599,525. Of this total the first issue yet to mature is $88,000, issued in 1880 and maturing in 1910. An issue of $2,800,000, placed in 1869, matures in 1917. The next, following in order, is an issue of $968,000 made in 1881 and maturing in 1921; an issue of $470,000 made in 1883 and maturing in 1923; an issue of $538,000, made in 1886 and maturing in 1931; an issue of $241,000, made in 1887 and due in 1932.

Opening up of the State.— The beginning of active operations in establishing the line marked the beginning of State development throughout a vast area which, up to that time, had been inaccessible to traffic of any kind except by means of the most rural contrivances, utterly inadequate for any but the most restricted local demands. The new move toward opening up commercial possibilities immediately doubled the price of public lands. These tracts were readily bought up as conditions improved and steadily increased in value year by year.

At a critical juncture in the nation's history, when it became necessary to move regiments brigades and divisions of western troops to the scene of active civil war operations, the Illinois Central Railroad provided the only available means of adequate rapid transportation. At the same time, the existence of that railroad and its excellent management made the prompt supply of rations and forage possible.

Payment of State Debt.— As mentioned in a previous paragraph, the attempt of the State to operate successfully a central railroad ended in utter failure. In 1851 the people of Illinois were under a burden of some $60,000,000 as the outcome of the experiment. The establishment and active operation, with ever continuing development of the road, enabled the whole of that debt to be paid off in due course with proper interest.

Other Benefits to State and City.— The persistency of the railroad authorities in extending their own lines and giving added vitality to smaller railroads made possible the cultivation of the Grand Prairie, previously waste, thereby raising the prestige of the State as a productive national factor of extraordinary importance. It is on record that over $3,000,000 has been expended since about 1836 by the railroad company upon the construction of dikes, piers and breakwaters to protect the city against lake encroachments. Very great benefits, too, have been derived by Chicago from being brought into close commercial touch with prairie lands and the agricultural area of the Lower Mississippi Valley. Chicago has also gained an outlet by rail to the Gulf of Mexico. It is said, to the credit of the Illinois Central Company, that the extent and vigorous administration of its affairs during the period extending from the inception of the World's Fair in 1893 until its close made the success of that enterprise possible by furnishing ample transportation within its jurisdiction for the immense passenger and freight traffic which impended there from start to finish.

Statistical.— The States in which the Illinois Central Railroad is now operating are Illinois, Indiana, Wisconsin, Iowa, Minnesota, South Dakota, Kentucky, Tennessee, Mississippi, Louisiana, Missouri and Alabama. The present total mileage of the road, including leased lines and the Yazoo and Mississippi Valley Railroad, is nearly one-half the railway mileage of the State. The total number of stockholders in the company, according to the latest report of the Interstate Commerce Commission, is 9,123. The value of stock outstanding, according to the latest quotations, 1905, is $95,040,000. The highest rate at which stock was quoted in 1904 was 159; lowest 125¾. The highest rate quoted for 1905 was 183; lowest 152½.

Other lines operating in Illinois are the Santa Fe; Baltimore and Ohio; Chicago and Alton; Chicago and Northwestern; Chicago, Burlington and Quincy; Chicago Great Western; Chicago, Indianapolis and Louisville; Chicago, Milwaukee and St. Paul; Chicago, Rock Island and Pacific; Cleveland, Cincinnati, Chicago and St. Louis; Erie; "Frisco System"; Grand Trunk; Great Central Route; Iowa Central; Lake Erie and Western; Lake Shore and Michigan Southern; Louisville and Nashville; Michigan Central; Missouri Pacific; Mobile and Ohio; New York, Chicago and St. Louis; Pennsylvania; Southern; Toledo, St. Louis and Western; Vandalia; Wabash, and Wisconsin Central.

Illinois College, an institution located in Jacksonville, Ill., the oldest college in the State, founded in 1829, largely through the efforts of the "Yale Band of Seven," an Eastern organization of college men. The courses of study are arranged according to the group system, which permits a fair amount of choice. In 1902 the attendance was 125 students with 17 instructors. In 1903 the college was affiliated with the University of Chicago. The same year the endowment fund was increased from $155,000, in 1902, to nearly $500,000. The college library contains 12,000 volumes, and the literary societies 4,000, available for reference.

Illinois River, an affluent to the Mississippi, formed by the confluence of the Kankakee, Des Plaines, and Du Page rivers, in Grundy County, about 44 miles southwest of Chicago. Its entire course of over 350 miles is within the State, through a fertile, undulating country, rich in bituminous coal deposits. It flows first westward to Ottawa and Lasalle, at Depue bending southwestward past Lacon, Chillicothe, Peoria, Pekin, Havana, and Beardstown, and near Naples turning due south and joining the Mississippi about 18 miles above Alton, at the mouth of the Missouri. The river is 1,200 feet wide at its mouth and is navigable throughout to Lasalle where a ship canal about 120 miles long connects it with Lake Michigan at Chicago, thus ensuring a clear waterway from the Great Lakes to the Mississippi and the Missouri. The Illinois has numerous tributaries of which the Fox and Sangamon rivers are the chief.

Illinois State Normal University, located at Normal, a suburb of Bloomington, Ill., was founded in 1857. It is the oldest State normal school in the Mississippi Valley, and has furnished principals or instructors for nearly all of the younger normal schools in the central and western States. Up till 1904 it had given instruction to 15,652 normal students, nearly all of whom have become teachers. Its graduates number 1,549. The school occupies three buildings upon a beautiful campus of 57 acres. It is well equipped with library, laboratories, gymnasium, and apparatus for instruction in all the various branches of study. Its revenue, about $60,000 per year, appropriated from the State treasury, includes the interest derived from the College and Seminary Funds granted by the Federal government in 1818. It is governed by the Board of Education of the State of Illinois, a body of 15 appointed by the governor. The State superintendent of public instruction is *ex-officio* secretary of the board. Its sole purpose is to prepare teachers for the schools of the State, accordingly students are required to sign a pledge declaring their intention to teach. Tuition is free. The programmes of study leading to graduation vary from two to four years, according to the preparation of the student. The required work includes courses in pedagogy, psychology, and general method, history and philosophy of education, school management and the Illinois school system and one year of practical teaching in the training department. Along with these are provided courses in special method in the various branches of elementary and high school course. Special courses are provided in manual training, art, vocal music, kindergarten and elementary agricultural science. The attendance in 1902–3 was 1,014, besides 502 in the training department. The faculty of instruction numbers 31. The presidents of the institution have been: Gen. Charles E. Hovey (1857–61); Richard Edwards (1862–76); Edwin C. Hewett (1876–90); John W. Cook (1890–99); Arnold Tompkins (1899–1900); David Felmley (1900——).

David Felmley, *President.*

Illinois, University of, the State university situated at Urbana. It was founded in acceptance of the national land grant of 1862 (see Colleges, Land Grant), and was incorporated in 1867 as the Illinois Industrial University. In 1870 women were admitted; in 1877 the State legislature granted power to confer degrees; and in 1885 the name was changed to the University of Illinois. It was the first American university to give shop instruction, a mechanical shop being equipped in 1870. It is governed by a board of trustees, consisting of three *ex-officio* members, including the governor, and nine elective members. The undergraduate department includes the college of literature and arts, of engineering, of science, and of agriculture; corresponding graduate courses are given; other departments of the university are the academy, State library school, the school of music, the college of law, the college of medicine, the school of dentistry, and the school of pharmacy, the three latter being situated in Chicago. The university has a number of valuable scientific collections; the agricultural experiment station organized under the Federal law of 1887 is controlled by the university trustees, but is separately supported by the national appropriation; the general university library numbers 71,039 volumes besides pamphlets; other libraries under university control are the library of State Laboratory of Natural History (15,000 volumes), the library of the college of law, and the special collection of the department of education (1,500 books and 3,000 pamphlets). The annual income amounts to $900,000; the number of students in all departments was 3,725 in 1904–5, the number of professors and instructors, 392.

W. L. Pillsbury,
Registrar University of Illinois.

Illinois Wesleyan University, founded in 1850 under the auspices of the Methodist Episcopal Church, at Bloomington, Ill. The college courses provide for the degrees of B.A., B.S., Ph.B., LL.B., M.A., Ph.D., and two honorary degrees. It has, also, a preparatory school. In 1902 the number of students was over 1,400, of which 478 were non-residents; professors and instructors, 38; volumes in the library about 11,000.

Illit'erates, those unable to read or to write, or to do either. The percentage of illiterates indicates the average intelligence, or at least of education, in the people of a country. The United States, Hungary, Italy, and Portugal, and the Australian colonies of Victoria and Tasmania, have attempted to take an exact census of illiterates; all children below six years of age were excluded, except in the United States, where all children below 10 years of age were excluded. The following gives the result:

	Per cent
United States (1880)	22.15
Italy (1881)	54.30
Hungary (1880)	57.14
Portugal (1878)	79.07

But the most exact results are gained by estimating the number of men and women who are unable to sign their names in the marriage registers. From this estimate the following are the results for 1886:

	Men	Women	Mean
England and Wales..	9.60	11.50	10.55
Scotland	4.65	8.28	6.46
Ireland	23.40	25.30	24.35
Victoria	2.00	1.98	1.99
New South Wales...	3.76	4.20	3.98
Queensland	4.52	6.71	5.62
South Australia	3.04	3.49	3.26
New Zealand	1.92	2.89	2.40
Prussia (1884)	3.31	5.11	4.21
France (1882)	14.39	22.62	18.50
Italy (1887)	42.36	62.80	52.58

The subjoined table gives the number of conscripts of the countries named who were illiterate in the fullest sense of the term:

	Per cent		Per cent
Baden (1884)	0.02	Holland (1887)	8.5
Würtemberg (1884)..	0.02	France (1886)	10.30
Bavaria (1884)	0.08	Belgium (1887)	13.87
Saxony (1884)	0.15	Austria (1888)	25.00
Sweden (1883)	0.27	Hungary (1888) ...	38.60
Denmark (1881) ...	0.36	Italy (1888)	42.98
Germany (1884) ...	1.27	Russia (1882)	78.79
Switzerland (1888)..	1.3	Servia (1881)	79.31
Prussia (1884)	1.97		

At the last general election in Great Britain and Ireland there voted in England and Wales 38,587 illiterate persons, in Scotland 4,836, in Ireland 36,722, giving a percentage of 2.69 out of a total of 2,969,381 voters. Illiteracy among voters, both white and black, increased greatly in the South between 1870 and 1880. In Texas in 1870 there were 17,500 illiterate voters; in 1880 there were 33,085. But between 1880 and 1890 the illiteracy in the States was reduced to 13.4 per cent of the total population.

Illuminati, ĭ-lū-mĭ-nā'tī ("the illuminated"), the name given to themselves by an association of people who professed to have attained to a higher knowledge of God, and heavenly things, and a deeper insight into the spiritual world than the rest of mankind. They were represented by the *Alombrados* in Spain and the *Guérients* in France. In the last half of the 18th century a sect of mystics rose in Belgium which from its foundation 1 May 1776 at Ingolstadt, spread over a large portion of Catholic Germany. At first they called themselves "Perfectibilists." Their founder was Adam Weishaupt (q.v.), a professor of canon law at Ingolstadt.

Illuminating of Manuscripts. See Books; Manuscripts, Illuminating of.

Illusion. In mental pathology it is necessary to distinguish the term "illusion" from the terms "delusion" and "hallucination." In common parlance these terms are often confused, and many persons in using them have not very clear ideas of what they wish to express by them. But this is not so among writers in psychiatry, for in this science these three terms are very clearly and very strictly demarcated. And it is highly necessary that these distinctions should be observed, because these terms stand for very different phenomena in mental disease — phenomena of different value and importance, and each with its own special significance as to the patient's welfare.

By an illusion is meant a misinterpretation of a sensory impression. Ordinarily, when the mind is acting in a perfectly normal way and there is nothing to confuse its impressions or to obstruct its proper perceptive powers, a sensation, whether of the eye, ear, taste, or skin, is conveyed to the consciousness and is recognized correctly. Thus a sound, as the note of a bird or the voice of a friend; or the sight of some object, as of an animal moving in the distance, is properly conveyed to the intelligence and is properly recognized. But this process may be interfered with in various ways. The senses, notoriously, are not always to be relied upon. Even the normal mind may make mistakes in the interpretation of sensations, and still more so may the mind that is impaired. It thus happens that all illusions are not necessarily evidences of a diseased mind; this faulty action of the senses, or of the perception, may and often does happen in the cases of persons of sound mind. For instance, a person walking along a path in the dusk may mistake a bush for an animal; he simply misinterprets an object, and this object is not imaginary but has a real existence. So, too, the mirage which sometimes appears at sea, might lead a perfectly ignorant person to maintain that he saw a ship inverted sailing in the sky. These are instances of illusions in which the normal mind may be temporarily deceived. But the normal mind tends to correct its illusions, and this it does sooner or later according to its opportunity and its degree of knowledge. In this respect the insane mind differs from it; the illusions of the insane are usually firmly believed in; there is no spontaneous tendency on the part of the insane mind to correct its illusions. On the contrary, they are firmly embraced, and are often made the starting point of a train of associated morbid ideas, whereby the mental disorder is all the more confirmed.

An hallucination differs from an illusion in the fact that it is entirely subjective. In a strict sense it is a disorder of perception in which the external sense organs do not participate, and it leads to a belief on the part of the patient that he perceives some external object, whereas in fact there is no such object corresponding to the perception. In other words, it is a disorder of perception giving rise to a false belief in a sensation. For instance, a person believes that he hears the voice of an acquaintance speaking to him, when there is no voice either of the acquaintance or of any one else; or, again, a person thinks he has a vision of a deceased friend or of some other spiritual being, whereas there is no external object or person whatever giving rise to this or any other sensation. The whole process, therefore, is subjective, or within the patient's own mind; it is without any objective equivalent. It is thus readily seen that an hallucination is much more deeply seated than an illusion, and is a much more direct evidence of a disorder of the mind. Some authorities doubt indeed whether a true hallucination ever occurs in a normal person; what appears to be so in any given case would probably be found on strict inquiry to be an illusion. Although this may be an extreme position, the fact remains that hallucinations are very rare in the sane and very common in some forms of insanity; and that, as in the case of illusions, the sane tend to correct them, while the insane adhere to them with unswerving belief. The most common hallucinations of the insane are the visual and the auditory, and they are sometimes very grave symptoms. Auditory hallucinations are especially dangerous, for they may lead the patient to commit acts of violence in response to their suggestions.

A delusion differs from both an illusion and an hallucination in the fact that it is not a sensory disorder — but a derangement entirely within the intellectual sphere. It is an erroneous belief, but one which is due entirely to mental disorder. The latter part of this definition is essential, because a delusion is essentially something more than a mere error of belief or judgment. It is an erroneous belief that is due to insanity, or to a disordered mind. Mere errors of belief may and do occur in persons who are sane: no person, in fact, is exempt. Such errors may be due to ignorance, prejudice or faults of education, but they are not evidence of insanity; otherwise the whole world would be insane. In the case, however, of an insane pauper who believes that he is a multi-millionaire, or that he is emperor of the United States, there is obviously something more than a mere erroneous belief in the sense of an error of judgment or opinion. Such a patient has developed an idea which no sane man in similar circumstances could have developed; in other words, he has a delusion, and he is not insane because he has the delusion, but he has the delusion because he is insane. The insanity or mental unsoundness is the fundamental fact, and is shown usually by other symptoms besides the tendency to form delusions. As in the cases of illusions and hallucinations, the insane cling to their delusions with great tenacity; no argument, no logic moves them. The delusions of the insane are usually distinguished as systematized and unsystematized. In the former the delusion has a certain consistence, coherence and endurance; in the latter the ideas are more or less incoherent and changing. Delusions again may be expansive or depressive, according to the emotional tinge. See also IMAGINATION; INSANITY.

JAMES HENDRIE LLOYD,
Formerly Neurologist Philadelphia Hospital.

Illustra'tion of Books, the art of making and reproducing pictures to supplement or adorn the text. In England book illustration may be said to have reached its culminating point as regards engraved and etched plates, in the first half of the 19th century, in the series of annuals, keepsakes, and the higher class books illustrated by such masters as Stothard, Turner, etc. The revival of wood engraving by Bewick and his pupils gradually led to the restoration of that art as an illustrating medium. In this it was greatly aided by the facility with which wood-engravings can be printed along with the text, together with the advance made in typographic printing. The series of Christmas books illustrated by John (afterward Sir John) Gilbert and Birket Foster had no small share in that advancement. Among the artists who have helped to raise the art to its present high position may be mentioned Cruikshank, H. K. Browne ("Phiz"), Doyle, Leech, Tenniel, Millais, F. Walker, W. J. Linton, Herkomer, etc. The development of what has been called the American school of wood-engraving has still further increased the influence of that branch of art for illustrative purposes.

Relief-Block Processes for Book Illustrations.— Many processes have been invented to produce relief blocks with a view to supersede wood-engraving in book illustration. The object aimed at is to reproduce drawings in line or wash, in fac-simile, on a relief block capable of being printed from the surface on the type-press. That is, the lines or parts which impress the paper are to be left in relief, while the white parts are cut out so as to leave the paper unprinted. "Process" relief blocks may be divided into two kinds, those reproduced from black-and-white, or line drawings in pen and ink; and those from half-tone photographs, or wash drawings. When pen-and-ink drawings, engravings, or any other drawing in line are to be produced the subject is photographed to the required size. This process allows the drawing to be made of any convenient size, while a drawing on transfer paper must be of the exact size required. There are also several gelatine processes, all of which are based on practically the same principle. The production of relief blocks from ordinary photographs or drawings made by washes of black and white baffled all efforts till the invention of Meisenbach's process. In relief block every part which touches the paper prints black, and every part which does not touch the paper leaves it white. Some method had to be devised of turning the smoothly graded tones of a photograph into pure black and white. The method sought after was to break up the photo-tones into a grain, stipple, or line, which should be closest in the darkest parts, and become more open as the lights were approached. That patented by Meisenbach of Munich in 1882 as the one on which nearly all the most successful subsequent processes are based, may be briefly explained. A glass plate is prepared with fine parallel lines. This is exposed between the lens and the sensitive plate in the camera, at a very short distance from the plate, and when the exposure is half completed the cap is put on the lens, the lined plate is taken out and put in with the lines in the reverse direction, and the exposure is completed. The resultant negative is thus broken into minute regular dots. In a successful process invented by Mr. Ives, of Philadelphia, and patented in 1884, a swelled gelatine relief is taken of the subject, and on a plaster cast of this a stipple is impressed by means of an elastic stamp, which gives the operator greater control over the effect. He is then able to ink the plaster cast and transfer an impression of it to a sheet of india-rubber, and from that to a plate of zinc. A "grained" photograph being finally obtained by means of any of the thousand and one processes, it is transferred to zinc and etched. Besides these photo-chemical processes there are various mechanical methods of producing relief blocks. Some of them are very technical. Dawson's typo-etching process, an improvement on Palmer's glyphographic process (patented in 1848) is very extensively used for the production of maps, plans, diagrams, etc. This process is carried to great perfection in the United States, where most beautiful maps are produced by it.

These processes, though simple enough in theory, give great scope for skill in manipulation, and much of their success depends on the ability of the operator. The rapidity with which they can be produced has rendered the daily illustrated paper a possible and accomplished fact. As to cost, blocks can be produced for from 8 to 30 cents a square inch of surface, according to the nature of the drawings — the stipple process being the more expensive. In France, Germany, and the United States the processes have been much more employed as a means of book illustration than in Great Britain, though even there every year shows rapid advance in their use. As to the comparative merits of wood-engraving and the processes, opinions differ greatly. Generally, it may be said that the processes are more suited for subjects on a large than on a small scale, unless they are very slight, in which case they can never pretend to be more than sketches. In wood-engraving the photograph can be transferred direct to the wood and engraved without further expense for drawing, and the result, both artistically and from a printing point of view, is much more satisfactory. Though within its limits the process makes good work and the future is before it, the fact remains that as yet for finished picture work, good wood-engraving has not been superseded. See BOOKS: ENGRAVING; LITHOGRAPHY; MANUSCRIPTS, ILLUMINATION OF; PHOTO-ENGRAVING; PHOTOGRAVURE

HALSEY C. IVES,
Director School of Fine Arts, St. Louis.

Illyria, ĭ-lĭr'ĭ-ạ, or **Illyricum,** a name anciently applied to a considerable region on the east side of the Adriatic Sea, the inhabitants of which were the ancestors of the modern Albanians. In 228 B.C. it became a Roman province. After various vicissitudes under different rulers it formed part of the Franco-Napoleonic empire as the Illyrian provinces. In 1815 it reverted to Austria and became the kingdom of Illyria, a title it retained until 1849, when it was divided into the provinces of Carinthia, Carniola, and the Coast-lands.

Il'menite, or **Menaccanite,** also known as titaniferous iron ore, is a black, heavy, mineral crystallizing in the hexagonal system. It is widely distributed, occurring in diorites and many other igneous rocks. It is an oxide of iron and titanium containing when pure 36.8 per cent iron and 31.6 per cent titanium, and is frequently associated with magnetite. Iron ores containing ilmenite occur in vast masses in the Adirondack region of New York, in Quebec, Canada, and in northern Minnesota, and ilmenite is a common constituent of the black sands found on some ocean beaches. The presence of titanium decreases the fusibility of an iron ore, hence the failure of many attempts to work black sands in the blast furnace. It is likely, however, that the titaniferous iron ores will become important sources of iron by the development of special methods for their treatment. See TITANIFEROUS IRON ORES.

Ilocos Norte, ē-lō'kōs nōr'tā, Philippines, a province of Luzon, occupying the northwestern part of the island; greatest length, 79 miles; area, 1,265 square miles (including the dependent islands). Two mountain chains inland extend parallel with the coast; the surface otherwise is much broken by foothills, but it is fertile and well watered. Among the natural wonders of the province is a grotto 39 acres in extent and of great beauty, situated in Lice Mountain. The products include rice, cotton, chocolate, corn, sugar, and a fair grade of tobacco; there are deposits of iron and copper in the mountains, the latter having been worked by the natives. The chief industries are agriculture, horse and cattle raising, fishing, and the weaving done by the women. Civil government was established in September 1901; the people of the province are among the most progressive and industrious of the native races, and the new government was received with general satisfaction. Pop. 164,000, mostly Ilocanos.

Ilocos Sur, soor, Philippines, a province of Luzon, on the west coast, bounded on the north by Ilocos Norte and on the south by Unión; length 70 miles; area 492 square miles (including dependent islands). The eastern boundary consists of a chain of mountains which slope toward the coast in terraces; the rivers are small. The coast road runs through the province from north to south, connecting the important towns and villages. The soil is fertile, the principal products are rice, corn, sugar, indigo, chocolate, peanuts, and vegetables; the chief industries, other than agriculture, are the weaving of cotton cloth, the manufacture of baskets, hats, card cases, and pipes, and cattle raising. There is also considerable trade, carried on mainly through the native markets in the different towns, and some export. Civil government was established 1 Sept. 1901. Pop. 180,000, mostly Ilocanos.

Iloilo, ē-lō-ē'lō, Philippines, province of Panay, including the eastern and southeastern coast of the island; greatest length, 111 miles; area 2,102 miles (with dependent islands). A range of mountains follows the northern and western boundary lines; the rest of the surface is undulating, sloping to the sea. There are several large rivers, the most important being the Jalaur and the Jaro. This province has some of the best roads in the archipelago; the principal towns are connected with the capital, Iloilo, and some of the rivers are navigable for native boats to the foot of the mountains. The products include sugar-cane, corn, rice, coffee, chocolate, tobacco, and hemp; there are also in the province deposits of gold and iron, stone quarries, and extensive forests. The chief industries are live-stock raising, the weaving of fabrics of pineapple fibre (piña) and cotton, and the manufacture of sugar. In 1899 the United States troops occupied the province, immediately began operations against the insurgents who were located there with headquarters at Santa Barbara, and succeeded in dispersing their forces. In April 1901 civil government was established. The inhabitants are mostly of the Visayan race and are generally Catholics, though some of the mountain tribes are still heathen. Pop. 423,500.

Iloilo, Philippines, capital of the province of Iloilo, Panay, situated on the Iloilo Strait at the mouth of the river of the same name. It is irregularly built, but the public buildings and the houses are of good construction. It has an excellent harbor, and is the second town of the Philippines in commercial importance; it is the centre of the trade of the province and has also a large foreign trade, exporting tobacco, rice, coffee, hides, and hemp, and importing Australian coal and general merchandise. There are also several industries, chief among them being the manufacture of piña, jusi, and simay. In February 1899 the insurgents who were in possession of Iloilo fired upon the United States gunboats Petrel and Baltimore; the town was then bombarded and taken by the Americans. Pop. 10,500.

Ilopango, ē-lō-pän'gō, **Illabasco,** or **Cojutepeque,** San Salvador, Central America, a lake of volcanic origin, 6 miles southeast of the city of San Salvador, about 14 miles long by 6 miles broad. It is surrounded by high, precipitous hills, composed of scoriæ and volcanic stones, and has several islets, one of conical shape about 400 feet high, formed during a volcanic eruption in 1879–80. Fish abound, although the waters exhale a disagreeable sulphurous odor, and are unpotable. The surface of the lake is 1,200 feet below the level of the surrounding country; when ruffled by a breeze the waters have a singularly brilliant parrot-green color.

Image, in optics, the picture or impression produced by the luminous rays from an object reflected or refracted in mirrors or lenses when they enter the eye of an observer as if they had proceeded from a representation of the object. More correctly, the image is the locus of the foci (or circles of least confusion. See FOCUS) of rays from consecutive points of the object. When the light rays actually pass through the points of the image the image is real and may be thrown upon a white screen. If no screen is interposed the image can be seen by an eye placed in the pencil of rays which pass through it. When the light rays do not actually pass through the points of the image, but diverge from one another on leaving the mirror or lens, the image is said to be virtual, and cannot be thrown upon a screen; it becomes visible to an eye placed in the pencils of rays which appear to have passed through it. See MIRROR; LENS.

Images, Veneration of, the practice of venerating and honoring in public or private graven or painted representations of sacred things or persons. Because of the general prevalence of idolatrous worship of images, the Jews in the Old Law were forbidden the making of images, although evidence of the lawfulness of the practice is afforded in the positive command to «make two cherubim of beaten gold on the two sides of the oracle,» to «make a brazen serpent and put it up for a sign.» The walls of the catacombs, which were the refuge of the first Christians in times of persecution, show many sacred pictures, and after the period of the persecutions the use of sacred images or paintings became open and undespised. Consult Damascene, 'Treatise on Holy Images,' translated by M. H. Allies (1898).

Imaginary Quantity, the result of an algebraic calculation, when the application of the rules for resolving equations leads to an operation that cannot be performed. The operation referred to is the extraction of the square root of a negative quantity. Thus in the equation

$$x^2 = -a^2,$$

to find the value of x we should require to take the square root of $-a^2$; and this is impossible. To indicate this impossibility the roots of the equation above are written thus: $x = +\sqrt{-a^2}$, $x = -\sqrt{-a^2}$, or more frequently and more neatly $x = +a\sqrt{-1}$, $x = -a\sqrt{-1}$. The name imaginary quantity is given to the $\sqrt{-1}$, and any algebraic expression containing $\sqrt{-1}$ is called an imaginary expression: thus $a + b\sqrt{-1}$ is an imaginary expression.

These imaginary roots have proved of great importance in algebraic geometry. In fact, the employment of imaginary quantities systematically is the foundation of some of the greatest modern discoveries and improvements in geometry. Even in algebra, although it is impossible to obtain a value for the expression, or to explain the meaning of it, yet it may prove of use in indicating how to alter the statement of a problem so as to obtain a real solution.

Imagination, that mental power which, according to McCosh, puts in new forms and dispositions what had been previously in the mind. It is therefore not a productive but a reproductive power, for it cannot create anything *de novo*, but can only reproduce in new forms those ideas or images of which it has derived the elements from previous experience. This is in accord with Locke, who says that man's power is much the same in the material and intellectual worlds, the elements in both being such as he hath no power either to make or to destroy.

The imagination differs from the memory, which is also one of the reproductive powers of the mind, in the following way. The memory reproduces what had formerly been before the mind in the form in which it first appeared, but the imagination separates and combines the mental contents in various ways. An act of memory is also accompanied with a belief in the past reality of what the mental picture represents, but an act of imagination (at least in the normal mind) is not accompanied with such a belief. As McCosh has expressed it, the memory may be compared with the mirror which reflects exactly what is before it; whereas the imagination may be likened to the kaleidoscope which reflects objects in an infinite variety of shapes and colors.

When an attempt is made to analyze the workings of the imagination, it is found that this faculty, like all the other mental functions, is governed by certain laws. First in importance among these are the laws of association of ideas. According to these laws the ideas which are summoned up and utilized by the imagination arise according to the principles of contiguity and correlation. By the association of ideas is meant the tendency of ideas to recur in the order or groups in which they naturally stand, either by virtue of some resemblances or some identities of time and place. Thus by correlation is meant the association of ideas in the mind because of some mutual resemblances of parts or qualities; and by contiguity is meant such association because of the proximity in time and place, and not because of any mutual resemblances. In analyzing any act of the imagination it will be found that it follows one or other of these laws of association, although they can be variously grouped and subdivided.

The uses of the imagination and its moral and hygienic relations open up vast questions which can scarcely be more than named here. It is almost enough to recall the activity of this faculty in the realms of poetry, of fiction and of art, but its offices are not confined to these fields, for in science also its activity is very great and of first importance. Imagination goes before theory, and theory points the way to new discoveries in science. Of such widespread activity is this faculty that practically it is almost impossible to dissociate it from the other mental functions. It is always manifesting itself in some way in even the most prosaic affairs of daily life. The conduct or control of the imagination is a subject that suggests many moot points in psychology, in psychiatry and in ethics. That the imagination is subject to control within certain limits may be granted, although these limits are not fixed, and outside of them the imagination may often run riot without the possibility of control. Its action, in fact, like that of most mental faculties, is largely automatic, and its control by the will, the intelligence and the conscience, is often a matter of the mental training and mental health of the individual. In ethics the control of the imagination, or at least its guidance, so that it shall not minister to sensuous or immoral pleasures, even though these be purely imaginary, is a self-evident rule of conduct, but one which is doubtless often broken with some degree of impunity. In mental discipline its control is also essential, for its too great or mere idle indulgence is no doubt unwholesome and wasteful.

In psychiatry, the imagination, like most or all of the other faculties, is found to be subject to derangement, and this in various degrees, according to the patient and the form of disease. That it is active in the formation of delusions, and is much disturbed in both depressed and exalted states of the mind, is quite evident. In all insane states, except the advanced dements, the kaleidoscopic function of the imagination is apparent. The mental pictures are broken reflections of past mental contents, arranged often at seeming haphazard, and often of only the most sombre and melancholy tints.

James Hendrie Lloyd,
Formerly Neurologist Philadelphia Hospital.

Imam, ī-mām, or -mām', a Mohammedan chief or leader; a title given to the four successors of Mohammed, and to the twelve great leaders of the shiites. In Turkey, applied to the functionaries who call the people to prayer from the minarets, perform circumcision, etc. They are chosen by the people, and confirmed by the secular authority, under whose jurisdiction they also are in criminal and civil affairs.

Imbriani, Vittorio, Italian poet: b. Naples 24 Oct. 1840; d. 1 Jan. 1886. He pursued historical and philosophical studies at Naples, Zürich, and Berlin, but later became a soldier, serving in the wars of 1859 and 1866. The best known of his works are 'Canti populari delle provincie meridionali' (1871–2); 'Dodici canti pomiglianesi' (1876); and 'La novellaja fiorentina' (1877).

Im'bricated Snout-beetle. See Snout-beetle.

Imbros, an island in European Turkey, west from the entrance to the Dardanelles. It is 18 miles long, east to west, 8 miles broad, and terminates west in Point Aufiaka, and east in that of Basse. It is mountainous, rising in its loftiest peak to the height of 1,959 feet; well wooded, and intersected with richly-fertile valleys, producing wine, honey, oil, cotton, and lead. It has only two towns — Flio and Castro. Pop. 10,000, mostly Greeks.

Imide, ĭmĭd, or -mĭd, a chemical substance derived from ammonia, NH_3, by replacing two of the hydrogen atoms by a divalent radical. If all three of the hydrogen atoms of the ammonia are replaced by one trivalent radical, the compound is called a nitrile. When one or more of the hydrogen atoms of the ammonia are replaced by a corresponding number of monovalent radicals the compound thus formed is called an amide or an amine, according to the nature of the radical by which the hydrogen is replaced. See Amide; Amine.

Imitation. Imitation is the process of reproducing by one's own act the observed actions of others. Its beginnings lie therefore in perception. It is the result of a desire to change from the role of spectator to that of actor. Imitation may be of two kinds (1), a primitive and (2) a developed form. The primitive form is an unconscious copying of some object of perception; and is simply a reaction in response to the outer stimulus which excites it. The best example of this kind of imitation is to be found in the sounds which a baby is wont to repeat when it has once heard them. It is a peculiar characteristic of the primitive imitation that the sound, for instance, when once imitated becomes in turn a new stimulus to start the process over again, the result being that the imitated sound is repeated rapidly again and again until the organs are wearied, or the attention is diverted. The exercise is evidently found to be pleasurable, and is therefore continued indefinitely. Mr. Baldwin has given the name «circular reaction» to this kind of imitation, the phrase indicating a sort of self-perpetuating process. The name also of «suggestive imitation» has been given to this class of acts which appear imitative to an observer, but are not consciously felt to be so by the imitator.

The second form of imitation is more complex, and marks a more developed stage of consciousness. The imitation has now become a conscious act. The object perceived has aroused some degree of interest, and there is consequently a conscious effort to reproduce it with the original set before one as a model. In imitation which is of this form, we find the process intimately connected with the attention. In attention there is always a conscious striving for a more accurate knowledge of the object of perception, and imitation serves to gratify this desire, inasmuch as one comes to closer quarters as it were with any act when one tries to reproduce it. Knowledge of it comes then from the inside. This means a concentration of attention, and a consequent result of more definite and satisfying knowledge. Moreover, attention will vary as the interest, for that which one attempts to do himself is always far more interesting than merely that which is observed.

In the development of consciousness imitation as a social factor plays a most conspicuous part. Through it a child acquires all of its social tendencies, and becomes a part of the social organism in which it is to live and move and have its being. Its education starts with the first rudimentary efforts at imitation; and is carried on from this initial stage to the very highest and most advanced forms in constant dependence upon the imitative tendencies. Through imitation the knowledge of one generation is acquired by the succeeding, and a continuity in development is assured which makes for the progress of the race.

In this connection, it is to be noted, however, that with the imitative impulse there are two other tendencies which have free play and a wide scope. These tendencies must be reckoned with also. They are the tendency to social opposition, and the tendency to inventiveness. The tendency to social opposition is a desire for self-assertion, an impulse primarily to do something different from that which others are doing merely from a feeling of native opposition. This impulse is seen in very young children, and remains throughout life. It is often recognized as unreasonable, but nevertheless irresistible. It is a fertile source of the differences of opinion which so early develop in childhood. It prevents a slavish imitation and the loss of initiative in action. However in order to act in a manner which differs radically from one's social environment, there is implied a preliminary training of an imitative sort; for there must be a basis of common activity in order that a departure from the accepted mode may have any significance, and there must be also a body of common beliefs, in order that there may be any such thing as a real difference of opinion. The other tendency is a more pronounced and a more definite form of opposition to imitation; it is the tendency to inventiveness, not for the sake of opposition, nor as the result of an inevitable clash of opinion in one's social setting, but for the sake of producing that which is suggested from within, and not from without. It is the working out of one's own individuality without waiting for a copy or model. It is a shifting of the centre of interest from some object which is perceived, to some object of the inner sense, a fancy born within the brain, an idea which has its origin in the depths of one's own consciousness. This tendency is seen even in early acts of imitation, a tendency to depart from the copy, to introduce variations of design, to improve upon the model.

Here again in order that there may be increased power of independent production, there must be a previous schooling in the art of exact imitation. The original artist is not one who has never copied from a model nor studied the works of the masters. It is the interplay of the imitative impulse with the tendencies to social opposition, and to inventiveness which make progress possible. Progress is not repetition nor is it on the other hand activity which swings clear of any past. Where there is progress there is imitation, but the kind of imitation which allows full range for inventive play, and independent opinion.

There is a special form of imitation which appears on a large scale in the so-called mob impulse, where individuality seems merged in the tendencies of the mass, and imitation is in the nature of a reaction. The individual is swept along with the crowd, not because he wills it necessarily, but because the action of the crowd carries him away as with a flood. This kind of imitation has been given the name of "plastic imitation." Much study has been devoted of recent years to the relation of imitative impulses in animals to congenital tendencies. The instinctive furnishes a strong predisposition to imitation, and in many of the early activities of animals it is most difficult to draw a line of distinction between instinct and imitation.

John Grier Hibben,
Professor of Philosophy, Princeton University.

Immaculate Conception of the Blessed Virgin Mary, a doctrine of the Roman Catholic Church whereby it is declared that "The Blessed Virgin Mary, at the first instant of her conception, was, by a singular privilege and grace of Almighty God, in virtue of the merits of Jesus Christ, Savior of mankind, preserved immaculate from all stain of original sin." In these words is the doctrine proposed for the acceptance of the faithful in the Apostolic Letter of Pope Pius IX., dated 8 Dec. 1854. Previously, for at least 600 years, the doctrine of the Immaculate Conception had been canvassed in the theological schools, and had from an early period in the Church's history been entertained with more or less definiteness by eminent Fathers of the Church and other ecclesiastical writers. The most notable passage from the writings of any of the Fathers relating to this subject is, doubtless, that quoted from St. Augustin's treatise on 'Nature and Grace' (c. 25) in which he makes an exception of Mary when he declares that all mankind are in sin because of Adam, "except the Holy Virgin Mary," he writes, "concerning whom, for the honor of the Lord, I would have no question at all raised in treating of sin — *nullam prorsus, cum de peccatis agitur, haberi volo quæstionem.*"

In the 12th century the great St. Bernard protested vigorously against the usage of certain churches of France in commemorating by an annual festival the Conception of the Blessed Virgin; but the ground of St. Bernard's complaint was, not that the belief in the Immaculate Conception was erroneous, but that the See of Rome had not signified its approval. At the same time St. Bernard refers the whole matter of his dispute with his opponents, the canons of Lyons, to the judgment of the Holy See. The authenticity of his letter has been disputed, but on grounds, as Benedict XIV. implies, absolutely insufficient. Throughout the 13th and following centuries the doctrine of the Immaculate Conception was a subject of keen disputation in the theological schools, its chief advocates being theologians of the order of the Franciscans, its opponents the children of St. Dominic. But the doctrine won ground steadily. In 1439 the Council of Basel declared it to be "A pious doctrine consonant with Catholic faith"; the Council of Trent abstained from formally approving it as an article of Catholic belief; but in their definition of original sin, the Tridentine Fathers took care, with St. Augustin, to except the Blessed Virgin out of the number of those bearing the stain of original sin.

At last, in 1849, Pope Pius IX. judging that the time had arrived for expressing the mind of the Church upon this question, addressed letters to all the bishops of Catholic christendom inviting them to report the opinion and feeling of their respective churches regarding the expediency of declaring the doctrine to be an article of Catholic belief. Five years were allowed to elapse before the next step was taken — that of pronouncing with the unanimous consent of the chief pastors throughout the world and of the churches, the dogmatic definition that "the doctrine was revealed by God, and therefore should firmly and constantly be believed by all the faithful." To catholic-minded men, says Cardinal Newman (Apologia p. 279), "there is no burden at all in believing that the Blessed Virgin was conceived without original sin: indeed it is simple fact to say, that Catholics have not come to believe it because it is defined, but it was defined because they believed it."

JOSEPH FITZGERALD.

Immigration to the United States. The subject divides itself broadly into seven heads: (1) the general history of the foreign influx, its numbers, fluctuations, and causes; (2) its relation to the previously existent population; (3) its sources, and the changes in them; (4) its distribution, the changes in it, and the constituents of the population due to it; (5) its industrial character; (6) its social effects, in occupations and wages of the native population, politics, crime, insanity, pauperism, and illiteracy; (7) the legislation with regard to it, and the public feeling which produced the legislation.

1. The same causes which were bringing a small but steady stream of European emigrants to this country before the Revolution continued to operate after it. From 1783 onward, it was estimated at 4,000 a year till 1794, when the French-English war raised it to 10,000. It dropped again to about 6,000 a year till 1806, when the British and French Continental blockades and the American Embargo practically annihilated it for a decade. (See EMBARGO.) In 1810 the passenger arrivals (including returned Americans) numbered toward 8,000, in 1817 22,240. The numbers and hardships from overcrowding drew out legislation noted later; and from 1 Oct. 1819 account has been kept at all customs ports of the number, sources, and conditions of arriving aliens. The following table gives the number in each year since.

IMMIGRATION TO UNITED STATES BY YEARS.

Year ending 30 Sept.		Year ending 30 Sept.	
1820	8,385	1843	52,496
1821	9,127	1844	78,615
1822	6,911	1845	114,371
1823	6,354	1846	154,416
1824	7,912	1847	234,968
1825	10,199	1848	226,527
1826	10,837	1849	297,024
1827	18,875	1850	310,004
1828	27,382	1850 (1 Oct. to 1 Dec.)	59,976
1829	22,520	1851 (Jan. to Dec.)	379,466
1830	23,322	1852	371,603
1831	22,633	1853	368,645
1832 (to 31 Dec.)	60,482	1854	427,833
1833 (Jan. to Dec.)	58,640	1855	200,877
1834	65,365	1856	195,857
1835	45,374	1857 (to 30 June)	112,123
1836	76,242	Year ending 30 June	
1837	79,340	1858	191,942
1838	38,914	1859	129,571
1839	68,069	1860	133,143
1840	84,066	1861	142,877
1841	80,289	1862	72,183
1842	104,565		

Year ending 30 June		Year ending 30 June	
1863	132,925	1884	518,592
1864	191,114	1885	395,346
1865	180,339	1886	334,203
1866	332,577	1887	490,109
1867	303,104	1888	546,889
1868	282,189	1889	444,427
1869	352,783	1890	455,302
1870	387,200	1891	560,319
1871	321,350	1892	579,663
1872	404,806	1893	439,730
1873	459,803	1894	285,631
1874	313,339	1895	258,536
1875	227,498	1896	343,267
1876	169,986	1897	230,832
1877	141,857	1898	229,299
1878	138,469	1899	311,715
1879	177,826	1900	448,572
1880	457,257	1901	487,918
1881	669,431	1902	648,743
1882	788,992	1903	857,046
1883	603,322		

Totals since 1820, 20,952,467. But it must be remembered, first, that up to 1856 the record is of all "alien passengers arrived," without discriminating passengers from immigrants, so that much should be abated from this total; second, that the immigration overland from Canada and Mexico is not counted in — and in 1900 Canada was put down as the birthplace of 1,183,255 persons, and Mexico 103,445 — so that a great amount should be added to the total. On the whole, it seems probable that these accessions have far more than balanced the above duplications, though not the other duplications of the same emigrants coming and going.

IMMIGRATION BY DECADES.

1821-1830	143,439	1861-1870	2,314,824
1831-1840	599,125	1871-1880	2,812,191
1841-1850	1,713,251	1881-1890	5,246,616
1851-1860	2,598,214	1891-1900	3,844,420

Since 1900, 1,993,707, or half as much in the past three years as in the whole previous decade. The number of arrivals reported in 1903 exceeds the largest number for one year (1882) by 68,054.

The barest glance at the first table shows that it has eight well-marked periods, though with notable fluctuations within them. The first is from the beginning to 1826 inclusive, with a slow increase to about 10,000 in 1794. Thence to the end of 1831 it rather more than doubles; probably from reports of the fertile lands just reaching a wider stratum of peoples, and the miserable European industrial conditions of the time of the Holy Alliance. Then with a sudden bound it almost trebles, and with a sharp drop after the panic of 1837, rises to seven-fold in 1846; the first leap perhaps due to the opening up of the West by steamer navigation, the steady increase due to the same and to railroads making the central lands easy of access. The Irish famine then begins to swell it to a torrent, shortly increased by the California gold discoveries, which do not exhaust their effect till 1854. The sudden drop then, and its continuance later, may be laid to several causes. The anti-foreign agitation in this country, owing to the flood of foreigners demoralizing politics and industry, probably had much effect; then the business depression of 1857 and the following years, merging into the War, kept it down in spite of the efforts of the steamship agents, now penetrating every country for business. Later in the War, the scarcity of labor here, owing to the drain of the able-bodied, drew in a larger immigration of laborers; but the new period fairly begins only after the War. From 1866 to 1873, the great inflation time, when countless new enterprises were started and new railroads built by thousands of miles, was naturally a palmy time of immigration. Then the great panic and the ensuing hard times struck it down and kept it down till 1879. The revival in 1880 brought it back instantly to the mark of eight years before, and two years later it reached a climax not again attained till 1903; and it has never gone down to near its old mark except for two years, 1897 and 1898, the drop 1894–8 being due to the panic and hard times. Of course each increase tends to widen the next, arrivals encouraging others to come.

2. The following table shows the number and proportion of the foreign-born for the past half-century, and also the native-born of foreign parentage, single or mixed, for 30 years, indicating the foreign strain in American blood.

Census years	Total Pop.	Foreign-born		One or both parents foreign	
		Number	Per cent	Number	Per cent
1850	23,191,876	2,244,602	9.7	....	......
1860	31,443,321	4,138,697	13.2	....	......
1870	38,558,371	5,567,229	14.4	10,892,015	28.2
1880	50,155,783	6,679,943	13.3	14,922,744	29.8
1890	62,622,250	9,249,547	14.8	20,676,046	33.
1900	76,303,387	10,460.085	13 7	26,198,939	34.3

Comparison of this table with the first two shows some striking facts. In 1850, of the 2,500,000 (about) who had come into the country since 1815, only one tenth were dead or had re-emigrated in the 35 years. It is true that nearly one half the whole had come in within five years; but even so, this is a suspicious showing, and suggests a large overland emigration from Canada (especially during the gold fever 1849–50) which does not figure on the records. Every succeeding census has shown a large and increasing discrepancy between the arrivals and the remaining foreign population, the falling-off being sometimes difficult to explain except by duplications, re-emigrations, and a heavy death-rate. As the grandchildren of the arrivals of two generations ago are now "Americans," the percentage of foreign-born is not rising, and even that of the whole foreign-parentage class is but little greater than that of old, under the enormous flood of immigrants.

3. Most of the early arrivals came from Great Britain; about 110,000, or 76.5 per cent, from 1820 to 1830, while Germany sent about 10,000. In 1850 the foreign-born of Anglo-Saxon blood, English, Scotch, and Canadian, must have been over 750,000, while that from Celtic Ireland was probably 650,000 — about 60 per cent from all Great Britain; the Germans furnished 584,000, or 36 per cent. The Teutonic blood was overwhelmingly dominant still, and the Anglo-Saxon largely so. In 1860 the elements were still much the same: Great Britain claimed nearly 2,500,000, or 60 per cent, Germany 1,276,000 or over 30 per cent. None others were of much account. In 1870 the totals were much larger for the older elements, but the British percentage was dropping, and other elements coming forward: Great Britain and Canada showed 3,120,000, or about 55 per cent; Germany 1,690,000, about 30 per cent as before; but there were nearly 250,000 Scandinavians against some 60,000 the decade before, and 40,000 Bohemians. Of the Canadians, probably 150,000 were French. In 1880 the still increasing British and English-Canadian contingent showed about 47.5 per cent; the German holding its own well, some 30 per cent; making over 2,000,000 in all. But there were 85,000 Bohemians, 48,000 Poles, 440,000 Scandinavians, 44,000 Italians, and 35,000 Russians. In 1890 the change was marked, though the Teutonic strain was still farther to the fore: the Germans and German Swiss and Austrians footed up nearly 3,000,000, or about 33 per cent, Great Britain and English Canada furnished about 2,700,000, now only about 29 per cent. But Poland, Russia, and Bohemia now showed nearly 450,000; Italy, 182,500; Hungary, 62,435; Austria, 123,271, much of it Slav; Scandinavia, 933,000. In 1900, the tendency had become so striking as to necessitate a further grouping for clear perception of its meaning: Poland, Russia, Bohemia, and Hungary — in a word the Slav countries — were the birthplaces of over 1,000,000 Americans, nearly 10 per cent of all our foreigners; Italy of nearly 500,000; Mexico of over 100,000; Scandinavia of over 1,000,000; France and French Canada of about 500,000: the whole representing nearly as great a share as Great Britain. If the showing is by immigration and not by the masses still living from the old immigrations, the account is far more impressive: the percentage of Great Britain had sunk in half a century from over half the total to 19.4 per cent; of Germany, from 38 per cent to 14: while the Scandinavian had risen from a neglectible quantity to about 10 per cent of the whole, and the East European, from practically nothing, had risen in the decade to 1,186,000, or nearly 31 per cent. The following table for half a century by decades, and for 1901–3 separately, tells its own story:

	England and Scotland	Ireland	Germany	Norway and Sweden	Italy	Russia including Poland	Austria-Hungary
1851-1860..........	423,974	914,119	951,667	20,931	9,231	1,621	......
1861-1870..........	606,896	435,778	787,468	109,298	11,728	4,536	7,800
1871-1880..........	548,043	436,871	718,182	211,245	55,759	52,254	72,969
1881-1890..........	817,357	655,482	1,452,970	568,362	307,309	265,088	353,719
1891-1900..........	342,357	403,496	543,922	325,943	665,668	588,866	597,047
1901-1903..........	64,065	94,542	90,041	144,547	544,993	328,697	491,380

A still further condensation will present the essential elements even more clearly:

	Teutonic and Anglo-Celtic	South and East European
1871-1880	1,914,341	179,982
1881-1890	2,494,171	926,116
1891-1900	1,615,718	1,841,581
1901-1903	393,195	1,365,070

Nearly as many have come from southern and eastern Europe in the past three years as in the entire preceding decade; while the Teutonic strain, even when reinforced by the great Scandinavian flood, has dropped to less than a fourth of that, and less than a sixth of what it was 20 years before.

4. The distribution of this mass of immigrants in the United States may be considered in various aspects — of foreigners as a whole, and of special races; of foreign-born as bearing on politics and industry, and of all with immediate foreign blood as bearing on heredity and sociology. Here we shall consider both; the latter to some extent, but the second first. In the last census, of 25,928,462 persons of foreign parentage, about seven eighths were in the North Atlantic and North Central divisions, where are the great manufacturing cities and abundance of fertile land. The first division had slightly the more. Only 1,059,009 were in the South Atlantic and South Central divisions together. Of cities, too many to mention have a majority of this population of foreign parentage; of cities with 25,000 and over, by the census of 1900, 93 had over 50 per cent, and 18 over 75; while 6 — Fall River, Holyoke, and Lawrence, Mass., Hoboken, N. J., Woonsocket, R. I., and Milwaukee, Wis. — had over 80 per cent. The highest percentage was in Fall River, 80.1. Of Massachusetts' 20 cities of this size, only 1, Haverhill, had less than half of foreign parentage, and that had 48.9.

Of course these figures, which seem very large, have no bearing on the question of Americanism in feeling or action. The children of foreign parents are not less intensely American than those of natives; it is their own country. The figures of actual foreign birth are very different. North Dakota still leads, but with only 35.2 per cent; Rhode Island 31.1, Massachusetts 29.9, Connecticut 26.1, New York 25.9, Minnesota 28.8, Wisconsin 24.8. Of cities, none have a majority of foreign-born, and but one over 40 per cent. But this concentration of the foreign-born in the cities is precisely one of the gravest elements in the problem. In 101 principal cities in 1900 was nearly half — 49.2 per cent — of the total foreign-born, making 26.1 of their population, against 9.4 per cent of the total in the rest of the country.

Of the nationalities which have formed "colonies" in the different places, those with the less understood tongues are of course the most prominent. Religion is occasionally potent, as well as proximity; thus the French Canadians keep together as Roman Catholics, and mostly in New England as nearest home. The Italians, city more than farming folk, are most numerous in New York, Boston, Chicago, New Orleans, and San Francisco; the Norwegians, mostly agriculturists, in Wisconsin, Minnesota, and the Dakotas; the Poles, city men, chiefly in New York, Boston, Philadelphia, Chicago, Milwaukee, Detroit, Minneapolis, and St. Paul; the Bohemians in New York, Chicago, and Cleveland; the Swedes in New York, Boston, the Connecticut cities, Philadelphia, Illinois, and Minnesota; the Welsh, not as Celts but as miners, mostly in the Pennsylvania mines. In 20 cities of which the census gives a special report, the Germans predominate over all other foreigners in [illegible]; the greatest actual number being in New York, which had 322,343; though the greatest percentage, [illegible] of the whole foreign population, is in Cincinnati, Milwaukee having 60.5, Louisville 57.8, and St. Louis 52.8. The Irish have a majority in 9, the chief lead being in Cambridge, Mass., 36.9. The French Canadians predominate in Fall River and Lowell, Mass., cotton-mill cities, with 40.3 and 35.8 per cent. The Swedes have the greatest number in Minneapolis, 32.8 per cent.

5. The question of occupations of the foreign-born is of the first importance, as bearing on that of wages, which they are supposed to lower. We have to discriminate between several facts in this: (1) their distribution between occupations; (2) the total number of working age; (3) their concentration in cities where most of the manufacturing is carried on. The last has already been shown. For the others, the government volume dealing with the census of 1900 is not yet issued; but that of 1890 in this regard probably differs little. The report of the occupations assigned by intending immigrants year by year gives little help, as they drift into various occupations; but it may be said that in 1902, of 495,500 male adults, only 80,000 were skilled laborers, and less than 3,000 professional men. This is natural, the best men being fairly placed at home, as a rule. In 1890, while the foreign-born over 15 formed 22 per cent of the whole population of that age, they formed 36 per cent of the domestics and menials, and 34 per cent of the hands in the manufactories. In special employments, they showed far more striking totals. They formed 71.12 per cent of all tailors, 59.52 per cent of bakers, 53.13 per cent of hucksters and peddlers, 49.00 per cent of restaurant and saloon keepers, 47.02 per cent of leather-workers, over 46 per cent each of stone-cutters, textile-mill hands, and cabinet-makers, and 44.5 per cent of gardeners, florists, and that class.

6. As to social effects, where the foreign-born are of moderate numbers, and do not increase faster than the general development of industries, they can hardly depress wages much; and two of the complaints made against them — that they lower wages by willingness to accept a poor standard of living, and demoralize industry by readiness to strike — cancel each other. They cannot at once be satisfied with poor pay and unsatisfied with fair pay. But when concentrated into special occupations in the cities, as the enormous tailoring contingent in the sweat-shops, where for a time they are willing to work for starvation wages to get on their feet, they can and do for a considerable time ruin all decent workers' prospects, depress wages below an endurable point, and drive natives or better-grade foreigners out of the trade, after extreme distress.

Politically, facts do not warrant the belief that the foreign element exercises the corrupting influence, either by ignorance or venality, that is often attributed to it. There are no worse governed or more corrupt cities in the Union than some where the foreign element is relatively small; nor is there any evidence that as a whole they are more easily swayed by appeals to selfishness. They are, however, the chief ingredient of political and industrial mobs.

Regarding crime, the usual statistics are misleading both for and against the immigrants. On the one hand, they restrict the records to the serious crimes, in which the native-born "tough," from his rearing and training into thorough knowledge of his surroundings, and superior chances of escape, naturally takes the lead; while the foreigner, from his great predominance among those with short sentences, seems to swell heavily the volume of petty crime. It is believed also, probably with truth, that the native-born of foreign parents are worse than their fathers and vastly worse than the native white. On the other hand, the statistics of crime are for the whole population, not for the adult males of youth and middle age, who mainly commit it; on the same basis, the foreign portion makes no worse showing than the native. Still again, it is believed that the fact of the foreign population being mostly of the lower orders in wealth and social position has much to do with it, and that, class for class, there is little difference.

In pauperism, there can be no question that the foreigners, mostly coming with nothing and having no friends to care for them, should swell the pauper population immensely. In 1890 there were over 3¾ times as many foreign-born as native-born paupers.

As to insanity, there is a considerably larger tendency to it in the foreigner than the native; most likely from greater average debility of constitution, which shows in the brain as well as in other organs. Between the ages of 25 and 55, the period which furnishes most of the patients, there was in 1890 a percentage of insane foreigners more than half as large again as that of natives.

With regard to illiteracy, while the foreign-born white is naturally much less educated than the native, his children average fully as well.

7. The first legislation in the United States on the subject of immigration was of 2 March 1819, and merely provided that a record should be kept of the number of passengers arriving in each customs district, with their sex, age, occupation, and country of birth. For many years there was no thought of anything but exultation in the number of arrivals, as increasing the wealth of the country, and providing an asylum for the poor and oppressed. Even the Know-Nothing agitation of the fifties, prompted by political reasons (see American Party), led to no restrictive legislation. In 1864 the first immigration act was passed by Congress, and was to promote and not restrain it; this was repealed 1868. Several States established immigration bureaus to encourage it and draw it their way. On 3 Aug. 1882 the first restrictive act was passed, but only to bar out criminals, insane, paupers, etc. Head taxes were imposed as a fund for relieving the distressed, etc. Foreign convicts (non-political), lunatics, idiots, and those liable to be a public charge, were to be returned at the expense of the owners of vessels on which they came. On 26 Feb. 1885 a more drastic one was passed, which was well meant, but from its sweeping character has been, as enforced by fanatical or interested persons, the source of much useless hardship, and has tended to make the country ridiculous. This was to prohibit any laborer coming over under contract to work; it did not except professional men or skilled laborers, and while it was aimed at strike-breakers and cheap gangs, was enforced against artists, musicians, architects, etc., and even clergymen, to the discredit of the country's good sense. It has since been somewhat modified. In 1891 the act of 1882 was extended to other classes, and to all "assisted" immigrants not affirmatively shown to be without the terms of the act. This act took the entire matter into the hands of the general government. The act of 3 March 1903 still further amended it by requiring a preliminary inspection at point of departure, and giving the government the right to deport the immigrant landed in defiance of the act within two years after arrival; it also extended to all persons advocating the overthrow of all governments and the assassination of public officials. The number of persons deported under the act of 1882, mainly for pauperism, had been 28,184 from 1891 to 1900, out of 3,844,420 immigrants.

The Law of 1907.—By the provisions of an act of Congress which took effect 1 July 1907, the tax levied upon every alien entering the United States is $4, instead of $2 as heretofore. This law provides that the tax shall not be levied upon aliens who shall enter the United States after an uninterrupted residence of at least one year immediately preceding such entrance in Canada, Newfoundland, Cuba, or Mexico. Others exempt are such as are otherwise admissible residents of any possession of the United States, and aliens who have been lawfully admitted to the United States and who later go in transit from one part of the United States to another through foreign contiguous territory. Aliens arriving from Guam, Porto Rico, or Hawaii are excluded from the above exemption provisions, under special conditions.

The exclusives include, under the law of 1907, imbeciles, feeble-minded persons, epileptics, persons afflicted with tuberculosis and persons not in the above and other named classes who are found by the examining surgeon to be mentally or physically defective, such mental or physical defect being of a nature which may affect the ability of such alien to earn a living. Persons who admit having committed a felony or other crime or misdemeanor involving moral turpitude are excluded by the new law, also persons who admit their belief in the practice of polygamy; women or girls coming for the purpose of prostitution or for any other immoral purpose; persons who procure or attempt to bring in those of this last named class and persons called contract laborers, coming under some inducement.

An important provision of the Act of 1907 is that which declares "Wherever the President shall be satisfied that passports issued by any foreign government to its citizens to go to any country other than the United States or to any insular possession of the United States or to the canal zone are being used for the purpose of enabling the holders to come to the continental territory of the United States to the detriment of labor conditions therein, the President may refuse to permit such citizens of the country using such passports to enter the United States."

For statistics, see 'Monthly Summary of Commerce and Finance,' by the government; and U. S. Census, 1890 and 1900. See also 'Reports of the United States Industrial Commission on Immigration,' and the article 'Restriction of Immigration,' by Francis A. Walker, in the 'Atlantic Monthly,' LXXVII., 23.

Forrest Morgan.

Immortality (Lat. *immortalitas, in + mortalis*, 'not mortal'). The doctrine that the soul continues to exist after death, or more specifically the doctrine of eternal personal survival. To the question 'What becomes of the soul after death?' various answers have been given by different philosophers and civilizations. The most noteworthy of these answers may be grouped as follows: (1) Complete annihilation (the Materialists); (2) Survival of the soul for an indefinite period in a world of filmy shadows (Aboriginal); (3) Eternal existence in a moral world of retribution (Christian and certain idealistic philosophies); (4) Transmigration (India, as early as the Upanishads; the Egyptians, Plato, the Pythagoreans, and sporadic amongst Aborigines); (5) Absorption into an Infinite or Absolute Being (Pantheism; the Buddhistic Nirvana, where the individual is annihilated only in the sense that the seed is annihilated in the fully developed plant,—the seed's life-goal); (6) The survival of the individual in the form of the posthumous influence of his personality and achievement, which is scarcely more than a metaphorical use of the term Immortality (many Evolutionists and Positivists; cf. also Ostwald, Münsterberg); (7) Merging or diffusion of the psychic energy of the individual into an unseen hypothetical etheric energy (quasi-materialistic).

Belief in some form of immortality is widespread, although not universal. It is found in all stages of civilization from the lowest form of aboriginal life to the highest occidental culture. The doctrine varies from a belief in an indefinite survival-period after death to the belief in eternal personal life, the latter being the legitimate use of the term Immortality.

Aboriginal Civilization.—Amongst primitive peoples, belief in the survival of the soul is due mainly to four things: (1) Their prevailing animism, which ascribes a soul to everything; (2) The phenomena of dreams and apparitions; (3) The instinctive will to survive and the instinctive aversion to annihilation; (4) The belief in the substantial character of the soul as an entity. 'Looking at the religion of the lower races as a whole, we shall at least not be ill-advised in taking as one of its general and principal elements the doctrine of the soul's future life' (Tylor, 'Primitive Culture,' Vol. II., p. 19). By "future life" is not meant immortality in the strict sense, but simply the soul's survival after death. Amongst aboriginal peoples we find two forms of the doctrine: Transmigration and the independent personal existence of the soul. It must be noted, however, that the dominant idea in the lowest civilization is simply the continuance of the soul in a new life similar to the present life. The abode of souls is usually in some distant part of the earth, less frequently in the nether world or the sky (some Hindus represent the seat of happiness to be vast mountains on the North of India), where it pursues a life modeled after this life, without ethical coloring. To some aborigines the idea of a bodiless existence is unintelligible or ludicrous (cf. Lubbock, 'Origin of Civilization,' 5th ed. p. 378). In the Tonga Islands, the chiefs are thought to be immortal, while the common people are held to be mortal. Amongst the Fijians the belief prevails that everything has a spirit, and they even hope that every cocoanut will be made anew in Paradise (Peschel, 'The Races of Man,' 2d ed. p. 259). They do not restrict future life to man or even to animals. So also the Itelmes of Kamschatka believe in the rebirth of all creatures "down to the smallest fly" (Peschel, *op. cit.* p. 259). The Fijians think that as is their condition at death, so will their condition in the next world be. The infirm and diseased will find it difficult to make the long journey to Mbulu; consequently it is a custom to put the aged to death before they become too weak to travel. A common belief amongst some primitive peoples is that the individual has several souls, as amongst the Chippewa Indians, the Khonds of Hindustan, and in Madagascar. The Sioux Indians believe that man has four souls, as has also the bear (in their view the most human of animals). The Totemism of the Indians rests on the theory that the souls of ancestors have passed into the bodies of animals. Certain Eskimos put a dog's head in a child's grave, because the dog is skilful in finding its way and can guide the child's soul to the spirit-land (Tylor, *op. cit.* p. 424). The Hottentots place the body of the deceased in the same position as the embryo occupied in the mother's womb, symbolizing thereby their belief that in the womb of the earth's darkness the dead will mature and come to birth. The lower races, in general, regard the soul as a filmy body, *i. e.*, a corporeal entity capable of life and action, and needing, consequently, no bodily renewal. The idea of a resurrection of the body is, however, often found amongst primitive peoples, although it forms no important feature of their belief, as it does in the doctrine of immortality in Persia, later Judaism, and the Pauline Epistles. On the whole, one may say that the difference between the conception of lower races and that of higher civilizations regarding the immortality of the soul, is that the former look upon the future life as a continuance of the present type of sense-life, with activities analogous to the present crass activities, a corporeally refined shadowy state, with a decrease in the struggle for existence and an increase in the amount of pleasure. The higher civilizations, on the other hand, make the doctrine of judgment and retribution paramount, spiritualize the conception of the soul and its future life, eliminate geographical definiteness from the soul's abode, and correlate the conception of immortality with a system of religion and ethics.

The Egyptians.—In the earliest known civilization of Egypt, the problems of religion and eschatology were central interests. In the remotest period of their history, the Egyptians believed in an invisible deity or deities and in the future life of the soul. The human soul is of the divine substance, an emanation from Ammon-Ra. At death it passes to the seat of judgment at the gateway of Amenti (the Hellenic Hades) and there it is adjudged by the 42 assessors (representing the 42 sins of which the soul must be innocent) of the dead, before the supreme tribunal of Osiris. The soul that is proved pure at the judgment returns to its divine origin, while the soul that has led an impure life is condemned to reincarnation and passes into an animal life to attain purification through probationary metempsychosis. The theory of the future life of the soul amongst the Egyptians is based on the metaphysical view that the soul is an emanation from an original cosmic soul, on the ethical view that the present life is a probationary period, and on the conception of the moral fitness of the soul for reabsorption into its original source, the sun-god Ra,—the head-spring of all light and life. (See 'Book of the Dead.')

Hebrews.—Sheol, or the realm of shadows, appears in the early history of the Jews to be an amplification of the idea of the grave, as the dark abode of departed spirits, where souls dwell bodiless, unconscious, without feeling. The references in the early part of the Old Testament Scriptures to a future life are rare and vague, and the doctrine of the immortality of the soul is nowhere explicitly taught in the early books. The rites of necromancy were discouraged by the prophets and lawgivers of ancient Israel as antagonistic to belief in the God of life, whose realm excluded Sheol (or the realm of the dead), until post-exilic times. Eternal life belongs to God alone, and to those celestial beings who have eaten of the tree of life and live forever. In connection with the Messianic hope and under the influence of Greek and Persian ideas, the later Jews adopted a doctrine of resurrection of the body which made room for belief in the soul's continuous life. The Cabalists took up the doctrine of transmigration (Gilgul, "rolling on" of souls) according to which the soul of Adam passed into David and shall pass into the Messiah, as is mystically set forth in the letters of that name (Ad[a]m). The Platonic doctrine of preexistence is also found in the rabbinical philosophy. Immortality conjoined with the dogma of the resurrection is the prevailing conception in the post-exilic literature, the latter (resurrection) becoming fixed in the Mishna and liturgy. Since the time of Moses Mendelssohn, who rehabilitated the doctrine of Plato in his 'Phædon,' progressive Judaism tends to lay less emphasis on the resurrection of the body, and greater emphasis on a purely spiritual immortality, the former dogma being discarded in the Reform rituals.

The Greeks.—The origin of the doctrine of immortality amongst the Greeks is lost in the remotest antiquity. It is found in the early traditions of the Orphic and Dionysiac mysteries, in the poems of Homer and Hesiod, and forms a central tenet in the philosophy of Pythagoras, a contemporary of Buddha-Siddhattha and Lao-Tze. The view of Pythagoras includes the doctrine of transmigration, which may have been suggested to him by the theology of the Orphic mysteries or by Pherecydes, rather than by the Egyptians (cf. Zeller, 'Pre-Socratic Philosophy,' Vol. I., pp. 71. 514). The great problem of a man's life is moral purification, which he pursues in a divinely governed Cosmos, where his chief end is to become like God. The soul is imprisoned in the body because of sins committed in a preëxistent state, and after death passes into a superior or inferior state, according as it has served Good or Evil. In the ascending stages of metempsychosis the soul is prepared for moral redemption. Although the belief in some form of immortality prevailed amongst the Greeks throughout their history, and probably came into their philosophy from their religion, it was not until Plato that a philosophic basis was furnished to the doctrine. The Platonic arguments for the immortality of the soul may be summarily stated as follows: (1) The fact that the mind brings to the study of truth a body of interpretative principles and axioms with it, as part of its native endowment, shows that they can be only reminiscential and, therefore, derived from a preëxistent state; (2) The soul is an ultimate unity (*i. e.* monadic in character) and, therefore, not being composite or divisible, it cannot be disintegrated; (3) The soul (ψυχή) means the "principle of life," having the idea of life essentially immanent in it, and inseparable from it, and therefore it must exclude the opposite idea, death; (4) The soul is self-moving, deriving its activity from within; consequently its motion and therewith, its life, must be perpetual; (5) The soul as an immaterial reality is essentially related to the immaterial, invisible, eternal idea; and as the former is akin to the latter in nature, so is it also akin in duration; (6) The superior dignity and value of the soul argue for its survival of the crass body, and even the crass body persists for a time; (7) The cyclical movement of nature shows everywhere the maintenance of life by opposition, as night, day; sleeping, waking; the dying seed, the germinating flower. This is an argument from analogy: out of the decay and death of one living organism, a new life is generated; (8) The instinctive aspiration of the soul towards a future existence shows that the belief is founded in natural law; (9) Things that are destructible, are destroyed by their peculiar evil or disease; the peculiar evil of the soul is vice, which corrupts the soul's nature, but does not destroy its existence; (10) The world as a moral and rational world demands a future life of rewards and punishments for the rectification of inequalities in this life, else the wrong would ultimately triumph, as in a bad play. This argument is based on the ethical claim that there must be a final equivalence between inner worth and external condition or reward. The views of the Greeks, and especially the views of Plato, have had a profound, an incalculable influence on Christian thought, on early theological formulæ, and on the sum of occidental philosophy. Plato was not merely a framer of philosophy, an intellectual interpreter of reality, but still more a man of religion, a seer.

The question of the preëxistence or survival of the soul is not a scientific problem. Positive science is impotent either to prove or disprove the dogma. It is a problem for religion, and its ultimate appeal is to faith. So long as science keeps within its borders, it is neither philosophy nor religion, and has no verdict to pronounce upon ultimate reality. The dogma of immortality in the higher civilizations is largely based on the philosophical theory of the ideality of human life, and on the demand for an ideal completion of experience which involves a transexperiential world. It is a postulate of purposiveness, of teleology in the ethical realm.

The general tendency of modern biological science and cerebral physiology has been to discard the doctrine of immortality, although the relations between molecular movements of the brain, on the one hand, and thoughts and feelings on the other, are known to science merely as concomitants, and in no case as [illegible] or effects. James (Human Immortality, 1898) has endeavored to "draw the fangs of cerebralistic materialism" by ascribing to the brain a "transmissive" function, instead of a "productive" function. Tait and Stewart (The Unseen Universe, London, 1894) postulate an unseen world, from which the known visible world has arisen and to which we must resort for the origin of molecules as well as for an explanation of the forces that animate these molecules; and it is reasonable to suppose, as these physicists say, that the ultimate unseen universe is connected by bonds of energy with the visible universe and is capable of receiving energy from it and of transforming the energy thus received. To say that the visible world is either eternal or has the power of originating life, contradicts the result of observation and experiment (*op. cit.* p. 220). Therefore, the hypothesis of an eternal unseen universe is necessary to explain the evolution of the matter and life of the visible world and the only method of avoiding a break in the continuity of reality. The law of the conservation of mass and of energy, the law of biogenesis (every living being presupposes an antecedent life), and the law of continuity (there is no break in reality, the universe is of a piece) make the assumption of an unseen universe the easiest mode of explaining the empirical. Further, the postulate of a rational cosmic energy is necessitated by the ordered character and inherent teleology of reality. The law of continuity and conservation of energy necessitate the further conclusion that the psychic energy of the individual is not lost, but transmuted into the unseen world.

During the 18th century and the early part of the 19th, the dogma of immortality was widely discussed. The French materialists denied the doctrine in every form, regarding the psychic life purely as an organic function. In the system of Identity (Schelling) and Spinozism no place for the doctrine is found. In Fichte's idealism the creative Ego is not the individual, but the absolute Ego; the individual Ego realizes itself only by negating its individuality, by universalizing itself, and the Ego thus exemplifying the conceptual life of truth, continues to all eternity, as an indestructible part of the reality of the Absolute Ego. Hegel paid little attention to the problem, but the early Hegelians split into two factions, the one affirming and the other denying the doctrine (cf. Feuerbach, Richter, Weisse, Göschel, Conradi). In Lotze's teleological idealism the immortality of the soul (which is hardly more than casually mentioned) is based on the principle of value: that thing will continue forever which by reason of its excellence should be an abiding constitutive part of the Cosmical Order. Yet Lotze cannot say that all human souls are immortal. This idea of a conditional immortality, determined by ethical value, reappears in later discussions (cf. McConnell, The Evolution of Immortality), *i. e.* immortality is simply a moral achievement.

According to Kant, scientific demonstration is not applicable to these three truths: the Existence of God, the Freedom of the Will, and Immortality. They are postulates of morality. The worth of man as a moral being, with infinite potentialities, *i. e.* infinite perfectibility necessitates an infinite time for their realization. The laws of the moral life are drawn from a transcendental sphere, free from conditions of time and space, and so the very essence of man's moral being is invested with the eternal. Man is infinitely progressive and perfectible in his moral and intellectual evolution, and this fact points indubitably to a further existence. If death were the end, the moral ideal would be illusory, and man would perish a fragment. An infinite moral imperative implies an infinite moral ability. Duty demands moral perfection. Further, the moral ideal is a character-ideal, an ideal of personal aim, which implies a personal destiny, and the non-illusoriness of the moral life implies the possibility of realizing its ideal.

One may fairly say that since the time of Kant the dominant note in the discussion of immortality has been ethical. The main postulates on which faith in the dogma has been based in the late literature of the subject are the moral perfection of a World-Governor, the basic rationality of the universe, and the worth of human life (cf. Gordon, Immortality and the New Theodicy, p. 46).

The advocates of psychical research claim to find in spiritistic phenomena a proof not only for the existence of disembodied spirits, but also for their power to communicate with spirits still incarnate. The examination of these phenomena, however, is as yet in an unsatisfactory stage, and in any case the phenomena, so far as we know, have no bearing on the problem of the duration of survival.

The chief traditional arguments adduced in support of the doctrine are: (1) The ontological argument, which bases immortality on the immateriality, simplicity, and irreducibility of the soul-substance; (2) The teleological argument, which employs the concept of man's destiny and function, his disposition to free himself more and more from the conditions of time and space, and to develop completely his intellectual and moral potentialities, which development is impossible under the conditions of earthly life; (3) The theological argument; the wisdom and justice of God guarantee the self-realization of personal beings whom he has created; (4) The moral argument, *i. e.* the moral demand for the ultimate equivalence of personal deserts and rewards, which equivalence is not found in this life; (5) The historical argument; the fact that the belief is wide-spread and ancient, showing it to be deep-seated in human nature, and the historical fact of the resurrection of Christ and the statements of the New Testament Scriptures.

As to the attitude of men in the present time towards the doctrine, Osler (Science and Immortality) happily groups them into three parties: (1) The Gallionians (cf. *Acts of the Apostles* xviii. 14), *i. e.* the Scientists who study the How of the universe and who regard the dogma as without the pale of science, neither affirming nor denying its truth, although tending to reject it; (2) The Teresians (Saint Teresa 1515-1582), *i. e.* the seekers of the Why of the universe, the mystics who "live by faith" and have the "will to believe," who read a purpose in human destiny and teleology in the world; these are of the spirit of Plato; (3) The Laodiceans, who study neither the How nor the Why of the universe, who are absorbed in empirical problems and the sense-life; these have no practical concern with the doctrine.

Immunity. It has been a common observation that certain individuals are prone to the infectious diseases, and others not. Some children in a family always "take things hard," while others are not susceptible. This resistance to the poisons of the infectious diseases, or to the bacteria that cause the poisoning, is termed immunity. It is a relative quality of living matter, and is not confined to man alone, for lower animals, and even plants, show marked variations in their reactions to chemical and organic poisons. Thus certain plants are capable of growing in soils impregnated with metallic poisons of sufficient strength to destroy animal life; many animals are immune to poisons that would kill man; thus birds are comparatively immune to strychnine; young children can take comparatively larger doses of belladonna than adults; the diseases of plants are almost unknown among animals, and *vice versâ;* certain diseases affect the lower animals and are rare or unknown in humans, and the reverse condition also holds true; thus swine-plague is comparatively unknown in other animals than pigs, and such human diseases as typhoid fever and cholera are not common in lower animals; thus plants, lower animals, and man, individually and collectively, enjoy certain relative immunity from destruction when exposed, under ordinary circumstances, to disease-producing agencies.

Natural immunity may be so modified as to be lost entirely, certain forms of disease predisposing the sufferer to ready secondary infection, as, for instance, is seen when tuberculosis follows measles; or a partial immunity be made more effective, or a new immunity conferred. This has been termed acquired immunity. The evolutionary doctrine would tend to interpret natural immunity as an inherited acquired immunity. In the case of man immunity sums up those powers of resistance which the body naturally possesses, or which it acquires in the struggle with infectious diseases, both in endeavoring to destroy the bacteria—bacteriolytic power—and to counteract the toxins—antitoxic power. Modern pathology has shown that the battle-field is a large one, and that the opposing forces are numerous and their powers largely unknown; and it must be remembered that the struggle has been going on perhaps for millions of years.

The observation that certain diseases—as measles, scarlet fever, smallpox—once acquired, confer a marked immunity, led up to vaccination, this inoculation against smallpox being the first conquest of disease by such means. It is certain that others will follow. Certain diseases—notably pneumonia, influenza, erysipelas—confer an immunity, but it is not lasting; thus demonstrating the principles of variability in the "immune bodies" as a class, and of an active and a passive immunity which may be conferred by various means, an active immunity being acquired by the animal for itself by direct adaptation, a passive immunity being conferred by a body made in the blood-serum of another animal.

Former theories for explaining the varied picture in this rapidly widening study have been numerous. They may be classed under the *exhaustion theory* of Pasteur, which assumed that the bacteria used up the available food-supply and died; or, as the laity often express it, "the disease wore itself out." This theory has been thoroughly disproved. The *retention theory*—that the bacteria are killed by their own products—is also untenable. The *mechanical, humoral,* and *phagocytosis* theories, which teach that the bacteria are destroyed by the humors or cells of the body, are partly true, but do not convey the whole truth, which in fact may never be known. The most popular theories of the present time are chemical, and that known as Ehrlich's *side-chain theory* is uppermost in discussion. This theory is extremely elaborate, but its fundamental principle is that the blood-serum of man and other animals may be so modified, in whole or in part—experimentally played upon, as it were—that it can be made to overcome the effects of infections, of poisons, or of both. The development of the diphtheria antitoxin in the blood-serum of the horse, to counteract the effects of the toxin of the diphtheria bacillus in man, was the first important practical deduction of this great principle. It was the first illustration of the production of a successful passive immunity in human pathology. In the discovery of the diphtheria antitoxin it was hoped that all the infectious diseases were conquered, but this hope was premature, as it was learned that other diseases involved other factors of a more elusive character than the simple toxin. The destruction not only of the bacteria within the body, but the neutralization of the poison as well, was found necessary, and hence the terms bacteriolytic immunity and antitoxic immunity. Ehrlich's side-chain theory tries to explain antitoxic immunity in chemical terms. He assumes that the cell-body has a number of side-chains upon it — receptors, as they are termed. These are capable of combining with food-products for the metabolism of the cell. There are certain receptors that can combine with toxic products as well, with damage to the cell. Antitoxins, according to Ehrlich, consist of surplus receptors made by the cell and cast off in the blood-serum. These unite with the toxin in the serum, and thus save the receptors of the cell for their normal food-taking properties. Any surplus of receptors over and above those combined with the toxin molecules floating in the blood are available as free antitoxins in the treatment of toxin-caused disease.

The other phase of the subject of immunity is concerned with the ability of bodies themselves to destroy bacteria — bacteriolytic immunity. It is known that if the blood-serum of certain animals is injected into an animal of a different species, the red blood-cells of the injected animal are destroyed This process has been termed hæmolysis, and is observed under other conditions, as in poisoning by drugs, such as acetanilid, sulphonal, etc. A similar action of blood-serum on certain bacteria can be brought about by artificial means, thus manufacturing a *bacteriolytic* serum for use in destroying given bacteria in the human body. The various terms that are used in elaborating this hypothesis may best be expressed in the form of a chart, since in medical literature so many synonyms have been in vogue.

Table showing various forms of adaptation products with their relationships and synonyms. (From Prudden.)

A

The body-cells in adaptation to alien substances of protoplasmic origin may elaborate	Antitoxins Antiferments Cytolysins (Cytotoxins) Agglutinins Precipitins	Hæmolysins Bacteriolysins Special Cytotoxins	Formed of two substances	COMPLEMENT Alexin Addiment Cytase. AMBOCEPTOR Immune body Intermediary body *Substance Sensibilatrice* Copula Desmon.

B

The "Antibodies"	Cytotoxins Agglutinins Precipitins	May lead to the formation of anti-antibodies.	Anticytotoxins Anti-agglutinins Antiprecipitins.	Anti-complement Anti-amboceptor.

As Prudden writes, "there seems to be abundant ground for the belief that the protective agencies which are evoked in both natural and artificial immunization are simply those which the body makes use of in its normal metabolism, exaggerated and diverted to different ends, it is true, in the face of emergencies, but giving evidence of the birth of no new physiological capacities." "The new methods of research and the far-reaching conceptions which they have stimulated and fostered seem likely to mark a new era in physiological chemistry, and to link more closely than any other extension of knowledge in our time some of the most subtle and urgent problems of medicine to the wider outlooks of general biology."

SMITH ELY JELLIFFE, M.D.,
Professor of Bacteriology, College of Pharmacy, City of New York.

Im'pact, the action which results on the coming together of two bodies, one or both of them in motion. If an ivory ball fall on a marble table which has a thin coating of oil, after impact the ball is found to have on its surface a patch of oil, which shows by its size that the ball must have been compressed at the moment of impact. When two bodies come into collision they compress each other at the points that touch until they have each the same velocity; during this time of compression each body acts upon the other with exactly the same impulse, the momentum lost by the one being gained by the other; if now the bodies are perfectly inelastic no further mutual rebound will take place; if the bodies are elastic they will regain their old shape, and the mutual impulsive forces of restitution will cause separation. The impulsive forces of restitution are found to be less than those of compression; that is (see IMPULSE), the momentum lost or gained by either of the bodies during the second or restitution part of the impact is less than the momentum lost or gained in the first or compression part of the impact in a certain ratio which is called the elasticity of the bodies. In a perfectly elastic body this ratio would be equal to 1, in a perfectly inelastic body it is 0.

Thus, when one ivory ball comes into direct collision with another of equal size at rest, the first comes to rest and the second moves in the direction of motion of the first before impact, but with a slightly diminished velocity. When two equal ivory balls come together with equal and opposite velocities each returns on its old path with a velocity slightly lessened. When one perfectly inelastic body overtakes or meets another directly the common velocity after impact is equal to the sum or difference of momenta of the bodies before impact divided by the sum of the masses.

In a collision of two balls not perfectly elastic it may be shown that the total energy of motion (see ENERGY) of the two balls after collision is less than it was before, some of it having been converted into heat.

Impeach'ment, the accusation and prosecution of judicial and executive officers for misdemeanors involving an abuse of their official functions, or immediately connected with those functions. In Great Britain the tribunal before which impeachments are tried is the House of Lords, and the impeachment is made by the House of Commons. The person impeached may be either a peer or a commoner; but while a peer may be impeached for any crime whatever, a commoner cannot be impeached for a capital crime. The method of procedure is this. A member of the House of Commons charges the accused with high crimes and misdemeanors, and moves that he be impeached. If the motion is carried the member is ordered to go to the bar of the House of Lords, and lay the impeachment before that tribunal. The lord high-steward presides at the trial. After the charges have been laid, and the answers of the accused heard, the lord high-steward puts the question whether the accused be guilty or not guilty of the crimes charged in the first article of impeachment to each of the peers in succession, beginning with the junior baron, and each of the peers answers "guilty" or "not guilty," as the case may be, "upon my honor." The lord high-steward gives his own opinion after all the other peers. The same question is then put with regard to all the other articles of impeachment successively, and the result is declared by the lord high-steward. The question of guilty or not guilty is decided by a majority of votes.

By the Constitution of the United States the House of Representatives is given the sole power of impeachment; and the Senate has the sole power to try all impeachments, and provides that at the trial of a President the chief justice of the Supreme Court shall preside. Section 4 of Article II. provides that the President and Vice-President and all civil officers of the United States shall be removed from office on impeachment for and conviction of treason, bribery, or other high crimes or misdemeanors, and the trial of officers by impeachment has been attempted seven times in the history of the United States. First came the Blount case. William Blount, United States Senator from Tennessee, was in 1797 impeached for conspiring with British officers to steal part of Louisiana from Spain for England's benefit. The Senate expelled him, after putting him under bonds for trial, but his defense being that a Senator was not a civil officer liable to impeachment, on the question of jurisdiction he was acquitted. John Pickering, judge of the Federal district court for New Hampshire, being impeached in 1803, for drunkenness and profanity on the bench, was convicted and removed from his office. Samuel Chase of Maryland, a justice of the Supreme Court of the United States, in 1804 was charged with having indulged in "highly indecent and extra-judicial reflections upon the United States government," in the course of a charge to a Maryland grand jury, and with other improper conduct on the bench. The impeachment proceedings, instigated and managed by John Randolph of Virginia, were political in their origin and animus. Judge Chase was acquitted. The prosecution failed to obtain a two thirds vote against him on any one of the eight articles of impeachment and, resuming his seat on the bench, he held it as long as he lived. Judge West H. Humphreys of the Federal district court of Tennessee, joined the Confederacy at the opening of the Civil War, and accepted office under it, without previously sending his resignation to Washington. He was impeached, mainly in order to vacate the office, and convicted on 26 June 1862. Andrew Johnson was impeached on 4 March 1868. He was charged in 11 articles with violating of the Tenure of Office act, with violating of the Constitution, conspiring to prevent the execution of the Tenure of Office act, and with utterances tending "to bring the high office of President into contempt, ridicule, and disgrace." This memorable trial lasted for nearly three months, and the fiercest of political passions were excited by it. Thirty-six votes were needed to convict. No vote was ever taken except on the three strongest articles, the 2d, 3d, and 11th, and on each of these the Senate stood 35 for conviction to 19 for acquittal, impeachment failing by a single vote. The seventh impeachment recorded was that of William W. Belknap, secretary of war under President Grant. He was accused in 1876 of corruption in office, and the House voted unanimously to impeach him. He resigned before the passage of the resolution, but, although his resignation was accepted by the President, the trial proceeded. The impeachment proceedings failed by the lack of a two thirds majority in the Senate for conviction.

Imperative Mandate. See REFERENDUM.

Impe'rialism, the national policy which tends toward the expansion of national domination and national ideas over a geographical area wider than that of national boundaries. Thus ancient Rome extended her dominion and system of government, attended with her laws and language first over the whole of Italy, then over Sicily, Northern Africa, Spain, Gaul, Greece, and parts of Asia. Charlemagne's idea was to hold France, Germany and Spain under one imperial head. Napoleon wished his empire to comprise all Europe. English nationalism has been partly a wide scheme of colonization, and partly as in India a plan for subjugating and Anglicizing a cluster of Oriental races. In the United States the term imperialism has been used in a more or less factitious sense. The avowed object of the government at Washington in the Spanish War was the liberation of Cuba from the Spanish yoke. The term "imperialism" was employed as a political catchword in the presidential campaign of 1900, especially with regard to the purchase of the Philippines. Yet the United States cannot scientifically be styled an empire, or likely to develop into an empire. The Supreme Court on 2 Dec. 1901 has, however, decided on the constitutionality of expansion. The principles settled by the decision are thus to be stated: (1) The Constitution does not follow the flag till it is planted on new territory by special act of Congress. (2) The extension of the sovereignty of the United States to new territory guarantees the enjoyment of liberty, the right to property and the protection of the United States to the people thus affected in securing justice and public order and promoting peaceful progress. (3) The islands acquired from Spain by the treaty of Paris are 'property of the United States,' and Congress can dispose of these islands in any way conducive to the interests of the people of the United States and of these islands.

A corollary of these propositions finds expression in the statement that the territory of the United States may be described under three heads: (1) The States. (2) Incorporated territories. (3) Unincorporated territory, belonging to the United States.

This gives to the nation three different classes of people dependent upon it: (1) Citizens vested with full political power, or the residents of the States. (2) Citizens of the incorporated territories, who are not vested with full political power as long as they are residents of the incorporated territories. (3) The people of the 'territory belonging to the United States,' as such, who cannot become citizens of the United States till Congress extends to such territory they occupy the privileges of the Constitution.

Impetigo, im-pē-ti'gō, popularly known as Pustular Tetter, Honey Scab, and Honey Sickness, a skin disease found mostly in children, consisting in an eruption of itching pustules, appearing in clusters, and terminating in a yellow, thin, scaly crust. They appear chiefly on the head and face, and sometimes on the hands. Feverishness and sensations of chilliness accompany the disease. The treatment is both external and internal, the former consisting in the application of ointments, etc., and the latter in the administering of various medicines calculated to improve and maintain the health of the patient.

Impeyan (im'pi an) **Pheasant**, a pheasant of the genus *Lophophorus* generally; specifically the species (*L. impeyanus*) of southern Kashmir, first brought to notice by Lord and Lady Impey. These are among the most splendidly clothed of birds, rivaling the humming-birds in the brilliance of their metallic hues. There are four or five species, each restricted to a particular region in southeastern Asia. The Himalayan species or Monal (*L. refulgens*) is the best known and is often exhibited in zoological gardens. The male is perhaps the most gorgeous of the *Phasianidæ*, presenting a wonderful combination of sparkling metallic purples, blues, browns and greens, with golden and coppery reflections and contrasting patches of snowy white and deep black; on the head is a crest composed of long racquet-shaped feathers. The female is plainly colored. High up in the mountains near the snow line the monal lives during the summer, breeding up to an elevation of 12,000 feet, but in the autumn, as the weather becomes cold, it gathers into flocks and descends to the deep woods or, in very severe weather, even to the cultivated lowlands. It both runs and flies swiftly, but is chiefly terrestrial, and feeds largely on roots and grubs dug from the ground. The impeyan pheasant has the black and white areas replaced by golden green.

Implements, Agricultural. See Agricultural Machinery and Implements.

Im'post, in architecture, the point at which an arch rests on the column, pier, or wall. It is often marked by horizontal moldings, though these may be absent. Imposts have received various names, according to their character. Thus, a continuous impost is one in which the moldings are carried perpendicularly down the pier, as in the later decorated Gothic; a discontinuous impost, one where the moldings abut, and are stopped on the pier; shafted imposts are those in which the arch moldings spring from a capital and differ from those of the pier.

Im'potency, a diseased condition of the male; in common law failure to consummate the marriage relation within three years is presumptive evidence, and constitutes a sufficient ground for divorce, or annulment of marriage.

Impress'ionism, the style of painting adopted by the Impressionists, a group of modern French painters, who held their first exhibition in Paris in 1877. This coterie included Claude Monet, Alfred Sisley, C. Pissarro, Auguste Pierre Renoir, and Berthe Morisot. These artists professed to have cut themselves free from all traditions of color, line or technique, and to paint things, not from what they had learned about things from other painters, but from what they saw in things. Their one immediate impression of a landscape, or a group of figures, they would transfer to the canvas without modifying one jot or tittle. «The Impressionist,» says Theodore Duret, one of their earliest critical interpreters, «sits down on the bank of a river, and the water takes its tones, in accordance with the condition of the sky, the angle of vision, the hour of the day, the stillness or agitation of the air. Without hesitation he sets upon his canvas exactly all the tints and tones which he sees in the water. The sky is overcast, the weather showery, he paints the water steely gray, dull, opaque. The sky is clear, the sun brilliant, he paints the water sparkling, silvery, azure blue. The wind blows, he paints the myriad hues of the rippling surface. The sun sets and darts his last rays into the water. The Impressionist smears yellow and crimson on his canvas. The winter comes. The Impressionist paints the snow, and as he sees that shadows cast upon the snow are blue he unhesitatingly paints blue shadows. Certain clayey soils seem to clothe the plains in lilac. The Impressionist therefore paints lilac landscapes. In the summer sunlight under the dim-lit arcades of green foliage, skin and clothes take a violet tint. The Impressionist paints them violet.» The French Impressionists claim Corot, Courbet and Manet for their fathers in art. It is certain that they owe much to Japanese masters. «Before our acquaintance with Japanese art,» says the critic already quoted, «painting kept on its course of falsehood, and Impressionism was impossible.»

Nevertheless, Impressionism is dying out, if it is not already dead in Paris, as Quilter some years ago stated. It has not taken any root in England, where the Pre-Raphaelite movement, with its idealism, linked to its freshness and originality of style, was the most recent dominating innovation. Among American artists it did, however, obtain some foothold, and Whistler, a great Anglo-American painter, began his

IMPEYAN PHEASANT (*Lophophorus impeyanus*).

career as an Impressionist, and though he did not continue on the extreme left of this radical school, he always was their friend and was willing to learn all they could teach him. In New York there are some survivors of the school, and Twachtner and Childe Hassam were for some years its exponents, and the death of the latter so early in life removed a really sincere and quickening influence in American art. It is certain that Twachtner never went to the extremes of the French Impressionists. He was one who felt their influence rather than a blind and literal follower of their theory. He was delicate and refined, as well as bold in color, and he cultivated to perfection what the French Impressionists sometimes seemed to neglect,— the sense of form as defined by the invisible line that divide the tones in a picture and in life, and which great painting defines with a magic and unerring accuracy that cannot be secured by daubing on the canvas a mass of tints in which color and value are everything and line nothing. Impressionism is chiefly notable as being a revolt from academic stiffness and conventionality, from slavery to certain pigments and methods of technique, long in use. It is a movement which has added fresh life to art by teaching the painter to use his eyes, and to trust them. Compare Sabrin, 'Science and Philosophy in Art' (1886); Duret, 'Les Peintres Impressionistes' (1878); 'French Impressionism' (in 'The International Monthly,' Vol. V. 1902); Duranty, 'La Nouvelle Peinture.'

Impress'ment, The right of changing one's natural allegiance (see CITIZEN; EMBARGO) was not acknowledged as a legal right in the 18th and early 19th century by any nation but the United States, which lacked power to enforce it against the world. Great Britain denied it, and Chancellor Kent early in the 19th century admitted that the denial was common law. During the Napoleonic wars, that country in its struggle for life especially on the seas, demanded the help of all its citizens; and not only refused to recognize any ceremonies of naturalization, but seized its alleged subjects wherever it found them, searching neutral vessels on the high seas and impressing into its service whoever were claimed as such. The naval officers were the reverse of particular whether they made mistakes and kidnaped born Americans, and many hundreds of the latter were impressed in this way. Not only this, but the right of search in itself, were rasping grievances which worked up the national temper to the pitch of explosion, resulting in the War of 1812; the right of search resulted in the bloody outrage of the Leopard on the Chesapeake (q.v.), which was one of the chief agencies in bringing about the Embargo.

Impris'onment is one of the three classes of punishment for crime, death and penal servitude being the other two. It has always been a power inherent in courts of justice to imprison for contempt of their authority, and under certain conditions for non-payment of debt. In criminal proceedings a person may, by a warrant of a justice of peace or magistrate, be imprisoned before trial, provided the justice considers it is not a proper case for allowing bail; and though in minor offenses an accused person may insist on being discharged on tendering sufficient bail, yet in more serious crimes it is in the discretion of the justice to accept or refuse the bail tendered, and on his refusal application may be made to judges of the common law courts to accept bail. Imprisonment may be with or without hard labor, or it may be solitary. Penal servitude may be inflicted for life, or any shorter term, but in the case both of imprisonment and penal servitude the convict can at any time apply for commutation or remission. In police and other petty offenses tried summarily at common law and under a variety of statutes, imprisonment is usually awarded with the option of a fine. The unlawful detention of the person by any one, or "false imprisonment," constitutes a personal injury, and may be treated as a criminal or as a civil offense. See DEBT.

Imprisonment for Debt is the restraint of the liberty of a debtor in a civil action. An arrest for debt is usually made by some mandate of a court having jurisdiction, after the nature and amount of the debt has been established by due process of law. But sometimes a debtor is restrained of his liberty on a preliminary proceeding, by order of a court, for the purpose of holding him to bail. In the United States, imprisonment for debt is made only by virtue of statutory regulations, several States having constitutional provisions prohibiting it under certain circumstances, and seven of them having absolutely prohibited restraint in any form of personal liberty on account of debt, by such provisions; namely, Alabama, Georgia, Maryland, Mississippi, Missouri, Tennessee, and Texas. Several of the States provide in their constitutions that there shall be no imprisonment for debt except in cases of fraud on the part of the debtor. In some of the States acts have been passed providing for imprisonment founded on contracts deliberately entered into, while others have provided that only absconding debtors shall be subject to imprisonment. The tendency of modern legislation is adverse to imprisonment for debt. Many of the States have provided in case of imprisonment that the restraint shall be made as free from indignity as is consistent with the safe-keeping of the debtor, and that his restraint shall be considered more in the nature of misfortune than as punishment for an offense.

Improved Order of Red Men, an American civic society, with benevolent and social characteristics, organized 14 Oct. 1833. Founded upon the manners, traditions and customs of the aborigines of the Western World, the Order adopted their unique figures of speech, which it transmits with historical accuracy. Knowing that some time the Indian race will become extinct it intends to occupy an original place in public interest as the repository of Indian customs, Indian traditions, and Indian nomenclature. The Order's motto is "Freedom, Friendship, and Charity." Its interpretation, as promulgated by official authority, may be concisely stated in these words: Freedom, in honor of that race to whom the forests, the plains, the hills, and the valleys of this land were as free as the air to the eagle, and in memory of the early struggles to wrest these United States from dependency to foreign rule. Friendship, to commemorate the unswerving loyalty with which an Indian maintained a noble and unselfish affection for him to whom it was plighted, and which makes sweet and lasting the relations that one member bears to another. Charity, the love expressed to a brother by those who meet around the brightly burning council fire; the sympathy which is pleased at his success, and the fraternal affection that grieves over his sorrows and disappointments.

Government.— The Order is organized along the familiar lines of civic societies. Its supreme power is the Great Council of the United States, and from this body emanates all authority for the establishment of local branches in towns and cities: also Great Councils in States and Territories and in the Dominion of Canada. State and Provincial Great Councils, under restricted delegated authority, exercise governmental oversight,— within their respective jurisdiction,— similar to that of the Great Council of the United States. Local branches of the order are: Tribes, Degree Councils, and Councils of the Degree of Pocahontas. The Great Council of the United States has for its chiefs, or officers, the presiding and executive official, who is called the Great Incohonee; the Great Senior Sagamore, second in authority; Great Junior Sagamore, third officer; Great Prophet, who is often a Past Great Incohonee; the Great Chief of Records, or Grand Secretary; the Great Keeper of Wampum, or Grand Treasurer; Great Tocakon, the messenger of the presiding officer, or Grand Marshal; the Great Minewa, an officer in charge of the inner wicket; and the Great Guard of the Forest, guardian of the outer door. State Great Councils have chiefs whose duties correspond to the officers of the supreme body, as follows: Great Sachem, presiding chief; Great Senior Sagamore, Great Junior Sagamore, Great Prophet, Great Chief of Records, Great Keeper of Wampum, Great Sannap, Great Mishinewa, Great Guard of Wigwam, Great Guard of Forest. The chiefs of a tribe are: The Sachem, who presides; Senior Sagamore, Junior Sagamore, Prophet, Chief of Records, Keeper of Wampum, Collector of Wampum, First and Second Sannap, four Warriors, four Braves, the Guard of the Wigwam, and Guard of the Forest. In Degree Councils the chiefs governing them are similar to those of a tribe. The Councils of Pocahontas admit white women to membership, and those of the order who have attained to the Chief's Degree. The chiefs of the council,— whose duties are defined in an ornate ritual,— are: Pocahontas, presiding officer; Wenonah, Powhatan, Keeper of Records, Collector of Wampum, Keeper of Wampum, First and Second Scout, First and Second Runner, two Counselors, four Warriors, Guard of Wigwam, and Guard of the Forest. Provision has also been made for the establishment of State Great Councils of the Degree of Pocahontas, similar in authority to those of the Tribal Branch, the officers of which run parallel with local councils. The names of the chiefs have the prefix of "great," and these Great Councils are given jurisdiction over this degree, all under the sovereignty of the Great Council of the United States. After various attempts to organize a branch for the "display element," legislation created, in 1899, the Red Men's League, with a uniform resembling the "Continental," and a perfect military code. Into this organization were merged prior uniformed bodies and beneficial councils. The adoption of consistent laws at once secured a continued increase in this branch of the Improved Order of Red Men.

Ritual.— The ceremonies of the Order are purely American. The ritual stands, and must ever stand, unique, and distinct, growing more valuable as the only realistic demonstration of those mystic ceremonies of the aborigines, which otherwise might fade into oblivion. Founded, as has been stated, on the manners, traditions, and customs of the American Indian, it portrays an existence more fascinating the longer it is studied, and gives the keynote to those bursts of eloquence which were at once the wonder and the admiration of the early missionaries, and of which the renowned "Black Hawk" is a shining example. The work of the Order is divided into three sections or degrees— the Adoption, the Warrior's, and Chief's,— each of which illustrates a phase of the characteristics mentioned. The degrees of the auxiliary branches of the Order are written in harmony with the general theme of the original ritual.

Nomenclature.— The attention arrested by the recital of this Order's official life is greatly enhanced when its terminology is considered. The expressions used not only differentiate the Improved Order of Red Men from other civic societies, but these form links connecting it with prior organizations of Red Men. This is further outlined in the "history" following. Time is not computed as in the common era, but according to a phraseology that has a hidden meaning and significance to the "initiated." Up to 1865, the Jewish style, namely, the year of the world, was used in dating documents. This was superseded by a revised system and "G. S. D.," or Great Sun of Discovery, was adopted, the year 1492 being considered G. S. D. 1. For convenience the year begins with that of the common era, and the enumeration follows: A year, *Great Sun;* a month, *Moon;* January, *Cold Moon;* February, *Snow Moon;* March, *Worm Moon;* April, *Plant Moon;* May, *Flower Moon;* June, *Hot Moon;* July, *Buck Moon;* August, *Sturgeon Moon;* September, *Corn Moon;* October, *Traveling Moon;* November, *Beaver Moon;* December, *Hunting Moon;* a week, *seven suns;* a day is a *sun*, and a night is a *sleep*. Morning is called the *rising of the sun;* evening, *setting of the sun;* noon, *high sun;* midnight, *low sun;* an hour is a *run*, and a minute a *breath*. Examples: 30 July 1903 A.D. would be expressed as "30th Sun, Buck Moon, G. S. D. 412," 1903—1491 = 412. "Tribes . . . shall, within two seven suns after the last council sleep in Hot and Hunting moons, transmit," etc. Wampum Belt signifies treasury, and wampum or money is computed as follows: *Fathom*, one dollar; *feet*, a dime, and an *inch* is one cent. To illustrate: "In case the wampum shall at any time be reduced to a less amount than five feet for each member, or to less than 50 fathoms, the tribe," etc. Non-members are called *pale faces;* tribal jurisdictions are *hunting grounds;* Great Councils govern *reservations;* opening and closing meetings consist of *kindling* and *quenching council fires;* minutes are called *records;* addresses or reports, *talks* or *long talks;* attending to business is *following the hunt*, and wronging another, *crossing the path*. *Wigwam* and *tepee* signify the halls of meeting, and *council chamber*, a room therein. Voting is called *twigging*.

History.— An attempt has been made to establish a succession from the patriotic societies of the American Revolution to the Improved Order of Red Men, but without much historical basis. That such organizations existed, there is no doubt. Moreover, the War of 1812, with England, served to foster the assembling and banding together of men fired with patriotic ardor. It is quite likely these associations may have led to the formation of the societies of Red Men,— possessing the terminology hereinbefore mentioned,— known to have flourished between the years 1813 and 1830, of which fragmentary records have been preserved. The impulse also may have come from the Tammany societies of the national period prior to 1812. A society of Red Men existed in Philadelphia, Pa., in 1824, and there were branches in other cities and States at earlier and later dates; but the movement, which began in Baltimore, Md., in 1833–4, really seems to be the authentic date of foundation. The Improved Order of Red Men was anti-convivial in its character, and was first brought into public prominence by the observance of Saint Tammany's Day (still on the calendar), 12 May 1837. The Order spread, and, on 20 May 1835, the Great Council of Maryland was instituted, and soon became an incorporated body. On 30 Jan. 1847 the Great Council of the United States was formed as the supreme government, and this, in turn, became a corporation, by special charter from the legislature of Pennsylvania, approved 30 March 1866. The policy of the Order has been to possess a legal standing in the State; and a brotherly hand extended early secured the adherence of the scattered bands of Red Men to the «improved» institution, so that unity of effort soon promised much for the future. The fortunes of the «Improved Order,» however, were fluctuating at first, and, until 1881, when it began to assume its present proud proportions of 350,000 members, embracing the entire republic, and reservations in Canada.

Impulse. This is a term used in mechanics to designate the «time integral» of a force. If the force is constant, the impulse it produces in a given time is the product of the force and the time in question. If the force is variable, its time of action may be divided into an infinite number of equal intervals. Then the impulse will be the sum of the products of each variable value of the force by the common infinitesimal time interval just defined. Impulse is a quantity of the same kind as momentum; that is, it is the product of mass and linear velocity.

It should be observed that in the cases of impulses in nature the forces are never infinite and their times of action never infinitesimal, though it is sometimes convenient to adopt these fictions in analysis. For the theory of impulses see especially Thomson and Tait's 'Natural Philosophy,' part I.

Imputa'tion, as a term in Protestant theology, is used to signify three things, first the imputation of the sin of Adam to all of his posterity, second the reckoning of the sins of man to Christ, third the reckoning of the righteousness of Christ to believers. Thus, on the theory of imputation the sin of Adam is so attributed to each individual of the human race as to be considered in the Divine counsels as the act of that individual, who is thus rendered guilty of it. When sin is spoken of as imputed to Christ it is meant that the condition or state which was actually man's becomes by imputation judicially his, and thus in law Christ became fitted to be a sacrifice and sin-offering for man. Had he not been man's substitute by the imputation of sin he could not have become his substitute in the endurance of the penalty of sin. The two are inseparably connected. In the very same sense in which Christ was made sin men are made the righteousness of God in him. According to this view he was made sin, not actually and personally, but by imputation; and men are made righteousness, not actually and personally, but by imputation.

Imus, ē'moos, Philippines, pueblo of the province of Cavite, Luzon, eight miles southeast of Cavite, the provincial capital; it is an important road centre. In 1896 it was the stronghold of the insurrection, Aguinaldo and other chiefs having their headquarters in its principal building. Pop. 14,700.

In-breeding, Evils of. See Breeding.

In Cœna Domini, ĭn sē'nä dom'ĭ nĭ, a papal bull, so called from its first words, it being annually read «at the Lord's Supper» on Holy Thursday. Its earliest form was that promulgated in 1363 by Urban V. against all heretics and favorers of heretics. The bull was annually promulgated at Rome till the year 1770, when a much modified document took its place, this in its turn being withdrawn by Pius IX. in 1869.

In Personam, spoken of legal rights, means such as are maintainable only against a specific person, and not against the whole world (see *in rem*). Rights *in personam* arise out of a specific engagement between individuals, or out of domestic or fiduciary relations. But the majority of rights *in personam* spring from the violation of rights either *in rem*, or *in personam*. A right once violated, a right of action against the violator immediately arises. An action brought against the violator is also called an action *in personam.*

In Rem, spoken of legal rights, means such rights as are not only maintainable against a specific person (see *in personam*) but can be maintained against the whole world. Nor are rights *in rem* limited to property rights, but include all rights, such as freedom from personal assault, from causeless imprisonment, from trespass. The term includes the right not only of suing for damages but of seizing and detaining certain articles. In admiralty practice this is a common resort, though in ordinary processes for the recovery of land or goods, it is rarely made use of nowadays.

Inagua, ē-nä'gwä, **Great and Little,** two of the Bahama Islands in the West Indies, at the southern extremity of the group. Great Inagua has an area of 660 square miles, and Little Inagua 36 square miles. The latter has few inhabitants. There is a considerable town on Great Inagua called Matthew Town, pop. (1900) 1,500.

Inaugura'tion Day, the day set aside for the inauguration of the President of the United States every four years on 4 March. It is said that Benjamin Franklin selected this date because in the next two centuries it would fall less often on Sunday than any other day in the year. President Washington took the oath the first time on 30 April, and Taylor and Hayes were inaugurated on Monday, 5 March. The same is true of Monroe's second inauguration, but his first was on the regular day. The second Adams, Pierce and Garfield were inaugurated on Friday. Five inaugurations have been on Monday and five on Wednesday.

Incarnation (from later Latin, *incarnatio*, first used by Irenæus, A.D. 180, derived from *in* and *carnem*, into flesh), the permanent assumption of human form or human nature by a divine personage. In the Christian religion, the incarnation signifies the assumption of human Nature by God in Jesus Christ. The classical statement is John 1:14, "And the Word became flesh, and tented among us." This is the central teaching of the Christian religion, and the source of its claim to universal acceptance and to finality. Very intimately bound up with it, though distinguishable from it, are the important teachings of the divine sonship of Christ, his sinlessness, his pre-existence and virgin birth, and inevitable deductions affecting the Trinity (q. v.) and the atonement (q. v.).

I. *Sources in the New Testament.*—(a) The gospels show how the disciples became convinced of the incarnation as a fact. The impression of the greatness of Christ's personality; his miracles, which showed his sovereign power over disease and nature; his sinlessness, proved not so much by express declaration and outward conduct as by a combination of the most penetrating ethical insight and moral power with an entire absence of any sense of sin or moral failure or need of forgiveness; the intimacy of his knowledge of God and communion with him; his claims that moral character and future salvation were decided by relation to himself; his assumption of authority to forgive sin, and his promises of rest to weary souls, who came to him; the experience of this forgiveness and rest in their own hearts — all predisposed the disciples to this belief. Yet the most powerful factor, taken in connection with the foregoing elements, was Jesus' claim to be the Messiah (q. v.), who had been prophesied in the Old Testament scriptures and was a familiar figure in the later current Jewish literature. This claim meant nothing less than that he would be the future judge of all men, the bringer of the supernatural kingdom of God, and king in that kingdom. This claim was acknowledged by Peter at Cæsarea Philippi with Christ's joyful approval, was constantly asserted by implications of more than human authority and by the use of the phrase, "Son of Man," which means nothing more nor less than Messiah, and was maintained, although Christ knew that it would cost him his life, in reply to the High Priest's question in the trial before the Sanhedrin. The resurrection, however, decisively and forever settled the matter in the mind of the disciples. After that event, they had no further doubts. John's gospel truly represents the growth of their faith to the climax, when Thomas calls the risen Jesus, "My Lord and my God."

(b) The early Church consequently proclaimed Jesus the Messiah, sitting not on David's throne, but at the right hand of God, and cited the resurrection as proof. They called Jesus Lord, using the very word used of Jehovah in the Septuagint, and in connections which exclude any other reference. The opening chapter of the earliest Pauline Epistle, 1 Thessalonians, associates God and Christ on terms of practical equality. 2 Cor. 4:4, 6, and Col. 1:15 assert that Christ is the image of the invisible God, cf. 2 Cor. 5:19. 1 Cor. 8:6, and Col. 1:16–18 make Christ the mediator of creation. 2 Cor. 3:17 identifies him with the divine Spirit, and, according to the best modern expositors, Paul in Rom. 9:5 calls him "God blessed forever." The earliest epistles already show that the pre-existence of Christ is no new idea to be explained and enforced, but the common property of Christians, cf. Rom. 8:3, 1 Cor. 15:47, 2 Cor. 8:9, Gal. 4:4. These thoughts are developed at length in Phil. 2:6–11 and Col. 1:15 20. The familiar and incidental reference to these teachings as matters of course in the belief of the Church dispose us to believe that they have their root in Christ's own declarations of pre-existence as recorded in John's gospel, John 17:5, 24, 8:58, 3:13, 6:62, 33, 38, 16:28, etc. The other New Testament writers shared these views of Christ's pre-existence, cf. Heb. 1:1–3, and 1 John 1:1–4. The Prologue of John 1:1–18, is the climax of the development of the teaching in the New Testament.

Historically viewed then, the early Christians believed without any doubts in the incarnation on the basis of a synthesis of proofs derived from Christ's personality, his moral spotlessness and force, his miracles, his Messianic claims, his resurrection and their own experience of his forgiving and renewing power, and not on the basis of the virgin birth, which is never mentioned outside the opening chapters of Luke and Matthew. This teaching however, was welcomed by men, who believed the fact of the incarnation, as an explanation of its method, and is accepted by most believers to-day in the same relation. It is therefore not essential to the teaching of the incarnation, which might have taken place in other ways, but is the gospel-given history of the method adopted by God to bring the incarnation about, and, logically considered, it is burdened by no more difficulties than any other possible method would probably be. It does not appear improbable to those who already believe in the incarnation. The historicity of the virgin birth has recently been keenly attacked on the most diverse grounds, principally by those who eliminate the supernatural. Its defenders are taking the position that though the reports of it were late in being disclosed, as shown by absence of mention of it in the rest of the New Testament, they are in fact the most archaic Christian documents. In support of this, they point to the Aramaic coloring of the narratives; their Hebrew background; their primitive Christian viewpoint; their simplicity, beauty, and delicacy; the reasons which immediately suggest themselves why such a story should be withheld till Jewish opposition had decreased, and the principal actors had passed from the stage; and their inexplicability on any other hypothesis than their truth.

II. *The Church Doctrine.*— The New Testament fails to give any answer to the questions of the exact relationship of Father, Son, and Holy Spirit, and of the manner in which the divine and the human in Christ were related to each other, and these matters formed the subject of the first great theological controversy, during which the teaching of the incarnation was defined and developed principally in opposition to misapprehensions of it by different parties and individuals within the Church.

(a) The earliest were the nearly opposite errors, Ebionitism (see EBIONITES) and Docetism (see DOCETÆ), both of which began in the 1st century and flourished during the second. The Ebionites were a sect of Jewish Christians who held that Jesus was naturally born, was merely a prophet, received an extraordinary enduement of the Spirit at his baptism, and was finally exalted to Lordship at his resurrection. It was merely Judaism in semi-Christian dress; against it the Fathers asserted the full teaching of the incarnation, and it soon passed away.

(b) Gnosticism (q. v.), which started with the assumption of the inherent evil of matter, almost necessarily drifted into Docetism, the doctrine that Christ could have no real relation to matter, that his body was merely apparent, a vision and delusion, or at least of a spiritual nature different from a human body, and not subject to suffering and death. This view was held in different forms and was shared also by Manichæism (see MANICHÆANS). It is a practical denial of the possibility of the union of the divine and the human. Docetism was very early. It seems to be opposed in 1 John 4:2, and 2 John 7. The apocryphal Gospel of Peter, discovered in 1886, is Docetic. It was attacked by Ignatius. The Fathers met it by an insistence on the real humanity of Christ. After large influence, it passed away with Gnosticism. Justin Martyr, Irenæus, Clement of Alexandria, Origen, and Tertullian were the principal theologians who defended and developed the teaching of the Church during this period.

(c) With Sabellianism (see MONARCHIANS, SABELLIUS), condemned in 262, began the real contest. Sabellius urged that the Trinity is not a trinity of persons in one substance, but merely three different or successive forms of the revelation of the one person. Christ was pre-existent because the one person persisted under the change of revelation-form. The Patripassians were Sabellians, who logically asserted that it was the Father who suffered on the cross. Sabellianism, variously modified, has constantly reappeared, and is now known as the doctrine of a modal Trinity. The controversy with Sabellianism did much to sharpen the definition of the Church.

(d) The greatest battle over the teaching of the incarnation was brought on by Arius (see ARIANISM; ARIUS), a presbyter of Alexandria, about 318. Arius held that Christ was a pre-existent divine being, but of a different essence from the Father (heteroousios), created by the Father out of nothing, but himself the creator of the world, and the incarnate Saviour. The Semi-Arians taught that Christ was not of a different essence from the Father, nor as the orthodox asserted, of the same essence (homoousios), but of a similar essence (homoiousios). This was a very elastic and ambiguous view. The great defenders of the coequality of the Son and the Father were Athanasius (q. v.), the father of orthodoxy, at one time called. "Athanasius versus mundum," Basil, Gregory of Nazianzen, and Gregory of Nyssa (q. v.). The whole Christian world rang with the contest, which culminated, but did not end, with the decision of the Council of Nicæa, the first œcumenical council, in 325 A.D., in these words, "We believe in one God, the Father Almighty, maker of all things visible and invisible. And in one Lord Jesus Christ, the Son of God, begotten of the Father (the only-begotten, that is, of the essence of the Father, God of God), Light of Light, very God of very God, begotten not made, being of one substance (homoousios) with the Father; by whom all things were made (both in heaven and in earth); who for us men, and for our salvation, came down and was incarnate and was made man; he suffered, and the third day he rose again, ascended into heaven; from thence he shall come and judge the quick and the dead." After a renewed struggle, this creed, slightly enlarged, was reasserted at the second œcumenical council at Constantinople, 381 A.D.

(e) Apollinarianism (see APOLLINARIANS), as well as Arianism, was condemned at this latter council. It was a reaction against Arianism, and taught that Christ had a human body and animal life, but that the pre-existent Logos took the place in Him of the human mind and spirit. Against this extreme, the Church protested that Christ had a real human soul as well as a real human body.

(f) Nestorius (q. v.), bishop of Constantinople, objected to calling Mary "the mother of God." This position led him, however, to join the human and divine in Christ so loosely that he was accused, probably unjustly, of giving Christ not only two natures but making Him two persons, at best a man inhabited by God. He was irregularly deposed at Ephesus in 431 A.D., but the verdict was generally accepted that the Church must insist on two natures vitally united in one person.

(g) The opposite extreme was attempted about 448 by Eutyches (q. v.), an abbot of Constantinople. He maintained that Christ had only one nature, a fusion of the human and divine, and something different from either. This period of controversy was closed by the celebrated formula of the council of Chalcedon (see CHALCEDON) 451 A.D. as follows: "We, then, following the Holy Fathers, all with one consent, teach men to confess one and the same Son, our Lord Jesus Christ, the same perfect in Godhead and also perfect in manhood: truly God and truly man, of a reasonable (rational) soul and body; consubstantial (coessential) with the Father according to the Godhead, and consubstantial with us according to the Manhood; in all things like unto us, without sin; begotten before all ages of the Father according to the Godhead, and in these latter days, for us and for our salvation, born of the Virgin Mary, the Mother of God, according to the Manhood; one and the same Christ, Son, Lord, Only-begotten, to be acknowledged in two natures, *inconfusedly, unchangeably, indivisibly, inseparably;* the distinction of natures being by no means taken away by the union but rather the property of each nature being preserved, and concurring in one Person and one Subsistence, not parted or divided into two persons, but one and the same Son, and only begotten, God the Word, the Lord Jesus Christ; as the prophets from the beginning (have declared) concerning him, and the Lord Jesus Christ himself has taught us, and the Creed of the Holy Fathers has handed down to us." This declaration has ever since been considered by the strictly orthodox the limit of human wisdom on this subject.

(h) Still it did not immediately end the controversy. Eutychianism revived in Monophysitism (see MONOPHYSITES), or the doctrine of one nature in Christ, which convulsed the Eastern Empire for more than a century; while its corollary, Monotheletism (see MONOTHELITES), the doctrine that Christ had one will, unfortunately induced the Church in the sixth œcumenical council at Constantinople in 689 A.D. to assert that will belongs to nature rather than to person, that consequently Christ had two wills, never at variance. This completed the orthodox statement.

III. *Modern Views.*—Since the Chalcedonian formula (see g above) followed the lines recommended by Pope Leo I., it was accepted by the Western Church, although it subsequently fell somewhat into the background before the development of the idea of the Church as the body of Christ. Briefly, though the incarnation was discussed in the Middle Ages, no progress was made, and the great Reformed Churches made, and still make, their Christological declarations on the basis of the Chalcedonian formula.

(a) While the great creeds and the great mass of the Christian Church still rest here, many modern Protestant scholars insist on reexamining this great central doctrine as they do all others, seeking a restatement more in accordance with modern points of view. There is an inclination, on the one hand, to magnify the incarnation as the great specifically Christian doctrine, and on the other, to object to the ancient definition of it as too fine-spun and metaphysical, going beyond what it is given men to know. These scholars insist on a revaluation of the scripture statements and the historical facts on which the doctrine is based, especially on giving to the fact of Christ's growth in knowledge and wisdom, and to his true humanity generally its proper weight, on proceeding on the lines of history and ethics, rather than on the lines of metaphysics. Many deem the ancient formulas full of bad psychology and impossible philosophy, and demand a restatement in line with the progress of human thought in other departments of knowledge. Many even of these, however, would agree that the general results of the earlier contest must be preserved as the expression of the universal faith of believers from the apostolic age to the present.

(b) The first of these attempts was made by the Socinians (see SOCINUS) in Poland in the 16th century. They rejected the Trinity, and held Christ to be not divine, but more than a mere man, in that he was conceived of a virgin, was absolutely holy, and was finally exalted to absolute power. The Socinians gave birth to the modern Unitarians (q. v.), who reject the deity of Christ, and in varying degrees look on him as the ideal of humanity, "the best we know," or, at least, as one of the prophets. This shades off into

(c) Pantheistic conceptions, to which Hegel gave a powerful impulse. There is an essential unity of the human and divine; humanity is itself divine. The pre-eminence of Jesus is seen in that he first awoke to the consciousness of this fact, and represents it in its purest and strongest form. The great body of Christian believers fail to find in the Unitarian or pantheistic statements a sufficient explanation of the Christ of history and experience.

(d) The Kenotic theories propounded by Thomasius, Gess, and Martensen, have a more orthodox origin and result. They are based on Phil. 2:6–8, especially the words "he emptied himself" (ekenosen), and are inspired by the desire to present the full human development of Christ. The Kenotists in varying degrees declare that the pre-existent Christ at the incarnation divested himself of the attributes of omnipotence, omniscience, and omnipresence, and *became* man, retaining, however, the essential attributes of truth, holiness, and love. By thus depotentiating the divine nature to the level of the capacity of the human, it was hoped to overcome the dualism of the ancient statement. These theories have had wide influence, but are severely criticized as metaphysically impossible.

(e) A theory of gradual or progressive incarnation was matured by Dorner (q. v.). There is no self-limitation of the pre-existent Logos, but a limitation of his self-communication to the human nature. Jesus Christ progressively became conscious of his divine nature and realized it fully only at the resurrection. Christ became conscious of his Godhood just as He became conscious of his manhood. Its opponents hold that this theory is Nestorianism in a more subtile form and does not really do away with dualism.

(f) The present dominant German theological school, the Ritschlian (see RITSCHL, ALBRECHT), follows a new method of procedure. Instead of beginning to discuss the incarnation with a consideration of the self-witness of Jesus or of the apostolic testimony, it begins with the Christian's experimental knowledge of Christ as Redeemer, and consequently asserts that none but the possessor of a Christian experience can have any real knowledge of his person. What the believer has learned of Christ in his experience leads him to call Jesus God, for none but God can do for the believer what Jesus has done. Christ is the full and perfect revelation of God in His grace and truth: Christ's will, too, is the will of God, namely, the establishment of the kingdom of God, and to found this was Christ's unique vocation in the world, a vocation to which he was absolutely true; in all his life and sufferings He was absolutely independent of and superior to the world, and so gained unlimited sovereignty over it. But if we meet God in Christ so as to *experience* the divine power and presence, God himself must be in Christ and in some true sense Christ must be God. How this can be is a matter of metaphysics which is insoluble and does not concern us. Ritschlianism thus attempts to prove the deity of Christ from experience, and to free Christianity from the entanglement of metaphysics on the one hand, and make it independent of the results of biblical criticism on the other. From such a viewpoint, it regards the doctrine of the two natures as a hindrance, and the virgin birth as a matter of indifference, something to be decided on the grounds of historical criticism. The tendency of the leading living theologians of the school is toward a personal pre-existence, and some form of the doctrine of the Trinity. Kaftan declares that "Christ's historical person stands in a connection of nature with God which is altogether unique and can never be repeated." (Consult Garvie, 'The Ritschlian Theology,' chap. IX.)

(g) The modern conceptions of the universe, and especially of evolution, have had their influence on the modern belief in the incarnation. (1) In many different schools of thought, the idea gains currency that the incarnation was an ethical, not a metaphysical, necessity of God's nature, a necessity of his love and grace, and would have occurred in some form, even if sin had never entered the world. The incarnation was no afterthought to repair an unforeseen calamity, but has its place in the eternal purpose of God alongside of and conditioning the plan of creation which made sinning possible. (2) Theistic evolution suggests not only that Christ is the consummate flower of the race, "the end and goal of the whole ascent of life, the perfect man beyond whom there can be none higher," but that this perfect man is raised to the throne of divinity. (3) It is also seen that the finality of the Christian religion can be guaranteed only on the ground of the deity of Jesus Christ; for if Christ was one like us, however superior to all who have yet existed, there is no certainty but that during the ages another may arise superior to Him. The incarnation is thus the central doctrine of Christianity, and its maintenance in some form or other is vital to its existence. See also CHRISTOLOGY.

FREDERICK L. ANDERSON,
Professor of New Testament Interpretation, Newton Theological Institution, Newton Centre, Mass.

Inca or **Ynca**, the name of a tribe of Peruvian Indians — not exclusively that of a royal family or caste, as has been commonly asserted. The members of this tribe sometimes called their war-chief "Cuzco," meaning chief or lord of Cuzco, but probably more often "the royal Inca," or simly "*the* Inca" (compare 'Royal Commentaries of the Yncas,' by Garcilasso de la Vega: Lisbon, 1609: Part I, chapters viii and xv). The latter usage was in the end adopted by Spanish chroniclers; and Garcilasso, half Spaniard, half Indian, in the 15th chapter of his commentaries, which were written, he tells us, 71 years after the conquest, uses both the longer and the abbreviated forms — "Yncas Kings" and "Yncas" — though feeling that he must explain that he means by the latter the "native kings of Peru." Throughout the tribe mother-right prevailed, and marriages were contracted between members of different clans: therefore offices could not descend from father to son; and especially the office of war-chief, or Inca *par eminence*, must usually have been filled by selection. The tribal dialect was called Quichua. See also PERU and SOUTH AMERICA.

Inca Semi-Civilization, the state of advancement in arts and learning reached by the most progressive tribe of South American Indians, occupying a portion of the Andean Sierra, and exercising control, in the regions now known as Peru, Ecuador, and northwestern Bolivia, over many other tribes of the highlands and lowlands before the Spanish conquest.

In the articles INCA, CUZCO, and PERU, reference has been made to certain popular misconceptions touching Inca government, chronology, and the tribal name. It is necessary to add that the evidence at present available is entirely insufficient to warrant such assertions as the following, which occurs in one of the leading works of reference: "The Inca was the absolute but, in most cases, *kindly* ruler. . . . In many respects the Inca government will compare favorably with any which at that time existed in Europe"; or this, from a popular account published in December 1903: "The far-famed Inca race had developed in pre-Columbian times an astonishing and marvellous civilization." Far from lending itself to such conclusions, the evidence furnished by Spanish writers of the 16th and 17th centuries, when their works are tested and corrected by a comparison with the results of modern archæological research, points to social conditions which cannot be ranked above semi-civilization. Moreover the objects collected by archæologists to illustrate or represent industrial and artistic activity in ancient Peru (especially the important Bandelier collection which was put in order at the American Museum of Natural History in 1904) in point of fact illustrate and represent the activities of a race very slightly elevated above semi-barbarism. In the customary treatment of their dead a lack of higher symbolism made itself felt oppressively: the crouched position of the body, bound in a tawdry pack, and the commonplace offerings buried with it suggested nothing better than the petty comforts, or ignoble miseries, of a life forever limited to alternating phases of servile toil, crouching rest, sensual indulgence, and childish diversions. The various tribes of the Sierra, from Quito to Lake Titicaca, were bound together by roads which ran from one highland village to another; the lowland Indians were held in subjection through fear alone, the Inca supremacy signifying to them a prolonged reign of terror.

Some of the war-chiefs may have been "kindly rulers": we shall, in all probability, never know whether they were or not. Cristoval de Molina, who described the "Fables and Rites of the Yncas," and who, in order to gain the knowledge of those rites which he imparts, "assembled," as he says, "a number of aged persons who had seen and participated in them in the days of Huayna Ccapac," believed that some definite, if scanty, records existed. He says: "It is so that these people had no knowledge of writing. But in a house of the sun called Poquen Cancha, which is near Cuzco, they had the life of each one of the Yncas, with the lands they conquered, *painted with figures* on certain boards." Another chronicler, Juan de Santa Cruz, who wrote about 1620, says: "I affirm that I have heard, from a child, the most ancient traditions and histories, the fables and barbarism of the heathen times, which are as follows." Such as these are the sources of our knowledge of the story of the Inca rulers. Some of the events in the lives of the war-chiefs were depicted, as valuable records or as parts of an ornamental design, in a "house of the sun"; otherwise all rests upon the prattle of Indian dotards and of Indian nurses. Accounts written by the conquerors themselves (for example, Xeres) leave almost everything to the imagination. We may be certain, at least, that tradition retained most accurately the traits of the last two or three native chiefs, whom the "aged persons had seen"; and though we may not condemn the unknown by reason of the credibly reported misconduct of the known, we shall be obliged to suspend judgment, instead of accepting the easy platitudes now current with respect to the succession of war-chiefs from Manco down to Huayna. The shameless private life of Huayna Ccapac is set forth in the 'Antiquities of Peru' by Juan de Santa Cruz. As for that great war-chief's still more famous son, we read in Garcilasso de la Vega's 'Royal Commentaries of the Yncas' (Book 9, chapters 35–37) that Atahualpa summoned all Incas of the blood royal to assemble at Cuzco, and put them to death. "The cruelty of Atahuallpa," says this historian, himself half Inca, "was greater than that of the Turks, for, not content with the blood of his own 200 brothers, the sons of the great Huayna Ccapac, he passed on to drink that of his nephews, uncles, and other relations . . . so that none of the blood royal might escape, whether legitimate or bastard. They were all murdered in different ways." The same fate was meted out to all the loyal captains of his rival Huascar; furthermore "he ordered all the women and children [of royal blood] to be assembled, of whatever age and condition, reserving only those who were dedicated to the sun in the convent of Cuzco. He ordered that they should be killed outside the city, by little and little, and by various cruel tortures, so that they might be long in dying." The varieties of ingenious tortures mentioned by Garcilasso are similar to those inflicted by North American aborigines upon captive women and children; and "though the work could have been done in a shorter time, they prolonged it in order to enjoy their cruelties more fully."

It appears to be altogether improbable that the Inca semi-civilization, if it had not been interrupted by the coming of the Spaniards, would have reached the height of 16th or 17th century European civilization, or by native merit have kept abreast of the advancing nations of the Old World. That the tribe had neglected to provide itself with a written language, and failed to develop high ideals in art, we have already noticed. A third essential for progress was equally wanting: the Incas had no money, or any medium of exchange corresponding to the wampum of the Indians who lived near the North Atlantic coast. But it is impossible for any people deprived of trustworthy records of human experience to construct a convincing system of morality; and without some convenient medium of exchange an extensive and pacific commerce is equally impossible. Both deductive and inductive methods of reasoning must, therefore, lead an unbiased student of old Peruvian institutions to the conclusions that, at home, inveterate and fully sanctioned practices made for degeneration; while steady blackmail, varied by occasional slave-raids, took the place of mutually beneficial dealings with neighboring, subject or independent tribes.

Limitations of the race's genius or experience may be exemplified in the department of music. The Inca musicians used drums which "were made by stretching a skin over a hoop of wood or over one end of a short section of the trunk of a tree which had been hollowed out to a thin cylinder" (compare 'The Musical Instruments of the Incas,' by Charles W. Mead, assistant, Department of Archæology, American Museum of Natural History). Other musical instruments of percussion in common use were copper bells, in form resembling sleigh-bells; rattles, made of small shells, gourds, and nuts, often strung together and attached to the wrists, ankles, or other parts of the body, in dancing; also cymbals of rudimentary form. Wind instruments were the syrinx or pan-pipe, consisting of reeds of graduated lengths, held in position by a crosspiece of split cane lashed to the reeds with a cord made of llama wool — the reeds being sometimes closed at the lower end, sometimes open, and occasionally arranged in double rows, yielding octaves; flutes, made of cane or bone, "simply tubes, open throughout their length, and all belonging to the class known as 'end-blown'," not scientifically constructed and not attuned one to another; resonator whistles, emitting several different notes; trumpets, made either of terra cotta or of conch shells,— primitive instruments, producing only four or five distinct tones (as shown by actual test of specimens taken from the ancient tombs); a double musical water bottle, consisting of two pottery vessels connected near the bottom in such a way that water passes freely from one to the other, and in its passage (when the vessels are swung backward and forward) forces air through an opening near the top, producing a series of whistling sounds; and finally the "cornets" mentioned by Garcilasso ('Royal Commentaries') and Herrera — instruments formed like the oboe, rather than the cornet in the modern sense. With this enumeration the list is exhausted. Such evidence as we have at the present time disproves the existence in Peru of any form of stringed instrument before the coming of the Spaniards. In other words, the unaided genius of the Inca Indians, exerting itself in the field of music, stopped short of the more complex instruments: ancient Peruvians were satisfied, as their Quichu and Aymara descendants are to-day, with the wild discords evoked from pan-pipes, flutes (or fifes), drums or clashing shells, all of rude construction.

And, as in music a great volume of sound — not harmony — was the desideratum, so in architecture they neglected beauty and strove to attain resistant mass, with walls as solid and homogeneous as possible — the prime essentials in a country shaken by destructive earthquakes; and their solicitude in this respect, which was less justified in Cuzco valley, suggests that the tribe, before the migration to which old legends refer, may have dwelt in the volcanic western part of the Sierra (see PERU). Hence the so-called "cyclopean" walls of the temples and palaces, structures built to endure, for which the builders utilized enormous stones of irregular shapes, fitted together so skilfully that mortar was not required.

It is safe to say that nearly all features of the ancient industrial life of the tribes inhabiting the Andean Sierra and Peruvian coast strip are either intimated or plainly shown by specimens in the Bandelier collection. With the utmost care products which are not properly to be classified as Incan have been separated from those showing the activities of the dominant race; and such care is obviously indispensable, for the Incan objects, though they may be discriminated by a trained archæologist, do not stand out from the rest quite unmistakably. One finds practically nothing to support the theory that there was ever a nearly unrelated, or a wholly distinct and marvellously superior, Inca civilization. Especially instructive are the examples of the potter's art which have been secured in great numbers — representing such different social classes as the warrior, musician, and water-carrier. Costumes, weapons, occupations, etc., are depicted faithfully, though without artistic charm. Fabrics of cotton, or woven from the wool of the llama, vicuña, and alpaca; looms, spindles, and colored threads, bear witness to the wide extension of the industry of weaving so often mentioned by early writers. Offerings made to the dead in the graves which have been explored (and, in the sacred cause of science, discreetly rifled) recall the fact that agriculture shared with warfare the distinction of being the chief occupation of able-bodied men. Inca women are shown to have been, like their Quichua descendants at the present time, eminently domestic in their tastes and employments, ruling supreme in the house, taking no part in public affairs, and perhaps never developing the characteristics of the Amazons who dwelt beyond the montaña in the region of tropical forests. Gold and silver appear to have been not less abundant — perhaps they were even more abundant — in the lowlands than in the highlands: at any rate vessels formed from the precious metals are found more commonly in the burial places near the coast. It is not to be supposed that the natives failed to appreciate the beauty and utility of silver, gold, and copper. An ingrained preference for the clumsy methods of barter — which the Quichuas have not even yet forsaken — prevented them from adopting any medium of exchange or setting apart one or more of the metals to be used as "money."

MARRION WILCOX.

In'cense, aromatic substances burned in religious rites on account of the sweet odor they emit. The custom of burning incense is ancient and widely spread. Among the Jews the practice was enjoined as part of the worship of the sanctuary (Ex. xxx. 27), the ingredients of the incense also being laid down, and it was to be burned on a special altar called the altar of incense. This altar was made of acacia (shittim) wood, and was overlaid with gold, hence it was called the golden altar, as distinguished from the altar of burnt-offering, which was made of brass. The incense was burned daily — morning and evening. Both the Greek and the Latin churches use incense in worship. Among Catholics it is used at every high mass, at consecration of churches, in processions, funerals, etc.

Inch, a lineal measure, the 12th part of a lineal foot, anciently said to consist of three barley corns. A statute of Edward II. (1324) makes "three barley corns round and dry" the definition of an inch. It is subdivided into halves for mechanical work, and for a scientific purpose decimally into thousandths, as in gunnery, and into ten thousandths by the makers of gauges. The English inch is equal to 2.54 centimetres. The old Scotch inch was slightly larger than the English.

Inch-worm. See MEASURING-WORMS.

Inch'bald, Elizabeth Simpson, English actress, dramatist, and novelist: b. Stanningfield, Suffolk, 15 Oct. 1753; d. London 1 Aug. 1821. In 1772 she was married to an actor named Inchbald, and the same year went upon the stage. She retired from this profession in 1789 and devoted herself to literature. Some of her plays, which belong to the class of high comedy, still keep the stage, but her greatest success was the novel 'A Simple Story' (1791), which was translated into several languages. She also wrote 'Nature and Art,' and among her plays may be cited: 'Such Things Are'; 'The Married Man'; 'The Wedding Day'; 'The Midnight Hour'; 'Every One Has His Fault'; and 'Lovers' Vows.'

Inclina'tion, Magnetic, or Magnetic Dip. See DIPPING NEEDLE.

Inclined Plane, one of the mechanical powers. When a body lies on an inclined plane part of its weight is supported; so that if a cord be fastened to it and pulled, a force less than the weight of the body, acting in a direction parallel to the plane, will prevent it from sliding, or will move it up the plane. Thus a heavy wagon is raised on an inclined road by a horse which would be quite unable to exert a pull equal to a quarter of the weight of the wagon. A body lifted by means of an inclined plane is moved through a greater distance than if it had been raised vertically, so that although the force employed may be smaller, it is exerted through a greater space. When the plane is smooth, so that friction may be neglected, the force parallel to the plane necessary to raise the body is equal to the weight of the body, multiplied by the vertical height through which it is lifted, divided by the distance it is moved along the plane. For instance, when a train moves up an incline which rises 3 feet for every 100 feet of rail, the engine exerts a pull equal to 3/100 of the weight (neglecting friction). Inclined plane railroads are common in the United States, the best known being located in Pittsburg and Cincinnati.

Income Tax, a tax levied directly from income of every description, whether derived from land, capital, or industry; first imposed in Great Britain in January 1799, during the ministry of Pitt, after the failure of an attempt to raise a revenue adequate to the exigencies of the period by trebling the amount of the assessed taxes. In the Pitt act incomes under $200 were exempted; the tax rose by a series of gradations till it reached 10 per cent, at which rate it was charged on all higher incomes. This tax was repealed in 1802, but was again imposed in the following year, though with a change of name to property tax, and a difference of rate.

But one income tax has been imposed by the United States government, arising from the necessities incident to the Rebellion. In 1861 Congress authorized a tax of 3 per cent on all incomes over $800 per annum. In July 1862 an act was passed taxing all incomes under $5,000 5 per cent, with an exemption of $600 and house-rent actually paid. Incomes in excess of $5,000 and under $10,000 were taxed 2½ per cent additional, and incomes over $10,000 5 per cent additional with no exemptions. Further taxes of 5 per cent on incomes of Americans living abroad and of 1½ per cent on incomes from United States securities were laid, these expiring in 1865. In 1864 a special tax of 5 per cent was imposed on incomes above $600. A readjustment the same year imposed a 5 per cent tax on incomes between $600 and $5,000; 10 per cent on incomes above $5,000. During Cleveland's second administration a bill was passed imposing a tax upon all incomes above $4,000. The constitutionality of the law was tested before the Supreme Court, which after a protracted hearing decided adversely by a majority of one.

Inconnu, ĭn-kŏ-nū', Fr. ăn-kŏ-nü', the French-Canadian name of a fish of the rivers that enter the Arctic Ocean (*Stenodus mackenzii*), intermediate between a salmon and a whitefish in its characteristics, and of great value as food for the people of that region.

Inco-ordina'tion, a lack of control over muscular movements. In inco-ordination there may be (1) some interruption in the paths of the motor impulses as sent from the motor areas in the brain to the muscle-centres in the spinal cord; or inco-ordination may result from (2) deficiency in the incoming sensory paths, thus causing an interference with the sense of muscular localization. One of the most familiar illustrations of inco-ordination is seen in acute alcoholism. In this condition the lack of motor control is largely due to interference in the conduction-paths of motor impulses. The intoxicated person is unable to control the movements of his hands to make them perform in their wonted fashion ordinary acts. In locomotor ataxia, a disease in which inco-ordination of the movements is very striking, the inco-ordination seems to result from a loss of muscle and joint sense, whereby the patient's mind is rendered unable accurately to realize just where his limbs are. Inco-ordination is a symptom of a number of different forms of poisoning, and is extremely characteristic in diseases such as locomotor ataxia, multiple sclerosis, chorea, and paralysis agitans. It is also found in a number of infantile diseases.

Incubator, a machine employed for the artificial hatching of chickens from eggs. Such devices were known to mankind from early ages. Pliny says that the Egyptians thus hatched 100,000,000 chickens a year. While artificial incubation was introduced into France and England during the 18th century, the incubator was brought to greatest perfection in the United States in the 19th century. The first patented invention of the modern incubator was in 1847, but any practical success in such machines cannot be met with before 1877, when Rouillier and Arnoult exhibited their hydro-incubators at the Paris Exposition.

There are two general classes of incubators, those in which hot air is used for the maintenance of heat and the application of it to the eggs, the other in which hot water serves this purpose. An automatic incubator of first class make is equally efficient whichever of these two heating mediums is employed, but there are many different types of machine offered for sale, and the struggle between cheapness and efficiency sometimes leads to the sacrifice of the latter. There are certain essentials to an incubator which must be attained at any cost, and the machine that is deficient in anyone of these is a failure, which means that it cannot guarantee to yield of living chicks at least 80 per cent. The following may be enumerated as absolute requisites in a good incubator: (1) An egg chamber heated at a uniform temperature. It is best that the heat should come from above, when it is likely to be reverberated from the floor of the chamber, and to more evenly affect the eggs, and may at once strike the germinal vesicle which from its lightness always rises to the upper surface of the yolk. (2) A source of heat which is self-regulative. The thermo-regulator in general use is actuated by an arm thrust within the egg chamber, and must be sensitive to an atmosphere ½° or at most 1° above that which is desired. (3) Good ventilation within the egg chamber, with some provision by which a certain degree of moisture may be maintained in the air. (4) Added to this, is a good turning apparatus. There are very many devices for effecting this purpose; perhaps the best is that of a tray fitting exactly over the tray in which the eggs are laid, and by the turning of which the eggs may be replaced in a reversed position in the applied tray.

Of course the aim of a true incubator is to reproduce as accurately as possible by artificial means the conditions of natural hatching under a sitting hen. Thus the supply of heat and air must be conformable to a fixed standard. The temperature is to be kept unchanged at 100° F., or a little above that, by placing the incubator in a room not exposed to draughts. To make accident in this respect impossible, a cellar, or specially built chamber, should be used, where no access of colder air may cause a fall in temperature, and a sensitive thermo-regulator furnish automatic means of preventing excessive heat from destroying the vitality of the eggs. Moisture must be preserved in the air of the egg chamber that the eggs may not be shriveled by excessive evaporation. There must also be adequate ventilation, that no harmful gases sicken or kill the hatching chick. The turning of the eggs is considered necessary, because the sitting fowl has the habit of so doing, but the eggs should not be disturbed after the 18th day, nor the incubator be opened after that date, until the hatch is completed. With regard to the moisture of the air, it has been considered proper, after studying the progress of evaporation, as reckoned from the loss of weight in a fertile egg during the process of hatching, that a humidity of 45 per cent is the safest degree of saturation.

Various ways have been resorted to of taking care of the chickens after they leave the incubator. They must at first be kept in an atmosphere of from 90° to 100°, at least for the first week, and heated places of shelter, known as brooders, must be prepared for them. There are many patterns and kinds of brooders, which are manufactured by the same firms as those which make incubators. The requisites for brooders are: (1) The temperature of the first week, as given above should be gradually lowered. (2) The greatest diligence should be applied to secure and maintain cleanliness, dryness, and good ventilation. (3) Their construction should be such that newly-hatched chickens may always be in view. As the chicks grow toward fledging, facilities should be afforded them to leave the brooder for exercise. See also POULTRY. Consult: Watson, 'Farm Poultry' (1901); Stoddard, 'The New Egg Farm' (1900).

In'cubus (Lat. «one who lies upon»), a spirit to whom was ascribed the oppression known by the common name of nightmare, in Greek *ephialtes* (from *epi*, and *hallomai*, I leap upon). These demons play an important part in the superstitions of the Middle Ages, having been perhaps not unfrequently employed, like the older gods of Greece, to cloak the advances of earthly lovers. See NIGHTMARE.

Incunab'ula, is a term applied by bibliographers to editions of books printed during the early period of the art, and is generally limited to works which appeared previous to 1500. The incunabula are divided into xylographic and typographic, the former those printed from engraved blocks, the latter from movable types. Among the most highly esteemed of the incunabula are those which are first editions of the ancient classics. See BIBLIOGRAPHY.

In'daja Palm. See ATTALEA.

Indemnity Contract, a form of contract which, while not of recent origin, is becoming much more common than formerly. Such a contract is any form of written agreement between two parties whereby one party agrees to indemnify or save harmless the other party for loss or damage arising out of a particular transaction, or against some specified claim of a third party. It is an original contract and must be in writing in order to come within the statute of frauds. Such contracts are frequently made in the form of a mortgage. But the substance and not the form is important, and the courts have usually given them a liberal construction with the intent of furnishing the party to be indemnified with all of the protection that was manifestly in the minds of the contracting parties when the contract was signed. Indemnity contracts are not adverse to public policy; but they are not binding when they undertake to protect persons against the consequences of illegal acts. Like other contracts, they must be founded on a sufficient consideration, and furnish indemnity only to the party named as indemnitee, and do not extend to a person having only a contingent or collateral interest in the subject matter of the contract.

Indepen'dence, Iowa, city and county-seat of Buchanan County, on the Wapsipinicon River, 70 miles southwest of Dubuque, and on the Rock Island and the Illinois Central R.R.'s. It is the centre of an extensive horse-breeding, farming and dairying region. There is located here the well known Rush Park, with its kite-shaped race track, the State insane asylum for northern Iowa, public library and other buildings. The electric-light plant and waterworks are owned by the municipality. Pop. (1890) 3,163; (1900) 3,656.

Independence, Kan., city and county-seat of Montgomery County; on the Verdigris River, 85 miles southwest of Fort Scott, and on the Atchison, T. & S. Fe and the Missouri P. R.R.'s. It is the centre and distributing point for a large agricultural section, and has cotton-mills, paper-mills, window-glass factories, flour-mills, cracker factories, brick works, planing-mills, and creameries. It has a public library, court house and other large buildings. Natural gas and oil wells are numerous near the city. Pop. (1890) 3,127; (1900) 4,851.

Independence, Mo., city and county-seat of Jackson County, five miles from Kansas City, on the Kansas C. & I., Missouri P. and the Chicago & A. R.R.'s. The city is considered a residential suburb of Kansas City. The town was settled in 1827, and in 1838 the Mormons' rendezvous was located here, and from hence the Latter-day Saints pursued their journey to Utah. Under the charter of 1889 the city is governed by a mayor and city council elected every two years. The electric-light plant is owned by the municipality. Pop. (1890) 6,380; (1900) 6,974.

Independence, Declaration of. See DECLARATION OF INDEPENDENCE.

Independence Hall, Philadelphia, a low plain brick building on Chestnut Street, begun in 1732 and completed in 1741, as a state-house for the colony of Pennsylvania, as closely connected with great national events as Faneuil Hall or the Old South in Boston. The architect was J. Kearsley, the builder E. Wooley. It was occupied as a state-house while unfinished, in 1735; the tower was added in 1750. Here the Continental Congress held its sessions; here Washington was appointed commander-in-chief of the Continental armies, on John Adams' motion; here the Declaration of Independence was adopted, and was read from its steps to the assembled crowds in front. The Convention of 1787 (q.v.), which framed the Constitution, was also held here. It is now kept as a museum of historical relics, especially of the Revolution.

Independent Catholic Church of the United States, a Polish religious body organized in Chicago, among disaffected Roman Catholics. Its founder, Rev. Anthony Kozlowski, attended one of the conferences of the Old Catholic Church in Europe and was there consecrated a bishop. The church has acquired considerable property in Chicago and has established a hospital, dispensary, orphanage, home for the aged, primary, grammar, high, and industrial schools. The society had in 1902 over 45,000 members, and 33 ministers and 43 churches.

Independent Order of Odd Fellows. See Odd Fellow.

Independent Telephony. In 1901-2, the expiration of numerous fundamental telephone patents enabled individual and independent companies to extend the telephone service to small communities, rural districts and farms in the West and Northwest. Many co-operative telephone lines were established in 1902 by farmers in the Middle West, and in 1903 it was estimated that 500,000 farms were in close communication by telephone with neighboring cities and commercial centres. The farmer finds that with the telephone he can keep in touch with the market, selling his produce or live stock when quotations are the most favorable. It is a common practice for the country doctor to give directions by telephone for caring for the patient, both diagnosing and prescribing. In Illinois the speeches of a political convention in 1903 were listened to by the farmers on a rural system as they sat in their homes from 15 to 36 miles away. Being in speaking distance of his neighbor, not only does the farmer feel a new sense of personal security, but he knows that his belongings are safer from molestation than they ever were before. The telephone has been instrumental in causing the arrest of many horsethieves and outlaws, and in some districts the farmers have almost broken up chicken stealing and petty larceny by telephoning the police and commission merchants of their losses, and thus enabling prompt arrests to be made.

An innovation in the use of the telephone which promises to be the vogue is already very popular. The local grocer or butcher, realizing that time is money, pays for the monthly rent of the telephone of any of his customers who spend $25 at his store during the month, or makes a corresponding discount for a smaller expenditure. He finds that in the increased amount of business coming through the greater ease of transmitting orders, and the reduction in his staff of order men, he can well afford to throw in the telephone service, which furthermore becomes a splendid advertisement for his store.

In the early days of the rural telephone the farmers were content to utilize their fence wires for intercommunication, and in many districts, particularly in the Western States, this method so reduced the cost of installation as to enable many communities to have a tolerably effective service, which otherwise would have had to go without any. But the farmers becoming more fastidious, demanded a better service. The systems employed range from a single line, with from three or four to a dozen instruments connected, to comprehensive systems covering entire counties and having hundreds of patrons. For instance, in Geauga County, Ohio, near Cleveland, where there is a population of about 14,000, there are over 1,000 patrons, the number in each township ranging from 50 to nearly 400. Great attention is paid to toll service, and the best construction and apparatus are insisted upon, as being in the long run the most economical. An example of the village and rural exchange is New Augusta, Ind., with 75 subscribers, 50 of whom are farmers, the most distant being about seven miles. When a single neighborhood line with a few instruments attached is desired, a switchboard is not necessary. The subscribers signal each other direct by giving different combinations of rings.

So easy has the organization of rural telephone systems become that it is safe to predict that within a decade the majority of the 4,000,000 farmers said to be yet unprovided with telephone service will have followed the example of their more enterprising brethren and brought themselves within touch of civilization. If any community wishes to install a system, no matter how limited, it has only to communicate with a reputable installation firm to receive the fullest and the clearest instructions as to how to go about it. A favorite method of organizing is for the farmers to form partnerships or co-operative (mutual) companies for the furnishing of service only to the locality in which the subscribers live. Sometimes the service is furnished by nearby telephone exchanges running lines into the rural districts.

In some places service cannot be given by city companies. In such case, the farmers can form themselves into a company, subscribe for the stock on pro rata or other basis, and install the system, running a direct line from their switchboard to that of the nearest town or city exchange. This is called the community system, the heart of which is the small switchboard, from which radiate in different directions the lines to which the various telephones are attached. See also, Telephone System, Independent.

In'dex Libro'rum Prohibito'rum ("list of prohibited books"), in the Roman Catholic Church, a title used to designate the catalogue or list of books prohibited by ecclesiastical authority, on account of heretical or immoral opinions supposed to be contained in them, or maintained by the authors or editors of them; when the list or catalogue is of books allowed to be read after correction or alteration, agreeably to the orders of the Papal authorities, it is termed *Index Expurgatorius*. Such prohibitory catalogues have been in use from a very early period in the history of the Church, commencing with a list of prohibited books drawn up by a council held at Rome in 494, or even earlier, with the proscription of the writings of Arius. These prohibitions, in fact, were often issued by other than the Papal authorities. In 1408 a synod at London prohibited the reading of the books of Wickliffe. In 1544 the Faculty of Theology in Paris published a catalogue of books censured by them, and in 1546 the University of Louvain published an index of books regarded as dangerous. The indexes of the Church were a subject of consideration at the Council of Trent, which referred the business of drawing up a complete index to a select committee under the Pope. Their Index was published in 1564, and besides the catalogue of prohibited books contains general rules relative to such books. In 1586 a special ecclesiastical board, the Congregation of the Index, was formed, with authority to judge of new works, to indicate those of which the reading is entirely prohibited, and those which are permitted after correction, etc. The most important editions are those of Alexander VII. in 1664, and of Benedict XIV. in 1744. An edition appeared in 1881, with a supplement in 1884. In 1607 the first volume of an 'Index Expurgatorius' was published at Rome. Pope Leo XIII. had a revision made of the Roman Index, and about 3,000 books were taken from the prohibited list.

India, also called **Hindustan** or **Indostan**, derived from the Persian form of the Sanskrit *sindhu*, a river, and signifying "the land beyond the Indus," is a name used both in ancient and modern times with great latitude of signification, and applied more or less comprehensively to the great central peninsula of southern Asia. The mainland of India proper is bounded north by the main range of the Himalaya Mountains; east by mountain ranges which divide it from Burma, southeast by the Bay of Bengal; south by the Gulf of Manaar, which separates it from Ceylon; west by the mountain chains enclosing the valley of the Indus, which separates it from Afghanistan and Baluchistan, and by the Indian Ocean. Its length north to south is nearly 2,000 miles; its greatest breadth east to west about 1,800 miles. It extends between lat. 8° 5′ and 35° 15′ N., and lon. 65° 45′ and 97° E.

Political Divisions.—Legally "British India" means all territory governed by the "King-Emperor" or "Kaisar-i-Hind," as the monarch of Great Britain is designated in Hindustan, together with any territories of native princes or rulers under the suzerainty of the King of England exercised through the Governor-General and Viceroy of India. They are as follows:

1 *Madras* (Area 141,726 sq. miles; pop. 38,209,436) was the most important of the three presidencies before Clive's conquest of Bengal. The people are chiefly Hindus, although there are at least a million native Christians. The languages spoken are principally Tamid and Telagu. It is ruled by a governor. The chief cities are Madras (509,346), Madura (105,984), and Trichinopoly (104,721).

2 *Bombay* (Area 125,144 sq. miles; pop. 18,584,496). The governor of Bombay administers Sind, and other districts. 77 percent of the people of the Presidency are Hindus, and 20 percent Moslems. The Parsis, the ancient fire worshippers from Persia, are very prominent in the City of Bombay. Marathi, Gujerati, Sindhi, and Kanarese are the principal languages. Chief cities, Bombay (977,822), Ahmadabad (185,889), Poona (153,320), Surat (119,306), Karachi (116,660).

3 *Bengal* (Area 115,819 sq. miles; pop. 50,722,067). Ruled by a lieutenant-governor. It comprises the districts of Bengal proper, Behar, Orissa, and Chota Nagpur; only 5 percent of the population live in towns. Nearly 78 percent are Hindus. Principal languages Bengali and Hindu. Chief cities, Calcutta (1,106,738), Patna (1,341,785).

4 *Eastern Bengal* and *Assam* (Area 106,130 sq. miles; pop. 30,961,459). Ruled by lieutenant-governors. Prinpal languages, Benga and Assamese. Chief city, Dacca (90,542).

5 *United Provinces* of *Agra* and *Oudh* (Area 107,164 sq. miles; pop. 47,691,782). Principal languages, Hindi and Behari. 85 percent of the population are Hindus and 14 percent Moslem. Chief cities, Allahabad (172,032), Agra (188,022), Benares (209,331), Lucknow (264,049), Cawnpur (197,170), Meerut (118,129).

6 *Punjab* (Area 97,209 sq. miles; pop. 20,330,339). Under the rule of a lieutenant-governor. More than half of the population are Moslems and one-third Hindus. Sikhism, the national religion of the province, numbers more than 2,000,000 adherents. The languages are Gurmuki or Punjabi and Handi. The chief cities, Lahore (202,964), Delhi (209,575), Amritsar, the sacred city of the Sikhs (162,429).

7 *Burma* (Area 236,738 sq. miles; pop. 10,490,624), the largest province in British India. Conquered and annexed, 1885. Ruled by a lieutenant-governor. The inhabitants are of Indu-Chinese stock. 90 percent are Buddhist. Principal language Burmese. Chief cities, Rangoon (234,881), Mandalay (183,816).

8 *Central Provinces* and *Berar* (Area 82,635 sq. miles; pop. 9,237,654). Ruled by a chief commissioner. The people are mostly Hindus, and speak Hindi and Marathi. Chief city, Nagpur (127,734).

9 *The North-West Frontier Province* (Area 16,466 sq. miles; pop. 2,125,480). Mainly Moslems, speaking Pushto, or the Afghan language. A chief commissioner administers the districts of Peshawar, Hazara, Kohat, Bannu, and Dera Ismail Khan, together with the political charges of Kurram, Malakand, Khiber, Tochi, Gomal, and Shirani. Chief city, Peshawar (95,147).

10 *Ajmer-Merawa* (Area 2,711 sq. miles; pop. 476,912). Administered by a chief commissioner. Chief city, Ajmer (pop. 73,839).

11 *Coorg* (Area 1,582 sq. miles; pop. 180,607). The resident of Mysore is ex-officio chief commissioner of Coorg.

12 *British Baluchistan* (Area 45,804 sq. miles; pop. 308,246). Under the governor-general's agent, who resides at Quetta.

13 *The Andemans* and *Nicobars* (Area 3,143 sq. miles; pop. 24,649). A chain of islands in the eastern part of the Bay of Bengal, administered by a chief commissioner and superintendent. Port Blair is a convict settlement of British India.

14 *The Laccadive Islands*, 14 in number, belong to the Madras presidency. Aden and Perim are protected chiefships and are legally part of the Bombay presidency.

There are a number of *Native States*, ruled by native princes who are responsible to the Viceroy of India for their good government. Attached to Bengal, with an area of 35,834 square miles, and a population in 1901 of 3,735,715, are the individual states of Orissa, Chota Nagpur, Kuch Behar, and Hill Tipperah; to the United Provinces of Agra and Oudh, with an area of 5,109 square miles, pop. 799,675, are Rampur and Garhwal; to the Panjab, with an area of 38,299 square miles, pop. 4,438,816—the chief states are Patiala, Bahawalpur, Kapurthala, Jind, and Nabha; to Madras, area 9,609 square miles, pop. 4,190,322—the chief states are Travancore and Cochin; to Bombay, area 69,045 square miles, pop. 6,891,691—the chief states are the Kathiawar group, Kolhapur, Rewa Kantha, Palanpur, Mahi Kantha, Cutch, and Khairpur (Sind); to Central Provinces, 29,435 square miles, pop. 1,983,496—the chief states are Patna, Kalchandi, Bastai, Bamra, and Raigarh.

The other native states and agencies are: the Rajputana Agency, including among others the states Jaipur, Jodhpur, Udaipur, Bikanir, Alwar, Bhartpur, and Jaisalmir, with a total area of 130,268 square miles and a pop. (1901) of 9,841,032; Central India Agency, including among others the states Gwalior, Rewa, Indore, and Bhopal, with a total area of 77,808 square miles and a pop. of 8,501,883; Baroda, area 8,226 square miles, pop. 1,950,927; Hyderabad, area 82,698 square miles, pop. 11,174,897; Mysore, area 27,936 square miles, pop. 5,538,482; and Kashmir, area 80,900 square miles, pop. 2,906,173. The total area of native states and agencies is thus 595,167 square miles, and their total population in 1891 66,050,479, in 1901 63,181,569.

The following native states, whilst they are independent of British rule, are treated as within the sphere of British influence: *Nepal*, of which a Maharajah is ruler; *Bhutan* and *Tibet*, whose relations to the British government are somewhat unsettled, having no British resident; and *Afghanistan*, governed by his Majesty Amir Abibullah Khan. (See AFGHANISTAN.)

Physical Features.—The natural boundaries of the peninsula of India, which forms a triangle washed on two sides by the sea, and having its base in the great mountain chain which separates it from Tibet on the north, are completed by its three great rivers, the Indus, the Ganges, and the Brahmaputra. These all rise in the Tibetan Mountains beyond the Himalayas, and the first flowing west, the two latter east, descend in a southern direction toward the sea; the Indus discharging itself into the Indian Ocean; the Ganges and the Brahmaputra, after watering in their separate course a large part of Northern India, uniting to pour their waters together by numerous mouths into the Bay of Bengal. The mountains enclosing the basins of these rivers form the east and west boundaries of the northern part of the peninsula. The Himalayas, the loftiest mountain range in the world, with heights of upward of five miles above the level of the sea, descend by successive slopes to the elevated plain of Northern India. (See INDUS, GANGES, BRAHMAPUTRA, HIMALAYA.) The entire peninsula is sometimes distinguished by three natural divisions. The Vindhya Mountains, a range of about 3,000 feet in height, which extends irregularly across the peninsula, from Gujarat to the basin of the Ganges, forms an anciently-recognized division into two parts under the names of Hindustan and the Deccan (Southern Land). The name Hindustan, given in this restricted sense to the northern part of the peninsula, is frequently applied to the whole. The ancient division of the Deccan is again subdivided into two, the name Deccan being restricted to the northern part, the southern from the river Krishna or Kistnah, which flows from west to east almost across the whole peninsula, being called Southern India or India south of the Krishna. The portion of India watered by the Ganges and its tributaries is by far the most fertile and populous of the whole. At no great distance from the opposite extremities of the Vindhya Mountains two great ranges proceed southward along the line of the coast. The Western Ghâts, which attain a height of 5,000 to 6,000 feet, though at some parts much lower, proceed along the west coast to Cape Comorin, the southernmost point of India. They do not generally recede more than 40 miles from the sea, and rarely more than 70. On the sea side their descent is generally precipitous, forming a regular sea-wall. On the land side they descend gradually, and sometimes almost imperceptibly, to the elevated plains of the interior. The Eastern Ghâts recede farther from the east coast, are less elevated and precipitous. Before reaching as far in their southern course as Madras, they trend inward, and unite with the transverse range of the Nilgiri Hills, which connects them with the Western Ghâts. This mountain-formed triangle encloses an elevated table-land with a gradual slope eastward from the Western Ghâts, and which is continued beyond the Eastern Ghâts to the sea. The elevation of the plain of Southern India also increases toward the south. In the Deccan it is about 3,000 feet above the level of the sea. In the neighborhood of the Nilgiri Hills, which rise 3,000 feet above it, it reaches 7,000 feet.

Hydrography.— The chief rivers of India besides the Indus, Ganges, and Brahmaputra, already named, are the Jamna, Ramganga, Gumti, Gogra, Gandak, Kusi, etc., tributaries of the Ganges; the five rivers of the Panjab, Satlej, Bias, Ravi, Chenab, and Jhilam, tributaries of the Indus; the Nerbudda, enclosed on its northern bank by the Vindhya Mountains, and the Tapti, which flow west into the Gulf of Cambay, the Mahánadi, the Godávari, the Kistna, North and South Pennar, Vellar, Kaveri, etc., all flowing eastward into the Bay of Bengal. The uniform direction of the great rivers south of the Tapti is explained by the inclination of the land already described. The coasts of India have very few indentations, and consequently very few good natural harbors. The western coast is known by the name of the Malabar, the eastern by that of the Coromandel coast. There are no lakes of any extent in India — Chilka and Kolair near the east coast being the largest.

Geology.— All the great mountain ranges are chiefly composed of granite and of granitic rocks, which form also the base of the plateau of the Deccan. Both in the peninsula and in the Himalayas gneiss predominates, associated with mica-schist, hornblende-schist, chlorite slate, and primitive limestone. Syenite prevails in the southeast of the peninsula. In the southern portion of the Western Ghâts the granitic rocks are overlaid by an iron clay, which is continuous to the end of the peninsula, and reappears in the island of Ceylon. In the upper portion of the Western Ghâts and adjoining ramifications of the Vindhya range, basaltic trap in various forms overlies the granite to an extent unparalleled elsewhere in the world. It entirely covers a large portion of the table-land of the Deccan. In this district trap and granite frequently pierce the surface in isolated masses, forming flat-topped hills nearly perpendicular, and which can only be ascended by steps, or winding, dangerous paths. These have been converted into strongholds from a remote antiquity. They are frequently crowned with forts, and form a peculiar feature of the landscape. On the lower sides of the Himalayas regular strata of the Secondary and Tertiary periods are largely developed. Many of the sandstones and shales of the Secondary period belong to the coal-measures. The Indian Tertiary formations attain their greatest breadth toward Sind and the Panjab, where fossil remains, including many of singular forms and gigantic dimensions, are abundant.

Mineral Resources.— The principal coal fields in India are found in the region bounded north by the Ganges, south by the Godávari, and stretching east and west from the neighborhood of Calcutta to the middle of the valley of the Narbada. Indian coal is distinguished by its excessive lamination. The annual production in India was 6,635,727 tons in 1901, from 427 collieries worked throughout Bengal, Hyderabad, Assam, Rewah, the Central Provinces, Panjab, Baluchistan, and Burma. The most important mines are those of the East Indian Railway Company near Giridhi (Bengal) and the Singareni mine in Hyderabad. Of the coal used on the railways 95 per cent is Indian coal. Iron ore is abundant in many parts of India, but the amount produced is still small. The only large iron-work in India is at Barrakur in Bengal, but iron is manufactured locally on a small scale in other parts of Bengal and in the central provinces. The chief obstacle to the successful development of the iron industry of India is the difficulty of finding the ore, fuel, and flux sufficiently near to one another to

make it profitable, but it is believed that iron-works near Calcutta, using Madras ore and Bengal coal, would succeed. Gold is worked to some extent, more especially in Mysore, the total production in 1900 being 513,266 ounces. Copper, lead, antimony, and other metals are fairly abundant. Burma yields a large amount of petroleum annually, and smaller quantities are obtained from Assam and the Panjab. The total output for 1900 was over 37,500,000 gallons, but much is still imported. There are valuable ruby mines in Upper Burma, and a few diamonds are still obtained in Central India. Salt is an important manufacture and source of revenue: its production is treated under the head of *Finance*.

Soils.— The alluvial deposits along the mountain valleys and in the plains, and the soil composed of disintegrated rock masses on the plateaus, are especially rich and of great productivity. Their fertility is greatly enhanced and maintained by an elaborate system of irrigation. See paragraph in this article on *Canals and Irrigation*.

Climate.— India extends 15½° within north tropical latitudes, and 12½° within the temperate zone. Owing to modifying circumstances, the climates contained within this range are not only extremely various, but distributed with great irregularity. One of the chief modifying circumstances is the distribution of moisture, the great regulators of which are the monsoons. The northeast monsoon blows from October to March, the southwest from April to September. The latter surcharged with vapor from the Indian Ocean condenses in torrents on the heights of the western Ghâts, and forms the rivers which flow to the east. Before it reaches the Coromandel coast, it becomes a dry wind which scorches up vegetation. In Hindustan, on the contrary, this wind passes over the low plains in the lower valley of the Indus, is arrested by the Himalayas, and fills the tributaries of the Ganges. The northeast monsoon runs a similar course in the opposite direction, but deriving less moisture from the Bay of Bengal, which is of less extent than the Indian Ocean, it has less influence on the climate, and its season is in general the dry one. The great plain of Southern India being exposed to greater heat than that of Hindustan, and not being watered by the snow-fed streams of the Himalayas, is naturally much less fertile. The seasons in India are divided into rainy, cool, and hot. The periods of these different seasons vary according to latitude and modifying circumstances. On the Malabar coast the rain begins earliest to the south. At Calcutta rain falls from June to October: the cool season begins about November, the hot season in February, the heat increasing gradually till May. In Calcutta where the mean annual temperature is about 79°, the range is from 50° to 85° F. In Bombay the mean annual temperature is about 82°, the range about 10°; in Madras mean about 84°, range 7° to 8°. The annual rainfall in India is much greater than that of England; but it is distributed with great irregularity. The basin of the Indus, including all Sind and the half of the Panjab, is an arid region with an annual rainfall under 15 inches. The high plateau in the interior of South India has an annual rainfall generally under 30 inches. On the whole Malabar coast the rainfall is over 75 inches; at Kananor it reaches 128 inches. On the Coromandel coast it is very much lower, being 45 inches at Vizagapatam, 50 inches at Madras, while farther south it falls below 30 inches. Between the arid region of the Indus and the Ganges runs a dry zone of 100 to 200 miles wide, including Lahore, Delhi, and Agra, with a rainfall between 15 and 30 inches. The valleys of the Tapti, the Nerbudda, the lower part of the Jamna, the Ganges, and the Brahmaputra, are generally over 30. Along the slopes of the Himalayas from Cashmere east to the boundaries of India, and southeast to the mouths of the Mahánadi runs a belt of country with a rainfall over 60 inches, within which is included the lower course of the Ganges. Within this is another belt, including a lower slope of the Himalayas, and the lower course of the Brahmaputra before its junction with the Ganges, in which the rainfall rises above 75 inches.

Forests.— The three most valuable timber trees of India are the teak (*Tectona grandis*), the sál or saul (*Shorea robusta*), and the deodar (*Cedrus Deodara*). The teak grows most luxuriantly along the Bombay coast, in Travancore and Cochin, and in Burma, but it is also abundant throughout much of Central India and elsewhere. The sál is the chief forest tree of the Himalayan slopes, from the Satlej eastward to Assam, and it grows also in the forests of Central India and the Eastern Ghâts. The home of the deodar is the northwestern Himalayas. Among the most valuable trees of the densely forested Western Ghâts from Kanara to Travancore and Mysore are teak, blackwood, bamboos, sandal-wood, a kind of ebony, and *Calophyllum inophyllum*, whose wood is prized for the spars of ships. In the United Provinces and neighboring districts the leading species are sál and several varieties of pines, and in the extensive jungles of the Ganges delta the most useful wood is that of the sundari (*Heretiera littoralis*). The forests of Assam yield sál, *Pinus Kasya*, caoutchouc (*Ficus elastica*), and other useful species, and plantations of teak, tun or toon (*Cedrela toona*), and sissoo (*Dalbergia sissoo*) have been laid out. Beside teak the Burmese forests contain ironwood and the cutch-tree (catechu). Before the formation of the Indian Forest Department the forests were recklessly destroyed by timber-cutters, nomadic cultivators, and others, but large forest areas in all the provinces have now been marked off as reserved forests under the immediate care of the forest officers, and other forest areas have been brought under partial conservancy. Timber-cutting and grazing have been either prohibited or restricted; and plantations of the more useful trees have been formed in many parts of the country. In every province a few of the most valuable timber trees are declared to be reserved trees, and can only be felled under special license. Forest revenue is raised by royalties on, or by the sale of, timber or other produce, and by the issue at specified fees of permits to graze cattle, or to extract for sale timber, firewood, charcoal, bamboos, canes, and other minor forest produce. The reserved forests now cover an area of more than 80,000 square miles, and the protected or partially conserved forests occupy other 30,000 square miles. Some of the native states, such as Mysore, Travancore, Baroda, and Kashmir, have followed the example of the British government.

Flora.— Where moisture is plentiful, as in the valley of the Ganges, vegetation is superabundant. The delta of the Ganges, in particular, called the Sunderbunds, is covered with dense jungle full of the largest wild animals, and the excessive vegetation renders most of the mouths unnavigable. There are many other similar tracts of extensive forest and jungle. On the Coromandel coast, on the other hand, the heat, which reaches 100° or 120° F., destroys vegetation, and the delta of the Indus from the southeast of the Panjab to the Ran, or great salt marsh of Kach (Cutch), forms a great sandy desert, continuous across the river with the desert of Baluchistan, and with a wide band stretching across the whole continent of Asia to Central Africa. In the various altitudes of the Himalayas forms of vegetable and animal life belonging to all the various climates from tropical to polar are to be found. These as well as the Western Gháts are magnificently wooded. Orchids, rhododendrons, and other valuable flowers are common. Among the staple natural products of India are rice, maize, wheat, barley, cotton, flax, hemp, jute, rhea, indigo, tea, coffee, sugarcane, opium, tobacco, ginger, pepper, cardamoms, palms bearing nuts which are extensively consumed, anise, dye-woods, etc. European fruits abound, and among indigenous fruits may be mentioned the mango, plantain, pomegranate, citron, date, almond, grape, pineapple, and tamarind. Palms, including the date, cocoanut, palmyra, betel-nut, and other species, the banyan, and bamboo, are common features of the vegetation.

Fauna.— The elephant, the rhinoceros, the camel, the tiger, a few lions in the northwest, the leopard, bears, hyena, jackal, wolf, and numerous smaller carnivora, the boar, antelopes, deer, wild ox, ass, sheep, and goat, monkeys in great variety, and the greater number of European quadrupeds are found. There are several large species of ox, such as the gaur or "bison" and the arnee or wild buffalo. Crocodiles, snakes (including the dreaded cobra), and reptiles in all varieties are very numerous; of birds, the eagle, vulture, falcons, peacock, parrots, kingfishers, mina-bird, partridge, quail, heron, stork, are characteristic species, and other varieties, both indigenous and common to other regions, are numerous. Fish are plentiful and in great variety both on the coasts and in the rivers.

Land Tenure and Revenue.— In India the state, or the monarch, has always enjoyed a share in the rent or profits from the land. Before the advent of the Mohammedans and the establishment of the Mogul Empire the almost universal unit for the purposes of revenue collection was the village community. In a village community land was held, not by private owners, but by cultivators occupying it under the village corporation, and the land revenue was collected from the head-man as representing the community. With the Mohammedan conquest new methods of revenue collection were introduced. The state claimed one third of the gross produce of the soil as its share, and entrusted its collection to persons who each agreed to pay a definite amount from the district assigned to him. These revenue farmers, known as *zamindars*, were often local magnates under the old Hindu system. Under British rule the aim has been to substitute private property in the soil, wherever practicable, for the older communal systems, and in consequence the zamindars, who were in no sense proprietors, have become so in several parts of British India, while in others the cultivating *rayots* (or *ryots*) have been raised to the status of peasant proprietors. The village community, however, in some form still exists both in British and in native territory.

The term "settlement" is applied in Indian revenue affairs to the process of assessing the land revenue demand. Occasionally, in newly acquired or specially backward tracts, the land revenue is assessed for a short term of years on a general review of the circumstances and capabilities of the land and people concerned; such a process is called a summary settlement. But a regular settlement is a more complicated affair, and consists of many stages. In the first place, every separate estate or holding is demarkated by permanent marks on the ground; and disputes between neighboring right-holders are investigated and decided. Every estate or holding is then surveyed and mapped, all boundary-marks, wells, and buildings being shown on the field or cadastral maps. After the field maps are prepared, the next process is to classify or record each field according to its productive value, as evidenced by its soil, the amount of its produce, or by the rent it pays. A record is at the same time drawn up of all rents paid, and of all rights, whether landlord rights, or tenant rights, or rights of user, over all the ground, buildings, wells, and trees shown in the map. Then the assessing officer (or settlement officer, as he is often called) compiles the information obtained for all the lands in a circle of villages; and on a review of all these data, of the past fiscal history of the tract, of the range of prices, of the accessibility of markets, and of other general considerations, he proposes rent rates or revenue rates for the several classes of lands in the circle. The rent rates or revenue rates proposed by the settlement officer, and the grounds on which they were based, are then investigated by a superior officer, and are not adopted until they have been accepted or modified by the latter.

In provinces where the zamindari tenure prevails, that is, where single proprietors or proprietary brotherhoods possess large estates of several hundreds or thousands of acres, the state revenue is assessed at an aliquot part (usually about one-half) of the ascertained or assumed rental. The revenue, though it is fixed with reference to acreage rates on the land actually cultivated, is assessed on, and is payable by, each estate as a whole; the assessment remains unchanged for the 30 years, or other period of the settlement; the proprietor can bring as much as he likes of his waste and fallow land under the plough; and it is only on re-assessment at the end of the term of the settlement that the state obtains any increase of revenue on account of the extensions of cultivation during the settlement period. In provinces where the rayatwari tenure prevails, that is, where each petty proprietor holds directly from the state, generally cultivates his own land, and has no landlord between himself and the government, the revenue is separately assessed at an acreage rate on each petty holding, and land revenue becomes payable at once, or

FEASTING THE IDOLS.

after a short term of grace in the case of uncleared lands, on all extensions of cultivation. The rayatwari proprietor is at liberty to throw up his holding, or any portion of it, at the beginning of any year, after reasonable notice; the zamindar, or large proprietor, engages to pay the revenue assessed upon him for the term of the settlement.

The land revenue assessment was fixed permanently more than 100 years ago on the greater part of Bengal, about a third of Madras, and certain southern tracts of the Northwest now the United Provinces, paying in all about $14,250,000 a year. In the temporarily settled tracts, comprising the rest of India, it is fixed periodically for terms of 12 to 30 years. In the nine chief provinces (Bengal, Bombay and Sind, Madras, the United Provinces of Agra and Oudh, Central Provinces, Panjab, Burma, Assam, Berar) the number of rayatwari holders is about 273,000, of whom none belong to Bengal, Panjab, and the United Provinces and Oudh. The total number of zamindars and village communities is about 318,500, of which only Sind and Berar have none. The total number of holdings is thus about 591,500. In the greater part of Bengal land is held by zamindars under a permanent settlement, but the tenants are protected by recent legislation. The rayatwari system is the prevalent one in Madras, and in Bombay a similar system has been established. In the latter province the cultivators are now protected by law against the extortions of the money-lenders. The village community is still common in the United Provinces and the Panjab. In Oudh much of the land is held by talukdars, who have been granted certain privileges which are denied to the zamindars.

Agriculture.— The total area accounted for in the agricultural returns for 1901 is 546,000,000 acres, of which 66½ millions are under forest, 135½ million not available for cultivation, and 147½ million culturable waste and current fallows. The net crop-yielding area is thus 198½ million acres, or, taking account of land cropped several times in a year, 223½ million acres The three chief food-grains of India are rice, millet, and wheat. Rice is the staple food of about a third of the population, and is grown on 75 million acres, but it is nevertheless essentially a local crop, which can be cultivated with profit only under exceptional circumstances. Of the total rice area 40 million acres belong to Bengal, where it is the staple crop, and about 7 million each to Madras and Burma. Over 90 per cent of the cultivated area of Lower Burma is under rice, and it is grown on nearly three quarters of the area of Assam, about one third of that of the Central Provinces, a quarter of that of Oudh, while it is of importance also in the United Provinces and Sind. It is grown to a less extent in the Panjab and Bombay. Rice is also cultivated by hill tribes in all parts of India. In Bengal there are two chief rice harvests in the year, the *áus* or early crop, chiefly for local consumption, and the *áman* or winter crop, chiefly for export; but in Lower Burma, whence most of the exported Indian rice comes, there is but one harvest, corresponding to the Bengal winter crop. The total area under wheat is 24 million acres, mainly in the Panjab (7½ million), where it is the leading crop, the United Provinces of Agra and Oudh, the Central Provinces, Bombay, Central India, and Bengal. Taking India as a whole, it may be broadly affirmed that the staple food-grain is neither rice nor wheat, but millet. The area under the various kinds of millet and maize is 43 million acres, chiefly in Bombay (13½ million), where these are the chief food crops; Madras, where also, though to a less extent, millets are the chief food-grains; Panjab, United Provinces, Berar, in which millets are by far the most important food crops; Central Provinces, Sind, Oudh, Bengal, and Upper Burma. The chief varieties of millet grown in India are *joár*, or *jawári*, or *cholam*, great millet (*Sorghum vulgare*); *bájra*, or *kambu*, spiked millet (*Pennisetum typhoideum*); and *ragí*, or *náchani* (*Eleusine corocana*), grown chiefly in Southern India. About 8 million acres are sown with barley, chiefly in the upper Ganges valley, the Himalayan valleys, and the Panjab. Gram crops or pulses, especially chick-pea, green-gram, horse-gram, lentil, and pigeon-pea, occupy 10 million acres, mainly in the United Provinces of Agra and Oudh, the Panjab, and Bengal. The large native demand for oil has been reinforced in recent times by a rapidly-increasing foreign demand, and in consequence the cultivation of oil-seeds has greatly developed. They are grown in many parts as a second crop on ground from which rice or some other food crop has already been taken. The chief varieties cultivated are linseed, rape-seed, sesamum (*til* or gingelly), and castor-oil, and the total area occupied by them is 22 million acres, chiefly in Bengal, Bombay, and Sind, Madras, Central Provinces, and Panjab. The area under ground-nuts in Bombay and Madras is about 170,000 acres. The cultivation of vegetables for household use is general, and near some of the towns it is carried on more extensively. Potatoes thrive best in the more elevated tracts. Among cultivated fruits are the mango, guava, orange, melon, citron, lime, fig, plantain, pineapple, pomegranate, tamarind, shaddock, jack, papaw, and custard-apple. The area under sugar-cane is about 2,800,000 acres in Bengal (especially Orissa), United Provinces, Panjab, Oudh, Madras, and Bombay. Jaggery sugar is made from the bastard date-palm, which is grown for this purpose in the neighborhood of Calcutta and in northeastern Madras. The tea crop is one of great and increasing importance, and occupies about half a million acres, of which 330,000 are in Assam, the rest being in Bengal, Panjab, United Provinces, Madras, Burma, and native states. With the exception of a few hundred acres in Burma, Assam, etc., the whole of the coffee-growing area, amounting to about 280,000 acres, is in Southern India, in Mysore, Kurg, Madras, Travancore, and Cochin. The chief cinchona plantations are the government ones at Darjiling and in the Nilgiris. The tree was introduced by the Indian government.

Cotton is one of the most valuable vegetable productions of India. The total area under the cotton-plant is 14,000,000 acres, distributed thus: Bombay and Sind (3,900,000), Berar (2,500,000), Hyderabad (1,700,000), Madras (1,400,000), United Provinces of Agra and Oudh (1,250,000), Panjab (1,200,000), Central Provinces (1,000,000), and smaller areas in Central India, Rajputana, Burma, and Bengal. Next in importance to cotton among Indian fibres comes jute, which is cultivated in eastern Bengal along the valleys of the Ganges and the Brahmaputra, occupying fully two million acres. The cultivation of the mulberry, for the rearing of the silk-worm, is chiefly carried on in eastern and northern Bengal, with Murshidabad as a centre. The indigo industry is one of the oldest in India, but it is at present in a languishing condition. The area under the plant is about 964,000 acres, chiefly in Bengal (300,000), United Provinces of Agra and Oudh, Madras, and Panjab. The opium poppy is cultivated in certain parts of western Bengal and the United Provinces of Agra and Oudh, in the Panjab, and in the native states of Rajputana and Central India, occupying in all about 600,000 acres. (See below under *Finance*.) Tobacco is grown in every district for local consumption. Among the numerous minor cultivated vegetable products of India are turmeric, chillies, ginger, coriander, aniseed, black cummin, fenugreek, pepper, cardamoms, betel-pepper, areca or betel-nut palm, cocoanut palm, palmyra palm, and date-palm. Experimental cultivation of rhea, rubber, sisal-hemp, and other valuable economic plants has been carried out on the experimental farms maintained by government in various parts of the country.

Stockraising.— Horned cattle are used in agricultural operations throughout all India, except Sind and the Panjab, where camels generally take their place. The total number of cattle in India is over 100 millions, of sheep and goats 40 millions, of horses, ponies, mules, and donkeys, 2½ millions, and of camels about a quarter of a million. There are large numbers of buffaloes in all parts of the country. A public veterinary department has been organized to attend to the improvement of the breeds of horses, ponies, mules, and cattle, the prevention of disease among domestic animals, and the provision of veterinary instruction. Its operations are mainly confined to Northern India, where the conditions are most favorable for the breeding of horses for military purposes.

Commerce.— From a very early period down till comparatively recent times Western traders visited India in order to obtain the gold and silver, jewels, spices, and other costly products for which India was then celebrated, but the present foreign trade of India has developed under British rule and rests on an entirely different basis. In the year 1700 the total value of the exports from India was under $5,000,000, in 1834 the value had risen to $50,000,000, and now goods and treasure to the value of about $400,000,000 are exported every year. In 1899–1900 the total value of private imports by sea (excluding treasure) was $235,706,200, of government imports of stores, $15,308,725; total of all imports other than treasure, $251,014,925. The total value of private exports of Indian merchandise was $352,379,510, of foreign merchandise re-exported $10,975,525, of government exports of stores $357,115; total of all exports other than treasure, $363,712,150. Treasure was imported to the value of $69,912,285 and exported to the value of $26,521,295. Thus, including treasure, the total exports by sea amounted to $390,233,445, and the total imports to $320,027,210, the total sea-borne trade being $711,160,655. The exports by land in the same year were valued at $18,800,925, and the imports by land at $23,529,025. Thus, the total trade of India by land and sea amounted in 1899–1900 to $753,490,605. The chief articles of import were: cotton woven goods, metals and hardware, oils, chiefly petroleum, sugar, railway material, machinery and mill-work, cotton yarns, chemicals, medicines, dyes, woolen goods, silk, raw and manufactured, provisions, liquors, and apparel. The chief exports were: jute, raw and woven, husked rice, hides and skins, oil-seeds, raw cotton, tea, opium, cotton yarns, wheat, indigo, coffee, raw wool, and cotton woven goods. The proportion of trade directly with European countries is about 63½ per cent, omitting the trade with Egypt, much of which really goes to Europe. The trade with the United Kingdom is over 70 per cent of the trade with Europe and nearly 45 per cent of the total trade. Next to the United Kingdom, the chief countries trading with India are China, Germany, United States, Straits Settlements, France, Japan, Belgium, Ceylon, Austria-Hungary, Italy, and Russia. The figures for 1900–1 show that, while Indian imports of American goods were valued at only some $49,000, Indian exports to America amounted to $241,640. The chief articles of export appear to be gunny bags and cloth, of which latter America takes more than all other countries. The trade of India with America, however, is only of short standing, but, wisely organized, is capable of being greatly expanded. At present Germany supplies many things this country should furnish, particularly in the electrical and chemical lines, in which it at present holds the market. Other important articles of Indian export are tea, jute and jute manufactures, wheat, oil-seeds, rice, leather, wool, indigo, coffee, teak-wood, cotton, and lac. The share of the five chief seaports of India in the total foreign trade (excluding treasure and government stores) in 1899–1900 was as follows: Calcutta, $264,130,000; Bombay, $188,230,000; Rangoon, $40,590,000; Karáchi, $35,170,000; Madras, $32,180,000. India has many other seaports of minor importance. The value of merchandise and treasure carried in coasting vessels during 1899–1900 was $135,470,000. The trade across the land frontiers is steadily increasing, the chief item among imports being food grains, and among exports cotton goods. Much greater than her trade with foreign countries is the internal trade of India, but no returns of its amount are available. It is mostly in the hands of natives, and to a large extent in those of particular groups or castes. It is still carried on, as it has long been, at village markets, town bazaars, religious fairs, and similar gatherings, but the development of railway and canal communication and the transformation in the system of agriculture have greatly altered its character in many ways.

Manufactures.— The domestic industries of India, such as weaving and spinning, pottery, brass-work, iron-work, and art work of many kinds, continue to be practised after ancient methods all over the continent of India. But Indian fabrics and products, made on a small scale by workers at their homes, have for years past been giving way before the cheaper, less artistic, and often less durable cotton yarn and fabrics, and the iron or steel products of British factories. Meanwhile an important manufacturing industry has been growing up, and steam-power factories are at work, among which those for spinning and weaving cotton, for spinning and weaving jute, for making paper, for husking and cleaning rice, for sawing timber, and for brewing beer, are the most important. Steam power is also largely employed in factories, on tea gardens, and indigo estates. In 1900 the number of cotton-mills in British India and native states was 186, containing 38,420 looms and 4,728,000 spindles, and giving employment to 163,000 persons. Of these mills 136 were in Bombay Province (80 in Bombay City), the rest being in Madras, Bengal, Central Provinces, United Provinces, Burma, Panjab, and Berar, besides some of the native states. The number of jute-mills was 33 in 1899–1900, containing 14,021 looms and 293,218 spindles, and employing over 100,000 persons. All the jute-mills are in Bengal, except one in Cawnpore, which is the chief manufacturing centre of the United Provinces. Four woolen mills produce blankets, serges, and cloths worn by the army and the police. The largest brewery is at Murree, in the Panjab Himalayas. Among other industrial works of importance are silk-mills, soap-factories, tanneries, iron and brass foundries, sugar-factories, coffee-works, cotton-presses and ginning-factories, jute-presses, rope-factories, oil-mills, cutch and lac factories, flour-mills, ice-factories, pottery and tile factories, bone-crushing works, tobacco and cigar factories, silk filatures, glass-factories, dye-works, indigo-factories (over 5,000), printing-presses, and dairy farms. The total number of persons employed in all these manufacturing industries is about 700,000. The present Indian Factory Act came into force at the beginning of 1892. The daily wages of a man employed in a factory vary, according to locality, from 2 to 4 annas (4 to 8 cents).

Shipping and Navigation.— In 1897–8, 9,759 vessels of 7,784,630 tons burden entered and cleared the ports in British India, as against 8,613 vessels of 9,625,317 tons in 1901–2. Of these in the latter period 3,988 were of British nationality, 2,003 native, 1,289 British Indian, and 1,333 foreign; included in these numbers were 1,644 steam vessels of 4,299,948 tons entering and clearing via the Suez Canal. In 1901–2 115 vessels of 4,833 tonnage, were built in Indian ports, 81 in Bombay, 13 in Madras, and 10 in Sind.

Railways and Roads.—The first Indian railway, from Bombay to Thana, was opened in 1853. The main trunk lines constructed from that time till about 1875 were built and managed by private companies on whose capital the Indian government guaranteed a fixed rate of interest, generally 5 per cent. The government in return for this assistance, exercised a general control over the companies, and reserved the right of buying the undertakings at specified dates on stated terms. In 1870 Lord Mayo initiated the policy of railway construction by direct state agency, but in more recent times several lines have been constructed by «assisted companies.» Several of these latter lines have been taken over by government. There are also native state railways constructed from capital raised in native states, but generally worked by a staff employed by the government of India or by the trunk railway companies to whose lines they serve as feeders.

The importance of railroads in India is largely increased, in a governmental sense, by reason of their forming strategical links between the various military cantonments through which the vast Indian population is held in check by a comparatively small army of British soldiers. This, more than any other incentive, has hastened the development of railways in India.

The main lines are two in number, and are known as the Bombay-Calcutta and the Bombay-Madras lines. The former crosses the great northern plain, the latter the great southern plain of India, and are both connected by means of branch lines with all the large cities of the empire — the capitals of the rajahs, maharajahs and nabobs. These two great trunk lines have also been extended to the farthest limits of India, and even into adjoining territories, as where the line which crosses the Indus at Sukkur enters Afghanistan, the terminus being not more than 60 miles from Kandahar. There is also the Burman line, which passes up the valley of the Irawaddy in the direction of the Chinese frontier. These three main lines, with their several offshoots, may be roughly sketched as follows: In the north, a direct line from Bombay on the west coast to Calcutta on the east coast; a line to Benares from Bombay; a direct line from Calcutta to Peshawar, on the Afghanistan border, by way of Benares, Delhi and Lahore; a line from Lahore to Karachi, with the branch line between these two cities to Kandahar. In the south, the main line between Bombay and Madras through Hyderabad; the line from Bombay to Goa, and from Goa to Madras, with lines connecting with Calicut and with the line from Madras to Tuticorin in the south. In Indo-China, the main line from Rangoon to the Chinese frontier, by way of Mandalay, and with an extension to Bhamo and another to Meaday. (It is proposed to extend the Bhamo line to Bishi and the main line to Yun-nan in China with offshoots to Tching-tou and Hai-pong.)

The total mileage of railways in India on 31 December was distributed as follows: State lines worked by the state, 5,884; state lines worked by companies, 11,654; total state lines, 17,538. Lines owned by native states and worked by state railway agency or by the states themselves, 1,314; native state lines worked by companies, 1,560; total native state lines, 2,874. Total of lines owned by government and native state, 20,412. Lines worked by guaranteed companies, 2,663; lines worked by assisted companies, 1,518; total private lines, 4,181. The total capital outlay of these railways till the end of 1900 was slightly over $1,000,000,000; the total number of passengers carried in 1900 was 117,613,218; and the total weight of goods carried slightly over 43,000,000 tons. The chief highways are well metalled with a kind of limestone called *kankar*, but in Lower Bengal and similar districts, where there is no available stone, roughly-made bricks are used for road-metal. Many of the roads are planted with avenues of trees. The total length of roads in India maintained by public authorities is over 152,000 miles, of which over 36,000 miles are metalled.

Posts, Telegraphs, and Telephones.— The number of post-offices in India in 1899–1900 was 10,823, and the length of postal lines 91,534 miles. The total number of letters and post-cards carried was 448,868,998; of packets of every kind, 509,006,476. Adding the district post lines and the political and military lines administered by the Imperial post-office, the total length of the lines over which mails were carried was 127,934 miles. The Indian telegraph system now consists (1900) of 52,909 miles of line, 170,766 miles of wire, and 283 miles of cable. The number of telegraph offices is about 5.000, and the annual number of messages over 6.000,000. There are telephone companies at important towns, such as Bombay, Calcutta. Karáchi, Madras. Maulmain. Rangoon, and Ahmadabad. India is now in direct telegraphic communication with the Straits Settlements and the Australian colonies, with Europe via Suez, via Teheran, and via Turkey, with the East Coast of Africa, and with China via Bhamo.

Canals and Irrigation.— In some parts of India, such as Sind, cultivation is impossible without irrigation, while in others, such as much of Lower Bengal, irrigation may be regarded as quite unnecessary; but in the greater part of all the provinces the rainfall is either insufficient for the proper cultivation of the soil, or so uncertain as to expose the agriculturists to the constant risk of scarcity and even of actual famine. Hitherto irrigation has had only a secondary place in the governmental development of India, the attention of the administration having run more to railways. The profit on the railways is, on an average, 5 per cent, while on the expenditure on irrigation works on which only $125,000,000 have been spent, the profit has averaged 7⅓ per cent; on the Eastern Jumna canals the profits rise to 25 per cent. The annual irrigation expenditure under the present Indian budget comes to only $7,500,000 for major and minor works together.

In 1903 it was proposed by a special commission that the sum of $150.000.000 be devoted to irrigation works, the expenditure to be spread over 25 years. This period is regarded by some as too long, and they think it should be curtailed by one-half, as the question is urgent from both the political and economic point of view. While not considering the expenditure on railways excessive, seeing their military importance, it is felt that they have more than sufficient capacity for draining away all the produce of the country, to which it is time to cry a halt, and to devote more money and attention to works that will extend and stimulate production. The larger irrigation works have been found unprofitable in four districts only, and in those the loss has been very small.

Many of the irrigation works now administered by the Public Works Department are simply old native works restored, and in some cases extended or improved. The total irrigated area of India is about 37 million acres. Tank irrigation is common in some districts, especially in Southern India, and the tanks are mostly of native origin. Many old tanks, however, have been repaired or improved by the British government, and new ones have been constructed in Madras (where there are now 60.000 tanks), the Bombay Deccan, and Ajmir Merwara: In parts of Baluchistan, where the rainfall is scanty and capricious, water for irrigation purposes is drawn from underground springs by means of tunnels driven into the hill-sides. The most common method of irrigation in India, however, is that by wells, which prevails over large areas in all the provinces. Canal irrigation was practised to some extent by the native rulers, but all the important canals have been constructed since the British occupation. Irrigation canals are of two kinds, inundation and perennial. The latter are furnished with permanent headworks and weirs, and are capable of irrigating large areas throughout the year, independently of the local rainfall; while the latter, which are peculiar to Sind and the Panjab, are simply earthen channels supplied with water by the annual rise in May of the Indus and its affluents. Many of the perennial canals are, either in whole or in part, used for navigation, and there are, besides, a few canals used for navigation alone. The total length of irrigation canals in operation was 42.352 miles, of which 12.497 miles were main canals and the rest distributaries. The total mileage of navigable canals in Bengal, Panjab, United Provinces of Agra and Oudh, and Madras is fully 4.000 miles, of which about 1,600 miles are for navigation only.

The total area irrigated by canals in Bengal exceeds 720,000 acres, and the length of irrigation canals is 3.381 miles, of which 747 miles are main canals. Of these canals 495 miles are open to navigation, and there are besides 1.339 miles of canals used for navigation only, thus giving a total length of 1.834 miles of navigable canals. The area in the United Provinces of Agra and Oudh irrigated by canals exceeds 2.800,000 acres, over 1½ million acres being irrigated by the Upper and Lower Ganges Canals (q.v.), and the total length of irrigation canals is 12.534 miles, 1.554 miles being main canals. Of these canals 537 miles are open to navigation. Over 5.000.000 acres in the Panjab are irrigated by canals, the total length of these being 12.069 miles, of which 3.478 are main canals, 432 miles of the latter being utilized for navigation also. Three million acres are irrigated by canals in Madras, and rather more by tanks and in other ways. The total length of irrigation canals in the province is 10.522 miles, of which 3.474 are main canals. The total length of canals used for navigation is 1,252 miles, of which 262 miles are for navigation only. In Bombay proper the canals are generally small, and they are usually associated with storage reservoirs. Taking Bombay and Sind together, the total irrigated area is 1.700,000 acres; the length of irrigation canals 3.801 miles, of which 3.240 miles are main canals. There are no large irrigation works in Lower Burma, but a considerable amount has been expended on river embankment and drainage works, and on making navigable channels. The chief work in Upper Burma is the Mandalay Canal.

Money, Weights, and Measures.— By an act passed in 1835 a uniform monetary system was established throughout India, with the Madras silver rupee of 180 grains, 11/12 fine, as the monetary unit. The rupee was subdivided into 16 annas, and each anna into 12 pies (or four pice). Silver was made the universal standard of value, and the silver rupee and half-rupee were declared to be legal tender to any amount. The other smaller coins were made legal tender up to the value of one rupee; 100.000 rupees are called a lakh or lac, and 100 lakhs a crore. Under this system large sums are punctuated differently from the usual European method. For instance, the Indian Post-Office Savings banks' statistics show that in 1900–1 816.651 depositors had to their credit 100.432.569 rupees, or, according to the Indian method, crores 10, lakhs 04, rupees 32.569.

The coins under this system are: Silver — Rupee, half-rupee, quarter-rupee; Bronze or Copper — Three pies (or a pice), six pies, one pie. There are also gold coins called mohurs, but they are not a legal tender, and there is no fixed ratio between them and the silver coins. Small payments in the bazaars are made in cowries, of which from 2,500 to 5,000 are equivalent to one rupee. The rupee was formerly valued at 48 cents, but it has fluctuated greatly, mainly downwards. In January 1895 it was nearly as low as 24 cents; at present it is about 32 cents. In view of the steady depreciation of silver, and the consequent financial embarrassments and burdens to which the government of India was subjected in its dealings with gold-standard countries, an act was passed by the Governor-general's Legislative Council in 1893 under which the Indian mints were closed to the free coinage of silver. On 15 Sept. 1899 a further act was passed, by which gold coins issued from the Royal Mint in England, or any branch of the Royal Mint, were made legal tender at the rate of 15 rupees to the sovereign. Arrangements are being made for the coinage of gold in India. By an act of 1861 and some subsequent acts, promissory notes for amounts varying from 5 to 10,000 rupees have been emitted under the authority of a public issue department. Currency circles have been established from time to time, and these notes are legal tender only within the circle of issue. They are payable at the place of issue and also at the capital city of the presidency in which the place of issue is situated.

By the Measures of Length Act of 1889 the British imperial yard of 3 feet or 36 inches was made the standard of length for the whole of British India. The most important of the old native measures of length was the *guz* of Bengal, which was practically equal to a yard. An act was passed in 1871 to prepare the way for the adoption of a uniform system of weights and measures of capacity throughout British India. The unit and standard of weight established by the act is the *ser*, which is equal to a kilogram or 2 1-5 lbs. The unit of capacity was declared to be a measure containing one ser of water, at its maximum density, weighed in a vacuum, and is thus equal to a litre or 1¾ pint. Among native weights the most important are the tola (Bengal) of 180 grains, and the imperial or Indian maund of 40 seers, equal to 82 2-7 lbs.

Government.— The government of the Indian empire is regulated by an act passed in 1858, by which all the territories formerly possessed by the East India Company are transferred to the crown, and all the powers of the said Company exercised in name of the sovereign, all taxes being received and disposed of for the purposes of the government of India alone. His majesty's secretary of state for India is invested with the powers formerly exercised by the Company or the board of control, and he must countersign all orders and warrants under his majesty's sign-manual. He is assisted by a council of from 10 to 15 members, the greater number of whom must be persons who have resided 10 years in India, and have not left it more than 10 years previous to their appointment. The secretary for India fills up vacancies in the council. The members receive a salary of $6,000 a year payable out of the revenues of India, and they hold their office for 10 years. All orders sent to India must be signed by the secretary, and all dispatches from the Indian government must be addressed to him. The executive authority in India is vested in the governor-general or viceroy appointed by the crown, and acting under the direction of the secretary of state for India. He has a salary of 250,000 rupees, or about $83,500. The governor-general in council has power to make laws for all persons, whether British or native, within the dominions subject to the British crown, and for all British subjects residing in allied native states. His council consists of five ordinary members and one extraordinary member, namely, the commander-in-chief. The ordinary members preside over the departments of home affairs, foreign affairs, finances, revenue and agriculture, military administration, legislation, and public works, and together with a certain number (not less than 10 nor more than 16, by the act of 1892) of "additional members for making laws and regulations," appointed by the viceroy, form a legislative council. The meetings of the legislative council are open to the public, and the governor of the province in which a meeting is held is a member for the time being. The members may discuss the annual financial statement, and ask questions about it, but they are not allowed to propose resolutions or to divide the council. The whole of India is now divided into a number of separate provinces, each with a separate administration of its own, but all subordinate to the supreme government at Calcutta, the capital. These are not all on exactly the same footing nor ruled by officials having the same title. Two of them, Bombay and Madras, are each under the rule of a governor, appointed by the crown, and assisted by a separate executive council. Bengal, the United Provinces of Agra and Oudh, the Panjab, and Burma are each under a lieutenant-governor, appointed by the governor-general with the approval of the crown, and the lieutenant-governor of the United Provinces is also chief commissioner of Oudh. The head of the government in Assam and the Central Provinces is a chief commissioner, appointed by the governor-general in council. The two governors and the four lieutenant-governors are each assisted by a legislative council similar to that of the governor-general. Ajmir Merwara, Berar, and Kurg are under the more immediate control of the central government.

Finance.— The gross revenue of India in 1899–1900 was $343,185,820, and the gross expenditure charged against revenue $329,312,705. In addition, there is a capital outlay on railways and irrigation not charged against revenue, amounting in 1899–1900 to over $20,000,000. The total public debt of India on 31 March 1900, was $995,637,675, of which $374,915,670 represented the debt in India, and the rest the debt in England. The largest item in the revenue is that derived from land, which amounted in the year under review to $89,376,150. (See paragraph on *Land Tenure and Revenue.*) The revenue from forests was $6,177,125, and the total amount of tribute received from native states was $2,933,015. The revenue from opium amounted to $22,009,610, but the net revenue is less than that amount by about $8,500,000. The opium revenue is raised partly by a monopoly in Bengal, and partly by the levy of a duty on all opium exported from native states. The cultivation of the opium poppy is absolutely prohibited in British territory, except in certain parts of Bengal and the United Provinces of Agra and Oudh, but a few thousand acres in the Panjab grow it for local consumption. The opium grower in the monopoly districts receives advances from government to enable him to prepare the land for the crop, and he is required to deliver the whole of his produce to government agents at the fixed price of 6 rupees per seer. The manufacture for the foreign market is carried on only in the government factories at Patna and Ghazipur, and the chests of manufactured opium are sold by auction at monthly sales in Calcutta. Outside of British territory opium (known as Malwa opium) is cultivated in the native states of Rajputana and Central India, and some of these states have agreed to control the manufacture and sale of opium in much the same way as the Indian government does in British territory. They levy heavy duties on opium exported from their territories for the China market, and the Indian treasury imposes on all such opium a duty now fixed at $166.66 per chest. The revenue from taxation is $201,000,000, the chief item in it being the salt revenue, $29,252,315. The salt revenue is raised by a duty on all salt imported into, or manufactured in India, the duty being now 2½ rupees (80 cents) per maund, except in Burma, where it is 1 rupee (32 cents) per maund. The native sources of salt supply are the coast, especially the Rann of Cutch (Baragra salt) and Maurypur (Sind), the salt lakes and pits (especially Sambhar Lake) of Rajputana, and the salt mines (especially the Mayo mine) of the Panjab. Bengal and most of Burma import their salt by sea, much of it coming from England. Several native chiefs have entrusted the management of their salt sources to the British authorities in return for certain payments. The excise accounts for $19,299,710 of the revenue from taxation. The only excisable articles are intoxicating liquors (including toddy, palm-wines, and rice-beer), and certain drugs (opium, ganja, bhang, charas), and the aim of the government in taxing these has been as much to reduce consumption as to raise revenue. The government treats the right to manufacture and the right to sell spirits at state monopolies, which are granted to individuals on special terms. Throughout Bombay and the Panjab, the most populous tracts of Madras, the United Provinces, Oudh, and Burma, and in some parts of Bengal and the Central Provinces, the central distillery system in some form prevails, and a still-head duty is levied on all spirits manufactured at the recognized distilleries. Except in Madras and some other parts, these central distilleries are government establishments at which private persons distil spirits. In other districts the spirit revenue is raised by farming out the spirit monopoly to the highest bidder, or by licensing the establishment of private stills, the latter method being called the out-still system. The Indian government is replacing the farming and out-still systems as far as possible by the central distillery system. The customs revenue amounted in 1899–1900 to $15,353,140. Import duties were abolished in India in 1882, but in 1894 they were reimposed, and now all goods, with the exception of railway material and industrial machinery, food grains, coal, jute, wool, and other raw materials, gold and unset precious stones, and some other commodities, are subject to import duty. The amount of the duty is generally 5 per cent, but petroleum is charged at the rate of 1 anna per gallon, and iron and steel are subject to a duty of only 1 per cent. Since 1896 all cotton yarns imported into or manufactured in India have been duty-free, while all woven cotton goods imported from abroad, or manufactured at power-mills in India, pay an *ad valorem* duty of 3½ per cent. There is an export duty on rice and rice-flour of 3 annas per maund of unhusked rice. A countervailing duty on bounty-fed sugar came into force in March 1899. The revenue from stamps was $16,327,385. The provincial rates, amounting to $12,493,925, are levied mostly on the land to meet local charges for roads, schools, etc., and are generally collected with the land revenue. The income tax, which yielded $6,501,425 in 1899–1900, is levied at the rate of four or five pie per rupee, certain incomes being exempted. Other important heads of revenue are: Post-office, telegraphs, and mint, $11,680,890; civil departments, $5,876,500; railways, $82,939,225; irrigation, $13,087,880; buildings and roads, $2,209,000. The chief elements in the expenditure are: Railways, $82,555,430; army, $74,250,000; civil salaries, etc., $47,987,720; charges of collection, $22,244,195; buildings and roads, civil and military, $20,673,260; miscellaneous civil charges (furlough and superannuation allowances, pensions paid in England, etc.), $17,565,690; irrigation, $12,208,825; famine relief and insurance, $10,494,240; post-office, telegraphs, and mint, $8,427,935; interest on public debt, etc., $6,711,415; refundings, compensations, drawbacks, etc., $7,295,000.

Army and Navy.— The army in India is under a commander-in-chief, who is under the control of the Indian government, and has directly under him four lieutenant-generals commanding respectively the forces in Bengal, the Panjab, Madras, and Bombay. The Indian army numbers usually from 215,000 to 220,000 in all, the native soldiers being twice as many as the Europeans. The native troops are officered by Englishmen. Wherever European troops are stationed there is always a larger native force, and in many of the smaller and less important posts there is a native force only. Much money has been spent in recent years on defensive works and military establishments, strategic roads, etc. India has also a certain number of vessels for coast defense.

Ethnology— India is inhabited by numerous peoples belonging to several distinct groups or families. Previous to the Mohammedan ascendency the dominant race were the Hindus, who, however, were not the aboriginal inhabitants nor even the first invaders. From the northwest of India, through Kashmir and down the valley of the Indus, and from Tibet through the passes of the Himalayas, the inhabitants of Northern Asia from a very early period migrated southward to the milder and more fertile plains of India. Two great successions of these invasions are recognized as having taken place before the period of authentic history. The first immigrants, of dubious ethnological connections, but commonly known as the Tamil races, appear to have overspread the entire peninsula. Following them the Sanskrit-speaking peoples, called the Hindus, of Aryan speech, dispossessed the Tamil races, and superseded their language in the whole of India north of the Nerbudda. The Hindus subsequently descended into the peninsula and penetrated as far as Cape Comorin; but though their influence on the languages of Southern India was considerable in the way of introducing

YOUNG BRAHMIN AND WIFE.

new terms, the grammar and construction of the Tamil languages maintained their place in the districts south of the Nerbudda. The native tribes were not exterminated by these invasions, but are still to be found under various names, as Bhils, Catties, Coolies, Gonds, etc., inhabiting the fastnesses of the mountain-ranges in Bengal, the Vindhya and Satpura Mountains, the Ghâts, etc. The hill tribes and other aborigines in all India are estimated at 70,000,000.

Population.— The first census of all India was taken in 1871–2, but it was not till that of 1891 was taken that a really reliable and comprehensive statistical account of the people of India was available. In 1871–2 the total population of India was returned at 240,931,521, in 1881 at 253,793,514, in 1891 at 287,223,431, in 1901 at 294,266,701, of which, as shown under *Political Divisions,* 231,085,132 were under immediate British authority. The total number of Europeans was only 168,000.

France still possesses in India Pondicherry, Karikal, and Yanaon, on the east coast of Madras; Mahé, on the west coast of Madras, and Chandarnagar on the Hugli, north of Calcutta. To Portugal belong Goa, Damão, and the small island of Diu, on the coast of Bombay. These French and Portuguese possessions have a total area of 1,754 square miles and a population of 852,752.

Education.— A system of education for India was inaugurated in 1854 in conformity with the instructions of the home government, and the despatch of Sir Charles Wood (afterward Lord Halifax) of 19 July 1854 is the basis on which the educational system still rests. The fundamental principle of the despatch was that the native languages should be made the medium of communicating European knowledge. Examining universities with affiliated colleges were to be founded, and English and vernacular elementary schools were to be established. The despatch enumerated five government colleges in Bengal; the Sanskrit College and Mohammedan Madrasa at Calcutta; five colleges in the United Provinces; the Elphinstone Institution, Puna College, and Grant Medical College in Bombay; the High School at Madras, and several missionary schools, as proper to be at once affiliated to the universities. In 1857 the three universities of Calcutta, Madras, and Bombay were formally incorporated by law as examining bodies based on the model of the University of London as then constituted. A somewhat different university, with teaching powers, was established in 1882 at Lahore in the Panjab, and in 1887 a fifth university was founded at Allahabad for the Northwest Provinces. The Education Commission of 1882–3 extended the system of Wood's despatch by placing education on a more popular basis and giving greater recognition to indigenous schools, and the first proposals for extending education to Indian women were made by this commission. Educational institutions in India are officially divided into two classes: (1) Public Schools, in which the course of study conforms to the standards prescribed by the Department of Public Instruction or by the University, and which either undergo inspection by the Department, or else regularly present pupils at the public examinations held by the Department or by the University. These institutions may be under either public or private management, and among them are many schools receiving grants-in-aid. (2) Private Schools, comprising all which do not fulfil the above conditions. The three main grades of institutions through which the system of education operates are: (1) Primary schools, which aim at the teaching of reading, writing, and such elementary knowledge as will enable a peasant to look after his own interests; (2) Secondary Schools, either English or vernacular; and (3) Colleges, the students in which, having passed the matriculation examination of a university, are reading for the further examinations required for a degree. There are also many other colleges teaching special branches of knowledge, such as medicine, law, and engineering, and special colleges for sons of native chiefs and noblemen. In Burma primary education is still very largely in the hands of Buddhist monks. Outside of a few exceptional districts female education is exceedingly backward in India, but slow progress is being made. There are schools of art in Madras, Calcutta, and Bombay, and many of the chief towns have good museums. Many normal schools have been established for the training of teachers.

The total number of colleges in India in 1899 was 169, of which only 5 were for females. The number of pupils in these colleges was 21,006. Secondary schools numbered 5,396, with 569,271 pupils, 43,403 of the latter being females. The number of primary schools was 100,858, with 2,824,257 male and 313,289 female pupils, or 3,137,546 in all. The total number of training and other special schools was 720, with 28,158 pupils, 2,371 of them being females. Beside all these, there were 42,805 private institutions, with 558,914 male and 42,926 female scholars, in all, 601,840. The total number of educational institutions of all kinds was thus 149,948, of which 7,454 were for females, and the total number of persons under instruction, 4,357,821, of whom 402,153 were females. Of these institutions 22,804 are under public management, 61,494 are state-aided, and 65,650 are unaided private schools. It has been estimated that 22.2 per cent of the boys of school-going age attend school, but for girls the percentage is only 2.3. In nearly all branches of education in India the missionaries have been the pioneers, and their work is still important.

Languages, Literature, and the Press.— All the Hindu languages are cognate dialects founded upon the Sanskrit, a language of the Aryan or Indo-European family, which has been extinct as a spoken language for more than 2,000 years, and bears a similar relation to the spoken languages of India with that of Latin to the modern European tongues. See Sanskrit Language and Literature, and Vedas. In the time of Alexander the Great, Sanskrit had already been superseded by a vulgar tongue, the Prakrit, founded on it. In ancient Hindu dramas persons of rank are represented as speaking Sanskrit, common people Prakrit. Pali, a dialect of Prakrit, became the sacred language of the Buddhists, their scriptures being compiled in it. It was spread by them into Ceylon and India-beyond-the-Ganges. It is still used for works, chiefly religious, for which a wider circulation is desired. Hindi, the prevailing literary language of the non-Mohammedan population, is a modernized form of an older dialect, Hindui, which flourished during the middle ages, having grown out of the Prakrit dialects about the 10th century. Both Hindui and Hindi are rich in poetical chronicles. Hindustani or Urdu, a kind of Hindi mixed with Persian and Arabic, is the language of the Mohammedan conquerors, and grew up after the conquest of Delhi at the close of the 12th century. It is also rich in literature, particularly in translations from the Persian, Arabic, and Sanskrit. It is the language which has been favored by the British government for purposes of administration and diplomacy. The Dakhni, a mixture of similar elements, grew up from the same cause in the Deccan. Among the numerous other descendants of the Sanskrit the most important are the Bengâli, the Orissa, Uriya, or Utkala, the Marâthi, the Gujarâti, the Sindhi, and the Panjabi. The languages of Southern India form a distinct group called the Dravidian, differing in structure from those of the north. The most important of them are Tamil, or Malabarese, spoken on the Coromandel and Malabar coasts, Telugu or Telinga, in the middle of the Deccan, Kanarese in the Carnatic and neighborhood of Mysore, Malayâlam on the Malabar coast from Mount Dilli to Cape Comorin. From all these Burmese stands apart.

The chief vernacular languages in which books are published are: Urdu (Bengal, N. W. Provinces, Panjab, Bombay), Bengali (Bengal), Hindi (Bengal, N. W. Provinces, Panjab, Bombay, and Central Provinces), Panjabi (Panjab), Marathi (Bombay and Central Provinces), Gujarathi (Bombay), Tamil and Telugu (Madras), and Burmese (Burma), and the bilingual works are mostly either in English and another language, or in a classical and a vernacular language. Many works are also published in English alone, or in one of the three classical languages, Arabic, Sanskrit, and Persian. The greater number of these publications belong to the departments of poetry, religion, philosophy, and philology, but Urdu and Hindi fiction has developed greatly in recent years. Till about 1850 newspapers were prevailingly religious, but since then the native press has become more and more a medium for the discussion of social and political questions.

Religions.— The religions of India like the races are numerous. The most important is the Hindu or Brahmanical, which is very ancient. The earliest period of the Hindu religion is called the Vedic, from the Vedas (q.v.) or sacred books in which its records are preserved. These exhibit several marked phases of transition. The earliest date of the Vedic literature cannot be satisfactorily determined, either from philological or internal evidence. Its latest writings are not more recent than the 2d century B.C. Each Veda consists of two parts, the Sanhitâ, a collection of mantras or hymns, and the Brâhmana, which contains the doctrinal and ceremonial development of the religion. The worship represented in the greater number of the hymns is that of natural objects: Indra, the cloudless firmament; the Maruts, the winds; Ushas, the dawn; Vishnu, Surya, Agni, and other deities, to whom various attributes of the sun were attributed. These deities were invoked for assistance in the common affairs of life, and were reminded by the suppliants of their former glorious deeds. In the earlier Vedas no attempt is made to classify the gods and assign them particular ranks. In the Upanishads, a species of commentary on the Vedas, a systematic attempt is made to solve the problems of creation, of the nature of the supreme being, and of his relations with the human soul. Some of the Upanishads are legendary in form, others doctrinal or exegetical. These commentaries, though not in form philosophical, being professedly founded on the Vedas, contain the germs of the great systems of Hindu philosophy which were afterwards developed.

A new era in the history of Hinduism begins about the time of the Christian era with the composition of the two great epics, the Râmâyana and the Mahâbhârata, the latter of which was the product of successive ages. The vulgar creed had by this time experienced the influence of the theological and metaphysical speculations of the Upanishads, and had assumed a mystical unity. Brahmâ, Vishnu, and Siva, the three emanations of the great soul Brahma, representing respectively the creative, preserving, and destroying principles, had become the leading objects of worship.

The third or Purânic period of Hinduism corresponds with the period of the Middle Ages in Europe. The Purânas are discussions upon religion and philosophy, in the form of dialogues conducted by sages. They are designed for popular instruction, and mark a rapid and extensive corruption of the Hindu religion. The epic legends are amplified and distorted. The Vedânta philosophy, which had become the basis of the educated creed, still exercises a favorable influence on the popular worship. The creed of the Purânas is that of the masses in India.

Buddhism arose in India in the 6th century B.C. It prevailed there extensively, and spread itself through the adjoining regions of Asia. It became extinct in India before the 12th century, but still flourishes in China, Japan, and in the southeastern regions of Asia, as well as in Nepal and Ceylon. (See BUDDHA.) The Jainas or Jains, whose religion is a mixture of the Buddhist and the Brahmanical creeds, are still numerous in Hindustan, and particularly in Gujerat. There are two sects of this creed, called Digambaras and Swetâmbaras. Sikhism is another heretical form of Brahamanism prevalent in the Panjab. There are numerous other minor sects of Hinduism and worshippers of particular gods in the Hindu mythology. The Brahmo-Somaj (q.v.) is a modern Hindu theistic sect. The Hindu Fakirs are devotees, who give themselves up to penance, filth, and self-torture. The Parsees or fire-worshippers are descendants of the Persian followers of that religion, who took refuge from Mohammedan persecution on the western coast of India. Their principal emigration was to Surat, and is supposed to have taken place about the end of the 8th century. They were well received in Gujarat. They are now to be found mostly in the mercantile towns in India, and are most numerous in Bombay. The Mohammedans of India are chiefly descendants of its Asiatic conquerors from Afghanistan, Persia, Baluchistan, and Arabia. They are said to be more liberal-minded than the Mohammedans of Western Asia. There is among them a sect of Fakirs like those of the Hindus. There are also numerous Jews in India. On Christianity in India see below under *Christian Missions*. Hinduism recognizes four castes — the Brahmans, or sacerdotal class; the Kshatriyas, or military class;

HALL IN TEMPLE, MADURA.

the Vaisyas, or mercantile and agricultural class; and the Sûdras, or servile class. These casts are hereditary (see CASTE). Closely connected with the Hindu religion is the collection of laws commonly known as the Institutes of Manu. (See MANU.) In the Indian census table of religions (1901) 8,584,349 people are returned as heathens or aboriginals, that is, devotees of some form of animism. Practically, for the purposes of the Indian census, all are classed as animistic who are not locally acknowledged to be Hindu, Mohammedan, Christian, Buddhist, Jew, Parsee, etc., but every stratum of Indian society is in reality more or less saturated with animistic conceptions. Of the total population of British and Native India in 1901, 207,146,422 were registered as Hindus, the greater number of these being in Bengal, the United Provinces of Agra and Oudh, Madras, Bombay, Hyderabad and Rajputana. There were 62,458,061 Mohammedans chiefly in Bengal and the Panjab, 9,476,750 Buddhists almost all in Burma; 2,923,241 Christians of whom two thirds are in Madras and in the Madras States; 2,195,268 Sikhs, chiefly in the Panjab; 1,334,148 Jains, chiefly in Rajputana and in Bombay; 94,190 Parsees, and 18,228 Jews mostly in Bombay.

Christianity and Christian Missions in India. — The introduction of Christianity into India is variously ascribed by tradition to St. Thomas the Apostle, Thomas the Manichæan of the 3d century, and Thomas, an Armenian merchant of the 8th century. The earliest Christian church in India of which we have any definite knowledge was Nestorian, but after the Portuguese occupation these Nestorians came into the Roman obedience. In 1663, after the arrival of the Dutch, some of these renounced their allegiance to Rome. In 1665 these latter received from the Patriarch of Antioch a Jacobite bishop known as Mar Gregory, and to this day they have remained faithful to his Jacobite tenets. Thus, the ancient Nestorian Church of southwest India is represented now by two bodies, namely: (1) Catholics of the Syrian Rite, owning the supremacy of the pope, but retaining the Syrian language and ritual in their services; and (2) the Jacobite Catholics, rejecting the errors of Arius and Nestorius, and following the Nicene creed, though not acknowledging papal supremacy. The spread of the Roman Catholic faith in India was mainly the work of Jesuits from the 16th century onwards, the first of these being the celebrated St. Francis Xavier, who reached India in 1542. The Jesuits were suppressed in the 18th century, but since the re-establishment of the order in 1814 they have made great progress. The Roman Catholics of India are at present organized in seven archbishoprics (Goa, Agra, Bombay, Calcutta, Madras, Pondicherry, and Verapoly), and 16 bishoprics (Daman, Cochin, Mailapur, Allahabad, Lahore, Poona, Dacca, Krishnagar, Hyderbad, Nagpur, Vizagapatam, Coimbatore, Mangalore, Mysore, Trichinopoly, and Quilon), and there are also several vicars and prefectures apostolic. The earliest Protestant missionaries in India were the Lutherans Ziegenbalg and Plutschau, who arrived in the country in 1705 and began work at the Danish settlement of Tranquebar. The Lutheran missions were supported from the first by the Society for Promoting Christian Knowledge, and from 1719 till 1844 they were entirely maintained by that body. The celebrated Christian Friedrich Schwarz worked under the auspices of this society from 1750 till his death in 1798. Kiernander, a Dane, was the pioneer of Protestant missionary enterprise in Bengal. He was allowed by the East India Company to settle at Calcutta in 1758, but soon afterwards the Company changed its policy, and began to prevent missionaries from landing in the country controlled by it. When William Carey, the great Baptist missionary, arrived in 1793, he had to settle on Danish territory at Serampore, 15 miles from Calcutta, and it was not till 20 years later that the Company's opposition to missions was withdrawn. Carey was followed at Serampore by Marshman and Ward, whose names will always be associated with his and with the wonderful literary activity begun by him. Other celebrated Indian Protestant missionaries are Henry Martyn and Bishop Heber of the Anglican Church, and Dr. Alexander Duff, at first of the Church of Scotland, afterwards of the Free Church of Scotland. The head of the Anglican Church in India is the bishop of Calcutta, and under him are the seven bishops of Madras Bombay, Lahore, Rangoon, Lucknow, Chutia Nagpur, and Travancore. Many American missionaries also work in India.

Judiciary.— The law administered by the courts of India is chiefly based on the enactments of the Indian legislative councils, the statutes of the British parliament relating to India, the Hindu and Mohammedan laws of inheritance and their domestic law in cases affecting Hindus and Mohammedans, and the customary law affecting particular castes and races. Bengal, Bombay, Madras, and the United Provinces have each a High Court supreme in civil and criminal cases (but with an ultimate appeal to the Privy Council in England), and somewhat similar tribunals exist in the other provinces. There are numerous courts of different grades throughout the country, and many of the judges are natives of India. Various enactments have been passed for the establishment of local government, and there are now upwards of 760 cities and towns with municipal government in the different provinces under these acts, and local taxation for police and local improvements has been enforced.

Local Government.— All the provinces, except Madras, are divided into divisions, each under an official called a commissioner, and all, including Madras, are divided into sections distinctively designated districts, the district forming the unit of administration. At the head of each district is an officer called a collector-magistrate or deputy commissioner, the former name implying the twofold nature of his duties, since he is not only a fiscal officer charged with the collection of the revenue from the land and other sources, but is also a revenue and criminal judge, both of first instance and of appeal. Police, jails, education, municipalities, roads, sanitation, etc., all come under his supervision; and he is expected to be familiar with the social life of the natives in all its phases. The districts are sub-divided into lesser tracts, known in Bengal as sub-divisions, in Madras and Bombay as *taluks*, in northern India generally as *tahsils*. The unit of police administration is the *thana* or police circle. An important portion of the administrative staff consists of persons who have received appointments in the Indian civil service, after being successful in competitive examinations held in England: these form what is called the *covenanted* civil service. A certain section of the civil service, known as "the statutory civil service," consists of natives specially selected. The native states are generally governed by hereditary princes, who exercise sovereign power within their own dominions. They are more or less controlled, however, by British influence, a British resident, agent, or commissioner being stationed at their courts. They have no power to make war or peace, to send ambassadors to each other or to non-Indian states; they can only keep up a certain specified military force, and they may be dethroned for misgovernment.

History.— Little is known of the political history of India previous to the expedition of Alexander to the Indus, 326 B.C. The 20th satrapy of the Persians comprehended, as Herodotus states, part of the northwest of India. Alexander did not penetrate beyond the tributaries of the Indus, and between his invasion and the Mohammedan conquest there is no authentic political history of India, although the territory was divided among a number of rulers of whom Asoka (q.v.), the founder of Buddhism, was one of the chief. At the time of the Mohammedan invasion a Hindu monarchy was the dominant power in India. The conquest of Persia (632–651) brought the successors of Mohammed to the Indus, and they subsequently acquired a temporary hold of some parts of India, as Sind, which they conquered in 710 and lost in 750. The foundation of a more durable Mohammedan empire in India was laid some centuries later. The Kingdom of Ghazna, in Afghanistan, founded, according to Ferishta, by Alpetegin, an ex-governor of Khorassan, in 962, was declared independent by Mahmud in 999. This monarch, of whom as many as 12 expeditions into India are recorded, penetrated in one direction beyond the Jamna; in another he occupied Gujarat and captured Somnauth. He annexed the territory of Lahore to his kingdom, and nominally extended his dominion to the Ganges on the west, and to Gujarat on the south. His last expedition was to Gujarat in 1024. About the middle of the 12th century the Kingdom of Ghazna was divided, and Lahore became the capital of the Indian portion. The Ghaznavid Kingdom of India was overthrown in 1186 by Mohammed Ghori. On his assassination in 1206 Kutb-u-din, his governor in India, established the Afghan or Pathan dynasty at Delhi, and conquered Behar and Bengal. His successor Altamsh conquered Sind (1225), and completed the subjugation of Hindustan. About this time Genghis Khan overthrew the western empire of Ghazna, and founded a great Mongolian empire, which began to extend eastward, and came into collision with the monarchs of Delhi while these were still pushing their conquests to the south and east of India. The Delhi kingdom was, moreover, exposed to frequent commotions, both from the revolts of its own rajahs and from the predatory excursions of the hill tribes. A revolt of the rajahs was suppressed in 1250, and in 1265, after an extensive slaughter of the predatory tribes, a line of forts was constructed to check their incursions. But though frequently defeated the Mongols continued their incursions into all parts of India. In 1240 they reached Lahore, in 1244 they invaded Bengal; Gujarat, the Deccan, and the Carnatic were assailed in turn; the Panjab was subject to frequent invasions; in 1298 they were defeated at Delhi. A new dynasty, the Khilgi dynasty, arose under the usurper Jelal-u-din in 1288, which was succeeded by a fresh dynasty in 1321, the house of Toghlak. The invasions of the Mongols still continued with greater or less success. During the reign of the last Toghlak king the celebrated Tamerlane invaded India at the head of a great host, took and sacked Delhi in 1398, leaving behind him his deputy Khizr Khan, who now assumed the government. A period of anarchy ensued, which terminated in the conquest of India by the Mogul emperors. Ibrahim, the last of the dynasty of Lodi, the third in order from that of Toghlak, was defeated in 1526 by Baber, who established the Mogul dynasty in Hindustan. His grandson Akbar succeeded his father at the age of 14 (1556), and during a long reign of about 50 years, terminating in 1605, subdued nearly the whole of India, which, by introducing religious toleration, he succeeded in consolidating into an empire. At the death of Akbar his empire was divided into 15 subahs or vice-royalties, which indicate its extent, namely, Allahabad, Agra, Oudh, Ajmir, Gujarat, Behar, Bengal, Delhi, Cabul, Lahore, Multan, Malwa, Berar, Khandesh, Ahmadnagar. His son Selim succeeded him under the title of Jehanghir. The Portuguese, as will be seen in another section, had already established their territorial dominion in India. In 1615 an English ambassador appeared for the first time at the court of the Mogul emperor in Hindustan. He died in 1623, and was succeeded by his son Shah Jehan, who had disturbed his father's reign by rebellions, and during his own reign the country was filled with civil wars. He quarreled with the Portuguese, and expelled them from their settlement at Hugli. During his reign the Mahrattas or Marathas, under their chief Sivaji, began to be an important power in the Deccan. He was deposed in 1658 by his youngest son Aurengzebe, who also murdered his brothers. His reign was passed amid continual contests, both for extending his dominion, and subduing the revolts of the numerous peoples under his sway, both within the limits of India and beyond the Indus. He made war successfully with the Afghans, the Rajputana tribes, and the rising power of the Mahrattas. The Sikhs, a Hindu sect which had been persecuted by the Mohammedans, formed a religious and military commonwealth in the Panjab in 1675. Aurengzebe died at Ahmadnagar, in the Deccan, in 1707. On his death the Mogul empire began to decline. The succession was disputed by his four sons. Bahadur Shah, who succeeded, died in 1712, and was succeeded by his son Jehundar Shah, who, in the following year, was put to death by Farokshir, a great-grandson of Aurengzebe, who usurped the crown. He was deposed and put to death in 1718 by Hosen Ali. Mohammed Shah, grandson of Bahadur, was raised to the throne in 1718. His reign was disturbed by the insubordinate spirit of his viceroys, and through the defection of one of them the Mahrattas succeeded in subduing the Deccan. In revenge for an insult Nadir Shah of Persia invaded Hindustan in 1738, took possession of

THE GREAT HALL IN THE HINDU TEMPLE ON THE ISLAND OF RAMESWARAM.

Delhi, and gave it up to be sacked and plundered by his soldiers. The country west of the Indus was ceded to Nadir Shah in 1739. Mohammed died in 1748, and was succeeded by his son Nadir Shah. The empire was now tending to dissolution. The new emperor called in the Mahrattas in 1751 to aid him against the Rohillas, who, in 1749, had defeated the last imperial army ever called into existence. The various states were seized by the former viceroys or by independent chiefs. The Mahrattas, now the most powerful people of India, possessed, besides the Deccan, part of Malwa, and the greater part of Gujarat, Berar, and Orissa. The whole empire was at this time in extreme agitation and disorder, every government fearing the attacks and intrigues of its neighbors. Ahmed Shah was deposed in 1754 by Ghazi-u-din, a former vizier of the empire, who set up Alamgir II. In 1757 Delhi was captured by the Afghans, against whom Ghazi-u-din called in the Mahrattas. In 1759 the vizier assassinated the emperor. His successor, Shah Alum, without the shadow of power, escaped from Delhi, and finally took refuge with the British. The rival powers of the Afghans and the Mahrattas, which had been brought into collision by the feebleness of the empire, now engaged in a fierce struggle for the mastery over its ruins. This terminated at the decisive battle of Paniput, fought 6 Jan. 1761, in the complete overthrow of the Mahrattas. The victor, Ahmed Shah, recognized the grandson of Alamgir as emperor by the title of Shah Alum II.; but the empire was now only a shadow, and the native states, which had divided its power, were destined soon to give way to the superior European commercial organizations which the pursuit of gain had brought to their shores. See Colonies and East India Companies. Henceforth the history of India follows the course of these European colonies, until it is merged in the Indian empire of Great Britain.

The doubling of the Cape of Good Hope opened up the way by sea to India, and led the Portuguese to the possession of a kingdom in Asia. A few years after Vasco da Gama had landed on the coast of India they were already the most favored merchants upon the whole coast, and in spite of the active jealousy of the Mohammedans, who had hitherto monopolized the lucrative commerce of India, they formed settlements, and made commercial treaties with some Indian princes, in which the latter acknowledged the King of Portugal for their lord. By 1542 the Portuguese ruled from the Arabian to the Persian Gulf; nearly all the ports and islands on the coasts of Persia and India fell into their power; they possessed the whole coast of Malabar to Cape Comorin, and had settlements on the coast of Coromandel and the Bay of Bengal; Ceylon was tributary to them; they had factories in China; and the ports of Japan, to which a tempest had shown them the way, were open to their merchant ships. For 60 years they carried on their lucrative commerce without any considerable rivals. Portugal owed this power to a few able men, among others Francis of Almeida, and Alfonso de Albuquerque (qq.v.). But the successors of the men were not endowed with the same talents, and a revolting abuse of power excited the resistance of the natives, who became united by the sight of their common danger. The union of Portugal with Spain, under Philip II., in 1580, decided the fall of their commercial power in India. The Portuguese, satisfied with bringing the commerce of India to Lisbon, had allowed the Dutch to become the carriers between that port and the markets of Europe. But Philip II. closed the harbor of the Portuguese capital to the Dutch ships on account of the revolt of the United Provinces, and thus obliged that enterprising people to go to the sources of this commerce. Cornelius Houtmann in 1595 was sent with four ships to India to explore the coasts and gain information concerning the inhabitants and the commercial relations in that region. He returned with favorable accounts, for in this very first voyage treaties of commerce were made with the princes of the island of Java. The hatred of the natives against the Portuguese, who had at times landed here, assisted in the accomplishment of the enterprise. After the Dutch East India Company had formed settlements at Java and upon other points, and had made commercial treaties with several princes of Bengal, there began the long struggle with the rival Portuguese. The stronger and better-served navy of the Dutch enabled them to take one place after another from the Portuguese. In 1607 the latter were stripped by their victorious rivals of the Moluccas; in 1641 of Malacca; in 1658 of Ceylon; in 1660 of Celebes, where the Portuguese had settled after the loss of the Moluccas, to retain by smuggling some part of the spice trade; and after 1663 the most important places on the coast of Malabar, where they had longest maintained themselves, fell into the power of the Dutch. The Dutch made Batavia the capital of their eastern dominions. Their power in India began to decline from the time of their wars with Louis XIV. The English began to form commercial settlements in India about the same time as the Dutch. A settlement was formed at Surat in 1613, which became the chief station of the Company on the west coast in 1615, and in 1657 the seat of a presidency. A grant of a small territory around Madras was received from the Rajah of Bijnagar in 1639, on which was erected the fort of St. George. Madras became a presidency in 1654, and till the rise of Calcutta commanded the Company's possessions in Bengal. Calcutta, the third presidency, and ultimately the seat of government in India, was settled in 1690, and became a presidency in 1707. The English had to defend themselves against the Mahrattas in Surat in 1664, and early came into collision with the Portuguese and Dutch in the Indian seas. It was, however, the struggle with the French, who followed them, and who had acquired considerable territorial possessions in India, and the alliances of both parties with the native princes, coinciding with the decay of the Mogul empire, which brought about that long succession of almost unbroken successes by which this great empire was established. The claims of rival candidates for the governments of the Deccan and the Carnatic brought the two parties into collision at various points, and after a succession of maneuvers Dupleix, the French commander, succeeded in compelling the English to take refuge in Trichinopoly. Here Clive, who had already distinguished himself in an unsuccessful attack upon Pondicherry, proposed to carry the war into the enemy's country. In 1751 he besieged and took Arcot, Tinnevelly, Conjeveram, and Arani. On his return to Fort St. David he was despatched by Major Lawrence on another expedition, which he again conducted successfully. Lawrence at the same time gained other successes against the French and their allies. These successes led to the Treaty of Pondicherry in December, 1754, in which the French and English agreed to divide their territorial possessions on a footing of equality, and abstain from interference in native affairs. This treaty procured for the English the cession from the French of the Four Circars; nevertheless, they treated it as a dead letter, and immediately began to reduce Madura and Tinnevelly. The French, after vainly remonstrating, followed their example in disregarding the treaty. About this time important events took place in Bengal. Suraj-ud-Dowla, nabob of Bengal, in 1756 besieged Calcutta with a large army, when it was evacuated so suddenly by the English that a considerable part of the garrison was left behind. These had no alternative but to surrender (20 June 1756). To secure the prisoners taken in the capitulation, 146 of them were thrust, apparently more from mere recklessness than intentional cruelty, into the common prison of the garrison, a room 18 feet square, with two small windows barred with iron, since famous as the Black Hole of Calcutta. After a night of unparalleled suffering only 23 were found alive in the morning. Clive, who was sent from Madras with an armament to Bengal, recovered Calcutta on 2 Jan. 1757. War had again broken out between France and England, but the French refused the alliance of Suraj-ud-Dowla, and maintained their neutrality. Suraj again invested Calcutta, but Clive, though he failed in a night attack, inspired him with so much respect for his means of resistance that he restored the English factories and made peace. Regardless of the benefit he had received from the neutrality of the French, Clive, in spite of the opposition of the nabob, determined to attack their settlement at Chandernagor, which he succeeded in taking. The nabob supported the French till he was attacked by the Afghans, when he became desirous of peace with the English. Clive, however, had determined to dethrone him and replace him by Mir Jaffier, his aunt's husband. In the battle of Plassey, 23 June 1757, the nabob was overthrown, and afterward assassinated by the son of his rival. Mir Jaffier bound himself to pay for his elevation a sum of over £2,500,000 sterling. This plunder was partitioned among the Company and the Company's servants, with the exception of a small share assigned to the native allies.

While the English in the Carnatic were engaged as collectors for Mohammed Ali in reducing the districts of Madura and Tinnevelly, the French recommenced hostilities. An attack upon Trichinopoly failed (May 1757), but Bussy reduced Vizagapatam, and established the French superiority throughout the Deccan. Count Lally, who had arrived with a formidable armament in April 1757, besieged and took Fort St. David, 1 June 1758. He afterward besieged Tanjore and Arcot, the latter of which he took. The want of funds, which crippled his operations, compelled him to engage with inadequate forces in the siege of Madras, which, after lasting two months, entirely failed in February 1759. The English took Conjeveram, to which the French retired, by assault. In the following campaign the French, after some successes, were totally defeated by Col. Coote near Wandewash on 22 Jan. 1760. Their power was now completely broken, their fortresses one after another fell into the hands of the English, and the English fleet, which had the command of the seas, co-operated in the reduction of those on the coast. Pondicherry, their last stronghold, surrendered on 15 Jan. 1765. The English had now established themselves, as a formidable if not altogether a ruling power, both in West and South India; but in both they committed the mistake of greatly over-estimating the resources of the country, and their rapacity and extortion, though they ultimately led to the extension of their power, were the cause of serious and protracted troubles. Mir Jaffier was deposed in favor of his son-in-law, Mir Cossim, who rebelled against English extortions, but, notwithstanding his skilful and vigorous preparations for a war he had anticipated, was worsted in successive engagements, particularly at Gheriah, 2 Aug. 1763, and forced to flee. In revenge he massacred his English prisoners. Sujah Dowlah, the nabob of Oudh, who received him, was defeated and deprived of his dominions, with the exception of Corah and Allahabad, which were given to the Mogul Emperor, who formally invested the Company in the dewanee or collectorship of revenues and virtual sovereignty of Bengal, Bahar, and Orissa, by a firman dated 12 Aug. 1765. The English came to terms with Nizam Ali, subahdar of the Deccan, who opposed their occupation of them, by agreeing to pay him a rent for the territory, and assist him with their forces, but this agreement brought them in 1766 into collision with Hyder Ali, the powerful sovereign of Mysore. Nizam Ali afterward joined Hyder against the English, and both invaded the Carnatic, and, in spite of several defeats, laid waste the country to the gates of Madras. Finally, Nizam Ali deserted Hyder, and the latter concluded a treaty with the English, April 1769, by which their conquests were mutually to be restored.

Notwithstanding the protests and prohibitions of the directors, the administration of the Company's affairs left much to be desired even during Clive's governorship, and during the administration of Verelst, who succeeded Clive in 1767, the Company's affairs were in extreme embarrassment. Parliament took advantage of the discontent and clamor raised against the Company's servants, and in 1773 remodeled the constitution of the Company, and appointed Warren Hastings (q.v.) governor-general of India, with a salary of $125,000, and a council of four members, each of whom had $50,000.

His administration was marked by firmness and resourcefulness in upholding British interests, and also by his unscrupulous methods in raising money to carry out his projects. In 1778 war again broke out between France and England. The English captured Pondicherry and Mahé, the last port of the French on the Malabar coast. This place was considered by Hyder Ali as one of his dependencies. In revenge for its capture he seized the passes of the Eastern Ghâts, invaded the Carnatic with an army of 120,000 men and laid waste the country. Sir Eyre Coote was sent into the Carnatic to conduct the war against him. Hyder Ali died in 1782, but the war was continued with his son Tippoo Saib, till 11 March 1784, when it was concluded by a treaty of mutual restitution. In 1784 Pitt's India Bill was passed. In 1786 Lord Cornwallis succeeded Hastings as governor-general. Cornwallis made various administrative reforms for the relief of the people from former exactions, but Tippoo Saib diverted his attention from these peaceful measures by attacking the Rajah of Travancor, now an ally of the British. Having made an alliance with the Mahrattas and the Nizam, Cornwallis invaded Mysore, besieged Tippoo in his capital, compelled him on 9 March 1792 to conclude a treaty, by which he ceded half his territory and undertook to pay the expenses of the war. On the death of Mohammed Ali in 1795, Lord Hobart, governor of Madras, determined to assume the government of the Carnatic, but the plan was opposed by the supreme government and was not carried out. In 1798 Lord Mornington arrived in India as governor-general, when Tippoo Saib was making arrangements to renew his enterprises against the British and soliciting the alliance of France and of Cabul. Early in 1799 Lord Mornington invaded Mysore. On 4 May he stormed Seringapatam. Tippoo was killed in defending his capital, and Mysore was divided among the British, the Mahrattas, and the Nizam. Some time before this (1775) Oudh had agreed to receive and subsidize auxiliary troops for the defense of their territory, and the fortress of Allahabad was ceded to the British, who undertook to defend Oudh against all enemies. Subsequently in 1801 the subsidy was commuted for the cession of Southern Doab, Allahabad, and other territories. During the war with Tippoo, Lord Mornington, whose policy was to induce the native powers to accept British protection and mediation in their disputes, endeavored to induce his allies the Mahrattas and Nizam Ali to come under similar arrangements. The Nizam in 1798 agreed to dismiss his French troops and receive British auxiliaries. The Peshwa, the nominal head of the Mahratta Confederacy, forced by the contentions of the chiefs Holkar and Scindia, accepted the policy of the governor-general. Under the Treaty of Bassein, signed 31 Dec. 1802, Sir Arthur Wellesley restored the Peshwa, driven from his capital by Holkar. Scindia and the Rajah of Berar now entered into an alliance against the British. After a campaign in 1803 distinguished by the successes of Generals Wellesley and Lake, the former defeating the allies at Assaye, 23 September, the latter at Laswaree, 1 November, Scindia was compelled to make peace. He ceded to the British Baroach, Ahmadnagar, and the forts in the Doab (29 December) ; the Rajah of Berar ceded Cuttack (17 December). Scindia, thus weakened, accepted the British alliance, and received an auxiliary force to defend him against Holkar, 27 Feb. 1804. A war with Holkar immediately followed, which the skill of that chief in predatory warfare enabled him to sustain with some dexterity, and in 1805 he was joined by Scindia, but the British arms finally prevailed and he was forced to flee. The Marquis of Cornwallis succeeded Wellesley on 30 July 1805. He disapproved of the ensnaring alliances into which the former statesmen had drawn the native powers, and although he died before being able to carry out his views (5 Oct. 1805), Sir George Barlow, who succeeded him, adopted his policy. New treaties were made with Scindia, 23 November, and Holkar, 24 December, restoring their territories and their independence. The new policy was even carried so far as to abandon the petty princes who had trusted to the British alliance. Lord Minto succeeded to the governor-generalship in 1807. During his administration the chief enterprises of the English were directed against the insular possessions of the French and Dutch in the Indian seas. The Moluccas, Java, and other islands were taken; many of which were restored at the peace. Some disturbances took place during this period at Travancore, and among the British troops at Madras and elsewhere, which threatened at one time serious consequences. Travancore and Cochin were placed under British management. The Earl of Moira (Marquis of Hastings) succeeded to the governor-generalship in 1813. In 1814 a war broke out with Nepal, which was at first attended with some serious repulses, but was brought to a successful close by Sir D. Ochterlony in 1815, and resulted in the cession of Kumaon. Hastings was also called upon to suppress the Pindaris predatory bands of the former troops of Holkar and Scindia; and the Peshwa of Indore rebelling against a treaty his capital was seized, he himself deposed, and the Mahratta Confederacy dissolved. His ally the Rajah of Nágpur, Scindia, who submitted, and Holkar, who was defeated, were compelled to accept alliances virtually placing them under British protection. This pacification was completed in 1818, and greatly improved the revenues of the districts effected by it. The Marquis of Hastings was succeeded in 1823 by Lord Amherst, under whom the first Burmese war was concluded in 1826 by a treaty ceding to the British the Aracan and Tenasserim provinces together with a large pecuniary indemnity. During the governor-generalship of Lord William Bentinck (1828-35) various administrative reforms were effected, but no great political events took place. Lord Auckland assumed the governor-generalship in 1836. The Afghan war broke out in 1838, in consequence of long and complicated intrigues arising from the advance of Russia in the East, and the mutual jealousy of that power and Great Britain. War was declared on 1 October, the object of the British was to dethrone Dost Mohammed and restore Shah Sujah, a former ruler. It was at first attended by great disasters, particularly the famous massacre of the Khoord Cabul Pass. It was terminated in 1842, under the governor-generalship of Lord Ellenborough, by the evacuation of Afghanistan by the British, after they had relieved their captives and vindicated the superiority of their arms by the capture of Cabul. Sind was annexed to British India after a war conducted by Sir Charles Napier in 1843. After a brief war, arising out of a disputed succession, the dominions of Scindia lay at the mercy of the British, and were disposed of by a treaty dictated by the governor-general at Gwalior in January 1844. While he was thus engaged Lord Ellenborough was recalled and superseded by Sir Henry Hardinge (May 1844), who was soon engaged in one of the most formidable wars the British had yet had to encounter in India. The Sikhs, a politico-religious sect already mentioned, had, under their leader, Runjeet Singh, conquered the Panjab about the beginning of the century. Runjeet Singh, who had always maintained friendly relations with the British, died in 1839, and the government fell into a chaotic state: the army, being without a head, began to commit disorders and threaten encroachments on the British territory. In December 1845 the Sikh army crossed the Sutlej in great force, and in the short war which followed the Sikhs were defeated by Sir Hugh Gough and Sir Henry Hardinge at Moodkee, Ferozeshah, Aliwal, and Sobraon. Peace was made at Lahore, by the surrender of the Sikh territories on the left of the Sutlej, and between the Sutlej and the Bias (Jalindar Doab), and the payment of an indemnity. During the governor-generalship of the Marquis Dalhousie, 1848–56, a new war broke out with the Sikhs, and after their final defeat by General Gough at Gujerat, 21 Feb. 1849, the Panjab was annexed to the British dominions. This was immediately followed by the second Burmese war, ending in the annexation of Pegu, 20 June 1853. Sattari, Jhansi, Nágpur, and Oudh were, on the failure of the native succession, also annexed to the British possessions, 1852–6. During Lord Dalhousie's administration the extensive scheme of Indian railways and telegraphs was planned and inaugurated, the Ganges Canal opened, and the Panjab Canal begun. His last important act as governor-general was the annexation of Oudh, 7 Feb. 1856. The annexation of Oudh, and other provinces, combined with a general feeling of unrest brought about the mutiny of the native army. (See INDIAN MUTINY.) He was succeeded by his friend Lord Canning; in less than a year after the arrival of the new Governor General, a mutiny of the native troops took place at Meerut, on Sunday afternoon, 10 May 1857. The main incidents of the Indian mutiny are the massacre at Cawnpur; the defence of Lucknow, under Sir Henry Lawrence; the taking of Lucknow, by General Havelock; and the siege of Delhi, 14 Sept. 1858. The mutiny sealed the fate of the East India Company, after a rule of more than 250 years, and brought about the transfer of the country to the direct authority of the Queen of England. The Royal Proclamation was read at a grand durbar at Allahabad, 1 Nov. 1858.

1 LORD CANNING became the first viceroy of India. He left India in March 1862, and died shortly after his arrival in England.

2 THE EARL OF ELGIN, became viceroy in 1862, and died in India November 1863.

3 SIR JOHN LAWRENCE, afterward created Baron Lawrence, 1864–69. Reformed the finances. Bhutan war. Orissa Famine, 1866.

4 VISCOUNT MAYO, 1869–72. Received Amir Sher Ali Kehan of Kabul in great state at Umballa 1869. Assassinated by a convict in the Penal Settlement at Port Blair.

5 EARL OF NORTHBROOK, 1872–76. The Prince of Wales, now King Edward VII., visited India. A famine in Bengal. The Guikwar of Baroda deposed.

6 EARL OF LYTTON, 1876–80. Famine in South India. The invasion of Afghanistan. The proclamation of the Queen of England, as Kaisar-i-Hind, or Empress of India, 1 January 1877.

7 MARQUESS OF RIPON, 1880–84. Extension of municipal government. Various reforms in favor of the natives.

8 MARQUESS OF DUFFERIN, 1884–88. Third Burmese War. The annexation of Upper Burma with the Shan States. The "Scientific Frontier" of India defined and strengthened.

9 MARQUESS OF LANSDOWNE, 1888–93. The strengthening of the army and the defences of India. Reform in currency, closing the free coinage of silver. Reconstruction of the provinces of India.

10 EARL OF ELGIN, 1894–98, son of a former viceroy. British control of the northwest frontier of India strengthened. Earthquake in Anam 1897. Cholera, plague, and famine 1896. Frontier War. Celebration of the Queen-Empress. Diamond Jubilee.

11 VISCOUNT CURZON, 1899–1905. Dispatched 8,000 British troops to S. Africa 1899. About 20,000 sent to China 1900. One of the worst Indian famines on record. A period of reform and reconstruction. King Edward proclaimed Emperor at Delhi 1 January 1903. Political Minister to Tibet 1904. Seven earthquakes April 1905. Resigned August 1905.

12 EARL OF MINTO, arrived in India November 1905. A descendant of a former Governor-General of India. Partition of Bengal Province 1905. Visit of Amir Habib Ullah Khan of Afghanistan January 1907.

India Ink. The usual basis of India ink is a finely divided solid carbon, mixed with a size to hold it in suspension when the ink is prepared for use by mixing it with water, the depth of the shade being regulated by the quantity of water used in the mixing. This ink was originally made in China and Japan, where the ink is applied with a brush both for writing and drawing. In Europe and America it is now used chiefly for black-and-white drawings.

India Rubber, the manufactured products of caoutchouc, or gum-elastic. Some of the properties of india rubber must have been known in America at a very early period, because balls made by the Haytians of the gum of a tree, bouncing better than the wind-balls of Castile, are mentioned by Herrera in his account of Columbus' second voyage. In a book published in 1615 Juan de Torquemada mentions the tree which yields it in Mexico, describes the mode of collecting the gum, and states that it is made into shoes; also that the Spaniards use it for waxing their canvas cloaks to make them resist water. More exact information was furnished by M. de la Condamine in 1735. India rubber was at first known as Elastic Gum, and received its present name from the discovery (about 1770) of its use for rubbing out black-lead pencil marks, for which purpose it began to be imported into Britain in small quantities about the end of the 18th century. Its application to the manufacture of waterproof cloth first gave it commercial importance. About the same time a method was discovered of fabricating articles of various kinds by casting india rubber in molds. The india rubber of commerce is obtained most largely from South America, but considerable quantities are also procured from British India, the Indian Archipelago, the west coast of Africa, and the Mauritius.

Pure India rubber is now used only to a limited extent in the arts, but it is applied in the vulcanized state to a very large extent. In the process of vulcanizing, the rubber, as a preliminary step, is either torn into shreds or crushed into thin pieces by machinery, and afterward washed. There are two principal kinds of vulcanized rubber, one hard and horny in its texture, the other soft and elastic. In the case of the former the caoutchouc is mixed with about one third of its weight of sulphur, and heated for several hours, the temperature finally rising to fully 300° F. For the soft kind of vulcanized rubber, on the other hand, a much smaller proportion of sulphur is required — viz. from 2½ to 10 per cent, and the heat to which it is subjected in the vulcanizing chamber is considerably less. Usually, too, with this latter kind, the articles are made before the rubber is heated. The sulphur is commonly added in the ground state, but sometimes the rubber is treated with some solution containing this element, such as the bisulphide of carbon.

Hard vulcanized rubber, termed vulcanite, and sometimes ebonite, is made into a great many small articles, such as combs, chains, bracelets, boxes, penholders, paper-knives, knife-handles, buttons, etc., as a substitute for materials like horn, bone, ivory, and jet. Like these substances themselves, it is formed into various objects by molding, cutting, carving, polishing, and other processes. Vast numbers of these articles are now sold. The black color of vulcanite ornaments has still a tendency to turn gray, but the brittleness which was a fault of combs made of it a few years ago seems to be overcome.

More than 50,000,000 pounds of india rubber, valued at more than $30,000,000, was imported into the United States in 1902. In 1890 the quantity was only 33,000,000 pounds; in 1880, 16,000,000; in 1870, 9,000,000, and in 1862, the earliest date at which it was separately shown in the import statements, was only 2,125,561 pounds.

Over $100,000,000 worth of manufactures from india rubber are now turned out from the factories of the country every year, and about half of this total is in the form of boots and shoes. So great is the demand for india rubber for use in manufacturing that not only has the importation grown from 2,000,000 pounds in 1862 to over 50,000,000 annually at the present period, but in addition to this the forests of the East Indies are called upon for several million pounds annually of a new substitute for gutta-percha, known as "gutta-joolatong," while at the same time the highways and byways of Europe and other countries are ransacked for cast-off rubber manufactures from which the rubber is "reclaimed" and re-used in conjunction with the new rubber from the forests of Brazil, Africa, and the East Indies.

The industry of importing and "reclaiming" india rubber for re-use in manufacturing is a comparatively new one, and while it utilizes large quantities of worn-out rubber boots and shoes and other articles of this character from the scrap heaps of the United States, it has only extended to other parts of the world in recent years.

Gutta-joolatong is another comparatively new material which may be used as a substitute for or in conjunction with India rubber. It is a product of the East Indies, chiefly the island of Borneo, located not far from our Philippines.

The tables which follow show the quantity and value of crude India rubber imported into the United States from 1893 to 1903, also the scrap and old India rubber for use in remanufacturing, also for gutta-joolatong from 1899, the date at which it was first separately stated, to 1903:

IMPORTATION OF CRUDE INDIA RUBBER, 1893 TO 1903.

Year Ending June 30	Pounds	Value
1893	41,547,680	$17,809,239
1894	33,757,783	15,077,993
1895	39,741,607	18,353,121
1896	36,774,460	16,603,020
1897	35,574,449	17,457,976
1898	46,055,497	25,386,010
1899	51,063,066	31,707,680
1900	49,377,138	31,376,867
1901	55,275,529	28,455,383
1902	50,413,481	24,899,230
1903	55,010,571	30,436,710

IMPORTATION OF OLD AND SCRAP RUBBER, FIT ONLY FOR REMANUFACTURE, 1893 TO 1903.

Year Ending June 30	Pounds	Value
1893	910,543	$25,633
1894	1,774,008	55,803
1895	2,032,563	63,112
1896	3,874,677	123,068
1897	3,653,945	113,722
1898	9,488,327	339,374
1899	10,513,604	462,044
1900	19,093,547	1,249,231
1901	15,235,236	988,316
1902	22,804,900	1,437,960
1903	24,659,394	1,516,137

IMPORTATION OF GUTTA-JOOLATONG, 1899 TO 1903.

Year Ending June 30	Pounds	Value
1809	6,473,882	$166,419
1900	8,701,753	237,214
1901	9,371,087	248,838
1902	16,850,821	501,418
1903	13,984,817	345,431

IMPORTATION OF GUTTA-PERCHA, 1893 TO 1903.

Year Ending June 30	Pounds	Value
1893	582,378	$155,428
1894	498,763	84,340
1895	1,326,794	122,261
1896	3,843,854	178,513
1897	1,117,665	100,187
1898	636,477	159,381
1899	518,939	167,577
1900	427,678	178,616
1901	280,560	130,957
1902	525,767	252,329
1903	316,290	22,400

Indian, Catholic Education of the. Upon the discovery of America in 1492. the various religious orders of the Roman Catholic Church hastened to send missionaries to the new field. A small school for the education of the natives was an accompanying feature of each mission station. and after Cortes had conquered Mexico. Franciscans. Dominicans. and Jesuits. in course of time educated and converted the natives to Christianity. and founded missions and schools which exist there to-day, and in California, now an integral portion of the United States. but formerly part of Mexico. North and south the missions and schools were established and as germs of diocesan organizations bore fruit in the foundation of the see of Caracas in Venezuela in 1531; that of Lima. Peru. in 1539; of Chiquisaca. Bolivia. in 1551; and of Santiago, Chile, in 1501. Brazil was entered in 1500 by Franciscans who were followed half-a-century later by Jesuits. The first Brazilian see was founded at Bahai in 1561; in La Plata. now the Argentine Republic. the see of Cordova was founded in 1570. and there in course of time the Jesuits built up a magnificent college. In Central America. Franciscans began their work of education and conversion in Costa Rica in 1560. and during the last 30 years of the century friars labored successfully in Guatemala. teaching the arts of civilized life along with the doctrines of salvation. Early in the 17th century. Jesuit fathers entered Acadia (Nova Scotia). and Canada. and in 1659 the first episcopal diocese in the region was organized at Montreal. Torture and martyrdom did not deter these brave champions and pioneers of Christianity and civilization, and the development of the United States followed the pioneer growth of Catholic congregations and schools among the native Indians. In the first half of the 19th century. the Indian nations of the Rocky Mountains and Northwest Territories (American and Canadian) were pagan. The Jesuit father De Smet made the long and dangerous journey from St. Louis. Mo., to the headquarters of the Flathead nation in Montana. inaugurated the introduction of Christianity. and prepared the way for the advent of younger members of the order. See CATHOLIC INDIAN MISSIONS IN THE UNITED STATES.

Indian, Education of the. Indian education as at present conducted in the United States is in no way the outcome of any deliberate plan on the part of the Federal government. but is directly descended from the first attempts to teach the Indians of Virginia. and particularly from like beginnings in Massachusetts. where the remarkable results of John Eliot (q.v.) were achieved.

Eliot's Work.— Eliot was actuated by high motives. and his simple measures were chosen with consummate wisdom. Having familiarized himself with the language. disposition. and character of his Indians. he secured their confidence and respect. Those who would follow him he gathered in towns. where he taught them the liberties and responsibilities of township government and the devices and institutions of civilized life. among which the Church and the school naturally occupied places of honor. A number of "choice Indian youths" he induced to attend English schools that they might prepare themselves for missionary work among their own people. He was warmly supported by 'the corporation for the propagation of the Gospel in foreign parts.' by the General Court of Massachusetts. and particularly by Daniel Gookins, the official superintendent of the Indians in Massachusetts. Eliot began his work in 1646. In 1674 there were 14 towns of "praying Indians," whose schools and churches. in the majority of instances, were administered by educated natives. and an Indian college had been founded at Cambridge. Yet in due time this success was swept away by the fears and prejudices which developed under the baneful influences of the Indian wars. Similar successful work under the direction of John Cotton and Richard Bourne in Plymouth colony shared the same fate.

Other Endeavors.— Followers of Eliot in the 18th century were John Sergeant at Stockbridge. Mass., and Eleazer Wheelock in Connecticut and New Hampshire. The work of Sergeant. which involved the establishment of day schools. of a boarding-school. and an experimental "outing system," was almost ideal in conception. but ended with the deportation of his Indians to the West. Dr. Wheelock's labors led to the establishment of an effective training school and. indirectly, to the creation of Dartmouth College 'for the education and instruction of youths of the Indian tribes in this land in reading. writing. and all parts of learning which shall appear necessary and expedient for civilizing and christianizing the children of pagans. as well as in all liberal arts and sciences. and also of English youths and any others.' Only the last purpose was destined to achievement.

Surviving Influences.— But in spite of external failure. the spirit and much of the form of these early enterprises persisted. Their impress is observable to-day in almost every prominent feature of the Indian-school organization of the United States. notably in the establishment of day schools in or near Indian villages as a means of domestic and industrial uplifting of Indian family and village life; of industrial boarding-schools in territory occupied by Indians. to introduce among the young a taste for the refinements. duties. and responsibilities of civilization; of advanced training-schools in civilized English-speaking communities for the fuller equipment of 'choice Indian youths" for full citizenship in such communities. or for missionary work in the ideals. institutions. and arts of civilization among their own people. It is seen in the universal stress in all schools upon instruction in husbandry. certain trades and domestic arts; in the 'outing system,' which places partially educated Indian girls and boys as paid helpers in suitable English-speaking families. and affords them instruction in the ordinary public schools; and in the importance attached to religious and ethical training.

Wrong Departures.— On the other hand. it is to be deplored that a number of valuable features of the early schools have been abandoned. and even supplanted by opposite tendencies — the unintelligent warfare against the Indian idiom; the introduction of certain brutalities of military discipline; an equally mistaken effort to wean Indian youth from Indian association by throwing contempt upon the Indian and by stimulating a feeling akin to hatred of Indian family ties; and in general a policy of compulsion and repression, rather than a spirit of development and benevolent helpfulness. Serious harm came to government schools because patronage entered as a factor in the appointment of officers and employees. Thanks to the Indian Rights Association, the Mohonk Conference, and a number of other societies, in 1893 civil-service rules were applied to employees of the Indian schools.

History of Organization.— The successive steps in the organization of Indian schools have been as follows: After the Revolution little heed was paid to Indian education for 30 years. Only minor appropriations are recorded on the basis of treaties with a few tribes. But in the first quarter of the 19th century a religious revival directed attention to Indian education as a Christian and national duty. Congress responded in 1819 with an appropriation of $10,000 in addition to certain treaty obligations. In 1820 the President was authorized to apply this sum annually in aid of societies and individuals engaged in the education of Indians. In 1823 $80,000 was expended in 21 schools maintained by missionary bodies, $12,000 having been granted by the government. In 1825 the number of such schools had risen to 38, their entire expenditure to $202,000, of which the government, directly and indirectly, had contributed $25,000. In 1848 there were reported in operation 16 manual-training schools, 87 boarding-schools and other schools. These schools continued to increase in number and efficiency up to 1873, under the control of missionary bodies, with scanty aid from the government, which had established only a few small day schools directly under treaty provisions. After 1873, however, the government entered upon an era of great activity in the establishment of strictly government schools. In 1877 Congress appropriated for schools outside of treaty provisions, $20,000; in 1880, $75,000; in 1885, $992,800; in 1890, $1,364,568; in 1895, $2,060,695; in 1899, $2,638,390; in 1900, $2,936,080; 1901, $3,083,403.65; 1902, $3,251,254; 1903, $3,531,220. The expenditures have doubled within the decade, and trebled within 15 years. During the quarter century the average attendance rose in more than like ratio. Increased appropriations naturally stimulated a desire on the part of the government to control expenditures. Moreover, the Constitution, by implication, at least, forbids the appropriation of public funds for denominational purposes. Conclusions unfavorable to government support of missionary schools were further strengthened by the fact that the Roman Catholic Church had gradually outstripped the Protestant missionary bodies and was absorbing the lion's share of government support. In 1893 the Methodist Episcopal Church withdrew from participation in government aid, but without abandoning its schools. In 1895 this example was followed by the Presbyterians and Congregationalists; in 1896 by the Friends; and in 1897 by the remaining Protestant denominations. This left only the Catholics in the field with an appropriation, and in 1901 it was withdrawn from them also. In 1804 Congress had declared its policy of abandoning all support of denominational schools, and this policy has gradually been followed out.

The Schools of To-day.— The present Indian schools under government control are day schools, reservation boarding-schools, non-reservation boarding-schools, and industrial and normal training-schools. These in 1902 numbered 249, with an enrollment of 24,434 pupils; 323 other pupils were maintained by contract at Hampton and in white public schools.

Day Schools.—Day schools in Indian villages, or near Indian camps or settlements, are, as a rule in charge of a male teacher and his wife, or, as in the pueblos of New Mexico and in the Indian villages of southern California, of a white woman teacher and an Indian housekeeper. These teachers are employed for 10 months in the year; the male teacher's wife acts as housekeeper. The children spend 5 to 8 hours during the 5 days of the week under the care of these employees, and return to their homes in the evening. The instruction is of the simplest character. The children are taught to speak, read, and write English within narrow limits, to cipher, to draw, and to sing. They get some rudimentary notions of geography, of natural history, and of United States history. The methods are borrowed largely from the kindergarten and from object-teaching, and much stress is laid upon habits of cleanliness and order, mutual kindliness, and prompt obedience. The boys receive some instruction in the use of tools, in gardening, and in some instances in the care of cows. The girls are taught sewing, cooking, and other arts of housekeeping. In the poorer Indian communities a noon-day lunch of a few simple articles is furnished. While these day schools accomplish comparatively little in conventional school-room work, they serve as concrete illustrations of a civilized Christian home which the Indians learn to respect and, in an appreciable degree, to emulate. Moreover, they reconcile the Indian with the idea of sending his children to school, and render him more willing in due time to entrust them to the care of boarding-schools, as well as more ready to appreciate and to accept the lessons of civilization. The most successful of 134 such schools in 1902, were located in Wisconsin, North Dakota, and South Dakota; the least successful, probably, among the pueblos of New Mexico, where the Indians live in a state of half-civilization which they owe to their Mexican and Spanish antecedents, and which fully satisfies their ideals.

Reservation Boarding-Schools.—There were 90 of these in 1902, averaging 125 pupils. They are in charge of a superintendent, assisted by a matron and such teachers, industrial and domestice helpers as the capacity and character of the school may require. In addition to regular teachers, the school is provided with a cook, a seamstress, and a laundress, whose office it is not only to supervise their respective departments, but also to instruct the girls in these arts. For instruction of the boys there is a farmer, an industrial teacher, and, at larger schools, a tailor, a shoe and harness maker, a carpenter, and a blacksmith. An experiment to provide for more methodical instruction in the use of tools, by expert manual-training teachers, failed because the Indian office would not afford a salary for this position sufficient to attract competent men. In 1894 the experiment of connecting kindergartens with these schools was tried, and proved eminently successful. At the present time there are 40 kindergartens connected with boarding-schools, and the use of kindergarten methods and material has entered the primary classes in practically all these schools with similar good results. In the kindergarten the children spend from 1½ to 2 hours each half-day. In most of the other schools children spend half a day in the school-room, and the other half-day in domestic or industrial work of a character suited to their age. Experience has proved that half-day instruction, at first forced upon the schools as an expedient, is commended by its good results.

The aim of the school-room work is to teach reading and writing within the usual limits of primary work; arithmetic for the needs of ordinary daily life; rudimentary geography and United States history; drawing and singing; the laws of hygienic living; garden and orchard work; and familiarity with the simpler requirements of agricultural and domestic industries suited to the locality. Moreover, in a few of the larger schools, the older boys have much opportunity to acquire skill in carpentry, blacksmithing, tailoring, and shoemaking. These institutions are to the children not only school, but home and community. The institution gives them shelter, food and clothing; it accustoms them to habits of cleanliness and decency; it cultivates their æsthetic tastes; it labors to secure right moral attitude, and in its Sunday-school seeks to stimulate the religious life of the children. The superintendent of the reservation boarding-school is subject in his work to the control of the Indian agent, who as representative of the government, administers the reservation's affairs. Inasmuch as these agents are selected on partisan grounds, usually at the suggestion of local politicians, this arrangement is fraught with danger to these schools.

In 1893, under civil-service regulations, there came some improvement. Still with reference to minor employees the superintendents, and even the Indian office, were powerless, and frequently good superintendents were forced out of service by combinations against them among the appointees of the agent, or through the aid and influence of unscrupulous partisan inspectors or supervisors. But in 1896 all employees of the school service were placed under civil-service protection, and since that time there has been marked improvement in the conditions and work of these schools. To a certain degree these evils still persisted, however, because of the power and political bias of the agents; but of late the government has adopted the policy of replacing the agents with bonded school superintendents, 22 agencies now being under such control. There has been decided gain in the equipment, in the sanitary condition, in the general character of employees, and in the conduct of the schools. For the Indian office, relieved of attention to office-seekers and their patrons, has been enabled to pay increased attention to the schools themselves. In the reservation boarding-schools instruction continues through 40 weeks; but often some children are kept at the school throughout the year.

Non-Reservation Boarding-Schools. — Of these there are 25. Seven of them are industrial training-schools, and three others are industrial and normal training-schools. The remaining 15, in their original scope of work, differed little from the reservation boarding-schools. But the superintendents of these schools are bonded and directly responsible to the Indian office. There is no intervening Indian agency, and the consequent sense of responsibility and self-respect in the head of the school finds its reflection in the attitude of his subordinates, as well as in that of the pupils. These schools are, as a rule, located at a distance from the Indian country, and in the vicinity of American towns which afford contact with the amenities of civilized life. Members of many different tribes are also brought together, and tribal antagonisms are broken down. The pupils are older than those at reservation schools, and some have had previous training in day schools or reservation boarding-schools. Because far away from their Indian homes, and near to English-speaking communities, they gain a better control of English; class-room work reaches far into the advanced grammar-school courses of study, with special stress upon language practice, arithmetic, geometry, geography, history, nature study, drawing, and civil government. Instruction in domestic and industrial arts is made effective by frequent opportunities directly to observe their practical applicability and value. The superintendents are paid from $1,200 to $1,500 per annum. Other employees are paid on the same scale as in reservation schools. The most noted and successful of these schools are located at Flandreau, S. D.; Pipestone, Minn.; Mount Pleasant, Mich.; Fort Mojave, Ariz.; Carson, Nev.; Perris, Cal.; Tomah, Wis.; Wittenberg, Wis.; Fort Lewis, Colo.; and Pierre, S. D.

Industrial Training-Schools. — There are schools of this class at Carlisle, Pa.; Chemawa, near Salem, Ore.; Chilocco, Okla.; Genoa, Neb.; Albuquerque, N. M.; Lawrence, Kan.; (the Haskell Institute), Grand Junction, Colo.; Sante Fe, N. M.; Phœnix, Ariz.; Fort Shaw, Mont. The most strenuous effort is now carried on at Chilocco; organized 1884; a large plant with a capacity of over 500 pupils, and a fine farm of about 9,000 acres. In organization these schools are similar to the schools just described, but in the scope of their work and in equipment they excel in a high degree. The government in 1894 added normal departments at Carlisle, at the Haskell Institute, and at Santa Fé. The experiment proved fairly successful with Carlisle and the Haskell Institute, at Santa Fé slightly so for a time, but of late it has shown better results there.

Contract Schools.— In addition to maintaining these strictly government schools, the Indian office up to 1901, as before said, paid by contract for the education of many hundreds of Indian pupils distributed in Catholic mission boarding-schools, in Catholic day schools; at Lincoln Institute, Philadelphia, and at Hampton Institute, Hampton, Va. In the appropriation for that year, the aid was withdrawn from all but the last-named, where 120 pupils were contracted for. Besides these, the government since 1891 has endeavored to place Indians in white public schools where there are many whites and few Indians, as the most rapid means of civilization. The antagonism of local or State authorities to this coeducation has made this plan a failure in some places; in others there has been some success. Rising from 8 to 45 between 1891 and 1896, the number of such schools has gradually sunk to 16 in 1902, with 110 pupils contracted for out of 189 enrolled, and average attendance of 98.

Supervision.— Direction of the Indian schools rests with the Indian office, which is under the supervision of the secretary of the interior. In the Indian office the details of the work are entrusted to the education division, to which all reports are made, and by which all directions and orders are drafted and issued. The education division is aided in its work by the superintendent of Indian schools and by 5 supervisors, assigned in their work to 5 districts respectively. These officials constitute a branch of the Indian-school service which occupies a very uncertain position. They have duties, but no rights. A similarly anomalous relation exists between the commissioner and the secretary of the interior with regard to all matters which the latter may wish to control directly. For this purpose the secretary has established under his direct control an Indian division, independent of the Indian office, to which all orders and directions the secretary may designate must be referred by the Indian office for approval. The power of this Indian division is further reinforced by a corps of inspectors in the field, appointed on partisan grounds, and responsible to him alone. Technically the superintendent of Indian schools may appeal from the commissioner to the secretary of the interior, and the commissioner from the decision of the secretary to the President. In view, however, of the hopelessly autocratic relation that runs through the chain, that is practically out of the question. Under these conditions, the fact that Indian education has prospered reflects credit upon all concerned.

Schools of Indian Territory.— The schools of the so-called "five civilized tribes" of Indian Territory are not included in the above sketch. The 5 tribes in 1900 included 25,639 Cherokees, 10,321 Choctaws, 7,963 Creeks, 5,872 Chickasaws, and 1,662 Seminoles. In addition there were in the Territory 36,853 freedmen and 302,680 whites. Missionary zeal availed itself promptly of this field for its efforts. Substantial boarding-schools were erected, more particularly by the Presbyterians, Methodists, and Baptists. In due time, however, the Indian authorities began to make appropriations for these schools. Ultimately they took entire charge of them. Unfortunately, administrative affairs were largely in the hands of whites, who, by intermarriage or bribery, had been adopted into the tribes, and there came over the schools, as well as over all other public interests, the blight of extreme partisanship and nepotism, which rapidly degraded them in character and efficiency. In 1898 the government at Washington assumed supervisory control over the affairs of all these tribes except the Seminoles. The conduct of the schools and orphan asylums in the 4 tribes involved was placed under the direction of a superintendent of schools in Indian Territory, appointed by the secretary of the interior. Under him there is for each of the tribes or nations a supervisor of schools, whose duty it is to inspect the educational institutions in his district, and to assist in their organization and conduct. The superintendent reports to the commissioner of Indian affairs at Washington through the United States inspector for the Indian Territory, who is his immediate superior. The initial report of this superintendent showed in the 4 tribes 24 boarding-schools, with an enrollment of 1,758 pupils, and an average attendance of 1,480, taught and cared for by 234 employees at an annual expense of $236,824. This does not include 363 neighborhood schools, in which more than 10,000 children are taught at an annual expense of $113,380, which, in character and equipment, show great inferiority.

William N. Hailmann,
Ex-Supt. Indian Schools.

Indian Affairs. The prevalent idea that the national government has always striven to dispossess the Indians from the lands they occupied, or has sympathized with such efforts, is the exact reverse of the truth. From its foundation until now, its history presents an unbroken record of quarrels between Indians and bordering or interdwelling white settlers, in which the government has been slowly and reluctantly pushed on to interfere; sympathizing with and justifying the Indians against its own citizens, its commissioners usually reporting in their favor, and even its generals in later days blaming the whites for the troubles; its courts deciding in their favor; attempting pacification amid local outcries against them, rebuffing appeals for aid, and only using its armies to reduce the Indians and its administrative power to remove them when it was no longer politically possible to leave them in possession. Even then, it has meant to deal righteously by them; but the complexity of the problem — one may say its insolubility till the country was very strong and the Indians very weak — along with the universal curse of "spoils" in the administration — has hindered success. While until 1887 there was no consistently formulated plan, there has been a sequence of government panaceas in a steadily descending line. First, there was to be one vast Indian reservation, large enough to give them all the hunting-room they needed, and so far from the United States that our growth would never reach to them and create more troubles; then three great reservations, to prevent so formidable an Indian district and internecine Indian wars; then a number of small ones, to segregate hopelessly hostile tribes, enable better training into civilized existence, and protect them from depredations; lastly, no reservations, but severalty ownership and individual citizenship. These changes of policy have been due not to fickleness or visionary causes, but to broadening experience and varying conditions.

The policy of removing the Indians west of the Mississippi was first formulated by Jefferson, who in a proposed constitutional amendment (1803) set off the Louisiana Purchase north of the Arkansas as a pure Indian country, in which no land was to be sold to whites. This was carried out, on a much reduced scale, in the formation of Indian Territory (q.v.) by act of 30 June 1834; by another act of same date a superintendent of Indian affairs was appointed, no one to trade or settle in the Indian country without permission from him or his agents. Previous to this the Indian matters had been under the War Department; in 1849 they were transferred to the new Department of the Interior, of which they still form a bureau. Under the commissioner of Indian affairs are eight inspectors and a large variety of subordinate officials and employees. The Indian agents, though under his control, are appointed by the President, for four years, with bonds; on their action depends often peace or war to great white populations, but in too many cases they have been the football of politics, and sometimes scandalously unfit for their places.

The legal theory, until a recent date, was that each tribe was a nation, but not a foreign nor independent one; a "domestic dependent nation," but with which, nevertheless, all intercourse was to be conducted through special commissioners appointed by the President. In 1871 Congress abolished this method of procedure, and substituted immediate Congressional control, but the fiction of Indian nations remained; nor, indeed, could any other system well be applied so long as the Indians were recognized as national wards, and could not be made a part of the regular republican system or thrown into the current of unrestricted competition. It was the general plan to let the larger and better advanced ones, as the five "nations" of the Indian Territory, govern themselves and thus develop political life, including a full judiciary system. But the smaller ones could not be thus left, even in leading-strings; and in all, the government has recognized its duty to watch over their ignorance, improvidence, and savage instability of will and emotion from either violence or cunning on the part of the whites. Traders with them must have certificates of good character and be licensed by the Indian commissioner, and the goods they sell are subject to regulation; no one can hunt, cut timber, or pasture cattle on Indian lands without the agent's permission; intoxicating liquors may not be sold to them. Still more important and beneficial is the educational work, which has not only been carried on by churches, missionary societies, and private individuals from early times, but has been actively forwarded by the government. The five civilized nations of Indian Territory had their own school system, of considerable extent; but for others, and even for those where needed, the President was empowered in 1865 to appoint instructors of Indian children in reading, writing, arithmetic, and agriculture, and in 1882 to appoint an inspector of Indian schools. (See INDIAN, EDUCATION OF THE.)

From 1877, when a $20,000 appropriation was made for Indian schooling, to 1900, when over $3,000,000 was appropriated, over $35,000,000 had been thus expended by the government. It has spent since its foundation nearly $400,000,000 on the Indians, outside of the cost of wars against them; and the present expenditure is about $10,000,000 a year. In 1900 it was maintaining over 45,000 wholly by rations, and 12,500 partly, at a cost of about $1,250,000 per annum; and paying annuitants (partly from trust funds derived from sales of their lands) over $1,500,000.

On 8 Feb. 1887, however, an act was passed, amended in 1890, to sweep away as soon as feasible all this system of tutelage and pauperization, in the belief that abolition was best for Indians and whites alike. All reservations were to be surveyed; all Indians who wished to take up lands in severalty to a certain amount might do so — and by the act become citizens, as well as all who had previously done so under treaties and Congressional enactments, over 10,000 in number. Up to 30 Oct. 1900 6,736,514 acres had been so allotted, to 56,996 Indians; about 2,000 a year comply with the permission; and a few years will see an end of Indian tribes except as historical reminiscences. Many of these new citizens are made voters by their States: there are over 20,000 such in the United States at present. See CHEROKEE; CHEROKEE NATION V. GEORGIA.

Indian Art. In none of the fine arts except architecture have the Hindus attained much eminence. Their paintings are of very little merit, though the walls of temples, of palaces, and of the better class of private dwellings are often ornamented at great cost with pictures illustrating the characters and events of their mythology. More attention has been paid to sculpture than to painting, and in the temples cut from the living rock great numbers of statues are contained, some single figures and others large groups. Many of these are bold and spirited in design, though the human form is not exhibited in good proportion nor with its parts well developed.

Indian Architecture, however, comprehends a great variety of styles, among which we may distinguish, as the most important, the Buddhist, the Jaina, the Dravidian or Southern Indian, the Chalukyan, and the Modern Hindu or Indian-Saracenic styles. The history of Indian architecture commences in the 3d century B.C. with the religious buildings and monuments of the Buddhists. Among the principal forms of Buddhist architecture are first, the *topes, stupas,* or towers built to mark some sacred spot, and the *dagobas,* constructions of a similar nature, containing relics of Buddha or Buddhist saints. These buildings generally consist of a circular stone basement, varying from 10 or 12 to 40 feet in height, and from 40 to 120 feet in diameter, on which rose a rounded domical structure, generally of brick or small stones laid in mud, the whole edifice rising sometimes 50, sometimes 100 feet high. Second, the rock-cut *chaitya* halls or churches, and the *viharas* or monasteries. Most of these are found in Bombay; some also in Bengal and Behar. In rock-cut buildings architectural skill is confined to the façade and the interior. Among the most notable for beauty of design are those at Ajanta, and, finest and largest of all, the great Chaitya cave at Karli, near Bombay, the date of which is probably about 80 B.C. Another interesting example is at Ellora. The Jaina style is a development or corruption of the pure Buddhist. It is characterized by the square or polygonal court, the twelve-pillared dome, the slenderness and elegance of the columns, the horizontal arch, the *sikras* or towers surmounting the cells containing the images, and, lastly, by the peculiar grouping of many temples together on hill-tops. Prominent examples of Jaina architecture are found at Girnar in Gujerat, and at Mount Abu. The most flourishing epoch of the Dravidian style comprises the 16th, 17th, and even 18th centuries of our era. To this late period belong the great temples at Tanjore, Tiruvalur, etc. The distinctive parts of a Dravidian temple are the *vimana* or temple proper, with storied pyramidal roof; the *mantapas* or porches, covering the door which leads to the cell; the *gopuras* or gate-pyramids, in the quadrangular enclosures surrounding the vimanas; and the *choultries* or pillared halls, used for various purposes. The general characteristics of a Dravidian temple of the first class are the storied pyramidal towers, the hall of 1,000 columns, the bold cornice with double flexure, the detached shafts, the richly carved stylobate, and the large tanks with flights of stone steps. The Chalukyan style, so named from a dynasty which rose in the 6th century in what is now Mysore and the Nizam's Territory, reached its perfection in Mysore from the 11th to the 14th century. The characteristic features are the open porch, the straight-lined, conical-shaped tower, the star-shaped temple, and the basement terrace of stone.

The Indian-Saracenic style is a general name for a number of somewhat varying styles, the result of the mixture of Saracenic principles of architecture, brought with them by the Mohammedan conquerors of India, and the distinctive architectural features of the different localities where they settled. Under the Mogul emperors in the 16th century were erected some most magnificent buildings, such as the tomb of Humayun Shah at Old Delhi; that of Akbar at Secundra; the palaces of Shah Jehan at Agra and Delhi; and the Taj Mahal, built by the same monarch at Agra. (See AGRA.) The Moslem architecture of India contrasts with the native Indian styles in its use of the radiating arch, in the superior simplicity and grandeur of its style — its flat ornamentation not interfering with the lines of true architectural construction. A characteristic feature also is its fine conventionalism of vegetable forms for decoration and tracery. See *Moslem Architecture* under ARCHITECTURE.

Indian Bean, a catalpa (q.v.); specifically the large southern tree (*Catalpa catalpa*), now planted as a shade or ornamental tree all over the country on account of the beauty of its masses of spring flowers and the quaint appearance in autumn of its long, bean-pod-like fruit.

Indian Bible, the first Indian translation of the Bible in the New England colonies. This translation was made in 1663 by John Eliot, «The Apostle to the North American Indians.» It was in the dialect of the Naticks, a Massachusetts tribe of the Algonquins. A second revised and corrected edition was printed in 1685, only 12 copies of which are known to exist. An edition with notes by P. S. Du Poneau, and an introduction by J. Pickering, was published in Boston in 1822. When the original edition was issued, 20 copies were ordered to be sent to England. A copy of the edition of 1663, with the Epistle Dedicatory, was sold in 1882 for $2,900.

Indian Bread-root, a plant of the genus *Psoralea;* the «large» was *P. esculenta;* the «small» *P. hypogæa.* See BREAD-ROOT.

Indian Corn. See CORN, INDIAN.

Indian Fig. See PRICKLY PEAR.

Indian Head, (1) the highest point of the Palisades, 550 feet; so called because it resembles somewhat the head of an Indian. It is in the northeastern part of New Jersey, on the Hudson and opposite Hastings. (2) The name of a village in Fayette County, Pa. (3) A small town in Maryland, on the Potomac River, below Washington, the seat of a naval station.

Indian Hemp. Sometimes called Canada hemp. See APOCYANACEÆ.

Indian Hippo, an American plant. See BOWMAN'S ROOT.

Indian Humped Cattle, a species of East Indian oxen (*Bos indicus*), now known only in the domesticated state, distinguished by a high fatty hump on the withers, by the prevalent ashy gray color, large drooping ears, enormous dewlap and several structural peculiarities. They vary in size from those as large as a European ox to the smallness of a half-grown calf. They form the working cattle and draft animals all over India and eastward more or less locally to China. They are venerated by the more pious sects of Hindus, especially in the persons of certain privileged bulls, called Brahma or Brahminy bulls, which wander about the bazaars of cities unharmed and unchecked in their depredations upon market produce.

Humped cattle are known in Madagascar, and in Abyssinia, and it has been suggested that the species was originally African. The Abyssinian form is a large animal with huge horns called «galla ox» or sunga. These animals seem to thrive only in hot countries, and have never been found profitable outside of their present range.

Indian Language and Literature. See INDIA.

Indian Mutiny. The British occupation of India had been largely aided by native troops called Sepoys, who were enrolled under British officers in the service of the East India Company. At the close of Lord Dalhousie's sway in 1856, when the whole of India seemed to have been either reduced directly under British rule, or if retaining its native princes to have placed itself under British protection, the Sepoy mutiny, a contingency for which the government ought not to have been altogether unprepared, occurred. Previous symptoms of disaffection had not been wanting. Mutiny had on several occasions broken out in the native army, in a way to indicate how easily through causes which Europeans, from their defective sympathy with native thought and feeling, could not anticipate, these troops might be alienated; but, on the other hand, the general fidelity of the Sepoys merited confidence, and this feeling prevailed over any grounds of suspicion which might have been formed from isolated occurrences. The Sepoys in Bengal were mostly either Mohammedans, or Hindus of the Brahmanical or military castes. The recent annexations had alarmed the native chiefs, while the fanatical Hindus had been deeply offended by reforms, including the successive abolition of various rites of their worship. Two European regiments had been drafted off for the Crimean war, and had not been replaced. Others had been sent to Burma, and in the beginning of 1857 fresh regiments were despatched to Persia, so that only eighteen regiments were left in all Northern India, of which nine were in the Panjab. In Oudh, where, from its recent annexation, disaffection was rife, there was only one British regiment, and Delhi and Allahabad, the two chief arsenals, were guarded by native troops. To add to these favorable circumstances a Hindu devotee had prophesied the termination of British rule at 100 years after the battle of Plassey. A slight incident sufficed to give point and direction to a spirit of disaffection which so many circumstances tended to favor. At this time the Enfield rifle was introduced into the Bengal army. This rifle was loaded with a greased cartridge, the end of which required to be bitten off at the time of loading. By a natural inadvertence the authorities had neglected to consider how this seemingly trifling requirement might affect the easily excited sensitiveness of the Hindus in regard to caste, and this insignificant circumstance removed the last security against a united movement of disloyalty among the native troops, by establishing a bond of sympathy between the Mohammedans and Hindus. A report got abroad that the cartridges were to be soaked in cow and pork fat. The prejudices of Hindus and Mohammedans were thus equally involved, and as this rumor rapidly spread, the excited imagination of the Sepoys conceived a conspiracy on the part of the government to convert them forcibly to Christianity, by compelling them to violate the laws of their own religion. When this grievance was explained it was at once removed, the manufacture of greased cartridges at Dumdum was stopped, and the men were instructed to grease them themselves with materials procured at the bazaars. Suspicion once aroused, however, was not to be allayed, and easily found a new object of contention. The paper of the new cartridges was glazed, and it was again alleged that grease was used in its manufacture. The spirit of disaffection became too deep-rooted for any measures of conciliation. Conferences among the disaffected gave rise to ambitious schemes, and the original grievances became a pretext in the hands of unscrupulous leaders, whose excesses debarred them even from the plea of patriotism, to extirpate the British power in India. On 26 February the first overt act of mutiny took place at Berhampur, when a regiment refused to receive their cartridges. Another dangerous outbreak took place at Barrackpur on 29 March. The arrival of a British regiment from Burma and the disbandment of the disaffected regiments was thought to have ended the trouble, but it soon became evident that disaffection, which had only wanted an occasion, was spreading rapidly not only among the Sepoys, but among the Hindus generally. Another outbreak took place on 2 May, near Lucknow, when a regiment of cavalry were, by some oversight of the government's instructions, ordered to bite their cartridges. Sir Henry Lawrence succeeded by a show of force in disarming it. A more formidable outbreak occurred about the same time at Meerut, 35 miles northeast of Delhi, when the mutineers, with the assistance of the native inhabitants, indiscriminately massacred the Europeans and escaped to Delhi. The advance-guard of the mutineers reached Delhi on 11 May, and at once entered the city, where they were assisted by the king's servants in massacring the Europeans. The native troops cantoned outside the city in the meantime joined the main body of the mutineers, and assisted in massacring their European officers. About 50 Europeans sought refuge in the palace, and placed themselves under the protection of the king, who had placed himself on the throne of the Moguls. These after some days were coolly murdered in an open court in presence of a general concourse of spectators, conspicuous among whom was Mirza Mogul, the king's eldest son, who had assumed the title of commander-in-chief. The magazine at Delhi had been blown up by its defenders; but the explosion was only partial, and most of its contents fell into the hands of the mutineers. European troops were now summoned from all quarters. Several regiments were detached from an expedition which was proceeding under Lord Elgin to China, and the Persian war having been concluded, the troops engaged there were immediately recalled. When intelligence of these events reached the Panjab the mutinous spirit which prevailed among the large body of Hindustani troops there was promptly subdued by disarmament. The Sikhs, though the Panjab had been so recently annexed, continued faithful. But the revolt had spread rapidly elsewhere, and British authority was almost extinct throughout the Bengal Presidency. Everywhere the mutiny was attended with savage excesses — women were outraged, and Europeans, without distinction of age or sex, barbarously murdered. Sir Hugh Wheeler, at Cawnpore, was betrayed by Nana Sahib, maharajah of Bithur, who, after offering aid, took the mutineers into his pay, and raising the Mahratta standard, besieged Cawnpore. The siege, or rather bombardment, lasted from 7–24 June, when a capitulation was agreed to, on a sworn promise of Nana Sahib to allow the garrison to retire to Allahabad. But as the embarkation was proceeding the boats were attacked by the Nana's troops, and the men indiscriminately massacred. The women and children were for the meantime made prisoners. Sir Henry Lawrence was besieged in Lucknow, where he died on 4 July from a wound received in a sortie.

Meanwhile mutineers had been converging on Delhi, and British reinforcements were hastening to the besieging camp on the ridge above the city. After protracted operations and repeated reinforcements on both sides Delhi was taken by assault, 14–20 September. Sir Henry Havelock, who had been engaged in the Persian campaign, had arrived in Calcutta, and immediately set out for Allahabad, to commence operations for the relief of Lucknow and Cawnpore. While his force was victoriously advancing on Cawnpore Nana Sahib, on 15 July barbarously massacred his prisoners, consisting of 210 women and children. Havelock was succeeded in the command at Lucknow by Sir James Outram, who held it till relieved by Sir Colin Campbell, on 17 November. At first it was feared that the mutiny might extend to the Bombay and Madras presidencies, and from this cause and the occupation of the troops in Bengal the mutineers had been left unchecked in Central India. At length columns organized in these presidencies entered Central India, and were united under Sir Hugh Rose. By the operations of these commanders the brave Rani of Jhansi, who died fighting at the head of her troops, was defeated, and Tantia Topi whose military capacity had prolonged Nana Sahib's resistance, was captured and the mutiny was finally suppressed. The war was substantially closed by June 1858, although the complete pacification of Oudh was not effected till the end of the year. See INDIA, EAST INDIA COMPANIES. Consult: Malleson, 'History of the Indian Mutiny' (1897).

Indian Ocean, that body of water which has Asia on the north, the East Indian Islands, Nicobar and the Andaman Islands, Australia and Tasmania on the east, Africa on the west, and the Antarctic continent on the south. The Cape of Good Hope, and the southern extremity of Tasmania may be considered its extreme limits from east to west. Its length from north to south somewhat exceeds 6,500 miles, its breadth varies from 6,000 to 4,000 miles. Its gulfs are the Red Sea, the Gulf of Aden, the Persian Gulf, the Gulf of Oman, the Arabian Sea, the Bay of Bengal, and the Great Australian Bight. Its islands are Ceylon, Madagascar, the Laccadives, Maldives, Socotra, Andamans, Nicobar, Mauritius, Bourbon, Kerguelen's Land, etc. Rocks and coral reefs render navigation dangerous. The Ganges, Brahmaputra, Irrawaddy, Indus, Euphrates, Gadavari, empty into the Indian Ocean. The southeast trade-wind blows between the 10th and 28th parallels of south latitude from April to October, after which date its limits are contracted; south of these are the northwest winds, which prevail almost in the same latitude, in the Atlantic and Pacific. The monsoons are mainly to be found in the north, from the continent of Asia to about lat. 8° S., and from the Mozambique Channel on the west to the western shores of Australia and the sea of China. They blow for six months, changing about the equinoxes. North of the equator the northeast monsoon prevails from October to April, the southwest from April to October; while south of that the northwest monsoon blows while the northeast is blowing on the north side, and the southeast prevails during the time of the southwest monsoon north of the equator. In the hot season, likewise, when the southeast trade-wind recedes south, the northwest monsoon flows between the equator and the 12th south parallel. The hurricanes of this ocean usually range between lat. 9° and 35° S., extending from Madagascar to the Island of Timor. They usually come from the northeast, and travel southwest and south, returning again east. Their season is from December to April.

According to the most recent soundings the mean depth of the Indian Ocean is 2,300 fathoms, or somewhat greater than that of the Atlantic. The greatest depths are in the eastern part to the south of the equator, where it is estimated that there are fully 50,000 square miles with a depth of over 3,000 fathoms. Over 13,000,000 square miles lie between the depths of 2,000 and 3,000 fathoms.

The area of land draining into the Indian Ocean is estimated at 6,813,600 square miles, and the rainfall on this land amounts to 4,379 cubic miles of water annually. The rivers flowing from the Asiatic continent are by far the most important, and they carry a vast amount of detritus into the Bay of Bengal and Arabian Sea, these forming immense deposits of blue mud. Along the African coasts, in depths from 100 to 1,000 fathoms, there are glauconitic sands and muds, and on these as well as other coasts, coral muds and sands, and blue and green muds in the shallower depths. In the deeper parts of the ocean, far from land, there are deposits of red clay, radiolarian-ooze, and globigerina-ooze. Toward the Antarctic continent the ocean bed is covered with a diatom-ooze.

The temperature of the surface waters varies much in different parts of the ocean, at different seasons, and under the influence of different winds. In tropical regions the temperature usually varies from 70° to 80° F., and the yearly range is 7° or 8° F. Off the Cape of Good Hope and Cape Guardafui, the annual range may be from 20° to 30° F. Sudden changes of temperature are often noticed off Cape Guardafui when the wind blows off shore. The cold and deep water is thus drawn up along the coast to take the place of the warm surface water which is driven east by the wind.

The temperature of the water at the bottom is very uniform and subject to little, if any, annual variation. In the Bay of Bengal and Arabian Sea temperatures of 33.7° F. and 34.2° F. have been recorded; these are only very slightly higher than those recorded by the Challenger in lat. 50° S. It is certain, therefore, that this deep cold water is slowly drawn into the Indian Ocean from the Antarctic to supply the place of the warm surface currents that are driven south by the winds.

The currents of the Indian Ocean are less constant than in the other oceans, being largely controlled by the monsoons. Some characteristic coral atolls and islands are found toward the central part, such as the great Maldive group, the Chagos, Diego Garcia, and the Cocos Islands. The tropical shores are generally skirted by fringing and barrier reefs. Christmas Island is coral formation, while St. Paul's, Mauritius, Rodriguez, and others are of volcanic origin, and Madagascar, Ceylon, and Socotra, continental islands.

The Indian Ocean was little known to the ancients. The first Europeans who explored it seem to have been the Phœnicians, who in the 7th century B.C., held the thalassocracy, or marine domination of the Mediterranean. Necho, an Egyptian monarch who flourished about 610 B.C., is reported by Herodotus to have sent some of his vessels, manned by Phœnicians, into the Indian Ocean, then known as the Erythræan Sea, to circumnavigate Africa. This they did, starting from the Arabian Gulf and regaining Europe by the Columns of Hercules. In the 6th century B.C. this sea was traversed by Hanno, a Phœnician admiral of Carthage. There is still extant his account of the voyage which is translated into Greek under the title 'Hanno's Voyage of Circumnavigation.' The Greek historian Arrian has given us an account of the coasting voyage of Nearchus, one of Alexander's generals, from the Indus to the mouth of the Tigris and Euphrates.

Hippalus, an Egyptian navigator who flourished about the beginning of the Christian era, was the first to observe the regular monsoons of the Indian Ocean, and to profit by them. In the 9th century the Arabs made frequent voyages across the Indian Ocean. In 1486 the Portuguese rounded the Cape of Good Hope, and in 1498 Vasco da Gama reached the coasts of India by the same route. In 1521 a ship of Magellan's squadron crossed the Indian Ocean in completing the first circumnavigation of the world, and has since been habitually traversed in a direct line between Arabia and Hindustan.

Indian Paint, the name of two American plants: (1) the golden seal (q.v.) or orange-root, which furnishes a yellow color; and (2) the bloodroot. (See SANGUINARIA.)

Indian Physic, an American plant. See BOWMAN'S ROOT.

Indian Pipe, or **Corpse-plant**, a smooth, waxy-looking, fleshy herb (*Monotropa uniflora*), of the order *Ericaceæ*, widely distributed in dark, rich woods almost throughout North America. It is said to derive some of its food from the roots of other plants, but much is obtained from decaying vegetable matter. From a matted mass of fibrous rootlets the white scaly, but not leafy, stems rise to a height of perhaps eight inches, and bear solitary, nodding, white, inodorous flowers during summer, followed by erect many-seeded fruits.

Indian Races. The numerous peoples of India belong to several distinct groups or families, speaking numerous dialects founded on two or three distinct stocks which are much blended by the intercourse of the different peoples with each other. Previous to the Mohammedan ascendency the dominant race were the Hindus, whose language is spread in various dialects over a great part of India, but who were not the aboriginal inhabitants nor even the first invaders. From the northwest of India, through Kashmir and down the valley of the Indus, and from Tibet through the passes of the Himalayas, the inhabitants of northern Asia have from a very early period migrated southward to the milder and more fertile plains of India. Two great successions of these invasions are recognized as having taken place before the period of authentic history. The first immigrants, of dubious ethnological connections, but commonly known as the Tamil races, appear to have overspread the entire peninsula. Following them the Sanskrit-speaking peoples, called the Hindus, of Aryan speech, dispossessed the Tamil races, and superseded their language in the whole of India north of the Narbada. The Hindus subsequently descended into the peninsula and penetrated as far as Cape Comorin; but though their influence on the languages of Southern India was considerable in the way of introducing new terms, the grammar and construction of the Tamil languages maintained their place in the districts south of the Narbada. Two great groups of languages were thus spread over India, which were further modified by the Mohammedan invasion. The native tribes were not exterminated by these invasions, but are still to be found under various names, as Bhils, Catties, Coolies, Gonds, etc., inhabiting the fastnesses of the mountain ranges in Bengal, the Vindhya and Satpura Mountains, the Ghâts, etc. The hill tribes and other aborigines in all India are estimated at 70,000,000. The leading religion is Brahmanism, the professed creed of the majority of the Hindus and the religion most distinctive of India. It reckoned 207,000,000 adherents in 1901. Large numbers in the north and northwest are Mohammedans (about 62,500,000). Buddhists number about 9,500,000; Parsees or Fire-worshippers 95,000; Sikhs 2,200,000. Among the Hindus the caste system still prevails. European missionaries have long been active, but only a mere fraction of the people are as yet Christians (2,284,380). Education is now making good progress, schools and colleges of all kinds having been established throughout the country. The pupils, however, only number about 4,000,000 in all. There are universities at Calcutta, Bombay, and Madras, besides other two at Lahore and Allahabad.

Indian Red, an impure oxid of iron, used as a pigment by painters. It was originally imported from India, but is now chiefly prepared by roasting ferrous sulphate. The sulphuric acid is expelled by the heat, and the red oxid of iron remains behind. It is very permanent, and the color varies from purplish to a yellowish red.

Indian River, an important stream in the eastern part of Florida, in Brevard and Volusia counties. It connects with the Halifax River at Titusville and extends 100 miles southeast to the ocean at Indian Inlet. Its width varies from 300 feet to 3 miles and it is navigable for vessels drawing five feet. The Indian River is famous for the excellent oranges grown along its banks.

Indian Schools, in the United States, are schools specially established either by private or denominational means or by the national government, for the education of children and youth of the Indian population of this country. For particulars concerning these schools see INDIAN AFFAIRS; INDIAN, EDUCATION OF THE.

Indian Shot. See CANNA.

Indian Summer, the name given to a period of mild summer weather which generally occurs toward the end of autumn. The term first made its appearance in the last decade of the 18th century. During the next decade the phrase was "second summer." This indicates that the spell of weather known by this name was not generally noticed much before 1800. The term Indian summer became established about 20 years after its first appearance, which was in western Pennsylvania, and spread to New England by 1798, to New York by 1799, to Canada by 1821, and to England by 1830. The term is, then, not an Americanism; to write in praise of Indian summer is now a literary convention of three continents.

It is by no means easy to account for the origin of the term. The principal characteristics of the season which it describes are haziness, smokiness, and high temperature. Some explanations of the origin of the term are (1) that the Indians predicted such spells of weather; (2) that the smokiness was produced by Indian fires; (3) that this was the last season of Indian attacks on the settlements of the whites; (4) that the season partook of the Indian character of deceptiveness; (5) that the name was given because one of the seasons of East India was similar in character. Horace Walpole used the term in 1778, not in reference to America, but in relation to weather in the tropics. "Squaw winter" was a name for the spell of cold weather preceding the Indian summer, and perhaps the key to the nomenclature is to be sought in this latter term.

Indian Territory, an organized body of land in the southwest centre of the United States, occupied by Indian allotments and reservations; not a "Territory" in the official sense, as it has no common local government, head, or capital, and sends no delegates to Congress. It lies between Kansas north and Texas south, Arkansas and a corner of Missouri east, and Oklahoma (till recently its own western half) west. It is about 250 miles north to south, and from 75 to 200 east and west. Area, 31,400 square miles, of which 400 are water.

The topography of the district is not yet fully studied, as Indians do not make surveys, and till less than a decade ago the government had no motive but a scientific one for undertaking them. Hence the interior was nearly as little known as central Africa, and as much misunderstood. Even yet, nearly every reference book describes the entire surface as "flat" or "gently rolling," and mostly prairie. But the government survey authorized in 1894, when the reduction to civilized conditions was undertaken, found it to be one fourth mountainous plateau, and two thirds woodland well distributed, mainly through the east and southwest portions. The prairie section is a continuation of the Kansas plains, and occupies most of the Cherokee district north of the Arkansas, and the Creek triangle between the Arkansas and Canadian, with about a fourth of the western half below the Canadian, the rest being timber land. In the extreme northeast is a rugged plateau cut by streams with a southward trend, west of which is a rolling plain with some hills. South of this the Ozark mountain chain, entering from Arkansas, stretches from northeast to southwest across the Territory, with a gradual declension; from about 2,500 feet high near the Arkansas line, they sink to about 1,000 feet in the centre. Their more pronounced elevations are termed the Boston, Poteau, Kiamichi, Sans Bois (treeless), Shawnee, etc. In the Chickasaw territory at the southwest, a set of low elevations from Tishomingo northwest, rising in the sharp spur called the Arbuckle Mountains, and again farther on in the Wichita Mountains of Oklahoma, connect the Ozarks with the outliers of the Rockies. The highest elevation in the Territory is about 3,000 feet above sea-level, the lowest 350. The timber north of the Canadian is mainly confined to a belt in the west, save for cottonwoods, elms, pecans, and a few other sorts along the streams; south of it the timber occupies much the greater portion, even in the west. The eastern half of the Territory is nearly all well wooded, the mountainous parts most heavily so; the woods besides the above are oak, largely in a belt from the Arkansas to the Red called the Cross Timbers (used only for fuel and railroad ties, not for construction), with valuable yellow pine and red cedar on the elevated grounds, and walnut in the bottoms.

The drainage belongs entirely to the Arkansas and Red River systems. The former, flowing across and cutting off a northern cantle, is joined east of the centre at Webber's Falls by the long Canadian, its main affluent, which forms nearly the median line of the Territory and its northern boundary with Oklahoma; and is further fed from the north by the Neosho and the Verdigris joining close together, and by the Illinois near the Canadian. The latter has hardly any water-shed on the south. Nearly the whole southern half of the Territory is drained by the affluents of the Red, forming the entire boundary with Texas; the chief are the Washita in the southwest and the Kiamichi in the southeast.

Geology and Minerals.— Geologically, the Territory may be divided into four sections: (1) The Arbuckle-Wichita region, with an outlying granite field at Tishomingo. This contains coal measures on the north and asphalt on the south; the former is the chief mineral product of the Territory. For the year ending 30 June 1903, there were employed in coal mining 6,091 men and boys; there were in operation for the same year 280 coke ovens, producing 52,625 tons of coke; the coal tonnage for the same year was 3,243,692 tons. Large bituminous asphalt deposits occur in the Choctaw and Chickasaw Nations; these have been worked some, but owing to the want of railroad facilities, and the asphalt trust, the operators have not been encouraged with very great success. There are also sandstone and limestone as well as granite. (2) The Ozark system, Carboniferous and Silurian, containing zinc and lead. (3) The northern prairie, Carboniferous, with coal and large quantities of petroleum. (4) The southern plains cropping over from Texas, underlaid by the Cretaceous, with artesian strata, and sand and marl above. There are valuable gold and silver deposits from which Indians have long made all their trinkets, but they have kept the places secret, to prevent an influx of miners.

Fauna.— The characteristic species are the timber and prairie wolves, panthers and foxes, black bear, deer, prairie dogs, and some smaller game. The wild turkey is the most important bird.

Climate and Rainfall.—The Territory belongs to the southern division by temperature and to the middle one by precipitation. It has a mean winter temperature of 35° to 48°, and a summer one of 77° to 82°; while the rainfall, light in the north like western Kansas, is heavy in the southeast (52 inches), and steadily decreases to the west (about 35 inches at Fort Gibson and 30 in the southwest). But hardly anywhere is it too scant for favorable agricultural conditions.

Agriculture.— Scarcely any region of the United States has greater natural advantages in fertile soil and plentiful water supply. With the opening of the Territory to white settlement and ownership, a vast increase in production will be effected. Until within the present year (1904) the word "ownership," as applied to tenures in the Indian Territory, had a peculiar meaning. To protect Indian interests, white men (except licensed traders and those made citizens by marriage to Indian wives in accordance with the laws of the tribe, or adopted into the tribe by tribal legislature) could not hold land, except as tenants of Indian landlords. The fee to the land in all cases was in the Indian tribes, and even the Indian citizen had only in a sense an occupancy right, owning the improvements absolutely, and cultivating the land practically as a fee simple owner, but always subject to future allotment among all the members of the tribe.

Within the past few years, agreements have been made between the United States and each of the five civilized tribes by which the lands of such tribes are being allotted in severalty to the citizens thereof, with the power of alienation in most of the nations, under certain restrictions, of all, except a certain amount reserved as a homestead, which, in some cases, is inalienable during the life of the allottee, and in others for 21 years, if the allottee lives so long.

In the Creek Nation, 120 acres of an allotment can at present be alienated with the consent of the secretary of the interior, which is being rapidly accomplished, under the rules and regulations prescribed by him, and the allotments are being bought by whites, who are either occupying them themselves or leasing them to other whites. The real Indian, as a rule, is not much of a farmer, and, as the amount granted to an Indian family is generally greater than the head can utilize or cares to utilize, the remainder is leased to some white farmer or cattleman. The whites farm a large proportion of the farms at present. In the year 1890, of the 35,451 farms cultivated by whites only 3,475 were owned by them.

These allotments to the Indians vary in the different tribes. A Choctaw and Chickasaw allotment is 320 acres of average allotable land, and of this the homestead consists of 160 acres of average allotable land, the latter inalienable during the lifetime of the allottee, not exceeding 21 years from the date of the certificate of allotment; the remainder of the land is alienable after issuance of patent, as follows: one fourth in acreage in one year, one fourth in acreage in three years, and the balance in five years; in each case from date of patent.

The Creek allotment is 160 acres, 120 of which is inalienable before the expiration of five years from the 8th day of August 1903, except with the approval of the secretary of the interior; the balance of 40 acres constitutes a homestead, which is inalienable for 21 years, unless the allottee sooner die, in which event the homestead remains for the use and benefit of children born too late to receive an allotment; but, if there be no such issue, then the allottee may dispose of his homestead by will free from restrictions, and, if this be not done, it descends to his heirs free from any limitations.

In all the above cases, as well as in the Seminole Nation, where the land was divided equally between all the members of the tribe, the allottee had the right to select his allotment so as to include any improvements owned by him at the time. At present the allottees can rent their allotments for one year for grazing purposes, and five years for agricultural purposes, and longer in some cases with the consent of the secretary of the interior. Mineral leases may also be made up to 15 years with the consent of the secretary of the interior.

The productions might easily be of the greatest variety in this warm moist region, but the conditions of tenure hitherto did not encourage tenants to diversify crops or improve the condition of farms to revert to Indian owners. The great crop at present is corn, of which in 1900, 30,700,470 bushels were raised; 1,486,820 of wheat, and 1,102,200 of oats were reported. The territory is well within the cotton belt, and 154,850 bales were shipped in 1900. The other products of note were about $1,000,000 of vegetables and fruits. Stock-raising is largely carried on; the value of domestic animals in 1900 exceeded $40,000,000, and included 110,687 dairy cows, 275,000 horses, mules and asses, 17,000 sheep, 10,500 goats and 650,000 swine. It has been known to many that there was a large quantity of oil and gas in this country, but owing to the lack of laws permitting leases and development in the Indian lands, nothing was done until within the last 18 months. The change in the laws, however, has permitted a great deal of development work in some of the towns as well as on outside allotments, and the production is proving very satisfactory to the lessees, as well as the lessors. The field thus far developed is in the northern portion of the Cherokee Nation and the border of the Creek Nation.

Manufacturing.— The manufactures till recently have been mostly confined to the Indian hand-made blankets, shawls, baskets, and trinkets. But within the decade a considerable genuine manufacture by whites has arisen. With only 20 establishments in 1890, there were 789 in 1900; the capital had grown from $204,329 to $2,624,265, the wage-earners from 167 to 1,714, the value of products from $248,932 to $3,892,181. The one great industry, nearly a third of the total products, was flour and grist milling; next greatest, toward half a million each, were cotton-seed oil and cake; and lumber, saddlery and harness, and car-shop work were also noted.

Railroads.— There are about 1,800 miles of railroad in the Territory; Several great lines cross it, giving the facilities for the vast business growth. The main lines are the Frisco System (St. L. and San F.), the St. Louis, Iron Mountain & Southern, the Missouri, Kansas & Texas, the Choctaw, Oklahoma & Gulf, the Atchison, Topeka & Santa Fe, and the Ft. Smith & Western.

Banks.— In 1902 there were 69 national banks, with capital of $2,779,000, deposits of $5,896,000, cash and other resources $548,000, and loans and discounts of $7,277,000. There were also 20 private banks, having capital of $203,975, deposits of $495,810, cash of $56,354 and loans and discounts of $602,676.

Population.— The total population in 1890 was 180,182; in 1900, 392,060, the increase being all white. The real Indian population had probably somewhat decreased, though it showed on the face a slight increase, from 51,279 to 52,500. But the word "Indian" is misleading; for legal purposes and tribal recognition, any one is an Indian who has even 1-64 or in fact any degree of Indian blood in him; and probably two thirds of the so-called Indians are mixtures of various complexities and elements. The negroes, numbering 36,853, are for the most part the former slaves of the Indians, to whom the United States after the war forced the tribes to grant citizenship and a share of the tribal lands and bounties, or their descendants. These two and the vast white population — married and adopted, leaseholders and tenant farmers, hired farm laborers, business men with permits, coal and railroad company employees, etc.— were distributed among the chief districts as follows (besides 27 Chinese):

Chickasaw Nation, 124,306 whites, 9,066 negroes, 5,872 "Indians." Cherokee Nation, 66,951 whites, 9,162 negroes, 25,630 Indians. Choctaw Nation, 70,332 whites, 10,123 negroes, 10,321 Indians. Seminole Nation, 1,143 whites, 981 negroes, 1,662 Indians. The other reservations — Modoc, Ottawa, Peoria, Quapaw, Seneca, Shawnee, Wyandotte — had 5,762 whites and

1,043 Indians. The concentration of whites in the Chickasaw district had made it the industrial leader of the territory.

The towns which grew there formerly had a peculiar status. They were "white" towns with white men occupying the buildings they had erected, and doing business insecurely, without legal title, but the ostensible owners of the ground were the Indians. The so-called Curtis Bill and the various agreements made with the tribes above referred to have changed this condition, and made it possible for the white man, or any other occupants of towns in the Indian Territory to purchase lots under the various provisions of these bills upon which they owned houses or other valuable improvements. The result is that all the larger towns have been platted, surveyed and sold to the occupants, so that the Indian titles have become almost entirely extinguished. Within a year or eighteen months every town within the limits of the Indian Territory will have been so platted and sold. The changes are so great and constant that statistics are nearly as useless as in a new mining district, but it may be said that the present chief towns are Ardmore, and Chickasha, in the Chickasaw Nation, South McAlister in Choctaw Nation, and Muskogee in the Creek Nation, is the handsomest town in the Territory, with good public schools, churches and four colleges of the four leading denominations — Baptist, Methodist, Presbyterian, and Roman Catholic. These towns now have a population approaching 10,000 each and there are over 20 others with over 1,000. The oldest white settlement is Vinita in Cherokee; the oldest in the southeast is Caddo; the best known has always been Tahlequah, for some generations the capital of the Cherokee Nation.

Internal Conditions and History.— The Territory was part of the Louisiana Purchase. Early in the 19th century many of the Southern Indians, their old hunting grounds invaded by the whites, removed to this virgin forest. In 1832 it was fixed on by the national government as a place for the tribes whom agreements with the Southern States had bound us to deport, and in 1834 special reservations were set apart. The Five Civilized Tribes, as they are called, established governments on the civilized model, with elected legislature, council and governor, courts and schools and responsible financial management, and even newspapers in the Cherokee tongue, with Sequoyah's famous alphabet. But the vast enclave of nearly 70,000 square miles in the heart of a swelling settlement could not be maintained, and the Indians from some constitutional blight do not grow to fill their districts. In 1866 some 5,500,000 acres were purchased of the Indians in the present Oklahoma; on 22 April 1889 over 3,000,000 acres were thrown open to settlement; on 2 May 1890 this and other territory was formed into Oklahoma. Meantime the old system in the eastern part was going to wreck, not so much from the white immigration, following the railroads which began to cross it, as from internal development which was making the primal object of the system a mockery. It was designed to protect the half-helpless Indian from white greed till he could stand on his own feet; in fact, the half-breeds and the intermarried whites were rapidly appropriating everything to themselves, while the full-blood was "crowded out upon the mountain and unproductive land, to take care of himself as best he could." (Dawes Commission.) The tribal governments were under control of these governments and were "recklessly leasing the community lands to cattlemen and coal companies" (Hinton), to railroads, oil and lumber companies, etc. The government, therefore, under the lead of ex-Senator Henry L. Dawes of Massachusetts, set about negotiations to break up the tribal governments, and turn the Territory into a set of ordinary civilized communities with ownership in severalty, protecting the Indian for a time by restraining his liberty of alienation. The Dawes Commission of 1893 began this work; in 1897 the United States extended its judicial power over the district; in 1898 the Curtis Act carried out the work, providing for the enrollment of citizens for allotment of lands, for laying out town sites and incorporating towns with power to elect officers and tax themselves for schools, etc., and giving the President a veto power over the tribal legislatures. The arrangements vary with the different tribes; the Seminoles continue their government after a fashion for the present, the Choctaws and Chickasaws with some modifications till 4 March 1906. The present government consists in reality of four federal judges or one court of appeals and four district courts, with 20 commissioners acting as petty courts and justices of the peace, and a resident Indian Inspector. The statutory code is in the main that of Arkansas.

The educational situation has been a part of the anomalous position of all social matters. The tribes maintained schools and admitted white children on payment of a fee; and the missionaries have operated others. But all were very insufficient, and the tribal schools, once the best of the vicinity, have not kept their quality. The Curtis Act of 1898 for the first time provided a public-school system, in cities and towns, and power of towns to levy taxes for them. In 1900 it was estimated that 50,000 white children were deprived of school advantages. Of academic schools, some claiming collegiate rank, there are good ones in each nation; these have sent many pupils to Eastern colleges. By act of 19 May 1902 municipalities of 2,000 or more inhabitants may issue bonds up to 10 per cent of their assessed valuation for school buildings, sewers, and waterworks on a two-thirds vote and with a 20-year sinking fund. Pop. (1900) 392,062; (1903) fully 500,000. Consult: 'Report of the Dawes Commission' (1903); Curtis Act in U. S. Statutes.

WILLIAM T. HUTCHINGS,
Muskogee, Indian Territory.

Indian or Wild Tobacco, one of the North American lobelias (*Lobelia inflata*), also called asthma-weed and gag-plant,— a tall plant with small light blue flowers quite overshadowed by numerous thin, oval, or obovate dentate leaves; the plant branches as a panicle, is fubescent and the pod is inflated. Its leaves have an acrid taste, and are, as Gray says, "poisonous and a quack medicine"; they were dried by the Indians as a substitute for smoking tobacco, or to mix with it, for the sake of their narcotic properties. The dried flowers still have a place in materia medica. It grows in dry fields and thickets through North America. Compare KINNIKINICK.

Indian Turnip. See JACK-IN-THE-PULPIT.

Indian Yellow, known in commerce as Puree, a pigment of unknown origin which is exported from India, China and probably from Arabia. It comes in the shape of balls, which are outside of a brown tint, and inside of a brilliant yellow. It has the odor of urine, musk or castoreum, is soluble in water or alcohol, and an essential element in its composition is carbonate of euranthin. It is used in India for house decoration, and is valued by artists all over the world as a dazzling pigment.

Indiana ("The Hoosier State"), a north-central State of the United States (No. 19 in order of admission) bounded north by Michigan, south by Kentucky, east by Ohio, west by Illinois; extreme length 276 miles, extreme breadth 177 miles: area (No. 34 in U. S.) 36,350 square miles, 440 water; pop. 1900 (No. 8 in U. S.) 2,516,462, or 70.1 to the square mile. (No. 11 in density.) The State boundary in Lake Michigan is an east and west line 10 miles north of the extreme southern point of the Lake. The Ohio River runs along the southern boundary, but, by a provision of the Virginia cession of Northwest Territory, Indiana extends only to low-water mark on the north bank of the Ohio. In consequence all islands in the Ohio belong to Kentucky, the Supreme Court having recently held this as to Green River Island (Indiana *v.* Kentucky, 136 U. S.) which, although an island at the time of the cession, became connected with the Indiana shore by alluvial deposits, and had been governed and taxed as part of Indiana for many years.

Topography.— The surface of the State is comparatively level, the highest point, in Randolph County, in the centre of the eastern tier of counties, being estimated at 1,285 feet above sea-level, and the lowest, at the southwest corner of the State, being 313 feet above sea-level. The Ohio at the southeast corner of the State is 436 feet above sea-level, and Lake Michigan at the northwest corner is 585 feet above sea-level. From the table-land of the east central part of the State, and western Ohio, radiate low water-sheds separating the drainage basins of Indiana. The northern part of the State is quite flat, the central part slightly rolling, and the southern part rather hilly on account of the valleys cut out by water. There are no mountains, and no large lakes, but there are hundreds of small lakes, chiefly in the northern part of the State.

River Systems.— The southern parts of the State are drained to the Ohio River by the Whitewater and smaller tributaries. The central part of the State — about four fifths of its area — is drained by the Wabash and its tributaries, the most important of which are the White, Tippecanoe, Eel, Salamonie and Mississinewa rivers, and Wild Cat Creek. The northeastern corner of the State is drained by the St. Joseph's and St. Mary's rivers; these unite at Ft. Wayne to form the Maumee, which flows into Lake Erie. The extreme northern part of the State is drained by another St. Joseph's, the Calumet, and smaller streams, into Lake Michigan. A part of the northwestern section is drained by the Kankakee and its tributaries to the Illinois River. The Wabash is navigated to a limited extent, by small boats, as high as Terre Haute, and also the lower part of White River. The remaining streams are not navigable.

Climate.— The climate of Indiana is mild, ranging from an average of 31° F. in the winter months to an average of 76° in summer. The mean temperature is 53°. The average annual rainfall is 43 inches, that in the southern part of the State being slightly in excess of that in the northern part. Serious droughts and destructive storms are rare. In earlier years parts of the State were malarial, but with the clearing of the forests and the drainage of lands this condition has almost wholly disappeared.

Geology.— The earliest geological formation that outcrops in Indiana is the Hudson and Trenton limestone, of the Silurian Age, which appears in the southeastern corner of the State, throughout the Whitewater Valley and the adjacent region. West of this is a belt of Niagara limestone, which broadens at the north and extends entirely across the State, covering all of a dozen counties and large parts of as many more. On the west of this, and also extending to the State line on the north, are belts of Hamilton limestone and sandstone of the Devonian Age. The remainder of the State — the southwestern corner and a broad belt to the north reaching beyond the Wabash — is of the subcarboniferous and carboniferous formations. The northern and central parts of the State are covered by glacial drift, which in some regions is of a depth of 400 feet.

Soils, Agriculture and Forests.— The soil of the State varies in character, but for the most part is fertile. Originally the southern part of the State, and as far north as the Wabash, was covered with a very heavy growth of forest, mostly of hardwood trees. North of this were low prairies interspersed with sand ridges and dotted with hundreds of small lakes. This region is now found very productive of cucumbers, melons and small fruits in the sandy parts. The richest lands are the alluvial valleys of the streams and the drained prairies. The forests have so far disappeared that the State is now encouraging tree planting. Agriculture is the chief industry of the State, the value of farm products in 1899 being reported at $204,450,196. The chief agricultural products were corn, 178,967,070 bushels, wheat 34,986,280 bushels, oats 34,565,070 bushels, potatoes 6,209,080 bushels, hay 3,470,378 tons. The value of animal products was $81,947,922, of forest products $5,235,459, of orchard products $3,166,338, of dairy products $15,739,594. The value of the poultry raised in 1899 was $8,172,093, and of the eggs produced $7,441,944.

Minerals and Mining Industries.— About one fifth of the surface of Indiana is underlaid by coal, workable veins having been found in 19 counties. There are at least 7 distinct veins of workable thickness, varying from 3 to 11 feet. The coals of the State are of two classes — caking or bituminous, and non-caking or block coal. The latter can be burned in blast furnaces without coking. The production in 1901 was 7,019,203 tons, valued at $7,370,163, the State ranking sixth in the Union as to quantity and seventh as to value of the product. The number of people employed in coal mining was 12,968. The mineral product second in value was petroleum, the production of which is a

comparatively new industry. In 1901 the oil product of the State was 5,749,975 barrels, valued at $4,795,312. This was largely increased — over one third — in 1902. Next in value of the mineral products of the State is building-stone, of which the chief varieties are the oolitic limestone, the blue Devonian limestone, the gray Niagara limestone, and sandstone. The oolitic, so called because composed of minute fossil shells resembling a mass of fish eggs, has become celebrated throughout the United States on account of its superior qualities. In 1901 Indiana was first in rank in the Union in the production of limestone for building purposes, and fifth in rank as to building-stone of all kinds, the product being valued at $3,028,145. There is also a large production of cement and lime. Good clay is abundant throughout the State, and brick and tile making are extensive industries. Kaolin and glass sand are also found in quantity in several counties, and are profitably mined. Natural gas has been found, by sinking wells, throughout a large part of the State. The supply at one time reached a daily flow of 900,000,000 cubic feet. It served to draw many manufactories to the State, but the pressure is now decreasing. In many places its cessation has been followed by a flow of petroleum. Many other minerals have been found in Indiana, but not in quantities of commercial importance.

Manufactories.— The manufactures of Indiana are chiefly a development of the past 30 years. In the earlier period manufacturing was confined almost wholly to supplies for domestic consumption, and was chiefly conducted at the homes of the people. In 1900 there were reported 18,015 manufacturing establishments in the State, employing 155,956 wage-earners, and producing goods to the value of $378,120,140. The leading classes of manufactures, with the value of products in 1900 and in 1890, are as follows:

	1900	1890
Slaughtering and meat packing	$43,862,273	$27,913,840
Flour and grist mills	30,150,766	31,239,627
Distilleries	22,738,106	9,677,973
Lumber and wood manufactories	34,471,902	32,725,647
Iron and steel (including foundries)	36,566,527	14,285,259
Glass and glassware	14,757,883	2,995,409
Carriages and wagons, and materials	15,891,826	10,531,683
Railroad cars	19,248,909	14,362,711
Agricultural implements	6,415,081	5,756,131
Textiles and clothing	8,618,360	7,736,890
Clay products	4,222,529	3,142,454

It is probable that this rate of increase will not be continued in the next decade, partly because of the decrease of natural gas, partly because of abandonment of plants under trust control, and partly for other reasons. The production of lumber in the State was almost stationary in the past decade, and will probably decrease in this on account of decreasing forest supplies.

Commerce and Navigation.—About one tenth of the people of Indiana (in occupations) are engaged in commerce and transportation. The navigation of the State is limited, being confined to the Ohio River on the south, with the lower Wabash and a small part of the White River, and Lake Michigan on the northwest. The canals of the State are practically abandoned except for water-power. The railroads furnish the chief means of transportation. Commerce is chiefly domestic, but both exportation and importation are steadily increasing.

Fisheries.— Indiana has no fisheries of commercial importance, though it has waters that might be made valuable. Recently laws have been passed for the protection of fish, and some interest is being shown in their propagation.

Railroads and Street Railways.— The railroad mileage of Indiana, in 1902, was 6,651 miles, exclusive of second main and side tracks. In 1850 it was 228 miles; in 1880, 4,320. Railroad lines extend through all but 3 counties in the State. The chief railroad centre is Indianapolis, from which 14 lines radiate. These are connected outside of the city by a belt railway. The valuation of railroad property for taxation in 1902 was $162,797,978. There are street railways in all of the cities and larger towns, the total aggregating 168 miles. In 1899 there began an extraordinary development of electric interurban lines. By the close of 1902 about 400 miles of these were in operation, and 500 miles were under construction, while new lines aggregating over 1,000 miles were projected. These lines have made a material change in the transportation of both passengers and freight, and will apparently furnish large competition with the steam railroads. One of these lines, operating between Indianapolis and Columbus, Ohio, has added sleeping-cars to its equipment.

State Finances.— The assessed valuation of the State in 1901 was $1,397,981,497, from which deductions for mortgage exemption were made amounting to $35,169,250. Individuals are permitted to deduct *bona fide* mortgage indebtedness from their schedules to the amount of $700. The total number of polls was 436,522. The State tax levy for general State government was 9 cents on $100, and 50 cents poll; for the benevolent institutions 5 cents; for sinking fund 3 cents; for State tuition — which is distributed to the school districts for support of the common schools — 11 cents and 50 cents poll; for State institutions of higher education 1⅔ cents; making a total State levy of 29⅔ cents and $1 poll. The reduction of the State debt was begun in 1889, when it amounted to over $10,000,000. On 31 Oct. 1902, it had been reduced to $2,887,615.12, on which the annual interest charge was $101,565.

Banks.— In 1902 there were 137 national banks with $16,618,552 capital, $4,789,956 surplus, $71,533,942 deposits, and $7,210,780 outstanding circulation; 113 State banks with $4,884,400 capital, $915,413 surplus, and $24,240,334 deposits; 5 savings banks, with $7,812,157 of deposits; 37 trust companies transacting bank business, with $4,392,500 capital, $465,947 surplus, and $12,378,348 of deposits, and 203 private banks, which are not required to make returns by the State. Of these last named, however, 68 made returns to the comptroller of the currency, showing $9,671,733 deposits. The only clearing-house organization in the State is at Indianapolis, and the volume of clearings in 1902 was $270,409,456.

Education.— Indiana has always given much attention to education and especially since the adoption of the present school law in 1852. At that time there was created a public school fund, the interest on which was to be distributed to the various school districts. The principal factor in this was the profits which the State had derived from the State Bank of Indiana, amounting to about $3,500,000, to which was added $573,000 of the surplus revenue distributed by Congress in 1836, and several smaller funds. To this additions have been made by fines and other public receipts, until in 1902 the common school fund amounted to $7,978,580.68, to which is to be added the Congressional township fund, derived from the sale of school lands donated by the national government, amounting to $2,465,304.64. This total fund of $10,443,885.32 is held by the several counties, and the interest on it is applied to the support of the public schools. Added to this is a State tax of 11 cents on each $100, and 50 cents on each poll, the proceeds of State liquor licenses and dog licenses, and local taxes assessed by local authorities. From all these sources the actual revenues raised for the public schools in 1902 amounted to $8,585,354.98. The enumeration of children of school age — 6 to 21 years — was 761,801 (of whom 15,002 were colored). A large number of these attended private schools, and the attendance in the public schools for the year was 423,078. The revenue was therefore in excess of $20 to each child in attendance. There were employed 16,039 teachers, and the average number of days of school was, in townships 126, in towns 153, in cities 179, in the State at large 146. The number of public schoolhouses is 5,080 brick, 4,807 frame, 97 stone, and 3 log. The value of schoolhouses and grounds is $22,904,607 and of school apparatus $1,277,455. In these figures are included 704 high schools, which are a part of the public school system. There are also a large number of private schools, notably those maintained by the Roman Catholics and Lutherans for children of all ages, and a number of academies, seminaries, institutes, boarding-schools, military institutions, colleges, normal schools, etc., for intermediate education.

There are three institutions of higher education that receive aid from the State, Indiana University at Bloomington, the State Normal School at Terre Haute, and Purdue University at Lafayette. Indiana University has an income of about $125,000 derived from a State tax levy and the interest on an endowment fund of $600,000 raised by State taxation. It had 1,285 students in 1902. The State Normal is also supported by a State levy, and the city of Terre Haute pays one half the expense of keeping the buildings in repair. It has 1,406 students. Purdue has an income of $150,000 derived from State tax levy and interest on endowments, and including $57,000 paid to it annually by the United States government as an agricultural school. It has 1,180 students.

Among the private institutions for higher education the more important are Wabash College (Presbyterian), University of Notre Dame and St. Meinrad's College (Roman Catholic), DePauw University (Methodist), Earlham College (Society of Friends), Franklin College (Baptist), Hanover College (Presbyterian), Northern Indiana Normal (non-sectarian), Winona Technical Institute (non-sectarian), and the University of Indianapolis. The last named was formed by the union of Butler College (Christian) with the Medical College of Indiana, the Indiana Dental College, and the Indiana Law School, all of which are located at Indianapolis.

An important branch of educational work in Indiana is the development of libraries. A feature of the school system adopted in 1852 was the establishment of a free public library in each township in the State. The State expended $273,000 for books, and the system was received with great public favor, but no provision was made for maintaining or increasing the libraries, and in the pressure of the war times they were allowed very generally to fall into ruin. To some extent these have been replaced as school adjuncts by the libraries of the Young People's Reading Circle, which are found at many of the schoolhouses of the State. These libraries in 1902 contained 436,151 volumes. There has also been a notable development of town and city libraries, 28 towns having accepted donations from Andrew Carnegie, aggregating $660,000, agreeing to maintain libraries in the buildings thus provided. There are 25 others that are maintaining libraries in buildings provided by themselves. The general supervision of library work is lodged in the Public Library Commission, which has charge of a system of traveling libraries furnished by the State. It also maintains a school for the training of librarians engaged in the work in Indiana.

Churches.— The principal religious denominations of Indiana in the order of their strength are the Methodists, Roman Catholics, Disciples or Christians, Baptists, Presbyterians, United Brethren, and Lutherans.

Charitable and Penal Institutions.— The State maintains 9 charitable and 4 penal institutions, at an annual cost of over $1,500,000. Of the former, 4 are hospitals for the insane located respectively at Indianapolis, Logansport, Richmond and Evansville. On 31 Oct. 1902, these had 4,039 inmates. The annual cost of maintenance was $649,834.54, or $173.79 per capita. The other charitable institutions are the Institution for the Blind, Indianapolis, inmates 127, per capita cost $276.40; Institution for the Deaf, Indianapolis, inmates 318, per capita cost $231.66; Soldiers and Sailors' Orphans' Home, Knightstown, inmates 603, per capita cost $174.52; Soldiers' Home, Lafayette, inmates 739, per capita cost $167.30; School for Feeble-Minded, Fort Wayne, inmates 318, per capita cost $127.05. The correctional institutions are the State Prison, Michigan City, inmates 796, per capita cost $133.32, earnings $53,395.86; Indiana Reformatory, Jeffersonville, inmates 923, per capita cost $130.68, earnings $62,350.67; Reform School for Boys, Plainfield, inmates 531, per capita cost $122.13, earnings $298.91; Industrial School for Girls and Women's Prison, Indianapolis, inmates 52 women and 175 girls, per capita cost $191.55, earnings $1,436.69. At the legislative session of 1903 a law was passed for the division of the last named institution and the establishment of a new Industrial School for Girls. The State has the convict-contract-labor system, but efforts have been made to abolish it, and the legislature of 1903 provided for a commission to investigate and report on the subject. The convict labor is all done within the prisons. The State has the indeterminate sentence system with commutation of time for

STATE CAPITOL AT INDIANAPOLIS.

good behavior. In addition to the State institutions each county maintains a poor asylum. In these, and the Marion County asylum for the incurable insane, there were on 31 Aug. 1902, 3,046 inmates, of whom 1,975 were men and 1,071 women. Of these inmates 518 were classed as insane, and 889 as feeble-minded. There are in the State 46 orphans' homes, in which there were on 31 Oct. 1902, 1,565 inmates, of whom 1,025 were boys and 540 girls. At the same date the Board of State Charities reported 811 orphan children maintained in private homes, without public expense.

State Government.— The elective State offices are held for periods of 2 years, with eligibility restricted to 4 years in any period of 6 years, except as to the governor, lieutenant-governor, and geologist, whose terms are 4 years. No one is eligible to the office of governor or lieutenant-governor for more than 4 years in any period of 8 years. The governor's salary is $5,000, with an allowance of $1,800 for house rent. The governor's veto power extends to all laws passed by the legislature, but the veto may be overthrown by a majority vote in both Houses. The legislature meets once in 2 years, and may be called in special session by the governor; regular sessions are limited to 60 days and special sessions to 40 days. The Senate is composed of 50 members elected for 4 years each, and the House of 100 members elected for 2 years each. The members receive $6 a day while in session, and $5 for each 25 miles traveled in reaching the capital and returning home. The State is required to be redistricted for legislative purposes every 6 years. The present Constitution was adopted in 1851, and is very generally considered unsatisfactory, especially as to legislative representation and the location of the appointing power. It can be amended only by the majority vote of both Houses of two consecutive legislatures, followed by a majority vote of the electors of the State.

Congressional Representation.— The State has 13 representatives in Congress.

Population and Divisions.— The population of Indiana territory in 1800 was 5,641, but only about 2,500 of this was within the boundaries of the State. In 1810 the population of the territory, with practically the same boundaries as the State, was 24,520. A territorial census taken in 1815 showed 63,897 inhabitants. After the admission of the State the census returns were as follows: 1820, 147,178; 1830, 343,031; 1840, 685,866; 1850, 988,416; 1860, 1,350,428; 1870, 1,680,637; 1880, 1,978,301; 1890, 2,192,404; 1900, 2,516,462. Of the population in 1900, 142,121 were foreign born, and 57,505 were negroes. The tendency of the negroes is to gather in the cities, more than one fourth of the entire number being found at Indianapolis, and an eighth at Evansville.

The State has 92 counties, whose names and county-seats are as follows:

Adams, Decatur.
Allen, Ft. Wayne.
Bartholomew, Columbus.
Benton, Fowler.
Blackford, Hartford City.
Boone, Lebanon.
Brown, Nashville.
Carroll, Delphi.
Cass, Logansport.
Clark, Jeffersonville.
Clay, Brazil.
Clinton, Frankfort.
Crawford, English.
Daviess, Washington.
Dearborn, Lawrenceburg.
Decatur, Greensburg.
Dekalb, Auburn.
Delaware, Muncie.
Dubois, Jasper.
Elkhart, Goshen.
Fayette, Connersville.
Floyd, New Albany.
Fountain, Covington.
Franklin, Brookville.
Fulton, Rochester.
Gibson, Princeton.
Grant, Marion.
Greene, Bloomfield.
Hamilton, Noblesville.
Hancock, Greenfield.
Harrison, Corydon.
Hendricks, Danville.
Henry, Newcastle.
Howard, Kokomo.
Huntington, Huntington.
Jackson, Brownstown.
Jasper, Rensselaer.
Jay, Portland.
Jefferson, Madison.
Jennings, Vernon.
Johnson, Franklin.
Knox, Vincennes.
Kosciusko, Warsaw.
Lagrange, Lagrange.
Lake, Crown Point.
Laporte, Laporte.
Lawrence, Bedford.
Madison, Anderson.
Marion, Indianapolis.
Marshall, Plymouth.
Martin, Shoals.
Miami, Peru.
Monroe, Bloomington.
Montgomery, Crawfordsville.
Morgan, Martinsville.
Newton, Kentland.
Noble, Albion.
Ohio, Rising Sun.
Orange, Paoli.
Owen, Spencer.
Parke, Rockville.
Perry, Cannelton.
Pike, Petersburg.
Porter, Valparaiso
Posey, Mt. Vernon.
Pulaski, Winamac.
Putnam, Greencastle.
Randolph, Winchester.
Ripley, Versailles.
Rush, Rushville.
Scott, Scottsburg.
Shelby, Shelbyville.
Spencer, Rockport.
Starke, Knox.
Steuben, Angola.
St. Joseph, South Bend.
Sullivan, Sullivan.
Switzerland, Vevay.
Tippecanoe, Lafayette.
Tipton, Tipton.
Union, Liberty.
Vanderburg, Evansville.
Vermilion, Newport.
Vigo, Terre Haute.
Wabash, Wabash.
Warren, Williamsport.
Warrick, Boonville.
Washington, Salem.
Wayne, Richmond.
Wells, Bluffton.
White, Monticello.
Whitley, Columbia City.

Chief Cities.— The largest city in Indiana is the capital, Indianapolis, with a population (1900) 169,164. Next in size are Evansville (59,007), Ft. Wayne (45,115), Terre Haute (36,673), and South Bend (35,999). Each of these cities has a charter specially made for it, though under guise of a general law. These charters are of recent creation — the oldest made in 1891 — and establish advanced forms of city government. Of cities of secondary importance may be named Muncie (20,942), New Albany (20,628), Anderson (20,178), Richmond (18,226), Lafayette (18,116), Marion (17,337), Logansport (16,204), and Elkhart (15,184). There were in all 80 cities and 330 incorporated towns in the State in 1901.

History.— The first-known visits of white men to Indiana were those of Sieur de la Salle, who followed the Ohio River along its southern boundary in 1669–70, and crossed its northwestern corner by way of the St. Josephs-Kankakee portage in 1671. There were no Indians living below the Wabash at that time, and probably not many in the northern part of the State, but those there were LaSalle induced to join his confederacy against the Iroquois, and they all removed to the Illinois River, leaving Indiana practically uninhabited. After some years they began moving to the East, reaching Detroit by 1712, and shortly afterward located at points along the Maumee and Wabash rivers. The Delawares, who afterward lived in the central part of the State, on White River, came there about 1750. It is probable that the French first placed representatives at the Indian villages near the site of Ft. Wayne, and next, about 1720, at Ouiatenon — on the north side of the Wabash just below Lafayette — and that there were stockade forts at these places, but there is nothing to indicate a permanent settlement at either place. The post at Vincennes was established in 1731, largely under the influence of Father De Beaubois, a Jesuit who had been stationed at Kaskaskia. Families located there soon afterward, and it remained a permanent settlement, though there is but one land grant recorded of date prior to 1736. The French posts were small and unimportant, and the history of the region under French and British rule presents no very striking features. In 1778 Vincennes was surrendered to representatives of Gen. George Rogers Clark, and the Wabash country was brought under American control. A recapture by the British was followed by a second taking by Clark in 1779. The region was ceded to the United States by the treaty of 1783, and was included in the Territory northwest of the Ohio River, by the ordinance of 1787. It was thus governed until 1800, when Indiana Territory was formed, including all of the Northwest Territory except Ohio. From Indiana Territory, Michigan Territory was cut off in 1805, and Illinois Territory in 1809, leaving it with practically the present State boundaries. By act of Congress of 19 April 1816, Indiana was authorized to form a State government, and the State was formally admitted by act of 11 Dec. 1816. In the meantime a State Constitution had been adopted on 29 June; State officials had been elected, and the State government had been actually inaugurated on 7 November.

There were almost continuous Indian troubles in the Ohio Valley from 1788 to 1795, when, after Gen. Wayne's successful expedition, peace was made at Ft. Greenville. After that date the American immigration began, and there was no material trouble with Indians until the formation of Tecumseh's confederacy in 1811. The Indians were overwhelmed at the battle of Tippecanoe (q.v.) on 7 November of that year, by the troops under Gen. Harrison, and sued for peace, but when the war with England came on there were Indian hostilities of minor importance continuing until the close of the war in 1815. After that year there was a gradual extinction of Indian titles, the Indians being concentrated in the northern part of the State and finally removed west of the Mississippi. The last removals occurred in 1836 and 1838.

The sobriquet "Hoosier," commonly used to designate the State and its people, was first applied to them about 1830. It was not coined for that purpose, as is commonly supposed, but was a slang word signifying an uncouth rustic, which was in common use in the South at that time, and is still commonly used there in that sense.

The history of the State after its admission was chiefly that of peaceful development — clearing lands, opening roads, building towns and cities, and establishing industries. The most notable feature was the disastrous internal improvement enterprise on which the State entered in 1836. It contemplated transportation routes on 7 main lines, involving the construction of 1,289 miles of railroads and canals. That the routes were fairly well chosen is shown by the fact that they are now practically all occupied by successful railroad lines. The chief defect was that the improvements were mostly high-line canals, and the breaks in these before completion caused such great damage that the estimated cost was enormously increased. The financial panic of 1837 added to the difficulties, and the effects of this were aggravated by the general entering of the States on such enterprises on borrowed capital. The total debts of the several States swelled from about $13,000,000 in 1830 to $207,894,613 in 1842. In 1839 Indiana was unable to realize on the sales of her bonds, and was forced to default interest on those already issued. The canals and roads being unfinished, did not furnish the revenues anticipated. Compromises were effected by which the work done was turned over to creditors, but the State was left with a debt of about $10,000,000 without any property to represent it. In all, Indiana built 453 miles of canals, at a cost of $7,725,262, all of which are now abandoned so far as transportation is concerned. But under private management, and more favorable conditions, the transportation lines developed rapidly, and in 1849 the one railroad originally contemplated was paying 8½ per cent dividends on its stock. In 1860 there were 2,126 miles of railroads in successful operation in the State.

In the war with Mexico, Indiana furnished troops to the number of 4,470. Of these there were killed and wounded 183, and died of other causes 218. When the Civil War began the State occupied an important position, and its resources were utilized to the uttermost by its war governor, Oliver P. Morton. The State furnished 196,363 men for the War, and 784 paid for exemption, or in other words supplied 74.3 per cent of her total population capable of bearing arms, by the census of 1860. Only one State in the Union surpassed or equaled this record, Delaware being credited with 74.8 per cent of her military population. But of the supply credited to Delaware nearly one tenth was in money commutation for exemption, and nearly one tenth of the men in actual service were colored. On the basis of white troops furnished for 3 years or more of service, Indiana supplied 57 per cent of her military population of 1860, and on this basis was surpassed only by Kansas, which is credited with 59.4 per cent. Of the troops sent by Indiana 7,243 were killed or mortally wounded in battle, and 19,429 died of other causes, making a total death loss of over 13 per cent of all troops furnished. One feature of the War period in Indiana, and some adjoining States, was the formation of secret treasonable societies known as Knights of the Golden Circle, and later Sons of Liberty. These attracted much attention at the time, and much comment later, but in reality they were neither extensive nor dangerous. They were organized with a system of "circles within circles," with mysterious rites and blood-curdling oaths, but the masses of the members understood that they were merely for mutual protection, and the treasonable designs were affairs of the inner circles. Among their members there were a number of government detectives who kept the authorities informed as to every movement, and at the final exposure the chief witness for the government was Felix Stidgers, a detective who had become so prominent in the order that he was made "Grand Secretary for Kentucky," and knew all of the secrets of the order. As is aptly stated by Gov. Morton's biographer, "No one can read the history of the secret organizations in Indiana and not feel that, widespread as they were, there was not an instant in which they were not securely within the grasp of the war governor." After the War, Indiana became peculiarly a political battle-ground. In 1868 the Republicans elected Conrad Baker governor by less than 1,000 plurality, and in 1872 the Democrats elected Thomas A. Hendricks to that office by the narrow plurality of 1,148, although Gen. Grant received the vote of the State for President. After 1872 neither party carried the State at two consecutive Presidential elections until after 1896, and neither carried it by a majority of all the votes cast, or by a plurality of as much as 20,000. One result of this close balance has been an improvement in State legislation, the Democrats leading in the legislature of 1889 which they held although they had lost the State offices and the Presidential vote of the State in the preceding year. Indiana in that year adopted the Australian ballot system, being the second State in the Union to do so, with some improvements that have been extensively copied. Other notable reform laws are a school-book law that has made a large reduction in the cost of books used in the common scools; a Board of State Charities law that has greatly improved the charitable and penal institutions of the State; a fee and salary law putting officials on salaries and requiring the payment of all fees into the public treasuries; a compulsory education law; laws for the encouragement of public libraries; laws for the incorporation of cities which provide the most modern modes of city government; laws for the reform of county and township government providing supervisory boards to which local legislation is entrusted and a tax law that has been largely effective in equalizing taxation and has been copied elsewhere. Another feature of Indiana's development that has attracted notice in later years is its production of native writers of poetry and fiction. Among the former may be named Joaquin Miller, John Hay, John James Piatt and James Whitcomb Riley; among the latter Gen. Lew Wallace, Maurice Thompson, Edward Eggleston, Charles Major, Meredith Nicholson, Booth Tarkington and Annie Fellows Johnston. These with lesser lights and some writers of note in other lines form a notable group for a commonwealth whose settlement and development have occurred in little more than a century.

JACOB PIATT DUNN,
Secretary Indiana Historical Society.

Indiana University, the State university located near Bloomington. In accordance with a provision of the State constitution, the legislature passed an act in 1820 providing for the establishment of a State seminary, which was opened in 1824 under the name of Indiana Seminary; in 1827, it was raised to the dignity of a college, and in 1838 the name was changed to Indiana University. In 1868 the university was opened to women, and has since been coeducational in all its departments. The university is the head of the public school system of Indiana, and no tuition fee is charged; the government is by a board of trustees which reports biennially to the governor. Courses are offered in languages, science, and history, all graduates receiving the degree of A.B. The degrees of Ph.D. and A.M. are given for graduate work; there is also a school of law connected with the university which confers the degree of B.L. There is a biological experiment station on Winona Lake, under university control, and a summer session is maintained. In 1904–5 the university reported: faculty, 78; students, 1,538; volumes in library, 53,000.

Indianapolis, Ind., capital of the State, county-seat of Marion County, the largest city in the State and the 21st in the United States; situated on the west fork of White River. It is the centre for 16 radiating railroads, which connect it with Chicago, 184 miles northwest, Cleveland, 283 miles northeast, St. Louis, 240 miles southwest, Louisville, 110 miles south, Cincinnati, 111 miles southeast, Columbus, 181 miles east, New York, 819 miles east, and other termini in Ohio, Michigan, Illinois, and Indiana. Its area is 29.35 square miles.

The site was selected in 1820 as the location of the capital by a legislative commission, and its name was adopted by the legislature in session at Corydon, 6 Jan. 1821. The first plat included a square mile, which was laid out with broad rectangular streets and avenues radiating from a central circle. The character of the plan was undoubtedly influenced by l'Enfant, the designer of the city of Washington, D. C., for one of the surveyors who made the town plat had aided in the work at the national capital. While the additions to the city have not been developed upon the same broad lines, most of them have been treated liberally and the city is noted for its wide streets, well paved and beautifully shaded. The city is very level, nearly all of its area being 700 to 800 feet above sea-level. There are 439.6 miles of platted streets, of which 92 miles are paved, 44 miles with asphalt, 27 miles with brick, 17 miles with wooden blocks, and 4 miles with macadam. The chief business streets are Washington Street, which is a section of the old National road projected and partly completed to run from Baltimore to St. Louis; Market, Maryland, and Georgia streets, all running east and west; Meridian, Pennsylvania, Delaware, and Illinois streets, running north and south, and Massachusetts, Indiana, Virginia, and Kentucky avenues, which are diagonals, radiating from the circular Monument Place. This central circle contains the State's monument to its soldiers and sailors, perhaps the most successful of the innumerable monuments erected by towns, cities, societies, and States in commemoration of the nation's defenders, and is generally regarded as one of the greatest in the world from an artistic point of view. The finest residence streets are Delaware, Meridian, and Pennsylvania. Several other residence districts are particularly well designed and cared for, such as Woodruff Place — a residence park, with esplanades, fountains, statues, etc.,— which has a town government of its own, though completely surrounded by the city; Morton Place, and Meridian Heights.

Public Service.— The first water supply and the first sewer system were constructed in 1870 to 1875, and but little else was done in the way of comprehensive public improvements until after the adoption of the present efficient charter in 1891. Prior to that year the city government had been by mayor and council. Public-spirited citizens who recognized the impossibility of comprehensive public improvements, through the Commercial Club and Board of Trade agitated the adoption of the new charter, which separated the legislative and administrative functions of the city government, making the mayor and his appointees fully responsible for the latter. The first Board of Public Works devised a broad system of improvement, including sewerage, paving and street cleaning, which was supplemented in 1895 by a Park Commission. Under these two boards the progress in the establishment of municipal public works adding to the beauty and convenience of the city has been rapid. As a step preliminary to the era of improvement which began in 1890 a paving exposition was held for the purpose of educating the people of the city regarding paving materials and methods. It was the first ever held in America and attracted attention throughout the country. Official delegations were sent to it from many cities. Prior to 1890 less than two miles of pavements had been laid. The amounts expended since the adoption of the new charter in 1891, including the year 1902, are as follows: for pavements of asphalt, $2,726,668.01; brick, $1,011,214.39; wooden block, $969,652.82; macadam, $154,522.91; gravel, $757,112.50; for alley improvements, $46,655.26; for cement walks, $879,610.21; for brick walks, $65,995.41; making a total for paving of $6,611,431.51. During the same period the expenditure for construction of 105 miles of sewers added to the 23 miles previously in use was $1,828,878.67, and for bridges $240,485.32. The grand total for the 12 years shows $8,680,795.50 expended in these departments of public improvements. The waterworks owned by the Indianapolis Water Company have developed with the city. The system of pumping by direct pressure is used, and a system of filter beds to purify the water taken from White River some miles above the city has been installed. The company has 226 miles of water mains and receives from the city about $85,000 a year for public water and fire protection service. Electric lights are in general use. The city pays about $115,000 a year for about 1,350 electric arcs for street lighting and about $7,000 for about 400 gas and vapor lights. The police department contains 175 men and costs $150,000 a year. The police court, city clerk, city dispensary, and central station are housed in a handsome building of recent construction. The fire department has 100 horses, 9 steam fire-engines, 20 hose wagons, 1 water tower, 1 aerial, and 4 service trucks, 4 chemical engines, and 175 men, and is housed in 22 stations. It costs the city $175,000 a year. There are 50 miles of underground conduits used by the telephone, telegraph and electric light and power companies, and 125 miles of electric street railway lines, owned by the Indianapolis Street Railway Company. The city is the most prominent centre of interurban railway traffic in the United States. Ten systems are in operation or in active construction, and others are early probabilities The city has recently made a contract with the Indianapolis Terminal and Traction Company, lessee of the city lines, under which a great terminal station and belt lines for the passenger and freight traffic of the interurban lines are under construction, the whole making a model system.

Parks and Cemeteries.—The public park system includes 9 parks of nearly 1,200 acres area. Riverside Park, purchased in 1898, contains 950 acres along White River, Garfield Park 108 acres, and Brookside Park 80 acres. Since the establishment of the park commission in 1895 $300,000 has been spent in purchasing new parks and $400,000 in improving them. There are several small parks scattered about the city, such as Military Park, 14 acres; University and St. Clair Squares, each 4 acres; Spades Place, 8 acres; Indianola Place, 2 acres; Highland Square, and combinations of park, boulevard, and residences as Elmwood, Fletcher, Morton, and other places, of which the largest is Woodruff Place, above noted. The city street railway company maintains two parks a short distance outside the city limits. The first cemetery of the city, Greenlawn, has not been used as such for many years and is kept in park form by the Board of Park Commissioners. Crown Hill cemetery, one of the notable cemeteries of the country, embraces over 540 acres. There are also Roman Catholic, Lutheran, and Jewish cemeteries.

Buildings.— The Indiana State House, costing $2,000,000, and built of Indian oolitic stone, is perhaps the most notable building. With its grounds it occupies two large blocks. The county building was completed in 1878 at a cost approximating $1,750,000. The new Federal building, containing the post-office, custom-house, and United States courts, is under construction at a cost of $2,400,000. Other municipal buildings of note are the police building, the public library, containing also the offices of the public schools, and some of the new public school buildings. Tomlinson Hall, a bequest by Dr. J. M. Tomlinson, is a public building, its lower story being used as a market. The Indianapolis Art Association is considering plans for an art museum and school. Among the prominent business buildings ornamenting the city, special mention may be made in the order of their construction of the Commercial Club, Majestic, Law, Stevenson and Newton Claypool buildings and Claypool Hotel. The Columbia Club building is an important feature of one quadrant of Monument Place, which surrounds the Indiana State Soldiers and Sailors' monument. This massive shaft is the central and most notable decorative feature of the city. It is 285 feet high, including the bronze statue, and its base is ornamented with symbolic groups of statuary and reliefs in stone and bronze. It was designed by Bruno Schmitz and cost over $500,000. Four epochs in the history of the State are commemorated by the statues of George Rogers Clark, William Henry Harrison, James Whitcomb, and Oliver P. Morton, which are grouped about its base. The width of Washington street, 120 feet, and of the streets of the original plat, 80 and 90 feet, give space for the best possible display of architectural features.

Transportation.— Indianapolis is the centre of trade for the State. With the completion of the Indianapolis Southern Railway every county in the State except three, which are on the Ohio River, can be reached by railroad in less than one day's travel. Consolidations have placed most of the railroads in two systems. One of these, the Pennsylvania lines west of Pittsburg, now operates the Madison and Jeffersonville lines, which reached the city in 1847, and the Vincennes line, completed in 1868; the Indiana Central to Columbus and the East, completed in 1853, and the Terre Haute and Richmond, later the Vandalia, completed in 1852, and now reaching St. Louis; also a line to Chicago, partly over the Lake Erie and Western. The other, the Big Four system, operates the Bellefontaine road to Cleveland, completed in 1852; the Indianapolis and Cincinnati, which reached the city in 1850; the Indianapolis and Lafayette, of 1852, now reaching Chicago; the Indianapolis, Bloomington and Western to Peoria, finished in 1870, its eastern extension to Springfield, O., completed about 15 years later; the Indianapolis and St. Louis, completed in 1876. Through trains are also run to Benton Harbor, Mich., and to Louisville, over branches of these lines. The

SOLDIERS' MONUMENT.

Cincinnati, Hamilton and Dayton Railroad Company operates the Cincinnati and Indianapolis Junction road, completed in 1868, and the Indianapolis, Decatur and Springfield road to Springfield, Ill. The Indianapolis, Cincinnati and Louisville operates a line to Chicago, which was completed about 1880. The Lake Erie and Western Railroad Company operates the old Peru and Indianapolis road, completed in 1854, and reaches Michigan City, Toledo and Peoria.

The construction of the system of interurban electric roads began about 1890 with the Broad Ripple line, now a suburban city line. The next to be constructed was the Indianapolis and Greenwood line in 1900, now reaching Columbus, Ind. It was quickly followed by the Indianapolis and Eastern, which now connects with lines to Columbus, Ohio, and other Eastern points. The Union Traction Company entered the city with a line from its centre in Anderson in 1901 and completed a new line north to Tipton and other points in 1903. The Indianapolis, Shelbyville and Southeastern is another line completed in 1901. Lines entering the city in 1903 are the Indianapolis and Martinsville, the Indianapolis and Plainfield, and the Indianapolis and Northwestern, reaching Crawfordsville and Lafayette. The Indianapolis and Cincinnati is under construction in 1903 to Rushville, and contracts have been let for the Indianapolis and Southern railroad. The steam railroads are served within the city by the Union Railway Company owning the Union passenger station and the belt railway for facilitating the transfer of freight. The interurban electric roads will in like manner be served by the Indianapolis Terminal and Traction Company owning a large terminal station and belt lines for passenger and freight business.

Manufactures.— During the brief natural gas era in Indiana, Indianapolis benefited largely by the cheap fuel. Since the failure of the gas supply the superior shipping facilities of the city and relatively cheap coal fuel have attracted many more manufactories, and more than 160 industries are carried on in about 2,000 establishments. According to the United States census of 1900 there was invested in 1910 establishments capital amounting to $36,828,114, employing 27,478 persons, including proprietors, and turning out products valued at $68,607,579. Among the most important industries are slaughtering and meat packing, whose product was $18,781,442 in the census year from 7 establishments; iron work of all sorts, $6,727,990; flouring and grist mill products, $3,820,373; carriages and wagons and material therefor, $2,812,498; furniture factory product, $1,685,827; saws, $1,587,827; malt liquors, $1,770,939; printing and publishing books and newspapers, $2,924,385; clothing, $2,190,050, half of it factory product; lumber and lumber-mill products, $1,588,797.

Finances and Banking.— The assessed valuation of the city in 1870 was $24,656,460. In 1891 at the beginning of the era of public improvements it was $93,595,930, and in 1902 it had increased to $132,927,210. The tax rate for State, county, township, city, and school purposes was $2.08 in 1902. The bonded debt is $2,421,000. The city's expenses are about $1,200,000 a year. The post-office receipts are $635,000. The custom-house receipts are $165,000, and the valuation of imports $350,000. There are 14 banks and trust companies, including seven national banks. The aggregate capital of the national banks is about $4,300,000, their surplus about $1,900,000, and deposits over $18,000,000. The six trust companies have a capital of $2,900,000 and individual deposits of about $7,500,000. The trust companies and private banks carry savings accounts. There are about 90 building, loan and savings associations in various stages of progress and liquidation.

Churches.— Indianapolis is the seat of a Roman Catholic bishop, with an auxiliary bishop and of an Episcopal bishop. Including missions there are 12 Roman Catholic churches in the city, 47 Methodist, 16 Presbyterian, 7 Episcopal, 34 Baptist, 10 Congregational, 7 Lutheran, 15 Christian, 3 German Evangelical, 3 Evangelical Association, 3 Friends, 2 United Presbyterian, 5 German Reformed, one each of 11 other denominations. There are 4 Hebrew congregations.

Charities.— In the city there are 15 hospitals, State, county, college, church, charitable, and private, 4 homes for the aged, 6 industrial schools and orphan asylums, 4 homes for women and girls, 16 organized charitable and relief societies, and several such institutions as the Y. M. C. A., Y. W. C. A., Friendly Inn, Bureau of Justice, Humane Society, Day Nursery. The township trustee is a source of official relief. The charities of the city are most efficiently administered, as a result of co-operation between organizations largely brought about through the efforts of Rev. Oscar C. McCullouch. In 1894 a plan of relief for the unemployed, whereby over 5,000 people were provided with the necessaries of life throughout winter without pauperizing influences resulting, became widely known as the "Indianapolis Plan of Relief." The plan was devised and carried out on behalf of the people of the city by a Commercial Club committee composed of Hugh H. Hanna, Col. Eli Lilly, and William Fortune.

Education.—There are 60 public school buildings, including 2 high schools, one giving manual training, in which about 700 teachers are employed, with a total enrolment of about 35,000 pupils; 22 Catholic schools, 2 Lutheran schools, 5 private schools and academies, besides the schools in connection with institutions. The University of Indianapolis is an organization formed in 1896 to unite several institutions of the city, including Butler College, first incorporated in 1850 as the Department of Liberal Arts; the Medical College of Indiana, organized in 1869; the Indiana Dental College, organized in 1878, and the Indiana Law School. There are in all five medical schools, prominent among them being the Central College of Physicians and Surgeons, founded in 1879, two dental colleges, a law school, and 21 business, music and other special schools. The United States Arsenal grounds in the city were purchased in 1902 for a technical institute. Free kindergartens are operated under the Free Kindergarten Association, and 23 kindergartens and a normal school are maintained largely from public funds, besides a number of private kindergartens. The Art Association of Indianapolis maintains the John Herron Art Institute, including art gallery, school, and museum. The Propylæum is a building erected by an association composed exclusively of women.

Libraries.—The most notable libraries are the public library with about 100,000 volumes, under the control of the board of school commissioners, and the State library with about 35,000 volumes. The State law library with 40,000 volumes, and agricultural and horticultural libraries in the State House, and the county library and bar association's library in the court-house may be noted. There are seven branches of the public library, including the newly erected Bona Thompson library of Butler College and many small special libraries of schools and associations.

Newspapers and Literature.— In 1903 the city had 9 daily papers, 23 weeklies, 38 monthlies, and 5 with other periods of issue. The list of trade and class papers published in the city is particularly notable. Indianapolis is the home of many writers whose names are familiar to the public, and it has in recent years become an important western book-publishing centre.

Organizations.— The development of the city has been markedly influenced by organized work in various directions. There are a great number of literary, art, and musical societies, and largely as a result of this activity there is a high standard of cultivation in such matters. This has had a notable influence in establishing in the social life of the city a standard of merit rather than determining the standing of the individual on questions of lineage or wealth. There are many social clubs, among the most notable being the University, Country, Contemporary, and Woodruff Clubs, the Deutsche Haus, the Männerchor, and the Elks, while the Columbia, Marion, and Indiana Clubs are political organizations, established in comfortable homes. The Columbia Club building, located on the Circle, is one of the finest club-houses in the United States. The Commercial Club, with a membership of over 1,000, which owns as its home an eight-story office building, was a dominant force in the new era of progress and development which started in 1890, and devotes itself to the welfare of the city. The Board of Trade, an older organization with a membership of about 500, has also been active in this direction. Organizations of various kinds, commercial, trade, fraternal, social, literary, art, musical, and miscellaneous, number over 500.

Government.— The administrative department is in the hands of a mayor, elected biennially, and of boards appointed by him. The council consists of 15 members elected one from each ward, and 6 members elected at large, with a two-years' term of office. The city clerk and police judge are also elected biennially. The mayor's appointees are the city comptroller, attorney, civil engineer, boards of public works, 3 members of public health and charities, 3 members of public safety, and of commissioners of public parks 4 members. The school system is in charge of a board of 5 school commissioners elected at special elections held for that purpose only.

Population.— Beginning with two or three families in 1819 or 1820, Indianapolis has shown a steady and rapid growth, having a population of 1,085 in 1830; 2,698 in 1840; 8,091 in 1850; 18,611 in 1860; 48,244 in 1870; 75,056 in 1880; 105,436 in 1890; and 169,164 in 1900. Since the last census the increase in population has been still more rapid. The growth of the city has been almost exactly parallel with that of Buffalo, but 20 years behind, and the parallelism promises to continue. In 1890 Indianapolis was 26th in population, and in 1900 it was 21st in the United States.

History.— The first settler, George Pogue, arrived in March of 1819 or 1820. The legislature of Indiana, meeting at Corydon, by committee selected, in 1820, the site for a State capital, and named it Indianapolis, 6 Jan. 1821. Another committee laid out the plat. Lots were slowly sold for several years, and the government was actually removed to the new capital in 1824, the first session of the legislature being held there in 1825. The first State House, modeled after the Parthenon, was completed in 1835. A town government was instituted in 1832 under three trustees, a town council was established in 1838, and a city government under mayor and council in 1847. The present metropolitan form of government, with the mayor as the responsible administrative officer and the council as the legislative branch, was adopted in 1891. A volunteer fire department was formed in 1826, which had much help from the State when the capitol building was completed. The first fire chief was appointed in 1853, and the department was changed to a corps of paid men in 1859. The police department was first established in 1854. The new town began to support a newspaper in January 1822, and a church in 1823. The first railroad reached the city in 1847, and several others were completed in the next four years. Their effect upon the town is seen in the large increase in population. The State capital was the centre of great activity during the War, and there was great expansion in business and manufactures as well as increase in population, most of which was retained. The city did its full share in raising regiments for the War, and is said to have expended a million dollars in contributions, bounties, and war expenses. Camp Morton, on its outskirts, was first a camp for training soldiers, and later for prisoners of war. The free school system now cited as a model by educational experts, was begun in 1853 with the accumulations of several years of special taxation spent in buildings and grounds. The Citizens' Street Railway charter was granted 18 Jan. 1864. The slaughtering and packing business, now so large a factor in the city's trade, began its great expansion in the same year. Public improvements were but few in number until the adoption of the new charter in 1891.

Indianapolis has numbered among her prominent citizens Benjamin Harrison, Thomas A. Hendricks, and others high in the affairs of the national government.

WILLIAM FORTUNE,
Prest. Municipal Engineering Co., Indianapolis.

Indiano'la, Iowa, city and county-seat of Warren County, 18 miles south of Des Moines, on the Chicago, B. & Q. and the Chicago R. I. & P. R.R.'s. There is a large and increasing trade here in grain, butter, eggs, fruit, live stock and garden products. Here is the seat of the Simpson Methodist Episcopal College, founded in 1867. The electric light plant is owned by the city. Pop. (1890) 2,254; (1900) 3,261.

Indians, American. Columbus, when he discovered America, believed he had reached a part of Asia, or of India, and in a letter of February 1493 wrote of «the *Indians* (in Spanish, *Indios*) I have with me.» Thus the aborigines of the New World came to be called «Indians» (French *Indiens*, German *Indianer*, etc.), or, to avoid confusion with the natives of India, "American Indians," for which rather cumbrous term the word "Amerinds," susceptible of many modifications by means of prefix and suffix, and easily adaptable to the exigencies of modern European and other civilized languages, has been suggested by an eminent American lexicographer and is used more or less by a number of anthropologists and other writers. The word "American," originally applied to the Indians, is still somewhat in use, and Dr. D. G. Brinton styled his comprehensive sketch published in 1891, 'The American Race'; but its employment to designate the white population of the continent seems to bar its ethnological application to the aborigines without some qualifying term. By some writers the Indians are called the "Red Race," and, more popularly, "Redskins" (in French *Peaux-Rouges*, in German *Rothäute*), or "Redmen," terms of no exact somatic significance. A few American, and many European, ethnologists continue to separate the peoples who created the civilizations of Mexico, Central America, Peru, etc., from the Indians, while others exclude the Eskimo, and others, again, the "Mound-Builders." But somatic, cultural, and linguistic evidence justifies the conclusions of Powell and Brinton in using the term "American Indians" to include not only the aborigines now existing, or known to have existed since the discovery, but also all the pre-Columbian peoples of America concerning whom we have little data,— the most divergent are no more than sub-varieties of American man. This unity is the great ethnic phenomenon of American aboriginal history. The study of Indian languages, archæological remains, arts, and industries, games, social and religious institutions, mythology and folk-lore indicates a general psychic unity, while the somatic diversities do not transcend those observable in the other great races of mankind. Whether one investigates, as McGee has so admirably done, the Seri of the Gulf of California, who represent about the lowest type of savage culture on the North American continent, or the Mayas of Yucatan, whose approach to a phonetic system of writing touches the high-water mark of Amerindian achievement, one receives the same impression: that it is a question not of very recent civilized or semi-barbaric intruders from Asia or from Europe, but of a race (whatever their remoter origins may be) who have dwelt for ages in an American environment, which has shaped them into the peoples met with by the whites at the time of the Columbian discovery. The limited effect of the "discovery" of the Norsemen may be held to discount any "discoveries" by Europeans before them; while, on the other hand, the American-Asiatic contact revealed by the investigations of the Jesup North Pacific expedition is as much American as Asiatic, and the "Bering Sea" culture is a local phenomenon no more fundamentally indigenous to the Old World than to the New. The arguments in favor of a trans-Pacific Malayo-Polynesian influence upon primitive America are no stronger than those that can be adduced to support the contrary opinion. The culture of the "Mound-Builders" does not in any way transcend the possibilities of what the American Indian was and is yet capable of, nor is it necessary to assume the presence of foreign culture-elements to explain the civilizations of Mexico, Yucatan, Colombia, and Peru. Since very primitive times America has been essentially the "ethnic island" of Brinton, Keane, and other investigators. The impress of America has been upon the aborigines so long that physically, socially, linguistically they have been "Americanized" in so marked a fashion that their right to be considered one of the "races" of mankind is not to be dismissed without cause. To group them merely as a branch of the Mongolian, or, again, of the Malay "race," is to obscure many points of great importance in the prehistory of America or to ignore them altogether. The American Indian is in too many respects a modified (and anciently so) variety of mankind to be thought of as expressing in any serious degree the type of the Mongolian or the Malay.

Language and Culture.— The ethnic isolation of the American race has already been noticed. The apparent independence of the culture-centres of North and South America is another interesting fact. With the exception of a few possible traces of the presence of tribes of Arawak lineage in ancient Florida and the spread of art-*motifs* of the Caribbean type over a portion of the adjacent Gulf region, no direct evidence of the influence of South America upon North American culture is forthcoming. The independent origin of Mexican and Peruvian civilizations seems certain, and convincing proofs of the community of origin of Peruvian and Chibchan and even of Mexican and Mayan are lacking. The possibility of inter-cultural relations having once existed is, however, not to be denied. The Pacific coast, from the Gulf of California to the Argentine and Chile, has been a nursery of culture just as the Mediterranean area was for the Eurafrican peoples. There has been a Mexico and a "greater Mexico," a Peru and a "greater Peru," while the Mayas and the Chibchas have also had their extensive spheres of influence. To the Pueblo culture north of Mexico corresponds the Calchaqui culture south of Peru. On the northern borders of Mexico still lie the savage Seri and Yaqui, and the culture-areas of Colombia and Peru have also their primitive frontagers,— and this was so in the time of the ancient Montezumas and the Incas. This juxtaposition of civilization and savagery is one of the characteristic facts of American ethnology, as it was once likewise of the history of the Mediterranean area in the Old World. In both areas we meet with a large number of peoples who rose above savagery, but, for some reason or other, failed to develop high stages of culture. That the more material evidences of civilization should be so confined to the Pacific coast is, to some writers, a significant fact suggestive of Asiatic relations; but the intellectual power of such Atlantic peoples as the Iroquois and some of the Muskhogean tribes of North America, and the moderate but distinct progress made by a few of the Brazilian tribes of the Atlantic area relieve us from any such theory, environment, and historical incident in America quite sufficing to account for the phenomena involved. (See Ethnology.) Certain other resemblances and contrasts in the various aspects of aboriginal culture in America merit attention here. At the extreme north of the continent, one stock, the Eskimo, with closely related forms of speech, kindred mythology, and folk-lore, similar customs and social institutions, etc., extends in a narrow line from east to west, even overflowing into Asia, while at the extreme south (much less extensive) the Fuegians, numbering altogether less than 10,000, are divided into three distinct linguistic stocks (Yahgans, Onas, Alikulufs). Eastern and northern North America, and the corresponding regions in South America, are areas of wide distributions of single stocks. The Pacific coast of America, as compared with the Atlantic, is a place where, in diverse spots, languages seem to pullulate. This region (including the narrow limits of Mexico and Central America) contained probably more independent tongues than all the rest of the continent. Indeed, within the present bounds of the State of California alone 22 such tongues are found, with several others in Nevada, and in Prof. Cyrus Thomas' list of the stocks of Mexico and Central America, made in 1902, nearly 30 are recognized.

The multiplicity of languages in primitive America has called forth explanatory theories of various sorts, among them Horatio Hale's suggestion of the origin of linguistic diversity through the spontaneous language activity of the child. As Gatschet has noted, the very existence of such a multitude of tongues all over America is proof that neither in ancient nor in later times has this continent been the scene, on a vast scale, of the suppression and extermination of peoples one by the other, which have been characteristic features of Old World history. In spite of the common belief to the contrary, mutual destruction was probably never so rife as when the coming of the white man introduced new means of warfare, and, crowding the natives for subsistence, led them to attack each other more effectively. The recent studies of Dixon and Kroeber in California have strengthened the view of a certain parallelism of language and culture.

That some culture-elements, however, have spread from tribe to tribe is shown by the distribution of certain inventions discussed by Mason, the northward movement of such plants as maize, the use of tobacco, the transmission of many themes and incidents of myths and legends (as demonstrated by Boas), the modes of occurrence of certain art-forms, etc. Interminglings of culture of a more or less local, though often of an extensive, character, have taken place in the Bering Sea area, in the Columbia River region, in the habitat of the Pueblo Indians of New Mexico and Arizona, in the southeastern part of the United States, in the Isthmian region of Central America, in Ecuador, in the Pampean country of the Argentine, etc.,— larger and more significant intermixtures have, perhaps, taken place in earlier times in Mexico, the Mayan country, Colombia, and Peru. A number of the borrowed culture-elements may be explained as the result of trade and commerce, by means of which useful or artistic objects, food, plants, etc., were easily conveyed long distances under primitive conditions. The wide-spread custom of adoption would also account for not a few instances of alien culture-grafts. So, too, with the exogamic marriage, when the women are culture-bearers. Where language-mixture has taken place it is more or less easily detectable in most American Indian stocks and tongues. When families of the same stock possess, in the one case (Algonkian) dialects which differ as much as Micmac and Blackfoot, in the other (Iroquoian) as much as Cherokee and Mohawk, we are justified in looking for culture-differences as well in such widely separated peoples. Doubtless the results of careful somatological, sociological, and other investigations of the various tribes of American aborigines will furnish us ultimately with diverse ways of classifying them. At present, however, the most serviceable classification is a linguistic one, the result of the labors of Major J. W. Powell and the Bureau of American Ethnology, supplemented by the work of Dr. D. G. Brinton.

Linguistic Stocks.— The Bureau of American Ethnology has issued the Powell map showing the extent of the 58 linguistic stocks north of the Mexican boundary line: that is, of families or forms of speech, so independent of one another as to be catalogued as distinct stocks: apparently no more closely related than the Aryan and the Semitic families of the Old World. For South America no such authoritative map is extant. The exact number of such linguistic stocks in America has not yet been determined with certainty, but the following list probably represents the best view of the matter to-day:

1. Adaizan (Louisiana)
2. Algonkian (northeast North America)
3. Alikulufan (Tierra del Fuego)
4. Andaquian (Colombia)
5. Arauan (northwest Brazil)
6. Araucanian or Aucan (Chile)
7. Arawakan (Central and N. E. South America)
8. Atacameñan (S. Bolivia)
9. Athapascan (N. W. Canada, etc.)
10. Attacapan (Louisiana)
11. Aymaran (S. Peru, N. Bolivia)
12. Barbacoan (S. Colombia)
13. Beothukan Newfoundland)
14. Betoyan (Colombia-Venezuela)
15. Caddoan (Texas)
16. Calchaquian or Catamareñan (N. Bolivia)
17. Canichanan or Canisianan (N. Bolivia)
18. Carajan (S. Brazil)
19. Cariban (N. E. South America)
20. Cayubaban (N. Bolivia)
21. Charruan (N. E. Argentine)
22. Chetimachan (Louisiana)
23. Chiapanecan (Central America)
24. Chibchan (Colombia and Isthmian region)
25. Chimakuan (Washington)
26. Chimarikan (California)
27. Chinantecan (Oaxaca, Mexico)
28. Chinookan (Washington)
29. Chiquitan (N. Bolivia)
30. Chocoan (N. W. Colombia and Isthmus)
31. Chumashan (California)
32. Churoyan (Colombia-Venezuela)
33. Coahuiltecan (Mexico-Texas, mouth of Rio Grande)
34. Coconucan (S. Colombia)
35. Copehan (California)
36. Costanoan (California)
37. Cunan (Isthmus of Panama)
38. Doraskean or Changuinan (Panama and Nicaragua)
39. Eskimoan (Northern fringe of North America)
40. Esselenian (California)
41. Guahiban (Venezuela)
42. Guaraunian (Venezuela)
43. Guaycuruan (Gran Chaco, Paraguay-Bolivia)
44. Huavean (Isthmus of Tehuantepec)
45. Iroquoian (Ontario-Erie region, with offshoot in S. E. United States)
46. Itonaman (Bolivia)
47. Jivaroan (Peru, Ecuador)
48. Kalapooian (Oregon)
49. Karankawan (Texas)
50. Kechuan or Quechuan (Peru)
51. Keresan (New Mexico, Pueblos)
52. Kiowan (Nebraska-Wyoming)
53. Kitunahan (S. E. British Columbia, N. Idaho)
54. Koluschan (Alaska)
55. Kulanapan (California)
56. Kusan (Oregon)
57. Laman (Peru)
58. Lencan (Central America
59. Lulean (Gran Chaco)
60. Lutuamian (Oregon)
61. Mainan (Ecuador, N. W. Brazil)

A GROUP OF UTE INDIANS.

62. Mariposan (California)
63. Matacoan (Gran Chaco)
64. Matagalpan (Nicaragua)
65. Mayan (Yucatan, Chiapas, Guatemala, etc.)
66. Mocoan (Colombia)
67. Moquelumnan (California)
68. Mosateñan (Bolivia)
69. Moviman (Bolivia)
70. Muskhogean (S. E. United States)
71. Natchezan (Louisiana)
72. Onan (Tierra del Fuego)
73. Otomian (Central Mexico)
74. Otomacan (Venezuela-Colombia)
75. Palaihnihan (California)
76. Paniquitan (Colombia)
77. Panoan (Peru)
78. Payaguan (Gran Chaco)
79. Payan (Honduras)
80. Peban (Peru)
81. Piman (S. Arizona, N. W. Mexico)
82. Piaroan (Colombia-Venezuela)
83. Puinavan (Colombia-Venezuela)
84. Pujunan (California)
85. Puquinan (Peru)
86. Quoratean (California)
87. Salivan (Colombia-Venezuela)
88. Salinan (California)
89. Salishan (British Columbia, etc., to the south)
90. Samucuan (S. Bolivia)
91. Sastean (California)
92. Serian (N. W. Mexico)
93. Shahaptian (Oregon-Idaho)
94. Shoshonean or Uto-Aztecan
95. Siouan (Carolinas and Missouri Valley)
96. Skittagetan (Q. Charlotte Is.)
97. Subtiaban (Nicaragua)
98. Tacanan (Bolivia)
99. Takilman (Oregon)
100. Tañoan (New Mexico, Pueblos)
101. Tapuyan (S. Central Brazil)
102. Tarascan (Michoacan, Mexico)
103. Tequistlatecan (Oaxaca, Mexico)
104. Ticunan (N. W. Brazil)
105. Timotean (Venezuela)
106. Timuquanan (Florida)
107. Tonikan (Louisiana-Mississippi)
108. Tonkawan (N. W. Texas)
109. Totonacan (Vera Cruz, Mexico)
110. Tsimshian (British Columbia)
111. Tsonekan (Patagonia)
112. Tupian (E. Central Brazil)
113. Uchean (Georgia)
114. Ulvan (Nicaragua)
115. Waiilatpuan (Oregon)
116. Wakashan or Kwakiutl-Nootka (British Columbia)
117. Washoan (Nevada-California)
118. Weitspekan (California)
119. Wishoskan (California)
120. Xicaquean (Honduras)
121. Xincan (Guatemala)
122. Yahganan (Tierra del Fuego)
123. Yakonan (Oregon)
124. Yanan (California)
125. Yaruran (Venezuela)
126. Yukian (California)
127. Yuman (Lower California, Arizona)
128. Yucan (Peru)
129. Yurucarean (Bolivia)
130. Zaparoan (N. W. Brazil)
131. Zapotecan (S. E. Mexico)
132. Zoquean (S. E. Mexico)
133. Zuñian (New Mexico)

Of the stocks enumerated, 51 belong to South America and 56 to North America north of Mexico. The status of investigation is such that the number assigned to South America is approximate only, and may ultimately be considerably increased or reduced. Some stocks, like the Adaizan, Beothukan (exterminated by whites), Chetimachan, and a few of the minor stocks in South America, are extinct or nearly so. A goodly number — including, for example, many of the stocks on the northwest Pacific coast, the Texas-Louisiana country, parts of Central America and the Pacific region of South America — were or are of limited area; others, like the Eskimoan, Athapascan, Algonkian, Siouan, Shoshonean, Arawakan, Cariban, Tupian, etc., are noteworthy by reason of the extent of their domain. Some, like the Kootenay, consist of practically a single language, while others, like the Algonkian, Siouan, Athapascan, Salishan, Aztecan, Mayan, Arawakan, Tupian, Cariban, etc., have developed numerous dialects, sometimes only remotely resembling the mother-tongue. Doubtless, with the perfection of linguistic research, some changes will be made in the list of stocks, or perhaps a method of groups may be devised in which stocks showing certain resemblances other than those of a lexical nature may be classed together. The studies of Dixon and Kroeber indicate the possibility of this for the numerous Californian stocks, and a similar result may be predicted for certain other regions of the continent. As said, all the American Indian stocks are far from being of the same significance, many of them having hardly any historical importance. A few words about some of the most typical and most important must suffice here.

North American Stocks.— The Eskimoan stock is noteworthy by reason of being the first of all the aboriginal peoples of America to be visited by representatives of European culture,— the Norsemen in the 10th century, etc. It is also the only primitive people who, unaided by civilized races, occupy a portion of both hemispheres, for the Eskimo stretch from Labrador to a considerable distance within the borders of northeastern Asia. They illustrate the victory of man over a difficult environment, for they are a merry and sociable people in spite of the inclement and depressing character of their arctic surroundings. They have also a marked sense of humor, as the institution of the nith-song, or settlement of disputes by public judgment of the comparative merits of the two parties in competitive singing, would indicate,— the themes of the singing being the dispute and sarcasm at the expense of the opponent. The Eskimo are also very skilful carvers and engravers of ivory, their spirited drawings of animals, etc., resembling in marked fashion the similar art-products of prehistoric man of the French river-drift, a likeness which has induced some authorities (Dawkins, De Mortillet) to assume a racial connection between these two peoples. Mason has recently suggested that these drawings owe a good deal to the contact with Europeans (introduction of iron tools, etc.), but Boas considers that their close resemblance to the bark and rock pictographs of the Indians forbids the conclusion that these drawings are of other than native origin. The unity of language, and (to a considerable degree) of custom, mythology, etc., among the various Eskimo tribes is remarkable when one remembers the extent of their distribution. The use of the Eskimo dog with the sledge, the kayak, the harpoon, the snow-house (iglu), and the invention of many mechanical devices, show them to be gifted with native intelligence.

The Athapascan stock is notable for the contrasts in culture and diversities of culture-capacity presented by its members. Some of the Athapascan peoples of northwestern Canada and Alaska are among the lowest types of American man, and a few of them have hardly yet come to knowledge of the white man, the advent of the fur-trader being, according to J. M. Bell, a matter of the last two or three years in part of their domain. To this stock belong also the Apaches, once the terror of the civilization of the Southwest, whose depredations, in earlier times, disturbed the peace of the native civilization of Old Mexico. It is fair to say, however, of them that individual Apaches (Dr. Montezuma, for example) shows good capacity for adopting the chief elements of white American culture. Several small tribes of Athapascans are scattered through Washington, Oregon, and California, the most noteworthy being the Hupa, on Trinity River, the "Romans of California," as they have been called. The Navaho, who have assimilated to a considerable extent the culture of the whites, were good agriculturists before the coming of the Spaniards, from whom they adopted the sheep, a fact which modified their environment and their response to it. The contrast between the rude tribes of the "Barren Grounds" of Canada and the Navaho of New Mexico and Arizona is, as Horatio Hale pointed out, one of the most remarkable instances of culture-change by process of environmental variation on record. The recent loan-word *Klondike* comes from an Athapascan dialect.

The Algonkian stock, members of which were found from Labrador to South Carolina, and from the confluence of the Ohio and Mississippi northwesterly to the foot of the Rocky Mountains and the borders of the domain of the Athapascans, are of interest for many reasons. The great area over which they are spread has brought members of this stock into contact with many other Indian peoples,— the Naskopi, Crees, and northern Ojibwa with the Eskimo; the Micmacs with the Eskimo and Beothuk; the Ojibwa and related tribes of New England, New York, and Pennsylvania, the Lenâpé of New Jersey, the Nanticokes, Powhatans, etc., of Maryland, Virginia, and the Carolinas with the Iroquois (who, both north and south, form an *enclave* in the Algonkian territory); the western Ojibwa, etc., with the Siouan tribes in the upper Mississippi region, and in the southern Mississippi country the Illinois and kindred peoples with the Caddoan and other stocks; the Blackfoot in the extreme northwest of the Algonkian area with the Athapascan Sarcees and the Kootenay. The aberrant Cheyennes and Arapaho (recently studied by Kroeber) belong to the Algonkian stock. Another evidence of the importance of this stock is the fact that many other stocks and tribes are known to us by names of Algonkian origin: *Eskimo, Athapascan, Siouan,* and possibly also *Iroquoian* and *Muskhogean; Chipwyan, Assiniboin, Mohawk,* etc. Of all the Indian stocks of North America none have made a greater impression upon the whites (French and English) than the Algonkian. This is seen when we remember that Powhatan and Pocahontas, King Philip, Pontiac, Tecumseh, Black Hawk, etc., the Indians who have appealed most to our historians, novelists, and dramatists, have all been of Algonkian lineage. This stock has also contributed to the vocabulary of spoken and written American-English some 140 words, of which many are hardly felt to be of Indian origin: *Carcajou, Caribou, Caucus, Chipmunk, Hickory, Hominy, Manitou, Maskinonge, Menhaden, Moccasin, Moose, Mugwump, Opossum, Pappoose, Pemmican, Persimmon, Powwow, Pung, Raccoon, Sachem, Skunk, Squash, Squaw, Tammany, Terrapin, Toboggan, Tomahawk, Totem, Tump, Tuxedo,* etc. A people who have contributed to such a cosmopolitan tongue as English important words like *Caucus, Mugwump, Tammany,* and *Totem*, deserve more than passing mention. Our civilization owes to them also more material things than these,— tobogganning and lacrosse, canoeing (in large measure) and numerous devices of agricultural and domestic industry adopted by the early colonists from the aborigines. From the Algonkian Indians the whites also learned how to make maple sugar and maple syrup. (See AMERICANS.)

The Iroquoian stocks are famous through the confederacy of the "Five (afterward Six) Nations" and the great "League of the Iroquois" (so sympathetically studied by Morgan). Their physical characteristics at the time of the war of 1861–5 were such that they exceeded the recruits of all other races (white included) in points of excellences demanded by military requirements. The high position occupied by woman among the Iroquois lifts them above many of their Amerindian kindred. The story of the Iroquoian statesman of the 16th century, Hiawatha, and his founding of the League that was to end all war and unite all the nations in one lasting bond of peace is a historical fact, which Longfellow's confusion of the Iroquoian patriot with the Algonkian demi-god Manabozho cannot altogether obscure. In political and social organization the Iroquoian tribes attained a position that was largely *sui generis*. The tale of their long struggle to preserve their independence against the whites will be found in Morgan and Parkman, while the Jesuit Relations contain their reaction to the efforts of the missionaries to convert them to the Christian faith, as well as the account of the fratricidal strife resulting in the extermination of the Hurons. The fame of the Iroquoian tribes (for example, Mohawks) as fierce warriors has caused the general public to neglect them in other respects. Through the researches of Horatio Hale and others it has been shown that the Cherokee of the Carolinas (recently so well investigated by Mooney) belong to the Iroquoian stock, together with several minor tribes in the south Atlantic region. This stock has produced a number of eminent men: Hiawatha (q.v.), Red Jacket (q.v.), Joseph Brant, and Dr. Oronhyatekha (q.v.), the present head of the Independent Order of Foresters; J. N. B. Hewitt, of the Bureau of American Ethnology at Washington, is also of Iroquoian blood. Sequoia, the half-blood Cherokee, who invented the alphabet now in use by his people, deserves mention here likewise. As compared with the prominent part played by them in the French-English and colonial wars, and in the Revolutionary War, War of 1812, etc., the Iroquoian people left little impression upon the culture and the speech of the English in America,— the words from their language which have crept into our own have been originally place-names: *Chautauqua, Conestoga* (horse), *Saratoga* (trunk), etc. To the French of Canada they have given a few more words. In the place-names of the region about lakes Ontario and Erie (Ontario, Niagara, Erie, Cataraqui, Oswego, Cayuga, Seneca, Onondaga, Tuscarora, Oneida, Ticonderoga, Tonawanda, Genesee, Ohio, etc.) the Iroquoian peoples are generously remembered, while their Cherokee kinsmen in the south have likewise left their impress upon the topographical nomenclature of the country. In both New York and Ontario, where considerable numbers of Iroquois still live, with no immediate danger of dying out, but particularly in the latter province on the Grand River Reserve, the pagan and Christianized Iroquois have existed side by side in the same community for so long a time as to make this phenomenon, the details of which have been pointed out by David Boyle, of great value to sociologists. See CANADA, INDIANS OF.

THE SNAKE DANCE OF THE MOKI INDIANS.

The Muskhogean stock (Choctaws, Chickasaws, Creeks, Seminoles, etc.) as their subsequent career in the "Civilized Nations" of the Indian Territory with the Cherokee has shown, are among the most gifted intellectually of the aborigines of America. Gatschet notes as characteristic of this stock: Their color-symbolism for peace and war, their totemic system, the use of the "black drink," the doctrine of the "Master of Life," sun-worship, mound-building (some regard this stock as having been one of the so-called "Mound-Builders"), the ceremony of the *busk*, etc. This stock has had many intertribal wars, and the Creeks and particularly the Seminoles of Florida are famous for their contests with the whites.

The Siouan stock (Crows, Mandans, Assiniboins, Hidatsa, Sioux, Winnebagos, Omaha, Tutelos, Catawbas, Biloxi, etc.) are noteworthy by reason of their migration from the Atlantic slope in the region of the Carolinas to the trans-Mississippian and Missouri country, where their culture was conditioned by the presence of the buffalo and the adoption (from the whites) of the horse. Their wars with the surrounding tribes, particularly the Algonkian, and their subsequent numerous collisions with the whites (Minnesota massacre of 1862, the troubles in which Sitting Bull figured, etc.), are matter of history. The use of buffalo-skins made it possible for some of the Sioux tribes to develop pictography to a high degree. The researches of J. Owen Dorsey and Miss Alice Fletcher have shown the Omaha in particular to be gifted with a religio-social consciousness of a marked character, reflected in their name-giving and the ceremonies associated with the passage from childhood to manhood, in which individuality is much emphasized. That their capacity for producing men of ability is not confined to those of the primitive type (Sitting Bull) is indicated by the way in which individual members of this stock (Dr. Eastman, La Flesche, the collaborator of Dorsey, etc.) have responded to the stimuli of modern culture. The Dakotan federation is well remembered by the names of the twin States of the Northwest; Minnesota, Nebraska, etc., are terms of Siouan origin; while the minor place-nomenclature of the northwestern States contains a multitude of names from the same source.

The Shahaptian stock is noteworthy on account of the Nez Percés and the famous chief Joseph (still living), one of the most remarkable Indians of any age, whose "retreat" in 1877 has been compared to the celebrated march of the Ten Thousand of old.

The "Pueblos" Indians, as they are called from their village life, have risen in New Mexico and Arizona above the stage of savagery into a state of semi-civilization, representing the triumph of man over the adverse conditions of the desert and the inroads of fierce enemies of the lowest culture. Their relations to the so-called "Cliff-Dwellers" has been the subject of some ethnological speculation. (See Pueblos.) The diversity of culture among the Pueblos is not as great as that of speech. Besides the Moqui or Hopi, who belong to the Shoshonian stock, there are found in the Pueblos group three other distinct linguistic stocks,— Keresan, Tañoan and Zuñian. The Pueblos culture has apparently been developed independently in several local centres, and the studies of Bandelier, Hodge, Fewkes, Cushing, etc., have thrown much light on the origins and interrelations of stages of culture largely the reflex of environment.

The Shoshonean or Uto-Aztecan stock offers the most wonderful contrasts in its members of any Amerindian stock. Linguistic and other evidence appears to justify the conclusion that not only certain peoples of the Sonoran country (Cahitas, Coras, Tepehuanas, etc), some of whom achieved a sort of half-civilization in contact with their more cultured neighbors, but the Bannacks, Shoshones, and Utes (even the wretched "Root-diggers") are kith and kin with the ancient Aztecs upon whose civilization Cortes intruded, and the tribes of Nahuatl lineage who carried that culture more or less from central Mexico to beyond Lake Nicaragua. The change from the low type represented by the Utes to the high type of the old Mexicans may have been due in large measure to environment. Intermediate stages are represented by some of the Sonoran tribes. The Mexican or Aztec branch of this stock has furnished to English and other civilized languages a number of interesting and valuable words: *Axolotl, chocolate, coyote, cacao, tomato, ocelot, chilli, copal, chinampa, jalap*, etc. The Moqui group of the Pueblos Indians belong also to the Shoshonean stock.

The Mayan stock (Cakchiquels, Huastecs, Tzotzils, Kekchis, Quiché, Tzendals, Mayas, etc.), creators of the civilization destroyed by the Spaniards in Central America, left, besides graven monuments in large numbers, other evidences of their having invented a system of "writing," which is the nearest approach by any of the aboriginal peoples of America to a phonetic method of record,— the solution of the Mayan hieroglyphics is perhaps *the* question of American archæology. Their calendar-system, nagualism in religion, and the important role of woman in religious and social functions, deserve especial notice. The recent explorations of the Peabody Museum (Cambridge) have resulted in many new discoveries.

Central and South American Stocks.— The Chibchan stock, whose culture varied from that of the savage Aroacos of the mountains of Sta Marta to the civilization of the country about Bogota represent a rise from barbarism independent of that to the south in Peru, etc. There is some reason to believe that the "gold-culture" of the Chiriqui country and allied remains in the same region to the borders of Nicaragua may be due to the Chibchan stock,— the Talamanca, Guaymi, and a few other dialects of Costa Rica, etc., show affinities with Chibchan tongues. Their use and working of gold were of a high order, but neither in architecture nor in pictography could they compare with the Peruvians, the Mexicans, and the Mayas. They had a characteristic hero-legend of Bochica, and a tale of the great flood. The shrine of Lake Guatavita was a famous religious resort. Some of the famous "El Dorados" were in their territory. The Quechuan stock, which is best known through the civilization of the Incas, superimposed upon an older, widespread culture, represents but one phase of higher human activity in the Peruvian area. The extension of Quechuan language especially von Tschudi and Brinton agree in attributing not to the military achievements of this people, which antedated the coming of the Spaniards by only a few centuries, but to intellectual and culture influences millenniums old. The marks of their language can be traced from near the equator on the north to the Pampean tribes on the south. Common in the Peruvian area seem to have been a highly developed agriculture (stimulated, as in the southwestern United States, by the necessity for irrigation and artificial treatment of the soil),— maize, tobacco, potatoes, cotton, etc., the breeding of the llama and the paco, the making of pottery (useful and artistic), metal-working of a fine and ingenious sort, stone architecture more massive and imposing than artistically beautiful, or of the highest order as regards decorative art. The Inca form of government was never probably so far removed from the system common to most of the American stocks as some writers have believed. The Incasic conquest has caused the Peruvians to be styled the "Romans of America," but the analogy is misleading. Beyond the use of picture-writing and the employment of the quipu (knotted colored strings) for purposes of record, the Peruvians had not advanced, and the semi-phonetic system, like that of the Mayas, was not developed by them. Ancestor-worship and sun-worship (state religion) were professed by the Peruvians, but the most far-sighted of their thinkers touched almost upon monotheism. The hero-god of the Peruvians was the sea-born Viracocha, about whom centred a rich and imaginative mythology. The mixture of races in the production of ancient Peruvian culture is indicated by the diversity of cranial type among the skulls from the old burial grounds and mummy-caves. North of the Quechuas, on the coast about Trujillo, were the Yunca-Chimus, etc., whose civilization is represented by the ruins of Gran Chimu and other remains in the valley of Trujillo, which preceded the period of Inca domination. Southeast of the Quechuan culture was that of the Aymaras on the Andean table-lands. To them are usually assigned the ruins of Tiahuanaco, near Lake Titicaca, which in their completeness were probably the most imposing structures raised by the hand of aboriginal man in America,— in architecture they differ in several notable ways from the buildings of Inca origin. Dr. Uhle has very recently sought to show the "succession of cultures" at Pachacamac, Trujillo, and their relations to that of Tiahuanaco. The Peruvian tongues have furnished modern English, etc., many words: *guano, condor, alpaca, pampa, paco, llama, coca, quinine, jerked* (beef), *vicuña*, etc.

In the northern part of the Argentine Republic (Province of Jujuy, etc.) the architectural and archæological remains brought to light by recent investigators (Ambrosetti in particular) indicate the presence of a "civilization," — village life in a desert environment, offering striking analogies with the culture of the Pueblos Indians of Arizona and New Mexico. This Calchaqui culture is evidently much more than the mere reflex of Quechuan-Aymaran conquest which it was formerly considered to be. Its origin and growth, however, remain to be clearly demonstrated.

The Araucanian stock, whose language has been studied by Lenz, are famous for their long resistance to the Spanish arms (the story of the "conquest" has been written in the last few years by Guevara), part of which gave rise to De Ercilla's epic of 'La Araucana.' To the Araucanian stock belong tribes on both sides of the Chilean Andes and a number of the nomadic peoples of the Pampas, where they seem to be intruders rather than aborigines. Chilean Spanish has borrowed many expressive terms from Araucanian.

The Patagonians, Tzonek, or Tehuelche, famous since the time of Pigafetta as "giants" (many of them exceed six feet and some are said to reach seven). To them belongs the "Setebos" of Shakespeare's 'Tempest.'

The Tapuyan stock of Brazil is looked upon by some authorities as the oldest people of the continent — some would affiliate with them the Fuegians, in this respect — representing a race once inhabiting a great part of South America. The man of the caves of Lagoa Santa and the man of the remarkable *sambaquis* or shell-heaps of the Brazilian coast are by many authorities considered to have related to the Tapuyans. Characteristic modern Tapuyans are the Botocudos, so called from the labret they wear in the lower lip. According to Ehrenreich, some of these ancient men of Brazil show affinities with prehistoric man of eastern Europe.

The Tupian stock (or Tupi-Guaranis, as they are also called), whose language was much used by the missionaries for general intercourse with the natives and is the basis of the *ligoa geral*, or "common language" of the region of the Amazons, were perhaps the highest in culture of the Brazilian tribes, having the elements of agriculture, village life, pottery (well developed and rather artistic), urn-burial, etc., but nothing beyond the Stone Age. Intermixture with both whites and negroes has taken place in the Tupi area, and the rich and imaginative tales of animals, etc., belonging to Tupi mythology have thus been given a wider extension, while negro and white influences have made themselves felt, both on the language and the literature of these people. According to Hartt, the Tupi language has influenced the Portuguese of Brazil quite as much as has the latter the former. Tupi-Guarani speech has furnished to the various European tongues a considerable number of words — to English, *ipecacuanha, jaguar, tapioca, tapir, toucan*, etc.

The Cariban stock were long famous for their cannibalism (the word *cannibal* is a corruption of one of their ethnic names), real and attributive, and their skill in making and using canoes. The shaman, or medicine-man, had great power among them, and they practised the curious and remarkable custom of the *couvade*. Rock-inscriptions and pile-dwellings are found in their territory. Some of them have been reduced to sad straits by the contact of the whites, but some of the Venezuelan tribes of this stock are still good, typical representatives of the American Indian.

The Arawakan stock, through its representatives (the Bahamian Lucayans, the natives of Haiti, Porto Rico, Cuba, etc.), was the first of the aboriginal peoples of the New World (exclusive of Greenland and Labrador) to come into contact with the white race, and likewise the first to come under its devastating influence. Many of the tribes of this stock were of a mild and gentle disposition, good agriculturalists, pottery-makers, workers in stone, wood and gold, and excellent canoe-men (the word canoe comes from an Arawak dialect). They were

1. Labrador Eskimo Woman. 2. Mexican of the coast. 3. Mexican of the highlands. 4. Yucatan Indian Woman. 5. Ecuador Indian. 6. Peruvian Indian. 7. Brazilian Indian (Ipurina).

users of cotton, and to them we owe the first Indian invention adopted by the whites (*hammock*, both name and thing are Arawak). From the Arawaks, too, the Spaniards first learned the use of tobacco. Like the Caribs they practised the *couvade*. The name of the stock is said to mean "flour-eaters," on account of their use of cassava, which has also passed over to the white. The Arawak and Carib stocks have furnished to English and to the other civilized languages of Europe a large number of important words, the exact ethnic distribution of which is not easy to determine with exactness: *Agouti, anotto* (and French *roucouyenne*), *barbecue, cacique, caiman, cannibal, canoe, cassava, colibri, hammock, hurricane, iguana, macaw, maize, manati, potato, tobacco,* etc. And with these names has gone the use of many of the things indicated and made known for the first time to Europeans. The debt of the Spanish and Portuguese settlers of South America and the West Indies is in these respects very great, for, naturally new fruits, plants, trees, etc., and many of their products came to be known by their aboriginal names or by corruptions of them. Thus a number of "balms" and "balsams" and other medicinal products retain in the pharmacopœia names of American Indian origin — *copaiba, tolu,* etc. Timber-trees, ornamental and dye-woods, have also largely kept their native appellations throughout Central and South America — the list would run into the hundreds. Large also is the catalogue of birds and other animals bearing Indian names.

Original Habitdts.— The question of the original habitats of the important aboriginal stocks is one of the most interesting in American ethnology and archæology. The researches of Rink and Boas in particular seem to have demonstrated that the primitive home of the Eskimo was in the region west of Hudson Bay, whence they spread northward and westward to Alaska, etc., and eastward (north and south) to the Arctic islands, Greenland and Labrador. See ESKIMOS.

The earliest habitat of the Athapascans was in northwestern Canada, to the westward of the home of the Eskimo. From there they migrated over the lake country, across the Rockies to the southward, leaving colonies along the Pacific to northern California, and sending out, through Arizona and New Mexico to the borders of the Nahuatl territory, the important branches of the Apaches and Navaho — the raids of the Apaches often reaching far into Mexico.

The original habitat of the Algonkian stock was, as Brinton and Hale have assumed, "somewhere north of the St. Lawrence and east of Lake Ontario," while that of the Iroquoian lay "between the lower St. Lawrence and Hudson Bay." The final result of the migrations and wars of these two stocks was to leave the Iroquois of the Ontario-Erie country entirely surrounded by Algonkian tribes. From their primitive home the Algonkian sent out numerous branches west, south, southwest, etc., making the extent of territory covered by them very large, and bringing them into immediate contact with many other Indian tribes and with the white settlers over a vast area. The Iroquois (in the Cherokee and the kindred tribes of the south) had branches, which were so separated from their northern kin as to be long taken for non-Iroquoian peoples.

The Muskhogean stock, according to Gatschet, have been from time immemorial inhabitants of the country between the Appalachian Mountains, the Atlantic, the Gulf of Mexico, and the Mississippi. The scene of their earliest development was in the neighborhood of the Mississippi, or possibly even beyond it.

The chief migrations of the Caddoan (Pawnee) peoples have taken place in historical times northward and southward from the Platte River, from which region they expelled in part the Siouan tribes, etc. If their own traditions are reliable, their primitive home lay farther to the south, on the Red River of Louisiana.

The primitive home of the Siouan stock (characteristic Plains Indians since the introduction of the horse) was eastward in the region of the Carolinas. This fact has been revealed by the study of the Tutelo and Catawba languages belonging to this eastern area, and by inspection of the traditions of the various Siouan tribes. The main bodies of Siouan migrants followed the Ohio and the Missouri far to the north and west; the Mandans, Assiniboins, etc., reaching to within the borders of Canada. Other minor bodies traveled to the southwest, their representatives still existing in the Biloxi, etc., of southeastern Mississippi. The Siouan tribes seem to have followed the buffalo in its retreat westward, and their migration from the Carolinas is of considerable sociological interest. At one time their trans-Mississippian habitat included practically all the territory between the Arkansas and the Saskatchewan from the great river to mid-Montana, with the Winnebagoes jutting out on Lake Michigan. Their forays and trade-excursions led some of them from time to time across the Rocky Mountains — the present writer, in 1891, met a friendly party of them far within the Kootenay territory.

The original habitat of the Shoshonean or Uto-Aztecan stock, which embraces the Ute, the Sonoran, and the Aztecan (Nahuatl) peoples, and has representatives from the north of Idaho to the Isthmus of Panama, was probably somewhere in the northwestern section of the United States. The primitive home of the Shoshonean section was "somewhere between the Rocky Mountains and the Great Lakes," and the traditions of the other two branches bring them from the far north, as compared with their present southern abode.

The Mayan stock, creators of the civilization of Central America, according to their own traditions, came from somewhere to the north,— the position of the Huastecan branch of this stock north of Vera Cruz suggests that the Mayan emigrants from the home-land skirted along the Gulf of Mexico from some region considerably to the north.

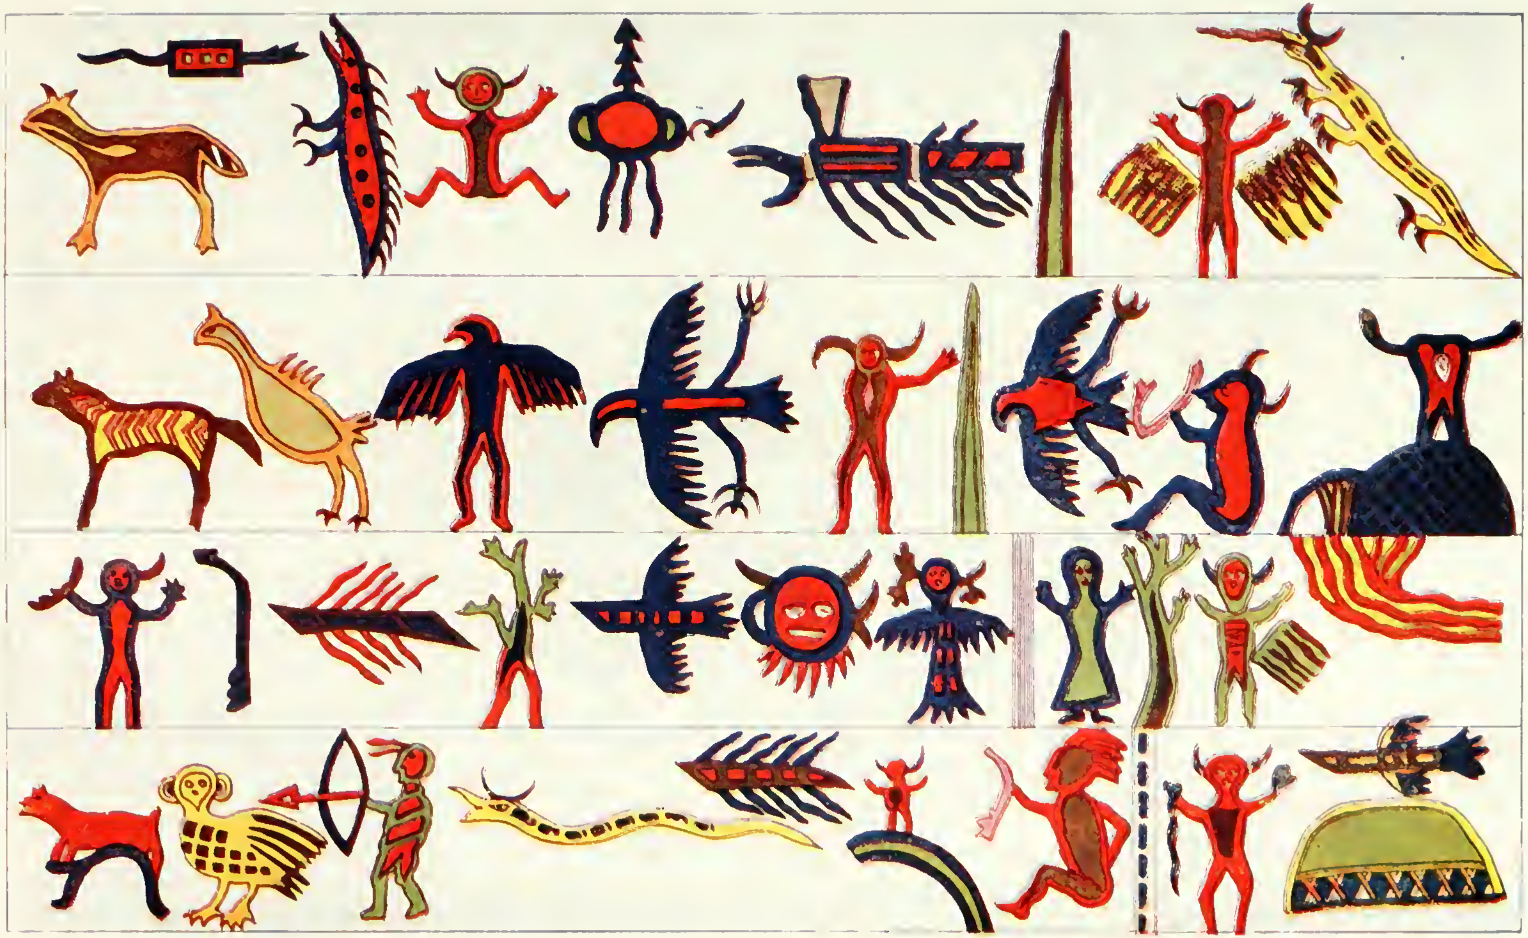
The Arawakan stock (including the natives of the Bahamas and the Antilles, except the intrusive Caribs) had an extension in South America comparable only to that of the Algonkians and Athapascans in the northern half of the continent,— from the high Paraguay to the Goajiran peninsula in Venezuela, and in its greatest expansion from the Xingû to the Amazon and Orinoco. Its primitive habitat was in some part of the Brazilian interior, probably between the Xingû and the Paraguay, the general trend of their migrations having been northward. The Cariban stock, another very extensive people, who at the time of the Colombian discovery were to be found in the smaller West Indian islands, and the northern part of the continent from the Essiquibo in Guiana to about the Isthmus of Panama, came originally, as the presence of the Carib Bakairi on the Xingù indicates, from the high interior of Brazil, at the sources of the Xingù and Tapajos.

The Tupian stock were widely extended at the time of the discovery along the Atlantic coast region from the La Plata to the Amazon, with branches scattered along the Paraguay and the Madeira to the foot of the Andes. Their primitive home, Brinton, with reason, assumes to have been in the central highland country to the east of Bolivia. The general direction of the earliest migrations of this stock was therefore southward (down the Paraguay to the Atlantic), after which the Tupi branch followed the coast to the Amazon. The Tapuyan stock, who once occupied the region between the Xingù and the Atlantic coast (from the latter they have been driven by the Tupis), are probably the oldest human residents of part of this area, their tenure of the seacoast reaching far back into prehistoric times.

The Chibchan stock, to which was due the civilization of the Bogota region of Colombia, had their original habitat in the Andean highlands of central or southern Colombia, whence they wandered northwest into the Isthmus of Panama and northeastward up the Magdalena.

The Quechuan stock, authors of the most remarkable of South American civilizations, according to their own traditions spread from vtry small beginnings in the country about Lake Titicaca; but von Tschudi and Brinton, for linguistic reasons chiefly, find the primitive home of this people to have been in the extreme northwest of their characteristic area. The Aymara stock, which some authorities consider to have been a branch of, or perhaps an older member of the Quechuan, had its original habitat to the southeast of the latter. The relation of the Aymaran stock to that which produced the Calchaqui civilization of the northern Argentine is not clear.

Language and Writing.— Although the languages of the American aborigines constitute so many independent families of speech, the vocabularies of which are entirely divergent one from another, nearly all (if not all) of them possess centain general grammatical characteristics which justify us in classing them together as one great group of human tongues. Brinton enumerates as points of resemblance: Development of pronominal forms, fondness for generic particles and for verbs over nouns, and incorporation,— the inclusion of subject or object (or both) in the verb, etc. Most American Indian tongues may be called "holophrastic," from the practice of compressing a whole "sentence" into a "word," the length of which is sometimes very remarkable. As an example may be cited the Micmac Algonkian) *yālec lemāktāwepokwŏse*, "I am walking about carrying a beautiful black umbrella over my head." This word, according to Rand, is derived from *pokwŏsăn*, "an umbrella"; *māktāwāc*, "I am black"; *wolāc*, "I am beautiful"; *yăleā*, "I walk about." From the Kootenay language may be cited: *Nātltlāmkinē*, "he carries the head in his hand" (*n*, verbal particle; *ātl*, "to carry"; *tlām*, composition form of *āaktlām*, "head"; *kin*, "to do anything with the hand": *inē*, verbal); *hinūpqanāpinē*, "thou seest me" (*hin*, "thou," (subject pronoun); *ūpqa*, "to see"; *āp*, "me" (object pronoun); *inē*, verbal). As typical incorporative languages the Iroquoian and Eskimo may serve. All the incorporative forms of speech in America do not, however, proceed upon identical lines: and some that do incorporate, like Kootenay and Eskimo, often have one or more cases. According to Dixon and Kroeber many Californian languages do not possess the feature of incorporation at all (such are, for example, Maidu, Pomo, Yuki, etc.). As types of incorporating languages less complete than Iroquoian we have Kootenay, Siouan, Aztecan. Some of the Central and South American tongues seem also to have little incorporation. Otomi and Maya appear to be evolving in somewhat the same direction as modern English, away from incorporation and grammatical plethora. Many of the Amerindian tongues are both prefix and suffix languages; others prefer prefixes, others, again, suffixes. Some possess, and some do not, a plural form for nouns; a dual; gender-distinction in pronouns; a high development of demonstratives; reduplication; syntactical cases, etc. A few possess grammatical gender and some exhibit differences in the words used by men and women. In the matter of phonetics the languages of the American aborigines are remarkably divergent, some being extremely harsh, guttural and consonantic, others equally smooth, soft, and vocalic. The absence of certain consonant sounds and the equivalence of certain vowels and consonants characterize some forms of American speech. Euphonic changes are of major or minor importance. Sentence-construction differs greatly in various tongues. The position of the adjective is not always the same. The Haida language has even a distinction like that between our *shall* and *will*. Careful investigation of the many Indian languages, as yet studied imperfectly, if at all, may reveal other interesting linguistic phenomena. How much has been written about and in some of the languages of primitive America may be seen from the bibliographies of Pilling! Our knowledge of them varits from a brief vocabulary of the Esselenian to the exhaustive dictionary of Yahgan compiled by Bridges. The native literature runs from the unrecorded tales of the northernmost Athapascans to the poetry of the ancient Mexicans and Peruvians, some of which has been handed down from pre-Columbian times. The only actually phonetic (syllabic) alphabet now in use among the Indians (except the syllabaries introduced by missionaries among the Athapascans, Crees, etc.) is post-Columbian, — the invention of a half-blood Cherokee. A sort of alphabet has, however, sprung up more recently among the Winnebagos. The development of picture-writing varied very much among the numerous tribes, as may be seen from Mallery's classic study of the subject. Sometimes, as is the case with the Kootenays, ability to draw does not seem to have been accompanied by exuberant pictography. The Walum Olum of the Delawares, the "calendars" of the Kiowa, Sioux, Pima, etc., are special developments of primitive records, the highest form of which is seen in the manuscripts ("books") of the Aztecs and Mayas of a religio-historical character. The pictographic records of the Ojibwa "medicine men" have been studied by



PICTURE WRITING OF THE OJIBWAY INDIANS

Hoffman, and the rite-literature of the Cherokee by James Mooney. The native literature of primitive America has been the subject of special monographs by Dr. D. G. Brinton. The Spanish-American countries have furnished several writers and investigators of Indian descent.

Religion.— The mythology and religion of the American Indians have received particular treatment at the hands of Müller, Brinton, Powell, etc. Perhaps the most general myth of importance is that of the divine hero, teacher, and civilizer, who after accomplishing his labors, leaves the earth, promising to return at some future time. This myth is found in Mexico (Quetzalcoatl), Yucatan (Kukulkan), Colombia (Bochica), northeast North America (Manabozho, Gluskap, etc.) Somewhat analogous is the myth of the twin reformers of the primitive world among the Pueblo Indians, Navahos, etc. The Iroquoian stock have the myth of the contest of the good and the bad mind. The Algonkians have a myth-cycle of the rabbit, the tribes of the northwest Pacific coast one of the raven and thunder-bird, the Rocky Mountain peoples one of the coyote, the Brazilian Indians one of the jaguar, etc. Some of the tribes are very rich in animal myths and, as Mr. Mooney asserts, the characteristic tales of "an 'Uncle Remus' nature" found among the Cherokee and other peoples have not, as many suppose, been borrowed from the negroes of the South. Even the famous "tar-baby" tales have their independent Amerindian analogues. Flood-legends are widespread in America and vary from the simple, locally colored stories of rude Athapascans to the elaborate conceptions of the civilized peoples of Mexico, Central America, etc. The cardinal points and the number four have developed with many tribes a rich symbolism, with which the chief colors are often connected.

The "medicine men" of the Ojibwa, the Cherokee, the Apache, have been investigated by Hoffman, Mooney, and Bourke, and a large amount of accurate and authentic information concerning shamanism among the Amerindian peoples has been accumulated. The power of the "medicine man" varies much from tribe to tribe,— with some he is a personage of little or no importance; with others he is the controlling influence in secular as well as in religious affairs. The acme of such influence is found among some of the tribes of Guiana and Brazil. These "medicine men" had often their secret societies and "lodges" into which chosen neophytes were admitted with appropriate ceremonies. They had also, with many tribes, the control of the rites to which the youth were subjected at the time of puberty, with others they performed such marriage ceremony as existed. Besides these shamans, there were "prophets" and religious reformers, especially since contact with the whites. The widespread "Ghost Dance," in its more recent outbreaks, has been studied in detail by Mooney. Worthy of note is also the "new religion" of the Iroquois, and the "Shaker" religion of the Indians of Puget Sound. The investigations among the Pawnee by Miss Fletcher and G. A. Dorsey have demonstrated the existence of a relatively high form of primitive religion in a rather unexpected quarter,— their worship of the morning star in connection with agriculture was, however, at one time accompanied by human sacrifice. The mortuary rites of the American Indians, corresponding to diverse ideas of the soul and its future in the other world, varied from simple neglect of the corpse to what is represented in material form by some of the mounds of the Mississippi Valley and the stone tombs of Peru. The mortuary customs of the aborigines of North America have been made the subject of a special monograph by Dr. Yarrow, and the doctrine of "animism" among the South American peoples has been treated at length by Koch. The contemplation of the *totem* (properly Ojibwa *ododema*),— tribal or family mark,— of certain Algonkian tribes has given rise to theories of "totemism," concerning which there is much dispute in the world of science. "Fetishism," as exemplified in the Zuñis, has been investigated with some detail by Cushing. Cannibalism (the word *cannibal* is the corrupted form of a South American tribal name) has been rarer in America than is generally believed. Outside of its occurrence through necessity in ways known to civilized peoples, it was chiefly partial and ceremonial. Epicurean cannibalism flourished along the coast of South America and on some of the Caribbean islands; ritual cannibalism among certain tribes of the northwest Pacific coast, in ancient Mexico, etc. The almost extinct Tonkaways of Texas have the reputation of being the "last of the cannibals," while the Attacapas owe their name to this practice attributed to them by their neighbors. In the legends of the Cree and Ojibwa tribes of the Algonkian stock, a cannibal giant (wendigo) figures, and a horror of human flesh eating is expressed at the present time, whatever may have been the case in the past. From the condition of human bones and other remains in the shell-heaps of various parts of the coast, some authorities have come to the conclusion that cannibalism did exist in prehistoric ages among some of the Indian tribes. Religious ideas approximating to monotheism are attributed by some chroniclers and investigators to some of the more enlightened aboriginal rulers of Mexico and Peru. In these regions of the continent, as also in Central America, architecture and the arts of commemoration and record were at the service of religion. See MYTHOLOGY.

Amusements.— The games of the American aborigines, some of which, like lacrosse, have passed over to their conquerors, are of sociological and religious significance in many instances. Stewart Culin has made a special study of the games of the North American Indians, and rejects the theory favored by Tylor and others, that many of them (for example, Mexican *patalli*), are imports from Asia. The games of the civilized Aztecs seem to be but "higher developments of those of the wilder tribes," and those of the Eskimo are modifications of games found among other aboriginal peoples of America. Among characteristic Amerindian games may be mentioned: The gambling game with sticks, the hoop-and-pole game, the ball-race of the southwestern United States, the ball-games of eastern North America, the woman's game of double ball, foot-races, the snow-snake, etc. Culin holds that back of every game lurks "a ceremony in which the game was once a significant part." The variations in games do not follow linguistic lines. One centre whence games have radiated and where some of their oldest forms are still to be found, is in the southwestern United States, from which their migrations can be traced north, northeast, east, and south. Interesting modifications arise from conditions of environment.

Arts and Inventions.— The arts and inventions of the American Indians correspond to the extent and variety of their environment. The mass of the inhabitants of the continent at the time of its discovery were hunters and fishers, or agriculturalists of the Stone Age, most of whom had some knowledge of pottery-making. The house followed the lines of climate and culture, from the snow *iglu* of the Eskimo and the rude *wickiup* of the Utes to communal houses of the Mohegans, the Iroquian "long-house," phalansteries of the Pueblan and Central American areas, and the stone dwellings of a more or less pretentious sort of the civilized peoples of Mexico, Central America, and Peru. The cavate lodges and cliff-dwellings of Arizona and New Mexico, the wooden (sometimes underground) houses of the northwest Pacific coast, the skin-tents of the plains tribes and the wigwams of the Algonkians, the earth-lodges of the Mandans, etc., correspond to environmental stimuli. A like variation may be seen in the cradles of the American aborigines, studied by Mason, and in their means of transport on the water.— kayaks, "bull-boats," woodskins and balsas, dug-outs, canoes of pine and birch bark, large and small, and of all varieties of design and finish. In North America the Algonkians and Iroquois, and in South America the Indians of the great Brazilian water-ways, have made themselves celebrated for their skill in navigation. So too has the Eskimo with his kayak and the Peruvian with his balsa. The Algonkian Etchemins are literally "the canoe-men." The seagoing canoes of the fishing tribes of the coast of Alaska and British Columbia also deserve mention. On land some of the American Indian tribes have used the dog (Eskimo in particular) and the sled (the Algonkian toboggan, adopted by the whites for amusement purposes, is a special form), while in Peru the llama has been employed for ages for "packing," but not for draft purposes. The use of the horse and the modifications of primitive culture thereby induced in the Indians of the plains of the Missouri-Mississippi valley, the llanos of Venezuela, the pampas of the Argentine, etc., are, of course, post-Columbian. So, too, the influence of sheep culture upon the Navaho and their primitive industries, and of the cow among certain South American tribes. The only animals domesticated by the Indians whose use amounted to a considerable factor in their social and religious life were the dog and the llama, the latter in Peru and Bolivia only. The other half-domesticated animals and birds are of little importance as culture elements. The domesticated dogs of pre-Columbian America represent several diverse species of *Canidæ*. The absence of such domesticated animals as the cow, the horse, the sheep, etc., in pre-Columbian America accounts for certain limitations of its culture as compared with that of the Old World. Pets, however, bird and beast, were very common, especially in Brazil and Guiana. The disappearance of the wild buffalo and other animals of the chase, since the coming of the whites, has been fateful for some tribes,— the contact with the latter as represented by the various "fur companies," etc., has caused many changes in the life of the aborigines, seldom for the better.

As Mason has pointed out, the Amerindian traps and other devices for the capture of wild animals indicate intellectual skill and marvelous adaptation to the habits and actions of these creatures. The Eskimo harpoon and its appurtenances, the simple and composite bow, the arrow-poisons of some North American and many South American peoples, the manufactures of obsidian and jade in ancient Mexico, cotton weaving and dyeing in the more southern regions, maguey-paper making in Mexico and Central America, stone carving (from Mexico to the Argentine), feather-work (in the southern United States, Mexico, Central America, and parts of South America), gold working (in the Isthmian region, Colombia, etc.), the hammocks of the Venezuelan tribes, the fish-poisoning devices of many peoples of South America in particular, the fine pottery of many regions of the continent, the *quipus* or knotted record-strings of the ancient Peruvians, the primitive drum-telephone of certain Brazilian Indians, the blow-gun (southeast United States and South America), cassava preparation (northern South America), the bolas of the Pampean tribes, etc., represent the diversity of invention and manufacturing skill among the American aborigines. The lamp of the Eskimo and some of the Indian tribes of northwestern North America is *sui generis* (its importance has been emphasized by Hough). Methods of computing time, season, etc., vary from the slanting stick of the Algonkian Naskopi to the elaborate calendar systems of Mexico and Central America. Of musical instruments, the drum, the flute, the pan-pipe, and the "musical bow" were known to the American Indians. Songs and dances to the accompaniment of these were in vogue. Practically all stages of primitive culture were to be found in pre-Columbian America, if we may judge from the tribes now surviving, from the savage Seris to the ancient Mexicans, Mayas, and Peruvians. Moreover, within the bounds of the same linguistic stock, as noted above, there may be found tribes representing a high and a low stage of development; as for example, the Aztecs and the Utes of the Shoshonean stock, the Dogribs and the Navahos of the Athapascan, etc. Some tribes were pre-eminently fishers, others hunters. Many excelled in both, like the Eskimo and some of the peoples of the northwest Pacific coast. Some sort of agriculture was widespread in America — the cultivation of corn, beans, varieties of pumpkin and squash, etc., was known all over eastern North America, and the regions of the southwest, etc.; and typical tropical and semi-tropical and other plants and fruits (potato, tomato, maize, pineapple, tobacco, varieties of cotton, manioc, sweet-potato, cacao, coca, etc.) were cultivated in the more southern regions of Mexico, Central and South America. The spread of tobacco and maize in North America and of certain other plants in Central and South America indicates agricultural receptiveness on the part of the many tribes concerned. The capacity of the American Indians generally for agriculture has been underrated probably, as both the desert-born cultivation of the Pueblos Indians and the tropically stimulated cultivation of the Indians of South America indicate. The arid regions of the Peruvian coast offer another example of considerably developed agriculture. In America the utilization of the gifts of earth varied from the seed picking and root digging of the Utes to the market gardens and chinampas of ancient Mexico. How the necessities of agriculture can shape a religious system may be seen from the rites and ceremonies of the Pueblos Indians, the cult of "mother corn," etc. With some tribes tobacco was more or less of a sacred plant, also tht mescal.

Position of Woman.— The relation of women to agriculture gave them a higher standing with certain tribes than would otherwise have been the case. With the Iroquois the position of women was very high and to them was allotted a considerable share in the government, peace negotiations, etc., and female chiefs were by no means unknown,— women were the "mothers of the nation." Among the Mayan peoples of Central America woman's position was also high. Many of the priests were women, and they were also commonly the leaders of their tribes in rebellion against the Spaniards — the most famous was Maria Candelaria, "the American Joan of Arc," who led the insurgent Tzendals in the 18th century. In ancient Mexico and Peru the position of woman was perhaps not quite so high. Among some tribes the position of woman was very low, and her sexual peculiarities added to the disesteem in which she was held, as for example, among the Tacanan Araunas of Bolivia. The Athapascan tribes vary much in their treatment of woman,— with some she is little better than a slave or servant, while with at least one Alaskan people of this stock female chiefs existed at times. The "purification" of women at the period of their menses, and the segregation of girls at the time of puberty, were accompanied with many rites and ceremonies among various tribes from the rude Athapascans to the civilized Aztecs. The curious custom of the *couvade* (imitative child-bed on the part of the husband) prevailed among many. Venezuelan, Guianian, and Brazilian peoples. The relations between environment and the share of the sexes in culture has been investigated by Mason; according to whom the zenith of virile Amerindian art is reached in Peru, while in Colombia we find woman as farmer, weaver, and potter. In the Oregon-California region one art, basket-making, reaches its acme of development in the hands of woman. A large female influence in religion is noticeable among the Pueblos Indians. Among some tribes, for example, the Hurons, the weregild for killing a woman was greater than that for a man. Some sort of matriarchal system, with maternal descent, prevailed very commonly in pre-Columbian America; among certain of the Koloschan Indians, for example, a man was considered to be in no sense related to his father, his sole parent being the mother. Besides this extreme form, numerous other varieties occur among the tribes now existing, the system in vogue among the Iroquois, etc., being more complicated and adapted to social needs. The systems of marriage known to the American Indians varied from the absence of any particular rite or ceremony to selection of the wife by the old women of the tribe, as among the Hurons, or the uniting of the couple by the "medicine men." Some of the tribes of the Brazilian forests, ranking very low in culture, are strictly monogamous; while peoples of higher civilization, like the Chibchans, Mexicans, Peruvians, etc., were polygamous or concubinative, or both. Marriage by purchase was found over a large area of America; but here as in other parts of the globe, the "money" received was often rather a compensation to the parents for the loss of their daughter than a real sale of her to a suitor. Divorce, in many forms, is known to the primitive Americans, both by mere word of the husband and according to set forms and rites. Consanguineous marriages were strictly avoided by many tribes; but among a few, such as some of the lowest Athapascans, incest was not condemned. In the matter of the sex-relations, as in many other fields, the American Indians exhibit almost all possible phases from the monogamic chastity of some of the lowest peoples to the unnatural indulgences of the Peruvians. Runaway matches and marriages for love, in spite of the contrary opinion entertained by some authorities, have been by no means uncommon throughout the continent. Suicide on account of unsuccessful wooing by both sexes is also not at all rare. Some peoples, too, have developed love-songs of a romantic order, for example, the *yaraveys* of the Quechuas.

Government.— The systems of government of the American Indians and their tribal organizations range from the simple democracy of the Kootenays and some of the Brazilian Indians to the elaborate state institutions of the ancient Mexicans and Peruvians, which in several respects resembled the corresponding institutions of mediæval Europe or the ancient classic world. The power of the chief, however, seems everywhere to have had limitations, and some tribes distinguished the permanent peace chief and the temporary war-chief. Chiefs were generally elected, either from the body of the tribe or from certain specified families. "Totemism" and secret societies are not found to any extent, if at all, among certain tribes (the Kootenay, for example); while with many of the peoples of the northwest Pacific coast they are perhaps the chief feature of aboriginal society, as Boas has recently shown. Property rights are represented in many stages, from the semi-anarchic Eskimo to the Aztecs of Old Mexico and other peoples of Central and South America. Slavery existed among many tribes, and on the northwest Pacific coast a sort of traffic in human chattels had arisen. See SLAVERY.

Trade and Commerce.— Within the spheres of the culture-centres of Mexico, Central America, Peru, etc., trade and commerce were well developed. The Columbia River region was the scene of a less developed trade; while the southeastern United States, the region of the Great Lakes and country west and south of them, had also their important distributing points. The region of Bering Strait was likewise an Asiatic-American commercial centre.

Education.— With the lower tribes generally, such education as was imparted to the children was given by the father to the boys and by the mother to the girls. Peoples like the Iroquois, the Siouan Omahas, etc., used the instruction of tales, legends, and proverbs. The ancient Aztecs and some of the other semi-civilized peoples of Mexico and Central America had schools for boys and others for girls, in which the duties proper to each sex were taught under the supervision of the priests.

Physical Characteristics.— The physical characteristics of the aborigines of America mingle uniformity with diversity. The skin color, popularly styled «red» or «copper,» is designated by Mantegazza, "burnt coffee," and by Brinton «brown of various shades, with an undertone of red.» This but varies from rather dark to rather light. Among the lighter tribes have been reckoned the Koloschan Tlinkit, the Bolivian Yurucari, etc., and among the darker the Charmas of the Gran Chaco, the Bolivian Canisianas, and a few other tribes of South and Central America. The hair is generally termed "black," but, as Brinton notes, there is in it «a faint under-color of red,» which shows up more in childhood and seems much more prominent with certain tribes than with others. Red hair is known among American Indians, but in some cases (certain South American tribes, for example), its occurrence may be due to infusion of white blood. The eyes of the Indians are, with rare exceptions, dark brown. The stature varies from rather low to rather high, represented on the one hand by some of the shorter Brazilian tribes and on the other by the Patagonian «giants.» Among the peoples presenting many individuals of tall stature, may be mentioned the Yumas and Pimas, some of the Muskhogean tribes, some of the Crees, Ojibwa and eastern Algonkians, Pawnees, Iroquois, Siouans, Huaveans, Ramas, some of the Cariban tribes, Yurucari, Cayubabas, Guaycuruans, Patagonians, etc. So far as is known no dwarfish people comparable to the dwarf races of the Old World existed in America, although the skeletons from certain Peruvian tombs prove the existence of a dwarfish element in the general population; and the stature of many individuals among certain Brazilian tribes is so low as to induce some authorities, with Kollmann, to predicate the former existence of a dwarf race. In the relations of trunk and limbs and in the relation of one limb to another many variations occur among the Indians, due to occupation (canoeing, etc.,— and, since the advent of the whites, horse-riding). In primitive America all the chief forms of skull (often with artificial flattening, etc.) are found. Among the dolichocephalic (long-headed) peoples are the Eskimo and Iroquois generally, some of the Muskhogean tribes, Otomis, Aymaras (partly), Tapuyas, and Tupis (largely), etc. Of the brachycephalic (broad-headed) may be mentioned the Araucanians, Caribs, Arawaks, Patagonians, Mayas, many of the tribes of the Pacific coast region of North America, etc. The civilized peoples of Mexico, Central America, and Peru appear to have been of stature below the average and of varied skull form tending to brachycephalic, indicating mixtures of types. In the Columbia River region type-mingling is indicated also by both stature and skull-form. The Peruvian region is another centre of race-mixture, as evidenced by skull-form. The oldest skulls discovered in prehistoric burial-places or in geological *situ* are not distinct from the American types,— the latest found, the «Lansing skull,» is quite Indian. The skull capacity of the Indian is below that of the white in general, but many exceptions occur. The brains of the less cultured Indian peoples (Fuegians, Eskimo), show no decided anatomical inferiority to those of civilized Europeans. Great varieties of build and set of body are found among the American Indians, from the half-starved Fuegians to the well-fed and corpulent Iroquois. Small feet and hands are very common. Among many tribes in various parts of the continent handsome men and women of considerable beauty are to be found. In the case of women an admixture of white blood often enhances their beauty.

Race-Fusion.— The intermingling of the American Indians with the intruding white race has been much greater than is generally believed. The extent of this fusion of races varies from certain parts of North America with their classic Pocahontas examples to Uruguay, in South America, where 90 per cent of the population are said to be of mixed blood. The Eskimo of Greenland have intermarried with the whites (Danish fathers, native mothers), so that except in the parts remote from settlements no pure-blood Eskimo exists: and the same is true of a good deal of Labrador, where the contact has been with fishermen of English descent. The Micmac, Abnaki, and related Algonkian tribes of Maine, New Brunswick, etc., have a large admixture of white blood (French fathers, native mothers), and all over Canada and the northwestern United States in the early days of colonization and exploration the French traders, trappers, *voyageurs,* and *coureurs des bois* mingled freely with the native women, particularly those of the various Algonkian peoples of the Great Lakes and the West. The Hudson's Bay Company, by introducing employees of English and Scotch descent into the Canadian Northwest, made possible other *métis,* of which those of Scotch descent on the father's side are said to be healthy and sturdy specimens of humanity, with more than ordinary capacities. As indicated by the present condition of the Iroquois on the reservations in Quebec, Ontario, and New York, some infusion of white blood has taken place from very early times. Here the combination of white mother (often an adopted captive) and native father is more common than is usual in race-mixture. The Cherokee had an admixture of white blood in ante-Revolutionary days, to which Mooney attributes much of their culture-achievement since that time. In Mexico, Central America, and South America generally, as Talcott Williams has very recently noted, the half-breed element is very large indeed, for the native population was never exterminated by the whites as some histories still teach. Of the 40,000,000 inhabitants of South America it has been estimated that less than 10,000,000 can lay any claim to pure white blood. There is reason to believe that the future of some of the South American countries will be as much in the hands of the Indians as in those of the whites. In Mexico, parts of Central America, Colombia, Peru, and Chile, the strain of Indian blood represents able and intellectual aboriginal peoples. In certain parts of South America, and, sporadically in northeastern North America, intermingling of Indians and negroes has occurred, giving rise to the so-called Cafusos, etc., of Brazil, and a few other small groups. The mixture of white-Indian-negro is also found here and there. In some of the Spanish-American countries there is a special vocabulary to designate the numerous degrees of *métissage.* In the Canadian Northwest the half-breeds have taken a prominent part in the development of the country (one noted *métis,* Norquay, was premier of the province of Manitoba), and they are likewise noteworthy in the annals of the northwestern United States. In Mexico and Central America, not alone the *métis* but

STONY INDIANS WEARING RICH OTTER AND ERMINE TROPHIES

the Indians themselves have produced celebrated men. Juarez, the liberator of Mexico, a really great man, was a full-blood Zapotec, and President Barrios of Guatemala a Cakchiquel (Mayan stock).

Treatment by Whites.— The ill treatment of the American Indian by the whites has often been such as to stamp with eternal dishonor the conquering race. Massacres, broken treaties, land-robbing, commercial swindles, etc., mark the path of advancing "civilization," — English, Dutch, French, Portuguese, and Spanish have all been guilty at some time or other. The English in Newfoundland, the Americans in the West, the Castilians in northern Mexico and Yucatan, have exterminated or sought to exterminate whole tribes. We must, however, believe that the accounts of the early chroniclers concerning the "millions" of Indians slaughtered by the Spaniards, were the customary exaggerations of those who sing the victor's deeds. Peru and Mexico, for example, would not contain so many Indians to-day were those stories literally true. Against the centuries of dishonor in the treatment of the Indians by the whites, we may place the efforts of missionaries of all faiths, from the good Las Casas in New Spain to Duncan of Metlakahtla. The Jesuits among the Iroquois and Algonkians in North America, the Moravians among the Eskimo and some of the Algonkians and Iroquois, have all done good work, which only the incapacity or worse of governmental authorities has made null. The missions in California and the "reductions" in various parts of South America (Paraguay in particular) might have succeeded in keeping the Indians gentle and loyal sons of the Church had the good fathers been forever in charge, but the oncome of the more strenuous life of the whites doomed them to helplessness. The story of the Paraguayan experiment is one of the most interesting in the annals of mankind, but also one of the most disheartening. Against such failures a few bright spots may be set, — the Fuegian mission, for example; but even there all is not well. Signs of a better treatment of the Indians still within the borders of the United States are not wanting, and it is to be hoped that the present educational fads with which white children are being experimented upon will be kept far from the Indian schools.

Influence on Civilization.—The contributions of the aborigines of America to the world's stock of civilizing factors and influences are much more numerous and of greater importance than is generally thought. Besides the innumerable place-names in all parts of America of Indian origin, the Algonkian, Peruvian, Brazilian, West Indian, Guianian, Venezuelan, and Mexican words in English, French, Spanish, and Portuguese (whence many of them have spread into all the civilized languages of the world) are able remembrancers of the conquered race. The literature of the Spanish-American countries and of Brazil has been more or less affected by the stimuli of native theme and treatment. Many of the old dances and folk-customs still survive even where Christianity has been at least outwardly accepted and have sometimes been adopted by the descendants of the European colonists. The 'Hiawatha' of Longfellow, and the tales and dramas based upon the deeds, adventures and romantic episodes in the lives of King Philip, Pocahontas, Pontiac, Tecumseh, etc., to say nothing of the novels of Cooper and his successors, indicate that the Aryan mind of the Anglo-Saxon order has found treasure in the Amerindian soil. In Mexico and other parts of Spanish America the cathedrals and other religious edifices, by intention or by happy chance, often occupy sites sacred ages before the Columbian discovery to pagan deities, — so the new religion gathers strength from the old, and the dislocation of faith so common in Protestant countries is avoided to a very large extent. Of more material things, we owe largely to the Indian the paths over which our highways and our railroads run, while many of our cities and towns have only sprung up on the old campsites of our predecessors. The great importance of some of these "Indian ways" in the history of the United States has been pointed out by Hulbert. The Indians' knowledge of the great water-ways of the country, of portages and trails through forest and over mountain, has made possible colonization and settlement otherwise utterly out of the question. Indian hunters and fishers, scouts, guides, canoe-men, carriers and packers, in all sections of the American continent, have been indispensable to the progress of white civilization. Nor have Indian slaves and servants been few or without social significance in some quarters; while French, Spanish, and English have at times availed themselves of the services of Indian warriors, — the Iroquois enlisted for the North and some of the Cherokee for the South in the Civil War, and then the government has sometimes set one tribe off against another. In Canada and part of the northwest of the United States, where commingling of the races has taken place, the civilization of the land owes even more to the half-breed, *voyageur, coureur des bois*, etc., than to the Indian himself. (See CANADA.)

Throughout the continent — more especially, however, in parts of South America — devices for hunting and fishing and appliances in woodcraft, primitive agriculture, etc., were transferred to the European colonists during the period of settlement, and many of them are still in active use. Fish-poisoning by narcotics, the use of the blow-gun for killing birds and small animals without damaging the skin, methods of stalking beasts of the chase, certain traps and snares, etc., belong here. In connection with agriculture we have menhaden-manure, guano, etc., the planting of corn and beans or pumpkins together, the burning over of land before tillage, etc. But it is upon the food-supply of the world that the American Indian has exerted the greatest influence. Potatoes (common and sweet, both), maize, and the tomato, now in use by all the civilized world, were first cultivated by him and taken over by the whites after the discovery. Cacao, vanilla, jalap, the kidney bean, several varieties of squash and pumpkin, manioc, Jerusalem artichoke, coca, agave, quinoa, persimmon, and perhaps also the peanut, came to us from the Indians. Maple-sugar and maple-syrup, pemmican, jerked beef, etc., are from a like source. Tobacco, the great narcotic, was one of the first gifts of America to the Old World. Of drinks the American Indian has given us Paraguayan *maté*, "Labrador tea," and several other like concoctions, chocolate, Mexican *pulque*, and a considerable number of other intoxicating beverages from South America.

Many medicines and medicinal plants were made known to the whites by the Indians, and in the era of settlement and colonization the "Indian doctor" (male and female) was not unimportant.—New England, for example, had its "Joe Pye," after whom the "Joe Pye weed" (*Eupatorium purpureum*) is named. The Californian Indians have furnished perhaps the three most important contributions of recent years to the American pharmacopœia. South America, besides numerous locally known remedies, etc., has furnished the world-famous *quinine*, and *ipecacuanha*, while the drugs *cocaine* and *curari* must ultimately be credited to the aborigines of America. Many dye-stuffs and dye-woods were first given to the civilized world by the Indians, both for domestic use and for employment in the larger world of æsthetic manufacture. These dyes range from the poke of northeast North America for dyeing basketry to the famous roucou or anotto of Venezuela, used, among other purposes, for staining cheese. Pottery and other household utensils of Indian manufacture are used throughout Spanish America. The hammock of the Arawak Indians belongs now to all civilized peoples. All that india rubber means, civilization owes to the Indian. Both in small things and in great the American aborigines, through their gifts to the white race, will long be remembered, even if, as some authorities (upon imperfect evidence) believe, they are rapidly passing away. On this point one may cite the remark of Deniker that Humboldt in 1825 estimated the total population of America at 13,000,000 whites, 6,000,000 half-breeds, 6,000,000 negroes, and 9,000,000 Indians, while a computation made in 1895–7 reckoned 80,000,000 whites, 37,000,000 half-breeds, 10,000,000 negroes and 10,000,000 Indians.

There might be mentioned here also the "Chinook Jargon" of the Columbia River region, the "Lingua Geral" of Brazil, and the minor jargons and trade languages of other sections of the continent, which prove how the Indian has compelled the white man, more or less, to use his language in some form or other for the purposes of friendly or commercial intercourse.

Antiquity of Man in America.— The question of the antiquity of the American Indian culture is difficult to settle satisfactorily. Time must be allowed for the divergence of the original stock into the numerous (more numerous in pre-Columbian eras) tribes and peoples inhabiting America at the time of its discovery, —time for the production of the Eskimo and the Iroquois, the Carib and the Patagonian. Time, again, must be allowed for the development of the Aztec from the primitive Shoshonean, the Mayan from the rude stock of that people, the Chibchan from the savage Bolivian, the Peruvian from the ancient barbarian of equatorial America. Then the civilizations of Mexico, Central America, and South America, as such probably took ages to rise and flourish. Town and village life, with all its social and religious implications, the differing architectural monuments of the various centres of American civilization, etc., did not spring up in a day, any more than did the culture of mediæval Europe. The domestication of the dog, the llama, etc., the change of maize, tobacco, the squash, the tomato, the potato, the pineapple, etc., from wild to cultivated plants, require a long lapse of time. Moreover, it is now known that American Indian languages do not now change and have not in the past changed at the fast rate once assigned to them by philologists. So, while one may not believe that America was the original habitat of the human race, he may be certain that very many millenniums have elapsed since the "Red Man" began his career as the autochthone of the New World. There seems every reason to believe that at the close of the Glacial Age man had spread over a considerable portion of both North and South America, and was contemporary with European man of an early epoch. To calculate man's residence in the American environment by years is impossible on present evidence. Dr. Stoll assures us that the linguistic phenomena met with in the Mayan dialects alone require thousands of years for their evolution, and some of the results deduced from the Mayan hieroglyphs by certain investigators imply the existence of civilization of the Central American order for very many millenniums. Perhaps it is fair to say that man has been in America at least 25,000 years and not more than 200,000, and that the civilizations of Mexico, Central America, and South America were probably as long-lived as those of Rome, Greece, etc. They were also in many respects just as typical of human attempt and achievement, for the American Indian was a man as we are men.

Y.); Morgan, 'Houses and House Life of the American Aborigines' (1881, Vol. IV. of Contr. Amer. Ethn.), 'League of the Iroquois' (1902); Müller, 'Amerikanische Urreligionen' (1867); Papers of the Archæological Institute of America, American Series (1880 —); Payne, 'History of the New World' (1900); Pilling, 'Proof Sheets of a Bibliography of the Languages of the North American Indians' (1885) — and subsequent special bibliographies — Algonquian, Athapascan, Chinookan, Eskimo,

Iroquoian, Muskhogean, Salishan, Siouan, Wakashan; 'Publications of the Field Museum'; Ratzel, 'History of Mankind' (1898); 'Relations des Pères Jésuites' (1902); 'Reports of Ontario Archæological Museum'; 'Reports of Committee of British Association on Northwestern Tribes of Canada'; 'Reports and Memoirs of Peabody Museum'; Von den Steinen, 'Durch Zentral-Brasilien' (1886); 'Unter den Naturvölkern Zentral-Brasiliens' (1894); Schmidt, 'Die Vorgeschichte Nord-Amerikas' (1894); Thomas, 'American Archæology' (1898); Tooker, 'Algonquian Series' (1901); Winsor, 'Aboriginal America' (1884-9).

The 'Publications of the Bureau of American Ethnology,' embracing original monographs by eminent specialists, are a lasting monument to the founder of the Bureau, the late Maj. J. W. Powell, to whom all students of the aborigines of the New World owe a debt of deepest gratitude. Among workers not connected with the Bureau, the death of D. G. Brinton in 1899 removed perhaps the most gifted and representative Americanist.

Alexander F. Chamberlain,
Clark University, Worcester, Mass.

Indicator, in steam engineering an instrument invented by James Watt, to record, graphically and automatically, the pressure in an engine cylinder at every point of the stroke. By means of the diagram that the indicator

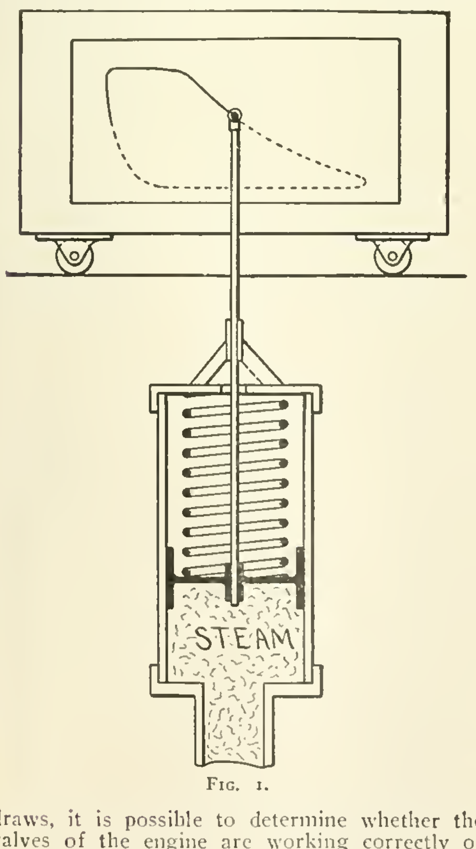


Fig. 1.

draws, it is possible to determine whether the valves of the engine are working correctly or not, and it is also possible to estimate the horsepower that the engine is developing, with considerable accuracy. Commercially, the steam-engine indicator may be had in many forms; but all are based on the same fundamental principle, which will be understood by reference to the diagram presented in Fig 1. The paper upon which the indicator diagram is to be drawn is here supposed to be secured, flat, to a carriage which travels back and forth upon a track; the motion of the carriage corresponding precisely

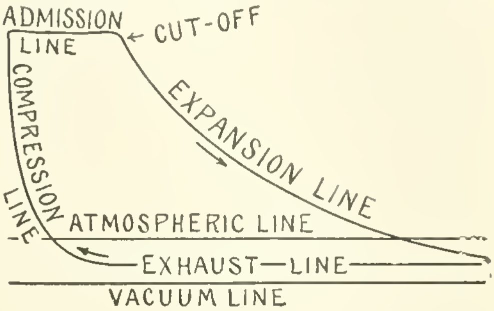

Fig. 2.

to the motion of the piston of the engine. In practice it would be inconvenient to have the carriage travel a distance equal to the whole stroke of the engine, and hence some form of reducing motion is used, so that the motion of the carriage may follow the motion of the engine piston accurately, but with materially reduced velocity. The indicator diagram is draw by means of a pencil-point carried on the piston rod of a small steam cylinder which is situated below the carriage, and which opens freely into the cylinder of the engine from which the diagram is to be taken. The piston of the indicator is pressed downward by means of a spring whose strength is accurately known, so that the increase of pressure corresponding to a rise of one inch in the position of the pencil-point is known. When the indicator is in operation, the pencil rises and falls proportionately to the pressure of the steam in the engine cylinder, and the carriage, with its attached paper, travels back and forth, horizontally, at the same time, keeping pace precisely with the motion of the piston of the engine. Under these circumstances the pencil-point traces a diagram somewhat like that shown in the illustration. In practice, the paper upon which the diagram is drawn is usually wrapped about a cylindrical drum, which rotates back and forth as the instrument works, following the motion of the engine piston just as the carriage here shown is supposed to do. In Fig. 2 an enlarged view of an indicator card (or diagram) is given, together with the technical names of some of its more important parts. The arrows show the direction in which the pencil travels as the diagram is drawn. The "admission line" is the part that is drawn while the engine is in full communication with the boiler, and drawing steam from it. The angle marked "cut-off" corresponds to the moment at which the steam supply is cut off, and the expansion of the steam begins. The "expansion line" is drawn during the expansion of the steam, and on the return stroke, after the exhaust valve has opened, the "exhaust line" is drawn. When the exhaust valve has closed again, the steam remaining in the engine cylinder is compressed until the end of the stroke, the indicator meanwhile drawing the "compression line." The "atmospheric line" is the straight, horizontal line drawn by the engine when the connection is broken between the engine cylinder and the indicator cylinder, and the latter is open freely to the air. The "vacuum line" is the line that would be drawn by the instrument under like circumstances, if a perfect vacuum could be maintained in the indicator cylinder. The "vacuum line," of course, must be drawn in by hand. It is parallel to the "atmospheric line," and at a distance below it corresponding to a pressure of about 14.7 pounds per square inch, on the scale to which the diagram is drawn. The diagram shown in Fig. 2 refers to a condensing engine. In a non-condensing engine, the exhaust line would not be lower than the atmospheric line, and would, in fact, be above it, if there were any sensible back-pressure in the engine during exhaust.

For detailed information concerning the indicator and its uses, consult: Pray, 'Twenty Years with the Indicator'; Peabody, 'The Steam Engine Indicator'; also, for less extended treatment, any good book on steam engineering.

Indictment, ĭn-dīt'mĕnt, a formal charge made before a legal tribunal against an accused person. The essential requisites of a valid indictment are,— first, that the indictment be presented to some court having jurisdiction of the offense stated therein; second, that it appear to have been found by the grand jury of the proper county or district; third, that the indictment be found a true bill, and signed by the foreman of the grand jury; fourth, that it be framed with sufficient certainty; for this purpose the charge must contain a certain description of the crime or misdemeanor of which the defendant is accused, and a statement of the facts by which it is constituted, so as to identify the accusation; fifth, the indictment must be in the English language, but if any document in a foreign language, as a libel, be necessarily introduced, it should be set out in the original tongue, and then translated showing its application, 6 Term. 162. The formal requisites of an indictment are, first, that the venue, which at common law should always be laid in the county where the offense has been committed, although the charge be in the nature transitory, as a battery. The venue is stated in the margin thus: "City and County of ——, to wit." Second, the presentment, which must be in the present tense, and is ordinarily expressed in the following formula: "the grand inquest of the State of ——, inquiring for the city and county aforesaid, upon their oaths and affirmations present." Third, the name and addition of the defendant; but in case an error has been made in this respect, it is cured by the plea of the defendant. Fourth, the names of third persons, when they must be necessarily mentioned in the indictment, should be stated with certainty to a common intent, so as sufficiently to inform the defendant who are his accusers. When, however, the names of third persons cannot be ascertained, it is sufficient in some cases, to state "a certain person or persons to the jurors aforesaid unknown." Fifth, the time when the offense was committed should, in general, be stated to be on a specific year and day. In some offenses, as in perjury, the day must be precisely stated, but although it is necessary that a day certain should be laid in the indictment, yet in general the prosecutor may give evidence of an offense committed on any other day previous to the finding of the indictment. Sixth, the offense shall be properly described. This is done by stating the substantial circumstances necessary to show the nature of the crime, and next the formal allegations and terms of art required. As to the substantial circumstances: the whole of the facts of the case necessary to make it appear judicially to the court that the indictors have gone upon sufficient premises, should be set forth; but there should be no unnecessary matter, nor anything which on its face makes the indictment repugnant, inconsistent, or absurd.

According to the rules of pleading in criminal actions at common law there are certain terms of art used, so appropriated by the law to express the precise idea which it entertains of the offense, that no other terms, however synonymous they may seem, are capable of filling the same office; such, for example, as traitorously in treason; feloniously in felony; burglariously in burglary; maim in mayhem, etc. In New York, and in nearly all of the States which have adopted the code system, the common law rules of pleading in criminal actions have either been greatly relaxed or entirely abolished. Many of the statutes of the subject are similar to the New York statute, Code Crim. Pro. § 273, which in substance provides that all common law rules of pleading are abolished, and the forms of pleading prescribed by the code shall be substituted, and § 275 of the same code provides that all an indictment must contain is, the title of the section, specifying the name of the court to which the indictment is presented, and the names of the parties, and a plain and concise statement of the act constituting the crime, without unnecessary repetition. It is also provided in § 283 of the New York Code Crim. Pro. that words used in a statute to define a crime need not be strictly pursued in the indictment; but other words conveying the same meaning may be used.

Indigestion. See DYSPEPSIA.

In'digo, the name of a genus of plants, and of the blue coloring matter obtained from them. The indigo plants are tall herbs of the pea family, forming the genus *Indigofera*, of which there are several color-yielding species in various warm parts of the world. The one yielding the indigo of commerce, and formerly extensively cultivated, is *I. tinctorium*, which is native to India, grows five feet high, and has bipinnate leaves. The coloring matter most abounds in the leaves, and especially as the time of flowering occurs, and that is the time when the crop is gathered by cutting down the plant, and making immediate use of the green stems or foliage, or by drying them for subsequent treatment. This coloring matter is a chemical substance called *indican*, the glucoside of indoxyl, which is converted by oxidation into indigo. Until the discovery of the sea-route to India the only blue vegetable dye available in Europe was that derived from the woad (q.v.), which was limited and costly; this dye-substance was therefore regarded as one of the most valuable of new commodities and a large capital was soon embarked in its cultivation in India, Ceylon, China, and other regions, where a profitable industry continued until after the middle of the 19th century. The indigo was obtained by macerating the leaves and stems in vats for several hours. Fermentation arises and the water becomes clear yellow. It is then run off into a lower basin, where it is subjected to incessant agitation and gradually turns green, whereupon the indigo begins to form in flakes and settle. The residuum is then thoroughly boiled, filtered through linen, molded into small cakes and dried. The best quality comes from Bengal and eastern India. Indigo plantations were made with more or less success in Brazil, Central America, and Mexico; and one of the foremost inducements held out to settlers in the southern colonies, from Maryland to Louisiana, was the probability of its successful cultivation there. The experiments never yielded results of much importance, partly because crops of tobacco, cotton, and food-stuffs were more profitable. Since the discovery of cheap methods of forming blue dyes from coal-tar the cultivation of indigo has declined greatly, but still supplies a steady demand from cloth-dyers who wish an imperishable blue of certain tints.

The wild indigo of the United States is any of several species of a closely related genus *Baptisia*, which flourishes especially in the Southern States. The best known is the yellow-flowered false indigo (*B. tinctoria*), or indigo brown, from which country people obtain a blue dye, and a domestic medicine.

Indigo Dyeing.— Before it can be employed in dyeing, the indigo must be brought into solution; and as indigo itself is insoluble, it must be first transformed into a soluble substance, so that it can penetrate the pores of the cloth, where it is subsequently again restored to the form of indigo. To bring the indigo into solution, it is ground up to a soft paste with water, after which it is thrown into vats along with ferrous sulphate, slacked lime, and water. The ferrous sulphate reacts with the lime to form calcium sulphate and ferrous oxid, the latter being immediately oxidized at the expense of part of the oxygen of the indigo, which in its turn is reduced to a substance called indigo-white. This dissolves in the presence of excess of lime, and the fabric to be dyed is dipped into the vat after the liquid in it is clear. On removing the fabric the indigo-white which has penetrated its pores is reoxidized by the air to indigo blue; and by repeating this treatment a shade of blue of any desired depth may be obtained. The dyed fabric is finally passed through dilute acid to remove any adhering lime or ferric oxid. Indigo appears to exist in the plant in the form of a glucoside known as "indican," which has the formula $C_{52}H_{62}N_2O_{34}$, and to be developed from this glucoside in the course of the fermentation by the action of a special bacillus, which closely resembles the bacillus of pneumonia. Indigo is now made artificially, the total production of synthetic indigo being probably about one fourth of the world's consumption. Although artificial indigo-blue appears to have the same chemical formula ($C_{16}H_{10}N_2O_2$) as the natural product, and to be identical with it in every way, it is more expensive than the natural product at the present time. If it could be made more cheaply, it would work as great a revolution in dyeing as did the introduction of alizarin in the place of madder. (See COAL TAR COLORS, and the references there given.)

Indigo-bird, a numerous and beautiful North American finch (*Passerina cyanea*), the male of which is dark greenish blue, while the female is grayish brown. They are migratory, but in summer spread over most of the United States, placing their neat nest and unspotted bluish eggs in garden bushes as well as in wild thickets. The male has one of the brightest and most persistent songs of any American bird; and he is easily habituated to captivity.

Indigo-snake. The gopher-snake (q.v.).

In'direct Damages, claims for damages not directly inflicted by the illegal act complained of, but by other causes themselves due to that act. The great historical case is that of the United States claim for many hundreds of millions of dollars' worth of loss, resulting from Great Britain's bad faith or carelessness in letting the Alabama (q.v., and ALABAMA CLAIMS) escape from her ports to prey on our commerce. It was alleged that aside from the actual loss to our shipping and cargoes, we had been damaged to a far greater extent by the resultant effects, chiefly of three sorts: (1) The prolongation of the Civil War due to the encouragement given to the South and the straitening of the North. (2) The destruction of commercial lines and relations, which took long to recover after the War. (3) The raising of the rates of marine insurance. As these claims exceeded the cost of a war plus the indemnity we should have exacted if victorious, Great Britain refused to consider them; and the commission threw them out altogether as contrary to international law.

In'dium, the name given to a metal discovered by spectroscopic analysis in 1863. It is of a silver white color, soft, and marks paper like lead; its specific gravity is 7.421 at 16.8°. The lead indium is related to cadmium and zinc, both associated with it in nature. The spectrum of indium exhibits two characteristic lines, one violet α and another blue line β; besides these two fainter blue lines are visible if the burner in which the metal is volatilized be fed with hydrogen instead of coal gas.

Individual Psychology. This term is applied to that branch of psychology which deals with the mental variations of individuals from one another. It is thus contra-distinguished from general psychology, which undertakes to determine the facts and laws of conscious processes as a whole and without special reference to their peculiar manifestations in any particular persons or group of persons. The field of individual psychology may be regarded as a part of the larger field of variational or differential psychology in which are to be included studies upon special races and upon social groups of various sorts. Such studies are carried on with special reference to detecting and describing the characteristic mental traits of such groups, but often with little emphasis on typical variations from other similar groups. Obviously the range of problems in individual psychology must be as broad as mind itself, for persons may vary in regard to any mental characteristic. It will only be practicable to mention a few of the problems thus far investigated, *e. g.*, mental type, temperament, and genius, the psychology of special mental defect, the psychology of the criminal, the psychology of sex, and that of professions or classes with their peculiar variations of mental constitution.

To exhibit more concretely the kind of material with which individual psychology works we may comment briefly on the first three of these topics. The determination of *mental type* is a problem of individual psychology in the narrow sense of the term in so far as it has to do with the ascertaining of the characteristic features of the mind of any particular person. In so far as it bears on the problem of discovering what actually are the typical groupings of such characteristics among people in general, it obviously belongs to the broader field of variational psychology.

1. Minds may differ from each other as regards the delicacy or sensitiveness with which they respond to stimulations of the sense organs. One may be more sensitive than another to slight variations in temperature, in color, in tone, etc. As a matter of fact, among normal persons such differences of sensitivity are relatively slight when the conditions of training and discipline are similar. As a general rule the higher mental functions show more variation than the lower ones such as sensitivity. Minds may differ as regards the special form of sense material toward which they manifest a predilection, *e. g.*, the musically minded person not only finds sounds of greater emotional interest than the unmusical person, but he also has a better memory for auditory experiences and his conscious processes in their entirety are likely to be much more influenced by auditory factors. A further development of such mental preference for one or another kind of sense material is found in the fact that certain individuals carry on most of their thought processes in terms of visual images, whereas others employ auditory images, and still others motor images. Probably the normal condition is represented by an admixture of various forms with some particular group dominating slightly over the others. Again, in memory we meet striking differences in addition to those of the imagery type already mentioned. For example, certain persons learn very rapidly and also forget rapidly. Others learn with difficulty but retain well that which they have learned. Occasionally we find persons who combine ability to learn quickly with capacity to retain permanently. It seems certain from psychological investigations that individuals supposed to possess particularly good memories are generally proficient only in certain directions. A universally efficient memory is rarely, if ever, found. People differ also very markedly as regards their ability to concentrate their attention. Some persons can concentrate very intensely for a short time but must then rest. Others are able to localize for more extended periods, and still others find it all but impossible ever to secure any intense concentration. Variations of a striking kind are also disclosed in the formation of judgments. Certain persons judge almost entirely in accord with the objective facts presented to their notice. Others are influenced in various degrees by subjective influences and show themselves peculiarly susceptible to suggestion. It is a matter of common observation that persons vary radically as regards temperament and feeling. One of the most practically important variations is represented by the difference in the rate at which the conscious processes proceed. Just as certain persons naturally walk and talk more rapidly than others, so do the mental processes vary as regards the speed with which they occur. Psychologists have demonstrated a rather characteristic daily variation as regards both rate and efficiency of mental activity. Many persons work best at night. Others are morning workers and still others afternoon workers.

2. The old familiar classification of temperaments recognizes the four types: sanguine, melancholic, choleric and phlegmatic. Both the choleric and the sanguine are supposed to be subject to rapid oscillations of emotional interest, but with the sanguine individual interest is rarely intense, whereas with the choleric it is rarely anything else. The melancholic and the phlegmatic represent the more persistent and dogged forms of interest but, like the previous pair, are distinguished by differences in the intensity of the interest, the phlegmatic person being less, the melancholic more, intense. These classifications are likely to be extensively revised by current investigation.

3. The modern study of genius has not only contributed to a more definite conception of the nature of genius and the general mental characteristics of the remarkable individual, but it has also revealed the hereditary character of marked intellectual superiority, and the relation between certain types of genius and mental defect.

Galton has gathered statistics to show that the frequency of genius is related in a definite and orderly way to the total number of persons in any given group. He has also shown that the genius appears with a background of heredity which affords a reasonable explanation of his peculiar characteristics. The view often urged by such writers as Lombroso that genius is essentially a morbid and degenerate mental phenomenon, seems to be sound only in so far as concerns the *liability* of persons of remarkable mental qualities to nervous derangement of various sorts. That insanity itself and genius are in any intrinsic sense identical is not generally granted. Among the interesting problems which deserve further study in the case of genius may be mentioned the determination of the extent to which the genius owes his superior endowment to heredity, as contrasted with education and favorable nurture; the ascertainment of the conditions which hinder or encourage the development of genius; the discovery of the general mental types to which the various remarkable individuals conform.

JAMES ROWLAND ANGELL,
Professor of Psychology, University of Chicago.

Indo-China, the southeastern peninsula of Asia, formerly known as Farther India, including

Anam, Burma, Cambodia, Cochin-China, French Indo-China, Tongking (qq.v.), and other districts.

Indo-Europe'ans, the Aryan race (q.v.). For accounts of the Indo-European languages see ARYAN; INDO-GERMANIC LANGUAGES.

Indo-German'ic Languages, the languages which are ancient and modern varieties of one primeval form of speech, anciently spoken in Central Asia. These languages are sometimes called the Indo-Celtic languages, the Japhetic languages, or more commonly, the Aryan languages. There are three forms of human speech, the monosyllabic, or isolating languages, such as the Chinese, whose words are unchangeable roots, each of which stands separately and is modified by the juxtaposition of other monosyllabic roots; the agglutinating languages, such as the South African, the Japanese, and the American Indian, in which, instead of being isolated, the roots are placed in close association, so as to agglutinate or agglomerate into one word. Some Eskimo words are as long as the longest compound epithet of Aristophanes. The third group are the inflectional languages. The Indo-Germanic languages are inflectional. In these the roots of all words are not necessarily modified, but they may be modified, in order to express certain relations, and the roots are also added to by suffixes and prefixes. The Indo-Germanic languages do not extend over so wide an area as the monosyllabic languages, but are spoken by the most civilized and intellectual peoples of the world. The Indic branches are the ancient Hindu languages, the principal of which is Sanskrit, and the modern Hindu languages. The Iranic or Persian branch includes, Zend, Old Persian, Armenian, Parsee, modern Persian and the dialect spoken by the mountaineers to the northwest of India. The great Hellenic branch was spoken anciently by the inhabitants of Greece, of the west coast of Asia Minor, of the islands of the Ægean, as well as of the south and southwestern coasts of Italy. It is spoken in a modified form in Greece and the Greek islands of to-day. Parallel to the Hellenic is the Italic branch, which includes the primitive Italic languages, Oscan, Etruscan, Umbrian, and Latin, as well as the classic Latin of Virgil and Cicero, which settled into the Italian of Dante and, on being extended over western Europe, grew through many modifications into French, Provençal, Italian, Spanish, Portuguese and Roumanian. Distinct from this branch was the Celtic, which survives to-day in the Welsh and Gaelic dialects. The Teutonic tongues include the Gothic of Ulfilas (4th century A.D.) the Norse languages, the Low German and the High German group. The Sclavonic languages are spoken in Russia and Poland and include the Lithuanian and the Old Prussian. There are several other Indo Germanic tongues and dialects which philologists have not been able to classify; such are the Etruscan in Europe and certain languages of Asia Minor. Compare: Schleicher, 'Compendium der vergleichenden Grammatik der Indo-Germanischen Sprachen' (1871); Corrsen, 'Ueber Aussprache, Vocalismus, und Betonung der lateinischen Sprache'; and most important Brugmann and Delbrück, 'Grundriss der vergleichenden Grammatik der Indo-Germanischen Sprachen' (1897 *et seq.*).

Induction. It is a familiar fact that an electrified (or magnetized) body causes electrical (or magnetic) disturbances in other bodies in its vicinity, when it is not in direct and visible connection with them, and the process by which these disturbances take place is called "induction." The ultimate mechanism of induction is still somewhat obscure, but something has been learned of its general nature. In the early days of physical science it was believed that bodies can act upon one another even across spaces that are absolutely void, and at the present time it is sometimes convenient to assume them to act in this manner, in forming mathematical equations for the treatment of physical problems. It is no longer believed, however, that this is what actually happens in nature; the phenomena of electric and magnetic induction being now attributed to motions or stresses in the ether which transmits light. (See ETHER.) Newton was of the opinion that induction is an ether-phenomenon, and in the first half of the 19th century Faraday may be said to have established the ether hypothesis upon a substantial experimental foundation. In later years Maxwell developed Faraday's conceptions mathematically, and added much more evidence that was partly theoretical and partly experimental; so that at the present time there are few or no physicists who doubt that induction is a manifestation of some form of activity in the light-bearing ether. Opinion is still divided, however, as to the precise nature of this activity. In fact, we cannot hope to gain any very precise information on this point until much more is known about the constitution of the ether itself.

The charging of a condenser is a phenomenon in electrostatic induction. If the condenser consists of two parallel plates (for example), of a given size and set at a constant distance from each other, and we charge it to a given potential, the quantity of electricity that must be put into it in order to charge it in this manner depends to a considerable extent upon the nature of the dielectric (or insulating material) which separates the plates. If the charge that is required when air is the dielectric is taken as unity, then with plate glass as a dielectric the charge will have to be 8.45 (according to Hopkinson), in order to bring the potential of the condenser up to the same value as before. If the space between the plates is filled with common turpentine, a charge 2.23 times as great as that required with air as the dielectric must be communicated to the condenser. It is evident, from these facts, and from others of the same nature, that electric induction depends, to a large extent at any rate, upon the nature of the medium which separates an electrified body from the other bodies upon which the inductive influence is felt. The constants that are given above are known as the "specific inductive capacities" of the dielectrics to which they refer.

Electrodynamic induction is the basis of practically all of the electrical machinery that has been found serviceable to man. The fundamental fact of electrodynamic induction may be stated as follows: If a closed electrical circuit, such as might be formed by joining the two ends of a copper wire, is placed in a magnetic field, then no current will be produced so long as the circuit is everywhere stationary, and the strength of the magnetic field remains every where invariable. If the intensity of the magnetic field is increased, a current of electricity will flow around the circuit while the intensity of the magnetism is changing, the intensity of the current being proportional to the rapidity with which the intensity of the magnetism varies. As soon as the magnetism again becomes constant, the current in the circuit ceases. If the intensity of the magnetic field be diminished instead of increased, a current will also be produced in the closed circuit, but it will be opposite in direction to that produced by increasing the magnetic field. Currents produced in this manner are called "induced currents." Instead of varying the magnetic field while the circuit is fixed in position, we may move the circuit about in the magnetic field. If the magnetic field is everywhere uniform in all respects, and the circuit is moved so as to always remain parallel to itself, then no induced current will be produced; but if the circuit is moved from a region where the magnetism is strong to one where it is weak, or *vice versa*, a current will be induced in the circuit, just as if the circuit were kept stationary and the intensity of the magnetism varied. Induced currents are also produced when, instead of being translated from one region to another, the circuit is rotated in a magnetic field, in such a way that the number of lines of magnetic force passing through it is either increased or diminished. In the induction coil the intensity of the magnetic field is varied, while the circuit in which the induced current is to be produced is kept stationary. In dynamos, on the other hand, the magnetic field is maintained sensibly constant, while the circuit in which the induced current is to be produced is rotated or otherwise moved about.

A current moving in a closed circuit produces a magnetic field in the space above it, and this magnetic field, when it varies on account of the variation of the current that produces it, causes the production of induced currents in any closed circuit that may happen to be near. Let us conceive two closed circuits, A and B, to be situated near each other, and let there be a current produced by any means in the circuit A. So long as the current in A is constant, no current will be produced in B; but if the current in A is variable, an induced current will be observed in B, whose intensity depends upon the rate at which the current in A is varying, upon the resistance of the circuit B, and also upon a certain numerical factor, whose value depends upon the sizes and shapes of the two circuits, upon their positions with respect to each other, and upon the nature of the medium (air, oil, or whatever it may be) in which they are placed.

If a pair of circuits, A and B, are near each other, and A is carrying a constant current of intensity C_1, while B is carrying a constant current of intensity C_2, then the displacement of either circuit, relatively to the other, would cause induced currents to flow in both; and hence (in general) neither circuit can be moved without the energy of the system being affected. The difference between the energy of a pair of coils that are near together, and the energy of a similar pair of coils that are conveying identically the same currents but are infinitely remote from each other, is equal to MC_1C_2, where M is a numerical factor whose value depends upon the sizes and shapes of the two circuits, upon their relative positions, and upon the medium in which they are placed. The factor M is called the "coefficient of mutual induction" of the pair of circuits.

The various parts of a single circuit act upon one another inductively, just as separate circuits do; and a circuit that is wound upon a spool, or otherwise coiled so that its parts come near together, possesses greater energy than the same circuit would have, if it was not so coiled. This fact is expressed by saying that every circuit has a certain amount of "self-induction." The energy that a circuit possesses in virtue of its self-induction is proportional to the square of the current that it is carrying, and to a certain numerical constant called the "coefficient of self-induction," whose value depends upon the size and shape of the circuit, and upon the medium in which it is placed. Like the coefficient of mutual induction of a pair of circuits, the coefficient of self-induction of a single circuit can be computed, for certain simple cases, by methods given by Maxwell, in his 'Treatise on Electricity and Magnetism'; but in the general case the computation is exceedingly difficult, and altogether impracticable; so that the values of these coefficients for given circuits are usually determined experimentally, except when a very rough estimate will serve.

The general subject of induction is essentially mathematical in its character, and cannot be properly explained nor understood without the use of the calculus. Consult Nipher, 'Electricity and Magnetism'; Maxwell, 'Treatise on Electricity and Magnetism.' See also the articles ELECTRICITY and MAGNETISM, in this encyclopedia. A. D. RISTEEN, PH.D.,

Induction Balance, in physics, an apparatus designed for detecting the presence of fragments of metal, or for studying the electrical conductivity of metals. It consists essentially of four coils of fine wire, an electric battery, a circuit breaker, and a telephone. Let the coils be designated, respectively, by the letters A, B, C and D; A being similar to B in all respects, and C being likewise similar to D. Coils A and B are placed in circuit with the battery, and coils C and D are placed in circuit with the telephone. The coils are disposed in pairs, A being placed near C, and B near D. If the current through A and B is rapidly interrupted, an induced current will, in general, flow through C and D, at each make and break; its presence being indicated by the sounds that it produces in the telephone that is in circuit with C and D. It is possible, however, to dispose the coils and their connections so that the current that A induces in C shall be sensibly equal and opposite to that which B induces in D. When the balance is perfect, no sound will be heard in the telephone. If a piece of metal be now brought near the coil A, the intermittent current in A will induce currents in the mass of the piece of metal, and these, in turn, will act upon the coil C, producing induced currents in this coil which are not compensated by similar currents in D. The loss of balance will be at once indicated by the recurrence of sounds in the telephone; and in this way the metal fragment will betray its presence. The induction balance has been used successfully for locating bullets in the human body. When applied for this purpose to President Garfield, however, it failed to give any useful indications,— owing, it is said, to difficulties of manipulation due to the presence of metal in the mattress upon which he lay. The instrument is so sensitive that if it is balanced with a genuine coin near one of the coils, and the genuine coin is then replaced by a counterfeit imitation, the telephone at once betrays the substitution. The intensity of the sounds produced in the telephone depends not only upon the size and position of the disturbing piece of metal, but also upon its specific electrical resistance; and hence the balance may be used to compare the specific resistances of metals.

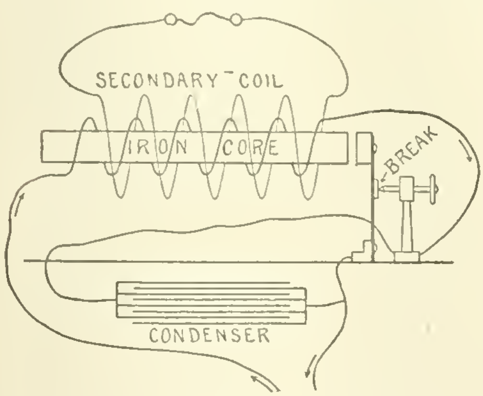
Induction Coil, an electrical instrument used for the production of high potentials, and depending for its action upon the fact that induced currents are generated in a circuit, when the strength of the magnetic field to which the circuit is exposed is varied. (See INDUCTION.) The essential features of the instrument are represented, diagrammatically, in the accompanying cut. A soft iron core is surrounded by two



coils of wire, one outside of the other. The outer coil is the one in which the high tension induced currents are produced; it is called the "secondary coil," and is not in direct electrical connection with any other part of the instrument. The inner coil, which is called the primary coil, is wound close to the iron core, and is connected to a battery, so that when the current from the battery is flowing, the primary coil causes the iron core to become magnetised. As is explained in the article INDUCTION, no current is generated in the secondary coil, so long as the magnetism of the iron core remains constant; but whenever the magnetism of the core increases or diminishes, a current is produced in the secondary. A device called a "break" or "interrupter" is therefore provided, so that the magnetism of the iron core may be rapidly established and destroyed. The commonest form of interrupter is that indicated in the cut, which does not call for special explanation, since it is used in electric bells and other simple forms of electrical apparatus. The Wehnelt electrolytic interrupter is greatly in favor among physicists, however, and is now often used in connection with induction coils, especially when they are to be run with the commercial current used for incandescent lighting, where the potential difference that is used is something over 100 volts. In the Wehnelt interrupter the primary coil on the iron core is made of a few turns of relatively thick copper wire, its purpose being solely to effect the magnetisation of the core; but the secondary coil, in which the induced currents are generated, is made of fine wire, and in order to multiply the inductive effect as far as possible, the secondary is made of great length, often containing many miles of wire. In the celebrated Spottiswoode coil the secondary contained no less than 280 miles of wire. The primary coil, being wound directly upon a soft iron core, commonly has a very considerable amount of self-induction, so that when the circuit is broken by the interrupter the current does not suddenly cease, but continues to flow across the interval at the break for an appreciable fraction of a second, as is readily seen by the strong sparking that occurs at the moment of interruption. In order to reduce the sparking as far as possible, a condenser of suitable capacity is provided, so that when the break is made in the circuit, the "after-current" due to the self-induction of the primary can discharge into the condenser, instead of passing across the break in the circuit and causing a spark. The condenser causes the interruption of the current in the primary coil to be much more sudden, and it materially increases the potential that is developed in the secondary coil, since this is proportional to the rate of variation of the magnetism of the core, and is much greater when the magnetism falls off abruptly than when it persists for an appreciable fraction of a second after the break has been made.

The induction coil was brought into something like its present form by Ruhmkorff, and is frequently known, in consequence, by his name. Improvements in the winding of the secondary coil were introduced by Ritchie, of Boston, about 1857. Ritchie's most important improvement consisted in disposing the secondary wire in sections, which were so related to one another that the risk of internal disruptive discharge through the coil itself might be reduced to a minimum. Induction coils are very generally used in studying the discharge of electricity through gases, for exciting x-ray tubes, and for producing high potentials required in wireless telegraphy. Induction, Mathematical. Despite the age-long tyranny exercised by the Aristotelian logic — a tyranny having, at least in the domain of science, scarcely a match except in the case of Euclid's elements — the forms of thought, those diagrammatic representations of the orderliness of the reasoning processes, sustain to-day perhaps even greater interest than ever before (see SYMBOLIC LOGIC). The mathematician's interest in these forms is two-fold, attaching to them both as norms for testing the validity of arguments and as constituting exceedingly subtle matter for mathematical investigation.

Of all argument forms, there is one which, viewed as the figure of the way in which the mind gains certainty that a specified property belonging but not immediately by definition to each element of a denumerable (see ASSEM-

BLAGE THEORY) assemblage of elements does so belong, enjoys the distinction of being at once perhaps the most fascinating, and, in its mathematical bearings, doubtless the most important, single form in modern logic. This form is that variously known as reasoning by recurrence, induction by connection (De Morgan), mathematical induction, complete induction, and Fermatian induction — so called by C. S. Peirce, according to whom this mode of proof was first employed by Fermat. Whether or not such priority is thus properly ascribed, it is certain that the argument form in question is unknown to the Aristotelian system, for this system allows apodictic certainty in case of deduction only, while it is the distinguishing mark of mathematical induction that it yields such certainty by the reverse process, a movement from the particular to the general, from the *finite* to the *infinite* (see ASSEMBLAGE THEORY).

Of the various designations of this mode of argument, "mathematical induction" is undoubtedly the most appropriate, for, though one may not be able to agree with Poincaré (see *Bibliography* below) that the mode in question is *characteristic* of mathematics, it is peculiar to that science, being indeed, as he has called it, "mathematical reasoning par excellence."

The nature of mathematical induction as it is ordinarily understood may be made clear by an example. Perhaps the simplest application of the method is found in the proof of the theorem:

$(\alpha)\quad 1+2+3+\ldots\ldots+n=\frac{1}{2}n(n+1)$

where n denotes any positive integer whatever. Suppose it ascertained by observation or otherwise that

$(1)\quad 1+2=\frac{1}{2}2(2+1)$,

$(2)\quad 1+2+3=\frac{1}{2}3(3+1)$.

Facts (1) and (2) justify the *suspicion* that (α) may be a fact. The proof by mathematical induction that (α) is indeed true runs as follows: It is *assumed* that (α) is true for some definite but unspecified integer n. Then by adding $n+1$ to each member of the assumed equation, n having the same meaning as in the assumption, one finds that

$$(\beta)\quad 1+2+3+\ldots\ldots+n+n+1 = \tfrac{1}{2}(n+1)(n+2).$$

So it is seen that, if (α) *be* true for *some* integer n, it *is* true also for the *next* greater integer $n+1$. But by (2), (α) is true when n is 3: it is, therefore, true for $3+1$, or 4: therefore, for $4+1$, or 5. The argument is then usually closed by saying "and so on, hence (α) is true for any integer whatever," or by an equivalent speech. The reader will recall that the binomial theorem, the Newtonian expansion of $(a+b)^n$, where n is any positive integer, is justified in essentially the foregoing manner. Numerous other examples of propositions similarly established may be found in the better recent text-books of algebra.

The nature and the role of the foregoing *etcetera*, "and so on," demand consideration. Without it, the argument as stated seems obviously incomplete. But how is the *etcetera* to be logically justified? By reference to some axiom or principle of thought? If so, what? Or can the phrase be in some way dispensed with without damage to the argument?

Before attempting to answer them it may be well to show the inevitableness of the questions by a further analysis. Suppose it established, in regard to some property p (where, for example, p might signify the validity of the binomial theorem for some integral exponent): (1) that p belongs to the integer 1, that is, referring again to the mentioned example, the theorem is valid for the exponent 1; (2) that, *if* p belong to an integer n, it belongs to $n+1$. Propositions (1) and (2) furnish the means of generating, one after another, a sequence of syllogisms by which one proves first that p belongs to 2, then to 3, then to 4, and so on. Note that in order to ascertain by this analytic (syllogistic) method whether p belongs to a specified integer m, it is necessary to determine in advance the same question for each of the integers 2, 3, ..., $m-1$, in the order as written, a process requiring a number of syllogisms which is greater the greater the number m. Accordingly *this* method, of successive deductions, is not available for determining whether p belongs to each in the (infinite) *totality* of integers. Equally powerless to that end is experience (including observation), for this can take account of the individuals of a finite assemblage of objects at most. Either analysis or experience may avail if a sequence be finite, but if it be infinite both must fail. Not less vain is it to invoke finally the aid of induction as the term is understood and employed in the physical sciences, for this latter, resting upon a purely assumed order in the external universe, is confessedly *inductio imperfecta*, and, being such, can yield approximate certainty only.

Nevertheless, despite the inadequacy of the means mentioned, as soon as hypotheses (1) and (2) are admitted and the indicated sequence of deductions is *begun*, "the judgment imposes itself upon us with irresistible evidence" that p is a property of *all* the integers. Why? That is, how justify the "and so on"? It appears to be clear that the answer must be the adduction or invocation of an additional presupposition of formal thought, a presupposition whose formulation shall mark a conscious extension of the domain of logic by affirming as axiomatic that apodictic certainty can and does transcend every limited sequence of deductions or observations. Such presupposition, which may be called the axiom of infinity, is stated by Poincaré, in answer to the foregoing question, "why," as follows: "It is the affirmation of the power of the mind which knows it is capable of conceiving the indefinite repetition of a same act as soon as this act is found to be once possible." The act or operation, which can not indeed be indefinitely repeated, but which by the axiom can be conceived as so repeated, is, in the present case, the construction of the syllogisms of the sequence above mentioned.

The *etcetera* in question is capable of justification without appealing, apparently at least, to the axiom of infinity, namely, by use of the so-called indirect method of proof, the method known as *reductio ad absurdum*. Thus let it be *supposed* that the argument sought to be indefinitely extended by means of the phrase "and so on" does not admit of indefinite extension along the ordered sequence of integers. There will, then, be a first integer, say $m+1$, for which the property p fails. As, by hypothesis, $m+1$ is the first integer for which p fails, p belongs to the preceding integer m; but since p belongs to m, it also belongs, by (2), to $m+1$. Hence the supposition that the argument does not admit of indefinite extension is false; and the conclusion is obvious. This procedure is convincing, but it is plainly less a natural completion than an "unindicated" fortification of the process it supplements. It is, besides, not entirely clear that the axiom of infinity is not surreptitiously subsumed by it.

By far the most penetrating investigation of the nature of mathematical induction was made originally by Richard Dedekind (see *Bibliography* below). His procedure and result are, in brief, as follows: Let S denote a system of elements (things of any kind) such that there is a scheme or law ϕ of depiction by which S may be depicted upon itself, that is, a scheme by which each element e of S may be thought as corresponding to one and but one element e' of S and so that no two elements of S shall be thought as corresponding to a same element of S. The correspondent e' of e is called the picture or image of e. Every part of S (including S itself as a special case) thus depicted upon itself is named *chain under* ϕ. Denote by A an arbitrary part of S and by A_0 the assemblage of all the elements common to all the chains (in S) that contain A. It is obvious that, S and ϕ being given, there is one and but one A_0 for a given part A of S. A_0, which is easily seen to be itself a chain, is described as the *chain of A under* ϕ. Now let Σ denote an assemblage of elements. Dedekind proves the following

Theorem.—*In order to prove that A_0 is part of Σ it is sufficient to prove: (1) that A is part of Σ; and (2) that, if an element of A_0 belong to Σ, the image of that element belongs to Σ.*

Dedekind's proof, simplified, runs thus: Let $A_0 = A_1 + A_2$ where A_1 denotes the assemblage of all those elements of A_0 that belong to Σ. By (2), A_1 is a chain, and, by (1), contains A. Hence, by definition of A_0, A_2 has no element, whence $A_0 \equiv A_1$. Such is the beautiful and marvelously fundamental theorem which its author characterizes, perhaps a little extravagantly, as "the scientific basis" of mathematical induction. It is at any rate *a* basis, and by virtue of it, as shown below, proof by mathematical induction need have no recourse to an *etcetera* consisting of an endless sequence of syllogisms.

It will be instructive to apply Dedekind's theorem to the *completion* of the proof by mathematical induction of the binomial theorem

$$(\alpha) \quad (a+b)^n = a^n + na^{n-1}b + \cdots\cdots\cdots$$

for positive integral exponents. Let it be granted that

$$(\beta) \quad (a+b)^1 = a+b,$$

and supposed it established in the usual way that, (γ), if (α) be valid for some integer, as $n-1$, then it is so for the next, n. Denote by S the sequence of integers,

$$S \equiv 1, 2, 3, \ldots\ldots, n-1, n, \ldots\ldots,$$

by ϕ the scheme by which each number in S except 1 is the image of its predecessor, and let A be 1. Then A_0 is S identically. Let Σ denote the assemblage of positive integers for which (α) is valid. The reader will now observe that Dedekind's theorem enables one to prove by a *single* stroke, so to speak, that (α) is valid for all positive integers. For, by (β), (α) is valid for 1, that is, A is part of Σ and (1) is satisfied; and, as A_0, or 1_0, is S, it follows from ( ) that (2) is satisfied; γ hence S is part of Σ.

With the modern increasing interest in the philosophy of mathematics, mathematical induction has steadily gained in interest and acknowledged importance. Certain questions respecting its presuppositions and field await definitive answers. It is agreed that every argument by mathematical induction is a mathematical argument, no matter what the subject-matter, but there is difference of opinion as to whether every mathematical argument is mathematical induction either in terms or in disguise. Were this converse true, mathematics (see Mathematics) would be definable in terms of this mode of ratiocination. This and kindred questions are considered in the works cited below.

Indulgence. An indulgence is a partial or total remission by the Church, through an extra-sacramental channel, of the temporal punishment due for sin after its guilt and eternal penalty have been removed by the sacrament of penance. The theological basis upon which the doctrine rests is that all the acts of Christ, the God-Man, were of infinite value, that the acts of the Saints are his acts because vivified by divine grace, and from this treasury of divine, supereminent merit the Church is able, so to speak, to pay the debt of temporal punishment for the repentant sinner.

Certain cardinal principles of Catholic life are requisite to obtain a correct idea of the Catholic doctrine of indulgences. Growth and adaptation have characterized the Christian organism from the Apostolic Council of Jerusalem to the Œcumenical Council of the Vatican. The development of doctrine upon which such explicit emphasis was laid by the late Cardinal Newman, is of prime significance for the student who would institute a comparison between the teaching and practice of the Church in the matter of indulgences at the present day and during apostolic times. We may observe in passing that the principle of doctrinal development is in perfect harmony with the scientific spirit of the present age. Growth and adaptation are now believed to be distinguishing features of every living and progressive organism. We should not, therefore, expect to find the Catholic system of indulgences, in all its complex details, flourishing in the primitive Church. In harmony with the law of development, essential to every organization among men, we believe that the Church's "proud boast of *semper eadem*" is not defeated by calling attention to the richness, variety, and flexibility of the outer forms of its polity and liturgy, or to the varying emphasis given to special dogmas in the course of its history, in response to the needs of particular eras. Unity in diversity is the Church's most appropriate motto. The doctrine and practice of indulgences, therefore, which obtain throughout the Catholic world at the present time must be sought for only in germ in Sacred Scripture and in the practice of the primitive Church, just as the bole, the branches, and the foliage of an oak tree, "the monarch of the forest," existed potentially in the acorn from which it sprung.

Indulgences being the remission of the temporal punishment due to sin, the interpretation of their true character should start from the Christian idea of the nature and purpose of punishment. It is therefore strange that writers of all schools of opinion concerning indulgences should fail to correlate the two concepts. At the present day the conviction prevails almost universally among non-Catholic students of penology that punishment is exclusively disciplinary and correctional. No theory could be more alien to the spirit of the entire Old Testament or to the mind of the early Christian Fathers. The inflexible and rigorous justice of God making death the wages of sin, appears in almost every page of the history of his covenant with Israel. The New Testament, founded on the atonement by Christ, only mitigates this view by impressing on the minds of men the possibility of vicarious satisfaction for their transgressions. But although Christ's atoning and vicarious sacrifice was all-sufficient in itself, or objectively considered, to satisfy the offended justice of his Heavenly Father, nevertheless the Christian economy of redemption demands each individual's co-operation at every stage in order to appropriate Christ's merits and make them subjective to himself. The opposite view (that is, the belief), that the creature has no active part in his sanctification and salvation, inclines toward Pantheism, robs good works and the Christian sacraments of genuine value, and differentiates the Lutheran from the Catholic position. According to Catholic teaching, the guilt of sin is cleansed from the soul by the application of the merits of the precious blood of Christ through the instrumentality of the Sacraments, whose efficacy, in the case of adults, depends on the subjective disposition of the recipient. The eternal punishment due to sin disappears with the guilt to which it is annexed. But, besides having these supernatural and eternal relations and consequences, sin viewed even within the circumscribed limits of man's natural life on earth, is an act of treason against God in his own kingdom involving forfeiture of all rights to life and all the good things with which God's providence has so bountifully enriched it. This temporal consequence of sin calls for a temporal reparation. The canonical penalties therefore imposed in the Church during the first centuries were intended to pay this temporal debt to the Divine justice, and were not merely disciplinary or correctional; and the sinner, in submitting to them, or in seeking mitigation from them through the intercession of the martyrs, recognized the necessity of his own personal act to satisfy the justice of God, either directly or vicariously by appropriating through the charity of the Church the superabundant merits of Christ and his Saints.

An indulgence granted to the living is an act of jurisdiction, or exercise by the Church of the power of the keys conferred on it in the well-known words of the Gospel of St. Matthew: "And I will give to thee the keys of the Kingdom of Heaven, and whatever thou shalt bind on earth, it shall be bound in Heaven, and whatever thou shalt loose on earth, it shall be loosed in Heaven." Every Church, in so far as it is a visible organization, claims in some degree a power of the keys, that is, the right to admit or exclude members — to determine fellowship. But the antithesis so emphatically expressed in the text between Heaven and Earth proves that the kingdom of Heaven there spoken of is more comprehensive than the visible Church of Christ. It is proclaimed that the power of binding and loosing on earth bestowed upon the apostles and their successors, is ratified in its every act by the supreme tribunal of God in the Church triumphant. In accordance with a well-known principle of Catholic exegesis, the best interpretation of a text of Sacred Scripture is furnished by the universal tradition of the Church from the age of the Apostles to the present time.

St Paul, in his epistles to the Corinthians, describes how he imposed punishment on the incestuous Corinthian and how he subsequently remitted it. The penalty was not merely an ecclesiastical censure of excommunication inflicted primarily for the purpose of safeguarding the flock of Christ. The Apostle expressly states that the chief motive which actuated him was anxiety for the individual salvation of the transgressor. Nor could it have been (as has been already shown) a mere disciplinary measure to impress upon the sinner the gravity of his crime or to test the sincerity of his repentance. Having no organic relation to confession, whether public or private, and no expressed or implied connection with perfect contrition, it was not a part of any conceivable Christian ordinance for the remission of the guilt and eternal punishment of sin. According to Catholic reasoning, it was therefore an exercise of the power of the keys by the Apostle to remit a temporal debt due to God for the offense; and since, according to universal Jewish and Christian belief, the Divine Justice rigorously demanded either direct or vicarious satisfaction, the Apostle could only concede that "indulgence" by appropriating to the individual sinner the superabundant merits of Christ and the Saints out of the treasury of the Church.

It will be observed that the Apostle of the Gentiles granted the first recorded indulgence in the form of an absolution. Indulgences usually took this form in the primitive Church. The early Fathers frequently refer to their being thus conceded by bishops on the presentation of a "Libellus Supplex" given to the penitent by some Christian martyr on the eve of suffering an heroic death for Christ. It is interesting to note that the present practice of never granting those favors except to persons who are in full communion with the Church, and who have received the Sacrament of Penance, was substantially insisted upon by St. Cyprian. He demands that the martyrs should not grant "Libelli" except to persons who had abandoned their sinful career and given ample evidence of heartfelt contrition and sincere conversion. Indulgences in the first centuries of the Church having implied a diminution of the period of canonical punishment (the name by which this act of leniency was then known was φιλανθρωπία.) (vide Conc. Ancyra, can. 5; Cfr:Hefele, Conciliengeschichte), such expressions as an indulgence of seven years and seven quarantines came into use. An indulgence of seven years means the condonation of as much of the temporal debt due to God for sin as canonical punishment extending over seven years would atone for. Likewise an indulgence of seven quarantines connotes a canonical punishment extending over seven Lents.

We find in the writings of St. Augustine reference to the remission, in return for almsgiving, of temporal penalties imposed for minor ecclesiastical offenses. Thus there gradually grew up the custom of granting indulgences under the form of commutation. Under this form they were especially conspicuous during the period of the Crusades. Every person who confessed his sins in a sincere and contrite spirit, received Holy Communion and joined the Crusade for liberating the holy places from the infidels was declared to need no other penance. "*Iter illud pro omni Poenitentia reputetur*" was one of the decrees of the Council of Clermont, held under Urban II. in the year 1095. The system of commutation for almsgiving afforded opportunity for abuse, as was evident in the practice of "farming out" to laymen the collection of alms in return for indulgence. Thus, for example, in the case of the famous indulgence granted by Leo. X., in 1517, to the Catholic faithful on condition that they would contribute to the completion of St. Peter's basilica in Rome, the right of collecting the money was conferred, in the first instance, on Albert, bishop of Maintz, and then sold by him to an Augsburg banker. Circumstances like these gave occasion to the Protestant party to charge the Church with the "sale of indulgences." Cardinal Pallavicini, the celebrated Jesuit historian of the Council of Trent, does not hesitate to say that if Leo X. had been surrounded by able theologians and enlightened by their counsels he would have proceeded more cautiously in dispensing indulgences. However, it should in justice be recognized that the erection of St. Peter's in Rome, the ancient capital of the Christian world, was an enterprise of the deepest interest to every member of the faithful. Together with the incidental abuses connected with commutations, other circumstances combined to inspire disaffection for the Holy See in the minds of European rulers and their dependents; and, as in the case of every revolution fed by prolonged and deeply-rooted discontent in the minds of those who control public opinion, a spark sufficed to start the conflagration. The life of Luther recently published by the Rev. Heinrich Denifle, O.P., and the abundant controversial literature which it has called forth from the ablest Protestant historians and theologians of Germany, have proved that the first Apostle of the Protestant Reformation was an epoch-maker by reason of conditions, not because he possessed in any high degree the qualities of the *Uebermensch*. Yet the nailing of his ninety-five theses on the doors of the castle church of Wittenburg in protest against the indulgence granted by Leo X., and preached by Tetzel, sub-delegate of Albert, bishop of Maintz, set all Europe aflame and destroyed the dogmatic unity of Catholic christendom.

Opposition to the doctrine of indulgences arose at different times, not because of their alleged novelty or repugnance to the religious sense of the Christian people, but because they did not always approve of the object for which alms were obtained by the preaching of indulgences, or because of the personal defects of those entrusted with their promulgation. It should be distinctly noted that these purposes were not always strictly religious. They were frequently philanthropic, such as the construction of bridges, the erection of hospitals, etc., and in such cases received the unqualified approval of princes and people. In order to comprehend the outburst which Luther was able to evoke against the indulgence granted by Leo X. we must bear in mind, besides the questionable motives that are alleged to have partly inspired the action of that pontiff, also the bitter memories that tarried in the minds of European monarchs after their defeat on the question of investitures, and the death-blow dealt thereby to the feudal system. The entire antipathy aroused, for this and other reasons, against the Holy See in the time of Leo X. found vent in the attack initiated by Luther on indulgences.

An Indulgence may be acquired directly by the living and applied by them, with the consent of the Church, to the souls of the faithful departed. All Catholic theologians are unanimous in the opinion that an indulgence should not be granted without grave and substantial reasons, since the ordinary Christian economy demands that each individual should make personal reparation for the temporal debt due for his sins. Moreover, in order to participate fruitfully in an indulgence, certain conditions and dispositions are necessary on the part of the subject. He must be in the state of grace, have a genuine desire to gain the indulgence, and perform certain acts prescribed by the Holy See.

The application of indulgences to the dead is not a juridical act of the Church, whose jurisdiction is limited to the members of the militant or visible Church on earth. Remission of the temporal debt due to God for sin by the suffering members of Christ's mystical body in Purgatory is communicated to them by the Church by way of suffrage or supplication. In other words, she authorizes the living to join their petitions with hers that God may graciously accept the indulgences which they gain and in the measure in which they gain them, in behalf of the souls of the faithful departed. Indulgences are now dispensed partly by way of absolution and partly by way of commutation. The well-known distinction between partial and plenary indulgences should be understood in an objective sense. The degree in which any indulgence is actually gained or subjectively appropriated by the individual depends on his subjective disposition, according to the theological maxim: whatever is received is received according to the measure of the recipient. The most solemn of all plenary indulgences is that which is granted on the occasion of a jubilee such as that which was proclaimed for 1904 by His Holiness Pius X to mark the 50th anniversary of the definition of the Immaculate Conception by Pius IX.

THOS. E. JUDGE, S.T.P.,

Formerly Professor of Mental and Moral Philosophy, St. Patrick's College, Maynooth, Ireland; afterward Professor of Dogmatic Theology in The Saint Paul Seminary, Saint Paul, Minn. Editor of 'The Catholic Review of Reviews.'

Indulgence, Declaration of, the proclamation issued in 1687 by James II. of England by which he sought to relieve his subjects from observing laws opposed to their consciences. As the persons then suffering most from the laws were Roman Catholics, and as the laws would leave them free to worship according to their consciences, the proclamation was opposed by many king's subjects. Seven bishops of the Church of England refused to order their clergy to read the king's proclamation. Charles II. issued two similar indulgences in 1662 and 1672, both of which were unpopular with the people outside the Roman Catholic Church.

In'dus (Sanskrit, *Sindhu*), the chief stream of the northwest of India, and one of the great rivers of the world. It has a length of about 1,900 miles, and drains an area of more than 300,000 square miles. It rises in Tibet on the north of the Himalaya Mountains, nearly 100 miles northwest from the sources of the upper Brahmaputra (q.v.), on the north side of the mountain mass of Kailas, 18,000 feet above sea-level. In the upper part of its course it takes a northwesterly direction along the northern foot of the main Himalayan range, enters the Kashmir territories, passes through Ladak, below the capital of which, Leh, it receives the Zanskar, farther on the Dras, after which it enters Baltistan. Here it receives, on the right, the Gilgit, from a glacier of the Karakoram, the largest tributary that joins it in the Himalayan regions, and takes the name of Indus or Sind. About 100 miles below this it takes a sudden bend toward the southwest, and after a course of about 180 miles more in this direction it leaves the loftier regions. At the British fortress of Attock in the Panjab — where it is crossed by a great railway bridge carrying the line to Peshawar — it is joined by the Kabul from Afghanistan, and here, 950 feet above the level of the sea, it is nearly 800 feet wide and from 30 to 60 feet deep according to the season. For the rest of its course (about 900 miles) it continues its southwesterly direction till it enters the Indian Ocean. At Kalabagh, 110 miles below Attock, it has a breadth of over 1,400 feet. Arriving in the low-lying country, its waters become charged with mud, and in the rainy season, and by the melting of the snow in the mountains, it overflows its banks. Near Mithankot it receives on the east the Panjnad, or united stream of the Five Rivers of the Panjab. Below the confluence it has a width of over 1,900 yards when the water is low. In Sind it gives off several extensive arms or canals, which are of great value for irrigation; and below Hyderabad it divides into a number of shifting mouths or estuaries, the most navigable of which is at present the Yatho mouth. The delta, formed by the enormous amount of alluvium brought down by the river, has a coast-line of about 130 miles, and the point or head of it at Tatta is 70 miles from the sea. The tide rises to this distance. The Indus loses much water from passing through dry and desert regions, and much is also drawn off for irrigation; accordingly it brings down much less water to the sea than the Ganges. Vessels drawing more than seven feet of water cannot generally enter any of its mouths; but steamers of light draft ascend from Hyderabad to Multan. A railway ascends the valley of the Indus from the important port of Karachi to Peshawar.

Industrial Commission, a non-partisan body authorized by Congress on 18 June 1898, to investigate the subjects of "immigration, labor, agriculture, manufactures, and business" in the United States, with the utmost fairness to both capital and labor, and report to Congress with suggested legislation, as a basis not only for national law and administration, but for uniformity of State laws. It was empowered to administer oaths in order to obtain sworn testimony, and send for persons and papers, as well as (by a supplementary act) to purchase relevant literature up to $1,500 a year. The members were to be five Senators appointed by its president, five Representatives appointed by the Speaker, and nine private gentlemen appointed by the President and Senate, fairly representing different industries and branches of national life. Originally appointed for two years, the term was extended to 15 Dec. 1901, and then to 15 Feb. 1902, the last report being dated the 10th. The actual work was done by the private members, who employed 27 experts on the various lines, and examined nearly 700 witnesses; making a report in 19 volumes, of the highest value from the unmatched thoroughness and authoritativeness of the view on every side of our industrial system brought out, and the competence of the witnesses, who represented all grades, from heads of trusts to presidents of colleges, and from lawyers to heads of trade unions, leaving no field untouched. The commission also digested a vast amount of facts from judicial decisions and official documents. The private commissioners were A. L. Harris, S. N. D. North (successor Albert H. Clarke), Ellison A. Smyth (successor D. A. Tompkins), J. M. Farquhar, E. D. Conger, T. W. Phillips, C. J. Harris, M. D. Ratchford (successor C. H. Litchman), J. L. Kennedy. The experts were on warehouse and grain inspection laws, immigration (two, statistics and labor questions), agriculture (four, distribution, labor, speculation, and taxation), labor organizations, prison labor (two), railroad labor, Asiatic labor, strikes, and arbitration, trusts, transportation (two), railroad legislation, taxation of corporations (two), domestic service, pure-food legislation, mining industries, mining labor legislation, tobacco industries, mechanical progress, besides advisory counsel and expert indexing.

Indus'trial Corporations in the United States, include the large number of trusts, or industrial combinations formed between 1890 and 1903. As the individual or private business firm gradually gave way to the limited partnership, so the limited partnership in turn practically yielded to the general corporate form of doing business, especially in respect to manufacturing which followed the general tendency of business toward consolidation. This was a natural result of the rapid growth of capital, which consolidated for its own benefit. In this development some of the earlier and larger trusts undoubtedly played a very prominent part, creating a precedent, setting an example, as it were, notably the Standard Oil trust and the Sugar trust, both of which have been in corporate form for some years. They were the pioneers in consolidation of manufacturing interests, but compared with the more recent United States Steel Corporation, with its capital of more than a billion dollars, they are but pigmies. The great majority of these combinations have capitalizations in excess of $5,000,000 each, while only a very few are capitalized at less than $1,000,000. Many of these manufacturing combinations practically control a very large proportion of the entire business of the country in their particular lines and are ever extending that control to other countries.

The most notable feature in the increase in the industrial growth of the United States from 1883 to 1903 is in the iron and steel industry, in which the production is nearly six times greater than it was at the beginning of that period. The total quantity of pig iron and steel produced in 1882 was 5,360,015 tons. In 1892 the quantity was 14,084,581 tons, and in 1902 it had increased to 31,255,595 tons. The increase in the production of pig iron in 1892 over 1882 was 98.99 per cent; and in 1902 over 1892 it was 49.18 per cent. The increase in the annual production of steel, however, was much greater in proportion. In 1892 it was 183.38 per cent greater than in 1882, and in 1902 it was 174.34 per cent greater than in 1892. Among the advantages of the corporate form over individual ownership which so largely tend to the advantage of consolidations of capital and the supplying of the demand for greater facilities for its employment in industrial fields is the fact that, while stockholders die, the corporation can go on forever. The ownership of these corporations is divided among hundred of thousands of individual stockholders, who are liable only for the amount of their stock, and which can be transferred without affecting the corporation or its liability and without any trouble. The number of stockholders of four of the largest corporations, for instance — namely, the United States Steel Corporation, the American Sugar Refining Company, the Amalgamated Copper Company and the Standard Oil Company — number about 100,000 persons.

The census of 1900 gave the statistics of industrial corporations (first table below):

In 1902 these figures had materially increased, there being 213 industrial combinations or trusts with a capital of $6,639,019,304, but even these figures are far from the estimates made in 1903 by Moody (Manual of Corporate Securities) who places the total capital at $9,000,000,000, and who states that the railroad consolidations would increase this to $15,000,000,000.

The United States Steel Corporation, the largest of the trusts, and its competition are marvelous examples of the "combination" plan of capital. The following are the figures for 1902 (see second table below):

Industrial Education. — The industrial growth of the country created a demand for higher instruction in commercial subjects which soon led to the establishment of separate institutions devoted exclusively to such instruction. For details see AGRICULTURAL EDUCATION; ARCHITECTURE, EDUCATION IN; COMMERCIAL EDUCATION; CORRESPONDENCE SCHOOLS; EDUCATION: ENGINEERING; INDUSTRIAL; PROFESSIONAL, IN AMERICA; SCIENTIFIC AND TECHNICAL; ENGINEERING, CIVIL; ENGINEERING, MECHANICAL; INDUSTRIAL TERMS; LAW, AMERICAN SCHOOLS OF; MANUAL TRAINING; MEDICAL EDUCATION; PAINTING, EDUCATION IN; SCULPTURE, EDUCATION IN; TECHNICAL EDUCATION; TECHNOLOGY, SCHOOLS OF; TRADE SCHOOLS; ETC.

No. of Co.'s.	INDUSTRIES	No. of plants controlled	Capital issued	
			Stocks	Bonds
40	Iron and steel companies	489	$763,806,295	$20,614,000
21	Food and allied products	277	277,618,300	12,725,900
14	Chemical products	295	278,357,295	9,294,000
11	Metals other than iron	113	203,505,600	8,565,000
28	Liquors and beverages	258	193,301,158	55,529,142
6	Vehicles (land)	72	189,680,000	10,300,000
4	Tobacco	41	197,184,628	....
8	Textiles	72	109,514,175	36,944,000
5	Leather	108	184,015,200	13,805,000
7	Paper and printing	119	130,006,500	42,461,217
15	Clay, glass and stone, etc.	203	63,896,858	5,567,500
8	Lumber, etc.	59	39,534,400	275,000
16	Miscellaneous industries	97	238,367,700	332,000
183	Total	2,203	$2,268,788,109	$216,412,759

SUMMARY	Capital Authorized	Capital Outstanding
United States Steel Corporation proper	$1,404,000,000	$1,319,560,000
Underlying securities of 26 controlled properties	90,435,656	68,478,656
Securities of 3 companies controlled in the interest of the United States Steel Corporation	139,250,000	131,250,000
Securities of 4 companies operated in harmony with United States Steel Corporation	118,686,200	86,661,000
Grand total	$1,752,371,856	$1,605,949,856
Securities of 32 of larger competitors of United States Steel Corporation	452,164,600	385,740,100

Industrial Terms. The following list embraces many of the important terms that are used technically in the several commercial industries. Such terms as are usually regarded as self explanatory, as well as those that have no general application, have been omitted. Those that are of more than ordinary importance will be found defined more fully under their appropriate heading.

Abandonment.— A term used in marine insurance to denote that all property saved has been relinquished to the underwriters in order that the insured may claim indemnification for a total loss.

Abb.— In wool-sorting the quality of the wool is denoted by the terms: "fine abb," and "coarse abb."

Abordage.— A term used in marine insurance. If a collision between two vessels happens on the open sea and the damaged ship was insured the persons insuring her must pay the loss, although they are entitled to relief at civil law against the party causing the damage.

Acceptance.— A term usually used, in marine insurance, in cases of abandonment. It is this process which perfects the rights of the insured in the recovery of his loss.

Actuary.— An officer of an insurance company whose skill in the application of the doctrine of chance to financial affairs enables him to make the computations necessary to determine the valuation of contingent liabilities, as shown in the compilation of tables, the computation of risks, etc.

Agreement.— In insurance the contract issued prior to the delivery of the official policy is known as the "agreement."

Annealing.— The process of treating substances by heat to remove their brittleness and yet make them tough and inclined to be elastic.

Annuity.— A fixed amount paid each year, whether in one sum, or periodically, in installments. When an annuity is continued for a specific number of years it is termed a "certain" annuity. If the period of its continuance is uncertain it is called a "contingent" annuity. When payment has already commenced it is an "annuity in possession," but when such payment does not begin until a specified period has elapsed, or a definite event has taken place it becomes known as a "reversionary" or "deferred" annuity.

Amount of Loss.— An insurance term denoting the diminution or destruction of the values of, or of the charge upon, the insured by the direct consequence of the operation of the risk incurred, according to its value in the policy.

Assessment.— In insurance, an assessment is made (1) as an apportionment in general average upon the articles at risk for contribution for damage and sacrifices purposely made for escape from impending peril, and (2) also upon premium notes given by members of mutual companies as a substitute for the investment of the paid-up stock.

Atichlor.— A term used in bleaching to denote the method employed to remove or neutralize the injurious effects of the free chlorine left in some bleached materials.

Arch.— When a portion of a lode is left standing, in mining, because it is too poor to work or is needed as a support, it is called an "arch."

Asterism.— A term in printing, denoting the 3 asterisks sometimes placed before a sentence to call attention to it.

Attemperation.— Regulating the temperature of the beer-worts in brewing.

Attenuation.— The decrease in density of the beer-worts in brewing is termed "attenuation."

Avivage.— A process for clearing and brightening the colors in dyeing.

Average Bond.— A bond in marine insurance under which the consignees of cargo subject to general average, guarantee payment of their contribution as soon as ascertained in order that their goods may be delivered at once.

Back.— (a) In metal-mining, the portion of the lode that lies between the level and the one next above; (b) in coal-mining, the inner end of a heading where work is being conducted; (c) the thickest and best hides are termed "backs" in the leather trade.

Back-casing.— A wall of dry brick sunken through sand or gravel in mining.

Back-lash.— A term denoting the backward suction after an explosion of fire-damp.

Back-stay.— In printing, the leather strap used to check the carriage of the press.

Balk.— When a bed of coal suddenly thins out it is termed a "balk."

Band.— A layer of rock that is interstratified with coal.

Barney.— A small car used in mining to push the mine-car up a slope; the pit from which it runs is termed the "barney-pit."

Barratry.— In marine insurance, the commission of any fraudulent act in the management of a ship, or its cargo, by which the owners, consignors, or insurers are subject to injury.

Barrel-work.— Pieces of native copper too small to be handled as mass-copper, but large enough to be shipped in barrels.

Bastard.— (a) An impure brown sugar made from the refuse of previous boilings; (b) the large mold into which the sugar is drained is also called a "bastard;" (c) in printing, any type whose face is out of proportion to the size of its body is termed "bastard" type.

Bating.— The process of steeping hides and skins to render them soft and fit for tanning.

Battery.— The timber structure that is used to prevent coal from sliding down a shute.

Bay.— In mining, an open space for waste in a long-wall working.

Beaming.— (a) Winding the warp-yarn on a loom in the manufacture of cloth; (b) working hides with a slicker over a beam in the leather trade.

Beater.— (a) A machine used in cotton manufacturing to open and clean the cotton before it passes to the carder; (b) a knife used for breaking flax or hemp; (c) the lathe or batten of the loom used in weaving.

Benching.— A term applied to the process used in getting the coal after it is holed.

Black-liquor.— A crude acetate of iron used, in dyeing, as a mordant.

Bleed.— (a) In bookbinding, to trim the margin too closely; (b) in dyeing, extracting the coloring matter.

Bleu-de-roi.— The term used to denote the cobalt-blue color in European porcelain.

Blick.— The iridescence appearing on gold and silver at the end of the refining process.

Blue-cap.— In mining, the bluish or brownish halo which, when it appears around the flame of the safety lamp, indicates a dangerous quantity of fire-damp, is termed the "blue-cap."

Boards.— The hard paper-stock inserted between the printed sheets in a press to remove an indentation of impression; often called "press-boards."

Bone.— The term used to define the slaty portions in a coal mine.

Bonnet.— The shield used to protect a mine shaft from substance which might otherwise fall into it.

Border.— The rim fixed about the bed-plate used in milling to prevent the meal from falling off before it reaches the proper opening.

Branning.— A term that is applied both to the process of steeping cloth before or after it is dyed, and to the steeping of skins before tanning.

Brood.— The term applied in mining to all heterogeneous mixtures found with copper or tin ore.

Brush.— An instrument constructed of several small trees, like the birch, and used by farmers instead of a harrow in covering grain, or small seed after sowing.

Buck.— The breaking of ore into small pieces for jigging.

Buddle.— In mining, to wash ore free from earthy matter the water is run over an inclined hutch which is termed a "buddle."

Bullocks' Hides.— The trade name given to the raw hides of cattle.

Bully-head.— The name by which the sledge-hammer used by miners is popularly known.

Bultow.— In the fishing industry, the practice of stringing many hooks on one line, used in fishing for cod off the Banks.

Bunchy.— Used in mining to denote that the ore is irregularly distributed through the lode in small masses, or "pockets."

Bundle.— (a) In paper-making, 2 reams of printing, or brown paper; (b) in spinning, 20 hanks, or 6,000 yards of linen yarn.

Buntons.— The timbers put across a mining shaft to divide it into compartments.

Butt.— A hide of sole leather in which the belly and shoulders have been cut off.

Cade.— A term of measurement in the fishing trade, denoting either 500 herrings, or 1,000 sprats.

Cage-seat.— The framework at the bottom of a shaft, so arranged as to reduce the jar when the cage drops upon it.

Calf.— A term applied to a bookbinding in calf-skin. This binding is of several grades: Divinity calf, a dark-brown binding, with blind stamping and no gilding; half-calf, in which the backs and corners only are of calf-skin, mottled calf, a calf binding of pale color in which the decorations have been made by the sprinkling of acid; smooth calf, or plain, undecorative leather; tree calf, a bright, brown calf binding stained by acid to imitate the trunk and branches of a tree.

Canch.— A term used to denote that part of a floor or roof of a gangway that is removed to equalize the grade because of a fault, or break in the strata.

Cannel.— A form of weaving that produces a corded or rep tissue.

Cap.— A term denoting certain sizes and shapes in paper: Double cap, 17x28 in.; exchange cap, a fine quality paper, used in printing bills of exchange; flat cap, or full cap, 14x17 in.; foolscap, usually 12x15 in.; legal, or pot cap, 13x16 in., etc.

Carding.— The disentangling of wool, cotton, or other fibres preparatory to spinning.

Carrot.— In the fur trade, to dress a pelt to preserve it from insects.

Carrots.— Rolls of tobacco after they have been so prepared that they require only to be ground and sifted to be made into snuff.

Case.— (a) A shallow wooden tray, the partitions making the small boxes in which the various characters of type required by printers are kept in order for the use of compositors. (b) A book cover that has been made separately from the book for which it is intended.

Casse-paper.— The wrinkled, broken, or otherwise imperfect paper rejected by the trade.

Cassette.— The utensil in which chinaware is baked; sometimes called the "coffin."

Cast.— (a) The water used in the preparation of beer. The quantity that is first placed in the mash-tub is termed the "first cast;" that which is subsequently added, the "second cast," "third cast," etc. (b) In bee culture, an after swarm led by a maiden queen.

Certosina Work.— A term used to denote the inlay of certain light materials — like ivory or satinwood — upon dark woods like walnut.

Chop.— (a) In milling the product of the first crushing of the wheat; (b) also used to denote the brand and quality of tea imported from China, as "first chop," etc.

Clicker.— The workman who cuts the uppers and soles for boots and shoes.

Clog.— The short pieces of timber used in mines to prop the roof.

Closing-machine.— (a) A machine that sews heavy cloth or leather with a lock-stitch, alike on both sides; (b) apparatus used in rope-making to twist the already made strands into rope.

Cobbing.— In mining, a process of breaking the ore that the better parts may be sorted out.

Cockle.— (a) A large stove used in the making of porcelain, to dry the biscuit-ware after its glazing preparatory to burning; (b) the kiln used for drying hops.

Color.— In gold mining, the particles of gold that are shown when auriferous sand is washed out.

Chase.— In printing, a square, open framework of iron into which the type forms are fastened to facilitate moving and working in the press.

Commercial.— A term used to denote the shape and size of paper: Commercial letter, 11x17 in.; unfolded commercial letter, small, 10½x16½ in.; commercial note, 8x10 in., unfolded.

Companionship.— In printing, a number of compositors employed in setting up a quantity of copy under the direction of one leader.

Compost.— A mixture of various manuring substances used by agriculturists in fertilizing land.

Concentrator.— A machine used, chiefly in mining in the United States, to separate the ore from the rock with which it was associated in the lode.

Constructive Total Loss.— A term used in marine insurance when the thing insured and damaged, while not entirely a total loss, is so nearly so that it is practically beyond recovery or repair. In such cases a notice of abandonment is served upon the insurers by the owners, after which the "constructive total loss" may be recovered.

Cord.— (a) In fancy weaving, the interval between two vertical lines of the design is termed a "cord;" (b) the same term is used in bookbinding when a book is tied firmly between two boards to assure its drying smoothly. The term "Maitland cord" is used in weaving to denote the cord which extends along the wooden shafts of leaves to which the heddles are secured.

Cording.— The term denoting the arrangement of the treadles in a loom by which they are made to move in such clusters and time as the production of the pattern may necessitate.

Core-piece.— The yarn running through the centre of a rope to assure its solidity.

Corner.— The tool used in bookbinding to decorate the corners of a book.

Couch.— (a) The operation, in brewing, of spreading the steeped grain upon the floor to convert it into malt; (b) in paper-making, the act of removing the paper from the mold upon which it has been formed that it may be placed upon the felt.

Counter-lode.— A term used in mining to denote a lode running in such a direction in relation to the main lodes that it crosses or intersects them.

Coursing.— The method of regulating the ventilation of a mine by conducting the air through various doors, stopings, etc.

Cram.— In weaving, a warp that has more than two threads in each split of the reed.

Crazing.— In the pottery industry, when the glaze separates from the body and forms blisters.

Creaser.— A tool used in bookbinding to define the width of the bands of a book, and to fix the position of the lines on the backs and sides.

Creep.— If the pillars of a mine are not sufficiently large, or the roof is not fully supported the pressure of the superincumbent strata sometimes causes an apparent rising of the under-clay. Collieries have been entirely destroyed by these "creep."

Crop.— An untrimmed hide, struck for sole-leather, is termed a "crop," or "crop-hide" in the trade.

Crutch.— A term used in soap-making to denote the perforated instrument with which the various ingredients are stirred together.

Cut.— The block upon which a picture is engraved and from which it is impressed in printing.

Cutter.— Usually applied, in mining, to a joint or crack which crosses a better defined system of cracks in the same rock. In coal-mining "cutting" is the work done in getting the coal into a condition where it may be broken down.

Dabber.— The use of the "dabber" by printers has largely ceased since the introduction of the ink-roller, but the same term is now applied to instruments used by etchers and stereotypers. The former is used to ink the surface of engraved blocks or plates; the latter to dab the back of the damp paper used in the papier-mache process of stereotyping, in order that it may be driven into the interstices of the type.

Dabbing.— The term applied to the process in stone-working by which the surface of the stone is covered with small indentations, after having been made uniform.

Dam.— The term applied to the underground wall frequently constructed to hold back water, air, or gas.

Damping.— A process used in bleaching to add a certain amount of moisture to a fabric, after it has been starched, that it may be properly finished.

Dandy.— The running-out fire for the melting of pig-iron in tin-plate manufacturing.

Dandy-roller.— The wire-gauze cylinder beneath which the web of water-pulp is passed in paper-making to drain it partially of water.

Dash-wheel.— The partially submerged wheel used in cotton manufacturing to wash and rinse calico in the piece.

Deck.— Used in mining to denote the loading or unloading of cars upon the cage.

Deckle-strap.— The contrivance used in paper-making to define the width of the sheet by regulating the flow of pulp.

Decrement.— A term used in insurance, usually in the sense of the "equal decrement of life," or the doctrine of annuities upon which assurance companies base their existence. It is the theory that in a given number of lives there should be an equal number of deaths within a given period.

Dele.— A term used in proofreading to direct the compositor or printer to remove a letter, word, or phrase.

Deviation.— A term used in marine insurance to denote the voluntary departure of a vessel, without necessity or reasonable cause, from the usual course of the voyage for which she was insured. All unreasonable delays are also involved in the same law, which releases the underwriter from all risks.

Devil.— An errand-boy employed in a printing-office.

Dipping.— A process in ceramics by which a coarse clay body is coated with fine enamel by being plunged into the liquid which constitutes the coating.

Discharge.— The term used in dyeing to denote the process by which white patterns are produced on colored grounds.

Discovery Claim.— In mining law, the portion of ground held by reason of the first discovery of its mineral deposits.

Distribute.— A term used in printing for the process of returning dead matter (type no longer required) to the cases; "throw-in" is another term used to define this process.

DOCTOR.— (a) A term in wine-making, used to indicate that the character of the wine has been changed by the addition of another liquor; (b) to alter any commodity for purpose of deception.

DOFF.— A term that has several distinctions in the textile manufacture: (a) The process of stripping the cotton or wool from the cards preparatory to spinning; (b) the act of mending broken threads; (c) the removal of full bobbins to give place to the empty ones.

DOSSIL.— The roll of cloth used to clean the ink from an engraved plate prior to printing.

DOUBLE.— A term used to denote the size and quality of paper: Double medium, a printing paper, 24x38 in.; double royal, a printing paper, 26x40 in.

DOUBLE-DYEING.— A method of dyeing mixed goods by which the wool and cotton are dyed separately with colors that have no affinity for each other.

DOUBLE INSURANCE.— A term used among insurance companies as a synonym for over-insurance. Thus, where divers insurances are made upon the same interests against the same risks in favor of the same assured, in proportions exceeding the value of the subject, the party insured may sue upon all the policies although he is entitled to but one satisfaction.

DOUBLE-MILLED.— A term applied to denote that cloth has been fulled twice to make it finer in quality.

DOUBLER.— (a) A machine for doubling and drawing silk; (b) a still made to intercept and redistill the vapors of distillation; (c) a felting placed between the fabric and the press before printing.

DOWNCAST.— A term used to denote the system of ventilation used in mining, the shaft down which the air passes into the mine being called the "downcast."

DRAFT.— Used in weaving to describe the cording of a loom or the arrangement of the heddles.

DRAG.— (a) A light iron-rod tool with a tapering spiral end, used by miners in cleaning out bore-holes before introducing the charge; (b) the device that guides wood to the saw in saw-milling; (c) also applied in printing to denote the thickened impression on one side of the letters produced by the scraping of the sheet on the type.

DRAWING-PAPER.— A term used commercially to describe a variety of stout papers manufactured expressly for use in drawing. The regular sizes are as follows: Cap, 13x16 in.; demy, 15½x19½ in.; medium, 18x22 in.; royal, 19x24 in.; super-royal, 19x27 in.; imperial, 21½x29 in.; elephant, 22¾x27¾ in.; columbier, 23x33¾ in.; atlas, 26x33 in.; theorem, 28x34 in.; double elephant, 26x40 in.; antiquarian, 31x52 in.; emperor, 40x60 in.; Uncle Sam, 48x120 in.

DRAWING-ROLLS.— The rolls used in spinning machinery. As they are set in pairs, each of which turns more rapidly than any previous pair, the sliver passes through them in succession.

DRAW-BOY.— Formerly the weaver's assistant; now, a mechanical device used in drawing the heddles to form the pattern of the cloth to be woven. The machine upon which this figure-weaving is done is known as the "draw loom."

DRAWING.— A term denoting the method of freeing substances from all particles of iron and steel by use of a magnet.

DRESSER.— (a) The workman employed in type-foundries to remove all defects from the types in preparing them for sale; (b) the tool, or machine employed to cut and dress the furrows on a millstone; (c) a mallet used by plumbers in closing joints in sheet-lead; (d) one of the picks used in mining.

DRIFT.— A term used in mining to describe the nearly horizontal excavations that are frequently made in working a mine; sometimes called a "drive."

DRILL.— In agriculture, when a field is not sown broadcast, but in rows, it is said to be in "drills."

DRIP-JOINT.— When two sheets of metal used in roofing have been so united that the joint forms a water conductor the arrangement is known, in plumbing, as a "drip-joint."

DROP-BAR.— A term applied to the bar or roller on a printing-press that regulates the passage of the paper sheets to impression.

DROP-DRILL.— The term denoting an agricultural instrument that is employed to drop the seed and fertilizer into the ground simultaneously.

DROP-FINGER.— In some cylinder printing-presses the rods that are employed to hold the sheets in place until they can be seized by the grippers are termed the "drop-fingers."

DROPPER.— A term used in mining to denote a branch or spur that connects with the main load but that does not materially enrich it.

DROPPING.— A term used to denote a defect in the product of the glassmaker. It is caused by the accidental dropping of the crude glass into the molten glass in the melting vessel.

DROP-ROLLER.— Used in printing to denote the roller that drops at specified intervals to supply the printing ink for distribution.

DROVING AND STRIPING.— A process in stone-cutting by which the shallow parallel grooves are made along the length of the rough-hewn stone.

DRYING-OFF.— A term denoting the process by which an amalgam of gold is evaporated.

DRYING-PLATES.— Used in brewing to denote the series of frames in the malt kiln. They are placed one over the other, and, being covered with woven wire, the hot air ascends through them in such manner as to dry the malt.

DUMP.— Used in printing to denote the act of removing types from the stick to place them on a galley.

DUNG-BATH.— In some processes of dyeing and calico-printing the cloth is subjected to a "dung-bath," composed of warm water, animal's dung, etc., for the purpose of removing the superfluous mordant.

EGG-SHELL.— A term used commercially to denote the thinnest and most translucent of china or porcelain.

ELBOW-PLATE.— A term used in paper-making when the cutter of the rag-cutting machine has been bent to something like an angle in the middle.

ELECTROPLATING.— The process of coating articles with silver or other metal by means of electrolysis.

ELECTROTYPING.— The process of making plate copies of any engraved or molded surface by means of electrical deposition.

ENDOWMENT.— A term used in life insurance to describe a policy in which the face value, with accrued earnings, is payable to the insured at, or after a stated period, or in which the face of the policy is paid to his representatives should he die prior to the expiration of that time.

ENSILAGE.— An agricultural term used to denote the process of preserving fodder, etc., in a green state by storing the materials in silos or pits dug in the ground.

FACE.— In coal-mining, the working, or portion of the seam that is being mined.

FASCET.— A rod, or basket of wire used in carrying the bottle from the mold to the leer in glass-manufacture.

FAT-WORK.— In printing, when copy is particularly profitable to the compositor owing to the fact that it has much open space that may be filled with leads, or that in other ways favors rapid execution, is termed fat-work. To beat, or ink "fat" in printing means that a form of type has been given an excess of ink.

FEEDING.— In printing, a term denoting the method of placing the sheets of paper in such position that they are ready to meet the requirements of the press.

FILATURE.— In silk-culture, a reel by which the silk is drawn from the cocoons.

FILLET.— (a) In weaving, a strip of card-clothing; (b) in dairying, a perforated curb used to confine the cheese-curds; (c) a wheel-shaped tool used in book-binding to impress a line, or decoration upon the covers of books; (d) in printing, a rule fixed with lines that may be used as a border.

FILLING.— The term by which the woof or weft thread of a woven fabric is known.

FILLING CAN.— Used in rope-making to denote the can in which the sliver is condensed and wound after coming from the doublers.

FINE-DRAWING.— The term applied to the finishing process in cloth manufacture. By exposing the cloth to a strong light all the minute holes due to breaks are discovered so that they may be repaired with a needle, by the introduction of sound yarns in the place of those that have proved defective.

FINING-ROLLER.— A cylindrical sieve of wire cloth used in paper-making to retain the coarse fibres and knots so that they cannot pass through with the finely ground stuff.

FIRE-GILDING.— A process of gilding by which the mercury is driven from the amalgam by the heat of a muffle, leaving a fine film of gold.

FIXING BATH.— In tanning, the catechu-bath is followed by another known as the "fixing" bath. It consists of water sufficient to cover the skins, acidified with nitric acid, modified with a little glycerin.

FLESHER.— The tool used in leather manufacture for the purpose of fleshing hides.

FLOAT.— A term used in weaving to denote the passage of the shuttle crosswise above or below the threads but without intersecting them.

FLONG.— The combination of moist tissue paper and paste used in stereotyping by the papier-mache process to form the mold or matrix from composed types or engraved surfaces.

FLOOR.— In brewing, each steeping is known as a "floor" or "piece."

FLOORING.— Used in brewing to denote the operation of spreading the grain on the malt-floor, that it may be kept at an even temperature, to check germination.

FLOW.— A term used in ceramics to denote the flux that is used to make the colors run and blend in firing.

FLURRY.— A term used in calico printing to denote the condition of frothiness which is sometimes developed by the colors during the process of printing.

FLY.— (a) One of the arms of a spinning-frame which revolves around the bobbin to twist the yarn as it is wound upon it; (b) in cotton-spinning, the term is applied to the waste cotton; (c) in weaving, a shuttle with wheels driven through the shed by a jerk; (d) in printing, the mechanism which receives and delivers the separate sheets as they are printed on the press; (e) in piano making, the hinged board with which the keys are covered when not in use.

FOLIO.— While the word "folio" is used to denote the size of a book it is also applied as a descriptive term for several sizes of paper, each of which is designated by a specific name: Pot folio, 7½x12½ in.; foolscap folio, about 8x12½ in.; flat-cap folio, 8½x14 in.; crown, or post folio, 9½x15 in.; demy folio, 10½x16 in.; medium folio, 12x19 in.; royal folio, 12½x20 in.; superroyal folio, 14x22 in.; imperial folio, 16x22 in.; elephant folio, 14x23 in.; atlas folio, 16½x26 in.; columbier folio, 17¼x24 in.; double elephant folio, 20x27 in.; antiquarian folio, 26½x31 in.

FOOLSCAP.— A term applied to a writing paper varying in size from 12x15 to 12½x16 inches. The term was derived from the water-mark, a fool's cap, which formerly appeared upon all the papers that bore this name.

FOOTLINE.— A term used in printing to denote the last line of a page of type. It is usually left blank, although it sometimes contains the number of the page or the signature on the sheets.

FORWARDER.— A term used in bookbinding to designate the workman whose duty it is to receive the sewed book, put on its back, cover, etc., and prepare it for the finisher.

FULL-FACED.— A term used in printing to describe a type with the thick lines that make it print extremely black.

FURNITURE.— The term "furniture" in printing denotes the pieces of wood or metal that are placed around the pages of type, not only to keep them the necessary distance apart but to assist in fastening them securely in the chases. When the furniture has been systematically cut into various lengths and widths, so that they may be easily combined, the pieces are known as "labor-saving furniture."

FUSTIAN.— The term applied to a short twilled cotton fabric, usually a cloth having a short nap, like corduroy, velveteen, etc.

GAGING-THREAD.— In weaving, a thread introduced temporarily to stop the weft-thread at a specified point.

GALLEY.— An oblong, shallow tray, now usually made of brass, but sometimes of wood, used in printing by compositors as a place to deposit the type they have set. Galleys in which the type may be locked are known as proof-galleys. Standing galleys are inclined frames fitted with cleats on which the type galleys rest. A proof taken from types being held on galleys is termed a "galley-proof."

CASUALTY.— A term frequently used in insurance as a synonym for accident.

CO-INSURANCE.— A form of insurance in which the insured, in view of a reduced rate of premium agrees to maintain insurance upon a certain specified percentage of the total value of his property, failing which he becomes his own insurer for the difference, a fact which makes him jointly responsible with the assuring company in case of partial loss.

GATHERING.— Used in glass-making to describe the method of coiling the molten glass on the end of an iron tube preparatory to the work of blowing.

GIGGERING.— A process in bookbinding by which the burnished lines are rubbed upon the covers decorated in antique fashion.

GIGGING.— The process of finishing cloth by drawing the loose ends of wool in a fabric to the surface to form a nap. After the work of napping is completed the fabric is ready to be finished by shearing.

GILLING.— A term denoting a process for making all fibres level and even in the manufacture of woolen yarns or worsted.

GINGERBREAD-WORK.— A phrase used, somewhat as a term of contempt, in describing the fanciful shapes of the ornamental wood-work and carvings seen upon furniture, etc.

GLANCE.— A term used in mining to designate those ores in which a peculiar lustre and color indicates that they are of metalliferous combination.

GLOSSING.— A term denoting the operation of twisting the hanks of silk, in silk-manufacture, after they have been dyed and dried. This process is sometimes termed "stringing."

GOTHIC.— A term used by American printers to describe a style of square cut printing type very similar in appearance to the old Roman mural letter. In England this type is known as the "grotesque."

GRAVEL.— Used in brewing to denote the appearance of the beer when yeast cells are floating about in it in the form of fine "gravel."

GRIZZLIES.— An arrangement in the mine sluice to receive and cast aside all the large stones brought down by the current during the process of washing the auriferous gravel.

GRAVEYARD INSURANCE.— A term used to designate a method of swindling insurance companies by the substitution of a person of robust health for the bad risk actually insured. Also used to describe other kinds of insurance swindling, or crimes committed in the collection of insurance moneys.

HACKLING.— In flax-manufacture "hackling" is the process of preparing the flax for spinning by the removal of all foreign substances and smoothing and equalizing all the lengths of fibre.

HALF-TONE.— A term used to designate a photographic process in which a screen made either of netting or ruled glass, is interposed between the lens and the sensitized plate, and from the image thus produced, a positive image is made upon the prepared metal plate. This is etched into relief by the use of acids.

HALL-MARK.— A term used industrially to designate any official stamp that has been placed upon an object of trade to denote genuineness.

HARD-CURED.— A term used in the fishing industry to designate that the fish specified has been cured by being thoroughly dried in the sun after salting, a process by which all the moisture has been evaporated.

HARDENING.— A process used in hat-manufacturing, by which the bodies of the hats are rubbed and pressed hard for the purpose of felting the material as well as to diminish the size and render them more dense. A hardening-kiln is a kiln in which the transfer printing process in pottery is completed: The pottery being relieved from all superfluous oils by exposure to a low heat.

HARNESS.— The term applied to the apparatus in a loom by the operation of which the warp-threads are shifted alternately to form the shed.

HARROWING.— A term used in agriculture to describe the process of dragging a many metal-teethed instrument over plowed land, either to level it and break the clods, or to cover seed that has been sown. A "chain harrow" consists of a congeries of iron rings, instead of the metal teeth, and is employed to separate weeds from the earth and to cover grass seed. In a "revolving harrow" the teeth are arranged on radiating arms that have been pivoted to the draft-gear in such a manner that, by their horizontal rotation, they add greatly to the raking or tearing power of the teeth.

HESSIAN.— A coarse cloth made of a combination of hemp, and jute and used for bagging is known as "Hessian" by the trade.

HIGH-PROOF.— Commercially all highly rectified spirits are termed "high-proof."

HOLLAND.— A term which, while formerly applied only to linens imported from the Netherlands, is now used to designate the glazed and unglazed linen cloths that are made in many places. "Brown Holland" is a cloth that maintains much of the original color of the retted flax fibre, it having been subjected to but little bleaching or boiling.

HONEYCOMBING.— In cloth-manufacture, a term applied to designate a thin fabric in which the stitches, running diagonally across the material, have been drawn up in such a manner that the spaces between them are puffed or in relief.

HOP-JACK.— A term applied to a vat with a false bottom used in brewing. It is so arranged that it retains the solid substances in the mash-tubs, but allows the wort to flow away after it has been boiled and the hops have been added.

HOPPER.— Used, in milling, to denote the inverted-cone-shaped trough through which the grain passes on its way to the shaking-shoe.

HORSE-POWER.— A term used as a unit of measurement in every industry in which power machinery is used. Although several values are assigned to this unit the prevailing value, both in America and England, is Watt's horse-power, which places it at 7.460 megaergs per second, or about three-quarters of the actual power of a horse.

IMPOSITION.— The act of laying pages of type, etc., upon a smooth stone slab to secure them in the chases and prepare them for the press.

INDENTION.— A term used in printing to denote that a certain amount of blank space has been left before the line, or a specified number of lines of type. An indenting of every line after the first, with an increasing blank constantly shortening on both sides is termed "diamond" indention. An indenting of every line except the first, that being of full width and so overhanging the others, is termed "hanging" indention.

INFUSION.— A term used in brewing to denote the process of preparing the mash by treating the bruised malt with water at a temperature of from 7 ° to 75°.

INSURABLE INTEREST.— It is essential to the insurance contract that the insured should have a legal interest in the object for which the insurance was taken. In France the laws annul all policies that exceed the insurable interest of the assured at the time of the subscription.

INSURANCE.— A term used to describe a contract whereby for an agreed premium one party undertakes to compensate another party for loss in a specified subject by specified perils. There are several kinds of insurance companies in operation, but nearly all are either "stock" or "mutual" companies, while the risks covered include, life, accident, fire, health, marine, burglary, live-stock, plate-glass, etc.

JAPANNING.— The process of coating the surface of metal, wood, etc., with varnish which is immediately hardened by exposure to high temperature.

KERFING.— (a) The process of preparing wood for bending without breaking by making a series of small cuts in it with a sawing-machine, (b) in cloth manufacture, the process of removing the wool by passing it through a shearing-machine.

KIPPERING.— In the fish trade, the process of curing fish by cleansing them, dressing them with pepper and salt, and curing them, either by drying them in the open air, or, artificially, by subjecting them to the smoke of some prepared substances.

LANDROLLING.— A term used in agriculture to denote the process of crushing clods, to make the earth friable, by means of a heavy roller.

LAYER.— The vat in which hides are left to lie in a strong solution of tannin towards the end of the tanning process.

LAYING.— The term is applied to two distinct stages in rope-making: (1) the twisting of three or more yarns to form a strand; (2) the twisting of three strands to form a rope. The machine that performs this operation is termed a "laying machine," the wooden cone placed between the strands to prevent a slack twist is termed a "laying-to ."

MANIFOLDING.— A term used in business circles to denote the process of making several impressions of a single letter or document by one operation, as by means of a manifolding-machine, or by the use of carbon paper.

MASH.— Used in brewing and distilling to describe the mixture of ground grain that has been infused in warm water.

MILLING.— (a) The process of manufacturing cereals into flour or meal. There are two methods of milling: (1) low milling in which the grain is ground but once before being bolted, and (2) high milling, in which it is ground repeatedly; (b) in pottery, the operation of grinding and mixing the slip; (c) the process resorted to in tanning to open and soften the pores of hides; (d) in cloth manufacture, the process of felting cloth to thicken it, etc.

PIECE-GOODS.— The trade name for fabrics that have been woven in lengths suitable for retail sale by linear measure.

POINT.— The unit of measurement in types, each point being about one seventy-second of an inch. The various types in use in the United States and their relative sizes in "points" are as follows: Excelsior, 3 points; brilliant, 3½; semi-brevier, 4; diamond, 4½; pearl, 5; agate, 5½; nonpareil, 6; minion, 7; brevier, 8; bourgeois, 9; long primer, 10; small pica, 11; pica, 12; English, 14; two-line brevier, 16; great primer, 18; paragon, 20; two-line small pica, 22; two-line pica, 24; two-line English, 28; four-line brevier, 32, three-line pica, 36; double paragon, 40; four-line small pica, 44, and four line pica, 48 points.

OPEN POLICY.— In insurance, a policy in which the value of the subject insured has not been fixed, but has been left to be determined in case of loss, or because it has been left open to permit of the addition of other things whenever occasion demands.

QUARTER-PLATE.— A term used in photography to denote the size of a plate. Thus, a quarter-plate measures 3¼x4¼ in.; a half-plate, 4¾x5½ in.; a whole plate, 6½x8½ in.

RECTIFY.— The term applied to the process of removing impurities from alcoholic distillations and to raise its strength to the required proof.

SALT A MINE, TO.— A swindling operation by which a mine is made to seem more valuable than it really is by the surreptitious introduction of ores obtained elsewhere.

SHELLS.— Those parts of the lay in weaving in the grooves of which the reed fits. They are of two classes and are termed "upper" and "under" shells.

SURRENDER.— A term in insurance to denote that the party insured has abandoned all right in his policy in consideration of having received a portion of the premiums already paid to the company. The percentage of premiums returned is known as the "surrender value" of the policy.

TOUTER.— Industrially, a person who makes it his business to solicit trade for a shop.

TONTINE POLICY.— In insurance, a policy in which the insured agrees that no money shall be received by him from the insuring party, either in the form of dividends, return-premiums, or surrender-value, for a specified term of years, but that, instead, the entire surplus shall be permitted to accumulate until the end of that period when it may be divided between those who have kept their policy in force.

TOTAL LOSS.— In marine insurance, total loss may mean that the subject insured has been absolutely destroyed by the peril against which it was protected, or it may mean that the loss by damage, seizure, or other causes has been so great as to be practically absolute. In the latter case it is often termed a "constructive total loss."

VALUED POLICY.— A term used in insurance to show that a policy is one in which the value has already been set upon the subject insured, the insertion of which fact in the policy with the amount agreed upon, makes proof of damages in case of loss unnecessary.

WAGER-POLICY.— In insurance, a policy in which the insured has no insurable interest, and, being generally regarded as a form of gambling, such policies are not valid except in places where the validity of a wager may be recognized.

WALKING DELEGATE.— A person selected by a trade union or other labor organization to visit similar bodies of workingmen, to interest them in the order, voice their demands upon their employers, direct them in their strikes, etc.

WALL.— Used in mining to denote the surfaces of the rock between which the ore is inclosed. If the vein is inclined at such an angle that the ore is over the miner's head it is termed a "hanging" wall; if it is beneath him it is called a "foot" wall.

WARP.— (a) In agriculture, the operation of fertilizing a poor piece of land by artificial inundation from waters which have large quantities of earthy matter; (b) in weaving, the threads that extend lengthwise in a loom. The roller upon which the threads are wound is termed the "warp-beam;" the machine which treats them with size before they are wound is the "warp-dresser," while the machine which draws the warp threads through the dye beck is termed the "warp-dyer."

WASH.— Used in mining to denote the process of separating the ore from earthy and other matter by the employment of water. The fermented wort from which the spirit is extracted in distilling is also termed the "wash."

WINNING.— The work of developing a mine preparatory to the work of mining is termed "winning" in the United States.

WOOF.— In weaving, the thread that is woven into the warp is also termed the "weft."

Inebri'ety. See ALCOHOLISM.

Iner'tia, a term introduced by Kepler to signify that property of matter in virtue of which it is "inert," so that when a body is at rest, or in a state of uniform motion in a straight line, it preserves its state of rest or of uniform rectilinear motion, unless some agency external to the body acts upon it in such a way as to modify that state. We gain our first conception of inertia by the attempts that we make to move bodies that are at rest, or to stop those that are in motion. Even if they are suspended freely, so that frictional forces are negligible, we find that their state of rest or motion cannot be modified without the exercise of a certain amount of muscular force; and by abstracting our own personality in the case, we gradually come to the conception of inertia as a physical property inherent in all bodies. Inertia has been popularly described as a "passive resistance" to change of motion; but this expression is objectionable because it is entirely inaccurate. Freely suspended bodies (that is, bodies that are free from frictional forces,) cannot be said to "resist" forces that are applied to them. On the contrary, they yield instantly to the smallest force; but a small force, when exerted upon a given body, for a given length of time, does not produce as great a change of motion as would be produced by a large force acting upon the same body for the same length of time. The conception of inertia shades insensibly into that of "mass"; the mass of a given body being proportional (by definition) to the velocity that is communicated to the body by a force of standard intensity, acting upon it for a standard length of time. (See MASS; MATTER; MOLECULAR THEORY.)

Infallibil'ity, exemption from the possibility of error. The word is used as applied to arguments, statements, reasoning, or the formation of judgments, and does not include impeccability, or exemption from the error of sin. The infallibility of the Church as believed by Roman Catholics means that "the Church can neither deceive nor be deceived in matters of faith and morals"; and she is limited to the definition of truths already contained in Scripture and tradition. The seat of infallibility rests in the Pope as successor of Saint Peter (Matt. XVI 18), and in the bishops in communion with the See of Rome, whether dispersed or united in a General Council (q.v.). In the acts of the Vatican Council, held in Rome in 1870, the following is the text defining the nature of the infallibility of the Pope: "The Roman Pontiff, when he speaks *ex cathedra*, that is to say, when in the exercise of his office of pastor and teacher of all Christians; he, in virtue of his supreme apostolic authority defines that a doctrine on faith and morals is to be held by the whole Church, by the assistance of God promised to him in the person of blessed Peter, has that infallibility with which it was the will of our Divine Redeemer that His Church should be furnished in defining a doctrine on faith or morals, and that therefore these definitions of the Roman Pontiff, of themselves and not through the consent of the Church, are irreformable." The Greek Church, the Church of England, and the Protestant Episcopal Church which is its representative and in communion with it in the United States, believe that infallibility resides in the universal Church in accordance with Christ's promise of the Spirit that should guide His followers unto all truth. Consult: Allies, 'See of Saint Peter'; Ballerine, 'De Primatu'; 'De Potestate Summ. Pontif.'

In'famy and Infamous Crimes, in common law the first means disqualification from giving legal evidence as a result of having committed the second, the theory being that a person capable of such crimes is incapable of speaking the truth. Both in Great Britain and generally in the United States this disqualification has been abolished by statute, and previous convictions for crime have been considered to affect a person's credibility without impairing his legal capacity to give evidence. Infamous crimes are strictly those which entailed infamous punishments. The fifth amendment to the Federal Constitution speaks of "capital or otherwise infamous crime" and we read in 2 Dane, Abridgement, 569, 570: "Punishments clearly infamous are death, gallows, pillory, branding, whipping, confinement to hard labor and cropping." Infamous punishments include imprisonment in State prison, or penitentiary with or without hard labor, and crimes which entail such punishments are undoubtedly to be considered infamous crimes, in the sense implied in the fifth amendment to the Constitution.

Infancy. The term infancy is used variously by different writers to include a shorter or longer period of the earliest stage of human existence. By most writers it is limited to the first 12 or 14 months, extending to the time when the baby begins to walk and to talk, and so is synonymous with a "babe in arms"; many medical authors would make it include the whole period of the first dentition, or up to about two and a half years. The characteristics of the period are utter helplessness, rapid growth of body, gradual development of muscular functions and great impressibility of the nervous system. In mankind this helplessness is more marked and the period of dependence is longer than in any other of the higher animals. It has been pointed out by John Fiske that the present elevation of man above other animals is due largely if not entirely to this lengthened period of plasticity,— to his prolonged immaturity. Man is born with only a few of the lowest vegetative capacities fully developed, such as digestion, respiration, and circulation; the muscular and nervous functions are latent and only gradually develop; while the higher functions of the mind go on evolving until the fifth decade of life. A long infancy or period of immaturity means a great capacity for development.

Birth and Heredity.— The infant comes into the world with a fixed sum total of vital force, along with certain hereditary tendencies in development toward health and, perhaps, toward disease. These hereditary tendencies are all modified by the physical, social, intellectual and moral status of the child's family and surroundings: in a word, they are vastly influenced by the child's environment. Heredity was formerly regarded as the most important factor in the child's life; but heredity is really only one of three great factors,— the others being the nutrition of the child, and his physical, intellectual and moral environment. During the plastic years of infancy, childhood and adolescence, a bad heredity can frequently be overcome by proper management: on the other hand, the capital of a good heredity can be squandered. Nature always tends toward the normal or healthy, so that there is always the possibility for a bad heredity to be obliterated if only the natural tendency is assisted. More then depends on the nutrition and environment of the infant than upon its heredity.

Nutrition: Breast-Feeding.—The best method of nourishing the infant is nature's way — to have it nursed by the mother. But for various reasons this is often impossible. Modern life — and especially city life — has in some way rendered a large proportion of women incapable of producing breast milk for their offspring. And the number of these mothers who desire to nurse their infants but cannot is increasing each year. Again, in not a few instances, the infant does not thrive upon the breast-milk, even though it may be abundant. In both these classes of cases some form of artificial or substitute feeding is a necessity. Good wet nurses are so difficult to procure in the United States that artificial feeding is generally preferable unless the baby is premature or feeble and failing: then the services of a wet nurse may be needed to save the infant's life.

Artificial or Substitute Feeding.— The best available substitute for human milk is an adaptation of fresh, clean unadulterated cow's milk. The milk should be diluted and otherwise modified to suit the infant's feeble digestive powers, and it should be given preferably, without being scalded or sterilized. In summer, or when there is any doubt as to the freshness of the milk, the cleanliness of the dairy or the careful handling of the milk, "Pasteurization," or heating the food to a temperature of 155° F. is advisable. Details as to milk modification and Pasteurization can be found in any book on "Infant Feeding." Ready-made infant foods,— the canned or bottled proprietary foods — do not contain the right ingredients for properly nourishing the infant, and their prolonged exclusive use is nearly always followed by some form of malnutrition — especially scurvy and rickets. These proprietary foods contain large proportions of sugar or starch, and so make fat babies, but such infants are generally pale, have feeble powers of resistance, and are prone to succumb to disease of the lungs or of the digestive tract. When the prepared infant foods are used as additions to milk they are less objectionable, and may at times be of advantage.

Weight and Development.— The infant that has been properly nourished before birth and is born at full term weighs on the average about 7½ pounds — boys being somewhat heavier than girls.

During the first few days, while the nourishment from the mother is insufficient, the baby regularly loses from six to eight ounces; but it soon begins to gain, and if the nutrition is normal and the infant remains well, there will be a steady increase in weight throughout the first two years. The gain during the first year is more regular, however, as well as more rapid than that during the second year. During the first three months the increase in weight each week is about half a pound: from the third to the sixth month the weekly gain is somewhat less, from four to six ounces: from the sixth to the ninth month about four ounces, and after the ninth month a little more, usually a weekly increase in weight of from four to six or even eight ounces. By the end of the fifth month the baby that has been perfectly well and is being properly nourished should have doubled its birth-weight and weigh about 15 pounds: at the end of the 15th month it should weigh three times its weight at birth. In many instances the baby will treble its original weight by the end of the first year; but 21 pounds may be considered the average weight for the end of the 12th month. Infants that were very large at birth do not increase so rapidly: while small or premature babies are apt to make a gain that is greater in proportion to their original weight. "Hand-fed" or "bottle" babies should weigh on the average about the same as breast-fed babies,— provided that they have had no disturbance of their digestion; the food must, however, have been perfectly adapted to the infant, and this is often a very difficult problem.

Height and Other Measurements.— At birth the length of the average baby is about 20 inches: during the first six months there is an increase of four to six inches, and during the second six months from three to four inches more; by the end of the second year the height is 32½ inches, a growth of over a foot since birth. By the end of the third year the stature is one half of the adult height. The head grows very rapidly during infancy and early childhood. The circumference of the head at birth is from 13 to 14½ inches; by the end of the sixth month it is 16½ or 17 inches: at the end of the first year 18 inches, and at the end of the second year it is 19 inches. By seven or eight years the circumference of the head almost equals the adult size of 21 inches. This is visible evidence that during the first months and years of life the brain is increasing in volume more rapidly than any other organ in the body,— the head or brain-box expanding to conform to the enlarging brain. The soft spot or "fontanel" usually closes between the 15th and the 20th months. The chest is smaller than the head at birth (13 inches), but its circumference increases rapidly, so that at 18 months that of the chest and the head are equal. After this the chest grows steadily but gradually until puberty, when there is a very rapid increase for four or five years. Aside from the regular increase in weight and measurement, the healthy infant shows other signs of well-being. The baby's flesh is firm, and the skin is satiny and elastic: the color is pink, and the body and extremities are well rounded. Very fat babies are not necessarily stronger or healthier than those that weigh less: as has already been noted they are apt to be pale, flabby and of weak resistance to disease. The healthy baby is happy and playful when awake, and sleeps from 16 to 20 hours out of the 24,— longer the younger the baby. It is desirable that the growing child have a nap during the day up to the time when kindergarten work is begun; with nervous or poorly nourished children the practice should be continued until the seventh or eighth year.

Muscular and Mental Development.— These begin with the entrance of the infant into the world, but are slow in unfolding. At first the grosser movements performed by the muscles working over the larger joints, next more complex movements, and during later childhood and early adolescence the finer movements requiring nice adjustment and delicate co-ordination. Hence it is that occupations or accomplishments requiring great manual dexterity, such as violin or piano-playing, should be taken up early,— "before the hand gets stiff," as the phrase is. The first movements are those of the legs, arms, and neck: they are not purposeful but merely reflex. By the sixth week the infant can hold up its head, when the back is supported, but very unsteadily until about three months old. At some time in the third or fourth month the infant makes its first voluntary movement, grasping at some object in the range of vision. Within a month or two later the baby can co-ordinate the muscles of the eyes, arm and hand sufficiently to take firm hold. Sitting alone is an accomplishment of the seventh or eighth month, and creeping also begins at about this time, if the baby is ever to creep at all. During the eighth or ninth month the baby begins to stand, having made the attempt for many weeks before; at ten or eleven months the infant can stand alone, and shortly after the twelfth month the first tottering steps are taken. It is some months before the baby is secure upon the feet, the maintenance of the equilibrium requiring nice control of many groups of muscles. Healthy infants differ greatly as to the time when they can walk alone, some walking at as early as ten months, while others may not walk until eighteen months. Very fat babies walk late but, in some instances, an excess of caution seems to be a factor. If a child is far behind in performing any of these muscular functions, a physician should be consulted so that careful examination may be made for signs of rickets or of disease of the brain or of the spinal cord.

Development of Special Senses.— For the first few days the newly-born infant avoids the light, and for many weeks cannot endure a direct bright light. Perception of light soon develops, the color first attracting attention being red. Clear perception of objects comes during the fifth month. Hearing is in abeyance for several days, a baby at birth being practically deaf; but after a week or ten days this function begins, and later hearing becomes very acute, the infant being able to recognize the mother's voice or a footstep at about three months. Loud sounds cause the baby actual pain, so severe are their impressions on the delicate auditory apparatus. The sense of touch (contact) is early developed, especially in the tongue and lips; but sensitiveness to pain is very dull during infancy. Heat and cold are recognized from an early period, the variation of a few degrees in the temperature of the food causing the baby to refuse it. Taste and smell also are present at birth, taste being very discriminating.

Development of Speech.— Speech is very closely related to the higher functions of the brain, and is therefore the last of the simple functions to develop. Usually a baby begins to say "Mamma" and "Papa," with clear knowledge of the meaning, toward the end of the first year. Next names of objects and persons are learned and soon two words are put together. Then verbs are used, and about the end of the second year little sentences are made. Pronouns are regularly the last of all the parts of speech to be used. During the third year speech develops very rapidly, the baby bringing out some new term or expression almost daily. There are great variations in the time when children begin to talk; and for this there are many reasons. Girls generally talk earlier than boys by two or three months: babies that associate in the nursery with other children talk earlier than only children. If, however, a young child reaches the age of two years without attempting to talk, mental backwardness or organic brain disease is apt to be the cause. Tongue-tie is seldom the cause of backwardness in talking, although it does produce imperfect articulation.

Dentition — Teething.— The first teeth appear about the sixth or seventh month, but a perfectly healthy baby may have no teeth until 10 or 11 months old, or on the other hand may cut the first tooth at four months. The regular order is as follows: lower central incisors, upper central incisors, upper lateral incisors, lower lateral incisors — each pair coming at intervals of three to six weeks: at about the fourteenth month the front double teeth (anterior molars) appear in the two jaws, and four or five months later the canines, known popularly as the "eye and stomach teeth." Finally, the last four molars appear sometime between the twenty-fourth and the thirtieth month, and these complete the twenty teeth of the first dentition. Teething babies are apt to be fretful, they have a reduced resistance against disease, and they are prone to slight disturbances of digestion. To attribute most of the ills of infancy to the process of teething is a great mistake; usually some other and better cause for the disturbance can be found if the baby is carefully examined. During the time when the successive pairs of teeth are coming through the gums, the usual food should be largely diluted, so as to prevent any serious indigestion.

Fever.— Sudden high temperature is readily produced in young children by slight causes, inasmuch as the heat-regulating centre in the brain is but poorly developed. Again, the temperature in disease is erratic, and is apt to be higher than in adults suffering from the same ailment. Only persistent high temperature need cause anxiety.

Convulsions.— A characteristic of infancy is the easy excitability of the motor side of the nervous system. Hence convulsions or spasms are much more frequent and less serious than in adults. The immediate cause of the motor explosion may be an overloaded stomach, fright or mental excitement, or the fever of an oncoming disease. Severe earache, intestinal worms or a paroxysm of whooping cough may also serve as an exciting cause. Underlying or predisposing causes are a nervous heredity, malnutrition, or rickets; or there may be organic disease of the brain or the kidneys. The spasm usually begins with a turning of the eyes to one side and twitchings or grimaces of the face: there may be frothing at the mouth; then the arms and legs are rapidly contracted and relaxed: later the body stiffens out, the breathing becomes noisy and labored, the face, — especially the lips — becomes livid. Shortly afterward the body relaxes, the breathing becomes easy, and spasm ceases for the time being — having lasted anywhere from five to thirty minutes. Until the physician arrives certain simple measures are of value. The infant should be undressed, wholly or partially, and put into a warm bath (not warmer than 105° F.) to which a handful of mustard flour has been added, and the baby should be rubbed all over while in the tub for about five minutes. Then remove from the bath and lay between blankets, putting a warm bottle at the feet and an ice cap or cold compress on the head. If the baby can swallow, a full dose of castor oil should be given. Most convulsions are due to the presence of decomposing food-remains in the alimentary tract, and the spasms usually cease when the stomach and bowels have been thoroughly evacuated.

Linnæus Edford LaFétra, M.D.,
Instructor in Diseases of Children, Vanderbilt Clinic, Columbia University.

In'fant, in law. By the common law persons come to majority at the age of 21 years, until which time they are called in law *infants,* but by common usage in the United States the word minor prevails. Infants cannot, in general, bind themselves by contracts, as they are supposed not to have sufficient discretion and ability for this purpose. But this is their privilege, and their contracts are accordingly held in general not to be void, but only voidable at their election; and they may elect to avoid their contracts during their minority, except such as they may have entered into for necessaries suited to their condition in life, but they cannot confirm them so as to be bound by them until their majority. Infants may possess property, but it must be under the management and control of a guardian. They have not the right of citizens as to voting, and discharging other political functions. But in regard to crimes and punishments, and trespasses and private wrongs, their conduct is regulated by the same laws as that of the other members of the community, in case of their being of sufficient age and discretion to understand their duties and obligations. And for this purpose no general limit can be assigned, as some children are much more intelligent than others of the same age; and it will again depend, in some degree, upon the nature of the offense committed, or the wrong done, whether a child of any given age can be considered legally guilty of it, since some offenses and wrongs can be more easily understood to be such than others. The law, in general, has a tender regard to youth, and does not permit them to be convicted and punished for offenses and trespasses unless it appears clearly that they have sufficient knowledge and discretion to distinguish them to be such. There are exceptions to the incapacities of minors as to contracting, and these exceptions are made for their benefit. Thus an infant not sufficiently furnished with necessary clothes, food, or instruction, by his parent or guardian, and not being under the immediate superintendence of the parent or guardian, may make a valid contract, in respect to those subjects, and such contract may be enforced against him. Infants require the consent of parents or guardians to marry. The jurisdiction in respect to infants is generally vested in either probate or orphans' courts. These courts appoint guardians to take charge of the property of infants, and, in case of the decease of the father, to take charge of their persons; but during the life of the father he has the guardianship and control of the persons of his children until they are 21 years of age.

Blackstone thus defines infant: «Infants have various privileges, and various disabilities: but their very disabilities are privileges, in order to secure them from hurting themselves by their own improvident acts. An infant cannot be sued but under the protection, and joining the name of his guardian, for he is to defend him against all attacks as well by law as otherwise: but he may sue either by his guardian, or by his prochein amy, or alone for wages in the county courts. In criminal cases an infant of the age of 14 years may be capitally punished, but under the age of 7 he cannot. The period between 7 and 14 is subject to much uncertainty: for the infant shall, generally speaking, be judged *prima facie* innocent: yet if he was *doli capax,* and could discern between good and evil at the time of the offense committed, he may be convicted, and undergo judgment and execution of death, though he has not attained to years of puberty or discretion.»

Infant Jesus, Daughters of the Congregation of the, is an order in the Roman Catholic Church. It owes its origin to Anna Maroni, a native of Lucca, who having come to Rome entirely destitute, succeeded by her industry in securing a competency. In more advanced years, her charitable feelings prompted her to establish an institution where poor girls should be instructed in such work as would enable them to earn a livelihood. The clergy approved of her plan, and afforded her much assistance, and it was finally established as a regular institution, and in 1673 Pope Clement X. acknowledged the existence of the society, gave it by-laws, and endowed it with sundry privileges, under the appellation of «Daughters of the Infant Jesus.» The number of the «Daughters» allotted to each convent was fixed at 33, in commemoration of the number of years Jesus lived upon earth. The novitiate lasts three years; the sisters make vows of poverty, chastity and obedience. Such as may wish to leave the convent are allowed to do so before taking the vows, but, in that case, they are to leave to the convent all they brought to it at their admission. Prayers and fasts are strictly enforced. The regular habit of the order consists of a wide, dark brown dress, and a white hood.

Infanta, ēn-fān'tä, Philippines, a former Spanish commandancia of the island of Luzon, consisting of a narrow strip of territory on the Pacific coast with Nueva Ecija on the north and Tayabas on the south. In 1902 it was made a sub-province of Tayabas, «the inhabitants to enjoy the same rights and privileges as if the said territory had been originally incorporated in the province of Tayabas.» The surface is very rough and mountainous and the construction of roads impossible except at heavy cost; several trails lead over the mountains to the central provinces. The forests are valuable, among the trees most important to commerce is the balate, which produces the balate gum. The agricultural methods are most primitive; the chief crops are rice, cocoanut, chocolate and coffee; the most important industry is the manufacture of nipa wine; there was formerly a large manufacture of cocoanut oil in Infanta, but this industry was paralyzed by the hurricane of 1882. Pop. 10,800

Infant'icide, the murder of a child born alive, is a crime of frequent occurrence. The main cause of the crime is shame, induced by a dread of the social disgrace attaching to mothers of illegitimate children; though in many instances infanticide has been the result of violence produced by puerperal insanity. The morbid disposition to kill the newly born has also been observed in certain of the lower animals. The sanctity of human life, from its beginning to its close, is a maxim of modern civilization, and the law treats as a murderer whoever wilfully terminates it at any stage. According to the law of England every woman who employs means to procure criminal abortion is guilty of felony, and liable to penal servitude for life, or not less than three years; and severe penalties are inflicted on those who aid women to procure miscarriage. The concealment of birth is a misdemeanor, and may be punished with imprisonment for two years. In the United States, when a child's death is occasioned by an illegal act, such act is considered either murder or manslaughter according to the circumstances. The crime, however, is rarely punished, and in large cities many cases occur each year which are never reported to the authorities.

Infanticide was prevalent in Greece and Rome. In modern times many barbarous peoples are guilty of wholesale child-murder. Among some of the Pacific Islanders and aboriginal Australians there is a great destruction of infant life. The Hindus used to destroy female children without compunction. In China infanticide is said to be very common.

Infantry («the juveniles,» probably at first the knights' pages), foot soldiery, as distinguished at once from cavalry and artillery. In all ages this has naturally formed the numerical bulk of armies, but its tactical importance has varied greatly with circumstances. The name cannot be given to the mere unorganized fighters of barbarian *mêlées;* it implies some organization, and at least the rudiments of tactics. The first large armies were the Egyptian and Assyrian, continued by the Persian: the social system was aristocratic, and the large plains ideal for the utility of cavalry; hence the infantry was rather an auxiliary, to complete a rout after the mounted lords and the chariots had broken the ranks, than the main fighting body. The first development of infantry as the chief reliance was naturally in the small Greek states, whose independence rested on their citizen soldiery, and whose rough territory made cavalry evolutions difficult. Cavalry was therefore used mainly to guard flanks and to skirmish; the Spartans for a long time would not use it at all. The infantry was divided into classes according to armor; hoplites (with heavy defensive armor, long spear and dagger), psiloi and peltasts (very little armor, light barbed javelins to throw), and gymnetes (sharpshooters, light-armored and with slings or bows). The battle formation was the famous phalanx, whose one basic principle was the value of mass and momentum, and which was irresistible either for attack or defense against barbarians who lacked firmness in the ranks. It was commonly a rectangular block eight ranks deep, so that only the first two or three could use their spears at the same time, the rear ranks serving only for instant reinforcement and for impact; the men were from 18 inches to 6 feet apart, according to conditions of defense or attack; the phalanx had usually 2,000 to 4,000 men, but sometimes as high as 10,000 or more. Sometimes the formation was the triangular wedge. The first great improvement was by Epaminondas, who made the ranks 50 deep, and by the enormous impact crushed the Spartan phalanx at Leuctra. This was the Napoleonic principle of concentration at the critical point, most of the Spartan army being allies with no heart in the fighting, and kept at bay by a few skirmishers. Nevertheless, the step was backward except for immediate necessities, as it increased the main vice of the phalanx — its immobility, which made it break up dangerously on bad ground, and gave little power to change front or execute flanking movements. In later tactics the larger ones were subdivided into companies of 120 with a distance equal to the front, forming an approach to the legion; and the latter was copied also in the formation by lines, increasing rapidity of movement and flexibility on difficult ground, as well as power of extension and so of flanking. The Macedonian *sarissa* or long pike doubled the number of ranks which could thrust at once over each other's shoulders. But the whole system went down before the Roman legion, which essentially maintained its position till the Empire too went down. It consisted normally of 1,200 each of hastati (spearmen), principes (veterans), and velites (light troops), 600 pilani (veteran reserves), and 300 equites or cavalry. It was divided into three lines and 30 maniples or companies, and combined solidity with ease of maneuvering.

In the Middle Ages, till the general use of gunpowder, the feudal system insured the degradation of the infantry, as it depended on the fighting power of the knight, and consequently lavished all the care and expense on perfecting his armament. But even without this, the same result would have come, for without good field artillery, and with only bows and arrows at their best, the heavily armed man was invulnerable, as the Spanish conquests in the New World amply prove. Hence the logical result was the extension of defensive armor till some new missile force came in. But the cost of this was so great — a full suit of steel armor cost about $2,000 — that only the richer even of the knights could afford them, no king could raise money to equip a standing army, and the aristocracy would combine to refuse him money for such a purpose; and the rank and file were scattered and slaughtered in face of a charge of a small number of mailed knights. The defeat of the French knights by the English bowmen was that of a disorderly and insubordinate mob, by a splendid archery which slew their horses and pierced the cheaper armor. But gunpowder at once changed the whole situation. A serf with a $10 hackbut could stand out of reach and kill a knight with his costly armor; and a sovereign could collect and arm a great force of these and use them to put down his unruly vassals. Hence armored knights and horses began to decrease, and standing bodies of foot soldiery with firearms to increase. The change in battle array was correspondent: theretofore, even the ablest commanders had maintained the great depth of 10 ranks, traditional from classic times. Gustavus

Adolphus reduced this to six, deploying to three under fire; while Tilly and Wallenstein and the other imperial commanders kept to the old phalanx formation. Breitenfeld (1631) and Lutzen (1632) were won by this and Gustavus' light artillery. The introduction of the bayonet about 1650 led to a reduction to four ranks. But the greatest single improvement was due to Leopold of Dessau early in the 18th century: he instituted the chief reforms usually credited to Frederick the Great, and formed the armies with which Frederick won his victories. He reduced the ranks to three, making it possible for all to fire, trained them to maneuver with great precision, and wrote the drill-book which is still the basis of all European and American manuals. Frederick's infantry organization, in regiments of two or three battalions, each 500 to 600 strong, was copied by all the other nations: and the general principle of open order, made necessary from the destructiveness of artillery on close masses of men, and possible by the confidence in each other bred by civilization, is still retained. Broadly, the difference between ancient and modern infantry is that between mass and mobility.

For obvious reasons — cheapness of maintenance, universal availability of men untrained in horsemanship, ability to march and maneuver on all sorts of ground, less liability to be crippled by loss of the animals, etc.— all modern armies consist mainly of infantry; and the nominal horse troops are most often dragoons, or soldiers mounted merely for quickness of movement, but who fight on foot. The quantities of other arms, as cavalry, artillery, engineer corps, etc., are based on the infantry numbers. The proportions vary in different armies and in different functions of the same army, according to nature of service: more or less cavalry and artillery being used according to need of concentration, or action in dispersed bodies. Forces like the United States Western troops a generation ago, for instance, in small squads on detached duty, would have different proportions from a great Continental army in the midst of a campaign. While there is no one system of infantry tactics which can be universally applied, the same cause which has made the change just spoken of has thus far continued to act with steadily increasing force. Artillery continues to grow in power and in range; the danger-line grows ever farther from the enemy; it is nearly impossible, and would be murderously losing, to charge in close column across the 2,000 yards which is now the average range. The system adopted is called "extended order," which means a considerable space between the men, and small bodies acting separately in a charge; each making a rush for some cover not so far off that they will be blown in reaching it, or will be decimated in the attempt. A certain relation between companies and regiments is kept up, to avoid destruction in detail and enable combined action, but precise parade alignment is not attempted. This involves not only the mutual confidence of civilized men, but some of the independent judgment of those who have not had initiative crushed out of them by red tape: the greatest of modern tacticians and commanders have expressed a preference for intellectual quality over mere numbers, even in the rank and file. In the United States, the extended order was first introduced in the Revolution.

For the organization of the line in this country, see ARMY OF THE UNITED STATES. In addition to this, a few facts may be given: The general orders of 19 May 1877 fixed the strength of the infantry at 9,575 men, in 25 regiments. The pay ranges from $3,500 a year for the colonel to $13 a month for the private. The appointments are made from the United States Military Academy, from the ranks after two years' service and severe examinations, or from civil life if there are no eligibles in the others. The arms are the Krag-Jorgensen and the new Springfield magazine rifle, with knife-bayonet. The equipment is knapsack, haversack with implements for meals, canteen, blanket wrapped in piece of shelter tent, and waist-belt with cartridges.

Infec'tion, the introduction of disease-producing micro-organisms in the body. Infection may result in a number of different ways. Micro-organisms may be introduced by means of direct injury. When a person falls and cuts the hand, the bacteria of pus-production or of tetanus may be so introduced, and blood-poisoning or tetanus may develop. Many infections come by means of the intestinal tract. Thus typhoid is commonly obtained from milk or drinking-water. The intestinal worms, tapeworm, roundworm, are contracted in this manner, and a number of other parasites, particularly the trichina, may come from infected food taken into the alimentary canal. Infection may also occur by means of the air-passages. The bacillus of tuberculosis is most often taken into the body in this way, and finding suitable soil, it causes the development of the dread disease. The bubonic plague is frequently contracted through the disease-germ entering the air-passages. At the present time it is deemed not unlikely that a number of infectious diseases, notably influenza, diphtheria, scarlet fever, measles, whooping-cough, are contracted through the respiratory tract by infection with the exciting cause. Occasionally direct contact seems necessary for infection, as in gonorrhœa and syphilis. In malaria, and probably in yellow fever, the active agent that causes the disease is introduced into the body by the bite of an insect, the mosquito. In malaria one particular genus (*Anopheles*) serves as an intermediate host in the developmental history of the parasite, in a manner analogous to the history of the development of a number of the intestinal worms. It is not unlikely that a large number of diseases may be disseminated by the bites of insects of one kind or another. In all the infectious diseases the element of a real, live, and active contagion should never be overlooked. Infectious diseases do not spring out of nothing. There must be some sort of contact in order that a person become infected. A most important part of the treatment of all infectious diseases is the protection of other people by proper care of all one's own excretions during sickness. The doctrine so frequently taught by some that sickness is ignorance is an important half-truth. But for the ignorance of people concerning the proper care of those afflicted with infectious diseases with reference to the protection of others, measles, diphtheria, scarlet fever, whooping-cough, typhoid fever, consumption, and a number of other maladies would be entirely eradicated from civilized communities.

In'fidel, in modern parlance, one who deliberately rejects the Christian faith after obtaining knowledge of it. In former times a man might be an infidel who had never heard of Christianity. *Infidelis* in ecclesiastical language means "unbelieving," and is applied to unevangelized heathen as well as doubters and apostates. Thus in the Roman Catholic Church a bishop *in partibus infidelium* merely means a bishop whose diocese is set in heathen countries.

In'finite, a term in metaphysics, which means a reality which has no limit or boundary, in time or space. The idea of the infinite is as old as the Ionian philosophy, when Anaximander (610 B.C.) declared that the one in the many, the basis of being in Nature, was το ἄπειρον, the infinite. The reality of infinitude has been the source of much controversy, and the tendency of many modern philosophers is to deny it. "An infinite number," says Bosanquet, "would be a number which is no particular number, for every particular number is finite. It follows from this that infinite number is unreal." On the other hand F. H. Bradley states the contrary, in the clearest terms, "We may be asked whether Nature is finite, or infinite. . . . if Nature is infinite, we have the absurdity of a something which exists; and still does not exist. For actual existence is, obviously, all finite. But, on the other hand, if Nature is finite, then Nature must have an end, and this again is impossible. For a limit of extension must be relative to an extension beyond. And to fall back on empty space will not help us at all. For this (itself a mere absurdity) repeats the dilemma in an aggravated form. But we cannot escape the conclusion that Nature is infinite. And this will be true not of our physical system alone, but of every other extended world that can possibly exist. . . . Every physical world is, essentially and necessarily, infinite."

It seems as if Aristotle had a clearer and more logical view of infinity, το ἄπειρον than many modern Positivists, such as Bosanquet. He says, λειπεται οὖν δυνάμει εἶναι το ἄπειρον. He means of course, that, with regard to finite human intelligence, the infinite remains unrealized, although logically it could be realized, and of course, when we speak of infinite time, or infinite creative change in nature, we speak of something which potentially exists, but is only gradually becoming actual.

Infinity is also applied to the divisibility of matter. This is termed "infinite fission." If an atom is divided into two parts, and each of these is again divided into two parts, the mind cannot conceive of any individual fragment resulting from this division as incapable of being divided.

Professor Royce of Harvard has undertaken the task of vindicating the concept of the actual Infinite against the charge of self-contradiction. He is controverting Mr. F. H. Bradley of Oxford, who while he admits "we cannot escape the conclusion that Nature is infinite," expresses also his belief that such an assertion is a contradiction in terms. Professor Royce accomplishes this vindication by proving the following theses:

1. The true Infinite, both in multitude and in organization, although in one sense endless, and so incapable in that sense of being completely grasped, is in another, and precise sense, something perfectly determinate. Nor is it a mere monotonous repetition of the same, over and over. Each of its determinations has individuality, uniqueness, and novelty about its own nature.

2. This determinateness is a character which, indeed, includes and involves the endlessness of an infinite series; but the mere endlessness of the series is not its primary character, but simply a negatively stated result of the self-representative character of the whole system.

3. The endlessness of the series means that by no merely successive process of counting, in God or in man, is its wholeness ever exhausted.

4. In consequence, the whole endless series, in so far as it is a reality, must be present, as a determinate order, but also all at once, to the absolute experience. It is the process of successive counting, as such, that remains, to the end, incomplete, so as to imply that its own possibilities are not yet realized. Hence, the recurrent processes of thought reveal eternal truth about the infinite constitution of real Being,— their everlastingly pursued Other; but themselves,— as mere processes in time — they are not that Other. The true Other is, therefore, that self-representative system of which they are at once portions, imitations and expressions.

5. The Reality is such a self-represented and infinite system. And herein lies the basis of its very union, within itself of the one and the many. For the one purpose of self-representation demands an infinite multiplicity to express it; while no multiplicity is reducible to unity except through processes involving self-representation.

6. Nevertheless, the Real is exclusive as well as inclusive. On the side of its thought the Absolute does conceive a barely possible infinity, other than the real infinity, a possible world, whose characters, as universal characters, are present to the Absolute, and are known by virtue of the fact the Absolute thinks.

This brings metaphysics face to face with the notion of a Supreme Being, who is infinite or absolute. With the mystics God is infinite love, joy and wisdom to his human children. The Hindus taught that God was the infinite universe, the Other, the reality. "That (that is, the Universe) art thou," was their dictum. Christianity teaches that "God is of infinite power, wisdom and goodness," of which qualities the best of men have but a finite endowment.

The term "infinite" was introduced into geometry by Kepler in his 'Nova Stereometria Doliorum: accessit Stereometriæ Archimedeæ Supplementum.' Thus he considered a circle as formed by an "infinite" number of triangles, having their vertices at the centre, and their bases at the circumference. A cone likewise, he taught, was composed of an "infinite" number of pyramids, having their vertices at the vertex, and standing on an "infinite" number of triangular bases, bounded by the circular base of the cone. In this sense infinite means incommensurable, not to be expressed by a finite mathematical formula. Consult: Bradley, 'Appearance and

Reality'; Royce, 'The World and the Individual'; Bosanquet, 'Logic'; Couturat, 'L'Infini mathematique.'

Infin'itive, the indefinite mode in which the verb is represented without a subject. As the verb expresses an action, or a state, it generally belongs to a subject whose action or state is expressed; but if we wish to express the mere idea of this action or state we use the infinitive, which, therefore, in many languages is employed without further chance as a substantive — for instance, in Greek and German — only preceded by the neuter article; but as the verb expresses an action or state under certain conditions of time, the infinitive can also express the action or state in the present, past, or future, though these conditions are not expressed in all languages by peculiar forms. Some languages express it by some grammatical contrivance, as is the case in English, where it is denoted by *to* prefixed to the general uninflected form of the verb, as *to love* = Latin *amare; to have loved* = Latin *amavisse*. The infinitive may be regarded as the point of transition from a verb to a substantive, and is often used as the subject of a proposition.

Infinitesimal Calculus. See CALCULUS, INFINITESIMAL.

Infin'ity, and the Infinitesimal. See INFINITE.

Inflammation, a term long used to indicate the phenomena that follow mechanical, chemical, or physical injuries to living tissues. These changes have been described for centuries as rubor (redness), calor (heat), dolor (pain), and tumor (swelling), which are the phenomena particularly seen on surface inflammations. At the present time the idea is becoming fixed that inflammation is a conservative process, the phenomena attending nature's effort to rid the tissue of harmful substances. In the normal process of repair of an injury there are changes which closely resemble the milder types of inflammation; but when to a mechanical, chemical, or physical injury there is added a growth of micro-organisms, the reply on the part of the body-cells differs from the ordinary repair of injury. The changes witnessed depend upon the strength and kind of invading micro-organism and the particular tissue invaded. The first change is *hyperæmia,* a suffusion of the part with blood from capillary dilatation; following this the liquid part of the blood, the serum, is poured out into the tissues and offers its resisting powers to the poisonous substance. If these measures be insufficient, the white blood-cells called phagocytes congregate in the tissues, destroying the invading organisms, by actually consuming them and neutralizing their toxic products. During this struggle there is more or less death of the cells, called «degeneration»; large masses «slough»; the remnants of the cells and the phagocytes killed form the thick fluid called pus. When an inflammation goes on to the formation of pus, it is spoken of as *purulent* or *suppurative*. Certain poisons cause a peculiar reaction on the part of the tissues, characterized by the formation of new tissue that is unable to carry on the function of the part. This tissue is the same as the connective tissues, and the process is called *productive inflammation*. The poisons that continue to act for a long time are particularly apt to cause this reaction, and the inflammation is called *chronic* because of its permanency. Catarrhal inflammations are these same processes when they occur in mucous membranes; the appearance of these catarrhs, however, is different, owing to the peculiar structure of mucous membrane and to the fact of the epithelial covering offering excellent resistance to invasion. When death of cells occurs they can readily be cast off. Croupous inflammation is the term used to describe those in which there is considerable destruction of the superficial layers of the mucous membrane, which, with the fibrin of the blood, forms a coating or «false membrane» on the surface. Granulation tissue (q.v.) is the name applied to the tissue formed during the repair of an injury. Names are given to certain types of inflammation having a characteristic appearance to the naked eye, but microscopically there is nothing absolutely distinctive in these except their arrangement. Particular examples of these are tubercular and syphilitic inflammations.

The majority of the diseases of the body that we recognize as entities are due to inflammation in some tissue or organ, but the picture depends on the various changes in the functions of different parts of the body. The kind and virulence of the generated poison, together with the reaction on the part of the body-tissues, makes the complete picture that we seek to recognize. The treatment of inflammation is, in large part, the practice of medicine and surgery. Efforts to help the tissues combat against invasion are made with more success as knowledge is gathered of the peculiar invading forces and the natural modes of defense. It is not that we wish to combat the inflammation *per se,* but rather to make it unnecessary by helping it to a successful issue. The actual destruction of the bacteria by drugs introduced into the body is of little use, for they would be apt to cause as much destruction of the body-cells as of the invading cells; but their toxines, which cause the actual damage, we are learning to neutralize by the administration of artificially prepared antitoxins, and by placing the body and its special tissues under the most favorable conditions for developing its natural forces of resistance.

In exposed parts of the body, where antiseptics may be applied, the toxic germs may be killed, and various measures that change the blood-supply may be advantageous. Where death of tissue takes place, nature may require help in its removal. It has long been the rule to evacuate pus wherever it is formed, unless its escape from the tissues is easy.

The treatment of chronic inflammation is entirely different, as this is a process where actual structure is changed beyond repair in many instances. The all-important question is whether the tissue can carry on its proper functions; for if it can, the body need not suffer. The inflammatory process is arrested in its progress by the removal of the irritating cause, by improving the blood-supply of the part and the vitality of the body generally. These constitute the measures in general applied for the cure of chronic inflammations, it being understood that the endeavor is to place the tissues in such a condition that they may carry on their functions for the good of the whole organism; and the failure of these measures shows either that they are at fault or that the tissue-change has gone too far. Inflammation of any part is indicated by adding the suffix "itis" to the name of the organ or tissue. See BRONCHITIS, COLITIS, LARYNGITIS, MENINGITIS; etc.

DUDLEY D. ROBERTS, M.D.,
Brooklyn, N. Y.

Inflexion (Latin, *inflexio*, a bending), that process in grammar which modifies words when placed in relation to other words in a sentence. Pronominal and predicative roots are combined to form one word in the Semitic and Aryan tongues, which are therefore called inflexional, a process impossible in monosyllabic languages like the Chinese or in languages of the agglutinate order like those of the Turanian family. In grammar, cases, numbers, persons, tenses, etc., are known as inflexions, and in many instances the original affixes can be readily recognized. The Semitic and Aryan families of languages, which admit of phonetic corruption both in the root and the terminations, are called organic or amalgamating languages. The pronominal termination varies according to the person or number. Thus the Sanskrit *mi, si, ti,* the endings of the three persons singular of the present of the verb, are perhaps from the personal pronouns *ma, sva, ta,* and the persons of the plural indicate the plural number by the form of the pronominal affixes. The plural of masculine and feminine Greek and Latin nouns of the third declension is probably a contraction of the duplication of *sa*, the pronoun of the third person. The verbs *i*, to go, *as* and *fu*, to be, supply the inflexions of certain tenses of the verb, there being also a pronominal termination varying according to the person. In English the common auxiliary verbs am, do, have, shall, will, may, can, asserting respectively existence, action, possession, obligation, volition, liberty, power, assume the function of inflexions, and are themselves inflected to denote past time. In French the same inflexional law exists, the connection between the auxiliary and the root being closer than in English. *Aimer-ai,* I have to love, that is, I shall love, is compounded of the infinitive *aimer*, to love, and *ai*, I have, the first person present indicative of *avoir*. The same is the case in Italian and Spanish.

Inflores'cence, Infructescence, botanical terms referring respectively to methods of flowering and fruit-bearing. The flowering shoot, says Strasburger, frequently bears only a single flower, which may then be either axillary or terminal. In many cases, however, the metamorphosis of the generative region, which results in the production of flowers, has led to the formation of a special system of fertile shoots termed an inflorescence or, after the fruit is formed, an infructescence. (See FLOWERS; FRUIT.) Such inflorescences are wanting or ill developed among the Gymnosperms, while in the Angiosperms they are often well differentiated, constituting unities of a higher order. The modifications exhibited by the fertile shoots of such an inflorescence are due, partly to a difference in their mode of branching, partly to the reduction or the metamorphosis of their leaves. These changes are the result of an adaption to pollination, in the endeavor to aggregate the flowers and at the same time render them more conspicuous by the reduction of the foliage-leaves. Sometimes the whole system of fertile shoots is converted into an attractive apparatus, as in the *Araceæ*, where the axis and the subtending leaf of the inflorescence have assumed the function, usually exercised by the perianth, of enticing insects. Viewed from a purely morphological standpoint, two types of inflorescences may be distinguished, the Botryose (racemose, monopodial) and the Cymose (sympodial).

Influenza, la grippe; an epidemic catarrhal fever, now believed to be due to a very minute bacillus that can be found in the various secretions. Epidemics of this disease have been traced back as far as the beginning of the 16th century, and since 1741 many such epidemics spreading over portions of Europe have been described. There are so many different types of the disease, and so many parts of the body may be distinctly attacked by it that it somewhat baffles close definition. The epidemics vary much in severity as well as in type. During the last decade it has become almost constantly present over portions of the United States, in some years being much worse than in others.

So great is the variation of its symptomatology that no standard description can be given, and the types are classified according to prominent features. After one to four days of incubation, the disease usually sets in abruptly with chilliness or true rigor: this is followed by a fever (which may be constantly low or may run very high), headache and general aching, and a degree of prostration out of proportion to any discoverable cause. The respiratory form is characterized by inflammation of the nasal, the pharyngeal, the laryngeal, the tracheal, and the bronchial membranes. Starting in the nasal mucous membrane, the inflammation is apt to involve the other membranes in the order given. It is quite common for the lungs to show small spots of bronchopneumonia. There is frequently nothing to distinguish such an influenza from similar acute catarrhs of the respiratory passages except the known presence of an epidemic and the disproportionate prostration. The gastro-intestinal form is characterized by nausea, vomiting, abdominal pain and profuse watery discharge, with prostration sometimes amounting to collapse. The typhoid form is characterized by the sudden development of rather high fever (with or without severe aches and pains), general apathy, or even a low muttering delirium. The fever runs from a few days to two weeks, and may very closely resemble typhoid. The nervous form is characterized by severe pains throughout the entire body, prostration, moderate fever, but no definite affection of any part or organ. The meningeal form is characterized by headache, fear of light, pain and stiffness of the muscles of the back of the neck.

Complications and extension of the inflammation to other parts are common. Pneumonia complicating influenza is rather apt to be very severe, and in some epidemics the mortality rises very high. Pleurisy is quite common. Great disturbance of the heart's action is seen in some cases, and the poison may actually attack the lining membrane of its chambers. Less commonly there is inflammation of the eye, ear, brain, liver, intestine, or kidneys. The skin is sometimes affected, showing a general blushing rash, herpes (small painful itchy blisters), or bloody patches. A very common sequel is great nervous depression, either an inability to make bodily or mental exertion or "low spirits," even amounting to true melancholia. Unless influenza is epidemic, differential diagnosis may be very difficult, but hasty refuge in a diagnosis of "grippe" is far too common; in doubtful cases search should be made for the specific bacillus and considerable reliance placed on the presence or absence of the characteristic symptom, extreme weakness.

For the disease there is no specific treatment; the infecting organism must continue to grow until the natural defenses of the body overcome it; as yet no means has been discovered of killing the bacillus in the body or overcoming its poisons by an antitoxin. Careful isolation of the affected individual will prevent the spread of the disease to other members of the family, and much can be done for the patient's relief. Useful measures consist in securing thorough action of the bowels, keeping up the nutrition by simple, easily digested foods, and the administration of drugs such as phenacetin, acetanilid, caffeine, and bromides to relieve the distressing pains or nervous tension. The nervous exhaustion which is apt to follow is best treated by a period of mental rest, nourishing diet, and little or no bodily exertion.

Brooklyn, N. Y.

Infor'mer, a person who sues for a penalty against those who have infringed any law or penal statute. To encourage the apprehending of certain felons, guilty of offenses not so much criminal as bordering on criminality, many English statutes, from 1692 downward, granted rewards to such as should prosecute to conviction. The penalty in whole or in part inflicted in the case of a successful conviction, and immunity from certain troublesome parish offices, were the inducements held out to informers. In many cases this practice has been resorted to in modern statutes. In the United States one who informs the government of the whereabouts of smuggled goods, counterfeit money, etc., is rewarded by a fee of ten per cent of the net value of the confiscated goods. In criminal law an informer is said to turn state's evidence (q.v.).

Infu'sion, in pharmacy, an aqueous solution of a medicinal substance obtained by treating with water, usually without the aid of boiling. The water may be either hot or cold, varying with the object to be obtained. According to the directions of the United States Pharmacopœia, infusions are generally prepared by pouring boiling water upon the drug and macerating in a tightly closed vessel until the liquid cools. The active principles are in this manner extracted more rapidly and, as a rule, in much larger portions than if the solution is colder. Heat is not advisable if the active principles are volatile. If an infusion is desired of a greater degree of concentration than that obtained by the process of maceration, it is frequently prepared by percolation, in which operation the drug is sliced or broken up into small fragments, packed in a percolator, and the water, either hot or cold, is passed through. Infusions are sometimes made with the aid of other liquids than water, but this is the exception rather than the rule. Infusions do not keep well, and therefore they should be made extemporaneously and in small quantities. In household medicine, infusions are very widely employed. These may be made at home or made by the pharmacist. It is essential to remember that if they are made in hot weather in large quantities they must be sterilized.

Infusion of saline solution into the blood-vessels is a very important procedure in medicine. It is employed largely in the treatment of shock, and in severe hemorrhage, especially following operations or childbirth. The solution that is used is known as a normal salt-solution, and consists of about one teaspoonful of common salt to a pint of water. This solution should be boiled carefully for one half to three quarters of an hour, the amount of evaporating water being made up as the boiling proceeds, and after being made it should be kept in large bottles provided with cotton plugs for stoppers. In severe cases of hemorrhage, infusion has often saved life, as it provides a body of fluid on which the heart and blood-vessels can act. The salt-solution is usually introduced into one of the large veins of the arm at a temperature of one to two degrees above that of the body-temperature. See BLOOD; TRANSFUSION.

Infuso'ria, Protozoa of the classes *Flagellata* and *Ciliata,* originally so-called from abounding in organic infusions. While the term is now restricted to the ciliate protozoans, it often includes the flagellate protozoans as well. The latter are represented by the monads. These are exceedingly minute round or pear-shaped animals, which move by one or two lash-like processes called flagella. They contain a nucleus and contractile vesicles. Some of them are fixed by a stalk, and are provided with a collar, as in *Codosiga,* out of which the flagellum projects. One of the simplest monads (*Heteromita*) is obtained by placing a cod's head in water at a temperature of about 70° F. In a few days the water will swarm with these monads. The young germs will live in boiling water, but perish at a temperature of from 212° to 268° F., while the adults are destroyed at 142° F.

In the ciliate infusoria the body is more or less flattened and covered with cilia (*Paramecium,* etc.). They have on the under side of the body a slightly defined mouth (or cytostome), which is permanently open, and the food is swept into it by the action of the cilia around it. The mouth leads into a funnel-shaped throat or cytopharynx, which ends in the protoplasm of the body. The food-particles swept into this throat and pressed into the protoplasm form a small enlargement which finally sinks farther in forming the "food vacuole," which, by the flow of the protoplasm, is carried about the body, while the digestible portions are absorbed and the waste matter is cast out at a fixed point,— a sort of vent (cytopyge). The fresh-water forms have contractile vesicles, and in certain species the animal possesses so-called stinging rods (trichocysts), which are very minute and are placed vertically to the surface of the cortex: by some students they are supposed to be tactile rather than stinging structures. What correspond to the muscular fibres of the higher animals, cause the quick convulsive movements observed in these creatures. Two important organs are present in all ciliate infusoria, that is the nuclei. The larger nucleus (macronucleus) is an oval, rod-like or spiral body, which appears to control the processes of feeding and motion. The other nucleus (micronucleus) is much smaller and is concerned with reproduction. Reproduction occurs usually by self-division, and more rarely the infusorians contract into a ball and divide into spores, which grow to become adults. The periods of fission are at times interrupted by the process of conjugation, which only differs from sexual reproduction in the fact that two individual infusorians meet and fuse together and then separate, the result being a process of fertilization which leads to a complete new formation of the nucleus, and thus to a new organization of the animal. (For a more detailed account see Hertwig-Kingsley's 'Zoology' 1903.)

The more specialized infusoria are *Stentor* and *Vorticella*. The former is large enough to be seen without a lens. It is purplish, and under the microscope shows itself to be a beautiful creature. It is trumpet-shaped, with a spiral tract of thicker cilia around the mouth-end. The most highly organized infusoria are the bell-animalcules (*carchesium*, etc.), which are compound bell-shaped forms, forming colonies with forked branched stalks. The nucleus is sausage-shaped, and near it is the micronucleus. They form a white mass like mold on the stems and leaves of aquatic plants. Some of the infusoria are parasitic in the digestive and circulatory organs of the higher animals. Consult: Stein, 'Organismus der Infusions-Thiere' (1859–83); Saville Kent, 'Manual of the Infusoria' (1880–2); M. Hartog, 'Protozoa' (Vol. I., Cambridge Natural History, 1903); Ray Lankester, 'Treatise on Zoology' (1902); Hertwig-Kingsley 'Zoology' (1903).

In'galls, John James, American lawyer: b. Middleton, Mass., 29 Dec. 1833; d. Las Vegas, New Mexico 16 Aug. 1900. He was graduated from Williams College in 1855, and was admitted to the bar in 1857. In 1858 he moved to Kansas and established a law practice there. He was secretary of the territorial council in 1860, and of the State senate in 1861, and in 1862 was elected a member of the senate. In 1873 he became a member of the United States Senate, and was re-elected in 1879 and 1885. He was president pro tem. of the Senate from 1887–91. In 1891 he was again a candidate for senator, but was defeated by the Farmers' Alliance. From that time till his death he devoted himself chiefly to lecturing and writing.

Ingalls, Rufus, American soldier: b. Denmark, Maine, 23 Aug. 1820; d. 15 Jan. 1893. He was graduated from West Point in 1843, fought in the Mexican War and in 1854–5 was a member of Steptoe's expedition to the Northwest. At the outbreak of the Civil War he defended Fort Pickens, then became quartermaster of the Army of the Potomac, and was present at many of the important engagements, and at the close of the war had attained the rank of major-general. In 1867 he became quartermaster of the military division of the Atlantic, quartermaster-general of the United States army in 1882 and was retired in 1883.

Ingelow, ĭn'jĕ-lō, **Jean,** English poet and novelist: b. Boston, Lincolnshire, 1820; d. Kensington, London, 20 July 1897. Her first published work appeared anonymously in 1850 under the title 'Rhyming Chronicle of Incidents and Feelings.' It was followed by 'Allerton and Dreux: or the War of Opinion' (1851), a story, and 'Tales of Orris' (1860); but not till the publication of 'Poems,' in 1863, did Miss Ingelow become famous. This volume won the enthusiastic praise of critics and the instant approval of the public, and passed through 23 editions. The most widely appreciated poems in it are 'The High Tide on the Coast of Lincolnshire'; 'Songs of Seven'; 'Divided'; and 'Supper at the Mill.' Later volumes were: 'Studies for Stories' (1864); 'Stories told to a Child' (1865); 'A Story of Doom, and Other Poems' (1867); 'Mopsa the Fairy' (1869); 'Off the Skelligs' (1872), her first long story; 'The Little Wonder Horn' (1872), a new series of stories told to a child; 'Fated to be Free' (1875); 'Sarah de Berenger' (1880); 'Don John' (1881); and 'John Jerome' (1886). A third volume of verse, 'Monitions of the Unseen' was published in 1885. Her works have been even more popular in America than in her native country.

Ingeman, Bernhard Severin, Danish poet and novelist: b. Torkildstrup, on the island of Falster, 28 May 1789; d. Soro 24 Feb. 1862. He was educated at the University of Copenhagen, and it was while a student there that he published his first 'Poems' (1811–12), of a dreamy, melancholy nature, showing the influence of German romanticism, and displaying the unhealthy state of his body and mind. In 1814 he published a long allegorical poem, 'The Black Knights,' which showed a marked advance. The next six works which he produced were plays, the tragedy 'Blanca,' brought out in 1815, being the most popular and successful, though 'The Miraculous Child Reinald' (1816) was undoubtedly the best. 'The Subterranean Ones, a Story of Bornholm,' his first prose work, was written in 1817, and the following year he started on a tour of the Continent, returning in 1819. On his return he wrote his 'Stories and Miraculous Tales,' which was published in 1820, followed in 1821 by a comedy, 'Magnetism in a Barber's Shop,' which, however, was unsuccessful, and thereafter he confined himself to prose work. In 1822 he accepted the chair of Danish language and literature at the Academy of Sorö, and then began his voluminous writings on historical subjects, his novels probably being inspired and copied from the Waverley novels, by Scott. The subjects and characters were taken from Danish history, and, while they were to a great extent inaccurate, were possessed of such strong nationality that they became of great interest. Among these historical romances were 'Valdemar the Victorious' (1826); 'Erik Menved's Childhood' (1828); 'King Erik and the Outlaws' (1833); 'Prince Otto of Denmark and his Time' (1835). From 1837–9 he wrote a collection of 'Evening and Morning Songs,' which became very popular on account of their great beauty of religious expression. From this time until his death his writings were mainly religious, and the last of his works, 'The Apple of Gold,' was published in 1856. His collected works in 41 volumes were published in Copenhagen (1843–65).

Ingenhousz, Jan, Dutch physician and scientist: b. Breda, Holland, 1730; d. Bowood, the seat of the Marquis of Lansdowne, England, 7 Sept. 1779. He studied medicine, and after practising in his own country for several years removed to London in 1767. In 1769 he was appointed aulic councilor and body physician to the Austrian Empress, Maria Theresa, and to Joseph II. After serving for 10 years in that capacity he returned to London, where he began his scientific researches, later becoming a fellow of the Royal Society, and publishing in their 'Transactions' several treatises and essays. Among these were 'Experiments on Vegetables, Discovering Their Great Power of Purifying the Common Air in Sunshine, but Injuring it in the Shade, or at Night' (1779); 'Anfangsgründe der Electricität' (1781); 'Essay on the Food of Plants and the Renovation of Soils' (1796). Dr. Ingenhousz is credited with being the discoverer of the use of carbonic acid for medicinal purposes, and he also invented the plate electrical machine.

Ingersoll, ing'gėr-sŏl, **Charles Jared,** American statesman, lawyer, and author; son of Jared Ingersoll (q.v.): b. Philadelphia 3 Oct. 1782; d. there 14 May 1862. After finishing his collegiate course he studied law, was admitted to practice, traveled in Europe, and became attached to the American embassy to France. In 1812 he was elected to Congress, taking his seat in May 1813. In 1815 he was appointed United States district attorney for Pennsylvania, an office which he held until 1829. Shortly after he was elected to the legislature of Pennsylvania. He was a member of Congress 1841–7 as representative of one of the districts of which the county of Philadelphia was then composed. He was the author of the poems 'Chiomara' (1800), and 'Julian' (1831); and of 'Inchiquin — the Jesuit's Letters on American Literature and Politics' (1810); 'Historical Sketch of the Second War between the United States and Great Britain' (1845–52); etc. Consult Meigs, 'Charles Jared Ingersoll' (1896).

Ingersoll, Ernest, American naturalist: b. Monroe, Mich., 13 March 1852. He studied at Oberlin College and in the Lawrence Scientific School and Museum of Comparative Zoology of Harvard University, where he was a pupil of Agassiz, and in 1874 and 1877 was connected as naturalist with the Hayden survey. He was also an expert on the United States fish commission, and later became known as a popular writer and lecturer on scientific subjects. In 1901 he was lecturer in zoology at the University of Chicago. Among his works are: 'Nests and Eggs of North American Birds' (1880–1); 'Oyster Industries of the United States' (1881); 'Knocking 'Round the Rockies' (1883); 'Country Cousins' (1884); 'The Crest of the Continent' (1884); 'Down East Latch-Strings' (1887); 'Wild Neighbors' (1897); 'The Book of the Ocean' (1898); 'Nature's Calendar' (1900); 'Wild Life of Orchard and Field' (1902); and also 'The Ice Queen,' and several other popular juvenile tales.

Ingersoll, Jared, American politician: b. Milford, Conn., 1722; d. 1781. Upon the passage of the Stamp Act he was appointed, in 1765, a stamp agent in Connecticut, and accepted the post by the advice of Franklin. This subjected him to the personal abuse and insults from which all colonial stamp agents suffered, and finally he was forced to resign, later, in 1770, becoming an admiralty judge. He wrote and published a pamphlet called 'The Stamp Act' (1776).

Ingersoll, Jared, American lawyer: b. Connecticut 1749; d. Philadelphia 21 Oct. 1822. Having been graduated at Yale College in 1766, he went to London, was entered of the Middle Temple, and passed five years in the study of law. The American Revolution breaking out while he was still in London, he espoused the cause of the colonies, although the son of a loyalist. He went from London to Paris, where he remained for 18 months, making the acquaintance of Franklin. Returning home, he took up his residence in Philadelphia, where he won almost immediately a prominent position as a lawyer. In 1787 he was chosen one of the representatives of Pennsylvania in the convention which framed the United States Constitution. Twice attorney-general of the State, he was United States district attorney for Pennsylvania, and was in 1812 the federal candidate for Vice-President of the United States.

Ingersoll, Joseph Reed, American lawyer and politician: b. Philadelphia, Pa., 14 June 1786; d. there 20 Feb. 1868. After graduating from Princeton in 1804, he took up the practice of law in Philadelphia. He was a Whig member of Congress from 1835–7, and again from 1842–9. In 1852 President Fillmore appointed him minister to England, a post which he held for only a year. He wrote 'Secession a Folly and a Crime,' which appeared just previous to the outbreak of the Civil War; also a 'Memoir of Samuel Breck' (1863).

Ingersoll, Robert Green, American lawyer, lecturer and author: b. Dresden, N. Y., 11 Aug. 1833; d. Dobb's Ferry, N. Y., 21 July 1899. He received a common school education and was admitted to the bar in 1854. He soon became prominent in the courts and in Democratic politics. In the Civil War he recruited the 11th Illinois cavalry and entered the army as its colonel. On 29 Nov. 1862, while trying with a force of 600 men to intercept a Confederate raiding party, he was captured by a force of 10,000 men, but was soon paroled and given command of a camp in Saint Louis. He soon afterward resigned. After the war he became a Republican, and was made attorney-general of Illinois in 1866. He was a delegate to the Republican National Convention in 1876 and placed in nomination for President James G. Blaine, whom he termed "the plumed knight." His nominating speech gave him national reputation as an orator, and he afterward lectured frequently. He was an agnostic, and in his lectures attacked the Bible and the beliefs of the Christian religion. He was prominent in politics for several years, and had he not given such frequent expressions to his agnostic views he would doubtless have been honored with high offices. He took up his permanent residence in New York city in 1882 and practised law there till his death. His most famous lectures include 'Some Mistakes of Moses'; 'The Family'; 'The Liberty of Man, Woman, and Child'; 'The Gods'; and 'Ghosts.' His publications include 'Lectures Complete' (1886); 'Prose, Poems and Selections' (1888); and 'Great Speeches' (1887). A complete collection of his works was published in 1900.

Ingersoll, Canada, town in Oxford County, Ontario, on the Thames River and the Grand Trunk railway, 19 miles northeast of London. It is the marketing centre for a rich grain and fruit-producing section, and has an important trade in lumber, grain, cheese, and general country produce. It has manufactures of iron products, machinery, agricultural implements, woolen goods, woodenware, lumber, and creamery products; banks, and weekly newspapers. Pop. (1901) 4,573.

Ingham, Benjamin, English evangelistic leader: b. Ossett, Yorkshire, 11 June 1712; d. Aberford 1772. He received his education at Batley School and at Queen's College, Oxford, whence he graduated B.A. in 1733. In 1735 he was ordained, and, becoming associated with John Wesley, went with him to Georgia, remaining two years. In 1737 he went with the Wesleys on a visit to the Moravians in Germany, and became so strongly attached to their doctrines that he broke with the Wesleys and founded in Yorkshire several congregations of what were known as «Moravian Methodists,» but more commonly as «Inghamites.» He endeavored to unite in this organization the chief doctrines of the Moravians and Methodists, and so successful was he as bishop or general overseer that in a few years there were 84 of these congregations in England. He moved to Aberford about the time of his marriage with a sister of the Earl of Huntingdon in 1741, and succeeded in converting the whole surrounding neighborhood to his faith. In 1759, however, the greater part of his followers deserted him and went over to Sandeman, and in 1760 Ingham himself joined the Sandemanians and the Inghamites disappeared.

Ingham, Charles Cromwell, American painter: b. Dublin, Ireland, 1797; d. New York 10 Dec. 1863. He was a pupil of William Cunning at the Dublin Academy, came to New York in 1817, was there a founder of the National Academy of Design (1826), and its vice-president in 1845–50. De Witt Clinton and Lafayette were among his subjects. His works include: 'Day Dreams'; 'The White Plume'; 'The Death of Cleopatra.'

Ingham, Samuel Delucenna, American politician: b. Bucks County, Pa., 16 Sept. 1779; d. Trenton, N. J., 5 June 1860. He was for some time in the Pennsylvania legislature, and was then sent to Congress, 1813–18, and again 1822–9. In the interim he was appointed prothonotary of the courts of Bucks County, but resigned in 1819 to become secretary to Gov. Finley. On 6 March 1829 President Jackson appointed him secretary of the treasury, a position he continued to hold till 1 Aug. 1831.

Ingleby, Clement Mansfield, English author and Shakespearean critic: b. Edgbaston, near Birmingham, 29 Oct. 1823; d. Ilford, Essex, 26 Sept. 1886. After graduating from Trinity College, Cambridge (B.A. 1847; M.A. 1850) he entered into partnership with his father, but in 1859 gave up his law practice and moved to Ilford, where he began writing for the magazines on scientific and metaphysical subjects. His best known works are his Shakespearean studies, among which are 'The Shakespere Fabrications' (1859); 'Shakespere Controversy' (1861); 'Shakespeare's Centurie of Prayse, etc.' (1874); 'The Still Lion' (1874; new edition 1875, entitled 'Shakespere's Hermeneutics'); 'Shakespere: the Man and the Book' (1877–8). He also wrote 'Outlines of Theoretical Logic' (1856); 'An Introduction to Metaphysics' (1864–9); etc.

Inglis, ĭng'lz, **Charles,** American Anglican bishop: b. New York 1734; d. Halifax, Nova Scotia, 1816. He was ordained priest in England, and in 1765 became assistant minister at Trinity Church, New York. A stout loyalist, he refused to omit from the service the prayer for the king and royal family, and upon the occupation of New York by Washington retired for a time to Long Island. In 1777 he was chosen to the rectorship of Trinity, and in 1783, at the evacuation of New York by the British, went to Halifax in the emigration of the United Empire loyalists. He was consecrated in 1787 bishop of Nova Scotia (with jurisdiction over the other North American provinces), and was the first missionary bishop of the Church of England. He published sermons and pamphlets.

In'got, a small bar of metal formed by casting it in molds. The term is chiefly applied to the bars of gold and silver intended for coining.

Ingraham, ĭng'gra-am, **Duncan Nathaniel,** American naval officer: b. Charleston, S. C., 6 Dec. 1802; d. there 16 Oct. 1891. He entered the navy as midshipman in 1812, and became a captain in 1855. While in command of the sloop-of-war St. Louis he arrived at Smyrna 22 June 1853, and was informed that Martin Koszta, Hungarian by birth, but entitled to the protection of the United States, was a prisoner on board the Austrian brig of war Hussar, then lying near the St. Louis. Ingraham went on board the Hussar, had an interview with Koszta, and learned that he had resided a year and 11 months in New York, where he took the usual oath of allegiance to the United States in July 1852, and was in possession of a legalized copy of a declaration of his intention to become an American citizen; that he had come to Smyrna from New York on business; that on the afternoon of 21 June he was seized by a party of armed Greeks, employed by the Austrian consul-general, carried on board the Hussar, where he was held in close confinement. Ingraham accordingly, on 2 July, at 8 A.M., demanded of the Austrian commander the release of Koszta by 4 P.M., declaring that he would otherwise take him by force. At 11 o'clock the Austrian consul-general proposed to deliver Koszta into the hands of the French consul, to be held by him subject to the disposition of the consuls of the United States and Austria, and not to be delivered without their joint order. As this proposition gave sufficient assurance of the personal safety of Koszta Ingraham accepted it, and the Hungarian was set at liberty. The conduct of Ingraham was fully approved by the government, and Congress by joint resolution, 4 Aug. 1854, requested the President to present a medal to him for his conduct on this occasion. In 1860 he resigned from the United States navy, entered the Confederate service and became a commodore.

Ingraham, Joseph Holt, American novelist: b. Portland, Maine, 1809; d. Holly Springs, Miss., December 1866. After a brief experience of mercantile life he became teacher in Washington College, Natchez, Miss., and in 1836 published his first book, 'The South-West, by a Yankee.' Thenceforth he produced in rapid succession 'Lafitte'; 'Burton, or the Sieges'; 'Captain Kyd'; 'The Dancing Feather'; and other romances of small literary merit, some of which attained a large circulation. He subsequently entered the Episcopal ministry and was rector of a parish and of St. Thomas's Hall, an academy for boys, in Holly Springs, Miss. He still continued to write, publishing 'Prince of the House of David' (1855) and the 'Pillar of Fire' (1859); 'The Throne of David,' which were widely popular, but nearly worthless from a literary point of view.

Ingraham, Prentiss, American soldier and author: b. Adams County, Miss., 22 Dec. 1843. He was educated at Jefferson College (Miss.), also studied medicine at the Mobile Medical College, entered the army of the Confederate States in 1861, fought later with Juarez in Mexico, with the Austrian army in the war with Prussia, and in the ten-years' war for independence in Cuba. Subsequently he entered a literary career, and published a great quantity of fiction, including: 'Without Heart' (1878); 'Zuleikah' (1887); 'Red Rovers on Blue Waters' (1890); 'The Vagabond' (1891); and 'The Wandering Jew of the Sea' (1891).

In'gram, John Kells, English educator and author: b. County Donegal, Ireland, 7 July 1823; d. Dublin 1 May 1907. He was educated at Trinity College, Dublin, and was appointed professor of oratory and English literature there in 1852, Regius professor of Greek in 1866, and librarian in 1879. At one time he was vice-provost of the college, and also held the presidency of the Royal Irish Academy. His 'History of Political Economy,' originally printed in the 9th edition of the 'Encyclopædia Britannica,' was separately published in 1888 and widely translated. He further wrote: 'A History of Slavery and Serfdom' (1895); 'Sonnets and other Poems' (1900); 'Human Nature and Morals according to Auguste Comte' (1901), etc.

Ingres, Jean Dominique Auguste, zhŏṅ dō-mē-nēk ō-güst ăṅg-r, French historical painter: b. Montauban 15 Sept. 1781; d. Paris 14 Jan. 1814. Placed in the school of David he made such rapid progress that at 20 he had gained in two successive years the first and second prizes of the Academy of Fine Arts. In 1806 he departed for Italy, where he passed nearly 20 years, abandoning, under the influence of a close study of Raphael and the old masters, the dry, classic style acquired from David His works are numerous, and comprise generally serious historical and classical subjects; in the great exhibition of 1855 at Paris an entire salon was appropriated to them. Many are in the Louvre, on the ceiling of one of the apartments of which is painted his 'Apotheosis of Homer.' He painted the portraits of many distinguished personages, from Napoleon I. downward. The art of Ingres is adjudged to hold a middle place between the classic and the romantic schools.

Inhala'tion, in medicine, a mode of applying remedies directly to the respiratory tract. Either steam alone, steam charged with drug-vapors, or drugs finely subdivided in sprays, are breathed into the air-passages as deeply as possible. This method of medication is useful only in relieving inflammations of the upper air-passages and possibly the trachea and larger bronchi. The air in the smaller bronchi is not changed by breathing, but by the diffusion of gases, so that substances in aërial suspension are deposited on the surface before reaching the smaller divisions of the bronchial tubes. Steam does not penetrate far, but is cooled, and deposits moisture as far as the trachea. The old-fashioned croup-kettle and many devices for carrying out the same idea are used for the first stages of laryngitis. Many substances, such as tincture of benzoin, etc., are added to the boiling water, but render it no more efficacious. Instead of conducting the steam directly to the mouth and nose by a funnel or tube, it may be well to place the patient in a simply enclosed tent, formed of bedclothes, and to allow the steam to charge the confined air. This method is particularly advisable for infants and older children.

Inher'itance, in law, a perpetual or continuing right to an estate invested in a person and his heirs. There are nine «canons of inheritance»: three may be quoted: (1) That inheritance shall, in the first place, descend to the issue of the last purchaser in *infinitum;* (2) That the male issue shall be admitted before the female; (3) That where two or more of the male sex are in equal degree of consanguinity to the purchaser, the eldest only shall inherit, but the females all together.

Inheritance Tax, an assessment laid upon those made heirs of property, either by distribution or descent. Sometimes this assessment is confined to collateral heirs, when it is called collateral inheritance tax. The raising of public funds in this way has been sanctioned by legislation from the beginning of Roman law, and in England and other countries is a large and steady source of revenue, although such taxes have been stigmatized by certain economists as «death duties.» During the Civil War taxes of this kind were made part of the internal revenue system of the United States, but abolished soon after the struggle ended. The rate and method of assessment vary in different countries, and in different States of the Union. The English inheritance tax ranges from a 1 to a 10 per cent assessment, in accordance with the amount of the inheritance and the degree of relationship of heirs. In the United States lineal, collateral and succession inheritance taxes have been instituted in several States, as a source of domestic revenue. In Connecticut the assessment on inherited property is 5 per cent on all sums and values above $1,000. In Delaware the assessment ranges from 1 to 5 per cent, according to the amount of property left, and the degree of relationship. In Illinois, 1 per cent on values over $20,000 to lineal descendants; 2 per cent to 5 per cent on all amounts to collateral relations. In Maryland, 2½ per cent on all legacies and successions. In New York, 1 per cent on all property over the amount of $10,000 to lineal heirs, 5 per cent on all amounts over $500 to collateral relatives. In Ohio, 5 per cent on all values over $500. In

Virginia, 5 per cent in every case. Several States leave untaxed the property descending or distributed to the lineal descendants, and place assessments of varying percentage on the amount or value of the legacy which falls to collateral heirs. These are California, Maine, Massachusetts, Minnesota, New Jersey, Tennessee, West Virginia. Inheritance laws have in the United States occasioned much discussion and litigation, but their justice and utility have been testified to by experience and the decision of the law courts. The economists of the present and other periods have seen the scientific propriety of such legal provisions, and have noted the uniformity with which they deal with all classes of the financial community.

In'ia, a genus of toothed cetaceans similar to dolphins, but placed on structural grounds in the allied family *Platanistidæ*, with the freshwater dolphins of the Ganges and the La Plata. The single species (*I. groffrensis*) is called bouto and tucuxi, and is found in some of the upper tributaries of the Amazon, and in the lakes near the Cordilleras. It measures about eight feet in length, has a long cylindrical snout with stiff hairs, and a very slight dorsal fin. It feeds chiefly on fish, and is hunted for the sake of its oil.

Initiative. See Referendum.

Injunc'tion, a writ issued by a court of equity, bidding, or forbidding, a person or persons to do a certain thing. The injunction originated in Roman law, and was anciently known as an interdict, a name it still bears in Scottish practice. It was introduced as a remedy for some of the abuses of common law, and as a preventive, when evasion of common law provisions seemed possible. It is to-day one of the most potent of the legal remedies of an equitable character which stand on the statute books.

There are three main divisions in the purposes for which a writ of injunction is issued. A writ may be prohibitive, protective, or restorative. In the first place it may forbid the commission of certain acts of a civil nature which are charged with injustice. Second, it may be so framed as to protect such civil rights of an individual or a corporation as seem to be threatened. Third, it may order the restitution or restoration of such rights as have unlawfully been taken away from an individual or a corporation. These characters of the writ have been clearly expounded by Blackstone, as follows:

"This writ may be had to stay proceedings at law, whatever stage they may have reached; to restrain alienations of property *pendente lite*, and tenants for life and others having limited interest from committing waste. It may be granted to restrain the negotiation of bills of exchange, the sailing of a ship, the transfer of stock, or the alienation of a specific chattel, to prohibit assignees from making a dividend, to prevent parties from removing out of the jurisdiction, or from marrying, or having any intercourse, which the court disapproves of, with a ward. The infringement of a copyright or a patent frequently calls for the exercise of this beneficial process; which may also be had to restrain the fraudulent use of trade marks, or of the names, labels, or other indiciæ of the makers or vendors of goods and merchandise, and in a large class of cases, far too numerous to be mentioned here."

The first two kinds of injunction are most commonly used, and a familiar example of the prohibitory writ is that which orders the abatement of a nuisance. A railroad which lays tracks without first gaining the right of way may be compelled by injunction to remove them. By such a writ patent rights, copyrights and trade marks are secured from infringement, or proceedings in a court of law are stayed. Sometimes a court of equity issues an injunction prohibiting litigants within its own jurisdiction from prosecuting a suit in another jurisdiction; for example, a United States court may restrain creditors for suing in State courts for the enforcement of their claims against a bankrupt, and reserve the disposition of his estate to its own jurisdiction. A court of equity only issues a writ of injunction when a remedy of law appears inadequate to give the wronged party the complete relief to which he is entitled. Thus in recent cases the courts have issued writs forbidding labor agitators and others from inducing or coercing workingmen, in such a way as to bring on a strike to the injury and damage of employers, who might thus be induced to sacrifice their rights in order to escape ruin or irreparable loss.

An injunction in the United States may be preliminary or perpetual. A preliminary writ is sometimes styled interlocutory, as it is issued *pendente lite*. The preliminary writ may be made perpetual, if, after arguments made and heard, the court decides that the grounds advanced for the continuance are valid, and have been so proved by evidence. Failure to obey an injunction is punishable as a contempt of court (q.v.) Consult Beach, 'Treatise on the Law of Injunctions' (1895).

Injunction, Government by. See Government by Injunction.

Injunction, Theatrical, a term applied to a mandate issued by a court of equity, to compel or prevent the performance of some act for which money damages would not properly compensate the injured party. Relief by injunction in matters pertaining to theatricals is probably more frequently sought than in any other business or profession, and precedents in law established in this class of cases has become of considerable importance. At first, courts of this country and England refused to grant injunctions against actors for the purpose of compelling them to perform their contracts, a learned justice saying: "The Court could not regard as law the old adage that 'a bird that can sing and will not sing must be made to sing.'" But latterly, when the service of an actor became recognized and it was made to clearly appear that an actor or singer, by intelligence, education and other artistic accomplishments and talents, was of extreme importance to one who had invested money in the production of a play or opera, it was held that a court of equity would by injunction enforce a covenant in a contract. But this has simply gone to the extent of compelling a fulfilment of the contract, or forcing the artist to remain idle during its term. The services of every actor will not be enjoined. He must actually possess some exceptional merit, so that his services may be termed special, unique and extraordinary, and it must be shown they cannot be fulfilled by any other person without injury to the employer. In the case of Lumley *v.* Wagner, the courts of England enjoined Johanna Wagner, a prominent prima donna of the early 50's from appearing at Covent Garden Opera House, London, in violation of her contract with Lumley; and then for the first time the British courts asserted their authority over contracts of actors, and granted an injunction forbidding her rendering professional services for any but her original employer.

In the United States, the Federal courts recognized the right of a manager to have the exclusive services of his employee, and in McCall *v.* Braham an injunction was granted which prevented Lillian Russell from violating her contract. In the State courts, the case of Augustin Daly *v.* Fanny Morant Smith (49 How. Pr. 150), Superior Court Justice Freedman also appreciated the fact that the ancient rule had been abrogated and the modern one compelling actors to live up to their agreements, as other individuals, was there enforced. The contract must unquestionably be fair. The rights of both parties to it must be equal. In other words, if the contract gives the manager the right to terminate it by giving notice before the expiration of the contract, a like right of termination must also be given the actor; and as stated before, the actor's services must be special, unique and extraordinary. In this latter connection, it seems uncertain where to draw the line. In the case of Carter *v.* Ferguson the court refused to grant an injunction to Mrs. Leslie Carter against William J. Ferguson, an actor, saying that his services were not so special and unique as to warrant a court of equity's interference. In Charles Hoyt *v.* Loie Fuller, the court granted an injunction against the dancer, holding that a serpentine dance in the performance of which she became famous, warranted the court's interference by injunction. In George Edwardes, the London manager, *v.* Cissie Fitzgerald, the New York Supreme Court granted an injunction against Miss Fitzgerald, on the theory that a certain wink of her eye used in a play was of special merit, and a drawing card. In Harris *v.* Sparks, an injunction was granted against John Sparks, the Irish comedian, the ground being that his portrayal of an Irish character was special, unique and extraordinary. While in the still later case of Shubert Brothers *v.* Aimee Angeles, imitations given by the performer were considered so special, unique and extraordinary as to warrant the granting of an injunction. Each case, however, must be determined by its own peculiar circumstances. In the most recent case — Harrison Grey Fiske *v.* Tyrone Power— the court refused to grant an injunction against Tyrone Power, although his ability as an actor was exploited in the newspapers; on the ground that his services were not so special, unique and extraordinary, as to justify an injunction. But in guarding the rights of an actor, the courts will see that no advantage has been taken of him by the manager, and that the manager for whom he is to perform is of such financial responsibility as to insure the salary of the actor. In the case of Rice *v.* D'Arville, Edward E. Rice, the theatrical manager, sought to restrain Camille D'Arville from performing for others; but on the defense that Rice was insolvent and indebted to her on a previous contract, Justice Oliver Wendell Holmes, then of the Massachusetts Supreme Court, would not compel her to perform for Rice.

Injunctions in the theatrical profession are not confined to actors and actresses, but are often invoked to prevent the piracy of a play or the use of a name. Where a play, or a scene from a play, has been copyrighted, the Federal courts alone have jurisdiction of the matter, and will by injunction prevent anybody from performing or producing it as their own. When there has been no copyright the common law protects the work, so well as its title; and the use of a similar name, or a name which is apt to deceive the public into the belief that it is the one already used by an author, will likewise be enjoined. A recent instance is the case of Charles Frohman *v.* Arthur Fraser, where the use of the title "Sherlock Holmes" was enjoined, this name having been adapted by William Gillette as the title of a play, notwithstanding the name had been used by A. Conan Doyle as the title of his novel. In that case the court held that Mr. Gillette having first used the name in connection with a theatrical production was entitled to all emoluments arising from it. Notwithstanding the numerous attempts to avoid the principles of law applicable to this class of cases, it matters not whether it is the actor who is involved or the theatrical manager, the American courts are humane, equitable, just and careful, and invariably zealously guard the interests of those engaged in the theatrical profession, so well as those engaged in any commercial business. See INJUNCTION; GOVERNMENT BY INJUNCTION; COURT; EQUITY; CHANCERY; CONTEMPT; LAW; etc.

Ink, a colored liquid used for writing and printing. They are of various classes, as writing and copying, black or colored, India, printing and lithographing inks.

For long ages past the best black writing-ink has been made by mixing together solutions of nutgalls and of ferrous sulphate of iron, known as green vitriol, and holding in colloidal suspension, by aid of a gum, the colored substance produced. The gallo-tannic acid present in a freshly prepared solution of galls, upon exposure to the air, changes gradually largely into gallic acid, and the protoxide of iron changes into peroxide. The color of this changed product is much deeper than that of the original mixture. It has been found that the permanency of the writing is greater if the ink is used before this conversion is fully completed. The change is held in check by having present in the ink a slight amount of some free volatile acid such as hydrochloric. The trace of acid also serves to hold the iron color in the state of colloidal suspension or solution. The moulding to which such an ink is liable is checked by adding to it a trace of some antiseptic, such as carbolic acid. All known commercial substitutes hitherto used for nutgalls in black writing-ink produce a fluid somewhat inferior to that from nutgalls.

An exhaustive scientific investigation of the chemistry of ink to determine the best ingredients and the proportions to be used of the same for the producing of the most permanent black writing-ink has been made in Germany by Osw. Schluttig and Dr. G. S. Neumann, and published in their work on 'Die Eisengallustinten,' issued by Zahn & Jaensch of Dresden in 1890. Their conclusions were followed in preparing the specifications for the official "Standard Record Ink" required under the laws of Massachusetts to be used on all the public records in that state. The same specifications have since been adopted by the U. S. Treasury for the ink used in that department. This ink has also been adopted by the Danish government for its official records. The specifications, which were prepared by Dr. Bennett F. Davenport of Boston, as ink expert for the State of Massachusetts, it is to be noted are for the required quality of the ink, and not for the compounding of it. The specifications are as follows:

It must be a gallo-tannate of iron ink, not inferior in any essential quality to a typical standard for comparison which has been properly prepared after the following formula, in which all the ingredients are of the quality prescribed by the United States Pharmacopœia, and the per cent of true acid present in the sample of tannic acid used has been determined by the Loewenthal and Schroeder method.

Take of pure, dry Tannic Acid, 23.4 parts by weight; crystal Gallic Acid, 7.7 parts; Ferrous Sulphate, 30.0 parts; Gum Arabic, 10.0 parts; diluted Hydrochloric Acid, 25.0 parts; Carbolic Acid, 1.0 part; Water, sufficient to make up the mixture at the temperature of 60° F. to the volume of 1000. parts by weight of water.

Inks submitted will be subjected to the following tests, as compared with the typical normal standard ink described above: (1) A fluid ounce allowed to stand at rest in a white glass vessel, freely exposed in diffused daylight for two weeks to the light and air, at a temperature of 50° to 60° F., protected against the entrance of dust, must remain as free from deposit upon the surface of the ink or on the bottom or sides of the vessel. (2) It must contain no less iron, and must have a specific gravity of 1.035 to 1.040 at 60° F. (3) It must develop its color as quickly. (4) After a week's exposure to diffused daylight the color must be as intense a black when used upon the standard record paper, and it must equally resist changes from exposure to light, air, water, or alcohol. (5) It must be as fluid, flow as well, strike no more through the paper, nor remain more sticky immediately after drying.

To such an ink a slight amount of some one of the water soluble coal-tar colors is usually added to give the desired initial color to the ink when used in writing.

Cheaper grades of black writing-ink are produced by substituting for the nutgalls other tannin containing substances, or by using logwood. In these other iron salts, or salts of other metals are sometimes used, as of copper, aluminum or chromium. For special purposes some of these have certain advantages. For copying, for instance, the ink made from logwood with alum cake and chromate has the highest efficiency known. This ink, however, fades out after a few years' exposure to the open air and daylight.

Within modern times colored liquid solutions have come much into general use as inks, made up with aniline and other dyestuff colors. They are easily and cheaply made, flow nicely from the pen, and allow of a great variety as to choice in coloring, but none of them have the permanency of the ancient nutgall iron ink on exposure to light and air.

The usual basis of commercial marking inks, for use on textile fabrics, is some salt of silver. The permanent color of this ink is developed through the action of light, heat or some chemical, after the ink has been applied. The usual basis of India ink is an exceedingly finely divided solid carbon, mixed with a size to hold it in suspension when the ink is prepared for use by being ground up with water. The usual base used for printers' ink is a linseed-oil varnish. To this the desirable color is imparted by the use of lampblack, or some other coloring substance.

Manual' (1904); Fehling, 'Handwörterbuch Chemie' (1903) vol. VII.; Haldane, 'Workshop Receipts,' series 2 and 5.

Bennett F. Davenport, M.D.,
Expert on Written Documents, the Writing, Ink and Paper.

Ink'berry, or **Winterberry,** a shrub (*Ilex glabra*) of the holly family which grows upon the Atlantic coast of the United States. It is a fine evergreen, two to four feet high. Its stems are slender and flexible, and its leaves, about an inch in length, are lanceolate in form, of leathery texture, and present a shining upper surface. It bears small, very black berries. Formerly its bark and leaves were used medicinally, especially in fevers. For bouquets and decorative purposes it is much valued, and finds a ready market in large Eastern cities.

Inkerman, ĭnk-ĕr-män', Russia, a village on the site of a ruined town in the Crimea, at the head of the harbor of Sebastopol, 35 miles by rail southwest of Simferopol. It gives its name to the sanguinary battle fought on the heights overlooking the town, on 5 Nov. 1854, when the Russians unexpectedly attacking the British camp were repulsed with great slaughter, losing in killed 3,000 and in wounded 6,000, the loss of British and French allies being 850 killed and 3,500 wounded.

Inlay'ing is the art of ornamenting flat surfaces of one substance by inserting into them pieces of some other substance. Various kinds of metal or wood, or pearl, ivory, etc., are employed in this process, which is now applied chiefly to the production of ornamental articles of furniture. When wood of one color is inlaid with others of different colors, as in ornamental devices in flooring, it is generally called marquetry, the various pieces of wood being usually disposed in regular geometrical figures. The art of inlaying iron or steel with other metals, as gold or silver, is called damascening. Buhl and reisner work, once highly prized, have lost much of their celebrity. The former took its name from Buhl, an Italian resident in Paris in the reign of Louis XIV., and the latter was designated after Reisner, a German who not long after settled in the same city. Buhl for the most part inlaid brass on tortoise-shell, Reisner a dark wood on a tulipwood ground. The usual instrument for cutting out veneers for inlaying is a fine saw, mounted in a bow or arched handle, and worked in short quick movements. Three or four veneers are sometimes cut simultaneously in this way. Inlaying with stone, in which the Florentines have long excelled, is called *pietra dura*, and differs from mosaic in having the holes not cut through the ground, which is commonly of black marble, but only to a regulated depth.

The best work of this kind is now produced at St. Petersburg, the art being stimulated by encouragement from the Russian government. An Indian variety of inlaying, in which the inlaid metal occupies more of the surface than that which forms the ground, is called *Kuftgari;* and in another variety, *Tutenague* or *Bederywork,* small pieces of silver are hammered into spaces previously cut in the ground, which consist of one part of copper to four of pewter, and is thus both hard and easily cut. See MOSAIC.

In'man, Henry, American artist: b. Utica, N. Y., 20 Oct. 1801: d. New York 17 Jan. 1846. From early boyhood he manifested a taste for art, and in 1814 Jarvis, the portrait painter, offered to receive him as a pupil, and he was bound an apprentice for seven years. Upon the conclusion of his apprenticeship he devoted himself to portrait painting. Among his most characteristic portraits are those of Chief Justice Marshall and Bishop White. He painted also landscape, genre, and history. In 1844 he visited England, where he was the guest of Wordsworth, whose portrait he painted, and at whose suggestion he executed his 'Rydal Water,' near the poet's residence. During his residence in England he also painted portraits of Dr. Chalmers, Lord Chancellor Cottenham, and Macaulay.

Inn, a river of Europe which issues from a lake at the foot of the Rhætian Alps, flows northeast through the deep and narrow valley of the Engadine, in the Swiss canton of the Grisons, enters the Tyrol at Martinsbruck, passes Innsbruck, Hall, and Kuffstein, and shortly after enters Bavaria. At Mühldorf it turns east till it receives the Salza, where it begins to form the boundary between Austria and Bavaria, and joins the right bank of the Danube at Passau, after a course of over 300 miles.

Inn and Innkeeper. In Great Britain inns are houses where travelers are furnished, for the profit of the provider, with everything they have occasion for while on their journey, and may be set up without license by any person, provided he refrains from selling excisable liquors, which of course require a license. Hotels, public-houses, taverns, victualing-houses, and coffee-houses are all inns when the keepers of them make it their business to furnish travelers with food and lodging: otherwise they are not. In the United States there are no inns, but hotels in cities and taverns in rural districts. See HOTELS IN AMERICA; TAVERNS.

Innate Ideas, certain notions or conceptions declared by many philosophers to be given to the mind of man when he first receives conscious being. Their existence has been much disputed by philosophers. The term innate, as applied to ideas, was first used by Descartes. As his definition failed in precision, the doctrine of Descartes was assailed by Hobbes and Locke. As afterward more strictly stated by himself, his views were as follows: An innate idea is not one that presents itself always to our thought, for there could be no such idea; but we have within ourselves the faculty of producing it. He has nowhere given an enumeration of the ideas that he considers innate, though he attaches particular importance to that of infinity, which he makes the foundation of his proofs for the existence of God. What the followers of Descartes designate innate ideas, those of Cousin term universal, necessary and absolute. Some of the greatest names in European philosophy are associated with the discussion of this theory, or of cognate theories, as Clarke, Newton, Malebranche, Kant, etc.

Innes, ĭn'ĕs, Alexander Taylor, Scottish jurist: b. Tain, Ross and Cromarty, Scotland, 18 Dec. 1833. He was educated at Edinburgh University, was admitted to the Scottish bar in 1870, appointed advocate-depute in Scotland in 1881, and served under later Liberal governments. Among his works are: 'The Law of Creeds in Scotland' (1867): 'Church and State: A Historical Handbook' (1890); 'Studies in Scottish History' (1892): a life of Knox in the 'Famous Scots' series (1896): 'The Trial of Jesus Christ' (1899): and 'The Law of Creeds' (1902).

Inness, George, American painter: b. Newburg, N. Y., 1 May 1825; d. Bridge of Allan, Scotland, 3 Aug. 1894. His art education began in boyhood and when 16 years of age he learned map engraving. He first attempted nature sketching in 1843, when he showed such promise that he was admitted into the studio of Regis Gignoux, New York; but soon opened a studio for himself and through the liberality of a patron was enabled to visit Europe. After spending 15 months in Italy and one year (1850) in France he finally made his home at Eagleswood, near Perth Amboy, N. J. He is looked upon as the first among American landscape painters, and was not only a clever and imaginative interpreter of the scenery among which he lived, but a man of intellect, a thoughtful yet bold theorist on art subjects and an incisive critic. He had a keen appreciation of American scenery, and the sky and atmosphere of the eastern States were sympathetically portrayed with an earnestness that recalls the sentiment of the Fontainebleau-Barbizon school. His early paintings are distinguished by conscientious care for detail, vivid perception of color, and the panoramic breadth of a bold and unconventional originality. After 1878 his style had ripened, and his technique grew simpler and less highly elaborated. He was willing to sacrifice all cleverness of touch in handling detail for the sake of portraying the emotion, or transitory effect of light and cloud in a landscape, the perturbation of storm or wind, the pageant of sunset, or the magic calm of a moonlight scene. In such productions his command of color was very remarkable. His pictures are much prized by connoisseurs, and when offered for sale command high prices. Five of them are in the Metropolitan Museum of Art, New York. Among the finest are: 'Under the Greenwood'; 'Close of a Stormy Day'; 'Pine Groves of Barberini Villa'; 'An Autumn Morning'; 'Autumn Gold'; 'The Edge of the Forest'; 'Passing Storm'; 'Moonrise'; 'Winter Morning, Montclair, New Jersey.'

Inness, George, Jr., American painter: b. Paris, France, 5 Jan. 1854. He is the son of George Inness (q.v.), the landscape painter. He was a pupil of the elder Inness at Rome in 1870–4, of Bonnat at Paris in 1875, began to exhibit at the National Academy in 1877, and became a member of the National Academy of

Design in 1899. In 1899 he obtained a gold medal at the Paris Salon. His manner is forcible, and skilful in color. His work includes landscapes and animal subjects, among them: 'The Pride of the Dairy' (1878); 'Pasture at Chemung'; 'A Mild Day' (1887); and 'Morning on the River' (1902).

In'nocence. A wildflower. See HOUSTONIA.

In'nocent, the name of thirteen popes, as follows:

Innocent I., Saint: b. Albano; d. 12 March 417. He succeeded Anastasius I. as Bishop of Rome in 402. He supported Saint Chrysostom (q.v.) when the latter was driven from his see of Constantinople through the machinations of the Empress Eudoxia. Rome was pillaged by Alaric in 410, during his pontificate. He is commemorated by the Roman Catholic Church on 28 July.

Innocent II. (GREGORIO DE' PAPI, or PAPARESCHI, grā-gō-rē'ō dā pä-pē pä-pä-rĕs'-kē): b. Rome; d. 23 Sept. 1143. He was elected pope in 1130 by a part of the cardinals, while the others elected Peter of Leon, who took the name of Anacletus. Innocent fled to France, where he was acknowledged by the Council of Etampes, by Louis VI., and soon after by Henry II. of England; also by the Emperor Lothaire, who conducted him in 1133 to Rome, where he occupied the Lateran, while Anacletus occupied the Castle of Crescentius, the Church of St. Peter, and a large part of the city and maintained himself against Innocent until his death in 1138. He held the second Ecumenical Council in the Lateran, which condemned Arnold of Brescia and his heresy, declared all the decrees of Anacletus null, and excommunicated Roger of Sicily, who had supported the latter. Roger, however, obliged Innocent to acknowledge him as king, absolve him from excommunication, and invest him and his heirs with Apulia, Calabria, and Capua.

Innocent III. (GIOVANNI LOTHARIO CONTI, jō-vän'nē lō thä'rē ō kōn'tē): b. Anagni, Italy, 1161: d. Perugia, Italy, 16 July 1216. On the death of Celestine III. (1198) he was unanimously elected at the age of 37. Innocent, in the vigor of manhood, endowed by nature with all the talents of a ruler, possessed of an erudition uncommon at that time, and favored by circumstances, was better qualified than any of his predecessors to elevate the Papal power. By his clemency and prudence he gained over the inhabitants of Rome, obliged the imperial prefect to take the oath of allegiance to him, and directed his attention to every quarter where he believed that a Papal claim of property or of feudal rights existed. He concluded treaties with many cities of Tuscany for the mutual protection of their liberties and those of the Church, and soon obtained possession of the ecclesiastical states in their widest extent. He excommunicated Philip Augustus, king of France; laid the kingdom under an interdict in 1200 because Philip had repudiated his wife Ingeburga, and obliged the king to submit. He was still more decided in his treatment of John, king of England, who refused to confirm the election of Stephen Langton as Archbishop of Canterbury. Innocent laid the kingdom under an interdict, and in 1212 formally deposed him. John was finally obliged to submit, resigned his territories to Rome, and received them as a Papal fief from Innocent. All Christendom acknowledged the Pope's spiritual sovereignty; two Crusades were undertaken at his order, and his influence extended even to Constantinople. Innocent was one of the greatest Popes and rulers. It has been said of his rule, as of that of Gregory VII., whom he most resembles, that in those times the power of the Pope was salutary as a bond of union for Europe, in which the still firmer bond of a common civilization and knowledge did not, as at present, exist. In 1215 he held a council, the fourth Lateran and twelfth general which passed the decree making confession and communion obligatory at Paschal time. Frederick II. was acknowledged as German emperor, and the Franciscan and Dominican orders were confirmed.

Innocent IV. (SENIBALDI DI FIESCHI, sā-nē-bäl'dē dē fē ĕs kē): d. Naples 7 Dec. 1254. He became Pope in 1243 and was perpetually at feud with the German emperor Frederick and his successors.

Innocent V. (PIETRO DI TARENTASIA, pē-ā'trō dē tä-rĕn-tä'sē-ä): b. 1225; d. Rome 22 June 1276. His pontificate lasted only from 20 January to 22 June of the year 1276.

Innocent VI. (ETIENNE D'ALBERT, ā-tē-ĕn däl bār): b. Brissac, France; d. 12 Sept. 1362. His pontificate extended from 1352 to 1362, and during this period the Papal residence was at Avignon.

Innocent VII. (COSMO DE' MIGLIORATI, kōs'mō dā mē-glō-rē-ä'tē): b. Sulmona, Abruzzi, Italy, 1366; d. Rome 6 Nov. 1406. He was Pope from 1404 till his death, but was opposed by the antipope, Benedict XIII., who held his court at Avignon.

Innocent VIII. (GIOVANNI BATTISTA CIBO, jō-van'nē bät-tēs'tä chē'bō): b. Genoa 1432; d. 25 July 1492. He became Pope in 1484 and was for some time at war with Ferdinand of Naples and held the sultan Bajazet's brother Zelim a prisoner.

Innocent IX. (GIOVANNI ANTONIO FACCHINETTI, jō-vän'nē än-tō-nē'ō fä-chē-nĕt'tē): b. Bologna, Italy, 1519; d. 30 Dec. 1591. He occupied the papal chair only from the 29th of October preceding his death.

Innocent X. (GIOVANNI BATTISTA PAMFILI, jō-vän'nē bät-tēs'tä päm-fē'lē): b. Rome 7 May 1574; d. 6 Jan. 1655. In 1629 he was elevated to the cardinalate and became Pope in 1644. Under him the temporal and spiritual power of the papacy was greatly increased. In 1651 he condemned the Treaty of Westphalia and he formally condemned Jansenism in 1653.

Innocent XI. (BENEDETTO ODESCALCHI, bā-nā-dĕt'tō ā-dĕs-käl'kē): b. Como, Italy, 1611; d. 12 Aug. 1689. He served in his youth as a soldier in Germany and Poland, took orders later and rose through many important posts, until he was elected Pope in 1676, on the death of Clement X. He was eminent for his probity and austerity; zealously opposed nepotism and simony, and restrained luxury and excess. He condemned the New Testament of Mons and several other Jansenistic works. He also anathematized sixty-five propositions drawn from the works of modern Casuists and condemned

Molinos and the Quietists. He determined to abolish the right of asylum exercised in Rome by foreign ambassadors; but Louis XIV. would not yield to so just a claim, occupied Avignon, and imprisoned the papal nuncio in France; in consequence of which the authority of the Pope received a severe blow by the IV. Propositiones Cleri Gallicani in 1682. These disputes were highly favorable to the English Revolution, as it induced the Pope in 1689 to unite with the allies against James II., in order to lower the influence of Louis XIV.

Innocent XII. (ANTONIO PIGNATELLI, ān-tō-nē'ō pēn-yā-tĕl'lē): b. Naples 13 March 1615; d. 27 Sept. 1700. He became archbishop of Naples, a cardinal in 1681 and Pope in 1692. During his pontificate Louis XIV. and the French bishops revoked the Declaration of the French clergy, and submitted to the judgment of the Holy See in the matters in dispute during the pontificate of Innocent XI.

Innocent XIII. (MICHELANGELO CONTI, mē-kĕl-ān'jē-lō kōn'tē): b. Rome 15 May 1655; d. 7 March 1724. In 1695 he was made archbishop of Tarsus, and became a cardinal in 1707. He was also made bishop of Viterbo in 1712 and succeeded Clement XI. in the papal chair in 1721.

Innocents, Feast of Holy, variously styled Innocent's Day and Childermas, a festival generally observed on the 28th, but in the Eastern Church on 29 December, in commemoration of the massacre of the children at Bethlehem, «from two years old and under,» by the order of Herod, with the purpose of destroying among them the infant Saviour. The Church of England at the Reformation retained it in its ritual among its anniversary festivals. St. Cyprian refers to these children as martyrs, as does St. Augustine with still greater explicitness. It is to them that the hymn of Prudentius, 'Salvete Flores Martyrum,' is addressed.

Innocents Abroad, The, a famous book of travels by Samuel L. Clemens («Mark Twain»). In a vein of highly original humor this widely-read book records a pleasure excursion to Europe, the Holy Land, and Egypt, in the sixties. Descriptions of real events and the peoples and lands visited are enlivened by more or less fictitious dialogue and adventures.

In'novators, a name applied in Great Britain to educational reformers who, in the 19th century, succeeded in having corporal punishment abolished in public and private schools. The novels of Charles Dickens, particularly 'Nicholas Nickleby,' and 'Oliver Twist,' had much to do with the origin of the reform movement.

Inns of Court are certain societies in Great Britain exclusively invested with the right to call to the bar. The colleges of the English professors and students of common law are called inns, the old English word for the houses of noblemen, bishops, and others of extraordinary note, being of the same signification as the French *hôtel*. The opinion is, that societies of lawyers, which before the Conquest held their chief abodes for study in ecclesiastical houses, began to be collected into permanent residences, soon after the court of common pleas was directed to be held in a fixed place,— a stipulation which occurs in the great charters both of King John and Henry III. In these houses exercises were performed, lectures read, and degrees conferred. The inns of court are governed by masters, benchers, stewards, and other officers, and have public halls for dining, readings, etc. In London the four inns of court are: the Inner Temple and Middle Temple (formerly the dwelling of the Knights Templars, and purchased by some professors of law more than three centuries since); Lincoln's Inn and Gray's Inn (anciently belonging to the Earls of Lincoln and Gray). Each inn is self-governing, and all have equal privileges.

Innsbruck, ĭns'brook, or **Innspruck** (ancient ŒNIPONTUM; locally called SCHPRUCK), Austrian town and capital of the Tyrol, beautifully situated 59 miles north of Munich, on the banks of the Inn, near the confluence of the Sill, and almost in the centre of the valley of the Inn (Inntbal), the sides of which are enclosed by mountains several miles distant, but so lofty (7,000 to 8,500 feet) as apparently almost to overhang the town. In consists of the town proper, situated on the right bank of the river, and of five suburbs. It is for the most part well built. The houses are generally of a limestone breccia, and from four to five stories high, and built in the Italian style. The buildings most deserving of notice are the Hofkirche, containing the tomb of the Emperor Maximilian I., one of the most splendid monuments of the kind in Europe, though he himself is not interred in it; and the tomb of Hofer; the Church of St. James, with a painting by Lucas Cranach; the Jesuits' church, considered the handsomest in the town; the Capuchin church, with good paintings; the new palace, built by Maria Theresa, a very extensive edifice, with gardens which stretch along the side of the Inn, and form an excellent promenade; the old palace, in which the Archdukes of Tyrol and several of the German emperors used to reside; the university, founded in 1677, and re-established in 1826, well endowed, provided with a library, botanical garden, and cabinet of natural history, and attended by about 1,000 students; a gymnasium, and several other important educational establishments; and the museum, called Ferdinaudeum, rich in all the productions both of art and nature within the limits of the Tyrol. The manufactures include woolen, silk, and cotton tissues, gloves, glass, etc. As the capital of the Tyrol, Innsbruck is the place of assemblage for its states, and the seat of superior appeal, civil, and criminal courts, and of many important public offices. Many of the spots in the immediate vicinity have become memorable for the noble exploits which the Tyrolese peasantry performed in the war of Independence. Pop. (1890) 23,325.

Innuits, ĭn'ū-ĭts. See ESKIMOS.

I'no, daughter of Cadmus and Harmonia, second wife of Athamas, king of Thebes, drew upon herself the anger of Hera by nursing Dionysus, the son by Zeus of her sister Semele. In order to favor her own children she projected the murder of her stepchildren, Phryxus and Helle, who saved themselves by flight. Hera, still more highly incensed, made Athamas, the husband of Ino, mad, and he dashed his eldest son by Ino, against a rock. Ino fled with her youngest son, Melicertes, and threw herself with him into the sea. Ino and Melicertes were made sea deities at the prayer of Dionysus. Ino was worshipped under the name of Leucothea.

Inocarpus, ĭ-nō-kär'pŭs, a genus of leguminous plants, having unifoliate leaves and yellow flowers in axillary spikes. *I. edulis* is the South Sea chestnut, native of Tahiti. It is a large tree, with luxuriant foliage, the delicate evergreen leaves being six inches or more in length. It furnishes seeds or nuts much valued in the South Sea Islands, the inhabitants gathering them while green, and mashing them for food.

Inocula'tion. See INFECTION; VACCINATION.

In'osit ($C_6H_{12}O_6$), (from Greek *is, inos,* a nerve, a muscle), a saccharine substance found in the muscular tissues of the heart, as well as liver, brain, kidneys, etc. It appears both in health and, to an abnormal amount, in disease. It exists also in a number of plants, such as foxglove, potato, kidney-bean, acacia, asparagus, cabbage. See GLUCOSE.

Inouye Kaoru, kä-ō'roo ē-nō-oo'yā, **Count,** Japanese statesman: b. in Choshiu 1839, pupil of Yoshida Shoin. With Ito (q.v.), in 1862, he went secretly to Europe, and returning in 1864 became an unswerving exponent in Japan of the ideas lying at the root of Western civilization. Surviving the wounds made by reactionary assassins, he has, since 1868, served his country in various high positions, as the mikado's minister at home and as envoy abroad, especially in Korea. As minister of the interior he began the rebuilding of Tokyo from wood to brick. His famous memorial of 1873 called for moral improvement. For seven years, as head of the foreign office, he was active in treaty revision. He was created a peer in 1885, and again called to the office as minister of the interior in 1892, and retains the emperor's confidence as one of the surviving "elder statesmen," whose word in Japan is law. See KATSURA.

Inquiline, ĭn'kwĭ-lĭn, a term applied in zoology to animals which live as tenants within the nests or homes of other animals. The use of the term is almost entirely confined to entomology and then often restricted to the cases in which the rightful and the intruding tenants are closely related. Similar cases among other animals are commonly designated as commensalism (q.v.), but these and similar terms are used rather loosely. Examples of the inquiline relation occur among the termites, ants, and bees, but are known especially among the gall-flies (*Cynipidæ*); indeed, one entire division, comprising more than 500 species, is named *Inquilinæ*, because of the predominance of this mode of life. These insects differ but little in structure from the true gall-flies, but they lack the power to produce galls and consequently deposit their eggs within those of other species. They infest certain species of galls, as those of the blackberry and some oak-galls, in large numbers and sometimes more than one kind occur in a single gall. Perhaps the most remarkable feature of these inquilines is their frequent close resemblance to the insect which produces the gall which they infest.

Inquisi'tion, a tribunal or system of tribunals instituted by the Roman Catholic Church for the discovery, examination, and conviction of heretics and their punishment by the secular arm. Under the successors of Constantine in the Roman Empire the repression of heresy, or rather the enforcement of the decrees of church councils and synods, was a function of the imperial government, which inflicted temporal penalties upon the propagators of religious beliefs that contradicted the creeds approved by the State. When the reigning emperor was a favorer of Arianism or any other of the heterodox creeds, the orthodox bishops and their flocks were persecuted: when he was of the orthodox party the heterodox sects were put under the ban. In executing the decrees of the councils the imperial officials, called in the laws of Theodosius and Justinian "inquisitors" (*inquisitores*), were assisted by the bishops; but the tribunals were the ordinary secular courts, and judgment was rendered in the name of the State, not the Church. But in the 12th century, when the supremacy of the ecclesiastical power was universally recognized in western Europe, the initiative in the work of repressing heresy was taken by the Church as of course, and the discovery, trial and conviction of the offenders were functions of the ecclesiastical power solely: the secular power simply executed the judgments of the church tribunals. Boniface VIII.'s definition of the respective powers and the mutual relations of church and state was not proclaimed till the close of the 13th century; but had a similar definition been promulgated in the 12th century it would have expressed the universal sentiment of princes and peoples at the time. The celebrated bull, *Unam Sanctam*, defines that "Both swords, the spiritual and the temporal, are in the power of the Church; yet the one is to be wielded for the Church's behoof, but the other by the Church herself: the one by the hand of the priest, the other by that of the king and the soldier, though at the will and sufferance of the priest *ad nutum et patientiam sacerdotis*. And sword must be subordinate to sword — *oportet gladium esse sub gladio*, and the temporal authority subject to the spiritual power — *temporalem auctoritatem spirituali subjici potestati.*"

The first step toward the establishment of courts of inquisition would seem to have been taken in 1179 when the third council of the Lateran issued a decree of excommunication against the adherents of the heretical sects of southern France, who are charged not only with holding abominable heretical tenets but also with practising "unheard-of cruelties against the Catholics," demolishing the churches and massacring widows and orphans. The council grants "an indulgence of two years to those who shall make war on them." This decree was re-enforced by the Council of Verona (1184) over which Pope Lucius III. presided, and at which the Emperor Frederic I. assisted: the Council directs the bishops to bring to trial persons accused of heresy and to inflict fit punishment on the guilty. The fourth Council of the Lateran (1215), held in the reign of Innocent III., imposed on the bishops the duty of making a visitation of their dioceses twice or at least once a year either personally or by delegates to see that the Church's laws be enforced. Bishops are authorized to bind the inhabitants of a district by oath to search out heretics and bring them to trial. By the Council of Toulouse (1229) in the pontificate of Gregory IX. the search for heretics (*inquisitio hæreticæ pravitatis*) was systematized. The bishops are to name for each parish two or three respectable laymen who shall take oath zealously to search out heretics and to deliver them up to the *baillis*. Whosoever knowingly conceals a heretic loses all his goods. If heretics are discovered on the estate of a land-owner, he incurs the penalties: the house of the heretic shall be torn down. Heretics who recant have to seek a new abode, and must wear on their clothing two crosses of different colors until the Pope or his legate permits them to assume the ordinary garb. Whoever abstains from use of the sacraments is held suspect of heresy. A person convicted or suspect of heresy is debarred from the practice of medicine. Lest the ordinary church authorities should be remiss in carrying out this system Gregory IX. named (1232) as "pontifical inquisitors" monks or friars from outside, chiefly Dominicans; shortly after the pontifical inquisitors were chosen from the order of the Dominicans exclusively. Thus the duty of inquisition was taken out of the hands of the bishops and was discharged by officials responsible only to the Pope; from the judgments of the inquisitorial tribunals there was no appeal but only to the Holy See: in 1263 Urban IV. appointed an inquisitor-general for Provence, as a means of lowering the flood of appeals to Rome. The institution passed from southern France into the other provinces of that kingdom and into Italy, Germany and Poland. The Inquisition in England was directed by the metropolitans and their suffragans without being responsible to any inquisitor-general: but as long as Lollardism disturbed the peace of the Church the search for heretics was prosecuted rigorously: bishops and archdeacons were required twice a year to make inquisition of suspects: any man might be compelled under penalties to inform against persons suspected of heresy; the statute *de haeretico comburendo* was enacted by the Parliament in 1396.

In Spain the Inquisition, as set up in 1481 by Ferdinand and Isabella, was as much (or more) a political as an ecclesiastical institution: the officials from highest to lowest were appointed by the sovereigns and its action was directed by them without responsibility to the Holy See: Ranke calls the Spanish Inquisition "a royal tribunal furnished with spiritual weapons"; Llorente admits as much. The number of persons put to death under sentence of the Inquisition in Spain is put by Llorente at 31,000 from first to last, that is during 330 years. But Llorente made it impossible to check his statements by burning the original documents. Ranke impeaches his honesty; Prescott says that his estimates are "most improbable." Catholic historians call attention to the fact that not only heresy, but many other offenses against the laws were judged by the courts of inquisition in Spain, viz: polygamy, seduction, unnatural crimes, smuggling, witchcraft, sorcery, false personation, etc. At the time when the Inquisition flourished, persecution for heresy was a universal practice amongst all Christian peoples, and the methods of punishment inflicted were general throughout Europe. Protestant England persecuted as harshly and vigorously as Catholic Spain, and in both countries denial of the state religion was equivalent to treason.

Insane Asylums, Cottage System, or Village Plan. A form of construction for insane asylums and charitable institutions, much in vogue at the present time, in which large and imposing buildings are replaced by detached cottages. The cottages vary in size from those which will accommodate six to a dozen patients to larger ones which will accommodate 20 or more. They are usually constructed either in groups or along streets and avenues as a village. In the former, the several groups are given up to a particular industry as a farm group, where the patients are employed at farming, and others, as the garden, the brick yard, shop industries, etc., all of these being a part of one institution on a single large estate. In the village plan the institution is laid off in streets and avenues, and has the appearance of an ordinary village, each cottage having a flower garden in front, shade trees, etc. In either plan, there is conveniently located near the centre of the plant an administration building, a hospital for the sick and those requiring special care, a bakery, a laundry, and other utility buildings. The cottages may be constructed of wood or other material, and the cost of construction is small as compared with the old plan of asylum construction. It is, besides, more homelike, more convenient for administration and permits of indefinite expansion. Some of the best known institutions constructed on this plan are Alt-Scherbitz near Leipsic: Gabersee near Munich, Germany; the Saint Lawrence State Hospital at Ogdensburg, N. Y., and the Craig Colony for Epileptics at Sonyea, N. Y.

Insanity, a disease of the brain characterized by disorder or derangement of the mental faculties. This is its strictly pathological or scientific definition. Therefore, according to this definition, any disease of, or accident to, the brain whatsoever, provided such disease or accident caused any derangement of the mental faculties, howsoever trifling or temporary, would furnish an example of insanity. Thus a blow on the head causing unconsciousness, or a fever giving rise to delirium, is an example of an affection of the brain characterized by disorder of the mental faculties. Practically, however, the term insanity is limited to a group of affections of the brain which is more distinctly fixed, and the members of which it will be the object of this brief sketch to define.

Causes.— The causes of insanity are many and various, and the chief of these are the following: Heredity, infection, poisoning, traumatism or injury, overwork or exhaustion, and mental and moral shock or strain. Of importance also are age, sex, race, and nationality.

Of all these causes the most important undoubtedly is heredity. As Krafft-Ebing, the German alienist, has well said, there is no ground, except in tuberculosis, upon which heredity shows itself more distinctly than in the case of mental disease. Statistics have been compiled by various authors to show as nearly as possible the exact prevalence of heredity in insanity, but the results have not been altogether in harmony. In fact, it is extremely difficult to determine this factor in many cases in which it has been active, and this is so for two reasons: in the first place many patients and their friends conceal or deny a hereditary taint, and in the second place not a few patients and their friends, are really ignorant of their family histories beyond a generation or two. How many persons can tell accurately of what their grandparents died? The more this subject of heredity in insanity is investigated the more reason there is to believe that its importance has been underestimated rather than the reverse. And yet as a factor in causation it is much more common in some forms of insanity than in others — a fact which will be emphasized later in this article. Some authorities have limited heredity to the direct line of descent, ignoring collateral lines; but obviously this restriction cannot be maintained. And yet, if the attempt is made to trace a neurotic taint through collateral lines, the difficulty is greatly increased. the subject is vastly broadened, and, from the medico-legal standpoint, the inquiry becomes greatly involved. In mental heredity, moreover, it is not so much the particular disease that is passed on from parent to offspring, as it is the predisposition; and this predisposition, often called neurotic, is not the result entirely of insanity in the ancestry, but may be shown by a family history of other grave nervous disorders, such as epilepsy, hysteria, neurasthenia, and imbecility. This is a fact not sufficiently apprehended by the laity.

Infections of various kinds may act as causes of insanity. The most important of these is syphilis, and this acts especially to cause that form of insanity known as general paresis. The various infectious diseases, such as typhoid fever, septicæmia, smallpox, cerebro-spinal meningitis and, in minor degree, some others, may cause mental alienation. Post-febrile insanity may follow typhoid fever; and puerperal insanity may be due in part to a septic infection.

Poisons of various kinds may be very active causes of insanity. Chronic lead poisoning may give rise to a well-known form of delirium or mania; so in minor degree may mercury. But the most potent and most common of all poisons in the etiology of mental disease is undoubtedly alcohol. And this poison acts in two ways, for it may not only induce insanity in the individual, but it also is most active in causing that hereditary predisposition to insanity in the offspring to which reference has already been made. In fact, the subject of heredity is not a little involved with the subject of alcoholism in the progenitor.

Traumatism, or injury, may act as an exciting cause of insanity. This is true especially of injuries to the head. Trauma acts most readily in conjunction with other causes, such as alcoholism and syphilis. Injuries to other parts of the body, especially when associated with great shock, as in severe railroad accidents, may lead to various forms of mental alienation.

Overwork and exhaustion from any causes whatever may predispose to, or directly cause, a mental breakdown. This is true especially in cases in which the blood is depleted, the nutrition of the nervous system impaired, and the mind harassed with care and anxiety. These causes are most active in persons otherwise predisposed, as by alcoholism, syphilis or heredity.

Mental and moral shock and strain, such as sudden loss, grief, fright, mortification, intense religious and political excitement (as in the French Revolution), long continued anxiety, and the harassment of uncongenial surroundings, as in the home-life, may all act as causes of insanity.

The above are the chief categories of causes, but they do not exhaust the subject. It is in fact too extended for brief treatment. Finally, it must be borne in mind that in any individual case not one but a combination of several of the above causes has usually been active.

Classification.— Almost every alienist of repute has attempted a classification of the forms of insanity. The subject is one of peculiar difficulty, owing largely to the fact that our intimate knowledge of many of these various forms is far from complete. One of the most satisfactory schemes is the one by Krafft-Ebing, and is as follows, slightly abridged:

"A."

MENTAL DISEASES OF THE DEVELOPED BRAIN.

I. Diseases without Anatomical Lesions, or Functional Diseases.
  (1) Psychoneuroses, or diseases of a brain otherwise sound.
    1st. *Melancholia.*
      a. Simple Melancholia.
      b. Stuporous Melancholia.
    2d. *Mania.*
      a. Maniacal Exaltation.
      b. Frenzy.
    3d. Stupor, or Acute Dementia.
    4th. Hallucinatory Delirium.
      Note.— The above affections are primarily curable, but the worst of them may terminate in chronic incurable forms and in dementia.
  (2) Degenerative Insanities: Affections of a brain endowed with a morbid predisposition.
    1st. Constitutional Affective Insanity.
    2d. Paranoia.
      a. Congenital.
      b. Acquired. This form includes various subgroups according to the character of the delusions entertained by the patient.
    3d. Periodical Insanity.
    4th. Mental Affections arising from the constitutional neuroses.
      a. Neurasthenical.
      b. Epileptic.
      c. Hysterical.
      d. Hypochondriacal.

II. Organic Insanities or Mental Diseases with Recognizable Lesions in the Brain.
    1st. Acute Delirium.
    2d. General Paresis.
    3d. Cerebral Syphilis.
    4th. Senile Dementia.
      Note.— Chronic Alcoholic Insanity and Morphinism may yet have to be added to this group.

"B."

MENTAL AFFECTIONS OF THE UNDEVELOPED BRAIN.

Idiocy and Imbecility.

This scheme by Krafft-Ebing, while not without defects, is excellent for practical purposes and until someone can devise a better. Its great merit is that it is flexible: it readily admits new forms. Its defect is that it draws too sharp a distinction between the so-called functional and the organic insanities; and between the psychoneuroses and the constitutional forms. The truth is, all insanities are organic; and a constitutional taint may be present in the psychoneuroses.

Following this classification we note the following forms of insanity:

A. The whole group of insanities as distinct from idiocy is included under this head, and as a first great subdivision comes:

1. Mental Diseases without recognizable anatomical lesions: Functional Diseases. As

was inferred above, this whole group is only tentative in one sense, because as scientific knowledge advances it is found more and more that insanity in all its forms depends upon anatomical changes. For the present, however, this group may be allowed, with some reservation, to contain the following:

(1) The Psychoneuroses. In these forms the mental disease is such as can happen in a person with an otherwise perfectly normal brain. It is in a sense fortuitous, and not dependent necessarily upon a hereditary taint. Given the same causes, and it may be presumed that any person might develop a psychoneurosis, just as he might develop a fever. By this it is not implied, however, that heredity cannot act to predispose to these forms.

Melancholia is marked by depression. The affective or emotional, rather than the intellectual, faculties are involved. The patient has a sense of personal unworthiness; in other words, the depression centres about the patient's ego. He is not so much concerned about his misfortunes or his troubles, as about his unworthiness. Neither is he concerned about other persons: he is entirely self-centred. This may be said to be the keynote of melancholia. Delusions of a depressive character, as of having committed the unpardonable sin, may be present. The depression may become so profound and overwhelming that the patient passes into a stuporous or atonic state. (*Melancholia Attonita.*) In this state the physical functions, such as appetite, digestion, and nutrition, may be correspondingly depressed. Suicide may result. In some cases the patient is restless under the burden of his mental suffering (*Melancholia Agitata*).

Mania is marked by exaltation. The intellectual faculties are much more involved than in melancholia, and the patient is active, loquacious, sometimes destructive and combative, or else gay. He is somewhat incoherent, and his delusions are not well-defined, but fleeting and changeable in accord with his varying moods and disordered thoughts. The physical functions suffer as a result of exhaustion from over-activity. *Frenzy* is only a higher degree of mania, in which the mental functions are in entire disorder from over-excitation. Exhaustion is rapid.

Stupor, as its name indicates, is a psychosis in which the predominant tone is one of profound subversion of all the mental functions. *Acute Dementia* is another term for it. The patient may recover from a most unpromising state, especially in the case of young persons. *Dementia Præcox* is such a form, although the prognosis is not always good. *Primary* Dementia occurs without preceding acute stages.

Hallucinatory Delirium is a form of acute insanity marked by confusion and by the presence of hallucinations of sight and hearing. *Confusional* insanity is a term sometimes used, especially for the types which occur after acute infection, such as post-febrile insanity, and some forms following child-birth.

All these psychoneuroses may, in unfavorable cases, pass into chronic forms, and terminate in incurable dementia.

(2) The Degenerative Insanities.

In these forms mental deterioration is engrafted on a constitutional defect. Heredity plays a great part. The patients have been born with the neurotic predisposition. Their insanity is simply a logical evolution of a badly organized nervous system.

The great type of this form of insanity is *Paranoia.* The chief characteristic is the formation of systematized delusions. At first these may be of a persecutory tinge: the patient believes that he has enemies, who plot against his welfare or his life. He has hallucinations, especially of hearing. In a second stage, the delusions acquire a more expansive type: the patient believes that he is some great personage. As preliminary to all this, there is often a long career of moral and mental perversion: the patient has been noted as erratic, eccentric, visionary, and even immoral. He usually has displayed but little real brain power or steadiness, but often an intense egotism and a lack of common sense. Innumerable varieties and several stages occur. From this class are recruited in large part the criminal insane. These patients are the monomaniacs of the older writers, and they include also the moral lunatics, pyromaniacs and kleptomaniacs of more recent systematists. Among them are found also the victims of obsessions, morbid impulses and fixed ideas. The paranoiacs are the dangerous lunatics, and the prognosis is not favorable.

Periodical Insanity is a form of constitutional insanity in which, as the name indicates, there is a tendency to recurrence. This recurrence is sometimes in cycles (*Circular* Insanity), in which there is a period of maniacal exaltation, followed by one of melancholic depression, and then a somewhat prolonged period of apparent recovery, to be followed again by the morbid cycle. With every recurring cycle, however, the patient deteriorates somewhat, and may eventually degenerate into chronic insanity.

In the constitutional nervous diseases, such as Epilepsy, Hysteria, Hypochondria, and Neurasthenia, there are often mental changes of a morbid type, and these give rise to the forms of insanity named in accord with these respective neuroses. The symptoms vary widely in the several diseases.

II. In the organic insanities, so-called, the disease is marked by recognizable changes in the brain-structure.

Acute Delirium, or Bell's mania, is an acute infectious disease of the brain, of unknown origin, and of rapid progress, usually terminating fatally. It is marked by confusion and delirium, passing into coma and death. The changes in the brain are of an inflammatory kind.

General Paresis, or Dementia Paralytica, is caused by a progressive infectious or destructive process in the brain substance. Its dependence on syphilis is no doubt close, and it is further induced by alcoholism, dissipation and overwork. It is marked by change of character, erratic conduct and loss of mental and moral control, passing on into a stage of expansive delusions with progressive dementia. There are also characteristic speech defects, changes in the ocular muscles and in the gait, with increasing feebleness and paralysis. Various crises occur, such as maniacal, epileptoid and apoplectic, and in the last stage the patient is paralyzed and demented. Death is the inevitable result in the vast majority of cases.

In *Cerebral Syphilis* there is a characteristic inflammatory process beginning in the coats of the small blood-vessels. Mental symptoms occur in great variety, also many forms of paralysis.

Senile Dementia is a form of deterioration occurring in old age, and is dependent primarily on changes in the blood-vessels in the brain. Progressive failure of mental powers, with occasional delusions, is the chief feature. In some cases paralytic and epileptic crises occur.

B. Finally we have the great group in which the mental affections are the results of arrest of development of the brain. These are not included in insanity proper by systematic writers, but are regarded as a group apart. This group includes Imbecility and Idiocy, and is defined under the latter head.

No attempt has been made in the above classification to include various debatable forms. Among such forms are *Hebephrenia* (occurring in adolescence) and *Katatonia* (a psychoneurosis with both melancholic and confusional symptoms), and some others about which alienists are not yet agreed. The list must still remain open.

Pathology.— In the group of organic insanities it has been pointed out that these diseases rest upon a recognizable anatomical basis: thus in general paresis the structural changes in the blood-vessels and tissues of the brain are so marked and so well studied that this disease may be said to have as well known a morbid anatomy as pneumonia. But this is true of very few of the insanities, and the above classification is constructed largely on the distinction between forms of insanity with, and those without, well-defined anatomical changes. But while such changes cannot in many cases be detected even with the most powerful microscope, there is practically no doubt in the minds of most alienists that all insanities depend upon a physical or structural basis. In other words, they are but manifestations of morbid changes in the brain-cells. To detect these changes is still one of the great problems of psychiatry. The tendency of modern pathology is to seek for the anatomical changes of insanity mainly in two directions: first, in heredity; and, second, in infection or toxæmia. Heredity makes its impressions so invisibly upon the brain-cell that there may be wise doubts whether we shall ever be able to detect them; but its signs, or stigmata, on the body at large are not so difficult to distinguish. The main difficulty is to interpret them. By these stigmata are meant defects or peculiarities in the grosser parts of the body, as in the bones, especially of the head and face, the ears, eyes, teeth, etc. As to infection, and the marks of it as found in the brain-cells, the evidence accumulates more and more that in many forms of insanity, especially those called functional, the direct agent is often a poison circulating in the blood and interfering with the nutrition and functioning of the brain plasma. Syphilis and chronic alcoholic poisoning leave definite changes in the blood-vessels, tissues, and membranes of the brain.

Treatment.— The treatment of insanity resolves itself into the preventive and the curative. Modern practice is beginning to concern itself more and more with the former, while of course it does not in any way relax its attention to the latter. The prodromal, or initiative, symptoms of many forms of insanity, especially the psychoneuroses, are now so well understood, that it is often an easy matter to recognize the insidious changes that herald a mental breakdown, and to guard the patient from the dangers and misfortunes of a fully developed attack. Of first importance is to remove the patient from the exciting causes. Complete rest and isolation are therefore required and cannot be instituted too early. In order to secure these, hospital treatment is often essential. Very recently it has been proposed to treat these patients in general hospitals, in special wards, and not to hurry them into asylums under legal certification. In other words, they are to be regarded simply as other sick persons, and not to be immured merely as lunatics. The motive is thoroughly humane, and the practice is often successful in promising and selected cases. The indications are for rest, isolation and attention to the nutrition especially. There is no specific for insanity except in cases in which syphilis is active.

In very many cases, however, the nature and course of the disease render it imperative to commit the patient to special hospitals for the insane. This is not only for the good of the patient, but also for the welfare of society. These hospitals or asylums in all civilized countries are now among the very best of public institutions, and the prejudices once existing against them are no longer warranted. The indications for treatment vary according to the nature of the case. The weak and exhausted must be built up; the depressed must be encouraged and diverted; the violent and excited must be restrained; the chronic and demented must be cared for often as though they were children. The practice of to-day is in favor of all humane methods, such as by recreation, useful employment, amusements, and an appeal to the best remaining or active elements of the mental life. Physical restraint is reduced to a minimum, although in the most violent cases it cannot be entirely abolished. Punishment is practically abandoned. It is satisfactory to know that all our best regulated hospitals for the insane are enabled to report annually a good percentage of recoveries, and this is in accord with the teaching and practice of modern science, which regards insanity entirely from its physical aspect as a disease of the brain. With this definition this brief article may end as it began.

Formerly Neurologist Philadelphia Hospital.

Inscriptions. The term inscriptions comprises, in its widest sense, all words or word-signs engraved (or painted) on relatively durable materials such as natural cliffs, wrought stone, baked clay, metal, or even wood. For rea sons of practical convenience, however, certain sorts of inscriptions are grouped apart; for example, legends on coins and the lettering on painted vases. The etymological sense of inscription (Latin *inscriptio*, "in-scratching") is not to be taken so strictly as to exclude raised lettering. The role of inscriptions in modern times accords in general with the ancient use, but is much less extended. Then, copies of official and religious documents were frequently promulgated in the form of inscriptions, a usage that no longer survives, though commemorative and titular inscriptions are still plentifully employed. In general, inscriptions serve one of two purposes: (1) they constitute a record, and the material containing them is wrought for the express purpose of receiving the inscription (example, known from literature only, Moses' stone tables that held the decalogue): (2) the object on which the inscription is engraved fulfils a purpose of its own, while the lettering indicates the name, nature, purpose, maker, or owner of the material object (commemorative column, mirror, ring, etc.). To these may be added another class, (3) the incidental inscription, a notice or entry upon an object not prepared to receive it.

Inscriptions furnish materials of value to students in many fields. To the historian — and we must understand history to be the life-record of the nation and its citizens — they supply evidence of great value, all the more valuable because nearly always contemporaneous with the facts recorded. The incidental as well as the formal record may bear testimony. An example of this sort has been found on the leg of a colossal statue at Abusimbel in Nubia, whereon Greek mercenaries who had ascended the Nile under the leadership of Psammetichus — more probably the second (594–589 B.C.) than the first (654–617) of that name — traced a brief notice of their expedition. The incidental inscription is particularly apt to furnish details valuable for social history. To the archæologist inscriptions of the second class furnish testimony of value for topography (witness the fragments of the marble *Forma Urbis*, an ancient inscribed plan of the chief buildings of Rome) and for the precise identification of statues and other works of art. The discovery of inscriptions is among the express tasks of the excavating archæologist, who thus supplies the raw material, so to speak, for the historian or philologian. To the philologian inscriptions yield the key to the history of writing and, if his interests lie in the comparative and historical study of words, give him a fuller knowledge of their form. To the philologian of literary interests inscriptions yield a knowledge of historical fact or of vocabulary that may lead to a correct interpretation of a difficult literary passage. For example, the Greek historian, Thucydides, records (6.54) an altar inscription set up by Peisistratus (527–510 B.C.), which, he says, was still "in clear evidence," but "in dim letters." The identical inscription was found in 1877, with lettering perfectly distinct, and the literary interpretation of "dim" had to be revised and brought into accord with the facts. Meantime, the archæologists had learned that red or blue paint was employed to bring out more clearly the lettering of Greek inscriptions, and it was easy to infer that not the incision but the coloring of this inscription was dim in the time of Thucydides. Inscriptions previously known from literary works have for the philologian the added value of yielding testimony concerning the reliability of the manuscript tradition. Thus the best manuscript of Thucydides is of the 10th century A.D. and, as the last in a long chain of copies, must have been exposed to a great deal of corruption in transmission. The fact that a treaty recorded by the historian (5.47) corresponds almost exactly with the (fragmentary) inscription recording the alliance is reassuring for the MS. tradition. The *littérateur*, even, may be concerned with material furnished by inscriptions. One of the most considerable fragments of the poet Simonides, for example, has reached us in a copy on stone of an epitaph (epigram) in honor of the Megarians who fell in the Persian war. Some literatures have survived only as inscriptions.

It is safe to declare that inscriptions are as widely diffused as the art of writing. Even a primitive picture, if painted to convey a message, would constitute an inscription. Hieroglyphics (conventionalized picture writing) constitute the most primitive type of writing, and inscriptions of this sort, in the Maya language, are found in Yucatan. Though probably not earlier than the discovery of America, these represent, as regards writing, the same stage of culture as the hieroglyphics of Egypt (4700 B.C.). Chinese inscriptions — the Chinese being a highly conventionalized hieroglyphic script — of 1,200 B.C. are also extant. The Mayan (and Aztec) system is still very imperfectly understood. Egyptian hieroglyphics were likewise long undeciphered, but in 1822 the Rosetta Stone (q.v.), a trilingual in Greek, demotic Egyptian, and hieroglyphics, whereon the names Ptolemy and Cleopatra were of frequent occurrence, furnished a clue to the hieroglyphics which had been conventionalized, through a syllabary, to a pure phonetic system.— — This means, to invent an instance, that a picture (symbol) representing motion [=(to) go] comes to be used for the syllable *go* in a proper name like Goshen (this step was taken by Aztec hieroglyphics), or in a word like gopher: and that in the last stage the syllable sign *go* reduces to the letter g. — — The decipherment and interpretation of Egyptian inscriptions belongs to the science called Egyptology. See EGYPT.

The cuneiform script, invented by the Accadians of Chaldæa, found its way to the Semites of Babylonia and Assyria. This was a syllabary, developed from an earlier pictorial system, and such it remained in those countries, where not only small objects like seals and cylinders, but whole libraries of clay tablets (reaching back into the 4th millennium B.C.), have been found. These tablets contain genuine literary works as well as the documents and announcements commonly included under the term inscriptions. The University of Pennsylvania is in possession of some 35,000 cuneiform documents, a collection particularly rich in fourth and second millennium records, and outnumbered only by the British Museum and the Louvre collections. The Tell-el-Amarna Letters are historically among the most noteworthy cuneiform inscriptions. Found by an Egyptian peasant woman in 1887, the collection is now split up between the Berlin and British museums, though a part remains in Egypt. These tablets contain a correspondence between three kings of Egypt (15th century B.C.) and the rulers of Babylonia, Assyria, Armenia, the states of Asia Minor, Syria, and Palestine. Of transcendent importance for the early political history of Western Asia, this correspondence is also accounted to confirm the validity of the Hebrew Scriptures as an historical record. It is noteworthy for the history of culture that the petty chief of every town could command the services of a scribe able to write a letter in Assyrian — the common correspondence language, it would seem, of all those countries. The science of Semitic Cuneiform belongs to Assyriology (q.v.).

Fortunately the Assyrian syllabary, after being borrowed by the Medic Aryans, was converted into an alphabetic system. King Darius (521 B.C.) caused an Old Persian (Protomedic) inscription of 413 lines, averaging 6 feet each, with versions in Neo-babylonian and Neo-elamitic, to be inscribed on the Great Rock of Behistun, at a height of 400–500 feet. The same script had been observed on other short inscriptions found at Persepolis, which evidently contained proper names chiefly. As early as 1802 Grotefend allocated the names Darius, Xerxes and Hystaspes to certain script groups in these brief formulæ, and correctly isolated 9 of the 13 symbols concerned. In course of time the entire Protomedic cuneiform alphabet was identified and subsequently the more complex Semitic syllabaries were worked out, resulting in the decipherment of the older cuneiform. In the Behistun inscription Darius, following precedents of Assyrian kings, summed up the history of his accession and reign. Copied in 1844 by Mr. H. C. Rawlinson, it has been carefully inspected again (1903) by the American scholar, Mr. A. V. W. Jackson.

Farther west, the Phœnicians, also Semitic, developed, perhaps from Egyptian hieroglyphics, a true alphabet, out of which sprang, on the one hand, the scripts used by the Hebrews, Arabs, Persians and Hindus, and on the other the Greek (and Roman) type. The most notable early inscription in alphabetic Semitic is the Moabite Stone (q.v.) (9th century B.C.), which recounts the victory of Mesha, king of Moab, over Israel. The language used differs but slightly from that of the Hebrew Scriptures, of the historical validity of which the Moabite Stone, like the Tell-el-Amarna Letters, is held to be in general confirmatory. For facsimile, transcript and translation see Hastings' 'Dictionary of the Bible' iii., p. 405 seq. Phœnician-Greek bilinguals from Cyprus, belonging to the 4th century B.C., are extant; also Phœnician-Cypriote, which furnished the key to the Cypriote syllabary. Punic inscriptions proper are chiefly of the dedicatory sort, and relatively late, all after the Greek period. Aramaic dockets on Assyrian contract tablets (8th century B.C.) form another instance of early alphabetic Semitic.

India also has its inscriptions. The oldest (250 B.C.) and most interesting are the religious edicts of King Piyadassi, known as the Asoka Edicts, which are engraved on rocks and pillars. They inculcate the religion and morals adopted by this king after his conversion to Buddhism. These inscriptions, in two unknown alphabets (Karosthī and Brahmī), were deciphered chiefly by James Prinsep, who, in the winter of 1837–8, single-handed, unraveled the Brahmī script. He guessed that in certain brief Brahmī inscriptions, plainly of a votive character, a frequently recurring final group of letters must stand for the notion "gift" and be equivalent, if the language was Sanskritic, to *dānam*. He further surmised that the consonant preceding *dānam* must be the genitive (possessive) sign — *s*. He thus isolated the three consonants *s*, *d*, *n* and, with this start, soon identified the entire alphabet.

Greek and Roman inscriptions have been more studied and are accordingly more systematized for study than any others. The ancient Greeks were themselves conscious of the importance of inscriptions. Herodotus used them as sources, and Thucydides and Xenophon quoted them. Decrees are sparingly mentioned by Isocrates, but freely quoted by Demosthenes, who probably made use of the papyrus originals from the department of archives, not all decrees being promulgated on stone. Euripides alludes to the custom of inscribing formal compacts on tripods and dedicating them in temples. Greek antiquaries and scholars even made collections of inscriptions and Polemon (300 B.C.), who was neither the first nor the last of these collectors, owing to his zeal as an inscription hunter, got the nickname of *stēlokopas*, "tablet-picker." Roman writers also — Cicero, Livy, Pliny the Elder, Suetonius — occasionally mentioned inscriptions of historical interest. Varro, the antiquary, and the lexicographer, Verrius Flaccus, commented on the diction of inscriptions; while Polybius, the Greek historian of Rome, actually cited inscriptions, making a fuller use of them than Livy. But no interest in collecting inscriptions, comparable to the Greek interest, ever developed among the Romans. From the Revival of Learning on scholars were not lacking to show an interest in classical inscriptions, but the modern impulse may be said to have had its point of departure in the first quarter of the 19th century when the Prussian Academy, under the promptings of August Boeckh, inaugurated the great collection known as the 'Corpus Inscriptionum Graecarum' (4 vols, 1825–56), which contained nearly 10,000 numbers. But fresh inscriptions are ever coming to light — *dies diem docet* — and in 1891 the number was estimated at 50,000. There has been a steady increase ever since. Excavations are now pursued in Greece and Greekish countries with a diligence and at an outlay never before known. Almost all the great nations have established archæological institutes in Athens, and all of these issue some form of learned journal devoted in part to the publication of the new inscriptions discovered; for example, 'Papers of the American School of Classical Studies at Athens,' 'American Journal of Archæology,' 'Bulletin de Correspondance Hellénique,' 'Ephemeris Archaiologikê,' 'Journal of Hellenio Studies,' 'Mittheilungen des Deutschen Archæologischen Institut,' 'Archæologisch-Epigraphische Mittheilungen aus Oesterreich,' etc. Further great collections like Boeckh's have been issued, for example, the 'Corpus Inscriptionum Atticarum' and the 'Sammlung Dialekt-Inschriften' (in progress). A similar activity has been exhibited at Rome also, with the same establishment of archæological institutes. In 1863 the first volume of the 'Corpus Inscriptionum Latinarum,' also supported by the Prussian Academy, was issued. Since then 15 volumes, with numerous supplements, have been published, new inscriptions being first provisionally printed in the 'Ephemeris Epigraphica.' In all, some 150,000 Latin inscriptions are now accessible in print.

Classical inscriptions require two classes of investigator, the field collector and the closet student. A knowledge of Greek and Latin acquired from printed books does not equip the student for field collecting. It is true that the decipherment of the known script of classical inscriptions does not present problems like those solved by the ingenuity of Grotefend and Prinsep but, for all that, training is needed for the accurate reading and copying of the inscription. Absolute accuracy in copying is difficult of attainment, but a "squeeze" made of (unsized) paper, wetted and packed into every crevice, or a copy made by covering the inscription with a sheet of dry paper and rubbing the same with powdered graphite secure excellent results. America has produced one collector of large and successful experience, Mr. J. R. Sitlington Sterrett, whose collections are to be found chiefly in the 'Papers of the American School.' After correct copies have been secured it remains intelligently to divine words and letters lost by mutilation and to expand the abbreviations, but the latter have been so thoroughly listed in works on epigraphy (= the science of inscriptions) as now to present little difficulty. The same works have so classified the script-forms as greatly to simplify the act of reading the inscription, and their topical arrangement of the subject matter of inscriptions is a great aid to interpretation.

Greek official inscriptions were chiefly recorded on marble, Roman on bronze. The latter material, being available for so many uses, proved the less enduring. But marble slabs were also converted into building material or foundation stones of ramparts, and at Rome many an inscribed stone was calcined into lime. So many were the hazards to which inscriptions were exposed that it is exceptional to find an important one in its original location. For purposes of study the modern habit of gathering inscriptions into museums is highly convenient. In Greece, besides public squares and buildings, temples were a favorite repository for inscriptions, such as state treaties, tribute and treasure lists; dress, armor, weapons and other offerings of gratitude — all with dedicatory inscriptions — made the temple a sort of museum; images of afflicted parts of the body that had been cured, with accounts of the case inscribed thereon, were offered to gods of healing, forming a sort of nucleus of an anatomical collection and a medical library. Commonest of all forms was the sepulchral inscription which began with simple announcements but grew into sounding eulogies. Among the Greek inscriptions none has been found so comprehensively important for history as the Great Rock of Behistun, but Mr. C. T. Newton, in his essays 'On Greek Inscriptions' ['Contemporary Review' (December 1876); 'Nineteenth Century' (June and August 1878, reprinted in 'Essays on Art and Archæology,' p. 95. seq.)], has set forth with great charm their collective value for history and the things pertaining to religion. At Rome, Augustus caused a succinct account of his deeds to be engraved in bronze and set up before his mausoleum. This inscription, widely diffused in the Augustus temples throughout the empire, was discovered at Ancyra (now Angora). The Monumentum Ancyranum constitutes an extensive historical document of the very first importance. The Edict of Diocletian (303 A.D.) has quite a modern ring, being a law to control mercantile "combinations in restraint of trade" by fixing a maximum price for provisions and other commodities. The Acta Fratrum Arvalium form an important memorial of a religious guild. A fragmentary black cippus unearthed in the Roman Forum (1899), supposedly near the grave of Romulus, aroused great enthusiasm. Its early date (550 B.C.) has been held to make for the credibility of the traditional account of Roman history as given by Livy rather than to give countenance to the skeptical method current since Niebuhr's time. Unfortunately, save for a few words of great interest for the comparative grammarian, the inscription admits of no more definite elucidation than the conviction that the words probably belonged to a religious prescript. The *graffiti* (wall-scratchings) of Pompeii form a large and interesting class of incidental inscriptions which comprises quotations, paraphrases, catchwords, proverbs; lovers' messages, complaints, tarryings, rendezvous; names and greetings. Among them the painted inscriptions (*dipinti*) contain election notices chiefly. The dialects of Latin are known almost entirely from inscriptions. The chief remains of the Umbrian language (dialect) are the Tabulæ Iguvinæ, seven bronze tablets found at Gubbio in 1444. They contain long ritual prescripts. Some 250 inscriptions, few of great importance save to the grammarian, represent the Oscan dialects. Etruscan inscriptions in considerable number have been found in Italy — one (supposedly) as far to the east as the island of Lemnos — but, pending the discovery of a long bilingual, these, though written in a well-known alphabet, still await definitive interpretation. The same is true of Iberian inscriptions (some 75 in number, several of between 50 and 150 letters). Runic inscriptions, in an alphabet derived from the Greek, have been found in Scandinavia and in England; the oldest (300 A.D.) being engraved on the utensils found at Thorsbjerg, others on stone monuments, rocks, weapons, ornaments and coins; the longest containing 16 words.

EDWIN WHITFIELD FAY,
Professor of Latin, University of Texas.

Insecticide, any agent which destroys insects. This definition includes natural as well as artificial means of control, the latter being those operated by man. The most important of the former are adverse temperatures, excessive or insufficient moisture, fire, bacteria, fungi, mites, spiders, fish, reptiles, insects, and birds. The artificial controls may be grouped according to their mode of action. Two principal groups are recognized; those intended to reach the alimentary tract through which they act, and those that act through the respiratory apparatus. The former are effective only with such insects as bite off and swallow pieces of plant tissue; the latter more or less also with these, but most frequently used upon insects which suck the plant juices from beneath the punctured epidermis. Caterpillars, beetles and their larvæ, grasshoppers, etc., all chew their food and have been most effectively controlled by Paris green, hellebore, arsenate of lead, etc., applied to the infested foliage either as a spray or as a powder. Plant-lice, plant-bugs, and other sucking insects have been held in check best by kerosene emulsion, whale-oil soap, fir-tree oil, or other substances that choke the breathing-pores in the insects' bodies. Some of these insects are dreaded because of their great prolificacy, their small size and resistance to treatment. Gases are often used under favorable circumstances to reach insects troublesome in stored grain, among clothes, upon plants in greenhouses, and even upon plants in the open air — these last being covered with tents or boxes while being fumigated. Various chewing insects which tunnel through the tissues cannot be controlled by sprays, and are usually beyond the reach of gases. The leaf-miners, which burrow just beneath the epidermis of leaves and green stems, have never been effectively controlled. Some borers (currant-borer) can be kept in check by burning the twigs they infest, (peach-borer) by prodding them in their burrows, (squash-vine-borer), by cutting them out, the method being suggested by the nature of attack. Other chewing insects (plum curculio) are jarred into kerosene. Lastly there are various oils and greases which are used upon animals and man to destroy fleas, lice, etc. Tobacco water and carbolic acid are also similarly employed.

Formulæ and Methods of Application.— Paris green should be mixed with a little water to form a creamy fluid, and then added to water or Bordeaux mixture (see FUNGICIDE) at the rate of one pound to 200 gallons or more. Arsenate of lead may be applied somewhat more liberally. Hellebore may be mixed with water (1 ounce to 3 gallons) and a little glue or flour paste to increase adhesiveness. Each of these may be applied as a powder sifted on the plant, through a salt sack or blown upon them through a powder-gun. A little flour aids the sticking quality. When powders are used, the plants should still be wet with dew or rain. Kerosene emulsion is made by intimately mixing a solution of hard soap (one pound to two gallons of hot water) with four gallons of kerosene, and diluting as needed for use with from 30 to 60 gallons of water. Pure kerosene and crude petroleum can be safely applied only to dormant plants, and then only upon bright breezy days, which will hasten evaporation. Kero-water pumps mix kerosene and water drawn from separate tanks, and apply the mixture direct to plants. They have hardly passed the experimental stage. Whale oil soap is mixed with water (1 pound to 1 or up to 10 gallons), and applied as a wash or spray. Carbon disulphide may be used where there is no danger of its inflammable fumes coming in contact with flame. An ounce is sufficient for from 50 to 75 cubic feet of air-tight space; and the exposure should be for 24 hours or longer. Hydrocyanic acid gas is prepared by adding cyanide of potassium (98–99 per cent pure) to water and sulphuric acid (cyanide, 1 ounce; water 2¼ ounces; acid, 1½ ounces for every 250 cubic feet of greenhouse; 100 cubic feet of nursery stock-room and 125 feet of dwelling house rooms, flour-mills, trees, etc.). Exposures may be from 30 to 60 minutes for trees, the former time being for plants in active growth, the latter for dormant ones; from 12 to 24 hours is usual for rooms, granaries, etc. Since these gases are considered violent poisons the greatest care should be exercised in their application. Oils and greases are merely rubbed on infested animals and man. Boiling water is effective in destroying both lice and eggs in clothing, but the clothing must be boiled for hours to destroy the eggs of the body-louse and the crab-louse. Dust, tobacco-dust, etc., are useful in poultry yards for the birds to wallow in. Carbolic soap is the favorite remedy for insects on pet animals. But with all stock, poultry, pets and man, cleanliness is the great preventive.

Department of Agriculture; Hinds, 'Carbon Disulphid as an Insecticide,' Farmers' Bulletin 145 (as above); Johnson, 'Fumigation Methods' (New York, 1902).

M. G. Kains,
Horticulturist.

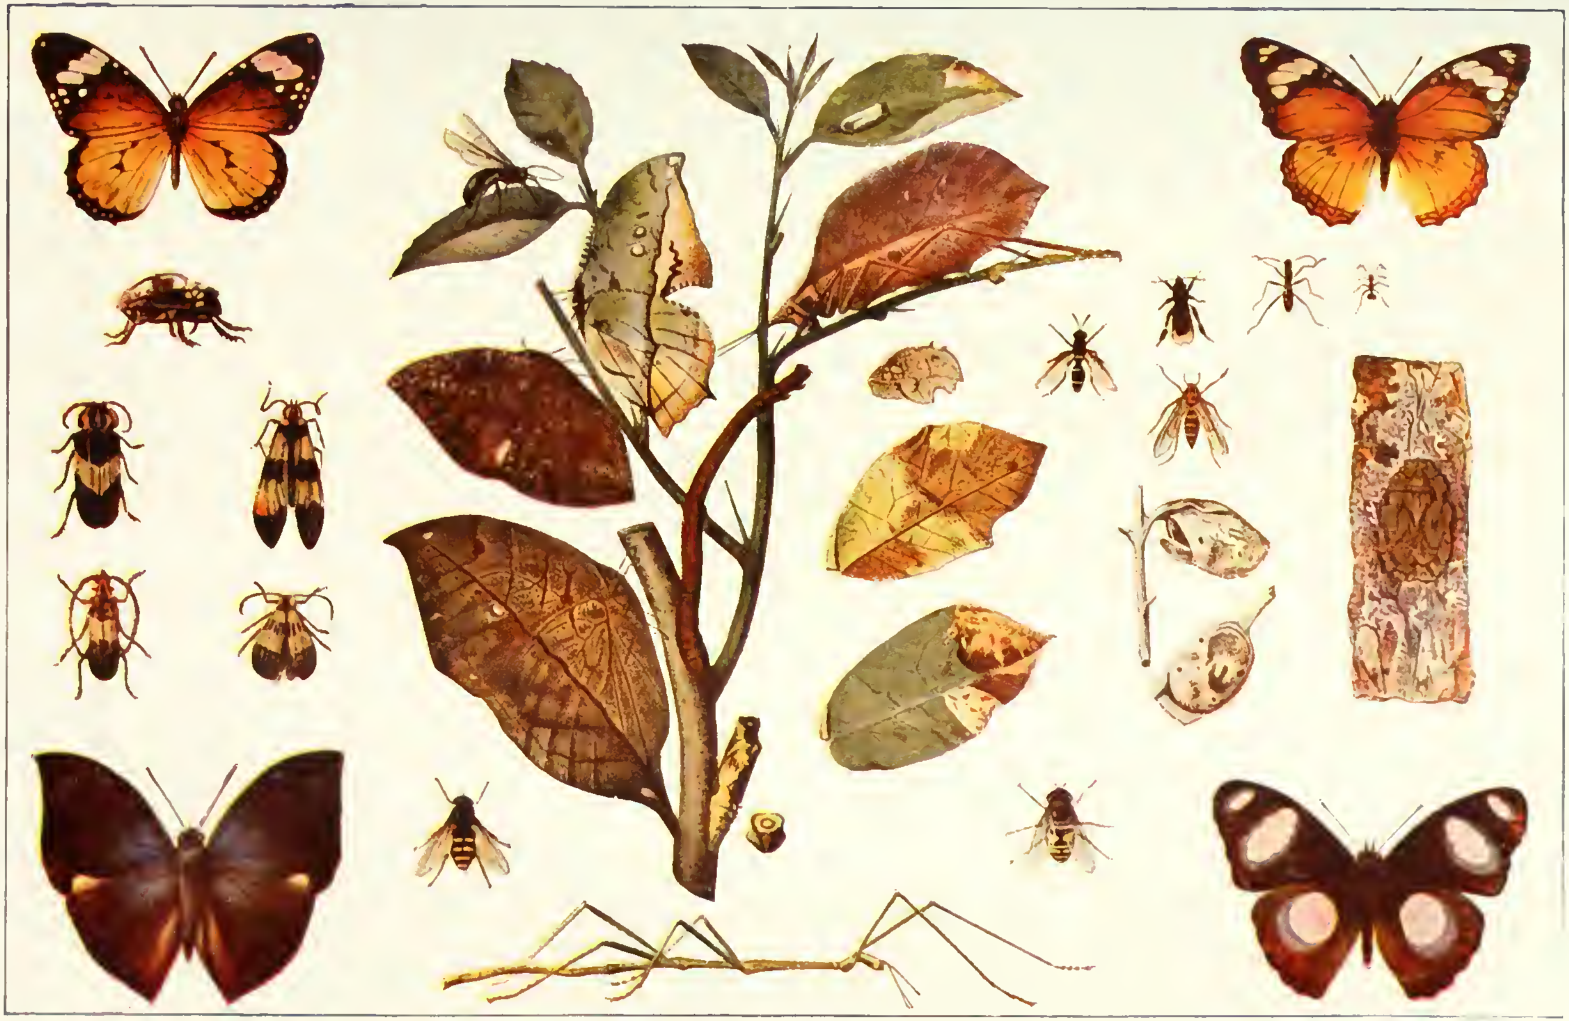
Insectiv'ora, an order of mammals, all of small size, usually five-toed, more or less plantigrade, and as a rule, possessing clavicles. "The snout is generally long, and is often prolonged into a small proboscis. There is a tendency for the teeth to be of a generalized type and their number is often the typical mammalian 44. Moreover, trituberculate teeth, which are certainly of an ancient form, are common." These teeth are adapted to feed on worms and insects alone. Many other evidences go to show that the type is a very old one, and Beddard thinks it may have survived because of the small size, imitative adaptiveness and nocturnal habits. Woodward speaks of the group as probably the little-altered survivors of some of the most primitive placental mammals, agreeing with the *Creodonta* in their low type of brain. Most of the families may be traced back to the upper Eocene. The order falls into two divisions, (1) True Insectivores, including the hedgehogs (*Erinaceidæ*), squirrel-shrews (*Tupaiidæ*), tanrecs (*Centetidæ*) otter-shrews (*Potamagalidæ*), hutias (*Solenodontidæ*), golden moles (*Chrysochloridæ*), elephant-shrews (*Macroscelidæ*), aquatic moles (*Talpidæ*), shrews (*Soricidæ*); and (2) Dermaptera, embracing only the colugos (*Galeopithecidæ*). See Hedgehog; Mole.

Insectiv'orous Plants. See Carnivorous Plants.

Insects. (Lat. *insectum*), a class of *Arthropoda* characterized by the body being divided into three regions, that is, a head, thorax, and hind-body or abdomen, and by the presence, in all but the more primitive and certain degraded forms, of wings, and of three pairs of thoracic legs. The body of insects consists of 21 segments (somites) of which six are used together to form the head, while there are three thoracic, and from 10 to 12 abdominal segments. To the head are appended five pairs of jointed appendages, that is, the antennæ, mandibles, and two pairs of maxillæ, while in the embryo of certain insects and in the adult *Campodea*, there has been detected a pair of vestigial appendages. Besides these appendages, there are two compound eyes, one on each side, and usually three simple eyes (ocelli) situated in the middle of the head. While the antennæ are undivided the first maxillæ are subdivided into three branches, an inner (lacinia), a middle (galea), and outer (palpifer), bearing the palpus. The second maxillæ are fused together, forming the under lip or labium; each second maxilla is composed of a lacinia, the palpus, while vestiges of the galea occur in certain forms. In bees certain accessory appendages called paraglossæ are present. Besides the maxillæ, the so-called tongue or hypopharynx is present, being highly developed in bees; it lies on the under side of the mouth, just above the labium; in caterpillars it receives the end of the salivary duct, and is called the spinneret. Attention should also be called to the upper lip or labium, on the under side of which is the epipharynx, which bears minute taste-pits. The thorax consists of three segments, which can be easily distinguished in the primitive wingless forms (*Campodea*) and in the cockroach and locust, but in the more specialized forms as beetles, moths, bees and flies, the segments are more or less fused together and, owing to the movements of the wing muscles, are subdivided into many separate pieces. In the wasps and bees the basal abdominal segment becomes toward the pupa state transferred to the thorax. The legs as a rule end in five jointed tarsi, the last joint bearing a pair of claws with a cushion (pulvillus) between them. Insects are enabled to walk on glass, etc., by means of a sticky fluid exuded from the ends of hollow hairs fringing the cushion. They climb by means of their claws.

Insects differ from all other animals except birds and bats in possessing wings, and their presence, especially that of the muscles of flight, have greatly modified the shape and structure of the thorax. The front pair of wings is attached to the middle thoracic segment (mesothorax) and the hind wings to the metathorax. In the two-winged flies (*Diptera*) the second pair of wings are reduced and modified to form the balancers (halteres). The wings are flat sac-like outgrowths of the skin, and are strengthened by the "veins" which form hollow rods. These veins contain a trachea, so that there is a space between the air-tube and the outer wall. When the insect emerges from the nymph or the pupa, the vein is filled with blood. The spaces enclosed by the veins and their cross-branches are called cells, and their shape often affords valuable generic and specific characters. In the more primitive insects there are numerous cross-veins, and such wings as in locusts, etc., are said to be net-veined. In the *Lepidoptera* there are few cross-veins. In the *Diptera* and *Hymenoptera* the number of veins is limited, the cells also being few. The skin of insects is hard, dense and elastic, due to the deposition of chitin.

Internal Anatomy.— One of the distinctive characteristics of insects is their mode of respiration. This is effected by an intricate system of internal air-tubes (tracheæ), which are filled with air by openings (spiracles) in the sides of the body; of these spiracles there are from one to two pairs in the thorax, and eight pairs in the abdomen. The tracheæ are kept permanently open by a series of threads (tænidium) each of which makes from three to five turns around the thin tube; in this way the entire tracheal branch is provided with what at first was supposed to be a continuous spiral thread. The slit-like openings of the spiracles are guarded by a grate of stiff hairs to prevent the ingress of dust, etc. It should be borne in mind that no insect breathes through its mouth, but through the spiracles. Hence the efficacy of all oily or greasy substances in destroying every kind of insect in whatever stage of growth; wherever the oil touches the body a thin film spreads over it, covering the air-openings so that the insect soon dies by asphyxiation. Though



PROTECTIVE MIMICRY AMONG INSECTS

insects have a delicate pulsating tubular heart, they have no arteries and veins, since the air in the tracheæ seeks the blood in the remotest parts of the body. The blood is thin and colorless. The aquatic larvæ and a very few perfect insects breathe by external tracheal gills, the spiracles being in such cases often absent. The genital opening is always situated near the end of the body, in front of the vent on the under side. Besides a complicated digestive canal, insects have urinary tubes opening into the end of the intestine.

The nervous system consists, besides the brain, of a chain of ganglia the greatest number of which is 13, but which become more or less fused in the more specialized groups, especially in the flies. The brain is remarkably complex, in accordance with the varied and complicated movements of the segmented body and jointed appendages, all capable of different kinds of motions.

Sense of Sight.— The compound or facetted eyes (ommatea) are composed of numerous simple eyes called ommatidia, which vary in number from 12, in *Lepisma*, to 20,000 in the dragon-fly (*Æschna*), and even 25,000 in a beetle (*Mordella*). Yet notwithstanding the wonderful complexity of these compound eyes, most insects are near-sighted, and perceive rather the movements of other animals than their exact outlines; the dragonfly and butterfly can see for a considerable distance. The simple eye probably only enables the insect to distinguish daylight from darkness, or at most very near objects. Insects, like bees and butterflies, have the color-sense, and prefer certain colors to others.

Sense of Smell.— Insects are chiefly guided by the sense of smell. This resides in the antennæ, in which there are microscopic pits filled with fluid; to this pit goes a fine nerve whose fibres end in staff-like sense cells. The number of these olfactory organs is in some insects enormous; thus in the European cockchafer there are 39,000 in the leaves of the male antennæ, and about 35,000 in those of the female; in a single antenna of the hornet (*Vespa crabro*) are about 13,000 to 14,000. In the cockroach the abdominal cerci or feelers also possess such pits.

Sense of Hearing.— The auditory organs of the locust are drum-like ears situated one on each side of the base of the abdomen, directly behind the first abdominal spiracle; in the green grasshopper, katydids, etc., a little auditory sac is lodged in the fore-legs (*tibiæ*). It is supposed that most insects are destitute of the sense of hearing, at least auditory structures have not yet been detected; yet all sound-producing insects must have ears to hear.

Sense of Taste.— The taste organs are little pits or papillæ which resemble the olfactory organs, but which occur on the inside of the upper lips, on the epipharynx, or at the base of the proboscis and maxillæ in the bee.

The Egg and Growth of Insects.— The eggs and the fertilizing fluid of the male are produced in glands which open near the end of the body on the under side. The eggs are deposited by the female in the earth or in wood, leaves, etc., by means of the ovipositor, an apparatus composed of three pairs of hard appendages, and which in the wasps and bees form the sting. Most insects die on the approach of cold weather, when they lay their eggs, the species being represented in the winter by the eggs alone. The eggs hatch in spring, the embryo passing through remarkable changes.

Metamorphoses.— Most insects after hatching pass through a remarkable series of changes called a metamorphosis. The small flies, moths or beetles, are not the young of large ones, but adult insects, while the most primitive insects have no marked metamorphosis, the mature locust only differing from the young in having wings; the more specialized forms, as beetles, moths, wasps, bees, and flies, pass through two stages of growth, that is, the larva and pupa, before becoming winged and sexually mature.

Larva.— The name was first given by the ancients to the caterpillar because they thought it masked the form of the perfect insect. Swammerdam supposed that the larva contained within itself "the germ of the future butterfly, enclosed in what will be the case of the pupa, which is itself included in three or more skins, one over the other, that will successively cover the larva." But the discovery by Weismann (q.v.) of the germs of the imago (imaginal disks or buds) in the larva completely changed our notions of the nature of metamorphosis (q.v.), and revolutionized our knowledge of the fundamental processes concerned in the change from larva to pupa or chrysalis, and from pupa to imago. Not only are the larvæ of each order of insects characteristic in form, so that the grub or larva of beetles is readily distinguished from the larvæ of other groups, or the maggots of flies from the footless larva of ants, wasps and bees, but within the limits of the larger orders there is a great diversity of larval forms, showing that they are the result of adaptation to their surroundings and mode of life.

The larvæ of nearly if not all the metabolous animals are probably secondary in their origin. Fritz Müller (q.v.) pointed out that this is the case with the larvæ of the higher insects. The larva of a beetle is popularly called a grub; that of a fly a maggot. The young of the more primitive insects, such as the cockroach, locust, all bugs, etc., which undergo an incomplete metamorphosis, is called a *nymph*. See LARVA.

Pupa.— The word pupa is Latin, meaning baby. Linnæus gave it this name from its resemblance to a baby which has been swathed or bound up, as is still the custom in Southern Europe. The term pupa should be restricted to the resting, inactive stage of the holometabolous insects, that is, those with a complete metamorphosis. The typical pupa is that of a moth or a butterfly, popularly called a chrysalis. A lepidopterous pupa in which the appendages are more or less folded close to the body and soldered to the integument, was called by Linnæus a *pupa obtecta;* and when the limbs are free, as in Neuroptera, Mecoptera, Trichoptera, and the lepidopterous genus Micropteryx, it is called a *pupa libera*. When the pupa is enclosed in the old larval skin, which forms a pupal covering (puparium), the pupa was said by Linnæus to be *coarctate*. The pupa of certain Diptera, as that of the orthoraphous families, is nearly as much obtected as that of the tineoid families of moths, especially as regards the appendages of the head, the legs being more as in pupæ liberæ. The pupæ of Coleoptera and of Hymenoptera, though there is, apparently, no near relationship between these two orders, are much alike in shape, and.

as Chapman pertinently suggests, those of both orders are helpless from their quiescence, and hence have resorted for protection to some cocoon or shell. But it is quite otherwise with the pupæ of Lepidoptera and Diptera, which vary so much in adaptation to their surroundings, and hence afford important taxonomical and phylogenetic characters. This, as regards the Lepidoptera, was almost wholly overlooked until Chapman called attention to the subject, and showed that the pupæ had characters of their own, of the greatest service in working out the classification, and hence the phylogeny of the different lepidopterous groups. The pupæ of the Neuroptera, Coleoptera and Hymenoptera differ structurally from the imago, in the parts of the head and thorax being less differentiated. Thus in the head the limits or sutures between the epicranium and clypeus, and the occiput and gula, are obscurely marked, while the tergal and pleural sclerites of the imago are not well differentiated until the changes occurring just before the final ecdysis. It is easy, however, to homologize the appendages of the pupæ with those of the imago of all the holometabolous orders except in the case of the obtected pupa of the Lepidoptera (and probably of the obtected dipterous pupæ), where the cephalic appendages are soldered together.

Classification of Insects.— The number of known species of insects is from 200,000 to 300,000, but it is estimated that there are upward of a million species now living. In fact, the class of insects vastly outnumbers all other groups of animals. This is probably due to their being winged, and to their great fecundity. At present the class of insects is divided into two subclasses, that is, the (1) *Synaptera*, represented by the wingless orders Thysanura and Collembola; and (2) *Pterygota*, comprising 15 winged orders and which may be thus tabulated:

Series 1.— *Heterometabola*, with an incomplete or variable, though slight, degree of metamorphosis. No distinct larva or pupa state, the young being nymphs.
- Order 1. Dermaptera. (Earwig.)
- " 2. Orthoptera. (Cockroach, locust, grasshopper, stick insect.)
- " 3. Platyptera. (Bird lice, Perla, white ant.)
- " 4. Odonata. (Dragonfly.)
- " 5. Plectoptera. (Mayfly.)
- " 6. Thysanoptera. Thrips.
- " 7. Hemiptera. (Bugs.)

Series 2.— *Holometabola*, or with a complete metamorphosis.
- Order 8. Neuroptera. (Corydalus, lace-wing fly, ant-lion.
- " 9. Mecoptera. (Panorpa, Boreus.)
- " 10. Trichoptera. (Caddis flies.)
- " 11. Coleoptera. (Beetles.)
- " 12. Lepidoptera. (Moths and butterflies.)
- " 13. Siphonaptera. (Flea.)
- " 14. Diptera. (Mosquito, fly.)
- " 15. Hymenoptera. (Saw-fly, ant, wasp, bee.)

Fossil Insects.— About 3,000 species of fossil insects have been described, of these from 200 to 300 are Palæozoic, 500 Mesozoic, and the remainder are Tertiary. The oldest fossil insect-remains is the wing of a supposed bug (*Protocimex*) from the Ordovician of Sweden. The wing of a cockroach (*Palæoblattina*) has been detected in the middle Silurian of Calvados, France. From the Devonian shales of St. John, N. B., nine species of primitive net-veined insects have been collected. The coal measures are characterized by cockroaches, primitive dragonflies, May-flies, and grasshopper-like forms, phasmids, etc., also occurring. All of the Palæozoic insects known are very primitive. Modern forms, those having a complete metamorphosis, begin to appear in the Triassic and Jurassic, where remains of beetles, a saw-fly, and a moth occur. Ants, bees and butterflies date from the Oligocene and Miocene Tertiary.

Bibliography.— The latest general works on insects are Carpenter's 'Insects, their Structure and Life' (London, 1899), and Sharp's 'Insects' (Vols. V. and VI. of Cambridge Natural History, 1895–9); both contain sufficient references to other works. For American insects consult: Packard's 'Text-book of Entomology' (1898), and 'Guide to the Study of Insects' (1889); Comstock's 'Manual for the Study of Insects' (1895); 'Insects and Crustacea' (Vol. II., Standard Natural History, 1884); Howard's 'The Insect Book' (1901). The last named contains a copious bibliography, especially to the voluminous publications of the Entomological Division of the U. S. Department of Agriculture.

See FRESH-WATER INSECTS; MARINE INSECTS, and the names of groups and species, as FLIES, HYMENOPTERA, MOTHS, etc.

Insessores, ĭn-sĕ-sō'rēz, a discarded term in Ornithology designating a group styled «perchers,» which included the majority of the smaller and more familiar birds. The term has been abandoned because the group denoted by it is a purely arbitrary one.

Insid'ious Flower-bug. See FLOWER-BUG.

Insolvency. In a popular sense the word insolvency applies only to persons without property or means sufficient to satisfy their creditors. The legal definition embraces all who are unable to pay their debts at maturity in the ordinary course of business, even though they may possess assets exceeding their liabilities. A failure to meet overdue obligations renders a person liable to proceedings against him in a court of insolvency, in which his assets may be taken into the possession of the officers, marshaled, and distributed to his creditors. Should there be an amount in excess of what is required to pay the creditors and the expenses of administration, the balance so remaining is the property of the debtor. From a very early period in the history of civil government, laws have existed providing for proceedings by creditors against insolvent debtors, by which the debtor's property could be taken from his possession, to be held by another as a trust fund to be applied to the payment of his just debts. In case of an insufficient amount to pay all debts in full, provisions are usually made for a *pro rata* distribution. These laws have generally provided for classes of preferred debts, payments of which were to be made in full, even though such payments exhausted the entire assets. Preferred claims commonly included all claims of the government or state, and often claims for labor to a limited amount, and claims for the necessaries of life. Provisions are usually made for the exemption of certain articles to the use of the debtor, not to be included in the assets. The Constitution of the United States provides that Congress may establish uniform laws on the subject of bankruptcy throughout all the States, and the first act upon that subject was passed in 1800, since which time there has been some Federal bankruptcy law, with brief interregnums. A uniform national law upon the subject now exists. The first act of Congress upon this subject provided for proceedings by the creditors only, but in 1841 an amendment provided for voluntary proceedings by the debtor, by which he could surrender his property and obtain a discharge from all of his debts, provided he had been guilty of no fraud. In the absence of a national law on the subject of insolvency, the States all have authority to enact and enforce laws upon that subject. The Federal act now provides for voluntary proceedings by the debtor, as well as proceedings against him by the creditors, with provisions for his discharge. The various State acts have usually contained such provisions. The Federal act suspends all State insolvency laws during its continuance. See Bankruptcy Laws.

Inspiration, in theology, the communication by the Holy Spirit, to writers and speakers, of a portion of the knowledge and feeling of God, in such fashion that they can be communicated to other men; especially used in relation to the Bible. On the fact of inspiration rests all attribution of divinity to the sacred writings above any others; but theories of its method and extent have necessarily changed with the advance of critical knowledge. They have never had an authoritative pronouncement even from the Church of Rome, which allows liberty of judgment on this; the Bible not holding the supreme place there as in Protestant bodies, and the latter being too divided for a credal statement on this point, by the very causes which call for one. All theories rest not only on the necessary implication of divine character in the Bible, but on two specific passages: 2 Tim. iii. 16: "All Scripture is given by the inspiration of God, and is profitable for doctrine" (Revised Version, "Every Scripture inspired of God is also profitable for teaching," which does not relinquish the claim of inspiration); and 2 Pet. i. 21, "Holy men of God spake as they were moved by the Holy Ghost" (Revised essentially the same). The Scriptures were the Old Testament.

The early Church did not generally dwell on theories of inspiration, regarding it as a passive "ecstasy" in which divine truth was communicated, but rarely going on to its effects on the inspired writings or the methods which produced them. Origen, however, the great builder of doctrinal framework, formulated an exact theory of "plenary" or entire inspiration, which preserved the writers from all faults of memory, and left no iota either incorrect or superfluous in Scripture. But others held that all believers were inspired in different degrees; as this made all believers infallible interpreters of the Scriptures, the perilous nature of such a doctrine led to the opposite one, that there was an inspired official depositary of interpretation as well as an inspired canon of writings. The mediæval schoolmen evolved the theory that there were two kinds of inspiration in the Scriptures: direct, found where moral and doctrinal truths are directly taught; and indirect, in historical passages, whence ethical truths can only be derived by allegorical interpretation.

Regarding inspiration not as a purpose but a method, there are three explanations within the limits of orthodox Christianity: the "plenary" or verbal, the dynamic, and what may be termed the "irradiant" theories. The remaining one, which makes the inspiration only that common to all human beings — who are part of the divine mind — and having no part in any special revelation, is really not a theory of inspiration at all, as it holds that there is none; that all things are parts of the world's evolution, and the sacred writers and the Bible were evolved like the rest, though the latter is the greatest moral product of the world, and to be reverenced in the moral rank as we reverence the greatest writers and thinkers in theirs.

In the early uncritical ages of the Protestant churches, the universal and obvious theory of inspiration was the plenary. The original text of the Bible was dictated word for word by the Holy Spirit, the writers being merely penmen, or media on whom were impressed certain phrases, which must not be varied on peril of distorting the divine revelation. The words of Scripture thus transmitted are God's words, to each reader as if spoken directly to him by the Deity, and no matter to what subject they relate, be it doctrine or history, the origin of man or the duty of man. That there are different styles, corresponding to different writers, means only that God has accommodated his expressions to their natures, for his own utilities. Hence the least particle in the Scriptures is surcharged with meaning, and if anything seems in conflict with science, history, or other portions of the Bible, it arises from corruption of text, bad translation, or other change from the actual revealed language. This is the only theory with perfect logical continuity; unhappily it can only be maintained, in face of the increasing body of knowledge of texts, facts, and natural ethics, by those willing to abnegate their own right of criticism wholly in favor of their own infallible interpretation. Indeed, the chief argument for the latter is that the divine purpose would be defeated, if its intention in giving the revelation were made null by the misunderstanding of fallible human faculties.

The dynamic theory is the first step outside this bulwark enforced by the impossibility of maintaining verbal inspiration, and relegates the divine agency to an indirect function. In place of its dictating the exact phraseology and the precise facts, the writers are so filled with divine force that for all purposes of conveying the essential divine purpose, that of showing the truths of sin and danger and the path of salvation, they are a portion of the divine and incapable of error. Under this theory the writers are left a free hand, according to their own limitations and those of their age, in dealing with narrative facts or their own guesses at them; but are guided explicitly in all matters of faith and morals. In order to be received, the revelation had to be accommodated to the mental conditions of different ages; and men of each received guidance from God to present it so that it was true in relation to them, and remained so for all ages under all conditions. The warrant of the Bible is its incomparable and superhuman system of ethics, and its proof of divine origin is that evident superiority to all human devices.

The "irradiant" theory is a recent one, and a step farther from the old claim of entire divinity. In this view the record as such has no divinity, nor infallibility of any kind. There is a divine revelation, but it acts by generating moral ideas in certain great selected men, and which, once generated, are left to fight their way and take their chance like the other useful ideas of the world, and undergo disbelief and mutilation, with the certainty that according to God's purpose, truth will prevail at last. The proof of divinity in Christianity lies in the fact that its moral truths are the greatest in the world, and were original with it.

Instinct. Instinctive acts are those physiological activities in which mind or consciousness is involved. Instincts may be regarded as intermediate between simple physiological or reflex actions and acts of reason exhibited by man. Animals of a grade higher than sponges, polyps, most mollusks and other forms of a corresponding grade, have organs of sense, of perception, and in the higher vertebrates a brain and nervous system and other organs of the same type as those of man, and such animals react to something more than mere physical stimuli. We know by observation that the social insects, birds and mammals, at least those which have become domesticated, have sufficient intelligence to meet the ordinary exigencies of life, and that at times the ant, bee, beaver, elephant, dog, and ape can meet extraordinary emergencies, that is, rise with the occasion; that they may to a very limited extent be free agents; that they are not mere automata. It has been observed that the more intelligent animals are not solely guided by the physical stimuli of light, odors, etc., but that they exercise the power of choice, selecting this or that kind of food, this or that mate. Animals are subject to what we call the passions: they show anger, even when not hungry or under the domination of the reproductive instincts; their sounds express dissatisfaction or contentment. They possess memory: with its aid ants and bees find their way back to their nests.

Definitions of Instinct.— Descartes believed that animals are automata. It is popularly supposed that animals are automata, physiological machines in which have been implanted by supernatural power what we call instincts. This view is still insisted on by two excellent observers of the habits of insects, Favre and Wasmann, who claim that instincts are special innate or natural propensities, "transcending the general intelligence or experience of the creature." But of late years the impression has arisen and gained force that instincts are "innate" and "natural" because they have arisen by a natural process and have been gradually acquired and transmitted from one generation to another.

Erasmus Darwin held that instincts were the result of imitation by young animals of the actions of their parents. This view is still held by Wallace, and, as Eimer claims, the power of rapid learning has played a part in the evolution of certain instincts. Thus the fox or rat learns from its parents, and becomes more cunning or sagacious with age and training. Lamarck practically regarded the lowest animals as automata, but in the higher animals, that is, those with a nervous system, we have instinct. "Hence, instinct in animals is an inclination which necessitates that from sensations provoked while giving rise to wants the animal is impelled to act without the participation of any thought or any act of the will." To satisfy these wants they contract different kinds of habits; these are transformed, he says, into so many propensities, from which "originate their habitual actions, and special propensities to which are given the name of instinct." He then adds that the same habits and the same instinct are perpetuated from generation to generation, "without offering any notable variation, so long as it does not suffer change in the circumstances essential to the mode of life." He thus intimates that instinct may vary, and he states that in birds and mammals instinct is variable.

Darwin does not give a formal definition of instinct, but after stating that several distinct mental actions are commonly embraced by this term, he adds that "a little dose, as Pierre Huber expresses it, of judgment or reason often comes into play, even in animals low in the scale of nature." He calls attention to the points of resemblance between instincts and habits, showing that habitual action may become inherited, whence it results that "the resemblance between what originally was a habit and an instinct becomes so close as not to be distinguished." He concludes that, by natural selection, slight modifications of instinct which are in any way useful accumulate, and thus animals have slowly and gradually acquired through successive generations, their power of acting instinctively, and that they were not suddenly or specially endowed with instincts. Herbert Spencer defines it as compound reflex action, and also as "a kind of organized memory," arguing that instinctive actions grow out of reflex, and in time pass into intelligent acts. Romanes defines instinct as "reflex action into which there is imported the element of consciousness." Lloyd Morgan also says: "It is a bit of animal automatism not necessarily involving more than the lower brain centres," but it is a bit of automatism accompanied by a consciousness in a broad sense. "The role of consciousness in a chick's pecking is to select the adequate responses, and to steady the muscular mechanism to its work." As the result of recent experiments Loeb regards instincts as inherited reflexes so purposeful and so complicated in character that nothing short of intelligence and experience could have produced them. Packard gives the following definition: "The sum of inherited reflex acts, becoming habitual and arising from blended reflex and subconscious though involuntary acts, performed at birth or through life blindly, without practice or previous experience, effort, training or thought."

Examples.— It should be understood at the outset that instincts in animals are fundamentally connected with the means of obtaining food, or with reproduction, the latter involving care for the young, as in egg-laying, the selection of a nesting place by insects and birds, the construction of the nest, and the defense of the young, and in the birds and mammals the training of the young to fly, or to hunt for prey.

Reflex acts are simply physiological responses to external physical stimuli, as muscular irritability, the different tropisms, such as response to odors, and other chemical properties, to cold, heat, etc. Many of the movements of the lowest animals, as the protozoa, sponges, polyps, worms, etc., their modes of selecting and getting food, of escaping their enemies, are scarcely more than reflex. As examples of instinctive acts are those of very young chicks. Morgan regards as instinctive in these birds the act of "pecking, walking, scratching themselves, preening their down and feathers, stretching up and flapping their wings, squatting down and dusting themselves, scattering and crouching when alarmed, uttering the danger-warning *churr,* and other sounds." Young ducks afford examples in the way they "seize and mumble their food in the bill, their aptness in swimming directly on leaving their shell, piping, and smoothing the down of their breast with their bill."

It is when we observe the complicated nesting habits of the spiders, and of the social insects such as ants, wasps, bees, as well as those of birds and the muskrat and beaver, when such striking and inexplicable forms of intelligence arise that we become perplexed how to explain them. Thus take the mode in which the honeybee builds its cells. Is it simply mechanical, the result of several bees working together, and due to the mechanical pressure of the insects against each other during the formation of the cell? While some contend that if left alone to build a single cell, this would probably be round, others show that a solitary wasp will build its cells in very regular hexagons. It is now conceded by Darwin, Romanes, and others, that the process is not a purely mechanical one, but is "constantly under the control of intelligent purpose." It is most probable that the hexagonal-cell building instinct is the result of habits which gradually arose, and which became fixed by heredity. In birds the modifications sometimes occurring in the shape and situation of their nests show that their instincts are, owing to change of conditions, plastic, reason teaching them to modify their nests so as to adapt them to new conditions. Experience and intelligence lead to such changes. The beaver manifests in his works intelligence and reasoning capacity, both in the construction of dams, canals, and in the mode of felling trees, and in the use in certain localities of "slides." In the monkeys and apes we apparently have the nearest approach to human intelligence, judging by the instances narrated by Romanes. Were it possible to breed apes for many successive generations more light would be thrown on their psychology. Meanwhile many acts performed by the domestic animals, the horse, dog, cat, elephant and even the pig, and their susceptibility to be trained, show that they may often act intelligently, and are prompted by a low degree of reason.

Instincts Variable and Sometimes at Fault.— Lemmings in their migrations, impelled by their instincts to go ahead, will swim out into the sea and be drowned. Ants will store up beads instead of seeds, and there are many instances where instinct is at fault. Certain instincts may also by change of the environment become directed into new channels. This is illustrated by numerous cases of insects, reptiles, and mammals which have become adapted to an aquatic life. An entire new crop of habits and instincts may thus arise. The instincts of young animals, particularly of larval forms, caterpillars, grubs and maggots, are of a different description from those of the pupa state, and more especially of the adult state. In fact, instincts are pliable, variable, and in certain cases may lapse altogether, to be replaced by a new set. Were this not the case we should have no progress in the evolution of life. The more generalized animals have vastly less intelligence than the highly specialized forms. Compare the instincts of so complex a being as the ant, or wasp, or bee, with that of the locust or bug, or the instinctive and intellectual acts of social insects, with their wonderful differentiation of the individual into workers of different castes and the normal and supplemental males and females. Such are what are called complex instincts, and they are all brought into action through the principle of the division of labor.

Do Animals Reason? — Lloyd Morgan observed that the chick rapidly profits by experience after a few practical trials; hence he concludes that intelligence is founded on experience. He allows that chicks have intelligence, this involving the association of impressions and ideas, and the power of making a choice. He then asks the question, "Do animals reason"? "Do they focus the therefore"? "Do they think the why"? Probably not. Reason is not (as animals "reason") adaptation; they do not profit by experience of actions to varying circumstances. Hence, he thinks that animals probably do not reason as man is capable of reasoning. Here might be quoted Herbert Spencer's definition: "Reason or intelligence is the faculty which is concerned in the intentional adaptation of means to an end." Finally, it is safe to assume that the higher animals, especially the domestic animals, which have been in contact with and more or less trained by man, exhibit the germs of reason, and while they cannot make inductions and deductions or predictions, their intellectual acts differ rather in degree than in kind from those of the lowest human races.

Alpheus S. Packard,
Late Professor of Zoology, Brown University.

In'stitute of France, a learned body organized after the first outbreak of the French Revolution, during which all the academies of learning and arts in France had been suppressed. It was formed by the decree of 25 Oct. 1795, to replace the Académie Française, the Académie des Sciences, and the Académie des Inscriptions et Belles-Lettres. Its object was the advancement of the arts and sciences by continual researches, by the publication of new discoveries, and by a correspondence with the most distinguished scholars of all countries, and especially by promoting such scientific and literary undertakings as would tend to the national welfare and glory. The Institute was composed of a number of members residing at Paris, and an equal number of associates in the different parts of the Republic. Each class could also choose eight learned foreigners as associates. It was at first divided into three classes, each of which was subdivided into several sections. The first class embraced the physical and mathematical sciences, the second the moral and historical, and the third literature and the fine arts. The number of active members, exclusive of the associates, was limited to 144. The Institute received, however, its final organization by a decree of 23 Jan. 1803. It was then divided into four classes: (1) the class of the physical and mathematical sciences, consisting of 65 members; (2) the class of the French language and literature, consisting of 40 members; (3) the class of history and ancient literature, of 40 members; (4) the class of the fine arts, with 28 members. A royal ordinance of 21 March 1816, restored the former names of the classes, so that the name of Institute was applied only to the whole body collectively. The same ordinance assigned the first rank to the Académie Française, as being the oldest; the next rank to the Académie des Inscriptions et Belles-Lettres: the third to the Academie des Sciences: and the last to the Académie des Beaux-Arts. These united academies were under the personal direction of the king, and each had an independent organization. To each academy were attached 10 honorary members, who had merely the right of being present at the meetings. In 1832 the old class of Sciences Morales et Politiques was reconstituted as a separate academy, so that there are now five academies.

The Académie Française had for its chief object the cultivation of the French language, and was charged with the composition of a French dictionary, the merits of which have been often disputed and its plan condemned. The disposal of its vacant chairs has not always been regulated by the best taste and judgment, Descartes, Pascal, Molière, La Bruyère, J. J. Rousseau, Balzac, Dumas père, Daudet, and Zola having been rejected, while in former times many a shallow court favorite was accepted.

The Académie des Inscriptions et Belles-Lettres has 40 members, 10 free academicians, and 8 foreign associates. It has 40 correspondents at home and abroad, and devotes itself chiefly to subjects of a historical nature. The most distinguished scholars, both in and out of Europe, are, or have been, connected with it. Committees of this academy superintend the erection of public monuments and the preservation of those already in existence. Works brought out under its auspices are: 'Histoire littéraire de France,' 'Recueil des Historiens de France,' and 'Corpus Inscriptionum Semiticarum.'

The Académie des Sciences has for its province the various branches of knowledge connected with the physical and mathematical sciences, natural history, medicine, etc., there being in all 11 sections. It has 66 members, 10 free academicians, and 100 correspondents. The number of foreign associates is limited to eight.

The Academie des Beaux-Arts has 40 members, 10 free academicians, 10 foreign associates, and 61 correspondents. A committee of this academy was charged with the publication of a dictionary of the fine arts.

The Académie des Sciences Morales et Politiques, has 40 members, 10 free academicians, 6 foreign associates, and 48 correspondents.

Members of the Institute of France are elected for life by ballot, and have an annual salary of 1,500 francs.

Institute of Social Service, American. See Social Service.

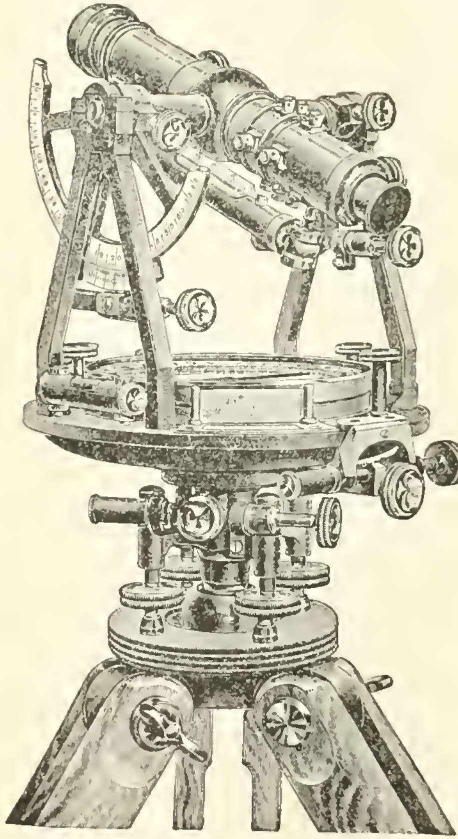
Institutional Church, a non-credal organization of Christians, to supplement the regular church methods and ministrations — preaching, prayer-meetings, Sunday school, and pastoral visitations — by helpful social work in the community. The moving spirit is the same as in the Y. M. C. A., University Settlement, Salvation Army, Rescue Missions, Christian Endeavor societies, etc.; but "with the emphasis on Church, not Institution." The prime object is to reannex to the church the functions which other bodies have been compelled to fill by its neglect of its duty: and strengthen it by gathering potential Christian elements which under the old system do not come to it, as well as by combining in itself all the claims to public gratitude and interest now shared between the purely ecclesiastical and the purely social institutions, or the half-way houses like the Y. M. C. A. It differs from the latter in not merely furnishing a religious atmosphere which may lead to church membership, but enrolling members at once in a real church of Christian work by absorbing the secular features of the other: in a word, to do, without vows or uniforms, what the Catholic Church has always done with its charitable functions — make them an integral portion of the church organization. Hence, it is not by itself a church in the sense of the Roman Catholic or the Methodist Church, but in a broad sense a description of any church which adds educational or social work: in general use, a title of any which throws into this work its predominant vitality. Free pews are an essential accompaniment, as the social aristocracy fostered by rented pews contradicts the basal democratic principle of institutional work; hence it is sometimes called Free Church, but preferably Open Church. The present name originated with President Tucker of Dartmouth College, who applied it to Berkeley Temple, Boston.

The movement started chiefly with the High Church element in England, modeled on the Catholic idea: it flourished for two generations in that country before reaching the United States, about 1880, and it has hardly been a vigorously spreading one here for above 15 years. Now, however, a large number of churches — Episcopal, Congregational, and Baptist in the forefront, but also Methodist, Presbyterian, Unitarian—have adopted the idea with increasing vigor, besides the work of this class always performed by the brotherhoods and sisterhoods of the Roman Catholic Church. One of the earliest of these was Plymouth Church of Indianapolis, inspired by the memory of Mr. Beecher. Notable among others are the St. Bartholomew, St. George, St. Paul, and Judson Memorial of New York, and the Tabernacle of Jersey City: Berkeley Temple, Parker Memorial, and Ruggles Street Baptist of Boston; Grace and Bethany of Philadelphia: Ninth Street of Cincinnati, Pilgrim of Cleveland: Plymouth Tabernacle of Detroit: People's of St. Paul: and the Denver Tabernacle. In 1894 the Open and Institutional Church League was organized in New York: it held several conventions in Eastern cities (1895–1901), and for three years published the 'Open Church' as its organ, but has practically lapsed, being merged in the 'National Federation of Churches and Christian Workers.' The total of its work, however, is not shown by its nominal membership; the same spirit has infected outside churches, and their methods are being more and more adopted as a general basis of work.

The platform of the League stated that it aimed to save all men by "abolishing, so far as possible, the distinction between the religious and the secular"; by "open church doors for every day and all the day, free seats, a plurality of Christian workers, the personal activity of all church members, a ministry to all the community through educational, reformatory, and philanthropic channels, to the end that men may be won to Christ and his service, that the Church may be brought back to the simplicity and comprehensiveness of its primitive life." It is not correct to say, as is often done, that its methods are purely secular: its *additional* methods beyond the regular religious ones are so, for the very reason it exists. These involve a thorough organization for social and philanthropic work; but the religious features are sedulously conserved and carefully fitted to the work, the spirit of worship being cherished and made the centre of inspiration. The service generally ends in the communion; there is congregational singing of both hymns and chants, led by a highly trained choir, and often responsive readings; the whole with the sermon are intended to be brief, varied, and attractive. Sunday schools are carefully attended to; prayer meetings given new features; in summer there are open-air meetings; and other Christian associations, endeavor societies, brotherhoods, etc., are encouraged. The officers and workers of the church are given active special duties, such as pastoral visiting, reception and welcome of strangers, canvassing for the various activities of the church; and there are not only sub-pastors, but deaconesses, sisters, and nurses. The purely secular side embraces all departments of culture, physical, intellectual, and moral, as well as direct charities. Morally, the church work above should be sufficient. The charitable departments include not only direct aid to the poor, but wood-yards, employment bureaus, etc.; personal endeavor to provide employment for those willing to work; dispensaries, hospitals, and crèches; and encouragement to thrift by savings funds. Special buildings are often erected.

That the movement is liable to perversions is admitted; such is the case with every institution. Secularization is one; but unless it can be faced, the churches cannot influence or draw in those outside them, for the simple reason that the latter cannot be brought within hearing. Sensationalism, to draw in hearers to be benefited, is a graver one, and ill-judged; as one of its chief workers puts it, "a camp-stool congregation neither pays nor repents," and a lasting work must be content with slower processes.

Instruments, Engineering. To attempt a definition of an engineering instrument is hardly practicable, as the wide range of departments into which the profession is now divided demands so many special appliances for their requirements that no one description is possible, and an extended catalogue is inadmissible within the limits of this article. The earliest known engineering instrument was the Diopter of Hero of Alexandria, 130 B.C., although rude appliances must have been used long before that time by the ancient engineers in the construction of the public works of Chaldæa and Egypt, the ruins of which even now awaken our admiration and wonder. It was not, however, until the beginning of the 19th century that the great impulse to the construction and use of engineers' instruments was given by the advance of civilization and commerce incident to the application of steam as a motive power on sea and land. Since that time great advances have been made not only in the design and accuracy of engineering instruments but also in the invention of new instruments for the many purposes required by engineers in the construction of railroads, canals, bridges, harbors, etc.



The characteristics of engineers' instruments differ in the various nations as the requirements of engineering practice, and thus American engineers' instruments possess a distinct character of their own as compared with other nations, having as a rule few parts and lightness of construction combined with great strength and an adaptability of parts for the special service required. It is not the purpose of this article to attempt a description of the various instruments used by engineers — this may be found in the article SURVEYING,— but to give the reader a general idea of their construction. The metals used in the construction of engineers' instruments are principally the alloys of copper and tin with small quantities of silver, aluminum, and German silver. Great care must be constantly exercised that these substances be free from iron or other material which would affect the magnetic needle. In the construction of an instrument such a distribution of the metals is aimed at that the greatest strength consistent with light weight may be obtained and that the metals coming into contact at the bearing surfaces may be of such varying composition as to cause the least friction.

Take, for the purpose of better illustration, an American transit, illustrated herewith, as typical, as far as the construction is concerned, of nearly all engineering instruments. The plate of the instrument on which the magnetic needle is mounted, or, as it is termed, the compass circle, is turned with great care so that the surface may be absolutely true, and is graduated usually into 720 spaces, each representing one half of a degree.

Compass circles are usually figured in quadrants of a circle, that is, from 0 at the point marked "N" or "North" to 90 and back again, while the figuring of the limb varies with the custom of the maker or the requirements of the engineer.

In engineers' instruments, however, the angular measurements are made usually without the use of the needle, by a telescope so mounted as to revolve in a vertical or a horizontal plane. The angular measurement of its movement being indicated on circles divided into fractional spaces of a degree and read for convenience to finer spaces by one or more verniers. Accuracy of graduation of the compass circle, and especially of the limb, is essential to the perfection of the instrument, and great pains are taken by manufacturers in perfecting and improving engines for graduating. The best machines are automatic in action and the spaces are so accurately laid off that there is no appreciable error in the finished work. The instrument rests on the socket or bearing surface to which the compass plate and limb are attached; the surfaces of the socket must be so accurately fitted together as to produce no error when the parts are moved on each other. The socket is mounted on a leveling head, which is actuated by three, or in the usual American practice, by four leveling screws, as shown, by means of which the instrument can be accurately leveled. Upon the compass plate are placed the standards which support the telescope, the preparation of the optical parts of which is next in importance to the fitting of the socket and the graduation.

The telescope consists of an eye piece and object glass mounted in a tube. The eye piece is simply a magnifier of the image produced at the focus of the object glass. Two kinds of eye pieces are used, one showing the image erect, and the other showing the image inverted. The object glass is composed of two plates of optical glass of such specific gravity and refractive index that it will magnify the image clearly without prismatic colors. To secure achromatism the two parts of the object lens are made the one of crown and the other of flint glass, the crown being a light glass of soda and silica and the flint being a heavier glass containing potash and lead. The surfaces of each are curved to such a degree that the rays of light entering the object glass may be properly refracted and concentrated at a point called the focus.

The making of the lenses is an operation requiring much skill in manufacture, as upon the accurate grinding of the curved surfaces depends the quality of the telescope.

At the focus of the object glass are placed the cross-wires, which are filaments of spider web or very fine platinum. In conjunction with these are often used two more wires commonly called stadia wires, so placed that they intercept on a rod a space proportional to its distance from the instrument, thus furnishing an efficient method of ascertaining distances directly by the observer. The metal parts of the instrument, having been prepared, are polished with some suitable material, a preparation of rouge being generally used for finishing the surface of the screws, and the larger surfaces being finished with fine emery paper. The larger parts are usually colored dark to avoid reflection of the sun, while the smaller ones, such as screws, etc., are left bright in order that there may be a pleasing contrast between the different parts of the instrument. The parts, prepared as above, are covered with a thin coat of lacquer, a preparation of shellac and alcohol, applied after heating. All the parts are assembled and fitted together, and the instrument is then ready for the final complete adjustment. This consists in fitting the sockets so that they will move freely on each other, placing the compass plate and limb in position on the sockets, making the limb truly concentric with the socket and placing the vernier in position. The telescope must be so adjusted that its parts may work freely, and having been supplied with optical parts, etc., it is then fitted to the standards or supports previously placed in position on the compass circle. The whole instrument is then tested for accuracy and if found correct is packed in its case and is ready for use.

The above description is only intended to give a general idea of the construction of a typical instrument, but in the same methods will practically apply in the construction of all engineering instruments, such as levels, plane-tables, the various kinds of compasses, etc.

W. F. Gurley,
of W. & L. E. Gurley, Troy, N. Y.

In'sulator, a body used to separate an electrified conductor from other bodies, and which offers great resistance to the passage of electricity. Glass, shellac, resins, sulphur, ebonite, gutta-percha, silk, and baked wood are notable insulating materials. Wires in which currents of electricity are passing are often arranged in coils. To prevent the lateral passage of electricity from one coil to another, the wires are usually covered with silk and shellac. Insulators on telegraph poles, to which the wires are attached, are usually made of porcelain, glass, or stoneware. Underground telegraph wires are usually of copper, insulated by means of a coating of gutta-percha or india-rubber, and protected by tape or iron wire, metal tubes, or wooden troughs filled with bitumen. The core of a submarine cable consists of a copper wire insulated by a covering of gutta-percha whose weight is greater than that of the wire. See Electricity (*Conductors and Insulators*).

Insur'ance, a contract by which one party, for a stipulated consideration, undertakes to indemnify or compensate another party against loss by certain specified risks. The party undertaking to make the indemnity is usually called the insurer or underwriter, the other the insured or assured; the agreed consideration is termed the premium; the written contract, a policy; the events or causes of loss insured against, risks or perils; and the thing insured or the subject to be protected, the insurable interest. Marine insurance relates to property and risks at sea; insurance of property on shore against fire is called fire insurance; life insurance, in its widest sense, is a contract entered into by the insurer to pay a certain benefit contingent upon the duration of one or more lives. Besides these classes of insurance there are many others; the traveler may insure himself against loss entailed from damage by rail or sea; the farmer from the inroads of disease among his live stock; the employer from the fraud of a dishonest cashier, etc.

The practice of marine insurance seems to have long preceded insurances against fire and upon lives. It is impossible to state the precise period of its introduction, but it is probable that it dates from about the beginning of the 15th century; though it is contended, on the authority of certain ancient writers, that traces of this form of insurance are to be found among the Romans. Some Anglo-Saxon guilds insured their members against loss from fire, water, robbery, etc. Commercial insurance, however, seems to have originated in Flanders about 1300, although priority is claimed for both Italy and Spain. It is probable that insurance was introduced into England by the Lombards early in the 16th century, but few court cases pertaining to it are found till the middle of the 18th century.

In Great Britain fire insurance has been practised for over two centuries, but on the Continent its introduction dates considerably later. The history of life insurance, as well as that of various other forms now in practice, belongs to a still later time. For the history and development of the principal insurance systems in this country, see INSURANCE, MARINE; FIRE INSURANCE IN AMERICA; INSURANCE, LIFE, IN AMERICA; INSURANCE, FRATERNAL.

Insurance, Accident. See ACCIDENT INSURANCE.

Insurance, Casualty. The definition of the word casualty is, "chance, or what happens by chance; accident; contingency; an unfortunate chance or accident, especially one resulting in bodily injury or death," etc. The term Casualty Insurance is commonly held to include those forms of indemnity providing for payment in case of bodily injury or death, or for loss or damage to property (except from fire or the elements), resulting from accident or some other such unanticipated contingency. The four great headings into which this insurance is usually divided are Personal Accident, Liability, Steam Boiler, and Plate Glass.

Personal Accident Insurance.— The first of these to be introduced into this country was personal accident insurance which had flourished, in a limited way, for many years in Europe, but was not attempted here until 1863. The pioneer of accident insurance in America was James Goodwin Batterson of Hartford, Conn., who, while traveling in England in 1859, learned of accident tickets insuring against injuries or death resulting from railway accidents and purchased one of these tickets in going from Leamington to London. Being at once impressed with the possibilities of developing this idea to include all forms of accidents in place of travel accidents only, he consulted with many well-known English insurance experts on the subject, all of whom with the exception of the famous statistician, Walford, expressed grave doubts as to the feasibility of the scheme. However, Mr. Batterson came home determined to make the experiment and in 1863, the first American accident insurance company was organized at Hartford, Conn. There is reliable authority for the statement that the first contract made by this company was a verbal contract entered into by the president of the company with a citizen of Hartford, whereby in consideration of a premium of 2 cents, the company agreed to become liable in the sum of $5,000 in case of accident to the assured while journeying from the post-office to his home on Buckingham Street. The second contract was a more formal one and was issued in consideration of $1 to protect the assured against loss of life or personal injury while journeying from Hartford to Washington, D. C., and return.

An accident policy is a contract of insurance against loss of life, limbs, sight, or time through bodily injuries effected solely by external, violent, and accidental means. The full amount of the policy is payable in case of death, or for the loss of both hands or both feet, or both eyes, or one hand and one foot. Proportionate amounts are payable for the loss of one hand or one foot or one eye, and a fixed sum is payable per week during the term of temporary disability.

The first rates, based upon the statistics of the English companies proved inapplicable to American conditions and accident insurance had a hard struggle to obtain a legitimate foothold on American soil. However, a series of catastrophes by land and sea in the following two or three years emphasized the importance of this form of protection, and little by little the business became more firmly established. During this time about 70 companies started, but all either failed or were absorbed by the pioneer company, which held the field for many years alone.

Gradually, however, other companies were organized, each newcomer profiting by the experience of its predecessors until on 1 Jan. 1904 25 stock companies were writing accident and health insurance in the United States, with aggregate premiums amounting to the enormous sum of $13,337,000. The first accident policies were very primitive affairs compared with the elaborate and almost unlimited contracts of to-day. In the early times, policies covered merely loss of life, limbs, or total disability, conditions were numerous and technical, and policies for small amounts were the rule. Gradually, however, the competition of progressive and aggressive underwriters made itself felt in the broadening of the contract. One of the first important changes consisted in extending the period of weekly indemnity from 26 to 52 weeks. Some of the more conservative companies hesitated for a long time to follow this lead, but the pressure proved too great and they were finally forced to acquiesce. The policies of the leading companies have now reached the limit of liberality on this point by providing for the payment of weekly indemnity in a sum equal to the principal sum insured. One of the important innovations was the introduction of the combination policy, covering not only all of the features of the regular policy, but giving double benefits for accidents happening in or on a moving conveyance using steam, electric or cable power and provided for the use of passengers. This clause was later extended to include accidents in elevators and burning buildings, as well as in any vehicle used as a carrier of passengers, such as carriages, coaches, omnibus lines, and the like.

During this period of evolution, other changes were taking place. Conditions and agreements, that for years had been considered indispensable, began to disappear one by one. The fundamental theory that accident insurance was indemnity for loss of income, resulting from total and absolute disablement, was qualified by the broader and more flexible rule of partial disability, whereby a varying percentage of the weekly indemnity called for by the policy became payable in case the assured was not totally disabled, but was partially prevented from attending to his business duties. This payment was fixed at 50 per cent by some companies, irrespective of the nature and extent of the partial disablement, whereas other companies adopted what may seem to be a more logical basis, providing for not less than 25 per cent, nor more than 75 per cent of the weekly indemnity, depending upon the special circumstances of each case. Other important concessions were made by the elimination of conditions that had been deemed a *sine qua non* to the safe and proper conduct of the business. One of the principal of these conditions was that "injuries, of which there is no visible mark on the body, the body itself in case of death not being deemed such a mark," were not covered by the policy. Others were the exclusion of accidents from "sunstroke or freezing; from injuries intentionally inflicted upon the insured by himself or by any other person, injuries from unprovoked assault excepted; from voluntary overexertion; violating law; violating rules of a corporation; voluntary exposure to unnecessary danger, expeditions into wild or uncivilized countries," etc. Many of these exceptions were reluctantly abandoned by the companies, oftentimes only after long and expensive litigation, the result of which was usually against the company.

The policies now issued by most of the companies are entirely free from all of the above-named conditions and are practically "conditionless," save as to the methods of reporting and adjusting claims. It was, however, not until 1890 that the most radical innovation yet to be introduced into the business of accident insurance was brought forward in the shape of health and disability insurance. It was perhaps but the logical sequence of events that after perfecting the accident policy to the point of the greatest liberality, the demand should make itself felt for insurance against "all the ills that human flesh is heir to" and underwriters in America again turned to their European neighbors, who had already taken the initiative. Sickness policies had become quite widely introduced into many Continental countries before that time and the system of compulsory insurance against accidents and sickness had been successfully instituted by many European governments. It is true that as early as 1847 sickness insurance was attempted in America, by the organization of companies in Massachusetts and Pennsylvania, but these companies, after brief and unprofitable careers, gave up the struggle, and nothing further was attempted in this way until about the year 1896. At this time a rider to accident policies, covering about eight diseases, was adopted by one or two companies. However, the statistics available on sickness insurance did not make the business appear very attractive, and hence, during the first year or two after its general introduction into the United States, few companies were prepared to assume the risk and then only from a limited number of diseases, about 15, comprising a few of the more prevalent forms, the balance being contagious and rare diseases. Soon, however, competitors entered this field and the number of diseases covered was increased to 30, and upwards, until finally all ordinary diseases were included under the policy. At first, a health policy was not issued alone, but was combined with the accident contract, the two constituting disability insurance. Many of the leading companies still adhere to this practice; others issue the so-called unlimited health policy alone, but do not write the limited health contract, which covers a specified list of about 30 diseases, except in connection with an accident policy, while a very few companies still issue either form of health contract separately.

The introduction of disability insurance was the signal for a still further broadening of the benefits and conditions under accident contracts. The most important of these benefits are the "Schedule of Operations," providing for a fixed sum, in addition to weekly indemnity, to cover the cost of a surgical operation for any of the injuries listed in the schedule; the "Schedule of Indemnities" providing for a specified sum to be payable in lieu of weekly indemnity for any of the injuries enumerated, and the "Accumulation Table" providing for a 10 per cent increase in the principal sum insured on each annual renewal until this accumulation amounts to 50 per cent of the original sum.

A startling innovation in the year 1903 consisted in the insurance of the beneficiary, without extra charge, in addition to the policy holder. This was limited, at first, to indemnity for loss of life from travel accidents, including accidents in elevators and burning buildings. However, this was extended in 1904 to cover loss of limbs as well, from accidents above described. It is difficult to predict what limit will be reached by the companies in the eager contest for business, unless a standard policy is adopted by agreement or through legislative enactment.

The figures for 10, 20 and 30 years of premiums written and losses paid, give some astonishing results. From 1873 to 1883, premiums amounted to $11,029,385 and losses to $4,221,616. From 1883 to 1893, premiums were $30,997,822 and losses $13,904,155, or an increase of 181 per cent in business and of 229 per cent in claims. From 1893 to 1903, premiums amounted to $64,-832,874 and losses to $28,686,686, or an increase of 109 per cent in business and of 106 per cent in losses over the previous 10-year period, and an increase of 487 per cent in premiums and of 580 per cent in losses over the first 10-year period. These figures speak eloquently of the enormous strides already made by accident insurance in America, and are but a forerunner of the growth and development that can reasonably be expected in the future.

Liability Insurance.— Liability insurance is of comparatively recent origin, and was unknown in America prior to 1887. As in the case of accident insurance, the business was first exploited in Europe, and its real development began after the passage of the English Employers' Liability Act of 1880. From time immemorial, the liability of employers for injuries caused by or suffered by their employees in the course of employment has been a part of the Common Law of all civilized nations. An eminent authority states that, as early as 1500 B.C. the Jewish law provided that "if a master were the means of causing the loss, either intentionally or unintentionally, of the eye or of the tooth of his slave, he was bound to let him go for his eye or his tooth's sake." And again, according to this same law, "if an employer allowed his ox to gore either his servant or a stranger, he was required to pay various compensations to the injured if he survived, or to his relatives in the event of the injury being followed by death."

Under the Roman law, a master was responsible not only for injuries suffered by his employees if due to his own negligence, but under the legal maxim, "Respondeat Superior," was liable for any personal injury sustained by a third person, due to the wrongful acts or omissions of his servants, acting as such and within the regular scope of their employment. The legal obligation to employees was expressed in the maxim, "*sic utere tuo, ut alienum non laedas*"; but the rule became subject to two important exceptions; firstly, that if the person injured and the one causing the injury were fellow-servants, the master was relieved from liability for the injury; secondly, under the doctrine of "*volenti non fit injuria*," if the person injured had actual knowledge or the means of knowing of and understanding the hazards incident to the employment and then voluntarily accepted the service, he was deemed to have assumed all the usual and ordinary dangers of the work and in case of injury, resulting therefrom, no recovery could be had against the master.

The passage of the Liability Act of 1880 by the English Parliament resulted in the organization of a number of companies for the protection of employers against the provisions of the act as well as against the expenses of litigation arising out of claims and suits instituted by employees for injuries sustained.

In 1887, the State of Massachusetts passed an Employers' Liability Act, fashioned to a great extent after the English statute, but with such changes and modifications as were necessary to suit the changed conditions.

One of the English companies then in successful operation abroad, deeming the time opportune to extend its field to America, determined to establish an American office and selected Boston, doubtless because of the existence of the act above referred to. It is stated that the local agency for the American branch was offered to various prominent insurance agents of Boston, but was declined by each in turn, as both the company and the class of business were unknown and there appeared to be no demand whatever for the kind of indemnity offered by the new-comer. It later became evident, however, that liability insurance had come to stay, and within the next few years a number of American companies were incorporated to carry on the business, and several foreign companies established American offices on somewhat the same lines as the first company had done.

During this early period, the business was entirely experimental and rates were constantly altered to suit the changing conditions, as they arose in the development of the various features of the insurance. At the outset, the indemnity was limited to employers' liability, under substantially the following form of contract: That the company, in so far as regards fatal or non-fatal injuries to any employee or employees of the insured at the place or places mentioned in the application, during the period covered by the premium paid or by any renewal premium, would pay to the insured or his legal representatives all such sums for which the insured might become liable in damages not exceeding the limits of liability stated in the policy, such payments to be made within one week after the receipt by the company of satisfactory proofs of claim. Soon, however, the insurance was extended to public or outside liability, whereby the insured was indemnified against loss in damages on account of common law or statutory liability for personal injuries suffered by any third person and due to the business operations of the insured or of his sub-contractors. This contract was limited for some time to contractors and builders, but gradually the demand arose for similar protection on the part of owners and lessees of buildings, which resulted in the further broadening of the insurance scheme to include general liability. This contract, briefly, provided indemnity to owners or occupants of hotels, apartment houses, office buildings and wholesale and retail stores "against claims for compensation for personal injuries to any person or persons whomsoever for which the assured may be legally liable, resulting from accident (fire excepted), happening to such person or persons on or about the premises of the assured, or caused by any of the horses or vehicles of the assured used in his or their business." It was further provided, that, subject to the limits of liability expressed in the policy in respect to any accident which should cause death or injury to any one person or to several persons, "the company will pay to the assured or his legal representatives, within one week after the receipt by the company of satisfactory proofs of claim, all sums for which the assured shall become liable for personal injuries caused and limited as aforesaid, during the period covered by the premium now paid or by any renewal premium, by virtue of the common law or any statute."

It was a comparatively short step from this contract to the issuance of separate policies covering liability for injuries caused solely by horses and vehicles, known as teams insurance, and for injuries caused by elevators, known as elevator insurance. Meantime a few of the companies were engaging quite freely in the insurance of common carriers' liability, covering "any and every accident to or caused by the cars, horses, plants, ways, works, machinery or appliances" used in the business of steam or street railroads, steamships, steamboats and ferries. It is but proper to say that this feature of liability insurance was looked on very unfavorably by the more conservative companies, and one of the companies engaging in the business notified its agency force after the disastrous results of this underwriting became first apparent in 1893 that "we are not now seeking to push these specialties, as we find competitors (particularly companies whose managers have a commission interest), doing such business at rates which can only be productive of serious loss. Railways we take only when the lines are short, and street railways not at all in great cities." But the handwriting was already on the wall, and in November 1893 one of the largest and most important companies was forced into bankruptcy, largely through the losses sustained on common carriers' liability. This placed almost an embargo on that class of business, only two or three companies continuing to issue such policies. Two of these later discontinued the business entirely, and the other, after a somewhat meteoric career, collapsed in 1897 with heavy liabilities and few assets. In March 1896 the first significant action was taken with a view of placing liability insurance upon a sound scientific underwriting basis in the shape of a conference of the leading companies held in New York. After a series of meetings and discussions extending over a period of several weeks, an organization was effected known as the Conference of Liability Companies. A bureau of statistics was formed, with a well-known underwriter in charge, and the work of compiling the experience of the various companies was vigorously taken up. Frequent meetings of the Conference were called at which the managers and officers of the various companies discussed the different phases of the business and compared experiences. Policy forms were analyzed and conflicting conditions either eliminated or reconciled. As a result of these meetings, and of the work of the bureau, a manual of rules and rates was promulgated in the summer of 1896 and standard policy forms were adopted shortly afterwards. From time to time thereafter manuals and supplements have been issued by the Conference companies altering rates already established and publishing new rates, these changes and additions resulting from the statistical work carried on by the bureau.

Logical development of liability insurance in America dates from the formation of the liability Conference. Standard rates and policies having been adopted, competition was reduced to practically legitimate methods, and for three years the business went on smoothly and grew rapidly.

This highly satisfactory condition of affairs was rudely disturbed early in the year 1900 by the withdrawal of one of the largest companies from the agreement, and while the Conference continued in existence, its usefulness was considerably impaired. Shortly after this time three foreign companies established American offices and two additional companies were organized in this country, and as none of these newcomers became members of the Conference, the situation grew more critical than before and the companies comprising the Conference came to be the minority, while they had formerly constituted the majority. Early in 1903 one of the smaller companies in the agreement withdrew, being unable to withstand the competition of the outside companies. At the beginning of 1904 the Conference consisted of five companies, while twelve companies were operating independently.

This great discrepancy in numbers has forced the Conference to become almost solely a bureau of statistics and there is little attempt made to the adherence of standard rates in cases of competition, which are of course the rule rather than the exception. In spite, however, of what might be termed these unsatisfactory conditions, the business has grown and developed astonishingly. From the inconspicuous beginning in 1887 already noted, liability insurance has in the comparatively short space of 17 years taken its place as one of the most important branches of underwriting in this country involving more technical and difficult features than almost any other kind of insurance business.

The liability policies of the present day are substantially the same with all companies, and are known respectively as Employers' Liability, Public Liability, General Liability, Teams Liability, Elevator Liability, Owners' Contingent Liability, Theatre Liability, and Marine Vessel Liability. The premium is based, in most cases, on the estimated annual payroll of employees, and is subject to adjustment at expiration of the policy according as the actual payroll expended is greater or less than the amount estimated. To ascertain this, the assured is required to render a payroll statement to the company which is usually verified by an audit of the assured's books.

Under the various forms of policies issued, protection against legal liability for damages on account of accidental death or injuries to employees and the public is afforded to manufacturers, and contractors, owners, lessees, and tenants of buildings; to owners and users of horses and vehicles, including automobiles, elevators, vessels and boats; to theatres, agricultural exhibitions and shows, and to owners and general contractors of buildings in course of construction. While at first the limits of liability were rarely in excess of $5,000 for one person injured or killed and $10,000 for two or more persons injured or killed in any one accident it is now quite common to provide double these limits and in fact the indemnity is often fixed at limits of $10,000 for one person and $50,000 for a number of persons injured or killed in one accident. These increased limits are due not only to the inevitable tendency of the courts in the majority of States to sustain verdicts for large amounts, but more particularly to the enactment of laws increasing and extending the liability of employers and others in cases of negligence. For example, in New York State the statutory limit for damages in case of fatal injury from negligence was $5,000 for an individual until this limit was removed by the legislature a few years ago, leaving the amount recoverable in such cases unlimited. In Illinois, likewise, the sum of $5,000 was formerly the maximum amount payable, but an act of 1903 increased the individual limit to $10,000. While it was rare to read 10 years ago of a verdict for $5,000, such amounts are now deemed quite reasonable in serious or fatal cases, and it is not unusual to find that verdicts of ten, twenty, and even fifty thousand dollars are sustained by the courts of last resort. In fact, legislation is playing a most important part in the evolution of liability insurance in this country. The Employers Liability Act of 1887 of Massachusetts, while the most important statute yet to be enacted on this subject, in America, has never been quite satisfactory and just as changes and amendments have been constantly suggested for the English acts of 1880 and 1897, so the legislators of the Bay State have attempted from time to time to extend and alter the provisions of their act. The latest effort in this direction, proposed in 1904, is known as the Workingman's Compensation Act and is quite revolutionary in its character so far as this country is concerned, for nothing of the sort has ever been attempted here before. In the words of an eminent member of Congress from Massachusetts, while discussing this measure, "One of the principal reasons for it is because there have grown up in this country, lawyers and doctors who combine together to hunt up trouble and cheat the injured person out of his money. Another great trouble and reason for the proposed legislation is the employee's habit of bringing suit at once, without trying to bring about amicable relations with the employer. As things are to-day, while employers frequently have to pay out large sums of money, in many cases the injured employee is not benefited. Now, an employee has to show that he received his injuries as the result of the neglect or fault of the employer. This new law does away with all of this and favors the compensation of an employee for the loss of an arm or other serious injury, whether the employer is to blame or not." The passage of the so-called Slater Act of 1902 by New York State was another step in the direction of absolute compensation to workingmen and it is only a question of time and probably a short time, when most of the important States will have legislated on this subject. Not only so, but there is some talk of a national act to be put forward by the United States government affecting these vital questions of the relations between capital and labor.

It may not be entirely utopian to believe that the ameliorating influences of these State laws either with or without a national statute will result ultimately in the more friendly and unselfish attitude between employers and employees and in the discontinuance of strikes and labor disturbances generally.

The growth of liability insurance has kept pace with the industrial development of this country during the past 15 years as will be noted from the following exhibit: From 1889 to 1893 inclusive, premiums amounted to $9,319,591 and losses to $3,838,665. From 1894 to 1898 inclusive, premiums were $20,535,668 and losses $10,084,319, or an increase of 120 per cent in income and of 162 per cent in claims. From 1899 to 1903 inclusive, premiums were about $50,000,000 and losses about $25,000,000 or an increase of 250 per cent in premiums and of 250 per cent in losses over the previous five-year period, and an increase of 437 per cent in premiums and of 552 per cent in losses over the first five-year period.

Steam Boiler Insurance.— The first steam boiler insurance in America was written in 1866, dating almost as early as accident insurance, and like that other branch of indemnity, it owes its origin in this country to the thrifty, practical citizens of Connecticut. It was, however, not until 1869 that the business became well established. At the close of that year total premiums amounted to $55,819, and total losses to $2,188, a modest beginning considering that for the year 1903, premiums aggregated about $2,000,000, and losses about $200,000, while the amount of insurance in force had grown from $5,000,000 to over $600,000,000.

For many years the pioneer company had a monopoly of the field, as, for some unknown reason, capitalists seemed disposed to leave this business alone, due, perhaps, to the slow growth of the premium income, as well as to the mechanical technicalities of the insurance.

At the outset, the form of contract was limited to indemnity for loss or damage to the boiler or boilers and other property of the assured, and to property of others for which the assured could be held legally liable, due to the explosion, rupture or collapse of the boiler or boilers. As a guarantee of the value of this indemnity, as well as a protection to the company against the insurance of old and unsafe boilers, a periodical inspection is made of each boiler during the term of the policy by an inspector of the company, and a written report is forwarded to the policy holder showing the condition of the boiler, recommending such repairs or changes as appear necessary, and stipulating the pressure under which the boiler can safely be run. Steam users were at first slow to grasp the many advantages offered by this new scheme, and engineers of plants strongly resented the reflection on their skill and management implied by some of the features of the insurance. Conflicts of opinion between the inspector of the company and the engineer of the assured were of frequent occurrence and oftentimes much hard feeling was engendered. Nothing daunted by these obstacles, the company vigorously pushed forward the business and at the end of the first 20 years the premium income had grown to about $1,000,000.

In the year 1887 another company was organized which gave considerable impetus to the business and introduced a new feature, namely, indemnity against loss from legal liability for fatal or non-fatal injuries suffered by any person or persons due to the explosion, rupture, or collapse of the boiler or boilers. From this time forward the business increased rapidly.

On 1 Jan. 1904 nine companies were engaged in the business of the insurance of boilers, tanks, dryers, rotaries, digesters, and other objects operated under steam pressure. Nearly 150,000 boilers were regularly inspected in 1903 and a small army of inspectors are maintained by the various companies at an annual expenditure of several hundred thousand dollars. Policies are frequently issued for as much as $100,000 limit for any one loss, and a limit of $50,000 is quite common. Notwithstanding the great number of objects insured annually, and the large limits of liability as above mentioned, serious explosions have been comparatively rare, and the average loss ratio of the largest company for 35 years has not exceeded 10 per cent per year. This showing would seem to indicate that there is an exceptionally large profit to be made in this branch of casualty insurance, but such is not the case, for owing to the inspection system before mentioned, the management expenses range from 60 to 85 per cent of the premium income. Some of the companies maintain in connection with the inspection department, a force of draughtsmen for the purpose of furnishing plans and specifications for new boilers, at the request of their policy holders or of prospective clients. This service is rendered without charge and adds somewhat to the already heavy expense of conducting the business. It is interesting to learn from the statistics of one of the companies, that from the beginning of their business to 1 Jan. 1903 the number of visits of inspection made was 1,815,405. The total number of boilers inspected was 3,508,838. The total number of defects discovered was 2,559,592, of which dangerous defects numbered 270,856, and 15,169 boilers were condemned as unfit for use. During the year 1902 the company made 142,000 visits of inspection, examined 264,708 boilers, condemned 1,004 boilers, found 145,489 defects, of which 13,000 were dangerous.

The total premiums of all companies during 35 years, to the close of 1903, amounted to nearly $25,000,000, and total losses to almost $2,500,000, and with the rapid increase in the number of new manufacturing plants throughout the country, and the general expansion of business, it is safe to predict that steam boiler insurance will develop much more rapidly in the next decade than in the past quarter century.

Plate Glass Insurance.— The first American plate glass insurance company was organized in New Jersey in 1868, but unlike the pioneers in the other casualty lines, this company does not rank among the leading companies in point of financial strength or amount of business written. In 1874, the first New York company was started, and from that year the business steadily increased in volume, total premiums for 1903 amounting to over $2,000,000, and total losses to over $800,000. There have been fewer changes in the plate glass policy than in any other of the casualty contracts, presumably because the business is less intricate and there has been no occasion to make many changes. Plate glass insurance provides indemnity on account of loss or damage caused by breakage of glass, provided that such breakage is the result of accident and due to causes beyond the control of the assured. No claim is paid, however, for breakage resulting directly or indirectly from fire, earthquake, inundation, insurrection, riot, or any military or usurped power, or from the blowing up of buildings or from alterations or repairs to the premises. While for years the insurance was limited almost entirely to what is known as plain plate glass, many different kinds of glass, such as bevelled, mitred, cathedral, leaded, chipped, bent, Florentine, jewelled, ribbed and wired glass are now insured freely by all companies

In 1900 plate glass underwriters were confronted with an entirely new proposition in the shape of clamped or patented plate glass, resulting from riveting the sides and tops of plate glass together without the use of wooden frames that before that time had been indispensable. The rates formulated for patented glass were at first entirely inadequate and the companies lost a considerable sum while experimenting with the subject. Not only was there great trouble and delay in having broken glass replaced, but the patentees, having a monopoly, were disposed to secure the full benefit from the product of their ingenuity As a result of these conditions, the companies placed an almost prohibitive rate on all patented glass in the hope that they could successfully taboo that kind of risk, but the public demand for it was too great and patented glass has come more and more into general use. However, near the close of the year 1903, the leading companies found that the experience with patented glass had been more favorable than had been anticipated, and, as a result, the rate was materially reduced.

Plate glass insurance is now almost as general as fire insurance, and while the average premium is small, the business has assumed very considerable proportions. During 30 years ending 31 Dec. 1903 total premiums amounted to over $20,000,000, and total losses to over $8,000,000. Fifteen stock companies were on that date engaged in the business, in addition to numerous local mutual companies located in various parts of the country. From time to time in the past 10 years, compacts have been formed between the largest companies for the purpose of regulating rates, and establishing sound underwriting practices. Unfortunately, however, these agreements have been of comparatively short duration and as oftentimes happens in similar cases, the demoralization following the termination of the compact has been even greater than before it was made.

It is difficult to predict what will be the final outcome of the admittedly unsatisfactory state of affairs prevailing in plate glass insurance, with rates low, commissions excessively high (sometimes as much as 50 per cent), and the cost of replacements increasing, unless the companies form a national compact and place the business upon a logical underwriting basis. One company heretofore writing plate glass insurance alone, decided early in the year 1904 to add a personal accident department, and it is probably only a question of time when every company engaged in this one line of business will be forced either to add other lines of insurance, or to consolidate with other companies engaged in the same business.

Sprinkler Leakage Insurance.—While not constituting one of the main divisions of casualty insurance, this form of policy is written to a limited extent by two of the casualty companies, as well as by some fire insurance companies. The contract covers loss or damage to the building and contents caused by the accidental discharge or leakage (except from fire) of the sprinkler equipment erected in or on the premises. The premium, based at a varying rate, depending on the class of merchandise covered, is predicated upon a certain percentage, usually 10 per cent, of the cash value of the building, stock, and machinery. Sprinkler leakage insurance has been in vogue only nine years in America, during which period the total premiums have not amounted to any considerable sum. There is, however, a slow, steady growth of the business, due to the wider use of sprinklers in mercantile and manufacturing plants, principally in the Eastern and Middle States.

Fly-wheel Insurance.—This is one of the less important branches of casualty insurance and is of recent origin in this country. One company alone is engaged in the business at this time, and hence the statistics are limited. The contract covers loss caused by the explosion, bursting, or disruption, during rotation of the fly-wheels or any of them, first for loss upon the fly-wheel or fly-wheels and upon other property of the assured; second, for loss from liability of the assured for loss upon property of any other person or persons; third, for loss from liability of the assured for bodily injuries or death sustained by any person or persons. Fly-wheel insurance is more or less allied to boiler insurance, and the limits of the company's liability in case of loss, as well as the rates of premium and the methods of handling the business, are very much the same as in boiler insurance. The insurance against breakage of machinery in general is being introduced to some extent in one or two European countries, but has not yet been attempted in America. There appears to be a field for such a policy, and doubtless the indemnity will be offered by some American company before very long. In fact, at the present time, a few corporations are engaged in the business of insuring the maintenance of electric machinery and of making the repairs found necessary from a periodical inspection of the premises or plants.

Physicians' Liability Insurance.—This is another of the modern schemes in casualty insurance, and provides indemnity against loss from common law or statutory liability for damages on account of bodily injuries fatal or non-fatal suffered by any person or persons in consequence of any alleged error, mistake, or malpractice by the assured in the practice of his profession. The limits of the company's liability are uniformly $5,000 for one person injured or killed, and $10,000 for any number of persons injured or killed during the term of the policy. Naturally, the moral hazard is the main consideration in a contract of this nature, and, while a fixed premium is charged, a careful selection is made by the conservative companies of the risks offered.

Taken all in all, the field for casualty insurance is an ever widening one, and the vast interests involved have given to this branch of indemnity a place in the front rank of insurance schemes. The magnitude of the business, the great scope of the contracts, the elaborate and comprehensive machinery required to properly conduct the affairs of these great corporations, can best be understood and appreciated when it is known that during the period in which the various lines of casualty insurance heretofore enumerated have been written by the total premiums have exceeded $221,000,000, the total losses have been more than $88,000,000, and the total amount of insurance in force on 1 Jan. 1904 was estimated at the bewildering sum of over $5,000,000,000.

EDWIN W. DE LEON,
Vice-President Casualty Company of America, New York.

Insurance, Credit, is a business proposition which offers to the seller of merchandise on credit protection against excessive losses as the result of bad debts. When loss occurs a certain percentage is to be borne by the party insured, and the balance of the loss is made good by the company issuing the policy of indemnity. To illustrate: Application is made for an insurance bond on sales amounting to $400,000 a year, and a bond is written on a basis of one half of 1 per cent loss; this one half of 1 per cent on sales, or $2,000, would represent the insured's own risk in bad debts, and if he lost no more than that amount he would receive nothing from his insurance. But should his losses be $5,000 in bad debts, his own loss would still be only $2,000, and the excess, or $3,000, would be paid him by the insurer, provided the losses had come within the terms and conditions of the bond. Credit insurance is a natural product of the present age. The first important systematic aid to the credit system was the establishment of the commercial agency, which is now recognized as indispensable to an intelligent transaction of credit business. But this first aid was not complete within itself, and a supplementary system was needed to still further minimize the risk of excessive losses through insolvency of debtors, which want is supplied by credit insurance.

The annual losses in the United States by the insolvency of debtors exceed by about 50 per cent the losses by fire. It has long been the general custom to pay insurance companies to carry the risk of loss by fire, but until comparatively recent years each merchant had to carry his own risk of loss through insolvency of debtors. Credit insurance is based on the sound economic principle which recognizes the province of the specialist. Both fire and life insurance offer protection superior to that which can be obtained through any other medium, because the principle of the law of average cannot be efficiently employed except by the specialist. Protection is against the possibility of abnormal loss no less with fire than with credit insurance. Credit insurance from the standpoint of the insurer proceeds on the principle of average which promises a profitable return on the sale of protection. The cost of protection is assessed on the basis of normal losses accruing in any given business for a period of years. Such loss may be termed the normal loss. Normal loss is that inevitable impairment of resource which can be borne by a business and yet admit of a satisfactory dividend on capital invested. Abnormal loss is loss in excess of that which permits satisfactory dividend on capital investment, and it is against such loss that credit insurance offers protection. From the standpoint of the insured, credit protection cannot be considered a profit-earning investment. It is simply and solely protection against excessive loss by bad debts. A crop failure; an epidemic of disease, or a widespread or protracted industrial labor strike, are possibilities of danger which no man can provide against, as respects commercial credits, except through the medium of insurance protection. Experience may qualify a credit man to guard against bad debts through the rascality or impaired credit condition of those seeking credit, but no amount of experience or capacity can of themselves render it possible to provide against contingencies growing out of such cases as above mentioned.

Great care should be exercised by the insured in taking out a policy of credit indemnity. The peculiar need of his business should be intelligently considered. Precedent cannot be safely followed, for the character of every man's business is in more or less degree individual. Unless an intelligent application of the principle of credit insurance is made to each individual case, the greatest amount of protection cannot be realized. The principle of credit insurance being economically sound, it follows that if the insured in any given case does not realize the protection contemplated, it is because the conditions of the indemnity are not adjusted to the needs of the business. No amount of indemnity can be considered a profit maker of itself; its true sphere is that of a profit saver. In explanation of the proposition that an insured is always a loser, when his losses make demand on the indemnity company, it is conceivable that excess losses should so dovetail with the conditions of the policy as to reimburse the insured for every dollar of excess loss, but such instances would be rare indeed.

It would be practically impossible to limit precisely the line of credit on every individual case to the exact ratio of protection. Such a conservative policy would by no means realize the best results of credit protection, and, if strictly adhered to, would restrict rather than expand business. Protection can be made to operate injuriously in both directions, and it would be as false policy to limit business to the letter of protection as it would be to expand it beyond the limits of the spirit of indemnity. A credit should not be extended merely by reason of the collateral security furnished by credit-indemnity, but such security should be used to justify a risk which would not otherwise be undertaken, and to increase a line of credit beyond its natural unsecured limit. A bank will not lend on collateral alone. The personnel of an individual borrower is an equation which can not be eliminated, whether the loan be in money by a bank or in merchandise by a merchant. Collateral security in the case of a bank operates to reduce the interest rate, and the difference between the rate which would be demanded without collateral and the rate with collateral, measures the premium paid by the bank for the protection. In the case of a merchant, the rate paid for protection is the cost of carrying the security as represented by the premium on the policy of indemnity. The banker, therefore, pays a higher rate for collateral protection than the merchant.

The essential features of the contract between the insured and the insurer are: (1) The insured to bear a normal loss of an agreed percentage of his annual sales. The said ratio of own loss to be determined by facts established by the record of the business for a series of years. (2) Insurance to apply to both rated and unrated accounts at an agreed ratio, as the circumstances of the business in question may require and justify. (3) Liberal insolvency conditions, in which technical distinctions are eliminated, and the actual and virtual facts equitably arrived at. (4) Prompt payment of losses at the period of settlement.

J. A. TAYLOR,

Prest. Wilmington, N. C., Board of Trade.

Insurance Engineering, a science or method of procedure for the better application of principles and rules in the business of insuring property against fire. The decision of the trustees of the Massachusetts Institute of Technology to establish a course in what for want of a better name has been designated insurance engineering, is commendable and should meet with hearty encouragement from the fire underwriters. Its object will be to instruct those who take the course in the selection and constructive use of materials with a view to minimize the risk of destruction by fire. Naturally, this will for the present relate more directly to mill and factory property than to dwellings, but the influence of such a school should soon be felt in every department of architecture, especially if out of its work shall grow a determination on the part of the fire underwriters to make such discrimination against buildings in which they are expected to take all the risks as will make it to the advantage of those who build or buy houses of any kind to do what is possible to share this risk by guarding against fire within practicable limits of slow-burning construction.

The latest official calculations — those of Insurance Commissioner Dearth of Minnesota — lead to the conclusion that 75 per cent of the enormous annual loss from fires in this country results from fires which are preventable. The policy of the insurance companies has lent itself to the encouragement of indifference on the part of owners of insured property to everything except the rate of premium. Commissioner Dearth's further conclusions are:

> It is not to the large number of promiscuous fires that heavy losses to property are attributable, but more to the larger select risks occuring in heavy commercial circles where great values are involved. One of the greatest evils in fire underwriting is in the matter of over-insurance, which places a premium upon criminal carelessness on the part of the assured, if not absolute incendiarism. For this evil the companies themselves alone are, of course, to blame, and consequently have it entirely within their power to eliminate. There is very little question that the companies are at the present time exercising a far greater degree of precaution in this direction than heretofore; in short, cancelations, reducing the liability of the companies on all the more hazardous classes of risks, are causing not only the local agents, but the assured, no end of trouble, and much greater care is, beyond question, being exercised in the line of inspections, especially looking to the matter of values as compared with the amount of insurance covering on the property. These are all matters that are being strenuously considered by the underwriters throughout the country, and beyond question must result in a material decrease in the fire waste.

The erection of insurance engineering into a profession will enable the insurance companies gradually to reorganize their business on safer lines, and in so doing discourage the practices which have grown up through the co-operation of owners and agents to saddle them with larger responsibilities than any scale of practicable premiums would warrant. The number of men qualified to practise as insurance engineers has never been great enough to meet the requirements of the companies. The new school should have an immediate and important practical relation to the public welfare in the safeguarding of life and property and the raising of the standards of construction in buildings admitting of classification as insurable risks.

The undertaking has the enthusiastic support and co-operation of Edward Atkinson of Boston, whose efforts in recent years have materially changed the methods of mill construction and the theories of industrial insurance; and it has appealed so strongly to mill owners, builders, manufacturers, and other investors to whom fire is a constant menace that, at Mr. Atkinson's instance, a fund sufficient to place it at once on a substantial money basis with liberal allowance for the heavy initial expense has been raised.

Insurance, Fraternal. The principles which govern the system of fraternal insurance can be gleaned only from the decisions of the courts of law, the dictum of the insurance departments of the different States, the files of the leading fraternal journals, and the official reports issued by the National Fraternal Congress, the associated fraternities of America and the fraternal societies themselves.

Fraternal Insurance, as popularly understood at the present time, is "The obligation of a fraternal beneficiary association to pay the benefits prescribed in its constitution and laws when all requirements by or on behalf of the members are fulfilled." In the early days of fraternalism in America the term "protection" was universally used in describing the benefits furnished by the different beneficiary societies. See Fraternal Beneficiary Societies in America.

The term fraternal insurance, although originally a misnomer, and clearly inapplicable in any true conception of the real aims and objects of a fraternal beneficiary association, has, however, come into general use of late years as being synonymous with the words fraternal protection and fraternal benefits, whenever reference is made to the money benefits paid by a fraternal beneficiary society. This change has come about so gradually that it is difficult to trace its origin or fully measure its effects. The primary cause of this mingling of insurance terms with fraternal names has undoubtedly been the failure of the officials of the different societies to constantly keep in mind the distinction between the insurance contract supplied by an insurance company and the fraternal protection furnished by a fraternal society, while a secondary cause has been the efforts of the insurance commissioners of the different States to compel all fraternal beneficiary associations to comply with the regulations in force as to insurance companies.

In order, therefore, to fully understand the scope and meaning of the term fraternal insurance, as now understood, it is first necessary to ascertain the meaning of the word insurance. Webster defines it as "a contract whereby for a stipulated consideration called premium one party undertakes to indemnify or guarantee another against loss by certain specified risks." The supreme court of Pennsylvania (1890), in the case of the Commonwealth *v.* the Equitable Beneficial Association (137 Pa. St. 412) (18 Atl. 1,112), thus points out the distinction between regular life insurance and fraternal protection, as then understood.

"The general object or purpose of an insurance company is to afford indemnity or security against loss. Its engagement is not founded in any philanthropic, benevolent, or charitable principle; it is a purely business venture, in which one, for a stipulated consideration or premium per cent engages to make up, wholly or in part, or in a certain agreed amount, any specific loss which another may sustain, and it may apply to loss of property, to personal injury, or to loss of life. To grant indemnity or security against loss, for a consideration, is not only the design and purpose of an insurance company, but is also the dominant and characteristic feature of the contract of insurance.

"What is known as a beneficial association, however, has a wholly different object and purpose in view. The great underlying purpose of the association is not to indemnify or secure against loss; its design is to accumulate a fund from the contributions of members for beneficial or protective purposes, to be used in their own aid or relief in the misfortunes of sickness, injury or death. The benefits, although secured by contract, and for that reason, to a limited extent, assimilated to the proceeds of insurance, are not so considered. Such societies are rather of the philanthropic or benevolent character. Their beneficial features may be of a narrow or restrictive character; the motives of the members may be to some extent selfish, but the principle upon which they rest is founded in the considerations mentioned. These benefits, by the rules of the organization, are payable to their own unfortunate out of funds which the members themselves have contributed for the purpose, not as an indemnity or security against loss, but as a protective relief in cases of sickness or injury, or to provide the means of a decent burial in the event of death. Such societies have no capital stock; they yield no profit, and their contracts, although beneficial and protective, altogether exclude the idea of insurance, or of indemnity, or of security against loss."

We may therefore assume that insurance is a contract between an insurance company on the one hand and the insured on the other, and provides for the payment of a specific indemnity by the company in consideration of certain stipulated premium payments by or on behalf of the insured. It has been held that a verbal contract of insurance is valid, but by universal practice the contract is made in writing, and is called a policy. The policy, therefore, expresses the terms of the contract, and governs the right of the parties.

Fraternal insurance, on the other hand, is the very antithesis of insurance as above understood. A fraternal society does not, and under the laws of the different States has no power to, make an insurance contract. It does not, and cannot, issue a policy. It does not promise indemnity against loss, and is not limited to any stipulated premium payments. Its contract is not between the society on the one hand and the members on the other, but between the members of the society, each with the others, and this contract is not expressed in the certificate of membership issued by the society. This certificate which it issues is not a policy. If it were, the society would immediately cease to be a fraternal society, and be not only classed by the insurance departments of the different States as an insurance company, but required to report and pay taxes as such. The usual form of certificate in use certifies that the holder has been duly and regularly accepted and admitted to membership in the organization, and entitled to all the rights and privileges accruing under the specified benefit, as prescribed in its constitution and laws as then existing or subsequently altered or amended by the duly constituted supreme body of the association. The certificate, therefore, is merely evidence of membership, and certifies that the holder is entitled to the rights and privileges flowing therefrom. It is in no sense a policy, and has never been so construed by any court of last resort.

Of late years there has been some conflict in the decisions of the courts as to the legal effect of some peculiar certificates of membership that have been issued by fraternal associations, but in the leading cases the courts have uniformly adhered to the rule that the certificate is merely evidence of membership, and that the rights of the parties, or, in other words, the contract for fraternal protection, is governed by the constitution and laws of the organization as they exist at the time the right to the benefit accrued, although in some cases the society has been held to have waived certain provisions in its constitution and laws because of peculiar features in the certificate, and in other cases, certain practices or customs that, in the judgment of the court, tended to mislead the members, as to the proper construction or binding effect of some clauses in the constitution, have been held to be a waiver on those provisions.

The laws of the different States require every fraternal beneficiary association to have a representative form of government and to be organized and carried on for the sole benefit of its members and their beneficiaries. Each member, therefore, has a voice in the management, and has no right to complain of any lawful changes, alterations or amendments to the constitution and laws made during his membership, because they have been made by him or in his behalf, and for the general good of the entire membership.

As the organization is purely mutual, every member who is to share in the benefits ought in equity to bear his fair share of the cost, and it follows, therefore, that he is also bound by any changes that may be made in his rate of dues or assessments by the constituted authorities of the organization.

To sum up in a word, "insurance" is a contract, while fraternal protection is the result of a contract; the one makes a definite promise of a certain indemnity in consideration of certain stipulated premium payments, while the other is the obligation of a fraternal association to pay the benefits prescribed in its constitution and laws when all requirements by or on behalf of a member have been fulfilled. Many, of course, prefer to rely on the business promise of the insurance company to pay the prescribed indemnity, but the millions of members in the fraternal societies of America prefer their fraternal protection, not only because it is cheaper, but because it is better and surer. Every member of every fraternal association fully realizes that any tampering with good faith in dealing with any single member would be fatal to the organization, and ultimately injure the entire membership. In the judgment of all true fraternalists, the mutual interests of the members, therefore, constitute a safeguard that is far more reliable, and certainly more durable, than the mere promise of any purely business company. The membership of the various fraternal beneficiary associations in America that report to the insurance departments of the different States is over 4,500,000, and the amount of protection carried is in excess of $6,450,000,000. Up to the end of 1902, the various societies have distributed over $800,000,000 among the beneficiaries of deceased members. Last year their total payments for death losses were over $73,[illegible]. These figures do not include the vast number of small societies scattered through the various States which do not report to the insurance departments. For further information consult The Annual Reports of the Insurance Departments of the different States, and the Official Reports of the Fraternal Beneficiary Societies.

FREDERICK GASTON,
President The Grand Fraternity.

Insurance, Industrial. *Definition.*—Industrial insurance may be defined as family insurance at retail. While in scientific principles it does not differ at all from ordinary life insurance as described by Mr. Nichols, in practice its distinctive features are: (1) that instead of having its policies written for $1,000 and multiples thereof at varying premiums according to mortality tables, its policies call for premiums of 5 cents and multiples thereof, the amounts of insurance varying according to age; (2) the premiums instead of being payable annually, or semi-annually, or quarterly, are payable weekly; (3) these premiums are called for weekly by collectors instead of being remitted by mail; (4) the amounts of insurance payable are based upon mortality tables drawn from experience in industrial insurance, and these tables differ very widely at all ages from the tables used by the ordinary companies; (5) the insurance is taken upon lives between ages 1 and 70, without distinction of sex as to premium, and, in the largest company, without distinction as to color. Industrial insurance is so called because it is the insurance of the working classes. For this reason it has grown very rapidly, and no doubt in time will exceed in amount the annual premium insurance.

History.—For its origin industrial insurance must point to the guilds of the Middle Ages, whose place was taken in England after the Reformation by burial societies or clubs. These were voluntary associations, meeting periodically and collecting dues and undertaking to bury members out of the funds so paid in. The dues were the same for all ages and the management so bad that up to 1867 14,000 of the clubs out of 38,000 had collapsed and a large majority of the existing remainder were insolvent. In 1849 the first industrial life insurance company was founded in England, called the Industrial and General; three years later an offshoot called the British Industry Life Insurance Company was formed; two years after this — in 1854 — the Prudential Assurance Company, which had been in existence six years as an ordinary company, took up the industrial business and soon absorbed the British Industry. At the outset the business was experimental, as actuaries had insufficient data upon which to base calculations; and several tables of benefits for the weekly premium of a penny succeeded each other, widely differing in amount. The first table ran from ages 10 to 50; age 10 was found too high for practical working and the table was run down to age 7; then a demand arose from the people for insurance at younger ages which was first met privately by an agent of the Prudential on his own account. His fine business record attracted the attention of the officers, who found it arose from his practice of himself insuring the younger members of the family. This discovery led to the company's making its system a real family insurance. It was not successful until all ages were accepted. Thereafter the business grew rapidly, so that at the end of 1904 the Prudential had 15,577,161 industrial policies in force secured by £24,073,082 of assets credited to the Industrial Department, besides £30,386,422 assets credited to the Ordinary Department. The Board of Trade exhibit of regular industrial insurance (that is, excluding friendly societies) in Great Britain shows the steady and rapid growth of the business as will be seen from the following table:

INDUSTRIAL INSURANCE IN GREAT BRITAIN.

Year	No. of Companies	No. of Policies	Insurance	* Death Claims Paid	Assets
1890	8	9,432,778	£86,203,873	£1,928,406	£8,737,936
1895	7	14,990,581	144,142,569	2,418,754	13,803,227
1900	14	18,653,846	181,135,538	3,410,642	21,512,384
1904	21	23,810,937	234,217,606	3,944,927	32,412,434

The number of policies in force in the industrial companies of Great Britain equals about one half of the population of the country.

In America the first weekly premium experiment of importance was the connection of the Hildise Bund, a German society which received premiums weekly and used them to pay to the Metropolitan Life Insurance Company to be credited upon quarterly premiums on policies issued by the Company on the lives of the members of the Bund. A large business was done on this plan for several years after 1869, amounting at one time to $7,500 per week. There were other similar societies in name, but they seem not to have done much business. The English experiment had attracted a good deal of attention in America, and various industrial insurance companies were formed which, however, never got to the point of issuing policies. There was a good deal of literary discussion which culminated in a State report in 1874 by Commissioner Clarke of the Massachusetts Insurance Department, describing the work of the English Prudential Company and setting forth the principles of industrial insurance. In 1875 the Prudential Insurance Company of America, then a small corporation in Newark, New Jersey, known as the Widows' and Orphans' Friendly Society, changed its name to the Prudential Friendly Society and in November began the industrial business on the lines of the London company after which it was named. Before it attained much growth the John Hancock Mutual Life Insurance Company, of Boston, the Germania Life Insurance Company, of New York (which, however, soon ceased writing industrial insurance), and the Metropolitan Life Insurance Company of New York, old line companies of experience, began the industrial business. The progress of this system of insurance in the United States has been wonderful. Its first policy was issued in America only 30 years ago; at the end of 1904 there were in force in the United States and Canada over fifteen and a half millions of industrial policies against less than five millions of annual premium policies — the amount insured thereby being respectively: $2,134,458,411 industrial insurance and $9,360,-278,728 annual premium insurance.

The following table shows the rapid growth of the business:

INDUSTRIAL INSURANCE IN THE UNITED STATES AND CANADA.

Year	No. of Companies	No. of Policies in Force	* Death Claims Paid	Insurance in Force	* Assets
1880	3	228,357	$ 430,631	$ 19,579,780	$ 4,687,074
1885	3	1,360,375	1,919,533	140,101,632	6,573,267
1890	9	3,875,102	6,438,334	427,882,964	21,229,162
1895	12	6,947,223	12,551,865	820,062,966	54,306,416
1900	17	11,115,908	20,301,793	1,450,324,885	122,943,845
1904	11	15,599,449	31,436,785	2,134,458,411	255,255,034

The following table shows how extensively the working classes take out this insurance, by a comparison of the population of five large cities with the number of industrial policies in force in three companies (other companies are doing business in most of these cities):

City	Population in 1900	Number of Industrial Policies in Three Companies in Force Dec. 31, 1904
New York	3,437,202	2,191,818
Philadelphia	1,293,697	1,145,172
St. Louis	575,238	427,403
Baltimore	508,957	424,135
Cincinnati	325,902	294,540
	6,142,996	4,483,068

There are in the United States about 30,000 agents writing industrial insurance and the head office clerical force numbers about 5,000.

Industrial insurance was introduced in Australia in 1884, but was not vigorously prosecuted until 1887. By the end of 1902 there were six companies, with 291,198 policies in force, assuring £6,216,589. In New Zealand the Government started the business of Industrial insurance in 1875, but quickly discontinued it. In 1881 the Government revived the work of the insurance branch of its Insurance Department, but finally abandoned it in 1887.

* The figures in the columns of payments and assets include the annual premium business of the companies. As to these items, the reports do not separate the weekly premium business from the annual premium business. But so very large a proportion of the business of the companies is industrial that these figures are not at all misleading.

The business flourishes best in Anglo-Saxon countries. It is scarcely known anywhere else except in Germany, where in 1900 there were 34 companies, having two and a half millions of policies in force for $115,000,000. In Austria, Holland, Denmark, Sweden, Switzerland, Hungary, and Belgium the business is transacted on a very small scale.

Policy Contracts.—We have said that the unit in industrial insurance is the five cent premium: the amounts of insurance vary with the age of the insured and the duration of the policy. The curve in the mortality table descends from birth to age 12 and then ascends, and the companies for the same premium increase the amount of insurance with each age up to age 10. The amount of insurance thereafter does not decrease through life; for the policies are, like the annual premium policies, constructed with a level premium carrying a reserve from age 10 on whole life and on endowments at all ages. Insurance at younger ages is term insurance. Different kinds of policies are issued. The Prudential and John Hancock companies' policies are nearly all whole life; the Metropolitan policies issued for the last ten years have been practically all endowments; together these three companies have in force and issue yearly about 95 per cent of the American business. This table of the largest of the companies shows the benefits payable on children for a 10 cent premium with the period of endowment:

PREMIUM OF 10 CENTS, IN USE BY THE COMPANY WHICH HAS IN FORCE ABOUT ONE HALF OF THE AMERICAN BUSINESS.

Amount payable provided death occur after the policy has been in force for the following periods:

Age next Birthday	Under 3 months	Under 6 months	Under 9 months	Under 1 year	1 year	2 years	3 years	4 years	5 years	6 years	7 years	8 years
2	[illegible]	[illegible]	24	[illegible]	34	[illegible]	[illegible]	[illegible]	110	100	200	240
3	[illegible]	22	[illegible]	34	[illegible]	[illegible]	58	102	150	200	240	
4	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	200	240		
5	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	240			
[illegible]	[illegible]	32	44	[illegible]	[illegible]	[illegible]	[illegible]	240				
[illegible]	[illegible]	[illegible]	52	[illegible]	[illegible]	[illegible]	240					
[illegible]	[illegible]	44	[illegible]	[illegible]	[illegible]	240						
9	[illegible]	[illegible]	[illegible]	[illegible]	240							

[illegible] policy, after the [illegible] re[illegible] of age, there will be added to the [illegible] the above table. ONE DOLLAR.

[illegible] the amounts payable at the end of each [illegible] are as follows:

Policy issued at age	2	mature in	[illegible]	years	for	[illegible]
"	"	"	3	"	48	"	[illegible]8.00
"	"	"	4	"	49	"	[illegible]
"	"	"	5	"	51	"	[illegible]83.00
"	"		6	"	53	"	286.00
"	"		7	"	56	"	200.00
"	"	"	8	"	62	"	297.00
"	"	"	9	"	68	"	[illegible]

For five cents per week the benefits are one half th[illegible] above.

No higher premium than [illegible] cents will be taken.

It will be noticed that the amount payable increases materially after the policy has been in force for several years. The reason is that in the early years insurance is not needed in so large amounts and the unearned part of the premium charged is used to increase the amount of insurance in the later years as well as to shorten the endowment period. Technically in industrial insurance adult insurance begins at age ten because the old actuarial tables were not carried below that age. Above that age at each advancing year at entry the amount of insurance for the same premium decreases. Thus, entering at age 10 the amount of insurance is $230 for 10 cents; entering at age 20 $154; entering at age 30 $120—and so on. These amounts are payable (with certain dividend additions) at age 80 or prior death. There are other tables, whole life tables, where the insurance at certain ages for the first few years of insurance is slightly higher for the same premiums; and there are also 20-year endowment tables, where obviously the death benefit for the same premium is less.

The provisions of the policies in industrial insurance do not differ in principle from the annual premium policies. Because of the small premium payable weekly the policies are only in partial benefit during the first year of insurance, that is, one quarter is paid if death occurs within six months, and one-half if death occurs after six months and within a year. The insurance is payable immediately upon receipt of proofs of death: and these proofs are prepared by the companies' agents without charge. The intention of the insurance being mainly to provide for expenses of sickness and death, everything is done to facilitate the payment of the premiums of the company and of the claims to the insured. Collectors call weekly for the premiums; the companies have local offices convenient to the policy holders and from there death claims are attended to and paid either without reference to the home office or on telegraphic instructions therefrom. Four weeks' grace are allowed in the payment of premiums which in practice is usually extended to five weeks, within which time claims are paid even if premiums have not been. Paid up policies are issued after two, three, or five years in different companies. The Massachusetts law provides for two years; the New Jersey law for three years; the New York law does not compel paid-up insurance—but the company grants it nevertheless. Revivals are freely granted in cases of lapsed policies, and where policies have been long lapsed, so that payment of arrears is difficult, the companies loan the amount of arrears on the security of the policies. Special allowances are made in cases of long strikes and lockouts, death claims usually being paid even if policies are lapsed.

Dividends.—Policies of industrial insurance have in form been mostly non-participating; but of late years three American companies have begun to pay dividends and have voluntarily disbursed to industrial policy holders over nine and a half millions of dollars—averaging over a million of dollars annually in cash dividends for the last eight years. The profits come from a very small margin upon an enormous amount of business. It has been estimated that the reduction of premium one cent a week on each policy would bankrupt the largest of the companies in five years. The only feasible way of reducing the cost to the holder is therefore the return of surplus by dividends. Two of the companies once in five years return to the holders of life policies a cash dividend equal to ten weeks' premium — or about 20 per cent of the premiums for a year. One of these companies, which in 1896 practically withdrew the whole life form and has since issued endowments, substituted as to this form of contract a reversionary dividend guaranteed in the policy; that is, after the third year a sum is annually added to the face of the policy equal to the sum of ten weeks' premiums. Thus a policy which is for $230 after the first year (premium 10 cents, age 10 years) eventually is for $297 payable as an endowment at age 80. One advantage of this long endowment is that the amount of paid up policy is readily calculated by the insured — being for such a proportion of the amount of the policy as the number of years paid bears to the endowment period. The other of the large American companies provides in the policies for reversionary dividends to be paid when death occurs after 5 years; for cash dividends after 15 years and quinquennially thereafter; and for cash surrender values after 20 years.

Mortality.—When the cost of industrial insurance is considered, the first thing to be noted is the increased mortality among the industrial classes. Let us compare the number per thousand dying at each of several specified ages according to (*a*) Farr's English life table of the general population in Great Britain, compiled from two censuses (we have no such table in America): (*b*) Actuaries' table, (that is, a table of insured lives formulated from the combined experience of 17 companies, compiled by English actuaries, which is made the statutory basis in many of the United States for the computation of insurance liability); and (*c*) the Metropolitan Life Insurance Company's industrial table (based on observation of twelve millions of insured lives):

DEATHS PER 1,000.

Age Next Birthday	Farr	Actuaries	Metropolitan
20	7.74	7.29	10.52
21	8.46	7.38	11.56
25	9.24	7.77	14.14
35	11.24	9.29	17.15
45	14.50	12.21	22.56
55	21.75	21.66	35.22
65	41.20	44.08	64.51
70	60.80	64.93	90.99

A glance at these tables shows the net cost of industrial insurance of adults to range from 140 to nearly 200 per cent of the Actuaries' table. As the experience of the American companies shows an actual mortality of only about 80 per cent of the Actuaries' table, it follows that the industrial mortality is from 170 to 230 per cent of annual premium insurances. At age 35, generally taken as an average age, the percentage is 230. A comparison of industrial mortality with general mortality shows a less, but still large, percentage of difference. It is reasonable that it should be so, because, in the first place, industrial insurance in this country has not yet reached, in proportionate amounts, the agricultural and rural population, which is so large a percentage of the whole population. In the second place, the mortality of the working people in cities is large, because of the exposure, the mode of life, the hard toil and confinement, the carelessness of self which the observation of everybody must have noted among working men and women. To some extent there is also a selection against industrial companies, often unconscious, which is the correlative of the unconscious selection against tontine and endowment policies in annual premium companies. A man vaguely conscious of low vitality will insure himself more readily than his opposite, just as one vaguely conscious of superior virility will prefer tontine to whole life insurance.

Insurance of Children.— The insurance of children has been the subject of much discussion in England and America, and legislation against it has been proposed; but no law of prohibition has been passed in any State where the business has been well established. In England the law has remained for many years permitting the insurance of children within the limits previously adopted and maintained by the companies; and this after repeated Parliamentary investigations. In America, New York State in 1892 adopted as part of the insurance code a provision authorizing the insurance of minors according to the table of benefits in use by the companies. The Province of Ontario, Canada, followed a few years after with a similar table. In the States of Massachusetts, New York, Pennsylvania, Ohio, Connecticut, New Hampshire, Tennessee, Missouri, Wisconsin, Michigan, Georgia, Virginia, North Carolina and California proposed legislation forbidding the insurance of children has been defeated, in many of them repeatedly. In Massachusetts in 18[illegible] the joint legislative committee took six weeks to investigate the subject, examining hundreds of witnesses, resulting in a vote of 143 to 29 against the prohibitive bill. Colorado is the only State which forbids the business and the law was passed there without a hearing of the company which had only recently begun business in the State — in other words, in anticipation of, not after experience of, evils. So France, which is without experience of industrial insurance, recently passed a prohibitive act; while in Australasia, where such insurance has been written for years, New Zealand has passed a law on the lines of the English permissive act. The tables above printed show the American limit on child insurance by the practice of the companies. It is apparent therefrom that at the earlier ages the insurance is simply burial insurance, while at the older ages it amounts to a very respectable endowment insurance. No case of child murder or abuse for insurance has ever been shown in the United States. In England the matter is thus summed up by Doctor Jones of the Royal Southern Hospital in Liverpool (where child insurance is most common and has been for many years) in a book 'On the Perils and Protection of Infant Life': "The incentive to child neglect and child murder is *not* the prospective receipt of insurance money." Statistics in both England and America show that the mortality of insured children is less than the general child mortality. The following table compares the mortality of the company which has in force one half of all the industrial policies in the United States and Canada, with that shown by Farr's English life table of the general population of

Great Britain and by the United States census of 1880.

DEATHS PER 1,000 AMONG CHILDREN.

Age Next Birthday	Farr's Table	United States Census: General Population 1900	United States Census: 31 Cities 1880	Co.'s Experience 1904
2	63.59	46.6	[illegible]	32.7
3	30.13	20.5	[illegible]	22
4	22.39	13.2	22.7	12.8
5	17.92	9.4	17.9	8.5
6	13.53			
7	10.75			
8	9.15	5.2	8.9	5.1
9	7.59			
10	6.56			

* The census tables of 1880 were the last to give mortality percentages for the group of 31 cities. Improvement in the mortality of the general population and of the company's experience is shown in the adjoining columns. The company's business is, however, done almost entirely in cities, and a very large proportion is in the 31 cities referred to in the census of 1880.

The companies limit the amount of child insurance to the amounts fixed by the New York statute, which are practically those shown by the Infantile Endowment tables printed above; and the rule in case of over-insurance is either for all companies to cut down the payments proportionately or for the companies issuing the latest policies to return the premiums. No specialty of child insurance is made. Industrial insurance is, as we have said, family insurance. This is strikingly shown by comparing the percentage of population at various groups of the ages with the percentage of policies in force at the same ages in the largest industrial company:

Ages	Percentage of Population Census, 1900	Percentage of Policies in Force, 1904
1 to 4 inclusive	9.57	9.57
1 to 9 inclusive	[illegible]	[illegible]
1 to 14 inclusive	31.94	34.66
1 to 19 inclusive	41.91	45.35
5 to 17 inclusive	28.42	31.65
20 to 29 inclusive	18.29	[illegible]
30 to 39 inclusive	13.88	12.83
40 to 49 inclusive	10.16	9.96
50 to 59 inclusive	[illegible]	[illegible]
60 to 69 inclusive	[illegible]	4.86
1 to 69 inclusive	[illegible]	98.74

Expense.—Like everything else sold at retail the cost of industrial insurance is high. Its cost, however, is scientifically adjusted. The loading on the net premium is necessarily about double that used in annual premium companies; and, as we have seen that the mortality is also double at some ages, the cost of industrial insurance is necessarily high compared with annual premium insurance. The expense ratio is high because of the system of weekly collection of premiums, because of the large number of policies for small amounts which have to be recorded and cared for at the home office, because of the relatively high cost of medical examinations, because of the large companies medically examine every applicant, adult and infantile, on every application, however small, and the third examines in cases of policies over $300), and because of the heavy lapse rate. One company paid $550,000 in the year 1904 for medical examinations of applicants for industrial insurance. As the premiums are payable weekly there are 52 opportunities each year for lapsing, as against 1 to 4 in annual premium companies; and in the first year of insurance the lapse ratio is very high. All of these lapses are a pecuniary loss to the companies: and this largely accounts for the high expense ratio. In fact it takes nearly and in some cases more than the fund accumulated from premiums for five years to cover the reserve. Of the business lapsed within the first three years, more than half goes off within the first three months, and six sevenths during the first year of the life of the policy. The lapses in industrial insurance, while they cause a heavy loss to the companies, do not usually represent any serious loss to the insured. The premiums are weekly and the policies are carried on grace for four weeks after lapse; and they are reissued upon payment of a single week's premium; the loss is therefore not like that of those who pay annually. On the infantile table the policy, if reissued, is for the same amount as the policy lapsed would have called for at the age of reissue, because up to age 10 the amount of death benefit increases each year; so that the only loss is from the partial benefit rule for the initial year. On the adult table a policy lapsing during the first year in force can be revived at any time without any loss to the insured; after a policy has been in force a year it may be revived within a year after lapse at the original amount in full benefit. Here also is no loss. If the policy has been in force two years and lapses, the premiums will within two years thereafter be loaned by the company if the applicant wishes to revive and is unable to pay the arrears. Here therefore there is no loss. If not revived and new insurance is taken, the amount of insurance at each advancing year is very little less than the preceding year. If the policy is kept in force until it is entitled to be surrendered for paid-up insurance, the holder may have paid-up insurance; or he has the alternative privilege of extended insurance, by which the full reserve is applied to the payment of premiums upon a new policy issued at the attained age. If he elects to take the extended insurance he can begin paying again when the period of extension has elapsed and thereby lose nothing by his original lapse except the reduction in the amount of the policy by his increased age at the date of the new policy. It goes without saying that in all these cases lapses are no great source of loss to the insured. There can be no doubt that the lapses in industrial policies are very largely by those who subsequently take new insurance, suffering no loss at all in case of revival, and otherwise suffering only the small loss arising from partial benefits during the first year and the small decrease of benefits by reason of advanced age. The fact is there are many who insure and lapse and reinsure, according to their disposition of mind and their resources, with small loss to the holders but large loss to the company, which is put to the expense of commissions for placing the business and the large expense of caring for it. After three years the business is very persistent; so that the average persistence of industrial business as a whole compares very favorably with annual premium business. The average duration of the policies in force in the largest English company is $10\frac{3}{4}$ years, and that of the policies of the largest American company (which has been in business only about half as many years) over $6\frac{1}{2}$ years. In Australia, in 1902, the average duration of the policies in the company which had two thirds of all the industrial insurance in force was about 6 years. The expense of insurance to the industrial classes has been greatly reduced by the introduction of what is known as intermediate policies. These are policies which in 1896 the two largest industrial companies designed and issued for the working classes. They are policies for an even amount of $500 each, premiums payable yearly or in half or quarter years. The premiums of the largest company are based on the industrial table of mortality and the loading is similar to that used in annual premium policies. The result is a moderate priced ordinary policy contract issued on all the usual forms — whole life, limited payment and endowment — and placed in a separate class for dividends. A working man who has got beyond the necessity of making small weekly payments and can afford to pay dollars annually where he has been paying cents weekly, finds in these policies insurance approximately as cheap as his rich neighbor buys. There were at the end of 1904, 308,796 of these policies in force in the United States and Canada, insuring $152,710,657. The English Prudential had at the same date 742,147 ordinary policies in force, of which a very large proportion is endowment, averaging less than £100 each, the premium averaging about £5. The English Prudential policies are participating, the dividends being applied to increasing the amount of insurance. In America the "Intermediate" policies are also participating, kept in a separate class; the dividends have been large, derived principally from saving in mortality and gains in interest; they are payable in cash reduction of the premium or in reversionary additions. The industrial companies on both sides of the water claim that by the issue of this class of policies they have perfected the system of industrial insurance and have performed their full duty to the wage-earners by furnishing insurance adapted to the condition, means, habits of life, and requirements of all: weekly premiums for those who can afford no better, and for those of an age unsuitable for large insurances; annual premiums for small policies with dividends as earned, bringing the cost down to nearly the cost of what is known as ordinary insurance. HALEY FISKE,

Vice-President of the Metropolitan Life Insurance Company.

Insurance, Life. Life insurance is the application of insurance to loss or injury caused by death. It may be defined as a contract under which one party called the insurer, in consideration of certain stipulated payments, termed premiums, agrees to pay to another a moneyed benefit upon the happening of a contingency dependent on the duration of a human life. The person whose life is the subject of the contingency is termed the insured, and the party receiving the benefit the beneficiary, while the benefit itself is called the insurance money. The contract when in writing is known as a policy. In practice the contingency involved is either the death or the continued survival of the insured. If the benefit is to be paid upon the death of the insured, it is known as a strictly life insurance contract, if upon his survival to a given age, it is called an endowment. The issue of such contracts is confined to companies incorporated for the purpose and to benevolent and fraternal associations. The fundamental object of life insurance is the protection of families and dependents, or of business interests from the pecuniary loss which is liable to result from the death of the party insured. It furnishes a method of at once providing a fund which shall be available in case of such misfortune, by means of a series of limited payments made during the continued life of the insured. The latter is able for a small consideration to secure the benefit of an immediate investment payable upon the expiration of the contract, instead of awaiting the slow and uncertain process of accumulating a capital which may be defeated by his untimely decease. The business man is thus enabled also to protect his creditors or his business as well as those dependent on him. In case of the endowment the policyholder is able to unite such protection with a fund available for his own use should he survive during a stipulated period. In short, life insurance may be regarded as a method of purchasing immunity against moneyed misfortunes liable to result from death, and appeals with special force to those whose chief dependence is on their daily or yearly earnings. It offers peculiar advantages, too, because it can be placed beyond the reach of creditors and need not be involved in business misfortunes, while the policies themselves can be hypothecated or sold like ordinary commercial securities.

The policies are issued by the companies upon written applications from the purchasers, in which detailed statements are required regarding the health, habits, and family history of the applicant, accompanied by the certificate of a physician based on a careful examination. The policy stipulates as to the amount and character of the benefit to be paid, the party to whom it is payable, and the premium payments to be received, together with such other provisions as may be needed to express the complete contract with the applicant. The premiums are usually payable annually or at shorter intervals in advance.

History.—Life insurance in its more modern form was practically unknown until it was introduced into England by the establishment of the Amicable Society in 1696. Other companies were gradually started there. But for many years afterward it was prohibited on the continent of Europe as immoral. Modifications of the system, however, known as annuities and tontines had long been familiar, and the former had been employed as a basis for national loans. It was not until the 17th century that sufficiently reliable observations on human life were compiled to furnish a satisfactory foundation for the business, and that the commercial elements of society attained an importance sufficient to give it the needed support. Companies thereafter multiplied in Great Britain and the business gradually extended to the continent of Europe.

Life insurance was introduced from Great Britain to America, and the first society was organized in Philadelphia in 1759 for the relief of Presbyterian ministers and their widows and children, followed 10 years later by a similar corporation for the benefit of Episcopal clergymen and their widows. Their operations, however, were confined to the classes named. The first company to attempt a general business was the Insurance Company of North America, organized in the same city in 1796. A number of other companies gradually followed in that and other important cities during the earlier part of the 19th century. All these earlier offices, however, combined fire or marine insurance, or banking and trust business, as well as annuities with life insurance, and gradually abandoned the latter. Popular prejudice proved to be too strong, and the economic condition of the country to be too little developed to make its prosecution successful. The real beginning of modern life insurance in the United States dates from the organization of the Mutual Life Insurance Company in New York in 1843, which was quickly followed by that of others, both there and elsewhere, some of which had already secured charters for the purpose. The business of these new companies was confined to life insurance, and their success led to the gradual multiplication of such companies until within 20 years it had attained proportions which made these corporations among the most important financial institutions of the land. The business has since continued to expand until the enormous sums now invested in life insurance in America far exceed those in any other country. Its leading institutions are unrivaled in their size elsewhere, and several are transacting business in every quarter of the globe.

Insurable Interest.—Every form of insurance presupposes some pecuniary interest in the subject insured, without which it would be a mere speculation or gamble and a temptation to crime which public policy does not permit. Where the insurance is on property, such interest on the part of the insured must usually be commensurate with the amount of the insurance. The insured is restricted in his recovery on the policy to a sum which will indemnify him for his loss. This doctrine, however, is relaxed in case of life insurance, since no strictly moneyed value can well be placed on a human life. The principle of indemnity goes no farther here than a requirement that the party procuring the insurance shall have such an interest in the life insured as shall prevent the contract from being a mere gamble on its survival. Any reasonable expectation of pecuniary advantage from the continuance of the life is deemed sufficient, such as dependence or the payment of a debt. Every person, too, is assumed to have an interest in his own life, which he may insure to any amount, and may make the policy payable to any beneficiary whom he may elect so long as the scheme is not a mere cover for gambling.

Classes of Companies.—Life insurance is carried on by two distinct classes of institutions. One consists of those which treat it as an ordinary commercial or financial business, the other, of those which deal with it as a form of benevolence or fraternal aid. The former may be again divided into those in which the premiums are definite in their amount and time of payment, and those which depend on assessments from their policyholders to pay claims as they become due. Life insurance as a business, however, is chiefly carried on by the first mentioned, which are known as old line or legal reserve companies. It has been found the only business method which has successfully stood the test of experience. Two systems have been adopted in this class of companies. One is the mutual, in which the policyholders are regarded as the owners of the corporation, and all profits or surplus arising from the business are distributed among them. Such surplus performs the functions of an ordinary capital. The choice of directors or trustees and consequent management of the company is usually placed in the hands of the members. The majority of companies in the United States are conducted on this system. The other is the stock plan, in which the company is owned and controlled by stockholders, who deal with the policyholders simply as customers and divide the profits of the business among themselves. Higher premiums are charged for mutual policies for the purpose of creating a surplus, which may be eventually returned in dividends to the policyholders. In the stock policy, on the contrary, the holder sacrifices the right to dividends in exchange for a lower premium rate. Many of the companies combine both features, mutual offices issuing also stock policies, known as non-participating, at lower rates of premium. Often, too, a stock capital is added to a mutual company which is restricted by the charter to the amount of dividends which it can receive. When the stock is allowed to share in the profits in excess of its legitimate earnings as an investment, the system is known as the mixed plan. Sometimes, too, the election of directors is apportioned between the stock and policyholders, or, in a company otherwise mutual, may be restricted to the former. In some of the States a capital stock is required by law in the organization of a mutual company until it can be replaced by surplus belonging to the policyholders. The distinctive feature of the legal reserve company, apart from its fixed premiums, is that it must at all times maintain a reserve fund adequate to the payment of its future obligations, less the future premiums which it will receive; in other words, it must in a commercial sense be financially solvent. It is also known as an old line company because conducted on the principles which have always characterized life insurance as a business until the introduction of the assessment plan.

Assessment companies were started in the United States over 30 years ago for the purpose of furnishing life insurance at lower rates than those charged by the regular old line companies. Instead of a fixed premium, assessments were levied on the policyholders to pay the losses as they occurred. Various methods were adopted for levying such assessments, and, as the policyholders were in theory liable for whatever assessments were needed, they only became insolvent when unable to meet their claims. The plan was an adaptation of methods employed by fraternal orders, and for a while was exceedingly popular among those seeking a cheap form of insurance, since the actual cost of insurance being low in the early years, the assessments were correspondingly light. But the increased cost as time went on ultimately so increased the assessments that it was found impossible to enforce them, and most of the companies were compelled to retire or change their methods. Comparatively few now remain, and the system itself has been condemned by some of the State authorities. Many of the companies were accustomed to assume the character of benevolent organizations in their operations.

Stipulated premium insurance is a combination of the assessment and legal reserve systems with a view to correct the defects of the former. The premiums, as in the old line company, are definite payments, supplemented, if needed, by assessments, and a moderate reserve is carried to reduce or render such assessments unnecessary. It has been employed by some of the assessment companies as a method of establishing their business on a firmer foundation. But life insurance as a business in the United States, as well as in other countries, is chiefly done by old line legal reserve companies, whose definite contracts, financial strength, and scientific business methods give to such contracts a commercial standing unattained under any other system.

Industrial insurance is a branch of the legal reserve system designed to furnish burial funds for the poorer classes, and especially children. Its principles do not differ from those of ordinary insurance, but its methods are essentially different in many respects owing to the small size of the policies and the character of the applicants. The premiums are payable weekly or at short intervals, and are collected by agents through house-to-house visitations. It was introduced into the United States from Great Britain about 30 years ago, having been an outgrowth of the burial clubs and friendly society system of that country, and has attained enormous proportions in America, as well as Great Britain. See INSURANCE, INDUSTRIAL.

Fraternal and benevolent societies have been popularly associated with assessment companies owing to the similarity of their methods. But they are a distinct class, having the character of social clubs solely for fraternal or benevolent purposes, with a form of insurance as merely one, though it may be their most important, feature. They are strictly mutual in their character. Their general type of organization is that of the ordinary society or club known as a lodge, whose members meet for social or fraternal purposes. The society is formed of a combination of such lodges, through chosen representatives, into a single grand lodge, by which the insurance is carried on, the subordinate lodges acting the part of agents in securing members and collecting the payments. The insurance itself is simply a death benefit allowed to the members under provisions in the constitution, and not a business contract secured by the purchase of a policy. The premiums are paid in the form of dues and assessments, much after the manner of assessment companies, the dues being used for expenses and other incidental features. Efforts are being made to scientifically adjust the payments and benefits of these societies according to the cost of insuring the various members, as is done in the legal reserve companies. The insurance which they furnish is regarded as a species of fraternal aid to the members and their dependents, and their operations are not subject to the same legal control as those of business corporations. See INSURANCE, FRATERNAL.

Mortality Tables.—The life or mortality table, from which the premiums must be determined, is at the foundation of the business. The tables mostly employed are constructed from the experience of the companies themselves with insured lives which have been found to have a mortality distinct from that of the population at large. Such a table in its simplest form consists of a statement of the number surviving at the beginning of each succeeding year out of a given number living at any age, from which the number of deaths and percentage of mortality at each age are readily determined. The latter is the important function employed in life insurance. In America the two tables which are chiefly used, and which have been recognized by the various States as standards for determining the liabilities of the companies, are the Actuaries or Combined Experience and the American Table. The former was constructed from the experience of 17 prominent English offices, and was published in 1843. Its general accuracy has since been confirmed by later observations. The American Table was constructed from the experience of the Mutual Life Insurance Company of New York, and came prominently into use about 1868. It was found to represent the actual experience of American companies better than foreign tables which had been employed. Many other mortality tables have been constructed which have attained a recognized standing. Prominent among them were the Northampton and later the Carlisle Table, both of which were framed from mortality returns of English towns, and were successively used both in England and America, until replaced by the Actuaries' Table. Farr's Tables, constructed from the census returns in Great Britain and published in 1864, have been much used for certain purposes. Various tables, too, have been constructed from observations in other European countries and employed there as standards. The three requisites of such tables for insurance purposes are that they should be safe, should be properly graduated, and should fairly represent the mortality to be expected.

Premiums.—The premiums, which must equal the cost of insurance, are computed from the risk of death, as shown by the mortality table; and since the former are usually fixed sums, while the risk increases with age, it is necessary to charge more than the actual cost in the early years in order to offset the deficiency later on. This excess above the cost is accumulated at compound interest by the company, and constitutes its reserve fund. The rate of interest assumed in the calculation is such as the company is justified in expecting will prevail during the continuance of the contracts. In the United States 4 per cent was formerly considered a safe rate, but the continued fall in interest has led to a general substitution of 3 or 3½ per cent for newer contracts. The payments, which, when thus accumulated will be sufficient on the average to meet the claims on the policies as they fall due, are known as the net premiums, to which additional sums are added for expenses and other contingencies. When thus loaded they are known as gross or office premiums, and are the real amounts charged by the company

These loadings may vary from a trivial addition to 40 per cent or more of the net premium, according to the character of the contract. Premiums in ordinary insurance are usually payable annually in advance, and are then known as annual premiums. Frequently the payments are restricted to a certain number or term of years. These are known as limited payments. Sometimes the entire payment is made at the start. This is known as a single premium payment. The annual premiums, too, are sometimes payable in instalments at shorter intervals to suit the convenience of the policyholder.

Expenses.—The expenses of a life company are chiefly made up of two classes, the cost of securing the business, and the office expenses incident to its care. The principal element in the former is the commission or other compensation paid to the agents, which also varies with the character of the contract. It is usually a large percentage of the first premium paid, and a very moderate percentage, in the nature of a collection fee, for those succeeding. The office expenses aside from the salaries of the officers and employees include taxes, fees, rents, and those numerous items involved in the care and investment of funds, and the conduct of the business.

Legal Reserve.—The legal reserve is the measure of an ordinary life company's liability on account of its insurance contracts to which, in addition to any other liabilities, its funds must be equal in order that it may be legally solvent. The process of estimating this reserve is known as valuing the policies. Two methods of valuation are used, known as net and gross, dealing respectively with the net and gross premiums charged. The former is generally employed in the United States, and is the one usually adopted by the State authorities. It consists in determining what fund the company must have in its possession in addition to the future net premiums which it expects to receive in order to meet future claims on its policies. This fund is the net or legal reserve. It assumes that all other expenditures are cared for by the premium loadings. The gross valuation, on the contrary, deals with the gross or office premiums, and a certain deduction is made from the resulting fund for assumed future expenses. The latter method is regarded as furnishing the surest test of a company's actual condition, and is sometimes employed when the question of legal solvency is in doubt. The former has the advantage of compelling the use of the premiums for the purposes assumed by the company in their computation.

As in the case of the premiums, the computation of this reserve depends on the future rate of interest which is assumed. In most of the States 4 per cent, as in the case of premiums, was formerly regarded as a safe rate, and even 4½ per cent was at one time allowed, but during recent years 3 or 3½ per cent have been insisted on in the case of new contracts by some of the States.

The mortality on which the sufficiency of the premiums depends is lighter in the case of insured lives, owing to their careful selection, than among the general population or that called for by the mortality table for a number of years after the policy has been issued. The cost of insurance in mutual companies is reduced to the policyholders by this lighter mortality. In American companies the mortality among lives that have not been newly selected remains nearly stationary after age 20, or increases but slightly until age 40 is reached, when it is not far from 1 in 100, increasing more rapidly with each age thereafter until it is about 2 per cent at age 50 years and 4 per cent 10 years later.

Form of Contract.—As before remarked, policies may be either participating or non-participating, the chief difference being that smaller premiums are charged in the last and no provisions are included for sharing the profits. Policies for short terms are more frequently made non-participating. The classes of policies most in use are three in number, whole life, term, and endowment. In the first the insurance is simply against death and covers the whole term of life, while in the second it runs only for a certain term of years. The pure endowment is an insurance payable at the end of a certain term of years only in case the insured is alive, and is the reverse of a term policy. The ordinary endowment which is almost exclusively used, however, and which has of recent years largely supplanted the whole-life policy, is a combination of the pure endowment and the term policy. The insurance money is payable to the insured if alive at the end of the endowment period, or to some beneficiary in case of his previous death. Such endowments are usually issued for periods of from 10 to 30 years.

The annuity is a contract frequently combined with life insurance in which the life insurance principle is reversed. The purchaser buys outright a contract under which he is to receive an annual payment during life. Annuities have been familiar since an early period, and before life insurance became understood was the principal form of contracts dealt in by this class of companies. It secures a fixed income during life to those who may wish to surrender their capital for that purpose.

Still another form of contract is the tontine, in which the funds of a body of subscribers are pooled and the accumulations are divided among the survivors after a certain time. Societies of this kind were formerly common in Europe and were occasionally found in the United States, though few, if any, remain.

All these different contract forms are now frequently combined in various ways in the ordinary life policy, in order to increase its attractiveness or to better meet the requirements of policyholders. Various methods of premium payments and of paying dividends are also combined for the same purpose. Great ingenuity has been displayed by the companies in making these combinations, and an almost innumerable variety of contracts have resulted. Among those more familiar in the United States are the tontine or deferred dividend policies, in which dividends are accumulated and divided among the surviving policyholders after a certain period; limited payment policies, in which the premiums are limited in number; instalment policies, in which the insurance money, instead of being payable in a single sum, is converted into a series of annual payments as an annuity; and debenture bonds, which are similar to instalment policies, except that the insurance money is represented by a bond bearing an annual interest and payable at the end of a certain time. Besides, there are policies insuring the life of more than one party. When they are payable upon the death of either of the parties insured, they are known as joint life insurances; when payable only on the death of all they are survivorship insurances. The greater part of the business in the United States is written either in the form of continued payment life, 20-payment life, or 20-year endowment insurance. Renewable term insurance is another plan for reducing the cost of insurance during the early years and avoiding the accumulation of a reserve. The premium is only sufficient to pay for the temporary cost of insuring and increases with age. The policies are written for a single year or term of years, with the right to renewal at the increased premium. The subsequent increase of cost, however, has been found a serious obstacle to the plan. Preliminary term insurance is also insurance for a single year, but with a right of renewal for the entire period at the same rate of premium. The object of such policies is to enable the company to use the fund which, under the law, must otherwise be added to the reserve during the first year of insurance to meet the cost of securing the business, and is a favorite method with young companies having a limited surplus.

Dividends.—Dividends are apportioned from the accumulated surplus according to the equitable share of each policy. Many different methods of determining this share have been devised. That chiefly employed in the United States is what is known as the Contribution Plan. The surplus is treated as made up of gains from a lower mortality and expense and a larger interest earning than those assumed in computing the premiums, and the contribution of each policy to the fund is estimated. Dividends are applied according to the provisions in the policy in various ways. They may be used as single premiums to increase the amount of insurance, which is called a bonus addition, or to shorten the term of the insurance, or to the payment of the premium, or may be received in cash. When, as in tontine dividends, they are to be apportioned among a special class, the share of surplus belonging to that class is separately dealt with. Sometimes a minimum future surplus earning, which can be relied on, is made the basis for guaranteeing the payment of a certain dividend in the policy. But as such earnings are uncertain, the usual estimates of these amounts, as given by the companies, are simply expectations and not obligatory as promises. The fall of interest rates has tended to reduce dividends during recent years. At an earlier stage of life insurance, dividends were payable at intervals of five years or more. Afterward, as the business became better understood, the practice of declaring annual dividends in the United States became universal. Of late, however, the introduction of deferred dividend policies has again lengthened the distribution periods among these special classes. Notes were at one time received by many of the companies in part payment of premiums, but the practice has been for the most part abandoned.

Policy Loans.—Practically all forms of life insurance in which a level premium is paid involve an investment or savings bank element, which is represented by the reserve and is now treated by the law and the contract as belonging, in a sense, to the policyholders. This is the basis of the policy loans which are so generally granted. The portion of the reserve fund belonging to the individual policy, or a portion of it, may be borrowed by the policyholder as a loan bearing interest, on his own note with the policy as a collateral, and is deducted from the insurance money when the policy becomes payable.

Termination of the Contract.—The life insurance contract is terminated either by becoming a claim, which is usually payable at once after satisfactory proofs have been furnished, or by previous lapse or forfeiture through a violation of its conditions, especially non-payment of the premium, or through a voluntary surrender. Policies usually provide for their surrender and allow the insured to receive back a large part of the reserve held against them, called the surrender value, either in the form of paid-up insurance for such an amount as this value will purchase, or insurance of the original amount for such a term as it would pay for, called extended insurance, or else in the form of cash. Statutes in many of the States require similar returns in case of lapse for non-payment of premium, and such provisions are also usually incorporated in the policies. Non-forfeiture laws, as these statutes are called, are designed to prevent the assumed hardship or injustice entailed on the insured through the forfeiture of the money standing to his credit in the reserve fund. This money is regarded as a saving bank accumulation for his future benefit, which is in a sense his property and which should be restored after reserving a surrender charge to compensate the company for his loss. Since healthy lives are most likely to lapse and the cost of insurance to be made greater for those who remain, the selection against the company, as it is termed, is an important element in determining the surrender charge.

Insurance for the Benefit of Wife and Children.—The fundamental object of life insurance as a family protection is liable to be defeated if the policies can be attached for debt. Therefore, statutes have been enacted in many of the States exempting from the claims of creditors policies up to a certain amount made payable to wives and children. The interests of such parties, too, have been held unassignable, at least without their consent. The life insurance contract, except in the case of benevolent societies, is held to be the property of the party who is the beneficiary, when not otherwise stipulated, and not of the party who may pay the premiums, and can usually be assigned as collateral or sold outright by the owner. Policies not protected by statutes, as above, may, like other personal property, be attached for debt to the extent of their surrender value; and where, as in endowments, two interests are sometimes involved, the interests may be severed.

Medical Examinations.—Medical examinations of applicants for insurance are essential to prevent an inroad of unsound lives that would wreck the company, whose mortality rates are based on the acceptance only of healthy lives. For this purpose medical examiners are employed, who report the health, physical condition, and habits of the applicant and the life history of his near relatives. These reports are passed upon by the medical directors of the companies to determine whether the life is up to the normal standard fixed by the company, otherwise the application is rejected.

Sub-Standard Insurance.— Parties who may not be seriously diseased and yet who are not insurable as healthy lives, on account of constitutional weakness or predisposition, are known as sub-standard or under average lives and are insured by some companies as a separate class under special rates of premium, or under special policy conditions, according to the defects of each applicant.

Limitation of the Risk.— Formerly many restrictions were imposed in the policy as to the residence, travel, and personal habits of the insured, and military employment and suicide were debarred. These have been gradually modified or removed, until it has become customary with some companies to issue so-called indisputable policies, which in the absence of fraud, can only be forfeited by failure to pay the premiums.

Moral Hazard.— The moral hazard in the business arises from deceptive representations as to health, the temptation to insure as a mere speculation lives in which no insurable interest exists, in the expectation of an early death, and the temptation to destroy life through suicide or murder in order to secure the insurance money. The ability of an average applicant to judge of his future health is shown in the higher death rates among those classes of policies where an early death would profit the applicant and is an element of the moral hazard.

Legislation and Supervision.—Until about 1860 little or no supervision was attempted over life insurance by the various States. Legislation concerning it was chiefly confined to taxation of the companies or restrictions on their operations. The multiplication of irresponsible corporations, the growing magnitude of the business, and the recognition of the dangers involved in its mismanagement, led to the creation of special departments for its supervision, and the enactment of laws for its conduct by the States of Massachusetts and New York. Their example has been followed by most of the other States. The fundamental aim of these laws is to compel the companies to so utilize and apply the moneys which they receive as to properly carry out the contracts with their policyholders. This is accomplished by requiring the funds in the company's hands to be at all times sufficient, together with its future accumulations and the future premiums, and their accumulations receivable from its policyholders, to meet its future claims as they arise. Since the proper investment of these funds is also essential, this becomes an important part of the investigation, as well as the general manner in which the business has been conducted. Annual statements are required from the companies, embodying the facts essential to such an inquiry, and may be supplemented, if necessary, by a personal examination of the company on the part of the State official. Failure to meet the required test may be followed by a prohibition against additional business until the defect is remedied, or, if actual future insolvency is threatened, by proceedings to close the company.

Theory of Life Insurance.— The fundamental problem in life insurance is to find the average premium at each age, which, with its accumulations, will be just sufficient to meet the promised future payment. This is done by first finding the present value of that future payment, or the sum which, invested immediately at compound interest, will, on the average, with its accumulations, meet this payment when due. The probability of death occurring, and consequently the payment becoming due, during any subsequent year is determined from the mortality table. This probability, multiplied by the sum which accumulated to the end of that year would equal the required payment, is the present value of the payment if made that year. The aggregate of such values computed for each successive year of life, is the entire present value of the future payment to which the present value of the premiums to be charged must be equal. These premiums are in effect so many annuities receivable by the company, and their present value is the amount which, at once invested at compound interest, would reproduce them. The problem, therefore, now becomes the determination of the present value of an annuity at any given age. The process is analogous to that already described. The value sought is the aggregate of the amounts which, at compound interest, would provide the annuity at the beginning of each year, multiplied by the probability of the insured being then alive to pay it. Having determined the present value of any given annuity it is easy to find the annuity which has the value required. This annuity is the net premium.

Life Insurance a Science.—This brief explanation will serve to illustrate the general character of the problems involved in the theory of life insurance, many of which are exceedingly complicated and require a knowledge of the theory of compound interest and of the calculus of probabilities, which, when combined, form the mathematical basis of life insurance. The calculus of finite differences has also an important place, and even the infinitesimal calculus has been utilized to advantage, especially in preparing mortality tables. This whole subject has been developed into a special branch of mathematics termed actuarial science, which has become a recognized profession, whose members, known as actuaries, direct the mathematical computations required for the business. A special class of symbols has been devised in connection with this science, by which the processes involved in its various calculations are readily expressed in the shape of ordinary algebraic formulas. Life insurance computations have been greatly facilitated by an ingenious device known as commutation columns, through the use of which the calculations are much simplified. Published tables of premium and annuity rates and policy values, in connection with the more important benefits, too, relieve much of the office work.

WALTER S. NICHOLS, A.M.,
Lecturer on Insurance at Yale University, and Editor of the 'Insurance Law Journal' and 'Insurance Monitor.'

Insurance, Life, Assessment. The plan of meeting the cost of life insurance through assessments was first used in the United States about 1867 by local bodies, making no pretense to business standing or management. Their plan followed in a crude way that of the levy societies and friendly societies of Great Britain, but without the variety of benefit which these give. As a rule, they confined themselves to funeral or death benefits, with, occasionally, weekly payments in case of sickness.

The disasters which, in the early seventies, overtook companies operating on the basis of fixed premiums and an accumulated reserve, turned popular attention strongly toward a system which claimed to give corresponding benefits without the accumulation of large funds, and which confined its demands for payments to its actual needs in meeting benefits. As a result there grew up organizations operating through local councils or lodges, having a general governing body, representative in character, at least nominally. These grew, in time, into the great fraternal or beneficial orders, with hundreds of thousands of members, obligated to pay hundreds of millions of benefit, the integrity of the obligation dependent upon the ability for perpetual renewal of membership, with perpetual willingness to respond to assessments.

The marked success of these organizations in securing large memberships and temporarily meeting claims at low cost attracted the attention of men intent upon conducting life insurance as a business. There were organized a great number of business, or open, companies, which dispensed with the lodge machinery and placed the business upon a commercial footing. In organizing these, advantage was taken of the charitable and club statutes of different States. Not until 1883 was there a special law regulating this business in New York. The law in Massachusetts was enacted in 1885.

There was no attempt at scientific method, and, indeed, the claim of the earlier projectors of these companies was that, for the practical business of life insurance, a mortality table is useless. It was constantly set forth that, since contracts remain in force but a comparatively few years, a table based upon the theory that every man will ultimately die and become a claim on the funds, is essentially a falsehood.

At first, the simple plan was to collect from every member, on the death of another, $1, with generally 10 cents for expenses, and to pay to the beneficiaries of the deceased the fund formed from the dollar payments. The benefit was, therefore, indeterminate in amount, as was also the cost. An early modification of this scheme was to divide the members into classes of 1,000 or 2,000, which classes were theoretically to be kept full by the infusion of new blood, which, it was claimed, would, by keeping a level average age, result in a level cost. This theory ignored the fact that death rate depends upon actual, and not average, age.

When the plan of uniform payments began to break, through its practical discrimination in favor of older lives and heavier risks, the plan of graded assessments fixed by the age of admission was adopted. This simply modified the degree of error, by substituting for the assumption that all risks were equal, the equally inconsistent assumption that, after the admission of a member to a society, the risk of death ceased to increase. The scheme thus resolved itself into an attempt to meet the cost of insurance, which increases with increasing age, by a level premium, but without the accumulation of a reserve for the diminution of the risk. The fallacy of this was repeatedly urged by those who understood the scientific principles of life insurance, but obtained little or no effective hearing. Strenuous opposition was developed to the accumulation of a reserve, and a great parade was made of "the reserve in the pocket," ready to the call of the company when needed.

The irregular periods for calling assessments gradually merged into periodical assessments at fixed dates, varying in amount with the number of claims which had accrued since the last preceding call. Then came a tendency to call for an assessment in advance, to provide for death claims to occur, the fund thus accumulated being generally named an "emergency fund."

In the meantime, statutes regulative of the business were passed in many States, but in none was any particular regard paid to the demands of a permanent business. In fact, these statutes were in very many instances addressed to securing the advantage of a claim of State supervision, without the imposition of the requirements necessary to permanence. In 1885, however, Massachusetts provided by law that the amount of the benefit must be fixed in the contract, and this provision was finally adopted by New York in 1892.

Finally, as the proportion of older members became heavy, with rapid increase in the cost of the benefits afforded, there came rapid diminution of membership, especially among the younger, and this, in turn, had a tendency to increase the death cost by depleting the character of the risks. The transfer of memberships from one association to another followed in many instances. There was no possibility in such transfers of protecting accumulated liabilities, the result being that claimants under death claims which had accrued received but a small percentage of their face. Later, many of the larger and better managed business organizations passed under the laws regulative of fixed premium insurance with accumulated reserve, and the plant which they had established thus became foundation for new legal reserve companies. In 1899, the State of Massachusetts repealed the law permitting assessment life companies to do business therein, and provided a means by which those then authorized to do business on the assessment plan could obtain licenses under the legal reserve law.

There was an important organization of the business assessment companies, known as The National Convention of Mutual Life Underwriters, which held its first meeting in Elmira, in June 1876. Reports of the fourth meeting, in 1879, show 136 companies, with a membership of 253,000. This convention held its last session, at Mackinaw, in 1898. The report made at the session in 1897 showed 650 companies, with a total membership of 4,039,000, and insurance in force to the amount of $7,800,000. The payments to beneficiaries for the year 1896 were given at $73,000,000, and the total payments to beneficiaries, so far as records existed, since the organization of the business, amounted to $711,700,000. These statistics, to a large extent, covered the fraternal, as well as the business, organizations. The reports of the 23 sessions of this convention afford an amount of historical matter connected with the movement of great importance.

The fraternal organizations established, in 1886, the National Fraternal Congress, which still holds annual sessions and has compiled and is compiling exceedingly valuable statistics. It formulated the National Fraternal Congress Mortality Table, which has been adopted as the official standard in several of the statutes since enacted, and which is coming quite generally to be recognized as a standard table in connection with fraternal insurance. Their latest compilations show a membership of four and one half millions, with benefit obligations amounting to nearly seven billions of insurance.

There is also an organization of younger fraternal orders, known as the Associated Fraternities of America, the first meeting of which was held in 1901. The published records of both of these associations afford a vast amount of useful material to anyone who would study the history of the fraternal insurance movement of this country. GEORGE DYRE ELDRIDGE,

Vice-President Mutual Reserve Life Insurance Company.

Insurance, Life, Statistics. The business of life insurance is of comparatively modern growth in this country, the oldest company transacting it being but little over 60 years of age. It was practised in Europe, however, many years before, but its development there was slow. There was much prejudice against it at first in this country, and instead of being regarded as a most beneficent method whereby the widows and orphans and other dependents upon the head of a family could be provided for in the event of his death, it was denounced as a gambling scheme, a wager against death, and some clergymen went so far as to condemn it from their pulpits as opposed to biblical laws. But the pioneer companies pushed the business with vigor, at the same time carrying on an educational campaign, until the public have come to recognize the value and importance of life insurance, valuable alike to the rich and the poor. To the poor, and to those of moderate means, it is held to be an imperative duty for every man whose life is insurable to insure for as liberal a sum as he can afford, in order that, in the event of his death, those dependent upon him may not become objects of charity or be thrown upon relatives for their support. The rich man finds in life insurance a relief from possible financial entanglements that might otherwise, upon his death, wreck his estate. Men whose wealth would seem to relieve them of all financial anxiety carry insurance upon their lives in sums ranging from $50,000 to $2,000,000. Their reasons for so doing are that they have investments that may prove troublesome for their executors to close up, necessitating sacrifices that would prove costly. The insurance upon their lives is payable immediately upon their death, and the funds thus made available at once will prevent the sacrifice of any portion of their estate to meet the claims of clamorous creditors.

Primarily life insurance is designed for the especial protection of families deprived by death of their head, the breadwinner, upon whose efforts they are dependent for subsistence. By the payment of a small sum annually a policy of insurance can be obtained whereby the company contracts to pay to the heirs of the insured a specified sum in the event of his death. For instance, a person 30 years of age can obtain a policy of insurance upon his life for $1,000 upon the payment of an annual premium of $24.18, and this rate does not increase during the life of the policy — hence the term "level premium." Should he die at any time after receiving the policy the company will pay the amount to his designated beneficiary immediately upon the receipt of proofs of his death. Insurance for a larger sum is obtainable by the payment of the same rate per $1,000 of insurance. The rates increase according to the age of the applicant, for the death rate increases with age, and the added liability must be provided for correspondingly. While at age 30 the premium for $1,000 of insurance is $24.18, at age 40 it is $32.76, and goes higher as age increases. The rates for life insurance are based upon scientific deductions. Carefully prepared mortality tables show how many persons out of a given number of a certain age will die each year, and while it cannot be told of an individual when he will die, it can be estimated with certainty how many persons in his class will die each year. Life insurance is a business of averages, and the cost of insuring 1,000 or 2,000 or 10,000 persons at a particular age is mathematically determined. The rates charged by all companies are substantially identical, and a person desiring insurance, if in good health, can obtain any amount he is able to pay for from $500 to $2,000,000 — this being the largest amount carried by one man.

As stated, the early days of life insurance in this country were days of trial and tribulation to the organizers of the pioneer companies, but the characteristic energy which is found in all great enterprises has carried the American life insurance companies far in advance of any others. A few statistics, given in concise form, will serve to show the magnificent proportions to which the business has attained in this country. At the beginning of 1905 there were 93 "old line," or "level premium" companies, doing business in the United States, a few confining their operations to a particular section, but the majority of them seeking business in all the States. Of this number 84 had 3,269,089 whole life policies outstanding, insuring the lives of their owners in an aggregate amounting to $6,767,197,991, while the total insurance in force (including endowments and other forms of policies) amounted to $10,412,078,338. The 93 companies were organized at different times and several of them have not been in business long enough at this writing to have made a record. The total premium receipts of 79 of the companies since their organization amounts to $5,214,441,446; they have paid to policyholders $3,276,051,607; their present assets held for the protection of policyholders are $2,261,851,182. As these companies operate on the mutual plan, all the assets belong to the policyholders; if the assets on hand be added to the amount paid to policyholders it gives an aggregate of $5,537,002,870, exceeding the amount paid in premiums by $323,461,433. In other words, the companies have paid to policyholders or now hold for their protection $106.20 for every $100 they have received in premiums.

In 1904 the total premium income of 79 companies was $378,118,121, most of this being in cash for new policies issued and for renewals on old policies. The investment of these vast sums pouring in to the several companies requires the highest order of financial talent in order that a profit to the companies shall be secured and no bad investments made. That these funds have been carefully and judiciously handled is shown by the fact that the companies hold or have paid out in benefits $106.20 for every $100 they have received in premiums.

The vast sums received annually by the life insurance companies for investment places them in the front rank of the great financial institutions of the country. Their finance committees are constantly on the lookout for safe and profitable investments, and their detailed annual reports to the various State insurance departments show that they are large holders of National, State, city, railroad, and other bonds, paying good rates of interest. Other classes of securities that are known to be safe are purchased at times, but their soundness must be absolutely guaranteed.

Other forms of policies than those referred to as "whole life" are issued by the companies, but the fundamental object of life insurance is the protection of families when the breadwinner is removed by death. Endowment policies provide for the payment of a stipulated sum at a specified period, 10, 15, or 20 years from the issuance of the policy. The gives the insured himself the use of funds in his mature years, the proceeds of his savings in his younger years, when his earning capacity was at its best. This form of insurance is popular with young men, who can afford to pay the extra cost of such policies. The companies also sell annuities, contracting for a specific sum paid in advance, to pay to the assured a certain sum annually during his lifetime. How much can be paid annually for the advance premium paid is computed by the actuaries of the companies, according to mathematical formulas scientifically evolved. It has been the aim of the life insurance companies, in their educational campaigns, to liberalize the conditions of their insurance contracts as far as safety will permit, and to popularize them by issuing policies to suit the requirements of all classes of persons, hence there are an almost endless variety of contracts grafted upon the original "whole life" or "ordinary life" form, as the basic contract is designated. But for whatever change of form there may be, whatever of special conditions may be exacted, there must be a corresponding increase in the premium paid.

Four of the American companies are doing business in foreign countries and have been wonderfully successful. Their active and aggressive methods have enabled them to meet in competition the native companies, and generally to excel them in the volume of business written year by year. This has led to restrictive legislation in some countries calculated to restrain the activities of the American companies, but they have been found equal to the emergencies and have generally conformed to all lawful requirements.

In some States the law requires that a life insurance company, before beginning business shall have a certain amount of capital paid up, for the protection of its policyholders, but before the enactment of such law, some companies were organized on the purely mutual plan, without capital. Of the 102 existing companies, including the latest additions to the number, 38 are mutual, while the others possess capital varying from $25,000 to $2,000,000. Dividends to stockholders are generally limited to 7 per cent, all profits in excess being apportioned among the policyholders. In 1904 the capital stock of all the stock companies amounted to $16,919,930; the dividends paid to capital were $916,824, while dividends to policyholders were $33,579,020. Policyholders thus participate in the profits of the companies, whether stock or mutual, according to the varying terms of their contracts. Dividends to policyholders are computed on the anniversaries of the dates of the policies and passed to their credit, to be applied to the payment of future premiums, to increasing the amount of insurance, or in some other way inuring to the benefit of the insured, as he may direct. The insured not only provides insurance upon his life for the benefit of his dependents, but he becomes a member of a dividend-paying corporation, with an interest in all its assets. No better testimony in favor of life insurance can be adduced than is to be found in the figures above quoted, showing the millions upon millions of dollars distributed among the beneficiaries of persons insured. The funds so distributed usually reach the beneficiaries in the hour of their direst need, when death has visited the home and removed the prop that supported it.

CLIFFORD THOMSON,
Editor 'The Spectator,' New York.

Insurance, Marine. American marine insurance business had its birth at about the close of the 18th century, but suffered heavily when the American flag began to disappear from the high seas. For the past quarter of a century it has had a hard struggle to keep itself anywhere near the old standard of prosperity. To do this it has had to draw for the greater part of its returns upon foreign commerce, and been forced to compete with English companies.

New York's marine-insurance history is that of all the other seaboard States, for in nearly all marine insurance once flourished, but has now succumbed to English competition. The golden period of American marine insurance was between the years 1840 and 1860, when the clipper sailing ship was developed and perfected. In those times the leading merchants owned their own ships, and frequently a member of the firm would go to China or the East Indies to supervise the proper distribution of the cargo, and to secure a remunerative one for the return. The ship and cargo were insured with an American company, and as it might be as long as nine months before the vessel was heard from, the risk was considerable and rates were high. As much as five or six per cent was charged for insurance in those times. The rate on dry goods from Liverpool to New York in the old packet sailing ships was placed at two per cent. This trade was carried in American ships, and the insurance, both on the vessel and on the cargo, was naturally placed in American companies.

But the rates of insurance have changed with the transformation of the ocean-carrying service. The East India goods are now shipped across the Pacific to San Francisco, and thence east via rail. The cost of insurance on these is now only three quarters of one per cent. Rates on the Atlantic have likewise declined. Insurance on dry-goods and like merchandise carried in the modern "liners" is placed at two tenths of one per cent. In other classes of goods depreciation in rates is in like proportion.

Marine underwriters do not ascribe the decline in American marine insurance to any trouble from unwise laws or legislative interference, but to the changed business conditions and to English competition. The bulk of the carrying trade of the world has passed into British hands, and a British merchant and ship owner insures in a British company. The English marine companies have, as well, invaded American soil, and have secured a large portion of the American business. When the English companies first established themselves in America, along in the early seventies, they began cutting rates. The American companies did not effect any combination to prevent this, but followed their example. The American companies were also placed somewhat at a disadvantage by the laws governing the admission of foreign marine-insurance corporations. The foreign companies are required to make a deposit before they can write American business; but in New York State, which has stringent insurance laws, the amount is fixed at the minimum capitalization allowed a home company, namely, $200,000. So much of the carrying trade of the world is done under the British flag and with the aid of British credit, and with countries under British control, that the American underwriter, working against all these disadvantages, is seriously handicapped. Therefore, there being no national or local tariff associations among marine underwriters, the American companies are worsted in this rate war. There are now not enough of them to form any sort of an association which would wield much power.

Despite the work of the American companies to hold their own, through loss of prestige on the ocean and active rivalry on land, there are a number of stock and mutual American marine-insurance companies which continue to do a flourishing business. The largest and one of the oldest is the Atlantic Mutual of New York, which has over $12,000,000 of assets, and has been most carefully managed throughout its career. It was formed in 1842, at the time when many stock companies were turned into mutual companies, and by which change the profits accrue to the policy-holders instead of the stockholders. The company is noted for retaining its faithful and tried officers until their death. The late John P. Jones was connected with the company for 50 years, and was its president for 40. In his life-work of building up the company he was ably assisted by Vice-presidents W. H. H. Moore and A. A. Raven, who have been with the company 30 and 40 years respectively. Among the other large companies which still do a thriving business are the two Boston corporations, the China Mutual and the Boston Marine.

There have never been many marine Lloyds in the United States, though this form of marine insurance has been most in vogue in marine underwriting in Great Britain. The origin of the term is both interesting and peculiar. The name of Lloyd originated in old Lloyd's Tavern, in Tower Street, London, far back in the days of Queen Anne. It was the practice of many ship-owners and traders to drop in at the tavern and talk over their prospective profits; and gradually a custom developed of inscribing their names on a blackboard, certifying that the men signing would be jointly liable for the loss of a vessel during a certain voyage. From this crude beginning have grown the world-famous associations in the British Isles. In the United States there are a few Lloyds, two of the principal ones being located in New York — the United States Lloyds and the New York Marine Underwriters.

The scope and definition of a marine policy is, of course, entirely different from a land fire policy. The risks insured against are many, and may be summarized as including all perils of the sea. There are two classes — a voyage and a time policy; the former is generally used in insuring vessels, and the latter for cargoes. There are naturally many clauses governing marine-insurance policies, such as capture, seizure, war, and so on. The life of the insurance on a ship begins at the port from which it is insured until moored for 24 hours at the port to which it is insured. When an insurance is made on freight to be carried under a charter, the policy attaches as soon as the vessel sails, although she may be destined to a distant port for her cargo.

Though single losses to marine underwriters have been small, compared with some of those of fire underwriters, there have been shipwrecks that have lived in marine insurance men's memories. One of the greatest losses to American marine insurance was that of the American steamer Central America, which foundered off the Cuban coast in September 1857. The Central America was bound from Aspinwall, now Colon, to New York, and was loaded principally with treasure from the California gold-mines. She carried insurance amounting to between $700,000 and $800,000, all of which had to be paid by American underwriters. Another notable loss was that of the steamer Erie, which sailed from Pernambuco, Brazil, loaded with coffee, on 1 Jan. 1893, and was burned at sea. Coffee prices were high in those days, and the Erie went down with $500,000 insurance.

Two losses which not only made inroads on the American marine companies, but which also seriously crippled the growth of American steam transatlantic service, were the sinking of the steamer Arctic, off Newfoundland, in 1854, by collision, and the disappearance of the steamship Pacific, which sailed from Liverpool for New York in January 1856, and was never heard from. Both steamships belonged to the Collins Line, which was the first one to put on steam-vessels for the Atlantic trade. These early losses were particularly detrimental to American marine insurance, because the companies carried extremely heavy lines in those days. Among the recent heavy losses was that of the steamer Oregon, which was run into and sunk off the Long Island coast in 1886. American marine underwriters had between $700,000 and $800,000 on the Oregon's cargo. The loss of the Oregon also showed underwriters how quickly even a properly constructed iron ship sinks. The introduction of iron in place of wood for building vessels has not made any material difference in the rates of insurance, for iron has hazards which wood has not, and *vice versa*.

As to the future of American marine underwriting, it is difficult to prophesy. As trade follows the flag, so marine insurance flourishes in the country with a prosperous merchant marine. The United States is again forging to the front as a great ship-building nation, and this gives American marine underwriters hope that American marine insurance may follow in the wake of the growth of American ship-building.

Insurance Patrol, an organization peculiar to New York and other large cities, which co-operates with the fire department, but is controlled by the combined insurance companies, who support it through the board of fire underwriters. The New York corps was organized in 1835, when there was an epidemic of incendiary fires. The patrol is provided with wagons and an equipment designed for its special work. Its most important service is in saving goods, which it does by removing them from burning buildings, or by covering them with rubber or oiled sheets, as a protection from water, dirt, or cinders. In some cities it is known as salvage corps, or protective association.

Insurance, Science and Economics of. Insurance, to-day, forms an integral element of our social and commercial life. From crude beginnings, the principle of providing, by the contributions of the many to a common fund against the financial consequences of individual losses due to the inherent uncertainties in human affairs, has been perfected until the modern practice of insurance includes all the more important contingencies affecting human welfare. In both science and economics insurance holds a most important position, which becomes more readily apparent as the practice and results of the business are inquired into and considered in their relation to individual and national well being. As a business insurance holds rank as one of the foremost enterprises of the age, equal in importance to banking and transportation. It would, without exaggerating, be as difficult to think of commerce without insurance as of transportation without railroads or the transmission of intelligence without the telegraph. Modern life has become so completely interwoven with the idea of insurance that there are few contingencies affecting life and property to which the principle of insurance has not been more or less successfully applied.

The scientific basis of insurance is the same in all its branches, that is, the laws of chance and probability. In considering any future event we are confronted by the uncertainty whether such an event will or will not happen, but from the facts of experience upon a large scale it is now possible to calculate with sufficient accuracy the monetary equivalent required to meet the risk assumed by an insurance company. The recognition of insurance as a science dates from 1747, when Corbyn Morris published his classical 'Essay Toward Illustrating the Science of Insurance,' wherein he attempted to "fix by precise calculations several important maxims upon this subject." Accuracy and precision is the essence of all scientific method which in its practical application to insurance does not differ in any important essential from the method which underlies all other scientific processes. The larger the mass of facts considered, the more definite must be the resulting conclusions, which for practical purposes are the equivalent of natural laws and confirmed by subsequent experience verifying the truth of the theory assumed.

Insurance science has thus far found its chief development in the department of life contingencies, due, no doubt, to the fact that the average duration of human life and its pecuniary value require to be determined with the greatest possible accuracy, since the contracts made dependent thereon extend, as a rule, over many years. In other forms of insurance, such as fire, marine, and accident, the contracts are generally for short periods, seldom of longer duration than a single year. Hence most of the scientific discussions and the numerous dissertations upon the subject relate chiefly to life contingencies, but there has been a decided improvement in this direction during recent years. The deliberations of associations of actuaries and insurance managers extending over many years, in particular the Institute of Actuaries of Great Britain, are fully entitled to rank, in thoroughness of research and grasp of fundamental principles, with the deliberations of other scientific bodies. It is, no doubt, due to this fact that insurance was included in the most recent classification of the sciences as represented at the International Congress of Arts and Science at Saint Louis, held in connection with the exposition of 1904.

Insurance as a science is a branch of economics, although only a few of the more recent writers on the subject have given careful attention to the theory of risk and insurance in its relation to public welfare. A fairly complete explanation of the economic theory of insurance is to be found in an essay by Allan H. Willett, published by Columbia University in 1901. He holds, and very properly so, that "as a general rule uncertainty exercises a repellent influence in human life, and the existence of risk in an approximate static state causes an economic loss, while (on the other hand) the assumption of risk is a source of gain to society." From this point of view the business of insurance does not differ essentially from general commercial enterprises. Risk is assumed in mining and agriculture in much the same manner as risk is assumed in the business of insurance, but in life insurance, for illustration, the assumption of a risk and the equivalent premium payments required are determined by the theory of probability and the established laws of human mortality and observed experience. In general commercial enterprise the risk assumed is, as a rule, created, while in insurance the risk is pre-existing. This marks the broad division between gambling and insurance. Insurance is not "in the nature of a bet," for in insurance an effort is made to eliminate an existing individual risk by its assumption on the part of the many, while in gambling a non-existing risk is created with resulting uncertainty and needless loss to society.

Insurance companies are chartered institutions with their powers of existence and rights of transacting business derived from the State. They are subject to supervision by special departments in charge of commissioners or superintendents of insurance, who have ample power to inquire into every important detail of office administration. At first the burdens of State supervision were light, since the companies transacted but little business outside of their home

State; but within the last generation the business operations of most of the companies have of necessity been extended to other States and territories. There has, as a result, been developed a vast system of over-supervision, accompanied by an immense amount of over-legislation, much of which is inimical to the highest and broadest development of the business. The position of the commissioner is, as a rule, a political one, subject to the changing fortunes of the parties, and new men have frequently come forward with radical ideas, which, if carried to the extreme, would have resulted disastrously to the companies and their policy-holders. It has been very ably pointed out by Senator John F. Dryden, in an address on 'The Regulation of Insurance by Congress,' that "Insurance is to-day a universal institution reaching all classes and affecting more or less all commercial interests. It is an essential element of human progress and a method and means for the uplifting of the masses to a higher level of economic security. It has become national in character, and few companies confine their operations to a single State: in fact, if operations were so limited they might prove disastrous and make the conduct of the business impossible."

The taxation of insurance is a difficult problem and a matter of serious concern to the companies. In its final analysis the incidence of insurance taxation falls upon the policy-holders and the cost of insurance is correspondingly increased. The fact is overlooked that insurance itself is in the nature of a tax and that additional tax burdens are a needless hindrance to the largest development of the business. In life insurance alone the annual amount paid in taxes, fees, etc., is not far from $10,000,000 and the proportion of taxes to income is constantly increasing, due to additional burdens placed upon the companies as a convenient source of public revenue. A tax upon premiums is an unjust burden upon the business, and is both inexcusable and unscientific. This tax falls alike upon new premiums for risks just incurred and upon renewal premiums upon risks assumed years ago. Since risks assumed years ago were calculated to produce a certain result on the assumption of a known mortality and 4 per cent interest, taxes upon premium payments must necessarily and considerably decrease the returns to participating policy-holders, and increase, in consequence, the cost of insurance. If carried to the extreme, especially in the case of companies which issue only non-participating policies, it is possible that the companies may ultimately be unable to meet their obligations in consequence of a policy on the part of the State which is as unwise as it is unnecessary.

Insurance by government is not a new proposition, but it is only during the last half century that there has been an effective effort to establish an insurance department by government in active competition with private companies. In life insurance the experiments of England and New Zealand are the most valuable because the results are, on the whole, fairly comparable with those of non-governmental institutions. Post-office life insurance in England was established in 1864, and the life insurance department of New Zealand in 1869. The former employs no agents or solicitors, while the latter, in all essentials conforms to the methods and usages of private companies. The premium rates and the results to policy-holders have been about the same, averaging fairly with those of regular companies of good standing. The business results in England have been insignificant, while in New Zealand a fair measure of success has been achieved. In New Zealand at best and at most, the results have not been better, the cost has not been lower, and the security has not been superior to that offered by private institutions, which have increased their business in force at the rate of 51 per cent during the past nine years, against an increase of 16 per cent for the government department. The private companies are gradually gaining on the government, and while in 1894, 49 per cent of the total policies in force were with the government, in 1902 the proportion was only 42 per cent. To those who believe that the government which governs best is the government which governs least, and that the limit of State duties is unduly enlarged by State trading in such directions as these, the New Zealand experiment is conclusive evidence that State effort in the field of life insurance is not likely to produce results superior to those which have made commercial life insurance the most successful business of the age.

As distinct from voluntary insurance by government or private companies, the so-called system of compulsory insurance for workmen holds a unique and important place in the social economy of certain European nations, particularly Germany. The term compulsory insurance is seriously misleading, for as a matter of fact, the system is not insurance at all, but a state provision for workmen against the financial consequences of accidents, sickness, invalidity, and old age. In its inception the German system of government insurance was a measure designed to counteract the socialistic tendency in opposition to the monarchy. In its development it has been made to include nearly the entire body of workmen and as a theory of government and social reform it has unusual attractions. Critically examined, the system is little else than poor relief under another name, and inadequate in many respects as all methods of compulsory thrift must necessarily be. It is insurance in name, but not in fact, for it is not by the sole contributions of the beneficiaries that the required funds are provided, but by the joint and compulsory payments of employer and employee, plus a state subsidy or grant from the general revenue raised by taxation. The evidence as to the economic and social results of this system is so involved and conflicting and subject to such different interpretations, that no final conclusion for or against the system can be advanced at the present time. This much, however, it is safe to say, that the anticipated benefits have not materialized, and the socialistic agitation, although much modified and of a somewhat different character, is to-day more pronounced in Germany than ever before. Nor has compulsory insurance solved the labor problem and brought about a substantial improvement in the relation of capital and labor. The most serious economic aspect is the burden of the system upon German industry and the resulting handicap upon competition in international trade. This explains the anxiety of the German government to induce other nations to follow its example and by means of exhibits, illustrations, and literature advance the cause of government insurance abroad. Even at the present time the system is but in its initial stage, and time alone can prove whether it will ultimately result to the advantage of the German people or otherwise. In the opinion of Prof. Farnam of Yale, an impartial student of the subject, "the supporters of the German system are claiming for it more than the facts of the case as they now stand warrant," and that "The German experience with this kind of insurance seems to show that, while it is possible with a highly trained intelligent administration to carry through a scheme which will compel provision against various contingencies, it has thus far been impossible to create the instinct of forethought and care which is implied where insurance is voluntary. There are many facts which go to create a strong presumption that the result of this governmental care is actually to make people less careful of the future, and less judicious in their expenditure."

Insurance had its origin in private enterprise and it has attained its commanding position as a world force for the betterment of the social condition of mankind through the initiative, ability, and courage of a group of men as much deserving of immortal fame and glory as any other class of benefactors of the human race. State trading in the field of insurance has never advanced the cause by a single important innovation or by a new theory or a material improvement in practice. The necessary reforms and changes as dictated by experience have been brought about by the companies and it is due to these and these alone that the insurance business has become one of colossal magnitude and world-wide extent. The amount of insurance of all kinds in force in the United States has been estimated by the Committee on Insurance Law of the American Bar Association to approximate $50,000,000,000. The aggregate assets of the companies approximate $3,000,000,000, and the American people pay annually for insurance of all kinds approximately $1,000,000,000, while they received from the companies during the year ended 31 Dec. 1904, approximately $800,000,000. These figures are exclusive of the business of many fraternal associations and local mutual fire insurance companies, of which there is no trustworthy or complete record.

No other business so completely enjoys public confidence and has so successfully stood the test of long experience. As the scientific principles of insurance are examined and the highly specialized administration of the companies is considered and the results are measured by a fair standard of benefits in proportion to cost, the verdict of science and economics will agree with that of the mass of mankind, that our social and commercial progress would have been impossible without insurance. Resting upon this broad foundation of human experience and public confidence, the colossal business of modern insurance challenges the admiration of the world.

Bibliography.— Insurance has a literature of its own and a most interesting history extending over more than four centuries, with suggestions of at least a conception of the insurance idea among the most ancient people of whom there is a recorded history. The limitations of this article preclude more than a brief reference to the more recently published works, among which, however, I may mention Willett, 'Economic Theory of Risk and Insurance' (Columbia University Press, New York 1901); the Yale Insurance Lectures 2 vols., C. C. Hine Company, New York 1904); Alexander, 'The Life Insurance Company' (Appleton & Co., New York 1905); Young, 'Insurance' (Isaac Pitman & Sons, London); Dean, 'Fire Rating as a Science' (J. M. Murphy, Chicago 1901); Phelps, 'History of American Insurance During the Last Decade' (American Underwriter, New York 1904); Vance, 'Handbook of the Law of Insurance' (West Pub. Co., St. Paul, Minn., 1904); Wolfe, 'Investments of Insurance Companies' (The Insurance Press, New York 1905). These are but a few of the many books on insurance which have been published during recent years. In addition there are the Insurance Year Books on life, fire, and miscellaneous insurance, published by The Spectator Company, New York, the annual reports of insurance commissioners, some of which contain critical observations on insurance problems of the day, the annual proceedings of underwriters' associations, and the national conventions of insurance commissioners, the special publications of insurance companies, their histories, etc., the discussions on State supervision and Federal regulation of insurance, of which the two more important are an address by John F. Dryden, president of the Prudential Insurance Company of America (1904), and a report of the Committee of the American Bar Association on Insurance, by Ralph W. Breckenridge, chairman, Omaha, Neb. (1905). But the chief source of information regarding insurance practice, the progress of the business, the organization of companies, etc., is to be found in the technical and general insurance periodicals, the 'Insurance Monitor,' 'The Spectator,' the 'Weekly Underwriter,' and the 'Insurance Press,' of New York, the 'Baltimore Underwriter,' of Baltimore, the 'Standard,' of Boston, and many others. The principal publishers of works on insurance are The Spectator Company, New York, and C. and E. Layton, London.

Frederick L. Hoffman,
Statistician of the Prudential Insurance Company of America.

Insurrec'tion, the act of rising against governmental authority, active opposition to the power of the state. In the United States, power to suppress insurrections by employing the militia is given to Congress by the Constitution, Art. I., Sec. 8, Clause 15. In 1792 and 1807 acts were passed giving the President power to call forth the militia when notified by an associate justice of the Supreme Court or a district judge that the execution of the laws is obstructed, and on application of a legislature or a governor, when the legislature could not be convened, and to employ also the land and naval forces of the United States. The Whiskey Insurrection (q.v.) was directed against the Federal authority and the President employed force to suppress it on notification by the Federal judge. During the Buckshot War (q.v.), in 1838, between the Whigs and Democrats in Pennsylvania, the governor of that State asked for assistance, but it was refused. The governor of Rhode Island made a similar application during the Dorr Rebellion (q.v.) and the regulars were held ready for action, but their aid proved unnecessary. These last two cases came under Art. IV., Sec. 4.

of the Federal Constitution, which provides "that the United States shall protect" each State on application of the legislature, or of the executive, against domestic violence.

When the Civil War began the President was obliged to take prompt steps in calling out the militia, though no application had been made to him as required by the acts of 1792 and 1795. His action was justified by Art. II., Sec. 3, of the Constitution, providing that "he shall take care that the laws be faithfully executed," but Congress on 6 Aug. 1861 formally validated and made legal all of President Lincoln's previous acts, proclamations, and orders. The Force Bill (q.v.) of 20 April 1871 gave the President special power to use military force in certain contingencies. In the South during the reconstruction period, and in the North, during strike riots, Federal troops have been used.

Integral Calculus. See CALCULUS, INFINITESIMAL.

In tellect. See MIND; PSYCHOLOGY.

Intent, a legal term signifying the end or object which a person had in the performance of an act, the making of an engagement, or the drawing up of a will. Generally the legal consequences of an act are considered quite independently of the intention or motive of such an act. A wrong done to the person or property of another is punishable at law without consideration of the intentions of the person committing the violence or trespass. But when an engagement has been made by person, or a written disposition of property executed, the intention of the person making the engagement or signing the deed is fair matter for legal inquiry. In this connection a subsequent stipulation by word of mouth is not competent to nullify or modify the terms of a written engagement. Intent also forms an important part in suits for defamation, fraud and negligence. Negligence must have intent to make it criminal, so must defamation and fraud and malicious mischief. Consult Thayer, 'Preliminary Treatise on Evidence' (1898); Black, 'Construction and Interpretation of Laws' (1896); Hardcastle, 'Rules which govern the Construction and Effect of Statutory Law' (1900).

Intent, in psychology, according to James, is that which intelligent consciousness "means or intends"; the intent is a feeling in consciousness which is usually identified or practically identical with the object of consciousness at a particular time. By others, however, the word intent is meant to apply to a certain point of view from which an object may be regarded. Thus when our conscious processes have a unity of interest, there is, as a rule, a certain amount of unity of object. If the interest is divided, more particularly in the attainment of a definite or a wider knowledge, the object as it becomes more perfectly known is identical with the object as previously less perfectly known; and as one's conscious thought is directed continually toward the object, it receives, little by little, further and further definite specification, the detail being more or less in the background; yet the detail is all the time in consciousness, as it were inevitably associated with the object itself. The detailed object, considered by Baldwin as the goal of conscious endeavor, may be called the intent of consciousness. The end pursued becomes defined in the pursuit of it, and so far as it is yet indefinite, and therefore only partially developed in consciousness, it is an intent. Consult Baldwin, 'Dictionary of Philosophy and Psychology,' Vol. I.

Intercollegiate Athletics. See EDUCATIONAL ATHLETICS.

In"tercolumnia'tion, in Greek architecture, the space between two columns. This space is measured in diameters of the foot of the column. Vitruvius mentions five varieties of intercolumniation. These are the *pycnostyle* (that is, with columns thickly ranged) of one diameter and a half, which are least frequently found; the *systyle* (that is, with columns harmoniously ranged) of two diameters, the *diastyle* (that is, with columns far apart) of three diameters, the *areostyle* (that is, with columns sparsely ranged) of four diameters; and the *eustyle* (that is, with columns a due distance apart) of two and a quarter diameters.

Intercontinen'tal Railway, or **Pan-American Railway**, a proposed line of standard gauge, to connect the railway systems of the United States and Mexico with those of the Argentine Republic, utilizing as far as practicable existing systems in Central and South America. At the first International Conference of American States, held in Washington (1889–90) the committee on railway communications said in their report, "That a railroad connecting all or a majority of the nations represented in this conference will contribute greatly to the development of cordial relations between said nations and the growth of their material interests." President Harrison on 19 May 1890 recommended that Congress should make an appropriation for the share of the United States in the expenses of a preliminary survey. Congress complied, and the Intercontinental Railway Commission began its work with A. J. Cassat as chairman and H. G. Davis at the head of the finance committee. The commission spent about $300,000 for surveys, maps, etc., three corps of engineers making experimental surveys between the north of Guatemala and Argentina in 1892, 1893, and 1894. It was found that the approximate length of the line to connect the southeastern boundary of Mexico with Buenos Ayres would be: in Guatemala, 230 miles; Salvador, 220; Honduras, 70; Nicaragua, 224; Costa Rica, 363; Colombia, 1,372; Ecuador, 635; Peru, 1,671; Bolivia, 774, and Argentina, 1,143; total, 6,702. The distance from New York to the Guatemalan frontier is 3,700 miles, and thus the total from New York to Buenos Ayres is 10,471 miles. Links between the termini of the Argentine and Mexican systems: In Bolivia, 192 miles; in Peru, 151 miles; in Nicaragua, 31 miles; in Salvador, 20 miles; in Guatemala, 30 miles. This statement shows that about half of the distance between New York and Buenos Ayres was covered by railways then existing. On 27 Nov. 1901 the Pan-American Railway committee of the Second International Conference held in Mexico City stated that "some additional railroad has been built that could be utilized as a part of a continental system"; that not more than 5,000 miles of road would have to be constructed to establish railway communication between the systems of North and South America; that $200,000,000 would be ample for this work; and that the surveys made by the engineers of the commission demonstrated the practicability of constructing all of the missing links. The concluding assertion, however, should be received with caution. In Central America the proposed line runs along the volcanic coast; on entering South America it is continued among the enormous volcanic Andes, still paralleling the Pacific shore, but further inland. Recommendations made by the committee on 27 Nov. 1901 were that a permanent committee on Pan-American Railway should be appointed "to further the project after the adjournment of the conference"; also that the United States should take the lead in sending "competent and reliable persons whose duty it shall be to determine accurately the resources of the different countries and the condition of railway lines in operation . . . and the prospects for business for an intercontinental line . . . and also to ascertain what concessions or assistance each of the respective governments is willing to grant to the enterprise." The permanent committee appointed by the president of the conference comprised Ex-Senator Henry G. Davis and four others. A special commissioner was sent to the Latin-American republics, as suggested.

In'terdict, an ecclesiastical decree which forbids the performance of certain acts of public worship. When an interdict was laid upon a town, district, or country, all the churches were closed, the bells were silent, the sacraments, except infant baptism and extreme unction (and sometimes even these), were withheld, the rites of burial were not performed, and all the public ceremonies of religion were suspended. Interdicts may be general, as applied to a country or city; particular, as applied to a parish or diocese; personal, as applied to a person, or some class of persons. The bishops seem to have anciently exercised the right of publishing interdicts; for in 870 Hincmar, bishop of Laon in France, issued one against a parish in his diocese. One of the earliest censures of this sort on record was imposed upon the city of Rouen in the 6th century on account of the murder of the Archbishop Pretextatus by order of Queen Fredegonda. In 997 Gregory V. laid the kingdom of France under an interdict because King Robert had married his cousin, and the king was abandoned by most of his court. The same penalty was inflicted upon the kingdom of England under Stephen (1147) by Eugenius III., under John (1207) by Innocent III., under Henry VIII. (1535) with little effect by Paul III., and under Elizabeth (1587) by Sixtus V. Adrian IV. laid Rome under an interdict for the purpose of compelling the Romans to drive out Arnold of Brescia. Gregory IX. made use of the same instrument of compulsion in his quarrel with the emperor Frederic II. During the middle ages the interdict was a powerful engine of attack for the popes in their contests with sovereigns, as the popular dread of its effects was so great that kings were often forced by rebellions to submit to almost any conditions in order that it might be taken off. From the time of the reformation general and local interdicts have become rare. When Paul V. laid Venice under an interdict in 1606, the churches were not closed, and only a minority of the bishops submitted to it.

Interest ("it concerns"— the party in issue — originally an award of damages, later used to evade the anti-interest laws), a charge for the use of money, by custom computed annually, on a basis of so many out of each 100 units loaned; but without diminishing the capital. It is possible to pay interest without loss, because, under conditions now general, the borrowed money can be employed in productive industry, from which a return equal to or greater than the interest can be obtained; or because comfort, prestige, or moral advantages of many kinds are derivable, justifying the expenditure when enough is left. Such borrowing is now useful on the whole, because civilization has ingrained a self-restraint in the masses which makes them in most cases manage money soberly and prudently. But in the early ages this was not so, except in a few developed commercial cities: Babylon carried on business by interest loans, and even bottomry bonds on shipping. Tyre probably did so, the great Athenian commerce was built up entirely by it, as Demosthenes explicitly says, but the mass of people were not fit to have the use of money, had no remunerative employment for it, and borrowed it only to use in self-indulgence, or in desperation because any rate was a choice of evils. There was little property to pledge, and the security was mostly the debtor's person; foreclosure meant selling him for a slave, and the grievance which called for Solon's legislation was the debt-slavery of a large section of the citizens. Hence arose a violent prejudice against the system altogether, as immoral in itself; the law of Moses prohibited it between Jew and Jew; Aristotle says it is essentially immoral, because money cannot breed money (this in the age of Athenian commerce), and never was meant for any such use; the Christian Church inherited the reprobation from the Jewish, and for many centuries forbade its members to take "usury" (money for the use of money, that is, interest at any percentage), and the secular laws were correspondent. In England interest did not become legal till the time of Henry VIII., but had been actually practised for many generations, by legal fictions of partnership or breach of contract, etc.; previously it was in the hands of the Jews — who were so indispensable as financial agents that a Jew who was converted to Christianity had all his property confiscated — and later of the Lombards. The first English permissive statutes fixed 10 per cent as the legal limit that might be charged; early in the 17th century it was set at 5. No serious doubt of the power of governments to regulate the current rate of interest obtainable was entertained till Bentham wrote his 'Defence of Usury' in 1786, proving that the laws could not possibly have any effect; because if the legal rate fixed was equal to or greater than the current rate it could not work any change in it; and if less, holders of money would not lend without obtaining their price plus an insurance for the risk of legal punishment. The doctrine was violently disliked, and has not even yet overcome the determination of the mass to show their dislike of usury by statute, or their belief that they can affect rates; but in a few American States of late years the anti-usury laws have been abolished. Of course a legal rate is always provided in default of contract.

Interest is not a natural right, but a matter of law or contract. The holder of a note payable without stipulation of interest cannot claim any until the note has become due and remains unpaid: thenceforward it draws money at the legal rate. The United States pays no interest on its debts, except where bonds are issued specifying it.

Of the separate States and Territories there is no legal restriction on the rate allowable by contract in Arizona, California, Colorado, Connecticut, Maine, Massachusetts, Montana, Nevada, Rhode Island, Tennessee, Utah or Washington: the legal rate in each is 6 per cent except with Colorado (8), Montana (8), Nevada (7), Utah and Washington (8). The others have rates as follows, the legal rate coming first, then the contract rate permitted: Alabama, 8, 8; Arkansas, 6, 10; Delaware, 6, 6; Florida, 8, 10; Georgia, 7, 8; Idaho, 7, 12; Illinois, 5, 7; Indiana, 6, 8; Iowa, 6, 8; Kansas, 6, 10; Kentucky, 6, 6; Louisiana, 5, 8; Maryland, 6, 6; Michigan, 5, 7; Minnesota, 6, 10; Mississippi, 6, 10; Missouri, 6, 8; Nebraska, 8, 8; New Hampshire, 6, 6; New Jersey, 6, 8; New Mexico, 6, 12; New York, 6, 6; North Carolina, 6, 6; North Dakota, 6, 12; Ohio, 6, 8; Oklahoma, 7, 12; Oregon, 8, 10; Pennsylvania, 6, 6; South Carolina, 7, 8; South Dakota, 7, 12; Texas, 8, 10; Vermont, 6, 6; Virginia, 6, 6; West Virginia, 6, 6; Wisconsin, 7, 10; Wyoming, 8, 12. The rates in the District of Columbia are 6, 10.

That these provisions are more the result of tenacious tradition than of any very exact reasoning is shown by their terms. Only in three States — Illinois, Louisiana, and Michigan — has there been any recent attempt to keep down by law the rate of contractual interest to the rate actually current in the community; in the others, unspecified debts bear 6 to 8 per cent interest while the current rate is 5. As to the contract interest, 11 States stick to the attempt to forbid anything beyond the legal rate; but that assumed interest being above current rates, some leeway is left. One of these, moreover — New York — favors its peculiar interest by allowing any contract rate on "call loans" over $5,000. Sixteen make the rate so high — from 10 to 12 per cent — that any one with the least pretense of credit or security can contract freely; above that, we have to deal with pawnbrokers and 'fences,' the former protected by tacit allowance, the latter amenable only to criminal legislation.

The theories of interest, like most economic principles, are much disputed by economists. The chief theories are those of "abstinence," holding interest to be a reward of abstinence from using up the capital in enjoyment (a variant of this regards it as a result of the general appreciation of the present above the future); of "productivity," holding it to be the return for production by capital in the same way that wages are a return for production by labor; the combination of the two, regarding the return as fixed by supply and demand, the latter depending on productivity and the former on abstinence; and the "monopoly" theory, which considers it a toll levied on the product of labor by the capitalists who control the means of production.

Interest, in psychology, is a term by which at least two or three different things may be meant. On the one hand interest may be defined as the consciousness which accompanies mental tendencies of any sort so far as they are concentrated on mental objects. It is manifested by a certain amount of voluntary attention to which it may be considered a stimulus. The exploiting habit, curiosity, the desire to know, may be defined as primary forms of interest, as distinguished from custom and habit and one's way of regarding things, the former being regarded by Baldwin in the nature of a stimulus to the intellectual function, the latter as frequent performance of a process.

The word also, in the vulgar sense, applies loosely to what is meant by personal advantage; as, for instance, it is "to a man's interest" to obtain such and such.

In pedagogics interest is often looked upon as a form of amusement, a stimulus through the play-instinct to induce intellectual effort. In the science of teaching, the ideal is to awaken an interest in the ends for which pupils study, and that a permanent interest in the ends should be fostered through the means. Baldwin well says that when interest attaches to the end, but not to the means of reaching it, we have drudgery, as in the case of workmen who think only of the dollar, taking no interest in the labor that wins it; on the other hand, when there is interest in the means, but not in the end, we have play, we do not work. When, however, there is interest in the end to be obtained, and also in the means for reaching the end, the ideal of work desirable in education is reached. See Herbart, 'Science of Education'; 'Doctrines of Interest'; Baldwin, 'Story of the Mind'; 'Educational Review,' Vol. X.; Baldwin, 'Dictionary of Philosophy and Psychology,' Vol. I.

Interfer'ence, in physics, is a phenomenon exhibited by wave motion of all kinds, and consists in the coming together of waves having different phases, in such a way that the effects of the waves are either increased or diminished. Interference may be observed when two different trains of waves come together upon the surface of water or any other liquid. Where the crest of a wave belonging to one system coincides with the crest of a wave of the other system, the elevation of the water surface is sensibly equal to the sum of the heights that the separate waves would have if each existed in the same place alone. When a crest of one of the waves coincides with the trough of another, the disturbance of the water surface is reduced, and the elevation (or depression) which results is equal to the difference between the elevation of one of the component waves and the depression of the other one.

The kinds of interference that are of the greatest practical importance in physics are those which occur among sound waves, or among waves of light. The phenomena in these cases are ultimately of the same general sort as those observed upon the surface of water. In the case of sound, interference may even produce entire silence in certain regions, when two trains of sound waves, of equal intensity, are brought together in a suitable manner. A more familiar result of the interference of sound waves, however, is the production of "beats," when two or more trains of waves, having but slightly different wave-length, come together while the two are moving in nearly the same direction. This phenomenon is exhaustively treated in Helmholtz's 'Sensations of Tone,' and it also receives a more or less adequate treatment in all of the better works on physics.

The more familiar of the interference phenomena that are afforded by light are those which are observed in connection with soap bubbles and with very thin plates of transparent solids. Light, upon striking the soap bubble or the thin plate, is reflected toward the eye from both surfaces, and the trains of light waves that reach the eye from these two sources, since they have a slight difference of phase (which varies, moreover, from point to point of the bubble or the plate), interfere with one another so as to produce effects that are often very beautiful and striking. A soap bubble, when viewed by monochromatic light, often appears to be covered with dark striæ; the dark lines being due to the fact that at the points that appear dark the two trains of light-waves, coming respectively from the inner and outer surfaces of the soap bubble, nearly or completely neutralize each other. When the bubble is viewed by white light, we do not commonly see the dark striæ, their places being taken by bands of color. This is because the different colors that compose white light have different wave-lengths, so that at any given point in the bubble only a portion of the colors are destroyed by interference, leaving the remaining constituents of the white light to produce their full chromatic effect upon the eye. See LIGHT; SOUND; PHYSICAL CRYSTALLOGRAPHY.

Inte'rior, Department of the, one of the executive departments of the United States government whose heads are cabinet secretaries. The "home department," long existent in all European governments, was only constituted in this country by act of 3 March 1849. Its functions had previously been exercised by bureaus or officials of nearly all the other departments: patents, copyrights, public documents, and the census belonged to the State Department; public lands, mines, and judicial accounts, to the Treasury: Indian affairs, to the War Department; and pensions to the War and Navy, each for its own pensioners. By later laws the Interior was given charge of education, public surveys (including the geological survey; but the coast and geodetic survey belongs to the Treasury), subsidized railroads, Territories, national parks and reservations, returns of public contracts made by several other departments, some charitable institutions in the District of Columbia, and a number of other matters. The secretary makes an annual report of the number of public documents received and distributed. He has a salary of $10,000, and two assistant secretaries. His office has seven divisions: appointments, disbursements, lands and railroads, Indian affairs, pensions and miscellaneous, public documents, and stationery and printing. Although most of these are managed by commissions appointed by the President, their work is under the secretary's direction, and their reports are made through him. Most of the clerks and subordinate officers in the bureaus are appointed by him. All patents issued by the United States must be signed by him. The first secretary was Thomas Ewing of Ohio.

Interlaken, ĭn'tĕr'läн ĕn ("between the lakes"), Switzerland, village in the canton, and 26 miles southeast of the town of Berne, one mile southeast of Unterseen, beautifully situated near the left bank of the Aar, in the valley of Boedeli, between the lakes of Thun and Brienz. It contains a beautiful old castle and numerous hotels. It is visited annually by 80,000 to 100,000 tourists. Pop. about 2,500.

Internal Improvements, the construction and reparation of roads, bridges, canals, harbors, lighthouses, etc., at the expense of the United States government. The Constitution not having made any provision for such improvements, the execution of public works of this character became subject to the vicissitudes of party politics. Yet since 1789 funds have been perpetually appropriated by Congress for the carrying on of improvements throughout the country, so long as these lay strictly within Federal jurisdiction. Such would include lighthouses, buoys, beacons and public piers, rivers and harbors. The Federalist party, and after it the Democratic party, opposed all improvements on rivers and roads, the benefit of which passes to the several States. Yet in 1806 an appropriation was made for the construction of the Cumberland Road, which should penetrate the Western States and facilitate the mail service, as well as open up unsettled territory to the increasing tide of immigration, and serve for the transportation of troops and army supplies. The Federal Government, about the same time, undertook the construction of a road through Georgia toward New Orleans. In 1898 Congress passed a resolution in which it claimed the power to make appropriations for such internal improvements as the construction of roads and canals, and the maintenance and direction of water courses. Such roads and canals as the President should consider of Federal importance were ordered by Congress to be surveyed, and $300,000 was subscribed to stock of the Chesapeake and Delaware Canal. But there was a wide difference of opinion with regard to the constitutionality of such legislative action, and in May 1822, President Monroe vetoed the Cumberland Road bill. He supported this procedure by the declaration that Congress had acted *ultra vires*. That body, he maintained, had no right under the Constitution to carry out such internal improvements at Federal expense. President Jackson in 1830 followed Monroe's example and vetoed the Maysville Turnpike Road bill. Henceforth, the matter of such internal improvements was left to the legislation of the various States. Jackson had somewhat mitigated the force of his veto by advocating the distribution of the Treasury surplus among the various States, but when the Whigs tried to put this into execution in 1841, President Tyler by his veto put a stop to any such attempts, and they have never since been repeated. The introduction of railroads under the management of private corporations did away with the call for road appropriations, although something like a bonus was given to the projectors of new lines by the vast grants of lands which were made to them. Tracts of 40,000,000 and 50,000,000 acres were thus transferred to railroad companies. At present both the great political parties are inclined to reclaim so much of the public lands thus granted, as has not been earned by a strict fulfilment of the conditions on which the grant was made. The appropriations for internal improvements under the head Rivers and Harbors for the year 1903 was $32,540,199.50 as against $7,4[illegible]23.00 in 1902.

Internal Revenue System, of the United States, properly all taxation except that of foreign goods at customs offices; but in use restricted to what were formerly termed excises (q.v.), on internal trade and manufactures, through a bureau of the Treasury Department, organized 1862. Before that time, though excises had been imposed, they were unpopular and brief. An intense dislike to them had been inherited from England, where they traditionally connoted an independent revenue for the sovereigns to free them from popular control, and arbitrary interference with private business and persons by irresponsible officials, the raw state of trade and manufacture in this country made a general excise system very injurious; and the customs dues amply provided for the expenses.

The first occasion when they were resorted to was just after the adoption of the Constitution. The assumption of the State debts, and other expenses of the new government, compelled Hamilton to recommend an excise, though in the 'Federalist' and elsewhere he had strongly urged its impolicy; he was also anxious to test the power of the government to enforce taxation, which the Articles of Confederation could not. On 3 March 1791 a bill was passed taxing distilled spirits of domestic manufacture. In the then West (western Pennsylvania) the still was like the New England cider mill, but much more important, because the long distances and bad roads made corn unprofitable unless condensed into whiskey, hence there was open revolt, which had to be put down by national troops (1794). Direct resistance ceased, but the tax was largely evaded, and it was two years before it was extended to Kentucky and Tennessee, while the collections in North Carolina were poor. In 1794 the system was extended in fear of a war with England, but owing to unskilful choice of articles or provisions in detail, the only one which produced much was that on sugar, from the high import duty, which gave the home market to the domestic manufacturers, so that what went into excise came off customs. Stamp taxes were laid in 1797, but were of odious associations. With the election of Jefferson as President the whole system came under ban, the Democrats having always opposed it, and on 6 April 1802 the entire internal taxes were repealed, with nearly $700,000 outstanding and uncollected, and which remained so. The dislike was not to the taxes as such, but to the inquisitorial methods of collection involved; and this persisted. But the War of 1812 compelled a renewal of them: unfortunately they were laid so late that the war was over before they began to produce much. They were needed to pay off the war debts, however, and were retained till 23 Dec. 1817. Thence till the Civil War no internal tax of any kind was levied in the United States.

The first real "system" — for the others included but few articles — and which has become a standing part of our system of taxation, was inaugurated 1 July 1862, others followed, placing an enormous and very ill-distributed burden on the people, which they bore uncomplainingly for the end in view. It is almost too complimentary to call it a system, as it was an indiscriminate heaping of taxes upon every stage of every article, on labor and tools, raw materials and finished products, processes and professions. Articles paid sometimes a dozen taxes on the various stages, and another on the final one, before reaching even the wholesaler to begin a round of middlemen's profits. "The only principle recognized," says David A. Wells, 'if it can be called a principle, was akin to that at Donnybrook Fair, 'Wherever you see a head hit it.' "Wherever you find an article, a product, a trade, a profession, or a source of income, tax it!" Within the period 1861–7 no less than 25 revenue bills were passed by Congress. The incessant endeavor was to find new objects of taxation. The industrial effects of the sudden huge unequal burdens, and the political effects of the enormous revenue to spend at discretion, cannot be discussed here. The taxes did not begin to produce largely at once; in 1863 the receipts were $37,640,787.95; in 1864, $109,741,136.10; in 1865, $209,464,215.25; in 1866, the summit, $309,226,813.42. Then the items began to be stricken off, the total sinking by 1873 to $113,729,314.14; able business men have attributed part of the inflation, and consequent panic, to the sudden removal of burdens to which business had adjusted itself. The next year it touched bottom, $102,409,784.90. The taxes by this time had been reduced to about the present status, and tended to increase with the growth of the country, even rising somewhat through the bad years 1875–9. The income tax, though fairly productive — the height being $37,775,873 in 1870 — was dropped in 1872; no other tax was ever so unpopular, from its prying into private secrets, and its working through informers. It is also the one which bears hardest on the most heavily burdened class of the community, the moderately salaried men in various callings. Protection leaders have repeatedly urged or hinted at repeal of all internal taxes, to prevent any reduction of customs duties; but the moral feeling reinforces the economic sense of the people in insisting on liquors and tobacco being taxed. Attempts have been made to increase the revenue from liquors by raising the tax; but the result is the reverse, the premium on fraud being too great. In 1894 the income tax was re-established, but the Supreme Court decided it unconstitutional under its particular terms. On 1 July 1898, to provide for the expenses of the Spanish War, fresh internal taxes were laid; of which the most fertile were stamps on all mercantile papers, telegrams, etc., and on patent medicines, and wines, which yielded in the ensuing fiscal year $43,837,816.66. Special taxes on bankers and amusements, and some other things, yielded several millions. The total receipts in 1899 were $273,484,573.44. In 1901 and 1902 the new taxes were all abolished.

International Brotherhood of Maintenance-of-Way Employees, an American labor union, having a department of fraternal insurance. It was founded at Demopolis, Ala., in 1887, and had a membership in 1903 of 40,000. Since its organization the society has disbursed $500,000 in death and disability benefits. It has secured increased wages for maintenance-of-way employees to the amount of $6,000,000 annually. It was actively engaged in the great strike on the Canadian Pacific Railway in 1901. The strike was settled after a struggle lasting 11 weeks, with the understanding that all members of the brotherhood would be reinstated in their former positions within two weeks; the question of wages to be left to arbitration. Sir John A. Boyd, Chief Justice of Ontario, was chosen chairman of the Board of Arbitration and awarded the employees an increase of 20 per cent over previous wages. The brotherhood holds a charter of affiliation with the American Federation of Labor, and publishes the 'Advance Advocate,' a magazine devoted to the interests of maintenance-of-way employees. See RAILWAY LABOR ORGANIZATIONS.

International Councils of Women. See NATIONAL AND INTERNATIONAL COUNCILS OF WOMEN.

International Date Line, an imaginary line

Map of the world, showing the International date line.

drawn through the Pacific Ocean somewhat irregularly, but tending in a general northerly and southerly direction, and separating the islands of the Pacific Ocean in such a way that all those which lie to the east of it carry the same date as the United States, while all those on the west of it carry the same date as Japan and Australia. The nature of this line may be made clear by the following illustration: A traveler leaves New York city at noon on Sunday, and proceeds westward just as fast as the earth turns on its axis, so that he follows the sun in its apparent westward progress with such precision that he keeps it always directly south of him. It will be noon, therefore, at every place he passes. If, however, he asks the day of the week at every point of his journey, he will be told that it is Sunday at all points in the United States, and even as far west as Hawaii. This can not hold true indefinitely, however, because when he has gone entirely around the world, and has returned to New York, he will have been gone 24 hours, and will therefore be told that it is Monday noon. Everywhere in Europe, too, he would have been told that it is Monday noon.

Yet it has always been the same day to him, and there must have been some place on the journey where he was told, for the first time, that the day was Monday instead of Sunday. At this place, if he wishes to be in accord with the people that he meets, he must arbitrarily change the name of his day from Sunday to Monday. Mariners are in the habit of making the change upon crossing the 180th meridian from Greenwich, England; but this fact is of no service to us if we wish to compare the date carried on one of the Pacific Islands with the corresponding date (say) at New York, because the mariners pay no attention to the local dates on the islands that they pass. The ideal way to find out where the date actually does change would be to canvass the entire Pacific Ocean, so as to find out what date is actually in use on every one of its islands at some given instant. A line drawn from pole to pole in such a manner as to keep all islands bearing one date on one side and all islands bearing the other date on the other side, would afford a perfectly definite basis for the comparison of dates, and would be the true "International Date Line."

No such canvass has yet been made. As a general rule, it may be said that the date now in use upon most of the different islands or groups, is the date which results from the one carried there by the first European or American colonists; and this date will presumably be different according as the colonists came from the east or the west. This is not true universally, however, because arbitrary changes in the date are known to have been made in a number of cases. For example, Alaska was first colonized by the Russians, who brought with them the Russian date. When the American settlers moved there, they carried with them the date of the United States, and this led to some considerable confusion, the Sunday of the Americans being the Monday of the Russians, in spite of the fact that the Russians still use the Julian calendar. In 1867, when Alaska was purchased from Russia, the date in use there was made to conform to that used in the United States. Again, the Philippines were discovered by Magellan, in 1521, and Manila was founded by Lagaspi in 1571. Magellan brought his date from the east, and after the islands were colonized they kept the same date as the Spanish possessions on the opposite side of the Pacific; and they therefore carried a different date from that prevailing on the neighboring Asiatic coast. This was changed in 1844, by the omission of the 31st day of December in that year from the Philippine calendar; this change bringing the date in use in the Philippines into harmony with that prevailing at Hong Kong and other Asiatic ports. The best data at present available indicates that the date line follows substantially the course shown upon the accompanying map.

which is prepared from data furnished by the United States Naval Observatory. This date line is subject to modification, as our knowledge of the dates carried on the various Pacific Islands increases.

International Law. International law as embodied in the practice of states begins with the Peace of Westphalia (1648), which gave rise to modern international society. International law as a branch of jurisprudence begins with the publication in 1625 of the epoch-making treatise of Hugo Grotius entitled 'The Laws of War and Peace' (*De Jure Belli ac Pacis*), although the earlier works of Albericus Gentilis entitled 'De Legationibus' (1585) and 'De Jure Belli' (1588–9, enlarged ed. 1598) were important contributions to the subject, and furnished Grotius with the pattern for a portion of his great book. After the Peace of Westphalia the teachings of Grotius made rapid conquest, and in 1661 the first chair of the law of nations was founded at Heidelberg, with Samuel Pufendorf as the first incumbent. He afterward became professor of jurisprudence at Lund, in Sweden, and while there published his work entitled 'De Jure Naturæ et Gentium' (1672). During the 18th century the publications of Bynkershoek, Wolff, Vattel, Moser, and de Martens contributed to advance and popularize the subject in the schools and among statesmen and military leaders. The work of Vattel in particular became deservedly popular for its practical value as embodying the law of nations as it then was (1758): it has been translated into most of the languages of Europe, and is still frequently referred to and cited. The first half of the 19th century made numerous additions to the list of authoritative writers, among whom may be especially named Henry Wheaton in the United States and Robert Phillimore in England. Of more recent writers the works of Bluntschli, Heffter, Calvo, Pradier-Fodéré, Hall, Lawrence, and Taylor are especially worthy of mention. David Dudley Field drafted an 'Outline of an International Code,' which is interesting as an attempt to codify the whole field of international law.

The term "Law of Nations" was formerly used to denote the body of doctrines governing the relations of independent states or sovereignties. The modern term "International Law" was first coined by Jeremy Bentham, in 1780, and is now everywhere adopted; it has been extended to include both public international law and private international law, but is here employed only in the first and more accurate sense. The phrase "conflict of laws" is better adapted than "private international law" to describe the doubts that may arise in a local court as to whether, in a case involving private rights, the local, territorial law should govern or a foreign, exterritorial law should be applied.

International law consists of that body of rules by which states are habitually controlled in their relations with one another, and by which arbitrators are controlled when authorized to determine international disputes. While it has not all the sanctions of municipal law, it is, as one writer has well said, binding on states in their international relations with a force comparable in nature and degree to that binding the conscientious person to obey the laws of his country, and it is also enforceable by appropriate means in case of infringement. These means are diplomatic negotiations, arbitration, withdrawal of diplomatic relations, so-called pacific blockade, seizure of property, and actual war. In addition, some parts of international law are enforced in the courts. The Supreme Court of the United States has recently said: "International law is a part of our law, and must be administered by the courts of justice of appropriate jurisdictions, as often as questions of right depending upon it are duly presented for their determination. For this purpose, where there is no treaty, and no controlling executive or legislative act or judicial decision, resort must be had to the customs and usages of civilized nations; and, as evidence of these, to the works of jurists and commentators, who, by years of labor, research, and experience, have made themselves peculiarly well acquainted with the subjects of which they treat. Such works are resorted to by judicial tribunals, not for the speculations of their authors concerning what the law ought to be, but for trustworthy evidence of what the law really is." (Paquete Habana v. United States, 175 U. S., 677.)

Owing to the absence of a common superior or sovereign to declare or to enforce the rules of international law, a school of jurists, led by John Austin, and known as the analytical school, has denied that it is law at all and has relegated the system to the domain of international morality. The historical school of jurists, of whom Savigny and Sir Henry Maine are brilliant exponents, has combated this view and has made clear that there have been and still are systems of municipal law in which it cannot be said that there is either a sovereign or a sanction, and that international law corresponds to all systems of law at some stage of their development and to certain archaic survivals still to be observed among primitive peoples. English legal thought has been profoundly influenced by the Austinian conception of law, but on the Continent, and even among English and American jurists of to-day, the historical conception is generally accepted. With the assertion of the primacy of certain great powers and with the establishment of an international tribunal, international law is tending toward an analogue of the common superior and the definite sanctions that now characterize municipal law in the more highly civilized states. There are those who now dream of an authoritative international legislative body, compulsory arbitration, and the enforcement of arbital decrees; but it is doubtful whether these indicia of municipal law are adapted to the peculiar conditions of international relations. It is probable that the same ends will be worked out by international conferences and conventions, and by voluntary arbitration compelled and enforced by enlightened public opinion.

The early publicists sought the basis of international law in the so-called "law of nature," or those principles of justice in which the speculative philosopher affects to see an abstract body of doctrine written in the very nature of man and of society. But the law of nature of the international jurist rested upon a firmer basis than the concepts of speculative philosophy. The 'Jus Gentium' (Law of the Peoples) of the Roman jurists was "the sum of the common ingredients of the customs of the old Italian tribes." It was upon this storehouse of determined and common customs that Grotius and his successors drew for the definite and practical rules of international law, and added them to such customs of modern states as were generally accepted and acted upon in international affairs. Thus arose the law of nations which, under the influence of the revival of Greek thought and speculation, was philosophized into the law of nature. Modern international law has escaped from the domination of speculative philosophy and now speaks in the language of the practical jurist; it is regarded as a branch of jurisprudence and the business of lawyers rather than a branch of philosophy and the concern of schoolmen.

International law rests, then, upon custom, and in this respect differs not at all from municipal law. In the last analysis the practices of states is the authoritative test. As evidence of such practices resort is had to the decisions of courts upon points that may be brought before them for determination, to the decisions of international tribunes to which questions have been referred for arbitration, to treaties and conventions of general application, to the writings of jurists, and to the arguments of statesmen in diplomatic correspondence and state papers. In comparatively recent times there have been negotiated numerous international conventions which correspond to legislative acts and put into definite form the rules to be observed. These sometimes codify the customary law, sometimes change it, and sometimes add to it. Among such great international documents may be named the Declaration of Paris (1856), the Geneva Red Cross Convention (1864), the Declaration of St. Petersburg (1868), the Convention for the Protection of Industrial Property (1883), the Convention for the Protection of Submarine Cables (1884), the Convention for the Repression of the Slave Trade (1890), the Universal Postal Convention (1891), The Hague Convention for the Pacific Settlement of International Disputes (1899), The Hague Convention with respect to the Laws and Customs of War (1899), The Hague Convention to extend to Maritime Warfare the provisions of the Geneva Red Cross Convention (1899). This growing body of international conventions indicates the method by which, in the future, international law may be expected to progress. The common law of international law is not likely to expand beyond its present content; it has either been settled by concurrent custom or its disputed problems have given rise to conflicting schools. It remains for states by international agreement to codify, to reconcile, and to extend the doctrines of the customary law.

Independent, sovereign states are the parties to international law. States whose external sovereignty has been wholly yielded up, as is often the case with members of a confederation or union, cease to have any independent international status. States whose external sovereignty has been limited, but not wholly extinguished, have an international status subject to the limitation imposed, as for example Bulgaria or Cuba. Certain states, like Belgium and Switzerland, have been neutralized, and while still parties to international law are forbidden to engage in offensive warfare. Any limitation upon freedom of international action tends to reduce the state so restricted below the normal status of the parties to international law.

Of the independent, sovereign states only those whose municipal law is essentially similar to that originating in Europe can be said to enjoy to the fullest extent the rights and privileges of international law. With states whose law is of non-European origin, the European and American states have insisted upon treaties under which they exercise through their consular courts an exterritorial jurisdiction inconsistent with the full international equality of such states. Outside of Europe and America only Japan can be said to enjoy full international equality. In Europe the position of Turkey is anomalous. While admitted by the Treaty of Paris (1856) to participate in the advantages of the public law and system of Europe, the powers still maintain there consular courts with exterritorial jurisdiction, as they do in most Asiatic and African states. On the other hand, such exterritorial jurisdiction has been abandoned in Japan, whose municipal law is now modeled upon that of Europe. While other states like China and the Asiatic and African Moslem states, are dealt with in general upon the principles of international law, and are expected to observe the obligations imposed by it and are entitled to its privileges, there is a specific reservation as to some parts of the system, and an underlying, though often unrecognized, difference in the whole spirit of their international relations.

Theoretically the principles of international law rest upon the postulates of the independence and the equality of the states that are parties to it. Practically six states in Europe, one in America, and one in Asia are dominant, and can, and often do, impress their will upon the other states within the sphere of their influence. Great Britain, Germany, France, Russia, Austria-Hungary, and Italy constitute the concert of Europe and settle or leave unsettled questions of European law and politics. The United States occupies the same dominant position in America and has the final voice in the settlement of American questions. Japan has very recently assumed the same dominant position in Asiatic affairs, but it is yet too early to predict how potent or lasting her influence will be in that quarter. While international law may be said to have well defined principles throughout the greater part of its field of action, the play and counterplay of international politics, as practiced by these eight powers, must continue profoundly to influence its application in specific cases of general importance and to determine its progress through international conferences and conventions.

The normal relation of states is that which exists when they are at peace with one another. An abnormal relation is created when two or more of them engage in war, so far at least as their relation to each other and to the neutral states is concerned. If we assume a war to be going on between State A and State B, the normal relation continues among all other states, but the relation of State A to State B is governed by the laws of war, while the relation of each to all other states is affected by the laws of belligerency and of neutrality. There are, then, three situations: the relation of peaceful states to each other; the relation of enemy states to each other; and the relation of belligerent states to peaceful states. Each has its own special code of laws.

Peaceful Relations.—States in times of peace sustain toward each other a relation similar to that of well-disposed citizens in civilized societies. Each possesses and enjoys its own rights with a due regard to the corresponding rights of others. These rights if infringed call for appropriate remedies, the gravest of which is that of self-help or self-defense. Modern states tend more and more to the avoidance of this ultimate form of redress, and the past century, and particularly the past quarter-century, has shown an increasing resort to peaceful arbitration when diplomatic negotiations have proved ineffective. The establishment in 1899 of a permanent arbitration tribunal at The Hague marks a decisive victory for the principle of arbitration. See HAGUE CONFERENCE.

A state may be said to possess these fundamental rights: to preserve its independence and integrity; to determine its own form of government; to acquire and dispose of territory; to protect itself and its citizens or subjects from unjust aggression; to exercise jurisdiction over persons and property within its territory, unless they be exempted by law or by treaty; to exercise jurisdiction over its public and private vessels on the high seas; to exercise jurisdiction over its public vessels, over its legations, and over persons connected with its public vessels and legations, even within the territory of another state. A visiting sovereign or head of a state is also exempt from local jurisdiction.

Some of these rights may be limited by treaty, as in the case of the consular jurisdiction exercised in Oriental states, or by the doctrines of intervention as illustrated by the action of the concert of Europe in numerous cases involving the balance of power or of the United States in cases involving the Monroe Doctrine (q.v.). Especially has the right to acquire or dispose of territory been limited by considerations of international politics.

Intervention is a doctrine of vague limits. Although usually based upon the asserted right of self-preservation, it has been justified upon the grounds of humanity, as in the case of the intervention of the powers in behalf of Greece in 1827 and of the United States in behalf of Cuba in 1898. In such instances it is a moral rather than a legal right, and has been aptly described as "a high act of policy above and beyond the domain of law." The Monroe Doctrine has as one of its purposes the prevention of European intervention in the affairs of the independent American states. On the other hand, the United States has as a fundamental maxim of its diplomacy that of non-intervention in the political affairs of Europe.

The territorial jurisdiction of a state extends to three miles of open sea adjoining its coast. This limit was fixed when that was approximately the distance that could be defended from the shore. With the increase in the range of guns, a proposition to extend the limit to six miles, or even more has been advanced, but has not been acted upon. Such a change in the law could now be made only by a general international agreement. Bays and gulfs not more than six miles wide from headland to headland are within the jurisdiction of the state owning the shores, and some whose mouths are wider than this are conceded to be within the jurisdiction of the local state, especially where the indentation is deep, as in the case of Chesapeake and Delaware bays. Straits not more than six miles wide are within the jurisdiction of the state or states owning the shores; but if they connect waters open to free navigation other states are entitled to navigate them subject to reasonable regulations. The three-mile territorial waters are also free for the innocent navigation of other states, but not for fishing or for naval warfare. Interoceanic canals are regulated by treaty. The Suez Canal is regulated by the treaty of 1888, signed by the six great powers and by the local power, Turkey; the Panama or other possible isthmian canal is regulated by the Hay-Pauncefote treaty of 1901; both are by treaty to be open in time of war or peace to every vessel, public or private, without distinction of flag. River navigation is now, as to all the great rivers flowing through two or more states, also regulated by treaty; prior to such treaties many disputes arose as to the right of an upper riverian state to navigate through the territory of the lower owner to the sea.

Exterritoriality is the name applied to the exercise by one state of jurisdiction within the limits of another state. It extends to visiting sovereigns, diplomatic agents and their families and suites, and visiting public vessels. It is also by The Hague Convention extended to the judges of an arbitration tribunal organized under that convention. Consuls do not enjoy the privilege unless by treaty. In Oriental countries the citizens and subjects of European and American states are by treaty generally subject to the jurisdiction of their own consular courts. In all the above cases the persons concerned are exempt from all local judisriction both civil and criminal. Moreover, local process will not run upon the deck of a visiting public vessel nor within the gates of an embassy or legation. This gives rise to the right of asylum by which political offenders often escape, especially in South American and Oriental countries, by taking refuge in a legation or on board a public vessel. This is a right which is guardedly exercised and is, or should be, never extended to ordinary criminals.

Extradition is the delivery up by one country of criminals who flee to its territory from another. It is regulated by treaty; no state is bound, except under treaty stipulations, to deliver up criminal refugees, and it is doubted whether any constitutional power is lodged anywhere in the United States to do so except under a duly ratified treaty. Political offenders are not subject to extradition.

A state has jurisdiction over aliens within its borders, except those representing another state. It may exclude aliens, and if it admits them it may fix the conditions of such admission. When admitted they are subject to the local laws, except, perhaps, that they cannot be compelled to render military service. But if a state deals unjustly with an alien, or fails to use due diligence to protect him, the state to which he owes allegiance may seek or compel redress.

If a subject of one state is naturalized in another state, a question of double allegiance may be raised. Formerly European states asserted the doctrine of indelible allegiance and did not recognize that a subject could expatriate himself without the consent of the parent state. This seems to have been the common law and is so announced by American writers and judges. But Congress, in 1868, passed an act declaring expatriation to be a natural and inherent right and that any order or decision to the contrary by any officer is inconsistent with the fundamental principles of government. Great Britain in 1870 enacted that any subject who becomes naturalized in a foreign state shall be deemed to have ceased to be a British subject. The United States has treaties with some governments fixing the status of its naturalized citizens. Where there are no such treaties the matter often becomes a delicate and difficult one in case the naturalized citizen returns to his parent state and military service, or some other obligation of citizenship, is there demanded of him.

The high seas are free to all and no state can claim any exclusive jurisdiction in them. The struggle for the establishment of this principle has been a long and difficult one, but with the Bering Sea arbitration of 1893 it may be said to have ended, when the claim of the United States to a property right in fur seal beyond the three-mile limit was decisively rejected. Vessels on the high seas are free from interference in time of peace unless suspected of piracy or slave-trading. Piracy is justiciable everywhere. Slave-trading is not piracy and vessels engaged in it cannot lawfully be visited, searched, or seized by vessels of other nations unless such right be given by treaty. The international convention for the repression of the slave-trade gives such a right within a specified zone adjacent to the coasts of Africa. All neutral merchant vessels are liable to visit and search in time of war by a public vessel of either belligerent. If carrying contraband of war or intending to run a blockade, a neutral merchantman is liable to seizure and detention until a prize court has determined the validity of the capture and whether the vessel or any part of its cargo is subject to condemnation as prize of war.

Relation of Belligerents to Each Other.— War suspends all civil intercourse between states. Formerly the subjects of enemy states were regarded as enemies, but this doctrine is now confined to rendering illegal all contracts and commerce requiring any communication across the lines of hostilities. But a subject of one belligerent residing in the territory of the other is permitted to remain and to carry on business there so long as this does not embarrass the state of his domicile with reference to his protection or the conduct of hostilities. If required to depart or if desirous of doing so, the alien enemy is given a reasonable time in which to withdraw himself and his family and property. The last instance of the forcible detention of alien enemies who were non-combatants was the exercise of this now obsolete right by Napoleon against resident subjects of Great Britain in 1803.

War suspends all executory treaties between the belligerents except those negotiated with a view to hostilities. At the close of the war executed treaties or those of a permanent nature remain undisturbed, but those of a transient nature and subject to change or extinction do not revive unless by express stipulation.

The laws governing armed hostilities on land have been the subject of much codification. The first was that of Professor Lieber, prepared for the American Civil War and adopted in 1863 for the government of the armies of the United States. In 1874 an international European conference at Brussels framed and recommended a code for general adoption, but its work was not ratified. In 1880 the Institute of International Law recommended one prepared by M. Moynier In 1899 The Hague Conference adopted and recommended one based largely on the Brussels code, and this has been ratified by the United States and many other powers. The United States in 1900 promulgated a Naval War Code for the guidance of its naval officers and forces. No international naval code has yet been framed.

Modern warfare seeks to distinguish between combatants and non-combatants, and to give every possible immunity to the latter, while providing for the humane treatment of the former. To this end the laws of war define combatants, provide against unnecessarily cruel weapons or missiles, against the refusal of quarter, and for the proper care of prisoners and of the sick and wounded. The Geneva Red Cross Convention neutralizes hospitals, surgeons, and nurses in land warfare, and The Hague Convention extends the principle to naval hospital ships and their attendants. Non-combatants who refrain from all participation in the war are free from molestation, although when a territory is occupied by the enemy they are required to give a temporary war-allegiance to the conqueror. Non-combatants engaging in hostilities are liable to punishment.

Save in the case of a levy *en masse* to resist invasion, persons in order to be regarded as combatants and entitled to privileges as such, must be commanded by a responsible officer, wear a fixed distinctive emblem recognizable at a distance, carry arms openly, and conduct their operations in accordance with the laws and customs of war.

All weapons are forbidden which cause needless suffering. By the Declaration of Saint Petersburg (1868) no projectile of less weight than 400 grams that is explosive or is charged with fulminating or inflammable substances may be used. By a declaration of The Hague Conference (1899) the launching of projectiles or explosives from balloons was forbidden for five years, but this has now expired by time limitation. The Hague Conference also declared against projectiles the object of which is the diffusion of asphyxiating gases and against bullets which expand or flatten easily in the human body, but the United States delegates did not assent to these propositions.

It is forbidden to use poison, to kill treacherously, to refuse quarter, to make improper use of a flag of truce or a Red Cross badge or ensign, to bombard undefended towns, or to pillage a captured place. The United States Naval Code forbids the use of false colors, though such a deceit has been deemed to be allowable under the older practices.

Private property on the land is now regarded as exempt from capture except in case of military necessity. Pillaging and freebooting are strictly prohibited. Requisitions may be levied for the support of an invading army with a due regard to the resources of the country. It has been found difficult to reconcile the doctrine of the inviolability of private property with the right to levy contributions, and no satisfactory rules have yet been framed to limit the exercise of this right.

Naval warfare has partaken more of the character of freebooting than modern land warfare. Private property is liable to capture. Privateering was long permitted, and is now theoretically admissible unless the belligerents have by treaty agreed to forego it. The Declaration of Paris (1856), assented to by most civilized nations, forbids it. The United States is not a party to this, but in two wars in which it has been engaged since the declaration was issued, it has observed it. Mr. Marcy, secretary of state, offered to assent to it provided the declaration was amended to read. "Privateering is and remains abolished, and the private property of the subjects or citizens of a belligerent on the high seas shall be exempt from seizure by public armed vessels of the other belligerent, except it be contraband." This was not assented to by the other powers. Since that time the United States has frequently sought to secure such an exemption of private property from capture, but as yet without success. All private and public vessels and property of the enemy are liable to capture except hospital ships, coast fishing craft, vessels on voyages of science or discovery, and property devoted to science, education, religion, and art. It is usual to exempt also vessels on voyage to or from a port of the captor at the outbreak of the war and to permit those in its ports a reasonable time to depart. All enemy merchandise in an enemy vessel is liable to capture, but the Declaration of Paris exempts enemy goods in a neutral vessel and neutral goods in an enemy vessel except contraband of war.

Vessels and cargoes captured during the war are taken into a prize court for adjudication. But if the captor cannot spare a prize crew, or there is danger of recapture, they may be sold or destroyed if clearly enemy property, and the papers and other testimony sent to the prize court in order that a judicial decree may be entered. Title to captured property changes only by decree of a competent court. The personnel of a captured merchant vessel of the enemy may be detained as prisoners of war, or as witnesses, or they may be released. Passengers are released at the first convenient port.

Relation of Belligerents and Neutrals.— The doctrines of neutrality have received their chief application since the foundation of the American Republic, and foreign writers give to the early statesmen of that Republic the credit of having done most to ascertain and establish the sound principles upon which neutrals should act toward belligerents. Jefferson summed up the whole matter in one of his felicitous phrases: "It is the right of every nation to prohibit acts of sovereignty from being exercised by any other within its limits. It is the duty of a neutral nation to prohibit such as would injure one of the warring powers." The conduct of M. Genet, the French minister, in using our ports as a base of naval operations in 1793 and in setting up prize courts in them, called for the rigorous application of the doctrines of neutrality, and led to that attitude on the part of our government which has elicited the admiration of all publicists. In 1794 Congress passed an act forbidding American citizens to enlist in the service of a foreign state at war with another state with which the United States is at peace and prohibiting the fitting out of ships of war or armed expeditions within the territory of the United States. This and its amendments were consolidated into the Foreign Enlistment Act of 1818, and the latter has served as a model for similar legislation by other states.

On the one hand each belligerent must observe the inviolability of neutral territory and territorial waters, and on the other the neutral must observe a strict neutrality and impartiality in its attitude toward both belligerents. It may admit their war vessels to its ports, but must so regulate the length of the visit and the amount and nature of supplies as to preserve its neutral duties. The usual rule is a visit of 24 hours, or, if a vessel of the other belligerent is in the same port, 24 hours after the latter has departed. The supplies furnished must be only sufficient to take the vessel to the nearest home port and are not to be again furnished within three months. It cannot be said that the letter of these rules is universally accepted, but the principle involved in them is admitted. An international agreement may be necessary to define them with precision.

To permit a ship of war to be built and equipped by one belligerent in a neutral port is a breach of neutrality. This was so adjudged by the Geneva Arbitration Tribunal in the case of the Alabama, Florida, and Shenandoah, which were built or adapted in England by order of the Confederate government during the American Civil War, and their equipment sent out from England in transports. It has been contended that a ship of war is a legitimate article of commerce, as much so as guns, ammunition, and the like, and that it is merely contraband of war; but the distinctions are marked enough to lead to the rule that neutral states must use due diligence to prevent the fitting out, arming or equipping of such vessels within its jurisdiction.

A neutral state is not bound to prevent its citizens from engaging in contraband commerce with the belligerents; but they do so at the risk that the contraband articles may be captured and condemned. Non-contraband commerce between a neutral state and a belligerent state cannot be interfered with, except by the establishment of an effective blockade.

The right of a belligerent to cut submarine cables has been much discussed of late. Those between belligerent points may be cut anywhere, but it is contended that those between a belligerent and a neutral point can be cut only in belligerent territory, and that those between neutral points cannot be cut at all. This is the provision of the United States Naval Code, but it is likely that an international agreement may be necessary to secure uniformity of action.

Relation of Neutral Individuals to the Belligerents.— Citizens of a neutral state may engage in commerce with either belligerent, subject to the right of the other belligerent to capture neutral vessels carrying contraband of war or intending to run a blockade. But neutral citizens who render belligerent or unneutral service, such as carrying military dispatches, military officers or forces, transmitting signals, and the like, may be treated as quasi-belligerents and their vessels and property may be confiscated. When Messrs. Mason and Slidell, agents of the Confederate government, were taken from the British steamer Trent on a voyage between Havana and England, the British government contended that the act was unwarranted. The United States government, while contending that the agents might lawfully be captured, admitted that in case of capture the vessel must be taken to a prize court and the legality of the capture judicially determined, and as this was not done, released the captives. The penalty for unneutral service is the confiscation of the vessel engaged in it. It is usually stated that neutral mail vessels may be searched for belligerent dispatches, but this right is very cautiously exercised.

Contraband of war consists of goods having a belligerent destination and purpose. It is impossible to fix a definite list or a specific classification of articles deemed contraband. Some are clearly so because their sole purpose is for military operations. Some are clearly not so because their use is exclusively peaceful. Between these lie many important articles which may be used for military or for peaceful purposes, and these are classed as conditionally contraband. The United States Naval Code declares the following to be conditionally contraband: "Coal, when destined for a naval station, or a ship or ships of the enemy; materials for the construction of railways or telegraphs; and money, when such materials or money are destined for the enemy's forces; provisions, when actually destined for the enemy's military or naval forces." Such a list might be extended by including clothing, balloons, bicycles, barbed wire, or any other articles used in warfare and destined for a belligerent. A neutral vessel carrying contraband is liable to capture. If the vessel belongs to the owner of the contraband it also is condemned, but otherwise it is released and the contraband condemned.

The United States Supreme Court decided during the Civil War that contraband goods shipped from England to Nassau, W. I., but with the intent to tranship them there and send them into a Southern port were liable to capture. This is known as the doctrine of "continuous voyage," and has been condemned by some publicists who argue that the destination of the ship should be conclusive as to the destination of the goods. Great Britain seems to have acted upon the same principle, however, in the case of goods shipped to Delagoa Bay during the Boer War in South Africa

Neutral vessels destined for a blockaded port are liable to capture. Blockades in order to be binding must be effective, that is, they must be maintained by a force sufficient to render hazardous the ingress to or egress from a port. A neutral vessel must have notice of the blockade before being liable to capture. This may be given by a general notification to the government of the neutral; but if the vessel sailed before such general notification it is entitled to a special notification which is entered upon its ship papers. Neutral vessels in a port when it is blockaded are allowed a reasonable time to load and depart. The penalty for an attempt to run a blockade is confiscation of vessel and cargo. The officers and crew are not to be deemed prisoners of war but may be detained as witnesses for the hearing of the prize court.

When a vessel is captured it is the duty of the captor to take it into a convenient home port and deliver it into the custody of a prize court. In the United States the district courts are vested with admiralty jurisdiction. Any claimant may appear and contest the legality of the capture. If the vessel or cargo is condemned it is sold and the proceeds paid into the public treasury. Formerly the captors were by law entitled to a portion of the prize money, but by an act passed in 1899 Congress repealed this provision.

The right to capture contraband and to capture vessels bound for a blockaded port carries with it the right to visit and search neutral vessels. A neutral claim has been pressed in recent times to the effect that private merchant vessels under convoy of a public vessel of the same nationality are not subject to visit and search in case the commander of the public vessel certifies that the merchantmen have on board no contraband articles. While this is in some dispute, the United States Naval Code directs naval officers to accept such certificate. A neutral vessel is bound to submit to visit and search unless under convoy, and any attempt to escape or resist, or to destroy her papers or present fraudulent ones, renders her liable to capture. International Peace Conference. See HAGUE CONFERENCE.

International Workingmen's Association, an organization of the workingmen of all countries for the advancement of the interests of labor and the emancipation of the working classes. It grew out of a visit of French workingmen to the World's Exposition at London in 1862. In 1864 an organization was formed in London, and an 'Address and Provisional Rules' published; the rules provided for a general congress to be held annually and a central council appointed by that congress to sit in London; workingmen's societies were to join the International in their corporate capacity. The principles and policy were not then definitely announced; the first congress held at Geneva in 1866 passed resolutions favoring the limitation of the working day and the abolishing of child labor; at the next congress at Lausanne (1867) socialistic principles were first definitely announced; from this time the influence of Marx and his followers grew in the organization. In 1868 at the Brussels congress the International announced its opposition to war, and favored the general strike; at the Basel congress in 1869 Bakunin and the anarchists were admitted; but they were expelled from the association in 1872 at the congress at The Hague; this same congress transferred the seat of the General Council to New York. The anarchists held a separate congress at Geneva in 1873. In 1867 the International rendered substantial aid to the strike of the bronze workers in Paris, and the next year to the strike of the Geneva builders; it assisted the English workmen by preventing the importation of underpaid laborers from the Continent in time of strikes. The International was accused of complicity in the Paris Commune, and while the two had no official connection many of the leaders of the Commune were Internationalists, and its principles and aims were defended by the International. In the United States the Social Party, a socialist political organization, was affiliated with the International in 1868, and later some individual trades-unions were also affiliated; finally the North American Federation of the International was formed and held its first national congress in 1872; its organization was in local sections of at least ten members, with a Federal Council of nine elected by the annual congress. Shortly after the transfer of the General Council to New York the Internationalists took a prominent part in the eight-hour day demonstration in New York. The formal organization of the International was dissolved in 1875; in Europe the Social Democratic parties of the different countries grew out of it, and in the United States the Socialist-Labor party. The anarchist faction in the United States split into two organizations, the International Workingmen's Association and the International Working People's Association. The International was important in the history of the labor movement as being the first expression of the recognition of the common interests of labor in all countries, and as being the means of spreading widely the knowledge of the principles of the Marxian socialism. Consult: Ely, 'French and German Socialism,' and 'The Labor Movement in America'; Villetard, 'History of the International'; Zacher, 'The Red International.'

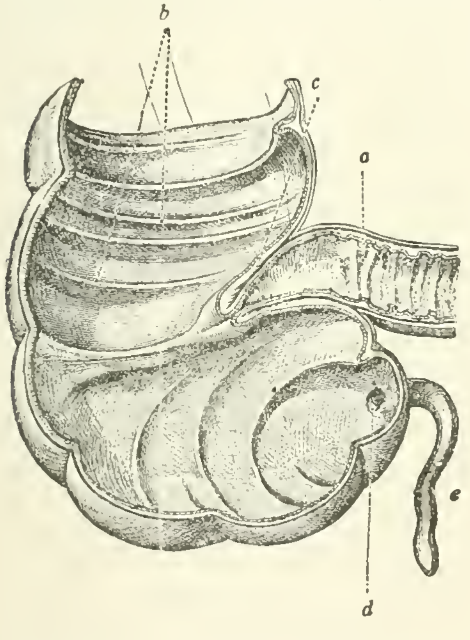
In terval, in music, is the distance or difference of pitch, arithmetically expressed, between any two tones of a given scale. Occidental nations, including America, employ the diatonic scale (see SCALE), an octave comprising five tones and seven semitones, named after the first seven letters of the alphabet. The affix of a flat or sharp before a note denotes its quality but does not affect its name, and the eighth note being in unison commences a new octave. Taking the scale in the key of C major, the various intervals are: minor second = E–F or B–C; grave major second = C–D, F–G, A–B; grave minor third = D–F; minor third = E–G, A–C, B–D; major third = C–E, F–A, or G–B; perfect fourth = C–F, D–G, E–A, G–C′, or B–E′; acute fourth = A–D′; acute augmented fourth = B–F′; grave diminished fifth = B–F′; grave fifth = D–A; perfect fifth = C–G, E–B, F–C′, G–D′, A–E′; minor sixth = E–C′, A–F′, B–G′; major sixth = C–A, D–B, G–E′; acute major sixth = F–D′; grave minor seventh = D–C′, G–F′, B–A′; minor seventh = E–D′, A–G′; seventh = C–B, F–E′; octave = C–C′, D–D′, etc. By taking various notes of the diatonic scale as starting points, and measuring known intervals from these, we arrive at intermediate notes of the scale, of which the following are examples: C♯ minor third below E; D♯ minor second below E; E♭ minor third above C; A♭ minor sixth above C; B♭ minor seventh above C; B♯3 major third above C. The difference of pitch between C and C♯ or between D and D♭ is called a semitone, and an interval increased or diminished by a semitone is said to be augmented or diminished. This applies especially to the interval of a fourth or a fifth, which with the octave are said to be perfect, because any augmentation or diminution mars their consonance. The major sixth or third may, however, be diminished to a "minor" sixth or third without destroying the consonance; and the term "minor" is also applied to the diminished second or seventh. Intervals confined within the octave are simple, when they exceed it compound; the octave beginning a new series, the ninth is the octave of the second, and so forth.

Intes'tacy, the legal state of a person dying without having disposed of his property by last will and testament. In Great Britain intestacy does not affect real estate, which is disposed of in accordance with the rule of descent. The effect of intestacy in Great Britain is merely that no directions have been left for the distribution of personal property. The effect of intestacy in the United States varies in accordance with the laws of inheritance fixed by each of them. Intestacy may be complete, as when a valid will is not left by the dead proprietor; or partial, when the extant will only provides for the distribution of part of the property. In these cases the property passes to the heirs or next of kin of the decedent in accordance with the laws of the place where the property is. See DESCENT; HEIR; INHERITANCE.

Intestine, Bowel, or Gut, the alimentary tube, in the higher animals limited to that portion between the stomach and the outlet at the anus. The human intestine is divided into the small and large intestine, the two parts varying in structure, movement, and function. The small intestine starts at the pylorus of the stomach, as the duodenum, and the first eight or ten inches are so distinguished. This portion is the widest and most deeply placed of the parts of the small intestine. About three or four inches below the pylorus the ducts of the gall-bladder and pancreas open conjointly into the bowel. The duodenum emerges from the cover of the peritoneum and becomes the jejunum. The remainder of the small intestine constitutes the jejunum (about two fifths) and the ileum. Between these divisions there is little difference, except that the jejunum is more freely movable, occupies the upper left portion of the abdomen more than the lower and right, and has thicker walls. The lumen of the small intestine gradually grows less from the duodenum, where it is two inches and a half in diameter, to little more than an inch where the ileum empties into the large intestine. The ileum is inserted several inches above the actual beginning of the large intestine, so that a blind pouch is formed below the point of juncture; this pouch, called the cæcum, gives off the appendix vermiformis (see APPENDICITIS) from its lower and back part. From the cæcum the large bowel passes up to the under surface of the liver as the ascending colon (see COLON), thence across the abdomen below the lower border of the stomach as the transverse colon, turns down to the iliac fossa as the descending colon, forms a peculiar S-shaped curve, the sigmoid flexure, which passes over the brim of the pelvis, where it is called the rectum (q.v.). The large bowel is about six feet in length. Both bowels have four coats, the mucous coat, the submucous, the muscular, and over most of the bowel an investment of peritoneum forming the serous coat. In the small intestine the mucous membrane is thrown up into permanent folds, each extending over half-way around the inside of the bowel. In this way a large surface is exposed for the absorption of food. Furthermore, the inner surface is covered with finger-like projections called villi, each having a large absorbing vessel in its centre. At the bases of the villi are tubular (of Lieberkuhn) and branching glands (of Brunner) that dip down into the mucous membrane. Scattered over the surface there are tiny collections of lymphoid tissue, called solitary follicles, and here and there collections of these follicles into groups one to three inches long, called Peyer's patches. It is these spots that are attacked and ulcerated in typhoid fever. The muscular coat consists in an inner layer running around the bowel and an outer longitudinal coat. The large bowel differs from the small in the absence of the folds and villi, and is but slightly movable within the abdomen, being bound down to the abdominal wall posteriorly by the peritoneum. (See PHYSIOLOGY.)



Section of the Ileum and Cæcum: *a*, ileum; *b*, cæcum; *c*, ileocæcal valve; *d*, opening of the appendix; *e*, appendix.

Diseases of the Intestine.— These may be disturbances of the function of the bowels without actual inflammation, or they may be inflammations in different parts and of different kinds; but with inflammations there is necessarily a disturbance of the various functions, and differentiation frequently becomes a matter of difficulty. Diarrhœa and constipation (qq.v.) are symptoms of many different conditions, as are also deficiencies of secretion and absorption. The nervous mechanism of the bowels may be changed, giving rise to abnormal sensations and disturbance of all the functions. True inflammation of the intestines is the most common cause of abnormal action, and therefore is described in detail.

Acute Intestinal Catarrh is an inflammation of the mucous membrane that varies much in its symptomatology with the part of the bowel affected and the causative agent. Among the causes may be mentioned the eating of tainted fruits and other foods; the overeating of any food; overdrinking, particularly of very cold liquids; the injestion of chemical or mechanical irritants; "catching cold"; and the poisons of the infectious diseases. The bowel is inhabited by numerous forms of micro-organisms, many of which are entirely harmless; but when any of the various agencies mentioned above affect the mucous membrane, the micro-organisms are able to attack the damaged surface. Many forms of bacteria produce particular types of disease when they find such lodgment, because they invade the system with their peculiar products. (See CHOLERA INFANTUM; CHOLERA; DYSENTERY.) But to the growth of bacteria must always be ascribed some of the symptoms in any intestinal catarrh. The attack usually starts in acutely with fever, general bodily discomfort, and abdominal pain. If the inflammation be confined to the upper part of the small intestine there may be constipation; but this is uncommon, and diarrhœa is the rule. Inflammation of the small intestine is spoken of as enteritis, but this is usually associated with more or less inflammation of the large bowel, called colitis (q.v.), although it may occur alone even in its last portion, the rectum. The pain in colitis is apt to be confined to the sides of the abdomen, and when the inflammation is low down there is constant desire to defecate, pain accompanying the act. Passage of mucus alone also indicates an inflammation low down in the rectum. The stools in acute intestinal catarrh vary much with the cause of the trouble; in some observed cases of dysentery the discharges are like rice-water. Treatment of these conditions depends upon the severity and location of the inflammation. The mild cases, with ordinary loose movements, recover without medication with abstinence from food for 24 hours. Castor-oil or small doses of calomel will cleanse the intestine of irritating substances. The more severe cases are kept in bed and allowed small amounts of milk after the first day, and are given small doses of castor-oil or mixtures of bismuth, opium, and other sedative drugs. If the large intestine is found to be involved, irrigation with common salt in water (teaspoonful to the quart) is valuable. Great care must be used in the selection of diet for some time.

Duodenitis occurs associated with acute gastritis (q.v.), and has the same symptoms, except for the presence of jaundice due to the closure of the bile-ducts. The disease runs its course ordinarily in a few weeks without any treatment except rest in bed for a few days, simple diet, and mild cathartics to relieve the constipation. *Chronic intestinal catarrh* results from a severe attack of acute inflammation in which the mucous membrane is left with permanent changes, or from repeated attacks of inflammation. Cases of chronic inflammation may occur without previous evidence of acute attacks. The symptoms vary much in kind and intensity, but pain, flatulence, and disturbance of the bowels are usually complained of. There may be pronounced constipation, alternating constipation and diarrhœa, daily unformed movements not distinctly diarrhœal, or, what is most common, a constant diarrhœa. More or less admixture of mucus in the stools is usually observed. Sooner or later there is apt to be a loss of flesh and strength. When the large bowel is much involved in such a process there is usually a coating of the stools with mucus, or the passage of clear mucus.

In the treatment it is best to rely mainly on carefully regulated life — exercise, baths, fresh air, sufficient rest, avoidance of exposure, and properly selected diet. In diet the objects sought are the regulation of the bowels and the avoidance of irritation. When there is diarrhœa it is wise to avoid fruits, salads, cabbage, coarse-fibred breads, sugars, honey, pastry, sour and sweet wines, and carbonic beverages. In cases attended with constipation most of these may be allowed, but sausages, rich dressings, cucumbers, cabbage, and very coarse-fibred breads should be forbidden. Mineral waters are frequently used with success, such springs as Carlsbad and Vichy for the diarrhœal cases, and such as Marienbad, Hathorn, and Congress for those attended with constipation. Chronic catarrh of the large bowel is treated with small doses of castor-oil and irrigations of the bowel with water, to which may be added antiseptics or astringents.

Intestinal Hemorrhage, or blood passed from the bowel, may be due to piles, tumors, dysentery, colitis, typhoid fever, tuberculosis of the intestinal tract, ulcers of the duodenum, portal obstruction as in cirrhosis of the liver, hæmophilia, purpura, and the hemorrhagic forms of the infectious diseases. When blood coming from the stomach or high up in the small intestine is passed by rectum it is changed to a tarry appearance. This is due to the action of the digestive juices and bacteria. The farther down the intestine the blood starts, the brighter red is it found when passed.

Intestinal Obstruction.— This is a term that includes a great variety of conditions in the abdomen having the common feature of obstruction to the passage of the contents along the bowel; and in addition there is in the acute condition some injury to the bowel resulting in special symptoms. Two varieties are differentiated, the acute and the chronic. Acute intestinal obstructions are caused by foreign bodies, gall-stones, and hardened or large collections of fæces in the canal; by contracting scars, or tumors of the wall, twists of the gut (volvulus), intussusceptions (invagination of a portion above into the part below); by adhesions of the peritoneum, causing constricting bands; and by strangulations of portions of the bowel contained in hernia. Besides these causes, from local or general peritonitis there is apt to be a condition of paralysis of a portion of the bowel, giving rise to the same state. The symptoms vary considerably with the cause of the obstruction and the part of the bowel affected, but in general the symptoms are pain — frequently of a colicky sort — constipation, inability to pass gas — with resulting tympanites — vomiting, first from the shock, and later from reversed peristalsis, until at length the vomitus is bilious and finally even fæcal. Because of these symptoms and the injury to the nerves of the intestine resulting in "shock," there is a gradually increasing prostration. Certain features indicating that the obstruction is in the small intestine are early vomiting, the passage of fæces from the lower bowel, and the greater swelling of the centre of the abdomen. Absolute constipation from the first is apt to mean an obstruction low down in the large bowel. The cause of the obstruction may be indicated by the presence of a tumor, or by something in the previous history. Intussusception is the most common cause of the obstruction in children; a tumor may be felt on the outside, or the bowel may be felt in the rectum. Fæcal impaction is indicated by a long history of constipation, and rectal examination shows the hardened masses. If intestinal obstruction be not relieved, the patient may die of shock, with gradual exhaustion, from gangrene of the bowel — the blood-supply being usually shut off — and sometimes from peritonitis.

Medical measures for the relief of most forms of the malady are not successful, and temporizing is attended with danger; but rest of the body as a whole, and especially of the intestinal tract, must be absolute. Some authorities advise the use of opium for further quieting the intestine when the diagnosis is certain. Lavage of the stomach is of great value, and large enemata may be curative when the cause of the trouble is intussusception, foreign body, or hardened fæces. Most forms of obstruction require the opening of the abdomen, search for the cause of the obstruction, and attempts at removal. Results depend on the quickness with which operation is undertaken; death may ensue, in spite of the removal of the obstruction, if interference be too long postponed. Chronic intestinal obstruction is caused by about the same conditions as the acute variety. The symptoms include various digestive disturbances, flatulency, constipation, and, when due to malignant growths, the general loss of flesh and strength.

Intestinal Parasites.— Three principal forms of these affect man — tapeworms, roundworms, and pinworms (qq.v.) The list of symptoms attributed to the presence of tapeworms in the human intestine is long and varied, but even loss of nutrition from such a parasite's presence is usually slight. Finding the worms or their eggs in the stools is the only convincing symptom. Treatment of this condition consists first in the preparation of the intestine by light diet for 24 hours before the tænifuge is given and six or eight hours before, allowing a liberal diet of onions, salty herring, and garlic; this rather loosens the worm's hold. Mild purgatives may also be given at this time. Early on the following morning the selected drug is taken, and this may be either male-fern, pomegranate, pumpkin-seed, kousso, or kamala. After about 12 hours a brisk cathartic is taken and the worm is passed. Careful search must be made for the head, for unless it is passed treatment must be started again while the worm is yet weak. Santonin and purgatives effect expulsion of roundworms. In the treatment of pinworms it is customary to take advantage of the fact that the females deposit their eggs in the large intestine and rectum. Santonin

and cathartics aid in gathering the worms where they may be killed by injections of benzine (20 drops to the pint of water), or by solutions of quinine, though further catharsis may be necessary. DUDLEY D. ROBERTS, M.D.,
Brooklyn, N. Y.

Inton'ing, the practice of delivering prayers in the recitative form. Intoning differs little from chanting: in the latter case the cadence is more developed, the divisions more rhythmical, and the music in continuous harmony. In intoning the greater part of the prayer is recited on one note, and then sung by several voices in unison, the closing words of the sentence being sung to the proximate notes of the scale and in harmony. The practice of intoning prevails in the Greek, Roman, Anglican, and Lutheran Churches.

Intoxica'tion (literally poisoning, commonly restricted to poisoning by means of alcohol, for a discussion of which latter see ALCOHOLISM). Intoxication in the sense of poisoning may result from poisons having their origin outside of the human body (exogenous poisoning), or from poisons which may be developed within the body itself (endogenous poisoning, or auto-intoxication). Some of the most important problems connected with the infectious diseases concern themselves with the study of the intoxications that result from the formation of toxins by specific bacteria distributed throughout the human body during the course of a disease. From the same point of view many of the most complicated intoxications result from variations in the normal metabolism of the body. Thus in diabetes mellitus (q.v.) there is developed an acid intoxication (diabetic coma), which is due to the inability of the body properly to neutralize by its alkaline salts the excessive amounts of acid produced as a result of the perverted metabolism of this disease. Similarly in Bright's disease a type of intoxication (uræmic poisoning) results from failure of the kidneys to eliminate poisonous products from the human body. It seems not unlikely that a number of diseases such as migraine (sick headache), some forms of epileptic convulsions, different types of skin-eruptions, and some of the mild insanities result from auto-intoxication (q.v.). See TOXICOLOGY.

Introduced Species. A long catalogue might be made of species of animals and plants which have been transferred by accident or design from their native country or locality to other regions. Sometimes, as in the case of salmon in New Zealand, rabbits in Australia, the European house-sparrow in America and elsewhere, or western fishes in eastern waters, this is done by design; but in the great majority of cases the introduction is accidental and unwelcome, as in the case of the hundred and more species of injurious insects brought into the United States from foreign lands (or the fewer sent abroad from here), and the very many species of «weeds» naturalized on our and other shores. Such introductions are in the main accidental, the eggs or seeds or grown individuals passing from one region to another in ships or railway trains, or cargoes or discharged ballast; so many plants have been introduced by the latter means that botanists class the group of alien weeds as «ballast plants.» See ACCLIMATIZATION; ZOOGEOGRAPHY.

Intuba'tion, the introduction of a tube into an orifice or an organ, as the larynx, to keep it open. Specially designed tubes for such a purpose are sometimes used in cases of croup, diphtheritic obstruction, etc., as a substitute for tracheotomy.

In'ulin, a substance resembling starch, but intermediate in nature between that body and the gums. It occurs in the roots of elecampane, dandelion, and certain other plants, and also in the Jerusalem artichoke and the common potato. When pure it is a tasteless white powder consisting of spherical particles. Its chemical formula is probably a multiple of $C_6H_{10}O_5$, though $C_{72}H_{124}O_{62}$ has been suggested. It is insoluble in alcohol, and but slightly soluble in cold water, although it is very hygroscopic. It dissolves freely in hot water. It melts at 320° F., becoming thereby converted into a different substance known as «pyro-inulin.» It is not fermentable, and does not reduce Fehling's solution. Iodine renders it brown or yellow.

Invariants and Covariants. 1. These terms were introduced, and are still ordinarily employed, in connection with a special mathematical theory, namely, the theory of the linear transformation of algebraic forms developed by Cayley and Sylvester during the middle third of the nineteenth century. The central idea, however, is a very general one, which has been applied in recent years to almost all branches of mathematics. It deserves, in fact, to be ranked with such fundamental concepts as function and group. We therefore divide our sketch into three parts as follows: (1) The general concept of invariant; (2) The theory of algebraic forms, or invariants in the narrow sense; (3) Other invariant theories.

THE GENERAL CONCEPT.

2. The suggestion for the formation of the concept comes from the familiar observation, at the bottom of all science and philosophy, that, while the world about us is in a continual state of change, there are yet certain aspects or properties which are unaltered. To find the permanent in the changing is the most general statement of the problem of invariants. Abstractly, the idea may be explained more definitely as follows: Consider a set of objects or elements O of any conceivable kind, finite or infinite in number; and a set of operations or transformations T, each of which interchanges the objects in a definite manner. Then a property of an object O is said to be *invariant*, provided it holds for all the objects obtained from the given O by the transformations T. Similarly, any relation between a number of O's which holds for the transformed O's is said to be an invariant relation, that is, an invariant relation of the given objects with respect to the given transformations.

The idea of *covariant* involves nothing essentially new. An object $\overline{O}$ is said to be a covariant of a given number of objects O_1, O_2, etc., provided $\overline{O}$ is invariantly related to O_1, O_2, ... In this case, if any one of the transformations T converts $\overline{O}$ into $\overline{O}'$, O_1 into O_1', O_2 into O_2', etc., then the relations connecting $\overline{O}'$ with O_1', O_2', etc., are the same as those connecting $\overline{O}$ with O_1, O_2, etc.

3. The idea is best illustrated by examples from geometry. Consider a number of points P_1, P_2, . . . , connected with a solid body. When the body is displaced, its points take new positions, P_1', P_2', ... Many such positions are possible, since the displacement may be made in an endless number of ways. But in every case, of course, the distance between P_1' and P_2' is the same as that between P_1 and P_2. That is, distances between points are invariant with respect to rigid displacement.

Suppose next that the solid carrying the points is not only displaced but is magnified (or diminished) according to any scale. (We may, for example, picture such a change as produced by subjecting the homogeneous solid to a higher or lower temperature.) The solid is then converted into one of different size but of the same shape, that is, a similar solid. Distances are changed in the same ratio. Hence $P_1'P_2' : P_2'P_3' = P_1P_2 : P_2P_3$. That is, the ratio of any two distances is invariant with respect to similitude transformations.

4. In both examples, points on a straight line are converted into points on a straight line. Collinearity is then a relation which is invariant with respect to displacements and similitude transformations. A more general type of transformation for which this is true is the homographic or projective transformation. We consider, for simplicity, only the case of figures drawn in a plane M. From a fixed point (termed the center of projection) outside of M draw lines to the various points of M until they intersect a second plane M'. Thus, every point P in M is associated with a definite point P' in M'. The operation of passing from a figure in M to the corresponding figure in M' is termed projection. Concretely, we may think of the center of projection as a source of light and the figure in M' as the shadow of that in M.*

If we consider three points P_1, P_2, P_3 on a straight line in M, they are converted, by projection, into points P_1', P_2', P_3' on a straight line in M'. But in general the distances and also the ratios of distances will differ. In fact, three points have no invariant, since they may be converted into three points at arbitrarily assigned distances by a suitable projection. If, however, we take four points (on a straight line) it may be shown that, for any projection,

$$\frac{P_1P_3}{P_3P_2} : \frac{P_1P_4}{P_4P_2} = \frac{P_1'P_3'}{P_3'P_2'} : \frac{P_1'P_4'}{P_4'P_2'}.$$

In each member of this equation we have a combination of the distances between four points which is termed their cross ratio (anharmonic ratio). Hence the cross ratio of four collinear points is invariant with respect to projective transformation.

5. Let the figures considered be all the ellipses of a plane. With respect to displacement an ellipse has two invariants, the major and the minor axis. With respect to similitude transformation, there is one invariant, the ratio of the axes, or what is essentially the same, the eccentricity. Finally, in the projective theory there are no invariants, since one ellipse may be converted into any other (and even into any proper conic).

In this connection we may illustrate the notion of a covariant. The center of an ellipse is a covariant with respect to displacement and magnification, but not with respect to projection. For if the plane containing an ellipse E and its center C is displaced or magnified, so that ellipse E is converted into another ellipse E' and the point C is converted into a point C', then C' is necessarily the center of E'; while under projection this is not the case. A similar result holds for the center of gravity of any figure, plane or solid.

6. Another well-known type of transformation is that known as inversion. Take a fixed circle F with center C and radius r, and suppose that any point P of the plane is converted into the point P' situated on the line CP, so that $CP \cdot CP' = r^2$. The points P, P' are then said to be inverse with respect to the circle F. By the inverse of a curve is meant the locus of the points inverse to the points of the curve. The collinear relation of points is no longer invariant, for a straight line (not passing through C) is converted into a circle. An arbitrary circle is converted into a circle, but the center of the circle is not a covariant point. The most important property of the transformation is this: the angle at which any two curves intersect is equal to the angle at which the inverse curves intersect. Angles are invariant with respect to geometric inversion.

7. We pass now to a few simple examples of the general definition in No. 2, in which the objects and transformations are analytic instead of geometric.

Let the objects O be functions of any number of variables, and let the operations T performed on these functions be the permutation of the variables involved. A function written down at random, for example $x^2 - 2yz$, changes its form when say x and y are interchanged. There are exceptional functions, like $x^2 + y^2 + z^2$ and $xy + yz + xz$, which are not altered by interchanging the variables in any way, and are termed symmetric. The symmetric functions are invariant with respect to permutation of the variables.

In the differential calculus it is shown that the exponential function e^x has the property of being its own derivative. The only functions which are invariant with respect to the process of differentiation are in fact those of the form ae^x, where a is a constant. It is obvious that if the first derivative is equal to the original function, all the higher derivatives will also be equal to the function.

The trigonometric functions have a period of 2π or $360°$. Such a function $f(x)$ is unaltered in value when x is replaced by $x + 2\pi$. It is obvious that the double application of the operation, that is, the replacing of x by $x + 4\pi$, will also leave $f(x)$ invariant. The periodic character thus involves the invariance of the function with respect to all the operations $(x, x + 2k\pi)$ (this denotes the replacing of x by $x + 2k\pi$), where k is any integer. We note here that if one of these operations, say that of adding $2k'\pi$ to the angle, is followed by another, say that of adding $2k''\pi$, the result is the same as the single operation of adding $2(k' + k'')\pi$, which is a member of the set. The set of operations thus possesses the essential property of a GROUP.

8. In general, if an invariant is found with respect to certain operations, T_1, T_2, . . . , the

* It is, however, necessary to include the ideal shadow formed by producing the rays away from M.

invariance also holds for all combinations of these operations. Adding these combinations to the original operations, a set is finally obtained with the group property; this is then termed the group generated by the given operations.

Thus, in connection with No. 6, since angles are unaltered by inversion with respect to any circle, it follows that they are unaltered by successive inversion with respect to a number of circles. The inversions themselves do not constitute a group; but the totality of combinations is the important group of circular transformations which are expressed analytically by the linear transformations of a complex variable and of its conjugate.

9. The general problem of the mathematical theory of invariants may now be restated as follows: Given any group of transformations, and any set of configurations (mathematical objects) which are converted into one another by these transformations, to find the properties of the configurations which remain unaltered. There are thus as many types of invariant theories as there are types of groups and types of configurations. The distinction according to groups is the more fundamental.

10. The relation between the concepts invariant and group is thus very intimate. Suppose that instead of assigning transformations and seeking invariants, the question is inverted: Given a property or a function, find the transformations which leave it invariant.

Thus, if space is to be deformed so as to leave the distance between every pair of points unaltered, the deformation must be simply a displacement. The totality of displacements forms a group; for if one displacement is followed by a second, the effect is the same as that due to a single displacement. In general the totality of transformations defined by one or more invariants is a group. Many groups are defined in this way.

11. In connection with any group this question may be asked: Given two configurations, is it possible to convert the one into the other by a transformation belonging to the assigned group? If this is the case, the configurations are said to be *equivalent* with respect to the group.

Thus, two figures are equivalent with respect to the displacement group when they are congruent; they are equivalent with respect to the similitude group when they are similar. The study of equivalence with respect to the projective group is the main object of projective geometry; its systematic analytic treatment depends upon the theory of algebraic forms considered below.

The importance of the notion of equivalence depends upon the fact that equivalent configurations necessarily have the same invariant functions and properties. Thus in studying the projective properties of (proper) conics, it is sufficient to consider the case of a circle. The circle may thus be taken as the *type* or *canonical form* of the class of conics.

The Theory of Algebraic Forms.

12. This part of modern algebra deals with the invariants of algebraic forms with respect to the group of linear transformations. It has been variously termed the theory of forms, the algebra of quantics, the algebra of linear transformations, the linear or projective invariant theory. Traces of the idea may be found in papers by Lagrange, Gauss, and Cauchy; and simple results on quadric forms were given by G. Boole (1841); but the construction of the systematic theory begins with the memoirs of A. Cayley (1845–) and J. J. Sylvester * (1851–). The recent developments are due mainly to German and Italian mathematicians.

13. The objects considered are algebraic forms. A *form* or *quantic* is a rational integral homogeneous function of any number of variables. Forms are classified according to the number of variables and the degree in which they are involved. A *binary* form involves two variables; a *ternary*, three; a *quaternary*, four; in the general case of p variables the adjective p-ary is employed. The degree in which the variables enter is termed the *order* of the form; we denote it in general by n. If n is one, the form is linear; if two, quadric (or quadratic); if three, cubic; if four, quartic (biquadratic); etc.

Thus the binary cubic form is

$$ax^3+bx^2y+cxy^2+dy^3,$$

where x, y are the variables and a, b, c, d the coefficients. It is usual, however, to distinguish the variables and the coefficients by subscripts, a notation which has the advantage of generality and symmetry; also binomial coefficients are introduced. Thus the above form is written

$$a_0x_1^{\,3}+3a_1x_1^{\,2}x_2+3a_2x_1x_2^{\,2}+a_3x_2^{\,3}.$$

The ternary quadric is

$$a_{11}x_1^{\,2}+a_{22}x_2^{\,2}+a_{33}x_3^{\,2}+2a_{23}x_2x_3+2a_{13}x_1x_3+2a_{12}x_1x_2.$$

The general binary form is

$$(1)\quad a_0x_1^{\,n}+\frac{n}{1}x_1^{\,n-1}x_2 +\frac{n(n-1)}{1\cdot 2}x_1^{\,n-2}x_2^{\,2}+\ldots+a_nx_2^{\,n}.$$

14. The group employed consists of the totality of linear transformations of the variables. A linear transformation from the original variables $x_1, x_2, \ldots x_p$ to the new variables $X_1, X_2, \ldots X_p$ is defined by p equations of the first degree, as follows:

$$\begin{aligned} x_1&=l_{11}X_1+l_{12}X_2+\ldots+l_{1p}X_p,\\ x_2&=l_{21}X_1+l_{22}X_2+\ldots+l_{2p}X_p,\\ &\ldots\ldots\ldots\ldots\\ x_p&=l_{p1}X_1+l_{p2}X_2+\ldots+l_{pp}X_p. \end{aligned}$$

The determinant

$$\Delta=|l_{ij}|,$$

whose elements are the p^2 coefficients in these equations, is termed the *modulus* of the transformation. It is assumed that Δ does not vanish; for in the latter case the X's cannot be expressed in terms of the x's, that is, the transformation is not reversible.

We shall deal mainly with binary variables and then employ the simpler notation

$$(2)\qquad x_1=l_1X_1+m_1X_2,\quad x_2=l_2X_1+m_2X_2.$$

The modulus is $\Delta=l_1m_2-l_2m_1$.

* Most of the technical terms employed (including invariant, covariant, form) are due to Sylvester, who gloried in the title of "The Mathematical Adam."

15. When a linear transformation is carried out on a form, the latter is converted into a form of the same order containing the new variables. The coefficients of this transformed quantic depend of course upon the transformation employed. Thus if in the quadric

$$f \equiv a_0x_1^2 + 2a_1x_1x_2 + a_2x_2^2$$

we make the substitution (2), the result is a new quadric,

$$F \equiv A_0X_1^2 + 2A_1X_1X_2 + A_2X_2^2,$$

where

$$A_0 = l_1^2a_0 + 2l_1l_2a_1 + l_2^2a_2,$$
$$A_1 = l_1m_1a_0 + (l_1m_2 + l_2m_1)a_1 + l_2m_2a_2,$$
$$A_2 = m_1^2a_0 + 2m_1m_2a_1 + m_2^2a_2.$$

It is easy to verify that

$$A_0A_2 - A_1^2 = (l_1m_2 - l_2m_1)^2(a_0a_2 - a_1^2).$$

According to the general definition in No. 2, the function $a_0a_2 - a_1^2$ is not an invariant function, since it is not equal to $A_0A_2 - A_1^2$; but the relation $a_0a_2 - a_1^2 = 0$ is invariant, since its fulfillment necessitates $A_0A_2 - A_1^2 = 0$. This is sometimes expressed by saying that the function is a *relative* invariant.

It is usual, however, to modify somewhat the general definition as follows: A function of the coefficients of a quantic is said to have the invariant property when it is equal to the same function of the coefficients of the transformed quantic, except for a factor depending only upon the coefficients of the linear transformation. Thus if $\phi(a)$ is such a function, where a denotes the coefficients collectively, and if A denotes the coefficients in the new form, then

$$(3) \qquad \phi(A) = M\phi(a),$$

where M depends only on the transformation coefficients.

All such functions can be expressed in terms of rational integral functions with the same property. These are termed simply invariants. Thus an *invariant* is a rational integral function of the coefficients with the property expressed by (3).

16. A *covariant* of a quantic differs from an invariant only in that it involves both the coefficients and the variables. Its defining property is expressed by

$$(3') \qquad \phi(A, X) = M\phi(a, x).$$

Thus the binary cubic

$$a_0x_1^3 + 3a_1x_1^2x_2 + 3a_2x_1x_2^2 + a_3x_2^3$$

has the covariant

$$(a_0a_2 - a_1^2)x_1^2 + (a_0a_3 - a_1a_2)x_1x_2 + (a_1a_3 - a_2^2)x_2^2;$$

for when the cubic is linearly transformed, it is found that the corresponding expression

$$(A_0A_2 - A_1^2)X_1^2 + (A_0A_3 - A_1A_2)X_1X_2 + (A_1A_3 - A_2^2)X_2^2,$$

built from the new coefficients and variables, reduces to the original expression multiplied by $(l_1m_2 - l_2m_1)^2$.

17. Invariants and covariants are collectively termed concomitants or, more simply, *comitants*. We give now a few of their important general properties.

A comitant is homogeneous in the coefficients (a) and in the variables (x). Its dimension in the former is termed its degree (d); its dimension in the latter, its order (m). For an invariant, of course, $m = 0$.

The factor M produced by the linear transformation is for every comitant an entire power of the modulus Δ. Hence

$$(4) \qquad \phi(A, X) = \Delta^w\phi(a, x).$$

The exponent w is termed the *weight* of the comitant.

The proof of the first theorem depends on the use of linear transformations of the special type $x_1 = \rho X_1$, $x_2 = \rho X_2$; that of the second theorem depends on the group property of linear transformations and the fact that Δ is not factorable.

18. The weight w, order m, and degree d of any comitant of a binary n-ic are connected by the relation

$$2w = nd - m.$$

This holds in the example given in No. 16, where $n = 3$, $m = 2$, $d = 2$, $w = 2$.

Taking $m = 0$ and n odd, we have the corollary: A binary form of odd order cannot have an invariant of odd degree.

When n is even, so is m. Hence a binary form of even order cannot have a covariant of odd order.

19. The preceding definitions and theorems may readily be extended to *simultaneous* comitants, that is, invariants and covariants of two or more forms.

20. An important process for the formation of simultaneous comitants depends on this principle: If in an invariant $\phi(a_0, a_1, \ldots a_n)$ of a single form f, we substitute $a_0 + \kappa b_0$ for a_0, $a_1 + \kappa b_1$ for a_1, etc., and expand the result according to powers of κ, the first term is the original invariant $\phi(a)$, the coefficient of κ^d is the corresponding invariant $\phi(b)$ of a form g with coefficients $b_0, b_1, \ldots b_n$, and the remaining coefficients are simultaneous invaraints of f and g.

For example, when this principle is applied to the invariant $a_0a_2 - a_1^2$ of a quadric $f = a_0x_1^2 + 2a_1x_1x_2 + a_2x_2^2$, we have

$$(a_0 + \kappa b_0)(a_2 + \kappa b_2) - (a_1 + \kappa b_1)^2$$
$$= a_0a_2 - a_1^2 + \kappa(a_0b_2 - 2a_1b_1 + a_2b_0) + \kappa^2(b_0b_2 - b_1^2).$$

It follows that $a_0b_2 - 2a_1b_1 + a_2b_0$ is a simultaneous invariant of f and $g = b_0x_1^2 + 2b_1x_1x_2 + b_2x_2^2$.

The coefficient of the first power of κ, by Taylor's theorem, is

$$b_0\frac{\partial\phi}{\partial a_0} + b_1\frac{\partial\phi}{\partial a_1} + \ldots + b_n\frac{\partial\phi}{\partial a_n}.$$

Hence if the operation $b_0\dfrac{\partial}{\partial a_0} + b_1\dfrac{\partial}{\partial a_1} + \ldots + b_n\dfrac{\partial}{\partial a_n}$ is applied to an invariant of a single form, the result is an invariant of two forms. The operation is known as the *Aronhold process*.

21. In the domain of simultaneous comitants the distinction between invariants and covariants may be said to disappear. All the covariants of a form f may be obtained from the simultaneous invariants of f and a linear

form $u_1x_1 + u_2x_2$ by the substitution of x_2 for u_1 and $-x_1$ for u_2.

22. *Geometric Interpretation.*—If a binary form f of nth order is equated to zero, the resulting equation, by the fundamental theorem of algebra, determines n values of the ratio $x_1 : x_2$. Taking $x_1 : x_2$ as homogeneous coordinates of a point on a straight line, we thus obtain a definite set of n points corresponding to the form f. Conversely, if a set of n points is given, the form f is determined (except for a numerical factor).

Linear transformation of x_1, x_2 has the same effect upon the points of the line as the projection of the given line upon a second followed by the displacement of the second line upon the first. Hence an invariant of f equated to zero represents a projective relation between the corresponding n points, that is, a relation not altered by the process of projection. Similarly, a covariant of order m represents a set of m points projectively related to points defined by f.

Thus, the vanishing of the invariant $a_0a_2 - a_1^2$ of a quadric form means that the two root points coincide. Again, the vanishing of $a_0b_2 - 2a_1b_1 + a_2b_0$, derived in No. 21, means that the pairs of points represented by the two quadrics are situated harmonically.

The interpretation often suggests the invariant character of complicated algebraic functions. For example, the *resultant* of two equations, $f = 0$, $g = 0$ (that is, the expression which vanishes when and only when the equations have a common root), is a simultaneous invariant of f and g. The condition that the equation $f = 0$ shall have equal roots leads to an invariant termed the *discriminant* of f.

23. *Absolute Invariants.*—By considering fractional instead of integral functions of the coefficients, it is possible to obtain *absolute invariants*, that is, functions which are unaltered by linear transformation. The factor M in (3) is then unity. An absolute invariant is necessarily the ratio of two (relative) invariants having the same weight. We give an example in connection with the form of fourth order. Here there are two invariants I and J with weights 3 and 2 respectively. Linear transformation affects them as follows: $I' = \Delta^3 I$, $J' = \Delta^2 J$. Hence $I'^3/J'^2 = I^3/J^2$. That is, I^3/J^2 is an absolute invariant.

Geometrically, every absolute invariant of any number of forms is expressible in terms of cross ratios of the corresponding points.

24. *The Symbolic Notation.*—The most powerful method for attacking the general problem of our subject, the determination of all the comitants of any number of forms and their interrelations, is the so-called *symbolic* method. The origin of the method is to be found in Cayley's hyperdeterminants (1845), but the symbolic notation itself is due to Aronhold (1859). The general theory was developed by Clebsch and Gordan (1870–).

A binary form of nth order is represented by the nth power of a linear form,

$$f = (\alpha_1 x_1 + \alpha_2 x_2)^n.$$

Here the α's are merely symbols which have a real meaning only in the combinations

$$\alpha_1^n = a_0,\ \alpha_1^{n-1}\alpha_2 = a_1,\ \alpha_1^{n-2}\alpha_2^2 = a_2,\ \dots,\ \alpha_2^n = a_n.$$

The Roman letters denote real coefficients and the Greek letters symbolic coefficients. The latter were termed *umbrae* (shadows of quantities) by Sylvester.

A combination of α's of dimension $< n$ has no real meaning. On the other hand, if the dimension is a multiple of n, there are several corresponding real quantities. Thus $\alpha_1^{2n-2}\alpha_2^2$ represents both a_0a_2 and a_1^2. This ambiguity is removed by introducing several equivalent sets of umbral quantities, each entering in precisely the nth dimension. We abbreviate by writing $\alpha_1x_1 + \alpha_2x_2 = \alpha_x$, $\beta_1x_1 + \beta_2x_2 = \beta_x$, etc. The given form is then

$$f = \alpha_x^n = \beta_x^n = \gamma_x^n, \text{ etc.}$$

The fundamental theorem is as follows: Every comitant of binary forms f is expressible symbolically as a combination of determinants of the type $(\alpha\beta) = \alpha_1\beta_2 - \alpha_2\beta_1$ and linear factors of the type $\alpha_x = \alpha_1x_1 + \alpha_2x_2$. In the case of invariants, only the determinants are involved. Conversely, all combinations of these two types (in which each set of symbols is involved in the proper dimension) represent comitants.*

Thus the quadric $f = \alpha_x^2 = \beta_x^2$ has the invariant $(\alpha\beta)^2$. Expanding, we have

$$(\alpha_1\beta_2 - \alpha_2\beta_1)^2 = \alpha_1^2\beta_2^2 - 2\alpha_1\alpha_2\beta_1\beta_2 + \alpha_2^2\beta_1^2$$
$$= a_0a_2 - 2a_1a_1 + a_2a_0,$$

which is simply twice the discriminant $a_0a_2 - a_1^2$.

25. *Transvectants.*—Among the comitants of two forms, $f = \alpha_x^n$, $g = \beta_x^m$ (here α and β are non-equivalent symbols), those represented by $(\alpha\beta)^\kappa \alpha_x^{n-\kappa}\beta_x^{m-\kappa}$ are of special importance, since they are of the first degree in each set of coefficients. They are termed the *transvectants* of f and g and are denoted by $(f, g)_\kappa$. Gordan has shown that all comitants may be derived by the repeated application of the process of transvection.

The first transvectant of two forms is termed their *Jacobian*; its non-symbolic value is $\dfrac{\partial f}{\partial x_1}\dfrac{\partial g}{\partial x_2} - \dfrac{\partial f}{\partial x_2}\dfrac{\partial g}{\partial x_1}$. The transvectant $(f, f)_2$ is termed the *Hessian* of f; its non-symbolic value is $\dfrac{\partial^2 f}{\partial x_1^2}\dfrac{\partial^2 f}{\partial x_2^2} - \left(\dfrac{\partial^2 f}{\partial x_1 \partial x_2}\right)^2$.

26. *Complete Systems.*—In general, a set of forms has an infinite number of comitants. Thus any entire power of a comitant, or a product of powers of two comitants, is also a comitant. It is evident, however, that there cannot exist an infinite number of algebraically independent comitants, since all are functions of a finite number of coefficients and variables. The following result is fundamental in the systematic theory: For a given set of forms there exist a finite number of comitants such that every comitant of the forms is a rational integral function of the selected comitants. The latter constitute the *complete system* of the given forms.

The proof was first given by Gordan (1870) by means of the symbolic method. It has since been simplified and generalized by numerous investigators—in particular, Hilbert.

27. We now give the complete systems for the forms of order 1, 2, 3, 4:

* Sylvester observed certain formal analogies between this symbolism and that employed in chemistry and developed a so-called chemico-algebraic theory. See Grace and Young, (Algebra of Invariants,) Cambridge, 1903, p. 366.

Linear form. No invariant; the only covariant is the given form $f=\alpha_x$.

Quadric form. One invariant (the discriminant) $D=(\alpha\beta)^2$; one covariant $f=\alpha_x^2$.

Cubic form. The only invariant is the discriminant $R=(\alpha\beta)^2(\alpha\gamma)(\beta\delta)(\gamma\delta)^2$; in addition to $f=\alpha_x^3$, there are two covariants, $H=(\alpha\beta)^2\alpha_x\beta_x$ (the Hessian of f) and $Q=(\alpha\beta)^2(\alpha\gamma)\beta_x\gamma_x^2$ (the Jacobian of f and H).

Quartic form. Two invariants, $I=(\alpha\beta)^4$, $J=(\alpha\beta)^2(\beta\gamma)^2(\gamma\alpha)^2$; three covariants, the given form $f=\alpha_x^4$, its Hessian $H=(\alpha\beta)^2\alpha_x^2\beta_x^2$, and the Jacobian of f and H, namley, $T=(\alpha\beta)^2(\alpha\gamma)\alpha_x\beta_x^2\gamma_x^3$.

Every invariant of the quartic form is thus a rational integral function of I and J; every comitant is a rational integral function of I, J, f, H, T.

28. The systems given are *irreducible;* that is, no member of a system can be expressed as a rational integral function of the other members of the system.

Complete irreducible systems have been calculated for single forms up to the order 10, and for pairs of forms up to the order 4. The system of the quintic contains twenty-three members.

While the finiteness of the system is assured, no general formula for the exact number of irreducible comitants is known.

29. *Ternary Forms.*—Many of the results stated for the binary case apply with little change to ultrabinary forms. There are, however, certain aspects of the general theory which are disguised when only the binary case is studied.

Consider a ternary form $f(x_1, x_2, x_3)$ of nth order. (The symbolic representation is α_x^n, where $\alpha_x=\alpha_1x_1+\alpha_2x_2+\alpha_3x_3$.) If x_1, x_2, x_3 are taken as the homogeneous coordinates of a point in a plane, the equation $f=0$ defines a curve of nth order. The vanishing of an invariant denotes a projective property of the curve. A covariant defines a curve which is projectively related to the original curve.

The principle of duality suggests the introduction of line coördinates u_1, u_2, u_3. When the x's undergo a linear transformation, the u's undergo another linear transformation which is said to be *contragredient* to the first. A function involving the u's and having the invariant property is termed a *contravariant* of f. Geometrically it represents a curve considered as the envelope of its tangent lines. A *mixed* comitant is one involving both point coordinates and line coordinates; geometrically it defines a so-called *connex.*

The complete system of the ternary quadric $f=\alpha_x^2$ consists of the covariant f, the invariant $D=(\alpha\beta\gamma)^2$, the contravariant $F=(\alpha\beta u)^2$, and the so-called identical form u_x. (Here $(\alpha\beta\gamma)$ represents a determinant of third order $|\alpha_1\beta_2\gamma_3|$.) Geometrically, $f=0$ represents a conic considered as a point locus, $F=0$ represents the same conic regarded as line envelope, and $D=0$ denotes that the conic degenerates to a pair of straight lines.

30. *Quaternary Forms.*—Here the essentially new feature is that in addition to point coordinates (x_1, x_2, x_3, x_4) and the dual plane coordinates (u_1, u_2, u_3, u_4) it is necessary to consider line coordinates $(p_{12}, p_{13}, p_{14}, p_{34}, p_{42}, p_{23})$. Comitants may contain, besides the coefficients of the given form, any combination of these types of variables. Little advance has yet been made in the complete treatment of even the simpler cases.

31. Gordan's method for proving the existence of a complete system applies only to binary forms. The proof for forms of any kind (including multiple forms containing two or more sets of variables) was first given by Hilbert (1890). The basis of his method is the following theorem, which has many important applications:

In any assemblage containing an infinite number of forms it is possible to select a finite number of members F_1, F_2, . . . , F_r, so that every member can be written $F=P_1F_1+P_2F_2+\ldots+P_rF_r$, where the P's are forms not belonging necessarily to the given assemblage.

Other Invariant Theories.

32. *Special Linear Transformations.*—Forms have been treated with respect to linear transformations of special type. Thus the transformations $x_1=\alpha X_1+\beta$, $y_1=\alpha Y_1$ lead to the so-called *seminvariants* of binary forms.

Again, the formulas for passing from one system of rectangular coördinates to another,

$$
(5)\qquad \begin{aligned} x &= X\cos\theta - Y\sin\theta + h,\\ y &= X\sin\theta + Y\cos\theta + k, \end{aligned}
$$

constitute a special linear group. Invariants with respect to this group are termed Cartesian or metric or orthogonal. In the case of the conic $ax^2+bxy+cy^2+dx+ey+f=0$, there are three such invariants, $a+c$, b^2-4ac, and the discriminant. The latter is the only one which is invariant in the projective theory. If $a+c=0$ the conic is a rectangular hyperbola; if $b^2-4ac=0$, it is a parabola.

For any number of variables the linear transformations which leave a given quadric form unchanged constitute a type of group which arises in many applications (line and circle geometries geometry on a quadric surface, etc.).

33. The general method of finding the invariants of any continuous group involving a finite number of parameters is due to Sophus Lie. An r parameter group is generated by r independent infinitesimal transformations; these determine a set of r partial differential equations whose solutions are the invariant functions.

34. A *differential invariant* is one that contains the derivatives of the variables. Thus for the group (5) the expression $\dfrac{y''}{(1+y'^2)^{\frac{3}{2}}}$ is a differential invariant. It represents in fact the curvature of an arbitrary curve at a point; this is obviously independent of the system of axes to which the curve is referred.

35. Special theories of invariants have been constructed in connection with *differential equations.* Thus an ordinary linear equation,

$$
\frac{d^ny}{dx^n}+p_1(x)\frac{d^{n-1}y}{dx^{n-1}}+\ldots+p_n(x)=0,
$$

is converted into an equation of the same kind by the substitution $x=\phi(X)$, $y=Y\psi(X)$. The totality of substitutions here forms an infinite continuous group, since ϕ and ψ are arbitrary functions. By an invariant of the equation is meant a function of the coefficients p_1, p_2, . . . and their derivatives, which retains its value (except perhaps for a factor depending on the transformation) when formed from the coefficients of the new equation.

36. *Differential Forms.*—In the theory of surfaces the distance between two consecutive points of the surface is given by the formula

$$ds^2 = E(u, v)du^2 + 2F(u, v)du\,dv + G(u, v)dv^2.$$

The second member is a binary quadratic differential form. Such forms possess a theory of invariants with respect to arbitrary change of variables. Any change is expressed by $u = \phi(U, V)$, $v = \psi(U, V)$, where ϕ, ψ are arbitrary functions. The simplest example of an invariant is the expression, depending on E, F, G and their partial derivatives, which represents the Gaussian curvature.

37. *Arithmetical Theory of Forms.*—In this theory, inaugurated by Gauss, the coefficients and variables involved are supposed to be whole numbers. Attention has been confined mainly to the binary quadratic $ax^2 + 2bxy + cy^2$. The transformations are defined by $x = \alpha X + \beta Y$, $y = \gamma X + \delta Y$, where the coefficients α, β, γ, δ are integers such that $\alpha\delta - \beta\gamma \neq 0$. In this case, then, the group is discontinuous.

38. *Automorphic Functions.*—Such discontinuous groups arise also in the theory of functions. Thus in No. 7 it was seen that the trigonometric functions are unaltered by the substitutions $x = X + 2k\pi$. Similarly, a doubly periodic function (of a complex variable) is invariant with respect to $z = Z + k_1w_1 + k_2w_2$, where w_1, w_2 are the given periods and k_1, k_2 are arbitrary integers. The modular function is invariant with respect to the linear group $z = (\alpha Z + \beta)/(\gamma Z + \delta)$, where α, β, γ, δ are integers such that $\alpha\delta - \beta\gamma = 1$. The problem of finding all functions which admit an infinite discontinuous group of linear transformations is one of the most important in recent investigation. Such functions are termed *automorphic.* They have been classified by Poincaré into Fuchsian and Kleinian according as the defining group involves real or complex coefficients.

Edward Kasner,
Instructor in Mathematics, Columbia University.

Invasion, the entry into a country by a public enemy. As early as 1795 Congress provided by law for protection against the invasion of the United States by any foreign nation or Indian tribe. The act made it lawful whenever there should be an invasion, or imminent danger of one, for the President to call out such number of the militia of the State or States convenient to the place of invasion as he might think necessary to repel it. This, strengthened in some respects by amendments, has been in force ever since. An invasion has usually all the elements of war, and the invaders may be dealt with as persons at war with the country invaded, in accordance with usages of warfare without the declaration of war by Congress. The Supreme Court of the United States has decided that a State is invaded when there is a domestic rebellion within its territory, and that the same rules of law may be enforced as in the case of an invasion by external foes. This decision practically abolishes all distinction between invasion and insurrection, and the same rules which furnish a remedy for invasion can be applied in the suppression of an insurrection or local rebellion. In case the State militia is not sufficiently strong, or not easily available, the standing troops of the United States may be ordered out by the President, if indeed it be necessary to call upon the State troops before resorting to the regular troops of the United States. It is not necessary that actual armed violence shall be resorted to in order to constitute insurrection. Any combination of persons too powerful to be suppressed by the ordinary course of judicial proceedings is tantamount to insurrection, and warrants the use of the effective measures provided for by law for its suppression.

As regards the rights of the invader many rules have been laid down, carefully distinguishing between invasion and conquest, especially with respect to private and public property. It is now held that public money, military stores, and public buildings with their contents are lawful sources of plunder, and telegraph and rail way property may be used as needs require The unwarranted burning of the capitol and other public buildings in Washington by the British in 1814; the removal of the Palatine libraries during the Thirty Years' War; the confiscation of the astronomical instruments in the Observatory of Peking by the Germans during the operations of the Allies against the Chinese capital—all these were in direct violation of the accepted rules of invasion. The levying of supplies, labor, forage, transportation facilities, etc., upon the native people is strictly within the lawful confines of invasion; for example, during the wars of Frederick the Great, both the Austrians and the Prussians were mainly supported by these enforced contributions of supplies. Napoleon was probably the greatest exponent of the belief that a war should support itself, either during the conflict, or by imposing a large indemnity, or both; hence we see that he exacted of Prussia, after the battle of Jena, more than a hundred million francs, and Spain was also forced during the Peninsular War to pay a similar amount. The pillage of private property is strictly prohibited, but should the owners give aid to their country, the property may be sold at the discretion of the invading general.

Inventions. The progress of the world in its numerous vast industries and arts has been founded, to a very large extent, upon inventions and discoveries and their subsequent development. Under the American patent law and system, inventors all over the world are stimulated to make public their inventions by reason of receiving in exchange a monopoly in the form of a patent on the invention for a period of 17 years. The remarkable increase in the number of protected inventions is shown by the records of the United States Patent Office, as follows: At the end of the first year (1790) 3 patents were issued. In the year ending 1902, 27,13[illegible] patents were granted. The total number of patents issued from April 1790 to November 1903 was 75[illegible].

An invention is recognized to be any new or useful mechanical contrivance or article, method, discovery, composition of matter, or system not previously known or used, or any improvement on any known machine, art, method, or system. Below is given in chronological order a list of important inventions beginning with the 16th century, with the title of the invention, the year it was made, the name of the inventor and his nativity:

Inventions	Date	Inventor	Nativity
Discoveries of Electrical Phenomena. With the title of "founder of the science of electricity."	1580 1603	William Gilbert	England
Screw printing-press	1620	Blaew	Germany
Spirally grooved rifle barrel	1620	Koster	England
Iron furnaces	1621	Lord Dudley	England
The use of steam ... The first authentic reference in English literature to the use of steam in the arts.	1630	David Ramseye	England
Bay Psalm Book, first book published in the Colonies	1640		Mass.
Barometer	1643	Torricelli	Italy
Steam engine, atmospheric pressure	1705	Thomas Newcomen	England
Machine for generating electricity	1681-6	Otto von Guericke	Germany
First paper mill in America	1690	William Rittenhouse	Penna.
First steam engine with a piston	1690	Denys Papin	France
The manufacture of plate glass established	[illegible]		France
First [illegible] conductors and [illegible]	1700 172[illegible]	Stephen Gray	England
The first [illegible] steam [illegible]	1702	Thomas Savery	England
First newspaper in America [illegible] News Letter	170[illegible]	John Campbell	Mass.
First [illegible]	[illegible]	Dr. J. Wall	England
Thermometer	[illegible]	Fahrenheit	Danzig
[illegible]	[illegible]	[illegible]	England
T[illegible]	[illegible]	Benjamin Franklin	Utd. States
F[illegible]	[illegible]	[illegible]	France
S[illegible]	[illegible]	[illegible]	Scotland
F[illegible]	[illegible]	[illegible] d[illegible]	France
F[illegible]	[illegible]	[illegible]	England
R[illegible]	[illegible]	[illegible]	England
F[illegible]	[illegible]	[illegible]	Germany
S[illegible] for [illegible]	[illegible]	[illegible]	England
Lightning [illegible]	[illegible]	[illegible]	Utd. States
S[illegible]	[illegible]	[illegible]	England
Piano forte, played in public in England in	1767		England
Drawing rolls in a spinning machine	1769	Richard Arkwright	England
The introduction of the "Hollander" or beating engine for pulping rags in the manufacture of paper	1773		
The mule spinner	1774	Samuel Crampton	England
Cut nails	1775	Jeremiah Wilkinson	Utd. States
Circular wood saw	1777	Miller	England
Embryo bicycle	1779	Branchard & Magurier	France
Steam engine, the basis of the modern engine	1782	James Watt	Scotland
Gas balloon	1783	J. E. & J. M. Montgolfier	France
Puddling iron	1783-4	Henry Cort	England
Plow, with cast iron mold board, and wrought and cast iron shares	1784	James Small	Scotland
Power loom	1785	James Cartwright	England
First steam-boat in the United States	1786	John Fitch	Utd. States
Steam road wagon (First automobile)	1787	Oliver Evans	Utd. States
Grain thrashing machine	1788	Andrew Meikle	England
Uranium discovered	1789	Klaproth	Germany
Hobby-horse, forerunner of bicycle	1790		England
Rotary steam power printing-press, the first idea of	1790	Wm. Nicholson	England
Wood planing machine	1791	Samuel Bentham	England
Gas first used as an illuminant	1792	Wm. Murdoch	England
Cotton gin	1794	Eli Whitney	Utd. States
Art of Lithography	1796	Alois Senefelder	Germany
Machine for making continuous webs of paper	1800	Louis Robert	France
Steam coach	1801	Richard Trevithick	England
Wood Mortising Machine	1801	M. J. Brunel	England
Pattern loom	1801	M. J. Jacquard	France
First fire proof safe	1801	Richard Scott	England
Steamboat on the Clyde, "Charlotte Dundas"	1802	William Symington	England
First photographic experiments	1802	Wedgewood & Davy	England
Planing machine	1802	J. Branch	England
The application of steam to the loom	1803	William Horrocks	England
Steel pen	1803	Wise	England
Steam Locomotive on rails	1804	Richard Trevithick	England
A[illegible] of twin [illegible] propellers in steam navigation	1804	John Stevens	Utd. States
Process of making [illegible] iron castings	1804	Lucas	England
First life preserver	1805	John Edwards	England
[illegible]ing	1805	Luigi Brugnatelli	Italy
K[illegible] machine, the [illegible] in the	1806	Jeandean	France
S[illegible] the Hudson River	1807	Robert Fulton	Utd. States
[illegible]	1807	A. J. Forsyth	Scotland
[illegible] gas light [illegible]	1807	F. A. Winsor	England
[illegible] saw	1808	Newberry	England
[illegible], strontium and calcium	1808	Sir Humphry Davy	England
Polarization of light from reflection	1808	E. L. Malus	France

Inventions	Date	Inventor	Nativity
Voltaic arc	1808	Sir Humphry Davy	England
First steamboat to make a trip to sea, the "Phœnix"	1808	John Stevens	Utd. States
Homeopathy introduced	1810	S. C. F. Hahnemann	Germany
Revolving cylinder printing-press	1810	Frederick Koenig	Germany
Breech-loading shot-gun	1811	Thornton & Hall	Utd. States
Storage battery	1812	J. B. Ritter	Germany
Dry Pile (prototype of dry battery)	1812	Zamboni	
First practical steam rotary printing press, paper printed on both sides	1814	Frederick Koenig	Germany
First locomotive in Scotland	1814	George Stephenson	England
First circular wood saw made in this country	1814	Benjamin Cummings	Utd. States
Heliography	1814	Jos. N. Niepce	France
Discovery of Cyanogen	1814	Gay Lussac	France
Kalcidoscope	1814	Sir David Brewster	England
Miner's safety lamp	1815	Sir Humphry Davy	England
Seidlitz powder	1815		
Dry gas meter	1815	S. Clegg	England
Morphine, first organic alkaloid known	1816	Sertürner	Germany
Knitting machine	1816	Brunel	England
"Draisine" bicycle	1816	Baron von Drais	Germany
"Columbian" press, elbowed pulling bar, number of impressions per hour, 50	1817	George Clymer	Utd. States
Stethoscope	1819	Laënnec	France
Electro-magnetism discovered	1819	H. C. Oersted	Germany
Lathe for turning irregular wood forms	1819	Thomas Blanchard	Utd. States
The theory of electro-dynamics first propounded	1820	Andre Ampère	France
Quinine	1820	Pelletier & Caventon	France
Electroscope	1820	Bohenberg	Germany
The conversion of the electric current into mechanical motion	1821	Michael Faraday	England
Galvanometer	1822	Schweigger	Germany
Multi-color printing	1822	P. Force	Utd. States
Calculating machine	1822	Charles Babbage	England
Silicon	1823	James Berzelius	Switzerl'd
Discovery of thermo-electricity	1823	Prof. Seebeck	England
Liquefaction and solidification of gas	1823	Michael Faraday	England
Water gas, production of	1823	Ibbetson	England
Portland cement	1825	Joseph Aspdin	England
First passenger railway, opened between Stockton and Darlington, England	1825		
Electrical spur wheel	1826	Barlow	England
Bromine	1826	M. Balard	France
First railroad in United States, near Quincy, Mass.	1826

Law of electrical resistance	1827	George S. Ohm	Germany
Improved rotary printing-press London Times, 5,000 impressions per hour	1827	Cowper & Applegarth	England
Hot air blast for iron furnaces	1828	J. B. Neilson	Scotland
Wood planing machine	1828	William Woodworth	Utd. States
Tubular locomotive boiler	1828	Séquin	France
Prism for polarized light	1828	Nicol	England
Spinning ring frame	1828	John Thorp	England
The "Washington" printing press, lever motion and knuckle joint for a screw, number of impressions per hour, 200	1829	Samuel Rust	Utd. States
First steam locomotive in United States, "Stourbridge Lion"	1829		
Double fluid galvanic battery	1829	A. C. Becquerel	France
Magnesium	1829	Adam Bussey	France
First portable steam fire engine	1830	Brathwaite & Ericsson	England
Magneto-electric induction	1831	Michael Faraday	England
Chloroform	1831	G. J. Guthrie	Scotland
First conception of electric telegraph	1832	Prof. S. F. B. Morse	Utd. States
First Magneto-electric machines	1832	Saxton	Utd. States
Rotary electric motor	1832	Wm. Sturgeon	England
Chloral-hydrate	1832	Justus von Liebig	Germany
Locomotive, "Old Ironsides" built	1832	M. W. Baldwin	Utd. States
Link-motion for locomotives	1832	Sir Henry James	England
Adoption of steam whistle for locomotives	1833	George Stephenson	England
Reciprocating saw-tooth cutter within double guard fingers for reapers	1833	Obed Hussey	Utd. States
"McCormick" reaper	1834	Cyrus H. McCormick	Utd. States
Rotary electric motor	1834	M. H. Jacobi	Russia
Carbolic acid discovered	1834	Runge	Germany
Horse shoe machine	1835	H. Burden	Utd. States
Constant electric battery	1836	J. P. Daniell	England
Acetylene gas discovered	1836	Edmund Davy	England
The revolver; a device "for combining a number of long barrels so as to rotate upon a spindle by the act of cocking the hammer."	1836	Samuel Colt	Utd. States
The screw applied to steam navigation	1836 1841	John Ericsson	Utd. States
The galvanizing of iron	1837	Henry Craufurd	England
Indicator-telegraph	1837	Cooke & Wheatstone	England
Photographic carbon printing	1838	Mungo Ponton	France
Babbitt metal	1839	Isaac Babbit	Utd. States
Vulcanization of rubber	1839	Charles Goodyear	Utd. States
The first boat electrically propelled	1839	Jacobi	Germany
Daguerreotype	1839	Louis Daguerre	France
First to produce a direct photographic positive in the camera by means of highly polished silver surfaced plate exposed to the vapors of iodine and subsequent development with mercury vapor.			
Making photo-prints from paper negatives (First production of positive proofs from negatives).	1839	Fox Talbot	England

Inventions	Date	Inventor	Nativity
Photographic portraits (Daguerreotype Process)	1839	Profs. Draper & Morse	Utd. States
Pneumatic Caissons	1841	M. Triger	France
Pianoforte automatically played	1842	M. Seytre	France
Steam hammer	1842	James Nasmyth	Scotland
Typewriting machine	1843	Charles Thurber	Utd. States
First telegram sent	1844	Prof. S. F. B. Morse	Utd. States
The use of nitrous oxide gas as an anæsthetic	1844	Dr. Horace Wells	Utd. States
The electric arc light (gas retort carbon in a vacuum)	1844	Léon Foucault	France
Automatic adjustment of electric arc light carbons	1845	Thomas Wright	England
Double cylinder printing-press	1845	R. Hoe & Co.	Utd. States
Pneumatic tire	1845	R. W. Thompson	England
Sewing machine	1846	Elias Howe	Utd. States
Suez canal started	1846	De Lesseps	France
Ether as an anæsthetic	1846	Dr. Morton	Utd. States
Artificial limbs	1846		
Gun cotton	1846	Schönbein	Germany
First pianoforte keyboard player	1846	Debain	France
Chloroform in surgery	1847	Dr. Simpson	Scotland
Nitro-glycerine	1847	Sobrero	
Time-lock	1847	Savage	Utd. States
Hoe's lightning press capable of printing 20,000 impressions per hour	1847	Richard M. Hoe	Utd. States
Match-making machinery	1848	A. L. Dennison	Utd. States
Breech gun-lock, interrupted thread	1849	Chambers	Utd. States
Magazine gun	1849	Walter Hunt	Utd. States
Steam pressure gauge	1849	Bourdon	France
Lenticular stereoscope	1849	Sir David Brewster	England
Latch needle for knitting machine	1849	J. T. Hibbert	Utd. States
"Corliss" Engine	1849	G. H. Corliss	Utd. States
Printing-press, curved plates secured to a rotating cylinder	1849	Jacob Worms	France
Mercerized cotton	1850	John Mercer	England
Collodion process in photography	1850	Scott Archer	England
American machine-made watches	1850		Utd. States
Electric locomotive	1851	Dr. Page	Utd. States
Self-raker for harvesters	1851	W. H. Seymour	Utd. States
Breech loading rifle	1851	Maynard	Utd. States
Icemaking machine	1851	J. Gorrie	Utd. States
The Rhumkorff coil	1851	Rhumkorff	Germany
Fire alarm telegraph	1852	Channing & Farmer	Utd. States
Reticulated screen for half tone photographic printing	1852	Fox Talbot	England
Soda process of making pulp from wood	1853	Watt & Burgess	Utd. States
Laws of magneto-electric induction	1853	Michael Faraday	England
Laws of electrostatics	1853	Michael Faraday	England
Electrolysis	1853	Michael Faraday	England
Duplex telegraph	1853	Gintl	Austria
Photographic roll films	1854	Melhuish	England
Diamond rock drill	1854	Herman	Utd. States
Four motion feed for sewing machines	1854	A. B. Wilson	Utd. States
Magazine firearm	1854	Smith & Wesson	Utd. States
Fat decomposed by water or steam at high temperature, since largely used in soap making	1854	R. A. Tilghman	Utd. States
Safety matches	1855	Lundstrom	Sweden
Iron-clad floating batteries first used in Crimean war	1855		
Cocaine	1855	Gaedeke	Germany
Process of making steel, blowing air through molten pig-iron	1855	Sir Henry Bessemer	England
Dryplate photography	1855	Dr. J. M. Taupenot	
Bicycle	1855	Ernst Michaux	France
Sleeping car	1856	Woodruff	Utd. States
Aniline dyes	1856	Perkins	England
Printing machine for the Blind (contains elements of the present typewriting machine	1856	Alfred E. Beach	Utd. States
Regenerative furnace	1856	Wm. Siemens	England
Refining engine in paper pulp making	1856	T. Kingsland	Utd. States
Coal-oil first sold in the United States	1857	Messrs. Stout & Hand	Utd. States
First sea going iron-clad war vessel the "Gloire"	1857		France
Ground wood pulp	1858	Henry Voelter	Germany
Inclined elevator and platform in the reaper	1858	J. S. Marsh	Utd. States
Cable car	1858	E. A. Gardner	Utd. States
Breech loading ordnance	1858	Wright & Gould	Utd. States
Feed injector for Boilers	1858	Giffard	France
Storage or secondary battery	1860	Gaston Planté	France
Singing telephone	1860	Philip Reis	Germany
Ammonia absorption ice machine	1860	F. P. E. Carré	France
Improved stereotyping process	1861	Charles Craske	Utd. States
Shoe sewing machine	1861	George McKay	Utd. States
Driven well, a tube with a pointed perforated end driven into the ground	1861	Col. N. W. Green	Utd. States
Passenger elevator	1861	E. G. Otis	Utd. States
Barbed wire fence introduced	1861		Utd. States
Calcium carbide produced	1862	Frederich Woehler	Germany
Revolving turret for floating battery	1862	Theodore Timby	Utd. States
First iron-clad steam battery, "Monitor"	1862	John Ericsson	Utd. States
Gatling gun	1862	Dr. R. J. Gatling	Utd. States
Smokeless gunpowder	1862	J. F. E. Schultze	Prussia
Pneumatic pianoforte player (regarded as first to strike keys by pneumatic pockets)	1863	M. Fourneaux	France
Explosive gelatine	1864	A. Nobel	France
Rubber dental plate	1864	J. A. Cummings	Utd. States
Automatic grain binding device	1864	Jacob Behel	Utd. States
Process of making fine steel	1865	Martin	Utd. States
Antiseptic surgery	1865	Sir Joseph Lister	England
Web-feeding printing press	1865	William Bullock	Utd. States
Automatic shell ejector for revolver	1865	W. C. Dodge	Utd. States
The Atlantic cable laid	1866	Cyrus W. Field	Utd. States
Open-hearth steel process	1866	Siemens-Martin	England
Compressed air rock drill	1866	C. Burleigh	Utd. States
Torpedo	1866	Whitehead	Utd. States
Dynamo electric machine	1866	Wilde	England
Sulphite process for making paper pulp from wood	1867	Tilghman	Utd. States
Disappearing gun carriage	1868	Moncrief	England
First practical typewriting machine	1868	C. L. Sholes	Utd. States
Dynamite	1868	A. Nobel	France
Oleomargarine	1868	H. Mege	France

Inventions	Date	Inventor	Nativity
Water heater for steam fire engine..	1868	W. A. Brickell	Utd. States
Sulky plow.........	1868	B. Slusser	Utd. States
Railway air brake...	1869	George Westinghouse	Utd. States
Tunnel shield (operated by hydraulic power)	1869	Alfred E. Beach	Utd. States
A curved spring tooth harrow	1869	David L. Garver	Utd. States
Dynamo-electric machine	1870	Gramme	France
Celluloid	1870	J. W. & Isaac Hyatt	Utd. States
Rebounding gun-lock	1870	L. Hailer	Utd. States
The Goodyear welt shoe-sewing machine	1871	Goodyear	Utd. States
Photographic gelatino bromide emulsion (Basis of present rapid photography).	1871	R. L. Maddox	England
Continuous Web printing-press	1871	Hoe & Tucker	Utd. States
Grain binder	1871	S. D. Locke	Utd. States
Compressed air rock drill	1871	S. Ingersoll	Utd. States
Positive motion weaving loom	1872	J. Lyall	Utd. States
Theory that light is an electric phenomenon	1872	Clerk Maxwell	England
Automatic air brake	1872	George Westinghouse	Utd. States
Automatic car coupler	1873	E. H. Janney	Utd. States
The photographic platinotype process Prints by this process are permanent.	1873	Willis	England
Quadruplex telegraph	1873	T. A. Edison	Utd. States
Twine binder for harvesters	1873	M. L. Gorham	Utd. States
Gelatino bromide photographic emulsion (Sensitiveness to light greatly increased by the application of heat)..	1873	Charles Bennett	England
Self-binding reaper..	1873	Locke & Wood	Utd. States
Barbed wire machine	1874	Glidden & Vaughan	Utd. States
Siphon recorder for submarine telegraphs	1874	Sir William Thompson	England
Store cash carrier...	1875	D. Brown	Utd. States
Illuminating water gas	1875	T. S. C. Lowe	Utd. States
Roller flour mills....	1875	F. Wegmann	Utd. States
Middlings purifier for flour	1875	Geo. T. Smith	Utd. States
Ice making machine	1875	R. P. Pictet	Switzerl'd
Speaking telephone..	1876	Graham Bell	Utd. States
Electric candle ..... (The first step towards the division of the electric current for lighting.)	1876	Paul Jablochkoff	Russia
Continuous machine for making tobacco cigarettes	1876	Russell	Utd. States
Steam feed saw mills	1876	D. C. Prescott	Utd. States
The first Portland cement plant in U. S..............	1876		Coplay, Pa.
Phonograph	1877	T. A. Edison	Utd. States
Gas engine..........	1877	N. A. Otto	Utd. States
Carbon microphone..	1877	T. A. Edison	Utd. States
Telephone transmitter of variable resistance	1877	Emil Berliner	Utd. States
Carbon filament for Electric lamp..... (Beginning of the incandescent vacuum electric light.)	1878	T. A. Edison	Utd. States
Rotary disk cultivator	1878	Mallon	Utd. States
Decided advance in the "Expression" of self-playing pianofortes........	1878	Gally	Utd. States
Automatic grain binder	1879	J. F. Appleby	Utd. States
Kathode rays discovered	1879	Sir Wm. Crookes	England
Steam plow.........	1879	W. Foy	Utd. States
Magazine rifle	1879	Lee	Utd. States
"Blake" telephone transmitter	1880	Blake	Utd. States
Hammerless gun.....	1880	Greener	Utd. States
Storage battery or accumulator	1880	Camille A. Faure	France
Typhoid bacillus isolated	1880	Eberth & Koch	Germany
Pneumonia bacillus isolated	1880	Sternberg	Utd. States
Button hole machine	1881	Reece	Utd. States
Improvement in "Expression" of self-playing pianofortes	1882	Schmaele	Utd. States
Hand photographic camera for plates..	1881	Wm. Schmid	Utd. States
Tuberculosis bacillus isolated	1882	Robert Koch	Germany
Hydrophobia bacillus isolated	1882	Louis Pasteur	France
Cholera bacillus isolated	1884	Robert Koch	Germany
Diphtheria bacillus isolated	1884	Loeffler	Germany
Lockjaw bacillus isolated	1884	Nicolaier	France
Antipyrene	1884	Kuno	Utd. States
Linotype machine ...	1884	Othmar Mergenthaler	Utd. States
The rear-driven chain safety bicycle.....	1884	George W. Marble	Utd. States
Chrome tanning of leather	1884	Schultz	Utd. States
Process of reducing aluminium	1885	Cowles	England
Gas burner	1885	Carl Welsbach	Germany
Hydraulic dredge ...	1885	Bowers	Utd. States
First electric railway in United States, Hampden and Baltimore, Md........	1885		
Contact device for overhead electric trolley	1885	C. J. Van Depoele	Utd. States
Graphophone	1886	Bell & Tainter	Utd. States
Electric welding	1886	Elihu Thompson	Utd. States
Combined harvester and thresher	1886	Matteson	Utd. States
Band wood saw.....	1887	D. C. Prescott	Utd. States
Cyanide process of obtaining gold and silver	1887	McArthur & Forrest	Utd. States
System of polyphase electric currents ..	1887	Nicola Tesla	Utd. States
Incandescent gas light .... The formation of a cone-shaped interwoven mantle of thread coated with a refractory rare earth and rendering the same incandescent by the heat rays of a Bunsen gas burner regardless of how the gas is produced	1887	Carl A. Von Welsbach	Austria
Process of annealing armor plate	1888	Harvey	Utd. States
"Kodak" snap-shot camera .... Constructed to use a continuous sensitized ribbon film.	1888	Eastman & Walker	Utd. States
Process of making artificial silk	1888	H. DeChardonnet	France
Hertzian waves or electric wave radiation	1888	Heinrich Hertz	Germany

Inventions	Date	Inventor	Nativity
First rotary cement kilns in U. S.	1889		Coplay, Pa.
Nickel steel......	1889	Schneider	Utd. States
Process of making aluminum	1889	Chas. M. Hall	Utd. States

The first oil burning steamship built in the United States, "Nevada"	1902		
English Pacific cable, Canada-Australia ..	1902		
American Pacific cable	1903		Utd. States

It is interesting to note that between the years 1872 and 1900 there were on what may be termed the honor roll of inventors 39 inventors each of whom had received over 100 patents. A few of the most important were:

Thomas A. Edison	742
Francis H. Richards	619
Elihu Thomson	444
Charles E. Scribner	374
Luther C. Crowell	293
Edward Weston	280
Rudolph M. Hunter	276
Charles J. Van Depoele (deceased)	245
George Westinghouse	239
Rudolph Eickemeyer (deceased)	171
Hiram S. Maxim	146
Philip Diehl	137
Hosea W. Libbey	127
Louis K. Johnson	114
Talbot C. Dexter	109
James H. Northrup	102

In the preparation of the foregoing statistics, credit is given to L. H. Campbell, of the United States Patent Office, for valuable assistance.

Frederick C. Beach, Ph.B.
Editor 'The Scientific American'

In'ventory, a written list or schedule of goods, chattels and other personal property of an individual or estate, whether for use in legal proceedings, or for commercial purposes. The term is also employed to designate lists of assets prepared in cases of insolvency and bankruptcy, and lists of property made out by guardians of estates or infants. These inventory lists are usually filed with the court for public examination. After an administrator or other officer of the court files his inventory he becomes personally accountable for the property or goods so listed. See also Executor.

Inver'sion, a change of order whereby the first becomes last and the last first. (1) In rhetoric, a reversal of the natural order of words for the sake of euphony, emphasis, or the like: also the turning of one's own argument against him by an opponent in discussion. (2) In chemistry, a change in molecular structure which is usually induced by fermentation or by heating with a dilute acid, as in the case of starch, sugar, etc. Thus starch and dextrine are changed into glucose, cane-sugar into invert sugar, and maltose into glucose. (3) In geology, the overturning or folding over of strata by igneous agency, so that the order of their succession seems reversed. (4) In mathematics, the operation of changing the order of the terms, so that the antecedent shall take the place of the consequent and the reverse, in both couplets. Thus, from the proportion $a : b :: c : d$, we have, by inversion, $b : a :: d : c$. (5) In music, the transposition of certain phrases having a common root. (*a*) The change of a chord by making one of the inner notes act as a bass note, by which means as many inversions can be made as there are actual notes in the chord, not counting the root, the harmony in such inversions remaining the same, though the order of component parts is changed; (*b*) alteration of intervals by making that which was the upper note the lower, and the reverse, the inversion of an interval within the octave being readily found in the difference between the figure 9 and the interval known; (*c*) the alteration of a subject produced by inverting the intervals of which it consists.

In'vertase, or **In'vertin,** an enzyme occurring in many fungi, notably in certain yeasts (for example, the saccharomyces), and also in the seed-plants. It transforms cane-sugar into a mixture of dextrose and levulose; this mixture being called "invert-sugar" because it turns the plane of polarized light to the left, while the cane-sugar from which it is obtained turns it to the right. According to some writers, a yeast cannot invert cane-sugar except by secreting invertase; but *Monilia candida* effects the inversion, and yet produces no invertase. In this case the action is probably due to some other enzyme, hitherto unidentified. Invertase probably plays a very important part in vegetable chemistry. Like other enzymes, it can apparently perform an unlimited amount of chemical work, without sensible diminution of its own substance. (See FERMENTATION.) Invertase is most active at a temperature of from 120° to 140° F., and in a slightly acid medium. It has been isolated in the form of a powder.

Inver'tebrates, a collective term for the lower divisions or phyla of the animal series, which agree in not having a vertebral column or back-bone, used in contradistinction to the highest group of the animal kingdom, to which the name *Vertebrata* or vertebrate animals is given. In the system of Cuvier the *Invertebrata* were divided into the *Radiata, Articulata,* and *Mollusca.* Further study revealed that these names did not distinguish natural groups; and the term *Invertebrata* has no longer any definite significance in classification (q.v.).

Inves'titure, in the feudal law, was the open delivery of a feud by a lord to his vassal, thus, by external proof, affording evidence of property. To use the words of Blackstone, "Investitures, in their original rise, were probably intended to demonstrate, in conquered countries, the actual possession of the lord, and that he did not grant a bare litigious right, but a peaceable and firm possession. At a time when writing was seldom practised, a mere oral gift, at a distance from the spot that was given, was not likely to be long or accurately retained in the memory of by-standers, who were very little interested in the grant." For this reason investiture was performed by the presentation of some symbol to the person invested, as a branch of a tree, etc. In the primitive church, after the election of a bishop, and his consecration, the early Christian emperors claimed a right of confirmation. Charlemagne is said to have introduced this practice, and to have invested the newly consecrated bishop by placing a ring and crozier in his hands. Gratian, indeed (Distinct. 63, cap. Adrianus), directly affirms that Pope Adrian positively conceded to the emperor the power of electing, even to the papacy, in 774; but neither Eginhard nor any other contemporary writer mentions this fact.

The custom, however, existed, nor does it appear to have been objected to or opposed during the lapse of two centuries from his reign. The disorderly state of Italy, which succeeded the death of Charlemagne, frequently interrupted the exercise of this right by the Carlovingians; but even so late as 1047, when the empire had passed to another line, Henry III. received an explicit admission of his prerogative, and repeatedly used it. The investiture in the lesser sees followed as a matter of course. Alexander II. issued a decree against lay investiture in general, which was revived by Gregory VII. (Hildebrand), who, having succeeded in annulling the prerogative of the emperors to nominate or confirm popes, sought to disjoin entirely the ecclesiastical from the civil rule. It was not, however, until the papacy of Calixtus II., in 1122, that the question was terminated, as it appears, materially to the advantage of the holy see. In France, even under the papacy of Hildebrand, the right of investiture does not appear to have been made a subject of open quarrel. In spite of the protests of the holy see, the kings exercised the power, but at length relinquished the presentation of the ring and crozier, and contented themselves with conferring investiture by a written instrument, or orally, upon which they were left in peaceable possession of the power. But in England Paschal II. was engaged in a contest little less fierce than that which he maintained with the emperor. Anselm, the primate, refused to do homage to Henry I. for his see. The king seems to have asserted an unqualified right of vestiture, which the pope, who was appealed to, as unqualifiedly denied. After a protracted struggle, and continued threats of excommunication, the controversy ended in England, as it did afterward in Germany, by compromise. Paschal offered to concede the objections against homage provided Henry would forego the ceremony of investiture. To this he agreed (1107).

Invin'cibles, an Irish secret society of 1882, an off-shoot of the Fenians. One of the objects of the Invincibles was to "remove" or assassinate government officers or others who might incur the displeasures of the association or its leaders. On 6 May 1882 the society succeeded in "removing" Lord Frederick Cavendish, who had just arrived from England as secretary for Ireland, and Thomas A. Burke, the under-secretary, in the Phœnix Park at Dublin. The plot was directed against the latter gentleman, and the former, interfering to protect his friend, shared his fate. On 20 Feb. 1883 20 persons charged with complicity in the Phœnix Park murders were put on trial; on 14 July, Joseph Brady, who had been convicted of actual perpetration of the murder of Mr. Burke, was executed, as were others subsequently. The leading witness, who revealed all the secrets of his fellow conspirators, was James Carey of Dublin. He was shot dead near Natal, on 29 July, by an Irishman, O'Donnell, who was subsequently tried, and executed for his crime.

Invocation of Saints. See SAINTS.

In'voice, a list or bill of goods; a detailed statement of merchandise in stock, or to be shipped. Very frequently an invoice accompanies a shipment of goods along with the bill of lading from the consignor to the consignee.

An invoice is a memorandum and is not a document of title nor a contract of sale, and has no value in law other than memoranda.

Io, ī'ō, in Greek mythology, a daughter of Inachus; according to others of Iasus or Peiren. Zeus (Jupiter) fell in love with her. Hera (Juno) perceived the infidelity of her husband, anl resolved to be revenged on both. Zeus, to protect Io from the jealousy of Hera, changed her into a beautiful white heifer. Hera was not deceived, and set a gad-fly to torment her, and persecuted her without a moment's rest through the world. The wanderings of Io in this condition were a favorite subject with the poets of ancient Greece. Also, in astronomy (1) the first satellite of Jupiter, discovered by Galileo in 1610. (2) The name of the 85th asteroid, discovered by Peters at Clinton, N. Y., 19 Sept. 1865.

Iodine, ī'ō-dĭn or -dīn, a non-metallic element, analogous in its general properties to chlorine and bromine. It was discovered by Courtois in 1811, in the mother-liquor of kelp that had been used for the production of sodium carbonate; occurring there in combination with sodium and magnesium. It is still obtained from the ashes of certain seaweeds, but the principal supply is now obtained from «caliche,» a crude nitrate of sodium that occurs in immense quantities in northern Chile. In the preparation of the commercially pure nitrate of soda from caliche, the mother liquors, after the removal of the nitrate by crystallization, are found to contain large quantities of iodine, chiefly in the form of iodate of sodium, $NaIO_3$; and it is from this substance that the iodine of commerce is now chiefly prepared. The richest caliche contains about 3.5 pounds of iodine per ton.

In its ordinary form, iodine is a solid substance, melting at 237° F., and boiling at about 380° F. In a vacuum, iodine sublimes without melting. Solid iodine is soft, and dark gray in color, with a metallic lustre. The vapor is violet in color, from which circumstance the element takes its name (Greek, «like a violet»). Chemically, iodine has the symbol I, and an atomic weight of 126.85 for $O = 16$, or 125.9 for $H = 1$. Solid iodine has a specific gravity of about 4.95 at ordinary temperatures, and a specific heat of about 0.05412. Its volume increases, on account of thermal expansion, by about 0.00013 of its own value for a rise of temperature of 1° F. At temperatures not far above its boiling point, the vapor of iodine has a specific heat (at constant pressure) of 0.03369; and in this same region of temperature the ratio of its specific heat at constant pressure to the specific heat at constant volume is about 1.294. Iodine shows an important change in its vapor density at high temperatures. Thus, below about 1,200° F. the vapor has a density about 126 times as great as that of hydrogen under the same conditions of temperature and pressure; but as the temperature rises the density of the vapor, relatively to hydrogen, falls off, until it is only about 68 at 2,700° F. It is believed that this change in density indicates that the molecules of iodine vapor split in two as the temperature rises; a molecule, just above the boiling point, containing two atoms, while at the higher temperature the molecules are monatomic. Iodine is freely soluble in alcohol, ether, carbon disulphid, chloroform, and glycerin. It is only slightly soluble in pure water, but dissolves readily in aqueous solutions of the iodides. It is also soluble in benzine, acetic acid, and numerous other organic fluids. Iodine is a non-conductor of electricity.

With hydrogen, iodine forms the important compound HI, known as hydriodic acid. (See HYDRIODIC ACID.) With the metals it forms binary compounds called «iodides,» which may also be regarded as salts of hydriodic acid. Of these the most important is potassium iodide, KI, which is largely used in medicine. It is prepared by dissolving iodine in a solution of caustic potash, evaporating to dryness, and igniting. This salt is very soluble, and crystallizes in cubes. The iodides of ammonium, sodium, strontium, and zinc are also used to a more limited extent. Iodoform, a yellow crystalline powder with a peculiar characteristic odor when warmed, is also much used as a dressing in surgery. It has the formula CHI_3, and is analogous in its chemical structure and deportment to chloroform. Iodoform may be prepared by dissolving iodine in an alcoholic solution of caustic potash, the iodoform that is produced separating out as a precipitate. It is also prepared in Germany, to a certain extent, by the electrolysis of a similar solution. (See Löb, 'Electrolysis and Electrosynthesis of Organic Compounds.') Iodine and its compounds are used to some extent in photography, and to a larger extent in synthetic chemistry, for the preparation of the coal-tar colors (q.v.), and other organic substances.

Iodine forms two important oxy-acids, known respectively as iodic acid, HIO_3, and periodic acid, $HIO_4 + 2H_2O$. These are analogous, in their chemical deportment, to chloric and perchloric acids.

Free iodine combines with starch to form a remarkable deep blue compound, whose production is a well-known test for the presence, in a given substance, of either starch or free iodine. To detect the presence of iodine in a solution, a few drops of thin, clear starch paste are added to the solution to be tested (which should be cold), and hydrochloric acid is added until the reaction is acid. A couple of drops of a concentrated solution of potassium nitrite are then added, when the dark blue color of iodide of starch will instantly be produced, if iodine is present. This test may readily be modified so as to serve for the detection of starch. The reaction is not given by dextrin, nor by other isomers of starch.

I'odine and Iodides in Medicine. Iodine and the iodides have been used in medicine since the Chinese are supposed to have introduced them, 2000 B.C. or earlier. The exact method of action of the iodides is not clear, but it would seem that iodine, being a normal constituent of the human body, is a very essential element in normal metabolism. It is found in comparatively large quantities in the thyroid gland, which is known to exercise a very important action in the general body-metabolism, and it is probably by means of the stimulation of the general metabolism of the body that the iodides manifest their beneficial action. The iodides are freely absorbed from watery solutions by mucous membranes throughout the body, particularly in the stomach and intestine. They are taken up into the blood, pass through the tissues, stimulating the lymph-flow, and are excreted in the urine in the form of salts. Iodine itself possesses a local irritant action. It is soon converted into the iodides when taken internally, and causes similar internal changes.

When the iodides are taken in large doses, or even in small doses for a long time, a form of chronic poisoning known as iodism results. In this the chief symptoms, found in the air-passages, consist of a catarrh, especially of the nose, with profuse watery secretion, sneezing, and sometimes bronchitis. There is usually swelling and irritation of the throat and tonsils, and salivation. Nausea and gastric discomforts are common, and skin-eruptions are frequent. There is usually loss of weight, and if the iodide has been taken for a very long period a condition of cachexia, characterized by a great loss of flesh, weakness, depression, and restlessness, may result. The chief use of the iodides in medicine is in the treatment of syphilis, on which it has a specific effect. It is also very useful in the various joint-pains of a chronic character, usually known as chronic rheumatism. Iodine is valuable in the treatment of those diseases known to result from thyroid insufficiency, notably in myxœdema (q.v.), and in cretinism, its allied form in children. For stimulation of the respiratory and nasal passages, as in chronic bronchitis, asthma, and dry nasal catarrh, the iodides are of great value.

Io'la, ī-ō'la, Kan.— The city of Iola, Allen County, Kan., is located on the left bank of the Neosho River, about 40 miles west of the Missouri line, and about 100 miles south of Kansas City. The town is reached by the Atchison, Topeka & Santa Fé, the Missouri, Kansas & Texas, and the Missouri Pacific railroads.

History.— It was laid out by the Iola Town Company in 1859. A post-office was located there the same year and a small village soon grew up. During the war the town made but little progress. In 1865 it became the county-seat of the county, and grew steadily, although very slowly until 1895, when its population was 1,565. In 1896 natural gas was discovered on the town site, and as soon as it was shown that a large gas field existed in and near the town it began to grow rapidly, the population in 1904 exceeding 11,000. This rapid growth followed the location in and near Iola of nine large zinc smelters, a number of brick factories, two Portland cement plants and other manufacturing enterprises attracted to the place by the cheap fuel which the large field of natural gas supplied.

Churches, etc.— The leading church denominations are the Presbyterian, Methodist Episcopal, Christian, Baptist, Episcopal, Reformed, and Catholic. The city is well supplied with schools, its high school being one of the best in the State. There are two daily papers, the 'Record' and the 'Register.'

Business, Population, etc.— The city is surrounded by a well-settled and prosperous agricultural community, but its chief business is derived from the manufacturing industries already named. The population is almost wholly American, the exceptions being a few Poles and Swedes employed in the manufacturing plants. An electric road connects Iola with a number of suburban towns, aggregating a population of about (1904) 5,000.

Charles F. Scott.

Io'na, or Icolmkill, an island on the west coast of Scotland, one of the Inner Hebrides, in the county of Argyle. Iona is about 3 miles long by $1\frac{1}{2}$ miles broad; area, 2,000 acres, of which 600 acres are under cultivation, the remainder being hill pasture, morass, and rock. The island derives its interest and celebrity wholly from its history and its ancient ruins, and especially from its connection with Saint Columba, who took up his residence here after the middle of the 6th century (565). The existing ruins are all, however, of a much more recent date. Forty-eight kings of Scotland, four kings of Ireland and eight kings of Norway are said to have been buried on Iona Island, among them being King Duncan, made famous by Shakespeare. About 1900 the Duke of Argyle conveyed the entire island to the Church of Scotland under certain conditions of preservation and restoration.

Ionia, ī-ō'nĭ-a, that part of the seaboard of Asia Minor which was inhabited by Ionian Greeks, a beautiful and fertile country opposite the islands of Samos and Chios, which also belonged to it. According to tradition, the Greek colonists came over from Attica about 1050 B.C., and founded 12 towns, which, though mutually independent, formed a confederacy for common purposes. These included Phocæa, Ephesus, Miletus, etc., and latterly Smyrna. Commerce, navigation, and agriculture early rendered them wealthy and flourishing, but the country was made tributary by Crœsus, king of Lydia, and later by Cyrus, king of Persia (557 B.C.). With an interval of independence they remained under Persia until this empire was overthrown by Alexander the Great, 334–1 B.C., when they became a part of the Macedonian empire. Ionia, at a later period, became part of the Roman province of Asia. It was afterward totally devastated by the Saracens, so that few vestiges of its ancient civilization remain.

Ionia, Mich., city and county-seat of Ionia County; on the Grand River, and the Detroit, G. H. & M., the Pere M., and the Grand T. R.R.'s; 34 miles east of Grand Rapids. It contains the State house of corection, the State asylum for the dangerous and criminal insane, large railroad repair shops, and manufactories of pottery, furniture, machinery, edged tools, and clothing. The industrial interests are greatly promoted by excellent power furnished by the river. The city has a public high school, library, several daily and weekly periodicals, and an assessed property valuation of about $2,500,000. Under the revised charter of 1897, the government is administered by a mayor and city council elected annually. Ionia was settled in 1833 and incorporated in 1873. Pop. (1890) 4,482; (1900) 5,209.

Io'nian Islands, a number of islands belonging to the kingdom of Greece, in the Ionian Sea, off the coast of Albania and the western and southern shores of Greece, the most southern, Cerigo, and its dependent islets being off the southeastern extremity of the Morea. The principal islands, seven in number, are, reckoning from north to south, Kerkyra (Corfu), Paxos, Levkas (Santa Maura), Ithaki (Ithaca), Kephallenia (Cephalonia), Zakynthos (Zante), and Kythira (Cerigo). To each of these larger islands a number of smaller, scattered along their respective coasts, are attached, and included in their several local jurisdictions. Area of the whole, 1,097 square miles. Pop. about 300,000. All these islands belong to the great calcareous formation of Greece. They are extremely mountainous, and do not contain enough arable land to produce the corn required by the population; and were it not for the vine, olive, and currant, all of which they produce, they could support but a small number of inhabitants. The climate is even more temperate than that of the neighboring mainland. Snow often falls in the winter, and lies on the mountains, but rarely on the plains. The staple exports are oil, currants, valonia, wine, soap, and salt. The few manufactures are chiefly textile and ornamental. The religion is that of the Eastern Greek Church, to which four fifths of the population belong. Each island has its own bishop, and at the head of the whole is an exarch or primate. The Ionian Islands, so called from lying in that part of the Mediterranean anciently known as the Mare Ionicum or Ionian Sea, often figure in the ancient history of Greece, but only singly, not collectively. In 1809–10 all the islands were overrun by the British troops except Corfu, which did not come into the hands of the British till it was assigned to them by the Peace of Paris in 1814, and the possession of the British was finally fixed and regulated by another treaty concluded at Paris in 1815. The seven islands were then formed into a republic, under the protectorate of Great Britain. In 1857 a wish was expressed by their representatives for reunion with Greece, and the islands, with the consent of the other European powers, were transferred to the kingdom of Greece in 1864.

Ionian Philosophy, the earliest school of Greek philosphy, a school which attempted to explain the phenomena of nature from the forces and attributes of matter itself. In order to do this the philosophers of this school followed two courses, some assuming a single original substance as the ground of all things, and explaining the development and formation of the phenomenal world by a process of condensation and rarefaction which they conceived as affecting the mode of existence of that substance; while others considered all things as formed by separation and combination out of a permanent and unalterable primitive form of matter. According to the view of the first class of Ionian philosophers, therefore, the original material principle was conceived as itself liable to change, and the changes which take place in it were held to give rise to the forms by which the world is known to us; while according to the view of the second class of Ionian philosophers the original material principle was looked upon as in its own nature and qualities unchangeable, and everything was explained by a change of external relations in space.

Ionian School, the school of philosophy which started from the Ionian city of Miletus. The leader of the school was Thales, who started from a disbelief in the current mythological fables of his day. Thales was born about 636 B.C. He was a man of political activity as well as of deep meditative habits. He was proficient in mathematical knowledge and founded the Ionian school which was principally concerned in an inquiry as to the constitution of the universe. He propounded the axiom that the basis of all phenomena was water, and perhaps he was just as near the truth as Huxley when he declared that everything came out of what he called, by a question-begging term, protoplasm. The next philosopher of the Ionian school was Anaximenes 529 B.C. He also was a materialistic philosopher and like Liebig believed that the origin and substance of everything was air. Diogenes of Apollonia went farther than his predecessor and taught that the basis of phenomena was mind. The Ionian school found its highest development in Anaximander of Miletus 610 B.C., who taught what has been the profoundest discovery of all philosophy ancient or modern that the basis of being was *τὸ ἄπειρον*, the Infinite.

Ionian Sea, that part of the Mediterranean communicating with the Gulf of Venice by the Strait of Otranto, and having Greece and part of European Turkey on the east; Sicily and the most southern part of Italy on the west. Its greatest breadth is between Cape Matapan in the Morea, and Cape Passaro in Sicily, which is about 400 miles.

Ion'ic Order. See ARCHITECTURE (*Greece*).

Ioniza'tion. See ELECTROLYSIS; ELECTRON; SOLUTION.

Ios, ī'ŏs, an island in the Ægean Sea, said to have been the birth-place of Homer. According to the ancients his mother was born here, and the poet's grave was likewise located here.

I O U, a written acknowledgment of debt, usually made in this form:—"To A. B. I O U Ten Dollars.—C. D. May 12, 1891." In Great Britain when the name of the creditor is stated such a document is evidence of a debt of the amount stated due to him by the person whose signature it bears. In the absence of the name of the creditor the document is *prima facie* evidence of such a debt being due to the holder of the document. It is not negotiable. The letters I O U are of course used instead of the words "I owe you," on account of the similarity of sound. The I O U is seldom used in the United States.

Iowa, ī'o-a ("the Hawkeye State"), a north-central State extending from the Mississippi River to the Missouri River, and occupying three and one sixth degrees of latitude. It is bounded on the north by Minnesota, on the east by Wisconsin and Illinois, on the south by Missouri, and on the west by Nebraska and South Dakota. Area, 56,025 square miles; 550 water; it is 310 miles east and west, and 210 north and south. Capital, Des Moines. Pop. (1900) 2,231,853. It is the sixteenth State in order of admission to the Union.

Topography.— Iowa is a part of the great central plain, and is chiefly undulating prairie, rising in gentle swells from the Mississippi River to a divide running diagonally, from a height of 1,694 feet in the northwest to a slight elevation in the southeast, with a parallel subdivide in the southwest. There are now no swamps and few natural forests. The only rough spots are the sharp bluffs where the rivers have cut their paths through the glacial drift; the only woods, those along the streams,— altogether about 7,000 square miles of woodland, with oak, elm, hickory, black walnut, maple, cottonwood, linden, ash, box-elder, pine,

cedar, etc. The eastern watershed, two thirds of the whole State, is drained to the Mississippi by a series of streams, nearly all of which are parallel and have a southeastward course. The western part is drained to the Missouri by shorter and swifter rivers, flowing first southwest and then south as the Missouri turns eastward. The chief Mississippi affluents are the Upper Iowa, the Turkey, the Maquoketa, the Wapsipinicon, the Iowa, and the Cedar (the "main" stream, the Iowa,— 375 miles, its "tributary," the Cedar, 400 miles, the two forming the second largest interior system of the State and joining not far from the mouth of the Iowa), the Skunk, and lastly the Des Moines with its numerous affluents, far the greatest and commercially the most important as well as the finest scenically, rising in Minnesota and running diagonally across the entire State in a course of 550 miles, with a basin of 14,500 square miles. The State is prolonged by a southeastern corner to include the entire channel of the Des Moines. The northern part of the State has a continuation of the many small, clear, pebbly lakes of Minnesota in glacier-scored pits; some of them — the Walled Lakes — surrounded each by a natural wall of loose stones. The largest are Spirit Lake and the two Okoboji lakes in Dickinson County, and Clear Lake in Cerro Gordo County, all popular summer resorts. West Okoboji, of great depth, lies between wooded hills, and is indented by several picturesque "points" or promontories.

Climate.— The winter climate is somewhat severe, owing to the influence of the great uninterrupted plains to the northwest; but like all this region, the severity is tempered by freedom from excessive moisture. The State is one of the healthiest in the Union, several of the streams in the northeast having rocky channels, and none having the miasmatic bottom-lands found farther south. The dry, pure air of its rolling prairies affords a valued sanatorium for consumptives. The extreme temperatures range from 110° above to 40° below zero; but the average range is from 95° above to 20° below. The average rainfall during the years from 1890 to 1903 inclusive was 31.4 inches — two thirds of it between April-October, and more than half during the critical crop months, May, June, July, and August.

Geology.— No less than five separate sheets of drift cover the State, giving a remarkable variety of productive soil, as well as many different clays for industrial purposes. The watershed shows the inclination to the underlying palæozoic rocks, in lines from northwest to southeast. The oldest formation is Sioux quartzite in the northwestern corner. Cretaceous deposits overlie the older formations through the northwest part generally; along the eastern side from north and south are Cambrian, Silurian, Devonian, and Carboniferous in succession. The most valuable mineral beds are the vast fields of bituminous coal, covering more than one third of the entire area of the State, and turning out in the year ending 30 June 1903, 6,185,734 tons, valued at $8,016,274; employing 13,192 persons, of whom 9,169 were miners. It is the leading coal State west of the Mississippi except Colorado, and a great factor in all the northwestern industries. Its limestone, the finest grade of building stone, near Marshalltown, Anamosa and other points, is quarried to the extent of about $800,000 a year. Its gypsum from the rocky hills in the vicinity of Fort Dodge is the basis of a fast increasing manufacture of stucco, hard-wall plaster, and paint, also clays for pottery, fire and building brick, tile, and terra-cotta. Iowa ranks eighth in the value of its clay products. Considerable mineral water is also exported, that from the Colfax springs being in the lead.

Agriculture.— Iowa is unsurpassed in the quality and extent of cultivated land. It presents mainly a friable black loam on the top, from one to five feet deep; is easily worked, is in the main free from stumps and stones, and requires little or no commercial fertilizers. It has three main varieties, the principal being the alluvial mud of the river bottoms, the glacial drift of the prairies, covering most of the State, a sand and clay loam, and the loess, a rich yellow deposit containing much carbonate of lime, found at great depth on the Missouri slope and along the streams in the central and eastern portions. There is now almost no waste land in the State. In 1900 it presented the unparalleled record of 86.5 per cent improved farm land. A large part of the remaining 13.5 per cent yields income as timber and pasture land. With this fertility and a steady and sufficient rainfall, the State has for many years been first in the Union in value of products derived exclusively from the soil. The total value of its farm products in 1900 was $365,411,528, of which over a hundred million was fed to its own live stock. Its great crop is corn; it varies, in bushels, from 129,104,930 in 1894 to 383,453,190 in 1900, with an average value of $100,000,000 to $150,000,000. A fourth of its surface is covered with cornfields. Its second crop is oats (of which it was second in the United States), with a total in 1900 of 168,364,170 bushels; third, barley, 18,059,060; wheat, 22,769,440; rye, 1,170,970; and buckwheat, 151,120. Its cereals altogether occupy nearly half of its area. It also raises considerable flaxseed. Its hay product is surpassed only by New York; in 1902 it was 5,211,232 tons, most of it used for feeding its own stock. The vegetable crops are also of great importance: in potatoes it was second in 1900, producing 2,662,660 bushels, also 224,622 bushels sweet potatoes, altogether realizing $3,870,746; other vegetables, $3,332,039. It has a considerable fruit crop, especially of apples; in 1900 the value of orchard products was $1,849,767, besides $878,446 of small fruits and berries. The average of Iowa's chief products during the 13 years, 1890–1902, in bushels, is: Corn, 261,200,750; wheat, 16,130,339; oats, 117,118,483; rye, 1,907,482; barley, 12,503,051; flax, 2,182,950; potatoes, 12,198,347; hay, tons, 5,517,884. Iowa leads all the other States in the value of the implements on its farms, namely, $57,960,660.

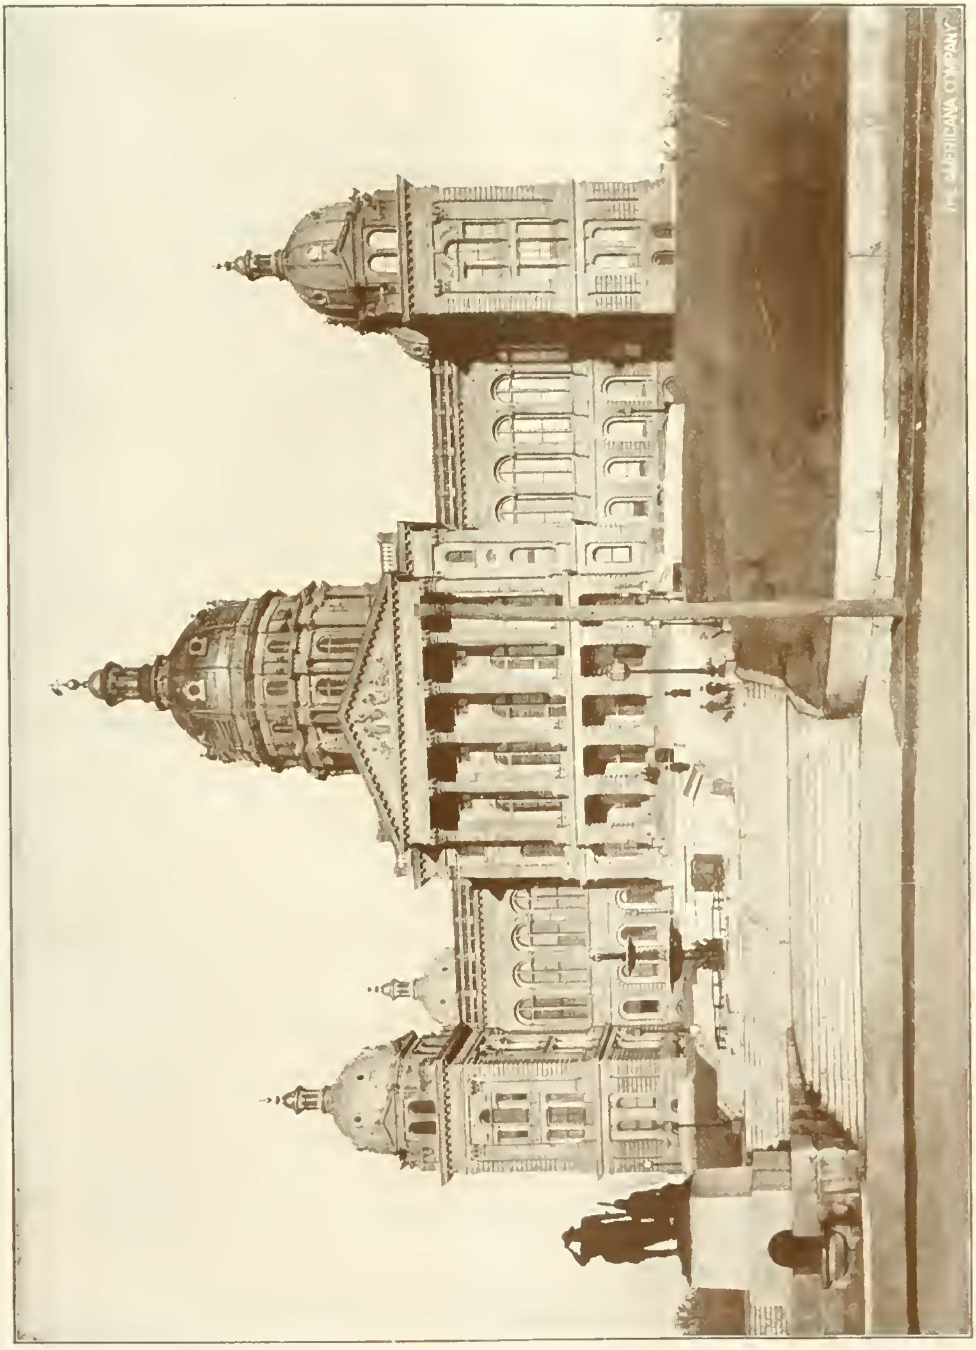
Stock-Raising.— Iowa stands near the top in the value of live stock, $278,830,096 in 1900; and it is significant that while one State, Texas, surpassed it in number of neat cattle,— 9,428,196 to 5,367,630 — the difference in values was only as $163,228,904 to $142,518,902; the average Iowa animal being worth $26.55 against the Texan's $17.31. In dairy cows New York alone takes precedence, and the value of dairy products in 1900 was $18,810,000. That of poultry and eggs was $10,508,000. Great care is taken to have the best breeds of stock, and this alone accounts for the difference in value of the Iowa and the Texas cattle. The richness of the milk is due largely to the breed. In the number of horses (1,268,016) and swine (9,723,791) Iowa led all the other States in 1900; and from 1850 to the last census there has been a steady increase in the number of swine, cattle, and horses.

Manufactures.— The State's fast-growing population and prosperity and its abundant and almost inexhaustible supply of bituminous coal have, together, within the last decade given a rapid impetus to manufacturing. Small factories have enlarged and many new factories have sprung up. Not a few of these are assuming large proportions. In 1900 Iowa manufactured 7,800 cultivators, 5,000 equalizers, 7,560 harrows, 34,500 hoes, 13,638 plows, 2,021 seeders, 100 drills, 3,720 harvesters, 3,775 hay-carriers, 10,980 dozen hay-forks, 5,809 horse hay-rakes, 79,296 scythes, 58,003 separators, etc., representing a total value of $1,343,455 — a gain of over $400,000 in a single year. In the same year Iowa's product of metal-working machines was valued at $273,501. There is but one manufactory of typewriters in Iowa (Des Moines), but it is fast becoming one of the foremost in the country, exporting largely to Great Britain, France, and the colonies. The output of carriages and wagons in 1900 was $4,087,400; product of paints was $336,867; chemical industries paid $70,022 in wages. A curious industry has sprung up in and about Muscatine — the manufacture of pearl buttons from mussel shells found in the beds of streams. Almost unknown, it has grown to huge proportions, and now that the manufacturers have united in the protection of the sources of supply, the future of this industry is assured. The value of its products in 1900 was $866,538, more than one fourth of which went for wages. The industry is now chiefly confined to the cutting of blanks for the eastern market. Iowa has 702 flouring and grist mills, two with a capacity of 100,000 barrels annually. The output of its mills in bushels is: wheat, 12,521,953; corn, 6,352,045; rye, 458,763; buckwheat, 277,593; barley, 538,740; other grain, 5,859,842. Cedar Rapids, Fort Dodge, and Muscatine have extensive oatmeal mills; the one at Cedar Rapids is said to be the largest in the world. The grand total of food products in 1900 was $142,000,000. The slaughtering and meat-packing industry represented in 1900 a total product amounting to $25,695,044. Cheese, butter and condensed-milk factory product in 1900 was $15,846,077 — an increase of nearly 50 per cent in 10 years. The fruit and vegetable canning product in 1900 was $1,350,958 — a gain of over $800,000 in 10 years. Iowa ranks third in the canning of corn. The starch product in 1900 was $806,831 — a gain of over $500,000 in 10 years; product of boots and shoes in 1900 was $7[illegible],141, a gain of over $200,000 in 10 years; product of gloves and mittens in 1900 was $142,600; product of planing mills in 1900 was $[illegible]. A fact not generally understood is that there is more timber in Iowa to-day than at any other time in its history. The clay products, which were $175,165 in 1890, had increased in 10 years to $2,224,920; to this should be added brick and tile products, which in 1900 aggregated $1,97[illegible]; also pottery, terra-cotta and fire-clay products, $192,702. The paper product in 1900 was $[illegible]43,776. Dubuque has the only ship-building plant in the interior. Among the larger cities Des Moines leads in brick-making (over 25,000,000 annually), proprietary medicines, book and job printing and binding, typewriters and hosiery; Sioux City, Ottumwa, Cedar Rapids, and Des Moines in meat-packing; Davenport, Dubuque, Burlington, Des Moines, and Ottumwa in foundries and machine works; Dubuque, Council Bluffs, and Grinnell in carriages; Burlington, Davenport, Des Moines, Dubuque, Ottumwa, Keokuk, and Oskaloosa in cigars; Sioux City, Des Moines, Cedar Rapids, Fort Dodge, Mason City, in flour and other food products; Des Moines, Ottumwa, Grinnell, Newton and Fort Madison in farm and other machinery; the principal river cities in malt products. The total value of manufactured products in 1900 was $164,617,877 — an increase of over 31 per cent in 10 years; the capital represented in 14,819 factories was $102,733,103 — an increase of over 32 per cent; the wages paid the 58,553 employes was $23,931,680 — an increase of over 17 per cent. These figures, showing enormous growth in the last decade, are a surprise to those who regard Iowa as distinctively an agricultural State.

Transportation and Commerce.— Several of the interior rivers are navigable for small boats, the Des Moines for 100 miles, the Missouri for fair-sized steamers its whole length, and the Mississippi for large ones. But the first named are not used to any extent; they have been superseded by railroads; the shifting channel, sandbars and snags of the Missouri make its navigation dangerous and slow. Only the Mississippi remains in practical use. The State, lying in the main path of transcontinental commerce, and originating much well-distributed local traffic, is a vast network of railroads, seven of the great trunk lines crossing it. Every one of the 99 counties has at least one railroad. The farthest distance between railroads at any point in the State is 13.79 miles. In 1903 it had 9,855 miles of road, exclusive of electric lines.

Banking and Insurance.— Iowa has the greatest number of banking institutions of any State in the United States. In August 1903, it had 1,482, divided into 258 national banks, 245 State banks, 350 savings banks, and 561 private banks. The State banks had capital of $10,445,800; deposits, $45,268,974.73; surplus, $1,718,832.41. The savings banks had capital $11,565,500; deposits, $87,620,377.34; surplus, $2,173,462.88. Total capital of all banks in the State, $53,435,020; total deposits, $264,803,000. Iowa is rapidly gaining prominence in the insurance world. In life insurance it promises soon to become a formidable competitor with the Eastern States. In 1902 there were 42 life insurance companies having headquarters in the State, and of this number 24 were located in Des Moines, "the Hartford of the West." Of the 42, 10 were "old line" life companies, carrying insurance to the amount of $36,972,257; 8 were assessment companies, carrying $209,955,500; 16 were fraternal benefit associations, carrying $168,418,000. Total of insurance carried by Iowa companies, $415,345,757.

Education.— Iowa stands second in the literacy of its population; 99.63 per cent of those from 10 to 14 years were, in 1900, able to read and write, although there was no compulsory attendance law prior to 1902. In 1902 it ex-



STATE CAPITOL AT DES MOINES

pended $9,556,890 on its schools, there being 18,513 schoolrooms with 22,708 teachers holding certificates. The enrollment of children in the public schools in that year reached 560,173. There has been a liberal increase in the wages of teachers during the school year of 1902 and 1903. About one third of the schools are located in towns and cities and two thirds in the country. Relatively few of the teachers have had normal training. One State normal school and several private normal schools were in operation in 1900. In 1902 the State normal school had 28 professors and 28 other teachers, with 2,065 students. Under a law passed in 1902, 16 private schools have become accredited for the training of teachers under State supervision. For higher education there are about 200 public high schools and a number of private academies. The courses of study pursued are of high standard and generally uniform. The State University, the head of the public school system, is at Iowa City, the former capital, with law, medical, dental, and other colleges, which in 1902 had 48 professors, 111 other teachers, and 1,512 students. There is also a State College of Agriculture and the Mechanic Arts, located at Ames, which in 1902 had 32 professors, 43 other teachers, and 1,480 students. In 1902 a "Memorial University," at present a military academy, was opened at Mason City by the national order of the Sons of Veterans. Connected with certain of the public secondary schools there are 20 training classes for teachers. Among the private schools of the State there are 16 business colleges and 26 academies. Under the auspices of the Roman Catholic Church there are in the State 25 schools for higher education (academies and colleges), with an attendance of 4,040 pupils, 3 normal schools, 167 parish schools, with an attendance of 22,529 pupils. Iowa was one of the first States to pass a township school law. This law has enabled a number of towns to better their school facilities. In 1895 Buffalo Centre township, for example, was organized into a school township, and within four years all the district schools except two were closed and the pupils were transported to a central graded school. The law makes provision for the transportation, at public expense, of children living remote from the central school. The State report for 1901 shows that consolidation has been tried in 28 counties, transportation in 35, and both in 19. Good results were reported in 27 counties, doubtful in 5 counties. Bad roads are the chief obstacle in the doubtful counties, but a vigorous "Good Roads" movement is minimizing this obstacle. Ninety-five per cent of the county superintendents for 1901 favored the plan.

Libraries.— In 1893 there were 83 public libraries in Iowa, as follows: Supported by the State, 12 (volumes, 118,974); college and academic, 24 (volumes, 95,114); association and subscription, 16 (volumes, 81,234); free public, 15 (volumes, 68,809); miscellaneous, 7 (volumes, 46,176); public school, 5 (volumes, 7,850); total, 418,157 volumes. In 1903 the number of libraries had increased to 248, as follows: Supported by State, 22 (volumes, 236,953); college and academic, 36 (volumes, 179,261); association and subscription, 32 (volumes, 52,080); free public, 70 (volumes, 336,305); miscellaneous, 11 (volumes, 89,159); public school, 77 (volumes, 75,982); total, 969,740 volumes.

Churches.— In the number of church societies in the State the denominations rank as follows: Methodist, Lutheran (three branches), Roman Catholic, Baptist, Christian (Disciples), Presbyterian, Congregationalist, United Brethren, Evangelical Association, Protestant Episcopal, Friends, Reformed, Adventist. There is one Roman Catholic archdiocese, with two dioceses. The non-polygamous Mormons or "Latter-day Saints," and the Amana Colony community of Christian Socialists, have a large and prosperous membership.

Charities and Penal Institutions.— The State charitable institutions are managed by a board of control appointed by the governor with the consent of the senate. There are four insane retreats: at Clarinda, Mt. Pleasant, Independence, and Cherokee; besides four private asylums; a school for the deaf at Council Bluffs; a school for the blind at Vinton; an institution for feeble-minded children at Glenwood; a soldiers' home at Marshalltown; and a home for soldiers' orphans at Davenport. There are State penitentiaries at Anamosa and Fort Madison, both have adopted the graded system; an industrial school for boys at Eldora, and one for girls at Mitchellville. L. S. Coffin has established a home for ex-convicts on his farm near Fort Dodge.

State Government.— The constitution was adopted in 1857. By law, the electors must vote once in 10 years on calling a convention to revise the constitution, which convention the legislature must call if so voted. All amendments must receive a majority vote of both houses at two successive legislatures, and then be passed by popular vote. The Senate has 50 four-year members, the House 100 two-year; legislative sessions are biennial. Bills must have a majority of all members elected to both houses — not merely present. A two-thirds vote overcomes the governor's veto. Executive officials are elected for two years — half in one year and half in the alternates, with the exception of the railway commissioners, who are elected for three; the railroad commission has power to regulate rates, etc. The judiciary consists of a supreme court, with a chief justice who is such by reason of priority of election, and five associate judges, one chosen every year; also 53 district judges in 20 districts, each serving four years. Women may vote only on school questions involving the expenditure of money. All incorporated towns of 2,000 people and over are ranked as cities; all platted but unincorporated towns are villages. In 1902 there was a militia of 2,474 officers and enlisted men. The number of representatives to Congress is 11. In politics the State has been Republican since the organization of the party, except in the years 1890–4, when the advocacy of prohibition drove it into retirement. The prohibitory amendment adopted in 1882 was pronounced unconstitutional by the supreme court of the State, and was succeeded by prohibitory laws which after several years' trial were in turn succeeded by a local option law, under which 54 of the 99 counties were reported in 1903 as wholly free from saloons.

Finances.— The State has no debt except one of $10,936 to its own school fund, which debt by provision of the constitution is a permanent one. It had a balance in the treasury 1 Jan. 1903, of $926,916.65. Local taxation is limited to 1 per cent of valuation for current expenses, but this may be exceeded for waterworks, sewers, schools, etc. The State as a whole cannot incur a debt greater than $250,000 except for war purposes, and cannot loan its credit to any person or association: counties and towns cannot run in debt to over 5 per cent of their actual valuation. The average income is about $3,000,000 a year.

Population and Divisions.— Iowa ranks tenth among the States in population. The population was 43,112 in 1840; (1850), 192,214; (1860), 674,913; (1870), 1,194,020; (1880), 1,624,615; (1890), 1,911,896; (1900), 2,231,853. The original population was part of the great Free-State movement which peopled the central States except Indiana. Of the entire population (1900), 305,920 were foreign-born. Of these 123,162 were from Germany; 72,611 from Scandinavia, or nearly two thirds from the Teutonic nations; besides several thousands from German Austria and Switzerland. From England and English Canada were 35,195, French Canadians 14,168, Ireland 28,321, Holland 9,388. Colored, 12,693. There were 81,845 more males than females. There are no great centres of population. The capital, Des Moines, on the river of the name, is the largest, with 62,139. On the same river to the north is Fort Dodge, an old frontier fort and settlement (12,162), and below it Ottumwa (18,197) and Keokuk (14,641). The Mississippi River business is chiefly represented, from north to south, by Dubuque (36,297 — the first settled site in the State), Clinton (22,698), Davenport (35,254), Muscatine (14,073), Burlington (23,201), Fort Madison (9,278), and Keokuk, the "Gate City," at the mouth of the Des Moines. Sioux City (33,111), in the extreme west near the mouth of the Big Sioux, and Council Bluffs (25,802), opposite Omaha, the old terminus of the Union Pacific, represent the Missouri River; Cedar Rapids (25,656) and Waterloo (12,580), the valley of the Cedar River; and Marshalltown (11,544), the valley of the Iowa River.

History.— The territory now included in Iowa was originally inhabited by the Ioway and Illinois tribes of Indians, which were driven out by the Sacs and Foxes. In 1761 the 'Ioway' or Iowa tribes were on the east side of the Missouri River and near the headwaters of the Des Moines; but in 1805 they were occupying land on the south side of the Des Moines River. Later they left the vicinity of the Des Moines, some going to the reservation of the Foxes and Sacs (now Oklahoma), others to a reservation in Kansas. The missionary, Father Marquette, and Joliet, the fur trader, were the first white men known to have traveled in this section. In 1673 they visited the tribes of Indians along the Mississippi River, and first landed on Iowa soil near the mouth of the river now known by the name Iowa. In 1788 a party of 10 white men under Julien Dubuque established the first white settlement at the place now occupied by the city of Dubuque. They were attracted to this locality because of the lead deposits in the vicinity. They opened mines, but how successful they were may be conjectured from the fact that after the death of Dubuque, in 1810, his associates abandoned the settlement. All that portion of country drained by the Mississippi was claimed by France because of the explorations made by Marquette and some of his companions, and because of settlements made by other Frenchmen. France's claim to this territory was ceded by treaty to Spain in 1763, but the country was returned to France in 1800-1. In 1803 all the territory now known as the "Louisiana Purchase" (q.v.) was bought of France by the United States government. The territory now the State of Iowa was part of the Territories of Louisiana in 1805; of Missouri in 1812; of Michigan in 1834; of Wisconsin in 1836. Iowa became an independent territory in 1838, and was admitted as a State in 1846. The Indian claims to lands within the boundaries of the State were purchased by the United States government before its admission as a State. The last purchase was made in 1843. Remnants of the Sacs and Foxes occupy a reservation, 419 acres, in Tama County, and still receive annuities from the government. In 1832 a settlement was made at Fort Madison, an abandoned government post, and soon after Burlington was founded, and in 1830 a settlement was again made at Dubuque. In 1857 the Indians attacked the settlers living near the Okoboji lakes and Spirit lake, in Dickinson County, and about 30 whites were killed and nearly all the houses burned. This action on the part of the Indians retarded for some years the growth of that section of the State. Iowa City was first selected for the Territorial capital (it became the State capital in 1846), but in 1857 the capital was changed to Des Moines. Iowa had in the Federal army during the Civil War 75,839 men, which was about one tenth of her population. Some of this number were in regiments belonging to other States. Consult: Aldrich, 'Annals of Iowa'; State Historical Society publications; Shambaugh, 'Documentary Material Relating to the History of Iowa'; Monette, 'History and Discovery of the Mississippi Valley'; Iowa Geological Survey publications; Shambaugh, 'History of the Constitutions of Iowa' and 'Messages and Proclamations of the Governors of Iowa'; Gue, 'History of Iowa.'

JOHNSON BRIGHAM,
Librarian, Iowa State Library.

Iowa Central Railway Company.— *History.* — The Eldora Railroad and Coal Company was organized in 1866 to build a railroad from Eldora northward to a junction with the Dubuque and Sioux City Railroad at Ackley, Iowa, a distance of about 17 miles, and to engage in the business of mining and selling coal. The company received about 1,200 acres of coal lands (about 600 acres thereof in fee simple and the rest by ground lease) as a consideration for completing the work within a specified time. The road was opened in July, 1868. It was then decided to extend the line 28 miles southward to a junction with the Chicago and Northwestern Railway at Marshalltown, Iowa. This necessitated a reorganization of the company, which was effected in August, 1868. In the reorganization, the coal interests were turned over to the Eldora Coal Mining Company and the railroad property to the Iowa River Railway Company. The capital stock of the latter was limited to $30,000 per mile and the first mortgage bonds were issued at the rate of $16,000 per mile, about $400,000 of them being used to retire an issue of bonds of the Eldora Railroad and Coal Company. The extension to Marshalltown was completed in December, 1869, the line being formally opened from Ackley to Marshalltown on 7 Jan. 1870. At about the same time the Saint Louis and Saint Paul Railway Company was organized under the auspices of the Iowa River Railway Company, to build a railroad from Ackley to the Minnesota State Line, and an independent corporation, the Iowa Central Railroad Company, was organized to build a north and south line, starting from the Missouri State Line at a point near the boundary of Appanoosa and Davis Counties and running northerly and northeasterly through Albia, Eddyville, Oskaloosa, Grinnell, Toledo and Cedar Falls to the Minnesota State Line. In 1870, the Iowa River Railway Company, the Saint Louis and Saint Paul Railway Company and the Iowa Central Railroad Company were consolidated under the name of Central Railroad Company of Iowa. The Iowa River Railway Company had in operation at the time 45.92 miles of railroad which was turned over to the consolidated company under an even exchange of $30,000 in stock and $15,000 in first mortgage bonds per mile. The entire issue of bonds of the Iowa River Railway Company was retired and the mortgage cancelled. A contract was made with the Iowa Valley Construction Company to complete and equip the road from Marshalltown to the Missouri State Line and from Ackley to the Minnesota State Line in consideration of receiving $30,000 per mile in stock and $16,000 per mile in first mortgage bonds, together with local aid guaranteed at $2,500 per mile. The entire line from Albia to Mason City, Iowa, a length of 178.72 miles, was completed and opened for traffic on 7 Feb. 1871. On 15 June 1871, the company made final settlement with the construction company for the 132.8 miles of new road, and was released from any obligation to build the rest of the projected line. The extension from Mason City to Northwood, 20.73 miles, was commenced on 1 Aug. 1871, and completed on 10 Oct. 1871. The total length of line in operation on 1 Jan. 1872, was 202.11 miles, the cost of the road being represented by $4,644,630 of capital stock, $3,700,000 of the first mortgage bonds and $609,000 of second mortgage bonds. Default having been made in payment of second mortgage interest due 15 April 1873, and of first mortgage interest due 15 July 1873, the property was placed in the hands of a receiver. The company was reorganized on 4 June 1879, under the Central Iowa Railway Company and took over the property after foreclosure sale on 18 June 1879.

In 1880–1882 the company constructed the following lines: Montezuma branch, 13.61 miles; State Centre branch, 25.64 miles; Story branch, 34.5 miles; Belmond branch, 22.20 miles; Keithsburg branch (Oskaloosa to west bank of Mississippi River), 97.16 miles, and Newton branch, 27.75 miles. The Peoria and Farmington Railroad, extending from Iowa Junction, Ill., to the east bank of the Mississippi River, a distance of 88.65 miles, was purchased in May, 1883, the company at the same time securing the right to run its trains into Peoria, Ill., over the tracks of the Peoria and Pekin Union Railway. First mortgage bonds to the amount of $1,531,000 were issued on the Keithsburg and Newton branches, and to the amount of $1,200,000 on the Montezuma, State Centre, Story and Belmond branches, both issues being dated 1 April 1882, and payable 30 years thereafter, with interest at the rate of 7 per cent. per annum, payable semi-annually. Also, $1,517,000 6 per cent. 45-year bonds dated 1 June 1879, secured by first mortgage on the Illinois division, were assumed from the Peoria and Farmington Railroad Company. Default was made in payment of interest due 1 Oct. 1884, and was followed by defaults under the main line and Illinois mortgages. A receiver was appointed 1 Dec. 1886. In pursuance of a plan of reorganization the road was sold under foreclosure of the several divisional mortgages, the sales taking place in September and November, 1887, and in March, 1888. The present company was organized by the purchasers taking over the property on 15 May 1889.

Lease of Iowa Central and Western Railway.— The company leases for 50 years from 1 July 1901, with rights of purchase at any time during the continuance of the lease, the Iowa Central and Western Railway, from Belmond to Algona, Ia., a distance of 37 miles, upon condition that it shall maintain the property, paying, in addition to all taxes lawfully assessed, 20 per cent. of all gross earnings accruing from the operation of the property. The earnings are to be applied to the payment of interest and principal upon the bonds of the Iowa Central and Western Railway Company as the same may become due and payable, and the Iowa Central Railway Company guarantees to make good any deficiency that may arise.

Traffic Agreement with Chicago, Burlington and Quincy Railroad Company.— Under an agreement effective 16 Jan. 1905, this company's freight business between Oskaloosa and Des Moines, Ia., is handled by the Chicago, Burlington and Quincy Railroad Company at an agreed rate per loaded car.

F. H. Davis,
Vice-President.

Iowa City, Iowa, city and county-seat of Johnson County, on the Iowa River, and the Burlington, C. R. & N., and the Chicago, R. I. & P. R.R.'s; 54 miles west of Davenport. The city is pleasantly built on a succession of plateaus, rising one above another from the river banks, which are here high. The first plateau is laid out as a public promenade, and the third, which is about 30 feet higher than the first, is crowned by a handsome Doric edifice 120 feet long and 60 feet wide, of a beautifully marked stone quarried in the vicinity called "bird's-eye marble." This building was originally intended for the State capitol, but, on the removal of the seat of government to Des Moines, was appropriated to the State University. From 1839 to 1854, this was the seat of the Territorial and State governments. It is the seat of the State University of Iowa, the Iowa State Academy, the State Historical Society and Library, the Homœopathic, Allopathic, and Mercy hospitals. It is the farming trade centre for Johnson, Cedar, and Iowa counties, with an annual trade exceeding $1,000,000; has excellent power provided by the Iowa River; and has manufactories of flour, iron, woolen goods, perfumery, gloves, jewelry, fencing, and linseed oil. The city has electric light and street railroad plants, waterworks on the Holly system, numerous churches, and an assessed property valuation of about $6,500,000. Besides its manufacturing interests the city has an extensive stock-raising and meat-packing industry. Pop. (1890) 7,016; (1900) 7,987.

Iowa College, a coeducational institution founded in 1847 at Grinnell, Ia.; under the auspices of the Congregational Church. In 1901 it had 33 professors and instructors, 411 students, 27,000 volumes in the library; productive funds, $470,000; grounds and buildings valued at $150,000; and an income of $49,000.

Iowa River, a considerable stream in the State of Iowa rising in Hancock County, near the Minnesota State line and flowing southeast into the Mississippi River, north of Burlington. It is 300 miles in length, and is navigable to Iowa City, 80 miles from its mouth.

Iowa State College of Agriculture and Mechanic Arts, a coeducational institution for technical education at Ames, Iowa. It received a grant of land from Congress under the law of 1862, and was first opened in 1868. Regular courses are offered in agriculture, mechanical engineering, civil engineering, electrical engineering, mining engineering, technology, science as related to industry, and general and domestic science; special shorter courses are given in the fall and winter in dairying, agriculture and mechanics, horticulture and mechanics, and domestic science. The State Agricultural Experiment Station is also allied with the college. The annual income in 1902, including the Federal appropriation, was $120,000; there were 1,220 students in attendance, and 84 professors and instructors.

Iowa, State University of, an educational institution forming an integral part of the public school system of the State, situated at Iowa City. It was first opened in 1847, receiving control of lands given by the Federal government. (See COLLEGES, LAND GRANT.) The university is controlled by a board of regents of 2 ex-officio members and 11 elective members. Its work is organized in the following departments: the college of liberal arts (including the summer session), which offers courses leading to the degrees of A.B., B.S., and Ph.B.; the graduate college; the Iowa school of political and social science, with both undergraduate and graduate courses; the college of law; the college of medicine; the college of homœopathic medicine; and the college of dentistry. The library, which [illegible] by fire in 1897, now contains nearly [illegible] volumes; the university issues the following publications: 'Natural History Bulletin'; 'The Transit,' an engineering journal; 'The Law Bulletin'; 'The Bulletin of the [illegible] Medical College'; 'The University of Iowa Studies in Psychology'; 'The State University of Iowa Studies in Sociology, Economics, Politics and History.' The State appropriates over $125,000 annually to the university, and the total income amounts to over $[illegible] annually. In 1902 the number of students was [illegible]; the number of professors and instructors, [illegible].

Iowa Wesleyan University, a coeducational institution founded in 1844, at Mount Pleasant, Iowa; under the auspices of the Methodist Episcopal Church. In 1901 it had 20 professors and instructors, and 380 students. There are 5,000 volumes in the library. It has productive funds, $75,000; grounds and buildings valued at $150,000; benefactions, $32,000; and an income of $14,000.

I'owas, a tribe of American Indians of the Algonquin family. In 1800 the Iowas lived in Minnesota and soon after moved southward. They were called Palinchas, or "Dusty Noses," in their own tongue. Lewis and Clark, the explorers, designate them as the Ayanways, and the early French traders called them the Ajowes. In 1836 they moved to the Wolf River region west of the Mississippi, and in 1861 ceded 16,000 acres of land to the United States. The remnants of the tribe, some 1,000 in number, at present live on reservations in Oklahoma and Kansas. See also INDIANS, AMERICAN; IOWA.

Ipecac, or **Ipecacuanha**, a South American plant of the order *Rubiaceæ* variously called by botanists *Cephaelis ipecacuanha* and *Psychotria ipecacuanha*. The plant, which is found mainly in moist shady forests in Brazil, is a creeping herb or sub-shrub with mostly bare stems, only the extremities producing leaves. The small white blossoms, which are borne in heads with long stalks, are followed by dark purple berries. The rather fleshy more or less divided roots were in medicinal repute among the South American Indians, and gradually found their way into European medicine under the name "ipecacuanha." They have been considered emetic, nauseant, diaphoretic and expectorant, and in large doses are reputed poisonous. They appear in commerce in various grades (gray, brown and red), which are dependent mainly upon the season at which they are gathered, the way they are dried, the age of the plants, etc. The chief supplies are collected during January, February and March by the Indians. Owing to the slow growth of the plant and the low price the roots command, ipecac is not cultivated commercially; it has, however, been successfully grown in various parts of the world. The roots of several other plants are substituted for those of true ipecac, among the best known being those of *Tylophora asthmatica* and *Sarcostemma glaucum* (Venezuelan ipecac), both of the natural order *Asclepiadaceæ*. Other species of *Psychotria* and certain species of *Richardsonia* are similarly but unofficially employed.

Wild or American ipecac (*Gillenia stipulacea*) of the rose family, is a common plant in the southeastern United States and as far north as western New York. It is a perennial herb about three feet tall, bearing paniculate corymbs of white or pale rose colored flowers. It is hardy, of simplest culture and being graceful is frequently planted for ornament in flower borders where the soil is of good quality.

Iphicrates, ī-fĭk'ra-tēz, Athenian commander: b. and d. in the 4th century B.C. Of humble origin, he raised himself to eminence by his courage and talents. In the war of Corinth (393–2 B.C.) he opposed with success Agesilaus, the warlike king of Sparta. He was sent to the Hellespont to act against Anaxibius, but in spite of his victory was unable to prevent the conclusion of the shameful Peace of Antalcidas (387 B.C.). In 369 B.C. he was appointed to the command of the troops sent by the Athenians to the assistance of Sparta, on the invasion of Epaminondas, but allowed the Theban general to retreat from the Peloponnesus. In the Social War (357–5) he was one of the commanders of the fleet fitted out by the Athenians for the recovery of Byzantium. Being accused of treachery and neglect of duty in the battle at the Hellespont, by one of his colleagues, Chares, and put on trial, he was acquitted, while his colleague Timotheus was fined 100 talents; but though he lived to a great age, did not again engage in active service. Iphicrates was the author of some improvements in Greek arms and accoutrements. He was accustomed always to fortify his camp in the field even in a friendly country; "Because," he said, "if, contrary to probability, I should be attacked, I may not be obliged to make the disgraceful excuse that I did not expect it."

Iphigenia, ĭf-ĭ-jē-nī'a, in Greek legend, a daughter of Agamemnon and Clytemnestra (according to some an illegitimate daughter of Theseus and Helen), who was to have been sacrificed to Artemis (Diana) at the advice of the prophet Calchas, when the goddess, enraged with Agamemnon, detained the Greek fleet in Aulis by a calm. Under pretense that she was to be married to Achilles, Iphigenia was led to the altar. But in the moment when the priest was about to give the death-blow Iphigenia disappeared, and in her stead a beautiful hind was substituted, whose blood gushed out on the altar. Artemis had relented, and conveyed her in a cloud to Tauris, where she became the priestess of the goddess. Conformably with the law of the country, she was obliged to sacrifice every Greek that landed there. While serving as priestess her brother Orestes came to take away the image of Artemis, as he had been advised by an oracle to do, that he might get rid of the madness to which he had been subject since the murder of his mother. Iphigenia having recognized him as her brother, the two contrived a means of escape, and carried off with them the image. The story of Iphigenia was dramatized by Euripides (who composed two plays upon the subject — 'Iphigenia in Aulis' and 'Iphigenia in Tauris'), and Goethe, and it is also the subject of two operas by Gluck, 'Iphigenie en Aulide' (1774); and 'Iphigénie en Tauride' (1779).

Ipomæa, ĭp-ō-mē'a, a genus of plants, including several hundred species, of the order *Convolvulaceæ,* consisting mostly of twining prostrate herbs, widely distributed in warm regions. The species of most importance is *I. Purga,* which yields the jalap of commerce. Some are cultivated for the beauty of their flowers, and are known to gardeners as convolvuli. *I. purpurea* is the best known garden species. See JALAP.

Ips'wich, Mass., town in Essex County, on the Ipswich River near its mouth, and on the Boston & Maine railroad, 27 miles northeast of Boston, and 9 miles south of Newburyport. As Agawam, it was settled in 1633 by John Winthrop and 12 others. The name was changed to Ipswich (after Ipswich, England), in the following year, by resolution of the Massachusetts General Court. As early as 1634 it had a meeting-house, while in 1642 the first free school in the town was established. Ipswich was among the foremost towns of Massachusetts in resisting the arbitrary taxation introduced under Gov. Andros in 1687, and a number of its citizens suffered punishment in consequence of this action, which foreshadowed the stand to be taken later, by this town and the colonies generally, against similar policies on the part of the British government. Among the distinguished persons who at some time lived at Ipswich were Anne Bradstreet, Nicholas Easton, William Hubbard, John Norton, and others. The town has various industries, among the articles manufactured being grist-mill products, hosiery and underwear, bricks, lumber and boxes, carriages, cabinet-work, soap, isinglass, heels, etc. The Manning High school, the Ipswich Historical Society, and the excellent public library give the town rank and influence in educational and literary affairs. Pop. (1900) 4,658.

Iquique, ē-kē'kā, Chile, a seaport in the province of Tarapacá, till quite recently merely a small fishing village, but now a town of about 34,000 inhabitants. It owes its prosperity to the export of nitrate of soda and borax, the former of which especially is found in great quantities in the pampa of Tamarugal. The annual export of nitrate amounts to about 350,000 tons, and that of borax to about 1,500 tons. Iodine is also exported. The pampa of Tamarugal still contains, it is estimated, about 60,000,000 tons of soda niter. In 1868, and again in 1877, the town was almost entirely destroyed by an earthquake. In 1879 it was bombarded and captured by Chile from Peru; and in 1891 it was much damaged by insurgents.

Iquitos, ē-kē'tōs, a native tribe in Peru, residing at Loreto, on the left bank of the Marañon, about 75 miles above the mouth of the Rio Napo. The settlement has an active trade, valued at $2,000,000 annually; the imports are exchanged mostly for india rubber. In 1900 they numbered about 12,000.

Irade, ĭ-rä'dĕ, a Turkish decree or command of the Sultan, directed to his grand vizier, whose duty it is to announce it to the public.

Iran, ē-rän', the name given by the ancient Persians to their native land, in opposition to Aniran (that is, Not Iran), the land of the barbarians, by which term were meant principally the Turco-Tartaric tribes bordering on the north. The Persian rulers of the dynasty of the Sassanidæ call themselves, in inscriptions on monuments and elsewhere, kings of Iran and Aniran. At the present day the name is used in contradistinction to Turan, the name applied to the more depressed regions of Asia inhabited by the Turco-Tartaric tribes, to designate the great table-land of Asia, which has a mean elevation of from 3,500 to 4,000 feet. The central portion of this table-land consists of an extensive salt-desert.

Iranian (ī-rā'nĭ-an) **Languages**, a family of the Indo-European languages, closely allied to the Indian group, and called by some philologists Persian, from the best known member of the family. The two oldest known Iranian languages are the Old Persian and Zend. The former — that of the cuneiform inscriptions of the Achæmenian dynasty, and the language of the Persians proper — has only become known in its chief traits at a comparatively recent date through the deciphering of those inscriptions. The Zend is the language in which the Zend-avesta, the sacred writings of the Parsees, are composed. By the term Middle Iranian languages the Huzvaresh or Pehlevi and the Parsi principally are understood, which are preserved in the commentaries to the Zend-avesta. The latter approaches to the modern Persian. The dialect of the Pehlevi coins, as well as the inscriptions of the time of the Sassanian dynasty, also belong to this section. The most important of the New Iranian languages is the Persian. The Afghan, or Pashtu, and the dialects of the Kurds, form separate branches of the Iranian family. The isolated Ossetes of the Caucasus also speak an Iranian language. The Armenian is a branch of the same stock, and contains many peculiar elements.

Irawadi, ĭr-a-wăd'ĭ, or **Irrawady**, one of the great rivers of Southern Asia, traversing Burma in a southerly course. One branch of it rises near the eastern extremity of Assam, another branch rises in East Tibet, the two branches uniting about lat. 26°. It has generally a south course, being deflected west, and its total length has been estimated at 1,200 miles. There are three rocky defiles in which its channel is suddenly contracted, the lowest near Mandalay; but from that point downward to its delta it has generally a breadth of from 1 to 4 miles. About 140 miles from the Indian Ocean, which it enters by numerous mouths, the delta commences. The current of the Irawadi is commonly gentle — even in its upper part being no more than at the rate of two miles an hour; except during the inundations, when it flows so rapidly that no sailing vessels could navigate it but for the assistance of the southwest monsoon. It is navigable from the sea upward for steamers of five feet draft to the Chinese frontier, 900 miles from the sea.

Iredell, īr'dĕl, **James**, American jurist: b. Lewes, Sussex, England, 5 Oct. 1751; d. Edenton, N. C., 20 Oct. 1799. He was appointed comptroller of customs at Port Roanoke, now Edenton, where he arrived in 1768, retained this office several years, and meanwhile studied law. He was appointed by the attorney-general his deputy in 1774, and in 1777 was placed by the legislature on the bench of the supreme court, then just organized under the State constitution. In 1787 he was designated by the general assembly sole commissioner to collect and revise the acts of previous assemblies, which were to be considered in force in North Carolina. This collection of the laws, now referred to as "Iredell's Revisal," was published in 1791. In February 1790 he became one of the justices of the Supreme Court of the United States, and held that office till his death. The 'Life and Correspondence' of Iredell was published in 1857.

Iredell, James, American lawyer, son of the preceding: b. Edenton, N. C., 2 Nov. 1788; d. Raleigh, N. C., 13 April 1853. He was graduated at Princeton in 1806, and was bred to the bar. He served for 10 years in the house of commons of his native State, and twice as speaker in a house of which the majority were politically opposed to him. In 1827 he was governor of North Carolina, and from 1828 to 1831 a member of the Senate of the United States. He afterward resumed the practice of his profession at Raleigh, where he was also for many years reporter of the decisions of the supreme court of North Carolina. In 1833 he was appointed by Gov. Swain one of three commissioners to collect and revise all the statutes in force in North Carolina. The result was the work known as the 'Revised Statutes.' He afterward published a 'Treatise on the Law of Executors and Administrators.'

Ireland, īr'land, **Alleyne**, American author and lecturer: b. Manchester, England, 19 Jan. 1871. He was educated at the University of Berlin, traveled widely, lectured on tropical colonization at Cornell University in 1899, and in 1900 was appointed lecturer in politics at the University of Chicago, where his subjects were tropical colonization and Chinese foreign relations. Besides contributions to periodicals, he has written: 'Georgetown, Demerara' (1897); 'Tropical Colonization' (1899); 'The Anglo-Boer Conflict' (1900); 'China and the Powers' (1901).

Ireland, John, American Roman Catholic prelate: b. Burnchurch, County Kilkenny, Ireland, 11 Sept. 1838. He came to America in 1849 and attended the Cathedral school at Saint Paul, Minn., and in 1853 went to France and studied theology in the seminary of Meximieux and subsequently in that of Hyeres, remaining there till 1861, when he returned to Saint Paul and was ordained priest on the 21st of December. During the early part of the Civil War Father Ireland tendered his services as chaplain of the 5th Minnesota regiment and later became rector of the cathedral, Saint Paul. An ardent advocate of temperance, he devoted much time and energy to promoting the cause, organized temperance societies and traveled about the country lecturing on the subject. For a time he was secretary to Bishop Grace of Saint Paul, whom he represented at the Vatican Council, Rome, 1870–71, and later became his coadjutor, being consecrated Titular Bishop of Maronea, 21 Dec. 1875. He was likewise very diligent in advancing Roman Catholic colonization in the northwest and not only founded colonies but became a director in the National Colonization Association. Later, in 1887, Bishop Ireland accompanied Bishop Keane to Rome to consult with Pope Leo XIII. upon the necessity of erecting a Catholic university in Washington, D. C., and on returning from Europe in 1888, he was made first archbishop of Saint Paul. He is a distinguished lecturer and pulpit orator, a contributor to the leading magazines, and a member of the American Federation of Labor. At present (1905) his diocese includes about 230,000 Catholics; 258 priests; 252 churches; 1 theological seminary; 90 parochial schools; 3 orphanages; 3 hospitals, and various other religious and educational institutions.

Ireland, Mary E. Haines, American translator and author: b. Calvert, Cecil County, Md., 9 Jan. 1834. In addition to serials and numerous other contributions to the periodical press, she wrote 'What I Told Dorcas' (1895), and 'Grandma Elliot's Farmhouse' (1900).

Ireland, William Henry, English literary forger: b. probably London 1777; d. there 17 April 1835. He imposed spurious Shakespearian

JOHN IRELAND,

ARCHBISHOP OF ST. PAUL.

MSS. upon his father, Samuel Ireland, a bookseller and engineer, who was a Shakespeare enthusiast, and also upon other men of letters, and produced two "Shaksperian" plays, 'Vortigern' and 'Henry II.,' the former of which was purchased by Sheridan and acted at Drury Lane, but was a complete failure. The criticisms of Malone led to the exposure of the fraud, which was acknowledged by Ireland in 1796. He wrote various novels, poems, etc., besides his 'Confessions' (1805), containing an account of his forgeries.

Ireland, the most westerly and smaller of the two principal islands of which the United Kingdom of Great Britain and Ireland is composed, extends from lat. 51° 26′ to 55° 21′ N.; its average width is about one fourth its length; area, 32,583 square miles. It is separated from England by Saint George's Channel and the Irish Sea, and from Scotland by a narrow passage, the North Channel. Ireland is on the continental shelf, or sub-marine plain, which borders the continental land mass of Europe, hence it is physically a part of Europe.

Topography.— The coast line is irregular; from Dundalk Bay to Wexford Harbor on the east there are less indentations than on any other part of the coast; Dublin Bay, an arm of the Irish Sea, is the only indentation of any size on this part of the island. Galway, Sligo and Donegal Bays are the largest on the western coast. The Atlantic currents, which beat against the western coast, have worn away the land in many places, thus causing fiords such as exist on the coasts of other countries subject to similar wave-action. Some of the many islands which fringe the coast have been formed by the washing away or the submergence of the land. The capes, promontories, and peninsulas have been formed largely by submergence. Some of the islands, all small, are Aran, Achill, Clare, and Rathlin. The chief ports are Cork, Dublin, Belfast, Waterford, and Londonderry. There are 14 harbors which will accommodate the largest ocean steamers.

The highlands are chiefly along the coast; the greater part of the interior is a plain. The mountains, more rounded hills than mountains, are short ranges with little or no connection except the several ranges in the southwest. Some of the mountains are Mourne, in County Down, the Wicklow Mountains, Knockmealdown and Galty in the south; Caha, Stack and other ranges in Kerry; Slieve Boughta in Galway, a number of short ranges in the counties of Mayo, Leitrim, Donegal, and Londonderry, and the Slieve Bloom between Queens and Kings counties. The majority of the peaks are less than 3,000 feet in height; Carrantuohill (Carrantual), in Kerry, near the Lakes of Killarney, is 3,404 feet, and Galty Mountains, in Limerick, are 3,015 feet. The plain in the interior is about 500 feet above sea-level.

Hydrography.— The rivers of Ireland, like those of England and Scotland, are small streams. The Shannon, the largest river in the British Isles, has its rise in the northeastern part of the province of Connaught, flows east, south, and west, forming quite a curve before entering the Atlantic Ocean, between the counties of Kerry and Clare. It passes through several lakes, the largest of which are Ree, Allen, and Derg. The estuary at the mouth is about 70 miles long; the whole length of the river is about 250 miles, 130 of which are navigable for large steamers. Its importance for transportation has been increased by the canals Royal and Grand, which connect it with Dublin. In the southwest, in County Kerry, is a short mountain stream called Roughly River, with a long, broad estuary called Kenmare River. The Liffey, which flows into the Irish Sea at Dublin, the Lee which flows into Cork Harbor, the Boyne with its tributary, the Blackwater, are all short streams which have been made famous in history and literature. The Foyle, Erne, Lagan, Moy, Slaney, and others reach the ocean through broad estuaries or bays. Lough Neagh in the northwest is the largest lake of the British Isles. A number of the lakes of Ireland occur along the river courses, but are really basins, and not merely expansions of the rivers. Lakes Corrib, Conn, Foyle, Belfast, Strangford, Carlingford, and others on the coast are estuaries or fiords, but the land-locked mouths entitle them to be called lakes, like Maracaibo in South America. The famous Lakes of Killarney are in County Kerry, in the southwestern part of the island. There is scarcely a place in Ireland that is more than 25 miles distance from water communication with the ocean.

Geology.— A limestone stratum belonging to the basal portion of the Carboniferous system underlies a large part of the interior plain. The upper Carboniferous rock has been destroyed by erosion except in a few places. Silurian rock underlies nearly all of the northern part, but the Cretaceous, Triassic, and Permian formations exist and appear at the surface in several places. Some of the cliffs of the north are of basaltic formation. The Giant's Causeway (q.v.) on the north coast of Antrim is basaltic. Its 40,000 or more, perfectly formed polygonal columns constitute remarkable specimens of this formation. Crystalline rocks form the axis of the mountains of the province of Connaught, and the highlands of Leinster. Old red sandstone and carboniferous limestone are found in the southwestern counties. Marble exists in large quantities in the county of Kilkenny and in parts of the adjacent counties coal of an anthracite variety is found, but not in large quantities; iron-ore exists in nearly every county. Copper of an excellent quality is in the western mountains, also gold and silver in small quantities.

Soil.— The erosion of the limestone rock which has been going on for ages has contributed largely to the fertility of the soil of Ireland. The igneous rocks, the red marls, and other mineral formations, have added to the richness of the soil, and all has been distributed, by the gradual removal of the ice-covering, over a large area of the plain. After deducting the area, about one fifth of the whole, which is covered by bog, mountain, and moorland, there is left a vast extent of arable surface covered with a deep friable loam of remarkable richness. In addition to the decomposed trap and the calcareous matter derived from the limestone, there is a large amount of vegetable mold which forms one of the most important ingredients of the soil. The bogs, useless for tillage, furnish peat for fuel. The Bog of Allen is the largest one in Ireland.

Climate.— The warm moist winds from the Atlantic blowing over Ireland affect its climate more than any other cause except its latitude.

The mean temperature is from 20° to 30° F. higher than other places in the same latitude on the eastern coast of America or the interior of Europe, and a few degrees higher than places in the same latitude on the west coast of America. The summer temperature is modified by the surrounding waters, being lower by a few degrees than inland places of the same latitude. The moisture brought by the winds from the ocean causes a heavy annual rainfall, and much fog, mist, and general dampness. The low mountains serve to some extent as condensing agents, so that the greatest rainfall is near the coast. The average rainfall on the west and south coasts was, in 1879, 43.56 inches; in 1896, 30.30. The averages for the interior were in 1879, 34.39 inches; in 1896, 34.07 inches.

Vegetation.— The climate and soil are very favorable for vegetation. Its mild temperature and humid atmosphere enable several delicate plants, which usually in the same latitude can be cultivated only in sheltered gardens, to flourish here with vigor in the open air; and frequently forest trees continue to retain their foliage after similar trees have lost their leaves in the warmest parts of England. The conditions would naturally indicate forests, and it seems that in early times, large tracts of magnificent timber were spread over its surface; but the grossest waste and mismanagement have prevailed, trees have almost disappeared except from the parks of the wealthy land-owners, or the "gentry"; and what ought to be among the best is about the worst wooded country in the middle latitudes of Europe. More attention is now being given to the subject of forestry; in 1901 there were 309,741 acres in Ireland under forest, a portion of which was a new growth. During the year, 1,740 acres were planted with trees, mostly fir, spruce, and larch. Grass grows luxuriantly in nearly all parts of the island.

Animals.— The fauna of Ireland consists now of birds and small rodents. Animals once found here and mentioned in the ancient literature, as the deer, bear, wildcat, wolf, beaver, cattle peculiar to the island, and certain birds (including the garefowl), have all disappeared. There are no snakes nor toads in Ireland. Fish are plentiful in the streams and on the coasts.

Fisheries.— The salmon fisheries are very valuable, and are increasing in value every year. With an increased supply of fish, high prices are maintained owing to the improved means of communication from remote districts with the best markets. In spite of this, however, these fisheries are not cultivated to anything like so high a degree as they might be. Still, the number of men engaged in the salmon fisheries in Ireland is over 13,000, the estimated value of the salmon exported being from $700,000 to $[illegible]50,000 annually. The principal sea fisheries of Ireland are those of herring and mackerel. The herring fisheries in the Irish waters are prosecuted chiefly on the east coast by Irish boats from Howth, Arklow, and other places on the Irish coast, and by a fleet of vessels from Cornwall, Scotland, and the Isle of Man. The number of boats engaged in this branch of the sea fishery is much smaller than in Scotland, from which considerable quantities of cured herrings are imported. The total number of vessels engaged in the sea fisheries is now about [illegible],525, the number of men and boys employed being about 26,200. The native fishermen, it is said, are now successfully competing with their rivals, yet the sea fisheries of Ireland on the whole have much declined, as shown by the decrease from 55,630 hands and 13,483 boats employed in 1860, to the figures just given.

Agriculture and Stock-raising.— The chief occupation is agriculture. The richness of the soil, its lightness that makes tillage easy, the large percentage of arable land, the amount of rainfall, the mildness of the climate, all combine to make Ireland an agricultural country. Despite the great extent of moorland-wastes and the large amount of bog-land, few countries raise, in proportion to the area, such a large amount of food products year after year. But with natural advantages above the average, agriculture as a system has not progressed as in many other countries. The wholesale confiscation of estates by the English gave the absentee landlord a large portion of the farm land of Ireland. The new owner usually cared only for his rent and gave little heed to improving the land, and showed no regard for the welfare of the man who tilled the soil. The holders and laborers received no encouragement to improve methods or make progress; on the contrary, they were handicapped in many ways, especially in the 18th century, when the English markets were closed to their products, and Ireland was excluded in a large measure from the commercial advantages given to the British possessions in other parts of the world. The holdings, or farms, originally too small to be occupied by farmers of capital and enterprise, were in many cases subdivided until they were reduced to the smallest patches, on the produce of which a family could barely subsist. One result of this poor policy was that the holders were obliged to raise as much as possible each year, for immediate use, without regard to the ultimate effect of this mode of farming upon the land. Competent authorities say that this over-cropping has had a most deleterious effect upon the land. Yet the soil must have been restored to some extent, by rotation of crops or by the use of fertilizers, for the average produce of the soil per acre, in 1902, was found to have increased over the years 1850 and 1860. In some cases the holdings were enlarged during the last years of the 19th century. Statistics show that a change in the kind of crops has been gradually taking place; a decrease in the acreage under cereals and green crops and an increase in the area under meadow and clover. The following table shows the distribution of the cultivated area, given in acres, the first years of the present century:

Year	Cereals	Green crops	Flax	Clover and hay	Pasture
1900	1,347,189	1,[illegible]8,377	47,451	1,218,717	11,510,370
1901	1,317,574	1,079,443	55,442	1,233,770	11,522,060
1902	1,306,398	1,070,440	49,7[illegible]6	1,228,498	11,375,592

The number of acres of farm land not under crops, but "resting," was, in 1900, 12,589; in 1901, 10,886; and in 1902, 9,558.

Between 1851 and 1881 the farms of 1 to 15 acres decreased in number by 66,363. The total number of holdings in 1891 was 486,865, or 12,244 less than in 1881. Of these 18,243 (1,364 more than in 1881) did not exceed 1 acre, 55,584 (decrease of 6,197) were from 1 to 5 acres, 130,-1[illegible]5 ([illegible]8,[illegible]28 decrease) from 5 to 15 acres, 120,472 (2,045 decrease) from 15 to 30 acres, and 139,401 (3,2[illegible]2 increase) above 30 acres. shows a decrease in the total number of holdings, but in Munster the number is very small. Between 1841 and 1899 there was a total decrease in holdings "above 1 acre" of 25 per cent.

The Land Act of 1870 greatly improved the conditions of tenure in Ireland. The chief aims of the act were to provide compensation to tenants for arbitrary eviction, and especially for improvements effected by them on their holdings in case of their being disturbed in their possession by the landlords, and to afford facilities to tenants for the purchase of their holdings. The act legalized what is called the Ulster tenant-right custom in all the districts in which it prevailed, and decreed the amount of compensation to be awarded in absence of such custom. In 1881 it was supplemented by a more thorough and comprehensive measure. The benefits conferred on Irish tenants by this act were briefly summarized under the terms "fair rent," "fixity of tenure," and "free sale." By the first of these every tenant who objected to his rent, or the rent the landlord wished to exact, was entitled to have a "fair rent" fixed for him by a court. The rent was to remain unaltered for 15 years, at the end of which period it might be readjusted, and raised or lowered. By the principle of "fixity of tenure" the law recognized that the tenant had a certain right in his holding in virtue of which he was not to be arbitrarily removed from it without compensation, and which enabled him on leaving his farm to obtain the best price he could for yielding up his possession. The "free sale" of this right of tenancy was restricted only in so far as that it must be to one person only (except under agreement with the landlord) that the landlord might object on sufficient grounds to the person purchasing, and that he also had the right of preemption. At the expiration of the 15 years the landlord might resume possession of the holding on paying the tenant compensation for improvements effected by him, and also paying him the value of his tenant-right, both being determined by the court should the parties be unable to agree. A tenant who sold his tenant-right on quitting his holding was not to be entitled to compensation for disturbance, or if he had received compensation he was not entitled at that time to sell his tenancy. A tenant holding under the Ulster tenant-right might sell under that or under this system, but not partly under one and partly under the other. The scale of compensation for disturbance of tenancy was fixed as follows: Where the rent was $146.70 or under, a sum not exceeding 7 years' rent; rent from $146.70 to $244.50, not exceeding 5 years' rent; from $244.50 to $489, not exceeding 4 years' rent; from $485 to $1,467, not exceeding 3 years' rent; from $1,467 to $2,445, not exceeding 2 years' rent; above $2,445, not exceeding 1 year's rent. The act also empowered the land commission to advance loans to tenants not exceeding three fourths of the value of their holdings, to enable them to become proprietors, and such loans were repayable by an annual payment of 5 per cent for 35 years. Provision was also made for assisting emigration. A tenant whose holding, or the aggregate of whose holdings, were valued at not less than $733.50, was entitled by writing to contract himself out of any of the provisions of this act, or of the act of 1870. Another act passed in 1887 extended the privileges conferred by the act of 1881, and a third act passed in 1896 went farther in the same direction. The Purchase of Land (Ireland) Act of 1891 supplied the Land Commission with further funds for advances to tenants to enable them to purchase their holdings. But the Land Purchase Act of 14 Aug. 1903, whereby the tenants may buy the farms and become independent of the landlords, is a great beginning toward a readjustment of agricultural conditions. The new law provides that the actual tenants or persons, or persons who have been tenants within 25 years, may purchase all the land they occupy or desire at prices varying according to the condition of the property, to be paid for upon the installment plan, the seller accepting a mortgage for a term of years, the government guaranteeing the payment at the ruling rate of interest. See GREAT BRITAIN—THE LAND LAWS; AGRICULTURE.

Stock-raising has increased in importance during late years. Statistics show that there are now in Ireland more cattle, in proportion to area, than in any other country of Europe. The following table will show the changes which have taken place since 1900:

YEAR	Horses	Cattle	Sheep	Pigs
1900......	491,156	4,608,550	4,386,876	1,268,521
1901......	491,430	4,673,323	4,378,750	1,219,135
1902......	509,284	4,785,204	4,215,740	1,372,592

England is the principal market for the cattle raised in Ireland. The breeds of horses vary with the locality; ponies are numerous in Connaught; hunters in the north of Leinster; and draft horses in nearly all the counties on the eastern coast. Much good has been effected by co-operative societies. The number of co-operative organizations in 1901 were as follows: 106 agricultural societies, 187 dairy and agricultural societies with 81 auxiliaries, 29 poultry societies, 103 co-operative banks, 46 miscellaneous societies, and 2 federations. The membership of the whole was 51,000.

Manufactures and Trade.— The linen manufacture early took root in Ireland, and still continues to be its most important staple; and in every article, except lace and cambric, competes successfully with all other countries. It has increased in a remarkable manner within the last 40 or 50 years, and Belfast, its centre, has now become the first city of Ireland in population as well as in manufacturing industry. The linen manufacture, indeed, is of importance; a large number of the factories are in Ulster. The cotton manufacture has had a very different history, the number employed in this industry having declined from 4,000 in 1868 to 800. The woolen manufacture appears at the outset to have outstripped that of linen. It had at least made such progress as to alarm the woolen manufacturers of England, who, in a spirit of petty jealousy, petitioned the English parliament for its discouragement, and succeeded. The Irish were prohibited from sending their woolens abroad, and could not even send them into England without paying an oppressive duty. Had the manufacture been suited to the country it might have surmounted all this absurdity and injustice; and, at all events, when these ceased to operate, would have revived. But the woolens of Ireland continue to be of very secondary importance, and indeed the manufacture seems to have much decreased in recent years. The tweed has retained its popularity. The manufacture of Irish poplins (of woolen and silk, or woolen and flax or cotton is very flourishing. The number of textile factories in 1890 was 203, which employed 71,788 persons. There are about 20 mills engaged in paper-making. The brewing of porter and distillation of whiskey form important items in the national production. The making of shirts and other clothing for men is becoming prominent. Ship-building was begun several years ago, and during the last of the 19th century it became quite prominent. The largest ship-building yards are in Belfast, where about 10,000 men and boys are employed. The ships of the White Star line are all built in Belfast. Ship-building is carried on to some extent at Dublin, Londonderry, and Haulbowline. Home work still flourishes; and the Irish hand-made laces and embroideries are still popular.

Commerce.— That of Ireland is not at all proportioned to her natural capabilities, and to the admirable facilities afforded by the excellent harbors situated on her coasts. The laws made by the British government to destroy the commerce of Ireland account in a large measure for the present condition of trade. The most important articles of export find a market in Great Britain. They consist chiefly of grain and flour, live stock, salt and fresh meat, eggs and butter. Manufactured articles, particularly linen, rank next in importance; but as the bulk of such articles is very small in comparison with their value, the trade, or at least the shipping connected with them, holds only a secondary place. The trade with foreign countries is also inconsiderable. The principal imports are colonial produce, woolen and cotton goods, wheat, wool, coal, and salt. Of the shipping employed in this trade only a mere fraction is Irish. Belfast and Dublin are the chief shipping ports. The value of the exports direct from Ireland to foreign ports was about $4,533,090 in 1883, of imports from foreign parts $53,166,020; in 1900 they were $6,560,240 and $50,072,985, respectively. In 1900 the number of vessels entered from the colonies and foreign parts was 1,048 (1,032,109 tons); and cleared 448 (473,758 tons); entered coastwise 31,0[illegible]0 (6,401,172 tons); cleared 31,026 (6,746,[illegible] tons). See GREAT BRITAIN—COMMERCE.

Transportation.— The rivers of Ireland form excellent navigable channels. In several of them, however, when the water was low, the navigation became seriously impeded by rocky shoals. In removing these, or in making artificial cuts for the purpose of avoiding them, vast sums have been expended. Improvements of equal importance have been made by the construction of canals; but since the introduction of railroads, canals have in Ireland, as elsewhere, sunk to a position of secondary importance. The principal canals are the Grand Canal, 1[illegible]¾ miles in length; the Royal Canal, 90¼ miles; the Barrow Navigation, 42¼ miles; the Newry Navigation, 35 miles; the Lagan Navigation, 2[illegible]¼ miles. With the exception of the Barrow Navigation, the Grand Canal, and the Lagan Navigation, the dividends paid by the Irish canals in the possession of public companies are almost nominal. The Royal Canal yields a profitable return, but it is merged in the Midland Great Western Railway. The Grand and Royal canals connect the important systems of the Shannon Navigation, in all 158 miles in length, with Dublin. The railroad system of Ireland has attained a considerable development. The roads are all constructed on a gauge of 5 feet 3 inches, which is compulsory. The average cost of construction, including carrying stock, is about $80,000 per mile. The principal railroads are the Belfast and Northern Counties Railway, with a total length of 180 miles; the Dublin, Wicklow, and Wexford Railway, 135 miles in length; the Great Southern and Western, 478 miles; the Midland Great Western Railway, 425 miles (including the Dublin and Meath, Great Northern and Western, etc.); the Great Northern of Ireland, 503 miles (including the Dublin and Belfast Junction, 63 miles, and the Ulster Railway, 140 miles); and the Waterford and Limerick Railway, 141¾ miles, or including the lines of other companies worked by it, 209 miles in length. Few of the Irish railroads pay any dividend at all; but those that do pay represent a large proportion of the capital invested in railroads in Ireland, and some of them are very remunerative concerns. The most profitable of them are a short one connecting Dublin with Kingstown, the Belfast and Northern Counties, and the Ulster Railway. The total length of railroads completed and open for traffic 1 Jan. 1902 was 3,208 miles. The total number of passengers for that year was about 28,000,000, the total amount of minerals and general merchandise carried, about 5,300,000 tons; the total receipts from the carriage of passengers and goods amounted to nearly $20,000,000.

Public Works.— Large sums have been advanced in loan by the sanction of the imperial parliament under various acts for public works and improvements in Ireland. The Irish board of public works has charge of such grants and their expenditure; the objects to which they are applied include landed improvements and drainage, fishery piers and harbors, roads, bridges, and public buildings, tramways, light railways, and certain lines of inland navigation, and the preservation of ancient monuments. The commissioners have authority to lend for the purpose of any work for which county or borough councils are authorized to borrow. Of $121,141,190 of loans advanced for purposes that have not yet been fully carried out ("current services"), $67,655,395 have been repaid, besides interest amounting to $35,707,115, while the sum of $7,985,250 has been remitted. The largest item of this expenditure, namely, $26,196,100, has been spent on the improvement of lands; river drainage and navigation have absorbed some $14,837,500, while on lunatic asylum buildings there has been spent $13,101,925; in schemes for the improvement of public health, $13,451,390; under the Laborers' Acts, $9,150,940 (to provide employment, etc.); on railways, $6,000,635; in advances to occupants for improvement of holdings, $5,355,530; roads and bridges, $5,041,220. Other sums have been spent on harbors and docks, reclamation of lands, dwellings for the poorer classes, teachers' residences, dispensaries, and in advance to tenants for the purchase of their farms. The recent Land Purchase Bill has made available a large sum of money to be used in aiding tenants in purchase of holdings (1903).

Money, Weights, Measures.— The standard of value is gold. Silver is legal tender up to 40 shillings; bronze up to 12 pence; and farthings only to 6 pence. Bank of England notes are legal tender. The names of the coins used are sovereign, half-sovereign, crown, half-crown, florin, shilling, sixpence, threepence, penny, half-

1. Albert Memorial, Belfast. 2. St. Stephen's Green Park, Dublin.

penny, and farthing. The standard units are: of weight, the pound, 7,000 grains; of length, the yard; of capacity, the gallon, containing 10 pounds avoirdupois of distilled water at 62° F., the barometer at 30 inches. On these units all other legal weights and measures are based.

The sovereign weighs 123.274 grains, and contains 113.001 grains of fine gold. The shilling weighs 87.27 grains, and contains 80.727 grains of fine silver. Bronze coins consist of a mixture of copper, tin, and zinc. The penny weighs 145.83 grains.

Banks.— The institution known as the Bank of Ireland has a royal charter and unconditional liability. This bank manages, free of charge, all the public debt of Ireland, and, like the Bank of Scotland, it loans money to the British government, for which, since 1865, 3 per cent is paid. In 1902 there were in Ireland nine joint-stock banks with 625 branches, all of which had adopted limited liability. Six of the nine banks were note-issuing. See GREAT BRITAIN — BANKING.

There are two kinds of savings banks in Ireland: one the trustee savings bank, which has been in existence since the first years of the 19th century; the other, the postal savings bank, which was begun in 1861. The annual amounts which may be deposited by each person are regulated by the Savings Bank Act. According to the act for 1893 the amount which may be deposited in one year by one person is £50, or $244.50, and not £30, or $146.70, as was the law under a former act. The amount of stock which may be purchased was raised from £100, or $489, to £200, or $978, and the increase in the stock-holding limit was changed from £300, or $1,467, to £500, or $2,445. The post-office savings banks are considered more secure than the trustee savings banks, and the deposits in the former are some larger than in the trustee savings banks. The trustee savings banks received in 1897 about $23,044,180, and in 1902 about $23,547,910. The postal savings banks received in 1897 about $10,869,735, and in 1901 about $12,298,705.

Charities.— The Poor Law, which regulates the system of public charities, is about the same for Ireland as for England and Scotland. It provides for relieving the needy in their own homes or for placing them in charitable institutions. The law is administered by the local government board through boards of guardians elected for the purpose. The number of indoor poor who received assistance for the year 1902 was 43,531; the number of outdoor poor for the same year was 57,813; and those in asylums, 1,427. A large amount of aid is dispersed through private means; but a strong effort is being made to remove the causes, which are about the same in all countries, and which usually result in poverty. Efforts have been made to improve the methods of work, and to foster habits of economy.

Government.— Ireland, by the Act of Union, became an integral part of the United Kingdom, and shares in its legislation by means of 28 representative peers in the House of Lords, and 103 representatives in the House of Commons. The representative peers are elected for life by the whole body of Irish peers. The Lord-Lieutenant, who represents the sovereign, holds his court in the castle of Dublin. Since 1898 great changes have been made in the manner of administering the local government. Previous to that date the chief authority in the county was the grand jury, and all local affairs pertaining to the government and local laws were attended to by the grand juries and presentment sessions. The act of 1898 provides for a council, elected by the people, for a term of three years. The government of the boroughs, rural and urban districts, is also vested in an elective council. The unincorporated boroughs are governed by commissioners. See GREAT BRITAIN.

The government of the incorporated boroughs is vested in a mayor, aldermen, and council. The large cities are now county boroughs. The chief secretary, the under-secretary, and four commissioners, who are appointed by the Lord-Lieutenant, constitute the local government board, which has supervisory authority over the local council. This board approves or rejects nominations made by the local authority, decides upon salaries, and has the whole local government in charge to a certain extent.

The judiciary of Ireland is similar in many respects to that of England. The highest tribunal is the Supreme Court of Judicature, composed of the High Court of Justice and the Court of Appeal. Other courts are the Court of Bankruptcy, the Land Commissioner's Court, and the High Court of Admiralty. The English municipal law is administered by the courts of Ireland.

Finances.— In addition to local indebtedness Ireland assists in the liquidation of the national debt of the kingdom. The amount which has been apportioned to Ireland, it is claimed, is larger, in proportion to the wealth of the island, than the amount apportioned to England and Wales. The imperial revenue collected in Ireland for the fiscal year ending 31 March 1902 was about as follows: Customs, $15,500,000; excise, $15,850,000; estate and duties, $317,300; stamps, $15,740,000; income tax, $5,822,000; post-office, $3,697,000; telegraphs, $876,200; crown lands, $163,400; miscellaneous, $574,200; making a total, together with the non-tax revenue, of $46,792,000. The local taxation revenue for the same year was about as follows: Customs, $74,850; excise, $635,000; estate and duties, $995,000. The expenditures for the same year were about as follows: Against exchequer, for the civil government, $22,200,000; for collection of taxes, $1,215,000; post-office, $5,435,000. For local taxation accounts paid the same year, $5,275,000. The whole makes a grand total of about, for imperial revenue, $284,125,000; for local revenue, $1,045,000. The total amount raised for local expenditure was distributed about as follows: For water, gas, electric lights, $12,270,820; tolls, dues, $1,013,560; rents, interest $1,229,225; government contributions, $7,810,780; loans, $2,365,800; miscellaneous, $2,103,685. The chief local expenditures were about as follows: Town and municipal authorities (police, sanitary works, etc.), $8,025,450; unions, poor relief, $5,502,420; county, rural sanitary, and road authorities, $9,591,165; harbor authorities, $2,422,620. GREAT BRITAIN—FINANCE.

Population.— Since the census of 1841, when the inhabitants of Ireland numbered fully 8,000,000, the population has almost steadily decreased. In 1846–7 a frightful famine, occasioned by the potato disease, broke out, and was followed by a visitation of fever and cholera. The population was in consequence greatly reduced, and since then emigration has taken the place of famine and disease in reducing it further. The extent of this emigration will be gathered from the following statement of the numbers that left the country between 1851 and 1899:

Provinces	Number of Emigrants between May 1, 1851, and Dec. 31, 1898.		
	Males	Females	Total
Leinster	355,104	320,706	675,810
Munster	673,106	640,092	1,313,198
Ulster	590,314	475,761	1,066,075
Connaught	282,532	306,616	589,148
Not specified	61,766	48,902	110,668
Total	1,962,822	1,792,077	3,754,899

From the causes just referred to the total population of Ireland, which might by natural increase have amounted to at least 10,000,000, had dwindled away to 4,425,597 in 1902.

The population by provinces in 1901 was as follows: Leinster, 1,152,829 (150.1 per square mile); Munster, 1,076,188 (112.3 per square mile); Ulster, 1,582,826 (183.8 per square mile); Connaught, 646,932 (94.5 per square mile). In that year the average population per square mile for Ireland was 136.7. In 1901 there were six county boroughs with populations as follows: Dublin, 290,638; Belfast, 349,180; Cork, 76,122; Limerick, 38,151; Londonderry, 39,892; Waterford, 26,769.

Education.— The present difficulties in establishing a public system of education in Ireland had their origin in the times following the efforts to make the people abandon the Roman Catholic Church. As a consequence, the parents refused to patronize the government schools. The laws of the time of William III. and Queen Anne made it a crime for Catholics to teach or to have their children taught by Catholics, or to send them abroad where they would be educated in Catholic schools. The rigid enforcement of these laws resulted in a large proportion of illiteracy among the Roman Catholics, although they had established schools abroad which were attended by those with wealth sufficient to live in a foreign country. (Consult, 'History of Irish Schools and Scholars of the Middle Ages.') The principal educational institutions in Ireland are Dublin University and the three Queen's Colleges. The Queen's Colleges were formerly connected with an examining and degree-conferring body, Queen's University, for which the Royal University of Ireland was substituted in 1882, in pursuance of the University Education (Ireland) Act, 1879; $100,000 being yearly granted from the surplus funds of the Irish Church (q.v.). The Queen's Colleges, however, are not directly affected by this act. The Royal College of Science for Ireland was established under the authority of the Science and Art Department, London, in August 1867. Its object is to supply a complete course of instruction in science applicable to the industrial arts, and to aid in the instruction of teachers for the local schools of science. There are professors of physics, chemistry, botany, zoology, agriculture, mining, geology, applied mathematics, etc. The course of instruction extends over three years. There are also the General Assembly's Theological College, Belfast; the Magee College, Londonderry, a Presbyterian college opened in 1865, and embracing in its curriculum literature, science, and theology; the College of St. Columba, near Dublin, founded for the purpose of establishing a system of instruction preparatory to the university.

The Catholic University of Ireland, established in 1854, grants degrees in theology and philosophy, and since 1882 sends its students to the Royal University for examinations for degrees in arts, medicine, law, and engineering. Affiliated with the Catholic University, and now a part of it, are the following colleges: St. Patrick's, Maynooth; University College, Dublin; University College, Blackrock; St. Patrick's, Carlow; Holy Cross, Clonliffe; and School of Medicine, Dublin. There are additional, in different cities and towns, about 40 Roman Catholic colleges and seminaries for men, and a large number of academies or secondary schools for women. There are numerous non-sectarian schools, some of them of royal and private foundation and endowed, but the most prominent are those established since 1831 under the superintendence of the commissioners of national education. These schools are open to the children of parents of all denominations. The pupils are not required to attend any religious exercises or religious instruction of which their parents or guardians disapprove, and opportunity is given to pupils of each religious persuasion to receive separately at appointed times such religious instruction as their parents or guardians may approve of. Of these schools there were 8,670 in operation in 1899, with 785,139 pupils on the rolls. The average daily attendance was small, being only 513,852. In 1892 an act was passed by which a beginning was made of free education, and a modified system of compulsion. In 1878 an act was passed for the promotion of the intermediate secular education of boys and girls in Ireland. By this act about $5,000,000 from the Irish Church surplus fund was set apart, being invested in commissioners who are to apply the revenue arising from it to the purposes of the act, these being (1) the carrying on of a system of public examinations; (2) the awarding of exhibitions, prizes, and certificates to students; and (3) the payment of results fees to the managers of schools fulfilling certain prescribed conditions. The schools referred to in the act are of a grade superior to the national schools. The subjects of examination are Latin and Greek, modern languages, Celtic, natural science, mathematics, etc. The system of apportion according to results is no longer in use; instead the amounts awarded are based on average attendance.

Considerable attention is given to technical instruction. In all the convent schools the young girls have regular courses in domestic science, and in several trades are taught. The Department of Agriculture and Technical Instruction has an advisory board of technical instruction. In 1901–2 the course of experimental science had been adopted in 152 schools with 6,412 science pupils. The central institutions belonging to this department are the Royal College of Science, Dublin, and the Metropolitan School of Art. Throughout the provinces the work is being organized by the councils of county boroughs, urban districts, and counties. The annual grant for the technical instruction is $25,895,000. Provisions are made for the

special training of teachers for the difficult departments of work. See GREAT BRITAIN—EDUCATION.

Language and Literature.— The predominant in the Irish literature is the heroic, pathetic, love of nature, romance, virtue, and through all runs the traditional. Although the Ogham, a system of writing, was introduced into Ireland about 13 centuries before Christ, yet the literary productions were transmitted orally. Hyde says, "The love of literature of a traditional type, in song, in poem, in saga, was more nearly universal in Ireland than in any other country of western Europe."

The modern literature of Ireland, or the literature produced by Irish writers of the last centuries, has been included under English literature because the language used is English. See CELTIC LANGUAGES; GAELIC LITERATURE.

Music.— See IRISH MUSIC.

Art and Architecture.— Many of the ancient types of architecture extinct in other lands may still be found in Ireland. Their buildings and home life remained practically undisturbed for centuries; no ancient Roman architecture is found on the island. When Christianity was introduced, the change in form of the Druid temple was for several centuries in accordance with the natural development of the people, except the addition of the small cross, the windows facing the east, and the altar. When the building became too small a new one was erected beside it. Some of the existing ancient specimens are a group of stone buildings on Skellig Michael, a rock rising precipitously out of the sea to the height of 700 feet, and about eight miles due west of the nearest headland in the County Kerry. The approach is by a flight of stone steps. Dry rubble masonry forms the walls, and in this group, as in others, the absence of the arch shows its ancient origin. It is oval outside, bee-hive in form, but rectangular within. The door has a horizontal lintel, above which is a small cross worked into the stone wall. The six cells in the interior, the common room for prayer (choir), the chapel, all show it was occupied by monks. The doors, with inclined jambs and horizontal lintels, antedate the arch. A wider lintel above, or the double lintel, indicates progression in architecture, a method of relieving the pressure of the roofs. The roofs of the ancient buildings were of stone. There are many of these ancient ruins, some in a good state of preservation. Off the coast of Sligo, at Inishmurray, on the Isles of Aran, on islands off the coast of Kerry, and in many places are found buildings of dry rubble masonry. The change shows itself when cement is used and the walls become perpendicular, as at Gallarus, in Kerry, and a further advance is shown in St. Declan's oratory in Ardmore, with square perpendicular towers, or, more properly, supports at the corners. Some of these were erected in the 6th, 7th, and 8th centuries. St. Columb-Cille's monastery at Kells was built about 807 A.D. In the 'Annals of the Four Masters' mention is made of the church St. Kevin founded in about 1108, and which is still in existence, at Glendalough. The Romanesque style makes its appearance in the 11th century; the earliest example is in St. Flannan's, at Killaloe. Brian Boroimhe is said to have built churches at Killaloe, in County Clare. A church built about this time, at Freshford, the ancient Achadh-ur, eight miles northwest of Kilkenny, is still in use. At Clonfert Cathedral, in County Galway, there is a fine example of an Irish Romanesque doorway. This church is said to have been founded by St. Brendan, "the navigator." The interlaced patterns on the piers, the ornamented column, are all most beautiful. "There is not," says Mr. Brash, "a square inch of any portion of this beautiful doorway without the mark of the sculptor's tool, every bit of the work being finished with the greatest accuracy." The Cathedral at Ardmore, County Waterford, shows another advance in its decoration; here may be seen The Judgment of Solomon, Adam and Eve, The Magi bringing their gifts, the stable indicated by a cow, etc. Many of the modern cathedrals are most beautiful.

The "Round Towers" of Ireland have been for years subjects of study and discussion. There exist in Ireland in whole or part about 100 of those towers; 18 are in a perfect condition. Many claim that the Round Towers are of pre-Christian origin, and cite the similar towers, two in Scotland, seven on islands off the coast, one on the Isle of Man, and a few on the Continent, as examples of pagan architecture. Their average size is 100 feet in height, circumference at base, 50 feet, walls at door lintel, 3½ feet. The interior is divided into from four to eight stories. Petrie, who has studied the subject with care, claims that the towers are of Christian origin and were used both as bell towers and as safes or places in which to deposit the Church treasures. The Irish name for the towers, *Cloigtheach,* which means "house of a bell," supports the theory of Petrie and others. Petrie advances other and strong arguments in support of his theory. The 'Annals of the Four Masters' mentions the bells in some of the towers. One of the finest examples of a Romanesque doorway in a Round Tower is at Kildare. Some of the ancient pottery shows skill and artistic merit. In designing and coloring the ornamentation of the old Celtic manuscripts show great artistic power. The initial letters are most beautiful, especially in the 'Book of Kells,' a copy of the four Gospels in Latin, and in 'Annals of the Four Masters.' The symbolism used by other early nations is not found in the works of the ancient Irish. The designs are geometrical patterns, interlaced ribbon work, diagonal and spiral lines, strange animals, peculiar birds, and the key pattern. The ancient metal work shows unique and beautiful designs; the bell shrines, the brooch of Tara, and many pieces of old metal work may be seen in museums. The laces of Ireland, revived the last of the 19th century, show most intricate and charming patterns. Sculpture and oil painting are modern arts in Ireland, and in both many of Irish birth have excelled.

Religion.— The first authentic account of the introduction of Christianity into Ireland was in the 5th century, when Pope Celestine sent Germanus, bishop of Auxerre, and later, in 431, Palladius as bishop. Both Germanus and Palladius found on the island believers in Christianity, but no organized body of Christians. However, the chief work of conversion and organization was accomplished by St. Patrick, who, good authorities state, was sent to Ireland by the same pope. Killpatrick, a town of Scotland, is said to have been Patrick's birthplace, but some authorities claim that he was a native of France. He had been consecrated bishop before coming to Ireland as a missionary, and he selected Armagh as his see. A large number of converts were made, so many that even before Patrick died he had other bishops and a number of priests to assist him. The Roman Catholic Church in Ireland has four archdioceses and 25 dioceses. The archdioceses are Armagh, Dublin, Cashel, and Tuam. The Roman Catholic clergy and churches are all supported by voluntary contributions. The college at Maynooth, for the education of those studying to become priests, was founded in 1795. There are several other Roman Catholic ecclesiastical seminaries and colleges. See GREAT BRITAIN—CHURCH OF ENGLAND; etc.

The Reformation never made much progress in Ireland, and though a Protestant Episcopal church was established by law, it was only the church of a small minority. In 1869 it was disestablished. Previous to this time the clergy were supported by a tithe rent-charge, the proceeds of the Church lands, etc., the total annual income of the Church, including the value of houses and lands in occupation, being about $3,068,920. By the above act, taking effect from 1 Jan. 1871, the position of the Church and clergy was entirely changed, though those holding benefices at the time of its passing have not suffered loss. The property and tithes formerly belonging to the Church are now vested in commissioners, who pay to all deprived of income by the act, so long as they continue to discharge the duties of their offices, such an annual sum of money as they would otherwise have received, deduction being made of curates' salaries, and other outgoings to which the parties would have been liable, and regard being paid to the prospective increase of incomes by the falling in or cessation of such charges; or instead of an annual sum, an equivalent single payment has been paid to such as have commuted their claims in that manner. The Irish Church accordingly is no longer a state Church, and none of its bishops have now a seat in Parliament. It is still a vigorous and flourishing institution, however, and possesses funds amounting to over $40,640,000. Of this, upward of $20,000,000 have been voluntarily contributed by friends of the Church since it was disestablished. While disestablishing the Irish Church, the act at the same time declared the cessation of the Maynooth grant and the *Regium Donum.* The affairs of the Irish Church are now managed by the diocesan synods and by the general synod in conjunction with the representative body. The supreme legislative powers reside in the general synod, which meets in Dublin, and is composed of the archbishops of Armagh and Dublin and the 11 bishops, and of lay and clerical representatives from the different dioceses; the lay representatives being more than twice as numerous as the clerical. The representative body incorporated in 1870 consists of the archbishops and bishops *ex officio*, 39 lay and clerical elected members (three for each diocese), and 13 co-opted members elected by the other two classes conjointly. This body is empowered by its charter to hold Church property, subject to the regulations of the general synod. The Church uses the Book of Common Prayer, as revised in accordance with statutes passed by the general synod, and furnished with a preface containing an exposition of its formularies in the sense in which they are understood by the Church.

The Presbyterian Church of Ireland is chiefly confined to the province of Ulster, where it may be said, more especially in the counties of Down and Antrim, to be the leading religious denomination. Its ministers are supported by voluntary contributions, seat-rents, and church funds. They were formerly aided by an annual grant from government, called the *Regium Donum,* the amount of which, paid in 1869, was $202,735. This annual grant, however, was abolished, as already mentioned, by the Irish Church Act of 1869, and was commuted to a single sum of $3,506,860 paid to the Church. According to the census of 1901 there were in Ireland 3,310,028 Roman Catholics, 579,385 Protestant Episcopalians, 443,494 Presbyterians, 61,255 Methodists, and 56,703 members of other persuasions, besides 3,769 Jews.

History.—The beginning of the history of Ireland is, like that of all European nations, enveloped in fable. Among the ancients it was known at least as early as the time of Aristotle, who calls it *Ierne.* In Diodorus Siculus it is called *Iris;* in Strabo, *Ierne;* in Pomponius Mela, *Iverna;* in Pliny, *Hybernia.* Plutarch calls the island *Ogygian,* meaning very ancient, and says: "They drew their history from remote antiquity, so that of other nations is new compared with them." Yet the information to be found about Ireland in the works of the ancient geographers and historians is altogether very scanty. The bardic historians of the country speak of Greek and Phœnician colonies, and lists of kings, for which there is no authentic, but some probable, foundation. The vernacular language of the Irish proves that they are a part of the great Celtic race which was once spread all over Western Europe. The first probable records of the Irish people show that for the times they were advanced in civilization. The ancient bards were called *Fileas* or *Feardanos,* which means philosophers. Cæsar mentions in his 'Gallic Wars' their advancement. Pliny, Cæsar, and other authors say that the Druids who inhabited Ireland were learned; they knew philosophy and the sciences. In the Irish chronicles we find that in the reign of Eochy the First, more than a thousand years before the birth of Christ, "society was classified into seven grades, each marked by the number of colors in its dress, and that in this classification men of learning, that is, eminent scholars, were by law ranked next to royalty." Another proof of the existence of an ancient civilization, marvelous for its time, was the institution of Feis Tara or the Triennial Parliament of Tara. The monarch, Ollav Feola, who reigned as Ard-Ri, or monarch, of Erinn, about 1,000 years before Christ, established this parliament. The subordinate royal princes or chieftains, constituted one branch; the Ollavs or law-givers, and bards, judges, scholars, and historians, another branch; and the third consisted of the military commanders. Under the Ard-Ri, or monarch, were the kings of the provinces, and under each king were the clans who were governed locally by a chief, each clan selecting its own. Wars were frequent, as fighting and bloodshed were common pastimes throughout the then known world. The battle was the final court of appeal, and in most instances the first court of trial. A cause of dissension in Ireland, as in Great Britain and other countries, was the antagonism existing among people of different races. The Milesians, the Tuatha de Danaans, and the Firbolgs (q.v.) were distinct races centuries after the Milesians landed in Ireland. The differences among themselves seem not to have seriously affected their union when attacked by a common foe; as at the birth of Christ, when Rome was mistress of nearly all of Europe, she had never gained possession of Ireland. The introduction of Christianity into Ireland was not attended with bloodshed as in many other countries; indeed, afterward the nation seems to have enjoyed a season of repose from strife, although southern Europe was being overrun with the Germanic hordes. This repose favored the growth and expansion of Christianity and the progress of learning. The schools and monasteries founded by Saint Patrick and his bishops in the 5th century became the centres from which went forth many scholars; and even as early as the 6th century, Ireland became the seat of western learning; and its monasteries were the schools from whence missionaries who disseminated the Christian faith throughout continental Europe proceeded. In the 8th and 9th centuries the scholars of Ireland were among the most distinguished at the courts of the kings, especially at that of Charlemagne, but when the Northmen commenced their descents some of the schools were destroyed and the monks dispersed. The ravages of the Danes at this period had results different from the attacks of the Romans. The continued attacks for nearly two centuries fostered internal dissensions, when in the beginning of the 11th century Brian Boroimhe (Brian of the Tribute) united the greater part of the island under his sceptre, restored public tranquillity, and subdued the northern invaders. After a contest of about 20 years he conquered Malachy, the brave warrior who "wore the collar of gold" won from the Danish invader, and became Ard-Ri of all Erinn. After the death of Brian, the island became a place of dissension; frequent wars rendered them weak against a foreign foe. This condition was largely the result of the divisions, made by Brian, of the island among his three sons. At this time Henry II. of England, professing love for Ireland and a great desire to restore peace, sought to gain possession of the island. This was the beginning of the Anglo-Norman invasion of Ireland. Henry II. claimed to have received from Pope Adrian IV. a bull authorizing him to take possession of Ireland. (The authenticity of this bull is very doubtful.) After some delays occasioned by internal troubles in England, Henry attempted to gain possession of Ireland. For many years after, the history of Ireland was a record of persecution, confiscation of lands, and attempts to wrest from the people inalienable and hereditary rights. So great was the resistance that in the 14th century, at the time of Richard II., the authority of England extended practically over only a small portion of country on the eastern coast, called "The Pale" (q.v.). This was governed by various nobles subject to a viceroy. The subjection was, however, sometimes little more than nominal. The nobles quarreled among themselves, and were very often at open feud. The beginning of the reign of Edward III. (1327) was marked in Ireland by the outbreak of civil strife in every part of the English "Pale," advantage of which was taken by the Irish for a general rising, which threatened the safety of the English colonists, and which the government found itself unable to subdue, until it yielded to the demands of the barons in Ireland, by granting them complete civil and military jurisdiction in their own districts. During the wars with France some Irish troops served in the English armies, and the common sympathies induced by that circumstance seemed likely to promote a better state of feeling between the two races, when the breach was made wider than ever by the celebrated statute of Kilkenny (1367), framed under the viceroyalty of Lionel, duke of Clarence, son of Edward III., forbidding, under severe penalties, intermarriages between English and Irish, the assumption of Irish names by persons of English blood, the use of the Irish language, the native (Brehon) law, etc. In consequence of this the disturbances between the Irish and English inhabitants of Ireland increased so greatly that the English viceroy found it necessary to protect The Pale by payments of money to the Irish chiefs, and this state of matters continued during the reigns of Richard II., Henry IV., and Henry V., until, in that of Henry VI., when Richard, duke of York, was appointed governor of the island, who succeeded by his politic measures in restoring peace. In the reign of Henry VII. (1495) was passed Poyning's Act (so called from Sir Edward Poyning, lord-deputy of Ireland), which provided that all former laws passed in England should be in force in Ireland, and that no Irish Parliament should be held without previously stating the reasons on account of which it was to be summoned, and the laws which it was intended to enact. The power of the English government in Ireland was thus strengthened, but nothing was done to improve the condition of the Irish, whom the oppressive severity of the English yoke embittered without subduing. At the beginning of the 16th century the greater part of the island still remained unconquered by the English. The Irish still lived according to their old constitution under their own chiefs. In 1541 Henry VIII. received from the Irish Parliament the title of King of Ireland; but he did nothing to extend the English sway, or to improve the social circumstances of the people. The Reformation which took place in England during this reign took but a slight hold upon Ireland even in the English districts; but the monasteries were suppressed, and the tribute to the Papal see abolished. Elizabeth's reign was marked by a series of risings, which finally terminated in a general war against England, usually called the Rebellion. Hugh O'Neil, who had been raised by the queen to the dignity of Earl of Tyrone, was the leader in this war, which, though successfully begun, ended with the complete defeat of the insurgents, and the reduction of the whole island by the English (1603). More than 600,000 acres of land were taken from the Irish chiefs, and for the most part distributed among English colonists. The reign of James (1603–25) was somewhat favorable to Ireland; the arbitrary power of some of the chieftains was restrained, and the administration of justice improved, etc.; but the means which he took to effect some of these improvements were tyrannical. He demanded from every Irish chief the document upon which he rested his claim to his property, and if it were not to be found, or contained even any formal error, his lands were forfeited to the crown. Of 800,000 acres of land which in this way came into the hands of the king in the north of the island, a large share was entirely withdrawn from the Irish, and divided among Scotch or English settlers. In addition to this, the Catholics, on account of the oath of supremacy by which all public officers were required to acknowledge the king as head of the church, remained excluded from all official appointments. The Roman Catholic hierarchy established in the 5th century was still in existence. Various circumstances, led, in 1641, to an attempt to shake off the English yoke. Dr. Lingard says of this insurrection that it has been usual, for writers to paint the atrocities of the natives, and to omit those of their opponents, but that revolting barbarities are still recorded of both, and that if among the one there were monsters who thirsted for blood, there were among the other those who had long been accustomed to deem the life of a mere Irishman beneath their notice. After the death of Charles I., Cromwell was appointed (15 Aug. 1649) lieutenant of Ireland. With great cruelty, he reduced the whole country within nine months. All the possessions of the Catholics were confiscated, about 20,000 Irish were sold as slaves in America, and 40,000 entered into foreign service, to escape the severity of the conqueror. (See Drogheda.) Charles II. restored a portion of the lands, but fully two-thirds remained in possession of the English or of Irish who had become Protestants. Under James II. some changes were made; under his viceroy, Earl of Tyrconnell, Catholics were given a fair representation in Parliament. In the English Revolution of 1688, the Catholics of Ireland sided with James, and the Protestants with William III. For a time the army favoring James were fairly successful; but the landing of William in Ireland changed matters. The battle, 1 July 1690, at Boyne, won by William, proved a turning point, as it encouraged the English and in a great measure discouraged the Irish. Sarsfield's gallant defense of Limerick, the last place in Ireland that held out for James, saved that city from capture by William's troops; but on 3 Oct. 1690, the city capitulated, a treaty being concluded with Gen. Ginkell on behalf of the English, according to which the Irish were to be allowed the free exercise of their religion, as had been granted by Charles II. More than 12,000 Irish that had fought on the side of James went into voluntary exile. The Treaty of Limerick was not kept by the English, a fact which is commemorated by the name which the Irish still give to the place at which it was concluded, "The City of the Violated Treaty." By a decree of the English Parliament upward of 1,000,000 acres of land were now confiscated and divided among Protestants. In order to keep down every movement of the Catholic population, cruel penal laws were passed against those who adhered to that form of religion. By these laws the higher Roman Catholic ecclesiastical dignitaries were banished from the island: the priests were not allowed to leave their counties; no Roman Catholic could hold a public office, acquire landed property, enter into a marriage with a Protestant, etc. Such suppression and persecution naturally led to the formation of secret organizations whose object would be an overthrow of those in power, in order to secure freedom and justice. "Whiteboys," "Levellers," and a number of kindred organizations were formed, whose methods were not always fair; but who were brought into existence by force of circumstances. All this, however, did not ameliorate the general condition of the country, and it was not till the American War of Independence taught the English government the folly of attempting to govern a people by coercion, that the severity of the laws relating to Ireland was mitigated. In 1778 the penal laws against the Catholics, although not repealed, were made much more lenient. Catholics were henceforth permitted to acquire landed property, to erect schools, and to observe their own religion under fewer restrictions. In 1783, Poyning's Act was repealed.

The outbreak of the French Revolution had naturally a great effect on the minds of the Irish people. Out of a corps of volunteers which had been formed in 1779, but which had been dissolved a few years later, a society was formed calling itself the Society of United Irishmen, which included in it many Protestants, and which sought to make Ireland an independent nation. The Catholics at the same time took advantage of the embarrassment of the British government to demand equal rights with the Protestants, and the government gave in to this demand so far as to remove the hindrances which had been placed by the law in the way of Irish trade and industry, and to repeal nearly all that remained of the penal laws against the Catholics, who now received the right of acting as counsel before the court, and of entering into marriages with Protestants. When further demands were refused, the Society of United Irishmen allowed its revolutionary aims to become more apparent, and the government then determined to quell the movement by force. The Habeas Corpus Act, which had been introduced into the country in 1782, was repealed; the towns were strongly garrisoned, and the society dissolved and disarmed. But the conspirators, trusting to expected aid from France, were not discouraged. At the close of 1796 a considerable French fleet did actually appear off the Irish coast bearing 25,000 land troops, under the command of Gen. Hoche; but owing to adverse winds, and the incompetence of the commanders, it was obliged to return without having accomplished anything. The only effect of this expedition was to induce the government to take still stronger measures in Ireland, the whole of which was placed under military law. The United Irishmen were thus prevented from taking any open steps for renewing the society, but they continued to pursue their ends in secret, and devised for themselves a very skilful military organization. At its head was a directory of five men, whose names were known only to those at the head of the provincial committees. In January 1798 the society already numbered more than 500,000 members, when a treacherous member gave information regarding the society to the government, and several of the leaders were seized. In consequence of this the conspirators, not knowing the extent of the revelations that had been made, resolved to anticipate any further preventive measures on the part of the government, and rushed into premature action. In May 1798, simultaneous risings took place at different parts of the island; but the government was fully prepared, and the main body of the insurgents, who made a brave fight, suffered a decisive defeat at Vinegar Hill on 21 June. Flying columns traversed the island, and checked by the most violent measures any further outbreaks. In August a French squadron appeared in Killala Bay with 1,500 men on board, under Gen. Humbert; but the British troops prevented a junction with the insurgents, so that they were soon compelled to surrender. Another French expedition which approached the Irish coast in September was overtaken and attacked by Admiral Warren, and nearly all the ships composing it were captured. Several subsequent attempts of the French were similarly frustrated.

The events of this insurrection brought the British government to form the resolution of uniting the Irish and English Parliaments, since in the state of feeling which that movement too plainly manifested as prevailing among the people, it was seen that the independence of legislation enjoyed by the country fostered the desire of political independence, and it was feared that new revolutionary efforts might thence derive a legal sanction. The first proposal to this effect which was made in the Irish Parliament was rejected with indignation. The government then resorted to bribery to secure its purpose, and $8,000,000 was spent in buying up the rotten boroughs which had the majority of seats in the Irish House of Commons. The Irish landlords were from the first favorable to the project. By these means an act providing for the legislative union of the two countries passed the Irish Parliament on 26 May 1800, and the British Parliament on 2 July in the same year, in virtue of which the union was effected on 1 Jan. 1801. But although this measure bound the destinies of Ireland still more closely to those of England, yet it was far from putting an end to the religious and political troubles which had so long divided the two countries. In order to gain the masses the enlightened Pitt had promised a complete political emancipation of the Catholics; but the bigoted George III. could not be induced to make this concession. Enraged at this great breach of faith the Catholics in 1802 formed a Catholic Association, having for its object the accomplishment of this end; but it was not till the period of O'Connell's agitation, favored by a change of public opinion in England, that the government was induced to bring in an Emancipation Bill, which after passing both houses of Parliament, received the assent of George IV. on 13 April 1829. A new oath, which could be taken by Catholics as well as Protestants, was substituted for the one previously required from members of Parliament, and the Catholics were thus enabled to take a seat in the house. They were also allowed to fill all public offices except that of lord-chancellor.

This victory was greeted by the Irish Catholics with great joy; but they wanted more than emancipation which meant permission to hold certain offices, they wanted independence. The efforts of the national party were now directed to the repeal of the Union, for which purpose O'Connell founded the Repeal Association, which caused the Grey ministry in 1833 to bring before Parliament the Irish Coercion Bill (q.v.). When this bill became law the Lord-Lieutenant of Ireland was empowered to forbid all assemblies of the people, and to proclaim military law throughout the island; and in order to give force to the act an army of 36,000 men, besides 6,000 armed police, was sent over. The Coercion Act was indeed soon repealed, and from 1835, under the viceroyalty of Lord Mulgrave, a better feeling seemed to be growing up between the people and the government. But when the Tories came again into power in August 1841, O'Connell began anew the repeal agitation, and with such boldness that in 1843 the authorities caused him to be apprehended on a charge of conspiracy and sedition, on which he was convicted and condemned to pay a fine and suffer imprisonment for a year. These proceedings were, however, declared illegal by the House of Lords, and O'Connell was released. Soon after the terrible famine which visited Ireland in the autumn of 1845, and still more severely in the summer of 1846, cast all other interests into the background. The spirit of the people seemed broken, and many of them sadly left their native land and by hundreds of thousands emigrated to America. In the midst of this crisis O'Connell died, and the place of the party which he led was taken by one still more advanced, which received the name of Young Ireland. In these circumstances of political excitement the French revolution, which took place in February 1848, had a great effect upon Ireland. The leaders of the Young Ireland party, Smith O'Brien, Mitchel, Duffy, Meagher, and others, entered into relations with the provisional government at Paris, and the people generally began openly to provide themselves with arms, and to exercise themselves in the use of them. But the measures of the government fustrated the designs of the conspirators. The Habeas Corpus Act was suspended, the insurrectionary newspapers suppressed, and Smith O'Brien, who had been hailed by the people as King of Munster, and a number of his associates were arrested and condemned to death. This punishment was afterward commuted to transportation. In a short time peace was restored; but the material distress remained undiminished. Famine and disease decimated the population. The agricultural holdings were deserted, whole districts remained uncultivated, and a constant and overflowing stream of emigration directed itself toward the United States.

After a time agriculture revived, and the manufacturing industries of the island began to compete with those of England. In 1849 were chartered the Queen's Colleges, offering the same advantages to Catholics as to Protestants; but these institutions have been taken comparatively little advantage of by the former. The history of those institutions made the Catholics fear they were meant as a menace to their faith. In 1852 telegraphic communication was opened with Great Britain. In 1853 an industrial exhibition was held at Dublin, resembling that held two years before in London; another exhibition was held in 1865. The latter year witnessed the discovery of a new conspiracy designed to effect a separation between England and Ireland. This had its origin in America at the time of the Civil War in the United States, when the numerous Irish in that country saw an opportunity in England's attitude toward the seceding States. This conspiracy, originating among the members of a secret society calling themselves Fenians (see FENIANS), soon spread to Ireland; but before the Fenians could take any overt action in that island their design was stifled by the proceedings of the British government (1865–6). The attention of English statesmen was now strongly drawn to the necessity of doing all that could be done to render the Irish people loyal and contented; and with this view an act to disestablish the Irish Protestant Episcopal Church was passed in 1869, and another to improve the tenure of land, in 1870. Since 1871 an agitation for what is called Home Rule has made itself prominent. In 1880 Ireland became the scene of an agitation carried on mainly by a body calling themselves the Land League. Various severe laws were passed to "coerce," but further concessions were made, and to redress Irish grievances a land act was also passed in August 1881. Under this act substantial reductions on rents were made. The Land League was suppressed, but a new body called the National League was soon organized in its place. Another act for the relief of tenants in arrear with their rents was passed, 1885. In 1885, 86 Nationalist members, headed by C. S. Parnell, were returned to Parliament, and their pressure on the government led to the production of a scheme by Mr. Gladstone, in 1886, by which Ireland was to receive a parliament of her own and the Irish members to be withdrawn from the Imperial Parliament. This scheme and the accompanying land purchase scheme were rejected by Parliament and the constituencies; and a fresh act against crime in Ireland was passed in 1887, although statistics showed the island was in a most peaceable condition, and no remarkable acts of lawlessness were being committed. In 1898 a very important Local Government (Ireland) Act was passed. It established county councils, urban district councils, rural district councils, and boards of guardians in Ireland, and transferred to them the administrative functions formerly discharged by the grand juries and presentment sessions. The first elections under the act took place early in 1899. The results showed that the voters of Ireland realized they were gaining ground. They never lost an opportunity to proclaim their discontent with the existing land laws, and their desire for "Home Rule." The Irish members of the British Parliament kept the cause of Ireland before the people; and in 1903 a further concession was gained. On 1 Nov. 1903 a new "Land Act" went into effect whereby the tenants, sub-tenants, or the people, may purchase the land and hold it as their own. See GREAT BRITAIN—THE LAND LAWS; IRISH HISTORY.

Ireland, Church of. See IRELAND.

Ireland, Language of. See CELTIC LANGUAGE; GAELIC LITERATURE.

Irenæus, ī-rē-nē'ŭs, **Saint**, one of the Greek Church Fathers: b. Asia Minor: d. Lyons, France, about 202. He was a learned and zealous man, a pupil of Polycarp and Papias. He actively opposed the Gnostics, and especially the Valentinians. His works are lost, except his 'Libri V. adversus Hæreses,' of which there are fragments in the original Greek, and a Latin version, made, it is supposed, toward the end of the 4th century. He suffered martyrdom at Lyons, of which he was bishop, in the persecution under Septimius Severus.

Irene, ī-rē'nē, empress of Constantinople: b. Athens about 752 A.D.; d. Lesbos 15 Aug. 803. In 769 she married Leo IV., after whose death, caused, as is generally believed, by poison administered by her, she raised herself (780) and her son Constantine VI., then but nine years old, to the imperial throne. When Constantine came of age he refused to permit her to participate in the government, and seven years later was arrested at the order of his mother, blinded and at last murdered. Irene was the first woman who reigned over the Eastern Empire. Her triumphal entrance into Constantinople, her liberality, the freedom bestowed on all prisoners, and other artifices employed by her, were not sufficient to secure her from the consequences of her criminal accession. She had ordered many nobles into banishment, when Nicephorus, her treasurer, who had secretly been made emperor, exiled her in 802 to the Isle of Lesbos. Her zeal for image-worship has caused her to be regarded as a saint by the Greek Church.

Ireton, īr'tôn, **Henry**, English general and statesman: b. Attenton, Nottinghamshire, 1611; d. Limerick, Ireland, 26 Nov. 1651. He was graduated at Trinity College, Oxford, and brought up to the law; but when the civil contests commenced joined the parliamentary arm·

and by the interest of Cromwell, whose daughter Bridget he married in 1646, became commissary-general. At the battle of Naseby he commanded the left wing, which was defeated by the furious onset of Prince Rupert, and was himself wounded and made prisoner. He soon recovered his liberty, and took a prominent part in all the transactions which threw the Parliament into the power of the army. He had also a principal hand in framing the ordinance for the king's trial, and was one of the judges. Ireton accompanied Cromwell to Ireland in 1649, and was left by him in that island as lord-deputy. He reduced the natives to obedience with great vigor, but not without cruelty. He was buried in Westminster Abbey, and after the Restoration his body was taken up, suspended from the gallows with that of Cromwell, and buried in the same pit.

Irid'ium, a metallic element resembling platinum in its general properties, and occurring in nature in the metallic form, alloyed, usually, with platinum and osmium. The commercial supply comes chiefly from the Ural district, from Brazil, and from Borneo. Small amounts have also been obtained from California. The existence of iridium was first recognized, in 1802, by Tennant, who observed that an insoluble residue remained behind after dissolving platinum ore in aqua regia. In 1804 he showed that this residue contains two new metals, to which he gave the respective names «iridium» and «osmium.» The separation of iridium from the other metals of the platinum group is a matter of some difficulty; and for details of the processes employed the more extended treatises on metallurgy and the chemistry of the metals must be consulted. Iridium is frequently obtained in the form of a spongy gray mass, or a gray powder; but by heating either of these to whiteness, and subjecting them to compression, the metal may be brought into the form of a compact, lustrous mass resembling steel. In this form it is harder than iron, and somewhat malleable when hot, though brittle when cold. At ordinary temperatures it has a specific gravity of about 22.4, being, with the exception of osmium, the heaviest substance known. Its specific heat is about 0.0323 at ordinary temperatures, and its coefficient of linear expansion (Fahrenheit) is about 0.0000039. Its melting point is very high, the estimates given by various authorities ranging from 3,600° F. to 4,500° F. Compact iridium, after being strongly heated, is insoluble in all acids, and is not affected by air or moisture. The metal has the symbol Ir, and an atomic weight of 193 if $O = 16$, or 191.5 if $H = 1$. It forms numerous salts, but these are of no practical importance. The name «iridium» (from Greek, «rainbow,») refers to the varied colors exhibited by the salts of this element, as they pass from one state of oxidation to another. Metallic iridium, either alone or alloyed with other metals of the platinum group, is used in the arts to a limited extent, where a hard, noncorrosible metal is needed. In particular, it is used for the tips of gold and stylographic pens, for the construction of standards of length, and for standard electrical resistance coils.

Iridosmine, ĭr-ĭ-dŏs'mĭn, or **Osmiridium,** a natural alloy of iridium and osmium in varying proportions, is a hard slightly malleable mineral, crystallizing in hexagonal prisms. It occurs as irregularly flattened grains, and contains some platinum, rhodium and other metals of the platinum group. It is found associated with platinum in the Ural Mountains, in South America, and elsewhere. It is also found in the black sands on the ocean beaches of northern California, and a small amount is recovered yearly by placer miners in the Sierra Nevada. Iridosmine is used to a small extent for pointing gold pens.

Iriga, ē-rē'gä, Philippines, pueblo of the province of Ambos Camarines (Sur), Luzón, on the Buhi River, 23 miles southeast of Nueva Cáceres. It is on the main road, is a military and telegraph station, and one of the most important towns in the province. Pop. 17,100.

Iris, ī'rĭs, in Greek mythology, daughter of Thaumas and Electra, sister of the Harpies, the fleet golden-winged messenger and servant of the Olympian gods, especially of Zeus and Hera. Iris was originally the personification of the rainbow, though she does not appear in the Homeric poems as the goddess of the rainbow. She is sometimes represented as a beautiful virgin with wings and a variegated dress, with a rainbow above her, or a cloud on her head exhibiting all the colors of the rainbow.

Iris Family, a natural order of monocotyledonous herbs, mostly perennials with tubers, corms or rhizomes, and usually with an acrid flavor. About 800 species belonging to more than 50 genera have been described from temperate and tropical climates, mostly from South Africa and tropical America. They are characterized by two rows of leaves, the outer of which fit over and protect the inner (equitant); regular or irregular perfect flowers which are frequently handsome; perianth six parted, the other floral organs in threes; and many-seeded, three-celled fruits (capsules). Some species have been used as food in countries where they are native; others furnish rootstocks which are used for making perfumes, especially orris; some few have been employed to a limited extent in medicine; but the species most widely popular are cultivated for ornamental purposes. Of these last the most important genera are *Iris* (fleurs-de-lis), *Gladiolus, Freesia, Crocus, Tigridia, Tritonia, Sisyrinchium, Ixia* and *Belemcanda*, elsewhere described.

The plants of the genus *Iris* constitute one of the chief ornaments of the northern regions of the globe, and usually grow in wet places, bearing flowers of various colors, but the prevailing tint is blue. The common wild iris or flag (*I. pseudacorus*), common in Europe and also found in the eastern United States, has yellow flowers of large size and long sword-like leaves. The gladdon or stinking iris (*I. fœtidissima*) is a British species, with bluish flowers. Among favorite garden species are the English iris (*I. xiphioides*), the Persian iris (*I. persica*), the common iris (*I. germanica*), the snake's-head iris (*I. tuberosa*), and the Chalcedonian iris (*I. susiana*). Orris root consists of the rootstocks of the white-flowered *I. florentina* and some other species. Among other species found in the United States are the larger blue flag (*I. versi-color*), common from the Atlantic coast to the Mississippi, the slender blue flag (*I. virginica*), and several dwarf species.

Irish Academy, Royal, a literary and archæological association founded in Dublin, Ireland, in 1786. Its object is to promote the study of literature, antiquities, and science. The library founded and owned by the association contains a large number of Irish manuscripts and documents of public interest. It has a fine collection of antiquities which have been loaned to the National Museum, Dublin. The association is governed by a council consisting of 21 members. This council meets regularly several times a year. The work is divided among the members, who are subdivided into committees. The committees are three in number; committee of literature, committee of science, committee of antiquities. Students making historical research in Ireland have found this association of great assistance.

Irish Catholic Benevolent Union, a fraternal organization founded in the United States in 1869. It has 149 subordinate societies and 14,000 members. The benefits disbursed since organization have amounted to over $2,500,000, and during the year 1902 amounted to $45,371. The membership in the union is confined to persons of Irish extraction who are communicants in the Roman Catholic Church.

Irish Deer, or **Elk.** See Elk.

Irish Language, Society for the Preservation of, an organization established in 1873, in Boston, Mass. The object is to foster the study of the Gaelic language so that it may again be one of the spoken languages of the Irish people. At first the society was called the Philo-Celtic Society. The headquarters are now in Dublin, where the organization was established in 1877. It has a number of branches in different parts of the United States.

Irish Land Laws. Under the Brehon laws, when the people of Ireland were divided into tribes, the land was usually the property of one of the four or five tribes which were the strongest in Erin. A large portion was given to the king or chief of the tribe, then divided among the clans that made up the tribe. Here again a large portion was given to the chief of the clan and then divided among the septs. The chief of the septs received the largest portion of the amount set apart for the sept. The free tribesmen, after the chief, received the greater part of the sept lands.

Some of the tribesmen, the Ceil, owned cattle, some, the Daer and Saer, were loaned cattle by the chief. The Fuidhir were the tenants who performed the manual labor.

When a chief died, the tribesmen distributed his land among his descendants, and when a tribesman died, the chief distributed his property. After England took possession of Ireland, the land tenure in a large part of the island continued to be administered under the Brehon laws; but within «The Pale» the English feudal system prevailed; there the king alone owned the land and the tenants derived ownership from him. Gradually England forced her land laws upon Ireland. This was done by driving the «rebellious Irish» out of certain counties, Kings and Queens, then all Ulster, when the Ulster plantation was established, in 1607. Other confiscations and dispossessions took place until all Ireland came under the English law. Cromwell took forcibly the best lands of Munster and Leinster and a large part of Ulster, and divided the whole among his soldiers. Although some of the lands were restored later, it was retaken, by act of Parliamen, under William III. Naturally the chiefs and leaders among the people of Ireland were deprived of their lands and the friends of the king of England or the English government, were given Irish possessions as a reward. The penal laws later made it a crime for a Catholic to acquire or hold land. Thus the Irish land question virtually began with the entrance of Henry II. into Ireland. With the Irish owners deprived of their lands there was instituted the system of «landlordism» which has been a hindrance to Ireland's progress. The majority of those who owned the land did not live upon it, and usually the money received for rent was spent in a foreign country. The landlord owned only the land, the houses had to be built and all improvements had to be made by the tenant and at his own expense. The more a holding was improved, the more rent was demanded. The «middle men» who held lands under the owner, and sublet to tenants were the means of increasing the burdens of the peasantry. The commission under Lord Devon, in 1843, to investigate conditions in Ireland, revealed an alarming state of affairs and the famine of 1846–8 brought the Irish Land question to the notice of the whole civilized world, even many of the English statesmen who had censured Irish shiftlessness were astonished when they learned the nature of the land laws which gave power of eviction without any remuneration for improvements; and the wonder was that so much thrift and industry existed. In 1847 Lord Russel endeavored to have Parliament pass an act to protect the tenant against loss by eviction. This measure failed, and others accepted by Parliament later proved ineffectual. Two years after the terrible devastation by famine, the Tenant Right League was organized in Dublin, and its members began a systematic campaign to elect to Parliament members pledged to support measures for the relief of the tenants. The Land Acts of 1860, under the Palmerston ministry, may be said to have resulted from the agitation kept up by the Tenant Right League. Various other organizations for the betterment of the people of Ireland were established, and among them were «physical force» societies. In 1870, under the Gladstone ministry, three new laws were enacted; that a tenant could not be evicted if his rent were paid; that this non-payment must be for at least three years; and that if the tenant choose, he might sell his improvements. This purchase of improvement clause was a great advance in favor of tenants' rights. The Land League in various parts of the world, especially the United States, continued the agitation and brought the question of the wrongs of the Irish tenants before the whole world. The Ashbourne Act of 1885 provided for the purchase of the lands by the tenants and nearly $25,000,000 was set aside for that purpose. Later a like amount was added. In 1891 the Balfour Law Purchase bill was passed and nearly $150,000,000 was provided for its enactment. In 1896 this law was improved; but for various reasons all the laws enacted by Parliament proved ineffective only in so far as the bringing of the matter to the notice of fair-minded statesmen. (See Land League.) The most radical and satisfactory «Land Purchase Bill» was enacted 14 Aug. 1903, whereby the tenant may purchase and own land and the government will, under certain and fair conditions, be responsible for the payment. To George Wyndham, who as chief secretary for Ireland, prepared the bill, the credit is largely due for the passage of the act. (See WYNDHAM, GEORGE.) Consult: Reports on the «Land Purchase» acts for relief of Ireland; Hansard's 'Parliamentary Debates'; Guinell, 'The Brehon Laws'; Maine, 'Lectures on the Early History of Institutions'; Fisher, 'History of Landholding in Ireland'; Richey, 'The Irish Land Law'; Godkin, 'The Land War in Ireland'; Richey, 'The Irish Landlord.' Irish Literary Society, an organization established in 1892, in London. Its object is to promote the study of Irish literature, music, art, and history. Some of the leading Irish literary men and women of England and Ireland are active or honorary members, and strive in many ways to promote the work of the society. The society provides lecture courses on topics pertaining to literary Ireland, and it has a large library which may be used by any of its members. Some of the members are Justin McCarthy, W. B. Yeats, Rev. Stopford Brooke, Barry O'Brien, and several of the well known writers among the Irish women. There were (in 1903) about 625 members.

Irish (Gaelic) Literature. See CELTIC LITERATURE; GAELIC LITERATURE.

Irish Moss, an edible dulse or seaweed. See CARRAGEEN.

Irish Music has been celebrated from almost prehistoric times, Irish teachers of the art as early as the 7th century holding high rank as specialists in the faculties of continental and English colleges. While the bagpipe was the popular instrument of the common people, the harp was in great favor among the noble and educated classes, and their professional harpists were noted for their skill. The Irish scale originally consisting of five notes, gradually developed with the addition of a sixth and a seventh, until the Irish harp had a finely graduated scale of tones and semitones either in the key of C or G, extending through a compass of four octaves. A harp in the museum of Trinity College, Dublin, said to be that of Brian Boru, has 30 strings, and the Dallway harp, made in 1621, has 52 strings. The national temperament was so musically imbued that there were special songs and airs for different crafts and for almost every conceivable occasion. War marches were played by the pipers at the head of the clansmen marching to battle; spinning, weaving, smithy, plowing, boating, and sporting songs were in daily use, and there were even milking songs, slow and plaintive airs which had the effect of soothing the cows and induced them to submit gently to the milking operation. In Irish literature, native music is frequently classed under three different styles, known as mirth, sorrow, and sleep music, comprising (1) lively, spirited pieces, as jigs, reels, hornpipes and other dance music; (2) solemn and slow pieces, as laments or dirges, commonly called *caiones* or *keens*, and sung on the occasion of a death; (3) plaintive and soothing airs, such as nurse tunes, cradle songs, lullabies, etc. In the numerous collections of these airs, about 2,000 different melodies are preserved, some of the most popular being 'Savourneen Dheelish,' 'Eileen Aroon' (popularly known by the Scotch appropriation 'Robin Adair'), 'The Coolin,' 'Garryowen,' 'Langolee,' 'Molly Asthore' and 'Patrick's Day.' With the universal spread of music after the 17th century, Irish music as a national feature became merged in the general history of the art. Turlogh Carolan, Carroll O'Daly, Reilly and the Conallons were among the chief of Ireland's ancient harpists and musicians. In modern times Ireland's musical productivity is represented by Michael William Balfe, William Vincent Wallace, Sir Charles Villiers Stanford, and others. Consult: Graves and Stanford, 'Songs of Old Ireland and Irish Songs and Ballads' (1882–92); id., 'Songs of Erin'; Graves and Wood, 'Irish Folk Song'; Graves, 'Songs of Irish Wit and Humor'; and collections of Bunting, Joyce, Moore and Petrie.

Irish Presbyterian Church, formerly called the Synod of Ulster. Its members are mostly descended from the Scotch Presbyterians, who migrated to Ireland by invitation of James I., between 1609 and 1612, to colonize Ulster.

Irish Sea, the body of water between England and Ireland. It is connected with the Atlantic Ocean on the north by the North Channel, and on the south by Saint George's Channel. The north shore of Wales and the southwest shore of Scotland are washed by this sea. It is almost circular in form, about 140 miles north and south, and the same east and west. The largest arms of the sea are on the west shore. The Morecambe Bay on the coast of England, and several large fiords. Dublin and Dundalk bays are the most important on the west coast. The only large islands are the Isle of Man in the north, about midway between England and Ireland, and Anglesey off the northwest coast and a part of Wales.

Irish Terrier, a rough-coated, strongly built terrier, resembling the Welsh and Scotch terriers. See DOG.

Irish Texts Society, an organization established in London. Its object is to promote the study of Irish literature,— that is, of literature in the Irish text. They foster societies and issue publications to aid the work. In 1900 they published their third volume, which contained the poems of Egan O'Rahilly. In 1901 their annual volume contained Keating's 'History of Ireland,' edited by David Comyn. The volume of 1903 contains an 'Irish-English Dictionary.'

Iritis, ī-rī'tĭs, inflammation of the iris, the colored curtain that shows the pupil in its centre. This disease follows several types, depending on the kind and virulence of the causative agent. In the serous form there is an exudation of blood-serum into the space in front of the iris, and more or less fibrinous matter that tends to glue the parts together. Pain shoots through the whole eyeball, and vision is dimmed by the turbid fluid. Persistent adhesions to the lens are formed, causing a permanent distortion of the shape of the pupil. Another form is the plastic, in which the pupil is actually occluded by the fibrinous deposits. Rheumatism and syphilis are the two most frequent causes of the malady, but many constitutional diseases — as gout, diabetes, anæmias, and menstrual disorders — may be factors in causing the disturbance, and it may also be secondary to diseases in other parts of the eye, or even in the other eye, as in sympathetic ophthalmia. The treatment consists of dilating the pupil by dropping solutions of some drug, as atropine, into the conjunctival sac, treating the constitutional disease at the seat of the malady, and in relieving the pain by hot fomentations, blood letting, and the administration of drugs that are sedative. Syphilitic iritis is a lesion of the third stage of syphilis (q.v.), where tiny spots called gummata grow in the substance of the iris.

Irkutsk, ir'kootsk, a provincial government of Russia, in eastern Siberia, separated from China by the Sayan Mountains. It has an area of 287,061 square miles. The country is generally mountainous, but produces rye, barley, oats and vegetables. The most important rivers are the Angara, Lena and its tributary the Vitim. Gold, iron, and salt figure foremost among the mineral products. Agriculture, cattle-breeding, and the transport of goods to and from China are the chief occupations of the people. Pop. 501,237 (one third exiles and forced colonists). The capital city, Irkutsk, on the Angara, is the residence of the governor-general of eastern Siberia and the seat of a bishop.

Iron, a common and exceedingly useful metallic element, which has been known and used in the arts for many centuries. It occurs in nature in the metallic form, both in meteorites and in certain lavas and volcanic rocks; but the commercial supply is obtained by the reduction of the oxids (or other ores) of the metal, by strongly heating them in a blast furnace with carbon. Iron is grayish in color, with a marked lustre. It crystallizes in the isometric system, usually in the form of cubes or octahedra. The melting point of iron varies to a considerable extent, according to the impurities with which the metal is associated, and also, apparently, according to the physical condition of the iron itself. Pictet gives it as about 2900° F. for iron that is sensibly pure. The specific gravity of the metal also varies to a considerable extent, the determinations ranging from 6.95 to 8.2. The specific gravity of pure iron, at 60° F., may be taken to be 7.85. The specific heat of the metal is about 0.112 at ordinary temperatures, and its coefficient of expansion (on the Fahrenheit scale) is about 0.0000068. Taking the electrical conductivity of mercury (at 32° F.) as unity, the conductivity of iron is about 9.68 at 32° F., and 6.19 at 212° F. Iron is the most magnetic substance known. Soft, pure iron is capable of being magnetized very highly when surrounded by a solenoid of wire that is conveying an electrical current; but its magnetization persists only while the electric current is flowing, falling off, upon the cessation of the current, to a value that is practically negligeable. It is upon this property of temporary magnetization that the action of the telephone, the telegraph, and many other useful electrical inventions depends. (See MAGNETISM; and for a full discussion of the phenomena of magnetization, consult Ewing, 'Magnetic Induction in Iron and Other Metals.') Hardened steel, when magnetized by the action of the electric current (or otherwise), retains a large proportion of its magnetism permanently. Iron becomes nonmagnetic at a red heat, but regains its magnetic properties upon cooling again. Wrought iron, when pure, is malleable to a certain extent at all temperatures; but it yields to the hammer with special readiness when heated to whiteness, and it may then be forged and welded without difficulty. The presence of any considerable proportion of sulphur or phosphorus makes the metal "short," or brittle. When phosphorus is present in too great a proportion, the iron is brittle in the cold (that is, "cold-short"); while if sulphur is present in excess it is brittle when hot (that is, it is "hot-short").

Chemically, iron is a dyad. It has the symbol Fe (from "ferrum," the Latin name for the metal), and an atomic weight of 56 if $O = 16$, or 55.6 if $H = 1$. It forms two basic oxids, (1) ferrous oxid, FeO, which gives rise to a series of salts known as "ferrous" salts, and (2) ferric oxid (or ferric sesquioxid), Fe_2O_3, which gives rise to a corresponding series of "ferric" salts. A third oxid, having the formula Fe_3O_4, is also known, which is magnetic, and occurs in nature, either amorphous or crystallized in octahedra, as the mineral "lodestone." This oxid is black in color, and is known as the black oxid, magnetic oxid, or ferroso-ferric oxid. It may be prepared, artificially, by oxidizing iron at a high temperature, either in air or in steam, or by heating carbonate of iron to 650° F., in a current of carbon dioxid. It is not readily attacked by acids or other chemical agents, and for this reason a coating of it is often formed on articles of iron to protect them from further oxidation. The Russian iron that is used for stove-pipes is coated in this way, by a secret process. When in mass, iron does not readily decompose water at ordinary temperatures, though it does so at high temperatures. Finely divided iron decomposes water at 212° F., and at lower temperatures according to some authorities. When in a sufficiently fine state of subdivision, iron will burn in the air or in oxygen, with the formation of a mixture of Fe_2O_3 and Fe_3O_4. Iron forms alloys with many metals, and combines directly with chlorine, bromine, iodine, fluorine, sulphur, carbon, boron, silicon, phosphorus, and arsenic. Melted iron dissolves carbon to some extent, and when the molten mass is cooled the carbon is largely deposited in the graphitic form, although a part of it remains in the iron, combined with it in the form of a carbide; and it is believed that the presence of varying quantities of such carbides has much to do with the physical qualities of iron and steel. When melted iron that is saturated with carbon is allowed to cool under great pressure, the carbon is partly deposited in the form of minute crystals of diamond (q.v.); but the manufacture of the diamond by this method has not yet been made commercially practicable.

Ferrous Compounds.— Ferrous oxid, FeO, has not yet been prepared in a state of absolute purity, but it may be obtained approximately pure by reducing ferric oxid, Fe_2O_3, by heating it to 600° F. in a stream of pure hydrogen. It is black in color, and absorbs oxygen with great readiness, passing into the higher oxids. Ferrous sulphate, otherwise known as protosulphate of iron, green vitriol, or copperas, is prepared by dissolving metallic iron in sulphuric acid, and crystallizing by evaporation. It has the formula $FeSO_4 + 7H_2O$, and is greenish in color. It is soluble in water, but the solution oxidizes readily, the salt becoming converted into ferric sulphate, $Fe_2(SO_4)_3$. Ferrous sulphate is largely used in the manufacture of certain black dyes, in the preparation of writing ink, and, to a certain extent, in photography. The ferrous oxalate developer, made by mixing a solution of ferrous sulphate with one of oxalate of potassium, was formerly in great favor, but has now fallen into comparative disuse, owing to the discovery of other developers that are more active and more convenient to handle. Ferrous chloride, $FeCl_2$, may be prepared by heating excess of iron wire or iron filings in chlorine, or by passing dry hydrochloric acid gas over hot metallic iron. It crystallizes in white, lustrous, six-sided forms, and is volatile at a yellow heat. In air it oxidizes readily to a mixture of ferric oxide and ferric chloride. Ferrous carbonate, $FeCO_3$, is an insoluble compound, occurring in nature as "spathose iron ore," and constituting a valuable ore of iron. Ferrous sulphide, FeS, is a black or grayish-black body, which may be prepared by melting sulphur and iron together in the proportion of 56 parts (by weight) of iron to 32 of sulphur. It is insoluble in water, but dissolves readily in dilute acids, with copious liberation of sulphuretted hydrogen gas. See CHEMICAL ANALYSIS.

Ferric Compounds.—Ferric oxid, Fe_2O_3, occurs native as hematite (q.v.), and it may be prepared artificially by heating ferrous sulphate to redness. Ferric hydrate, $Fe(OH)_3$ is precipitated as a brownish-red powder when ammonia or caustic potash is added to the solution of a ferric salt. Ferric sulphate and ferric chloride are prepared by dissolving this hydrate in sulphuric and hydrochloric acids, respectively. In general, a ferrous salt, when in solution, is converted into the corresponding ferric salt by the action of oxidizing agents; and the ferric salts, conversely, are reduced to ferrous salts by the action of certain reducing agents. Ferrous salts give a white precipitate with caustic alkalies, and, with potassium ferrocyanide, a light-blue precipitate which quickly turns black. Ferric salts give a reddish-brown precipitate with caustic alkalies, and a deep blue precipitate with potassium ferrocyanide.

Iron Age, (1) in mythology, the last of the four great ages of the world, supposed to be characterized by abounding oppression, vice, and misery. (2) In archæology, an age, the third in succession, in which weapons and many other implements began to be made of iron, stone having been used for these purposes in the first, and bronze in the second.

Iron Founding, Chemistry of. Chemistry is the science which deals with the composition of material things; the chemistry of iron founding or iron casting is the science which deals with the composition of cast iron. Cast iron implies a quality of iron which can be melted and poured into moulds and which will take the shape of the moulds. The three properties which make cast iron valuable as a cast product are fluidity, low shrinkage, and mutability of hardness. Pure iron does not have these essential characteristics, consequently the casting properties of cast iron must be due to impurities present with the iron. The chemistry of iron founding must therefore deal with these impurities and their reactions in making iron a cast product. The substances which occur with iron are carbon, silicon, phosphorus, sulphur, and manganese, and each of these has a decided effect upon cast iron.

Carbon.—Carbon is the controlling element; in fact, cast iron could not be cast iron without carbon. Iron as it comes from the blast furnace, known as pig iron, contains from two to four and one half per cent. carbon. Cast iron as it comes from the cupola generally retains from three to four per cent. carbon; special grades sometimes contain as low as two and one-quarter per cent., and as high as four and one-quarter per cent.

Condition of Carbon in Cast Iron.—Chemically, all the carbon which does not dissolve in a certain strength of nitric acid is classed as Free Carbon, while the carbon which dissolves in this acid is designated as Combined Carbon.

Free Carbon.—Free Carbon occurs as pure carbon interspersed in appreciable-sized particles between the crystals of iron. Free Carbon is subdivided according to its structure and mode of formation into Graphitic Carbon and Annealing Carbon.

Graphitic Carbon.—Graphitic Carbon is the crystalline or platy form of carbon existing in all soft pig and cast iron which has been allowed to cool slowly from a molten condition.

Annealing Carbon.—Annealing Carbon is an amorphous modification of carbon which is developed in white iron by continued annealing at a high temperature.

The difference between Graphitic and Annealing Carbon is a physical one and is due to the mode of formation.

Combined Carbon.—Combined Carbon exists in cast iron in two forms, Hardening Carbon and Carbide Carbon. Neither is visible to the naked eye, but each gives to iron a definite physical structure which is discernible under the microscope. Chemically, they may be separated by treating the iron for a long period with a weak non-oxidizing acid in a non-oxidizing atmosphere.

Hardening Carbon.—Carbon is held in the hardening condition by rapidly cooling iron from a high temperature. The exact condition of the carbon has not been definitely determined. The writer considers that in this rapid cooling the carbon is caught and held in an atomic condition by the surrounding iron.

Carbide Carbon.—Carbide Carbon is the carbon which exists in the carbide of iron Fe_3C.

Factors Controlling the Condition of the Carbon.—There are three factors which control the condition of carbon in cast iron. First, the percentage of carbon in the iron; second, the rate at which the iron cools; third, the percentage of other elements present with the carbon in the iron.

(1) *Condition of Carbon Determined by Amount Present.*—The more carbon there is present in molten cast iron when it begins to cool, the greater will be the percentage of carbon which will separate out in the free condition during cooling. For example—a four per cent. carbon iron would contain a greater percentage of free carbon than a three per cent. carbon iron, provided both were cooled under similar conditions and carried the same amount of other elements.

(2) *Condition of Carbon Determined by Rate of Cooling.*—The slower cast iron cools the greater will be the percentage of carbon present in the free condition, and conversely, the faster

an iron is cooled, the greater will be the proportion of the carbon present in the combined condition. If a portion of molten cast iron of a correct composition is poured into water the carbon will be retained in the combined condition; if another portion of the same iron is cooled very slowly, all the carbon will separate out into the free condition.

(3) *Condition of Carbon Determined by Other Elements Present.*—The condition of the carbon in cast iron is controlled by the percentage of carbon present and the rate of cooling, consequently any elements which affect these two reactions will affect the relation of the free to the combined carbon. Silicon, sulphur, phosphorus, and manganese take a prominent part in one or both of these reactions and consequently exert an important influence upon the condition of the carbon. (This is discussed later under the individual elements.)

Effect of Carbon on the Physical Properties of Cast Iron.—Free carbon makes iron soft and is instrumental in prolonging the fluidity, decreasing shrinkage, and regulating strength. Hardening carbon and carbide carbon increase the hardness and strength of cast iron; they prevent the decrease in shrinkage which would occur if their carbon was present in the free condition; they lower the melting point of cast iron.

Action of Carbon in Affecting the Physical Properties of Cast Iron.—As cast iron cools from a molten condition the carbon separates out as free carbon, unites with the iron as carbide carbon, and is retained in the form of hardening carbon. Cast iron in the molten state is a solution of carbon in iron; as the temperature decreases the ability of the iron to hold the carbon in solution decreases, and the carbon begins to separate out as graphitic carbon. Heat is rendered latent in the solution of the carbon in the iron and this heat will be given up when the carbon separates out from the iron. This evolved heat will prolong fluidity and consequently will give a longer time for the separation of free carbon, thus increasing the softness and decreasing the shrinkage of the iron.

When cast iron cools, the carbon which did not separate out as free carbon tends to unite with the iron as carbide carbon in the compound Fe_3C. This occurs while the iron is passing through the zone of temperature in the neighborhood of 700° C. The remainder of the carbon, which neither separates as free carbon nor unites with the iron as carbide carbon, remains present as hardening carbon.

Silicon.—Silicon is of value to cast iron on account of its influence upon the carbon. Silicon of itself would add no beneficial quality as its effects are indirect and through the carbon. Pig iron generally contains from two-tenths of one per cent. to twelve per cent. silicon. The lower silicon grades are hard charcoal, basic, or off bessemer irons, while the extremely high silicon irons are special softeners made to mix with other irons to increase the percentage of silicon. Cast iron carries from four-tenths of a per cent. to one per cent. silicon for chilled work and from one to three per cent. for different grades of grey iron work.

Condition of Silicon in Cast Iron.—The condition of silicon in cast iron has not been fully determined. Certain silicides of iron have been separated from cast iron, but their composition is so indefinite and they are so easily broken up that their condition exerts no important influence upon cast iron.

Effect of Silicon on the Physical Properties of Cast Iron.—Silicon through its action on the carbon softens cast iron, reduces its shrinkage, increases its fluidity, and regulates its strength.

The effect of silicon as a softener is limited, and when too much silicon is present its softening action ceases and it begins to harden iron. The same is true with regard to its effect on fluidity and strength. Cast iron with three and one-half per cent. silicon will hold almost no carbon in combination, consequently any silicon in excess of this amount exerts a direct effect upon the iron and renders it unfit for use as a cast product.

Action of Silicon on Carbon.—The importance of the action of silicon on carbon is due to the fact that silicon reduces the solubility of iron for carbon. An iron containing silicon will dissolve less carbon than an iron containing none. At a given temperature, then, the more silicon an iron contains the less carbon will the iron retain in the dissolved condition, consequently when an iron cools from a high temperature the amount of carbon that will separate out from solution is regulated by the amount of silicon present. The higher the silicon the less carbon will the iron hold in solution, and the more will separate out as free carbon.

Phosphorus.—Phosphorus confers both beneficial and harmful properties on cast iron. Cast iron generally contains from two-tenths to one and five-tenths per cent. phosphorus, but on account of its injurious effect it should be kept below one per cent. for light thin castings, and below five-tenths per cent. in heavy castings.

Condition of Phosphorus in Cast Iron.—Phosphides of iron have been separated from cast iron, and phosphorus probably exists in some such form in cold cast iron. In the liquid state it presumably acts as a dissolved gas, giving greater activity to the particles of the iron and prolonging the period of cooling.

Effect of Phosphorus on the Properties of Cast Iron.—Phosphorus makes iron fluid, or at least prolongs the fluidity, and thus aids the iron in taking the exact form of the mold. It makes iron weak, brittle, and liable to break under shocks. It is advantageous in light, thin castings where fluidity and exactness of outline are important and where strength can be neglected. It is very detrimental in large irregular-shape castings, especially where strength is required.

Action of Phosphorus on Cast Iron.—Phosphorus by prolonging the fluidity of the iron gives the graphite a further opportunity to separate and thus tends to reduce shrinkage. By prolonging the iron in a plastic condition just after it sets, phosphorus allows the separating graphite to force the iron into the minutest corners of the mold. The phosphorus prolongs the cooling of the iron as it crystallizes out and thus allows it to separate into larger crystals, which weakens the iron and causes it to be brittle. When phosphorus is present in large quantities it forms a eutectic with the iron which fills up the crevices between the particles which have previously solidified. When the eutectic solidifies later it causes strains in the iron which makes it short and liable to break under shock.

Sulphur.—Sulphur acts in two ways in cast iron. First through the carbon and second by uniting directly with the iron. On account of its injurious action sulphur is generally kept below fifteen hundredths of one per cent., and for light work below eight hundredths of one per cent.

Condition of Sulphur in Cast Iron.—Sulphur exists in cold cast iron as a sulphide of iron or as a sulphide of manganese. In molten cast iron it is probably dissolved as gaseous sulphur.

Effect of Sulphur on the Properties of Cast Iron.—Sulphur makes iron hard, red short, weak, and liable to contain blow holes. Its only beneficial effect is to give a hard wearing quality to iron subjected to frictional wear.

Action of Sulphur on Cast Iron.—Sulphur, by shortening the time of cooling of cast iron, prevents the separation of graphitic carbon. The carbon which has not been able to separate as free carbon remains in the combined condition, and consequently sulphur tends to harden the iron.

When cast iron solidifies sulphur is still in a gaseous condition and surrounds each particle of iron with a covering of gaseous sulphur. When the iron is sufficiently cold, the sulphur solidifies, or unites with the iron as a sulphide of iron. In this condition it occupies less space than in the gaseous condition and thus leaves the crystals surrounded by minute spaces which makes the iron very brittle and weak.

Manganese.—Manganese acts in two opposite ways on cast iron. It increases the power of the iron to hold carbon in solution and consequently tends to increase the combined carbon and hardness. It unites with the sulphur and forms a sulphide of iron which separates out before the iron sets and thus prevents the sulphur from exerting a hardening effect. Pig iron contains from two-tenths of one per cent. to three and one-half per cent. manganese, while cast iron ordinarily runs from one-tenth of one per cent. to one per cent. in manganese.

Condition of Manganese in Cast Iron.—Manganese exists in three conditions in cast iron. In the molten condition it tends to unite with the sulphur as manganese sulphide. As the iron cools through the critical temperature the manganese unites with the carbon to form a carbide Mn_3C. Any manganese not so united alloys with the iron.

Effect of Manganese on the Properties of Cast Iron.—Manganese by its action on the carbon tends to harden cast iron, while its effect on sulphur tends to soften cast iron. Whether the hardening effect with the carbon or the softening effect on the sulphur predominates depends upon the amount of manganese and sulphur present.

Action of Manganese on Cast Iron.—Manganese unites with the sulphur and forms a manganese sulphide at a temperature above the solidifying temperature of cast iron. Consequently this manganese sulphide has no more detrimental effect on the iron than so many small particles of any neutral impurity. Manganese therefore prevents the bad effect of the sulphur, and hence in the case of high sulphur irons it acts as a softener. The manganese in excess of that which unites with the sulphur unites with the carbon to form a carbide Mn_3C. This carbide hardens the iron, for it of itself is an intensely hard substance.

HERBERT E. FIELD.
Pittsburgh, Pa.

Iron, Manufacture of. The metallic products extracted from iron ores for use in the arts are generally divided into three classes: (1) pig or cast iron, (2) wrought iron, and (3) steel. See IRON AND STEEL; IRON AND STEEL INDUSTRY; STEEL INDUSTRY; STEEL.

Although the minerals in which iron occurs are very numerous, the only ones from which the metal can be extracted under economical conditions—that is, the only ores of iron—are those in which the iron is present as an oxide, as in magnetites, hematites, and limonites, or as a carbonate as in siderites. (See IRON ORES.) When carbonate of iron, moreover, is heated to a sufficiently high temperature either at an early stage of the process of manufacture or in a preliminary operation (the calcining of the ore), the carbonic acid which it contains is expelled as a gas and the iron is reduced to the condition of an oxide, hence the operation of extracting metallic iron from its ores always consists in the deoxidation or reduction of iron oxide.

In order to reduce oxide of iron two conditions are essential: (1) contact with a reducing or deoxidizing substance, and (2) a high temperature. By heating iron oxide in contact with some carbonaceous fuel these two necessary conditions are realized, the carbon acting both as the needed fuel and as the needed reducing body, for at a sufficiently high temperature it has a stronger affinity for oxygen than iron and therefore deprives the latter of that element.

Iron ore, however, never consists of pure oxide of iron: in the richest varieties the iron oxide is associated with at least a small amount of other minerals, generally of an earthy character, such as quartz, clay, or limestone, and which are called the *gangue* or *vein stuff*. In the majority of cases the gangue is silicious, that is, made up chiefly of silica or quartz. Silica is *per se* a very infusible compound, but when brought in contact with iron oxide at a high temperature it combines readily with it to form a silicate of iron, a readily fusible substance or slag.

Besides the earthy matters which constitute the gangue, iron ores generally contain other minerals in which are present such elements as phosphorus, sulphur, manganese, etc. See IRON FOUNDING, CHEMISTRY OF.

Finally, if metallic iron be kept in contact with incandescent carbon for a sufficient length of time, a considerable amount of that element will be absorbed by the metal. The conditions are then said to be carburizing. This affinity of iron for carbon plays a most important part in its metallurgy, chiefly because of the marked influence of carbon upon the melting point of the metal. Pure or rather carbonless iron requires a very high temperature to be melted (about 2,000° F.), necessitating the use of special furnaces and implements capable of producing intense heat. By the introduction of some carbon in the iron, however, its melting point is greatly lowered, from which the important conclusion is to be drawn that if the metallic product of the metallurgical operation be highly carburized it will be produced and maintained in a liquid state much more readily than if it were freer from carbon. If the iron contains but a small amount of carbon and if we lack the means of producing an intense heat, the product of the operation will be pasty and not molten.

The Primitive or Direct Methods.— The simple operation outlined in the preceding paragraphs which consists in heating iron ore in contact with carbonaceous fuel, was the one conducted in the direct or primitive methods which for ages were the only ones used for the production of iron and steel. Charcoal was the fuel employed and the simple furnace required, called a forge or bloomery, resembled a smith's forge.

So simple is the operation required for extracting a small mass of malleable iron from some rich ore that it seems highly probable that man became acquainted with the use of iron at a very early period of his existence. A fire accidentally lighted by a primeval man upon the ground where iron ore occurred near the surface would have resulted, under suitable conditions, in the production of some metallic iron. Indeed, the first iron furnaces of which we have any record consisted in a single excavation dug preferably on the side of a hill, facing the prevailing wind, and with suitable openings at the bottom for the necessary draft. Artificial blast was later introduced and the construction of the furnace improved. It will suffice to mention here two representative types of this class of furnaces: (1) the old catalan furnace or forge, and (2) the American bloomery, a modern adaptation of this primitive forge.

The catalan forge takes its name from the province of Catalonia, in Spain, where at one time it supplied a large proportion of the world's production of iron, and where, indeed, it is still in operation, as well as in other localities adjacent to the Pyrenees. In its more modern form it consists of a shallow hearth made up of thick iron plates, with the exception of the back, which generally consists of masonry lined with fire clay, while the bottom is frequently made of a movable block of granite. The blast was undoubtedly at first supplied by crude bellows, but was later produced by a water blower or "trompe." The furnace is kept filled with charcoal and small lumps of rich iron ore until a pasty mass of metallic iron is obtained weighing some 350 pounds, called a "bloom," and which contains much slag. It is then removed from the furnace and much of the slag expelled by hammering or squeezing.

For many years a direct process known as the American bloomery process was extensively used in those localities of the United States where suitable ore and an abundant supply of charcoal were available. This process does not differ in any essential feature from the catalan method, which has just been described, but in details of furnace construction and in manipulations there are many points of difference between the two methods.

The hearth of the bloomery is kept full with burning charcoal and coarsely pulverized ores until a bloom of iron weighing some 300 or 400 pounds has been produced and which generally requires three hours. The loss of iron in the operation is said to be about 20 per cent and the fuel consumption some 2½ tons of charcoal per ton of iron produced.

These methods are called direct because they yield iron by the direct treatment of the ore in a single operation, in contradistinction to the modern methods in which at least two distinct treatments are required for the production of iron and steel, the first operation yielding, as will be seen presently, an impure product called cast iron, which must be refined or purified in order to convert it into iron or steel.

While these methods are now obsolete, having been replaced by the more modern indirect processes, they are still in use in some countries, although only to a very limited extent.

According to James M. Swank, in 1902 and 1903 there were no forges in operation in the United States for the manufacture of blooms and billets from the ore. In 1901 the blooms and billets so made amounted to 2,310 gross tons, against 4,292 tons in 1900, 3,142 tons in 1899, 1,767 tons in 1898, 1,455 tons in 1897, 1,346 tons in 1896, 40 tons in 1895, 40 tons in 1894, 864 tons in 1893, and 2,182 tons in 1892. All the ore blooms produced since 1897 were made by the Chateaugay Ore and Iron Company, of Plattsburgh, N. Y., at its Standish Works, which, however, have been idle since 1892.

The Blast Furnace.— In order to prevent the great waste of iron previously alluded to and resulting from the combination of the gangue of the ore with some of the metallic iron, it is necessary to provide a substance with which the silica of the gangue will readily unite, forming with it a fusible slag, and as silica is an acid it is necessary to provide a base to that effect.

Limestone (a carbonate of lime) is the most readily obtainable and cheapest substance for such purpose. It is either burned or calcined in a preliminary operation by which it is converted into lime, the carbonic acid escaping as a gas, or if used raw, it is likewise changed to lime at an early stage of the metallurgical operation by the heat to which it is exposed.

The substances which are thus added for the purpose of forming a fusible compound with the gangue of the ore or with other impurities are called fluxes.

The use of fluxes constitutes one of the most important improvements ever introduced in the manufacture of iron, for it made it possible to extract the metal, under economical conditions, from the enormous amount of relatively lean ores which occur in nature, and to do so at a relatively very low cost. Previously to the use of fluxes it was unprofitable to treat ore containing less than some 60 or 70 per cent of metallic iron, while with their assistance iron ores with as little as some 25 per cent of iron may be profitably smelted.

With the addition of lime, however, it is no longer possible to carry on the operation in the very simple furnace or forge previously used, because the resulting slag or silicate of lime is a much more infusible substance than the silicate of iron produced without the addition of lime and a sufficiently high temperature to fuse this lime slag could not be produced in the forge furnace.

The very high temperature required to fuse the lime slag necessitates the use of a very different type of apparatus (a high, chimney-like furnace), together with the necessary appliances for the production of the needed heat; in other words, the reduction of the ore must be carried on in the modern blast furnace. The blast furnace was gradually evolved from the primitive forge or bloomery by a mere increase in height, such furnaces as the "Osmund," the "Stückofen," and the "Blauofen" forming as many steps in this evolution. The exact date of the origin of the blast furnace, that is, of an apparatus in which cast iron alone could be produced — and it might be added with addition of flux — is not positively known but it is generally believed that it originated in the Rhine provinces about the beginning of the 14th century.

The operation conducted in early blast furnaces consisted chiefly in smelting iron ore with the necessary amount of charcoal for fuel and of limestone to flux the gangue of the ore. The waste gases which contained a large amount of carbon monoxide were allowed to escape and to burn freely at the top of the furnace. The molten cast iron was allowed to collect at the bottom of the furnace until a sufficient quantity had accumulated, when it was withdrawn by opening a tap hole at the bottom and in the front part of the furnace. The slag was permitted to escape as soon as formed by flowing through an opening and over a stone on one side of the furnace known as the dam-stone. The blast was at first created by rude bellows, later by blowing cylinders, and finally by steam-blowing engines, while no attempt was made at preheating it.

The following improvements introduced in blast furnace practice, outside of mere improvements in construction, marked the most important steps which have led to the modern blast furnace operations. They are mentioned in a chronological order: (1) Use of coke instead of charcoal introduced by Abraham Darby in 1735; (2) the heating of the blast first proposed by James Beaumont Neilson in 1828; (3) the closing of the top of the furnace and utilization of the waste gases by P. Taylor in 1840; (4) the heating of the hot blast stoves by the waste gases of the furnace successfully accomplished between 1833 and 1845 by Faber du Faur and James Palmer Budd; (5) the cup and cone arrangement for closing the top of the furnace invented by G. Parry in 1850; (6) the waste gases used for generating steam by James Palmer Budd in about 1855; (7) regenerative stoves for heating the blast introduced by E. H. Cowper in 1860.

The important and numerous improvements in construction cover every part of the furnace as well as every appliance connected with iron making. To attempt even to mention them would occupy an amount of space which is not here available.

Modern American blast furnaces generally measure from 90 to 100 feet in height and from 20 to 30 feet in diameter at the widest part, while the hearth diameter frequently measures 13 or 14 feet, giving a capacity of from 20,000 to 30,000 cubic feet. The bosh walls which extend from the hearth to the widest part of the furnace are cooled by hollow rings of cast iron or bronze built in sections and inserted into the brick work, and through which water is constantly flowing. The water required for cooling purposes often exceeds 3,000,000 United States gallons in 24 hours. Two down-comers conduct the blast from the top of the furnace to the dust-catchers, from which it is led to the stoves and the boilers by means of a gas main. Another main leads the blast from the stoves to the furnace. Before connecting with the bustle pipe surrounding the furnace the hot blast main frequently divides in order to better equalize the pressure around the complete circle. Explosion doors are provided at the furnace top, and whenever possible in all pipes and chambers carrying gas.

Blast at the rate of 40,000 to 60,000 cubic feet per minute is forced into the furnace through pipes or "tuyeres," varying between 12 and 20 in number, under a pressure of 10 to 15 pounds per square inch and preheated by its passage through the stoves to a temperature of 1,000 to 1,500° F. The output of these furnaces frequently averages 600 tons of pig iron in 24 hours and is occasionally considerably greater, the furnace being tapped six times a day and some 100 tons of iron being obtained at each cast. The tapping hole is frequently opened by means of compressed air drills and closed by means of a tapping hole gun which forces clay into the hole. The fuel consumption varies between 1,500 and 2,000 pounds of coke per ton of pig iron, according to conditions.

The raw materials are conveyed to the top of the furnace by an inclined plane and skip cars, which discharge the raw materials automatically into a receiving hopper provided with a bell and placed over the main hopper. The use of an upper bell acting as a seal while the material is introduced into the furnace, prevents the escape and waste of the gases during this operation, resulting in further economy.

Modern blowing engines supplying the blast to the furnace are constructed both horizontal and vertical and are generally compound and condensing. They frequently have a capacity of some 30,000 cubic feet of air per minute which they can deliver under a pressure of 25 pounds or more per square inch if needed. Two such engines are generally employed for each furnace. A recent improvement in blowing engine construction consists in the use of gas or internal combustion engines for creating the blast. The first successful engine of this type was built at the Cockerill Steel Works at Seraing in Belgium and the results were so encouraging that many other similar engines have since been constructed, especially in Germany, Belgium, and France. It has been found by careful tests that gas blowing engines consume only from one sixth to one fourth of the gas which would be required to raise the steam for use in an ordinary engine of the same capacity. In spite of its evident superiority over steam engines, however, its introduction into American plants is proceeding very slowly.

The modern stoves employed for heating the blast before it enters the blast furnace consist, roughly stated, in high cylindrical chambers filled with bricks placed some distance apart. The waste gases from the furnace are admitted at one end of these chambers together with sufficient air to burn them, and the hot products of the combustion on their way to the chimney heat the brick work to a very high temperature. After the stove has thus been properly heated, the supply of gas and air is shut off and the cold blast from the engine is admitted. The heat which has been stored up in the brick work is now imparted to the blast, which in this way is highly preheated. After the stove has cooled down to a certain temperature the blast is shut off and the stove is again heated by the waste gases. Modern furnaces are generally provided with four of these stoves, the blast passing in succession through each stove for one hour, while the three others are being heated. With such regenerative system of heating the temperature can readily be maintained at 1,450° F., which results in a considerable economy of fuel in the furnace.

Until quite recently it was the universal practice, after opening the tap hole, to allow the iron to run into sand molds, prepared for that purpose on the floor in front of the furnace, and this method is still widely used. The metallic mass filling each mold is called a pig, while the metal filling the channels connecting a number of molds is called a sow. The pigs are, of course, fastened to the sow, and, after solidification, must be broken loose, generally with sledgehammers. When the cast iron is to be used for conversion into steel by the Bessemer process the metal as it flows from the furnace is frequently received in large tanks or «ladles» mounted on wheels, which are afterward taken to the steel mill, where the metal is converted into steel without being allowed to solidify, thus saving the cost of remelting the pig iron. In later years casting machines have been introduced to save the heavy labor connected with the handling of the pigs, and to otherwise expedite the casting operation. Nearly all these devices consist in an endless chain, the links of which are made of small iron molds, which are filled in succession by passing under the stream of molten metal. The chain then carries the partially solidified pigs or «chills» under water to promote their cooling and discharge them automatically on cars, the empty molds returning to the ladle again to be filled, and so on.

In the modern furnace the slag tap hole or «cinder notch» is kept closed as well as the iron tap hole, being opened only at stated intervals, generally a short time before the casting of the iron. In the latest American practice the slag is generally received in ladles which carry it away to the dumping place, or it is handled by means of a device known as «slag conveyor,» and which is not unlike the casting machines just described, consisting in an endless chain of shallow pans which are successively filled as they pass under the stream of molten slag. After being immersed under water the pans are automatically emptied on cars.

The Products of the Blast Furnace.—Owing to the extremely high temperature at which the operation must be conducted and to prolonged contact between the reduced iron and the incandescent carbonaceous fuel, the conditions in a blast furnace are strongly carburizing, the metal absorbing a large amount of carbon, (generally between 3 and 4 per cent). Moreover, owing to the fact that highly carburized iron is much more fusible (melting generally between 2,100° and 2,400° F.) than iron containing little carbon, and to the intense heat of the furnace, the extracted metal, instead of being obtained in a semi-fused, pasty condition, will be perfectly liquid, and on account of its high specific gravity will settle at the bottom of the furnace. The slag also will be melted, and being lighter than the iron, will float as a separate layer above the metallic bath. The molten slag and the molten iron are withdrawn separately from the furnace, thus effecting their complete separation.

This highly carburized iron produced in the blast furnace is called pig iron, or cast iron. Owing principally to the large amount of carbon which it contains, the properties of cast iron are very different from those of wrought iron and steel.

Owing to the intensely reducing conditions prevailing in a blast furnace, to the high temperature and to the presence of metallic iron, many impurities, such as phosphorus, sulphur, manganese, and silicon, which are always present in greater or less amount in the ore, flux, and fuel, are partially or wholly reduced to the metallic state, and in this condition are retained, in part at least, by the molten cast iron. Cast iron, therefore, is not simply an association of iron and carbon, but contains also varying amounts of the impurities just mentioned.

The following table illustrates the rapid increase in the world's production of cast iron since the beginning of the last century.

YEARS	Production tons.	YEARS	Production tons.
1800	825,000	1880	17,950,000
1830	1,825,000	1890	27,157,000
1850	4,750,000	1900	40,400,000
1870	11,900,000	1903	46,420,000

The following table shows the wonderful growth of the manufacture of cast iron in the United States:

YEARS	Production tons.	YEARS	Production tons.
1810	53,908	1901	15,878,354
1850	563,755	1902	17,821,307
1875	2,023,733	1903	18,009,252
1900	13,789,242	1904	16,497,033

The Refining of Cast Iron or the Indirect Methods for the Production of Wrought Iron and Steel.— Cast iron is not malleable — it cannot be forged; that is, it cannot be shaped into finished implements by mechanical pressure such as that exerted by hammering, rolling, etc. Cast iron, therefore, can only be used as such for casting purposes, which means that cast iron implements can only be obtained by pouring the molten metal into molds having exactly or very nearly the external shape of the objects we desire to manufacture. Cast iron, moreover, is brittle and lacks both strength and toughness, which further greatly limits its useful application. To produce a metal which is forgeable, which possesses more strength and toughness and other valuable properties absent in cast iron, and, therefore, a much more useful metal, it is necessary to subject cast iron to a refining operation by which it is converted either into steel or into wrought iron.

This indirect method of producing iron and steel is the prevailing modern method, for, in spite of strenuous efforts made to improve the older or direct method, it remains by far the cheaper of the two.

The refining of cast iron or its conversion into wrought iron or steel consists essentially in eliminating a large proportion of the impurities which it contains, especially carbon and silicon. In order to expel these impurities we must bring the cast iron in contact with a substance, either solid or gaseous, possessing more affinity for them than the iron itself, and here again heat is required for such reaction to take place. Oxygen has a very great affinity both for carbon and silicon, and in general for the other impurities present in cast iron, and it is upon this element that we shall depend for the elimination of the impurities. We may for that purpose use either atmospheric oxygen or the oxygen of some oxidizing substances. The oxidizing agents generally used besides atmospheric oxygen are rich iron ore or rich slag from some previous operation, or the slag produced in the refining operation itself. These substances are composed essentially of oxide of iron, which is an oxidizing compound, for it readily parts with some of its oxygen which is taken up by the carbon of the cast iron.

When cast iron in order to be purified is exposed at a sufficiently high temperature to the action of atmospheric oxygen or of some other oxidizing substance, the silicon which it contains combines with some oxygen, being converted to silica. Some of the iron itself will be oxidized and the resulting oxide of iron will in turn enter into combination with the silica to form a fusible silicate of iron or slag.

The carbon present in the cast iron also combines with some atmospheric oxygen, or more frequently with some of the oxygen held by the slag or by some iron ore purposely added, and is converted into carbonic oxide or carbonic acid gas, in which condition it escapes from the furnace. By being deprived of its oxygen the iron ore added in some of these refining operations is reduced to the metallic state and incorporated into the refined metal.

The Products of the Refining of Cast Iron.— As was the case in the treatment of the ore, the nature of the metal resulting from the refining of cast iron will likewise greatly depend upon the temperature at which the operation is conducted. If the temperature be low the refined metal will be obtained in a semi-fused or pasty condition, and will on that account include a relatively large amount of slag, while it will generally be quite free from carbon. In other words, the product of the refining operation conducted under these conditions will be wrought iron, or, if the conditions be made slightly more carburizing, steely iron. These are the conditions prevailing in the old forge refining of cast iron or "finery method," as well as in the more modern puddling process for the manufacture of wrought iron, which methods will be outlined briefly.

The Finery Methods for the Production of Wrought Iron.— When the ironmaster of the 13th or 14th century, through the gradual development in height of its catalan or other forge so increased the carburizing conditions that he finally obtained a small amount of molten cast iron, he was confronted with the necessity of refining this brittle, unforgeable metal in order to convert it into malleable iron, and he quite naturally endeavored to conduct this refining operation in furnaces similar to the low hearths or forges which for so many centuries had been the only apparatus used for the direct extraction of iron from its ores. In these forges, known as "fineries," the pig iron was melted in contact with charcoal and under the oxidizing influence of a blast issuing from a single tuyere. While the details of the finery operation and of the furnace differed much in various countries, and even in different sections of the same country, their essential features were identical. Four of these processes attained especial prominence and have not been entirely driven out of existence by the puddling process nor later by the Bessemer process; they are the Walloon process as still conducted in Sweden, the Franche Comté process, the Lancashire process still used in England, the United States, and some other countries, and the South Wales process which was for many years extensively used in South Wales for the production of iron plates for tinning. In recent years, however, soft Bessemer and open hearth steel have taken the place of wrought iron for such purpose and this once flourishing industry is now quite, if not altogether, extinct.

These charcoal hearths or fineries are frequently used for the remelting of iron and steel scrap resulting in the production of wrought iron of high quality. The operation consists in filling the hearth with charcoal, upon which the scrap is placed and covered with additional charcoal and the charge melted. The slag produced in this operation is very basic and therefore promotes the removal of the phosphorus and sulphur which are eliminated to a notable extent.

The iron manufactured or remelted in these hearths is mainly used for the manufacture of plates, sheets, skelp rods, etc., which are used in the manufacture of boiler tubes, boilers, screws, rivets, wire, etc.

According to J. M. Swank, the iron blooms produced in forges from pig iron and scrap in 1903, in the United States, and which were for sale and not for the consumption of the makers, amounted to 9,940 tons, against 12,002 tons in 1902, 8,237 tons in 1901, 8,655 tons in 1900, 9,932 tons in 1899, 6,345 tons in 1898, 7,159 tons in 1897, and 6,494 tons in 1896. All the pig and scrap blooms made in forges from 1895 to 1903, and for sale, were made in New York, Pennsylvania, and Maryland.

The Puddling Process.— The finery methods described in the preceding paragraphs were the only ones available for the conversion of cast iron into wrought iron until an Englishman by the name of Henry Cort invented the puddling process in the year 1784, a date which marks a very important epoch in the metallurgy of iron. It has been seen that in the finery processes the pig iron is heated in contact with solid fuel, and this necessitates the use of charcoal, because this fuel alone is sufficiently pure to yield wrought iron of good quality. If the attempt were made to use inferior fuels, such as coal or coke, it would be found that the iron absorbed so much impurity from the coal, notably sulphur, as to be of inferior quality. The necessity of using such an expensive fuel as charcoal, and a large amount of it, is a serious limitation of the finery processes, greatly increasing the price of the iron. To make the use of more impure but cheaper fuel possible, Cort proposed to conduct the refining of the pig iron in the hearth of a reverberatory furnace, that is, out of contact with the fuel itself, thereby preventing the contamination of the iron by the impurities of the fuel. In a reverberatory furnace the fuel is burnt in a separate fireplace, the substance to be treated coming ir contact only with the flames and gases resulting from the combustion of the fuel. In the puddling furnace, moreover, the labor required per ton of iron was greatly reduced and it was possible to treat in one operation a considerably greater amount of pig iron.

The puddling operation as originally conducted by Cort and others is now known as the "dry puddling process," while the more modern method of conducting the operation which involves some important alteration of the original method, is known as the "wet" or "pig boiling" puddling process. Only the latter will here be described.

The Wet or Pig Boiling Puddling Process.— In the original or dry puddling process, while the oxidation of the carbon, silicon, and other impurities was brought about to a certain extent by the oxide of iron formed during the operation, we depended mostly for their elimination upon the oxygen of the air, and this necessitates for reasons which cannot here be explained the use of white or refined pig iron. The modification about to be described was introduced into the puddling process for the purpose of making it possible to treat grey cast iron at once in the reverberatory furnace doing away with the preliminary refining operation and otherwise hastening the process. It is said to have been first used by Joseph Hall, of the firm of Barrows and Hall, of Tipton, England, about the year 1830.

The modern puddling furnace employed for the conduct of the pig boiling process resembles in its general lines the earlier puddling furnaces, the essential difference being in the nature of the lining of the hearth. The bottom of the hearth and the sides are made of iron plates which are protected by a thick layer of oxide of iron, called the "fettling" of the furnace. The substances used for fettling purposes consist of pure hematites (ferric oxide) crushed or ground to the desired size and of slags or scales obtained in the production or working of iron, and which are very rich in oxide of iron, such as roasted tap cinder or "bull-dog." This oxide lining, as previously stated, plays an important part in the operation by giving up a part of its oxygen to the carbon and other impurities present in the pig iron, thus greatly hastening their removal. From 300 to 500 pounds of grey pig iron are generally treated in these furnaces, frequently with the addition of some hammer scale, which consists of magnetic oxide of iron and which therefore help in oxidizing the impurities. The pig iron is now melted and becomes liquid without assuming the pasty condition characteristic of white pig iron. During the melting down period a large proportion of the silicon is oxidized and some of the carbon chiefly by the oxygen of the air. Some iron also is oxidized and slag formed, while owing to the removal of silicon the remaining carbon passes to the combined condition.

The bath is constantly stirred or "rabbled" so as to promote contact of all portions with the oxidizing lining and with the iron oxide of the slag, thus hastening the oxidation of the silicon and carbon. As the carbon is expelled the mass becomes pasty, the metal having now "come to nature." The spongy mass of wrought iron is then divided into balls weighing some 60 pounds, which are withdrawn from the furnace and worked in the usual way.

The whole operation lasts usually about 1½ hour, but may be longer or shorter, according to the purity of the metal treated. The loss varies from 7 to 20 per cent, being chiefly dependent upon the amount of impurity in the pig iron. According to Turner, the consumption of coal in the puddling furnace per ton of puddled bars amounts generally to about 2,600 pounds. The following interesting comments are from Prof. H. M. Howe:

"While the yearly production of wrought iron in the United States more than doubled between 1870 and 1890, yet since the latter year it has shrunk very much, probably nearly to that of 1870; and between 1870 and 1900 the proportion which the production of wrought iron bears to that of steel diminished very greatly. Of the combined annual production of wrought iron and steel in the United States that of wrought iron formed 95 per cent in 1870, 63 per cent in 1880, 37 per cent in 1890, and probably not far from 15 per cent in 1899. The corresponding numbers for Great Britain are 34 per cent for 1890 and 19 per cent for 1899, and 16 per cent for 1901. In the year 1899 the average number of British puddling furnaces in operation is reported as 1,149 out of a total of 1,320 in existence. Thus in 19 years the position of wrought iron changed from that of the chief product to one of secondary importance."

Albert Sauveur,
Assistant Professor of Metallurgy, Harvard University, and Editor of 'The Iron and Steel Magazine.'

Iron and Steel Industry in America. The iron of commerce is classified under three groups. These are "wrought iron," "steel," and "cast" or "pig iron."

In the colonial period the British government systematically discouraged all efforts of the colonists to produce iron, in order to avoid competition with home industries. There were forges or bloomeries in nearly all the colonies from the times of earliest settlement, and as unlimited supplies of fuel were always at hand in the vast forests it was only necessary to find ore and obtain persons who could construct forges. The iron required for structural purposes, such as bars, straps, nails, sheets, etc., was obtained in the early days either by hammering the bloom from the forge or by shaping with rolls propelled by water-power. In fact, before the invention of the puddling process in England by Cort, in 1784, a large proportion of all forms of wrought iron were derived in this manner. The old so-called "Walloon" process of refining pig iron into the malleable or wrought form or into a crude mild steel was introduced into the colonies at an early date in their history. By the puddling process malleable iron is not directly produced from the ore, as in the older methods of manufacture, but indirectly from pig iron. The introduction of the puddling process was second in importance to no other invention in the history of the iron industry of this country.

After the Revolution the iron industry developed steadily but slowly, probably owing to the fact that, as in colonial days, much, if not most, of the iron used along the seaboard was imported. No statistics of the production of iron were collected before the year 1810. The production of pig and cast iron in that year was 53,908 tons; wrought and malleable iron of all kinds, 27,105 tons; having a total value of $6,081,374, of which amount Pennsylvania produced $2,473,748. The product of the steel furnaces of Massachusetts, Rhode Island, New Jersey, Pennsylvania, Virginia and South Carolina in 1810 was 917 tons, valued at $144,736; of the whole number of steel furnaces Pennsylvania contained five, producing 531 tons, valued at $81,147. An analysis of these figures gives us some idea of the state of the industry at the beginning of the century. The product of the blast-furnaces — pig, or, as it was at that time termed, cast iron — was run directly into small castings then in demand for commercial purposes; the malleable iron was probably all derived directly from the ore in forges or bloomeries, whence it was taken to the rolling or slitting mills to be made into rods, bars, plates, nails, etc. The steel made at this period in the United States was probably all produced by the cementation or blister process, and was all of the grade now known as high-carbon or tool steel. Although Huntsman's improvement of this process, by which the steel bars thus made were fused in crucibles and subsequently cast into ingots, had been in operation in Sheffield, England, a number of years prior to 1810, it is doubtful if his invention had been adopted in the United States at this early date. In the census of 1820 the quantities of iron made are not given; their value, however, is stated as follows: Pig or cast iron, $2,230,275; wrought iron, $4,640,669; total, $6,870,944. The 1830 census gave: Pig iron and castings, $4,757,403; wrought iron, $16,737,251; total, $21,494,654. The production of iron steadily increased upon much the same lines as before and in 1840, 804 blast-furnaces produced only 286,903 tons of iron, and 795 bloomeries, forges, and rolling-mills only 197,233 tons of malleable or bar iron. For the first time in the history of the industry the production of cast or pig iron exceeded that from the bloomeries and forges. No figures are published for the value of the product in 1840, but if we assume the ton of pig iron to have cost $30, and the ton of hammered bar iron $90, we obtain $8,607,090, or nearly double the value of pig and cast iron produced in 1830. The total value of the bar iron at this estimate would be $17,750,970.

The high cost of manufacturing charcoal, and its enormous consumption in the furnace per ton of iron produced, were serious obstacles to the growth of the industry, even where a good supply of ore was well assured. As early as 1835 the adaptation of anthracite to the manufacture of iron began to attract attention, and Franklin Institute offered a gold medal "to the person who shall manufacture in the United States the greatest quantity of iron from ore during the year, using no other fuel than anthracite coal, the quantity to be not less than 20 tons." The medal was never awarded, but there is abundant evidence that from 1830 to 1840 a number of attempts to use mineral fuel in smelting iron ores were made. The first practically successful attempt to produce pig iron by the use of anthracite was made by David Thomas at Catasauqua, Pa. The furnace which he erected there for this purpose was blown in on 3 July 1840. It was equipped with a "hot blast" operated by water-power, and thus inaugurated in the United States, two of the greatest innovations in blast-furnace practice. This furnace, producing from the start 50 tons of iron per week, continued in profitable operation until the year 1879, when it was dismantled. The early forms of hot-blast apparatus consisted of nests of iron pipes heated externally by separate fires, the object being to pass the air from the blowing- or blast-engine through these pipes, thereby greatly augmenting its temperature, and to decrease the consumption of fuel per ton of ore smelted. The hot blast was patented in 1828 by James B. Neilson of Glasgow, and its use is perhaps the most important improvement ever made in blast-furnace practice, for without it the present large and cheap production of pig-iron would have been impossible. Notwithstanding that the success in smelting iron in blast-furnaces with anthracite had been practically demonstrated in 1840, the general use of this fuel appears to have grown slowly; it was 10 or more years before the use of coal (either anthracite, coke, or a mixture of the two) became general. In 1846 the first furnace constructed with the intention of using raw bituminous coal as fuel was successfully placed in operation at Lowell, Mahoning County, Ohio. Although coke had been in general use in England for a number of years, it was not until 1837 that it was successfully used in the United States in the blast-furnace at Lonaconing, Alleghany County, Md. The manufacture of Connellsville coke was commenced in 1841, but, according to Weeks, it was not until a number of years later, when railroad transportation had become more fully developed, that its value as a furnace fuel became thoroughly demonstrated. The period between the years 1840 and 1850 was a most eventful one in the history of the American iron industry. The introduction of the improvements in smelting already indicated, together with the use of steam-power for propelling the blast and in performing other varieties of work about the furnaces, its replacement of water-power in operating rolling-mills and hammers, in mining coal and ore, and the rapid growth of the railroads, produced a stimulating effect probably never before experienced in a similar degree by any American industry. The railroads contributed largely to the development of the iron industry in two ways: directly, by rendering transportation comparatively cheap, thereby enlarging the iron market and increasing the demand; and indirectly, by creating in their construction a new and unprecedentedly large consumption of iron. As the production of iron increased in later years, the older iron-ore deposits became exhausted, or were proved inferior to the newly discovered ore-beds of the Lake Superior region. The problem of suitably locating a modern blast-furnace producing from 9,000 to 10,000 tons of pig iron per month became a serious one, and its solution has had the effect of moving the geographical centre of the iron industry west of the Alleghany Mountains, nearer a new and larger ore supply, yet handy to the coke of Connellsville. In 1850 there were produced in the United States 563,755 tons of pig iron by 377 establishments, and wrought iron to the value of $22,629,271 in 552 establishments.

The evolution of iron and steel plate making, particularly boiler-plates, forms an interesting chapter in the growth of our great industry.

About 1815, when steam began to be used, Dr. Charles Lukens remodeled his mill to produce thicker plate. The bloom was reheated at the forge and hammered thin, usually about one and a half inches. It then went to the rolling-mill, where it was laid on a bed of coal in what was called a grate-furnace. After heating, it was rolled into plates one quarter and three sixteenths of an inch thick and sent to the boiler maker. But soon the mill began shearing into regular commercial sizes: 48 and 49 by 26 by one quarter or three sixteenths; or, if large enough, it was sheared into plates 68 and 69 by 26, and the scrap was cut into nails. But when the reverberatory furnace was introduced, the scrap was arranged into piles of such size as was necessary to produce the required plate, heated to a welding heat, and rolled in the mill. This state of things continued until the introduction of the puddling furnace. The most important advances made in the years between 1850 and 1860 were the invention of the "three-high" roll-train; the introduction of mills for rolling beams, by Cooper & Hewitt, at Trenton, N. J.; and the invention in 1848 of the "universal mill," by Daelin, a German engineer, which found its way to America 12 years later. In the manufacture of the finer qualities of steel, no progress was made up to 1860. According to the census of 1860, 97 establishments in the United States produced 51,290 tons of blooms, valued at $2,623,178; 286 establishments produced 987,559 tons of pig iron, worth $20,870,120; 256 establishments produced 513,213 tons of rolled iron, worth $31,888,705; 13 establishments produced 11,838 tons of steel (probably of cheap grades), worth $1,778,240.

During the Civil War the resources of the iron industry in the Northern States were taxed to their utmost. The industry in the South, strained at an early day beyond its feeble capacity, soon broke down, and most of the requirements of the Confederate armies were supplied from abroad. In the train of dire disaster wrought by the Civil War some good to the iron industry may be found; for not only did iron ships make their appearance in the navy, but the use of iron plates had its inception. As early as 1859 the French had built the frigate Gloire, armored with iron plates five inches in thickness, and in 1861 the British constructed the frigate Warrior, which was protected by solid iron plates four and a half inches thick. As regards armor, either of these vessels was much better protected than any of our monitors constructed during the Civil War, for the first monitor was protected by six to eight thicknesses of one-inch iron plates bolted one on the other with overlapping joints, and later vessels were probably protected in much the same way by armor made up of a greater number of similar one-inch plates.

In 1855 and 1856, Henry Bessemer, of London, had obtained patents for a process of converting molten pig iron into steel by forcing small jets of cold air through the molten iron; but his invention was not successful until modified by Robert F. Mushet, who added to the molten steel, after the blast had been stopped, a sufficient quantity of spiegeleisen (an alloy of iron and manganese) to neutralize the oxide of iron caused by blowing and to give the steel the proper degree of hardness and fluidity. Neither Bessemer nor his American rival, William Kelly, of Pittsburg, who secured a patent but did not utilize it, accomplished anything in America until 1866, when their interests were combined with Mushet's and the first plant to produce the steel as a commercial article was put in successful operation by the Pennsylvania Steel Company at Steelton, near Harrisburg, Pa., June 1867. The first steel rails rolled in the United States in the way of regular business were rolled by the Cambria Iron Company, Johnstown, Pa., August 1867, from ingots made by the Pennsylvania Steel Company. The production of Bessemer steel in the year 1867 was 3,000 tons, the industry continuing to grow with rapid strides. In 1890, 4,131,535 tons were produced, in 1900 7,532,028 tons, and in 1902 9,138,363 tons. Of these amounts 2,550 tons were made into rails in 1867, 1,853,862 in 1890, 2,250,457 in 1900, and 2,935,392 tons in 1902. The importance of the invention of the Bessemer process to the world in general and the United States in particular cannot be overestimated, since it has reached a development with us greater than in any other country in the world. In 1901 the total amount of all varieties of steel made in the United States was 44 per cent of the entire world's product. The rapid and enormous development of the Bessemer-steel industry in the United States is attributable chiefly to the great extension of our railroads. Bessemer steel is also used for steel bars, merchant steel and for tin plates. The basic Bessemer or Thomas process though used in Germany to produce 4,888,054 tons in 1902, has not gained a foothold in this country.

The open-hearth steel process was first used in 1856, when the Siemens Brothers of London perfected what is now generally known as the Siemens regenerative gas-furace, without which no open-hearth steel can be made. In 1864, Messrs. Emile and Pierre Martin, of the Sireuil works in France, erected, with the assistance of Dr. Siemens, one of the regenerative gas-furnaces to convert steel in an open-hearth or reverberatory furnace of their own construction. This scheme was a success from the start, and by a subsequent consolidation of the Siemens and Martin inventions a steel-making apparatus was devised, known as the Siemens-Martin or open-hearth process. This process was introduced into America in 1868 by F. J. Slade for Cooper, Hewitt & Company, at the works of the New Jersey Steel and Iron Company, at Trenton, N. J. In 1870 the production of open-hearth steel in the United States was 1,500 tons, and in 1890 574,820 tons, the industry showing a rapid development during the intervening 20 years. Great Britain was long the largest producer of open-hearth steel in the world, and in this branch of the iron industry the United States was somewhat behind its great rival, until 1900. In 1890 Great Britain produced 1,564,200 tons, as against 574,820 tons in the United States; in 1899 Great Britain produced 3,030,251 tons and the United States a little more than 2,900,000 tons; but in 1900 the figures are 3,398,135 tons for the United States (following James M. Swank, 'Iron and Steel at the Close of the 19th Century,' 1901; the census figures, always incomplete, are 3,044,356) and 3,156,050 for Great Britain. This growth is all the more striking when it is known that in 1895 the writer of this article hopefully prophesied that the production might reach in that year 1,000,000 tons. Five years later it had passed the 3,000,000-ton mark. The so-called "basic" open-hearth process, although in successful operation in Europe for a number of years, was not introduced into the United States until 1888, when a number of such furnaces were constructed at the works of Carnegie, Phipps & Company, at Homestead, near Pittsburg, Pa. Without going into technicalities, the basic open-hearth process may be briefly defined as an ordinary open-hearth plant whose furnace lining is made of a basic material, such as dolomitic limestone or the mineral magnesite. When pig iron containing a sufficiently great quantity of phosphorus to render it unfit for conversion into steel by any other method is melted in such a furnace, the basic lining, together with a basic flux which is added, removes the objectionable phosphorus and renders (other conditions being normal), the resulting steel equal to that prepared in the open-hearth furnace in the old and usual manner. The purposes for which open-hearth steel is ordinarily adapted are quite different from those for which the Bessemer steel is most suitable; but the converse of this fact, however, is not true, since open-hearth steel may be and frequently is used to an equal, if not greater, advantage wherever Bessemer steel is employed. In this country, at least, all high-grade structural material, such as boiler and ship plate, bridge and building members, high-grade castings, etc., is almost invariably of open-hearth steel, which is generally considered, and doubtless is, more uniform in quality than soft steel made by the Bessemer method.

One of the most curious phases in the history of the American iron industry is the fact that although the United States at one time consumed nearly 60 per cent of the world's entire production of tinned plates, with the exception of a few sporadic attempts in 1873 and 1875, no tin or terne plates were made in the United States until 1891. Great Britain furnished virtually all the tin-plate used in the United States during the 20 years ending 1890. No better evidence of the success of our domestic tin-plate industry could be afforded than the fact that our imports have steadily decreased since 1889, those for 1890 being 29,435 tons, for 1894 215,068 tons, and for 1900 only 60,386 tons. The American production amounted to 999 tons in six months of 1891; to 6,092 tons in 1892; 44,563 tons in 1893; over 100,000 tons in 1895, and in 1900 to 302,665 tons. The census of 1900 reports 57 establishments manufacturing tin and terneplate; gives their capital as $6,650,047, its wage-earners as averaging 3,671, and their wages as $1,889,917; and estimates the cost of materials at $26,728,150, and the value of the product as $31,892,011. In 1890 the industry was practically non-existent and was not reported in the census of that year.

If the history of the development of the American blast-furnace practice were written it would form a large book of itself. In 1870 most of the blast-furnaces in operation were still very primitive, and although no statistics for that year are given, it is probable that the best of them did not produce as an average over 50 tons of pig iron per day, whereas in 1902 the production of 300 tons per day was a common occurrence, and some furnaces regularly produced over 500 tons daily. The table at the bottom of the page taken from the United States census reports, exhibits the production of pig iron from 1870 to 1900.

These figures show the rapid fall in the number of establishments, resulting from the movement of concentration nowhere so strikingly shown as in the steel and iron industry. The capital invested has increased 150 per cent approximately in 30 years, the production nearly 700 per cent and the value of the product almost 200 per cent. During the 20 years between 1870 and 1890 production in the Middle States had nearly quadrupled, in the Western States increased nearly 5 times, and in the Southern States nearly 10 times. In 1890 the American product passed the record figures of the British furnaces, made in 1882. Between 1890 and 1895 the American trade suffered considerably and fell below the British in its total product; then it again advanced and is now 100 per cent greater than that of Great Britain.

The wonderful growth of the world's iron industry within 50 years is shown by the following tables, in metric tons (2,204 pounds).

Country	1854	Per cent	1902	Per cent
United States	750,000	12.5	18,003,448	40.7
Great Britain	3,000,000	50.0	8,653,976	19.5
Germany	400,000	6.6	8,402,660	19.0
France	750,000	12.5	2,427,427	5.5
Russia	200,000	3.3	2,566,000	5.8
Austria-Hungary ..	250,000	4.3	1,335,000	3.0
Other countries ..	650,000	10.8	2,869,480	6.5
Totals...........	6,000,000	100.0	44,257,991	100.0

Even more striking is the increase in steel output in the last 35 years, as shown below:

Country	1867	Per cent	1902	Per cent
United States	19,963	4.1	15,186,406	44.0
Great Britain	235,000	47.8	5,102,420	14.8
Germany	122,591	26.0	7,780,682	22.5
France	47,597	9.7	1,035,304	4.8
Russia	6,271	1.3	1,730,250	5.0
Austria-Hungary...	15,000	3.1	1,143,000	3.3
Other countries ...	35,000	7.1	1,900,82[illegible]	5.6
Totals..........	491,422	100.0	34,479,783	100.0

PRODUCTION OF PIG IRON.

	1870	1880	1890	1900
Number of establishments..........	386	341	304	224
Capital	$56,145,326	$89,531,362	$134,608,543	$148,226,113
Wage earners....................	27,554	41,695	33,415	39,358
Total wages.....................	$12,475,250	$12,665,428	$14,614,458	$18,500,462
Tons produced...................	1,832,876	3,375,912	8,845,185	14,452,234
Cost of materials................	$45,498,017	$58,619,742	$110,098,615	$131,536,424
Value of product.................	$69,640,498	$89,315,569	$145,643,153	$206,823,202

The total iron and steel exports and imports of the United States for the years 1890, 1900, and 1902 are shown below, the totals being long tons (2240 pounds).

Year	Exports	Imports	Excess
1890	45,687	603,749	Imp. 558,062
1900	1,154,284	209,955	Exp. 944,329
1902	370,805	1,212,839	Imp. 842,034

A sketch of the American iron industry would be incomplete without some reference to the introduction of the manufacture of armor-plate into the United States. This class of material not only has a peculiar and limited demand, but its manufacture requires the highest degree of metallurgical and mechanical skill, together with an exceptionally expensive plant. When the reconstruction of the United States navy was begun, some 20 years ago, we had absolutely no facilities for making the simplest kind of armor-plate, although we had some of the largest steel-works in the world. One of the first of the new armored vessels completed (the monitor Miantonomoh) was protected by "compound" plates imported from England. All the large forgings for the guns and shafts of the earlier ships were likewise imported. Owing to the policy of Congress, the Bethlehem Iron Company, and Carnegie, Phipps & Company, of Pittsburg, were induced to erect expensive plants necessary for making not only the heavy gun-forgings required, but also for all the different grades and thicknesses of armor-plate. In 1891 these firms began to supply armor for the ships in course of construction, although at first their output of finished armor was extremely slow. The delays have now been slowly overcome, and at the present time there is little doubt that these great steel-works will be able to supply the armor as fast as new ships are constructed. How successful these works have been in furnishing our government with the best grades of armor-plate could have no better illustration than the fact that the Bethlehem Iron Company soon began supplying foreign governments with armor for their ships. The only two important iron and steel commodities which the iron industry of the United States did not supply in 1890 (tin-plate and armor-plate) are at present being made in large quantities, and the census for 1900 reports during the year 1900 15,302 tons of armor plate all produced in Pennsylvania, and valued at $7,526,479. Vast improvement has been made in the machinery necessary to manipulate iron and steel. The Bethlehem Iron Company has a hammer of 125 tons' capacity, built by John Fritz and put into successful operation in 1891. But armor-plate is no longer rolled nor forged by hammers, but manufactured with huge hydraulic presses, some with an energy of 15,000 tons. George Fritz is the inventor of what is known as the "automatic tables," which with John Fritz's roll train enables the manufacturer to successfully handle almost any weight of ingot. I well remember when a 500-pound mass of iron was thought to be so heavy that the whole neighborhood gathered in to see it rolled. The necessity of handling such very heavy weights as could be made from ingots cast in large masses brought into play the invention of hydraulic machinery, so that we now have pumps to produce any required pressure in a series of pipes which deliver the water to the hydraulic engines in any part of the works. By simply turning a valve now a boy will pick up a heavy ingot (say of 10,000-pound weight) with his hydraulic crane and deliver it anywhere within reach of the crane. If on a car, it may then be taken by a small locomotive to the rolling-mill, where another crane picks it up and puts it into the furnace, and, after heating to the required degree, takes it out and delivers it to the machinery at the rolls; then the automatic tables push it back and forth through the rolls until it is reduced to the required dimensions. The same tables now take it to the shears, which are also operated by hydraulic power, and the plate, sometimes two inches thick, is sheared ready for shipment. All this is done with more ease than was possible a few years ago. Within the last few years electricity has been brought into play to do some of the heavy work.

Revised by S. Sanford,
'Engineering and Mining Journal,' *New York.*

Iron and Steel, Metallography of. The study of the structure of metals has been actively pursued for the last 10 or 15 years in all metallurgical countries, and has called into existence a new department of metallurgy, for it has been shown that all alloys and all industrial metals (which always contain a certain amount of impurities), are made up of constituents which may be regarded as minerals, and as the study of rocks created the science of petrography, from the study of the constitution of metals was developed the new science of "metallography."

In order to examine the structure of metals through the microscope, it is necessary to prepare surfaces almost absolutely free from the minutest scratches. To accomplish this, it is quite evident that the sample must be rubbed successively over various abrasive substances of increasing fineness. Supposing the surface to be examined has been filed with a smooth file, the tool marks would not be removed and a perfectly specular condition could not be imparted to the surface in a single operation. The transformation must be gradual. The file marks must be effaced by rubbing the sample over a properly selected polishing substance, and replaced by finer markings. These, in turn, must be removed by a second rubbing with a finer abrasive agent, being replaced by still finer marks and so on, until finally, the last operation removes the very minute marks from the previous treatment and leaves the surface absolutely free from scratches or nearly so. Emery powder of various degrees of fineness is the abrasive substance which naturally suggests itself, at least for the first treatments. The powders may be used in the shape of emery wheels, emery cloths, or papers, or even spread loose over a suitable support, in which case they are kept wet during the rubbing. Emery may, of course, be replaced by carborundum for these operations. The polishing powder known as "jeweler's" or "gold" rouge suggests itself for the final polishing. It is generally spread over a piece of wash leather or other soft and smooth texture, which in turn is fastened to a block of wood. The powder is generally kept wet during the rubbing. The details of the manipulation vary greatly with different operators, but it may be said that they all use emery (or carborundum) in some form for the rough polishing and jeweler's rouge for the final treatment. The markings left even by the finest emery powders, however, cannot always be removed readily by the rouge, and the operation is frequently a long and tedious one. The need of a suitable polishing powder to be used after the last emery treatment and before the final rouge polishing was soon made evident and many substances, such as water-of-Ayr stone, crocus, tripoli, diamontine, "Brilliant Belge," etc., have been tried. It is in this particular that the polishing methods of the various experimenters engaged in metallographic work vary the most. Somewhat roughly stated, the method at present in use for the preparation of metallic samples, is in most cases as follows:

One or more treatments with emery (or carborundum) of increasing fineness.

One treatment with one of the powders mentioned above.

One treatment with jeweler's rouge.

The polishing may be done entirely by hand, or it may be hastened by the use of some simple power-driven machine consisting of revolving emery wheels and discs upon which the various powders are spread.

Many treatments have been tried to develop the structure of polished samples of iron and steel, *i. e.*, to make their structure apparent when examined under the microscope. To do this, it is necessary to impart unlike appearances to the various constituents. The most successful methods and those most widely used consists in etching the polished surfaces with highly diluted aqueous solutions of acids, especially nitric acid or with absolute alcohol containing a small proportion of acid, a solution made up of 10 parts of nitric acid in 90 parts of absolute alcohol being especially effective.

Microstructure of Pure Metals.—When a properly prepared sample of a pure metal is examined under the microscope it is generally found to be made up of irregular polyhedric grains as shown in figure 1, which represents a drawing of the structure of pure gold under a magnification of 50 diameters.

It will be noticed that many of the grains are hexagonal, which strongly suggests that gold crystallizes in the regular cubic system, these hexagonal grains being probably due to interfering cubes and octahedra.

Many pure metals, including iron, crystallize in the cubic system, and exhibit, therefore, a structure similar to that of gold.

The dark net work shown in Fig. 1 mark the junction lines between adjacent grains. It is made apparent by suitable treatment of the polished surface, generally by immersing it in some acid, the acid corroding the metal more deeply between the grains than over their surface.

These grains of which pure metals are composed are not single-crystals. If the polished sample be etched more deeply and examined under higher power, it will be found that each grain is made up of a great number of small crystals, frequently cubic. It will be found, moreover, that all these small cubes which make up a single grain are oriented in the same direction in the same grain, but that their direction changes as we pass from one grain to another.

The size of the grains varies with the nature of the metal, some metals being made up of much larger grains than others, even when cast and solidified under exactly the same conditions.

The presence of impurities, sometimes of an extremely small amount, frequently exert a powerful influence on the size of the crystalline grains, some impurities increasing it, others reducing it.

The size of the grain in the same metal is also greatly affected by the temperature to which the metal is heated and from which it is allowed to cool, and by the rate of cooling. Generally speaking, it may be said that the higher the temperature, the larger the grain, and also that the slower the cooling the larger the grain. These results might have been anticipated, if it be considered that slow cooling from a high temperature are conditions favorable to the formation and growth of crystals.

Undisturbed cooling is a necessary condition to the free development of crystals. If

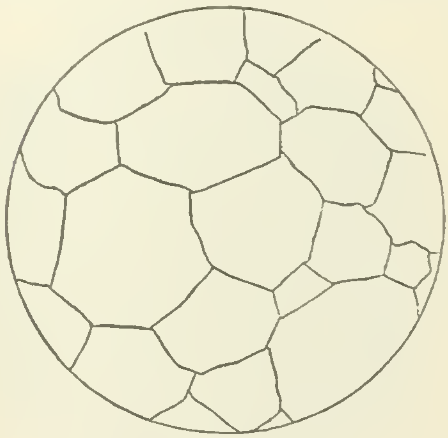

Fig. 1.—Structure of Pure Gold (Andrews) Magnified 50 Diameters.

the metal be agitated while solidifying, and worked—that is subjected to powerful mechanical pressure—while cooling from a high temperature, the formation of the crystalline grains will be greatly hindered, if not altogether prevented, the metal assuming an amorphous-like structure, hence the important influence of work upon the structure of metals.

The Microstructure of Pure Iron.—Pure iron is not a commercial product. It can only be obtained in small quantities by carefully conducted laboratory manipulations, and even with the most refined care it is quite impossible to produce it absolutely pure. The purest commercial iron is of Swedish origin and may contain as much as 99.8 per cent. of iron.

When a sample of this iron is properly prepared and examined under the microscope, some regions may be found which are absolutely free from slag and from carbon, and which exhibit, therefore, the crystalline structure of pure iron, or, at least, of carbonless iron. (See Fig. 2.) It will be noted that this structure is very similar to that of gold shown in Fig. 1. Like gold, it is made up of polyhedric grains, generally hexagonal. Iron, like gold and like many other metals crystallizes in the cubic system.

Ferrite.— Pure iron, or rather carbonless iron, considered as a microscopical constituent, has been called ferrite, a name which suggests its nature and which was proposed by Prof. Henry M. Howe. This constituent necessarily makes up the whole mass of carbonless iron, while in low carbon steel and in gray cast iron, ferrite occurs in decreasing amounts as the percentage of combined carbon increases.

The physical properties of ferrite are evidently those of carbonless iron. It is, therefore, soft, being easily scratched by a needle, a test which will occasionally be found useful by the metallographist. It is moderately strong, having a tensile strength of some 50,000 pounds per square inch. It is very ductile, its elongation amounting to 20 or more per cent. in eight inches. Ferrite does not possess any hardening power since carbonless iron cannot be hardened by sudden cooling from a high temperature.

The Microstructure of Commercial Wrought Iron. Longitudinal Section.—The microstruc-

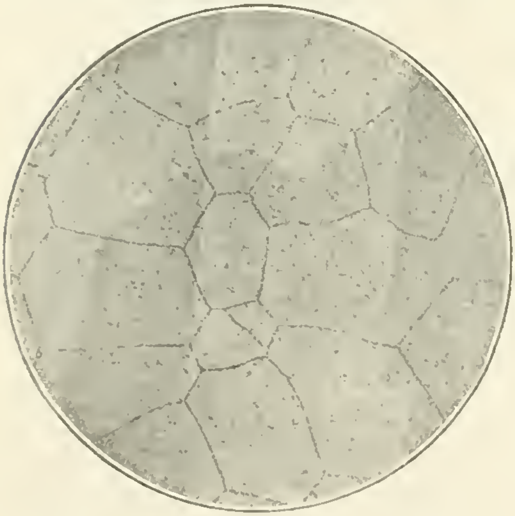

Fig. 2.—Structure of Carbonless Iron. Magnified 150 Diameters (Longmuir) Ferrite.

ture of the longitudinal section of a wrought iron bar is shown in the accompanying illustration (Fig. 3). The ground mass or matrix of the metal will be found to be made up of polyhedric crystalline grains similar in every respect to the crystalline grains of pure iron and of pure metals in general. Many irregular black lines, varying much in thickness and length, but all running in the same direction, will also be noted in Fig. 3. These lines indicate the location of the slag which is always present in commercial wrought iron, and which assume the shape of streaks or fibres running in the direction of the rolling or forging, thus imparting a fibrous appearance to the metal. Wrought iron then is made up of a mass of ferrite, as might have been anticipated, assuming its characteristic crystalline structure, and of numerous elongated particles of slag.

It was thought for many years that wrought iron actually had a fibrous structure, and, indeed, the number of persons who still hold this view is surprisingly large. Many valuable properties were attributed to puddled iron on account of its "fibrous structure" which were denied to steel because of the "crystalline structure" of that metal. The microscope has summarily disposed of this erroneous belief in showing that the ferrite which constitutes the bulk of wrought iron is in no way different from the ferrite forming the bulk of low carbon steel. Both are equally crystalline.

When wrought iron contains an appreciable amount of carbon it results in the appearance of another constitutent, soon to be described.

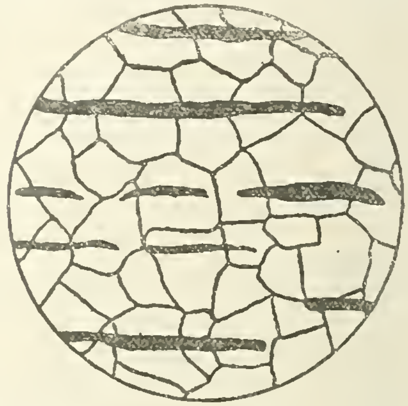

Fig. 3.—Structure of a Longitudinal Section of Wrought Iron (Longmuir) Ferrite and Slag.

Transverse Section.—The microstructure of the transverse section of a wrought iron bar is shown in Fig. 4. Like the structure of a longitudinal section (Fig. 3), it consists in a

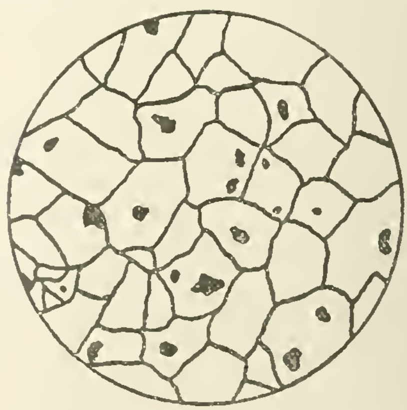

Fig. 4.—Structure of a Transverse Section of Wrought Iron (Longmuir) Ferrite and Slag.

mass of crystalline grains of ferrite. The slag, however, which in the latter section occurred as fibres running in a direction parallel to the rolling, here assumes the shape of irregular, dark areas, which correspond to the cross-sections of the slag fibres.

The Microstructure of Low Carbon Steel.—If a small amount of carbon be introduced into molten iron and the resulting product cast, the metal is converted into what is known as low carbon steel. From the fact that it was obtained in a molten condition it will follow that, unlike wrought iron, it is quite, if not altogether, free from slag. The absence or presence of slag constitutes the most distinct difference between wrought iron and low carbon steel, for these two metals may otherwise have identical chemical composition and very similar, if not identical, physical properties.

The microstructure of a very low carbon steel is illustrated in Fig. 5. It will be noted that it consists in a mass of ferrite; that is, of carbonless iron, made up of polyhedric crys-

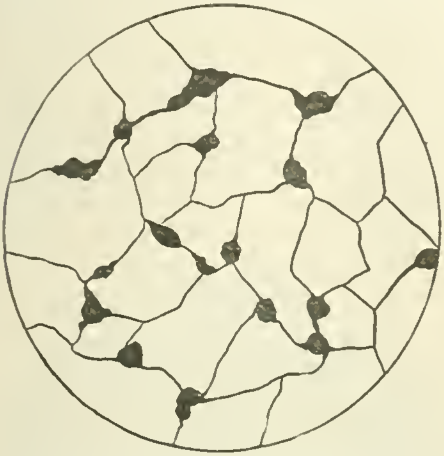

FIG. 5.—Structure of Low Carbon Steel. Carbon 0.08 per cent (Arnold) Ferrite and Pearlite.

talline grains and very similar to the ferrite constituting the bulk of wrought iron. At the junction lines of many ferrite grains, however, some dark areas will be seen, which indicate the presence in the metal of another constituent. Since ferrite does not contain any carbon, it is evident that all the carbon present in the steel has segregated into these small dark masses, and thus we arrive at the interesting

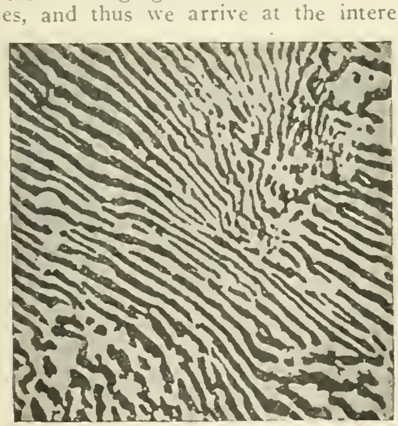

FIG. 6.—Structure of Pearlite Highly Magnified (Osmond).

conclusion that in low carbon steel the carbon is not disseminated all through the mass, as might reasonably have been expected, but that it gathers in small particles embedded in a mass of iron.

Pearlite.—Speculating as to the nature of this new constituent, we know that it cannot consist of pure carbon; for it is known that the carbon present in steel does not exist in the free state, but is combined with some iron, forming the carbide or iron Fe_3C. This iron carbide must necessarily be located in the dark areas, but are these made up exclusive of this carbide? To assist us in determining the character of this constituent, let us examine it under a high magnification. We then find that each dark particle breaks up into two components (Fig. 6), which occur as small parallel plates alternately bright and dark. As to the nature of these components, it is evident that one of them is the carbide Fe_3C and the other must necessarily be iron or ferrite; for these are the only two constitutents which, to the best of our knowledge, are present in unhardened steel.

Dr. Sorby, who was the first observer to describe the appearance of this interesting constituent, proposed for it the name of "pearly constituent," because it frequently exhibits a display of color very suggestive of mother of pearl, especially when viewed by oblique illumination. Later Prof. Howe suggested the name of pearlite, which has been universally adopted.

FIG. 7.—Structure of Medium High Carbon Steel. Carbon 0.38 per cent (Arnold) Ferrite and Pearlite.

Cementite.—The carbide Fe_3C has been called cementite, also by Prof. Howe, because it occurs abundantly in cemented steel, merely owing to the fact that this steel is generally a high carbon steel. Pearlite then is a mechanical mixture of ferrite and cementite after the fashion described in the preceding paragraphs.

It should be stated here that pearlite does not always assume such a distinctly laminated structure. In many instances its structure remains ill-defined or assumes a granular rather than a lamellar appearance, this being due chiefly to the treatment to which the steel has been subjected.

A high magnification is required for the resolution of pearlite, generally not less than 200 diameters. The samples should also be very carefully etched.

The Microstructure of Medium High Carbon Steel.—The microstructure of a steel containing 0.38 per cent. of carbon is illustrated in Fig. 7 under a magnification of 100 diameters. It will be noted in comparing this structure to that of low carbon steels (Fig. 5), that the introduction of more carbon in the iron has resulted, as should be expected, in the presence of a greater amount of pearlite and of a correspondingly smaller proportion of ferrite. The pearlite occupies now roughly about one-third of the total area. Under sufficiently high power the pearlite areas exhibit the characteristic lamellar structure illustrated in Fig. 6.

On further addition of carbon, the amount of pearlite, which is evidently proportional to the percentage of carbon, increases correspondingly, as shown in Fig. 8, which illustrates the microstructure of steel containing about 0.59

Fig. 8.—Structure of Medium High Carbon Steel. Carbon 0.59 per cent (Arnold) Ferrite and Pearlite.

per cent. of carbon. The pearlite occupies here over one-half of the total area. It will be noted that the ferrite areas are not resolved into polyhedric grains, apparently because the ferrite now occurs in particles often too small to be made up of several crystalline grains. The

Fig. 9.—Structure of High Carbon Steel. Carbon 0.89 per cent (Arnold) Pearlite.

internal structure of these small masses of ferrite, however, is still made up of small cubic crystals as previously described. A high-power photomicrograph of this steel would reveal the laminations of the pearlite shown in Fig. 6.

The Microstructure of High Carbon Steel.—It has been shown that the introduction of an increasing amount of carbon in steel results in the formation of a correspondingly increasing proportion of pearlite and decreasing amount of ferrite. A degree of carburization, therefore, must necessarily be reached, when the whole mass will be made up of pearlite, the ferrite having finally disappeared. This critical point in the structure of steel is attained when the metal contains about 0.80 per cent. carbon. In exceptionally pure steel a little more carbon may be required to cause the complete disappearance of ferrite, while in the presence of much impurity a smaller percentage may be sufficient.

Steel made up exclusively of pearlite is sometimes said to be saturated, it is also called "eutectic," or "eutectoid," steel, the latter term having recently been suggested by Prof. Howe. If it contains less than 0.80 per cent. carbon, and, therefore, an excess of ferrite, it is called under-saturated or "hypo-eutectoid" steel, while if it contains more than this amount of carbon

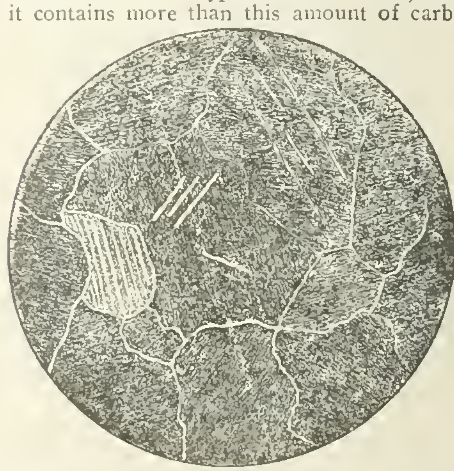

Fig. 10.—Structure of High Carbon Steel. Carbon 1.20 per cent (Arnold) Pearlite and Cementite.

(and therefore, as will be seen, an excess of cementite) it is called over-saturated or "hyper-eutectoid" steel. The use of the terms eutectic and eutectoid implies that steel is considered as an alloy of two constituents, ferrite and cementite, which, upon cooling, gives rise to the formation of a third constituent, pearlite, made up of small particles of both components. Many alloys contain a constituent possessing the same characteristics and which is called "eutectic alloy."

The structure of steel made up exclusively of pearlite is shown in Fig. 9. The magnification is not sufficiently high to show clearly the laminations of pearlite.

Let us now consider what effect a further addition of carbon will have upon the structure of the metal. Fig. 10 is the reproduction of a drawing showing the structure of a steel containing 1.20 per cent. carbon, or much more carbon than the amount required to convert the whole mass into pearlite. It will be noted that while the bulk of the metal is still made up of pearlite, it now contains also another constituent, which in Fig. 10 occurs chiefly as a light net-work surrounding the meshes of pearlite. This structure recalls that of medium hard steel and an inexperienced eye might be led to infer that this light constituent is ferrite. This net work, however, consists of cementite which is now present in excess over the amount required to form pearlite, just as in the case of low carbon steel, ferrite was in excess.

Cementite has a more metallic lustre than ferrite and remains bright and structureless even after prolonged etching, while ferrite is colored and resolved into grains after such treatment. Cementite is extremely hard and stands in relief in the structure, while ferrite is soft and is depressed by the polishing. Ferrite is readily scratched by a needle, while cementite cannot be marked. The excess of cementite, however, does not always assume the shape of a fine net work, its mode of occurrence depending upon the treatment to which the steel is subjected.

With further increase of carbon, the amount of cementite will necessarily increase and the proportion of pearlite decrease correspondingly.

The structure of unhardened carbon steel just described may, for our purpose, be accounted for as follows: The carbon present in the steel unites with a portion of the iron to form the carbide Fe_3C or cementite (which con-

FIG. 11.—A Graphical Representation of the Relation Between the Carbon Content and the Microstructure of Iron Carbon Alloys.

tains 6.67 per cent. carbon). The remaining iron, or ferrite, and this cementite then unite structurally in definite proportion to form pearlite, leaving as the case may be, an excess either of ferrite or of cementite, the former in low carbon steel, the latter in highly carburized steel.

The changes in the structural composition of steel, due to changes in the percentage of carbon may be represented graphically as shown in Fig. 11.

This diagram clearly illustrates the fact that if no carbon be present the whole of the metal is made up of ferrite, and that by introducing increasing amounts of carbon, pearlite is formed in increasing quantity, while ferrite decreases correspondingly. With 0.80 per cent. of carbon the whole mass consists of pearlite. Further addition of carbon results in the introduction of cementite in the structure, which then increases in amount with the carbon, while the proportion of pearlite decreases.

In our description of the structural composition of steel we have purposely ignored the effect of impurities, because while their influence is not to be overlooked, quantitive information on this point is lacking.

The Microstructure of Cast Iron.—Cast iron may be sharply divided into two classes: (1) White cast iron and (2) Gray Cast Iron. That is, into cast iron free from graphitic carbon and cast iron containing graphic carbon. The microstructure of these two varieties of cast iron will be considered separately.

The Microstructure of White Cast Iron.—Like steel, white cast iron is free from graphitic carbon; it contains the whole of its carbon in the combined condition, that is, as the carbide Fe_3C or cementite. We should, therefore, ex-

FIG. 12.—Structure of White Cast Iron Magnified 150 Diameters (Longmuir). Pearlite and Cementite.

pect to find the microstructure of white cast iron very similar to that of high carbon steel that is made up of pearlite and a large excess of free cementite. In Fig. 12 is shown under a magnification of 56 diameters, the structure of a sample of a white cast iron, and it will be seen that as just anticipated, it is composed of pearlite and cementite, roughly in equal proportions. This iron contained about 3.50 per cent. of combined carbon, which theoretically would call for about 45 per cent. of free cementite. A higher power would as usual be re-

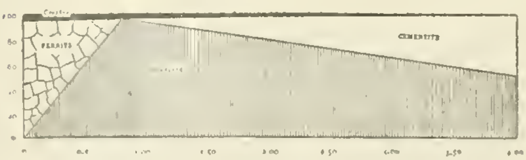

FIG. 13.—A Graphical Representation of the Relation Between Percentage of Combined Carbon and the Microstructure of Cast Iron.

quired to resolve the structure of the pearlite areas.

The close analogy which exists between the structure of steel and that of white cast iron, is, therefore, evident. Indeed it is not possible to distinguish high carbon steel from white cast iron by the examination of the structure of these metals; nor is this possible by any other test. To distinguish between high carbon steel and white cast iron, we must necessarily adopt an arbitrary rule, consisting, for instance, in calling steel, all carburized iron containing less than 2 per cent. carbon and cast iron, those products which are more highly carburized. Starting with carbonless iron and gradually increasing the carbon content, we produce in succession, low carbon steel, medium high carbon steel, high carbon steel, and finally white cast iron, without any suggestion as to when the metal ceases to be steel and becomes cast iron. The changes of structure and of properties caused by this gradual increase of carbon are continuous and do not indicate any abrupt transformation. As the carbon increases the strength of the metal increases until the carbon content reaches about 1 per cent. and then it decreases; the hardness increases and the ductility and weldability decrease continuously; the malleability decreases and finally disappears, but these changes occur gradually as the carbon increases and not abruptly upon reaching the composition of white cast iron.

To sum up, white cast iron may be considered as forming the most highly carburized member of the steel series.

The Microstructure of Gray Cast Iron — Gray Cast Iron free from Combined Carbon.— Perfectly gray cast iron does not contain any combined carbon. It should, therefore, be made up of a mass of carbonless iron (ferrite) and of a certain amount of graphitic carbon. The graphite occurs as numerous plates irregular in shape and size, disseminated through the iron, and breaking up its continuity. It is because of this breaking up of the continuity of the metallic mass that the original ductility and malleability of the iron is so completely destroyed by the presence of a sufficient amount of graphite.

Gray cast iron is seldom free from combined carbon. It generally contains from 0.10 to 1 per cent. and even more of carbon in the combined condition, and it is well known that this percentage of combined carbon depends chiefly upon the amount of silicon present and upon the rate of cooling of the casting. Various proportions of combined carbon, and, therefore, of graphitic carbon impart different appearances to the fracture of cast iron, which was, and still is to a considerable extent, classified accordingly into the various grades "No. 1, 2 and 3 Foundry," "mottled," "forge," etc.

The presence of some combined carbon in the iron must necessarily imply the presence of some pearlite in its structure. The metallic matrix which in perfectly gray iron consists of ferrite now possesses the structural characteristics (and therefore the properties also) of a low carbon steel. Gray cast iron containing a small amount of combined carbon may be considered as a low carbon steel whose continuity is destroyed by the presence of numerous plates of graphite. Such an iron would correspond to a No. 1 Foundry.

The presence of a larger proportion of combined carbon must necessarily result in a correspondingly greater amount of pearlite in the structure.

By increasing the percentage of combined carbon in cast iron, we convert its metallic matrix into steel of a correspondingly higher carbon content. We must necessarily reach a point, therefore, when the matrix will become a mass of pearlite, or, in other words, when it will assume the character of a saturated or eutectoid steel. This will occur when the metal contains about 0.70 per cent. of combined carbon. It will be remembered that in the case of steel some 0.80 per cent. of carbon was required to convert it into a mass of pearlite. In the case of cast iron, however, the amount of iron to be saturated is less (because of the space occupied by the graphite) and requires a correspondingly smaller amount of carbon, namely some 0.70 per cent.

Classified by its fracture, a cast iron of this character would correspond to a number 3 or 4 Foundry.

A further increase of combined carbon would result in the presence of some free cementite in the structure. Such cast iron is known, from the appearance of its fracture, as "mottled" iron.

Relation Between the Structure of Cast Iron and the Percentage of Combined Carbon.— The relation between the structure of cast iron and the proportion of combined carbon may be clearly illustrated by the diagram of Fig. 13, in which the percentage of total carbon (graphitic carbon plus combined carbon) has been assumed to be 4 per cent. and to remain constant. The plan followed is the same as that used to illustrate the changes of structure in steel and will therefore be readily understood. By comparing this diagram with that of Fig. 11, the close analogy between the constitution of steel and that of cast iron is strikingly brought out. That the properties of steel and cast iron, in spite of this similarity, differ so much, is due to the presence of graphitic carbon which by breaking up the continuity of the steel mass greatly decreases its strength and ductility, and deprives it of its malleability.

The structure of iron and steel which has been briefly described in the preceding paragraphs is greatly affected by the treatment or treatments, both thermal and mechanical, to which the metals are subjected during the processes of manufactures and further conversion into finished implements. Metallographic methods, therefore, afford a means of detecting defective treatments and of suggesting improvements in manufacturing methods through a careful study of the close relations existing on the one hand between the structure of iron and steel and their physical properties, and on the other hand between their structure and the treatment they have received.

ALBERT SAUVEUR,
Professor of Metallurgy, Harvard University.

Iron in Medicine. In its native form, iron is devoid of action, but when reduced to a salt, or oxide, capable of dissociation, it becomes active. Iron differs from many of the other heavy metals in that it is an active ingredient of the tissues. In the human blood it is an absolutely essential constituent, and its importance is great for all of the tissues of the body. It is well known that the presence of iron is necessary for the active processes of photosynthesis in plants, and that in its absence the higher plants are unable to develop chlorophyll. Nencki, a Russian biologist, has shown that reduction compounds of hæmoglobin and of chlorophyll are very closely allied, and he propounds the interesting speculation that probably the same iron compound was present in the living matter before a differentiation of animal and plant was made, and that as plants and animals developed along divergent lines of structure the iron compounds became somewhat separated in their chemical character.

Iron combinations in medicine are usually divided into two classes, inorganic and organic. In the former the iron is dissociated in solution, and is usually acted upon by the hydrochloric acid of the gastric juice and converted into soluble chlorides, in which form it probably enters into the tissues. In the organic iron it is probable that the same conversion takes place, although there is much controversy regarding the method of its absorption; but this is true of all iron. The iron is usually taken up in the stomach and intestines, the larger part of it being rejected, and it enters into the blood in the form of an albuminate which passes into the duodenum, some being absorbed by the epithelium, and more or less of it carried directly to the spleen and probably to the liver. In the spleen it seems to undergo some changes, and is taken up by the blood and thereafter deposited more particularly in the liver and in the bone-marrow. When there is deficiency of iron in the blood or other organs, the liver gives up its store and it is absorbed by the tissue that is most in need of it. While in the blood, iron is the great organ of oxidation. By means of the hæmoglobin the oxygen of the air is taken up and distributed to the different parts of the body. This permits of the active chemical oxidative changes that take place throughout the entire body, which changes are of such vital importance in general metabolism, and without which the body suffers, degenerates and dies.

Iron is used particularly for diseases in which the blood is poor in that metal. This is particularly the case in anæmias of primary and secondary character. In primary anæmia or chlorosis (q.v.), iron is a distinct help, often curing the condition. In primary pernicious anæmia, which is a grave blood-disease, it is of secondary value. In all of the secondary anæmias, those that follow hemorrhage, the acute infectious diseases, such as scarlet fever, malaria, whooping-cough, measles, typhoid, pneumonia, etc., iron is of great service. It is particularly valuable following childbirth or any condition in which there has been a great loss of blood. It is also useful in conditions of scanty menstruation, in tuberculosis, and is one of the best general tonics in the realm of medicine. The effects of inorganic and iron solutions on the teeth should be borne in mind, although they are much exaggerated. Iron is apt to cause a certain amount of constipation, but this, by proper laxatives regularly taken, should be overcome.

Iron Mask, The Man with the, a famous personage who was kept a prisoner in two or three French prisons in the time of Louis XIV., and who excited a curiosity corresponding to the care with which his identity was concealed. His first prison was the castle of Pignerol, of which Saint-Mars was governor. In 1686 he was carried by Saint-Mars to the isles of St. Marguerite; and the same precautions were observed as upon his first journey. Saint-Mars having been appointed governor of the Bastile in 1698, carried the prisoner with him there, but still masked. An apartment had been prepared for him more convenient, and furnished with more care than those of the other unfortunate beings who inhabited this sad abode. He was not permitted to take off his mask even before his physician. In other respects the greatest attention was shown him, and nothing which he requested was refused him. His education appeared to have been carefully attended to; and he amused his leisure by reading, and playing upon the guitar. This unknown person died 19 Nov. 1703, at 10 o'clock in the evening, without having undergone any severe sickness. He was buried the next day in the afternoon in the cemetery of the church of St. Paul. He was, it was said, about 60 years of age, although the register of burials for the church of St. Paul, in which he is mentioned under the name of Marchiali, makes him only about 45. It is said that orders were given to burn everything which had been employed in his service; that the walls of the chamber which he had occupied were rubbed down and whitewashed; and that the precautions were carried so far, that the tiles of his room were removed, in the fear that he might have displaced some of them to conceal a letter behind them. Conjecture exhausted itself to discover who this mysterious personage might be.

At the time of the destruction of the Bastile, in July 1789, there were not wanting curious persons, who sought, in the archives of this fortress, to discover some notices which might throw light upon this historical problem. But to no purpose. A widely-accepted conjecture was first thrown out in a letter written in 1770 by Baron D'Heiss to the 'Journal Encyclopédique.' According to this view the Man with the Iron Mask was Count Girolamo Magni, or Mattioli, first minister of the Duke of Mantua, who had betrayed the interests of Louis XIV. by failing to secure for him, as he had pledged himself to do, in consideration of a large bribe, possession from his master of the fortress of Casale. For this offense he was lured to the French frontier, secretly arrested, and imprisoned in the fortress of Pignerol in 1679. The secret was preserved so carefully, on the supposition that Mattioli was the prisoner, because his seizure and detention were flagrant violations of international law. In a more recent investigation by M. Jung, 'La Vérité sur le Masque de Fer' (1873), an attempt is made to identify the Mask with a gentleman of Lorraine, who was connected with an association for the assassination of Louis. Funck-Brentano in 1894 revived the view that Mattioli was the mysterious prisoner, and many now consider the controversy settled and this view established. Consult: Hopkins, 'The Man in the Iron Mask.'

Iron Mountain, Mich., city, county-seat of Dickinson County; on the Chicago, M. & St. P. and the Chicago N. W. R.R.'s; about 47 miles southwest of Marquette and 57 miles west by north of Escanaba. It was settled in 1879 and chartered in 1888. It is the commercial centre for a large mining section in Michigan and for a farming section in Wisconsin. The city government consists of a mayor and council, elected annually. Its trade is principally in iron-ore and farm products. Pop. (1900) 9,242.

Iron Mountain, the southern spur of the St. Francois Mountains, a low range in the eastern part of Missouri. This mountain, which is really a hill or knob, is in St. Francois County, about 60 miles southwest from St. Genevieve, the nearest point on the Mississippi River. It is about 300 feet above the surrounding land and about 2,000 feet above the sea. It covers an area of 500 acres. It is famous for its remarkable mineral deposits, specular or hematite iron-ore, the purest iron ore in the United States. The average elevation above the land around is 550 feet, and the area it covers is about 500 acres. Large oak trees flourish on its slope, their roots embedded in soil composed largely of fragments of peroxide of iron. Excavations were begun in 1845. An artesian well has been sunk to the depth of 152 feet, with the result that the beds passed through from the surface were as follows: Iron ore mixed with clay, 16 feet; sandstone, 34 feet; magnesian limestone, 7½ inches; gray sandstone, 7½ inches; hard blue rock, 37 feet; pure iron ore 5 feet; porphyritic rock, 7 feet; iron ore 50 feet to the bottom. It would seem that nearly the whole mountain was a mass of magnetic iron ore. The adjacent valleys are underlaid with magnesian limestone in horizontal strata. Pilot Knob (q.v.), about six miles south of Iron Mountain, also contains an extensive deposit of iron ore; Shepherd Mountain, a short distance southwest of Pilot Knob, is the largest of the iron mountains in that immediate vicinity.

Iron Ores. Although iron is the most abundant of the useful metals, forming 5 per cent of the earth's crust, it is rarely found native — one famous native occurrence of it, however, being at Ovifak on the west coast of Greenland. The iron ores of chief commercial importance are hematite, magnetite, limonite, siderite and pyrite. Pure hematite contains 70 per cent iron; magnetite 72.4 per cent; limonite 59.89 per cent; siderite 48.27 per cent; pyrite 46.6 per cent. Iron ores, however, are practically never mined pure, but are mined in quantity averaging 10 per cent and over less iron than above stated, the principal impurities being silica, alumina, and lime.

Hematite, ferric oxide (Fe_2O_3), by far the most important iron ore, varies greatly in physical characteristics. Specular hematite is black, with a brilliant metallic lustre. Martite is a variety of hematite. Magnetite, a ferro-ferric oxide ($FeO.Fe_2O_3$), is black magnetic, and crystallizes in octahedra, but as mined it is usually massive or granular. Ilmenite, an oxide of iron and titanium, is not yet an ore of commercial importance. Franklinite, an oxide of iron, manganese, and zinc, found at Franklin, N. J., is used in making spiegeleisen, an alloy of iron and manganese after the zinc has been removed by roasting. Limonite or brown hematite, hydrated ferric oxide ($2Fe_2O_3.3H_2O$), is brown or yellow in color and occurs in massive, earthy, or in botryoidal forms. Bog-ore is a variety of limonite. Goethite, differing from limonite in crystalline form and containing less water, is found in large quantities in Minnesota. Siderite, or spathic iron, ferrous carbonate ($FeCO_3$), is white to gray when pure, and crystallizes in rhombohedra. As mined, it varies much in appearance, owing to oxidation. Clay iron stone is siderite mingled with clay. Blackband ore is siderite mixed with more or less bituminous matter. Pyrites, ferric disulphide (FeS_2), often called "fool's gold," is used in great quantities to make sulphuric acid. The residue, known as "blue-billy," or pyrites clinker, is in some countries smelted in the blast-furnace as an iron ore.

In smelting an ore the silica, lime, and alumina are removed as slag. Ores high in silica require more limestone in the furnace-charge for fluxing, that is, for combining with the silica. Some ores contain silica and lime in such proportions as to be self-fluxing. The higher the iron content of an ore, generally speaking, the greater the yield per ton of material put through the furnace, and the lower the cost per ton of the iron made.

A very hard ore must be broken into small lumps to give best results in the furnace. Hematites often smelt easier than magnetites. A fine granular ore makes trouble in smelting, and a certain proportion may be lost as dust, which clogs furnace-flues. The really injurious impurities most often found in iron ores are sulphur, phosphorus, and titanium. Sulphur can be largely removed by roasting the ore before smelting; phosphorus cannot, and all the phosphorus in the ore goes into the iron. For making steel by the Bessemer process an ore should contain less than 1–1,000 of its amount of iron; thus, to be classified as Bessemer, an ore containing 61 per cent iron should contain less than .061 per cent phosphorus. For making steel by the basic process, high phosphorus ores are used.

The present development of the world's iron mines is the outcome of many factors. Generally speaking, it is cheaper to bring the ore to the fuel than the fuel to the ore, hence, countries or districts that have great supplies of iron ore may be insignificant producers of pig-iron. Low-priced fuel has been the chief factor in determining the location of iron and steel industries, while the chief factors in the development of iron mines are the quality of the ore and the cost at which it can be put down at the furnace.

Iron-Ore Supplies of the World.— The iron industry in Asia is several thousand years old, but the annual output of iron ore is small. China has vast but little-developed deposits of limonite and hematite. Japan is very poor in iron ores. The iron industry of Australia is not of importance. The only ores exported from Africa are mined in Algeria, where the annual production has fallen to about 150,000 tons. Europe has famous ore fields. The ores of Elba and those of Styria were worked by the Romans. Certain Swedish mines have been worked almost continuously since 1300. The German output now comes chiefly from so-called minette beds of Lorraine and Luxemburg. The ore, a low-grade limonite high in phosphorus, is used in making steel by the basic process, and the present annual output is over 7,000,000 tons annually. The total ore supply left in the field is estimated at nearly 2,000,000,000 tons. The iron fields of Great Britain have passed their greatest productiveness. The principal districts are Cleveland in North Yorkshire, yielding clay ironstone containing about 30 per cent iron; Cumberland and Lancashire, yielding red hematite containing 50 to 60 per cent iron; and Lincolnshire, Leicestershire, and Northampton, yielding cheaply-mined low-grade hematite. The blackband ores of Scotland are of much less importance than formerly. The principal Spanish mines are in the Bilbao district in the province of Biscay, the productive field being 15 miles long and 2½ wide. The ores are red and purple hematite, limonite, and carbonate, the iron content in the crude ores running from 45 to 56 per cent. The district has produced to date about 95,000,000 tons. The greater part of the

Russian ore supply comes from the Ural Mountains, the ores on the east side of the range being magnetite, and on the west side limonite and carbonate. Near Krivoi Rog, in the Caucasus, are mines of hematite and magnetite. Fully 80 per cent of the iron ore of France is obtained from the minette beds of the Moselle that extend into Lorraine and Luxemburg. Most of the French ores are limonites. The principal Austrian iron mines are in Styria, the Styrian Erzberg having one of the largest deposits of siderite in Europe, yielding yearly about 1,000,000 tons of carbonate ore, containing 40 per cent of iron. In Bohemia are mines of magnetite, limonite, and siderite. Sweden has immense deposits of iron ore, chiefly magnetite with some specular hematite. The most important deposits are at Grangsberg in Central Sweden, where are specular hematite and magnetite ores containing 62 to 64 per cent iron and 0.9 to 1.5 per cent phosphorus, and at Gellivare, 100 miles from the Gulf of Bothnia, where are huge bodies of magnetite that run from 68.69 iron and 0.05 phosphorus to 60 per cent iron and 1.5 per cent phosphorus. The ores from this field and the neighboring districts of Kurunavara and Luossavara will be of great importance to British iron-masters, and shipments to the Atlantic seaboard of the United States are quite possible.

WORLD'S PRODUCTION OF IRON ORE — METRIC TONS.

United States	29,350,325	37.7
Germany	16,570,182	21.4
Great Britain	12,475,700	16.1
Russia	6,700,000	8.6
France	4,260,747	5.5
Austria-Hungary	3,623,115	4.7
Sweden	2,793,566	3.6
Other countries	1,800,000	2.4
Total	77,573,635	100.0

The total production was undoubtedly larger, since among the "other countries" are those that collect no returns of mineral output. The figures are for 1901 or 1902.

The iron ore supplies of South America have been little developed, and those of Mexico are just coming into prominence. In the province of Santiago, Cuba, are deposits of high-grade hematite. From there over 690,000 tons were exported to the United States in 1902. At Belle Isle, N. F., beds of hematite are now worked on a large scale. In Ontario, Quebec, and British Columbia are deposits of good hematite and magnetite, and the Dominion will soon be a large producer. There is a possibility of iron ores being mined in Labrador.

The United States leads the world in the production of iron ore. The ores mined range from low grade limonite to the highest grade hematites and magnetites. The purest ore ever mined in the United States in quantity was probably the magnetite from the Lovers Pit at Mineville, N. Y., which ran 72 per cent iron in carload lots, though the Lake Angeline mine at Ishpeming, Mich., has shipped hard hematite running 68 per cent iron and 0.008 phosphorus in thousand-ton lots. Minnesota now leads the States in production, with Michigan second, Alabama third, and Pennsylvania fourth. The chief centre of iron-ore production is about Lake Superior, where the ores occur along five mineral belts or "ranges," in Pre-Cambrian rocks. The Marquette range, in Michigan, was opened in 1856; the Menominee, mostly in Michigan, but partly in Wisconsin, in 1887; the Gogebic, in Michigan and Wisconsin, in 1884; the Vermilion, in Minnesota, in 1884; and the Mesabi, in Minnesota, in 1892. The ores shipped are nearly all red hematite. The Marquette produces some magnetite. As much of the ore is hauled long distances to a furnace, 60 per cent iron was once about as low grade ore as could be shipped profitably, but now some mines ship Bessemer ores containing but 45 per cent iron. The ore-bodies are sometimes of great size. The Chapin mine, on the Menominee range, is working lenses 100 feet wide and 600 feet thick in the middle, and 2,500 feet long. The Fayal mine, on the Mesabi range, in 1902 shipped 1,681,000 tons, and the Chapin in the same year 927,747 tons. The Mesabi deposits are flat-lying, covered by a varying depth of clay, sand, and boulders. By stripping off the surface and working the granular ore with steam-shovels, an enormous output is possible. The output of the various ranges in 1902 was: Mesabi, 13,342,840 long tons; Menominee, 4,627,524; Marquette, 3,853,010; Gogebic, 3,663,484; Vermilion, 2,084,263; making a total of 27,571,121 long tons.

In the South there are three important iron-mining centres — one near Birmingham, Ala., another in southeastern Tennessee, and the third in southwestern Virginia. The ores are red hematites and low-grade limonites. The growth of the Alabama industry is due to cheap ore, limestone and coking-coal being found in close proximity. Pennsylvania leads the Union in the production of magnetite, chiefly from the great ore-body at Cornwall, and also produces much limonite. New York and New Jersey also produce magnetite, and the former State some red hematite. Carbonate ores now come chiefly from Ohio. Of the western States, Colorado produces limonite, and in Utah and Wyoming are great deposits of magnetite and hematite, destined to be of importance in the near future. The famous specular hematite mines at Pilot Knob and Iron Mountain, Mo., are exhausted. Texas has large deposits of ore, and several other States are or will be important producers.

Mining and Handling Iron Ores.— Some extraordinary records of cheap mining and transportation have been made in the Lake Superior iron-ore trade. Large ore-bodies, effi-

UNITED STATES IRON ORE PRODUCTION — IN LONG TONS.

	1880	1890	1900	1902
Lake Superior	1,985,334	7,558,076	19,095,393	27,571,121
Southern States	627,517	2,904,322	5,100,000	4,850,000
Other States	4,884,658	4,056,469	1,758,000	2,215,000
Total	7,497,509	14,518,867	25,953,393	34,636,121

cient labor, and excellent management have been the factors in reducing mining costs, while the long lake-water haul, nearly 900 miles, in specially designed vessels, has made it possible to put down Lake Superior ores at Pittsburg, over 1,100 miles from the mine, at a total transportation cost of under $2 per ton. On the Mesabi range, in some large mines steam-shovels load the ore directly upon the cars, one shovel having loaded 170,000 tons in 26 days, or at the rate of over 6,500 tons per day. The shovels are each operated by five men, and the labor cost for mining and loading averages but about 16c per ton, and at one mine which dug and loaded 293,651 tons in 174 days, the labor cost was only 4c per ton. The loaded ore-trains go 50 to 115 miles to a shipping port. There they are run on to long, high docks having large pockets or bins into which the ore runs through openings in the bottoms of the cars. From these pockets the ore passes by gravity down along chutes into the hold of the vessel, so that no hand-labor is required. The ore-pockets hold about 160 tons each, and number from 90 to 384, according to the length of the dock.

In unloading the ore from the vessels, the use of labor-saving machinery is even more notable. A series of steel bridges, easily moved along the docks, is supplied with hinged arms which can be lowered into the hatch of the vessel. Along each arm and across the bridge runs a trolley-train to which are attached automatic grabs similar to a double scoop. The grab or scoop holds about five tons of ore, and when it begins to draw together it digs into the ore. The grabs can remove over half of the cargo without any assistance, and the remaining half is brought directly under the hatch by use of a scraper, operated by similar machinery. The grabs are so controlled by the engineer that he can drop them at any point over the hold he may wish, and after a grab seizes its load of ore it is raised at full speed, carried rapidly along the trolley to any given point, and dumped into railroad cars or on stock piles. This 5-ton grab has a hoisting speed of 100 ft. a minute, and can run along the bridge at the rate of 1,000 ft. a minute. The bridges to which the arms with their grabs are attached are worked by electricity. By such a device 26 men can do the work of 300 under the old system. Another unloading device, the Hulett unloader, requires even fewer men, and takes out a larger proportion of the cargo without aid.

Bibliography.— Owing to the enormous growth of the iron industry, there is no recent single work covering the production and use of iron ores. Statistics of production can be found in 'The Mineral Industry,' the 'Mineral Resources of the United States,' and the 'Engineering and Mining Journal.' Descriptions of geological occurrence and mining methods can be found in the monographs and bulletins of the United States Geological Survey; and the 'Transactions' of the American Institute of Mining Engineers. See GOETHITE; HEMATITE; ILMENITE; LIMONITE; MAGNETITE; MINING; ORE DEPOSITS. SAMUEL SANFORD,

Assoc. Editor 'Engineering and Mining Journal.'

Iron Skeleton Construction, a modern system of constructing high buildings, by which architects and builders are enabled to plan and erect buildings as high as 15 or 20 stories on plots of ground 20 to 30 feet wide. By the use of this system the thickness of walls is considerably reduced, thus giving a larger floor space, a very desirable consideration, especially in office buildings. Iron and steel columns are carried up from foundation to roof, and then covered in with bricks or stone. Thus a carrying capacity equal to that of walls of much greater thickness is produced. A 12-story building in New York city thus constructed upon a lot 25 by 100 feet means a saving in floor space of thousands of feet.

I'ronclad. See ARMOR-PLATE.

Ironclad Oath, The, an act passed by the United States Congress in 1866, excluding voters, in the States lately in rebellion, from the franchise. The act practically disfranchised all Southerners over 25 years of age. It was repealed shortly after its passage.

Irondale, ī'ėrn-dāl, Wash., a place in the northeastern part of Jefferson County, a few miles south of Port Townsend. The first blast-furnace on the Pacific coast was erected at this place in about 1880. The furnace was in operation about 12 years, and was then abandoned because of the great expenses incurred in production. The ore was obtained from Texada, an island belonging to British Columbia, and 130 miles distant. The last of the 19th century the Pacific Steel Company, a corporation in which practical iron-makers of Pennsylvania are the chief owners, began investigations as to the nature of the ore, and the possibility with improved machinery, to manufacture iron at Irondale or vicinity at paying rates. As a result the Pacific Steel Company have taken up the work abandoned by the Puget Sound Iron Company. The works have been so improved as to be practically new, and 20 brick charcoal kilns have been erected for the use of the company. Coke is obtained in Washington.

Ironton, ī'ėrn-tôn, Ohio, city, county-seat of Lawrence County; on the Ohio River, and on the Detroit S., the Norfolk & W., and the Cincinnati, H. & D. R.R.'s; about 100 miles directly southeast of Columbus. The Chesapeake & Ohio railroad, in Kentucky, has here a ferry for passengers and freight, which practically gives the city the benefit of four important railroads. Ironton was settled in 1832, and for some years was known as a river-trading town. It was incorporated in 1849. It is situated in a section of country noted for its clay (suitable for pottery), iron ore, and bituminous coal. Its chief industrial establishments are foundries, rolling-mills, blast-furnaces, machine-shops, nail-works, furniture factories, and planing-mills. It has also among its manufactures doors and mantels, stoves, boilers, cement, and fire-bricks. The clay in the vicinity is much used for pottery. The parks, River View, Lincoln, and Beechwood, are attractive. Some of the principal buildings are the Briggs Public Library, the Kingsbury school, Odd Fellows' Hall, Masonic Temple, City hospital, and several churches. Ironton was the home for some time of the artist Sarah Cotter-King. Pop. (1900) 11,868.

I'ronweed, a tall, coarse, composite plant of the genus *Vernonia*, three species of which grow abundantly in woods and along roadsides throughout the southern half of the Union, bearing heads of magenta-colored flowers somewhat like miniature thistles. The most conspicuous species (*V. gigantea*) is often 10 feet high, and blooms in August and September. A similar species (*V. noveboracensis*) grows in low grounds throughout the Northern States.

I'ronwood, Mich., city in Gogebic County, on the Wisconsin C. and the Chicago & N. W. R.R.'s; about 12 miles south of Lake Superior and 33 miles southeast of Ashland. It was settled in 1884 and incorporated in 1887. It is situated in a region rich in iron ore and timber; the section is known as the "Gogebic iron region." The famous Norrie mine is in this vicinity. Ironwood is the trade centre for the greater part of the mining and lumbering business of the county. Some of the principal buildings are the Carnegie library, the city-hall, the high school, and several churches. Trolley lines connect the city with Gile and Hurley, Wis. The government is vested in a mayor, who is elected annually, and a council. The mayor appoints, subject to the approval of the council, all the subordinate officials except the members of the board of education. Pop. (1900) 9,705.

Ironwood, a popular name for many trees whose timber is very hard and heavy. Probably the best known species in America is also known as leverwood, *Ostrya Virginica*, of the natural order *Cupuliferæ*, indigenous from Nova Scotia to Florida and westward to Minnesota and Texas. It is a medium sized tree with furrowed bark, birch-like foliage, pistillate flowers in catkins resembling the female flowers of hop, hence its popular name hop-hornbeam. The name ironwood is also sometimes applied to *Carpinus Americana* or *Caroliniano*, of the same natural order. (See HORNBEAM.) Among foreign "ironwoods," perhaps the most widely known is *Mesus ferea*, an East Indian tree planted around Buddhist temples for its fragrant flowers, which are used to decorate the images of Buddha. Another Asiatic species is *Metrosideros vera*, from which the Chinese and Japanese make rubbers. In Australia and South Africa various species of *Olea, Melaleuca, Sideroxylon, Notelaea*, and *Myrtus* are valued for their timber, locally called ironwood, employed where great toughness is desirable and weight no obstacle.

Iroquoian Stock, a linguistic stock of North American Indians deriving their name from the form Iroquois (q.v.), the name given to the "Five Nations." The Saint Lawrence River was probably their first habitat, and from there they gradually spread to the Great Lakes, primarily because of the hostility of the Algonquins. Cartier found, in 1535, a people living between Montreal and Quebec whose language showed them to be Wyandots, but 100 years later these had entirely disappeared and the Algonquins occupied their territory. The Iroquoian stock is divided into four groups: the northern — Wyandot, Tionontati, Wenrorono, Tohotænrat, Neuter, Hochelaga; the central — Mohawk, Oneida, Cayuga, Onondaga, Erie, Conestoga, Seneca; the southern — Tuscarora, Meherrin, Nottaway, Chowanoc, Coree; the Cherokee — Elati or Lower Cherokee, Middle Cherokee, and Atali or Upper Cherokee. The tribes of the Iroquoian stock were all agricultural, and were noted for their houses and fortifications. They have also made considerable advance in education. The whole population is about 43,000, of whom 10,000 are in Canada. The major portion of the population are Cherokee. See IROQUOIS.

Iroquois, ĭr-ō-kwoi', the name given by the French to the confederacy of North American Indians, called by the English the "Five," and afterward the "Six Nations." The Mohawks, Oneidas, Onondagas, Cayugas, Senecas, and Tuscaroras, after they were driven from their hunting-grounds in North Carolina in 1712, were the members of this confederacy. They formerly resided on the Mohawk River in New York State and on the lakes which still bear their names, and extended their conquests to the Mississippi and beyond the St. Lawrence. Their valor and successes had procured them the name of the Romans of America. Their territory abounded with lakes well stored with fish; their forests were filled with game, and they had the advantage of a fertile soil. The sachems owed their authority to public opinion: the general affairs of the confederacy were managed by a great council, composed of the chiefs, which assembled annually at Onondaga. The history of the Iroquois probably dates back to 1535, when Cartier found the peoples who had settled along the shores of the Saint Lawrence River, from Quebec to Montreal, and who, judging from the similarity in languages were undoubtedly the ancestors of the later Iroquois. The Algonquins, who at this time were more powerful, drove those people from their habitations and scattered them throughout the country, some, like the Hurons, traveling west, and the majority, among whom were the Iroquois, going south, settling mainly in North Carolina. Hiawatha, their leader, then persuaded them to form a league or confederacy for their own protection, and the league thus formed became known as the "Five Nations," and was based upon such sound and well-ordered plans that it is in existence at the present time. In 1712 they were driven from their territory in North Carolina and coming north again settled in Central and Western New York. Here they gathered other tribes and merged them into the confederacy: and in 1715 took in the Tuscaroras, after which the league was known as the "Six Nations"; they bought firearms and supplies from the Dutch and gradually strengthened themselves so that in 1630, they took the offensive in a long and bloody war against the Algonquins, first attacking the French missions among the Hurons in Canada and either slaying, capturing, or sending into exile all this tribe: they then rapidly subdued the Neutral Nation, the Erie, the Ottawa, and all the remaining tribes of the Algonquin race: and conquered in quick succession the Conestogas in the south, those east of the Hudson, among whom were the Mohicans, and the Miami and Illinois tribes of the Middle West, the only tribes who successfully opposed them being the Ojibwas of the Northwest and the Cherokees of the South. In the long wars between the British and the French, which continued with some interruption for nearly a century, until 1763, they were with a few exceptions in the British interest. These exceptions were notably the

Cayugas and the Mohawks, over whom the French Jesuit missionaries exercised a great influence, and who later withdrew from the league and settled in the villages of Caughnawaga and Saint Regis. In the Revolution the Iroquois as a league were neutral, but the separate tribes took up the warfare generally in favor of the British, the Oneidas and some of the Tuscaroras being the only ones who sided with the Americans. Brant led the Mohawks and Cayugas into Canada, where, at the end of the war, the Canadian government gave them several reservations, and where a majority of them are at the present time. The reservations for the Iroquois in the United States are mostly in New York, where all now live except the Oneidas, who in 1820 migrated to Wisconsin, and a small band of Senecas, who have a small reservation in the Indian Territory. According to the United States census, and a Canadian report, the total number of the Iroquois in 1902 was about 17,000, of whom about 8,000 were in the United States. See SIX NATIONS, THE.

Irradiation, an apparent enlargement of a bright body when seen against a background darker than itself. A simple method of observing this phenomenon is to view a bright sky through the spaces between a grating. If the breadth of the opening can be made equal to the breadth of the bars of the grating it will be seen that, when viewed from a little distance the bars look narrower than the spaces between them. This is obviously owing to the encroachment of the light upon the dark spaces around it. The first question to arise and one which was long discussed was whether the encroachment was due to an excitation of the nerves of the retina outside the limits on which the light fell upon the nerves, or whether it was necessary that the light should actually fall outside of its geometrical limits. The latter view is found to be the correct one, unless in cases of extreme brilliancy of the light. Irradiation is almost entirely in the nature of an optical defect or aberration of light. It begins with the atmosphere, which, when light passes through long stretches of it, slightly deflects the rays, so that a point is no longer seen as such, but as a small ill-defined waving surface. No lens ever brings the rays from a point to exactly the same focus. The lenses of the eye itself have defects which everyone who consults an oculist is acquainted with. The result of all these imperfections is to produce the enlargement we have described.

Irradiation is a notable subject in the history of astronomical observations. It was necessarily larger with the imperfect telescopes of former times than with the improved ones of our own period. Total eclipses of the sun, the transits of Venus and Mercury were especially productive of the phenomenon. The enlargement of the moon resulted in a star appearing as if within the bright disc of the moon when its light was really only grazing the surface. The sharp points or horns of light formed by the limb of the sun during the transits of Venus and Mercury were rounded off, so as to present quite an illusory view of their form. Just at the beginning and end of total eclipses of the sun the phenomenon known as Bailey's beads, really enlargements of the last points of light from the sun's limb, which could be seen before the sun was quite covered, looked like a string of beads. Many learned memoirs have been written on the subject, but the consensus of opinion to-day is toward the very simple and comprehensive theory above mentioned.

Irrawad'dy. See IRAWADI.

Irredentists, an Italian political party formed in 1878, having for its object the redemption and incorporation into the kingdom of Italy of all those regions near Italy having an Italian-speaking population and which they called "*Italia Irredenta*" (unredeemed Italy). This immense territory included some of the lands now belonging to France, Austria, Switzerland, and England. The immensity of the undertaking was probably the cause of the downfall of the movement, though the formation of the Triple Alliance also gave it a setback, as Austria was the enemy against whom the main efforts of the party were directed.

Irrigation, the watering of land by artificial means to make it productive. Historically, irrigation seems coeval with the earliest attempts to construct complicated machinery, and the systems of irrigation used in the earliest times in the Far East, in Babylonia, and in Egypt, dating in the last-named country 20 centuries before Christ, furnish as important a chapter in the history of invention as in the story of agricultural development. In our times the systems of India (q.v.) and Egypt (see ASSOUAN; NILE) are probably the best organized, being largely under governmental control. In Europe, irrigation is widely used in northern Italy, southern France, and throughout Spain. The British colonial possessions of the southern hemisphere, notably Australia and South Africa, benefit more and more by artificial water-supply.

Early Irrigation in America.— Irrigation was practised in prehistoric times by the town-building Pueblo Indian tribes inhabiting portions of New Mexico and Arizona. The descendants of these Indians still utilize some of the lands which were tilled by irrigation at the time when the Spaniards first came from the south, and practise many of the primitive customs of their ancestors. The Mexicans of mixed Spanish and Indian origin, gradually extending their settlements from the south, through necessity practised irrigation. The early missions of the Pacific coast also used it, and in southern California particularly are to be found the ruins of substantial dams and headworks built of masonry and constructed by Indian labor. But the first systematic application of irrigation in the arid West by English-speaking people was made by the Mormons on the shores of the Great Salt Lake. The soil was so barren that crops could not be raised by ordinary means, and they turned the waters of the little cañon streams upon the ground where Salt Lake City now stands. After many years they succeeded in mastering the art of irrigation, and under the wise rules of Brigham Young, limiting the size of irrigated farms, the Mormons have become a prosperous people. At about the time the Mormons were settling Utah, the gold-miners in California were building ditches for placer-washing, and were using water from these ditches for irrigation. The results obtained attracted public attention, and irrigation slowly

1. Scene in Southern California, showing the furrow method of irrigation.
2. Desert land reclaimed by irrigation, showing recently planted orchards.

developed as an adjunct to mining. With the stoppage of hydraulic mining, the ditches built for mining were either abandoned or used exclusively for irrigation. Many of them have been enlarged, and have now even greater value than in the old days of mining excitement.

Development in the United States.— The successful irrigation attained by the Greeley colony in Colorado, and the wonderful results shown by the Mormon communities in Utah, Idaho, and Arizona greatly stimulated the colony idea; many organizations brought people in large bodies from the Eastern States, and even from Europe, and placed them on small farms located near each other and supplied with water from a common ditch. Individual settlers also sought opportunities for bringing land under cultivation by artificial watering; and thus, at many widely scattered points, irrigation has been introduced. There are no statistics concerning the area irrigated in 1870, but it is probable that in that year there were not over 20,000 acres under irrigation in the whole United States; but 1870–80 saw a rapid development of small ditches, constructed by individuals and associations of farmers. At the end of that period there were probably 1,000,000 acres under irrigation. In the decade 1880–90 occurred the "boom" of speculative enterprise in irrigation canals. Large sums of money were obtained for irrigation works, but nearly all of these failed, and although they aided in the extension of irrigation, they did not enrich the investors. The 11th census showed that in 1889 there were 3,631,381 acres irrigated on 54,136 farms, with an average irrigation area of 67 acres. During the following decade the irrigated acreage doubled in extent. This was due to the extension and enlargement of the many canals existing in 1889, and to the more complete practice of irrigation on the lands under ditch.

In addition to the statistics obtained at the Eleventh (1889), and Twelfth (1899) Censuses, a special investigation was ordered in 1902 of irrigated farms and extent of irrigation in acres in the principal arid States, and also the total in the semiarid States, namely, North and South Dakota, Nebraska, Kansas, Oklahoma, and Texas. These lie east of the truly arid region but extend in parts into regions of deficient rainfall.

National Irrigation Act.—The latest and most important step in American irrigation is marked by the National Irrigation Act, which was passed by Congress in 1902, and received the countenance of President Roosevelt. The act provides for the construction of irrigating works under the control of the secretary of the interior, the funds being derived from the disposal of public lands in the 13 States and 3 Territories. The public land is withdrawn from entry excepting under the Homestead Act. The holdings when reclaimed are to be restricted to between 40 and 160 acres, the area being limited to the acreage which in the opinion of the Secretary may be reasonably required for the support of a family. The cost of the reclamation works is to be apportioned to the reclaimed lands and is to be refunded in not exceeding 10 annual installments, the charges being determined with a view of returning to the Reclamation Fund the estimated cost of construction. For land in private ownership no right to the use of water shall be sold for tract exceeding 160 acres to any one landowner, and he must be an actual resident on or near the land. The result of the law is to give free land under the terms of the Homestead Law and supply water at cost from permanent systems without charging profit or interest to the settler. The management and operation of the irrigation works will ultimately pass to the owners of the lands to be maintained under such rules as may be acceptable to the Secretary, the title and operation of the reservoirs and similar works remaining in the government. It is believed that during each 10 years for the next third of a century an acreage equal to the total now under irrigation in all the West may be added to the agricultural area of the 16 States and Territories affected; thus rapidly multiplying production, furnishing new homes for millions, and providing the food products needed for shipment from the Pacific coast for use in the lands across the Pacific where new markets are now being opened for the surplus products of this country.

Upon the passage of the Reclamation Law in 1902, examinations and surveys were begun in the arid States and construction started in Arizona and Nevada. In Arizona flood water is to be stored on Salt River by a dam below the mouth of Tonto Creek, furnishing a supply for arid lands in the vicinity of Phœnix. In Nevada the flood water of Truckee River is to be diverted by a canal under construction taking it to Carson River, storage being there provided for the excess water of both streams. This will be used upon the desert area in the vicinity of Carson Lake. Other principal projects favorably reported upon are Colorado River in Arizona and California; Gunnison River in Colorado; Snake River in Idaho; Milk River in Montana; North Platte River in Nebraska; Rio Grande and Pecos rivers in New Mexico; Yellowstone River in North Dakota; Umatilla River in Oregon; Belle Fourche in South Dakota; Bear Lake in Utah; Palouse River in Washington, and Shoshone River in Wyoming.

Surface streams supply over 90 per cent of the irrigated land of the United States. Streams within the arid region of the United States rise high, and at one point or another flow for a time through upper valleys or parks. But after passing through rocky defiles to a fertile lower valley, the typical stream of the arid West loses itself in a shallow sandy channel.

Water-Supply and Regulation.— The water used in irrigation is for the most part taken from the river or creek by natural flow or gravity. The cost of lifting or pumping water is usually too great in proportion to the value of crops raised to permit the general use of pumps. Water will flow rapidly in a ditch having a fall of two feet per mile, and the stream supplying the ditch may be falling at a rate of 12 feet per mile. At the end of the first mile the water in the ditch will be 10 feet above that in the river, and at the end of the tenth mile will be 100 feet higher, and will thus cover land which is less than 100 feet in altitude above the stream at this locality. It is usual to construct some device at the upper end of each ditch or canal by which the amount of water entering from the river can be regulated. Without this, flood-waters would fill the ditch beyond its capacity, and would overflow and wash away the banks. In times of low water, also, the stream may fall to such an extent that it must be raised somewhat and forced into the ditch, and at all times it may be necessary to regulate the flow in order to apportion the water fairly to all concerned. In the case of the simplest ditch, a small dam of brush and stone is built diagonally or into or across the stream-bed as the water becomes low in summer, and this is made tight by means of sod and earth. More permanent dams are sometimes built of timber, or masonry. The head-gate or regulator of the canal placed at the end of the dam consists of a stout framework firmly bedded in the earth or rock with one or more openings, each of which can be closed by a gate sliding vertically. The water enters under the gates, the quantity being controlled by raising or lowering them.

A considerable slope can be used for small ditches, since the volume of water is not sufficiently great to move the large particles of sand and gravel. As a general rule, conduits of this character built in common earth should be so proportioned as to have an average velocity of a little less than three feet per second, or two miles per hour, when carrying their full capacity. It is necessary, therefore, to take into consideration the amount of water to be carried and from this deduce the size and shape of the cross-section of the canal or ditch in order to obtain the desired velocity. If the grade be excessive the seepage or loss of water becomes large. The shape of the cross-section of a canal depends largely upon the character of the surface soil. In light or sandy soil, where the earth is easily eroded, very gentle side slopes are given, while in harder materials the side slopes can be steeper. When the fall of the canal is so great that it is impracticable to allow the water to flow freely down the slope, devices known as drops are introduced. These consist of an arrangement whereby the water can drop to a lower level without injury to the canal. Drops are usually built of planks with a sharp overfall edge, and a low dam or obstruction below the fall in order to maintain the pool. Occasionally they are made in the form of an incline, with a pocket at the bottom to break the force of the falling water. They are expensive to build, and difficult to maintain, because of the rapidity with which the timbers decay and the wearing action of the water, which constantly tends to cut exposed portions.

It is necessary in the construction of nearly every ditch or canal to take water across a depression at some point in its course. This is usually done by means of a flume or long box, usually rectangular and supported above the ground by a frame or trestle of timber or iron. Such flumes are often used across rocky ground where it is impracticable to dig a ditch. This is particularly the case near the head, where the water, after being taken from the river, is often carried through a narrow, steep-walled cañon. Here the foundation for a flume is prepared along the rocky cliffs, supports being devised to suit the inequalities of the ground. A better, though more expensive, type of flume is that having a semicircular section, and built of narrow planks or staves laid side by side and held in place by iron bands run around the flume, joined by nuts and threads by which the bands can be drawn up and the staves brought together. In crossing very deep depressions it is necessary to have a correspondingly high trestle in order to carry the flume across on grade. Such high trestles are expensive and liable to destruction from storms. In their place there have been built inverted siphons, wooden stave-pipe, or aqueducts of other form. The stave-pipes are similar in construction to the semicircular frame of narrow plank, carefully planned to a given dimension, and held in place by circular iron bands or hoops.

Applicotion of Water.— The methods of irrigation practised in various parts of the United States differ with the climatic conditions and soil, and especially with the early habits of training of the irrigators. The methods of conserving and applying water have been improved under the stimulus of modern invention, although there has been little if any scientific or well-considered information available. Water is applied to the irrigated field in three ways — by flooding, by furrows, and by sub-irrigation.

Flooding.— This is done by the check system and by wild flooding. By the latter process the irrigator turns the water from a ditch over a level field and completely submerges it. Perfectly level fields are, however, camparatively rare, and the first step in primitive agriculture by irrigation has been to build a low ridge around two or three sides of a slightly sloping field, so that the water is held in ponds. These low banks are commonly known as levees or checks. In construction they are frequently laid out at right angles, dividing the land into a number of compartments. Water is turned from a ditch into the highest of these compartments, and when the ground is flooded the bank of the lower side is cut or a small sluice-way opened, and the water passes into the next field, and so on until each in turn is watered.

Furrows.— Irrigation in checks has gradually been given up, owing to the expense of leveling and leveeing the ground. With experience the irrigator has become able to apply water to crops which are cultivated in furrows, without resorting to such expensive means. The furrows are plowed in such a direction that the water when turned into them from the lateral ditches will flow freely down them without washing away the soil. When the water has completely filled the furrows, and has reached the lowest points, the little streams are cut off and turned into another set of furrows. The methods of doing this differ. Sometimes the irrigator simply cuts the bank of the distributing ditch with a shovel and then closes the opening after sufficient water has escaped. A more systematic method is commonly employed in California. Water is carried to the furrows in a small box-flume with openings in the side. These openings are closed by little shutters and a number can be opened at once, permitting a certain quantity of water to escape into each furrow. The slope given the furrows determines to a certain extent the amount of water received by the soil. If the fall is very gentle, the water moves slowly and a large portion is absorbed while the furrow is being filled. If steep, the water quickly passes to a lower end and the ground does not absorb so much. When the entire field has been watered the furrows are usually plowed out and a thin layer of the top soil stirred to make an open, porous covering or mulch, preventing excessive evaporation and allowing the air to enter the ground. Without such cultivation a hard crust may be formed. The loosening of this crust breaks the capillary connection with the moisture beneath and thus lessens the loss of water. For irrigating small grain, such as wheat, the ordinary plow furrows are not used. The fields, brought to a uniform surface, are thoroughly cultivated, and after the grain has been sown, small parallel lines are made similar to furrows, but smaller and nearer together. These tiny channels are made either by a peculiar drag or by a roller upon which are projections so arranged as to make small grooves in the soil. These are made in the direction of the desired slope, so that the water can flow down the marks through the grain as it would in furrows through a cornfield. The rapidly growing grain shades the surface and prevents the formation of crust, rendering subsequent cultivation unnecessary. In order to cause the water to spread from the lateral ditches into the furrows through the ground, use is made of the tappoon — a small sheet of metal of such shape as to fit across the ditch. This can be forced into the soft earth, making a small dam and causing the water to back up and overflow the field of grain. Sometimes a canvas dam is used.

Furrow-irrigation is usually employed in watering trees and vines. In some localities, however, basin or pool irrigation is practised. The supply is conducted often in cement-lined ditches and by wooden flumes as near as possible to the trees and vines, and is then turned out into the furrows plowed around or near the trees. The water issuing from small apertures in the side of the wooden box falls into the furrows and is immediately conducted to the vicinity of the trees. Care is usually taken that the water shall not actually touch the tree-trunks, and it is extended far enough about the extremities of the roots to encourage these to spread outward. After the water has traversed the furrows to the lower end of the orchard, the supply is cut off, and the ground is tilled as soon as the surface dries sufficiently.

Sub-Irrigation.— Attempts have been made to conduct the water beneath the surface immediately to the roots of the trees, thus preventing waste by evaporation from the surface of the ground. Few devices have been successful, owing to the fact that the roots of the trees rapidly seek and enter the openings from which the water issues, or, surrounding the pipe by a dense network, cut off the supply. Porous clay tiling has been laid through orchards, and also iron pipes perforated so as to furnish a supply of water along their length. A machine has been invented and successfully used for making cement-pipe in place. Small trenches are dug through the orchard between the trees and the pipe-making machine deposits the material in the trenches, which are filled with earth as soon as the cement is set. Water is thus distributed underground where needed. In orchards where sub-surface irrigation has been unsuccessful because of roots stopping up minute openings beneath the surface, the system has been reconstructed and water has been brought to the surface at or near each tree by means of small hydrants. Vertical pipes are placed at short intervals leading to the level of the ground, and in these are small iron gates or shutters so arranged that the flow can be cut off in the buried pipe. For annual or root crops sub-irrigation has been successfully practised by the use of small iron pipes partly open at the bottom, allowing a small amount of water to escape. These pipes are laid 12 inches or more beneath the surface, and are connected with lines of tile or clay pipes leading from the reservoir or source of supply. As the crops are removed each year, and the ground cultivated, the roots have no opportunity to stop up the pipes. The term sub-irrigation is occasionally applied to conditions occurring in nature where water percolates freely beneath the ground for a considerable distance sufficiently near the surface to supply the need of crops. Where the subsoil transmits water freely, irrigation ditches may sub-irrigate large tracts of country without rendering them marshy. Thus farms may obtain an ample supply of water from ditches half a mile or more away without the necessity of distributing small streams over the surface. In the San Joaquin Valley, California, vineyards in certain localities are thus maintained in good condition, although water has not been visibly applied for many years.

Quantity of Water.— The amount of water required for raising crops varies according to the character of the soil. The plants themselves need a certain minimum supply, but a far larger quantity is required to saturate the surrounding soil to such a degree that the vitalizing processes can continue. Prof. F. H. King of Madison, Wis., has found by direct measurements that from 300 to 500 pounds of water are required for each pound of dry matter produced. When the ground is first irrigated an enormous quantity of water is sometimes required to saturate the subsoil. The quantity of water turned upon the surface during the first year or two has frequently been sufficient to cover the ground to a depth of 10 to 20 feet, and in some cases an amount equal to a depth of 5 feet or more per annum has been thus employed for several years. Gradually, however, the dry soil is filled. The pioneers of irrigation frequently use too much water, often to their disadvantage.

The quantity of water used in irrigation is usually stated in one of two ways: (1) In terms of depth of water on the surface; (2) in quantities of flowing water through the irrigating season. In the humid regions the rainfall is usually from three to four inches per month during the crop season. In the arid region, where the sunlight is more continuous, and the evaporation greater, there should be for the ordinary crops at least enough water during the growing season to cover the ground from four to six inches in depth each month. The second method of stating the quantities necessary for irrigation is of convenience when considering a stream upon which there is no storage. It is estimated that one cubic foot per second, flowing through an irrigating season of 90 days, will irrigate 100 acres. One second-foot will cover an acre nearly two feet deep during 24 hours, and in 90 days it will cover 180 acres one foot deep, or 100 acres to a depth of 1.8 feet, or 21.6 inches. This is equivalent to a depth of water of a little over seven inches per month during the season of 90 days. Successive years of deficient rainfall in southern California from 1897 to 1900 served to prove that, with careful cultivation, crops, orchards, and vineyards can be maintained by using very small quantities of water. In some cases an amount not exceeding six inches in depth was applied during the year, this being conducted directly to the plants, and the ground kept carefully tilled and free from weeds. As estimated by various water companies in southern California, one miner's inch of water will irrigate from five to ten acres, the miner's inch equaling 12,960 gallons in 24 hours, or almost exactly 0.02 second-foot, this being the amount delivered under a 4-inch head, measured from the centre of the opening. Under this assumption one second-foot should irrigate from 250 to 500 acres. If it be assumed that one miner's inch is allowed for ten acres, or one second-foot for 500 acres, this quantity of water flowing from May to October, inclusive, will cover the ground to a depth of a little over seven tenths of a foot. The method of applying water largely governs the amount used. With alfalfa flooding is practised; with small grains the water is run in furrows; while with orchards the water is sometimes applied directly to each tree, or is run in furrows, four or five in each case between two rows of trees.

The annual charges for water by the acre in southern California, where this economy of water is practised, have been as low as $3, and from this rising to $15 or more per acre. For good farming in parts of the arid region outside of southern California, a depth of from 24 to 30 inches of water during the crop season should be sufficient. The usual charge for this quantity is from $1.00 to $2.00 per acre irrigated per annum. The temperature and the wind-movement introduce so many conditions that broad statements of this kind are merely suggestive, and not to be followed as rules.

Where an excessive amount of water is put upon irrigated land, as high as 70 per cent has been known to pass by seepage to the lower grounds. Growing plants evaporate in many cases 300 times their own weight of water each year. If a crop be carelessly cultivated and weeds allowed to grow with plants, the worthless plants waste as much water as is used by those that are valuable. But with careful cultivation the evaporation is lessened and the waste of water is prevented. Thus the quantity of water required is only one half or one third of the amount needed where the farming is carelessly done.

Users' Rights.— The first settlers frequently laid claim to the whole flow of the stream. Soon after the first ditch was built others were constructed a few miles above or below. As long as the stream is of sufficient volume to fill each of the ditches, no difficulties from this arise; but sooner or later the increasing size and number of ditches and canals result in diminishing the flow in the river to such an extent that it becomes low, and water does not reach the ditches farthest downstream.

The result has been that in many parts of the arid region, owing to scarcity of water, lawlessness has prevailed, and every man has endeavored to obtain for his own crops as much as possible of the scanty supply. Usually the irrigators elected a water-master to apportion to each claimant a certain amount of water, or assign certain days or hours upon which water can be used. Often the quantity of the water has been settled only after vexatious lawsuits or neighborhood quarrels. In some parts of the arid region, notably in Wyoming and Colorado and Idaho, the States have undertaken the regulation of disputes, and have created special boards or tribunals to consider the matter and apportion water.

Methods of Obtaining Water.— In the arid region water can be obtained frequently by digging or boring wells at points near stream-channels or along the foot-hills. Out on the broad valleys it may be necessary to go to a depth of from 100 to 300 feet or more before reaching moisture. Where the supply of water from wells is ample, various devices have been employed, such as windmills and gasoline engines, for bringing it to the surface. It is very important to continue the borings through the water-bearing sands or gravel, so as to take advantage of the full thickness of the pervious deposits. Perforated pipe is often driven into the layers of coarse gravel, and adds greatly to the capacity of the well. Artesian or flowing wells may be sunk wherever water held under pressure in pervious material is overlaid by clay. In a well dug through the impervious layer into the gravel the water will rise to a height equal to the line of saturation of the gravel stratum in the surrounding country. Artesian conditions occur in nearly every State, but they do not extend over any considerable portion of the country, excepting on the Great Plains and in California. Wherever they occur the water has especial value on account of the convenience incident to its rising above the surface. In some places, as the James River Valley of South Dakota, the pressure is 100 pounds or more to the square inch, throwing the water to a considerable height and enabling the wells to be used as sources of power. The quantity of water to be had from deep wells is governed by the diameter of the well, the structure and thickness of the water-bearing rocks, and the pressure sustained by the water. With relatively dense rocks a slight head of water will throw only a feeble stream, but from thick layers of open gravel or sand rock large volumes are delivered. It frequently occurs that a 4-

inch pipe will deliver all of the water which can reach this point, and increasing the diameter of the well will not alter the flow.

While most of the water used in irrigation is diverted by gravity from flowing streams, yet, as regards value, it may be said that some of the most important sources of supply are utilized through pumping. In some localities where horses have little value, pumping by horse-power is in vogue. The practicability of irrigation in this way is limited largely by the depth of the water and the number of animals available. The force of flowing water itself is frequently employed to bring water up to the level of the irrigable land, the bucket-wheel having been utilized from the earliest historical times up to the present. The most important source of power for pumping water is wind. Over the broad valleys and plains of the arid region the wind-movement is almost continuous for days and weeks. It is a comparatively simple and inexpensive operation to sink a well into the water and erect a windmill, attaching this to a suitable pump. A windmill once erected on the plains is operated day and night by the wind, bringing to the surface a small but continuous supply of water. This small stream if turned out on the soil would flow a short distance, then disappear into the thirsty ground, so that irrigation directly from a windmill is usually impracticable. To overcome this difficulty it has been found necessary to provide small storage reservoirs or tanks, built of earth, wood, or iron, to hold the water until it has accumulated to a volume sufficient to permit a stream of considerable size to be taken out for irrigation. Such a stream, flowing rapidly over the surface, will penetrate to a distance and cover an area much greater than is possible with the small flow delivered by the pump. One disadvantage connected with the use of windmills is that most of them are constructed to operate only in moderate winds. As the strength of the wind increases, the wheel begins to revolve, increasing in efficiency until the velocity of the wind is about eight or ten miles an hour. At greater speed the mills are usually so constructed that the efficiency decreases rapidly as the wind becomes more powerful. When it approaches a gale, the mill stops completely.

In many places drainage-works are a necessary adjunct of irrigation. On bench-lands or gently sloping hillsides the water which escapes from one man's farm is eagerly caught and used by his neighbor below, and there is none left to stagnate, the surplus from the cultivated lands being often of great value in watering the lower meadows. There are cases, however, where the question of disposing of the water is as important as that of obtaining it. These are on the nearly level lands, where the subsoil has been filled to saturation by the water which has no opportunity to escape, and expensive works are required in order to redeem the lower lands for agricultural purposes.

Duty of Water.— The amount of land which can be irrigated with a given quantity of water, or the relation which these bear to each other, is commonly expressed by the term duty of water. The investigation of the duty of water is one of the most complicated problems of irrigation. There is such a difference in methods of measurement, localities, soils, crops, application of water, and frequency of watering that the statements made by different persons are almost irreconcilable. In general, more water is used, or the duty is less, on the newer land than on that which has been cultivated by irrigation for some years. The rainfall also affects the quantity used, and as this is exceedingly irregular, the amount of water applied each year fluctuates. Seepage likewise complicates matters, for a field may often receive considerable water indirectly and require less by direct application. The duty of water is quoted at from 30 to 500 acres or more to the second-foot. For convenience the unit of 100 acres to the second-foot has been considered as indicating careful irrigating, although in the more southwestern portion of the arid region this would be considered low, and in the northern part high.

Since the value of water per second-foot varies largely with its duty, it will be recognized that it is exceedingly difficult to estimate. However, it is necessary to arrive at certain averages in order to approximate the possible values of river, or of storage basins, in the future development of the country. It has been estimated that a perpetual water-right is worth from $25 to $50 per acre in a grain or grazing country, and as high as from $100 to $500 per acre for fruit-land, rising in southern California for the best citrus lands even to $1,000 or more per acre.

Alkali.— The accumulation of alkali in irrigated lands presents one of the most serious problems encountered in this method of agriculture. The injuries from the presence in excess of earthy salts are usually evident in the corrosive action of the tender bark, especially at the root-crown. Experiments made in California show that apple-trees are severely injured by the presence of 3,000 pounds of common salt per acre, this amount being disseminated through four feet in depth. On the other hand, the olive thrives at Tulare, where the soil contains as high as 5,600 pounds of salt per acre. Alfalfa, when young, is easily killed by alkali, but it has been found to thrive in soil containing as much as 6,000 pounds of common salt, 3,000 pounds of carbonate, and over 1,000 pounds of sulphate, per acre, distributed through six feet in depth. Sugar-beets also have been known to grow well where a large amount of alkali is present. Grapes apparently are least affected by small amounts of alkali, while peaches and lemons are more susceptible to injury because of its presence. The recently introduced salt-bush is notable for its ability to grow in alkaline lands, and sorghum and alfalfa, especially when the latter has reached maturity, are almost equally vigorous.

The most effective way of removing alkali is by underdrainage through tiles laid at a depth of from three to five feet, the drainage-water being allowed to escape into a stream, or into a well from which it can be removed by pumping. Recent authorities on the subject claim that the trouble caused by alkali yields sometimes to careful treatment, and that science has partly solved the problem. It is shown that the tiling of land for alkaline washing costs no more than drain-tiling as practised on eastern farms. In the government demonstration at Salt Lake City, where the percentage of alkali is enormous, the lines of tile are 150 feet apart. The water descending into the soil dissolves large quantities of alkali near the surface and carries it off in solution. Land so tiled, even if badly alkaline, can be returned to profitable cultivation in time if heavily irrigated, and within one year can be used for the production of some crops suited to the climate. Large areas of alkali land in the West may be reclaimed at a cost below the actual increase in the value of the land. It is thought that the time will soon come when drainage will be as common in the irrigated districts as are the tile-drained fields of the Middle West.

States Compared.— In the number of irrigators California stands far ahead of any other State, having about one fourth of the total number in the United States. Colorado, however, exceeds in the number of acres irrigated, although not in the value of irrigated crops. In this respect California leads, having a value double that of Colorado, and over one third that of the total value of irrigated crops in the United States. The greatest percentage of increase in the number of irrigators has been in the State of Washington, and the least in Oregon. This, doubtless, is due to the fact that in irrigation Oregon reached a certain culminating point previous to 1889, while in Washington the construction of ditches had only begun.

Comparison of Crops.— In considering the character and value of the crops produced on irrigated land in the arid States and Territories, hay and forage form the most important item, being over one third of the whole. Cereals — principally wheat, oats, rye, and barley — come far below the forage crops; and next to these in order are vegetables, orchard fruits and small fruits. In California only the orchard fruits surpass the forage crops in value. The large production of hay and forage under irrigation illustrates the fact that in these States irrigation is, to a large extent, an adjunct of stock-raising. The production of cereals under irrigation is relatively small. In California, for example, only 6.0 per cent of the wheat is irrigated, and 8.0 per cent of the barley. The total value of all the cereals produced under irrigation in the United States is far less than that of those produced in almost any one of the humid States of the East; in New York, for example, though it is not considered a farming State, the value of the cereals raised is more than double that of the entire amount produced under irrigation in the whole country. In many localities the irrigation of cereals and staple crops has been brought about by local conditions, such as difficulty of transportation and consequent heavy cost of importation. The irrigated cereals in such localities are raised almost wholly for local consumption, and do not enter the markets of the world.

Economic Bearings.— Irrigation has important economic aspects especially seen in the greater success of the small irrigated holding. The Salvation Army, following the example of the Mormon colonies of 1847 in Utah, and of the Greeley community in California, has located small communities on reclaimed farms. The process of colonization will always be slow from the nature of the case, and the effect on eastern agriculture, far from being sudden and severe as was urged by the opponents of the Irrigation Bill in 1902, will be gradual. It may be very beneficial in forcing eastern farmers to more careful use of their water-supply, and perhaps to the adoption of a modified scheme of irrigation, which has been found to increase crops even in humid districts, and which would at least be a valuable resource in times of drought.

Irrigation Bill, or Reclamation Act, a Federal measure, dated 17 June 1902, for the reclamation by irrigation of arid and semi-arid lands in Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, South Dakota, Utah, Washington and Wyoming. See Irrigation.

Irtish, ir'tish, a river of Asia, which rises in China, in the Altai Mountains, and after expanding into Lake Zaisan, flows through the Russian territory of Semipalatinsk, passes the town of Tobolsk, and finally, after a course of about 1,800 miles, joins the Obi near Samarova.

Irus, nickname of the beggar of Ithaca who served the suitors of Penelope as a messenger. Immortalized in the 18th book of Homer's 'Odyssey,' he becomes the typical beggar of later literature.

Irvine, William, American Revolutionary general: b. near Enniskillen, Ireland, 3 Nov. 1741; d. Philadelphia 29 July 1804. Having graduated at Dublin University, he studied medicine and surgery, and was appointed surgeon on board a ship of war, serving during a part of the war of 1756–63 between Great Britain and France. On the declaration of peace he emigrated to America, and in 1764 settled in Carlisle, Pa. At the opening of the Revolution he took part with the colonies, was a member of the provincial convention assembled 15 July 1774, until he was appointed by Congress, 10 Jan. 1776, colonel of the 6th battalion of the Pennsylvania line. On 12 May 1779 he was promoted to the rank of brigadier-general, and assigned to the command of the 2d brigade of the Pennsylvania line. In the autumn of 1781 he was ordered to Fort Pitt, to take command of the troops on the western frontier, and continued to fulfil the duties of this post, until after the war had closed. He was early in 1785 appointed by the State agent under an «act for directing the mode of distributing the donation lands promised to the troops of the commonwealth.» About this time he suggested to Pennsylvania the purchase from the United States of the tract of land known as «the triangle,» thus giving to the State an outlet upon Lake Erie. He was a member of Congress under the confederation 1787–8, and of the Federal Congress 1793–5. In 1794 he was assigned to the command of the Pennsylvania troops for the purpose of quelling the «whiskey insurrection,» and in all the most important movements in connection with this subject took an active part. He was president of the State society of the Cincinnati at the time of his death.

Irving, ėr'vĭng, **Edward,** Scottish preacher, founder of the religious sect known as Irvingites: b. Annan, Dumfriesshire, 4 Aug. 1792; d. Glasgow December 1834. He was graduated at the University of Edinburgh, and in 1815 became a licentiate of the Church of Scotland and subsequently Dr. Chalmer's assistant. In 1822 he became minister of the Caledonian Asylum chapel in Cross Street, Hatton Garden, London. Here he soon attracted very large congregations by the force and eloquence of his discourses, and the singularity of his appearance and gesticulation. The greatest orators and statesmen of the day crowded with the wealthy and fashionable to hear him. The appearance of the preacher — tall, athletic, and sallow — displaying a profusion of jet-black glossy hair reaching to his shoulders, with a singular obliquity in one of his eyes, and a stern calm solemnity of aspect, enhanced the interest and excitement produced by his discourses. His phraseology was one of the peculiarities which gave him *éclat* with the public, for he expressed his ideas in the language of Milton, Hooker, and Jeremy Taylor. At London he began to publish books in which he broached novel theological views. 'Sermons, Lectures, and Occasional Discourses,' in which his theological peculiarities were first distinctly enunciated, were published in 1828. In the beginning of 1832 his aberrations had become so marked and extraordinary that his hearers, who in 1829 had erected for him a large church in Regent Square, preferred charges against their minister. On 2 May 1832 the London presbytery unanimously found him guilty of error. The consequence was that he became dispossessed of his cure. In 1833 the presbytery of Annan, which had licensed him, deposed him from the ministry, on which occasion his defense of himself was a sublime effort of oratory. He retired to Scotland, broken in health and spirits, and was attacked with consumption. For the religious sect he founded see CATHOLIC APOSTOLIC CHURCH. His life has been admirably written by Mrs. Oliphant.

Irving, SIR **Henry** (originally JOHN HENRY BRODRIBB), English actor: b. near Glastonbury 6 Feb. 1838; d. Bradford, 13 Oct. 1905. He was a clerk in London, but adopted the theatrical profession, his first appearance being at Sunderland in 1856. He appeared first in London at the Princess' Theatre, in 1859; later went to Manchester, where he remained for five or six years, but returned to London in 1866, where his first marked success was as Digby Grant in Albery's 'Two Roses' (in 1870), which was followed by his powerful impersonation of Mathias in 'The Bells.' His next noteworthy parts were Charles I., Eugene Aram, and Richelieu, in the plays so named. In 1874 at the Lyceum Theatre, he sustained the part of Hamlet so successfully as to raise himself to the first place among English actors. His chief Shakespearian parts are Macbeth, Othello, Shylock, and Richard III. In 1878 he leased the Lyceum Theatre for himself, and later put on the stage in excellent style 'Othello,' 'The Merchant of Venice,' 'Much Ado About Nothing,' 'Romeo and Juliet,' 'Twelfth Night,' 'Faust,' 'Macbeth,' etc., playing in them the principal character with Miss Ellen Terry. His appearances in the provinces were equally successful with those in London, and he met with like favor in his repeated visits to the United States. Of his last great roles may be cited Becket in Tennyson's play of that name (1893), King Arthur in a play of that name (1895), Napoleon in 'Madame Sans-Gêne' (1897), the title role in his son's play of 'Peter the Great' (1898), and Robespierre in a play of that name (1899), specially written for him by M. Victorien Sardou, and the title role in 'Dante' (1903). He was knighted in 1895, and in 1898 Cambridge University conferred on him the honorary degree of LL.D.

Irving, Washington, American author: b. New York 3 April 1783; d. Tarrytown, N. Y., 28 Nov. 1859. His father, William Irving, merchant, came to New York from the Orkneys in 1763, having married Sarah Sanders, daughter of Cornish parents, two years before. Washington was the youngest of their 11 children. His school training was far from thorough, and was not directed toward academic culture — though two of his brothers had been sent to Columbia College — a decision of his father that he much regretted in maturer years. He made up for his lack of interest in school subjects by enthusiastic reading in English authors, particularly Chaucer and Spenser. At 16 he entered a law office, and in 1802 began authorship by contributing humorous sketches, over the name of «Jonathan Oldstyle,» to *The Morning Chronicle,* a daily edited by his brother Peter. Developing symptoms of consumption, he sailed in 1804 for France, and spent two years in travel, on the continent and in England, which restored his health. On return he was admitted to the bar, but instead of practice began, in 1807, with his brother William, and James K. Paulding, the issue of 'Salmagundi,' the success of which determined his career, and the immediate character of his writing. At the close of the next year he set about reshaping the burlesque history of New York, which he had begun, with Peter Irving, some time before on a different plan. While in this work he met with the great affliction of his life, the loss of his betrothed, Matilda Hoffman, daughter of a prominent lawyer of the city, in whose office he had finished his legal studies. The completion of the book, 'Dietrich Knickerbocker's History of New York,' published in 1809, was the only solace that he permitted himself in the first months of seclusion and grief. In 1810 he wrote a short life of the poet Campbell, and was received into partnership by his brothers Peter and Ebenezer, who were founding an importing house, and wished to provide

Washington the means, without contribution of time or labor to the business, of preparing himself more fully for his chosen work. In 1813 and 1814 he edited the 'Analectic Magazine,' published in Philadelphia, and contributed biographical articles upon some of the naval commanders in the war then in progress with Great Britain. After the burning of our national capital in 1814, he offered his services to his native State, and was made aide-de-camp to Governor Tompkins, with the rank of colonel. At the close of the war he sailed for England, and was received with distinction by the American artists Allston and Leslie, and by Scott, Campbell, Moore and other literary men. In 1818 the firm of P. and E. Irving and Co. failed, and Washington's pleasant rambles in England and Scotland came to an end. He declined a post in the navy board, at home, and set himself at work in London with his pen. Early in the next year he sent over for publication in New York and Philadelphia, the first number of the 'Sketch Book,' containing 'The Voyage,' 'Roscoe,' 'The Wife,' and 'Rip Van Winkle.' Other numbers followed, the success was great, and in 1820 John Murray brought out an edition of the work in London. Its popularity with British readers was such that Murray became the first publisher of 'Bracebridge Hall' (1822), 'Tales of a Traveller' (1824), and other works. In 1826 Irving went to Madrid, at the instance of his friend, Alexander H. Everett, American minister to Spain, who advised the translation of Naverreté's 'Voyages of Columbus,' then issuing in parts. Irving found the work impracticable to translate, being a collection of sources rather than a consistent narrative, and prepared instead the 'History of the Life and Voyages of Christopher Columbus,' finished in 1828. This first serious product of Irving's powers retained much of the ease and charm of 'The Sketch Book' and 'Tales of a Traveller,' and was eminently adapted to increase his fame. It was not especially successful, though Murray paid 3,000 guineas for the copyright; an abridgment of the work had a better sale. 'The Conquest of Granada' (1829), 'Companions of Columbus' (1831), and 'The Alhambra' (1832) were further fruits of his Spanish studies and travel. In the meantime he had been made secretary of legation (1829), in London, and received the medal of the Royal Society of Literature (1830), and the degree of LL. D. (1831) from Oxford. In 1832 he returned to America, but not to rest. He accompanied an Indian commission to Fort Gibson, on the Arkansas River, and wrote 'Tour on the Prairies,' published as the first volume of 'Crayon Miscellanies,' in 1835. The second volume, 'Abbotsford and Newstead Abbey,' and the third, 'Legends of the Conquest of Spain,' followed in a few months. He now bought the little Van Tassel farm, at Tarrytown, and began to enlarge its Dutch cottage, and improve the grounds. To this home, called "Sunnyside," he soon removed from the city, and eventually brought to it the brothers who had aided him in earlier years. In 1836 he finished 'Astoria,' with the help of his nephew, Pierre M. Irving, from materials furnished by John Jacob Astor. The next year he published 'The Adventures of Captain Bonneville,' properly a continuation of the preceding. He then began a history of the conquest of Mexico, but on learning that W. H. Prescott was at work on the same subject, resigned the task to him. In 1839 he engaged to write for the 'Knickerbocker Magazine,' and furnished monthly articles for about two years. In 1842 he was appointed Minister to Spain, and for the next four years wrote little. On return he arranged with G. P. Putnam for a complete edition of his works, in 15 volumes, to which he added (1849) the 'Life of Goldsmith,' and (1850) 'Mahomet and his Successors.' The way was now open for the 'Life of Washington,' which had long been contemplated. In 1855 appeared 'Wolfert's Roost,' mainly a reprint of the Knickerbocker papers, and two volumes of the 'Life.' The work told on his strength, and the fifth and last volume, finished in March, 1859, left him a broken man. His death was from heart disease, in his 77th year. He was buried by the side of his mother, whose tastes he had inherited, and whose sympathy and nurture had made him what he was. His authorship was the outcome of his personal character, and was little modified by the literatures of the world. With all his graces of expression, he lacked the gift of deep insight, and failed to achieve much vigor of style. The best biography is still the 'Life and Letters' by his nephew, Pierre M. Irving (1863). Consult also Warner, 'Washington Irving' (1881); Laun, 'Washington Irving: Ein Lebens- und Charakterbild' (1870); Richardson, 'American Literature' (1887–8); Wendell, 'A Literary History of America' (1900).

Ir'vingites. See Catholic Apostolic Church.

Ir'vington, N. J., a town in Essex County, adjoining Newark on the southwest. It is a pleasant residential suburb of that city, and also has a number of manufactories, among which are smelting-works and establishments for making wall-paper, pocket-book frames, tools, brushes, rules, etc. The town was incorporated in 1898, although its settlement dates back almost to 1660. Its governmental affairs are in the hands of a town council. Pop. (1900) 5,255.

Irvington, N. Y., village in Westchester County, on the Hudson River, and the New York C. & H. R. railroad, 23 miles north of New York, and a short distance south of Tarrytown; named in honor of Washington Irving. It is mainly a residential village of recent growth and is noted for its beautiful dwellings and grounds, with their fine situation on the river-bank. These are largely the homes of New York business men and their families. The Guiteau Library and the town-hall are among its most noteworthy buildings. The village is a place of great interest as being the location of "Sunnyside," for many years the home of Washington Irving. The house, half a mile north of the railroad station, "is a many-gabled, vine-clad cottage, covered with stucco, and shadowed by grand trees." It has been rebuilt and enlarged. Pop. (1900) 2,231.

Isaac, ī'zak (Heb. "he will laugh"), Hebrew patriarch, the son of Abraham by Sarah, so called to denote the laughter and gladness occasioned by his birth. He is remarkable for his miraculous escape from death as a burnt-

WASHINGTON IRVING.

offering; and for the fraud perpetrated upon him, at his wife Rebecca's instigation, by his son Jacob, to the injury of Esau. He died at Hebron 180 years old, and was buried in the cave of Machpelah, the resting-place of Sarah and Abraham, and of Rebecca.

Isaac, I., Comne'nus, Byzantine emperor: d. 1061. He was the son of Manuel Comnenus, an eminent general under Basil II., emperor of Constantinople, and was the first of his family to assume the purple. He had distinguished himself as a soldier and commander in the wars against the Arabs in Asia Minor, and had married a captive Bulgarian princess. In 1057 he succeeded to the throne upon the deposition of the aged and incompetent Michael VI. He abdicated in 1059 and spent the remainder of his life in a monastery.

Isaac, II., An'gelus, Byzantine emperor: d. 1204. He became sovereign of the East in 1185, and reigned 10 years. Isaac was a vicious and cowardly prince, and was dethroned, blinded, and imprisoned by his brother Alexius in 1195. Eight years later he was restored to the throne and reigned for six months, when he was again dethroned, and soon after died in prison.

Isaak Church, The, the finest building in Russia, or in northern Europe, begun by the Empress Catherine, and finished by Nicholas I. The foundation alone is said to have cost $1,000,000. It is a magnificent structure, one of the most remarkable sights of the Russian capital. The design is simple and majestic, the whole being surmounted by a gilded dome. The total cost of the structure was $67,500,000.

Isaaks, Jorge, hor'hā ē'säks, Columbian novelist and poet: b. Cali, State of Cauca, Colombia, 1843; d. 1895. He was the son of an English Jew who had married a Spanish woman and was taken to Bogotá in childhood, and ever after made it his home. He published a volume of poems in 1864, and in 1867 his masterpiece, the novel 'Maria,' a story of domestic life in Colombia, told with consummate skill and tender simplicity.

Isabela, ē-sä-bä'lä, Philippines, province of Luzon, on the northern Pacific coast of the island with Cagayán on the north and Principe and Nueva Ecija on the south; length 118 miles; area 5,395 square miles (including dependent islands), the largest province of Luzon. The Sierra Madre mountain range runs parallel to the coast, a short distance inland; the rest of the surface is broken by low hills; the Grande de Cagayán River traverses the entire length of the province; and the main highway from Aparri to Manila parallels this river. Rice, sugarcane, chocolate, coffee, corn and vegetables grow with little cultivation; tobacco is extensively raised and its growth and treatment is the most important industry. Cattle raising is also an important industry. Civil government was established in 1901. Pop. 48,300.

Isabella, (ĭz-a-bel'a) **(I.) of Castile,** queen of Spain, daughter of John II., king of Castile and Leon: b. Madrigal 23 April 1451; d. Medina del Campo 26 Nov. 1504. She married, 19 Oct. 1649, Ferdinand V., king of Aragon (q.v.), surnamed "The Catholic." After the death of her brother, Henry IV., in 1474, she ascended the throne of Castile, to the exclusion of her elder sister, Joanna. After the kingdoms of Aragon and Castile were united, Ferdinand and Isabella assumed the royal titles of Spain. She was always present at the transaction of state affairs, and insisted that her name should be placed beside that of her husband in public ordinances. The conquest of Granada, after which the Moors were entirely expelled from Spain, was in a great degree her work; and the encouragement she gave Columbus assisted him to the discovery of America. In all her undertakings Cardinal Ximenes was her assistant. In 1492 Pope Alexander VI. confirmed to the royal pair the title of "Most Catholic," already conferred on them by Innocent VIII. The zeal for the Roman Catholic religion, which procured them this title, gave rise to the Inquisition, which was instituted in Spain in 1480, at the suggestion of their confessor, Torquemada. See FERDINAND V., XIMENES, and COLUMBUS. Consult Prescott, 'History of the Reign of Ferdinand and Isabella the Catholic.'

Isabella II., ex-queen of Spain, daughter of Ferdinand III.: b. Madrid 10 Oct. 1830; d. Paris, France, 9 April 1904 she succeeded her father in 1833. The early years of her reign were disturbed by a rising in favor of her uncle, Don Carlos, who, if the Salic law had not been set aside, would have ascended the throne instead of her; but this was quelled in 1839. She was declared of age in 1843, and in 1846 was married to her cousin, Don Francisco d'Assisi (q.v.). Her reign was so despotic that a revolution took place in 1868, which drove her from the country. She resigned her claims to the crown in favor of her son Alfonso, who ascended the throne in 1875 as Alfonso XII.

Isabellita. See BUTTERFLY-FISH.

Isaeus, one of the "Ten Attic Orators," though probably a native of Chalcis, made his home in Athens, and there, in the first half of the 4th century B.C., we find him actively engaged in the profession of a speech-writer for clients in the law courts. He seems also to have taught rhetoric, to Demosthenes among others, according to one tradition. We have from him a dozen orations dealing with inheritance cases, two of them in a fragmentary condition. The best edition is that of H. Buermann (Berlin 1883). There is an English translation by W. Jones (London 1779).

Isaiah, one of the great Hebrew prophets. The name Isaiah, more exactly *Yeshā'yā* and *Yeshā'yāhū*, is derived from two Hebrew words and means "Jehovah saves." It refers to the general burden of the prophet's message. The prophet, who was the son of Amoz (q.v.), a man otherwise unknown to us, was born probably at Jerusalem, and this place, the scene of his life work, and in his thought synonymous with his country, engrosses his attention. The year of his birth must have been about 760 B.C., his known activity begins in 739 and continues to 701 B.C., at least. He was married not far from the time of his call in 739, for in 735 a son of his, with a name symbolic of his prophetic message to Judah, *Shear-yashubh*, "a remnant shall turn" (*i. e.*, to Jehovah), was of an age suitable to accompany his father in his walks. Another son, *Maher-shalal-hash-baz*, was born in 734, and his name also is symbolic of predicted events in the national history, namely, the fall of Damascus and Samaria, and means "hastening to booty, speeding to prey."

It is to be remembered that Amos (750 B.C.), and Hosea (q.v.) (735 B.C.), are the only canonical prophets that preceded Isaiah, and these had their work in the northern kingdom, though Micah (q.v.) prophesied in a country district of Judah during the middle and later periods of Isaiah's ministry. It is next to certain that Isaiah was of high rank, if not of the nobility in Judah, and at times might be as bold as he chose in his utterances to the court. We cannot be certain whether the Jewish traditions that he was the nephew of King Amaziah (Megilla, 10b), that he was slain by Manasseh (Jebamoth, 49b), and that he was sawn asunder ('The Ascension of Isaiah,' Ethiopic version: cf. Justin Martyr, 'Dial. c. Trypho,' ch. CXX.), have a basis in fact or not.

The principal crises of the country in Isaiah's time occurred in 735, 734 (during the reign of Ahaz), and in 701 (during Hezekiah's reign). The occasion of the first was the union of Damascus and north Israel against the Assyrian over-lord, Tiglath-pileser III. (745–727) and their attempt to overcome Judah. The occasion of the second crisis was the attempt of Judah and her neighbors to avoid tribute to Assyria and their alliance with Egypt against her. At this time Sennacherib was on the throne of Assyria (705–681). Besides these, there were moderate political disturbances in Judah during the reigns of Shalmanassar IV. (727–722), and Sargon (722–705), for both of these warlike kings in these times were in the west country for conquest and subjugated north Israel, as well as the Philistine territory.

In meeting these crises, Isaiah showed himself the most consummate statesman and the most brilliant theological teacher in Israel in the times before Christ. His hold of truth was strong, his presentation of it was uncompromising, his oratory was superb, and the variety and finish of his discourses and the aptness of his illustrations, as well as the measured flow of his thought, were inimitable. It is of course true that in his teaching he built upon his predecessors, Amos and Hosea, but he put such a stamp of genius upon the ideas he cherished, that his influence has been the greatest of all the Hebrew prophets.

In general it may be said that Isaiah's messages had to do with the safety of the capital in the warlike times in which he lived, with the character of God in his sublime holiness and righteousness, and with the duty of his fellow-citizens to cultivate the righteous life, and, forsaking human political wisdom and alliances with the nations, to depend absolutely upon the Lord God. With him, religion and politics go hand in hand, and theological thinking is the kernel of his most practical and stirring addresses. Incidentally he has given us a view of the circumstances of his time, its social relations and habits, the fashions, the commotions and rumors, in times of peace and war, in seasons of prosperity and distress; in all showing himself the most vivid and powerful preacher of the olden time.

The convictions of Isaiah are due to his faith in God and arise out of the circumstances of the time. Jehovah is the Holy One of Israel, hence he must punish Jerusalem for her injustice to men and her falseness to God, and this he will do through the instrumentality of the most potent political powers of the age; but since Jerusalem is the throne of His glory, and the seat of true religion, however formal the people have made their worship, therefore, a portion of the Judeans will be spared, and the city will prove invincible. Indeed his own beloved capital is destined to become the centre of religious truth for the nations, and is to have a new and perfect ruler, who will reign in wisdom and might, and will bring righteousness and peace to the people.

Charles Rufus Brown,
Professor of Hebrew and Cognate Languages, The Newton Theological Institution, Newton, Mass.

Isaiah, Book of. It must be premised that the old prophets of Israel, for the most part, gave themselves to oral utterance, and made little use of the written roll. In the case of some of them, the issue of written discourses was an after-thought, and the latter assumed forms revised to suit the practical needs of the readers, just as the first forms had been adapted to the need of the audience that listened to the preacher's spoken words. This is undoubtedly true of the prophet Isaiah, who appears to have felt that by changes in phraseology he could the better meet the advancing needs of the men for whom he labored. In other words, the prophet's interest was not historical; he did not reproduce his sermons with the thought of preserving them for the world exactly as they were delivered, but he had the practical aim of moving a new circle of people to that faith in God which he had previously inculcated. This example was not lost upon the disciples and admirers of the prophets, and in the book of Isaiah the old messages have received modifications at different times to suit the conditions of successive generations. Indeed Isaiah in the pre-Christian centuries was held in such honor that authors added to his writings other discourses and historical material that were calculated to produce the results aimed at by our prophet, and in much of this material there is not even a kernel of Isaian authorship. It is true that such procedure is not in accord with modern ideas of literary ownership, but there is reason to suppose that in ancient times the name of the author of new material was of little consequence, and his work was often hidden in the product of some distinguished predecessor, the delivery of an exigent message being all important.

The book of Isaiah contains 66 chapters from various sources, being a combination of several collections of oracles, and divides itself naturally into seven grand divisions, viz.: chapters i–xii, xiii–xxvii, xxviii–xxxiii, xxxiv–xxxv, xxxvi–xxxix, xl–lv, lvi–lxvi.

1. Chs. i–xii contain several small sections or series of addresses, mostly by Isaiah himself. From the time of his call to the prophetic office in 739 B.C., he probably made notes of his discourses, and about 734, perhaps, he began to issue combinations of these, first for his disciples, and then doubtless for a larger circle of readers. Chs. vii:1–ix:7, composed of discourses delivered to Ahaz and the people of Judah in 735, 734, is probably the first of these

combinations, and not long afterward this was increased by prefixing to it the inaugural vision, ch. vi, and by affixing ix:8–x:4 (with v:25–30, now misplaced), the prophetic interpretation of north Israel's unhappy history and the application to Judah. Subsequently the prophet appears to have added the woe on Assyria, the instrument of Jehovah's anger against his people (x:5–34), and a prophecy of the righteous king, to whom he had already referred, and of the restoration of Israel (ch. xi).

He, or some disciple of his, prefixed to the book ii:1–iv:1; ch. i; v:1–24, series of discourses that present in most vivid manner the social conditions and the debased life of the age of Jotham and Ahaz, as well as the evil consequences to follow, ere the kingdom of God could be established. Ch. i, called by Ewald "The Great Arraignment," is a general introduction to this part, and was composed after 734, possibly several years afterward, ch. i:1 being an editorial note to introduce all the prophecies of Isaiah. Ch. iv:2–6, ch. xii, are probably post-exilic additions to this division of Isaiah.

2. Chs. xiii–xxvii may be called the book of woes. The genuine Isaiah passages are in substance: xiv:24–27, the removal of the Assyrian yoke, xiv:28–32 woe on the Philistines, both delivered during the domination of Sargon or Sennacherib; xvi:13–14, on Moab, delivered perhaps in 711; xvii:1–11, the fall of Damascus, 735; xvii:12–14, the repulse of Assyria, 701; ch. xviii, the message to Ethiopia concerning the disaster to Assyria, 701; ch. xx, on Egypt, 711; xxi:11, 12, on Edom, and xxi:13–17, on Arabia, of uncertain date, may have been readapted to the exilic situation in 545 B.C.; ch. xxii, against Jerusalem and one of its prominent statesmen, belongs to 702, 701; the substance of ch. xxiii (on Tyre), especially vss. 1–14, was given about 702 B.C. Upon these as a nucleus have been grafted oracles from various epochs and authors; namely xiii:1–xiv:23, the fall of Babylon, composed in Babylonia about 549 B.C.; xv: 1–xvi:12, an old oracle quoted by Isaiah himself, possibly in 711; ch. xix, on Egypt, is a post-exilic oracle, but in vss. 1–15 there may be an Isaiah kernel, from 720, 711, or 702; xxi:1–10, on Babylon, is exilic, dating from about 545 B.C.; chs. xxiv–xxvii form a long post-exilic apocalypse, concerning the judgment on the world and the future blessedness of Israel, and may be assigned with probability to the later Persian period.

3. Chs. xxviii–xxxiii are substantially from Isaiah's hand, and belong chiefly to the time of his later activity. In ch. xxviii, Isaiah's earlier message against Samaria (vss. 1–6, before 722) is reiterated with reasons, in or about 704. In chs. xxix–xxxii we have in several paragraphs a representation of the straits to which Jerusalem was put just before 701 B.C., the futility of reliance on Egypt for help, the weakness of the Judean politicians, the indifference of the women of the capital, the ultimate deliverance of the city, the fall of Assyria, and the coming of the Messianic age (the latter in three passages, xxx:18–26; xxxii:1–8, 15–20; ch. xxxiii is supplementary to this, contains a woe upon some power hostile to Jerusalem, and the prediction of Judah's deliverance. This is probably a post-exilic expansion of Isaiah's utterances in 701 B.C. The sections xxix:16–24; xxx:18–26; ch. xxxii, have been assigned by some writers to exilic or post-exilic times, and they may contain some elements from these periods.

No further prophecies in the book can be assigned with probability to our prophet.

4. Chs. xxxiv–xxxv form a post-exilic prophecy of 450 B.C., or later, and treat of Israel's victory over Edom and of the joyful circumstances of Israel's restoration.

5. Chs. xxxvi–xxxix are historical chapters taken in large measure from 2 Kings. The Isaian passage omits 2 Kings xviii:14–16, and introduces the song of Hezekiah (Isa. xxxviii: 9–20) before 2 Kings xx:12.

6. Chs. xl–lv are a long and developed prophecy, and comprise the great exilic prediction of about 540 B.C. concerning the return of Israel from Babylonia, through the instrumentality of Cyrus. Omitting subdivisions, of which there are many, Skinner and others divide about as follows:

Chs. xl–xlviii, the restoration: (1) xl:1–11, the theme; (2) xl:12–31, the infinity of God; (3) ch. xli, the historical situation, as it has been brought about by God for his servant Israel; (4) xlii:1–xliii:7, the work of Jehovah's ideal servant (xlii:1–4) for Israel and the world, and the contrast with the servant Israel as he is; (5) xliii:8–xliv:5, the witness of Israel's history to the divinity of Jehovah, and the salvation of Israel and the nations through the divine interposition; (6) xliv:6–23, the folly of idolatry; (7) xliv:24–xlv:25, the mission of Cyrus, the anointed of Jehovah, for Israel and for a world-wide religion; (8) chs. xlvi, xlvii, the fall of Babylon; (9) ch. xlviii, the closing argument, and the joyful summons to Israel to depart from Babylon and to declare to the world their redemption by their God.

Chs. xlix–lv, the glorious future of Israel; (1) xlix:1–13, the mission of the servant (vss. 1–6) to the world; (2) xlix:14–l:3, consolation for afflicted Zion; (3) l:4–11, the perfection of the servant through suffering; (4) li:1–lii: 12, the Israelites encouraged to accept the promises; (5) lii:13–liii:12, the servant's sacrificial work and his exaltation; (6) chs. liv, lv, the felicity of Israel and the gracious call to accept the promised deliverance.

7. Chs. lvi–lxvi are probably for the most part of post-exilic origin, as they appear to contain detached messages of condemnation and promise to a people living in Palestine. Here there are details concerning the moral, social, and religious duties of the people, and worship in the new temple appears to have been established. We divide: (1) lvi:1–8, the admission of foreigners and eunuchs to the Israelitish community; (2) lvi:9–lix:21, a series of rebukes to several classes, interspersed with promises for fidelity; (3) chs. lx–lxii, the new Jerusalem; (4) lxiii:1–6, the divine hero in Edom; (5) lxiii:7–lxiv:12, confession of sin; (6) chs. lxv–lxvi, the contrasted futures of true servants of God and apostates.

The principal idea of Isaiah, besides that of judgment, common to the prophets, was the deliverance from the foes of Jerusalem of the remnant of Israel, meditated by a righteous king. The principal ideas of Isa. xl–lv are the deliverance of Israel from exile through Cyrus, and the deliverance of the people from sin and the impartation of spiritual graces through the suffering servant of Jehovah. Hope, therefore, is the keynote of this prophecy and comfort is the opening word. In connection with the theme, the prophet declares, in turn after turn of speech, the reliability of God in bringing to pass his promises, the sublime grandeur of the Holy One, his creative power, the absurdity of idolatry. The writer makes it clear that the absolute and sole sovereign in the earth is Jehovah, the God of Israel. In Isa. lvi–lxvi there is no advance upon these ideas, but many of them are reiterated there.

Bibliography.— Besides the appropriate sections in Encyclopedias, Old Testament Histories, Old Testament Introductions, Old Testament Theologies, works on Old Testament Prophecy and Messianic Prophecy, Dictionaries of the Bible, Histories of Assyria, Babylonia, Persia, Egypt, and Syria, the following selected works may be consulted. For fuller lists the reader is referred to the articles in the Bible Dictionaries, and for the later books, to the lists of current literature in 'The Biblical World.' In the present list, works written in other languages and translated into English, are given in the translation only.

1. *Commentaries.*— Calvin (1850); Vitringa (1714–20, Latin); Lowth (1778); Gesenius (1821, German); Hitzig (1833, German); Ewald (1876–81); Henderson (1840); Umbreit (1846, German); Drechsler (1851–54, German); Alexander (1865); Delitzsch (1892); Reuss (1876, French); Nägelsbach in 'Lange' (1878); Birks (1878); Cheyne (1889); von Orelli (1889); G. A. Smith (1888, 1890); Duhm (1892, German); Skinner (1896, 1898); Guthe and Ryssel in 'Kautzsch' (1896, German); Mitchell (chs. i–xii, 1897); Kittel's 'Knobel-Dillmann' (1898, German); Marti (1900, German); Whitehouse (1905).

2. *Other Works.*— Driver, 'Isaiah, His Life and Times' (1893); Davidson, 'Theology of Isaiah xl–lxvi' ('Expositor,' 1883–84); 'Theology of Isaiah' ('Expository Times' 1894); Guthe, 'Das Zukunftsbild des Jes' (1885); Giesebrecht, 'Beitr. z. Jes. Kritik' (1890); 'Der Knecht Jahves des Deuterojes' (1902); Hackmann, 'Die Zukunftserwartung des Jes' (1893); Cheyne, 'Introduction to Isaiah' (1895), Translation of Isaiah in 'Polychrome Bible' (1898); König, 'The Exiles' Book of Consolation' (1899); Davidson, 'The Servant of the Lord in Isaiah' ('Brit. and For. Evan. Rev.' 1872); Driver and Neubauer, 'The 53d of Isaiah according to Jewish Interpreters' (1876, 1877); Wright, 'Pre-Christian Jewish Interpretation of Isaiah LIII' ('Expositor,' May 1888); Lane, 'Die Ebed-Jahwe Lieder' (1898); Bertholet, 'Zu Jesaya LIII' (1899); Füllkrug, 'Das Gottesknecht des Deuterojes' (1900).

CHARLES RUFUS BROWN,
Professor of Hebrew and Cognate Languages, The Newton Theological Institution, Newton, Mass.

Ish'maelites, the descendants of Ishmael, the son of Abraham by Hagar. These are to be found among the Arabians, as physical characteristics and language prove beyond a doubt. The Joktanite and Cushite monarchies in southern Arabia give no indication in character and habits of having had Ishmaelites as founders, but the Bedouins who roam over the deserts lying between the Peninsula of Sinai and the Persian Gulf are unquestionably of Ishmaelite origin. They maintain a primitive and partiarchal form of life, and are full of Isthmaelitie traditions.

Ishmailis, ĭsh-mā'lēs, one of the 72 heretical sects of Mohammedanism (q.v.).

Ish'peming, Mich., city in Marquette County; on the Duluth, S. S. & A., the Chicago, M. & St. P., and the Chicago & N. W. R.R.'s; about 14 miles west of Marquette. It was settled about 1856 and received its first charter in 1857. It is situated in the great iron ore region of Michigan, and is the centre of the iron ore mining industry of the State. Gold and marble are found in the vicinity and an excellent building stone. The manufactures are chiefly the machinery used in mining. There are 2 banks with a combined capital of $150,000, 14 church edifices, and 9 large school buildings. Municipal affairs are administered by a mayor and city council of 20 members elected annually. The population is composed mainly of Scandinavians and English. Pop. (1890) 11,197; (1900) 13,255.

Isidorus, Spanish ecclesiastic: b. Carthagena, between 500 and 570; d. 4 April 636. As bishop of Seville (from about 600) he played a leading role in all affairs of church and state, and in his influence upon the thought and literature of the whole Middle Ages he is to be ranked as second only to Boëthius and Cassiodorus Senator. Among his numerous theological, historical, and grammatical writings, the 'Etymologiae' or 'Origines' should be mentioned. His works are chiefly valuable today for their quotations from earlier writers. The best edition is in Migne's 'Patrologia Latina.'

I'singlass, a form of gelatine (q.v.), whitish, firm in texture, and of great purity, prepared mainly from the sounds or air-bladders of different species of fish, especially of the Russian sturgeon and, in this country, of cod, sturgeon, hake, etc. In some cases the skins are also used for this purpose. Besides Russia, from which it had been principally obtained, the United States and Canada, Brazil and the East Indies furnish considerable quantities to commerce, as do also Manila and the West Indies. It is the basis of the Russian glue, preferred to all other kinds for strength. Isinglass receives its different shapes in the following manner: The sounds are taken from the fish while sweet and fresh, slit open, washed from their slimy matter, divested of a very thin membrane which envelops the sound, and then exposed to stiffen a little in the air. In this state they are formed into rolls about the thickness of a finger, and in length according to the intended size of the staple; a thin membrane is generally selected for the centre of the roll, around which the rest are folded alternately, and about half an inch of each extremity of the roll is turned inward. Boiled in milk, it forms a mild nutritious jelly, and is thus sometimes employed medicinally. It is used in making court-plaster, cement, mock pearls, and many other articles, also in clarifying fermented liquors for improving soups, jellies, etc., and as sizing for linens, silk, ganzes, and other fabrics.

I'sis, the principal goddess of the Egyptians, the sister and wife of Osiris, representing the moon, as Osiris did the sun. The Egyptians believed that Isis first taught them agriculture. She is represented in various forms. In one she has the form of a woman, with the horns of a cow, as the cow was sacred to her. She is also known by the attributes of the *lotus* on her head, and the *sistrum* in her hand, a musical instrument which the Egyptians used in the worship of the gods. She is often accompanied by her infant son Horus. In one celebrated Egyptian statue she was shown with her face veiled. She was particularly worshipped in Memphis, but at a later period throughout all Egypt. From Egypt her worship passed over to Greece and Rome.

Is'lam, a term which signifies the Mohammedan religion: complete submission of body and soul to God, His will and His service, as well as faith in all those articles of profession, commands, and ordinances ordained by Mohammed. Every man who makes this profession (*aslama*) is a Moslem, that is, has entirely given himself up to the will of God, and is, on that account, in a state of salvation (*salam*). It is held that Islam was once the universal religion, and that every child born in the true faith would abide in it, without defection, were it not for parental wickedness. As Islam comprehends the practical as well as the doctrinal tenets of the Mohammedan religion — everything which Moslems must believe and practise — it embraces the whole of their civil and religious polity: for the system of Mohammed relates more to this world than the next, and was designed, like the law of Moses, for the secular as well as the spiritual direction of his followers. But, taken in its more common and direct sense, it signifies the profession of the five fundamental doctrines on which, according to a traditional declaration of the prophet, the whole edifice of the faith is built. Those five points are: (1) The acknowledgment of the Divine Unity and of the prophetic mission of Mohammed; (2) Observance of prayer; (3) Giving of alms; (4) Keeping the fast of Ramadan: and (5) The performance, if possible, of the pilgrimage to Mecca. They are also often subdivided and enlarged, in order to arrange them more conveniently into the two classes of belief (*iman*) and practice (*din*). The former relates to (1) God; (2) the angels; (3) the Sacred Book; (4) the prophets; (5) the last day; and (6) the divine decrees: the latter to (1) purification; (2) prayer; (3) alms; (4) fasting; and (5) the pilgrimage. To the first article of this creed the Persians and other adherents of Ali add, "Ali is the vicar of God": and that is the only essential point in which they differ from the Sunnites, or orthodox Mussulmans, who acknowledge the authority of the four first khalifs. The disputes concerning the succession to the khalifate, or supremacy of the prophet, spiritual and civil, which arose immediately after his death, split his followers, as is well known, into two distinct sects, the Sunnites and the Shiites, who have never since ceased to hate each other with a bitter animosity; but they differ more in the degree of veneration paid to Ali than in any other point; and professing the same creed, with the exception of one article, they derive their doctrines from the same sources. In their respective rituals, and their interpretation of particular texts, there are many minor differences; but both agree in superadding a traditional to the written law of Mohammed, and both have sanctioned that departure from the original simplicity of his doctrine, the re-establishment of which was the professed object of the Wahabees. See MOHAMMED.

Island, a body of land entirely surrounded by water. Islands are of very different extent and surface, and some are so large that authors have doubted whether they should be called continents, as Australia; this, however, is a mere matter of definition. The great masses of land forming the Eastern and Western Continents are in reality islands. The following table shows the relative mainland area of the largest islands:

ISLANDS	Area in sq. m.	ISLANDS	Area in sq. m.
New Guinea	303,000	Iceland	40,300
Borneo	284,000	Mindanao	37,000
Madagascar	227,000	Ireland	32,600
Sumatra	162,000	Haiti	28,800
Honshu	86,500	Tasmania	26,200
Great Britain	83,700	Ceylon	24,700
Celebes	76,500	Nova Zembla — (N. Island)	19,300
New Zealand — (S. Island)	58,500	Tierra del Fuego	18,500
Java	49,000	Nova Zembla — (S. Island)	15,700
Cuba	45,000	Formosa	15,000
New Zealand — (N. Island)	44,500	Hainan	14,000
Newfoundland	40,200	Sicily	9,800
Luzon	40,000	Sardinia	9,000

A cluster of several islands is called an archipelago. The principal clusters in the Atlantic are the West Indies, the Azores, the Canaries, the Hebrides, Orkneys, Shetlands, etc. But the great world of islands is in the Pacific, and some modern writers consider them as forming a fifth division of the world, including the Eastern Archipelago, Polynesia, and Australia, to which they have given the name of Oceania. A large island is a continent in miniature, with its chains of mountains, its rivers, lakes, and is often surrounded by a train of islets. The rivers of islands are in general little more than streams or torrents, and the smaller islands are often uninhabitable from want of water; but they serve as haunts and breeding-places of innumerable sea-birds. There are islands in rivers and lakes as well as in the sea. In rivers they are often formed by the division of the stream into various branches, and often by accumulations of earth brought down and deposited around a rocky base. Examples are not wanting of floating islands, which are formed by the roots of plants and trees interlacing with each other, and thus constituting a support for deposits of successive layers of earth. Islands have been grouped into the two distinct classes of continental and pelagic or oceanic islands. Continental islands follow each other in succession along the margin of the continents, and are generally of the same geological structure. Pelagic islands are mostly of volcanic or coral formation. Considerable islands have been known to be suddenly raised up from the sea-bottom by volcanic action, and soon after to have as suddenly disappeared in the ocean. The Pacific contains a great number of low islands having their basis formed of coral reefs, these reefs being produced by the labors of innumerable coral-animals or zoophytes. (See CORAL.) Submarine islands, as they have been sometimes called, are immense banks of sand above which there is no great depth of water.

Isle La Motte, Vt., in the northern part of Lake Champlain, the northern point about 8 miles from Rouse's Point, N. Y., on the Canadian border; the southern point about 15 miles north of Plattsburg, N. Y. It is about 7 miles long and 2 miles wide. The island has large marble quarries; some of the stone for Victoria Bridge, Montreal, for Fort Montgomery on Lake Champlain, for the Brooklyn Bridge, and for many other structures and buildings came from those quarries.

This island was a frequent resort for the Algonquin and Iroquois Indians: at the south end was once an Indian village. It was discovered by Samuel de Champlain in July 1609 and was named after a French officer, Sieur La Mothe. In 1665 a wooden fort called Fort Sainte Anne was built on the south shore. The 'Jesuit Relations' contain numerous references to Fort Sainte Anne, Isle La Motte, and the visits made to this island by the early missionaries. (The chapel of Sainte Anne, erected near the ruins of Fort Sainte Anne, was consecrated 16 July 1893 by Bishop De Goesbriand of the diocese of Burlington, and it is now a place of pilgrimage.)

On 24 Aug. 1690, Capt. John Schuyler and his company stopped at Fort Sainte Anne on their return from an expedition into Canada. The island was included in the grant made in 1733, by M. de Beauharnois, then governor of Canada, to Sieur Pean, major of the town and castle of Quebec, and in the French seignory granted to Sieur Pedon, councillor in the superior council of Quebec in 1752, notwithstanding the cession of sovereignty to the crown of Great Britain by the French in the Treaty of Utrecht in 1713 over the Five Nations of Indians, who claimed Lake Champlain and the circumjacent territory. In 1775 Philip Schuyler remained on this island over night and joined James Montgomery near there en route for Quebec, where Montgomery lost his life. In the spring of 1776, when Gen. Sullivan withdrew his forces from Canada, the sick were sent to Isle aux Noix, Point au Fer, and Isle La Motte. On 8 Aug. 1776, Benedict Arnold, after engaging the Indians in the British service on 6 August, at the Bouquet River, fell back to Isle La Motte, where his fleet remained anchored until 19 August, when he sailed south toward Cumberland Head.

Isle La Motte was settled in 1785 by Ebenezer Hyde, Enoch Hall, and William Blanchard and was organized as a town in 1790. In 1814 Commodore Macdonough stationed his fleet for a time north of this island and subsequently sailed to the bay near Cumberland Head, N. Y., where he afterward fought the battle of Plattsburg. Soon after Macdonough's departure from the island, in September 1814, Capt. Pring (British) erected a battery on the west shore of the island about a mile and a half south from Fort Sainte Anne and made efforts to win over the inhabitants to the British cause, but failed. On 8 Sept. 1814, he was joined by Capt. Downie and three days later they sailed away to attack the Americans at Plattsburg, where they were repulsed. They returned to Canada, removing their munitions of war from the island in their retreat.

The first permanent settlers on the island were from New England. One of those sturdy pioneers was Capt. Caleb Hill, who, at the War of 1812, organized his townsmen into a military company which was known as Company F of the 2d brigade of the 3d division of the Vermont militia. After the departure of Macdonough, Capt. Hill's house was entered one night by a squad of British soldiers, and in his efforts to take them prisoners he was killed. The first ferry established from Isle La Motte to Alburgh, Vt., was by Capt. Hill, and the ferry was maintained by his descendants for three quarters of a century, until the construction of a stone bridge connecting the two islands.

There are on the island two public schools, a Methodist church, town-hall, and a government light-house. The light-house has been in charge of Wilbur F. Hill for nearly 30 years. The island is a favorite summer resort. The strangers who visit the island and vicinity are reminded of the words by which the Indians, in 1609, told Samuel de Champlain about picturesque Lake Champlain, that "It was filled with beautiful islands and with a fine country surrounding it."

Island Number 10, a former island in the Mississippi River, near the northwestern corner of Tennessee, and about 40 miles below Columbus, Ky. Since the Civil War it has been washed away. It was the tenth in a succession of islands lying below Cairo, Ill. Early in 1862, having been fortified by the Confederate. Gen. Polk, it was commanded by Gen. Mackall, who had about 7,000 troops of Beauregard's army. It was bombarded for three weeks by Commodore Foote, commanding seven Federal gunboats, and surrendered 7 April 1862. The evacuation was forced by Pope with a large land force. He, under cover of a vigorous fire from two gunboats, which had run past the island by night, brought his men across the river in transports. The defenders of the batteries fled, and were pursued into the swamps. Over 6,000 prisoners were taken, together with an immense quantity of ammunition and supplies. The Federal forces lost only a few men. Consult the Century Company's 'Battles and Leaders of the Civil War,' Vol. I.

Isle of Man, in the Irish Channel, the largest island in the English seas. The principal towns are Douglas, Castletown, Ramsey, and Peel. Castletown is the ancient capital, but Douglas (pop. 15,719) is the chief town and the seat of government, which is "home rule" under a lieutenant-governor, who, with council and House of Keys of 24 members, makes up the Tynwald Court. The Manx people are a distinct Celtic nationality. Their language and old customs are rapidly disappearing. Area, 220 square miles. Pop. (1900) 55,608.

Isle of Pines (Isla de Pinos, ēs'lä dā pē'nōs), a small island belonging to Cuba, 40 miles southeast of Pinar del Rio. In 1900 the United States gave unofficial expression to the policy of its acquisition as a coaling station. It has an area of about 840 square miles. It is in effect two islands connected by a marsh, the one on the north being somewhat broken by hills, the one on the south low, flat, and sandy. The climate is healthy, the soil fertile and the mineral resources extensive. For administrative purposes the island is a municipal district of the province of Havana. There are large marble quarries here. Cattle raising is the chief occupation of the inhabitants. Pop. (1900) 3,199.

Isle Royale, roi-al (Fr. ēl rwä yäl), an island in Lake Superior, within the state boundary of Michigan. It is 45 miles long, 9 miles wide and has an area of 229 square miles. Valuable deposits are found here.

Isle of Wight, wīt, the second largest island in the English seas, near the Hampshire coast. It is four miles in breadth, but only a mile in width on the west, between Hurst Castle and Cliff End, while it expands to seven miles between Southsea and the Foreland on the east. In shape the island is an elongated rhomboid. Its extreme length, from the Foreland to the Needles, is about 23 miles, and its extreme breadth, Cowes to St. Catharine's Point, is about 13 miles. The late Queen Victoria had a residence here. The area is calculated at 145 square miles. Pop. (1901) 82,000.

Isles of Shoals, a group of eight barren islands in the Atlantic Ocean, near the New Hampshire coast, 10 miles southeast of Portland, Maine, from which a daily steamer plies during the summer months. The three principal islands are Appledore (400 acres); Star (150 acres), and White (55 acres). There is a revolving government light on the last named, 87 feet above the sea. On Star and Appledore islands are several large hotels for summer visitors who find sea air, boating and fishing here. A few fishermen are numbered among the permanent inhabitants.

Is'lip, N. Y., town in Suffolk County, on Long Island; on the Long Island railroad, 44 miles east of New York. The town comprises several small villages and covers an area 20 miles long and 10 miles wide. Here are the Manhattan State Hospital for the Insane, Saint Joseph's Convent (Roman Catholic), and a large fish hatchery, owned by the State. The town is popular as a summer resort and has many fine hotels along the shores of Great South Bay. The Fire Island lighthouse, 166 feet high, is located eight miles from the mainland. Blue Point oysters are shipped from the town in large quantities. The government is vested in a town supervisor and town board, elected every two years. Pop. (1900) 12,545.

Isocrates, ī-sŏk'ra-tēz, Greek orator: b. Athens 436 B.C.; d. there 338 B.C. His principal teachers were Tisias, Gorgias, Prodicus, and Protagoras. On account of his weak voice and natural timidity he was reluctant to speak in public, but gave lessons in the art of eloquence, and made orations for others. He thus made considerable profit, for he received twenty talents ($14,375) for a speech that he wrote for Nicocles, king of Cyprus. He was the first who saw the value of oratory in public life. By basing it on sound moral principles he rescued it from the abuses of the Sophists. He was distinguished for a polished style and a harmonious construction of his sentences. The composition, revision, and repeated polishing of his speeches occupied so much time that he published little. His celebrated panegyric on Athens 'Panathenaicus' employed him 10, or according to others, 15 years. As all his speeches were modeled after the same pattern, their sameness excited weariness, although his subjects were the most important points of morals and politics. His patriotism was sincere, and his desire for the freedom of Greece so intense, that he starved himself to death in his ninety-eighth year from grief at the battle of Chæronea, «fatal to liberty.» In Plutarch's time 60 orations went under his name, not half of which were, however, deemed genuine. Twenty-one now remain, of which the principal are the 'Panegyricus' (an oration in which he exhorts the Greeks to concord, and to war against the Persians) and the 'Panathenaicus' (in which he dilates on the services rendered by Athens to Greece).

I″sodimor'phous Series. See ISOMORPHISM.

Isoetales, ī-sō-ē-tā'lēz. See FERNS AND FERN-ALLIES.

Isola'tion, in evolution (q.v.), the separation or segregation of any set of animals in a particular area, so that incipient varieties or species are prevented from breeding with the parent species of adjoining regions. Through such isolation the swamping or leveling effects of free intercrossing, or mixing with allied varieties or incipient species, are prevented. As a consequence, variations or nascent species become fixed or localized, being prevented from spreading by some geographic or topographic barrier, with the result that there are many thousands of local races, varieties and species; indeed, probably over half of the number of known species are such forms. Not only species, but genera and higher groups are thus isolated. Thus the marsupials of Australia are, with one or two exceptions, confined to that continent, the connection once existing with Asia having been cut off. In one sense natural selection, or the inbreeding of the fittest, is a form of isolation, as also is preferential mating (q.v.) and also those cases when animals breed at slightly different seasons. What Weismann calls Amixia is substantially the prevention of free intercrossing by the geographical isolation of a part of the individuals of a species from their parent stock. Romanes insists that «without isolation, or the prevention of free intercrossing, organic evolution is in no case possible.» and he claims that isolation «has been the exclusive means of modification, or more correctly, the universal condition to it.»

Examples of Isolation.—These are found among cave animals (q.v.) where animals confined to the nether world, living in total darkness, are prevented from breeding with their ancestors of the upper world. The deep-sea fauna is another such assemblage, living in gloom and in water at the freezing point, although at the surface the winter temperature of the sea may be 80–85° F. Other examples of the result of isolation are the assemblage of animals peculiar to certain islands, to basins walled in by mountain chains, valleys, deserts, and Alpine summits. Interesting cases of isolation on islands are the gigantic moa birds of New Zealand; the local species of birds confined to the different islands of the Galapagos archipelago, also the land shells living in the different valleys of Oahu, one of the Hawaiian Islands.

Another form of isolation Romanes calls «physiological selection,» though Seebohm suggests that physiological isolation would be a better term. The first to call attention to the value of isolation was Lamarck, while Wagner has shown the great value of migration and the intervention of geographical barriers in the formation of species.

Isomerism (Greek, "having equal parts"). Chemists formerly assumed that two bodies must be identical in chemical nature, in all respects, provided they consist of the same elements, combined in the same proportions. This view was long ago found to be untenable, and many substances (mostly compounds of carbon or nitrogen) are now known, which exhibit widely different properties, although possessing the same empirical formula. Bodies which possess this peculiarity are said to be "isomeric" with each other, and the property itself is called "isomerism." In its broadest sense, isomerism may be regarded as embracing (1) polymerism, (2) metamerism, (3) isomerism in the narrower sense, and (4) geometrical isomerism.

Bodies are "polymeric" when they have the same percentage composition, but have different molecular weights. Acetic acid, $C_2H_4O_2$, and grape sugar, $C_6H_{12}O_6$, for example, are polymeric with each other, because they consist of the same elements, combined in the same proportions, and yet the molecular weight of grape sugar is three times as great as that of acetic acid. In this particular case there is no specially close relation between the polymeric substances, and the polymerism is therefore said to be "accidental." When a close relation does exist between the bodies compared, the polymerism is said to be "generic." Ordinary acetic aldehyde affords a good example of generic polymerism. Aldehyde has the formula C_2H_4O, but when treated with a mineral acid it becomes transformed into paraldehyde, which has the formula $C_6H_{12}O_3$; and the reverse transformation (of paraldehyde into aldehyde) may be effected by the application of heat.

Compounds are said to be "metameric" when they have the same empirical formula, but differ structurally by containing different radicals, joined by a polyvalent element such as oxygen, nitrogen, or sulphur. Ethyl ether and propyl-methyl ether, for example, both have the empirical formula $C_4H_{10}O$; but ethyl ether contains two ethyl radicals, united by an oxygen atom, and propyl-methyl ether contains a propyl radical and a methyl radical united by oxygen in the same manner. Thus these two metameric bodies have the structural formulæ $\begin{matrix} C_2H_5 \\ C_2H_5 \end{matrix} > O$ and $\begin{matrix} C_3H_7 \\ CH_3 \end{matrix} > O$, respectively. Metamerism is manifested, most commonly, by the ethers, esters, and amines.

Isomerism in its narrower sense, or "true isomerism," embraces those cases in which the bodies compared have the same empirical formulæ, but have different structural formulæ, and do not (like metameric bodies) consist of definite carbon radicals united by oxygen, sulphur, or nitrogen. True isomerism may be of two kinds: (1) "nucleus isomerism," and (2) "isomerism of position." The hydrocarbons afford good examples of both kinds of true isomerism. The paraffin known as propane, for example, has the empirical formula C_3H_8, and the structural formula $CH_3—CH_2—CH_3$. Propane may be converted into butane by replacing one of its hydrogen atoms by the methyl radical, CH_3; but the substitution may be made in two essentially different ways, according as the hydrogen that is replaced is attached to the interior carbon atom, or to one of the terminal ones. In the latter case the structural formula of the new substance is $CH_3—CH_2—CH_2—CH_3$, and the substance itself is known as "normal" butane. If the hydrogen that is replaced is attached to the interior carbon atom, a different substance, known as "isobutane" and having different properties from normal butane, is formed; its structural formula being

$$\begin{array}{c} CH_3—CH—CH_3. \\ | \\ CH_3 \end{array}$$

These two substances,— normal butane and isobutane — are said to manifest "nucleus isomerism," since they differ by the mode of arrangement of their fundamental carbon chains. As the number of carbon atoms in a compound increases, the possibilities of nucleus isomerism becomes enormous. Thus the general empirical formula of the saturated fatty hydrocarbons (or paraffins) is C_nH_{2n+2}. We have seen that in the case of butane (for which $n=4$) two nuclear isomers are possible. If the same kind of reasoning is applied to the higher members of the series, regarding each member as derived from the preceding one by the substitution of a methyl radical (CH_3) for a hydrogen atom, we shall find that there are 3 pentanes ($n=5$) possible: 5 hexanes ($n=6$); 9 heptanes ($n=7$); 18 octanes ($n=8$); 35 ennanes ($n=9$); 75 decanes ($n=10$); 159 hendecanes ($n=11$); 355 dodecanes ($n=12$); and no less than 802 tridecanes ($n=13$).

In that kind of true isomerism which is called "isomerism of position," the isomeric bodies contain substituted atoms or radicals, which occupy different positions in the main chain. Thus a paraffin may be converted into an alcohol by substituting a hydroxyl radical (OH) for one of the hydrogen atoms, and the resulting alcohol will have different properties according to the position of the hydrogen atom that was replaced. For example, four butane alcohols are possible. In normal butane, the structural formula of which is given above, the hydroxyl radical may be substituted for one of the terminal hydrogen atoms, in which case an alcohol is obtained which has the structural formula

$$CH_3—CH_2—CH_2—CH_2—OH$$

and is known as "normal primary butyl alcohol." If the hydroxyl is substituted in the place of one of the interior hydrogen atoms, an alcohol is obtained which has the structural formula

$$\begin{array}{l} CH_3—CH—CH_2—CH_3 \\ | \\ OH \end{array}$$

and is known as "secondary butyl alcohol."

Proceeding, now, to the consideration of isobutane, we note that two essentially different substitutions of the hydroxyl radical are here possible. We may replace a hydrogen atom in one of the three CH_3 groups, or we may replace the one in the CH group. In the first case the alcohol has the structural formula

$$\begin{array}{l} CH_3—CH—CH_2—OH \\ | \\ CH_3 \end{array}$$

and is known as "isoprimary butyl alcohol";

and in the second case it has the structural formula

$$\begin{array}{c} OH \\ | \\ CH_3—C—CH_3 \\ | \\ CH_3 \end{array}$$

and is known as "tertiary butyl alcohol." All of these four alcohols have been actually prepared. (For isomerism of position as manifested in the aromatic compounds, and for the nomenclature used in distinguishing the various isomers that those compounds can exhibit, see AROMATIC COMPOUNDS.)

Certain compounds are known which possess not only the same empirical formula, but the same structural formula also, and yet manifest distinctly different properties, either chemically or physically. Fumaric and maleic acids (see FUMARIC ACID) are examples of this. In such cases the provisional hypothesis is made, that the geometrical structures of the molecules of the two substances are related to one another in something like the same manner that the image of an object in a mirror is related to the object itself, and the isomerism is said to be "geometrical." (See STEREO-CHEMISTRY.)

With reference to isomerism in general, consult Hjelt, 'Principles of General Organic Chemistry'; Lothar Meyer, 'Modern Theories of Chemistry.'

Isomorphism, identity of crystalline form. Isomorphous bodies can form homogeneous mixed crystals; and each one is capable of growing in a saturated solution of the other, fresh crystals being gradually amassed around the original body as a nucleus. Carbonates of calcium, known as calcite; of magnesium, iron, manganese and zinc (magnesite, siderite, rhodochrosite, smithsonite) all are of the same class in crystallography (q.v.). The presence of the same chemical elements of composition in substances does by no means imply isomorphism and substances of very varying components may yet be isomorphous. The isomorphous elements in isomorphous salts, as, for instance, the metals, are generally of the same or related groups of elements. Dimorphous substances, that is, those which form crystals of more than one kind, are often connected by a third dimorphous substance, such as carbonate of lime in the case of calcite and aragonite, and form a group known as isodimorphous substances. See CRYSTALLOGRAPHY.

Isopoda, ī-sŏp'ō-da, an extensive and varied group of *Crustacea* (q.v.) usually ranked as a suborder of the *Arthrostraca* or sessile-eyed *Malacostraca*. The body is broad and flattened, and either short or elongated; the carapace is little developed; the thorax long with seven free segments, each bearing a pair of walking limbs; the abdomen more or less shortened and bearing lamellar branchial appendages. The *Isopoda* are classified in seven tribes and more than 30 families, embracing an enormous number of species. They vary greatly in form and mode of life but all are of relatively small size and retiring habits. The vast majority are marine, but a few are inhabitants of fresh water or terrestrial; the latter are familiar to everyone under the names wood-lice and pill-bugs. Most of the marine forms live a free life but conceal themselves in crevices or among sessile animals and plants, others bore into wood, some, as the gribble and its allies, being destructive to piling; many are commensal or parasitic, among the latter being the *Cymothoidæ*, which infest fishes and whales, and the greatly degenerated *Bopyridæ*, which live in the branchial chamber of prawns and similar crustaceans. Consult Packard, 'Zoology' (1887); Richardson, 'Key to Isopods of North America,' in Proceedings United States National Museum, Vols. XXI. and XXIII. (1899, 1901).

Isospondyli, ī-sō-spŏn'dĭ-lī. See ICHTHYOLOGY.

Isothermal. See LINE; THERMODYNAMICS; MATTER.

Ispahan, ĭs-pa-hän', or **Isfahan**, important city and former capital of Persia, 210 miles south of Teheran, in the midst of an extensive plain watered by a broad river. In the time of Chardin the walls were 24 miles in circuit, and contained 162 mosques, 48 colleges, 1,802 caravansaries, and 273 public baths, and the population was then estimated at 600,000. A great part of the city is at present a mass of ruins. Under the caliphs of Bagdad it became the capital of the province of Irak. Being situated in the centre of the empire, and surrounded by the most fertile territories, it soon became a place of great population, wealth and trade. In 1387 it was taken by Tamerlane and the citizens were given up to indiscriminate massacre, and 70,000 are said to have perished. In 1722 it was taken by the Afghans; but in 1727 it was retaken by Nadir Shah, since which it has not been a royal residence. The great palace built by Shah Abbas is said to have been five miles in circuit, a great part of which space, however, was laid out in ten gardens, adorned with summer houses. The square called Maidan Shah was one third of a mile in length, and was formerly encircled by a canal bordered with plane-trees; but all vestiges of both are now obliterated. The streets are narrow, winding, irregular, unpaved, and very dusty. When Ispahan was in its prosperity its suburbs were distinguished for their extent and beauty. The manufactures of the city are still extensive, including trinkets, fire-arms, sword-blades, glass, and earthenware. The textile fabrics range from the most expensive velvet and satin to the coarsest nankeen and calico. The present population is about 75,000.

Is'raelites. See JEWS and JUDAISM.

Israels, Joseph, yō'sĕf ez-rä-äls', Dutch painter: b. Groningen 27 June 1824. He was a pupil at Amsterdam of Kruseman and at Paris of Picot, and established his studio first at Amsterdam and later at The Hague. Having essayed historical painting with no marked success, he turned his attention to genre work. He found his subjects among fisherfolk and the humbler classes, whose existence, particularly in its more serious or tragic phases, he depicts in a style likened to that of Millet. Among his canvases are: 'Awaiting the Fishing Boats'; 'Alone in the World'; 'Nothing More'; 'The Struggle for Existence'; 'On the Dunes.' He published 'Spanien, eine Reiseerzählung' (1900). Consult the study by Liebermann (1901).

Isthmian Canals, American. The plan of uniting the Atlantic and Pacific Oceans by a great ship canal has been a dream of navigators for several centuries, almost in fact since the days of Columbus, for as early as 1581 the first survey was made to determine the feasibility of connecting the two oceans. In that year, in obedience to instructions, Capt. Antonio Pereira, governor of Costa Rica, organized an expedition and explored a route by way of the San Juan River, the lake, and the rivers emptying into Gulf Nicoya, Costa Rica. In 1620 Diego de Mercado submitted to King Philip of Spain an elaborate report in favor of the construction of a canal over that route which is known as the Nicaragua route. The Panama canal project was conceived later, and other projects were advanced, one of which was the bold conception of James B. Eads, an American engineer, to construct at Tehuantepec a railroad which would be able to carry the largest ships from ocean to ocean. The scheme of connecting the two oceans has possessed a fascination for men of science and an intense interest for men of commerce ever since it was proposed. A number of surveys of the Panama and Nicaragua routes were made during the past half century, but it may be said that not till 1879 was the first positive step taken toward the realization of the project on which so much thought had been expended. In May of that year an International Congress was convened in Paris by M. Ferdinand de Lesseps to discuss the plan of cutting a canal through the Isthmus of Panama. The congress adopted a plan which had been prepared previously by M. de Lesseps, and immediately following that action the Panama Canal Company was formed. The company secured from Lieut. Lucien Napoleon Bonaparte Wyse of the French navy the concession which he had obtained from the United States of Colombia. After the concession had been secured by the company, a commission, known as the De Lesseps Engineering Commission, was sent to Panama to make surveys and prepare estimates of cost. The commission estimated that a canal could be made for 843,000,000 francs. De Lesseps reduced these figures to 600,000,000 francs, or $120,000,000, and announced that a *canal à niveau*, or tide level canal, could be completed for that sum. So confident was he of the accuracy of his calculations that he invited men of prominence to attend the opening of the canal, which he set for 1888.

On 21 Feb. 1881 the first detachment of canal employees arrived at Colon. Surveys were made, and the building of camps, hospitals, and other necessary buildings followed. In 1882 the Panama Canal Company purchased the Panama railway. Interest charges accumulated between 1882 and 1888, while nothing like the progress on the canal which had been anticipated had been made. In the autumn of 1888 further borrowing became impossible, and then came a crash which shook the financial world. On 1 Jan. 1889 the company was forced into liquidation. This event created a ferment throughout France, no less than 800,000 French shareholders having been induced to invest in the stock of the company, largely through the appeals which had been made to their patriotism. A receiver was appointed by the Court of the Seine with unlimited powers. In 1890 the receiver sent a commission of French and other engineers to Panama to report on the actual condition of the work. The report was discouraging. Not more than a fifth of the proposed work had been done; a valuable plant, estimated at $30,000,000, was rusting away and useless; the tide level at Colon was filling in and the harbor was shallowing, owing to the cut.

In 1891 the government of Colombia granted to the Panama Canal Company an extension of 10 years from 1893 in which to finish the contract, provided operations were resumed before February 1893. In November 1892 a member of the French Chamber of Deputies, M. Delahaye, created a profound sensation in Paris by declaring on the floor of the Chamber that the Panama Canal Company had obtained exceptional privileges, which it had used for the purpose of defrauding investors, by the bribery of no fewer than 100 deputies. The demand for an investigation of the charges was of such force and insistence as to be irresistible, and the ministry decided to submit the whole question to a committee. Following this decision, Baron Reinach, a banker accused of being the instrument or agent of much of the corruption of the company, died suddenly, and it was alleged that he had poisoned himself. Amid a popular clamor, such as Paris had not known for many years, the investigation was carried on, and the disclosures before the investigating committee indicated that the operations of the canal company had been slimed with fraud. It was shown that the Panama Company had bribed deputies and journalists on an extensive scale in order to cover up its shortcomings and leave the way open for further imposition.

In February 1893 M. de Lesseps, his son Charles, and some of their colleagues were sentenced to various terms of imprisonment for fraud and bribery. At the time the blow fell M. de Lesseps had passed his 80th year. Bitter as was the feeling of the French toward those who were responsible for their loss of money, much sympathy was manifested toward the man who had been the presiding genius of the great enterprise. That he had been knowingly a party to the great fraud which had wrecked the hopes and fortunes of so many worthy persons in France, the public was loath to credit. The sympathy for him took such form that he was not imprisoned. But the great engineer, who had reaped so much glory through the construction of the Suez canal, was unable to withstand the blow which the Panama exposure gave him. He died in November of the year following. At the end of 1893 the only prominent person left in prison as the result of the Panama prosecutions was M. Baihut, formerly Minister of Public Works.

In 1894 a prominent French engineer proffered a scheme by which he claimed the work could be completed in four years at an additional cost of $110,000,000. A new company was formed, and 300,000 shares were issued. Work on the canal was resumed under French auspices. Early in 1895 a strike occurred among the laborers on the canal, and the methods of the new company were criticised severely by the stockholders. Another scandal such as had attended the operations of the original company was feared, but developments showed that the suspicions were unwarranted. Nevertheless, the confidence of the French public in the ultimate success of the enterprise had been shaken to such extent as to make it manifest that the com-

pletion of the canal under French auspices was no longer a possibility.

That being the situation, those who were bound up in the enterprise turned toward America for relief. The United States up to that time had concerned itself, as far as the building of a canal was considered, solely with the Nicaragua route. The first survey for a canal at Nicaragua under American auspices was made in 1852 by Col. A. W. Childs. The project as outlined by him has been the basis for all subsequent locations. A second survey was made in 1872 by a party under the charge of Commander E. P. Lull of the United States navy. Eleven years later another survey was made by A. G. Menocal, a civil engineer, also of the United States navy. In 1889 the Maritime Canal Company was organized to construct the Nicaragua canal on the lines of the Menocal project. As there was, for a decade following, considerable enthusiasm over the Nicaragua canal scheme in the United States, the project of the Panama Company enlisting American capital, were anything but promising.

Nevertheless an auxiliary American company was organized. In the investigation of the French company's affairs which was made by the new American company, it was ascertained that of the $156,400,000 expended by the original company only $88,600,000 had been expended legitimately on the excavation and construction, the rest having gone in bribery and corruption. The second French company was started with a capital of 65,000,000 francs, about one half of which was expended cautiously on construction in four years. The second French company had abandoned the original plan of constructing a tidewater canal. Its plans contemplated the construction of a canal with locks.

The history of the isthmian canal project shows that faith in the Nicaragua route as the most practicable suffered a steady decline. This decline was due more than anything else, perhaps, to the uncertainty of the cost of carrying out the project. The first estimate of the Maritime Company was $67,000,000. After doing more or less work on the canal the Maritime Company ceased operations in 1893 for lack of funds. In 1895 Congress appointed the Ludlow Commission to examine and report on the Maritime Company's project. This commission placed the cost of the canal's completion at $133,472,893. The Walker Commission, appointed subsequently, increased the estimate to $140,000,000.

Up to the outbreak of the Spanish-American war the project of constructing an isthmian canal, while acquiesced in by the general public in the United States, had received ardent advocacy only in quarters where a special study of the subject had been made. But at the commencement of that conflict the people of the United States received an impressive object lesson on the need of a canal. That lesson was the historic trip of the battleship Oregon. With the declaration of hostilities American attention was absorbed by the possibility of the Spanish fleet under Admiral Cervera making a sudden attack on some one of the important cities of the Atlantic coast. At that time the Oregon, a newly constructed battleship, was on the Pacific station. It was considered desirable to have the ship added to the strength of the Atlantic fleet. Orders were sent to her commander, Capt. Clark, to bring her around Cape Horn, using all speed possible. The American people watched with anxiety the famous voyage. It furnished an argument for the construction of an isthmian canal more effective than a century of discussion.

But coincident with the making up of the American mind that a canal must be built, there came the conflict of opinion as to the choice of routes. Those who were interested in the Panama enterprise were quick to see the opportunity opened to them. When the commission that was appointed by President McKinley in 1899 to examine the American isthmus at every available point in order to determine the most practicable and feasible route for a ship canal went to Paris to examine the plans of the Panama Company, the company, realizing the improbability of its being able to raise sufficient funds in France to carry the enterprise to a successful conclusion, decided to face competition with the Nicaragua project before the Congress of the United States. At a meeting of the directors it was decided to transfer all of the property of the company, its rights and powers, together with those of the American auxiliary company, to a new American company. That company was organized under the laws of the State of New Jersey, with the title of the Panama Canal Company of America. The capital was fixed at $30,000,000 and the company was authorized to increase the amount if necessary. The arrangement which it made with the French company in taking over its rights, was to pay the shareholders of that company partly in money, but mainly in shares of the American company. The French company retains only an equity in the shape of a lien on a specified percentage of the profits remaining after the payment of all operating expenses and fixed charges and a dividend to the stockholders of the new company. An international commission of French, German, Russian, English, and American engineers, consulted by the French company in drawing up its plans, estimated the cost of completing the Panama canal at $102,000,000, if the two locks were made of a certain width, and $125,000,000 if the locks were wider. The extended concession from the Colombian government runs till 31 Oct. 1910, a bonus of $15,000,000 having been paid to secure the extension.

After the American company was organized and the proposition for a transfer was brought definitely before the French directors, so much opposition was developed to the surrender of an enterprise that had absorbed so much French enthusiasm and entailed such sacrifices on the French people that the directors were unwilling to shoulder the responsibility of carrying out the arrangement, and all resigned. The trustees of the De Lesseps company, in particular, were reluctant to sanction the total transfer of the entire management and control from France to the United States. A new board of directors was chosen, which continued the negotiations with the American company, and the transfer was made. Congress ultimately decided on the Panama canal route as the most feasible and practicable and passed the bill under which President Roosevelt was authorized to acquire the American Panama Canal Company's rights.

The price fixed that the United States government should pay the Panama Canal Company of America for its rights and privileges was $40,000,000. The cost of the completed canal was estimated at $184,233,358. Thus, the passage of the Act of Congress, approved 28 June 1902, "To provide for the construction of a canal connecting the waters of the Atlantic and Pacific Oceans," was the first decisive action taken by the United States Government to secure an isthmian canal. The second important step was taken 17 March 1903, when the Senate ratified the treaty that had been negotiated with Colombia to secure for our country the concession necessary for the canal's construction and management.

The law of 28 June 1902 authorized the President to buy out the New Panama Canal Company, negotiate a treaty with Colombia for a concession, and proceed by means of a commission with the construction of the Panama Canal. If unable to secure a satisfactory title to the property of the Panama Canal Company, or "to obtain by treaty control of the necessary territory from Colombia," the President was empowered to negotiate with Costa Rica and Nicaragua for a concession, and having secured the privileges desired, to construct the canal by the Nicaragua route. The purchase price to be paid the Panama Canal Company was not to exceed $40,000,000 (the valuation which the Isthmian Canal Commission had placed on the company's entire assets, including the Panama Railroad), and before paying over the money to the company the President was required to assure himself of the validity of the title to the property to be transferred and to await the exchange of ratifications of a satisfactory treaty with Colombia.

The first duty of the President was to investigate the title held by the Panama Canal Company and to determine whether it was a good one, free of encumbrance, and transferable to the United States. The attorney-general was promptly instructed to make this investigation, and his elaborate opinion, together with the data upon which his opinion was based, was laid before the President 25 Oct. 1902. The subject entrusted to the attorney-general was one of great importance, and his report is fortunately comprehensive, thorough, and entirely convincing.

Before the attorney-general made his inquiry, the validity and transferability of the Panama Canal Company's title had been investigated by the Isthmian Canal Commission and by the Senate committee on Interoceanic Canals. One of the important duties imposed upon the Canal Commission was to "ascertain what rights, privileges and franchises" were held by the Panama Canal Company, and "the cost of purchasing all of the rights," and of placing the canal under the control of the United States. Accordingly, one of the five committees to which the several departments of the commission's investigation were committed was the Committee on Rights, Privileges, and Franchises. The report of the Isthmian Canal Commission contains a full historical and analytical discussion of the subject of concessions. The relations of the original Panama Canal Company to the New Panama Canal Company were set forth, and the opinion expressed that the New Panama Canal Company was able to sell its concession and property to the United States, provided the representative of the rights of the old company, the "liquidator," gave his approval of the sale, and united with the new company in the offer to sell. Shortly after this report was made the New Panama Canal Company offered to sell out to the United States, and the liquidator gave his consent to the sale. The Commission prepared a supplemental report dealing with this offer, and came to the conclusion that the offer thus made was one that the New Canal Company was competent to make, and that Congress ought to accept.

The chairman and a majority of the Senate committee on Interoceanic Canals disagreed with the conclusions of the commission, but the report of the majority was criticised by the minority members of the committee in an ably written report that supported the conclusions reached by the Canal Commission. The latter was accepted by the Senate.

The treaty granting to the United States the concession and rights necessary for the construction, operation, and control of the Panama Canal was signed by Secretary Hay and the Colombian chargé d'affaires, 22 Jan. 1903, and ratified without change by the United States Senate, 17 March. It is a lengthy treaty, containing 28 articles, but is remarkable for the conciseness and directness with which each provision is stated. The Canal Commission did not consider it necessary for the United States to acquire sovereignty over the territory adjacent to the canal. The desirability of our country's having the sole and undivided ownership and control of the canal when constructed was emphasized, and the recommendation was made that the compensation to be paid by the United States should be definitely fixed either as a single payment or as a predetermined annual payment, or as a combination of these two methods. The treaty authorizes the New Panama Canal Company to sell out to the United States; exempts the Panama Railroad Company from its financial obligation to Colombia, and gives the United States a lease for a period of 100 years, renewable at the option of the United States, of a strip of land 10 kilometres wide across the Isthmus of Panama. The United States not only recognizes the sovereignty of Colombia over this leased strip, but "disavows any intention to impair it in any way whatever, or to increase its territory at the expense of Colombia or of any of the sister republics in Central or South America." The United States secures the right to construct the canal and harbors, to establish free ports at the termini of the canal, to maintain hospitals and drainage and sanitary works along the line of the canal and its dependencies, and to install waterworks and a sewerage system in Colon and Panama, with the authority to "collect equitable water rates during 50 years." Colombia agrees not to cede or lease to any foreign power any territory in the Department of Panama, and the United States guarantees that no country shall be allowed to seize such territory.

It is provided that the canal shall be neutral in perpetuity, in conformity with the treaty of 18 Nov. 1901, between the United States and Great Britain; but the United States secures the right to protect the canal. The new treaty in no wise limits the rights of the United States under the treaty of 1846–8 with New Grenada, by which we guarantee the neutrality of the isthmian transit route and the sovereignty of Colombia.

In the summer of 1903 came the unexpected rejection of the treaty by Colombia, and this put a new phase upon the question. It seemed possible that this act of Colombia might lead to the reopening of final negotiations with Nicaragua and Costa Rica for the construction of a canal by the Nicaragua route. At least, there arose again considerable discussion on the old problem of the two canals. The President was empowered to negotiate with those governments if unable to secure a satisfactory title to the property of the Panama Canal Company, as the Nicaragua route from an engineering standpoint was equally as practicable and feasible as the Panama route. The reports of the International Commission on Panama and of the Nicaragua Canal Commission exhaustively treat the subject of both canals, and a comparison of the two routes may be obtained by referring in this work to the illustration under CANALS, "Comparison of the Panama and Nicaragua Canal Routes." The canals projected on both routes have certain features in common. The greatest problem in both is the maintenance of the summit level and the control of the flood waters of rivers which are subject to extremely heavy freshets. In both cases the most favored plans sought to make the one difficulty cancel the other, the flood waters of the rainy season being stored by the erection of large dams across the course of the rivers, the dams being associated with spill-ways, or waste weirs, by which the impounded waters may be regulated between predetermined maximum and minimum levels.

The total length of the Nicaragua route from sea to sea is 186.5 miles; the total length of the Panama route is 49 miles. But although nearly four times as long as that of Panama, the cost of the Nicaragua route is nothing like proportionate to its greater length, the estimated cost of its construction exceeding by $6,000,000 only, the estimated cost of the Panama Canal. The controlling features at Nicaragua are the existence of a great deep water lake near the Pacific, and its connection with the Atlantic Ocean by the Rio Grande or San Juan, a river of considerable size and discharging in the rainy season an enormous volume of water. The canalization of this river to Lake Nicaragua, a distance of 49.64 miles, and the cutting of a canal from the western shore of the lake to deep water on the Pacific, 17.34 miles, through an elevation of 110 feet, are the labor problems of this route, the remaining 70.51 miles being supplied by the deep waters of Lake Nicaragua.

The successful revolt of Panama from Colombia in November, 1903, as fully described under PANAMA (q. v.), and the immediate recognition of the new republic by the United States and other governments, however, confined the canal question to the Panama route.

The provisional government of Panama at once arranged a new treaty with the United States government for the construction and control of the canal, differing from the treaty with Colombia in that the Canal Zone was enlarged, and greater powers granted to the United States. This, known as the Hay-Varilla Treaty, was signed at Washington 18 Nov. 1903 and ratified in Panama 2 Dec. 1903. By its terms the United States guarantees and will maintain the independence of the Republic of Panama. Panama grants the use in perpetuity of a zone 10 miles wide, and its exclusive control for police, judicial, and other purposes; cedes territory for subsidiary canals and the coast line within the zone; and if police and other matters in the cities of Panama and Colon prove unsatisfactory, the United States government may intervene. The canal is to be neutral and open to the world's commerce. For these grants, the United States was to pay $10,000,000 on the ratification of the treaty and $250,000 yearly beginning nine years after. The sovereignty of Panama over all her territory to be recognized.

Major-General Whitfield Davis was appointed head of the Canal Commission with gubernatorial powers within the zone, his assistants being William Barclay Parsons, N. Y., Wm. H. Burr, N. Y., Benjamin M. Harrod, La., Carl Ewald Crinsky, Cal., and Frank J. Hecker, Mich. The preparatory work of construction was begun on the plan of high-level locks, as favored by Congress in 1902. In this plan the physical difficulties of the Culebra cut through the continental divide near the Pacific, and the floods of the Chagres river, which latter flows down from the northeast, intercepts the line of the canal about its centre, and coincides more or less with the general route of the canal from the point of interception to its Atlantic terminus, had to be overcome. The problem was to be solved by cutting a tide-level canal for the first 16 miles from the Atlantic to Bohio, where a dam was to be thrown across the Chagres river, of sufficient height to form a great lake in the valley of the Chagres, at a maximum elevation of 90 feet above mean sea-level. Allowing for the greatest possible variation due to continued drought or to heavy freshets the level of the lake was to be maintained between the extremes of 82 feet as a minimum, and 90 feet as a maximum level above the sea at mean tide. The surplus waters of the rainy season were to be discharged over a weir 2,000 feet in length, built not far from the Bohio dam, the waste waters being conducted to the Atlantic partly by the Chagres river and partly by artificial channel. At Bohio a double lift lock was to be located with a total maximum lift of 90 feet. The line of the canal would traverse the Bohio lake thus formed for a distance of about 14 miles, or until it reached Obispo, where a set of gates 100 feet wide were to be placed. The purpose of the gates was to retain the waters of Lake Bohio should it at any time be desirable to drain off the waters of that portion of the summit-level lying beyond the gates. Passing through the gates the canal would enter the Culebra section, which consists of a great cut through the continental divide, about eight miles in length, with the Pedro Miguel locks at the Pacific end. A level 1.33 miles in length would lead to the Miraflores locks, by means of which the descent to the tide-level on the Pacific would be made, the distance from the Miraflores locks to the six-fathom line on the Pacific being 8.5 miles.

The average summit-level proposed was to be 85 feet above mean tide. This was to be secured by the Bohio dam, the most important structure of the high-level canal. The dam proposed by the French Panama Company was to have been of clay founded upon a variety of material — hard clay, soft clay, sand, gravel, etc. The Isthmian Canal Commission decided upon a core-wall-and-earth-dam, the core-wall to be carried down everywhere to rock, the latter being reached in places at a depth of 128 feet below sea-level. The cost of the dam was estimated at $6,369,640, and as it would probably take 10 years to build, it would be the controlling feature in the question of time required to construct the high-level canal.

On 19 Dec. 1904, however, the chief engineer of the Isthmian Canal Commission laid his report before the Congressional Committee of Commerce. He was in favor of a return to the original plan of a sea-level canal as the best and cheapest in the end. The cost was estimated at $300,000,000 and the time of construction 20 years.

Early in 1905 the Engineering Committee consisting of Messrs. Burr, Parsons, and Davis also issued a report recommending a sea-level canal, which they estimated could be completed in 10 or 12 years for $230,500,000. As outlined by them the canal is to extend 49 miles from the 36-foot depth mark in Colon harbor on the Atlantic to the similar depth mark in Panama harbor on the Pacific, and with a bottom width of 150 feet, is to be 30 feet in depth. A reference to the "Profile of the Panama Canal" on the map accompanying the article on PANAMA reveals the course of the canal and its natural features. The first section from the Atlantic to Bas Obispo is 29 miles of low, marshy, and unhealthful surface, thick with tropical vegetation; work here is facilitated by the considerable amount of excavation done by the French Company, and a stretch of completed waterway. The second and most difficult section of the canal is in the hill ground from Bas Obispo to Pedro Miguel, 7.91 miles, and is known as the Culebra Cut. It is so well chosen, however, that it affords the lowest crossing in the ridge between the oceans. The third section from Pedro Miguel to the Pacific, nine miles, is similar to the Atlantic side, low and marshy. The chief difficulties to be overcome are keeping the floods of the Chagres river under control and the cut through the rocky height of the Culebra ridge, the isthmian backbone and continental divide that rises 300 feet above sea-level, nine miles from the Pacific.

The intention of building the canal with high-level locks, as planned by Congress in 1902, was recommended to be waived in favor of a sea-level waterway. The general plan to construct the most important dam at Bohio was abandoned for the safer rock foundations at Gamboa where a dam 200 feet high was planned to be built, and a tunnel 10 miles long and 30 feet in diameter bored through the Culebra Ridge at a height of 132 feet to carry the surplus flood waters of the Chagres to the Pacific. Part of the canal would utilize the course of the Bohio Lake and the Obispo river. Although planned as a sea-level waterway, the tidal differences in both oceans necessitates a lock at Miraflores, a short distance from Panama. On the Atlantic side the tidal fluctuation is less than two feet; on the Pacific side 20 feet. The lock, built of concrete upon rock foundations would be 1,000 feet long, of twin construction, with guard gates and intermediate gates of steel. A breakwater at Colon to form an outer terminal harbor on the Atlantic side is also projected, and is to be built from rock quarried from the Culebra cut, the transport of which is facilitated by the Panama railroad built in 1855. The latter is, in the main, parallel to the course of the canal, and was acquired by the United States government as indispensable to the work on the canal.

In consequence of the recommendations a series of radical alterations were made in the United States programme for 1905, but, on March 30, Secretary Taft sent to President Roosevelt a drastic statement concerning the whole scheme, which was acted upon with such promptitude that an executive order was issued on April 3, reorganizing the Canal Commission.

The salaries of the Commissioners were resettled and their duties defined. Theodore Perry Shonts, Ill., was appointed chairman at an annual salary of $30,000; Charles E. Magoon, Neb., to act also as governor of the Canal Zone and as U. S. minister to the Republic of Panama, $17,500; John F. Wallace, Ill., chief engineer, $25,000; Rear-Admiral Mordecai T. Endicott, U. S. N., $7,500; Brig.-Gen. Peter C. Hains, U. S. A., retired, $7,500; Col. Oswald H. Ernst, corps of engineers, U. S. A., $7,500; Benjamin M. Harrod, $7,500. President Roosevelt issued a comprehensive list of instructions concerning the duties of the new commissioners and the administrative work of the canal, simultaneously with their appointment, and organizing at once the Executive Committee proceeded to Panama and assumed charge of the construction preparations with directions conveyed in a contemporaneous catch phrase "to make the dirt fly." The Executive Committee comprised three commissioners in charge of special departments. The chairman, Theo. P. Shonts, presided over the first department, embracing the fiscal affairs of the Commission, and the purchase and delivery of materials. Governor-Gen. Chas. E. Magoon superintended the second department, embracing the government of the Canal Zone and its sanitation, and the Chief Engineer had charge of the third department, embracing the engineering work of the canal. On June 29 it was announced from Washington that the resignation of Mr. Wallace, chief engineer, had been accepted, after a strongly-worded arraignment on public duty from Secretary Taft. He was succeeded by Mr. J. F. Stevens of the Chicago, Rock Island and Pacific Railroad, at the time acting with the Philippine Commission as railroad expert.

Among other recommendations of Secretary Taft was the formation of an advisory board to consider the best design of canal. A board of consulting engineers was appointed upon which were representatives of Germany, England, France, and the Netherlands, nominated by their respective governments at the invitation of President Roosevelt. The members were Gen. George W. Davis, chairman; William Barclay Parsons; W. H. Burr; Gen. Henry L. Abbot; Eugene Tincauzer (Germany); Édouard M. Quellenec (constructing engineer of the Suez Canal Staff); Adolphe Guérard (French); J. W. Welcker (Dutch); Isham Randolph, F. P.

Stearns, Joseph Ripley, W. H. Hunter (Manchester, England). After numerous sittings in Washington the board of consulting engineers divided in vote 17 Nov. 1905 on the plan of canal to be recommended to the President as follows: For a sea-level.— Gen. George W. Davis, chairman; William Barclay Parsons and William H. Burr (America), William Henry Hunter (England), Adolphe Guérard and Edouard M. Quellenec (France), Eugene Tincauzer (Germany) and J. W. Welcker (Netherlands). For a lock-canal — Gen. Henry L. Abbot, Joseph Ripley, Alfred Noble, Isham Randolph, and Fred B. Stevens (America).

Meanwhile, preparatory work proceeded upon the canal cuttings, large bodies of men and much new machinery being employed. But during the summer of 1905 the work of excavation had to be virtually suspended. The mortality had proved alarming, and Governor Magoon diverted most of the labor upon sanitary work, which should have been undertaken at the commencement. Considerable attention was devoted to the draining and oiling of marshes for the destruction of mosquitos propagating malaria and yellow fever, to the sewerage systems of the isthmus, and to a good water supply for the cities of Panama and Colon by the construction of a dam at the headwaters of the Rio Grande, with the result that the mortality from yellow fever was soon completely reduced. The housing, provisioning, and entertainment of the laborers in the zone were also arranged on a generous scale.

The report of the board of consulting engineers was submitted to the consideration of the Senate Committee on Interoceanic Canals, and extended deliberations took place upon the two problems of a high-level lock canal to cost $147,000,000, and not more than eight years to build, and a sea-level waterway to cost about $250,000,000 and from 12 to 15 years to build. Owing to the greater cost of and longer time for constructing a sea-level canal it was considered probable that the lock-canal plan would be recommended for the decision of Congres , a view supported by Secretary Taft, Chairman Shonts, Chief Engineer Stevens, and other members of the Isthmian Canal Commission. On 17 May 1906, the majority report of the Senate Committee on Interoceanic Canals in favor of a sea-level type of canal was submitted by Senator Kittredge. Concerning the division among experts as to the best type of canal, the report says that the following propositions were considered irrefutable: The ideal canal is one at sea-level; its construction would be attended with no more, and probably with less, hazard than one with locks and dams on doubtful foundations; the sea-level canal is safer and more convenient than one with locks; it would take but little longer time to build; it is the simpler and more economical in operation and maintenance.

The dangers to which a lock canal would be exposed in case of earthquake shocks such as had caused the recent disaster in San Francisco were emphasized. The report further asserted that while the cost of the lock canal is uncertainly estimated at about $190,000,000, the ultimate final cost of the sea-level plan as estimated by the majority is $250,000,000, but the cost of transforming the lock plan into a sea-level canal after the former is completed would be at least $200,000,000.

Ships of all classes could pass through the sea-level canal in eight hours, while half that time would be consumed in passing ships through locks alone.

On 15 June 1906, Congress in committee of the whole voted in favor of a high-level lock canal by a majority of 110 to 36, and on 21 June the Senate by a test vote of 36 to 31 also declared for a lock canal. President Roosevelt signed the bill on 29 June 1906.

Isthmian Games, so called because they were celebrated on the Isthmus of Corinth. Here was a famous temple consecrated to Poseidon, near which the Isthmian games were celebrated. On one side of the temple were the statues of the victors in these games, and on the other was a grove of pines. In the temple stood four horses, gilded all over, with the exception of their ivory hoofs; by the side of the horses were two Tritons, the upper parts of which were gilt, and the rest of ivory. Behind the horses was a car, with the statues of Poseidon and Amphitrite, of gold and ivory. Not far from the temple were a considerable theatre, and the stadium, of white stone, in which the games were celebrated. The whole isthmus was sacred to Poseidon, who was thence called *Isthmius*. According to the common opinion the Isthmian games were founded in honor of Palæmon or Melicertes, by Sisyphus, king of Corinth. When there was war between the states of Corinth and Athens a sacred truce was concluded, and the Athenians were solemnly invited to attend the celebration of the games. They were celebrated with the same splendor as the Olympian and other public games, in the first and third years of each Olympiad, probably in autumn; the athletic exercises were the same. The victors were at first adorned with wreaths of pine-leaves, but afterward with wreaths of dry and faded ivy. The pine wreaths were afterward resumed. Victory shed a lustre not only over the individual, but over his family and the community to which he belonged.

Istle, is'tl, or **Tampico**. This structural fibre is produced from several species of small agaves in Mexico, chiefly *Agave heteracantha*, and *A. lechuguilla*. The plants grow wild over a wide area of central and northern Mexico, the centres of the industry being located in the states of Coahuila, Tamaulipas, Nuevo Leon and San Luis Potosi. The fibre is extracted by the peons by hand labor and prepared by rudest methods. The filaments are harsh and stiff, but smooth, and in color a yellowish white, and form an admirable substitute for animal bristles in brush manufacture. Nearly 8,000 tons of the fibre is imported into the United States annually, worth almost half a million dollars. In Mexico the fibre is used for rough cordage and webbing (for saddle girths), and for sacks for the transportation of all kinds of merchandise. A litle fibre finds its way into this country to mix with the cheaper cordage fibres, but it cannot amount to very much in the figures of imports. The fibre is derived from the cogolla, or central spike of unopened leaves, these being separated by hand and each leaf scraped on both sides with a kind of dull edged knife, in order to release the fibre, which lies just under the epidermis. After drying, the fibre is sold at the haciendas, put up in bundles of about 75 pounds, and transported on the backs of pack animals to the neighboring towns, where it is sorted, baled, and sent by rail to the port of Tampico for shipment, hence the commercial name Tampico. For further information see article on Istle Fibre in Mexico, Scientific American Supplement, (1902). See CORDAGE: CORDAGE INDUSTRIES: FIBRE: MEXICO.

CHAS. RICHARDS DODGE.

Itacolumite, ĭ-tạ-kŏl'ū-mīt, also known as flexible sandstone, is a mineral curiosity. It is a light colored, laminated-granular quartzite containing besides quartz grains, mica, talc and chlorite. Usually thin bedded, pieces an inch thick or more have considerable flexibility. This property is attributed to the presence of thin laminæ of mica, talc, etc., and also to the shape of the sand grains which have interlocking angles, due to a secondary growth of the grains by deposition of silica. Itacolumite is found in Brazil, also at several localities in the southern Appalachians.

Itagaki, Taisuke, tī-soo'kä ē-tä-gä'kē, COUNT, Japanese statesman: b. Tosa province, island of Shikoku, 1838. He received a military education, and in the war of the Restoration (1868) was prominent in the imperial army. From 1871 until his resignation in 1873 he was a privy councillor to the emperor. He then became the centre of a movement for constitutional government which in 1877 addressed to the government a memorial asking for a representative assembly and broaching popular rights. Itagaki aimed at a system based on that of Great Britain or the United States, as opposed to the system based on that of Germany, drafted by the Marquis Ito and promulgated in 1890. But he would have been satisfied at first, it is said, with an assembly which quite excluded the popular element. He organized the *Jiyuto*, or Liberals, the first Japanese political party, which rapidly increased in numbers. In 1878 he became minister of public works, in 1880 minister of the interior, and in 1898 the Liberals united with the Progressists, led by Count Okuma, to form the so-called Constitutional party, which had a large majority in the lower house of Parliament. At the Mikado's request Itagaki and Okuma formed a cabinet, with Itagaki as minister of the interior. The cabinet resigned after six months, and the Constitutional party was separated into its original parts.

Italian Architecture. See ARCHITECTURE: ITALY.

Ital'ic Languages, the languages of ancient Italy, before it had become Latinized by the predominance of Rome. These are generally described as Umbrian, Oscan, Etruscan, and Latin. The three first only survive in some fragments and inscriptions. Thus the Eugubine Tables, seven tablets of brass discovered in 1444 near Eugubium, are engraved with a series of sacerdotal inscriptions in ancient Umbrian. Taken together they contain about 450 lines, reading from left to right, some in Roman, others in Etruscan letters. The most important fragment of the Oscan language is that inscribed on a bronze tablet discovered in 1793, and called the Bantine Table, from the neighboring city of Bantia. The Oscan Bantine inscription contains 36 lines, and is much more easy to interpret than the Eugubine Tables. The Oscan language was spoken in the south of Italy. Another important monument of Oscan is the Cippus Abellanus discovered in 1685. The bronze tablet of Agnone discovered in 1848 also contains an Oscan inscription. The Etruscan language is most difficult to all to interpret. The most important remains which are known were discovered in the neighborhood of Perugia in the year 1822. The inscription is engraved on two sides of a block of stone, and consists of forty-five lines. The learned are divided about its interpretation. The most copious and important of the legal fragments which exhibit the Latin language in its earliest form are the Twelve Tables (q.v.).
