LXXII

JANUARY
1897

THE BUILDER

 N : ILLUSTRATED : WEEKLY
MAGAZINE : FOR : THE
ARCHITECT : ENGINEER : ARCHÆ-
OLOGIST : CONSTRUCTOR : SANI-
TARY-REFORMER : & : ART-LOVER.

CONDUCTED BY

H. H. STATHAM,

FELLOW OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

"EVERY man's proper mansion-house, and home, being the theater of his hospitality, the seat of self-fruit, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kind of private principedome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned."

"Architecture can want no commendation, where there are noble men, or noble mindes."—SIR HENRY WOTTON.

"OUR English word To BUILD is the Anglo-Saxon Býlsan, to confrm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PURLEY.

"ALWAYS be ready to speak your mind, and a base man will avoid you."—WILLIAM BLAKE.

OFFICE: 26, CATHERINE-ST., COVENT-GARDEN, LONDON, W.C.

Printed at
74-76 Great Queen Street, Lincoln's Inn Fields,
London, W.C.

The Old and the New Year.

LN offering to all our friends and readers the best wishes for a happy and prosperous new year, it is gratifying to think that there is a reasonable hope that this year may be, for the majority and in a general sense, a prosperous one, and that those who are concerned in architecture and building will have their share in the general prosperity. Not only are there general signs that things, as the phrase is, "are looking up," but the mere fact, which will be present to every one's mind, that this is the year in which we are to have the pleasure of celebrating the attainment of the longest as well as one of the happiest reigns in the annals of the realm, must in itself do much to promote and quicken business of every kind.

The past year has not been architecturally a very eventful one. The most important incidents to record in it, in connexion with

English architectural work, have been the two competitions which, though not for buildings of the first size or importance, attracted more than usual attention and interest; those, namely, for the Royal Insurance Offices and for the Technical School and additions to the Free Library; both at Liverpool. In regard to the latter, we publish in this issue the revised design by the successful competitor, Mr. Mountford, in which some slight alterations have been made from the original competition design published in our issue of August 8, 1896, and in which moreover the merits of the design are done more justice to in a better drawing. The building, when carried out, will be a very fine and effective addition to what is already a remarkable architectural group, though not all that it might have been had the original competition for the Free Library and Museum been carried on as well and ended as satisfactorily as this recent one has ended. In that old competition for the block of buildings of which Mr. Mountford's will form the completion some very fine designs were sent in, but instead of any one of them being selected, the then Borough Surveyor of Liverpool was allowed to

make what use he could of the hints to be derived from the competition designs, to compile a rather commonplace design of his own. Although tricks of this kind are still occasionally played in small competitions, it would be hardly possible now to carry out such a policy with a large and important competition; there would be too much public feeling on the subject, and a large corporation would probably have more self-respect than to act in such a manner,* so that we may be justified in thinking that there has been some advance in the *marale* of competitions.

Two other events, of a very diverse character, will be remembered as occurrences of the past year. One of these is the scandal in connexion with the Works Committee of the County Council, into which an inquiry is now being held, so that any further remarks on the subject would be out of place and mistimed until this inquiry is concluded and the Committee's Report presented. But the circumstances which rendered the inquiry necessary, though happily not characterised

* We do not forget the discreditable affair at Durham; but Durham, though with a great cathedral, is a very small borough, and the affair hardly rose higher than a vestry competition.

by anything so flagrant as those which led to the downfall of the Metropolitan Board of Works, show unfortunately how strong is the tendency in a London official body of this kind, to mingle the proper carrying out of the business for which it was elected with a kind of party policy which seems to lead almost inevitably to the pulling of underhand wires to bring about, not the accomplishment of work, but the triumph of a party system. The London County Council was elected to do the practical municipal work of London; it has got itself more or less discredited, for the time, indirectly through a craze for mingling political and social partisanship with the carrying out of work; and it is to be hoped that the exposure of the incidents which have no doubt indirectly resulted from this policy will not be without a wholesome effect, in inducing the members of the London County Council to recognise the unsuitability of importing political aims into what should be simply an institution for the conduct of public works.

The other event to which we have alluded has been the excitement and discussion in regard to Peterborough Cathedral; indeed, 1896 may perhaps be remembered among architects as the Peterborough year. Looking back to our last year's volumes, we find that it was in the first number of January, 1896, that we went into the subject, and first suggested our opinion as to the possible ultimate outcome of the matter in the following words, which it will be admitted are guarded enough:—

"The mention of this point leads one to notice the possibility, which must be faced, that no way of making the work perfectly stable could be found without taking down the façade and rebuilding with the same stones, but on a proper foundation and with a better system of bonding. One almost dreads even to suggest such a thing, for fear of the opening that would be made for playing "restorative" tricks with the work in rebuilding. At the same time there is the fact that the facing stones are mostly in good condition and they could be numbered and reset, and that with proper care the front might remain in all essentials the old front set up again. To attempt to push the work into position by hydraulic jacks, as was done with the south wall of St. Alhans, is not to be thought of; the mass is too great to be handled in that way, and even if the power could be applied, the first result of it would probably be to crush and bring down all the vaulting between the front and the west wall of the nave. The matter seems to rest between extensive underpinning combined with ties up above, or the radical cure of rebuilding. If only the latter operation were carried out as an honest piece of rebuilding—taking down the old stones and putting them together again, with no "restoration" frolics except the mere putting in of a new stone here and there in place of a decayed one, we are inclined to believe that no other process would be so satisfactory in the end, or give so long a new lease of life to the grand façade."

From that opinion, expressed twelve months ago and before there was any symptom of the outbreak of public criticism and letter-writing on the subject which has recently taken place, we see no reason to depart. The probability is that the piers are badly and hastily built, and the fact that they were on an equally bad foundation has probably been the means hitherto of saving them from worse damage than being pushed out of the perpendicular; the foundations gave instead of the piers cracking. Now the foundations have been rendered immovable; it is proposed to make repairs and rebuilding in the super-

structure which will increase its weight; and if the piers, as is probable, have little or no lateral bond, to do this is to put them between a pair of gigantic nut-crackers, which will crack the nut sooner or later. While referring to the subject, we may remark also on the extraordinary degree of ignorance and intolerance which has been shown in the correspondence and comments on the subject in various daily and weekly papers. It really seems as if, the less people know about building, the more right they think they have to lay down the law on the treatment of an ancient building. Things have got to a pass in this respect which is perfectly ludicrous. As an example of the absurd things that are said we have Mr. Pennell accusing the Dean and Chapter of Peterborough of having obviously intended from the first to pull down the façade, because he found a scaffolding all ready which had been there for months, he being apparently ignorant of the fact that the erection of a scaffolding is a necessary preliminary to the examination of the condition of the building. In a weekly paper (the *Speaker*) it is seriously suggested that if the Dean and Chapter prove contumacious the lesson will be that we must put our ancient buildings under the control of a National Commission, as in France; the writer being evidently unaware that the "Commission des Monuments Historiques" has carried "restoration" further than it has ever been carried in this country, almost obliterating the interest of many of the architectural monuments of France; and that Viollet-le-Duc, to whom the *Speaker* also refers with admiration, was a restorer more drastic even than Scott. The Dean and Chapter of Peterborough have in our opinion shown both firmness and judgment in their action, and a temper which contrasts very favourably with that of some of their violent and ill-informed critics.

In the coming year the most important subject before the Architectural world is that of the proposed New Government offices. Upon the general features of the site-schemes and the block-plans for their occupation, as set out in the Report of the Special Committee, we have already commented—favourably in regard to some, unfavourably in regard to others, especially that for the War Office. Nothing, however, is definitely settled yet; there is opportunity for improvement in the scheme, which it is to be hoped may yet be carried out in a manner worthy of the nation; and we have the satisfaction of knowing that the present First Commissioner of Works is fully alive to the architectural importance of the subject, and desirous that the new buildings should represent fine architecture as well as convenient offices. It is to be hoped that for these new Government offices there will be either a general or a limited architectural competition, and that it will be better managed and more satisfactory in its results than some previous competitions of the same kind.

Amid the various proposals which are in the air for doing something to commemorate this year of the Queen's reign, it is natural to consider whether any architectural monument significant of the occasion can be or should be erected. A new War Office, if adequately carried out in an architectural sense, would be important enough for the occasion, but would hardly form a suitable memorial of the reign of a Sovereign who has always and

consistently wished and promoted peace as far as possible. We have had various suggestions made to us, but none of them worth taking into account. One correspondent suggested that a great building of some kind should be erected, on the ground that the present reign had not been marked by the erection of any great building of the first importance; a building called the Houses of Parliament having apparently escaped his recollection. But the suggestion reminds us that the Houses of Parliament has never been completed according to the architect's design, and we can think of few more suitable architectural memorials of the reign than would be furnished by its completion. Another suitable one might be the realising of the scheme, so often suggested in different forms, of a national Walhalla for the monuments of eminent persons, not in connection with Westminster Abbey, which is complete in itself, and would only be spoiled by a modern addition, but as a separate building. A third course which would be more to the purpose than either, and which is what would be certainly done in France or Germany, would be to carry out an artistic memorial of the Queen and her reign, purely as a work of art in architecture and sculpture, and as a monument only, without considering its practical use. This would be by far the most graceful way of doing it, and the most satisfactory in an artistic sense. We have the Albert Memorial—a remarkable work in its way in spite of some obvious defects; why should we not have the Victoria Memorial?

A NEW MUSEUM OF ANCIENT SCULPTURE.

BY PROFESSOR FURTWÄNGLER.

THE Glyptothek at Ny Carlsberg, near Copenhagen, founded by the well-known brewer, Herr Carl Jacobsen, is the latest Museum of ancient sculpture in Europe, and yet takes rank among the most important. It is, moreover, an outcome of the times, of which we may well feel proud. In past centuries, potentates collected statues for the adornment of their palaces. The practice inaugurated in Italy by princes, Popes, and cardinals, spread, under the influence of later Renaissance and Barocco architecture, to the Courts of France, of Spain, and of Germany, and, not least, to the English aristocracy. But to-day, a rich industrial competes with the grandees of a bygone age. And his collection of ancient sculpture is not destined to adorn a palace, but to minister at once to artistic enjoyment and scientific research. Its aim is to unfold before the visitor, by means of a noble series of well-selected examples, the whole development of Greek art. And this aim has been steadily kept in view. For Herr Jacobsen is enough of a connoisseur to appreciate above all what is intrinsically exquisite and beautiful; but he is also enough of a scholar to estimate at its right value what is significant for the historical study either of the development of form or of the mythological conceptions of the ancients.

To fulfil its aim such a collection must be conveniently exhibited, must be arranged on an easily grasped principle, and be made easy of access to all interested in art—all of which conditions are admirably fulfilled at

Ny Carlsberg. One requisite, however, was till lately wanting; in order that the scholar or the student who cannot undertake the pilgrimage to the collection of Ny Carlsberg might possess trustworthy reproductions of its works of art, a large publication must be started. In fact, the well known firm of Bruckmann in Munich has begun to publish the ancient monuments of the collection.* The three first parts, containing thirty large and splendidly executed plates in heliogravure, have already appeared, accompanied by an exhaustive text in French, itself richly illustrated, from the pen of Paul Arndt, a pupil of Heinrich Brunn.

The first *livraison* contains a selection from works of different epochs. As samples of the comprehensive character of the collection, which extends from Egyptian sculpture of the Old Empire down to late Roman sarcophagi and grave stones of Palmyra, we are given an Egyptian statue, a sitting Anubis of bronze, of uncommonly fine workmanship. An excellent sarcophagus of the later Roman Empire, from Sidon, displays on its front the contest of Apollo and Marsyas, while the portrait of the dead man—a certain Greek, by name Hermogenes, who has all the air of a Professor in a modern Academy of Music, and had probably devoted himself to the art—adorns the centre of the lid. A bronze statue of the youthful nude Herakles, reproduced on three plates, takes us to the efflorescence of Greek art. The statue, save for the bow and arrows once held in the left hand, is preserved intact; even the eyes, which consist of variegated substances, and were let in separately, are not lost, so that the figure preserves the life-like look wanting to so many statues, owing to the loss of the pupil in cases where it was let in, or to the disappearance of the colouring in others. The statue may be derived from a work in the manner and of the epoch of Skopas.

Another plate in this same *livraison* gives a small marble head from Athens, a charming, delicate original, probably by a pupil of Praxiteles.

A large portion of the collection consists of Roman copies after lost Greek masterpieces. In my book, "Die Meisterwerke der Griechischen Plastik," I had already referred to many of these pieces. Since then the indefatigable owner of the collection has acquired many new important works. Not only the villas and the palaces of the Roman aristocracy—of the Borghese and the Sciarra—but also the recent excavations in or near Rome have helped to enrich the Glyptothek of Ny Carlsberg. In the first *livraison* the most remarkable object of the class is the head of a goddess, in the severe style which recalls the figures from the pediments and metopes at Olympia.

In the second number the plates appear in stricter chronological order. Among the archaic sculptures, a place of honour is taken by the Early Attic head of a youth, which once belonged to the French archaeologist

Rayet; it is a work full of the strength and vitality which distinguish archaic art. From the archaic period, shortly before Pheidias, comes a draped female statue, which is closely related to the quiet, standing figures from the Olympian pediments and metopes. But the workmanship is finer and more precise; the ideal which inspired the Olympian figures finds in our statue clearer and purer expression. The statue is evidently an original; unfortunately, the head is missing; it seems to have been already restored in antiquity, probably in Rome where the statue was found; the neck is cut off straight, and shows a dowel hole; but in the period to which the work belongs heads were never adjusted in this fashion—a remark which the editor Arndt fails to make.

Still another original work of this period appears in the same number: the head of an anthropoid sarkophagos from Sidon, of Parian marble. As I have already noted in "Meisterwerke," p. 737, it strikingly resembles the Harmodios by Kritios and Nesiotes. Indeed, all the sculptors of those Parian marble sarkophagi in which the rich Phœnicians of the fifth century B.C. were wont to have themselves buried, were *Nesiotes*, men of the islands, Parian masters *par excellence*.

The third part contains a series of five remarkable terminal heads from Athens or the Peiraeeus, original works from the period shortly before and after the middle of the fifth century B.C., precisely, therefore, from that highly interesting period from which so few originals have survived. The five heads are by different artists, each of whom had his own individuality; a distinction can also be made between the earlier and the later heads. Two are still fairly archaic; two come close to the free style of Pheidias (pl. 13, 14), and one (pl. 15), the most careful in execution, and most remarkable of all, seems to me influenced by the Argive art of the epoch preceding Polykleitos. All five heads represent dignified, bearded divinities. Only one of these can be named with certainty, for he alone wears a distinguishing attribute—it is Hermes (pl. 12), represented with his travelling cap, as on Greek vases. True, the editor, Arndt, believes that the other heads also can be accurately identified, and he attempts to do so in a long disquisition. But herein the editor shows himself somewhat behind his times.

In a manner which is now, fortunately, out of date, he surrenders to the naïve illusion that we can name ancient divinities on the ground of the subjective impression roused by this or that facial form, on the ground of a popular but non-historic presentment of the nature of this or that Greek divinity, without seriously inquiring into the objective sense, the meaning, and the origin of that particular art-form, or into the conceptions and beliefs which really obtained in the epoch to which the work of art belongs. One of the heads, for instance (pl. 15), impresses the editor as mentally limited; he sees in it an "esprit médiocre" "inintelligence," and "stupeur;" and since he has further come to the curious conclusion that Hephaistos must have been conceived as a mentally narrow personage (the god whose cleverness and understanding ancient poetry cannot sufficiently praise!), he feels himself entitled to call that god Hephaistos. The other names are found on the same method, and are equally valueless, for that supposed mental narrowness is merely the result of certain

stylistic habits of the artist. The heads on pl. 13, 14, 15 might, as they probably do, all represent the same personage—a dignified, bearded god or hero; more we cannot say, seeing the numberless possibilities that crowd upon us in such a case. The differences between the heads, however, are those of style, and of artistic individuality, and these are of supreme interest to us, although the editor does not touch upon them. But if Arndt in this case thus abandons historical thought and understanding for deductions from arbitrary, subjective fancies, he is here following the lead of Heinrich Brunn, who in his essays upon the Greek ideals of the gods is not free from the same failing. For this reason Brunn's essays must perforce be looked upon nowa-days as in great measure false, however admirable and brilliant they may be owing to the author's genial and profound understanding of the finest forms of Greek ideal heads.

The Glyptothek of Ny Carlsberg contains still a crowd of important monuments, which will appear in subsequent *livraisons* of the great work. The publication will bear striking witness to what may be accomplished, even in our day, by an intelligent and appreciative collector of ancient sculpture. Side by side with well-known works such as the Anakreon from the Villa Borghese, which I conjecture to be copied from a Pheidian original, or the Hera from the same villa, which apparently goes back to Alkamenes, the forthcoming numbers will contain many still unknown sculptures of great historical and artistic interest.

The text, likewise, in spite of a few weaknesses which we felt bound to mention, has its special strength in the wide knowledge of ancient sculpture commanded by the editor. In a manner peculiarly serviceable to students he illustrates the text with less well-known monuments bearing upon those of the collection.

We here take our leave of the Glyptothek at Ny Carlsberg with feelings of gratitude towards the founder, who not only makes his collection accessible by every means in his power, but who has already made arrangements by which to secure the gallery for all time to his native city Copenhagen. We can only hope that Roman princes and English lords may soon follow the truly noble example set them by a simple burges.

ADOLF FURTWÄNGLER.

ELECTRICITY DIRECT FROM COAL.

IN recent years there have been two favourite scientific subjects for writers of magazine articles, namely, how to get light without heat, and how to get electricity direct from coal. Considerable progress has been made towards a satisfactory solution of the first of these problems, and the second, according to an article by Dr. Jacques which appeared in the Christmas number of *Harper's Magazine*, has now been solved. It is more than a year ago since Dr. William W. Jacques, of Boston, invented his so-called carbon battery, and although electricians, deceived so often, at first ridiculed it, they are beginning to admit that it is a novel and meritorious invention. The inventor's account of it, therefore, even though written in a Christmas magazine, is deserving of serious consideration.

* The full title runs: "La Glyptothèque de Ny Carlsberg, fondée par Carl Jacobsen. Les Monuments Antiques, Choix et textes de Paul Arndt." Munich, Verlaganstalt für Kunst und Wissenschaft, Ancienne Maison Fr. Bruckmann, 1896. Up to December of this year three parts (*livraisons*) have appeared, each containing ten plates. The whole work is calculated to consist of twenty-two parts. The Greek and Roman portraits, although an important part of the collection (it is the most valuable gallery of ancient portraiture in existence) will be omitted from this large publication, since they are appearing separately in another work by Arndt and Bruckmann which is exclusively devoted to portraits.

The battery consists of an iron pot which forms the negative pole, and contains molten potash at a temperature of between 400 and 500 deg. Centigrade. In this is put a rod of carbon with an iron hook suspender, which forms the positive pole, and air is kept bubbling up round this carbon by means of an iron pipe with a rose at the end, through which air is forced by means of an air pump. The potash is kept at its high temperature by means of a fire below the pot, and when the air pump is working it is found that although the electromotive force between the terminals is only a little greater than one volt, yet the resistance of the battery is so small that currents of enormous intensity can be got from it.

The results of a test made of this battery by independent experts show that between 30 and 40 per cent. of the electricity theoretically obtainable from a pound of coal can be got by this method even when the capacity of the battery is only two horse-power. Remembering that the best steam engines give only 5 or 6 per cent. of the theoretical energy, it will be seen how important this result is. Hence an account of this battery by the inventor deserves careful attention to see what are the weak points in this method of obtaining electricity.

Dr. Jacques begins by pointing out the waste of energy in our present methods of generating electricity by combined steam engines and dynamos, and this, of course, is common knowledge. He then gives a slight sketch of the various unsuccessful ways by which he tried to get electricity from natural forces without the intervention of machinery. Amongst others, he tried getting large currents from thermopiles which turn heat directly into electricity. Theoretical considerations induced him to drop this method, as he proved to himself that their efficiency must always be very small. This statement is not correct, for a thermopile which has a difference of temperature between its junctions of 400 deg. Centigrade could easily have an efficiency of 50 per cent. It appears, therefore, that Dr. Jacques is strongly prejudiced against theories of thermo-electric action, and wishes to persuade people that it is impossible to obtain high efficiencies by their means.

Then comes a description of a very feeble attempt to follow what he calls nature's plan, and get electrical energy from artificial thunderstorms. He finishes up the biographical opening with a poetical description of how one day he surprised nature's secret and found out how to convert the stored up energy of coal directly into electricity.

His first successful experiment was to suspend a piece of coal about the size of a nut in a platinum crucible full of melted potash. Into the potash a stream of cold air was blown by means of a platinum pipe. A wire attached to the coal formed the positive pole, and the platinum crucible the negative, and the current developed was sufficient to run a small motor. The inventor says that the current is undoubtedly due to the combination of oxygen in the air with the carbon. We cannot, however, admit the "undoubtedly." The inventor naturally hopes that it is due to this, but he has given us no proof, and personally we prefer the theory of thermo-electric action.

Dr. Jacques then describes the difficulties he encountered in repeating his experiment on a large scale. Platinum, on account of its

cost, was out of the question, so he tried various metals. We wonder how many minutes some of these metals withstood the molten potash. Only one ignorant of chemistry would have tried zinc, tin, and aluminium. Iron, when he first tried it, did not answer, because "most specimens of iron have an oily surface, which, when heated, becomes converted into carbon." This, we are afraid, is nonsense, as we fail to see why a very small quantity of carbon on the anode, which is not acted on, could have any effect on the working of the battery.

We now come to perhaps the weakest point in the whole article, which is contained in the following statement:

"It has been found best to crush the coal and mould it into large sticks of convenient size to handle, and bake them to drive off the included gases and give them good electrical conductivity."

So that it is not electricity from coal, but from purified carbon baked in a furnace. What included gases are driven off is left to the imagination of the reader. Then comes a test made by two experts upon a two horse-power electrolytic generator, in which it is found that the electricity generated is 32 per cent. of that theoretically obtainable from the coal (?) consumed. Apparently the coal consumed in baking the carbon is left out of account. The "efficiency" of new inventions is one thing, the "economy" is quite another, and it is the latter that is important commercially.

We strongly suspect that there must be some fatal practical defect about the method. It has been before the public for nearly a year, and yet no mention is made in the article of the first cost or maintenance. The potash must rapidly become contaminated with the ash of the carbon sticks; how is it cleansed? Again, each cell, having only a very low voltage, must be coupled up by huge copper cables, and joints must be very carefully made. It is not proved that it is a galvanic battery consuming carbon and may be merely a thermo-electric generator, which is a class of apparatus notoriously unpractical.

Dr. Jacques ends his article by pointing out the great boon cheap power would be to humanity, and we cordially agree with what he says. His invention is a very meritorious one from a scientific point of view, and he has written a most interesting magazine article on it.

NOTES.

Dangers of Peat Bogs.

ON the 28th ult. another of those terrible calamities which so frequently overtake those who dwell in the neighbourhood of Irish peat bogs took place. The scene of the disaster was the vicinity of Rathmore, a poor and thinly-populated district some twenty miles to the east of Killarney, and on the confines of county Cork. A foreman quarryman and his family were overwhelmed by the black mud, but no other loss of life is reported. At the same time large tracts of land have been destroyed so far as agricultural purposes are concerned, and quarrying operations have been suspended not only on account of roads being rendered impassable, but because the workings are now filled with peat slime, whilst the bog is still moving and seems likely to do more mischief. The daily papers allude to the occurrence as a landslip, but, of course, it is nothing of the kind—at least in the technical sense. Such great bogs as

we have in Great Britain have been largely made up by mosses, especially species of *Sphagnum*, which, growing on hill tops, slopes, and valley bottoms, as a wet, spongy, fibrous mass, die in their lower parts, and send out new fibres above. Where ponds and small lakes are gradually converted into bogs, the marshy vegetation advances from the shores, and sometimes forms a matted, treacherous, green surface, the lower portions being water-logged, beneath which the waters of the lake sometimes still lie. The decayed vegetable matter from the under part of this crust sinks to the bottom of the water, forming there a fine peaty mud, which slowly grows upwards. Or a thick bed of moss, decayed in its lower parts and being of a spongy nature, absorbs much water. Heavy rains, by augmenting the watery layer, or by over-filling the bladder-like spongy mass, sometimes make the centre swell up until the matted skin of moss bursts and a deluge of black mud pours into the surrounding country. This is what has happened in regard to the recent bog-slide near Killarney. Can nothing be done to prevent such occurrences? Many of the bogs are roughly drained, and a better system of drainage would, no doubt, go a long way to mitigate the evil, but from the agricultural point of view it would not pay, and that is the *crux* of the whole matter.

Open Spaces and the Queen's Reign.

THE suggestions for commemorating the sixtieth year of the reign of the Queen have been added to by an influential proposal that the dedication of open spaces in different localities, the purchasing for the public of historical ruins, and so forth, would be a desirable measure. We do not know that an open space is the best kind of memorial of anything, but any excuse for securing open spaces in perpetuity ought to be welcome. The Corporation of London never did better work than when they secured Burnham Beeches and Epping Forest for the public for ever. Why should not Kensington make a collective effort and purchase Holland House and its park? We give this as an example of the way in which the proposal which has been put forward may be carried out. In every neighbourhood those who are acquainted with it may call to mind some piece of land or some building which it is desirable to obtain and to keep as a public possession, free from all dangers of the future.

Public Works in Germany.

AS usual, the Budget for the German Empire (which, by the way, should not be confused with the Budgets of the Kingdom of Prussia or other minor kingdoms of Germany), contains very large proposals for expenditure on buildings, the total amounting to about 2,300,000*l.* The greatest outlay, as usual, is for military work—approximately 1,200,000*l.* The State Railways require 400,000*l.*, whilst the General Post Office and the Naval Departments each show totals of approximately 250,000*l.* The estimates do not show the same interesting features as was the case some years back when the Imperial Houses of Parliament, the Imperial Law Courts, and other great national works were in hand, and it should, of course, also be remembered that, in many instances, the items shown are only votes on account; there are to be some new Infantry Barracks, for instance,

a cost of 150,000*l.*, of which only 50,000*l.* will be voted at present. Among the items the Naval Estimates we notice a second one for 50,000*l.* to be expended on some docks at Kiel, which will require a total lay of over 400,000*l.* The General Post Office appears to continue erecting its own buildings in every important town, as in England; but some of them at all events are better buildings than our Office of Works is out.

THE Board of Trade has not been so successful in mediation between Lord Penrhyn and his quarrymen as it was in the recent dispute between the London and North-Western Railway and its employees. It appears that on September 30 the Welsh workmen applied to the Board of Trade to take action under the Conciliation Act, 1896, and the application was acceded to by the Department. The President of the Board of Trade and Mr. Young, Lord Penrhyn's lawyer, appear to have had an informal interview early in December, and arrived at a verbal understanding. Thus far everything had gone satisfactorily if slowly, but on December 9 Lord Penrhyn himself wrote the Board of Trade a letter harsh in tone and apparently contrary to the terms arranged between Mr. Young and Mr. Ritchie, since the former had agreed, it would appear, that Lord Penrhyn should receive a deputation of his men if one were appointed. The result is that matters have come to a deadlock, entirely, it would seem from the recently published correspondence, through the irremediable position taken up by Lord Penrhyn. It is obvious—we say nothing in regard to the merits of the dispute—that the Board of the quarries should have met the opposition from the men, and should have secured a representative of the Board of Trade to be present at the interview, as was suggested by the men. Lord Penrhyn has put himself in the wrong in this respect, and has shown once again that there are some employers who appear to act without tact or reasonableness.

It is very rare for the Court of Sanitary Authorities and Appeal to grant a new trial of a case. But they have done so in the action of Digby *v.* The East Ham Sanitary District Council which was tried before Mr. Justice Cave and a special jury in October. The action arose out of the death of one of the defendants' workmen, who was suffocated by poisonous gases as he was descending a manhole in a sewer. Mr. Justice Cave at the trial non-suited the plaintiff (the widow of the workman) on the ground that there was no evidence of negligence because the plaintiff had not shown that any Sanitary Authority adopted the precautions which it was suggested should have been taken by the defendants, and that as testing the air of the manhole before workmen were allowed to descend into the sewer. In a note upon the case we pointed out that the result of the trial was unsatisfactory, since, according to the judge's ruling, a Sanitary Authority could not be considered negligent for not taking a perfectly reasonable precaution, if other and similar Authorities had not previously done so. The circumstances of the case must be considered without reference to the conduct of other people. When the case comes on for a new trial, we hope that the

judge will leave it fairly to the jury to say whether or not the Sanitary Authority took reasonable precautions for the safety of their workmen. If they did not, then they must pay damages, and their misconduct will be a warning to others.

It appears that a "Remonstrance" is in course of signature in regard to Peterborough Cathedral to the following effect:—

"We, the undersigned, wish to express our sorrow at the proposal to rebuild a portion of the west front of Peterborough Cathedral, the beauty and value of which it is impossible to over-estimate. We earnestly hope that the Dean and Chapter will see their way to reconsidering their decision."

To this are appended a number of names of persons mostly more or less distinguished in Art, science or literature, but not a single one of whom probably knows anything about building construction, or has any special right to form or express an opinion on the subject. The question is one of practical structure simply; the Dean and Chapter do not want to move a stone of the front if it were not structurally necessary; they have the advice of one of the first and most practical architects of the day, who thinks the partial reconstruction necessary; on what ground are they to listen to a party of ladies and gentlemen who know nothing about the practical side of the subject, and who announce that the beauty of the front of Peterborough "can hardly be over-estimated," as if that were a special discovery of their own, and no one else were conscious of it?

THE exhibition of Mr. Watts's pictures at the New Gallery is not only a very fine one itself, but some additional interest is given to it by the painter's own preface to the catalogue, in which he imparts to us some of his own thoughts as to the aim and purpose of his pictures. The conventional preface to a catalogue, to which we are so constantly subjected now, is an addition we could generally very well spare; but the artist's own preface is a different matter. We defer any detailed notice of the exhibition, however, because we propose to consider it next week in connexion with the collection of Leighton's works at Burlington House. The collected works of two artists who were both idealists, yet with such very different ideals, must gain an additional interest when considered in relation to each other.

In his "Intermezzi" Dr. Furtwängler publishes a paper on the "East Pediment of the Parthenon," in which he claims to have discovered the original central figure of the composition. Dr. Furtwängler, with many other archaeologists, had gradually arrived at the conviction that the central place on the pediment was occupied by a full-length figure of the goddess Athene dominating the whole. This figure he claims to have rediscovered in the well-known torso of Athene, known as the Minerva Medici, in the Ecole des Beaux Arts at Paris. In his "Meisterwerke" Dr. Furtwängler pronounced this statue to be a marble copy from a bronze original. On a closer inspection he believed it to be an original Athenian work of Pentelic marble, and closely allied to the Parthenon figures in general

conception and the technique of details. From the rough condition of certain parts, and from the general pose of the figure, it seems likely that, as Karl Bötticher long ago conjectured, it was intended as a pediment figure to be seen at a high elevation and from a distance. M. Bulle has also pointed out that the dowel marks in the plinth are just such as are used for the attachment of pediment figures. Dr. Sauer, in his examination of the pediment marks of the Parthenon, had arrived at the conclusion that a certain central ridge in the east pediment (a Randbank) precluded the possibility of a single central figure. Dr. Furtwängler thinks this can be otherwise explained. It will be interesting to see what Dr. Sauer has to say. A further difficulty is that the plinth of the torso shows clear traces of dowel marks. The front of the east pediment shows no corresponding marks. Dr. Furtwängler explains this by a theory that the figure was carried off to Rome, and there used to decorate some temple pediment, and the dowelling marks made at that time. The whole theory is an interesting one: and whether the actual Athene is now found or not, we believe that a figure of the goddess did dominate the east pediment, thereby marking the temple as her own. The "Intermezzi" contains several other papers of great interest. A beautiful bronze head of Apollo from the Chatsworth collection is published, and its recognition is due to the acute eye of the Duke's new librarian, Professor Strong.

THE number of ancient Greek roadways that have been recently discovered is distinctly noticeable. The course and structure of the old Panathenaic Way at Athens is now known in detail, and the same may be said of a considerable portion of the Sacred Way at Delphi. During the autumn months two other important roads have been laid bare: one by the Americans at Corinth, noticeable from the fact that it has a paved footpath at each side; the other road discovered is the road that led from the Dipylon Gate to the Academy. This was, of course, one of the most important roads from Athens; its direction has been much disputed, and turns out to be somewhat different to what had been conjectured. Along this road lie, as is well known, some of the most important public grave monuments of Athens. Long ago, Dr. Schliemann tried to find the tomb of Perikles, but prohibitive prices were asked for the land. Let us hope that the Greek Archaeological Society now at work may be more successful.

THE General Council of the Seine, on the suggestion of "Mairies." M. R. Brown ("Inspecteur-en-Chief des Beaux-Arts") has voted money for some new decorative work on buildings in the suburban district of Paris. M. E. Michel Lançon and M. Ferry have been commissioned to decorate the new Mairie of Suresnes, one of the most graceful buildings in the environs of Paris, of which we published an illustration some time since. M. Lançon is to execute three large ceiling-paintings in the Council-room, and M. Ferry is to paint two landscapes with figures on the grand staircase. M. Eugene Simas is commissioned to paint a large decorative landscape in the Mairie at Créteil. M. Hercule, a sculptor who has produced some excellent

work, is to execute a marble bust of "The Republic" for the Mairie of Maisons-Alfort; and four decorative vases in bronze, after an ancient model in the possession of the Paris municipality, are to be erected at Clichy-la-Garenne, in a large square recently completed in the centre of that Commune. In commissioning landscape subjects, which are not in a general sense the most suitable for decorative painting, for the suburban Mairies, the General Council aimed both at securing some variation from the constant succession of allegorical subjects in decoration, and also at making some of these paintings a topographical record of the original aspect of the neighbourhoods concerned, which are constantly undergoing change from year to year.

WE understand that the proprietors of the Alhambra Theatre are about to extend their premises by rebuilding No. 28, Leicester-square, and the house at the rear in Castle-street. In 1768 John Hunter moved from Golden-square into a house in Jermyn-street in succession to his brother, William. Upon the expiration of the lease, 1783, he purchased a twenty-four years' lease of No. 28, Leicester-square and what was then No. 13, Castle-street, with the ground abutting upon Leicester-court, entered from Castle-street, between the two. On that ground he erected, at a cost of 3,000*l.*, a large museum for his collections, and lecture and dissection rooms. The museum, latterly used as a workshop, rises through two stories, with a wide gallery midway, and is lighted by three cupolas in the roof. A plan of the two houses, museum, &c., drawn by his assistant and curator, William Clift, we have seen in the collection of papers and drawings deposited by Sir Richard Owen's executors in the Royal College of Surgeons. At Leicester-square, Hunter (like Sir Joseph Banks in Soho-square) held his Sunday evening receptions, gave courses of lectures, set up a printing press and book-warehouse, and, in 1785, instituted with Dr. Fordyce the Lyceum Medicum Londinense. Hunter died in 1793, and was buried in St. Martin's-in-the-Fields. His remains, found after a long search in the vaults (1859) by Dr. Frank Buckland, were re-interred by the College of Surgeons, near Ben Jonson's grave in the north aisle, Westminster Abbey. His pictures, drawings, and library were sold "by Mr. Christie, at his Great Room in Pall Mall," January and February, 1794. In the auctioneer's catalogue (Stone Collection) of the sale of his household effects, including a set of painted hangings by Zucarelli, on September 24, 1806, the house is described as "his residence, No. 28, on the east side of Leicester-square"; yet it appears that it had been previously known as No. 12, Leicester-fields. The materials of the house he built at Earl's Court, Kensington, in 1763, were sold at auction, February, 1886, when the ground, two acres, was taken for Barkston-gardens.

**New System
of Railway
Signalling.**

THE electrical system of railway signalling, invented by Mr. W. S. Bout, which is now

being tested in daily working on the Manchester, Sheffield, and Lincolnshire Railway near Dinting Station, promises to be of great importance. Although many electrical systems of communicating with trains in motion have been devised, few of them can be de-

Brass of Sir Nicholas Hawberk (A.D. 1407), in Cobham Church, Kent.
From a rubbing by Mr. C. W. B. Bradon.

ended upon in actual work. The weak point about most of them is the mechanical method adopted of making electrical contact with the train. No mechanical method can be absolutely relied on in all weathers and in all conditions of the line. Mr. Boul's system is a very simple one, an electro-magnet on the road actuating two needles in a box below the engine, and each of them completing a circuit works two miniature semaphores in front of the driver and at the same time rings a bell. The use of two contact-making needles is to avoid all risk of a danger-signal failing to be received.* The signalman is thus enabled to have direct communication with the driver and guard even when the train is at full speed. If this system stand the test of further experience, it will make semaphores and coloured lamps superfluous, and do away with the present barbarous system of fog signalling.

We observe from a notice in the *Centralblatt der Bauverwaltung* that the Supreme Court at Leipzig has refused to endorse the verdict of a lower Court punishing the theft of electrical current, owing to the laws of the country having restricted the punishment for theft to "tangible objects," whilst an electrical current cannot be considered as such. The decision of the Supreme Court no doubt exhibits the legal mind in its most conscientious and strictly logical aspect. Whether the verdict is equally in accordance with justice and common-sense is another question.

BRASS OF SIR NICHOLAS HAWBERK (A.D. 1497), COBHAM, KENT.

The brass here illustrated lies in the chancel of Cobham Church, Kent, in commemoration of Sir Nicholas Hawberk, the third husband of Lady Joan de Cobham, who was his second wife. This is considered the finest military brass of the period.

The figure is surmounted by a handsome triple canopy, containing in the centre the Holy Trinity, on the right the Blessed Virgin and Child, and on the left St. George and the Dragon. Sir Nicholas Hawberk's head rests on his tilting helmet as a cushion, a common occurrence in monuments of all description. This helmet is crested with a fish in a circle. At the foot, on a pedestal, stands the figure of his son, John.

Sir Nicholas died at Cowling Castle on October 9, 1497.

Surrounding the brass is the following inscription, written in Latin:—

"Here lies Sir Nicholas Hawberk, Soldier, formerly husband of the Lady Joan de Cobham, relict of Sir John de Cobham, founder of this College, which Nicholas died at the Camp of Cowling on the 9th day of October, 1497, on whose soul God have mercy, Amen."

C. W. B. B.

THE LONDON COUNTY COUNCIL INQUIRY.

THE Special Committee of the London County Council, appointed to inquire into the organisation of the Works Department, met again on the 23rd ult., at Spring-gardens, when the Chairman of the Council, Sir Arthur Arnold, presided. Before the examination of Mr. Blashill, the Architect to the Council, was resumed, two documents were put in, one containing a statement by the Assistant Solicitor, showing the clauses added to the old Metropolitan Board of Works' form of contract, by the London County Council, and the other a report by Mr. C. J. Stewart, Clerk of the Council. The new form of contract besides prohibiting the contractor from underletting, requires him to pay the Trades Union rates of wages, and

to observe the hours of labour and conditions recognised by the Trades Unions. Mr. Stewart's report deals historically with the Works Department from its formation and the appointment of a Manager in January, 1893.

Up to March, 1893, the Council entrusted all works for general repairs to contractors, London being divided for this purpose into four districts, and the work was carried out under schedules of prices which were prepared by the Engineer and the Architect respectively; tenders were obtained for a fixed period on the schedules referred to, and the contractors were asked to state in their tenders at what percentage above or below they were prepared to carry out the work. After that date jobbing works were carried out by the Works and Stores Committee; a clause being added in October, 1895, exempting jobs of the estimated value of less than 5*l.* when they had to be carried out at a distance of more than three miles from the central works, and another added in 1896 giving the option to the Fire Brigade Committee to get executed, either by contractors or by the Works Department, any jobbing work required at Fire Brigade stations. If the Works Committee was satisfied as to the sufficiency of the estimate it proceeded with the work at once, and if the estimate was deemed insufficient, a report to that effect was made to the Council, and the estimate was then referred back, for revision, to the originating Committee. There had been two cases in which works had been refused by the Works Committee, and, tenders having been invited and found to be in excess of the estimate, they had been referred to the Committee on a revised estimate. These works, which are still unfinished, are (1) alterations to Pimlico River-station, and (2) paving work at Mill-lane, Deptford. On the Pimlico estimate of 700*l.* the only tender received was 1,171*l.* This estimate, on being revised to 950*l.*, was accepted by the Committee. For the paving at Deptford the tender received was 1,988*l.*, the original estimate 1,854*l.*, and the revised estimate accepted by the Committee 1,968*l.* Statistical tables appended to the report show that the total cost of works supervised by the Architect was 232,222*l.* upon final estimates amounting in the aggregate to 224,417*l.* The jobbing works executed by the Committee on a schedule of prices show an actual cost of 27,410*l.* upon a scheduled value of 29,372*l.*, showing a profit of 1,962*l.*

The examination of the Architect was resumed by Dr. Longstaff, who brought out the point that the objections to important works being carried out by the Committee were not so great in the case of engineering contracts as in that of architectural contracts, on account of the much greater complexity of the latter than the former. In illustration of this, Mr. Blashill stated that in the contract for Blackwall Tunnel, an engineering work which cost 800,000*l.*, there were only 935 items, while in the contract for a Weights and Measures station, an architectural work costing but little over 6,000*l.*, there were 2,175 items, or at the rate of 150 items to 1, in proportion to cost. Dr. Longstaff (recurring to the extraordinary bill of charges for repairs to a lamp at Blackheath, at a cost of sixty-eight shillings, when the estimate was only eleven shillings) asked: "What could the carpenter have to do with repairs to a lamp? Does not this look like another 'bogus transfer'?"

Mr. Blashill: I should not like to say that. It might have been so. The witness added that he should have thought it only a case of waste of time by workmen had these been merely excessive in number; but when men who could not have been employed on the job were charged, he owned that it looked like another case of transfer. Other cases of extraordinary bills of costs having been elicited, Mr. Blashill said the quantity of the work done by direct labour of the jobbing class was satisfactory, but not the cost. Questioned on the allegation of carelessness of some of the workmen of the Works Department, the Architect instanced a 6-in. drain 160 ft. in length where the cement had not been properly wiped from the inside at the joints. This defect, which was only discovered by a fortunate accident, was a serious one, which would eventually have stopped up the drain, and would have caused considerable expense if it had not been discovered at once. With respect to the charges made against members of the Works Committee of interference, and consequent insubordination on the part of the workmen, the witness said he had heard of such interference, but it was only hearsay and not evidence. With regard to getting the proper amount of work out of the men, he said he did not see why, with proper supervision, the same

work should not be done for the Department as for a contractor. The complaints were not against materials, as a rule.

Mr. Beachcroft: Is it the fact that needlessly superior materials are used, and that the supervision is needlessly stringent?—No. In answer to further questions from Mr. Beachcroft, the witness said the Department tried to get materials as cheaply as possible in order to complete their jobs within the estimate, and that delays had taken place in consequence of the search after cheap materials. He thought it impracticable for the Department to tender, and it was not necessary. Even if the Works Committee were continued, it would always be advisable to get tenders from contractors. He believed the Admiralty and the Ordnance Department did so, and thus got a good test whether they were being well served by contractors. With regard to extras, he must say, in justice to the Department, that it was very solicitous to have his opinions. He made no complaint of the Department for not letting him see their estimates. The Committee was friendly—at arm's length. With regard to work done at New Cross on an estimate of 16,000*l.*, which was higher than any of the seven tenders sent in, the Architect said he did not want to criticise the acts of the Council; besides, one of the good tenders was as high as 14,587*l.*

Mr. Beachcroft: Can you account for the remarkable disparity in tendering? Yesterday, for example, we had some tenders on work estimated by you to cost 100*l.*, the lowest of which was 71*l.* 5*s.* 3*d.*, but one was as high as 1,500*l.*!

—They always found tenderers who did not know how to estimate, and some would send in a tender merely in order to get back the deposit money paid on obtaining the bills of quantities. Sometimes a high tender would be sent in by a contractor who wanted to get his name before the Council, but did not want the job. If from a number of tenders they took off two or three of the lowest and two or three of the highest, they would usually get very good average tenders. In reply to a question whether he would like to put the manager in the same position as the contractor, Mr. Blashill said: No; he only proposed that he should be like himself. He would be in the same way as other officers, responsible to, and controlled by various spending committees. Questioned with regard to the advantage derivable by the ratepayers from the direct employment of labour by the Department, the Architect expressed his opinion that the financial result would not be great. They might get certain kinds of work done more cheaply, but with regard to works generally if it were left to him he should think it better, if there was no other disadvantage, to deal with one set of persons rather than with twenty sets of persons. He thought none but economical reasons should be considered in employing workmen. The employment of labour for the good of the labourer was not to be considered.

Replying to Mr. Davies, the witness said he did not know that lack of technical knowledge made the work done by the Department cost more. Want of proper supervision was the reason why certain works were too costly. With regard to his method of estimating, Mr. Blashill said he went on the ordinary lines of the architect.

Mr. Davies: Do you consider that the abolition of the Department would make any difference to the rate of wages in London?—No.

The witness, in answer to questions, gave further explanations with regard to the bad wood used for doors, iron, used at a fire brigade station, which did not stand the test, and the 60 tons of spent lime used as sand.

In reply to Mr. Torrance, the witness said that the work done by the Works Department had been well done, as a rule. They might carry out a number of works better and more cheaply than contractors, but there had been no great economy. The whole thing was still in the experimental stage, though a number of difficulties had been surmounted. He believed that ultimately the Council would attract superior workmen to its service.

Responding to Mr. Fletcher, the witness repeated his former statement that he had not been more severe against the Works Department than against contractors, nor *vice versa*, except where it was necessary to consider the interests of the spending Committees. When he made the Works Department do work over again, his spending Committees had to suffer, and sometimes it became a question whether he should insist.

Replying to a suggestion to try an experimental tendering by the Committee, he said he was averse to trying experiments where the pro-

* If one of the needles fail, a fault indicator at once points it out to the driver without interfering with the working of the other needles.
+ For reports of previous sittings see our issues for December 19 and 26.

bability was that they would fail. It would certainly be a disadvantage to the Council if contractors refused to tender. He had heard of workmen in the suburbs complaining that they could not get work from the Council. Those complaints would continue so long as the work was given out from one central place.

Dr. Collins, referring to a statement made some time ago by Sir John Lubbock, on the authority of the Architect, asked whether variations of the method of preparing the estimates took place from time to time? Mr. Blashill, in reply, said that for a long time the practice had been uniform, and that since 1893 a more scientific method had been adopted, four quantity surveyors, who were architects, being employed for the purpose. Since 1892 the profit had been lower on account of strikes, and the rise in prices. The recent tables of statistics presented were nearer the mark.

The inquiry will be resumed on Wednesday, January 13th, when it is expected that the Comptroller will be examined.

ENGINEERING SOCIETIES.

INSTITUTION OF CIVIL ENGINEERS.—At the ordinary meeting of this Institution, on the 22nd ult., Mr. John Wolfe Barry, C.E., F.R.S., the President, in the chair, the paper read was on "Steel Skeleton Construction in Chicago," by Mr. E. C. Shankland, M.Inst.C.E. The congested area of the main commercial district of Chicago, confined as it was by the lake, river, and railways, had brought about the erection of high buildings. The compressible nature of the soil, however, had made it necessary to build thin walls, carried on a steel frame, with isolated footings, spread so as not to exceed the safe pressure on the clay, namely, about 3,500 lbs. per square foot. After a brief historical account of the earliest high buildings, a description was given of the mode of designing the steel frame, the disposition of the columns, and the framing plans of the roof, attic, and each floor being respectively dealt with. In a typical case, the Fisher Building, eighteen stories high, the live load, made up to the weight of the tenants, the furniture and the partitions, which were constantly being changed, was taken at between 60 lbs. and 75 lbs. per square foot for the upper floors, and from 75 lbs. to 100 lbs. per square foot for the first and second floors, which were generally used for shops and banks. The weight of the tenants and furniture of a typical office was found by experiment to be only 6 lbs. or 7 lbs. per square foot. The average weight of the partitions was 25 lbs. per square foot. Having ascertained the live and dead floor-weights, the weights of the outside walls, the lifeloads, the weights of the lift and house-tanks, and of the water-closet floors, window-panes, glass, mullions, &c., a column sheet was drawn up showing the weight supported by each column at each floor. The live load, except that for the partitions, was then deduced and the remainder was used in designing the foundations. The unit stresses commonly employed were 16,000 lbs. per square inch per fibre strain in steel I-beams, 15,000 lbs. per square inch for plate girders, and 15,000 lbs. per square inch for short columns in compression. The roof was made up of beams and girders supporting tee-bars, spaced at 18-in. centres, between which book-tiles were built. Over the book-tile was spread a layer of cement, and on this a six-ply tar and gravel roof was laid, and the beams supporting the tees were fire-proofed. The types of columns in general use were mentioned and their relative merits discussed. The steel smoke-stack had supplanted the brick chimney, special arrangements providing for expansion and contraction of the steel where the stack passed through the roof. The author's practice was to construct the frame to withstand a horizontal wind-pressure of 30 lbs. per square foot over the whole side of the building, the resulting stresses were supposed to be taken up by all the columns in each row. If the maximum stress in any column from live, dead, and wind stresses exceeded 25,000 lbs. per square inch the column was enlarged to bring the stress below this limit. The various kinds of wind bracing employed, including roofs, portals, knee braces and plate girders between outside columns were illustrated, and the effectiveness of each discussed. Different portions and connexions of the steel frame, as well as the cover column connexions, spandrel sections, cornice and roof construction, bay win-

dows and balcony construction, &c., were illustrated and described. The most recent floor arches and column fireproofing were also discussed and drawings of different methods given. It had been stated that there was no such thing as fire-proof construction if the phrase were taken in a strictly literal sense, no known substance being able to resist a change of state when subjected to intense heat; but the Chicago high buildings were absolutely fireproof in the sense that they would safely resist any fire which could occur in or around them. This had been shown by severe tests to which certain buildings had been exposed, accounts of which were given. For best practice was to thoroughly scrape off the scale and apply a coat of oil at the mill, and a coat of red lead, graphite, or asphaltum after erection. This sufficed for the beams, but all outside columns were filled with Portland cement concrete. The steel beams used in the foundations were always embedded in Portland cement concrete, without being either oiled or painted, as the concrete adhered better to the unpainted metal. In the case of internal columns, when the fireproofing was well fixed and covered on the outside with plaster, the column was surrounded with a nearly air-tight space and the danger from corrosion was small. Spread footings formed the typical Chicago foundation. Foundations had in some cases been sunk into the hard pan so as to give greater basement height. Experience had, however, shown that it was safer never to descend below the top of the hard pan. If the borings showed any sand pockets or soft spots, the contractor was required by the specification to excavate them, and fill the cavity with concrete. A typical boring was shown, and the results of two tests, to determine the bearing capacity of the clay, were tabulated. The design of a spread footing, on the assumption of a given load per square foot to be used on the clay, was described in detail, and, as an example, a layer of beams in a large footing under the Masonic Temple was computed to show how the number and size of the beams, and their length, were determined. The reason for not using the live load in designing the footings was stated, and a prominent building was mentioned to show the bad effect of using the live load in calculating the foundations. Cantilever construction used in foundation work was described and illustrated. The foundations were only used under a few office buildings, and tubes filled with concrete, were referred to as unsatisfactory. The author considered the settlement was caused by the water being squeezed out of the clay, and that it gradually diminished, and finally stopped. This was illustrated by an occurrence during the construction of the Masonic Temple, and was further shown by the settlement curves of the same building, extending over a period of four and a half years. The amount of settlement of the high buildings amounted to nearly one foot, and the footings were raised, when construction was begun, in anticipation of it. The weight of the steel frame in an office building from sixteen to twenty stories in height was very uniform, ranging between 1½ lbs. and 2 lbs. per cubic foot of the building. The cost was between 49 cents and 6 cents per cubic foot, being from one-seventh to one-ninth the cost of the building. The length of time required to completely finish a high building was between seven months and one year. The paper was also illustrated by lantern-slides, showing typical buildings in various stages of construction.

THE INSTITUTION OF JUNIOR ENGINEERS.—At the meeting of this Institution, held at the Westminster Palace Hotel on December 18, the Chairman, Mr. H. B. Vorley, presiding, a paper was read by Mr. P. W. McDougall, A.I.E.E., on "Electric Central Station Working." With reference to the choice of a suitable site for an electric light station, the author stated that it depended upon two questions—1, whether the system to be adopted be high or low pressure; 2, the relative cost between any proposed sites of obtaining the daily supplies of fuel. Low-pressure stations had to be close to the consumers, but those of high-pressure could be placed right away on inexpensive ground, and with a river frontage. This was a great advantage, not only from the fact that any quantity of water could be obtained for condensing purposes, but also on account of the facility with which sea-borne coal could be brought to the station. As to boilers, the marine type was most suitable for an electric supply station, where quick steaming was an essential quality. Electric light engines used to drive alternators should have as even a turning

moment on the crank shaft as possible, so as to ensure satisfactory parallel running. The latest addition to the Deptford station of the London Electric Supply Corporation, which was designed by Mr. P. Walter d'Alton, engineer-in-chief, had this quality in a very high degree. It was a direct-coupled plant. The engine consisted of three separate compound engines with cylinders tandem fashion on a three-throw crank shaft with cranks at 120 deg. The alternator was of the Ferranti type and generated 100 amperes at 10,000 volts, at a speed of 150 revolutions per minute. The design of the armature, which was built on to the rim of a wheel 16 ft. diameter, was very open, and therefore gave plenty of ventilation and ensured cool running. The governors were either of the throttle or expansion type. The expansion governor was, perhaps, more generally the practice in electric light stations, but although the throttle governor was often considered not at all suitable for electric light engines, where steady governing and economy were such important matters, it had been adopted in some stations with very satisfactory results, especially when the engines were non-condensing. Whatever the type of governor used, it was a matter of first importance that all the governors should have as near as possible the same range of sensitivity. If an engine had a governor which allowed a variation of 1 per cent. another of 2 per cent., then when put into parallel, the one would work against the other, and the load would not be divided evenly, and great unsteadiness of the light would result, and perhaps failure of the dynamos. Alternators could be excited either by small continuous-current dynamos driven by separate steam engines, or by ropes from the alternator shaft, or by rectified current from the alternator. The rectifier method had not proved an unqualified success, the regulation not being satisfactory, a slight variation in the speed of the engine producing a very considerable variation in the voltage of the alternator. The exciters were often a weak part of an alternating station. There should be one for each alternator, driven by ropes off the alternator shaft, and made of ample size, so that the exciting system might not need any special attention on the part of the engineer in charge. With regard to the mains and their insulation, paper saturated with Oookerite (tarb wax), or resinous oil, had given very satisfactory results in high-tension work. The switching gear of a large central station was generally rather complicated, and in a high-tension station the switches had not only to be sure in their action of "breaking" the current, but great care had to be taken that they were well insulated, so that the operator was not endangered. The high-tension switches at Deptford which had been redesigned by the Company's own engineers, consisted of a long, light gun-metal arm worked by a lever of the signal-box pattern. The "break" was 4 ft. 6 in., and being high up overhead, perfect safety was assured. There had been no difficulty in "breaking" the current with the machine working at full speed, i.e., 100 amps. at 10,000 volts, and also on a short circuit. Owing to certain effects due to the capacity and length of the trunk-mains from Deptford it had not been possible to put on a main or withdraw it suddenly by pulling off a plug, without producing a variation in the voltage of the system. But this had been successfully overcome by an arrangement suggested by Mr. G. W. Partridge, of the L.E.S. Company. The main was connected to the bus bar through a high inductive resistance, and was gradually charged to the required potential by reducing the induction. As soon as the potential on the main was equal to that of the bus bar, then the main plug was inserted and the discharger disconnected. The reverse operation was performed when it was necessary to withdraw the main from commission. Arc lamps supplied by Ferranti rectifiers were, perhaps, the most practicable and efficient method of lighting in alternating current systems. Very satisfactory results had been obtained in several provincial towns with street lighting carried out in this way.

SKETCHES OF LONDON STREET ARCHITECTURE.—IX.

HOUSE IN CHEYNE-WALK, CHELSEA.

This is a house designed by Mr. C. R. Ashbee, and erected on the site of the old "Maggie and Stump" at Chelsea. It is built chiefly in red brick, the basement, the porch, and the cornices being in stone. The windows of the projecting bay are constructed in wood, and all the wood-work is painted white.

Sketches of London Street Architecture.—IX. House at Chelsea. Mr. C. R. Ashbee, Architect.

The cornice presents a curious example of indifference to the usual proportions of architectural detail, in the abnormally large size of the egg-and-dart ornament; but the incident is in

keeping with the *naïveté* of style characteristic of the Georgian era and especially of Chelsea architecture, and the house keeps up the traditional local character, besides being picturesque in itself.

PREMISES, EDINBURGH WORKING MEN'S CLUB.—The new premises of the Edinburgh Working Men's Club and Institute in Infirmary-street were opened recently. The architect was Mr. J. Breingan.

Illustrations.

FRIZEE: "VITE LAMPADES."

THIS frieze, under the title "Vite Lampades" ("Life's Torches"), is a design in water-colour which was exhibited at the Liverpool Autumn Exhibition of 1896. Love lights the torch of Life; Sleep and his elder brother Death confront and stay all mortals in their course, taking from each his torch; and these they forthwith quench. The idea was primarily suggested by the lines of Lucretius, bk. 2, 78:—

"Inque brevi spatio mutantur secula animantum,
Et, quasi cursuros, vitali lampada trandunt":—
the allegory being treated in its general significance, and without any attempt to reduce it to the exact terms of an ancient torch race.

J. S. B.

ALDGATE IN 1531.

DOWN nearly to our own day Aldgate was comparatively rich in medieval remains, as it and Bishopsgate were the only portions of the City proper which escaped the catastrophe of 1666; recent "improvements," however, have cleared off almost every ancient landmark, except the two churches of St. Andrew Undershaft and St. Catherine Cree. It must be admitted that both are interesting structures and have been carefully preserved. St. Andrew's is an excellent example of a late "Perpendicular" City church, and is moreover the burial place of the great City chronicler, John Stowe. St. Catherine's was, with the exception of the tower, which dates from 1498, rebuilt by Archbishop Laud, and is, internally at any rate, a graceful example of the Gothic of his day; it contains a monument to Sir Nicholas Throckmorton, who was a man who had "the courage of his convictions," for he was a Protestant under Mary and a Catholic under Elizabeth.

In Medieval times the glory of this neighbourhood was the magnificent Priory of Holy Trinity or "Christ Church," which was founded and most generously endowed by the Empress Matilda, who gave to the Canons-Regular not only their vast church and convent, but the whole ward of Parsoke, four parishes, and the City gate. This last seems to have proved rather a white elephant to the religious community, as it brought them frequently into collision with the civic authorities. It will be seen from our view that the monks were allowed to carry their buildings right across the main thoroughfare, so that the only access for the citizens was either through the courtyard of the Priory, or round by the narrow lane called the "Poor Jewry." This right over the City gate was upheld in favour of the monks by every English Sovereign until the suppression of the monastery by Henry VIII. in 1531. The buildings were shortly after handed over to Sir Robert Audley, who pulled down the greater part of the church and converted the monastic buildings into a dwelling-house. In the time of James I. the place seems to have become a kind of "rookery," and a good Alderman of London built a brick church amidst the ruins of the ancient building, which was called "St. James's, Duke's-place." Old views show that it was a Gothic edifice, of small dimensions, probably built of old materials; it was rebuilt in the eighteenth century in a perfectly plain manner, and was finally pulled down in 1878.

At the present time nothing, except a small arch at the back of a shop, is to be found of all this great monastery; though no longer back than the year 1876 the present writer made sketches of two beautiful vaulted apartments which existed beneath a house on the site of Messrs. Moses & Sons' Aldgate establishment. One of these stood north and south, and the other east and west, in the shape of a letter L. The vaulting, and, in fact, the whole structure, was early fourteenth-century work, 14 ft. in span, and very carefully constructed, with richly moulded ribs, carved bosses, and corbels adorned with foliage and grotesque heads. The walls had originally been pierced by large windows, so that it could not have formed a portion of a crypt; it was on the opposite side of Aldgate to the main structure of the Priory, and probably formed a portion of the Prior's house. It may here be noticed that the ground floors of the Bishop's palaces at Wells and Norwich are vaulted, but not so elaborately as this, and I am inclined to think that one

of these may have been the Prior's Guest Hall; they evidently formed the angle of a courtyard, but what was their original length or height it was impossible to say, as they were walled off and filled almost up to the "springing" with earth. In the year 1851 another beautiful building existed behind the houses facing Aldgate pump. It consisted of a hall, vaulted in two spans, supported by lofty and extremely elegant clustered columns. The sides of the building were not at right angles and, no doubt, it stood between the gates which led from the courtyard of the Priory to Aldgate-street-Within and Leadenhall-street. Numerous plans, elevations, and perspective drawings by Sewell and others are to be found. True writer remembers the building well, and often saw it. The tradition in the neighbourhood was that it was formerly "the Church of St. Michael, Aldgate," but it could never have been a church, and was in all probability the refectory for poor pilgrims, which was always attached to the gates of the greater monasteries. It was only 45 ft. long by about 24 ft. wide, so that the little space of ground might have been spared for one of the most beautiful architectural remains in the city.

The principal gate of the priory, in Cree-lane, existed in 1816, and is shown in drawings by Smith, Sewell, and Schnebele; it had a large and a small arch, and was of good Early English work; one of these drawings shows picturesque old gables adjoining. Plans and elevations by Wilkinson and Schnebele, dated 1823, show the plan of part of the cloister court on the site of Duke's-place, and the building forming the western side of that structure with a great hall on the upper story, 120 ft. long by 27 ft. wide. The lower story was pierced by large irregular arches, one looking like a kind of bridge. Audley's alterations, in the latest Tudor style, can be distinguished, and there would appear to have been an external stairway leading up to the great hall, which was probably the dormitory for "externs." To the north was a gateway which led to a public passage on the site of the north walk of the cloisters, and attached to this was a fragment of the west front of the church, with an arch which was probably the head of the window at the end of the south aisle of the nave. In Aggas' view of London (certainly published after 1571) the refectory is shown (partly in ruins) lighted by a range of Gothic windows; it was on the south side of the cloister court parallel with the church. In the so-called "view of London, by Van Wyngaerde," the church is shown entire, with a great centre tower like that of St. Saviour's, Southwark; the ends of the choir and transepts flanked by large turrets. The square east end is, at first, a little puzzling, because the etchings and drawings of the ruins in Mitre-court, by Smith & Sewell, in 1802 and 1803, show a Norman chevet and radiating chapels, but probably the east end of the choir had been rebuilt square in the fifteenth century (as was the case of St. Bartholomew the Great, an almost contemporary church of the same order) leaving the old Norman chevet and eastern chapels. The church was a favourite burial place for City worthies, and the first Lord Mayor of London, Alwyn Childe, was interred here. There are numerous drawings and engravings of the ruins of this noble monastery, but hunting them up has been a work of several years, as they are in portfolios and books in several of the London museums, and some of them in a History of London in twenty-seven volumes without index, arrangement, or pagination!

The old City gate, at Aldgate, was singular in plan; it was, in fact, a double gate, the inner one possessing two archways, one leading into the Jewry, and the other into the court of the monastery, so that it may almost be said to be at right angles to the City wall. The outer gate had lofty towers, upon which were exhibited those ghastly trophies, the amputated heads and arms of those who had suffered the "extreme penalty of the law." The gate is shown fairly distinctly in Aggas, and in the old view in the Bodleian Library, wrongly attributed to Van Wyngaerde, and incorrectly dated 1550.†

The old parish church of St. Botolph, down to the year 1754, stood just outside the gate, a little to the north, on the site of the present building; there are several views of it extant; perhaps the most reliable is one by R. West, dated 1737. It appears to have consisted of three naves of almost equal height and width,

with a fine lofty tower to the south, a singular porch on the same side quite close up to the west end, and a building, probably a vestry, to the north-east. The windows were very large, but the tracery had disappeared, and the roofs were high-pitched; it looks like fourteenth century work, but the tower was probably Perpendicular.

Just inside the Wall was the small old parish church of "Saint Augustine-upon-the-Wall," with an institution called "The Papey" attached. I have been quite unable to discover any reliable drawing of these buildings. The church is, however, indicated in Aggas' view as a very diminutive structure with a low square tower, but, as it is shown in a garden quite isolated, the college attached to it had probably been pulled down at its suppression by Edward VI.

Aggas also shows a large house with numerous gables, and a garden just at the point where Bury-street joins Cree-Church-lane, and opposite to Henegate-lane. This was probably the town mansion of the Abbots of St. Edmund's-Bury, which after the Reformation passed into the possession of the Henegate family, hence the names "Bury" and "Henegate" lanes. There is, however, another street about here, the derivation of the name of which is not so easily accounted for. That is "Bevis Marks," which all historians of London tells us is a corruption of "Bury Marks," but is it in the least likely that "Bury," a word which enters into the composition of some two or more thousand names of English localities (not a few of which are in London itself), could get corrupted into "Bevis" road, after all, what is the meaning of "Bury Marks"? It is much more likely that Bevis is simply the old English word "Beaves," and "Marks" is market, or "Mart." In other words, the place was in early times a meat market, which is extremely likely, as it is close to the town gate, just as Newgate market was.

The distant portion of our view is composed of the following places: Whitechapel, The Minories, Houndsditch, near which will be found the walled garden and farm of Holy Trinity Priory with its "Dove's house," and "Storge gate." The "Dove's house" is shown in the old Bodleian view as a very respectable tower, looking as though it might have belonged to a church. In the extreme distance the villages of Bow, Bromley, West Ham, and Hackney, are indicated by their church towers, which for the most part still exist. The churches of East Ham and West Ham, by the way, are the most interesting and probably the oldest in the whole neighbourhood of London. H. W. B.

SKETCH FOR A CORNER OF TENNYSON'S "PALACE OF ART."

The allegorical palace of Tennyson's poem, as most readers will remember, was built on a "huge crag-platform" (the poet adds "smooth as burnished brass," which crag-platforms never are) where the soul was to "live alone unto herself" and look down in pity, from her isolation, on the common herd who dwell in the plains below.

The idea of this palace on the crag with its solitary occupant always fascinated me, though the present sketch of it can only be considered "as an essay in the intervals of business," having been planned and carried out between Christmas Day and Monday morning, which is short space for designing even a palace in the air and built without contractors.

It is probable that the palace in Tennyson's mind was Gothic, as he speaks of "deep-set windows, stained and traced;" but then the poem was written before the neo-Classical revival.

H. H. S.

GREAT MALVERN.*

The monastery of Great Malvern—more correctly a priory—forms one of a group of churches formerly attached to Benedictine foundations lying within a few miles of each other in the valley of the Severn. Two of these, Gloucester and Worcester, have already appeared in our Cathedral Series, and a third—Tewkesbury—in the present series of Abbeys. A fourth—Pershore—will be illustrated and described later in the present year. Of all these monastic churches Malvern is the smallest, though not by any means less in interest. It has one point of similarity with its neighbours—that of retaining some portion of its Norman structure. Though inferior in scale to the great Norman naves of Gloucester

* The arch is said to have formed a part of the Refectory (?), but more probably it belonged to the infirmary, as it is too far east to have been part of the former building.

† Some of these are preserved in the Guildhall Museum.

* Reproductions are dated 1896, but the date is certainly incorrect. See article upon "London in the Time of Henry VIII."—*Builder* for January 7, 1898.

† The reasons for believing this view to date from the year 1522 are given at length in the article in the *Builder*, January 7, 1893.

* The series of the "Abbeys of Great Britain" is continued this month with illustrations of "Great Malvern." The next of the series (Sherborne) will appear in the number to be published on April 3, 1897.

and Tewkesbury, it bears evidence of being the work of the same period. Later work—of the Perpendicular period—has, as regards the exterior, obliterated nearly all traces of the earlier work, and the apparently late character of the exterior causes something akin to surprise when the comparatively low and simple treatment of the nave arcade is seen on entering.

In the "Archæological Journal" of March, 1845, an interesting paper on the legend of St. Werstan, by Mr. Albert Way, gives many points which should be taken in connexion with an examination of the building. According to Leland, the church was erected by the hermit Aldwin about 1084. There was already in existence apparently a hermitage or oratory dedicated to St. Michael, situated between the present church and the beacon, and which may be said to have been the origin of the larger monastic establishment. The spot now known as the "Hermitage" may mark the site of this earlier chapel, and the present church is dedicated to St. Michael as well as to the Virgin.

By reference to the ground plan it will be seen that sufficient remains of the Norman work to mark the extent of the nave and its aisles, and also the position of the piers of the central tower. There were doubtless aisleless transepts—perhaps with small apsidal chapels on their east sides as at Tewkesbury and Gloucester—and an apsidal presbytery, but although much of the later planning bears evidence of having been framed on earlier work, there is nothing at present existing which enables the exact extent of the eastern portion of the church to be determined. Whatever additions or alterations might have been made during the three succeeding centuries, nothing at present is visible, and the almost entire remodelling of the church in the fifteenth century has obliterated everything of subsequent date to the Norman work already described. This restoration—or rebuilding—was commenced by

Prior John, of Malvern, about 1450, the presbytery being first dealt with, and the nave was not completed until 1476-1486—during Bishop Alcock's episcopate at Worcester.

These Perpendicular works consisted in the entire rebuilding of the presbytery and its aisles, with a Lady Chapel projecting beyond, as at Gloucester and Tewkesbury; the rebuilding of the transepts, central tower (the Norman piers being strengthened), the clearstory of the nave, north aisle of nave and north porch, and a portion of the west front. The original width of the south aisle was, owing doubtless to the monastic buildings and cloister on that side, retained; two doorways being, however, made at its west end. The church as at present existing thus consists of a nave of six bays with aisles and north porch, a tower over the "crossing," two aisleless transepts (the south partly destroyed) and an eastern arm of three bays with aisles, two bays of the centre alley forming the presbytery, the eastern bay, an ambulatory connecting the aisles and, before the destruction of the Lady Chapel, forming the approach to it through an open tracered stone screen below the great east window, as now to be seen at Gloucester Cathedral. The nave columns are about 5 ft. in diameter, and 9 ft. in height between plinth and cap. The caps resemble those at Tewkesbury and Gloucester, and, with the exception of a small portion of the north-east respond, are plain (see illustration). The arches are semicircular, and of three orders, without mouldings or labels. The responds at either end are half columns. The bases are circular throughout, but the three western columns on both sides stand on square plinths. This, doubtless, places the position of the rood screen at the second column from the east, and a recess or niche (now occupied by a modern monument) on the west face of the column marks probably the site of one of the lesser altars. Another small niche with ogee cusped head is on the north-east face of the first column from the west end of the north arcade.

CHELSEA HOSPITAL

NORTH WEST ELEVATION OF

WESTERN DETACHED WING

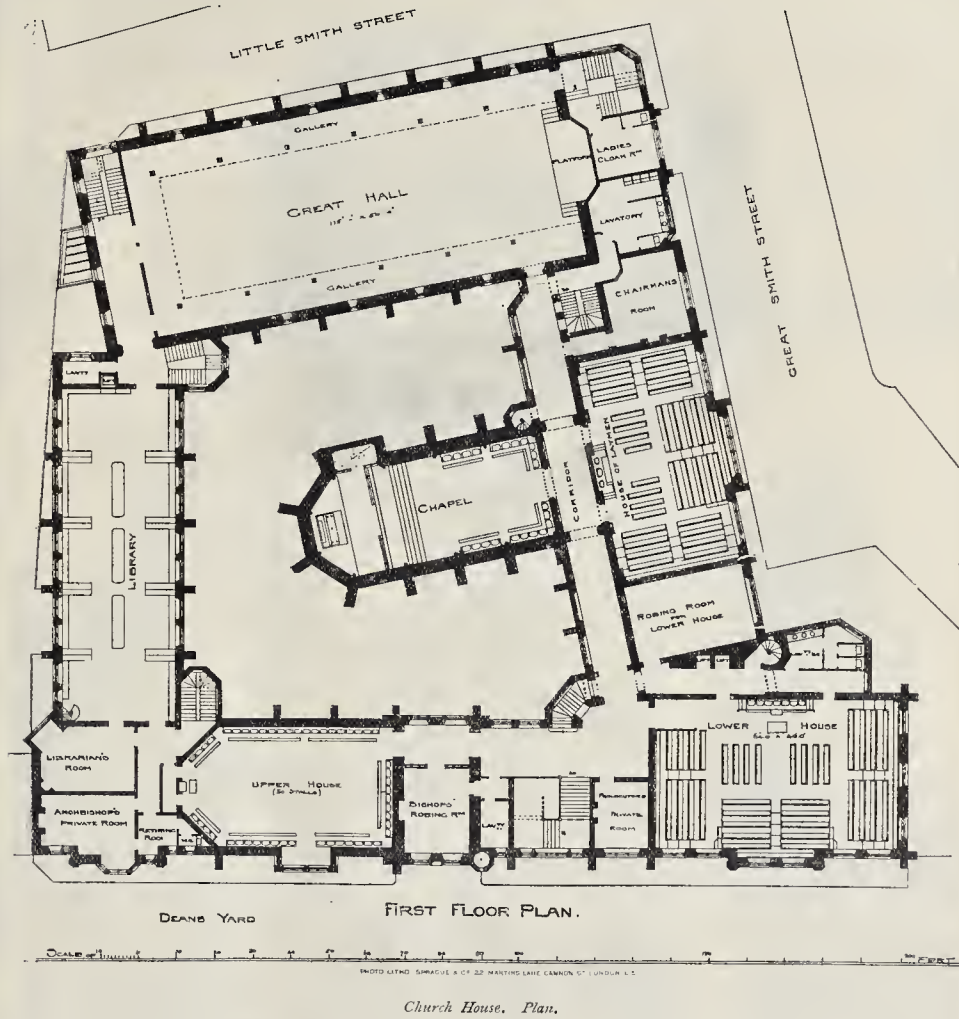

This should be compared with a similar recess at Tewkesbury, near the north porch (see plan of Tewkesbury Abbey in *Builder*, December 1, 1894). The original Norman masonry exists for some little distance above the arcade (see illustration of interior of west-end), and near the site of the rood-screen, already noted, there are evidences of its superstructure in the rough Norman walling. In the south aisle, near the junction with the transept, is the original doorway that led to the cloister, and nearly all this wall is Norman. The north aisle is Perpendicular, with a three-light window in each bay, separated by buttresses, and finished on the exterior by pinnacles, and stone vaulted, with a room over approached by a stair in the thickness of the west wall of the aisle. Both nave and aisles are covered with wooden panelled ceilings. The west window is

a fine Perpendicular one of seven lights, with a transom. The north transept (formerly the Jesus Chapel) has a six-light window on the north side, and a three-light window and doorway in its west wall. Two recesses for effigies, now empty, are in the north wall. Two recesses for effigies, now empty, are in the north wall. Near the floor level on the east side are traces of rougher masonry, possibly the remains of the Norman transept, but the Thompson monument, now at the east end of the north choir aisle, formerly stood here, and it is difficult to say whether the roughness of the stonework is original, or caused by its removal.

The south transept has been almost entirely destroyed, and a later wall with three buttresses has been built up to support the south wall of the tower. A portion of the jamb of its east window, close to the angle with the choir aisle, shows it to have been included in the rebuilding in Perpendicular times.

The ritual choir formerly extended at least one bay westward into the nave, and the inner faces of the tower piers were kept flat to receive the choir stalls. Some of the seats and misericords, with quaint grotesques, are still used as choir stalls, and placed in two rows on either side in the bay east of the crossing (see plan). Over the crossing rises a fine panelled tower of two stages, crowned by large angle pinnacles, and an open embattled parapet. The belfry windows are of two lights, set between pairs of pinnacled buttresses finishing under the main cornice. In the ringing stage are openings with trefoiled heads, the masonry set back at an angle to give the effect of deep shadow. The north and south sides differ slightly in treatment from the east and west sides, owing to the lower level of the transepts. All these features are shown in the exterior view, taken from what is now the kitchen garden of the Abbey Hotel. The design of this tower will recall the larger one

at Gloucester, which in a simpler form it strongly resembles, many of its features, in fact, being identical.

The presbytery of three bays is undoubtedly the earliest portion of the remodelled church. It has holdy designed piers, the mouldings carried round the arches and a shallow cap, or, rather, continuous moulding marking the springing level. At the second pier from the west is the altar screen, with two doorways leading to a space behind, divided from the ambulatory by a curved wall of some height (the altar is approached by four steps, and the side aisles are two steps below the presbytery, thus increasing the height from the ambulatory). It is finished with a moulded cornice, pierced with four small triangular cusped openings. This curved wall is generally considered to be original, and perhaps its form was in some measure due to the apsidal form of the Norman church. Without careful examination of the pier foundations and the space below the altar it is impossible now to say how far the original foundations were utilised, but bearing in mind how much of the early work was retained and recased both at Tewkesbury and Gloucester, it is possible that the form of this wall, and even the position of the piers, might have been fixed by the lines of the Norman Presbytery. The aisles have four-light windows in the side walls, and three-light windows at the east end, and the Presbytery is lighted by clearstory windows of four lights transomed, and a fine east window of eight lights. The south aisle was St. Ann's Chapel. Both

aisles are vaulted in stone, but the Presbytery has a panelled ceiling of wood. Some remains of the side walls of the Lady Chapel are left at the east end, showing it to have been about 23 ft. in width. It is said to have been 50 ft. in length.

The monuments, though not numerous, are interesting. North of the altar is an early effigy of a knight holding a circular shield and a battle-axe. It is well illustrated and described in Stothard's "Monumental Effigies." On the opposite side is a tomb of John Knotsford and his wife Jane, 1589. The tomb stands on a vaulted chapel of two bays, open to the south aisle. This contains two arched recesses for tombs, and on its floor lie two early slabs, one commemorating Prior Walchere, of Lorraine, 1113. The floor of this chapel is much below that of the aisle. The view of it from the aisle forms a picturesque feature of the interior (see illustration). In the space behind the altar are some monuments of the Lygon family, and two modern monuments, one at the east end of the north aisle in memory of Mrs. Sophia Thompson, and another to Sir Henry Lambert, designed by Sir Gilbert Scott, at the west end of the nave, complete the list. Malvern Church is, above all, justly celebrated for its encaustic tiles and stained glass. The tiles are mural, and cover the face of the altar screen, the side screen walls, and curved wall of the Presbytery, towards the aisles and ambulatory. They consist largely of a very interesting series of armorial tiles, including those of Edward the Confessor, and the families of De Clare, De

Spencer, and Beauchamp, and others. A few of the tiles seem of early date, but the majority are of Perpendicular character, and one or two patterns bear the date of 1453 and 1456, showing them to be coeval with the rebuilding of the church. There are two curious tiles with inscriptions—both from the same mould—one attached to one of the columns of the north arcade of the nave, and the other in the screen wall of the sanctuary on the north side facing the aisle. Most tiles have the emblems of the Passion. Other tiles have the emblems of the Passion. Most of the windows in the church retain some portion of their old glass. The great east window, the side windows of the clearstory, those on the south side of St. Ann's Chapel, the north and west windows of the north transept, and the tracery of those in the north aisle of the nave and choir all have very interesting glass of fifteenth century date. Figures under canopies and a series of events in the life of St. Werstan occupy the windows of the choir clearstory. The east window is filled with various fragments of glass, and in the north window of the transept are the kneeling figures of Sir Reginald Bray and Prince Arthur, eldest son of Henry VII., two only of a larger series. In the west window of the same transept are figures of St. John the Evangelist, John the Baptist and Paul, and the Annunciation, Nativity, and Presentation. St. Ann's Chapel has curious representations of the Creation, while the west window of the nave, said to have been given by King Richard III., has figures of St. George and the Dragon, St. Michael, St. Christopher, St. Lawrence, and St.

Church of Sacré Coeur, showing its present aspect with the scaffolding for the central dome.

National Gallery of British Art. Plan.

gathering, one or two coats-of-arms, and various fragments, brought from other parts of the church. A good deal of the glass, except that in the north transept, the clearstory, and St. Ann's Chapel, is not in its original place, but all is of the greatest interest and value. With the exception of the stalls, all the fittings are modern. The font is partly ancient, and stands on modern steps at the west end of the nave, in front of the Lambert Memorial.

Of the monastic buildings nothing now remains except the entrance gateway, a few yards west of the church. It has lately been extensively restored, and has a small oriel window over the archway and a panelled front.

The buildings formerly adjoined the west end of the nave, and communication with the church was obtained through two small glazed openings in the lower part of the west window. The refectory has been removed during the present century and the cloister garth is now the garden of the Abbey Hotel, and the hotel itself stands on the site of a portion of the monastic buildings. The ground falls rapidly to the eastward, and adds much to the dignity of the exterior as seen from the east and south-east. The elaboration of the tower contrasts well with the comparatively simple treatment of the nave and choir, the solidity of the plain wall forming in its turn the best setting for the elaborate windows, especially those at the east and west ends. In 1895 a violent storm destroyed some of the details of the exterior, and one of the pinnacles of the central tower fell through the Presbytery ceiling somewhat damaging the floor of that part of the church. At the present time restoration of the destroyed parts, and renewal, where necessary, is being carried out under the able direction of Mr. T. G. Jackson, R.A.

CHELSEA HOSPITAL.

It has been stated that this time-honoured foundation is about to give way to a scheme for new barracks, a revised system of out-pensions for military service, and a new hospital. In that case we shall lose yet another masterpiece of plan and design by Sir Christopher Wren, who, shortly after Charles II. had laid the foundation-stone on February 16, 1682, was made surveyor-general of the works, completed in 1693. The exterior of the buildings, with gardens extending to the new

embankment, is familiar to our readers. The grounds cover 65 acres, lying for the most part south of Queen's-road, which was formed by continuing the way from Stone Bridge, across the West Bourne (at the end of Pimlico road) to Old Paradise-row, thus separating the Great, now Burton's, Court (14 acres) from the site (7 acres) of James I.'s College, founded by Dr. Matthew Sutcliffe, Dean of Exeter, the Thames Shot (29 acres), and Arnold's Mead (21 acres) on the West Bourne's right bank, and sundry smaller parcels of land. The site of the College was bought from the Royal Society for 1,300*l.*, contributed by Sir Stephen Fox, Paymaster to the Forces, who, according to Evelyn, may justly be considered to have taken a large share in establishing the hospital. The other plots were purchased of Lord Cheyne (Burton Court) and Sir Thomas Grosvenor. Subscriptions of 20,000*l.* to the fund were made by the general public; Tobias Rustat, Gentleman of the Backstairs, and Archbishop Sancroft gave 1,000*l.* apiece; the Army gave a day's pay; and the King resolved, *teste* Evelyn, that "he would settle 5,000*l.* per annum on it, and build to the value of 20,000*l.* for 400 men to be as in a college or monastery." In the result 150,000*l.* was expended. Wren received 1,000*l.*, and in the accounts "an entry of 10*l.* paid, in 1687, to Hawksmoor "for drawing designs for the hospital." Mr. Beaver says in his "Memorials of Old Chelsea" (1892) that by 1872 a total sum of 289,580*l.* had been spent on buildings and lands. In that amount must be included the sum paid by the Crown for the ground—about 22½ acres in all—on the east side, which the governors had leased in 1690, and later to Richard, Earl of Ranelagh, who in 1698 obtained a grant of the two parcels in fee at an annual rent of 5*l.* per annum. On that land he built a house, and in the grounds was afterwards built the Rotunda, described in our "Note" of February 2, 1895. The Ranelagh site is now part of the hospital gardens, and lies south of the burial-ground, along the west side of Chelsea Bridge-road. The infirmary, formerly Walpole House, to which additions were made in 1809 by Sir John Soane, was originally built on the plot known as Great Sweet Court, leased in early times by the governors to one Jephson, whose house was occupied by the Earl of Orford in 1696-1707, and in 1723-46 by Sir Robert Walpole; its dining-room is now

No. 7 Ward. Walpole erected a summer-house and a green-house, designed by Vanbrugh, in a part of his garden, subsequently leased, 1810, to General Gordon. In Gordon House and grounds were held the Military and Naval Exhibitions of 1890-1; their site has been taken for the block of houses designed by Mr. Delius & Josephs.*

In the chapel are Sebastian Ricci's painting of the Resurrection and carving by Grinling Gibbons; the interior is paved in black and white marble, and has Dutch oak wainscot; there is a west gallery, the ceiling is coved in compartments. The organ, by Gray (1817), retains the original case of that presented by Major Ingram; the communion plate is by John Rogers, who in 1687-92 was paid 542*l.* 8*s.* for it. Rustat presented the bronze statue, by Gibbons, of Charles II., in the big court; he defrayed the cost of James II.'s statue, also by Gibbons, at Whitehall. The gardens were at first laid out after the Dutch mode, by William III., yet their formality, since modified, was in keeping with the general style and character of the hospital. Dr. Durney was appointed organist, through Burke's offices, in 1783, and was there visited in 1791 by Haydn. He is interred in the burial-ground belonging to the hospital. The chapel and great hall each measure 110 ft. by 30 ft.; between them is the saloon, octangular, and lighted by a dome and lantern; the east and west wings of the main court are 365 ft. by 40 ft.; at their ends are the officers' houses. In the long room is an interesting view of the hospital by Peter Tillemans, who came to England from Antwerp in 1708. The general design of the building has been compared to those of the Ospedale dei Mendicanti at Venice, and the Invalides at Paris. The proportions are just, the composition is dignified, and admirably proclaims its purpose by a stately simplicity which nowhere deviates into monotony of expression. Many of the details are highly characteristic, such as the beading around the edges or outlines of doorways, windows, compartments, and niches; we may instance, too, the brick and stone piers, capped with vase-necks and balls, at the several entrances about the courts, and the pyramidal iron lamp-standards over the pumps having large perforated pedestals

* *Builder*, March 28 last, "Architectural Association Spring Visits."

and circular columns enriched with wrought foliage. The particulars we give of the site are taken from surveys made by James Hamilton, circa 1680. Burton's Court, on the north side of Queen's-road, opposite the hospital main gates, was converted into a recreation ground for the Guards' Brigade seven years ago. In addition to the general view of the building, we are able to add measured drawings of the detached west wing, by Mr. Alfred E. Corbett, who has kindly lent them to us to assist in illustrating the building.

THE PALAZZO PUBBLICO, PERUGIA.

THE "Town Hall" of Perugia is not the least important of those buildings which meant so much to the mediaeval cities of Italy. Although this Palazzo Pubblico has not so graceful a tower as that of Siena, nor so formidable an aspect as the Palazzo Vecchio at Florence, it has a dignity of its own, and an appearance of strength sufficient to illustrate in its day the important position held by the great city of Perugia amongst its fellows. The view shows the entrance from the Cathedral-square, opposite the famous fountain. The chains and iron bar which hang from the two animals or "supporters"—one of which is the Griffin of Perugia, and the other perhaps intended for the Wolf of Siena—are said to be the chains and bar of the principal gate of Siena taken by Perugia as a trophy of victory in a mediaeval quarrel. Perhaps some day these chains will be returned by the city of Perugia to Siena, like those which once belonged to the Gates of Pisa, and which were taken by the Florentines some time in the fifteenth century, and lately returned by the city of Florence to Pisa, and are hung now on the walls of the Campo Santo.

GERALD C. HORSLEY.

CHURCH OF SACRÉ CŒUR, MONTMARTRE, PARIS.

WE have said so much about this church at different times that it is hardly necessary to repeat the information here, beyond reminding our readers that it was the design of the late M. Abadie, who died however before the building was very far advanced, and has been carried out in the main from his design, though with some modifications which are not all improvements.

The drawing was made on the spot for our pages by Mr. W. Monk, the central dome only, which is still unfinished, being obtained from other sources. We subjoin Mr. Monk's sketch of the building precisely as it appears just now, or appeared two months ago, the scaffolding for the dome having a very picturesque effect.

THE HALL OF THE CHURCH HOUSE, WESTMINSTER.

THE hall of the Church House is the first portion of a group of buildings which, when completed, will enclose an irregularly-shaped quadrangle and occupy nearly the whole space bounded on the north by Dean's-yard, on the east by Tufton-street, and on the west and south by Great and Little Smith streets.

The plan of the first floor as originally designed and adopted shows the general disposition of the various parts, which with certain modifications of detail will, it is hoped, be ultimately carried out.

The arrangement of the Assembly-hall has, in execution, been reversed, the platform being transferred to the east end and another staircase added; in other respects it remains as planned.

The leading idea is that the three Houses of Convocation, the Assembly-hall, the Chapel or Oratory, and the Library, should all be on the same floor and with easy means of inter-communication. The lower floors are occupied by committee rooms, offices, &c.

Under the new hall on the ground floor and basement are sets of offices for letting, but for the present, by the temporary omission of certain walls and partitions, the ground floor is now being used for meeting-places for the Upper and Lower Houses of Convocation, and for the necessary rooms in connexion therewith.

The next section of the buildings to be undertaken is that facing Great Smith-street, which will include the permanent quarters of the Lower House, with committee-rooms, &c., and sets of offices for letting below. These, it is hoped, will shortly be begun.

The Hall needs no description, except to state that the walls are of red brick, with dressings,

* It is, we hear, the present intention to omit the chapel altogether, but it is to be hoped that this decision is not irrevocable.

Monument to the Emperor William I., Porta Westphalia. Plan.

&c., of Portland stone, Ancaster stone being used internally. The fittings of the Hall and the roof are of oak, the latter being covered with Whitland Abbey slates.

The contractor was Mr. John Thompson, of Peterborough; and the architect Sir A. Blomfield, A.R.A.

It should be added that when the Hall was designed five years ago, an organ was promised by an intending donor, which was to be placed in the Eastern gallery—that end which now attracts attention by a great extent of bare wall. The organ, however, is not yet forthcoming.

LIVERPOOL TECHNICAL SCHOOLS AND MUSEUM BUILDING.

THE drawing here published represents the building as it will be carried out, the only important alteration in the design, as compared with the original competition design, being the omission of the small dome above the principal entrance, which the architect (Mr. E. W. Mountford) considered would break the curve in rather an unpleasant manner.

There is another reason however for the publication of this view of the building, as Mr. Mountford considered that the perspective drawing submitted in the competition and published in the *Builder* of August 8, 1896, did not show the design in the most favourable point of view.

RESIDENCE, FIFTH AVENUE, NEW YORK.

THIS illustration, which is reproduced from a photograph, represents one of the last of the large houses designed by the late Mr. R. Morris Hunt, and is a good example of his work of this kind, besides being one of the largest and in some respects the most splendid city residence in New York.

As will be observed, the design shows strongly the impression made on its architect's mind by his Parisian education; indeed, but for one or two details which are not according to the "Ecole des Beaux-Arts" standard, it might pretty well pass for an illustration of a Paris "Hotel."

NATIONAL GALLERY OF BRITISH ART.

WE have before illustrated the original design for this building; the view here given represents the building as it is actually being carried out, with some modifications from the original design; and the revised form of the plan is also given.

The principal entrance doors open into a rectangular vestibule, with an Ionic order 13 ft. high of columns running round the sides, with handed rustication between them for wall surface,

all in Portland stone. The ceiling is a plaster-barrel vault, with panelled stone ribs springing from the entablature over the columns. The height from the pavement to the crown of the vault is 25 ft. 6 in. From the vestibule is entered a corridor 12 ft. wide, which surrounds the central (octagonal) sculpture hall. From this central corridor all the various picture galleries are entered, and they have been so arranged that there is no necessity to retrace one's steps.

There are seven picture galleries, three of them being 59 ft. by 32 ft.; a long gallery, 93 ft. by 32 ft.; a square gallery, 32 ft. by 32 ft., and the two before-mentioned pavilions, shaped internally as octagons, and having a breadth of 32 ft. The picture galleries are all top-lighted, the ceilings being formed with elliptical panelled plaster ribs and ornamental spandrels. The pavilions are lighted from the top by a glass dome, with panelled and ornamental plaster ribs and cornices. The glazing used for lighting the galleries has been W. E. Rendle & Co.'s patent throughout.

The stairs are entirely treated in white marble. The central sculpture hall is open at the first floor, and has an arcade of coupled Ionic columns, with curved balustrades, dividing it from the upper sculpture gallery (which runs all round). The basement of the building is divided up into rooms similar to the galleries, and will be used for picture receiving and cleaning, students' easels, store rooms, and boiler house.

The basement is entered from the ground floor by circular staircases, which also lead to the lavatories and cloak-rooms.

The whole of the carving has been executed from models made at the works, from full size drawings by the architect for every part, which have been given to the modeller, the general treatment being Greek in feeling.

The floors of the central portion will be in Sicilian marble and marble mosaic, and the galleries will have polished oak floors.

The warming and fire appliances are being carried out by Messrs. Z. D. Berry & Sons; the drainage and sanitary fittings, &c., by Mr. Geo. Jennings; the whole of the ironwork was executed by Messrs. Handyside & Co.; Mr. Stone has supplied all the casements and window fittings, the glazing for them being by Mr. W. Ramsey; roof glazing, as before mentioned, by Messrs. W. E. Rendle & Co.; Messrs. Dennett & Ingle's fireproof construction is used in all floors; Messrs. Waygood supplied the lifts, and Messrs. Hayward the prism lights; the carving has been carried out under the direction of Mr. Christopher Smith; and Messrs. Drake & Gorham and Mr. Russell are responsible for the electrical lighting.

The contractors for the building are Messrs. Higgs & Hill; Mr. C. Coggin represents the architect, Mr. Sidney R. J. Smith, on the works. In addition to the building, Mr. Tate, the donor

of it, is presenting also a fine collection of British paintings of great value.

The perspective drawing was made by a pupil of the architect, under his supervision.

The building is now nearly all roofed in and the picture galleries (except floors) practically completed, so that it is hoped that the formal opening will take place the middle of next year.

The Trustees of the National Gallery will have the charge and care of this building, and arrangements are already being made as to the pictures, of which Mr. Tate's fine collection (which he will present) forms the nucleus. The original design prepared by Mr. Sidney Smith showed a lofty central dome, but at the wish of many artists (more particularly that of the late Sir Frederick Leighton), who were afraid of a shadow being cast by this circular feature on the galleries themselves, he was obliged to eliminate it, and the design, after many revisions, is now being finally carried out as shown.

MONUMENT TO EMPEROR WILLIAM I.

We have frequently had occasion to refer to the many monuments which have been erected throughout Germany in memory of the Emperor William I., and have in many instances given particulars of the competitions which were opened with a view to obtaining suitable designs, in many of which Herr Bruno Schmitz was the successful competitor, and his competition successes have often been followed by commissions to act as architect where the schemes have been carried out.

The design here illustrated may be said to be one of Bruno Schmitz's typical monuments, which are primarily architectural memorials. As in other monuments by the same architect, the advantage of a prominent position has been given, coupled with the requirement that the memorial should be essentially a land mark, the actual statue of the deceased monarch being only of secondary consideration.

The small plan which is appended sufficiently explains the design, which in its execution presents an admirable piece of masonry work. The cross at the top is about 50 metres above the terrace. The situation is on the side of a hill. The cost, exclusive of the statue, has been about 25,000*l.*, and with all expenses, levelling and the statue, about 40,000*l.*

The idea of having a monument for the province of Westphalia dates back as far as 1800, but there were great difficulties in finding a suitable site. Work was not commenced until 1892, and the monument has only lately been inaugurated. Herr Bruno Schmitz—who has now been made a Professor—had sole charge of the execution; the sculptors who participated being Professor Caspar von Zumbusch, of Vienna, for the statue, and Messrs Vogel and Schwartz, of Berlin, for the bas-reliefs. The statue, which measures seven metres and stands on a pedestal five metres high, is of bronze, and comes from an Austrian foundry.

MONUMENT TO WATTEAU, PARIS.

This monument has been recently erected in the garden of the Luxembourg, as the result of a public subscription. The pedestal, in white stone, was executed after the plans and under the direction of M. Henri Guillaume, architect (son of the former architect to the Louvre). The pedestal takes in plan the form of a painter's palette, forming in elevation a semicircle with steps attached. The figure of the woman in Louis XV. costume, seated on the balustrade, is the work of M. Henri Gauquié, who is also the sculptor of the bust of Watteau which surmounts the stone stele forming the extremity of the balustrade. The bust is in pewter, the silvery lustre of which forms an effective contrast with the rest of the work and with the surrounding foliage.

THE "BUILDER" ALBUM OF ACADEMY ARCHITECTURE.

This publication, which we have issued annually for some years back, is now ready, and will be in the hands of those entitled to receive copies in a few days. We may here call attention, however, to the improvement which has been made in it by the addition of plans and descriptions of the buildings or designs illustrated, so that it is now no longer only a collection of drawings of buildings, but affords the opportunity also for studying their plans.

A copy of the Album is presented to every architect or artist who has contributed to its con-

tents. The price of surplus copies to non-contributors, which was formerly a guinea, has now been reduced to half a guinea.

ALMANACS AND DIARIES FOR 1897.

MESSRS. HUDSON & KEARNS, of 83, South-wark-street, S.E., have issued their well-known diaries and blotting-pads for 1897, the merits of previous issues of which we have referred to on former occasions. While not presenting any new features, the diaries and pads are as well arranged as ever, and their get-up leaves little if anything to be desired. "The Architect's Diary," which is issued in two sizes, Nos. 12 and 13 (one and two pages to a day respectively), is not only valuable as a diary, but also for the information likely to be needed by architects which is published in it. The issue contains a list of cases decided in the superior courts of justice during the legal year from November, 1895, to August, 1896; revised regulations under the London Building Act, 1894; the Metropolis Management and Building Acts Amendment Act, 1878; names and addresses of district surveyors, &c., as well as the usual postal and other information. The section entitled "Architecture and Archaeology"—i.e., a list of some London and provincial architectural and archaeological societies—which is apparently complete as far as it goes—does not go far enough, seeing that several provincial societies are omitted from the list. A little more revision of this section in future issues would be desirable. "The Builders' Diary," No. 11, and "Diary and Note Book," No. 9, contain much of the special information to be found in the Architects' Diary. "The Builders' Diary" contains some useful practical tables. The same firm have sent us some of their date-indicating blotting-pads in various styles and sizes. "The Bankers' Pad" is a specially good form.

"The British Almanac and Family Cyclopaedia of Useful Information for 1897" (Charles Letts & Co., Royal Exchange, for the Stationers' Company) is the seventieth issue of a very useful annual. The publication is illustrated, and the aim of the publishers appears to be to produce the most popular annual of this kind.

"The City Diary and Almanac for 1897" (Messrs. W. H. & L. Collingridge, 148 and 149, Aldersgate-street, E.C.) is the thirty-fourth issue of this annual. It is interleaved with blotting-paper, and is a handy and neat little work, containing a large amount of information in regard to the City and City affairs.

"The Railway Diary and Officials' Directory for 1897" (London: McCorquodale & Co., Limited) is a work likely to prove of value to some of our readers, as it contains information as to traffic returns, accounts, dividends, lists of officials, &c. The "Railway Almanac," issued by the same publishers, is an interesting sheet.

We have referred before to the many excellent features of "The Indian and Eastern Engineer" (Calcutta, and London, 28, Victoria-street, W.), and the issue for 1897 is as well arranged and as useful as previous issues. The publication is presented to yearly subscribers to "The Indian and Eastern Engineers." It is to be regretted that the cover of the issue and the interleaved blotting-paper are covered with advertisements.

"The District and Parish Councillors' Diary and Guardians' Manual for 1897" (Messrs. Hazell, Watson, & Viney, Limited) contains the full text of the Local Government Act, 1897, a concise digest of its provisions, and most of the enactments incorporated with or referred to in the Local Government Act, the members of the Local Government Board, and a mass of useful general information. It also contains a diary of two days to a page, with memoranda for the guidance of Guardians and others. The work is handy in size and admirably got up.

Messrs. Dargue, Griffiths, & Company, Limited (specialists in warming and ventilating, 15, Lord-street, Liverpool), have sent us a handy little diary for 1897; and from the Limmer Asphaltic Paving Co. (Moorgate-street, E.C.), and the Rugby Portland Cement Company, we have received their respective almanacs for 1897, which are illustrated and mounted on cardboard.

"The Gloucester" Diary and Directors' Calendar for 1897 (W. H. Bridgen & Company, Gloucester, for the Gloucester Railway Carriage and Wagon Company, Limited), is the second issue of a handy little diary.

"The Gardening Year Book, and Garden Oracle for 1897" (W. H. & L. Collingridge, Aldersgate-street, E.C.) is the thirty-ninth issue of a valuable little work for gardeners.

Books.

The Preservation of Open Spaces and of Foot-paths and other Rights of Way. By SIR ROBERT HUNTER, M.A., Solicitor to the Post Office, formerly Honorary Solicitor to the Commons Preservation Society. London: Eyre & Spottiswoode. 1896.

THE time was when commons and footpaths were of no interest to the dwellers in towns, they were of importance only to those who lived in country places, often very remote from the centres of life. But this is now changed. The extension of the towns of England has brought them into contiguity with various open spaces, so that the commons which at one time were simply places where some few people pastured their cattle, or from which they cut gorse or bracken, have now become important as places of recreation and refreshment. The pathways, which at one time were traversed only by agricultural labourers on their way from the fields to the cottages, are now of importance to men who spend their days in city life. The railways, too, have brought the townsman into close touch with rural life, and he values the woodland footpath perhaps more than the tiller of the soil.

A work at once practical and legal, which can be read by the layman, and is also useful to the lawyer, has thus for some time been needed. It is satisfactory to find that a competent writer has taken up the matter, with the result that the hook at the head of this review will for a long time to come clearly remain the standard work on the subject of which it treats.

It is obvious that the modern interest in commons is in them as places of recreation, at least so far as readers of this journal are concerned. We do not propose, therefore, to touch on rural rights of common. What we are concerned with are rather rights of recreation over open spaces, whether they are what are commonly called commons or village greens.

The first point to bear in mind so far as recreation is concerned is that, in order to justify the playing of games on a common or a green, a custom must be proved to this effect. Moreover, a custom so proved does not extend to strangers, but only to persons who live in proximity to the open space. In these days the popular idea of commons and greens is that they are essentially places for recreation. To some extent this may be true of village greens, but certainly the object of commons was that they might be employed for purposes of utility as for example, that the commons might feed their sheep on them. The world at large may obtain rights of way over them, but more than these they cannot claim, and these only when they are proved by distinct usage.

It is well, however, to bear in mind that the commons near London are now on a different footing to those in the country; for three Acts, beginning with the Metropolitan Commons Act, 1866, are applicable to commons within the Metropolitan Police District, which extends for a long distance outside London proper. In any scheme for the regulation of commons under these Acts the governing body is empowered to set apart portions of the commons for games, to form cricket grounds, and to enclose such parts for their protection. Thus in the Metropolitan area the essential character of commons has totally changed from what it was in the past. They have ceased to be places for use for agricultural purposes, and have become places useful to the neighbourhood for purposes of health and recreation. There can be no doubt that the tendency of legislation and of public opinion is running in the same direction in regard to other commons than those near London. It is indeed a serious question whether the provisions of the Metropolitan Commons Act might not well be extended to all commons within a radius of twenty-five miles of Charing Cross. The protective Act, for what may be called provincial commons, is the Commons Act, 1876, which declares "that it is desirable that enclosure in severalty as opposed to regulation of commons should not be hereafter made, unless it can be proved to the satisfaction of the Commissioners, and of Parliament, that such inclosure will be of benefit to the neighbourhood, as well as to private interest and to those who are legally interested in any such common." The difference, however, between the policy of the Metropolitan Commons Act and this Act is that regulation under the former can be carried out without the consent of the parties actually interested, but under the latter it requires the consent of persons representing two-thirds in value of the legal interests in the common, and

gives the lord of the manor, in the case of a manorial common, a veto upon regulation. The difference in theory is obvious: in the Metropolitan area the public interest is held to be paramount, in provincial districts the public interest is to be considered, but private interests are held to be of higher importance. Sooner or later the former theory will have to be extended beyond the present narrow extent, and it should for some reasons be done promptly. There are now to be found commons outside the Metropolitan area which are becoming surrounded by houses; these commons are undrained, and frequently tend to cause ill health; their open character is more than counterbalanced by the sodden nature of the soil.

We do not propose to state the technical steps by which a common can be placed under the care of a local authority. It is sufficient to say that under any such scheme provision is made for draining, manuring, or levelling a common, planting or improving it, making by-laws for the prevention of nuisances or the preservation of order, for general management, and for the appointment of conservators. There is no doubt that any such scheme is most desirable in the interests of residents near a common, though it is to be hoped that good sense will prevail in one particular, viz., that no attempt will be made to *improve* the natural beauty of a common, which is still in an untouched state. On the other hand, there are some commons round the edges of which some planting of timber would be for the benefit of future inhabitants.

The subject of footpaths is, in many respects, of no less importance than that of commons; it is in the public interest that they should be kept free and open, and any one who wishes to know how this should be done may well read what the author of this treatise says on the subject. The main point to bear in mind is that once a right of way is established, it cannot be lost except by means of certain public measures, and after it has been shown that such way is useless, or that some equivalent is given for it. No footpath can now be destroyed where the local public is reasonably vigilant, and we hope that in every part of rural England these important rights will be kept intact.

Der Bau des Reichsgerichts zu Leipzig. By VOLKMAR MÜLLER. Berlin: Georg Siemens, 1896.

We have much pleasure in calling attention to the excellent series of descriptions of well-known modern public buildings in Germany issued by Mr. Georg Siemens, of Berlin, of which this guide to the Imperial Law Courts at Leipzig is a second number, the first having been the guide to the new Houses of Parliament at Berlin. The guide-book under consideration is well written and shows the sound architectural knowledge of the author—Herr Müller. It is illustrated by five views in photo-lithography and two plans. The frontispiece is a photograph of the architect, Herr Ludwig Hoffman, who now occupies the office of City Architect in Berlin. The book commences with some notes on the general requirements of German public buildings, followed by a description of the plan from an architect's point of view, and the guide proper, which then follows, is written in such sequence as to conduct the visitor through the whole building in an easy and intelligible manner. The pamphlet ends with some criticisms, which are, of course, written from the German point of view, and some historical and technical notes as to the construction of the building. It would be well if similar guide-books were available for our modern buildings, and for the matter of that for older buildings, for the guide-books offered for sale in this country are generally beneath criticism.

Practical Hot-Water Heating, Steam, and Gas-fittings. By JAMES J. LAWLER. New York: Excelsior Publishing House.

THIS is short, practical treatise on each of the three above-named subjects by an American. We do not quite like his tone, and the following paragraph gives an idea of it:—"And since Americans pay well for American brains, the wonderful improvements made in the line of sanitary appliances for domestic purposes within the last ten years show that they have lost no time, and have outstripped every other country on the face of the earth, no matter how old it may be." And again:—"How much we thought the customer would pay where we had the inside track." These are not necessary remarks in a book which is essentially one for fitters and the trade. There are some useful tables and advice to those about to set out lines of pipes, but there

is nothing above the average. We highly approve of the advice given, that all mechanics engaged in the special branches should study their own trade journals at least, if not some of those outside their own line in addition, as nowadays it is necessary for a man to be able to take advantage of all the latest improvements if he wishes to do work which shall be up to date. A great portion of the book is taken up in descriptions of the various sorts of fittings used in the States; and very useful will be in that part of the world; but only one short chapter is devoted to the "one pipe" method of heating by hot water, and we should have liked some information as to steam heating from large centres.

Hints to Plumbers on Joint-wiping, Pipe-bending, and Lead-burning. By JOHN W. HART, R.P.C. Smith, Greenwood, & Co. 1893.

THIS work is stated to be a collection, in book form, of a series of articles which have appeared in the *Decorators' Gazette and Plumbers and Gasfitters' Review*, suitable for students joining practical plumbing classes, and as such should fulfil its object, as the information given is clear and to the point, although, of course, some advance has been made in the methods since 1893, notably in pipe-bending. For pipes of large bore a new machine by which a bend on a 4-inch pipe can be made in about ten minutes will take the place of the laborious system in use heretofore, which occupied at least a couple of hours. Almost all the types of joints are treated in detail, and a study of them should be of great advantage to the young plumber. Very good advice is also given on a burning subject on works, viz., the reckless way in which plumbers damage all the surrounding work to carry out their particular object, their capacity for doing damage being only equalled by the electric light fitter. It is to be hoped the students will profit by the advice of Mr. Hart, and exercise more care in future. A very great improvement in this class of text-book would be to employ a good man to design the few sketches where an opportunity for such occurs. One of the difficulties of the craftsman is that he is not brought into contact with good design, which would tend to elevate his taste, and an opportunity has been lost in the few sketches of heads and tacks on rain water pipes. It is no excuse that the book is a purely practical one, that the sketches should not show some good design where possible.

A Practical Guide to Warming Houses from the Kitchen Fire by Low Pressure Hot Water on the One-Pipe System. By THOS. POTTERTON.

MR. POTTERTON'S work is of the trade catalogue nature, giving diagrams of a boiler which he has invented to be used in place of the ordinary range boiler, giving a large heating surface and so more power, the flame being made to take a zig-zag course up the centre. With this increased power it is proposed by the inventor to heat portions of houses by means of radiators, as well as supply hot water for domestic purposes. Various diagrams are given showing the best means of carrying this into effect, nearly all on the one-pipe system, and the general idea of economy in making the one fire serve the two purposes is a good one, and would no doubt answer under some circumstances. We are not sure whether it is to be recommended in cases where the water leaves a large amount of deposit, as in that case the whole of the pipes would have their interior more or less coated, reducing the heating capacity largely. This is obviated in the ordinary hot-water system by using the same water over and over again, adding only enough to make up for evaporation and other slight losses. As giving information upon the "one-pipe" method of heating, the book is well worth study. No doubt Mr. Potterton's system would be useful in careful hands, and his hints to fitters as to the best methods of running pipes and such like technical points will be greatly appreciated by the trade in general.

Unsere Kirchen und Gruppierter Bau bei Kirchen. By OTTO MARCH. Berlin: Ernst & Sohn. 1896.

THIS publication, which has been well illustrated, is practically the reprint of various articles which have appeared in the *Centralblatt der Bauverwaltung* and in the *Bayreuther Blätter*. Its purpose is to advance the methods of church building in Germany, especially for small provincial towns and rural districts, and there is much in the arguments and illustrations of the church architecture recommended by Herr March

that reminds one of the principles adopted in many of the small American townships, where, with due regard to purpose, we find those interesting combinations of church, vicarage, school-room, &c., all contained in one block. At a time when church building has become exceedingly popular throughout the German Empire, owing to the influence of the Emperor, the publication should be of considerable service to the communities or to those in authority in the localities concerned. In this country we do not think Herr March's proposals would find much favour, as church building on a small scale and for small parishes has already developed to such an extent as not to necessitate reference to a study of this description. The book, which includes twenty-four pages of text and five plates of illustration is, however, in every way a pleasing one, and the literary portion shows much thought and a thorough knowledge of the requirements of the country for which it is intended.

Mittheilungen über das Verhalten Hydraulischer Bindemittel. By GERHARD HERFELDT. *Notizblatt des Deutschen Ziegler- und Kalkbrenner-Vereins.* By FRIED. HOFFMANN. Berlin. 1896.

THESE two publications particularly call for the attention of our building trades and manufacturers, as they are excellent examples of descriptions of research work carried out in connexion with the testing of cements, mortar, bricks, and other artificial materials. Throughout Germany the subject of the manufacture of building materials is receiving the serious attention of the respective Governments, the Local Authorities, and the trade societies, and the result is that a very considerable amount of literature on the various sub-sections of the subject has been already put together. The *Notizblatt*, in particular, refers to the work of the brickfields and the limekilns, whilst the *Mittheilungen* makes particular reference to the various kinds of mortar. The issue of these publications will be at irregular intervals. The present number of the *Notizblatt* treats of a very interesting discussion at a Trades' Congress on "The Preparation of Lime," and on "Brickmaking"; whilst in the *Mittheilungen* the subject chosen is the "Effect of Sea-water on Mortar." The latter publication contains very extensive statistical details.

TRADE CATALOGUES, &c.

ONE seldom has to complain that firms do not advertise their names sufficiently large on the cover of their catalogues, but Messrs. O'Brien Thomas & Co. (London) go to the other extreme in sending us a volume of more than a thousand pages without any name on the back, or any title page, and it was only after some search through its pages that we succeeded in discovering the name of the firm, incidentally occurring in a specimen of a form of letter for making complaint to a railway company about damaged goods. This is much better taste, no doubt, than the prominent display of the name that we often see; but its entire omission may lead to mistakes as well as to inconvenience. The catalogue itself is a large and important one, including everything in the way of general ironwork—stoves, mantels, lavatories, railways and gates, sanitary and hot-water fittings, electric bell fittings, garden furniture, gaseliers, laundry machinery, kitchen utensils and household ironmongery generally. It is well and clearly arranged and printed.—Messrs. Robert Jenkins & Co. (Rotherham) send us a catalogue of wrought-iron and steel boilers, with exceedingly well-executed and practical illustrations, not merely pictures of the articles, but constructional sections. The Instructions for Telegraphing orders, so as to ensure getting the type and fit of boiler required, are clearly worded and useful. In a note accompanying the catalogue they draw attention to the fact that the heating powers have been altered to what may be expected under average conditions.—Messrs. W. Richardson & Co. (Darlington) send us their illustrated catalogue of conservatories; these illustrations are entirely pictorial; they serve to show that some pains are taken to give the conservatories as good an aspect as possible.—Messrs. Jessop & Appley (Leicester and London) disguise what is really a trade catalogue under the semblance of a practical treatise Appley's "Illustrated Handbook of Machinery"; the book does contain a good deal of useful and practical information besides the diagrams and prices of various machines; but it is a priced catalogue all the same, and we like things called by their right names.—The Crittall Manufacturing Co. (Birmingham) send a handsome and decoratively

ot-up hook of their metal casements and other metal work, such as stays, handles, &c., as well as party-wall doors. The metal stays are well designed, the arrangement of the catalogue is exceedingly good, the drawings large and clear, and the whole gives an impression of representing the best class of work.—Messrs. Oates & Green (Halfax) send a catalogue of sanitary specialties, gullies, pipes, salt-glazed sinks, &c.; and the several forms of latrine shown, made of highly glazed "Naletric" stone ware, appear, as shown in the drawings and described, to be among the best forms of latrine for working with automatically applied waste water that have been devised, from their simplicity and the nature of the materials.—Messrs. Ames, Barrard & Co. (London) send a set of sheets of design for electric light fittings, as specimens of the kind of fittings they are prepared to design for each client, instead of keeping stock patterns, a system which we entirely approve of, and the examples sketched here, for execution in wrought iron, are graceful and in good taste. They are all arranged to be used without unscrewing or taking to pieces.—

Messrs. W. Richardson & Co. (Darlington) send another example of what we may call the essay-catalogue, being really illustrations and descriptions of work done by the firm, under the title, "Hints on Heating," though the compilers do admit that methods are employed which they do not describe; but within its own limits their pamphlet is useful to intending purchasers.—Messrs. A. C. Wells & Co. send the description and illustrations of their plant for painting by machinery, both by compressed air and steam, a process exceedingly useful where large areas have to be painted.—Messrs. R. H. & J. Pearson (London) send an illustrated catalogue of what they term the "Rumford Teale" and Rumford Armstrong fire-places, which are intended to combine the principles of Rumford and Mr. Pridgin Teale. They are made with a preponderance of fireclay and with little iron; we may add that the fire-places are much better designed and much better drawn than we generally find them in trade catalogues.—The Swan Electric Engraving Co. (London) send an illustrated catalogue of specimens of drawings &c. reproduced by their excellent process, which has occasionally been employed in our own pages. The drawback to it from our point of view, is that the size of the plates producible is somewhat limited, but otherwise we have nothing but praise for the results.—

Mr. W. F. Stanley (London) sends us the new edition of his catalogue of drawing instruments, which contains several alterations, and the addition of a telegraphic code for ordering the principal articles.—Messrs. T. Bagshaw & Co. (Bulley) send us a catalogue of wrought iron pulleys, shafting, and friction clutches and couplings, with some practical rules for transmission of power by shafts, wheels, ropes, and belts.—The Universal Sewage Purification Company (Derby) send a descriptive and illustrated pamphlet of their important system of chemical precipitation through upward flow tanks, which should have the attention of those who are about to carry out work on sewage farms.

Correspondence.

To the Editor of THE BUILDER.

PETERBOROUGH CATHEDRAL.

SIR,—It is difficult for one who has not inspected the Cathedral to form any absolute opinions on the controversy, but on one point I think most architects will cordially agree, and that is in deprecating the very absurd suggested reference to an engineer.

On a question of strains in ironwork, or of pure science and mathematics, an engineer's opinion is valuable, but on a question that is almost entirely one of experience and of judgment founded on practical knowledge, there is no one with any public claim to competency to compete with that of an architect.

Most of us are, I hope, quite as well able as an engineer to make any small calculation necessary as to the question of weight to be placed on stonework, although a small section of architects wish to rid themselves of such responsibility; but in this case no powers of calculation can be of the slightest use. An engineer has less experience than any one connected with building in the repair and patching up of old buildings, whereas very few architects are unfamiliar with such matters. Those who invoke the aid of the engineer might do well to remember the fate of

that British Prince who, to resist the inroads of the Picts and Scots, called in the assistance of Hengist and Horsa.

I cannot agree with Mr. Thackeray Turner that the increase of weight on the piers will be but small. On the contrary, it must surely be very considerable, and the danger to the piers that you have yourself pointed out must be great. Neither does Mr. Webb's plan of joggling long-stones on to the facing commend itself to me at all, since of all material stone combines the maximum of weight with the minimum of tenacity. The best material for the purpose, if it be feasible at all, would surely be Portland cement concrete imbedding iron or copper bars. The cement must, of course, be well slaked, and the aggregate should be ash clinkers or gas breeze, so that the weight may really be reduced, as well as perfectly distributed. I have used this material pretty constantly in repairing old walls, since it can be conveniently packed into all sorts of places.

I can hardly help thinking the method might be used in this case and save the destruction that we all deplore. I find a good many architects share my regret that those in charge have not agreed to meet so general a wish as has been expressed to give time for a further and fuller consideration of the matter, even though the original plan has to be eventually carried out.

RALPH NEVILL, F.S.A.

"BRICKWORK TESTS."

SIR,—As one who was present at the reading of papers by Messrs. W. C. Street and Max Clarke on the above subject, I should esteem it a favour to be permitted to make a few remarks suggested by the discussion arising thereon.

In the first series of tests, the papers and resulting discussion and correspondence played round the question of the kind of bricks used in the tested piers, coupled with the use and position of the closer, in which all agreed, as far as one could learn, that the closer constituted the real source of weakness in the initial line of cleavage or fracture (a conclusion which I fail to see has yet been upset). And this would be more especially so in practice as compared with the tests. For, in the one pier yielding the greatest result in the second series of tests, Mr. Max Clarke told the meeting that all the queen-closers were cut by himself (doubtless true and workmanlike), whereas on the building—unless under strict supervision—any brick spawls often serve for interior closers, with an abundance of mortar to make up the deficiency of brick. The President, in dealing with the subject of supervision, and the great difficulty of carrying out the same conditions on the building as in the case of the testing, remarked that the bricklayer has to do a day's work, a sentence into which may be read more than one meaning; and for that reason any ultimate conclusions arrived at from data obtained by these tests must, to be of any value, be based on a large margin of difference between the conditions of testing and the conditions of building in actual practice.

In the second series of tests the subject has been dealt with more as a whole—especially so with respect to the all-important questions of sand and supervision; and if architects would always specify the use of river sand, failing which, that pit sand shall be sharp and clean washed, free from loam and other impurities, we should be working on lines that make for good results. The engineer is no less concerned about the quality of his sand than that of his cement. He bases this faith in methods and conditions, knowing that if these be good, satisfactory results must ensue.

It would be interesting to know whether the piers tested were built with bricks (not the Staffordshire blues) wetted to saturation and allowed to drain; or whether they had been wetted at all. Whether the mortar (lime or cement) was mill-lime (ground) or hand-made; conditions which materially affect results in practice; it being generally accepted that hygro-metric conditions of atmosphere affect the ultimate strength of brickwork in course of erection; or, in other words, that a wet building makes a dry house, and *vice versa*. The best results (as far as strength goes) being obtained in water-bound brickwork where crystallisation has been induced by the continued presence of moisture.

Another interesting experiment would be with similar piers, built with mortar newly made up, which one so often sees specified, and which my own personal experience teaches me to believe is wrong in principle and practice, except during the winter months—and with mortar that had been made up some time, and retempered before use.

Though the frog in a brick be a source of weakness in the brick itself by reason of the diminution of material substance, yet the frog is necessarily one of the conditions which make for the production of a good brick and for good brickwork, on account of the facility of manipulation and easy, solid bedding which it affords; and should, therefore, as a builder, be considered a source of strength rather than of weakness. We are, of course, speaking of the ordinary-sized frog of the stock brick, for

instance, not of the double frog, intended to reduce the cost of freighting. The whole question of brickwork requires overhauling, and in this, so far as the tests go, the Royal Institute of British Architects is conferring a benefit upon the British public.

F. WALKER.

THE CHEMICAL DEPARTMENT OF THE UNIVERSITY OF ABERDEEN.

SIR,—My attention has been called to a letter headed "Ventilation of Marischal College, Aberdeen," which appears in your issue of December 19, and in which the writer, Mr. William Key, says:—

"The Professor stated that it was admitted that these chemistry classrooms at this university are the finest in the world. . . ."

My actual statement was more modest. All that I said was that one or two experts had inspected the new chemical department, and had expressed the opinion that it was "the finest they had seen."

So far from claiming that the laboratories were the finest in the world, I expressly said, in my opening address at the beginning of the present session:—"They will not compare with many of the palatial laboratories now erected on the Continent, especially in Germany." F. R. JAPP. Chemical Department, University of Aberdeen.

LISKEARD CHURCH TOWER.

SIR,—Seeing the announcement in your columns that designs are invited for a new Tower at Liskeard Church, Cornwall, may I be allowed to state a few facts as to what has lately passed in connexion with the existing tower of this Church, so that any who think of competing for this work may know how matters stand.

Early in the present year I was asked to inspect and report upon the condition of the present tower. Before making my inspection I was told by some gentlemen interested that it was generally hoped that my report would be favourable to the removal of the tower, as a certain lady had left a considerable sum of money for its rebuilding if the work was undertaken before a stated date, otherwise the money was to go to Truro Cathedral.

I made a careful inspection of the old tower, and sent in my report on April 4, 1895. Now, sir, one would think that a report bearing on so vital a matter in the history of the parish as the retention or destruction of a tower that linked the present with a past of over 700 years would, at least, receive the careful consideration from those into whose hands the care of this ancient structure is temporarily placed. Some consideration it may have had, but the views expressed in the report were evidently not in sympathy with the wishes of the majority of the Committee. The report was not even acknowledged, no intimation was given me that the report had been considered, or acted upon in any way, nor was I further consulted in the matter; and not until hearing of the advertised competition for a new tower was I made aware of the serious step taken by the Committee. To many, one would think, the most ordinary courtesy would have dictated another course. But, needless to say, the report sent in was entirely adverse to the removal of the fine old tower, which, although it has been allowed to fall into a shameful state of dilapidation is, with its Norman details and carving, by far the most interesting part of Liskeard Church, and which, with careful restoration, would stand to hand on the Church history of this ancient borough for centuries to come. It is surprising that its destruction should ever have been contemplated, and it will be a crying shame if this ancient landmark of the Church in Cornwall is removed simply to satisfy the craving for something new, and the passing whim of a few local townsmen who by chance have the temporary stewardship of this tower.

GEO. H. FELLOWES PRYNNE.

THE NEW HOLBORN POST OFFICE.

SIR,—If not too late, I should like to suggest to the authorities a considerable improvement in New Oxford-street, and one that would secure a Government building an adequate facade.

It is proposed, I understand, to build a new West Central District Post Office, and a site has been partially cleared with that object. This is bounded, on the north, partly by New Oxford-street and partly by a little narrow by street, Hyde-street; and on the west by Museum-street. The piece of Hyde-street might well be abolished, and the small triangle of houses—which will else stand in front of the Post Office—be cleared away. It consists of some six or seven shops, &c., only.

A fine frontage would thus be secured to the new building on New Oxford-street, extending from its eastern boundary to the corner of Museum-street; thus continuing the real line of New Oxford-street, and removing a somewhat stupid and very long break caused by the entering of Hyde-street into it in a very oblique direction.

A glance at the map, or better still, at the actual site, will, I think, show what a real improvement this would be. The Civil Authorities might well join in the scheme, and by setting back the line of houses on the west right up to the (very awkward)

angle of Shaftesbury-avenue, the throttling of the traffic outside Mudie's would be avoided, and the new building he well seen on approach either from east or west. The hock of traffic opposite Mudie's is really becoming serious. C. H. BRODIE.

MORLEY PUBLIC BATHS COMPETITION.

SIR,—I enclose a copy of correspondence which has passed between myself and the Borough Surveyor, as it may be a useful warning to those who may wish to compete. It would seem, from the advertisement in your last issue, that the Borough of Morley is offering the net sum of 15*l.* for sketch plans of Public Baths, the work to be carried out by some one who is incapable of designing it.

December 29, 1896.

ERNEST HERBERT.

37, Bedford-row, London, W.C.,

December 24, 1896.

PUBLIC BATHS COMPETITION.

DEAR SIR,—Kindly send me particulars of above and plan of site as advertised, for which I enclose 10*s.* deposit, to be returned if the conditions are such that it is impossible to comply with them. If there is any doubt as to the successful competitor being employed, to carry out the work, you can return my deposit without the particulars, &c.

From the wording of the advertisement, I should imagine that you have to pay the premiums out of the deposits forfeited, which does not seem a liberal treatment to offer to competitors.—Yours faithfully,

ERNEST HERBERT.

Mr. M. H. Sykes, Borough Surveyor, Morley.

Borough Surveyor's Office,

Town Hall, Morley,

December 28, 1896.

RE PUBLIC BATHS.

DEAR SIR,—I beg to acknowledge receipt of your letter of the 24th inst., together with postal order for 10*s.* As the Corporation cannot give a guarantee to employ the successful competitor to carry out the work, I return you your postal order as requested.—I am, dear sir, Yours truly,

M. H. SYKES,

Borough Surveyor.

Mr. Ernest Herbert,

37, Bedford-row, London, W.C.

The Student's Column.

SPECIFICATIONS.—I.

BEFORE commencing to write a specification the student should endeavour to obtain a clear comprehension of the object and uses of such a document, and then proceed to consider how he can best fit his work for its purpose. The primary object of a specification is to supplement and elucidate the drawings, so that the workmen who have to carry out his designs may completely understand the architect's intentions. It, therefore, especially deals with the quality of materials and workmanship, and describes the sizes and forms of those items which cannot be conveniently shown on the drawings. It may include a description of what is shown on the drawings, but, speaking generally, it is not advisable to repeat or attempt to repeat one document in another. Some things can be far better shown on drawings than described verbally in a specification, and the attempt to include in the latter what is already better expressed in the former, is liable to confuse rather than to inform the mind of the workman. Although the specification universally forms part of the documents on which the contract is founded, it should be remembered that the specification is rather for the use of the foreman either on the works or in the shop, than for the master builder in his office. The conditions of contract are therefore better omitted from the specification, and made a separate document, which can be kept in the contractor's office.

The predominant characteristic of a specification should be precision. Every item which it deals should be so clearly defined and explained that there can be no possible doubt as to what are the intentions of the architect in respect of every detail, and hence what is included in the contract. Precision can only become the characteristic of any particular specification through the exercise of that quality by the writer. He must therefore possess a thorough knowledge of construction, and be able in his mind's eye to see into the innermost recesses of every part of the building, and to follow the consecutive processes by which the work arrives at completion. He must have a competent knowledge of materials, so as to be able to express precisely the quality that he expects. He must know completely the full intentions of the designer in respect of every particular. The right man, therefore, to compile the specification is he who makes the design, and the practice of deputing this work to another, be he quantity surveyor or assistant, is one that is discreditable to any architect worthy of the name, and must

result in a loss of efficiency, and often breeds future trouble out of all proportion to the relief that appears to come from shirking the initial duty. If he would attain precision, let the student be very chary of using terms of general but indefinite meaning, such as "best," "necessary," "sufficient," "proper," and the like, which are but too common in many specifications, and usually indicate clearly nothing but the ignorance or indolence of the writer.

Equipped with the necessary knowledge and the determination to be precise, clear and accurate, the student should look carefully through his drawings and jot down, as memoranda, the headings of the various items in each trade which he is to specify. Then he can take these memoranda and, after numbering them in the order in which he intends them to follow in the specification, proceed to deal with each item in turn. To facilitate reference, each item should have a marginal note or heading, and if the specification is a long one, it is worth while to make an index of these headings. It is advisable to adopt the same order, both of trades and of items in each trade, in all one's specifications; and it is just as well to adopt the order of trades usual in specifications and bills of quantities; whilst, for the individual items, as good an order as any is to arrange them, as nearly as may be, in the order in which they are executed. As materials have to be provided before work can be done on them it follows that in each trade a commencement will be made with a description of the materials for that trade. Then comes a general description of work, and following this the special items in proper order. Where a general requirement stands for all the items of a class it is well to place this general requirement before the description of the particular items, thus: "All frames to external doors to have iron dowels, &c.," should precede the detailed account of the various external doors. The adoption of this practice makes for brevity, and brevity, as far as is consistent with precision and thoroughness, is a desirable feature in a specification, rendering it easier for reference, and more likely to be thoroughly read and remembered.

Although the arrangement of the various items in a specification will naturally be grouped under the different trades, it is advisable not to follow such a division with the literal exactness observed in a bill of quantities, but rather to keep together the description of all the adjuncts of each part. Thus, for example, in describing a door, the linings, architraves, and ironmongery should be included. Indeed, it is quite possible to write a good model specification, totally ignoring the usual division into trades, and grouping the various items under headings of the various parts of a building, as walls, roofs, floors, ceilings, windows, doors, fireplaces, water supply, sanitary fittings, &c. In such a system the heading of "roofs," for example, would comprise a description of carpenter's work in the timbering, battening, and boarding; slater's or tiler's work; plumber's work in gutters, flashings, &c. The adoption of this system implies, of course, that there is one contractor only for the whole of the work, and that the Scotch practice of letting out the work in different trades to different contractors is not followed, but as the single contract system is practically universal in England, and sub-contracting is out of favour both with architects and trades unions, there is little advantage in favour of the older system of specifying by trades.

To facilitate reference between drawings and specifications, it is a good plan to number all the openings on the plans, doors, windows, fireplaces, &c. In this numbering no great attempt should be made to keep the sequence full. Let the doors begin with, say, number twenty-one, the windows with fifty-one, and fireplaces ninety-one, even if there be no more than, say, a dozen doors and a score of windows. The rooms of which there are no special names, as bedrooms, may be lettered bedroom A, bedroom B, and so on.

The student is now prepared to commence the actual work of writing his specification and will head it thus: "Specification of works required to be done in the erection of a house at for in accordance with drawings numbered 1 to prepared by Mr. of the architect referred to in this specification. January, 1897."

Then begin with

"PRELIMINARY AND GENERAL."

Under this heading include:—

Notices and Fees.—Give all requisite notices to Local and other Authorities, obtain all licences, and pay all fees.

Setting-out.—The contractor is to set out the whole of the works in accordance with the plans, and he will be responsible for the correctness of the setting-out, and is to amend the same if it shall be found by the architect to be incorrect.

Dimensions on Drawings.—Figured dimensions are, in all cases, to be taken in preference to scale, and large scale details to be followed in preference to small scale general drawings. In the event of any apparent discrepancy between the drawings, or between the drawings and this specification, the contractor is to ask for an explanation from the architect before proceeding.

Drawings to be Returned.—If this is desired, stipulate accordingly.

Hoarding.—Specify what height of hoarding is required, with its fans, gates, planked footway, and rail, to be to the satisfaction of Local Authorities, and removed at completion. State whether advertisements will be allowed.

Roads and Footways.—State whether the contractor is to take up paving and form temporary roads or footways, and reinstate, or whether he is to pay Local Authority for doing the work.

Temporary Enclosure.—If it is desired to keep building operations within limited space, state how much of site is to be temporarily enclosed with post-and-rail fence, to be removed at completion.

Scaffolding.—The contractor is to supply all scaffolding and plant required for the works, but is not to bring on to the site any other building material or plant not required for these works.

Old Drains, Cesspools, &c.—Carefully search for and open all disused drains, cesspools, &c.; empty cesspools, remove drains, and fill up with concrete.

(N.B.—As this is a very speculative item, it is well to provide a definite amount of digging and concrete to be so used if required.)

Watching and Storage.—Supply all requisite watching by day and night for the whole of the building and works till the completion of the contract, also the requisite storage and safekeeping of all stores and other fittings during and after delivery.

Water and Lighting.—Pay all charges for water and lighting required for the works during the erection of the building, and supply, alter, and remove, as may be required, all pipes and fittings, and pay fees for the necessary connexions. The contractor will be required, before receiving his final certificate, to produce receipts for water and gas.

(N.B.—This last clause is desirable to prevent the employer being dunned by water and gas companies after the completion.)

Attendance.—Each trade is to attend upon, cut away for, and make good after all others, and to perform all work in the nature of jobbing work that may be required. The contractor is to afford facilities to any other tradesman employed by the architect in the building, and to provide scaffolding and attendance as may be required.

Provisional Sums.—In all cases of provisional sums of money and of any specific quantities of work which are included in this specification, the architect shall be at liberty to direct the application of the sum or to deduct all or any portion as the case may require.

The amounts included in this contract as provisional sums are exclusive of contractor's profit, carriage and fixing, unless specially included.

(N.B.—Provisions are frequently a cause of trouble at the final settlement. Instead of the clause given, it may be stated that the p.c. amounts include a certain profit of 10 to 15 per cent. for the contractor, or that they are list prices, but this does not always save the trouble. The specification should define the basis on which p.c. amounts are to be treated, and the architect should adhere rigidly to the basis he lays down in his specification.)

Protection of Work and Materials.—Protect all materials and finished work from damage by weather, carelessness of workmen, or other cause, and make good any damage that may occur. This stipulation is to apply to materials and workmanship of any person employed by the architect as well as that of the contractor.

Latrines.—Provide latrines for the use of workmen, taking the necessary precautions to prevent same from becoming a nuisance; empty, remove, and disinfect with hot lime their site at completion.

Office.—If desired for clerk of works or architect, this should be specified with a stipulation that the contractor is to provide firing, light, and attendance, and remove at completion.

Sand and Gravel.—State whether the contractor is to be allowed to use this on the works, and whether or not he may remove any from site.

Curiosities.—A similar stipulation should be made.
Removal of Rubbish.—Remove and cart away all superfluous earth and rubbish as it accumulates and at completion, together with all plant and superfluous materials.

OBITUARY.

MR. DANIEL BRADE.—We regret to have heard, rather late in the day, of the death on December 11 of Mr. Daniel Brade, the architect who gained a reputation as the only English competitor placed among the successful twelve in the Milan *Exposition* competition. Mr. Brade was born in or near Liverpool, and was articled in an architect's office there, and subsequently went to Sir Joseph Paxton's office for some years. He was in practice in London for two years, after which he bought a practice in Kendal, where he remained for twenty years. He was architect to Lord Beaufort, for whom he built a fine bridge, and also some churches. Since 1850 he had lived in London. Besides his success in the Milan Competition, he won gold and silver medals for two designs for the Victor Emmanuel memorial, and was second in the Leeds Municipal Buildings Competition. He was sixty-seven at the time of his death.

GERMAN ARCHITECTS RECENTLY DECEASED.—We regret to have to record the death of Dr. Paul Spieker, of Berlin, at the age of 77. Herr Spieker was Director-in-Chief to the Prussian Ministry of Public Works, and was hence the leading building official at Berlin; and for a considerable number of years he held the post of Technical Councillor to the Education Department. He was appointed Director-in-Chief at the Ministry of Public Works in 1861, and only died last year. Besides the prizes obtained in his professional career we would add that his popularity was such as to make his resignation felt by all classes of officials throughout Germany. His geniality to the younger members of his profession was particularly noticeable. Of other prominent German building officials who have died in the course of the last month we have to record the death also of Bau Rath Boetike, who held a very high position on the military Board of Works; and of Oberregierungs Rath Busse, who was long associated with the various government building departments, and was a member of the *Akademie für Bauwesen*.

GENERAL BUILDING NEWS.

LUNATIC ASYLUM, DENBIGH.—Extensive additions are about to be made to the Lunatic Asylum at Denbigh, the contract for which, exceeding 50,000*l.*, has been placed in the hands of Mr. Samuel Warburton & Miles, Plating, Manchester. Messrs. C. O. Ellison & Son, of Liverpool, are the architects.

MUSIC HALL, SALFORD.—A music hall, to be called the Empire, capable of accommodating 2,500 persons, is to be erected at Salford. Mr. Frank Matcham has been retained as architect.

PARISH CHURCH, WOODWELL, YORKSHIRE.—The foundation stone of St. Mary's New Parish Church, Wombwell, which is to replace an ancient dilapidated structure, was laid on the 21st ult. by Viscount Halifax. The architects are Messrs. A. R. Garland & C. Hadfield, of Sheffield; Mr. G. Webster, Sheffield, is the contractor; and Mr. F. Coates, of the works, the new church will afford accommodation for 750 worshippers.

POST-OFFICE, TIPTON, STAFFORDSHIRE.—On the 21st ult. the new post-office at Tipton was opened. The building was designed by Mr. Tainer, H.M. Office of Works, Mr. J. Mallin, Churchfield, West Bromwich, being the builder, and Mr. Atkinson clerk works.

RESTORATION OF THE PARISH CHURCH, ALRESFORD, HANTS.—The Church Restoration Committee, Alresford, have obtained from Sir Arthur Blomfield & Sons plans for a scheme of restoration, which have been approved by the committee.

NEW CHAPEL, WHITECHAPEL INFIRMARY.—The new chapel at the Whitechapel Infirmary was consecrated. The chapel has been adapted from a disused ward, at a cost of 300*l.* designed by Mr. Capell, architect, and is intended to accommodate 150 persons. The contractors were Messrs. Jones & Groves.

BOARD SCHOOLS, BARKING.—The schools erected by the Barking School Board on a site near North-street, were opened by Major S. Glennly recently. Mr. C. Dawson is the architect. The schools are on the class room and central hall principle, in three stories. The total accommodation is for 1,714 children, divided as follows:—Infants, 674; girls, 520; and boys, 520. The external walls are of blue, yellow, and buff terracotta bricks, while the internal walls are of glazed piimrose bricks. The cost of the whole work has been 21,771*l.*

OPERATING THEATRES, ST. GEORGE'S HOSPITAL, LONDON.—On the 23rd ult. the new operating theatres in connexion with St. George's Hospital, Hyde Park-corner, were opened by the Duke of Cambridge. The suite of rooms embraces the large (east) theatre, which has been remodelled, and the small (west) theatre, which is entirely new,

two chloroform rooms, one in connexion with each theatre, a sterilising room, and other necessary adjuncts. The whole of the work has been carried out under the personal supervision of the architect, Mr. H. Percy Adams.

HOSPITAL, FALKIRK, STIRLINGSHIRE.—On the 22nd ult. a new fever hospital was opened by the Eastern District Committee of Stirlingshire. The new hospital, which is situated to the west of Camelon village, occupies a site extending to about three acres. The building, which cost about 7,500*l.*, embraces administrative, scarlet fever, enteric fever, and laundry blocks, besides two observation wards. There are twenty-four beds in all, and sufficient cubic space has been reserved to allow of further bed accommodation in case of emergency. The architects are Messrs. A. & W. Black, Falkirk.

LYRIC HALL, DUBLIN.—It is stated that plans of the Grand Lyric Hall, Dublin, have been lodged with the City Architect, Mr. W. H. Byrne, architect, has designed the hall.

CHURCH, CWM PARK, GLAMORGANSHIRE.—The Bishop of Llandaff, consecrated on the 22nd ult., at Cwm Park, St. George's Church. The church, which is situated in the centre of the village, accommodates more than 400 worshippers, and comprises a chancel, nave, south aisle, porch, and tower over 60 ft. in height. The architect is Mr. George E. Halliday, the Diocesan Surveyor for Llandaff. The walls are composed of native stone, while hard Doulton stone is used for the window tracery and other dressings; the hammer-beam roof is of pitch pine. The internal face of the walls is of pointed rubble work. The pulpit and font are of green Bridgend stone. The reredos is of polished pink alabaster, carved. The contractors were Messrs. Knox & Wells. The church is lighted by electricity.

MUNICIPAL BUILDINGS, HYSON GREEN, NOTTINGHAM.—The Mayor of Nottingham (Ald. E. H. Fraser) opened the new buildings at the junction of Radford-road and Gregory-boulevard, Hyson Green, on the 22nd ult. The buildings occupy a narrow site with a frontage of 320 ft. to the Gregory-boulevard, and are set back a distance of some 20 ft. from the thoroughfare. The charge-office and inequest-room above command a view of both the Boulevard and Radford-road. The buildings are of red brick with stone dressings, and have been erected by Mr. J. Adams, of Nottingham, to the plans of Mr. Arthur Brown, the Borough Engineer, at a cost of about 7,000*l.*

PROPOSED NEW THEATRE, ABERDEEN.—A syndicate has acquired from the Town Council of Aberdeen, by way of perpetual feu, a piece of ground with 120 ft. frontage and 126 ft. of depth, on the east side of Rosemount Viaduct. It is proposed to erect on the site a theatre capable of accommodating over 2,000 persons. The building will be fireproof throughout, the pit resting on arches fronting Upper Denburn, a street running under the viaduct at a lower level, but all the entrances will be from the viaduct. The new building will be of granite, and Messrs. Harper & Sutherland, Aberdeen, will act as architects for the syndicate.

BUILDING TRADES, GLASGOW.—Trade generally in all branches of business in Glasgow during the past year has been encouraging, and fully maintained the best anticipations, and presents indications of a promising character for the new year. The electric lighting branch of business has been fairly brisk throughout the year, having received a slight impetus owing to reduction (long promised) in the price of the electric current supply from the Glasgow Corporation.

BUILDING TRADES, LEICESTER.—The past year has been one of the best experienced for a long time past in the various trades connected with building operations in Leicester. Indeed, so busy have all sections of that industry been, and continue to be, that the difficulty is not to find work for the men, but men to do the work. Taken all round, the building trades are probably in a better position than any other in the town at the present time, and the outlook is still a bright one. Of course, the advent of such an immense undertaking as the M. S. and L. new line of railway has had a great deal to do with stimulating enterprise in the direction of building works, although it cannot be said that these have been confined to any particular part of the town. The clearing out of some of the older parts of the borough necessitated the erection of many new cottages as well as new business premises. As would naturally be expected, it was in the outlying districts of the town where the greatest activity in building operations was to be found. A noticeable feature of much of the new building work of the past year or two is the free use which is made of terra-cotta for frontages. Manufactured stone and cement concrete are also largely used, the last-named being, of course, a local production. Just now, and for some time past, empty houses in Leicester have been conspicuous by their absence, a fact that is closely associated with the exceptional activity in the building trades. In almost every direction new working-class dwellings may be seen in course of erection.—*Leicester Post*.

BUILDING TRADES, EDINBURGH AND DISTRICT.—Not for many years has more activity been manifested in the several branches of the building trade than during the past year. One of the largest of

the undertakings at present on hand, the rebuilding of the Waverley Station and the erection of the North British Railway Hotel, has not yet reached the stage when the mason and the joiner with their coadjutors come fully into play; but when the ground has been properly cleared for them the trade will undoubtedly witness a "boom." This, at any rate, is the opinion of those who know how numerous are the new schemes which in the next year or two will be launched, the North British reconstructions, formidable as they are, being only among several which, should they be proceeded with simultaneously, will tax the resources of builders to the utmost. Thus, the Caledonian Railway Company we understand, are seriously contemplating the erection of a hotel above the fine station at the west end of Princes-street, which they recently completed. Then, the Corporation are preparing for the construction of a new fever hospital at a minimum outlay of 250,000*l.*, while the cabling of the streets will necessitate a series of new tramway stations at various points in the city. Another big undertaking will be the building of the Usher Hall, when the Town Council have finally decided where Mr. Usher's gift shall be placed, and there is besides the re-erection of the Council Chambers, or at least such a structural re-arrangement as will be almost tantamount to a re-erection. The year has seen a further extension of the housing capacity of the city, especially in the Morning-side, Merchiston, and Murrayfield districts. Altogether the year has not only been an exceedingly prosperous one for the most influential trade in Edinburgh, but the prospects for the coming year are of the brightest. There have been no wage disputes during 1896. The joiners were on strike for a fortnight pending the re-arrangement of their working rules. The matter was compromised on concessions on both sides. The standard rate for masons fixed by the Master Builders' Association, in conjunction with the men, stands at 9*d.* per hour, but this is by no means the maximum which has been paid, many employers granting 9*d.*, and even 10*d.* The joiners' rate remains at 8*d.*, and has been seldom exceeded; and plasterers 9*d.*, not wood-ward receiving a halfpenny more; bricklayers 9*d.* to 10*d.* per hour; and lathspitters, 9*d.* per hour. The number of masons in Edinburgh is under 2,500—2,300 of the number are paying members of the Edinburgh Lodge of the Operative Masons Association of Scotland—and there are between 1,100 and 1,200 joiners employed in the city. It may be mentioned that a movement is on foot to start in Edinburgh a builders' exchange similar to that which has worked so successfully in Glasgow, and Colonel Bennett, of the latter city, will shortly deliver a lecture on the subject.—*Glasgow Herald*.

THEATRE, RUNCORN.—The foundation stone of the New Runcorn Theatre was laid by Mrs. Caddick recently. The theatre has three main entrances from Front-street. The auditorium is 34 ft. wide by 52 1/2 ft. in depth. The pit floor has a slope of 2 1/2 ft. from back to proscenium wall. The circle on the first tier has a seating for 240, and is also provided with two private boxes. The centre part of the circle is fitted up with 100 tip-up chairs, the side seats being continuous; on this tier also are provided ladies' and gentlemen's cloak rooms, lavatories, &c., complete. The gallery is on the next tier, and will accommodate about 500. The stage is 39 ft. wide by 31 ft. in depth. There are six dressing-rooms. There are also provided refreshment bars to pit and circle, the latter being 28 1/2 ft. by 27 ft. For the heating of the building and dressing-rooms, hot-water pipes are used, on the low-pressure system. The architect is Mr. William S. Shell.

BAPTIST CHURCH, FALKIRK.—A new Baptist Church is in course of erection at the corner of Weir-street and Orchard-street, Falkirk. The new church, which is in the Gothic style, has accommodation for 350 sitters, with ladies' and gentlemen's rooms behind, which can be thrown into one so as to form a hall. Mr. G. Deas Page, Falkirk, is the architect, and the cost is 2,000*l.*

RESTORATION OF GREAT HARROWDEN PARISH CHURCH.—The ancient Parish Church of Great Harrowden, dedicated to All Saints, which has recently undergone restoration, was re-opened on the 10th inst. The architecture of the church is Early English, consisting of nave with clearstory chancel, north aisle, north porch, vestry, and square embattled tower, with four crocketed pinnacles, containing bells and clock. It was found necessary to restore the nave and north aisle. The roof and floors were in a dilapidated condition, and the wood-work decayed. The old-fashioned box pews have been removed, and modern oak seats, with traceried ends, have been placed in the church, and are erected on a wooden floor. Ketton stone has been laid in the passages and aisles, and the old memorial slabs and grave stones have been replaced. In the interior of the nave a new oak pulpit, on a stone base, has been erected, as well as a box pew desk and a new font. The ancient Perpendicular wooden screen crossing the chancel has been carefully restored with a vaulted canopied cornice, enriched by a screen. New roofing of pitch pine has been placed over the nave and aisle and covered with lead as previously. The walls in the interior have been replastered, and the roof, parapets, walls, and stone seats of the north porch have been restored, and new

oak doors have been placed at the north and west entrances. The stonework of the windows and buttresses have also received attention, whilst steps have been taken to protect the base of the walls from wet by providing surface drains. This restoration has cost between 1,000 and 1,200. During the progress of the work fragments of very interesting wall paintings have been found, but they were so fragile, and the plaster so rotten, that it has been possible only to retain the one over the chancel arch and a portion of that on the east end of the north aisle. The arcades have been exposed. They are of Early English character of quatrefoil form, with disengaged columns. Messrs. Talbot Brown & Fisher have been the architects, and building operations have been carried out by Mr. G. Henson, of Wellingborough. — *Norhampton Herald.*

BUILDING TRADE IN FRASERBURGH, N.B.—There has been another year of very considerable activity among the building trades in Fraserburgh. A great many new houses have been erected. Extensive improvements have been effected on existing buildings, and other work of a kindred nature has kept all branches very fully employed. The great want of house accommodation, nevertheless, continues to be felt keenly, and the need of still further enterprise in this respect is great.

BUILDING TRADES, LEEDS.—Paralysed though it was for a period of twenty-two weeks, the Leeds building trade at the end of 1896 may fairly be described as in a very healthy condition. The outlook is exceedingly hopeful, and this is because of the absence of that feeling of unrest and forsoaking of disputes which had marked the beginning of some previous years. The unfortunate dispute of 1896 began on May 1; it ended on September 19; and, perhaps, each side felt that in the settlement they had gained some advantage. The bricklayers got an advance of a halfpenny, which made their payment an hour; the labourers were granted an advance of a farthing, with the promise of another farthing on September 19 next. On the other hand, the alteration in regard to walking-time, which substituted a two-mile radius from City-square for the fixed points which had previously controlled the payment, was regarded by the masters as a move in their favour, especially in view of the rapid rate at which building work was being carried on in the outlying parts of the city. The employers also believed that the adoption of certain new rules would assist them in their trade. The actual condition of the trade has not been better for years. There is work in almost every quarter. Among the larger undertakings are the Manston Hospital, the banks of Messrs. William Williams, Brown, & Co., the National Provincial Banking Company, and the Yorkshire Banking Company. In New Briggate the principal work is the new double arcade, and in Briggate the re-erection of the Buck Inn. Incidentally it may be mentioned that a great deal of alteration to public-house property has been effected. The rate at which dwelling-houses of all kinds, including the back-to-back class, are being erected is a satisfactory indication of the prosperity of the city. The Building Clauses Committee of the Corporation are said to be passing more plans than they have previously done in a similar period, the chief development being in the direction of Kirkstall-road and Buteley Hill, and also in the neighbourhood of Roundhay road. — *Leeds Mercury.*

BUILDING TRADE, PETERHEAD.—The building trades in Peterhead have been busy during the year. More new houses have been put up than last year; and there has been much more work obtained on structural alterations of houses. In addition, the work outside the town has been greater than usual, not a few masons, joiners, slaters, and plumbers having found lengthened employment in connexion with the erection of station houses for the new Cruden railway. In fact, the joiner trade was so promising in the summer time that the men demanded an increase of wages. The masters agreed to increase the standard rate to 6½d. per hour, which is the highest wage that has been paid in the joiner trade locally for a considerable number of years. — *Aberdeen Free Press.*

BUILDING TRADE IN DUNDEE.—To the building trade in Dundee the year just closed has from beginning to end been characterised by almost unbroken prosperity. It opened with the brightest prospects. A number of large undertakings were on hand, with others in view, while the boom in tenement building, although it had to some extent abated, had still left an enormous amount of this class of property in the hands of the builders. Thus throughout the year there has been no lack of employment in any of the branches of the building trade. Indeed, so far as masons are concerned, the difficulty has rather been in a scarcity of men, and no relief could be obtained from other centres in Scotland, where trade has been equally brisk. The only serious trouble was the strike of hewers at the end of May for an increase of 3d. per hour in their wages. Their action brought about a complete stoppage of building operations in the city, but after a struggle lasting for a month or five weeks the men returned to their employment on the old terms. The rate of wages has therefore remained unchanged during the year, viz., 9d. per hour for builders, and 8½d. per hour for hewers. The demand for houses of three rooms has been slack. In many parts of the city, too, there are numerous empty flats of four

and five-roomed houses, accounted for partly by the fact that many people who were formerly content with dwellings of this kind in the city are finding their way to suburbs like Downfield, Wormit, or Newport, and particularly the two last-named, with which there are cheap and easy means of communication. Thus year by year it is becoming increasingly evident that Dundee has been over-built with dwelling-houses. Judging by present appearances, there will be much less tenement building in 1897 than there has been for several years past. — *Dundee Advertiser.*

BUILDING TRADE, INVERNESS.—The year 1896 has commercially been one of the most prosperous in Inverness during the last forty years. The opening up of the Highlands by the introduction of railways gave a boom to the building and other trades, the effects of which were felt for many a day. And now once again the near prospect of the opening of the new through line from Inverness to Aviemore, and the almost certain passing of a bill in favour of either one or other of the companies for the construction of a line from Inverness to Fort Augustus, with a through connection with the Inverary line and speculators to the work of preparing for the great increase of traffic which they confidently expect will follow the completion of these great undertakings. The growth of the town in recent years has been remarkable. — *Dundee Advertiser.*

BUILDING TRADE, HALIFAX.—In the stone and building trades in Halifax there is a consensus of opinion among those engaged that the year has been a busy and a satisfactory one. The stone-quarrying trade has had a very favourable year. Throughout the twelve months the demand has been continuously steady and large. The exports to Germany have been above the average, and the consignments to London have been fairly large, whilst local requirements have been heavier than usual. For flagstones the demand has with difficulty been met, and all sections of the building trades have experienced a fairly busy year. The erection of cottage property on the outskirts, especially in the western district, has been more extensive than usual.

BUILDING TRADE, YORK.—The building trade in York has been very active during the year. Plans for about 350 villa residences, houses, and cottages have received the approval of the Council. Plans have also been approved for the construction of twenty-four new streets and back roads in Haxby-road and Fullford-road districts, showing sites for 300 or 400 houses; also for six new hotels or public-houses. Several large structural alterations to business premises have been approved, and there have been many instances of the conversion of houses into shops or the modernising of existing windows.

SCHOOL, AULDEARN, NAIRN.—A new school has just been opened at Auldearn. The new building was erected at a cost of 1,275*l.*, and 277*l.* for the transformation of the old school into a teacher's dwelling-house. The school will accommodate over 200 scholars. The contractors were—Mason, Mr. Thomas McDonald, Inverness; carpenter, Mr. J. Grigor, Auldearn; slater, Mr. Gray, Inverness; plumber, Mr. F. Wink, Nairn; plasterer, Mr. Campbell, Nairn; painter, Mr. McIntyre, Nairn. The architects were Messrs. Reid & Wittet, Elgin.

SANITARY AND ENGINEERING NEWS.

UNDERCLIFF DRIVE FOR BOURNEMOUTH.—The Bournemouth Corporation appear at last to be seriously taking into consideration the question of an undercliff drive and the preservation of the cliffs in the Bournemouth Bay, and at their meeting on the 30th ult. they instructed Mr. F. W. Lacey, their Borough Engineer, to be prepared with full particulars of his scheme. The ground landlord, Sir George Meyrick, and the London and South-Western Railway Company have promised to contribute towards the probable cost, which is estimated at about 60,000*l.* Mr. Lacey's scheme consists of a concrete wall about 20 ft. wide at the base, and constructed at an incline of about 2 in 1, and finished at the top with a stone coping, and terminating at the bottom well into the stratum, generally known locally as blue clay, at a depth of at least 2 ft. below low-water mark. He is of opinion that this form of wall as a sea defence is greatly superior to the vertical wall proposed in the pre-matured schemes in the competition, which would probably not resist the attacks of a single heavy storm. The scheme provides for a carriage-drive at the promenade from Alum Chine to Boscombe Pier, about 23,000 ft. long. The wall would be broken by flights of steps, giving an aggregate length of 4,400 ft., and the wall would be otherwise divided into bays by circular projections, on which would be placed shelters or seats. These projections would very much help to prevent the washing away of the sand, should there be a tendency to scour. There would be ramps at Boscombe and Bournemouth Piers, Dudley Chine, and Alum Chine for access to the beach, for the purpose of bathing machines, boats, &c., as may be required. The drainage of the cliffs would be effected by means of a system of small drains emptying into shafts sunk at the back of the cliffs, in connexion with adits driven up the face of the cliffs, which should again empty on to the beach through outfall-pipes passing under

the proposed drive. The present state of the cliffs in Bournemouth Bay is such as to render some scheme of the kind highly desirable, as they are so constantly changing and crumbling that an accessible path to the beach one year may be found to have nearly disappeared the next year.

NEW SEWERAGE SCHEME, ABERDEEN.—Mr. William Dyack, Borough Surveyor, recommends a new sewerage scheme for Aberdeen, the estimated cost of which is 150,000*l.*, exclusive of any allowance as compensation for way leave or surface damages. Mr. Dyack's plans provide a complete scheme for the interception and disposal of the sewage from the whole of the city, with two main outfalls—one in deep water in the sea at Girdleness, and the other beyond the bar at the mouth of the river Don—and two secondary outfalls—one at Abercrombie's Jetty in the navigation channel of the harbour, and the other near Victoria Bridge across the river Dee. The works recommended to be executed at once would cost 75,000*l.*, and the works—low-level sewer, high-level sewer from Old Ford-road to Skene-street, storm outfall at Esslemont-avenue, and storm culvert at Hutcheon-street—which are required without delay, would cost 34,000*l.* The scheme includes works for the purification of the Don, and as a means of stopping the pollution of their burns, which unite and flow along the Old-town Links into that river, Mr. Dyack recommends the discontinuance of the process of sewage irrigation on the lands of Spital.

BRIDGE, REDHEUGH, NEWCASTLE.—The Redheugh bridge, which has for some twenty years formed the principal means of communication between the western portions of Newcastle and Gateshead, is about to disappear. The present bridge had as engineer the late Sir Thomas Bouch, who designed the ill-fated Tay Bridge. The new one by which the Redheugh Bridge Company are about to displace it, has been designed by Messrs. Sandeman & Co. Moncrieff.

WATER SUPPLY WORKS, HAVERHILL, EAST ANGLIA.—Col. A. G. Durnford, R.E., an inspector of the Local Government Board, recently held an inquiry at Haverhill Town Hall with reference to an application by the Urban District Council for permission to borrow 2,000*l.*, a further loan on works of water supply. Mr. T. Cockerill (Engineer) attended.

PIER, BANGOR, COUNTY DOWN.—A new pier has been constructed at Bangor. The new pier is 790 ft. in length, and the breadth is 40 ft. The work, which was carried out by the firm of H. & J. Martin, Limited, Belfast, was commenced over two years ago. The work has been supervised under the supervision of Messrs. Martin's engineer, Mr. Wheeler, the foremen on the works being Messrs. Robert and Alfred Pippin.

WATERWORKS, LISBURN, IRELAND.—The formal opening of the new waterworks at Lisburn took place on the 23rd ult. The main features are—first, the reservoir, which is designed to give a population of 15,000 twenty gallons per head, and hold a supply for 122 days. The reservoir is formed by an embankment some 1,200 ft. in length. The catchment area above the reservoir is about 460 acres. The area of ground enclosed for the reservoir is 22 acres. The water is drawn off through valves into a cast-iron stand-pipe, which is in the centre of a cast-iron water tower standing about the middle of the embankment. The supply of water comes from springs mostly on the hills above. There are two filter tanks constructed of concrete, each 102 ft. by 69 ft., giving an area of filtering material sufficient for the work. The filtering material is broken stone, gravel, coarse sand, and fine sand on the top. At the base of the filter there is a clear water tank 82 ft. square, 10 ft. deep, where the water can be stored as it comes from the filters. This tank is constructed of concrete, and covered with the same material. The engineer of the scheme is Mr. Lanyon, M.Inst.C.E. The resident engineers were Mr. D. Sims, M.Inst.C.E., who died in January last, and Mr. A. M. Pearce, A.M.Inst.C.E. The contractors for the works were Messrs. H. & J. Martin (Limited), who were represented at the works by Mr. J. Fleming and Mr. J. Alexander.

ELECTRIC LIGHTING NEWS.

ELECTRIC LIGHT, BRAY, IRELAND.—Mr. R. O'Brien Smyth, C.E., Engineer, Inspector of the Local Government Board for Ireland, held an inquiry on the 23rd ult., in the Town Hall, Bray, with reference to the proposed extension of the Bray Township Electric Light Works, for which the Commissioners, acting as Urban Sanitary Authority for the district, had applied to the Local Government Board for their sanction to a loan of 6,450*l.* Sir Henry Cochrane, D.L., J.P., Chairman of the Bray Commissioners, was present, as were also the Town Clerk (Mr. Patrick McDonnell), and Mr. George Marshall Harris (Township Electrical Engineer).

STAINED GLASS AND DECORATION.

WINDOW, PARISH CHURCH, GOSBERTON.—A new memorial window has been placed in the Parish Church of Gosberton, Lincolnshire. The subject of the window is "The Walk to Emmaus."

and it is from the studio of Mr. T. W. Camm, of Smetwick, Birmingham.

STAINED-GLASS WINDOW FOR BUENOS AYRES.—The window intended for the Church of St. Andrew, Buenos Ayres, and executed by the firm of Messrs. D. & W. Guthrie, Glasgow and London, from the cartoons of Mr. David Gauld, is a perpendicular five-light treatment. The entire supervision of the work has been entrusted to Mr. John James Burnet, A.R.S.A.

WINDOW, ST. GEORGE'S CHURCH, EDINBURGH.—A feature of the improvements now being carried on in St. George's Church, Edinburgh, is the filling with stained glass of the large window of three divisions looking to the west. By somewhat enlarging the height of the central opening, sufficient space has been obtained for the representation of the subject of the Ascension. The composition divides itself into two groups. The upper one, elliptical in its main lines, consists of our Lord, in the act of blessing, surrounded by a group of angels. A hand of clouds and cloud forms of various hues separate the upper from the lower group, which latter consists of Apostles and the Virgin Mary; some kneeling, others standing, but all with upturned faces concentrated on the ascending figure. The side spaces are filled with classic ornament upon a coloured ground, the emblem of the burning bush being prominent. The lower group of George forming central features. The window was executed at the direction of the architect, Mr. Leadbetter, at the studios of Messrs. A. Ballantine & Gardiner, Edinburgh.

FOREIGN.

FRANCE.—M. Homolle, Director of the French School at Athens, has been re-appointed for a new period of six years. In order to give more time for the works for the 1900 Exhibition, it has been decided that the Old Salon this year will open not on the 1st of May as usual, but on the 20th of April, and will be closed on the 8th of September. After which the demolition of the building will commence. Where the exhibition will be held for the next three years, until the new Palace is at their disposal, is not yet known; a memorial has been addressed to the Fine Art Department on the subject. Extensive works are being undertaken for the improvement of the Gare d'Est, which will become one of the finest railway stations in Paris. Twenty window frames are to be spent on the work.—The works for the completion of the Avenue Ledru Rollin, connecting the Place Voltaire with the Seine, are to be commenced early this year.—An International Exhibition, in which industrial art will be largely represented, will be held at Lille, in the Palais Kameau, in April.—The restoration of the old church of Notre Dame-de-Joie, at Pontivy, has been completed by the construction of a stone spire. The work has been carried out under M. Lemoine, architect, of Lorient.—The Municipal Council of Paris has resolved that M. Bartholomé's "Monument aux Morts" shall be erected at Père Lachaise according to the original design, which it had proposed to modify on grounds of economy.—The death is announced of the age of 30, of a young architect, M. Henri Collet, pupil of Laloix. He had obtained the diploma of architect in 1893, and was considered to have a future before him.

GERMANY.—We have much pleasure in recording the fact that the title of an honorary professor has been conferred on Herr Bruno Schmidt, in connexion with the various monuments erected to Emperor William I. which have been executed from his designs.—Of competitions open to sculptors one of the most interesting is at present a memorial to Helmholtz. The subject has been open to a general competition amongst sculptors, and is now being treated in limited competition by the sculptors, Messrs. Hatter, Jarneuch, and Lessing. The memorial is to be placed in the forecourt of the Berlin University.—The new City Architect of Berlin—Herr Ludwig Hoffmann—will have sufficient occasion to make his post a most prominent one; and the Municipality has already voted 7,500*l.* to enable the preliminary work for the proposed local museum to be taken in hand. Herr Hoffmann has promised to have his sketches of Government prize and travelling studentship will next year be awarded to the most successful design for a town hall, and the Civil Engineers theme for a similar prize, offered by the *Architekten Verein*, is for the best plan of a harbour.—The Prussian Royal Academy—the presidential chair of which is now being held by an architect, Professor Ende—has offered a valuable Government prize and travelling studentship for architectural students. The value of the prize is about 150*l.*, and the premium will be awarded to the candidate who shows the best designs of any subject he may wish to treat, or drawings and photographs of work he has executed.—The German Budget contains an item of 3,000*l.* to facilitate the research work on Roman remains in Germany; about 10,000*l.* has been granted by the Government with this view during the last five years.—The public advertisement—or poster—appears to be becoming the subject of considerable interest at Berlin, as there has been a special exhibition of posters in the Arts and Crafts Museum.—The *Centralblatt der Bauverwaltung* publishes some further details as to the training

requirements of Fire Brigade officers, who are now enabled to undergo a systematic course of instruction at the headquarters of the Police Fire Brigade. Knowledge of building materials, construction, &c., is considered essential for the candidates for commissions.—An interesting series of controversial articles on lighting conductors is at present appearing in the *Centralblatt der Bauverwaltung* (published by Messrs. Ernst & Sohn, of Berlin). We shall in due course comment upon the controversy and the results arrived at.—The number of students attending the Royal Technical College at Berlin has now nearly reached 3,000. The buildings at Charlottenburg are now over-filled, and it will soon be necessary to add to the accommodation. Nearly 600 of the number are students of architecture.—Among the many public works in hand at Breslau a new prison has lately been completed at a cost of nearly 100,000*l.* It comprises a separate building for male misdemeanants, and another for female misdemeanants, together with the various offices and tenements for the officials. There are cells for approximately 400 male and 200 female prisoners.—A competition for sculptors has been decided at Dresden for a Bismarck monument; the first premium of 150*l.* has been awarded to Herr Werner Stein.—A competition has been opened for the designs of a new City Hall at Leipzig, and premiums of the value of 600*l.*, 400*l.* and several other prizes will be given. There will be a committee of assessors, comprising seven architects and two laymen. Among the names of those on the committee we notice that of Professor Wallop of Dresden.—The municipality of Hanover has also decided to open a limited competition for the design of a new town hall, the cost of which is limited to 225,000*l.* The competition seems to be arranged on very practical lines, as each competitor who is invited will receive a fee of 600*l.*, whilst the successful design will apparently procure the commission. The limited competition is the result of an open competition held some time back.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. T. Batterbury, hitherto practising as architect at 29 John-street, Bedford-row, has removed his offices to Imperial Chambers, 47, Chancery-lane.—Messrs. D. Campbell & Son, Surveyors, have removed to 4, Finsbury-circuit, their old offices at 69, Finsbury-pavement having been taken by the City and South London Railway Company for a station.—Messrs. T. & W. Farmlice, of Rochester-row, Westminster; Nine Elms, and Mitcham, S.W., have converted their business into a private Limited Liability Company. No shares will be offered to the public, and there will be no change in the management.—Mr. J. T. Passmore, estate agent, of West Kensington, has taken into partnership Mr. H. J. Cooke, formerly with Messrs. Debenham, Tewson & Co. The business will be carried on at Avon Lodge, West Kensington, under the style of "Pa smore & Cooke."—The partnership between Messrs. James Woodward & Rowley, sanitary earthenware manufacturers, Swadlincote, near Burton-on-Trent, has been dissolved by mutual consent. The business will be carried on by Mr. S. H. Rowley, managing partner for twenty-three years in the old firm, whose works are situated near Swadlincote station.—**LIFTS, ITALIAN INFIRMARY.**—The Committee of the Italian Infirmary have agreed to adopt electricity for working the lifts at their new Infirmary. The work, consisting of six passenger lifts and two service lifts, with all motors and accessories, has been placed in the hands of Messrs. Easton, Anderson, & Golden, Limited, of Erith.—**NATIONAL REGISTRATION OF PLUMBERS.**—A deputation from the District Council of the National Registration of Plumbers waited on Mr. Bryce, M.P., recently at the Grand Hotel, Aberdeen, for the purpose of enlisting his sympathy and support in connexion with the Plumbers' Registration Bill. The deputation consisted of Professor Matthew Hay, President of the Council; Mr. A. B. Robertson, master plumber, Vice-President; and the following members of Council—Mr. J. F. Anderson, Mr. William Gardiner, operators, and Mr. E. G. Wilson, architect. It was pointed out that the chief object of the Bill was to confer additional safeguards on the public health by enabling persons employing plumbers to select, when they desired to do so, those who had given evidence of their qualifications for plumbers' work. The Bill, it was also mentioned, did not contemplate any monopoly, and did not interfere in any way with the rights of non-registered plumbers, but prohibited them from representing themselves to be registered. Mr. Bryce, in reply, expressed his sympathy with the object of the deputation, and promised to give the Bill his most attentive consideration.—**GUILDHALL ALTERATIONS, WESTMINSTER.**—The dispute with the builders over the alterations to the Guildhall, Westminster, the meeting place and offices of the Middlesex County Council, is in a fair way to be settled. Messrs. Higgs & Hill, the contractors, sent in a bill for 1,340*l.* over the contract price and extras agreed to by the Council, on the ground that there had been extra work in connexion with some old walling that was made of stone rubble and not brick, as they asserted it had been repre-

sented to them. On the other hand, the County Council put in a claim against the contractors of nearly 1,300*l.* for penalties, and then referred the matter to the County Surveyor as arbitrator under the contract. The contractors objected to the arbitrator, and wished the reference to be to an independent engineer, and the County Council refusing this, the contractors issued a writ for 2,972*l.* 2*s.* 10*d.*, which they said was owing to them. Finally an offer has come from them that they will withdraw the claim for extra work if the County Council also waive a claim of 402*l.* for expenses. The Council has agreed to the terms, and a dispute which has lasted for more than two and a half years will be settled.—*Hornsey Journal.*

ECCLESIASTICAL DECORATION.—On the 22nd ult., in the studios of Messrs. Stephen Adam & Son, 109, Bath-street, Glasgow, Mr. Adam, sen., delivered a lecture to the Glasgow Ecclesiastical Society. It was, he said, in continuation of one on "The Methods of Mediaeval Glass-staining" which he gave before a meeting of the Society in Park Church in February, 1894, and which was published in the transactions of the Society for 1895. Having briefly recalled what was said then on the subject, he went on to refer to lectures on ecclesiastical decoration to which he said he had lately listened. While these had given him pleasure they did suggest a little that this art of his (the lecturer's) should, to put it mildly, take a back seat, that white windows and enriched walls should be desirable features in the perfect church. There was much of truth in what was said, but he asked—But for the mellowed and enriched light which stained glass was so capable of giving, how would the modern over-stencilled kirk interior look? Verily, his art cloaked many sins. The mural decorator had much to thank the glass stainer for; so had the architect. Many criminalities in colour, form, in cheap chiselling, had as it often was, acquired harrowed plumes, subdued richness, by the glorified light of the glass staining art. Genuine work, he continued, could only be produced by men of training who had studied what was good in early work and had the intuitive sense of colour harmonies. The lecturer went on to show wherein and to what extent the modern development of the art had succeeded in catching the spirit of what was purely mediæval glass-staining, where and how in later times it failed to do so, and consequently declined as an art, and how in recent years a healthy Renaissance had sprung up among them like an exhilarating sea-breeze which would resuscitate in modern forms the splendour and glory of earlier work. His hope for the improvement of modern church decoration lay in the restoration of their ancient trade guilds. The lecturer also gave practical illustrations of the process of glass-staining. At the close Mr. Adam was cordially thanked for his lecture.—*Glasgow Evening News.*

NOTTINGHAM AND DISTRICT TRADES COUNCIL.—A meeting of the Nottingham and District Trades Council was held on the 23rd ult., at the Exchange Hall, the chair being occupied by Mr. J. G. Hancock. With regard to the "contracts resolution" previously adopted by the Council, the Secretary reported that he and Mr. Richards waited, as a deputation, upon the Building Trades Council with a view of ascertaining how far that Council was prepared to support this Council with regard to the contracts resolution which they proposed to put before every candidate for municipal honours. The resolution was an important and far-reaching one, and this Council desired to secure a thoroughly united organisation of labour in the town. When the deputation waited upon the Building Trades Council the latter reminded them that this was a principle for which they (the Building Trades Council) had fought for many years, but they held out very friendly overtures to the deputation. He understood that after the deputation left the matter was referred to a committee, and no doubt this Council would subsequently receive a report. The resolution might require the alteration of a few words to make it stronger, but if they secured a thorough unity of workers he thought they would be arriving at a satisfactory understanding, and be considered that the result of the deputation appeared to be a happy augury for the cohesion of the two Councils.

THE EXECUTION BELLS, ST. SEPULCHRE'S.—It is stated that there was found recently in the church vestry, a relic of old times and old customs. It is the hand-bell which the clerk, or sexton, used to ring outside Newgate Prison on the eve of execution of sentence upon convicts in the "condemned cell." In 1605 Robert Dowe (he is called John Dowe in Mumby's Story) gave 50*l.*, arising out of a rent-charge on premises in West Smithfield, "For ringing the greatest bell in the church on the day the condemned prisoners are executed, and for other services for ever concerning such condemned prisoners." The "other services" included the ringing of the hand-bell, with the repetition of certain admonitory lines at the prison, and whilst the prisoners passed the church on their way to Tyburn. The Duchess Dudley gave a great bell to St. Giles's-in-the-Fields for a like purpose (see Hamper's Dugdale). Dowe's Charity was scheduled a few years ago by the Charity Commissioners, who framed a scheme for diverting the money from its original purpose, and giving it, in trust, to the

rector and churchwardens, to be applied in behalf of deserving and necessitous prisoners upon their discharge, with preference to those committed in the district of the Central Criminal Court.

IMPROVEMENT OF THE CATHEDRAL APPROACHES, MANCHESTER.—The street improvements round about the Manchester Cathedral are approaching completion, and something like 1,400 square yards of land have been added to the approaches. In Hunt's Bank land to the width of 37 ft. has been added along the west front of the building, and the thoroughfare is now twenty yards wide at the narrowest part.

THE BUILDING REGULATIONS ACT, GLASGOW.—At the last meeting of the Glasgow Building Regulations Act Committee a deputation was received consisting of Messrs. Paterson, Goldie, Ferguson, and Shaw, as representing the Glasgow Building Exchange, Limited, who were heard regarding the amending of certain of the by-laws made under the Building Regulations Act, 1892, as follows:—(1.) On By-law 31, which provides that "slates . . . shall be secured by at least two strong copper, or galvanised, or other suitable nails," that provision should be limited in its application to every third course of such slates.

such cylinder, and to the flushing pipe, and a shorter syphon-pipe connected to the larger one.

1,408.—MANUFACTURE OF FLOORING BLOCKS, &c.: G. L. Falconer.—This invention consists in manufacture of composite blocks, upper stratum being of wood, compressed wood, fibre, &c., and lower of concrete, such surfaces being connected by metal tongues, nails, screws, &c.

1,435.—FLOORS, PLATFORMS, &c., FOR PUBLIC BUILDINGS: W. Horsfall and Another.—Consists in making such floors, &c., in two or more parts, pivoted or hinged in the centre, and capable of being raised by jacks or similar mechanism.

1,835.—CHIMNEY COWLS: A. B. McKennie.—In cowls the inventor places a fan or exhauster, arranged to rotate on a horizontal axis by the action of the wind.

2,449.—INSPECTION AND CLEANING JUNCTIONS FOR DRAINS, &c.: E. Coding.—The invention is a junction of eye for drains, &c., provided with internal guides by which the cleaning-rod can be deflected in the direction desired.

2,714.—CHISEL FOR CUTTING STONE, IRON, WOOD, &c.: J. Drausefeld.—Consists in a steel holder with slit end, forming a pair of jaws, capable of being drawn together by set screws or bolts, into which a thin steel blade for cutting can be securely held.

3,228.—HINGES: W. G. Spaul.—This patent relates to a flush hinge especially designed for falls of plating, cases, desk-flaps, &c. The hinge is constructed of two box-like parts connected by a cranked or bent connecting link, hinged at its opposite ends to the inner ends of said box-like parts.

3,237.—STOP BLOCK FOR SINK PIPES, &c.: F. Holders.—The inventor claims a special combination in a stop block of inlet, trap, outlet, waste water inlet, cleansing inlet, and outlet.

3,665.—WATER-CLOSETS: E. A. Green.—This invention relates to the species of water-closets where a vertical shaft is fixed over a trapped pan, from which a supply issues. The inventor proposes a trapped pan, formed with the bottom of pan sloping from top of same into throat of trap, and with top of pan formed at same level as lowest part of the interior of out-go of trap, where the trap is made water-tight in pan and trap, whereby the pan is kept full of water, with a large surface area for the dejecta to drop into, and the trapped pan is made of smaller depth and capacity than for other purposes.

3,863.—WINDOW FITTINGS: J. Lunsdon.—This invention consists in the combination of a locking catch, sliding catch, and shoe or socket of special forms.

3,797.—WINDOW SASH-FASTENERS: W. R. Ray.—This fastener consists essentially of a rod passed horizontally through the top and bottom sashes, the rod having one end split and furnished with knobs and notches. Fastener may be also used for other purposes.

3,904.—DOWEL PINS AND JOINTS: A. J. Beull.—The inventor adopts a wooden dowel pin, having longitudinal ribs adapted to embed themselves in the wood into which the pin is driven. There are also shallow grooves between ribs adapted to retain glue, and a longitudinal vent groove of greater depth.

NEW APPLICATIONS FOR LETTERS PATENT. DECEMBER 14.—28,528, H. Waite and Others, Door, Casement, or Window Adjustment.—28,554, S. Bradshaw, Reversible Windows.—28,582, G. Duffield, Water-closets.—28,611, L. Cohn, Device for Indicating the Stoppage of Water-closets.—28,615, H. Schröer, Roofing Tiles.

DECEMBER 15.—28,653, J. Horn, Fismatic Lights.—27,674, D. Fletche, Mechanism for Lifting, Lowering, and Locking Window Sashes, &c.—28,671, C. Stowe, Traps for Waste Pipes, &c.—28,749, J. Minto, Automatic Flushing System.

DECEMBER 16.—28,758, J. Haynes, Sash Line Fastener.—28,795, J. Allen, Apparatus for Obviating the Rattling of Window Sashes and Preventing same from being Opened from the Outside.—28,824, A. Marlew, Chimney and Ventilating Cows, &c.—28,829, R. Fraser, Roof Supporting Frames.—28,832, G. Brown, Junr, Brake for Ship Weights, &c.—28,877, H. Kelson and G. Strecker, Mills.—28,892, M. Murray, Fire, Water, Waste, &c. Homan, Construction of Walls or Partitions.

DECEMBER 17.—28,929, E. Royston, Tiles, Slabs, &c.—28,963, J. S. Dibble, Combined Water-closet and Seat.—DECEMBER 18.—29,029, A. Delig, Walls.—29,059, J. Thomas, Treatment of Wooden Surfaces for imitating Mahogany, Rosewood, Enamel, Tortoise Shell, Veneering, &c.—29,114, A. Nicholson, Draught Excluder for Doors and Casements.—29,149, A. Mills, Water Waste Preventer.—29,151, T. C. Fawcett, Limited, and T. Fawcett, Brickmaking Machines.—29,160, A. Wragg, Machine or Die to make Perforated Kilo Bottom Bricks or Lump by means of Power Presses.—29,212, Fittorie, Limited, Manufacture of Cement.

PROVISIONAL SPECIFICATIONS ACCEPTED. 24,071, F. Chaplin, Sliding Bolts for Doors.—24,711, R. Hunter, Finely Pulverised Substances for Use in the Production of Portland Cement, Pigments, &c.—26,744, J. Duckett & Sons, Limited, and Others, Waste Water Closets.—26,745, J. Duckett & Son, Limited, and Others, Sink Fittings.—26,946, E. Bloom and Others, Paint Brushes, &c.—27,216, Tonks, Limited, and J. Whiting, Spring Hinges and Door Springs.—27,279, W. Westwood, Hinges or Bolts for Ventilators, &c.—27,374, H. Hyde and J. Aday, Hinges.—27,406, P. Wood, Kilns.—27,420, M. Newlove, Raising and Lowering Window Sashes.—27,429, J. Longue, Window Fasteners.—27,437, T. Mathews and F. Tarr, Clamps.—27,614, J. Sankey and C. Turnock, Sharpening and Setting Saws.—27,828, J. Morton, Enamelling or Glazing Bricks, Tiles, &c.—27,829, J. Berry, Machines for Moulding Bricks, &c.—28,003, S. Marchant, Gauge for Saws.

COMPLETE SPECIFICATIONS ACCEPTED. One is application for two months. 24,013, W. Bird and the Globe Inventors' Trading Company, Limited, Windows with Sliding Sashes.—2,015, S. Helyer, Water-closets, &c.—2,155, J. Shanks, Lavatories.—3,421, W. Ludlow, Miter Clamp.—3,591, S. Hill and R. Hodges, Morse Fastenings.—13,791, G. Fuhrer, Socket for Securing Nails, &c., to Walls, &c.—24,902, A. Gries, Slabs for Building and other purposes.

MEETINGS.

SATURDAY, JANUARY 2. Sanitary Inspectors' Association (Carpenters' Hall)—6 p.m.

SUNDAY, JANUARY 3. Sunday Lecture Society.—Mr. Richard Kerr on "The New Photography: the Röntgen, or X Rays"—with experiments. 4 p.m.

TUESDAY, JANUARY 5. Royal Victoria Hall, Waterloo-road, S.E.—Professor H. G. Seeley, F.R.S., on "The Heat of the Earth," 8.30 p.m.

WEDNESDAY, JANUARY 6. Liverpool Engineering Society.—Mr. J. W. Anderson on "Mechanical Refrigeration." 8 p.m.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

978.—SELF-CLOSING DOOR HINGES: E. Edwards.—This invention relates to a hinge, the rubbing surfaces of which are made of an undulating form round the pin which connects upper and lower parts to the door, which, when opened, always comes back by its own weight to its lowest position. A tubular ring oil-holder is attached.

1,301.—SYPHON CISTERNS: H. J. Dakin.—The inventor claims a siphon cistern provided with a cylinder, having mounted upon it a ball, with a small hole therein, actuated by a weighted lever, a long syphon-pipe connected with

SOME RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT. December 8.—By J. H. North (at Dublin), Raphoe, co. Donegal.—Enclosure—12 a. 3 r. 19 p. 2 r. 3 p. 4 f. £3,000

PRICES CURRENT OF MATERIALS.

Table listing prices for various materials like timber, iron, and copper. Columns include item names and prices per unit.

DENBIGH.—For additions, &c., at the North Wales Counties Asylum, Messrs. C. O. E. & Co., architects, 29, St. Thomas Street, Liverpool. Quantities by the architect.

DOVER.—For providing, laying, &c., cast-iron water-mains &c., Folkestone-road, for the Town Council.—

SAWEN.—For the supply of 1,420 tons broken granite, &c., for the Town Council.—

DRIFFIELD.—For additions to National Schools, Driffield. Mr. J. Shepherdson, architect, Driffield.

WALSINGTON (Durham).—For the supply and erection of iron hospital for infectious diseases, with outbuildings, for the Rural District Council.—

FRIMLEY.—For the erection of six cottages. Mr. A. E. Hall, architect, Frimley, Surrey.—

GOLCAR.—Accepted for the erection of a residence, Seaford, for Mrs. Fielding. Mr. Arthur Shaw, architect, Golcar.

GREAT YARMOUTH.—For additions to 'The Anchor and Hope Hotel,' Gosport Pier, Messrs. E. Laxon & Co., Messrs. Bell & Oley, architects, Great Yarmouth.—

HASLINGDEN.—For the erection of boiler house, chimney, &c., for the Central Sewage Plant, Mr. H. Leonard Hinnell, C.E., 41, Corporation-street, Manchester.

KEIGHTLEY.—For the execution of private improvement works, Dure and Wren streets, for the Corporation. Mr. W. H. Hopkinson, C.E., Municipal-buildings, Keightley.

LEEDS.—Accepted for the erection of two labourers' cottages, Scarforth, Leeds, for Mr. H. Miles. Mr. W. Carby Hall, architect, Prudential-buildings, Park-road, Leeds.

LONDON.—For the erection of additional premises at Gladstone-road, Battersea, for the Globe Foundry Company.—

LONDON.—For the erection of iron church for the Rev. Percy M. Bayne, at Manor Park, E.C.—

LONDON.—For erecting the Kennington-road public baths and washhouses, for the Commissioners of Baths and Wash-houses for Lambeth. Mr. A. Hessel, 1, Cannon-street, Bedford-row, London, W.C.—

LONDON.—For engineering work for the new women's swimming bath, Calcutt-road, & additions to the public washhouse, for the Vestry of St. Mary, Islington. Mr. A. Hessel, architect, 6, Johnson-street, Bedford-row, London, W.C.—

LONDON.—Accepted for alterations and repairs at 270, Hoxton-square, Hoxton, for Mr. A. Gottwein.—

LONDON.—For alterations and additions, 29, Gordon-road, Peckham, for Dr. Hignett. Mr. J. William Stevens, architect, 21, New Bridge-street, City, E.C.—

LONDON.—For alterations and additions to Langewath, Belsize-lane, Hampstead, for Mr. A. R. Bay, Mr. J. William Stevens, architect, 21, New Bridge-street, City, E.C.—

LONDON.—For four houses, Duke-road, Chiswick, for Mr. Wm. Forch. Mr. Herbert S. White, architect, 155, High-road, Chiswick.—

LONDON.—Accepted for the erection of a new warehouse at Tumb Green, for the Army and Navy Auxiliary Co-operative Society, Limited. Mr. J. Durrill, architect. Quantities by Messrs. John Leaning & Sons.—

LONDON.—For the execution of sewerage works, Burnt Oak, Orange Hill (Low Level Sewerage, Contract No. 4), for the Urban District Council of Hendon. Mr. S. Suter Gwynne, Engineer, Public Offices, the Burroughs, Hendon, N.W.—

Table with columns A, B, C, D listing various contractors and their prices for different types of pipes and fittings.

NEATH (Wales).—For the erection of the Cambrian Hotel, for Mr. E. E. Bevan. Messrs. Lambert & Rees, architects, Metropolitan Bank Chambers, Neath. Quantities by architect.—

PONTYFRIDD.—For the erection of two villa residences at Giddegreen, for Messrs. W. & D. Thomas. Messrs. Giffitts & Jones, architects, Pontyfridd & Tonyrundy.

RISCA (Mon.).—For the erection of school buildings, Cross Keys, for the School Board. Mr. Geo. Rosser, architect, Victoria-houses, Holywell, Newbridge, Mon.—

ST. LEONARD'S-ON-SEA.—For alterations to Nos. 24 and 25, London-road, St. Havenock-road, Hastings.—

ST. LEONARD'S-ON-SEA.—For alterations and additions to stabling and cottage at 'The Wren,' Silverhill, St. Leonard's, for J. Higgins & Sons, 2, 15, 16, St. Wm. Cooper, architect, 21, 66, G. Vitor & Co., 517, St. H. Ashdown, W.—

WATFORD.—For the erection of additional premises for the Acme Tint Engraving Company.—

WATFORD.—For erecting a new brewery, for Messrs. Benskin's Watford Brewery, Limited.—

WORSBOROUGH DALE (Yorkshire).—For the construction of sewers and streets, for Mr. Benjamin Turner. Messrs. Wade & Turner, surveyors, 10, Pitt-street, Barnsley.—

TENDERS.

communications for insertion under this heading should be addressed to 'The Editor,' and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot sub tenders unless authenticated by the name and address of the sender; and we cannot publish announcements of tenders accepted unless the amount of the tender, or, in any case, the lowest tender is under, unless in some exceptional cases and for special reasons.

WORKING (Essex).—For the construction of sewers, &c., Axe-way, New-road, and Bridge-street, for the Urban District Council. Mr. J. Davery, surveyor, Council Offices, East-street, Barking.

NEW-ROAD, AXE-STREET, BRIDGE-STREET, TOTAL. S. d. S. d. S. d. S. d. S. d. S. d.

SWICK UPON-TWEED.—For paving Featherbed-lane, for sanitary authority. Mr. Dickson, Borough Surveyor, Berwick-upon-Tweed.—

BEHILL.—Accepted for the erection of house and shop in Behill-road, Beahill, for Mr. J. Farnen, Hasting. Mr. D. Hicks, architect, Sea-road, Beahill.—

BEHILL.—For the erection of three houses and shops, St. D. Hicks, architect, Sea-road, Beahill.—

BEHILL.—For the construction of sewer, &c., and making an ash-pit on-road, Beahill, for Mr. W. Mayner, Stratford. Mr. A. C. L.D., surveyor, Beahill.—

BRIDGE (Ireland).—For the erection of two labourers' cottages, Colclough, for the Union Guardians. Mr. L. A. Strick Moore, Dunboyne.—

DYDOND.—For the erection of detached house, Parklane, for Mr. Bruce Johnston. Mr. A. Broad, architect, 3, Street, Dydond. Quantities by architect.—

COMPETITION, CONTRACTS, AND PUBLIC APPOINTMENT.

COMPETITION:

Table with 4 columns: Nature of Work, By whom Advertised, Premiums, Design to be delivered. Includes 'Designs for Houses' by J. C. Hill, T. Ashward.

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, Ac. supplied by, Tenders to be delivered. Includes 'Paving Works, Hope-street, &c.' by Ramsbottom U.D.C.

CONTRACTS—Continued.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, Ac. to be Supplied by, Tenders to be delivered. Includes 'M*aking-up and Paving Roads' by Fulham Vestry.

PUBLIC APPOINTMENT.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, Application to be made. Includes 'Two Inspectors of Sewage Works' by Carshalton U.D.C.

Those marked with an asterisk (*) are advertised in this Number. Competition, p. iv. Contracts, pp. iv, vi, viii, & x. Public Appointment, pp. xvii.

LONDON SCHOOL BOARD TENDERS.

The following lists of tenders were submitted by the Works Committee at a recent meeting of the London School Board:

Table of tenders for London School Board, including sections for Ashburnham, Baltic Street, Beethoven Street, Berger Road, Bolingbroke Road, Brecknock, Brinton Hill, Brockley Road, Bucks Row, Campbell Street, Chequer Alley, and Conway Road.

Table of tenders for various streets including Dempsey Street, Dulwich Hamlet, East Lane, Edwards Street, Eleanor Road, Farncombe Street, Gideon Road, Gloucestergrove East, Hamond Square, Hargrave Park, and Harwood Road.

Table of tenders for various streets including Hasetline Road, Holland Street, Horseferry Road, Keeton's Road, Laxon Street, Lyham Road, Tower Hamlets, Minaroad, and Mordey Terrace.

TAR-PAVING ON A RUNNING CONTRACT.

Table with columns for Schedule, W. H. Renstead & Son, Brunwick & Co., W. E. Comptable & Co., W. Gibbs & Co., A. C. W. Holbourn & Co., D. Marchall & Co., and Josiah Smart.

Table listing various streets and their respective contractors and costs, including Warple Way, Webb Street, William Street, Wolverley Street, and Walnut Tree Walk.

The Burlington House and New Gallery Exhibitions.

It seems both fortunate and appropriate that a collective exhibition of Mr. Watts's paintings should be held at the New Gallery concurrently with the exhibition of Lord

Leighton's works at Burlington House. The two exhibitions afford very interesting matter for comparison and contrast. Both artists are, in the majority of their works, painters of ideal subjects, but the ideal is a totally different one. Leighton painted solely for beauty and decorative effect; his pictures have for the most part no intellectual meaning, and certainly they are entirely devoid of any moral or didactic element. Mr. Watts, on the other hand, in painting figures and subjects has professedly aimed at making them the medium for the expression of a moral meaning; in his own words, "the object has been to suggest, in the language of Art, modern thought in things ethical and spiritual." A noble object certainly; the question is whether in striving to carry it out he has not been in danger sometimes of outstepping the proper limits and capabilities of the art of painting, of attempting what had better have been expressed in words, and sacrificing artistic beauty to a moral end.

The collection of Leighton's works is on the whole a very representative one; the only important one which we hoped to find there and missed is the grand picture of "Phryne," a nude figure almost larger than life, at all events of what is called "heroic" size, which some of our readers may remember hanging in the large gallery a good many years ago, just over where the "Daphnephoria" now hangs. This was an impressive work from its large scale and the power of design displayed in it; we should be interested to know what has become of it.

The pictures are all dated, so that we can compare the painter's style at different periods. Up to about twenty years ago, the period of the "Daphnephoria," his art may be said to have been steadily progressive; beyond that date it is fluctuating; he never surpassed the "Daphnephoria," but since

that time we have had pictures equal to it in essential qualities of style and colour, mingled with others which were decidedly inferior. The difference between the earlier nudes and the best style of the later period is very well illustrated in the contrast between "Actæa" (49) dated 1868, and the "Bath of Psyche" (51), painted in 1890. In the former the figure is cold in colour and hard and sculpturesque in quality; in the latter, though there is still a certain degree of hardness and artificiality which is inseparable from Leighton's style, there is a delicacy of colour which contrasts strongly with the cold tone of the older work. The "Venus Disrobing" (56), painted in 1867, is another typical example of the time when Leighton was a splendid draughtsman but a poor colourist; the pose in this figure is a very difficult one, and treated with great mastery of drawing. In some of the latest works the artist seems to have dropped again into his earlier style, as in "Summer Slumber" (70), a work hard in texture and inharmonious in colour, and which displayed the artist's shortcomings rather than his powers.

The exhibition of "Cimabue's Madonna" (65) which hangs opposite the "Daphnephoria," and was painted forty-one years ago, furnishes an indication of the progress which has been made in the art of painting in this country since the fifties. Even as the work of a young painter of the age of five-and-twenty, it would hardly in the present day produce a sensation, as probably its author would have readily admitted. It would rank as a very good picture for a young painter who had not yet emerged from the effects of scholastic training. It is methodical and mannered, and has no touch of dramatic reality about it. We have learned since to think more of realising a scene in history, less of merely making a composition of it; and the "Cimabue" is mainly a careful composition, rather stiffly put together in a conventional manner, with a good deal of attention to costume. As its author's first important work it will always retain its interest, but the point of view has altered since it was painted. The contrast between this stiff conventional composition and the "Daphnephoria" opposite is one of the most striking points in the exhibition; the perfectly free and apparently improvised manner in which the procession in the latter picture seems to move along, as if we had

just seen it come from round the group of trees, is a triumph of the *ars celare artem*. Among Leighton's larger works this is unquestionably the finest and most successful, both in colour, movement and composition, and in the beauty of the individual figures. Whether the conventional and stage character of the trees which form the background is the result of an intention on the part of the artist to give them a certain decorative flatness and artificial character, so as to prevent their interfering with the effect of the figures, or whether it is only another instance of his apparent want of power to paint landscape with freshness and reality, it may be difficult to decide; but even if the conventionalism were unintentional, it perhaps hardly detracts from the effect of the picture; the trees form a sombre background to the glittering procession, and beyond that office they do not claim much attention. It is curious, however, that an artist who showed such close and patient realism in his pencil studies of trees and plants, should never have succeeded in getting a real-looking tree into a finished picture; the landscape, whether as a whole or in detail, is always, where introduced at all, the weakest part of his work.

The most complete perfection of Leighton's work is perhaps to be found in some of the smaller figure subjects which represent a single moment of beauty of action, pose, and colour, treated with absolute unity of aim and style. Two such works are to be seen in Gallery I, equally perfect though very different in style and colour. One of these is the "Antique Juggling Girl" (15), painted in 1874, an example of decorative design and colour, the value of which no fashions in art can change. As some of our readers may remember, it is a small picture representing a nude girl, whose figure is perfectly drawn and painted, in front of a wide vertical strip of curtain the lines of which are of great value in the composition, tossing four balls, two with each hand, her upturned forehead face so completely drawn and made out, in this most difficult position, that the features would be recognisable if one knew the personage before. The other work referred to, "Weaving the Wreath" (6), is even simpler in scheme and still finer in colour; a dark-skinned girl with black hair seated and almost wholly wrapped in a dark purple robe, weaving a wreath of leaves, with a marble bas-relief as a back-

ground. The subject is nothing; it is simply a momentary incident of beauty of colour and composition perfectly rendered—a faultless work of abstract art. The two were painted within a year of each other; and to the same period belongs what is perhaps a still finer work of the same class, "Summer Moon" (84), now hanging in, if we remember right, the very same position in the large room in which it was first seen just a quarter of a century ago. This work, popularly known by engravings, may be called superior to the other two not in execution but in the fact that to beauty and unity of composition it adds poetic sentiment. The texture and manner of painting in this picture is very different to Leighton's usual style of execution—much fuller and less flat in texture, perhaps with the intention of conveying better the softened effect of coloured draperies only half seen in the moonlight.

Among the well-known works which will be found here are the "Cymon and Iphigenia" (20) which is not hung to the best advantage in Gallery 1.—the scale of the picture demands more space; "Perseus and Andromeda" (32) which we hold to be a greater success in conception and composition than in colour; "The Music Lesson" (47); "Captive Andromache" (57); and "Flaming June" (75) which, in spite of the somewhat contorted attitude of the figure, is one of the most powerful and successful of the artist's single-figure pictures.

The Water-colour Room is occupied by a number of sketches and studies, which give remarkable evidence of the care which Lord Leighton bestowed on the study and preparation of his pictures. Not only are there numerous small studies in crayon for individual figures in various pictures, but bronze models in the round for various figures and groups in the "Daphnephoria," for the two figures in "Cymon and Iphigenia," and for the whole composition of the "Hesperides" and the "Perseus and Andromeda." Sketches in the flat for pictorial compositions and for separate figures in them are of course made by all painters who take their work seriously, but the actual modelling of figures which are to be painted in the flat points to a thoroughness of study which is not common in these days, though it was largely employed by Michelangelo. Among the sketches are two or three of small Italian towns nestled among hills, probably made with a view to their use as incidents in the backgrounds of pictures, and the one bit of original design of an architectural nature which we noticed is a sheet of three designs for Mrs. Brownning's tomb.

The contrast on coming to the New Gallery and to Mr. Watts's paintings is striking in many ways. Mr. Watts is a great colourist, which Leighton was not pre-eminently, though he produced very fine colour occasionally. Leighton's treatment of the nude figure is generally conventional, in most cases somewhat hard. His figures do not resemble real life because they lack the appearance of softness and warmth; Mr. Watts's aim, on the other hand, seems to be to spiritualise away the flesh into a mere visionary semblance of a figure, with more colour and warmth and less precision of line and anatomy than the reality. In his beautiful "Olympus on Ida" (68), in reality a representation of the Judgment of Paris, we see not so much three

goddesses as three visions of goddesses, in the golden haze of a dream. So are "Uldra," the Scandinavian spirit of the rainbow (27) and "Psyche" (88); ghosts of figures rather than realities; though in these two cases the nature of the subject affords an excuse or suggestion for such a treatment. This kind of treatment belongs more especially to the painter's later and more mature period. In the large picture painted in 1848 under the title of "Life's Illusions" (64) we could fancy that the painter had been studying Hilton, so much is there in the composition and the design of some of the figures which recalls some classical composition of Hilton's such as "The Abduction of Helen;" and even in the "Fata Morgana" (84), seventeen years later, there is the same kind of classic elegance in the limbs of the principal figure, though the subject is a moral allegory. The later "Fata Morgana" (109), painted in 1889, it is interesting to compare with the other one; it is unquestionably a finer composition and conception, with less prettiness about it, but it is not equal to the earlier one in colour.

Among the latest class of allegorical paintings we meet with things which must "give us pause," paintings in which moral allegory has quite over-ridden art, and in which the picture requires the explanatory comment before we can find any interest in it. Such are "Faith" (123), "The Dweller in the Innermost" (131), "The All-pervading" (129). These are not so much pictures as puzzles, and we fear it is their fate to be so regarded. There are certain works in which the pictorial grandeur is so evenly balanced with the moral meaning—a moral easy and obvious to every one—that they may be regarded as successes from both points of view. Such a picture is "Love and Death," of which one of the editions, not quite the best, is here; "Love and Life," which is neither quite so obvious nor quite so fine, but which justifies itself; such is "Hope," a poetic vision beautiful both in the poetic and pictorial sense. Such also are "Mammon" and "The Minotaur," for the power with which coarse and evil natures are depicted in these two works is in itself a fascination. "Sic Transit" is also a truly decorative allegorical painting which explains itself. The failure comes where the picture does not explain itself, and where its pictorial motive is not in itself striking. The climax of this mistake is reached in the picture of "Chaos" (148), an attempt to symbolise the evolution of social order out of chaos and confusion; a picture which is bewildering without the explanatory comment, and we fear verges on the absurd with it. The two paintings of Eve—"She shall be called Woman" and "Eve Repentant"—have a noble meaning, which is intelligible enough, but unhappily they are totally devoid of womanly beauty, almost even of natural verisimilitude, and how can such an Eve appeal to our sympathies? On the other hand, the strong draped figure with bowed head, illustrating the verse, "He went away sorrowful, for he had great possessions," is impressive in itself from its dramatic force of expression, and gains an added interest when read with the title, though it does not require that to impress us as a powerful work. The conclusion forced upon one from a comparison of the various moral works is that there is a line in moral and allegorical painting which cannot be

safely overpassed. A picture must be a picture in the first instance, to be admired for its pictorial quality; as soon as we come to the point where the moral meaning is the principal point and the pictorial interest secondary, we have got out of the proper region of painting, and might as well have a printed sermon at once.

In one picture in the collection, and which was recently seen at the Royal Academy, the painter has indeed shown us that he can still paint for pure beauty. The "Childhood of Jupiter" is a work so remarkable for beauty of composition and colour, such a pure pictorial poem, without the shadow of a moral about it, that when it was exhibited at the Academy there was an impression among many people that it was a work of the artist's earlier period, then exhibited for the first time. It appears, however, from the New Gallery catalogue, that it was painted only last year, and thus gives us assurance that Mr. Watts can still paint a purely beautiful picture when he can shake himself free from his desire to turn pictures into sermons. Let us hope that there are more such works still to be looked for from his hand.

COLOMBO.

THE first view of Colombo from the deck of a mail steamer coming up from the South is pleasing in the extreme. A few large and imposing buildings, a broad expanse of bright green turf, boldly grouped masses of foliage, and enough palms to show that one is right in the tropics. When the fine and massive breakwater of concrete blocks is turned, the ship swings round into the harbour, and another aspect of the town is opened up. A few large buildings surrounding the Clock Tower, some spacious, wide-roofed warehouses away to the left, and the confused but by no means prominent mass of the low-pitched roofs of the native town, make up this picture.

But no, it is not quite complete; for if the day be fine, there is a background of rolling ranges and distant grey-blue peaks, that adds the final touch, and makes Colombo, from the sea, one of those rare scenes that live in the memory when much else is forgotten. When one lands, however, the spell is broken, for the palatial buildings, so prominent in the view from the sea, which should at least be of stone, if not of marble, resolve themselves into stucco showing evident signs of decay and disrepair.

The general design of the older buildings is, however, effective and admirably adapted to the climate. Mostly of one story, they are surrounded by a spacious verandah, with widely-spaced columns of classic detail, carrying a solid-looking roof of reddish-brown tiles, similar to those in common use in Italy. The covering tiles are, however, doubled, to guard against the sheets of rain that fall in the wet season penetrating the laps. Most of the old buildings were erected during the Dutch occupation of the island of Ceylon, and though the detail is poor, the general effect is satisfactory.

It is a pity that as much cannot be said of those put up under the English rule. Buildings of two or even three stories are common, but the detail is quite as poor, and, in addition, is hard and mechanical. The extensive barracks facing the sea are a

striking instance. The new Post and Telegraph Office, only finished about four years since, is, however, somewhat better. It is a building of three stories, the lower forming a rusticated basement. There are no verandahs, but a large open hall, entered from the street by a wide flight of steps; and three archways serve as a gathering place where the public business of the department is transacted. The other principal external features are projecting piers, which in the upper story change into coupled columns. The attempt is ambitious, but the effect is not so impressive as it might be, owing to the most objectionable salmon-coloured wash which covers the cement. A coat of plain lime-white would be infinitely preferable.

Near the landing-stage some new offices are being erected for the Peninsular and Oriental Steam Navigation Company, and here the sloppy character of native bricks and brickwork may be studied, if not with advantage, at least as a warning. It is, however, as good as can be obtained, and one wonders whether the natives have lost the art of doing good work, or have never attained to it. The former appears to be the case, if the written descriptions of some of the old cities and temples of a bygone civilisation are to be trusted. Another and larger work is the rebuilding of a large hotel, a favourite resort about a mile away from the town, enjoying the fresh breezes and facing the rolling surge of the Indian Ocean. There, if anywhere, one would expect that the old and satisfactory system of external verandahs or loggias would be retained. But, alas, the huge pile shows no sign of one at present, and from the visitor's point of view, the battered and dirty-looking relic of the old building is preferable. This is to be pulled down, and then surely some provision will be made to secure the shade so urgently required.

Of course, every one goes to see a Buddhist temple, of which there are several, but they scarcely repay a visit. One has a dagoba of brick of the type made familiar to us by Fergusson and other writers. It has but few decorative features, and they are in cement. That on the road to Mount Lavinia is perhaps the most interesting, and possesses (or did possess) a few well designed metal finials. The buildings consist of two or three groups, and there are several loggias in which a few yellow-robed priests are sure to be seen praying, reciting, or lounging, or else a class of scholars under instruction. The effect is thoroughly Oriental and pictorially satisfactory.

The great attraction to the visitor is, of course, the varied teeming life of the markets and the native quarter, where brilliant colour studies and figure subjects meet one at every turn. But this is rather the province of the painter than the architect, and although devoted to the latter art, one is seized with a wild desire to change places for a time with our brothers of the brush and, inspired by the wealth of Oriental life all around, to attempt that which even to the accomplished painter would be a difficult task. So it is as well that mail steamers wait for no man, and one is compelled perforce to bid this attractive bit of the glowing East "au revoir," if not "good-bye."

BUILDING TRADE, BLACKPOOL.—The Building Plans Committee, Blackpool, at their monthly meeting on the 20th ult. considered ninety-two plans. Of these seventy-two were accepted, and twenty disapproved.

NOTES.

Peterborough Cathedral. The most important feature in the Peterborough correspondence since last week has been the protest of Mr. T. G. Jackson, who, in stating his reasons for refusing to sign what he calls the "irrational petition" which the opponents of the Dean and Chapter are sending round, calls attention to what we have already commented on, that "the appeal, we are told, is being largely signed by persons eminent in literature and various walks in life—persons who have not examined the building themselves, and who, if they did examine it, have not the knowledge of construction and masonry requisite to make their opinion of the slightest value." In reply to a letter by Mr. Micklethwaite in the *Times*, who insinuates that Mr. Jackson's expressed regret that there should be any necessity for rebuilding any part of the front of Peterborough is "conventional," Mr. Jackson pertinently remarks that Mr. Micklethwaite and his companions "allow no one to love an old building but themselves." The letter signed "J. R. C.," another new importation into the controversy, though well meant, unfortunately goes too far. He instances the Portland Vase, which has not suffered in appearance from its breakage and putting together again; but a vase is not a building, and the cases are hardly parallel. Generally speaking, the effect of this controversy, with all calm-minded people who know anything of the subject, will probably be to weaken the influence of the archeological party in these questions; they have overdone the matter even from their own point of view, and have shown such irrational temper and such a disregard for accuracy of statement as must diminish their chance of being listened to on any future occasion. As to some of the newspapers which have been so violent on the subject, their object has palpably been to raise what they thought would be a popular cry, for journalistic purposes.

St. Séverin, Paris. The church of St. Séverin, well known as one of the finest examples of late Gothic in Paris, is reported to be in so serious a state of decay that repairs will be required on a scale which the parish has not the means to provide for. It is hoped that the Municipal Council, which is occupied with the question, will supply the funds necessary for its repair, and also for clearing away some of the mean old buildings which cling round it. That is the Parisian view; as to the latter point it may be a question whether it is well to meddle with these hanging-on buildings, which are in many cases a highly picturesque adjunct to French churches and cathedrals, and the removal of which will furnish only too much temptation for restoration in the objectionable sense of the word. In these matters the French are in the opposite case from ourselves; public money can be found for repairs to important buildings where it would never be forthcoming in England; on the other hand, the authorities who supply the funds are apt to want to have too much done for their money.

Pembroke Earthquakes. At a meeting of the Geological Society held on Wednesday last, a paper by Dr. Charles Davison was read "On the Pembroke Earth-

quakes of August, 1892, and November, 1893." He showed that during the former month no fewer than eleven shocks occurred; the principal one being the third; in the latter month there were four undoubted earthquakes, of which the chief was the first one. The author sought to show the connexion between these seismic disturbances and faults or dislocations of the strata in part of South Wales. For more than fifty years prior to the earthquakes of 1892-93 there were no slips of importance along the fault system in Pembrokeshire. Then the earlier movements took place along the north and south faults, and the later along the east and west. The three faults of the latter series which the author connects with the disturbances lie successively one to the north of the other, and there can be little doubt that the fault slips of 1892 affected the conditions of stress along the neighbouring north and south fault. The detailed particulars concerning earthquakes collected by Dr. Davison cannot fail to be of great practical use, though their chief interest, so far as England is concerned, is of a purely philosophical character. The evidence he is accumulating here, however, is in reality available also for "earthquake countries," for should he ultimately prove that seismic disturbances are always connected with faults, and that the position of the latter, either as caused in the first place or as a limiting influence subsequently, determines the distribution of the chief effects of the disturbance, then it will not be difficult to indicate, with certainty, localities which must enjoy comparative immunity from shocks, even in an "earthquake country." We thoroughly agree with Dr. Davison that the study of such earthquakes as take place in England is extremely valuable as supplementing geological surveys.

Iron Curtains in Theatres. The fatal accident at Liverpool in one of the Variety theatres, owing to a mishap with the iron curtain, again calls our attention to the great negligence in English theatres in respect to the division of the auditorium from the stage in the case of fire. In the first place, we believe there is no power to enforce any such division in old buildings, unless they are undergoing material alteration; and in new buildings the actual construction of such curtains is practically all the authorities can order. There is no definite policy, either in London or in the provinces, as to which form of "fire-resisting" curtain can be considered efficient, and which type of screen or mechanism should be used. When such a curtain has once been installed, there are no further regulations to compel its constant use, either at the end of a performance or between the acts; nor do the authorities compel the owner or manager to provide a competent attendant, whose sole duty it should be to work the proscenium curtain. The result is that comparatively few old theatres have the necessary curtains, and that the types here, as well as in the new buildings, where they can be enforced, vary considerably, their efficiency often being exceedingly doubtful should need ever arise for their use. We have found, in fact, that a great many of the curtains will not work at all, owing to the want of regular use and attendance. As it is everywhere recognised

that the divisional curtain is one of the prime factors of protection from fire in places of public entertainment, we hold that the subject of their proper regulation calls for special attention and, if necessary, special legislation. Such fatalities as the one at Liverpool should not occur.

Municipal Tramways.

TRAMWAY legislation will be well represented during the coming Parliamentary Session. Some twenty or thirty towns are going to Parliament for authority either to extend their systems or to work the lines. If many of these schemes be carried through the tramway mileage of this country will be doubled within the next few years. The important question that has to be considered at the present time is not so much whether municipalities or private companies should own the lines, as what system of traction is to be adopted. It is generally admitted that in the future mechanical traction will be used in preference to horse traction for tramways. Municipalities would be wise not to adopt any system of overhead trolley wires hurriedly. There are a large number of new methods being tried which avoid the drawbacks of the overhead trolley, so that it is probable that those municipalities who pride themselves on being the pioneers of electric traction in England will, as in the case of electric lighting, have reason to regret their haste. It is instructive to note that in America, where there are over twelve thousand miles of road equipped with overhead wires, the greatest activity is being manifested by electrical engineers in inventing systems of electric traction which will obviate the necessity of the dangerous and disfiguring trolley wire.

THE new Opéra Comique at Paris is now complete as far as the building is concerned, and the sketches and models for the interior decoration have been submitted to a special committee presided over by M. Roujon, Director of the Fine Arts Department. The decoration of the cupola of the building is to be entrusted to M. Benjamin-Constant; that of the grand staircase to M. Olivier Merson and M. François Flameng. The sketches for the work seem to promise an interesting scheme of decoration pervaded by a general unity of style and design. The foyer, the vestibule, and the two salons situated at each extremity of the façade, will be decorated by artists who will be selected by the committee during the course of the present month.

Scaford.

MANY persons regret the necessary extinction of the small coast village or town on the south of England, and the growth in its place of the more fashionable watering-place. Such a change may now be witnessed in progress at Scaford, a village near Newhaven, comfortably sheltered by the sloping downs. But it is to be regretted that this transformation does not take place there systematically. Eastbourne has benefited very greatly from the systematic manner, in which—thanks to the town having been built wholly on two large estates—it has been enlarged. At Scaford, on the other hand, the primitive character of the place is already lost, whilst on the other hand it has none of the

merits of the well-built watering-place. An unfinished esplanade is ugly and dangerous, picturesque bungalows can only be approached up a muddy lane, which would, perhaps, not be out of place in a Midland hunting shire. A large and capacious pit marks the site of some future terraces, whilst an existing block of houses ends in a moat-like ditch. Towards Newhaven houses appear to rise up here and there, turning their faces and their backs to each other, as the fancy of the owners dictates. As regards aspect and access to the Downs, Scaford is superior to Eastbourne, and the Urban District Council should endeavour to guide its development with taste and knowledge, otherwise it may be spoilt with growth. For after all, a good site and an ancient town go but a little way towards a pleasant, modern dwelling-place, which may be created on any bit of coast, if the persons interested in the locality set to work in a systematic manner, as, for example, at Bexhill.

A BILL has been deposited by the promoters of the City and West-end Railway for an underground line, 64 miles long, to be worked by electricity, between Cannon-street (Budge-row) and Hammersmith. Two of the scheduled sites include Thanet-place, Strand, and St. Mildred's Church, Bread-street, with some adjacent property. As regards the latter, we may quote a passage from Mr. G. H. Birch's work, recently reviewed in our columns (see the *Builder*, June 6 last) :—

"If any one wishes to see a perfectly untouched City church just as Wren left it, let him wend his way to St. Mildred's, which is innocent alike of medieval adornments or nineteenth-century arrangements."

The church contains some excellent iron and brass work, wood-carving, and plaster work in flowers and foliage, well worthy the attention of lovers of seventeenth-century craftsmanship. There is a memorial to members of the Crisp family, parishioners, one of whom, Sir Nicholas (King Charles I.'s devoted friend), is said to have introduced into England a new method of brick-making. The register records the marriage, on December 30, 1816, by licence, of Percy Bysshe Shelley and Mary Wollstonecraft Godwin; and on October 3, 1791, by banns, that of "Henry Cecil, of the Parishes of St. Mildred's, Bread-street, Batchelor, and Sarah Hoggins, of the same Parishes, Spinster." One does not at first recognise, in this entry, the actual substance of a favourite legend. "He is but a landscape-painter, and a village maiden she," sang the late Laureate; yet there seems to be no doubt that the entry relates to the second (but first legal) marriage to his second wife, of the nephew and heir of the ninth Earl of Exeter, who, on his first wife's elopement, retired to Bolas, co. Salop, where, as "John Jones," he went through the marriage ceremony, on April 13, 1790, with Sarah Hoggins of that place. In July, 1791, he obtained an Act dissolving his marriage with Emma Vernon; and succeeded his uncle in December, 1793, having meanwhile returned to Bolas as "John Jones," with his wife Sarah. The entry in St. Mildred's register is witnessed by E. Foulkes, who was the family solicitor, we believe. Thanet-place, just without Temple Bar, is a *cul-de-sac* of old-fashioned houses, which is named after the Tuftons, Earls of Thanet. At the entrance stood the "Rose"

tavern, at one time famous for its vine and the painted room mentioned by Walpole, of which the history has been traced to more than 200 years ago.

Landscape Exhibition, Dudley Gallery.

THE Dudley Gallery is the scene of a very interesting little exhibition of the works of a few landscape-painters of special style and aims, including Mr. Hope McLachlan, Mr. R. W. Allan, Mr. James S. Hill, Mr. Peppercorn, and Mr. Leslie Thomson; and also Mr. Waterlow, whom we mention separately because his is a *talent vague*, and leans not to experiments and eccentricities, and if there is less power in his works than in some of the others in the room, there is a finish of execution and balance of style about them which is not to be found in other works in the room. Nevertheless, some of Mr. McLachlan's paintings of special effects of light and weather are very fine and effective, as "Night on the Loch," "Moonrise," (in which there is a real look of moonlight), and "Storm at Sundown," a fine effect of a fiery windy sky. Mr. Allan's "The Golden Hour" is a little too obviously inspired by Corot, but there is much beauty in it, and it is interesting to see how a painter generally noteworthy for the keen freshness and light in his open-air subjects can touch a quite different key at will. Mr. Hill's "Meadows at Sandwich" is what would be a fine picture spoiled by a too dirty and material sky; "Across the Sand Dunes" we like better. Mr. Waterlow's "Golden Autumn" received a gold medal at Berlin last year; it is a little too delicate and demi-tinted, but a beautiful work nevertheless, perhaps surpassed in real artistic feeling by one or two of the smaller ones, "A Little Farm, Tintagel," especially. Mr. Peppercorn splashes too violently in "The Solent" and "The Pool," but his "Twilight" with its "sallow-rifted glooms" is really fine, as also one or two others of the group. Of Mr. Leslie Thomson's "Wareham" is the best; there is a certain power in one or two of the others, but "Sunset, Poole Harbour" will never do—or rather, it is quite overdone.

Mr. Walter Emden.

WE have had a communication on the part of Mr. Emden, to the effect that we have done him injustice in the "Note" in our issue of December 26, under the heading "Mr. Emden and the London County Council Contracts." We are assured that Mr. Emden did not take the prominent part that is supposed in recommending the artificial stone made by the company of which he was a Director; that he neither received nor expected any commission in the matter; and that his reported observation on resigning his position in the Metallic Stone Company, that he could be of more use to them when free, was merely a general remark implying nothing more than appeared on the face of it. We are glad to be given to understand that this is so; merely observing that Mr. Emden's own action in the matter was so ill-judged that he was himself to blame if unfavourable deductions were drawn from it; and this, we believe, his own friends will admit.

SYNAGOGUE, MAIDA HILL.—In reference to this building, illustrated in our issue of December 26 last year, Messrs. Ewart & Co. ask us to mention that they performed the work of covering the dome with sheet copper.

THE EFFECT OF ADMIXTURES OF KENTISH RAGSTONE, &c., UPON PORTLAND CEMENT.

THE following is the paper on this important practical subject which was read before the Society of Engineers on November 2 by Mr. D. B. Butler, the present representative of Messrs. Henry Fajja & Co. The publication of this valuable paper has been deferred hitherto for want of space to give it entire:—

“At the conclusion of a paper which the author had the honour of reading before the Society last year, the question of cement admixtures was briefly touched upon, and the author intimated that he preferred to reserve his opinion as to the effect of such admixtures until the completion of a series of experiments on the subject which he then had in hand. These experiments now being completed, he has great pleasure in placing the results before the Society, together with the conclusions he has deduced therefrom.

It will be remembered that during the controversy on this matter that was carried on in the technical journals some two years ago, one firm of Portland cement manufacturers in the London district strenuously upheld the admixture of Kentish rag with cement, and maintained that a judicious admixture of that material was not only not an adulterant, but actually improved the cement. Kentish rag is the local name for a sandy limestone of the Lower Greensand formation, which is extensively quarried near Maidstone and elsewhere for building and road-making purposes. It is a more or less impure carbonate of lime, the impurities consisting of sandy argillaceous matter, which vary according to the strata in which the stone is found. The particular ragstone used for these experiments was obtained from a firm of quarry owners near Maidstone in the ordinary course of business, and its chemical analysis was found to be as follows:—

Water	...	100
Insoluble Siliceous Matter	...	7.28
Soluble Silica	...	2.75
Alumina	...	3.79
Oxide of Iron	...	3.34
Carbonate of Lime	...	80.69
“ “ Magnesia	...	56

For the purposes of these experiments, the stone was carefully picked to avoid as far as possible the sandy matter forming its outer surface,

and was ground to the following degree of fineness:—

Residue on a 180 sieve	...	37.0 per cent.
“ “ 120 “	...	25.0 “
“ “ 76 “	...	9.8 “
“ “ 50 “	...	0.3 “

The first series of experiments undertaken was to add this ground ragstone to an ordinary Portland cement in quantities ranging from 2 to 50 per cent., and to ascertain the effect of the admixture by means of the usual tests for tensile strength, both neat and with three parts of standard sand, at dates ranging from seven days to twelve months. The results of these tests are given in Table I. To facilitate comparison, a column is added to each table giving the net gain or loss per cent. at the completion of each series of tests. Broadly speaking, the admixture does not seem to materially affect the strength of the cement when gauged neat, in some cases showing a slight gain, especially at the earlier dates, but when gauged with three parts of standard sand, the adulterated cement almost invariably gives a lower result than the pure cement.

A further experiment was tried with the same cement gauged with fresh water in the ordinary way and left in air, and also gauged with sea water and placed in sea water at the expiration of twenty-four hours. Fifteen per cent. of ragstone was added in each case, and the results are given in Table II. These results suggest that the prejudicial effect of the admixture is greatly intensified when the cement is left entirely in air, and also when exposed to sea water. As 15 per cent. seemed to be about the quantity of admixture used by the advocates of the ragstone, that proportion was tried with three other cements from different London manufacturers; the tests of two of them were carried to three months only, the third being extended to the end of the twelve months. The results are given in Table III., and confirm the previous experiments, viz., that when tested neat the strength is not materially affected by the admixture; in fact, in the case of cement C, it shows a distinct gain; but when tested as a mortar with three parts of standard sand, its strength is in every case seriously diminished, the diminution ranging from 6 to 14 per cent.

In the course of the discussion before mentioned, one correspondent maintained that the addition of ragstone was of no more value than

the admixture of so much fine sand, and the author therefore thought it would be interesting to ascertain what the exact effect of an admixture of fine sand would be. For that purpose, therefore, some standard Leighton Buzzard sand was pulverised to the following degree of fineness:—

Residue of a 220 sieve	...	28 per cent.
“ “ 76 “	...	7 “

Fifteen per cent. of this fine sand was mixed with cement A and the mixture tested as before, the results of which are given at the bottom of Table I. Taking the neat test first, it will be seen that the strength of the cement was sensibly diminished by the admixture at the end of a week, while at twenty-eight days, three months, and six months, it was equal, and even superior, to the pure cement; but at twelve months it dropped back to a loss of 8.7 per cent. The three to one sand briquettes, on the other hand, show a marked diminution of strength throughout, especially at the earlier dates.

The experiments hitherto described, formed the first series undertaken by the Author in carrying out his researches on this subject. The chief points which seemed to him worthy of further experiment were the comparative effect of ground sand and ragstone upon cement, and also the effect of the ragstone admixture when the cement was used with sea water and when left entirely in air. The following experiments were therefore instituted with the view of corroborating or otherwise the results obtained in the primary series.

Referring first to the effect of an admixture of finely ground sand compared with that of ragstone, experiments were instituted to ascertain the comparative effect of admixtures of 2, 10, 20, and 30 per cent. of each of these materials, and the results are given in Table IV. Based on the neat tests alone, cement containing as much as thirty per cent. of fine sand is slightly stronger at the end of twelve months than the pure cement; but taking the three to one sand briquettes as the basis of quality, the cementing power of the adulterated material is found to be diminished by the admixture as much as fifteen per cent. The results of these experiments tend to the conclusion that, so far as improvement goes, the admixture of finely ground sand has practically the same effect as an admixture of ragstone, viz., it certainly in some instances increases its strength when gauged neat, but when used as a mortar, with three to

one of standard sand, it diminishes its value according to the amount of diluent used.

Coming next to the effect of admixtures of Kentish ragstone upon cement that is left with sea water and upon cement that is left in air, the author tried the comparative effect of such admixtures upon two samples, cement F being manufactured on the Thames near Gravesend and cement G from the lias formations of Warwickshire. Cement F was mixed with 15 per cent. of ragstone, and cement G with 10 and 20 per cent. respectively, and the effects of these admixtures are given in Tables V. and VI. It will be seen that the addition of 15 per cent. of ragstone to cement F weakens it throughout, both when tested neat and with three parts of sand, the weakening effect of the ragstone being specially marked when the cement is left entirely in air, and to an even greater degree when gauged with and placed in sea water.

With cement G (Table VI.) the addition of 10 and 20 per cent. of ragstone does not seem to materially affect its strength when gauged neat, but when gauged with three parts of standard sand, the loss of cementing power is represented by 1.2 per cent. and 8.9 per cent. respectively, at the end of six months. The briquettes left in air indicate the presence of the ragstone in a very marked degree, both neat and with three parts of standard sand, while those gauged and placed in sea water show a much greater diminution in strength than the ordinary fresh water briquettes, though not to such an extent as those left in air.

The author has not thought the effect of the ragstone admixture upon the minor properties of the cement, such as colour, time of setting, specific gravity, &c., of sufficient importance to warrant any special experiments. It is very evident that, as the ground ragstone is much lighter in colour than Portland cement, its addition would tend to lighten the colour of the mixed material according to the proportion used. The same remarks apply to its effect upon the setting properties of the cement, inasmuch as being by itself

an inert material, it merely retards the setting in the same way that an addition of sand or other aggregate would do. There is, however, one peculiarity which is worth noting, and that is, when gauged for testing purposes in a Fajia mechanical mixer, a cement containing the admixture has a tendency to ball together, or cohere in the machine more readily than pure cement, and this cohesive property may in some degree account for the improved results obtained in certain instances."

For the purposes of reference the chemical composition and fineness of the several cements used in the foregoing experiments are given in Tables VII. and VIII. It should be noted, however, that as the analyses were made some time after the inception of the experiments, the amount of carbonic anhydride and water found is largely due to absorption from the atmosphere.

Taking these experiments as a whole, they clearly show that, although in some instances a certain percentage of ragstone may improve the strength of the cement when gauged neat, it invariably produces an inferior result when tested with three parts of standard sand, especially when left in air or placed in sea water. In other words, although it sometimes increases the cohesive strength of the sample, it invariably diminishes its adhesive power or cementitious value, which is the most essential property of a cement. It is probable that if tested with a larger proportion of sand, say five to one, instead of three to one, the weakening effect of the ragstone would have been still more marked, inasmuch as the inert particles of the admixture would have been spread over a larger area, and their inertness as a cementing material brought more into prominence. The author's object, however, in these experiments was to compare the results of the pure and mixed cements by the standard methods of testing, and only those methods have been adopted throughout. As, therefore, in actual work, cement is never used neat, but always with a certain proportion of aggregate, these experiments show that

an admixture of ragstone is merely a diluent, and, as has been shown by the experiment given in Table IV., is practically of the same value as an admixture of finely-ground sand.

Why the admixture of a considerable percentage of inert material, such as Kentish ragstone or finely-ground sand, should in some instances improve the strength of a cement when gauged neat, is a matter which is not altogether easy to explain. In the course of some recent researches on the finer grinding of Portland cement, the author found that by re-grinding a cement having a residue of about 30 per cent. on a 180 sieve, so as to all pass through that sieve, its strength when gauged neat, although slightly higher than the original cement at the seven days, practically showed no increase at the twenty-eight days, three, and six months, while the original cement gradually increased at each date. On the other hand, the three to one sand briquettes of the fine cement showed a great deal higher strain at the seven days than the sand test of the original cement, and continued to increase at the longer dates till, at three and six months, they were considerably stronger than the neat briquettes. This suggests that the extremely fine particles of the cement—by themselves, unless they have some considerable body of hard inert substance to crystallise around, are not so strong as a cement containing coarser particles of clinker, which form, so to speak, a perfect aggregate and nucleus of crystallisation. It may be, therefore, that in some instances a certain percentage of hard inert material gives body or hardness to the neat briquette, and that the presence of small particles of inert material afford more nuclei of crystallisation, and thus enable the briquette to withstand a higher tensile strain. That an admixture of ten or twenty per cent. of inert material should cause the cement to develop a lower strain when tested with three parts of standard sand is only what might have been expected, for it is very evident that if two particles of sand or aggregate have between them a particle

of an inert substance, such as Kentish rag, instead of an active cementitious particle of cement, the weakening of the mass must result. The author is, therefore, of opinion that any admixture which by itself is inert, unless it is readily soluble in water, or reduced to an absolutely impalpable powder, so that it can be acted upon by every particle of the cement, must diminish the cementitious value of the cement, and therefore prove a source of weakness to the structure.

Having conclusively demonstrated that, so far as the cementitious value of the cement is concerned, these admixtures are simply diluents, or adulterants, the author next proposes to discuss some of the methods by which their presence may be most readily determined. The most certain method of detection is, of course, by chemical analysis; but a chemical examination of a fairly simple nature will determine the presence of Kentish rag. As already stated, Kentish rag is a more or less impure carbonate of lime, and, as such, effervesces freely upon the addition of hydrochloric acid. If, therefore, a sample effervesces to any considerable extent when treated with a weak solution of this acid, there is reason to suspect the presence of ragstone, and a further examination should be made to corroborate, or otherwise, these indications. In applying this test, however, it must not be forgotten that all well-matured cements effervesce more or less when treated with this acid, owing to their having absorbed a certain amount of carbonic acid from the atmosphere, and care must be taken that this slight effervescence is not confounded with that due to the presence of ragstone. If any appreciable quantity of ragstone is present, the effervescence is more prolonged, and the larger particles of the limestone float about in the liquid giving off gas. If the dilute acid is placed in a glass or other suitable dish and the cement dropped into it, a few grains at a time, from the

point of a pocket knife, a very little experience enables the operator to discriminate between the effervescence caused by the presence of ragstone and that which is merely due to a well-matured cement. Of course, if a complete chemical analysis is made of the sample, there are other indications in addition to the evolution of carbonic acid gas which enable the presence of ragstone to be finally and conclusively determined upon.

Another admixture which is more particularly used in the North of England is blast furnace slag, and, although the author has not experimented specifically with this substance, he is of opinion that, having of itself no cementitious value, its effect, when added to cement, is practically the same as that of ragstone. The presence of slag is also fairly easy to detect by chemical means, though to determine it with any certainty requires practically a complete analysis. A peculiar characteristic, however, of many cements containing slag is that, after immersion in water about a week, a briquette or pat freshly fractured has a peculiar dark-green appearance, which fades to the normal grey after exposure to the air for a few hours.

Taken in conjunction with a chemical and mechanical examination, the author has found the microscope an invaluable ally in determining the presence of foreign added materials in cements. For the purposes of a microscopic examination, he has found it most convenient to examine the coarser particles of the powder, viz., those particles which pass through a sieve having 70 holes per lineal inch, and are retained on a sieve having 120 holes. A piece of well-burned cement clinker, reduced to particles of this size, and examined under the microscope with a low power (say a one inch objective), has a dark, almost black appearance, somewhat resembling coke, and is of the well-known porous honeycombed nature characteristic of cement clinker. Kentish

rag on the other hand, reduced to particles of the same size, is almost white in appearance, and is considerably less opaque. Slag, similarly treated, is also considerably lighter in colour than the cement clinker, and, moreover, appears to split up into angular, almost flaky, fragments in grinding.

It will therefore be readily understood that, with the aid of a microscope, the presence of Kentish rag, and also of slag, is fairly easily determined if in any appreciable quantity. To illustrate the difference microscopically between these substances, the author has prepared a few micro-photographs of cements with and without such admixtures, shown in figs. 1 to 6 (see p. 33). The powder in each case was prepared as previously described, viz., by sifting through a 70 and retaining on a 120 sieve. Fig. 1 is a micro-photo of the Kentish rag used in these experiments, and fig. 2 of a piece of well-burned clinker from the Rugby district; the difference between them is so marked as to need no comment. Fig. 3 represents cement G (see Table VI.) as received from the manufacturer, and fig. 4 the same cement after 20 per cent. of ragstone had been added; the difference between them is very distinct, the particles of ragstone being readily recognisable from their almost white, semi-transparent appearance, in contra-distinction to the dark-coloured clinker. Fig. 5 is a micro-photo of a cement as received from a firm of manufacturers who use Kentish rag in their ordinary manufacture; the rounded, white, semi-transparent nature of the ragstone renders it easily distinguishable. Fig. 6 is a sample of cement received by the author for testing in the ordinary course, which was found to contain a large admixture of slag. The one great disadvantage of photography is that it does not reproduce the colour of the object. In this particular instance (fig. 6) the substance under the microscope has very much the appearance of

Fig. 1.

Fig. 2

Fig. 4.

red sweets, to use a somewhat saccharine
nile, which effect is very inadequately repro-
ced in the photograph. It will be noticed also,
at in addition to the difference in colour,
other peculiarity of this substance is the sharp,
gular, almost jagged fracture of the fragments
slag, as distinguished from the more rounded
pearance of the cement clinker.

Fig 2, being a piece of picked clinker, rather
presents the microscopic appearance of an
eal cement than of the usually manufactured
ticle, inasmuch as it consists only of thoroughly
dined particles, and contains none of the more
less imperfectly burned portions which are
generally found in the ordinary cement of com-
merce. Fig. 3 conveys a better idea of the
appearance of an ordinary cement, the particles
which range from a brownish coloured semi-
transparent substance, somewhat resembling gum
rabie to the almost black-looking material shown
in Fig. 2. The microscope is of value, there-
fore, not only in detecting the presence of im-
urities, but also enables some opinion to be
formed of the amount of calcination to which the
ement has been subjected in the process of
manufacture.

In conclusion, the author would add that the
ements used in these experiments were in no
ay specially selected for that purpose, but were
ther purchased from the manufacturers' wharves
rough a builder, or had been sent to the author
or testing in the ordinary course. Altogether
he experiments comprise the results of some two
housand briquettes, in addition to analyses and
ther tests, and the author trusts they are suffi-
ciently exhaustive and conclusive to clear up a
exed question."

SOME EXAMPLES OF ANCIENT
IRON-WORK:
FROM THE MUSEUM OF SCIENCE AND ART,
DUBLIN.

THE specimens of ancient ornamental iron-
work exhibited in the above Museum, although
not numerous, include, however, several works of
exceptional interest, both from an artistic and
archæological point of view. For instance, there
s to be seen a compartment of the railing from
Iampton Court Palace, the work of Huntington
shaw, the blacksmith, of Nottingbam, an exceed-
ngly fine work of the seventeenth century, but
which is probably too well-known to the readers
of the *Builder* to require any description;
and amongst other works hitherto unnoticed, but
well displaying the handwork of the worker in
iron, are the following of which illustrations are
given. No. 1 is a very elegant example of
artistic iron-work, described as a "Fanlight Grille
of iron wrought in scrolls and foliage. A mask
in the centre. German sixteenth century. Sent
by the Trustees of the Compton Downville Estate,
per Captain G. Leslie Poe." This is a very elab-
orate example consisting of scroll-work springing
from a central stem and extending its convolutions
to the right and left. The scrolls are moreover
enriched at every turn by graceful foliage. The
central stem has a mask at about
the middle of its height. The iron composing the
scroll-work is round in section and 1/2 in. diameter.

The size of this work is considerable, being
7 ft. 6 in in width. Although described as being
of the sixteenth century it is evidently much later,
and is probably of the same date as the next
example.

No. 2.—A grave cross, described as being of
Bavarian work of the seventeenth century. This
iron cross is of large size for a memorial of this
description, being 7 ft. 4 in. in height and
4 ft. 7 in. in width. The composition exhibits a
combination of beautiful curves starting from
either side of the central stem of the cross, and
twining in varied directions. A small receptacle
of rather rude design is placed in the centre
of the cross, and opens with a small door turning
upon hinges, probably as a place for an inscription,
or repository of some memento of the deceased. A
very appropriate design surmounts the cross,
being an angel holding a trumpet. This is cut
from sheet iron. The scroll work is formed of
round iron through which the various intersecting
pieces are inserted.

The exceeding richness of the whole design is
very remarkable, combining elegance with
strength and lightness.

No. 3.—Two very curious articles of domestic
use, labelled "A gridiron and fork of the Ancient
Corporation of the Good Fathers of Alost,
Belgium. Flemish c. 1500. From the Ménard
Collection, Ghent." From the appearance and
state of preservation of the "gridiron," it
appears somewhat doubtful as to whether

Length about 5 feet.
Height 3 1/2 inches.

Fig. 3.

it could have been used as a gridiron in the
manner in which it is employed at the present
day, but that it was employed for cooking or heat-
ing food over a fire the two claws underneath
evidently denote. As will be seen from the illus-
tration, it is composed entirely of open-work,
octagonal in form, and surrounded by fleurs-de-
lys, which project from its sides. The handle is
also formed of open scroll-work, and terminating
with a fleur-de-lys.

The fork corresponds in design with the grid-
iron. The total length of the gridiron is 2 ft. 10 in.,
that of the fork, 1 ft. 6 in.

The whole form a very interesting example of
the domestic work at the commencement of the
sixteenth century.

No. 4.—This large iron candlestick is described
as a "Candelabrum with revolving pan of brass,
and socket for a large candle. French, fifteenth
century. Portion of the Peyre collection." As
will be seen from the illustration, it stands upon
three feet, and the stem as high as the cusps sup-
porting the brass pan is of 1/2 square iron;
thence it becomes round and decreases in
diameter. The details accompanying the illus-
tration will, it is hoped, explain the construction

of the upper portion which revolves round
the central stem. With regard to the use
to which this large candlestick was ap-
plied, it is difficult, in the absence of any
information with regard to its original locale,
whether religious or civil, to form a con-
jecture. Should it have been the former, it
might be suggested that it was for holding the
Paschal candle; but its unecclasiastical form
seems to militate against the suggestion.
Altogether, it is a very curious and puzzling
piece of work, and of much interest. The height is
5 ft. 11 in., and the diameter of the lower bowl
or pan is 1 ft. 4 1/2 in. D. A. W.

BUILDING TRADE, LEIGH, LANCASHIRE.—
Despite interruptions through had weather the
building trade in the Leigh district has during the
past half-year been in a flourishing condition. The
Leigh, Atherton, and Tyldesley operative brick-
layers and their labourers have given notice of their
intention to apply for an increase in wages of one
halfpenny per hour. The bricklayers at present
receive ninepence, and their labourers sixpence.
The strike of the moulders at Bull's foundry still
continues.

Illustrations.

THE WESTERN CHOIR, BAMBERG CATHEDRAL.

THE Cathedral of Bamberg, on the Main, is one of the most valuable examples of twelfth and thirteenth century architecture to be found in Germany. It is finely situated on the top of a hill, completely overlooking the town, and, like many early German churches, it has an apse flanked by lofty towers at either end. Internally, the church has choirs at both ends, which are supported upon large crypts, all above ground. The whole of the eastern choir and its crypt are fine rich Romanesque work, and were erected after the year 1110, when the first cathedral was burnt down. This eastern choir is shown in the distance in my drawing. The nave of the church occupies three large quadripartite bays between the two choirs, and to an Englishman the arrangement of the interior is very puzzling, because not only is there a stalled choir at either end, but there are also two high altars and two subsidiary altars, with flights of stairs on either side leading to the choirs above. The western choir is the finest example of pure "first pointed" work I have met with in Germany. It is bisected by transepts in the same style. Its crypt is a singularly beautiful work. I am inclined to think that the western choir and high altar were formerly the more important of the two, because, in the first place, the choir itself is deeper than that at the western end. In the second place, it is bisected by the transept; and, in the third place, in the centre of it is the tomb of Pope Clement II., who died in 1028. It is evident that his monument must have been placed here after the rebuilding of the cathedral, and as he was raised to the Papacy from the episcopal See of Bamberg, it is extremely probable that this western choir was erected as a kind of memorial to him. The tomb has been much mutilated, but is still very curious. It consists of a sarcophagus, which is undoubtedly a genuine old classical work, and probably came from Rome; around it are the marble bases of eight slender columns, which probably carried a thirteenth century canopy, which no longer exists. The ends of the tomb are adorned with mermaids having double tails, which would seem to suggest that it was originally the sarcophagus of some Roman admiral. This tomb is shown in the immediate foreground of my drawing.

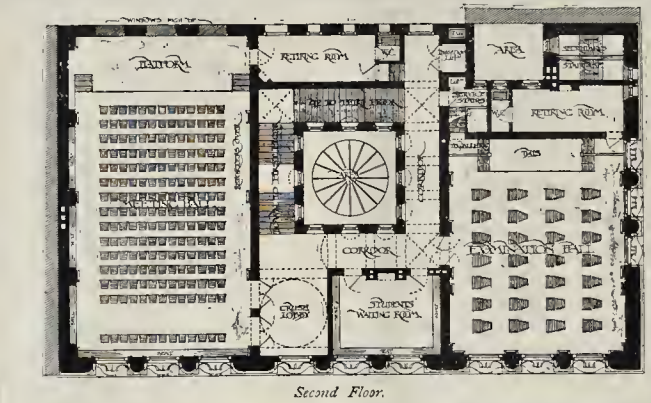

The stalls are remarkably fine, evidently dating from the close of the thirteenth century or the commencement of the fourteenth. Few examples of early wood carving are so rich and elegant in detail.

The stalls of the eastern choir are later in date, and somewhat resemble those of King's College Chapel, Aberdeen; the stone screens at the back of them are thirteenth century work, and on their outer sides are adorned with the noblest thirteenth century sculpture in Germany. The whole cathedral, in fact, is remarkable for its sculpture and carving.

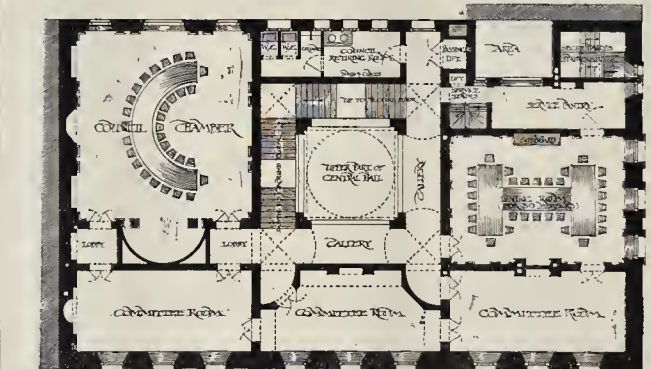

Attached to the pier between the nave and eastern choir on the north side is a grand equestrian statue, nearly life size, forming a monument of St. Stephen, King of Hungary, and dating from the thirteenth century. In the centre of the nave is the beautiful marble monument by Tilman Rhiemenschneider, erected in the year 1513 to the Emperor St. Henry II. and his wife St. Cunigunda. The effigies of the Emperor and Empress are remarkable for their grace and dignity, and the subjects filling in the Gothic panels round the tomb are remarkable for their delicacy. The whole is executed in white marble. Attached to the walls and piers are several upright effigies of bishops. Three of these are said to be the work of Peter Vischer. An altar in the south transept has over it a twelfth century crucifix of ivory, a most remarkable work; and opening out from the same transept is a long building divided into a nave and aisles, called "The Chapel of the Holy Nail."

The walls are completely covered by monumental bas-reliefs, cast in bronze, dating from the fifteenth to the seventeenth century, and the principal altar has a beautifully carved wooden reredos enclosing pictures by Wohlgemuth.

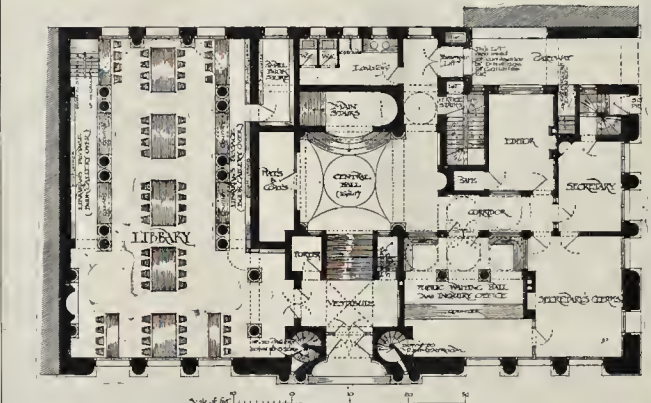

It is said that this cathedral contains one hundred and thirty ancient monuments, all of them interesting works of art. During the restoration of the church some fifty years ago, all the modern monuments were removed to the church of St. Michael, where they can still be seen. None of them, however, are of special value, and by their removal and that of the

First Floor.

Ground Floor.

Design for an Institute of Architects. Plans.

whitewash, wall paintings of remarkable interest have been exposed; and I think that these were also monumental, as several of them are full-length figures of bishops.

The sacristy and treasury of this cathedral are full of objects of interest, some of the reliquaries and curiosities having been given to the Church by the Emperor St. Henry II. and St. Cunigunda; those, however, which date from the fifteenth century are finer as works of art, though not so curious.

Bamberg is an interesting place full of curious old churches. The immediate district is one of the most fertile of all Europe, the scenery charming and rich in well-preserved old castles, some of which are still inhabited and contain remarkable examples of ancient furniture, tapestry,

plate, &c. In fact, few more pleasant localities are to be found in Europe than this Franconian Bavaria.

H. W. BREWER.

DESIGN FOR AN INSTITUTE OF ARCHITECTS.

This design was prepared in competition for the Soane Medallion, and was exhibited at the Royal Academy last year. The exterior was intended to be of Portland stone, with the exception of the ground story, which was to be of unpolished granite. The frieze of sculpture is illustrative of the arts and crafts allied to architecture, and the shields under the second-floor windows have medallions commemorating famous

architects. A dignified effect in the entrance and central hall was aimed at, the latter being lanterned above the level of the first floor, the walls lined with marble, and the vaults frescoed. The masking of the main staircase seemed to convey an air of mystery, and add interest to the interior. The basement contains storage and strong rooms, and a porter's residence. Bedrooms are contived in the roof, over secretary's residence, and mezzanine floors are arranged over all the smaller rooms. The accompanying plans show the more important floors.

PERCY E. NEWTON.

LONDON AND PROVINCIAL BANK, ENFIELD.

The design for this building, by Mr. W. Gilbey Scott, was selected in a limited competition. The whole of the ground floor stage of the bank is in stone, and all cornices, window dressings, and other architectural features above this would be in stone also, the remainder being faced with red bricks, and the roofs covered with green slates.

It is proposed to construct the entrance doors, the internal lobby, the counter, cashiers' desks, the panelled dado, and all other fittings in teak. The floor is fireproof throughout. The space for the public would be laid with marble mosaic, and that in the banking space, and in the waiting-room and manager's-room, with pitch pine-wood block flooring. The ceiling of the bank is also fireproof.

The strong-room has a thick fireproof floor and ceiling, and is completely isolated from all external walls. The manager's house is arranged so that he will be able to get to his room in the bank direct from his house without passing through the bank, by means of a short corridor which is quite shut off from the rest of the house.

The bank being 16 ft. high, it was thought waste of space and money to give the same height to the strong room, lavatories, private entrance, &c., which are situated behind the bank. These portions, therefore, are only 9 ft. high, which gives a floor at a mezzanine level, which has been utilised for the kitchen and its offices.

With the view of utilising the remainder of the bank site, it was considered that a block of offices would be the best and most remunerative building to erect. Twenty offices are provided, with lavatory and water-closet accommodation on every floor; and doorways would be formed and then bricked up, so that at any time they could be opened without structural alteration, should any tenant require two or more rooms communicating. The external architecture of the offices is of the same character as that of the bank, but more simple, that it may not detract from the importance of the principal building.

The drawing was exhibited at the Royal Academy last year.

THE MARY PEASE ALMSHOUSES, DARLINGTON.

These almshouses were originally founded by the benefactress, whose name they bear, in 1820, and were situated in the heart of the town. The

present re-erection and enlargement of the establishment is due to the generosity of Miss Emma Gurney Pease. Not only is provision made for six inmates (women), instead of four, but being removed to a less crowded position near the outside of the town, the site is more open and attractive. It will be seen from the plan that each inmate is provided with a fair-sized sitting-room, a bedroom, larder, sink, coal-cellar, &c. Most of the accommodation is on the ground-floor level, but the bedrooms in the case of the two central houses are placed upstairs. The building is of local brick, the external walls being 14 in. thick, with a cavity of 4 1/2 in. Commondale moulded bricks are used for the gable copings and chimney dressings.

Miss Pease unfortunately died just as the contract was about to be signed (though she had directed and approved all the arrangements of the plan), and the task of seeing the undertaking completed was taken up by her brother, Sir Joseph Pease.

The late Mr. Robert Kitching, of Darlington, was the principal contractor, and the architect, Mr. Paul Waterhouse (of A. Waterhouse & Son) was assisted in the superintendence by Mr. J. P. Pritchett, of Darlington.

The total cost of the work was 1,498*l.*, including fencing, turf, and brick paths.

The drawing was exhibited at the Royal Academy last year.

ADDITIONS TO WYE COLLEGE.

THIS is a drawing which was exhibited at the last Royal Academy, by Mr. Paul B. Chambers, but in regard to which we have no further information from the architect. In the absence of a plan, the building has at least the merit of expressing pretty well, externally, its general arrangement.

MAGAZINES AND REVIEWS.*

The *Art Journal* contains an article by Mr. Cosmo Monkhouse on "A Northern Home," illustrating the interiors in an exceedingly sumptuous mansion somewhere in Scotland (we are not told precisely where), which are very rich and effective, though perhaps rather too showy and wanting in repose. Mr. F. Miller contributes an article on "Book-binding," with some illustrations of admirable work by some contemporary bookbinders. We quite concur in the principle that few tools, and the design a simple development of the characteristic marking of each tool, is the right path in designing book-cover decoration. We are also glad to read of the method employed by Messrs. Dent for some less expensive bindings, in which "the binder who tools them works out his own ideas in each cover, so that no two are quite alike;" the general design being given we presume. This seems a most sensible procedure where entirely original and special work cannot be afforded. The Rev. J. Cavis-Brown gives a popular article on "Chichester," and one of the

* The object of these notes is to point out anything in the contents of the current magazines which is of special interest to our readers, with occasional brief criticisms on the views expressed in such articles. When a magazine which has been sent to us is not noticed, it is because that number contains nothing that it is within our province to comment upon.

illustrations in the number is a reproduction from a study by M. Dagnan-Bouveret for the head of the Christ in his "Last Supper."

We are glad to see the small monthly publication which used to appear under the title of *A. A. Notes* appearing this year in an enlarged form, and with the title in the more dignified form, *Architectural Association Notes*. There are two interesting sheets of illustrations from the work of the Class of Design, "A Porch" and "A Convalescent home." The latter is very suitably treated in a quiet style, but the members of the Class of Design should we think, be required in such a case to add a north point to their plans and to show that these are laid out with due regard to aspect. We may also point out that the kitchen fireplace is hadly placed in regard to the window, so that the cook would be in her own light; an oversight common enough in plans by older architects than the members of the Class of Design.

The *Antiquary* has an interesting paper on the five-storied cliff houses of Pompeii, of which one does not hear very much, though the street houses seem as familiar to us as our own. In the course of the article one is glad to read of one very sensible piece of preservation of old ornament on the part of the Administration of Pompeii. On the ceiling of an old bath room were patches of fresco and relieved stucco ornament, which threatened to fall off. The pieces were carefully detached, and the whole put together into a wooden frame, into which they were cemented. The frame was then raised and placed in the position in which the fragments were found, and fixed by iron supports. In referring to the Peterborough controversy the *Antiquary* naturally takes the side of the Society of Antiquaries, but in advocating that the advice of an engineer should be called in our contemporary would find that engineering advice, in comparison with that of architects, would be (from the antiquarian point of view) out of the frying-pan into the fire. People fancy an engineer would advise how to keep the structure up without interfering with it; whereas the engineer would only say, "it is not worth while to make the attempt." We should like to hear a colloquy between an eminent engineer and the representatives of the Society of Antiquaries and the Society for the Protection of Ancient Buildings; it would afford amusement at all events, if no other result.

In the *Contemporary* is to be found Mr. Holman Hunt's paper on "Religion and Art," read at the last Church Congress, which should be read by all who are interested in seeing church art raised to a real art instead of being a medievalised form of decoration carried on as a business. "Throughout my life," says Mr. Hunt, "I have looked upon the artificiality of religious design with despair. It was impossible to cure the evil, for some artists acquiesced in the practice it had given rise to. What gives new hope for the generation to come is that ecclesiastics have arisen with a new sense of the value of living art, and a small number of young artists have thought it high time to combine to denounce the prevalent taste, and to strive to serve religious thought with designs of original conception." Professor Sayce's article in the same magazine, on "Recent Discoveries in Babylon," sums up the results of the latest excavations, unfortunately not by Englishmen, but by Frenchmen (under M. de Sarzec) and Americans. The suggestion made a year or two ago in Mr. Statham's "Architecture for General Readers" (page 21) that the discoveries of M. de Sarzec seemed to leave room for the question "whether architectural influence may not have travelled in the first instance from Assyria to Egypt instead of the reverse way," appears likely to be more than fulfilled, according to Professor Sayce's reading of the results of these recent discoveries.

Harper gives a summary of the state of "Science at the beginning of the Century," with portraits of Humphry Davy, Lagrange, Herschell, and others. An article on "Literary Landmarks of Rome" deals mainly with buildings and monuments connected with literary celebrities, and, in connexion with the illustrations, will interest those who wish to make the most of their Rome.

In the *Century* an article on "Public Spirit in Modern Athens" presents an interest of rather exceptional kind, as it serves, both in illustrations and text, to bring the ancient and modern Athens side by side for comparison. One illustration on the modern side, the head of "A Girl from Eleusis," shows at least that the type of perfect Greek beauty is not extinct in modern times. The article is followed by a short poem, by Mr. R. W. Gildery, on "The Parthenon by Moonlight," which however is hardly equal to the occasion.

In *Scribner* the article on "Thackeray's Haunts and Homes," with sketches of various houses in England and abroad in which he lived at different times, ought to be of interest to many English readers. Under the heading "The Field of Art" are some remarks on the causes of the inability to appreciate sculpture and why it is so universal, which will be read with sympathy by sculptors, though they will hardly find therein consolation or any hope of better appreciation. As a frontispiece is a scene from "David Copperfield," No. 1 of a series of "Scenes from the Great Novels," by Mr. L. Ravenhill, which as an example of book illustration is really masterly; the characters are the precise personages of Dickens, without the element of caricature which has generally pervaded "Dickens" illustrations, and for which a truth the novelist gave only too much excuse. We wish Mr. Ravenhill would illustrate Thackeray, who merits illustration more than Dickens, and has had less of it.

The *Revue Générale* contains an interesting critical article on the architecture of Vienna, "Une Promenade dans Vienne," by M. J. G. Freson, which by the way closes with a compliment, not we think undeserved, to English architecture. Speaking of the excessive classicism of Vienna, M. Freson observes that not only is one met by structures unsuited to the climate and locality of Vienna, but that this continual imitation of Renaissance details leaves hardly any distinction between the modern and the old architecture. "Toutefois, cette observation est applicable aux édifices contemporains en général. L'Angleterre seule a gardé une certaine originalité, grâce au mode d'éducation de ses architectes; heureux effet dû à l'absence d'écoles d'architecture."

Knowledge commences a series of articles on "The Age of Mountains," by Professor Lohley. Mr. E. Walter Maunder makes an interesting suggestion under the title, "An Old Record of the Corona"—that one of the forms of Assyrian ornament, "a ring with wings," is really a conventional adaptation in ornament of the effect of the corona in solar eclipse.

In the *Essex Review* (quarterly) Mr. F. Chancellor describes and illustrates St. Mary the Virgin, Runwell, in his series of "Essex Churches." There is an illustrated article on some brasses in various Essex churches—Great Bromley, Cold Norton, Shopland, Stebbing, and Wenden Lots.

The *Pall Mall Magazine* gives an illustrated account of Warwick Castle.

The *Gentleman's Magazine*, in an article on "A Country Town in the Seventeenth Century," gives some interesting details as to the official, social and business life of such a town two hundred years ago, as gathered from old papers and mercantile accounts &c. The number also includes a short article on "Spectroscopic Double Stars" by Mr. J. Eiland Gore.

Under the heading "The Most Wonderful Tunnel in the World" the *English Illustrated* gives some account of the making of the Blackwall Tunnel, which is illustrated by sections, as well as views, in a more practical and workmanlike style than is usual in magazines for general reading—in this country at least.

CYCLING AND THE BUILDING TRADE.

THE present enthusiasm for cycling has had a remarkable effect during the past year on the building trade in connexion with the central home of cycle manufactory, Coventry. Nearly all the hundred or more cycle companies, as a result of the extraordinary volume of trade, thought it necessary to increase their factory accommodation. One important feature of the cycle trade was the introduction of several new undertakings into the city, intended to supply certain parts of the machines hitherto purchased from other towns. These have all had their effect upon the building trade. During the year the Cycle Manufacturers Tube Company erected an entirely new factory at a cost of 21,000*l.*; a new stamping factory was opened late in the season by a local firm, and at the present time large stamping works are being erected. Altogether, last year about forty new factories were built, and about sixty plans passed for additions to others, in the majority of cases quite as large as the original buildings. In 1895 only ten new factories were erected, and in 1894, fifteen; and the buildings erected last year are on a far more extensive scale than before, and their total value cannot be much less than 250,000*l.* Included among them are the new workshops of the New Beeston Cycle Company, which cover eight acres; the Rover Cycle Company (four

acres); the Pneumatic Tyre Company, who have doubled their factory accommodation; the Premier, Singer, Sparkbrook, Coventry Cross, Centaur, Roulette, Viking, Conqueror, Coventry Macinists, and Elk Companies, and many others. The old Colton Mill has been converted into a factory for the accommodation of the Beeston Tyre Company, and two entirely new firms—the Daimler Motor Company and the Great Horseless Carriage Company. The works of the Humber Company, which were destroyed by fire in July last (the damage being estimated at 100,000*l.*), have been rebuilt and are now in occupation.

All these circumstances have led to strange developments. As the city filled up with mechanics, attracted by the activity in the cycle trade, builders began to be employed on the new factories and extensions. For this work more bricklayers and carpenters were required than the city could supply, and it was not long before new arrivals exhausted the existing house accommodation. The large contracts given to builders prevented them turning their attention to the erection of houses. As early as May there was not an empty house in the city, and hundreds of men, for whom there was plenty of employment in the cycle and building trades, had to seek work elsewhere. In the summer months many houseless men took their rest in the neighbouring fields, and one contractor, Mr. C. Gray Hill, was obliged to so far recognise the situation as to put up a tent for many of his workpeople who would otherwise have been shelterless. For a long time houses continued to be built very slowly, considering the exceptional opening for remunerative investment. An idea of the demand for house accommodation may be gathered from the fact that in many instances rent was paid for houses long before they were completed, in order to secure the tenancy. But builders themselves had something to say upon the subject of house building. Many were fully employed on large contracts, but the speculative builders, who confined their attention to dwellings, complained that they received little encouragement. Land had increased in value to almost prohibitive prices, materials had risen, wages were higher, and the building by-laws (according to their view) far too stringent. The increase in the price of bricks—about 20 per cent.—was, of course, partly due to the inadequacy of the local supply. Then, again, more building meant more building trade operatives, for whom there was no accommodation in the city. But with the completion of many of the large contracts, and the relaxing in certain particulars of the building by-laws, more attention has lately been given to the erection of artisans' dwellings. Plans were passed about during the last few months of 1896 for twenty new streets and nearly 600 houses. Apart from these, other estates are being rapidly developed, and it is not improbable that during 1897 the number of new houses will be at least 2,000.

Amongst municipal projects occasioned by the prosperity of the industries of Coventry are a new sewage system at an estimated cost of 156,500*l.*; the extension of the fever hospital and the erection of a smallpox hospital, to cost 6,700*l.* and 3,100*l.* respectively; the beginning of the scheme for new municipal buildings by the passing of plans for a new police station (14 571*l.*); the widening of several central thoroughfares; and the re-organisation of the City Surveyor's department by the proposed appointment of a Borough Engineer.

While it may be safely said that the building trade in Coventry will be active in the present year, it is probable that fewer hands will be employed. At present quite 1,000 bricklayers, and as many carpenters and joiners are in regular work. Nearly all the large contracts will be completed in a few weeks, and a considerable number of workmen who have temporarily lived in Coventry will then probably leave. In ordinary times there are about 600 bricklayers and carpenters and joiners in Coventry, but there is no fear of this level being reached during 1897.

COMPETITIONS.

SKIPTON INFECTIOUS HOSPITAL.—The Skipton Joint Hospital Committee, at their last meeting, had before them the report of Mr. Thos. Worthington, of Manchester, as to the best six designs for an infectious hospital. There had been twenty-seven sets sent in for competition, but Mr. Worthington had brought the number down to six. He had submitted these for a further examination, with the following result:—1st premium, 20*l.*, Mr. G. E. Bolshaw, architect and surveyor, Southport and

Grew; 2nd premium, 10*l.*, Mr. A. Cullen, architect, Motherwell, Glasgow; 3rd premium, 5*l.*, Mr. H. W. Pratt, Chancery-lane, London. Mr. Bolshaw's estimate for carrying out his design amounts to 10,000*l.*

CORONER'S COURT, POPLAR.—We understand that the designs of Messrs. Lansdell & Harrison, of Highbury, for the Public Coroner's Court and Mortuaries for the Poplar District Board of Works, have been placed first by the assessor.

ARCHITECTURAL SOCIETIES.

ARCHITECTURAL ASSOCIATION OF IRELAND.—At the ordinary meeting of this Association on Tuesday evening, Mr. Thomas Drew, R.I.A.A., delivered a lecture on "The Architecture of Dublin." Mr. R. Caulfield Orpen presided. Mr. Drew said that in the study of architecture as a living art in Dublin they had remarkable advantages in the mere luxury of living in an old, historic, respectable city, with many dignified monuments of a past time, with a picturesqueness of architectural effect—spontaneous, unstudied; the growth of accidental creation, not made, as it was impossible to make it in a brand new town or city. Let them think what the difference would have been had their lot been cast as students in such new towns as Birmingham, Bradford, Leeds, Wolverhampton, even Manchester. Let them even take his native city, Belfast. How much was there in the modern makings of such towns to inspire the architectural student with one spark of genuine enthusiasm for his art of architecture as he went to his work in the morning and returned in the sunset of the evening? London had great wealth of noble and illustrative architecture, if the student could find it out—from its unmatched Abbey of Westminster, running through all the gamut of progression of styles of the Middle Ages, up to the grand chord of the Renaissance architecture in St. Paul's Cathedral, than which there were few more satisfying examples in all the world of classic Renaissance architecture. In London the architectural student had the run of all that, if he were appreciative and discriminating, and lived on a bicycle; but he did not run it as a matter of fact. The interests and objects were too widely apart, and overflowed by a teeming modernism and a sordid flood of building of a greater modern city. Edinburgh had native charms to inspire the architect artist with a fire of enthusiasm in his daily life of going to and fro, such as he knew nothing to approach in all the lovely cities of these kingdoms. There was nothing in pictorial, theatrically-imagined architecture, and aerially enchanted effect to be conceived like the picture of Edinburgh from the valley below its native Prince's-street. Dublin might not afford exhaustive examples of every age and style, but he maintained that it presented such examples as were wanted to illustrate methods of architectural study. The lecturer then spoke of the architects and architecture of the Custom House, the Bank of Ireland, the Four Courts, Trinity College, and of the residences of the Irish nobility and gentry in Dublin a century ago, and amid applause he concluded his interesting and instructive lecture.—Mr. A. E. Murray, R.H.A., in proposing a vote of thanks to Mr. Drew, said his lecture was the result of a genuine study of the history and architecture of the finest buildings in Dublin, and if Mr. Drew enlarged on the subject and published it, it would be full of interest not only to the citizens of Dublin, but to strangers who visited the city. The Chairman announced the next meeting for the 19th inst., when Mr. J. J. O'Callaghan would lecture on "Design." The library of the Association is now open, and the classes on building construction commence this week, and those on design next week.

PRIVATE BILLS, SESSION 1897; AND PROVISIONAL ORDERS (BOARD OF TRADE).

THE number (293) of private measures prepared for the coming session exceeds the total (251) of last year. The increase is mainly in respect of gas, water, and electricity projects. There are sixty-eight railway bills as compared with sixty-three, nineteen tramway bills as compared with fifteen, and fifty-five electricity and electrical lighting orders as compared with thirty-seven. We give an epitome, abstracted from the official "Notices," of the more important enterprises with our own province, to which we have not already adverted.

MUNICIPAL, BUILDING, SANITARY, AND OTHER LOCAL IMPROVEMENTS.

BILLS—City of London: To dissolve the Commissioners of Sewers (1843), and vest their property,

powers, duties, &c., in the Corporation, to be administered by the Common Council. *H.M.S. Commissioners of Works:* To acquire the sites of Nos. 27-8, Southampton-buildings, for an extension of the Patent Office, westwards of the new block in Staple Inn (south side). *London County Council (general powers):* A new street, from north side of St. George's Lane, through the church-yard to Long-lane, opposite Tabard-street, giving, in lieu of the churchyard, lands on the east side of the new street, and to lay out the same as a recreation ground; widen Long-lane on the south side, between Great Dover-street and Sneathall-place, and on the south side for 4 ch. from the church; widen Battersea Park-road on both sides (in parts), and reconstruct the West London Extension Railway bridge, the Battersea Vestry to contribute; widen Holloway-road (in part), St. Mary, Islington, Vestry to contribute; to provide for contributions by the respective District Boards or Vestries in respect of open spaces at Well-street, Sydenham; East-street, Walworth; Nelson-street, Bermondsey; and Fortune-green, Hamstead; to enable the Council, or any District Board, or Vestry, with their consent, to erect and maintain on a deeded burial ground, such buildings as may be necessary for the efficient management of such ground as an open space or recreation ground. To admit the sewage of Acton and part of East Ham into the Metropolitan drainage system, the Acton, and East Ham Urban District Councils to contribute.

By the following Corporations:—*Birkenhead:* Consolidation of wharves, extension of borough limits, and regulation of places for public dancing. *Bolton:* New streets, a boating-lake, 572 yds. by 80 yds., at Deane and Horton, with diversion of the Middle brook; underground sanitary conveniences, and regulations as to nuisances, libraries, &c. *Bournemouth:* To purchase from Mr. J. E. Cooper Dean the Dean Park House Site, and build thereon municipal offices; widen and improve several streets; acquire lands for public gardens and recreation ground. *Bradford:* For street improvements; extension of the borough, to include Alerton, Heaton, Thornbury, and Tyersal, and improvement of St. James and Rawson-place markets; control and licensing of the ice-cream and fried fish trades; control of places occupied by or for the Salvation Army; regulation of sky-signs, and to deal with trade sewage and effluents. *Bristol:* Extension of boundary to take in Hofield, Stapleton, and St. George parishes, with parts of Westbury, Brislington, Bedminster, Long Ashton, Portbury, and Pottishead; wharfs and quays on the Avon and the floating harbour, and an opening bridge across the Avon. *Colne:* (1) For a new street, to be called North Valley-road, the owners, lessees or occupiers of the land to bear the cost; to take a site in Albert-road for erecting a public library, buildings for technical instruction and secondary education, and other purposes; to set apart land for games, with provision of gymnastic and other appliances; the regulation of sky-signs, advertisement boards, signs, and street advertisements, with various provisions relating to public health. *Glasgow:* Various local measures and improvements. *Huddersfield:* To widen and improve certain thoroughfares; to work their tramways by other than animal power; to prohibit (except as to such as may be required for the tramways) the suspension of electric wires or lines over, across, or along any street, and to permit the same to be placed underground, with removal of those now existing; provision for recreation grounds, including the two offered by Mr. J. Nield Sykes and G. W. Shaw. *Kingston-on-Hull:* To extend the borough area, and erect an opening bridge in Scalcoates; provide a crematorium in the Western cemetery; prohibition of sky-signs and projections of any kind over the streets, and to regulate all structures or devices for advertisements. *Leeds:* Improvement of the drainage area of the Washburn Valley, taking 28 a. of Swinsty Moor and 13½ a. of Hoodstorth-lane Common and Thruscross Green; to widen many streets, and take up and re-enter the human remains in Holy Trinity burial-ground at West End. *Leicester:* Extension of gas and water area; to work the tramways by mechanical or electrical power; to build a public hall with an organ, and to pay musical bands; to erect a crematorium in First Horse-close, Gilross; regulations as to caravans, shows, steam and other organs, whistles, hours for driving cattle, &c., also as to lodging-houses, the hanging of articles and flags over the streets, sky signs, advertisement vehicles, and house signs, sanitary matters and the like. *Nottingham:* For new streets and the widening of others; to construct a towing-path between Wilford and Trent Bridges, and embark the river. *Pullheli:* To constitute themselves the Harbour Authority; to buy the Pullheli Water Company and erect new works; and to enlarge, improve, and fit up the town and market hall. *Salford:* To buy a site for a warehouse for grain or "grain silo"; lay down tramways (4 ft. 8½ in. gauge); to alter and amend existing laws and regulations as to building; and to provide for better regulation of traffic. *Great Yarmouth:* To lay out as a public park or recreation ground Southtown Common, 15½ a., in Gorleston; regulations for the sea-shore; to provide swimming baths and recreation

grounds; to control and restrict the erection and placing of booths, exhibitions, &c., on the marine parade, beach, gardens, sea-shore, and jetty; to provide for the observance of decency and order at the bathing places; to require (with other sanitary measures) that urinals shall be attached to all kinds of refreshment houses and places of public entertainment, and provide public conveniences and lavatories; to supervise lodging-houses; for the removal or prevention of cranes, sign-boards, flag-poles, and other projections into streets, and prevention of street noises.

For a body of Commissioners in Birmingham to pull down the churches of St. Peter, St. Mary, and Christ Church, with schools and vicarage, sell the materials, graveyards, monuments, vaults, &c., church furniture and plate, to form and endow three new ecclesiastical districts, and convert the site of St. Mary's Church and churchyard into a public recreation ground. (See the *Builder* of November 14 last.)

By the following Urban District Councils:—*Cassey Bay and Colwyn:* Provisions as to the promenade, fore-shore and sands, bathing, and bathing-machines; for new recreation grounds, or winter gardens; to contribute towards musical bands, and advertise the local attractions. *Hoylake and West Kirby (Cheshire):* To construct two parades, a marine lake, and carry out the Hoylake Lake Improvement Scheme, by forming an embankment, with gates and sluices, 433 yds. in length. *Llandudno:* To purchase the undertaking of the Great Orme's Head Marine Drive Company (1873); to control street musicians; prevent street cries, and singing; to prohibit, regulate, and restrict the use of sky-signs, vehicles, and boardings for advertisements, together with sundry other local improvements. The Commissioners of the Borough of Bournemouth, co. Linnhlgow, propose to make a new road from the Church Wynd to Starks Brae road, and to sell the harbour and docks to the Caledonian Railway Company. Mr. David Lewes (or a Company in that behalf) promotes a Bill to authorise the erection of new markets, for provisions and merchandise, at the Twyn, and elsewhere, in Caerphilly, for live stock, fodder, &c., in Tonypandy Meadow, with powers to alter and improve the existing markets.

NAVIGATION, HARBOURS, DOCKS, FERRIES, PIERS, BRIDGES.

BILLS.—By the Corporations of *Birkenhead:* To buy the entire undertakings of the Rock Ferry and New Ferry across the Mersey, and construct a pier at Rock Ferry slip, 267 yards long, east-north-eastwards, and a floating landing-stage. *Caernarvon:* To acquire the ferries to Anglesey, construct a pier, 600 ft., south-eastwards at Barras, and a swing-bridge across the Selont at the entrance from the quay to the Eagle Tower, Caernarvon Castle, to Aberly Ferry House, and the *Cornes.* The incorporation of Commissioners to manage, maintain, and improve the harbour, sea-roads and anchorage. *King's Lynn:* To incorporate a Conservancy Board for the port and harbour, with dissolution of the present Harbour Mooring Commissioners; to define the limits of the port as being all the area defined by the charter of a James I., and regulate pilots' charges and surveys of the harbour. *Plymouth:* To vest in them the Lary Bridge at Catwater Harbour, improve and widen approaches of the same; to enlarge the borough boundary to include Lary Bridge and part of Pymstock parish.

North London Railway Company: To widen and otherwise improve the access to Poplar Dock for vessels of larger burden, widen the east side of the entrance between Blackwall Basin and Poplar Dock, and remove the lock gates. *North Eastern Railway Company:* New dock works at Kingston-on-Hull and Middlesbrough; a new dock at east of Victoria pier. *Bradling Harbour and Railway Company:* To sell all their undertaking to the Isle of Wight Railway Company. *Deal Harbour Company:* For revival and extension of powers under the Act of 1893. *Hastings Harbour Commissioners:* For two sea-walls, 850 ft. and 300 ft., with an opening of 100 ft., and two sea-walls, 140 ft., in lieu of the sea-wall and embankment authorised by their Act of 1890. *Mersey Docks and Harbour Board:* To extend their Wallasey landing-stage from its west end for 250 ft. northwards, a fixed pier and bridge to connect the existing river-wall therewith, and for a pier or jetty from near the Canada basin, 950 ft. long, north-westwards, parallel to and 270 ft. distant from the river-wall, with branch piers thereto. *Numbles Railway and Pier:* For extension of the limits imposed by their Act of 1889. *Plymouth and Dartmouth Railway Company:* A pier, 100 yds., southwards, in Deadman's Bay. *Tyne Improvement Commissioners:* For extension of time, and various powers, including the construction of the new ferries.

By various Companies. At Weston-super-Mare—a pier, 200 yds., westwards, from the Caté de Paris, with approach roads; a sea-wall, 600 yds. on the west side of the Grand Parade, to take over the Weston-super-Mare Pier and Grand Pier Companies, and to vest these several undertakings of the new Company in the Urban District Council; by a separate Bill the Grand Pier Company seek for an extension of time under their Act of 1893. At Penarth Flats—for sea-walls, a dock, and railways,

&c. For two piers at Lock Fyne and the Bay of Oban, with enlargement of the quay and sea-wall, Oban. The *Caledonian Railway Company* propose new dock works at Grangemouth, to construct a dock, 32 a. in area, a sea-wall 900 yds. long, with new railways in Lanark and Dumfries.

PROVISIONAL ORDERS.—*Clacton-on-Sea Pier Company:* To widen, improve, and lengthen by 200 yds. the existing pier. *Hunstanton Pier Company:* To extend the pier 100 yds. seawards, widen it, and erect assembly, concert, and refreshment rooms thereon. *Tenby Urban Sanitary Authority:* A pier of 600 yds. at Castle-hill. *Walton-on-the-Naze:* Extension of the pier by 600 yds. or thereabouts. *Whitley:* A marine promenade pier, of iron or steel, with wooden deck, 1,000 ft. north-eastwards from the "Corkscrew" and a pavilion thereon, having a capacity for 1,200 people. By certain "promoters": A pier of jetty at Clacton-on-Sea, 275 ft. south-eastwards from Wash Gap sea-wall; a pier, 400 yds. northwards from the Concert Hall, Llandudno, and with pavilions, shops, bazaars, baths, aquaria, &c., thereon; and by Mr. Reginald J. Weld, for a solid pier or breakwater, about 600 ft. eastwards, from the existing pier at Ilfracombe.

RAILWAYS.

BILLS.—*City and West End:* An underground electric railway from Cannon-street (Budge-row) to Broadway, Hammersmith, beneath the blackfriars, Ludgate-circus, Fleet-street, Strand, King William-street, Leicester-square, Piccadilly, and so to Hammersmith, with a generating-power station by the riverside, Fulham; to be worked by electricity, on a 4 ft. 8½ in. gauge. [The proposal is for double tunnels, 11 ft. 6 in. interior diameter, in iron segments, laid at an average depth of 60 ft. below the street levels, and having twelve intermediate stations in the length of six miles; the estimate of cost is from three to three and a half millions.] *Metropolitan District:* A railway or subway from Earl's-court to Mansion House Station, of 4 ft. 8½ in. gauge, to be worked by electricity or cable, or steam-power, with generating-power stations at Walham-green, Parson's-green-lane, and Del Brook-common. The estimate of cost is from three to three and a half millions. Sir Benjamin Baker's report gives estimates for the cost, being 1,000,000. for a double line five miles long, and 453,000. for installation, rolling-stock, and incidental charges.]

Piccadilly to Brompton: An underground railway from Air-street to south end of Exhibition-road, with subways under Piccadilly at Air and Dover streets, to be worked by electric cables or wires, or other motive power; and with a generating-power station at Swan Wharf, Chelsea Creek. *Central London:* To acquire the sites of Nos. 350-2, Oxford-street, at the south end of Marylebone-lane, for a station in lieu of that in Davies-street, as authorised by their Act of 1891. [The latter site is on the Grosvenor Estate, and we understand that the Company feel unable to comply with certain restrictions demanded by the Duke of Westminster's agents.] *Whitechapel to Dow:* A line worked by steam or electricity, from the Metropolitan District at Vallance-road, through Bethnal Green, Mile End, Stratford, and Bromley to the London, Tilbury, and Southend Railway at Campbell-road, Bow. *West Sutherland:* A line from Invergate Wharf-road, Praet-street, to the "Grand Junction Arms" public-house, by the bridge over the Grand Junction Canal, in Willesden parish, worked by mechanical power, with generating works at the Willesden terminus. This line will take 5½ r. of Wormwood Scrubs and Old Oak Common. *Walford, Edgware, and London:* From a Junction with the Walford and Rickmansworth branch (London and North-Western Railway), through Bushey, Aldenham, Elstree, Little Stanmore to Edgware, and thence two lines to Edgware branch of the Great Northern, and to Mill Hill Station of the Midland. *South Eastern:* To widen Cannon-street terminus, their Charing Cross line in Lambeth and Southwark, for three more lines on the north side of the viaduct between New Cross and London Bridge; viaduct from Tanner-street to South Bermondsey; station at Corbett's-lane, with line thence to New Cross; widen goods line at Bricklayers Arms, and extend the line thence towards New Cross; widen lines (both sides) at Darford, Ashford, and Hastings; sell the Pavilion Hotel, Folkestone, and for extension of time limit under their Folkestone Harbour Works Act of 1885. *Great Eastern:* A line from Woodford, through Buckhurst Hill and Chigwell to Ilford; widenings and improvements at Broxbourne, Ware, Ilford, and North Walsham; to abandon their authorised line (1890) in Tottenham parish; to purchase the Mellis and Eye, Watton and Swaffham, Thetford and Watton, and Downham and Stoke Ferry Railways and undertakings; lines from their Southtown station, Gorleston (Yarmouth), through Gorleston, Hopton, Corton, and Gunton, to Lowestoft, and from Knapton, on the authorised Mundesley branch (1888) of the Midland and Great Northern Companies, through Paston, Edingthorpe, Bacton, Ridlington, and Walscott to Happsburgh (5 m.). *Great Western:* A line from Acton to Wycombe, through Twyford, Perivally, Greenford, Northolt, Ruislip, Ickenham, Harefield, Denham, Gerrard's Cross, Chalfont St. Peter, and Beaconsfield, with a

branch to their Uxbridge and Rickmansworth line (1896), taking 2 a. of Ickenham Green, $\frac{1}{2}$ a. of the Roundabout, Beaconsfield, and 1 a. of Drayton Green. A separate Company promotes an almost identical scheme for continuing the Ealing and South Harrow Railway, 1894 (with branches at Hillingdon to the Uxbridge and Rickmansworth line, and to Denham), to Temple Farm, Chepping Wycombe, and, eastwards, to the Midland and the South-Western at Willesden, taking 3 r. of Long Bottom at Seer Green, and 2 r. of the Roundabout. The Great Western will rebuild and enlarge the bridges at Westbourne Park and Hammersmith stations. The "Bristol Harbour Extension Railways" (four), and the "Canon's Marsh Railways" (four), in Clifton, Bedminster, and North and South Bristol, an opening foot-bridge and swing-bridge across the Avon: line from their West Cornwall Railway at Chacewater to their East Wheel Rose branch at Newlyn, through Kenwyn, St. Agnes, Perranzabuloe and St. Allen. "Great Northern": Line from their Bulwell Forest station (Leen Valley) at Bestwood Park, to Basford, Notts; wide main line, both sides, from Sandy to Offord (14 m.), and from Yaxley to Fletton (4 m.); dissolution of the Royston and Hitchin Railway Company; to establish a savings bank for their officers, workmen, and apprentices, and their wives and children, being minors, and to erect dwellings for the labouring classes on the Company's lands. "Midland": A line from New Mills, Derby, through Glossop, Newtown Disley, Marple, Bramhall, Stockport, and Cheadle to Heaton Mersey, Lancs; and to take over the Kettering, Thrapston, and Huntingdon Railway. To fill up and embank the spaces under the viaduct carrying their goods and mineral lines at St. Pancras-gardens (burial ground), and for sundry minor powers. "Midland and Great Northern Joint Committee": An "Austin-street" branch from North Runcion to St. Margaret, King's Lynn; lines from their Union line at Caister-road to the mackerel and herring market, Lowestoft (10 m.), through Great Yarmouth, Runham, Vauxhall, Southtown, Gorleston, Hopton and Gunton; a dock at Gorleston; to take 10 a. of Southtown Common for the new line and dock; wide line at King's Lynn station; (vide also ad hoc under "Great Eastern.") "London and South-Western": For the Meon Valley line from their Farham station to Alton (about 25 m.), on their Farham and Winchester line through Titchfield, Wickham, Soberton, West Alton, East Meon, East Tisted, Newton Valence, Farington, and Chawton; to widen their line at Alton. Various powers: Wide main and suburban lines at Clapham Junction and Wandsworth, main line between Basing and Woking, and branch between Farham and Alton; to take certain lands, &c., including Battersea Grammar School and $\frac{1}{2}$ r. of Newnam or Hook Common, with the same, jointly with the London, Brighton, and South Coast Railway, Portsmouth Harbour station. "Sheffield & District": A line (with branch to the Midland) from Midland main line between Attercliffe and Brightside stations to their authorised line (1895), which connects the manufacturing quarters of Sheffield with the East of West Railway; by means of the Lancashire and Derbyshire and the Sheffield District lines the Great Eastern obtain access to Sheffield and the coalfields around, the first-named line from Beighton and Chesterfield to Lincoln, 55 m., being nearly completed, and now opened for mineral and goods traffic. "Hall and South Yorkshire Extension": Incorporation of a Company to construct railways from the Hull and Barnsley Railway at Elmsall to Wath-upon-Dearne, where a junction will be made with the Manchester, Sheffield, and Lincolnshire (S. Yorks) Railway; taking nearly 4 a. of Moorhouse and Hooton Pagnell Commons. "Woodhouse and Conisborough": From Handsworth through Orgrave and Rotherham, to Treeton; from Treeton through Rotherham, Thrybergh, Ravenfield, Firby, Denaby, and Mexborough to Conisborough. "Deane Valley, W. R. Yorks": Lines in connexion with the Midland, Manchester, Sheffield, and Lincolnshire, Hull and Barnsley, and Swinton and Knottingsley Railways; a dock at Mexborough, by the confluence of the Rivers Deane and Dun; and to take 5 a. of Mexborough Low Pastures. "Skipton to Linton": From the Midland at Embay, through Stirton, Gargrave, Burnshall, Flasby, Hetton, Rilstone, Croaco, and Threshfield to Linton (14 m.). "Macclesfield to Leek": Line from Prestbury (L. & N. W. Railway), Macclesfield, through Sutton, Gawsword, Besley, Wincle, Heaton, Tittesworth and Lowe to Leek (15 m.), with a branch to the North Staffordshire Railway at Sutton, Manchester, Sheffield and Lincolnshire: From their line at Eydon, Northants, through Canon's Ashby, Moreton Pinkney, Thorpe Mandeville, Cropredy, Edgote, Chalcombe, and Banbury, to join the Great Western Railway at Warkworth (14 m.); to acquire further lands in Marylebone parish, London, and to change the Company's name. "Chatham Loop": A line from the London, Chatham and Dover Railway at Chatham, through Rochester, Strood, Gillingham, Rainham, Upchurch and Luton to that Company's line at Newington, near Sittingbourne (9 m.). "Crowthurst to Bevilhill": For a line from the South Eastern at Crowthurst, through Hollington and Sadley, to Bevilhill, taking $\frac{1}{2}$ a. of Bevilhill Downs. "North Pembrokehire and Fishguard": Lines from Litterston to Clynderwen,

and Carmarthen to Gowerton and Aberdare; abandonment of their Llandilo Loop line (1895). "Bute Docks Company": New lines with branches 10 or near Pontypridd and Treforest, and at and near Cardiff; diversion of the river Taff for about 1,170 yds. from the head of their low water pier to the entrance channel into the Butts Docks; and to take 3 acres of Coed-pennryn Common at Pontypridd. "Vale of Rheidol": for a company to make a light railway, of 2 ft. gauge, from Aberystwyth to the Devil's Bridge, co. Cardigan. "West Highland": Various short lines in Inverness-shire, and near Spear Bridge, with one from Fort Augustus to Inverness. "Caledonian": New railways in Lanark and Dumfries. "Cullinstee and Oban": New lines, and to widen their line at Oban. "Dublin, Wicklow, and Wexford": A line from their New Ross extension at Rosbercon to Ferrybank, Waterford, on the Waterford, Limerick, and Western Railway. "Fishguard and Rosslare": New line from Rosslare to Waterford. "Hastings": A company for lines from the old Fish Market to Ore (S. E. Railway) and from Ore to Silverhill and the district; also for a sea-wall and parafores from the harbour works to Ecclesbourne Glen. By another company, for a line from the harbour to Hollington (S. Eastern Railway), and thence to Balverthly (L. B. & S. C. Railway). For extension of time under authorised Acts: For London Walthamstow, and Epping Forest (1894-95), which works, under an Act of 1891, is to be abandoned: Charing Cross, Euston, and Hampstead (1893); Ealing and South Harrow; and Birmingham, North Warwickshire and Stratford-upon-Avon (1894). For abandonment of their authorised undertakings by the Kingstown and Kingsbridge Junction (1887), and the S. Yorkshire Junction (1886). To the Light Railways Commissioners for an Order for a light railway from Clevelenham (Midland station) to Wincoboeam, Glouc.; 4 ft. 8½ in. gauge. TRAMWAYS. BILLS.—London County Council: To purchase the undertakings of the North Metropolitan Tramway Company (1896) and the Great Northern Tramway Company (1870). "North Metropolitan": Two bills for lines* from Shore-ditch to Cambridge-road, Amhurst Park to Upper Clapton-road, Barking-road to East Ham, Manor Park to Ilford, Holborn Town Hall to the "Angel," Theobalds-road to Bury-street, Bloomsbury; Pentonville to High-street, Islington; Islington and Camden Town to Holloway, and in Hackney. By the Corporations of Swansea,* Sheffield, and district around.* Southampton: For additional lines, and purchase of the Southampton Tramway Company; Neath, additional lines in the borough and its vicinity, and to acquire the Neath and District undertaking (1873), and Halifax.* "Manchester, Carridge, and Tramway Company": Lines in and through Eccles, Manchester, Ashton-under-Lyne, Worsley, Altrincham, Droylsham, Withington, &c. "Swansea Improvements and Tramway Company": For use of mechanical power and electrical works. "City of Birmingham Tramway Company": Lines in the City, Aston, Yardley, King's Norton, &c. "New General Traction Company": Lines in London, in Norwich and Coventry, by electricity (overhead or otherwise). "Bristol Tramway and Carriage Company": Several lines* in Bristol and the suburbs. "By certain 'promoters' for lines in Hastings and St. Leonards, from the Albert Memorial along the sea front to West St. Leonards;" in Newport, Mon.; for taking over the South Staffordshire and other local tramway companies, with new lines in Wolverhampton, Wednesfield, Handsworth, Bilston, Kingswinford, Wednesbury, Dudley, Stourbridge, Birmingham, &c.; and Dublin United Company, new lines. PROVISIONAL ORDERS.—By the Corporations of Blackpool and Huddersfield.* "Cardiff Tramway Company": Several new lines* within the borough, by electricity (overhead or otherwise). "Great Grimby Street Tramway Company": New lines,* by electricity (overhead or otherwise). "Imperial Tramway Company": In Middlesbrough, Stockton-on-Tees, and Thornaby. "Liverpool United Tramway and Omnibus Company": To work all the tramways in Liverpool, Bootle, and Litherland by electrical power, and using the overhead, or trolley, or traction, or other system. "Reading Tramway Company": For Reading and Caversham. "Worcester Tramway Company": Several lines (3 ft. gauge) within the city. By certain "promoters" for lines in Carlisle,* Manchester,* Moss-Side (Lancs.), Morecambe; Yarmouth and Caister,* with acquisition of the undertaking authorised by the Yarmouth and Gorleston Tramway Order of 1883; Cardiff to Penarth,* and in Weston-super-Mare.* In most of the foregoing provision is made for the adoption, if deemed expedient, of mechanical power. ELECTRICITY AND ELECTRIC LIGHTING. PROVISIONAL ORDERS.—To produce, store, and supply electricity, electrical energy, and power, and to erect, install, and maintain machinery, by the Corporations of Bangor, Bingham, Darwen, Dudley, Ipswich, Morley, Southampton (an enlargement of their Order of 1895, so as to include the entire borough), and Wrexham; by the Urban District Councils of Baking, Wimbledon, Ambleside, Bexhill, Dorking, Droylsham,

Farnworth (Lancs.), Garston, Kearsley (Lancs.), Levenshulme (lighting only), Morecambe, Moss-Side (Lancs.), Newmarket, Ramsbottom (Lancs.), Redditch, Stretford (Lancs.), Swadlowne (Derby), Tonbridge, Wallasey, Wilmslow (Cheshire), Withington (Lancs.), and Ventnor; and the Vestries of Fulham and St. Mary, Newington, with acquisition of so much of the London Electric Supply Corporation's Order (Act, 1895) as applies to the parish, and to light within two years from the date of the desired order, Borough High-street, Newington Causeway, Great Dover-street, New Kent-road, Newington Butts, and Kennington Park, Walthow, and Cambridge-road. By the following companies—London Electric Supply Corporation: For such parts of St. Margaret and St. John, Westminster, parishes as lie south of the bridge, Bridge-street, Parliament-square, and Victoria-street. County of London and Brush Provincial: In Bardonsey, Kotherthie, Brixton, Tulse Hill, Herne Hill, and St. Mary, Newington; Holborn District B.W. district (east of Gray's Inn-road), the Liberty of the Charterhouse, and parts of St. Leonard, Shoreditch, west of the City-road; St. George's-in-the-East, Bethnal Green, Mile End, Limehouse, and Poplar; and Fulham parish. "Blackheath and Greenwich District": For Greenwich, Charlton, Eltham, Kidbrooke, Lee, and Lewisham. "Bournemouth and District": Poole and Branksome. "British Insulated Wire Company" (of Prescott): Huyton-with-Roby, Whiston; and the Urban district, and Eccleston. "Leatherhead": For the urban district. "Llandridnod Wells": For the urban district. "Rottlingdean": For Rottlingdean, Ovingdean, and Wooddean. "Walton-on-Thames": In Walton, Hersham, and Oatlands; and by the Weymouth Consumers' Gas Company. By J. C. Howell, of Liphook, to supply the borough of Tenby, and Pembroke, and Pembroke Dock; also by the "John de la Warr and Robert Kersey" to supply certain parts of Bexhill. Also for Bury St. Edmunds, Mount Embo and Donorch, Fornsiorad, Melorch, and Port Skerrat, Dundalk, Ballymena, Clontarf, and Hill of Howth. WATER SUPPLY. BILLS.—London County Council: For acquiring, by agreement or arbitration, the undertaking of the East London (1853), and in that event to proceed with those of the Kent (1869), West Midlands (1866-10), New River (first Act, 13 Eliz. 2, and 3 and 4 Jas. 1, c. 8 and c. 12), Lambeth (1848), Southwark and Vauxhall (1852), Chelsea (1852), and Grand Junction (51 Geo. III, c. 169), companies; for raising money therefor by creation of consolidated stock or annuities, and powers to include in their county rate precepts such sums as may be requisite for the purpose of such purchase. "Kent River": Acqueducts and lines of pipes from their Staines reservoirs to new reservoirs and filter-beds at Kempton Park; from their new pumping station there to an equalising reservoir and pumping station at Cricklewood, and thence to a new service-reservoir, with pumping station, at Fortis Green, with subsidiary and filter stations at New Wood, Westbury, Twyford, Willesden, Hendon, Finchley, and Hornsey; taking 1½ acres of Hounslow Heath, but reinstating the ground surface. The aqueduct from Cricklewood to Fortis Green is to be laid by Golders Green, the "Spaniards" at Hampstead Heath, and the Mutton brook. "East London": Two joint water reservoirs, with aqueducts, &c., at Edmonton and Tottenham, taking a total of 100 acres of Chingford, Wild, and Mitchley Marshes in Chingford and Tottenham parishes; and to divert and impound waters from the Lea, Ching Brook, and Tottenham Mill Stream and Lead. A Water Board for Beckenham, Bromley, Dartford, Erith, Pexley, Bromley, and Sevenoaks districts, purchase of the Kent Waterworks Company, and so much of the Lambeth Company's undertaking as relates to Kent. For additional works and extended area of supply: by the following Corporations—Chichester, taking over the Chichester Water Company; Eastbourne, taking over the Eastbourne Water Company; Harrogate, and purchase of the Harrogate Water Company; Loughborough, with a reservoir at Whitbyck; Maidstone; Manchester, and to buy the Manchester Water Company; Newark; Newport, Monmouthshire, with reservoir at New Church West by an embankment across the Castrogroy brook, and one in Llanvaches by embanking the Llanvaches brook; Nottingham; Southampton, taking over the South Eastern Water Corporation; and Weymouth, with acquisition of the North Shields Water Company. By the Deal and Walmer District Council for a Joint Water Board, taking over the "Company of Proprietors of Deal Waterworks," the minor provisions include the registration and control of plumbers; and a Water Board for Gravesend and Northfleet, with purchase of the Gravesend and Northfleet Water Company—this same purchase is proposed by a separate Bill of the Gravesend Corporation. A Joint Water Board of representatives of Blackpool Town Council and the Urban District Councils of Fleetwood, Lytham, St. Anne's-by-the-Sea, and Kirkham, with purchase of the "Hyde Water Company," East Warwickshire Water Company, with reservoir at Astley; Weymouth Water Company; Lowestoft Water, Gas, and Market Company; Harrogate Water Company,

* 4 ft. 8½ in. gauge.
* 3 ft. 6 in. gauge.

* The Eastbourne Waterworks Company promote a Bill for new works with pumping-station at Holywell.

with reservoir by an embankment of Scargill brook; new Companies for supply of St. Neot's and Crowborough (Sussex) and the districts around; reincorporation of the Newhaven and Seaford Water Company, with new works and extension of area. The Reigate Corporation seek to alter and reduce the existing charges of the East Surrey Water Company, to prescribe a fresh scale of rates chargeable within the borough, and to require the Company to supply the Corporation for public purposes, and other persons for trade or business purposes, by meter, at a prescribed charge per 1,000 gallons.

PROVISIONAL ORDERS.—For new works and extension of area of supply by the Royston, Gosport, South Hayling, and Frith Hill, Godalming, and Farncombe Water Companies; and by certain "undertakers" for works to supply Steyning, Bramber, and Upper Beeding, Benliff, Hadleigh, and district (Essex), and Dumtöcher and Dalmuir.

GAS.

BILLS.—By the Urban District Councils of St. Anne's-on-the-Sea (Lancs.), with purchase of the existing Gaslight and Coke Company; Swadincote, with extension of area and acquisition of the existing Gas and Coke Company; Malvern, with purchase of the Malvern Link Gas Company, and additional works; Malvern Link, with that same purchase; and Coves, with purchase of the Coves Gas Company, and extension of area. A Company to supply Tuxford and district (Notts); by the Crays Gas Company, and Weymouth Consumers' Gas Company, for extension of area; and by the Ashford, and the Arundel Gas and Coke Companies, for reincorporation and extension of area. The South Metropolitan Gas Company seek for powers to alter the qualification of a director.

PROVISIONAL ORDERS.—For additional works and extended areas, by Droitwich Corporation; and the Market Harborough, Harrogate, and Wimborne Gas Companies.

GAS AND WATER.

BILLS.—By the Corporations of Lowestoft, for extended area and purchase of the Lowestoft Water, Gas, and Market Company, and Falmouth for purchase of the Falmouth Gas Company and Falmouth Water Company. By the Urban District Councils of New Hunstanton, with acquisition of the Hunstanton Gas Company and Hunstanton Water Company; and of Caerphilly, for three new reservoirs at Eglwysilan and Llanfahan, by damming three brooks; for dissolution into a new Company of the Hunstanton Water Company and the Hunstanton Gas Company, with additional works and area; for a Company to supply Rhyemey and the Aber Valley district, with acquisition of several local gas and water Companies, and to take 3 a. of Gelligaer Common.

The Tending Hundreds Water Company and Clacton-on-Sea Gas and Water Company apply for a Provisional Order for waterworks at Ardleigh (Phoenix Mill) and enlargement of area of supply.

THE SANITARY INSPECTORS' ASSOCIATION.

The first monthly meeting for the year of this Association was held on the 2nd inst. at Carter's Hall, London Wall, with Mr. W. W. West (Chairman of Council) presiding. After the election of thirty new members and the adoption of the terms of a letter of condolence to the widow of the late President (Sir B. W. Richardson), Dr. Newsholme (Medical Officer of Health of Brighton) read a paper on "The Prevention of Tuberculosis." A discussion followed the reading of the paper, on a resolution of thanks, proposed by Mr. Dee (Westminster), and seconded by Mr. Gardiner (Worthing). The motion was supported by Mr. Billings (Holborn), Mr. Pettitt (Kennington), and several members of the Council. Mr. Alexander (Shoreditch) concurred in the statement that the overcrowding, dampness, and insanitary surroundings of the dwellings of the poor made consumption the most prevalent among the poor. Mr. H. Thomas (Bernoldsey) suggested that the paper should be printed, and circulated widely, the attention of County, District, and Town Councils, and members of Vestries and Local Boards, being especially called to the paper. Mr. Grigg (Fulham) said he could have wished that certain country members, in districts containing a large number of back-to-back houses, who were advocates of that class of dwellings, could have heard the paper. He inquired whether there was any means of ascertaining if a higher death rate from consumption prevailed in districts where back-to-back houses abounded than in other districts where the houses had through ventilation. Mr. Lightfoot (Chelsea) adverted to the difficulty, among certain classes of the population, in getting people to keep their houses clean, referred to the decision of a London magistrate to dismiss a summons brought against a householder for not properly cleaning his house. The magistrate

said that if the house was unfit for human habitation he could give a "closing order," but he had no power to give a "cleansing order." The Chairman, in closing the discussion, said Dr. Newsholme had told them that the abolition of private slaughter-houses was one of the means to be adopted for the prevention of tuberculosis. He thought that the building of proper houses for the people to live in was no less important. Sanitary inspectors should insist upon the houses of the poor being constructed not simply with regard to the drains, but with due regard to thorough ventilation. The vote of thanks having been accorded with acclamation, Dr. Newsholme briefly replied, and the meeting terminated.

Correspondence.

To the Editor of THE BUILDER.

COPPER ROOFS.

SIR,—I should be glad to know if any modern copper roof can be referred to which has been erected within the last three or four years and which has acquired that green colour we so much admire in ancient roofs. My experience, as far as it goes, is that if the green colour does not come at once it never comes at all, not even in the air of the Cumberland Lake district after an exposure of ten years.

In order to try it on the East coast I have for two years had a specimen of sheet copper exposed on the roof of one of the masons' sheds at Bamburgh Castle, 150 ft. above the sea level, with no apparent change in colour. On the other hand, copper gratings in an unoccupied building adjacent to these sheds turned a beautiful green colour in a few days; the cast metal was, of course, an amalgam. It had been suggested to me that such an amalgam as Muntz metal, which, I believe, 1'50 of copper to 1 of zinc, would give the desired colour on roofs as it does when applied as sheeting to ships' bottoms. I shall be glad if any of your readers can tell me if it has ever been so applied, and with what result.

CHARLES J. FERGUSON.

THE RIGHT TO ARCHITECTS' PLANS.

SIR,—With reference to your report and observations in your issue of 26th ultimo, the following is a case for the consideration of the profession:—

An architect was employed to design a pair of villas. The work was carried out, and both the architect and contractor were paid, and the houses are occupied. The client now demands the plans, specifications, and map of sewers. There was no stipulation that these should be given, and the question is, would a court be likely to hold that these documents, having been all along in the architect's possession, should now be given up? If so, see how unjustly such obligations might work—that after one pair of villas are built the client can use them, *ad infinitum*, without further charge.

ARCHITECT.

HEATING HOUSES FROM KITCHEN FIRE.

SIR,—I have read with interest your comments on my hook, and should like to say a few words. With reference to incrustation formed in heating apparatus, my experience has been that in the winter months, when heating apparatus is in operation, no incrustation takes place in an apparatus where the water passes from the boiler at 180 deg. Fah. But in the summer months, when the heating apparatus is shut off, incrustation is liable to take place in the boiler, tank, and domestic supply pipes unless care is taken to shut the damper, to prevent the water being over-heated.

THOMAS POTTERTON.

GOOD TEMPLAR HALL, PERTH.—Alterations and improvements at the Good Templar Hall, King-street, Perth, have just been completed. On the first floor is the main entrance of the hall, and a committee room has also been provided, besides lavatory accommodation. The south part of the floor has been fitted up as a shop, with entrances to both Canal-crescent and King-street. On the upper floor is the main hall, with waiting and retiring rooms and lavatories. The hall has been seated for between 400 and 500 persons. The buildings have been designed and executed under the personal supervision of ex-Baillie Smart, architect and surveyor, Perth, and the contractors for the different works are the following:—Mason, Thomas Dick, Broughty Ferry; carpenter and joiner, David Morrison, Perth; plumber and heating, A. & J. Davidson, Perth; plasterer, Charles Law & Sons, Perth; slater, Alexander Adie, Perth; glazier, Charles Alexander, Perth; ironwork, George Barker, Perth; painters and decorators, Hugh Mackay, Perth.

The Student's Column.

SPECIFICATIONS.—II.

EXCAVATOR.

IN dealing with this portion of the work it is advisable to prepare the site plan with rather more care than is too often done. The determination of a datum line and the careful levelling of the site before any work is commenced, and, indeed, before the plans are finally settled, will materially assist in producing accuracy in the arrangement of, and contracting for, the excavator's work. The architect should determine what are to be the levels at which the ground is to be left at the completion of the works by the contractor. The simplest way is to prepare a block plan of the site with the levels marked in different colours, say blue for those existing before the work is begun, and red for those to be left at completion. If the site is at all irregular in its surfacing before the building operations, or is intended to be so after them, it is well to add sections to the site plan. This site plan will also serve as the plan of drains, the arrangement and position of which should be determined, and shown clearly on the drawings, before the contract is made.

In order to promote even tendering amongst the competing contractors it is particularly necessary to be clear in the specification of the excavator's work. More contracts are lost and won, and more unsuspected profits made on the excavator's trade than probably on any other in the bills of quantities. In the interest of his client it is the architect's duty to give every tenderer an unquestionable basis on which to form his estimate, for it too often happens that a contractor whose general pricing is below his competitors is put out of court by a mistaken reading of some loosely expressed or improperly defined stipulation in a specification. The student therefore should guard against any temptation to the vagueness and indecision which are too frequently characteristic of the part of the specification relating to the excavator's work.

The specification should state clearly what is to be done with the earth from excavations, whether it is to be used for filling up depressions or for forming banks or terraces, or whether it is to be removed and carted away. Other points we shall notice in detail, as the clauses relating thereto are given.

Levels.—The datum line shown on the drawings is 2 ft. above the level of curb at north end of site (or define by reference to an ordnance bench-mark, or some easily accessible and well-defined point). The levels shown by the blue figures on site plan are those existing, and by red figures the finished levels.

Surface Digging and Filling.—Remove vegetable soil one spit deep, and wheel and deposit at spot where marked on site plan. Remove present superfluous surface soil, and use earth for filling where required to make up finished levels, and cart away superfluous earth; made-up soil to be well rolled with a heavy roller to finished surface.

Excavate under boarded floors to a depth of 2 ft. 6 in. below floor level, and below paved floors to a depth of 1 ft. 6 in. below floor level.

Trench Digging.—Excavate for trenches (and haesement, if any) to the depths shown on drawings, and of the following widths: for 9 in. walls, 2 ft. 6 in. wide, for 14 in. walls, 3 ft. 6 in. wide (or as the architect may desire). Level and consolidate earth at bottom.

The depths of foundations shown on the drawings are believed to be sufficient, but should a firm bottom be not reached at those depths, the contractor is to call the attention of the architect to the fact before putting in the concrete. (N.B.—Or the specification may state that the bottoms of foundations are to be approved before the concrete is laid.)

Filling-in.—All trenches to be filled in as soon as walls are above ground level. All filling-in to be well punned in layers, and watered when so directed.

Pipe Trenches.—Excavate for all water and drain pipes, and fill in and pun over same as before directed.

Surplus Earth.—All surplus earth from trenches is to be removed and carted away (or otherwise, if so desired).

Pumping.—Pump or bale out water from the trenches, and keep same dry till filled in, and supply and remove any temporary drainage requisite for this purpose.

Planking and Strutting.—Execute all planking, strutting, and shoring which may be

necessary for maintaining sides of excavations. The contractor will be required to cut out to a square section for concrete any trenches that may be allowed to fall in through insufficient support, and the concrete will have to be filled in to the extra width thereby required at the contractor's expense. (N.B.—Contractors are prone to neglect adequate support for sides of trenches, and it is important that trenches should have vertical sides, and the concrete be filled in to the full width of trench.)

Concrete.—The concrete for foundations to be composed of fresh burnt blue lias lime, and ballast of clean hard river or pit gravel, broken to pass a sieve of 2-in. mesh, and clean sharp sand, and to be mixed on a clean boarded or stone platform, in the proportion by measure of one part of lime to five parts of ballast and two parts of sand, with a sufficient quantity of water; and the whole to be thoroughly incorporated and tipped into trenches. (Or otherwise describe concrete as desired.) The concrete to be filled in to the full width of square-cut trenches, and not between boards.

(Then describe any other varieties of concrete for pavings or fireproof floors.)

Brick Rubbish.—The concrete under pavings to be laid on a bed of hard, dry brick rubbish, in, thick, and well rammed.

Provision.—(Specify any provision desired of digging or concrete for filling in to cesspools, &c., making it clear what description of digging and of concrete is required.)

Roadways and Graveling.—(Specify what is to be done by the contractor, or provide a sum of money.)

Grubbing Up.—(If there are any hedges or trees to be removed and roots to be grubbed up, this must be specified.)

DRAINAGE.

Drains.—The drains to be laid as shown on plans with Albion Clay Company's patent Paragon pipes (or whatever is intended; but make it quite clear whether "London-made" or "tested" pipes are wanted or not. Do not say that the pipes are to be of "approved" manufacture without indicating what will be approved, as the quality varies considerably. If there is to be a difference between the rain-water drains and the soil-drains describe it thus:—

The rain-water drains to be of "A" form and the soil-drains of "B" form, all to be laid truly with joints formed and filleted with Portland cement, and the latter to rest on bed of concrete 6 in. thick, the full width of the trench.)

Testing.—The contractor will be required to test the drains in the presence of the architect. (State what test will be required, whether water test, and to what head of water, lamp test, straightness of line, and gradient, &c. If the work is within province of Local Authority, add: The drains are to be laid in such a manner as to satisfy the requirements of the inspector to the (Local Authority).)

If the drains are not satisfactory in all respects, the whole shall be taken up and relaid at the contractor's expense.

Connection with Sewer.—Give notice to the (Local Authority), and pay their fees for making connection with sewer. (The Local Authorities in nearly all cases now require that the connexion with sewer shall be made by them, and their charges paid for same.)

Cesspools.—(If there is no public sewer, these may be required. Then specify size, depth, and whether steined, dry, or in cement, as the case may be; also, whether cemented and made water-tight, as required by some Local Authorities. Specify the brick dome and manhole cover, and ventilation, if any.)

Soak-away Hts.—(These are allowed in some districts. Specify size and depth, whether steined, dry, of course, and whether filled with gravel, or brick, or stone rubbish.)

Lidded Pipes.—All bends and junctions, except in inspection chambers, to have lidded pipes.

Gullies.—(Specify as required also the slippers or open channels for sink and bath wastes. Also grease traps where wanted.)

Disconnecting Chambers.—Disconnecting chambers to be built in accordance with detail drawing by _____ in the clear, and _____ deep.

The sides to be built one brick thick in white glazed bricks in cement, and to be corbelled over at top to receive iron covers, 24 in. by 18 in. The bottoms to be formed of Portland cement concrete, in, thick, and sloped in cement to channel. (Specify also the trap, the ventilating pipe, foot-irons, air-tight manhole cover.)

Inspection Chambers.—Inspection chambers to be _____ in the clear (if of varied size, letter on plans and describe them separately) and

without trap and ventilating pipe, but in other respects similar to disconnecting chambers.

Lamp Holes.—(Specify if any are required.)

Flushing Tank.—(Describe if any with Field's syphon or other automatic arrangement. State size and construction.)

(N.B.—With reference to special items connected with the drainage, it is generally better for the architect to decide beforehand what he means to adopt, and specify by a manufacturer's name, as So-and-so's gully trap No. _____, p.c. Care should, however, be taken to find out if these special articles are kept in stock, and, if not, how long before they are wanted the order must be given, and this should be stated in the specification, as Builders often do not order special articles till the day before, or even the day after, they are wanted on the works.)

OBITUARY.

MR. E. HOWARD DAWSON.—We regret to have to record the death of Mr. E. Howard Dawson, of Lancaster, architect, and Associate of the Institute of Architects, at the early age of thirty-three, and under very sad circumstances. Mr. Dawson had gone to Manchester on business, and was taken ill in the train, whence he was carried to a hotel in Manchester where he died on the night of December 31. He had been married only three years, and leaves a widow and daughter. Mr. Dawson had carried out a considerable amount of work, and during the last seven years had been principally engaged in extensions and re-erectments at the County Asylum, Lancaster. He carried out the County Police-station at Skerton, and three others in the district; the Phoenix Hall, Lancaster; the Congregational churches at Grange and Carnforth; and a good deal of work on building estates.

HERR FERDINAND SCHIFFER.—We regret to have to record the death of Burath Ferdinand Schiffer, whose name has long been associated with the great railway works of Germany.

HERR JULIUS HOFMANN.—In a special article, the *Deutsche Bauzeitung* refers to the excellent work done by Oberbaurath Julius Hofmann, of Munich, recently deceased, whose principal work was in connexion with the numerous castles erected and decorated for Ludwig II. of Bavaria, and explains the curious relationship of client and architect, which existed between the Bavarian King and Oberbaurath Hofmann, and the origin of what have been considered as meaningless eccentricities in these particular buildings. Herr Oberbaurath Hofmann was born in 1840, and his technical education was obtained at Vienna. He had the curious fortune of obtaining the post of Court Architect to Emperor Maximilian of Mexico, into whose service he entered in 1864, and he was responsible for two well-known royal residences in that country. After frequent changes, holding important offices, Herr Hofmann became the successor in 1884 of Professor Dollmann, as Court Architect at Munich, and it was from that date that he was particularly occupied with work on the castles of Herrenchiemsee, Linderhof and Neuschwanstein, as well as on the designs for many castles which were never built. His last work was the design of a memorial chapel to the deceased King, which will now be carried out by Professor Thiersch.

GENERAL BUILDING NEWS.

PREMISES, SELKIRK CO-OPERATIVE SOCIETY.—New premises for the Selkirk Co-operative Society, Limited, have been erected as an addition to the existing buildings. The frontage is 114 ft. long, with an average depth of 30 ft. The work has been carried out from plans prepared by Messrs. J. & J. Hall, Galashiels.

BUILDING TRADES, THE POTTERIES.—In the Potteries, bricklayers, for the time of the year, are well employed. Joiners and carpenters report trade exceptionally good for the time of the year, hence hands being well employed. There are a few outside carpenters and fixers suspended through the weather. There are, practically speaking, no joiners out of work in the district. At Leek in all branches of the building trade there is great activity for the time of the year. At Crewe all joiners and bricklayers are working full time. At Stafford trade is dull, with a few out of work in all branches.—*Staffordshire Sentinel.*

POST-OFFICE, SOUTHEND.—A new post-office has been opened at Southend-on-Sea in West-on-land. The architect was Mr. Henry Tanner, and the builders were Messrs. Lavis & Leaney, the fitting being supplied by Messrs. Everett & Son, of Colchester.

RESTORATION OF MORLAND CHURCH, WEST-MORLAND.—The ancient church at Morland was reopened recently after undergoing restoration at a cost of about 1,800*l.* exclusive of the chancel, which was restored by the Ecclesiastical Commissioners. Among the principal alterations was the new transept, the end of which was pulled down to the bottom of the old window and rebuilt with three windows to agree with those in the south transept. The vestry had to be pulled down so as to open out a window which was built up in the chancel

wall, and that entailed the building of another vestry. The old ceiled roof has been taken away, with the exception of the principals, and replaced with a new open one. In the tower three Saxon windows have been opened out. Inside, the old pews have given way to new stalls in oak. The old three-decker pulpit has been removed to the other side of the church, and reconstructed on modern lines. The choir has been brought into the chancel, and the communion rails lowered. A new heating apparatus has been put in. The contractor for the work was Mr. Edmondstone, Morecambe, and Mr. C. J. Ferguson was the architect.

BANK, EXMOUTH.—A new building in Rolle-street, Exmouth, which is to be the new branch of the Exeter Bank in that town, has just been opened. The old premises have been altered and extended in accordance with the plans of Mr. Chas. Cole, architect, of Exeter. The building work has been carried out by Mr. A. Hayman, Exmouth.

WORKING MEN'S CLUB, NEATH.—The memorial stones in connexion with the Neath Working Men's Club were laid recently by the mayor (Councillor A. R. Thomas). The architects are Messrs. Lambert & Rees, Neath and Bridgend, and the contractor Councillor Abraham George. The new premises will have a pressed brick front, and will contain reading rooms, a library, billiard-room, skittle-alley (97 ft. long), bar, and committee and cart-tyer's rooms.

PROPOSED KURSAL AND MUNICIPAL BUILDINGS FOR CHELTENHAM.—At a meeting of the Cheltenham Town Council, on the 4th inst., the Town Improvement Committee made its report on the proposed spa scheme, &c., for the town. The Committee had engaged the services of Mr. E. R. Robson, architect, Westminster, and he had had several interviews with the Committee, and had prepared plans for the erection of a kursaal and baths at the south end of the Winter-garden, and for the conversion of the existing Winter-garden into municipal offices and a winter-garden. Mr. Robson estimates the expenditure to be as follows, viz.:—50,000*l.* if all the work is done at once, and 53,700*l.* if done in sections. The Committee, and had prepared plans for the erection of the buildings be advertised for in such sections as the Committee may decide on, and that application be made to the Local Government Board for their sanction to a loan. After a brief discussion, it was decided to adjourn the whole matter to a special meeting of the Council, to be called for the 22nd inst.

SCHOOL NEAR LOWESTOFT.—A new voluntary school has just been opened at Carlton Colville, by the Lord Bishop of the Diocese. The architect is Mr. F. W. Richards, of Lowestoft, under whose direction the school has been built, at a cost of 1,100*l.* Mr. W. J. Searle carried out the brickwork, and Mr. A. G. Beckett the wood work. The interior of the building is 98 ft. by 22 ft., divided by a sliding partition, both girls and boys being accommodated. It is constructed to hold 200 children.

RESTORATION OF ST. PETER'S CHURCH, BARTON-ON-HUMBER.—This church is about to be restored. The work is to be put in hand at once, under the superintendence of Mr. C. Hodgson Fowler, of Durham. The scheme comprises the building of a new chancel, the north side of the new gery vestry, restoration of the tower, renovation of the interior walls, and the purchase of a new organ.

NEW ACCIDENT HOSPITAL, ALLOA, N.B.—This new building is to be erected on a site immediately to the west of the existing Hospital, and is to be designed by Mr. James Bryden, architect, Glasgow. There will be two entrance gates on a new road leading to the hospital buildings. The main building will consist of a central administrative block, and two wings. Each of the wings will contain one ward for six beds, one ward for three beds, and two private wards for one bed each. All these wards will face the south. The wards will be approached from the central part of the building by wide corridors. From these corridors the latrines will enter at the back; ward sculleries are also provided entering off the corridors. Observation windows are arranged in the wards. The floors of the wards are of pitch pine, and all corners are rounded. The lower walls of the corridor are lined with tiles, and the upper part has an exit porch for convalescent patients, obtaining access to the grounds in rear of the buildings. The central part of the building contains toward the front, the entrance vestibule, doctor's room, and men's and women's day-room, behind which are placed the operating-room, doctor's store, kitchen and scullery service, pantry, and matron's storeroom, &c. The central building is two stories in height, and the upper floor contains matron's rooms and seven bedrooms. In the rear of the main hospital building will be erected the offices required, comprising washing-house, laundry, boiler-shed, store for patients' clothing, mortuary, and post-mortem room.

BUILDING IN HIGH STREET, SHEFFIELD.—The progress of Sheffield in the direction of the improvement of the city has been greater and more marked during 1896 than in any previous year since the City Council woke up to the fact that so large and important a centre was despoiled behind the times in the character of its buildings and main thoroughfares. The

widening of High-street was in this connexion the most notable event of the year. A change which brings the converging thoroughfares of Vargate and Church-street and the noble block of Cole's buildings into the line of vision of the pedestrian standing at the Post Office, and affords a fine, spacious thoroughfare in the place of one that was tortuous, narrow, and awkward, is so decided an improvement in the city's main artery that the lethargy of preceding Councils on this subject only evokes surprise. The buildings in High-street completed during 1896 include the London and Midland Bank, at the corner of York-street, the lofty pile raised by Messrs. Foster & Sons, and the pretty terra-cotta building of the Grand Clothing Hall. The Café Company's premises consist of the original premises set back to the prescribed line. The new premises of Messrs. F. L. & S. Smith were the first to appear behind the disappearing bricks and mortar, and now the vestry is practically completed. As yet the new roadway is only temporarily laid, awaiting the solidifying effect of the traffic, and the completion of the connecting link of the new sewer, which extends from the Monolith to the Church Gates, and from Change-alley to the top of Commercial-street. This sewer replaces the rotten and ineffective drain which in places simply carried out of the rock in its course.—*Sheffield Telegraph.*

RESTORATION OF ST. GEORGE'S CHURCH, WOLVERHAMPTON.—This church is undergoing restoration at a cost of 2,500*l.* Among the alterations being carried out is the entire removal of the galleries, the re-flooring with wood blocks, a new organ, modern oak seats in place of the old high pews, a new choir vestry is provided, and the chancel window is filled with a representation of the Crucifixion, and a carved oak screen is erected across the entrance to the chancel. Mr. T. Skett has the contract, and the architect is Mr. Beck.

LABOURERS' DWELLINGS IN MILK-STREET, BIRMINGHAM.—The Birmingham Improvement Committee, in their report to the City Council, recall the proceedings that have been taken in relation to the improvement scheme for the insanitary area in Milk-street, under which the land was acquired by the city and cleared of its objectionable buildings. The Committee now report that they have been unable either to sell or let the land as subject to the conditions laid down by the Local Government Board, and have therefore given their most careful attention to the preparation of plans for houses suitable for the labouring classes. 103 dwellings suitable for the artisan class, at rents varying from 5*s.* to 6*s.*, each with three bedrooms, have been erected in the vicinity of Ryder-street, and the committee, having provided so many houses of this class, feel they would like to supply a dwelling suitable for that portion of the working class who are earning a labourer's wage. Drawings are submitted by the Committee showing such suggested dwellings from which it will be seen that it is proposed to erect upon the site sixty-four dwellings, each having a living room 12 ft. 6 in. by 11 ft. 3 in., bedroom, 12 ft. 6 in. by 9 ft.; bedroom, 11 ft. 3 in. by 8 ft.; water-closet; scullery to every two houses, 10 ft. by 8 ft. 6 in. These houses are designed on the dual-house system—viz., one house built upon another, the upper storey of the first of houses being obtained by a balcony running the whole length of the rear of the dwellings, and are estimated to cost 6,250*l.* The rent proposed to be charged is for the lower houses 4*s.* 3*d.*, and the upper 3*s.* 6*d.* Although, in accordance with the requirements of the Local Government Board, only one half of the houses has been completed, the remaining part is wholly unoccupied, and the materials in the buildings rapidly disappearing; under these circumstances it is suggested that the scheme be carried through in one contract, and the committee therefore recommend that the proposed scheme be approved, subject to such modifications as they may deem advisable, and that the Finance Committee be authorised to borrow a sum not exceeding 6,250*l.* for the purpose of carrying out such scheme.—*Birmingham Post.*

NEW HOTEL NEAR THE CENTRAL STATION, MANCHESTER.—Before the details of the new hotel proposed to be erected close to the Central Station by the Midland Railway Company are finally decided upon, Mr. C. Trubshaw, F.R.I.B.A., the Architect of the Company, and Mr. William Towle, the manager of the company's hotels and restaurants, are to proceed to America in order to make a tour and inspection of the large hotels in the States. The new hotel, which it is proposed to make one of the largest and finest in the country, will occupy the site at present bounded by Lower Mosley-street, Windmill-street, Mount-street, and Peter-street. One of the chief features will be a large courtyard in the style of a winter garden. To take the place of the Gentlemen's Concert Hall, which is one of the buildings to be demolished to make way for the new hotel, a large concert room will be attached to the hotel, but the entrance will be a separate one.—*Manchester City News.*

THE STATE OF BOCKING CHURCH.—A vestry meeting was held at Bocking recently, Col. Savill presiding, to consider the report of the architect (Mr. F. Chancellor) upon the condition of the church fabric. The report urged the necessity of a thorough examination of the whole of the roof of the church.

Mr. Chancellor had examined the chancel arch and the pillars supporting it, and had come to the conclusion that they would have to be taken down and rebuilt. About 500*l.* or 600*l.* was required to carry out this work. The Chairman said this sum would not put the church into a thorough state of repair, but only the roof and chancel arch. A committee was formed to collect the money for the carrying out of the work.

BAPTIST CHAPEL, BEXHILL.—The new Baptist place of worship in Clifford-road, Bexhill, was opened recently. The new building is in the Gothic style. The chapel proper is about 45 ft. by 27 ft., and there are two vestries in the rear. The contractor was Mr. C. Thomas, the architect being Mr. R. W. Moore, of Brighton.

BUILDING TRADE, STONEHAVEN.—Trade in Stonehaven during 1896 has been on the whole of most satisfactory character. The building trades have had a busy year. The large amount of work carried over from 1895 kept all well employed during the early months of the year. During summer a slight lull set in. Towards the end of the year, however, a number of important contracts were settled, and from the number of buildings now in progress or projected the coming spring is certain to be a busy one.

NEW SCHOOLS, BELFAST.—A new school has been erected in Mayo-street, Belfast. Messrs. Young & Mackenzie, architects, superintended the work of erection, which was in the hands of Mr. William Kerr, builder.

HEADQUARTERS FOR LEEDS MEDICAL STAFF CORPS.—The Leeds Volunteer Medical Staff Corps have commenced the erection of offices and hall in St. James's-street. The drill hall will be 68 ft. in length, and will have a width of 35 ft., with a wood block floor resting on a bed of concrete. The roof is to be of wrought iron. The other buildings will comprise quartermaster's office, stores, and residence of the staff-sergeant, while outside the main block a lavatory will be fixed, and a shed erected for the service wagon. The whole of the work is to be carried out in accordance with plans prepared by Mr. William Bakewell, of Leeds.

CONDITION OF THE PARISH CHURCH, TARNWORTH.—Owing to the anxiety felt as to the safety of the south-west pinnacle of the tower of the old church at Tarnworth, the vicar and churchwardens considered it advisable to take the opinion of Mr. Basil Champneys, who has made a careful survey. In a report, Mr. Champneys states that, in regard to the tower, there is a considerable inclination towards the west. He advised that the top of the spirelet be at once taken down to the level of the bed above the second crocket from the top. Steps are being taken to have the more dangerous portion of the pinnacle at once removed, and when funds are obtained the remainder will be taken down, and the whole re-erected in a substantial manner. The three other pinnacles of the tower have all been rebuilt during the present century.—*Birmingham Post.*

THE NEWCASTLE INFIRMARY SITE.—In connexion with the proposed erection of a new infirmary for Newcastle, the question of sites has been advanced another stage by the receipt of the report of Mr. Waterhouse, who was called in to advise the House Committee on this matter. Mr. Waterhouse, it is stated, favours the erection of a new hospital on the present site. He considers it will afford ample space for the erection of a first-class modern hospital, of 400 beds, with the necessary administrative buildings, and accommodation for eighty nurses. Mr. Waterhouse is further of opinion that the work of constructing the proposed new hospital may be carried on without in any way interfering with the work of the Infirmary during the period which will be required for the construction of the building.

CHURCH FOR THE WREXHAM DISTRICT.—The plans sent in by Mr. J. H. Swainson, Wrexham, for the new church, to be called St. Peter's and to be erected at Rhosrobin, in the parish of Rhosddu, a suburb of Wrexham, have been adopted.

RESTORATION OF TOWER, HINDERCLAY CHURCH, SUFFOLK.—The tower of Hinderclay Church has for some time been in a critical condition. It was lately inspected by Mr. W. Fawcett, F.S.A., of Cambridge, and by his advice, the work of restoration was undertaken.

SANITARY AND ENGINEERING NEWS.

LIGHT RAILWAYS, ABERDEEN.—There are two rival schemes for light railways from the City of Aberdeen to the Skene and Echt districts. That promoted by a private syndicate, which has met with most favour in the localities to be served, is estimated to cost 103,571*l.* The other, promoted by the Great North of Scotland Railway Company, is expected to cost 60,000*l.*, and is proposed to be worked in conjunction with the city tramways and with a proposed circular railway to be formed by making through the suburbs of Aberdeen a connexion between the Deeside line and Great North main line, there being already a through connexion at the existing joint passenger station. The G.N.S.R. shareholders have approved of the application and order in this connection will be considered at the first sitting of the Light Railways Commissioners in the North of Scotland.

BRIDGE, NEAR DURHAM.—Mr. C. A. Harrison, Engineer to the North-Eastern Railway Company, has designed a bridge to cross the Browney stream at Rely Mill, about a mile south of Durham. The new bridge will be of red brick, and includes five arches, each with a span of 60 ft.; and when completed the bridge will measure 300 ft. long, and 70 ft. high at the deepest arch.

DRAINAGE OF RUABON.—On the 1st inst., at the Court-house, Ruabon, Colonel Marsh, R.E., one of the Inspectors of the Local Government Board, held an inquiry as to an application by the Wrexham Rural District Council for a loan for the purpose of draining the village of Ruabon. The village has an estimated population of about 1,700, and the older portion is at present drained by a system of pipe or brick sewers into the Ruabon Brook. The new portion at Bryn, which has a population of nearly 700, is at present drained into cesspools. Mr. E. B. Martin, of Stourbridge, has prepared a scheme, which he explained. The total cost of the works was estimated at 6,830*l.* There was no opposition.

SEWAGE QUESTIONS IN SOUTHPORT DISTRICT.—The report by Mr. Mansergh on the treatment of sewage in view of the early silt-up, through the Ribble works, of Crossens Channel, has been received and referred to a sub-committee of the Southport Corporation for report. It is understood that Mr. Mansergh advises an initial expenditure for pumping and filtration works of some 30,000*l.*, to be afterwards doubled by carrying out a complete scheme.

SEWERAGE, KNOTTINGLEY, YORKSHIRE.—An inquiry on behalf of the Local Government Board was held recently at Knottingley by Colonel Hasted, R.E., in regard to an application by the Knottingley Urban District Council for powers to borrow 13,000*l.* for works of sewerage. Mr. E. D. Atkinson, clerk, explained the scheme, which has been prepared by Mr. J. Richardson, engineer, Methley.

THE ULLET-ROAD SEWER BURST, LIVERPOOL.—The Health Committee of the Liverpool City Council, at their last meeting, had under consideration a number of letters complaining of the damage done to property by the recent bursting of a sewer in Ullet-road, Sefton Park, and resolved: "That, although the committee consider that the accident to the Ullet-road sewer and the damage done thereby was caused by the exceptionally heavy rains which took place on the evenings of December 24 and 25, they think that, without admitting any legal liability on the part of the Corporation, the Corporation should repair the actual damage to property by the accident, and that the matter be referred to a sub-committee, consisting of the chairman, deputy-chairman, Mr. Campbell, and Mr. Thomas, to see the parties affected, and to authorise any works to be carried out which the sub-committee may think necessary." It was also decided to instruct the treasurer to pay all extra wages on the works as certified and directed by the City Engineer, who was authorised to obtain such machinery and materials as he might require for completion of the works.

STAINED GLASS AND DECORATION.

WINDOW, BRAMSHOTT CHURCH, HAMPSHIRE.—A window to the memory of the late Mr. Alexander Macmillan, the publisher, and to his son, the late Mr. Malcolm Kingsley Macmillan, has been placed in the north aisle of Bramshott church, in Hampshire, in which parish Mr. Macmillan had a residence. The window is the work of Mr. H. Holiday, of Hampstead.

MEMORIAL WINDOW, TRINITY CHURCH, WINDSOR.—A memorial window has been placed on the north side of Holy Trinity Church, Windsor. The window depicts the Annunciation. The work was executed by Messrs. Campbell & Smith, of London.

FOREIGN.

FRANCE.—M. Gougeon, pupil of M. Lalou, has won the prize for the competition of American architects, the subject of which was "A large factory in Alaska."—M. Scellier de Gisors, architect to the Luxembourg, has been elected Inspector-General of "Batiments Civils et des Palais Nationaux," in place of M. Daumet, who has reached the limit of age.—M. Roly has just been elected President of the Académie des Beaux Arts, and M. Emil Barrias has been elected Vice-President.—There is a talk of uniting the Seineaux line of railway with the line of the Ouest, by means of a branch line of railway, the cost of which is estimated at three million francs. It will leave the Robinson station and end at Clamant, going by Plessis Piquet, Bagnaux, and Châtillon.—There is an exhibition in the Rue Volney of the new works of the Russian painter Vereeschagin. The most interesting picture in the collection is one of the retreat of Napoleon I. in the Russian Campaign.—The thirteenth exhibition of impressionist and symbolical painters has just been opened in the Gallery "Barc de Bouville," in the Rue Pelletier.—A new bridge is shortly to be built over the Seine between Genevilliers and Cléchy.—The municipality of Bourges has just voted a sum of 250,000 frs. for the... These schemes will be considered at the first sitting of the Light Railways Commissioners in the North of Scotland.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

COMPETITIONS.

Table with 4 columns: Nature of Work, By whom Advertised, Premiums, Designs to be delivered. Includes entries for Working Class Houses and Corn Exchange Spalding.

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, ac. Supplied by, Tenders to be delivered. Includes entries for Pipe Sewers, Residences, and various industrial buildings.

CONTRACTS—Continued.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, ac. Supplied by, Tenders to be delivered. Includes entries for Drainage Works, Gravel and Shell, and various engineering projects.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, Applications to be taken. Includes entries for Manager, Works' Department and Borough Engineer's Assistant.

Those marked with an asterisk (*) are advertised in this Number. Competitions p. iv. Contracts, pp. vi, vii, & viii. Public Appointments, pp. xvi, & xix.

under Puerrefitte, is being actively carried on.—The municipality of Châlons-sur-Marne have just decided to suppress the Chapel belonging to the College, which from its size and decoration constitutes one of the finest ornaments of the town. This chapel dates from the seventeenth century.—The works undertaken by M. Fournigier for the restoration of the Théâtre at Orange have now been nearly completed. The vaults supporting the ranges of seats to right and left of the scene have been rebuilt.—An interesting exhibition of archeological objects and documents relating to the primitive races of America, will shortly be held at the Trocadéro.—There is a question of placing in the Council Hall of the Tribunal de Commerce the beautiful marble bas-relief by M. Puché, "La Seine," which was exhibited a few years ago at the Champs Elysées.—Some measures are soon to be taken by the Municipality of Saint Maudé to put into some sort of repair an old tower which is situated at the angle of the Grande Rue de Paris. It is considered one of the last vestiges of the park of Philippe Auguste.—The death of M. Aumont, architect, in Paris, is announced.—A distinguished architect, M. Ludovic Douillard, has just died at Nantes, at the age of seventy-three years. He belonged to the Société Centrale since 1873, and had founded an atelier for young architects. M. Douillard, who was a Catholic priest, built the church of Paimbœuf, near Nantes, and the convent of the Capucins at Nantes. It is a monument of a pure and harmonious style, remarkable for its cloisters.—There is a talk of erecting a statue to the artist Troyon in one of the public squares of Sevres.

GERMANY.—The architectural journals are much occupied at the present time with a controversy as to the fairness of public building officials entering into open competition against architects in private practice. At present it is permissible, and a common occurrence, but it appears that the private architects would prefer to see some limitation.—The "Vereinigung Berliner Architekten," under the presidency of Herr von Hude, has held a special meeting in honour of the three architects of the Berlin International Exhibition of last year.—Messrs. Griesebach, Hoffacker, and Schmitz. The subject of the lecture for the evening was "Exhibition Buildings," by Herr Kyllmann, who gave much valuable information as to former exhibitions.—In connexion with the difficulties in obtaining a suitable design for a monument to the Ex-Chancellor Bismarck, at Berlin, we understand that a limited competition has now been opened for the ten candidates in the open competition of 1895 whose work was considered the best.—In the course of the

present year considerable works are to be carried out in connexion with the new Botanical Gardens at Leipzig, bearing the name of the "Palmengarten." Premiums have been offered in competition for the necessary designs, and the scheme will be decided on in the course of a month. The premiums offered are very large as compared with the amount of work required from the competitors. The cost of the work will amount to at least 50,000. In the competition which has been held at Leipzig for the design of a National Monument, as a memorial of the battle of Leipzig, the premiums have now been awarded, the first of the value of 3000, being given to an architect—Herr Wilhelm Kreis, of Charlottenburg; the second premium was given to another architect—Herr Otto Kiehl, of Berlin; and of other premiums the fourth was given to Professor Bruno Schmitz. There were sixty-eight candidates, and the average merit of the contributions was exceedingly high.—The Dortmund-Ems canal has made rapid progress during 1896. The expenditure up to this time being about 2,600,000. A great deal of the soil has already been moved, though there are still fully 2,000,000 cubic metres to be dug. All the brickwork for the twenty locks is well in hand; also the embankments for the harbour at either end.—Thirty designs were sent in for the S.übbel monument at Dresden, and the first premium has been given to Messrs. Schilling & Grächner, architects.—In the course of 1897 the Municipality of Dresden proposes erecting a monument to the present King—Alfred of Saxony—on the twenty-fifth anniversary of his reign, and a competition has been opened with a view to obtaining a suitable design, the premiums amounting to 6000. A very influential committee, including Professor Walot, will act as assessors, and the competition will be decided during May.

DURBAN.—The Durban Corporation Building Committee passed forty-two plans for the week ending December 7, including new premises for the South African Mutual Assurance Society, to cost from twenty-five to thirty thousand pounds. Arab merchants are also building warehouses. All new buildings are of a substantial character, wood and iron being nearly wholly discarded.—Johannesburg Standard.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. Charles Barry, architect, is removing at Ladyday from his offices at the Westminster Chambers, Victoria-street, to Parliament Mansions, Victoria-street. He has taken into partnership his eldest son, Mr. Charles Edward Barry, and the new

firm will be "Messrs. Charles Barry & Son."—Messrs. Leopold & Co. have opened Japanese paperhanging show-rooms at 24, Cecil-court, Charing Cross-road.

APPOINTMENT.—Mr. E. B. Newton, of the City Surveyor's office, Carlisle, has been selected out of a large number of candidates for the appointment of Engineering Assistant to the Borough Engineer of Rochdale. Mr. Newton secured his articles with the late Surveyor of Carlisle, Mr. W. Howard-Smith.

THE DIVINING ROD AT FAULT.—A difficulty having arisen with regard to the supply of water at Grandborough, the Rugby Rural District Council, at the request of the village authorities, called in the services of a water-diviner, who visited the place a short time ago, and indicated several spots where water might be found. At the meeting of the District Council recently, it was stated that a well-sinker had sunk a well at one of the spots where water was said to be obtainable at a depth of 25 ft., and although he had bored to a further depth of 25 ft., making 50 ft. altogether, no water had been found. It was suggested that the diviner should be asked to return the fees paid to him, but it was eventually decided to test another place before doing so.—Birmingham Gazette.

NATIONAL GALLERY OF BRITISH ART.—We are asked to state that the Portland stone used in this building was specially selected from the quarries of Mr. F. J. Barnes, Isle of Portland, and that the whole of the wrought-iron sashes and steel doors were made by Mr. Joseph Stone, of St. George's-road, Southwark, S.E.

THE WORKING MEN'S COLLEGE, GREAT ORMOND-STREET, LONDON.—An appeal is made for funds whereby to erect, at an estimated cost of 7,000, a building for the Working Men's College, which was established in 1854 by the exertions of F. D. Maurice, Thomas Hughes, J. M. Ludlow, and others. The present premises, No. 46, Great Ormond-street, have proved too small, and a laboratory and gymnasium are much desired. It is calculated that a further sum of 8,000, is needed for the equipment and maintenance of more efficient buildings. The house, now numbered "46," is remarkable for its handsome main staircase, has been identified with that occupied by Lord Chancellor Thurlow in 1784, when, on the night of March 2, thieves entered from over the garden-wall and carried off the Great Seal. It is commonly stated that the loss occasioned a long delay in the issue of documents under the name of "46." Mr. Thomas Major, engraver to the Court, and Stamp Office, then living at No. 5, Tavistock-row, Covent Garden, supplied within twenty hours a perfect fac-

substitute in brass of the Great Seal. Major then made one of silver, which continued in use until the end of the year.

AN OLD-ESTABLISHED FIRM.—To celebrate the completion of the 40th year of the firm's existence, Messrs. Joseph Chater & Sons, glass, lead, oil, and colour merchants, of St. Dunstan's Hill, London, entertained their staff on the 2nd inst. at the "City Arms," St. Mary-ave, when about fifty sat down to dinner. During the subsequent proceedings the toast of "Prosperity to the Firm" was proposed by Mr. Humphreys, who has been in the firm's employ since 1857, and upwards of forty years, and the partners, Messrs. Leathley Chater & F. Clive Chater, were presented with two silver cigar-boxes, subscribed for by the whole of the staff, the lids being engraved with the dates 1746-1896, as a memento of the occasion.

THE PRESERVATION OF GREENBANK, SEFTON PARK, LIVERPOOL.—Subject to approval by the City Council, the Finance Committee have entered into an agreement with Mr. Herbert Rathbone with the object of preserving, for the purposes of public recreation, an extensive piece of land, containing about 90,000 square yards, situate between Sefton Park and Greenbank-road. This estate, which contains a large and picturesque mere of natural formation, has hitherto been used for building purposes by Messrs. David Roberts & Son, but as the erection upon it of rows of houses of the ordinary type would not only ruin the beauty of the district, but seriously depreciate the property of the Corporation leaseholders who have built villas on that side of Sefton Park, the Finance Committee have agreed that if Mr. Rathbone purchases the property from Messrs. Roberts for 12,000l., the Corporation will repurchase it from him for 13,000l. upon the condition that whilst they shall have power to lease the frontage to Greenbank-road as sites for houses of a superior class, they shall maintain the lake and surrounding land for the use of the public, and make a public access to it from Sefton Park and Greenbank-road also. In the present estate is in possession during his lifetime.—Liverpool Post.

THE PLUMBERS' COMPANY AND EX-BAILIE CRAWFORD.—In accordance with a resolution passed by the Court, the Freedom and Livery of the Plumbers' Company were on Tuesday, last week, conferred at the quarterly Court, held at the Guildhall, on ex-Bailie Crawford, late Chairman of the Health Committee of Glasgow. The resolution which was read by the Clerk, set out that the honour was conferred on Mr. Crawford "in recognition of his timely aid and eminent encouragement of the movement for the national registration of plumbers by personal efforts and official influence, securing the alliance of the representatives of the health and educational authorities and plumbers of the locality, with the District Council for Glasgow and the West of Scotland, and the active co-operation of that body and others in promoting the higher technical training of plumbers, and the certification of qualified men in the interests of the public health." Mr. Philip Wilkinson, Master of the Company, presided, and spoke of the useful work which Mr. Crawford had done as Chairman of the Health Committee of Glasgow. Mr. Charles Alderman Sir Stoddart, and Mr. W. H. Bishop, also bore testimony to Mr. Crawford's valuable services to the cause of sanitation. The customary oath having been administered by the Clerk, Mr. Crawford was formally admitted by the Master as a freeman and liveryman of the Plumbers' Company. In thanking the Court for the honours bestowed on him, Mr. Crawford referred to the progress made in sanitary matters during the past few years as being largely due to the work of the Plumbers' Company. Their efforts to impart technical instruction to plumbers had necessarily been of advantage to the community as a whole. He believed every householder was now beginning to realize that it was his business to ascertain that the plumber he employed was a registered man. The freedom of the Company was afterwards conferred on Mr. E. R. Collins (Sanitary Inspector to the Camberwell Vestry) and Mr. W. Moss (of Manchester), they having become entitled to it through having passed the examinations in practical workmanship and knowledge of plumbing prescribed by the Company. The Court afterwards entertained ex-Bailie Crawford and the other honorary freemen, and the London Registration Committee to dinner at the Guildhall.

ELECTRIC LIGHT, SOUTH SHIELDS.—Major-General Crozier, R.E., an inspector of the Local Government Board, recently held an inquiry in the Town Hall, South Shields, into an application of the Corporation to borrow the sum of 7,500l. for the purpose of extending the electric-lighting works. Amongst those present were the Town Clerk (Mr. J. Moore Hayton) and the electrical engineer (Mr. J. A. Jeckell). The Town Clerk stated that the electricity works, which were in the hands of the Corporation, were opened in September last, and so successful had they been, and so well had the light been taken up, that the capacity of the station was now taxed to its utmost extent.

THE NEW GENERAL HOSPITAL, BIRMINGHAM.—The new General Hospital, Birmingham, is expected to be ready for opening in June. Certain branches of the work in connexion with the new

building have already been completed, and as the number of men employed there will now begin to diminish from week to week, Mr. J. C. Holder (the chairman of the New General Hospital Building Committee) took advantage of Saturday last to give a dinner to the workmen before any of them were moved to other jobs. The dinner took place in the evening at the Masonic Hall, New-street, and as many as 400 workmen of various grades were present. Mr. Holder presided. The Chairman proposed "Success to the New General Hospital Building," Mr. W. Henman (the architect) and Mr. T. Barnesley (the builder) responding. Mr. J. B. Clark next proposed "The Workmen," and said they had engaged on the work 70 carpenters, 40 bricklayers, 20 plumbers and painters, 110 labourers, 90 plasterers, 11 were working in connexion with the electric-light installation, 3 with the telephone, 10 laying down asphalt, 12 glaziers, 13 masons, 10 tilers, 4 well-sinkers, 6 working in connexion with the ventilation, and 4 slaters. Mr. Berrill (for the carpenters), Mr. Randel (for the bricklayers), and Mr. Roddy (for the plasterers) responded. Other toasts followed.

CAPITAL AND LABOUR.

COVENTRY BUILDING TRADE: DEMANDS FOR RISE IN WAGES.—Some months ago, when the building trade was at its height, a demand was made by the bricklayers for an increase in wages, but the request was refused by the employers. The workmen remained at their posts, but intimated that at the proper time—December 31—a general application would be made. This has now been done, and the bricklayers have asked for an advance in wages from 8d. to 9d. an hour, to come into force on April 1. In addition to this the Operative Bricklayers' Society have framed a new code of rules, which they ask shall be substituted for those now in operation. If accepted, they will have the effect of reducing the hours of labour by two and a half hours a week, the payment of overtime after 5.30 p.m. instead of 8 p.m. as hitherto, and limiting the number of apprentices (who shall be bound by the age of 16 for at least five years) employed by any firm to two. The bricklayers are not the only workmen desiring to profit by the present trade activity—similar applications have been received from the different societies of carpenters and joiners, masons, plasterers, scaffolders, labourers, &c. It may be said that, with the exception of the painters, the demand for increased wages is general among the building trade employees throughout the city. The carpenters and joiners ask for a minimum rate of wages of 9d. an hour and likewise submit a new code of rules. The masons demand an increase from 8d. to 9d., fixers to be paid 8d. The operative plasterers ask for an increase from 8d. to 9d., bricklayers' labourers from 5 1/2d. to 6d., and scaffolders and plasterers' labourers from 4 1/2d. to 5d. The alterations of rules proposed by the workmen are of considerable importance on account of the extraordinary state of trade and the number of employees affected. At the present time there are nearly 5,000 men working in Coventry in different branches, and the coming year promises little slack time for builders. A meeting of the Master Builders' Association is to be held shortly to consider the demands of the employees.

SWANSEA PLUMBERS AND THEIR WAGES.—A meeting of Swansea builders has been held to consider the demands of the plumbers for an increase of wages. Eventually the meeting decided to agree to pay the men 8d. per hour all the year round, instead of 7 1/2d. as at present; but not to accede to the request for a minimum of 30s. for the 48 hours per week worked in the winter.

MEETINGS.

- SUNDAY, JANUARY 10. Sunday Lecture Society.—Professor Vivian B. Lewis on "Artificial Light." 4 p.m. MONDAY, JANUARY 11. Royal Institute of British Architects.—Business meeting and election of new members. 8 p.m. Surveyors' Institution.—Mr. Howard Martin on "The Future Development of the Surveyors' Institution." 8 p.m. Clerks of Works Association (Carpenters Hall).—Paper by Mr. H. W. Handley. 7.30 p.m. The Architectural Society.—Mr. C. E. Mumford on "Belgian Churches," illustrated with limelight. TUESDAY, JANUARY 12. Institution of Civil Engineers.—Professor W. Ripper on "Superheated-Steam Engine Trials." 8 p.m. Society of Biblical Archaeology.—Anniversary Meeting. 8 p.m. Carlisle Architectural, Engineering, and Surveying Society.—Mr. F. J. Nickols on "Disposal of House Refuse." WEDNESDAY, JANUARY 13. Northern Architectural Association.—Mr. W. H. Allen on "Fireclay Manufactures." 7.30 p.m. THURSDAY, JANUARY 14. Society of Antiquaries.—Ballot for the election of Fellows. 8.30 p.m. Institution of Electrical Engineers.—Inaugural Address of the President, Sir Henry Mance. 8 p.m. FRIDAY, JANUARY 15. Architectural Association.—Mr. E. Prioleau Warren on "Decorative Plaster Work," with models. 7.30 p.m. Institution of Civil Engineers.—Society Meeting. Mr. Walter Beer on "Monier" Girders and Arches. 8 p.m.

PRICES CURRENT OF MATERIALS.

Table with multiple columns listing materials like Timber, Iron, Steel, and various types of wood and metal, with their respective prices per unit.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday. N.B.—We cannot publish Tenders unless authenticated by the name and address of the sender; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is given, nor any list in which the best Tender is under £100, unless in some exceptional cases and for special reasons.]

BURNLEY.—For the construction of a subway beneath the Leeds and Liverpool Canal, for the Corporation.—J. Simpson £1,707 10 0 S. Taylor £1,318 2 6 Sun. Bros. £1,347 15 0 J. & J. Lee £1,299 5 0 (accepted) £1,227 5 0

DAVENTRY.—For additions, &c., to police-station, for the Northamptonshire County Council. Mr. E. Law, County Surveyor. Quantities by architect: J. Neal £2,397 J. W. Wharve, Northampton (accepted) £2,399

FENNY STRATFORD (Bucks).—For the erection of school buildings, for the School Board. Mr. John Chadwick, architect. Fenny Stratford. Quantities by the architect: Mann & Sons £5,717 2 6 Thos. Yerrill £1,495 0 0 Wm. Wade £2,648 0 0 Thos. Hy. Coleman 3,444 0 0 S. Grist, Ltd. 3,988 0 0 Slaymaker & Hilliar £2,400 0 0 H.A. Williams 2,800 0 0 Northampton £1,387 16 4 C.E. Fishers 3,629 19 3 * Accepted, subject to approval of Education Department.

GALWAY.—For the erection of school buildings in convent grounds, Taylor's Hill, for the nuns of the Dominican Convent. Mr. J. Conroy, C.E., County Surveyor. Office, Galway. Lyden £10,116 10 5 T. Griffin £1,300 0 0 Ryan £9,394 0 0 J. Concha, Gal. £1,000 0 0 Emerson 9,296 0 0 way £853 0 0 * Accepted.

LEAMINGTON.—For the execution of street works, for the Corporation. Mr. De Nounville, Engineer, Town Hall. Jacob Hughes £7,072 0 0 Richard Bowen, Tavistock-street, £2,000 0 0 Martin 6,257 0 0 Leamington £15,000 15 0 Geo. Bell 5,429 0 0 * Accepted.

LEIGHTON BUZZARD.—For drainage and water supply works at the "White House," Leighton Buzzard. Mr. T. H. Bishop, architect, Leighton Buzzard. Dawson £200 10 0 Cook & Son £200 0 0 Tull £105 0 0 (accepted) £175 8 0 Butcher £117 3 3 Speers £175 8 0 * Accepted.

LINSLADE (Bucks).—For the erection of a detached house in Stoke-road, Linslade, Leighton Buzzard. Mr. T. H. Bishop, architect, Leighton Buzzard. Dawson £1,791 0 0 Cook & Son £1,000 0 0 (accepted) £1,791 0 0 Yirrell £300 0 0 * Accepted.

LONDON.—For alterations and fittings at the "White Hart," 30, High-street, Whitechapel. Messrs. Houn & Sons, architects, Shoreditch.—Lancaster £445 Walter Boun & Co. £750 C. M. Henry £439 J. P. Goodwin £348 J. Valentine £374 * Accepted.

LONDON.—For building a Baptist School, Queen's Park, Kilburn. W. M. George Baines, architect, 5, Clement-street, Strand, W.C.

Table with columns: Main School, Infants' School, Offices, Total. Lists various contractors and their bids for the Baptist School project.

LONDON.—Accepted for alterations and fittings at No. 124 Southwark street, for Mr. J. H. Richards— John Appleby, Cornwall-road, S.E. £185 (No competition)

LONDON.—Accepted for constructing, fireproof strong rooms, easter closets and lavatories at Suffolk-lane, Cannon-street, for Messrs. Jas. Truscott & Son. Mr. G. Gordon Stanham, architect, rock, Queen Victoria-street. John Appleby, Cornwall-road, S.E. £320

LONDON.—For rebuilding the Royal Cambridge Music-hall, Commercial-street, Shoreditch, E., for the Consolidated Contract Corporation, Limited. Mr. Harry Ferriell, architect, 22, Buckingham-street, Adelphi, W.C.1.— Kirk & Randall, £27,665 W. Wallis, £20,409 Lascelles, £19,972 Patman & Fotheringham, 20,417 Johnson & Co., 21,724 Kilby & Gayford, 23,221 McCarthy Pitt, 21,773 Widdelbank & Co., 20,170 M. Patreck, 21,620 Beer & Gosh, 20,930 Leslie & Co., 21,929 Wimpsey & Co., 20,462 Laing, 21,465 Dearing & Sons, 20,443 Holloway, 20,340 S. K. Jambelle, 19,239 Revised and accepted.

LONDON.—For proposed new laundry and conversion of premises into sale rooms at the St. Mary's Day Nursery, Finsbury, E., for Miss T. Green Wilson, Messrs. Newman & Jacques, architects, a Fen-court, E.C.1.—

Table with 3 columns: Name, Laundry, Sale Rooms. Includes Batstley, Sons, & Holness; Hoasking; Gregor & Son; Heaste & Farrow.

LONDON.—For alterations to 89, High-street, Whitechapel, Messrs. Brown & Son, architects, 101, Commercial-street, Shoreditch, for Mr. Heathman, architect, 101, Commercial-street, Shoreditch, N. Lancaster, £245; P. Bond & Co., £238; W. Henry, £420; J. P. Groomer, £395; Valentine, £370.

MAIDSTONE.—For the execution of road works, &c., Charles-street, for the Urban District Council. Mr. T. F. Bunning, Borough Surveyor, Four Meadow, Maidstone.— W. J. Logan, £157; J. H. Bridge, Maidstone (accepted), £150

MANCHESTER.—For sewerage, kerbing, &c., Lacy-street, Stretford, Mr. J. Bowden, surveyor, 14, Ridgefield, Manchester.— Thos. Cooper, £285; J. R. E. Jones, Patn, Etheridge & Clark, 75, 2nd crst*, £250; Geo. Bayson, £75; 0 0 *Accepted.

NEWPORT (N.W.).—For erecting imbecile and receiving wards at the Union Workhouse, Park-road, for the 15th of Wight Board of Guardians. Mr. John I. Barton, C.E., architect and surveyor.— Cullinan, £1,851; 15 0 Barton, £5,150; 0 0 Jolliffe, £450; 0 0 Jenkins, £459; 0 0 Jenkins & Son, £273; 0 0 Leader, £407; 0 0 Barton Bros., £220; 0 0 G. Hayes, Shanklin, £300; 0 0 Day, £173; 0 0 *Accepted. [Architect's estimate, £5,500.]

SOUTHAMPTON.—For the erection of store premises, Town Quay, for the Harbour Board. Mr. E. Cooper Toole, surveyor, 4, Portland-street, Southampton.— W. J. Clinch, £1,500; Dyer & Sons, £2,618; H. W. Bull, £2,825; F. Osman, £2,618; R. Hasley, £2,825; Roe & Grace, Southamp., £2,825; Jenkins & Sons, £2,825; 100 (accepted), £2,500 [Surveyor's protecting estimate, £2,735, 12s.]

SOUTHEND-ON-SEA.—For the erection of a pair of villa residences on the West Cliff Parade, for Mr. J. Kerry, Mr. Frank E. Smee, architect and surveyor, 22, West Smithfield, E.C.1.— J. Dupont, Southend (estimated amount accepted), £2,597

RETFORD.—For the erection of a malling, for Messrs. Walker & Hemfrey, Ltd. Mr. Richard Hardy, architect, Beatrix Buildings, Whitegate, Nottingham.— John Wilson, £1,050; 0 0 Mackenzie & Son, £6,273; 0 0 Preston & Hirst, £6,990; 0 0 W. Smith, £6,990; 0 0 F. Messon, £6,978; 0 0 Geo. Hirst, £6,215; 0 0 C. Jones, £6,550; 0 0 Brown & Son, £6,222; 0 0 E. Rigley, £6,626; 12 0 J. Gen. Farnham, £5,618; 0 0 C. Barnes, £6,425; 0 0 F. Partinson, £6,754; 12 7 T. Love & Sons, £4,240; 0 0 J. H. Vickers, Nottingham, £5,990; 0 0 H. Vickers, £5,990; 0 0 *Accepted.

WHITCHURCH (Tavistock).—Accepted for building four houses on the Chalkwell Estate, plumbing, glazing, and painting excepted. Mr. B. Priestley Shires, architect, Central Exchange, Plymouth.— W. H. Higman, Tavistock, £1,450

SUBSCRIBERS IN LONDON AND THE SUBURBS, (by prepaying at the Publishing Office, 10s. per annum or 4s. 9d. per quarter), can ensure receiving "The Builder," by Friday Morning's Post.

TERMS OF SUBSCRIPTION. "THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom, at the rate of 9s. per annum PREPAID. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, &c., 20s. per annum. Remittances payable to DOUGLAS WILKINSON, should be addressed to the publisher of "THE BUILDER," No. 4, Catherine-street, W.C.

PUBLISHER'S NOTICES.

Registered Telegraphic Address, "THE BUILDER, LONDON." THE INDEX and TITLE-PAGE for VOLUME LXXI. (July to Dec. 1896) are given as a supplement with the present number. CLOTH CASES for Binding the Numbers are now ready, price 2s. 6d. each; also READING CASES (Cloth), with Straps, price 9d. each, and THE SEVENTY-FIRST VOLUME of "The Builder" (bound), price Twelve Shillings and Sixpence, will be ready on the 15th inst. SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 3s. 6d. each.

CHARGES FOR ADVERTISEMENTS. SITUATIONS VACANT, PAPEEERSHIPS, APPRENTICESHIPS, TRADE AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under, £s. 6d. Each additional line (about ten words), 0s. 6d. Terms for series of Trade advertisements, also for Special Advertisements on front pages, Competitions, Contracts, Sales by Auction, &c., may be obtained on application to the Publisher.

SITUATIONS WANTED. FOUR lines (about thirty words) or under, 2s. 6d. Each additional line (about ten words), 0s. 6d. PREPARATION IS ABSOLUTELY NECESSARY. *Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Postal Order, payable to DOUGLAS FORBENIER, and approved to the Publisher of "THE BUILDER," No. 4, Catherine-street, W.C. Advertisements for the current week's issue are received up to THREE o'clock p.m. on THURSDAY, but "Classification" is impossible in the case of any which may reach the Office after HALF-PAST ONE p.m. on that day. Those intended for the Front Page should be in by TWELVE noon on WEDNESDAY.

SPECIAL ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE must reach the Office before 11 a.m. on WEDNESDAY MORNING. The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

PERSONS Advertising in "The Builder," may have Replies addressed to the Office, 4, Catherine-street, Covent Garden, W.C., free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

AN EDITION Printed on THIN PAPER, for FOREIGN and COLONIAL CIRCULATION, is issued every week.

READING CASES, (By Post (carefully packed) 1s.

J. J. ETRIDGE, JR. SLATE MERCHANT, SLATER and TILER.

ESTIMATES GIVEN FOR SLATING AND TILING.

To be executed by Contract in any part of ENGLAND, Penrhyn - Bangor, Oakeley - Portmadoc,

And other description of Slates Ready for immediate delivery to any Railway Station. Applications for Prices, &c., to BETHNAL GREEN SLATE WORKS, BETHNAL GREEN, LONDON, E.

TO CORRESPONDENTS.

L. & H. (to late, next week). NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline publication of books and giving addresses. Any communication to write an article is given subject to the approval of the Editor, when written, by the Editor, who reserves the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

THE BATH STONE FIRMS, Ltd. BATH.

FOR ALL THE PROVED KINDS OF BATH STONE. FLUATE, for Hardening, Waterproofing, and Preserving Building Materials.

HAM HILL STONE. DOULTING STONE.

The Ham Hill and Doulting Stone Co. (Incorporating The Ham Hill Stone Co. and C. Trask & Sons, The Doulting Stone Co.). Chief Office:—Norton, Stoke-under-Ham, Somerset. London Agent:—Mr. E. A. Williams, 16, Craven-street, Strand,

Asphalte.—The Seyssel and Metallic Lava Asphalte Company (Mr. H. Glenn), Office, 42, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tun-rooms, and terraces. Peterborough Cathedral.

THE latest phase in the futile agitation of the Society of Antiquaries and their henchmen the Society for the Protection of Ancient Buildings against the

action of the Dean and Chapter in respect of the west front of Peterborough Cathedral is really colossal in its impertinence. The Dean and Chapter have taken the advice of Mr. Pearson and Sir Arthur Blomfield, who, it is not too much to say, have had a more extensive experience in church building and restoration than any other architects now living. Acting on the advice of these counsellors, they employ Mr. John Thompson, the builder, who has had a larger experience in dealing with dilapidated cathedrals than any other in England, to carry out the work the experienced architects recommend. Then a Committee of the S.P.A.B., the Secretary and four others, produce a so-called "preliminary specification," and a number of other architects, who "have not examined the west front of Peterborough Cathedral from the scaffolding," express their approval of this specification, which professes to teach the Dean and Chapter a better way than that proposed by Mr. Pearson and Sir Arthur Blomfield.

Part of this specification, with the names of the architects approving it, will be found in another column, and a considerable portion of it has appeared in the *Times*, and the British public may be supposed to imagine that the Dean and Chapter are doing something very wrong and foolish.

When the practising architects of Great Britain look through the names of those who thus question the judgment of experienced advisers, the great majority will wonder who some, at least, of these "architects" are, and what they have done or learnt, that they should speak so loudly and confidently. Those who do recognise the names of these signatories will know at once that youth and inexperience are their best qualifications for dealing with the west front of Peterborough Cathedral; that the majority were babes unborn when

Mr. Pearson and Sir Arthur Blomfield were architects of experience in church building and restoration; that the whole of the nineteen signatories between them have not carried out a tithe of the church work that either Mr. Pearson or Sir Arthur Blomfield has done,* and we doubt very much if Mr. John Thompson, with his experience of the construction of Peterborough Cathedral, would care to risk his reputation or the lives of his workmen in carrying out the scheme propounded under the official hand and seal of the Society of Antiquaries.

The fetish of the S.P.A.B. is non-disturbance of the visible work, the panacea of their committee is underpinning. They would first underpin the foundations of the piers and the porch, then work upwards, still underpinning, although above ground. They would tunnel into the piers from behind, putting in a new core to the old facing, underpinning to the defective work above, gradually reaching the spandrels of the arches, tunnelling into these also from the back, working upwards, and underpinning again the defective work above, and so on to the top.

This sort of suggestion is good enough for the Society of Antiquaries and the general public, but readers of the *Builder* scarcely need telling what these cocksure critics seem to forget, if they, indeed, have ever learnt, that you cannot underpin unless you have sound work above to pin up to, sufficiently sound to stand whilst the new work underneath is being brought up to support it. The authors of the specification admit that the substance of the walling must, "to a greater or less extent, be in a state of disintegration," and "that careful and persistent watching of the building when applying the supporting constructions would be very necessary, so that every sign of possible weakness might be met from time to time as the different works were being carried out." These gentlemen also rightly enough insist as a prime necessity for their method upon an elaborate and "effectually contrived" system of shoring, strutting, cradling, and

* It may be added that there is an obvious amount of partisan spirit in the matter which the public, who know nothing about architectural parties or politics, do not of course perceive. With the exception of Mr. J. J. Stevenson, the whole of the architects signing the document are of the party who refuse to belong to the Institute of Architects or to have any dealings with it. That is no crime; only the fact shows that this agitation proceeds from a clique.

centering, so that "the narthex would be securely sustained from the ground upwards, and in the direction towards the west wall of the church." The specification itself, indeed, contradicts the report of the representatives of the S.P.A.B. that it was "obvious to any practical man that the Society's recommendations could be carried out in their entirety with ease and safety," and in fact the description in their specification of the proposed methods of burrowing into disintegrated stone-work and pockets of vaulting, with the elaborate provisions which even they must perceive to be necessary at every step to prevent the building coming down on the workmen—all this to prevent the crime of taking off the facing stones and numbering and replacing them, reads to us, we must frankly say, like the lucubrations of people who are hardly in their right minds; unless the truth is that they really never expected their advice to be taken at all, and that all this extraordinary description is only something intended to influence the minds of the uninstructed public. At all events, it is probably well for the signatories that they are not allowed to try the experiment, for we believe the result would be that either they or the Dean and Chapter (according to the view the law took of responsibility in the matter) would be exceedingly likely to find themselves placed on their trial for manslaughter.

The Committee of the S.P.A.B. "were much interested in the varied curves of the ribs resulting from the slow strain put upon them by the settlement of the piers." They wish, in short, to retain all the accidental effects of time, weather, bad construction and failure, and the President and Secretary of the Society of Antiquaries affix their signature to the statement that the method proposed "is also better for the subscribers to the Restoration Fund as being obviously less costly than rebuilding." We appeal to "any practical man" amongst our readers as to whether it is even remotely possible that the elaborately constructed timber supports and the replacing of the defective core of the walling by small tunnels, each timbered and strutted in turn, would be "less costly than rebuilding."

The method of working by tunnel might be possible if the core were in fairly good condition; but in all seriousness we ask who are the best judges of this: Mr. Pearson and Mr. Thompson, who have found out by

past experience what the internal construction of the walling at Peterborough is like, or the irresponsible and comparatively inexperienced architects who by their own confession have not been able to make a sufficiently close inspection of the wall, even from the outside, to render their specification complete.

One consideration is very strongly impressed upon one in connexion with the subject, viz: that the preservation from ruin of our great mediæval buildings ought to be regarded as a matter of national concern, on which public money should be expended. The custodians of our cathedrals in almost all cases are without the funds to make even necessary repairs to the structures for the safety of which they are responsible. There is Salisbury spire evidently in considerable danger; there is no question here of taking down or rebuilding, but only of making it safe, but evidently it is doubtful whether or when funds can be collected from private sources for such a purpose; and the collapse of Salisbury spire would be a national loss. The architects of Leicester, the largest town in the Peterborough Diocese, have, as mentioned in another column, subscribed somewhat over 70*l.* towards the Peterborough repairing fund, partly as a practical testimony of their reliance on Mr. Pearson; but how far can such sums go towards doing the necessary work? It is a matter of national interest, and should be taken up by the nation at large.

PRIZE DRAWINGS AT THE INSTITUTE.

 HE always interesting exhibition of drawings submitted for the various Institute prizes is this year hung in rather cramped spaces in the council chamber and meeting room. The officials have done better than could have been expected under the circumstances, but the result is less satisfactory than in the old days when the large galleries were available.

The designs of the Soane medallion, Tite prize, and Grissell medal are in the lower room; the first-named, for which thirteen designs were submitted, occupying by far the largest part of the room. The subject set for the Soane competition was "A Provincial Market Hall," and the plans naturally bear a strong family resemblance to one another—an open space on the ground level, generally vaulted, with a large meeting room above, one or two staircases, and retiring rooms on both levels appear in all cases, usually somewhat similarly arranged in the manner that naturally suggests itself. This being the case, the interest centres chiefly on the architectural treatment of the building; and this varies over a wide field, the most marked feature of which is the almost entire absence of the "very latest, entirely original" manner, which has appeared in several students' exhibitions lately.

Mr. J. A. R. Inglis, who is the successful competitor, has chosen a "Palladian" style, skilfully modified, and treated with restraint and good taste externally; inside he seems to have succumbed to the danger, which any one using the style must run, of being rather uninteresting and commonplace. His draughtsmanship is excellent, especially in the neat and effective perspective, and he has certainly well earned his success. It is less easy to understand why any lesser awards were given. Mr. J. A. Swan receives a

medal of merit, and Mr. C. H. Holden honourable mention; but their designs, though certainly good, hardly seem to us to rise so much above the level of some others as to merit especial distinction. The chief points in Mr. Swan's work are excellence of draughtsmanship in the elevations and details, a rather weak water-colour perspective, and minute attention to heating and ventilation. Mr. Holden takes a unique view of the requirements, and gives a direct entrance to the upper hall and no connexion between the two: his perspective is drawn as if it were to be cut on wood, but has a certain effectiveness. Among the other designs the most striking is one under the device of a scallop shell. It looks as if imported from the Netherlands, and has a great slated or shingled turret which, however, is very inadequately supported. One other, "Neath Southern Skies," deserves notice as an unsuccessful attempt to imitate the style of a certain prominent architect: it is a very gorgeous production but might please some persons' taste.

The subject for the Tite prize was the fascinating one of an Italian Villa and Garden, but it has attracted only two competitors, one of whom has designed a large country house which, moreover, is more English than Italian. The other competitor has well grasped the general idea, but failed to produce a satisfactory design, especially as regards the garden, to say nothing of the draughtsmanship, which is very poor. The prize is not awarded.

"A bay of a church, vaulted in stone throughout" has produced what we think is the best competition design for the Grissell gold medal since it was first offered. There is no doubt that Mr. S. K. Green-slade, the successful candidate, has well earned the honour by his charming design, and his neat pencil drawing. There is, however, one other competitor who has succeeded in being exceptionally interesting. He has constructed his arches and vaults on strictly scientific lines, using catenary curves, and has produced something which is by no means very ugly, and seems to us to show that, in the hands of the right man, such forms would not be incompatible with very beautiful results.

The competition for the Pugin studentship is better than it has been for many years. It has been awarded to a beautifully executed set of very thorough and workman-like pencil studies by Mr. Wm. Haywood, among which the drawing of the pulpit in St. Chad's, Birmingham, is conspicuous for the effective use of pure outline and for patient labour. He has not been afraid to deal with the richest and most complicated work, nor has he neglected what is simple and useful. His drawings are all to measurement, except two illustrative perspective sketches and some studies of carving. Mr. C. De Gruchy receives a medal of merit for a mixed collection of measured drawings and sketches, most of them useful and interesting and all very well drawn: the pretty pictures got up for show being in a minority. He has used ink as well as pencil, and in some works a little wash. His *pièce de résistance* is the Chantry of Abbot Ramryge at St. Albans. A medal of merit is also awarded to Mr. J. A. Swan, who has again taken the rather unusual course of submitting drawings of foreign work only. We suppose this is admissible, but it does not seem to be quite what one

would suppose, from its name, to be the intention of the prize. The excellence of some of Mr. Swan's work is, however, unquestionable. He has added to the drawing of the "Skipper's House," Ghent, which appeared last year, an equally effective—perhaps more effective—one of the Meat Market, Ypres, in the same style; and another, which we think is also new, of "pew" in Notre Dame, Bruges. But he continues to rely partly on some rather useless large pencil perspectives. To Mr. W. E. Dobson honourable mention is accorded for some careful and fairly skilful studies and sketches which seem to be the promising work of a youngish man.

We do not think that either of the two sets of drawings submitted for the Owen-Jones Studentship are quite equal to the best work sent in in former years; but there is much that is excellent and interesting in that of Mr. A. E. Henderson to whom the Studentship is given, and Mr. A. T. Griffith, who is awarded the Aldwinckle Studentship, has been very industrious, and has spread his studies over a very wide field. Mr. Henderson has given his chief attention to the early Italian and Sicilian, so-called Byzantine, churches; St. Mark's, Monreale, &c.; Roman mosaics, and pre-Raphaelite frescoes. He would, perhaps, have learnt more by making a few more diagrams of colour schemes, instead of some of the water-colour sketches. Mr. Griffith's best drawing is a water-colour sketch of a church tower and other buildings at Colwall. The drawings by Mr. Corlette, last year's Owen-Jones student, are most interesting. They consist of fairly complete studies of a church—St. Savin—near Poitiers, of late Romanesque type, with the original barrel vaults and colour decorations still existing, and four carefully finished drawings of the coloured statues at Albi.

Three candidates have chosen St. Mary-le-Strand Church as their subject for the silver medal competition, and one, Mr. F. J. Wass, Melrose Abbey. We think, on the whole, that justice has been done in giving the medal to Mr. Wass; but none of the sets of drawings are really altogether good, and in neatness and finish the competitor signing himself "St. Mary" is nearer to the usual standard than the winner. It would, we fancy, have done no great harm to withhold this prize.

Some drawings by Mr. Crouch, the Tite prizeman last year, and several sets of the "testimonies of study," submitted by candidates for examination, are hung with the competition works.

As a whole, we think the Institute competitions must be considered a distinct success this year. Those for the Pugin studentship and Grissell medal are quite exceptionally good, and that for the Soane medallion is above the average. The other work submitted is perhaps a little below the highest standard reached before, but the only real failure is in the Tite prize competition.

THE SEWERAGE OF NEW BUILDING ESTATES IN RURAL DISTRICTS.

 T is a matter of common knowledge that building estates are being constantly laid out all round the coast of the United Kingdom. Places which in one year are comparatively barren agricultural land are

next year seen to have become covered with houses. It is for this reason that a case recently decided by the Lord Chief Justice of England and Mr. Justice Wills deserves something more than mere cursory notice. For it appears to lay down a rule of conduct both to proprietors of estates who are developing them and to the Local Authorities within whose jurisdiction they lie. The decision to which we refer is that of the Queen v. The Tynemouth Rural District Council which will be found reported at length in the Law Reports for 1896 (Q.B. Vol. II. p. 219). Probably the most satisfactory course for any one interested in the question would be to read this report *in extenso*, but for the benefit of those who are not able to do so, we may point out the salient features of the case.

In 1894 Lord Hastings proposed to lay out an estate at Seaton Delaval, in Northumberland. He therefore deposited with the Rural District Council plans which showed the new street which he intended to lay out, and also other plans which showed some of the new houses proposed to be built in a new street called Avenue-road. To these latter plans the following note was appended:—"It is proposed that the street and outfall sewers should be made by the Rural District Council and not by the landowner." The Council approved the street plans, but refused to approve the house plans, upon the following grounds, which were also appended to the plans:—"Disapproved of until it is shown into what sewer or other means of drainage the house drains are to communicate and empty, and for want of a proper and sufficient mode of drainage and sewerage. The Council object to the proposal that they should make the street and outfall sewers except under agreement with, and at the expense of, the landowner or the depositor of these plans. Otherwise than this, the Council require the same to be made by such landowner or depositor." There was thus a direct conflict between the landowner and the Sanitary Authority, one which, it is obvious, might occur any day in any part of England where extensive building work is about to be carried on. The question was next brought into the law courts on an application by Lord Hastings for a mandamus to compel the Council to approve his plans—so that the Court had to lay down a rule which would obviously affect, not only this dispute, but future and similar cases. The practical question may be stated in the words of the Lord Chief Justice: "Can a Local Authority, who have no objection to the plans of the buildings as such, decline to approve of a building owner's mode of laying out his property unless that building owner undertakes to have a system of sewage carried out at his own expense, including an outfall sewer?" The answer to this question obviously depends on the authority and power given to Sanitary Authorities by the Public Health Act. Under section 277 of the Public Health Act, 1875, a *rural* Local Authority can obtain from the Local Government Board an order constituting the area proposed to be built on, or any proper modification of it, a special drainage area, in which case the whole of the cost of the new drainage will be thrown upon the area. On the other hand, the new area will then be exempt from the drainage rates of the district generally. But if a rural Sanitary

Authority wishes to keep the building owner as a contributor in respect of the area in question, to the rest of the drainage, then the proper course would be to apply to the Local Government Board to give them urban powers in respect of new street and when the authority was invested with such power, it would be able to proceed under Section 150 of the Public Health Act. That section empowers an Urban Sanitary Authority to give notice to owner or owners of a new street to sewer, pave, or metal it at his or their expense. The street can then be taken over by the Public Authority. The action of the Tynemouth Rural District Council was therefore illegal. They were disapproving of Lord Hastings' plans on untenable grounds. The proper course was to approve of them and set to work to take the necessary legal steps to enable the Council to see that the work consequent upon them, namely the construction of sewers was undertaken at the proper time under one of the two systems which we have mentioned. As the Lord Chief Justice remarked, if only a few houses under the building scheme were erected "it might be perfectly possible to deal with the sewage of that limited number of houses by means which need not necessitate or require any expensive scheme of sewerage." In other words, the Local Authority might adopt some temporary expedient. On the other hand, it is the postponement of extensive sanitary operations which has over and over again landed Sanitary Authorities in difficulties. As soon as a building scheme is proposed, which, on paper, at any rate, requires sewers to be made, it is clearly the right policy to proceed to get the necessary plans drawn out. If the building scheme halts in its execution, the authority may well wait to see that it is really executed before going to any expense in the matter. One thing, however, is quite clear from the decision in this case, that a Rural Sanitary Authority cannot proceed as did the Tynemouth Council: they must approve the land owner's plans for the buildings if they are in accordance with the prevailing by-laws, and then make up their minds which of the two courses open to them they will follow, and, having taken this decision, they should inform the building owner of the work which he will have to do.

On the other hand, the building owner should be on his part aware of the proper course of procedure. The somewhat off-handed note appended in the present instance by him to the plans was provocative of disapproval of the terms on which the plans seem to be put forward. In fact, the present case is illustrative of the way how this kind of matter should not be managed for both building owner and Local Authority appears to have acted in a somewhat heedless manner, resulting, it is true, in a useful decision and in some grist for the legal mill.

NOTES.

M. BOURGUET, of the French School at Athens, publishes, in the current number of the *Bulletin* (1896 I-X., p. 197), two important inscriptions from Delphi, dealing with the accounts of the temple officials for building and restorations. They are of considerable interest to all students of ancient architecture, as throwing light on the meaning of certain technical terms, and giving many inter-

esting details as to price of work and salaries of officials. Both inscriptions were found to the north-east of the treasury of the Athenians, near the Sacred Way; they are engraved on large slabs of bluish calcareous limestone, and in all amount to over 200 lines. Their date is fourth century B.C. They are evidently meant to be read consecutively, and are a statement of the sums given by the Council of Delphi to a commission of *procuratores* for payment of expenses incurred in the sanctuary. For details, which are given with extreme minuteness, we must refer our readers to M. Bourguet's commentary. We may note that an architect, Xenodoros, gets for six months' salary 350 drachmas, which cannot be regarded as excessive. The existence of the *procuratores* was, of course, known before; but little had been made out with certainty before as to either their constitution or functions.

WE have received particulars of the International Art Exhibition at Dresden, which will be held this year at Dresden on the occasion of the twenty-fifth anniversary of the reign of King Albert of Saxony. Perhaps the most noteworthy feature of this Exhibition will be that the number of works to be shown will be limited to one thousand, which is, of course, a comparatively small number for an Exhibition of this description. The Dresden Exhibition buildings will be arranged for the purposes of the collection under the supervision of Baurath Wallot, who has 10,000*l.* at his disposal for alterations and decorations. Particular care will be taken in respect to the hanging of oil-paintings, and a number of preliminary experiments have already been made with this view. The great success of former art exhibitions at Dresden would seem to promise success for this one. Full particulars can be obtained from the offices of the "Internationale Kunst Ausstellung," at Dresden, and it is to be hoped that English artists, not omitting architects, will be well represented.

FROM time to time we have referred to the progress made in the restoration of the Marienburg Castle, which was the subject of a lecture at the Architectural Association last year. From official reports we understand that no less than 115,000*l.* are still necessary to complete the work, and that it has been decided to raise the funds by a State Lottery. According to the amount of work being done under the present estimates and contracts, quite 100,000*l.* is being expended at present, for which the necessary funds are forthcoming, as no less than 50,000*l.* were in the hands of the Society, which is undertaking the alterations, and there was nearly 50,000*l.* promised. It is interesting to observe to what an extent contributions have been raised for the completion of what may be termed "A National Restoration" of one of the great landmarks in the history of Prussia.

WE drew attention recently to the discovery of the ancient road to the Academy at Athens. We are glad to learn that this has been speedily followed up by the identification of a precinct of Artemis, which Pausanias notes on his way to the Academy

Architectural Accounts at Delphi.

Excavations on the Academy Road at Athens.

(1, 29, 2). All that he says is that there was an enclosed precinct (*περιβολος*), with xoana of Ariste and of Kalliste, of the Best and the most Beautiful; these tiles, he adds, are, in his opinion—confirmed by the poems of Sappho—epithets of Artemis. Exactly what traces of the *περιβολος* have come to light is not yet reported, but inscriptions have been found relating to the priest of Artemis. Long ago, near to the Dipylon, was found a small square altar of Pentelic marble, bearing in letters of Macedonian date the inscription, "Mitrobates dedicated (it) to Artemis;" also a stele built into a wall near the Dipylon, bearing a long inscription (*circa* 262 B.C.) dealing with a thiasos. This stele it was directed should be set up in the sanctuary of Artemis. Immediately after the peribolos of Artemis, Pausanias noted "a temple of no great size, to which the image of Dionysos is conducted every year on appointed days." This we hope may be discovered, and who knows but that the monuments of Solon, of Perikles, of Thrasylbulus, of Phormio may come to light.

We have received from the British Electric Traction Company a pamphlet describing, in a popular manner, various methods of tramway working. The overhead trolley system is treated at greatest length, and quotations from the reports of deputations appointed by the Glasgow Corporation and the City Council of Belfast to inspect the tramways of the United Kingdom and the Continent are given to show what an excellent thing the trolley wire really is. The Glasgow deputation, after a further lengthened tour in the United States, say, "We are perfectly reconciled to it, and feel that it only wants to be seen to be appreciated." It is odd that so many Corporations send deputations all over the world instead of having a consulting engineer. There are many excellent books on electric traction published, and quotations from these would be far more interesting and instructive than badly-worded Corporation reports. The British Traction Company say that they possess the British patents for the only practicable surface contact system. This is a mysterious statement, as we know several practicable surface contact systems. There is the Westinghouse system, which Dr. Hopkinson has recommended for some streets in Leeds, and there is the Claret-Vuilleumier system, adopted in Paris by the tramway between the Place de la République and the suburb of Romainville, which was opened last June. Both these methods are excellent and practicable.

A DECISION of Mr. Justice Stirling is reported in the current number of the Law Reports which, though turning on a strictly legal point, is one of much practical importance. A Sanitary Authority gave notice to the occupier of a leasehold house, under the Public Health (London) Act, 1891, to do certain sanitary work. He also gave a similar order to the agent who collected the rent of the house on behalf of the owners. These owners were trustees, who, of course, handed over the net proceeds of the rent to certain beneficiaries. The work in question was done, and cost 122*l.* odd. Then the question arose whether the sum was to be paid out of the rent or out of the capital;

that is to say, was the money to come out of the pocket of the tenant for life or out of that of the remainder-man. In the opinion of the judge these works, drainage repairs and alterations, disconnecting sinks from drains, and supplying new traps and pipes in place of old and defective ones, were not "ordinary repairs," and therefore should come out of the capital or "corpus." We have nothing here to do with what may be called the financial policy of the management of estates, and as to whether it is good or bad management to come upon the capital for such work as here mentioned. But there can be no doubt that when such work may be charged by trustees against capital, there is often a larger fund available, so that the work may be done more efficiently, and thus the sanitary condition of house property is likely to be better in consequence of this decision. Nor, again, are we criticising the judge's definition of ordinary and extraordinary repairs, though it must be confessed that, as traps and other sanitary articles wear out, it is doubtful if the phrase "ordinary repairs" was not looked at in rather a narrow spirit.

A Patent Museum.

THE President of the Society of Patent Agents recently suggested the establishing of a Museum of Patents at the Patent Office. Bacon said that he took all knowledge for his province, and patents are connected with every form of mechanism. It is difficult, therefore, to see how any Museum of Patents can be really complete. Where is it to begin and end? How is it to be limited so as to be brought within reasonable proportions? What are required appear to be rather museums of various branches of applied mechanism, in which patents applicable to such mechanisms can be studied, both historically and practically. It is said that without a Patent Museum ingenious persons are misled. Sometimes they proceed to take out patents for what are not new inventions; sometimes they fail to take them out under the erroneous impression that they have already been patented. One can hardly see how a necessarily limited Patent Museum can be of real service in many of these instances, since it is obvious that in it can only be contained what may be termed cardinal or guiding patents, whilst the ingenious inventor is in doubt over some subsidiary piece of mechanism which cannot be exhibited except in a museum strictly confined to one subject.

The Priory, Birkenhead.

It is proposed to raise a fund for acquiring the ruins of the Priory, at Birkenhead, and conveying them to the Corporation in trust for the burgesses. Hamon de Massey, third baron of Dunham Massey, founded the priory, dedicated to SS. Mary and James, for sixteen Benedictine monks, in the twelfth century; in 1282 a charter was obtained for ferry-rights across the Mersey. The rights of ferry at Birkenhead formed a cause of litigation that extended over a long period, beginning with a suit against the prior in 27 Edward III. in respect of the Monks' Ferry, and the controversy was not determined until about fifty years ago, when the Ferry was bought by the Town Commissioners. Leland says the priory was subordinate to St. Werburgh's Abbey, Chester;

Tanner considers it was independent. The priors sat in the Parliaments of the Earls of Chester, enjoying the rights and dignities of barons of the County Palatine; the revenues were valued at the suppression as worth 10*l.* 16*s.* 10*d.* yearly, *teste* Speed. The priory, garrisoned by the Royalists, was captured in 1644 by the Parliamentarians. The ruins comprise a portion of the refectory whereof the principal entrance has been described by Rickman and other writers for the variety and beauty of its mouldings. As at Chester, the church stands south of the quadrangle: there are a plan and two views (after G. Pickering) in Ormerod's "Cheshire."

THE loan exhibition of the Burlington Fine Arts Club. late Mr. Alfred Hunt forms one of the most beautiful collections of artistic work which has ever been seen in that well-known room. Once again we see illustrated the remarkable variety of Mr. Hunt's landscapes, in which there is no trace of mannerism or trick of style, but which seem almost as various as the varied aspects of nature herself. The two main objects which Mr. Hunt seems to have placed before him were to study nature faithfully and unremittently, and, in reproducing her effects on paper, to endeavour to escape as much as possible from the mere materialism of pigments. This latter end he achieved to a wonderful extent in many of his works, which seem more like small aerial visions of landscape than collections of brush touches on paper; though he could be vigorous enough in touch, too, when the style of subject suited it. Among those which convey most completely the feeling of the scene while concealing the mechanism of execution is that of the "Stiff North-Easter" (49) in Robin Hood's Bay; also the "Wind of the Eastern Sea" (68). Compare with these the solidity of "Schloss Elz" (72); the exquisite gradation of light and tone in "Climbing Shadows" (62), the grand contrast of the dark and light hills in "Ben Sleoch and Craig Roy" (91); the wonderful rainbow light in No. 102; the fine architectural effect in the drawings of Durham. But one might go on to mention every drawing in the room; there is not one that has not its special beauty.

We understand that there is a movement on foot on the part of Mr. Pearson and the Petter borough Dispute, of some of the leading architects in London and elsewhere to make some kind of formal testimony of their respect for and confidence in Mr. Pearson, in view of the fact that he has been, as they consider, the object of a most violent and uncalled for attack.

ARCHITECTURAL ASSOCIATION OF IRELAND.—We have received the printed book of the Constitution, By-laws, and Syllabus of Meetings of this Association. The following is the list of papers already promised: "Hospitals and Hospital Construction," by Mr. F. Batchelor; "Medieval Embroidery and Ancient Vestments," by Mr. M. J. C. Buckley; "Electric Lighting of Buildings," by Mr. J. W. Boucher; "Early Irish Art and Contemporary Work on the Continent," by Mr. W. G. Doolin; "Some Old Buildings in Antrim and Down," by Mr. W. J. Fennell; "Method of Shorting Buildings by Iron Frames," by Mr. C. Geoghegan; "Artificial Heating of Buildings," by Mr. W. R. Maguire; "Drainage and Sanitary Construction," by Mr. W. Kaye Parry; "Open Roofs," by Mr. Pentland Howard. The actual dates at which each of these papers will be read are apparently not fixed yet, though the dates of ordinary meetings (on alternate Tuesdays) are arranged.

THE USE OF PRACTICAL GEOMETRY IN DESIGNING BUILDINGS.

By W. R. CORSON, ARCHITECT.

IN 1846 R. D. Chantrell, of Leeds, architect, had a paper to the Royal Institute of Architects upon proportioning churches by means of a geometric system. This system had been suggested to him by finding, on the bed of a stone that had been a portion of a medieval building, a diagram of interlaced equilateral triangles. The figure, which is called by Freemasons the Royal Arch, the root of the diagram (fig. 1).

About the same time a paper by Professor Lockyer, read before the Archaeological Institute, was published in their Transactions, 1845, was upon proportions geometrical, illustrated by Winchester Cathedral.

Some time before this Mr. Kerrick, in "Archæologia," vol. 19, 1821, propounded a system based upon the use of the pointed oval, called *vesicae piscis* (a hallucination).

Mr. Pettit Griffith, of London, architect, published several thin quarto books, applying geometry to Classic and Gothic buildings, but his methods were fluctuating and uncertain, and led to nothing.

A book by Matthias Roriczer, 1486, was re-published in Germany, and partly reproduced in "Archæologia," 1846. It shows the use of intersecting squares in designing pinnacles.

Cesar Cesarianus (early sixteenth century) gives a plan and a section of Milan Cathedral; the former designed by using squares, and the latter by equilateral triangles.

It was in consequence of reading Chantrell's paper that I sought out these and other books, and that in 1847-8-9 I made a study of diagrams founded on the square and the triangle equilateral, and the pentagon, with the result that I began the use of the hexagram—the Royal Arch being the basis—in planning, and in designing all parts of a building—elevations, sections, and mouldings. In planning, however, I have in later years found the square and its diagram to have been most certainly used by Medieval architects, and to be very valuable.

It was probably used by Egyptian and Greek architects, and surely by the Moors, but I have not followed out an investigation in these styles any extent. The Temple at Jerusalem was planned on squares, and five cubits was the dimension of the initial square. On linear paper the entire plan of the buildings, which cover, including courts, about eight acres, may be drawn without using a scale.

When four intersecting triangles are drawn,

they form a dodecagon in the centre of exactly one half the diameter of that which may be inscribed about the four triangles; within that space therefore may be drawn again the diagram of four triangles to half the scale, and outside may be drawn the diagram to twice the scale, thereby giving a series of equal divisions, and making it possible to repeat on a larger or smaller scale any figure that may be drawn within the diagram, by using the corresponding lines outside or inside the original figure.

Intersecting squares repeat in the same manner, and in the same ratio.

For many years I used only the hexagram in planning, but latterly I have sometimes used the tetragram, or, rather, the square (fig. 2). For the elevations and sections, instead of a network of triangles, as shown on Milan Cathedral, I used the hexagram, basing the initial circle on the floor line. It has advantages over the former, which gives simply equal divisions, vertical and lateral. This gives in addition others not equal, but yet always proportional. It also gives lines that are full of suggestion; this, indeed, is a grand feature of the system as used in elevation, or in section, or in mouldings.

It also, I think, tends to compress dimension, to avoid bulkiness, and yet to give the effect of greater dimension than the real. For mouldings it is invaluable, no matter what the style.

I am satisfied from recent investigations that the Medieval architects used the diagram in designing sections and elevations, and not the web of triangles as shown by Cesar Cesarianus. I had often tested the latter method on drawings of old churches, but it was never satisfactory. Viollet le Duc favoured it, but neither was his application of it satisfactory. Here and there were coincidences of lines, and that was all. I tested also the "diagram" on drawings, but the difficulty I felt was to find and use the initial dimensions: it had not occurred to me, I think, to take the dimension of one bay, although, strange to say, after I had begun to use the diagram in my own work, that was what I myself did in designing street buildings and churches—any building which naturally is divided into bays or severies, or, as the French say, *travées*. Since I began to write these memoranda, however, I have tested drawings on this basis, and am now satisfied that it was what the old architects did. Next, it will be asked, "How did they arrive at the bay?" It has been to me a puzzle to determine the initial work of men long since dead, and whose modes of thought we are ignorant of, but at present my idea is that circles were first drawn—two, three, or four it may be—in a line, each of them divided

into four by the leading lines of the diagram, and each of these divisions became a bay, which then became the subject of design by squares, defining the pillars and their size, the walls and buttresses. Beginning at the west end, and marking off the number of bays according to the intention, there is generally, in the case of a transept church, a break, and the dividing of the eastern portion is sometimes difficult to trace. Very often the bays are slightly less in width than those in the nave, but we do not know what was in the mind of the designer, and cannot follow his footsteps. In doing these things it was not necessary or imperative to work to a scale and to definite dimensions; the whole plan might be drawn and the dimensions determined afterwards. It was usual to begin to build a large church at the east end, and work towards the west; but the plan, when it was being designed was to my mind—began at the west end, the entrance.

There is one proportion which in pointed architecture seems to have been adopted invariably, or almost so, in all churches having aisles. An equilateral triangle, which has the floor in cross section for its base, defines by its apex the height of the nave. It is this rule which gives the great height to the Cathedrals on the continent of Europe, that is, of those which have double aisles, the base of the triangle being thereby extended nearly a half, and the height nearly a quarter. Sir C. Wren adopted this proportion in the nave of St. Paul's. In the case of churches without aisles, like the Saint Chapelle at Paris, that at St. Germain, and that at Rheims, the line of the floor is continued as though there were aisles, and the proportion of height determined in the same way. (In the E. P. Church, Wittington, the ceiling of the nave is determined in height in this manner, and so also that of the billiard room at Broadock, Wittington.)

When planning a house there is usually, to begin with, a definite idea of the size of the principal rooms; say that it is 24 ft. by 16 ft., or 27 ft. by 18 ft., I would take 16 ft., or 18 ft., as my normal dimension, draw the diagram with that dimension, and extend it for the length. Sometimes I have taken the length instead of the width, but whichever it may be, upon a diagram of that dimension all the drawings are worked; plans, sections, elevations, enlarged portions, and details; full size these last generally. To do this with ease it is necessary to choose a series of scales, such that being multiplied by two continually will end in full sizes. This led me to use the series which does so, $\frac{1}{2}$ in., $\frac{3}{4}$ in., $1\frac{1}{2}$ in., 3 in., 6 in., and 12 in., or full size. The first for sketch designs, the second for working

Fig. 7.

drawings, and the third for enlarged portions, such as doors, windows, &c. It follows that every detail bears a reference to the normal dimensions on which the rooms are drawn. In the rooms planned with either the diagram or intersecting squares, the position and the size of every door, window, fireplace, or other feature may be found geometrically. The relation of the leading features of a house to one another also is determined by the diagram, but how to use it each architect working with it would determine for himself. It is a tool, not a machine.

Gilbert Scott used, I believe, for gables a numerical proportion, 7 ft. base to 5 ft. height of the triangle, or something of that kind. Viollet le Duc, in a similar way, gives a proportion for a pointed arch, intermediate between a semi-circular one and an equilateral one, 8 ft. base to 5 ft. high. I do not think the medieval architects worked that way.

For the gable take $a b$ (fig. 3) for the height; the result is the same nearly, but the method much better. The other way is simply a rule for copying.

For the arch: $a b c d$ (fig. 4) is a square bay of vaulting; in plan, $d a b$ curve is the semi-circular diagonal rib; in profile, with the same radius describe arches and wall-ribs $a b$; $b c$, &c., and you have the proportion which Viollet-le-Duc's formula aims at. By this method one template serves the stone-cutter for all his ribs. (Herein lies the root of pointed architecture, *i.e.*, with groined rib-vaulting came in the pointed arch, and all else followed). This method is much more draughtsmanlike work, and easier, too, than dividing into sevens or any other arithmetical proportion.

Viollet-le-Duc calls the arch alluded to Egyptian. He does not say why, but evidently because the Great Pyramid and others have the proportion 8 base to 5 height. My belief is that the Pyramids were designed geometrically, and that those which have the proportion 8 to 5 have the heptagon for their initial, and that the side has the seventh part of a circle for its slope. Other pyramids have other angles found geometrically, one from the square and its diagonal, like the arch given above; another from the dodecagon.

Besides the proportion for an arch given above there are others found in a similar way by the use of the ruler and compasses, and it may be taken for granted that in this way they were usually by the mason delineated for construction. I have tested many arches in Viollet-le-Duc's "Dictionnaire," and have rarely failed to find them conform to one or other of these methods. To transfer a design to full size a workman needed only the width of the arch—no figures required to define centres, or to give radius. The radius, where it is found on the above diagrams (fig. 5), is marked a , b , in each example. The choice of which of these to use in each case rested with the designer, and its fitness depended on his judgment (except when, in vaulting, it determined itself). No. 2 is, perhaps, more frequently found than any other. In No. 1 the angle, b, a, c is 30 deg.; in No. 2 it is 45 deg.; in 3 and 4 it is 60 deg.

It is worth noting that the radius of No. 3, $a-b$, which is the minor radius of a hexagon,

Fig. 8.

Fig. 9.

gives the length of a side of a heptagon, a fact which I have not found noticed in any book. But, farther, on the fully-developed diagram may be found lines giving the length of the side of polygons up to one of eighteen sides, and also one of twenty-four sides; that is, within a circle of, say, 8 in. diameter, delineate the diagram, and within that a second (4 in. diameter), and in these may be found the length of the sides of polygons of 3, 4, 5, 6, 7, &c., sides up to 18.

It is worth while for an architect to fix in his mind, or have a memorandum at hand, of the numerical relations of the side of a square to its diagonal, 5 to 7.071; and of the side of an equilateral triangle to its height, 5 to 4.33 (or 10 to 14.14; and 10 to 8.66).

It is important to notice that equally in the hexagram and tetragram the radius is bisected, and consequently the two diagrams correspond at that line and its repetitions in diminishing (or increasing) ratio. Coincidences therefore will be found when the two are used on the same plan.

The proportion of gable shown (in fig. 6) is often found in parish churches. In cathedral churches the equilateral triangle is required because of the greater height of the building. When the proportion shown is used in domestic work, and there are dormer windows, it will be found desirable to use the equilateral for the window gable, otherwise the angle will seem less than that of the gable. (The angle is 54° 42', the same which polarises light.)

I have used the plan of Sweetheart Abbey (fig. 7) church because:

- 1st. The plan is from my own measurements.
- 2nd. It has never been altered or added to.
- 3rd. Early examples like this are likely to show a more simple use of the system than those of later date or those which have been partially rebuilt. The date is 1275.

It will be noticed that the position of the piers, and the position and thickness of the aisle walls are determined by either hexagram or squares.

I have found in a number of cases that the orange form which includes three bays seems to have an influence on the design, particularly in determining the length of the chancel and the transept, but it is difficult to say whether this is a leading feature, or only incidental to the method adopted—probably the latter.

Errors or adjustments which have been made by the builders in setting-out their work are, of course, disregarded. For instance, in this church the respond at the west end being less than half a pier, the first pier is brought a few inches westward to equalise the arches; also, the piers at the crossing being larger than those of the nave, that one next to the crossing is also brought some inches westward with the same view. Again, the south transept is 3 in. longer than the north; this difference is accidental, no doubt, while the former are intentional adjustments.

The transept chapels are the only parts of the church that were vaulted.

The plan of Lincluden College Church (fig. 8) is a contrast to that of Sweetheart. Originally founded for a convent of nuns in the thirteenth century, it was changed into a college for men some time previous to 1400 by Archibald the Grim, Earl of Douglas, and a rebuilding was then commenced. When my drawings of it were made in 1846, the west wall and the north, and the north arcade piers, which are those of the original church, gave no sign. Since then their foundations, or such part of them as remain, have been laid bare, and their position I have taken from a plan given to me by Mr. Barbour, the architect who directed the work. I am not sure, however, that the north wall is from actual remains or from conjecture only.

The oldest portion of the rebuilding is the wall separating the nave from the chancel. The lower part of the wall has a doorway, and supports a roof-loft. Its architectural features indicate a different architect from him who carried out the remainder of the works, and are markedly inferior to these. The normal dimension of the nave—13 ft. 8 in.—is that of the original church, but the plan is rearranged in the position of the piers and of the south wall. The chancel normal is one-eighth more—15 ft. 4 in.—externally, but internally 14 ft. 8 in., and there is, therefore, a complication which it was not easy to unravel. The 14 ft. 8 in. is used for all the features of the chancel internally, including windows. The manner in which the diagram is applied to the different parts shows a man of independent thought, and all his work indicates a man of consummate ability and taste. It must be noticed that the normal dimension is used

throughout the details—*i.e.*, 13 ft. 8 in. in the nave and 14 ft. 8 in. in the chancel, but here and there with an accommodation—for instance, 7 ft. 2 in. for 7 ft. 4 in.—in several places. In the case of the windows it has been apparently for the purpose of having the glazing dimension exactly 2 ft.

The chancel was rebuilt, there is no doubt, at the instance of the Princess Margaret, daughter of Robert III., and widowed Countess of Douglas, who made gifts to Lincluden in 1429, and who was buried in a sepulchre in the north wall of the chancel. The architect, there is as little doubt, was John Murdo, who designed the finest parts of Melrose Abbey about the same time.

The respond and arch mouldings (fig. 9) given are from the work of John Murdo's predecessor, and are not, in my opinion, elegant, but they show the manner of using the diagram.

Since beginning to write these notes I have thought me of a plan of the Parthenon in my possession—a stray print from some French book, well engraved to a scale of about 18½ ft. in an inch. The scales given are in French feet and mètres, and some dimensions are given in English feet. The plan is probably a copy of that in Stuart and Revett's great work.

I rather expected that a diagram of squares would be found to rule the plan, and was surprised to find that the same mode of setting-out the leading lines had to be followed in this case as in Mediaeval work.

Two circles on the centre line would divide the fronts into eight bays and the flank into sixteen, and give the position of all the external pillars, provided there were no variation in the intercolumniations; but those at the angle being smaller, the operation is not so straightforward.

In each circle inscribing the diagram, the leading lines give seven centres of intercolumniations, and consequently the positions of six pillars of each portico; lines connecting the outer pillars define the flank walls outside, and a line of the diagram defines the same inside, thus fixing the width of the treasury and atrium (I am not sure that I use the correct terms). The wall at the rear of each portico is also defined by lines of the diagram. Then, falling back on the older method, the internal space is divided into squares. For the length of the treasury the space is divided into ten, and seven parts of the ten are taken for the width of it; the squares formed by these lines define the position of the six pillars and their size, and the width of the doorways.

The atrium is five squares in width and eight in length; the outer squares define the lines of the pillars, and the centre pillar on each side; the spaces between the corner and central pillars divided into five give the remaining pillars.

Instead of taking the tangent-line of the circles for the line of the step along the flank, the line of the side of a dodecagon is taken.

The line of pillars on the flank is obtained from the intersecting squares in the manner on the plan, and the first interval being made equal to that on front (now defined) the space between the second pillar and the centre one is divided arbitrarily into seven, giving spaces about four inches greater than on the front.

The inner line of portico pillars is midway between pillars and wall, and the space is divided arbitrarily.

It is certain that Sir Christopher Wren designed with the help of geometry, of which he was a master, and his pupil Hawksmoor, to judge by his church of St. Mary Woolnoth, followed his example. That Sir Charles Barry used some system of proportion was evident to me long ago, but I have lately examined a plan (which happens to be among my papers) of the Mansion House of Lord Tankerville at Walton, Surrey, of which Barry was, I believe, the architect. It seems to be a new wing to an older house, or perhaps a rebuilding. There are five principal rooms, all determined in proportion by squares, but not equal squares in all rooms. They are:—

- a. Dining room 33 by 21 ft. — 5 to 3 by 7
- b. Bed room 28 „ 21 „ 4 „ 3 „ 7
- c. Breakfast room 28 „ 21½ „ 4 „ 3 „ 7
- d. Library 29 „ 21½ „ 9 „ 5 „ 4½
- e. Lord T.'s room 28 „ 18 „ 3 „ 2 „ 9

(the dimensions are from scale, not figures). In *a* and *e* the position and perhaps the width of the windows are determined by the squares, but not in *a*, *b*, *d*, (except, of course, the central), and the doors are not in any case, so that the proportioning would seem to have been numerical rather than geometrical. In the approach to the corridor, however, intersecting squares seem to rule.

I have referred to the Temple at Jerusalem

as having been designed on squares of 5 ft. The porches or piazzas which form a main feature of the architecture were 10 cubits wide, each bay 10 cubits, and the pillars 2 cubits. The plan which I give of a bay at the angle of the court shows how probably the size of the pillar was determined, and also the manner of turning the angle. This combination of pillar and pillar is to be seen in the monument called Absalom's; in the ruins of the Synagogue at Capernaum, and elsewhere. I am fainful to think that it was used *per se* in Solomon's Temple, and perpetuated in the succeeding temples and in other buildings, just as the semicircular flight of steps in the Court of the Women has its successors in Jerusalem and elsewhere at the present day.

The plan of the gateways which gave entrance to the Outer and Inner Courts, as minutely described in Ezekiel xlvi., is in its main arrangements preserved to us in that gate of the eastern wall of the Harâm, called the Golden Gate. The geometrical foundation of this plan is well worth study. The circle is of 20 cubits diameter; the third compartment from the circumference gives the diameter of the pillars (1 cubit); then lines being drawn at 45 deg. from the angles *a*, the position of every pillar is obtained, giving bays 6 cubits square (or 7 taking centre to centre of pillars). A space 20 by 15, which is in the proportion of 4 to 3, is converted into that of 3 to 2 by placing the side pillars inside of the fifteen, and the end pillars outside of the twenty; the centres of the pillars are then 21 by 14, and the six square compartments are defined.

A study of the chevets of French cathedrals is not only interesting but very useful, in that it is an example of how much variety can be evolved in one feature. No two are alike throughout. The initial step may be the same in several, but each one is worked out in a manner peculiar to the man who designed it. Notre Dame at Paris (fig. 10) is further peculiar among all those given by Viollet-le-Duc in that its root is a polygon of nine sides, and it alone is so designed that a pillar (of the second Order) stands on the axis line of the church. Viollet-le-Duc highly commends the way in which this chevet is designed having regard to the exigencies of the vaulting and the distribution of the points of bearing and thrust. With regard to effects in perspective it is not perhaps possible to judge from a plan.

An angle of 120 deg. contains three sides of a nonagon; that angle can be divided into three geometrically, and each of these again into three, so that not only a nonagon but a polygon of twenty-seven sides can be constructed by rule and compass, and it may have been the knowledge of this property that suggested and prompted the use of the nonagon instead of the more usual dekagon (*i.e.*, five sides of the one or the other.)

The fact that no other chevet shows a pillar on the axis line has led me to draw the plan called a "suggestion" (fig. 11)—a plan based on the same initial lines, but with ten instead of eleven pillars in the second circle, and consequently a vista on the axis, and towards north-east and south-east. I imagine that the perspective views would be better on this plan.

Another use of the nonagon is in the chapels of the Cathedral of Reims; probably also the eastern chapels of Sens and Canterbury.

The apse of the south transept of Soissons Cathedral is a semicircle divided into three, and each third again into three, with subordination of pillars. This arrangement also may be set-out geometrically.

There is one example (in Viollet-le-Duc) of an apse with the angle of the polygon on the axis line, namely, the timber-built church of St. Gilles, at Troyes, a half octagon apse. The arrangement is not to be commended. Having seen two instances of it in modern domestic architecture, one four-sided and one six-sided, I can say that the external effect is faulty in this respect, that there are no lines corresponding with the horizontal lines of the house, and the eye is baffled and unsatisfied. Internally it is always preferable to have a void rather than a solid on the axis line—especially when the windows are grouped.

In Gwilt's Cyclopædia a theory is mentioned with approval that the number of bays in the apse of a church, and the number of bays in the nave have a numerical relation to each other. If there be five bays in the apse, then ten in the nave; if seven in one, then seven or fourteen in the other. Among the plans given by Viollet-le-Duc the following do not agree with the supposed rule:—Soissons, Cologne, Sens, Tours, Mons. If the tower bays be counted in, then Chartres, Amiens, Noyons do not agree. If the tower be left out, then Reims does not agree. There is no logical con-

nexion between the two constituents. If in any case one has been made to rule the other, it must have been simply the fruit of a whim, a caprice, on the part of the designer: but is there any foundation whatever for the statement that there was such a rule?

In Vol. IX., p. 212 of Viollet-le-Duc is a skeleton plan of the apse of the church of Notre Dame de Vaucelles, taken from the sketch-book of Villars de Honnecourt (church destroyed in 1793). It is

half of a polygon of fourteen sides. This is not often found. The only one I have noted is that of Mans Cathedral of the eleventh century, replaced in the thirteenth century by an apse having seven sides of a dodecagon; this is the usual mode when the apse has seven bays, the reason being that a counter thrust to the arch-ribs of the vault is obtained within the apse itself, instead of being obtained from the adjoining bay of the

The twelve-sided polygon of which seven sides are used in the plans of quite a number of apses is not a regular one of twelve equal sides (at least, not always). They seem to be thus:—The angle which includes two sides of a pentagon (144 deg.) is divided into five bays; and the other two bays are exceptional, and vary in proportionate width (or seem to do on the plans, but these being on a small scale, and not intended to show minute details, the variances may be more

in seeming than in reality). Viollet-le-Duc gives Amiens apse to a larger scale, and according to it the angle contains 142 deg., instead of 144: there may have been a little adjustment, or it may be a slight error in the plan. It happens that one-fourth of the radius of a circle in which a pentagram is inscribed divides the angle (144° 0 deg.) into ten, and thus are obtained the centre lines of each pillar, and each chapel. It is easy to divide a line into four, but it so happens that the lines of a pentagram fully drawn divide the radius into a fourth and a half, and consequently three-fourths.

In fig. 12 are shown these two methods of planning an apse of seven bays, and (fig. 13) the geometrical trisection of an angle. I have not seen any demonstration of this problem.

To trisect an angle $A B C$. Bisect in D , and again in E and F (dividing the angle into four). From D draw two sides of an equilateral triangle. With D as centre draw an arc, touching the radial line $E B$, and with E as centre draw an arc touching the line $D G$:—then a radial line drawn from the intersection of these two curves gives one-third of the angle, and the process repeated with F as centre gives the other third.

Fig. 14 shows the developed diagrams of the Pentagram and Heptagram. The lesser radius of the pentagram divides the angle 144 deg. (which comprises two sides of the pentagon) into three as shown. In the heptagram the lines of the great pyramid at Chizeh (and of others) are indicated by thicker lines of the diagram. The angle is $51^{\circ} 25' 42''$.

† The radius being 100 the chord of 48 deg. is	8134732
And the perpendicular of the pentagon is	8090170
Showing a difference of	0044562
The line $a-b$, or line $b-c$ on the pentagram gives the side of a polygon of eighteen sides, the latter being (with radius 1)	3472964
And the former	3454915
Difference	0018049

With centre d , the radius $d-c$ marks off 21 deg. on the circle; and with centre f the radius $f-g$ marks off 24 deg. These being repeated from the twenty radii, and the arc of 18 deg. being bisected, the circle will be divided into 120 spaces of 3 deg. each.

Chord of 21 deg.	3644710
Radius of curve	3632712
Difference	0011998
Chord of 24 deg.	4158224
Radius of curve	4122147
Difference	0036077

TRIPOD FOR A CHAFING PAN: SIENA.

This is an example of the characteristic mediæval metal-work in which Siena abounds. The square conventional treatment of the animal heads, or rather suggestions of heads, which hold the rings, is a good example of design suited to the material and situation. The treatment of the feet is somewhat more naturalistic, though very free and bold.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

PRIZES AND STUDENTSHIPS FOR 1896-97.

The fifth general meeting (business) of this Institute for the present session was held on Monday last, the President, Professor G. Aitchison, A.R.A., occupying the chair.

The minutes of the previous meeting having been taken as read, the following gentlemen were elected, viz.:—*As Fellows*, Mr. A. B. Pinckney, M.A. Cantab., Henwick, Worcester; and *as Associates*, Messrs. H. J. G. Smith, London; P. A. Robson, London; and H. W. Walker, London.

The Deed of Award of the prizes and student-ships for 1896-97, made by the Council (in accordance with the terms of by-law 66) was then received. The following is the list of successful candidates and competitors:—

Institute Silver Medal and Twenty-five Guineas (Essays).—Subject: The True Value of Tradition and Precedent in Architectural Design.

* I do not say that the division is mathematically true, but it is so nearly true as to be sufficient practically.

Tripod for a Chafing Pan: Sta. Caterina, Siena.

The Medal was not awarded, but the sum of Fifteen Guineas was voted to the author of the essay under motto "Things New and Old"—viz., Mr. John J. Cresswell, A.R.I.B.A., of Grimsby.

Institute Silver Medal and Ten Guineas (Drawings).—Awarded for the drawings, under device of fleur-de-lys within circle, by Mr. Fred. J. Wass.

The Soane Medallion and 100l. (for Continental Travel).—Awarded for design for a Provincial Market Hall, submitted under motto "Russet," by Mr. J. A. R. Inglis, A.R.I.B.A.; Medal of Merit to Mr. James A. Swan, "Labor ipse Voluptas" (Birmingham); Certificate of Hon. Mention to Mr. Charles H. Holden, "Elephant d'Argent" (Bolton).

The Pugin Studentship: Silver Medal and 40l. (for Travel in the United Kingdom).—Awarded to Mr. William Haywood; Medal of Merit to Mr. J. A. Swan; Certificate of Hon. Mention to Mr. W. E. Dobson.

The Godwin Bursary: Silver Medal and 40l. (for Travel outside the United Kingdom). Awarded to Mr. R. Stephen Ayling.

The Owen Jones Studentship: Certificate and 40l. (for Travel outside the United Kingdom): Awarded to Mr. A. E. Henderson.

The Tate Prize: Certificate and 30l. (for Travel in Italy).—Not awarded.

The Grissell Gold Medal and Ten Guineas (for Design and Construction).—Subject: Design for a Bay of a Church. Awarded for design, under device "Heart and Shield," to Mr. Sydney K. Greenslade.

The Aldwinckle Studentship: a Certificate and 30l. (for Travel in Spain).—Awarded to Mr. A. T. Griffith.

The Ashpitel Prize.—Awarded to Mr. T. D. Brooks (Doncaster).

The meeting then adjourned. The next meeting will be held on Monday, when the President will deliver an address to students; and some critical observations on the students' work will be made. Subsequently, the presentation of prizes will be made by the President. Prior to the distribution of prizes, Mr. Alfred Waterhouse, R.A., the new Chairman of the Board of Examiners, will present, on behalf of past and present members of the Board, a testimonial to Mr. Arthur Cates in recognition of his long and valued services as Chairman of the Board.

ENGINEERING SOCIETIES.

LIVERPOOL ENGINEERING SOCIETY.—The fifth ordinary meeting for the present session of the Liverpool Engineering Society was held on the 6th inst. in the Royal Institution, Colquhoun-street. Mr. George Farren, J.P., of Carnarvon (Vice-President), occupied the chair. Mr. James Glover, jun., M.A., Assoc.M.Inst.C.E., read a paper entitled "Some Notes on Current Specifications and Tenders for Public Works." The lecturer dealt with a few points in connexion with specifications and quantities which in many current documents were the reverse of reasonable, and which led to much friction and irritation between engineer and contractor, coupled very often with great financial loss to the latter. After referring to the classes of current risks, and to the arbitration clauses in specifications, and also giving specimens of the most unreasonable he had met with, he concluded by suggesting that a well-thought-out scheme

with variations of conditions and quantities within well-defined percentage limits, and with well-defined corresponding percentage price allowances for plus and minus excursions from the schedule average, together with an arbitration clause removing the final appeal from the engineer to a mutually respected and accepted umpire, must inevitably tend to improve the design, workmanship, quality, and progress of the contract work by enabling the engineer and the contractor to devote their respective special talents solely to the accomplishment of the work in hand, and without the irritating, distracting, and paralyzing disputes so common when the extrinsic risks were not fairly provided for or excluded. A discussion followed.—*Liverpool Mercury.*

Illustrations.

DESIGN FOR DECORATION OF A ROOM IN GRAFFITO.

THE chief object of the artist in the conception of this "Design for the Decoration in Graffito of a Room," was the introduction of the real Italian graffito in monochrome. The graffito is distributed all round the walls, the colouring being introduced in the pictures on the ceiling. The lightest tones of the graffito are cream, and the shadows sepia. The architectural parts should be in marble of some warm colour, or in stucco of the same colour, with some gilding. The principal subject represents the ancient Grecian game of ball. The smaller designs represent various sports, and the subjects on the vaulting are the Elements. C. F.

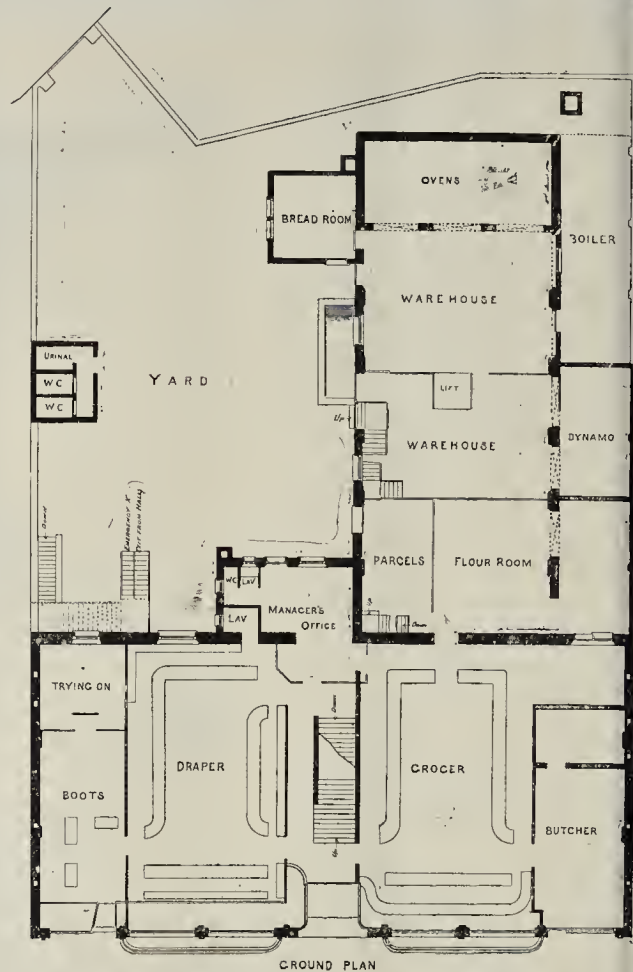

INTERIORS, NEW TECHNICAL SCHOOL, LIVERPOOL.

THE two drawings of the Technical Schools at Liverpool, represent the interior of the entrance hall and of the students' lecture hall, as intended. The former is top-lighted, and has a cloak room upon either side, while the entrance to the lecture hall is seen at the end. The lecture hall itself is about 70 ft. by 40 ft. and 27 ft. high, occupying the height of two floors. It is proposed that it should be vaulted in fibrous plaster with a panelled dado, and the windows kept high up each side. It will provide accommodation for 400 students. It should be added that the drawings were made by the architect for his own purposes since the competition, and were not among the drawings submitted in competition.

NEW WING TO BOARDING-HOUSE, RUGBY.

THE house to which this addition was made in the summer of 1895 is one of the oldest of the Rugby boarding-houses, and the original building is a plain square stucco block of no particular style. Several years back Mr. H. Lee Warner, who was then its "house-master," added a small quad on the east side of the old house, containing a hall, studies, and dormitories. These were built in the then fashionable Queen Anne style, and more recently a further addition was made on the south side of the house in a similar style. The present addition was made for the Rev. W. H. Payne Smith, and forms the north side of the quad. The drawing shows the outer front. As the new wing was to form the front to the boys' block, it was planned to harmonise with the style of the quad rather than with that of the residential portion, though there are many variations from the details of the rest of the boys' block in the new work. The available space was very much cramped, and a good deal of accommodation was required. This explains why some "fancy planning" had to be contrived (a most undesirable necessity). The materials were red sand stock facings with stone dressings and tile roofs. A good deal of rough-cast is introduced, and in the centre of the front is a coloured plaster panel, representing an oak tree—the house crest. This was made very cleverly by the builder, Mr. Linnell, of Rugby, who carried out the work most skilfully and promptly in the short space of the two months' summer holidays. The old buildings were dismantled on the first day of the holidays, and when the next term commenced the boys went straight into their new studies. Mr. Linnell's foreman was Mr. Barber, and Mr. J. T. Franklin, the school surveyor, kindly acted as clerk of works.

CHARLES A. NICHOLSON.

New Business Premises, St. Helens.

NEW BUSINESS PREMISES, ST. HELENS.

THESE premises have just been completed for the St. Helens Co-operative Society, at a cost of upwards of 20,000. The building is three stories in height, with cellar under the whole. The ground floor consists of shops for the various branches of the trade. On the first floor are show-rooms, offices, and board-room, and on the top floor is a large lecture-hall. A feature has been made of the lighting of the basement by forming areas in front and carrying the shop windows down to the bottom. The wing at the back is devoted to warehouse purposes and bakehouse.

The front is faced with Ruabon red bricks and York stone dressings. The building is fireproof throughout, the floors being finished with oak blocks or mosaic; the whole is heated throughout by hot water, low pressure, and lighted by electricity, the lifts and hoists being worked by the same power.

The contractors were Messrs. Whittaker & Woods, of St. Helens; the fireproof floors, wood blocks, and constructional ironwork are by Messrs. Homan & Rodgers, of London and Manchester; the mosaic was laid by Messrs. Diespker & Co., of London; and the architect was Mr. Frank S. Biran, of St. Helens, from whose designs and under whose superintendence the work was carried out.

NATIONAL PRESS AGENCY.

THIS building, in course of erection on the Victoria Embankment in Carmelite-street, is constructed of brickwork in cement, faced with red bricks, all the dressings being of a warm, gold brown tint of terra-cotta (Messrs. Doulton & Co.). The building is of fire-resisting construction throughout.

The contractor is Mr. H. J. Williams, of Ipswich, and the architect Mr. Edwin T. H. London.

TESTS OF STEEL AND CONCRETE FLOORS.

ON Monday last we had an opportunity of witnessing the testing of two systems of combined concrete and steel flooring, carried out in Manchester under the direction of Messrs. Maxwells, architects. The first test was that of floor patented by the Expanded Metal Company, an arched concrete floor, 4 ft. wide and 11 in. span from centre to centre of the joists for the abutments (11 ft. 6 in. clear span), with rise of 12 in. and a thickness of 3 in. at crown and of 4 in. at the springings, and having a layer of expanded metal (weighing about 1 lb. per square foot) embedded in the lowest part of the concrete, was loaded uniformly with 100 lb. of lead until it broke suddenly under a weight

THE BUILDER, JANUARY 16, 1897.

29½ tons, or 12½ cwt. per square foot. The amount of deflection observed before the collapse was rather more than 1½ in. The second test was of the "Golding" floor, a floor which has been already largely used in America. Mr. Golding himself was present at the testing on Monday. The specimen tested had the same span as the arched floor just described, but was 2 in. wider. It consisted of two concrete ribs, spaced 3 ft. 6 in. from centre to centre, and each having the intrados formed with a 6 in. by 2½ in. arched steel channel, weighing 12½ lbs. per foot, and laid flat side down, the rise being 13 in.; over the two ribs, and united to them by the adhesion of the concrete, the floor itself extended, consisting of a flat concrete slab 3 in. thick, with a layer of expanded metal (similar to that in the first test) embedded in the lowest portion. With a load of 12 cwt. per square foot (*i.e.*, equal to that which broke the other floor), the deflection was ¾ in.; but with increasing loads the deflection rapidly increased, until it amounted to no less than 4½ in. under a square load of 40 6 tons, or 16½ cwt. per square foot. Darkness had at this time rendered further loading somewhat difficult and dangerous, and the floor was left unbroken under the load mentioned. When the load had reached nearly 16 cwt. per square foot a crack was observed in the underside of the flat slab, extending across it about the middle of the span, and under this load the deflection was about 3½ in. The greatness of the deflection was undoubtedly due in a large measure to the yielding of the steel framework between which the floor had been constructed, the spreading being no less than 1 in. when the maximum load was reached. The concrete in both cases was composed of 1 part of Portland cement and 3 parts of crushed granite passed through a screen with ¾ in. meshes, and both floors were constructed thirty-three days before being tested.

We reserve comment on the tests just recorded, as we hope in an early issue to give fuller details of these and other tests, together with explanatory drawings. It is clear, however, that both floors attain great strength with a remarkably small quantity of metal, a further proof—if such were needed—of the extravagant waste of metal in most of the systems of fire-resisting floor-construction now in use in England. The tests made last year by Mr. Fowler and Sir Benjamin Baker—which we hope to record when we comment on this week's tests—show beyond question the enormous accession of strength gained in concrete slabs by the insertion of expanded metal, and, indeed, are a far better index of the value of the addition than are the tests made last Monday.

PETERBOROUGH CATHEDRAL.

The Society of Antiquaries have printed and circulated their views as to the whole controversy about the West Front of Peterborough Cathedral, accompanied by the specification showing how they would treat it, which is signed by Mr. Thackeray Turner, Mr. W. R. Lethaby, Mr. Detmar Blow, Mr. Philip Webb, and Mr. T. J. Micklethwaite, with the rider of a testimonial from a member of the Institution of Civil Engineers, Mr. John Carruthers, to the effect that he is of opinion that the method suggested could be safely carried out and would be effective in making the building secure.

The controversial portion we must pass over; enough has been said about it. The specification we have not space to print in full, it can be obtained from the Society of Antiquaries, but we give those portions of it which refer to the question of the condition of the piers and vaulting, and the means proposed to repair them. After describing the work of underpinning the piers the specification continues:—

"The next work would be to look to the condition of the pier itself, vaulting its foundations and the springing of the arch and vault; this would not be the least important part, for much would depend on its solidity. It is possible that disintegration may not have occurred in its substance to any serious extent, but this would have to be ascertained. The signs of its condition, so far as they can have been observed at present, tend rather to the conclusion that the subsidence and pressure outward from the vertical have been so slow from the time it was built that the multitude of its parts have yielded, almost elastically, to the change in stability, so as not dangerously to dispossess its parts, and the core with its ashlar casing may still be in a state of cohesion."

However this may be, no pains should be spared in finding out what its condition is; and after the plumbing, girding, and raising of all its perpendicular lines have been done, the pier should be gently tapped with a wooden mallet on its surfaces, and the sounds at different parts listened to for any indications of hollowness. Should the sounding not be satisfactory, a stone or stones would have to be drawn from the flat surfaces of the pier inside, and

the core examined in one place at a time. The triangular form of the pier in plan, and its being some 25 ft. wide on its inner side, would allow of the examination being made without risk, and of the core being consolidated without serious difficulty, in a similar way to that hereafter described in connexion with the spandrels of the great arches. Any process of penetrating securely into old walls depends upon the care and ingenuity of the men engaged in the operations and their director, with an avoidance of heavy blows, keeping to one hole at a time, and that of the smallest workable size; a watchful foreman of the works, upon the direction of the architects, with a few picked men on whom they could depend, being the most important consideration in such work.

This pier, on which so much depends, having been secured in the whole of its height, attention would then be given to the springing line of the great arch and the vaulting, for complete consolidation here would be the basis for securing the great arch itself and the spandrels right and left of it.

Of necessity, a hole or holes would have to be made just above the springing line inside, where the metal tie-rods, which would have to be arranged at this level, would connect. At present the best opinion is that two tie-rods should be used, so as to lay hold of a larger body of material at both ends than a single rod would allow.

The particular size and form of the rods would depend upon the exact calculation of the holding power on the arch mouldings as they set down on the capital of the pier, and on the least injurious form of anchorage to be found inside the west wall of the nave. At the present time we incline to the opinion that the rods should be at the end of the rods a little behind the quintuple attached shafting, which runs up from the ground to the base of the pinnacle between the spandrels. The form and exact position of this connecting-plate, which would be fixed upon as the work proceeds. Two tunnel passages, to be made in the same way as hereafter described, would be the safest and soundest way of working here, and it may be that copper or tough bronze would be used, instead of iron, &c., or, if not, the most approved kind of iron or steel; in either case their strength would have to be tested before using. The making of one tunnel at a time would allow of taking greater pains with the new consolidating material to meet the strain both above the springing line and below.

The consolidation of the walling here, in connexion with the tie-rods, having been done and allowed to set, the tympanum at the base of the pier, between the decorative arching and the wall rib of the vaulting at the base of the great pinnacle, would afford easy and secure access to the core of the walling in the centre; and further access would be made without difficulty or risk from the hollow pockets of the vaulting right and left.

We now come to the very important point in connexion with the present repair of the front, the manner in which the great arches can be safely and securely strengthened, *without having recourse to rebuilding.*

It has already been noted that the internal parts of the walling of the northernmost arch have expanded from east to west during the slow settlement of the detached pier below; and in a lesser degree this is probably the case in the other arches also. The substance of this walling must therefore, to a greater or less extent, be in a state of disintegration, and its removal and replacement by sound masonry are essential to the permanent stability of the masonry. The manner in which this may be done *without risk or danger either to the building itself or to the men engaged in it*, is as follows:—

In the rubble walling, which has no ashlar facing at the back of the arches, beginning at the lowest point, a hole or tunnel, just wide enough for a man to work in, would be slowly driven by short sections at a time. The sides and roof of each section would be made absolutely secure by timber framing before beginning the next one, and the hole would be gradually carried through the wall to the back of the facing stones of the wall itself. The hole would be made as deep as 6 ft. in length. Any possible danger from the running of disintegrated material would be met by the prompt application of short lengths of 3-in. planking, thickly coated with wet clay, and held in position by stout wire props, with expanding screws are applied to the ends, so as to press each plank well home and keep it in place. Moreover, only one tunnel would be made at a time, and this would be filled and pinned up before another material as hereafter is described before another one is begun; it would therefore bear but a small proportion to the area of the wall bored into. The new filling would thus support the work above it until that in its turn was removed.

Clearly, when doing this underbuilding in the spandrels of the arches, the chief danger in underpinning foundations, namely, the great superincumbent weight, would practically be non-existent, owing to the comparatively slight structure of the gable above. The only danger to be faced, the possibility of the sides or roof of the holes falling in, would be effectually guarded against by the precautions already described.

The process of consolidating the walling of the west front, above the piers and overlying the arches, is simplified by the great thickness of the walling at this part of the work under consideration; and the foregoing indication of a very complete system of timber support to all the weight and thrust of the work above the springing line of the arches shows that any disturbance caused by the execution of the work would be met all points by the counter support. Extra support in detail would have to be supplied from time to time, so as to make sure that no further dislocation of material would happen, as the supporting framework would be brought into action as soon as the slightest movement took place.

The principle underlying this working by tunnel into the walling from the inside, at the back of the ornamental ashlar stonework on the outside, is that of applying horizontal bands of very hard material at certain distances apart vertically, so as to become, as the work proceeds upwards from the springing line of the arch, something analogous to "cantilever" construction used in modern iron bridges; that is, a corbelling out right and left from the central axis of the piers below till the bands from opposite sides meet over the centre of the arch between its two piers. The rods and hard horizontal material thus set, as ribs, and the filling in between them as support to the ribs.

As has been said before, the very thickness of the walling is of assistance to this kind of work, for these bands or ribs, having a great horizontal width, have also considerable power in lateral resistance to bulging.

As this laminated corbelling and its interfilling is passed on to the outer surfaces of the arching, the weight being carried by the arch ribs alone is then shared by the renewed core of the walling. Also, while this process

of relief and strengthening is going on, each of the orders of the arch is caught up and securely connected by natural adhesion bonding, or, when needed, by dowels of hard material; and at the same time the spaces between the rings of the arch, which have opened on account of settlement, would be securely filled and incorporated with the work behind.

The horizontal bands, or ribs, which were constantly used in the best Roman walling, served more than one office in construction, as they were, so to speak, built in compartments, and the rubble or concrete lying on the laminated bond of two or three joint-broken courses stopped the running down of the water from the new rubble above them to the rubble below, that having already been saturated with grout.

It must also be understood that these laminated bond courses would be of the whole thickness of the wall from the back of the facing stones to the inside face of the wall lining, and on these would be built, or put in, the rubble or concrete filling. While the work in each tunnel was being done, these horizontal bonding courses would be thrust into and under the sides of the walling of the holes beyond the general width of each tunnel, so that after one tunnel was filled up, and a sufficient time was allowed for setting, another parallel tunnel would be made, and these outsaucing bond courses would be caught up at the base of the fresh hole, and a continuous line of them would run as far as different circumstances would allow.

In order to make the horizontal courses, or ribs, as strong as possible, we should mostly use the hard blue Staffordshire paving tiles, 1½ in. or 2 in. thick, of the size we would use with smaller sizes of the same material to avoid cutting. These semi-vitrified tiles have great affinity with Portland cement, and are very holding.

We have specified rubble walling or concrete as the composition of the filling-in between the ribs, but this work would be varied by the differences found to exist in the work of the core. Any solid parts of the core which might prove not to have been disintegrated would be washed, and then laid hold of by new filling-in bonding stones or flat bricks, so as to range horizontally with any of the work met with on the way, which should not be disturbed; but the particular use of rubble concrete is given for it can be pressed into the interstices of old walling, and lays hold of any connecting bonding from the internal irregular faces of the ashlar or other facing stonework. At different times, from the end of each tunnel, parts of the ashlar facing would be exposed to view, and all the gaps in it could be securely dealt with; the renewing of the bedding and pointing of the stones (an almost impossible work from the outside only) would be thoroughly secured, and attachments incorporated with the rubble backing.

It is highly probable that the quintuple shafting, up from the springing of the arches to the underside of the base of the great pinnacle between the roofs, will have to be built back with much cube stone, and if this is found so, it will not have to be disturbed (unless in any way dislocated), but carefully embodied in the new filling-in and band work of the spandrels.

So far as can be seen at present, the internal support at the base of these pinnacles is of solid and unfractured work, as is also much of the work of the gable proper, though here fractures or displacement of the stones would have to be dealt with, especially along the range of alternate window opening and niche work.

The gable proper, that is the triangular part resting on the continuous dentilled string-course, would present few difficulties in securing it after the strengthening of the foundation on which it stands (*i.e.*, the spandrels of the arch below) it had been consolidated. The alternation of windows and niches occurring in thinner walling than that covering the great arch, a far larger part of the work here is done in squared stone, and this would allow of the masonry under the base of the wheel window being made quite sound from the inside, so as to avoid displacing the iron-fretted stones of the bottom part of its circle; the joints of this stonework at this point could be thoroughly washed out from above, run in with new filling-in, and incorporated with the solidified work below, which would have been done from the inside. Any disturbance of the ornamental stonework on the outside would be most mischievous.

Doubtless, as the work proceeds from time to time, at the different parts of the walling, any scheme set down on paper now would have to be modified to suit the peculiarities of the various works as they become disclosed; caution while each part was being dealt with would have to be insisted on, and special contrivances put in practice to suit all situations.

We need scarcely here say anything as to the repair and strengthening of the vaulting in connexion with the great arch at this part of the front, save that we were much interested in the varied curves of the ribs resulting from the slow strain put upon them by the settlement of the piers; but they present no serious difficulty in the way of strengthening them as they now stand, when once the work on which they rest and about is made secure.

The following architects add their signatures as approving the proposed method of procedure but admitting that they have not examined the building:—Robert Weir Schultz, F. W. Troup, Edward S. Prior, F. Inigo Thomas, Halsey Ricardo, Mervyn Macartney, P. Morley Horder, J. A. Cossins (Birmingham), H. Wilson, Ernest Newton, E. Guy Dawber, C. R. Ashbee, J. J. Stevenson, F.R.I.B.A., Chas. H. M. Mileham; to these Mr. Horsley and Mr. John Richmond desire to add their names.

COMPETITIONS.

LUNATIC ASYLUM, BELFAST.—A new asylum for 1,000 patients is about to be erected near Belfast. Competitive designs were invited, and Mr. Sydney Mitchell, architect—of Messrs. Sydney Mitchell & Wilson, Edinburgh—was appointed by the Irish Board of Works assessor to select the three best plans. He returned from Dublin on Monday, having given his decision on Saturday, though the names of the successful competitors will not be disclosed for some days yet.

MUNICIPAL BUILDINGS, DOUGLAS.—A special meeting of the Douglas Town Council was held

on the 6th inst. for the purpose of selecting plans of the proposed municipal buildings. Seventeen plans had been submitted by English and Manx architects, and the committee appointed to consider them, acting under the advice of Mr. Woolfall, of the Liverpool Society of Architects, recommended that the first premium should be awarded to the plan signed "Mona." After a prolonged debate this was agreed to. On the letter containing the name of the competitor being opened, the name of the successful architect was discovered to be Mr. Arthur Ardron, London. Manx architects take the second and third premiums.

WORKMEN'S DWELLINGS, SUNDERLAND.—Some time since the Sunderland Corporation offered premiums of 50*l.*, 30*l.*, and 20*l.*, to architects who chose to send in designs for the dwellings the Council propose to erect on the Hat Case site, which has been cleared of its dilapidated property. Mr. J. Slater, of London, was appointed to adjudicate upon the plans sent in. These were fifty-eight in number. The first award the assessor recommends should be given to "Pro Artifice," whose plan shows accommodation for 468 people in forty-two three-roomed dwellings and fifty-four two-roomed dwellings. Each tenement is provided with a bath. The total cost is estimated at 20,000*l.* The second premium the assessor awarded to "Homes," whose design is estimated to cost 23,351*l.* in carrying out. The number of persons provided for is 448. "Salis Populi" takes third premium, with provision in his plans for 402 persons at an estimated cost of 20,000*l.*

ARCHITECTURAL SOCIETIES.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The monthly meeting of this Society was held on Tuesday at the School of Art, Arundel-street, Mr. C. Hadfield, the President, in the chair. A lecture was delivered by Mr. Beresford Pite, President of the Architectural Association, on "The Study of Architectural Design," illustrated by numerous drawings, photographs, and blackboard sketches. He stated that the modern architect suffered from lack of artistic motive. He sought it in archæology and mere picturesque quaintness, there being now no traditional style or intuitive sense of beauty in architecture. No doubt this was as characteristic of our age as if it were quite otherwise, but it was impossible that the architectural student should be left without direction or serious intention in his study of design. Present purposes could perhaps best be served by seeking to excite enthusiasm from interest in detail work, and by understanding and analysing the beautiful qualities in the means employed in plans and working drawings, which were the instruments by which a beautiful building was obtained, and thus made up for the loss of genuine national architectural style. An architect's plans had a beauty of their own, and this was pointed out in some detail from many examples. This beauty was indiscernible in the building, and belonged to the embodiment in the drawings of the building. In the same way the sectional plans of buildings were examined, and the means illustrated from them of obtaining different architectural effects by a carefully-studied interest in the sections. Elevations were grouped in different classes dominated by general ideas, such as verticality or horizontality, concentration or distribution of ornament, a picturesque grouping of sky-line, or dignified severity. These points were illustrated from photographs and sketches, as well as grandeur of line, simplicity of rhythm, luxuriousness, a simple line with a rich surface, or a rich line. The students were exhorted to thoughtfulness in detail as being pre-eminently the road to good architecture. In conclusion, architecture was vindicated as a decorative art, and as such was the foundation of all art other than imitative. A vote of thanks was unanimously accorded to the lecturer.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—At a meeting of this Association, on the 8th inst., Mr. E. Preston Hyatt (Secretary to the School of Art) gave an address, entitled, "The Architect as a Teacher." It was the duty of the architect, he said, to stimulate work in the allied arts. Amongst the grounds for hope as to the future of architecture in England, he said, were the increasing earnestness of architects themselves—an earnestness which had induced many capable architects to sacrifice to teaching in public classes, often at a pecuniary loss, much time that would otherwise be devoted to private practice.

Birmingham was especially fortunate in this respect. The growing interest taken by people generally in art, the love of home, and even the possibility of the extended possession of houses which building societies afforded, the development of public spirit—all these were forces of which the architect should avail himself, and which he should adapt to the best ends. It was the duty of the architect to stimulate work in the allied arts; he could render to the community great service by facilitating the employment of worthy sculptors, mural decorators, wood-carvers, and others. In this way his influence would also penetrate beyond those craftsmen working immediately under his supervision. The attendance of young architects at the various classes of the Birmingham Municipal School of Art was fraught with advantage to all concerned. Domestic architecture, whose improvement Mr. Ruskin and Arthur Helps had enforced as a moral duty, and which was alike the best and the readiest starting-point, and national and municipal architecture, which should exemplify the highest life of the community, were considered in some detail. It would be worse than a paradox if a community which spent large sums upon art education should itself erect unworthy buildings. The possibility was considered of appointing, in connexion with the First Commissioners of Public Works and Buildings, an advisory council of leading architects, chosen on representative lines; and attention was called to the fact that at least since 1885 no member of the Birmingham City Council was in the municipal diary described as an architect. Birmingham did not stand alone in this matter, which was noticeable in view of the development of local duties, and of their interest and importance to architects. In conclusion the lecturer summarised the work of the Municipal School of Art. A hearty vote of thanks was passed to him on the motion of the President (Mr. William Henman), seconded by Mr. H. T. Buckland, and supported by Mr. W. H. Bidlake, M.A.

LIVERPOOL ARCHITECTURAL SOCIETY.—The fourth ordinary meeting of the forty-ninth session of this Society was held at the Law Library, Union-court, on the 11th inst., when a paper was read by Mr. C. E. Mumford on "Belgian Churches." Mr. George Bradbury, President of the Society, presided. Mr. Mumford, in his opening remarks, said Belgium was without doubt one of the countries of Europe where the fine arts have flourished and are still flourishing with the utmost vigour. The long series of great painters who succeeded each other for more than four centuries had not alone brought her the renown which she so justly enjoys; architects and sculptors had contributed their part. The devotion and intellectual culture of the Flemings had been shown in the vast number of churches of high architectural merit which are to be found in the country. Few of the older buildings now in existence date back beyond the beginning of the thirteenth century. It was not until the Gothic style was firmly rooted in the adjacent countries that it came to be adopted by the Flemings. All the vast wealth of ornament accumulated in these churches up to the middle of the sixteenth century was destroyed by the Calvinist iconoclasts, and there perished a wealth of art the loss of which was irreparable. About the commencement of the seventeenth century, the country again becoming prosperous, art and architecture received a new impetus, and many new churches were erected. The builders of Belgian churches, whilst striving successfully after the beautiful, always kept the practical utility of their work well in view. About 150 lantern slides were shown on the screen.

GLASGOW ARCHITECTURAL ASSOCIATION.—A meeting of this Association was held on the 5th inst., Mr. Wm. Tait Conner in the chair, when Mr. W. J. Blaine read a paper entitled, "Some Scotch Houses." The lecturer limited himself to the consideration of four of the finest and most characteristic examples of Scottish castellated architecture—Crathes, Craigievar, Midmar, and Castle Fraser, all situated within a short circular tour from Aberdeen. Mr. Blaine took into consideration only the original castles or keeps, which in date lap from the latter half of the sixteenth century into the first half of the seventeenth century, leaving out the later wings, and, after describing the natural surroundings, gave an account of their individual history; then entering into a critical analysis of the principles of design they illustrate. Comparing the one with the other, he pointed out their strong and weak points, making this clear by diagram sketches and photos, the former of which he referred to as also exemplifying a theory

of his, that the size of a building appears on a drawing in inverse ratio to its size in reality. In summing up, the lecturer placed these four buildings and their characteristics in the following order of merit:—Crathes, dignity with beauty of detail; Castle Fraser, beauty of detail with dignity; Midmar, dignity without beauty of detail; Craigievar, beauty of detail without dignity.

THE SURVEYORS' INSTITUTION.

MR. HOWARD MARTIN read a paper "On the Future Development of the Surveyors' Institution" at the temporary premises of the Institution, Savoy-street, Strand, on Monday. The chair was taken by the President, Mr. Daniel Watney. Mr. Martin, after referring to the history of the Institution since its formation in 1868, and the progress it had made, said its members were now spread over the whole country. With regard to another institution which he named, he said there was little done for its country members; but as to the country members of the Surveyors' Institution, they were charged somewhat lower fees, and had all the advantages of the Institution in London. While this was so, however, they laboured under the disadvantage in reference to the obtaining of information, their means being limited to their own circle of influence. He proposed, first, that provincial libraries should be established; and secondly, that meetings should be held taking the provincial centres in rotation. By these means the provincials would be kept posted up, and an increased interest in the Institution promoted. A vote of thanks to the lecturer was proposed and carried, and the discussion was adjourned.

Books.

A Wandering Scholar in the Levant. By DAVID G. HOGARTH. London; John Murray; 1896.

THIS is a very pleasant little book of impressions of travel, partly archæological but more especially concerned with the record of the general aspect of a country and of its inhabitants, and touched with the scholarly tone and literary style which the wording of the title seems to promise. There is not much in it that is of directly archæological interest, and the book is rather suggestive than didactic. The reader about to explore for antiquities may indeed obtain useful hints as well as amusement from the records of dealings with the native intellect when in search of such things as inscribed stones; how slow is the peasant to realise that a stone which he has been familiar with all his life is the thing the *gêner* wishes to see, or to convince himself that it is his interest to show it; how the price of the Bor stone fell, under judicious diplomacy, from 50*l.* to 20*l.*; and how a Government Secretary promised that if there were any difficulty about the conveyance of the stone, "he could arrange that we should be robbed of it outside the town, and for a slight consideration recover it at the port." The following picturesque passage describes the impression produced when the explorer in Anatolia "breaks into some hidden hollow of the hills and sees grey among the lentisks the stones of a dead town":—

"Such fairy-cities are the nameless pirate-towns that were built on the Cilician slopes in the first two centuries before the Christian era. Water, no longer guided by man through long ducts, has failed on the high lands, and the region remains as it was left two thousand years ago, a vast Pompeii, where no man has rebuilt or destroyed. In its capitol, Olba, citadel, walls, streets and roads are choked with brushwood. A triple arch leads into the forum; on the left the fragments of a Temple of Fortune stands in the brake, and in front rise the fluted columns of the Olbian Zeus, whose priests were kings. Passing a ruined portico, the explorer lights suddenly on a theatre lined with vegetation sprouting from every crevice in auditorium and scene. But nothing in the city is more wonderful than the road leading from it to the coast. Mile after mile it's embanked pavement runs over the naked rocks; mile after mile stones, fallen or standing, inscribed with the titles of Roman Emperors, record your progress; here you pass a group of tombs, there clatter through an ancient village, and at last wind down sweeping curves to the sea, past towers and tombs rising white out of the scrub; and in the towers on the villages, on the road or in the city is there a human thing except the wandering shepherds."

Theatre Panics and their Cure. London: B. T. Batsford. Edinburgh: A. Elliot. 1896.

"THEATRE PANICS and their Cure" is the title of a small pamphlet which has been issued together with some plans claiming to illustrate a safe theatre. We regret that the efforts, no doubt well meant, of the authors of the pamphlet and the drawings are about fifteen years too late in the date of their publication. Instead of aiming at clear and straightforward planning with roomy staircases, which is the essence of safety for an audience, they try innumerable make-shifts, among which the most noticeable are the galleries running round the theatre at each tier. Such make-shifts remind one of those first proposed during the period of panic legislation after the "Ring" Theatre and Nice Opera House calamities, and do not speak well either for the authors' reading or practical experience. The proposed galleries and the special emergency staircases leading from them take up far more space on the superficial area than well-planned and roomy staircases and passages would have required. It is absolutely wrong to lay stress on "emergency" exits, as it is a well-known fact that an audience will always make for the exits which served as entrances when they approached their seats. The very terms "emergency" exit and "emergency" staircase should be cancelled from the vocabulary of theatre architects, as far as the safety of the public is concerned. It should be their ambition on the other hand to obtain clear and straightforward approaches without any complications whatever, and the maximum of symmetry in the disposition of doors and stairs on either side of the house. The idea of the emergency galleries, we should add, has been already carried out in the "Flemish" Theatre at Brussels, erected in the year 1857. We regret that the labour which has evidently been employed in preparing the drawings should have been so misapplied.

Gothic Wood-carving: being a Series of Drawings from the original work chiefly of the Fourteenth and Fifteenth Centuries. With explanatory Notes. By FRANKLYN A. CRALLAN. London: B. T. Batsford. 1896.

Is there going to be a revival of the Gothic revival? Mr. Crallan's hook would suggest the idea, for his large lithographed drawings of Gothic woodwork finials, bench-ends, &c., well selected and very well executed, form exactly the kind of illustrations which used to be published forty or fifty years ago; they remind us of the days of "Brandon's Analysis" and other such standard hooks. Mr. Crallan, who has been instructor in wood carving at the Municipal Technical College at Derby, says that his intention in the book was to re-awaken an interest in a branch of art which had languished for many years. Whether he means Gothic art in general or Gothic wood-carving in particular is not very clear; if the former, he must have lived rather apart from the movement of the day to have been taken by surprise with the discovery that Gothic art had dropped very much out of practice for a good while past. For one professed object of the hook, the desire to furnish models or suggestions for carving classes which could be formed to beautify their local churches with carving in the same spirit as Medieval work, the hook is well adapted, the examples being carefully drawn to a large size. And although the passion for Gothic detail which belonged to the revival has died out, people will still want good drawings of it, and they will find here one class of work well illustrated.

Correspondence.

To the Editor of THE BUILDER.

COPPER ROOFS.

SIR,—In case you receive no replies more to the point, I may cite, in response to Mr. C. J. Ferguson's letter in the *Builder* of last week:—

1. The dome of St. Joseph's, Highgate Hill, the Church of the Passionists, which, when I saw it last, in August, was light green in colour. The church, opened November 22, 1889, is described in the *Builder* of November 30, 1889. The architect was Mr. Albert Vicars, then of Somerset-chambers, Strand.

2. The spire, covered in 1724, of Hampstead Parish Church, 1747.

3. Mr. Ewart's lecture on "Roof Coverings," read before the Architectural Association on November 6 last, and reported in the *Builder*, November 21 last. Mr. Ewart mentions, for its colour, Hampstead spire; and (in his reply after the discus-

sion on his paper) the roof of York Minster for its colour.

4. If my memory serves me—the spire of St. Mary's Parish Church, Battersea. D.M.

The Student's Column.

SPECIFICATIONS.—III.

BRICKLAYER.

THIS is one of the easiest trades for which to write a specification, but, at the same time care must be taken not to indulge too much in generalities, to which the work of this trade particularly lends itself. As before premised, begin with the materials, and follow up with the various kinds of work, thus:—

Bricks.—The bricks for walling to be approved, sound, hard, well burned, whole stocks and no bats are to be used except where legitimately required for bond. The bricks for facing to external walls to be Fareham first quality red facing bricks of a tint to be approved by the architect. (If varieties of bricks are to be used for various parts of the building, these must, of course, be here specified.)

Lime.—The lime to be highly burnt blue lias lime of approved quality. (If grey chalk, Dorking, Merstham, scintific or other lime is required, state so.)

Sand.—The sand to be clean, sharp river sand from above bridge, of medium coarseness and approved quality (or pit or sea sand if desired or allowed).

Cement.—The cement to be Portland cement of Messrs I. C. Johnson & Co.'s (or other selected firm) manufacture, to weigh not less than 112 lbs. (or upwards, if a slow-setting, heavy cement is wanted) per struck bushel, and ground sufficiently fine to pass 90 per cent. through a sieve of 2,500 meshes to the square inch, and to bear a tensile strain of not less than 300 lbs. (or up to 450 lbs. if very high quality) on the square inch of a briquette seven days old kept under water.

Mortar.—The mortar to be composed of 1 part of lime to 3 parts of sand, to be mixed in a pug mill and prepared in quantities sufficient only for one day's consumption. Cement mortar to be prepared as required in small quantities, and to be mixed in the proportion of 1 part of cement to 2 parts of sand.

Brick Walls.—Build all walls throughout of the various heights and thicknesses shown and figured on the drawings, with all the projections, recesses, openings, &c., shown, in their proper positions. The footings of all walls to be of the number of courses shown (or of the number of courses required by the London Building Act, 1894, or by the local by-laws), each course projecting 2½ ins. beyond the face of wall or footing immediately above same. To be built perfectly level, not to rake with the ground, but to be stepped up where the levels vary, as may be directed by the architect. The drawings show, and the contract includes, an uniform depth of brickwork (7 ft.) to bottom of footings from the ground floor level, but the contractor is to follow the instructions of the architect as to the precise level at which the brickwork is to commence after the foundations have been approved by the architect.

The brickwork is to be carried up in level courses in English bond with buttered joints, and each course well flushed up. (Buttered joints are better than grouting unless this latter is done in liquid cement, and even then may be reasonably preferred.) No portions of walls to exceed 3 ft. above the adjoining parts whilst being built, and to be raked back and not toothed up. All bricks laid in dry weather to be well soaked previous to being used. No four courses to rise more than 1 in. (or 1½ in.) in addition to the thickness of the bricks laid without mortar.

Brickwork in Cement.—All brickwork in chimney stacks above roof level, all brickwork erected as piers standing alone, and such parts of the walls as are shown attached on plans to be built in cement mortar. The half-brick walls to be built wholly in stretchers and in cement mortar.

Hollow Walls.—(If these are intended specify thus.) The hollow walls shown on plans to be built in two thicknesses, 9 in. internal, and 4½ in. external, with a 2½ in. cavity, bonded together with wrought-iron ties, dipped in tar and sanded, every (18 in. to 3 ft.) in height and 2 ft. 3 in. (18 in. or 3 ft.) apart. The hollow and ties to be kept free of mortar droppings by haybands to be lifted as work proceeds. The damp course to hollow walls to be laid at two levels, that over

inner thickness one course above that over remainder. The perpend of bottom course to be left open. Build in for ventilation of cavity (if this is desired and it keeps cavity drier) 9 in. by 3 in. terra-cotta air bricks, 3 ft. apart at bottom of cavity, and also immediately under eaves. All door and window openings in hollow walls to have immediately over arches an apron of 5 lbs. lead projecting ½ in. from face of wall extending through outer thickness, across space, turned up 2 in. against inner thickness, and extending 9 in. each way beyond frame. The perpend of course immediately over these aprons to be left open.

Facings and Pointing.—The facings to be carried out in English bond, the perpend carefully kept, and the joints pointed at completion with a neat struck weather joint in grey tinted mortar (or as may be desired). If diaper work is intended or ornamental bonding, describe it thus. The diaper work shown on south elevation to be executed in cross bond (or Flemish, &c.) with the pattern in black header bricks from Sussex. No staining or colouring is on any account to be applied to any brickwork, and the brickwork is not to be rubbed down before pointing, but washed only with a weak solution of green copperas. (State if work in cement is to be p. in cement, or if joints are to be raked out and pointed to match facings.)

The inner faces of walls where plastered to be left with rough joints, as key for plaster, and in other cases to be worked fair with flush joints and twice limewhitened (or dinged with wet brush and distempered to an approved tint).

Gauged work.—(Refer to the parts where this occurs.) The . . . to be executed in gauged work with Lawrence's orange-red rubbers (or Suffolks, &c.), the moulded work to be carefully cut and rubbed to the architect's full size details. The gauged work to be set in lime putty, with ½ in. joints, and each course of plain wall to carry with a course of the backing. (If there is raving the rubbers are sometimes set in shellac. If this is desired say so.)

Arches.—The external arches on front elevation to be executed in gauged work; the remainder to be fair axed arches. The arches to fireplace openings to have two half-brick rings in cement, and wrought-iron chimney bars, 1½ in. by ½ in., each 18 in. longer than openings, split and turned up and down at ends. The trimmer arches to be half-brick in cement rampant arches, to avoid the use of feather-edged springs.

Chimneys.—The kitchen flue to be 14 in. by 14 in., the remainder 14 in. by 9 in., all to be pargeoted with cow-dung mortar, properly cored, and finished with Cooper's, of Maidenhead, red terra-cotta chimney pots, No. 15 gauge, p.c. each, to be hedded in brickwork for 9 in., and flanchued up in cement.

Hoop-iron Bond.—Lay throughout all walls under sills of first-floor windows a continuous range of hoop-iron bond, No. 15 gauge, 1½ in. wide, tarred and sanded, and laid in cement three courses in height, and one row to every half-brick in thickness of wall.

Moulded Strings, &c.—(Describe these, stating whether stock patterns are to be used; if so, refer to catalogue, and give price, or if to be purpose made to special full size details.)

Plinths.—(Describe if of special brick, as salt-glazed, what the plinth course is to be, if plinth is to be battered, or any other special treatment.)

Damp-proof Course.—A damp-proof course of Val de Travers asphalt, ½ in. thick, is to be laid in all walls, and this work is to be executed by the company's workmen.

Air Bricks.—Build in where directed No. 60 red terra-cotta air gratings, 9 in. by 3 in., to ventilate floors and form proper splayed apertures for same, and render around in cement.

Copings.—(If brick copings are intended, describe them.) The coping to hack wall of office building to be of brick on edge and double tile creasing, all set and pointed in cement.

Window Sills (if brick).—The window sills on first floor to be executed in splayed brick on edge, set and pointed in cement, with tile course under projecting ½ in.

Pavings.—Pave the floor of scullery with 6-in. red Staffordshire tiles hedded and jointed in cement on 6-in. bed of Portland cement concrete. Pave the coal place with hard brick-on-edge paving set and jointed in mortar on a bed of sand 3 in. thick (or as desired). The kitchen yard to be laid with Jones's granolithic paving, 1½ in. thick, on a 4-in. bed of cement concrete, laid to current. The contractor is to lay the concrete bed after excavating the surface soil and filling in with

9-in. bed of dry brick rubbish, and the granolithic paving is to be laid by the patentee at the p.c. sum of 10s. per yard, which is to be paid to the patentee by the contractor within fourteen days after the production of the architect's certificate.

(Similarly describe any other pavings, asphalt, Staffordshire brick, or other material.)

Brick Steps.—(Describe these, if any.)

Boundary Walls.—Build garden fence walls on three sides of site, one brick thick, in Flemish garden wall bond fair on both sides, and finish with half round salt glazed brick coping, set and pointed in cement, with double tile crenasing. These walls to be 6 ft. high above ground, and 1 ft. 6 below, with two courses of footings and 12 in. bed of concrete. Piers 18 in. by 18 in. to be built, every 10 ft. apart. Damp course of two courses of slate in cement to break joint.

OBITUARY.

HERR ENGELBERT PEIFFER.—Of eminent German sculptors deceased during the winter, we would notice the death of Herr Engelbert Peiffer, of Hamburg, whose work was well known throughout Northern Germany. He was the architectural sculptor who commonly had commissions from the leading German architects, such as Messrs. Ende and Boeckmann, of Berlin. He also sometimes practised as an architect, and in this capacity was associated with the well-known Hanseatic Building Company, which flourished between 1870 and 1880. He was exceedingly popular and much reputed for his talent in arranging special decorations on festive occasions—such as the visit of the Emperor to Hamburg in 1867—when he carried out the decoration of the Alster Lake and the artificial island which was constructed upon it.

DR. ALBERT ILG.—We regret to record the death of the well-known archeologist and art historian—Dr. Albert Ilg—one of the departmental chiefs of the Science and Art Museum at Vienna. Herr Ilg died at the early age of forty-nine, and has held offices as custodian in several important museums. He was well-known in archeological circles throughout the Continent, and was the author of several important works.

MR. W. T. ROBSON.—The death is announced of Mr. William T. Robson, of Grainger-street and Crossley-terrace, Newcastle, architect and surveyor, who died at Newcastle on the 11th inst. The deceased gentleman, who had been in an ailing state of health for some time, whilst walking along Newgate-street on the 9th inst. was seized with a fit, and was carried to the Infirmary, where he died at the age of 32.

GENERAL BUILDING NEWS.

SCHOOLS, GATESHEAD.—Two school buildings are in course of erection in Gateshead. On the Higher Grade School site, in Shipcote-lane, near Prince Consort-road, the new offices of the Gateshead School Board are being built, by Messrs. T. & R. Lamb, contractors, Gateshead, according to plans by Mr. Edwin Bowman, architect, Newcastle, and under the supervision of Mr. W. Edington, west corner of the nave and a niche by the doorway is a statue of St. Kessog. The vestries and organ chamber, with heating chamber underneath, are on the north side of the chancel. The chancel is the same width as the nave, and the roof is, externally, the same height in both, the riding of red tiles being continuous from one end of the building to the other, except over the chancel arch, where it is intersected by a fleche. The fleche is of wood, covered, like the rest of the building, with green slates from Aberfoyle. It rises to a height of 70 ft. Externally and internally the walls are of warm red local stone, the dressings being in white stone from Auchinlea Quarries, near Motherwell. The roofs are of dressed timber, open to the ridge, 35 ft. above the floor of the nave. The nave is divided into four bays, and is lighted by groups of double lancets along the sides, and by triple tracered lancets in the west gable. The chancel is divided into two bays. The east window is placed high in the gable so to give space for a reredos over the altar. The altar and reredos are to be of stone, with marble columns, and the panels filled in with sacred subjects in mosaic. The altar is raised above the floor level of the nave by eight steps. On the south side of the sanctuary are placed the stone sedilia, piscina, and credence. The nave will accommodate nearly 200 persons. The architects are Messrs. Ross & Macbeth, of Inverness. The contractors are—Mason: James Martin, Anderson-Aucherterarder; carpenter: Peter Arter, Auchterarder; slater: H. Gibson, Auchterarder; plumber: James Macleish, Perth; painter and glazier: C. Alexander, Perth.

NEW CHURCH OF ST. MARY MAGDALENE, ALSAGER, CHESHIRE.—This church is of the Decorated style and consists of a nave and chancel 26 ft. wide, north and south aisles opening into nave by arcades of five bays each, and organ chamber on the north side of the chancel, with choir and clergies vestries opening out of the same. The church will be entered at the west end by north and south porches, both of which open into the tower, which is 16 ft.

boys and girls 688, and infants 350; total, 1,038. The architect is Mr. G. A. Fox, of Dewsbury.

SCHOOL, THORNLIEMANK, N.B.—Thornliemank Public School Buildings were declared open on the 5th inst. The plan of the reconstructed school is of the central hall type, with class-rooms grouped round, and the building being one story high. The main entrance for boys and girls forms the public road; the infants enter at the west side, while the boys have also an exit to the east side. The basement is entirely set apart for boilers, heating apparatus, &c., while the ventilation is designed on the plenum system. Artificial light will be supplied by gas pendants fitted with incandescent lamps. The total cost is estimated at 10,000. Mr. W. G. Rowan, Glasgow, is architect, Mr. A. B. Watson, measurer, and Messrs. Cameron & Dalgligh, Thornliemank, builders.

POST OFFICE, HARROGATE.—The new post-office at Harrogate has just been opened. The architect is Mr. H. Tanner, of the Office of Works, and the style of the building is Perpendicular, freely treated. The post-office has been built of stone, with dressing of Pateley Bridge stone. The building was commenced on October 15, 1894, and has been erected at a cost of upwards of 9,000. The new offices stand on a corner site at the junction of Chapel-street and Cambridge-road. The contractors were Messrs. William Lives & Son, of Shipley.

PREMISES, SCOTTISH WHOLESALE CO-OPERATIVE SOCIETY, GLASGOW.—The new premises of the Scottish Co-operative Wholesale Society in Morrison-street, Glasgow, which have been built at a cost of about 90,000, were opened recently. Situated on the south side of the Clyde, overlooking Kingston Dock, the new buildings are five stories in height, and cover about an acre of ground. The principal front to Morrison-street is 212 ft. long. The main pediment at the base of a tower is filled with emblematic sculpture. A round tower at the back of the pediment, 70 ft. high, is divided into bays by Ionic columns, and surmounted by a figure representing Light and Liberty, holding in her extended arm an electric light. The main entrance is by an ornamental wrought-iron gate in the centre division of Morrison-street front, and through a tower 150 ft. high into a vestibule, laid with mosaic and lined and panelled with Sicilian marble and Parian cement, and divided into bays by quarter pilasters and Ionic columns. Beyond this is a large entrance hall and staircase, and right and left from it corridors leading to the various sub-committee and buyers' rooms, thirty in number. The board-room is also on the ground floor; on the first floor are the cashier and auditor departments, while the rest of the building is designed for warehouse purposes. The premises are illuminated by electric light. The work, with the exception of the sculpture, marble and mosaic, iron and glazing work, was done by artisans employed directly by the Society. The architects were Messrs. Bruce & Hay, Glasgow.

ST. KESSOG'S CHURCH, AUCHTERADER, PERTH.—This church, the memorial stone of which has just been laid, is situated in a park of 2½ acres on the north side of the High-street of Auchterader. The church consists of a nave, 48 ft. by 24 ft., and a chancel, 26 ft. by 24 ft., separated by a stone chancel arch, with carved capitals. The porch is at the south-west corner of the nave and is a niche by the doorway is a statue of St. Kessog. The vestries and organ chamber, with heating chamber underneath, are on the north side of the chancel. The chancel is the same width as the nave, and the roof is, externally, the same height in both, the riding of red tiles being continuous from one end of the building to the other, except over the chancel arch, where it is intersected by a fleche. The fleche is of wood, covered, like the rest of the building, with green slates from Aberfoyle. It rises to a height of 70 ft. Externally and internally the walls are of warm red local stone, the dressings being in white stone from Auchinlea Quarries, near Motherwell. The roofs are of dressed timber, open to the ridge, 35 ft. above the floor of the nave. The nave is divided into four bays, and is lighted by groups of double lancets along the sides, and by triple tracered lancets in the west gable. The chancel is divided into two bays. The east window is placed high in the gable so to give space for a reredos over the altar. The altar and reredos are to be of stone, with marble columns, and the panels filled in with sacred subjects in mosaic. The altar is raised above the floor level of the nave by eight steps. On the south side of the sanctuary are placed the stone sedilia, piscina, and credence. The nave will accommodate nearly 200 persons. The architects are Messrs. Ross & Macbeth, of Inverness. The contractors are—Mason: James Martin, Anderson-Aucherterarder; carpenter: Peter Arter, Auchterarder; slater: H. Gibson, Auchterarder; plumber: James Macleish, Perth; painter and glazier: C. Alexander, Perth.

NEW CHURCH OF ST. MARY MAGDALENE, ALSAGER, CHESHIRE.—This church is of the Decorated style and consists of a nave and chancel 26 ft. wide, north and south aisles opening into nave by arcades of five bays each, and organ chamber on the north side of the chancel, with choir and clergies vestries opening out of the same. The church will be entered at the west end by north and south porches, both of which open into the tower, which is 16 ft.

square, and forms the baptistry. The tower will be surmounted by a spire. The total length of the church is 124 ft., and the width across the nave and aisles, 56 ft. The portion now carried out consists of the chancel, organ chamber, and vestries, the nave, with the south aisle and a portion of the north aisle, the south porch, and the lower portion of the tower to the level of the roof of the nave. The church is seated at present for 450, but will eventually accommodate 700 people. The cost of the present portion will exceed 8,000, an additional sum of 1,500, being required to complete the tower and spire. The church is built of Alton stone throughout, the roofs, seats, and dados being of pitch pine, and the chancel seats, altar rail and altar table of wainscot oak. The roofs of the nave and chancel are covered with red Staffordshire tiles, and of the aisles and porches with lead, the ceilings throughout being boarded. The heating is effected by hot-water pipes on the low-pressure system. The present contract has been executed by Mr. John Fielding, of Alton, and Messrs. Austin & Paley, of Lancaster, are the architects.

SCHOOLS, DONCASTER.—The new elementary schools connected with St. James's Church, at Doncaster, were opened recently by Mr. Ivatt, Great Northern Railway Chief Engineer and Locomotive Superintendent. On the site is a school providing accommodation for 350 boys. The girls' school has a clock tower and clock. The school buildings and fittings cost 4,500. Messrs. Brundell, Simmons, & Brundell were the architects, and the builders were Messrs. Arnold & Sons, of Doncaster.

SCHOOL, ABERLOUR, N.B.—On the 5th inst. the new public school erected by the School Board of Aberlour was opened. The new school is situated opposite the Fleming Hall. Entering by the main door, which is at the west, the lobby, to the right and left of which there are teachers' retiring rooms, is reached, and it leads into the central hall, measuring 40 ft. by 27 ft. by 24 ft. high. From the hall the various classrooms are entered. Besides these, there are cloak and retiring rooms. Outside shelter shades have been provided for boys and girls. The cost of the buildings is about 3,500, and they are built from plans supplied by Mr. Watt, Aberdeen.

SCHOOL, BLAISDON, GLOUCESTERSHIRE.—A new National school has been erected at Blaisdon. The schoolroom is 35 ft. by 18 ft. by 15 ft. high, the accommodation being for about ninety children. The work was entrusted to Messrs. King & Son, Gloucester, from designs of Mr. F. W. Waller.

SCHOOL EXTENSION, FARNDON, NOTTINGHAMSHIRE.—The foundation-stone of a new infants' classroom, with cloakroom attached, was laid on the 7th inst. at Farndon, near Newark. The building contract is in the hands of Mr. Fox, of Farndon, and the architects are Messrs. Sheppard & Harrison, of Newark.

THEATRE, LEEDS.—It is proposed to erect at Leeds, on the south side of the river, a new theatre, at the junction of Jack-lane and Meadow-road. The new theatre, which is to be called the "Victoria," has been designed by Mr. William Smelt, architect, Newcastle, assisted by Mr. F. W. Rhodes, architect, Upper Wortley. It is proposed that the front of the building should be of red Rushton bricks, relieved by stone and iron cast dressings. The roof is a curve, which is broken up into sections by pilasters with ornamental bases and caps. There will be four lock-up shops each 14 ft. 6 in. in height. Seating accommodation will be provided in the theatre for over 3,200 persons. The pit, which will be 60 ft. by 76 ft., will seat 1,300, and in the stalls there will be accommodation for 130. In the circle there will be seats for 480, and the gallery will seat the same number of persons as the pit. There will also be six stage boxes. From the pit three exits will be constructed, on a level with and leading directly into the street. The gallery will have two exits. The circle will be approached by a marble staircase, at the top of which there will be a large crush room. Behind the circle a refreshment saloon will be placed, 28 ft. by 18 ft., and 15 ft. in height. Ladies' and gentlemen's cloak rooms will also be provided. In connexion with the pit there will be another refreshment saloon, 28 ft. by 19 ft., and 15 ft. in height. The stage portion of the building will be 62 ft. by 36 ft., and 48 ft. to the grid. The proscenium front will be 30 ft. wide and 31 ft. high. The auditorium will be seated at the rear by a fireproof curtain, and it is intended that the building should be fireproof. The estimated cost is about 15,000.

PROPOSED THEATRE, SMETHWICK.—It is proposed to erect a theatre in Rolfe-street, Smethwick, at a cost of 8,000. The building will cover a site of 1,500 square yards, and afford sitting accommodation for 2,300 persons. The principal entrances will be in Rolfe-street, the galleries being approached from a side-road. There will be four staircases from the gallery, including an outside iron escape staircase for use in case of panic. The stage will be 63 ft. by 44 ft. The structure is to be made as nearly fireproof as possible, and will be lighted by electricity. An ornamental iron grandstand entrance will be at the west end of the whole length of the building. Messrs. Owen & Ward, of Birmingham, are the architects, and Messrs. J. Harley & Son, of Smethwick, the contractors.

NEW PREMISES, LANCASHIRE INSURANCE COMPANY, GLASGOW.—On the 7th inst., the memorial stone was laid of the range of buildings erected by the Lancashire Insurance Company, Glasgow. The structure has a frontage of 60 ft. 9 in. to West George-street, and of 108 ft. 9 in. to Renfield-street. It is five stories in height, with a basement and attic floor, and on the Renfield-street frontage there is an entrance. The Company's offices will occupy the ground floor in West George-street, with a central portion for the office, surmounted by the arms of the company. The other portions of the buildings will be occupied as shops and business chambers, and will be provided with a passenger hydraulic lift for the whole of the upper flats, entering from West George-street. The stone used is red freestone from Locharbriggs Quarry, near Dumfries. The architect is Mr. J. Thomson, of Glasgow.

POLICE-STATION, GARDENTOWN, BANFF.—The new police-station at Gardentown is now almost completed. The contractors for the work were—Messrs. M. R. Morrison, Macduff; carpenter, Mr. John Gordon, Macduff; plasterer, Mr. Gibson, Banff; slater, Mr. Liddel, Macduff; plumber, Mr. A. Strachan, Banff; and painter, Mr. Forbes Watt, Banff. The architect was Mr. M. William, Portsway.

TECHNICAL SCHOOLS AND PUBLIC LIBRARY, LONGTON.—The foundation-stone of these schools was laid on the 17th inst. "with Masonic honours," before a large number of spectators assembled in a tent specially erected. The Prince of Wales, as Grand Master, laid the stone with the usual formalities, the Borough Surveyor representing the architect, who is in fact not yet selected, no design having yet been selected from the competition drawings sent in, so that the ceremonial seems to have been a little premature.

PROPOSED PUBLIC HALL, TEIGNMOUTH.—A meeting was held at Teignmouth on the 9th inst. to consider the question of the erection of a public hall. Mr. J. Weston, architect, Teignmouth, presented plans, and it was resolved that a site be secured and a hall erected provided the necessary capital was forthcoming, and that alternative plans be produced at the next meeting.

TOWER, WEST RIDING COUNTY OFFICES.—Some months ago Messrs. Gibson & Russell, London, the architects for the County Council Offices at Wakefield, suggested that the tower should be heightened, but the General Purposes Committee at that time were not satisfied that the heightening was necessary. The architects, however, again brought forward the subject, and furnished perspective drawings showing the appearance of the tower as it will actually present itself from various points of view. By the instructions of the Chairman of the County Council and the Chairman of the Committee, the designs and perspective sketches showing the tower as originally designed, and as proposed to be heightened in accordance with the Royal Institute of British Architects with the object of eliciting their opinion. The Institute expressed the view that the County Council should take the advice of their architects in the matter. The Committee, after very careful consideration, have satisfied themselves that the appearance of the tower will be very disappointing, owing to the fore-shortening, unless it is heightened in accordance with the architects' proposal, and they recommend the County Council to grant 65*l.*, 1*s.* 4*d.* for carrying out the work.—*Leeds Mercury.*

EXTENSION OF ECCLES TOWN HALL.—At the last monthly meeting of the Eccles Town Council, Councillor Oldfield moved, and Councillor Mort seconded, the adoption of the minutes of the Town Hall Committee, which included a resolution approving of revised plans prepared by Mr. Bagot, architect, for the proposed extension of the Town Hall at an estimated cost of 4,500*l.* The original estimate, prepared by the Borough Surveyor, was 3,500*l.*, but this amount did not include all the work contained in the plans of the architect. Councillor F. Smith suggested that other plans should be obtained before powers to borrow the money were applied for. Alderman Parr agreed that it would be well to have competitive plans for the work of extension. The proceedings of the Committee were adopted.

SANITARY AND ENGINEERING NEWS.

BIDEFORD OLD BRIDGE.—During recent years Bideford and district have developed rapidly, until the bridge which has provided passage over the Torridge for centuries is totally inadequate for present requirements. For a long time the Bridge Trustees have recognised this fact, and at last called in Mr. C. E. Ware, M. Inst. C. E., of Exeter, to survey the ancient structure and formulate a scheme, or schemes, for widening and strengthening it. He has now sent in plans of four schemes, all of which provide for a widening of the bridge to 35 ft. (inclusive of pathways). Each scheme provides for the rounding off of the bridge at the western side—a much-needed improvement—and the lowest estimated cost of the alteration is 9,854*l.*, while the highest is 17,964*l.* From a sentimental point of view, it is to be regretted that the "four and twenty arches" immortalised by Kingsley are proposed to be reduced, but doubtless the exigencies of the case demand it. On one of the plans the number of

arches appears to be eleven, and on another twelve.—*Western Morning News.*

REFUSE DESTRUCTION, HANDSWORTH, BIRMINGHAM.—A Local Government Board inquiry was held at the Council House, Handsworth, on the 6th inst., concerning the application of the District Council for permission to borrow 8,500*l.* for the purpose of erecting a refuse-destroyer for the district. Mr. F. H. Tulloch, M. Inst. C. E., was the inspector appointed to head the inquiry. The Clerk to the Council (Mr. H. Ward) explained that it was desired to build an eight-cell destructor, with a chimney-stack 200 ft. high, with boilers and the necessary buildings, including a couple of cottages in Queen's Head-lane, Handsworth. Mr. E. Kenworthy, Surveyor to the Council, explained the details of the scheme. He added that an eight-cell destructor would be sufficient to meet the needs of the district for the next eight or ten years at least.

WATER SUPPLY, LERWICK, SHETLAND.—At the monthly meeting of the Burgh Commissioners of Lerwick recently, plans of a proposed new water scheme, which has been prepared by Messrs. C. & A. Leslie & Reid, Edinburgh, were submitted. The new scheme provides for the erection of three new filters and two large settling ponds, also the laying down of an additional six-inch main and other necessary works. The cost of the whole works was estimated at nearly 4,000*l.* It was resolved to approve of the plans with some modifications.

PROPOSED STREET IMPROVEMENTS, WARRINGTON.—On the 8th inst., at the Town Hall, Warrington, Colonel W. Langton Coke, M. Inst. C. E., conducted an inquiry on behalf of the Local Government Board in connexion with the application of the Warrington Corporation to borrow 43,721*l.* for the purpose of street improvements. There were present the Mayor (Alderman Fairclough), Mr. J. L. Whittle (Town Clerk), Mr. Longden (Borough Surveyor), and other officials and members of the Corporation.

ELECTRIC LIGHTING NEWS.

ELECTRIC LIGHTING OF STIRLING.—The report of Professor Kennedy, of London, the expert consulted by the Stirling Police Commissioners as to the introduction of the electric light into the burgh, has just been received. The report shows generally that the aggregate cost of lighting the compulsory area—Port-street, King-street, and Murray-place—would be about 15,000*l.*, but Professor Kennedy recommends that plant should also be put down for lighting the residential part of the town, which would bring the total cost to from 20,000*l.* to 22,000*l.*

STAINED GLASS AND DECORATION.

WINDOWS, STONY STRATFORD PARISH CHURCH.—A series of six three-light windows has recently been filled with stained glass in this church, the subjects of which form a complete scheme. The first and last were offerings of Mr. E. Swinfen Harris, architect, in memory of his father and mother, the former one having three types of "Duty"—(1) "Our Lord and St. Joseph in the Carpenter's Shop at Nazareth," (2) "Joseph Distributing Corn to his Brethren," (3) "St. Joseph of Arimathea Begging Our Lord's Body for the latter's burial"—(1) "Our Lord and Nathanael," (2) "Jacob's Dream," (3) "Jacob Blessing the Sons of Joseph." The whole series were designed by Mr. N. H. J. Westlake, and are the work of Messrs. Lavers & Westlake. They are a good example of two essential points needful to the success of painted glass, all being the work of one hand and one "colour scheme," and all following a prearranged Bible story.

WINDOWS, ST. MARGARET'S CHURCH, BURTON-ON-TRENT.—The clearstory windows of St. Margaret's Church have been filled on the south and west sides with stained glass. The old glass taken out of the north and south transept windows of St. Paul's Church has been adapted and improved by new borders and fillings-in by Messrs. Burlison & Grylls, of London. There are now fifteen of the windows filled with stained glass.

FOREIGN.

FRANCE.—The medal granted annually by the Société Centrale des Architectes to the architectural pupil who has gained the greatest number of "recompenses" at the Ecole des Beaux-Arts, has been awarded this year to M. Gustave Umbdenstock and M. John Van Peit.—The election for the remodelling of the committee of the *Société des Artistes Français* for the years 1897, 1898, 1899, has just taken place at the Palais de l'Industrie. The results in the Architectural Department are as follows:—M. M. Laviot, Garnier, Daumet, Laloux, A. Normand, Pascal, Raulin, Ginain, Coquart, and Redon.—Last week, for one day only, the public were admitted into the Boussod and Valladon Gallery (late Maison Goupil) to view a large water-colour painting by M. Edouard Detaille, which is to be offered to the Russian Sovereign. It was ordered by the Franco-Russian Syndicate. The picture represents the Imperial procession passing the troops which are collected in the plain of Châlons-sur-Marne. The moment chosen

is when the Tsar is passing the flag of the Chasseurs-à-pied, and saluting it, at his right is the carriage containing the Empress, with M. Félix Faure at her side, at the end of the picture are the African and Arabian troops. The details are done with the utmost precision and with an ingenuous fidelity, which redeems it from the ordinary modern historical painting, but it is entirely wanting in anything like poetry or sentiment.—The Administration des Voyages are now preparing a new regulation. The projections in front of the doors will in future be regulated by the width of the road in which the house is situated.—The Femmes Artistes have just opened their fifth exhibition in the Georges Petit Gallery, where several pictures of real merit are displayed in the mass of mediocre works. We may mention the landscapes of Mme. Brouardel, the flowers of Mmes. Muraton, Foyot, and Louise Desbordes, and the miniatures of Mme. Isbert.—In the Durand Ruel Gallery is an exhibition of Frances-Comptois artists.

—The sculptor Injalbert has been commissioned to execute the monument which is to be erected at Sceaux in memory of the poet, Paul Arène, who has recently died.—The Society of Civil Engineers has been authorised by the Government to erect at the junction of the Boulevard Péreire and Rue Alphonse de Neuville and Verniquet, the commemorative monument to the engineer Eugène Flachet, who made the Ceinture railway. This monument is composed of a bust of Flachet, the work of Alfred Boucher, placed on a pedestal by the architect, Gaston Tielat, and ornamented with bas-reliefs.

—M. Chaplain, Member of the Institute, has just finished the model of the new gold coins which are to be circulated at the end of 1897.

—M. Platel has been elected President of the new Société des Architectes du Hâvre.—M. Geay has been elected Honorary President of the Société des Architectes du Limousin, the acting President of which is M. Dubet, architect at Perigueux.—A competition has been opened at Châlons-sur-Saône for the making of a public garden in this town.

The prize has been awarded to MM. Latour, architect at Châlons-sur-Saône, and Redont, architect at Reims.—The death of M. Eugène Maron is announced. He left a "Histoire de l'Art à Travers les Ages," at which he had been working twenty years, and fragments of which were published in the magazine *L'Art*.—The death is also announced, in Indo-China, of an architect of talent, M. Antoine Garnier, inspector of *batiments civils* at Pnom-Penh (Cambodia). Born at Lyons in 1859, M. Garnier studied in the Pascal studio. He went to Indo-China in 1895, where he shared in the building of many buildings lately erected in the Protectorate—hospitals, custom houses, and houses for French residents in the province.

GERMANY.—We have frequently given some data as to the enormous change by tenants of their residences that takes place at Berlin. It is interesting to observe that at October quarter-day last over 100,000 tenants changed their residences.—We understand from the *Deutsche Bauzeitung* of December 30, 1896, that there are sixteen candidates for the annual Schinkel Studentship, which is a larger number than is usually the case.—The idea of giving Berlin an Artists' Home or Club seems to be finding considerable favour, and we understand that a competition was opened some time back for designs to remodel an old building, which we believe to have been bought by the Berlin "Society of Artists."

—The Hamburg municipal authorities have arranged a course of public lectures for this winter on subjects relating to building and public works, more especially in connexion with those of that city. This is one of the first instances in which a German municipality has undertaken to arrange lectures for the public of this kind.—Of the many competitions which are being held for designs of bridges, there is one for a bridge over the Elbe at Harburg, where premiums to the amount of 600*l.* have been offered. The competition will be decided during February, and among the assessors is the City Architect of Hamburg.—We understand that the Prussian Government has been giving some attention to the question of scavenging, and has made a grant of 250*l.* to one of the societies interested in this subject, which is to be given as a premium for the best proposed method of cleansing a small town.—Perhaps one of the most important private theatrical enterprises which has yet been carried out in Germany has lately been executed at Munich, where a new "German" theatre and casino has just been erected as a speculation. The theatre contains accommodation for 2,000 persons, whilst the casino includes a large restaurant, club rooms, assembly rooms, billiard rooms, &c.

Herr Alexander Blum acted both as architect and contractor for the work, but was assisted by a number of prominent specialists, including Herr Lautenschlaeger, of Munich, for the stage fittings, Herr Wagner and Herr Kramer for the decorations. There appears to be the possibility of combining the theatre, the assembly rooms and the club rooms for special festive occasions, when accommodation could be found for altogether 6,000 visitors. There are a number of tenements and shops in connexion with the block.—Of other theatres lately opened in Germany, Bromberg has been given a municipal playhouse costing 22,000*l.*, with accommodation for an audience of 800 persons. Herr

Heinrich Seeling, of Berlin, was the architect; he has practically become the theatre specialist of Germany, his principal theatres being the Municipal theatres at Halle, Essen, Rostock, and a private theatre at Berlin. Besides the Bismarck monument at Berlin, memorials to Bismarck are to be erected at Dresden and at Magdebourg. As is customary in Germany, competitions were opened for the design in both cases.—The present year, it appears, will again be associated with numerous industrial exhibitions on the Continent, and of these, perhaps one of the most important will be the forthcoming exhibition at Leipzig, which will be opened early in the summer. The situation of the exhibition has been well chosen on a wide and undulating site near the Johanna Park, and the general plan was the subject of a competition.

NORWAY AND SWEDEN.—At Stockholm there is to be an important competition for the design for a central railway station, at which premiums of approximately 700*l.*, 450*l.*, and 225*l.* are offered. The competition is an international one, and hence, architects of all countries are free to enter, but particulars as to the details have not yet reached us.—We understand that the Government Office of Works at Christiania has opened an international competition for the design of a new railway station at Christiania, and has offered premiums of 10,000, 4,000, 2,000, and 1,000 kroner. Particulars can be obtained by applying to the Ministry, where the necessary site plans are provided on depositing 500 kroner. The sending-in day is March 31, 1897. The requirements of the programme are such as to necessitate combined collaboration of an architect with a railway engineer, and they are by no means such as can be solved by an architect without special knowledge of railway matters. There will be a jury of assessors, comprising three laymen and four specialists; among the latter is Baurath Schwering of Berlin. We scarcely regard the jury sufficiently representative, either as regards the nature of the subject or its international importance.

RUSSIA.—A competition has been opened for a large hospital at Stawropol, in the Caucasus, for which the sending-in day is in April next. Of all the competitions, we hear from St. Petersburg that the Trotting Association at Moscow has opened an international competition for a grand stand for three thousand spectators, which is to be a substantial structure, and for which the cost is limited to 350,000 roubles—about 55,000*l.* This is an international competition; the premiums are of considerable value, and the designs will be assessed by a jury of fifteen, of whom six are laymen and the other nine architects. Particulars can be obtained from the Architectural Society at Moscow. We have had occasion to refer to the Theatre Competition which is being held at Kieff, and which may be considered an international one. Seeing the value of the premiums offered, we are much surprised to hear that there are only sixteen designs before the jury, and of these we understand that there are seven from St. Petersburg, and of the nine strangers three are from Germany, two from France, one from Sweden, and one from Italy. We are indebted for this information to Professor Schroeter.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. H. C. Eyres, London Agent of the Coalbrookdale Company, Limited, has resigned his position there and assumed the position of manager of the Architectural Department in London of the Falkirk Iron Company.—Mr. W. Galt Millar, architect and surveyor, Reading, has taken into partnership Mr. W. James Nasmith, who will carry on business with him under the style of Millar and Nasmith, at Reading and at 43, Cornmarket-street, Oxford. Mr. Nasmith devoting his time exclusively to the interests of the Oxford branch.

TIMBER TRADE DURING THE PAST YEAR.—According to Messrs. Foy, Morgan, & Co.'s annual wood report for 1896, the past year has been exceptionally favourable for the timber trade, prices in almost all departments having slowly hardened from the commencement until the close of the season. The grounds for the satisfactory nature of last year's business and the increased cost of next season's supplies are practically the same, being quite general and not merely local. Among them, the most prominent have been, firstly, the unusually open weather last winter and spring, which permitted building operations to proceed uninterrupted, stimulating consumption leading to a considerable depletion of customary stocks throughout the country; secondly, the unexpectedly cheap freights ruling in the spring and summer, which allowed the gap in stocks here to be filled at an almost imperceptible increase in cost, thereby affording the merchants the opportunity, while the demand continued unabated, of an early turnover at a profit somewhat more liberal than usual; and, finally, the sharp and totally unforeseen rise in autumn freights, which effectually prevented the impulse to import at a time when such additions to stocks were certain to become dangerous. As it is, the import during 1896 has expanded to an extent which in ordinary seasons must have led to a general collapse in prices, a result which has only been averted

by the favourable conditions, already named, under which the trade has been carried on. In regard to imports from various countries, the Board of Trade returns put the increase in the total import into the United Kingdom of sawn goods from Russia at 15 per cent. more than in the preceding year, but the surplus into London has been proportionately greater than this, being at least an additional 20 per cent. This surplus, moreover, has been drawn mainly, if not entirely, from the White Sea, Petersburg having contributed even less than usual to the London stocks. From Sweden there has been a further decline in the import of deals, and a corresponding increase in battens, accompanied also by a remarkable expansion in the flooring business. From Norway the import of planned goods has been of almost the same proportions as in the preceding year. Prices have improved continuously throughout the season, and a good market awaits those with unsold stock available for shipment during the winter and early spring. From Finland the import has not greatly varied from that in 1895. The market improvement was the speediest, and proportionately also the greatest, in the classes of goods in which this country is chiefly concerned, battens, and to some extent flooring. From Canada the import of pine into London has again been considerable, and this, following on the excessive import in the preceding year, leaves us with a present stock considerably in excess of the probable requirements of the market, although the low standard of prices prevailing is perhaps the best guarantee for the continuance of the recent excessive importation. In spruce the import has been much larger than usual, but still not excessive. During the three previous years the import had fallen on an average to 7 or 8 per cent. below the annual consumption, leaving the stock in hand at the commencement of the present season one of the smallest on record. Even now, notwithstanding the fact that last year's import was actually greater than that of 1895 by about 40 per cent., the stock which remains is, owing to the large quantities which have passed into consumption, only slightly in excess of the average, although appearing unfavourably when compared with the exceptionally small stock of last year. Oak has been dull of sale all the year. The stock is now ample, having regard to the fulfilment of the demand. In elm the stock is not large, but there is little inquiry. Birch experienced a sudden revival in consequence of the advance last winter in the price of mahogany, as a cheap substitute for which it seemed to be suited. The import of both timber and deals, &c., has been larger than last year. The mahogany trade during the year now closing has been exceedingly satisfactory. During the first three months of the year prices slowly but surely advanced, after which they settled to a level which has been maintained with but slight variation ever since. In consequence of the somewhat limited supplies, a quantity of wood of poor quality and condition was sent in, which has resulted in the value of minimum wood slightly declining, but such imports have not been on a very large scale, and the market has not seriously suffered thereby. There has again been an increase in the importations of cedar to Europe, the figures being about 30 per cent. more than last year, but the character of the wood imported differs from that of 1895. The quantity from Cuba has dropped away to almost trifling proportions, while the shipments from Mexico and the West Coast of America have increased to a very considerable extent. A very important feature has been the enormous quantity of Cedar imported from Paraguay. There has been an excellent demand for greenheart timber throughout the year, and as supplies have come forward on a moderate scale prices have improved, and the market is now very firm. The outlook for 1897 is favourable, as it appears probable that the demand will quite keep pace with the importations. Of sequoia (Californian redwood), there having been no fresh arrivals for nearly two years, a cargo which came in during the autumn found the market almost bare of stock, and is consequently selling at good prices. The high price of mahogany has also helped materially to keep up value. In American black walnut logs of large size and of good quality and manufacture continue to fetch high prices. In American whitewood there is less demand for logs, and prices are low. Prices for both quartered and plain-sawn American oak have been fairly well maintained. In Australasian hardwoods kauri pine in planks has been in steady request throughout the year. For hardwoods for paving the demand in the London district during the year has been rather disappointing, but the consumption in the provinces has been more encouraging. For the first time for several years the supply of jarrah has been ample, and the stock is quite large enough to cover the probable requirements in this market for several months.

BY-LAWS AND BUILDINGS, BLACKPOOL.—At a meeting of the Blackpool Town Council on the 5th inst., Mr. Grime proposed that a committee be appointed to take evidence and otherwise inquire into the administration of the building by-laws of the borough. Mr. Grime, in supporting his motion, said it was difficult to imagine that such an unsatisfactory state of affairs existed in the borough. Here they had the Medical Officer complaining that he and his department had no authority to insist

upon the first elements of public health. Dwelling-houses, it was said, were frequently erected in violation of the bye-laws passed by the Corporation, and inhabited in spite of the protest of the Medical Officer regarding the insanitary condition of the building. The regulation that houses should not be occupied without a certificate was a delusion. They had the surveyor openly repudiating his responsibility for the carrying out of the by-law, and along with the Chairman of the Committee advocating the creation of a new authority apart from the Council to carry out the by-laws. Architects and builders were openly saying that they could not get equity and justice unless they had friends at court, whilst other builders openly flouted the by-laws when the plans had not been passed. He appealed to the Council to endeavour to wipe out one of the cankers of the public life of the town. Alderman Buckley seconded the motion. Mr. Dickinson, who defended the committee, said that no favour was shown. Mr. Holden mentioned instances of breaches of the by-laws. Mr. Brodie laid the blame on the magistrates, who never convicted, and said that in many cases magistrates were brought down specially to dismiss cases. The motion was carried by 11 votes to 3.

PULPIT FOR ST. MARY'S, ASHFORD.—A new pulpit is to be placed in St. Mary's Church, Ashford. The design is by Mr. J. L. Pearson, R.A.

BUILDING OFFICIALS AT BERLIN.—Amongst the most important changes contemplated in the official circles at Berlin, as far as the Commission of Works' office is concerned, we observe that Herr Hinkeldey, who so ably presided at the Berlin Architectural Congress of 1895, is to fill the office of "Oberbaudirektor." This is one of the highest appointments which a Prussian building official can obtain, and relates particularly to the architectural branch of the office. In the event of the resignation of Herr "Bauidirektor" Heber, who is specially connected with the survey sections of the Department, Herr Kummer has been appointed to this office. Both the new officials are very popular among Continental architects and engineers, and their appointments—which are dated from October 1, 1896—have, consequently, been very well received.

CENTRAL SCHOOL OF ARTS AND CRAFTS, REGENT-STREET.—This week work has recommenced at the new Central School of Arts and Crafts, which was opened in October last at 316, Regent-street, opposite the Polytechnic. The school has been established by the Technical Education Board of the London County Council, and is under the direction of the two art advisers of the Board, Mr. George Frampton, A.R.A., and Mr. W. K. Lethaby. The object of the school is to provide for artisans who are engaged in trades where artistic handicraft is required, a training both in the principles of artistic design and in the application of design to their specific industries. The teaching is throughout specially directed to the requirements of the trades in which the students are engaged, and the school is only open to those who are actually working at a trade. At present the school provides teaching mainly for those who are engaged in the silver trades, and in those branches of the building trade where artistic training is specially needed; but steps are being taken to provide for other trades, such as the gilding and the bookbinding trades, and it is not impossible that out of the many who have existed at the Regent-street school, there may eventually grow a complete system of artistic and technical instruction which will ensure for the artisans of the Metropolis that sound and practical artistic training which they require to enable them to hold their own in the industrial struggle with foreign countries.

ROYAL VISIT TO TILE WORKS, STOKE-ON-TRENT.—During the recent Royal visit to Trentham Hall, the Princess of Wales visited the works of Messrs. W. T. Copeland & Sons, manufacturers of ceramic wares, Stoke-on-Trent. The Princess afterwards proceeded to the patent tile works of Messrs. Minton, Hollins, & Co., where they were received by Mr. J. B. Ashwell (Town Clerk of Stoke-on-Trent), who is the representative of Col. Hollins, and by Mr. Darlington, the manager. The Princess and party were first shown the method of tile-making by the dry dust process, after which the manufacture of tiles from plastic clay engaged attention. The show-room was subsequently inspected. An arrangement of tiles, similar to those supplied to form a dado at Appleton House for Princess Maud, was seen.

ARTIFICIAL ILLUMINATION.—Lecturing on this subject on Sunday afternoon last at St. George's Hall, Langham, Professor T. B. Lewes showed that, until the advent of the electric light, flame had no rival as a source of artificial illumination, and if we attempted to trace the genesis of our illuminants we found ourselves taken back to the days of the old Norsemen who, using branches of pinewood to cook the spoil of their hunters, noticed that as the fat melted and dropped upon the burning embers they blazed anew, and emitted a more light, flame had the wood burned alone; and the idea naturally arose of steeping the wood in heated fat before using it as a torch. They tried dipping thin pine rods into their fat pots, so building up a rough form of candle. They soon, however, found that the wood burnt far too slowly to keep pace with the fat, and at length

found that a core of the pith of rushes gave the best result, and thus was created the "rush-light," which played the part of illuminant and time-keeper to our Saxon ancestors, and which might even now be met with in some of the old-world villages where the incandescence of modern improvements had not as yet reached. Flame was one of the chief manifestations of combustion, which was the generation of heat and light during intensely active chemical combination, usually that of the oxygen of the air with the combustible substance. Flame was burning gas, and hence the combustible must be a gas, or be capable of vaporisation. The terms "combustible" and "supporter of combustion" were purely relative, as a jet of air would burn as readily in an atmosphere of coal gas as a coal-gas jet would in air. Many theories had been advanced as to the cause of luminosity in flame, but the first and most generally accepted was the one enunciated by Sir Humphrey Davy, that when a gas containing carbonaceous material was burnt, the luminosity was due to the separation of minute carbon particles heated to incandescence by the combustion going on around them. A flame was generally considered to consist of three parts, the inner dark zone where the gases were subjected to a preliminary baking, the luminous zone in which the particles, after being separated were raised to incandescence and yielded the light, and a faint non-luminous zone, or mantle, or flame where complete combustion was taking place. The luminosity of hydrocarbon flames was largely due to the gas acetylene, which contained twelve parts by weight of carbon to one of hydrogen. As explained by the late Sir Edmund Davy in 1835, but it was not till the last few years that a simple mode of manufacture had brought it within the range of commercial possibility. A Mr. F. L. Wilson devised a process for manufacturing aluminium by the electric furnace, and endeavouring to obtain the metal calcium in the same way, using lime in place of alumina, he obtained an extremely hard semi-crystalline body. Regarding this as a process, he threw it into the neighbouring stream, when an instant evolution of large quantities of gas attracted attention. The gas proved to be acetylene, and the solid obtained carbide of calcium. This gas, when consumed in burners of the proper kind, emitted a light fifteen to twenty times greater than that of ordinary coal-gas, and the ease of its production and its marvellous luminosity rendered this discovery one of the most interesting chapters in the history of artificial illumination.

BETHNAL GREEN MUSEUM.—We have received a copy of the catalogue of a collection of Oriental Porcelain lent to Bethnal Green Museum by Sir A. Wollaston Franks, by whom, as we gather, the descriptive catalogue is written. The catalogue, studied with the collection, forms a most instructive analysis of the subject. It includes a special chapter on the marks on Continental Porcelain. We have also received the catalogue, by Mr. Hungerford Pollen, of the loan collection of English Furniture and figured Silks at the same museum. Both are published by Messrs. Eyre & Spottiswoode.

PETERBOROUGH CATHEDRAL.—The following letter has been addressed by architects in Leicester to the Dean and Chapter of Peterborough:—"We, the undersigned, architects and surveyors of Leicester (being the largest town in the diocese), having full confidence in the judgment of your architect, Mr. J. L. Pearson, R.A., and knowing from what he has done in the past that any work he does to the West Front of Peterborough Cathedral will be of the most reverent and conservative character, beg to subscribe of 7/6 towards the fund you are raising for the restoration of this unique portion of the Cathedral of our diocese." The signatures of thirty-eight architects and surveyors of Leicester are appended.

ANTIQUARIAN DISCOVERIES IN CARLISLE.—An interesting discovery has just been made in the course of excavating for the foundations of some new buildings at the top of the east side of Botchegate. The find consists of an urn of plain pottery, nearly 3 in. in diameter on the base, and swelling out to a maximum diameter of 7 in. at a height of 3½ in., after which it contracts. It now stands about 5 in. in height, but the upper portion, with the neck, is broken off and lost. Inside the urn was found the irregular bottom, 3 in. in diameter, of another vessel of red clay, which had apparently been used as a lid. The urn was about half full of burnt and broken bones, from their size the bones of a wild from four to six years old. With them was found a small grotesque figure, carved in bone, about 2 in. long; the figure of a man with a large Roman nose, in an extraordinary position, not unlike that of our present Highland gigmen. The urn was not protected by any stone lid, or otherwise and the remains must be those of a cremated child of poor parents, who has placed in the funeral pile one of the child's juvenile toys, or the bone figure has also gone through the fire. The place where the find occurred is within the limits of the great Roman Cemetery at Carlisle, which extended, probably sparsely on either side of the London road from the Court Houses to Harrybridge. By the kindness of Mr. H. Davidson, the urn, with its contents, has been handed to Chancellor Ferguson, and will shortly be on exhibition in Tullie House.—*Carlisle Express.*

CAPITAL AND LABOUR.

WAGES IN THE BUILDING TRADE AT DARTINGTON.—On the 9th inst. a meeting of operative carpenters and joiners was held at the Ruby Hotel, Dartington, to consider the question of wages. A resolution was passed that, in consequence of the much better state of trade in the town, and activity in the building department, the employers be given notice for an increase of 1d. per hour from January 19, such notice to expire on Easter Monday.

PAINTERS' WAGES, SUNDERLAND.—The members of the Master Painters' Association in Sunderland have received a demand from the men for an advance of wages. The present rate paid is 8d. per hour, and the demand is for a penny advance before March 1. Some 400 men will be affected.

LEGAL.

A BUILDER'S CLAIM FOR WORK.

ACTION IN THE QUEEN'S BENCH DIVISION.—The case of Cole v. Boutall came before Mr. Justice Lawrence, in the Queen's Bench Division, on further consideration, on the 11th inst., the case having previously been before His Lordship at Winchester in June last, when it was arranged that the record should be withdrawn on terms to be agreed on, and with liberty to apply.

Mr. Giles, who appeared as counsel for the plaintiff, stated that as the parties had been unable to agree on the terms, it was necessary that the case should be heard by His Lordship. From the statement of the learned counsel, it appeared that the plaintiff, a builder, claimed from the defendant £171 12s., the balance of a sum he alleged to be due to him under the following circumstances.—The defendant had some property in the neighbourhood of Alton in Hampshire, and was interested in some lithographic works there, the manager of the works, a Mr. Crampton, required a house to live in, and the defendant was tempted, by seeing some houses which were being built in the neighbourhood, to employ Messrs. Clarke & Short, architects, of Bournemouth, to build the house for him. The architects seemed to have heard of the matter from Mr. Crampton, and they made an offer to build a bungalow-house on the Beach-place Estate for 415/. That offer was accepted by the defendant, and the architects proceeded to find a contractor to carry out the work, and ultimately employed Cole, the plaintiff, a local builder, who undertook to build the house for 415/., the difference being retained by the architects for their fees, &c. The question in dispute was whether there was a binding contract between the plaintiff and the defendant, Mr. Giles contending that the defendant having employed the architects to construct the house, they had authority to employ a contractor to carry out the work, and therefore authority to bind the defendant.

At the close of the plaintiff's case, Mr. Bullen submitted that judgment should be entered for the defendant, inasmuch as the plaintiff had failed to make out any case. The learned counsel said that he was ready to go through the documents in the case to show what his case was.

His Lordship replied that he had gone through all the documents that morning, and therefore it was not necessary to go through them again. He failed to see any contract between the plaintiff and the defendant. There was no evidence to show that the plaintiff and the defendant ever got together in any way, or that the plaintiff was recognised by the defendant in any way. On the contrary, it showed that if anything went wrong the plaintiff looked to Messrs. Clarke & Short as the only persons responsible to him.

After hearing further arguments, his Lordship gave judgment for the defendant on the point of law raised, with costs.

ACTION BETWEEN BANKS WITH REGARD TO ANCIENT LIGHTS.

The case of the London and Midland Bank v. the National Provincial Bank came before Mr. Justice North in the Chancery Division on the 11th inst., on a motion by the plaintiffs for an interim injunction to restrain the defendants from an alleged infringement of the plaintiffs' ancient lights. It was stated that the defendants were building a new bank opposite that of plaintiffs in Park-row, Leeds, which it was alleged interfered with the plaintiffs' ancient lights.

Ultimately it was arranged that the motion should stand over for three weeks, it being stated that there was a probability of the respective architects arranging the matter.

A DISTRICT COUNCIL AND BUILDING PLANS.

IMPORTANT CASE IN THE DIVISIONAL COURT.

The case of the Wetherby District Council v. Hewling came before a Divisional Court of Queen's Bench, composed of Mr. Justice Wright and Mr. Justice Bruce, on the 12th inst.

Mr. Scott-Fox appeared as counsel for the appellants (the local authority), and Mr. Compton for the respondent.

Mr. Scott-Fox explained that this was a case stated by the Justices of the West Riding of Yorkshire, and had relation to the building of some houses at Boston Spa. The respondent was a gentleman who had laid out a building estate on the side of a road which undoubtedly was an ancient highway leading to the River Wharfe. The road was about 30 ft. wide. The respondent had laid out about a dozen houses in the corner going down the road towards the bridge. When he originally submitted his plans the District Council called his attention to the fact that he was going on to an ancient highway, and they would disapprove of his plans unless he agreed that the road should be 36 ft. wide. The effect of that would be that he would have to throw 3 ft. into the road opposite his new houses. The plans were given back to the respondent for the purpose of making the alteration which he had consented to carry out. He altered his plans, which showed on the face of them a 36-ft. road, and in this condition they were sanctioned. After that he had again to make some alteration in the houses, and he submitted substituted plans showing a road 36 ft. wide. When he came to finish the houses in 1895, the respondent was advised he was under no obligation to make the road as required, although he had had his plans passed on the understanding that he would do so. He did not take down the wall that divided his premises from the road, and he was summoned for not having carried out his plans and constructing the new street as required by them, and, although the Bench offered to stay a case, he did not accept it, and paid the fine. The defendant, however, did not pull down the wall, and another summons was taken out. On this occasion the Bench was differently constituted, and the magistrates then came to the conclusion that, in spite of the plans and his undertaking to make the road 36 ft. wide, yet, the road being an old highway, it was not subject to the by-law. The question for the Court to decide now was whether or not this was a new street which came within the by-laws.

Mr. Justice Wright: Is not that a question of fact alone?

Mr. Scott-Fox replied that the magistrates did not seem to have treated it as such. They had expressed no opinion, but they did not see their way to say that the respondent should be called upon to take down a wall which had stood for 100 years.

Mr. Compton said that the magistrates had expressly found as facts that the respondent did not by the erection of the houses lay out, or intend to lay out, a new street, and they also found that the road was not a new street.

Eventually their Lordships sent the matter back to the Justices with the three following intimations from them: (1) That only so much of the information should be retained as alleges the laying out of the new street less than 36 ft. wide; the rest should be struck out. (2) The magistrates are bound by the former conviction, the parties being the same, if, after hearing counsel for the respondent, they think that the former conviction necessarily or actually involved a decision that this was the laying-out of a new street. If so, they were to convict now. (3) If the former decision does not bind them, the question for them is, whether, under all the circumstances of the case, including all that was done in relation to the plans, they think, as a matter of fact, that the respondent, when he began to build, meant to begin and did begin to execute a building plan which would, when finished, constitute a road or a street. There was sufficient evidence to justify a finding either way on this point. Mr. Justice Wright added that no fresh evidence was to be called unless the Justices wished it.

POINT UNDER THE METROPOLITAN BUILDING ACT, 1894.

The case of List v. Sharp came before Lord Justice Chitty in the Chancery Division on the 12th inst., for judgment on a motion by the plaintiff to continue an interim injunction until the trial, restraining the defendant from interfering with a wall. The case was argued before his Lordship on December 16 and 17 last. The facts were shortly these:—

By an agreement dated December 12, 1894, Sir Charles Oppenheimer agreed to demise certain property in St. James's-place held by him under the Commissioners of Woods and Forests, to the plaintiff for a long term, at a rent of 550/ after Michaelmas, 1895, and the plaintiff agreed within a specified time to erect buildings on the land at an expense of not less than 100,000/. The production of a certificate, signed by the Commissioners' architect and surveyor, was made a condition precedent to the granting of the lease. It was further provided by the agreement that the plaintiff should forthwith, upon the signing of the agreement, be entitled to the possession of the land, and reserved to the surveyor and all officers and workmen of the surveyor, and of Sir C. Oppenheimer, acting on the authority of the surveyor, a right to enter upon the land at all times during the erection of the buildings for the purpose of examining buildings, and otherwise as therein mentioned. There was also a stipulation that nothing in the agreement should be construed "into a demise at law" of the premises so as to vest any estate to the plaintiff, but that he should only have a right to enter upon the premises for the purpose

COMPETITION, CONTRACTS, AND PUBLIC APPOINTMENTS.

COMPETITION.

Table with 4 columns: Nature of Work, By whom Advertised, Premiums, and Designs to be delivered. Includes entry for New Town Hall.

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, &c. Supplied by, and Tenders to be delivered. Lists various construction contracts.

CONTRACTS—Continued.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, &c. Supplied by, and Tenders to be delivered. Continues list of construction contracts.

Those marked with an asterisk (*) are advertised in this Number. Competition, p. iv. Contracts, pp. iv. vi. & viii. Public Appointments, pp. xviii. & xxi.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, and Applications to be in. Lists various public appointments.

of performing the agreement. The plaintiff accordingly entered upon the land, and pursuant to the agreement proceeded to erect the buildings. The defendant, who was the adjoining owner, wishing to execute certain works upon a wall, about which there was some contro-

versy as to whether it was a party wall or a party fence wall, gave in February, 1896, the necessary notices, under the London Building Act, 1894, to Sir Charles Oppenheimer, but omitted to give any to the plaintiff. At the time, the plaintiff had nearly completed the buildings, but had not obtained the lease. In August, 1896, the lease was granted to the plaintiff, and an *ex parte* injunction had been obtained by the plaintiff, restraining the defendant, as building owner under the Act, from interfering with the wall, which injunction it was now sought to continue till the trial.

His Lordship, in the course of an elaborate judgment, granted an injunction, restraining the defendant in the terms of the notice of motion, but without prejudice to the rights, if any, of the defendant, under the Metropolitan Buildings Acts, the hearing of the motion to be treated as the trial if the parties should so agree.

Mr. Hyne, Q.C., and Mr. R. C. Glen appeared as counsel for the plaintiff; and Mr. Leveit, Q.C., and Mr. C. Jones for the defendant.

MEETINGS.

- FRIDAY, JANUARY 15. Architectural Association.—Mr. E. Prieleau Warren on "Decorative Plaster Work," with models. 7.30 p.m. Institution of Civil Engineers.—Students' Meeting. Mr. Walter Beer on "Monier Girders and Arches." 8 p.m. SATURDAY, JANUARY 16. British Institute of Certified Carpenters.—Meeting at Carpenters' Hall. 6 p.m. SUNDAY, JANUARY 17. Sunday Lecture Society.—Professor Norman Collie, F.R.S., on "The Mountains of Great Britain." 4 p.m. MONDAY, JANUARY 18. Royal Institute of British Architects.—Sixth General Meeting (Ordinary). Address to Students by the President; and some critical observations on the students' work, after which the presentation of prizes will be made by the President. Prior to the distribution of prizes, Mr. Alfred Waterhouse, R.A., the new Chairman of the Board of Examiners, will present, on behalf of past and present members of the Board, a testimonial to Mr. Arthur Cayley, in recognition of his services as Chairman of the Board. 8 p.m.

- Victoria Institute.—Professor Hull, F.R.S., on "The Assuan Embankment." 4.30 p.m. Leeds and Yorkshire Architectural Society.—Mr. Max Clarke, on "The Experiments conducted by the R.I.B.A. as to the Strength of Brickwork." 7.30 p.m. TUESDAY, JANUARY 19. Institution of Civil Engineers.—(1) Further discussion on Professor W. Ripper's paper on "Superheated-Steam Engine Trials." (2) Time permitting, the following papers to be read:—(a) "The Experiments conducted by the Colonel J. Penryck;" (b) "The Periyar Tunnel," by Mr. P. Roscoe Allen. 8 p.m. WEDNESDAY, JANUARY 20. Liverpool Engineering Society.—A Paper by Mr. T. Parker. 8 p.m. THURSDAY, JANUARY 21. Society of Antiquaries.—8.30 p.m. London Institution.—Mr. H. J. Powell on "The Art and Craft of Glass-making," illustrated. 6 p.m. Royal Institution.—Professor H. A. Miers, M.A., F.R.S., on "Some Secrets of Crystals." 1 p.m. Institution of Civil Engineers.—Students' Visit to the Engine Works of Messrs. James Simpson & Co. 2 p.m. (Assemble at the works, Grosvenor-road, Fimlico, S.W.) Devon and Exeter Architectural Society.—Mr. Edmund Sedding on "Local Gothic Architecture," at the School of Art, Princess-square, Plymouth. 7.30 p.m. FRIDAY, JANUARY 22. Royal Institution.—Professor Dewar, M.A., F.R.S., on "Properties of Liquid Oxygen." 9 p.m. Institution of Junior Engineers (Westminster Palace Hotel).—Professor A. Barr, D.Sc., on "Comparisons of Similar Structures, Large and Small." 8 p.m. SATURDAY, JANUARY 23. Institution of Junior Engineers.—The Twelfth Annual Dinner, Westminster Palace Hotel. The President, Mr. A. R. Binnie, in the chair. 6.30 p.m.

RECENT PATENTS:

- ABSTRACTS OF SPECIFICATIONS. 23,350.—VENTILATION OF SEWER ENTRANCE COVERS AND OTHER DRAINAGE COVERS: W. H. Moran.—With the object of rendering manhole covers, lamp-hole covers, side-entrance covers, &c., ventilating or non-ventilating at will, the inventor so arranges a dirt-box below cover that it can be easily raised or lowered by means of arms, centre plate, bolts and nuts, &c. When ventilation is desired, the dirt box is permitted to rest on bracket arms, leaving a free passage for the accumulated gases to escape. 23,973.—BRICK AND TILE-MAKING MACHINERY: J. S. Anderson.—In a double-shaped pug-mill, the inventor uses twin screws or propellers, to revolve right and left. These are fixed at the end of each shaft. A hop coupling is also fixed on each shaft, so that one or both shafts can be taken out if desired. 24,099.—LADDERS: A. G. Perkins.—The ladder is formed in two parts, one sliding in grooves or hollows

- formed in the other part; a screw bolt passes through apertures in one of the sliding parts and engages in a screwed aperture in the other part, thus securing the two parts together, so that the length of the combined ladder may be regulated as required. It can also be adapted for use as a step-ladder. 19,000.—WOOD BLOCK FLOORING: J. W. Muscellwhite.—The invention consists of wooden blocks, in length three times their width, with a tongue worked on one side, and a groove on remaining three sides. It is claimed that such blocks can be laid much thinner than any in use. 2,497.—CURTAIN-RODS AND SIMILAR TOOLS: A. von Knauski.—In order to provide means for quickly and easily removing the chips from holes bored (especially long ones), inventor adopts, in combination with the boring bit proper, a tube, having the said boring bit fixed to it, and adapted to receive the chips produced by the said bit, and a threaded spindle arranged within such tube, a ratchet wheel, and other details. 2,493.—SPRING-SAWING MACHINERY: G. Anderson.—The invention relates to stone-sawing machinery of the type where stone is secured on a bogie while being acted on by reciprocating saws, actuated by a steam-engine, &c. The saw frame is suspended by means of pendulums from slides, whose position, and, therefore, that of the saw, is determined by four wire ropes, controlled by a central barbell. The saws are fed down to the work by this barbell and ropes. Such barbell may be moved slowly by the feed motion, or, may, by various means, be adjusted to actuate the saw frame quickly. 2,484.—KILNS FOR LIME, CEMENT, &c.: H. Simmonds and another.—The invention relates to improvements in kilns described in patent 7,433 (1895). Inventors construct kiln with one or more producers on the outside thereof. Between delivery passage of producer and inlet passage, they place a combustion chamber built of fire-brick. Complete combustion of the gas takes place therein and the products, in a highly heated state, are delivered to the other end of the kiln. By this construction, inventors claim that they raise the products to a greater temperature than when combustion takes place in the interior of the kilns, and thereby obtain a greater heat in the interior. 2,487.—KEYS, ENGING BLOCKS, PLATFORM COUPLERS, &c.: A. F. Tjebkust.—Inventor cuts or moulds an extension or cap in the inner face of a kerb, &c., with a forwardly sunken top surface, into which, and from which, angle, chocks, channels, or gutter-like grooves can be formed, to lead any water percolating through joint seams, from deflection of the path, flags, or other causes, to the front or in other direction desired. 2,489.—ADJUSTABLE STRIPS FOR WINDOW SASHES, &c.: F. J. Gibbons.—This invention relates to adjustable strips for sashes, &c., whereby the amount of opening can be regulated. The invention consists of a cylindrical bolt, provided with an interior screw thread, secured to top sash at about 6 in. from the bottom rail. In bottom sash is secured a plate, furnished with two, three, or more holes, wherein said bolt may engage. Bolt is unlocked by key. 2,475.—CHIMNEY COWL: J. McLaren.—In order to prevent down draught, the inventor arranges a number of round louvers, made of sheet iron, &c., one above the other, and placed in sashes apart, and set at an angle, which gives the opening for smoke. Inside top of fire a baffles cone is held in position by three guide rods to direct the

down-blow through the top louver opening, leaving the other four openings to give free flow for the smoke.

2674.—ARTIFICIAL STONE: F. W. Maxwell and Another.—The inventors take a quantity of any suitable stone—other than marble—in the form of chips or powder, and oxide of magnesium, or its chemical equivalent, and mix them thoroughly in a dry state and in a dry place, in the proportion of, say, three parts stone and one part of the oxide of magnesium, &c. Mixed materials are then moistened with a solution of magnesium chloride, or its chemical equivalent, beaten up or mixed into a mass, and moulded as desired.

2675.—VENTILATING CHIMNEY TERMINALS.—J. Walker.—The inventor places at summit of face a system of spiral louvers, or circular vanes. Preferably, he also provides beneath these three downwardly and outwardly projecting tubes, in order to increase up draught.

17,023.—PLASTER SLABS FOR BUILDING: J. Mack and Another.—The inventors, in order to form their "Mackolith," lay on the bottom of the mould a board to which are attached ledges of India-rubber. Into the spaces between these are laid thin plates of earthenware, &c., for "facing plates." Mould is now filled with liquid mortar, and wooden laths are pressed into this so that they will be situated behind the joints of the face plates as soon as the mortar is set plate is taken out and dried in the air. These plaster slabs can be made with a facing on both sides. Process is applicable not only to flat slabs, but also to convex and concave surfaces.

18,238.—JOINTS FOR DRAIN-PIPES, &c.: T. W. Yardley.—The socket portion of pipe is made with a loose piece, which is arranged to be on top-side when pipes are laid. Flange is so formed that it fits tight when pipe is set, and, one after the other, by lowering them vertically, and without moving them endwise into the sockets.

22,626.—VENTILATING: H. Shuck.—Inventor constructs a bell or concave surface, which is tubed at its upper end, rising from ceiling and passing through roof. Lower end of this is provided with a grid. The upper end of this vertical shaft is furnished with four-way fan, which is so arranged that it can be placed in any position, their ends being of a shape to afford protection from stormy weather. Thus, from whatever quarter the wind is blowing, an efficient suction is provided.

23,714.—TILES, &c.: H. W. H. In order to prevent the warping of slabbing tiles, mosaic panels for grates, &c., inventor provides at the back of the cement, &c., a series of plates of metal, whereby the tiles, or panels, are prepared of rectangular shape, which provide a countering influence in the process of the shrinking of the cement, holding the mosaic tiles, &c.

23,715.—SAWING STONE AND MARBLES: G. A. B. Viney.—In order to cause the saw-frame to descend proportionately to the cut, inventor combines with a suspended saw-frame for sawing stone, &c., a feed-regulating device formed by a hydrostatic balance, consisting of a counter-weight immersed in water, suspended by a rope winding on a drum, from which unwinds the suspension ropes of the saw-frame as the sawing proceeds.

NEW APPLICATIONS FOR LETTERS PATENT.

December 27.—29,235, C. Hartnell-Sinclair, Self-acting lock-fastener for the Automatic Locking of Windows, &c.—29,264, H. Cross, Link Trap.—29,347, F. Guttridge, Self-making Machine for Floor, Plastering, &c., without Joints or Chinks.—29,687, C. afford-Noble and others, Door Hinges or Pivots.—29,698, F. Hughes, Sashes of Windows, Doors, &c.

December 28.—29,765, D. Cameron and others, Drains.—29,823, W. Lambert, Fire-grates or Stoves.—29,864, A. Zboril and A. Schenk, Plates, Slabs, &c., for covers, &c., and Method of Manufacturing same.—29,865, A. Zboril and A. Schenk, Covering for Floors, &c.—December 29.—29,870, J. Tucker, Electric Lighting Fixtures.—29,900, J. Stewart, Domestic Grates.—29,910, J. Dickett and W. P. Fares, Flushing Appliances.

December 30.—29,944, G. Gregory, Ball Joint Ventilator.—29,959, J. Eckersley, Coping for Walls &c.—30,012, H. Sutcliffe, Lavatory or Cabinet Stand Wash Sins.—December 31.—30,702, G. Robertson and others, Bricks.—30,709, J. Wood, Firegrates.—30,755, Sinzig, Fastening of Floors and Ceilings in or to Walls.

JANUARY 1.—75, G. De Tuzelmann, Electric Light Fitting.—77, J. G. Gun, Cowl or Chimney-top for Preventing down-draught from descending chimneys.—82, R. Wood and S. Richards, Draught-Proof Excluder as applied to doors, windows, door and window frames and casings, &c.—80, D. Ruban, Drain Pipes.—76, W. Osmer, Block for Spindle Wood-working Machines.—58, T. Partridge and E. Abbott, Device for Lifting Well-leading to Sewers, &c., and for disinfecting same.—59, J. Kirkbride, Device for Preventing Window Sashes from Rattling.—60, J. Kirkbride, Sashes, &c.—61, J. Kirkbride, Casement Windows, and Hinges for Windows.—62, H. Gypson, Skylight Frames, &c.—75, J. N. Morris, Chimney-tops.—83, C. Cockson, Doors, Windows, Sliding Shutters, &c.—84, A. Woolley, Fastenings, Doors, Hinged Panels, &c.—93, W. Coats, Chimney-tops.

JANUARY 2.—97, G. Bray, Arrangements for Gas Sinks.—137, C. Hubbard, Cooking Stoves.—117, V. Nuti, Device for Preventing the Picking of Lovers.

PROVISIONAL SPECIFICATIONS ACCEPTED.

3,947, W. Thompson, Imitation Wood Carvings.—3,948, W. Borrer, jun., Tool for Wood Working.—1,079, C. Henschel, Coverings for Roof and Walls.—1,079, E. Hodgkinson, Cover Tiles for Roofing Purposes.—1,079, E. Jackson, Lead Glazing.—73,379, J. Allen, Flushing of Drains, Sewers, &c.—73,479, G. Madley, Siphon Flushing Apparatus.—77,648, A. Taylor, Artificial Stone for Building, Paving, &c.—77,810, F. Smith, Fastenings for Windows, &c.—28,069, A. Boulton, Stoves or Fireplaces.—28,314, C. Shaw, Novel or improved construction or formation of sheet metal capping valley pieces and flashings for use with roofs which are covered with corrugated sheet metal.—28,429, A. Sabine & T. Sabine, Earthenware Sinks, &c.

Modely, Siphon Flushing Apparatus.—77,648, A. Taylor, Artificial Stone for Building, Paving, &c.—77,810, F. Smith, Fastenings for Windows, &c.—28,069, A. Boulton, Stoves or Fireplaces.—28,314, C. Shaw, Novel or improved construction or formation of sheet metal capping valley pieces and flashings for use with roofs which are covered with corrugated sheet metal.—28,429, A. Sabine & T. Sabine, Earthenware Sinks, &c.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to application for two months. 7,389, T. Simmonds, Combined Fastener and Opener for Skylight, &c.—1,712, T. Elliott, Urinals.—2,870, S. Abram, Continuous Down Draught Brick Chimney.—4,273, Hougham, Cupboard, and other Door Fasteners.—17,273, W. McLaren, Window Blind Apparatus.—163, J. Mearns, Drain Trap.—283, J. Jones, Preventing Pipes Bursting through Frost.—2,223, F. Turner, Cement or Artificial Stone.—20,665, A. Jungblut & E. Crouch, Window and Door Fastener.—24,242, A. Clery, Artificial Stone.—26,145, R. Bell & W. Hall, Water and like Taps.

PRICES CURRENT OF MATERIALS.

Table with columns for Timber (Greenheart, Teak, etc.), Metals (Iron-Pig, Bar, Sheet, etc.), and Oils (Lined, Cottonseed, etc.). Prices listed in various units like per ton, per cwt, per barrel.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated by the name and address of the tenderer, and we cannot publish anonymous tenders unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

- BEDFORD.—For sewers and road-making works, St. Cuthbert's Glebe Building Estate, for Messrs. Henson & Martin. Mr. Richard G. Harrison, 15, St. Paul's Church, Bedford.—£1,451 5s.
BURTON-ON-TRENT.—For erecting a Minister's house, Shotwell-street, Burton-on-Trent. Mr. Chas. F. Underhill, architect, Burton-on-Trent.—£266 0 0.
BLACKROCK (Co. Dublin).—For the erection of artesian drillings for the Town Commissioners. Messrs. Millar & Symes, architects, 186, Great Brunswick-street, Dublin. R. F. Lidwell, 22, St. Andrew's-street, Dublin.—£4,680.
BRIDPORT.—Accepted for the restoration of the parish church, for the Rector and Churchwardens and others. Mr. C. E. Posting, F.S.A., architect, Marlborough.—£745.
BURTON-ON-TRENT.—For erecting a Minister's house, Shotwell-street, Burton-on-Trent. Mr. Chas. F. Underhill, architect, Burton-on-Trent.—£266 0 0.

DOWNE.—For counters and bar fittings at the Queen's Head Inn, Downe, Kent, for Nalder & Colyer's Brewery Company, Limited. Mr. Robert M. Chard, architect, Union Bank-chambers, Cleveland.—£270 10 0.
DURHAM.—For additions, &c., to workhouse, for the Union Guardians. Mr. H. T. Gordon, architect, Market-place, Durham.—£1,489 0 0.
EAST BARNET.—For new roads and sewers at East Barnet, for the Great Northern London Cemetery Company. Messrs. E. E. Grenier & Co., surveyors, 26, Chancery-lane, W.C.
NEWELL & ROBINSON.—£5,125 0 0.
GEO. BELL.—£3,869 0 0.
WILLIAM GRIFITHS.—£4,324 14 4.
WILLIAM NEAVE & CO.—£3,707 0 0.
SON.—£3,224 0 0.
JAMES NASH.—£3,760 0 0.
Rowland Bros. [Surveyor's estimate, £3,826 5s. 8d.]

GATESHEAD.—For sewerage, &c., Back Westbourne avenue. W. Cunningham, £393 5 8. G. E. Simpson, New. W. Robinson, £38 10 0. G. Maughan, £26 15 0. J. Wardlaw, £23 12 3. J. Robson, £21 7 6.

HARGREAVE.—Accepted for levelling, paving, &c., streets on Valley Park Estate, for the Corporation. Mr. Samuel Stead, Borough Surveyor, Municipal Offices, Hargreave.—William Annakin, 53, Frankland-road, Harrogate, £3,900 6 2.

HILKEY.—For the execution of street works (sewer contracts), for the Ilkley Urban District Council. Mr. W. A. Pailiser, Surveyor, Ilkley Drive.

Table with columns for Roadway, Asphalting, Footways. Matthew Hall, £337 17 2. W. Barrad, £34 10 0. John Murdoch, £32 3 6. R. W. Ibbotson, £29 7 2. The Asphaltic Concrete Co., Birmingham, £170 0 0.

John Murdoch, £45 0 0. Matthew Hall, £62 2 2. R. W. Ibbotson, Horsforth, near Leeds, £7 10 0. W. Barrad, Bradford, £40 6 0.

Matthew Hall, £34 10 0. R. W. Ibbotson, £26 8 3. John Murdoch, £21 0 0. W. Barrad, Bradford, £25 6 0.

Matthew Hall, £56 10 0. R. W. Ibbotson, £48 8 8. John Murdoch, £40 10 0. W. Barrad, Bradford, £43 11 1.

Matthew Hall, £36 2 0. R. W. Ibbotson, £27 9 4. John Murdoch, £29 13 11. R. W. Ibbotson, £22 9 4. W. Barrad, Bradford, £27 9 4. The Asphaltic Concrete Co., Birmingham, £35 4 4.

LEEDS.—For the erection of a tramway depot, &c., for the Corporation. Builders' Work. Schofield & Sons, Leeds.—£3,204. Ironwork. Clayton, Sons, & Co., Ltd., Hunslet.—6,692.

LEYTON.—For private street works for the Leyton District Council. Mr. W. Dawson, engineer and surveyor, Town Hall, Leyton.—£4,884 4 2. W. Griffiths, £4,707 11 9. T. Adams, £4,812 7 8. J. Jackson, Grove. G. J. Anderson, £4,451 10 8. House, Leyton.—£422 0 0. [Surveyor's Estimate, £4,680.]

LONDON.—For converting nurses' cubicles into a ward, and for forming an approach to the new Nurses' Home, at the Infirmary, Calcutt-street, Chelsea, for the Chelsea Guardians. Messrs. Lansell & Harrison, architects, 21, Compton-terrace, Highbury, N.—£1,995. C. Goodson & Sons, £1,975 13 6. Brown & Co., £1,995. W. Lawrence, £657. The General Builders, Ltd., £350. F. R. H. P. Higgin, £753. R. E. Williams, Battersea, £273. W. H. Lorden & Son, £491. See* £1,250. *Accepted.

LONDON.—For alterations to the Railway Hotel, Shepherd's Bush, W., for Messrs. Holway & Moore. Mr. J. Henry Richardson, architect, 57, Shepherd's Bush Green, W. Quantities by Mr. T. Woodhouse Rogers, 10, Clifford's-lane, E.C. E. Lawrence & Sons, £5,163 13 6. Wimpey & Co., £4,715. J. Atley, £4,741. G. Todd, £4,747. Messrs. Gosh & Davies, Queen's, £4,793. J. Dendon, £4,729. Kilby & Gayford, £4,676. Courney & Fairbairn, £4,657. Grey & Cusman, £4,751. R. Eddie, £4,459. *Accepted.

LONDON.—For alterations to the Railway Hotel, Stratford, W. Henry J. Hollingsworth, architect, 20, Old Cavendish-street, W. 2. J. H. Baines, £4,550. T. Walsh & Son, £4,282. A. E. Symes, £2,381. Edwards & Medway, £1,956. *Accepted.

LONDON.—For alterations to the "Mermaid" public-house, 56, Nite-street, Hackney, for Mr. James Broke. C. Neesham, architect, 11, Powerscroft-road, Clapton, N.E.—Wm. Critchley, £600. E. Lancaster, £384. Sheffield Bros., £343. *Accepted.

LONDON.—For alterations to the "Mermaid" public-house, 56, Nite-street, Hackney, for Mr. James Broke. C. Neesham, architect, 11, Powerscroft-road, Clapton, N.E.—Wm. Critchley, £600. E. Lancaster, £384. Sheffield Bros., £343. *Accepted.

LONDON.—For alterations to the "Mermaid" public-house, 56, Nite-street, Hackney, for Mr. James Broke. C. Neesham, architect, 11, Powerscroft-road, Clapton, N.E.—Wm. Critchley, £600. E. Lancaster, £384. Sheffield Bros., £343. *Accepted.

LONDON.—For alterations to the "Mermaid" public-house, 56, Nite-street, Hackney, for Mr. James Broke. C. Neesham, architect, 11, Powerscroft-road, Clapton, N.E.—Wm. Critchley, £600. E. Lancaster, £384. Sheffield Bros., £343. *Accepted.

LONDON.—For alterations to the "Mermaid" public-house, 56, Nite-street, Hackney, for Mr. James Broke. C. Neesham, architect, 11, Powerscroft-road, Clapton, N.E.—Wm. Critchley, £600. E. Lancaster, £384. Sheffield Bros., £343. *Accepted.

LONDON.—For alterations to the "Mermaid" public-house, 56, Nite-street, Hackney, for Mr. James Broke. C. Neesham, architect, 11, Powerscroft-road, Clapton, N.E.—Wm. Critchley, £600. E. Lancaster, £384. Sheffield Bros., £343. *Accepted.

LONDON.—For alterations to the "Mermaid" public-house, 56, Nite-street, Hackney, for Mr. James Broke. C. Neesham, architect, 11, Powerscroft-road, Clapton, N.E.—Wm. Critchley, £600. E. Lancaster, £384. Sheffield Bros., £343. *Accepted.

LONDON.—For alterations to the "Mermaid" public-house, 56, Nite-street, Hackney, for Mr. James Broke. C. Neesham, architect, 11, Powerscroft-road, Clapton, N.E.—Wm. Critchley, £600. E. Lancaster, £384. Sheffield Bros., £343. *Accepted.

LONDON.—For alterations to the "Mermaid" public-house, 56, Nite-street, Hackney, for Mr. James Broke. C. Neesham, architect, 11, Powerscroft-road, Clapton, N.E.—Wm. Critchley, £600. E. Lancaster, £384. Sheffield Bros., £343. *Accepted.

LONDON.—For alterations to the "Mermaid" public-house, 56, Nite-street, Hackney, for Mr. James Broke. C. Neesham, architect, 11, Powerscroft-road, Clapton, N.E.—Wm. Critchley, £600. E. Lancaster, £384. Sheffield Bros., £343. *Accepted.

LONDON.—For alterations to the "Mermaid" public-house, 56, Nite-street, Hackney, for Mr. James Broke. C. Neesham, architect, 11, Powerscroft-road, Clapton, N.E.—Wm. Critchley, £600. E. Lancaster, £384. Sheffield Bros., £343. *Accepted.

LONDON.—For alterations to the "Mermaid" public-house, 56, Nite-street, Hackney, for Mr. James Broke. C. Neesham, architect, 11, Powerscroft-road, Clapton, N.E.—Wm. Critchley, £600. E. Lancaster, £384. Sheffield Bros., £343. *Accepted.

LONDON.—For alterations to the "Mermaid" public-house, 56, Nite-street, Hackney, for Mr. James Broke. C. Neesham, architect, 11, Powerscroft-road, Clapton, N.E.—Wm. Critchley, £600. E. Lancaster, £384. Sheffield Bros., £343. *Accepted.

HALESOWEN (near Birmingham).—For the construction of collecting sewers at Lye, Wolfescote, Cradley, and three other parishes, for the Urban District Council. W. W. Fiddian, engineer, Town Hall, Southbridge.

Table with columns for Halesowen, Hasbury, Hawn, Cradley, Lye, and Wolfescote. Rows list contractors and their respective amounts in £ s. d.

*Accepted.

†Withdrawn.

SCARBOROUGH.—Accepted for the erection of a cottage, Wearhouse Estate, Jackson's Lane, for the Town Council.

Table for Scarborough with columns for £ s. d. and contractor names like Joseph Petch, Beck and Stone, etc.

SURBITON.—For the execution of sewerage works, etc., Minnie Dale, James street, and Elwell's place, for the Urban District Council.

Table for Surbiton with columns for £ s. d. and contractor names like W. Mather, C.E., Lee & Son, etc.

LONDON.—For the erection of two shops, Nos. 308 and 310, Mare-street, Hackney, E., for Mr. G. Evans.

Table for London with columns for £ s. d. and contractor names like Rice & Sons, J. Smith & Sons, etc.

WHEATSTONE (Leics).—For the construction of sewers, &c., for the Blaby Rural District Council.

Table for Wheatstone with columns for £ s. d. and contractor names like Jax Johnson, J. Smith & Co., etc.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications.

PUBLISHER'S NOTICES.

Registered Telegraphic Address, 'THE BUILDER,' LONDON. THE INDEX and TITLE PAGE for VOLUME LXXI. (July to Dec. 1896) is given as a supplement with the number published 2nd inst.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under, 4s. 6d.

Peterborough Cathedral: Actual State of the Front.

DETAILED examination of the west front of Peterborough Cathedral from the scaffolding, which we have had the opportunity of making since our last issue, more than

confirms the opinion we had previously formed as to the impracticable and even absurd nature of the method of dealing with it for which the Society of Antiquaries have unwisely made themselves responsible. The mere perusal of the extraordinary document which they have taken under their protection, coupled with what may be said to have been common knowledge as to the state of the upper portion of the front, must have induced a feeling of healthy scepticism; but in this case seeing is unbelieving. No one with any knowledge of construction who looked at the upper part of the front from the top of the vaulting behind the gables could for a moment regard the proposals of the "specification" as anything short of lunacy, unless we are to conclude that those who drew it up had themselves never seen the walls from that point of view, and were specifying without a knowledge of the task they were undertaking. We expressed a doubt last week whether Mr. Thompson, the contractor, would ever have cared to risk the lives of his men in carrying out such work in such a manner. We were more than correct. We now learn as a fact that Mr. Thompson, who has had quite exceptional experience in work of this kind, had definitely stated that, should the Dean and Chapter give way and allow Mr. Webb and his friends to try their experiment, he would have thrown up his contract, as he would not have felt justified in undertaking such a risk. That portion of the public which has been taken in by the clamour raised against the Dean and Chapter in certain daily journals, in which they have been accused of wantonly destroying Peterborough Cathedral, may possibly realise a little better now what it is that the cathedral authorities have been invited to do. They have been invited in the first place to dismiss their architect, the man of admittedly the first experience

in England in dealing with large mediæval structures, and to put the work instead into the hands of those of whose experience they know nothing, and at the same time to lose from the work their contractor, who stands first in experience in such work, because he regards the proposed method as one which is unsafe not only to the building but to the lives of his workmen. And it is for resisting the demand that they should do this that they have had wholesale abuse heaped upon them in public prints. If they had yielded to the clamour against them they would have been absolutely false to the trust reposed in them.

The absurdity of the "specification" can only be fully realised by seeing the actual section of the walling over the great arches. For a distance of 4 ft. or 5 ft. above the crown of the vaulting of the porch the wall is carried up nearly 7 ft. in thickness, the inner portion of it—that is, all but the actual facing of the gables—being built of very small rubble-stones, the mortar between which is now reduced to a powder which can be scraped out in dust with the fingers. Some parts are more "crumbly" than others, but all the backing is more or less in this state. Above this level the upper part of the gables rises in worked stone, about 2½ ft. thick. The whole of the weight of this upper portion of the gables rests upon the three outer rings of the great arches, and where the ashlar fronts the rubble backing the stones have mostly very little tail into the wall; there are no through stones to tie it in, or anything of that kind; some of the facing stones are loose, or nearly so, and have only a very narrow bedding. Standing on the thicker portion of the wall, behind the upper part of the gables, nearly the whole length of it can be seen taking the form of an outward curve; the gables and piers fall over in regard to the vertical line, and the whole structure shows a considerable curve in regard to the horizontal line, between the points near the two ends where vertical, or nearly vertical, cracks on the inner surface of the wall mark the points at which the centre part of the structure has dragged away from the end portions. The mere appearance of this immense mass of work, at this height in the air, bulging outwards in this manner, as seen from the point of view we have been taking, is alarming enough. Below this thinner portion of the gables, the thick rubble wall has broken away from the vaulting, leaving large furrows between, one of which has evidently at one time been

actually gaping open, and has been roughly filled up with rubble masonry, as if concealing the gap would do something towards making people more comfortable in their minds. The action of the front on the vaulting has been a double one, it has apparently parted from the vaulting after dragging the vaulting part way with it; for in the centre portion of the porch there is a considerable separation on the side of the vault nearest the church, so that the central portion of the vault is structurally broken off both from the back and front.

To all this we have to add that in the northern arch, where the work of reparation is now being done, the arch stones of the outer orders have themselves dropped in several places, and the curve of the arch is broken. And upon this dropped portion of the arch, and upon it alone, comes the whole weight of the gable.

What the authors of the "specification" proposed to do was to make a series of tunnels, successively, at different points, through a mass of rubble walling nearly 6 ft. thick (not counting the ashlar facing) in order to put in solid work piecemeal, and thus to tie into a wall which is hanging over, an ashlar facing which is also hanging over, which is in parts very shallow on the bed, and carries a great weight over it all of which rests on the outer edge of an arch that is leaning outward and several of the joints of which have dropped, the arch being in fact crippled just at the point where the greatest weight of the gable comes upon it, and partly in consequence of the incidence of that weight, co-operating with the movement of the foundations and piers. The "specification" is ridiculous and one has only to look at the building from this point of view to see that it is so. The work is risky enough as it is.

We have already observed that the architectural opposition to Mr. Pearson and the Dean comes almost entirely from one special section among architects, including some very clever men who hold some rather eccentric views in regard to architecture, and who are strongly opposed to the Institute of Architects, of which Mr. Pearson is a member. We are inclined to think that some of the extra-professional opposition is the gratification of an anti-ecclesiastical feeling. One of the most active in it has been Mr. Frederic Harrison, who is the leader of the Comtists in London, and who has set up the cry that the cathedrals ought to be in the hands of a national secular authority, as national

possessions. It may be observed also that the two daily papers which have been most conspicuous in the opposition—the editor of one of which, indeed, seems to have entirely lost his head on the subject—are essentially Radical and anti-Church papers. This is not a Church paper but an architectural paper, and we have nothing to say in regard to this ebullition of *odium anti-theologicum* in itself; we merely note the fact that all this clamour from people who have no particular reason for caring about architecture is probably not raised on purely architectural or artistic grounds, however these may be made the pretence; it has its origin in a desire to get up a cry against church officials. The question whether the cathedrals, as among our most precious architectural possessions, ought to be regarded as a national charge, is one quite open to consideration; we have already said that we think their reparation ought to be a charge on public money, or its cost at least be subsidised from public funds. But it is very doubtful whether they would receive by any means reverential treatment from any public Committee or Trust as they do receive from their ecclesiastical custodians. The example of the “Commission des Monuments Historiques” in France is not reassuring in this respect. As a member of the Peterborough Chapter observed, “Who in all England can care so much for our cathedral as we do? We love every stone of it; we would not willingly displace a single one.” And that we believe is the predominant feeling among Capitulard bodies; and in fact it is only natural that it should be so.

There can be no doubt that the main agent in bringing about the present insecure state of the front was the failure of the foundations of the piers. The section of them suffices to tell the tale. There were three stages of stepped footings; nine courses of limestone in the first step, four in the second, seven of rather deeper courses in the third. Below these came, in the front of the pier, a pretty thick layer of gravel, on which the lower footings rested, while the gravel rested on a thin layer of clay below which was the rock. The gravel gave way to the pressure and tended to bring the piers over. But another influence which no doubt helped in bringing over the superstructure, and which has not been quite sufficiently emphasised, lay in the fact of the weight of the gables being carried on the outer rings of the arches. Had the design been arranged so that the gables should have rested more on the centre rings of the arches, they would not have assisted the turning over as they evidently have.

The bases of the piers afford a curious subject for study. A late Gothic base mould, a long raking set-off with a moulding under, covers the original Transitional base-course, and immediately beneath this, no one knows exactly when, a not very thick template of hard stone has been inserted, carried a considerable way back under the pier, and obliterating the moulding of the late Gothic base-course. This was evidently done with an idea of strengthening the base and arresting the overturning action.

There is more to be worked out in regard to this great front arcade yet, or might be if the materials for the study were not to some extent obliterated. There appears to be some reason to think that the present design was not the original one except in regard to the centre arch, which it will be

remembered is narrower than the side ones. Mr. Irvine, the clerk of works, who knows nearly every stone of the building, suggests that originally the front was of three equal arches, and that the side ones were rebuilt wider at a rather later date. Of the reasons for this one is said to be the existence of a footing-trench at right angles to the front and further inward than the present end wall of the porch; but the evidence of this is at all events not at present visible. What is visible, however, if looked for, is the fact that down the middle line of the northern pier, at the back or flat face, is a distinct break in the line on plan, the northernmost half of the back face of the pier bending slightly inwards towards the church, making a very obtuse angle with the southern half. Also, there are recognisable slight differences in the workmanship, the “touch,” as one may say, between the mouldings and ornaments of the centre and the side arches, as if those of the side arches had been consciously imitated from the centre one but under different handling. This is most noticeable in the dog-tooth enrichment, which, when examined closely, will be seen to be distinctly different in the two arches; that in the side arches being rather smaller, or more frequent in repetition in the same space, and less boldly executed. The theory has this in its favour also, that it explains what we have always thought the curious anomaly of designing the central arch narrower than the other two. The idea was that of a colossal porch of three arches; why not make them equal in span? The possibility, perhaps we may say probability, seems to be that they were so originally, and that the side arches were rebuilt shortly afterwards in order to extend the front and give greater breadth and dignity to it.

There is also some reason to think that the north gable is not, after all, such untouched thirteenth-century work as has been generally assumed, and that it was probably more or less repaired in the seventeenth century. In Gunton’s “History of the Church of Peterborough” (1686) the following passage occurs: “Benjamin Laney, bishop, 1660-62. His Presidency was not long, nor his hand short in expressing its benevolence towards the repairing of the Cathedral Church.” In the supplement to the book by Dean Patrick we read—“Bishop Laney his benevolence mentioned by Mr. G. was this; he gave an hundred pound towards the repairing one of the great arches of the church porch which was fallen down in the late times.” Some extracts from the Cathedral accounts give a general confirmation of this, though there is nothing to show exactly in what the work consisted—

“1661. March 15, Pd Thos. Mansfield 6 days mending the roof over the porch which the wind blew downe, 8/- His son the like, 8/-

1662. March. Old Saunders six days slating roof over the church porch y^e great wind blew down on Feb. 18, 8/- His son 6 days, 8/- 2 boys 6 days, 6/-

1662. Augt. 15. That John Lovell he agreed with by the Dean and Receiver at the price of 70l. to perfect the work of the porch and to sign such articles and bonds with the Dean and Chapter as the Dean with the Treasurer and some of the Prebends shall think fit.

1663. To John Lovin* for the arch of the porch 80l.; carpenter 21l. 4s. 2d.”

* This is no doubt John Lovell again, only the name written differently from carelessness.

These last two payments of 70l. and 80l. evidently refer to some considerable amount of work, which appears to be all connected with the same part of the building.

At the present moment the upper portion of the north gable has been taken down, including the rose window, and the stones are laid out in order on the next floor below of the scaffolding, where there is a complete floor the whole width of the porch and projecting two or three feet out from it, thus forming a tolerably spacious loft on which the old work can be laid out in sections as it is taken down. The following dimensions of the north arch and gable may be of interest:—

From the springing of the north arch to the underside of the great string is 23 ft. 6½ in. in centre.

From same line to top surface of socket stone of cross on gable 52 ft. 10 in.

Clear width of arch at present ... 25 ft. 10½ in.

Height of clear opening at present 16 ft. 6½ in.

The gable seems to be an equilateral triangle, but is in execution about 1 ft. 3 in. higher.

The circular window inside its outer order has a vertical height of 10 ft. 3½ in., but the breadth is only 10 ft. 1 in.

It is possible that this latter discrepancy may be intentional, in order to prevent the circle looking squat when seen from below; it seems too great a discrepancy to be accidental in a single feature in which it would have been so easy to take the same measurement both ways across. This may do as a piece of evidence for Professor Goodyear, for proving the existence of optical corrections in mediæval work.

The work on the gables, when seen at close quarters on the scaffold, produces the usual impression which mediæval work of this date produces when one can get to look at it closely, of immense vigour and boldness of execution and relief, both in the moulded and decorative portions, the latter more especially. Of course some portion of this effect of boldness arises from the weather-worn state of the features, which retain their high relief but have lost whatever finish in detail they might have had, and present a rock-like character which no doubt adds to the effect.

As far as has been ascertained at present it seems probable that the masonry of the piers is in fairly good condition and of good character internally, as it certainly is externally. Some small trial holes have been cut, partially banked up with clay at the mouth, and filled with water to the level of the clay weir. The water has remained held up in these very satisfactorily, which of course would not have been the case had the interior been of a rubble character. It is intended to take iron ties from the piers through to the main building, drilling the piers some little way below the springing, close to the central triple shafts. If the piers are generally in the sound interior state which the trial holes already made seem to promise, there is no doubt that with the underpinning and the iron ties they will be quite safe in spite of their being out of the perpendicular. But the state of the other two gables, though not so bad as the north one, is still very precarious in appearance, having regard to the curve on plan to which they have settled outward, and we are inclined to think that the work now being done on the north gable can hardly be the end of the necessary repairing. There is the curious question, too, on which we have not heard anything

yet—is the north gable to be reset plumb, or to follow the line which the other gables have taken? It is certainly a question to be asked. Our own opinion still is that if we could call up the ghosts of the original builders and show them the front in its present state, they would say, "*mea culpa*, we have indeed made a bad piece of building of it; will you rebuild it straight and everlasting for us, and for the honour of our name to posterity?" It must not be supposed, however, that there is the slightest intent of this kind on the part of the Dean and Chapter, nor indeed would it be easy to say how the funds could be obtained for such a work; we only mention it as what in our opinion would be a "counsel of perfection" in the case.

Internally the restoration of the crossing has been an entire success, and we have the satisfaction of knowing that the rebuilt crossing piers and the tower over them may be expected to stand as long as stone will last. Nor internally is the effect of renewal very marked or obvious. Externally indeed the tower does show as an evident restoration, and we can understand that some fear should be felt lest the rebuilt gable should assume as great an appearance of newness as the tower does. But we are satisfied that this is not the intention, and that every exterior stone which is not absolutely decayed will be replaced. Of course it cannot look as if absolutely untouched, but it may look with very little renewing.

In the rebuilding of the crossing piers one odd little memorandum has been left. At the springing it was found that the original Norman caps to the main shafts had been turned round into the wall, and a transitional cap moulding worked on what was before the back of the stone; a proceeding telling of a remarkable desire to economise stone. In rebuilding the piers the cap on the north-west pier has been turned round again, in order to form a record of the use that had been made of it. This is interesting, but we rather doubt whether it was the right thing to do; it is spoiling the unity of design for the sake of a little historic point, which might after all have been recorded otherwise; and design is really something, even in ancient architecture as well as in modern. In the choir the inlaid marble floor is beautiful in material and workmanship, but the design does not seem in keeping with the building; it is too Italian in character; nor can we much admire the baldachino, also a very rich piece of work, but more noticeable for its richness than for its beauty. To an erection of the kind there can be no objection whatever; but we do not feel that this particular design is a great success.

NOTES.

Memorial to Archbishop Benson.
The proposal to complete Truro Cathedral as a memorial to the late Archbishop of Canterbury has again been brought forward, and, as reported in the *Western Mercury*, a very influential Committee has now been formed to consider how this object can best be carried out.* It is proposed that a monument

* The Committee includes the Duke of Cornwall (the Prince of Wales), the Dukes of York, Connaught, and Cambridge, the Archbishops of Canterbury and York, the Duke of Westminster, the Bishops of London, Truro, Durham, besides others. The Hon. Secretaries are Archdeacon Cornish, Canon A. B. Donaldson, and Mr. E. Carlyon.

to the late Primate in Canterbury Cathedral should be the first object, and that the efforts of the Committee should then be directed to the completion of Truro Cathedral. It is of course fitting that a special monument should be erected in Canterbury Cathedral, but it will be wise to restrict this to a rather simple and inexpensive one if it is seriously desired to carry out the Truro Cathedral scheme. It appears that the present two bays of the nave can be completed and four bays added for 16,500*l.* This however will not complete the nave, which will still require two more bays and the narthex and at least the lower portion of the western towers. This will bring up the sum to about 45,000*l.* The whole building can be entirely completed, it is said, for 75,000*l.*; this appears to be based on an estimate from the architect, but we cannot understand how such a sum could suffice for its adequate completion according to the original design. However, what we would urge at present is that the erection of merely a further portion of the nave, though it would be one step further towards the completion of the cathedral, would be no recognisable "memorial." If the nave is to be the memorial, nothing short of its entire completion is worth attempting in that sense. If it appears impossible at present to raise enough money for that, it would be better to let the memorial be the completion of the central tower. On the other hand, if the funds needed for the entire completion of the nave can be raised now, that would no doubt be the best thing to do, as that would be the completion of the cathedral as an interior at all events. But three-quarters of the nave is neither one thing nor another, and cannot be regarded as a memorial.

The Crusade against Advertisements.
The "Society for Checking the Abuses of Public Advertising" held a meeting of members and their friends on Thursday last week in the hall of the Society of Arts; a meeting which was public in so far that reporters were present. The chair was taken by Sir Lepel Griffin. The main objects of the meeting were to come to a general agreement, in an informal manner, in regard to the following propositions:—

(1) A memorial or deputation to the First Lord of the Treasury or the Home Secretary to draw attention to the grave harm done by advertising disfigurement, and the certainty that the practice must spread indefinitely unless subjected to reasonable control; to urge the Government (a) to grant facilities for Mr. Boulnois' Bill, or (b) to introduce a measure of their own, or (c) to grant a Parliamentary Committee or a Commission to inquire into the subject as one of national importance.

(2) A memorial or deputation to the Chancellor of the Exchequer to ask him to consider the propriety of imposing a duty on exposed advertisements.

(3) The establishment of some concert between Members of Parliament who are favourable to our cause for the purpose of introducing (by way of amendments or instructions) provisions in restraint of advertising disfigurement into Railway Bills and similar measures.

The proposals were not formally put as resolutions, but a show of hands was taken as to the general agreement of the meeting in regard to the three proposals, resulting in an affirmative as to the first and last, and a very doubtful support to the second, which was practically dropped. In the course of the discussion, reference being made to the common criticism that it was hard on the farmers to attempt to deprive them of the rent for field advertisements, one speaker

stated from his knowledge that the rent paid by the owners of these advertising boards which are displayed along the lines of railway was really so small that it was absurd to reckon it as of any importance in a farmer's revenue, or support it on philanthropic grounds. If so, the only possible excuse for suffering the continuance of this disfigurement of whole lines of country is taken away.

The Law and London Water Supply.
The case of the Thames Conservancy against the South-west and Vauxhall Water Company, shows the curious state of the law in regard to the London water supply. By various agreements with the Thames Conservancy, this Company is entitled to take from the river in the course of any twenty-four hours 2,500,000 gallons of water, and no more. It appears, however, that more than this quantity has been taken, and the question thus arose, Was this legal? The answer depended on the construction of various statutes and the agreements in question, but the result was that the judge decided that the Company could only take the specified quantity. In deciding the point, the judge only had to consider the legal rights of the parties, not the necessity for taking more water, or the capacity of the Thames to yield it. But, to the ordinary mortal, it is curious to note that, apparently, parts of London might be quite insufficiently supplied, and yet the Water Company is powerless at present to increase the supply. The case appears to illustrate the necessity for settling the water question on broad and sensible lines.

The Civil Engineers' Home in Paris.
The French "Société des Ingénieurs Civils" have just inaugurated their new house, at 19, Rue Blanche, Paris. The building was designed by M. F. Delmas, engineer and architect. The floor of the large meeting room, which will seat 500 persons, is arranged so that it can either be a sloping floor with rising ranks of seats for ordinary meetings, or a flat floor for fêtes and receptions.

Thames Floods.
THOUGH it is satisfactory that during the recent persistent wet weather the Thames Conservancy have been able, by the proper use of their weirs, to prevent injury to health and houses by the overflowing of the Thames, yet it is wholly discreditable to this body that they have not taken proper measures to safeguard property and persons before this winter. It is obvious that with moderate care the floods which have proved so disastrous in the Thames Valley, and have so frequently depreciated house property in that district, might have been prevented. It shows that the Thames Conservancy is not a sufficiently representative body, since, if they had been, they would not have waited until the arrangements of Windsor Castle were threatened, and the whole district inconvenienced, before trying in a systematic manner to cope with these evils. However, it is better to take measures later than never, and we hope that the means employed during the present winter to prevent floods will have a permanent effect on the health of the Thames Valley.

The Picketing Case.
THE case of picketing in the glass trade which came before Mr. Baron Pollock and a jury last week, though it finally ended by the

defendants allowing a verdict to be given against them, is of importance. Not that it decides any new legal point, but it emphasises the fact that workmen are not to resort to any violence at the time of a strike, nor is it legal to endeavour to get workmen to break their contracts. The case turned entirely on questions of fact, and from the beginning it was obvious that the defendants were in the wrong. It is to the advantage of the artisans in every trade to have exemplified what they may and what they may not do during a strike. It is equally necessary that while the law should protect workmen in peaceful combination, it should safeguard with care the liberties of workmen who prefer not to be bound by the rules of trades-unions.

SIR HENRY MANCE, the new President of the Institution of Electrical Engineers, is the

inventor of the system of sun-signalling by the heliograph, which has been adopted for army signalling by many European nations. He is, however, best known in connexion with submarine telegraphy, and this he took for the subject of his presidential address last week. The address was most interesting, and he kept his audience fascinated to the end. The length of the submarine cables in existence is 162,000 nautical miles, and a fleet of forty-one telegraph ships is necessary to keep them in repair. It seems that the cables, which get incrustated at intervals with shellfish, are regarded by many marine monsters, such as sawfish, as their larder, and sooner or later their formidable teeth penetrate the core, and a fault develops. Whales have been known to get entangled in a cable, and Sir Henry once saw the dead body of an enormous whale come to the surface with the fractured cable. His few practical remarks about the affairs of the Institution deserve serious consideration. If the Society is to prosper, it ought to lay itself out to attract all who are interested in the development of electrical science, not only those interested in a special branch. After an existence, too, of twenty-five years, it is time that it had a home of its own.

The late William Morris. THE *Edinburgh Review* includes, in a number of unusually varied interest, an article on "William Morris, Poet and Craftsman," a title which very well expresses Morris's position and genius. The latter portion of the article deals with Morris as craftsman and designer, with his influence on household taste, and his views on architecture and on painting and the make-up of books. The review is more decidedly laudatory in regard to this side of Morris's work than in regard to his poetry; holding that there is room for a good deal of difference of opinion on the poetry, but for very little in regard to Morris's influence on decorative art, except in one or two minor details. The following quotation will give an idea of the tone of the article on this head:—

"The change which has taken place in the average public taste in this country in regard to the design of carpets, furniture, &c., and the general fitting up and decoration of dwelling-houses, is something extraordinary, and can only be appreciated by those who can remember the general appearance of an ordinary 'well-furnished' drawing-room some forty years ago—the staring white marble chimney-piece with the gilt timepiece of debased Louis Quinze aspect, the sprawling sofa-legs in

double curves, the big knobs of flowers on the carpet and hearthrug, and the terrible colours and realistic foliage of the wall-papers. About the present furnishing taste there is no doubt often a certain amount of affectation; it is adopted as a mere fashion by some persons who would follow any fashion that was set them; but the fact remains that whereas some thirty or forty years ago the general taste in England in such matters was perhaps worse than that of any other country, it is now on the whole better than that of any other country, except the United States; and even the Americans learned from us lately in the first instance, though they have perhaps in some respects improved upon our lessons. Even in the ordinary work exposed for sale in furniture shops the effect of the change is manifest; tradesmen, it is true, care nothing about artistic style, but they have been compelled to do their best to follow the change in the public demand. And this improvement in household taste is the direct work of Morris more than of any one else."

Building in the Transvaal.

THE *Deutsche Bauzeitung* has been publishing an article on the advisability of German architects and the German building trade giving some attention to the development of the South African Republics, and practically advising young men to try their fortunes in these countries. This advice may perhaps be equally applicable to Englishmen, though this will not be the view of the *Deutsche Bauzeitung*, and it is to be regretted that an architectural journal which has frequently shown a gratifying interest in things English, should allow the publication in its columns of sentences written with so much political feeling as is the case in the article in question (signed by Mr. O. Kalt-Reuleaux). We should add that, according to this article, it also appears that the Transvaal Government and the Orange Free States require railway engineers, but are making a point of taking only men who have had a German military training, and have, preferably, been officers of the Royal Engineers in Germany. We believe that what is said about the scope for German architects and engineers also holds good for the skilled artisan.

The École de Droit, Paris.

THE new buildings of the École de Droit at Paris are now entirely completed. They form an "island" isolated by the Place du Panthéon, Rue Cujas, Rue St. Jacques, and Rue Soufflet. The furnishing and arrangement of the lecture theatres is now in progress. With this building, and certain supplementary offices, the whole of the establishment of the Faculté de Droit is now provided for. The architect is M. Lheureux.

The County of Norfolk.

THE *Quarterly Review* contains an interesting article on that exceedingly interesting county of Norfolk; an article to a great extent historical, but not omitting the artistic and architectural aspect of the county, and the charm of its scenery, which is sometimes thought little of because the country is so flat; but "though mountains are wanting, there is hardly any other phase of English landscape that may not be found in this land of Cromer and Constable. . . . Nor must we forget the old-world aspect of the country towns, such as Lynn, Yarmouth, and parts of Norwich itself, with their narrow streets but little changed since the fifteenth century, with their many gables and high-pitched red-tiled roofs, and here and there an old coaching inn with its

sign of wrought-iron work, and its courtyard and wooden gallery standing as it stood when seventy coaches a day passed along the high road." The writer of the article is obviously a lover of Norfolk, otherwise he would surely not have quitted the "sweet and civil county" without a rough word for the wretched way in which its roads are kept, and their extraordinary and bewildering divagations from the direct line of travel from place to place.

Mr. Thorne Waite's Drawings.

THE collection of water-colour drawings by Mr. Thorne Waite, at the Fine Art Society's Gallery, presents a certain amount of artistic tautology, it one may use the expression; the material is rather limited, and a haystack and a "distance" recur rather often as the elements of the scene. The "Cornfield on the Brighton Downs" (11) is very beautiful in the aerial treatment of the distance, which is contrasted and kept back by the brown belt of trees and shadowed land near the foreground; but in "Haymaking on the Downs Findon" (16), a composition of the same character, and as good, the same brown belt appears; in short, either drawing would impress one more if seen apart from the other. In "Shoreham and Brighton" (19) larger and somewhat more elaborate composition, we find the same incident again though this also is in the main a very fine landscape. What is perhaps the finest thing in the room, "Autumn: Steyning" (53) shows again something of the same device in composition, though here the dark band formed by the line of trees is taken more through the centre of the picture and further from the foreground, and the whole composition of this scene is most effective as well as the breadth and unity of style displayed in it, the truth of autumnal effect and the light aerial manner in which the rainbow is touched in. Among others which are of special interest is the long low sketch under the title, "Cornfield: Horsham Valley" (22), a powerful effect of stormy sky, treated in a grand manner though on a small scale, and giving the idea of a study for a large picture. "Aldborough" (43), smaller sketch, has the same kind of power. "Haymaking, Bradgate" (54) and "Evening" (58) are two others which have a special individuality about them; the latter for the manner in which the distance seems to fade away under the faint evening light. Among the larger drawings two views on the outskirts of Banff (28 and 38) are specially noticeable for the fresh open-air effect and the freedom of their execution.

A Graceful Room to Art Students.

A LADY, who desires to remain anonymous, has offered to the École des Beaux-Arts to place a villa belonging to her, at Neuilly, at the disposal of any three art students whom the Ecole may annually select as being at the same time among the most meritorious and among those most in need of assistance. The villa is near the Pont du Courbevois and is we believe a former residence of no less a person than Pascal. As Thackeray makes one of his characters say in English French, "a good action gains to be repeated, and the present one might be a hint to some persons in England who have small houses on their hands which they cannot make use of, and who might be able and willing to benefit struggling artists in this way.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

PRESENTATION TO MR. ARTHUR CATES AND PRESIDENT'S ADDRESS TO STUDENTS.

The sixth ordinary general meeting of this Institute took place on Monday at No. 9, Conduit-street, Professor George Aitchison, A.R.A., President, presiding.

The Late David Brandon and his Bequest to the Institute.

The minutes of the last meeting having been taken as read,

Mr. F. Warren said that, as an old pupil of the late David Brandon, and one of the executors named in his will, he had much pleasure in announcing to them that he had left a bequest of 1,000*l.* to the Institute, in which he took so much interest in his life, and where he was so highly esteemed. The bequest, which was free of duty, was worded as follows:—"I give to the Royal Institute of British Architects 1,000*l.* to be added to the funded property of the Institute, and the income arising therefrom to be applied at the discretion of the Council for the time being towards the advancement of architecture." Mr. Brandon had already given earnest of the great regard he had for the Institute by his munificence in the matter of the Institute Library Catalogue, presented to members in 1889, the cost of compiling, printing, and publishing this work being entirely defrayed by him. The deceased was elected an Associate in 1839, and a Fellow in 1840, and at the time of his death he was Senior Fellow.

On the motion of the Chairman a vote of thanks was tendered to the survivors of Mr. Brandon for his bequest to the Institute. They almost all knew Mr. Brandon, said the Chairman, and they were aware that he was a most amiable and polite gentleman, one of whose objects was to further the useful work of the Institute. He (the President) had known Mr. Brandon for many years, and amongst the deceased gentleman's other good works was his payment for the printing of the whole of the catalogue of the Library.

Presentation to Mr. Arthur Cates.

Mr. Waterhouse then rose and said that that part of the work of the Institute which had to do with the examinations was a serious and anxious undertaking, and although it was only of late years that it had assumed anything like its present dimensions, some idea of its importance might be gathered from the fact that 780 candidates had already passed the examinations, while upwards of 1,000 more were at present engaged in preparing for the second or the third of the three progressive steps into which the examinations were divided. Or, to put it in another way, comparing the old Voluntary examination with what followed, forty-three gentlemen passed the Voluntary examination between the years 1863-81; while since 1882, when the examination qualifying for Associateship became obligatory, 737 had passed, which total did not include the 1,086 before alluded to, who were now preparing for the Intermediate or Final examination. These gentlemen were, of course, not exclusively from London: they were from all parts of the country and some from distant corners of the Empire. So that this work of the Institute, however great an ordeal to those who submitted to it, seemed to possess an attraction after all, and when it was considered that, independent of the intrinsic advantages appertaining to the examinations themselves, it was only through these obligatory examinations that membership of the Institute could be attained by the youthful practitioner, they would cease to wonder at the enthusiasm with which the initiative of the Institute in the matter had been responded to. On whose shoulders did the task fall of initiating and carrying out this, the greatest work of the Institute as he did not hesitate to call it? On many shoulders, no doubt; but on no shoulders did it fall so heavily, and perhaps none were so well able to sustain it, as those of Mr. Arthur Cates. Mr. Cates had shown a great interest in the subject as early as 1855, and in 1877 he became identified with the Examining Board. When the examinations became obligatory in 1882, Mr. Cates was appointed Chairman of the Board, and he elaborated the scheme for the progressive examinations in 1889. His position as chairman he retained until last year, when for prudential reasons, his health seemed to demand his retirement. It was doubtful if, without Mr. Cates's influence, the work he had referred to could have been carried on with the success which had hitherto

attended it. Mr. Cates's tact and courtesy had always been perfect, and his ready sympathy, accorded to colleagues and students alike, had been most conspicuous. Unsuccessful candidates had returned to thank the Chairman of the Board for relegating them to their studies for a period, and they were stimulated to greater exertions, and were enabled to pass later examinations with credit to themselves. Mr. Cates last year had most generously offered a prize in books to the value of ten guineas, to be given at each final examination, now twice in the year, to the candidate who sent in the best testimonies of study, himself passing the examination. He (the speaker) had endeavoured to show the gratitude the Institute ought to feel, from the oldest member down to the latest accession to its ranks by way of the examination-room, towards Mr. Cates for his services on its behalf. He was now most happy to be the medium of the past and present working members of the Board of handing to him a testimonial, which was intended as a slight but sincere expression of their personal regard for him, and of admiration for the way in which he had presided over their deliberations for the last thirteen years.

Mr. Waterhouse then presented Mr. Cates with a large silver bowl, upon which the following inscription had been engraved:—

"To Arthur Cates, Esq., for fourteen years chairman of the Board of Examiners (Architecture) of the Royal Institute of British Architects, from his colleagues, as a mark of their esteem in recognition of his untiring zeal in organising and successfully working the examinations, November, 1896."

Mr. Waterhouse, continuing, said that his colleagues desired him to express their unceasing regret that they were to see Mr. Cates' presence in the chair no longer, though they hoped it would be long years before he ceased to take an interest in their proceedings, even to giving them his varied counsel and advice. The offering was from past and present working members of the Board alone, but no doubt many other members of the Institute would have liked to have joined in the presentation had they been invited, for if a great work, well carried out, deserved recognition for its success, then so did the work which Mr. Cates had carried out in establishing the Institute Examinations. The bowl was just an ebullition from the hearts of those who had borne with Mr. Cates the burden and heat of the day, and there never was a testimonial so spontaneous and so generous. Mr. Cates had seen his good ship of Obligatory Examinations (which he christened himself) built on lines for which he himself was in large part responsible, fairly launched and fully equipped. She had gone forth on many conquests, and had returned freighted with the quickened intelligence of their younger brethren. That ship had met with no misadventure so far. It would be remembered that at first those who disapproved of the venture were scandalised at the thought of testing candidates in their powers of design, and had they (the Institute) done anything to force systematically a particular school of architecture upon the exclusive attention of the candidates there might have been some reason for that anxiety; but such was not the case. Their desire was to educate their candidates into some knowledge of what made for good design, apart from all questions of style—some insistent for the architectural fulfilling of requirements; for the fitness of things; for the adaptability of means to ends, and an absence of eccentricity and conceit. Their desire was that candidates should keep in view the great end of architecture, viz., that of promoting the amenities of human life, and they did not fear to award a good proportion of marks to those designs which displayed thought and judgment and that sense of rhythm and repose which were acknowledged to be characteristics of good architecture. In conclusion, he congratulated Mr. Cates most heartily upon the cordial relations which subsisted between him and the Board of Examiners, and also upon the success of his efforts. He trusted that many years would be given Mr. Cates to watch the growth and development of his work—a benefit to those who came under its influence, to the Institute, and to architecture at large.

Mr. Arthur Cates said that he thanked them all for the very kind way in which they had received the remarks made by Mr. Waterhouse, and he thanked that gentleman and those who had been with him in the matter, for the testimonial which had been presented to him. Whatever might have been his own individual efforts, they would have been of little account had he not from the first received the kind and sympathetic aid from

many friends who encouraged him to proceed, and with whose assistance the Obligatory examinations were established. The support that he received from the Board was of the most encouraging character, and year by year that Board adopted the policy of gradually stiffening the examinations—gradually raising the standard, until a standard was obtained which enabled and justified the introduction of the Progressive examinations. He hoped that as time went on that standard would be not only maintained but increased, so that the great results which had followed the establishment of the Obligatory, and had already followed the introduction of the Progressive, would be continued. There were exhibited that evening some testimonies of study by Mr. Anderson, the son of their recent President (and a worthy son of a worthy father), in the Intermediate examination, which ten years ago would have been considered remarkable, but now, though the drawings were so admirable, others followed closely behind. He did not know if the student, who benefited from the examinations, quite appreciated the amount of labour and the amount of pains which the Board of Examiners had devoted to the matter. He was surprised at the sacrifice of time which the members of the Board had given to the conduct of the examinations, and in the excellent advice which they had given to the candidates. In them the success of the examinations was due, and to them the students and those who had passed were deeply indebted for the time that they had given without remuneration. They had had some reward, though, for they had seen the result of that sacrifice in the excellent work which the students had produced, and in the great advance in knowledge shown by the candidates, and the general improvement of architectural education. In addition to the members of the Board who had rendered such valuable services there was one, alas! no longer with them, who had given them so much valuable aid, viz., their dear friend, W. H. White. To him they were indebted for work and assistance in regard to the examinations which could have been given by no one who was not thoroughly acquainted with the details of the examinations. They were also under great obligation to Mr. H. G. Taylor, who, by his care and attention and calm appreciation of difficulties, had done great service in working out details in regard to the examinations. More than fifty years ago he (the speaker) became a pupil in the office of Sydney Smirke. In those days the term of pupillage was five years; it had been seven. It was reduced to five, and it was now three. At that time parents paid a premium of 300 or 500 guineas for "the run of the office" for their sons, who, if they chose, could work, and, if they did, would save their masters the expense of a paid clerk. They had no systematic education, and though there were lectures at various institutions, there was no systematic arrangement. In 1855 the Architectural Association memorialised the Institute on the subject of architectural education, which led to a great deal of discussion, and the Voluntary examination was not established until 1861. Now, however, the words of the memorialists of 1855 were realised, and they now gave students guidance in their studies—on or before entering an office, during their pupillage, and during the critical period between the expiry of their articles and commencing practice—not before obtainable. Not only in England, but in other countries, there had been a great advance made in the education of the architect, and he would refer to what had been done in the United States, where Professors Babcock, Ware, and others had established systems of education and University courses, which must produce a very great effect upon the future of American architecture. In a pamphlet which he had circulated in 1887 he gave full particulars of these courses, and in the evidence which he had given before the Royal Commission on the Charter of the Gresham University in 1893, he entered into detail on the subject, as did Messrs. Slater, Emerson, and McVicar Anderson, who had endeavoured to get architecture treated as a separate subject in the University course. The result of that evidence, he was glad to say, was that the Institute had been recommended, in the report of the Commissioners, for the privilege of nominating a member of the Senate of the new University—a very important concession—and placing architecture for the first time in the position which it should occupy in every University course. The question of design was a matter of vital importance, which had been much misunderstood and had led to a considerable amount of opposition to the examinations when they were first started.

There was, indeed, a very great danger in all educational schemes—a great peril of Academic influence, which had indeed affected some countries, and which, he hoped, would never occur in England. England had of late years attained a position amongst the architectural societies and bodies of Europe. In all the communications that he had had with architects in America or France, Germany or Italy, there had been one expression of admiration and of praise for the individuality, the independence, the originality of English architecture, and those who studied the architectural journals of other countries and compared the works illustrated in them with the work produced in this country, would fully appreciate how much, how far, England stood before all other countries in that freedom, in that ability of design—not in great public buildings always—but in the general domestic work of the country. To imperil that by introducing any academic system would be most unfortunate; and it was that academic influence—that one style or mannerism—which must be carefully avoided. Hitherto it had been: he hoped that it would be—and that nothing would be done to imperil the independence and facility of design of English architects, but rather that what was now being done would aid in improving that, and would give to those who desired it an opportunity of mastering a knowledge of the grammar and syntax of architecture before they attempted to compose great works in it. He had never been an advocate of competitive examinations; the examinations were simply tests of the standard that each candidate had reached; a standard of merit to be worked up to, and only to be obtained by close study; a guidance for education and a standard by which the knowledge of the student might be ascertained. Still further, they made no pretence that the examinations would make an architect. The examinations provided the minimum; they were not conclusive, and there was no finality in them. The most successful student, by passing the examinations, still remained only a student; he had simply acquired the power of learning, the power of study, and he must use that knowledge simply as the basis for further study in order to place himself in a position as a worthy member of the profession and of the Institute. The great good that the examinations had done was the widespread influence that they had had in raising the standard of education throughout the country.

President's Address to Students.

The following address to students was then read by the President:—

"It has been the custom for the President to say a few words to the students on these occasions. You have had from Mr. MacVicar Anderson, when he was President, some admirable remarks on planning, besides those on professional brotherhood, and most excellent advice from my learned predecessor Mr. Penrose, who found out for us all and the world the optical refinements of Greek architecture. He was trained in the reverent study of the antique from the actual remains of Greek and Roman structures, and is not less learned in those of the middle Italian Renaissance, which he has also measured, and we have heard from him that Palladio alone of the Renaissance architects had learned the secret of the grand Roman style.

However much I may be inferior to my predecessors in weight and eloquence, I think I may say that I cannot yield to them in my ardent desire for the improvement of our English architecture, nor for giving all the advice and all the knowledge that can be imparted in a short speech to the students, in whom we see the future architects of our country.

No teaching will give genius or parts to learners, but I think I may say, without fear of contradiction, that untiring diligence is an absolutely necessary qualification, and this has been so evident to those who possess genius, that Buffon defined it "as the art of taking trouble," which we all know it is not; but diligence is so absolutely necessary for the development of genius, that it is excusable to confuse the necessary servant with the master.

I would call your attention to the works of Lord Leighton now being exhibited at the Royal Academy, and also to the large collection of his studies at the Gallery of Fine Art in Bond-street. The studies there are but a portion of the innumerable ones he made, and you will see by these that the exquisite perfection he attained in his finished pictures and statuary resulted from the most careful and accurate study of nature; that there is not a form, an extremity, or a piece

of drapery that was not perfectly studied before it was painted or modelled.

Necessary as indefatigable diligence is, the longest life is only too short for the attainment of even a competent knowledge in the master art we profess, which embraces so many various arts, and requires a knowledge so wide and so various, and qualities of mind that are rarely found in one person. It is a great saving of time to have a map, a compass, and a knowledge of the streams and currents, of the reefs and sandbanks, before we embark; not only to prevent shipwreck, but also to avoid great deviation from our course, so that there may be no waste of labour, however strong and indefatigable we may be. Some of the wisecracks of the last century, during a dearth, employed labourers to dig holes in the ground and fill them up again, and although this kept the labourers' muscles in training and prevented the loss of habits of diligence, the crop that should have resulted and rewarded the labourers for their exertions was non-existent; nothing is more disheartening than useless labour. Many of my own early years were wasted in inking in drawings, and I could not help wishing at the time that I had been a shoemaker, for stitching shoes could not be more irksome, and would have prevented some people from getting their feet wet or worn. The creation of something useful would have mentally compensated me for the irksome labour, while no one was benefited by my inking in drawings.

The wisest saying of the Delphic oracle was, 'Know thyself,' and it can be as usefully applied to themselves by those who study architecture as by others in the various exigencies of human life. It is obvious that if one knows oneself one can best choose the part of architecture most fitted to one's aptitudes, and one can map out those parts that are essential to be learnt; by this means not only is much useless labour saved, but that worst of all shipwrecks is averted, the having embraced a profession that is not congenial, and for which one finds one's capacities are not fitted, and this, too, when it seems too late to throw up the profession. I recollect hearing of a pupil of Laing's—the Laing who built the Custom House—who found architecture so uncongenial that he embraced the law, and became a Vice-Chancellor; as Alfieri the barrister became a celebrated architect. It is within the knowledge of most men that many of those who have become distinguished have changed their profession; but these men have mostly had a natural aptitude for the subject they eventually embraced and excelled in.

To those unfortunates who have embraced architecture but have no aptitude for it—nor, as far as they know, for anything else—I can only recommend the behaviour of Scotchmen under the circumstances. I think I may say that Scotchmen are the only people of the United Kingdom who have a good education, and by this I mean a moral education; each man who finds himself in this position says to himself, 'This is my only chance in life; I have no natural aptitude for it, but I must try by application and striving in season and out of season to make up for my lack of aptitude; and you rarely find that they fail in whatever walk of life they have embraced, for they mostly gain a good position.

Youth is naturally enthusiastic and ambitious, and would fain know everything connected with its occupation. Most students have probably read Bacon's programme of mastering all human knowledge; but we are not all Bacons, and had Bacon lived now, when the memory wanted for one small branch of science is greater than that given to most men, he would never have set out on so impossible a quest.

A student, for example, has to see what a column or stanchion will safely bear; and so he wants to know the laws of flexure, and find himself referred to Poisson; he gets Poisson's book, but finds that to understand it he must master the differential calculus; he gets a treatise on that, but finds it would take him his whole life, if he could learn it then; yet as the multiplication table is to arithmetic, so is the differential calculus to the higher branches of mathematics; he therefore comes to the old conclusion 'that everybody cannot do everything.'

It is, perhaps, a laudable ambition to take one of the great architectural geniuses as a pattern, but you should have common sense enough to calmly and dispassionately review your own powers and capacities before entering on a serious attempt at imitating his achievements. There is only one genius in several millions of people who is blessed with the capacities of the great architects, who has the making of a Brunellesco, an Alberti, a Peruzzi, a Bramante, a Lionardo,

or a Wren, and I only wish more of those who find themselves incompetent would abandon the profession. The average capacity of mankind is not great, and yet each one wishes to be the bright particular star of the world. Each unit of mankind cannot endure the idea that his capacity is not equal to that of the greatest genius; but he will admit that he is deficient in industry, and in that judgment which guides a man to concentrate himself on the principal aim of his life. This shows us one of the weaknesses of humanity, to be ashamed of admitting that which is a pure accident, over which we have no control; and to admit, without wishing, our neglect of those things that are in our power. It is the fashion to encourage the belief that all men are born with equal capacities, as it is to suppose that every epoch is equal in mental and moral power, and that the difference depends on teaching, as if cutting and polishing a flint stone would turn it into a diamond. I recollect Roeluck talking this sort of nonsense at Sheffield, and after pointing out what John Stuart Mill could do at thirteen years of age, who had then mastered Greek, Latin, and mathematics, he said:—'But if John Mill could do what he described, why may not John Brown do as much, or nearly as much?'

The subjects that seem to me of the utmost importance are—firstly, the recognition by students and their teachers that architecture is a structural art, and that until this is realised and acted on no great improvement is likely to take place. All the materials we use have weight, and in their ultimate position have size too, and in the positions they are placed have, as well as downright pressure, cross and diagonal strains. All these strains occur in almost every building, and must balance one another, or else the building becomes deformed or ruined, or tumbles down. The theory of the strains that produce equilibrium is called statics. The architect with the keenest observation, the strongest memory, and the greatest experience is a mere child, compared with one who is a master of statics and the strength of materials; secondly, we all admit that without proportion buildings and their parts are unsightly, and we endeavour to train the eye to good proportions by studying classical buildings; their proportions, however, mainly give the statical results gained by experience at the time the buildings were erected; if these studies are pursued too long they are apt to make us fall in love with a state of knowledge inferior to that which we now possess.

That friend of our youth, Mr. Ruskin, partially enlightened us on this subject by pointing out the infinite variety of proportions in nature, most of which we find agreeable to the eye, and we now know that what may be called the fundamental proportions depend on the weight to be carried, the strength of the material, and its height and size. Statics allow us to go further, for, knowing the strains to be borne, and where they come, and the strength and peculiarities of the material, we may mould it into various forms, either by cutting away useless parts, or by adding to the bulk in certain directions. By statics we know where there is a change of function, and where various strains are concentrated, and these parts call for some expression, and the only way of expressing them architecturally is by moulding.

The proper arrangement of each chamber for the duties it has to perform, the collocation of the different chambers, and the access to them by means of halls or passages without unnecessary waste of room, is commonly denoted by the word 'planning,' and in reality it includes much more, as, for instance, their proper lighting, aeration, ventilation, and warming; in fact, the enabling us to make the different portions fulfil their ends is the foundation of all good architecture. But man wants more than this; he wants not only certain parts to be more striking than others, but to make the whole have such an external appearance that it tells us the use of the building and evokes the emotions proper to its use. All we have to deal with outside are walls and roofs, but we may want porticoes and porches, towers, lanterns, spires, and domes for certain uses and under certain circumstances.

Inside we have much the same elements, but we have as well, floors, ceilings, and staircases, and although we always want floors to be flat, there are circumstances where steps are required to give elevation and dignity to certain parts, and there are also certain shapes which add beauty or dignity to the rooms, and if the ceiling is vaulted or domed we may want it made striking or beautiful.

One particular point is usually missed in speaking of architecture—the skill in combining the

junctions between forms of diverse or opposed shapes, and of marking the different changes of function where they occur, or of marking the concentration of strains. These, as I mentioned before, are accomplished by moulding, and these mouldings are to give us varieties of light and shade, and to have a sort of logical sequence in their forms. The Greeks were the first and the greatest masters of mouldings, which were, of course, shaped to be played on by brilliant sunshine and in a clear air. The Roman mouldings were only badly-designed Greek ones with infinitely less variation. The second masters of moulding were the Gothic architects, who designed them for the misty climates and feeble sunshine of the countries they lived in. They were as logical as the Greeks, though destitute of their refined artistic sensibilities; and since then the study of profiling has been abandoned.

I say nothing of sculpture, in which I included naturalistic as well as vegetable and animal forms, for this is another art; but it must be exercised with due regard to the architecture, and must neither be incongruous nor destroy the scale of the part, the chamber, nor the building. You cannot expect sculpture from architects, as it takes the life study of an artist, and architecture alone may be said to embrace the life studies of many men—men of science, men of ingenuity, and men of art. When, however, the architect is so transcendent a genius that he can master his own art and that of another artist, he excites our wonder and our admiration; but to be a bad architect and an execrable sculptor too is not a combination to be admired, and still less to be proud of. It merely entitles the possessor to Martial's compliment, who called the amateur who did so many things nicely a great meddler.

There are one or two more points that I must mention, but perhaps the influence of the age is the most important; in this one direction is what we call the taste of the nation, and it inevitably defines the individual taste of the artist. The old proverb says, "The mind of man is greedy of novelty," and novelty in his life has, no doubt, a certain charm, but it should only be that difference from what has gone before which must inevitably follow from those thousands of things, circumstances, and temperaments that distinguish one age from another. It shows us, too, how ridiculous antiquarianism is when it takes the place of architecture. We are not Greeks, Romans, nor Byzantines; our age is not Romanesque, nor Gothic, nor Renaissance, and if the architecture of the day is to charm the age it must discover and embody the desires of the age. The paraphrasing of deceased styles only charms us in so far as our civilisation approaches that of the date of the building paraphrased, and the building wants novelty too. We naturally do not admire Gothic paraphrases, as the desires of those times are so far removed from our own inclinations. The Gothic architect's passion for geometry is very far from being ours.

The nation, too, has lost all desire for art which is the embodiment of ideas, by which alone the bulk of the people can be taught; now a little scientific jargon, embodied in a newspaper paragraph, or an Act of Parliament, is expected to fulfil the function of art, but any person of observation can see it does not. Art, which should proclaim to the most uneducated the various estimable advantages obtained by being free, by having a voice in the election of its representatives, by belonging to a great nation with colonies, by free teaching, by free surgery and doctoring, by free lunatic asylums, by the free housing, clothing, and feeding of aged paupers, by free libraries, by public parks, gardens, and baths, by free museums and free picture galleries, knows nothing of it, because it is not brought to their eyes by art; in fact, so far is this from being the case that all these benefits, if not unknown, are unnoticed, because art is suppressed in all the buildings which minister to the people's wants. Such buildings should be of the most impressive appearance, and adorned with sculpture, expressive of their use. Splendid tombs and monuments in public places should perpetuate the memory of the great warriors and statesmen, the great inventors and industrial leaders, the great poets, the great writers, musical composers, painters, sculptors, and architects, whose works will make the nation live in the memory of the world when its greatness and glory have departed.

Architects can but slightly modify the desires of an age, as there are so many thousand things, conditions, and influences that combine to mould public taste. All they can do is to have the attainable knowledge and skill required for their art, and if invention in architecture is extinct we

must try to recreate it. I hope it is not extinct, but if it be we still have the mountains, rocks, and peaks, the caverns and grottoes, the woods, the trees, and the plains, the rivers and seas, the clouds and the heavens, to stimulate us to embody the lessons we can learn from these natural effects; not to speak of the lessons we can learn from the past architectures of the world. I cannot help thinking that if the horn architect should arise and be single-eyed in his devotion to this grand art we might hope to see it again flourishing, as in the grand epochs of the past. Antiquarianism is not content with gnawing out the vitals of architecture, but is destroying our faith in its being still alive.

Another of the points that wants attending to is the study of the means employed by the great architects of the world to evoke the emotions proper to the use of buildings, and particularly to those dedicated to the adoration of the Almighty. Students are naturally apt to seize upon features that they admire and use them in the most incongruous way, as if the adornment of a temple or a palace were appropriate to a labourer's cottage, a coal store, or to a tailor's shop, whose owner makes the human form divine ludicrous and ignoble. Elegant simplicity of appearance should be the architect's aim for most of his buildings, as his aim should be to produce horror and repulsion in a prison.

Our great object now is to be sure that we have done our best to learn all that we ought to learn. How delightful would it be if we were as sure of our progress as were the Gothic architects, and instead of being as careful of every scrap left by a semi-barbarous age, as if it had come from Heaven, and were sacred, we could use with a light heart a good stone, as they did, for our own work, and build in their worked part which we have surpassed. I may say this was not confined to Gothic days; the Greeks used the sculpture they had surpassed for filling in holes and trenches, and Mr. Purdon Clarke showed me a Saracenic wood block that had once formed a door-head in a destroyed mosque, the back of which had been used for the work of the day, while the carved part, worked in a former age, had been built in.

If the Institute wants to start this work of fundamental improvement, it will see that its examinations are not confined to students alone, but are to be passed by every one who joins it, and that everything that is not architectural is excluded from the examinations, and that those things alone are included that every architect ought to know to be worthy of the name. No one can say that the arts of surgery and medicine have not enormously advanced since the surgeons and doctors had to pass a strict examination in the subjects of these arts. No sane person can suppose that if architects were required to show that their knowledge rested on a solid foundation of science and aesthetics that architecture would not rapidly progress."

Designs and Drawings Submitted for Prizes and Studentships, 1897.

Mr. W. M. Fawcett then briefly reviewed the designs and drawings submitted for prizes and studentships. The chief prize, he said, for which competition was asked was undoubtedly the Soane Medallion, and the *cool* which accompanied it. Soane was chiefly interested in Classic work, and he (the speaker) believed that the Council had nearly always been particular to give subjects which could well be worked out on Classic lines. The "Market Hall," given this time, had met with but little Classic response; but as no rule was laid down on the subject, and students were left to their own feelings, it was not surprising that the numerous examples of quaint old Medieval and later work had brought ideas to the mind, and dispelled the visions of really early Classic work. Mr. Fawcett then referred in detail to some of the designs submitted for this and other prizes, in the course of which he said that though he had let his criticisms, perhaps, fall a little into fault finding, he could not pass to other work without supplementing these detailed remarks with the more general statement of his pleasure at seeing such a vast amount of really good work submitted for the prizes. There was a great deal of good design, well thought out and well expressed. Speaking of the measured drawing competition, he said that the competition had produced three sets of drawings. Two of these competitors had taken St. Mary-le-Strand, and the third Melrose Abbey. The two first had chosen a subject that appealed to nearly every one as one of the most beautiful of the churches in London, and both students would have gained a good deal by their work, though they had not

gained the prize. The Melrose Abbey was a fine piece of work, and the larger scale drawing of the south transept was done with a strength of line and vigour of execution that showed the energy of the draughtsman. The larger scale foliage was also given with remarkable vigour. If he might make a deprecatory remark on such a set of drawings, it was with regard to a not uncommon fault in the smaller scale drawings of young draughtsmen. In setting out tracery, &c., the fact had not been calculated that the thickness of the outline counted to the tracery while all was clear, but it counted to the shaded part when the spaces were darkened, so that the tracery was made to appear thinner and weaker than it was. This, however, was a minor fault which did not lead to any great misapprehension, and he mentioned it as one on which young men were often tripped up on setting out work of this kind.

The President then distributed the prizes and studentships to the successful candidates (for list, see our last issue, p. 57).

It was also announced that the next meeting would be held on the 1st of February, when a paper would be read, under the management of the Art Standing Committee, by Mr. Alfred Gilbert, R.A., on "The Sculptor's Architecture of the Renaissance."

The meeting then terminated.

THE ARCHITECTURAL ASSOCIATION:
DECORATIVE PLASTER WORK.

An ordinary fortnightly meeting of this Association was held on Friday last in the Meeting Room of the Royal Institute of British Architects, No. 9, Conduit-street, Mr. Bressford Pite, the President, occupying the chair.

The minutes of the last meeting having been read and confirmed, the following gentlemen were elected members, viz., Messrs. E. F. M. Fims, S. H. Evans, W. V. Morgan, and A. W. Waddington.

Mr. Bonister F. Fletcher, senior honorary secretary, announced the presentation to the Library, by the proprietors of the *Builder*, of "The *Builder* Album of Royal Academy Architecture for 1896." He proposed a hearty vote of thanks to the proprietors, which was agreed to.

The Chairman said that Mr. Seth Smith, in furtherance of the suggestion he made in the paper which he recently read before the Association, had forwarded to the committee some suggestions of the conditions for a competition for a prize of ten guineas which he proposed to offer. The committee would consider those conditions, and announce their decision at a subsequent meeting. He (the Chairman) had also to state that Mr. Fellows Prynn, who was one of their vice-presidents last session, had been nominated by the committee to fill the vacancy caused by the resignation, as vice-President, of Mr. John Begg. The committee would nominate at the next meeting, in accordance with by-law 35, a gentleman to fill the vacancy on the committee caused by Mr. Prynn's re-assumption of the duties of vice-President, and they proposed to nominate the gentleman who was next on the election list last session, but who was not elected.

Mr. E. Prioleau Warren then read the following paper on "Decorative Plasterwork":—

Among the subsidiary arts with which the architect has to deal there are few of more general application or importance than that of the plasterer. So much of our construction nowadays is of necessity concealed, and plaster is so handy a means of concealment, and indeed, when rightly used, so excellent a one, that its use in the interiors of buildings is inevitable.

It is a material so sympathetic and lending itself so easily to decorative treatment and the repetition of ornamental design, that a vast amount of decorative plaster work—good, bad, and indifferent, and I fear the last two adjectives are fully entitled to qualify two-thirds of the work—is being daily done. There is none of us who can well escape its use even if he wishes to do so. It therefore behoves all of us who have to do with building and decorating to consider and to learn what can and should, or what cannot and should not, be done with plaster work; and it is much more with a desire to direct the attention of the younger members of my audience to some of its uses and abuses, than with any hope or intention of giving technical instruction, that I venture to appear before you.

One of the first considerations that borders the subject of plaster work is that of its fatal facility—which constitutes a great decorative danger

Its comparative cheapness, its possibilities of rapid workmanship, and the endless and easy opportunities of reproduction that it affords—in a word, its immunity from the natural and powerful restraints that cost and structural necessities impose in most other building materials—seem to me in the case of plaster work to render self-imposed restraint and careful discrimination more than ever necessary to the designer.

We are all of us, unhappily, familiar with the incontinent cornices of amazing horticultural suggestion, with their basketwork and lattices, their vines and passion flowers insecurely supported by internal wires, which bedecked the chief chambers of our fathers. We all know, and none of us, I hope, love, the weirdly confectioned "centre flower" with dependent "gassier" that formed the cherished ceiling ornament of the British householder in the fifties, the sixties, and even the seventies, and dropped, in intermittent fragments, into his tea-cup or his soup-tureen. So fearfully and wonderfully made, so all-pervading were these adornments, that they hegot a natural nausea in time, a nausea that—as often happens in such cases—communicated itself in mental connexion to the innocent material that they vulgarised, causing sober folk to forego an ornament of any kind in plaster work, to find a safe and wholesome refuge in absolute negation, absolute plainness. This was, of course, only a partial revulsion, and was accompanied or followed by "revivals," as they are called, of many types in plaster work, as in all architectural design. The beautiful ceilings and friezes of the seventeenth century, which made our country famous for its plaster work, were studied to good purpose by the very few, to evil by the very many, and "Elizabethan" and "Jacobean" travesties became nearly as rife and rampant as the exuberances of the centre flower period. "Revivals" of Italian, French, Saracenic, indeed, of all and every hygone manner, have been practised, and there are many eminent plaster shops where you can buy a "reach-me-down" design in imitation, superficially correct, of any style you please, at so much—the term is apt—"per superficial foot." These things have had a great vogue with the uneducated. They please because they offer a romantic suggestion of a possibly romantic original, or of the manorial or seigniorial appurtenances of romantic fiction; a suggestion only, for even as copies they are poor, with their dead, level floated grounds, their railway-like rigidity of "run" mouldings, their sharp arrises, and mechanical "repeats." What a contrast they offer to the originals they travesty. Any one who examines, with eyes of discernment, a good seventeenth century English ceiling, will see that, beautiful as the plan of design and forms of ornament may be in themselves, they only count for a portion of the total sum of beauty. The hand of time, and recurrent coats of whitewash, have often done much in contribution of effect; but the intrinsic, ineffable, underlying charm of handiwork, of human pleasure and interest, of "handling" is there.

The plain surfaces are not hard and level, they are full of slight undulations, the ribs or "strap work" have no mechanical rigidity, they are by no means accurate at their intersections, they are softly and pleasantly moulded, and usually modulate somewhat with the uneven surface of the ceiling.

The ornamental foliations—bosses, roses, and the like—when they rep at, do not do so with regimental exactitude; awkward corners caused by irregular wall lines, chimney breasts, &c., are lightly and nonchalantly dealt with; there is no strained attempt at fit, begotten of the drawing-board; the design is curtailed, expanded, chopped off, or twisted to meet the emergency in a manner that would look queer on a smart office drawing, but is delightful in reality.

Experts differ very much as to the methods of preparing the plaster used for these old ceilings, and as to the way in which they were put up. It is, of course, well known that some were rendered in lathing, some on rough withies, and some on reeds or rushes. It is obvious that casting was employed in many instances for the ornamental foliations and bosses, and it is stated that a sort of stamp or pressing-mould was employed for repeating ornaments of small size, such as the roses in the beautiful ceiling at Chastleton, one or two of which I was able to examine closely, as they had fallen down. They certainly seemed to me to have been squeezed into a mould. There are many indications that a good deal of the rib-work was formed by pressing into the plaster ceiling, while still damp, lengths of rib in a similar damp condition. One finds awkward joins and curious failures to fit to

a centre, in the case of radiating ribs, which warrant that idea.

If you examine a fallen bit of plaster from one of these old ceilings you will generally find it very thick and coarse—often very earthy and sometimes full of little bits of gravel, &c., the kind of stuff the conscientious architect would have to condemn. But its very coarseness helped the effect of the plain surfaces by giving them texture, a quality we so often miss nowadays. How the elaborate and complicated ceilings were designed and set out we do not know with certainty, but there was probably a rough plan, which was all that a well skilled workman needed—he had his tools, his models, and his traditions. That he had models of ornaments for ceilings and friezes we know, as we find exact repetition not only in different rooms of the same house, but in different houses. And you will often find ornamental designs, obviously intended for a ceiling, formed into a frieze or used to decorate the spandrels left between the horizontal frieze and the end of a vaulted ceiling, as in the library at Merton College Oxford. It is probable, however, that much if not most of the decorative design was modelled *in situ* on the ceiling itself partly with tools, partly with fingers.

When fingers were used upon the actual plaster it is obvious, as any plasterer will tell you, that the line used cannot have been as sharp as that we use now—it must have been old or deadened, or no man's fingers would have stood it.

There are many lessons to be learned from the abundant examples, to be found in almost every county of England, of beautiful old plaster work, while Scotland, Wales, and Ireland have their characteristic examples, and one of them is the extreme importance of plain surfaces of texture. I am glad to know that within the last few years that lesson has been taken to heart by one or two artists who have turned their attention to plaster work.

There were some striking instances of the fact in the work of Mr. Ernest Gimson at the last Arts and Crafts Exhibition; work full of charm and feeling, and quiet originality, and delightful in uneven surfaces, roughish texture, and broad unlaboured modelling—work as different in spirit from the average mechanical plaster work of to-day as was that of the Elizabethan or Jacobean plasterer. I believe that the first essential of success in plaster work of frieze or ceiling is the treatment of the ground. It will be difficult but necessary, if we are to succeed, to wrest from the modern workman his ideal of perfect even-floated and set levels, innocent of the faintest undulation as fresh thin snow over a sheet of ice—and looking just as cold and hard. It is amazing with what skill a good and conscientious plasterer, armed with his float and straight-edge, will arrive at that result. It is neat, it is smart, it is difficult to do, and he is proud of the achievement, and I don't blame him; he does well what is expected of him, and satisfies his conscience, we will hope. When his ceiling is to be sub-divided by ribs or decorated with ornament of any kind, he still appears to be ruled by the instinct for sharpness, hardness and rigidity. He starts with a billiard table surface, the ribs are "run" with a zinc mould *in situ*, or are cast in a "run" reverse mould and put up subsequently, the ornaments are cast from sharp feelers, models, and the work reaches a wonderful perfection of mechanical accuracy which, to the mind of an artist, is its glaring imperfection. The arrises are sharp as razors, the beads are round and smooth as glass tubes, a core pondence religiously exact is maintained on both sides of a centre line. The cornices are run as accurately, as mathematically as the rest, and the drawings and details are faithfully observed. The result is naturally as unsympathetic as the method.

I speak of the average. I am well aware that, fortunately, there are exceptions—I am happy in believing that they are many, and the number seems likely to increase rapidly as architects increasingly devote more time and thought to what is one of the most interesting and important crafts amongst the many that they rule. What we need, it seems to me, to fit us for a more competent control of plaster work—as of so many crafts, is to draw less and model more. Fortunately, within the last few years a good many sculptors of talent have turned their attention to decorative plaster work, and beautiful ceilings, friezes, and panels in low relief, stand to the credit of several men whose names are well known to you. There is an increasing demand for decorative work in plaster. People, even of moderate means, are no longer generally content with the blank white lids of the boxes they live in. This discontent is exemplified in many ways, one of them is that suburban joy, the patterned ceiling paper; other indications are

the patent substitutes for modelled ceilings whose illustrated catalogues, with their alluring titles, are lavished on the letter box and waste-paper basket of every architect. A desire for decorative friezes is also prevalent, and is exemplified by precisely similar instances. I think this discontent is responsible for many queer results and unlovely makeshifts, it is not in itself ignoble. It is our business to divert it into wholesome channels. The instinct to enrich the ceiling or the roof is, I think, a natural and an obvious one—the roof is surely as worthy of adornment as the walls. In a church or a great hall it is, or should be, the crown and glory of the whole scheme. In domestic work, in the home of the average comfortable Briton, the cheap substitute for modelled plasterwork obtains a readier acceptance on account of the fact that we dwell—most of us—like hermit crabs, in other people's shells. The leasehold condition of our occupancy has begotten a leasehold type of decoration. The householder wants something that will "last my time, don't you know"—or, at any rate, suffice for seven, fourteen, or twenty-one years. So he not unnaturally shrinks from permanency, which implies cost, and he thinks that real thing costly; but, as a matter of fact, it is by no means necessarily so. With care and thought, and a little ingenuity, it is possible to get good decorative results in plaster at small cost. There are many ways, for instance, of redeeming the absolute bareness of a plain plaster ceiling, without much expenditure. You can have a well moulded cornice and divide your ceiling into plain panels by means of shallow ribs. At very little extra cost if your design "repeats," you can put some simple little ornament into the panels. You can dispense with ribs, and have ornamental cornice pieces and a centre; or you can have the general plain, and have an ornamental border near the cornice, and modelled in low, broad relief. Where your conditions make it possible, and, I should say, in a longish room or corridor, you can drop the cornice a little way down the walls and form your ceiling to a shallow curve. This may be delightful in itself, even if quite unrelieved, or can be very effectively decorated with light ribs at intervals and simple flattish ornaments. There is really no end to the simple and effective possibilities of very slightly decorated ceilings. I have seen an old ceiling in a low room at Oxford which has four corner ornaments and a centre, very simply modelled in a highly conventionalised grape vine design—and it wants nothing more—but the plain surface is such as would horrify the skilled plasterer of to-day.

The ceiling under an ordinary collar-rafter roof frequently gives a pleasant opportunity for plaster decoration. You can accept the splayed side between ceiling and cornice, and treat it as a sort of sloping frieze, ornamenting the flat under the collars more simply and sparsely, or you can fix out and form a curved or vaulted ceiling, as I have suggested before; and a vault is one of the most delightful fields for decoration.

When cost is not a closely restrictive consideration, the range of possibilities is wide for ceiling, frieze, decorative panels on chimney breasts, or such like positions, or for the treatment of the walls themselves. It is sometimes desirable—in a hall or a ball-room, for instance—to treat the walls with a permanent architectural decoration that precludes further adornment by means of pictures, wall papers or hangings, and this, if you use low relief and have a good protective base or dado, can well be done with plaster work, by means of pilasters, decorated panelling, reliefs, &c.

If pilasters are used, it is generally advisable to enclose the plaster relief in a wooden frame, for preservation's sake. Whatever the field of your decoration, it is necessary, of course, to use restraint to avoid over-crowding and fussiness; to aim at a broad decorative result, to remember that you will cheapen your devices by over-repetition, and spoil your ornament by over-elaboration. The eye wants some unadorned spaces to rest upon. It seems to me in most cases wise to have rather plainly treated walls and a simple frieze, for instance, where your ceiling is elaborate, and a simple ceiling where you want an elaborate frieze. It is hardly necessary to say that your plaster work should be "plastery" in effect, round and soft, and should not imitate the treatment of any other material.

The ceiling, frieze, panels, or whatsoever forms the plaster work may take, should fall into the architectural scheme of the interior they contribute to, they must be in coherent relation to

rest. The scale must be preserved. And there are many considerations to be taken into account in designing a frieze or ceiling. The proportion of the room, of course, first. It is obvious that the same design would be inappropriate—in one instance, if applied to two rooms, one of which is 10 ft. high and the other 20 ft., and that a long, low room needs different ceiling treatment to a high square one. Then the lighting must be taken into account. Where the tops of the windows reach nearly to the ceiling, and especially where a longish room has such windows pretty evenly distributed along one side only, very delicate relief will tell at a considerable height. In the same room if the windows are low, or so small as to give inadequate light, the relief will require to be bolder in order to tell. A room lit from two opposite sides, giving a strong cross light, is the most difficult to treat successfully. The cross light defeats the shadows and spoils the effect of relief; in such a room greater emphasis, greater sharpness of modelling is advisable. All these remarks are intended to apply to daylight effects, but artificial lighting should be considered, too. In great reception rooms, chiefly used at nights, and in all rooms intended to be brilliantly lit—say, by electric light—it is well to keep the relief rather softer and more delicate than in rooms of more ordinary character by illumination.

As a general rule, in an averagely lighted room, to 13 ft. or 14 ft. in height, the relief of ceiling-buildings or ornaments does not require very cast projection if the ceiling is left white or early white, as relief looks exaggerated. Ribs, think, are best rather broad and shallow in form, and with a tendency to round members rather than sharp-arrised ones. Their size, of course, must depend upon the scale of the room, the heights at which they occur, and the effect aimed at. Constructional beams dividing the length of a ceiling frequently help the design greatly, and are capable of very effective treatment in themselves. In many splendid old ceiling the ornament was confined strictly to the beams and the cornice with which they intersected.

When there are no beams, I am personally inclined to prefer detachment between the decorative design of the ceiling and the cornice. I leave a margin left along the cornice. This helps you if you wish to leave the ceiling whitish and to colour the cornice; and, generally speaking, the cornice must be regarded as the crown of the wall and not as the beginning of the ceiling.

However, that is, after all, a matter of design circumstance; it is risky to generalise too early. But it is safe to say that too much attention cannot be bestowed, first, on the ground surface—whether of ceiling, frieze, or panel—second, on the modelling of any ornament, whether simple rib or foliated or arabesque design. If you cannot be sure of getting good modelling, have none at all: find safety in plainness. If you wish to avoid sharpness and hardness, have ribs and cornices modelled, not sharp. Keep them simple and broad, not heavy and wiry. Generally speaking, I believe that for ceilings a more or less symmetrical basis for the leading lines gives the happiest effect; the arrangement should, at any rate, be ordered, if not formal. But whatever the basis and whatever the treatment, the design should essentially be a ceiling design, the ornamentation of a flat surface—to be seen from below and in a room where it is intended to be seen from all points, it should "read," as it is called, in all directions equally well, though it may have main longitudinal or lateral tendency. It is, perhaps, hardly necessary to counsel the avoidance of any obviously unsuitable type of design for a ceiling, such as swags and festoons—imitable, perhaps, on a vertical surface like a frieze, where the sense of vertical dependence is appropriate, but inappropriate and awkward in a ceiling. A frequently effective treatment for a frieze is to have some form of ornament repeated at wide intervals, the interspaces being either quite plain or filled with a plain moulded line.

I have so far dealt with the consideration of plaster work for the interiors of private houses. Great mansions and great civic buildings differ in degree rather than in kind from these, and, as regards their internal plaster work, the principles applicable to smaller buildings apply to them. Where deep-beamed and coffered ceilings are used, greater structural support is needed for them, and bolder modelling and moulding, of course, to preserve their relation in scale to their architecture. They often, however, present the

decorative problem of the treatment of domes, of which in a civil building, I have not yet seen a strikingly original treatment in plaster work. I have seen, you have all doubtless seen, dozens of domes treated with diminishing coffered panels, whose frame-work ascends on converging radial lines. Wren left us many fine instances of these. The dome of St. Stephen's, Walbrook, is, I think, the most beautiful instance I know. In this dome there are four tiers of diminishing coffer panels, the second above the cornice, and the final one having panels corresponding in width to two of the first and third. And, indeed, Wren's churches, and those of his pupils and immediate successors, provide an abundant field for study of a certain type of design in plaster work, mannered and formal very often, but full of vigorous character and excellent workmanship.

A great deal of the plaster work, which is by no means confined to the ceilings, of our city churches is, of course, subject to the criticism of being in direct and purposeful imitation of classical Italian models in stone or marble. The coffered soffits of the arches of St. Bride's, Fleet-street, of St. Katherine Cree, show this strongly, and it is observable that in St. Paul's Cathedral the stone and plaster details are precisely of the same character. In St. Stephen's, Walbrook, there is much fine plaster work beside the dome; there are light and narrow arch soffits with running patterns of roses, &c., and the transverse arches of the vaulted roof mark the plain vaulting bays—unrelieved except by a large central boss—with a holly-moulded band of convoluted foliage ornament. The churches of St. Mary Aldermay and St. Katherine Cree both have groined Gothic ceilings in plaster—very reprehensible theoretically, but distinctly picturesque. And at St. Mary's Aldermay the arch spandrels of the nave arcade are charmingly filled with coats of arms, and flowers, and fruit, &c.—a good instance of the effect of confining ornament, using it to give special emphasis to particular features of construction—the wall above the arches being perfectly plain. Christ Church, Newgate, shows a sparing use of plaster adornment. And the beautiful little interior of St. Anne and St. Agnes, Aldersgate, shows in its large decorative panel borders, its shallow arch cofferings, and the enriched soffits of its corner spaces, some graceful and delightful examples of this Anglo-Italian Architectonic style of plaster work.

It has been reserved for the last few decades of this century, and the devotees of the "Gothic Revival," to find that plaster work is inappropriate to the interior of a church. In the seventeenth and eighteenth centuries, and until near the end of the first half of the nineteenth, plaster ceilings were the rule and not the exception in churches.

A great many very charming ones have disappeared before the hand of the restorer, but several seventeenth and numberless eighteenth century examples remain. I am glad to see that plaster work is regaining its place in church interiors; it provides, at any rate, a pleasing variant to ceilings of stained or painted deal, or to open roofs with timbers of small scantling and wrought "die-square." For the enriched ceiling of sanctuary chancel or side chapel, I think it is a most excellent material; and the invention of fibrous plaster makes it possible, with little difficulty and comparatively small cost, to use enriched plaster work, not only for ceilings, but for other decorative purposes in churches.

The slabs of plaster which bear portions of the design, or completely fill separate panels, are put up like wood-work, and screwed to the rafters, or firing pieces, put to receive them. Each slab should be composed of thinish plaster, embedding layers—usually two in number, I believe, of very wide-meshed canvas; the plaster being worked well through the meshes. They are stiffened with laths or battens, and can be worked to any required angle or curve. If the relief is not great they are very light. Where a number of slabs have to be joined to form a ceiling, without intermediate ribs, it is customary to pack damp canvas between their meeting edges, which not only protects them, but forms a stiff setting when it dries; the fissures are subsequently pointed in with plaster. Brass screws should be used for fixing, and the screw-holes, of course, must be stopped in. If steel screws are used, the heads require to be coated with japan or paint to prevent the inevitable rust from staining the plaster.

I put up a panelled ceiling of this kind over the sanctuary at Groombridge Church some two years ago. I believe that many of you have visited that building. In that case the panels

were each in one slab, and their edges were clipped by the overlapping oak ribs and fillets.

In my Church of St. Clement's, at Bradford, I had the good fortune to secure, for the decoration of the chancel roof, the services of Mr. George Frampton, who modelled the fibrous plaster ceiling, and of Mr. Anning Bell, who coloured it.

In this case Mr. Frampton was first provided with a model, to a scale, I think, of one quarter full size, of one side of the covered inner roof. On this he modelled his first sketch, which with some other details of the ceiling, he afterwards exhibited at the Arts and Crafts exhibition two years ago. He then set to work on a full-sized model of the eastern bay, and upon the repeating ornament of shields and rose trees, and the frieze of cherubs that fill the rest of the ceiling. Casts were made from his models and were screwed up, joined, and stopped in the manner I have before described. The ridge, cornice, and vertical ribs are of deal, and are painted and gilded with the rest of the ceiling, which was dry and paintable within a day or two of fixing.

The use of fibrous plaster enables one to escape the flatness and rigidity I have spoken of as due to finishing surfaces and running mouldings. The casts bear the direct impression of the modeller's handiwork. The use of this material is not without its artistic dangers, the chief of which is that its modelling is not as a rule done upon the actual ceiling. It is possible, of course, to model *in situ*, and then cast from the models elsewhere, and that, I fancy, would be one of the safest ways in which to prepare the design of a fibrous ceiling; for nothing can quite come up to the actual position and the actual lighting of the building for which the work is destined. The next best method is to arrange your model in the workshop at as nearly as possible the height that the ultimate casting will occupy, approximating as far as possible the conditions of light and surroundings, and modelling the ceiling from below. If you cannot manage this, it is wise, at least, to get your model either conveyed to the site it is to occupy, or hoisted up in some similar position for your judgment of effect.

It is essential in case of a ceiling with a cornice, and divided by plaster ribs, to have cornice and ribs cast from models also, not run. In the case of ribs this can be efficiently done by casting a reverse from the first model and pressing the clay into it to form ribs for the model section of the ceiling. The laying of the moist clay ribs into the ground surface of the model insures the avoidance of rigidity. I have said that it is impracticable to mould with the fingers the actual plaster so as to avoid casting altogether, unless that plaster differs very much from what we generally use. But that difference is now obtained, as I am told, by the use of old or deadened lime, and some special kind of sand, and ceilings and other decorative work are modelled in plaster and in position. That, it seems to me, must be the best plan possible when the object is to avoid repetition, and when cost admits of it; for where exact repetition can be avoided the better will be the result.

The consideration of decorative plaster work for the exteriors of buildings is almost a subject by itself. As you know, a great use of it was made in certain districts, the Eastern counties especially, in the fifteenth, sixteenth, and seventeenth centuries. "Sparrow's house" at Ipswich is a striking instance of rather coarse and crude, but very picturesque, adornment. A good deal of external plaster work (using that term to cover work in cement and sceleritic mortar) has been done in our time, as several of Mr. Norman Shaw's buildings testify. Until quite recent times the old traditional and delightful "stick-work" was done by village plasterers on rendered cottage fronts, but I fear that tradition has gone the way of many others.

One suggestion I would make with regard to external work in low relief, is that the relief should be stronger on the north side of a building than on the others.

I have now only a few words to say as to the treatment of finished internal plaster work. When the plaster—fibrous or otherwise—is perfectly dry, it can be treated with a thin coating of wax dissolved in turpentine, wiped or rubbed here and there with a rag; this gives it a pleasant, soft, ivory like appearance that is more agreeable than the even tint of distemper. (At Groombridge I had the shields and emblems entirely gilded, and then glazed over partially with thin oil colour, the whole of the remainder being waxed.) If heraldry is employed, the coats of arms must, of course, be coloured, or the blazonry is incomplete. There are some good instances of the effect of emblazoned coats occurring in a general field of

toned white plaster in the cloisters of Corpus College, Oxford. It is a contrast of which I am fond, that of richly tinted heraldry and toned white plaster work. In church work it is likely that colour over the whole surface of the work may be needed, and this presents no difficulties either in the case of oil colour or distemper; in the latter case the suction of the plaster will probably need to be stopped with a coat of priming. I referred just now to the effects of a cross light. In my opinion a ceiling lit from both sides requires colour, and, perhaps, gilding, more imperatively than one lit from side or end only, when the relief gets its full value through shadows.

Plaster reliefs may, of course, be readily used for decorating wall spaces or arch spandrels in churches.

There is, in fact, no end to its decorative applicability.

Time, and your patience, would fail me if I endeavoured to cover all the ground of my subject.

You will notice that I have omitted all consideration of Sgraffito work and Scagliola, which certainly come under the head of decorative plaster work; I did so advisedly, for the former subject alone would readily fill the limits of a paper like this.

For similar reasons I have not treated of foreign work—Italian, French, Spanish, or Mauresque, European or Asiatic—the subject is really a tremendous one. If I have succeeded in arousing any interest or enthusiasm for a very attractive craft, I have realised the full intention of my paper.

Mr. L. A. Shuffrey, in proposing a vote of thanks to the lecturer, said that Mr. Warren had touched upon most points connected with his subject, provided a line was drawn at the type of plaster work which was illustrated by the specimens exhibited in that room. But plaster work went a good deal further than that in England. In the Adam work, for instance, about which they had heard nothing that evening, there was a great deal of beauty, and there were many situations where that work seemed to be exceedingly suitable. But they would have to start upon it with rather different ideas from those suggested by the lecturer, otherwise they would find difficulties to contend with, as in the idea that the ground was to be wavy or uneven. He thought that a plain ground answered the purpose very well, especially if it were considered as a contrast to the modelled work which was put upon it. He remembered an important piece of advice which Mr. Stephen Webb gave him some time ago, and that was, when modelling ornament upon their ground, either in plaster or clay, a little bit of clay just rubbed along the edge where the modelled work intersected the ground, would do much to check the harshness which would otherwise result. He would like to lay stress upon the point that the lecturer had referred to as to the value of the ground. There was no doubt that a very little ornament, indeed, could be made to go a long way, and it was often found that a great deal of trouble was taken to model or to construct ornament which it would be better to remove altogether. In regard to the model of the frieze which Mr. Warren had brought there that evening, it would be much improved, he thought, if a considerable amount of the ornament were removed. As ornament largely contributed to cost and labour, this point should be kept in mind.

Mr. W. Millar said that in regard to the Adam work, it was not plaster at all, but composition, and it gave very little exercise for the modeller's art. Fibrous plaster had its advantages and disadvantages. Comparing it with lime plaster, it did not possess many advantages—for one thing, it did not afford the resistance to sound that lime plaster did, owing to its thinness, and it was not so fireproof, because it was backed with wood. It was generally believed that fibrous plaster was a modern invention, introduced by a French modeller about fifty years ago. When working in Paris, he had discovered a book on architecture by an architect who had visited Egypt, in which it was stated that the method of working fibrous plaster—plaster and linen—(canvas was apparently not known) was certainly practised in Egypt in the fourteenth century just as we did it now. In reading up for his forthcoming book on plain and decorative plaster work, he had discovered that fine linen and plaster were often used formerly in the decoration of coffins, while mummies were swathed in fine linen and plaster. Fibrous

plaster was very useful for ceiling work and in renovating old ceilings. At the extension of the Holborn Restaurant the fibrous plaster ceilings were fixed before the roofs were on, each floor being taken in succession, beginning at the bottom and working upwards.

Mr. Hampden W. Pratt seconded the vote of thanks to the lecturer, and said that with all the plaster work that was done now it was surprising that the speculative builder was so conservative in clinging to that old feature, the centre flower or ceiling flower. If there was one thing he was brought up to abominate more than another, it was that one ornament in the centre of the ceiling, and he was surprised to hear Mr. Warren speak of it as a legitimate feature. No doubt it could be done very nicely sometimes, but then one had to get out of one's mind the prejudice for centre flowers which were screwed up to the ceiling. With regard to modelling plaster so as to suit the light in the different rooms, that was an exceedingly difficult thing to do, more especially when daylight as well as artificial light had to be considered. It was really time to seriously reconsider the question of designing mouldings and ornament for ceilings now that the electric light was so much used in lighting rooms, for electric light did light up our ceilings more than either gas or other lights, and it produced very strong shadows. He was glad that Mr. Warren had referred to that illegitimate treatment for ceiling work, viz., the "swag." There was good authority for doing it in some of the old plaster work, but it seemed absurd, although an everyday occurrence, to hang swags on a flat ceiling.

Another mistake which was frequently made was in treating the cornice as part of the ceiling instead of as part of the wall. It was better to start with the idea that a cornice was part of the wall and not of the ceiling. The frieze was such an ordinary feature nowadays that if it were properly treated in connexion with the cornice would naturally form a crown or finial to the wall. Over-ornamentation was, no doubt, very frequently practised, and, in order to get good effect, reserve in all these matters must be very carefully studied. In regard to external work, he would have liked the lecturer to have given them a little more information on that point. No doubt others beside himself had had the same difficulties in getting external plaster work that would be weather-proof. Portland cement had been referred to, and he should like to know what plaster work could be relied upon for exposed positions.

The Chairman asked if there was any specification of proportions and materials that Mr. Warren would recommend for ornamental plaster ceilings. They had heard a very careful and accurate account of some specimens of old work which the lecturer had examined, but it would help them if they could have definitely from him a specification as to sand, and its proportions, at the time that he would recommend, and hints to workmen as to its proper slaking, and as to the advantage or disadvantage of using old lime. Mr. Warren had not mentioned Parian cement: he (the Chairman) was under the impression that Parian was comparatively easy to work with the fingers; that there was not the objection to working it with the hands that there was with ordinary plaster.

Mr. Millar said that Parian was formed from gypsum, so that they had plaster in a different state. Various solutions were applied to gypsum to give it hardness. Parian was a good material to model in, for it was pliable and mellow, and it afforded time to manipulate properly.

The Chairman said that that was an interesting and important point. In a ceiling recently done for him, with some amount of decoration about it, they floated in Portland and then set in Parian, after which the Parian was cut out back to the Portland, and the Parian ornaments were run in. Mr. Warren had wisely confined his attention to a particular class of work, viz., the domestic plaster work of England from the Jacobean period down to the beginning of the Adam time.

There was a point in what Mr. Shuffrey had said as to the eye-enjoying freedom in the ground; there were cases in which it was just as valuable to have it as in other cases it was valuable to be without it; and he (the speaker) thought that in proportion to the light and height of the room they required smoothness of ground and sharpness of detail; that where the light was moderate and the room was small in proportion and height, the more unevenness there was in the ground, the more delight there would be in the ceiling, and the freer and softer the mouldings the pleasanter it would be to the eye. He was very much averse to leading any one to suppose

that because a thing was uneven and rough it was beautiful, or, on the contrary, that because a thing was smooth and regular it was beautiful. They must be careful in avoiding Scylla that they did not fall into Charybdis. During the last excursion of the Association they saw a great deal of interesting plaster work in the heart of Kent. Those who took part in that excursion would remember King Charles's Chapel at Tunbridge Wells, Groombridge, and Holmbury, where there was an interesting ceiling which attracted some attention because the number of scattered bosses suggested to some of the members the practice of some nineteenth century decadent artists of leaving work unfinished for the sake of effect. An inspection of the work showed, however, that the design for the ceiling existed, but that it had not been completed. The effect was picturesque, but wholly accidental. At the Bank of England there were some interesting little domes in the passages and corridors, which were of plaster, and which would well repay a visit of inspection; and in modern work there was a charming ceiling by Mr. Macartney in Berkeley-square.

The vote of thanks was then put to the meeting and carried by acclamation.

Mr. Warren, in responding, said that in reply to Mr. Shuffrey as to the omission of historical information, his paper was not intended to be chronological. With regard to the Adam work, he had not omitted to refer to it with any slighting intentions, though he might add that he did not find it of the same exciting interest as the work of previous periods. It was dainty and pleasing, but very imitative. It not only repeated itself over and over again—its stock in trade they all knew; but those forms were not original, as an inspection of some of the old work at Rome would show. There was a traditional style about it, and the Adam brothers knew what they were about, and produced graceful and refined results. He had omitted specific mention in his paper of a great deal of Queen Anne work. His object had been to use past instances to exemplify qualities which he thought of importance. Mr. Shuffrey's criticism of his frieze was true, but he might point out that he was building up to what existed, which was a ceiling with very heavy beams. As to the question of the flat ground, he thought an absolutely flat ground was unpleasant.

Mr. Shuffrey asked how they could avoid it?

Mr. Warren said they must get the workman to give up the absolutely level floated ground. In the use of fibrous plaster there was no difficulty. Mr. Pratt seemed to think that he (the speaker) was in favour of the centre flower for ceilings. There was all the difference in the world between the centre flower which was palpably stuck on and the centre-piece which was worked into the ceiling. As to the influence of the electric light on ceilings, that was an important point. Since the adoption of the electric light objects were made more definite, and he did not think that the ceiling was thereby improved. He thought that they would have to pay special attention to mouldings, especially ceiling mouldings, where the electric light was used. As to external plaster work, he had not used it very extensively. He had used chiefly Portland cement and a silicious wash to give it the colour he required. Mr. Millar would no doubt be able to give them the information as to the nature of lime and the proportions which were best to put into the specification. As to the beautiful ceiling at Ashburnham House. The treatment of surfaces could easily be overdone in a room where the electric light was used, and great care was necessary in order to prevent this. It was extremely important also, where work was costly, to employ for ceiling or other plaster work a good artist, and leave the design to him. The more that was left to the modeller the better.

The architect should be responsible for the general lines of a decorative scheme, but the modeller, who had technical knowledge and skill, should be left to supply the details.

The Chairman, in calling upon Mr. Millar to add a few remarks on the question of specification, said that the ceiling in the passage to the building in which they were assembled was a charming example of a plaster moulded ceiling. The ceiling above them was a mixed blessing.

Mr. Millar said that, as to the specification of materials for ordinary plaster ceilings, the old Roman laws enforced a period of three years before lime could be used, and that was a law which might be followed with advantage at the present time. As to Portland cement, he could not see any objection to it, because it was

the strongest known cement we have. There was objection to the colour, but the material could be coloured to any requisite tint by the use of oxides. As a substitute for Portland cement, there was silicious or any hydraulic lime. Portland cement could always be modelled in, because it was so soft and pliable; but it must be finished up by the modeller went along, for it could not be left like clay or wax. As to the effects of light on ceiling work, he wished that architects would encourage hand work rather than cast work, as there was more opportunity for doing satisfactory work under such circumstances. The effects of light and shade could be better realised by the worker. As to cost, it ought to be as cheap as cast work, which in the first case had to be modelled in clay, then moulded, and then cast and fixed; whereas hand work could be done in one operation.

The Chairman announced that the next meeting would be on the 5th prox., when Mr. A. S. Flower would read a paper on "An Unwritten Chapter of English Architectural History." The meeting then terminated.

THE LONDON COUNTY COUNCIL INQUIRY.*

THE Special Inquiry Committee resumed and completed the examination of Mr. Blashill, the Superintending Architect of the London County Council, on Wednesday, January 13, at Spring Gardens, Sir Arthur Arnold being again in the chair.

The Chairman expressed a hope that the examination of witnesses would be concluded within the month, in order that the report of the Special Committee might be ready for consideration by the County Council before the end of the financial year. He also stated that Mr. Holloway, President of the Master Builders' Association, and a gentleman familiar with the conditions of carrying out engineering works in the Straits Settlements, had expressed their willingness to give evidence before the Committee.

Dr. Collins, in continuation of the examination of Mr. Blashill, asked for further information with regard to the inferior lime and timber referred to in previous questions, and with respect to the defective work discovered in a drain. With regard to the last point, the Architect said the defects were discovered through the drain being improperly laid in the first instance. It had been necessary to take a portion of it up, and in making the necessary alterations the defects were discovered. In the cases referred to, where the wages bill had been excessive, the workmen had put in more work than was necessary. It was not in painting only that this fault was observed. There was a case of brickwork, which was grouted where grouting was not necessary. Since the Architect's complaints, a method had been found to prevent disputes, and the jobbing work was now done to his entire satisfaction. In reply to further questions, Mr. Blashill repeated that the later works undertaken showed better results than the earlier works, that while work upon foundations always showed a profit, work upon superstructures generally showed a loss. He had expressed a hope that eventually the Council would succeed in attracting the best workmen, but so far that had not proved to be the case, but it must be admitted that the circumstances had not been favourable. He thought the dual method of letting some jobs to contractors on tenders, while reserving the right to execute others by direct employment, a good one. Where the employer had the power to do the work for himself at will, he had a check upon the contractor who might otherwise think he had the matter entirely in his own hands.

Mr. Dickinson cited a long list of jobs for which the total estimates amounted to 157,571*l.*, while the tenders accepted amounted to 162,454*l.*, or about 3 per cent. higher. Mr. Blashill said he could not charge his memory with details, but he had no objection to the inference sought to be drawn. In further reply to Mr. Dickinson, who also referred to the greater cost of the earlier jobs, the architect thought the difficulty necessarily arose from starting too many jobs at once with insufficient plant, but the chief cause was not getting enough work out of the workmen. There had in the past been great waste of time on these jobbing works. That arose from the Council's workmen, so far as he could gather, having a somewhat bigoted adherence to what he might call trade rules. It had been the rule that one workman must take another to a job. If

said nothing against that, but when it came to the case of the mere tightening of a joint, and the plumber examined it and then sent for the fitter to carry out the work, the cost was out of all proportion to the work done. A man would not act in the same way if he were a contractor's man. Matters were now improved, though there was something of the old spirit left. The men who were now doing jobs seemed to have a better notion of what was wanted, and they were better looked after. He would not abolish the Works Department, but he feared, with all the calls upon his time made by his own department, that he could not find the time for the supervision of that Department.

In reply to Mr. Gruning (architect) one of the assessors, Mr. Blashill stated that the quantities were taken out by his estimates by four quantity surveyors who were paid by the Council. The cost of the quantities was not added to the cost of the works. There had been no material alteration in the method of getting out the estimates. In giving out contracts he thought it better to select from a list of builders, the number in the list being considerable, than to offer work by open advertisement. In answer to other questions by Mr. Gruning, the witness said that all the jobs which had been refused by the Works Department had been afterwards carried out by contractors for amounts which were within the estimates on the whole. On one job carried out by the Department he found mortar being used of such a nature as would not only have been condemned had a private builder used it, but the builder might have been prosecuted. He could not pass such material. A sample of the mortar was asked for and produced. On the question of discounts allowed to the Works Committee he said they were of two classes—a cash discount of about 2½ per cent. with regard to which there was no question, and a larger amount allowed as trade discount for which he had required to see vouchers, but he had had the greatest difficulty in getting these from the Department.

Mr. Gruning: Why? They thought if I knew I should strike off the difference, if any. The witness added that the names of contractors were never submitted to him, but he recommended that the names should be submitted to some responsible officer of the Council like himself.

In reply to Mr. E. Waterhouse, assessor, the witness said it was important for the architect to see the works from time to time in order to be able to give certificates. He did not inspect for the Works Committee. In preparing his estimates he had to take care that they should not be higher and should not be lower than those which a substantial builder would prepare. Questioned with regard to the addition in the schedule of prices for jobbing works of 12½ per cent. upon the School Board schedule, Mr. Blashill explained that the 10,000 items in that schedule had been fixed at the cost of a great deal of trouble. He had adopted that schedule, but had found it necessary to add several thousands of items to it. On finding that on these latter there was an increase of 12½ per cent., he had increased the whole by that amount.

In reply to Sir Godfrey Lushington, the witness said he had not a list of these jobbing works. The fact that the actual cost of a certain list was 12,784*l.* upon a schedule value of 13,678*l.*, proved that the prices had not been exceeded, but it did not prove that the works would not have been done more cheaply by private contractors.

Mr. Jackson, the Assistant Solicitor to the Council, was next examined by the Chairman, Mr. Dickinson, and Mr. Beachcroft. The witness put in a statement, showing the changes made in the conditions of tendering since the institution of the Works Department. He stated, in answer to questions, that in the form of contract there had been no alteration.

Mr. Ilaward, the Comptroller of the Council, was next called. He put in a long statement showing the irregularities he had discovered in the accounts, and giving an analysis of the cases of what he termed fictitious transfers. The earliest irregular entries appeared in the books in July, 1895, the total amounts concerned for that and the current year being 7,229*l.* 11*s.* 10*d.*; about one half related to temporary buildings at Colney Hatch. Suspicions were strongly aroused on items being charged to the account of "Bexley Asylum Foundations," of materials such as yellow deal and flooring, hard core cement and lead pipe, which could not have been required in such foundations; and again in the same month (March, 1896) a charge to the account of "Lewisham Sewer" of yellow deal valued at 920*l.*, and bricks and cement amounting to 77*l.* 18*s.*, the

total sum represented by these fictitious transfers being nearly 1,000*l.* On examination, it was found that the Bexley job was not commenced until the April following, and that the delivery of materials did not commence until April 16. An examination of the Colney Hatch materials sheets, moreover, showed no record of the dispatch of the materials on the dates given in March. The Comptroller caused an abstract to be made of all the timber which had been sent to Colney Hatch, and compared it with what was credited to Colney Hatch as having been sent away to other jobs or returned to stock. He found that the total debits to Colney Hatch were insufficient to cover the surplus material purporting to have been sent away from Colney Hatch to other jobs. Both in value and quantity there appeared in many instances to have been more materials sent away after a job was finished than were ever charged to the job in the first instance. It was only after a prolonged investigation that the manager admitted that "An error had been made." In concluding his statement the Comptroller observed that he had no authority to go behind the manager's certificate, and that it was only the peculiarity of the circumstances that induced him to do so. The documents were in some cases tampered with, and there appeared to have been collusion between various officials of the Works Department. The whole subject was full of difficulty. Builders' cost accounts necessarily involved questions of a highly technical and intricate character. The difficulties inherent in such accounts were much increased during the first two years of the existence of the Works Department, owing to inadequate staff, want of organisation, and the condition of the premises at Belvedere-road. The regulations framed in 1894 were now being revised by order of the Works Committee.

In the course of his examination the Comptroller stated that the malpractices had not involved any pecuniary loss to the Council. If it had been so it would have been a case of fraud, and it would have been more easy to discover the irregularities.

The inquiry was then adjourned to Friday, January 15, when the examination of the Comptroller was resumed by Sir Arthur Arnold, who asked for further explanations with regard to an allowance of 963*l.* 10*s.* claimed by the Works Department in respect of extra cost to which they were put as compared with a contractor. The witness's opinion was that the claim should not be allowed, but it was a point to be considered.

In reply to Mr. Gruning, Mr. Howard said he had no special acquaintance with builders' accounts. The accounts of the Department might be more numerous than those of a builder doing the same amount of work, because the accounts of a public body must be more complete. He would not express an opinion as to whether a capital of 175,000*l.* for a turnover of 240,000*l.* a year was inordinate.

In reply to Mr. Dickinson, the witness stated that certain irregularities would, he thought, not have been found out if the late manager had not admitted them. He thought it would be advisable to appoint a works accountant, who should possess a knowledge of builders' accounts.

Dr. Collins, asking whether the witness could state the motives for malpractices which did not amount to pecuniary fraud, the Comptroller said he thought the motives had been stated in the course of the inquiry. The transfers made it appear that all the jobs were being carried out at a profit, instead of some at a profit and some at a loss.

Replying to Mr. Fletcher, the witness said that since 1894 he was able to check every item, but he could not check jobbing works except according to the time books.

Mr. Fletcher: Would jobbing works be better done by a contractor than by the Department? I should not like to answer that.

Don't you think it would be more economical if the manager was responsible only to a spending committee with your audit?—You must always have some central committee, but whether of a works or of a stores department is a matter for consideration. With regard to the question of abolishing the Works Committee, that was a matter that would require to be very carefully considered. A suggestion had been made by Mr. Blashill, but he only threw it out as a crude suggestion.

In reply to a question from Mr. Torrance, whether any system of check could be devised to prevent irregularities, the Comptroller expressed the opinion that where they had collusion between half-a-dozen persons and fictitious signatures it would be very difficult to devise a perfect system

* For reports of previous sittings, see our issues for December 19 and 26, and January 2.

of check. Certainly he thought the accounts had been better kept during the last two or three years. In reply to further questions from Mr. Beachcroft, Dr. Longstaff, and Sir Godfrey Lushington, the Comptroller gave explanations in detail of various paragraphs of his statement and of the appendices. He could not state that the cost of the works in progress and completed, but not yet reported, would reach £519,000, but he thought they would show some loss. With regard to malpractices, he thought they had got to the bottom of the discoveries.

The further examination of the witness was adjourned to Wednesday, the 20th inst.

Illustrations.

DESIGN FOR TECHNICAL INSTITUTE AND PUBLIC LIBRARY.

THIS design, of which we publish a view and plan, was submitted in competition for the West Ham Technical Institute and Public Library, and was intended to be constructed with red brick facings and stone dressings, with a roof of green slates and domes of copper or lead.

With the exception of the main front of the Technical School the structure was to be of one story on a high basement. It may be noted that the author has given a symmetrical treatment to the plan to suit the irregular site, and that the four angles are accentuated by towers. On the side of the view which is in shade the central feature is a bay of about 80 ft. in length.

The main scheme of the plan of the library was to get cross light and ventilation, and to make every external wall readily accessible in the event of fire.

The large hall was intended to be available for purposes of the Institute and also for separate letting to outsiders. Special attention was paid to exits in the event of fire.

In the Technical School the art class-rooms face north.

The small lecture theatres are placed on the quietest part of the site.

The aim of the author was to give a dignified "solid" appearance to the buildings, as being consonant with their purpose.

The estimated cost was under 40,000l. The design is by Mr. Edwin T. Hall.

The drawing was exhibited at the Royal Academy last year.

MAR LODGE, DEE SIDE, ABERDEEN-SHIRE.

This is the new Highland residence recently built for the Duke of Fife, whose last house in Mar Forest was destroyed by fire in 1895. In October of the same year the foundation-stone of the present house was laid by the Queen.

We give the general view and the plan of one floor; the shape of the plan is adopted to secure shelter from the prevailing winds up and down the valley.

The walls of the house are built of a light-coral coloured granite found on the estate. The timber is also native, being of Scotch fir from the forest of Mar. The upper parts of the gables are of half-timber construction, the spaces between the timbers being plastered, and harled with an outer coating of crushed quartz from the Cairngorm Mountains. The roofs of the building are covered with English made red tiles. Electricity is to be used for lighting as well as warming the interior.

In the centre of the building is a hall and grand staircase. By these access is obtained to the public rooms, including a large dining-room and a smaller dining-room. Then there is a spacious drawing-room, a large billiard-room, and twenty-six bedrooms, and also bedroom accommodation for twenty-five men-servants and forty maid-servants.

The stabling accommodation consists of thirty-six stalls, with two harness-rooms attached, two carriage houses, and mess-room and scullery.

The contractors are:—Mason, Mr. Edgar Gauld, Aberdeen; carpenter, Messrs. M'Robbie & Milne, Aberdeen; ironwork, Mr. George Bisset, Aberdeen; plumbers, Messrs. J. Blaikie & Son, Aberdeen; painters, Messrs. George Donald & Sons, Aberdeen; plaster and fire-proof flooring, Messrs. P. Stuart & Co., London; slater, Mr. James Grant, Ballater; electric light, Messrs. P. C. Middleton & Co., Aberdeen.

At the stables the contractors are:—Mason, Mr. George Hall, Aberdeen; carpenter, Mr. D. Macdonald, Braemar; plumbers, Messrs. J.

Blaikie & Son, Aberdeen; plasterers, Messrs. P. Stuart & Co., London; slater, Mr. James Grant, Ballater; and painters, Messrs. George Donald & Sons, Aberdeen.

The architect is Mr. A. Marshall Mackenzie, of Aberdeen.

CHURCH ROOM, ST. MARY'S, EWELL.

THE church room of the parish church of St. Mary, Ewell, was erected by the vicar during the autumn of 1894, and was opened by the late Bishop of Winchester in the early part of 1895.

The intention was to provide a small hall for gymnastic classes among the boys of the neighbourhood, besides its use as a common centre for parochial work. It is not primarily a mission hall, and the character of the neighbourhood and some of the purposes which the room was likely to serve suggested its architectural treatment.

It is fitted and furnished in a rather more finished manner than is usual in such halls; the walls are plastered over a green stained and panelled dado, while the rafters are hoarded in narrow widths of pitch pine, with mouldings forming panels capable of decoration hereafter.

There are also double doors in the ample porch, which is in two storeys, the upper part open to the room, with a projecting gallery, the front of which is hung as doors so that the apparatus and chairs can be stored when the whole area of the hall is required. This loft is also intended for a music gallery, on occasion, being approached by a stairway in the depth of the porch. The room will seat 115 very comfortably, and will hold up to 150 when necessary. The recessed fireplace helps in the arrangement of the chairs.

The use of the room as a gymnasium affected the construction also, to provide against the swing of the trapeze acting on an open roof. The room is divided into three bays by two strong arched trusses, to which the fireplace and porch provide three points of support, the fourth being a strong external buttress.

The trapeze and other apparatus hang or rest on two lattice-girder perulins of wood 1 ft. 9 in. deep resting upon the trusses and continuous from gable to gable. The turret, which will carry a large bell, also stands upon these framed perulins.

The end wall of the room is arranged for diagram and lantern exhibitions, and the gas-lighting is studied for that purpose and to avoid interference from the gymnastic apparatus.

There are four red Mansfield stone corbels to the trusses, excepting which the building is all brickwork and wood framing. It has been very well built, under the supervision of the architect, by Messrs. Cornish & Gaymer, of North Walsham, except the fencing in oak by Messrs. Agate, of Horsham. The contract price was 600l., excluding fittings. Messrs. Spencer & Co. supplied the gymnastic apparatus, Messrs. Turpin the wood block flooring, Mr. Jackson the lead glazing, Messrs. Bailey & Co. the gas fittings, Messrs. Mears & Co. the bell. The architect is Mr. Arthur T. Bolton, of Westminster. The drawings illustrated are by Mr. C. E. Mathews, sketched from the building after completion.

THE CONVENT, 26, BOW-ROAD, E.

THIS building, now being erected, is for the Sisters Marie Auxiliatrice, whose principal convent is at Paris.

These Sisters have been established for several years at 24, Bow-road, adjoining, their special work being amongst factory and working girls at the East End; this building, however, being inadequate for the community and the particular work they had undertaken, the adjoining site of No. 26 was purchased, on which to erect the building illustrated.

The materials of construction are walls of stock bricks in cement, with Gentry's red brick quoins, mouldings, and facings; Bath stonework in entrance doorway, niche, pinnacles, &c.; Stuart's granolithic copings and staircases; slate roofs, walls inside finished with trowelled stucco; Terazzo floors in corridors and entrance hall.

The building throughout will be heated with hot water, and the total cost is 6,280l.

The builder is Mr. W. Watson, of Ilford, and the architect Mr. J. H. Eastwood, of Kensington.

NEW BOARD SCHOOL, MERTON ABBEY, SURREY.

THIS is a new school for 430 boys, now being built for the Mitcham School Board upon a site containing an acre of ground, with a frontage of 100 ft. to Church-road, and 435 ft. to a proposed

road on the north side. The buildings consist of a central portion, containing a large hall 50 ft. 9 in. by 28 ft., around which are grouped four class-rooms for sixty boys each, and two wings on the east and west sides respectively, each accommodating 120 pupils. The class-rooms in each wing are for seventy and fifty boys respectively, divided the one from the other by a sliding glass partition, the withdrawal of which enables the two rooms to be thrown into one lecture-room 59 ft. by 22 ft. Cloakrooms, lavatory, and heating chamber are provided as shown on the plan, the whole being upon the ground-floor level, with the exception of the heating chamber, which is in the basement, and a committee and master's room (having a window overlooking the corridor, hall, &c.), which is situated over the north cloak room.

The walls externally are for the most part of hand-made and pressed red facing bricks, with dressings, &c., of Portland and Monk's Park stone. The half timber work is of English oak, and the roofs are covered with dark brinded-Brosley tiles from Madeley Wood.

Although 480 pupils have been provided for, it is not intended to carry out the whole of the work at once. The first portion of the building, with slight modifications of detail in the elevations, now in course of erection, includes the central hall and class rooms for 240 scholars, with the necessary accessories for their accommodation, and the boundary walls and gates.

The contract has been placed in the hands of Mr. John B. Potter, of Sutton and Epsom, whose tender was 4,763l. Mr. Rees Roberts is acting as clerk of works. The architect is Mr. H. P. Burke Downing, of London and Merton.

COMPETITIONS.

NEW GOVERNMENT SCHOOL BUILDINGS, DURBAN.—The Education Department recently offered two premiums, a first of 50l. and a second of 25l. for the best designs and plans for a proposed new girls' Model school at Durban, to be built on a rectangular piece of ground situated between Gale-street and Smith-street, at the foot of the Berea. Nine sets of plans were sent in to the Department. The first premium has been awarded to Messrs. Frank M. Kent and Matthew B. Price, two Home architects now employed in the draughtsmen's office of the Public Works Department. Messrs. Street-Wilson & Fyfe, architects, of Durban, have secured the second premium, and an alternative plan submitted by them has been highly commended. The plans of Messrs. Methven & Ritchie, of Durban, and Mr. Rowland Ridgway, of the Engineer's Department, Durban, were also highly commended. The adjudicators were the Engineer of the Public Works Department (Mr. J. E. Barnes), the Mayor of Durban (Mr. G. Payne), and the Superintendent Inspector of Schools (Mr. K. Russell). The new building is estimated to cost from 9,000l. to 10,000l., and will accommodate about 600 pupils. According to the plans placed first, it is to be a double-storey structure. There is to be a central hall 65 ft. by 35 ft., with a large class-room on each side, which may be thrown into the hall by means of sliding-doors, and will thus enlarge the hall to 120 ft. by 66 ft. The hall will have a gallery. The building is to contain two other class-rooms, and adequate accommodation for the staff, such as teachers' rooms, &c. On the front floor the plans show four other class-rooms, and verandahs extend nearly all around the building.—*Times of Natal*.

EDINBURGH ARCHITECTURAL ASSOCIATION.—The Council of this Association have arranged with Mr. Alexander Drew, Consulting Engineer (Constructural and Electrical), for a course of six lectures on the practical designing of iron and steel roofing. The lectures will deal with matters specially interesting to practising architects, civil and mechanical engineers, their assistants and artisans, and will be delivered in the Edinburgh Architectural Association's Rooms, Royal Institution, Princes-street. The first lecture was announced for Wednesday, this week; the remaining five will be given on January 27, February 3, 10, and 24, and March 3; at 8 p.m.

NEW BATHS FOR LOUGHBOROUGH.—At a meeting of the Loughborough Town Council, held on the 4th inst., a letter was read from Mr. Joseph Griggs, J.P., offering to erect and present to the town public baths at a cost of 3,000l. to commemorate the completion of the sixtieth year of the Queen's reign, upon a site to be provided by the Corporation. Mr. George H. Barrowcliff, architect, of Loughborough, has been entrusted with the work.

COMPETITION DESIGN FOR TECHNICAL INSTITUTE, WEST HAM By Mr E T Hall, F.R.I.B.A.

NEW DECORATIONS AT THE MANSION HOUSE.

The chief point which strikes one on visiting the Mansion House is its complete change of aspect. Remarkable before for its grimy and venerable aspect, it now presents an appearance of lightness and cleanliness which to many doubtless would be less in harmony with the associations and glamour of City pomp and splendour. As far as the public are concerned, the chief alterations would be noted in the Saloon and Egyptian Hall—the former forming an antechamber to the latter—and the State Drawing Rooms.

In the Saloon, which is interesting architecturally on account of the free columns and central lantern, the ceiling and upper part of the walls are schemed in ivory-cream and gold, stencilling being sparingly introduced, the dado being of a dark red. The tapestry panels from the Windsor works have been replaced in more prominent positions and are decoratively well worthy of the change. The vista from the vestibule, through the saloon into the Egyptian Hall, has also been improved by the removal of the gasaliers which formerly hung from the lantern. The Egyptian Hall has been renovated almost beyond compare. The upper part of the walls are treated in shimp pink, the dado below being dark crimson, as are the niches which serve to throw forward the statuary which they contain. This treatment of wall surface also serves to outline the Corinthian columns which flank the hall, and which are painted in cream and gold; the barrel vaulted coffered ceiling also now shows to advantage, the carving to the coffers having a blue background. The State Drawing Rooms have been taken in hand, the chimney-piece of correct Georgian type have been relieved of successive applications of stucco, gilt and paint, and show their original marble treatment. The wall panels are treated in yellow damask silk from Spitalfields looms, and these give brightness to apartments which are much in need of it. The decorations throughout are in quiet submission to Dance's architectural features, and we can congratulate the city that in this work of renovation, the character and requirements of the Chief Magistrate's residence have been maintained. Messrs. Gillow have executed the works under the superintendence of Mr. Andrew Murray, the City Surveyor.

ARCHITECTURAL SOCIETIES.

EDINBURGH ARCHITECTURAL SOCIETY.—The opening meeting of the present session of this Society was held in the Rooms, on the 13th inst., Mr. J. A. Williamson, A.R.I.B.A., President, in the chair. The minutes of the previous meeting having been read, the Hon. President, Mr. R. M. Cameron, delivered an opening address on "The Dean of Guild Court," and "Hints on Valuation." He pointed out the necessity of attending minutely to the requirements of the Court in the preparation of plans, so as to avoid any unnecessary delay in passing such plans; he also indicated the limit of the powers of the Court, besides giving some very interesting instances where the Court had used its utmost powers to the advantage of the amenity of the city. He afterwards gave some hints on valuation of property, pointing out that valuation may not be learnt from books, but must be gained by study of sales of property, land, &c., combined with forethought and common sense.

LEEDS ARCHITECTURAL SOCIETY.— "Sir Christopher Wren and his Work" was the title of a paper read on the 18th inst. by Mr. Arthur Straton, of the University College, Liverpool, to the members of the Leeds and Yorkshire Architectural Society, at the Mechanics' Institute. Born in 1630, Christopher Wren lived during the turbulent period of the Commonwealth. After taking full University degrees, he was induced, as the result chiefly of the great London fire of 1666, to turn his attention to architecture, though his studies had been arranged to fit him as an astronomer. How this diversion of his talents into the channel of architecture resulted is recorded in the annals of fame. The task that was early placed in his hands was a gigantic one; it was to rebuild St. Paul's Cathedral and about fifty London churches. For the performance of his huge work he received the stipend—a mere pittance—of 200*l.* per annum. The rebuilding of St. Paul's occupied nearly fifty years, the foundation-stone being laid in 1675, and the structure completed in 1723. Though his work was largely modelled

on the Italian masters, yet, strange to say, Sir Christopher Wren never visited Italy. He worked with the highest motives with which an architect can be imbued—the ennoblement of the art to which he contributed so much was the object of his aspirations and the aim of his labours. His career closed in 1723, when he died at the age of ninety-five years. The lecture was illustrated by a number of slides. Mr. W. Watson, President of the Society, occupied the chair.

YORK ARCHITECTURAL SOCIETY.—Members of the York Architectural Society and invited guests dined at the White Swan Hotel recently. After dinner a brief toast list was gone through, the remainder of the night being devoted to social intercourse and music. Mr. Henry Perkin, F.R.I.B.A., the President of the Society, occupied the chair, and there were present:—Mr. W. Watson, of Wakefield, President of the Leeds Architectural Society; Mr. A. W. Turner, York, one of the vice-presidents; Mr. Wm. Hepper, past-President; Mr. Geo. Benson, Mr. J. W. Knowles, Mr. Norman R. Yeomans, hon. treasurer; Mr. A. B. Burleigh, hon. secretary; Mr. E. A. Pollard, hon. assistant secretary, &c. The first toast was "The Queen," proposed from the chair. Mr. A. W. Turner then submitted "The Royal Institute of British Architects and Kindred Institutions." We lived in an age of progress and invention, he said, and the Institute and kindred institutions were taking active parts in the onward march. He advised youthful aspirants in the profession to pull with the times in educational matters, and to cultivate the thinking and reasoning faculties. Mr. W. Watson, in responding, remarked that lately the Royal Institute had done better work for the profession generally than was the case ten or fifteen years ago. Formerly it was sadly too exclusive. He thought the time had come when architects should be registered as one of the learned professions, and if such a result could be achieved during the present memorable year it would be a matter for great satisfaction. Mr. J. W. Knowles proposed "Success to the York Architectural Society," which, he said, was progressing, and had been in existence about fifteen years. The President made response. He called attention to the Syllabus and Papers for the fifteenth session, and stated that in March there will be an exhibition of the prize competition drawings of the Royal Institute of British Architects. He remarked that the Society fairly held its own in an increased membership, but there were several leading architects in York whom he would like to see amongst them. He spoke of the advantage of being allied with the Royal Institute and of benefits which members of the profession hoped to reap. He thought the Institute had shown a disposition to treat them fairly.—On Thursday evening last week, the first meeting of the winter session was held in the Church Institute, Mr. H. Perkin in the chair. Mr. Godfrey Bingley gave an address upon "A Study of English Architecture," and illustrated his subject with a series of lime-light views, including examples of domestic and ecclesiastical architecture. A vote of thanks was passed to Mr. Bingley.

ENGINEERING SOCIETIES.

INSTITUTION OF CIVIL ENGINEERS.—At a Students' Meeting of this Institution, on the 15th inst., a paper on "The Monier System of Construction" was read by Mr. Walter Beer, Stud Inst. C.E., Mr. Ewing Matheson, M.Inst. C.E., occupying the chair. In the brief historical account of the Monier system, with which the paper opened, the author showed how it originated in the attempts of a Parisian florist of that name to obtain large vessels of a material more durable than wood and lighter than concrete. The principle of the system was stated to be the combination of Portland-cement concrete with iron or steel in such a manner as to develop in the same material the high resistance, to compression and binding of the former, and the great tensile strength of the latter. It had been found that in such a combination the good qualities of both materials were retained, and no chemical action was found to occur between the iron and the moisture in the concrete. The latter adhered firmly to the smooth surface of the metal; and the co-efficients of expansion of the two constituents were for all practical purposes identical. The economy of the system in the construction of girders and arches was considerable, owing to its great strength and compactness, and further it was absolutely fire-proof. Large spans might be used for floors, and the small amount of head-room required was a factor often of great value.

Arches of 150 ft. or even greater span might be constructed, and the rise need not exceed one-tenth of the span, so that the system could be used in situations where brick and stone would be impossible. The author dealt with the practical details and cost of the method, stating the particular qualities of materials most advantageously used; and he also entered into a mathematical consideration of the relations existing between the dimensions and quality of the different portions of the structures and the stresses in them under known loads. The paper concluded with an account of tests to destruction of three Monier arches with a span of 12 ft. and a width of 4 ft. They were composed of three to one concrete, for which crushed granite, coke breeze, and crushed brick were respectively used, with a simple netting of 4-in. mesh, formed of $\frac{3}{8}$ -in. longitudinal rods and $\frac{1}{2}$ -in. transverse rods, embedded 1 in. above the undersides of the arches. The first arch was loaded uniformly, and after a central deflection of 2 in., failed when the load reached 11.7 cwt. per square foot. The second was loaded at one side of the centre only, and failed under a load of 4.8 cwt. per square foot, when the deflections at the unloaded and loaded sides and centre were respectively $\frac{1}{8}$ in., $\frac{1}{16}$ in., and $\frac{1}{4}$ in. The third arch was also broken by a load on one side only, but withstood a pressure of 7.0 cwt. per square foot. The paper was accompanied by drawings illustrating several examples of the system, including the arches upon which the author's tests were performed.

Correspondence.

To the Editor of THE BUILDER.

TESTS OF STEEL AND CONCRETE FLOORS.

SIR,—I have read with great interest your admirable article in this week's issue of the *Builder* upon "Tests of Steel and Concrete Floors." To avoid, however, any misapprehension, may I venture to explain that the "Golding" floor, which stood such a severe test, is, as a matter of fact, the Expanded Metal Company's Patent Fireproof Flooring, Mr. Golding being the inventor of expanded metal, as well as of this floor. H. B. TAYLOR, General Manager Expanded Metal Company.

A WARNING TO QUANTITY SURVEYORS.

SIR,—In the interest of fellow quantity surveyors we think it right to inform you that a man called on us on Wednesday last, professing to be an architect, and proposing to place a job in our hands for quantities. He promised to bring the drawings to-day (Tuesday).

He said he had been sent to us by an architect who is known to us—one well known in the profession.

Before he went he borrowed money with the plausible excuse that he had left his overcoat, which contained his money, at the dentist's.

On Monday one of us happened to be at another surveyor's office, when this same man turned up with the same tale of the job he proposed to bring, and with an introduction from another well-known architect.

It appears that neither of these architects knew the man personally, though he called on them both and asked them to recommend him a surveyor.

It is needless to add he failed to keep his appointment with us. SURVEYORS.

January 19, 1897.

SLATE TRADE IN 1896.—The year opened with a general stiffening of terms; the quarry proprietors, however, fearing a repetition of the "slump" of 1879, wisely kept prices at a level which they believed would not allow foreign slates to be imported at a profit, and the year would have been one of great prosperity for all in the trade but for the unfortunate strike at the Penrhyn Quarries, which, by reducing supplies, has given an impetus to the use of competing materials for roof covering, and has caused a heavy loss in wages. The make will show an increase, as present prices cause rock to be worked which would not pay at lower prices, and some small quarries have been reopened which were closed in bad times; but, owing to the limited area of workable rock, no great further increase is to be anticipated. Wages were advanced proportionately with prices, and many quarrymen who had left the district in less prosperous times have returned. In the way of legislation, open quarries have been placed under Government Inspectors, and an additional Truck Act has been passed, which will affect one quarries.

The Student's Column.

SPECIFICATIONS.—IV.

MASON.

IT is well to begin this trade with the stipulations as to quality of material and methods of workmanship which apply to all the varieties of stone, and then to indicate what parts of the works are to be of each particular kind, giving sizes of those items which are not figured or shown on the drawings. As there should be $\frac{3}{4}$ in. or larger-sized details of all the special features, the sizes of beds and heights of stones are better and more clearly denoted on these drawings than in the specification.

Materials.—All stone to be of the best quality of its respective kind, free from vents, sandholes, flaws, and other defects, thoroughly seasoned, and free from quarry sap (except in the case of those stones where the quarry sap in drying forms a protective film, in which case omit the requirement here and insert it under heading of those stones to which it applies), set on its natural bed, except where otherwise directed by this specification or the drawings, cleaned down at completion, and left perfect, all stone injured during the progress of the building by frost or other causes being taken out and replaced. All stones to hold their full scantlings, die-square at back, and no shellac is to be used on any account.

Workmanship.—All sizes of stones shown on the detail drawings, to be followed exactly, and the stonework to be put together with slate dowels 1 in. by 1 in. and 3 in. long, fitted to square cut mortises. Cramps, where necessary, to be of iron, and run with Spence's metal. All beds to be truly level, and no stones to be hollow bedded. All joggle joints to be V-joggles. (N.B.—If quarry-worked stone is allowed, say so, but stipulate that any damaged in transit is to be replaced by sound stone.)

Rubble-walling.—The walls of to be built of local limestone, from quarry, squared and brought up to level courses, not more than 2 ft. apart, and with not less than one through stone to each superficial yard. (If these walls, as usually done, are to have half-brick lining, specify thus.) These walls to have half-brick lining (better in cement), bonded to stonework, with headers in each course, one to every four stretchers. No bond stone to be built through brick lining. The face of stones to be scabbled and joints pointed with V joint in mortar.

Ashtar-facing.—The walls of to have ashtar-facing of stone, the stretchers stones to be $\frac{4}{3}$ in. thick, the headers 9 in. thick, with banders in long ($\frac{1}{3}$ in. less than thickness of wall) in the proportion of $\frac{1}{3}$ of wall surface. The joints to have dovetailed mortises run with lead as sketch. (Sketch the shape of lead plug or dowel preferred, or specify cramps of bronze or gunmetal.)

Rusticated Work.—The quoins to be 16 in. by 24 in. on bed, set to project 2 in. from ashtar facing with chamfer 2 in. wide around each face, and worked with snail-creep rusticated face (or other variety if desired) as directed by the architect. One specimen stone to be worked and approved before the others are commenced. (Describe also rusticated work to plinths or elsewhere.)

Arches.—(With rubble walling, arches are often used over lintols of dressed stone, if so, describe.) Turn relieving arches over lintols, the voussoirs 12 in. deep by average width of 6 in. with scabbled face and pointing to match facing. (Arches of dressed stone will, of course, come under heading of the particular kind of stone of which they are formed.)

Bath Stone.—The external stone work of to be of Box Ground stone, to be supplied by the Bath Stone Firms, Limited, hard and well seasoned, picked from stock by the architect or clerk of works (if so desired). (Or it may be specified that certain parts are to be Gorsham Down or Monk's Park, or other variety.)

The external Bath stone work after being cleaned down is to be treated with "Fluate," applied in accordance with the instructions of the manufacturers.

(Then describe the internal work, if any, to be executed in Combe Down, Farleigh Down, or whatever is selected.)

Kentish Ragstone.—This, of course, is usually employed only for rubble walling. In specifying it is important to mention that the stone is to be free from "hassock" where used externally. "Hassock" is useful internally occasionally.

Chalk.—For internal work only. Specify that it is to be from the "hull-head," free from veins,

shells, and flints, or even texture, and not to be in less size blocks than shown on the detail drawings.

Portland Stone.—Specify the bed, generally the "whit bed," though others may be used if desired. Say that overhanging cornices are to be joint bedded. This applies also to Bath stone.

(N.B.—In specifying Portland, Bath, and similar stones be particular to say how the face of stone is to be finished, whether tooled, dragged, or rubbed.)

For steps and landings, &c., old Portland stone, if obtainable, should be specified. Usually they are described as "hard Portland." Age adds hardness, a quality in which the beds vary.

With all limestones it is well to specify that they are not to be set in Portland cement.

Yorkshire Stone.—By this term is usually understood the more or less laminated or flag-stones, but there are a large number of free-stones in Yorkshire, as the various quarries in Huddersfield, Halifax, and elsewhere, which are useful for dressings.

Cornels and Cover Stones.—State size, whether "self faced" or "tooled," with "coped edges" where wanted.

Templates.—Give full list with size, whether "tooled" or how otherwise finished.

Steps and Thresholds.—Specify widths and depths, how much longer than openings, how finished, and if "back-jointed." Particularly note whether they are to be in one stone, or if not, how jointed and joggled. Say whether they are to be built in, or cut and pinned, and made good to.

Sills.—Give size and finish, whether sunk, weathered, throated, &c.

Cappings.—Give size and form, whether parallel, saddle backed, weathered or throated, and method of setting and jointing. If cramps are desired say so, quoting length and weight, and whether run with lead, Spence's metal, sulphur, or cement.

Hearths and Slabs.—Specify thickness, projection beyond opening, and description of surface, "tooled," or "rubbed."

Favings.—State thickness, widths of courses, or average sizes of stones, surface finish, method of setting.

Stairs.—Give sizes, amount pinned into walls, describe whether solid, spandril, or built up treads and risers, if related, moulded nosings, and whether returned. Also finish of surfaces and faces.

Chimney-pieces.—If plain, they can be sufficiently described verbally, widths and thicknesses of jambs, lintols, and shelves, whether chamfered or moulded, finish of surface, how set, if cramps are of iron or other metal, whether solid or boxed. Or a provisional sum can be allowed, or detail drawings be given.

Granite.—Usually the best way is to obtain separate estimate from merchants, and include as provisional sum, stating if it includes carriage; if not, where it comes from. If specified in detail, give quarry, and, of course, all sizes, whether polished, or machine worked. Stipulate that it is to be free from slippers, iron stains, and metallic veins.

Marble.—Here, again, a separate estimate and provision is best. If this is not done, give sizes, description of kind, whether polished, and stipulate that stopping is not to be allowed. In some marbles this, however, is almost impossible. Veining and colour to be approved. Specify method of fixing. In marble paving, as in black and white squares, give the sizes of these, with the thickness, and especially stipulate for evenness of colour and close joints.

Tile Paving.—Usually specify a certain make or get separate estimate and include provision. Specify who is to lay, and if contractor say how it is to be done, if jointed and laid in cement, also that surface is to be perfectly true and level. If manufacturer lays it provide for attendance and water.

Mosaic Paving.—Usually best done by separate contractor at stipulated amount or p.c. sum per yard. Attendance as for tile fixer.

Wall Tiling and Mosaic.—These follow same principles as described for paving.

Carving.—Allow provisional sum. State if contractor is to do boasting and specify sizes stones are to be left for carver. Provide for scaffolding and attendance and, if external, y. for shelter and screens. Sometimes provision may be only for models and contractor does carving. In all provisional sums for such work as described under this trade, and indeed for all provisional sums it is as well to state when the contractor is to pay, say within fourteen days after the architect has certified for payment and reserving power

to the employer to pay direct if contractor omits to pay within stipulated time and that in this event the contractor shall not be entitled to any profit on the provisional sum or sums.

GENERAL BUILDING NEWS.

CHURCH RESTORATION, LISKEARD.—In his report to the vicar and churchwardens, Mr. G. H. F. Prynne (architect) mentions that the tower of Liskeard Church is Norman in design and detail, although various conspicuous additions have been made at later periods. The tower arch is a curious example of Transitional work, and blending of the Norman and Early Pointed work. It seemed probable that defects in the tower showed themselves at an early date, possibly when the old Norman church was removed and the present late fifteenth century church was built, and subsequently a very considerable portion of the exterior was faced with granite. The western doorway, a late Perpendicular work, was probably inserted early in the seventeenth century. Walls were generally massive in bulk, and built of rough rubble work. The cornice under the battlement was very rich in early carving, and the thirty-four grotesque heads, &c., were of interest. The battlement itself, which was built in a solid manner in granite, was of later date. It was perfectly possible to repair and restore the tower in a satisfactory manner, but if undertaken thoroughly be roughly estimated the cost at 700l. to 800l., including the entire rehanging of bells upon a new frame. The one thing to be most careful about was that the architectural and archaeological interests were in no way injured. The repairs could well be done without any such injury, and one of the most interesting old towers in Cornwall preserved.—*Western Morning News.*

BOARD SCHOOLS, HALIFAX.—The new infants' Board School at Caddy Field, Halifax, was opened on the 11th inst. The total cost of the building and site was 3,200l. The plans adopted were selected in competition, the original scheme providing for 375 infants. At present only a portion of the scheme has been carried out to accommodate 165 children. The premises include a central hall, or assembly room 41 ft. by 22 ft. 6 in., three classrooms 18 ft. by 16 ft., and a teachers' room. Each classroom has a separate cloak-room, and a lavatory provided. The building is arranged to allow of the addition of four classrooms on the easterly side and on a higher level than the present structure. The contractors were—Mr. L. Firth, mason; Messrs. P. Greenwood & Son, Queensbury, joiners; Messrs. John Naylor & Son, plumbers; Messrs. Rushworth & Firth, slaters and plasterers; Messrs. George Greenwood & Son, concreters; Mr. John Berry, iron and steel work; Mr. T. Kushton, painting; Messrs. P. M. Walker & Co., ventilating; the Westminster Flooring Company, London, wood-block flooring; and Messrs. William Trusswell & Son, St. Asaph, heating apparatus. The architect was Mr. F. Walsh. —The buildings to be known as the Warley-road Board Schools were opened on the 11th inst. The architects were Messrs. Horsfall & Williams. The site of the building has cost nearly 1,200l., and the building and site together 13,200l. The entire cost was 16,000l. In addition to the ordinary accommodation, there are slippers and swimming baths, a workshop, a croking kitchen, &c. Provision is made for the three departments—boys, girls, and infants—furnishing accommodation for 1,132 scholars.

LIBERAL CLUB, COALVILLE, LEICESTER.—A new Liberal Club has just been opened at Coalville by Lord Crewe. The club has a frontage of 60 ft. to Marlborough-square. Messrs. Kelles & Fosbrooke, of Leicester, were the architects, and Messrs. Griffin Bros. the builders. The materials used are Ellistown pressed bricks with Derbyshire stone facings. Downstairs there is a vestibule and entrance-hall, leading to a smoke room, reading room, and temperance room. The remainder of the ground floor is taken up with lavatories, kitchen, and other offices. Upstairs there are billiard and card rooms, so constructed as to be formed into one apartment when required.

LLANELLY CHURCH RESTORATION, BRECONSHIRE.—The first portion of the work of restoration of this building has been completed, viz., the removal of the old spire, the repair of the external masonry of the tower, and the erection of the new spire. The architect was Mr. Baldwin, of Brecon, and the builder, Mr. Foster, of Abergavenny.

BOARD SCHOOLS, PAIGNTON.—The new Board Schools at Paignton were opened on the 11th inst. The schools being exclusively for girls, a kitchen is provided, with range, scullery, &c., for continuation classes. Teachers have their separate rooms. Mr. Rabbitt, of Paignton, built the schools, and plans by Messrs. Bridman & Sons. The contract price was 4,250l., but this has been exceeded by about 1,000l. Recently Mr. J. W. Rowell, of Newton Abbot, sat as arbitrator concerning the extras, but he has not yet given his award. Accommodation is provided for 384 children.

BANK, LINCOLN.—A new bank is in course of construction for Messrs. Peacock, Wilson & Co., of Lincoln. The architects are Messrs. W. Watkins & Son, of Lincoln. The building has a frontage to High-street of 42 ft., and an area of 1,080 square ft. In the front elevation all the enrichments are in

Doulton's brown-buff terra-cotta, the plain walling being in ordinary red brick work. The building consists of a basement, three stories, and attics, and there are two entrances, one giving admission to the banking office; the other to the manager's house and a passage common to some adjoining properties. The last-named entrance is closed by a Bostwick gate. In the basement, which is lined throughout with glazed bricks—as also is the passage, and a portion of the back yard—are the heating apparatus, the clerks' cloak-room, and other necessary requirements of a bank. On the ground floor is the banking office, the manager's room, and a waiting-room. The woodwork of the interior of the banking office is executed in oak with the exception of the counters and the desks, which are of mahogany. The ceiling will be an enriched plaster ceiling and a model plaster frieze 3 ft. deep round the room, these decorations being carried out by Mr. W. H. Horne, of Alle, near Bradford. On the first floor are drawing, and sitting rooms, and all requisite conveniences; the second floor is given up to bedrooms, above which are the attics. The building has been wired throughout for the electric light, a mode of illumination which will be adopted so soon as the Corporation are in a position to supply it. The consulting engineer in the department is Mr. J. E. Cole, of Sleaford. In the meantime gas has been laid on. The building is heated by the high-pressure hot-water system, worked from a boiler in the basement. A lift communicates with the banking office and the basement, and there is also a lift at the back for the elevation of tradesmen's goods, &c., to the manager's house. The contract for the buildings is in the hands of Messrs. Wadley & Co., of Horsham.

PROPOSED ENLARGEMENT OF CHURCH, CASTLE CRUICK, STAFFORD.—It is proposed to enlarge this church as a memorial to the late Vicars of Castle Church. Plans for the enlargement were made by the architect, the late Sir Gilbert G. Scott, R.A., who carried out the work, and these are in the hands of the committee. It was the intention of the late Vicar, as soon as the addition to the churchyard and enlargement of the schools had been carried out, to proceed with the enlargement of the church as a memorial to his minister, and, as the plans were approved by both of them, the committee think that no more fitting memorial could be desired. The plans consist of a new north aisle, organ chamber, and vestry. The additional accommodation will provide about seventy-five seats. Mr. J. O. Scott has been consulted and estimates the total cost at, say, 1,500l.—*Tamworth Mercury.*

EXTENSION OF THE BRITISH SCHOOLS, CHESTER.—Three new class-rooms have been added to the British Schools in Victoria-road, Chester. The work has been executed by the contractor, Mr. Thos. Mayers, of Rowton, from the designs of Messrs. T. M. Lockwood & Sons.

OFFICES FOR THE NEWCASTLE WATER COMPANY.—The Newcastle Water Company's new offices are situated in Pilgrim-street. The main portion of the structure is of Kenton stone, and the design is Italian Renaissance. The architects are Messrs. Freeman & Robins, of Newcastle. The main business portion of the building is the general rate office—some way from the main building to the rear, and is only one story high. This office measures 70 ft. by 30 ft. The walls of this room, as well as those of the neighbouring corridors and grand staircase leading to the various official apartments, are all lined with Burmantofts glazed tiling. The front offices on the ground floor of the new building are for the use of the secretary. On the first floor there is another suite of apartments, devoted to the engineer and his staff, and on the second floor there is a board-room. Above is a set of apartments for the use of the caretakers. In the rate offices the fittings are in Spanish mahogany, the moulded ceiling is by the Veronese Company, and the mosaic flooring by Messrs. Emley & Sons. The main light into this room comes through the roof, but there are a number of side windows which are filled with stained glass, from the works of Messrs. Atkinson Brothers, of Newcastle. The roof light extends nearly the whole length of the room, and is supported by ironwork, by Messrs. Somerset & Co., Newcastle, who have supplied the bulk of the heavy iron work used in the general construction of the building. The grand staircase consists of five flights of steps, all of Sicilian marble. The lower portion of the main hall is paved by a pillared and arched casement, the open spaces in which are filled with a light iron railing. The whole of the balustrades in the remaining portions of the staircase are in similar ironwork, wrought from the design of the architects. The secretary's room on the ground floor has the Acme patent flooring. The whole of the building has an independent telephonic installation whereby every room may be switched on to any other, or to the secretary's room. There is a lift going from the basement of the building to the top. The directors' room on the second floor front is an apartment measuring 40 ft. by 20 ft., and the ceiling is 20 ft. high. Round the room is a panelled mahogany dado with enriched carving. The carving was designed by Mr. Ralph Hedley, of Newcastle. The doorway is decorated with two sets of twisted pilasters on either side. The whole of the plumbing in the building has been carried out by Bland

Bros., Barras Bridge. The basement of the building contains, amongst other departments, rooms and stores for the company's inspectors and fitters. It also contains the lavatories for the general staff. Here also is the heating apparatus for the whole of the building. The system is that of Messrs. Ashwell & Nesbit. Messrs. W. B. Emley & Co. the marble, mosaic, and other work; Messrs. Robertson & Sons have done the outside painting; Messrs. T. Beck & Co. and Mr. W. Ferguson the plastering work; Mr. John Ferguson has been responsible for the general building—stone work, brick work, and joinery work. The electric light installation is by Messrs. Ernest Scott & Mountain, Limited, and the interior painting and decoration have been executed by Messrs. Sykes. Mr. J. Towers has acted as clerk of the works.

MEMORIAL HALL, CRANFORD, NORTHAMPTON.—A new reading-room has just been opened at Cranford in memory of the late Rev. Sir F. L. Robinson, Bart. Messrs. Blackwell & Thomson, architects, Kettering, prepared the plans; Mr. John Ball, of Burton Latimer, was selected to do the work. The building consists of a reading-room, 30 ft. by 20 ft., with porch entrance and offices.

CHURCH, SKIPNESS, ARGYLLSHIRE.—The new Established Church at Skipness was opened on the 13th inst. The church is from the designs of Mr. B. V. Johnson, of London. A feature of the building is the large stained-glass window presented by Mr. Graham, of Skipness. This window was executed by Messrs. J. Powell & Sons. Mr. Graham designed the window.

ST. PETER'S CHURCH, HORNSEY.—Plans were recently passed by the Hornsey District Council for St Peter's Church, which is to be erected at the corner of Wightman-road and Lausanne-road, and which is to replace the present iron building. The plans have been prepared by Messrs. James Brooks & Son, who were the architects for the new church of St. Mary. The building is to be of stone and brick with glazed roof. Provision has been made for a side chapel at the north-eastern corner, while on the south side of the choir is the organ chamber, with a large vestry beyond, divided by a movable partition. It is now only intended to erect the nave and aisles, which will accommodate 500 people, the estimated cost being 6,275l.

LIBERAL CLUB, CLEVEDON, SOMERSETSHIRE.—A new Liberal club has just been opened at Clevedon. The internal accommodation consists of entrance hall, refreshment bar, amusement room, and skittle alley, all on the ground floor. Several of these apartments can be thrown together to give accommodation for 300 or 350 persons attending political gatherings, concerts, &c. Above is a billiard room. The plans for the new club were prepared by Mr. H. G. Hewlett, of Clevedon, and Mr. W. A. Green carried out the contract.

PUBLIC BUILDINGS, BLYTH.—The new Council chamber and offices which have been erected in Seaford-street, Blyth, were informally opened a few days ago. The building, which has been erected by Mr. J. N. Healey, in accordance with plans by the Surveyor to the township, Mr. R. Grieves, is of pressed bricks, with stone dressings, a conspicuous feature in the structure being the centre gable and ornamental roof turret. The entrance hall is paved with ornamental tiles, and on either side of the entry are the various offices allotted to the officials of the Authority. On the first floor is the Council chamber, 34 ft. by 22 ft. Adjoining the Council chamber is an ante-room, which will be used as a committee room. Contiguous to the main building are the stables, hayloft, and outbuildings, which have been fitted out by Messrs. Dinning & Cooke, of Newcastle.

REBUILDING THE CAMBRIDGE MUSIC HALL, LONDON.—It is stated that the tender of Mr. R. S. Lambie, of 19,460l., for the rebuilding of the Royal Cambridge Music Hall, for the Consolidated Contract Corporation, Limited, from plans which have been prepared by Mr. D. H. Percival, architect, of Adelphi, has been accepted, and the work will be immediately proceeded with.

VILLAGE ROOM, BLACKHEATH.—A new village room has been built at Blackheath which has recently been opened. The work has been carried out by Messrs. Brown Bros., of Bramley. The architect is Mr. Townsend. There is accommodation for about 250 people.

COUNTY SCHOOL, MERTHYR.—The formal opening of the Merthyr County School took place recently. The school occupies a site on the Clock Field at Penydarren. It provides accommodation for 100 boys and 80 girls. The Building Committee offered a premium of 25l. for the best plan submitted for the erection of the school, but the one chosen was found to be far too expensive, exceeding considerably the stipulated cost of 15l. per head, and further designs were afterwards solicited, the basis of cost being raised to 25l. per head, and that of Mr. E. Lingen Barker, of Hereford, was selected and carried out, the builder being Mr. J. Williams, of Swansea. Before the building had been completed and opened for the reception of scholars, the cost had run up to 6,918l. 3s. 2d.—*Western Mail.*

WELSH CONGREGATIONAL CHAPEL, SWANSEA.—The foundation stones were laid recently of the new Welsh Congregational Chapel now being

erected in Henrietta-street, Swansea. The new building is expected to be opened towards the end of February. Its style is Romanesque. It is built of native stone. There will be a circular gallery, lobbies, with a staircase leading to a circular gallery. An organ chamber will be constructed, and a pastor's vestry, a cloakroom, a heating chamber, and a room for the combination of hydraulic and electric engine for the purpose of organ blowing. The builder is Mr. Billings, and Mr. W. W. Williams is the architect.

DISPENSARY, BEDMINSTER, BRISTOL.—A new branch of the Bristol Dispensary is being erected at Malago-road, in the centre of Bedminster. It was designed by Mr. W. V. Gough, and the contractor for its erection is Mr. George Humphreys. The building is of red brick, with Broseley tiles, the panel bearing the name, Bristol Dispensary, is of freestone. The building stands back from the road, and is approached within its own ground by an incline which rises to the central doorway. This opens into a hall 7 ft. in width, and on the one side of it is a large general waiting-room, to which the dispensary is attached; while on the other there is a second waiting-room connected with the doctors' consulting rooms. The first floor is arranged as a residence for the dispenser, and the basement is used as a store and also for the heating apparatus.

SCHOOLS, SWANSEA.—The foundation stones of St. Thomas School, Swansea, were laid recently. The building will consist of three departments—infants on the ground floor, girls on the next floor, and the boys on the top, the three departments being made to accommodate 1,200 children. Each department is planned with a large central hall, with classrooms leading into it. The cloakrooms and the lavatories for the boys are arranged on the level of their playground, with a terrace above for access for the girls and infants to their own playgrounds. The building will be in brick, with fire-proof and wood-block floors throughout. It is estimated to cost 10,500l. Mr. G. E. T. Lawrence, London, is the architect, and the builders are Messrs. J. & F. Weaver, Manselton.

SANITARY AND ENGINEERING NEWS.

ENGINEERING TRADES.—In Messrs. Matheson & Grant's half-yearly "Engineering Trades' Report" it is stated that the improvement in trade, which had fully set in at the time of their July report, has continued and increased. In regard to iron and steel, pig iron has, with occasional fluctuations, been rising in value since 1893. Flamingo pig iron, the material for steel-making, did not till recently share the same tendency, but now the diminished supply of Spanish ore, and the activity of the steel trade, have raised its price also. Finished iron and steel, as used by engineers, do not differ much in price. Every year the respective advantages of the two materials are becoming more clearly defined. Where smithing and welding are required, fibrous iron made from puddled blooms is likely to maintain its place as more suitable and trustworthy than steel. For light structural work, such as roofing, iron is still much used; but for larger structures steel is everywhere gaining. Nominally iron is cheaper than steel, but the facilities for manufacturing large plates and heavy sections of steel have been so improved, that the steel can be supplied at normal prices where, in the case of iron, considerably extra rates would be demanded. Mechanical engineers and ironfounders share in the general activity, and overtime is the rule in most of the factories. A considerable proportion of the home demand is due to the requirements of the steamship builders and for electrical plant of various kinds. Railway extensions abroad, under British management, involve corresponding additions to plant in the local repairing shops, most of which are supplied from this country. The expectations of an extensive introduction of motor carriages have proved premature, for although legislative restrictions to their use on town and country roads have been removed, none of the carriages yet exhibited are sufficiently successful to lead to general adoption. Machine-tool makers are well employed and are likely to continue so for the whole of the year. But besides satisfying the demands from the new or enlarged factories at home and abroad, the leading firms have of late been paying special attention to the improvement of old types of machines, by so balancing and speeding them as to increase greatly their output and economy. When once such improved tools are available, manufacturers are compelled by competition to use them, and old machines are brought down to a "scrap" value, though not worn out. In steel constructional work all the leading firms are well employed, though still to a considerable extent at the low prices that till recently prevailed. As, however, the aggregate tonnage under contract will occupy many of the factories till the summer, prices are likely to rise for those who are still able to offer delivery in reasonable time. On the railways there have been very large orders given out; the structural work of goods stations and sidings, as well as the strengthening, widening, and reconstruction of bridges on the main lines are still going on; and much work is in view for new railways already authorised. The shipments of bridgework to India still continue, and are likely to increase rather than diminish. As the continental factories are also well

engaged and the United States have not yet commenced to seriously compete with great Britain in foreign markets, the prospects for the year are favourable. Portland cement forms at present an exception to the general improvement, for although in the summer there was a slight recovery from the very low prices that had prevailed for some time, it has not continued, and prices are at a low level. The selling rates are ruled by the demand for export, which is almost entirely from the works on the Thames and Medway forming the London district, and is at present slack, the shipments to the United States especially having greatly fallen off during the last year.

INSANITARY AREAS, LEEDS.—A meeting of the Leeds Insanitary Areas Committee was held on the 17th inst., Ald. F. M. Lupton presiding. Having now obtained the permission of the Local Government Board to deal with the insanitary property in the neighbourhood of York-street, and also that at Camp Field, the Committee resolved to recommend the Council to proceed with schemes for dealing with the whole of the two areas. The greater area covers about sixteen acres, and it is bounded on the north by Dyer-street and High-street, and on the south by Marsh-lane. It is the Committee's intention to demolish much of the crowded and unhealthy property at present existing in the locality; to cut two or three broad streets through the property, and eventually, possibly, to make York-street and Marsh-lane each 60 ft. wide. The latter idea has not yet, however, taken the form of a written recommendation. As to the smaller area in Camp Field, the Corporation appear only within the last few weeks to have obtained the necessary sanction of the Local Government Board to proceed with the work, and this permission is granted conditionally, the Local Government Board stipulating that the Corporation shall provide the artisans' dwellings in the neighbourhood of the property demolished.—*Leeds Mercury.*

PROPOSED NEW STORAGE RESERVOIRS, EAST LONDON WATER SUPPLY.—The Bill which has been deposited at the next session by the East London Water Company sets out in the preamble that in order to enable the Company to supply the water required by the increasing population in their district, and to comply with their statutory obligations, it is necessary that they should be empowered to construct additional waterworks, and make agreements with other companies for the supply of water. In accordance with this preamble power is sought by the Company to construct two storage reservoirs. The larger of these two will be situated on Wild Marsh and Mitchell Marsh, Tottenham, and will occupy an area of fifty-eight acres. The smaller reservoir will cover an area of about thirty-four acres on Chingford Marsh and Wild Marsh. In connection with these works power is sought to divert and impound waters from the river Lea, Tottenham Mill Lead, Ching Brook, and Chingford Mill stream, and to construct aqueducts from these sources into the new storage reservoirs. The time sought for the construction of these works is seven years.

REFUSE DESTROYERS, LEEDS.—As the refuse destructor at Beckett-street, Leeds, is now somewhat out of date, it has been decided to have it remodelled, and plans for this purpose are being prepared by the Leeds City Engineer (Mr. T. Hewson).

A BRIDGE REMOVING FEAT.—The Great Eastern Railway Company, who have lately been replacing in a single night several of their bridges which span rivers, brought its own record on Saturday night, when, in spite of a snowstorm, the bridge over the river Lea to the south of Tottenham Station, on the main line, was replaced by a new bridge, the old one being removed and the new one placed *in situ* in nine hours. The old bridge was removed and the new one put in its place by the same process and at the same time. Mr. Wilson, the Chief Engineer, with a large body of officials, and gangs of men to the number of seventy, were on the bridge soon after 12 o'clock with a huge crane, several land crabs, a couple of 100-ton jacks, and several 50-ton jacks in reserve. At 12.35 a.m. operations were commenced. The first thing to do was to strip the rails from the old bridge, taking up the planking as well as the permanent way in order that the lifting apparatus could be attached to the girders to raise the whole bridge bodily to the extent of 18 in. This was to allow of movable trolleys or carriages to be placed underneath resting on transverse girders, which had been the most arduous part of the task, and occupied the men incessantly until a quarter to seven. Then, by means of powerful crabs and winches attached to the new bridge, this was slowly pulled into the place of the old, the latter being at the same time pushed out of the way. It was a dead weight to move of 250 tons, but it was accomplished in an hour. At a quarter to eight the new bridge was in its place, and the old bridge was by its side. The next thing to be done was to remove the trolleys or wheeled carriages from under

the new bridge, and lower it into its final position flush with the permanent way. The completing of this occupied the remainder of the morning, and then the levelling up and adjusting was gone on with; but at 2.20 the engineer's train was able to cross the new bridge, and the work was practically completed.—*The Times.*

PEMBROKE DOCK WATER AND DRAINAGE.—At the last monthly meeting of the Pembroke Town Council Mr. Beesley, C.E., attended, and submitted plans and estimates both for the sewerage and for supplying Pembroke Dock with water. The Council ultimately passed a resolution to apply to the Local Government Board for sanction to borrow 27,000*l.* for water purposes and a sum of 15,000*l.* for sewerage, being the engineer's estimates. Mr. Beesley was further instructed by the Council to prepare a scheme for the sewerage of the Pembroke Ward, and this he promised to do within a month, and the Town Clerk was instructed to inform the Local Government Board of this, and send the plans, &c., immediately.

GLASGOW: DISTRICT SUBWAY.—The Kelvin Bridge Station of the new District Subway is to be equipped with an electric lift, to carry fifteen passengers. It will be fitted with safety gear, automatic stops, and other accessories, and is now in course of erection by the makers, Messrs. Easton, Anderson, & Goolden, Limited, of Erith.

BRIGHTON SEA DEFENCES.—Important proposals on the subject of Madeira-road defences were, according to the *Daily Chronicle*, to be laid before the Brighton Town Council on Thursday. Following the gale of December 4, which swept away the Old Chain Pier, Mr. May, the Borough Engineer, called attention to the urgent necessity of building permanent defence works in view of the rapid encroachment of the sea between the Albion groyne and Royal Crescent groyne. He now points out that in fourteen years the high-water mark has advanced from 50 ft. to 70 ft., and that the denudation of the beach is steadily proceeding. He emphasises the need, Mr. May, in addition to the present groynes, and dwells on the importance, for the prosperity of Brighton, of the Madeira-road being made attractive for all classes, and as safe as possible for the use of residents and visitors. He recommends the construction of a low concrete wall similar to that being erected between the West Pier and the western boundary, and the opening up of a good view of the eastern foreshore, right through from Junction-road to Black Rock.—The line he suggests is 2,760 ft. in length, giving a roadway 85 ft. in width at the foot of Rock-placing steps. The wall, moreover, would reclaim and permanently preserve an additional area of two acres of foreshore, which might be laid out as lawns or otherwise, as might be deemed desirable. The cost of the scheme is approximately 25,000*l.* The Committee recommend the adoption of Mr. May's report, and that application be made to the Local Government Board to borrow 10,000*l.* for a period of thirty years, to defray the cost of the groynes, and that 25,000*l.*—the estimated cost of the wall—be borrowed under the powers of the Brighton Corporation Act, 1865.

FOREIGN.

FRANCE.—M. Ernest Barrias, sculptor, has just resigned his post of Vice-President of the Académie des Beaux-Arts on account of ill health. His successor will be chosen next week.—M. Edmond Detaille has been unanimously re-elected President of the Société des Artistes Français.—A recent circular by M. Derville, Director of the arrangement of the 1900 exhibition, predicts a triple exhibition of fine arts, in which decorative and industrial arts will take their place.—M. Puvion de Chavannes has now on view in the Durand Ruel Gallery, large but very faithful copies of his three large panels executed for the Boston Library.—La Philosophie, La Chimie, et l'Electricité.—The Municipal Council will be occupied this session in transferring the Gare d'Orléans to the site of the Cours des Comples. This operation, which is very much interesting the inhabitants of the centre of Paris, will most likely necessitate the rebuilding of the Pont Solferino and the clearing away of several roads on the two banks of the Seine. A new road will be carried through the Tuileries Garden, a prolongation of the Rue de la Paix and the Rue Castiglione.—M. Dubois, architect, of Angers, has just been elected President of the Société des Architectes at Angou.—The International Exhibition at Nice will be inaugurated on the 28th February 17.—The Municipality of Bourg is building a theatre in the town, which is to cost about 330,000 frs.—At the Musée Feltré, at Nantes, a monument has been erected to the memory of the artist Elie Delaunay. This monument, which has been executed by M. Montfort, architect, is ornamented with a marble medallion of the late artist, by M. Chavalan.—The new French hospital at Constantinople, which has just been solemnly inaugurated, has been built under the direction of the French architect, M. Carré, from the plans of the late Juste Bourmaeur.—The death of M. Edmund Petit of Villeneuve, architect, at the age of 57, is announced.—The death is also announced of M. Charles Lieprie at the age of 81. He was well known as a landscape painter, pupil of MM. Jean Paul Laurens

and Harpignies. He received medals at the Salons of 1865, 1869, and 1890. He painted nature with great charm and truth, and his panel of the "Jardin du Luxembourg" is one of the finest compositions that the Hotel de Ville possesses.

GERMANY.—The Emperor has bestowed the title of "Geheime Hofbauherr" on Mr. Inne, of Heidelberg, who is his Court Architect, and is also responsible for the mansion of Empress Friedrich at Cronberg, which was illustrated in the *Builder* some time back. At the same time, Mr. Geyer has been made "Hofbauherr."—One of the first reports by the new Architect Attaché at the German Embassy in London has been on the Arts and Crafts Exhibition, which he describes and illustrates at considerable length in the *Centralblatt der Bauverwaltung*.—Among the interesting series of lectures which is to be held this year at the "Arts and Crafts Museum" at Berlin, we notice that Mr. Richard Bornmann will discourse on the history of German houses.—The *Centralblatt der Bauverwaltung* reports that no less than sixteen competitors entered this year for the annual Schinkel studentship.—The Municipal Gas Works at Berlin have now been in existence for over fifty years, the first works dating from January 1, 1847. The fact is of some interest in this country as the first gas-works in Berlin originated through English enterprise in 1825, when "The Imperial Continental Gas Association" obtained the contract, the whole of which it held until 1846. The municipality has sunk a capital of nearly three and a-half millions sterling in its gas-works, which are managed by a special committee of the municipality. A publication has just been issued describing the working of this municipal institution.

AUSTRIA.—We have on a former occasion referred to the competition for the design of a Bohemian Museum at Reichenberg, in which Professor Ohmann, of Prague, obtained the first premium. It now appears, however, that the commission has not, after all, been given to this architect, and Herr Griesbach, of Berlin, has been called in by the Town Council.—The design for the new Government hospital at Amstetten was the subject of an important competition, but owing to the elaborate character of the work required only three candidates submitted schemes. The first premium was awarded to Messrs. Froehlich and Scheininger, of Vienna. It had generally been expected that more candidates would have entered, but the requirements were such that a limited competition, with a fixed honorarium for each candidate would have been more suitable.—Of architects recently deceased at Vienna, we regret to record, during the winter, the death of Professor Hanser, at the early age of fifty-five. Herr Hanser was well known in architectural circles, and for some time held important curatorships. Of work carried out under his directions, perhaps the most important was the restoration of the Cathedral at Spalatro.—The question of finding suitable habitations for the middle and lower classes appears to be causing considerable attention at Vienna at present, and interesting lectures on the subject have been given. From various statistics presented, it appears that 28,500 rooms are filled by 70,000 tenants, and not having a kitchen; not very satisfactory for a city that prides itself on its modern improvements.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. Henry A. Jones, Surveyor and Sanitary Specialist, has removed his offices from 11, Wellington-street, to 49, Bedford-street, Strand.—Messrs. Ernest Mathews & Co., slate merchants, request us to mention that all orders should be addressed to their City office, 61, St. Mary Axe, E.C.

APPOINTMENTS OF ARCHITECTS.—A special meeting of the Barry School Board was held on the 17th inst., to appoint an architect for the new schools to be erected on Barry Island. The applicants were Messrs. Gethin & Wallis, Cardiff; Mr. J. A. Owen, Cadoxton; Mr. W. E. Knapman, Barry Docks; Mr. George Thomas, Cardiff; Mr. G. A. Birkenhead, Penarth; Messrs. J. P. Jones, Richards, & Budgett, Cardiff; and Mr. W. H. Dashiwood, Cardiff. On division, Mr. Birkenhead was elected by five votes, Mr. Owen and Mr. Thomas receiving one vote each. The same gentlemen were candidates for the same appointment with reference to Cadoxton Moors School, the voting resulting in four in favour of Mr. Caple and three for Mr. George Thomas, the former being appointed.—*Western Mail.*

THE FIVE ARCHES, TENBY.—Mr. Freese James, the Borough Surveyor of Tenby, having advised the Town Council that this historical gateway required immediate attention, the Board have accepted his suggestion for putting it in repair, and have decided to carry out his plan at once.

BUILDING TRADES FEDERATION, DUNDEE.—A meeting of the Dundee Trades Council was held on the 13th inst., when a circular was read from the Glasgow and Suburbs Building Trades inviting the Dundee Trades Council to send a delegate to a conference to be held in Glasgow on February 13 for the purpose of considering a proposal to form a federation of the building trades of Scotland.—Mr. Joseph Cane stated that this year there was a want made to federate the Scottish trades, but while the

proposal was being considered a committee was endeavouring to get the federation of the building trades in Dundee. The trades in Dundee were generally in favour of the local federation, but when the scheme was put before them it was found that a number of the trades could not federate without the permission of the societies throughout the whole of Scotland. The masons in Dundee, for instance, could not enter into any scheme unless it included the consent of the whole of the members of the trade in Scotland, and the joiners were in the same position. If the national scheme were gone into, he believed a great many of the obstacles in the way of a local federation would be removed. He thought they ought to give the scheme the heartiest support, for there was no city in the country that required fed-ration more than Dundee.—Mr. T. Scott said he did not see how they as a Council could take up this matter by sending delegates to a conference of the building trades. The Council, however, could do their very best to get a conference of the building trades in Dundee to break down the little barriers that existed. But the trades should themselves send delegates to the conference. He moved that the Council take up the matter as he suggested. Mr. George Kirkaldy said he believed the joiners would do their very best to help forward the federation movement. Mr. John Thomson seconded Mr. Scott's motion, which was unanimously agreed to.

BUILDING TRADES' EXCHANGE FOR EDINBURGH AND DISTRICT.—A meeting, attended by close upon 200 of those interested in the formation of the proposed Building Trades' Exchange for Edinburgh and district, on somewhat similar lines to the Glasgow one, was held on the 18th inst. in Dowell's Rooms, Edinburgh, when a lecture was delivered by Colonel Bennett of Glasgow. Colonel Bennett gave a short sketch of the building exchanges he had visited in America. These, he thought, might be advantageously introduced into this country. They had in Glasgow, to a certain extent, proved the possibility of the existence of these exchanges in this country. The general principle on which they had been founded was that the builders in the United States, believing in a more intimate social relation and acquaintance with each other would check bitterness and rivalry, and keep the eagerness of competition within limits, and believing that the skill and knowledge of each member would in great measure be acquired by all, and their usefulness to the community in which they lived increased, formed themselves into associations which had gradually grown into what were now known as Building Exchanges. These institutions would exist in every large city. After referring specially to the Philadelphia Builders' Exchange, which he took as a model, the lecturer remarked that the weak part of the architect's office in this country was the want of professional journeymen to carry on their labour. Too much was attempted to be done by the young gentleman assistant, who failed to realise the real nature of the business till he started as a full-fledged architect for himself. Speaking of the value of the Exchange to trade, Colonel Bennett said the institution would be worth at least 50% a year to every one of them, and would soon put an end to shoddy work and shoddy work prices. The public would have more confidence in the tradesmen they employed, and a better feeling would be established between architects, surveyors, and tradesmen all round.—Mr. Cook, of the Glasgow Building Trades' Exchange, and Mr. John Laird, valuator, Glasgow, also spoke. The Chairman having called for an expression of opinion whether the proposed Building Trades' Exchange in the city and district should be gone on with, Councillor Graham Vooll, Leith, formally moved that such an association should be established for the encouragement and protection of the building trades and relative interests within the county of the city of Edinburgh or elsewhere within Scotland. Such an institution, he said, was most desirable, because at present there were no means by which merchants and builders could meet and transact business, except by their being called on by the merchants and travellers. Mr. Peter White seconded, and the motion was unanimously agreed to. The Chairman intimated that the number of shares applied for was between 700 and 800, which augured pretty well for a beginning. Colonel Bennett was thanked for his lecture, and a committee of twenty-five was appointed to forward the formation of the Exchange. Mr. John Nicol, solicitor, was appointed interim secretary.

EMBANKING THE WATERS OF THE NILE AT ASSOUAN IN UPPER EGYPT.—At a meeting of the Victoria Institute, held at Adelphi-terrace on Monday, Professor E. Hull, LL.D., F.R.S., described the last proposed scheme for embanking the waters of the Nile at Assouan in Upper Egypt. After referring to the long lapse of time during which the cultivation of the ground in Egypt had been carried on by irrigation, and having described the origin of the rise and fall of the Nile and the source of the fertilising sediment, the author proceeded to deal with the question of the proposed embankment of the Nile waters at the First Cataract, by which during the period of Low Nile the waters would accumulate to the extent of allowing a second flood by means of distributing canals carried down the valley on each side of the river. He also gave an historical sketch of the various projects proposed by Linant

de Bellefonds, Count de la Motte, and Mr. Prompt, and the final adoption of the Assouan site on the report of Mr. W. Willcocks, Director-General of Reservoirs, together with the arrangement by which the island of Philæ with its monuments would be preserved from injury. As regards the advantages of the scheme in increasing the productions of Egypt, it had been estimated by Mr. Garstin that the gain to the State would amount to 850,000l. per annum, and the increased value of the crops from Upper, Middle, and Lower Egypt to 16,000,000l. per annum. Many present took part in the discussion which ensued, in which the importance of a well-considered plan was urged in a land in which the ground teemed with hidden and other records of antiquity.

THE AUCTIONEERS' INSTITUTE.—The third meeting of the session of this Institute will be held in the lecture hall of the Institute, 57 and 58, Chancery-lane, on Tuesday next, the 26th inst. at 8 p.m., when a paper will be read by Professor Banister Fletcher upon "The Practice of Compen-sations."

CAPITAL AND LABOUR.

WAGES IN THE WOLVERHAMPTON BUILDING TRADES. The Wolverhampton Master Builders' Association have conceded a demand for an advance in wages from 9d. an hour, made on behalf of the operative carpenters and joiners, to take effect in April. Concessions were also made with regard to special rules. The bricklayers have handed in a notice for an advance of 1d. per hour, and an alteration of some of the working rules, and this demand is also likely to be granted. An advance will probably be received likewise later on by the labourers.

WAGES IN THE NORTH STAFFORDSHIRE BUILDING TRADE.—The North Staffordshire Master Builders' Association have given notice to the joiners, bricklayers, and masons of a reduction of wages of 1d. per hour, and to the labourers of a reduction of 1d. per hour, such alterations to come into force on May 1 next. The joiners, on the other hand, have given notice for 1d. per hour increase. The latter have also given notice for a new rule limiting the number of apprentices, a new rule revising the walking-to-work time in the morning, and a new rule for a representative of the men to be allowed to visit all shops and jobs. The Operative Bricklayers' Society have given notice of alteration in the rule as to two hours' notice, which was recently before the Potteries Stipendiary, in a case at Hanley. The present wages are:—Bricklayers, 9d.; joiners, 8d.; masons, 8d.; and bricklayers' labourers, 6d.

BRICKLAYERS' STRIKE AT BLYTH.—The bricklayers connected with the building trade at Blyth came out on strike on the 18th inst. It was intimated by the Master Builders' Association that it was intended to reduce the wages of bricklayers by 1d. per hour at the beginning of the present month. The men object to the proposed reduction, and as the masters remain firm in their demand, work has been suspended. The current rate is 9d. per hour.

LEGAL.

THE CLAIM AGAINST THE ST. PANCRAS GUARDIANS.

THE further hearing of this claim, which arises out of the contract for erecting the workhouse buildings in King's-road, was resumed at the Reference Court, in Portugal-street, before Mr. Ridley, Q.C., on the 18th inst., a report of the former proceedings having appeared in the issues of the *Builder* for November 21 and 28 and December 5 last.

It will be remembered that the plaintiffs, Messrs. Tom Drew-Bear, James Brown Henry Tolpitt, and the contractor, Mr. Wm. Brooks, of Folkestone, allege is due under a contract, for the erection of the workhouse buildings, the defendants being the St. Pancras Guardians and Messrs. Arthur and Christopher Harston, the architects. In November, 1894, the contract between Mr. Brooks and the Guardians was determined, owing to disputes between the contractor and Mr. Poole, the clerk of the works appointed by the Guardians Board, the plaintiffs' case being that the contractor, Brooks, was prevented from continuing the work by the action of Poole, who condemned the materials without sufficient cause. The defendants, while generally denying liability, relied on the Public Authorities Protection Act of 1893, which provides that they are not responsible for damages after the expiration of six months from the date of the occurrence alleged by the plaintiffs.

Mr. Reginald Bray and Mr. Alfred Hudson appeared as counsel for the plaintiffs and the contractor; Mr. English Harrison and Mr. W. Moyses for the defendants, the St. Pancras Guardians; and Mr. MacIntyre and Mr. R. W. Turner for the architects, Messrs. Arthur and Christopher Harston. When the hearing was resumed, Mr. Jas. Brown re-entered the witness-box, and, further cross-examined by Mr. Moyses, said that he personally made no complaint to the Guardians in the Armpit-trap matter, although it might have been mentioned in an interview. At a meeting of the Guardians the

matter of the plaster arch was specially referred to; a difficulty about the gas meter was also referred to. There was a meeting at a very early stage on the question of finance. The Guardians had assisted them. He first knew of the question of the hand-rail when it had been worked for about a fortnight or three weeks. He was afraid that his experience of building was that when special sub-contractors came upon works which were being executed, it always caused a certain amount of inconvenience. In the present case the special sub-contractor's work was of a very extensive kind. The special sub-contractors caused enormous delay. On April 21, 1893, there was held, at the Work-house, a meeting of the creditors, Mr. Boden being present. That meeting was just about the time when they were debating amongst themselves whether or not they would continue the contract, or let the thing take its natural course. It was about four days after that meeting when they decided to continue the contract. At that meeting Mr. Brooks gave a full account of his liabilities. Brooks made a complete and clean sheet as to how he stood. The Guardians then undertook, as far as they could, to support the contractors. Witness told the Guardians that they thought they could make a margin of profit. At the meeting of the Building Committee on May 4th at which he was present he stated that he and his fellow-inspectors were satisfied as to the manner in which Brooks was executing, and complied with, his contract. He (witness) asked the Guardians to strain a point to help the builders financially, and said that he and his fellow-inspectors would supply the materials on credit.

The Guardians consented, and gave general instructions to Messrs. Harston to make their certificates as close to the margin as they could. Witness had not investigated the history of the contract up to that date, he was sorry to say. He personally looked at the amount of work done, and the prices in the bills of quantities, and the possibility of carrying the job through with profit to the creditors. He had never heard of the harassing by the architects and the clerk of the works at that time. He had no idea of the ironwork being condemned until it was. If he had heard of that he should have hesitated before advising them to go on with the contract. They had had Brooks there, and Fearon, but they relied on the surveyor, who was taking quantities of the work. Mr. Drew-Bear had supplied a good deal of the ironwork, and some of it had been returned, and made good at that time.

Cross-examined by Mr. MacIntyre. Until the creditors took over the contract he was only once at the works, and that was the occasion when he went about there facing bricks. He only saw Mr. Harston once about them. Mr. Harston's complaint was that the bricks were knocked about. Witness saw that they were knocked about, but he protested that it was not their fault, but the fault of the railway cartage to the works. The bricks at the railway station he found in good condition, but those on the works had been somewhat damaged. That was the only complaint that Mr. Harston made about his bricks. The stock facing bricks could have been got for 35s. in 1893, but he could not say from memory about 1892. 1892 was not a particularly bad year for brick making. It was a wet spring, and that interfered with brick making. The architect, in his opinion, according to the specification would not be within the contract if he required bricks up to 70s.

Mr. MacIntyre: Do you suggest that whether the bricks were good or bad Mr. Harston ought to have passed them?—No, I do not suggest that. Is it or is it not in the discretion of the architect to say whether a particular brick is sufficient for the purpose or not?—I do not think an architect should read the specification unfairly. I think the builder is entitled to bring upon the work bricks sufficiently good for the type of work he is doing. I think I can say that he could have got proper bricks for that purpose for 35s. in 1893.

How many times did you go to examine the works after the creditors took over the matter over?—I should think twenty or thirty times. That was from April, 1893, till the end of the job. He never particularly examined the timber. The only thing he said about it was as to the two pieces produced. The specification said that it should be free from sap, but he suggested that that was almost an impossibility. He complained of two instances of stoppage of work through drainage. One of the cases was where the drains were left open at the back of block H. That arose through a leakage from some old cesspool or drain which could not be discovered. The duty of the clerk of the works then was to have immediately seen to it and to have got instructions what to do. Instead of that the thing was left open for weeks—a most dangerous thing to do. When Mr. Harston was instructed on the matter sometime after, he gave orders what to do in a few minutes. The clerk of the works ought to have seen to it. It was what he was there for. Fearon was not waiting for pipes to lay in the drainage at the time he spoke of. When he saw the plaster arch it was not good enough to be left. Mr. Harston was quite right to have it altered.

The learned Referee: I think it objectionable that there should be double cross-examination on every point. It is not fair to the witness.

Mr. MacIntyre agreed to adopt this suggestion. Cross-examination continued.

By the end of 1893 the great bulk of the work had been finished, and early in 1894 he instructed an accountant to go down to Folkestone to go through Brooks's books. The accountant had the assistance he ought to have had both from Brooks and Fearon. No complaints were made to him as to any interference, nor was his attention brought to any complaint. He remembered Mr. Drew-Bear writing a letter to him in February, 1894, in which he said that he was not at all satisfied with the accountant's work at Folkestone, nor as to Fearon's pulling him up when the work was half done. Witness was of opinion that the contract price was a sufficient one. Mr. Tolpitt had written to him to say that Brooks ought to have had another 25 per cent. on his contract price. Tolpitt, however, said that twelve months after the contract—in April, 1893. The labour bills consumed all their money, and that was the thing which troubled them. He had several interviews with Mr. Harston, and he should have been very much astonished if he only saw him three times at his office. Whenever he went to Mr. Harston personally he did not have any difficulty with him, except that he found that he was very stiff to compel Brooks to do things which he (witness) thought he ought not to compel him to do. Probably Mr. Harston thought it was his duty to do so under the contract. He now wished that he had gone to Mr. Harston more often. He had said a good many things to Mr. Harston which he did not want to repeat here. When Mr. Harston came upon the works he always settled things one way or the other. Brooks left the job about the end of 1894.

Re-examined by Mr. Bray :

During the execution of the contract great inconvenience, delay, and cost were occasioned by the slow progress of special sub-contracts covered by provisional items. Generally these provisional items were ordered by the contractor, who was then the master of the situation, but in the present case Messrs. Harston retained the sub-contracts in their own hands, thus permitting of delay. Witness found that bricks, which he regarded as sound, were condemned by the clerk of the works after they had been built in the walls. They showed no chipping on the face.

Mr. Bray proposed to ask the witness what was the general nature of the reputation of Messrs. Harstons with regard to their dealings with builders?

Mr. MacIntyre objected to the question being put.

Mr. Bray submitted that the question was admissible, inasmuch as it arose out of the cross-examination of the witness.

The learned Referee called for the shorthand notes of the last hearing.

These were read, from which it appeared that the witness stated in cross-examination that Messrs. Harstons bore a very high reputation as architects, and had been employed in that capacity for similar buildings to the St. Pancras Workhouse by the Metropolitan Asylums Board.

The learned Referee said that he being so, the question proposed to be put to the witness was admissible.

Re-examination continued: The witness said that Messrs. Harston's general reputation with reference to their dealings with builders was that they were hard, severe, and, he thought he might use the word, exacting. They would always do their duty to their clients. In consequence of this the contract with Mr. Harston one day in 1894, in his office, he recollected Mr. Arthur Harston coming in and saying to his brother:—"Here is another builder failed who worked for us. That makes three at the present time."

Mr. MacIntyre asked leave to further cross-examine the witness as to this conversation, and obtained permission to do so.

Further cross-examination by the learned counsel, the witness stated that that happened sometime in 1894. He knew two out of the three builders mentioned. One was Mr. Brooks; the second was Mr. Holland, of Poplar; but the third he would rather not mention, as he might be doing the man an injury.

Mr. MacIntyre: Will you give us the name on paper? (The witness did so.)

Cross-examination continued: He knew that Messrs. Harston's had been in practice for many years, and he knew that all their work was advertised:—"The lowest tender always accepted."

Mr. A. E. Brown, B.A. and B.Sc. (London), and son of the last witness examined, said that he managed the brick manufacturing department of the business. They commenced to supply red bricks for the St. Pancras Workhouse the latter part of August. They had supplied them before to Kirk & Randall. In consequence of complaints they had from the huller he went and visited the works. That was on August 25. He saw Mr. Fearon and Mr. Poole. He inspected a stack of bricks, and also work which had been built adjoining the stack. The bricks had been damaged slightly in transit. Looking at the bricks as a whole, he considered that there was cause for complaint, but not for refusing their use. He saw some blue pencil marks on the brickwork. Mr. Poole took him out and showed them to him. Poole told him

that he had instructed Fearon to cut those bricks out, as they were not fit to be in the work. He did not say why they were not fit to be in the work, and witness could not see any reason why they should not be there. He told Mr. Poole that he did not consider that he was justified in marking them. Poole immediately took out his pencil, lost his temper badly, and marked a great many more wholesales in the same way. That was on August 25, 1893.

Cross-examined by Mr. MacIntyre: Some of the bricks he saw stacked were chipped and very much wrong. He had been told that the bricks that Poole had marked were still in the building, and that Poole's condemnation was overruled by Mr. Harston and the bricks passed.

Mr. George Andrews, a director of Smead, Dean, & Co., examined, said that on September 20, 1892, Fearon came to him with reference to his supplying picked stock facing bricks, and, after examining their bricks, arranged to have some. Fearon selected the best kind of facing bricks, and ordered some ordinary stock. He ordered 10,000 facing bricks, and 24,000 ordinary stock. He afterwards heard that they were condemned. He charged 45s. for the 10,000, and 32s. for the others. Malm's were not quite the same sort of bricks as facing bricks, in malm's the earth was specially prepared, and they were a more expensive brick. They cost about 10s. per thousand more. A shipper was a harder brick than a picked stock facing, but not so uniform in colour. They were usually the same price as picked stock facings, but not always; in the present instance they were 3s. cheaper. They had supplied bricks to the Workhouse after the bricks Brooks left. They were not as good as the facing bricks, nor so good as the shippers. The price was 35s. a thousand. No complaint was made of them. Stock bricks were slightly more in 1892 than in 1893, about 1s. a thousand.

Cross-examined by Mr. MacIntyre: In the picked stock facings they had to get an uniformity of colour as bricks as they could, and as free from chips as possible. They never had bricks sent back to them. He did not know whether Poole was clerk of the works when the bricks were sent after Brooks had left.

Wm. Franks, a foreman bricklayer of eighteen years' experience, examined by Mr. Hudson said that he entered into the employ of Brooks in February, 1893 when he was put on the St. Pancras Workhouse as leading foreman. He was told by Poole that he must pick over the old bricks purchased by the Guardians. Poole continually complained of their use. A certain number of bats were used necessarily in breaking bond. Witness kept on picking the old bricks. The new work was in red rusticated corners and stock panels, and these were objected to by Poole. The colour was not right, they were too rough, and some were chipped—the latter complaint was well founded. Poole marked the bricks objected to with a piece of black carbon, which left a white mark that penetrated the material. Poole said that stocks were specified and he would have them. All the bricks used for facings were picked stocks excepting one lot of golden malms. Poole objected to the softness of these, and they had to be used for bull-noses in inside work. Of the bricks marked some were good and some had faults. Witness had four bricklayers on the ground for six weeks picking bricks, and others cutting out bricks, and thus delaying the removal of the scaffolding. Poole marked the whole of a pier on the front of C block, but witness did not pull it down, and it stood there now. It was such a common practice for Poole to condemn work that at last witness took no notice of it. The brickwork was generally well done. The condemnation of the girders also delayed witness. Poole would not allow old bats to be used for inside walls, for breaking bond, but new ones had to be snapped for the purpose.

Cross-examined by Mr. Harrison: Witness did not cut out all the bricks condemned by Poole, as there was no real ground of complaint.

George Edw. Wragg, secretary of Messrs. Eastwood & Co., with twenty-four years' experience, said that his firm manufactured between ninety and a hundred million bricks made by hand at Shoebraynes. They would vary in quality, first malms to cutters, mean seconds, pavers, shippers, malm stocks and common stocks, rough grizzles, and placks. The price of malm stocks varied from 10s. to 12s. above stocks. Brooks applied to witness for quotations, but witness declined to supply him.

In answer to the learned Referee, the witness said the best coloured and most expensive brick was the softest, because to get a hard, well-baked brick the colour had to be sacrificed.

Witness thought that some bricks marked and rejected, according to the specification, ought to have been passed, and that others were passed which ought to have been condemned.

Mr. George Armitage, of the firm of Armitage & Sons, stone merchants, the Robin Hood Quarries, Wakefield, examined, said that he supplied the landings and steps for the staircase work generally.

Some landing work stone was rejected as being laminated. Witness examined it, and as he could not find any defect in it, went to the architect's office with Poole. Mr. Harston hammered the stone in

order to split through the laminations, but it broke across. All landing stone was laminated. Mr. Harston then told Poole that if the landings were equal to the sample they ought to be used. The landings were, however, condemned by Poole, and were carted away from the works, and could now be seen at another builder's yard in Lambeth. The pieces produced by Fearon, and spoken to by the witness, were a fair sample.

Cross-examined by Mr. MacIntyre: The stone for the steps and that for the landings were of two different classes, the latter being laminated. He received a complaint calling attention to this fact. He replied, that the landings would wear as long as the steps, and that owing to the size required they could not be cut out of the same beds as that for the steps. The landings came from Scotgate Ash, near Pateley Bridge, the steps came from Bradford.

Mr. Frank Trickett, of the firm of Samuel Trickett & Sons, Great Northern Railway, King's Cross, stone merchants, with over twenty-five years' experience, examined, said that he had examined the samples of York landing referred to by the witness Armitage as having been rejected by Poole. It was excellent hard laminated material. It was practically impossible to get pieces of the size required in unlaminated stone, but the laminated stone was nearly twice as strong and durable as the unlaminated.

Cross-examined by Mr. Turner :

There was great difficulty in getting large pieces in unlaminated stone, and when obtained it would name so well.

In answer to the learned Referee, the witness said that the best and the highest-priced Yorkshire stone was the laminated. The expression, "free from laminations or other blemish," which occurred in the specification, was a very common one.

Charles Edward Newman, of Ironmonger-lane, E.C., secretary of the Thames Sand Company, examined, said that he supplied seven barge loads of Thames and pit sand to Brooks for the workhouse. The river sand came from near Gravesend and was universally used in the trade. In a commercial sense there was no "above bridge river sand" (such as was specified) on sale. Very small quantities were obtained for their own use by local builders. The Thames and pit sand supplied by witness was washed and screened by machinery, and was furnished to some of the largest builders.

Cross-examined by Mr. Turner: When witness had an order for pit sand he often delivered below bridge river sand. No salt remained in it.

In reply to the learned Referee, Mr. Turner stated that Poole rejected the sand as not being sufficiently coarse.

The learned Referee: We have had a very strong body of evidence that for some reason the clerk of works in this contract rejected every successive material brought on to the works as not good enough. The result seemed to have been delay, ruin to the contractor, and gross injustice.

Mr. Turner replied that the materials were not according to the specification of Mr. Harston, who surely had a right to demand from the contractor that which he specified.

The learned Referee remarked that he should be glad to hear Mr. Harston in the box.

Mr. Henry Tolpitt, timber merchant, of Folkestone, one of the plaintiffs in the action, as a member of the Committee of Inspection, examined, said that he supplied timber for the works from 1892 till the end. Of the 250 loads of small timber, 49 were removed, having been stated by Mr. Fearon to have been condemned by Poole, and of the 45 loads of large scantlings 17 loads were sent back, some not being even unloaded. He (witness) could find no reason for the rejection, as he was supplying Government contracts and other large undertakings with the same.

Cross-examined by Mr. Turner: The scantlings were supplied according to specification, and those accepted were identical with the ones sent back and from the same parcel as imported. Memel timber lying about in the open would be affected if freshly sawn.

Cross-examined by Mr. English Harrison: The tie-beams were unusually long, and it was difficult to get them absolutely free from sap. It was quite unusual to have so large a proportion rejected.

Mr. Daniel Thos. Heaven, timber merchant, of Greenwich-street, E.C. and late traveller for Messrs. Baines & Brard, of Reading, examined, said that between 1892 and 1894 that firm was supplying through witness flooring under this contract. Fearon was particular as to the qualities to be supplied. In April, 1893, in consequence of a letter from Fearon he (witness) saw Poole and Fearon and heard the complaints of the former. He (witness) afterwards supplied another brand, described in the price lists as equal in quality, and this flooring was also rejected as not being dry by Poole, with whom witness had another interview. They were, however, eventually passed.

Alfred Mier, of Meir & Son, timber merchants, King's-cross, also gave evidence of a similar character as to the flooring timber supplied. He stated that it was being constantly condemned, until he grew tired of supplying and replacing it.

Cross examined by Mr. Turner: The rejections were so numerous that after a time

ey never credited the timber in their books till the total load was signed for. The total amount supplied was from 400*l.* to 500*l.*, and the firm were editors for the last 20*l.* or so.

George Smith, examined, said that in April, 1894, he was foreman to Harston, who was then carrying a contract at the Bromley and Stepney Asylums, Messrs. Harstons being the architects. Witness and young Mr. Holland went over to see the brickwork at the St. Pancras workhouse. He considered the work was done fairly well.

Cross-examined by Mr. Turner: The work was done well, including some which had been marked with blue marks. George Smith, a foreman bricklayer, examined, gave evidence as to being engaged on the K or undry block, and as to the delays caused by Poole's complaints as to the brickwork, the levels, and by the engineers who fixed machinery.

George Akehurst and William John Taylor, foremen bricklayers, gave evidence corroborating the witness, and spoke as to Poole's rejection of plans and girders.

John Walker, a general contractor, examined, said that he had a contract with Brooks for making the roads to workhouse. Poole complained about the flints although they were similar to those supplied at the same date to Islington Vestry. He asked leave to withdraw from the contract but was persuaded to go on.

Wm. Brown, general foreman to Brooks from the commencement of the contract, was examined in great detail as to the rejection by Poole of bricks, timber, and other materials which the witness said he considered satisfactory, and that bricks and other work were allowed by Mr. Harston to remain, and could still be seen.

After hearing further evidence, the learned Referee, addressing counsel, said: I should just like to say that while there has been nothing brought before me tending to show that the architect was in fraud or collusion, yet there has been a mass of evidence produced, all going to show that they have not exercised their discretion fairly. It is for you to consider your future conduct of the case.

Mr. Hudson replied that the plaintiff's case would be shortly brought to a close.

The witness was then cross-examined by Mr. MacIntyre as to the materials rejected, with a view to show that they were imperfect, and not according to specification. The witness admitted that some of the bricks were much chipped, and that timber was little sappy on the edge.

Mr. MacIntyre called the witness's attention to his hoarding, cut on the previous day from the roof of Block C of the workhouse. One sample was, he said, sappy, another was all right, and was only from a young tree. He thought that both specimens ought to have been passed. The hoards rejected were not worse than these.

Mr. MacIntyre then called attention to a section of 9-in. wall, five courses high, and 4 ft. 6 in. long, in which the face of the bricks were certainly bipped. Witness replied that this was a very good sample of brickwork for a 9-in. wall, and that the bulk of the wall was being shown. The specimens were then turned round, when this proved to be the case, the other face being in good condition.

Joseph Holland, contractor, examined, said that he had carried out works at Stepney, in 1892-4, under Messrs. Harstons, when questions arose between the architects and himself as to the brickwork. Mr. Harston referred him to the St. Pancras Workhouse to see the work there as being what he wanted, and witness and his son and the witness George Smith went over and inspected the brickwork there.

Mr. Edward Massey, of the firm of Goddard, Massey, & Warner, of Nottingham, ironfounders, examined, said that they cast sixty-four columns for the workhouse to the order of Drew-Bear, Perks, & Co. On receiving a complaint as to eight of the castings, witness examined them with Mr. Drew-Bear at the workhouse, and as he could find no fault in them, he (witness) refused to replace them without fresh payment, and this was agreed to by Messrs. Drew-Bear, Perks, & Co. Witness wrote very strongly as he felt unjustly treated, and the castings were kept on exhibition at his works.

Wm. Jas. Bradshaw, manager for Messrs. Kirk & Randall, examined, said that he had been with that firm for just twenty-seven years, and one of the rejected candidates for the post of manager to the London County Council. He was frequently on the works at St. Pancras when his employers held the contract for the first portion of the workhouse.

The witness was proceeding to state that these were difficulties with the architects when Mr. English Harrison objected that this would not be evidence against the Guardians, as any dispute then arising was settled by reference.

Mr. MacIntyre on the same side submitted that evidence as to previous disputes was irrelevant, as tending to introduce fresh issues.

The learned Referee said that he should not allow evidence as to the arbitration; but he must hear the evidence in question as it affected the conduct of the architects.

Examination continued:

When Kirk & Randall had the contract Messrs. Harstons were the architects and Poole was the clerk of works. There were objections raised to

nearly all the materials—bricks, ballast, sand, timber, flooring—and the contract was abandoned by consent, and the surplus materials were taken over by Brooks. There were also disputes as to other contractors employed by the architects delaying the work.

Cross-examined by Mr. English Harrison: In the subsequent arbitration Kirk & Randall claimed about 4,300*l.*, and were awarded 1,500*l.*

John Gosby, clerk of works under the Folkestone School Board, and general foreman under Brooks at the workhouse from May, 1892, till December, 1894, examined, spoke as to the delay experienced in getting possession of the site owing to the fact that parts of the buildings to be reconstructed were occupied. He also described in detail the mode in which Poole complained of materials after they were built in. Witness was present when Brooks spoke to Poole about the treatment of his manager, foreman, and men, and of the wholesale rejections, and inquiring if Poole wished to ruin him. Poole went into his room and shut the door in their faces. The witness then corroborated the evidence given by the witness Fearon previously reported.

Cross-examined:

When he left the workhouse job he asked Mr. Harston to give him a testimonial, but that gentleman refused to give him one. He also asked Mr. Poole for a testimonial, but that gentleman also declined to give him one. He had worked for Fearon for twelve years. Witness was general foreman, and Fearon was manager. When Mr. Harston refused to give him a testimonial he said that he did not know enough of his qualifications to give him one.

Mr. MacIntyre: Is that all? His reply was by letter, was it not? Have you got the letter?

The witness replied that he had the letter, but not in court.

Mr. MacIntyre then read a copy of Mr. Harston's letter to the witness, in which it was stated that as he knew but little of the witness's qualifications, and the St. Pancras job was so unsatisfactory, he did not feel justified in giving the testimonial asked for.

The learned Referee said that there was no evidence that the contract was unsatisfactory.

Mr. MacIntyre dissented, and pointed to the materials supplied.

The learned Referee remarked that there was no definite evidence on which he could rely that any of the materials supplied were unsatisfactory.

Mr. MacIntyre replied that the learned Referee had not heard the defendants' evidence on that part of the case yet.

The learned Referee said that it had turned out, so far as he had been able to judge, that the objections were ill-founded. He would not say that the things were right to the utmost farthing, but it could not be said that the job in question was an unsatisfactory one.

Mr. MacIntyre: Let us take Brown's evidence, for instance. He admitted that the red bricks he saw were chipped and rubbed.

The learned Referee: Do you know of any job in London where bricks are not chipped or rubbed?

Mr. MacIntyre: Nor do I know of any job in London where some of the materials were not objected to by the architects.

Mr. Wm. Brooks, examined by Mr. Bray, said that he had been in the building trade ever since a child, and in business since 1870. Mr. Fearon was the practical manager of the job in question. His (witness's) overdraft was 200*l.* when he undertook the contract, and he had hook debts of about 200*l.* available, and the whole of his stock and plant, and independent of what the bank held, fifteen houses in Folkestone. He had made out a statement of what his position was when the contract was entered into.

Cross-examined by Mr. Moyses:—He had to make an arrangement for an overdraft when he undertook the contract, but they always had to do that. The largest contract he had had before this was the building of the Victoria Hospital at Folkestone. The contract price of that contract was 9,000*l.*, but it cost 10,000*l.* He had never had a contract in London before this, but he had worked under London architects. He could not recollect having a conversation with Mr. Milward on April 16, 1894, with regard to his financial position, but if that gentleman said that he had a conversation with him he could not contradict him.

Did you tell him that you had no complaint whatever to make against the Guardians, and that your misfortunes were due to a series of unfortunate circumstances, and having to pay trade union rate of wages?—I do not recollect the conversation, but, so far as I can recollect, that is what I should say on such an occasion.

Cross-examination continued:—He did not wish to make it an element that he had had to pay trade union wages. As gentlemen, the Guardians had treated him with great kindness.

Cross-examined:—Mr. Harston, independently of Poole, had treated him properly.

This evidence closing the plaintiff's case, Mr. English Harrison then proceeded to address the Court on behalf of the Guardians.

The learned counsel said that he did not propose to deal with the case so far as it concerned Messrs. Harstons, the architects, but only on behalf of the Guardians. The learned Referee would recollect

that the contract was a contract by which the builders undertook to do the work to the entire satisfaction of Messrs. Harstons. The architects were described to be the sole judges of, and were to determine, all differences arising between the parties, and therefore they were described there as being judges, and there could be no doubt that they were persons acting as arbitrators or quasi-arbitrators.

There was also a clause (on page 13) which dealt with the position Poole was to occupy, and therefore it was a contract by the builders that Poole was to act in the particular way set forth in this clause. The learned counsel read the clause, which ran as follows:—"The clerk of the works for the time being shall be considered to act solely as the inspector and assistant of the architects, and the contractor shall afford to him every facility on the work." Therefore, said Mr. Harrison, Poole was to be the assistant and inspector of the architects—that was to say, when materials were coming on the job he was to inspect them in the first instance. The learned Referee would notice how carefully the provisions were framed. As being the inspector and assistant of the architects, it might be said that he had to exercise the functions of the architect in ordering the execution of extra work. His power, however, was limited by a particular part of the clause. In order to avoid any ambiguity as to the power of Poole, it provided that he should have authority to do particular things. That part of the clause, he submitted, was most important, because it showed what sort of functions the clerk of the works was, under that clause, to perform.

The learned counsel then cited several cases with a view to showing that within the decisions of the courts the architects were arbitrators or quasi arbitrators. It was suggested at one time, continued Mr. Harrison, that the Guardians or the architects had been guilty of fraud; but it might now be stated, however, that the allegations with regard to that, which decorated the statement of claim, had been withdrawn. He therefore submitted that as the case now stood, it was quite clear that neither party to the litigation, neither the Guardians nor the plaintiffs, could bring an action against the architects for negligence in arriving at their conclusion. There was no warranty that they would bring any skill or care in the case at all. (The learned counsel cited cases in support of this contention.)

The learned Referee: I doubt very much whether an architect is not bound to bring to bear reasonable skill and care. I think there is that duty upon him.

Mr. MacIntyre: There is a duty upon him to act honestly. The learned Referee: I think he is like other people. He is like other skilled people. You say the architect is protected because the clause makes him an arbitrator. But I cannot help thinking that the arbitrator must bring reasonable skill and care upon it, and if he does not it is no decision at all. I have decided that before, more than once here, against the architect, because he had not brought his mind to bear upon it. I am quite sure of that. You say that he can do whatever he likes.

Mr. Harrison: No. I say that he must be honest, and not guilty of any fraud. The learned Referee: Suppose he said, "I know I am arbitrator, and nobody can question my decision, and I will let the builder understand I am master of this situation and that he is not." Suppose he said that?

Mr. Harrison: Then I should say he is not acting honestly. In that case the builder ought to go to the employer and say that he was not being treated fairly by the architect, and that he would not have it, and that the employer must employ another.

The learned Referee: The builder is put under the supervision of the architect under a contract. If he found fault with the architect, what do you think the employer would say? He would say the architect was the arbitrator, and that he could not go into it.

Mr. Harrison: I say that the law answers that in this way: If the employer chose to say that, he is then colluding with the architect to defeat the builder, and the law affords him the proper remedy at once.

The learned Referee: If an employer wrote to the architect, "I hope you will decide this in my favour," and the reply was, "Oh, yes," that would be collusion; but this is a very different thing. The collusion comes in because he asked the architect to do that thing. That is a different thing to what has arisen here.

Mr. Harrison: I dare say it is. I dare say Mr. MacIntyre will go into all that. But I have no doubt the substance of my friend's argument will be that when Mr. Harston was appealed to he went and looked at the thing and overruled Poole in many cases, and did not do so in other cases. In fact, that in some cases he affirmed Poole, and in others disaffirmed him, would be strong evidence that Mr. Harston was exercising his functions properly. Those, however, are all matters of fact I do not propose to enter into.

The learned Referee: He rejected, in point of fact, materials which ought to have been accepted, and so delayed the contract for a material time, and made it impossible for the builder to perform it in the way it was drawn. Does not that put an end to the contract?

COMPETITION, CONTRACTS, AND PUBLIC APPOINTMENT.

Table with multiple columns: COMPETITION (Nature of Work, By whom Advertised, Premiums, Designs to be delivered), CONTRACTS (Nature of Work or Materials, By whom Required, Forms of Tender, To be supplied, Tender to be delivered), and PUBLIC APPOINTMENT (Nature of Appointment, By whom Advertised, Salary, Applications to be received).

Those marked with an asterisk (*) are advertised in this Number. Competition, pp. iv. Contracts, pp. iv, vi, & viii. Public Appointment, pp. xvi, & xviii.

Mr. Harrison replied in the negative. The learned Referee: I cannot understand why not any more than giving up possession. If the architect has rejected material—good material—time after time, why should not that come into consideration on the contractor giving up the contract? Mr. Harrison: He has absolutely contracted with us to abide by the decision of the architect. The learned Referee: That is, as a reasonable man would arrive at—using the reason that God has given him. Mr. Harrison: He has contracted to abide by the decision of Mr. Harston. The learned Referee: Not however wrong he might be. I think that the things were good on the present evidence. Mr. Harrison, continuing his address, said that Mr. Harston having acted in the position of arbitrator, or quasi-arbitrator, they (the Guardians) could not in law be held responsible for those things. His contention was that, however negligent or wrong Mr. Harston might be found to have been, the Guardians could not be made responsible for that. If the learned Referee came to the conclusion even that the architect had been guilty of fraud his submission was that it would be impossible to hit the employers for that fraud. The learned counsel read a passage from Mr. Hudson's book to the effect that a contract of agency conveyed no authority to commit fraud, and the liability of the architect who committed fraud was personal to himself, and did not affect the employer unless collusion was proved, in which case the employer would be jointly liable with the architect. He (Mr. Harrison) wished to point out that the builders had acquiesced in the decisions of Mr. Harston and Poole according to the evidence as it now stood. When from time to time Poole said particular work ought not to go in, instead of taking the case before Mr. Harston, or where Mr. Harston had decided against them, instead of writing a letter to the Guardians, the holders preferred to say nothing at all about it. On the contrary, by the tone of Fenron's letters it appeared that he had been treated with great kindness by Mr. Harston. Now that Fenron had to get out of those letters he wished the learned Referee to believe they were written with a purpose. It was perfectly monstrous if the Guardians were to have the contract swept entirely away and left with the most rightful litigation and all sorts of demands on them, simply because Fenron did not wish to complain at the right moment. The learned counsel pointed out that one of the difficulties of the position was that the present board of guardians, being like the ratepayers who elected them, a more or less fluctuating body, was not the one which employed the architects or entered into the agreements with the builders; and, therefore, the plaintiffs sought to hit a body of gentlemen who were not responsible for the difficulties, and he (the learned counsel) represented a board who were not really responsible for the undertaking. Mr. Harrison argued at great length that the

case for the plaintiffs as to the alleged delay in getting possession of site, and the interference of sub-contractors by the clerk of the works, had been grossly exaggerated by certain witnesses, and especially by Fenron. (The case was proceeding when we went to press.) ALLEGED INTERFERENCE WITH A PARTY WALL. The case of Thornton v. Hunter came before Mr. Justice Romer, in the Chancery Division, on the 15th inst, on a motion by the plaintiff to restrain the defendant from the alleged interference with a party wall. Mr. Farwell, Q.C., on behalf of the plaintiff, said that as the wall had now been pulled down, and the footings had been removed, there was no question left on the motion now before the Court. He understood, however, that there was a dispute as to whether the wall in question was a party wall or not, and there were other questions at issue which would have to be decided at the trial. Mr. Alexander, Q.C., on behalf of the defendant agreed with his learned friend's statement, and his lordship allowed the motion to stand till the trial, no order being made except that the costs be reserved. ALLEGED OBSTRUCTION OF ANCIENT LIGHTS. The case of Neave v. Saxby was mentioned on motion to Mr. Justice Romer in the Chancery Division on the 15th inst. Mr. Neville, Q.C., on behalf of the plaintiffs, said that this was an action for the obstruction of his client's ancient lights. As the matter stood at present the building owners had given an undertaking to pull down if ordered to do so subsequently. That, of course, was only a temporary undertaking, but he (the learned counsel) had spoken to his learned friend (Mr. Levett, Q.C., representing the defendant), and he was prepared to continue that undertaking till the trial, and if his lordship would allow them to dispense with pleadings, and to have the action set down at once without pleadings, he (Mr. Neville) would be willing to take that course, and to accept his friend's undertaking. Mr. Levett said that he would admit the ancient lights, and he would put the issue solely upon "interference" or "no interference." His Lordship: Very well. IMPORTANT POINT UNDER THE LONDON BUILDING ACT, 1894. The case of Venner v. McDonnell came before Mr. Justice Wills and Mr. Justice Wright sitting as a Divisional Court of Queen's Bench on the 15th inst., it being a case in which the information

charged that the appellant (Venner), the secretary of the Royal Agricultural Hall, did at the instance of the District Surveyor, begin to execute a work in respect of which the appellants ought to have served a building notice before commencing, as provided by the London Building Act, 1894. It appeared that some of the seats in the Hall which had been removed for the purpose of an exhibition were re-erected without notice to the District Surveyor, and it was in respect of replacing of those seats that the information was laid. The iron columns which permanently supported the roof and galleries of the Hall have sockets attached to them, and the temporary and movable timbers, to which the seats are for the time being screwed or bolted on, are dropped or let in to the sockets. The District Surveyor, on being notified of the re-erecting of the seats, issued a notice requiring the appellants to repair the roof windows, or put up a fixed cupboard in his bedroom, or a new kitchen range, without giving notice to the District Surveyor, and without being subject to his supervision, nor without, even in the case of the most trivial matters, paying him half the fee which he would have been entitled on the original construction of the house or building. It was impossible to suppose that that was intended. The Act of 1894 was not retrospective, and the work in question was not work done to or on the building. The operation in question was not "the beginning of a structure" within Section 125 of the Act, and in his opinion the appeal must be allowed. Mr. Justice Wright concurred, and the appeal was accordingly allowed. Mr. Macmorren, Q.C., and Mr. R. C. Gilchrist appeared as counsel for the appellants, and Mr. Horace Avory for the respondent. MEETINGS. FRIDAY, JANUARY 23. Royal Institution.—Professor Dewart, M.A., F.R.S., on "Properties of Liquid Oxygen." Institution of Junior Engineers (Westminster Palace Hotel).—Professor A. Barr, D.Sc., on "Comparisons of Similar Structures, Large and Small." 8 p.m. SATURDAY, JANUARY 23. Institution of Junior Engineers.—Twelfth Annual Dinner, Westminster Palace Hotel. The President, H. A. R. Hincks, in the chair. 6.30 p.m. MONDAY, JANUARY 25. Surveyors' Institution.—Adjourned discussion on D. Howard Martin's paper entitled "The Future Development of the Surveyors' Institution." 8 p.m. Institution of Junior Engineers.—Mr. Willis Burton on "Material and Design in Pottery," II. 8 p.m.

TUESDAY, JANUARY 26.

Society of Arts (Applied Art Section).—Mr. W. H. T. John Hoop, M.A., on "The Artistic Treatment of Heraldry." 8 p.m.
Institution of Civil Engineers.—Colonel J. Pennycook on "The Division of the Plate." 8 p.m.
Auctioneers Institute.—Professor Banister Fletcher on "The Practice of Compensations." 8 p.m.
Newcastle Architectural Association (Students Meeting).—Severely Annual Social Gathering and Exhibition of Sketches, to be opened by the President of the Association, Mr. A. M. Dunn. 8 p.m.
Carlisle Architectural, Engineering, and Surveying Society.—Mr. Drinkwater Butt on "Columbian Antiquities, with special reference to Carlisle Cathedral and Casde."

WEDNESDAY, JANUARY 27.

Society of Arts.—8 p.m.
Edinburgh Architectural Association.—Mr. Alexander Reid, C.E., on "The Practical Designing of Iron and Steel Roofing." 8 p.m.
Royal Institution.—The British Architectural Society.—Mr. Ramsay Traquair on "Heraldry." 8 p.m.

THURSDAY, JANUARY 28.

Society of Antiquaries.—8.30 p.m.
Society for the Encouragement of the Fine Arts.—8 p.m.
London Institution.—Mr. Joseph Pennell on "The Johns and Use of the Pen." Illustrated. 6 p.m.
Royal Institution.—Professor H. A. Miers, M.A., F.R.S., on "Some Secrets of Crystals." 11 p.m.
Institution of Electrical Engineers.—Mr. F. T. Hollins on "The Electric Block and Mechanical Signals on Railways." 8 p.m.

FRIDAY, JANUARY 29.

Institution of Civil Engineers.—Students' Meeting.—Mr. H. Barrat on "An Experimental Investigation of the Efficiency of a Peton Waterwheel." 8 p.m.

SATURDAY, JANUARY 30.

London and Provincial Builders' Foremen's Association. Meeting at 11, Park-st., London-road, E.C.4.—January Quarterly Meeting. 7.30 p.m.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

4,043.—SLIDING WINDOW SHASSES; H. B. Bird and Others.—The object of this invention is to construct window frames with sliding shashes, the shashes may be opened inwards. This the inventor effects by a combination of hooks, slotted plates, clutch bolts, and clutch plates, &c., securing thereby the supporting top sash when lower one is opened inwards, and automatic detachment of the line and balance weight and its retention in position ready for re-attachment as required.
2,015.—WATER-CLOSED STOP SINK, &c.; S. S. Helber.—The basin is provided with its upper edge, a hollow flushing rim of special form, into which the flushing water enters prior to passing into the basin, by which an efficient action of the flushing water is secured, so as to clear out the pan or basin very effectually with a minimum amount of water.
2,155.—LAVATORIES; J. Shank. —In one form of lavatory shown there is, when in use, a continual flow of water from the front to the back, where a hollow gutter or other outlet is formed. A water-supply valve is arranged in connexion with the lavatory or in connexion with each basin of a series, each valve being controlled by a hinged footboard, on which the user stands. Other arrangements are noted in the specification.
3,451.—MITRE CRAMP; W. Ludlow.—The inventor forms a mitre cramp for picture framing, &c., by providing four metal plates, each plate being with two lips, and the plates forming a right angle with each other. Three of these plates are provided with a grooved pulley at outer angle, and the fourth, which is larger, bears a drum, with a plain flange on one side, and a ratchet wheel on the other. A handle is also provided to ratchet wheel, and a pawl to engage with its teeth. A cord passes around the pulleys, and connects them with the drum, which, when the latter is rotated by its handle, draws the corner plates firmly against the corners of the picture and under operation.
3,621.—MORTISE FASTENINGS; S. Hill and Another.—In a mortise fastening for a show-case, a pedestal, or other receptacle, the inventors fix a mortise fastening comprising an independent catch lever, with or without an enclosing metallic case, which is inserted with the mortice through an opening on front edge of door stile. This is actuated by a handle having a stem, which is passed through a small hole formed in the face of the stile, and thence into the edge of the catch lever of the mortise fastening.
18,743.—SECRET FOR SECURING NAILS, &c.; G. Fisher.—This patent relates to fixing curtain nails, hooks, &c., to walls. For this purpose inventor applies to walls hollow wall bolts or sockets, which the curtain nails, &c., can be secured. Such hollow wall bolts are cast in one piece, and have a boss, and the exterior surface is preferably notched, corrugated, or otherwise roughened. The wall bolt is also provided with a pinching screw to secure slank of curtain nails, &c.
24,002.—BUILDING, &c.; SLABS; A. Orig.—The invention consists in the use of templates having peculiar sections on their inner edges, whereby slabs, plates, bricks, &c., of cement, gypsum, artificial stone, &c., may be prepared with edges of such a kind that the slabs, when placed together, can receive between them another material to form joint, such middle space, when filled up, securing efficient bond. These slabs are well suited for waterproof floorings, &c.
NEW APPLICATIONS FOR LETTERS PATENT.
JANUARY 4.—162, T. & J. Jones, Sash Window Fastener Used in the Manufacture of Ceramic Tiles, and Glass for use in General House Decoration, Furniture Panels, &c.
JANUARY 5.—222, W. Starley, Nails.—234, J. Brindley, Machinery Used in the Manufacture of Ceramic Tiles.—229, T. Kemp, Inspection and Sweeping Inlets to Drains, Ponds, and Junctions.—288, H. Hawgood, Sash Fasteners.—302, A. Hayward, Window Shutter Fasteners.—312, R. Ewing, Joining Iron and other Metal Pipes.
JANUARY 6.—21, D. Dickson, Iron or Steel Dovetail or Wood Joint.—377, S. Shail, Kitchen Range.—389, J. Pawsey and G. Glasscock, Water Waste Preventing or Flushing Appa-

ratus.—410, G. Winock and H. Machepey, Machinery for Sawing Stone.—411, G. Winock and H. Machepey, Sawing of Stone.
JANUARY 7.—503, A. Lenton, Handles for Bits.
JANUARY 8.—252, J. Shank, Water-closets.—545, E. and L. Richards, Flushing Cistern Apparatus and Fittings.—563, G. Cande, Open Stoves and Flues therewith.
JANUARY 9.—595, R. Gregory, Road Scarifying Machine.

PROVISIONAL SPECIFICATIONS ACCEPTED.

24,981, L. Robertson, Application of the Double Water Valve Principle to Starting of Syphonic Action in Sanitary and other Fittings.—25,847, J. Moffat, Fireproof Floors, Ceilings, &c.—27,249, C. Bedford, Varnish.—27,329, W. Beynon, Raisers for Door and other Latches.—28,161, H. Powell, Window Sash Fastener.—28,213, E. Vaughan, Latch Mechanism of Front Door Locks.—28,227, H. Craig, Lavatory Basins.—28,332, E. Collins, Door and other Knobs and Terminal Ornaments.—28,430, H. and T. Sabine, Sanitary Pipes, &c.—28,495, N. Cooke, Flushing Rim for Water-closets, &c.—28,496, B. Cars, Gas Brackets.—28,520, G. Duffell, Water-closets.—28,545, H. Schrier, Tiles Suitable for Roofing.—28,824, T. Marley, Chimney Ventilating and like Cowls.—28,872, M. Mulreary, Fire Gates.—29,212, Petretille, Lint, Cement.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

4,703, J. Hannah, Fire Grates.—3,744, H. Lasenby, Locks of Window-shashes.—2,872, L. Seager, Ladders, Step Ladders, &c.—2,979, W. Reading, Grating for Intercepting Traps.—3,745, F. Phelps and P. Daw, Plumb Lines.—3,712, St. Basil, Gones for Water-closets, &c., commonly called Closet Cones.—5,161, T. Smith, Chimney-pots, as a means of ventilation for the prevention of down draughts.—24,929, O. La Rue, Traps for Sinks, &c.

PRICES CURRENT OF MATERIALS.

Table with columns for material names (Greenheart, Teak, Sapele, etc.), units (ton, 1000 ft., etc.), and prices (£/cwt, £/sq. ft., etc.). Includes sections for TIMBER, METALS, and OILS.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish Tenders unless authenticated by the name and address of the sender and we cannot publish announcements of Tenders accepted unless the amount of the Tender is given, nor any list in which the lowest Tender is under £100, unless in some exceptional cases and for special reasons.]

Table for BEDFORD tenders. Columns: Bidder Name, Amount (£), and Remarks. Includes Messrs. Suter & Adams, Russell-Sellers, etc.

CHELMSFORD.—Accepted for the erection of a house at Writtle, near Chelmsford, for Mr. F. Parlett. Mr. K. Mawhood, architect, Chelmsford. £266 [No competition.]

EXETER.—For the demolition of St. David's Church, Exeter.—Bloxham, £530; Dart & Folland, £280; W. B. Terry, £294; W. H. Terry, £294; Richards & Co., £30; Wm. Gibson, £40. * Accepted.

Table for the erection of new church. Columns: Bidder Name, Whole Cost (£), and Temporary Works (£). Includes Laphorne & Co., Luscombe & Sons, etc.

LEEDS.—Accepted for erecting eighteen small terrace houses, for Sir John Barran Bart., at Chapel Allerton, Leeds. Mr. W. Carlyll, architect. Quantities by the architect: Bricklaying and Masonry.—Joseph Richardson, Chapel Allerton, £1,000; Carpentry and Joinery.—J. Wilson, Leeds, £320; Plumbing.—Wesley Bugge, Leeds, £42; Electrical.—Thomas Moore, Leeds, £40; Painting.—Watson, Worsnop, Chapel Allerton, £100. Total, £1,460.

LONDON.—For alterations and additions at 76, West End-lane, for M. E. Couper. W. Sumner & Co., Limited, £575.

LONDON.—For alterations and additions, including fireproof floors, &c., at 241, 243, 245, 247, Fitchley-rd. for Messrs. Green & Edwards. Mr. R. Gaggins, architect, 11, Gray's Inn-square, W.C.1.—Wm. McSwiggan, £2,657; W. Sumner & Co., Ltd., £2,150.

LONDON.—For alterations, including shop-front fittings, at 21, Regent-street, for Messrs. Aves & Co. W. Sumner & Co., Limited, £510.

LONDON.—For extension of show-room and addition to Nas 229, 230, Upper-street, Islington, N., for Mr. J. W. Lewis, Mr. E. Edmund J. Harris, architect, 22, Compton-terrace, Highbury, N. Extra in Cement. Dixon, £1,550; J. & S. per foot, £15; Jarvis & Son, £540; McCormick, £437; Wall & Co., £410; W. & A. B. B. B., £395; Fatman & Fotheringham, £297; R. Eadie, Lyndale-place, £190. * Accepted in cement.

LONDON.—For making up and paving Clonmel-road, and flagging part of New King's-road, Fulham, for the Fulham Vestry, Mr. Charles Botterill, Surveyor, Town Hall, Waltham Green, S.W. —

Table with columns: CLONMEL-RD., NEW KINGS-RD., and sub-columns: Rounley, York, Imperial, Victoria, Admanst., York, Admanst., Imperial, Victoria.

LONDON.—For paving Manson House-square, Camberwell-road, S.E., for the Camberwell Vestry, Mr. O. S. Brown, Surveyor, Vestry Hall, Camberwell, S.E. —

LONDON.—For building a factory, Cornwood-street, N., for The Town Company Limited, Mr. R. Medworth, architect, Bank-chambers, Station-road, Finsbury Park, N. —

OXFORD (Surrey).—For the erection of two villa residences, for Mr. Percy Ravencroft, on the Tusey Estate, Mr. H. Ewing, architect, Tunbridge Wells —

RAMSBOTTOM (Lancs.).—For paving, &c., Hope-street, and four other streets, for the Urban District Council, Ramsbottom. Quantities by surveyor:—

RYDE (H.W.).—For new Forester's Hall for Court Astrina No. 2, 255, Mr. J. I. Barton, architect, 7, St. Thomas's-street, Ryde —

RYDE.—Accepted for alterations and fitting up saloon bars at the "Crown Hotel," Ryde, Mr. John I. Barton, architect, 7, St. Thomas's-street, Ryde. —

SHOOTERS HILL.—Accepted for alterations and additions to the Crole-Wyndham Convalescent Home, Shrewsbury-lane, Mares, B. Scott and Seron-Morris, architects, 30, St. James's-street, W.C. —

WITHINGTON (Lancs.).—For the execution of street works in Withington —

Table with columns: Keppell-road, Warwick-road, Holland-road, Cavendish-road, Stockton-road, Beechwood-avenue, Lime-grove, and sub-columns: £, s, d.

SOUTHSEA.—For alterations and additions, including new shop-front, &c., at 35, 37, 39, and 41, King-road, Southsea, for Mr. J. Edgill, Messrs. Kake & Co., architects, Trudential buildings, Landport —

TONBRIDGE.—For pulling down and rebuilding shop and premises, No. 47, High-street. Mr. H. Elwig, jun., architect, Tunbridge Wells —

WORKING.—For complete grocery fittings at 24, Chertsey-road, Working, for Messrs. J. Douglas & Son, Mr. J. H. Waddell, architect, 20, High Holborn —

TO CORRESPONDENTS.

T. N. (Amount should have been stated).—Notice (We cannot answer the question. Consult the building by-laws in force in your own district). NOTE.—The responsibility of stated articles, and papers read at public meetings, rests of course, with the authors.

SUBSCRIBERS IN LONDON AND THE SUBURBS, preparing at the Publishing Office, 191, per annum (4s. 3d. per quarter), can ensure receiving "The Builder" by Friday Morning's Post.

The Architecture of Our Large Provincial Towns.

IV.—BRISTOL.

BEGARDED as a modern city, Bristol is deficient in having no great central or predominant building, like St. George's Hall at Liverpool and the Town Halls at Manchester and Leeds.

or is there any special or marked impressiveness in any of its lesser buildings of the modern period, though there are some very good ones among them—and yet, taken as a whole, there are few cities in the kingdom more interesting and picturesque than Bristol, its central portion at all events. The variety and irregularity of the ground, the winding network of mostly rather narrow streets, the manner in which modern and ancient buildings are jumbled together, and the presence of the long river-like harbour and shipping almost in the heart of the city, all combine to give Bristol a marked character of its own, which no one who has seen can readily forget.

Bristol is of course much more of an ancient city than those on which we have previously commented; and though we are dealing in these articles mainly with cities as they are at the present time, one cannot write of this one without remembering that it has a greater and more remarkable past story, and has retained more of the impress of the past in its streets, than any other large provincial town in England. It was for centuries the greatest English shipping port next to London. As late as 1735 Pope recorded its astonishment at the sight of "the quay along the old wall with houses on both sides, and in the middle of the street, as far as you can see, hundreds of ships, their masts as thick as they can stand by one another." The mixture of shipping and houses is not so striking now as in Pope's time, for the great days of Bristol as a seaport are (relatively at least) passed away; but this element of the picturesque still remains to some extent. The impression which it produced in those days of being a dirty city unfortunately is still produced, though in this case also we may say relatively only.

As in most cities which date from Mediaeval times, the main lines of the Mediaeval city

are still traceable in the lines of the modern streets. Bristol in the thirteenth century was what would now be called a small walled town in a rather long narrow irregular shape, on a small inland peninsula between a bend of the Avon and a loop of the Avon's small tributary the Frome, which encircled the city westward. The west end expanded rather and ended in an approximate half circle, the line of which is followed by St. Stephen's-street and part of Baldwin-street. At the east end, where the space between the Avon and Frome narrowed, stood the castle, the position of which is now only recorded by the names of Castle-green and Castle-street. As the castle must have fully commanded the narrow neck of land between the two rivers, and they formed a natural moat around all the rest of the Mediaeval town, its natural position was a very strong one, and no wonder that it was the scene of frequent fights and sieges.

This ground on which the Mediaeval town stood is still one of the two specially interesting portions of Bristol, and still readily traceable. The preparation for what we may call the other interesting section of the city was made when, in the middle of the thirteenth century, the bend of the Frome at the north-west of the city wall was joined with the Avon by a wide straight canal running southwards from the city parallel with a reach of the Avon eastward of it, enclosing between them a parallelogram of low flat land rather longer than its width, extending southwards from the city wall, and surrounded on three sides by water, on the east and south by the Avon (which here turns almost at a right angle)* and on the west by the new channel. This land, bought from the Abbey of St. Augustine in order to make the new channel, was marsh land at the time, and appears as "The Marsh" in old maps. At the beginning of the eighteenth century, however, this flat peninsula was to enter on a new stage of existence, and, with Queen-square as its centre, to become the fashionable residential quarter for the time; again in due time to fall from that position into its present curious medley of new warehouses and old residences.

The centre of ancient Bristol was at the

* This, which was originally a reach of the Avon, is now all part of a floating dock following the old course of the river, the actual river Avon having been taken across south of it by a new cut made at the beginning of the present century.

"Cross" now represented by the junction of High, Broad, Corn and Wine streets. The cross itself, of late fourteenth century date, now in the grounds at Stourhead, was removed in 1733, and stood on the site of an earlier cross, and a very curious drawing "by Robert Ricart, a lay brother of the Fraternity of Calenders" is preserved amongst the archives of the City.* An illustration of the cross at Stourhead was given in the *Builder*. Apart from the removal of the cross and the three churches, the centre of the city may be said to exist much in its old state. Many individual buildings have indeed been destroyed, and replaced by others more in keeping with the requirements of the time, but the thoroughfares in this part of the city retain to a large extent their somewhat tortuous character, and much of interest is still to be found in and behind them. The great Norman castle that stood east of the city, between the Avon and Frome, hardly exists in anything but name. One or two vaulted rooms remain, however, incorporated with modern buildings, and by street names it is possible to identify sites. The walls, too, that formerly surrounded the city have, with the exception of one or two fragments, entirely disappeared; and of the city gates only one, St. John's Gate, exists. Of the three old streets south of the Avon and Bristol Bridge, two, Redcliffe-street and Temple-street, had gates at their southern end, and another, St. Leonard's Gate, stood on the site of Clare-street, not far from St. Stephen's Church. Bristol was rich, and is still, in churches. We have already dealt at length with the cathedral, formerly the church of the monastery of Saint Augustine, and detailed reference is, therefore, unnecessary. It stood west of the city proper, outside the wall, and formed one of a series of religious foundations which surrounded the city on all sides. St. Mark's Church, known as the Mayor's Chapel, and formerly attached to the hospital founded by the Gaunts, is rich in glass, armorial tiles, and monuments; and a window of Decorated period, with a profusion of ball flower ornament, will recall the work in the south aisle of Gloucester Cathedral. It has lately been restored, and a shallow north transept has been added. The site of the hospital itself is now occupied by the Merchant Venturers' School, in Union-street. St. Stephen's is remark-

* Pooley's Crosses of Gloucestershire.

able for its fine western tower, crowned with an elaborate parapet and pinnacles; the interior is noticeable for the figures of angels which take the place of caps in the piers, and for a good light modern wrought-iron chancel screen. St. John's, with its comparatively low tower and spire, forms a picturesque feature in Broad-street, built with the church on the City wall, and the City gate. Christ Church, at the corner of Broad-street and Wine-street, is a classic church with a tower and spire, rather reminding one of a Wren City church; the lower story of the tower has been enriched in recent times, with carved ornament rather too florid and out of keeping with its general style; the interior is divided into three aisles by an odd-looking colonnade of columns with classic capitals but of Gothic tenacity of proportion. All Saints, near the opposite corner, has a picturesque octagonal lantern on a plain ugly tower, and surprises one internally by two western bays with Norman piers, above which, where the arches should be, the space is filled up by secular structures which encroach on the church, leaving a flat ceiling over the aisles, on a level with the Norman capitals. St. Nicholas, near the quay, has a lofty spire and interesting crypt, and this church also extended over the gate that spanned the City approach to old Bristol Bridge. Externally the church is a large square-lined very late Gothic structure; internally we find a flat Renaissance plaster ceiling painted in gaudy colouring. In the western porch is a very rich late Gothic canopied tomb with a re-

cumbent figure; a work dated, as far as can be read, "162—"; for so late a date it is remarkably pure Gothic of its kind. Eastward, without the walls, are the interesting churches of St. James and St. Phillip, the former showing a fine and well-preserved Norman nave, while within the walls, near St. Nicholas, are the churches of

St. Peter and St. Mary-le-Port. Southward are three churches, St. Mary Redcliffe (outside the walls), and St. Thomas and the Temple churches, both standing in streets of the same name. St. Mary Redcliffe is perhaps one of the best known, as it is undoubtedly one of the finest parochial churches in the kingdom; it will only be necessary here to

St. Stephen's Church, Bristol.

Bristol Tower of the Temple Church

St. Peter's Hospital.
(taken from a photograph.)

New Buildings Bristol for the PROVIDENT LIFE INSURANCE CO. (See Henry Edwards' Article)

speak of the beauty of its Decorated tower and north porch, and the grand scale on which the church was rebuilt in early fifteenth century times. Some interesting glass fills the lower windows of the tower; a curious whale rib, popularly known as a rib of the dun cow that is said to have supplied Bristol with milk, is a relic of the days of Cabot; and the room over the north porch is memorable for its connexion with the boy Chatterton, whose monument stands at the angle of the churchyard. St. Mary Redcliffe is in fact the architectural jewel of Bristol, but it is too well known to need a passing illustration, and should rather be the subject of a special illustration and plan, as a pendant to the cathedral, to which it is in fact in some respects superior; on some future occasion we may endeavour to give it the separate attention which it merits.

St. Thomas's Church is of no great interest, but its weather-beaten tower is a good example of simple Perpendicular work, shorn of its parapet and pinnacles like its neighbour the Temple Church. The tower of this latter leans away from the church considerably towards the west, and the somewhat curious design of its belfry stage is accounted for by the present belfry being a later edition to the tower. Originally it was finished with the trefoil parapet, now forming a broad band below the belfry windows (see sketch). There are many remains of domestic work in and about the city. In St. Mary-le-Port-street and Peter-street, in Broad-street, and, until lately, in the Pithay were many of the old timbered houses. The house now known as St. Peter's Hospital, formerly the house of the Nortons, merchants of Bristol, is a very elaborate building with projecting windows, and good fireplaces, and at the angle of High and Wine streets still stands a curious timbered house, the material for which is said to have been brought from

Bristol
 Tower of Saint
 Thomas's Ch.

Holland. Of earlier date is the beautiful doorway in the Welsh Back, near St. Nicholas Church; the hall of Canyng's house in Redcliffe-street, with a fine roof; a house formerly the offices of the *Times and Mirror*; and some fragments of the Dominican Priory. The Red Lodge, on St. Michaels Hill, is a later building, with fine fireplaces and ceilings. Other old houses are still to be seen in Temple, St. Nicholas, and Redcliffe streets, south of the bridge, but this approach to Bristol has been much altered of late years by the making of the new street, Victoria-street, from the joint station to the bridge; and large warehouses now occupy the sites of old buildings. But, in spite of much recent alteration, the city retains a remarkable number of interesting ancient buildings, both ecclesiastical and domestic.

Turning to what is our more special object

on this occasion, the modern element in the city, we naturally look first at the latest completed "public improvement," which has consisted in filling up the end portion of the dock on the old line of the Frome, northwest of the old "city," and forming a central place here. There was once talk of building on this filled-up ground a new Bristol Town Hall or Municipal Buildings, and it is a great pity this was not done, as Bristol wants a central building, and this would have been an ideal site for one. The still greater pity is that the opportunity even of making a fine place has been utterly thrown away, and the whole thing completely bungled. A long irregular enclosure has been formed with railings, the entrance at each end flanked by large but commonplace stone pedestals each supporting a thin lamp-post for which the pedestals are absurdly too large. The sides of this enclosure have been formed into flowerbeds confined with irregular wobble-waggle lines of fencing, and the centre of the space is marked by a tall thin iron lamp-post. There is not the slightest dignity of design in the whole thing. Near the upper (west) end of the enclosure is a poor statue of Burke on a still poorer pedestal, bearing the fine sentence (we know not when uttered). "I wish to be a Member of Parliament, to have my share of doing good and resisting evil." The cynic who is acquainted with the political history of the city may be disposed to remind the Bristol people of the fact, which they evidently wish to forget, that Bristol rejected its brilliant representative, after three years' service, exactly because he was too forward in "doing good and resisting evil," and preferred abstract right and justice before the immediate commercial interests of his constituents. At the other end is a better statue of Edward Colston, on a better pedestal than the other, with some decorative historical bronze reliefs attached

to the four faces; the bronze dolphins at the angles, however, do not combine with the stone-work, and look like rather unmeaning excrescences. Altogether, the *place* is a rather sad spectacle of wasted opportunities. The buildings surrounding it form an irregular mass of commonplace structures, which unfortunately seem in too good repair to present much chance of rebuilding and improvement. Near the dock, facing the west end of the *place*, the owners of a long block of warehouses have made a spirited attempt to embellish the end of their line of buildings with a pediment decorated with symbolical figures and ornament in terracotta, and an octagonal angle turret, and deserve credit for the attempt. At the north side of the *place* the Roman Catholic church of St. Mary, a severe Grecian structure, shows up well by contrast with the motley crowd of buildings round it, and gives in fact the only touch of architectural dignity to the scene, though in an old-fashioned manner.*

Colston Hall, designed by Mr. Foster and which, as almost every one knows, is the main public hall of Bristol, suffers from being in a back position and having a very inadequate façade, which by no means architecturally suggests the importance of the building in its rear, though it is meritorious in itself for simplicity of design and some good detail, especially in the treatment of the upper story with its coupled colonnettes connected by a square-section lintel decorated with carved ornament. The top finishes level, with a sufficiently well-marked cornice. The interior is rather coarse and incongruous in detail; side-aisles are formed by circular columns which do not diminish, which spring from gigantic splayed bases of Gothic character, and end in classical capitals carrying the ends of highly-decorated entablatures which run back to the walls, over the galleries. The whole of this upper part seems too heavy for the columns, as well as out of keeping with them. The plain panelled barrel vault of the ceiling has a good effect, and the entrance staircase is spacious and shows a well designed balustrade of transitional Norman character. The whole building is rather a mixture of styles; Classic, Norman, and touches of Byzantine; a sort of mixture to which there seems to be rather a tendency in modern Bristol architecture. However, there are many worse public rooms than Colston Hall, though it is unfortunate that its exterior architectural effect is rather *manqué*.

Clare-street, Corn-street, and Wine-street, which, running in a continuous line, form the backbone from west to east of the old city, contain a good many of the best commercial buildings; and though Bristol can show no one street comparable in interest and importance with Park-row at Leeds, there are a sufficient number of interesting and more than creditable buildings to be found. One of the most recent buildings in this neighbourhood, the new Capital and Counties Bank (illustrated in one of our lithographs),

* The *place* has however been put to a good practical purpose in forming a "tramway centre," where all the principal lines of tramway meet or cross, so as to facilitate intercommunication. The tramway service in Bristol is very well worked, at very low fares. The electric tramway to Kingswood, worked by overhead wires (before mentioned in these columns), and which starts from a point further east, in Old Market street, seems to answer very well, and is run through the streets at a speed which suggests the idea that they will kill somebody some day, if they have not done so already.

The Royal Exchange.

New Offices, Baldwin-street (Mr. E. Gabriel).

by Mr. Milverton Drake, has secured two frontages, one in Clare-street (at the bottom of Corn-street), and one in Baldwin-street, the building running through from one to another; the upper portion, as will be seen, is treated identically in both fronts; in the lower portion the principal entrance in Clare-street is distinguished by a decorative entrance door with some well-executed carving, though the bracketted-out piece, carrying a second pediment below the larger one, seems rather an excrescence. The best portion of the design is the treat-

ment of the first and second floor windows between the columns. On the left hand going up Clare-street the new Provident Life Office, an angle building, is a very good design with a great deal of character; the ground floor lighted by large circular-headed windows on short baluster-like pilasters; two stories of oriel windows above with a carved frieze between them, and an open arched loggia at the top, ranging vertically with the ground floor arches. There is good detail in this building, which is picturesque and satisfactory also as a

ole. The architect is Mr. H. Edwards. little further up on the same side General Assurance Company show a classic front (not recent) of some originality, especially in the treatment of the first-floor windows and their surroundings; and at the corner of Corn-street and St. Stephen-street is the very dignified Classic building of the Royal Insurance Company. This Company has always endeavoured to secure good architecture in its offices (as we have seen lately in the Liverpool competition), and the Bristol building is no exception. It is a really Classic structure, the ground-floor treated with coupled pilasters with rusticated courses running through from one to another; above is an order of fluted pilasters at the sides, the front to Corn-street being specially treated with columns and heavy rusticated angle piers. The carved details of the doorways are rich and refined. Above is the National Provincial Bank is rather a mixture of styles; painted rusticated arches on the ground story with polished granite cornices in the jambs; there is a richly rusticated Corinthian order above, the whole effective, but the upper and lower portions do not harmonise. The little façade of the "Old Bank," two doors above it, is a pleasing specimen of old-fashioned Classic design. The Wells and Dorset Bank, with its rusticated arched ground story and an order of polished granite Corinthian columns above is rather showy than really artistic; and opposite to this the Liverpool London and Globe Insurance Company shows a front which is still more open to the same objection; it is altogether overdone, and yet not unobtrusive in design, with coupled Roman Corinthian columns in two stories, finishing above in coupled statues—everything in its place; it would have been twice as effective

had the lower portion been more simply and boldly treated. Lloyd's Bank, higher up on the north side of the street, though a little overdone with sculpture, is a really fine and effective Classic front, all the more so for the great depth of projection and reveal which it shows, with a noble contempt for economy of stone-work. This front would make its effect anywhere. Opposite to it the more simple and conventional front of the Royal Exchange carries on the face of it "Wood of Bath—his mark." It is dignified, but bears a very remarkable similarity to other works by the same architect, who seems to have mastered one effect of Classic architecture, the plain rusticated ground story with a plain order above, and stuck to it. But this, like all his buildings, has the charm of carefully considered proportion. The County Hall, at the angle of Corn-street with Broad-street, is an example of pure Greek architecture, by some one with the Erechtheion strongly pervading his mind; its only ornaments are two great Ionic columns flanking the slightly-recessed centre and entrance, with answering pilasters on the remainder of the front, and a band of carved ornament, also from the Erechtheion, dividing the height of the front; it is perfectly cold and expressionless, but not without a certain dignity and importance, and carried out by an architect who at all events understood the particular aim which he had taken in hand. At the commencement of Wine-street stands the well-known old half-timbered house already referred to, and said to have been brought from Holland. There are no modern buildings along Wine-street of any importance. The general aspect of this street, as well as of others in the centre of Bristol, is very much affected by the practice

which prevails of placing shop signs and names on large lettered boards fixed at right angles to the houses and projecting out over the pavement. This is convenient for the shopkeepers and perhaps to some extent for the public who wish to find a particular class of shop, and it gives a certain picturesque effect to the view along a street, but it is very injurious to the architectural effect where there are any buildings worth attention. While on this class of subject we may mention also that at Bristol, as at Leeds, we find the naming of streets carried out in a very partial and inefficient manner; many corners even of important streets presenting no name to the visitor, who has to get to the other end before he finds out what street he is in, and perhaps does not discover it even then. This is a matter which the city authorities should take in hand. On the west side of Broad-street, the principal street crossing at right angles to the central line of Corn and Wine streets, is the Guildhall, by Mr. Pope, a respectable building in Late Gothic style and showing a very good knowledge of that phase of Gothic; it is decorated with statues in legal costume in niches between the windows. The building is expressive of its purpose, in so far as it may be said to be in what is a kind of conventionally accepted "Guildhall style." It is oddly contrasted with the Bank of England next door to it, evidently one of Cockerell's designs, a severe façade with a Doric order running through the ground story and a mezzanine, with circular-headed windows and a pediment above. In its way it is a dignified work, with "Bank of England" written (architecturally) on its face. On the opposite side of the same street is the large mass of the Grand Hotel, a building in Italian style

which deserves credit as being of a far better and more refined type of architecture than we usually find in large modern hotels; the open loggia with colonettes, at the top, is a pretty feature in itself, but it looks a decidedly weak support for the large and boldly projecting cornice immediately over it. Unfortunately whatever architectural effect the building might have had is nearly ruined by the projection of the ground floor shops at the base, a commercial advantage possibly, but a great injury to the building in every other sense. In Small-street, another of the cross streets, the Post Office on one side and the Assize Courts opposite furnish the same kind of marked contrast of style as the Guildhall and the Bank of England in Broad-street. The Assize Courts, by Mr. Pope, is one of the best modern buildings in Bristol; a small illustration of it, from an old drawing lent by the architects, is given on one of our lithograph plates. The left hand portion is the Assize Courts front, the part on the other side of the tower being occupied by the Law Library, and it will be seen how well and characteristically this portion of the front is treated. The courts are good-looking and spacious Gothic interiors; no attempt has been made to differentiate the architectural treatment of the Crown and Civil Courts; it would have been better to have endeavoured to express architecturally their difference of character and purpose. The Post Office, a blank piece of regulation Classic architecture, has nevertheless the same kind of merit as the Bank of England—it expresses its purpose; it can hardly be taken for anything but the Post Office. This expression is chiefly the result of the treatment of the two recessed openings or porticoes breaking the flat line of the front, and screened each by two columns; one marking the entrance to the offices, the other the recess for access to the letter-boxes. In spite of its very cold and formal architecture, the Bristol Post Office is much less objectionable in point of architectural taste than the more florid and pretentious buildings which have recently been erected as Post Offices in some of our large towns.

The eastern portion of the city centre, as well as some of the narrow streets in other portions, contain a good many bits of picturesque old houses and shops, all looking however, very grimy and dirty, and leading to a question whether their room would not be better than their company, on sanitary grounds at all events. There appears to be very little new building going on; besides the one or two quite recent buildings which we have mentioned, there is a new block of offices in course of erection in Baldwin-street by a London architect, Mr. Gabriel, of which we give an illustration. Among other buildings in the city quarter which may be noticed in passing are the Bristol Municipal Charities, a good brick free Classic front in St. Stephen-street, nearly facing the *place*; the Bristol Property Companies Offices a few doors further on, a building in rather florid Classic, costly, but with somewhat coarse details. At the south end of St. Stephen-street the *Western Daily Press* offices shows a large mass of plain and solid brickwork satisfactory in itself; it would have been better without the corbels under the first floor string course, which carry nothing and

are only unnecessary ornament, the string course being broken round them to give them a finish. A building which is to impress chiefly by its plainness and solidity is best left as plain as possible. The blocks of offices about Baldwin-street, mostly brick more or less ornamentally treated, are commonplace enough. At the rounded corner leading off into Charlotte-street something bold has been attempted in the way of a Gothic offices front, with large pointed-arched compartments nearly the whole height of the building, the piers between them balanced on bracketed columns on the ground story in a not very satisfactory manner.

Among buildings of the warehouse class there are some well-meant and creditable attempts. At the corner of Broad Mead a Union-street Messrs. Fry's great warehouse shows a rather powerful and effective treatment of the two lower stories in grey granite with very deep reveals to the windows. It is unfortunate that the rest of the building is in the disagreeable yellow brick rather too largely employed in modern Bristol. We may observe that the sense of the powerful effect of deep reveals to openings has been a good deal recognised in Bristol. We see it again in the very creditable block of Gothic warehouses on the south side of Broad Mead (Hall's oil warehouses), with large pointed arches on the ground floor and a series of lofty couplets and trefoiled windows above; evidently an effort of the Gothic revival, and a building of more than average merit for a warehouse. Messrs. Worth & Co. make a milk attempt at a Gothic warehouse in Queen-street, not remarkable, but deserving credit for the intention of treating a warehouse architecturally. Messrs. Robinson's stationery warehouse, close to Bristol Bridge in a plainer and more warehouse style, a good purpose-like building, diversified with a touch of art in the small sculptured frieze round the angle tower.

In the north quarter of the city portion, the neighbourhood of Bridewell-street, so many staring brick buildings of the modern sort are pleasantly contrasted by the quiet brick front of the All Saints' Almshouse adjoining them. In this quarter the corner Police Station and Police Courts show a very suitable architectural treatment, and the iron gateway to the Police Courts is well designed. This is however a very tiny, slightly quarter of the city, full of ha-

smantled corners and rubbish-covered lots for which there seems to be no outlet to be found; we presume that from various uses there is little building enterprise, capital to lay out on building, at present; it the state of things resulting gives a solitary and neglected aspect to this and many other portions of the city. The large angular piece of broken-up ground south of St. James's Churchyard is we presume intended to be treated in some scheme of public improvement; it is to be hoped it will be better carried out than the neutral place.

The flat peninsula before referred to, south of the city proper, is the most curious and characteristic part of Bristol. Surrounding on three sides are quays and shipping-warehouses, including the one really grand and powerfully designed warehouse in Bristol, the well-known one on Welsh Back, on the east side of the peninsula, by Messrs. Gougeon & Gough, of which we give a small illustration as a reminder; it was illustrated in an engraving in our pages many years ago. In the centre is the once fashionable Queen-square, a very fine large square surrounded by what passed for very handsome residences in the reign of good Queen Anne, and nearly all lapsed into offices. On one side is the new building for the Bristol Clock Offices, by Mr. Milverton Drake, of which we give an illustration; a good building, but not harmonising with its surroundings. King-street, crossing from east to west, is full of picturesque curiosities; half timber houses; the faded Classic front of what was once the Mayor's Hall, now a warehouse; the old quadrangle of almshouses with their red-tiled roofs; the stone front of the old Bristol library, with its columned porch, standing back from the street; at the end the small but dignified Classic stone building of the Merchant Venturers' Hall, with its handsome iron gates gilt and emblazoned with the Venturers' arms and their sturdy motto, "Indocilis pauperiem timet." Down the west side runs the wide avenue of Prince's-street, with warehouses on one side and on the other side various fine handsome buildings now fallen from their high estate; the largest being the fine front of what is now the offices of the Great Western Railway Company, still bearing on its walls the apparently incongruous motto, "Curas cithara tollit"—"The lyres we lay away our cares"; for this was once the Assembly Rooms of the Bristol aristocracy

who abode in Queen-square. At the end of the vista one may probably see the masts of a large ship. A more picturesque corner than this, one more full of curious associations and suggestions of past times and social, commercial, and architectural changes, is perhaps not to be found in any city in England; to see it is alone worth a visit to Bristol.

On the road up to the higher ground where Clifton commences there are various buildings of more or less architectural interest; the Almshouses in Colston-street, by Messrs. Foster & Wood, a pleasant bit of domestic Gothic with its quadrangle and timber-gallery; the Technical Schools by Mr. Robins, just off the bottom of Park-street, of which we give two illustrations; in Park-street the pleasant bit of old Classic taste shown in the circular colonnaded portico of what was originally the Bristol Institution, (a relic of Cockerell's refined taste); and at the top of Park-street the Museum, an important building in a rather nondescript but picturesque Gothic style, apparently partly suggested by the Ducal Palace at Venice, though with a difference. Behind this is the Medical School, a building, like a church and one or two others near it, in rather a tame Gothic style; and in fact, with the exception of Street's well-known church at Clifton, one cannot say much of Bristol modern Gothic churches as a rule; at the best they do not generally merit a higher title than pretty. Higher up there is a group of buildings, including the Italian front of the School of Science and Art (it is a "front" only, science and art not having apparently been able to turn the corner), the front of the Victoria Rooms with its colonnaded portico, and one or two others, which, though no single building is of much architectural worth itself, combine to make a somewhat effective group in connexion with the open space which they adjoin.

Among miscellaneous points to be noted in and about Bristol is the frequent occurrence of old Classic buildings, fronts to the street mostly, of more or less merit, and which speak of some former dignity of the site or the building which has now passed away. Thus in Broad Mead there is the elegant Ionic façade to a covered gallery, a kind of deserted "Burlington Arcade" (but of much better architecture); the Classic house with an order, facing the open space of St. James's Barton; the old Classic

building with a columned portico in Bath-street, now occupied as a warehouse, but which suggests the idea of having once been a district Town Hall or assembly room. In most towns one finds these remnants of the Renaissance or of the Classic revival, but they seem more frequent than usual in Bristol, and crop up in most unexpected places, telling of social or other changes in their neighbourhood. Near St. James's Barton the small old St. James's Square is a curious nook of past respectability, with its projecting shell hoods over the front doors. Among the fountains that at the end of St. Nicholas Church, erected by Bristol iron merchants some half a century ago, with a bronze angel holding up an appropriate text over it, is well intended; had it been carried out now the sculpture and general design would probably have been better. The old fountain close to the wall of St. John's Church, in a recess in the wall, with a much faded Renaissance frieze of griffins &c. over it, is interesting in another sense. Also one may note the picturesque view to be found on turning down to the dock wall at the opening near the end of Peter-street; the mass of irregular buildings grouped about the water are all ugly enough taken separately, but the whole picture is a remarkable one.

The interest of Bristol mostly ceases with the central part of the city. One may take tram journeys of exploration this way and that, but from Dan to Beersheba is mostly barren of all interest. On Kingswood road are the St. George's Technical Schools by Mr. Bligh Bond; on the road to Bishopston the Colston Girls' School; of both of which we give illustrations. But the one suburb of Bristol, to speak of, is Clifton; and what a suburb! Even Edinburgh can hardly match the effect of Clifton Down for beauty and picturesqueness; whether from above, looking down on the Avon and the smoky town, or from below, where we see the ends of the terraces rising on the top of the precipitous rock, and the wooded banks of the Avon, and the Suspension Bridge crossing the view. Architecturally indeed there is little to say about Clifton (which is perhaps hardly within the scope of this article); the style of the houses is for the most part simply the "respectable residence" style; the buildings of Clifton College are fairly good architecturally, and there has evidently been an intention to make them so; but they cannot be said to be of any great architectural interest; they again, like the churches, are "pretty" rather than anything else. But everything in Clifton seems spacious and well kept; the roads wide and clean, the houses mostly pretty well spaced; and the splendour of its position, with the wide open downs contiguous to it, makes one regard the architecture as rather a secondary matter. It may be partly the striking contrast between this lofty and picturesque suburb and the smoky town immediately below it that gives to Clifton its special effect; certain it is that there is no spot in England, forming almost a portion of a great city, to equal it in beauty and in that impression of romantic charm which no familiarity seems able to weaken or destroy.*

CONGREGATIONAL CHURCH, PERTH.—Messrs. H. B. W. Steel & Balfour have been appointed architects for the new Congregational church to be erected in Kinnoull-street, Perth.

* The next of this series of articles, on the architecture of Cardiff, will appear in our issue of March 13.

NOTES.

A QUESTION was asked on this subject in the House of Commons last week, and though the reply of Mr. Macartney amounted to an admission that the question must be shelved for the present, still it is encouraging to find that it has by no means been lost sight of, and that Foreign Powers have been consulted in regard to a common agreement on the subject; but they are not unanimous, and it appears to be considered that no definite step can be taken until unanimity has been obtained. The "Nautical Almanac" for 1901 has therefore been calculated on the existing system. It is something to find that there has been a distinct move made towards obtaining a general consensus of governments in the adoption of a "world-time." But is unanimity among the leading governments an absolute necessity in the case? Surely a reasonable majority might agree on the adoption of the new system, and the conservative objectors would then have to adopt it whether they would or not. The convenience of a "world-time" would be so great that a minority of objectors among civilised nations ought not to be allowed to delay its adoption, which is a matter of course sooner or later.

WE lately had occasion to refer to the considerable expenditure on public works for the coming year on the part of the Imperial Parliament of Germany. The various budgets of the separate German States are now being published, and it appears that Prussia proposes spending no less than seventy-four million marks—or 3,700,000*l.*—on building operations. The Prussian railways absorb 2,200,000*l.* of this sum, whilst the Commissioner of Works will expend 650,000*l.* for the purposes of his department only. The Educational Department proposes spending 250,000*l.*, and the Ministry of Justice over 200,000*l.* As in the case of the Imperial budget, much of the money will only be voted "on account" to large works spread over a number of years, and this particularly refers to the railway administration. The extension of the Wiesbaden Station, for instance, this year only requires 50,000*l.* out of a total proposed expenditure of 500,000*l.* In a similar way, there are many votes "on account" for Prussian canals, harbours, or inland waterways; the Ministry of Justice will be spending 50,000*l.* on a prison, the total cost of which will be 150,000*l.* There appears, however, to be a distinct decrease in the number of large architectural works in hand for the present year. The Cathedral at Berlin, which is estimated at 500,000*l.*, appears to be the only important architectural monument to be paid for by the Prussian Diet. The sixth vote on account for this building for 1897 will be 80,000*l.*

WE presume that the question asked by Mr. Carvell Williams a week ago in the House of Commons, whether the Government would consider the expediency of transferring the maintenance and repair of the fabrics of our cathedrals from Deans and Chapters to Her Majesty's Board of Works, "as in Scotland," was part of the echo of the Peterborough controversy. Mr. Balfour, we are glad to record, had the good sense to give a curt and direct negative to the question. One is not

always satisfied with what Deans and Chapters do to the cathedrals, but we may certainly expect more reverence for the buildings at their hands than at those of the Office of Works, considering what sort of persons may from time to time have sway there. Imagine the cathedrals of England under the temporary charge of Mr. Shaw Lefevre or the late Mr. Ayrton!

FROM a communication to the *Times* it appears that the Trustees of St. Cross have

taken the right course in regard to their proposed new buildings. They will enlarge the hospital, but for this purpose they will take the old master's house, and build a new master's house outside the precinct, so that there will be no intrusion of modern building to destroy the unique effect of this relic of ancient life. In some cases we might think that this tenderness about intruding a modern building which was practically wanted was carrying reverence for the past too far; but St. Cross is unique; the nation cannot afford that it should be spoiled.

A MEETING of persons chiefly concerned in sailing and boating on the Thames was held

on Friday last at Kew Bridge in furtherance of the proposal to make a new lock on the Thames at or just below Putney. The advantages to the sailing clubs, members of two of which, the "Thames" and "London" sailing clubs, moved and seconded the resolution in favour of the new lock, are obvious; and the rowing clubs would seem to be as much concerned in the improvement; it is surprising that none of them appear to have been represented on the occasion. The advantage to the general public also, in so far as the appearance of the river at that part and the sanitary condition of the banks are concerned, is indubitable. On the other hand it must not be forgotten that there are interests on the other side. One minor one was mentioned at the meeting—the barge-repairing industry at Brentford, which would of course be practically ruined by the interposition of a lock which would prevent barges coming up with the tide. But the serious question for the general public is the effect on the lower tidal reach of the Thames of any alteration which shortens the tidal flow, and this point seems to be hitherto entirely lost sight of by those who hold meetings and pass resolutions in favour of the new lock—or rather it is a point they know nothing about. For many reasons we should like to see the scheme carried out, but it ought not to be done until the opinion of one or two of the first river and harbour engineers of the day has been taken in regard to the probable effect of the scheme on the lower Thames.

WE regret to find that the efforts of the Acton District Council to have the fatal level

crossing in their district closed, and a bridge placed in its stead, have not proved successful. It is obviously necessary that the Board of Trade should be empowered by statute to oblige railway companies to place bridges over their lines, in such places, as level crossings are dangerous to the public safety. It is preposterous that where the public safety is imperilled, the Government department which has the superintendence of the

railway system should be unable to compel a railway company who ought, but will not, make such necessary improvements, to do so. It is the more absurd because, when a new line has to be made, it is possible to prevent dangerous level crossings from being made. Localities change their character and a crossing which may not be dangerous at one time, may, a few years hence, become distinctly perilous to the public safety.

Motor Cars as Dust-carts.

THE expected development of motor cars as private carriages has not yet given much sign, and it seems likely that the first uses of the newly legalised method of locomotion will be for humbler and more practical needs. It was stated some weeks ago that one of two large shops had given orders for motor cars to take their goods round; and we now see that the District Council of Chiswick has ordered two for use as dust-carts. Economy is the main object in the order, the Council expecting to be able by this means to carry out the dust-collecting themselves instead of by contract. If the experiment is successful in an economic sense, it will be an advantage to the public not only in saving rates, but in all probability the greater efficiency with which the work will be carried out.

Accumulator Charging.

THE St. Pancras Vestry, considering the probable great demand there will be soon for charging accumulators for motor cars, has fixed the price for charging them at 2*d.* per unit, subject to certain regulations as to the times at which their central stations will be prepared to do this. Of course, they are only able to do it at this low figure because the most of their machinery is lying idle the greater part of the day and it pays them to run it, and sell electricity at a trifle more than the bare cost of production. We expect that very few companies will be able to underbid them. At this price it would pay a good many people, who are late consumers, to have a waggon load of accumulators, which they could send out in the morning a week to get charged, and then use the electricity for ordinary lighting purposes. It would certainly pay a good many small manufacturers to buy a motor a barrow load of accumulators, especially where the power is only wanted intermittently. The action of the Electric Committee is to be warmly commended, and we hope that it will bring down the price of charging accumulators for electric launches, bicycle lamps, &c., which has been hitherto almost prohibitive. On the Thames they used to charge 1*s.* 6*d.* a unit of charging electric launches, until last year the Kingston Corporation came in and brought down the price to 1*s.* 3*d.*, being content with a modest 300 per cent. of profit.

Bolsover Church.

THE parish church which, excepting the Cavendish Chapel, was destroyed by fire early last Sunday morning, consisted of nave, aisles, chancel, and western tower capped with a low spire of the kind not unusual in the locality. It was erected, for the most part, *circa* 1200, instead of one built in 1000 on the site of a Christian church built, so we say, nearly four hundred years before. Norman work remained a semi-circular arch above the chancel doorway, with a carved

of the Crucifixion in the tympanum, and a font with late fifteenth-century tracery on it. Transitional Norman were the chancel arches, and many of the arch stones embedded in the later walls. The tower and spire were early English; the south aisle and east window, decorated; the west window, Perpendicular. In 1878, Messrs. Shillitoe & Morgan, of Campsall, restored the fabric under the superintendence of Mr. J. D. Mitchell-Withers, of Sheffield. The restoration comprised a new north aisle and arcade, a new roof replacing the low fifteenth-century roof over the nave, rebuilding of the chancel arch, an organ-chamber, complete renovation of the chancel, a Bath stone reredos, and roof of red Staffordshire tiling. In the course of the work some Transitional capitals were recovered and walled in as corbels in the south aisle. In that aisle was recessed a stone much injured by the fire) found in 1704 outside the north door, where it had served, inverted, as a step. The stone bears a relief, in high relief, of the Adoration, once richly coloured, of supposed fourteenth-century workmanship. The organ was entrusted by Messrs. Foster & Andrews, of Hull. Messrs. Taylor, of Loughborough, recast the bells, and Mr. Smith, of Derby, made the clock. In the chancel was the tomb of Huntingdon Smythson (d. 1648), reputed architect of the first portion of Welbeck Abbey, for Sir Charles Cavendish, and of the riding-house and tables. William (Cavendish) first Duke of Newcastle is said to have sent Smythson to Italy to collect the best designs for his additions to Bolsover Castle, being the unfinished range of buildings on the terrace, including gallery 220 ft. by 28 ft.* In the Cavendish chapel, built 1618, were buried several of that house. Sir Charles's monument has his effigy, armour-clad, under an enriched arch in Corinthian columns; below is a figure of his second wife, co-heir of Cuthbert, Lord Eggle, the epitaph by Ben Jonson. The effigy is supposed to have originated in the vestry, which stands over the warming-apparatus. We read that the church was insured for 3,150*l.*, and that the Duke of Portland has decided to open a restoration fund with a donation of 1,000*l.*

In a paper at the Society of Artistic Heraldry, on Tuesday evening, Mr. W. H. St. John Hope dealt with this interesting subject in a very concise and suggestive way. He, moreover, illustrated his lecture by a very fine series of lantern slides and a number of photographs of the stall plates of the Knights of the Garter, coloured by hand, from St. George's Chapel, Windsor. Being the only set of facsimiles, they are extremely interesting and valuable. Mr. Hope assumed that his audience were to some extent conversant with the rudiments of the science and terms of heraldry, and drew attention to the varying forms of shields, from the early "heater" shield to the elaborate forms of the Renaissance period, when the ancient form of shield in many cases is hardly observable in the design. Seals form a very fruitful field for the study of heraldic devices and badges, and the fertility of design in these was well

shown by the lantern slides, a sad contrast to these being the design for the half-crown now in circulation. We might add a still worse example in the four-shilling piece, in which one of the chief causes of the success of ancient designs—the proper filling of the "field" by the "charge"—seems to have been wholly ignored. "Supporters" again in the old designs did support either the shield or the helmet. Attention was drawn in this connexion to the poor design of the Royal Arms over the entrance to the New Portrait Gallery. How largely heraldry entered into mediæval life was instanced by extracts of bequests of personal apparel, furniture hangings, and plate, all of which were richly decorated in gold and colour. The application of heraldry to architecture was illustrated by the well-known gateway to the Monastery of Kirkham, in Yorkshire, and the sumptuous shrine of the Percys at Beverley; but the number of ancient examples is legion, and almost every mediæval church and manor house in the kingdom bears evidence of the value of heraldry as a decorative addition to the building. Its application to wood and metal were also illustrated by screens, and the fine gates and tomb of Henry VII. at Westminster Abbey. Although heraldry may be a "lost art," and the necessity for it in these days may not be apparent, yet Mr. Hope's plea for its proper and careful designing and also for freedom, as opposed to mechanical treatment, is one that all interested in the decorative arts must welcome and support.

We read that the parish church, dedicated to All Saints, of Connington, near Stilton, in Huntingdonshire, is in a dangerous condition, and that Mr. Thompson, of Peterborough, having examined the fabric, reports that a serious settlement has taken place. The church, with its fine tower, with battlements and pinnacles, was erected *temp.* Henry VII. It contains monuments to the Cottons, and Heathcotes, and memorials to Robert Bruce, King of Scotland, and Prince Henry, who, in 1152, predeceased his father, David I. Prince Henry's third son was David, Earl of Huntingdon.

This exhibition has just opened in its usual quarters in the Rue de l'Art et Littéraire." Volney, to close on February 19. The most important work there is a portrait of Dr. Peyrot by M. Bonnat. M. Benjamin-Constant has sent a fine study for the portrait of Lord Dufferin, and M. Carolus Duran a figure of an Armenian in many-coloured vestments. M. Jules Lefevre exhibits the portrait of his wife, and M. Weerts a portrait of M. Henri Brisson, painted with the minute precision of a Flemish painter of the seventeenth century. We may mention also a curious and mystical composition by M. Desvallières entitled "The Annunciation," and which recalls the early Florentine school; a fine autumn landscape by M. Frank Lamy, a twilight effect by M. Gosselin, two small humorous pictures by M. Jean Weber, a bust of a woman by M. Puech, and a powerfully modelled bust of a man by M. Alfred Boucher.

The Society of Painters in Water-Colours has opened an exhibition of works of some of its lately deceased members—Mr. Alfred

Hunt, Lord Leighton, Mr. G. Fripp, Mr. Alfred D. Fripp, Mr. Beavis, Mr. E. K. Johnson, and Mr. du Maurier. Of the works of the three last not much need be said; Mr. du Maurier was certainly not at his best in colour; Mr. Beavis's are good cattle paintings uninformed by the higher spirit of art; Mr. Johnson's figures are such as are popular in illustrated periodicals for general readers. The works of Lord Leighton which are exhibited only consist of two or three unimportant studies; the bulk of his work of this class is in other exhibitions. The strength of the exhibition lies in the works of Hunt and the two Fripps, the former standing however quite apart as something on a higher level. One could in fact hardly have a more remarkable proof of the varied nature of Hunt's powers than is shown in the twenty-seven works by his hand which are grouped at the commencement of the catalogue. Compare the wonderfully solid drawing, "Cumberland Fells" (2) with such an atmospheric vision as "Sunlit Rain, Warkworth," (22) and "Robin Hood's Bay, Grey Morning" (15), and reflect that these are by the same hand, and we realise a variety of power such as no landscape painter since Turner has attained. In such a drawing as No. 22 we lose the impression of brush work and pigments altogether; it is as if rain and misty light had been caught on the paper. There are other very fine works by Hunt scattered about in the collection, every one of which makes its mark; "Carnedd Llewellyn—heavy shower passing along" (78) is one of the finest. The contrast between these and such excellent works of their kind as those of Geo. Fripp exemplifies strongly the difference between genius and talent. On the other hand some of Alfred Fripp's works appear to greater advantage than his brother's; his style is, at its best, the quintessence of pure delicate water-colour painting, and his large drawing "Durdle Door" (162), with its aerial distance and the bright effect of sunlight on the sea-water through the natural aisle formed by the rock near the foreground, strikes us even more than it did when first exhibited here some years ago. Another noteworthy work, exhibited long before that, and exceptional among Alfred Fripp's productions, is the figure group of an old man, a child, and dog, "The Coming Storm" (212). The colour is rather conventional, but there is a unity of expression and thought and composition about it which stamps it as a remarkable work of art in its way.

THE BAZIN ROLLER BOAT.

A PAPER was read before the Society of Arts, last week, by the French journalist, M. Emile Gautier, descriptive of the long talked of "roller boat." Sir Frederick Bramwell, an ideal chairman of the old school, presided. As might be expected, the novelty and unusual interest of the subject brought together many well-known experts in marine architecture, who were, doubtless, somewhat disappointed at the absence of scientific details notable in the paper. It is certainly worthy of comment that a journalist, neither conversant with our language, nor pretending to scientific knowledge, should have been deputed by M. Bazin to read a paper on his invention before a scientific society, and it is not to be wondered at that, during the discussion, several of the speakers should have complained of the absence of details, and the impossibility of obtaining them from the author. As a literary production, we think the translator of the paper has every reason to be proud of the result of his by no means easy task, but as an addition to what has already been published

* See the views by H. Rooke, in Pegge's account of Bolsover and Peak Castles, 1785; Bibliotheca Topogr. Brit.; also in the *Builder* September 22, November 17, and (fire-places) December 15, 1888; and Deependock's view, 1695.

in this country, we find little, if anything, fresh to notice.

Many of our readers are doubtless already familiar with the general design of the roller boat as now being constructed, and at the moment nearing completion, at Rouen. Speaking generally, the vessel consists of a deck or platform, 131 ft. 3 in. by 38 ft. 9 in., carried by means of bearings on six hollow disc wheels 32 ft. 10 in. diameter, and something like a cigar in section, being 11 ft. 9 in. thick at the centre between the skins. Each pair of wheels is mounted on an axle (after the fashion of paddle-wheels), and is driven by independent engines. The main propelling power is developed by an ordinary screw propeller mounted at the end of a central inclined shaft driven by engines of 550-horse power, while those for the rollers develop 660-horse power each, making a total of 750-horse power available for propelling the vessel. The deck is fitted with cabins, deck-houses, hoats, engine-rooms, &c., much on the same lines as any ordinary passenger steamer. When the vessel is in motion the rollers are caused to revolve at such a speed that the forward motion of the boat is about 60 per cent. of the velocity at the circumference of the rollers.

So much for a brief description of M. Bazin's invention as embodied in his experimental craft. Now let us turn to the principles involved which have led the inventor to this novel departure from all our preconceived ideas of an ideal high-speed vessel, for it is mainly on the score of speed that claims are made for the roller boat. We may best do this by following M. Bazin in the history of his invention. Having set himself the task of reducing the skin friction of vessels so as to increase their speed, his first thought turned, somewhat naturally, to a similar solution on terra firma, viz., wheels, and he, therefore, experimented with revolving hollow discs, but with no success. Taking a single disc, however, he found that when caused to rotate (the axis being horizontal) it travelled much further through the water, with a definite impulse, than with the same effort applied to the disc when not revolving, and therefore naturally, he drew the deduction that the revolutions of the wheel have a beneficial effect in aiding its forward motion. Oddly enough, however, he noticed that the revolving disc had no forward motion unless pushed. Conclusive as this simple experiment may at first sight appear, we are tempted to think that it contains a fallacy, which is this: does the distance travelled by the revolving disc exceed the distance which the same disc would travel under the influence of the same push and *plus the energy stored in its revolving mass?*

So far as we are aware, no definite information has ever been put forward on this point, and when we come to examine the results of trials with the model which was made before the present boat, with a platform 16 ft. 5 in. long, we find a similar vagueness, under the cloak of apparent simplicity. In the case of the model, which the author of the present paper, however, passes over as not worthy of much attention (notwithstanding the fact that it was upon the results obtained with it that money was forthcoming to build the present boat), the propeller and rollers were driven by electricity, which lends itself to a simple measurement of the power used. When the rollers were at rest a considerable excess of force was required to drive the model at a given speed as compared with when the rollers were also driven, but no idea is given as to the relative powers employed. As far as we are aware, the only quantitative experiment before the public is that of the model pulled by a known force, both with the rollers revolving and at rest. When the rollers revolved at their most efficient speed the time occupied in crossing the tank was rather less than half that when the rollers were at rest. So far, so good; but what was the power absorbed by the rollers during the operation? We are told nothing beyond the fact that they were driven by *clockwork*; thus the power required may have been comparatively small or comparatively great—we fear the latter.

Judging from the relative powers of the propelling and roller engines of the present boat, the anticipated relation seems to be as 5 to 2, but we are strongly tempted to doubt whether full allowance has been made for the water, which, at the speed proposed, will be carried a certain distance up the surfaces of the rollers, acting as a continual retarding weight. Also, as the rollers are immersed to one-third their diameter, there can only be a very small part of their surface which can be said to roll through the water; all the other parts will be passing through the water at a greater or less speed in an inclined direction,

causing very considerable skin friction to be overcome. Added to all this it is very apparent that for a given carrying capacity the dead weight of a roller boat must be fully double, if not treble, that of an ordinary boat. Further, six small boats, which the rollers virtually are, must have a far greater wetted skin, and therefore skin friction, than a single boat of the same tonnage.

Again, the author, and also M. Bazin, seem quite to ignore the inertia of the water. In an ordinary vessel the water has to be displaced only once, while in the roller boat it will be displaced six times. Looked at from every standpoint, there appear to be causes at work tending to show that M. Bazin and his backers are destined to disappointment. The immense strength required for the platform construction, the gyroscopic action of the rollers, and consequent great stresses in a rough sea, the friction of the roller bearings carrying the platform, the problem of keeping the direct acting roller engines dry, the comparatively deep draught of the rollers, and numerous other problems to be solved, are enough to show that if success is achieved it will be to the lasting honour and renown of M. Bazin, which we should much have liked to be able to look forward to with a greater hope of fulfilment.

The roller boat will, it is proposed, shortly cross the Channel, and anchor just below London Bridge; so that our London readers will have, doubtless, an opportunity of judging for themselves before very long.

ARCHITECTURAL SOCIETIES.

EDINBURGH ARCHITECTURAL SOCIETY.—A meeting of the Edinburgh Architectural Society was held on the 20th inst.—Mr. G. S. Aitken in the chair—when Mr. Alexander Drew, C.E., delivered the first of a series of lectures on "The Practical Designing of Iron and Steel Roofing." At the outset the lecturer pointed out the difference in treatment which was necessary in substituting iron or steel for timber in roof framework, and noted generally the lines on which this treatment should proceed. The necessity of considerable practical training and experience was emphasised, and it was claimed that only those possessing such special training were competent to design thoroughly practical and economical structures. It was admitted, however, that in the case of the smaller and more ordinary types of framework frequently met with in everyday practice, sufficient knowledge might be acquired by study to prevent the architect from falling into serious error, and ensure the result being at least practical and safe, if not the best and most economical. A vote of thanks was accorded the lecturer, on the motion of Mr. D. Hunter Crawford.

DEVON AND EXETER ARCHITECTURAL SOCIETY.—Mr. Edmund Sedding read a paper on the 21st inst. at the Plymouth School of Art before the Devon and Exeter Architectural Society, the subject being "Local Gothic Architecture." He said that, situated as Plymouth was, amid scenery of considerable beauty, it was incumbent on those who designed in that town that they should design well. The architectural status of a town or city depended on the character of its domestic buildings; if they were mean and of a second-rate order the architectural character of that town would be in comparison. Referring to the two great divisions of architecture, Classic and Gothic, and after giving reasons for the adoption of the latter, which he described as the national architecture, Mr. Sedding said the inhabitants of Plymouth had acted wisely in erecting their principal public buildings in the Gothic style, which was so adaptable to the climate and so much more suitable for constructional methods. With regard to the decoration of architecture, which he described as the most important part of this fine art, he remarked that it should be of Gothic character, in proper proportion to the distance at which it was placed from the eye—not as the Greeks placed it, on the top of their buildings, but as the Goths placed it, at the entrances to their buildings. There was very little in the way of stimulant in Plymouth for the architectural student like museums or old buildings. It was necessary to be in touch with old work in order to design well, and that could be done if only the trouble were taken. He advised that the Society should spend their afternoons in visiting old buildings when the weather permitted. A vote of thanks terminated the proceedings.—*Western Mercury.*

CARLISLE ARCHITECTURAL, ENGINEERING, AND SURVEYING SOCIETY.—An ordinary meet-

ing of this Society was held at the Town Hall on Tuesday last, Mr. A. W. Johnston in the chair. Minutes of the last meeting having been read and confirmed, the Chairman presented to the late Hon. Secretary, Mr. E. B. B. Newton, who has recently obtained an appointment under the Borough Engineer of Rochdale, four standard works on professional subjects, a testimonial on behalf of the members of the Society, and acknowledging his abilities and energy as Hon. Secretary and Treasurer. Mr. Newton returned thanks to the members in suitable terms. Mr. Drinkwater then read a paper on some Cumbrian antiquities, illustrated by limelight, and gave an interesting account of the various old parish churches in Cumberland, and also a few of the remaining buildings of antiquity in Carlisle. The lecturer concluded by describing the cathedral and castle, and the ancient relics therein. A vote of thanks terminated the proceedings.

ARCHÆOLOGICAL SOCIETIES.

SOCIETY OF ANTIQUARIES.—January 14, Sir A. W. Franks, President, in the chair. This being an evening appointed for the election of Fellows, no papers were read. Mr. C. H. Read exhibited a silver dish of north Indian work. Mr. Henry Willett, through the President, exhibited a curious painting by Cranach, representing apparently Mary, the daughter of John Constant and her brother, John Ernest. Mr. J. O. Scot exhibited a full-sized drawing of part of the Westminster front. The President referred to the statement concerning Peterborough Cathedral which had been circulated among the Fellows and others, accompanied by the specification which had been kindly prepared for the Society by the Society for the Protection of Ancient Buildings. The Council, unfortunately, had not been able to submit the specification to an engineer as they had proposed, owing to the blank refusal of the Dean and Chapter to allow any one to examine the front on behalf of the Society. The following resolution was proposed by Mr. Norman, seconded by Rev. R. B. Gardner, and carried with only one dissentient:—

"That the Society thanks the President and Council for the admirable way in which they have taken action about the west front of Peterborough Cathedral."

The following gentlemen were elected Fellows: Sir S. Montagu, Bart., M.P.; Rev. F. C. Hippkins; Messrs. W. A. Littleale, W. W. Watts, J. M. Mackinlay, D'Arcy Power, and G. L. Beechforth.—January 21, Sir John Evans in the chair. Major Braithwaite Wilson exhibited a complete set of twelve painted wooden trenchers or roundels of the sixteenth century in their original box. Mr. Percy Stone exhibited and described a silver gilt case of mathematical instruments, several of unique character, made by Bartholomew Newsome, clock-maker to Queen Elizabeth, who died in 1597. Mr. Arthur Evans read a paper on a remarkable hoard of gold votive objects from Ireland recently acquired by Mr. Robert Day, F.S.A., of Cork, and which were exhibited to the Society. The objects were found by a ploughman in subsoiling near the sea on the north-west coast of Ireland. The relics, which were all of gold, consisted of a small votive boat, with yards and spars, the place for the mast, benches for eighteen rowers and miniature oars, grappling-iron, and forked punting poles; a howl intended for suspension from four rings; two chains of exquisitely fine fabric with remarkable fastenings; two twisted neck-rings, or torques, and a large hollow gold collar with bold repousse work designs of Celtic character—beyond question the most magnificent object of the kind ever discovered. Examining the objects in detail, Mr. Evans maintained that not to speak of the very satisfactory nature of the evidence as to the actual finding, there was no sufficient reason for doubting that the relics were deposited at the same place and time. There were, it was true, three classes of objects. The fine chains, perhaps imported; the gold collar and torques, made probably by an indigenous Irish goldsmith for actual wear; and the howl and boat of thinner and paler gold, designed for a purely votive purpose. The curious mechanism of the fastening of the collar was compared of that of some gold torques found near Carcassonne, dating from the end of the second century B.C., and perhaps part of the celebrated *aurum Tolosanum* carried off by the Romans from the Temple treasure. The balance of evidence, however, inclined to the view that the Irish torque belonged to the first century of our era. The fastening of the chains closely resembled very late Ptolemaic or early

gypto-Roman examples from Alexandria. Mr. Adams scouted the idea that the boat necessarily implied a "Viking" origin. In form and details was purely Celtic, and it seemed to be a rough del—of the votive kind—of a ship with a her keel and ribs, but with hide-covered sides, fabric of which had been borrowed by Caesar himself from the ancient British ship-builders, a vessel before them, with its yards and sails, essentially an ocean-going type, such as had developed itself on the Atlantic shores. In characteristic Scandinavian craft adapted for use on an inland sea, oars were the important feature. The deposit of such a hoard, containing miniature ship, in the neighbourhood of the lake, and on a rocky part of the coast, pointed to the conclusion that it was a thank-offering vowed some marine divinity by an ancient Irish sea-god who had escaped from the perils of the ves. It might well have been dedicated to the deity Neptune, Nuada Necht, the British deities, whose temple, with illustrations of his fine attributes, had been discovered at Avebury, and whose name—in its Welsh form—had still survived, as associated with the port of London, in Ludgate-hill.

TIMBER TRADES' BENEVOLENT SOCIETY.

A MEETING of the Timber Trade of the United Kingdom was held at Carpenters' Hall, London, on Monday afternoon, for the purpose of founding a Benevolent Society for the Timber Trade in celebration of the Queen's long reign. The object of the Institution, as set forth in the proposed scheme, is to grant pensions and also temporary relief to deserving and necessitous members of the timber trade, and to widows and children of the same. The qualifications for pensions were stated to be as follows:—(a) Candidates must have been in the timber trade at least ten years, and must be British subjects, and must have been engaged in business either as makers, agents, merchants (foreign or English), sellers, managers, clerks, or foremen; they must not be less than fifty years of age, unless it proved to the satisfaction of the Committee or if nominated, that at an earlier age they are incapacitated from earning a livelihood. (b) Widows of the same, during widowhood, and subject to like conditions as regards age and incapacity. (c) Children. The Society will use its best endeavours to secure the election of children of all mentioned in paragraph (a) to the benefits of recognised orphan asylums. In addition to temporary help, rule 4 provides for an immediate grant of money up to 20*l.* to be made in cases of temporary and urgent necessity, at the discretion of the Committee. It is proposed that the amount of annuity granted shall not be less than 25*l.* or more than 50*l.*, payable quarterly in advance, and become due on January 1, May 1, August 1, and November 1 each year. Rule 7 provides that a single payment of five guineas entitles the donor to one vote for life, of ten guineas to two votes, and so on in proportion. That an annual subscription of half-a-guinea entitles the subscriber to one vote, one guinea to two votes, and so on in proportion. Such subscriptions shall be payable in advance, and will fall due on January 1 in each year. That executors paying to the funds of the society a sum of twenty guineas shall be entitled one life vote each, and to a further life vote for every additional twenty guineas so paid.

Mr. E. J. Morgan, having been elected chairman, Mr. C. Bird moved the following resolution:— "That a Society, to be called the Timber Trades' Benevolent Society, be formed to provide annuities, temporary relief for necessitous and deserving makers, agents, travellers, merchants, managers, clerks, and foremen engaged in the timber trade (being British subjects), and their widows and children, and at this meeting pledges itself to do everything in its power to promote the speedy formation and establishment of the Society."

In doing so he said that there was no organisation or federation in the timber trade whereby members of the trade could be called together to discuss matters of importance, and he thought that theirs was one of the very few trades in England, if not the only one, which had no benevolent or philanthropic society to help their fellow brethren in time of need. He had been specially struck with the great amount of good which the Builders' Benevolent Institution had done, and it was his hope to raise a similar society in the timber trade. The scope of the society was not to be limited to London, but they hoped to extend it all over the country. He was

glad to state that over 3,000*l.* had already been subscribed.

Mr. C. J. Wade seconded the motion. Mr. Neame said that many foreigners were employed in the timber trades in this country, and he desired to know if they would be excluded from the benefits of the scheme. In his opinion, if they had been a certain number of years in the trade they ought to receive the same advantages as British subjects.

After some discussion on this point, the motion was agreed to unanimously after amendment, the words "in the United Kingdom for not less than ten consecutive years" being substituted for "being British subjects."

On the motion of Mr. C. Churchill, it was agreed that Mr. W. L. T. Foy be elected first President of the Society.

The following officers were also elected:—as Treasurer, Mr. E. J. Morgan; as Trustees, Messrs. Beeton, Bolton, and Price; and the following gentlemen were elected to form the Committee:—Messrs. C. Churchill, R. Brandt, J. E. Cobbett, B. G. Elliott, R. Foster, T. Gabriel, P. Hoar, L. Neame, F. Nicholson, G. H. Renton, A. Rafferty, T. Stevenson, J. A. Wilson, T. Booth, W. H. Rider, C. Leary, Gellatly, Mulford, R. J. Kidman.

The Bank of England having been appointed Bankers of the Society, a vote of thanks was accorded to the Master and Court of the Carpenters' Company for the use of their hall for the meeting. A vote of thanks was also passed to the Chairman, and to Messrs. Bird and Wade, Honorary Secretaries *pro tem.*, for their efforts in founding the Society.

The donations to the fund so far amount to 3,617*l.*, and the subscriptions to 396*l.* The meeting then terminated.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council, the first after the Christmas recess, was held on Tuesday, in the County Hall, Spring-gardens, Sir Arthur Arnold, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend the St. James's Vestry 3,850*l.* for electric lighting purposes; the Fulham Vestry 4,150*l.* for street improvements; the Wandsworth and Clapham Guardians 10,000*l.* for alterations to Tooting College; and the Asylums Board 100,000*l.* towards the cost of erecting the Grove Hospital.

The Cost of Paving Streets.—The adjourned report of the Parliamentary Committee stated that a letter had been received from the Vestry of Hammersmith, forwarding suggested clauses to empower Vestries to borrow and the Council to lend money for the execution of paving works in new streets, so as to enable Vestries to extend payments by owners over a period not exceeding twenty years, and asking the Council to insert the clauses in one of their Bills in the next session. Section 77 of the Metropolitan Management Act, 1862, gives the Vestries a discretionary power to accept the payment of apportioned expenses in new streets by instalments spread over a period of not exceeding twenty years, but it does not give the Vestries power to borrow the money for the execution of paving works in new streets, and thus enable them to give the owners of premises, who have to pay, the benefit of the Act. On receipt of the letter, the Vestry asked what steps had been taken by them to ascertain the views of the Local Authorities, and they subsequently forwarded a statement showing the nature of the replies received to a letter addressed by them to all the Vestries and District Boards. The replies were twenty-three in number—six being in favour, seven against, and ten in favour of no action or simply acknowledging the letter from the Vestry of Hammersmith. On the whole, a consideration of the circumstances inclined the Committee to the opinion that the proposal was a reasonable one, and they recommended that the request of the Vestry of Hammersmith be complied with.

On the motion of Mr. T. W. Williams, the recommendation was referred back.

Mr. N. W. Hubbard then proposed, and it was agreed, that the Committee should consider "whether powers should not be obtained providing for the cost of paving works in new streets being in all cases borne by the freeholders."

Combined Drainage.—The following adjourned report of the Main Drainage Committee was then considered:—

"The Council on February 12, 1895, decided to apply to Parliament for an amendment of the definition of the words *sewer* and *drain* in the Metropolitan Local Management Act, so that the mean-

ing of the word *drain* should be made to include any drain the plan of which has not been approved as a sewer under Section 69 of the Act of 1855, and Sections 45 and 46 of the Act of 1862. A Bill was subsequently prepared and circulated among the Local Authorities, who arranged for a conference to be held to which representatives of the Council were nominated. After several meetings of the conference had taken place, the terms of the Bill were generally agreed upon. Such Bill was approved by the Council on January 28, 1896, and in due course introduced into Parliament as a public Bill. In view, however, of the opposition offered to the Bill it was withdrawn before the second reading on July 20, and the Parliamentary Committee have now asked us to report to the Council what further steps should be taken with respect to it. Having regard to the representations made on the subject by a large majority of the Local Authorities, we are of opinion that the Council should again, as the Central Authority, endeavour to give effect to the desire of the Local Authorities by promoting, as far as possible, the Bill in question; and we accordingly recommend—"That the Metropolitan Sewers and Drains Bill be re-introduced in the next session of Parliament, and that the Parliamentary Committee be instructed to take the necessary steps for that purpose."

Mr. Boulnois, M.P., said he hoped the Council would not go forward with the Bill, as it was an unjust Bill and would inflict great hardships upon many householders.

Mr. Cornwall said that the Local Authorities were anxious to get a correct definition of the word "sewer."

The recommendation was subsequently agreed to.

Protection of the British Museum and the Natural History Museum from Fire.—The Trustees of the British Museum having expressed the hope that the Council would allow the new chief officer of the fire brigade to render the same services in connexion with the protection from fire of the British Museum and the Natural History Museum as were undertaken by his predecessors in office, the Fire Brigade Committee recommended, and it was agreed, that Commander Wells be allowed, during the pleasure of the Council, to undertake the periodic inspection of the fire appliances in the British Museum and the Natural History Museum, and the instruction in the use of such appliances of the museum employees; it being understood that neither he nor the Council accepts any responsibility in the matter, and that no payment is to be made to him by the Trustees for his services.

Technical Education.—Mr. Sidney Webb brought up a report of the Technical Education Board, which stated that the most important new feature of the Board's work during the past quarter had been the very successful start made at the Central School of Arts and Crafts, but every other branch had increased in extent and variety.

Mr. H. Clarke expressed his satisfaction at the excellent work which had been done by the Board since its inception. It had been the means of rescuing London from a discreditable position in regard to technical education.

Mr. Roberts thought the funds of the Board should be devoted more to the improvement of practical handicrafts and less to the purposes of scientific study. He suggested that more encouragement should be given to the training of workmen, and he specially referred to hick-laying and plastering work. Could not the Board give a higher standard to brickwork, so that intelligent lads might be induced to take up that work?

Mr. Sidney Webb said they were pressing forward technical classes for mechanics as fast as they could, but the difficulty was in regard to the attendance in consequence of the late hours to which some trades worked. He desired to appeal to employers to make some reduction in their hours, and was pleased to be able to state that the leading printing firms had consented to allow their apprentices to leave at half-past five in the evening.

Theatre, Deptford.—The report of the Theatres and Music Halls Committee contained the following paragraph, the recommendation being agreed to:—

"We have considered nine drawings, dated 15th and one dated January 19, 1897, which have been submitted on behalf of Messrs. D. Allen & Sons for a new theatre which it is proposed to erect at Deptford on a site directly facing the Broadway, and having frontages to the New Cross-road and Tanner's Hill, and which will have seating accommodation for 1,500 persons. The site has a total boundary of 417 ft.; of this 98 ft. 6 in. abut on New Cross-road, and 96 ft. on Tanner's Hill, which it is proposed to widen to 35 ft. at the narrowest point. It will be seen, therefore, that 194 ft. 6 in. abut on public thoroughfares of the required width

instead of 208 ft. 6 in. as required by the Council's regulations. This small difference is, in our opinion, amply compensated for by the formation of a private way 10 ft. wide on the south side leading into Pearson's Avenue, and we therefore think the site a satisfactory one. The construction and arrangement of the theatre as shown on the drawings submitted is satisfactory, and we recommend—

* That the nine drawings, dated 15th as amended by the one dated January 19, 1897, be approved, on condition that the works be commenced within six months, and be carried out in all respects in accordance with the Council's regulations and the provisions of the London Building Act, 1894, and that upon our reporting the completion of the building in accordance with the approved drawings and the above conditions a certificate under the Metropolis Management and Building Acts Amendment Act, 1878, be sealed and issued to the owners of the premises.

Marylebone-road Widening.—The Building Act Committee reported that they had again considered an application for consent, subject to specified conditions, to the erection of buildings upon the site of Nos. 250 to 268, Marylebone-road. The proposal was to extend the frontage of the new buildings 7 ft. at the western end and 15 ft. at the eastern end beyond the line of the old buildings which they were to replace, and in consideration of this advanced line sufficient land in front would be given up between the road between Stafford-street and Lisson-grove to 70 ft., the area of the land to be surrendered being about 3,350 ft. If the application be granted, an improvement would be effected; but, in view of the disinclination which the Council had repeatedly evinced to permit any advancement of the building line in Marylebone-road, they had decided to recommend the Council not to give its consent to the application.

Mr. Reed moved an amendment to refer the report back, with instructions to the Committee to consider and report whether some recommendation could not be submitted to the Council to secure the widening of the Marylebone-road.

Mr. Roberts hoped the amendment would not be adopted. The proposed encroachment would spoil this splendid boulevard.

Dr. Longstaff said if the application were granted he did not see how they could refuse consent to a similar encroachment along the whole line of the forecourts in the Marylebone-road.

On a division the amendment was rejected by fifty-two to twenty-nine, and the recommendation was then agreed to.

The Council having transacted other business, adjourned soon after 7 o'clock.

COMPETITIONS.

LAYING-OUT LAND, WELLINGTON.—The following is the result of the competition for laying-out for building purposes lands near Wellington, Salop, the property of Lord Forester:—1st, Messrs. Mawson & Gibson, Wenderholme, Windermere. 2nd, Messrs. Reece & Griffiths, 32, Hamilton-street, Birkenhead. 3rd, Mr. Thomas Reid, C.E., Wellington, Salop. 4th, Mr. J. H. Holland, 237, Abbey Dale-road, Sheffield.

INFIRMARY, NEWPORT.—The directors of the Newport and Monmouthshire Infirmary have just received the award of Mr. N. G. Pennington, architect, of London, upon the designs for the new infirmary buildings which it is proposed to erect at Newport. There were thirty-four plans sent in, and it is found that the winner of the first premium—viz., of 100*l.*—is Mr. Richard J. Lovell, of 46, Queen Victoria-street, London; and the second premium—viz., 50*l.*—Mr. J. T. Harnett Harrison, of Central-buildings, North John-street, Liverpool.

WORKMEN'S DWELLINGS, SUNDERLAND.—The competition for workmen's dwellings, Silver-street, Sunderland, has been decided as follows:—First premium, design, Messrs. Martin B. Perry & R. Angell, Garrick House, York-buildings, Adelphi, London, W.C.; second, Messrs. Jacob & Brand, 34 and 36, Gresham-street, London, E.C.; third, Messrs. Houston & Houston, 13, Furoval's Inn, London, E.C.

CEMETERY BUILDINGS, DOUGLAS, ISLE OF MAN.—In an open competition instituted by the Town Council for their new cemetery buildings, &c., the designs sent in by Messrs. H. A. Mearns, F.R.I.B.A., and C. Sydney Ingham, of Liverpool, Manchester, and Southampton, have been awarded the first premium, while the second has gone to Messrs. Kay & Lucas, of Eastfield.

SCHOOL, MONTROSE.—A new school is in course of erection at North Links, Montrose. The plans are by Mr. McKenzie, architect, Aberdeen.

Illustrations.

ILLUSTRATIONS OF BRISTOL ARCHITECTURE.

THE illustrations in the plates are of various buildings in Bristol, most of which are mentioned in the leading article in this issue; but we may here summarise the buildings and the names of the architects, which are as follows:—

The Capital and Counties' Bank (Mr. Milverton Drake); the Granary on Welsh Back, the Colston Girls' School, and the Free Library in Trinity-road, all by Mr. Gough (if we remember right the granary, built a good many years ago, should be credited to the then firm of Messrs. Ponton & Gough); the Assize Courts (Mr. Pope); the Clifton College Buildings (Mr. C. F. Hanson); the completed portion of the Roman Catholic Pro-Cathedral, by the same architect; the Greenbank Board Schools, by Mr. Bligh Bond; Lloyd's Bank Buildings, by Mr. Bruce Gingell; the Bristol Technical Schools, exterior and interior, by Mr. E. C. Robins; the St. George's Technical Schools, by Mr. Bligh Bond; the Medical Schools, by the same architect; the exterior and entrance lobby of the offices of Messrs. Lysaght & Co., by Mr. Milverton Drake; and the new Bristol Docks Office, by Mr. Gough.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

THE under-mentioned applications under the London Building Act, 1894, have been considered by the Building Act Committee of the London County Council, and the following decisions have been arrived at. Those applications which have been agreed to are granted on certain conditions:—

Lines of Frontage.

Chelsea.—That consent be given to the erection of an iron and glass shelter in front of Hans-place Hotel, Hans-encressent, on the further application of Messrs. Read and Macdonald, on behalf of the Hans-place Hotel Company.

Strand.—That consent be given to the erection of an iron and glass covered way at the new entrance to the Alhambra, No. 23, Charing Cross-road, on the application of Mr. W. M. Bruton on behalf of the Alhambra Company.

Marylebone, East.—That consent be given to the erection of a porch in front of No. 19, Langham-street, Portland-place, on the application of Mr. C. H. Worley on behalf of Mr. W. R. Stevens.

St. George, Hannover-square.—That consent be given to the erection of a portico and balcony in front of No. 2, Great Stanhope-street, on the application of Messrs. Matthews, Rogers, & Co.

Bristol.—That consent be given to the erection of an iron and glass shelter in front of Avondale Hall, Landor-road, Stockwell, on the application of Mr. W. G. R. Sprague on behalf of Mr. Sims.

Dulwich.—That consent be given to the erection of projecting shop-fronts upon part of the forecourts of Nos. 2, 3, 4, and 5, Derwent-terrace, Grove-vale, East Dulwich, on the application of Messrs. T. & C. Bowyer on behalf of Mr. G. H. Judd and M. J. G. Evans.

Greenwich.—That consent be given to the erection of two houses with shops on the north side of Woolwich-road, between Denford-street and Glenforth-street, on the application of Mr. D. G. Forlock.

Greenwich.—That consent be given to the erection of an overhanging lamp in front of the "Bugle Horn" public-house, Charlton-road, Charlton, on the application of Mr. R. McPherson.

Hammersmith.—That consent be given to the erection of a temporary wood and iron office on part of the forecourt of No. 57, Fulham Palace-road, on the application of the Vestry of Hammersmith.

Hampstead.—That consent be given to the erection of a porch in front of Wycheombe, No. 99, Haverstock Hill, on the application of Mr. R. Groom on behalf of Mr. R. Bellamy.

Hampstead.—That consent be given to the erection of seven houses with shops on the east side of Edgware-road, with the flank of the westernmost house to abut upon Skardu-road, on the application of Mr. J. Phoenix on behalf of Messrs. Bridge & Neal.

Kensington, South.—That consent be given to the erection of an iron and glass covered way upon part of the forecourt of No. 62, Bedford-gardens, on the application of Messrs. J. Barker & Co., Limited, on behalf of Miss Williams.

Lewisham.—That consent be given to the erection of a one-story shop in front of No. 122, Rushey-green, Catford on the application of Mr. H. Hopton on behalf of Mr. Watts.

Limehouse.—That consent of the Council be given to the erection of an open iron footbridge across High-street, Wapping, to connect Sharp's wharf with Messrs. Beresford & Co.'s warehouses opposite, on their application.

Marylebone, East.—That the application of Mr. T. Murgatroyd for an extension of the perimeter within which the erection of a two-story addition, No. 47, York-terrace, Regent's Park, was required to be commenced, be granted.

St. George, Hannover-square.—That consent be given to the erection of an oriel window at No. 2, Park-street, to abut upon Reeve's-mews, on the application of Mr. M. E. Collins.

Strand.—That consent be given to the erection of an iron and glass covered way in front of Prince's Restaurant, Piccadilly, on the application of Messrs. J. T. Wimperis & Arber, on behalf of Prince's Restaurant, Limited.

Westminster (Detached).—That consent be given to the erection of three projecting oriel windows with columns and pediments to a new building, the south side of Knightsbridge, between William-street and Seville-street, on the application of Mr. E. L. Florence, on behalf of Messrs. Woolfe Bros.

Strand.—That consent be given to the erection of a shelter in front of the Vaudeville Theatre, No. 4 Strand, St. Martin-in-the-Fields, on the further application of Messrs. Hampton & Sons on behalf of Messrs. A. & S. Gatti.

Clapham.—That consent be not given to the erection of a house with shop on the east side of Weh road, with the flank of such building abutting upon Mallinson-road, and to the erection of a house, with shop, in the latter road, on the further application of Mr. H. Branch on behalf of Messrs. J. Nicks & Co.

Kensington, South.—That consent be not given to the erection and construction of an open iron shed for storing timber in a yard on the south side of Fimbroke-yard, Earl's Court, adjoining the Kensington Vestry, upon the application of Messrs. J. Barker & Co., Limited.

Marylebone, West.—That consent be not given to the erection of a block of residential flats on the site of No. 47, Abbey-road, St. John's Wood, on application of Messrs. Metcalf & Greig.

Wandsworth.—That consent be not given to the erection of one-story shops in front of Nos. 208 & 210, Merton-road, on the application of Mr. J. Howard on behalf of Mr. C. Hoyer and Mr. Foden.

Westminster.—That consent be not given to the erection of one-story shops on the forecourts of Nos. 95, 96A, 96B, 98, 100, 102, 104, and 106, Victoria-street, on the further application of Mr. F. Powell on behalf of Mr. C. Fruen.

Width of Way.

Kennington.—That consent be given to the erection of additions at the rear of the "Wheatstaple" public-house, No. 126, South Lambeth-road, at the prescribed distance from the centre of Wheatstaple-lane, on the application of Mr. W. M. Bruton on behalf of Mr. G. R. Sheath.

Stepney.—That consent be given to the erection of a church training college on the north side of Steel's-lane on a portion of the site of Nos. 3, 386, 388, 390, and 392, Commercial-road, at the prescribed distance from the centre of Steel's-lane, on the application of Messrs. Young Hall on behalf of the Society for Promoting Christian Knowledge.

Westminster.—That consent be given to the erection of a block of buildings on the north side of Douglas-street, between Hide-place 1, Chapter-street, on the site of Nos. 26, 28, and Douglas-street, and No. 46, Chapter-street, on the application of Messrs. Boehmer & Gibbs on behalf of Mr. F. Colwill.

Hackney, North.—That consent be given to the retention of a building erected by Mr. S. Smith at the rear of No. 66, High-street, Kingsland, at the prescribed distance from the centre of road or way leading out of Ridley-road.

Greenwich.—That consent be not given to the construction and erection of iron sheds at Durck canal wharf, River-bank, New Charlton, near Anchor and Hope-lane, on the application of Mr. J. R. Land on behalf of Messrs. Wood Brothers.

Southwark, West.—That consent be not given to the erection of an addition to the Evelina Hospital, Lombard-street, Southwark Bridge-road, St. George's-Martyr, on the application of Mr. T. Harris on behalf of Baron Ferdinand de Rothschild; as such addition beyond the line of the adjacent buildings shown upon the plan is considered objectionable, and having regard to the extreme narrowness of Lombard-street, and the intended height of the new building (which, it appears, would exceed that of the building formerly upon the site) it is deemed inexpedient to permit the erection of the addition as proposed.

Open Space About Buildings.

Hammersmith.—That the Council do, in exercise of its powers under Section 41 (1) (b) of the London Building Act, 1894, allow a modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of No. 50, Bolingbroke-road, and Richmond Villa and Bolingbroke Villa on the west side of Richmond-road, at the corner of Bolingbroke-road, with an irregular space at the rear of each of the three houses, on the application of Mr. H. Stevens, on behalf of Mr. G. Elyatt.

Clapham.—That the Council, in the exercise of its powers under Section 41 of the London Building

Act, 1849, do not permit the erection of a two-story dwelling-house upon a portion of the garden at the rear of No. 70, Temperley-road, to abut upon the west side of Balamy-road, without a space at the rear, on the application of Mr. A. E. Willbourn, on behalf of Mr. G. Collins.

St. George, Hanover-square.—That sanction be not given to such deviations from the plans, certified by the District Surveyor under Sections 13 and 43 of the London Building Act, 1894, of the space previously occupied by buildings at Nos. 141 and 142, New Bond-street, and premises at the rear fronting upon Bloomfield-place, as would permit of the erection of new buildings upon that site, on the further application of Mr. F. W. Foster on behalf of Mr. A. Coombs.

Whitechapel.—That consent be not given to the erection of two additional stories to the one-story offices at the rear of No. 279, Whitechapel-road, on the application of Mr. M. J. Kind on behalf of Messrs. C. Webster, Limited.

Line of Fronts and Width of Way.

Newington, West.—That consent be given to the erection of twelve houses on the north side of South-place, and of two houses on the east side of Dodding-grove, Kennington-park, on the application of Messrs. Briant & Son on behalf of Mr. A. F. De Laune.

Southwark, West.—That consent be given to the erection of a coal-shed in the playground of Pooock-street schools, to abut upon Fria-street, on the application of Mr. T. J. Biley on behalf of the School Board for London.

St. Pancras North.—That consent be not given to the erection of three blocks of residential flats on the west side of Highgate-road, between Greenwood-place and Carker's-lane, on the further application of Mr. W. T. Read.

Formation of Streets.

Dulwich.—That an order be sealed and issued to Mr. E. J. Strevens sanctioning the formation or laying out for carriage traffic of a street 40 ft. wide, to lead out of the north-west side of Lordship-lane into Blackwater-street, on his further application to the Council, on behalf of the Right Rev. Lord Abbott Snow. That the name Bassano-street be approved for the new street.

Woolwich.—That an order be sealed and issued to Mr. A. B. Bryceson, sanctioning the formation or laying out of a street for carriage traffic, to lead out of Riverdale-road, Plumstead Common, on his application to the Council on behalf of Mr. H. F. Driver and Mr. T. Driver. That the name Viewland-street be approved for the new street.

Clapham.—That an order be sealed and issued to Mr. C. J. Bentley, sanctioning the formation or laying out of a street 40 ft. wide, for carriage traffic, to lead out of the south side of Nightingale-lane into Temperley-road, Wandsworth, on his application to the Council. That the name Blandfields-street be approved for the new street.

Leatham.—That an order be sealed and issued to Messrs. Eastman Brothers, sanctioning the formation or laying out of a street 40 ft. wide, for carriage traffic, to lead out of Mayow-road into Perry-ridge, Sydenham, on their application to the Council. That the name Queenswood-road be approved for the new street.

Wandsworth.—That an order be sealed and issued to Mr. J. R. Sadlier, sanctioning the formation or laying out of a street, 40 ft. wide, for carriage traffic, to lead out of Pathfield-road into Greyhound-lane, Streatham, on his application to the Council. That the name Pathfield-road (in continuation) be approved for the new street.

Clapham.—That an order be sealed and issued to Mr. W. N. Dunn, refusing to sanction the formation or laying out for carriage traffic of new streets, 40 ft. wide, to lead out of the south side of Broomwood-road, Clapham Common, West Side, on his application to the Council on behalf of Mr. T. Ingram.

Hampstead.—That an order be sealed and issued to Mr. W. Sanders, refusing to sanction the formation or laying out of a street, 42 ft. wide, for carriage traffic, to lead out of Haverstock-hill into Lawn-road, on his further application to the Council on behalf of Mr. J. Sanders.

Artisans' Dwellings.

Hammersmith.—That the Council do, in the exercise of its powers under Section 42 of the London Building Act, 1894, disapprove and refuse to sanction the plans delivered by Mr. E. Sage on behalf of Mr. W. Moss, for the construction of three blocks of buildings upon the west side of Queen-street, one similar block at the rear to abut upon Church-lane, otherwise Sussex-place, and two other blocks adjoining the latter block, but not to abut upon a street, such buildings to be inhabited by persons of the working class; and, further, that the consent of the Council be not given to the erection of the four first-mentioned blocks of buildings to the line and in the position shown on the said plans.

Deviation from Certified Plans.

St. George, Hanover-square.—That sanction be given to certain deviations from the plans certified by the District Surveyor, under Section 43 of the London Building Act, 1894, so far as relates to the proposed rebuilding of the "Blue Posts" public-house,

No. 6, Bennett-street, at the corner of Arlington-street, Piccadilly, on the application of Messrs. Eadie & Meyers, on behalf of Messrs. W. H. Chapman.

Means of Escape at Top of High Buildings.

St. George, Hanover-square.—That the Council, in the exercise of its powers under Section 63 of the London Building Act, 1894, do grant a certificate in respect of the means of escape, in case of fire, proposed to be provided for the persons dwelling or employed in the fourth, fifth, and sixth floors of the new Claridge's Hotel, Brook-street, on the application of Mr. C. W. Stephens, on behalf of the Hotel Company.

Construction and Conversion of Building.

Space at Rear, &c.

Westminster.—That the Council, in the exercise of its powers under the London Building Act, 1894, do not approve of, permit, or allow the construction of a riding-shed in the yard at the rear of No. 81, Page-street, the erection of two blocks of loose-boxes, the adaptation as loose-boxes of two old buildings without open spaces at the rear, and the conversion into a dwelling-house without an open space at the rear of a portion of a workshop in the said yard, on the application of Mr. W. Brass, on behalf of Mr. J. S. Brown.

Cubical Extent.

Bermondsey.—That subject to the provisions of Section 76 of the London Building Act, 1894, consent be given to the erection of two additional stories to a drying shed at "The Grange" tannery, Spa-road, together exceeding in extent 250,000 but not 450,000 cubic feet, and to be used only for the purpose of the trade of a tanner, on the further application of Messrs. G. Elkington & Son, on behalf of Mr. W. Whitmore.

Correspondence.

To the Editor of THE BUILDER.

PETERBOROUGH CATHEDRAL.

SIR,—As, in your searching criticisms of "the preliminary specification" for repairing Peterborough in the last two numbers of the *Builder*, you question the value of some of the signatories' names, on a charge both of youth and inexperience, and also cliquism, will you allow me to correct my position in respect of the latter charge, and to state briefly what I think you will admit justifies my name appearing on the list of those who "have not examined the west front of Peterborough Cathedral from the scaffolding."

I have not the honour to belong to either of the societies by whom "the specification" is issued, and had it occurred to me that you would make division of the list of names into sheep and goats, as represented by "memorialists" and Institute men, I should have hastened to sign my name with the distinguishing brand of "A.R.I.B.A."

In respect to the former charge, it is now ten years ago since I had an experience in restoration which it is not the fortune of many architects to enjoy, namely, to act as resident clerk of works during the twelve months occupied in extensive repairs to an Oxford college. This work, which was at St. John's College, was done under the able direction of Mr. J. J. Stevenson, whose name you single out as representing the Institute among the signatories to "the specification." The condition of affairs in this college, although in a much smaller scale, resembled in many particulars those at Peterborough, but in an aggravated form resulting from the use of that picturesque but deplorably bad Headington stone, so universally adopted in Oxford for building during the seventeenth century. Almost exactly the same means that are recommended in "the specification" for Peterborough were adopted wherever it was possible and advisable in order to save the facing stones at St. John's. And, notwithstanding the precarious state of these stones, it was found possible to burrow out the rotten wall core from behind and replace with sound bricks in cement, sometimes for 30 ft. to 40 ft. at a stretch, where the facing stones were only from 2½ in. to 3 in. thick.

The eight or nine years' lapse of time since the work at St. John's was finished has so far justified the methods adopted for this particular building, and, with an extension of the same principles and means and precautions proportioned to the greater weights and size of the building, such as "the specification" suggests for Peterborough, I am convinced the same results could be obtained. No stone can possibly be worse for structural purposes than the charming, though treacherous, Headington stone, yet if these things can be done in Oxford, why not also in Peterborough? F. W. TROUP.

* * * We have already fully given the reasons "why not," for which we refer Mr. Troup to the two last numbers of the *Builder*. That such a method could be employed under some circumstances we never questioned. Mr. Troup seems to think that, without having examined the state of Peterborough, he is a better judge than Mr. Pearson and Mr. Thompson, who have examined it, and

who have ten times his experience. That attitude is characteristic of the whole movement.—ED.

RE ST. DAVID'S CHURCH, EXETER, COMPETITION.

SIR,—As there has been so much misrepresentation upon this matter, I think it may be interesting to know that the Building Committee have adhered to the award of the assessor, Mr. James Brooks, despite the strong attempt made by others to override it. He placed Mr. W. D. Caröe's design first, and a tender having been accepted for it last week, the objectors on the score of cost were silenced. Mr. Brooks having awarded the second place to my design, Dr. it was on Friday last decided that the second premium of £501. should be paid accordingly.

HARBOTTLE REED,
12, Castle-street, Exeter.
January 20, 1897.

The Student's Column.

SPECIFICATIONS.—V.
SLATER.

THE chief points in which specifications of this trade vary, and as to which the student should be careful, are the difference of custom in Welsh and Westmoreland slate supply and the selection of ridges. The production of Welsh slates being far greater than that of Westmoreland, it is customary to sell Welsh slates sorted to sizes, countess, duchess, &c., but Westmoreland slates are more usually supplied in mixed sizes. If the architect, therefore, wishes the slating laid in diminishing courses from eaves to ridge, it must be specially mentioned in respect of Welsh slates, and, under ordinary circumstances, adds to the price, whereas the converse is the case with Westmoreland slates, with which diminishing courses may be taken as the normal method of supplying and laying.

Slate is a material which does not lend itself kindly to the formation of ridges and hips, still less of valleys, and although we shall give an example of specifying such, it is more general nowadays to use tile or lead for these parts of the construction. With this explanation we may proceed.

Roofs.—Cover the roofs with best Bangor blue slates, "countess" size of approved colour and quality laid to 3 in. lap on 1½ in. by 1 in. sawn battens and nailed with two penny copper nails to each slate.

(If Westmoreland slates are to be used, say) Cover the roofs with Tilberthwaite (or other quarry) green slates, of approved colour and quality, laid in diminishing courses from eaves to ridge with 3 in. lap on 1½ in. rough boarding (or battens) and McNeil & Co.'s (or other maker) patent bituminous inodorous felt (or Willesden paper, 2-ply). The slating to be nailed with two 1½ in. compo. nails to each slate.

(Whichever slate is used, add also.) All eaves and verges to have double course, hips and ridges to be cut close.

Ridges.—Cover the ridges with 2½ in. rubbed slate bird's-mouthed roll and 6 in. by ½ in. sawn slate wings, all bedded and jointed in oil cement, and secured with brass screws.

(Or, in the alternative) Cover the ridges with red tile ridges, No. in list, p.c.

per foot, set and pointed in cement. (If green ridges—glazed or unglazed—are desired, it is well to say that they are to be purposely made by Carter & Co., of Poole, Dorset, or other maker at p.c. price of per foot, free on rail.)

Hips (These may be covered with slate roll and wings, in similar manner to that described for ridges, or with ridge tiles, but are more generally at the present time finished with close-cut slating and secret gutter, which may be thus described).—The hips to have the slating cut close to mitre line, with 5-lb. lead secret gutter 18 in. wide under same (or with 5-lb. lead soakers, 10 in. by 18 in., laid to bond in with courses of slating. Or a lead roll and wings may be used, but whatever is adopted should certainly be described under the heading of slater, even though it may be plumbers' work).

Hip Finials.—Provide and fix at apex of hips, hedded and jointed in cement, red terra-cotta hip finials, as No. in the list of the Rowland's Castle Brick and Tile Company, p.c. each. (If the hip finials are to be in lead, mention it here.)

Valleys (Say whether the valleys are to be formed with soakers or with lead valley gutter, and describe).—The slating to be cut in true line to valleys with in. between edges of slating.

Verges.—The verges to be pointed (or set) in cement.

Stone Slates.—Cover the roofs with Horsham Collyweston, Stonesfield, or Forest of Dean stone slates 13 in. thick of approved quality, laid in diminishing courses from eaves to ridge, bedded in mortar and torched on the underside, each slate to have two oak pins hung over 2½ in. by 1½ in. battens (sometimes lifting is employed and sometimes the slates are simply bedded) to 3-in. lap. The ridges to be bird's-mouthed plain ridges of stone (a freestone of durable character, sometimes Box ground or Doulting), 6 in. by 6 in. set, and jointed in blue lias lime mortar (not cement).

SLATE MASON.

Cisterns.—(The use of slate cisterns is almost obsolete, but we give an example). The slate cistern in roof of scullery to be 6 ft. by 4 ft. and 3 ft. deep internal dimensions, with sides 1 in. thick and bottom 1½ in. thick, all in sawn Valenta slate slabs, put together with rebated and grooved joints in red lead and oil cement, the grooved slabs pointed externally with weathered cement filletting. Put around same two sets of wrought-iron straps, 1½ in. by ½ in., forged and screwed at ends with nuts and washers.

Sinks.—(These would be similarly described, but, of course, with smaller dimensions and thicknesses).

Shelves.—Fit up in larder two tiers of shelving, 9 in. wide at sides and 12 in. wide at end. The shelves to be inch rubbed Valenta slate slabs, with rubbed and rounded edges, and rounded corners to 4 in. radius, and to be in one length each (or two, &c., if allowed), cut and pinned into walls 2 in. deep in cement. The shelves to be supported on wrought-iron brackets *p.c.* each plugged and screwed to walls, and secured to shelves with brass screws let in and bedded with oil cement (or mastic). (Or slate cantilevers can be used, which specify thus). The shelves to be supported on 1½ in. rubbed (or sawn) diminished cantilevers, rounded on edge and at end, and to be the full width of shelving, 3 in. deep, and cut and primed ¼ in. into wall in cement.

Urinals.—Form the urinals shown on plan with hacks of ½ in. sawn Valenta slate slabs, bedded in mastic cement (or Portland), and secured with bronze cramps, cut and pinned into brickwork. The divisions to be of ¾ in. slabs grooved to backs, and secured with bronze (or brass) tuning-fork cramps 10 in. long, cut and pinned into wall, and screwed to slate with brass screws, nuts, and washers. Channel to be of 6 in. by 3 in. sawn slate dishd to current, and set in cement flush with asphalt paving.

(The above are sufficient examples of the method of specifying for slate mason's work, any other special items being treated in a similar way.)

If enamelled slate is to be used, it is advisable to select a manufacturer in whom the architect can place confidence, and specify that make of goods at a *p.c.* price, inasmuch as the durability of the enamel depends entirely on the care taken in the manufacture and the quality of the workmanship is very difficult to determine in the completed article without damaging it.

TILER.

Roofs.—Cover the roofs with hard, well-burnt, approved red tiles of local manufacture (or Broseley, Bridgewater, or other desired kind), entirely free from fire cracks and all other defects, laid to a 3½ in. gauge, with two short cast-iron tile pins to each, and bedded in hay or 1½ in. by 1 in. deal battens, with proper tile and a half where required at edges to prevent the use of closers. (This is the old-fashioned tiler's way of laying tiles, and has the approval of experience and of many good judges; but tiling is now often laid by bricklayers, and these craftsmen cannot get on without mortar, so, as an alternative, one may specify instead: The tiles to have their lower edges bedded in a small quantity of lime and hair and to be torched on the underside. (Some architects bed their tiles wholly in mortar, but this method is more likely to hold the wet and keep the roof damp. Again, tiles are sometimes nailed, sometimes hung over the battens with nibs formed on the tiles, and even, though rarely at the present day, hung with wood pegs. This is a matter for the discretion or fancy of the architect. The specification should state which method is to be followed). All eaves and verges to have double courses, and to be pointed in cement. (This last stipulation is open to question.)

Ridges.—Cover all ridges with half-round ridge tiles set and pointed in cement (or specify a special make and pattern if desired).

Hips and Valleys.—Lay all valleys and cover all hips with special valley and hip tiles to course and bond with roof tiling. (These are only kept in stock for mitres of roofs of the same pitch. If roofs of different pitch intersect at valleys or hips, the tiles would have to be purpose made. These tiles cannot, of course, be properly used where there is any curve in the slope of roof tiling even if it be only the tilting of lower courses.)

Hip Finials.—(Specify as indicated under the heading of slater.)

Filletting.—(If this is to be used instead of flashings specify). At junction of tile roofs with vertical face of brickwork put stout cement filletting with nails and twine to hold same.

Vertical Tiling.—Cover the cheeks of dormers with vertical tiling of similar description to that used on roofs, nailed to 1½ in. rough boarding with two compo nails to each tile, the courses to range with the courses of roof-tiling. (Describe whether the junction of vertical and roof-tiling is to have secret gutter or soakers). The tiles to be cut close at junction of vertical and sloping faces. (If the whole of the upper story is tile hung describe the way in which it is to be done, whether nailed to battens, plugged to wall, nailed to joints of brickwork, usually on edge, or bedded in lime and hair mortar).

With both slate and tile-roofing the final clause should be—

Completion.—Clean out gutters, replace any cracked or broken tiles (or slates), make good any defective pointing or filletting, and leave the roofs clean, perfect, and weather-tight at completion.

GENERAL BUILDING NEWS.

BOARD SCHOOL, BOOTLE.—A special meeting of the Bootle School Board was held on the 20th inst. at the Public Offices, and the object of the meeting was to select a plan for the new Grey-street school. Mr. Smith proposed for adoption the following recommendation of the Building and Finance Committee:—"That, subject to the consent of the Education Department and to a contract being entered into by the architect for the carrying out of the scheme in accordance with the conditions enumerated in the memorandum issued to competitive architects, the plan for the Grey-street school set in under the *nom de plume* of 'Left-hand Light' be adopted, and that the architect whose *nom de plume* is, he, and he is hereby appointed architect of the school upon the usual conditions." Mr. Francis seconded the adoption of the recommendation, which was carried unanimously. The cost of the new school, which will accommodate about 1,100 children, is estimated to be 7,297. The architect called in by the board to advise upon the plans was Mr. Paul Ogden, of Manchester. Fifteen sets of plans were sent in, and the successful architect was Mr. Cox (Cox & Marnon), Liverpool.

CLONFORT CATHEDRAL.—During the last twelve months a considerable amount of work in connexion with the restoration of Clonfort Cathedral has been carried out by Mr. A. P. Sharp, builder, Dublin, in accordance with the plans prepared by Mr. J. F. Fuller. The chancel has been thoroughly repaired, as well as the belfry-tower, the buttresses, and the roof. The sacristy has been successfully preserved without altering the ancient character of the structure. Other necessary work has been accomplished. A thorough system of drainage has been carried out around the entire building. Messrs. Craven, Dunnill, & Co., of Shropshire, have laid down tiles in the chancel, specially made for the situation. A new heating apparatus, supplied by Messrs. W. K. Fayle & Co., of Parsonstown, has been placed in the chancel, and a carved oak communion table, specially designed by Mr. Fuller, is being made for presentation to the cathedral. Clonfort Cathedral was originally founded by St. Brendan, in the year 558, thirty-nine years before St. Augustine landed in England. The present doorway, of Hiberno-Romanesque architecture, dates from the year 1166. The east window is nearly a thousand years old. The cathedral is small, but very beautiful in many respects. It is now used as the parish church. The south transept is in ruins and roofless. The north transept is completely gone. About 1,000, it is necessary to complete the work of repair. Canon McLarny, Rector of Clonfort, Banagher, King's Co., will be glad to receive help in this undertaking.

FREE LIBRARY, CARDIFF.—An inquiry has been held at the Town Hall, Cardiff, by Mr. E. H. Bioknell, on behalf of the Local Government Board, with reference to an application made by the Cardiff County Council for power to borrow 2,000, for the erection of a branch Free Library in the Docks district. The proposed building is to be erected from plans prepared by Mr. W. H. Washwood Cople, architect, of Cardiff, on the site of two cottages in George-street and near the centre of the shipping community.

RENOVATION OF HAMILTON PARISH CHURCH, LANARKSHIRE.—The Parish Church of Hamilton, which has been closed since the beginning of October for renovation and the introduction of an organ, was

reopened on the 17th inst. The work of renovating and redecorating has been carried out under the direction of Mr. A. Cullen, architect. The organ, which has been placed in the Duke's Aisle, has been erected by Messrs. Ingram & Co., Edinburgh and Hereford.

SCHOOL OF ART BUILDINGS, GLASGOW.—Messrs. Honeyman & Keppie, Glasgow, were the successful architects for the new school of art buildings in Renfrew-street, immediately behind the Skating Palace.

FREE METHODIST CHAPEL, PUDSEY.—Contracts amounting to between 6,000, and 7,000, for the erection of a new Free Methodist Chapel in Lowtown, Pudsey, have now been signed. The following are the contractors, viz.:—Mr. William Hutton, Fulneck, mason; Messrs. Appleyard Bros., Bramley, joiners; Mr. F. Thompson, Farsley, slater; Messrs. J. Laycock & Son, Stanningley, plasterers; and Mr. A. Higginbotham, Idle, plumber and painter. The chapel will be erected from the designs of Mr. W. H. Dinley, of Chorley, accepted in competition.

WESLEYAN SCHOOL, PUDSEY.—Miss Nora J. Mason recently opened a new school which has just been erected by the Wesleyans at Valley-road, Pudsey. The school contains a tea-room in the basement, a schoolroom on the first floor capable of seating 450 persons, and six large and two small class-rooms, the architects being Messrs. Hodgson & Farrar, Pudsey. The cost is 1,200.

BAPTIST SCHOOL, BRAMLEY.—The new Sunday-school just erected by the congregation of Zion Baptist Chapel, Bramley, was opened recently. The building, which has been designed by Mr. W. A. Hobson, architect, of Leeds, is a two-storied building, faced with stone. On the ground floor is a meeting-room, with accommodation for 300 people, with eight class-rooms communicating. Staircases give access to the upper floor, which contains an assembly hall, with seating accommodation for 500 people, two class-rooms, and two reading-rooms, and a tower stage against there are two more class-rooms. The principal contractors were Mr. W. W. Haley and Messrs. J. Trickett & Sons, and the clerk of works was Mr. E. Webster Tate. The building has cost about 2,500.

CHURCH OF ST. PATRICK, TRIM, CO. MEATH.—The main building of the new church of St. Patrick, Trim, is now nearly completed, and the tower is far advanced. Mr. Hague is the architect of the new church, and Mr. Nolan the contractor.

HOSPITAL, BEDFORD.—At a special meeting of the Governors of the Bedford County Hospital recently, it was decided to accept the estimate of Messrs. Kerridge & Shaw, of Cambridge, for the building of the new County Hospital, the cost of which will be about 33,000. Mr. H. Percy Adams is the architect for the new buildings.

RESTORATION OF PARIS CHURCH, IRTHINGTON.—The parish church at Irthington, which has been closed for some time for alterations and repairs, has been reopened. The alterations and additions have been designed so as to harmonise in style with the existing structure. The chief addition externally is the new vestry on the south side of the chancel, and below it is the heating chamber. The vestry has been placed so as not to interfere with the low side window of the chancel or with the old Norman doorway, and care has also been taken not to damage the old Roman walling of the chancel, whilst the windows have been made to match those of the chancel. Inside, the walls have been cleaned and discoloured where stained, and a mosaic pavement has been laid in its natural colour. The whole of the old-fashioned seats and square pews have been replaced by new seats of modern design, made of Dantzic oak, and an oak dado has been fixed all round the church. New pitch-pine flooring has been provided throughout, and a system of drainage introduced. The mason work has been done by Mr. Robert Mark; the joiner work and carpentering by Mr. William Edger, Brampton; the oak work by Mr. J. Heywood, Manchester; painting, Messrs. Atkinson & Elliott, Brampton; plumbers' work, Mr. W. Anderson, Carlisle; and the heating apparatus has been fixed by Mr. Corbett, Carlisle. Mr. J. F. H. Harrison had charge of the works. The architect engaged for the work was Mr. T. Taylor Scott, of Carlisle.

TURKISH BATHS, DONCASTER.—Turkish baths have been erected at Doncaster, situate on the Station road. The architect was Mr. T. G. Edwards, of Sheffield; the contractor, Mr. W. Anelay, of Doncaster. The heating and ventilation works have been carried out by Messrs. Bradford & Co., of London, and Manchester. The floors are of marble mosaic, the walls and ceilings are faced with white-glazed bricks.

TECHNICAL INSTITUTE, BRADFORD-ON-AVON.—A building for the purposes of a technical institute for Bradford-on-Avon has just been completed in Junction-road. The total cost is about 3,900. The frontage is 75 ft. to Junction-road, with a depth of 45 ft. From the centre of the hall a wide staircase extends to the first floor, stairs beneath communicating with the heating chamber and store rooms. On the left of the hall is the women's department, fitted with a suitable range for cooking, with a scullery and store room adjoining. On the first floor is a chemical laboratory 30 ft. by 20 ft., and the lecture theatre, 30 ft. by 15 ft., is also on the first floor, in

the centre of the building and adjoining the chemical laboratory, provision being made by specially ventilated fume closets for carrying off the gases emitted from chemical experiments. There is also on the first floor a large room, 40 ft. by 20 ft., to be used for the teaching of drawing, building construction, and other technical subjects. The cooling room and lecture theatre are to be fitted with raised galleries for the convenience of the students, and special arrangements are made for efficient ventilation and heating. The architect was Mr. T. B. Silcock, of Bath.

CHURCH EXTENSION, LEICESTER.—The foundation stones of the churches of St. Stephen, North Evington, and St. Michael and All Angels, Knighton Fields, were laid at Leicester recently. The new church of St. Stephen will be situated at the corner of East Park-road and St. Saviour's-road. According to the original scheme it was proposed to provide the following accommodation:—Nave 640, chancel 40, parish room 300; but this was abandoned, and the present scheme, which will cost a little over £2,000, was resolved upon. This will comprise a church affording accommodation to about 300 persons, and this is the portion of the scheme which is now in course of erection. Eventually the building will be doubled in size, the added portion comprising chancel, parish room, vestry, &c. At present only the body of the church is to be built, and this will have no nave or transepts, but will be a plain red brick Gothic building, with one wide spire. The architect is Mr. Stockdale Harrison, who Mr. T. R. Tebbutt is the builder, and Mr. William Mathew the clerk of the works. The church of St. Michael and All Angels at Knighton Fields will be built of brick, will accommodate about 560 people, and will cost about 4,500l. The architects are Messrs. Everard & Pick.

SCHOOLS, HOLLOWAY.—The opening of the Woodstock-road Schools, Holloway, took place recently. The architects were Messrs. Mitchell & Butler, whose design was selected by the Board after a limited competition amongst twelve architects. Messrs. Kirk & Randall were the builders, and the contract sum was £23,521. The school is built in three separate and distinct departments. 575 infants are accommodated on the ground floor, 418 girls on the first floor, and 416 boys on the second or top floor, being a total accommodation of 1,435 children. The central hall system has been adopted, each department having a large hall, with short corridors at each end connecting the various class-rooms with the hall. Each department has two entrances direct to its own playground. Each of the upper floors has two stone staircases, so that half the number of children enter on each side of the hall. Each department has lavatories and cloakrooms, and the teachers are provided with rooms for their own use. In addition to the ordinary school and class rooms there is a manual instruction room and a cookery schoolroom provided in a separate block of buildings, to which latter is also attached the caretaker's house. Each playground has a covered playshed. The school is built of picked stock bricks with red brick facings. A great deal of white glazed brickwork has been employed internally, the whole of the corridors, cloakrooms, lavatories, and staircases being lined with the same. All the school and class rooms have open fireplaces. In addition there is a complete system of hot-water heating by Messrs. Winton Smith, Gray & Co., for corridors, cloakrooms, and halls, with ventilating radiators at the most suitable positions.

NEW POLICE-COURT, SHEFFIELD.—At a cost of between 17,000l. and 18,000l., Sheffield has been provided with additional police-court accommodation. The preparation of the plans for the new court, which was opened on the 13th inst., was entrusted to Messrs. Flockton, Gibbs, & Flockton, architects, of Sheffield. In size the new court is about the same as in which the Stipendiary sits. There is a large corridor for witnesses-in-waiting, a room for the use of solicitors, and another where they can consult their clients. All these rooms are on the ground floor, and are approached from the end of the hall of the old building. Additional offices have been provided for the Stipendiary and the Magistrate's Clerk, and a room of about the same proportions as the grand jury room has been placed at the disposal of the Stipendiary. The magistrates' entrance from Waingate has also been enlarged, and there is now an entrance hall and improved staircase. Under the court there are twenty lock-up cells, and a couple of large cells for prisoners awaiting trial. A covered van-way passing under the court from Waingate to Castle-green, and a room for prisoners being removed from cell to prison-van in private. The caretaker's house is in Waingate. The building is to be heated by hot-water pipes fixed in the basement, the hot air to be mixed with cold air to the required temperature, and driven by a fan into the court and other rooms. The foul air will be drawn out by another fan. The contracts were let to Messrs. James Fidler, of Ackington, mason and bricklayer; J. H. Lillaker, joiner; Corrie & Sons, plumbers; Chadwick & Sons, plasterers and plasterers; Kenton & Co., who supplied the heating apparatus; Longden & Co., who provided the wrought-iron gates and grills.

BUILDING IN MANCHESTER.—The extraordinary activity of all branches of the building trade in Manchester during the past year cannot be paralleled by

any more recent reference than one to the years 1876 and 1877, when many of the suburbs round the city may be said to have had their birth. In the city several very large structures have been completed and others begun, while a considerable quantity of rebuilding of warehouses, offices, and shops has been in progress. In offices of all descriptions, the hydraulic lift, now readily worked by the public high-pressure supply, bids fair to become universal, and an immense amount of alteration to make room for it has been carried on. Iron and glass continue to supplant heavier materials, especially in the building of shops. The attempts to give elegance as well as individuality to the designs of shop fronts have become very numerous, but it may be noted that local contractors have lagged behind the times in this special department, Birmingham and London firms being generally employed to do work of this kind of the best class. In the suburbs, the designs even of the cheapest classes of cottage property show in many cases considerable improvement upon the styles that have been too long in vogue. Thousands of new houses have sprung up, built to let at rents usually ranging from 5s. 6d. to 7s. 6d. per week, and the rule has been for them to be taken considerably before completion by bodies of tenants newly immigrated to the town. There has been practically no desertion of older property of this class, which remains fully tenanted. As may be imagined, labour has been abundant all the year, at hardening rates. Bricklayers have been better paid, and plasterers, whose numbers are, by the rules of their Society, strictly limited, have often been in urgent request. The demand for such favourable materials as Ruabon bricks has not slackened, in spite of the production of large quantities of imitations by makers of various shale bricks in Accrington and Burnley. There is every appearance of continued prosperity throughout the building industries in Manchester. The demand for house accommodation shows no sign of abatement, and in the city some enormous contracts are about to be given out.—*Manchester Guardian*.

SCHOOLS, CHADWELL.—The new school buildings erected by the Hford School Board at Chadwell were opened recently. Mr. C. J. Dawson, the architect, stated that the site of the buildings contained a little more than half an acre. The building was designed as a mixed school for girls and boys, on the classroom and central hall principle. There were four classrooms for sixty children each, two for fifty each, and the central hall would accommodate forty children, or 330 children in all. The total cost of the buildings was 2,764l.

PROPOSED NEW LIBERAL CLUB, FARSLEY.—It is proposed to erect at Farsley new premises for the Liberal Club. Mr. W. O. Gill, architect, has prepared plans.

FEVER HOSPITAL, KILWINNING, Ayrshire.—The new District Fever Hospital at Kilwinning has now been opened. It is situated a little to the east of the town, opposite the cemetery, and was erected from plans by Mr. John Armour, jun., of Irvine. There are two principal blocks, the hospital proper and the administrative building, also a mortuary, laundry, &c. The hospital is divided into five wards, with accommodation for thirty beds. The administrative block contains five bedrooms, also a matron's and doctor's room, and a kitchen.

SCHOOL, PENARTH.—The new County Intermediate Schools at Penarth, which have been erected at a cost of about 8,000l., were opened on the 20th inst. The schools have been built to the plans of Mr. H. Snell, architect. They accommodate 120 boys and 80 girls, and include a lecture theatre, provision for the teaching of music, specially-designed rooms for drawing, painting, and architectural studies, and a series of class-rooms, in the one wing for girls, and on the other side for boys.

PREMISES, PERTH.—A new block of buildings is in course of erection at the corner of New Scott-street and South-street, Perth, for Baillie Wright, proprietor of the *Perthshire Courier*. The buildings, which are to be of three stories and attics, will have the ground area occupied by shops, with extensive cellars in basement. The upper floors are to be occupied by offices, printing works, and dwelling-houses, with stores, &c. The buildings are to be built of stone, with polished face and dressing, from Pelonaie Quarries, Bannockburn, and will have two façades of 60 ft. and 54 ft. respectively to New Scott-street and South-street. The roofs will be covered with slates from Port-Dinorwic Quarries. The contractors for the whole works are:—Mason and brick work, Alexander Beveridge, Perth; carpenter and joiner, Thomas D. Falconer, Perth; plaster and cement work, Daniel Campbell, Bridgend; slater, James Buchan, Perth; glazing, Edward M'Conocher, Perth; iron and steel contract, George Baillie, Perth. The plans, &c., have been executed by ex-Baillie Smart, architect, Perth.

ENLARGEMENT OF STANNINGLEY LIBERAL CLUB.—The work of enlarging Stanningley Liberal Club has now been practically completed. By the enlargement a new lecture hall, capable of accommodating about 400 persons, with the usual lavatory arrangements, has been added to the club on a level with the ground floor, the entrance to the hall being in a direct line with the front or main street entrance to the club. Under the hall provision has been made for three slipper baths, a committee-room,

and store-room. The old lecture hall has been converted into premises for the caretaker, and the rooms in the basement formerly occupied by the caretaker will in future be utilised for heating purposes, &c. A new stone staircase has been erected from the ground floor of the club to the billiard-room, and other improvements have been effected. The enlargement, &c., has been carried out from designs prepared by Messrs. Hodgson & Farrar, architects, Paisley and Bradford.

BRITISH SCHOOL, CHIPPING NORTON.—New British Schools were opened recently at Chipping Norton. The plans were prepared by Mr. J. H. Gibbons, of Birmingham, the contractor being Mr. S. Lewis, of Chipping Norton.

RENOVATION OF KNOX FREE CHURCH, PERTH.—For some time improvements and alterations have been in progress in connexion with the Knox Free Church, South-street. The work of renovation has now been completed. A new church hall and offices have been erected at the back of the church, and the old hall razed to the ground. The hall is 28 ft. square. The cost of the improvements will be about 1,200l. Mr. Alexander Beveridge was builder, and the architect was Mr. A. G. Chalmers.

CO-OPERATIVE STORE, ROWHEDGE, ESSEX.—The Colchester and East Essex Co-operative Society have just opened a new store at Rowhedge. The new store is situated in Regent-street, opposite of the new Hall, and consists of a provision shop, with hutch's shop at the side, storage accommodation at the rear, and on the upper story an assembly-room and a reading-room approached by a separate staircase at the side of the building. The architect was Mr. C. E. Butcher, of Colchester, and the builder Mr. R. Beaumont, of Lexden.

ALTERATIONS AT STOKE GIFFORD CHURCH, NEAR BRISTOL.—On the 23rd inst. the ancient church of Stoke Gifford was reopened. The church has undergone various alterations, carried out after the designs of the architect, Mr. Lingen Barker, of London.

SANITARY AND ENGINEERING NEWS.

SEWERAGE AND SEWAGE DISPOSAL, STAMFORDHAM.—The Castle Ward Rural District Council have adopted the scheme of main sewerage and sewage disposal for Stamfordham and Hawkwell, prepared by Mr. D. Balfour, M.Inst.C.E., of Newcastle-on-Tyne, and which will prevent the pollution of the river Pont, complained of by the County Council.

THE BLACKWALL TUNNEL.—At the meeting of the London County Council on Tuesday it was stated that the Blackwall Tunnel would be opened by the Prince of Wales in May next. The sewer works on both sides of the river, the fireproof fence at and approach road to Ordnance-wharf, East Greenwich, the river-wall at Northumberland-wharf, the "cut and cover" operations on the south side of the Thames, and the cast-iron lining of the tunnel are completed. The glazed brick lining of No. 4 shaft is finished, and about one-half of that of No. 1 shaft is executed. From the "cut and cover" on the north shore to No. 1 shaft, the concrete lining to the cast-iron skin of the tunnel is formed nearly up to the road level, and from No. 1 to No. 2 shaft the lining is built up two feet above the road level; from No. 2 to No. 3 shaft it is completed, and from the last-named point to No. 4 shaft about two-thirds of it are executed. A length of about 200 ft. of the tile facing in the tunnel, between shafts No. 2 and 3, is done. At the Poplar end of the tunnel, out of a total distance of 436 ft. of "cut and cover," a length of 427 ft. is completed. All the concrete foundations for the open approach roads on both sides of the river are finished. On the north side of the river the granite pitched carriageway, granite kerb and channel and York paved footpaths, are laid for a length of 1,100 ft.; while on the south shore the granite pitching, the York flagging, and the granite kerb and channel, are put down for lengths of 230 ft., 600 ft., and 1,200 ft. respectively. The progress made with the entrance-houses to the tunnel has been very slow on both sides of the river, owing to the non-delivery of stone from the quarries, but the material is now coming in more rapidly. The house on the north side is built to an average height of 24 ft., and that on the south shore to an altitude of about 17 ft. The concrete foundations for the boiler-house and for the chimney shaft connected with the electric light station are finished, and the well from which it is proposed to obtain water for condensing purposes is sunk to its full depth. Out of the total contract sum of 879,047l., including Messrs. Pearson's contract for works to the approach roads, it is estimated that the operations up to date have cost 748,437l., which is an increase of 12,385l. for the month.

STAINED GLASS AND DECORATION.

WINDOW, WRENTHAM CHURCH, SUFFOLK.—The dedication of a stained glass window took place recently at the Parish Church, Wrentham. The window has been inserted on the north side of the church, in memory of the late Mrs. Waterworth, and the work was carried out by Mr. L. J. Watts, of Colchester.

FOREIGN.

FRANCE.—M. Loviot has just been elected President of the Société des Architectes Diplômés du Gouvernement, in place of M. A. Chancel.—The new pavilion of the Luxembourg Museum, built on the site of the old terrace, is now quite finished. It consists of a gallery reserved for drawings and engravings, and two halls, one containing the Callebotte collection, and the other paintings of foreign schools.—The Académie des Beaux-Arts has elected as their Vice-President for the coming year M. Fénélet, the sculptor, in place of M. E. Barrias, who has resigned.—The Municipal Council has just voted a sum of money for the restoration of the celebrated carillon of the church of Saint Germain l'Auxerrois; it is in the tower close by the church.—There is a question of commissioning the sculptor, M. Paul Dubois, Director of the Ecole des Beaux-Arts, to make the statue of Pasteur, which is to be erected in Paris in the environs of the Luxembourg gardens.—The Decoration Committee of the Hôtel de Ville have just chosen the following artists, who will compete for the decoration of the ceiling of the Municipal Council's Library in the Hôtel de Ville: MM. Baschet, Carrière, Raphaël Collin, Elliot, Lerolle, and Fréjavé.—Two new bridges are to be built at Saint Denis, one over the Meuse, and one over the Canal des Grands Moulins.—The Société des Architectes de la Seine Inférieure have elected M. Barthélemy, who is a Rouen architect, as their Hon. President, and M. Gonnault, also a Rouen architect, as President. M. Bernard de Compiègne has been elected President of the Société des Architectes de l'Oise, and M. Regnault has been elected President of the Société des Architectes de Rennes.—The jury on the open competition for the building of the Hôtel de la Caisse d'Épargne at Pont à Mousson, have awarded the first prize to M. Toussaint Emile, of Nancy, the second to M. Callay, of Pont à Mousson, and the third prize to M. Lauternier, of Nancy, and the fourth prize to M. Humbert, of Nancy.—It is announced that M. Chartran is painting the portrait of Mr. McKinley, the President of the United States, for the Carnegie Gallery at Pittsburgh.—Part of the old Château of Portzic, near Brest, dating from the sixteenth century, has been destroyed by fire; it is a favourite haunt of tourists.—The Superior of the Benedictine Convent of Chantelle has just sold to the Louvre Museum three beautiful statues in stone, dating from the fifteenth century, and which were discovered in the excavations. These statues appear to have belonged to the chapel of the old Château of Chantelle.—The International Exhibition of Fine Arts has just been inaugurated at Monte Carlo, it has been well arranged by Georges de Dramard, the artist, and contains paintings by MM. Gérôme, Detaille, Ziem, Kroybet, Henner, J. Lefebvre, Sisley, Thaulow, and François Flameng.—The death is announced, at the age of sixty-eight, of M. Etienne Journoud, architect, at Lyons. He was a pupil of Dupasquier and Bresson. He began by being architect at Bellej, and for nearly forty years he superintended the erection of numbers of civil and religious buildings.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The Val de Travers Asphalt Paving Company have removed from their former address in Palmerston-street, to the Bishopsgate-street, the Hamilton House, Bishopsgate-street Without, E.C.—Owing to arrangements entered into with the executors of the late Mr. Robson, the firm hitherto known as "Novell & Robson," stone merchants, Warwick-road, Kensington, will henceforth carry on its business at the same address, under the style of "B. Novell & Co."

OLDHAM BUILDERS' ASSOCIATION.—The eighth annual dinner of the members of the Oldham and District Builders' Association was held recently at the King's Arms Hotel, Yorkshire-street, Oldham. Mr. W. Cunliffe, the President of the Lancashire Builders' Federation, proposed the toast of the "Oldham and Master Builders' Association and the Master Builders' Federation of Lancashire," and said that he hoped the coming year would be a flourishing one for the Oldham builders. With reference to the Lancashire Builders' Federation, it was, he might say, as yet in its infancy. They as masters had to meet organised forces, and singly they had no chance of winning in the long run, but standing shoulder to shoulder they could meet them properly, and state their case effectively when tyranny was attempted. There were one or two things which the men would put forward if the masters were weak, but he maintained, for instance, that masters had a right to obtain their materials wherever they liked, and at what rate they liked. There was the question of limitation of the number of apprentices, as to which he maintained that reliable men were even now not too plentiful, and that by the limitation of apprentices they would gradually have fewer men to meet an increased demand. It would then become a matter of dictating such terms that they would not be able to afford. There was a great scope for the Federation in questions which could not be dealt with locally, and which were for the general good of the trade of building, questions directed at the

extinction of the term "jerry-builder," which was a gross libel on the average builder.—Mr. Smethurst, President of the Oldham Association, in responding, said that during the past year, in respect to its magnitude, the building trade had been fairly good, but, he was afraid, not very profitable, an inconsistent state of things which he might explain by saying that whilst prices had remained somewhat stationary, the cost of labour especially had been increasing by slow stages, giving in the total an enhanced cost of production, which would have to be met by an increase of prices before the trade could be called profitable. The relations between the masters and men during the year had been fairly amicable, and with the exception of one matter the year had passed without any serious trouble. He had always been of the opinion that to proceed to an industrial war was a mistake, if not merely a crime, and he also believed that the combination of the men was a good thing, for all if rightly used, and that their claim for fair working conditions was just, and would be to the injury of nobody. But he believed that the bricklayers, though they secured their point for the moment, took up a false position in claiming foremen in charge of jobs—who really represented the masters on the work—should be members of their Association. There had been a very complete organisation of the men in the various branches going on recently, and he did not complain of that, but he wanted to point out that unless the masters were equally well organised they would have unfair conditions and proposals foisted upon them. The secretary (Mr. E. Stephenson), read his eighth annual report, after which Mr. J. C. Varley submitted the toast of "The Guests." The toast was duly acknowledged.

SALE OF HISTORIC BUILDINGS AT COVENTRY.—That well-known property in Earl-street, Coventry, the Palace-yard, has been purchased by Alderman Singer and other gentlemen, and is believed to be destined ultimately to be converted to some public object. The site, which is partially covered by quaint old timbered buildings, comprises about a 800 square yards. It has been the hostelry of several Royal visitors, particularly in the seventeenth century. In September, 1687, James II. was entertained there by Richard Hopkins, a citizen. In December, 1688, Princess Ann of Denmark lodged there. In 1689 Mr. Hopkins was elected a member for the city, and in the following year Prince George of Denmark was his guest. The buildings have of recent years been used as builder's premises, and as offices and warehouses. They adjoin the Technical Institute, and front the site of the proposed new municipal buildings.—*Leicester Post*.

ENGINEERING APPOINTMENT.—The compromise scheme brought forward by the Water Committee on the subject of the engineering in connexion with the Little Don Valley Water Works stipulated for the appointment of an experienced civil engineer to reside in the Little Don Valley, or at Sheffield, and devote the whole of his time to the work, and to be responsible for the designing and construction of the Langsett Reservoir, at a salary of 1,200l. to 1,500l. per annum, Mr. E. M. Eaton to be consulting engineer at 500l. per annum, with 250l. additional as consulting engineer for the existing works and for distribution. This scheme having been accepted by the Council the resident appointment resolution. A large number of applications were considered at the meeting of the Water Committee on the 20th inst. The number was reduced to six, whose claims will be further investigated at a future meeting.—*Sheffield Telegraph*.

FONT, ST. FRANCIS' CHURCH, CARDIFF.—A service to consecrate a new font was held at St. Francis' Church, East Moors, Cardiff, recently. The bowl of the font is of Portland stone, in one piece, with carved lip and scrolls, and rests upon green Irish marble columns, having moulded Portland stone capitals and bases, the whole standing upon two massive stone steps. The cover is of polished oak. The bowl is lined with lead and furnished with a drain. The font has been erected by Messrs. A. J. Howell & Co., from the designs of Mr. H. H. Turner (of Messrs. Habershon & Fawcaker, architects).

AN ANCIENT CHURCH BURNED.—The church of SS. Mary and Lawrence, at Bolsover, Derbyshire, was destroyed by fire on the 24th inst. Within the chapel—and this is the only portion of the building saved, it is stated—are two costly monuments, one to Sir Charles Cavendish, who died in 1677, and to his lady, and another to the memory of Henry Cavendish, Duke of Newcastle. Every single particle of the church, with the exception of the skeleton walls, which are almost entirely burnt beyond repair, has been destroyed.

THE BUILDERS' MERCHANTS' ASSOCIATION OF LONDON.—The third annual dinner of this Association, preceded by the annual general meeting, over which the President for 1896 (Mr. W. Sankey) presided, was held at the Midland Grand Hotel, St. Pancras, on the 21st inst. At the dinner there were forty members and guests present. Mr. Clement Braby, President for 1897 (who presided), having proposed the health of the Queen and the Royal Family, the toast of the late President, Mr. W. Sankey, of Hammersmith, was given by Mr. E. H. Sankey, of the President's Club, who proposed and that of "The President for 1896" was proposed

& Marten, Stratford. Mr. Braby, in replying, said the very fact of the Association existing, and of these annual dinners being held, giving the merchants an opportunity of meeting in good fellowship, had done, and was still doing, a great deal to further the interests of the trade generally. The next toast was that of "The Builders' Merchants' Association and kindred Associations," coupled with the names of Messrs. Hughes & Wragge, which was proposed by Mr. Dobson (of Messrs. Godson & Dobson). Mr. Wragge (of Messrs. Eastwood & Co.) replied on behalf of himself and the kindred associations. Having referred to the Brickmasters' Association, and the newly-formed Lime Merchants' Association, he said that he was entirely in sympathy with the Builders' Merchants' Association, because it had been the means of his becoming acquainted with many merchants whom he only knew before by reputation. Mr. Hughes responded for the Builders' Merchants' Association. Following this toast was that of "The Visitors," proposed by Colonel Sankey, who said that he was certain the Builders' Merchants' Association would succeed if only these existed combined in honesty of purpose amongst the members. Mr. Joseph Cook (of Messrs. Freund & Co.) responded for the visitors.

DIARY, &c., FOR 1897.—Messrs. B. Finch & Co., Limited, sanitary engineers, of Lambeth, have sent us a copy of their "Architects and Surveyors' Diary for 1897," which is a useful and well-arranged work containing information likely to be of use to the profession.—The Patent Victoria Stone Company, Limited, Kingsland-road, have issued a folding blotting-pad, which will be found useful. It is issued in commemoration of the sixtieth year of the Queen's reign.—Messrs. P. S. Brownlie & Co., of the Crown Fireclay Works, Glasgow, have issued a date-indicating card which shows illustrations of their enamelled goods.

CAPITAL AND LABOUR.

PLUMBERS' STRIKE, LEIGH.—The members of the Leigh branch of the United Association of Operative Plumbers being met recently and decided there was no reply had been received from some of the employers to the men's request for an advance in wages from 8d. to 9d. per hour, to come out on strike. Accordingly a number of the men have come out, but one or two leading firms succeeded the advance.

LEGAL.

THE CLAIM AGAINST THE ST. PANCRAS GUARDIANS.

MR. EDWARD RIDDLEY, Q.C., the Official Referee on the 22nd inst. resumed the hearing of this claim brought by the trustees of the creditors of Mr. Wm. Brooks against the Guardians of St. Pancras, and which was continued *de die in diem*. It will be remembered that the plaintiffs, who are builders, merchants, sue as trustees of creditors of Mr. Wm. Brooks, of Folkestone, builder, against the Guardians of the Poor of St. Pancras and their architects, Messrs. A. & C. Harston, for a balance of 24,262l., or alternately 24,262l. alleged to be due on a contract for the completion of the St. Pancras Workhouse. The plaintiffs' case was that some years ago the Guardians resolved to reconstruct the workhouse in King's-road, and appointed Messrs. Harston as their architects. The contract for the work was first taken by Messrs. Kirk & Randall, of Woodwich, but was afterwards taken by a firm requested to be relieved of further work under the contract. Fresh tenders were invited for the unfinished work, and that of Mr. Wm. Brooks was accepted for 50,867l. The work was to occupy fifteen months from May 1892, but delays arose, and in November, 1894, the work was stopped. Messrs. Drew-Beak, Peaks, & Co., of Queen Victoria-street, who supplied the ironwork; Mr. H. Tolpitt, of Folkestone, who supplied the timber; and Mr. J. Brown, of Cannon-street, who supplied bricks sued on behalf of creditors for the balance alleged to be due to Mr. Brooks. The net cost of the work executed was stated to be on the first claim 65,479l., plus ten per cent. profit, 6,547l., making 72,026l., of which 47,864l. had been received under various architects' certificates, leaving a balance of 24,262l. In the alternative claim the net cost of the work executed was estimated at 65,479l. as before, but the 10 per cent. profit was reckoned on the contract price of 50,867l., which was some 24,262l. The plaintiffs alleged that Brooks was hindered from continuing the work by the action of Mr. George Poole, the clerk of the works, who interfered without sufficient cause, and condemned materials supplied wholesale. It was also further alleged that the architects were seldom on the works, and that the interference of the clerk of the works caused needlessly a net loss of Mr. Brooks of 2,525l. in addition to 2,537l. the value of the materials left by Messrs. Kirk & Randall, and not permitted to be used. The defendants generally denied the charges against the clerk of the work and alleged that Brooks had not carried out his undertaking to complete the work left unfinished by Kirk & Randall. The Guardians further relied

the Public Authorities Protection Act, 1893, as being a defence, inasmuch as the matters referred to in the action occurred more than six months before the action was brought. The defendants, Messrs. Harston, pleaded that they were not liable, and said that they had received no complaints from Poole with respect to the manner in which the works were being carried out by Mr. Brooks. Reports of the former proceedings have appeared in the issues of the *Builder* for November 21 and 28, December 5, and the 23rd inst.

Mr. Reginald Bray and Mr. A. A. Hudson appeared as counsel for the plaintiffs; Mr. English Harston and Mr. W. Moyses for the Guardians; and Mr. MacIntyre and Mr. R. W. Turner for Messrs. Harston.

Mr. Harrison, in resuming his speech on behalf of the defendants, the St. Pancras Guardians, said that if the learned Referee came to the conclusion that the old contract had gone, then he would have to ascertain upon what terms the Trustees continued to carry on the work. It was most material to determine that. He thought, however, when the learned Referee came to look at the facts and conduct of the parties, that all through, from beginning to end, he would come to the conclusion that they had acted on the supposition that the old contract was binding upon them. From first to last they had always asked for certificates. When the Trustees took over the contract they did not suggest for a moment that the contract was at an end. On the contrary, the whole contract went on on the basis that the Trustees should carry out and complete the work on the terms of the contract. The learned counsel referred to a letter written by Mr. Brown and addressed to Mr. Harston on April 25, 1893, in which he said, "The creditors are desirous of completing the contract if they can see their way to do so," as evidence of what was in the minds of the Trustees at that time. Mr. Brown, in his evidence, said that they had studied the bills of quantities, and went through the whole matter with a view of considering whether or not they should go on and complete the contract. The matter, however, did not rest there. It was provided in the old contract that 20 per cent. retention money should be kept back, and the Trustees approached the Guardians and suggested that they should vary that particular term of the contract so that they should be enabled to draw within a smaller margin, and the Guardians met that suggestion made on behalf of the creditors, and did make a concession to them, and to which they (the creditors) had assented in grateful terms.

That showed that all parties were acting on the terms contained in the contract, otherwise there would have been no object in their going to ask the Guardians to allow them to draw within the 20 per cent. margin. They therefore professed to be doing work on the terms contained in the contract. It did not, however, rest even there. Mr. Brown had in his evidence said that he regretted not having appealed to Mr. Harston more often, as he might have got the work done quicker. What was the meaning of that? The contract provided for an appeal to Mr. Harston, and Mr. Brown was actually saying now that he was extremely sorry that he did not act on the powers of the contract. The whole basis of the arrangement and transactions between the parties was on the footing of the contract.

Mr. Brown went on to affirm in the strongest possible way that the work was done under the terms of that written document. He had examined the quantities, and had wanted to see what monies were becoming due, and what the position was. There was a question as to what the value of the work to be executed was, and to see how much money was in the hands of the Guardians, and what was outstanding, and what would go to the creditors out of the retention money. Take, for instance, Mr. Drew-Bear's evidence. The columns were rejected under and pursuant to the terms and powers of the contract. Then, as late as 1894, when the question of the handrail arose, it was the strongest proof that all parties at that date were acting on the terms contained in the contract. What was done in 1894 about the handrail? That was work which was supposed to be condemned under the powers in the contract. Mr. Poole was said to have behaved very unreasonably and improperly in condemning that, and Mr. Harston was called on the scene, and afterwards the Guardians. Did anybody suggest that that meeting was beside the mark and that Harston and Poole had no power to reject? On the contrary, the Guardians went out of their way and refused to back up Mr. Harston, and said that they would not insist on the full terms of the contract being enforced. The learned counsel submitted that that again showed that the contract was binding upon the plaintiffs. The whole struggle between the parties had been in enforcing the provisions of the contract. The whole of the work, he submitted, had been done under the terms of the contract, and on those terms alone. If the learned Referee came to the conclusion that the terms on which the work was to be executed were to be found in the contract they therefore arrived at the same result as if the contract had not, in fact, been set aside. For those reasons it was quite clear that the plaintiffs could not sue on *quantum meruit* at all. Of course, if there was any damage caused owing to the delay in giving possession of the site that would have to be

made good to the contractor. It was, however, a monstrous thing to attempt to make the ratepayers in 1896 pay for the default of the ratepayers in 1892. He only mentioned that for the purpose of showing how important it was that a contractor should not acquiesce in decisions, and say nothing about them at the time to the persons who were responsible—if there was any responsibility—and then come down upon somebody who was a totally different person.

At the close of Mr. Harrison's speech, the learned Referee said that he should object to hear Mr. MacIntyre until he had heard the evidence for the Guardians.

Mr. MacIntyre protested against this course, and said that the most convenient course would be for him to put forward what his case was on behalf of the architects.

Mr. Harrison remarked that he was placed in a somewhat difficult position by that arrangement. He did not know what evidence to call for the Guardians. Mr. Harston was the man whom the learned Referee had been asking for over and over again, and both his learned friend (Mr. MacIntyre) and himself both wished to put him in the box at the earliest possible opportunity. Mr. Harston was himself desirous of going into the box to give an explanation on all the various matters which had arisen. He (the learned counsel) was not going to discuss whether he was his witness or his learned friend's.

Mr. MacIntyre: You will hear me on the point whether there is any case for me to answer.

The learned Referee: No, I think not; you must deal with this case in a reasonable manner. Your first point, Mr. Harrison, was that Mr. Harston was an arbitrator—and I think you dealt with that up to a certain point in a proper manner—and as arbitrator no action could be brought against him. I cannot accept any other speech before the evidence is called for by the Guardians.

Mr. MacIntyre: I desire to say that the plaintiffs have made out no case against Messrs. Harston.

The learned Referee: I must hear Mr. Harston before I decide that.

Mr. MacIntyre: But will not you hear me on that point? I submit that there is no case against Mr. Harston, and I ask for your ruling on that.

The learned Referee: I must hear the evidence first. I am not going to hear two speeches now, and I will not do it.

Mr. Harrison: I have not got possession of Mr. Harston's proof.

The learned Referee: Well, you have taken up the cudgels for Mr. Harston, and which you were obliged to do in order to protect the Guardians.

Mr. Harrison replied that he had submitted that the Guardians were not responsible for the acts of Mr. Harston.

Mr. MacIntyre remarked that the course proposed by the learned Referee was very inconvenient, as Mr. Harston would have to be called twice. He did not intend to call his evidence before addressing the learned Referee, and therefore Mr. Harston would have to be called again.

The learned Referee said that he should take the course he had suggested. He was perfectly regular in doing so, and that was what he was going to do. If the evidence was called for the Guardians he should know what to do.

After some further discussion, it was arranged between Mr. Harrison and Mr. MacIntyre to call Mr. Poole first.

George Poole, clerk of the works, was the first witness called for the Board of Guardians. He said that he had been fifty years engaged in the building trade, the last twenty of which he had acted as clerk of works under Messrs. Harston. He was now in the service of the St. Pancras Guardians. He had heard the evidence given by the witness Fearon in the case. He had not spoken disrespectfully of Messrs. Drew-Bear & Co., when he heard that they were going to take the ironwork. Drew-Bear & Co. knew what was required, and they could do good work if they liked. They had done a large job for Messrs. Harston before, and knew their style of work. It was not true that witness had said to Fearon that he always made a practice of condemning the first parcel of goods received, for by that plan he got people to send better. Witness was clerk of works during the whole time that Kirk & Randall held the contract. He believed that two of the men afterwards employed by Brooks were there then—Gosby and Robinson. On June 1 or 2, 1892, Mr. Millward, the clerk to the Guardians, sent for witness to his office, respecting the erection of temporary buildings. Witness was directed to show Brooks and Fearon the ground plan, and to explain the way to conduct the job. At that time Brooks's tender had not been accepted. This was done in a friendly way at the office of Messrs. Harston. There were always from the beginning more men put on the job than were required. The job was flooded with men—country workmen. There was much waste in wages. He never saw such a rough and ragged lot. Witness tried in every way to assist the contractors to get possession of parts of the building to be pulled down. He in no way interfered with the clearing of the site, but they could not get at the particular point they wanted to work at. It was absolutely false that he told Fearon not to get on the hoarding. It was a huge job, five acres of ground being en-

closed, and they did not want all the hoarding at that time. It was totally untrue that the first lot of Thames ballast was condemned on July 14, 1892. His diary for that date said, "A quantity of satisfactory Bricks came this day." On February 14, 1893, Brooks certainly came up about a complaint witness made, and it was untrue to say that these complaints began in July, 1892. There was not a new brick put into the foundations anywhere. Witness never objected to old bricks being put into the foundations, but he did complain of too many bats. The diary produced showed that. He did not say the bricks were too soft, and not cleaned sufficiently. He merely cautioned the contractor, as his diary, produced, showed. The diary showed that he did say that the bricks used in the foundations were not cleaned sufficiently; they had left the old mortar on them. He said to Fearon, "w-o-l-e bricks have to be used," but he did not mean to enforce it.

The learned Referee: What did you mean?—I mean, whole bricks, and not bats.

Mr. Moyses: And the contract says whole bricks.

The learned Referee said the clerk of the works had no business to say such a thing and not enforce it.

Mr. Moyses read the clause of the specification relating to the use of whole bricks under the heading of old material: "Such of the old bricks as are sound, whole, and approved by the architects may be cleared, stacked, and re-used."

The Witness: As long as it was anything in fairness I was pleased to let it go. But I did it by way of caution.

Examination continued: It was not true that in a 14-in. Flemish bond wall witness insisted on every bat being cut out of a whole new brick. He had heard Franks's evidence, and it was decidedly untrue. A man of witness's experience would not do such a thing. It would be the trick of a dunce and a donkey, too.

The learned Referee: Franks was a very good witness.

Examination continued: He insisted on having a man put into the trench whilst the foundations were being laid to level up each barrow load of concrete when it came in. He had it rammed, but not packed back—a different thing altogether. As to Fearon's complaint that he could not get the specification until August 1, 1892, he could only say that there was the specification in witness's office for them to see. They did not want the specification at all then. Witness was doing all the work for them at that time with regard to taking out quantities, and assisting them in every way and shape. He was doing that out of kindness. Witness was answerable for the specification, and they did not want it at the time.

Fearon did say before August 1 that he had not then got the specification. Witness procured it, and deposited it at Brooks's office soon afterwards. He (witness) had to vary the depth of the foundations in C Block, but no one could give the levels until they had excavated the old work. At that time they were on friendly terms, and witness helped them all he could. They got possession of part of the old block on August 22, but although the middle part of it was kept up, Brooks could have begun on the ends if he had liked. There was nothing to prevent Brooks getting on in his work. Until he heard Fearon giving evidence in court, he never heard of the delay. The contractor kept part of the block left up in use for his own stores, and so saved money. When the blue Staffordshire bricks came on the job witness did complain that they were too sandy and asked for them to be removed. He never condemned to him had no power of condemnation. The two blue bricks produced were not fit for facings. Witness also complained that the copings were sent in before the bricks that had to go underneath. He remembered sending away red facing bricks on August 30 as "very unsatisfactory."

His diary would show this. He called the general foreman's attention to this. Witness went, at his own expense, and in his own time, down to Slough to get a look at the bricks in Nash's fields, but he never spoke to a soul there. He afterwards wrote to Mr. Harston telling him of those bricks, and when Fearon came on the ground he said, "I think you will find some bricks on the ground down there that will about do." This report to Mr. Harston was openly set down in his diary. Witness had to cross off a good many facing bricks, but it was untrue that he crossed and slashed them off in a temper. He did not think he lost his temper once in the whole affair. He had a great deal to contend with. With regard to the ironwork, Mr. Harston passed a girder that witness objected to, and it was probable that witness might have said that would have to come out, because the thing was being done in defiance. Fearon told him that the girders were sent back, and witness remarked that such action was premature. The girders were brought back a day or two afterwards. They were badly made things. Mr. Harston considered them of inferior make but did not consider the quality of the iron objectionable. He did not see Mr. Drew-Bear.

Mr. Moyses said that no prudent man would allow himself to be seeing the manufacturers who continually came to justify their own goods. The

clerk of the works had only to deal with the contractors and the contractors' men.

Examination continued: Fearon told witness that Drew-Bear had said that one girder should not have been sent. The joist which was objected to as not of fair weight was very light—something like 15 percent.—and witness asked that they should not be built in until he had heard from Mr. Harston. (Letter produced from Mr. Harston to Brooks.) "Those (girders) which you have delivered have joists of different sections, mostly light, and the weight is made up by a heavier top plate." Fearon promised a proper weighted joist, and saw Drew-Bear. They put up the light girder after all in defiance. Witness was in a responsible position, and when people defied him it made him speak out a little bit strongly. Witness was sixty-six years of age. Amongst a few of the large contracts he had acted as clerk of the works for were the Natural History Museum and the Imbecile School at Darenth. That was a 100,000l. job. He had also been engaged at the Limehouse Town Hall (a 10,000l. job), the Chelsea Workhouse (a 6,000l. job), at Kensington on a 15,000l. job, the Bethnal Green school (45,000l. job). He had also for some time been in the service of the Great Northern Railway Company. With reference to the ordering of bricks at Slough, the witness said that he did not see Mr. Nash nor anybody belonging to him. Witness did not, as Fearon said, select a malm pavilion in there. He never saw such a thing. It was not true that the foreman Brown was made ill by his treatment of him. He considered Brown a good foreman, and had he been allowed to do it as he should have been, he would have done capital work, but he was not allowed to do so. He remembered Mr. A. E. Brown coming to see him. It was his suggestion that Mr. Brown should be called to see the bricks that he objected to. Mr. Brown came and Mr. Fearon said he could say that the bricks were not up to what they should have been. It was really kindness to Mr. Brooks in this way, that he explained to Mr. Fearon that he thought it better to see Mr. Brown upon the matter, and get him, if possible, to send a better class of bricks, so as to save any further friction. It was not true to say that he flew into a towering rage and refused to listen to any explanation. He did not fly into a temper and go and cross off all the brickwork. It was impossible; he could not do it. He allowed the contractor every latitude, and gave him every assistance so that he should get new bricks. He had never rejected any bricks as good as the sample produced by Smeed, Dean, & Co. Fearon had carted from time to time bricks off the grounds which the witness would have allowed to be used. Large quantities of these old bricks were carted away, and witness drew Mr. Harston's attention to it. The bricks that were being carted away had never been rejected or ever complained about; they were too good. He made this complaint to Mr. Harston in the presence of Fearon. Witness's diary showed that he complained of the unsatisfactory way the concrete was being mixed with too much broken bricks and too little sandy ballast and not being half turned over or rammed. Witness could not condemn any material.

To reply to the learned Referee he said that he had not the slightest doubt that he did say to Mr. Brown, junior, in reference to the red brick work, that he would take good care that the bricks were cut out and a good many more besides.

The learned Referee: What do you mean by saying such a thing and then telling us that it means nothing? That is what troubles me in this case. He goes about making those random statements, and then he says, "I will have some of those bricks cut out."

Mr. Moyses: Those that he had marked.
The Witness: Those I had marked.
The learned Referee: Then you say that is not condemnation?
Mr. Moyses: No.
The learned Referee: You tell the builder so. Is he to suppose that the clerk of the works does not mean what he says when he makes these random statements? He had to act upon them.

Examination continued: He considered that the bricks he had marked were not good enough. He marked the bricks because he objected to them. If Fearon had said that he should leave them in until Mr. Harston came, there was nothing to prevent him doing so. To have marked the bricks in the way the plaintiffs' witnesses had suggested he would have wanted about half a dozen people walking after him with pencils. With reference to the Thames sand the witness never heard where it came from. He never rejected any. He could not help sand rejected there was not a barrow load to his knowledge sent back. Thames sand now was pretty well all coal rubbish.

The learned Referee: There was not any coal in the samples produced, nor have I heard it suggested. Examination continued: His diary showed that on October 12, 1892, he complained to the general foreman as to the sand being very salty, and showed him by test that it was so.

The learned Referee: I thought you said that you never rejected any sand at all about five minutes ago.
Mr. Moyses: That is not rejecting it. The clerk of the works has no power to reject. His power is to condemn.

The learned Referee: It is a pity he did not do that at the time.

Mr. Moyses: Surely he has a right to tell them not to use it.

The learned Referee: I do not know.

Mr. Moyses: That is clearly so. It is in the contract.

Examination continued: The entry in his diary for the next day showed that in consequence of the using of the salty sand being continued he was compelled to give the foreman a written notice to stop the further use until Mr. Harston's judgment could be taken on the matter. Fearon promised to order sand from a firm at Ware. Witness did tell them that they might use Mossop sand left on the job by Kirk & Randall. With reference to the columns, the witness said that he had never told Fearon that he wanted an engine-fitted joint. He wanted a fair honest bit of work done, which he expected to be done, and which he should expect to be done now. He did not alter his position at all. Witness believed he had told Gosby at the end of 1892 that, though the architects had passed those girders, he never would. He should stick by that now. It was not true that certain coke breeze lints condemned in June, 1893, had been put to the wrong height by drawings given either by him or Mr. Harston. There were no drawings, but there were general instructions. Fearon appealed to Mr. Harston, who supported witness. The lints had been up some months. Any ordinary person would have measured the doorways before putting up the brickwork. Witness rejected six columns on the ground that the brackets were out of plumb. As his diary would show, the foreman was impatient about it. The witness was taken great deal to heart by his diary as to the rejection of the columns and girders, and as to the interviews Mr. Drew-Bear and Fearon had with Mr. Harston on the point.

Examined as to the question which arose over the rods, the witness stated that he had had a lot to do with Messrs. Drew-Bear & Co., and that he did not put himself to the trouble he should otherwise have done, knowing they were honourable people, as he thought now. The last time he was in a law court was for Mr. Drew-Bear as his witness. He (witness) admitted that he objected to the holes in certain bars, to receive the rods in plaster-work, being too large, and Messrs. Drew-Bear had to have a special punch made to meet his requirements.

The learned Referee: Mr. Drew-Bear says the same thing.

Examination continued: Witness never insisted on the holes being so small that the bars which had to go through the holes had to be hammered in. The proper difference between the diameter of the rod and of the hole was one-sixteenth of an inch in his opinion. He insisted on the rods being in one length. There was no difficulty about that. Kirk & Randall got the same thing, and they put them all right. He had never approved of any plans submitted to him by the ironfounders. As to the iron handrail in Block A, witness denied that he ever saw it before it was put up. Had he done so, he would have objected to it at once. When he saw it he pointed out that the section was all wrong. It was not an oval section. It was untrue to say that they had been six weeks at work upon it before he examined it. It was an absolute falsehood altogether. As to the drain traps, the witness stated that he did insist on Amphill's, or similar, being used, as the specification demanded. He could not alter the specification. As to the landing stone supplied by the witness Armitage, the witness said that he objected to laminated stone on the ground that all laminated stone would flake. All except one piece of the laminated stone was taken away, and that was a very good example of how laminated stone would wear. That piece was the top step of the hall of the B Block. They deceived witness in putting in this piece. He never said anything to anybody about having the slates drilled. He had only condemned four chimney-pots. When he saw them they were on the ground, with the exception of one. That one was on Block, and the reason he objected to it was because it was faulty, and it was taken down. He had only objected to one chimney-pot after it was fixed. He did not remember a sample of glazed bricks being sent from Cliffs. He had never told Fearon that he must go to Ruabon, although he had told him before that they had had bricks from Ruabon. It was not true that the glazed bricks were constantly being rejected on account of colour. The galvanised tanks which had been spoken of came on the job pretty nearly all together. It was during a dense fog, on January 4, 1893. He saw them on the works before they were hoisted into position. The tanks were so badly unloaded and clambered with sand and other materials that he could not inspect them. He meant that he could not get at them to see them at all. He could see the outside but not the inside. He made objection to one which was being hoisted at the time. The first chance he had had of examining it was when they were hoisting it.

The learned Referee said that the point made was that these tanks were there for months.

Mr. Moyses said that before the tank in question was being hoisted Poole had had no chance of looking inside it.

The learned Referee: There is no dispute about this. They had been there for months.

Mr. Moyses: Yes, that may be so, but we had no opportunity of inspecting them.

The learned Referee: What does it matter whether the clerk of the works had had an opportunity to inspect them or not. There they had been for months. I suppose they had got rusty in the open air, had they not?

Mr. Moyses: Yes, but the specification provides for the protection of all materials by temporary sheds.

Examination continued: If the tanks had been properly galvanised in the first instance and properly taken care of the rust would not have occurred.

The learned Referee (to the witness): Do you say they came from the work rusty?—No, I did not see them then.

Mr. Moyses: We never have said that.

Examination continued: It was not true that he caused one of the tanks to be filled with water, and then turned over and emptied, and that then he condemned it on the ground of its being strained by its being emptied. He had advised its being filled as it was the best way to test it.

He remembered the boarding to the roof of the coach-house under the slates. Some boards were put up which had to come down again. They had used some boards which had been used before for boarding. The boards were at a place where they were exposed to view. They put up some which were all right, and then they added some which were objected to. It was not right to say that everything had to come down. Only that used for boarding was objected to. There might have been three or four squares. In November, 1892, he remembered a lot of sashes and frames coming which had been used.

Mr. Moyses: Is it true that when those sashes and frames were unloaded you immediately got out a blue pencil and began slashing at them, and said that you would not have those things used?—No.

Did you ever make use of any expression of that sort?—I did not use that word.

Examination continued: Gosby was rather insulting, and he ordered his men to put the things in the stores without giving witness any opportunity of properly seeing them. He marked eleven, so far as his memory went. He could not mark any more as Gosby ordered the men to take them in. There was necessarily delay and interference to the contractor by the sub-contractors, but he did not think there was any undue delay. There was a little hindrance with the machinery for the laundry. It was not true that there was no provision for the heating stoves going through the roof.

Is it true that you were all through the work of this contract constantly interfering with the workmen?—No; I was always very friendly with the workmen.

Is it true that instead of going to the foreman or manager you went to the workmen themselves and interfered with them?—No.

Examination continued: He had never pushed a piece of brickwork down—at least, to his knowledge.

It is said that you pulled the bricks up, and threw them down. Is that true?—No.

Did a bricklayer, when you were doing that, say to you, "Leave it alone, Mr. Poole. I am paid for putting it up. If you want it altered I will speak to the foreman?"—No; I know nothing about it.

Examination continued: He had never shifted a man from point to point on the different buildings.

Is it said that you hunted a man down for three days, and that his position on the works was so intolerable that he went for his money and left?—I am not aware of it.

Mr. Bray said that he did not suggest that Mr. Poole was very fleet of foot.

The learned Referee said that one had a difficulty in keeping the ludicrous side of the case out of his mind. He himself felt that the case was exceedingly ludicrous. When they found a man saying first one thing and then another, one did not know whether to believe him or not. It was very difficult to say what weight should be given to a man who gave evidence like the witness.

Cross-examined by Mr. Bray: Do I understand you that you cannot trust your memory much except where you have got the entries in your diary?—I prefer having the diary before me. My memory is not so good as it used to be. I consider this (the diary) is my evidence.

As I understand you, your diary was made up day by day?—Yes; I cannot say every day. I kept notes and then made these entries.

You kept notes from day to day and then wrote it (the diary) up at the end of the week?—No; everything was written up every two days.

Is this entry in the diary "I came to this office about 11 a.m. on Saturday last. I had then finished writing my last week's report." The witness was understood to say that that was correct.

The learned Referee pointed out to the witness that he was contradicting himself.—The witness remarked that everything was faithfully written.

Cross-examination continued: It was part of Mr. Harston's system that he (witness) should keep a diary. He sent his diary to Mr. Harston every week. The object was to show exactly what took

place. He kept very few copies of letters he wrote, with the exception of those he sent to Mr. Brooks. He did not keep copies of his letters to Mr. Harston. So far from obstructing Mr. Brooks and Mr. Fearon in the work, he did all he could to assist them.

Now as regards the materials. Did you do all you could to pass all materials reasonably good?—I did conscientiously.

Can you tell us how it was that Mr. Brooks made that accusation against you in February which you record in your diary?—I cannot account for it at all.

You cannot account for Brown telling us that his life was a misery?—No, I cannot.

That you were a very nice gentleman outside the work; but inside his life was a misery?—No, I cannot.

Cross-examination continued: There was a good deal of good material which was not looked after properly—knocked about and chipped. The materials on the whole, were about the average of what contractors supplied. There was always some difficulty with materials—always sure to be. The number of complaints as to the materials was nothing unusual to him—they were about the fair average.

I think you will admit that your diary is full of complaints?—Well, no, it is not full of complaints—only the ordinary complaints.

The learned Referee: There are not many days without them. Scarcely an entry has been read without complaints.

Mr. Bray: Now, you have told us that Messrs. Drew-Bear & Co. are most respectable people and a well-known firm?—Yes.

What sort of material did they supply?—They supplied about the average of materials; some good and some not so good.

About the same as merchants usually do?—Well, it would be an awkward job to say that. I cannot say that exactly.

Cross-examination continued: The timber merchants supplying the timber were all good people, but the timber was not good. He supposed that the reason the people sent such a lot of bad material on the job was that they were bought for cheapness.

Mr. Bray: Give us an instance. Where have they bought too cheap?—What was the price?

You say that you know they were bought too cheap?—I said probably.

Then you do not know anything about it?—Yes, that is the best way.

The learned Referee: Just explain what you mean. You do not seem to know anything about the prices. What do you mean?—I said probably. I do not know what he gave for them, I know what I should give.

The learned Referee: Of course, if it were true they scamped the job in that way, you would make out a good case against them?—I do not know what prices they gave for the materials.

Cross-examination continued: He should say that Fearon wished or was party to scamping the work.

Mr. Bray: Now you say that he had too many men on the job. That does not look like scamping, does it?—No.

You and the Guardians were continually complaining of the slow progress, were you not?—Not continually.

Very often?—From time to time. I cannot say the number of times.

Was not that a reason why Fearon should put as many men on as possible?—The men wanted more looking after.

Have you anything to say against the foremen?—No, not particularly.

You have said that they were a rough lot of men?—I only meant the pullers down—the ones that came on first.

Cross-examined as to the girders supplied by Messrs. Drew-Bear & Co., one of which was objected to by witness as being 2 lbs. per foot too light and the other as too heavy, the witness said that he did not know that any margin was allowed as to weight in girders. Of the two girders weighed, each 27 ft. 2 in. long, one was 19 lbs. under, and the other 29 lbs. over weight in the aggregate. Mr. Harston did write saying that the deficiency in that one girder was trifling and not worth notice. Five days afterwards Mr. Harston rejected the girders. He rejected six of the cast iron columns because the brackets were wrong. There were two defects, the first being that the bracket was out of the upright, and secondly, that the bracket was not at right angles to the cap. Some of them were as much as an inch out of the upright. He did not say that their being out of the upright diminished the strength. It would affect the look of them, however.

At first Fearon had no one on the works who could take the levels, and on his recommendation Fearon employed from July, 1892, witness's son Alfred, a surveyor, who took the levels for five or six weeks. Then Mr. Harston wanted Alfred Poole for other work, and Fearon engaged another of witness's sons for the work. Alfred Poole was not more competent than witness was to take levels. He had never intended to say that they had never had a competent person to take the levels. He would not swear that he never marked more than one brick at a time. It was absolutely untrue, as George Brown had sworn, that he (witness) got into a temper and

marked the bricks without noticing whether they were good or not. He only once marked the bricks with a carbon; most of them were done with a pencil, and the scratch would remain even though Mr. Harston overruled witness. He had no power of condemnation.

Mr. Bray referred the witness to an entry in his diary in which he recorded that he had told Gosby that all the brick he had marked must be cut out. The witness replied that Mr. Harston had just been on the works and inspected the bricks which had been marked nine months before.

Cross-examination continued: He marked eleven of the sashes and frames with lead pencil, and the men planed the marks out so that witness could not trace them; that was a little bit of deception that he was subject to all along. There had been no material friction with Kirk & Randall—perhaps a little more than usual. Witness could not get on with their foreman. The sample of picked stock brick produced in court and referred to previously was cut out of the workhouse in witness's presence as a specimen of very common work, very poor facings, some being of very poor colour, and not equal to the needs of modern workhouses. The specimen was made from bricks from Nash's, of Slough. A great part of the work done by Fearon was very much better than that. He and Mr. Harston were present when this was selected one day last week, and they also selected the defective pieces of timber also produced, after examining all the roofs. As a whole the brick-work at St. Pancras was a very fair job. There was no difference between Brooks' and Kirk & Randall's work.

The witness was next cross-examined as to the difficulty in the supply of bricks, and was confronted with an entry in his diary of October 15, 1892. "The difficulty in getting a satisfactory facing brick may partly arise from Fearon omitting to send a competent person to explain the quality of brick required," and was asked to explain it having regard to the fact that he knew that Fearon had been down to Eastwood's himself. The witness said that he did not consider Fearon to be a competent judge at that time. He (Fearon) had learnt a great deal since then. He agreed with the witness called for by the plaintiffs that if a hard stock brick was wanted, it could not possess a good colour; the softer brick was the most expensive. This only referred to the Essex bricks.

The witness was cross-examined as to the complaints concerning the sand and the rods through the floors. He said that the latter were specified to be either in one length, or, if in two lengths, to lap in the middle, with an extra hole. He would not admit that when Brooks had purchased a stock of short rods and proposed to lap them, he compelled him to use long rods—he advised him to use long ones for the contractors' own benefit. Fearon did take out the short lapped ones and put in long lengths instead in "C" block, at witness's request, as a letter (produced) from witness to Fearon in November, 1892, showed.

In answer to the learned Referee, the witness said that he asked Fearon to do this, but he expected it to be complied with.

Cross-examination continued: At that time the walls were up to 5 ft. above the second floor level, and those rods were in the first floor, and certainly there was great difficulty in getting the long rods in. The coke breeze lintels were put in according to his directions, and some months afterwards he insisted on lowering them 8 in. He did not know that two were not lowered, and were still to be seen.

Cross-examined as to the flooring, the witness said that Mr. Young and Mr. Corderoy, the surveyors, inspected the materials left on the ground by Kirk & Randall, and decided what were to be taken over by the Guardians, and those materials were afterwards purchased by Mr. Brooks. Among those materials was flooring, which was stacked. When Fearon tried to lay it, however, he (witness) objected to it. It was a pure invention to say that he (witness) declared he condemned the stuff when Kirk & Randall brought it on the ground, and he should condemn it again. He had certainly said that the flooring was bought too cheaply. He objected to the old boarding being planed and used for the coach-house roof, although this was specified to be rough boarded and lime-washed. He did not consider that boarding was suitable or clean enough.

Cross-examined as to the York steps, the witness said that he was greatly deceived. One piece of stone was rejected by Mr. Harston, but it was afterwards brought back, faked up by the contractor, and used in the building.

The witness pressed, could not point to any entry in his diary as to the matter, but he remembered calling Mr. Harston's attention to it.

He went with Mr. Armitage to Messrs. Harston's office when the stone was tested by hammering it, but he could not recollect the details, nor was it entered in his diary. He had had great experience in York stone, and knew that plenty of block and unlaminated stone was to be got.

Cross-examination continued: In September, 1892, he told Mr. Thornby, one of the Guardians, that the works were going on fairly well, but that there was some difficulty in getting satisfactory facing bricks owing to the spring of the year being unfavourable to the making and stacking. If it appeared in his diary that on October, 1892, the

contractors were getting on fairly well, it was correct. At that time he had every reason to believe that the contractors were anxious to push on with the work. He could not point to any other entry in his diary excepting that in February, 1893, stating that there were too many men on the works. Witness considered it would assist the contractor if he could get possession of the old A block. He was not aware that on April 20, 1893, complaints were made against him that he had condemned work which had been passed by the architects. Witness was referred to his diary when he stated that he had made a mistake, and did know of it. On January 23, 1894, he was aware that he was accused of obstructing Mr. Fearon in getting on with the work—at least a Mr. Channell told him so.

Re-examined by Mr. English Harrison: It was not a fact that he had obstructed Mr. Fearon. He had simply done his duty in cautioning Brooks from time to time, and he did that when he thought it was necessary. Certain of the Guardians were on the works the days Mr. Bray had put to him in cross-examination. It was his duty to observe the materials supplied. He would not have accepted a suggestion of any particular Guardian as to the way he was to perform his duty. If a Guardian had mentioned it, he (witness) should have wanted to know the reason why. He was on good terms with Mr. Fearon at the beginning of the work. Brooks had asked him to go and pay him a visit at Christmas, 1892. Fearon had visited at his house once, and once only. He thought that Benham (who supplied the laundry fittings) had delayed the contractors a little. With regard to the stone, the witness explained that he had said that if all the stone was as good as that he had hammered he would not object. He was clear that he had not condemned the flooring while it was stored there by Kirk & Randall. The lintels were made according to his drawing, and he wished them altered because he wanted them lower—they were too high, as there was a space between the door frame and the lintel. The whole thing did not fit, and he wanted it lower. Mr. Shallo, recalled, said that eight columns were rejected because the brackets were a little askew, and were recast. (The invoice was produced.)

Mr. Christopher Harston (examined by Mr. English Harrison) said that he was one of the defendants, and an architect and surveyor carrying on business at 15, Leadenhallstreet, in partnership with Mr. Arthur Harston, his brother. He had been in practice about thirty years. The witness mentioned several works upon which he and his brother had been engaged as architects. Among them being the Poplar and Stepney Sick Asylum (50,000l.), Darent Pauper Imbecile School and Asylum (150,000l.), Kensington Union Casual Wards Workhouse additions (35,000l.), Western Fever Hospital, Fulham (150,000l.), Paddington Union Infirmary (50,000l.), Chelsea Workhouse and Infirmary (70,000l.), Gore Farm Convalescent Hospital (22,000l.), St. Pancras Casual Wards (11,000l.), Kensington Casual Wards (5,000l.), East Tottenham Fever Hospital (54,000l.), Jewish Workhouse (56,000l.), and several other camp and other temporary hospitals. His firm had in hand at the present time buildings for the Metropolitan Asylums Board the contracts of which would amount in the aggregate to about 500,000l.

Examined as to the roadway, the witness said there was no truth in the statement of Mr. Fearon that he (Fearon) had complained to him about the entrance at the north end of the works. Fearon had neither consulted him on the matter or complained to him about it.

Fearon made no complaint as to the boarding, nor did witness hear of any difficulty in the matter, except that Brooks left a wall up (in lieu of erecting boarding on its site) which he (witness) considered dangerous, and wrote to him accordingly. He offered no obstacle to the contractor getting possession of portions of the site, and when appealed to on the subject, dealt with the matter immediately. He considered that Fearon could have got on with the work in the laundry block earlier, but he was somewhat impeded.

In answer to the learned Referee, the witness said that he did not point out to Fearon how he could have expedited this section, as Fearon never took any notice of his orders.

Mr. English Harrison said that he supposed Poole would have made any such suggestions.

The learned Referee: Put you, on behalf of the Guardians, have repudiated Poole, and have said that the Board looked to the architect to settle disputes with the builder.

Examination continued: He (witness) always made a point, in coming on the work, to look at the sand, as it was an important item. He had found the sand salty on one or two occasions, and, on another, had said that too fine a quality was being used. He objected to the salty sand, but did not order it to be removed from the site; he allowed it to be used between the damp course levels. As to the fine sand, he permitted it to be used with coarser stuff, as it could do no harm if used slowly with better sand. At a later date witness observed old material—brick rubbish and old lime—concealed under the sand, and spoke to the foreman about it. He declared that he knew nothing about it. He (witness) wrote a letter (which was produced), say-

COMPETITION, CONTRACTS, AND PUBLIC APPOINTMENTS.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, Applications to be in. Includes 'Starkeeper', 'Engineer Fitter', etc.

Those marked with an asterisk (*) are advertised in this Number. Competition, p. iv. Contracts, pp. iv, vi, viii, & xix. Public Appointments, p. xvi.

ing that he regarded it as a species of fraud, and, if it occurred again, he should take strong measures. Witness did not know the foreman's name.

Mr. Hudson objected to this evidence as being unexpected.

The learned Referee said that he saw no importance in the evidence if it represented an isolated instance; if it were an habitual practice it was proof that the work was scamped.

Examination continued. Sand might look all right, but still might be impregnated with salt, a fact which must be tried by tasting. Below-bridge sand varied much from mud to gravel in which bits of coal had fallen, and therefore he (witness) specified above-bridge or pit sand. The process of washing below-bridge sand had improved lately, but witness did not think it removed all the salt. He rejected two out of eight basement columns on September 8, 1892. All were rough and poor castings, and two exceptionally bad. In October a foreman said that the contractor had himself sent back the columns.

The witness said that he looked at the columns said to have been rejected by the contractor, and found that the capitals of the brackets were askew and the columns were rough. On October 21 he (witness) rejected other columns for similar defects. Drew Bear saw witness about the columns, but witness would not recognise him, as he was only a sub-contractor; but he added that if the contractor wished for his decision he would give it. He (witness) ridiculed the suggestion that the brackets should be screwed on, for they were needed to add strength, and they might as well be glued on as merely screwed. It was material that the brackets should have been cast with the capital. He (witness) would have been only too delighted if he could have passed the columns on the site, and he decided the matter to the best of his judgment and in the discharge of his duty. On November 24 he inspected two "B 2" girders and found them with unequal joists. Witness received a communication from Poole as to the weight of the girders and finding them short weight. The top plates did not increase the strength so much as if the weight had been at the bottom. The girders in question had to support three stories and the weight of the roof. One of the girders was 3 per cent. short, but the margin the witness allowed was about 2 per cent. everywhere. Witness wrote to Poole that the deficiency was trifling, and did not matter. Witness endeavoured, therefore, to exercise his authority in a conscientious manner. He had never told Fearon, as that witness had said,

that he should always uphold the clerk of the works.

He never had any complaints or appeals from the contractor as to the extra work alleged to have been done to the rods. With reference to the York landings, witness said that he objected to one piece as beddy, or laminated, and said that some other position must be found for it. Afterwards he rejected three more, and also one, a long step—the top step in the hall, the principal place in the whole building. Afterwards Poole objected to a York landing, but upon examining a sample with Armitage and Poole he (witness) passed it. York stone could be got free from lamination.

In answer to the learned Referee, the witness stated he found that laminated stone decayed when used inside a building. He objected to all laminated stone, and in the present case had specified that it should not be introduced. Armitage had already supplied other landings with slight laminations.

The learned Referee reminded the witness that he had specified distinctly there were to be no laminations, and yet he now discriminated.

The witness was then examined as to the bricks, and said that he had had no communication with Nash, of Slough, about the job in question, but he had not used his bricks for twenty years. Fearon told him that he could only get, with difficulty, satisfactory bricks, and witness replied by giving the names of Nash, Wright, and Ogle as makers of bricks of the sort he wanted. Nash sent some bricks which were not good enough. Witness always described the brick he required in writing a specification, because the names of bricks differed in various yards. It was not impossible to comply with his specification. The red bricks were more chipped than those of Brown's usually were, but otherwise they were of good quality.

Examined as to the timber, the witness said that it was generally inferior in character. He had always endeavoured to exercise his authority in a conscientious manner.

The hearing of the case was then further adjourned till March 1.

MEETINGS.

FRIDAY, JANUARY 29.

Institution of Civil Engineers.—Students' Meeting.—Mr. S. Henry Barradough on "An Experimental Investigation of the Efficiency of a Pelton Water-wheel." 8 p.m.

SATURDAY, JANUARY 30.

London and Provincial Builders' Foremen's Association. (Memorial Hall, Farringdon-road, E.C.)—January Quarterly Meeting. 7.30 p.m. St. Paul's Ecclesiological Society.—Annual Meeting, to be held at the Chapter House. 2.30 p.m.

SUNDAY, JANUARY 31.

Sunday Lecture Society.—Mr. C. W. Kimmins, M.A., D.Sc., on "Ancient and Modern Views of Fire," with experiments and illustrations. 4 p.m.

MONDAY, FEBRUARY 1.

Royal Institute of British Architects.—The seventh General Meeting (Ordinary). (1) To announce the name of the person the Council propose to submit to Her Majesty the Royal College of Surgeons in connection with the Royal College of Surgeons, 1897; (2) To read (under the management of the Art Standing Committee) a paper on "The Sculptor's Architecture of the Renaissance," by Mr. Alfred Gilbert, R.A. 8 p.m.

Royal Academy of Arts.—Third Lecture on "The Advancement of Architecture, Chiefly in Relation to Gothic Architecture," by Professor Aldrich. 8 p.m. Society of Arts (Lecture).—Mr. William Burton, F.C.S., on "Material and Design in Pottery," III. 8 p.m.

Society of Engineers.—(1) The President for the past year, Mr. Samuel Herbert Cox, will present the Premiums awarded for Papers read during the year; (2) The President for the year 1897, Mr. George Maxwell Lawford, will deliver his "Inaugural Address." 7.30 p.m.

Liverpool Architectural Society.—Mr. F. I. Thomas on "Art Out of Doors." Illustrated by sixty illuminated views. 6 p.m.

TUESDAY, FEBRUARY 2.

Institution of Civil Engineers.—(1) Paper to be further discussed: "The Diversion of the Periyar," by Colonel J. Pennington, C.S.I., R.E. (2) Time permitting Mr. H. F. Donaldson on "Cold Storage at the London and India Docks." 8 p.m.

Institution of Junior Engineers (Westminster Palace Hotel)—First Lecture of Course of Six on "Dynamo Design, Construction, and Working," by Mr. F. A. Nixon. 8 p.m. Leeds and Yorkshire Architectural Society.—Mr. W. H. Bidlake, M.A., on "Two Methods of Architectural Practice and Design." 7.30 p.m.

WEDNESDAY, FEBRUARY 3.

Royal Archaeological Institute.—Mr. George E. Fox, Hon. M.A. Oxon, F.S.A., on "Uriconium." Part II. 4 p.m.

St. Paul's Ecclesiological Society.—Mr. J. T. Micklethwait, F.S.A., on "The Plans of English Churches from the Sixth Century to the middle of the Eleventh." 7.30 p.m.

Society of Arts.—8 p.m. Northern Architectural Association.—Mr. H. Barnes on "Architectural Epidemics." 7.30 p.m.

Autobiography and Memoirs of an Art Critic.

THE various works of Philip Gilbert Hamerton cover so much ground in regard to the criticism of Art and Life, and combine so many fine qualities both of literary genius and of artistic insight and

knowledge, that one would be prepared to find the man himself as interesting a study as his books. Indeed, the volume* which is occupied half with his autobiography, brought down to the time of his marriage, and half with the biography of the subsequent period of his life supplied by his widow, is fully as interesting as any book he ever wrote, and the effect of it is to give us the impression of a character more individual and remarkable than one had fully realised from his writings.

A good deal of the autobiography is occupied with subjects of social and personal interest, which it does not come within our province to enlarge upon; it need only be observed here that the narrative of the circumstances of his childhood includes a great deal which is both interesting and pathetic, not least so the portrait of his proud, stern and almost-cruel father, whose principal or only virtue seems to have been his uncompromising honesty and love of truth, and who, with splendid and exceptional physical advantages of appearance and health, brought himself to an early grave by reckless convivial indulgence. Hamerton's mother died a few days after he was born; had she lived possibly a different impress would have been given to his rather wayward though loveable character. Another thing which must strike every reader of the autobiography, which was intended to be published only after his death, is the calm serenity with which he accepts that fact before him. Speaking of his father's funeral, he writes—

"I am the only survivor of that day's ceremony! The little procession has all followed my father into the darkness, descending one by one into graves

separated by great spaces of land and sea. And when this is printed I too shall be asleep in mine."

Similar reflections, always in the spirit of one quite calmly contemplating his own death, recur more than once. An interesting and picturesque element in the book, too, is the account of his marriage with the young French lady who became his wife, and who, an inhabitant of Paris, French in all her social and domestic habits and sympathies, and unable at that time to speak a word of English, was taken straight away to her husband's painting-lodge, as it might be called, on the desolate shore of Loch Awe. That their married life was in the main one of happiness and mutual trust and affection is obvious enough from the biography, but we fancy the young Parisian wife must have had some rather trying days in the early period of her transplantation.

In the autobiography Hamerton observes, "I have been sometimes represented as an unsuccessful painter who took to writing because he had failed as artist. It is, of course, easy to state the matter so, but the exact truth is that a very moderate success in either literature or art would have been equally acceptable to me, so that there has been no other failure in my life than the usual one of not being able to catch two hares at one time." Hamerton's life was not a failure, but it seems nevertheless that the criticism he objected to was really not far from the truth. He was left well off when he came of age, and wished to pursue either literature or painting, because he thought (and wisely) that "a very moderate success in either of these pursuits would be more conducive to happiness than a greater success in some less congenial occupation." But he decided on painting, and went into the study of landscape-painting from nature with an earnestness and determination very unusual, making an encampment in a hut on a Yorkshire moor in order to study foreground and changes of effect with the scene constantly before him; and subsequently settled on the shores of Loch Awe with the same object, of living amid the scenery and studying it continuously. Yet the interesting and characteristic books in which he described his life and experiences in both these quarters formed apparently the only real success which he obtained from the experiment. We never happen to have seen any of his paintings; some few we believe have been exhibited; but he at all events

never obtained a reputation through them, as a painter. In the course of two very interesting letters which he received later in life from Mr. Peter Graham, extracts from which are given in the biography, his correspondent pointed out what he believed to have been Hamerton's real stumbling block, viz.: that he had attempted a special branch of art without having had the requisite broad training in painting generally. In the second letter Mr. Graham wrote:—

"I think it unfortunate that you 'learned painting with a clever landscape-painter.' You probably far excelled him in sympathy with nature, power of observation, and all the gifts especially required for a landscape-painter. What you really needed, study under a figure-painter, or better still at an academy, would have given you. Landscape nature is too complicated to be a good school to acquire the mastery over the mechanical difficulties in art."

This is an admirable piece of advice which we quote the rather as it is worth the attention of all art students. Again, Hamerton acquired a thorough and even exceptional knowledge of the technical processes of etching, and produced what is far away the best and most instructive book on etching in the English language—it is in fact the book *par excellence* on the subject; and yet the only weak points in the book are the one or two etchings of his own introduced among the illustrations. And we get some insight into the reason of this from a passage in the memoir:—

"His main fault, as I thought, was attempting too much finish and effect, and I used to tell him so. He acknowledged that I was right, and when taking up a new plate he used to say playfully—'Now this is going to be a good etching; you don't believe it because you are a little sceptic, but you'll see—I mean not to carry it far.' Then before biting he showed it me with 'Look at it before it is spoilt.' It was rarely spoilt in the biting, but by subsequent work. Many charming proofs I greatly admired. 'Oh! this is only a sketch, you will see the improvement when I have darkened this mass.' Then I begged hard that it should be left as it was, and I was met by arguments that I could not discuss—'the effect was not true so,' 'the lights were too strong,' or 'the darks too heavy,' 'but very little re-touching was necessary,' and it ended in the pretty sketch being destroyed after having been re-varnished and re-bitten two or three times. When it was no longer shown to me, I was aware of its fate."

Hamerton was in fact a kind of victim to a foible which is peculiar to a certain sane class of clever and ardent men, of being taken up with perfecting the means rather than looking to the end to be attained. This

* Philip Gilbert Hamerton, an autobiography, 1834-1838; and a memoir by his wife, 1858-1894. London: Seeley & Co.; 1897.

peculiarity seems to have run through everything he did, except literature, and perhaps he was only saved from it in literature by the absolute necessity that came upon him later in life of producing books that would find a market, and finishing them in time for the publisher's demands; for unfortunately in later life his circumstances were much straitened (partly from causes over which he had no control), and he had to write for a living. Whenever a new picture was projected, there must be a new purchase of painting materials, always far more than were required for the work, to provide against accidents. A special cart or gig was designed and built for taking his painting materials about the country in the most complete assortment. He had a passion for boats and boat building, either with his own hands or under his own direction, but was never satisfied with the last boat, and had hardly finished before an improvement occurred to him to be put in practice in a new one. During the Loch Awe days two workmen were got over to build a larger boat than any before, at a time when the expense could ill be afforded, and when he was in fact very anxious about future means of livelihood, on the plea that it would be an economy in the long run, as the boat would take them and their things about much more conveniently, and save the occasional hire of conveyances or boats for special expeditions. All these things ran away with money without producing any compensating result; and his wife, whose memoir shows a touching combination of unvarying affection for her husband with a clear perception of his little weaknesses and peculiarities, obviously was made very anxious and uneasy by this impractical side of his character. As is sometimes the case, he combined with this continued expenditure on *matériel* which at the moment was not really necessary, an exaggerated passion for perfect order and system in his life. There were prescribed hours for doing this and that, there was a place and a pigeon-hole for everything. An amusing instance of this is given in the anecdote of a friend at the house who asked for a bit of string, and was directed to the pigeon-holes. He easily found the one labelled "String," but the string was too coarse for his purpose. "Look above," said his host. He did, and there saw another pigeon-hole with the label—"String (thin)."

It is curious that the first book which made a real success and got Hamerton's name widely known was one which had little to do with art, the one entitled "The Intellectual Life," and which appears to us to be his weakest book, though there was rather a new idea in it, and it appealed to a larger circle of readers than some of the others. But his really valuable work consists in his art criticism, using the word in its widest sense. His own practice in painting and etching, if it did not make him an artist himself, gave him an acquaintance with the processes and the difficulties of those arts which was most valuable to him as an art-critic. But the most valuable quality of all in his criticism was its entire independence of thought and taste. He was entirely aloof from, or above, any of the current fashions in art-criticism; he took his own view of things, and in several instances may be said to have almost alone spoken the real and sober truth on subjects on which there was a great deal of popular exaggeration on one side

or the other. His "Life of Turner," first issued in the *Portfolio*, was remarkable for its calm and thoughtful judgment of Turner as man and artist; not without enthusiasm, but entirely free from extravagant adulation. He was for some years art critic to the *Saturday Review*, in the days when that publication was something of a power; and the value attached by thoughtful writers and artists to these criticisms is exemplified by a letter written to him by M. Véron, on the appearance of a review of his book "Esthétique," which he evidently immediately supposed could be by no other than Hamerton:—

"On me communique une revue très remarquable de la *Saturday Review* sur mon *Esthétique*. Ce qui distingue cet article c'est une sérieuse connaissance du sujet et une puissance d'analyse des plus rares. Cela ne ressemble en rien à ces généralités vagues et flottantes dont se contentent la plupart des écrivains que fait la critique dans la revue des journaux. . . . Cet homme, je suppose que c'est vous."

The *Portfolio*, which was his own special foundation, set up a higher standard of Art-periodical than had before been seen in England; it is to be regretted that it seems rather to have languished since his death.

Though Hamerton had never attempted the practice of architecture as he did that of painting and etching (we feel quite sure he would have done so had he found time and opportunity), the practical turn of his mind, as evinced in his boat-building work, probably gave him a better insight into the practical side of architecture than is possessed by most non-professional men; and at all events the architectural criticisms and articles which he produced are as remarkable for insight into and sound judgment on the aesthetics of the art as his criticisms on painting. From one passage in the autobiography it appears that he had at an early age a great love for architecture, and that he also experienced that curious feeling as to the unity of the architecture and the music during a church service which affected Viollet-le-Duc at a still earlier age. The passage in which he refers to this is sufficiently noteworthy to quote:—

"We were taken to the services in Doncaster old church, which was destroyed by fire many years afterwards. Though not yet in my teens, I had an intense delight in architecture, and deeply enjoyed the noble old building, one of the finest of its class in England. Our pew was in the west gallery, not far from the organ, and from it we had a good view of the interior. The effect of the music was very strong upon me, as the instrument was a fine one, and I was fully alive to the influence of music and architecture in combination. The two arts go together far better than architecture and painting,* for music seems to make architecture alive, as it rolls along the aisles and under the lofty vaults. I well remember feeling, when some noble anthem was being performed, as if the sculptured heads between the arches added a noble animation to their serenity. Even now, the impression received in those early days still remains in my memory with considerable clearness and fidelity, and I believe that the habit of attending service in such a beautiful church was a powerful stimulus to my inborn passion for architecture."

We are glad to see it stated in the memoir that "it was a pleasure to my husband to see that his articles on the architecture of Paris had been so favourably noticed as to bring requests for contributions from the

* There is a reason for this which Hamerton omits to notice. Music and architecture are both abstract arts, which do not imitate anything; painting is an imitative art, in its basis at least.

Builder and *L'Architecture*." We remember making the request, and Hamerton's modest reply, doubting whether he could have anything "to say that could be of value to the readers of a professional architectural journal though he was willing to comply when he had more time at his disposal—a matter which did not unfortunately arrive.

Only Hamerton's intimate friends, probably, were aware of the great difficulties under which in the latter part of his life he carried on his multifarious work. Naturally of a very sensitive and nervous temperament (at an early period of his life he found it impossible to live in cities, on account of the want of quiet), he had become in his late years painfully affected by noise and rapid movement, a misfortune which came to a climax during a journey from Dover to London, when his cerebral irritation became so painful that he had to leave the train at a roadside station, and remain in the country for some time. For long after this railway travelling was impossible for him, though the endurance of it was gradually attained again by trying short journeys in slow trains until he had a little recovered his balance. By his health in latter years was a constant subject of anxiety, partly no doubt from want of sufficient mental rest among the numerous avocations which he continued to pursue so eagerly. He died at length suddenly and unexpectedly of heart disease.

The autobiography, and still more the memoir, leave one with the feeling that with all the interest of Hamerton's various writings, the most interesting fact of all was Hamerton himself. He was a man eminent the reverse of commonplace; of the highest honour, of the most versatile perceptions and interests, full of the keenest love for and enjoyment of all that was beautiful in nature and art. If he did not accomplish the artistic aspirations with which he set out in life, he at least lived a life full of warm emotions and intellectual enjoyment, he came to be loved and appreciated by the best minds of his country in art and literature, both for his writings and his personal character; and, in spite of troubles from ill health and other causes, such a life cannot be called either an unhappy or an unsuccessful one.

MANCHESTER MAIN DRAINAGE.

RULY the problem of the hour for municipal engineers and authorities is that of sewerage and sewage-disposal, and in no part of the country is a solution of the problem more necessary than in South-east Lancashire. The rivers and brooks of Manchester are literally sewers, while the Ship Canal has been forcibly, but accurately, described as a ditch. The labours of the Mersey and Irwell Joint Committee are, indeed, as arduous and appalling as those of Hercules in the Augean Stables. The sewage from innumerable towns and villages, and their refuse from all manner of manufactories, have been allowed to foul the streams so long, that the offenders had begun to think they had a right to go on fouling them for ever, and now consider themselves hardly used because a vigilant and impartial authority bids them cleanse themselves from the error of their ways. Even great Manchester bows before this authority, and attempts to set its house in order.

A long report on the Manchester Main

rainage Scheme and Works was recently prepared by Mr. T. de Courcy Meade, the "City Surveyor," and presented to the Council. It is largely historical, and shows to one reading between the lines—how difficult it has always been to extort money for sewerage works. Undoubtedly the Arabian method of delay has its advantages; any rate, the dilatory authority saves interest on the deferred expenditure, and profits by the failures of those authorities which are Quixotic enough to make haste to keep their streams pure and their people healthy.

Thirty years ago the prevention of floods in Manchester seems to have been a more pressing problem than the purification of the rivers, and somewhat curious powers were obtained by the Council in 1865 in order to increase the flow of water in the River Medlock. It appears that the riparian owners did very seriously reduce and obstruct the bed of the river, and the Corporation was empowered to execute various works for the improvement of the river, and to recover from the riparian owners two-thirds of the cost. The actual cost of the River Medlock improvements was 30,000*l.*, and of this sum little more than 18,000*l.* was recovered from the Corporation—a salutary lesson to riparian owners in Manchester and elsewhere. The improvements, however, were not sufficient to prevent the recurrence of floods, and in 1874 Mr. J. G. Lynde, the City Surveyor at that time, recommended the construction of a tunnel 20 ft. in diameter for the conveyance of sewage and storm-water; a larger size—namely, 34 ft. wide by 21 ft. high—was subsequently suggested by Mr. Lynde, and adopted by the committee, but on reference to the Council, in December, 1874, the scheme was referred back to the committee "with a view to their reporting a matured scheme, providing not only for the safe passage of the storm-water of the valley of the River Medlock, but also for the complete interception of the drainage of the city." This was the commencement of the Manchester Main Drainage Scheme, or other schemes. Two years later a report by Mr. Lynde and Mr. Bateman (who had been associated with Mr. Lynde in the work) was presented, but the Council was not by any means eager to act upon the report when it had been presented. Two years, at any rate, had been satisfactorily passed without any expenditure except for surveys and plans. Three more years were spent in fruitless negotiations with neighbouring Local Authorities for the purpose of agreeing upon a combined scheme. Meanwhile, Mr. Lynde had resigned, and Mr. John Allison had been appointed in his stead. In 1880

Mr. Allison thought it advisable that the sewerage works of various important towns should be visited, and that year and the next were agreeably spent in visiting Bradford, Leeds, Darlington, Carlisle, and Nottingham. The year 1884 was occupied by a sub-committee in the same manner. Ten years had thus elapsed since the Council, with such a show of sanitary enthusiasm, had snubbed the Committee, and instructed it to prepare a "matured scheme." Neither the Council nor the committee was in any hurry. Sewage schemes take a long time to mature. In 1885 the committee reported the results of the visits to various towns, and received authority "to make further inquiries," and in the following year

Mr. Allison presented a report on the proposed main drainage scheme, together with plans showing some alterations from the original scheme, partly necessitated by a considerable increase in the area of the city. Mr. Bailey-Denton was consulted, and advised some further modifications to be made, and in April, 1887, thirteen years after the Council's memorable resolution, the committee recommended that the modified scheme be carried out at an estimated cost of half a million; and the Council adopted the report. But not until 1889 was the approval of the Local Government Board given to the scheme, or the Rivers Committee instructed to commence the work.

Fifteen years had passed, the rivers becoming filthier every year, and not a yard of main sewer had been laid. The committee had not been unduly or officiously hasty in maturing the scheme. Then the Ship Canal complicated matters, and delays were caused in 1890-93 by the inclusion within the city boundary of numerous out-townships, and more money had to be borrowed in 1894 for the additional sewers.

In February, 1894, Mr. Allison died, and a few months later was succeeded by Mr. Meade.

Then came more alterations, and (in 1895) an overhauling of the sewers which were then in course of construction. This, perhaps, is one of the most interesting and instructive portions of Mr. Meade's report. Sewers were found to have been built of 4½ inch brickwork instead of 9 inch. Bricks had been laid without mortar. Ordinary bricks had been used instead of Staffordshire blue bricks. Bricks had been used instead of stoneware invert-blocks. Thousands of pounds' worth of work had been scamped, and had to be re-executed by the various contractors at their own cost. In one contract for over 2,418 yds. of sewer, no less than 1,413 yds. had to be taken out and reconstructed by the contractor. The underdrains of the filter-beds were found to have been "most improperly constructed, no attention having been paid to either the lines, levels, or specified method of laying," while the concrete effluent carrier had been made with "much less than the specified quantity of cement." The contractor was compelled to re-execute the work, and at length, after "considerable trouble, inconvenience, and seventeen months' delay," the committee obtained just value for its money. It is such disclosures as these which lead men to say hard things of the contract system, and to advocate the execution of work by municipal authorities themselves, without the intervention of a contractor.

The sewage (about 15,000,000 gallons daily) is conveyed to Davyhulme, and there treated with milk of lime and green copperas, from 5 to 10 grains of each per gallon of sewage. Precipitation takes place in eleven tanks, each 300 ft. by 100 ft. by 6 ft., and a small portion of the effluent is passed through land which has been drained and laid out for filtration purposes. Clearly the area of land is utterly inadequate for the quantity of sewage treated. Recently Mr. Meade recommended the construction of an effluent sewer sixteen miles long (to a point in the Mersey Estuary about three miles on the Manchester side of Runcorn), in lieu of attempting to filter the effluent. This proposal was adopted by the Council, but at a

recent meeting an amendment was carried to the effect that the Council is of opinion that the obligations of the Rivers Committee will be fully met, and no public injury will accrue, by the proposed effluent conduit terminating in the river Mersey in or near the township of Thelwall, below Woollaston Weir. This weir is about three miles above Warrington, and is the highest tidal point of the river. Two reasons have weighed with the Council in making this change, the first being the usual economical one, and the second the fear that Warrington would object to the reduction of water in the river which would be occasioned by discharging the important volume of sewage effluent below that town instead of above it, as at present. But has it not occurred to the Council that Warrington may object to an avowedly impure, unfiltered tank-effluent being discharged into the river close to its gates? And will not the Mersey and Irwell Joint Committee have something to say about the matter? In the matter of sludge-disposal, Manchester is about to imitate London and Salford by carrying it out to sea in barges.

It must be gratifying to the inhabitants of Manchester to know that the long-delayed system of sewers is approaching completion, but it must also be disappointing to be compelled to admit that, notwithstanding the advice of expert engineers and chemists, the problem of sewage-disposal is practically as far from satisfactory solution as ever.

NOTES.

THE debate last week in the House of Commons upon the subject of the dispute between Lord Penrhyn and his men was practically useless. It did nothing whatever towards ending the struggle. It was, perhaps, however, not altogether valueless in throwing some light on the working of the Conciliation Act of last Session. It is obvious from the tone of some of the speakers that Government interference will be resented, and it is clear that the Board of Trade will have to be prepared for a good deal of ill-natured criticism when they endeavour to mediate between parties who are not reasonably minded. In the case of the London and North Western Railway, each side in reality welcomed the intervention of the Board; it enabled each party to give up a position which it should not have taken up. But Lord Penrhyn equally clearly resented the Board of Trade taking action; and we are inclined to think that the Department, when they saw how opposed Lord Penrhyn was to their attempts, would have done well not to have pressed the matter further. It is doubtful, also, whether their sensible proposal that a representative of the Board should be present at a meeting between the opposing parties was within the terms of the Conciliation Act. But it was a reasonable and well-meant offer, and should not have been rejected by Lord Penrhyn in the very bad tone in which it was.

THE first Order under the Light Railways Act has been secured by a Railway Company, thus realising the anticipation that the existing lines would be among the first to benefit by the new legislation. The Order is for a single line to connect Basingstoke with Chawton—a village situated about two

miles from Alton; and as it will pass through districts at present five or six miles from any railway station, it should prove of considerable service to the inhabitants. Further southward there are villages in Hampshire—such as Warnford and West Meon, places of importance in Saxon times, but sparsely populated now—which are still eight or nine miles from a station. At the statutory inquiry, held last week at Basingstoke by Lord Jersey's Commission, it was stated that the estimated cost of the proposed line was 66,700*l.*—which works out at about 5,500*l.* a mile. This is a sufficiently heavy figure to cause local bodies to consider well before embarking in similar enterprises, but no higher than was estimated by competent authorities during the debates which preceded the passing of the Act. After all, the working of these lines is, perhaps, likely to prove more successful under the direction of a railway company than if controlled by a body having no previous experience in this direction, and with fewer opportunities for economy in the matter of equipment after the railway has been constructed.

In the last issue of the *Éphéméris Archaologiké* (1896, 1 and 2), M. Tsountas publishes

a monument which, as regards the history of art, is only second in importance to the famous Vaphio cups. The monument in question is a painted stele discovered in one of the tombs recently opened in the lower city of Mycenæ. The stele is covered with a coating of white stucco, on which the paintings are executed in colours, still vivid—yellow, blue, red. The design is in three tiers, of which the topmost one has unfortunately almost disappeared; but enough remains to show that three figures were represented seated on sort of thrones. In the middle tier are five warriors marching. They brandish lances in their right hands, and their bodies are completely protected from neck to knee by huge shields of the pattern seen on the Mycenæ vases published by Furtwängler and Löschke (plate 43). In fact, in pose, dress, and accoutrements the figures of these two designs are closely analogous. On the third are figures of deer. The difference of the shape of shields between those described by Homer and those found on Mycænæan objects is, it will be remembered, one of the chief arguments on which Professor Ridgeway relies in his paper recently published in the *Hellenic Journal* (xvi. i.) under the title "Which People Produced the Objects called Mycænæan?"

THE Société Archéologique of Montmartre is organising what will prove an interesting museum, containing whatever can be collected in relation to Montmartre, its history and its monuments. It is being installed in the new Mairie of the XVIII. Arrondissement, and includes a number of water-colours, engravings, and photographs of picturesque corners of the hill, as well as remains of sculpture and architectural detail, dating even from as far back as the Merovingian epoch; old pottery, jewels and insignia, and a collection of portraits of all illustrious "Montmartroises." This will not only be a collection of great interest in itself, but it is hoped that it may also suggest the formation of similar collections illustrating the history of other ancient quarters of Paris.

The "Union Artistique," Paris.

THE club called the "Union Artistique" has just opened its annual exhibition, which contains some very interesting works. The majority are portraits; among these may be mentioned particularly a head of a young girl by M. Cormon, a portrait of an old man by M. Aimé Morot, a portrait of a cuirassier by M. Carolus Duran, and one of his best works, and a portrait of the Duc de Doudeauville by M. Bonnat, painted with a breadth and vigour of style which is almost overdone. A figure of an artisan, by M. Roll, and a rather mediocre "Nativity" by M. Gervex, are among other works exhibited. In sculpture, two sketches of heads by M. Puech, a pretty statuette by M. R. Verlet, and a Sphynx by M. Hugues, are the only exhibits of special merit.

Fire Risks at Electricity Works.

MUNICIPALITIES which have taken up electric lighting are at present suffering from what they consider a very real grievance, namely, an increase in the fire insurance rates with respect to central station risks. To such an extent have they excited themselves that a special meeting of the Municipal Electrical Association was convened at the Westminster Palace Hotel on Thursday of last week. Councillor Pearson, of Bristol, read a paper in which he advocated that municipalities should become their own insurers; at first in part until a sufficient sum had been laid by, and then they could take the whole risk. This view was pretty generally endorsed by many aldermen present, and the Borough electrical engineers spoke vigorously against the insurance companies. To listen to them, one would think that the companies had made immense profits out of this kind of risk in the past, instead of having been heavy losers. Instead of abusing the insurance companies, would it not have been far better to have invited some representative of the companies, Mr. Heaphy, for example, and consulted with him in a rational manner as to the best ways of reducing fire risks? If the insurance companies will not insure central station risks at 9s. per cent., it is not because of their ignorance of electricity, but because it does not pay them to do so.

French School at Athens.

THE French School of Archaeology at Athens is to celebrate its twentieth birthday this spring. The occasion is to be marked by an international gathering of classical archaeologists. This is to take place from the 25th-28th of April. M. Homolle, the Director of the School, intends at the same time to celebrate the conclusion of the Delphi excavations, which will then be practically complete. It is to be hoped that he will further mark the occasion by publishing at least some of the results of the excavations. Important inscriptions are given to the public with commendable promptness, but two years have now elapsed, and the interesting sculptures of the various "treasuries" are still inaccessible. The German Institute, to facilitate attendance at this French jubilee, has altered the dates of the Peloponnesos and island tours. The Peloponnesos tour is now to be from April 8-23; the island tour from May 5-13.

Art in Glasgow.

"ART IN OUR CITY" is the title of an excellent address, both in a literary and artistic sense, delivered to the Architectural Section

of the Glasgow Philosophical Society by their President, Mr. P. Macgregor Chalmers, and which now reaches us in a pamphlet form. It contains suggestions for the improvement of the city and for the promotion of the effectual study of art in Glasgow which are well worth the attention of its citizens.

At the instance of Mr. E. Belmont House, Newton, a member of the Hampstead Vestry, the Society of Architects agreed a few weeks ago, with the occupier and owner's consent, to affix a memorial tablet upon Belmont House, Rosslyn Hill, formerly inhabited and, it is said, built by Sir Harry Vane, who was taken thence prisoner to the Tower, as Ludlow relates in his "Memoirs." In Vane House, as it was then named, afterwards lived for many years Dr. Butler, Dean of St. Paul's, and author of "The Analogy of Religion," who two years before his death in 1752 was appointed Durham. By his will of that year he directed that the house should be sold. The next tenant, a Mr. Regnier, divided the house into two; a later tenant, a Mr. Pilgrim, gave name to the adjacent Pilgrim's-lane. The premises have since undergone considerable alteration by way of adapting them for the purposes of the Soldiers' Daughters' Home, removed thither about 1860. Bishop Butler fixed in the windows several pieces of old coloured glass, many of them bearing date 1571, and given to him, it is local tradition reports, by the Pope. Some of the glass which is Flemish work, has remained to our own day. It mainly illustrated Scripture subjects. It has been surmised that this similar glass at Oriol College, Oxford, from the same source, or may have been taken thither from Hampstead after Butler's death. A view of the house in its former condition will be found in the *Gentleman's Magazine*, May, 1828.

The exhibition of Madox Brown's works, at the Grafton Galleries, taken in connexion

with the lengthy descriptive comments given in the catalogue, mostly written by the artist himself, forms a rather curious medley of literary and artistic impressions. Madox Brown's remarks on the scene between Leander and Cordelia (20) are admirable, but they are a good deal more interesting than the picture. And this is the kind of discrepancy we seem to find in many other instances. Madox Brown regarded painting from an intellectual and moral point of view, as the illustration or explanation of a historical scene; he took great pains to understand and to express the facts of the scene, but he too often failed to give natural life and action to it in the picture; the facts are all there, in a way, but they do not coalesce into a pictorial whole. In "The Expulsion of the Danes from Manchester" for instance, the Dane turning and shaking his sword at the inhabitants is a mere stage figure, carefully arranged in a suitable attitude; there is no life or reality in him. The elaborate painting called "Work" is a sermon rather than a picture; pages are written about its intention, but it is an absolute failure in a pictorial sense. Madox Brown's real successes, among the works exhibited here, may be said to be the "Christ and Peter" (43), "Cromwell at his Farm" (62), "Wickliffe on his Trial" (31), a picture much better in colour than many

thers; "Juan and Haidee" (48), "The last of England" (64), a truly pathetic though very ugly work; and the "Romco and Juliet" (60), one of the most passionate love-pictures ever painted, and effective in proportion. If Madox Brown could have been content to "let himself go" in that way a little more often, instead of labouring to tell a story and point a moral in every one of his pictures, it would have been better for him and for art. Among the small works in the collection the little landscape entitled "Carrying Corn" (26) should not be passed over; it shows a wonderfully true and powerful effect of light.

The Metropolitan Railway. It is satisfactory to find that the Board of the Metropolitan Railway Company are apparently about to undertake in a systematic manner the general rebuilding of their stations. They state that the work which has been done at Moorgate-street will be continued at Bishopsgate-street. We hope that they will make haste to take in hand one of the more westerly stations. Gower-street and Baker-street stations are wholly inadequate for the traffic, and the badness of the station is made worse by the different lighting. The Directors also mention that they are in communication with the Board of Trade in regard to the ventilation of the line, and will co-operate with the Departmental Committee which is about to be appointed. We have no objection to the company making a virtue of a necessity, but there can be no doubt at all that if the Government had not put pressure in the manner they have done on the company, all that would have been done by the latter would have been the making of one or two more vent-holes in the public streets. Considering that the Metropolitan Railway is now in a better financial position, it would be wise and prudent to take some decisive measures towards the better ventilation and better lighting of the stations, and for the improvement of their rolling stock.

Mr. Gilbert on Architecture. It can hardly be said that Mr. Gilbert's paper, or rather short address, at the Institute of Architects on Monday, was equal to the criticism on the subject. Mr. Gilbert seemed to think that a promise to deliver a paper to the Institute was sufficiently met by a short address, not well prepared, exceedingly vague in substance and expression, and of which the chief recognisable point seemed to be that the best architecture had been produced by sculptors who had undertaken to act as architects, while, conversely, architects who tried to be sculptors had been notable failures. We have heard this of our sculptors before; whether it be true or not, it may be a question whether it comes gracefully from the mouth of a sculptor; and Mr. Gilbert's replies to the speakers in a discussion, though very amusing, were somewhat too much flavoured by an assumption of intellectual superiority which occasionally bordered rather closely on pertinence.

ARTS AND CRAFTS EXHIBITION AT CHESTER.— On the 29th ult. an exhibition, under the auspices of the Chester Guild of Arts and Crafts, was opened in Grosvenor Museum, Chester, by the Duke of Westminster. The exhibition comprises specimens of painting, wood-carving, leather embossing, weaving, embroidery, tapestry work, modelling, and dried crafts.

THE ADVANCEMENT OF ARCHITECTURE* : WITH SOME REMARKS ON THE STUDY OF GOthic.

It is now one hundred and twenty-nine years ago since the Royal Academy of Arts was founded by his Majesty George III. It was founded at the request of Sir W. Chambers, his architect, and in the charter granted by his Majesty, and dated December 10, 1768, it was provided that there shall be "a Professor of Architecture who shall read annually six public lectures, calculated to form the taste of the students, to instruct them in the laws and principles of composition, to point out to them the beauties or faults of celebrated productions, to fit them for an unprejudiced study of books, and for a critical examination of structures."

At that time, the tide of the Italian Renaissance was still flowing, although there were slight signs of reflux in the growing admiration for Gothic. Horace Walpole altered Strawberry Hill in the Gothic taste in 1750, while, in the very year of the Royal Academy's foundation, Milizia published his lives of the architects, in which the works of Palladio were held up as the standard of taste. The Dilettanti Society, in 1762, published the first volume of Stewart's "Antiquities of Athens," and subsequently the "Antiquities of Attica and Ionia," and is, I believe, still publishing works on Greek architecture. At any rate, the researches of Pullan on the Temples of Apollo Smintheus, of Bacchus at Teos, and Minerva Polias at Priene, or one at least, was published in the year 1831.

Wilkins published his "Antiquities of Magna Græcia" in 1807, Inwood the "Erechtheum at Athens" in 1827, Penrose the "Parthenon" in 1847, 1851, 1888. Sir C. Fellows published his works on Lycia, Caria, and Lydia, in 1839-1847; J. Pennethorne "The Geometry and Optics of Ancient Architecture" in 1878, Sir C. Newton and Pullan on the "Discoveries at Halicarnassus, Cnidus, and Branchide" in 1862-3; Cockerell and Donaldson their supplements to Stewart's "Athens" in 1830, and Cockerell his "Temple of Jupiter Paubellenius and Apollo Epicurus" in 1850; and in the same year Falkener published his "Classical Museum," not to speak of foreign publications. I need hardly speak of Hittorff's Restoration of the Temple of Empedocles at Selinus, 1851, nor of Abel Blouet's scientific expedition to the Morea and to Macedonia, 1831-1838.

There is no task more difficult than that of unravelling the causes of certain movements among mankind. And this is even more difficult when it is a purely intellectual movement. We speak of the Renaissance as if it were a change of taste that could be as precisely dated as a revolution or a battle, while it had been led up to for centuries, and we can only be certain of its existence and preponderance long after it had begun. In this case of the Greek movement, one prime factor in it was the enthusiasm of Winckelmann, who began to write on Greek sculpture when he was at Dresden, and afterwards published his history of ancient art about the middle of the last century, and he found sympathisers who had come to much the same conclusions before he wrote. From attention being called to the perfection of Greek architecture in 1762 and subsequently, a wave of Greek taste swept over most of the countries of Europe. The Elgin marbles were purchased by the British Government, and placed in the British Museum in 1816; even children who saw them were struck by the beauty of the Panathenaic frieze, and doubtless this revelation of beauty to the public prolonged the call for imitation Greek architecture.

The admiration, however, of Gothic increased in England partly owing to Sir Walter Scott's novels, and partly to the efforts of such men as John Britton, Rickman, the second Pugin; and to the enthusiasm of the Ecclesiastical and other societies. This admiration became so prevalent as to strongly influence public opinion, so that in 1840 it was determined that the Gothic style should be adopted in the new Houses of Parliament. Even before this, the very champions of Classic architecture were so affected by the increasing admiration for Gothic that the great Wilkins himself dabbled in it, and Sir James Pennethorne and Professor Donaldson tried their hands at it. Decimus Burton, once a well-known Classic architect, who persisted in his creed was so far forgotten that, when

* Being the first Royal Academy Lecture on Architecture this session. Delivered on the 29th ult. by Professor Aitchison, A.R.A.

he died a few years ago, his name and works were almost unknown.

A passion for the study of Gothic spread largely in society; antiquaries, clergymen, undergraduates, heads of houses, and other amateurs; architects, as well, employed their spare time and holidays in making notes on Gothic buildings in England and abroad, measured and drew out the mouldings of different dates, and a few of the more learned endeavoured to solve the mysteries of Gothic construction. In 1841 Professor Willis read an admirable paper at the Royal Institute of British Architects, called "The Construction of the Vaults of the Middle Ages," really a treatise on Gothic stone-cutting, greatly admired abroad, and still studied by architects in this country; while the Gothic flame was still burning, fanned by Mr. Ruskin. In 1854-68 was published by that Cuvier of Gothic architecture, Viollet-le-Duc, his "Dictionary of Architecture," now of world-wide celebrity, which may be said to have completed the Gothic conquest. Casts of figures and foliage from the Gothic cathedrals and churches were collected at the Architectural Museum, and masons were encouraged to copy them; while during the professorships of Scott and Street at the Royal Academy Gothic was pronounced to be the only true architecture in the world; and that eccentric genius, W. Burges, was never tired of advocating its universal adoption. Casts of Gothic figures and foliage were collected at the South Kensington Museum and even at the Royal Academy. There was a long struggle between those who were getting their living by paraphrasing Classic and Renaissance buildings and by those paraphrasing Gothic buildings; bard words were bandied about, and "Pagan" and "Papist" were affixed by their opponents to the rival practitioners. A truce was at length concluded, and a practitioner was allowed to paraphrase Classic, or Gothic, or both, without having an offensive epithet bestowed on him. Students were allowed to compete for prizes at the Royal Academy, and at the Royal Institute of British Architects, in either style, much to the disgust of those brought up in the belief that Renaissance was the only admissible style.

Owing to the large increase of travelling, the publication of architectural works, and the multiplication of photographs, the desire for novelty, and the absence of any proper teaching, all phases of architecture from Greek days downwards, if we except the Egyptian Hall and Angelo's School of Arms, were in turn adopted. This produced two results. The first was this: that the public looked on architects as persons keeping an architectural costumer's shop, at which colourable imitations of every past style could be procured. The public still believes that Gothic has a stronger ecclesiastical flavour than any other style, and that Renaissance is more adapted for municipal buildings; so it has a Gothic architect for its churches, and a Renaissance one for its other buildings. Some of the wealthy and some of the eating-house keepers occasionally desire their rooms to form an architectural pattern book, each room being of a different style or phase of a style, a Gothic chapel, a Græco-Roman hall, an Elizabethan dining-room, a Louis XIV. drawing-room, a Louis XV. boudoir, an Early French Renaissance morning-room, a Roman library, and a Moorish smoking-room, with perhaps a Chinese, Indian, and Japanese room thrown in. The other result was that thinking men interested in architecture began to ask themselves what architecture was, beyond designing habitations or shelters for men and animals, factories for making goods, warehouses for storing them, and shops for selling them; why the buildings of certain countries, and at certain epochs, had always been admired; why the shapes and details of buildings at successive epochs were so different from one another; and why at so brilliant a period as this of the nineteenth century, when men's minds are so active and so restless, nothing but paraphrases of bygone styles were to be met with, even in important buildings. They soon saw that some of the differences in past styles were brought about by the greater number of men's wants, and by the greater complexity of society; that some were owing to an increased knowledge of materials and of their powers, and to advancement in the art of building. A good many thought that when every part of a building exactly answered its purpose, and when every redundancy had been pared away, and each part took its shape according to the work it had to do, an architecture would arise of itself without further trouble, more wonderful, more perfect, and one that caused more exalted emotions than any that the world had seen; but it became

apparent that this was a wrong hypothesis. The wonderful iron structures of our engineers have surpassed all that was done before in the world in a scientific direction, without regard to anything but cheapness and utility; but nearly all their works are unsightly, and many of them are hideous.

It is just possible that if this hypothesis could have been perfectly carried out, it might have given the true solution; for we believe Nature makes her organisms in the best way and with the least possible material, while most of her works are beautiful. But we have not got her materials, her knowledge, nor her skill, and we are not sure, either, that she does not aim at beauty. Still, I think that most of our minor problems point to a solution in this direction; but the major problem seems to me to wholly depend on man, for it is not the purely necessary problems that are alone to be solved, but the proper emotions that should be excited, by the sight of the building. Solemnity, adoration, and thankfulness should be evoked by a temple; majesty by a building for legislation; awe and apprehension by law courts; dignity by buildings for public offices, great officers of State, and magistrates; magnificence in the mansions of merchant princes and great manufacturers; grace and delightfulness in theatres, concert, and fine-art exhibition rooms; comfort and comeliness in the houses for ordinary citizens; while the grimness of a prison should excite repulsion and terror; but beyond these master emotions, we want each part to exhibit the æsthetic cultivation of the day, and show not only the mastery of the architect, but the knowledge, the care, and the skill of the workmen.

The lessons of how these various emotions are to be raised must be learnt from those buildings of former times which show how cognate emotions were excited. The rest depends on the genius of the architect and the cultivation and aspirations of the best of the public.

A perfect architectural monument has much more human interest given it by sculpture and by figure painting than by pure architecture, while fine monumental colouring is another source of delight. Sculpture and figure-painting have for their highest models the most physically perfect human beings. If the figures created by these artists will not harmonise with the architecture, the architect must look to it; for his art is then below that of his brother artists, and the completed monument is patchwork. The serenity of high ideal sculpture or painting will not harmonise with coarse Romanesque nor with tormented Gothic; so you see that it does not depend on the will of the architect to adopt any past style he chooses, but the style is evolved from the necessities of the case. The rude figures of the Solomon Islanders would be as much out of place in the pediment of the Parthenon, as the Panathenaic frieze would be in a Norman cathedral.

I do not address you as persons anxious to get your living, and naturally the best one possible, by the exercise of a respectable calling, but as poets in structure, who not only hope, but desire, that the monuments you erect will call forth admiration and delight in the cultivated, hundreds or thousands of years hence, and who spare no study and no pains to ensure this result. What Milton says of fame is true; it is "That last infirmity of noble mind." If you feel the divine power within you, that will enable you to delight millions yet unborn, you feel that fame is but an unimportant accident. You must, however, not only "scorn delights, and live laborious days," but you must study as the poets have studied, and see how your predecessors learned to evoke the emotions that now delight you.

As I have addressed you as poets in structure, it will not be amiss to see how the poets in words inspired with the divine afflatus, have learned the elements of their art. Take Dante, or Milton, or Tennyson, and see how they studied all the best poetry of the past and of the present, how they mixed among mankind and studied the emotions of those around them, how they translated or paraphrased the poems of other times and of other tongues, to get their hand in and to learn their art. Some of you may object that such transcendental poems as Shakespeare and Burns had but little learning. You may be sure that both of them deplored it, and endeavoured to make up for their deficiencies by learning all they could from ancient story, from ancient poetry, and from contemporary work, and by the constant and piercing observation of the persons and things around them and by repeated efforts, make their works immortal. In our own art we see Brunelleschi, who was to become the great architect of his day, working as a journeyman goldsmith at Rome, so

that he might measure and study the Roman ruins, and obtain from them constructive and æsthetic knowledge. In our own day we have seen Alfred Stevens getting his living by designing grates, tiles, and fire-irons, while he was learning to be a great sculptor, a painter, and something of an architect. Remember that above all things architecture is a structural art, and that all that you can do is to build; by that you must show your knowledge, your skill, and your aspirations, your manners and your morals, and as an architect, by that alone. You can, of course, avoid the study of tactics by getting examples of what has been done before, and keeping well within the old lines, but this is not what the Roman, the Byzantine, or the Gothic architects did; their aim was to outstrip their predecessors. It is not the method our engineers have adopted whose works are the wonder of the world; they learnt as much as was necessary of that part of science that underlies their practical work, and taking iron as their material, have immeasurably surpassed all that was done before them in construction. They never would have done this if they had merely feebly copied the engineering works of the Romans. All the sciences have so far progressed that the knowledge of them amongst the ancients is only mentioned in archaeological treatises. The mechanicians who have perfected the steam engine, invented the locomotive, the spinning jenny, the power loom, and the lace weaver, laugh to scorn the childish machines of the ancients; the artisanists are not contented with balista and catapults; the astronomers are not humble students of the Almagest of Ptolemy, but have discovered that the earth is a small planet revolving round the sun, that the laws of gravity control all the celestial bodies in the visible universe; and have learnt that most of the substances found on earth exist in the sun. Nor do geographers speak much of the knowledge of the earth to be found in Homer and the Pentateuch, or in the works of Strabo, and Pomponius Mela.

In art, however, there is a very different story to tell. The arts may be said to appeal to the emotions through the eye and the ear, and the accumulated knowledge of them does not help us beyond a very limited distance. When accurate modelling has been attained, there is little more to be learnt except how to create ideals that are, in certain respects, more perfect than the average human being. In drawing, when form can be exactly copied, and when that knowledge of perspective, called fore-shortening, is attained, there is but the composition of line and grouping to be added; the rest depends on the imagination of the artist, whether it be to create allegorical figures, or scenes from the past. In colour there is the harmonising and contrasting of the different tints and tones to be attained, and the choice of those most appropriate to the subject of the picture, and the imitation of such subtlety of mixed colouring as is found in the nude human form.

We have no reason to believe that after the Greeks had cultivated gymnastics the human form has improved. Landscape painting may have improved, as the forms and laws of inanimate nature are better known and observed, but we have no reason to believe that the beauty of inanimate nature has increased. Ordinary emotions have become more complex, but this can hardly be the case with the grand ones, such as æsthetic joy, heartrending grief, terror, and despair. Is eloquence, wit, humour, or pathos, more common or more forcible than in the best ages of Greece? I think almost the emotions, being now more complex than of yore, have become more difficult to portray, so that if the modern artists portray them with an effect equal to that attained by the great Classic artists, they must be greater men.

Music is said to have progressed, and if so, it has a merit beyond the other fine arts; but, not being musical, I cannot judge. Some of the musical critics still hold that for evoking religious emotions the Gregorian chants are as yet unsurpassed; so it may be that Aristoxenus is superior to the modern composers as the Classic artists are to those of modern times; supposing that he was a composer as well as a writer on music.* Drowning, Tennyson, and Mr. Swinburne, though they studied the Greek and Latin poets, are not mere humble imitators, but have tried to embody the vicissitudes and emotions

* The modern art of music can hardly be said to have begun till the fifteenth century. Since then it has progressed and developed, and some of its decisions, very much in the same kind of sequence followed by the art of painting two or three centuries earlier. There is nothing exceptional about its position. What was called "music" by the Greeks was a totally distinct thing from the modern art of music as we know it.—Ed.

of the present day in their verse, in the hope that their poems may hold their own in comparison with the masterpieces of the past, if it surpass them. We hope the assertion is no longer true that

"Old poets outsing and outlove us,
And Catullus makes mouths at our speech."

A poet only can give us a chance of testing the truth of this saying; he alone has that accurate knowledge of the value of his own tongue which we all try to attain, and the gift of harmony and rhythm. Few have that intimate knowledge of Greek and Latin that would enable them to judge of the relative excellence of classic poetry. J. D. Swinburne would confer on us an inestimable boon if he would give us in his verse a few translations of the most beautiful passages of the Greek and Latin poets.

It would be amusing, if it were not so melancholy, to see with what a light heart the architectural students treat the master art they follow; every one of whose three or four branches—transcendental, *i.e.*, each one may take a whole life of a man to master, and require genius as well, to enable any one to surpass the ancient masterpieces—I mean planning, construction, proper emotional excellence, a healthfulness; yet after three years passed in an architect's office each student feels himself competent to practise if his friends can get him work. Sir John Soane's retort to a young architect is apposite. The young architect said, "I ought to understand architecture, for I was articled to it for seven years." "The time takes to make a cheese-monger," was the reply.

When I see the long hours and the long years devoted by artists to drawing or modelling human figure and to the study of anatomy, a knowledge that even then he has but the elements of his art, and may want the divine gifts that are required to make an artist, I am almost despair at the prospects of architecture; still there is hope for the future in the fact of architectural students having their eyes opened to their own ignorance, which, through the teaching of the Architectural Association, they are trying to dispel. I was pleased to see a young architect working out models of masonry at the schools of the Associated Guilds in Titchfield street. I am doing my best to dispel from the students' minds the notion that the paraphrases of dead styles, is architecture, that it is more than the means of learning how to express themselves architecturally.

Sketching in perspective is no doubt a charming accomplishment, and the young men of the present day have progressed wonderfully in it; but art, and though it is not without its value as a means of cultivation, still it can never teach the architecture. When I look at the sketch-book of Willars de Honcourt, the French architect of the thirteenth century, I see that he was a man who could sketch but poorly; at whose efforts accomplished draughtsman of the present I would laugh; but Willars could design a cathedral, and see it properly carried out, and he could do so well that he was sent for to Hungary to build one there. The art of sketching is like making a coloured sketch of the painted decoration on the soffit of a vault, useful enough as a memorandum of the excellent effect produced, but affording no information as to how the effect is obtained; to get that information, the student wants a scaffold to see the actual colours used and the methods of using them, to produce the desired effect one or two hundred feet from the eye.

Although Greek architecture is the most perfect the world has yet seen, in which everything was studied with endless labour, and treated with supreme ability, so that a whole building, each part, answers as perfectly to the intention of the architect as the strings of a fiddle respond to the hand of the musician, it is absent without effect in this dull and misty climate; least for the greater part of the year, and the brightest sunshine never produces the rest obtained in its native country. In Greece sunshine plays endless symphonies on it from daylight to dark.

It is doubtful if we can ever again have such complete simplicity, owing to the number of modern wants, and the complexity of modern society; still, let us study it deeply, and take heed the lessons it so strongly enforces, of aiming at simplicity if we hope to attain the sublime. Every architect feels that he could design the Parthenon, if it had not been done before; though in this respect he is absolutely mistaken for to attain elegant simplicity is the most difficult as well as the highest achievement in art. To make architecture simple and expressive

nd lovely when loveliness is wanted, is the aim of most architects, and should be the aim of all; but for the architect to find out how to attain this in his particular work is the greatest difficulty, involving as it does the greatest efforts, as well as supreme genius. In comparing Greek with modern architecture it may be said:—

"We shift and bedeck and bedrape us,
Thou art noble, and nude, and antique."

Some pessimists say we can do nothing but paraphrase until the present civilisation of the world is submerged by a flood of savages; yet surely this is not a necessary consequence. We see that the Romans, when almost effete, when cruelty and corruption seemed hardly able to go farther, managed to develop a style that equalled, if it did not surpass, the best work done in the Gold and Silver Ages of the Empire. This fact alone ought to banish despair. Let us all combine our efforts to set architecture on its feet again, and if we can do this, I think we may be sure that the new phase of architecture that results will be a credit to our age and to our country. We should recollect that we are still, in the main, a courageous, honest, industrious, and enterprising people, and I hope we are also beginning to be a tasteful people, and may hereafter make the boast of "erikles that we love the beautiful." Wealth is the result of the virtues I have enumerated, and we should neither deery nor abuse this wealth, but learn how to use it properly for the instruction and delight of the world and for the honour of our country.

I have touched, in former lectures, on the merits and peculiarities of Greek, Roman, Byzantine, Saracenic, and Romanesque architecture, and I now propose to give you some remarks on Gothic, not as Mr. Ruskin once said, "to put into a storehouse for use, but into a gallery for study." I think it will not be amiss now to show you some masterpieces of Romanesque and Gothic after the Parthenon, for all subsequent architecture is a lineal descendant from the Greek.

I think, nowadays, few will deny that, though Gothic is very far from having attained the perfection of Greek architecture, even if it attained to the dignity of Roman, it has been able to raise emotions of, perhaps, a loftier sort than those raised by any other monuments; it has given us lessons in composition that, at least, are different from those to be learnt from any other architecture, and has shown to what perfection construction in stone may be carried. One of the aesthetic triumphs of late Gothic is the effect produced by pierced work in stone, which is certainly different from anything west of India, and it made another stride in the logic of building. The Greeks, and the Greeks alone, studied how to gain the utmost effect in their buildings from brilliant sunshine in a clear air; every moulding was adapted to that end with a perfection that indicates the most profound study corrected by experience and failure. The Gothic architects had neither the clear air nor the brilliant sunshine; as a rule, the atmosphere in which they built was always more or less misty, and their sunshine, where they had any, was feeble; so they set themselves to work in the most logical way to see how effects might be obtained in the mist by deepening shade, by strongly accentuating the parts that took the light, and by perfecting outlines to be seen against the sky.

That severe restraint that the Greeks imposed upon themselves the Gothic architects were not cultivated enough to practise, even supposing that they were sensible of the matchless beauty of Greek architecture, which is most improbable; for, apart from their professional knowledge and skill, the bulk of them were probably ignorant and uncultivated men. As late as the fourteenth century, the French architects, the Bons, the designers of the Porta della Carta and the Ca d'Oro at Venice, were merely designated as stone cutters (*tagliatori di pietra*). It is scarcely likely that these Gothic architects, who had at their fingers' ends a new development of architecture, who had surpassed the Romans in the height of their buildings, and had nearly equalled them in the spans of their vaults, and were revelling in intricate geometrical forms, should have been captivated by the massiveness and simplicity of Greek architecture. They probably despised the constructive ignorance of the Greeks and their lack of ornamental geometry, and what they looked on as the absence of interesting detail. The Gothic mouldings were, in all probability, the result of the architects' efforts to gain the effects they wanted in their own climate. If you exclude square mouldings, such as the fillet and fascia,

the Greek mouldings were the bead and torus, the quarter round, the ogee, and the hollow, and, in late work, the Cyma recta; each one infinitely varied, as the case required, but rarely departing from the generic form; and in their best Doric work a very few even of this restricted number of mouldings were used: while in Gothic there were hundreds, if not thousands, of mouldings used in a great abbey church or in a cathedral. It was, there, ore, impossible to bestow much time on their elaboration.

I may here say that I use the word Gothic in its common signification, as the laymen's art that sprang up at the end of the Romanesque period of clerical art, about the middle of the twelfth century, which, for easier recollection, we call the art of the thirteenth century, to its extinction in the early part of the seventeenth century.

I may also say that I do not propose to investigate Gothic archaeologically or philosophically, though both sorts of investigations are profoundly interesting. I am going to treat it practically; that is, to see what lessons we may learn from it for present use. Many get their living by being able to copy or paraphrase Gothic, and though the desire of getting one's living is very praiseworthy, it will scarcely help us directly in advancing the art of architecture, which is the one thing to be most earnestly desired and sought after. I hope I may enlist you in this quest, for surely nothing should be more desired by architects than to see architecture again a flourishing and progressive art, expressing all the main characteristics of the wonderful epoch in which we live, and meeting the desires and raising the admiration of the most cultivated people of this epoch.

When the public realises what architecture does for a nation, even for a town, it will be treated with greater respect, and the architects will be more cherished, admired, and honoured, and will thus be stimulated to make greater exertions. It must be borne in mind that it is an obtrusive art. In a town it meets you at every step, and cannot be hid away like a book, a picture, a statue, or a musical instrument. If it be real architecture, and produces the right emotions that the building should excite, it makes that building at once deeply interesting. It proclaims even in an ordinary street the relative dignity and taste, the occupation, or the liking of the owner—that is, supposing he has had it built for himself; while if it be a public building it speaks a higher or more important office, and in both cases causes admiration for the care, thought, and invention bestowed upon it. At the same time it shows the character and condition of the nation at the time it was erected, and is a permanent memorial of the cultivation of the people. No reflective person can see any kind of architectural monument without it giving him a notion of the people at the time it was built; its gables, pediments, domes, spires, towers, lanterns, and pinnacles diversify the sky-line and give interest to it; it tells of an expenditure of wealth and labour, of skill and invention, and gives us a sort of epitome of what the people once admired. It is full of lessons of the most important sort that we can hardly miss, while many buildings fill us with delight from their beauty. We know little of mediæval times, and we should know much less, were it not that mediæval buildings are dotted all over the country. Architectural monuments may be ruined or pulled down, but except in the case of the very small ones they cannot be moved, and if they are beautiful, lovely, sublime or frowning, they attract persons from all parts of the world to see them, or as students to study them, and when at last, in the vicissitudes of ages, the nation that built them becomes insignificant, or is swept away, they still remain as landmarks to show how rich, powerful, scientific, and tasteful it once was. How little should we know of Egypt, of Babylon, or Nineveh, of Mexico and Peru, and how much less should we think of their former power and greatness, if all their colossal buildings had been destroyed. Should not this reflection appeal to the patriotism of nations, and induce them to foster architecture and to honour the architects? and should not the same reflection stimulate the architects to hand down to remote posterity in enduring monuments the greatness and cultivation of their time?

VILLAGE HALL, ST. NICHOLAS, CARDIFF.—A village hall has been erected, at a cost of 1,200l., at St. Nicholas, on the main road to Cowbridge. Built of Duffryn stone, and covered with red Broseley tiles, the building consists of a hall capable of accommodating 250 persons. The architects are Messrs. Lansdowne & Griggs, Newport, and the builders, Messrs. Horton & Co., Chepstow.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

THE SCULPTOR'S ARCHITECTURE OF THE RENAISSANCE.

AN ordinary fortnightly meeting of this Institute was held on Monday last at No. 9, Conduit-street, Regent-street, Mr. Alexander Graham, F.S.A., Vice-President, in the chair.

The Royal Gold Medalist.

The Chairman announced that the Council proposed to recommend that, subject to the sanction of Her Majesty the Queen, the Royal Gold Medal be presented to Mynheer P. J. H. Cuyppers, of Amsterdam, for his executed works as an architect. It was the opinion of the Council that this year the medal might be awarded to a foreign practising architect. Mynheer P. J. H. Cuyppers was the leader amongst architects in Holland, and, as would be seen from a little catalogue of his works, he had been practising for nearly fifty years, his labours having extended to nearly all kinds of architectural work.

The Chairman also announced that a visit would be made on Saturday, the 6th inst. (to-day), to Peterborough Cathedral. The number of the party was limited to thirty, and twenty-one members of the Council and others had already announced their intention of going. In conjunction with this matter, the Council at a recent meeting passed the following resolution:—"That the Council, having fully considered the matter of the restoration of the west front of Peterborough Cathedral, are of opinion that it would be inexpedient for the Institute to take any public action therein."

Mr. Alfred Gilbert, R.A., then read a paper on "The Sculptor's Architecture of the Renaissance."

Mr. Gilbert said that the subject of his address suggested very much, but his remarks were intended as suggestions for inquiry by his hearers. In the days of the great artists of the Renaissance, art was in her re-birth: it was no age of assertion, but of endeavour; it interested, enchanted, and lured them, therefore, to inquiry. Why were they present that evening to discuss the architecture of sculptors of a past age? Surely it was because they recognised in certain works which held them, which puzzled them, the handiwork of a class of individuals who, though cunning with their tools, were yet children in the use of the T square and the set square of modern times. A study of the methods of those men was refreshing, not to say restful, in these days of hurry and materialism. The very title of his address would be a wonder to most, an astonishment to many, and to not a few an anxiety. Sculptor-architect! Architect-sculptor! Where was the difference?—and yet, what a difference existed! Add the magic word "Renaissance," and the query was almost immediately answered. The sculptor-architect at that period was still alive, but the architect-sculptor—his existence was really not a matter for their inquiry. He probably existed despite the fact that his efforts formed less of a phenomenon than those of his brother craftsman. How came this so-called sculptor-architect into existence? At the memorable period which they were considering, despite the desire to create a national architecture, there seemed to have been little attempt on the part of the architect of the period to realise anything beyond a more or less free revival; of imitation or adaptation of classic models examples were not wanting. The sculptors, though imbued with the same spirit, had fewer examples of the finest in their art. The glories of Phidias were unknown to them, but the source from which he drew his inspiration was open to them daily in their studies from nature in all her suggestiveness. The architects were hard at work as students of antiquity, striving to reascend and imitate, while the sculptors were yearning to create—indeed, to give to future generations the true impression of their own lives and time, and not that of a remote age, with which their admiration and not their actual sympathies were in accord. Was it to be wondered at that, under such conditions, the sculptors of the period should long for licence and liberty, and a larger field for their invention, and that they should venture to essay the provision of accompaniments to their own work, and then, greatly fascinated by the vision of possibilities which had been revealed to them in their endeavours in structural art, should carry their ambition still further to attempt the creation of the very forms they had been called upon to decorate? In short, to govern, instead of being governed? This, to his mind, though he put it forward tentatively

and as a suggestion, supplied the origin of the most remarkable phase in the history of the Renaissance. And since the influence of it, spreading as it did through Europe and inspiring such works as were to be found in all the great centres of art, was manifestly so great, he thought that if more attention were given to the study of those productions much good would result, and there would be some hope of the next generation placing themselves, through their works, in the independent position of those artists of the Renaissance whom they admired, and whom they had every inclination merely to imitate. But Art was not imitation, but creation; and, above all, it recognised no specialities. Those were the wares of the pedlars of Art—the purveyors of trifles. That was evidently recognised by the men of the Renaissance, and it was not to be wondered at that in an age of sumptuousness and magnificence, such as was that of the Renaissance, when employment was not lacking and encouragement was intoxicating, that the striving to excel should have become a passion—that the ambition to build palaces should have taken the place of the former tendency to ornament palaces already built? In fact, that the sculptor should have aspired to hind his own art with that of the architect, and place himself above the position of journeyman decorator to a master adapter; and, furthermore, to work on lines founded upon his own conception of the spirit and traditions of the art of his predecessors, strengthened by that intense craving to create for himself. So far, he (the speaker) had endeavoured to trace the possible origin of the existence of the sculptor-architect, and he would now refer to his work. He was not prepared to claim for it a striking pre-eminence when directed simply to the erection of edifices. In examples which they all knew as the productions of sculptors there was undoubted evidence of the hand and mind which had been trained for the practice of the plastic art. It was rather in the treatment of ornament, when combined with purely architectural forms, that he felt inclined to favour the sculptor in his dual capacity. The sculptor had been used, before his usurpation of freedom, to design and execute ornament for building in which he had had no hand, and to his employer his ornament meant so much decoration, while to him it was the expression of an idea. A knowledge of this peculiarity fitted the sculptor for the task he was about to undertake. Another qualification which was his, and which we must not overlook, for the outcome of it was so marked a feature in all the productions of the sculptor-architect of the Renaissance and the period immediately following, was the training he usually received in the art of the goldsmith. To that must, no doubt, be attributed that extraordinary freedom of treatment, that abundance of invention, and that accuracy and delicacy of execution—to say nothing of the sense of colour and light and shade and due appreciation of proportion which characterised their work. With the freedom thus obtained, the knowledge of their particular tasks, and with the fire of their new ambition, no wonder their productions were what they were. In regard to the desirability of young architects and sculptors studying the art of the Renaissance, such a study could not fail to impress upon them the grandest lesson that could be learnt, viz., that it was a duty that every artist owed to himself, his art, and his generation, to endeavour to place himself beyond the reproach of being a mere imitator of masters and styles of a past age. It was the spirit of the age and not the letter which he should accept, and he should worship it and bind himself to the obligations which its mere influence should place upon him to endeavour to pass on to posterity the rich legacy, further enriched by the imprint of his own time and his individual judgment. Art was a very old republic, and to it had been given the grand secret, the elixir of life—that secret which for ever had been denied to man. Art was as young to-day as it was centuries ago. Its existence was a curious mystic one—at once retrospective and progressive. Its every movement forward was a reflection from the mirror of the past. Its life was a constant reflection backwards and forwards in the mirror of ages. Its future was written in the magic word "tradition," and this word, with its mighty significance, would ever remain the "Sesame" of Art's every onward movement. It was the spirit and traditions of Art's great principles which must govern them, that they might grasp the inspiration in their time, and through their own individuality, before they could hope to hand

on, much less to realise, the important legacy that they had from those who sought to be more than mere specialists, journeymen-decorators or master-adaptors. In conclusion Mr. Gilbert said that he had miscalculated his time and had miscalculated his would-be effort. He had counted only upon the hope that what he thought was more than it appeared to be, would inspire them to a discussion, which, as he had already said, would be more faithful than any words of his. He begged the pardon of his hearers for letting them off so easily, and he prayed them to co-operate with him in helping him to make what he thought would have lasted much longer, last long to their profit.

Mr. Alma Tadema, R.A., in proposing a vote of thanks, said that the paper was full of theories of the highest aim, which made him dream of all the beauties of the Renaissance, and all that time of the revival of the antique, without giving him anything positive to say beyond admiration for those beautiful things, in the light of which we were daily feasting, and from which we daily profited in our life. That time that was so fruitful for mankind in every direction, was for Art, of course, an everlasting source of study, and to be brought to admire that which was worth admiring was always a reason for feeling full of gratitude. What the influence of the sculptor-architects and architect-sculptors had been was a thing which he should like to see more developed in the modern practice of building. He should like to see the Arts more clasping hands together, the architect being a little more of a painter and a sculptor, and the painter and the sculptor being a little more of the architect; then they would be more complete; and any effort that was made to direct them in that way they accepted gratefully.

Mr. J. M. Brydon, in seconding the vote of thanks, said that it must be apparent that he had arrived at some progress when it was possible that a discussion of that kind should have been inaugurated in that room, when they remembered that not many years ago the architecture of the Renaissance was treated as something to be scouted, and that anything approaching such a matter as was done in St. Paul's was considered far beneath anything done, say, in the thirteenth and fourteenth centuries. It was not so long since that room re-echoed to the cheers that greeted papers on Gothic architecture, and it indicated progress that they had got to look with a lenient eye on the work that came after it in England. Mr. Gilbert's paper had been very suggestive in many ways; he had told them what a meaning there was if they liked to look under the surface in the workings of that great artistic phase in the period of men's minds that passed over Italy in the days of the Renaissance, and produced works that we all admired. His immediate purpose was to talk of the architect-sculptor; but it was very difficult to draw the line; it was a question whether they were not architect-painters, because more or less they were painters as well as sculptors, and sculptors as well as architects. But there were one or two names that did stand out as sculptor-architects, and one of them was Michelangelo. He was a great painter and a great sculptor, and he was a great architect, although he (the speaker) did not say he was the greatest architect of the Renaissance, and they would find this characteristic in his work, that he looked upon architecture from the sculptor's point of view—naturally the decorative side of it obtained over the constructive side. If they looked to his early work, e.g., the San Lorenzo Library, Florence, or the Chapel of the Medici, they would find that (he was not saying anything derogatory to the sculptor-architect in this) it arose, probably, as Mr. Gilbert had said, from the sculptor having an ambition to create the work he was to decorate. They saw the genesis of that in the staircase of the San Lorenzo Library; if they looked round the walls of the room, the columns that decorated it merely decorated it; they were not constructive in any sense of the word; they were set in recesses in the wall and merely formed objects of decoration; they did not even supply the place of the decorated pilasters so dearly loved by Palladio and some of the later architects, the object of which was to support the entablature. But apart from all that, Michelangelo was a great architect, and one of the things that he did, which redounded to his everlasting credit, was the saving of the facade of the Farnese Palace which he completed at Rome. So far as they could gather from San Gallo's original design, the top was to be completed by a series of pilasters, but he died before the building was finished, and Michelangelo was called in to complete one of the greatest monuments of the very best period of

the Renaissance of the sixteenth century. He designed the magnificent cornice which pulled the building together. If he had never done anything else than that, he thoroughly grasped what was required of him as an architect. Putting that enormous cornice on that building saved it from being a repetition of one story upon another, and from being commonplace. That was the work of the sculptor. They might say it was decorative work, but it was also constructive work, because it was the finish of the whole and the support of the roof to some extent; and therefore Michelangelo there showed himself to be endowed with the attributes of a architect in being able to clothe with beauty a feature that was absolutely utilitarian. Sansovino, again, was an architect who was also a sculptor. He designed the Library of San Marco at Venice, which was a sculptor's facade, against the architect's facade on the other side of the Piazza, which was purely constructive. The Sansovino Library was distinguished above all things by its sculpture, which was, he would not say obtruded, but brought into decorative prominence, which perhaps only a sculptor would have made of such importance. When he had added a small story over the main building of the Library, he did it by enlarging the frieze, and putting very small windows into the frieze, united to each other by a band of sculpture ornament, as had been done to a certain extent at the Carlton Club in Pall Mall. This again was the characteristic of the sculptor, and Sansovino was a sculptor of considerable eminence, though not such a giant as Michelangelo. He (the speaker) hoped we were getting back to the time when sculptors and architects would feel that building was not complete unless they worked together. It seemed to him that the greater future of our English sculpture, and, he thought, of our English architecture, would be found in the decoration of our great public buildings by the sculptor and architect in harmony with each other. He did not agree with Mr. Gilbert that the architects in the age of the Renaissance were all adapters. They were not there to discuss the relative merits of the different architects who contributed to that vast movement, which extended not only to sculpture and painting, but to everything else. There were some greater architects than sculptors; he merely mentioned two, Bramante and Peruzzi, who were peculiarly architects without being sculptors, and carried out the idea of architecture, in the sense of a constructive art, as it ought in the first instance to be, most completely than sculpture.

Mr. Beresford Pite, in supporting the vote of thanks, said that some of them regarded Mr. Gilbert as being in many ways a typical example of the combination of architectural art with that of the sculptor, and they therefore welcomed his presence and assistance in a very special manner. He (the speaker) suggested that architecture and sculpture were in a particular sense in these days in need of each other's ideas. He was afraid that any usefulness in this exchange would not be derived at by the architect trying to combine the sculptor with his work, any more than it would have been if Michelangelo had called in an architect to assist him in the design of St. Peter's. An architect suffered from a complaint that the sculptor did not, and the sculptor suffered from another complaint (he was going to say homely) from which the architect did not suffer and the conjunction of these two complaints might produce a very healthy state of design. An architect was fettered by a large number of facts, by the lines he draws, by tradition from his fathers, by his Orders, by his plan, by a number of constructive circumstances, problems, and difficulties, with which he was bred and which practically became part of the bone of his artistic soul. He could not get free of his traditions, he would have to unlearn everything and start again if he was to think of his problems from the point of view of the sculptor; and in the same way the sculptor suffered from the loss of these restrictions. The sculptor's art was too often merely an effort to create an idea out of nothing; a statue which a maiden was listening to a bird, or that Love was standing in the moonlight. Such ideas were played out; they had had their day, and the public had enjoyed them and the sculptor—though profited by them; but he thought the time had arrived when the introduction of a little architectural vaccination into the arms of the sculptor and the infusion of a little sculptor's blood into the veins of the architect might produce a mongrel sculptor-architect or architect-sculptor of a distinctly strong breed. Mr. Brydon

nd introduced Michelangelo to them as a great architect, though not, perhaps the greatest architect of the Renaissance. He should like very much to ask who was the greatest architect of the Renaissance?

Mr. Statham: Brunelleschi.

Mr. Pite: Could they separate Brunelleschi together from the sculptor's surroundings and training? Could they compare Brunelleschi with Michelangelo? Michelangelo found a singular measure in taking an architect's facts and features and treating them as if he were treating the facts and features of the human figure; he took masses which he found provided for him by the architect and threw them together, not with reference to structure or decoration, but with reference to the sculptor's idea of strength, of vigour of line, of delicacy, and of contrast of light and shade, they would see if they looked at that staircase in the Library of San Lorenzo. He did not believe that it proceeded from the hands of Michelangelo; he believed the man who designed it was Vasari, who put the curved lines in the steps because he fancied, like Hogarth, that there was an esoteric beauty resident in the ogee curved line. There was nothing of that in Michelangelo; he scorned it in his own work as in his architecture. Could not you, as architects, take up with some amount of the sculptor's materials and tools and work in them, and could not they find the same measure in sheer massing of light and shade, in the sheer treatment of the features for their plastic elements rather than their constructive elements? It might sound heretical, but he cited that Vren had a great idea that all the weight was massive force when he piled up the heavy wall around that great dome, and when he formed that delightful colonnade round the dome externally which bore no architectural connection to the Cathedral at all, and when he put it divided into masses its recesses, for the sculptor's reason simply because he liked the contrast, the play of light and shade. Coming down to our own time, we found in the work of Alfred Stevens a wonderful illustration of the fact that another genius took up architectural forms, he was going to say, threw them about. His Wellington Monument was enough to make the stand on end when they looked at that deepening curved pediment springing off the corner of the cornice. It was unconstructive. It is traditional, he admitted, and the beautiful effect he had maintained the tradition, with the effect of giving spring, strength, and virility to design, was marvellous; but he had achieved by a sculptor's process of thought, and not by a constructor's process of thought. But there is even a step further that he (the speaker) thought we could go. Some of the most successful architectural buildings in London had not been erected by architects—he wished we could see they had been erected by sculptors. He thought it would be generally admitted that the best school at Kensington was one of the most successful buildings of our period; there is design, great originality, and very great beauty of detail. Now none of them could say out of an office that design came, or tack it on to any particular school of English tradition. It was evolved quite apart from the Gothic revival and quite apart from the traditional classic school of the time; it came out of the mind of Stevens's studio, and it stood as a wonderful record of a beautiful building in the middle of a number of very architectural and very architectural buildings. In these days, when we have searched antiquity and have worn it out, when we have tried to attain to the secrets of Greece even by the mysterious road of mathematics, and when we have exhausted all that archeology and ecclesiology have provided for us out of the Middle Ages, and have come down to those almost cursed impostures which strip us of ideal architecture and leave only bare brickwork and simple construction, and letting architecture conceal itself to the door-knockers, he thought when a door was opened to us so suggestively as Mr. Gilbert had done that night to the consideration of the higher aims that actuated the great sculptors of the Renaissance we had some little hope left to us that if architects could rise to the occasion and read their studies to the real beauties achieved in these sculptor-architects, we should have a chance before us that we should do well to walk in.

Mr. Statham said he wished to explain why he mentioned Brunelleschi when Mr. Pite appealed to him to name any architect of the period as equal to Michelangelo. He did so because he considered that the very beginning and basis of

being an architect was that a man should know how to build. Now Michelangelo failed in the construction of the dome of St. Peter's, which cracked at the haunches and had to have a chain put round it subsequently to keep it from falling altogether; whereas Brunelleschi knew where such a tie would be necessary in the section of his dome, and put it in from the first; he was therefore a better architect. It had been said that Michelangelo would have gained nothing by having an architect associated with him. He (the speaker) did not agree with that in the least. An architect who knew his business could have taught Michelangelo that there was such a thing as scale in architecture, and that to make a building look colossal it was not the right way to make the details colossal; and secondly, an architect could have taught him how to build a dome so that it would not crack. That, he submitted, counted two points to the architect.

Colonel Prendergast said he was in hopes that he would have been told to what period of the Renaissance Mr. Gilbert's remarks were directed, and he had had an idea that he would have heard explained a matter of great interest, viz., the sculpture-architecture of the Quattrocento period. No one who travelled in Italy and who saw those magnificent and perfectly gem-like works could do otherwise than feel that there was a refinement and knowledge about those men, and there was a culture about them to which at present we had not the key.

Mr. H. L. Florence said that what passed through his mind during Mr. Gilbert's very suggestive address was that there was a certain analogy between architecture and sculpture and poetry and prose in the formation of language—that the one was the other gained from the association of ideas; that as prose was ennobled by the words and frequently the rhythm of poetry, so architecture in the periods to which Mr. Gilbert referred gained certainly by the refining and elevating influence of the sculpture. But one of the two must always be the leader; if it was to be poetry, the poetry must be left to itself, and if it was prose it must be free from the too great licence of poetry. He thought that the same had happened in the history of architecture and sculpture. In the early days the lines of the sculpture and its general ideas and disposition were purely architectural, but in later times the influence of the sculptor upon architecture was more prominent, and, to a great extent, it was a deterioration. He would take Bernini as an example. Bernini was a great artist both in his architecture and in his sculpture, and he was successful in combining them and in imparting new ideas and heretical ideas into both, but he was the commencement of a period that led to great degeneration. His almost immediate successor, Borromini, carried all these to too great an extent; he was not content with the simple lines of leading architecture, but imported into them sculptural and fantastic types, which led to combinations, pediments, curves, and twisting of curves, which had cast a reflection upon that period of architecture ever since. To show the influence of the painter's art upon the architect, they might refer to Sir John Vanburgh. He was an architect of very great merit, but he proceeded upon lines of design more in the way of a painter's combination of masses of light and shade. Blenheim, both in its plan and its combination, showed that very plainly, although it might be taken as lumpy and heavy as an edifice. When it came to be studied there was a great deal of thought both in the plan and the groupings of the various blocks of buildings. At the present day we did not often have such opportunities of bringing into contrast the light and shade; our buildings in modern cities were more frequently in regular masses—we had not the opportunity of projecting vast recesses and carved figures, except in those unhappy corners of streets which occurred so frequently, and a return to a simpler style of architecture, such as was practised by the great architects who had been referred to of the more early period of the Renaissance, would show them all by the study of their works that they had much yet to learn from the architects and sculptors of those days.

Mr. Owen Fleming asked if Mr. Gilbert would look upon the spire of Bow Church as a fine piece of sculpture architecture? It was a beautifully modelled spire, but it had no figures and nothing that one ordinarily associated with sculpture. If that was his view, then Mr. Pite's remarks would almost mark an epoch in the development of the way we looked at buildings from what one might almost call the plastic point of view. Another reflection was whether

we were training the younger members quite in the right direction to look at their buildings from this point of view.

Mr. G. A. T. Middleton said that all the great architectural periods seemed to have been periods when architecture and sculpture had been very closely allied—the great Grecian period, the great Early Gothic period, and the great Italian and Renaissance period. But while in the Italian Renaissance period the sculptors were to a great extent architects, that did not seem to have been the case in the other two great periods. The Parthenon was the work of one architect, embellished by another sculptor—there were two men employed, two minds at work. Was it necessary, therefore, that the building should be designed and embellished by the same hand? So, too, in the Gothic days, were the same men the architects and the sculptors? We did not really know, but it hardly seemed so. In the Renaissance period the sculptors in many instances were architects, but there were also architects who were nothing but architects; others were painters and architects, but not sculptors. Others, like San Gallo, were architects only. Great buildings could be produced by architects only; greater buildings perhaps by architects who worked in combination with sculptors; great buildings also by sculptors who work as architects; but they, as architects, would submit that at least architects were capable of producing the greatest work. One of the greatest modern works in London, the Accountants' Institute, was the work of an architect in combination with a sculptor—two minds at work again.

The Chairman, in putting the vote of thanks to the meeting, said that Mr. Gilbert had opened up what one might call the higher ranges of thought in this matter, and it was for us to apply them in our practice. It was difficult, perhaps, to define what a sculptor-architect was any more than what an architect-sculptor was. In medieval times one could not say where the architect left off and where the sculptor came in. That perhaps was a matter of regret; it would be better if architect and sculptor combined in all cases where their joint artistic efforts could be brought to bear upon any monumental work. It was very seldom indeed that we found a completeness in the work of the architect and sculptor in any building—perhaps not half-a-dozen model buildings in the whole of London were to be found. He might mention the London University, in Burlington-gardens, which, he believed, was erected from beginning to end exactly as it was intended to be, but that was owing to the pertinacity of Sir James Pennethorne, who insisted that the building should be complete. Mr. Brydon made some very interesting remarks with regard to the great man to whom he alluded. Such names as Michelangelo, Sansovino, and others come up to one almost "like recollected music"—they were the standposts to which we cling, and to which all who come after us would cling as their guides in artistic life. What Mr. Brydon said about Sansovino most of them would concur in: that any expert in architecture could tell which was the sculptor's work apart from that of the architect's. Architecture was necessarily a constructive art, and in examining a building we always looked for the constructive art, and he thought that was a matter that sculptors did not always bear in mind—they did not see, from their art point of view, that architecture was essentially an art of construction.

The vote of thanks was then put and carried unanimously.

Mr. Gilbert in reply said, in regard to the Chairman's remarks about the London University, would it not have been better if a second thought had been entertained before those—he was going to call them finials, he would call them statues, (because they were intended for statues), were allowed to stand as continuing columns and do nothing except look ugly? The essence of the training of the sculptor was really more with a view to imbuing him with a sense and a real appreciation of the necessity of the knowledge of structure, but it was in a different form from that of the architect. The construction, the structure of a building, after all was contained in very little, but the structure of the human figure was a complex thing. He should like to contrast the structure of the human figure with that part of the structure in architecture which was known as "thrust" and "compensation of balance"; it really was that. Therefore the sculptor's task was to master structure and construction in that which he was supposed to confine himself to. The making merely of the human figure was no slight task, it was much more complicated in

the methods by which he arrived at his training than were those methods which an architect had to go through to learn his construction. He had, so to speak, a log book, but the sculptor had no good log book; he had nothing set down for him, and he took it that with the painter it was the same. If they built a wall of a certain thickness and a certain height, which had to carry a certain weight, they could work it out, or rather they could have a book in which it was worked out for them. Sculptors could not do that. If they wanted to make a figure stand on its legs they had one principle—plumb. They could make any amount of undulating lines they liked, where the architect had to depend upon his plan for his undulating lines. Sculptors could change their lines; they could begin at the head and go down; the architect must begin below and go up. That was the difference of construction. As to Mr. Pitt's remark that the modern aim of sculptors was to represent the old-fashioned form, that was not so, and the very object of the words he used in his lecture was to advocate the breaking loose from that idea—that the sculptor should not be considered by the architects or by anybody as merely a maker of what the Italians of whom they had heard that night would have called "pupazzi." As for Michelangelo, he (the speaker) purposely left aside the mention of any name. Michelangelo might have made faults, but his great so-called imitator also made them. They were both sculptors—for he claimed for Wren the distinction (he called it a distinction) of being one of the very greatest English prototypes of what he would like to call the sculptor-architect. He was a modeller of things, and he could not say that Wren was second to the great god he had been taught to worship. The matter of scale was better understood by Wren than it was by Michelangelo. Michelangelo in his belfry windows made apertures that St. Paul's might have been expected to be put through. Let them go to St. Paul's and look at that non-constructive, if they liked to call it so, that do-nothing colonnade—but it is beautiful. It might be carrying nothing—Bow Church had things that carried nothing—but it was plastic. There were lots of examples, but there was not a single example he knew of Wren's that was not a pure and simple specimen of what he called the sculptor-architect's work. He was a modeller of things, not a builder of things, not a bricklayer, not a mason, but a great moulder, a great plastic artist, an enormous giant that he had not seen the like of since in England. Here came in the plea that he ventured to set forth—that architects should study sculpture and sculptors should study architecture; then they might get that appreciation of that force which that great man had given us. Stevens's Wellington monument had been alluded to. No one admired him more than he (the speaker) did—not only because he was a contemporary, or because he was a singlehearted workshipper at the shrine of all that was beautiful, but because he was a man who tried to emulate everything that was fine, a man who came at a bad time (like another great man who was lost just before him, and like many men who began their life at that time) on the top of a rotten-crested wave. But they did not see Stevens at his best in the Wellington monument. His greatest effort was in those works which distinguished the sculptor-architects; it was that power of design, of realising an idea in the design—not merely a mass of tracery, "This is an ornament" written underneath, but every line meaning something. He was like the great Bernini, whom they had heard so much abused, who built and made that magnificent baldachino in St. Peter's. Stevens took from Bernini traditions, but he did not copy Bernini because he was essentially Stevens. He had not the slightest intention to convey that building and sculpture should be necessarily the work of one hand—that we knew was an impossibility; but what he wanted to impress was that it would not be at all a bad or an unbeneficial thing for those who were learning to walk in their respective Arts, whether they be builders or whether they be architects, if they would each study the art of the other, that they might know, when they had to build a building, that it was far better to employ a man who was trained as an artist to help the architect to carry out his work than to call in, forsooth, the purveyor who would supply at so much a foot, and through the hands of imported labour that which he could get cheaper, but the interests of the maker of which he could not enlist further than the Saturday night's consideration. Would it not be better that the architect should

learn that it was possible to get the sympathy of his brother artist and treat him as such, and let the sculptor treat the architect as a brother artist and give encouragement to the would-be sculptor-architect to make beautiful things? There were men who might be young in their Art but who were quite as capable as the hired labourer of the purveyor and pedlar of trifles. There were hundreds of youths who could make Gothic statues if they wanted Gothic statues, and could make recumbent bishops if they wanted recumbent bishops, and what he had in his mind was that the architect of to-day did not seek to work with the sculptor, and consequently the sculptor said "*Ennas nocte*"—as he (the speaker) did then to his hearers.

The Chairman announced that the next meeting would be held on the 15th inst., when Mr. H. E. Milner would read a paper on "The Garden in Relation to the House."

The meeting then terminated.

NATIONAL ASSOCIATION OF MASTER BUILDERS OF GREAT BRITAIN.

THE National Association of Master Builders of Great Britain held its thirty-eighth half-yearly meeting at the Old Bull Hotel, Blackburn, on the 26th ult., when representatives were present from London, Liverpool, Birmingham, Bristol, Manchester, Hull, Blackburn, Bolton, Bradford, Huddersfield, Plymouth, Wolverhampton, Southport, Scarborough, Burslem, Leicester, Wigan, &c. Mr. Thos. F. Rider, London, President, was in the chair.

The report for the past half-year was approved and adopted. Mr. C. W. Green, of Liverpool, the Hon. Treasurer, submitted his audited accounts for the half-year, showing the financial position of the Association to be most satisfactory.

The President, in his opening speech, said that though the state of trade generally was good, they had to deplore the ruinous competition which seemed to prevail in all trades throughout the country. It seemed to him that competition up to a point was a very valuable thing, but he objected to "cutting each other's throats." This competition seemed to increase as years went on. He supposed it was one of those matters which would go on, but it was rather a pity that men should follow out a practice which was inimical to them in so many ways. Another thing that they had to consider was the old complaint of the British workman, whose desire seemed to be to give the smallest possible amount of work for the largest amount of wage. The only remedy seemed to be a revival of the old system of payment for piecework. As regarded the question of the Employers' Liability Bill, no doubt this would be of a considerably more stringent character than ever. It seemed probable they would be held liable for accidents of every description, whether caused by negligence or otherwise, and he thought that this liability might be met by joint insurance. If some means could be devised to make a fund to be subscribed to by master and workman, it might solve the problem of Employers' Liability. No further steps had been taken respecting the Plumbers' Registration Bill. The question of arbitration had taken up a great deal of time with many of the Associations. In London they had a clause that in the event of any man being obnoxious, and the employer refusing to discharge him at the wish of the workmen, the matter should be referred to arbitration, and if the masters and workmen could not agree in the choice of an arbitrator the Board of Trade should appoint one. If this way became universal there was no doubt that it would lead to a much more happy state of things, as there must necessarily be more satisfaction in arbitration than in fighting a matter out. The President then spoke at length as to the best form of contract, and stated that the old form, agreed upon more than twenty-five years ago, still continued in use, in face of a new and more elaborate one prepared by the architects, and this principally because, he said, of the unfairness of the Arbitration Clause. Finally, he wished to increase the number of the National Association of Master Builders, and to make it in every sense a "National" Association.

Mr. Bowles (Burslem) and several other members supported the President's remarks with regard to increasing the scope of the Association.

The question of the form of apprenticeship indentures was discussed, and it was decided to leave the matter over until the next meeting, so that members should have an opportunity of further considering the proposed form.

The Secretary read a resolution of the London Central Association as to the scarcity of plasterers.

The President said they had had considerable trouble in London, and one thing had been proved to them, viz., that the supply of plasterers was insufficient. Various ways had been suggested of increasing their numbers. Among the ways were:—1. To increase the number of apprentices. 2. To find a substitute for plastering. 3. To maintain schools of plastering. Several of the members expressed their opinion on the subject and it was decided to refer the matter to a Council.

Mr. T. F. Rider (London), Mr. J. Stevens Jones (Liverpool), and Mr. Ald. W. Holdsworth (Bradford) were re-elected to the positions of President, Senior Vice- and Junior Vice-President, respectively for the ensuing year. Mr. A. Kray (Bristol) was elected Hon. Auditor for the ensuing year. Mr. G. Hardington (Leicester) and Mr. R. G. Jenkin (Plymouth) were elected members of the Council for their respective towns. Mr. C. A. Hayes (Bristol) invited the members of the Association to hold their next half-yearly meeting in his city, which it was unanimously resolved upon to do.

A hearty vote of thanks was accorded to the President for his services in the chair.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Sir Arthur Arnold, Chairman, presiding.

New Entrance to Richmond Park.—Mr. Bounois, M.P., submitted a petition, which, said, was numerously signed by the Metropolitan ratepayers generally, urging the Council to consider the advantages that would arise from opening up some of the streets leading to Roehampton-gate, Richmond Park, by way of forming a new entrance to the park.

The petition was referred to the Improvement Committee.

Loans.—On the recommendation of the Finance Committee it was agreed to lend the Chad Vestry 7,900*l.* for laying asphalt in King-street, the Battersea Vestry 2,040*l.* for electric light purposes at the vestry offices and town halls; and the Holborn District Board 3,000*l.* towards defraying the cost of their contribution towards Brooke's Market improvement scheme.

Manager of Works.—The General Purposes Committee reported as follows:—

"The Council on December 1st resolved that an advertisement should be issued inviting applications for the position of manager of the Works Department, with the understanding that the appointment is not necessarily a permanent one, and that the salary would be subject to revision in the event of the Council deciding that a limit should be placed on the extent and character of the works to be executed by the Works Department; and that in response thereto 237 applications were received. The applications were in the first place considered by a sub-committee, who, after seeing twenty-two of the candidates, submitted to us the names of five of the candidates. We have ourselves seen these five candidates, and, having weighed their respective merits and qualifications, we now, in accordance with the standing order, submit to the Council the names of the following three, viz.:—1, Mr. Adams; 2, Mr. H. H. Holt; 3, Mr. J. J. W. Brink. The standing order also authorises the Committee to indicate, if it should think fit, the candidate whom it recommends the Council to appoint. We recommend—

"That, subject to his passing satisfactorily a medical examination, Mr. William Adams be appointed Manager of the Works Department at a salary of 1,500*l.* a year, in the understanding that the appointment is not necessarily a permanent one, and that the salary is subject to revision in the event of the Council deciding that a limit should be placed on the extent and character of the works to be executed by the Works Department; and that the appointment be made upon the following conditions:—That the appointment be terminable by three months' notice on either side; that the manager be required to give whole time to the duties of his office, and be not allowed to take any private business; that any fees received by him either as a witness or in any other capacity, and any claim placed on the estate or materials purchased, be paid to the Council; and, further, that on retirement he shall not be entitled and shall not make any claim to any retirement allowance under the Superannuation Act, 1886, and that he shall be subject to the Council's regulations in respect of a superannuation and provident fund."

Colonel Ford moved, and Mr. A. Smith seconded, to refer the matter back for further consideration, but after some discussion the recommendation was agreed to.

Mr. Adams thanked the Council for appointing him to the post, and said that he would spare no effort to make the Works Department a success.

From his experience he had no doubt whatever that a great deal of the Council's work could be done cheaper without a contractor.

Boadicea Statue.—The same committee brought up the following report, the recommendation being agreed to:—

"On December 22 last we brought up a report to the Council on the subject of an offer made by Mr. W. J. Bull, L.C.C., with reference to the Boadicea statue, and the Council adopting our recommendation passed the following resolution:—That the Parliamentary Committee be instructed to take the necessary steps for a clause to be inserted in one of the Council's Bills, empowering the Council to purchase, or contribute towards the cost of purchasing, or otherwise incur expenditure in connexion with the provision and erection of works of art in London." We have now to report that a further letter has been received from Mr. Bull to the effect that the Boadicea Fund Committee are anxious to have the statue erected this year, and that Mr. J. I. Thornycroft, the son of the sculptor, who has offered to present the group to the Council, will give the order at once for the casting of the model, and pay the money as and when required, he relying upon the Council to repay him it and when it obtains Parliamentary powers, or upon further subscriptions being secured, or finally standing to any eventual loss if the Council does not contribute. This is a generous offer on the part of Mr. Thornycroft, but, as in the ordinary course, the necessary power for the Council to contribute cannot be obtained for eighteen months, we think it would be inexpedient for the Council to accept at the present time any liability whatever in the matter. We accordingly recommend:—

"That Mr. Bull be asked to convey to Mr. Thornycroft the thanks of the Council for his offer in connexion with the Boadicea statue group, but at the same time to inform him that the Council is not in a position to contribute towards the cost of casting the model of the group, or to bind itself to bestow even should the Parliamentary power be given for the purpose; and that while the Council will proceed to promote the Bill, it must be understood that any steps which Mr. Thornycroft may like to take in the matter are taken entirely on his own responsibility."

Boundary-street Improvement Scheme.—Paving-work.—The Housing of the Working Classes Committee recommended, and it was agreed, that the work of constructing the temporary roadways referred to in the report in connexion with the Boundary-street scheme be executed by the Council without the intervention of a contractor, and that the plan, specification, and estimate be referred to the Works Committee for that purpose; but that in the event of that Committee not being satisfied of the sufficiency of the estimate, the Housing of the Working Classes Committee be authorised to invite tenders for the work.

Land at the Cattle Market, Islington.—The Parks and Open Spaces Committee recommended that the Council do approve the estimate to be submitted by the Finance Committee, and do contribute one-half of the cost of the acquisition by the Vestry of Islington of two pieces of land, having a total area of about 5½ acres, lying to the south of the Cattle-market, Islington, such contribution not to exceed 8,000*l.*, on condition that the Vestry do acquire the land under the powers of the Metropolitan Market Act, 1896, and do undertake to pay all the costs of the acquisition and to lay out and maintain the land as a place of public recreation; and that it be referred to the solicitor to prepare the necessary undertaking.

Dr. White moved as an amendment to insert the words "as an open space" after "maintain." The amendment was defeated and the Committee's recommendation agreed to.

The Water Question.—The Parliamentary Committee in reference to the Water (Purchase) Bills now before Parliament, reported that they had been engaged in discussing terms of agreement with the authorities outside the County of London, but within the area of the water companies, and had made very considerable progress. The questions remaining to be settled were (with one exception) rather questions of detail than of principle. They now presented two agreements to the Council for acceptance. Both of these had been very thoroughly considered. They were advised, and were of opinion, that these agreements afforded a fair settlement as between the interests of the respective authorities, and were advantageous to the County of London. They therefore recommended:—That the agreement with the County Council of Surrey be approved and sealed, and that, subject to the approval of Parliament, such clauses as may be necessary to give effect thereto be inserted in the Bills relating to the Lambeth and Southwark and Vauxhall Water Companies, and that the clause arranged with the Corporation of Croydon be approved, and, subject to the approval of Parliament, be inserted in the Bill relating to the Lambeth Company."

Dr. White moved to refer the matter back until

the Committee could bring forward agreements with all the outside authorities.

Mr. H. P. Harris seconded the amendment. The Earl of Onslow believed that the effect of the agreements was not fully understood, and doubted if it were desirable to saddle the purchase of the water undertakings with agreements to sell off a very large portion of the rights acquired. How could they decide how much water Surrey should take from the Thames before they knew how much Hertfordshire would require from the Lea? They were dealing with powers they did not possess, which was premature.

Mr. McKinnon Wood, Chairman of the Committee, pointed out that the Council's scheme was to give to the outside authorities rights similar to those claimed for the County of London.

Sir John Lubbock, M.P., said the matter required further consideration, as there were great difficulties in drawing the lines between the various districts.

After some further discussion the amendment was defeated on a show of hands by 36 votes to 35, but on a division it was carried by 53 votes to 51.

Millbank Prison Site.—The Housing of the Working Classes Committee brought up the following report, the recommendations being agreed to:—

"The Council, on December 22 last, approved the plan for the laying out of the roads on the Millbank prison site, and instructed us to take the necessary steps for the execution of the work in accordance with the plan. It now becomes necessary for the Council to decide as to the preparations of the plans of the dwellings to be erected on the site. We estimate that the portion of the site acquired by the Council will accommodate about 4,500 persons. It will be remembered that 1,500 of the persons displaced under the Clare-market scheme have to be accommodated on the Millbank site, and as the scheme will no doubt be confirmed during the present session of Parliament, we are very desirous of being able to offer dwellings to these persons before they are compelled to leave their homes; moreover, the War Office authorities are preparing plans for the buildings they propose to erect on the portion of the site retained by the Government, and are pressing us for the levels of the centre roadway on the site. We have given the matter our careful consideration, and we are of opinion that the most expeditious method of procedure will be for the Council's architect to prepare plans for the erection of blocks to accommodate about 1,200 persons. With regard to the remaining blocks, we think that in view of the important position of the site, the Council would do well to invite designs from outside architects. By adopting this course the Council will obtain the benefit of the experience of architects who have given special attention to this class of building, and will, moreover, have the advantage of the criticisms of its own architect upon such plans. Under the proposed arrangements the Council's architect will at once proceed with the preparation of plans of the dwellings to accommodate a portion of the persons on the site, and we expect that these dwellings will be in course of erection by the time that the competitive designs have been considered. We propose that an advertisement should be issued inviting architects to submit their names as being willing to compete, and that a limited number of those replying to the advertisement should be selected to send in designs. We recommend:—

(a) That the Committee be authorised to instruct the architect to prepare plans of dwellings for the accommodation of about 1,200 persons on the portion of the Millbank prison site acquired by the Council.

(b) That the Committee be authorised to issue an advertisement inviting architects to send in their names as being willing to submit designs for the erection of buildings on the remaining portion of the area; to select a limited number from among such architects, and to invite competitive designs from those so selected."

Churchway, Euston-Road.—The proposal of the Improvements Committee to contribute 3,800*l.* for the improvement of Churchway, Euston-road, was objected to by Mr. McDougall, who moved its rejection. After a discussion there voted, for the rejection 35, against 40. The recommendation was then agreed to.

The Council having transacted other business, adjourned soon after seven o'clock.

COMPETITIONS.

CHURCH TOWER, LISKEARD.—The Liskeard Church Tower Committee have received a report from Mr. E. Sedding, of Plymouth, as to the two best designs for the proposed new tower of the parish church. Twenty-five designs were examined by him, and the plans of Mr. J. Sansom, of Liskeard, and Mr. H. P. Burke Downing, Great College-street, Westminster, S.W., have been respectively awarded the first and second premiums of fifty guineas and twenty-five guineas.

SURVEYORS' INSTITUTION:

STUDENTS' PRELIMINARY EXAMINATION.

Of the candidates who presented themselves at the preliminary examination of this Institution, held concurrently in London, Manchester, and Dublin, on the 20th and 21st ult., the following satisfied the examiners:—C. H. Alderson, Faling; J. W. Armstrong, Blacon, Stratford-on-Avon; W. B. Aubrey, Chelmsford; R. Bartram, Highbury; F. Bate, South Hackney; H. A. Bettger, Kilharn; W. R. Bingham, Hatcham; A. G. Bradshaw, Lancaster; C. J. B. Bridge-water, London; H. C. Brierley, Sledmere; H. W. Brindley, Edgbaston; S. L. Broad, Bournemouth; T. E. Butcher, Chesham; B. C. H. Cannell, Norwich; A. P. Chattell, Chislehurst; G. R. Church, South Hampstead; N. Clark, jun., Pitt Hill, Co. Durham; G. H. Cole, Tonbridge; F. N. Cooke, Leicester; G. H. Cope, Broxton, Chester; C. H. Cramphorn, Chatham; G. H. Croft, Brighton; E. H. Crump, Cheltenham; H. W. Curry, London; H. Dann, jun., Dartford; J. W. S. H. Davies, London; P. F. Dyer, Lewes; H. E. Edwards, Chelsea; R. L. Ellis, Lewisham; H. Evered, Horley; J. L. H. Flew, Manningham, Bradford; A. C. Frost, Morden; H. A. A. Gate, London; S. S. Gettings, Erdington, near Birmingham; H. Gould, Forest Hill; G. F. C. Hamilton, Dunboyne, Co. Meath; W. W. N. Harlow, Ilanley; H. K. H. Henderson, Worcester; H. A. S. N. Hoare, Bayswater; A. E. Hooper, Andover; W. C. Houghton, Walthamstow; C. F. Hutchinson, Preston near Hull; E. J. S. Jenner, Henley-on-Thames; H. D. Jones, London; A. V. Kington, Finchley; W. F. Langridge, Tunbridge Wells; L. Latham, Basingstoke; R. A. Lees, Bedford; H. Lemmoin-Cannon, London; J. Lewis, St. Albans; F. R. Lanley, Downton; W. S. Mackintosh, Studley; S. Mager, Tufnell Park; F. R. Mark, Stepney; C. V. W. Martin, Wakefield; T. J. Mealy, Wimborne; S. G. Meacher, Malvern Link; H. L. Michell, London; D. A. Morle, London; S. H. Newsome, Alvechurch; S. S. Orchard, Exeter; A. B. Paget, London; G. K. Pierson, Altrincham; G. Pinson, Solihull; F. P. Pratt, Ongar; H. R. Quarterly, Maidstone; H. S. Rendell, Newton Abbot; W. F. Robbins, Wingham; A. D. Rutley, Caterham Valley; P. Schofield, Atherton; E. Sharpe, Leicester; G. S. Simpson, Lancaster; E. J. Stead, Moss Side, near Manchester; C. F. Stedman, Cranleigh; A. W. A. C. Tannahill, North Finchley; R. Tanner, London; W. W. Tremlett, Downton; V. Turner, Wolverhampton; T. B. Wacher, Canterbury; P. Watson, Petworth; E. M. Wehh, Norwich; C. S. Weekes, Tunbridge Wells; H. Welsh, Cokermonth; F. C. Wheeler, Cobham; C. C. O. Whiteley, Streatham; C. E. Widdicombe, Cambridge; S. P. Wigley, Winslow; H. Williams, Norwich; J. Winslip, Cambridge; J. G. Withycombe, St. Albans; T. H. Wright, Streatham Park.

ARCHAEOLOGICAL SOCIETIES.

SOCIETY OF ANTIQUARIES.—A meeting of this Society was held on the 28th ult., Viscount Dillon, V.P., in the chair. The Rev. W. C. Stratfield exhibited and presented a number of illuminated pedigrees and other documents. Mr. Rome exhibited a small white marble bust of Jupiter Serapis, found in Egypt. Mr. Haverrfield communicated a note on a Roman lamp of terracotta found at Bradford, Berks, which was also exhibited. Mr. Hilton Price exhibited some beautifully-worked flints, with crescent-shaped heads, from Luxor; also a remarkable terra-cotta object containing an Archimedean screw—perhaps a model of similar contrivances used for irrigation purposes. Mr. J. R. Mortimer communicated a paper on a number of cruciform embankments in East Yorkshire, which he supposed to be the Christian successors of the circular mounds used for the assembly of the folk-moot. It was, however, suggested in the discussion that followed that such embankments were more probably thrown up as shelters for sheep and cattle, the summits being planted with bushes or small trees to keep off the wind.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. Thomas Elsley, ironmonger, informs us that his business has been converted into a Limited Company. The name of the firm will be Thomas Elsley, Limited, and the office address, 28, Great Titchfield-street.

DESIGN FOR A MARKET HALL.

THIS is the design, by Mr. J. A. R. Inglis, to which the Soane Medallion has been awarded this year; an award in which we entirely concur.

The building takes the old form, familiar to us in so many country towns of England, of an open vaulted ground story supporting a more lofty roofed hall above. The details of columns, ornamented windows, and rusticated voussours, are such as present no novelty in themselves, but the author has treated them with a rather unusual and sculptural boldness of relief which is very effective, and is well brought out in the perspective sketch. The weak point of the design lies in the projecting additions at each end, which do not seem quite sufficiently incorporated with the main design. But as a whole this is a very agreeable design which shows a good deal of promise for the future of its designer. The following is the author's description of the design:

"The conditions drawn up by the Council of the Royal Institute of British Architects for this travelling Studentship required a design for a provincial market-hall covering an area not exceeding 4,000 superficial feet, detached on all sides, and forming the centre of a market-place.

The subject does not seem to allow of much licence in the planning, and in this scheme the general features of our old examples have been adhered to, with some necessary modern additions in the accommodation of the adjuncts to the hall, private stairs to the retiring-rooms, &c.

The endeavour in the architectural treatment has been to follow in the lines of some of the best-known examples of market-halls, at the same time not rigidly keeping to tradition."

EYAM HALL, DERBYSHIRE.

The village of Eyam, in the North of Derbyshire, has obtained historic renown through the heroic conduct of its inhabitants during the terrible year of 1666, when the plague devastated the little community. Eyam Hall, however, according to Wood, the historian of his village, was built after the plague year, some time near the close of the seventeenth century, and is described by him as a "large, handsome, and rather picturesque looking building." This description was written in 1842, when, apparently, the appreciation of what we now call "the picturesque" was unknown to our historian. In other parts of his book, indeed, he evinces a decided partiality to the "elegant and respectable," but he evidently does not wish to disparage this building as he has said that it has been commended by "one skilled in architecture."

The Hall has been long the residence of the Vigants, an ancient Derbyshire family. It is situated in the heart of the village, facing the main street, but partly hidden by a high wall. The stone has weathered a beautiful colour, and with its well kept lawns, the building forms not the least picturesque bit in an exceedingly interesting village.

F. H. CHEETHAM.

DESIGN FOR FOUNTAIN.

The conditions of the competition stated that the fountain was to occupy a triangular open space and was to serve people, cattle, and pigs. These particulars very naturally suggested a triangular plan.

The materials proposed to be used in its construction were: Doulton's Carrara ware for the tiers, pedestals, shafts, entablatures, roof, &c., all in fawn colour, except the shafts of the small columns, which were in blue; the filling of the lower part was to be in best selected dark-blue Staffordshire bricks. Owing to the curved shape of the trough it was thought advisable to use Victoria stone for this purpose. The steps and posts were to be in grey granite.

A small cistern regulates the supply to the drinking basins; this is placed in the centre of the brickwork, and is accessible from a small iron door fixed over one of the basins. The water from the drinking basins supplies the dog trough, which is placed underneath the cattle trough. Another small ball-valve is suggested at the side of trough to regulate this supply. The amount estimated for the erection of the fountain was 120*l*.

HUGH MACINTOSH.

* * * This is the premiated design in the com-

petition for a fountain which was advertised in our columns some little time since, and as to the result of which we received several inquiries from competitors.—Ed.

HOUSE ON HINDHEAD.

This house is being built for Mr. Rayner Storr, on Highcombe Edge, Hindhead, adjoining the Devil's Punch Bowl; and commands on three sides some of the most magnificent vistas in Surrey.

The materials are Petersfield brinded bricks, with red brick dressing, Headley stone piers, and keys, rough cast plaster. The roofs are covered with Elterwater slates in diminishing courses, and the dormer cheeks are tile hung; one of the bays being hung with oak shingles.

The contractor is Mr. Ernest Chapman, of Grayshott; the slating by Messrs. Thos. & J. H. Stirling; the sanitary work by Mr. George Chapelow; the architect being Mr. William A. Pite, of London.

PRESBYTERIAN CHURCH, WEST NORWOOD.

This building, which is shortly to be erected, will stand on an elevated and prominent site at the corner of Thurlow Park-road and Court-road, West Norwood.

The building comprises a church with minister's, elders', and choir vestries, and a large hall and class-rooms. In the church itself the ordinary aisle arcading is done away with—the roof being constructed on a modified hammer-beam method—in order that every seat may have an uninterrupted view of the pulpit. The materials to be employed are red brick facings externally and internally, with Portland stone dressings. The roof will be of pitch pine, as will also be the seating.

Messrs. Treadwell & Martin, of London, are the architects.

GRAY'S INN CHAPEL.

The accompanying drawing represents the interior of the chapel belonging to the Honourable Society of Gray's Inn. The old flat plastered ceiling has been replaced by a panelled ceiling in Sequoia wood supported on four-centred principals, four in number, and with intermediate ribs, and a stone cornice with carved bosses beneath the wall plates, and carved stone corbels under the principals. The old east window, which had been partly bricked up, has been restored as far as practicable to its original size, the remains of the old sill having been found in cutting down the wall. Two three-light windows were also discovered in repairing the walls, the brickwork of which had crumbled

away, and had to be cased with new brickwork in Portland cement. The three windows on the north side have also been restored and glazed with plain cathedral glazing.

The old shields of arms which were formerly in the east window have been incorporated with the glazing of the windows on the north side. Three of the openings of the five-light east window are glazed with stained glass (from one of the north windows) representing the Ascension, and the remainder with painted Grisaille glass, the work of Messrs. Heaton, Butler, & Bayne.

The screens to the entrance lobby, and beneath the gallery to the vestry, also the front to the gallery, are of oak, partly with linen-fold panels and enriched with suitable carving. The seats are also of oak. A moulded stone string course has been carried round beneath the sills of the windows, and the plastering of the walls is finished in Keen's cement. The altar space and the aisles are paved with black and white marble mosaic.

The site of the former vestry has been added to the chapel, so as to afford space for an organ chamber, and two four-centred arches accordingly have been reinstated in the south wall. The organ is by Messrs. Henry Jones & Sons, and is a much more powerful instrument than the organ formerly existing. The chapel is warmed by hot-water pipes, on the high-pressure system.

A stone tablet in three panels has been inserted in the south wall to commemorate the names of the preachers of the Inn from 1574 down to the present time. These names have been engraved on brass plates, which are inserted in the panels of the tablet.

During the progress of the works the remains of the old holy water stoup were discovered; these have been carefully rebuilt into the north wall near the entrance. The old Jacobean pulpit, which was covered with many thicknesses of paint, has been carefully cleaned, prepared, and refixed with an appropriate new staircase thereto. The paint which had been placed on the ashlar facing of the porch, has been carefully scraped off, and the stonework restored to its original condition, and a new panelled ceiling of oak formed in lieu of the incongruous plaster ceiling and cornice then existing.

No discovery of any importance was made in the excavations beneath the old floor, although it was at first thought that some objects of archaeological interest might be found hidden therein. A brass plate has also been inserted to commemorate the restoration.

The design and supervision of the works were entrusted to Mr. Charles Herbert Shoppee, of London. The contractor for the general works was Mr. S. F. Halliday, of Stamford, Lincolnshire; the paving was carried out by Mr. J. F. Ebner; the heating by Messrs. J. L. Jacon & Co.

LONDON COUNTY COUNCIL INQUIRY.

The special inquiry into the organisation of the Works Department of the London County Council was continued on Wednesday and Friday, January 20 and 22, Sir A. Arnold presiding.

The Comptroller, Mr. Haward, was examined at great length on the resumption on Wednesday, but no new point of importance was elicited.

The next witness called was Mr. Jacobs, one of the foremen in the employ of the Works Committee, who in reply to questions put by the Chairman with regard to the method of engaging workmen, said he took them on when they were wanted without making any distinction between trade unionists and non-unionists. There had never been on his works any interference by members of the Council, and he was not aware that any relatives of members of the Committee were employed.

In reply to Dr. Longstaff he said he was not now, but he had been formerly, a member of a trades union, that he had been twenty-five years a foreman, and since 1893 in the employ of the County Council. He had been employed principally under the Architect on many different jobs, some large and some small. He had never known any serious delay to take place in the supply of materials. He had usually found the workmen under him industrious, and he had not had more trouble with skilled workmen than unskilled men. He had had more difficulty with labourers than with skilled men. He could not say that the men he had under him in the employ of the County Council were better than those he had under him when in the employ of contractors, but they were quite as good. He thought the quality of the work was better. He had complete control of his men, was not unduly severe, and he thought that his works had been fairly profitable. He had never been told that the work was costing too much. His job was visited occasionally by the Chairman of the Works Committee, but seldom by individual members, and the witness repeated that on this account he had never had any serious difficulties. He had always been on good terms with the late manager, of whom he had no complaint to make, but he thought he might have been a little more experienced in building matters.

In reply to Mr. Alderman Peachcroft, he said he had been engaged as foreman by the late manager. It was part of his duty to engage workmen, and he had full power to dismiss them. There was no particular rule of selection. They were engaged by him solely on his own judgment and knowledge of the men, his acquaintance with workmen being very extensive, and it was not true to say that workmen were engaged on the recommendation of others. He kept a list of the names of workmen, but not of their addresses. Asked with regard to the popularity of the late manager and as to the existence of malpractices, the witness said that the late manager was not generally liked; he no doubt wanted to make the Department as successful as possible, but he (the witness) had not heard of any malpractices.

In reply to Mr. Davies, the witness said he had been employed in a similar capacity under various contractors, and he had no more difficulty now than under his former employers. He had no special instructions from the manager as to the quality of the work; both under the Department and under contractors his instructions were to get his jobs done as speedily as possible. He had never had special instructions from the manager as to the ordering of materials, and it had never occurred to him to order more than was wanted, though he might have been required at times to send to another job a few materials such as header bricks if he had any spare ones. He had no knowledge of any inferior mortar being used on his jobs. His work was performed under the direction of Mr. Blashill's assistants, but not under the Architect direct. He believed his work was considered satisfactory. With regard to the quality of the work done by the Department as compared with that done by contractors, he thought the work done by the Department was of higher quality for many reasons. He thought the workmen had a spirit to do the work better than contractors' men.

Questioned by Mr. Dickinson with regard to the code of regulations governing his work, the witness said he selected his men from a knowledge of their ability, without giving preference to local labour. It was subsequently explained by the next witness, Mr. Ward, the Chairman of the Works Committee, that a clause with regard to giving preference to local labour had been

omitted from the revised code of regulations which were those governing the duties of the foreman at the present time. On the question of strikes in the building trade it was elicited from the witness that the only workmen in the employ of the Department who went out during the late strike in the building trade were the plasterers.

In reply to Mr. Gruning, the architectural assessor, the witness said he generally selected his men from workmen he had known for years. He could almost always tell men that were suitable from their appearance. There was no difficulty in getting men when they wanted them, because it soon got known when men were wanted on any job.

Mr. Gruning: Do you know contractors who employ gangs of men on special terms?—Yes; to do special work. So do we for certain work, such as scaffolding.

Mr. Henry Ward, M. Inst. C.E. (Chairman of the Works Committee), the next witness called, in reply to Sir Arthur Arnold, said that the last witness had correctly described his functions, and that notices were posted on all the works, instructing foremen to make no difference between union and non-union men. Questioned with regard to the purchase of timber, Mr. Ward said the whole of their timber was bought by public auction (except a little hardwood), by an agent, on a commission of 1 per cent. The qualities varied as well as the prices, some being of best quality and some much cheaper. The Works Committee had to pay a much larger sum than any contractor doing the same amount of work in audit charges, and it was at a disadvantage in other respects. The tendency was, perhaps, for their workmen to do rather less work than for a contractor, whose sole idea was profit-making, and the more favourable conditions of the specifications issued to contractors would often enable them to make a saving where the Department could not make any saving. There was not the slightest doubt that the Council had suffered disadvantage from the friction that existed between the Committee and the Architect. This had arisen almost at the first, through the first job, the Fire Station at New Cross, having a specification very full of special items requiring the Committee to obtain certain materials from certain specified firms. Without these items the Committee could have carried out the work at 5 per cent. less cost. He denied that the iron-work was of an inferior character, and he also denied the allegations which had been made with regard to the use of lath and plaster instead of sand for mixing with mortar at Hughes Fields. The witness said a sample was taken at half-past seven at night, at a time when no one was at the job except the watchman, and the sample was probably taken from a heap of rubbish that had been rejected as unfit for use. Members of the Committee had tried the mortar with their knives and found it very good. He hoped the assessors would also try it. With regard to the alleged inferior brickwork at Mount-street, which the foreman had refused to rebuild, he said it had been examined since and had been pronounced one of the best bits of brickwork in London.

Asked to give his opinion with regard to the constitution of the Works Committee, the witness said he thought it was too large, and that the method of electing the Committee was a bad one. It had given them ten members in sympathy with the Works Department, and ten who were not altogether sympathetic. The result was that they pulled in opposite directions, and were like partners in a business who did not agree. If the Committee consisted of only five members selected from the Chairmen and Vice-Chairmen of the Spending Committees, or if they were men who really desired to get the work done instead of making party capital out of the Department, it would be a great improvement.

With regard to the question of tendering by the Committee, Mr. Ward said he doubted whether contractors would agree to tender under such conditions. A still more serious objection was that the Committee, which could only obtain its work from the Council, could not compete in open contract with a certain class of contractors, who, as stated in evidence by previous witnesses, did not know how to tender. He thought the work of the Department exceedingly good, and most experts would give 10 per cent. more for it than for work done by a contractor.

Replying to the allegation that the visits of members of the Committee had been disadvantageous, the witness said that in his opinion such visits, on the contrary, had proved a great advantage to the Council, and had helped forward the Council's interest.

The sitting was at this point adjourned on Friday, the 22nd inst.

The examination of the Comptroller was resumed on Friday by Mr. Gruning, who elicited the further statement with regard to audit charges that £50, was paid last year simply in order to satisfy the curiosity—the legitimate curiosity—of the Council as to the cost of the works completed or in progress. The difficulty of getting contractors to tender for work after introduction of the new labour clauses led to the formation of the Works Department, the tendency in which was to do less work than contractors had to do it better. It had been stated by Messrs. Cubitt, Trollope, Hoiland and Hannen, &c. that they could not compete with the Department at competition prices and put in the quality of work required. The Department, therefore, did work equal to the best firms and at competition prices. Notwithstanding the disadvantages mentioned, the Department was able to show a profit of 8 or 9 per cent. The jobs which the Department had refused were refused on the advice of the late manager, when he was not satisfied with the estimates. The witness was in favour of giving out some of the jobs to contractors in the same way as the Admiralty. He agreed that it was highly desirable that there should be a closer connexion between the Architect's, the Engineer's, and the Works Departments, but added that the principal difficulties had arisen from the fact that in order to satisfy those who thought the Department would fail, it had been decided to treat the Department exactly as a contractor, and although at a double cost, the Departments were organised to check one another. That course was, perhaps, justified on account of the great suspicion with which the Department was regarded. The time might arrive when a better understanding would prevail, and when it would not be thought necessary for one Department to supervise another. Being asked to account for the fictitious transfers, Mr. Ward said the Department was criticised very severely if it was not making a profit on particular jobs, while not getting credit in cases where a profit was being made; and it gave way to the temptation to hide or diminish the loss.

Mr. Gruning: To save its credit, in fact?—Yes.

In reply to Mr. Waterhouse, assessor, Mr. Ward said he did not think there would be an advantage in a separate staff for the book-keeping department; and with regard to the Architect and Engineer's estimates, he said the Works Committee were not informed of the details. The only required to know the lump sum, which was stated in open Council. This was submitted to the manager, who reported whether he was satisfied with the sum. When any job was undertaken the manager took out his own bills and quantities. With respect to the early difficulties met with, Mr. Ward said one of their chief difficulties was to get good foremen. Good foremen and a good staff could only be got by a process of natural selection. He agreed with Mr. Blashill that at first they had not proper control over the works. In reply to further questions with regard to strikes, the witness said they had not been source of difficulty for the Department, except one case. The men knew that they would get paid the new rates of wages that a strike might establish without going out themselves, and the result was that the Department's works had gone on when others were suspended on account of strikes.

In reply to a question from Dr. Collins with regard to the malpractices, the witness denied that any investigation had been offered by any officer of the Department. The Comptroller had reported the matter to him during the recess, and was upon his information that he had brought the matter before the Council.

Mr. Fletcher next examined the witness at considerable length, eliciting the admission that would not advocate an unlimited extension of the principle of direct employment. The object of the Department had in view was to get the work done as cheaply as possible, consistently with a good quality of work, and he thought that policy was in harmony with the general trend of public opinion. He could account for a certain amount of unpopularity by the fact that thousands of men had put down their names in the books, and many of them had failed to get employment, and were therefore disappointed. He did not know why policy should be unpopular, of which the main object was to save, for the ratepayers, the middle man's profit. He did not know it was any part of their duty to protect contractors. He admitted that the County Council would hold a more in-

partial position as arbitrator in labour disputes if it confined itself to administrative work.

In reply to Mr. Torrance, Mr. Davies, and Mr. Beachcroft, the Chairman of the Works Committee entered into long explanations with regard to the complaints of the Architect of inferior ironwork, overcharges on repairs to a directing lamp at a fire-station, and of bad work on a 6-in. drain. With regard to the latter he said the Architect had been entirely misinformed. The drain referred to in Scotland Yard was not 160 ft., but only 14 ft. long, and was not a 6-in. but a 4-in. drain. The joints were left unfinished because the workman refused to continue the job. He admitted that the affairs of the Department might have been better managed if it had not been for the misunderstanding about the Fire Brigade station, that Mr. Blashill did his duty nobly to the Council, and that the Architect had had to struggle with great difficulties, though having too much work put upon him. The witness admitted that it had been an advantage to the Department to have its work subjected to criticism. He would put no limit on the work to be undertaken by the Department, provided it was done well and fairly cheaply. The examination of Mr. Ward was not concluded when the Committee adjourned to Wednesday, January 27.*

ARCHITECTURAL SOCIETIES.

NORTHERN ARCHITECTURAL ASSOCIATION.—The Students' Sketching Club of this Association held their seventh annual smoking concert and exhibition of drawings and sketches in the Grand Assembly Rooms, Newcastle, on the 26th ult., when about 100 members and friends were present. The Vice-President, Mr. Joseph Oswald, occupied the chair, and opened the concert. Those present included the hon. secretary, Mr. A. B. Plummer, and Messrs. J. T. Caskett, W. S. Hicks, H. C. Charlewood, W. L. Newcombe, W. Glover, T. H. Morton, C. S. Ericsson, S. Piper, &c. The musical arrangements included the provision of an orchestra of nearly twenty performers, and the evening was considered to be very successful. The whole arrangements were made by Mr. W. E. Fenwick and Mr. Harold Oswald.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—"Two Methods of Architectural Practice and Design" was the title of a lecture delivered on the 2nd inst. to the members of the Leeds and Yorkshire Architectural Society by Mr. W. H. Bidlake, of Birmingham. At the outset the lecturer explained that a variety of new forces, such as the introduction of machinery and the commercial spirit had destroyed the traditional method of building, and at the present time we were, he said, in a state of flux. In all probability a considerable period of time would elapse before anything like a single or definite aim again actuated architects to endeavour to bring about a more satisfactory state of affairs by eliminating thoughtless architecture, which was simply swayed by passing fashion, and, by being true to first principles, assist the development of some general evolution towards a new style. Mr. Bidlake took as typical examples the man who simply satisfied the present thoughtless demand, although he might be perfectly conscious that the public demand was not the right one; and, again, the man who had convictions and principles, and instead of being ready to sacrifice these for his commission, endeavoured to modify public opinion, and so brought about a period of better taste. The lecturer was at the close accorded a hearty vote of thanks. Mr. W. Watson, the President of the Society, occupied the chair.

GLASGOW ARCHITECTURAL ASSOCIATION.—On the 26th ult., the President, Mr. William Tait Comber, in the chair, Professor E. J. Mills, D.Sc., F.R.S., of the Glasgow and West of Scotland Technical College, delivered a lecture on "The Application of Photography to Architectural Measurement." He stated at the outset that the architectural capabilities of an ordinary camera, and consequently of an ordinary photographic print, were much greater than usually supposed. It was, however, necessary that the camera should be used with reasonable care, and especially that it should be (1) rigorously upright; and (2) parallel to the plane of building whose reproduction was desired. A single measurement on the plane itself would then give a scale for any part of the resulting negative or print. But operations were greatly facilitated by the simple graduation of the ground

glass into squares and their sub-divisions; thus enabling the observer to obtain true parallelism at once, as well as vertically, and to measure also the height of an object's image. Professor Mills went on to explain how, by the aid of very simple mathematical formulae, the height of a distant object, accessible or not, could be easily ascertained with a camera so provided. Among adjuncts to a measuring camera, a ball and socket support was shown for a half-plate camera. Professor Mills supports his lenses in rising and cross fronts, each provided with scales and verniers, and screw motion, which he uses for obtaining very delicate measurements of the dimensions of images in the ground glass. The lenses he prefers are ordinary Goetz and wide angle zeiss rectilinears. It was shown that by following very easy rules, the plan of a photograph could be readily drawn; an illustration of this was exhibited. The lecturer concluded with the exhibition of a number of architectural lantern slides, illustrating a variety of points referred to in the lecture. On the motion of Mr. Wm. Jas. Anderson, seconded by Mr. Alex. McGibbon, a vote of thanks was accorded to the Professor for his lecture.

THE ARCHITECTURAL ASSOCIATION OF IRELAND.—A meeting of this Association was held on Tuesday evening, at the Grosvenor Hotel, Dublin. Mr. R. Caulfield Orpen occupied the chair, and an interesting lecture was given by Mr. W. J. Fennell, of Belfast, on "Some Old Buildings in Antrim and Down," which was illustrated by lantern. The lecturer gave some accounts of the ruins at Hollywood, co. Down, the old churches at Newtownards and Movilla, and the very interesting ruins of the Castle at Dundrum, the Cistercian Abbey known as Inch Abbey, and thence on to the historic town of Carrickfergus, with its fine old Church of St. Nicholas, and Antrim, with one of the best preserved round towers in Ireland, 92 ft. high, and 50 ft. circumference at base, Ballycastle, with its old Abbey and Gate House, and the extremely interesting stronghold of the McDonnell's Dunluce Castle. Mr. T. Drew having proposed, and Mr. McGibboun seconded, the vote of thanks, the Chairman announced the next meeting for the 16th inst., when Mr. F. Batchelor will lecture on "Hospitals and Hospital Construction." The drawings done by members of the Advanced Class of Design (the subject being "A Village Public-house") were hung in the room, and attracted much attention.

ENGINEERING SOCIETIES.

THE INSTITUTION OF CIVIL ENGINEERS.—At the ordinary meeting of this Institution, on the 2nd inst., Mr. J. Wolfe Barry, C.B., F.R.S., President, in the chair, it was announced that seven associate members had been transferred to the class of members, and that seventeen candidates had been admitted as students. The monthly ballot resulted in the election of five members, of thirty-six associate members, and one associate.

SOCIETY OF ENGINEERS.—The first ordinary meeting of this Society for the present year was held on the 1st inst., at the Royal United Service Institution, Whitehall. Mr. Samuel Herbert Cox, the President for 1896, occupied the chair, and presented the premiums awarded for papers read during that year, viz.:—The President's Gold Medal to Mr. George Tbudichum for his paper on "The Ultimate Purification of Sewage." The "Bersermer Premium" to Mr. D. B. Butler for his paper on "The Effect of Admixtures of Kenish Ragstone, &c., upon Portland Cement." The "Rawlinson Premium" to Mr. W. G. Wales for his paper on "Discharging and Storing Grain," and a "Society's Premium" to Mr. M. A. Pollard-Urquhart for his paper on "Examples of Railway Bridges for Branch Lines." Mr. Cox introduced the President for the present year, Mr. George Maxwell Lawford, to the meeting, and retired from the chair, receiving a hearty vote of thanks for his services during the past year. After briefly reviewing the work of the Society during the past year, the President drew attention to the steady reduction in the general death rate of this country during the last fifty years, and the comparative freedom from zymotic diseases, both of which were attributed to the progress of sanitary science and the impetus given to the practice and study of hygiene by the Public Health and River Pollution Prevention Acts. The provision of pure water and efficient drainage was the duty of the engineer, and on these two subjects, which are of such vital

importance to all communities, the President based his address. After alluding to the discoveries of Pasteur and the influence of biology in its relation to the purification of water he contrasted the system of lake supplies, as instanced by the water undertakings of Glasgow, Manchester, Liverpool, and Birmingham, with the Metropolitan supply, which, coming from such polluted sources as the Thames and Lea, was entirely dependent for its bacterial purification on sand filtration. He further contrasted the successful municipal enterprise of the four cities mentioned with the working of the London Companies, which were managed solely in the interests of the shareholders, finally expressing the opinion that the London supply should be managed in the consumers' interests by a body from which party and political feeling should be entirely excluded.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on the 28th ult., the following recommendations of the Building Act Committee, in regard to applications under the 1894 London Building Act, were agreed to:—

Lines of Frontages.

Woolwich.—(a) That consent be given to the erection of one-story shops upon part of the forecourts of Nos. 13, 15, 17, 19, and 21, Lakeland-road, High-street, Plumstead, on the application of Mr. J. O. Cook on behalf of Mr. A. Hilder. (b) That so much of the application as relates to the proposed erection of a one-story shop in front of No. 23, Lakeland-road, be not acceded to; as the Council is not prepared to permit the erection of the shop, having regard to the objection of the owner of the property adjoining southward.

Greenwich.—That consent be given to the erection of a one-story addition in front of the "British Queen" public-house, Trafalgar-road, on the further application of Mr. H. Roberts on behalf of Mr. G. Burney.

Rotherhithe.—That consent be given to the erection of an open footbridge and gallery across Tooley-street, St. Olave's, Southwark, to connect Nos. 10 and 12 with Sun Wharf opposite, on the further application of Mr. S. Pullett, on behalf of Messrs. Culverwell, Brooks, & Co.

Westminster.—That consent be given to the erection of a block of residential flats on the south side of Birdcage-walk, on the site of Nos. 6 and 7 and a portion of the site of No. 5, Storey's-gate, and premises at the rear, on the further application of Mr. B. Slade.

Westminster.—That consent be given to the erection of a building with an open portico on the south side of Birdcage-walk, on the site of Nos. 2, 3, 4 and part of No. 5, Storey's-gate, Great George-street, on the further application of Mr. B. Slade, on behalf of the Institution of Mechanical Engineers.

Westminster.—That consent be given to the erection of buildings with projecting plinth, pilasters, bay window, balcony, and porch, at No. 12, Great George-street, at the corner of Little George-street, on the application of Messrs. A. Waterhouse & Son, on behalf of the Surveyors' Institution.

Norwood.—That consent be given to the erection of No. 58, High-street, West Norwood, with a one-story projecting shop front, upon the flank next Ernest-street, on the application of Mr. J. W. Brooker, on behalf of Mr. C. B. Southby.

Clerkenwell.—That consent be given to the construction and erection of a porch to a detached house on the north side of Alexandra Park-road, at the corner of Muswell-avenue, on the application of Mr. H. D. Evans, on behalf of Mr. T. H. Evans.

Fulham.—That the application of Mr. W. Hall for an extension of the period within which the erection of four houses with shops on the south side of Fulham-road, at the corner of Burlington-road, was required to be completed be granted.

Hackney Central.—That consent be given to the erection of five houses, with projecting bay windows, on the site of Nos. 133, 135, 137, 139, and 141, Haggerston-road, Dalston, on the further application of Mr. A. Woodward, on behalf of Mr. F. Bowcher.

Hamstead.—That consent be given to the erection of a balcony overhanging the public way in front of new bank buildings on the east side of Roper-hill, at the corner of Pilgrim's-lane, on the application of Mr. H. Field, on behalf of the Directors of Lloyd's Bank, Limited.

Holborn.—That consent be given to the erection of an iron footbridge across Lloyd's-court, Charing Cross-road, St. Giles-in-the-Fields, on the application of Messrs. Roumie & Aitchison, on behalf of Messrs. Crosse & Blackwell, Limited.

Kennington, North.—That consent be given to the erection of an iron and glass covered way in front of No. 17, Dawson-place, Bayswater, on the application of Messrs. H. Corry & Son, on behalf of Mr. G. Pitts.

Marylebone, West.—That consent be given to the erection of an oriel window at the second and third

* A report of subsequent sittings of the Special Committee is held over until next week for want of space.

floor levels in front of Nos. 1 and 2, Duke-street, Lisson-grove, on the application of Messrs. Wylson & Long, on behalf of Messrs. Spencer, Turner, & Boldeo.

Paddington, North.—That consent be given to the erection of an external iron staircase in front of No. 6, Blomfield-mews, Harrow-road, on the application of Messrs. New & Son, on behalf of Mr. W. Walker.

Rotherhithe.—That consent, granted December 1, 1895, to the erection of a one-story bay window in front, and of a two-story bay at the rear, of Pickle Herring Wharf offices, Pickle Herring-street, Tooley-street, on the application of Messrs. Mountford & Thompson, on behalf of Messrs. Hicks, Nash, & Co., as amended by the drawing dated November 7, 1895, be modified by the omission of the words "and at the rear" immediately preceding the words "of the building be dedicated to and left open for the use of the public."

Stepney.—That consent be given to the erection of two oriel windows in front of proposed new buildings on the site of Nos. 384, 385, 388, 390, and 392 Commercial-road, on the application of Mr. Keith D. Young on behalf of the Society for Promoting Christian Knowledge.

Hackney, Central.—That consent be not given to the erection of a house on the north side of Blackstone-road, London Fields, to flank upon Lansdowne-road, on the application of Mr. W. H. Adams.

Wandsworth.—That consent be not given to the erection of a covered way on the west side of "Angleholme," East Hill, to abut upon Acris-street, on the application of Mr. W. H. George on behalf of Dr. P. H. Davis.

Battersea.—That consent be not given to the retention of a timber store erected on the forecourt of No. 92, St. John's Hill, on the application of Mr. R. D. Hanson on behalf of Mr. T. Mills.

Fulham.—That consent be not given to the erection of a harness-room at the rear of No. 745, Fulham-road, to abut upon Dornell-street, on the application of Mr. S. E. Storr, on behalf of Dr. Eland Stewart.

Hackney, South.—That consent be not given to the erection of one-story shops upon the forecourts of Nos. 206, 208, 210, 212, 214, 216, 218, 220, 222, 224, and 226, Morning-lane, on the application of Mr. W. Hall on behalf of Mr. T. W. Webber.

Hampstead.—That consent be not given to the erection of an addition on a portion of the forecourt of a house known as "Daydawn," No. 7, Netherhall-gardens, South Hampstead, on the application of Mr. D. Brown on behalf of Mr. L. Sinclair.

Kensington, South.—That consent be not given to the erection of an iron and glass covered way over the part of the footpath in front of the Maisonettes Hotel, Nos. 28 and 30, De Vere Gardens, on the application of Mr. C. A. Daw.

Lewisham.—That consent be not given to the erection of a one-story wash-house on a site between Nos. 68 and 70 Honor Oak-road, Forest-hill, on the application of Mr. S. E. Musgrove.

Marylebone, East.—That consent be not given to the erection of an open iron bridge across Berner's mews, to connect Nos. 1 and 3, Mortimer-street with Nos. 51 and 52, Newman-street, on the further application of Mr. J. Slater on behalf of Mr. E. Penton.

Strand.—That consent be not given to the erection of a sheet-iron sign, to overhang the public way, in front of Faraday House, Charing Cross-road, St. Martin-in-the-Fields, on the application of Mr. H. Fould, on behalf of the Electrical Standardising, Testing, and Training Institution.

Westminster.—That consent be not given to the erection of an iron and glass covered way at the Francis-street entrance to the Army and Navy Mansions, Nos. 109, 111, 113, and 115, Victoria-street, on the application of Mr. C. J. C. Pawley, on behalf of Mr. W. Goodwin.

Westminster.—That consent be not given to the erection of projecting porches, a bay window, and an angle oriel and turret at No. 54, Parliament-street, at the corner of a footway leading to Cannon-road, on the application of Mr. A. Williams, on behalf of Messrs. Grindlay & Co.

Width of Way.

Southwark, West.—That consent be given to the erection of a gymnasium on the north side of East-street, at the corner of Kell-street, St. George-the-Martyr, with the forecourt fence at less than the prescribed distance from the centre of East-street, on the application of Mr. Rowland Plumbe on behalf of the Borough-road Polytechnic.

Woolwich.—That consent granted on October 27, 1895, to the erection of a temporary wood and iron entrance and cloak rooms to the school building on the west side of Kne-hill, Plumstead, to abut upon, and with the boundary-fence or wall in front of such entrance and cloak-rooms at less than the prescribed distance from the centre of a footpath leading from Kne-hill, on the application of Mr. T. J. Bailey, on behalf of the School Board for London, be modified by the omission of the condition as to the setting back, without compensation, the portion of the boundary-fence or wall next the said footpath the prescribed distance from the centre of that footpath, when required by the Council so to do.

Greenwich.—That consent be not given to the rebuilding of No. 27, Woolwich-road, with the new portion of the flank of the building to abut upon Hatcliffe-street, on the application of Mr. W. A. Finch, on behalf of Mr. W. A. J. Hensler.

Greenwich.—That consent be not given to the extension of a portion of No. 45, Woolwich-road, at less than the prescribed distance from the centre of Commerell-street, on the application of Mr. W. A. Finch, on behalf of Mr. W. A. J. Hensler.

Hackney, South.—That consent be not given to the erection of two additional stories upon the existing one-story shops at Nos. 120 and 122, Morning-lane, at the corner of Back-lane, on the application of Mr. J. Hamilton, on behalf of Mr. E. Stevens.

Poplar.—That consent be not given to the erection of two houses on the north side of Manilla-street, Millwall, at the corner of Alpha-road, in the position and with a portion of the forecourt boundary of the house next the latter road as shown upon the plan submitted with the application of Messrs. J. and S. F. Clarkson, on behalf of Mr. W. Legg.

St. George-in-the-East.—That consent be not given to the retention of a temporary wood and iron shop and store erected on the north side of Watney-passage, at the corner of Winterton-street, on the application of Mr. F. Parker, on behalf of Mr. Craze.

Width of Way and Space at Rear.

Paddington, North.—That the Council in the exercise of its powers, under Sections 13 and 41 of the London Building Act, 1894, do not consent to nor permit the erection of an addition, not to exceed 30 ft. in height at the rear of "Carlton-vale Tavern," No. 33, Carlton-road, Maida-vale, at less than the prescribed distance from the centre of a road leading to Paddington recreation ground, on the application of W. J. Ancell, on behalf of Mr. G. C. Butcher.

Southwark, West.—That Messrs. F. S. Breton & Son be informed that their application on behalf of the trustees of Marshall's Charity for the Council's consent to and allowance of the erection of twenty-three houses on the west side of Webber-row, St. George-the-Martyr, on a site of Nos. 7 to 37, Webber-row and 77, Webber-street, with the flank of the northernmost building and the fence or boundary in front of such houses at less than the prescribed distance from the centre of Webber-row and Webber-street respectively, and with an open space not in accordance with the rules of the Act at the rear of the eight southernmost houses in the row as shown upon the plans submitted with the application, having been further considered, the Council sees no reason to depart from its decision of December 1, 1895, not to grant the application.

Open Space about Buildings.

Hackney, South.—That the Council do, in the exercise of its powers under Part V. of the London Building Act, 1894, permit the erection of one-story stabling and of a two-story engine-house and offices in a yard leading out of Chelmer-road, Homerton, with open spaces about such buildings, on the application of Mr. R. Peters, on behalf of Mr. F. Adams.

Kensington, South.—That the Council, in the exercise of its powers under Section 41 (r), iii. (h), of the London Building Act, 1894, do allow the erection of a five-story addition at the rear of No. 10, Brompton square, to abut upon an open space as shown upon the plan submitted with the application by Mr. E. W. Parker, on behalf of Mr. J. Davies.

St. George, Hanover-square.—That sanction be given to such deviations from the plan certified by the District Surveyor, under Sections 13 and 43 of the London Building Act, 1894, of the space previously occupied by buildings at Nos. 141 and 142, New Bond-street, and premises at the rear fronting upon Bloomfield-place, as would permit of the erection upon that site of a building on the further application of Mr. F. W. Foster on behalf of Mr. A. Coombs.

Brixton.—That the Council in the exercise of its powers under Section 41 of the London Building Act, 1894, do not allow a modification of the provisions of that section with regard to open spaces about buildings, so far as relate to the proposed erection of three blocks of residential flats, with shops on the ground floor, on the west side of Coldharbour-lane, next No. 18, with irregular spaces at the rear of such flats, on the application of Mr. J. T. Holmes, on behalf of Mr. H. Wood.

Paddington, South.—That the Council, in the exercise of its powers under Section 41 of the London Building Act, 1894, do not permit the erection of an addition upon a portion of the open space at the rear of No. 9, Gloucester-square, Hyde Park, at the corner of Devonport-street, on the application of Messrs. Mullett, Booker, & Co., on behalf of Mr. W. P. W. Norsworthy.

Line of Fronts and Width of Way.

Wandsworth.—That consent be given to the erection of a one-story addition to the Holy Trinity National School for Boys, Trinity-road, Upper Tooting, to the line, and with the forecourt boundary at less than the prescribed distance from the centre of the road, on the application of Mr. C. E. Sayer on behalf of the Rev. J. H. Potter.

Brixton.—That consent be not given to the erection of buildings on the site of Nos. 6a, 6, 8, 10, 12, 14, 16, &c., Coldharbour-lane, on the application of Mr. J. T. Holmes, on behalf of Mr. H. Wood.

Kensington, South.—That consent be not given to the erection of an enclosed covered way, constructed of glazed wood sashes and brickwork, upon part of the forecourt of No. 2, Victoria-road, on the further application of Mr. H. G. Ioberson, on behalf of Mr. H. Hampton.

Formation of Streets.

Woolwich.—That an order be sealed and issued to Mr. T. J. Young, sanctioning the formation or laying out of an extension 40 ft. wide, for carriage traffic, of Abbey-grove, Plumstead, and the widening of portions of Bostal-lane and Bostal-mews-way, on his application to the Council, on behalf of Messrs. J. & C. E. Pearson. That the name Abbey-grove (in continuation) be approved for the new street. That as the land upon which the extension of Abbey-grove is proposed to be formed appears to be below Trinity high-water mark, the attention of the Local Authority and of the applicant be called to the regulations made by the Council under the provisions of Part XI. of the London Building Act, 1894, with regard to the erection of dwelling-houses upon low-lying land.

Lewisham.—That an order be sealed and issued to Mr. J. Norton, refusing to sanction a deviation from the plan approved on October 19, 1893, for the formation or laying out for carriage traffic of Rhyme-road, Motes-vale, by partially widening and diverting the course of that road as shown by the amended plan and particulars dated December 7, 1895, on his further application to the Council.

Cubical Extent.

Finsbury, East.—That consent be not given to the erection on a site between Old-street and Banner-street, at the corner of Bunhill-row, St. Luke, Old-street, &c., of three blocks of buildings each to exceed in extent 250,000 cubic feet, and to be used only for the purposes of the manufacture of Bovril, and that the Council do not allow a modification of the provisions of Section 54 (a) of the London Building Act, 1894, with regard to the thickness of the recesses under the windows on the third floor of the block of buildings next Old-street, on the application of Mr. H. V. Lancaster, on behalf of the Bovril Company, Limited.

Recommendations marked * are contrary to the views of the Local Authorities.

Correspondence.

To the Editor of THE BUILDER.

"EXPERT" EVIDENCE.

SIR.—The other day I was waiting to give evidence in one of the Queen's Bench Courts, and listened to the trial of an action for obstruction of light.

The defendant relied on the evidence of a man who in the box described himself as a "builder, sanitary engineer, member of the Society of Arts, and light and air expert." This fellow—who had not an "h" in his vocabulary—endeavoured to teach the judge that the defendant had rather improved the light of the plaintiff's house by the substitution of a stock brick wall 20 ft. high, and 7 ft. distant from the windows, for a formerly existing low fence backed by a row of trees, which it was admitted by the defendant's own witness were spaced some 10 or 12 ft. apart.

Of course, the plaintiff won and got damages. That, however, is by the way. What impressed me was the fact that it should be possible for evidence from such a witness to be tendered at all on an expert point. I wonder what would happen if a judge were asked to receive testimony upon questions of law and medicine from a barrister's wig maker and a manufacturer of surgical instruments?

HARVEY DYBALL.

London, January 29, 1897.

THE CAPITAL AND COUNTIES BANK (BRISTOL BRANCH).

SIR.—Referring to the article on Bristol architecture in your last number, the Capital and Counties Bank in that city is the extension of a building which was erected from my designs, and illustrated in the *Builder* of December 12, 1895.

FRED. MEW.

9, Gordon street, Gordon-square, W.C.

KING'S COLLEGE SCHOOL.—It is stated that the Council of King's College, London, have acquired South Hayes, with about 6 acres of ground, at Wimbledon Common, whither the school will migrate after the current term. Until recently nearly all the school class-rooms were in the basement floor—on a level, though, with the small playground at the back, bounded by Strand-lane—of the buildings erected, after Sir Robert Smirke's designs, upon the establishment of the College in 1831; for the Hospital, founded in 1839, the present building was begun in 1852. Several eminent men have had their education here.

The Student's Column.

SPECIFICATIONS.—VI.

CARPENTER.

IN specifying the materials for this trade, the architect should make up his mind definitely as to the precise grade of quality which he desires and then define that grade clearly and insist upon its being supplied. To do this requires a good knowledge of the market, and of the current prices and supply. The marks on timber are constantly changing, and the quality of the various classifications of different shippers is widely divergent, hence the knowledge required to accurately specify the quality of timber needs constantly to be revised and brought up to date. We give examples of various methods of specifying timber.

Materials.—The whole of the fir timber is to be of the best Memel, Dantzic, or Riga. The deals to be the best quality seasoned Christiania. The timbers and deals are to be cut die square, entirely free from sapwood, shakes, large, loose, or dead knots, and all other defects.

(This is the oldest fashioned form now in use, and, in spite of its apparent stringency, is in reality delightfully vague. The term "best" has no real significance. The quality of Memel, Dantzic, and Riga timber is not equal, nor are these the only ports from which high-class timber can be obtained; whilst Christiania may almost be said to be the one port from which the deals for any particular work will most likely not come.) As another example of a clause not intended to be unduly strict, but meant to imply average quality, we have the following:—

Materials.—The timber for carpenter's work to be good quality yellow fir timber from Baltic ports, cut out of haulk where necessary, but in other cases converted from boards, free from sap, large or loose knots, shakes and other defects, all to be well seasoned and sawn die square, and to hold the specified scantlings when finished. No outside slabs or sapwood to be used, and no pitch line or other American timber to be used for arpentry without special permission from the architect. (If the architect wishes the scantlings, gured or specified, of his woodwork to hold full when finished it is necessary to state it, as the custom of the trade, both of carpenter and joiner, to allow for waste in working. There are many advantages in using converted timber rather than cutting from baulk, chief amongst which are better seasoning, and as a general rule better quality. In spite of the increased labour of working, pitch pine is, for reasons sufficiently obvious, really in favour with present day builders in preference to Baltic fir, and its use should therefore be guarded, as discretion is required.) Again as another example we may specify thus, hearing in mind that practically there are four qualities of fir timber, viz., "Crown," "best middling," "good middling," and "common middling," and that boards have "Crown" and "Crown brack" superiors though little used qualities to 1st, 2d, 3rd, 4th, and 5th quality.

Materials.—The timber for carpenter's work to be Crown Memel or other approved fir of equal quality where cut from baulk and of a quality equal to Petersburg 1st where cut from deals. The architect will, of course, use his own discretion as to the selection of the quality or brand that is to form the criterion of excellence. Crown Memel, for example, is far superior to the timber generally employed in building.) Having settled the question of quality, the specification will proceed as follows:—

Distances Apart.—No joists, rafters, or quarters to be fixed more than 12 in. apart in the clear, and all to be properly trimmed for fire-places, chimneys, &c. The trimmers and trimming rafters and joists to be in all cases 2 in. thicker than the ordinary timbers. (In some cases it may be desirable to still further increase the thickness of trimmers. Where this is so, the particular instances should be mentioned, as the cause given will apply generally.)

Lintols.—Put lintols where required to internal openings of all plastered rooms 1 in. in depth for every foot of span, the full width of reveals and 2 in. longer than the respective openings, but in no case less than 3 in. deep.

Centres, &c.—Supply all requisite centring for arches, turning pieces, springers, templates, &c., the trimmer arches to be fitted down and filleted or centres left in) to receive lathing, and no centre to be struck until sanctioned by the architect. Supply and fix all necessary bracketing and lathing.

Centring for Joinery.—Insert in jambs of all openings to be fitted with joinery wood slips

3/4 in. thick, 4 1/2 in. wide, and in length the full width of opening, built into and securely fixed in the joints of brickwork. (If wood bricks or breeze concrete fixing blocks are preferred, specify accordingly.)

Bresssummers and Binders.—The bresssummers over . . . to be formed of No. 4 9 in. by 3 in. deals bolted together with 3/4 in. wrought-iron bolts with heads, nuts, and washers, No. 6 to each bresssummer. The bresssummers to be 18 in. longer than opening, and to have 3 in. tooled Yorkshire stone templates, 1 1/2 in. by 1 1/2 in. under ends. The binders . . . to be 6 in. by 4 in. and 12 in. longer than span, and to rest on 3 in. tooled Yorkshire stone templates, 9 in. by 9 in.

Floor Joists.—The timber floors to be formed with joists of the following scantlings, all to be properly notched and spiked to 4 1/2 in. by 3 in. plates, which are not to be built into walls, but carried on corbelling of two oversailing brick courses where plaster cornices allow, and elsewhere on wrought iron corbels, weight 7 lbs. each, built into walls every 3 ft. apart. Joists to ground floor rooms, 5 1/2 in. by 3 in.

Joists to first floor rooms over scullery, larder, pantry, and servants corridor to be 7 in. by 2 1/2 in., over remainder of ground floor 9 in. by 3 in.

Herringbone Strutting.—All floors of first floor to have herringbone strutting 2 1/2 in. by 1 1/2 in., not more than 6 ft. apart.

Sound Boarding.—Put between joists of floors over reception-rooms, 1/2 in. sound boarding on 1 1/2 in. by 1 in. fillets, and lay pugging, 2 in. thick, of chopped hay and lime, in proportion of 4 to 1, laid dry.

Roofs.—(If the roofs are fully and clearly shown on the drawings, it may be sufficient to say:) The roofs of buildings and the trusses to same to be framed up, as shown upon drawings with timbers of the sizes figured thereon. The rafters to be notched down upon purlins and plates, cut true at the ridges, and securely spiked thereto. (Or the particulars may be given thus:) The roof over offices to be framed with three king post trusses, the beams 9 in. by 4 in.; principal rafters, 6 in. by 4 in.; struts, 4 in. by 4 in., and 1 inch circular wrought-iron king-rod, with wrought-iron plate at head, 18 in. long by 4 in. wide, and 1/2 in. thick, forged to shape and bolted with No. 2 1/2 in. bolts to principals. Put 1 inch wrought-iron bolts, 18 in. long, fixed solid through the beams and feet of principal rafters.

Purlins to be 6 in. by 4 in.; ridges, 9 in. by 2 in.; common rafters, 4 1/2 in. by 2 1/2 in.; hips and valleys, 7 in. by 3 in.; plates, 4 1/2 in. by 3 in. The main roof to have four king-post trusses, tie-beams, 10 in. by 4 1/2 in.; principal rafters, 7 in. by 4 1/2 in.; struts, 4 1/2 in. by 4 1/2 in.; and 1 1/2 in. circular wrought-iron king-rod with wrought-iron plate at head, 20 in. long by 4 1/2 in. wide and 5/8 in. thick, forged to shape and bolted with No. 2 3/8 in. bolts to principals. Put 1 1/2 in. wrought-iron bolts 20 in. long fixed solid through the beams and feet of principal rafters. Purlins to be 7 in. by 4 1/2 in.; ridges, 9 in. by 2 in.; common rafters, 5 in. by 3 in.; hips and valleys, 7 in. by 3 in.; plates, 4 1/2 in. by 3 in.

Boarding and Battening.—Cover main roof with inch rough boarding and McNeill & Co.'s bituminous, inodorous felt, lapped 2 1/2 in. at edges, and nailed to boarding with zinc or compo clout nails. Lay over the roof to offices 1 1/2 in. by 1 in. battening, set out to 3 1/2 in. gauge for tiling (or to the proper gauge for slating).

Flat.—The flat over porch to have 5 1/2 in. by 2 1/2 in. joists, 4 in. by 3 in. plates, and to be laid with 1 1/2 in. deal traversed boarding edges shot for lead, laid to fall with the necessary firrings. Put 2 in. rounded deal rolls for lead, 3 ft. centre to centre.

Gutters.—Lay the gutters with 1 1/2 in. gutter boards and framed bearers to a fall of 1 1/2 in. in 10 ft., with 2 1/2 in. cross rebated drips 9 ft. apart. The gutters to be 9 in. wide at the narrowest part. Form deal dovetailed cesspools, 8 in. by 8 in., and 6 in. deep, for outlet of gutters, with proper disbed and rebated perforation for 4 in. pipe.

Snow Gratings.—Lay over all gutters deal wrought snow gratings of 2 in. by 1 1/2 in. battens, about 1 in. apart, on 4 in. by 2 in. cut and shaped bearers, about 3 ft. apart. These gratings to be made in 6-ft. lengths for easy removal, and to be put together in white lead and pinned with oak pins and crossoted.

Lier Boards and Tiling Fillets.—Put 3/4 in. by 7 in. lier boards at sides of gutters and valleys and along slopes of roofs adjoining vertical faces and deal tiling fillets 1 1/2 in. by 1 in. To eaves put tiling fillets 3 1/2 in. by 1 1/2 in.

Eaves.—Put 3/4 in. by 7 in. wrought and beaded

fascia to eaves (or instead the treatment of eaves may be specified thus): The feet of rafters to project 12 in. from face of wall, and to be wrought and the ends shaped to detail with wrought sprocket pieces 18 in. long by 3 1/2 in. wide and the full thickness of rafters. (If the under side of eaves is boarded specify it; if to be plastered, say.) Put under eaves on feet of rafters and also plugged to wall, 1 1/2 in. by 1 1/2 in. fillet to receive lathing.

Half-timbering.—The half-timbering to be of well-seasoned fir, with 7 in. by 4 1/2 in. posts and beams out of 11 in. by 6 in., and heads 4 1/2 in. by 4 1/2 in., left as from the saw, put together in white lead and pinned with 1 1/2 in. oak tenails left projecting 3/4 in. from face of timbering. This half-timber work is to be cut out immediately after signing of the contract, and to be properly exposed to absorb 10 lb. weight of creosote per cubic foot. The contractor is to arrange for the weighing of the worked timber in the presence of the architect, before it is despatched to the erecting works, and also on its return before fixing.

Barge-boards.—The barge-boards to be 2 in. wrought and cross-tongued yellow deal 15 in. wide on main roof, and 12 in. wide on roof of offices, all to be moulded on lower edge, and to have 4 1/2 in. by 2 in. moulding planted on to the other. (If moulding is returned at foot, say so. Also specify apex finials if desired.) The barge-boards to be mitred and cross-tongued at apex.

GENERAL BUILDING NEWS.

PROPOSED ADDITION, CHURCH OF ST. LUKE, DEEPLISH, ROCHDALE.—An effort is now being made, it is stated, to complete the Church of St. Luke, Deelish, Rochdale, by the building of the nave. The present nave is entirely of a temporary character, and the chancel, designed by Mr. R. Keill Freeman, cost 2,700l. Further plans have been prepared by the same architect, which will require about 3,000l. to carry out.

BUSINESS PREMISES, DUBLIN.—New premises in Henry-street, Dublin, are being erected for Messrs. Arnott & Co. The architect for the entire works is Mr. George P. Beater. The contractors are Messrs. H. & J. Martin for the general building work; Messrs. Homan & Rodgers for the fire-proof construction; Messrs. Cummins Brothers for the electric installation; Messrs. Waygood for the electric lifts; and Messrs. Haywood & Co. for the patent glazing of roofs.

HOSPITAL, INVERURIE, ABERDEEN.—The fever hospital which has been erected at Inverurie has been built by the Garioch District Committee and Inverurie Town Council. The hospital, of which Messrs. Jenkins & Marr, Aberdeen, were architects, consists of a ground floor and attic. The cost of the hospital has been about 2,000l. The contractors were:—Mason—Mr. William Lauder, Inverurie; carpenter—Mr. James Milne, Inverurie; plasterer—Mr. Robert Moir, Inverurie; slater—Mr. S. Christie, jun., Dyce; and plumber—Messrs. Laing & Sons, Inverurie.

PROPOSED NEW THEATRE AT HOLBECK, LEEDS.—At a meeting of the Leeds Building Clauses Committee recently, it was reported that Mr. Hainsworth (the Building Inspector), together with two or three members of the committee, had had an interview with Mr. Rhodes, the architect who has prepared plans for the erection of a new theatre at Holbeck, and that the latter had agreed to make additional alterations and to improve the access to the gallery. The committee being now satisfied with the amended plans passed them.

CHURCH EXTENSION, SEFTON PARK, LIVERPOOL.—The Mission Church of St. Pancras, Sefton Park, was recently opened. The church is subsequently to be used as a parish room and Sunday school, &c. Adjoining this is the choir vestry, and between the latter and Lidderdale-road will ultimately be built a permanent church capable of accommodating 800 people. Pending the erection of the church the services will be conducted in the mission church, which is 60 ft. by 30 ft. The ceiling has a height of 29 ft. The building is of grey brick, with red brick quoins, and Rainhill sandstone dressings to the doors and windows. The choir vestry is 23 ft. by 16 ft., and the roof is panelled in pitch pine. The lead glazing has been executed from the architect's designs by Messrs. Williams & Watson, and the zinc roofing by Braby & Co. The architects are Messrs. H. & A. P. Fry, Liverpool, and Messrs. Morrison & Sons, Wavertree, have been the general contractors. The heating work has been carried out by Messrs. Killick & Cochrane.

ST. MARGARET'S CHURCH, JUNIPER GREEN, EDINBURGH.—A dedication service took place recently in St. Margaret's Church, Juniper Green, which has just been completed from plans by Councilor R. M. Cameron, architect, Edinburgh. The church, which has cost 5,000l., is seated for six hundred people. At present the only part of the church unfinished is the tower. The fabric is a Gothic structure, cruciform in form, with side aisles, a centre nave, north and south transepts, chancel, and

apse. The nave is separated from the side aisles by five pointed arches, while the transepts and chancel are spanned in single arches from the large piers of the central square tower which rises above the building. A barrel-shaped timber roof extends along the whole length of the building, and is divided into bays by moulded ribs. A stone-arched organ chamber is placed near the chancel and south transept.

RESTORATION OF EAST TUDDENHAM CHURCH, NORFOLK.—The parish church of All Saints, East Tuddenham, has been undergoing interior restoration, Mr. G. H. Green, being the architect, and Mr. C. S. Smith, of Norwich, carrying out the work under his directions. A new floor (with the exception of the centre passage in the nave) has been put down throughout, on a bed of concrete, wood blocks being placed by the London Wood Floor Company under all the sittings. The chancel and nave have been re-seated, the pulpit and prayer-desk altered and moved, and the reredos enlarged.

SCHOOL, GRANTHAM.—By the completion of the new school for infants, on Launder-terrace, Spittlegate, Grantham, additional accommodation for 348 children is provided. Messrs. Green & Wright are architects, and the contract was entrusted to Messrs. Walker Brothers & Parks. The new school—which is intended for infants only—is constructed of red brick, with Ancaster stone dressings. The large block facing Launder-terrace is capable of accommodating 216 children. It can be divided, if occasion requires, by two sliding screens. This room is heated by three open fireplaces. Two large classrooms, each with a gallery, open from this apartment. A small room is set apart for the use of the teachers.

SALVATION ARMY BARRACKS, HARGOATE.—Memorial stones were laid recently in connexion with the erection of the new Salvation Army Barracks in Beulah-street, Hargoate. The site cost 8,000*l.*, but the lower portion of the Army saloon will be utilised for shops. The architects for the building are Messrs. H. E. & A. Bown, of Hargoate; and the contractors, Messrs. Rhodes Bros., of Shipley.

ALTERATIONS, FREE ST. GEORGE'S CHURCH, MONTROSE.—Free St. George's Church, Montrose, has been re-opened after being altered and improved. Messrs. Matthew & McKenzie, Aberdeen, were the architects, while the contractors were:—Masons, Messrs. Reid & Burnett; joiners, Messrs. J. & W. Craigie; glazier, Mr. Douglas; heating, Mr. Alexander Mung; plumbers, Messrs. Christie & Smith; and painter, Baillie Adamson.

CASUAL WARDS, ST. PANCRAS.—New casual wards have been erected in Holmes-road, Kentish Town, at a cost of nearly 11,000*l.* The new wards will accommodate forty-eight males, eighteen females, and six children. The site has a frontage of 125 ft. to Holmes-road, and an average depth of 250 ft. The front or official block is a red brick structure occupying the centre of the frontage, and standing back in a wide forecourt with a cartway entrance on either side. To the rear of this block is the main building, stretching away for a length of nearly 200 ft. to the rear, and terminating in a railed yard communicating with the oakum store, sanitary offices, and the mill room. The accommodation for males is on the ground floor, and each inmate is provided with a separate cell sleeping apartment, which will be fitted with a hammock. The women have similar accommodation upon the upper floor, the apartments to be used by women with children being of larger area, and the whole fitted with beds in lieu of hammocks. The whole of the sleeping apartments are warmed by hot-water pipes, and in each is a push connected with an electric bell and indicator in the superintendent's office. Separate entrances are provided for each sex, with covered shelters for those who arrive before the regulation time. These give access to the entrance lobbies. The bathrooms are fitted with porcelain baths, supplied with hot and cold water. From the bathrooms run long corridors, giving access to the sleeping apartments.

In the basement of the front block is a small laundry, fitted by Messrs. Bradford & Co. Here also is a Lyons steam disinfecter, with boiler and other necessary appliances, and the hot-water boilers for warming the building and for supplying the bath water. The ordinary labour test at casual wards is stone-breaking and oakum-picking, and working cells have been provided for this purpose in connexion with some of the men's dormitories. Seeing, however, that these tasks are easy for the habitual tramp and hard for the occasional wayfarer, it is proposed to adopt a corn-grinding test, which gives no advantage to the expert. The grinding shed contains a central mill room, with accommodation for twenty-two hand-mills and a flour-dresser. Each mill handle is in a separate bunk for the use of one man, and a crank, for the use of twelve men, works the dresser. The building is so arranged that the men on mills or dresser have no access to the mill room, but small glazed openings in the division walls enable the official in charge of the mill room to see each man at work, and the men themselves to note the progress they are making with their tasks, small strips of glass being let in the hoppers of the mills for this purpose. Above the mill room is a corn and flour store. The buildings generally are of plain block brickwork, but the block next Holmes-road is faced with red bricks with moulded brick and

stone dressings. The floors throughout are of concrete. The surface finish of the greater portion is limestone and cement, but the day rooms and entrance lobbies are finished with carpet and the officers' rooms with wood flooring. The buildings have been erected by Messrs. T. Gregory & Co., of Clapham Junction, from the plans and under the superintendence of Messrs. A. & C. Harston, architects, Mr. G. Poole acting as clerk of the works. The contract sum was 10,697*l.*—*St. Pancras Guardian.*

WESLEYAN CHURCH, CROWBOROUGH, KENT.—The foundation-stone of the new Wesleyan Church, at Crowborough, was laid recently. When completed, it will accommodate over three hundred people, the inside measurements being 66 ft. 6 in. by 34 ft. 6 in., and there will be a schoolroom providing for a hundred children. The building is faced externally with local stone. Bath stone being used for the chief features. Mr. F. Borcham is the architect, and Mr. G. Beard, of Crowborough, the builder. The scheme involves an expenditure of 1,450*l.*

RECREATION-ROOM, GIRLS' HIGH SCHOOL, LOUGHBOROUGH.—A new recreation-room has been erected at the Loughborough Girls' High School. Plans were prepared by Mr. G. H. Barrowcliff, and the contract was placed in the hands of Mr. A. Faulks.

RESTORATION OF RAVENFIELD CHURCH, YORKSHIRE.—On the 28th ult., the new pulpit and font of St. James's Church, Ravenfield, near Rotherham, were dedicated. In addition to necessary repairs, &c., the church has been re-seated with pitch pine benches, a carved oak reredos has been erected, and the walls of the sacarium hung with curtains, the semidome above having a colouring of blue, studded with gold stars. The pulpit is of oak, with open panels of tracery. The font is also of oak. It is octagonal in shape, and has carved panels. The restoration has been carried out from the designs and under the superintendence of Mr. E. Isle Hubbard, of Rotherham, by Mr. J. Wortley, of Rotherham. Nearly the whole of the carved work has been done by Mr. Glenn, of York.

ASYLUM BUILDINGS, BODMIN, CORNWALL.—Mr. Silvanus Treval, of Truro, has we hear, been appointed architect of the new county asylum buildings at Bodmin, which are to be erected at a cost of about 40,000*l.*

PUBLIC HALL, TEIGNMOUTH.—A site for a public hall has been secured in Station-road, Teignmouth, running back to Lower Brook-street, and the building is to be so constructed as to be capable of use for theatricals, bazaars, &c., with lobbies and cloakrooms, and separate exits into each street. The length of the hall will be 92 ft., and the width 43 ft., with height to the roof of 36 ft., and seating accommodation for 500 to 600 persons. The architects are Messrs. Watson & Watson, of Torquay.

SCHOOL, LEYTONSTONE, ESSEX.—The memorial stone of the new boys' school at Newport-road, Leytonstone, was laid recently. The works of enlargement comprise:—1. A separate and distinct school building for 600 boys. 2. The addition to girls' department of the rooms now occupied by boys. 3. The addition of a class-room to the infants' department. 4. The erection of a house distinct from the school buildings for the caretaker. Boys' school. The new school building is designed to accommodate 600 boys on two floors, five class-rooms on each floor, the school places per class varying from fifty to seventy, to allow of the varying numbers in the classes. On the ground floor is a hall, 60 ft. long by 35 ft. wide, for assembly drill and other physical exercises. All the class-rooms are entered from this hall, those on the upper floor by means of a gallery extending the whole length of one side of the hall. Staircases are provided to the upper floor at both ends of the building, and cloakrooms and lavatories on each floor. Rooms for the master and assistant teachers are provided on the upper floor. The floors throughout will be constructed with steel joists and concrete, on which will be laid solid wood block flooring. The caretaker's cottage is being erected at the junction of the two roads, and will command the entire length of the two frontages. The contract for the entire work amounts to 8,772*l.*, and is being carried out by Mr. F. J. Coxhead, of Leytonstone, under the supervision of Mr. William Jacques, of London, the Board's architect.

REOPENING OF GREAT BADDOW CHURCH, ESSEX.—On the 24th ult., after having been closed six months for repairs, the parish church of Great Baddow, near Chelmsford, was reopened. The work has been carried out by Messrs. Choat & Sons, of Chelmsford, under the superintendence of Mr. Charles Pertwee, architect.

PROPOSED NEW TOWN HALL FOR COLCHESTER.—The Municipal Officers Special Committee of the Colchester Corporation have been deliberating as to whether a new town hall should be built or whether the existing erection should be modified and added to. They have had reports from Mr. E. W. Mountford, and from Mr. Binyon, Ipswich. Mr. Mountford's report is to the effect that the present town hall hardly contains a sound plank, and that it is dangerous. To pull it about would be dangerous and costly. He estimates that if were retained, the cost of the necessary additions to work would be less than 14,000*l.* or 15,000*l.*, while the result would be unsatisfactory. In a new town hall, a hall

to seat 500 persons, a Council chamber, mayor's parlour, committee-rooms, and sets of rooms for all the borough officials, together with Quarter and Police Sessions, courts, cloakrooms, and retiring rooms for persons engaged in the business of the courts would be absolutely necessary, and this would make a grand total of 24,192 square feet of required floor. To meet this there was at disposal the site of the existing hall, Joslin's premises, a store building, engine-house, yard, and police offices, and land left little to spare. As regards the style of architecture, he favours the free classic treatment, red bricks for the fronts, the principal fronts being treated in a simple and broadly dignified manner, such money, as could be spared being spent in employing a good sculptor to illustrate the town's history, an idea carried out with good effect at Sheffield, Northampton, and elsewhere. A perfectly new building exclusive of fittings, would cost between 48,000*l.* and 50,000*l.* Mr. Binyon reports that, notwithstanding defects, he is of opinion that the existing building could be made thoroughly sound for 700*l.* to 1,000*l.* He has, however, no doubt that the best results would be obtained by pulling down the present building. He considers that a town hall might be provided for 30,000*l.*, or with cost of furnishing, architect's commission, &c., a total of 35,000*l.* The cost of altering the existing structure and adding municipal offices, he estimates at 15,000*l.* As to the style of architecture, he favours a Jacobean or a later form of English Renaissance. The site, he adds, lends itself to the most effective introduction of a fine tower. The committee have decided on the recommendation they will make, and it is said they do not favour the patchwork scheme.—*Essex County Chronicle.*

SANITARY AND ENGINEERING NEWS.

DRAINAGE OF WEST HARTLEPOOL.—The Borough Engineer of West Hartlepool, Mr. W. Brown, has just issued his report to the Town Council of the Borough on the existing sewerage of West Hartlepool, with suggested remedial measures and extensions. In regard to the remedial measures Mr. Brown says "to fully provide for a trade and domestic sewage forty gallons per head of population per twenty-four hours is regarded by many experts as a proper provision, but, after fully considering the requirements of West Hartlepool, I have come to the conclusion that thirty-five gallons per head is a reasonable amount." Continuing Mr. Brown says—"The Barn Sewer is much too small, being little more than sufficient for the upper waters west of York-road alone, during heavy rain fall, and since Baltic-street, Whitley-street, and York-road sewers are intended to discharge into it an additional capacity of 6,000 cubic feet is necessary. 2. A new sewer should be constructed in Whitley-street, from Church-street to Burn-road. 3. New sewers of much increased capacity should be constructed in Baltic-street, Oxford-street, and Cleveland-street. 4. A new and much enlarged sewer should be constructed in York-road, Park-road, Waldon-street, and Hart-road. 5. The Bridge-street and Mainsforth-terrace sewers should be constructed to new levels. 6. The existing sewers in Front-street, &c., should be raised to new levels. 7. The existing sewerage system constructed prior to 1884 being found in such an unsatisfactory condition in every way, they should be wholly reconstructed on modern lines." The approximate estimate of the cost of the scheme is 70,922*l.* 10*s.*

NEW DOCK AT BURNISLAND.—The Burnisland Harbour Board met on the 30th ult., and the business of receiving offers for the construction of a new deep-water dock was before the meeting. The committee's report on the tenders received from the elected contractors recommended that the offer of Sir John Jackson, Westminster, be accepted, and the meeting unanimously adopted the committee's recommendations. The estimate of Messrs. Melk R. Henderson, engineers, as to the probable cost of the new works was 300,000*l.*, and the tender accepted, it is understood, is between 250,000*l.* and 260,000*l.* The new dock is to have a water area of fully ten acres, and a depth at spring tides of 29 ft.—*Scotsman.*

SEWERAGE SCHEME, CRABBS CROSS.—The Eckenhead Rural District Council have instructed Mr. J. E. Wilcock, G.E., of Birmingham, to prepare a scheme of sewerage and sewage disposal for the districts of Crabbs Cross, Hint End, and portion of The Ridgway within their district.

BRIDGE, BOLTON ABBEY, YORKS.—The contract for the making of the Bardenbeck Bridge and road has been let to Messrs. Morrison & Mason, contractors, Garsington, who are executing the works for the Bradford Corporation Waterworks, the conduct of which passes close by. The engineers are Messrs. John Varley, C.E., & Son, Skipton. Being on the route of tourists to Bolton Abbey, it is intended to open the works in time for the Diamond Jubilee.

THE CLAIM AGAINST THE ST. PANCRAS GUARDIANS.—In our report of this case in G. issue for the 22nd ult., page 87, we mentioned that Mr. Kirk & Randal's matter should have been given Wm. Jas. Renshaw, instead of "Bradshaw."

FOREIGN.

FRANCE.—A Committee has been formed for the erection of a monument to Sainte-Beuve in the Luxembourg garden.—M. Frémiet is to execute the statue of Jules Simon to be erected on a site to be hereafter selected in Paris. M. Scauer Glisson will design the pedestal.—The fourth exhibition of the works of French painters in the East will be opened at the Durand Ruel Gallery on the 15th, to remain open till March 13. The exhibition will include this year, besides modern sculpture and painting, a section for Oriental Art, consisting exclusively of Persian miniature paintings, and a retrospective exhibition dedicated to the works of the late Theodore Chassériau, which deal with Oriental subjects.—M. Huet, Inspector-General in the Department of "Ponts et Chaussées," has reached the age of official superannuation, but the difficulty of finding at present any one adequate to take his place has induced the Prefect of the Seine to continue M. Huet in office until the exhibition of 1900.—The jury in the competition opened by the town of Dunkerque for a Prefecture Hôtel have awarded the first prize to M. L. Portier, architect, of Valenciennes, and the second to M. Mollet, of Lille.—The death is announced of M. Blaquière, architect, of Bordeaux. He was born in that town in 1820, and after having studied architecture under his father, came to Paris to the atelier of Uchard. Subsequently he erected in his native town a number of noteworthy buildings, marked by a special style and refinement of design. Among them may be mentioned the Hôtels of the Comtes de Gohannes and Lafourcade; the Villa Faust, at Arcachon; and the château of Bivassac, in the department of Dordogne. He was a member since 1877 of the Société Centrale, and from 1882 to 1883 was president of the Société des Architectes de Bordeaux, of which he was the founder.—The death is also announced, at the age of eighty, of M. Collin, former manager-in-chief of the Gobelins ateliers, and who sat for twenty years in the Municipal Council of Paris, where he gave most valuable assistance in all questions of artistic improvement, especially in regard to the teaching of drawing. It was owing to his suggestion and his experience that the Fine Arts department of the Paris Municipality was able to preserve and restore its ancient tapestries, a selection from which is now to be seen in the Galliera Museum.

GERMANY.—Particular attention appears to be paid at present to the development of riding schools, which have become a necessity at Berlin, owing to the frost preventing outdoor riding, which sport is growing more popular from year to year in that city. New riding-schools have lately been built near the Brandenburg Gate and near the Bendlerstrasse, and we now hear of another at Charlottenburg. As is generally the case with the modern German riding-school, stabling is provided on the ground-floor level, whilst the riding-school is some 15 ft. above the pavement, the approach generally being by an easy gradient. In this instance there are two riding-schools, the larger of which measures 150 ft. by about 75 ft., while under it room has been found for ninety-three stalls and eight boxes. The architects are Messrs. Ende & Böckmann, and the total cost is 35,000*l.* We regret to record the death of Herr Arnold Bergstrasser, of Darmstadt—a well-known German architectural publisher—who has been responsible for such large publications as the "Handbook for Architecture," "The Heidelberg Castle," and other important technical works.—The twenty-fifth anniversary of office of Mr. Zimmermann, City Architect, of Hamburg, has been celebrated with considerable ceremony. Mr. Zimmermann has been responsible for an expenditure of over three millions sterling, more particularly on the numerous school buildings erected at Hamburg, and on the large and many important buildings in connexion with the new free harbour in that city. Mr. Zimmermann is also well known as a frequent visitor to this country, the occasion of his last visit being, we believe, to inspect the new fire stations built in London and the provinces.—From Hamburg we hear of a competition for the best method of heating conservatories, with particular reference to the requirements of the Horticultural Exhibition Committee of that town. A very influential jury will award the premium, the selection of the assessors being from master gardeners and engineers. April 1 is the sending-in day for the designs, the first premium being 50*l.*

AUSTRIA.—At a season when many visitors to the Mediterranean make some sojourns at Abazia, it is of considerable interest to note that new waterworks will be constructed for this resort, according to the design and under the supervision of Herr Anton Hecker, whose experience in waterworks for minor townships has been considerable. The promenades at Abazia are to be lighted by electricity.—The work for the Metropolitan Railway at Vienna has been carried out very energetically during 1896. The official report shows that about equal progress has been made on all sections of the line, both in the levelling of the track and in the new buildings.—Vienna is to have its first electrical tramway in the course of a few days, according to the system of Engineer Bannak, the principle of which is the installation of contact studs between the rails at a distance of some four or five metres from one

another. This prevents either the necessity of a third rail being laid in between the two principal rails or wires being carried overhead.—The architects of Vienna propose giving a large ball under the patronage of Prince Otto. Herr Oberbausch Wagner has taken the matter in hand.—Professor Neumann and the Cathedral architect, Herr Julius Hermann, have been appointed members of the special Government Commission on the Historical Monuments of Austria.

MR. RHODES'S SOUTH AFRICAN RESIDENCE.—One of the last acts of Mr. Rhodes before leaving Cape Town for England was to instruct Mr. Herbert Baker, architect, to rebuild his house which was lately destroyed by fire. The original design will be closely followed, except that Dutch tiles will be used for the roofing in place of the thatch in which, in the former building, the fire is supposed to have originated. The bronze bas relief of "The Landing of Van Riebeck," placed over the entrance to the house, was fortunately preserved unharmed, together with many of the most important works of art within.

MISCELLANEOUS.

THE INCORPORATION OF WESTMINSTER AND OF KENSINGTON.—Local committees have been formed to present petitions to her Majesty in Council in respect of the proposed incorporation of Westminster and of Kensington, under the Municipal Corporations Act, 1882. The united parishes of St. Margaret and St. John, Westminster, with the hamlet of Knightsbridge, population 55,509, rateable value 870,000*l.* are at present governed by a Vestry which was reconstituted in 1888, upon the dissolution of the Local Board of Works appointed in 1855. The Vestry, as such, claim to be the most ancient of their kind in London, carrying back their record for the civil parish to more than 350 years. Westminster, as another name for Thorney, is cited in Offa's (reputed) charter of A.D. 785; the boundaries of the manor which King Edgar gave to the Abbey by a generally accepted charter included parishes of which Langton deprived it in 1222, namely, St. Giles-in-the-Fields, St. Andrew, Holborn (in part), St. Bride, St. Clement Danes, St. Mary-le-Strand (Holy Innocents), and St. Dunstan-in-the-West. In 1535 it was further reduced for Henry VIII.'s new parish of St. Martin-in-the-Fields; out of the latter were successively taken St. Paul, Covent Garden, St. John the Evangelist, St. Anne, Soho, St. James, Piccadilly, and St. George, Hanover-square parishes. The detached portion of St. Margaret's contains nearly all Kensington Gardens, with the Palace and grounds (*olim* Neate Manor-house), Kensington Gore, and a slip of Hyde Park—these belonging to Eia, the three manors of Hyde, Neate, and Ehury, which Geoffrey de Magnavilla bestowed upon the Abbey *teme* William I. In Elizabeth's reign the civil government of Westminster was settled in lay hands, yet a survival of earlier times is found in the appointments of High Bailiff and High Steward—the latter by the Dean. The first High Steward was William Cecil, Lord Burleigh, nominated by Dean Goodman. In the muniment-room at the town-hall are records of parochial matters, beginning with the year 1464. In 1892 St. Mary Abbot's, Kensington, parish contained 24,139 rated householders, the rateable annual value being 1,164,947*l.* In Domesday Survey the manor of Chenevist appears as being held by Aubrey de Vere of the Bishop of Coutances, Aubrey, ancestor of the de Veres, Earls of Oxford, gave a large part of his holding, including the church, to the abbots of Abingdon; the remainder continued in the de Veres until 1266, when it passed through female descendants of the last male of that house to the families of Neville, Cornwallis, and Wingfield. In Edward III.'s reign it was valued at 20*l.* 5*s.* 6*d.*, arising out of a message with dove-house, one windmill, 360 acres of arable land, 24 acres of pasture, and 140 acres of wood, rents of tenants, &c., and is now represented, it seems, by Holland House, built, 1607 (and reputedly by Thorpe) for Sir Walter Cope, whose daughter Isabel married Henry Rich, advanced Earl of Holland in 1624. The wings are later. Thorpe's drawing, at the Soane Museum, is inscribed, "Sir Walter Cope plectet p me.—J. T."

A SHIP LIFT ON THE DORTMUND CANAL.—We have frequently referred to the extensive canal works being carried out in Prussia in connexion with a systematic programme of water-way inter-communication brought forward by the Government. The canals, as such, cannot be classed among works of considerable technical interest, but a number of the docks, locks, &c., call for comment. We would particularly call attention to a new ship-lift on the new canal between Dortmund and the Ems Harbours, which practically comprises an enormous tank into which the ships are first floated, the tank being then raised by a system of diving bells. The length of the tank is 70 metres, and its width 8½ metres; it allows for a water-level of 2½ metres. The tank is supported by five wrought-iron columns, and there in turn rest on five diving bells or buoys, which float in large reservoirs, and can be raised or lowered according to the amount of water let into the reservoir. The diameter of each reservoir is about 8 metres, or 25 ft.; boats of 600 tons capacity can be raised in the tank. The ship-lift is certainly one of the most interesting pieces of modern constructon

on the Continent. The patentees and constructors are Messrs. Haniel & Lueg, of Dusseldorf.

CITY COMMISSION OF SEWERS.—On the 26th ult. a meeting of the City Commission of Sewers was held at Guildhall. On the motion of Mr. Alderman Treloar a cordial vote of thanks was accorded to Mr. Benjamin Turner, the chairman, for his services in that capacity during the year. Mr. Turner, in reply, referred to the improvements carried out or projected during the year by the Commission, among these the most important was the intended widening of the western end of Cheapside, which would cost 160,000*l.* Other improvements at that part of the City would be the rounding off of the Post Office end of Newgate-street, and a corresponding advantage on the other side. The widening of Fleet-street between Salisbury-court and Ludgate-circus would be of vast public benefit, as would be the improvements in Thames-street. The Finance and Improvement Committee reported that the London County Council refused to contribute to the proposed widening of the eastern end of Widgegate-street. It was resolved to ask them to reconsider the decision. It was stated that the vacant land in Widgegate-street had been sold for nearly 30,000*l.*

MEDIEVAL ARCHITECTURE.—On the 25th ult., in the principal hall of the Nottingham Mechanics' Institution, Mr. Arnold Mitchell delivered a lecture on "English Architecture of the Middle Ages." In the course of his remarks, Mr. Mitchell, referring to Dnrham Cathedral, said that the edifice was the most beautifully situated of all English cathedrals, only rivalled, not equalled, by Lincoln. Its main feature was what was seen in all the great cathedrals—three large towers. Mr. Mitchell then proceeded to show how these towers gave external expression to the structural arrangement of the plan, referring to the great space which is devoted to the clergy, he said that few of the cathedral churches were built originally as cathedrals (Lincoln was an exception). They were only lesser portions of a great ecclesiastical foundation. They were monastic churches, and this was the reason why they had the extraordinary elongation of the eastern limb of the building. Returning to the subject of the towers, the lecturer explained that they also gave the required stability and strength to the long line of arches inside. The towers, he said, further, were intended to support spires, but Lichfield was the only instance in which this idea had been carried out, and in which the spires were still standing. The lecturer devoted some remarks to the lighting of the buildings from the top, which was the secret of obtaining entirely satisfactory light. In all periods of architecture this fact had been recognised. The Pantheon at Rome was the oldest building, he supposed, still standing, and in ordinary daily use. This building was without a single window, being lighted by a great hole, 30 ft. in diameter, in the centre of the dome. How barbarous and how primitive, they might say. Notwithstanding, there was not a single building in existence more beautifully lighted than was the Pantheon at Rome. Mr. Mitchell found much to relate in reference to the architectural beauties of Lincoln Cathedral, saying that Lincoln could teach them all they could desire to know of its beautiful period of architecture. It was divided into three groups, and extended over about one hundred years. He traced the history of the beautifying of the stonework by the early builders, and explained the manner in which they first began to enrich their ornamentation, exhibiting on the screen an example from Chichester to show the very early methods, and subsequently introducing photographs from Rochester, Peterborough, Lincoln, &c. Mr. Mitchell concluded with details of the west front of Peterborough Cathedral, strenuously advocating the restoration by the Dean and Chapter, he carried the large audience entirely with him in support of their scheme. The lecture was illustrated by lantern views.

THE PATENT OFFICE.—After a service extending over forty-seven years, Sir Henry Reader Lack retires this month as Comptroller-General of the Patent Office. When chief of the Statistical Department, Board of Trade, he was placed in charge of the Trade Marks Registry, opened on January 1, 1876. In March of that year he succeeded the late Bennet Woodcroft, F.R.S., as Clerk to the Commissioners of Patents for Inventions. Upon the abolition of the Commissioners, under Mr. Chamberlain's Act of 1883, the Patent Office, with the Registry of Trade Marks and Designs, was reconstituted as a department of the Board of Trade, a large staff of expert examiners of specifications was appointed, and Sir Henry Reader Lack was made Comptroller-general. We understand that the Comptroller (knighthood in June, 1891) will be presented by the members of his staff with what should prove a highly gratifying token of their regard and appreciation of his public services, and that to the appointment is attached a maximum salary of 1,500*l.*

BARRY MASTER BUILDERS' ASSOCIATION.—A meeting of the master builders of the Barry district was held at Barry Docks recently. Mr. Geo. Rutter, occupying the chair, when it was unanimously resolved to form a Master Builders' Association, with the following officers:—President, Mr. G.

* *Obit.* February, 1879. Founder of the Patent Office Museum and Free Library; formerly a consulting engineer, and Professor of Machinery, University College.

Rutter; vice-President, Mr. C. H. Hirst; secretary, Mr. E. E. Bryant, 11, Glamorgan-street, Barry; treasurer, Mr. E. Jones; committee, Messrs. S. Hopkins, H. Lloyd, W. W. Don, N. Thomas, E. Phillips, J. A. Marston, Jonathan Lewis, J. Poot, and E. J. Ince. The Chairman reported that a draft code of working rules had been received from the local Carpenters' Association, and it was decided to consider the same at the next meeting.

BRISTOL MASTER BUILDERS' ASSOCIATION.—The annual meeting of this Association was held on the 28th ult., at the Guildhall, Small-street, under the presidency of Mr. C. A. Hayes. The Secretary (Mr. Henry J. Speer) presented the annual report, which stated that the past year had been a fairly active one, business being active in most of the branches of the building trade, and the work of the Association had probably been of a more attractive character than in the preceding year. Several discussions had taken place during the year with reference to priced bills of quantities, and the following resolution was adopted by a large majority:—"That, in the opinion of the members of this Association, the practice of depositing priced bills of quantities with architects at the delivery of the tender is both unfair and inconvenient to the contractor, and should be discontinued by the members from November 5 last." This resolution was duly brought under the notice of the member of the Association, with an intimation that should they be invited to tender for a job where it was stipulated for the quantities to be sent in, they were to inform the Secretary, and the Committee would at once take up the matter, and thus avoid any friction arising between the member and the architect, and should the contract be accepted, of course the member could then let the architect have a copy of the priced quantities if required. Reasons having been assigned by some of the members that the resolutions passed upon May 27, 1891, were not considered still in force, the Secretary was thereupon instructed to call the attention of the whole of the members to the same, and to enclose a copy of the form of tender, together with the resolutions referred to, to follow. That, on and after the 1st of July next, the enclosed form of tender will be adopted by this Association, and that the members of this Association conform to such form for all work in this city and district." "That, from this date, the members of this Association pledge themselves not to sign any contract in which any professional man employed by the principal is the sole arbitrator. During the year there had been two plasterers', one bricklayers', and one painters' disputes, but it was satisfactory to state that all had been of a very trivial nature, and that though in most instances boards of conciliation had met and discussed the points at variance between the employers and employed, yet they all had been settled in a most amicable manner, and with great despatch. Mr. C. A. Hayes moved, and Mr. A. Krauss seconded, the adoption of the report, which was carried *nem. con.* The treasurer (Mr. George Humphreys) presented the audited accounts of the Association, which showed a credit balance of over 50*l.* The President moved and Mr. George Humphreys seconded, and it was resolved by acclamation, that Mr. August Krauss be elected President of the Association for the current year. Upon the motion of Mr. E. Walters, seconded by Mr. Geo. Wilkins, it was resolved unanimously that Mr. William Church be elected Vice-President for the ensuing twelve months. The re-election of Mr. George Humphreys as treasurer to the Association was unanimously adopted upon the motion of Mr. Frank Cowlin, seconded by Mr. A. S. Scull. The election of the committee was then proceeded with, and at the close of the proceedings Mr. A. Krauss, Mr. C. A. Hayes, and Mr. William Church gave a report of the proceedings in connexion with the National Association at Blackburn recently. A vote of thanks was accorded to the retiring President (Mr. C. A. Hayes) for his valuable services during the past year.

INDUSTRIAL AND TRADES EXHIBITION, LEAMINGTON.—An eleven days' Industrial and Trades Exhibition was opened at the Winter Hall, Leamington, on the 2nd inst., by the Mayor.

LEEDS BUILDERS' EXCHANGE CLUB.—The annual dinner of the Leeds Builders' Exchange Club was held in Fairburn's City Restaurant on the 29th ult. Mr. G. Burnell presided over the gathering of about 80 members and friends. "The Mayor and City Council, and the Chairman of the Highways Committee," was proposed by Mr. J. Speight. Mr. W. H. Cliff proposed "The Chairman and Deputy Chairman of the Building Clauses Committee and Officials." Mr. Batley, Chairman of the Committee, responded. Mr. Carter, Mr. D. Hainsworth, and Mr. W. Towers also responded. Mr. Hainsworth said that anyone who had seen the slums of Leeds would agree that it would have been a blessing if the Building By-laws, made as they were criticised, had been in force 10 years ago. He referred with pleasure to the settlement of the strike in the building trade, adding that, in spite of it, more plans had been passed last year than in any previous one. Never at any time had the work of the builders in the city been done better than it was at the present time. "The Visitors" was proposed by Mr. E. Stead, and responded to by Mr. Freeman and Mr. Sawlow. "The Leeds Builders' Exchange

Club" was given by Mr. Dews, and Mr. Puffitt responded. After dinner, a smoking concert was held in the club's rooms.

BUILDERS' ASSOCIATION DINNER AT HANLEY.—The annual dinner of the Potteries, Newcastle, and Leek branch of the National Builders' Association took place at the "Saracen's Head" Hotel, Hanley, recently. Mr. J. Gallimore (Newcastle) presided, and the vice-chairs were occupied by Mr. W. Grant (Burslem) and Mr. L. Price (Stoke). After dinner the loyal toasts were proposed. Mr. W. Cartledge (Burslem), in submitting the toast of "Success to the Building Trade and the Builders' Association," said, from the present outlook success seemed a long way off. Success in the building trade depended upon the treatment which they experienced, and they were told by their secretary that according to a notice received from the operatives they were to be hampered by delegates from the trades union going to a job, and even to a builder's yard, to make inquiries at various stages. This would sure to entail a loss upon the builder, because the moment a delegate appeared, men put down their tools and wanted to know what he was after. If the delegates were going about in that way to examine men's tickets, the employers would suffer, by reason of work being hindered. Then again, if a builder was to be successful he must have control over his own business, and regulate the numbers of apprentices according to his requirements. The next thing which he wished to mention was the new Truck Act, which he recommended every builder to carefully examine and consider: it should be brought before the National Federation of Great Britain. Mr. J. Bowden (Burslem), the secretary in responding, said it was their duty to be united and to meet the requirements of the workpeople in a fair and reasonable manner. Trades unions were an institution, and they had to be dealt with, and the only way to deal with them was for employers to meet workmen in harmony and strength. It would be better for the masters if every workman belonged to a trades union. One source of weakness was that many workmen did not belong to trades unions, and were not under the same instructions to delegates would be final. With two or three exceptions all the builders of the district were in the Association.—Mr. Cooke, one of the auditors, having presented a financial statement, the President said Mr. George Ellis, Mr. Bowden, and himself were the only three present who were members of the old Builders' Association. During the seven years of the present organization Mr. Ellis had been their hon. secretary. How well he had done the work they all knew. The members of the Association wished to mark their sense of Mr. Ellis's good qualities by presenting him with a testimonial on his retirement. He (the President) then presented to Mr. Ellis, on behalf of the subscribers, an illuminated address, bound, and containing ninety signatures, also a purse of money. Mr. Ellis briefly replied. Mr. J. Bagnall (Tunstall) proposed the toast of "The President and Officers." Mr. Gallimore, in reply, strongly urged them to band themselves together for their own well-being as tradesmen. Mr. L. Price and Mr. Chas. Smith (Tunstall) also responded. The toasts of "The Visitors," for whom Mr. E. J. Hammersley responded, "The Press," and "The President" followed.

CAPITAL AND LABOUR.

THE COVENTRY WORKMEN'S DEMANDS: INCREASE GRANTED.—As was reported in these columns recently, at the end of last year applications were received by the Coventry Master Builders' Association from every branch of the building trade, except the painters, for an increase of wages; and in several cases also the employers were asked to assent to important alterations to the trade rules. Carpenters, who were receiving 8*d.* per hour, asked for a "minimum wage" of 9*d.*—the masters could give more if they liked; bricklayers, plasterers, and masons applied for an increase from 8*d.* to 9*d.*, and mason fixers from 8*d.* to 9*d.* Bricklayers' labourers, who were getting 5*d.*, requested an advance of 3*d.*, and plasterers' labourers and scaffolders desired 1*d.* increase, from 5*d.* to 6*d.* The Masters' Association have now considered the applications, which affect 5,000 men, and have decided to grant the carpenters, bricklayers, plasterers, and masons a fixed increase of 3*d.*, and the various labourers 4*d.* per hour, and to meet them part of the way in reference to the proposal to introduce new rules. The replies to the trade societies have yet to be received. It is possible they may not be satisfied with the concessions; if not, the matters will be settled by arbitration. With regard to the alteration of rules, the carpenters and joiners, bricklayers, and masons each asked for a reduction of working hours, viz., carpenters 2 hours, bricklayers 3 hours, and masons 2 hours. To this the masters reply that they will consent to any reasonable alteration, provided that there shall be uniformity in the working hours in all branches of the trade. With regard to the bricklayers alone, the masters agree to the omission of the following rule, which has hitherto prevailed:—"Neither masters nor men shall interfere with any man on account of his being a society or non-society man. The society men pledge themselves not to annoy

non-society men, and the masters pledge themselves not to annoy or allow any annoyance to society men." As to the question of apprenticeship, the masters assent to the indentures being extended from three to at least five years. They also agree to convert 1*l.* 5*s.* 6*d.* ball count from 5.30 p.m. instead of 8 p.m.

WAGES IN THE OLDHAM BUILDING TRADE.—The Builders' Association of Oldham and district has received notices for advances in wages, &c., as follows: (1) The operative bricklayers have given three months' notice for an advance in wages from 9*d.* to 10*d.* per hour, such notice to expire on April 30, 1897. (2) The operative plasterers have given six months' notice for an advance in wages from 8*d.* to 9*d.* per hour, and an alteration of existing rules as to overtime, &c., such notice to expire on July 15, 1897.—*Manchester Courier.*

LEGAL.

AN ARCHITECT AND HIS ARTICLED

PUPIL:

ACTION FOR DAMAGES.

The case of Sadgrove v. Coad came before Mr. Justice Charles, sitting without a jury, in the Queen's Bench Division on the 17th ult. It being an action brought by Mr. Edwin James Sadgrove, an architect and surveyor, of Surrey-street, Strand, to recover from the defendant, Mr. John Coad, of Tunbridge Wells, damages for the alleged breach of certain covenants contained in an apprenticeship indenture dated October 23, 1894, entered into by Mr. Richard Henry Coad, deceased, the defendant being sued as the executor of Mr. R. H. Coad.

The statement of claim alleged that the indenture in question contained a covenant that Mr. Percy Arthur Coad, the son of Mr. R. H. Coad, should faithfully and diligently serve the plaintiff as clerk and articled pupil during the term of three years, and that Percy Arthur Coad would not absent himself from such service without the plaintiff's consent; that on September 15, 1896, Percy Arthur Coad had unlawfully absented himself without the plaintiff's consent, and had ever since continued to absent himself, and refused to serve the plaintiff. The plaintiff alleged that inasmuch as his pupil had become of value to him on September 15, 1896, he had been injured by his continued absence, for which he claimed damages.

The defence pleaded was that it was a term of the indenture that the plaintiff should to the utmost of his skill and knowledge teach and instruct, or cause to be taught and instructed, P. A. Coad in the profession of an architect and surveyor in consideration of a premium of 50*l.*, and that the plaintiff had neglected and refused to do so, and had prevented him from learning his profession by employing him on other work than that agreed upon, and whereby he had failed to obtain the benefit of the agreement. The defendant counter-claimed for the return of the premium and for damages.

Mr. Kemp, Q.C., and Mr. J. C. Earle appeared as counsel for the plaintiff; and Mr. McCall, Q.C., and Mr. G. M. Cohen for the defendant.

The plaintiff in his evidence-in-chief stated that Mr. P. A. Coad had become useful to him in his business, and that to fill his place would cost him 250*l.* per annum for a qualified man.

Mr. McCall cross-examined with a view to showing that the witness had constantly sent Coad on errands of a personal character which had nothing to do with his profession. The witness further stated that Coad did plenty of work as an architect, and that he was to be secretary and clerk of works to a company he had promoted at Dulwich, where he would have had a splendid opportunity of gaining experience in his profession. Coad was to receive a salary of 100*l.* a year from the company, but out of that he was to pay an assistant 1*l.* a week.

Re-examined: Coad had never made any objection to going for little errands for him.

Mr. Thompson, an architect and surveyor, and an Associate of the Surveyor's Institution, gave evidence as to frequently assisting Mr. Sadgrove in his business. So far as he saw Coad was instructed in the work of the office, and he himself had instructed Coad. He did not remember Coad making any complaint about not being instructed.

Cross-examined: He had his own practice to attend to. Mr. Sadgrove assisted him sometimes and sometimes he assisted Mr. Sadgrove. He would not be the person to receive complaints from Coad.

Mr. Harry Watkins, examined, said that he entered the plaintiff's employment in 1893, and became articled to him in July, 1894, and was in the office the whole time Coad was there. Coad performed the same duties as himself. Quantity surveying was witness's forte, and he went into that more than architecture. Coad was instructed from time to time by the plaintiff. When the plaintiff was away qualified assistants were left in charge. Coad had complained to him about being sent on errands by the plaintiff, but that occurred very seldom. At the time Coad left he was able to assist in the work of the office. Coad had made progress.

Cross-examined: Coad was of use to the plaintiff at quantity surveying. He got on better at quantity surveying than Coad, as he kept almost exclusively

quantity surveying. Coad did complain to him as he was put to do work that an office boy should have done. Coad had complained to him of dusting the plaintiff's office.

Re-examined: The housekeeper employed there sometimes did not dust properly, and he and the other gentlemen used to dust sometimes to save the trouble of sending for the housekeeper. Coad rarely seldom complained to him about going errands for the Sages.

Mr. King gave evidence as to entering the service of the plaintiff in February, 1896. During the time he was there Coad was treated as an articled pupil in the same way as Mr. Watkins. Witness entered Mr. Sadgrove's service as an improver, to gain experience. He had previously served his articles. Mr. Sadgrove had more work than could be done during office hours, and he (witness) did many hours overtime work for him. Coad had made drawings as an architect, and had also been sent on quantities. Coad most certainly had an opportunity of learning his business if he had liked to do so.

Cross-examined: He went to the plaintiff as an approver at a salary of 2l. 2s. a month, with extra remuneration for overtime work.

For the defence Mr. P. A. Coad, called and examined, said that when he first went to the plaintiff's office no boy was kept to do the ordinary work. From time to time he used to visit the plaintiff's office in conjunction with Watkins, the other articled pupil. He did that on many occasions.

His Lordship remarked that the witness had kept very minute diary, and it was curious to find that he did not say much in it about the dusting.

The Witness: Because I did not put it down.

His Lordship: It does not matter a twopenny piece whether the witness did or did not dust the plaintiff's papers.

Examination continued: As far as quantity surveying was concerned Mr. Sadgrove had instructed him in the way to take abstracts and to square dimensions, but any one could learn how to do that in about five minutes.

He had been on several personal errands for the plaintiff from time to time. He had been sent by the plaintiff to the tobacconist, and also to the tailor, and boots to be mended. The sum of 540l. had been put in the Dulwich Company by his brother and himself. The plaintiff had never expressed satisfaction at any work witness had ever done, and he had received no encouragement. He was absolutely of no use in taking out quantities.

Cross-examined: He had never written to the plaintiff making a complaint he had made them. The plaintiff had complained to him of the way he had done his work sometimes. The reason he had remained with the plaintiff for two years was because he did not wish to create any unpleasantness between the plaintiff and his father. Since his father's death he had been studying architecture privately. He came into an annuity a few days before he threw up his articles. He had not earned any money since he threw up his articles.

Mr. John Coad, the defendant and the uncle of Mr. P. A. Coad, gave evidence as to a conversation which he had had with the plaintiff, who then told him that he (the plaintiff) had advised young Coad to get out of it, as he was of no use in the work adapted for the profession.

Cross-examined: His nephew was a moderately intellectual young man, but not at his profession. He did not think that his nephew was capable of doing out quantities.

At the conclusion of the defendant's case, Mr. Coad addressed his Lordship in mitigation of damages, stating that he could not now deny, having heard the evidence, that there had been a breach of the agreement with the plaintiff.

Mr. Kemp having replied,

His Lordship, in giving judgment, said that having heard the evidence he had no doubt whatever that the plaintiff had done his duty by the young man in mitigation. The plaintiff did a large business and gave young Coad ample opportunity of seeing that business. Further, the plaintiff had instructed him, as far as he could, himself, and when not able to attend himself, there were able assistants in the office who could give instruction to him. His opinion was that at the close of the second year of his articles young Coad was a great deal of use to the plaintiff, although he (Coad) had invited him to believe he was next door to a blockhead and of no use at all. He felt that the young man had done an unreliable account of his own capacities, as he had no doubt that he had learned a great deal in the last two years. There was proof of that, because he could not believe that a man like the plaintiff, who was working up a company to develop the Dulwich Estate, would propose to put the youth in a responsible position of secretary and clerk of works at a salary of 100l. a year if he was the incompetent person he (Coad) said he was. On the other hand, he was of opinion that the plaintiff had exaggerated the damage he had suffered. There was no evidence to warrant the assertion that had the services were worth 250l. a year to him. He thought that the proper thing to do would be to give

judgment for the plaintiff for 55l. on the claim and also judgment for the plaintiff on the counter-claim, with costs.

Judgment accordingly.

THE COUNTY COUNCIL AND THE BUILDING ACTS.

AT the North London Police-court on the 29th ult., Mr. William Hickling, of Stoke Newington, and Mr. A. T. Frampton, of Bournemouth, were summoned before Mr. d'Eyncourt for paying rates in respect to a series of buildings in Prince George-road, Stoke Newington. The sum claimed amounted to 136l., and Mr. Webb, who appeared for the Vestry, asked that orders should be made for the payment of the amount forthwith.

The rate had been made in respect to the buildings on a piece of land 120 ft. wide by only 20 ft. deep. The buildings have been the subject of much litigation. The County Council alleging that the buildings, which had been erected at great expense, stood out 7 ft. beyond the building line. Nearly two years ago the High Court decided in favour of the County Council, and the case being remitted to this court, the magistrate (Mr. Lane) made an order for 7 ft. of the whole length (120 ft. of the building) to be demolished. On the 29th ult., as the owner had not complied with this order, the Council proceeded to erect a hoarding round the buildings preparatory to the 7 ft. of the whole length being demolished.

Mr. Hickling said that this action on the part of the Council altered his position with regard to the paving rates. His frontage was being altered into a flankage, and he objected to pay frontage rates for a flankage such as the land would be when the Council had demolished his building—a receptacle for all the dead cats and rubbish of the neighbourhood.

Mr. d'Eyncourt said that the position was clearly altered. He would adjourn the case for twelve weeks to see whether the Council did pull the building down.—Morning Advertiser.

THE LONDON BUILDING ACT.

BEFORE the Lord Mayor, at the Mansion House, on the 12th ult., C. F. Kealey, a builder in High-street, Kensington, was summoned under the London Building Act, 1894, for failing to comply with a notice of irregularity requiring certain omissions to be remedied in the building of premises at 60, Cheapside.

Mr. Hugh McLachlan, the District Surveyor, who appeared in support of the complaint, said the builder was willing to do the work required, but the architect and owner declined. The question was whether certain dormer windows on the roof of the premises which were constructed of wood covered with lead were combustible within the meaning of the Act, because, if so, the party walls must be made 12 in. higher and wider on each side of them to comply with the Act, and that was what the notice served on the defendant required to be done.

Mr. Dalry, solicitor, who appeared for the owner of the premises, contended that the dormers being covered with lead were not combustible, although the lead might be melted by fire. There was only a small proportion of wood, and his view was that lead and glass were not combustible.

The Chief Clerk (Mr. Douglas) said the list of fire-resisting materials enumerated in the Act did not include lead.

The Lord Mayor, observing that it was a pity the Act was not more explicit, directed the notice to be complied with within a month, and granted 13s. costs.—Morning Advertiser.

MEETINGS.

FRIDAY, FEBRUARY 5. Architectural Association.—Mr. A. S. Flower on "The Written Chapter of English Architectural History." 7.30 p.m. Royal Institution.—Professor Jagadis Chandra Bose, M.A., D.Sc., on "The Polarisation of the Electric Ray." 9 p.m. Institution of Mechanical Engineers.—Annual General Meeting (concluded). 7.30 p.m. Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of the members. 8 p.m.

SATURDAY, FEBRUARY 6. Sanitary Inspectors' Association (Carpenters' Hall)—6 p.m.

MONDAY, FEBRUARY 8. Royal Academy of Arts.—Fifth Lecture on "The Advancement of Architecture, Chiefly in Relation to Gothic Architecture," by Professor Atchison, A.R.A. 8 p.m. London Institution.—Mr. Cyril J. Davenport, F.S.A., on "Decorative Bookbinding from Medieval Times," illustrated. 5 p.m. Surveyors' Institution.—Mr. J. W. Willis Budd on "Allotments and Small Holdings." 8 p.m. Society of Arts (Cantor Lectures).—Mr. William Burton, F.R.C.S., on "Material and Design in Pottery," IV. 8 p.m. Clerks of Works' Association.—Fourteenth Annual Dinner, Holborn Restaurant (The King's Hall). The chair to be taken by Mr. Beresford Pitt. 9.30 p.m.

TUESDAY, FEBRUARY 9. Society of Arts (Applied Art Section).—Mr. George Cullison on "Lithography as a Mode of Artistic Expression." 8 p.m.

Institution of Civil Engineers.—Mr. H. F. Donaldson on "Cold Storage at the London and India Docks." 8 p.m. Carlisle Architectural, Engineering, and Surveying Society.—Mr. G. Slack on "Warming of Buildings."

WEDNESDAY, FEBRUARY 10.

Sanitary Institute.—Dr. F. J. Waldo on "Sanitary Supervision of Shelters for the Homeless." 8 p.m. Society of Arts.—8 p.m. Edinburgh Architectural Association.—Mr. Alexander Drew, C.E., on "The Practical Designing of Iron and Steel Roofing," IV. 8 p.m.

THURSDAY, FEBRUARY 11.

Royal Academy of Arts.—Sixth Lecture on "The Advancement of Architecture, Chiefly in Relation to Gothic Architecture," by Professor Atchison, A.R.A. 8 p.m. Royal Institution.—Mr. J. W. Gregory, on "The Problems of Arctic Geology," I. 3 p.m. Society for the Encouragement of the Fine Arts.—Mr. James Orrock, R.I., on "William Miller." 8 p.m. Institution of Electrical Engineers.—Continuation of discussion on Mr. F. T. Hollins paper on "Electric Interlocking the Block and Mechanical Signals on Railways." 8 p.m. Society of Arts (Indian Section, Imperial Institute).—Professor Jagadis Chandra Bose (of Calcutta), D.Sc., on "The Progress of Science Teaching in India." 4.30 p.m.

FRIDAY, FEBRUARY 12.

Institution of Junior Engineers (Westminster Palace Hotel).—Paper on "The Construction of High-class Bridge and Girder Work," by Mr. J. A. Macpherson. 8 p.m. Royal Institution.—Professor John Milne, F.R.S., on "Recent Advances in Seismology." 9 p.m. Institution of Civil Engineers (Students' Meeting).—Mr. H. W. Barker on "Cooling Reservoirs for Condensing Engines." 8 p.m.

SATURDAY, FEBRUARY 13.

London and Provincial Builders' Foremen's Association.—Annual Dinner, Holborn Restaurant. 7 p.m. Edinburgh Architectural Association.—Visit to Brougham School.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

161.—DRAIN TRAP: J. W. Maerns.—This invention consists in a trap formed of one piece of stoneware which inventor claims is self-cleansing. It is not so deep as other traps, though providing sufficient water-seal; flow of matter and water through trap is unobstructed, and it can be fixed to existing drains without reducing the gradient.

351.—PREVENTING FROST FROM BURSTING PIPES: J. G. Jones.—In order to efficiently empty pipes from cisterns when stop-cock is turned off and draw-cock is turned on, inventor forms an air channel in the outer surface of, and between the two openings in the plug of the stop-cock, and extending from the top of the plug (and consequently open to the air) towards, but not reaching, the bottom of the plug. A similar air channel may be used in the spindle of screw-down tap.

3223.—CEMENT OR ARTIFICIAL STONE: F. Turner.—Inventor relates to a novel compound, composed of powdered limestone and powdered waste slate, and powdered stone or stone chippings, in suitable proportions, intimately mixed with fresh or salt water. The slip or slurry, if for cement, is spread upon layers of coke in a kiln to the desired depth, for the water or moisture to be absorbed by the coke, and be rapidly dried thereby. The coke becomes slightly impregnated with limestone and the result is a better cement.

20,665.—WINDOW AND DOOR FASTENER: A. R. Emsphart and Another.—Invention consists in a modification of the brass pivoted arm-catch at present in ordinary use for sash windows, &c. Inventors form a projection inside the brass plate which holds the catch (that on lower sash), and a corresponding recess in plate which bears arm (that on upper sash), with the result that any interference between the meeting bars of sashes is bridged over by this projection, and the blade of a knife, &c., inserted between projection and recess, will not force back the arm which fastens the window.

24,242.—ARTIFICIAL STONE: A. Clerly.—Invention consists in the preparation of a more or less plastic, strong mass, suitable for various purposes. The formulae are:—Solid Mixtures:—(1) Zinc oxide, 33 per cent.; pulverised sandstone or freestone, 67 per cent. This is used for restoring weathered or decayed stone, and for mouldings, vases, statues, &c. (2) Zinc oxide, 30 per cent.; pulverised Portland stone, 35 per cent.; sand, 35 per cent. For lining basements, vaults, cisterns, &c. (3) Pulverised marble, 50 per cent.; silver sand, 20 per cent.; zinc oxide, 30 per cent. For interior walls, cornices, &c. (4) Crushed granite, 70 per cent.; zinc oxide, 30 per cent. For pavements, steps, landings, &c. Liquid Mixtures:—Aluminate acid, 65 per cent.; zinc, 35 per cent. (or thereabouts). For forming solids into paste.

26,145.—WATER AND LIQUE TAPS: F. Bell and Another.—Inventors form an annular groove around a conical plug or tap, which, when in proper position relative to neck and nozzle of tap, permits water to flow around it and out. When screwed down, however, this groove descends below the passage of tap, and only the upper solid part of plug comes there, closing up the channel. Various modifications are specified, and the invention is applicable to all draw-off taps, whether for water or other liquids.

NEW APPLICATIONS FOR LETTERS PATENT.

JANUARY 18.—1,259, J. Coulthurst, Joining Sanitary Pipes.—1,299, C. Edgington, Sheet Iron Corrugated Roofings.—1,322, Tonks, Limited, and I. Whiting, Spring Hinges and Door Springs.—1,345, J. Thomason and others, Dies for Brick-making Machines.

JANUARY 19.—1,334, W. Goodman & Co., Sack Supports of pipes for Sewerage, &c.—1,414, J. Richardson, Moulds for Brick-making Machinery.—1,432, A. Boulton, Decoration of Glass Tiles, Bricks, &c.—1,453, P. Tomkinson, Setting the Teeth of Saws.—1,454, F. Dessoigne, Closing Doors Opening Both Ways.—1,507, L. Schlenker, Hearth Stones and Curbs.

PUBLISHERS' NOTICES.

Registered Telegraphic Address, THE BUILDER, LONDON.
 THE INDEX and TITLE-PAGE for VOLUME LXXI. (July to Dec. 1896) was given as a supplement with the number dated Jan. 9.
 CLOTH CASES for Binding the Numbers are now ready, price 6s. 6d. each; also
 READING CASES (Cloth), with Straps, price 9s. each, and THE SEVENTH VOLUME of "The Builder" (bound), price 10s. Twelve Shillings and Sixpence, is now ready.
 SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 2s. 6d. each.

CHARGES FOR ADVERTISEMENTS.
 SITUATIONS VACANT, PARTNERSHIPS, APPOINTMENTS, FRAMES OF GENERAL ADVERTISEMENTS.
 Six lines (about fifty words) or under 4s. 6d.
 Each additional line (about ten words) 6s. 6d.
 Terms for series of Trade advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c., may be obtained on application to the Publisher.

SITUATIONS WANTED.
 FOUR lines (about thirty words) or under 2s. 6d.
 Each additional line (about ten words) 6s. 6d.
 PREPARATION IS ABSOLUTELY NECESSARY.

* Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Postal orders, payable to DOUGLAS FOURDRINER, and addressed to the Publisher of "THE BUILDER," No. 45, Catherine-street, W.O.
 Advertisements for the current week's issue are received up to THREE o'clock p.m. on THURSDAY, but "Classification" is impossible in the case of any which may reach the Office after HALF-PAST ONE p.m. on that day. Those intended for the Front Page should be in by TWELVE noon on WEDNESDAY.

SPECIAL ADVERTISEMENTS IN STANDING DISCONTINUED. ADVERTISEMENTS or ORDERS TO DISCONTINUE same must reach the Office before 10 a.m. on WEDNESDAY MORNING.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to advertisements and strongly recommends that the latter OFFERS ONLY should be sent.

PERSONS Advertising in "The Builder," may have Copies addressed to the Office, 45, Catherine-street, Covent Garden, W.O. free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

AN EDITION Printed on THIN PAPER, for FOREIGN and COLONIAL CIRCULATION, is issued every week.

READING CASES, { NINEPENCE EACH. By Post (carefully packed) 1s

Stained Glass as a Modern Art.

MODERN works on the art of stained glass have hitherto almost invariably, in this country, been mainly occupied with the art in its archaeological or historical aspect. Just as painting is pre-eminently the art of the Renaissance, so stained glass is pre-eminently the art of the Mediaeval period; it arose, developed, and declined as a decorative adjunct of mediaeval buildings; it was finally lost entirely as an art of modern practice, and attention was only seriously turned to it again with the mediaeval revival; and until quite lately it was followed, both in theory and practice, almost entirely on mediaeval lines. It is only within the last few years that we have awakened to the perception that with this art, as with architecture, the mere imitation of mediaeval precedent can produce not a dead and not a living form of art. And even with this perception, the emancipation of this decorative art from the bonds of precedent has come about much more slowly than is the case with the mother art of architecture; if indeed it can be said to have been fairly achieved as yet. The bulk of the stained glass produced in this country is still for the most part designed on mediaeval models; the designs in which there is an attempt at infusing a modern spirit into the work are comparatively few and exceptional; and the illustrative books on the subject, some of them voluminous and valuable in their way, are still mainly occupied with mediaeval history and mediaeval examples; and thus, as far as their influence goes, tend to keep up this mediaeval view of the object.

The practice, however, of a few able artists seems at last to promise a breaking up of the old revival school, and the great agent in this emancipation is the study of the figure as the leading element in stained glass design. It was the neglect of figure-study in connexion with this form of art which, more than any other cause, operated in keeping us bound to an archaeological manner. It was assumed that the stiff, timidly drawn, and apparently conventional figures

of the mediaeval artists represented somehow a style which was peculiarly suited to stained glass; whereas in fact the artists who designed the mediaeval windows were not essentially figure draughtsmen, and merely drew the figure as well as they were able, and in the same way as they would have drawn it in a painting, making a little allowance for the more rigid and limited possibilities of representation in glass. This has indeed been said over and over again, but it has been hitherto but little acted on. Recently, however, artists like Mr. Richmond, Mr. Holiday, and Mr. Whall have shown practically that the free study of the figure from nature is as applicable to stained glass as to the almost equally conventional arts of fresco and bas-relief; and with that practical demonstration the mediaevalising theory goes overboard at once. The predominance of figure-study for modern glass promises us a double emancipation. It overthrows the mediaeval precedent, and at the same time it overthrows the system of the production of stained glass as a mere trade. The imitative production of windows in the style of the fourteenth or fifteenth centuries can be carried out, as it usually is, by a firm with a body of nameless trained artisans in its employ. For the design of glass in which the figure, as studied and employed in modern art, forms the principal element, the individual artist must be reckoned with. The actual putting together of the materials, as in mosaic, may be the work of subordinate hands; the design must be as much the work of an original artist as any other form of pictorial design.

The appearance of an important work on stained glass in which almost the whole of the illustrations are those of modern and not of ancient glass* is, at this juncture, both appropriate and significant. Mr. Holiday's illustrations in the body of the work are, in fact, taken entirely from his own designs, for which he makes a partial and intelligible apology, to the effect that it was more easy thus to illustrate his own remarks, as he could lay hand at once on whatever design would specially illustrate any one point; that they naturally illustrate his own views best; and that in taking the works of other artists he might

* "Stained Glass as an Art." By Henry Holiday. London: Macmillan & Co.: New York: the Macmillan Company: 1896.

unintentionally read into them something which the authors had not intended. He gives, however, as additional illustrations, several designs by Sir E. Burne-Jones and Mr. Richmond. The book is divided into three main sections: I. "Material and Technique;" II. "Artistic possibilities inherent in stained glass from the point of view of technique;" III. "Artistic possibilities of stained glass, considered in relation to the situation and purpose of the work." In regard to the first section we need only remark here that the materials and processes are very clearly though briefly described; that the author disapproves of thick or wide leading, which he considers an error in modern glass—a matter which however (as he partially admits) depends to some extent on situation and distance from the eye; and that he gives some special and detailed reasons against a realistic style in stained glass, which may be recommended to the attention of those who require any reasons on such a point. But our interest here is more with the second and third sections of the work, and with some of the critical points discussed in them.

In speaking of the "artistic possibilities" of design in stained glass, Mr. Holiday sets out with the perfectly sound position that the design has to be subordinate to the architectural forms which it should adorn, and therefore condemns all designs for windows of more than one light which ignore the dividing mullions or other stonework between the lights, making the stonework appear an interruption to the design instead of one of its governing conditions. Of the truth of this principle we are so convinced that we are not disposed to allow Mr. Holiday the exceptions which he makes in his own favour, in the case for instance of the window in the Church of the Incarnation at New York (fig. 17 in the book) where the couch on which Jacob blessing his children is seated runs through two lights, and that of the boat in "Christ stilling the tempest" (fig. 18), which runs through three lights. Mr. Holiday argues that the continuity of the background in these designs "has no more tendency to make the mullion appear to be an interruption than does the continuity of the panels of ornament and architectural features in fig. 15." We turn to fig. 15, and find that this is a five-light window in which the portions above and

below the figures are occupied by ornamental designs, all on the same line and of the same character, no doubt, but each of which is a separate design in itself. The author has thrown over his own principle here, and given a very illogical excuse for doing so. When he says that a subject containing many figures may be extended over a mullioned window, provided that the groups of figures in each light, though with a general relation to the whole composition, have a more close and special relation to each other, so that they form a sub-composition within their own compartment, we quite agree with him; and some of the examples which he gives of this method of treatment are admirable and convincing as far as the figures are concerned. But as soon as you attempt to introduce a common background, extending behind the groups of figures and ignoring the mullions, however subordinate this background may be, you have given up the principle and introduced an anomaly in design; and we prefer Mr. Holiday's decisive words on one page to his ingenious exceptions on other pages.

And the fact is that this restriction, rigidly adhered to, is a most wholesome one, for it tends to keep the designer from straying beyond the proper limits of stained glass art. Above all other forms of decorative art, perhaps, in which figures are introduced, stained glass is essentially the art for symbolism rather than for representation. If it is urged that, under these restrictions, it becomes impossible to put a background at all into a figure composition extending through several lights of a window, we should reply—"So much the better." Backgrounds are a snare, as soon as they begin to represent anything real. You cannot indicate a landscape, in however conventional a manner, without dropping nearer to realism than stained glass will bear, if you are to make the landscape recognisable at all. And then there is the question of plane, too. Mr. Holiday says, "A distant mountain often looks blue. Why should I not represent it by a piece of blue glass?" To which we reply—What have you to do with representing a distant mountain at all in a stained-glass window? It is a thing that has no business there. Your blue glass mountain implies a distance plane behind the plane of the figures; it implies the representation both of aerial and linear perspective. We have nothing to do with either in stained glass: we are treating the transparent plane of the window-surface in a decorative manner by means of line and colour; what have we to do with suggesting another plane far beyond it? That is all right in a picture, because it is intended that a picture should produce a perspective illusion; we look *into* it; but we look *on to* a window-glass. Mr. Holiday on the same page makes what seems to us the equally curious suggestion that "a distant figure looks smaller than a real one. If the suggestion of distance is in some degree essential in a subject, by all means make the remote figures small. There is no fear of their *looking* on a different plane, the quality of the colour and the lead lines round each will preclude this. The spectator will *infer* difference from the difference of scale: there will be no illusion to the eye." No, there certainly will not; but will there not be a somewhat ludicrous contradiction to the eye, and to the mind also? And what a

very curious mode to take to lead the spectator to "infer" something which, after all, he ought not to infer. We press this point strongly because we feel that there can be no true school of stained glass design, no right æsthetic of stained glass, without the full recognition of the fact that stained glass is the medium for symbolic design, in figure and ornament, *in one plane*, and that a stained glass artist has no business to be coquetting with distances and landscapes and "blue mountains" and little bits of perspective merely because they fill up conveniently some spaces in his design. That is why we approve very much of Mr. Whall's stained glass designs, as far as we have seen them; he is purely symbolic; that is why we think Mr. Richmond's clearstory windows for St. Paul's Cathedral, two or three of which are illustrated, among the most real stained glass art exemplified in the book; that is why we far prefer the style of Mr. Holiday's own west window in St. Saviour's, Southwark, or his Quillinan memorial window, both of which are pure symbolism, to such a design as "Joseph leaving Pharaoh's Court," where we see a gallery in the rear and steps coming forward to the foreground, down which Joseph is advancing, and the two ladies (with a curiously modern air, by the way) walking away from us into the background. That would make a very good mural decoration in fresco painting; we do not call it a good stained glass design. In the author's window in Salisbury Cathedral (fig 10), which is almost entirely a pure glass design, the æsthetic completeness is just spoiled by the little bits of perspective seen through one or two of the arches in the lower compartments. As Mr. Holiday himself says—"If the mind of the spectator is once entrapped into a false position by attempts at pictorial realism in the glass, he will misread the whole work. If he gets realism in one form he will expect it in another." Nothing could be more true; then why not act up to it always and consistently?

The question of the supporting ironwork in wide windows without architectural divisions is rather a difficult one. Mr. Holiday recommends that the design should be made with some regard to them, at all events to the extent of getting the bars to fall, as far as possible, where they will either coincide with some prominent line in the design, or avoid crossing any important feature, especially a head. The point seems to be whether the iron supports should be recognised as a part of the design or not. Mr. Holiday has shown one design (fig. 11) for a window in the Brick Church at New York, where the metal framework is treated almost as a simple form of tracery, and marks with arched heads the main divisions of the design. We should not go so far. The iron supports are not a portion of the architectural design, they are a practical necessity which we would do without if possible. They ought not therefore to be recognised as part of the design; only the design should be studied so as to escape being prominently interfered with by them.

The author's circular window in the Theological College, New Jersey, is a good example. The metal bars, though carefully avoiding the heads, make horizontal cuts through the space between the inner and outer circles, in a manner quite at variance with the main lines of the work; but just because we feel this, and that they

are not intended as part of the design, we are able to ignore them. If they had been arranged as equidistant bars radiating from the centre of the window, they would have forced themselves on the eye as claiming to be an element in the design, and would have caused much more annoyance.

What does the author mean by saying, in reference to the Chartres and Florence windows illustrated in figs. 2 and 7, that "such shading as there is in these windows serves to suggest natural forms, but is treated solely as a means of heightening the beauty of the glass"? The words imply that the shading was introduced only to add to the decorative effect of the glass; which surely cannot be the right way to put it. That it was (and rightly) carried out in such a manner as not to interfere with the decorative effect would surely be the more correct expression.

In the chapter on "Style" Mr. Holiday puts more effectively than we have seen it put before the absurdity of the modern manufacture of mediæval windows, with many trenchant comparisons which hit hard; what he says is what all artists are agreed upon but a large proportion of the public are still in the dark on the subject, and may learn something from this chapter, if they will read it. Mr. Holiday particularly instances as a concomitant evil of the trade manufacturing system, the deadening "division of labour" among the artisans, so that one man has only learned to do one thing, and "the one who painted draperies could not paint a head." It was mainly on account of this, and the consequent difficulty of getting his work carried out in the spirit which he wanted that the author established his own glass-making works, where he abolished the division of labour and had the whole making of a window under his sole control from first to last.

In considering the question of Style in relation to architecture and ornament, the author, while repudiating the idea that any concession can be made to architectural style in the matter of the figure, touches on the interesting question how far ornament in a window inserted in an ancient church or in a building in any special architectural style, should conform to the recognised types of ornament of that style. While admitting that the point is quite open to argument, he leans towards the conclusion that well-designed ornament—that which is really ornament and not "ornamental painting" (like Raphael's arabesques), will harmonise with any good style of architecture. This position must not be pushed too far; Arabic ornament, for instance, has a very marked character of its own, and would look much out of place in a building of Renaissance stamp; but in the main we think it is correct. The grisaille ornament shown in fig. 41, from the author's window in Salisbury Cathedral, would do equally well either in a Classic or a Gothic building; and the fact is that one of the effects of conventional treatment of foliage is to tone down special characteristics in natural leafage, and to lead to the evolution of an idealised foliage which cannot be claimed as belonging to any particular group, either botanical or architectural.

There are other interesting points raised in regard to the treatment of figures and drapery in windows, as to which we are mainly in agreement with the author, but for which we must refer the reader to the book.

One could have wished that the digression (or such it certainly is) on pages 71-74 had been omitted; it is out of place in a work on art-processes, and because an author is an authority about stained glass it does not allow that his readers attach any special value to his opinions on religion and on international morality. But on the subject which it mainly treats the book is one which is calculated to clear the air a good deal.

NOTES.

On Saturday a small party of members of the Institute of Architects visited Peterborough, on the invitation of the Dean to have the opportunity of inspecting the west front of the Cathedral. The party was limited to thirty, and the visit was considered as a private one, as it had been already announced at the Institute would take no publication in the matter. We hear, however, from a member of the party, that the visitors in general thought the state of the front even worse and more alarming than they had realised from description; and thus we fancy will be the remark of most architects who have any opportunity of seeing it for themselves. Among other things a careful examination was made of the bonding of the piers, which was pronounced to be exceedingly faulty in method; in fact, says our correspondent, "such as could not be tolerated by any reputable architect" in the present day. The Dean and Chapter, it is interesting to learn, have purchased an old farm-house built of Barlick stone, in order to use the material for facing the front where new stones are absolutely necessary.

It is not altogether satisfactory that apparently the intentions of the Government in regard to the water supply of London should have been made public in a hole-and-corner manner. It is understood that when the President of the Local Government Board met the London Unionist members this week he informed them that the Government proposed to support the second reading of the London County Council's Bills. By supporting the second reading, the Government agrees to the principle of the Bill, which is that the County Council should be the public body in whom the management of the water supply is vested. This of course is a policy quite opposed to that of last session, when, as will be remembered, the Government proposed to establish a "Water Trust," or separate body, to look after the water supply of London and the adjacent districts. We have always been of opinion that it would be best to place the management of the water supply in a separate body, created for the purpose only. If, however, the Government have come to the conclusion that it is impracticable to establish such a body, then the only course open to them is to make the County Council the water authority. But this sudden change of policy on the part of the Government says little for their capacity as vigorous politicians.

To the last number of the *Revue Archéologique* M. Henri Lechat contributes an interesting paper on the nature of the patina on Greek bronzes. It has usually been supposed that

this patina, often beautiful in effect, was produced by a natural process of oxydisation, due to exposure to the air and to chemical action of the soil. The question of natural *versus* artificial patina was raised, it will be remembered, long ago (Plutarch, "De Pyth. Orac," II.), by visitors inspecting the bronzes at Delphi, some of which were covered with a beautiful deep blue patina. M. Lechat holds it certain that in many cases the patina was produced artificially by the artist himself, and was an effect he deliberately aimed at; in fact, patina in bronzes played the part of polychromy in marble statues. In such cases a kind of coloured varnish was applied to the bronze, which materially affected and aided the natural oxydisation. The precise effect, he believes, was known and carefully allowed for. The exact chemical process M. Lechat does not discuss, nor does he seem hopeful that it will ever be formulated. The paper should be of interest both to artists and archaeologists.

Railway Rates. THE Mansion House Association, who have had the subject of railway rates legislation under discussion this week, and who have for years been very persistent in pressing it upon the attention of Parliament, are far from satisfied with what has been achieved. The interpretation of the Acts has proved rather uncertain, and the railway companies manifest a great disinclination to regard the decisions in the test cases promoted by the Association as final. It has always been a matter of complaint that the procedure before the Railway Commission is too expensive. The inquiries are certainly almost invariably very protracted—as in the apparently interminable coal case of Messrs. Rickett, Smith, & Co., which has just been to the fore again—and also that heard last week, in which the Manchester Ship Canal Company have sought the intervention of the Commissioners. They are asking for compulsory through rates for timber and other imports from the Canal Station to distant towns on the Midland Company's system. Although suing as a railway company, and with a view to bettering the position of the Canal in competing with Liverpool, the arguments, as usual, have turned very much upon "the public interest,"—a phrase occurring in the Act which appears of considerable service to others besides the public. Highly desirable as a cheapened form of procedure may be, however, it must be conceded that the questions involved are frequently of considerable magnitude, and the issues too far-reaching and complex to be decided by any but competent specialists.

Railway and Canal Traffic Acts. THIS was the subject of an address by Mr. J. H. Balfour Browne, Q.C., on Wednesday at a special meeting of the London Chamber of Commerce. The lecturer referred to the well-known Southampton case, in which the question was raised whether the South-Western Railway Company were entitled to charge English traders for the conveyance of goods from Southampton and intermediate stations to London a higher rate than was charged for similar goods coming from abroad. As the lecturer said, this involves a large issue which must be settled before long if the English trader is to successfully compete with the foreigner. In fact, the ques-

tion is of national importance, and its solution must give to the English manufacturer means of transport which are at least equal to those of his competitors; not only is the foreign producer favoured in the introduction of his goods into this country, but the home producer, when he desires to compete with a foreign rival in a continental or colonial market, finds the home railway rates against him and foreign railway rates in favour of his competitors. The lecturer suggested various alterations in the present railway law, and urged that some further control of the railway companies was needed. Whether any expedient similar to that which now existed in the case of gas companies, by which the company was allowed to divide a dividend larger than the standard dividend only when they reduced the price of gas below the standard price—and by which the profits were in effect divided between the shareholders and the customers—could be devised for railways it was difficult to say. But short of the acquisition of all the railways by the State, might not an experiment be made in that regard? There were in this country a considerable number of railway companies which did not pay, and had not paid, any dividend upon their Ordinary stock for some years. It would therefore be easy for the State to purchase these derelict lines at a price which would put no great burden upon the taxpayer—and if they purchased these lines the public would insist upon their being worked at rates which were reasonable in the interests of the community. In that event State competition, by means of these at present derelict lines, would introduce a wholesome element into the railway world, and would, he thought, make the other railways of this country so conduct their business towards trade as to make the purchase of the whole of the railways in the country a matter which might be indefinitely postponed.

The Flushing of Closets and Drains. A SERIES of tests for the purpose of ascertaining the volume of water required to flush water-closets and to keep the drains from them clean was carried out last year at Newcastle by the Newcastle and Gateshead Water Company and the Northern Architectural Association, and formed the subject of a paper read by Mr. Arthur B. Plummer at the Sanitary Congress held at Newcastle in September last. The tests are far from exhaustive, and some of the conclusions which Mr. Plummer draws from them do not appear to us to be reasonably deducible. His opinion that "all syphon cisterns are a mistake, so far as water companies are concerned, and . . . necessary from other points of view," will not be generally accepted by sanitarians. Briefly, the tests afforded further proof that drains are now usually too large and that iron drains are kept clear more easily than stoneware drains of the same gradient. They also showed that drains were soon choked by artificial faeces carried into them by a two-gallon flush from a water-closet, while a two-and-a-half-gallon flush sufficed to keep them clean. It may be pointed out that the drains in these experiments were laid with less inclination than is customary for branch drains. A fall of 1 in 40 may be sufficient for a 4-in. drain running constantly about half full, but it is not sufficient for a branch drain having an intermittent flow. The well-known rule that

a 4-in. drain may have an inclination of only 1 in 40, and a 6-in. drain 1 in 60, has probably been as much misapplied as any other rule; it is intended for drains running half full, and is *not* applicable to drains running only one-fourth full or having a very variable flow.

In connection with the same subject we may call attention to the letter printed in another column, signed by the managers of several firms or companies dealing in sanitary appliances, and complaining of the new and baneful activity now shown by some of the Water Companies in endeavouring to require the removal of 3-gallon flushing cisterns and the replacing of them by 2-gallon ones, in defiance of sanitary science and common sense. The Companies are unfortunately within their legal right, and are now stimulated to fresh activity by the recent illjudged and mischievous action of the Local Government Board (who were evidently misled by some persons acting in the interest of the Water Companies) in formally confirming the 2-gallon cistern. We heard only a few days ago of the case of a house on one of the London ducal estates, where the tenants under a new lease, doing up a house in a manner regardless of cost, had at the demand of the Duke's agent inserted 3-gallon cisterns, and were forthwith served by the Water Company with a notice to remove them! It is impossible that this kind of thing can go on much longer; public opinion will not stand it; and the Water Companies are acting very unwisely in thus putting themselves forward as the opponents of sanitary progress at a time when their very existence is threatened.

We are informed that a scheme is on foot for the "complete external restoration" of the tower of this church, and that the Vicar is anxious to receive subscriptions for that purpose. Is anything so sweeping as is implied in the term "complete external restoration" really required? If not, it ought not to be done. It is stated that the pinnacles are in a dangerous condition, partly from injuries received in the recent gales, and that their total collapse is inevitable unless measures are soon taken to make them secure; and also that it is desired to add two additional bells to the existing six, to complete the octave. These are perfectly rational objects, in aid of which subscriptions may reasonably be asked from those likely to be interested in the church. But when we are asked to draw the attention of "those interested in old English church architecture" to the fact that the complete external restoration of the tower is contemplated, we may as well point out to the Vicar that, unless the external masonry is in such a condition of decay that refacing is practically necessary, those "interested in old English architecture" are exactly those who will demur to subscribing towards its restoration.

Ilicit Commissions.

FROM a circular letter dated February 5 we are glad to learn that the Council of the Chamber of Commerce has appointed a Special Committee to inquire into and report upon the subject of "the pernicious practice of giving and receiving secret trade commissions." One of the obstacles towards

effectually contending with this evil has always been the difficulty of obtaining evidence of a practice which is essentially an underhand one; and it is no doubt in recognition of this difficulty that the following sentences have been incorporated in the letter which the Secretary of the Chamber of Commerce has been instructed to write:

"In order that the Committee may have the fullest information before it I am desired to make it known through the medium of your valuable columns that the Committee are willing to receive and consider *confidentially* any evidence or information on the subject which any one may be disposed to bring before it.

I am further desired to invite confidential communications to be addressed to me by letter, or to be made to me verbally to be laid before the Committee, and to say that no communication or information will be given to the Committee without the previous consent of the party forwarding the same. I have also to add that any communications or information which may be given to me will be treated in the strictest confidence, and no names or particulars will, unless authorised, be allowed to transpire even in Committee."

Communications of the kind mentioned can be addressed to the Secretary, Mr. Kenric B. Murray, at Botolph House, Eastcheap. The mere publication of such a request for information will be enough to put a considerable check on the practice referred to, as any one making such offers may be denounced to the Chamber of Commerce, under circumstances which will prevent the denouncer being in any danger of an action for libel. We have done what we could, on various occasions, to expose the practice as far as it concerns the architectural profession and the building trades, and we are glad to find that the subject has been taken up in a formal manner by so important a body as the Chamber of Commerce.

THERE is no doubt that Dr. The London Dwelling House. Poore, in his lecture on "The Dwelling House" briefly reported in another column, is perfectly right in his strictures as to the increasing evil of overcrowding, and the inconvenience and labour entailed by the increasing development in London of the tall and narrow type of house, in which, as he observes, all changes from room to room have to be made vertically instead of horizontally, with great increase of fatigue both for owners and servants. The most serious evil of the modern tall house, however, is the manner in which it promotes overcrowding, by providing lodgment for a much larger number of persons over the same square area of ground. With all this we are quite in agreement; but what is the remedy? Dr. Poore does not seem to suggest any; he confines himself to pointing out the evils. In doing so he is perhaps preparing the way for a gradual improvement, by promoting the growth of a public opinion adverse to this vertical piling up of dwellings, which may in time have its effect in lessening the supply of them. But such an influence must be very slow in producing any sensible improvement. Do we not require some legislation limiting the number of persons who can be housed per square rood of surface, so as to put a compulsory check on this vertical overcrowding?

The Kerry Bog Slide.

THE Congested Districts Board of Ireland are considering the advisability of carrying out several works in the district recently devastated by the bog slide in Kerry. Amongst

other things, it is proposed to reopen a quarry by clearing it of the mud; also to erect a bridge, re-make roads, to clear the lands at present covered with peaty matter and to restore the area as far as possible to its former condition, so that the ground may be used for agricultural purposes. So far so good. But we cannot find that anything is going to be done to the remains of the bog to prevent further slides, or to prevent the peat from accumulating again at the same spot. No scheme which does not include an elaborate system of drainage will be of any use in remedying matters, and we doubt if the results obtained in any case will be worth the expenditure.

Ventilation of Underground Railways.

THE comparatively recent fight over the "blowholes" on the District Railway is, no doubt within the recollection of most of our London readers, although the efforts of the Metropolitan Railway to secure ventilation are not so well known. It is interesting to note in this connexion that it is now definitely proposed to work the District Railway by electric haulage, under powers to be obtained this Session, together with the deep level express extensions. We are inclined to doubt, however, whether it would not be a much sounder policy, considering the large amount of extra capital involved, to make a further attempt to obtain a thorough system of ventilation under the present régime, worked by the induced currents caused by the trains themselves. Such a system can be employed without unsightly blowholes, and with great improvement on the present outlets for the vitiated air.

Floods and Reservoirs.

THE rural districts have lately passed through one of their uncommon periods of floods. Water is too abundant, and has become a nuisance, doing harm to property and health. In about six months' time it is quite probable that many of those localities which are now complaining of floods will be crying out about a drought. The fact is that as regards the storage of rain-water no proper progress has been made. In the rural districts, and in small semi-urban localities, far too much dependence is placed on the springs. The health, comfort, and well-being of many districts would be greatly improved were some of the great quantities of rain-water, which is now allowed to run to waste, preserved in reservoirs. The latter are very easy to construct. Some labour for excavation, a good bed of concrete, a sound cover, and a large pump, pretty well complete the tale. There is hardly a village in the South of England which would not be the better for such a reservoir, and Parish Councils should take up the matter. Again, landlords are very short-sighted, in places where the soil is dry, not to construct tanks on their farms. There is often in dry summers a large sum spent on extra labour in conveying water to dry places, and a serious pecuniary loss to farmers by the want of it. Yet this could be almost entirely prevented by the storage of rain-water in tanks when it is abundant.

The Manufacture of Enteric Fever.

DR. BRUCE LOW'S Report to the Local Government Board on the cause of the recent outbreaks of enteric fever at Kessingland in the Rural District of Mutford and

...thotland, Suffolk, states that there is no proper system of sewerage; excrement and refuse disposal is chiefly by means of pit privies; these are situated generally close to the dwellings, and are excavated below the level of the ground; some of them have no brickwork lining to their sides or bottoms, and consequently readily permit the soaking of fluid filth into the porous soil. The water supply is from surface wells, also situated "generally near the houses," and merely dry stoned. The manufacture of potteriferous is thus carefully and scientifically provided for.

The Paris Peintres et Sculpteurs have opened their sixteenth annual exhibition at the Palais de l'Industrie, which this year includes some remarkable works, almost all among a preponderance of inferior productions. The exhibition includes over nine hundred works. Among the good ones are various contributions by Mme. Demontretton; Mme. Elodie La Villette exhibits a remarkable sea-piece, and Mlle. Beck a painting of calm water which is also worth attention. Miniatures by Mlle. de Chaussé, water-paintings by Mlle. Voruz, some landscapes by Mme. Scailles, are among other things that are a credit to the exhibition; and in sculpture, a statue by Mme. Coutan, bust by the Duchesse d'Uzès, and some very pretty polychromatic wax figures by Mlle. de Fresnaye.

The people at Oxford who were hostile to Mr. Hare's proposals for the treatment of the Carfax Tower seem to have succeeded in getting Mr. Bodley called in to advise, without doubt in the hope that he would demolish Mr. Hare; but his report, which was printed in full in the Oxford *Weekly News* of last week, practically only repeats Mr. Hare's recommendations, except that Mr. Bodley thinks that to reface the lower portion with rough ashlar work would make it look too much like a new work. As Mr. Bodley admits that the lower or ancient portion of the tower must be refaced for practical reasons—on which point he is as strong as Mr. Hare—it might seem that as the exterior facing will actually be modern work it is not of much consequence how modern it looks. Mr. Bodley entirely concurs in thinking that the upper stage of the tower is of no value whatever, and should be rebuilt in a better style. Altogether the opponents of Mr. Hare have certainly not made much by calling in Mr. Bodley.

THE ADVANCEMENT OF ARCHITECTURE*: WITH SOME REMARKS ON THE STUDY OF GOTHIC.

ARCHITECTURE, properly so-called, does not exist without an ideal or emotional side, and it is always hemmed in by the practical difficulties of construction, so that when the art of construction has greatly advanced, reconditio emotions can be more readily expressed: take, for example, the Propyleum of the Acropolis. The central opening had to be made large enough for the herds of sacrificial cattle to pass through, but this span of some thing like 17 ft. 10 in. could only, in monumental buildings, be spanned by a stone lintel before the arch was in use. At the central opening at the Temple of Diana at Ephesus a similar difficulty occurred. Although in both

cases the marble quarries were near at hand, this large marble lintel had to be brought by oxen to the site, and in the case of the Propyleum it had to be dragged up a steep incline, and then rolled up a slope of earth to its place. In Pliny you read of the difficulties of the fixing this vast piece of marble at the Temple of Diana, the despair of the architect, and the assistance of the titular goddess. At Lincoln Cathedral you have the flat arch of 28 ft. span, each stone of which could probably be carried up on a man's back, so you see how more complex emotions could be expressed constructively in the thirteenth century than in 450 B.C., though in the thirteenth century there were vaults of much larger span. I mention the flat arch on account of its flatness, its rise being only about one-twenty-third of its span. You see in the latter part of the nineteenth century Sir Benjamin Baker building the Forth Bridge, one of whose spans is 1,700 ft., so that the constructive difficulties, as far as architects are concerned, have disappeared.

A vast change in the sentiments of mankind has, however, occurred since the sixteenth or seventeenth century; up to that time, or even later, mankind desired to embody every abstract idea by a building, a statue, a group of figures, or by symbols; but that desire has ceased, at least among the most advanced of mankind, and a little semi-scientific jargon is supposed to supply its place; leaving the mind of the masses completely vacant of instruction. The principal embodiment of law and order in their minds is the policeman, by no means a high ideal figure; while punishment and penal death is embodied by a man in a big chair with a gown and a wig, not so very unlike a Japanese Venus. The glimpses the scientific men have got of our visible universe and of its laws, and the rough results which are spread abroad, so far from diminishing our wonder and our awe, should increase them; but nothing is done to embody these wonders, so that they may be understood by the multitude. The pangs of grief, of guilt, and of remorse are not extinct in the human breast, the cries of misery, agony and despair resound from the whole earth, and yet we are told that there is no occasion for religion; and we are even without the consolation of the Stoic philosopher, Epictetus, who tells us that Jupiter said to him, "I would have made you always comfortable and happy if such a state were compatible with the conditions of the universe, but it is not; consequently I have given you a particle of the divine spirit by which you will be enabled to bear without complaint the necessary evils that will occur, and when these become intolerable you can go out."

I have adverted to these matters, which may appear irrelevant, to point out that to learn to evoke emotions from architecture we must study their embodiments in the structures dedicated to extinct faiths and worn-out creeds, to show us how to evoke the emotions proper only to our own time. We cannot afford to neglect the study of the embodiment of the emotions by any past race, nor can we afford to lose the aesthetic or practical lessons that they teach, and least of all can we afford to do without a study of Gothic, for it is certainly one of the most wonderful phases of architecture that the world has seen.

My Romanesque lectures brought us down to the time at which the groin points of vaults had just begun to be superseded by ribs, the rudiments of which are found at the front half of Vézelay, the choir having ribs, and exterior flying buttresses.

We might have supposed that the Romanesque architects would have been satisfied with the knowledge they had then got of the strength of materials, the solution of the apparently insoluble problem of vaulting in thin stone securely, and with the sort of buildings they had already erected (we must not, however, forget that in the thirteenth century, architecture from being a clerical art became a lay one); but so far was this from being the case, that new features were at once introduced, and the style progressed for 300 years and continued for at least 450 years, for the piece of fan-vaulting over the staircase to the hall at Christchurch, Oxford, was built in 1640. We must remember, however, that the Renaissance in Italy began early in the fifteenth century. Poggio discovered the MSS. of Vitruvius in 1414, and Brunelleschi had measured some of the Roman ruins and began to build in the new way about 1419. Leon Battista Alberti built at Rimini the Temple to Isotta for Pandolfo Malatesta in 1447-50, and the Rucellai Palace at Florence in 1460. The visits of Charles VIII. and Francis I. to Italy, where the revived Classic

taste permeated society, were probably the cause of that grafting of Classic detail on Gothic that charms us in Blois, Chambord, and the other early Renaissance buildings of France. About 1500 Torrigiano paid a visit to England, and a little later executed the tombs of the Countess of Richmond and Henry VII., and probably encouraged a taste for the Classic revival. At Hampton Court Palace there are Renaissance terra-cotta medallions of the Roman Emperors. Holbein came over in 1526, and John of Padua in 1544; if not earlier, and is supposed by some to have furnished designs for Wollaton Hall, while Daniel Barbaro, one of the editors of Vitruvius, and one of the patrons of Palladio, was ambassador here about 1550.

It seems curious enough to us that a highly organised phase of architecture, like Gothic, that seemed to meet every want of its time, ecclesiastical, lay, and military, and that by the knowledge, skill, and genius of its architects had rivalled the buildings of the Romans in size and height, and nearly equalled the spans of their vaults, should have been supplanted by a futile attempt to revive Roman work. We must, however, remember that when society has been permeated with new beliefs, new hopes, and new aspirations, it wants a new phase of architecture to express these changes. This was the case at the Renaissance, and from the absence of architectural schools and trained architects, there was nothing to be done but to fall back on the less developed phase of Roman, which would at least express some of the most prominent of the new ideas, such as the appearance of solidity, simplicity, and grace. The sciences fortunately are not carried on in this way, the new advances are built on those that have last been made and tested. If this method could be adopted in the fine arts, our painting, sculpture, architecture, music, poetry, and eloquence would be as much in advance of the best of bygone times as our arithmetic is beyond that of the Romans, or our astronomy is beyond that of Job.*

I think, however, that in architecture we are wrong to abandon any advances that have been made in the knowledge of materials, construction, or arrangement, if it can be helped; for instance, I doubt if we should revert to the massive pier of the Romans, which is expensive, and reject the flying buttress, which is a cheap substitute, merely because we do not like the look of a building permanently shored up with slight stone-shores. We might make the flying buttresses stronger, so that they were not a constant menace to the building through their decay by weather wear. And we might try and make them beautiful, according to our own taste, and not by geometrical piercing that is not. Their main use to us now is to see how they managed in Gothic days to give them an architectural appearance; they were originally plain arches, but were eventually made into pierced work or open arcades. The flying buttress was an entirely new feature, and one purely structural, and was brought into harmony with the rest of the work. Now, if we wanted to roof a building with an incombustible ceiling, we should use ironwork, concrete, and plaster, or coloured and enamelled terra-cotta. The using of bygone forms of construction is archaeological pedantry or incompetence; and we should throw off the pedantry, and try to make ourselves competent. Architecture is essentially a constructive art; the first and more important part is to make the general forms, both inside and out, of such a character as not only to perfectly meet the wants, but also to proclaim the use of the building; and the higher its use, the more important is it that the shapes employed should suggest that higher use.

Those important structural parts that arrest the attention have all to be made conducive to that end; the Greeks used round piers to look like columns, and the parts of the column, when it was originally of wood, *i.e.*, the capital and base were necessary, and eventually those necessities were made as beautiful as possible. The Romans used monoliths when the weight to be carried was considerable, and beautified their capitals more or less after Greek models, modified to suit their coarser taste. The Byzantines kept close to the Roman examples, only modifying the abacus to take larger piers and heavier weights, and greatly varied the shape and the carving of the capitals. Many of their capitals are cubical and their carving superficial, so that the mass of the capital was preserved to bring down the weight securely to the shaft. The early Mohammedan columns were mostly Classic or Byzantine taken from old buildings, but their later capitals were

* Being the second Royal Academy Lecture on Architecture this session. Delivered on the 28th ult. by Professor Atchison, A.R.A.

* That is to say—if Art were Science; which it is not.—Edo.

of the Stalactite form, or with their own poor floral ornament, either keeping the concave outline of the Corinthian or the solid cubic or ogive form of the Byzantines. The early Romanesque architects sometimes used enormous piers, column-shaped, as at Durham, Peterborough, Southwell, Gloucester, &c., with shallow caps, and even when thin shafts were used, the cap was often comparatively shallow.

As the Romanesque architects progressed in knowledge and skill they got their sculptors to carve their capitals mainly with figures.

The Gothic architects threw aside all thought of Classic proportions—at any rate above the bases of their columns or piers, and ran up their piers to a great height, and let their sculptors use floral ornament almost exclusively for the capitals; the foliage was altered from nature to produce a more broken surface, with brighter lights and sharper shadows, but the foliage of their capitals was almost destitute of interest or grace.

As the Gothic architects became abler constructors, they more and more lost all sense of artistic beauty, and trusted to their utilitarian success, by this I mean the better lighting of the nave by enormous windows, and to the astonishment of the beholders at their apparently insufficient and acrobatic construction; a paltry ambition. The great feature of the latest comices was a large, flat hollow, filled in with stone imitations of the struts in gingerbread from a country fair. The structural perfection attained in late Gothic culminated in the single open-work spire of Strasburg, supremely wonderful, and supremely ugly.

We saw in Romanesque architecture the logical tendency of the times. The architects found that the Romans had always used a column to support something definite, so they did the same, and carried up the wall pillars to support the roof truss; the stepped arches, a purely economical arrangement to save centring, were each supported by a separate column. The piers were sometimes made cruciform, with a half column on each face to resist the thrust of separate arches, and sometimes they clustered the columns. The Gothic architects carried this out more completely, and carried down every rib by means of columns surrounding the main one, and afterwards made them attached; and eventually they superseded the columns by a pier down which the ribs of the vaulting descended, though this is describing how they were designed; looking at them we should say that the channelling of the piers ran up and formed the mouldings of the arches of the aisles, and the ribs of the vaulting of the nave and aisles, or else a cylinder was supposed to have fallen from heaven on to the channelled pier leaving the projecting bits of the original one sticking out. The rib and panel vaults are a useful and most interesting study, showing the gradual multiplication of the ribs, eventually forming patterns known in English Gothic as stellar vaulting, such as those in the cloister at Westminster, at Oxford Cathedral, and elsewhere. Some of these ribs abroad were made into curious and pretty patterns, as at the Cathedral of Las Palmas, Grand Canary; in England, however, the stellar vaults gave rise to the fan vault, in which real ribs ceased to be used, the very numerous thin and small ribs worked out of the solid vousoirs, and in some places in England and abroad flat stones were carried by open work on the curved ribs, an instance of this may be seen under the rood screen at Southwell. Most of the progressive steps are shown and explained in Professor Willis's interesting paper read before the Royal Institute of British Architects in the year 1842. However much the Gothic architects may have lost their early artistic sense, some qualities remained with them to the last. They never lost their logic, their daring, or their excellence in mechanical contrivance. They made their windows where they were wanted, and kept them of the requisite size for the lighting they had to do, and when stained glass came into vogue, a church was all window, except where the buttresses occurred, and this is only one instance, for if they found the slopes of their buttress tables did not take off the rain fast enough, or that the splashing of the rain damaged the stonework above, they made them steeper and steeper, until they perfectly answered their purpose. The height and slightness of Strasburg spire is certainly an instance of their daring, and there are innumerable instances of their ingenuity in mechanical contrivance in windows. For example: When the stone was hard they used pierced slabs; when it was soft tracery; and some of their late tracery is as mysterious as the eddies of a stream, and as

compared with the size of the building, as slight as a spider's web. With an elastic style like this, neither the architects nor the sculptors were ever at a loss for invention, and they trusted to a general picturesque effect however incongruous the parts might be, e.g., if a pointed arch were wanted with a rose-window beneath it, they put the circle in and left the point to take its chance. I by no means wish to depreciate the invention either of the architects or the sculptors, but, as compared with a Greek or a fine Early Renaissance building, the task was slight when anything crammed in would answer the purpose. In such vast buildings with such infinity of detail, forgotten pieces had sometimes to be filled in impromptu. At Ely Cathedral there are two buttress tops which had been apparently left for appropriate buttress caps to be designed for them. I suppose these had to be finished in a hurry. I presume some plants had grown up in the accumulated dust on the unfinished square tops, and the architect had these wind-sown plants cut in stone to make a finish.

Architecture would not be one of the master arts of the world if it did not require the possession of so many varied capacities, some of which, if not antagonistic to one another, are rarely found in the same person. Great architects can, therefore, be only looked for occasionally, when men of exceptional genius, industry, and ambition embrace it. Architecture rarely arrives at any great pitch of excellence all at once, even if it ever does; there is mostly a school with an aim, in which the knowledge that is acquired in one generation may be handed down to the next as the foundation on which a new edifice can be raised. Unhappily, the method of teaching in the different schools from which the brilliant epochs of successive architectures have sprung has been entirely lost, and we can only very imperfectly judge of what it was, by an exhaustive study of the buildings that have come down to us. We must recollect that before the last century much of the knowledge that can now be got from books was personal or traditional, or was worked out by some rule of thumb. Until Wilkins, in 1812, found out what Vitruvius meant by his "unequal steps"—"Scamilli imparēs,"—no one had suspected the optical refinements of the Greeks, and it was not until Mr. Penrose verified their existence at the Parthenon that we could appreciate the geometrical knowledge of the Greek architects. We see by the plan of the Temple at Bassæ that there was some thrust against the columns, and a considerable number of pieces of the stone ceiling have been found. Professor Cockerell showed in his restoration a segmental arch, but, as far as I know, no one has calculated the thrust of such a ceiling, and the resistance that was offered by the wall and the attached columns, so we are in complete ignorance as to the truth of his hypothesis. We know a little of the early Roman knowledge of construction from Vitruvius, supposing he lived into the reign of Augustus, for a learned Dane, a Mr. Ussing, has just published a treatise to prove that Vitruvius was a literary man who lived in the third or fourth century A.D. We know that the Emperor Constantine started schools of architecture in certain parts of the Roman dominion, but we know not what was taught. Still, we know St. Sophia, and since the publication of M. Choisy's "Art of Building among the Romans, and the Byzantines," we know more about the methods of both people than was ever known before, since the irruption of the barbarians. Mr. Tarn, too, has given those who will take the trouble of learning it, the methods of calculating the thrusts of vaults and domes. We know that a profound knowledge of stereotomy was possessed by the Gothic architects from the researches of Professor Willis, Viollet-le-Duc, and others.

Let me, however, enumerate the requisite equipments of an architect. He wants first to know the strength of materials and their resistance to the ravages of the weather. He wants to know by experience, or still better, by calculation, *statics*, or the equilibrium of opposing forces. He wants not only to be able to plan conveniently, but so that the shapes both of his whole building and of its internal parts have the proper character. He wants the whole and every part to evoke the emotions proper to the structure, and these emotions vary at different epochs. The masterpieces of Greek, Roman, Byzantine, Romanesque, Saracenic, Gothic, and Renaissance architecture aroused enthusiasm and admiration when they were built. Some continue to do so still, some are only viewed with indifference, while others excite contempt or disgust. The question for us now is, how cognate emotions can

be raised by us in the present, or by some of our successors in the immediate future. That we do not raise the enthusiasm and admiration we hope for and expect, I, I fear, only too obvious, for who ever hears of an architect or his building calling forth anything but condemnation or censure, and when the building does not, it is supposed to have built itself. This must, I think, be due to one of two causes—either that the public are capable of enthusiasm for architecture, and that at present the architects are unable to apply the proper stimulus. During the Gothic period, we read of the building of a cathedral in a town evoking an enthusiasm akin to madness; the townspeople not only contributing to it in money and kind, but men and women too, dragging in the materials, and working at the building, assisted by the monks, and even on some occasions by the aged bishop himself. I am far from supposing that this enthusiasm was wholly due to expectant artistic delight, even to a better chance of getting to heaven. These cathedrals were a mark of earthly benefit that had accrued to the people by the exertion of their bishops, and were built with a prospect of obtaining still further benefits. Many doubtless looked forward to seeing new beauties and new structural achievements, that were beyond their fondest expectations; while all were ready to admire in anticipation the size and splendour of the proposed edifice. The people looked for more well-paid work being wanted, to the immense advantages of a new centre of attraction, opportunities, too, for their own intellectual and artistic exercise, that did not bring with it pain and penalties. Dull and unimaginative as people now are, I think if a man discovered a gold reef in which all might share, and from which those who harpies who get all the benefit of new discoveries and inventions were driven off, were to suggest the building of something grand and novel as thanks offering, and promised that, when the building was done, he could lead them to still greater advantages, there would be no want of subscriptions or enthusiasm now.

There must be a certain amount of liking for every creation of beauty and perfection, as we saw by the Greek revival in the last century. We look on the last century and the beginning of this as peculiarly tasteless and inartistic periods; yet this Greek revival gave us some admirable works of a beauty of proportion, of a delicacy and refinement that we now look for in vain, though the style is not fitted for our climate, and is in some respects even absurd,—still, it touches chords in us that are not touched now. I mention such buildings as the National Gallery and University College by Wilkins, the Bank of England and Bank buildings by Soane, the Suffolk Fire Office, the London and Westminster Bank, and Hanover Chapel in London (now, alas, destroyed), and the Insurance offices, at Liverpool, by C. K. Cockerell, as well as St. George's Hall, by Elmes, in the same town. We, therefore, need not be surprised at the passion for the cathedrals of the thirteenth century while the Gothic style was being elaborated, when, too, the buildings were not only erected to the highest end, and showed the greatest constructive skill the world had seen, but met every taste and passion of the day. We have an intellectual admiration and a pride in the Forth Bridge which only carries a railway conveniently and cheaply; what should we feel if it were also an ideal of perfect loveliness? But even then it would not excite the admiration caused by the Gothic cathedrals, embodying, as they did, the very highest aspirations, and offering the highest pleasures then known. There was the colossal structure, the very acme of skill of those days, with its lanterns, towers, and spires bathing in the sunshine, or peering through the mist, turned into mother-of-pearl by the moonlight, or cut out of ebony against the moonless sky. In its day the cathedral was the very ideal of beauty, full of illustrations of natural and scripture history, of ethics, of the sciences, of fables, and of every traveller's tale, and like nothing ever seen before. Inside it was refulgent with stained glass, and a gorgeous ceremonial, where plate, jewellery, and enamels, gorgeous robes and hangings were exhibited, and where imposing, brilliant, and solemn processions were seen, while the curling clouds of incense ravished the senses, and captivated the imagination. In it the ear was pierced with the sweet sounds of singing and music, and the highest eloquence of the dæmonstrated the passions or pictured the way to heaven, and where the contagious adoration of crowds carried the soul upwards, as on wings. On nocturnal festivals, where all these delights were heightened by a brilliant illumination, the

church must have suggested heaven, and the black shadows the abysses beyond.

Matchless as was Greek civilisation, dignified as was Roman, gorgeous as was the Saracen, we can hardly picture to ourselves any ceremonial of theirs so congruous and so striking as high mass in a newly-built cathedral of the thirteenth century. The earth was then held to be the centre of the universe, as man was the highest creature in it, with Heaven for his goal. When the rude and poverty-stricken worshippers were gathered in multitudes to offer their adorations in a building that was awe inspiring by its size and proportions and to them of superhuman skill, witnessing ritual as splendid as it was solemn, performed by holy men for their salvation, they must, when they flung themselves on the marble pavement to the elevation of the host, have felt themselves ascending to heaven to enjoy all this gorgeous pageantry and delight, without satiety and for ever.

THE ARCHITECTURAL ASSOCIATION: AN UNWRITTEN CHAPTER OF ENGLISH ARCHITECTURAL HISTORY.

A MEETING of this Association was held on the 5th inst. in the Meeting-room of the Royal Institute of British Architects, No. 9, Conduit-street, Mr. Bressford Pite, President, in the chair.

The minutes of the previous meeting having been read and confirmed, the following gentlemen were elected members:—Messrs. D. T. Hew, F. J. Corfield, O. S. Doll, S. A. Heaps, H. Withall, J. A. R. Inglis, G. L. O'Connor, Omrod, and W. N. F. Woodland.

The Chairman said that, in accordance with by-law 35, he desired to formally nominate Mr. H. Fellowes Prynne as Vice-President, to fill the vacancy caused by the resignation of Mr. John Begg. As no other nomination was made, the Chairman then declared that Mr. Prynne had been elected as Vice-President for the remainder of the session. He also announced that in order to fill the vacancy on the Committee caused by a previous appointment, he proposed to nominate the gentleman whose name was next on the election list last session, but who was not elected, viz., Mr. C. C. Brewer. As there was no other nomination, Mr. Brewer was then declared to be elected.

Mr. Banister F. Fletcher, Hon. Sec., proposed a vote of thanks to Mr. John Begg for a set of guide books which he had presented to the Library.

The Chairman, in putting the vote of thanks, which was agreed to, said that no doubt they would desire to add their hearty good wishes to Mr. Begg for a safe and prosperous journey to South Africa, and for his speedy return.

The Chairman then called upon Mr. Arthur S. Lower, M.A., to read the following paper, entitled "An Unwritten Chapter of English Architectural History":—

As the history of English architecture has not yet been written, no apology is due to any particular author for venturing to suggest a few unconsidered trifles, for which room might perhaps be found in such a work. But to an audience of architects, an apology for introducing a subject of this kind at the present day, seems very much needed. One is confronted at the outset with the question: Are not all such studies wholly useless and pernicious? Leaders of opinion confidently assure us that they are; and, knowing quite well the disesteem into which historical studies are at present fallen, I hardly dare to occupy your time with matters which so many architects desire to be not merely "relegated," but eternally consigned, to limbo. It is simply in obedience to the request of the honorary secretaries, binding us as a command on every loyal member of the Architectural Association, to provide a paper, which they specified to be "on a historical or scientific subject," that these notes are offered. I could think of no other subject upon my own out-of-date and very unfashionable hobby of English Gothic architecture; but, as thinking the duty, or, as I think I ought to say, declining the honour, seemed out of the question, I took encouragement from a passage in the President's opening address, where he had us, "study the mind in the building, through painstaking measurement and logical reasoning. Find out how and why every joint and form was made. The answer lies hidden in the building." This is just what for a long time I have been trying to do, and I am therefore at least acting on our President's advice, in bringing before you the results of some independent research into the history and characteristics of the Medieval archi-

King and Architect: from a Thirteenth Century Drawing.

ecture of England. Waiving then, for the present, the great question as to whether any such studies are to be recommended at all, and assuming, merely as a premise, that a young architect wishes, for some reason or other, to learn something of the old architecture of his country, how can we best assist him? I should like first to quote some old advice given on this subject, which no one here can ever have seen in print. The extracts are lengthy but have a bearing on what follows. "If you ask how you are to study architecture, you will probably be told to read up the whole history of the art in all countries, with formidable lists of names, dates, and dimensions. You will have recommended to you treatises on the orders, and styles, on rules of proportion and other arithmetical niceties; and will be further advised to read books on the principles of beauty and taste, and probably much poetical extravagance in addition. . . . However we may define architecture, we must agree that it is a practical art, confined by the requirements of utility, the properties of materials, and the laws of mechanics. Therefore in studying it, be practical; put aside all considerations derived from archaeology, sentiment, or association, and simply use your own eyes and your own common-sense; learn by observation and by reasoning. Ask the buildings themselves why they are as they are, and what is their meaning. Imagine yourself with the builders, asking what they are going to do, and wherefore. . . . So, when you criticise, you will neither praise a building because it is correct or classical or reminds you of something which you have admired elsewhere; nor will you condemn it because it appears new and strange, or, on the other hand, familiar and unoriginal; you will simply consider, is it good in itself, that is, is it well fitted for its purpose and well adapted to its position, are its materials well chosen and well put together, is it expressive of its object and its construction, does its design show everywhere a striving after beauty. If all this is the case, it is good architecture; but if one of these qualities be lacking, though the building may display the most costly and splendid materials, the highest mechanical skill, the most careful workmanship, the most accurate copying of some acknowledged masterpiece, the result, as architecture, is bad. . . . To criticise buildings, you must try to grasp the circumstances of their erection, and look at them from the point of view of a constructor. The disposition must be encouraged of thinking of a building as a thing composed of stone, brick, timber, and iron, erected for a definite purpose, and under particular conditions, and not, with the architectural writers of the last three centuries, as merely an affair of lines and conventional proportions and ornaments, quite independent of materials, use, or position, just as if it existed only on paper; nor, with some of our own day, as a thing whose essence is accidental picturesqueness, historic or romantic associations, or the superficial decoration of sculpture, painting, or heraldry."

This almost anticipates the new philosophy of architectural materialism, and as we hear so much nowadays against even the use, and not only the abuse, of hooks in connexion with architecture, I quote these passages from an unpublished paper which I read to an amateur society many years ago. The present subject obliges me to make many references to books, so I wish just to clear the ground, and put myself in order, so to speak, by explaining that, having gone through the phase myself, I quite appreciate the standpoint, and can thoroughly enter into the feelings of certain good friends of mine, fellow members of the Architectural Association, who not only object to any form of book-learning, but even declare, as one quite lately did, that all architectural books ought to be burnt. There is truth, of course, in the idea underlying this—all the books in the world will not make one architect; but the easy proof of this proposition does not negative nor even weaken another one—namely, that books may be useful to architects.

Returning to our imaginary student, we tell him, of course, to go out sketching and measuring, and not to neglect to take notes of construction and materials; every one will agree in this advice. He then surmounts, let us suppose, every technical difficulty, until we find him able to draw with the utmost accuracy and most thoroughly artistic touch any subject he may meet with; he has seen and sketched hundreds of buildings, and acquired quite a respectable acreage of details; he can freely reproduce from memory any portion of his sketch-book; he is, in short, a consummate draughtsman; but there is still something wanting. I am not speaking now of the faculty for design, but simply of that knowledge of the architecture of the past which we are presuming that he desires. Does he really understand these buildings? For all that he has done so far, he may be no more capable of seeing into the ideas and motives of the men who built them than the most prosaic and mercenary photographer. The difference between the two is not necessarily more than one of manual process; the mental attitude of each may be substantially the same. Unaided observation, accompanied by however great technical skill in recording, will not enable a man to read the riddles of ancient buildings. Whenever curiosity begins to be aroused as to how, or when, or why, some particular work was built; whenever, in short, the student wishes to go a stage further, and to know all about what he is sketching, he comes to feel the need of definite guidance; in fact, he has recourse to books. He requires them for several reasons: to learn methods of arranging, connecting, and utilising his own disjointed memoranda; to obtain many indispensable facts, which he could not possibly discover for himself; to bridge over gaps in his own experience; to become acquainted with principles and theories which may throw light on what he has observed, or direct him into fresh fields of inquiry. Books on the history of architecture are not, as is frequently asserted, fetters forged by malign opponents for the

enthrallment of art; nor are they simply labour-saving tools to assist lazy men in the mechanical business which they call their art. Rightly used, they are the means by which an architect may learn the true nature of his art, its difficulties, its qualities and powers, its grand possibilities. But architectural books lead us at once to the thorny question of styles. "Read a little history," the student is sometimes told, "but steer clear of anything to do with divisions of styles. All art is one; therefore all Gothic architecture is one, and it is criminal wickedness to attempt to divide it." Advice of this sort in many cases cannot possibly be attributed to any dislike or contempt for the kind of architecture in question. It is principally based, I believe, on a misconception, which it seems worth while trying to explain. In most branches of knowledge, if not in all others, it is generally agreed that subdivision and definition are requisite in order to render learning and teaching possible. "The orderly arrangement," I have seen it expressed, "and classification of its material is necessary to the true advance of knowledge." Of course if it has to be conceded that Gothic architecture is a thing by itself, not subject to the common rules of human experience, the argument that methods like those found necessary in other arts and sciences can be successfully applied to it, falls to the ground at once. But this those who talk about a one and indivisible style have still to prove. In the meantime I prefer to believe in the sound old Roman maxim, *Divide et impera*, which may be freely rendered, "By division you will become master." If we suggest, then, that for the sake of a more intimate acquaintance with the character of Gothic building, the learner should analyse it, should consider its component parts separately and in their relations to one another, instead of only gazing on it as a whole, beautiful but incomprehensible, we must consider the means at his disposal to enable him to grasp his subject. Directions, guide-posts, and landmarks innumerable await him; but unfortunately the greater number of them, and these the most conspicuous and most generally followed, have been set up on the wrong roads. This is, I believe, the real cause of the distrust now so strongly manifested in all definite study of Gothic. Many men have a vague sense that there is something inadequate, something unsatisfactory, in the orthodox teaching on the subject, and jump to the conclusion that therefore all teaching of it must be wrong and misleading. The idea of improving our present methods does not seem to any one worth a thought. As it is of no material disadvantage nowadays to an architect to know nothing about Gothic, the elder men either leave it alone, or go on, content with the notions about it remembered from their boyhood, thinking the whole subject so simple, so easily mastered, that everything which could possibly be known about it was long ago finally settled and laid out, cut-and-dried, leaving no room for further research or progress. But this attitude has had results for the younger generation. There are still men, even amongst the youngest of us, who take an interest in our inheritance from the middle ages, and there is besides a much larger, and rapidly growing body outside, who do the same, and who look to us for instruction and guidance. To these architectural students, craftsmen, and amateurs, we have nothing to offer but a confused, incomplete, and largely untrue account of our ancient architecture. Shoals of books, indeed, there are, but all of them, down to the very latest, are but echoes of the imperfect description of Gothic architecture composed, and to a great extent invented, by the antiquarian *dilettanti* of a hundred years ago. Perfectly true and correct echoes of the old voices they may be, as to that there need be no dispute; but the very important consideration, that in so many ways we have now the means of knowing more than even the cleverest of our great-grandfathers could possibly attain to, has, in the general treatment of this subject, been most strangely and sadly overlooked. No wonder is it, then, that an intelligent student, turning to the recognised authorities, and finding himself in a maze of unrel and contradictory statements, often quite at variance with the evident testimony of the buildings as well as with the authentic records of history, becomes utterly disgusted, and is tempted to say, "These things have nothing to do with architecture." Illustrations, of course, have been immensely improved, many new facts and descriptions have been added; but as to all matters of generalisation of principles and of application to practice, we are using a system which is demonstrably absurd, and which deserves to

to be obsolete. I speak from a considerable experience of the actual difficulties found in pursuing this subject, which evidently oppress even zealous and hard-working students, and these remarks are entirely prompted by the desire to do something, if possible, towards smoothing the path to a reasonable understanding of it. We have stayed marking time, while in every other branch of knowledge a great advance has taken place, and it is quite time that we should bring ourselves up into line. But the remedy is not to be found in general abuse of antiquaries. Their pioneer work has been of indispensable importance. The fault lies in our having yielded up to them the duty of commanding and directing, which we ought to have exercised ourselves. Hence so many of the generally received ideas about Gothic architecture come from laymen, not from architects, with the natural result that they are thoroughly amateurish, and completely ignore the one thing which we care most about—design. We have forgotten that the proper function of our antiquarian comrades is merely to heave the lead and accurately report the soundings for our information and guidance; and not, in any circumstances, to set the course or steer the ship. To descend from metaphor to details the lay mind—even in the case of the best educated and the cleverest men—seems incapable of thinking of architecture except only as a species of superficial adornment, applied in an ascending scale of ostentation. Every imaginable question in architectural design is reduced by the average Englishman to the single, and to him all-sufficient, one of comparative richness or plainness. Thus we hear Members of Parliament and other typical exponents of public opinion treating all buildings as necessarily falling under one or other of three heads; they must belong, that is to say, to what they term the "plain" or "cheap" style, to the "ornamental" or "expensive" style, or else to the intermediate one generally known as the "handsome" style. Imbued with such ideas our lay antiquaries when, unfortunately not content with collecting and verifying facts, they took to formulating systems, naturally classified and described all our ancient architecture according to the increasing quantity of ornament, which they supposed they could recognise in successive periods.

They were practically unanimous in their division of all Gothic work into early or plain, intermediate or more ornamented, and late or profusely ornamented. There was a vast amount of discussion as to the precise terms to be used to express these distinctions, and as to the particular dates at which one should be held to have merged into another, and almost by accident the designation of the latest style, which very nearly settled down into "Floral," has come down to us as the much more architectural "Perpendicular"; but the method all round was the same; not to study the differences of design in the buildings, and trace thence the divers principles which had governed their builders, not to study the social history of the nation and learn thence the various events which had influenced its modes of building, but to start with a hard and fast, ready-made schedule of three heads, and cut, cram, maim, and squeeze so as somehow to get it filled. It was reserved, however, for a later generation, almost our own contemporaries, to carry this tripartite system to absolutely symmetrical perfection, by overriding clear historical facts, and declaring the existence of three separate styles, each exactly contemporaneous with one century of the Gothic age. Com complaints of this kind may perhaps be called unreasonableness or hypercritical. The books in common use, one may be told, give us quite as near an approximation to truth as we need either expect or desire. To try, therefore, how far this easy confidence is really justified, I must ask you to consider, as briefly as possible, just one instance of irreconcilable difference between views generally accepted and plain facts of history. To quote from a very well-known manual: "The change from one style to another was not immediate: it generally took nearly half a century to effect the transition, and the last half of each of the five centuries was such a period of change or transition. Buildings of the last ten years of a century generally belong in style rather to that which follows." Passing on to particulars our authority further tells us:—"In the fourteenth century the general character is of the style called Decorated; the last half of it is the period of transition from the Decorated to the Perpendicular." Nothing could be more beautifully simple and regular; but nevertheless it used to be a great puzzle to me how, if all this were true, one never met with a "Decorated" building after the middle of the century, while, without

any premonitory signs of change, every building after that time was to be found designed or entirely different, indeed almost opposite, principles. No reaction in taste could by itself account for such a startling change, and from no architectural writer nor any general historian could an explanation of the mystery be obtained; indeed none of them seemed to recognise the fact. O after a good deal of search in the by-paths of history did I come across the clue, namely that the "Decorated" style, after an existence of only some five and thirty years, was suddenly cut short and literally killed by the *Black Death*, that awful pestilence which was near to depopulating England in the years 1348. Epidemics are disagreeable and unpicturesque subjects, apt to be avoided or lightly passed over by even the best historians, as this particular one has been until quite within the last few years. The *Black Death*, though it ravaged every corner of Britain, carrying off in a few months more than half the population—destruction compared with which even the "Great Plague" of 1665 sinks into insignificance, did not strikingly affect the general course of politics; on the surface, the current of affairs appears to flow on unchanged; but in the artistic, just as much as in the social history of England it forms a turning-point of immense importance. All the conditions under which building was carried on were suddenly and violently, and permanently altered. Time was not allowed, nor, perhaps, would you care to hear even a brief description of the effects of this visitation; but I believe that any one who will take the trouble to study the inner history of these few years will have no difficulty in learning both how it came about that the "Decorated" style never ran its natural course of logical development, and also what were the causes of the special characteristics of its successor.

The chapter of the history of English Gothic architecture which has never yet been written—the one which shall treat of the whole matter of the sole basis of design. No one, except an architect, can write this chapter, but only one, as far as I can discover, has ever fairly essayed it—refer, of course, to the late Edmund Sharpe. His description of Gothic building is the most architectural one which we possess, and is full of valuable suggestions; but hardly any one regards it more than a partial success, and it has certainly not succeeded in supplanting, as its author hoped, the popular amateur version. Sharpe made bold and original endeavour to place the study of Gothic on better foundations, but his work was doomed to failure, because it rested only on one particular section of design, and that not in reality the most important. In seeking a key to the understanding of Gothic architecture in window-tracery alone, and grouping all buildings in accordance with the one standard, Sharpe showed that, after all, it was, however unconsciously, still under the influence of the amateur school, who saw tracery, as they do to this day, the principal evidence of that comparative amount of decoration which they denominate "style." But if rush in where Sharpe failed, if he feared not, tread, I shall be in danger of the apt quotation of an ancient proverb. If any one is expecting me to say that I have got the missing chapter in a pocket, I fear he must be disappointed. But over there, in the lantern which our kind friend Mr. Wonnacott will shortly bring into action, I have collected some material which may suggest some one how it might be written, and will, any rate, lighten the dulness of my sermon. . . . This first slide is one which I have just had made from an MS. in the British Museum, and I do not know that the subject has ever been exhibited before. It is taken from Matthew Paris's "Life of King Oifa" (Cottonian MS. Nero D.1.). The author and illustrator of this work was, I may perhaps remind you, a Benedictine monk of St. Albans Abbey, who died a few years before King Henry III., and is said to have been equally distinguished as theologian, historian, artist, poet, and mathematician. The original is an outline drawing in brown ink, measuring about 9 in. by 5 in., so that the large figures are about 4 in. high. The subject is Oifa, King of Mercia, directing the building of St. Albans Abbey, at it is hardly necessary to say, the drawing illustrates a building-scene of the days of its author, and not of the remote period which he is describing. Its main interest lies in the fact that we have here an unquestionable contemporary representation of a mediæval architect, together with some important evidence as to his position and methods of work. It is worth while taking note of even the details of this drawing, because some of the most fastidious

able modern theories about Gothic architecture depend entirely upon the supposed non-existence of architects in the Middle Ages. It has quite recently been confidently stated, though apparently upon no better grounds than an *a priori* assumption, that "there never was no such person," or that, if there was, he was quite undistinguishable in any way from an ordinary mason. We have been told that he could never, like a degenerate modern architect, have been seen upon the works with his coat on—because he could not have possessed one, nor even in his shirt-sleeves, for a similar reason! Now the man before us, to consider his outward aspect first, is not of this sort. In all particulars of dress and general fashion, he bears a close resemblance to the king and his attendant. So far, too, from looking just the same as any one of the crowd of workmen whom we see engaged in their various handicrafts, he is unmistakably a man of learning and culture, whose work lies in designing and directing, rather than in simple manual labour. He is discussing, on very friendly terms, some point concerning the building with the king; the latter apparently has made some suggestion, but the architect is giving his opinion with no undue show of deference, while the courtier kneels in the background till the question is settled. Even were there no other signs to guide us, this drawing is enough by itself to suggest that a great Gothic building was not, as is so often pretended, a mere concretion of material, piled up by the unorganised and undirected labour of many similar units—exactly in the manner of a coral reef—but was, on the contrary, the actual creation of a single intellect, as truly and absolutely so as a play of Shakespeare or an oratorio of Mendelssohn. There is not in reality the slightest disparagement of the other workers who took part in raising such a building in saying that their work could not have come into being without an original mind to give the necessary impulse and control; it is no more than saying that the cleverest actors and the most skilful musicians depend after all for the opportunity of exercising their powers on the previous labour of the individual dramatist and composer. When we know that Matthew Paris not only witnessed important building operations in his own abbey, but was in great favour with Henry III., and present at his court during the erection of the Abbey Church of Westminster, we may readily imagine that in representing the legendary scene of Ofa's foundation of St. Albans, Paris drew upon his recollections of the frequent interviews he must have witnessed between Henry and the architect of the great church, in the building of which the king took such deep and constant interest. But notice also this architect's compasses and square—they denote more than that he is merely an expert in building—they mark the geometrician. This is a point we must return to, after looking at the other slides, views and details of buildings, selected for special reasons, which, for convenience sake, must be shown now. . . . To come back now to Matthew Paris's drawing. Here we may find the clue, without which we can never learn to see the mind of the medieval architect in his work. He was essentially a geometrician. In the great intellectual movement of the thirteenth century, no branch of learning, except theology, was more widely cultivated than geometry; and this science, both then, and for long afterwards, occupied an altogether higher position relatively to other intellectual pursuits than it does at the present time. Among the many side-lights which the recognition of this fact seems to throw upon the development of English architecture is one with regard to the vexed question of influence from the East. Most people have at some time felt, if they have not, through lack of tangible proofs, actually allowed, that Oriental suggestions must have played some part in the formation of English Gothic architecture. As an explanation of this, it has generally been loosely asserted that the English crusaders tried to reproduce at home the Saracenic architecture which they had seen and admired in the course of their campaigns; a supposition which, besides being unsupported by a shred of evidence, must seem to any one acquainted with the average military mind, absolutely incredible. But when we think of the highly-prized Arabic geometrical treatises then finding their way into every monastery and university (the latter being at the time thronged by lay scholars, in numbers almost impossible to realise), there is little difficulty in imagining how the subtle influence of books, written by men whom the most learned of Europeans revered as their intellectual masters, became the means by which Oriental inspira-

tions were grafted upon the rising tree of English architecture. Until we can form some idea of the influence of geometry during the middle ages, nowhere stronger, I believe, than in our own country; until we can partly realise the fascination in the study and exercise of it which then possessed every educated mind, lay and clerical alike, we shall never be able to understand the conditions under which our Gothic structures were designed. Geometry is the indispensable key to the thoughts of the men who built them; indeed, I will go so far as to say that, were I asked to define English Gothic architecture in the fewest possible words, my definition would be:—"A species of building wherein every part, from the greatest to the least, is dominated by the same geometrical motive?" I beg you to notice, however, that I do not say, simply, "dominated by geometrical motives," nor "by a motive," but "by the same motive." A great deal turns upon this. It will not be at all surprising to hear this definition objected to as being neither new nor true. It may be contended, on the one hand, that everything possible to be said about the connection of geometry with Gothic architecture has been already said; and, on the other, that true art soars far above the trammels of such a cold, hard, prosaic science. Both objections cannot be dealt with together. The former, of course the less important, may perhaps be sufficiently answered in a few words; but, to establish a case to meet the latter, which I expect would be fervently urged, would require the production of a large body of pictorial and other similar evidence, such as, unfortunately, I am unable to bring before you in the limits of the present paper.

But there may still be time to say a little about previous references to the relation of geometry to Gothic design. The mention of it at once calls up visions of plans and sections of churches, crossed over like maps by squares and triangles, with arguments on the supposed rules of their setting out, which have rarely succeeded in carrying conviction, chiefly on account of the apparently arbitrary and usually contradictory systems of measurement adopted by rival theorists. It suggests also that much ingenuity has been devoted to one particular class of geometric design by the illustration of the infinite variety of patterns producible from contained and intersecting circles. Nor will it be forgotten that some authorities have gone so far as to speak of a "geometrical period," though only as a short-lived minor division of English Gothic. We may be grateful for hints from all these sources, but they neither exhaust the subject nor give us the information for which we seek. It should be remembered that, owing to the general destruction of our ancient libraries, and the consequent dearth of direct home evidence, people have been implicitly relying upon certain works on proportion, which happen to have come down to us from German and Italian architects of the latter part of the fifteenth and of the sixteenth centuries, to explain the principles of English architecture in the thirteenth and fourteenth centuries! To arrive at an understanding of the actual manner in which Old English architecture was influenced by geometry, not for a limited time only, but from its birth to its decline; not through any one form or figure only, but through many; not vaguely and at random, but with a single order of forms dominating, as a key-note, each particular era in succession, and quickening inert matter by the inspiration of an intellectual force, we must discard many old methods, old prejudices, old associations. We must look for new facts in our own buildings, and for new light upon them from our increasing knowledge of our own social history. We must establish our principles solely upon the firm base of careful observation, instead of stubbornly dogmatising in the old, vicious manner, and mangling facts to make them square with unwarrantable theories. In doing this we may gain even more than truer and fuller knowledge of the past; we may find sure helps and great encouragement for the future.

The Chairman said that when he observed the title of Mr. Flower's paper some time ago he regretted that it did not define its subject more clearly, but now he was quite convinced that Mr. Flower had done the right thing. The paper was very suggestive, though at the same time he was afraid it would be difficult to discuss it. Mr. Flower's line was new, but there was something about it to his mind which carried a conviction of its truthfulness. He could not explain why he thought that, but it seemed to him that the theory was extremely probable. It seemed that a link was missing, as Mr. Flower had so characteristi-

cally described, in history books of architecture, and this link he hoped Mr. Flower had found. They had for some time been accustomed to talk about Medieval architecture as a sort of sanctified engineering, and some of them did not consider that any reflection was cast upon Medieval art in that definition. Mr. Flower had certainly carried that belief to a very practical point, as his studies had convinced him that the whole progress of that art, their national art, up to the time of the Renaissance, proceeded on geometrical lines, or a system of geometry applied to a particular building and existing for the furtherance of that building. He expected that an engineer would give them practically the same definition of the motive underlying any modern work of engineering. He proceeded upon a geometrical method, and certain scientific factors which were found mainly in his materials; and it seemed to him (the speaker) that his method was exactly the same. A more interesting prospect certainly was thus opened to them than the prospect of a barren geometrical investigation of works that were to them works of sentiment and romance, in the singularly beautiful way in which the aesthetic sense was combined with the geometrical engineering, as the essence of the evolution of their architecture. Oh, that they might learn the lesson, and be more geometric! and that engineers might learn the lesson, and be more aesthetic! He (the speaker) listened carefully to the opening of Mr. Flower's paper, and noted how carefully he dealt with the architectural history books, and also with their critics; and it seemed to him that Mr. Flower would undoubtedly have to write the new history of English architecture; and no doubt, in arriving at the conclusions which he had given them that night, he had collected the material necessary, at all events, for an efficient handbook to the proper and effectual study of a developing architecture. The portrait of the Medieval architect that he had discovered and shown upon the screen would no doubt mark that meeting as historic. They might think he was unduly exaggerating the importance of this discovery, but he believed that the point would receive, through the publicity it would gain in the press, the attention it deserved. To have unearthed from the British Museum a thirteenth-century architect addressing his client, and having in his hand, not a two-foot rule or a five-foot rod, or a bill of quantities, but simply a revolving calliper, was a discovery of no little importance. Similar testimony to that afforded by the illustration which Mr. Flower had exhibited was borne in the celebrated album of Wilars d'Honecourt, in the Library of Notre Dame, Paris, which was produced in facsimile by a French architect, and of which Professor Willis issued a translation. That book proved that architects existed as architects and as draughtsmen—there was no evidence of a draughtsman in the illustration shown that evening. The draughtsmanship in the album he referred to was interesting because it was geometrical, and because the geometry was carried to the extent of drawing the human form, and showed how to design the figure in triangles. The designer also sketched in a wiser way than we did. We sketched things as we saw them, while this travelling architect of the thirteenth century (about the same date as the architect exhibited that night) sketched as he thought things ought to be. That was vastly interesting; for instance, he sketched the west window of Laon Cathedral, not as it was, but as he thought it should be. In conclusion, he (the Chairman) would like to refer to a matter of some interest, and that was the way in which the Black Death removed the tenderness of our national architecture. After that the Deluge, the Perpendicular, and then no life, no feeling, "no nothing," until the Renaissance.

Mr. Paul Waterhouse, in proposing a vote of thanks to Mr. Flower, said he congratulated the Association upon the excellence of the paper they had heard that evening. It was very difficult to open the discussion upon it, however, since it was a paper by a specialist, Mr. Flower having devoted so much careful study to Gothic architecture. He felt that in suggesting more system in the study of Gothic architecture, Mr. Flower was doing them, as students, great service. They had long been accustomed to complain that the recognised divisions, chronological and formal, of Gothic architecture were misleading—in fact, that they hindered as much as they helped; and he supposed that the great difficulty in the study of the subject arose from the fact that Gothic architecture, when they were first led up to it, was chaos, and a young student could not make much

out of it; the only way was to divide it up, as Mr. Flower had said. It unfortunately happened that the first divisions were done by persons who had only a very partial view of the subject, and those divisions were taken up and elaborated by various antiquarians. Moreover, these divisions, even if they were of the best description, had in each student's education only a temporary purpose. Granted, for the moment, that the anatomy, the analysis of Gothic architecture, had been as good as it could be, Gothic architecture was so complex that these divisions must, after having first served to illustrate the subject, have tended to obscure it. It would be impossible to so divide the subject of Gothic architecture so that the divisions would not become, after increased study, a kind of obscuration. He thought that must be granted as inevitable. They knew to their cost how very much those conditions hindered. People imagined that the periods of Gothic architecture existed as clearly in actual fact as they did in text-books, and no one could do a greater service to students of Gothic architecture than to point out to them a higher consideration of the subject. The divisions should enable the student to approach the matter with a clearer set of ideas. It had often been a matter of astonishment to him that they were so unable to criticise a Gothic building. He knew hardly any one who had such courage in his convictions as to adversely criticise a building of earlier date than the fourteenth century, but it was inevitable that some buildings of that date which had survived could be criticised. In regard to the way in which first principles were laid before young architects, he believed that in the true evolution of an architect (by which he meant a designer), first principles should not come first. He believed that the first process of growth in an architect began by the study of everything that came within his province as an architect. Secondly, the canons of taste were not rules of proportions, or rules laid down by a Ruskin, but something in themselves which, the more powerful it was, the more difficult it was to define. That must be cultivated in every individual architect after the study. They would find springing up in themselves laws which were principles, by which they obtained the power of criticism—criticism of other buildings, and criticism of their own designs. As to the ancient architect, an illustration of whom had appeared on the screen, he did not appear to have any india-rubber, and he (the speaker) was inclined to think that india-rubber was one of the chief factors in design. Perhaps it would not be altogether incorrect to say that in many men design consisted in the power of mercilessly criticising their own productions, and there were many excellent designs which, instead of taking form at once, were rubbed into shape by india-rubber. He was not prepared to discuss at that time the question of whether the geometric principle was the great secret of Gothic design.

Mr. W. H. Seth Smith seconded the vote of thanks to Mr. Flower for a paper which, he said, represented a vast amount of work. Mr. Flower's paper might be described briefly as a scientific paper—that was to say, it was scientific in its historic method. The illustration which Mr. Flower had obtained from the British Museum was of quite exceptional value and, as the President had said, it would mark an epoch in the information which they had on the subject and would rather shatter the idea they heard so frequently expressed that in the Middle Ages there were no architects—an idea which was very popular just now, and which threatened great harm to young architects in their training. He thought the paper, and Mr. Flower's statement of the geometrical origin of Gothic architecture, brought into prominence the idea, which was now very often discussed and which appeared to the speaker to have very great weight, viz., that they as architects required much more scientific training—much more training in the direction of engineering science—and that they needed to have not only the artistic power, but also a thorough training in these principles upon which such a constructive art as theirs was based. The paper, which he imagined would be opposed very energetically by men like Mr. Ruskin, was, he hoped, only an instalment of a larger work by Mr. Flower on the same subject, and that they would have from him further papers which would lead them to study more scientifically the styles of English architecture.

Mr. A. H. Hart, in supporting the vote of thanks, said that he was a little unable to grasp the full meaning of Mr. Flower's thesis. He had told them that geometry entered very largely

into the designing of medieval buildings, but he (the speaker) would like to see that theory carried a little further. Did he understand the lecturer to think that geometry was responsible for the many beauties of medieval architecture? If that were so, a great deal was being attributed to geometry. In regard to the draughtsmanship of the Middle Ages, he had the opportunity recently of inspecting the original design for the west front of Orvieto Cathedral, and an interesting drawing it was. Not more was shown than was absolutely necessary to direct the workmen, and that only in a very sketchy way. Some parts of the front of the cathedral were entirely omitted: the metal work for instance—the lions and so forth—which added very greatly to the beauty, was not shown upon the drawing.

Mr. Banister F. Fletcher, in supporting the vote of thanks to Mr. Flower, said that the lecture concluded with the geometric idea, which had surely been well threshed out before in connexion with Gothic architecture. Any one who desired to know what had been written on the subject had only to refer to Billing's "Infinity of Geometric Design" and he would see how much geometry must have entered into the design of Gothic structures. It was a fact which he supposed every one would admit, but could it be stated on every page of an architectural history book? Mr. Flower had also taken exception to the formidable list of dates which were contained in some history books, but could a history of architecture be very well written without them? The Board of Examiners of the Institute asked for the dates, but if Mr. Flower, as one of the examiners, would get those gentlemen to eliminate dates from the examinations he would have a large following of students. As to the important point of the laws of mechanics in relation to Gothic architecture of the Middle Ages, it seemed to him that they must follow the history of architecture in the Gothic ages as a history of construction, the different forms which were evolved being nearly all traceable to constructive principles. Mr. Flower had done well to enforce that. It was not so much a question of design as of construction which architectural students ought to consider. As to the public understanding of design, he thought they did a little until last year, when he heard the west front of Canterbury likened to St. Paul's. As to the divisions of Gothic architecture, he agreed that it was ridiculous to refer to "Early English" and "Perpendicular," but what were they to do? A line must be drawn somewhere, for they could not talk about Gothic architecture as a whole—at least the student could not. They were told that the sub-divisions were absurd, but they must be mentioned in books. Sharpe, however, took one feature, the window, and he made the whole of his system depend upon that: whereas, as a matter of fact, the system of window tracery was almost entirely brought about by the system of vaulting. If Sharpe had taken the buttress and the vaulting, and made his system depend on that, he would have given a more satisfactory definition of Gothic architecture. He thought that Mr. Flower had overlooked the fact that the crusaders were the most intellectual men who went abroad, and that the engineers of the army were quite likely to adopt any Oriental features. For the intellectual study of English architecture, a good history of England should be read at the same time, and he would suggest a careful perusal of Green's "Short History of the English People." The speaker's pet idea was that engineering was a part of architecture, and that the more they got away from the true practical building the less likely were they to get a style which was essentially characteristic of their period. During the whole Gothic period, as far as could be understood, the men who built were practical men—they were not paper draughtsmen—and that was the true secret of all architecture. The true modern architect he regarded as an engineer. Mr. Flower had spoken against the triangulation of the English cathedral, but he had not ventured to put anything in its place. There was one matter which ought to enable Mr. Flower to get over his objection to text-books, and that was the article written by Viollet-le-Duc on "Construction." That was a most valuable discourse—a scientific, a builder's discourse—on the development of Gothic architecture. There were no divisions, and that would enable Mr. Flower to get over his objection to divisions into periods. The English translation lately published could be obtained from the Library. He could not help thinking that Gothic architecture was really the best architecture for any student

to study: whether he was going to design in Gothic or not, it was a study in construction. Any one who measured up a cathedral edifice from top to bottom, and reasoned the building out on paper, would find the work an architectural education in itself, even if he did not agree with the ideas or the principles of the style.

The vote of thanks having been put and carried unanimously,

Mr. Flower, in reply, said that, in regard to the suggestion that he should give a further instalment on the subject of his paper, he had no idea of doing so—at least, at present. In regard to Mr. Hart's remarks about geometry, of course a very hard view of geometry indeed could be taken. He (the speaker) would not say that geometry was a royal road to good architectural design, and he did not suppose that any Medieval architect rigidly insisted upon it. He did not assert that those architects were fully conscious of definite motive in what they were doing—the English, at any rate, for the French architects were more logical. But certain leading ideas were perceptible not only in tracery and in mouldings, but even in carved and painted work—no division that only regarded tracery would enable them to understand the preferences for particular classes of forms which seemed to have influenced those architects. But it was a subtle influence much more easy to feel and recognise than to rigidly define. Mr. Fletcher had criticised his remarks recommending students not to trouble themselves with historical data, but those remarks were contained in a paper written years ago, from which he had quoted: his views had been modified since. As to the text-books, why was it that the public took their views of English architecture so implicitly from Parker? Chiefly, he believed, from his prominent position as the bookseller and publisher at Oxford; he had done much excellent work as an antiquary, but were it not for these other causes his theories would never have attained such prominence. He did not desire to say anything against Mr. Parker—in fact, he admitted him very much as a man who knew a great deal, but he was not an architect. Another similar book was that by Mr. Bloxam, a country solicitor. He, too, was a most estimable man, and though there was no objection to such men writing on the subject, it became a serious matter when, upon the imperfect systems constructed by them, architectural students were instructed and even examined. He (the speaker) was well acquainted with Mr. Billing's books, but could not discover in them any principles except those relating to the use of circles. As to the architecture of the Middle Ages his view was that during a certain number of years men preferred to work mainly on circles; at another time on triangles, and at others on more complicated systems; but no one system could be got to include the whole of the Middle Ages. He was quite in agreement with what Mr. Fletcher had said in regard to the laws of mechanics, as well as with what he had said about the necessity of divisions. It was only a question of why and where they should draw their lines. One text-book, for instance, said that the flowing line began to be used after the middle of the fourteenth century, which was directly contrary to the facts. As to the crusaders, he did not agree with Mr. Fletcher, for many of those men could not even read or write, and a man who could not read or write had seldom much idea of form; he would be just the kind of man who, as Mr. Fletcher had told them, could see no difference between Canterbury and St. Paul's. As to Green, they must remember that his history was written more than twenty years ago, and they must seek newer authorities to get at the real facts of the great social changes which happened at the period they were discussing. The Black Death having carried away half the population, the only important works carried on for some years after were the royal buildings at Windsor, and for these William of Wykeham had to impress workmen from all over the country. The necessity of employing quartermen and hedge-carpeners to take the place of trained craftsmen, in consequence of the enormous mortality in the crowded cities and monasteries, was an architectural factor of considerable importance. It took England centuries to recover from the shock of this plague. He admired Pullan's work to some extent, but his principles of proportioning did not tell them all they wanted to know. He did not think that the sculptors and masons of the Middle Ages understood thoroughly the principles which it was interesting to try to trace in their work; but they had some sort

motive, or there would not have been so much illarity in their work all over England at the same time. He agreed with Mr. Fletcher thatallet-le-Duc's article on Construction should certainly be read by the student; he would include his Lectures on Architecture. The Chairman announced that the next meeting would be held on the 10th inst., when a paper would be read by Mr. W. H. Bidlake on The Architect and the Public. The meeting then terminated.

MAGAZINES AND REVIEWS.*

THE *Art Journal* is almost entirely devoted to letters and their works. The principal illustration is an etching, by Mr. David Law, of a portrait of "Souverain d'Italie," accompanying an article on the artist by Mr. Arthur L. Salmon. Cosmo Monkhouse continues his description (begun in the January number) of Mr. Arthur Benson's artistic treasures, the present paper giving an account of "The British Portraits" belonging to this notable collection. "A New Colour Printing," by Mr. Gleason White, describes a lately developed invention, employed in a factory at Deptford, for producing coloured printed fabrics on a very large scale and with wonderful mechanical exactness; the specimens illustrated are hardly satisfactory as examples of design, but there is no opportunity of judging in them of the actual colour effects produced in the new process. Mr. Lewis P. Day contrives a somewhat pessimistic article on "Art in Advertising," with some characteristic illustrations. He offers some practical advice on designing advertisements, but seems to be of opinion that the conditions of advertising are necessarily antagonistic to Art. "The better the picture," concludes, "the less it is suitable to advertise." Good pictures do not shout; and advertisement, when all is said, means shouting. It solves itself very much into a question as to who shall shout loudest, and so down the throat of his competitors." "Holheim's Porch," often and illustrated by Mr. G. Fidler, describes a pretty little fragment of architecture, standing by itself in the gardens of Wilton House, but formerly at the entrance to the mansion. Mr. Fidler gives, at some length, the grounds for its attribution to the great painter. His drawings are rather weak, and somehow convey an impression of the whole thing being cut in white plaster. An article, signed "B. B.," on the work of Tito Lessi, is illustrated by some excellent photographs of some of his best pictures, which go far to substantiate the opinion made for him of being "An Italian Dissonance." Mrs. H. M. Stanley gives some personal reminiscences of Bastien Lepage and his visits to London, of which some of the most interesting are the painter's observations on the particular "notes of colour" respectively characterizing Paris and London, and on the difference in the atmosphere of the English atmosphere. The new Central School of Arts and Crafts is criticised by "E. D.," some of whose remarks are worth consideration. "It is surely the greatest possible mistake," he says, "to shut out from them all those actually engaged in the particular branch of the industry taught." Distribution of labour "has, in great part, to account for the present unsatisfactory condition of things; and if, for example, trades like silversmithing are to be brought into line with the artistic movement of the day, the first thing to be done is to break down the trade barriers dividing them into half a dozen sections, each of whom knows nothing of the other is about. The real need among workmen (though they may not know it) is that they should understand something more about their handicraft than pertains to the small section to which they are confined in the factory. The London County Council seems to stand too far off in awe of the trades unions to do the work it might do with the funds at its disposal." The exhibitions of pictures by Lord Leighton and by Mr. Watts receive short notices, with illustrations of the "Procession of Cimabue's Madonna" of the one, and the "Chaos" of the other.

To the *Nineteenth Century* Prince Krapotkin contributes a comprehensive survey of "Recent Progress," which includes a summary of our present knowledge of the "North Polar Basin."

The object of these notes is to point out anything in the contents of the current magazines which is of special interest to our readers, with occasional brief criticisms on views expressed in such articles. When a magazine which has been sent to us is not noticed, it is because that number contains nothing that it is within our province to comment upon.

as modified by the results of the Nansen expedition.

In the *Contemporary* Mr. W. H. Dickinson, under the head of "The Water Supply of London," makes a vigorous attack upon the present water companies, which he contends ought to be abolished. He would not be content with any middle course of exercising fuller control over their administration, or of establishing a Water Trust; "the only logical solution of the question," he sums up, "is to place the water supply entirely in the hands of the proper representative bodies." Mr. Edmund Gosse, by his "Coventry Patmore, a Portrait," reminds us of an author, who, although he seldom touched on architectural matters, did so at times, in his prose essays, with a rare union of enthusiasm with discrimination. The poet's "ceaseless pre-occupation and daily delight" for several years in watching the growth of the church built for him by Mr. Basil Champneys at Hastings is graphically described; it is interesting also to notice the efforts which he made to get really first-rate statues into the churches of his communion, to supersede "the wretched Munich things Catholics now have to put up with."

"Vanishing Paris," in *Macmillan's Magazine*, is a doleful lament over the continuing process of "Hausmannization," which is reducing all Paris, says the anonymous author, "to a criss-cross of straight lines." It describes the havoc among the old associations of the Faubourg Saint Germain now taking place, owing to the construction of the new Boulevard Raspail, and gives some graphic descriptions of the fallen greatness of the once splendid mansions of the Rue Galande.

The *Gentleman's Magazine* contains an account by Mr. E. H. Parker of "The Emperor of Annam and his Capital," from which some idea may be formed of the general aspect of Hué, the capital, and other Annamese cities. There is also a full review of Miss Phipson's new work on "Choir Stalls and their Carvings."

In *Temple Bar* we find "The Dome and its Wanderings," by Mr. J. C. Paget, a popularly-written account of the geographical distribution and general history of domical building. Several of the most famous domed structures at Constantinople, Venice, and Agra, are described from personal recollection.

The *Fortnightly Review* contains a short article by Mr. H. H. Statham on "Leighton and Watts: two ideals in Art," comparing Lord Leighton's and Mr. Watts's use of the figure as a medium of expression in Art, and condemning Mr. Watts's tendency towards mere moral symbolism in some of his later pictures.

The *Cornhill* contains an article by Mr. E. T. Murray Smith on "Two Centuries of National Monuments"—to wit, those in Westminster Abbey; rather historical than artistic, but summing up with the opinion (in which we quite concur) that however some of these monuments may offend against art and good taste, we have to accept them as they stand; "One generation cannot lightly undo the knots tied by those before it." The *Cornhill*, under its new management, has not dealt much with subjects which come properly under our criticism, but we are glad to take this opportunity of expressing our sense of the varied interest of its articles since its new start, and we would particularly mention the series called "Pages from a Private Diary" as including much admirable and witty criticism on contemporary events, by an evidently shrewd and original mind.

"Chatsworth," in the *Pall Mall Magazine*, by Mr. A. H. Malan, with illustrations from photographs by the author, is evidently written for the sake of the photographs, and does not aspire to be more than a pleasant and appreciative chat about the principal "lions" of the place; the prints are mostly clear and good. "The Cathedral," written and drawn by Mr. G. M. Henton, is a little descriptive poem, in obvious imitation of Longfellow. The verses are interspersed with sketches from various places.

In *Knowledge*, Miss A. M. Clerke's "Sixty Years of Astronomical Research" is accompanied by a sketch-elevation of Vienna Observatory, described beneath as "An Ideal Establishment, such as we might have, but have not in England." The building, with three bold domes, and conspicuous telescope-apertures, looks both sensibly and gracefully designed and thoroughly appropriate to its object. Mr. W. H. S. Monck's letter on "Underground Cavities and Streams in Ireland" is of some geological interest.

The *Quarry* has several useful articles and notes in particular on "Variability of Building

Stones;" "The Bolsover Fire," and the effects of high temperatures on stone; "Slates and Slatings," a fresh and sensible treatment of an old subject; and "Tests of Sands for Making Mortars," translated from a paper by M. R. Feret.

The *Antiquary* devotes a good deal of its space to making common cause with certain Radical journals in their desire to "rescue" English cathedrals from their clerical guardians—a strange combination! In language by no means of the sober and temperate sort to be expected from such a quarter, for the sake of the possible preservation *in situ* of a certain quantity of old masonry, the entire destruction of a far older institution is demanded, and with a childish display of ill-feeling, a photograph (a very poor one, by the way) of the west front of Peterborough is reproduced, for the small satisfaction of printing below it: "Now in course of Demolition!"—a statement which can only be characterised either as foolish ignorance or direct untruth. Miss Sophia Beale begins a series of gossip, popular articles, entitled "Gleanings from French Churches."

Harper includes several interesting articles. Under the fanciful heading of "Hygiene in Manhattan," Mr. K. Wheatley gives a scientific and statistical account of the character, functions, and methods of the New York Board of Health. Mr. T. Hastings' "Architecture and Modern Life" is a thoughtfully written essay on some aspects of contemporary American architecture, dealing chiefly with the influence of French Renaissance models, which the author would like to see generally followed, but with freedom and discretion. "Poor Sir John Vanbrugh, one of England's greatest architects, whose charming floor-plan of Blenheim Palace will be admired for all time to come," comes in for some unusual and unexpected praise. "The Awakening of a Nation," by Mr. C. F. Lummis, has some capital views of Mexican cities.

In the *Century*, Mrs. Van Rensselaer's illustrated article on "Places in New York" is chiefly of social and ethnological rather than of topographical interest.

The same may be said of "London," in *Scribner*, by Mr. C. D. Gibson, the illustrations being devoted entirely to types of character from the streets. The works of Giuseppe Segantini, the Italian landscape painter, are described by Sig. Alfredo Melani; and in "The Field of Art" a description, with a sketch, is given of Tligner's newly erected monument to Mczart at Vienna.

The *Atlantic Monthly* contains Miss Robbin's account of the excellent work done by the "Village Improvement Societies," founded to plant trees, lay out parks, &c., in many villages and towns in New England. The decorative paintings just completed by M. Puvis de Chavannes in the Boston Public Library are described by Miss Waern. Under the title of "Two Interpreters of National Architecture," Mr. H. Van Brunt gives a careful and interesting review of the lately published biographies of J. W. Root and Charles Bulfinch.

The special issue of the *Engineering Magazine*, entitled the "Prosperity Number," is a well got-up number, devoted chiefly to topics of mechanical engineering. Mr. Dankmar Adler treats of "The Stimulus of Competition in Architectural Construction," regarding all advancement in architecture as the result of competition, first among individuals, and afterwards between communities, and calling on architects "not to fail to bear their part in the progress and work of the day, and in the competition and emulation to surpass one another, which lies at the foundation of human progress."

La Monde Moderne contains prettily illustrated general descriptions of Bucharest and Nice, and some good specimens of "picture-making" by photography from the exhibition of the Paris Photo Club.

La Revue Générale contains M. Arthur Verhaegen's concluding article on Trades Unions in Belgium, strongly advocating their legal recognition. A new illustrated work, "Les Grandes Cathédrales du Monde Catholique," by M. L. Cloquet, Professor of Architecture in the University of Ghent, receives very favourable notice.

In the *Architectural Record* the principal article is a somewhat profusely laudatory account of the works of Mr. H. J. Hardenbergh, a designer of "mammoth" hotels and "sky-scraping" blocks of offices. Mr. Goodyear continues his ingenious, if unconvincing, researches into the "constructive asymmetry" of medieval Italian churches. Some cathedrals of Provence are described in a well illustrated article by Mr. Barr Ferret, and other articles deal with "Corner

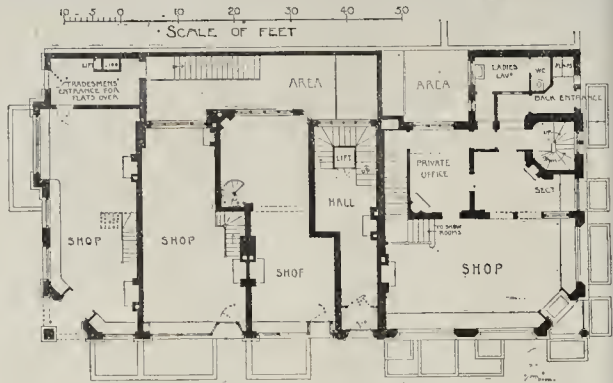

Houses in Paris," "The Villas of Rome," "Sicily," and "Modern Decoration."

The *Engineering Magazine* has a suggestive criticism of the architecture of American Government buildings by Mr. W. M. Aiken, the variety of types illustrated being specially interesting. Mr. G. E. Waring, Jun., discusses the "Relations of Street-cleaning to Good Paving."

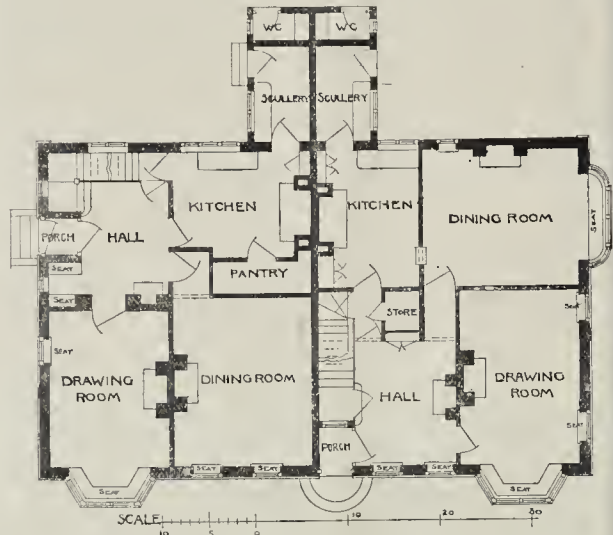

ARCHAEOLOGICAL SOCIETIES.

SOCIETY OF ANTIQUARIES.—A meeting of this Society was held on the 4th inst., Sir II. H. Howorth, M.P., V.P., in the Chair. Mr. James Harrison exhibited and presented a photograph of a stone shaft, surmounted by a small bowl, evidently a holy water stock, lately rescued by him from the churchyard, and now in the vestry of St. Andrew's Church, Charnmouth. Rev. Canon Church exhibited a remarkable thirteenth century wooden pix canopy, from Wells Cathedral, upon which Mr. W. H. St. John Hope read some descriptive remarks. The canopy is in the form of a cylindrical lantern of open tracery work and is about 4 ft. in height. Though much "re-fitted" it bears traces of having originally been richly painted and gilded. The top is surmounted by a hold cresting of leafwork, and retains the curiously arranged ironwork by which the whole was suspended with a swivel hook from which the pix depended. Mr. C. Lynam exhibited a cast of, and communicated a note on, a fragment of a pre-Norman cross-shaft lately discovered at Leek, Staffordshire. Professor T. McK. Hughes read a paper on "The Derivation of the Four Characteristic Implements of the South Pacific," namely, the battle-axe, the throwing-stick, the boomerang, and the patoo-patoo, and he showed, from actual comparison, there were strong grounds for believing that they had directly derived their present forms from the bones of cetacea.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—The fourth meeting of the session of this Association was held on the 20th ult., at the rooms in Sackville-street, Piccadilly, Mr. C. H. Compton, V.P., in the chair, when a paper by Dr. Fairbank, F.S.A., on "Portable Altars" was read, in the author's absence, by Mr. Patrick, Hon. Sec., illustrated by sketches made by the author. A lengthy discussion on this very interesting subject followed, in which Mr. Dobson, the Rev. Cave-Browne, and others took part. On Wednesday, the 3rd inst., the fifth meeting of the session was held in the rooms in Sackville-street, Mr. Thos. Blashill, Hon. Treasurer, in the chair. A most interesting exhibition of prehistoric implements was made by Mr. G. F. Lawrence of Wandsworth, including a unique specimen of a weapon of stag's horn still retaining its wooden handle, thought to be of blackthorn, which was recently found in the Thames at Hammersmith. This must have been a very effective weapon, from the toughness of the horn and the pliancy of the handle, in a fierce hand-to-hand combat. In the course of his observations Mr. Lawrence remarked that in the Yorkshire pile dwellings, and in a few instances in the Thames, the leg bones of oxen and other large animals had been found which had been used in a similar manner, but the greater difficulty of fixing the bone in order to secure it to the handle must have made the use of the stag's horn more general. This example is supposed to be about 3000 years old. Mr. Earle Way exhibited two specimens of Cyprian pottery and a whistle, together with a pretty little model of a quern in soapstone, and a bronze bracelet from Egypt. Mr. Hoyle exhibited a translucent jade earring from New Zealand, about ten miles from Christ Church, the hole in which had been made by a stone instrument close to the edge, but yet without in any way injuring the jade. Mr. Patrick, Hon. Sec., read a short paper descriptive of the discovery of a Roman house at Burham, in Kent, upon the property of the Burham Brick, Lime, and Cement Company, which, by the Company's invitation and generous assistance, Mr. George Payne, F.S.A., of Rochester, and himself had recently had the opportunity of disinterring. The house is a small one, measuring about 60 ft. by 34 ft., but possesses a very perfect and unusual form of hypocaust. This consists of a system of horizontal flues cut in the chalk sub-soil, and running round all four sides of an apartment measuring about 18 ft. by 16 ft. These flues connect with a central and two radiating flues from the mouth of the furnace, the central flue being large enough for a boy to crawl through; the others varying in diameter from about 13 in. to 8 in. or 6 in., where they joined the wall flue. At intervals round the walls were

New Premises, Duke-street. Ground Plan.

Houses, Headingley, Leeds. Plan.

eight or nine recesses, in which vertical wall flues, ranged in pairs, carried the hot air and smoke to the roof. Some of these were found *in situ*, the remains of others lying in the bottom of the shaft. Remains of pottery, tiles, bones of animals, and portions of coloured plaster decoration, and one small bronze fibula, were found. The house appears to have been one of the smaller and less pretentious kind frequently met with along the line or in the immediate neighbourhood of the principal Roman roads in the south of Britain. The paper was illustrated by plans and drawings from sketches made and measured on the spot by the author, and by numerous photographs taken by Mr. Payne of the various features and phases of the excavations. The next meeting will be on February 17, when a paper will be read by Miss Edith Bradley on "London under the Monastic Orders."

ENGINEERING APPOINTMENT, LITTLE DON WATER SCHEME, SHEFFIELD.—On the 3rd inst. the Sheffield Water Committee met at the Town Hall to finally select a Resident Engineer to take charge of the work of the Langsett reservoir, in connection with the Little Don Water Scheme. There were originally thirty-two applicants for the post, and out of this number six attended before the committee recently, when the list was further reduced to two. The committee resolved to recommend the City Council to appoint Mr. Wm. Watts, of Oldham, at a salary of 1,200l. per annum.

Illustrations.

GATES, SHEFFIELD MUNICIPAL BUILDINGS.

THIS drawing represents the gates of the main entrance to the new Municipal Buildings. The work was carried out to Mr. E. W. Mountford's design by Messrs. W. Singer & Sons, of Frome. The upper portion is a fixed grille with the city arms painted in heraldic colours, and the gates slide into a groove in the wall. They were made in forged iron throughout. The gates, which will be opened by Her Majesty the Queen in May next have cost 3000l.

NEW PREMISES, DUKE-STREET, GROSVENOR-SQUARE.

The drawing of this was made from the buildings by Mr. Richards.

The whole of the southern portion of the block was erected for Mrs. Kerr, and contains in the basement, kitchens and assistants' dining-room; &c.; on the ground floor, shop and office; and on the upper floors sitting-rooms and workrooms with dormitories and sitting-rooms for the assistants and servants.

The remainder of the block consists of shop on the ground floor and basement, with residential flats above.

WORDSWORTH BUILDING, LADY MARGARET HALL, OXFORD.—MR. REGINALD BLONFIELD, M.A., ARCHITECT.

LADY MARGARET HALL, OXFORD
WORDSWORTH BUILDINGS.

NOS. 2 & 3, SHIREOAK ROAD, HEAD-
INGLEY, LEEDS.

THESE houses were built in 1893 for Mr James Bedford. The main idea in planning them was to have two good rooms and a decent hall. All houses, of this size and rental, built in this district during the last eighty years, have aimed at three rooms, with the result that the rooms have been small, and the entrance reduced to the narrow passage with crowded stair so commonly seen. The halls in both cases have fireplaces, and are panelled up to the height of the doors. In No. 2 the panelling encloses the staircase, which has a door at the foot, so that one may smoke in the hall without fumigating the bedrooms. The houses are built of bricks, which were specially made thinner than usual in the locality, where they commonly measure 3 1/2 in. to 3 3/4 in. in depth. The roofs are covered with thick green slates.

The architect was Mr. Francis W. Bedford, of Leeds. Messrs. Wm. Thompson & Sons did the brickwork, and Mr. Banks Mawson the joiner's work.

THE ARCHITECTURAL ASSOCIATION
SPRING VISITS:

NATIONAL GALLERY OF BRITISH ART.

ON the 30th ult. the first spring visit of the Architectural Association was paid to the National Gallery of British Art, and a party of more than fifty members inspected the building now nearing completion, under the guidance of Mr. Sidney R. J. Smith, the architect.

A full description of the building appeared in the *Builder* for January 2. Some items of considerable interest were the large blocks of stone, weighing several tons, used in the architecture of the main pediment, and entirely supported by being joggled without any use of iron or girders, and the figure of Britannia on the apex of the pediment weighing some ten tons.

The chief feature of the building is the central octagonal sculpture-hall, covered with a glass dome with iron ribs, each rib being bolted down with anchor plates to the stone piers. The picture-galleries are all top lighted, with only one thickness of glass, and the effect appears to be admirable.

The drawings showing the various suggestions for the external treatment were an interesting study of the various methods of treating the same subject.

ADDITIONS TO HYDRO, CLIFTON.—Additions are to be made to the Clifton hydro, from the designs of Messrs. Harper, of Birmingham. The floors will be fireproof, on the Fawcett system.

COMPETITIONS.

BOARD SCHOOLS, SUTTON ST. EDMUNDS.—The following is the result of the competition for the new Board schools, for the Sutton St. Edmunds' School Board:—Accepted design, Mr. R. H. Holmes Hand, architect, Spalding; second, Mr. Gilbert S. Doughty, C.E., Pelham-street, Nottingham; third, Mr. Gerald McMichael, 21, Pershore-road, Edgbaston, Birmingham.

MOSELEY PRESBYTERIAN CHURCH.—At a meeting of the committee, the designs for a new church, lecture hall, &c., to cost 6,000*l.*, at the corner of Chantry-road, Moseley, were considered, and out of seven sets of designs submitted, those of Messrs. de Lacy Aherne and Arthur E. McKewan were placed first.—*Birmingham Post*.

ARTISANS' DWELLINGS, SUNDERLAND.—It is stated that Mr. Marten B. Perry, architect, of 17, St. Mary's-road, Walthamstow, in conjunction with Mr. Robert Angell, has been successful in obtaining the first premium in a competition for artisans' dwellings proposed to be erected by the Corporation of the Borough of Sunderland. The plans provide accommodation for 468 persons, at an estimated cost of 20,000*l.* There were in all fifty-eight sets of designs submitted.

ARCHITECTURAL SOCIETIES.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMAN'S SOCIETY.—At a recent meeting of this Society, a discussion took place on the paper on ventilation, read to the Society in December by Mr. Isaac Low. The meeting was presided over by Mr. J. Lockhead. The various systems in vogue were illustrated by means of a small model air-tight chamber, on which were fitted cowls of all descriptions for the demonstration of the natural systems, and by the use of a small fan the mechanical action of the system of extraction and propulsion was also very cleverly shown. Mr. Low, in referring to a recent letter by Mr. Keys, still adhered to his opinion that it is of great advantage to have school windows so constructed that they may be opened while the building is unoccupied, whatever system of ventilation is resorted to while the building is occupied. He held that there could be no gain in having a room shut up, almost air-tight, for say eighteen hours out of every twenty-four, and for over sixty hours at the end of every week, not to speak of holidays, and no one would think of keeping a fan running during these times, unless the power was running to waste otherwise. Mr. Keys' system, properly applied, provides an excellent means of keeping the rooms fresh during the short time they are occupied, but why allow them to stag-

With the exception of a low plinth in Portland one, the whole of the building is erected in red bricks, with fireproof flooring.

The builders were Messrs. George Trollope & Sons, and the architect Mr. W. D. Caröe.

The drawing was exhibited at the Royal Academy of last year.

DESIGN FOR CHAPEL, BERKHAMSTED SCHOOL, HERTS.

THIS design was prepared for the Rev. T. C. Fry, D.D., the head master of Berkhamsted school, by Messrs. Batterbury & Huxley, architects. In order that the chapel might accord with the existing ancient school buildings, erected by Dean Incent, and opened in 1544, late Perpendicular was chosen.

The raising of the sacrum and the choir was suggested by Dr. Fry, who wished to follow, to some extent, Pietro Lombardo's Santa Maria del Miracoli, Venice.

WORDSWORTH BUILDINGS, LADY MARGARET HALL, OXFORD.

THIS building is the south wing of a range of new buildings, of which the centre block and north wing are not yet built. The north and south wings are intended for students; and the centre block will contain main entrance hall and staircase, dining hall with kitchen and offices under and library over, and will be carried higher than the wings.

The site is beyond Norham Gardens to the north-east corner of the Parks, and extends from the road down to the Cherwell. Owing to the shape of the site, the buildings have had to be designed on an irregular plan; and as the sites lies below the roadway level, a causeway with a stone balustrade has had to be formed on the north side in order to get the drains into the town sewer.

The materials used are red brick, gauged brick, and Clipsham stone, tile roofs, and lead flats. A large skylight, inside the balustrade above the central part, lights the principal staircase. The south wing contains twenty-eight students' rooms, common room, lavatory, and bath rooms. An extension has been built on the north side, including temporary kitchen and offices and dining hall. This will ultimately form part of the central block.

The building has been erected from the designs and under the superintendence of Mr. Reginald Blomfield, architect, of London, at a total cost of 6,783*l.*, inclusive of electric lighting. The contractor for the works was Mr. J. A. Hunt, of Hoddesdon; electric lighting by Messrs. Hill & Co., of Oxford; carving by Mr. W. Aumonier.

nate during the longer time that they are unoccupied?

GLASGOW INSTITUTE OF ARCHITECTS.—The usual quarterly general meeting of this Institute was held in the rooms, 187, Pitt-street, on the 28th ult., Mr. John James Burnet, A.R.S.A., President, in the chair. The President referred to the fact that two of the members, Messrs. Honeyman and Leiper, formerly Associates of the Royal Scottish Academy, had now been elevated to full membership, and it was unanimously agreed that the hearty congratulations of the Institute should be sent to them. The Secretary reported that the prize drawings of the Royal Institute of British Architects would be on exhibition in the rooms of this Institute during the two weeks commencing 12th April next. It was agreed to hold an informal dinner in the rooms on March 3.

ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.—The sixth meeting of this Society was held on the 13th ult. at 56, Great Marlborough-street, Mr. W. Pywell in the chair. A paper was read by Mr. B. N. Southall on "Sham Construction and the Fixing of Facings," in which he traversed the most prevalent forms of false construction, and made many suggestions for improvements in the direction of truthful detail. In the discussion which followed, Mr. Brodie doubted whether exposed construction would be acceptable to the public; and Mr. Strange thought that the example of Nature, who never hides her construction, might safely be followed. Mr. Lander pointed out that although Nature may hide her construction, she does not deny it, as many buildings do theirs, and he thought a distinction should be made between concealment and a deliberate intention to deceive. Mr. Garbutt called attention to the dangers arising from the rust caused by condensation inside cast stanchions, and also to the inadvisability of casing steel joists solidly in concrete, as the expansion is liable to crack it. Mr. Herbert thought it difficult to know where to stop in one's criticism, as one might even abuse a plaster ceiling because it did not show the joists. He said he would like to see fireproof floors carried through to the outside face of the wall. He objected to cast iron which imitated wrought iron. Mr. W. C. Marshall, the Special Visitor, said he believed in all Mr. Ruskin said in his "Lamp of Truth," and could not understand why a lie represented in art did not bear the same moral culpability as a spoken lie. Some forms of deception, however, were generally accepted by all, such as gilding. He looked forward to the day when there should be a greater appreciation of iron forms, so that they need not always be concealed. He advised every one to cultivate truth in everything, however small. It came like writing fair—by practice. If every one would rise above the little facilities now so common, we might some day really "build in truth."

GLASGOW SCHOOL OF ART.—The first of a series of special lectures on "Hellenic Architecture" was delivered recently to the students of this school by Mr. William J. Anderson. Mr. Malcolm Stark occupied the chair, and introduced the lecturer, who had taken as his subject, "The Mycenaean Age in Greece." After a review of the formative influences of circumstances on the Greek character and genius, the lecturer said that to the book of the history of this race, which for our fathers opened with the Homeric Epics, there had been written a long preface and introduction. Researches in the Isle of Santorin, and Schliemann's work at Mycenae and Tiryns, had recovered in broken outline the story of a bygone phase of human life, which had some affinity with early Celtic civilisation of Europe, and which was, in greater measure than had been formerly believed, the direct precursor of Hellenic culture in its greatest period. Viewed as architecture as a whole, two different forms of practice would be observed: one, a timber style, employing stone for foundations, combining wood with stone in walls, and sheathing it with metal; the other, a stone style, in which wood forms were directly imitated, and which still made use of metal plates in its decoration, both being closely related, and probably cotemporaneous. Conjectural restorations of the palace of Tiryns, the domed tombs of Mycenae, with Chipiez and Clarke's restorations of the portal and the cupola, were shown by lantern, with details of ornament, including the frieze of Tiryns, of alabaster, inlaid with glass paste, which is so valuable for the light it sheds on the origin of the Doric entablature. To these structures it did not appear possible to assign a later date than about 1200 B.C. Perrot, indeed, dates them at 1450 B.C. But this early civilisation—so advanced in many respects,

and on the way to new inventions—was cut short and scattered by the Dorian migration, to begin its life over again, and in a fuller and larger way to work out its destiny. But the lecturer believed that the more this earliest period of Greek art was studied and explored the more we should discover what the arts of a later day owed to it, and how many of its principles and motives had survived. The dome construction, its decoration by metal plates, the use of the applied column and entablature, appeared again at Etruria and Rome, while the retreating faces of the architrave and inclined sides of the doorway, the fluted column, the triglyph frieze, the patera, rosette, palmette, and spiral—all were forms on which the later Hellenic would exercise his genius. So that it was not too much to say that in Mycenaean art we see the shoot appear above the ground, and that Hellenic architecture of the age of Pericles was essentially of the same root, the same plant in the same soil.

LIVERPOOL ARCHITECTURAL SOCIETY.—The fifth ordinary meeting of this Society for the present session was held on the 1st inst., in the Law Library, Union-court, under the chairmanship of Mr. Bradbury, the President. The paper read was by Mr. F. I. Thomas, and was entitled "Art Out of Doors," in illustration of which some sixty photographic views were shown by limelight. These had been selected so as to indicate the multiplicity of country seats throughout Great Britain in which architectural and horticultural art derive great attraction from their natural surroundings.

BRADFORD SOCIETY OF ARCHITECTS AND SURVEYORS.—The annual meeting of this Society was held recently at the Great Northern Victoria Hotel, Mr. James Ledingham, President, in the chair. Mr. W. B. Woodhead was elected President for the year, and Mr. Fairbank was re-elected Secretary and Treasurer. After the election of the Council the annual dinner was held.

NORTHERN ARCHITECTURAL ASSOCIATION.—A meeting of the members of the Northern Architectural Association was held on the 3rd inst., at the Art Gallery, Newcastle, Mr. F. W. Rich in the chair. The Chairman proposed the following resolution:—"The Northern Architectural Association, looking to the amount of public interest and criticism that has arisen respecting the proposed restoration of the western front of the Cathedral, Peterborough, desire to convey to the Dean and Chapter their appreciation of the course pursued by them in upholding and carrying out the advice of their architects, Mr. J. L. Pearson and Sir Arthur Blomfield, and however much the Northern Architectural Association may regret the circumstances that necessitate the pulling down part of the work, yet feel sure that in the hands of such an experienced and able man as Mr. Pearson there will be nothing done without cause." He said there had been a great deal of amateur criticism on this matter, and the more architects stood up against these innovations on the part of amateurs the better it would be for themselves. Mr. Reay seconded the motion, which was cordially agreed to. Mr. Frank Caws, of Sunderland, then read a paper on "The Probable Influence of the Technical Education Movement upon the Architect and his Work," in the course of which he said that architects should take deep interest in the technical education movement, because of the splendid opportunities it afforded for developing the talents of the young; and not from the merely selfish motive that it helped us to remain masters of the markets of the world; but because it tended to increase the happiness of men and women by increasing their knowledge and usefulness, and particularly by giving them a deeper insight and interest in their work, and so minimising the monotonous drudgery of their lives. Technical education could not long continue without thus raising the status and character of the worker, thereby inducing a general gain of intelligence, skill, and respectability in all trades and handicrafts. If the architectural profession would not remain hopelessly behind other crafts and professions; if architects would retain the proud position of masters of the technical arts—which the very name of architect implied—then they must bestir themselves and take advantage of the great opportunities the present moment afforded. How to do this Mr. Caws explained by showing how architects' pupils and students should devote the years of their apprenticeship so as to attain to the higher standard of qualification now called for. A hearty vote of thanks was accorded to Mr. Caws, after which the meeting terminated.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The monthly meeting of the members of this Society was held at the School of Art,

Arundel-street, Sheffield, on the 9th inst., when Mr. John Slater, B.A., gave a lecture on "The Buildings of the Ancients." Mr. C. Hadfield (President) occupied the chair. Mr. Slater, at the outset, quoted the late Mr. Ferguson's remark that beauty in architecture consisted not so much in particular features as in appropriateness of design and elegance of detail. In the present century there had been many changes of style. Each successive period had found ugly and unsuitable what had been praised as fit and beautiful by its predecessor, thus showing the narrow-mindedness of those who posed as the directors of the public in matters of taste. It might not be uninteresting to go back to a time anterior to all the recognised styles, and see what kind of buildings were erected by the ancients, when the sole object was to meet the requirements of the people for whom the building was intended, and who obtained architectural effect by ornamenting their construction, and not by constructing their ornament. The first builders who attained to any great architectural skill were the Egyptians, in whose history four periods stood out as those of great architectural activity. These periods were the fourth dynasty, when the great Pyramids were erected; the twelfth dynasty, to which belonged the tombs at Beni Hassan; the period when Thebes was at the zenith of her power; and the period of the Ptolemies. Details were given of the construction of the Pyramids, showing that the most scientific precautions were taken to prevent the heavy superincumbent mass from crushing in the sepulchral chambers. In the tombs of Beni Hassan, it was noticeable how often wooden forms were reproduced in stone. In these tombs were to be found the prototype of the Doric column, as well as of the plan of the perfected Greek temple. The enormous temple of Karnak, with its hypostyle hall, was described, and so were the different forms of capitals found there. The great feature of the Egyptian temples was their solidity and massiveness, but relieved by the most elaborate and varied system of colouring, the granite columns having been coated with stucco before the application of the colour decoration. Crossing from Africa to Asia, different materials and methods of building were found, and dried and burnt bricks forming, in the absence of stone, the staple building materials. In consequence of the friable nature of these materials there existed for many centuries nothing but heaps of rubbish to mark the sites of some of the most notable buildings of antiquity. Quite recently, the most valuable and interesting discoveries had rewarded the exertions of explorers. No less than seven palaces of the Ninivite kings, whose dynasty lasted from B.C. 1250 to B.C. 625, had been exhumed, the most complete and interesting being that of King Sargon at Khorsabad, which was thoroughly explored by Messrs. Botta and Place. Here were discovered the most magnificent arched gateways of brick, arched covers to sewers and conduits, and enamelled encaustic tiles of different colours and patterns, which were as fresh and vivid as if they had only recently been taken from the kilns. The exact manner in which these large buildings were lighted was largely a matter of conjecture. The third great building people of antiquity were the Persians, whose supremacy in Central Asia dated from about the sixth century B.C. The rocky plateau of Persopolis was the site of the most magnificent palaces of the kings, and the ruins still existed to testify to their grandeur. In the recently-explored Hall of the Hundred Columns, the columns were of marble, the capitals being the well-known double bull's head, between which rested the beams supporting the roof. The height of the columns, 67 ft. 4 in., was more than double the height of the columns of the Parthenon. The bases of the Persopolitan columns were particularly graceful, and it was rather curious that this form had never been adopted by the Greeks. The curious and interesting domed building at Feruzabad and Sarvestan, the dates of which it was difficult to determine, were almost certainly the precursors of the Mohammedan mosques. From the wall decorations discovered by M. Dieulafoy, it was certain that the Persians, like the Assyrians, had arrived at a high pitch of excellence in the manufacture of glazed enamelled tiles. After alluding to recent discoveries in the district anciently called Phrygia, and to some curious examples of the exact imitation of wooden forms in stone, the lecturer concluded by saying: As the byways of the world become opened up to us, we are continually finding unexpected remains of building nations, and it is not too much to say that wherever over the whole face of the earth explorers have come upon the relics in stone

or brick of a remote civilisation, their wonder has been excited at the solidity, and in many cases the high artistic quality of the work. It appears to me that, despite all our modern resources and all the discoveries of science in these latter days, no one can study such buildings as I have brought to your notice this evening without having a little of his nineteenth-century conceit taken out of him; for truly all the remains testify that in energy and in intelligence, and in skill, there must have been giants in those days. The paper was illustrated by a number of large diagrams prepared by Mr. Slater. A vote of thanks was accorded to the lecturer, on the motion of Mr. E. Winder, seconded by Mr. Joseph Smith, and supported by Messrs. J. B. Mitchell-Withers, F. Fowler, T. Winder, E. M. Gibbs, C. Hadfield, and C. J. Innocent, and Mr. Slater briefly replied.

ENGINEERING SOCIETIES.

INSTITUTION OF CIVIL ENGINEERS.—At the ordinary meeting of this Institution on the 9th inst., Mr. John Wolfe Barry, C.B., F.R.S., the President, in the chair, the paper read was on "Cold Storage at the London and India Docks," by Mr. H. F. Donaldson, M.Inst.C.E. The author traced, from the commencement of the experimental stage in 1851, the progress in the accommodation of the frozen-meat trade in the Port of London. The work had been carried on first by the London and St. Katharine and the East and West India Docks Companies, and subsequently by the London and India Dock Joint Committee, which came into existence in 1889—in the construction of receiving-chambers at the Royal Victoria Dock, and later, at the South West-India Dock. The first experimental chambers at the Royal Victoria Dock had been constructed in 1851, but they were discarded, and improved buildings, insulation and machinery had been adopted in 1887. These buildings consisted of two floors, each about 10 ft. high, arranged with chambers on each side of the engine-room, which was placed in the middle. One end of the buildings abutted on the quay on which the meat was discharged from vessels. They were further supplied on each side with platforms generally used for receiving meat from the quay, and for discharge into railway wagons of meat for despatch to the various centres of consumption. The end remote from the water-side was provided with a platform for the delivery of meat into carts for transport into the meat market, or for delivery by road. The side platforms were also supplied with small lifts by which the upper chambers were charged, curved rails being fitted at the top to automatically discharge the load when the ram of the lift arrived at the end of its stroke. The flooring of the ground floor was a few inches only above the normal level of the ground or rail-level. Entrance to the chambers was obtained through small doors opening into lobbies at the level of the ground floor, from which ordinary insulated doors opened into the chambers, and by these means the rise of temperature through the opening of the doors to the outer air was reduced to a minimum; the coldest air remaining in the trough or tray, between the sill-level of the entrance door and the ground-level. The lobbies were so arranged that two chambers could be entered from one outer door. The meat was received and delivered through porches, about 4 ft. 6 in. above the ground-level and 1 ft. 6 in. above platform-level, made of two sizes, one inside the other, the larger offices being used for quarters of beef, and the smaller for frozen sheep. An account was also given of the construction of stores at the North Quay, West India Dock, and at the cold store, which had been built and equipped at West Smithfield. The total storage capacity now in use by the London and India Docks Joint Committee was, at the Royal Victoria Dock, 926,604 cubic feet; at the South West-India Dock, 50,000 cubic feet; at the North Quay, West India Dock, 378,613 cubic feet; and at West Smithfield, 305,717 cubic feet.

THE INSTITUTION OF JUNIOR ENGINEERS.—At the last meeting of this Institution, held at the Westminster Palace Hotel, the Chairman, Mr. H. Bloomfield Vorley, presiding, an interesting lecture on "Comparisons of Similar Structures, Large and Small," was given by Professor Archibald Barr, D.Sc. of Glasgow. The lecturer first enunciated the general principles regarding the loads which similar structures can bear with like severity of stress, and showed their application to pistons, cylinders, boilers, beams, bridges, roofs, columns, shafts, &c. He then dealt with com-

parisons of similar structures with respect to rigidity, illustrating them by reference to shafts, beams, bridges, test-specimens, &c. Similar structures with regard to suitability for bearing their own weights, were then treated, and applications to tanks, ships, &c., shown. The influence of size upon the design and proportions of structures was considered, and illustrations given taken from nature. Comparisons of similar objects with respect to their suspension in water and in air, formed the next section of the lecture, and in this connexion the flying-machine problem was investigated. Similar machines, with reference to inertia stresses, were then compared. At the conclusion of the lecture, on the proposal of Mr. S. Boulding, seconded by Mr. E. King, a cordial vote of thanks was passed to Professor Barr.

THE DWELLING HOUSE.

ON Thursday evening last week, at the London Institution, Dr. G. Vivian Poore delivered a lecture on "The Dwelling House," illustrated by lantern slides.

The lecturer stated at the outset that he intended to deal with his subject from the physician's point of view, and not from the architect's. The first plans exhibited showed a five-storied London house, before and after it had been altered in accordance with modern notions of plumbing. Generally speaking, there were necessary or unavoidable defects about most London houses, owing to the limited area of the land upon which they were built, but in the country those defects could be generally avoided. In the London house the cubic contents of the house bore an undue proportion to the land upon which it stood. Speaking of the staircase of the London house, the lecturer said that one of its defects was that unless the staircase was efficiently ventilated it served as a channel for the conveyance of the air from one part to another, which sometimes was not at all desirable. There was nothing more important in a dwelling house than the perfect ventilation of the channels of internal communication. If those channels were properly ventilated fresh air could be got for the rooms in the house; but if they were not they then served for the drifting of foul air from one room to another. Another difficulty in regard to the London house was as to the supply of light and air laterally. The lecturer also referred to other defects in the London house, such as dark underground basements, absence of back doors for delivery of goods or removal of refuse, ill-ventilated staircases and close "areas" shutting in the gullies leading to the sewer, insisting that, although such defects might be inevitable in London, they should never be imitated in the country. Great height not only increased the risk from fire but increased the labour of service, because moving vertically involved twenty times the labour of moving horizontally. The risks from infectious diseases were greatly increased by these high houses which were getting daily more common. Modern methods of sanitation gave a fatal facility for over-crowding, which was certain eventually, if not checked, to do more harm than the sanitation had done good. In country places where it was possible to give adequate area to a house, it was most important to ensure the thorough ventilation of the staircase and passages. In dwelling-houses, as in hospitals, all sanitary offices should be shut off by a ventilated lobby from the main structure, and the lecturer showed plans by which the staircase might be made to fulfil this purpose. The question of aspect, the advantages and disadvantages of a cellar beneath a house and the great importance of a wholesome larder were points which received attention. The lecturer next considered plans by which the sanitation of an isolated house might be made independent of the Local Authorities, and he showed plans of "filtration gutters" by which domestic slop-water might be easily purified. Overcrowding was the greatest of all sanitary ills, and was often fostered by sewage schemes. A plan was shown of an estate of nine acres lying between two newly sewered suburban roads, which had, as was usual in such cases, been bought by a so-called building society—and in which 177 houses, with a population of over 1,200 was contemplated! These societies were a cause of sanitary ruin, æsthetic ruin and financial ruin; they encouraged artisans to begin life with a mortgage round their necks, and occasionally landed them in the clutches of a professional usurer. Some of the model by-laws of the Local Government Board were not suited for country places, and

regulations as to air space round dwellings, which might be beneficial in towns, became mischievous suggestions when printed and circulated in the country. Again, the London Building Act placed no adequate check upon enormous structures, and "open spaces" (bought at great cost) were definitely made an excuse for the abolition of private curtilage to houses. These large buildings were common in the centre of London, and it was curious to note that the "Strand Registration District," which was the pulpit from which we had preached sanitation to the whole world, and which was exceptionally well provided with open spaces was, next to the City of Liverpool, the most unhealthy registration district in the country. So-called "lungs," in which the blood only circulated occasionally on a Sunday, were no compensation for a lack of space and light and air in the dwelling. The cost of the dwelling-house was steadily increasing. Taking a concrete example in Marylebone—it was shown how the rates had risen 87 per cent. in twenty-three years, and how the whole of the obligatory charges—rent, rates, taxes, and water—amounted to over 22 per annum per square yard of occupied land. Would this upward tendency of the rates ever cease? Increase of cost of the dwelling inevitably led to over-crowding, and every addition to the rates increased the cost of the dwelling. Looking at the physical and moral harm which resulted from over-crowding, every increased tax on the house ought to be very seriously considered. Schemes of ostentation and so-called philanthropy which fell heavily on the householder in the form of rates, did harm rather than good. Some outlet ought to be left for private generosity. Very little was done to check over-crowding. On the contrary, the jerry-builder was fostered at the expense of the ratepayers. Modern sanitation was largely based on a mischievous, lop-sided socialism, which was doing incredible harm. No improvement could take place unless it were found possible to encourage the sanitary well-doer. If the man who built a wholesome isolated house and completed his sanitation on his own premises was merely "rated up" and practically fined for doing so, no improvement was possible. The lecture concluded with sundry suggestions for the equitable adjustment of sanitary rates.

THE CLERKS OF WORKS' ASSOCIATION: ANNUAL DINNER.

THE fourteen-h annual dinner of this Association was held on Monday in the King's Hall, Holborn Restaurant, Mr. Beresford Pate, President of the Architectural Association, occupying the chair, supported by Professor Roger Smith and Messrs. W. Fie, H. E. Crosswell, H. D. Searles-Wood, W. H. Sath-Smith, J. E. Drower, T. B. Whitney, Stanton W. Preston, J. Shepherd, Stanley Clarke, Bosfield, and others.

The usual loyal and patriotic toasts were proposed from the chair, the "Army, Navy, and Reserve Forces" being responded to by Col. Sergt. J. Atchison. The Chairman, in speaking of the Navy, said that whatever other nations might think of our domestic, ecclesiastic, or monumental architecture, they had a profound admiration for our beautiful naval architecture.

Mr. J. Brady, editor of the *Clerks of Works' Journal*, in proposing the toast of "The Architects and Surveyors," said that architects of late years had been doing a great deal for their Association by coming to them when in need of clerks of works, and to both architects and surveyors that Association felt much indebted. The toast was coupled with the names of Professor T. Roger Smith and Mr. J. E. Drower.

Professor Roger Smith, in replying for the architects, said he had often thought of the large amount of thought and labour which was represented in connexion with every building. They had granite from one quarter of the world, stone from another, and iron from another; but beyond that each building represented a large amount of thought, and he sometimes wondered, after the building was completed, where all the thought and labour had gone. In the carrying out of their work architects were helped to a large extent by clerks of works. The question of the cost of a building having been thought out before the clerk of works came upon the ground, those gentlemen should do all they could to help keep reasonably within the limits which the employers set as to cost. Clerks of works might also render great service to architects and the undertaking in looking ahead. The clerk of works should keep his architect well posted up,

not merely in the work of the moment, but in prospective work.

Mr. Drower, in a humorous speech, responded for the surveyors, and in doing so referred to the Architectural Association—a body in many respects one of the most extraordinary in the kingdom, and which was doing a vast educational work for architects, which in nearly every other country would be carried on by the State. In his opinion the Clerks of Works' Association could to some extent be compared with that Association, since it was a self-helping body, and self-relying, and their main principle was education and the laudable desire of keeping up the status of their vocation.

Mr. F. Dashwood, secretary, then proposed the toast of "The Worshipful Company of Carpenters." To the Carpenters' Company a debt of gratitude was owing by the trade for its important help in matters of education. At one time he thought that nothing could compensate for the old-time system of apprenticeship, but having for some time seen the character of the work carried out by the young men who attended the schools of the Company, he had no hesitation in saying that in some cases the character of their work was even better.

Mr. Stanton W. Preston, Clerk to the Company, in response, said that there were twelve so-called great Companies, the rest being minor Companies, and the Carpenters' Company was one of the latter. He thought that he had some reason to be proud of the work which his Company was doing, and he believed that this work took the place, as far as anything could, of apprenticeship. Besides their workshops at Great Titchfield-street, there was the Institute at Stratford. In reply to the last speaker, he would say that the Company had no intention of admitting amateurs into their classes—for one reason, because they had no room.

The toast of the evening, "The Clerks of Works' Association," was then proposed by the Chairman, who referred to his early acquaintance with clerks of works, and with their Association. He had watched with considerable interest the growth of their Association. The sentiment which drew men of the same avocation together was a very worthy one, which nearly always resulted in good to the community. No one that evening had any doubt that the idea of clerks of works associating in a body, in which they could combine for their own mutual benefit and for the cultivation of a higher standard of efficiency, was one which had been justified by the results. He therefore desired to cordially invite any clerks of works who had not yet united themselves to that Association to consider the very great advantage that would accrue to them by joining men who had set before them a high standard. He was very much struck by one note in the constitution of their Association, viz., to "neutralise as far as possible the disadvantage of enforced isolation under which many clerks of works labour." He had never before realised the truth of those words. A clerk of the works occupied an exceedingly isolated position. This fact was a complete justification for the existence of that Association. A clerk of works had to think and decide for himself, and had to be a man of rapid thought, but at the same time his position was an enjoyable one, since he was not troubled by the responsibilities either of the architect or of the contractor. He believed that the Association consisted of men strong in mind and strong in hand, and men who were trustworthy, and who were not only self-reliant, but upon whom others could rely—they were men of experience and common-sense which could not be achieved by university training, and could scarcely be tested by examination. That common-sense was of great value to architects as well as to the community. Clerks of works were an ideal embodiment of the handy practical man.

Mr. W. S. Woolacot, President of the Association, in reply, referred to the comparatively small membership of the Association, which was a subject of regret. If a clerk of works possessed anything like the qualities which the Chairman had bestowed upon him, he should most certainly be better paid. The London County Council had recently raised the wages of their clerks of works by half a guinea per week, and he thought that a further increase might very well be made.

Mr. E. W. Nightingale proposed the toast of the visitors. They had twenty architects as guests that evening, besides others. He was glad that the architects were taking more interest in their Association than they ever did before.

The toast was responded to by Mr. T. D. Whinney.

Other toasts were "The Press," proposed by Mr. J. E. Peacock, and coupled with the name of our representative, who responded; "The Hon. Treasurer" (Mr. J. Oldrid Scott), proposed by Mr. P. J. King (Vice-President), and responded to by Mr. J. Spooner; and "The Chairman," proposed by Mr. J. Plowman. The proceedings then terminated.

SANITARY INSPECTORS' ASSOCIATION.

A MEETING of this Association was held at Carpenters' Hall, on Saturday last, when the newly-elected President, Sir John Hutton, filled the vacant chair of the late Sir B. W. Richardson, and a paper was read by Mr. Billing, on the subject of "Meat Inspection." In the discussion which followed on the usual resolution of thanks, Messrs. West, Young, Alexander, Thomas, Montem (Portsmouth), Crigg, Tidman, Raymond, Munro, and Sir John Hutton took part. A suggestion was made that the Technical Board of the London County Council should help Sanitary Inspectors, whose duty it had now become to inspect meat offered for sale to the public, to educate themselves in this difficult branch of their duty. The President agreed with one of the speakers who pointed out that a Sanitary Inspector should scarcely be expected to have the experience necessary for the new duty put upon him, or to be able to spare the time from his multifarious duties to acquire that experience.

A vote of thanks to the lecturer was agreed to, and Mr. Billing briefly replied.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Sir Arthur Arnold, Chairman, presiding.

Tower Bridge Southern Approach.—On the recommendation of the Improvements Committee, it was agreed that, in connexion with the formation of the new southern approach to the Tower Bridge, the Council do take such steps as may be necessary to acquire from Mr. Lafone, at the sum of 14,500*l.*, the vacant land (having an area, including the approach road, of about 48,170 square feet) situated near the line of the proposed street, and at present having approaches from Tanner-street and Newham's-row.

Housing of Lunatics.—The Asylums Committee stated that their Sub-Committee, appointed to report as to the expediency of adopting a better and less expensive method of housing and treating pauper lunatics, and to consider the systems adopted in the principal European and American cities, had come to the conclusion that it was impossible to proceed further in forming any definite or practical opinion as to the merits of the modern continental system of the housing and treatment of lunatics without personal inspection of some of the asylums where special methods other than those obtaining in this country were in vogue, and that for this purpose it would be desirable for three members of the Sub-Committee, with two expert medical officers, to visit the various asylums at Paris, Berlin, Leipzig, and other continental cities. The Council were asked to authorise the expenditure of 150*l.* for travelling and out-of-pocket expenses. After some discussion, an amendment to refer the whole matter to the General Purposes Committee for consideration and report was agreed to.

Proceedings with regard to Dangerous Structures.—The Building Act Committee reported as follows, the recommendation being agreed to:—

"We reported on January 26 last that the High Court had on December 26 reversed a decision of the magistrate at the Thames Police-court dismissing a summons for recovery of expenses incurred in respect of a dangerous structure, as he held the opinion that it was necessary, under Section 103 (r) of the London Building Act, for the Council itself to consider each intimation that a structure was dangerous, and to authorise service of notice upon the owner and other proceedings if necessary, and that the case had been referred back to the magistrate to be heard on the facts. The case was again before the magistrate on January 13 and 27, when he raised another point, namely, that by reason of Section 103 the Council could not recover any expenses unless it had obtained an order under Section 107 (1). The point was argued at some length, but the magistrate eventually dismissed the summons on the ground that the Council could not recover expenses when, as in this case, the owner did the work upon receipt of a notice, and consequently no order was obtainable. This point was not included in the special

case stated by the magistrate for the decision of the High Court, as it was understood that, although the question was raised, the magistrate took the Council's view upon it. This not being so, as shown by his recent decision, we think it essential that the matter, which affects a very large number of cases of the course of each year, should be submitted to a High Court. We have accordingly directed the Solicitor to get a case stated, and we recommend that the Solicitor be instructed to take the necessary measures for obtaining a decision of the High Court upon the point above referred to."

Higgate Archway.—Major Probyn, Chairman of the Improvements Committee, stated, in answer to a question by Mr. Westacott, that the Council would shortly be in a position to proceed with the reconstruction of Higgate Archway.

Water (Purchase) Bills.—The Parliamentary Committee submitted for approval the agreement on the Water (Question with Surrey, Croydon, Kent, Essex, and West Ham).

Mr. McKinnon Wood first moved:—"(a) That the agreement with the County Council of Surrey be approved and sealed, and that, subject to the approval of Parliament, such clauses as may be necessary to give effect thereto be inserted in the Bills relating to the Lambeth and Southwark and Vauxhall Water Companies, and that the clause arranged with the Corporation of Croydon be approved, and subject to the approval of Parliament, be inserted in the Bill relating to the Lambeth Company." He pointed out the serious consequences to the whole question of the purchase of the Water Companies if the just claims of the outside authorities were not fairly dealt with. He did not see how the Council's Bill could be expected to pass the House of Commons if opposed by the Companies and the Home Counties.

Sir John Lubbock, M.P., moved, as an amendment, "That it is undesirable to break up the water area until after the fullest inquiry; and further, that in the opinion of the Council it is not just to the ratepayers of London that the outside authorities should have the option of determining whether they will join in the purchase of the undertakings of the Water Companies, after the price has been fixed; and that it would be equitable that they should be bound by the results of the arbitration, in the same manner as the County of London."

The Earl of Onslow, in seconding the amendment, said the agreements grossly neglected the interests of London. Parliament would now see in all its nakedness the Progressive scheme of spoliation, as by it London was to bear the cost of purchase, and then hand over the most remunerative parts of the area to other bodies.

Mr. McKinnon Wood, in reply, said that the agreements simply provided that the outside authorities should go on as customers of the Council, or buy out at a fair price the right to supply their own areas.

On a division the amendment was rejected by 57 votes to 47, and the recommendation of the Committee was agreed to.

The next proposal, to arrange an agreement with the Kent authorities, was taken back.

The Council then, on a division, agreed by 51 votes to 44:—"(c) That the Council accept the memorandum set out in Appendix B, substituting for the 6th clause a provision to the effect that the necessary clauses be adjusted between the Councils of the Counties of Essex and London and the County Borough of West Ham." By this vote the London County Council agree to purchase the East London Water Company; an Essex authority to have the option of taking over an apportioned part of the East London undertaking; and the County Borough of West Ham to elect whether it will join London or Essex or have an independent portion of the undertaking transferred to it.

It was further resolved that petitions be presented against the East London Water Bill, the Kent Water Board Bill, and the New River Company's Bill.

Proposed Incorporation of Westminster.—Mr. Costelloe brought forward a report of the Local Government and Taxation Committee dealing with a petition which has been presented to Her Majesty in Council, praying for a charter of incorporation of the City of Westminster. The committee recommended the Council to pass the following resolutions:—

"(a) That while the Council does not object to a charter being granted for the incorporation of any suitable area in London, for the purpose merely of the change of the corporate name and the substitution of the name of the mayor and council for the existing name of a vestry or district board, provided that this can legally be done in the manner proposed,

the Council will strenuously oppose any transfer of powers by any such machinery, or any such transfer by any other machinery to a particular area, without the simultaneous consideration of the whole subject of powers and areas in London.

(b) That a communication in accordance with the above resolution be sent to the Privy Council."

There being a prospect of a long debate on the report, Mr. Costelloe consented to postpone its further consideration for a week. There was, however, much opposition to any adjournment, and a considerable body of Progressives demanded a division, with the result that the adjournment was carried by 44 to 43.

The Council then adjourned.

THE LONDON COUNTY COUNCIL INQUIRY.

The special inquiry into the organisation of the Works Department of the London County Council was continued at Spring-gardens on the 27th ult. Sir Arthur Arnold presided.

The examination of Mr. Ward, the Chairman of the Works Committee, was continued by Sir Godfrey Lushington and completed. The witness said with regard to work executed before the institution of the Works Department that the work done under the direction of the Engineer, Mr. Binnie, was of the highest character; but he could not say the same of the architectural work. He instanced Bishopsgate-street Fire Station as a case in which a great deal of money had had to be spent on sanitary work within a few years of its erection. One of the advantages of the Works Department was that it secured low tenders from contractors, because contractors knew if they sent in excessive tenders they would not be accepted, but the work would be done by the Department. Pressed to mention other Corporations which executed building work by direct employment, Mr. Ward stated that the Great Eastern Railway Company were building many stations, and that the London and North-Western Railway were following in the same direction. Liverpool, Birmingham, and Glasgow had all executed or were carrying on large operations in the construction of waterworks. He did not admit that the Works Committee had been instituted for the protection of workmen.

In reply to Sir G. Lushington, Mr. Ward said the Committee might be regarded as a builder. It was true that it did less work than a contractor, and that its manager did rather less than a contractor's manager would do. The Committee did not claim to have any authority over the Architect or the Engineer, and it had no right to call upon either to attend the Committee.

The examination of the Chairman of the Committee was completed by Dr. Longstaff, who elicited the opinion that certain great evils in the system were largely due to open tendering, and that tendering from a selected list of builders would be very much better. He did not think that such a method of tendering would do away with the necessity of the Department, because the tenders of contractors would, in that case, at once jump up. The witness reiterated his opinion that the work of the Engineer had always had a high reputation, and his complaints against the building and sanitary work at the Bishopsgate-street Fire Station, which although only erected in 1884, had already cost from 500l. to 1,000l. to remedy the defects. There had no doubt been a great advance in sanitary matters in the meantime, but no one could justify such work as had been done there. The joints had not been properly made and the result was a constant escape of sewer gas. Matters had now been improved, but bad work was still done, although he admitted that the inferior work was usually done by jobbing contractors and not by the original builders.

At the close of the examination, Dr. Longstaff asked: Are you not helping the strikers and taking a side against the employers when you agree to await the result of a strike and to pay the new rate of wages?—I don't think so.

Is it not substantially an agreement in favour of the workmen? Don't you think this will have a tendency to make the men, while continuing in the employment of the Department, ready to support a strike going on in another place?—It may have that effect.

Mr. Edward White, the next witness, said, in reply to Sir Arthur Arnold, that he had been Vice-Chairman of the Works Committee for a year, and had had considerable experience as a builder. In answer to the question whether there was any difference in the work of the Department and that of contractors, the witness said a fair comparison might be instituted between Binstead

Asylum, executed by an outside contractor, and the temporary buildings at Colney Hatch, executed by the Department, which were similar in design and construction. The work carried out by the contractor was very satisfactory, that of the Department was of a very inferior character. The cost, too, of Colney Hatch he set down at 23,482l., or about 6,000l. above the estimate. Questioned with regard to the refusal of contractors to tender, Mr. White said he did not think there existed any ring in the ordinary sense of the word, but he thought there was an agreement amongst the best firms not to submit to certain vexatious conditions, such as the examination of their books, which was among the conditions exacted. He thought no contractor would object to the examination of his time-sheets, which must be the very best evidence they could have, and that the examination of books was not necessary. Money was not saved by the Department through these conditions, but the effect was all the other way. With regard to the cost of management (20,000l. for the past year), he thought it very excessive, and that the capital employed was out of all proportion to the work done. He thought it would be an improvement to reduce the number of the members of the Works Committee, but in his opinion it would be better to abolish it. He would give a competent manager full power over the works, subject only to a financial committee. He should have a proper buyer, but should not be controlled by the Council. A competent manager might with advantage tender with contractors, because, like the builder, he would consider values only, and not be guided by tenders, however low. He knew of no other public body that undertook building works, though there were many that undertook engineering, or what he would call municipal works. By municipal works Mr. White afterwards explained he meant the construction of streets, roads, sewers, main drains, and other works of the same character, which would be designed by the engineer. Such works could be better or as well done by the Department as by a contractor, but jobbing works should be done by contractors. The system of the School Board was very satisfactory, the metropolis being divided into twenty districts, and clerks of works being appointed for each. He considered a monthly return of the cost of works in progress an absolute necessity. If they had had such a return in an undertaking where they had dropped 2,000l., they must have found it out. No monthly return was ever presented to the Committee when he became vice-chairman. He had brought the question forward on more than one occasion, but was always "pooh-poohed," the proposal being described as worse than useless—misleading. At the last meeting such a return was presented, and he (the witness) asked certain questions upon it, the answers showing that, until completion, the Committee had no idea whether jobs were costing too much or too little. From a builder's point of view such returns were extremely important. Asked with regard to the stock of timber, the witness thought the stock was not too large; but many of the purchases had been badly made, and there had been a good deal of waste in consequence. In regard to the question of interference by members of the Committee, he said he himself had never interfered, but there had been an advantageous intervention in the case of works at Shore-ditch, on account of a threatened strike of non-union men. He advised that a notice that no difference would be made between the two classes of men should be put up, and since then there had never been any difficulty.

In reply to Sir G. Lushington, Mr. White drew a strong contrast between the methods of the Committee and the methods that would be adopted by the ordinary builder. A builder would never listen to a complaint from a discharged workman. He would insist upon periodical returns. If a builder found out that a job was going wrong and he could not find any special cause for it, he would think the foreman was not doing his duty and would demand an explanation at once, but this could not be done without regular periodical returns. He had found, eventually, that the rules did contain a clause requiring such returns, but a copy was never sent to him or other members of the Committee, and the rule was never acted upon. They had been carrying on important works for two and a half years without these necessary reports being demanded during the progress of any works. This seemed to him like the work of amateurs. He was afraid that when workmen were employed by a public body they did not see the importance of doing as much work as when employed by contractors. He had read the very

flourishing report given in evidence by Mr. Jacobs, and he compared the cost of the works, of which that witness had been foreman, with the estimates, finding in each case a loss where the works were completed, and what must necessarily prove to be a loss in works not yet completed. If he had found such a state of things on a job in which he, as a builder, was interested, he would have tried another foreman.

The further examination of the witness was adjourned until Friday, January 29, when, before the examination of Mr. White was resumed, a document was put in by the Clerk to the Council, giving the replies of the Corporations of Manchester, Liverpool, Birmingham, and Glasgow to questions which the Clerk had been instructed to make as to the systems adopted by them in carrying out works. Similar questions were also answered by the engineers of the Great Eastern, London and North-Western, and seven other leading English railways. In the case of both classes of corporations structural works appear, as a rule, to be given out to contract, the principle of direct employment being applied, generally speaking, only to the work of maintenance. The main drainage works of Manchester are executed by contractors; while in Liverpool all work of an extensive character is done by contract under the supervision of the Surveyor, and in Glasgow a similar practice is in force. Birmingham carries furthest the principle of direct employment. The following reply from the London and South-Western Railway Company may be taken as the type of the answers from all the railway companies: "The general practice of the company is to execute all works by contracts, taking care to employ only firms of experience and ability."

The examination of Mr. E. White was resumed by Dr. Longstaff, who elicited details with regard to the opposition of the witness and some other members of the Committee to certain jobs being undertaken. He advised that the Committee having lost its manager and being in a disorganised state, a proposed orphan asylum should not be undertaken, because, under the circumstances, it was sure to result in a loss. Attention had been frequently called to defective woodwork at Westview cottages. On examination he found the doors coming away from their hinges through the absence of the blockings which were necessary to enable the 2 in. screws used in the jamb linings (rebated 1½ in.) to bite effectively. Only the plain part of the screws was in the wood. When asked why he had neglected to put in proper blockings, the manager answered that no blockings were shown in the drawings. The witness said he had never seen such work. Blockings were never shown in drawings. It was the business of all artisans to know when they were required to be used. With regard to defective plumbers' work, the witness said he had seen "the museum." He called attention to the D-traps which, though now disused, were considered proper ten years ago. They were very good, but they had, of course, not the nice finish of new work. With regard to soil-pipes, it would have been considered sufficient a few years ago to put the end of one pipe into the head of another and finish off the joints with red lead. It was not bad work for the time, though it might seem so now when there had been a great advance in sanitary work. He was much opposed to open tendering. Some firms would not tender for jobs in competitions thrown open to all, because it encouraged a kind of dishonesty in the less scrupulous contractor. It had been stated by Mr. Burns that a ring had been formed to prevent contractors from tendering, but he had no knowledge of such a ring. Builders of the better class refused to tender under the conditions imposed, and the Committee was compelled either to go to builders of a lower type or to do the work themselves.

In reply to Mr. Beachcroft the witness justified the use of the phrase "boss of the Committee" he had applied to Mr. Burns. He had refused to take the position of chairman of the Committee when it was offered, because he was dissatisfied with the way in which they were carrying out the works. He felt that great disasters were ahead, and he considered it better to be in opposition. As vice-chairman he was never consulted by the chairman, and had no more share in the business of the Committee than an ordinary member. There was a general antagonism between the two parties on the Committee, the circumstances of one of the numerous disagreements being detailed by the witness. He had repeatedly, he added, asked the Council not to undertake more work because it had its hands already full. In another dispute which led to the decision to make no

difference between union and non-union labour his opponents had predicted a revolution—a general turn out of the workmen—but the only revolution had been a peaceful one, for they had never had any trouble since.

In reply to further questions, Mr. White gave explanations in great detail regarding his investigations of monstrous overcharges in the cases of Manchester square and Westminster Fire Brigade stations. He had made a calculation which showed that on jobs completed last year, but not yet reported, there would be a loss of 20,000l. Exact figures were given with regard to each work in order of date, and the grounds of the assumption as to the amount of the loss were fully stated. Mr. Beachcroft: Are you satisfied that nothing further will be discovered in the nature of "bogus entries?"—Well, I have received a letter from a former employee of the Department who holds a different opinion, and who offers to give evidence.—The letter, signed W. B. Fullwood, now Engineer to the City of London Lunatic Asylum, was read. The writer offered to point out where the first false entries were to be found and indicated the existence of a duplicate set of books. Only one set had been seen by the Comptroller.

In reply to Dr. Collins, the witness described the Works Committee as "the most imperfect piece of machinery that could be devised for carrying on a large business." The examination of Mr. White was not concluded when the Committee adjourned to Wednesday, February 3.*

Correspondence.

To the Editor of THE BUILDER.

LONDON WATER SUPPLY.

SIR,—As a matter of public interest we have thought it our duty to call attention to the present action of some of the London Water Companies in serving notices on owners of houses to take out their three gallons flushing cisterns, and to substitute two gallons cisterns.

Although the Water Companies' Regulations only permit a two gallons flush, the Regulation has not been hitherto strictly enforced, at any rate, not in the better class of houses.

As experienced sanitarians, we have been in the habit of recommending three gallons flushing cisterns, being satisfied that a two gallons flush is not sufficient to clear the closet trap and drain however perfect their construction, and it is also well known to us that most of the so-called two gallons flushing cisterns do not discharge more than a gallon and a half.

We consider that such a retrograde movement should not be allowed to pass unchallenged, as it is a serious menace to the health of the metropolis, and we, therefore, take this means of making known our views on this important point.

There are other matters in which sanitary engineers are at variance with the Water Companies, especially in the district served by the New River Company, such as the provision of automatic flushers for urinals and drains in clubs, banks, &c., where their use is, from a sanitary point of view, of paramount importance.

It is, therefore, quite time that the public should be impressed with the absolute necessity of placing the water supply of the metropolis in the hands of a body of men who will formulate regulations more in consonance with the advance of sanitary science rather than perpetuate the antiquated powers at present vested in the Water Companies.

It is hardly necessary to say that, in making this public statement, we are exclusively actuated by a desire to see the health of London advanced.

"EXPERT EVIDENCE."

SIR,—Will you please allow me to correct the very inaccurate statement of your correspondent,

* We are again compelled to hold over the remainder of our report of this Inquiry.

Mr. Harvey Dyball, in this week's issue of your journal?

Being the "fellow" alluded to, I beg leave to inform Mr. Dyball that I can prove my evidence to be correct from scientific data.

If he would take the trouble to test my statement, he may be wiser after his experiment than he is at present.

His whole letter is a garbled statement of my evidence, and does not contain one single fact.
February 5, 1897. T. L. FEARON.

The Student's Column.

SPECIFICATIONS.—VII.

CARPENTER.—(continued.)

Quarter Partitions.—Frame the quarter partitions on first floor with head sills and braces, 4½ in. by 3 in.; posts, 4½ in. by 4 in.; quarters and puncheons, 4½ in. by 2½ in.

The trussed partition over drawing-room to be framed with queen post truss as sketch (give sketch in margin showing in single line the timbers forming the truss), with tie beam 7 in. by 4½ in., and the remaining timbers shown in sketch, 4½ in. by 4 in. Put 1½ in. by ½ in. wrought iron straps 30 in. long to feet and 24 in. long to heads of queen posts, with gibs and collars, and 2 in. bolts 14 in. long, with head, nut and washer to feet of principals, fixed solid through tie beam.

Ceiling Joists.—Put 4½ in. by 2 in. ceiling joists over bedrooms on first floor.

Trap Doors.—Trim for trap doors where indicated on plans; one over bedroom corridor 2 ft. 6 in. by 2 ft., and one on roof 2 ft. 9 in. by 2 ft. 3 in.

Cupola roof.—Construct the octagonal roof of cupola over vestibule as shown in detail drawing, with principal ribs at angles 7 in. by 2½ in., intermediate ribs, 5½ in. by 2½ in. These ribs to be fitted up to curve with stuff of 2½ in. thickness, spiked on. The principal ribs to be bolted to curb 6 in. by 4½ in., with ½ in. wrought-iron bolts. Posts of lantern to be 6 in. by 4½ in. wrought and worked to sunk faces. Head and braces 4½ in. by 4½ in. Rafters 4½ in. by 2 in. Finial out of 4½ in. by 4½ in. turned and moulded, and with turned ring out of 2 in. cross-tongued, and fitted to finial. Head to be scarfed at angles, and bolted to posts with 8 in. coach screws. Balusters to be out of 2½ in. by 2½ in., turned and moulded, and spandrels out of 2½ in. wrought, cross-tongued shaped, and moulded on lower edge and framed to posts and heads with oak dowels to balusters. Sashes to lantern to be 1½ in. ovolo moulded fixed sashes, with shaped heads. Ceiling joists under cupola to be 4½ in. by 2 in.; plates, 4½ in. by 3 in. Put 1½ in. wrought and cross-tongued apron lining with moulded condensation gutter out of 4½ in. by 2 in. The moulded cornice above sashes of lantern to be out of 7 in. by 1½ in., bracketed, and screwed to framing.

Dormers.—The dormers on main roof to be formed with front of 4½ in. by 4½ in. wrought, rebated, and twice moulded posts, 4½ in. by 4 in. wrought, rebated, and moulded head, 6 in. by 4 in. oak sunk, weathered, rebated, and throated sill. These dormers to have rafters ¾ in. by 2 in., plates 3 in. by 3 in., ceiling joists ¾ in. by 2 in., ridges 5½ in. by 2 in., hips and valleys 7 in. by 2 in., cheeks to be framed with studs 3 in. by 2 in. The roof and cheeks of dormers to be covered with inch rough boarding and felt, as described according to the plan adopted for main roof, see p. 129 ante) and to have deal moulded cornice out of 4½ in. by 2 in. nitred at angles, and screwed to framing. The casements to be 2 in. ovolo moulded with sash-bars 1½ in. wide, hung with 3 in. wrought-iron butts, to open outwards, and to have 12 in. japanned iron casement stay-bar with stub-plates and japanned iron cock-spur fastening. Edges of casement and sides of frame to be throated to form water-stop. Bottom rail of casement to be splayed, rebated, and throated. Finish inside with 1½ in. by 3 in. moulded architrave, and 1½ in. rounded window board 6 in. wide, tongued to oak sill. Window back to be formed with 3½ in. by 2 in. ashlar for plastering.

Verandah.—Construct the verandah as shown on detail drawing, with all visible and exposed woodwork of carefully-selected Riga fir of "best middling" quality, wrought with a clean finished surface. Posts to be 5 in. by 5 in., with 4 in. by 1½ in. moulding planted on, and ¾ in. by 7 in. chamfered plinth. Heads to be 5 in. by 4 in., and the curved filling pieces to be 2 in. thick, cross-tongued, cut to shape, and moulded on edge. The posts to have 5 lbs. lead sealings and

dowels of inch wrought-iron barrel, 4 in. long, mortised into posts and stone bases. The roof over verandah to be constructed with 4½ in. by 2 in. rafters, 1½ in. pitching piece, 5½ in. by 3 in. hips, and to be covered with 1½ in. by 1 in. tiling, set out to ¾ in. gauge for tilting. The eaves to have spruoked pieces out of 18 in. by 3 in., and feet of rafters to be cut to shape, as shown in detail.

Fencing and Gates.—Put at back of site open pale fencing, 4 ft. 6 in. high from ground, with oak posts 9 ft. apart, one pair of fir aris rails out of 3½ in. by 3½ in. and 3 in. by 1 in. sawn deal pales, 2½ in. apart, with pointed ends, and stand 2 in. clear of ground at bottom. The oak posts to be cut out of trees not less than 9 in. diameter, the parts below ground to be left full size and charred, and every third post to be set in concrete block at least 6 in. wider each side than heel of post. The remaining posts to be well rammed. The fencing and posts to be twice tarred with Stockholm tar at completion.

Put at sides of site oak pale fencing 5 ft. 6 in. high, with 6 in. by 4 in. posts, two aris rails out of 4½ in. by 4½ in. and gravel board 9 in. by 1½ in., filled in with cleft oak pales lapped and nailed to rails. The feet of posts to be well tarred in gas tar before fixing.

(N.B.—Alternative treatment of feet of posts is specified in this and preceding clause for the sake of example. With oak posts the first method is generally preferable.)

Put to openings in . . . 2½ in. framed, ledged, and braced oak dwarf open gates with cut and moulded horns to stiles put together with white lead, and pinned with oak trenails. The gates to be hung with a pair of purpose made wrought iron strap hinges 24 in. long, with ornamental heads to detail to 5 in. by 5 in. wrought and rebated posts with turned and moulded finials out of 6 in. by 6 in. and 15 in. long dowelled to posts. Each gate to have strong wrought iron purpose made gate latch to detail.

Summer House.—Construct the rustic summer-house as shown on drawings with oak sill, 6 in. by 4 in. laid on 6 in. bed of cement concrete, sides constructed of larch saplings, average 3 in. diameter, halved where shown on drawings to cross each other, put together in white lead, and pinned with oak trenails. The roof to have 4½ in. by 2 in. rafters, 4½ in. by 2 in. collars dove-tailed and spiked to rafters, 9 in. by 2 in. ridge and hips, and 4 in. by 3 in. plate. Under side of rafters and collars to be lined with inch matched and V-jointed boarding in half batten widths. The roof to be covered with thatching of oaten straw, 18 in. thick, properly tied and secured. Put around sides of summer-house, internally, 1½ in. elm seat with 2 in. shaped elm brackets and inch elm skirting board around. Provide for flooring lattice grating of 1½ in. by 1 in. teak battens, halved and pinned with 1½ in. meshes, and formed in sections about 6 ft. superficial each, as shown on plan, and to have framed and curved teak beams 1½ in. thick under edges of each section.

There are, of course, many other structures which come within the carpenter's province in special cases which must be dealt with separately, but the specimens already given should serve as a sufficient guide to the student.

OBITUARY.

MR. S. D. BUTTON.—Stephen Decatur Button, perhaps the oldest practising architect in the United States, has just passed away in his eighty-fourth year. Born in Preston, Connecticut, during the exciting times of a war with England, and at a moment when the naval exploits of Commander Stephen Decatur proved victorious over the English, the infant son of Roswell Button (then serving with his regiment of Militia as one of the defenders of the Port of New London) was named after the hero of the hour. Passing his early boyhood on his father's farm, he was apprenticed at sixteen to learn carpentry with his uncle, a prominent builder in those days; here he thoroughly acquainted himself with practical building construction, learned geometry, and industriously studied the "five orders." At the age of twenty-one he went to New York, and became assistant to George Purvis, a Scotchman from Edinburgh, who had been a pupil with Cubitt Bros. of London, and one of the four or five qualified architects at that time settled in the United States. The style of design most in vogue with them was that which was being mainly upheld in England by Sir William Chambers and his pupils. In America at this period it was quite customary for the architect to design and to undertake the contract for building his work, therefore upon leaving Mr. Purvis, Mr. Button in this way planned and erected many private houses, churches, and other public buildings in the States of Pennsylvania, New Jersey, Florida, and Georgia. When about the age of thirty-

one he won in competition the State House at Montgomery, Alabama, and spent two years in superintending its erection, returning north in 1838 to Philadelphia, to settle there and practise his profession as an architect. In that city he designed many of its most important business buildings. Railroad offices, ferry-houses, markets, banks, insurance buildings, theatres, museums, churches, office buildings, and many fine residences, also large hotels at several fashionable seaside resorts, besides county asylums, city halls, churches, schools, and residences in various towns and cities of the adjoining States, Pennsylvania, and New Jersey. During all this busy life, and notwithstanding the lack—natural in a comparatively young, unsettled country—of public appreciation for the art of architecture, Mr. Button laboured continuously, with a genuine enthusiastic love for his profession, above all sordid considerations, and though his design was more influenced by the Italian Renaissance than by the Gothic styles, still his church buildings displayed good, simple effects gained by fine proportion without over-elaboration of detail. Enthusiastic himself, he was the source of enthusiasm in others; his numerous pupils and assistants, who in the course of fifty years have done service with him, are now widely spread through the prominent cities of the States, all spontaneously testify to the kindly, helpful spirit invariably manifested towards them as students, and bear witness to a character in their master singularly generous, cheerful, and inspiring. Not a few mechanics and craftsmen owe their successful, advanced positions to his guidance, encouragement, and even substantial assistance, freely bestowed to influence their efforts in their younger days. Mr. Button, on entering upon his eightieth year, with his courteous manner, his genial sympathies, and his youthfulness of spirit preserved up to date, elicited from his professional brethren in Philadelphia, and from pupils in other cities, a mark of honour and esteem in the form of an elegantly illuminated address on vellum, as follows: "Presented to Stephen Decatur Button, June 8, 1892, by hrother architects, desiring to congratulate him on entering the eightieth year of his age, as an expression of their respect for an honourable career extending over half a century, and remarkable for many important public works, executed with integrity before clients and fellow-citizens, joined with an unassuming, courteous bearing, a self-abnegation combined with generous helpfulness, and an ever ready counsel for his younger associates, to whom he has endeared himself as a model of right-minded and faithful dealing." Mr. Button was an industrious student of geology, and his large collection contained many valuable specimens. He possessed a library of fine architectural works, which he some time ago presented to the Philadelphia Chapter of Architects, of which society he was the oldest member. He leaves a son, William G. Button, a civil engineer, and a daughter, Maria Button, an artist of considerable ability.

MR. JOHN FAULKNER.—Mr. John Faulkner died in his seventy-fourth year on the 7th inst. at his residence in Strangeways, Manchester. He had been connected with electric science for upwards of sixty years. He was one of the first to introduce a perfect system of conductors for the protection of buildings from lightning. His "electric kite" was applied in early days to high steeples and tall chimneys. One of his earliest applications of electricity was made in connexion with signals and bells for coal mines. In 1875 he invented improved electric magnetic telegraph sounders and bells. One of these sounders was adopted by Professor Bell in his earliest telephonic experiments and was first exhibited at the Centennial Exhibition at Philadelphia in 1876.—*Manchester Guardian*.

GENERAL BUILDING NEWS.

METHODIST CHAPEL AND SCHOOL, ARMLEY, YORKSHIRE.—Memorial stones were laid recently of a new Methodist chapel and school at Armley. The cost of the projected buildings, including land, is estimated at £377. Mr. W. S. Braitwaite is the architect, and Mr. Walter Lolley is carrying out the brick and stonemasonry work. The chapel will have a tower at the north-west corner, and is intended to accommodate 410 persons. A school 52 ft. by 28 ft., with four class-rooms, preaching-room, minister's vestry, and caretaker's house, is to be added. The buildings will be of brick with stone dressings.

INFECTIOUS HOSPITAL, KEIGHLEY.—The infectious diseases ward block containing the laundry machinery and disinfecting apparatus, a mortuary, and a porter's lodge. The work of laying out the grounds is in progress, and there yet remains the building of the typhoid fever block. The buildings have been erected from the plans of Messrs. J. Judson & Moore, architects, of Keighley, and Mr. R. Armistead, of Bingley, has acted as the surveyor to the Hospital Board.

MOUNT FLORIDA SCHOOL, GLASGOW.—This school is being erected for the Catholic School Board, and it will accommodate 1,200 scholars when finished. There are cookery and piano rooms in addition to all the others, with a janitor's house in the basement. The school is Classic in design, and is two to three stories in height. The architect is Mr. Barclay.

CHURCH SCHOOLS, LEWES, SUSSEX.—New Church schools at the Pells, Lewes, were opened recently. There are two blocks of buildings, one block being the boys' and girls' schools, which are under one roof, while the other is for the infants. The entrance to both schools is by stone porches, and immediately inside of the porches are provided cloakrooms. The accommodation for the girls comprises a room about 43 ft. long by 20 ft. wide, and also a class-room. The boys' school is divided from the girls' school by a glass-panel door, and is of the same dimensions as the girls' school. It has also a class-room. There is accommodation for about 100 boys and 100 girls. The infants' school is on the south-west side of the main entrance, and is about 63 ft. by 22 ft., with accommodation for 210 children. There are two class-rooms leading from the main room. The architect was Mr. R. Creed, of London; Messrs. Stewart & Sons, of Wallington, were the builders.

PRIMITIVE METHODIST CHAPEL, NEW BROMPTON.—The trustees of the P. M. Chapel, New Brompton, Kent, have approved of sketch plans for a new chapel and Sunday schools to be built upon a site where the existing iron church stands (Gillingham-road), and have instructed their architect (Mr. E. J. Hammond, New Brompton) to proceed with plans and specification forthwith.

ADDITIONS TO ASSAY OFFICE, BIRMINGHAM.—Additions are being made to the Birmingham Assay Office. Messrs. Ewen and J. Alfred Harper are the architects. Mr. Breyden is the builder, and the floors are fireproofed on the Laxew system.

BUILDING IN ABERDEEN.—Plans of new buildings representing a total value of about 9,000l. were submitted to the Plans Committee of the Aberdeen Town Council at its meeting on the 29th ult. One of the plans was that of a school to be erected in St. Swilkin-street, in connexion with the Convent of the Sacred Heart. The cost of the school will be about 1,000l.

CHURCH INSTITUTE, OTTERY ST. MARY, DEVONSHIRE.—The opening of the new hall of the Ottery St. Mary Church Institute took place recently. The hall is 60 ft. by 30 ft., rising to a height of about 26 ft. The contract was entrusted to Mr. F. Williams, and the architect was Mr. E. G. Warren, of Exeter.

BUILDING IN BLACKPOOL.—At the meeting of the Blackpool Building Plans Committee, on the 29th ult., 78 plans were gone through, 43 being approved and 35 disapproved.

CONSTITUTIONAL CLUB, OVENDON, YORKSHIRE.—The Halifax Corporation have passed plans prepared by Mr. J. F. Walsh, architect, Halifax, for a new Constitutional Club, which it is proposed to erect on a plot of land on Park Lodge Estate, Ovendon. Advantage is taken of the natural fall of the ground to form a lower floor level to Campbell-street. This space will be occupied by a caretaker's house, a public entrance to the club rooms, supper room, smoking kitchen, servants' lodges and gents' men's cloak rooms and retiring rooms, heating apparatus, and bath room for the use of the members. The assembly hall is approached by a flight of steps from the lower level, with an extra entrance on the north side of the room, and also from the club premises. The assembly hall is 36 ft. by 68 ft., and will provide sitting accommodation for over 500 people. It will be fitted with a spring dancing floor, a platform, and the usual retiring rooms. The supper room is 25 ft. by 36 ft., and will provide accommodation for upwards of 100 people. The club entrance is in the centre of the site in Whealey-lane. The club premises proper consist of a reading room, 30 ft. by 20 ft., a committee room, and a bar 12 ft. square, on the ground floor. On the first floor there will be a billiard room, a game room, with lavatories and conveniences. There will be a hall and vestibule at the members' entrance.

DRILL HALL, GLASGOW.—The new drill hall and headquarters of the 1st V.B. Highland Light Infantry were opened on the 22nd ult. by General Chapman, commanding the Scottish District. The halls are situated at the corner of Hill-street and Rose-street. They have been built from designs prepared by Mr. Horatio K. Bromhead. The most prominent feature of the structure is the corner tower, in which is provided a house for the caretaker. The main entrance to the halls, which is from Hill-street, leads by an inclined plane of easy gradient to the drill hall situated on the upper floor. The hall measures 100 ft. by 120 ft. long. The walls are pierced with loopholes, and light is supplied from the roof. The roof is constructed of steel. On the ground floor there is a concert hall measuring 68 ft. by 40 ft., with retiring rooms adjoining. In the western section of the building, entered from Rose-street, are club-rooms, gymnasium, and reading-room. The east front is devoted to the officers' quarters, which have a separate entrance from Hill-street. Accommodation is also provided on this floor for the sergeants' mess, staff-sergeants' room, armoury, and quartermaster's office, and in the

basement are the quartermaster's store, &c., as well as a range for Morris tube practice.—*Glasgow Herald*.

REPAIR OF METHODIST CHURCH, BELFAST.—Falls road Methodist Church, Belfast, has just been reopened after undergoing repair. The builders are Messrs J. Lowry & Sons, and the work has been carried out under the superintendence and from the plans of Messrs. J. J. Phillips & Son.

BANK, COCKERMOUTH, CUMBERLAND.—The directors of the Carlisle and Cumberland Bank, Limited, propose erecting a new bank in Main-street, Cocker-mouth, opposite the Globe Hotel, and have accepted tenders for the erection of the new premises. Mr. George Dale Oliver, Carlisle, is the architect.

VESTRY, TYLORSTOWN.—The memorial-stones of a new vestry at Tylorstown, in connexion with Hermon Baptist Church, Pontygnait, were laid recently. The vestry, which cost 1,100l., has been erected by Messrs. E. Davis & Sons, Treherbert. The architects were Messrs. Griffiths & Jones, Tonypandy.

SANITARY AND ENGINEERING NEWS.

SEWERAGE SCHEME, NEWPORT PAGNELL.—The Newport Pagnell Rural District Council have instructed Mr. D. Balfour, of Newcastle-on-Tyne, to prepare a scheme of main sewerage and sewage disposal for the town of Newport Pagnell, Buckinghamshire, to obviate the pollution of the rivers Ouzel and Ouse.

WATER SUPPLY, DOUGLAS.—A few months ago Mr. Hill, water engineer, was instructed to report on the water supply of Douglas, with a view to provide means for an extended supply, if, in his opinion, it should be found necessary. Mr. Hill's report has been received. He lays it down that, in view of the increasing population of the town, an increased water supply is absolutely necessary. He suggests two alternate schemes for the purpose of extending the supply. One is the construction of a reservoir at the lower end of Ballacottier stream, Onchan. He estimates that the reservoir could be constructed at this place to hold 105,000,000 gallons for 47,000l. to 48,000l. The other scheme is to construct a reservoir in West Baldwin valley. That site is admirably adapted for a reservoir, with a broad base, and he estimates that one could be constructed here to hold 300,000,000 gallons at a cost of about 49,500l., or only 1,500l. more than the cost of the suggested reservoir at Ballacottier, while its capacity would be nearly three times greater. The engineering difficulties in connexion with West Baldwin scheme are much less than those of the Ballacottier scheme, inasmuch as the retaining embankment at West Baldwin would not be more than quarter the length of that which would be required at Ballacottier. The great difficulty with regard to the West Baldwin scheme arises from the enormous pressure which would result from the height of the reservoir above the town, and the engineer suggests, as a means for getting over this difficulty, that a main should be laid over West Baldwin, and join the existing main at Parkfield, the residence of Mr. Hercin, the height of which above the town is only 200 to 300 ft. *Liverpool Mercury*.

WYLES'S PIPE-JOINT.—This is a patented method of jointing iron, earthenware, and other pipes, but as the only novelty consists in tapering the spigots of the pipes, and in making the sockets slightly conical, we fail to see that it will prove of much service. In the case of pipes with thin walls, the taper could only be of the slightest, and in any case, the advantage gained by tapering the spigot is not manifest.

ELECTRIC LIGHTING NEWS.

ELECTRIC LIGHTING AT WALLASEY.—The supply of electric light for the district of Wallasey was inaugurated on the 29th ult., when the electrical station in Seaview-road, Liscard, was formally opened. The new electric light works adjoin the S. Z. de Ferranti, Limited, pumping station, and the District Council have economised the mechanical power in their possession, so that the existing machinery can be utilised for providing the supply of electricity to the district. The scheme was suggested by Mr. J. H. Crowther, the engineer and manager of the council's gas works. The contractors for the work at the new station were—for engines, alternators, and switchboard, Messrs. S. Z. de Ferranti, Limited, Hallowood and London; for cables, Messrs. the British Insulated Wire Company, Limited, Prescott; and for buildings, Mr. John Gourley, Liscard and Liverpool.

PROPOSED ELECTRIC LIGHTING OF PUBLIC STREETS IN LEEDS.—The Lamp Committee of the Leeds Corporation are contemplating lighting the principal thoroughfares in the central parts of the city by electricity. They propose to place arc lamps on the poles that are to be used to support the overhead wires for the electric system of tramways. It has also been suggested that the requisite electrical current for lighting should be obtained from the central generating station at Crown Point.

ELECTRICITY AT SOMERSET HOUSE.—Somerset House, it is stated, is to be lighted throughout by electricity. A scheme of installation, involving a total expenditure of 8,000l., has been sanctioned by

the Treasury; and the Estimates of 1897-8 will provide for a payment on account of 2,500, for that portion of the work scheduled for completion by the end of the next financial year.

FOREIGN.

FRANCE.—The President formally opened last Sunday the new Rue Réaumur, which was decreed as of "public utility" as long ago as 1864, but the completion of which was not decided on till 1892. The work has been carried out by M. Henri Marchal, an engineer of the "Ponts et Chaussées," who is specially attached to the municipal service of Paris. The jury in the Ecole des Beaux Arts competition of the First Class, for which the subject was "a suite of reception-rooms," has awarded First Medals to M. Wolf, pupil of M. Redon; M. Seré's pupil of M. Kaulin, and to M. Paul Guadet, pupil of M. Guadet and Paulin. Among 700 projects in connexion with the 1000 Exhibition, brought forward by private speculators, the Committee has licensed eighty-four, most of which are panoramas of one kind or another: one is for a sliding railway (iron), and one for a moveable platform or sidewalk. The Louvre has just acquired a Christ, carved in wood, by Alonso Cano, and one of his finest productions. A committee has been formed to erect a monument at Paris to the poet Alfred de Vigny. The crematorium at Père Lachaise is at last to be completed, as well as a columbarium or repository for urns, in connexion with it. M. Formigé is the architect. A competition has been opened by the municipality of Brunoy (Seine-et-Oise) for a new Hotel-de-Ville. Sixty-one designs have been sent in, and will be on view till the 20th. M. Rioulet, architect, of Grenoble, has been elected president of the Société Nationale des Architectes de Dauphiné. The National Fine Arts Exhibition at Bourges is to open on May 15, to remain open for one month. The thirteenth exhibition of the "Union Artistique" of Toulouse will be open from February 25 to March 5; and the tenth annual exhibition of the Fine-Art Society of Lyons will be open from March 4 to May 2. The "Union Artistique du Nord" will open, at Lille, from April 1 to July 1, an exhibition of industries and arts applied to the habitation.

GERMANY.—Messrs. Kayser & von Grossheim have received the first premium in the competition which has been held at Berlin for a new Royal Academy of Arts and an Academy of Music. The value of this premium is 4000. A premium of equal value, and bracketed with the first, has been given to Herr Adolf Hartung, of Berlin. The next two premiums were given to Baurath Eggart and Schwechten respectively, and there were also a number of minor premiums. There were thirty-two candidates.

MISCELLANEOUS.

LEEDS SLUITS.—The sub-committee of the Leeds Corporation, which was specially appointed a short time ago for the purpose of making recommendations as to the best manner in which to deal with the property in the "insanitary areas" of the city, met at the Leeds Town Hall on the 1st inst., and discussed details connected with the scheme for dealing with the property situated in what is known as the York-street area. According to the Housing of the Working Classes Act, the Corporation are bound to provide dwellings for the inhabitants—or, at any rate, a certain proportion—whom they displace by the demolition of the insanitary dwellings. In the present case the Corporation are compelled to provide housing accommodation for 2,000 persons. The Act does not stipulate that this provision shall be necessarily made within the area that is being dealt with but it must be within a reasonable and convenient distance. Many members of the committee favoured the idea of having a number of the tenement houses that will be required erected on the Ivy House Estate, a site belonging to the Corporation, adjoining the East End Park, and a distance of about three-quarters of a mile from the present terminus of the York-road tramway. It was pointed out that the Highways Committee had already decided to extend the tramways in the direction of the park, and with such tramway facilities, it was thought the Local Government Board would not raise any objection to the proposal. Whether that be so or not, the sub-committee have resolved to obtain the opinion of the Local Government Board on the subject. As to dealing with the property in the condemned area, the committee appointed two sectional committees for negotiating with the property owners affected by the scheme, together with valuers. A third sectional committee was formed to consider how best to deal with the licensed property in the area. The Engineer to the Committee (Mr. Carter) was instructed to visit Barrow and Manchester, to inspect the tenement dwellings that have been erected by those Corporations, and to report thereon to the next meeting of the sub-committee.—*Leeds Mercury.*

CASELS' WASH-BASIN RANGE.—This is a water-saving lavatory range for schools, reformatories, &c. It consists of a trough, in the bottom of which are formed a number of small basins just large enough to admit of emersing the hands freely. A copper pipe, passing below, is connected to the

bottom of each basin by a brass inlet. When, at washing time, the attendant turns on the water supply, it fills each basin and overflows all round the rim into the trough, whence it is discharged by a grated outlet to the drain. The basins being so small, the water in them is quickly changed by the supply from the bottom, while the constant overflow at the top of the basin carries off at once all the soapy and dirty water. One basin in a range can be fitted with a separate supply valve for occasional use by individuals. As long as the general use of the lavatory is confined to stated periods, under the management of an attendant, this seems to be a good system for such places as reformatories and lower-class schools and factories; but it presupposes attendant having control of the water-supply.

MASTER BUILDERS' ASSOCIATION DINNER, SHREWSBURY.—The fifth annual dinner in connexion with the Shrewsbury and District Master Builders' Association was held at the Lion Hotel recently. Mr. H. Farmer presided, in the absence of the President, Mr. K. Price, and Messrs. Gethin and T. Morris occupied the vice-chairs. After the usual toasts had been honoured, Mr. T. S. Harris proposed the toast of the town and trade of Shrewsbury. Mr. J. A. Lea responded. Mr. Morris proposed the health of the President and Vice-Presidents, and said that there was no dearth of trade in the building trade, which brought more business into the town than anything else. Mr. Farmer replied. Other toasts followed.

SURVEYORSHIP APPOINTMENT.—A meeting of the Batley Corporation was held at the Town Hall on the 4th inst., the Mayor (Ald. Nettleton) presiding, when a resolution of the General Works Committee, to appoint Mr. Oscar J. Kirby as Borough Surveyor, at a salary of 2500 per annum, subject to his resigning the office of Waterworks Manager, was confirmed after a long discussion.

MASTER BUILDERS' ASSOCIATION, TUNBRIDGE WELLS.—A meeting of the builders of Tunbridge Wells, Southborough, and district, convened by circular, was recently held in the Committee Room of the Town Hall, Tunbridge Wells, when there was a large attendance, presided over by Mr. C. M. Strange. It is stated that it was unanimously decided to form a Master Builders' Association, and some twenty-eight firms were enrolled. Mr. Mansfield (Messrs. G. Mansfield & Son) was elected President; Mr. C. J. Gallard, Vice-President; Mr. J. Jones (Messrs. Soper & Jones), Hon. Treasurer; and Mr. E. J. Strange (Messrs. Strange & Sons), Hon. Secretary. The committee was constituted, as follows:—Messrs. G. Mansfield, W. E. Judd, W. B. Jury, T. Hudson, and C. M. Strange, and they were deputed to frame a code of rules for the Association.

BRISTOL MASTER BUILDERS' ASSOCIATION DINNER.—On the 2nd inst. the annual dinner of the Bristol Master Builders' Association was held at the Royal Hotel, College-green, under the presidency of Mr. C. A. Hayes. The loyal toast having been proposed by the President, Mr. G. Huntley proposed "The Mayor, High Sheriff, and Corporation of Bristol." He regretted the loss which the local Association had sustained in the last year by the death of Mr. W. H. Cowlin, one of their members who was in the Municipal Council. They had known the Sanitary Committee do much of the work which used to be done by the builders, but he believed it would be for the benefit of the ratepayers if the work were done by contract. In putting the Sanitary Committee in competition with the builders, there should be no extraneous pressure put upon contractors that would not be put upon the Sanitary Committee, and all fair charges should be put down against the Sanitary Committee.—The High Sheriff (Mr. J. C. Godwin) responded. The High Sheriff also spoke to the toast. He said that he believed there was much of the work done by the Sanitary Committee which ought to be done by the master builders; but he did not sympathise with the demand that everything should be done by the builders. The Committee must make roads and drains and other matters in the interest of the public.—Mr. L. Walters gave "The Architects, Engineers, and Surveyors." Mr. Frank Wills responded. Mr. J. Holman (Vice-President of the Chamber of Commerce) proposed "The National Association of Master Builders." He saw that among the matters that was most essential for uniformity of contracts, and a question which came before them, and he was glad they attempted to bring it into their business. He had found arbitration very much quicker and far less costly than an appeal to the law courts. Mr. A. Krauss, in responding to the toast, said that during the last twelve months they had had few strikes in the building trade, and in Bristol none. The few differences that did arise there were speedily settled by their Conciliation Board. They all looked forward each year for less strikes and lock-outs. It gave him much pleasure to tell them that the next half-yearly meeting of the National Association of Master Builders of Great Britain would be held in Bristol. His Worship the Mayor had already placed at the disposal of the Association the Civil Courts for the business proceedings, and he trusted they would have a very successful meeting.—Mr. W. Church also acknowledged the toast. He said that the President of the National Association had spoken about the ruinous competition

that was going on between master builders, and cut-throat efforts for the job they would get. They could only come to some understanding between themselves to prevent that ruinous competition which was going on. The meeting would be of great advantage to them all.—Mr. E. G. Clarke proposed "The Bristol Master Builders' Association." The President (Mr. Hayes) returned thanks, and he said their Association to assist as far as possible in settling disputes in the best manner with the workmen. In the past year there had been three disputes in various trades, and they were settled amicably, which prevented no trouble. Mr. W. H. Brown proposed "The Kindred Associations." Mr. E. W. Wooster (President of the Bath Master Builders' Association) in acknowledging the toast, said the building trade had become flourishing of late years, and a good deal accomplished by their Associations. Mr. E. J. Mercer (Secretary to the Bath Master Builders' Association) responded, and adverted to the advantage of being federated with the National Association. The High Sheriff proposed the health of the President, and Mr. W. Church, the new Vice-President, was subsequently inducted to the vice-chair, and he acknowledged the honour done him. Mr. E. Cowlin proposed "The Builders' Merchants," and Mr. Arthur Lea responded.

PLYMOUTH, &c., MASTER BUILDERS' ASSOCIATION DINNER.—The President (Mr. R. G. Jenkin) presided at the annual banquet of the Plymouth Stonehouse, Devonport, and Neighbourhood Master Builders' Association, held at the Royal Hotel, Devonport, on the 3rd inst. The loyal and patriotic toasts having been delivered, "Our Municipalities" was given by the Chairman, who observed that they took a very keen interest in their municipalities, their movements, and their working, for they found what went on within the inner chambers affected them very much. He associated with the toast the name of Mr. A. B. Pilling, the new Town Clerk of Devonport. Mr. Sowerby gave the toast of "Success to the Master Builders' Association and the Building Trade." Mr. E. Pile replied on behalf of Devonport. Mr. H. Kerswilland Mr. Turpin also acknowledged the toast, and pointed out that it was only by combination and standing shoulder to shoulder, as the men did, that they would secure success. Mr. W. G. Wakeham, C.C., submitted "Trade and Commerce," and Mr. J. Cole and Mr. T. Dennis responded. Mr. N. Coles gave the health of "The President." The Association had been formed fifteen years, and this was the first occasion on which a President had been elected outside Plymouth. Referring to the labour difficulty looming in the distance, the speaker said they did not want any strike to take place in the Three Towns. If the building trade was stopped, almost every business suffered. With regard to the erection of working men's dwellings, he maintained that that matter should not be undertaken by public bodies, but builders, they had their living to get, and if public bodies took up building it was taking away the living of the builders. The houses built at Prince Rock would not pay 2 per cent. on the outlay. No one could turn out work so cheap as a contractor, and, as an illustration of this, he said that two jobs cost the Plymouth Corporation 2000 above the contract price (he Mr. Coles) sent in. He strongly advocated an arbitration clause in their future contracts. The President acknowledged the toast, and, referring to the labour dispute, said that in the negotiations that had so far proceeded, the men had behaved themselves in a very decorous and proper manner. They showed every sign of being wishful to compromise and meet the matter in such a way as to avoid a strike. But there were principles upon which they (the master builders) did not intend to deviate or give way. The toasts of "The Visitors" and "The Press" concluded the list.

CAPITAL AND LABOUR.

PETERBOROUGH CARPENTERS AND JOINERS.—There is an agitation among the carpenters and joiners of Peterborough for an advance in wages. The members of the trade consider they are entitled to an advance on the same grounds as those on which the bricklayers of the city obtained concessions last year. No strike is intended at present, but a petition will be made in a week, which in a few instances, it is stated, has already been granted by employers.

LABOURERS' WAGES, WOLVERHAMPTON.—At a meeting on Monday last week the members of the Wolverhampton Master Builders' Association agreed to concede an advance of 3d. per hour to labourers, to take effect on April 1 next.

LEGAL.

CONTRACTORS IN THE DIVISIONAL COURT.

THE case of Murdoch and Cameron v. the Mayor and Corporation of Bournemouth, came before Mr. Baron Pollock and Mr. Justice Bruce, sitting as a Divisional Court of Queen's Bench on the 27th ult., for judgment, it being an appeal from the decision of the Official Receiver, sitting at Bournemouth, in an action arising out of the alterations and enlargement of the old pier at Bournemouth. The facts of the case sufficiently appear from the judgment.

Mr. Baron Pollock said that the learned Referee decided principally in favour of the defendants in the action which was brought by the plaintiffs, who are a firm of contractors carrying on business at Glasgow, to recover a considerable sum of money, being the price of work and labour done under a contract to enlarge the old pier at Bournemouth. The contract contained certain clauses which were not initially found in contracts of such a nature. It was provided that the materials should be of the best quality, and if they became, during the term of maintenance defective, or damaged, so as to be imperfect in the terms of the contract, such portion should be forthwith remedied, and the work re-executed in an approved manner. The contract therefore provided for what was to happen during the term of maintenance. The contractors were also to guarantee the stability of the work and to maintain the works for twelve calendar months. The contractors had pleaded that damage had been done to the works by what was known as an "Act of God," but, said his lordship, although the winds and waves were unusually severe, these were nevertheless matters within the contract, and the learned Referee was right in negating this defence. The defendant denied that the works were properly done and that the materials were insufficient, and the learned Referee found that there was due to the plaintiffs from the defendants in respect of the work 1,666*l.* 18*s.*, but that there was due to the defendants from the plaintiffs upon the counterclaim 1,800*l.*, leaving a balance due to the defendants of 133*l.* 10*s.* His lordship came to the conclusion that the learned Referee's decision was right, and that his judgment ought to be affirmed.

Mr. Justice Bruce concurred. Their Lordships slightly varied the learned Referee's order as to costs. The plaintiffs, under the order, were given the costs of the claim, and the defendants the costs of the counter-claim; but their lordships now decided that as regarded paragraph 17 of the counterclaim there should be no costs on either side.

A stay of execution was granted for fourteen days, pending an appeal; but Mr. Baron Pollock remarked that he did not encourage the appeal, as he considered the case a very clear one. His lordship further said that the storm of wind had been, no doubt, responsible for a good deal of money, but the storm of law would probably be responsible for more.

PARTY WALL DISPUTE AT HOUNDS-DITCH.

The case of *Crux v. Bell* came before Mr. Justice Romer in the Chancery Division on the 22nd ult., it being a motion by the plaintiff to continue an *interim* injunction to restrain the defendant from pulling down or interfering with the party wall between Nos. 113 and 119, Houndsditch, until an award had been made under the London Building Act, and otherwise than in accordance with that award.

The defendant, who appeared in person, asked for an adjournment so as to enable him to instruct Counsel and his solicitor. He said that he had taken up the award and paid all the fees. The plaintiff had delayed him for months. The award was only made at three o'clock the previous afternoon, and at half-past three o'clock he took it up and paid the fees.

His Lordship: You only intend, I gather, now to proceed in accordance with the award.

The defendant replied that that was so, but the plaintiff had delayed him for months. The award was only made at three o'clock the previous afternoon, and at half-past three o'clock he took it up and paid the fees.

His Lordship: I will give you further time, but you must undertake not to deal with the wall, except in accordance with the award. Will you undertake until the trial of the action, or until judgment or further order, not to deal with the wall, except in accordance with the award?

The Defendant: Yes, my lord. His Lordship: Well then, I will make the costs of this application yours in the action.

The Defendant: Then we can simply proceed with the building in accordance with the award?

His Lordship: Yes. Mr. Terrell represented the plaintiff.

A MOOT POINT UNDER A LOCAL IMPROVEMENT ACT.

The case of the Mayor, &c., of West Hartlepool v. Robinson came before Mr. Justice Stirling in the Chancery Division, on the 30th ult., for reserved judgment, it being an application by the plaintiffs, who sought to establish and enforce against certain lands belonging to the defendant and abutting on two streets known as Murray-street and Sandringham-road, two charges for sums of 27*l.* 16*s.* 6*d.* and 32*l.* 3*s.* 4*d.* in respect of paving and sewerage the two streets. The charges were claimed under the provisions of the West Hartlepool Extension Act, 1870, the questions at issue turning upon the construction of that Act, which, however, is substantially in the same terms as the Public Health Act, 1875. The defendant, in the year 1878, was the

owner of the land in question, which formed part of the Lynfield Estate, which was, down to quite recently, occupied by him for residential purposes. The owners of the immediately adjoining land on the south were, in 1878, desirous of developing their property for building purposes, and applied to the plaintiffs' predecessors in title (the West Hartlepool Improvement Commissioners) to sanction a scheme for that purpose. They submitted a plan showing a proposed road 36 ft. wide, half on the land of the applicants and half on that of the defendant. The proposed scheme was sanctioned, and a road was made called the Sandringham-road, but in the first instance only 18 ft. wide, there being an agreement between the defendant and the Commissioners that he would thereafter contribute a sufficient quantity of land on the north to give a street 36 ft. wide. In January, 1890, the Corporation made an order for the paving and sewerage of the roads in question being 18 ft. wide, notice of which was served on the defendant and the other owners; but none of the owners executed any part of the works, and the Corporation proceeded to do them themselves. The Borough Surveyor apportioned the cost of the works, the above-mentioned amounts being charged against the defendant; and on his refusing to pay, the present summons was taken out. It appeared that the defendant had afterwards thrown the agreed portion of his land into the road, making it 36 ft. wide, and that he had done the necessary work of paving, &c., of that portion of the road; the claim in dispute being for the apportioned cost of making the 18 ft. of road which was not upon his land at all. The most material defence raised was that the order of the Corporation was inoperative, inasmuch as the defendant had no means of obeying it without committing a trespass by going upon land which did not belong to him.

His Lordship, in giving judgment for the plaintiffs, said that the statute had imposed on persons whose lands abutted on a street certain duties, for the discharge of which it was necessary that they should enter on the street, and those duties were imposed irrespective of the circumstance whether those persons were or were not the owners of the soil of the street. Acts done in discharge of those duties could not, in his Lordship's opinion, constitute a trespass.

Mr. Buckley, Q.C., and Mr. Druce appeared as counsel for the plaintiffs; and Mr. Graham Hastings, Q.C., and Mr. Strachan, Q.C., for the defendant.

LEEDS LIGHT AND AIR CASE:

ACTION BETWEEN BANKS.
The case of the London and Midland Bank v. the National Provincial Bank of England, Limited, was mentioned to Mr. Justice North in the Chancery Division on the 31st inst., it being a motion by the plaintiffs to restrain the defendants from building a new bank in Park-road, Leeds, opposite the plaintiffs' premises, so as to interfere with the plaintiffs' light and air.

Mr. Bryce, Q.C., for the defendants, said that his clients were anxious to complete their building by putting the roof on it. This would only necessitate going 4 ft. higher which could hardly injure the plaintiffs, and they (the defendants) would undertake to pull down whatever was ordered by his Lordship at the trial, if any pulling down were ordered.

Mr. Clode, for the plaintiffs, said that the defendants had given an undertaking over that day not to build any higher, and he should ask that that undertaking be continued until the motion was effective or until further order.

After some argument his lordship ordered the case to stand over till the 12th inst., the defendants in the meantime to continue the undertaking not to build any higher, the plaintiffs also giving an undertaking in damages in case the defendants should be proved to have suffered any.

Order accordingly.

MEETINGS.

FRIDAY, FEBRUARY 12.
Institution of Junior Engineers (Westminster Palace Hotel).—Paper on "The Construction of High-class Bridge and Girder Work," by Mr. J. A. Macpherson. 8 p.m.
Royal Institution.—Professor John Milne, F.R.S., on "Recent Advances in Seismology," 9 p.m.
Institution of Civil Engineers (Students' Meeting).—Mr. H. W. Baker on "Cooling Reservoirs for Condensing Engines." 8 p.m.

SATURDAY, FEBRUARY 13.
London and Provincial Builders' Foremen's Association.—Annual Dinner, Holborn Restaurant, 7 p.m.
Edinburgh Architectural Association.—Visit to Broughton School.

MONDAY, FEBRUARY 15.
Royal Institute of British Architects.—Mr. H. E. Milner on "The Garden in Relation to the House." 8 p.m.
Society of Arts (Cantor Lectures).—Mr. C. F. Cross, F.R.S., on "The Industrial Uses of Cellulose." 11 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Introductory lecture, on "Factory Legislation," by Dr. A. Wynter Blyth. 8 p.m.
Leeds and Yorkshire Architectural Society.—"An Architectural Student's Rambles between Wakefield, Doncaster, and Selby," by Mr. K. A. Easdale. Illustrated. 7.30 p.m.

Northern Architectural Association.—Mr. D. H. S. Cramage, M.A., F.S.A., on "A Medieval Abbey." 7.30 p.m.

TUESDAY, FEBRUARY 16.
Painters' Company.—Annual Dinner, Carpenters' Hall. 6.30 p.m.
Royal Victoria Hall, Waterloo-road.—Mr. P. Gaskell on "Some Old Pictures in the National Gallery." 8.30 p.m.
Institution of Junior Engineers (The Westminster Palace Hotel).—Lecture II. of Special Course of Six on "Dynamo Design, Construction and Working," by Mr. F. A. Nixon. 8 p.m.
Institution of Civil Engineers.—Paper to be further discussed:—"Cold Storage at the London and India Docks," by Mr. H. F. Donaldson. 8 p.m.

WEDNESDAY, FEBRUARY 17.
Society of Arts.—Mr. Everard R. Calthrop on "Light Railways." 8 p.m.
British Archaeological Association.—Miss Edith Bradley on "London Under the Monastic Order." 8 p.m.
St. Paul's Ecclesiastical Society.—Mr. W. H. St. John Hope, M.A., on "The Plan and Arrangement of a Christian Abbey." 7.30 p.m.
Liverpool Engineering Society.—Mr. E. W. Pierce on "Principles of the Law of Rating as affecting Engineering Works." 8 p.m.
Northern Architectural Association.—Mr. H. Barnes on "Architectural Epidemics." 7.30 p.m.
Edinburgh Architectural Association.—Mr. H. F. Kerr on "Elgin Cathedral." Illustrated. 8 p.m.
Edinburgh Architectural Society.—Paper by Mr. A. Muirhead. 8 p.m.

THURSDAY, FEBRUARY 18.
Society of Antiquaries.—(1) Rev. G. B. Savage on "Ancient Burial Customs." (2) Mr. Grazebrook on "Medieval Surnames and Their Various Spellings." 8.30 p.m.
Royal Institution.—Mr. J. W. Gregory, D.Sc., F.R.G.S., on "The Problems of Arctic Geology." II. 3 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Dr. H. Manley, M.A., on "Sanitary Law: English, Scotch, and Irish; General Enactments Public Health Act, 1875; Model By-laws, &c." 8 p.m.
Institution of Civil Engineers.—Students' visit to the Locomotive Works of the Great Eastern Railway Company, Stratford. (Train leaves Liverpool-street at 3.5 p.m.)
Devon and Exeter Architectural Society (Plymouth, &c., Branch).—Mr. G. H. Fellowes Pyne on "Screens, their Treatment and Symbolism." With lantern illustrations. 7.30 p.m.

FRIDAY, FEBRUARY 19.
Architectural Association.—Mr. W. H. Bidlake on "The Architect and the Public." 7.30 p.m.

SATURDAY, FEBRUARY 20.
Institution of Junior Engineers.—Visit to the Metropolitan Fire Brigade Headquarters, Southwark Bridge-road, S.E. 3 p.m.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

470.—**FIRE GRATES:** *J. D. Hannah and Another.*—In order more effectually to warm rooms by fire grates, inventor provides the back, and preferably also the sides, of grate with an air-chamber, of such shape that the fire in the grate rests against it so as to heat the contained air. At suitable position in such air-chamber one or more radiating pipes are fixed, to allow heated air to escape into room. The supply of air to chamber's means, well replenished through opening in lower part of chamber.

2,744.—**LOCKS OF WINDOW SASHES:** *H. G. Lazenby.*—Invention relates to improvements in the locks of sliding window sashes, more particularly to the kind adapted to be mortised into the pulley-styles of window frames, and to engage with the sashes by means of bolts which enter recesses in the style of the sashes. Instead of making the bolt of the lock to operate by means of a motion or protrusion from and reaction into the lock case, and accomplishing the locking of the sashes by means of a rotary motion in a plane parallel to the face of the pulley-style.

2,872.—**ADDERS, STEPS, TAPSELS, &c.:** *L. Seeger.*—In order to render ladders, &c., more convenient, rigid, and safe, inventor connects two or more lengths of steps near the ends by suitable hinges or bolts. One length of these steps he provides two semicircular metal rings, with indents at convenient angles to admit a bolt or spring catch, &c., and on the other length suitable staples or caps for these rings to pass through, having bolts or spring catches to engage in the indents of the rings.

2,979.—**GRATING FOR INTERCEPTING TRAPS:** *W. H. Reading.*—Invention consists in the adaptation of a spring impelled bolt placed in the recess in the frame part of trap, so as to automatically lock cover when drain is closed. Bolt is unlocked for opening cover by a key.

3,745.—**FLUSH-RULES, LEVELS AND CLINOMETERS:** *A. M. Phelps and Another.*—In order to obtain a means of determining the perpendiculars of a building or structural work, inventor constructs an instrument formed of a parallel strip of wood, &c., and cut a plummet line dependentially across its centre. In place of this line they attach a metallic plate having two projecting ends; to the centre of plate is pivoted a metallic pendulum, consisting of a long pointer extending upwards, and a short pendulum rod extending downwards, which is weighted so as to cause the centre of oscillation with the pointer, the ends preventing it oscillating too far either way.

4,110.—**CONES FOR WATER-CLOSERS:** *S. T. Baster.*—In order to water-closet "cones" have been made of sheet-rubber and canvas. In place of this inventor employs a mould of internal shape of the "closet cone," and dips it in a bath of rubber solution till sufficient substance is obtained, strips of canvas are then cemented around this and it is dipped again. Inventor thus obtains a similar article with the canvas embedded in its substance, and, therefore, not liable to split.

4,151.—**GRINDING-POROS:** *T. Smith.*—In order to secure ventilation and obviate down draught, inventor forms in pot (preferably a square one) at two opposite sides and different heights, openings, consisting of a series of vertical slots, this being done in the manufacture. Pivoted baffles-plates are hinged immediately below these openings, such plates being so bent and disposed that the inrush of down currents of air are turned outside by one or other of the plates. From the manner in which plates are hinged they offer no impediment to the brush in sweeping chimney.

The Insulation Resistance of an Electric Installation.

WHEN the wiring of a building is completed, it has to pass certain tests before the public supply company will switch on the current. What these tests are can only be vaguely guessed at, as the supply companies talk learnedly in their rules about insulation resistance, and yet when the consumer tries to find out what electricians mean by the insulation resistance of the wiring of a building, he will find out that it is a vague expression used in different senses by different people. He will probably be told by the consulting electrician that it is a measure of the resistance to leakage flow between the house mains; this is the favourite definition, and, being the simplest, is strongly adhered to by youthful electricians, who think they understand it. How this is measured is clearly described in a well-known work on electrical engineering, published recently, and which has been most favourably reviewed by the electrical Press:—

"All that is necessary in testing the insulation resistance of any circuit, is to connect the + and - mains (the insulation resistance between which is to be measured) to the terminals, turn the handle, and the needle at once points to the number of ohms representing the insulation resistance."

Is it to be wondered at that most youthful electricians, whether they be wiremen or apprentices of a consulting engineer, imagine that they know all about insulation resistance?

Again, if the consumer watch the inspector of the supply company (direct current, suppose) he will notice how careful he is to measure the resistance between each house main and the earth, and if this is below a certain value he will refuse to switch on the current. Insulation resistance to the supply company thus seems to mean the resistance to leakage current flowing from either main to the earth, and so back to the central station. Insurance company's inspectors, if they turn up at all (which is a very rare event), seem to follow on the lines adopted by the supply company.

The consumer is thus led to think that what supply companies mean when they say,

for example, that the insulation resistance should average seventy-five megohms per lamp, is that the resistance to leakage flow from both the house mains together should be greater than $\frac{75}{x}$ megohms, where x is the number of lamps. He also learns that the test is done with a Goolden testing set, consisting of a small hand dynamo, which generates a pressure of 200 volts in order to satisfy the regulations of the Board of Trade, and an Evershed ohm-meter.

It is to be remembered that all this time the intelligent consumer is only guessing, as he is unable to get any definite information from the secretary of the supply company, and electricians and electrical books are hopelessly contradictory. He may think he has found it at last in a new copy of fire office rules, but on turning up this he finds that the insulation resistance has to be measured when all current-consuming and current-producing devices are turned off; and so he gives up the hunt for a definition, and regards electricians as a slippery and unsatisfactory kind of people.

Yet the theory of insulation testing is very simple, it is only the interpretation of what is meant by it in specifications that offers any real difficulties. To illustrate the theory we will consider a simple case. Consider a building wired to receive current from a direct current supply company. Let A and B fig. 1 (see next page) be the terminals of the two house mains, and let X, Y, and Z be the resistance between the main A and earth, the two mains A and B, and the main B and earth respectively. It will be noticed that current can flow from A to B in two ways, either directly through the resistance Y or through X to earth, and then from the earth through Z to B. Hence, if we measure the resistance between A and B by the ohm-meter we do not measure Y, but the joint resistance of Y and X+Z in parallel, *i.e.*, $\frac{Y(X+Z)}{X+Y+Z}$. This will be seen by the inspection of fig. 2, which is a diagrammatic representation of fig. 1.

It is customary to measure the resistances to leakage by an ohm-meter; and as these resistances are very high, they are expressed in megohms (a megohm—a million ohms). To do this one terminal of the ohm-meter is connected to A (say), and the other to E, a convenient water-pipe or gas-pipe being, for all practical purposes, in good electrical

connexion with the earth; and the handle of the machine being turned, the needle then points to the resistance between the points A and E. This is usually assumed to be the leakage resistance of the main A to E, *i.e.*, X; but from our diagram we see that it really reads $\frac{X(Y+Z)}{X+Y+Z}$ and if Y+Z is small, it may be something very different from X.

In order, therefore, to determine X, Y and Z, we should need to measure the resistances between A and E, A and B, and B and E respectively. We should then have three very difficult algebraical simultaneous equations to give us X, Y, and Z. We need hardly say that a foreman wireman does not puzzle his head trying to solve them, but assumes that his three measurements give him X, Y, and Z directly. For many practical purposes this is sufficient, but to the contractor and the consumer a knowledge of the values of X, Y, and Z is important. To find these values we can get over the mathematical difficulties by taking the following measurements:—

I. Measure the resistance a between A and E, when B is connected directly to earth by a wire. We have,

$$\frac{1}{a} = \frac{1}{X} + \frac{1}{Y} \quad \dots \quad (i)$$

II. Measure the resistance b between A and E, when A and B are joined by a piece of wire. We get

$$\frac{1}{b} = \frac{1}{Z} + \frac{1}{X} \quad \dots \quad (ii)$$

III. Measure the resistance c between B and E, when A is put directly to earth. Then

$$\frac{1}{c} = \frac{1}{Y} + \frac{1}{Z} \quad \dots \quad (iii)$$

From the equations (i) (ii) and (iii) we easily deduce that $\frac{2}{X} = \frac{1}{a} + \frac{1}{b} - \frac{1}{c}$

$$\text{Or } X = \frac{2abc}{bc+ca-ab}$$

Similarly $Y = \frac{2abc}{bc-ca+ab}$ (iv)

$$\text{And } Z = \frac{2abc}{-bc+ca+ab}$$

For example, suppose we find that the readings for the three operations, I, II, and III, are $3\frac{1}{2}$, $1\frac{1}{2}$, and $\frac{5}{8}$ megohms respectively, then by formulæ (iv), the insulation resistance of the main A to earth is 10 megohms,

Fig. 1.

Fig. 2.

the insulation resistance of the main B to earth is 1 megohm, and the insulation resistance between the two mains is 5 megohms. The ordinary test would have given the insulation resistance of A as $3\frac{2}{3}$ megohms, of B as $\frac{1}{3}$ megohms, and between A and B as $3\frac{1}{10}$ megohms.

It may be objected that the finding of the accurate values of the insulation resistance is a matter of very little importance, and is hardly worth the slight extra calculation involved. But this is a quite erroneous view to take of the matter, although it is the usual one. The numerical example worked out above shows that the numbers ordinarily given may be 200 or 300 per cent. out, and this is a matter of great importance when the current is taken from a company supplying on the three-wire system. Most electricians think that the pressure between the middle wire of this system and earth is very small, and would be surprised to hear that it is often eighty or ninety volts. We have had no practical experience with a five-wire system, but should not be much surprised to hear that the pressure between the middle wire and earth often approached 200 volts, and in this case the pressure between one of the outer mains and earth would be getting on for 400 volts. Surely it is important that the house main, which is connected on to the high-pressure supply main, should have a high insulation resistance. It is unnecessary to urge the necessity of good insulation when there is a 200 volt system of supply, as the company's officials are painfully nervous about the possible effects of a 400 volt pressure to earth.

When superintending recently some measurements on the insulation resistance of an electric installation, the electric current for which was supplied by a London company, we found that the pressure between one of the company's mains and earth was + 192 volts, and between the other and the earth + 88 volts. Of course, this may have been due to abnormally good insulation of the positive outside main and the middle one, but whether the company are to blame or not, it was evident that one house main had to withstand a pressure to earth of 192 volts. Having found out by the method given in this article which of the mains had the best insulation resistance, all lamps being in their sockets, and all the switches turned off, we naturally connected this main to the high pressure supply main. As the company always put their meter on the high-pressure house main, it is obvious that any accidental leakage from the other house main to earth must be a dead loss to the company, besides being a source of danger

to the consumer. Leakage currents are nearly always microscopic, and have no effect on the meter, except in special cases where the wiring has been damaged through gross carelessness or tampered with by mischievous clerks. Although the insulation resistance of any particular building supplied by the company may be, comparatively speaking, high, yet the insulation resistance of the whole network of wires joined to the station is often painfully low. Leakage current is not only an expensive item in the working, but as it varies from day to day, it makes accidental leaks, provided they are not dead short circuits, hard to locate, and a serious leak may go on for days without being discovered.

When the tests show that the insulation resistance of a building is unsatisfactory, expert advice is usually necessary to find out where the fault is. We have found switches with an insulation resistance of less than 10,000 ohms each offered for sale. It would not need many of these switches in an installation to produce perpetual motion in the meter. It is a very false economy to use inferior material for large installations. That dishonest workmen aided and abetted by eager consumers, manage to cheat the company's inspector by disconnecting the faulty floor whilst the tests are being made, shows how exceedingly careless some people are of their own interests. It is customary for contractors to run down insulation tests, and to point out that they are no guarantee for certain dangerous defects in the wiring. Good work and good material is held up as the best guarantee of everything being all right. It is no doubt a good guarantee, but no electrician would like to switch on current to an installation without having first tested the insulation resistance of the good work and the good material. We came across electricians a few years ago who relied on fuses saving the building if there was a fault anywhere, but this class of persons got one or two nasty frights on 200-volt installations, and they are now convinced of the importance of insulation tests.

In conclusion, we would point out that to test the insulation resistance of the wiring in a building can easily be done and requires no special knowledge. In making the tests it is most important that all the lamps should be in their sockets and all the switches turned off, and, of course, the house mains disconnected from the supply mains. A testing set can be hired from several testing institutions in London for a few shillings, and with the help of the foreman wireman three readings can easily be taken with it by the architect or the consumer in the

way we have described, and a very fair idea can be obtained of the electrical quality of the contractor's work. It has to be remembered that the insulation resistance is a variable quantity, and often improves greatly when the building gets drier, so no great importance is to be attached to the absolute value of X, Y, and Z, so long as they are sufficiently high to prevent the total leakage current being greater than the hundred thousandth part of the total working current.

For alternating current supply the insulation resistance has to be tested in a somewhat similar way, care being taken to disconnect the wiring from the secondary terminals of the transformer, and good insulation from earth is just as important as with direct currents.

MORTAR FROM PETERBOROUGH CATHEDRAL.

WITH a view of extending his researches into the composition of the mortar used in the construction of our old castles and abbeys also with a view of obtaining reliable information upon a subject having an important bearing upon the proposed restoration of a building which has lately attracted much public interest, the writer was desirous of obtaining specimens of mortar from the west front of Peterborough Cathedral.

By the courtesy and with the assistance of the contractor, Mr. John Thompson, two samples were obtained.

The first, marked A, was taken out from the bed of the ashlar of the gable now being taken down; it was very soft, easily broken, and evidently of poor quality.

The second, marked B, was taken out from the rubble walling about seven to nine inches from the face of the spandrel, and apparently consisted of loose concrete of inferior make.

Average samples of each were prepared for analysis and the results were as follows:

	A	B
Water (lost at 212 deg. Fah.)	1'56	'64
Loss on ignition	3'33	2'20
Oxide of iron	8'34	11'54
Alumina	1'21	1'01
Lime	28'25	25'14
Magnesia	'32	'23
Potash	'23	'08
Soda	'23	'29
Sulphuric acid	'20	'10
Carbonic acid and loss	20'88	19'57
Silica soluble in alkali	3'55	3'45
Insoluble silicates	31'90	35'75
	100'00	100'00

On comparing the above results with those in previous articles, published respectively in the *Builder*, June 18, 1892, and February 11, 1893, it will be noticed how very inferior the general character of the mortar must be.

The actual percentage of lime is certainly very high, but this is largely due to the calcareous nature of the small stones and gravel, consisting largely of cretaceous chalk, associated with the original mortar.

This is essentially an instance in which the high proportion of lime is no indication of the quality of the mortar, and, as such, is an interesting and useful illustration.

The next important feature to notice is the unusually large amount of oxide of iron, indicative of the soft and ferruginous nature of the sand and gravel.

But perhaps the most important point to

observe is the deficiency of soluble silica, or silica in the form of silicate soluble in a 10 per cent. solution of caustic soda.

It is silica in this condition that forms the important element in cement, and according to the writer's investigations, it is the respective richness in such soluble silica that constitutes the chief difference in the quality of certain kinds of lime for building purposes.

Thus chalk lime contains only 1 or 2 per cent. of soluble silica, greystone 9 to 10, Abertaw 15, while the best Portland cement contains as much as 20 to 22 per cent.

On applying this test to the mortar found in certain old castles and abbeys, already reported in the *Builder*, the following results were obtained:—

Caerphilly Castle	contained 9.85 per cent.
Corfe Castle	" 7.50 "
Whitby Abbey	" 8.20 "
Tintern Abbey	" 6.20 "
Glastonbury Abbey	" 6.10 "
Fountains Abbey	" 5.75 "
Bolton Abbey	" 5.65 "
Crowland Abbey	" 5.01 "
Carisbrooke Castle	" 4.35 "
Raglan Castle	" 4.10 "
Tattershall Castle	" 3.95 "
Rochester Castle	" 1.60 "

The mortar from the west front of Peterborough Cathedral, therefore, according to chemical analysis, although rich in lime, is essentially of inferior quality, and being very brittle would not be capable of standing much lateral pressure.

In many respects it closely resembles the quality of Gundulf's mortar in Rochester Castle, which, though containing 28.67 per cent. of lime, is admittedly of very inferior quality.

JOHN HUGHES, F.I.C.

NOTES.

We have given so much information and illustration on different occasions in regard to the new nave of St. Saviour's, Southwark, that it is hardly necessary here to do more than refer to the fact of its formal opening on Tuesday last by a special short service, and to congratulate Sir A. Blomfield on the successful completion of one of the most important pieces of modern church building. Now that the whole length of the church can be seen the interior has an exceedingly fine effect, and the new work in the nave combines well with the noble architecture of the choir; as well, at all events, as modern work can be expected to combine with old. Although we are not much in favour of reproductions of Gothic, this seems to be one of the cases in which *design* has to be considered; for it seems certain that only a continuation of the building in the same style of architecture could have succeeded in making it as much a harmonious whole as it now is. We confess however that, in spite of what may be said in favour of the continuous vista, we should have preferred, both for architectural and musical reasons, to have seen (and heard) the organ in the old cathedral position under the tower arch; no position has ever been so good for architectural and musical effect combined. The organ, a very good one (by Mr. Lewis) as far as it goes, would then perhaps have sounded sufficient for the building; as placed, it is lamentably insufficient for a great nave service. The church was crowded to excess, it is to be feared not merely for either religious or

architectural interest, but because it was announced that Royalty would take part in the service. That the Prince of Wales should attend a formal service to open what is practically a new Metropolitan cathedral was fitting enough; but that a number of the congregation should stand on the seats during the singing of the grand final hymn, "Now thank we all our God," to look at the Royal procession passing down the nave, was a proceeding which struck us as unseemly and disgraceful in the highest degree, the more so as those who acted in this way were persons admitted by privileged tickets, and therefore presumably belonging to a class who might have been expected to have more sense of reverence and propriety of demeanour at what was professedly at least a religious service.

ATTENTION was properly called last week in the House of Commons to the City of London Sewers Bill, which was read a second time, and by which it is proposed to transfer to the Corporation of the City of London certain powers now vested in the Commissioners of Sewers, such as those under the Local Loans Act and the Valuation of the Metropolis Act, 1869. We think that those members who urged that this matter should be dealt with by a public, and not by a private, Bill were right. It is essentially a public matter, and, further, it is most inconvenient that legislation of this kind should be contained in private Acts of Parliament. That it is desirable to concentrate the authority over the area of the City in one body we can hardly doubt, and, therefore, there can be no objection to the details of the Bill. But some definite Parliamentary rule should be laid down, and adhered to, in regard to the inclusion of such legislation as this in private Bills.

M. DUTERT's new building for the "Museum d'histoire naturelle" in the Rue Buffon, Paris, is now complete in portions, and some part of the palaeontological collection has already been installed in it. The entire block, when complete, will be 92 metres long and 27 metres wide. Externally the appearance of the new buildings is simple but dignified. A few pieces of sculpture decoration relieve it here and there. Above the entrance door of the principal pavillion M. Gardet has carved, on the keystone, an eagle with outspread wings. M. Allar has executed some sculpture in the pediment, symbolising the three kingdoms of Nature. At the first floor level are a series of bas-reliefs in marble and bronze. Those in marble are the work of M. Tony-Noël, M. Lanson, and MM. Maniglier, Fagel, Lemaire, Carlier, Gauquié, and Bayard de la Vingtrie. Those in bronze are by MM. Barrias, Frémiet, Marqueste, and Couton. Among the latter, the "Horse Tamed by Man," by M. Marqueste, and the "Nubian Killing a Crocodile," by M. Barrias, are particularly successful. On the consoles dividing the bays are sculptured figures of animals and busts of celebrated naturalists, arranged so as to produce a kind of decorative grouping.

Excavations at the Acropolis, Athens, on the north-west slope of the Acropolis, inscrip-

tions have come to light which prove that the cave usually pointed out as the Grotto of Pan was in reality sacred to Apollo Hypakraios; so that, in fact, both the apertures, long visible from below, belong to Apollo's sanctuary. In front of one of them—the most easterly—has been found a quadrangular space, hollowed in the rock, and this, probably, once held the altar of which Euripides speaks in the "Ion." In the larger of the two caves are traces of niches where votive offerings were placed. The excavations of the Archaeological Society have brought to light two other larger and deeper caves close at hand, and these it is supposed are the real Grotto of Pan. Euripides speaks of the sanctuary in the plural, the "Seats of Pan," "The Shepherd Caves," and these caves were "neighbour" to the Hollow Rocks, where Apollo dwelt. In fact, the case seems to stand thus: The whole region of the Makrai (Long Rocks) was from early days the primitive seat of Apollo Pythios. It was from this sanctuary, not from the Pythian near the Iliissus, that—as Dr. Dörpfeld long ago pointed out—the Pythiastai took their observation of the lightning from Harma. Then when, on the introduction or revival of the worship of Pan after the battle of Marathon, a sanctuary was needed for the shepherd god, a part of the precinct of Apollo was made over to him. To the north-east of Pan's real cave a portion of a flight of steps has been dug out. It continues the staircase made out by M. Kabbadias in 1886. The next discovery we may look for is of the Anakeion, the precinct of Castor and Pollux, which must be close by.

LAST Monday, at the second general meeting of the Hellenic Society, Professor Percy Gardner read two short papers, one of which, on "A Stone Tripod at Oxford" was of some architectural interest. The tripod was a gift to All Souls by Mr. Lefroy, and, though it had been noted and described by Professor Michaelis in his "Ancient Marbles of Great Britain," it had not received the attention it deserved. The design consisted of a pedestal with three women figures of archaic type, each standing on a lion, the tail of which each woman held in her hand. The monument belonged to a class, of which other specimens are now known, e.g., one at Olympia, others at Delphi and in the Central Museum at Athens. Professor Gardner suggested that the idea of a tripod support may have led to the triform figures of divinities, e.g., of Hecate. He further stated his belief that the type of woman standing on a lion had become purely arohitectonic, and cited the analogy of the lion-supported column. In his second paper Professor Gardner discussed the now famous sculptured basis of Mantinea, the design of which is attributed to Praxiteles. He controverted Dr. Waldstein's theory that a slab had been lost and that there were nine figures of Muses. Dr. Waldstein, in the discussion that followed, maintained his original view. Both these interesting papers will shortly appear in the journal of the Society.

On Wednesday evening Mr. W. H. St. John Hope gave an exceptionally excellent and interesting lecture to the St. Paul's Ecclesiological Society on "The Plan and Arrangement of a Cistercian Abbey." The lecture was illustrated by a large plan

Plan of the Cistercian Abbey.

of Fountains Abbey, and smaller ones of Kirkstall and Brildwas. Basing his remarks on documentary evidence, Mr. Hope traced the uses and purposes of the various portions of a Cistercian plan from the east end of the church, following the series of buildings round to the west end. Among special points elucidated were the use of the recess in the east wall of the cloister near the church (often broken through at a later date) as a book store for books of recreation or "edification," a use not unnaturally connected with the use of the adjoining north walk of the cloister as a day-room; the calefactory or "warming-room" (sometimes mistaken for the kitchen); the use of the *misericorde* as in fact a room for indulgence in better fare than the strict rule allowed in the refectory proper; the probable position of the infirmary for the *conversi*; the gradual (and unlawful) extension of the abbot's residence into a luxurious house; the extra-mural chapel for women to hear mass, &c. No positive opinion, however, was offered as to the vexed question of the special use of the usual long room south of the chapter house (parallel with the east cloister walk), but it was suggested that it was appropriated to novices; a suggestion, however, which seemed to be based only on the fact that no other place could be found for them. Mr. Hope lectured for nearly an hour and a half without any one finding it a minute too long—a rare thing to say of a lecture.

WE read that the Marquis of Arlington-street, Granby has lately purchased Piccadilly. the house, No. 16, which Lord North acquired upon the death of his father, the late Colonel John Sidney North, who lived there during many years. The house, on the street's west side, was formerly Lord Gage's, and then the Duke of Rutland's, being that wherein the Duke of York died on January 5, 1827; it was afterwards occupied by Lord Dudley. In the Park—then known as Upper St. James's Park—behind the house was fought the duel between Mr. Pulteney, since Earl of Bath, and John, Lord Hervey, son of the Earl of Bristol, at an early hour in the morning of January 25, 1731, as is recounted by Thomas Pelham in a letter to Lord Waldegrave. Some say that the encounter (with swords) took place in the garden of the house we mention.

THE report of the Borough Electricity Supply at Brighton. Electrical Engineer to the Brighton Corporation, which has just been adopted, is a very satisfactory one. The "electric lighting business," as Mr. Wright calls it, is in a very flourishing condition, and justifies his policy of giving to those consumers who produce the profits rebates proportional to them. The success of the electricity supply also benefits the general body of the ratepayers, since they get the electricity consumed by the street lamps at a much cheaper rate. For the coming year the Brighton Corporation are going to charge 7d. per unit for the first hour, and 13d. per unit for all electricity consumed afterwards. At this rate it will pay any manufactory in Brighton which generates its own motive power, whether by gas or steam engines, to get its supply from the Corporation. Mr. Wright also anticipates a profitable demand for charging motor-car batteries and for electric traction in connexion with the sea-shore tramways. It is true there is a little

grumbling by those thrifty consumers who yet like a little mild ostentation occasionally, and so have many lamps connected. They must suffer considerably when such an accident as turning on all the dining-room lamps before the drawing-room ones have been turned off happens, since their quarter's bill is charged on the maximum demand basis. Still, from the point of view of the general prosperity, they are hardly worth considering. If the electric-lighting supply at Brighton was in the hands of a private company, its shares would be at a considerable premium. The ratepayers are to be congratulated on having a man of the scientific eminence and business capacity of Mr. Wright as their electrical engineer.

Tramway Traction.

THE lengthy report of a committee of the Sheffield Corporation on tramway traction which has just been issued, is very similar to the reports recently made by other municipal committees. They sum up strongly in favour of electric traction on the overhead system, and they see great advantages in having span wires suspended from house to house across the streets to support the trolley wire. Fire-escapes, they say, can be made to run horizontally, and the firemen, as at Hamburg, can be provided with india-rubber gloves and shears to handle and cut the trolley wire if necessary. The loud-sounding bells and brilliant head-lights of the cars impressed the deputation, and on some of the suburban routes they travelled at a speed of twenty-five miles an hour; a rather dangerous speed, which is said to have caused some accidents. We are informed that the surface contact system in Paris is in quite an experimental stage, but that it is being considered by the Birmingham Corporation. This was the only surface contact system which the deputation saw; a visit to America doubtless, as with the Glasgow Committee, will be necessary before they can give a final opinion. They were told in Brussels that great improvements were being made in the manufacture of motors, that by the substitution of a new kind of armature, the efficiency of a 15-horse-power motor is increased to 25 horse-power, leaving it to be inferred that still greater horse-power would be obtained in the early future. What nonsense this is will be seen by remembering that a good traction motor converts 85 per cent. of the electric energy it receives into mechanical energy.

Dudley Gallery Art Society.

THE exhibition of water colours by the members of the Dudley Gallery Art Society, at the Egyptian Hall, contains a rather considerable proportion of architectural subjects, of very unequal merit. St. Paul's, against which artists seem to have a kind of spite, is illustrated in two drawings, by Mr. Burgess (13) and Miss Nesbitt (278), in both of which the dome, and in the latter of which the western towers, are very badly drawn and misrepresented in effect. Mr. Medlycott's "Santa Maria della Salute" (49) is also very bad in drawing and perspective; domical architecture being a constant source of failure with painters. The latter artist succeeds better with Gothic work, as is apparent in his "Rouen" (85) and the sketch of "Cologne" (145). Miss Margaret Bernard exhibits a broad freely executed view of "St.-Pol-de-Léon, Brittany" (132) and the "Market-

place, St. Lo" (121), the latter a little too obviously under the inspiration of Mr. R. W. Allan. Mr. Finn's "Christ Church Gateway, Canterbury" (6), though rather woolly in texture, is good in drawing and original in colour, and Mr. Newton Bennet's "Crown Inn, Dorchester" (3) is in every way admirable. Among landscapes may be noticed Mr. David Green's "Breakers" (53), a fine broadly executed study of sea, and his "Cloud land" (74); Miss Rose Douglas's "The Ferry, Walberswick" (79), a beautiful work; Mr. George Marks's small and delicate works, especially "A Berkshire Village Street" (266); Mr. Sidney Evans's "Bolton Abbey" (253), effective in an old-fashioned style; and Mr. Claud Haye's "Road to Portsmouth" (225), a fine study of moorland and sky. There is rather a preponderance of works, including some of the larger and what are meant as the more important ones, which are sensational and violent in effect rather than truly artistic.

Minor Exhibitions.

MR. AUMONIER seems to have been induced to get up a collection of no less than fifty-eight sketches of the old Chain Pier, Brighton, which certainly did not merit so much illustration, but which we presume are expected to have a market value since the demolition of the pier. They are exhibited at Messrs. Dowdeswell's. The best (as might not unnaturally be expected) are those general views in which the element of landscape effect comes in, such as Nos. 29, 34, 35, and 38. "The Last of the Old Pier" (36), showing the last portion of the staging and beams left standing in the sea, is effective, and the artist has also found some picturesque effects in the view of the structure from below (25 and 44), but on the whole more attention has been given to the pier than it was at all worth, except, as observed, from a commercial point of view. Mr. Wallace Rimmington's collection entitled "Wanderings in Italy" (Fine Art Society's Gallery) deals a good deal with architectural subjects which however, though well drawn, are rather weakly treated for the most part; but the landscape subjects exhibit a good deal of originality in style and colour, as for instance "Torcello" (2), "A Town of the Lagoons" (111), "Orvietto" (132), and "Siena" (6). Mr. C. E. Holloway's collection of water-colours (chiefly at the Goupil Gallery) are the work of an artist of some originality and power in broad rough sketches, with an almost scandalous contempt for detail; "Waterloo Bridge" (5) is admirable in general effect, but does not gain from the slovenly way in which the architecture of the bridge is indicated; "Clacton Sands" (20) and one or two others are happy effects of light and colour; but in many of the supposed sea sketches the sea is more like mud than water, and "The Lido" (6) and "Chioggia" (9), with the bits of white building dotted on in body-colour, are rapid tricks of effect rather than genuine sketching. The collection as a whole impresses one as of a pretentious and superficial cleverness.

The Sisley Exhibition, Paris.

M. ALFRED SISLEY is exhibiting at the Georges Petit Gallery 150 pastels and paintings which form a very good summary of his work, and which have excited great enthusiasm in the art world of Paris.

M. Sisley's effects of colour are startling at times, but he has an exceptional power in giving the effect of bright sunlight in scenes of full summer, especially in his later works; his earlier productions, before 1876, are in a more subdued style, and belong rather to the school of Corot. These earlier works are however really the finest, though not the most astonishing; there is a truth of atmospheric effect and colour in them which we hardly find in the artist's later works.

ARCHITECTS should pay their tribute of respect over the grave of G. P. Boyce, one of the most beautiful and accomplished of water-colour artists in dealing with subjects in which old buildings form an important element. Unlike some other recently deceased members of the "Society of Painters in Water Colours," Boyce had not been able to keep up painting almost to the time of his decease; failing health had incapacitated him from exhibiting for some years past, and his work had perhaps dropped out of the memory of the younger generation. But those who can recall a long series of exhibitions in the Water-colour Society's rooms will retain a vivid recollection of Boyce's beautiful and perfect little drawings of quiet English landscape in combination with building, in which such an object as an old barn, or even an old wall, was painted in such a way as to make one love it, and certainly as if the artist loved it. In treating such subjects he showed the highest finish, the most perfect verisimilitude, the most delicate perception of local colour, without ever becoming hard or mannered. His forte was buildings, but his foregrounds and skies were also well worth study, and he succeeded in preserving aerial effect along with the most painstaking minuteness of detail. He was an artist of exceptional style and talents, and no one can be said to have exactly filled his place.

THE ADVANCEMENT OF ARCHITECTURE *

WITH SOME REMARKS ON THE STUDY OF GOTHIC.

THE west fronts of the Gothic cathedrals are the best instances to be found of the Gothic architects' skill in composition, for they presented the largest surface to be dealt with unhampered by the necessity of resisting the thrust of the internal vaulting, the west towers acting as huge buttresses; and even when there are no walls of the towers inside but only piers, as in Notre Dame at Paris, the weight of the towers stiffened the piers that bore the thrust of the nave arches, and the vaults of the nave, aisles, and triforium. The position, too, of the west fronts from there being a large open space in front of them, encouraged the architects to concentrate on them their greatest efforts and to display the greatest richness; and as they contained the principal entrances, in which grand processions entered or from which they emerged on solemn or festive days, they may be looked upon as combining all the reasons for care and for display.

I begin with the three cathedrals of the Isle of France, of Picardy and of Champagne, Notre Dame of Paris, Notre Dame of Amiens, and the Cathedral of Reims, because the main motive of each is an arcade of kings, and, in my opinion, that of Paris very far exceeds the others in perfection of design. It is plainer, simpler, and more vigorous than the other two. The two others have more the air of beautiful women decked for a ball, while that of Paris looks like a warrior caparisoned for war.

In most cathedrals there is the Gothic device of horizontal connexion, by running up a door head or a canopy into the next story, as Wren got his horizontal tie to the bell towers of St. Paul's by running his lower portico into them; but the genius of the architect of Notre Dame made him keep his three stories separate. If you will take the trouble of laying a piece of paper above the balustrade of the ground story, you will find it makes in itself a most admirable design, not for a cathedral, but for some vast hall. Push the paper up to the top of string of the first floor, you have still a tolerable composition; push it up again to the balustrade of the second floor and you have a better design. Remove the paper and the cathedral is complete; the huge doublet windows of the towers seem to bring the whole into scale, and you have no doubt as to the destination of the building.

The architect knew the value of plainness to set off decoration and repetition. The flat splay of the doorways with their seven lines of ornament to each, would have hardly borne the carving of the tympanums, lintels, and central supports, had it not been for the mass of plain stonework in the buttresses and spandrels; by the canopied niches in each buttress he introduced an ornamental note, to prevent the ground story being divided into three separate slices; in the same way, in the gallery of kings, he brings forward each niche on the buttress, and these, too, look a trifle wider than the others, thus preventing the repetition from being monotonous; and by the flat arches of the lower trefoiled arcade he keeps a pretty equal amount of shade round each figure, while the smooth perpendicular shafts contrast well with the arms and sceptres of the kings and the pleats of their drapery; and this arcade makes a noble crown to the story, being about a quarter of the space below it, and binds the whole front together, above the solid part, in a way that is not only unique, but a master stroke.

The whole front, as you see, is divided into three unequal bays by buttresses, and what we may call the first floor has each of its three spaces nearly square. A very plain rose window beneath a circular arch fills the centre compartment and two blank trefoils adorn the spandrels above the semicircular arch; a pointed arch spans the two side spaces, each filled below with doublet windows with a blank rose in the solid head above them, and in the middle of each spandrel above the arches are blank trefoils; this story is rather heavy, and contrasts well with the light balustrade and the gallery of kings below and with the open arcade above, which again ties the whole front together at the springing of the towers. Above rise the towers with their grand doublet windows with deeply-splayed jambs, while floral cornices crown the towers and have slight pierced parapets above them. At the outer corner of the hack of each tower the roofs of the circular staircases just peep over the balustrade, and between the two towers the top of the thin central spire looks like a standard from which the banner has been torn. The whole front to the springing of the towers is but a trifle higher than its width. You may remark that the height of each main arch of the top arcade is about twice the height of that of the arcade of kings, which is also about a quarter of the height of the windows of the tower. These towers are 204 ft. high, 2 ft. higher than the Monument of London. The composition of this west front of Notre Dame is, in my opinion, the masterpiece of the west fronts of French cathedrals.

"Simple, erect, severe, austere, sublime."

Amiens is also divided vertically into three divisions, only the centre space is much larger than the side ones; measured by the statues in the gallery of kings, there are eight in the middle bay and five in each of the sides.

The bottom stage of each buttress that goes up to form the side of the towers projects so as to form deep porches, and the buttresses widen out so much in the lower story that the whole of the archivolts of the porches are on them, and the tops are turreted, and have spires, the finials of which run up into the gallery of kings. There are gables over the pointed arches of the porches, while behind the gables of the side porches are windows that light the aisles. The ground story is much higher in proportion than that of Notre Dame, and instead of the great rose-window filling in the first floor, it is above the second floor, and I must remark that the top of the gallery of kings, most unfortunately, cuts off the bottom of the rose, even when you stand with your back at the extremity of the Parvis. The first floor consists of an arcade of four arches over the middle doorway, and

of two under each tower; and each arch is subdivided by a shaft in the middle with trefoiled arches, and in each head there is a circle with a quatrefoil in it; above this is the gallery of kings. Standing between the shafts, which support high trefoiled arches, are the kings—eight in the middle bay and five in the side bays, as well as one in a niche on the face of each buttress. These niches are canopied, the canopies running up on the buttresses of the towers to just above the middle of the lower windows. In the centre bay of the third story is the rose-window filled with late tracery of kaleidoscope pattern, and on either side there are stepped doublet windows in the bottom of the tower; the opening of each window is about four times its width. Above is another story of tower with doublet windows, but of different dates, with the north tower higher than the other; and between the towers, and running up to about half the height of the north tower, is an open arcade. The north-west tower is 223 ft. high.

When the whole of these porches are in shade, they form, as at Soissons, the great and striking feature of the west front, although marred at Amiens by the stone fringe round the arches. The masons deserve as much praise for doing them so nicely, as the architect deserves blame for spoiling, by this trivial device, what would otherwise have been an impressive and dignified effect. All the architectural features up to the springing of the towers are harked by being overlaid with floral ornament, which, like that inside, errs on the side of over luxuriance; while the gallery of kings is spoiled as a feature, by the architect not keeping enough shade round the figures, and by the head of the arcade having too much luxuriant foliage: to put sculpture higher than need be is a colossal blunder. The two adjacent stories, viz., the arcade and the gallery of kings, are too nearly equal in height to look well, while the two stories of windows in the towers, of almost the same height, diminish their effect and the junction of the rose window, and the open gallery above it with the towers, almost destroys the idea of their being towers, for there is no striking contrast between the horizontal lines of the front and the vertical lines of the towers. The photograph, unfortunately, does not show the masses of shadow in the porches which produce the best effect.

The vigour of Notre Dame contrasts favourably with the fronts of Amiens and Reims, in both of which the gallery of kings makes no striking feature, and at Reims the canopied tops of the king's gallery is even more vague than a Saracen parapet. The facade lacks the strong horizontal lines of the cornice which make the composition of Notre Dame so vigorous.

Reims is generally held to be the finest of all the French cathedrals, and its west front is one of the richest, without having altogether lost all its vigour. For, with the exception of the vague line at its top, the strongly marked side windows of the first floor, and the long slits in the towers, form a useful corrective to its over softness, but the vigorous note of the first floor is echoed in the towers. Like Notre Dame and Amiens, it is divided by buttresses into three compartments that run up to the base of the towers, and the relative space between these may be measured by the gallery of the Kings, the centre division containing seven arches and the sides four each, exclusive of the statues on the buttresses. The front is divided into three stories in height, from the ground to the springing of the towers. On the ground are three deeply recessed portals with tall gables; the two end buttresses beyond have arches on their face, with gables over, making the tops of them simulate doorways; the gable of the middle portal runs up to the centre of the rose window; the gables of the two side ones just run into the windows above, and the last gables end at the string of the ground story. On the first floor the buttresses have little columned adiculae, with statues in them surmounted with spires, whose finials run up to the feet of the Kings in the gallery above. In the middle space is a pointed arch, with a rose window beneath it, some 41 ft. in diameter, looking like a huge plate in a tray of the *vasica piscis* form; under the towers on the same story are two gabled windows on each side, each window having a centre mullion and a traceried head; this story is crowned by a well marked string, carrying an open balustrade in the centre part. The story above is the gallery of Kings. This consists of an arcade, in each arch of which there is a statue. There are four side arches and seven in the middle. As these arches have traceried heads, the upper part looks, at a distance, like machicolations, for, as at Amiens, there is not enough shadow round the figures to detach them properly, and

* Being the third Royal Academy Lecture on Architecture this session. Delivered on the 1st inst. by Professor Aitchison, A.R.A.

the Kings and columns make a wide blurred band; the buttresses in this gallery have similar arcades on the face and sides of the buttresses, and the whole arcade is canopied, and over the three centre ones there is a sharp gable, but the tops of the canopies make a bazy line instead of a firm one. Each face of the tower consists of a long window with a centre mullion and a traceried bead, and there are projecting polygonal turrets at the angles pierced with long narrow windows on each face, and the spires and pinnacles have perished. It is a pity that Mr. Gossec has not given in his monograph the original spires, of which I am told a drawing remains.

I must revert to a few of the peculiarities that mark the porches. The gables are very steep so that between the apex of the archivolt and the raising cornice of the gables there is room for sculpture; the north pediment has the Crucifixion, the south the Last Judgment, and the middle one has the Coronation of the Virgin. On the cornices of the central gable canopies run up in steps to the top, looking like the stalactite work of the Saracens, or at a distance like a flock of doves that have settled there.

The portals are so high that windows are inserted above the lintels of the doorways, the window in the centre is a rose. Inside towards sunset the effulgence of the stained glass in this rose window is very striking. I may mention that the clear opening of the central portal is 52 ft. high and 20 ft. wide, divided by a central pier on which is a Virgin and child, and the doorways themselves are 20 ft. high. At the level of the door-heads there is a continuous string of canopies that runs right across all the buttresses, which is reasonable enough in two of them as they have figures beneath, but on the two end buttresses that have no statues beneath them, though there the canopies are of slight projection.

As a monument of bathetic grandeur it surpasses everything I have seen in Europe, for I have never been in India, but as a purely architectural composition it falls far short of Notre Dame. In the case of each of these three cathedrals I have merely given you my own impression on the merits of the composition, but in the actual edifice we are as much affected by the size as by other qualities. As architects we are still more affected by them as wondrous masterpieces of construction, and that, too, effected by architects straitened for means and surrounded by every difficulty.

It may be as well to speak of some of the late Gothic work before I leave France; and, as I have told you on former occasions, in criticising buildings I always endeavour to speak only of what I have seen—second-hand admiration or blame is, I think, of very little use. You can, as the astronomers say, allow for the personal equation of the observer; but you cannot do this if you do not know who the critic is.

The Church of St. Wulfran, at Abbeville, is said to be due to Cardinal Amboise, by whom it was founded, and it is said to have been begun in 1488, but not carried up far till early in 1500. It consists of two stories, with twin towers above the second story. The ground story consists of three portals, only divided from one another by canopied buttresses. The portals are not very deeply recessed, but of the utmost elaboration; and the central portal is so lofty that it has a rose window over the lintel. The tracery of this rose is, however, ugly. From the archivolts of the portals spring gables full of tracery, the two side ones stopping at the string, and the middle one running up to more than half the height of the window above, the whole of the space between the buttresses and the gables being arcaded so as to form minute panels in two stages.

Above the ground-floor string is a pierced parapet to protect those in the wide gallery above, so that the buttresses at the end of the towers are of great projection. In the middle compartment of the first floor is a large pointed west window nearly filling the whole space between the buttress, and with the top of the window treated as a rose; and the label above the archivolt is carried up and finishes against a single pinnacle above the parapet attached to the gable behind. The front consists of a canopied niche containing the Virgin and Child. All the space between the first-floor window-head and the string is arcaded in narrow panels. Under the towers are twin doublet windows filled with louvres. Above the windows the ground is panelled, but the plain masonry is left below the sills, with a little window below the sill, and a doorway below in the north one. These doublet tower windows have no architectural relation in height with the centre window. Above the string is a pierced parapet to a narrow gallery. Above the parapet are

two towers, having twin doublet windows filled with louvres. These windows are rather taller than the lower ones, with canopies and paneling between the heads and the cornice. Each tower has a floral cornice, which is capped with a pierced parapet with standards at the angles and in the middle. Both towers have octagonal outside staircases, whose tops are steeply roofed, and form twin angles to the towers.

It is a striking monument of exceeding richness and elaboration, and if it were not for the curious position of the lower tower windows it would be an effective composition.

The centre portal of the west front of Rouen Cathedral and the part above, as well as the upper part over the side portals, is said to have been built in the days of Cardinal Amboise, between 1509 and 1530, the side doorways being of the latter part of the twelfth century; and I may say, by the way, that the north doorway is, perhaps, with the exception of the south porch of Chartres, which also shows Romanesque influence, one of the finest pieces of Gothic composition in France.

The whole of this facade is flanked by two towers, the north one called the Tower of St. Romain, of the thirteenth century, and the south one the "Butter Tower," of the fifteenth and sixteenth centuries. Just short of these two towers the composition of the centre is flanked by two small square towers crowned with spires. The centre part between them is also flanked by two small, square towers, which probably had spires whose cornices range with those of the former towers. It is not easy to give a clear verbal description of the design, but, after hearing it, the lantern will show its appearance. Beginning at the ground, projecting buttresses flank the doorways. These buttresses are elaborately enriched with canopied niches and run up to the level of the centre of the rose window: between the buttresses of the centre bay springs the stepped arch of the central portal surmounted by an open gable. The cornices of the gable run up the rose window. Just over the point of the outer archivolt of the door is a string with an open balustrade above it, and at the back of this is an openwork arcade, the arches of which form an A, probably for Amboise. At the back are the deep jambs and arch of the central window, beneath the latter is the central rose window filled with thin and elaborate tracery. From the top of the archivolt of the great window run up ten small buttress-headed mullions cut off by a string level with the top of the arch through which they run, forming a pierced and canopied parapet with an arcade over it, each arch of which is alternately canopied and gabled, and at the back is an arcaded parapet. From the tops of the three centre ones runs a sharp curved gable with a finial behind it, flanked by two pinnacles with open flying buttresses. The spaces to the north and south of the great window are formed into an arcade of three arches on each side mullioned with two mullions and divided into three heights with two heights of main arch filled with tracery; and with the head of each tower are blank and the one between has its traceried head open to the sky; standing on the canopied transoms are three rows of statues, one between each pair of mullions. A great part of this tabernacle work had perished, but was being restored some ten or a dozen years ago when I was last there. Between the last small northern tower of the front another arch wanting going right up to the tower of St. Romain.

Rouen Cathedral cannot be said to be existing in effect, the grand recessed central portal gives a sufficiently deep shadow—as does the deeply-recessed rose window with the harbed point in deep shadow above it, which almost looks as if the lofty gable of the door were its handle. Above, the open gallery has little more than a quarter of its length in light against the deep shade behind; the whole gallery holding the two narrow towers together. Attention is arrested by the slight cornice of the open gable to the central portal, which stand out light against the great dusky west window, which it cuts in two. Still, with all this, and with all the wonder experienced by the mysterious shapes and by the knowledge shown and the skill exhibited, it cannot be considered a satisfactory composition, nor in the true sense an architectural one. The central feature—that is, the middle portal—with its buttresses, is not ill proportioned, but the flank windows in the towers give a look of weakness to them, and an amateur could scarcely admire the proportions of the whole front between the tower of St. Romain and the Butter Tower, while to the architect it neither suggests permanence nor durability, but an ivory casket to be put under a

glass case; nor do the arcades suggest any comprehensible interior. The traceried heads of the second arcades, through which the sky is seen suggest folly, as the blind arches against the towers suggest weakness, while the open gable over the central portal suggest two scaffolds or the gigantic wooden compasses seen in the monuments to Gothic architects. With all its elaboration, originality of design, and superhuman skill in workmanship, it is much less satisfactory than the front of Soissons; which is plain, simple, effective, and eminently suggests permanence and durability: as well as that masterstroke of the architect, the production of the proper effect with the slightest amount of work. The cathedral up to the first floor consists, exclusively of the buttresses, of plain flat masonry with three deeply-recessed portals, there is a narrow recessed archivolt to each of the portals corbelled over, the edge of which is ornamented with string beads at considerable distances apart, a small cornice or string ornamented with leaves and a pierced parapet above, finishing this projecting story; the design of which is almost perfect, the sizes of the openings being of most exquisite proportions, and the ratio of shade to light is equally agreeable. Above this the front is divided into three portions by projecting buttresses, whose three upper sets are nearly equal, and this is capped by a cornice with some effective ornament on it and a deep splay at the top. Two deeply-recessed windows, now blank, fill up the outer divisions, and in the middle space there is a fringed pointed arch, beneath which is a circular rose window. This feature is not to my taste. This story is capped with an open arcade binding the whole front together. When I was there one tower alone remained and two bays of the arcade. The one tower that still remained had a buttress on each angle with pinnacled tops, the finial of each just peeping over the cornice. The whole space between the buttresses is filled with two long windows, which are louvred. The tower is capped with a strong cornice, and with an open halustrade above it.

I must just say a word or two about our own cathedrals, though I doubt if any one can in all respects hold it own against the great cathedrals of France, still I think that the west front of York is a vigorous composition and the treatment of the west front of Peterborough is unique, called by Ferguson, if I recollect rightly, the only instance of a Christian portico. Though barbarous enough, it would be striking if it were not for that ugly little abortion, the library, stuck in the centre arch. One can hardly believe it was put there of malice prepense; I have always supposed that the piers there showed signs of bulging before the library was built. Durham owes much of its fame to its situation, and from the river banks the Galilee perched on the crags is one of the most picturesque things I have ever seen, though it is externally without any merit.

As far as composition on a grand scale is concerned, at least as far as I have seen, Lincoln surpasses everything.

In the Parthenon we admire the exquisite contrast of line; the tapering columns springing from a flight of steps with architrave frieze and cornices repeating the horizontal motive of the steps; but at Lincoln, in the view I give, there is a horizontal line of 160 ft. to set off the vertical masses of towers more than 30 ft. square and 100 ft. high, while the centre lantern tower is more than 50 ft. square and nearly 120 ft. above the ridge, with windows in it more than 40 ft. high. When you get composition on this scale you cease to care about detail.

I just give you a view of Milan Cathedral and the west front of Siena Cathedral, not to leave out Italy.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

THE GARDEN IN RELATION TO THE HOUSE.

A MEETING of this Institute was held on Monday, at No. 9, Conduit-street, Regent-street, Professor Aitchison, A.R.A., President, in the chair.

The minutes of the last meeting having been taken as read, Mr. W. Emerson, Hon. Secretary, announced the death of Mr. W. Tipping, Hon. Associate. Mr. H. E. Milner, Hon. Associate, then read a paper entitled "The Garden in Relation to the House," the following being an abstract of the paper.

Mr. Milner said that he proposed to speak of the treatment to be adopted in laying out grounds, particularly in their more immediate relation to the house, and to indicate generally a practical

application of the theories advanced. The formal treatment of gardens reached a high state of perfection under Elizabeth, when the architect who designed the house also laid out the garden with its forecourt and broad terrace, its straight walks leading from it encompassing the flowerbeds, and all harmonising with the building. Little thought, however, was devoted to the treatment of the country outside beyond the planting of avenues. Towards the end of the eighteenth century fashion ruled the destruction of most of the old formal gardens, to be replaced in very many instances by a less artificial and formal imitation of nature. The designers were not content with amalgamating with whatever was good of the old work a natural treatment of the outlying ground, or of giving greater breadth to the existing formal work, but swept away all this and replaced it by meaningless walks, by clumps of trees and shrubs dotted irregularly on the lawn and park, by a hounded planting, by imitation of bits of natural scenery, by the introduction of artificial ruins and such-like objects, with the desire of making a picturesque landscape. The author then went on to speak of the happy-mean between the formal and the picturesque treatment. He differentiated greatly between the treatment of terraces, walls, steps, balustrades, &c., in stone and verdure. Architects should extend their work in the garden in connexion with the building; but this work should go hand-in-hand with the composition of the greater picture, which the art of landscape-gardening should produce. The increased resources of modern horticulture should be taken into account: not merely the eye but the mind should be appealed to by the beauty of composition of line, colour, perspective, and grandeur; a liberal art should not degenerate into a mechanical one. Places differed in the conformation of the ground, in climate, in soil, in the requirements of the owner, in the amount to be expended, and in the possibility of an extension beyond the immediate precincts. It was, therefore, futile to lay down any hard-and-fast rules for design. The author then proceeded to treat in detail of the site, the approach, the terrace, and the garden formation and planting. The approach to a house should always appear to be direct, and any deviation from such directness should not only arise from, but should also be made to arise from, some decided obstacle. By direct was not meant straight. A straight approach required careful treatment. It was artificial in character, it could appropriately be used when an imposing or somewhat pretentious building was at the end of it, or when the distance was short, and when the country was flat. In sloping ground it should, if possible, be made against the slope of a hill. The gradient should be even and flat, or very slightly and continuously curved, otherwise it would appear not straight. If the ground be very undulating, a straight road is out of character with its surroundings. A curved line of road was generally to be preferred, as being more easy of construction, more varied views could be obtained, its gradient could be varied, following within limitations the natural undulation of the ground, and the side slopes could be more easily and freely dealt with than the sides of a straight drive. Gradients, width of walks and drives, entrances, were here discussed in considerable detail by the author. The lodge and entrance gates belong to the drive, and should be parallel with, and at right angles to it, as distinguished from the highway. The face line of lodge should be at least 10 ft. from the edge of the drive, and its windows should be able to command the entrance and a certain length of drive. On entering by the drive it was advisable to create a good impression, and, therefore, to mark distinctly the difference between the dusty highway and the shaded, well-trimmed drive within the gates. Planting might be introduced on either side of the entrance, but once well inside a view should be given of the outlying grounds, or stretch of park, or distant wood. A curved drive should not be planted continuously, but broad masses of planting introduced, at first to shut off the highway, at turns in the drive, and on the top or slopes of knolls round which the drive may wind. The direction and level of the approach, and the character of the architectural features, ruled greatly the plan to be adopted for the treatment next the house. The treatment of the terrace also depended very much on the architectural character of the building. By "terrace" was meant not only the narrow strip of level ground placed parallel with the house, or the more stately portion—often with architectural ornaments—laid out along the face of the structure, but the whole of the ground that formed the base or setting of the building.

Having next discussed the various forms of terraces, the author passed on to the treatment of the garden proper, quoting partly from his book on the subject, which defined the system he advocated. So many considerations press in to vary design in the general plan of a garden, that arbitrary dealing by imposition of what may be termed paper designs, however ingenious, was ill advised. The detailed plan should spring from the site as an adaptation of its natural, or created natural, features, and should not be forced upon the position, crushing it to an artificial scheme. To copy simply the design of another place is inadmissible. Considerations that rule in this connexion were almost infinite—extent, geological formation, soil, existing natural formation or features, climate and aspect, the display of distant beauty, conformity to outside influences, particularly to the requirements of the possessor and the expenditure of money that may be made. There were points of similitude between the painter's art and landscape-gardening; but the landscape-gardener must consider that his colours change and grow; he must realise as he creates his picture that in a few years what now seems like a light green stroke of pigment to the painter may have become a tall tree, beautiful in itself, but of altered beauty, either helping or marring the landscape. He must follow nature by adapting or garnering her beauties, and tutoring her, so to speak, to a display of them. But by following nature was not meant a slavish imitation or reproduction of any of her particular scenes. Some were unattractive, some very inappropriate—all were subject to dissimilar conditions, and imitation in nature as well as in art produced pettiness. But the spirit of the beauty of nature embodied as it were in those of her works or features that express her majesty, simplicity, peacefulness, sweetness, repose, refinement, strength, and variety in form, colour, abundance, or any of her modifications as parts of loveliness, should be included and brought into juxtaposition in an ideal scene so far as it was possible to promote its natural development. The terrace, the region immediately next the house, and the general arrangement of the walks and gardens, having been discussed, the author next dealt with the most suitable positions for planting trees and shrubs, principles of grouping, the effect of colour on distance, character of foliage, &c. He maintained that they should carry out in the parts surrounding the house the architectural feeling of the design in terraces, walls, steps, basins, beds, and so form a base; that they could still have the dignified and quiet delight of formal work—not a narrow curtailment of the whole design. But there was in addition a broader treatment beyond—a work difficult to proportion in relation to foreground, to broad lawn-spaces, to grouping, and choosing trees and shrubs for effect in size and colour, to directing the eye to desired points, to taking advantage of climate and character of the place either natural or acquired, to provision of light and shade in the undulation of the ground, and to a knowledge of horticulture. This art-gardening was far beyond the limitations of formal work only, for it could apply the balance and proportion of the latter, and, in addition, present a noble conception of art-work, in its execution of outline, surface-formation, and grouping, and draw into the picture the greater, broader, varied landscape.

The Hon. Alicia Amherst said that she certainly thought that the garden should be laid out as much as possible to coincide with the architecture of the house, and that that was being more seen to every day by the designer. She was glad to hear the allusion to Parkinson and his old-fashioned flowers; certainly there never was a time when there were so many old-fashioned flowers as there were to-day, and they ought to be taken very much into consideration when designs for new gardens were being made, just as in designing an old Elizabethan house we had to adapt it to modern requirements. And the kind of plants should be thought of. In some parts of England, a sheltered garden, or a garden with sheltering trees, would grow anything; and in the southern or western parts of England, many trees which were sub-tropical in appearance could be easily naturalised; and it would not be at all in the interest of horticulture to contract or limit the design.

Mr. Aston Webb, in proposing a vote of thanks to Mr. Milner for his paper, said that the architect and the landscape gardener were most closely and properly associated. The nearest approach to a paradise was a beautiful garden on a beautiful summer's day, and anything that would help us to realise that paradise was very

much to our advantage; but the most beautiful garden was incomplete without a house, just as the most beautiful house was incomplete without a garden surrounding it, and it was essential that the two producers of the house and the garden should work hand in hand from the very commencement. When we were building a house we should call in the landscape gardener as our friend and discuss with him the way in which we proposed to enter the house and lay out the general building before we laid a stick or even drew a line on paper. The question whether the garden should be formal or otherwise had interested architects not only, as some people seemed to think, now, but from the time of Elizabeth. The term "formal garden" was rather overdone, and often very much misunderstood, not so much by architects, but amongst their clients and the public generally. The formal garden that we were striving for was not the formal garden of Holland or of Italy, but the formal garden of England, such as that at Hampton Court or as left at Hatfield and in hundreds of thousands of our old English homes, with high hedges and long walls, with wide sloping lawns to look at and to walk on. How far the garden should be cut off from the general grounds must naturally have affected all that we did. Mr. Sedding thought gardening disappeared when the ha-ha fence was discovered. That was true, and one could recognise the disastrous effect that it had had upon our gardens; but, on the other hand, Mr. Austin, the poet laureate, who had written so delightfully on gardens, quoted from a book lately published, in which it was advocated that there must be a boundary line between the garden and the house, for choice a good high wall, and said that this was an idea that could only have emanated from an architect who naturally went for bricks and mortar. He had not been able to discover that passage. He had also seen a notice in *The Garden* that an architect's idea of a garden was a small square plot of land surrounded by a high brick wall. There must have been some mistake there. Architects did not wish to surround the house with a brick wall and put a garden in the middle of it, but they certainly were not afraid of hedges or walls. Mr. Milner spoke of the courtyard of houses having a wall 3 ft. high. He was sure he must have meant 9 ft. or 10 ft.; a courtyard with walls 3 ft. high would not have been a courtyard at all to his thinking. Mr. Austin, in "The Garden that I Love," had exactly described the ideal sort of garden, and in a little poem called "Had I a Garden" he described his ideal garden as not a strictly formal one, but a combination. It should "lie in the sun;" it should have "Alleys green that lead where none should trace;" it should have a certain mystery about it; it should provide "shelter for feeble feet" under its tall trees and in shady walks, and it should have "design." In a garden which was man's work man's hand should be visible—not too apparent, but showing some object in view.

Mr. Statham seconded the vote of thanks to Mr. Milner, although he could not say that he altogether agreed with him. We were in a sort of reaction in regard to the question of the formal and informal garden. For a long time the formal garden was discarded as an old-fashioned thing in favour of the natural garden; now there was a movement in favour of it by some clever enthusiasts who were disposed to go to the other extreme. Like Mr. Milner, he had no sympathy for that movement. He did not think that hedges and trees clipped into artificial shapes necessarily belonged to the formal garden. Hampton Court as it now stood was almost an ideal formal garden in connexion with a house, but the old engravings of Hampton Court, as originally laid out, showed a totally different thing—a formal garden of little box hedges laid out in intricate and elaborate patterns. That had all been done away with, and to the great improvement of the garden. He agreed with Mr. Milner in advocating the formal treatment of the garden in immediate connexion with the house. Till recent years that was not realised, but now both the formal and informal people were inclined to it; but he disagreed with Mr. Milner where his walks began to wriggle. The walks and clumps of bushes in one of the plans reminded him of the great problem in creation—which came first, the bird or the egg; were the walks curved in order to get round the bushes, or were the bushes planted for the walks to curve round? His opinion was that the whole process of what was called landscape gardening—the carving out of a sort of picturesqueness out of the ground, and planting trees to make what might be called an artificial accident—was all a delusion, and did not give pleasure, because it was always

found that it was a contrived thing. Turn again to Hampton Court; nothing could be better; the garden formal in detail; the park, beyond the garden fence, not formal in detail, but formal in its general lines, keeping up the appearance of design over the whole ground. As to light and dark coloured trees being used to give the effect of nearness or distance, he did not quarrel with Mr. Milner on that point, but it reminded him of the case of the poet Shenstone, who had a fancy for artificial effect, and in a small garden arranged an avenue with converging sides to make an artificial perspective; he made bays in it half-way down, ending with large dark trees on the nearer side and beginning with small light tinted trees on the further side, to give a false extent to the opening, and the vista ended with a miniature summer-house too small for any one to get inside, and painted in delicate tones to give the effect of distance. The Nemesis that overtook Shenstone was that his neighbours the Lytteltons, on the next estate, used to bring their friends to the boundary to look at Shenstone's perspective from the wrong end.

Colonel Prendergast said he thought that Mr. Milner's paper would be found to contain a great deal of most valuable information on a subject that touched the Institute more nearly than people were inclined to believe, for each generation had to deal with the difficult task of making our English homes more charming than they were before. Fifty years ago the great houses of England were laid out so as to have a great field right up to them. At that time the Duchess of Sutherland, who had been brought up at Castle Howard, which was Italian in all its surroundings, set to work at Trentham to create an Italian garden, but splendid as it had been and was, one knew that the bedding out business was now utterly worn out and done for. In England in all matters we were divided into two parties, and in the matter of gardening we had the formalist and those who went in for a free hand. He agreed with Mr. Milner that the garden could only be treated properly in these days by a combination of the two methods. The Institute was chiefly concerned, no doubt, with new buildings. Unlike the buildings of a former day, which were always built in hollows or on the flat, the houses were now almost always placed on high ground, which at once altered the whole method of treating the grounds round them; it was therefore the more essential that the architect and landscape-gardener should be in consultation, and in complete accord from the very commencement, and that no cut-and-dried plan should be laid out for the grounds until you knew how the house was going to look, and how the superfluous material was going to be disposed of.

The President, in putting the vote of thanks to Mr. Milner, remarked that every one who was born in England was sure to have more or less of a taste for a garden, whether it was a formal one or a natural one. He admired Mr. Milner for his modesty, for he had always understood that the landscape-gardener looked upon himself as entirely master of the situation; that the only important thing was to lay out the grounds, and having done that, he could always recommend an architect to build the house to accord with them. There was a certain charm about what it was the fashion to call the formal garden, with its cut yews and cypresses, especially in a cottage garden in wildish places in the country, where they formed such a contrast to the natural wildness and introduced a touch of humanity into nature. This trimmed garden was derived, like most things in our civilisation, from the Romans, by whom it was carried, perhaps, to an excessive degree when the trees were cut into the shape of animals. Martial told us of a little boy who put his hand into a bear's mouth cut in the foliage of a tree, but a serpent had got in there and bit him, so the bear was the end of the boy. The best thanks of the Institute were due to Mr. Milner, for there was hardly one present who had not had a house or even a cottage to build inhabited by people who had not always been accustomed to cottages where a garden formed its principal delight.

The vote of thanks was then put, and carried unanimously.

Mr. Milner, in reply, said: It was difficult to say where in the discussion lay the happy mean, when on the one hand one of the greatest authorities on art (the President) stated that it was pleasant and delightful to see a cut bird next a little cottage, and another gentleman (Mr. Statham), who certainly had studied gardening, insisted that the formality should extend not only close to the house, but should form the whole of the garden. Then, again, Mr. Aston Webb, whom he had always considered most moderate, advocated the extension of the formal garden in a

GATES. ITALIAN. 17th CENTURY

Fig. 1.

greater direction than he should do. He had tried to explain that the formal garden (which he agreed was a misnomer) should extend to and form the platform of the house, but that once passed you must at some time get into the natural treatment of the ground. He thought Colonel Prendergast had made a most important point which he admitted in his paper that houses were now placed on the hills or hill-sides, whereas formerly they were on the flat ground. The only rational way of treating the ground was to adapt your plan to the natural site. It was unwise, if not impossible, in an undulating district or on the hill-side or at the top of a hill to form a regular formal garden, such as Hampton Court. He agreed with Mr. Statham as to the alterations and improvements at Hampton Court, but at the time when the avenues there were laid out there was not that fringe of houses that there was now, and many of the avenues led from nowhere to nowhere, and if that Hampton Court plan had been made on the hill-side, he thought the result would have been ridiculous. You must adapt yourself to the place in all your work. He felt with Mr. Aston Webb that the architect and the landscape-gardener should work hand in hand. The work of the landscape-gardener he took to be to form in his mind a picture of how the ground would look when he and the architect had finished with it; and so they ought to work in harmony. He always in his own practice tried to induce the architect to carry out into the gardens more of his architectural work, and he felt strongly that this

subject had been very much neglected. It was all very well to talk of the formal garden, but the hedges would grow and shut off views. There was no formal garden over eighty years old that retained anything of its former and ideal character. The really old gardens had a picturesque quality in the growth of the trees themselves, but that was not owing to their design; it was owing to the beauty of the trees themselves. Mr. Aston Webb spoke of the courtyard. He should be very sorry to see a courtyard with walls nine or ten feet high all round the north side of the house. The walls must necessarily be high if they were to enclose the offices, &c., or to provide shelter, but surely one would like to have a peep into the park on the north and north-west sides through the courtyard.

The Chairman announced that a Special General meeting would be held on the 1st prox. to elect the Royal Gold Medallist for the current year.

The meeting then terminated.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—We are informed that the partnership which has for many years existed between Mrs. Mary Woodward and Mr. Samuel Hunt Rowley, who traded as James Woodward & Rowley, sanitary earthenware manufacturers, at Swadlowcote, Burton-on-Trent, has been dissolved by mutual consent. Mrs. Mary Woodward will henceforth carry on the business of James Woodward on her own account at the works and premises where the partnership business has been carried on.

ARCHITECTURAL SOCIETIES.

ARCHITECTURAL ASSOCIATION: DISCUSSION SECTION.—The seventh meeting of the Discussion Section of the Architectural Association for this session was held, on the 27th inst., at 56, Great Marlborough-street, Mr. W. Pywell in the chair. Mr. F. C. Eden read a paper on "Mystery as an Architectural Quality." Mystery, the author said, was that which is obscure until explained. It might be either absolute or relative to man's knowledge at the time at which it was expressed. Its value in the arts was its truth to Nature, and its function its power to rouse the interest of the spectator. Mystery had a well-recognised place in poetry and the drama, and it was especially appropriate in music and architecture, and, though it was perhaps not essential to beauty, yet in the greatest works it was ever present. In architecture its sources were found in various qualities, such as reserve in the mind of the designer, which became suggestion in that of the beholder. Such reserve was seen in complication and inexplicability of parts, as in Gothic tabernacle work, interpenetration of mouldings, and intricate vaulting; in subdivision of plan, as where the altar screens at Winchester, thwarting the view, suggested further glories beyond; in incompleteness or unsymmetry, as in the differing twin towers of many foreign churches. Other sources of mystery were found in surprise; in gloom, which, however, was only telling when relative to surrounding brilliance either in other parts of the same building or in the open air, as in sunny lands; in inspiration of design, occasionally so marked as to be mysterious; in size; in sumptuousness; in situation and environment; and in remote age, which was always mysterious, and which gave to buildings, though they might have been commonplace to contemporary men, a mysterious interest to succeeding generations.—In the discussion which followed, it was brought out that mystery as seen in architecture was probably more a result of fortuitous circumstances than a quality deliberately sought for by the designers of buildings; and that a quality in the mind of the beholder was perhaps as essential to its existence equally with the qualities in the object beheld. The next meeting will be held on the 24th inst., at 7 p.m., when Mr. Henry Rose will read a paper on "Dodges."

EDINBURGH ARCHITECTURAL ASSOCIATION.—This Association, by permission of the Edinburgh School Board, visited on Saturday last the new school at Broughton, under the leadership of Mr. Robert Wilson, architect. The school is built upon the site of Blackfield House, and

consists of a central block with a wing at each side. The central block contains the principal class-rooms, entering from a combined boys' and girls' staircase, and in the wings are the teachers' private rooms and coveys and laundry class-rooms. There is a total accommodation for 1,358 children, provided at a cost of about 24,000*l.*, exclusive of the site. In the basement are situated the gymnasium, swimming bath, boiler house, and engine room. The visit was brought to a close by a vote of thanks to Mr. Wilson for his explanation.

DUNDEE INSTITUTE OF ARCHITECTURE, SCIENCE, AND ART.—A meeting of this body was held in the Victoria Art Galleries, Dundee, on the 10th inst., Mr. Leslie Ower presiding. Mr. J. J. Henderson, the Secretary, read the announcement of awards in connexion with the local competitions of the Institute. The referees in connexion with the competition were Messrs. T. S. Robertson, James Langlands, J. G. H. Spindler, Robert Hunter, and John MacLachlan. There were eight competitors for the first competition (sketch-book), and the awards were as follows:—1, Miss Ada Hill Walker, St. Andrews; 2, Robert Annal, Dundee, and A. G. R. Mackenzie, Aberdeen, equal; 4, Thomas Ross, Dundee. The other competitions resulted as follows:—Measured Drawing—1, Andrew Haxton, St. Andrews; 2, R. D. Baillie, Cupar Fife. Design for Pediment—A. Hilton. Outline Drawing from Museum Cast—1, Miss Catherine Fidler, Dundee; 2, W. H. Grant, Dundee. Interior Glass Door—J. Wyse, Maryfield. Mr. Walter McGregor, Superintendent of the Public Baths, Dundee, then gave an address on "Water Heating by Steam." He explained the working of the various kinds of apparatus in use in the Dundee and Lochee Baths.

CARLISLE ARCHITECTURAL, ENGINEERING, AND SURVEYING SOCIETY.—A meeting of this Society was held in the Town Hall on the 9th inst., Mr. C. Lonsdale occupying the chair. A paper was read by Mr. J. Slack on "The Warming of Buildings." The lecturer described the methods of warming buildings by means of one-pipe apparatus, and described their advantage over the old two-pipe system. The lecture was illustrated by diagrams and photographs of the most improved fire-grates now in use. A vote of thanks to Mr. Slack for his paper terminated the proceedings.

THE ARCHITECTURAL ASSOCIATION OF IRELAND.—The first of a series of visits to buildings was held on Saturday last, when, by the kind permission of the architects (Sir T. N. Deane & Son), the party were conducted over the

new lecture theatre of the Royal Dublin Society by Sir T. N. Deane. On Monday evening at the Advanced Class of Design Mr. J. J. O'Callaghan criticised the designs submitted for "A Village Public-house." The next subject to be criticised, by Mr. T. Drew, is "A Small Country Church." On Tuesday evening the ordinary meeting was held at the Grosvenor Hotel, Mr. R. Caulfield Orpen in the chair, and among the visitors were a number of the medical profession, who took part in the discussion, the subject of the lecture being "Hospitals and Hospital Construction," by Mr. F. Batchelor. The lecturer drew attention to the fact that Dublin stands second in the United Kingdom in the proportion of hospital beds to the population. London stands first, and Edinburgh third. Of the Continental cities Rome occupies the first place, with about three times the number in proportion to the population that Dublin provides. The lecturer then described the various types of hospitals in the United Kingdom and the Continent, and, after describing them, he went fully into the construction, accommodation, arrangements, methods of heating and ventilation, and various other points of interests. A discussion ensued, in which Mr. Jameson Johnston (City of Dublin Hospital), Mr. Rawson Carroll, and Mr. F. Hicks, took part. The Chairman having announced the next subject for the Advanced Class of Design, "A Cottage Hospital," to be criticised by Mr. Batchelor, the meeting terminated.

COMPETITIONS.

POSTER FOR THE BUILDING TRADES' EXHIBITION.—The premium of 10*l.*, offered for the best design for a poster to advertise the Building Trades' Exhibition in March next, brought forth some thirty competitors, the winner being Mr. J. Houry, 9, Athelney-road, Bristol. The following competitors were highly commended:—"The Master Builder" (Muirhead Bone, Glasgow); "Sphinx" (Alfred Morgan, London); "Bis" (Robert F. Sherar, Edinburgh); "L'Elephant Blanc" (David Pearce, Glasgow).

SKETCHES OF WROUGHT IRON-WORK: SOUTH KENSINGTON MUSEUM.

THESE examples, mostly of the seventeenth century, serve to illustrate some of the decorative effect which may be obtained from the simple treatment of wrought iron in lines which express more or less the ductility of the material, without any of the more elaborate effects of smith's work in conventional foliage and other such details.

Of the Italian examples, the gates shown in fig. 1 present an admirable example of the form of ornamental design in perfectly symmetrical panels which is characteristic of the taste of the Italian Renaissance, reminding us of the effect often found in carved pilaster panels, but treated in a manner entirely suited to the material. The whole design is formed by the twisting of the bars and the manner of putting them together; and though the whole is completely symmetrical whether we regard it as divided vertically or horizontally, yet there is complete freedom and play of line in the detail, which is bent and played with in its various curves in a very expressive manner. If we compare this with the two German designs shown in figs. 2 and 3, of about the same period, we may recognise that neither of these makes so characteristic a use of the ductility of the material. Fig. 2 is designed in curves, but in a more rigid and less playful manner. In fig. 3 there is more freedom in the treatment round the edges of the panel, but the central portion shows a stiff cross-barred pattern which is quite out of keeping with the character of wrought iron, and, as far as decorative purpose is concerned, is both commonplace in effect, and a throwing away of the real capabilities of the material.

Fig. 4 (p. 170) is elegant in design, but derives a little stiffness of effect from the straight lines running through it, which makes it inferior in point of style to fig. 1. The grille shown in fig. 5 is a good example of Italian taste in the production of a geometrical diaper pattern in a thoroughly wrought iron manner, and in this respect may be instructively compared with the hard mechanical effect of the centre portion of fig. 3.

Fig. 6 is an example of German freakishness in the design of the vane, which is rather original, and the decoration at the top and bottom is in harmony with the material. Figs. 7 and 8 are fair examples of bracket designs, a little wanting in decision of form.

Fig. 9 is exceedingly English in character, one of those examples of the way in which English smiths would ornament an instrument for

practical use in a manner which rather interferes with its appearance of efficiency for its purpose, and perhaps with its actual efficiency, but nevertheless converts it into an object of artistic interest, though in a rather eccentric and semi-grotesque manner, as is often the case with English work of this class, where we are struck not so much by any beauty of line in the implement as by the curiously pertinacious endeavour of the workman to twist his work into shapes which were intended to conceal its merely practical character. This class of English work is not of the finest type in an artistic sense, but it is interesting from a certain original humour which seems to pervade it.

THE SANITARY INSTITUTE.—The council have accepted an invitation from the City Council of Leeds to hold a Sanitary Congress and Health Exhibition in that city in the month of September next.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday at the County Hall, Spring-gardens, Sir Arthur Arnold, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend the St. Marylebone Baths Commissioners 10,500*l.* for rebuilding the public baths, and the School Board for London 150,000*l.* for school buildings and other purposes.

Proposed Incorporation of Westminster.—A long debate took place on the following recommendation of the Local Government and Taxation Committee:—

“(a) That while the Council does not object a charter being granted for the incorporation of any suitable area in London, for the purposes merely of the change of the corporate name and the substitu-

tion of the name of mayor and council for the existing name of a vestry or district board, provided that this can legally be done in the manner proposed, the Council will strenuously oppose any transfer of powers by any such machinery, or any such transfer by any other machinery to a particular area, without the simultaneous consideration of the whole subject of powers and areas in London.

(h) That a communication in accordance with the above resolution be sent to the Privy Council.”

After two amendments had been defeated the recommendations were agreed to, the phrase, “the Council will strenuously oppose any transfer of powers,” being altered to read, “the Council will oppose any transfer of central powers.”

New Theatre, Norris-street, Haymarket.—The Theatres and Music Halls Committee brought up the following report:—

“The Council, on June 30, 1896, approved of two drawings, submitted on behalf of Mr. Henry Dana, showing a site for a proposed theatre situated at the junction of Norris-street and St. Alban's-place, Haymarket. Norris-street, it was pointed out, is only 28 ft. 6 in. in width at one end, but is shown on the drawings to be increased in width to 30 ft. in front of the theatre. St. Alban's-place is at present 41 ft. 2 in. in width in front of the proposed building. On November 24, 1896, we reported to the Council that we had received seven drawings, dated November 10, 1896, submitted on behalf of Sir Henry Brownrigg, for the erection of a theatre upon this site, that seating accommodation would be provided for 800 people, and that all the regulations of the Council would be complied with. These drawings we asked the Council to approve upon the usual conditions, but the matter was withdrawn when our report was laid before the Council in order that we might further consider the question of the site of the proposed premises. We therefore gave the whole question further consideration, with the result that our previous report was again submitted to the Council on December 15 last, and again withdrawn. We have to report that we have again carefully gone into the whole matter, and having regard to all the circumstances of the site, we recommend—That the seven drawings, dated November 10, 1896, be approved, on condition that the works be commenced within six months, and be carried out in all respects in accordance with the Council's regulations and the provisions of the London Building Act, 1894, and that upon our reporting the completion of the building in accordance with the approved drawings and the above conditions, a certificate under the Metropolitan Management and Building Acts Amendment Act, 1878, be sealed and issued to the owner of the premises.”

Mr. Roberts moved as an amendment “That the recommendation be referred back to the Committee with an instruction to consult the solicitor as to the legal position of the Council in the matter, and to report to the Council thereon.”

He especially called attention to the narrowness of the thoroughfares leading to the site.

Mr. John Balfans, M.P., strongly supported the amendment, contending that the site was altogether unsuitable, and that the approaches were of less width than the regulations required.

Lord Monkswell said whether the plans complied with the regulations or not did not much matter, because it must be apparent to any one who had seen the locality that a theatre on this site would be nothing more nor less than a death trap. Therefore they ought not to hesitate in rejecting the application.

The amendment was carried by a large majority.

Drainage of Clerkenwell Detached: Construction of a Sewer.—On the recommendation of the Main Drainage Committee it was agreed that the tender of Mr. John Jackson, as amended, and amounting to 1,075*l.* 14*s.* 6*d.*, for the construction of a sewer and other incidental works for the drainage of Clerkenwell detached, be accepted; and that the Solicitor be instructed to prepare the contract.

City of London (Sewers) Bill.—The report of the Parliamentary Committee contained the following paragraph, the recommendation being agreed to, 54 voting for and 51 against:—

"The object of this Bill is to dissolve the Commissioners of Sewers of the City of London, and to provide for the vesting of the property of the commissioners in the mayor and commonalty and citizens of the City of London, and for the execution of the powers and duties of the commissioners through the Common Council of the City. We need not remind the Council that the City of London stands in an exceptional position, never having been subjected to the legislation under which the other municipal corporations of the country have been reformed. The general powers of local government which have been granted to the reformed municipal corporations have not been granted to the Corporation of the City of London, which at the same time is not placed under the same financial restrictions as those corporations. The City Corporation possesses uncontrolled powers of borrowing and of alienating its property, and is not under the usual obligations as to the redemption of its debts; it does not submit its accounts to independent audit, or publish an account of the value of its corporate property. All the general powers as to management, sewerage, street lighting, watching, and rating within the City have been placed under the Commissioners of Sewers. Under the present scheme of metropolitan management, therefore, the area of the City under the Commissioners of Sewers stands on much the same footing as the areas of the other parishes and districts under the local government of vestries and district boards. The effect of the present proposal is to invest the City Corporation with all the general powers of local government, including new powers of rating, without at the same time subjecting it to the general law applicable to municipal corporations, and the bill, if passed into an Act, would certainly place a considerable impediment in the way of future reform of local government upon all the principles which have been hitherto suggested. We recommend:—That a petition be sent and presented against the City of London Sewers Bill."

The Council adjourned after having transacted other business.

THE LONDON COUNTY COUNCIL INQUIRY.

The special inquiry into the organisation of the Works Department of the London County Council was resumed on the 3rd inst., when the examination of Mr. Edward White was concluded.

In reply to Mr. Dickinson, the witness said that, in putting the loss on the Colney Hatch works at from 5,000*l.* to 6,000*l.*, he had purposely understated the amount. He now showed that 7,000*l.* would more nearly represent the total loss. The real cost was found by adding the 3,253*l.*, which the Comptroller estimated as the amount of the transfers when adjusted, to Mr. Dyson's figures, 20,229*l.*, making the real total 23,482*l.*, and not 22,891*l.*, as had been stated. The sum of 2,900*l.* was still in dispute, that amount being claimed by the Works Committee for extra work done. The Engineer was of opinion that only 300*l.* should be allowed. This dispute would have to be settled by arbitration. In the case of Banstead Asylum, a precisely similar work, but done by a contractor, the claim for extras was only 230*l.*, which, as afterwards explained by Mr. White, was reduced by the Engineer to 70*l.* The witness denied that the work at Banstead was inferior; it was, on the contrary, very good, while worse work than some of that at Colney Hatch, especially the

matchboarding, he had never seen. The wood was full of knots, was sappy, and very badly prepared. He had never seen such stuff used for varnished work. Work had been passed there, because it had been done by the Works Committee, which never would have been passed if done by an outside contractor. In the case of both Colney Hatch and Banstead the buildings were of a temporary character, and of such a special nature that they should never have been undertaken by the Committee. The witness invited the Inquiry Committee to go down to Colney Hatch and see the work for themselves. In the case of the Bexley Asylum foundations, where the prices obtained by the manager were good, there should have been a large profit, instead of which, when the establishment charges of 6 per cent. were added, there would be a loss of 7,700*l.*, instead of a profit of about that amount. The brickwork in the foundation requiring no scaffolding was charged at 15*s.* a yard, and 20,000 yards of sand at 1*s.* a yard. On both these items there should have been a very good profit. Then, during the construction, the Committee were fortunate in having four or five months of extremely fine weather, and the manager naturally thought that this would be a good job. The loss was simply due to mismanagement and to the waste of labour. The works executed by the Committee at the Asylum were only the foundations and not the superstructure, the whole cost of which the Committee knew would be 350,000*l.* In answer to further questions, the witness said the real amount of the contract for these foundations was 105,000*l.*, but it had been stated by Mr. Ward at 34,000*l.*, and nothing had ever been said to the Moderate members on the Committee about this higher sum. He did not know who had prepared the estimates, but he had been told that they were made up by Mr. Burns. It was true that out of a selected list of twenty-two builders only eight had sent in tenders, but several others had written to say that they would have been glad to tender but for the onerous conditions imposed. Seven out of eight of the jobs let to contractors were being carried out by country firms because the London builder would not compete so long as such conditions existed. They were thus driving the work into the country, and the London ratemayers were the sufferers. Not only was the contractor required to show his books, but he had to make a statutory declaration that the books were kept correctly, and this condition was regarded as an insult. The only alternative was to obtain tenders from a selected list of contractors.

Mr. Dickinson: Mr. Alderman Taylor has told us that the Government have given up the system of selected tenders.—The School Board do it, and their jobs are much more comparable to ours than Government jobs. The examination was continued at great length by Mr. Dickinson upon the witness's previous statement that the knowledge of the regulation for the production of periodical returns had been withheld from the Committee, which Mr. Dickinson regarded as a very serious charge. Mr. Dickinson endeavoured to make the witness admit that these periodical returns were only ordered for the information of the Comptroller, but the witness stated that the rule in question (Rule 62) had been passed in November, 1894, three months before he, as a member of the new Council, was elected, and when the complexion of the Committee was of a less party character. Mr. White adhered to his opinion that the first return should have been presented in November, and not left until March 25. A return brought down to the beginning of March should undoubtedly have been produced at the first meeting of the new Council. Instead of that it was withheld, and the witness did not think it was withheld accidentally.

In reply to Mr. Gruning, the architectural assessor, Mr. White made a further statement with regard to the losses on Vauxhall Temporary Bridge, Shelton-street, Bexley, and other jobs. He had estimated the loss on Vauxhall Bridge at 2,000*l.*, but when the establishment charges were added he believed it would amount to more than 3,000*l.* On November 20 last 11,484*l.* had been expended on the work, which was 44*l.* over the original estimate, but according to the new manager there was still, at that time, three months' work to be done, and that, by adverse conditions of weather and tide, might be further extended. When the losses on the other works mentioned were added the total loss would not be less than 29,750*l.*, and he still thought that this estimate was very much under the mark. There were some other large jobs which were not yet sufficiently advanced for a similar estimate

to be formed. With regard to the question of friction between the Works Committee and the Architect's and Engineer's Departments, Mr. White expressed the opinion that the friction must continue so long as those officers did their duty, unless the Committee could show a profit on their jobs, and then, of course, there could be no dispute.

Mr. Gruning: What is the cause of the excessive cost?—It may be attributed chiefly to two causes—the cost of management and supervision, and the cost of labour. The supervision should be strengthened, and the tendency of the men not to do the same amount of work for the Council as for a contractor should be overcome if possible. No contractor would think of investing 125,000*l.* in a business of the extent of that of the Department, and of this sum he would never lay out 75,000*l.* for stores. The contractor's chief source of expense would be the wages, which he would have to provide for two months, at from 3,000*l.* to 4,000*l.* a week, amounting to about 25,000*l.*

Mr. Gruning: Would the builder turn over his money more often?—A builder would not require more than 50,000*l.* for a turnover of 250,000*l.* The witness expressed an opinion that the more work was undertaken by the Department the more money would be lost. The tendency in the Department was to take on too much work. They had fifty jobs running at one time, and as many as 4,000 jobbing works, which would, in the ordinary way of business, be distributed amongst thirty or forty jobbing builders. He found it difficult to say whether the Committee would be better employed in doing large works than in jobbing works because all their jobs showed a loss. He did not know of any Corporation which took on so many jobbing works as they did.

In reply to Mr. Waterhouse the witness reiterated his opinion that the Architect's estimates would have to be increased if these excessive costs were to continue. This agreed with the statement in evidence of Mr. Blashill himself, and also that of the Engineer, Mr. Binnie.

The next witness examined, Mr. Alderman Taylor, a member of the Works Committee, said in reply to questions from the Chairman, that before becoming a member of the County Council he was secretary of the Bricklayers' Union, and he was still the bricklayers' representative on the Arbitration and Conciliation Board of the London Chamber of Commerce.

His visits to the Central Works as well as to the other jobs had been very frequent, but they were merely to see how the works were progressing, and he had never spoken to a single individual upon any of the jobs except the manager or clerks of works. He did not know whether less work was done by the men in the earlier jobs, but at present they did a very fair day's work. After further questions with regard to the employment, as a bricklayer, of one of the witness's brothers the examination was adjourned.

The examination of Mr. Taylor was resumed on Friday, the 5th inst., by the assessors, Mr. Waterhouse and Mr. Gruning. In the witness's opinion, though less work was done by workmen under the Council, it was of a better quality than they would do for contractors, and he considered that good results had followed the institution of the Department. As instances of good work, he gave the jobs at the New Cross Fire Station, Claybury farm buildings, and one or two others. The whole finish in these jobs was of a superior character, and more especially the brick and stone work. He would object to the removal of the wages clauses, because that would enable contractors to employ inferior labour at inferior prices. There was now no need for strikes or disputes with regard to wages.

Mr. Gruning: They can afford to wait until a dispute is settled. But does not this facilitate strikes of contractors' men by reducing the number of idle men to be sustained?—That is so, from one point of view. The witness agreed that unless something very unusual occurred on a job, the actual conduct of the work should be left to the foremen, without interference.

In reply to Mr. Dickinson, the witness explained the loss on the foundations of the Bexley Asylum by the low prices of some portions of the work. There was a bad price for digging and also for grubbing.

In reply to Mr. Fletcher, who desired to know whether the system of the School Board, in employing local labour, was not more economical, more popular, and more fair to the 118,000 builders' workmen not in the Council's employ than the centralisation policy of the Council, Mr. Taylor said he had doubts as to economy,

if they were to be guided by the experience of the London School Board. The cost of its repairs, which in 1892 was £59,000, was £94,000 last year.

In reply to Mr. Beachcroft, the witness said he was still a member of the Union but not an official.

Mr. Beachcroft: Do you draw a salary?—I do.

The witness was now closely pressed to say what he knew of the working of the ticket system by certain officials of the Union called ticket stewards. The custom, he said, had formerly been to appoint somebody to collect tickets, but no examination of tickets now took place on the works.

Mr. Beachcroft: Is there anybody at the gate to do it?—Yes, occasionally.

Does a man stand at the gate?—Sometimes.

Mr. Henry Holloway, President of the Master Builders' Association, was now called. In reply to Sir Arthur Arnold, he disputed the allegation which had been made by Mr. Ward as to the existence of a ring amongst builders against the wages clauses in the Council's contracts. There was not, and never had been any such ring. The objections of builders were not to the Council's wages list, but emphatically against the last few obtained in the form of contract, "in practice obtained in the London district."

Sir Arthur Arnold: Would that prevent you from tendering?—Yes. That in connexion with other things. Builders did not object to their wages books and time sheets being open to the Council's officers, but an inspection of a builder's private books they felt to be both unnecessary and offensive. Another clause to which the strongest objection was felt was that which required a statutory declaration to be made that the books were correctly kept. This was not merely an absurdity but an insult. They had an objection to furnish to the Council their priced bills of quantities, because these documents, which were the builder's trade secrets were never returned to them whether their tenders were accepted or not. That gave the Committee an undue advantage in tendering, and the witness endorsed Mr. Blashill's opinion that it must stop tendering. The Architect's invitation to tender, when there was a selected list, was regarded as a mark of confidence, but the better contractors would not be likely to respond to the invitation under present conditions. One of the main objections was the arbitration clause. In the case of dispute the Architect gave his award in the first instance, but the builder who did not accept it must go on with the job and await the final settlement before his side of the dispute could be listened to. A builder should have the power to appeal at once to arbitration. Then, power was given to the Council to determine a contract if it became known that the contractor had sublet any portion of the work. This was a dangerous condition. If the Council had a desire to get tenders from responsible firms it should adopt the contract clause agreed upon between the Institute of British Architects and the Institute of Builders. Builders had no objection to pay a properly-recognised rate of wages, but certain exceptions should be made in favour of old or infirm employes whom a contractor might wish to continue in his employment. Most contractors had also improvers, to whom, of course, they did not pay the full rate of wages.

Mr. Holloway, in response to an invitation, gave valuable advice upon various points of a builder's practice, adding that he should like to say that he could see no advantage whatever obtained by the Department which could not be obtained from a contractor. In reply to Dr. Longstaff, the witness said it was always to the builder's interest to get his work rapidly done, that the conditions of contracting seemed to have been deliberately drawn up to prevent builders from tendering, and that trade union rules were often oppressive to workmen, and to old men positively cruel.

On the resumption of the inquiry on the 10th inst., Mr. Mowlem Burt was the first witness examined. Sir Arthur Arnold put a number of questions as to the objections entertained by builders to tender under the Council's form of contract. The witness said contractors made no objection to the wages schedule of the London County Council, but they strongly objected to the wages clause in the form of contract, because it recognised trades-unions only, and the masters thought they were worthy of being recognised as well as the men. The masters had met the men and agreed with them as to the rates of pay, and that agreement was as worthy of being mentioned as the trades-union agreement. They did not want to alter the general rate of wages, but they thought it a very

hard thing, as the result of the trades-union clause, that thousands of workmen were prevented from getting employment. The witness further objected to the form of contract on the same grounds previously urged by Mr. Holloway. The examination of a contractor's private books and the arbitration clause were two points most strongly objected to. These conditions were altogether arbitrary. Contractors would far rather be in the hands of a professional arbitrator, the Engineer, or Architect, than in the hands of the Council. His firm had no complaint against the Council, but they had never made a tender since the new rules came into operation. He should not object to enter into competition with the Works Department at first, and his firm would be willing to tender against them so long as they found themselves fairly treated.

In reply to Mr. Waterhouse, one of the assessors, the witness said the books of his firm had not been examined, and he could not, of his own knowledge, say whether the private books of other firms had been examined or not.

In reply to Mr. Gruning, the architectural assessor, Mr. Burt said he preferred the form of contract agreed upon between the Institute of British Architects and the Master Builders' Association, and he accepted the alteration suggested by the Institute.

In reply to Mr. Dickinson, the witness said they were willing to tender for the Holloway storm sewer with altered conditions, but without such alteration they would not have tendered at all. It was true that their tender was considerably higher than the stated actual cost when done by the Department, but he had heard, and had good reason to believe that materials had been used, he alluded particularly to bricks, such as they (the contractors) would never have been allowed to use. In the cases in which they had undertaken work they had struck out certain paragraphs to which they took exception, and had suggested alterations in others. The penalty clauses they had struck out altogether. He would prefer the terms of the old form of contract, which made the termination of the contract the penalty for infractions, rather than he exposed to vexatious and arbitrary fines for infractions which were usually of an insignificant nature and often accidental. The Council would never dream of terminating a contract because a man had been paid 3d. or 1d. less per hour. Most firms had men working for them who might no longer be worth the full rate of 6d. an hour, but were very well worth 12. a week. They had also young men, just out of their apprenticeship, to whom they could not entrust the finer work, and to whom they could not, of course, pay the full rate of wages. The tendency of trades-unions was to limit the number of young men—improvers—and also the number of apprentices, which was bad for all concerned.

In reply to Dr. Collins, Mr. Burt admitted that the arbitration clause was not so objectionable in the case of his own firm as to builders because they had not so many different items in their contracts out of which disputes might arise. The opportunities of dispute were so numerous in architectural contracts that an architect might render a good job a bad one. An architect had to look at so many little matters that he was apt, perhaps, to become a little captious. In his opinion, engineers who dealt with much larger items were generally larger minded men. His firm had never had any reason to object to an engineer's decision, but if he had made unreasonable demands they would have objected. There should be provision for an outside arbitration. It was very hard on a builder who believed he was entitled to draw perhaps 5,000l. to be told by the architect, "No, I shan't give it to you until the job is measured up."

In reply to Mr. Fletcher, the witness thought the conditions exacted by the Council seemed intended to discourage contractors, as if it wished to stop contracting altogether. It would be a very difficult thing for the Department to find a manager equally well versed in all departments of the building trade, but the contractor had able foremen on his different jobs, some being best at one thing, some at another.

In reply to the invitation to suggest improvements in the Department, Mr. Burt said he feared he had not sufficient confidence that any suggestions he might make would be properly carried out by the Department as at present constituted. He thought it was a very costly way of doing jobbing work to send men to all the various districts from the central works at Belvedere-road. He believed the system adopted by the School Board was preferable.

In reply to questions from Messrs. Torrance, Davies, and Beachcroft, the witness gave par-

ticulars as to the terms of apprenticeship, the diminishing number of apprentices, the necessity of a contractor frequently visiting his works, contractors' methods of purchasing materials, and the execution of works by direct employment by corporate bodies. Contractors, in his opinion, could do engineering work at least as cheaply and as well as any corporate body provided they were treated in the same way, but, as in the case of their York-road sewer, such bodies could do work more cheaply at lower cost by making for themselves favourable conditions. His firm in tendering had to provide for the cost of keeping the traffic open, which would entail considerable expense, but the Council, having undertaken to do the work, closed the road and so saved that expense; then they found gravel where his firm had been led to expect running sand. The Council would probably find out what that meant in the Fulham sewer. Questioned as to the existence of a strike against the Council among contractors, the witness most emphatically denied the charge; so far as his firm was concerned there was not the slightest reason for it, and he believed that there was not the slightest reason for the allegation against any other firm.

Mr. Beachcroft: Your interpretation was that it was rather in the nature of a lock-out, the Council saying in effect you shall do no work for us unless on these terms.—Yes, and they still keep us out.

In reply to questions from Sir Godfrey Lushington bearing upon the favouritism practically shown to trades-unions by the policy of the Council, the witness admitted that the extension of the radius covered by the Department to twenty miles from Charing-cross and the agreement to pay any new rate of wages that might be established by a strike might work that way, but whether it was intended to do so was another matter. With regard to periodical returns of prime cost, Mr. Burt said the practice of his firm was to insist upon such returns every month wherever a job cost over 1,000l.

Mr. Kowland B. Plunbe, architect, the next witness, in reply to Sir Arthur Arnold, explained in detail the causes of the loss of 2,600l. (or 3,600l. as estimated by Dr. Longstaff and other members of the Committee) on the Shelton-street job, and the loss which a previous witness had alleged would be incurred on the Boundary-street job. Speaking generally, he said the work done by the Department was as good as that done by the ordinary contractor. He was unable to see any difference, and he had taken care to compare. The supervision was as strict as in the case of contract work so far as he could judge.

In reply to Mr. Fletcher the witness said he thought, on the whole, that it was undesirable for any such body as the Council to do the whole of its work itself. It was desirable to employ outside contractors for work it could not do so well as they. There were certain works the Council might do with advantage to the public and in a fair way, if not in a better manner, than the contractors. In the case of the Blackwall Tunnel there was special risk, and it would have been better not to undertake it.

In reply to Mr. Alderman Beachcroft, Mr. Plunbe said that, since May, 1894, he had been in the employ of the Department and had had no special difficulty to contend with. He denied that, when completed, there was bound to be a loss at Boundary-street. A return made a few days ago showed that when all charges were included, with a charge for extra work of 1,070l. which would about balance that for deductions, there would be a balance of about 600l. to complete the job, and he was under the impression that there would be no loss. The Shelton-street job was one of the most unfortunate that a builder could possibly have undertaken. They had hardly started when the new act came into force and many alterations were made in accordance with its provisions, which need not necessarily have been made. There was delay from the ruinous condition of the neighbouring properties, which had to be shored up, and from strikes among the builders, carpenters, and plasterers, but he confessed he was somewhat surprised at the amount of the loss, and he thought more inquiry was required, and he had asked for it because he did not think so much could have been lost.

In reply to Dr. Collins, the witness explained what he meant by "loss," and "estimate of the Works Department." It did not necessarily follow that where a loss was shown, the Council had not received good value for money. As far as he had observed the quality of timber used was equal to that used by contractors, though from one job at Clapham a small lot had been sent away. He had found no fault with the ironwork

except on account of delay, the mortar was very good, and he had good foremen, especially at Boundary-street (Mr. Jacobs). Mr. Plumble would strongly advise the Council not to give work out to open competition. They should invite only men they knew to be capable of doing the work properly.

In reply to Mr. Gruning, the witness said he was aware of the new contract between the Institute of British Architects and the Builders' Association. He had used it ever since it came out, and had had no difficulty.

Mr. Gruning: Have you had more or less difficulty with the Department than with contractors in settling accounts.—I have had no trouble with the Department. Where you have had to condemn materials does the loss fall upon the public?—Yes; on the Department. Mr. Gruning: But in the case of a contractor it would fall on the contractor personally?—It would.

If contingencies occurred in a job undertaken by the Works Committee, there might be a loss to the Department?—That is so. A contract might be done cheaper by a contractor.

The inquiry was adjourned, after one or two further questions from Mr. Waterhouse and Dr. Longstaff.

The examination of one of the Labour representatives on the Council, Mr. Alderman Taylor, interrupted to admit the evidence of Mr. Holloway and Mr. Burt, was resumed on the 12th inst., by Dr. Longstaff, whose questions with regard to "the man at the gate" (the ticket steward) and the method adopted when men became members of the union, only elicited the reply, "I would rather not answer."

The witness was invited to make any further statement he wished, when he adduced a number of statistics with a view of showing that in a large number of cases the amounts of contractors' tenders, which commenced by being below the Architect's tenders, had jumped up in the course of a few months to 8, 12½, 15½, and even as much as 18 per cent. above his estimates. These figures showed, the witness contended, that either the Architect's estimates were being cut down, or that builders were increasing their tenders.

Asked by Sir Godfrey Lushington with regard to the made claim that men worked better for the Department than for a contractor, the witness admitted that the better the quality of work, the longer the time occupied was, and that the true explanation might be that the workman in spending an inordinate time over it merely desired to make more work for himself.

Sir Godfrey Lushington: Would it not be your duty, as a salaried officer of the union, to see that the practices of the trade unions were observed?—Yes; to advance its interests.

Then you serve two masters?—I don't think I do.

Are the trades unions your masters?—I am not bound to them body and soul.

After your visits to works did you report to your union?—Yes; frequently.

Finally the witness was asked, Do you think it right for the London County Council to engage in work at a loss in order to help workmen?—I have not considered the question.

Mr. John Burns, M.P., was then called and examined by Sir A. Arnold as to the visits of Labour members of the Works Committee, as to the advantage to workmen of having a scheduled list of wages, what security the labourer would lose by the abolition of the wages clause, and as to the quality of the work done by workmen in the employ of the Department. To all these questions Mr. Burns gave answers in harmony with those of the previous witnesses with whom he works. He could see no reason why the Works Committee should be reduced below twelve members, and adhered to his opinion that that number was necessary.

In reply to Alderman Beachcroft, the witness still maintained that the withdrawal of tenders justified him in making the statement that the contractors had formed a ring against the Council. The witness gave a number of reasons why he was pledged to the principle of the direct employment of labour.

Mr. Beachcroft: You have omitted one object—to obtain control of the labour market. Oh! I don't claim that. In reply to Mr. Gruning, the witness said he believed, in case of a general strike, the men in the employ of the Department would do precisely as they would if working for contractors, and in the case of a lock-out in the building trade he did not see why the County Council should sympathise with the builders, or close their works. Some builders did not sympathise in lock-outs.

Mr. Gruning: Had there been any difficulty in obtaining tenders before 1892?—I would not like to answer that question off-hand.

In reply to other questions, Mr. Burns said he believed public bodies ought to do engineering work successfully, and he did not see why they should not build a town hall. It was only the "cussedness" of partisanship in the Council that prevented them from doing all work cheaper and better than contractors. The inquiry was further adjourned to Wednesday, the 17th inst.

ARCHÆOLOGICAL SOCIETIES.

LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.—An afternoon meeting of the members of this Society was held on the 8th inst., at St. Michael's Church, Wood-street, Cheap-side, preparatory to its demolition. Mr. Philip Norman, F.S.A., met the visitors and described the church. It was destroyed in the Great Fire of 1666, and afterwards rebuilt by Sir Christopher Wren. An evening meeting of this Society was also held the next day, at the London Institution, Finsbury-circus, when Canon Benham presided. Mr. Charles Welch, F.S.A., pointed out and described some Roman pottery, &c., which had been recently discovered in the heart of the City during the excavations of the new London Central (Electric) Railway in Threadneedle-street. There were some large fragments of a broken amphora, with some vessels that had been found inside, and which were exhibited to the members. There was also a cinerary urn, which was found a few feet east of Princes-street. The Rev. James Christie next read a paper on "The Parishes of St. Michael, Wood-street, and St. John Zachary, and their Records." He exhibited several ancient minute books, and described the various changes through which these churches had passed from 1625 and onwards. Stow, the historian, asserted that there was interred in the Church of St. Michael the head of King James IV. of Scotland, but without any outward monument. Mr. Welch also produced and described a manuscript book containing a plan of the churchyard of St. Mary Abchurch, with particulars of burials prepared by order of the churchwardens in 1732. In the cases of some of the coffins only six inches of earth sufficed to cover them, and several of the graves contained three or four bodies.

SOCIETY OF ANTIQUARIES.—February 11. The Right Rev. the Bishop of Stepney, Vice-President, in the chair.—The following resolution was proposed by the Rev. G. W. Minns, seconded by Sir Samuel Montagu, Bart., M.P., and carried unanimously:—

"The Society of Antiquaries of London having heard that the sanitary welfare of the Borough of Southampton demands the removal of some ancient and dilapidated dwellings, respectfully urges upon the Mayor and Corporation the importance of preserving ancient landmarks of historic interest. It hopes that an ancient vault of the fourteenth century in Simons-street may be carefully preserved, connected as it is with the commercial history of the town and the privileges it enjoyed in olden time."

Mr. A. Wyon exhibited and presented casts of a fifth great Seal of Charles II., and impressions and casts of some modern episcopal seals. Sir J. C. Robinson exhibited a double mazer, mounted in silver-gilt, probably German work of the end of the fifteenth century. Chancellor Ferguson, as Local Secretary for Cumberland, reported the discovery, (1) at Gosford, of a coped tombstone of the "hog-back" type, decorated on one side with knot-work and interlacing ornament, on the other with two groups of warriors; (2) of a cinerary urn at Carlisle; and (3) a mutilated and defaced Roman altar at Baldwinholme, near Carlisle. The Chancellor further reported briefly on the excavations made on the line of the Roman Wall during the past summer. Professor John Ferguson read the first section of a paper on "The Secrets of Alexis," a sixteenth century collection of medical and technical receipts.

ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—At the meeting of this Institution, held at the Westminster Palace Hotel on the 12th inst., the Chairman, Mr. H. Bloomfield Vorley, presiding, a paper on the "Manufacture of High-class Bridge Work" was read by Mr. J. A. Macpherson, of London. He said there were two systems of setting-out practised at the present time:—(1) by wood template; (2) by using the actual plates

and bars as templates from which to mark every corresponding piece. The author showed how the employment of the wood template method might be accepted as producing the best results. The direct system, however, being more expeditious (if the material were to hand) was very beneficial applied in ironwork for the building trades where high finish was not required. Great responsibility rested upon the leading template maker. It was necessary that he should cultivate a system by which hitches might be most effectually avoided during the progress of the work. Fixed trammel gauges were far superior to the common rules for measuring corresponding parts, absolute exactness being highly essential for all intermediate portions. Owing to the variable nature of the metal due to change of temperature, reliable check was required to be taken of all the important measurements by noting the temperature at the time of measuring. I was shown how the necessary camber in a bridge complicated the process of manufacture, and an example was given of a convenient and economical method of producing the correct camber in a web girder. In considering the question of the bearing surfaces the unsatisfactory hearing due to the deflection was partially remedied (apart from introducing expensive knuckle bearers) by making the plane of the bearing surface a mean between the horizontal and the continuation of the camber line. In illustration of the methods of setting out the rivet holes, &c., a 50-ft. single web girder was taken, and all the operations described. The desirability of no two holes coming opposite in small angles, so as not to weaken the section and avoid difficulty of riveting, was pointed out. In referring to lattice constructions, the author showed that theoretically a lattice girder formed a segment of a very large circle, and the true lengths of every member could be readily obtained by mathematical calculation. This method gave far more satisfactory results than the old-fashioned rule of thumb and laborious process of drawing down the girder full size on a floor, and fitting the templates to the lines. Difference of opinion existed as regards the size of rivets and rivet holes, some preferring the rivet to be the size figured on the drawing, and the holes $\frac{1}{8}$ in. larger; others that the holes should be the size figured, and the rivets $\frac{1}{8}$ in. smaller. In the designing of iron and steel work the ultimate erection of the structure should always be borne in mind, the parts being made as far as possible universal and interchangeable to facilitate putting together. Individual knowledge and skill were more essential in the economical production of first-class work than extensive and elaborate plant.

THE PAVIORS' COMPANY.

AT the invitation of the Master, Wardens, and Court of Assistants of the Worshipful Company of Pavors, a large company assembled at the Carpenters' Hall on Tuesday to meet the Lord Mayor and Sheriffs at dinner. Mr. F. Bennett, the Master of the Company, presided, and there were also present the Bishop of Stepney, Lord Rodney, Sir F. Dixon-Hartland, Mr. A. Cock, Q.C., the Dean of St. Paul's, Sir Hugh Owen, Professor Aitchison, A.R.A., Mr. Alexander Graham, F.S.A., Professor Banister Fletcher, and others.

The loyal and patriotic toasts having been honoured,

Sir Hugh Owen proposed, and Mr. Cock, Q.C., responded, to the toast of "Bench and Bar."

The Chairman then proposed "The Lord Mayor and Corporation," the Lord Mayor responding.

The toast of "The Carpenters' Company" was given by Major L. H. Isaacs, who referred to the excellent work which the Company is carrying on in its technical education classes and instruction, and the good uses to which they put their fine hall.

The Master of the Carpenters' Company briefly replied, remarking that the Company spent nearly 5,000*l.* a year in educational work alone.

Mr. D. Burnett, the chief Commoner, proposed the "Paviors' Company," and the Master, in reply, said that the Company was one of considerable antiquity, and according to Stow it dated back to the fifteenth century. After a period of extinction, the Company was resuscitated fifteen or twenty years ago. They were doing all they could to justify their existence, and they had offered prizes recently, and had received some very good essays which had been put to practical results.

Other toasts followed.

Illustrations.

MONUMENT, BRADING CHURCH.

THE Alton tomb lately erected in the Oglander Chapel of Brading Church to the memory of Sir Henry and Lady Oglander was designed by Mr. James C. Powell of the Whitefriars Glass Works, and carried out under his supervision. The tomb is of white alabaster, the slab and base being of slightly coloured alabaster, and stands on a step of black marble. The panels are of Rosso-antico with gilt lettering, and a slab of the same material has been inserted as a background to the mantling of the central panel. The border round the tomb is composed of glass enamel work in blue and gold. The top slab is incised with inscription and arabesque, and inlaid with small pieces of blue and red glass enamel.

The two figures at either end were modelled and carved by Mr. H. A. Pegram; the remainder of the carved work was carried out by Messrs. Earp & Hobbs.

The heraldry and ornament is further enriched by painting and gilding.

There are in the same chapel four old altar tombs to ancestors of the same family.

COMPETITION DESIGN FOR LIVERPOOL MUSEUM EXTENSION.

THIS design, submitted in the recent competition, was understood to have been disqualified on account of overstepping the limits of the site on the Byrom-street frontage. The instructions stated that competitors were at liberty to exercise their discretion as to the building-line towards this and the back street, and this was interpreted in a literal sense, and a "give and take" line adopted; which was, however, still well within the general line of the street. Considerable advantage was thus gained both in internal accommodation and in external treatment, and it is difficult to see what objection can be urged against it.

The existing museum building, being a complete composition, it was felt that the correct treatment was to design a building which should harmonise and group with it, rather than extend it.

The accommodation generally was slightly in excess of the requirements, and every room and corridor was well and efficiently lighted and ventilated. The lecture-hall was so arranged as to be used either independently or in conjunction with the technical school. H. T. H.

HOUSE, SUNDRIDGE PARK, KENT.

THE site of this house is an old orchard, now converted into a picturesque garden, which lies on the outskirts of Bromley, in a position commanding extensive views over wooded country. The materials employed for the exterior are red bricks, with tile-hanging and stone dressings. The roofs are covered with Reading tiles. In addition to the accommodation shown there are six bedrooms, dressing-room, hatroom, &c., on the upper floors, with cellarerage in the basement. The builder was Mr. R. S. Robertson, of Edgware-road, N.W., and the architects Messrs. Gibson & Russell.

THE KYRLE HALL, BIRMINGHAM.

THE Kyrle Hall, in Sheep-street, Birmingham, is the centre of the local Kyrle Society's work. Here, facing the street, are club-rooms for girls, men, and boys, together with committee room, library, and caretaker's dwelling. The centre of the site is occupied by a large hall, capable of seating 600. It has a stage, with adjoining dressing rooms for the free dramatic performances given on Saturday evenings throughout the winter months. In the rear are the workshops of the Birmingham Guild of Handicraft, where printing, bookbinding, and metal work are carried on, specimens of which were to be found in the last Arts and Crafts Exhibition. The buildings were erected in 1893 from the designs of Mr. W. H. Bidlake, at the cost of about 4,000*l.* The builder was Mr. John Bowen.

MASONIC TEMPLE, GREENOCK.—The foundation-stone of the new Masonic Temple at Greenock was laid recently. The building is being erected at the corner of Argyle and West Stewart streets, and it is estimated, will cost 4,000*l.* Messrs. Boston Menzies & Morton are the architects, and Mr. William Steel is the builder.

LONDON AND PROVINCIAL BUILDERS' FOREMEN'S ASSOCIATION:

ANNUAL DINNER.

THE Annual Dinner of this Association was held on Saturday last at the Holborn Restaurant, Mr. E. G. Thompson occupying the chair.

The toast of "The Queen and Royal Family" having been honoured,

The Chairman briefly proposed the toast of the evening, "Success to the London and Provincial Builders' Foremen's Association." He had, he said, carefully studied all the rules and objects of the Association, and he considered that they were worthy of encouragement and support, both from builders' foremen and master builders. A builders' foreman's duties were of an arduous and responsible character, and he had many different interests to consider, and much tact and management were necessary in carrying out his duties.

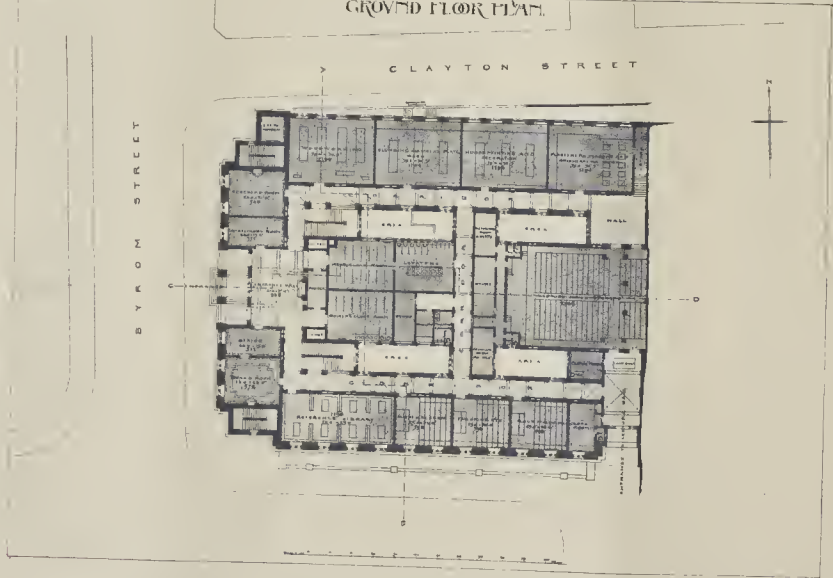

Mr. G. Barclay, the President of the Association, in reply, said that the success of that gathering augured well for the future. The Association was founded in 1894, when the London County Council took the important step of inaugurating its Works Department. It was thought that foremen ought to have a society, especially of a social character, and as soon as the Association was founded, thirty-three foremen joined, while now their

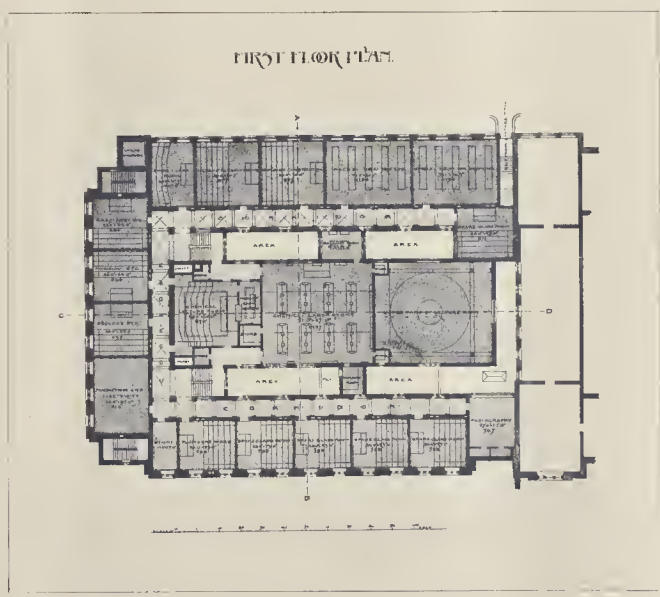

membership was about seventy. Of the thirty-three original members, the names of thirty were still on the books. He had been asked why the Association was started, seeing that another similar society was in existence. It was out of antagonism to that society—and he might add that some of its members belonged to their Association—but was the result of a desire partly to admit to membership foremen who were beyond forty years of age. There were many capable foremen beyond the age limit set by the Builders' Foremen and Clerks of Works Institution and the Association had decided to considerably extend that age limitation. Another reason for establishing the Association was that since many of their members already belonged to some provident society, and it would tax them too severely to ask them to belong to another, it was thought better to encourage foremen to join an association in which the work of a provident society was not attempted. In his opinion there was scope for both associations. His Association made a special appeal to master builders to make use of their employment bureau, and to write to their secretary if in need of a competent foreman. The membership subscription was 1*l.* per annum, and out of that they gave 2*l.* out-of-work foreman 10*s.* for the purpose of advertising for a situation. They had monthly meetings, at which papers were read and discussed

and the Association was, in short, an excellent means of intercourse between foremen. In conclusion, he said he hoped that they would receive support from master builders who could help them by becoming honorary members.

The Chairman then proposed "The Building and Kindred Trades." The building trade, he said, and no doubt the kindred trades, had for some years past suffered from a time of depression, but there were signs of improvement everywhere, and he was glad to say.

Mr. J. M. Wales, Clerk of Works to the London School Board, in reply, referred to the great indebtedness of builders to foremen. Both should work together, he said, for the good of each other. He quite agreed that it was absurd to limit to forty years the age of a candidate for admission to an association like theirs.

Other toasts were "The Chairman," proposed by Mr. Chinery, Vice-President; "The Visitors," proposed by Mr. A. Warren, Secretary, and responded to by Mr. Pultman, of the firm of Messrs. Hobbs, Hart, & Co., and "The Press," proposed by Mr. Young.
