THE twenty-fifth annual general meeting of this Association was held at the offices, 31 and 32, Bedford-street, Strand, London, W.C., on Wednesday, the 10th inst., the President, Mr. Henry Holloway, being in the chair.

The notices concerning the meeting and the following annual report were taken as read, the report being unanimously received and adopted:—

"1. In presenting the twenty-fifth annual report the Council are pleased to be able to state that trade continues to be in a satisfactory condition, and, but for the increasing friction with the workmen, there is every indication of a period of prosperity.

2. The past year has been a time of exceptional disturbance with the workmen. Early in the year notices were received from the various trades demanding an increase in the rates of wages and a code of working rules. A special meeting of the members of the Association, together with other builders, was called to consider these demands, and it was agreed to concede the advance in wages to the principal trades, provided they assented to a satisfactory code of rules. In pursuance of this decision, arrangements were made for meeting each trade separately in conference. The main variations to the 1892 rules insisted upon by the Council were the following:—

(a) The working hours in winter to be altered—the breakfast time being abolished, the hour for commencing work being 8 a.m.;

(b) A rule to put an end to the practice of the trade unions striking against non-union workmen;

(c) The omission of the date (May 1) for the termination of rules.

3. All the trades have practically accepted the foregoing. In dealing with the second item, the Council were successful in establishing the principle of a Conciliation Board, consisting of an equal number of employers and workmen, with power to call in an umpire, for settling disputes arising out of the rules. All the trades have agreed to this with the exception of the Painters' and Labourers'. The Plasterers' Association, after being on strike for over two months, agreed to a modified form of the rule, which, however, has proved to be unsatisfactory.

4. The dispute with the bricklayers on Messrs. J. Mowlem & Co.'s works, at the beginning of last year, terminated at the end of February. The offer of arbitration made by the Council was declined by the Operative Bricklayers' Society, but the strike was afterwards formally withdrawn.

The scarcity of skilled workmen throughout the country is a serious difficulty, and largely accounts for the independent and aggressive attitude of the trade unions towards employers. The Council strongly urge special attention to this matter, and hope that every employer will take immediate action to deal with the difficulty by increasing the number of apprentices and improving in all trades, but especially those of plasterers and bricklayers.

6. The case of Trollope & Co. The London Building Trades' Federation has, the Council are pleased to record, been carried to a successful issue, the plaintiffs succeeding in getting the injunction obtained last year made perpetual.

The Council have under consideration a proposal for putting the Association in a more satisfactory position financially by creating a reserve or contingency fund. The numerous disputes and litigation with the trade unions have caused a considerable increase in the expenditure during the past year, which the Council hope will be readily met by the members of the Association, especially as the Council consider that the result of the proceedings in the case of Trollope's Black List, before

referred to, will be beneficial and of vast importance to the trade.

8. The Council take this opportunity of expressing their obligations to the members of the various committees.

9. The Council would again urge upon the members the importance of inducing those employers, who are not at present members, the desirability of joining this Association.

10. In accordance with the rules, the audited accounts will be presented to the meeting, and it will be necessary to elect two auditors and three members of the Council. The elected members of the Council who retire are Messrs. Joseph Hill, William F. King, and G. J. Lyall, all of whom are eligible for re-election."

The Secretary, Mr. R. S. Ienshaw, having read the accounts for the year 1896, they were adopted. Mr. Geo. Williams and Mr. Horace S. Foster were reappointed auditors, a cordial vote of thanks being accorded to them. Mr. Wm. F. King was re-elected and Mr. W. J. Adamson and Mr. Howell J. Williams were elected members of the Council.

A vote of thanks to the Chairman for presiding terminated the proceedings.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on the 9th inst., the Building Act Committee reported that they had considered the under-mentioned applications under the London Building Act, 1894, and had arrived at the following decisions. Those applications which have been agreed to are granted on certain conditions:—

Lines of Frontages.

Islington, North.—That consent be given to the erection of the flank wall only of an addition to a house on the north side of Dresden-road, Hornsey-lane, to abut upon Ashmount-road, on the further application of Mr. W. E. Sanders, on behalf of Mr. J. Sanders.

Lewisham.—That consent be given to the erection of a house on the south side of Brookdale-road, Catford, to flank upon Schneckburgh-road, on the application of Mr. H. Hopton, on behalf of Mr. J. Laird.

Battersea.—That consent be given to the erection of bay windows to four blocks of residential flats on the south side of Prince of Wales-road, between Rosenau-crescent and Bridge-road, on the application of Mr. J. Halley, on behalf of Mr. J. R. Ward.

Hoddeston South.—That consent be given to the erection of a covered playshed at Millfield-road schools, Clapton, to abut upon Hilson-road, on the application of Mr. T. J. Bailey, on behalf of the School Board for London.

Hammersmith.—That the application of Messrs. Fuller & Co., for an extension of the period within which the rebuilding of the "Red Cow" public-house, No. 157, Hammersmith-road, at the corner of Colet-gardens, was required to be commenced, be granted.

Hampstead.—That consent be given to the erection of a porch in front of "Wychcombe," No. 99, Haverstock-hill, on the application of Mr. R. Groom on behalf of Mr. R. Bellamy.

Hampstead.—That consent be given to the erection of enclosures and an iron and glass addition to the porch in front of No. 11, Arkwright-road, on the further application of Messrs. F. W. Porter & Son on behalf of Mr. E. H. Manning.

Holborn.—That consent be given to the erection of a balcony at the first floor level, in front of the Royal Music Hall, Nos. 242 and 243, High Holborn, St. Giles-in-the-Fields, on the application of Mr. E. Kuntz on behalf of Mr. John Brill.

Kensington, South.—That consent be given to the erection of an oriel window in front of No. 61, Kensington-court, on the application of Mr. W. W. Gwyther, on behalf of Mr. J. Joshua.

St. George, Hannover-square.—That consent be given to the erection of an iron and glass hood in front of No. 179, New Bond-street, on the application of Mr. E. W. Wimperis, on behalf of Messrs. Lafayette.

St. George-in-the-East.—That consent be given to the erection of a wood and iron lookum in front of the Eagle Brewery, Wellclose-square, on the application of Messrs. A. Kinder & Son, on behalf of Messrs. H. Greenfield & Co.

Wandsworth.—That consent be given to the erection of an iron and glass covered way in front of Wandsworth Town Hall, High-street, on the further application of Mr. G. Patrick, on behalf of the Wandsworth Vestry.

Dulwich.—That consent he not given to the erection of three houses with one-story shops and an arched entrance, on the north side of Park-road between No. 77, and Gorleston Villas, on the application of Mr. J. Bartlett.

Dulwich.—That consent be not given to the erection of a building on the west side of Peckham Rye, on the north side of No. 138, at the corner of East Dulwich-road, and the erection of a house in that road adjacent to and eastward of No. 3, on the

application of Mr. A. Keen on behalf of Miss E. Chamberlin.

Hampstead.—That consent be not given to the erection of six one-story shops on the north-west side of Belsize-road, upon part of the grounds of Nos. 2 and 4, St. George's-road, on the application of Mr. J. Mackland on behalf of Captain Bagot, M.P.

Lewisham.—That consent be not given to the erection of a building with one-story shop next No. 504, Brockley-road, at the corner of Comerford-road, on the application of Mr. J. Weuster on behalf of Mr. J. Chappell.

Paddington, South.—That consent be not given to the erection of an iron and glass covered way in front of No. 1, Southwick-street, Hyde Park-square, on the application of Messrs. R. Hogg & Son.

Width of Way.

Hammersmith.—That consent be given to the erection of three houses with bay windows, on the west side of Ceylon-road, Blythe-road, with the forecourt boundary of such houses at less than the prescribed distance from the centre of the road, on the application of Mr. W. J. Burns.

Holborn.—That consent he not given to the construction and erection of a wood and iron room, for cleaning carpets, adjoining a warehouse on the west side of Newton-street, High Holborn, St. Giles-in-the-Fields, on the application of Messrs. Simmonds Bros., Limited.

Width of Way and Space at Rear.

Finsbury, Central.—That the Council, in the exercise of its powers under Sections 13 and 41 of the London Building Act, 1894, do not consent to nor permit the erection of four blocks of dwellings adapted to be inhabited by persons of the working class, with shops on the ground floor, on plots A, B, C, and D of the Council's land in Rosebery-avenue, Clerkenwell, with portions of the buildings at less than the prescribed distance from the centre of Jolley's-yard and Garnault-mews, and exceeding in height the width of those streets respectively, and also with irregular open spaces at the rear of the new buildings, on the application of Messrs. Goren & Tapp, on behalf of Mr. H. Rofey.

Open Space at Rear and Projections from Buildings.

Hampstead.—That the Council, in the exercise of its powers under Section 73 of the London Building Act, 1894, do not consent to the erection of a block of residential flats on the west side of Langland-gardens, at the corner of Finchley-road, with an enclosed porch, projecting balconies, turret and four-story bay windows; and that the Council, acting under Section 41 of the Act, do not allow a modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of the said block of flats with an open space at the rear, on the application of Messrs. Boehmer & Gibbs on behalf of Mr. E. A. Cave.

Open Spaces about Buildings.

Norwood.—That the Council do, in the exercise of its powers under Section 41 (1) (b) of the London Building Act, 1894, allow a modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of a dwelling house on the north side of Harpenden-street, Norwood-road, at the corner of a passage leading to a timber yard, with an irregular space at the rear of the new house, on the application of Mr. H. Bignold on behalf of Mr. T. Crabb.

Southwark, West.—That the Council do not permit the erection of a stable, with loft and two living rooms over, and of a harness room and one-story stable at the rear of Nos. 15, 17, and 19, Gray-street, Blackfriars, without an open space at the rear of each of the new buildings, on the application of Mr. H. Smith on behalf of Mr. C. King.

Line of Fronts and Width of Way.

Strand.—That consent be given to the erection of buildings on the site of Nos. 13, 14, and 15, Broad-court, and Nos. 19 and 20, Bow-street, St. Martin-in-the-Fields, on the application of Mr. R. S. Wornum, on behalf of the Duke of Bedford.

Strand.—That consent be given to the erection of an enclosed iron footbridge across Northumberland-street, Strand, to connect the Grand Hotel with No. 1, Northumberland-street, St. Martin-in-the-Fields, on the application of Mr. W. Woodward, on behalf of the Gordon Hotels, Limited.

Lewisham.—That consent be not given to the erection of one-story shops upon part of the forecourts of Nos. 29, 31, 33, 35, 37, and 39, Ladywell-road, on the application of Mr. G. Kimble, on behalf of Mrs. F. Kimble.

Peckham.—That consent be not given to the erection of nine houses with projecting bay windows on the west side of Lower-park-road, and also of eight houses with similar bays on the south side of Commercial-road, on the site Nos. 72, 74, 76, 78, 80, 82, 84, 86, 88, and 90, Lower-park-road, on the application of Messrs. Benison and Bargman, on behalf of Mr. Pennack.

Width of Way and Cubical Extent.

Marylebone, East.—That consent be not given to the erection of an iron and glass roof over a por-

tion of Duke's-mews, Lisson-grove, on the further application of Messrs. Wilson & Long on behalf of Messrs. Spencer, Turner, & Boldero.

Formation of Streets.

Lewisham.—That an order be sealed and issued to Mr. H. H. Fuller, sanctioning the formation or laying out for carriage traffic of a street, 30 ft. wide, to lead from Honor Oak-road to Devonshire-road on the Oakfield estate, Forest Hill, on his further application to the Council.

Strand.—That an order be sealed and issued to Mr. C. Stanley Peach, sanctioning the formation or laying-out of a passage-way 10 ft. wide, for foot traffic, to lead from Carnaby-street into Marlborough-row, St. James's, and the erection of an addition to the central electric lighting station on the north side of such passage-way, to abut also upon Carnaby-street and Marlborough-row, on his application to the Council on behalf of the St. James's and Pall-mall Electric Light Company, Limited.

Hampstead.—That an order be sealed and issued to Mr. W. E. Sanders, sanctioning the formation or laying out of a street, 42 ft. wide, for carriage traffic, to lead out of Haverstock-hill into Lawn-road, on his further application to the Council on behalf of Mr. J. Sanders. That the name Downside-crescent be approved for the new street.

Dulwich.—That an order be sealed and issued to Mr. W. Hancock, refusing to sanction the formation or laying out of a street, 40 ft. wide, for carriage traffic, to lead from the east side of Denmark-hill into Daneville-road, Camberwell, and also the formation or laying out of a spur street, 90 ft. long and 30 ft. wide, to lead out of such new street, on his application to the Council on behalf of the Oriental Palace of Varieties Company, Limited.

Height of Buildings.

City of London.—That consent be given to the erection of a building on the south side of Tallis-street, at the corner of Carmelite-street, to exceed in height the width of each of those streets, on the further application of Messrs. Robertson & Ellis, on behalf of Messrs. Harmsworth Brothers, Limited.

Cubical Extent.

Battersea.—That consent be not given to the erection at the London Road Car Company's premises, Wellington-street, to abut upon the river Thames, of a forage-preparing granary, with openings in the party walls to connect it with a bay store on the west side, and a covered yard on the east and south sides, communicating with other premises in the same occupation, together exceeding in extent 450,000 cubic feet, on the application of Mr. P. Dollar, on behalf of the said company.

Buildings for the Supply of Electricity.

Strand.—That the Council do approve of the plans, dated January 28, 1897, submitted with the application of Mr. C. Stanley Peach, on behalf of the St. James and Pall Mall Electric Light Company (Limited), for the construction of an addition on the south side of their central generating station and works in Carnaby-street, Regent-street, St. James's.

*Recommendations marked * are contrary to the views of the Local Authorities.*

Correspondence.

To the Editor of THE BUILDER.

LONDON WATER SUPPLY AND THE REMOVAL OF THREE-GALLON FLUSHING TANKS.

SIR,—I am in perfect sympathy with the efforts of your correspondents, Messrs. Carter, Tidman, Lawford, and Ilubert, whose letter upon this matter appears in your issue of last week. It would be had enough if the Companies were insisting that in future the maximum shall be a two-gallon flush, but to put persons to the expense and inconvenience of removing all three-gallon flushing cisterns is grotesquely ridiculous, to say nothing of the unfairness of the proceeding; and, as your correspondents point out, it is high time that this and other such arbitrary powers of the Water Companies should not be tolerated longer than is absolutely necessary.

This extraordinary arbitrariness on the part of the London Companies is certainly another nail in their coffin, and I trust it will awaken so much distrust in sanitarians as will lead to such discontent on the part of the general body of consumers as will bring about the change so much desired by all classes of people who have the health and welfare of the people at heart, viz., the placing of the water supply in the hands of the consumers themselves.

I believe there are very few persons who have experimented with the two-gallon flush under conditions as commonly existing—and which conditions it is often physically impossible to alter—who would say that a two-gallon flush is sufficient. I am aware that experiments have

been made, and I have heard them described, to prove that a two-gallon flush is sufficient; but these experiments have been, in fact, only theoretical in nature, and although they may be interesting, particularly to the experimenters, in practice they are valueless. What we have to contend with is a set of conditions as they exist in practice, and there are a number of observant men who are daily in contact with conditions as they are usually met with, and they are practically unanimous in advocating a three-gallon flush, and such testimony as theirs should be accepted as it is given, solely in the interest of the community at large, and without fee or award of any kind.

My own impression is that the companies will gain little, if anything, by their uncalled for action, as oftentimes the water closets will be flushed two or three times in order to effectually remove all the soil from the trap. The advice to all users of water closets until the companies give way should be "Flush before and after using," and these directions should be printed on a card and hung up in every water closet.

It is surely high time that the public, not only of the Metropolis, but of other towns and districts supplied by private companies, should arise to the necessity of getting the water works in their own hands, and thus prevent undue monopoly of nature's gift to man.

I have known water companies' inspectors carefully measure flushing tanks after they have been fixed, with standard measures, and condemn the tanks on account of their holding a little more than two gallons. Such behaviour as this is extraordinary, and I am sure it cannot be suffered much longer. I would suggest memorialising the Local Government Board, or even Parliament, upon this important matter, and I should be pleased to undertake to get the signatures of practical men in this district.

T. J. MOSS FLOWER,
Assoc. Mem. Inst. C. E.

Bristol, February 16.

THE A.A. "DISCOVERY" OF A THIRTEENTH CENTURY ARCHITECT.

SIR,—In your last issue you reproduced a thirteenth century drawing of King Oifa and his Architect, exhibited by Mr. A. S. Flower in reading his interesting paper at the A.A. on the 5th inst. According to your report of the discussion which followed, the President said, "The portrait of the medieval architect that he (Mr. Flower) had discovered . . . would no doubt mark that meeting as historic. They might think that he was unduly exaggerating the importance of this discovery, but he believed that the point would receive, through the publicity it would gain in the press, the attention it deserved." And Mr. W. H. Seth-Smith said, "The illustration . . . would mark an epoch in the information which they had on the subject."

But they had forgotten their Violet-le-Duc. The first volume of the *Dictionnaire*, published in 1858, contains (p. 115) a reproduction of the figures of King and Architect from the same drawing.

JOHN BILSON.

** Two other correspondents write that the illustration is given in Green's "History of the English People," and in Gardiner's "Students' History of England."—Ed.

PAVILION COMPETITION, WESTON-SUPER-MARE.

SIR,—Doubtless many of the competitors in the above competition—the drawings for which were sent in on December 21 of last year—were anxiously awaiting some information, and, although nothing has appeared in the professional papers, nor has any intimation been sent to any of the competitors, I am in a position to state what has transpired up to the present.

Under the terms of the competition, a professional assessor would be appointed to select three schemes to the authors of which would be awarded the respective premiums of 50*l.*, 20*l.*, and 10*l.*, and the Council "absolutely reserve to themselves (I am quoting from their advertisement) the right to carry out such one of the three premiated designs as they may consider best adapted to the requirements of the town, and the architect thereof will be appointed architect of the works if carried out at an inclusive remuneration of 5 per cent. to cover all charges and expenses."

Mr. Alexander Graham, of London, was appointed assessor, and he has placed the designs "Promenade," "Stability," and "Straight," and these designs are now being publicly exhibited in premises adjoining the market.

From the local press and other sources I gather that there is a strong feeling against carrying out any of the three premiated designs, and it is commonly reported that some of the rejected designs

find much favour with many members of the Council, one in particular. Will this be found to be by a local man?

This my plain unvarnished tale, which will doubtless serve to arouse to some course of action the authors of the three designs selected by Mr. Graham. Personally I am absolutely ignorant of the identity of any of these gentlemen, and only write in the interest of fair-play and justice. Unless this farce of competition is not to become more corrupt than it already is, something must be done. Who is to lead us? the profession certainly expects the Institute, which, whatever its faults, is the recognised mouthpiece of the majority of the profession.

"NON SIBI."

RISKS OF ADVERTISERS.

SIR,—In the *Builder* of January 9 appeared the following advertisement:—"Architect's junior assistant required in City office. Only those with some artistic taste need apply, stating terms and previous experience, to P. H., 26, Royal Exchange, E.C."

I applied by letter, also sending several drawings upon which I had expended much time. I asked for the return of the drawings, and enclosed stamps for the purpose. A month has now elapsed, and my drawings have not yet been returned, nor any reply received, although I have again written.

Inquiries have been made at the address given, which we found to be the City Advertising Company, and the clerk there said he did not know the address of the advertiser.

Although I fear my drawings are lost to me, still the warning may put other assistants on their guard, and induce them not to reply, or at least not to send drawings of any value, or stamps, to the unknown.

"SOLD."

BRISTOL ARCHITECTURE.

SIR,—I notice in your article on Bristol Architecture that the design of the Dock offices, Queen's square, is attributed to Mr. Drake. The building was designed by me.

Bristol, February 13.

** We much regret the mistake.—Ed.

The Student's Column.

SPECIFICATIONS.—VIII.] JOINER.

UN this case, as with the carpenter, the precise determination of the quality of wood required is the first consideration, and the student will, of course, bear in mind that it does not necessarily follow that the deals and fir timber from the same port are of equal quality or equally suitable for the different work of the carpenter and the joiner. Thus, whilst crown Memel may be taken as representing the highest quality of fir timber for carpentry work, Omega and Archangel deals are about the best suited for joinery.

Materials.—The deals to be of (approved) quality yellow or red deals, from (Russian) ports, but for panels only of internal doors and framing, American red or yellow pine of approved quality may be used. (This is, of course, a matter for the architect's discretion. If there is no objection to American wood, it should be thus stated in the specification.) All deal and pine to be perfectly sound and well seasoned, cut out perfectly free from sapwood, large, loose, or decayed knots and other defects.

The fir for casement and door frames and other joiner's work to be cut out of (approved) quality red or yellow fir of bright colour and straight grain, and free from knots.

(If the work is practically entirely in deal, the oak for sills and the small amount of other hard wood required, as mahogany for water-closet seats, can have their quality stipulated under this section, but if there is a considerable amount and it is as well to make a separate heading, and write the description of all work in that wood together.)

The oak for sills and thresholds to be sound, well grown, and properly seasoned oak of English growth.

Workmanship.—All joiners' work to be wrought and finished according to the detail drawings, with a clean, even, and smooth surface from the plane, and no sand paper to be used.

The dimensions and thicknesses of joiners' work, figured on the drawings or described in this specification, are the original ones out of which the joinery is prepared, and not the finished thicknesses after planing and cleaning down. (This being the usual practice of joiners, it is as well to adhere to it and save confusion. It is often specified that the sizes are to be finished sizes when fixed; but bearing in mind the way in which joinery is prepared, legitimately, from deals, it is really irrational to expect that finished

sizes shall be exact in inches. The finished thicknesses should be stated in sixteenths of an inch, as a "1 1/16 inch door," and so on.)

All glued joints to be feather-tongued, and the glue to be a mixture of equal parts Scotch and French glue, used fresh. External work to be put together in white lead.

The joiners' work is to be put together without wedging, and placed in a hot-stove room for at least one month before finishing, and any which may split, shrink, part in the joints, or show flaws or other defects, is to be removed and replaced with new material.

The floors, after being laid, are to be protected with a thick covering of dry sawdust until completion, and treads of stairs to be protected with rough cover boards.

Floors.—The floors of frame to be laid with 1 1/2 in. yellow deal flooring in half batten widths, grooved and tongued with rebated heading joints, and mitred borders to hearths. These floors to be secret nailed.

The floors of to be laid with inch yellow batten flooring, ploughed and tongued with hoop iron, with splayed heading joints, and mitred borders to slabs.

The floors of to be laid with inch yellow deal straight joint flooring, with splayed heading joints, and to be covered with inch parquet flooring, to be supplied and laid by Messrs. at p.c. price of per yard super (or quote the amount in lump sum) to be paid to Messrs. by the contractor within one month after presentation of the architect's certificate.

The floor of to be laid with mill-traversed yellow deal boarding, inch thick, laid straight joint, with butted heading joints.

Skirtings.—All skirtings to be tongued to floors, and to have tongued and mitred angles.

Put to 1 1/2 in. double faced and fully moulded skirtings, 15 in. high, on splayed grounds and backings.

The skirtings in to be 1 1/2 in. moulded skirting, 9 in. high.

The skirtings in to be 1 in. by 7 in. square skirting.

Put 2 in. by 2 in. rounded fillet as skirting to floor of kitchen.

Windows.—The windows numbered on plans to have deal cased frames, oak sunk, weathered, and cheek-throated sills, and 2 in. double hung ovolo moulded sashes with sash bars 1 1/2 in. wide. Deal cased frames to have 1 1/2 in. pulley stiles, and 1 in. inside and outside linings, and 3/4 in. back linings, all tongued together, and the parting beads tongued to frame. All oak sills to be grooved on underside, and to have 1 1/2 in. by 3/4 in. galvanised iron water bar bedded in whitelead, and let into groove in stone sill (or brick). Sashes to be double hung with brass lashed axle pulleys, braided cotton lines, and iron weights. All double hung sashes to have strong knife-proof brass sash-fasteners, each lower sash to have a pair of brass sash-lifts, p.c. each, and each upper sash to have a pair of brass sash-pulls, p.c. each. All double hung sashes to have moulded horns, and in place of usual bottom bead a beaded sill piece 4 1/2 in. by 1 in.

The windows numbered on plans to have double hung sashes as above described, but with 6 in. by 3 in. rebated, weathered, and throated transome, and 2 in. fanlight above same to match sashes in detail, and to be hung at bottom with a pair of 3 in. brass butts. These fanlights to be rebated on bottom rail, and to have externally a moulded and throated weather fillet out of 2 1/2 in. by 2 1/2 in. tongued on to rail. Fit the fanlights with wrought-iron quadrant stay-bar, with lines and pulleys to open and close fanlight from floor. (In every case the student may be advised to fix a p.c. price for each item of ironmongery, and to select his ironmongery at that price. But let it be quite clear, as enforced in an earlier chapter, what p.c. means, as ironmongery is pre-eminently a discount trade.)

The windows numbered on plans to have 4 1/2 in. by 4 in. rebated and twice moulded casement frames, with 6 in. by 3 1/2 in. oak, rebated, sunk weathered and throated sills, and to have 2 in. ovolo moulded sashes with sash-bars 1 1/2 in. wide. These casements to be hung with a pair of 4 in. brass butts to open outwards, and to have 12 in. brass casement stay-bars with stout plates and strong brass cockscrew fastening (p.c.).

The windows numbered on plans to have similar frames and casements, but these are to be fixed.

The windows numbered on plans to have 4 1/2 in. by 4 in. fir rebated, chamfered, and moulded frames, with 6 in. by 3 1/2 in. oak, rebated, sunk, weathered and throated sills, and to be fitted

with 2 in. ovolo moulded sashes, the lower part fixed and the upper hung on butts as fanlight, in a similar manner to those windows numbered

The bull's-eye windows numbered on plans to have 4 1/2 in. by 4 in. fir rebated, chamfered and moulded frame, put together in two thicknesses and keyed with oak hammer-headed keys, and to be hung with 2 in. ovolo moulded casements on brass sash centres and fitted with white cotton cords in one length and brass screw-eyes in sash to open and close same, and brass cleat to fix same (quote p.c.).

Linings to Windows.—All linings to be tongued to frames, and with tongued and mitred angles. The windows numbered on plans to have 1 1/2 in. frame, moulded, and panelled linings and soffits, on deal dovetailed backings. The architrave moulding around to be out of 4 1/2 in. by 1 1/2 in. wide. The window board to splayed grounds to be 1 1/2 in. rounded with moulding out of 3 1/2 in. by 1 1/2 in. below same. These windows to have 1 1/2 in. moulded, panelled window backs and elbows.

The windows numbered on plans to have 1 1/2 in. plain jamb linings and soffits, ovolo moulded on edge, 5 1/2 in. by 1 1/2 in. moulded architraves on 1 in. splayed grounds, and 1 1/2 in. rounded window boards. No window backs to these windows.

The windows numbered on plans to have no window linings or architraves, the plaster being continued over jambs, but they are to have 1 in. rounded windows with returned nosings.

(N.B.—If the linings correspond exactly with the classes of windows, it is well to let the description of linings follow immediately that of the windows to which they apply, but if as would usually happen where there is a considerable variety of windows as indicated in the descriptions given above, it would probably happen that one class of linings would apply to more than one kind of window. In this case it is better to specify all the window-linings together after the model given above.)

Doors.—All door frames on stone thresholds to be doweled with 1 in. wrought iron dowels, 3 in. long.

The doors numbered on plans to be 2 1/2 in. folding doors, each leaf four panelled, the top and bottom panels to have raised panels, and all to be moulded both sides. The frame to be 4 1/2 in. by 4 in., rebated, chamfered, and moulded, and the doors to be hung thereto with one and a half pairs of 9 in. wrought iron butts to each leaf. Put a pair of 9 in. wrought-iron barrel-bolts and street-door latch, p.c. 25s. to these doors, and a pair of bronzed iron door-knobs, p.c. 10s. each. These doors to have 6 in. by 2 1/2 in. architrave moulding, splayed at back for plaster. The pedimented over-door to be out of 2 in. stuff with moulded scrolls as shown on detailed drawing.

The doors numbered on plans to be similar, but the frame to have twice rebated and twice moulded transome 4 1/2 in. by 4 in. and 2 in. ovolo moulded fixed fanlight over. Put to these doors 8 in. rebated mortice-locks with brass furniture hot sides and two keys. These doors to have 4 1/2 in. by 2 in. splayed architrave moulding both sides.

The doors numbered on plans to be framed, ledged, and braced with 1 1/2 in. framing covered with 1 in. V-jointed boarding in half batten widths, and hung with a pair of 4 in. wrought-iron butts to 4 1/2 in. by 4 in. rebated and chamfered frames, and to be fitted with 7 in. rounded rim dead lock and a pair of 9 in. wrought-iron barrel bolts.

The doors numbered on plans to be 2 in. five-panel doors, moulded both sides, hung with a pair of 4 in. wrought iron butts to 1 1/2 in. rebated and beaded jamb linings with architrave mouldings out of 4 1/2 in. by 2 in. These doors to be fitted with 6 in. 2-bolt lever mortice locks, with brass furniture both sides.

GENERAL BUILDING NEWS.

SOUTH HACKNEY SYNAGOGUE AND CLASS-ROOMS.—The foundation stone of the South Hackney Synagogue and class-rooms was laid by the Hon. Walter Rothschild, Chairman of the Building Committee, on Sunday, the 14th inst. The new buildings will comprise a lower ground floor, containing nine class-rooms and an assembly hall, with lavatory and cloak-room accommodation for boys and girls. This floor will be fitted with sliding partitions, which, when put aside, will convert the entire floor into a great hall for prize distributions and overflow services. The upper ground floor will be the main floor of the Synagogue, and will contain accommodation for 340 men. The whole of the seats will be placed crossways, and

the ark, pulpit, and reading platform will be grouped together at the eastern end of the building. There will also be on this level lavatory accommodation for gentlemen and a robing-room for the ministers. Two self-enclosed staircases will lead direct from the street to the gallery, which will contain sittings for 210 women, and two sets of cloak-rooms. The total cost, including the freehold site, will be 7,350l. The contractors for the whole of the work are Messrs Brown, Son, & Blomfield, and the architect is Mr. Delissa Joseph.

NEW BUILDINGS IN BIRMINGHAM.—The following is the Building Surveyor's return of new buildings erected in Birmingham, for which plans were approved by the City Surveyor, during 1895:— Houses and shops, 1,852; business premises, 354; warehouses and shopping, 247; miscellaneous, 314; alterations and additions, 324; churches, 2; chapels, 2; schools, 2. The plans submitted for approval numbered 1,017, as compared with 797 in 1895, an increase of 220. The churches are both temporary iron structures, one being situated in City-road, and the other in Cherrywood-road. The chapels, two in number, are a Baptist chapel, in Crabtree-road, and a temporary chapel, in Elkington-street. The schools are St. Martin's (Church of England), Dean-street, and Wesleyan Schools, in Benacre-street. The principal items among the miscellaneous are the rebuilding of the Gaiety Palace, Coleshill-street; a new police station, at Harborne; branch district post office, Five Ways; extension of Central Fire Station, Upper Priory; water-gas works, at Salfley and Windsor-street; extension of the Deaf and Dumb Institute, Edgbaston; reconstruction of the old Inland Revenue Offices, Waterloo-street; mission-room and institute, Freetb-street; mission-room, Garrison-lane; mission-room and Sunday School, Belmont-row. The alterations and additions include:—Alteration and extension of Unitarian Chapel, Newhall-hill; extension of schools, All Saints' Church, Hoxley; enlargement of Free Library, Aston-road; additions to Board Schools in Highfield-road, Salfley, Hutot-street, Goodrick-street, and Icknield-street; also to St. Matthias's Church School, Wheeler street, and to schools in South-street, Harborne, and Tennant-street. Amongst the business premises are:—New premises for the National Telephone Company, Newhall-street and Edmund-street; Messrs. Newbury's, Old-square; A. R. Dean, Corporation-street; rebuilding "Hen and Chickens," New-street; residential premises, Cornwall-street and Newhall-street. During the year 773 notices have been served on property-owners and others as to dangerous buildings, projecting signs, &c. Six hundred and forty-nine square yards of land have been given up to the Corporation by owners of property setting back shop-fronts, hay windows, and other projections. Under the Factory and Workshops Acts 142 factories have been inspected, seventeen of which have been altered, and twenty-three others are now being altered in accordance with the requirements. The year generally has been a very busy one with the building and kindred trades in the city, and has been chiefly notable for the number of new warehouses and factories that have been erected, and for the many large alterations and extensions of existing factories that have been made. This has been especially marked in the cycle trades.

BOARD SCHOOLS, BILTON, HARROGATE.—These schools have been erected at New Park on a site containing 4,840 sq. yds., with a frontage to Skipton-road of 188 ft. The buildings give accommodation for 510 mixed children, and consist of central hall, with classrooms, infants' room, and cookery room grouped around; cloak rooms, teachers' rooms, heating apparatus chamber, and spare cellar in the basement. In the play-yards are play-sheds and the necessary latrines. The central hall will seat (after allowing space for platform, &c.) 300 adults on the occasion of a concert, public meeting, &c. The stone used in the buildings has been obtained from the local quarries. Welsh slates and Staffordshire ridge tiling is used on the roof. The floor of central hall is of pitch pine, laid solid on a concrete bed. An ornamental glazed brick dado surrounds the whole of the rooms on ground floor, with the exception of teachers' rooms. The contracts for the whole of the works (including master's house) amounted to about 6,000l., and have been carried out by the following contractors:—Mr. H. Abbott, mason, Harrogate; Mr. G. H. Carrick, carpenter and joiner, Harrogate; Mr. J. Shepherd, slater, Harrogate; Messrs. Laycock, Bros., plasterers, Harrogate; R. & C. Barran, plumbers, Leeds; Mr. S. M. Parlane, cementer, Leeds; and Messrs. Homan & Rodgers, concreters, Manchester; Mr. Hutton, painter, Shipley; Messrs. J. King, Ltd., heating engineers, Liverpool. Messrs. Illingworth, Ingham, & Co., of Leeds, have supplied the school furniture. Mr. George Fletcher is clerk of works; and Mr. George Bland of Harrogate, is the architect.

BOARD SCHOOL, LOW FELL, DURHAM.—A new school, erected by the Gateshead School Board, at Kell's-line, Low Fell, was opened on the 25th ult. The new school has been built from the designs of Messrs. Oliver & Leeson, of Newcastle, and provides accommodation for 380 children. It is designed on the class-room and central hall principle. Each of the two floors has six class-rooms, in addition to the usual teachers' rooms, cloakrooms, &c. The school is so planned that it may be worked either a

a separate boys' school and separate girls' school, or on the "mixed" principle. Each room is lighted from the two sides. Warmth is provided by means of hot-water pipes, and, in addition, there is a fireplace in each class-room. The school is built of Pelaw bricks, with stone dressings. The whole of the work has been carried out by Mr. Joseph Elliott, of North Shields. Mr. W. Edington having been the clerk of the works. The central hall of the school is 85 ft. by 30 ft. On the second floor are a gymnasium 86 ft. by 30 ft., a cookery class-room 38 ft. by 25 ft., a large scullery, pantry, and larder, and cloakroom. A room, 25 ft. 6 in. by 64 ft., is provided for the purpose of manual instruction, together with two store-rooms. Two fireproof staircases are carried up as ventilating towers with ventilating turrets over them, to which exhaust flues are led from the various rooms. There are covered playsheds for the children. The slating was done by Mr. Wylie, of South Shields. Messrs. Dinning & Cooke supplied the heating apparatus, and the lavatories and sanitary fittings generally were supplied by Messrs. Twyford & Co.

NEW BUILDINGS, QUEEN'S COLLEGE, BELFAST.—The Lord Lieutenant of Ireland, Lord Cadogan, has just opened the Students' Union and the Pathological and Physiological Laboratories at Queen's College, Belfast. The principal elevations of the Union Buildings face University-square. A broad flight of stone steps leads to the principal entrance on the ground floor. Advantage is taken of the sloping nature of the ground to obtain a basement floor, which contains apartments for caretaker, kitchen, offices, and heating chambers. These are separated from the students' quarters, which contain a two-table billiard-room, 40 ft. by 30 ft., with bay-window recesses and wall seats. Adjacent are the apartments containing the lavatories, baths, and students' lockers. These rooms are separated from the kitchen and offices by a vestibule or under hall, 40 ft. by 70 ft., which gives accommodation for the storage of bicycles. The principal apartment is called the "M'Mordie Hall," and will be used for public meetings for the various societies in connexion with the college. It will also be available as a reading-room. The hall measures 40 ft. by 30 ft., and contains accommodation for about 400 people on the floor and gallery. The gallery runs round three sides of the hall on the upper floor, and is reached by the grand staircase. The hall is lighted at each end by large five-light traceried windows, and at the side by the large recessed bay window. The grand staircase is approached by the porch and vestibule. It is of polished oak, on a foundation of granolithic concrete. The dining-room is 30 ft. by 24 ft., is reached from the hall, and is over the kitchen, from which it is served by lifts. There are pantries and stores adjoining this department, also served by lifts from below. The upper floor contains smoking-room, 30 ft. by 24 ft., approached from the grand staircase. A class-room leads off the vestibule of the grand stairs. The committee-room is approached from the grand stairs. The building is of brickwork, picked Annadale bricks being used for facing, and Giffnock sandstone for all quoins, window and door jambs, &c. The large windows of the M'Mordie Hall and the lower staircase are filled with ornamental quarry glazing in lead, of colours to harmonise with the internal decorations, and are hierarchically emblazoned, showing the arms of the college, of Belfast, of Ulster, of Ireland, and the United Kingdom. The contract for the Union Buildings was entrusted to Messrs. R. & J. Thompson, of Belfast. The architect is Mr. Robert Cochrane, of Dublin. The gas-fittings have been done by Messrs. Richard Patterson & Co., and the heating by Messrs. Boyd, Paisley. The pathological and physiological laboratories were also opened by the Lord-Lieutenant. The external brickwork of the building is the manufacture of the Annadale Brick and Tile Company, Belfast. The contractors for the buildings were Messrs. Fitzpatrick Brothers, Limited, of Belfast; and the heating was done by Messrs. Musgrave. The whole was designed and carried out under the supervision of the architect, Mr. Robert Cochrane, Dublin.

THEATRE, FEBRUARY, DURHAM.—The new theatre which has been erected by Messrs. John Rowell & Co. at Ribblesdale Quay was opened on the 1st inst. Mr. Simpson was the architect, and Mr. Pringle the contractor. The theatre seats about 1,500.

BUILDING ACTIVITY, SHEFFIELD.—The Sheffield City Surveyor, in a report on the work of the Building Department during 1896, makes the following statements:—This has been without exception the busiest year since the Building By-Laws were first adopted by the Corporation in 1864. The number of plans submitted has risen from 329 in 1888 to 1,230 during the past year, or almost four times as many as those submitted in the former year, and is also an increase of 238 upon the high figures of 1895. The number of houses certified during the year was 1,059, as compared with 523 in 1895. The number of houses erected, but not certified, on account of the absence of metal gullies, specified on the approved plan, is now reduced from 476 in 1895 to 124 in 1896; the total number of houses erected 1,183, being an increase of 184 on 1895, and the largest number of houses erected in any one year since 1880, and only exceeded on three

occasions since 1864, viz., 1—1866, when 1,187 houses were erected; 1876, 1,448; and 1880, 1,220. The numbers of other buildings of every description erected during the year is 305, as compared with 253 in 1895. These figures have only been exceeded once since 1888, viz., in 1892, when 340 buildings were erected. The number of houses completed, but not certified, has increased from 156 at the end of 1893, to 1,052, and these figures will be increased but slightly since the non-enforcement of cast-iron gullies. Since building by-laws were first adopted by the Corporation in 1864, there have been 27,230 houses certified as fit for human habitation, and, in addition, during the last four years, 1,052 houses have been erected and not certified, making a total of 28,332. Although, generally, the class of buildings has much improved during the past year, it has been found necessary in four cases to take proceedings, all of which were successful, the penalties imposed by the magistrates amounting to 207. 15s. 6d., and in addition costs in two of the cases.

PUBLIC CONVENIENCES, HYDE PARK CORNER.—These conveniences have been erected by the Vestry of the Parish of St. George, Hanover-square, in Hyde Park at Hyde Park Corner, opposite St. George's Hospital. Provision is made for separate conveniences for men and women. The men's department is underground, and is built of brick-work faced inside with white glazed bricks. It is surrounded above the ground level by a parapet wall faced with Bath stone in coursed ashlar, finished with a moulded cornice of brown Portland stone. It has two entrances, one from Knightsbridge and one from the park, each staircase is 5 ft. in width and provided with brass hand-rails, and fitted with Bostwick's patent collapsible iron trellis gates. The entrance from the park is lined with "ceratite" or glass-faced bricks. The following accommodation is provided, viz.:—Twelve water-closets, thirty-two urinals, one large lavatory with six wash-basins, and an attendant's room situated in the centre of the building. The water-closets are of the pedestal pattern, fitted with mahogany seats and three-gallon waste-preventing cisterns. The urinals are semi-circular fire-ally backs in enamel, with polished St. Anne's marble divisions. The lavatory is lined inside with "ceratite," and is provided with six tip-up basins and receivers. The women's department is built entirely above ground. It is a structure of Grecian design, and is built of brickwork, faced on the outside with Bath stone in coursed ashlar; the columns, pilasters, cornices, and other dressings being of brown Portland stone. The roof is covered with lead, and has a central copper-covered dome forming an octagonal lantern inside, having sashes, gables, and ornamental lead lights. The whole of the woodwork (with the exception of that in the entrance hall and waiting-room, which is polished American walnut) is selected pitch pine, stained and varnished. The building consists of a central hall, or waiting-room, with projecting wings, and contains the following accommodation, viz.:—twelve water-closets, a lavatory with four wash-basins, and an attendant's room; the fittings in this department are similar in all respects to those in the men's department. The water-closets and lavatory are arranged in corridors on the north, south, and east sides of the waiting-room from which each corridor has a separate entrance. The corridors are warmed by hot water radiators supplied from a boiler in the basement, which also supplies hot water to the lavatory basins. The entrance, which has a covered portico with fluted Grecian columns, is in the park, but has an approach from Knightsbridge. A private entrance and lobby is also provided in the park at the north-east angle of the building, to obviate the necessity of the officer entering the main building to collect the money. The floors in each department are laid with "terrazza," and with borders, &c. in Roman mosaic. Both departments are fitted throughout with the electric light. The doors of all the water-closets are fitted with Maskelyne's patent automatic "penny in the slot" locks. The sanitary work has been carried out by Messrs. Doulton & Co.; the electrical installation by Messrs. Ridout & Co.; the current being supplied by the Westminster Electric Supply Corporation. The whole of the works have been constructed by Messrs. Patman & Fotheringham, at a contract price of 6,473/1, from plans and specifications prepared by and under the supervision of Mr. George Livingstone, C.E., Surveyor to the Vestry, and his chief assistant, Mr. C. S. Milner.

HOSPITAL, MONKLANDS, GLASGOW.—On the 11th inst. the trustees of the late Provost Alexander, Coatbridge, applied at the Dean of Guild Court for lining for the erection of an hospital to be called the Alexander Hospital, in Blair-street, for which the deceased left 30,000. The plans, which were passed, have been prepared by Mr. A. McGregor Mitchell, architect and Bush Engineer, Coatbridge, and show a set of buildings in the Old Scotch Baronial style. The cost will be about 8,500, and there will be thirteen beds for patients meeting with accidents in the districts of Old and New Monkland and Shotts. The buildings will cover 13 acres of ground near Gartsherrie and Drumpeller Station, N.B.R., and will include nurses', doctor's, convalescent, &c. rooms.—*Glasgow Herald.*

RECREATION HALL, SCHOOL FOR THE BLIND, NEWCASTLE.—On the 12th inst. the new recreation hall was opened at the Royal Victoria School for the

Blind, Benwell Dene, Newcastle. The architect for the erection was Mr. W. L. Newcombe, and the contractor was Mr. Pringle, of Gateshead.

THE PALACE AT DARMSTADT.—The Grand Duke of Hesse has appointed Messrs. Bailie Scott & Stetson Morris, of London and Douglas (Isle of Man), as his architects for the decoration and general fitting of certain rooms in the Palace at Darmstadt.

ALTERATIONS, K.C., WESLEYAN CHURCH, SPRINGBOURNE, HANTS.—This church, which has been enlarged and renovated, was recently reopened. The alterations carried out comprise the erection of a porch and lobbies in the front of the building, the placing of a gallery to accommodate some eighty or ninety persons in the western end of the church, re-fitting the whole of the ground floor with pitch-pine seats, improving the choir accommodation, decorating the walls, rearranging the lighting, and other minor details. The contract was entrusted to Messrs. J. McWilliam & Son, of Bournemouth, and Mr. W. A. Hillier has been in charge of the work; the architect being Mr. G. J. Lawson, of the firm of Messrs. Lawson & Donkin.

SCHOOL, FIFE.—The new school erected by the Wemyss School Board at Coalton of Wemyss was opened on the 8th inst. The school is built to accommodate over 400 children. Mr. Alex. Todd is the architect, Mr. Thomas Brown builder, Mr. Robert Suttie joiner, Mr. D. Johnston slater and plasterer, Mr. William Nicol plumber, Mr. R. B. Forrester painter, Mr. McCulloch railings and other iron work, sanitary fittings, Messrs. Adams & Co., Glasgow.

REPAIR OF CHURCH SPIRE, SWAFFHAM.—The spire of this parish church was last year examined by Messrs. Milne & Hall, architects, London, and found by them to be unsafe. Plans for the repair of the spire have been prepared by the same architects and approved by the necessary parties, and the work has been entrusted to Mr. George Jeffries, builder, of Swaffham.

BUILDING TRADES, STAFFORDSHIRE.—The building trade for the season of the year is good. This is principally on account of the large number of artisans' houses which are being erected all over the district. Through the severe weather of the past week all outdoor operations have been stopped, consequently there have been large numbers of all classes of operatives temporarily thrown out of work, and now that the severe weather has gone there are less than 3 per cent. of bricklayers out of work, and joiners are practically all employed. The plumbers and painters are slack, and there are a large number of labourers unemployed.—*Staffordshire Sentinel.*

NEW UNION OFFICES, DARLINGTON.—The Darlington Guardians held their first Board meeting in their new quarters on the 1st inst. The building is situated in Mill-street, and measures about 83 ft. by 50 ft. north-east of the Edward Pease Public Library. The building was designed by Mr. G. G. Hoskins. The materials employed are grey bricks and buff terra-cotta. A feature in the design is a turret occupying the south-west angle, the lower portion of which forms a bay window in the Board room, while the upper part serves the special purpose of a ventilating chamber. The principal façade faces the south, and placed centrally here is the main entrance. On the west façade is the entrance for the relieving officers, while that for applicants for relief is from the back road on the north, and opens upon a waiting-room. From the main entrance the vestibule leads into the hall, both of which are floored with marble mosaic pavement. To the left is the Board-room, which, by means of a partition, can be converted into two committee rooms. To the rear of this is the waiting-room, and on the west of the latter are the separate offices of the two relieving officers. On the right of the entrance hall is the assistant's clerk's office, and adjoining this is the private office of the Clerk to the Guardians. North of these are a committee-room, strong-room, and lavatory accommodation. The several contractors for the various works have been:—For excavators, bricklayers, masons' terra-cotta, and plasterers' work, Messrs. Geo. Marshall & Son; carpenters' and joiners' work, Messrs. Thos. Stairmand & Son; slaters' work, Mr. J. Wandless; plumbers, glaziers, and gasfitters' work, Mr. E. Smith; painters' work, Messrs. W. H. & W. Hoskins; and heating arrangements, Mr. G. Denham, all of Darlington.

SAVINGS BANK, GATESHEAD.—The branch establishment which has been erected by the Committee of Management of the Newcastle Savings Bank, at Gateshead, was opened recently by the Mayor of Gateshead. The new premises are situated at the corner of West-street and Bensham-road. The style adopted is English Renaissance. The building has a massive Peterhead granite plinth and doorway. Above the plinth and up to the first floor level the facing is of Kenton stone, varied with red stone from Dumfries. Above the first floor level, the facing is of Normandy red, relieved with stone bands and dressings. The roof is covered with green slates, and the dome at the angle is of copper. The banking-room, lighted on three sides, measures 37 ft. 6 in. by 26 ft. 6 in., and is entered at the angle through an inner porch of oak, with lead glazing introduced. The walls and ceiling are finished in adamant, the ceiling being divided into panels with

moulded cornice. There is a panelled oak dado about 5 ft. high, and the flooring in front of the counter is of mosaic. The board-room is on the first floor, and above are rooms for the caretaker. There are cellars in the basement. The floors of the private entrance and lavatories are of coloured tiles, and the walls of the latter are lined with glazed brick. Messrs. Haswell & Waugh, of Gateshead, were the contractors, and Mr. G. B. Burnett has acted as clerk of works. The slating has been executed by Mr. J. Hewitson, Newcastle; the plumbing by Mr. Coking, Gateshead; the plastering by Mr. Rule, Gateshead; and the painting and glazing by Mr. Moreton, Gateshead. The granite, marble work, tiles, stoves, and gasfittings have been supplied by Messrs. Emley & Sons, the counter and other furnishings by Messrs. Sopwith & Co., and the leadglazing by the Gateshead Stained Glass Co. The contract for the whole of the work was 3 615s., and it has been carried out under the supervision of the architect, Mr. Stephen Piper, Newcastle.

TECHNICAL SCHOOLS, PAISLEY.—This school is expected to cost about 20,000*l.* The main fronts are to be built of stone from Cullallo Quarry, Fifeshire, and the corridors, cloak-rooms, lavatories, vestibules, &c., laid with terrazzo. The architect is Mr. T. Graham Abercrombie, Paisley; the measurer, Mr. James B. Lamb, Paisley; and the clerk of works, Mr. James Murray, Paisley. The following are the contractors:—Messrs. John Bryce & Co., Paisley, mason work; Messrs. I. & W. McInnes, Paisley, joiner work; Messrs. Hunter & Goudie, Paisley, plumber work; Messrs. Jas. Jeffrey & Co., Paisley, slater work; Mr. D. T. Hutchison, Paisley, plaster work; Messrs. Galbraith & Winton, Glasgow, tiler work; Messrs. P. & W. MacLellan, Limited, Glasgow, iron work; Mr. John McKenzie, Glasgow, cement paving work; Mr. Wm. Kay, Glasgow, heating and ventilating.

TOWN HALL, EAST COTES.—This building, which is situated in York-avenue, was opened as the Town Hall of East Cotes recently. The front of the building outside is 42ft., the length being 102 ft. 6 in., and it is constructed of white brick with cement facings and mouldings. The entrance is paved with mosaic work, and on each side of the vestibule are cloak-rooms. Above is a room intended for the use of the District Council adjoining being a smaller apartment for the accommodation of the Clerk. The hall itself contains a gallery over the entrance door, and at the opposite end a roomy stage, and the ceiling is panelled. With a length of 70 ft. and a breadth of 35 ft., there is room for an audience numbering about 500, exclusive of the platform. Behind the stage are dressing-rooms and a green-room, below being a kitchen. The hall was designed by Mr. James Newman, of Sandown, and the building work has been carried out by Messrs. W. H. Brading & Son, of East Cotes.

TECHNICAL SCHOOLS, SWINDON.—Lord Herschell recently opened the new technical schools at Swindon. The building, which is built of local bricks, is 174 ft. in length and three floors in height, and consists of a centre block, one room deep, with a wide corridor along the back leading to the projecting wings at each end. Accommodation has been provided for 1,000 students, and the structure is designed in such a way as to admit of enlargement by the extension of the two end wings; these can be carried back to form the two sides of a square with another connecting building at the back, the whole enclosing an inner quadrangle. The whole of the upper floor is devoted to art, and on the basement floor the various science rooms and laboratories are placed, while the women's department is located at the south end of the ground floor and the large lecture theatre at the north end. The building is heated throughout by hot-water pipes from a boiler in the sub-basement. Large extraction trunks are carried from each room to two large ventilating shafts, each 72 ft. in height, fixed one at the north end and one at the south end. Separate staircases are provided for the two sexes, with cloak-room accommodation on each floor. The whole of the work has been carried out by the contractors, Messrs. J. Long & Sons, of Bath, under the supervision of Mr. J. Eldsen as clerk of the works. The architect was Mr. Silcock.

PUBLIC HALL, NEWPORT, ISLE OF WIGHT.—The new public hall in the High-street, Newport, the Medina Hall, has just been opened. The facade of the building is executed throughout in red brick. The front entrance, which is paved with tiles, leads to the main hall, which has a floor space of 60 ft. by 30 ft., the height to the ceiling being 22 ft., and the floor being specially constructed for dancing. At the north end of the hall is a gallery, 30 ft. by 12 ft., this, as well as the staircase leading thereto, being of fireproof construction. At the south end is a raised sloping stage, 30 ft. by 20 ft. The hall will seat about 600 people, and it can be quickly cleared. At the back of the stage are ladies' and gentlemen's retiring rooms, with lavatory accommodation to each, and there is also a kitchen. The heating chamber is in the basement, together with a second kitchen. On either side of the main entrance is office and cloak-room accommodation. The building has been carried out by Messrs. Barton Bros., the heating arrangements by Messrs. Wood & Tame, whilst the ventilators were supplied by the Grahtrix Company.

The whole of the building was executed from the designs and under the supervision of Mr. E. A. Swane, C.E., of Messrs. Swane & Clark, architects.

WORKMEN'S DWELLINGS SCHEME, ABERDEEN.—The Aberdeen Town Council has resolved to purchase, at the price of 2,000*l.*, a triangular piece of ground of 2 1/2 acres in extent, with frontages to three streets, near the City Hospital, and to erect eight tenement houses fronting Urquhart-road, at a cost of 750*l.* each. Each tenement will be three floors in height, with accommodation for six tenants. The plans are by Mr. John Kust, junior, City Architect.

NEW OFFICES FOR PARISH COUNCIL, ABERDEEN.—The Aberdeen Parish Council has purchased a site in Union-terrace, and will erect thereon new offices according to plans by Messrs. Matthews & Mackenzie, architects, Aberdeen.

EMPIRE PALACE THEATRE, ABERDEEN.—To replace the "People's Palace," destroyed by fire, tenders, amounting in all to rather over 10,000*l.*, have been accepted. Mr. John Kust, junior, Aberdeen, is the architect.

A MODEL LODGING-HOUSE, MANCHESTER.—The Manchester City Surveyor (Mr. T. de Courcy Meade) has reported to the Sanitary Committee that in accordance with instructions he had prepared alternative sketch plans showing how the building sites now in the possession of the Committee can be used for tenement dwellings and for cottages for working people. The total number of persons to be housed is 2,584. With regard to the Oldham-road area, under the scheme recommended for adoption by the Committee, the buildings would be four stories in height and consist of fifteen shops and dwelling-houses. The first, second, and third stories would consist of five-roomed dwellings connected with the shops. The buildings on the remaining portion of the site would consist of two rows of two-story tenement buildings, fronting to a new twelve yards street, and one row of five-roomed cottage dwellings fronting to George Leigh-street, which is eighteen yards wide. The clear space between the buildings at the rear would vary from 38 ft. and 55 ft. in width. The four rows of dwellings would afford accommodation for 377 persons. The estimated cost of erecting the four rows of buildings is 17,501*l.*, equal to 36*l.* 15s. 3d. per person. The estimated cost of sewerage and paving the new streets, exclusive of the cost of widening the existing streets, is 900*l.*, to which must be added the estimated value of the site, 7,981*l.*, or a total of 26,772*l.* In Chester-street, Hulme, it is proposed to erect four blocks of buildings on the site, with frontages to Chester-street, Marsland-street, and Hulme-street. The buildings would be two stories high, and each dwelling consist of two two-roomed and two three-roomed tenements. They would accommodate 300 persons. The estimated cost of the buildings is 11,874*l.*, equal to 38*l.* 6s. per person, and the estimated cost of new streets, exclusive of street improvements, is 350*l.* The estimated value of the site, which has an area of 4,554 yards, is 2,277*l.*, or a total of 14,500*l.* It was proposed to erect on the Post-street area, Ancoats, two blocks of three-story tenements similar to those in Chester-street at a total estimated cost of 17,478*l.* Accommodation will be provided for 190 persons. The City Surveyor says that if Harrison-street, Oldham-street, site were utilised for a model lodging-house instead of for cottages and tenement dwellings, the site would accommodate 363 persons. The Committee recommend these schemes for adoption, and ask the Council to authorise them to carry out the plans, subject to the sanction of the Local Government Board. The number of persons to be accommodated is estimated as follows:—Oldham-road area, 377; Chester-street area, 305; Post-street area, 300; Harrison-street model lodging-house, 363; total, 1,345.

NEW PREMISES, WHITEFRIARS.—A large extension has just been made to the premises in Whitefriars, London, of the Argus Printing Company, from the drawings of Mr. Chas. Val. Hunter, C.C. The foundations were put in by Messrs. Greenwood, and the superstructure has been erected by Messrs. Estman & Fotheringham. The lower part of the building is in massive blocks of Portland stone, and the upper part in Raughon terra cotta. The floors are all fireproof on the Fawcett system.

CHURCH, HERNE BAY.—A new church, to accommodate 1,000 persons, is about to be built at Herne Bay. Mr. K. Philip Day, of London, is the architect.

SANITARY AND ENGINEERING NEWS.

PUBLIC WORKS, MANCHESTER.—In accordance with the standing orders of Parliament, Mr. George Hill, C.E., has deposited in the Private Bill Office an estimate of 40,000*l.* as the cost of the new water-works proposed to be authorised under the powers contained in the Manchester Corporation Bill of the present session. This estimate includes the purchase of necessary lands and provides for contingencies. The City Surveyor has also deposited an estimate of 950,000*l.* as the cost of constructing the effluent conduit and the street improvement as proposed by the same Bill. Of this sum 200,000*l.* will be expended upon the effluent conduit, and 350,000*l.* upon the proposed street improvement. *Manchester Guardian.*

LOCAL SEWERS IN LONDON.—The Main Drainage Committee of the London County Council have, subject to a condition recommended by the Engineer, sanctioned the construction of local sewers, as follows:—Lee: 950 ft. of 9-in. pipe and concrete sewer in Church-lane, Charlton, Shore-ditch; 220 ft. of 3-ft. 9-in. by 2-ft. 6-in. brick sewer in Clifton-street, 250 ft. of 12-in. pipe and concrete sewer in Dysart-street, and 920 ft. of 3-ft. 9-in. by 2-ft. 6-in. brick sewer in Curtain-road.

STAINED GLASS AND DECORATION.

WINDOW, HOLY TRINITY CHURCH, SYDENHAM.—The very large west window of Holy Trinity Church, Sydenham, has recently been filled with painted glass at a cost of nearly 1,000*l.* It commemorates a deceased parishioner. In the six long lights are two rows of pictures which illustrate, each in two panels in the upper tier, three incidents in the life of Job, and, in the lower tier, "Noah's Ark," "The Sacrifice of Isaac," and "Jacob's Dream." In the tracery openings, at the apex, is the Holy Lamb; in the other pieces figures of St. Michael and St. Gabriel, and of the other four Evangelists. The surroundings are of canopy work of the style which prevailed with fourteenth century Gothic architecture, in which style the church was built some years ago. The work is from the atelier of Messrs. Lavers & Westlake, of Endell-street, and was designed by Mr. N. H. J. Westlake.

PROPOSED MEMORIAL WINDOW, HAWARDEN PARISH CHURCH.—The members of the Gladstone family, as a thanksgiving for the extended years of life granted to their parents, intend, it is stated, erecting a memorial stained-glass window in Hawarden parish church. A design, by Sir E. Burne-Jones, representing "The Nativity," with "The Visit of the Shepherds," and "The Adoration of the Magi," has been accepted by Mr. Gladstone's sons and daughters.

THE RESTORATION OF ST. PETER'S CHURCH, THANET.—On the 7th inst. the chancel of this church was reopened, after the completion of the decoration and restoration that has been carried out in commemoration of the sixty years' reign of Queen Victoria. The coved ceiling of the chancel is divided into five main bays by ribs, which retain their original colouring of alternate gold and chocolate bandings, and white and black fillets; a similar rib at the ridge, with rich pendant bosses at the intersections; the cornices at the top of the walls are also ancient, and have furnished the key-note of the decoration. The ceiling between has been covered with pitch-pine boarding, which has been slightly darkened and allowed to form the ground-work for the painted figures and the other ornamentation. The three central bays have on each side a large figure of an angel, holding a shield bearing the monogram of our Lord or St. Peter. These angels are the work of Miss Maud Seddon (the daughter of the architect), and are surmounted by labels inscribed "Hosannah." The easternmost bay, that over the sacarium, has on each side three smaller angels with outstretched arms, with labels over, inscribed, "Hallelujah," and the westernmost bay, that next the nave, has on each side six half-length figures of the Apostles, seated on thrones, with gilded and diapered backgrounds. All these, together with the full-sized cartoons for the mosaic work, are the work of Mr. Henry G. Murray. The rest of the ornamentation consists of stencilled borders on either side of the vertical ribs, with a triangle of floriated panels on either side of the ridge rib, and on one side above the cornice, the work of Mr. C. Stollé. The eastern wall of the chancel has been covered with mosaic (Rusts' glass mosaic), and has a large figure of St. Peter on one side of the east window, and on the other of St. Andrew, both under canopies; angels bearing scrolls with inscriptions fill up the spandrels above the window, and there is a similar treatment in the same material of the east wall of the nave on either side of and above the chancel arch. The whole of the work is from the designs of Mr. John P. Seddon, and has been executed by Messrs. Belham & Co., with the assistance of the several artists above named.

FOREIGN.

FRANCE.—There is some talk of having a competition for a new *Salle des Stances* for the Chamber of Deputies in the *Cour d'honneur* of the Palais Bourbon. The expense is estimated at about four million francs. A limited competition between the following artists will shortly be opened by the Ville de Paris—M. Carrière, M. Laroche, M. Frouvé, M. Eliot, M. Raphael Collin, and M. Baschet—for the decoration of the ceiling of the library of the Municipal Council at the Hôtel de Ville. The Luxembourg Museum, which has been much enlarged and rearranged, has now been thrown open to the public. The two new halls on the terrace have been filled, one with the works of foreigners, and the other with the collection left by the late M. Gailletotte and a few other impressions of pictures. One of the halls at the end has been given up to engravings, and engravers are to be represented in succession, beginning by M. Braquemond, whose works are already there. The "Société des Artistes Graveurs au Burin" have just opened their

third annual exhibition in the rooms of the "Cercle de la Librairie," 177, Boulevard Saint-Germain. It will close on March 3.—The new silver coins designed by the engraver Roty, bear on the face the figure of a woman in profile, with a Phrygian cap on her head her right hand is scattering grain, which she takes from a bag held in her left. The reverse shows a lighted torch, round which is an olive branch, and at the most "Liberté, Egalité, Fraternité."—M. Alfred Boucher, the sculptor, has just finished the bust of the engineer, Flachbat, which is to be placed in the Boulevard Pereire, on a pedestal ornamented with industrial symbols from the designs of M. Gaston Trélat, architect.—M. Osiris has just founded a prize bearing his name, of the value of 200,000 fr., to be given to the person who makes the most remarkable work for the 1900 exhibition.—M. Jacques Lequeux, architect, is now superintending the building of a large hospital for old people, which the Conseil Général are erecting on the heights of Bry-sur-Marne, in a fine park that has been generously given to the Department of the Seine by a private individual.—Madame Elisa Bloch is making a bust of Daguerre, the inventor of the Daguerrotype, for the town of Bry-sur-Marne; it is to be paid for by subscription.—M. Rouyon, Director of Fine Arts, is at last roused by the destruction of the ramparts of Antibes, and he has convinced M. Revoil, the architect, the task of trying to save such portions of the debris as may contain anything of value, during the process of taking down.—M. I. Genay, architect, of Nancy, has been elected President of the "Société des Architectes de l'Est de la France."—There is talk of transforming completely the Babazon quarter at Algiers, which forms one of the most important suburbs of this town.—M. Haro *père*, the well-known art connoisseur, has just died. From a child he was familiar with the great painters of this century, particularly with Jacques and Eugène Delacroix. He had great experience in ancient and modern paintings, and his advice was always taken in the large artistic sales which have taken place in Paris during the last thirty-five years. He had made a fine collection of paintings, the sale of which, in 1892, was watched with intense interest amongst amateurs, and which realised the sum of upwards of 700,000 francs.—The death of M. Victor Guillemin, architect, of Paris, is also announced.

GERMANY.—It has long been intended to publish a monumental work on the new Houses of Parliament at Berlin; and we are now informed that the art publishers, "Cosmos," of Berlin, have taken the matter in hand. The monograph on this building is to be a large folio, profusely illustrated with photographs and etchings, and will appear in ten parts, at intervals during the course of the next three years. At the same time there will be a publication on craftsmen's work in the building. This publication will be in three parts, representing masonry, woodwork, and metal work.—The *Vossische Zeitung*, in its New Year's number, has a special supplement in connexion with a new building it has lately erected as a printing house and editorial offices. The publication contains a large number of interesting historical views of Berlin, and calls for some attention from those interested in the development of this city. It is only to be regretted that the illustrations, interesting in themselves, should not have been more carefully prepared, as far as the draughtsmanship is concerned. The post of City Engineer at Berlin has become vacant, and we understand that there are seventeen candidates for the new office, all of whom are from Berlin.—The popularity of the Royal Technical College at Munich seems to be on the increase, as no less than 1,750 students have availed themselves of the classes. A number of foreigners are also attending this college, but there are no Englishmen among them.—At Berlin the increase of the students at the Technical College promises to cause inconvenience, as the building is already over-filled, and there are now nearly 3,000 students attending the classes, as compared with about 2,000 five years back. In this case we find that there are three Englishmen on the lists. The largest number of foreigners is from Russia, which nationality sends 119 students.

AUSTRIA.—Professor A. Hausmann, of Buda Pesth, has been decorated with the order "Litteris et Artibus" in recognition of his services in the development of the architecture of Buda Pesth. It will be remembered that Professor Hausmann was entrusted with the extension of the Royal Castle of Ofen on the death of Von Yel.—According to the *Deutsche Bauzeitung*, there appears to be a rapid increase in the price of ground at Vienna, the data given by our contemporary being highly interesting.—A most influential committee of the members of the Municipality and some experts are considering extensive plans for the improvement of No. 1 District at Vienna, which is practically the principal business quarter inside the boulevards. Much of the central portion of the city requires rebuilding, and the opportunity will be taken of widening some of the leading thoroughfares.—The Municipality of Vienna has now finally decided to erect its own gasworks and lay down its own gas-mains throughout the city; and we understand that the present contractors, who hold the monopoly of supplying Vienna with gas, will have to retire in the course of a few years.

There has been an acrimonious discussion as to the renewal of the present contracts, which has resulted in these extreme measures. Practically, the whole of the Vienna roads will have to be opened up for the new mains, and a commencement has been made for the first, second, and third sections in the city. Incandescent gas-light will be introduced extensively for all the main thoroughfares.

SWITZERLAND.—In the preliminary competition for the proposed *Jungfrau Bahn* the first premium of 5,000 francs has been awarded to Mr. Strube, an engineer practising at Interlaken, whilst the second premium was also given to a Swiss engineer. Sixteen premiums were given in all, but, though the competition was an international one, only one award falls to England, *i.e.*, the fourteenth, to Mr. J. Bernays, of London. A number of German engineers participated in the competition and were successful in obtaining various premiums. Forty-eight designs in all were sent in, and besides those that received premiums the promoters also bought three of the designs, paying a nominal price of 100 francs for each.—An important competition for a church at Zurich is now being arranged. The cost of the church is not to exceed 350,000 francs; the premiums amount to a total of only 5,000 francs. There will be a national committee of assessors, among whom is Mr. Bluntschli.

SCANDINAVIA.—Rapid progress is being made on the Exhibition Buildings at Stockholm, which will be situated on a most picturesque site on the Oestermalmsviken and Djurgårdsbrunnsviken. The whole of the buildings are well designed, particularly the Industrial Hall, which is entirely of wood, and the large gallery for machinery. The particular feature of the exhibition will be the Fisheries Collection, and there will be the usual representation of the old town—this time, the "old Stockholm." The last exhibition at Stockholm, we believe, was held in 1866, the other more important exhibitions of the Northern Countries taking place at Copenhagen, in 1872 and 1888.

LAHORE CITY SANITATION.—The city of Lahore is as ancient as 300 years can make the more modern parts, while the "old" Lahore is supposed to have been situated somewhere in the times of the Vedas, by Lohr, one of the great ancient dignitaries of the Asoka family. Let this be as it may, what we are concerned with is the Lahore of to-day, and verily it is a dreadful incongruity of dirt and distress, coupled up to evidently abortive efforts at sanitation and drainage. The open bullock cart conveys away the town sweepings as it did in the days of Akbar, while close by may be seen the new-fashioned water-pipe stand, with its tiny streamlet of water issuing out to supply slowly but surely the patient crowd who surround it, and await their turn to approach the dribble. The gutters are open as they were 300 years ago, and the smell from them is killing in its strength and power. The city lends itself to very much better sanitary arrangements than those which exist, since it is a series of undulations which might easily be utilised for flushing purposes.—*Indian Engineering.*

MISCELLANEOUS.

BUST OF DR. ARNOLD, RUGBY.—The bust of Dr. Arnold, by Mr. Alfred Gilbert, R.A., which has been presented to Rugby School by the past and present members of the school and other friends, was unveiled recently by the Archbishop of Canterbury. The bust, which is of marble, is a large size, and is placed at the end of the new big school, in the head of the gallery of painted portraits or former head masters and distinguished Rugebeians. It now stands on a temporary pedestal, but this will shortly be replaced by a permanent one, made from the last of the three elm trees which stood in the school close at the time of Dr. Arnold's head mastership, after designs executed by Mr. T. M. Lindsay, art master to the school, and approved by the sculptor.

PRACTICAL TESTING COURSE AT THE SHEFFIELD TECHNICAL SCHOOL.—Considerable use is being made of the appliances at the Technical School, and a course is now commencing with the testing machines, the subject being "The Strength of Materials." A number of important points of interest and value to practical men will be dealt with by the demonstrator, Professor W. Rippea, M.Inst.C.E. The next ten demonstrations include tests of the strength of wrought iron, cast iron, the various types of steel, brass, copper, &c.; also the strength of pulley ropes, chains, and pipes. These must be of considerable interest to engineers and others engaged in a course of study. A further series of tests to be carried out by the students, architects, these including the strength of timber, stone, bricks, cement, &c. Instruction will also be given in the various types of measuring instruments and appliances now used in mechanical laboratories. A few years ago only a few of the largest works had such laboratories for the testing of materials, but now such laboratories are becoming much more common, not only with the manufacturers of metals, but with the engineers by whom the material is used. Scientific methods are finding their way into all departments of manufacture, particularly in the special departments peculiar to Sheffield. That the young men of Sheffield are aware of this, and appreciate the value of the instruction given at the Technical School, is shown by the excellent

attendance at the various classes.—*Sheffield Telegraph.*

CLOISTER ARCHES, GREYFRIARS CHURCH, ABERDEEN.—In the course of the demolition of the buildings at Marischal College to make way for the extension of the south wing, there has been revealed an interesting ecclesiastical relic, in the shape of the arches of the cloister of the Greyfriars Convent. The arches are contained in the wall which runs eastward from Greyfriars Church, separating Longacre houses from the quadrangle of Marischal College. At some time or other the arches had been filled up with masonry, so as to form a solid wall. Rev. Dr. Cooper has now noticed the existence of the old arches in the comparatively modern masonry, and he pointed them out to Mr. Marshall Mackenzie, the architect of the buildings, who gave instructions that the wall should be taken down carefully, so that the arches should be left standing for a short time in their original form before they are finally demolished. The Greyfriars convent was founded in the middle of the fifteenth century by the Observantist Order of Greyfriars. A church was built at the same time, but was replaced about 1515 by a new church, which is the building now existing. The arches are believed to be part of the cloister of the convent, and are thus a very interesting historical relic.—*Aberdeen Free Press.*

THE LATEST "REVOLUTION IN CYCLES."—Mr. Thomas Bennett, of "The Bennett Scooter & Steeplechase Cycle Company," has been good enough to forward to us a circular of what he is pleased to term the "Eureka driving wheel for cycles, motor cars, and railway locomotives," which we find very difficult to take seriously. Mr. Bennett seems to have been learning roller skating, and to have been struck amongst other things, with the speed with which his feet shot out in front when he lost his equilibrium, coming, as he naively remarks, "on to the back of his heels with a great deal of force, and a very heavy blow." What more simple, therefore, thinks Mr. Bennett, than to fit the back wheel of a cycle with a series of skate wheels, and use this "tremendous velocity (the heavier the rider the greater the velocity)" to propel the cycle? A rather fallacious we cannot conceive. The inventor of the "Eureka" proposes sixteen small wheels grouped round the main driving wheel, which cause the rider to rise on each small wheel comes directly under him, and to sink as it passes that point. In other words, the driving wheel is practically a sixteen-sided polygon which on a flat surface would cause the rider to rise and fall sixteen times per revolution—not a very pleasant sensation, we should think, at the best. The theory seems to be that having passed the point where the apex is directly under the rider, a forward motion would be imparted to the machine. Ever were this so, it would only be in proportion to the energy the rider had just stored up when raising himself on to the apex. Where, then, is the gain in speed? If we have correctly understood the woodcut and description, we should think the principle involved is about as sound as that of making a crank 12 in. long, and curving the end back again, so as to lift the pedal only 6 in. from the centre, and then considering the power as applied at a 12-in. average, which idea was actually patented not so very long ago. If Mr. Bennett is serious in what he prints we hope, for his own sake, he may have a friend with an elementary knowledge of mechanics who can spare ten minutes for his instruction.

THE OLD GRAMMAR SCHOOL, DUBLIN.—Monday in this week was the last day for the sending in of competitive plans for a new grammar school, the master's house on a site in St. James's-road. In connexion with this we may mention that the original free grammar school was founded in 1566 by Thomas Wattewode, of Stafford, clothier, and Mark Bysmore, of London, silk-throwster. Upon the decay of the old school house, the school, after a temporary sojourn in Wolverhampton-street, was removed to new premises built in King-street in 1842.

PROPOSED SCOTCH BUILDING TRADES FEDERATION.—A meeting was held in the Trades' Hall, Glasgow, on the 13th inst., to consider the question of a Scottish Building Trades' Federation. The chair was occupied by Mr. John Hardie, President of the Glasgow and Suburbs Building Trades. Mr. T. Anderson, secretary of the Glasgow Trade Union, explained the purpose of the meeting. The question of a Scottish Building Trades' Federation had been under the consideration of the various trades, and one and all were agreed that such a Federation would be a benefit to the building trade of Scotland. The Glasgow and Suburbs Building Trades' Federation, with the approval of the Aberdeen Building Trades' Federation, the Associated Carpenters and Joiners, and other affiliated trades in the local federations, were of opinion that the time had now arrived when it was their duty to take the initiative in bringing about a closer bond between the workers in the building trade. No working member of the building industry could fail to have been impressed with the strides federation had made of late years among the employing class. The composition of the conference was as follows:—Painters, 7; slaters, 3; labourers, 2; masons, 2; sawmillers, 1; bricklayers, 4; glaziers, 2; plumbers, 1; carpenters and joiners, 16; tilelayers, 2—total 38. After some preliminary business, Mr. Munro, Amalgamated Joiners, Edinburgh, moved:—"That we establish a Scottish Building Trades

Federation for the purpose of forming a closer bond of union between the workers of the building trades." Mr. P. Keenan seconded. Mr. Steven moved, as an amendment, "That we approve of the principle of a national federation." Mr. Henderson moved, "That we approve of the establishment of a Scottish National Building Trades' Federation," which was accepted by Mr. Steven. Mr. Riley, labourers, Glasgow, seconded the amendment. On a vote being taken, Mr. Henderson's amendment was adopted by twenty-one votes to sixteen. Mr. M. Lean, bricklayers, Glasgow, moved, "The object of this Federation shall be to maintain the right of combination of labour by trade unionism, by mutually supporting any of the societies within the Federation if individually attacked by employer or body of employers; to promote conciliation in trade disputes, and to advance and elevate the cause of labour generally." Mr. John Ure, tilemakers, seconded. Mr. Riley moved, in addition to the objects of the Federation, the words "organise the workers in connexion with the building trade." He was very sorry the word skilled labour had been introduced into the meeting. By twenty-six votes to thirteen, Mr. Riley's addition was adopted. The remainder of the business was taken up in discussing the constitution of the Federation.

THE "KLEINE" SYSTEM OF FIREPROOF FLOORING.—This is a patent invented and owned by a German Government architect, Herr J. F. Kleine, of Erbach on the Rhine. The essential point in the system is that the lower portion of the floor is formed of roughly-squared stones carried by the joint aid of a metal band on edge between them, and of cement; the top being finished with concrete. The metal bands (*hand-eisen*) assist in carrying the courses of stone between the main iron beams on which the ends of the floor is shown in fig. 1, and three forms of section in figs. 2, 3, 4. It will at once be seen that this is a far inferior fireproof floor to some with which we are familiar in England; but the author claims for it that as any stone can be used for it, with only rough squaring, it is far more economical than floors in which "expensive forms of terra-cotta are used." That may be; but the question is whether it would not be still more economical and even more efficacious (in a fireproof sense) without the stone, and will merely a thickness of concrete with the iron bands enclosed in the concrete. Certainly in England we

sitting later on was occupied in an unfinished discussion as to whether the Commission should oppose the Bills of the East London Water and New River Companies in Parliament.

MEDIAEVAL AND MODERN SCULPTURE.—Professor Baldwin Brown recently lectured in Moffat on mediæval and modern sculpture. Mediæval sculpture was partly Christian and partly antique, and about the thirteenth century they found it was largely used in connexion with architecture. In the French Gothic school it was found to be employed in the technical correctness of the Greek and Italian sculptors, it was carried out in a manner truthful, simple, and fresh, and always in connexion with the decoration of the building. The Early English work of the same period had similar attributes. The Italian workers in sculpture had benefited by their training in beauty and effect. Their reliefs in bronze of religious subjects were of a strongly pictorial character, showing a very special turn in the direction of painting. They crowded in many figures, and the result was florid and theatrical, without concentration. During the last century there had been a revival of the Classic style. Now, however, the feeling was becoming more Italian, and Greek was less looked upon. The influence of painting was days in Italy. Modern sculpture lacked the beauty and grandeur of Greek sculpture. The sculptor of to-day did not work so much for the type, and that was the reason that modern sculptors were less successful in the monumental style than in works of the domestic style.—*Glasgow Herald.*

NOTTINGHAM MASTER BUILDERS' ASSOCIATION DINNER.—Under the presidency of Mr. Enoch

a demand for an advance of wages, and alteration of rules from the bricklayers. By negotiations, and after they had had many meetings, that advance of wages was conceded, and certain alterations were made in the rules. The bricklayers conceded the members of the Association some small points, and the matter was amicably arranged. In connexion with this they had done something on which several of their prominent members had set their minds very strongly for a long time, namely, in the direction of securing a uniformity in working hours throughout the trade. The plumbers' strike assumed a very serious aspect indeed, and although the Association was not directly connected with it, the other branches of the workers decided to combine with the plumbers, and he was sorry to say that they combined with them outside their working rules with the builders. This was rather a new feature, and one which might crop up again in the future, and the members of the Association would be well advised to remember that, and be prepared for it. As they perhaps all knew, they had had a notice from the joiners for an advance of wages and certain alterations in the working hours. He considered that the joiners had made a very serious mistake. They had been offered the money that they asked for, if they would give a little concession on the winter working hours, and they had absolutely refused to accept it. He was afraid that the difficulties they had had were but an indication of what was to follow, for there was no doubt that while trade was good they would have plenty of opportunity for exercising unity, and in order to cope more effectually with the difficulties which might probably arise they had reconstructed the Association. They had now a committee appointed to deal with each branch of the trade, and every member of the Association was on one or more of the committees.—Mr. Woodsend, in replying, said when they became a strong Association and were thoroughly combined, they might, he trusted, be able to see their way to start a benevolent fund, as had been done by the National Association and other similar organisations. Mr. Hodson also responded. Other toasts followed.

TEMPERANCE PERMANENT BUILDING SOCIETY.—The report for the year ended December 31, 1896, states that the advances during the year amounted to 240,349*l.*, an increase of 59,134*l.* over the previous year. Of 3,328 properties mortgaged to the society, no fewer than 3,065 are for sums not exceeding 500*l.*, or upwards of twelve hundred more small properties than are held by any other building society in the United Kingdom. It is therefore claimed that the society is carrying out, to a greater extent than any similar institution, the object for which building societies were established, namely, to assist the industrious and provident classes to become owners of house property.

THE EAST END DWELLINGS COMPANY.—The report of this Company, to be submitted to the fourteenth ordinary general meeting on the 22nd, states that no building operations were carried on by the Company during the year, but an important leasehold site, with frontages to Columbia-road, Hassard-street, and Ravenscroft-street, in the parish of Bethnal Green, was acquired. Plans have been approved for building on this site, which show 112 lettable rooms, divided into tenements of one, two, three, and four rooms each, besides two shops and twenty-two workshops, some with living rooms attached. The work of excavating for the foundations has already been commenced, and it is hoped that the new buildings will be ready for occupation before the close of the present year. As was anticipated in the last report, the remaining tenements at Winton Houses were quickly taken up, and at the close of the year, with the exception of one tenement at Gordon Dwellings and another at Meadows Dwellings, the whole of the Company's properties were fully let.

GRAY'S-INN CHAPEL.—Mr. C. Herbert Shoppee writes:—"I regret to have to call your attention to an error in the lettering of the plate in which you put my father's name, Mr. C. J. Shoppee, instead of my own name, although the latter appears correctly in the letterpress." The copy for the letterpress was not received when the plate was printed.

CAPITAL AND LABOUR.

LABOUR IN THE BUILDING TRADES.—At the end of January the building trades were scarcely so busy as in the previous month, owing to the weather. Employment, however, was considerably better than a year ago. The percentage of unemployed in unions making returns for January was 24, compared with 37 in January, 1896. Six disputes took place, involving 309 workpeople.—*Labour Gazette.*

LABOURERS' WAGES, YORK.—A meeting of the York Master Builders' Association was held recently to consider the applications from the Operative Bricklayers' Society and the Amalgamated Builders' Labourers' Union for an advance of one penny and one halfpenny per hour respectively, from May 1, 1897. The secretary reported that the Bricklayers' Society had withdrawn their notice, and it was unanimously decided that an intimation be sent to the Labourers' Society that their application could not be granted, as the state of the building trade in the city does not warrant any advance.

should not consider the section fig. 2, with the naked stone soffit, as deserving the name of a fireproof floor at all. We give the illustrations and description of it, however, for those whom it may interest; and we have ascertained that one of the Kleine floors obtained high results at a fire-testing competition in Germany, which may very well have been the case with some forms of this floor, though not, we think, the section fig. 2.

CITY COMMISSION OF SEWERS.—On Tuesday a meeting of the City Commission of Sewers was held at Guildhall, Mr. H. G. Smallman, the Chairman, presiding. At the instance of the Finance and Improvement Committee it was resolved to serve notices to acquire ground in Fetter-lane for the widening of the public way. An arrangement was adopted to settle a claim for the freehold interest in the ground required to widen the thoroughfare in front of No. 100, Fleet-street, for 8,300*l.* It was also decided to give 8,05*l.* for the freehold and leasehold interests in 101, Fleet-street, for the same purpose. The Committee were given power to the London County Council in regard to applications for contributions towards City improvements. The

Hind, the members of the Nottingham Master Builders' Association, together with a number of guests, held their annual dinner at the Albert Hotel, Derby-road, on the 17th inst. The loyal toast having been honoured, Mr. H. Vickers submitted the "Mayor and Corporation of Nottingham," Ald. Bennett and Mr. J. Wright, whose names were coupled with the toast, responding. The Vice-President (Mr. Wright) next proposed "Success to the Master Builders' Association." They might congratulate themselves, he said, that up to then the Association, which had only been started about five years, had been a success. The past year had been one in which they had several little and some rather serious troubles. There were at first three or four little difficulties with the labourers, and while trade was good they were sure to have some little annoyance, but they had a right to claim that the Association had smoothed over the difficulties without any very serious trouble. The masons' strike was a somewhat serious matter, and to those who took an interest in it it must be a matter of most sincere regret that a strike should have occurred, which lasted four or five weeks, over so small a difficulty—simply a question of apprenticeship. Then they had

LEGAL. AN ARCHITECT'S CLAIM:

BEESLEY V. DANGERFIELD.

This case was before Mr. Ridley, Q.C., the Official Referee, on Monday and Tuesday last week. The plaintiff is an architect and surveyor of Westminster, and the defendants are printers, lithographers, &c., of St. Albans. The plaintiff was employed to prepare drawings and quantities for the erection at St. Albans of premises for the defendants. This work was carried out and tenders were received, the lowest being over 5,000*l.*, afterwards reduced to nearly 4,000*l.* The defendants dismissed the plaintiff, alleging that they had always stated that they could not spend more than 3,000*l.* This the plaintiff denied, and no mention of such a sum appeared in the correspondence. The defendants proceeded to erect a building themselves, and on plaintiff finding this out and being unable to obtain any payment at all for his services the action was commenced.

Mr. C. H. Brodie, architect, was called to show the resemblance of the building erected to the plaintiff's design, and Mr. Gilbee Scott, architect, for rebuttal. There was a counterclaim by the defendants for loss of time, &c., caused by the alleged neglect of instructions by the plaintiff.

The Official Referee decided that the defendants were wrong in dismissing the architect and not allowing him to come down the building and erect it as they themselves, in fact, had done. He must be paid for his services, and he, therefore, gave judgment for the plaintiff with costs, on the claim and counterclaim, which, he held, could not be sustained. He fixed the remuneration to which the plaintiff was entitled at 100*l.*, to include a small sum paid into court.

It transpired that the plaintiff, who said he was a member of the Society of Architects, had undertaken to erect the building for a commission of 3 per cent. on the cost, exclusive of the quantities, which were agreed at 2 per cent.

Mr. Saunt appeared for the plaintiff, and Mr. Harrison for the defendants.

THE LIGHT AND AIR DISPUTE BETWEEN BANKS.

The case of the London & Midland Bank *v.* the National Provincial Bank, Limited, was mentioned to Mr. Justice North in the Chancery Division on the 13th inst., it being an action brought by the plaintiffs to restrain the defendants by injunction from continuing the building of their bank in Park-row, Leeds, so as to cause an alleged interference with the light and air of the plaintiffs' bank which is opposite that of the defendants.

Mr. Seward Bryce, Q.C., for the defendants, said that he wished to have the trial expedited, and to have the case tried at the next Leeds Assizes. He also asked for permission to complete the building by putting on the roof, the defendants undertaking to pull down so much as was found by the Judge to interfere with the plaintiffs' light and air.

Mr. Swinfen Eady, on behalf of the plaintiffs opposed this course, and submitted that he was entitled to an injunction restraining the defendants from increasing the height of their building.

In the result the defendants undertook till the trial not to build any higher, except for the purpose of putting on a temporary roof, the action to be set down at once.

ALLEGED INTERFERENCE WITH AN ARCHITECT BY BUILDERS.

MR. R. G. PARKER applied *ex parte* to Mr. Justice Kekewich, in the Chancery Division, on the 12th inst., for an injunction to restrain J. Allen & Sons, who are building a large building for Messrs. Maple & Co. in Fitzroy-square, from interfering with Mr. William Woodward, an architect, in the discharge of his duties under the contract and specification of works. The learned counsel stated that in the building certain concrete made in a particular way had to be used for fire-proof floors. When the architect went to the building a day or so before he found that improper materials were being used for the making of this concrete, and, in pursuance of his powers under the contract, he required it to be removed. At the same time he said that if the good part were taken out and the rubbish were rejected he would pass it. The foreman undertook that that should be done. On the 10th inst. the architect received notice that it was not being properly sifted, and he then told Allen & Sons that if it was not properly sifted he should remove it. The architect went up on the 11th inst. and met with forcible opposition, ladders being removed and a gang of men being brought up to oppose any proceedings he might take under the contract. The architect, therefore, had to capitulate and came to his lordship and asked him to restrain the defendants from interfering with him in the discharge of his duties, and also from using improper materials in the making of the concrete floors.

His Lordship said that he did not see his way to grant the application as to compelling specific performance of the agreement. An injunction to restrain the defendants from interfering with the architect in the discharge of his duties under the

contract was quite another matter. He would grant the injunction as to that extending over that day week, the plaintiff to serve notice of motion on the defendants for that day.

PIRACY OF AN ARCHITECT'S DRAWINGS: IN THE CHANCERY DIVISION.

The case of Neale *v.* Harmer and others came before Mr. Justice Kekewich in the Chancery Division on the 12th inst., on a motion by the plaintiff, Mr. James Neale, F.R.I.B.A., and a Fellow of the Society of Antiquaries, for an *interim* injunction to restrain the defendants, Messrs. Harmer & Harley, and Architecture, Limited, the publishers and proprietors of a paper entitled *Architecture*, from printing, publishing, selling, delivering, or otherwise disposing of any copies of that magazine containing any drawings or plans copied from "The Abbey Church of St. Alban," a work published by the plaintiff and duly registered as copyright.

Mr. Warrington, Q.C., and Mr. Pattinson appeared as counsel for the plaintiff, and Mr. W. H. Uppjohn for the defendants.

It appeared from the statement of Mr. Warrington that the plaintiff was the author of a very elaborate work on the history and architecture of St. Alban's Abbey, containing about 200 measured drawings and plans of the details of the Abbey in its original state before the restoration, together with descriptive letterpress. The defendants had published an article on the Abbey, and copied the ground plan of the Abbey, and also reproduced, by some photographic process, three of the drawings taken from the plaintiff's book. The plaintiff did not complain of the insertion of the ground plan, because he had given the defendants leave to reproduce it. The defendants did not dispute that they had taken the drawings in question from the plaintiff's book, but they contended that they were entitled to do so. The defendants had prepared blocks of five or six more drawings from the plaintiff's work, intending to insert them in another number of the magazine.

The learned counsel read an affidavit by the plaintiff and correspondence which had passed between him and the editor of *Architecture*, from which it appeared that the plaintiff had declined to allow any of the drawings (with the exception of the ground plan) to be used.

Mr. Uppjohn contended that it was impossible to decide on affidavit evidence what the agreement between the parties was. But apart from that, and even assuming that there was no agreement permitting the defendants to reproduce the plates, he should contend that there had been no piracy. The law laid down that a man was entitled to make a fair and reasonable use of the work of those who had gone before him.

His Lordship, in giving judgment, said that the editor of *Architecture*, being anxious to obtain drawings of the old as well as the new part of St. Alban's Abbey, wished to do so cheaply, and applied to the plaintiff, the author of what was stated to be a standard work. He would assume for the moment that there was no licence given to the defendants to use the drawings. It was admitted that the three drawings in question were taken directly from the plaintiff's book, and these were the only three strictly architectural examples of the old Abbey given by the defendants. The defendants had simply cribbed the plaintiff's industry and knowledge, and had not exercised any ingenuity of their own, except such as was displayed in the copying. That seemed to him entirely wrong. With reference to the question of licence, it was said that there was no conflict of evidence, and that he (his Lordship) ought not to try the case then. He considered that there was no conflict at all—at least, worth speaking about. The affidavits and correspondence read together seemed perfectly plain. The plaintiff was applied to to allow these drawings of his to be used, and he said, "You may use the ground plan, but nothing more." The defendants applied to him again, and he objected to his drawings being used unless he wrote the article himself. He offered, for a certain price, to write the article, and to illustrate it. The defendants said that he offered to allow them to use the illustrations at a certain price, but that he did not offer to write the article; but it was impossible to put that construction upon the correspondence. He thought, taking the whole of the circumstances into consideration, that the plaintiff was entitled to an injunction as asked, until trial or further order; but the injunction would not extend to the ground plan.

Order accordingly.

AYLESBURY BANKRUPTCY COURT. RE SIAREY—EX PARTE THE OFFICIAL RECEIVER.

On the 27th ult., at a special meeting of this Court—before his Honour, Sir A. G. Marten, Q.C., a motion was made by the Official Receiver, acting as trustee of the estate of William Howard Siarey, of Aylesbury, builder, against John Sladen, of Amersham.

The Official Receiver was represented by Mr. A. Carrington, barrister, and Mr. Sladen by Mr. Arthur Powell, barrister (instructed by Messrs. Albin Hunt & Pourmy, solicitors, Chesham).

Several witnesses were in attendance to give evidence for Mr. Sladen, amongst whom were: Mr. H. Bushell, F.S.I.; Mr. Guest Luckett, architect,

Aylesbury; Mr. George Darlington, builder, Amersham; Mr. H. T. Grimsdale, builder, Aylesbury. The motion was for an order that Mr. Sladen should pay the sum of 117*l.* 18*s.*; alleged to be due from him to the estate of W. H. Siarey, being the balance for the erection of a villa at Amersham Common.

Mr. Sladen's case was that, under the agreement entered into between himself and Siarey, Mr. Sladen, Luckett, architect, of Aylesbury, and who was a architect employed, was to value and price the extras that might have been ordered over and above the original contract, which had been done, after paying Mr. Darlington, who had been called in to finish the work, the accounts showed that Mr. Sladen had been overpaid. The agreement stated that Mr. Luckett's decision should be binding and final on all parties in case of any dispute.

Mr. Arthur Powell applied to stay the proceedings on the ground that the parties themselves had made Mr. Luckett sole arbitrator. He objected to this Court assuming jurisdiction on legal grounds, quoting authorities in support. After long legal arguments, the Judge overruled the preliminary objections, and decided to hear the motion.

Mr. Carrington then opened the case for the Official Receiver, reading an affidavit of Mr. George Mallam and the shorthand notes taken on the private examination of Mr. Sladen and Mr. Luckett.

Mr. Herbert Quinton, architect, Oxford, was the first witness called for the Official Receiver. He stated that he had seen and examined the contract, specification, and plans for Mr. Sladen's villa. His (witness's) instructions were to price the quantities according to the schedule in the Architect's Compendium for 1895. He was to price the extras and omissions. He did so, and now produced his valuation. It amounted to 237*l.* 5*s.* 9*d.*, in addition to which there was 22*l.* 14*s.* for extras not allowed for by Mr. Luckett. In cross-examination by Mr. A. Powell, witness admitted that he had departed in his valuation from the prices mentioned in the compendium, varying it in accordance with local prices. It was perfectly reasonable for Mr. Luckett to do the same. The witness admitted that he had not priced the additional extras claimed for by the Official Receiver in accordance with the compendium, neither had he measured them up, but had simply taken the items from the bankrupt's account book.

Mr. Carrington here intimated that in the face of the admissions on cross-examination he must abandon his claim for the increase over Mr. Luckett's valuation.

Mr. William Siarey, the bankrupt, was then called, and stated that the whole of the additional extras claimed for by the Official Receiver, had been carried out by him, and that he had not been either paid or allowed for the same by Mr. Luckett in his valuation. He, however, admitted that the amounts charged were not in accordance with the Architect's Compendium; that some had been allowed for by Mr. Luckett, others were specified for and formed part of the original contract, either being included in the specification or bill of quantities.

Mr. Carrington here intimated that in the face of these admissions he could not continue the case, and acting under the instructions of the Official Receiver, who only desired to do what was right in the matter in his official capacity, he would withdraw from the case.

His Honour then gave his judgment for Mr. Sladen, refusing the motion with costs.—*Chesham Examiner.*

ACTION BY A BUILDING MANAGER: SOLICITORS AND THEIR SPECULATIVE BUILDING TRANSACTIONS.

MR. RIDLEY, Q.C., one of the Official Referees of the Chancery Division of the High Court of Justice, has had before him recently the case of Messrs. *v.* Saunders and others, in which the plaintiff, Mr. J. J. Messer, of Fernlea-road, Balham, seeks to recover from the defendants, Messrs. Saunders, Hawksford, & Bennett, of Colman-street, E.C., and Mr. J. Grayhurst Hewat, formerly carrying on business as solicitors under the style of Saunders, Hawksford, Bennett, & Co., a sum of 3,300*l.* 13*s.* 4*d.*, alleged to be due to him, and including advances made by him to enable defendants to finance certain buildings. Mr. Hewat, who had been carried off them, was admitted a member of which they engaged largely in speculation in land and buildings. They either purchased freeholds or got long leases of land suitable for building, and entered into agreements with various builders to erect houses on the land, using their own money, or that of clients, or money advanced by their clerks to finance the buildings. Plaintiff's first advance was in 1879. In 1885, the then surveyor for the firm's estate work having been dismissed, plaintiff was asked to undertake the management and superintendence of the various building estates, and in addition to the continuation

of his salary of 200*l.* a year, he was given a free residence and survey fees; he was to have the letting of the finished houses, the collection of the rents, and the execution of repairing jobs required from time to time, doing the latter as cheaply as possible, and charging such sums as might be slight to him a margin of profit. In 1890 a builder who had contracted with defendants for the erection of some houses in Pathfield-road, Streatham, failed to complete his work, and it was agreed that plaintiff should undertake the finishing of the houses as cheaply as he could; but this necessitated the purchase of a horse and cart, the hiring of stables, and a considerable increase of his ordinary plant and materials for repairing work on the firm's building estates. Thirty went on until 1894, when the defendants found they were losing money, and plaintiff, becoming worried about the large balance due to him, was seized with a severe attack of brain fever, and incapacitated from business. After his recovery he failed to obtain a settlement of his account, and hence the action. General account, according to the particulars of claim, showed a balance of 68*l.* 6*s.* 9*d.* and repairs account, 1,74*l.* 2*s.* (inclusive of 1,56*l.* 10*s.* the cost of finishing the houses in Pathfield-road); the other items comprising loans to builders and interest on the total debt sued for from June 24, 1894, to the date of the action.

Mr. Houghton, on behalf of Messrs. Saunders, Hawksford, & Bennett, said their case was that plaintiff was a trusted and confident servant of the firm, and on his representations as to the manner in which they were dealt with, the previous surveyor was discharged, an alteration of plaintiff's duties was arranged; he was to do no legal work in the office but, for the protection of the firm, to superintend and manage their estate building work. Plaintiff suggested that if money were found him he would buy materials and engage labour so as to avoid contractors' profits, and, practically, finish the house building at cost price, which was agreed to, and he was entrusted with the duty of certifying the builders' accounts. But when the latter "broke down," it was found that he had already certified for nearly the scheduled estimates of cost while the new buildings were nothing like completed. On complaint being made about this, plaintiff told the firm that everything would come out all right, that the houses were well worth all the advances, and that he would himself finish them, looking to the property for repayment. Plaintiff always encouraged the firm to go on, until Mr. Bennett took matters into his own hands, and after plaintiff became ill, investigations were made which revealed the state of things on which the counter-claim was based, viz.:—That plaintiff had received secret commissions for supplies of materials, used defendants' material for the purposes of his own business, and had been in partnership with certain builders. Altogether, counsel said, upwards of 30,000*l.* of the defendants' money had been handled by plaintiff, and the bulk of it had been lost.

Plaintiff was examined at considerable length as to his transactions with the defendant firm, and in cross-examination he denied any knowledge until March, 1894, that Mr. Hewat was not jointly interested with the other partners in the building undertakings, and when Mr. Hewat had him so he was startled and surprised. It was not a fact that the sums set out in his claim were substantially profit he had made on the moneys of the firm which had passed through his hands. He denied having received secret commissions.

Several witnesses on both sides were examined. A settlement was arrived at subsequently, and Mr. Ridley accordingly gave judgment against the defendant Hewat for 2,000*l.* and for 200*l.* as against the defendant firm, with costs.

A CLARE MARKET LIGHT AND AIR CASE.

THE case of Dye v. Patman and others came before Mr. Justice North, in the Chancery Division, on the 5th inst., on the application of the defendants for an adjournment of the case under the following circumstances. Mr. Dodd, who appeared as Counsel for the defendants, said that the plaintiff owned a public-house situated at the corner of Filders-street, Clare Market, the action being one for alleged interference with his light and air. His house, however, together with a number of other houses, had been scheduled as being in an insanitary area, under the Housing of the Working Classes Act, 1890. After representation had been made to the Medical Officer of Health, the London County Council complied with that Act, and gave the plaintiff notice of this representation, and eventually, under instructions from the Local Government Board, a person was authorised to make a report, to be laid before Parliament. If the plaintiff's house was in such an insanitary condition that it was not fit for habitation, and could not reasonably be made so, then the London County Council purchase it compulsorily, and they pay to the owner of the land compensation for the value of the land and the materials thereon. That report was expected to be made to Parliament shortly. Under those circumstances, if the case was set down and heard, it would be an injustice for plaintiff to obtain a mandatory injunction to compel the defendants to pull down their building, which was a new building, and which had been erected with the approval of the

London County Council. He (the learned Counsel) therefore wanted an adjournment of the trial, because the owner of the premises was not in England but in South Africa, and this was an important witness connected with the case.

His Lordship: How is that?
Mr. Dodd replied that he ought not to have suggested that he was a material witness, but he was greatly interested in the proceedings. His (the learned counsel's) substantial ground for asking for the adjournment was that if the plaintiff were to succeed in his action as it now stood he would have a mandatory injunction compelling the defendant to pull down a building which had already cost a large sum of money, and which had been built with the approval of the London County Council.

Mr. McSwiney, for the plaintiff, submitted that the application was merely an attempt to postpone the evil day when the mandatory injunction would be granted. If the area in question was condemned, the plaintiff would be purchased out, and the light would be a valuable easement which would have to be taken into consideration when the purchase took place.

His Lordship: Yes, and purchased out by the people who sanctioned the defendant's structure. After some further discussion, his lordship said that he thought that the case ought to be postponed, not because of the owner of the defendant's premises being away—because he could have had a shorthand note taken of the proceedings, and read it over afterwards—but it was quite possible that there might be a report which would prevent him (his lordship) ordering the building to be pulled down. If that report had not been made at the time of the trial, and if he went on to hear the case, and decided it in the plaintiff's favour, he certainly should suspend any proceedings under the order to pull down until he knew what the result of that report was, and it might turn out that the whole trial had been useless. The plaintiff could not, therefore, get any benefit from a decision, even in his favour. What then was the reason for wasting the time on a trial in the meantime? It was not unreasonable on public grounds to postpone the trial, and he should, therefore, adjourn the case. He thought that the best order would be that the case should stand over until further order, with liberty to either side to apply to restore. The costs of the motion to be costs in the action.

Order accordingly.

A BUILDER AND HIS PLANS.

THE case of Smith v. the Chorley District Council came before Mr. Justice Kennedy, in the Queen's Bench Division, on the 8th inst., for judgment. The action was brought by the plaintiff, a builder at Chorley, for a mandamus to compel the Council to pass the plans of a house in Back-lane, Chorley, which, however, it declined to do, on the ground that if the house was built it would make the street 24 ft. wide instead of 36 ft. 6 in., which was the minimum width allowed by the by-laws. The plaintiff's contention was that Back-lane was not a new street. The case was tried before his Lordship and a special jury at the Manchester Autumn Assizes, when the jury found that Back-lane was not a new street. The short point which his lordship had to decide was whether a writ of mandamus was the proper remedy.

His Lordship said that after having carefully considered the arguments of counsel, and the numerous authorities on the point, he came to the conclusion that the defendants' contention was well founded, and that the action for a mandamus could not be maintained.

Judgment accordingly for the defendants with costs.

A FEARDON BUILDING DISPUTE.

THE case of Harrison v. the Feardon Urban District Council came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Lopes and Chitty, on the 10th inst., it being the appeal of the defendants from the judgment of Mr. Justice Kennedy in an action tried by his lordship at the Leeds Assizes.

The plaintiff in the action, Mr. William Harrison, claimed an injunction to restrain the District Council from pulling down or otherwise interfering by themselves, their servants, or workmen, with a coach-house and stable which he was causing to be erected on a plot of land on the western side of Cemetery-road, Feardon, close to a number of cottages owned by him. The District Council in February or March, 1896, proceeded to pull down the buildings, contending that they were an infringement of their by-laws in so far as by their erection plaintiff was making a new street on the space in question, that the passage was not of sufficient width, and that if this building was suffered to stand the new street would only be 13 ft. 3 in. wide instead of 26 ft. 6 in. as required by one of their by-laws. There was no aperture or means of exit of any kind from the building, as erected, into the space or passage; the only access to the building, as constructed, was at its north end, and furthest away from the space or passage. The question was whether the plaintiff had by his erection been beginning to lay out a new street. Mr. Justice Kennedy decided the case against the Council, granting Mr. Harrison an injunction, with the nominal

damages of 40*s.* for the trespass. The defendants now appealed.

Mr. Lawson Walton, Q.C., and Mr. Scott-Fox appeared as counsel for the appellants, and Mr. Robert Wallace, Q.C., and Mr. W. R. Watson for the respondent.

Mr. Scott-Fox said that the question before the Court was one of construction of the by-laws, and although the issues were very complicated the question to be decided had narrowed itself to small limits. The plaintiff had built in Feardon certain property which for the sake of argument, though it was not named yet, might be called Carlton-terrace. It consisted of a row of nine houses, the fronts of which opened on to a narrow pathway, but the backs of which opened on to a road which gave the only access to carts. It was at the back of one of these houses on which the stable and coach house were built. He contended that the roadway was a new street and thereby came under the by-laws.

The court without calling upon counsel for the respondent dismissed the appeal with costs.

MEETINGS.

FRIDAY, FEBRUARY 19.
Architectural Association.—Mr. W. H. Bidlake on "The Architect and the Public," 7.30 p.m.
Incorporated Association of Municipal and County Engineers (Metropolitan District Meeting).—(1) Mr. W. Weaver on "London House Drainage," (2) Mr. R. W. Richards on "Hard Wood Pavements," 7.30 p.m.

SATURDAY, FEBRUARY 20.
Architectural Association.—Visit to the L.C.C. Working Class Dwellings, Boundary-street, Bethnal Green, 2.30 p.m.
Institution of Junior Engineers.—Visit to the Metropolitan Fire Brigade Headquarters, Southwark Bridge-road, S.E. 3 p.m.

MONDAY, FEBRUARY 22.
Surveyors' Institution.—(1) Adjourned discussion on Mr. J. Willis Bund's paper on "Allotments and Small Holdings," (2, time permitting) Mr. C. H. Hooper on "Fruit Growing as an Auxiliary to Agriculture," 8 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Lecture by Dr. A. Wynter Blyth, 8 p.m.
Society of Arts (Lectures).—Mr. C. F. Cross, F.C.S., on "The Industrial Uses of Cellulose," II, 8 p.m.

TUESDAY, FEBRUARY 23.
Institution of Civil Engineers.—Papers to be read: (1) "The Main Drainage of London," by Messrs. J. E. North and W. Santo Crisp; (2) "The Purification of the Thames," by Mr. W. J. Dibdin, 8 p.m.
Royal Victoria Hall, Waterloo-road, S.E.—Mr. J. W. Wagborn, D.Sc., on "X and other Rays of Light" (with experiments), 8.30 p.m.
Auctioneers' Institute.—Mr. J. Hepper on "The Law of Fixtures in Practice," 8 p.m.
Carlisle Architectural, Engineering, and Surveying Society.—Mr. A. W. Johnston on "Architectural Proportions," 8 p.m.

WEDNESDAY, FEBRUARY 24.
Surveyors' Institution.—Annual Dinner, Victoria Hall, Hotel Cecil: Strand entrance, East Black.
Society of Arts.—Sir Henry Trueman Wood, M.A., on "Reproduction of Colour by Photographic Methods," 8 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Inspection and demonstration in the Parish of St. George's, Hanover-square, 2 p.m.
York Architectural Society.—Rev. Canon Angles on "The History and Development of York Minster," Illustrated, 8 p.m.
Edinburgh Architectural Association.—Mr. Alexander Drew, C.E., on "The Practical Designing of Iron and Steel Roofing,"—V, 8 p.m.
Architectural Association (Discussion Section).—Mr. H. Rose on "Dodges," 7 p.m.
Carpenters' Hall, London Wall.—Professor T. Reger Smith on "Our Ancient Cathedrals," 8 p.m.

THURSDAY, FEBRUARY 25.
Society of Antiquaries.—(1) Mr. C. H. Read on "An Inscribed Roman 'Prow' Found in London," (2) Mr. F. Gann on "Antiquities Found in British Honduras," (3) Mr. C. E. Keyser on "The Figures of Saints Found on Devonshire Screens," 8.30 p.m.
Royal Institution.—Mr. J. W. Gregory on "The Problems of Arctic Geology," III, 3 p.m.
Society for the Encouragement of the Fine Arts.—Mr. G. C. Halcott on "Design and Designers during Her Majesty's Reign," Illustrated, 8 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Dr. A. Wynter Blyth on "Sanitary Laws and Regulations Governing the Metropolis," 8 p.m.

FRIDAY, FEBRUARY 26.
Institution of Civil Engineers (Students' Meeting).—Paper to be read:—"Rockers and Expansion-Bearings as applied to Girders of Short Span," by Messrs. A. F. Baynham and F. B. H. Doherty, 8 p.m.
Royal Institution.—Lieut.-Col. C. R. Conder on "Palestine Exploration," 9 p.m.

SATURDAY, FEBRUARY 27.
Builders' Foremen and Clerks of Works' Institution.—Annual Dinner, King's Hall, Holborn Restaurant, 6.30 p.m.
Edinburgh Architectural Association.—Visit to North British Distillery.

MELMERY (Perth).—For the execution of water-supply works, for the Rural District Council:—
 J. & W. Scott, Perth, £440 12 6

MENBOROUGH (Works).—For the execution of road works, Halgate and Crossgate, for the Urban District Council, Mr. G. F. Carter, Surveyor, Council Offices, Menborough:—
 Wm. Hobson Hill-gate. Cross-gate.
 C. A. Walker 453 8 2 301 6 8
 G. Frye 363 10 0 252 0 0
 F. Frye, Sheffield (accepted) 343 11 0 297 6 0

MOVILLE (Ireland).—For the erection of two dwelling-houses, for Messrs. M. Laughton, Londonderry, and Mr. P. Glackin, Moiville, Mr. Foster Nolan, architect, Greenacastle, co. Donegal:—
 Daniel Gillespie £471 0 Charles Doherty 636 0
 James Gallagher & Sons 435 0 M. McDermott, Moiville, 636 0
 Michael M'Daid 355 0 do, Donegal (accepted) 350 0

NEWPORT (Salop).—For the erection of school-buildings, Edgwood, for the Committee of Managers, Messrs. J. R. Veall & Son, architects, Wolverhampton, Quantities by the architects:—
 Willcock & Co. £2,476 9 11 Bradway & Lloyd £2,951 4 0
 T. Facer 1,464 4 11 J. G. Mulhead 863 10 6
 G. Bullock 1,476 8 6 E. Whittingham, New 863 10 6
 A. Roper 1,679 2 6 P. R. Salop 863 15 6
 H. Gough 1,623 16 9 Tommy Brock 855 11 21
 G. de Downing 795 0 * Accepted.

OLNEY (Bucks).—For additions, &c., to school buildings, for the School Board, Mr. C. Dorman, architect, 51, Abington-street, Northampton:—
 J. F. White £1,239 M. Clayton £1,035
 H. Coleman 1,189 G. F. Sherman 920
 W. Whitbread 1,150 J. C. Sherman 943
 E. T. Whitroy 1,110 G. E. Fother, Bedford 924
 Rootham & Jeakings 1,110 * Accepted.

REBOURN (Herts).—For the erection of "Bylands," Red-bourn, Herts, for Mr. J. M. Ashford, Mr. David Burnett, architect:—
 Thompson & Beveridge £2,135 Marriage & Co., The Oval, Croydon £4,510
 C. Ansell 1,990 S. C. Smith 1,470
 C. Miskin 1,737 * Accepted.
 F. Hall 1,605

SOLIHULL.—For the erection of ambulance depot at the Infectious Diseases Hospital, Lyndon Fud, Solihull, Mr. A. E. Carrall, Surveyor, Solihull:—
 S. Turner £1,110 H. W. Thompson £200
 J. Freeman 830 H. Gregory 760
 [Surveyors' estimate, £750]

SOUTHEND (Essex).—For works at the London Hotel, Southend-on-Sea, for Mr. A. Wilson, Messrs. Buries & Harris, architects, Clarence-street, Southend, Quantities by Mr. Henry Bushell, F.S.I., 33, New Bridge-street, City:—
 Contract A.—Structural Alterations and Decorative Works.
 A. E. Symes £285 F. Woodhams £500
 F. Dupont 785 T. Whit, Southend 590
 Contract B.—Bar Fittings and Hard Wood Finishings, &c.
 Brown, Kreuse, & Co. £160 Lascelles & Co. £725
 A. E. Symes 589 F. Dupont, Colchester 720
 * Accepted.

SOUTHEND-ON-SEA.—For wood paving, Clarence-road, for the Corporation, Mr. Harold Harlock, Borough Surveyor, Clarence-road, Southend:—
 The Acme Wood-Floor, s. d. The Improved Wood- s. d.
 Wrig Co. 13 0 Paving Co., 45, Queen- Wm. Griffiths £5,029 L. Whitehead & Co. * 10 6
 * Per yard super. * Accepted.

SOUTHEND.—For the erection of small new church, Southchurch, Southend-on-Sea, for the Rev. Phillips:—
 T. J. Hawkins, Ashford, Middlesex £144

STANMORE.—For the erection of a house on the Stanmore Park Estate, Stanmore, Middlesex, for Mr. W. S. Pritchard, Messrs. Boehmer & Gibbs, architects, 11, Spring-gardens, S.W.:—
 McCormick £5,029 L. Whitehead & Co. * £4,800
 Baley 4,950 * Accepted.

ST. ANNES-ON-SEA.—Accepted for providing and laying pipes, &c., for the Urban District Council, Mr. H. Bancroft, C.E. 88, Mosley-street, Manchester:—
 Josiah Dale, Northwich £693 1 2

WARRINGTON.—For the construction of four streets and thirteen passages for the Corporation, Mr. Thomas Longdin, Borough Surveyor, Town Hall, Warrington:—
 William Beaton * £537 13 0 F. T. Bennett £54 12 9
 Thomas Stringer 24 13 0 *
 * Nine streets and passages. † Seven streets and passages. One street.

WEMBLEY.—Accepted by the Wembley Park Company for the construction of exhibition buildings at Wembley Park, London:—
 T. J. Hawkins, Ashford, Middlesex £5,500

WIMLEEDON.—For the erection of five cottages, Hubert-road, for Mr. W. M. Gilbert, 22, Havelock-road, Hastings, Mr. Wm. Cooper, architect, 27, Havelock-road, Hastings:—
 General Builders, Ltd. £2,214 0 J. Barges £1,750 0
 H. E. Key 2,212 0 J. L. Inan & Co. 1,753 0
 T. L. Pearson 2,212 0 W. Greenfield 1,753 0
 William Beaton * 2,476 0 S. Southam 1,753 0
 Decekill & Son 2,285 0 F. Doubell & Co. 1,650 0
 C. Fryer 2,249 0 H. Brown 1,590 0
 C. Burridge 1,741 0

YARDBLEY.—Accepted for fire stations, for the Yardley District Council:—
 T. J. Hawkins, Ashford, Middlesex £134

TO CORRESPONDENTS.
 B. F. & S. (amounts should have been stated)—J. S., J. S., J. W. L. E., W. C. G. (below outline)—R. K. (too late; next week).
NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.
 We cannot undertake to return printed communications. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.
 We are compelled to decline pointing out books and giving addresses.
 Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.
 All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

SUBSCRIBERS IN LONDON AND THE SUBURBS preparing at the Publishing Office, 19s. per annum (4s. 6d. per quarter), can ensure receiving "The Builder" by Friday Morning's Post.

TERMS OF SUBSCRIPTION.
 "THE BUILDER" (Published Weekly) is supplied DIRECT to the Office to residents in any part of the United Kingdom, at the rate of 19s. per annum PREPAID. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, &c., 26s. per annum. Remittances (payable to DOUGLAS FOURDRINER) should be addressed to the publisher of "THE BUILDER," No. 46, Cannon-street, W.C.

The Question of the London County Council Offices.

THE debate on the London County Buildings Bill last week, in regard both to its tenour and to the vote which followed it, strikes one as a somewhat extraordinary precedent in Parliamentary procedure. Questions in regard to the propriety of the site, and the amount which that and the building cost, might very well have been matters for consideration before a Select Committee. But the House of Commons in this case constituted itself a court to decide on the question whether or no the London County Council required more room for its staff, a matter on which the Council itself certainly was entitled to know best, and acted as the champion of the London ratepayers in a spirit in which, as Sir William Harcourt truly observed, it would not have acted in respect of any other municipality in England. The idea prevailing in the minds of a majority of the speakers seems to have been that because the London County Council's Bill dealt with a metropolitan site, therefore it was to be treated as a State and not a municipal question. But this is a mere geographical illusion. In relation to the House of Commons, the London County Council is exactly in the same position as any other municipality in England. The County Council have established a *prima-facie* case of want of further accommodation, and it seems extraordinary that, under such circumstances, the second reading of the Bill should have been rejected. Moreover, for the House of Commons to reject a purely Municipal Bill of this kind, not after investigation by a Select Committee, but before such proceeding, introduces a dangerous precedent. It may be that the result of the decision is the same as would have occurred after the Bill had been before a Committee; but practically the House of Commons, by rejecting this Bill when they did, constitute themselves the managers of the Metropolis. There is no difference in principle between rejecting a Bill for a town hall and a Bill for a system of drainage.

Considering the importance and indeed urgency of the question—considering that, as Mr. Whitmore pointed out in moving the second reading, two-fifths of the County Council's staff of 500 persons are housed away from the central offices, at a cost of 6,000*l.* a year as well as of much delay and inconvenience in the transaction of business; that there are often as many as fifty Committee-meetings in a week, with only five rooms available for their use; with all these practical arguments it can hardly be supposed that the question of new offices will be allowed to be indefinitely shelved. In spite of the negative vote of Parliament, therefore, we may consider the question as one that we are likely to hear more of before long. Various objections have been raised against the proposed site in Trafalgar-square, of which the two really valid ones are that the site is of a rather awkward shape to deal with, and that the property upon it is expensive to acquire. The former objection however is rather apparent than real, when we consider what successful plans have been carried out on sites presenting quite as awkward lines: the Manchester Town Hall for example. Beyond these, there appear to be two quite opposite objections urged against it; the one that it is unnecessarily large, the other that it is too small. The former is the special cry of the daily papers, most of which know nothing about the requirements of such a building or the space necessary to provide for them, and merely court popularity by adopting what is supposed to be the ratepayer's view. The latter was the view urged on the County Council by the Art-Committee of the Institute of Architects, which has given a great deal of attention to the subject in a very public spirit, and from an architectural point of view. In the Report of the Establishment Committee of the County Council (June 9, 1896) it is stated that the present offices have an area of 37,400 square feet, and the proposed new site has an area of 84,000 square feet. At first sight this no doubt seems a very large increase in area; but when we consider that the present offices give accommodation for only three-fifths of the staff, that the supply of committee rooms is most inadequate, that the stairs and corridors are far too cramped, and that a large margin must be left for future increase of the business and of the staff (and experience shows that such institutions always are increasing), it will

not appear that this is too large a margin. The Establishment Committee, who must have had more information as to their own probable requirements in regard to accommodation than any outsiders could have, seem in fact to have been so satisfied as to the sufficiency of the space that they proposed to devote the ground floor of the new building to shops and business premises, an arrangement which they estimated would still leave double the present floor space available. This proposal, which we suspect was thrown out as a sop to the champions of the ratepayers, as promising a considerable recoupment of the cost of the site, strikes us as a double mistake. In the first place, a larger margin is needed than would be afforded by twice the present floor space, and this proposed employment of part of the ground floor would just throw away space which is likely to be ultimately required. But an almost more serious objection is that such a treatment would be most prejudicial to the architectural dignity and fitness of a building for so important a body and on so important a site. This is so obvious, in fact, that we doubt whether this part of the scheme was ever meant to be seriously adhered to. Wherever and whenever the new offices for the London County Council are built, we have a right to expect that every effort should be made to render them a building worthy of the great metropolitan district the business of which will be carried on there. Cutting and cheeseparing ought to be considered quite out of place on such an occasion.

The Art Committee of the Institute, who have kindly placed before us the information which they have been collecting and on which their views of the insufficiency of the Trafalgar-square site are based, compare this site unfavourably as to extent with that of several Continental Town Halls of which they have procured the block plans, and even, relatively, with the size of some English provincial Town Halls. They take the Paris Hôtel de Ville, which has an area of 14,566 square metres, and compare it with the 9,333 square yards of the Trafalgar-square site,* and ask how London is to be satisfied with so much smaller a site than Paris for its municipal buildings, which are stated to be already proving too small for

* A metre, we may remind the reader, is a little more than 3 ft. 3 in. linear measure.

the requirements of the Paris municipal service. But surely they have overlooked the fact that the Paris Hôtel de Ville is a building for municipal hospitality and fêtes as well as for municipal business. It performs, in fact, the functions of the Mansion House and the County Council offices united. The County Council offices is proposed as a business building only; a council chamber and offices. They cite the Manchester Town Hall, of about 7,740 square yards in area; with the natural inference that a metropolitan building for the same purpose ought to be at least twice as large. But they appear to forget, again, that a considerable portion of the Manchester Town Hall is occupied by a great public hall for entertainments, and that no such feature is in question for the London County Council offices. It certainly seems rather unfortunate that a committee representing the Institute of Architects should, with the best architectural intentions, have been advising the London County Council as to the insufficiency of their proposed site, while overlooking what we should have thought such a very obvious difference between the character and objects of the proposed building and of those with which a comparison was made.

The site favoured by the Institute, as suggested in the *Journal* of May 21, 1896, seems at present to be the only one which can be put in competition with the Trafalgar-square site. It consists of a large triangular plot of land proposed to be left at the south end of the new street from Holborn to the Strand, between the spur streets east and west, containing roughly about 17,000 square yards; situated centrally behind St. Mary-le-Strand. There is room enough for anything here, and of course the property taken would be much less valuable. Against this are to be set the three considerations that, for the County Council business, it is not so central as Trafalgar-square; that, as we understand, in the event of the Trafalgar-square site being adopted the present Council Room would be retained and incorporated in the new buildings; it is certainly quite possible to do this and the Council Room itself is a good room and quite as large as such a room can conveniently be for purposes of debate; and that the County Council wish to retain what may be regarded as their historic position in London. This latter predilection in itself may not be worth paying very much for, but it has its weight in connexion with other recommendations.

At all events, with the absolute and proved need, urgent need, of increased accommodation for the London County Council, we cannot possibly regard the Parliamentary vote of the 18th inst. as disposing of the question for an indefinite period; and though there are objections to the site the Council are seeking for we are inclined to think that on the whole the points in its favour predominate, and that most of the objections raised against it have been somewhat unreasonable.

GLAZED BRICKS.

THE use of glazed bricks is now rapidly extending, not only for internal walls but also for external. They possess several advantages over ordinary bricks and stone, and also over plaster and other wall-surfaces, but

they have also some disadvantages. They are practically impervious to moisture, easily cleaned, and proof against the acids present in the air and rain. On the other hand, some glazed bricks are easily chipped or cracked, and the glaze may soon be stripped by frost. We do not propose to enter into the question of faience, but to discuss briefly the two kinds of glazed brick in most common use, namely, *salt-glazed* and *enamelled*. The best bricks of both kinds are produced in the neighbourhood of Leeds and Halifax.

Salt-glazed bricks vary very much in quality, from the ordinary brick fused on the surface by common salt being thrown into the kiln, to the specially-prepared pressed brick, the face of which is dipped into a "slip" of fine clay before being fired and salted. Bricks of the former kind are known as "ordinary" or "common" salt-glazed bricks, and are chiefly used for sewers, manholes, and other places where a clean, impervious surface is required at comparatively little cost. They are not, as a rule, suitable for external or internal face-work in buildings. The dipped bricks, which are generally known as "best" salt-glazed, are also used in manholes, but more largely in urinals, and for dadoes and other internal work, and also for external work, chiefly in plinths, as in the Clerkenwell Town Hall; but occasionally for the whole front of a building, of which there is a good example in Great George-street, Westminster. These bricks are first pressed, and, while still green, their faces are dipped into a "slip" of fine clay carefully weathered and ground, and sifted through fine silk sieves. It is absolutely necessary that the slip should be of the same clay as the body of the brick, otherwise unequal contraction will occur during firing, and a "crazed" surface may result, or even the thin film may "shell off." "Best" salt-glazed bricks are hard, free from surface-cracks, clean, impervious, proof against rain, air, and frost, and almost as smooth as an enamelled brick. Their durability is now beyond question, as they have for many years withstood the atmosphere of London, and numerous smoky provincial towns. From an artistic point of view they are greatly to be preferred to hard-glaze enamelled bricks. The colour of the latter is too uniform, and the effect of a wall built of them is hard, cold, and monotonous; salt-glazed bricks, on the contrary, are full of variety in colour, toning from orange or light red to a deep red-brown, and this variety adds a great charm to the finished work. A further advantage of good salt-glazed bricks over enamelled is that the glazed surface is actually an integral portion of the brick itself, the face of the brick being entirely fluxed or fused by the action of salt; while in enamelled bricks, the glaze is really a thin plate of porcelain or earthenware fused to the face of the brick by heat, and never becomes actually part and parcel of the substance of the brick.

The best enamelled bricks are prepared from a special kind of clay which burns to a buff or "biscuit" colour. The clay is carefully weathered and ground, and then made into brick-shaped blocks, each of which is brought to the proper weight by having some portion removed from the side where a "frog" will be formed. After being weighed the blocks are passed through one or two presses, by which the frogs are formed and the name or initials

of the maker impressed upon the bricks. Two methods of adding the glaze are adopted, known as the "wet-dip" process and the "dry-dip." In the former, the bricks, while still green, are dipped in the glaze, while in the latter, the bricks are first dried in a heated shed, and then "biscuit," that is to say, burnt in a kiln to a biscuit colour. Each method has its advocates, but as a general rule, it may be said that the question is determined by the nature of the clay and "slip" used in the manufacture of the bricks. The dry-dip process has one advantage, namely, that all bricks which develop cracks or twists or any other defects in the preliminary burning will not be dipped, and consequently the average quality of the final product is often higher than that attained by the wet-dip process.

When the bricks are sufficiently dry to be dipped, or (in the dry-dip process) when they have cooled sufficiently after the preliminary firing, they are dipped three or four times (with intervals between drying) into a thin "slip" which will burn to the desired colour, and also into a transparent glaze. Sometimes, however, the colour is added in the latter instead of in the slip. The portion of slip and glaze overflowing down the sides of the brick is scraped off, and, when the face is sufficiently hard, the bricks are placed in the kiln (care being taken to keep the faces from contact) and burnt till the desired colour is attained. Small bricks are placed in the kiln with the others and drawn out at intervals in order to ascertain how the firing is proceeding.

Sometimes on account of the unequal contraction of brick and slip during firing, or from some other cause, the enamel "shells off" the brick, and may be gathered in shovelfuls from the bottom of the kiln. This is a bitter experience for the brickmaker, and the cause and remedy are often difficult to find. Shelling may be the result of using inferior or unsuitable clay for the body of the brick, or of using a slip which does not contain the exact proportion of materials necessary for insuring its adhesion to the clay under all conditions. Frequently all will go well for a time, and then a change occurs in the bed of clay which is being worked, and the bricks will shell until the slip is changed to suit the clay. With some clays it is impossible to use a slip of the finest quality. Yorkshire enamelled bricks have a good reputation in this respect, the enamel literally differing from that on bricks from some other counties as china differs from common pottery; common potter's clay, or ball-clay, is used in considerable quantity in the slip for inferior bricks, instead of the finest kaolin, or china-clay.

Even when the enamel does not shell off, its adhesion may be so slight as to be overcome by a blow or by the natural agency of wind and rain and frost. The nature of the adhesion may be easily tested by means of a hammer and chisel, or, better, by lightly striking the beds of two bricks together in such a way that the edge of the enamel in one brick is brought into contact with the other brick. If the enamel flies off, exposing a smooth surface beneath, the brick must be condemned. If, however, the enamel carries away with it a portion (however small) of the body of the brick, the bricks may usually be accepted as sound.

In the product of each kiln there is always a considerable number of more or less

damaged bricks—bricks with cracked or discoloured faces or with chipped edges. These are carefully sorted, and sold at reduced prices as "seconds" and "thirds." Only perfect bricks are sold as "best," so that an architect need have no hesitation in condemning defective glazed bricks, however slight the defects may be, provided that "best" bricks have been specified. Strict supervision in this respect is greatly to be desired, as otherwise the quality of "best" bricks is sure to deteriorate, as has been the case with timber and other materials.

Enamelled bricks of several colours can now be obtained—chalk-white, ivory-white, cream, buff, salmon, pink, and various shades of red, brown, blue, and green. Black bricks are also made. White bricks are the cheapest, some of the coloured bricks being nearly 50 per cent. dearer. Moulded bricks for plinths, string-courses, reveals, and other purposes, can also be obtained, and also embossed bricks, and bricks with patterns printed in one or more colours. Most of the patterns on enamelled bricks are, it must be confessed, almost as ugly or ineffective as they can be made.

Soft-glaze bricks of the nature of majolica are often made, but, while possessing a richer body of colour (somewhat like salt-glazed bricks in effect, but softer), they are frequently crazed on the surface. They are not considered as durable as the "hard-glaze" bricks, of which we have hitherto been speaking, and should not be used for external work, especially in towns, as the sulphuric and sulphurous acids in the air act injuriously on the lead which forms part of the glaze.

Of the sanitary advantages of glazed bricks there can be no question. In water-closets, urinals, lavatories, bath-rooms, sculleries, corridors, basements, areas, and other places where dirt and darkness are wont to abide, they may be used with vast improvement of "sweetness and light." They may also be adopted with advantage in larders, pantries, and kitchens, and even in dustbins and the inspection-chambers of drains. The "best" bricks of the best makers are now of such excellent quality that little fear of shelling or decay need be entertained; at the same time it must be acknowledged that the makers of some of the best of these bricks do not advocate the use of enamelled bricks in the open air in towns—at any rate, in exposed situations.

NOTES.

It is to be hoped that, in spite of the completion of the *non possumus* of the Treasury, the suggestion that the completion of South Kensington Museum should be taken in hand this year, as one method of commemorating the longest reign, will not be lost sight of by the Government. We have not heard hitherto of any proposal to celebrate the occasion by a work of art; this would be both a work of art and a work of utility. It is impossible to mention the subject without referring to the absurd attempt made by Sir Charles Robinson, in a letter in the *Times*, to urge that no architectural art should be represented on the exterior of the building; that all we want for an art-collection is a shelter. That is in the true English spirit; other objects of art are of interest, but when it comes to the question of a great building, anything that is

cheap will do. It is true that the competition designs for the completion of South Kensington showed an unnecessary emphasis in towers; that is an English weakness also; but in other respects an Art Museum is one of the most fitting occasions for architectural richness and beauty of treatment. In this case, besides, the keynote has already been struck by the rich and effective elevation of the Science Schools towards Exhibition-road, with which the new building must be in immediate contact.

A Sham Institute of Architects.

THE promoters of a society which calls itself the "Institute of Architects and Surveyors" are again sending round printed circulars to those who they presume to suppose will be attracted by their prospectus. The "Council" is composed of persons whom no one has ever heard of, and we observe that the President, one Mr. J. H. Wilkinson, places after his name the letters "F.S.A.," which are universally taken to stand for "Fellow of the Society of Antiquaries," but we find (as we expected) that no such person is known to the Secretary of the Society of Antiquaries. It appears to us that the Institute of Architects ought to take legal steps to prevent the use of a title of which the first and principal portion is identical with their own. Knowing as one does how ill-informed the daily press are, and what blunders they make, in regard to everything connected with architects and architecture, there will certainly be mistakes made in regard to this title—mistakes which may be prejudicial to the real Institute of Architects. Our own readers will not need to be put on their guard.

We have recently had an opportunity of examining the process by which "Petrifite" artificial stone is made, as well as many samples. In the manufacture of the material, sand, slate, dust, common earth or mould, sawdust, and waste products of various kinds may be used as a base, the loose particles being compacted by "Petrifite," which, therefore, acts as a cement. It is obvious that the value of the material depends almost entirely on the properties of the cement. Beyond well-incorporating the latter in the wet state with sand, or whatever base may be employed, and allowing the whole to set, nothing else is done, the process being exceedingly simple. The nature of the cement was not stated by the makers, but there is no difficulty in seeing that it is of an entirely different character to Portland or cements of that kind. Unless we are mistaken, "Petrifite" is composed essentially of magnesium lime: *i.e.*, lime prepared from the carbonate of magnesia—the magnesite of mineralogists. The cement certainly possesses many remarkable properties. In the samples submitted for our inspection many peculiar substances were used as bases. Amongst others were a piece of moulding consisting of "Petrifite" and slate dust; a corrugated roofing tile the base of which was slate dust and sand; iron oxide and slate dust cast; and billiard table slabs of slate dust and sand. "Petrifite" binds common earth quite readily. In making a path it is only necessary to dig up the surface mould, and mix it with the cement on the spot, then, smoothing it over, the whole sets in a few hours, producing a hard paving material. Tiles, stone blocks, slabs of marble,

paving bricks, and slabs made of "Petrifite," mixed with refuse of various kinds, were on view, and there are many additional applications of the cement for building and other purposes. Being a fireproof material it has its advantages in that respect; it may be used as a "fireproof paint," pieces of wood painted with it burning with difficulty. It may be used as wall plaster; for making sewer and other pipes, &c. It is almost non-porous, and in the shape of stone blocks bears a great crushing strain, quite as high as many good, natural stones. From the general chemical composition of "Petrifite," and from its structure, as seen under the microscope in thin sections, which latter show it to be of a semi-crystalline nature, we imagine it would stand well in the atmosphere. The material undoubtedly has a future; something like it has been in use in Germany for a few years, and has given satisfaction.

The Trial of Patent Cases.

SOME discussion has been taking place recently among those interested in the settlement of legal points which arise in regard to patents, on the desirability of having all patent cases assigned to one judge for trial. During the last sittings of the Courts Mr. Justice Romer was almost entirely engaged on the trial of patent cases. It is argued that if shipowners and merchants have, in the Admiralty Court and the Commercial Court, a special tribunal, why also should not those who are concerned in litigation as to patents. The reasoning is sound. There can be no doubt that it would conduce to the satisfactory and to the prompt disposal of patent trials if they came before the same judge. No new procedure is necessary, all that is required is an order by the Lord Chancellor assigning all the patent cases which are set down for trial to one judge. They should be placed on a separate list to be dealt with at the judge's discretion. Whether the patent cases should have priority, or the judge only take cases other than patent cases if none of the latter are ready for trial, is perhaps a matter open for discussion. We are inclined to think that if the lists of the other Chancery judges were freed from patent cases, the judge to whom this class of litigation is assigned might well give it priority over other business, and merely deal with the latter as a kind of extra work on such days as patent cases were not ready for trial. Such a change would be entirely in accordance with the tendency of modern business.

Continental Exhibition Finance.

As we have observed, there were last year a large number of national exhibitions on the Continent; we have at times specially referred to those at Berlin, Buda-Pesth, Nichninovogorod, and Geneva. The various reports of the financial results of these exhibitions are now accessible, and are practically all unsatisfactory. Commencing with the Geneva Exhibition, which we considered badly managed, the deficit is 20,000*l.*, whilst for the Industrial Exhibition at Berlin, if we are rightly informed, the guarantors will have to pay at least 75,000*l.* The exhibitions at Nichninovogorod and at Buda Pesth were not intended to be commercially successful, as they were primarily of historical importance. The extra expenditure above the estimates is, however, in both instances enormous. Of the smaller exhibitions at

Dresden and Malmoe (in Sweden) we at least do not hear of a deficit; but nowhere, even in connexion with the smallest exhibition, do we hear of good financial results. This, we think, should be a lesson to those who promote so-called "National" exhibitions, and who, during the early stages, are generally so optimistic as to the financial results.

It appears that the Department of Fine Arts in the French Ministry has appointed a special Committee to consider the question of making provision for the exhibitions of both the Paris Salons during the years 1898 and 1899, when the buildings in which they have hitherto exhibited will not be available owing to the preparations for the exhibition of 1900. What the result will be is very doubtful at present. It is much to be wished that this difficulty could be made an opportunity for amalgamating the two Salons, which would be a great deal better for the artistic standard of both exhibitions.

THE remarkable tribute of esteem and admiration which has been offered to Mr. G. F. Watts on the occasion of his eightieth birthday is a gratifying proof that, in spite of the prevalence of a taste in the present day for what is superficial and sensational in art and literature, there is at least among us a considerable leavening of persons who can appreciate and honour an artist of high and serious aims, and a personal character so noble and sincere as that of our greatest living painter. Probably one may assume that the tribute was paid as much to the man as to the artist. If, however, the remarks which we have read to the effect that it was felt that "Mr. Watts was something more than a painter," &c., are taken to mean that part of his claim to this honour arose from his attempts, in recent years, to render painting subservient to the reading of moral, philosophical, and historic lessons, we must so far dissent. It is rather, we think, Mr. Watts's one weakness—a noble one no doubt—that he has attempted of late to make painting do what cannot be done with it, without interfering with its purely artistic ends.

THE announcement that the most important portion of the great art-collection of the late Sir Richard Wallace is to be given to the nation is one over which all lovers of art may well rejoice. The collection included in it of the works of Meissonnier and Decamps, to which we devoted a long article a good many years ago, would alone render it a national art-treasure of a most precious kind. It is to be hoped that the condition that a special gallery should be erected for the collection will be carried out in a liberal spirit, and that the architectural framework will be worthy of the treasures it is to contain.

IN the north-west pier, 4 ft. from the face of the front adjacent to the passage, an owl's nest has been found, about 9 in. diameter of entrance; in it were the usual twigs, bones, &c. This is a demonstration by nature of the character of the material of the filling. The birds and bats take the view

of the Society of Antiquaries and the S.P.A.B., and resent the interference of the Dean and Chapter.

A RUMOUR of a rather alarming nature was recently circulated in the Isle of Wight to the effect that Carisbrooke Castle was to be "put into a state of thorough repair." The statement was made, in addition, that plans for this alleged future repair were to be laid before her Majesty in the early spring, for her sanction. Probably this apparently authentic report arose from the erection of the scaffolding at the gateway for the museum works inside it. However, no such "thorough repair" appears to be contemplated, and official information from the Secretary of the First Commissioner of Works and Public Buildings has been forthcoming, to the effect that not only is the museum being built under the control of the Board's officers, but that permission to construct it was granted under the express condition that the exterior should not be interfered with.

THERE are several new precautions recommended to be taken for protection against fires in the latest edition of the Liverpool, London, and Globe Company's Installation Rules. Contractors would do well to read the rules for "conductors," which have been largely rewritten; they will find several useful hints as to the methods of protecting casings under floors, passing vertically through floors, &c. Several additions have been made to the rules for electromotors; for example, that every motor should be legibly marked with the speed at which it may be run, and the volts and amperes it is designed to use at full load. The necessity for this rule shows that there must be a large number of inferior motors in use. Another rule, suggested by the recent fire at St. George's, Hanover-square, is that every motor should be enclosed in a fire-proof case which should form part of the motor itself, and not be an added removable covering. The company recognise that the switchboard forms the point of an installation at which fires most frequently start, and they should therefore be made as incombustible as possible. They point out that special precautions should be taken against earth faults arising from resistance and choking coils in the circuit, a point upon which we have always laid great stress. Electricians will be interested in the warning to central stations to run the conductors from the accumulators in such a way that if on fire they could not form short circuits destructive to the accumulators.

DR. R. BRUCE Low's report to the Local Government Board on the water supply of Long Buckby in the Rural District of Daventry, Northants, gives one of the worst accounts we have seen of the pollution of water supply by a bad drainage system. The village is not sewered. Larger houses have cesspools, some of which are so constructed as to allow fluid sewage to soak away, and therefore they require little trouble in emptying. Excrement is disposed of mainly by vault or cesspit privies situated in backyards, and emptied, usually at long intervals, by the occupiers on fields, allotments, or gardens. Some cesspits have recently been

cemented, but the majority have not, and are therefore not watertight. The ashpits and middens are emptied sometimes once some times twice a year by the occupiers. Large accumulations of house refuse that had long ago overflowed from the midden or ashpit on to the adjacent ground were frequently seen; the occupier's usual excuse being that some farmer had failed to fetch the manure when requested to do so. "In such instances the filth lies for some hours or days exposed to rain and sun, creating nuisance, sometimes by soaking into the ground and polluting it at others by being blown about in the village as excrement-laden dust. In several instances excrement from the privy had been spread on the garden close to the house. When after this we read that "Long Buckby derives its water supply from about 116 local wells," we are not surprised to find that there are serious complaints as to the character of the water.

SOME interior alterations, together with the erection of a additional gallery, or sale-room, are being carried out by Mr. H. Roffey of Putney, builder, under Mr. Emden's superintendence, at the premises of a well-known firm of auctioneers in this street. The firm of Sotheby, Wilkinson, & Hodgson was originally founded by Samuel Baker, in 1744, at a house in York-street, Covent Garden. In 1804 the business was removed to No. 141, Strand (opposite Catherine-street), and in 1818 to No. 13, since renumbered 13, in Wellington-street. Mr. John Wilkinson, late senior partner, died three years ago, aged ninety-one. Jacob Tonson's house, the "Shakespeare Head," over against Catherine-street in the Strand, was afterwards numbered "141"; as rebuilt, it was occupied by Andrew Millar, publisher, by the sign of "Buchanan's Head," and next by his quondam apprentice, Thomas Cadel, alderman, the friend and publisher of Gibbon. Messrs. Foster & Dicksee, of Rugby and Manresa-road, S.W., are contractor for the new buildings at the corner of Wellington-street and the Strand, the architect being, we are informed, Mr. A. N. Bromley of Nottingham. For those premises, which stand back 11 ft. from the former alignment, have been pulled down the houses numbered 134-138A, Strand, and Nos. 2-8 (even) Wellington-street, as far as the front (west) of Somerset House. Thus has disappeared Duchy-place, or court, a descent between Nos. 136 and 137, Strand, on the Duchy of Lancaster estate. It formed the boundary on that side, of the precincts of the Savoy and, moreover, marked the position of the Strand Bridge, as laid down on the Ordnance Survey. Vertue's survey and view of the Savoy was done in 1736 for the Vetusta Monumenta; an earlier plan, by Wren, is in the Soane Museum.

THE society of French artists under this title has just opened its fourth exhibition in the Durand-Ruel Gallery in Paris. The exhibition, which is an interesting one generally, includes a fine collection of the works of Théodore Chasseriau. Among other works of special interest may be noticed the studies of Algerian life by M. Gabriel Rigolot, the "École Arabe" of M. Taupin, and the paintings by M. Dinet, whose "Courtisane"

in particular has a force and power of colour which recalls the oriental subjects of Delacroix. Among others of the most prominent works are the "Fête des Morts chez les Juifs" by M. Girardot, the "Vues d'Egypte" in which M. Morand has conveyed such a strange sensation of pathos; the "Cimetière de Tunis" by M. Nézière, and the "Etudes d'Orient" by M. Charles Landette. It may be observed that this exhibition is entirely free from the artistic commonplaces which are so abundant in many of the minor exhibitions in Paris.

SKETCHES OF LONDON STREET ARCHITECTURE.—X.

NO. 163, SLOANE-STREET.

THIS is not a new house, but a conversion of an old one. The aim was to get away from the red brick mania; so the old stock brick walls remain, and Monk's Park stone is used for the window dressings, bay window, &c., and the stone is massed at the entrance and in the top story. Mr. Fairfax B. Wade is the architect.

THE ADVANCEMENT OF ARCHITECTURE*:

WITH REMARKS ON THE STUDY OF GOTHIC.

Plans.

PLANS are not only necessary, but are interesting in many particulars. They are necessary to show the sizes and arrangement of buildings, as well as the thickness of the walls, the sizes of the piers, and other independent supports. They are interesting to architects, at least, from showing certain peculiarities or excellencies of disposition, and of suggesting difficulties in construction, and the most important, perhaps, is that of suggesting how large spaces are to be roofed. In Greek times several temples remained hypothetical from the difficulty of roofing wide spans with the timber they had, and their knowledge of trussing. In Roman days, when almost all large and important buildings were vaulted, though their method was to abut the concentrated thrust of groined vaults by dead weight, yet we can see the care they took, and the ingenuity they displayed in utilising the walls of adjacent chambers for this purpose. And it must be borne in mind that as their vaults when once set had no thrust, being constructed of horizontal courses of rubble or concrete, yet this thrust was very serious while the work was green, and we see that what were practically flying buttresses were used to abut the vast vaults of the Basilica of Maxentius, those of Caracalla's Baths, and elsewhere. Gothic vaults were elastic, and depended for their stability on counter-thrusts, and where the dead weight was carried by slight columns, large buildings, such as abbey churches and cathedrals, were designed downwards from the vaults, the plan showing the directrix of every vault, thus giving the plan a great additional interest. Plans also suggest effects, such as that of extreme length or width, and the combination of agreeable forms, the size and situation of the windows, and the thickness of the walls; they give some notion, too, of the climate in which the buildings were erected. A rough idea of the purposes for which a building was to be used is also to be gained from the plans, but from its very vagueness it gives great scope to the imagination, as well as a stimulus to deduction. I may say that no detective story of Gaborian's or Poe's can require more patient investigations or more logical deductions than the plan formed by the walls of a destroyed building when we are not intimately acquainted with the particular occupations of the people who inhabited or used the building; and in this respect the uses of buildings and of particular parts of them are much more complex than the motives of crime, or supposed crime: plunder being the usual motive, occasionally jealousy, hatred, revenge, or madness, and sometimes the supposed crime was caused by accident. Take the Roman baths for example, nearly the whole of Latin literature teems with allusions to the bath and to bathing, and yet the uses of many of the chambers cannot even be guessed. To speak of Constantine's Baths alone, there were two galleries some 20 ft. wide, and 100 ft. long, shewn by Palladio

Sketches of London Street Architecture.—X. No. 163, Sloane-street.
Mr. Fairfax B. Wade, Architect.

to have been vaulted, whose use we cannot even guess. We are perhaps not quite so badly off in respect to the cathedrals and great abbey churches, as there must be traditions, one would think, and we know some of the reasons for some of the shapes. Constantine gave some of the ancient basilicas to the clergy which were in the old Taw form; and I believe it is stated that he dreamt that some church he was having built should be of cruciform shape. We know, too, that some time between the sixth and ninth century each aisle of a church was dedicated to a separate saint, and apses were put at the east ends of the aisles. Sta. Prassede, at Rome, built in 817, has not got these apses to the aisles, and yet Sta. Maria, in Cosmedin, said to be built in 772, has them; though I cannot affirm that these aisle apses are not of later date. I merely mention these matters to point out that if the reasons of some peculiarities are unknown to us, the reasons might be found out by a closer attention to changes in ecclesiastical ritual, to favourite methods of decoration such as stained glass, to structural reasons, and to what I may perhaps be allowed to call taste, that is, the

æsthetic effect certain proportions had on the people who paid for the structure.

I begin by giving you the plan of the great Renaissance Cathedral of St. Peter, about whose area there seems to be the greatest divergence of calculation, as the area given varies from 227,069 to 150,000 superficial feet, and though one may have taken it at the line of the main wall, and the other at its extreme projection on the ground, one can hardly suppose this immense difference could be due to such a cause, but must suppose that it was due to one or both of the plans from which it was measured being inaccurate. I think, however, that it is agreed that its area of supports are more than one-fourth, or 26 of its whole area, the total area of Notre Dame at Paris varies in different authorities from 67,343 to 54,050 superficial feet, while its area of supports are little more than one half that of St. Peter's at Rome, or one-seventh '14, and I believe that this is a considerably larger percentage than other large vaulted French churches and cathedrals have; I think St. Ouen is said to be but one-ninth.

Some of the Roman baths have large halls,

Illustrations to Professor Aitchison's fourth Royal Academy Lecture. Comparative Plans of Cathedrals. (No scale.)

* * * As these plans were supplied to us by Professor Aitchison on various scales, and mostly without any scale appended, we have thought it best to ignore scale in this instance and reduce them to the same size, as the real object is not the comparison of size but the comparison of plan and of the proportion of piers to spaces.

something under 200 ft. long, 80 ft. span, and 100 ft. high, and these are mostly the warm rooms or Tepidaria, but these are not to be compared to the great cathedrals in length, which are often nearly 500 ft., nor in height can they compare with Amiens or Beauvais, which are respectively 140 and 153 ft. high; and though the cathedrals with the widest spans such as Seville, Milan, Florence, and Bologna, do not exceed about 56 ft. span, yet most of them are supported on comparatively small isolated piers. As far as towers are concerned, the Romans, we believe, never reached half the height of the Mediaeval spires. Those of Antwerp and Chartres are said to be 403 ft., Salisbury 404, that of the Cathedral of Vienna 441, Strasbourg 468 high, and these are by no means plain, sloping, corbelled out spires; for the spire at Strasbourg, at least, was of lace work. To revert to certain peculiarities, I may point to the five Absidiolles in the apse of Vezelay, which is so characteristic a feature in most of the French cathedrals; those at Vezelay were probably put in when the choir was rebuilt after the fire, 1167, and may be found

at Westminster Abbey; the fifth one, probably the Lady Chapel, having been removed to make an entrance to Henry VII.'s Chapel, but in most of the principal English cathedrals they do not exist, though there are the early adopted Absidiolles in the east transept of Lincoln, Canterbury, and Gloucester, and in the latter church there are two Absidiolles in the retro-choir. At Notre Dame, Paris there were three, before it was enlarged by taking in the space between the buttresses. There are five in the following cathedrals and churches: Chartres, Soissons, Clermont, Alby, St. Ouen, Narbonne, Limoges, and Tours. There are six besides the Lady Chapel at Amiens, at Contances and at Troyes, and ten at Le Mans.

As regards the east ends of cathedrals in France, they were mostly semi-circular or polygonal, except at Laon, which was possibly built under English influence, and has a square east end, while in England they are mostly square. The Saxons are said to have mostly had square ends to their churches; besides, square ended churches give less trouble in vaulting. When

churches became a mere framework for stained glass, a large extra surface for glass was got by keeping the east end square, though at the expense of artistic effect. Probably two things then desired were gained, the certainty of the east window being looked at, and the avoidance of the worshippers turning their backs to the altar; but by doing so, the proper effect of the altar and its ministrants is spoiled, it ought to be well lit by screened side-lights, and stand out light against a mass of shadow, as may be seen at Strasbourg. When Justinian dreamt that the apse of St. Sophia ought to have windows, to say the least he had an unfortunate dream, for nothing destroys the effect so much as having the light right in front of you as you enter. Nothing, in my opinion, has a worse effect than boxing in the choir, it looks like a small building that has fallen into the large one, and merits Charles V.'s disgust at the clergy, for putting a new church into the middle of the mosque at Cordova. At St. Mary-of-the-Blossom at Florence you see the altar as the main feature on entering at the west, with the vast dome as its canopy. The greatest mistake in

cathedrals and large churches is the uniform lighting, which destroys all effect. Certain parts want the most brilliant lighting attainable, but these light spots should be set off by a proper background of gloom. In those buildings especially that are dedicated to emotional use, and where mystery and awe should be awakened, no artistic blunder is so colossal as to sacrifice a grand emotional effect to uniform lighting. As a rule the cathedrals at home and abroad miss the emotional effect of lighting altogether, except at dusk or when there is evening service in the winter, when there are violent transitions from brilliant illumination to the deepest gloom. The finest daylight effect is to be seen at the Pantheon at Rome lit by that single eye, which is quite worth a journey to Rome and back to experience the emotion it causes. Admirable effects are to be seen in cathedrals and churches when it is dark or even dusky, and there are artificial lights. At the Basilica of St. Mary the Greater at Rome one chapel is occasionally illuminated at a night, and you have to pick your way to it through the gloom, lit perhaps here and there by a small dim lamp. The effect of one illuminated chapel amidst "this mighty contiguity of shade" is not only picturesque but wondrous. The only time that Milan Cathedral is impres-

sive is at early service in the winter. The vaults and even the capitals of the vast piers, hidden by rolling wreaths of mist, while dim figures, but partially outlined, are seen hurrying to the chapel, lit, perhaps, but by one lamp, whose light pierces through the darkness. In the old days, the two bronze pulpits stood out blacker than the gloom, and marked out the extent of the enclosed choir, now they are benedized like a French plum-box, and utterly cease to be effective in daylight or at dark. One aim of the late Gothic architects was to make a whole church nothing but a picture-gallery of stained-glass, wonderful as a constructive architectural effort, but mostly destitute of effect, for when the glass painters began to pride themselves on their drawing, you have large Scripture subjects with the principal figures transparent, and generally of poor colour. In the old glass the painter's aim was to get colour and to be careless of form, so he made most of his Scripture subjects to a small scale, but he got glorious and divine colours from the sunshine streaming through the windows. At Chartres you get a heavenly effulgence of resplendent and harmonious colours through the windows, throwing beams of loveliness around, which "dissolve me into ecstasies and bring all

heaven before mine eyes." We can now admirably imitate the bad drawing and miss the divine harmonics of colour! The early Saracen conquerors believed that the Almighty had given David that power over iron that it could be woven like thread in his hands. Stone was like this in the Gothic architects' hands, they knew its powers thoroughly, and could do what was possible with it. I do not think its tensile strength was ever turned to architectural account in Europe until Late Gothic times, when you see vaults springing from pendants, as at Henry VII.'s Chapel, and at St. Ouen, and it was then that the men of genius did those feats with stone which astonish and almost awe us; just as a great composer, who is a great performer as well, throws his rules and canons to the wind, and lets his emotions carry him where they will, so that he may captivate and enchant his audience and carry them to the summit of ecstasy or to the depths of despair. If we want to attain this power we must submit ourselves to the training that the Romanesque and Early Gothic architects went through. There is every reason to believe that all the great building races, Egyptian, Greek, Roman, and Medieval, had some set proportions for their

buildings arranged by some method of triangulation. Cesare Cesariano tells us in his edition of "Vitruvius" of 1521, that the Cathedral of Milan was set out by the German architects on a figure of two equal equilateral triangles put base to base, the apexes of both triangles being on the vertical centre line of the building, and that the east face of the polygonal apse was drawn at right angles to the centre line from this apex, the other apex gives a point a little inside the west wall, the base of the two triangles giving the east walls of the western staircase towers of the transept, and although the plan does not exactly agree with this statement, it may be from bad drawing, bad engraving, or the unequal shrinking of the paper. Cesare also speaks of many more systems of triangulation inside than those I have just spoken of, but it seems to me that the German architects gave him very vague or imperfect information, for he gives the main dimensions of the building in Braccia. There is, though, one triangle in one of the sections that gives us something definite; an equilateral triangle, whose base is the distance between the internal faces of the walls on the pavement line, settles the central vault of the nave, as these lines are tangential to the sides of the pointed arch. Viollet-le-Duc believes that there were some general proportions adopted in cathedrals and other Gothic buildings, but he is not much clearer than Cesariano himself; so I think we may say that, though it is most probable that the Gothic architects had some rule, it has not yet been discovered. We know, however, as regards the insides that one great aim was to strike awe by disproportion, *i.e.*, by making the naves and choirs enormously high in proportion to their widths.

It is most extraordinary what strange views are taken of the importance of certain measurements as compared with others; for instance, as regards width, the span of the widest vault is the most important; and next to that the height of the nave looked at from a constructive and from a certain æsthetic point of view. Even in so common a thing as a bandbook, one might expect that the width of the nave could be taken by a local antiquary, with the help of the verger and a tape, and now, with one of those gas inflated india-rubber balls and some string it is not difficult to get the height of the nave. Even architects mostly decline putting on the general lengths and widths in figures, leave out the scale, and put on the ratio in writing, which is aggravating enough when the scale is in English feet, but when it is in metres it renders the task impossible for the time, *i.e.*, until you get a metre scale. We have to thank M. Gosset for putting a scale to the plates in his monograph on Reims Cathedral.

I append a list of some French cathedrals, with the length, span, height of nave, height of towers, with a note of their transepts and their aisles.

Also a list of some of the English cathedrals, with their areas and the other particulars, as in the French cathedrals. The dimensions are taken partly from Ferguson, and partly from Lord Grimthorpe's book.

[The lists referred to will be given as an appendix at the end of the lectures.]

THE ARCHITECTURAL ASSOCIATION: THE ARCHITECT AND THE PUBLIC.

An ordinary fortnightly meeting of this Association was held on Friday last week, in the Meeting Room of the Royal Institute of British Architects, No. 9, Conduit-street, Mr. Eresford Pitt, President, occupying the chair.

The minutes of the previous meeting having been read and confirmed, the following gentlemen were elected members of the Association:—Messrs. S. E. Barrow, C. B. Cheshire, and T. M. Wilson.

On the motion of Mr. E. Howley Sim, Junior Hon. Sec., a vote of thanks was passed to Mr. Sidney R. J. Smith for recently conducting the members over the National Gallery of British Art, Millbank, and for providing refreshments on the occasion.

Mr. Banister F. Fletcher, Senior Hon. Sec., said that Mr. Wallace Rimington had kindly made arrangements by which members of the Association might be admitted to the exhibition of his drawings at the Fine Art Society's Gallery. Members would be admitted by presentation of their tickets of membership.

The Chairman then called upon Mr. W. H. Bidlake to read the following paper, entitled "The Architect and the Public":—

The public is not inherently or intuitively antagonistic to the architect, nor the architect to the

public. Some assume that this state of hostility does exist. On the contrary, each stands for a mutual help to the other. I must live and he sheltered. This want you will satisfy, and you will make my shelter beautiful for me. For all this I will assist you in turn towards living and being sheltered. What arrangement could be more just? Quite true, but yet the working of the arrangement might undoubtedly be more harmonious. Then comes the question, How? That is the subject for to-night's discussion.

The world is divided by the English schoolboy broadly into two classes: What is good to eat, and what is not.

To the architect society appears in similar fashion divided into two groups—clients and non-clients. The architect has the advantage of the schoolboy; he can regard any member of the public as a potential client—perhaps would be wise to do so—but the small boy cannot regard, in the same way, his rod of chastisement as a potential plum-cake. Literally, too, every taxpayer and ratepayer is a client where state or municipal buildings are concerned. Of course, he will take an interest in the matter, will see, as far as he can, not only that money is wisely expended in a well-constructed and convenient building, but that its architectural beauty shall gratify his citizen pride. In securing economy he will undoubtedly take an interest, beyond that, not the slightest.

The unwelcome fact may be faced at the outset. The British public is profoundly indifferent to architectural matters. Some one perhaps says no. I reply, "Brompton ho!" From this lethargy one will occasionally awake, and with a volume of Ruskin in his hand, vehemently denounce the modern architect and all his works. To me it seems immensely to the credit of architects that in the teeth of this public indifference so much good work is done.

No wonder Seti or Rameses could count upon the production of a hypostyle hall at Thebes, superbly grand. The services of the architect were then regarded as amongst the highest in the State.

Under Pericles every Athenian gloried in each fair jewel of that architectural diadem that crowned the Acropolis.

At Florence, in the days of the Renaissance, the same keen interest in architecture invigorated the air her great builders breathed. It braced them to surpass each other, to surpass themselves, to rear works that should be the subject of public praise, even of public gratitude. And of the many great men of that period who practised Architecture some have achieved immortal fame.

When a people is deeply touched in its heart and emotions, especially when it has been emancipated from some yoke and is intoxicated by the spirit of freedom and hope, then is there an outburst of music and song, and exquisite and grand creations of Art.

Such was the case amongst the Athenians after the overthrow of the Persians at Marathon and Salamis, and such, when at the Renaissance, men threw off the superstition and tyranny of the Church which had held them in moral and intellectual slavery.

A certain degree of wealth ungrudgingly spent is necessary before the enthusiasm of a people can express itself in grand architecture. But easy commercial prosperity makes men content with the uneventful commonplace present; it does not set them longing or idealising. Physical luxury and social position is what they ask, and that they may be left alone to make money. Life runs smoothly, and surface currents do not disturb deeper emotions. The arts, however, minister to the pleasures of life amongst those who are cultivated to feel their influence, and so, even in easy commercial days like these, they may not only flourish, but progress in a steady, quiet fashion, provided that public apathy be replaced by a keen appreciation. For no lovely flower blooms in the garden of neglect.

An architecturally appreciative public would stimulate the architect to produce his best. He would produce better work than then he could do in an indifferent world. All his faculties would be awakened. The prospect of public commendation would stimulate him to create something worthy of public praise. But, gently! He will need more than that. Public praise is very well, but what if it be the applause of ignorance. Public appreciation, to have any worth and to be capable of influencing the best men, must be critical, and founded on knowledge and good taste. Else will it only be despised.

This leads us to consider a second unwelcome fact. The British public is profoundly ignorant in architectural matters. How could it be other-

wise? Indifference breeds ignorance, and ignorance indifference.

People for the most part do not even know what architecture consists in. Some seem to regard as the application of archeology to modern building, a view which has been fostered by architects themselves. There are some clerics, for instance, who have studied Park "A.B.C. of Gothic Architecture," or have mastered the terms in a glossary, whose lecturing on correctness of style the architect—much more trying than modest ignorance. As we may, no doubt, recall one or more amateur architects whom a little knowledge has made extremely dogmatic.

The popular idea of architecture is that of ornamenting buildings. Here is a barn or factory. Ooly cover it with sufficient ornament and it will become architectural. The ornament may be inappropriate and misplaced, it matters not. Before it was a plain, ugly building, now it is a beautiful one; it is a work of architecture. Such a view might be pardoned in an uneducated man, but it is the view of many an otherwise well-educated man. It is notorious that men of taste who can appreciate good music and painting, and literature, fail in understanding the excellences of good architecture.

If a building is treated in simple broad masses it is called plain and ugly—that is, unornamented. The grandeur of breadth and mass is the thing that the public will admire, unless it is that equally fine quality of reticence. No doubt there is a winning grace in modesty, theoretical; but the Englishman likes to see a man push himself to the front, and he likes to see a self-assertive building, too. He calls it a "hard structure."

This popular architectural taste is especially to be deplored, because it is answerable for the production of an ostentatious class of building which is vulgarising whole districts. And we must suppose that there are architects as insensible to their clients to modesty and refinement in design or else that they are content to sacrifice whatever principles they may have to captivate the popular taste.

Another popular fallacy is that the planning of buildings and the designing of them are two separate processes, and, further, that a building may be designed on paper. So it may be by the experienced man who is reading the perspective value into every part of his drawing. But the paper and T-square designing is, I fancy, one of the chief causes of architectural failure. The right treatment of building material is a matter about which the public has no ideas at all—fact, does not even know that there may be right and a wrong way of using material, still less that this is an important factor in judging the excellence of a building.

The effect of this widespread ignorance is not only that architects are deprived of the stimulus of cultivated public opinion and approbation, but the public itself is a loser. For not being able to criticise its architects intelligently, and being perhaps, conscious of the fact, it is at their mercy—and the tender mercies of an architect may be very cruel. Having revived Greek, Mediaeval, Gothic, or some other more or less unsuitable style, the architect will tell his client what is the present fashion, and what is the proper thing to have, and the client, with British long suffering will pay heavily for being made miserable and uncomfortable until his lease or his life runs out.

But why should this public ignorance of architecture surprise us? From our youth up we have been taught music, and have studied English literature. We have also been taught English history—as being for the most part a series of sanguinary conflicts between England and France, with occasional civil wars at home; but no one has instructed us how to read for ourselves the history of our forefathers written in the stones of our village church. Is it not astonishing that the study of English architecture is not part of a school, or at least college curriculum? What better method could there be of teaching a boy to observe accurately, and reason from his facts. Even in the schools of art throughout the kingdom, we may find, perhaps, building construction taught, but the study of architectural history and design is conspicuous by its absence.

A man ought to be considered as lacking in the cultivation of an English gentleman if he did not possess more or less knowledge of English architecture at least.

Can this be remedied? If architects who have presumably studied the subject exerted themselves to further its claims by bringing it before public notice, by assisting in the appointment of architectural professorships and lecturers

ships, and the foundation of architectural scholarships, and by exciting an interest in their own neighbourhood in architecture, much might be done towards securing public recognition of the claims of architectural study. This, of course, would not necessarily mean a purification of architectural taste, but it would assuredly tend in that direction. It is vastly more important than that our streets, wherein we walk every day, should be adorned with beautiful buildings, than that we should be able to listen to grand music for a few hours in the winter season. Yet we think much more of our concerts than of our street fronts.

One of the most important departments of municipal government nowadays is that which deals with the erection of new buildings. Never by any chance is an architect, whose experience might be invaluable to his town, found to offer his services on its Council. No; architects neglect their opportunities of advancing their art, and instructing public taste, and stand by and whimper.

Indifferent as the average Englishman may seem towards architecture, he is not so any longer when his interest has been excited. He really wishes to know what is good and what to admire, and if he is authoritatively told to do so he will admire it. But he must be taken in hand first; he will not take the initiative, and it is the architect from whom he has a right to expect this leading.

He is for the most part unimaginative and commercial. He worships a fact, especially if that fact is a bargain sealed to his own advantage. So when he builds he likes to see his money's worth. Refinement of proportion is a quality which eludes him. Ornament is tangible. Let him have plenty of it, and full flavoured, and he will be content; he will even praise his architect. But if beauty of proportion and grouping, breadth of mass, and contrast of light and shade, elegance, and all those other evidences of refined thought were pointed out to him, he is so insensible but that he would learn to admire them. But who will point them out to him? Not architects; they are too busy with their private practice.

If this be the attitude of the public towards architecture, how does it regard the individual architect? Frankly, it cannot see the reason for his existence. It does not regard him as the practical man—that term refers to the builder. It is a luxury, and an expensive one, and his services may be dispensed with, especially in these days of municipal and rural inspection, when one can rely on the "authority" for seeing that our drains are right and walls dry.

People are quite ignorant of the *modus operandi* of designing and erecting a building. They think that when an architect has made a plan and designed an elevation, and obtained a builder's estimate, he has practically finished his work. They have no idea of the immense amount of detail work necessary, of the varied knowledge required, of the responsibility, anxiety, and labour entailed.

It comes as a surprise to most clients who have had no previous experience of building to see the number of drawings required, and to find the architect actually giving his attention to the most minute details.

If this knowledge were generally diffused it would save much misunderstanding. "Well," says a client, "I really had no idea you architects had to do so much work for your money. Why, I should not think the 5 per cent. pays, does it?" And you answer, "Well, perhaps not."

As it is, however, 5 per cent. commission is usually considered a high rate, and architects are frequently asked to take less. Not a few do so rather than lose work, even though they are men of established practice, and it becomes a difficult matter to obtain more than 5 per cent., even for the most elaborate church fittings or church decoration.

If a building is to be erected for a religious or charitable purpose, the architect is often asked to forego part of his commission on those grounds, and if he demurs he is reminded that a subscription towards the organ would be very acceptable. Perhaps it is desirable to have an imposing ceremony of foundation-stone laying because that stimulates the subscriptions, and the architect is asked to present a silver trowel. Later on, he may have to present a silver key for the opening ceremony. As a result, the architect whose practice lies not amongst the commercial, but amongst religious and charitable bodies, is subjected to a perpetual fine, while at the same time the work probably requires a larger amount of attention.

Not infrequently a committee will act with contemptible shabbiness towards its architect. In fact, a committee may sometimes prove a very good instance of individual morality and collective immorality. Happily, I have not suffered from these experiences myself, but I know I am fully justified in these remarks from the experiences of others.

On a committee there is usually at least one member who has already had some experience of building, and he assists in formulating the requirements of his colleagues, but the private client is often incapable of forming an idea of his own wants, and the architect has to find them out for him. This sometimes entails a number of alternative sketches, and then, perhaps, the client will decide not to build. He is astonished if his architect then sends in his bill. "Why," says he, "I did not approve of any of the sketches you made me." But he knows at the same time that sometimes his doctor's prescription has done him no good, but he has still paid for it, even if it has done him harm.

Many a patient architect will continue to lay one after another of his most exquisite ideas before unrefined and uneducated wealth to find them brusquely set aside, and will meekly endure with only a sigh for the ill association of beauty and the beast.

Another method by which a client realises his own wants at the expense of the architect is the private competition. This method is becoming alarmingly prevalent owing to the folly of architects in ministering to it. It appears to me a very mean way of getting £100's worth of brains and paying £10 for it. For undoubtedly the client, if he saw good points in the unsuccessful drawings, would not hesitate to incorporate them in his building. I wonder if painters will in time be asked to compete for painting portraits.

Public competitions, on the other hand, provided that a professional assessor is appointed, seem right and desirable. But the offer of a first premium is a delusion and a snare. Why, it always merges in the commission. The architect competes under the tacit understanding that if placed first by the assessor he will be employed to erect the building. It would not pay him to do the immense amount of work necessary in a competition for the paltry and wholly inadequate amount of the first premium. The competition drawings will not serve as the working drawings. All the work must be done over again and it is right that the architect should receive some compensation for his preliminary labours. There are others, however, to whom these labours have been just as great and who have not the consolation of carrying out the work. Should not these, too, receive compensation for their work in all cases wherein they have been personally invited to compete, and would it not be far more satisfactory to divide the amount offered in premiums, including, of course, the first premium in equal honorariums to all those who had been invited to compete, than the present system of prizes?

Further, would it not be to the interest of all, to limit the number of competitors in any competition and so avoid the enormous expenditure of labour and bad language which the Exeter Church Competition must have entailed. It is practically impossible for an assessor to select the best out of four hundred drawings unless one chance to be of conspicuous merit. No competition should have more than twenty competitors, and these should be taken in the order of their application or by some system of ballot. Those of them, however, who had been invited would, of course, receive precedence.

In the case of one of the competitors submitting a design of great excellence, but at the same time omitting to fulfil one or other of the conditions, it seems wrong towards the public and posterity that they should be deprived of a great or beautiful building on trivial or ephemeral grounds. The right course seems to be undoubtedly to erect such a building, but part of the commission payable to its architect might be deducted and paid over as compensation to the first of those competitors who had observed the conditions. In any case the latter should receive a substantial compensation, and any course of procedure which might be adopted by the committee in such a contingency should be clearly made known to the competitors from the first.

Now, while the public generally knows little of the extent and character of the architect's work, the attitude of the public towards the architect himself, I believe, one of distrust. This is the underlying sentiment, the fundamental note, engendered both by prejudice, hearsay, and experience. We may be inclined to deny this, we

certainly should wish to be able to do so. But is it not true? If it is true, what are the causes? There may be many, but I believe there are two chief ones, the distrust of the architect as included in the general distrust of the term "artistic," and the particular distrust of him on financial grounds. As a red rag to the Britisher is the very word "artistic," except as restricted to washed out colours and painted drain umbrella stands, to which his wife and daughters, instigated by the various ladies' journals, have accustomed him. To him it means feckless, want of common sense, the sacrifice of comfort to architecture, an unnecessary outlay of money without any compensating gain. It means a complex system of gables and gutters which are always needing repair. Sham half-timber work which warps off in the sun, small windows with a transome at the eye line, leaded glass so arranged that it distorts the outlook, angle nooks with very uncomfortable straight backed seats. Ask the Britisher himself, and he will say that if he has to go to an architect at all he will go to a practical one, and not one of those "artistic chaps."

Now, architects have to blame themselves for this conception of the artistic. The Britisher has shrewd common sense, and his idea of a home is comfort; further, he has an idea that every building should be made as serviceable as possible for its purpose. He does not think it proper to make a building dark in order that its exterior should be in the style of Medieval Gothic.

I am aware of the extreme excellence of much modern domestic work, and how possible these examples prove it to be to combine the greatest comfort with the artistic in its best and highest sense, but we must remember that the public judges from the rank and file of buildings and the rank and file of architects.

Undoubtedly most architects set themselves sincerely to interpret their client's wishes, but there are others—a minority—who seek their own reputation at their client's expense, practically compelling him against his will to accept a certain design or certain features of that design.

Now, if a private client consults an architect, and has definite wishes, it is the duty of the architect to respect those wishes if he feels they are wise and reasonable. If not, it is equally his duty to persuade his client against them, to, so to speak, save him from himself. This is especially the case in an uneducated man, or one who is possessed of some fid of which he will probably tire. If the architect acquiesces without protest, his client will turn upon him afterwards, and say: "It is true I wanted such and such, but I did not know much about the business, and I certainly did not foresee the effect of it. I came to consult you as a specialist, and I expected you to advise me. I was quite open to argument."

If he cannot persuade his client, then he must carry out his wishes, and make the best of the circumstances, for it seems only reasonable that if a man is going to pay for the work he should have it to suit him.

With public work the case is different. The committee stands for the public, and the individual opinion of any member ought not to override that of the architect, who, presumably, better understands the subject. The architect, it appears, convinced of the rightness of his view, should then maintain his position, not dogmatically defending it so much as winning his opponents to his own side by persuasion. The fact is, both a client and a committee will allow themselves to be persuaded by their architect if they put confidence in him.

A further question remains to be considered, one of the greatest importance—the public distrust of the architect on financial grounds.

It is often said that if you go to an architect to build you a house you never know when the expense will end.

The client lays his wants before his architect, and tells him how much he is prepared to spend. Usually the sum is quite inadequate. Of course the architect tells him so? Not at all. He tells him that it will need economy, and implies that the design which he submits, and which meets his client's approval, can be carried out for the sum named. All goes well until the builders' tenders are opened, and then comes the disillusionment of the client. The lowest tender is half as much again as the sum to be spent. The architect anticipated as much, but he trusted to his power to surmount the difficulty when the time came. This misleading of a client as to the cost is of most frequent occurrence. How much more

confidence a client would have in his architect one would think if the latter told him at once that it would be impossible to erect the building for the sum named. Not at all; he would doubt the architect's judgment, and say that Mr. So-and-So had built a house of similar size for less money, and eventually he would consult another architect, who was willing to mislead him. Every architect knows that if he is thus frank and straightforward with his client he runs the risk of losing him. Notwithstanding this, it is better, even as a matter of policy, and certainly as a matter of professional morality, to let the client know the worst. For you will in time obtain the rare distinction of being regarded as an architect whose estimate can be trusted, and that means in time a practice based on the most solid foundation.

A similar difficulty occurs in competitions. A fixed sum is stated, and competitors must design a building which can be carried out for that sum. Each competitor must give an estimate of cost. Some of them conscientiously endeavour to carry out the instructions in the spirit as well as in the letter. They have to somewhat cripple their design in consequence. Others make elaborate drawings of an equally elaborate building, and give every accommodation that could be desired. They arrive at the probable cost by dividing the sum allowed by the cubical contents of their building, and then, having found a constant—42d. a foot, perhaps—they multiply this by the cubical contents and find to their satisfaction that it works out at exactly the sum they have to spend. This operation, if judiciously described in the report, is sufficient to throw the committee off its guard, and has even misled the professional assessor. In due time the builders' tenders are opened, and then comes this disillusionment of the committee, and the suppressed growls of the fellow competitors.

But if the public distrust the architect on account of the unreliability of his first estimate, how much is that distrust deepened when the bill of extras is presented.

Here, again, the architect has himself to blame. He cannot, perhaps, prevent extras altogether, but he can do much to spare his client from the extreme annoyance of an unexpectedly heavy bill.

The two most fertile sources of extras are the absence of a thorough thinking and working out of the scheme before the quantities are taken out, and the subsequent alterations made by the client himself. Every building ought to be worked out in half-inch detail, and an exact specification written by the architect himself, and not by the quantity surveyor, and then, and not before, the quantities should be taken out. And if a client is inclined to order extras he should be kept informed by the architect of how the bill is mounting up, and he will not then be taken by surprise at the total.

All this takes much trouble, and a client in his hurry to commence work grudges the time spent in making details. Besides, the work may fall through, and then a large proportion of the work will have been done in vain, although the architect will certainly be entitled to claim payment for it.

Notwithstanding these drawbacks, the reputation of being able to build without extras is so unique and so priceless to the architect that it is worth some trouble to win. It will increase his practice more than any misleading shifts, or engaging to do work for less than 5 per cent.

There remains but one more subject for consideration. The public has heard from time to time some talk of illicit commissions associated with the practice of architecture. There have even lately been discussions on the subject in the Press. There may, of course, be no truth in it but the public is naturally suspicious.

Now, while it cannot be doubted that the majority of architects, as upright and honourable men, would not stoop to receive indirect commissions, yet it is an equally undoubted fact that there are some who do. It is useless to disguise the fact, as it is too well known. The opportunity of increasing his income by the acceptance of those commissions is no temptation to the well-established architect. But all architects are not well-established; some have a struggle to make a living, and others are just starting in practice and have not thoroughly grasped the moral question involved. Very severe blame, therefore, rests with those manufacturers and others who offer these temptations, and it is the duty of every honourable architect to endeavour to attach a public stigma to the name of any such firm. In fact, a black list ought to be kept by each local association, and the members of that

association should undertake to boycott all manufacturers and tradesmen whose names appear on such a list.

But it is not from tradesmen only that architects sometimes receive indirect payments. It is a practice far too prevalent for architects to take a share in the quantity surveyor's fees. It is not, indeed, to the credit of either architects or surveyors that the practice should exist at all. The architect employs a surveyor to take out quantities, and for this the surveyor charges certain fees, of which he pays the architect a certain proportion. What for? If the architect has properly worked out his plans and written his specification, both of which are supposed to be included in his own fees, it gives him no extra trouble to employ a quantity surveyor. The payment is as much an illicit commission as if it were paid by a tradesman, although a specious defence is sometimes advanced by those who receive it on the score of custom. It is not that the surveyor is paid less for his work; the extra charge comes indirectly out of the client's pocket.

It is the architect, as the client's agent, and not the client himself, who employs the surveyor, and the latter is, therefore, largely dependent on the architect for his work. The same may be said of the builder, as it is usually the architect who invites him to tender. The client meantime, who is entirely ignorant of the preliminary methods of procedure in building a house, is very existence of the quantity surveyor, and as the latter is paid, not by the client, but by the builder, there is no very evident way by which a client should get to know of his existence, or that he had been indirectly paying him through the builder. Still less that he had even been paying the architect in turn through the quantity surveyor. The relationship of architect, quantity surveyor, and builder is a closed ring, and the client remains outside.

Now, while I would most carefully guard myself from implying the slightest motive of dishonourable practice in thus keeping the client ignorant, I do say that the present system of an architect, practically on his own initiative, employing a surveyor, and the latter receiving payment directly from the builder, so that the amount of that payment is hidden in the builder's charges, is one which might readily lend itself to the practice of dishonesty and fraud. I do not say that the fraud exists, but that when the means for it exist without the likelihood of discovery, there is a probability amounting to certainty that some one will sooner or later be found to avail himself of them.

The wise architect will explain everything to his client in the fullest detail at the very first. He will explain the functions of the surveyor, and mention the name of the one whom he proposes to ask. He will state his charges. He will also explain that if the building is not proceeded with the surveyor will none the less be entitled to his charges in full. And he will also consult his client as to the builders who should be asked to tender. And I think it would be wise if he arranged that the surveyor should be paid by his client direct. It may come to the same thing in the end, but in an evil world one must consider appearances.

It is only by the utmost frankness on the part of the architect, combined with loyalty and justice towards client and builder alike, and associated with the most assiduous care in sparing his client unexpected or excessive expense, that that distrust to which I have referred, and which undoubtedly does exist, can be removed. That is a consummation devoutly to be wished. It devolves upon each architect individually to assist in its realisation.

Mr. Osborne Smith, in proposing a vote of thanks, said he had a recollection of a previous paper which Mr. Bidlake had read to members of the Association, and the pleasure which he derived from listening to his previous address was equalled on this occasion. Mr. Bidlake had referred to certain defects, which he, the speaker, had been conscious of in the course of his practice and which he thought ought to be called attention to. He had been extremely interested in all that Mr. Bidlake had said, and he was prepared to endorse most of it. As to the difficulty that the average client had in realising the vast amount of thought that was required in the preparation of drawings, he took every opportunity to show clients how much work was required in the erection of a building. In his opinion every architect ought to do the same, so that clients might see the difference between the erection of a dwelling house, for instance, under the super-

vision of an architect, and in its erection by speculative builder. He was very much surprised to hear Mr. Bidlake's remarks as to irregular financial relations between some architects and quantity surveyors. He did not think the remarks applied to first-rate or even second-rate surveyors in London, and it certainly was not the custom for quantity surveyors to pay architects any portion of what they received for taking out quantities; and as to the trouble an architect was put to in giving the surveyor the necessary information, if he prepared the drawings and specifications properly the necessity did not arise, as many architects did, and to a small scale and with no specifications whatever, except a few notes, it was obviously necessary that the quantity surveyor would require information on innumerable points; and this would take up the architect's time, which ought to be spent in the client's interest in preparing the specifications and the details. He had heard some of the best builders complain a good deal about that; they also said that the sections were too frequently taken through the worst place—through the line of least resistance. He believed that in too many instances architects did not take the trouble to properly prepare working drawings for the use of the workmen. Many draughtsmen were now in the habit of making details without a plan, relying only on an elevation and section, which was an unintelligible method. A remedy for all that was entirely in the hands of architects, who must develop their ideas before the work was proceeded with, and they must not neglect their drawings in the hope that the work would come right in the end; no work ever did come satisfactorily unless proper control and attention was given to it. He particularly agreed with the lecturer that it was very necessary to be candid with the client and to make everything clear to him—to tell him, for instance, that the quantities were being taken out by a surveyor who would have to be paid. Many difficulties, and a lot of distrust, would disappear if the client were taken into the architect's confidence. It was quite evident that the distrust did exist, and candour would not only remove this, but it would have the effect of getting the client to think and act with his architect.

Mr. Banister F. Fletcher, in seconding the vote of thanks, said that he did not agree with the lecturer on many points. One of the lecturer's theories was that of the indifference of the British public to architecture—a theory which was very well worn—and in this connexion I had quoted the "Brompton Boilers." But who else could be expected from the public in regard to architecture? Architecture was one of the most difficult, and should be one of the most progressive arts, or sciences, or professions; it was a subject that required the lifetime of any man to learn the elements of, and yet there were people always crying out about the ignorance of the public in regard to it. Let them think of the ignorance of architects as to architecture, to see how much room there was for improvement there. In his opinion, the public were just as ignorant of medicine, law, or military tactics, or any specialised subject, as they were about architecture, and not much else could be expected. It was probably because the public did not know a little about architecture, and because of the connexion of antiquaries with architecture, that there had been brought about so many revivals. If there had been no Parker and no Parsons to reach him, some progress might have been made by architects in evolving new forms and new ideas. As it was, such progress had been prevented by those who had merely a smattering of architectural knowledge. The same might almost be said of proportion; architects knew very little about it, and really they could not teach it. They could not tell people the right proportion of anything; the knowledge of it was innate, and the capability of producing proportion in any building was not to be taught by rule of thumb; it was simply found by experience and by the natural artistic qualifications which a man, assisted by long study, possessed. So that if they had to wait until the public valued buildings for the sake of their proportions, they would have to wait a very long time. Then, again, as to the right use of material, it seemed to him that that was the very last thing the public would learn about. A knowledge of construction, on which material was most firmly based, was a very difficult and laborious study, and architects could not expect the public who had had no training in a knowledge of building materials, to estimate the value of a building by the knowledge of whether the materials composing it were used in the right way.

or not. It was an instance of a little knowledge being a dangerous thing with the public in regard to architecture. It was his firm conviction that the more the public knew up to a certain point about architecture, the worse it was for architecture, because the public only looked at the form produced, and they often unconsciously admired very bad forms. The five per cent. system seemed to have taken a firm hold of the public because they liked to understand what they were going to pay, and they would never care to be told that the sum depended upon the amount of work the architect did. Then as to extras, it was almost impossible to huild without them, unless they had no end of provisions. As to the question of commission, that hardly came within the scope of the paper. The latter part of Mr. Bidlake's paper should have been entitled, "Architects and themselves." He agreed with the previous speaker, in thinking that what Mr. Bidlake had referred to in this connexion did not exist in London to anything like the extent that it appeared to do in the provinces.

Mr. Hampden W. Pratt, in supporting the vote of thanks, said he was not aware before that the practice of sharing commissions with surveyors was so general on the part of architects as Mr. Bidlake seemed to make out. In fact, he took leave to doubt whether it was so at all, at any rate, in London. It might exist to a very slight extent, and, in any case, he was opposed to it in every shape and form, and he did wish that architects would look at the matter conscientiously and honestly. Architects should not mix themselves up in this way with surveyors or builders, and if five per cent. was not a sufficiently large commission, the client was the man to go to. He, the speaker, had a little quarrel with architects for taking commission in another way, viz., in kind; and that was in compelling the surveyor to prepare the specification. Surely that was sharing the commission! It was putting work on the surveyor which the architect ought to do, and by thus getting some one else to perform it, the architect was getting work done without paying for it. In his opinion the architect should write the specification himself, and it was a very prevalent thing, he believed, for the quantity surveyor to write the specification. He was sorry that Mr. Bidlake had raised the question of commissions because, owing to the publicity which it would receive, it would be quite a revelation to the public of what was supposed to go on between architects, surveyors, and builders, and it would thus receive an importance which it did not deserve. The question might have been more appropriately discussed among architects themselves, but not in public, although generally he was not disposed to hush up matters of this kind. He was glad that Mr. Bidlake had pointed out some of the work which architects had to do, and of which clients had no idea, for he quite agreed that the client had no idea, as a rule, of the amount of work which the architect had to perform. Then another point was as to the question of competitions. Clients had an idea that when an architect had sent in his competition drawings he had prepared drawings which would be useful at subsequent stages of the work, and that those competition drawings could be used as working drawings. That was entirely incorrect, of course, but it was believed in. Then, as to private competition among architects. He believed that it was a fact that in the provinces more than in London, the practice was for clients to call on leading architects to send in designs, and generally, he could see no objection to the practice. Mr. Bidlake had referred to the defects of architects in their practice, and it was to be hoped some of his remarks would be taken to heart. No doubt if architects put a little more business capacity into their professional work and ways it would be of considerable advantage to them and to the client. Unfortunately the public had some ground to mistrust architects in regard to estimates, and architects had themselves to blame for the trouble they got into sometimes for extras. He did not agree with Mr. Fletcher that extras were a necessity. He did not think that there were unavoidable extras, and if an architect carefully worked out his drawings, and thought out his specification, in nineteen cases out of twenty there would be no bill of extras. As to the commission question, he hoped that Mr. Bidlake would be able to modify his remarks as to "closed rings." He never heard of such a thing before, and he really could not believe that such a ring existed, and he was afraid that the idea would give a false impression generally as to the relations of architect, surveyor, and builder. He could not believe that such a thing existed either in London or the provinces,

and at all events he hoped that Mr. Bidlake would believe that it did not exist in London.

Mr. E. W. Mountford, in supporting the vote of thanks to Mr. Bidlake for his interesting paper, said he also regretted that prominence had been given to matters which would have been better discussed in private. At the same time, he was sure that there existed nothing like a "ring" with which architects, surveyors, and builders had anything to do. Of course it was possible for both architects and builders to make arrangements, and for the builder by that means to make more than a legitimate profit; but it was the object of every honest architect to see that the builder did not make any undue profit. Of course the builder was entitled to a fair profit, and the ideas of builders differed as to what that profit should be. Some were content with ten per cent., while others thought it should be fifteen per cent.; in his opinion anything from ten to fifteen per cent. was a fair profit for a builder. Anything above that the architect ought to be able to prevent; and if he did so, as all good architects would, there was an end to the "ring" at once. As to commissions, he agreed with Mr. Pratt that no respectable architects did accept them. That commissions were offered by tradesmen and accepted by architects he was afraid was true to some extent—he said "afraid" because in his younger days he had commissions offered him. He was glad to say that they had not been offered to him in recent years, because he made it a rule wherever a commission was offered to terminate his relations with the firms who offered it. He did not think that the practice existed to anything like the extent that Mr. Bidlake imagined, though he believed that clients generally credited architects with accepting commissions. Either in the provinces or London he did not think that it had been formerly; and if any one would provide him with particulars he would undertake to bring the case before the Institute. They had heard a good deal that evening about the number of drawings architects had to make in designing a building. It was absolutely true that if the quantity surveyor was to do his work properly, architects must provide him with full details before the work commenced. Personally he did not attach the same importance to specifications as some people did. If they made full details of every part of the building, with plenty of notes upon drawings, any other specification would be unnecessary. He could not agree with Mr. Pratt that the architect was dividing the commission with the surveyor, by allowing the surveyor to prepare the specification. In actual work they would find that the specification was thought very little of as a rule, because the builder invariably took the quantities as the standard of what he was to supply. It was the quantities which would bind him and not the specification. It was true that the public were quite ignorant of architecture, but what else could be expected? It was also a fact that clients had very little idea of the large number of drawings that architects had to prepare in designing a building, and as to the general public regarding the architect as an artist, they never regarded him in that light at all.

Mr. H. B. Creswell said that Mr. Bidlake's remarks seemed to suggest that his bitter experience of the public arose from expecting too much from them. If he had taken a less exacting and a wider view of the public, he would have seen that the public was deserving of something besides condemnation.

The Chairman, in putting the vote of thanks to the meeting, said they would have to recognise the fact which would clear the ground of a large amount of difficulty—a fact which architects were very loth to recognise—viz., that they were never paid for design. The client never contemplated for a single moment that they would put sufficient time into their work to evolve a thoroughly satisfactory artistic design. The client did not understand that such a practice was implied, and he certainly would be very much surprised if they asked him to pay them for the time they spent on the design; and they had really to regard themselves as men of business—surveyors pure and simple—to prepare the necessary plans for the execution of the building. Under these circumstances the temptation to a young architect to fing artistic impulse and sincerity to the winds, and to merely prepare his plans, was very great indeed, and only those men who understood the unfortunate fact that an architect was a self-denying artistic philanthropist were able to do good work at all. Did the client care how many times the architect rubbed out his detail? What did he

care for their particular intention of satisfying some definite ideal that they had been cultivating with care, and study, and practice? It did not matter to the client, though it mattered to them a very great deal; for they would sacrifice anything and everything—they would make the whole set of drawings over again if need be, in order to get me pet idea of their own (an idea that they had developed and cultivated and were enthusiastic about) embodied in stone and mortar; at the expense of some one else. A client did not know anything about that desire, and under those circumstances he did not think that they ought to ask him to pay for the exercise of their ideas. Had it ever occurred to them that they ought to pay a client for the opportunity he gave them of erecting in a public position their dreams of Gothic architecture, for instance? Recently he, the speaker, had overheard in a train a conversation upon architects and architecture between two electrical engineers. One of them summed up the whole question in this way, viz., "The worst of architects is that they will expect other people to carry out their own ideas!" Clients paid architects to carry out their ideas, and architects took the opportunity of carrying out their own. This was a fact that architects were conscious of and would have to plead guilty to. There was no doubt that the amount of work demanded of the architect had increased very largely, and that the amount of work for the ordinary 5 per cent. remuneration was of a very onerous character, and in his opinion the architect has just cause for complaint. Since the practice of architects refraining from taking out the quantities, which had been established in London principally at the instigation of the Institute of Architects, and which could not be called an unreasonable practice in view of the relationship existing between the architect and the builder, the architect had been deprived of a very definite source of profit—a source of profit which, added to whatever profit there might be on the usual 5 per cent., made his practice a little more remunerative than it was at present. He could not help thinking that many of the difficulties under which architects laboured would disappear if the architect was able to take out the quantities as of yore, and as he still did in the provinces. He did not think that the client would run more risk of suffering injustice than he did at present, and the work would not be more expensive to the client, and would be more expeditiously carried out. He advised his hearers to take to heart all that had been said that evening as to slovenliness and uncertainty in drawings. Unless they cultivated the habit of thoroughness in preparing their working drawings, they would never do much good as architects or surveyors, or as artists. They must get to the bottom of their work and thoroughly understand it before they embarked upon an estimate. In preparing the quantities the surveyor was apt to measure very heavily in order to magnify his office—he expanded the bill of quantities into a large number of folios, to do which he measured labours up and he measured labours down, while the architect used to be able to get all that was necessary into a small number of folios. This was an absurd state of things which must sooner or later come to an end, and it seemed to him that the London architect ought to take out his own quantities again. In regard to architects taking commissions from quantity surveyors, he did not know any case that had ever come before him in London, though he had heard of cases in which this was done. The state of things which Mr. Bidlake had described could very well be discussed at a meeting of that kind, so that young architects could understand the view of the practice taken by honourable men. But one fact ought to be remembered in order that the ethics of the matter might be understood. When an architect took a commission from a tradesman when placing an order with him, that architect was prevented from exercising a *bona-fide* judgment on behalf of the client, but when the architect took from the quantity surveyor 3 per cent. or something of that sort, he did not see in what way the client suffered. He did not desire to defend the practice, but he wanted to know where the mischief existed. As to architects taking commissions from tradesmen, a large number of clients—commercial men principally—in London and elsewhere, did not regard it as a moral obliquity, or as in any sense improper; but, whatever they thought, it was wrong, and ought to be discouraged in every way. As to competitions, he thought that the adjudication of competitions as conducted at the present day was mischievous and very unsatisfactory, and that the payment of large fees to the assessors could be avoided. He

did not see why, in a large competition, the decision should not be left to the competitors themselves, who were the best qualified, by their study of the conditions and in preparing their designs, to be adjudicators; but failing that, he suggested that the Institute of Architects should offer, on behalf of the profession, to adjudicate in all competitions without charge, and solely in the interest of the profession. The honour which would fall to the Institute in so acting would soon make itself felt. Mr. Bidlake had given them good advice as to how they could succeed with their clients, viz., to be perfectly reliable in matters of estimate, and that meant that they were to be perfectly frank with themselves. He (the speaker) believed that an architect must succeed who made it his business to please his client and to satisfy him in his reasonable wishes. On the other hand, they must never do anything against their better judgment without protest, and remember not to apply that principle merely to ideal matters. A client was generally able, in the long run, to appreciate the architect's artistic work, and it must not be forgotten that the artistic question was less important to the man who had to live in a house than his own common-sense requirements.

The vote of thanks was then put to the meeting and carried unanimously.

Mr. Bidlake, in reply, said he had no wish to speak disrespectfully of the British public, for he was part of it himself. He rather pitied the public, because they had no architectural leaders. If the public was ignorant it was its misfortune, and not its fault. Mr. Fletcher had said that it was impossible to get the public to appreciate all those subtle questions of proportion, &c., which architects themselves found very difficult to understand. That he allowed, but the question was: Is the present state of knowledge of the British public a fixed quantity? If it were not then there was a possibility of that ignorance being lessened. That was the whole question. Why should not architects set about trying to lessen that ignorance by taking the public more into confidence, and pointing out what buildings were beautiful, and wherein they were beautiful? If the public generally had no power of appreciating or finding out for themselves beautiful proportion, still, if they were taught to believe that a certain building was beautiful and of fine proportions, and they became acquainted with its details, then a standard of taste was set for them; but at present there were many who had no standard of taste, and he thought that architects might do more to help in establishing such. With regard to the question of extras, he still maintained that an architect ought to be able, if he thoroughly worked out his drawings and studied the building in detail before the quantities were taken out, to avoid extras to a very large extent, although perhaps not altogether. He thought that the endeavour to see how a building was working out was to some extent a function of the architect's imagination. An architect ought to be able to picture his building and every part of it while he made the drawings. If he was incapable of doing this until the building was half finished, no doubt he would soon incur extras. As to the relations of quantity surveyor and architect, he adhered to his statement that the sharing of fees was practised possibly to a larger extent than was supposed. He did not mean by the expression "closed ring" to accuse either architects or surveyors of fraud, but he repeated that all the machinery for fraud was there, and it was that which he denounced.

The Chairman announced that the next meeting would be held on March 5, when a paper would be read by Dr. F. S. Granger on "Greek Sculpture and Greek Legend" with lantern illustrations. The meeting then terminated.

THE COX THERMO-ELECTRIC GENERATOR.

An account of this generator appeared in the *Electrical Engineer* of New York about two years ago, and although it attracted a good deal of attention at the time, yet very little further information regarding it has been given to the public. On Friday last week, on the invitation of Mr. Cox, we went down and inspected his laboratory and workshops at St. Albans, and saw his thermopile in all stages of its construction, and a large number of them in operation. Our experience with the Clamond and Noé thermopiles had made us sceptical as to the practical use of this class of apparatus, but what we saw convinced us that this generator is a very great improvement on the older types.

At present the Company confine themselves to

the manufacture of a small generator suitable for a large variety of domestic purposes, and we shall confine ourselves to describing and discussing this apparatus, without following Mr. Cox into his interesting but sanguine speculations as to the future rivalry between his method of generating electricity and the ordinary dynamo and steam-engine method.

The great defect of the ordinary types of thermopiles met with in physical laboratories, is that the junctions oxidise and the cells soon deteriorate. In this thermopile the couples are made by casting, no soldering or brazing being used, and as copper and a graded alloy of antimony and zinc are the two metals, it is claimed that oxidation is completely prevented. The cell is formed by successive rings of these castings completely enclosed in a vitrified cement, which, after baking, is turned into a hard stone cylinder. A metallic annular chamber is cemented to the exterior, and water is kept trickling through this while the cell is in action. A plastic cement is applied to the interior and vitrified, and this is heated by means of a small gas jet, which plays on a series of deflectors, heating them uniformly. The reflected heat keeps the inner side of the cell, and, therefore, one set of junctions hot, the other set is kept cool by the water jacket.

These cells are made with voltages varying from two to ten, and the maximum power given out is about ten watts. They consume from two to four cubic feet of ordinary illuminating gas per hour. They are well finished, being, in appearance, small cylinders with old bronze sides and polished nickel rims. This is a simple and strong piece of mechanism, even a fortnight's immersion in a bucket of water doing it no harm. To start it all that it is necessary to do is to light the gas and to turn on the tap to let the water flow slowly through the jacket; in about ten minutes it attains its maximum activity, and can be left in continuous action for months, as it requires no attention. Short circuiting does it no harm, and in this respect it compares favourably with small accumulators. It is, of course, expensive, as compared with a primary battery, but there can be no question as to its convenience in many cases, provided that its average life is found to be several years.

The New York office of the Commercial Cable Company has operated its entire lines successfully with these generators, and for cable and telephone work it will prove a formidable rival to the motor generator.

The following are the cases where, in our opinion, it can be usefully applied, and for which it is worth considering as an alternative to the ordinary methods: for charging small accumulators, for working fan motors, electric bells in hotels and flats, and for X ray apparatus. The small accumulators, for instance, used for lighting bicycle and carriage lamps are ordinarily charged by primary batteries, which require continual attention, and any one who has kept his bicycle accumulator in good order for two or three years by this method will not grudge the expense of one of these generators.

Since writing the above we regret to learn that the laboratory and workshops of this company, containing many hundreds of these generators, were totally destroyed by fire last Tuesday morning. The cause of the fire is unknown. The general contents of the building were insured, but the destruction of all his valuable testing apparatus, and the records of the experiments he has made during the last ten years, must be a heavy blow to Mr. Cox, who has our sincerest sympathy.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

The thirtieth annual general meeting of this Institution was held on the 23rd inst. at the offices, 21, New Bridge-street, E.C., the President-elect, Mr. Thomas Hall, occupying the chair, supported by the retiring President (Mr. R. E. Nightingale), the Treasurer (Mr. E. Brooks), and others.

The annual report stated that the income for the past year consisted of 2137. 3s. in subscriptions, 3007. 17s. in donations, 1407. 5s. in dividends, and 17. 3s. interest on deposit, expended a total of 6557. 8s. The amount expended was 4534. 10s. 5d., which included 3907. paid in pensions, and 107. in temporary relief. One of the widows had re-married, thus resigning her pension. An election was held in December, at which James T. Gough, being the only candidate, was elected. The number of pensioners on the books is twenty. The total number who have been elected is forty-three.

There are three children in the Orphan Working School, per presentation of the Builders' Clerks' Benevolent Institution. The eighteenth annual dinner was held on March 24, 1896, in the King's Hall, Holborn Restaurant, Mr. B. E. Nightingale in the chair. The Committee, in thanking the Chairman for his services, wished to express their great appreciation of his kindness in serving the Institution as President, and for his efforts in promoting its welfare. Mr. Thomas Hall (Messrs. Hall, Beddall, & Co.) had kindly consented to act as Mr. Nightingale's successor in the Presidential chair.

The President-elect (Mr. Hall) moved the adoption of the report, which was seconded by Mr. Nightingale and agreed to.

Mr. E. C. Roe, in proposing a vote of thanks to the outgoing President and other retiring officers, said that all present knew of the great advantage Mr. Nightingale's services had been to them. He had taken much interest in the Institution, and the result was known to all.

Mr. Newling seconded, and the resolution was carried unanimously.

Mr. Nightingale, in acknowledging the vote of thanks, said that the Institution would always have his good wishes.

On the motion of Mr. Oldham, seconded by Mr. Gammon, the officers for the present year were elected.

A vote of thanks, on the motion of Mr. Turpin, seconded by Mr. Brooks, was then passed to the Chairman, who replied, and the proceedings closed.

THE ARCHITECTURAL ASSOCIATION SPRING VISITS:

LONDON COUNTY COUNCIL WORKING-CLASS DWELLINGS, BOUNDARY-STREET.

On Saturday, the 20th inst., the second Spring Visit of the Architectural Association was paid to the L.C.C. Dwellings, Boundary-street, Bethnal Green.

This being the most extensive scheme for housing the working classes yet carried out, the visit was of considerable interest. The area included is about fifteen acres, and it has been entirely cleared with the exception of a Board school and a church. The leading feature of the plan is a circular garden, 270 ft. in diameter, radiating from which are seven streets, 50 ft. wide. In order to save the expense of carting, all the earth removed from foundations has been placed in the garden, forming a mound some 20 ft. high, and crowned with a bandstand.

The blocks of dwellings have been planned so that the front and back face respectively east and west as far as possible, to ensure the largest amount of sunshine; this produces a curious effect, as the buildings in consequence are not at right-angles to the streets, and the method on plan appears to waste a considerable amount of space.

About half the total number of blocks have now been erected, and it is possible to judge of the general effect, which is decidedly spacious, and a considerable amount of money has been spent in ornamentation, bay windows, turrets, gables, and chimneys. The total number of persons displaced by the clearing of the site is 5,719, and the total number provided for is 4,700. The accommodation for these is divided into one, two, three, or four room tenements, chiefly either two or three rooms, in which families of four or six persons can be accommodated. Each tenement is a self-contained dwelling, approached from a wide passage or staircase, at least 3 ft. 6 in. in width. The living rooms have a floor measurement of 144 ft. super, clear of all obstructions; the bedrooms about 6 ft. super. The floors have a height of 8 ft. 6 in. in the clear; a small scullery is entered from the living room, and the larger tenements have a water-closet provided, with a lobby; the smaller ones are approached from the staircase. No provision is made for dust, which is to be carried away in iron pails by the parochial authorities. The blocks have been planned to ensure in every case through ventilation, that is, every tenement has either two outer walls or one outer wall and one wall on passage opening directly to the outer air. The blocks are five stories in height, and are separated from the next block by a distance equal to the height. The construction is as far as possible of fire-resisting materials, the floors being composed of breeze concrete and iron joists, and the partitions of breeze concrete, and all stairs and landings are of concrete. It is proposed to construct the roofs of future blocks also with breeze concrete, on which will be nailed the battens and slates—an interesting experiment. The whole of

the walls to ground floors are faced with salt-glazed bricks, the greater original expense being compensated by the durability, and the upper parts chiefly in red bricks with stone dressings. Workshops for cabinetmakers and other trades have been erected at the back of the main blocks, and a public laundry has been provided, this having been found more economical than supplying a separate copper to each tenement.

The total estimated cost of the scheme is 300,000*l.*, and it is calculated that this will be extinguished by means of a sinking fund at the end of fifty-four years. The average rent per room per week is 2s. 6d.

The party was conducted over the building by Mr. Owen Fleming and other members of the Architect's Department of the L.C.C., who kindly gave many interesting particulars as to the various details of the scheme.

ARCHITECTURAL SOCIETIES.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—"An Architectural Student's Rambles between Wakefield, Doncaster, and Selby," was the subject of a paper read by Mr. R. A. Easdale, at a meeting of the Leeds Architectural Society, held on the 15th inst. at the Institute of Science, Art, and Literature. Mr. Easdale said he thought that architectural students did not sufficiently study the places they visited; they preferred rather to obtain a hurried view of many places. Yorkshire was second to no county in England in its wealth of ancient buildings. Its village churches were full of interest. Students, he believed, would find it more profitable to study the designs of parish churches, pulpits, and small villa-residences, than to devote their time sketching cathedrals and town halls, which were structures rarely required. Proceeding to the subject of his paper, Mr. Easdale touched on various specimens of bygone architecture to be found in the neighbourhood of Wakefield, Pontefract, Methley, Kirkthorpe, Oulton, Kippax, and Selby. The lecture was illustrated by a collection of sketches and photographs.

DEVON AND EXETER ARCHITECTURAL SOCIETY.—"Screens: their Symbolism and Treatment," was the subject of a lecture by Mr. G. H. Fellows Pryne to the members of the local branch of the Devon and Exeter Architectural Society, at the Plymouth School of Art, Princess-square, on the 18th inst. After giving a historical sketch of the origin and development of screens, the lecturer explained their symbolical meaning, and commented upon the fact that in English churches the screens were found in nine divisions, each symbolical; while on the Continent they were usually in three divisions. In no country in the world were there so many churches with rood screens as in England, and for beauty of detail and workmanship the English screens were hardly to be surpassed. He dealt at some length with the different methods of treatment adopted in the construction and decoration of screens, and remarked that while in many English churches were found beautiful examples in both wood and stone, the modern metal screens were for the most part a lamentable failure. The lecture was profusely illustrated by views of English and Continental church screens, shown by means of the oxy-hydrogen light. At the close a cordial vote of thanks was, on the invitation of Mr. Shires, seconded by Mr. Bazely, passed to Mr. Pryne for his address.

GLASGOW SCHOOL OF ART.—A lecture on "The Architecture of Asiatic Hellas," one of a series on Greek architecture, was delivered last week by Mr. W. J. Anderson, director of the Architectural Department, to a large audience of students of the Glasgow School of Art. After a brief survey of the geography of the coasts peopled by the expatriated Ionians and Æolians, and the history of Asia Minor in its relation to the arts, the lecturer proceeded to trace the growth of the "Archaic" Greek style in that region, by whose traditions the settlers and their artistic expression were largely moulded. The influence of Phrygia, *i.e.*, in its cult of a great Mother, Cybele, through whom all descent was traced, appeared to have determined that most of the great Ionian temples were dedicated to goddesses, and the Ionic style as a whole represents what may be called the feminine side of Greek art. In the severe Doric and the lighter Ionic styles, they had the happiest symbol of the two great elements of the Greek race, whose rivalry made the history of Greece, and who seemed to have been complementary one to the other. The plan of the *templem in antis* was foreshadowed in the

megaron of the palaces of Troy and Tiryns, and before 550 B.C. its peripheral form was settled and its structural evolution complete, the talents of succeeding architects being directed only to its modification by refinements in detail and sculpture. Examples of the Archaic style were supplied in early votive columns, and among others by the earlier temple of Diana at Ephesus, of which there are fragments in the British Museum; while the great temple of Paul's time, built in the fourth century B.C., was shown as now restored by Dr. A. S. Murray, and the famous sculptured columns and pedestals as they have been arranged under his directions. In conclusion, a series of restorations of another wonder of the ancient world, the Mausoleum of Halicarnassus, was shown by lantern, including that of Professor Cockerell (published in the *Builder* of August 29, 1896), and the more recent one of Mr. J. J. Stevenson, as set forth in our issues for September, 1896, which appeared better to satisfy the requirements of Phiny's description with the actual remains now arranged in the Mausoleum room of the British Museum.

ARCHÆOLOGICAL SOCIETIES.

THE NATIONAL TRUST FOR PLACES OF HISTORIC INTEREST OR NATURAL BEAUTY.—A meeting of the executive Committee of the National Trust was held at No. 1, Great College-street, Westminster, on the 17th inst., Sir Robert Hunter in the chair. It was determined to take steps to initiate a regional survey of the country, and, by means of local correspondents, initiate the compilation of a catalogue of buildings, objects, and places of historic and archaeological interest, with a view to their proper protection and preservation. A report by the Treasurer showed that the work of repairing and making sound the old clergy-house at Alliston (which has recently been acquired by the Trust) had had to be suspended on account of lack of funds; a sum of 200*l.* is still needed to put this interesting edifice into a proper state of repair. It was announced that the purchase of Barras Head, situated opposite Tintagel Castle in Cornwall (which has been recently acquired by the Trust), was now complete. This fine headland, comprising four acres of down, is now, therefore, in the hands of the Trust, the property of the nation for ever. The Secretary was able to report that the circular issued by the Trust, in conjunction with three other societies, suggesting the acquisition by Local Authorities throughout the country of a piece of land or place of historic interest or natural beauty as a "Victoria open space," in commemoration of the Queen's long reign, had aroused wide-spread and sympathetic interest. Finally, the Committee were unanimous in agreeing to resist as strongly as possible the Hastings Harbour District Railway Bill, on the ground of the serious interference, to which it will give rise, with the most charming features of natural beauty in the district.

SOCIETY OF ANTIQUARIES.—At the ordinary meeting of this Society on the 18th inst., Sir Henry Howarth, M.P., V.P., in the chair, Sir A. Wollaston Franks, President, exhibited a beautifully wrought silver-gilt *nef* of Swiss workmanship, of a date *circa* 1520. Sir H. Howarth exhibited a curious contemporary portrait on vellum of George Clifford, Earl of Cumberland, in his capacity as Champion of Queen Elizabeth, an office conferred upon him in 1590. Rev. E. B. Savage communicated a note on some ancient burial customs, in which he suggested an explanation of the existence side by side in barrows of cremated and inhumed remains. The former, he thought, might represent those who had died in troublous times, and whose bodies had been burnt to preserve them from mutilation or indignity. The latter were probably the remains of those who had died in more settled or peaceful times. Mr. G. Grazebrook read a paper on "Medieval Surnames and their Various Spellings."

BRITISH ARCHÆOLOGICAL ASSOCIATION.—The sixth meeting of the session was held at the rooms in Sackville-street, Piccadilly, on Wednesday, February 17th, Mr. C. H. Compton, Vice-President, in the chair. A paper, entitled "London under the Monastic Orders," was read by Miss Edith Bradley, illustrated by maps of the City, indicating in different colours the sites of the many religious houses which existed, both within and without the walls, between the thirteenth and sixteenth centuries. Miss Bradley noticed in detail many of the houses, arranging them in groups under the orders to which they belonged, thus, the Benedictines, the Cistercians,

the Carthusians, the Augustine Canons; and the orders of friars were each in turn described, and the circumstances of the foundations of the several houses were related. The Cistercians apparently possessed but one abbey in London, that of St. Mary Grace's on Tower-hill, founded by Edward III. in 1339. He called it "Eastminster," in contradistinction to Westminster. It was surrendered in 1539, and was valued at 60*l.* 11s. 6d., according to Speed. The site it occupied is now covered with victualling and biscuit bakeries for the Royal Navy. Not a trace or fragment of its walls remains. The paper conveyed a good impression of the power and influence wielded by the religious orders in London, and showed what a large share they must have had in the making of the history of the City in the medieval centuries. In the discussion which ensued, Mr. Blashill, hon. treasurer, spoke of the value of the ordnance maps in identifying the sites of religious houses and in other ways enabling us to illustrate the life of the old city. Mr. Patrick, hon. secretary, pointed out that, although the great fire destroyed the majority of the churches of old London, yet much of the walls must have remained standing, and their foundations, of course, were untouched, and in that connexion it is interesting to know, on the authority of Mr. Geo. H. Birch, that the present church of Christ Church, Newgate-street, is built upon the actual foundation-walls of the eastern portion of the Old Church of the Grey Friars Monastery, the nave of which extended considerably further to the west, covering the site of the present burial-ground.

COMPETITIONS.

BOROUGH OF SUNDERLAND WORKMEN'S DWELLINGS.—We are asked to mention that the designs under mottoes "Esperanza" and "Invicta" have not been returned for want of addresses. Will the authors kindly communicate with the Borough Engineer, Town Hall, Sunderland.

SUTHERLAND INSTITUTE, LONGTON.—A public competition of designs for this Institute has just been decided by Mr. W. Gilbee Scott, as assessor, in favour of Messrs. Wood & Hutchings, of Tunstall and Burslem, whose design, "Knowledge," was placed first, and their design, "Compact," was placed second, thus carrying off the two premiums of 75*l.* and 25*l.* The building will provide a public library, and technical schools of science and art, manual training and cookery. On the 7th of last month, the foundation stone was laid by the Prince of Wales, although the plans at that time had not been adopted. The estimated cost is 8,000*l.*

NORTH BRIDGE-STREET IMPROVEMENT, EDINBURGH.—At a meeting on the 17th inst. of the Lord Provost's Committee of Edinburgh Town Council, the report of a sub-committee on the North Bridge-street reconstruction was considered. The sub-committee recommended that the plans for the reconstruction of the buildings on both sides of the street, submitted by Messrs. Scott & Williamson, architects, whose designs were adjudged first in the competition, should be adopted with such modifications as the Council might think necessary. Failing satisfactory offers from outside parties to undertake the work in whole or in part at their own risk, the sub-committee were of opinion that the reconstruction should be executed by the Corporation itself. The Lord Provost's committee approved of this report, and agreed to ask a remit to instruct the preparation of working plans for the corner blocks meantime, and to obtain estimates. —*Edinburgh Evening Dispatch.*

TECHNICAL COLLEGE, SUNDERLAND.—At a recent meeting of the Sunderland Town Council, the Technical Education Committee reported that as to the competitive designs for the Technical College, the President of the Royal Institute of British Architects had nominated Mr. J. McLean Brydon, of London, as assessor, and the committee recommended his appointment accordingly. On the motion of Mr. W. M. Roche the report was adopted.

POLICE STATION, HALIFAX.—On the 10th inst. the Watch Committee of the Halifax Corporation held a special meeting with regard to plans for the new police station, court-house, &c. After a long discussion it was decided that competitive plans for a new building should be invited, that two premiums of 50*l.* and 25*l.* respectively should be offered, and that the successful plans should be compared as to cost, &c., with the adaptation plans submitted by the Borough Engineer (Mr. E. R. S. Escott), and if favourable that the premiated competitive plans should be

adopted. There was a divergence of opinion on the Committee as to whether the competition should be limited to the Borough architects, but ultimately it was resolved, by 8 votes to 4, that the competition should be an open one.

ENLARGEMENT OF CORN EXCHANGE, SPALDING.—The Spalding Urban District Council, at a recent special meeting, accepted plans for the enlargement of the Spalding Corn Exchange and Poultry Market, at an estimated cost of £2,000. Eight architects sent in competitive plans, and those of Mr. Corby, architect, of Stamford, were accepted.

THE AUCTIONEERS' INSTITUTE.

A PAPER, affecting the interests of mortgagors and mortgages of real property, buildings, and the appurtenances technically known as "fixtures," was read on Tuesday last at a meeting of the Auctioneers' Institute, 57, Chancery-lane, over which Mr. J. F. Field, President of the Institute, presided. The lecturer, Mr. J. Hepper (Leeds), dealt mainly with claims arising out of mortgages, and the illustrations given chiefly related to woollen and worsted mills, iron and engineering works, warehouses, public-houses, and dwelling-houses in cases in which the lecturer had been engaged as arbitrator or umpire in the North Midlands. The disputes with regard to "fixtures" were few between landlord and tenant or vendor and vendee, but numerous between mortgage and mortgagor, or the trade trustee of the latter, and as the simplest forms of conveyingance gave rise to the widest claims, the lecturer mainly confined his remarks and illustrations to mortgages of that kind. In laying down certain preliminary definitions the term "land" was extended to mean buildings attached thereto, and "fixture" as something which, when unattached, might be a mere "chattel," but when either actually attached by bolt, screw, nail, or other visible method of annexation, or only attached to the realty by a construction of law, must pass "with the land." Of the latter class were locks and keys, windows and doors serving to a house, as well as engines and boilers, shafting and transmitting machinery, and steam, gas, and water pipes, for workshop or factory. Even bellows must pass with the freehold, as well as, under most circumstances, the machine to which it was attached, unless the belt was cut, which the mortgagor had not always the right to do. Some interesting illustrations were given of looms of a light description, such as run in worsted mills, having to be given up to the mortgagee, while heavier looms, such as run in woollen mills, which could be worked without being permanently fixed to the walls or floor, could be removed by the mortgagor or his trustee. One of the most interesting illustrations given was of a travelling overhead railway, such as are common in engineering works, timber and stone yards, and known as a "Goliath." The lecturer was of opinion that all "travellers" driven from pulleys, or revolving square iron rods connected with the motive power, should pass with the freehold, and his practice was to claim them for the mortgagee, but in several cases which he had carried before a legal umpire, the decisions were adverse. Although the beams were fixed to piers of brick, forming part of the walls, firmly into the ground and stayed by props, the "traveller" was held to be a chattel standing in the same relation to the fixed frame, works, and rails, that a railway engine does to the railway. Disputes with regard to fixtures in dwelling houses had been less numerous than in factories, but the practice of an important firm of solicitors was referred to, which claimed for the mortgagee chimney glasses, screws to walls, window cornices of every kind, sideboards screwed to walls, brackets, valances—everything, in fact (except carpets) that was in any way attached to the freehold. The sounder principle appeared to him to be to regard as belonging to the fee whatever was measured or fitted to the walls or made so as to fit into one harmonious design, but to regard as chattels, glasses, grandoles, or other furnishings, put up to harmonise with the furniture of a room, but forming no part of the original structure or decorative design of a house. In hotels and also in shops and warehouses fixed articles might lose their chattel character more readily than in private houses, because there was a closer relation between certain classes of fixed articles and the freehold in the former than in the latter, the use of the article in relation to the purpose to which the owner was applying the premises being the leading principle in deciding whether in one case a fixture was "part of the land," and in another a chattel. In the valuation of fixtures the lecturer

found too much laxity. Valuers should become more accurately acquainted with the law than they often were, in order to guard their clients from the serious difficulties in which he had sometimes known them placed.

A discussion followed the reading of the paper, Dr. Hart proposing a vote of thanks, which was supported by Mr. W. R. Peck (Messrs. Hampton & Sons), Mr. Johnson, Mr. Harper, and the President. All the speakers concurred in setting the highest value on the paper, but Dr. Hart questioned the invariable application of a principle laid down in the paper, that a fixture under a mortgage was constituted by the qualifications, limitations, or definitions in the mortgage deed. He cited a case in which a gas-engine hired from the engineers was adjudged to pass with the freehold in spite of these limitations, because it was held to be sufficiently fixed "to pass with the land." Mr. Peck said the practice in the north was not the practice in London, so far as regarded cornices, gasaliers, and fixtures of that kind. Mr. Hepper replied to the criticisms offered. The vote of thanks was cordially given, and a vote of thanks was accorded, in conclusion, to the President.

Illustrations.

DRAWINGS OF ROUEN AND COUTANCES CATHEDRAL.

THESE two views, which formed a portion of the illustrations to Professor Aitchison's Royal Academy Lectures on Architecture, are from drawings by the late W. W. Deane.

That of Rouen shows the south porch with its sculptured arch springing between two buttresses, of late thirteenth century date, with a clumsy looking doorway of comparatively modern date inserted beneath the medieval arch.

The other drawing illustrates a portion of the nave and the central tower of Coutances, an earlier building than Rouen, and belonging entirely to the first half of the thirteenth century.

The octagon lantern in the centre of the composition was doubtless intended to have a spire, though it may be questioned whether the tower itself would have been improved by that addition, for which it seems too tall and slight in design; though the general effect of the whole cathedral, with its two western spires, might have been better balanced thereby.

CHURCH AT PALLERA, ITALY.

We give this elevation of a recently-erected Italian church as an example of the style of modern Gothic which obtains in Italy at the present time.

Pallera is a small country village two hours' walk from Turin, near Moncalieri. The church, of recent construction, is built in the Piedmontese Gothic style, with red bricks and artificial stone, and ornamented with coloured pottery. The interior is decorated in polychromy, and on its walls Professor Gaidano is painting illustrations of the Stations of the Cross. The altar is made of marble, and the tabernacle will be enriched with precious stones.

Signor C. Gallo is the architect; the illustration is from an elevation specially prepared for us by Signor Frizzoni.

THE ALMHOUSE CHAPEL AT HADLEIGH, SUFFOLK.

DR. WILLIAM PYKENHAM, Archdeacon of Suffolk and Rector of Hadleigh, made his will on the 6th day of April, 1497, and after enumerating certain charges for life, &c., made on his property, he proceeds to enumerate more particularly the items of which it consists and where the lands and tenements were situated, and then names who shall be "seized & possessed in the same Lands and Tenements," amongst whom, "the Parson & Wardens of the Parish of Hadley (Hadleigh) yearly for evermore, shall be ex-officio members, and shall well and completely repair, sustain, and maintain, as well all the said Land & Tenements, as also the xii. Tenements and the Appurtenances lately by me the aforesaid William Pykenham of new edified and builded for xii. Alms Houses, sit and being in the Town of Hadley abovesaid, and lay out the remainder yearly for ever to and among the xxiv. poor persons Almsmen and Women now being & which for the time shall in the xii. Tenements or Alms-houses abovesaid towards the Exhibition. Finding and Sustentation of the same xxiv. poor persons, Men & Women, that is to wit to every of the same poor persons men and

women like much in eschewing of warrants and stryfes."

These almshouses were taken down and rebuilt some few years ago, as they had fallen into a bad state of repair. The chapel was, however, left standing, although it was in a very dilapidated condition, and in 1891 it was repaired as shown in the illustration. A date (1498) was found cut upon one of the roof timbers. It appears also that there was a screen, for there are grooves and mortises in the eastern tie-beam, and the remains of the sill were found under the paving. A brick wall had been built at the west end to support the chapel, the timber framing shows that this was necessary. This was left standing. The roof had to be stripped and the brickwork taken out from between the timbers. Decayed portions were cut away and pieced with new wood, a new oak sill was inserted on the north side, the whole framing strengthened with iron ties, bolts, straps, &c. Some new rafters were inserted to replace decayed old ones, the roof boarded and felted, and the old tiles replaced. The old bricks were carefully replaced and the plaster repaired. The window-frames were quite rotten, so it was necessary to put new ones, and these have been put in regardless of the slope of the old timbers, quite upright. Such new work as was necessary was of the simplest description, and no attempt was made to copy the old work. The pulpit and two old benches, it is believed by the people of Hadleigh, were brought from the church, and it is said that the pulpit is the one used by Dr. Rowland Taylor, the martyr for conscience' sake in the reign of Queen Mary.

Dr. Pykenham also willed that the alms men and women said certain offices every day in the chapel, and that the bell be tolled every forenoon at eight of the clock and in the afternoon at four of the clock by one of the said poor men to call them to the chapel.

Dr. Pykenham also built the Rectory tower and gate, and probably the Archdeacon's house, and the Pykenham Gateway in Northgate-street, Ipswich, where he resided for some years. He was appointed in 1472 to the Rectory of Hadleigh and he died in 1497.

DRAWINGS FOR THE ROYAL ACADEMY.

As before, we shall be glad to take charge of and deliver at the Royal Academy any drawings sent to us in time to be photographed before the day of delivery, with a view to subsequent publication in this journal and in the "Builder Album of Royal Academy architecture."

We cannot accept any drawings sent to this office later than Saturday morning March 27, before 12 noon.

Architects sending drawings are asked to give special attention to the following requirements of the Royal Academy:—

1. All frames must be gilt.
2. Every drawing must have a label on the back, giving legibly the title and the artist's name and address.
3. Every drawing must have a similar label attached to the frame by a card so as to bang over in front.
4. Every drawing must be accompanied by a letter addressed to the Secretary of the Royal Academy, and signed by the artist, containing the artist's name and address, and the title or titles of the drawings sent. If more than one drawing is sent they must be distinguished by numbers, and the corresponding number must be repeated in the labels fixed to each drawing.

N.B.—We cannot undertake to supply or affix labels when omitted by the carelessness of the sender.

ARTISANS', LABOURERS', AND GENERAL DWELLINGS COMPANY.—According to the thirtieth annual report, the work of the year has been the pressing forward of operations at Leigham Court Estate. At Shaftesbury Park, Batterssea, two houses have been repurchased during the year. The estate at Noel-park, Wood Green, is now fully let. At Leigham-court, Streatham, 157 houses and 152 maisonnettes are let and occupied; besides these fifty houses and 154 maisonnettes are structurally complete, and will be ready for occupation during the year. It is intended during 1897 to build additional houses and maisonnettes, so as to finish Ameshury-avenue and the roads on the right of it from Streatham Hill to Mount Nod-road. Nineteen shops are structurally complete, five of which are let and occupied. The Local Authorities have arranged with the railway company for the widening of the bridge over the railway at the southern end of the shops. When this improvement of the road and footway is carried out it is expected that additional shop tenancies will be arranged.

A ROADSIDE MASS CHAPEL, AT HADLEIGH, SUFFOLK.—MR. C. SPOONER, ARCHITECT

THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A METROPOLITAN District Meeting of the Members of the Association of Municipal and County Engineers was held at the Institution of Civil Engineers, Westminster, on Friday evening, the 19th inst. Mr. F. J. C. May, C.E., Brighton, President, occupied the chair, and there were present, Messrs. W. Weaver, Kensington; J. P. Barber, Islington; W. N. Blair, St. Pancras; P. Dodd, Wandsworth; G. Livingstone, St. George's, Hanover-square; W. Low, Hampstead; C. Mason, St. Martin's-in-the-Fields; J. P. Norrington, Lambeth; N. Scorgie, Rotherhithe; J. A. P. Waddington, Whitechapel; G. R. W. Wheeler, Westminster; T. Cole, Westminster, Secretary, and others.

Mr. G. R. W. Wheeler, of Westminster, was unanimously re-elected honorary Secretary for the Metropolitan District.

Mr. W. Weaver, C.E., Surveyor to the Kensington Vestry, presented a paper on London House Drainage as affected by the draft by-laws framed by the London County Council, December, 1896. Mr. Weaver said that in June, 1893, certain by-laws regulating the construction of water-closets, soil-pipes, &c., were framed by the London County Council under the Public Health (London) Act, 1891, and the Council had recently formulated draft by-laws under Section 202 of the 18th and 19th Vic., cap. 120, dealing with other portions of the drain and adjuncts not dealt with by the by-laws, and partially repealing them. From 1855, for a period of thirty-eight years, the central authority, although possessing the power—which they were repeatedly urged to exercise—neglected to formulate any by-laws for regulating the construction of house-drains, &c., and it was left with the various Local Sanitary Authorities to frame their own regulations under similar powers conferred upon them by Sections 75 and 76 of the Act of 1855. The regulations made by the forty different Local Sanitary Authorities of the metropolis varied more or less in different districts and it had long been felt that comprehensive by-laws should be framed for adjusting the work throughout the metropolis on lines of uniformity. Whether he was correct or not in his interpretation of the law there could be no doubt that the tenor of the statutes indicated the wish of the Legislature that the Local Authority should have full voice in formulating the rules governing the work which it (and not the Central Authority) had to supervise in execution; and in adopting the imperious course which they had followed, virtually ignoring the Local Authorities, the London County Council had treated with contempt the evident intention of the statutes and the feelings of the Local Authorities, the majority of whom he believed were desirous that the by-laws should not be approved until the Local Sanitary Authorities throughout London had had full opportunity of considering the same and formulating amendments thereon. It was essential that the drains and sanitary fittings of a house should be executed in a sound and substantial manner, but in striving for that end the question of cost should be borne in mind. To some persons expense was no object, but to many others increased rent arising out of increased cost of building was a matter of moment, and nothing, therefore, should be made compulsory but what was necessary. Unless the by-laws were made somewhat elastic and a certain amount of latitude as to their enforcement was left to the Local Authority cases of hardship would arise.

In dealing with different classes of buildings and with different soils, variation in the work was desirable and should be permissible; it was not necessary to enforce the same standard of work in a 20l. a year house as in a 1,000l. a year mansion; huge blocks of flats and business premises could hardly be dealt with on the same sanitary lines as small detached or semi-detached cottages. Variation in soil also varied the requirements of the work. Mr. Weaver then proceeded to deal with the various by-laws as drafted by the London County Council. With reference to By-law 2 as to rain-water pipes, he expressed the opinion that it should be amended so as to allow at the discretion of the Local Authority the connexion with rain-water pipes of wastes from baths, lavatories, and sinks other than slop-sinks. Dealing with By-law 3, Mr. Weaver said that if the drain was constructed for the purpose of conveying sewage, it must not be less than 4 in. internal diameter. Four-inch drains might in many cases be laid with advantage, but in every instance the size of the drain should be governed by the area of the building to be drained, and

the quantity of drainage which would have to be conveyed. As regarded fall, the present rules varied considerably in different districts, but he was of opinion that in all new buildings the level of the basement-floor should be such as to permit of a minimum fall of 1 in 48. By-law 4 did not describe what was a suitable trap; must an interceptor be fixed, or would a flap-trap meet the by-law? These points required careful consideration and settlement, especially as By-law 7 insisted on "efficient siphon traps in other positions." Intercepting traps were a modern introduction, and had many drawbacks; they hindered the flow, were a frequent cause of stoppage, and in many cases gave off from themselves more offensive smell than they intercept from the sewer. The complaints as to smells from sewer ventilators in road surfaces increased year by year in proportion to the number of intercepting traps fixed on house drains. He was of opinion that the question of intercepted or non-intercepted drains was the most important point requiring settlement, and the London County Council should face the difficulty, and determine, with the assent of the Local Government Board, whether or not every new or reconstructed drain was to be intercepted in its way to the sewer. If the determination was in the affirmative, then a very large outlay in the future would have to be incurred by the ratepayers for exceptional methods of dealing with the confined sewer air, unless ventilating pipes on the sewer sides of interceptors or other effective methods were adopted. The whole of By-law 6, referring to the ventilation of drains, appeared to be confused and unsatisfactory, and he was of opinion that it should be made clear on the following points:—(a) Size and material for ventilating pipes; (b) whether mica flap inlets may be used; (c) distance from windows and position of ventilating pipe so as to make same "a safe outlet for foul air;" (d) position of air inlet where there is no forecourt or open area. By-law 7, which provided for "no inlets to drains within buildings," could not be observed in many cases, more especially in existing buildings. There were houses without open areas either central or at the rear, and in new buildings used for trade purposes gulleys were frequently required for the basement for washing-down purposes. The Local Authority must be allowed to exercise discretion in enforcing this by-law. In the present By-laws of the London County Council it was imperative as regards new buildings to place the soil-pipe outside such building. The new by-law proposed that a soil-pipe fixed in connexion with a new building or an existing building should, wherever practicable, be placed outside such building. This was an important alteration as regarded new buildings. As to By-law 9, which deals with the ventilation of trap of water-closet, he was of opinion that the requirements as to anti-siphonage pipes were excessive and beyond what was necessary. By-law 13 was very important, as it made the by-laws applicable, so far as practicable, to existing buildings. It might in many cases be practicable to apply the by-laws to existing buildings, but only at considerable extra expense, owing to the construction of the existing premises. A person reconstructing a drain would be forced, irrespective of cost, to carry the drain, if practicable, outside the building, and other instances would occur where this by-law, if rigidly enforced, would press with great severity on property-owners. He pointed out that the following subjects were not dealt with by the draft by-laws, viz.:—(a) diminishing or taper pipes; (b) drainage from urinals; (c) removal of old drains, or the filling in of same, and the removal of contaminated adjacent earth; (d) drainage plan to accompany notice of commencement of work. In conclusion, he desired to accentuate the opinion previously expressed that, subject to a general code of by-laws on the subject of drain construction, the matter should be left with the Local Sanitary Authority, who must be allowed discretion in enforcing and interpreting the by-laws. It was a scandal and reproach to local self-government that at the present time any person carrying out drainage work in any part of the metropolis could appeal to the London County Council as to the method of making a joint between pipes, or as to the form of a closet pan; and he had been occasionally amused whilst attending on business at the County Hall, Spring-gardens, by observing persons with closet-pans, patiently waiting their turn to explain the merits of the same to a committee of the Council, who, it must not be forgotten, were not vested with any power of supervising the construction of drains, but had themselves, when executing drain

work in any district of London, to carry out such work under the direction and to the satisfaction of the Local Sanitary Authority of such district.

Mr. W. Nisbet Blair (St. Pancras) said these by-laws were eminently needed in London, and he thought they were all in agreement that there should be a complete code for the whole of London. In addition to the by-laws which they had before them, there were statutory regulations which he had suggested to, and which had been adopted by, his Vestry, to be placed as prefatory clauses to the by-laws. The first addition would be to give the notice required under Section 76 of the Metropolis Management Act. Every builder should be compelled to give seven days' notice, and such notice should be accompanied by a plan of the alterations proposed.

Mr. Low (Hampstead) agreed with Mr. Blair as to the necessity for plans, but he said there was a Bill before the House now—the Sewers and Drainage Bill—by which powers were sought to obtain the deposit of plans with the Sanitary Authority. They ought to avoid the suggestion in the letter of the County Council, that any suggested alterations will be further considered on the occasion of a future revision of the by-laws. That was what they wanted to avoid. They did not want any future revision; otherwise they would never get any finality. They wanted to urge upon the County Council to get the by-laws complete.

Mr. Mason (St. Martin's-in-the-Fields) thought there ought to be some provision made for revising these by-laws every few years.

Mr. T. W. E. Higgins (Chelsea) agreed with Mr. Mason that by-laws required revision every few years. He was of opinion that nothing should be made compulsory unless necessary. The proposal for a 4 in. pipe was with the idea of killing the 6 in. They tried to do it by specifying for the shaft to be the same as the drain, because no man would think of putting a 6 in. or 9 in. pipe up the side of his house.

Mr. J. P. Norrington, Lambeth, said he did not think the letter from the County Council was such as should be sent to the vestries of London. As to the by-laws themselves, notwithstanding the "careful consideration," he was not very much impressed with them. They seemed to be based on the model by-laws of the Local Government Board, and whoever drafted them did not seem to have the practical experience of the construction of drainage which many gentlemen in that room possessed. He thought the result would have been more happy if the County Council had given longer notice of their intention to make the by-laws, and had consulted surveyors of experience on the subject. The regulations of the Fulham Vestry provided for notice being given and plans deposited of drainage work. Reference had been made to clause twelve of the London County Council's Sewerage and Drainage Bill. He had considered that clause, and was advising his vestry that it did not go quite far enough. The clause was intended to provide for the deposit of plans, but he did not know whether it would cover the deposit of plans for the reconstruction of drains. He had always been pressing his vestry for that power, and he was advising his vestry to ask the County Council for it.

On the proposition of Mr. Cooper, Wimbledon, a Committee, consisting of Messrs. W. Weaver, Kensington, J. P. Barber, Islington, C. Mason, St. Martin's-in-the-Fields, G. R. Norrish, St. Saviour's, Southwark, and G. R. W. Wheeler, Westminster, was appointed to consider the by-laws, together with the paper of Mr. Weaver, and reports from other metropolitan surveyors, with power to act for the Association.

Mr. Weaver, in replying to the discussion, expressed the opinion that the surveyors who had to supervise the work, ought to draw up the rules for supervising that work.

On the proposition of Mr. Norrington, seconded by Mr. Low, a hearty vote of thanks was accorded to Mr. Weaver for his paper.

Hard Wood Pavements.

Mr. R. W. Richards, C.E., City Surveyor of Sydney, New South Wales, then read a paper on hard wood pavement in Sydney. He said that as the result of seventeen years' experience, he had come to the conclusion that a carriage-way pavement laid upon a good foundation of concrete with New South Wales' hard woods, with slope or butt joints, with convexity of 1 in 60 or 80, properly cleaned and maintained, was the best and most suitable form of pavement for heavy and continuous traffic; and that the best timbers for such work were tallow wood, blackbutt, blue gum, red gum, and mahogany. These timbers, after having been laid in Sydney

streets, had, upon examination, shown wear at the rate of from $\frac{1}{16}$ to $\frac{1}{8}$ in. per annum, and had not required repairs of any kind whatever. The cost of the first wide-jointed pavement, including all labour, materials, &c., was about 27s. per yard super, while recently pavements with the close joints in Sydney cost 15s. 6d. per yard.

The President, in inviting discussion upon the paper, remarked that it was of very great importance, particularly to metropolitan authorities.

Mr. McBriar, Lincoln, said he would like to have some information as to the comparative slipperiness and noiselessness of these New South Wales hard woods, and also some explanation as to why they had not taken in the English market like karri and jarrah. The convexity of the roads in Sydney was less than the London practice.

Mr. C. Mason, St. Martin-in-the-Fields, said that the greatest difficulty he and other metropolitan surveyors had with Australian hard woods was that their expansion and contraction was an unknown quantity. He had found one sample would expand enormously, another would contract. He could not get from the importers information as to whether the wood was seasoned in the same way as Norwegian and other timbers, and whether it was cut in any particular season of the year. He was very favourable to hard wood, more so than he was twelve months ago.

Mr. Norrington, Lambeth, asked as to the comparative methods of tallow wood, black butt, and ironbar, and said he wished to know whether, if large orders were given for these woods, they were in such abundance that the orders could be satisfied with reasonable rapidity.

Mr. Stainton, New South Wales, expressed the opinion that of all the woods which come from Australia, those of New South Wales were infinitely preferable. Given close-jointed pavements with the woods he had seen they had the most economical and satisfactory wood pavement.

Mr. W. Weaver, Kensington, said his experience of hard wood pavement was not of sufficient duration to lay down any firm conviction upon the matter. He should like to get hold of a good hard wood pavement which would not present the objectionable features apparent in the hard wood pavements in London, and if all Mr. Richards had said as to black butt could be borne out in London, the sooner they laid down trial lengths the better it would be for the metropolis.

Mr. Nisbet Blair, St. Pancras, said he believed that black butt and tallow wood would give them as good a pavement as karri and jarrah. Of course, a comparison of the results in Sydney and in London depended entirely upon the traffic standard in the streets. He doubted very much that the streets in Sydney, where these blocks were laid, had their streets. In Euston-road, for instance, which received the traffic of three London termini—the London and North-Western, the Midland, and the Great Northern—a very large number of omnibuses, approximately 300—buses an hour, brought very severe wearing effect upon these woods. Blocks laid under traffic for three years showed an average annual wear of about $\frac{1}{16}$ of an inch.

Mr. Waddington, Whitechapel, said he visited Sydney nine years ago, and he was very much impressed with the paving of the roads.

The President, in submitting the vote of thanks to the meeting, expressed his personal thanks to Mr. Richards for the paper.

Mr. Richards, in reply, satisfactorily answered the questions put by the members. He remarked that the pavement was as noiseless as asphalt, and that slipperiness was dealt with by free sanding. The traffic in some of the streets of Sydney was very heavy. The woods named had not been pushed on the English market, but could be obtained in large quantities. He affirmed that the hard woods of New South Wales would be found the most economical and satisfactory that could be used for pavements.

The meeting then terminated.

PROPOSED CIRCULAR RAILWAY, ABERDEEN.—The Great North of Scotland Railway Company have given statutory notice to include in their Running Powers to Inverness Bill the proposed circular railway through the suburbs of Aberdeen. The branch—3 miles 1 furlong 156 yards in length will extend from near Kittybrewster Station on the main line to Oldmill Refractory, where it will join the proposed railway to Stone and Echt. The steepest gradient is 1 in 15. There will be a tunnel at Clifton-road, where the excavation will be 52 ft. deep.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Sir Arthur Arnold, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend the Battersea Vestry 2,745*l.* for carrying out improvement works at Vicarage-road and York-road, and for making a footpath at Clapham Common; the Shorelitch Vestry 24,800*l.* and 17,000*l.* for electric lighting works; and 18,830*l.* for paving and sewer works; the St. George's (Southwark) Vestry 550*l.* for paving works; and the St. Marylebone Guardians 40,440*l.* for the erection of a new administrative block at the workhouse.

The Works Department Inquiry.—Mr. T. W. Williams asked whether it was true, as reported in the Press, that Mr. Holloway, the late manager of the Works Department, had written offering to give evidence before the Committee of Inquiry on the conditions that his solicitor should be allowed to be present, and that an indemnity was given him against any further proceedings. The public, he thought, would not be satisfied if Mr. Holloway were not called, and he should like to know whether it was possible for the Committee to reconsider their decision not to call him, if it was true they had arrived at such a decision.

The Chairman replied that Mr. Williams had been misinformed as to the reasons why Mr. Holloway had not been called. There had been a good deal of correspondence from which it would be seen that the terms upon which Mr. Holloway was willing to give evidence were that he should be allowed through counsel to cross-examine witnesses on his behalf. The Committee were unable to accede to that request, but they had never objected to Mr. Holloway's solicitor appearing. The Chairman added that the report of the Special Committee would be out within a month.

Buildings of Historic and Architectural Interest.—The General Purposes Committee brought up the following report:—

"The Council on January 21, 1896, passed the following resolution:—'That the following addition be made to the order of reference of the General Purposes Committee:—'To consider and report in the case of the contemplated destruction of any building of historic or architectural interest what course of action the Council should adopt.'"
We now report for the information of the Council the steps we have taken with a view to giving effect to the above-mentioned resolution. In the first place it seemed to us essential that a list, as complete as possible, should be obtained of all buildings of historic or architectural interest in London, and we appointed a Sub-Committee to deal with the matter. With a view to obtaining the necessary particulars for such a list, a communication was addressed to certain institutes and societies, several of which expressed their willingness to assist the Council. Subsequently it was decided that the best means of arriving at a satisfactory and expeditious mode of procedure would be to hold a conference with the various institutes and societies who had been asked to kindly assist the Council in the matter, and, with our concurrence, the Sub-Committee convened a conference, which took place at the County Hall on December 4 last. Representatives from the following societies attended, viz., Architectural Association; British Archaeological Association; City Church Preservation Society; Committee for the Survey and Registration of the Old Memorials of Greater London; Kent Archaeological Society; Kyle Society; London and Middlesex Archaeological Society; London Typographical Society; National Trust for Places of Historic or Natural Beauty; Royal Archaeological Institute; Royal Institute of British Architects; Society of Antiquaries; Society of Arts; Society for the Protection of Ancient Buildings; and Surveyors' Institution. After an interesting discussion, in the course of which the representatives of the various societies expressed their gratification at the Council taking action in the matter, and the hope that the interest shown by the Council would stimulate greater public interest in ancient buildings, Sir Robert Hunter, representing the National Trust for Places of Historic or Natural Beauty, stated that the members of different societies had had a preliminary conference, and were all of opinion that some register or list of buildings, interesting by virtue of their antiquity or architectural beauty and associations, should be compiled. In support of this it was contended that at the present time there was considerable ignorance as to what London possessed in the way of buildings of interest, and that frequently it was only realised that a building was of historic interest when that building was in danger of being removed. The Trinity almshouses were cited as an instance. A list or register would, it was thought, remove in a great measure the risk of losing such buildings. The

Committee for the Survey and Registration of the Old and Interesting Memorials of Greater London having already commenced to prepare such a register, it was thought that good purpose would be served if that Committee were to continue it in connection with the preparation of the register. The resolutions passed at the conference were as follows:—(1) That it is desirable that a register or list be made of buildings of historic or architectural interest in London; and that the register be in such a form as to admit of amplification, both as to buildings and detail of building, according as future information comes to hand. (2) That it is desirable to form a general committee to include representatives of the different societies interested in the matter, and that the Council be requested to appoint representatives on such committee. (3) That the existing Committee for the Survey and Registration of the Old Memorials of Greater London, having already made a register of buildings in the east end of London, be requested to continue its work; and that it is desirable that similar registers be compiled for the rest of London, it being understood that such registers are formed for the use of the London County Council. (4) That the General Purposes Committee be requested to consider the desirability of the register being printed from time to time by the Council with suitable drawings and illustrations. We have since the conference considered the resolutions, and are of opinion that they should be adopted. The preparation and printing from time to time of the register will necessarily involve some expenditure, and when we have further considered the matter in this respect we propose to bring up definite recommendations based on the results of the inquiries which have been suggested. It is the opinion of the Council generally that it is willing and desirous to assist in the collection of particulars for a register of the nature suggested, and we have accordingly given directions for a circular letter to be addressed to members asking them, if they have information or suggestions to offer with regard to any buildings of historic or architectural interest in the districts they respectively represent, to be good enough to forward such information or suggestions to the Clerk of the Council."

Workmen's Trains.—On the recommendation of the Housing of the Working Classes Committee, the Council resolved—

"That the special maintenance estimate of 60*l.* submitted by the Finance Committee for the cost of making inquiries as to the adequacy of the facilities provided by the railway companies for working men residing in South London be approved, and that the statistical officer be authorised to engage for the period till March 31, the services of four temporary assistants, at 2*s.* 2*d.* a week each, for that purpose."

Highgate Archway.—The Bridges Committee reported that they had had before them several designs for the reconstruction of Highgate Archway and had selected one (design "D") for a single arch bridge, 120 ft. span, with steel ribs. The work was estimated to cost 28,100*l.* Tenders for the work are to be invited from contractors.

Technical Education.—The Technical Education Board recommended the Council to vote the sum of 150,000*l.* from the beer and spirit dues for the purposes of technical education for the ensuing year. This is 30,000*l.* more than was voted last year.

Dr. Cooper moved an amendment to reduce the grant by 29,175*l.*, being the amount to be expended on the county scholarships. He complained that the polytechnics were kept idle during the day, and were crammed with artisans in the evening who were too tired to receive the education provided. If the scholarships were to be of benefit they should be given for study during the whole day.

The amendment was seconded by Alderman N. W. Hubbard, but was rejected, and the recommendation of the Board was subsequently agreed to.

Contractor's Work in Rosebery-avenue.—The Improvements Committee reported that they had received a letter from the Clerkenwell Vestry in regard to the repairing of the carriageway of Rosebery-avenue between St. John-street-road and Farringdon-road. Twice last year the Council informed the Vestry that they had no power either to call upon the contractor to repair the roadway or to reimburse the Vestry the cost of this work, which is nearly 3,000*l.* The Committee therefore recommended that they should inform the Vestry that the Council, having taken counsel's opinion on the matter, is advised that it has no power to assist the Vestry in connexion with the repairing of the carriageway.

Mr. Burns said that he had never seen such bad work as had been put into the road. The roadway ought to have lasted four years longer. The contractor who had done the work had become bankrupt because he had underbid everybody else.

Mr. Spokes moved that the recommendation should be referred back to Committee.

Mr. Banning seconded the amendment.

On a show of hands the voting was equal and a division was taken, with the result that 51 votes were given for the amendment and 55 against. The recommendation of the Committee was subsequently agreed to.

Construction of New Fire Brigade Appliances.—The report of the Fire Brigade Committee contained the following paragraph, the recommendation being agreed to:—

"The Chief Officer has suggested that the form of some of the appliances used by the brigade can be considerably improved, and he has submitted to us designs of the kind of apparatus which he proposes should be adopted. The Chief Officer wishes the Council to have the benefit of the improvements, and, in order that the Council may not be prejudiced by the Chief Officer's ideas becoming known, we have instructed him to obtain provisional protection for the apparatus, which for obvious reasons we do not describe. Judging from the designs, it appears to us that the suggested machines possess several advantages over those now in use, but it will, of course, not be practicable to come to a definite conclusion until the apparatus has actually been constructed and tested. With that view we suggest that the Chief Officer should be authorised to expend a sum not exceeding 200*l.* in making specimens of the appliances, and that he should be authorised to select the persons to be employed to do parts of the work. We think it desirable that some of the apparatus should be made in the brigade workshops, and that tradesmen should be employed to do what cannot be executed there. Such of the expenditure as will be incurred before March 31 next is covered by this year's estimate, and the balance will be provided for in next year's estimate. We accordingly recommend—that the Council do authorise an expenditure not exceeding 200*l.* in respect of the construction under the Chief Officer's direction of fire appliances of new design, and that it be referred to the General Purposes Committee to consider and report as to the course to be followed in this and similar cases."

Proposed Widening, Watling-street.—The Improvements Committee recommended that the City Commissioners of Sewers be informed that the Council does not feel justified in contributing any part of the cost of the suggested widening of the road at Nos. 16, 17, and 17½, Watling-street. After some discussion this was agreed to.

The Works Department.—The Parks Committee recommended the erection of sanitary conveniences at Hilly Fields, at an estimated cost of 650*l.*, by the Works Department.

Mr. Corbett moved an amendment that the work should be done by a contractor.

Upon a division the amendment was defeated by fifty-two to thirty-eight votes, and the Committee's recommendation was then agreed to.

After transacting other business, the Council adjourned soon after seven o'clock.

THE COUNTY COUNCIL INQUIRY.

THE inquiry into the organisation of the Works Department of the London County Council was resumed on the 17th inst. at Spring Gardens, Sir Arthur Arnold again presiding.

The first witness examined was Mr. W. B. Fulwood, formerly an employe of the Works Department, who had written a letter to Mr. E. White containing allegations with regard to irregularities in the accounts, and with regard to the borrowing of money from an employe by a County Councillor. All endeavours to make the witness divulge the names of either of the parties to the latter transaction failed, but it was elicited that both the lender and the borrower were still connected with the County Council, and that the amount borrowed was 200*l.* With regard to the irregularities in the books, some of which were handed up for inspection, the witness indicated entries where amounts had been charged as foremen's wages where no foreman was employed, and where the witness himself had charge of the job. He did not suggest that anybody had put money into his pocket, but such items as one of 1*l.* 4*s.* 5*d.*, charged as wages of a foreman who was not employed on the job, ought not to have been entered. Because he had insisted upon drawing attention to these irregularities, he had been compelled to relinquish his post.

The next witness called, Mr. Steadman, Secretary of the Bargebuilders' Union, said, in reply to Sir Arthur Arnold, that, in his judgment, no honest employer of labour had any reason to fear the wages clause. He was in favour of a selected list for tenders, because it was less likely to lead to jobbery than open tendering. He was opposed to either reducing or abolishing the Works Committee.

In reply to Sir Godfrey Lushington, the witness said he did not claim to have more knowledge than other people, but he flattered himself that, as a mechanic, he knew a good piece of work when he saw it. He was satisfied generally with the character of the work done by the Council, and some of it, he thought, was a credit both to the manager and the workmen. Questioned with regard to the shop-stewards, he said there were none in his trade. He was not a builder, and he could not say what were the customs of the building trade.

In reply to Dr. Longstaff, Mr. Beachcroft, and Mr. Fletcher, the witness said that he had been Vice-Chairman of the Works Committee since March, but, except during a temporary absence of the Chairman, Mr. Ward, his duties had been only the same as those of any other member of the Committee; he had accepted the office of Vice-Chairman when there was a difficulty in getting any other member of the Committee to accept it. He thought the position was something of a figure-head; he had practically nothing to do, and he should not again take the office. He was not in favour of the Department tendering with contractors, but he would like to see it one of the largest employers of labour in London. With regard to possible improvements in the system of the Department, he said he thought the Committee should be composed only of men who wished to make it a success, that the manager should stay more in his office, and should have three or four responsible men under him to superintend the work done outside. The late manager had tried to do too much. He thought no manager should be entrusted with the purchase of materials.

In reply to Mr. Gruning, the witness said he did not think it would be a good thing for men on the promise of constant employment to accept less than the regulation wages.

Mr. Gruning: You would rather be out of work?—A good mechanic can always get employment.

Mr. Binnie, the Engineer to the Council, was recalled for the purpose of giving information with regard to the Hackney and Holloway storm-sewer, and other jobs as to which allegations had been made. Speaking generally, the witness said the work done by the Department had been of high quality, and it had been very successful. To build up a large contracting business was not usually a matter of a few years. Great firms, like several he named, had required three generations to mature. He considered that the Council had done wonders during its comparatively short existence. The witness subsequently added, in replying to Sir Godfrey Lushington, that he referred to the work of the Department as a whole, but that the success had been greater in engineering than in architectural work.

The inquiry was then adjourned till Friday, the 19th inst., when the first witness called was Mr. W. J. Livingstone, who, as it now appeared, was the official referred to by a previous witness (Mr. Fulwood) as the lender of £200 to a Councillor (Mr. J. W. Benn). The witness having replied to a number of questions, Sir Arthur Arnold declared that the explanation given by the witness was clear and satisfactory, that the transaction was a legitimate one, and one that the witness was entitled to make, and that no discredit attached either to the witness, Mr. Benn, or the Council.

The Architect of the County Council, Mr. Blashill, was now recalled to be examined upon a supplementary statement which he had obtained permission to put in, in contradiction of statements made by Mr. Alderman Taylor and Mr. Ward.

Among the leading points referred to in the supplementary statement was the allegation that at least 5 per cent. might have been saved upon the actual cost of work done by the Department but for the existence of friction between the Works Committee and the Architect's department. There was no foundation for that suggestion. The best feeling had always existed between the executive officers of the departments, and disagreement about items made no important difference. When at one time the late manager suspected some little friction, witness had sent a memorandum to his staff laying down the principles on which, as brother officers, they should conduct business with the officers of other departments. As regards the settlement of accounts, added the supplementary statement, the four independent quantity surveyors employed by the Council have all complained that they could not satisfy the demands of the Works Department.

In every case where the manager had appealed, he had been allowed for anything that had been overlooked by inadvertence, and the quantity

surveyors had demanded and received extra payment for trouble given by the Department in settling up the accounts. Nothing of this kind had happened with any contractor. In the supplementary statement Mr. Blashill repudiates entirely the explanation given by Mr. Ward of the drainage work done at Scotland Yard, and gives a flat contradiction to the numerous statements of Mr. Ward and Alderman Taylor that no allowances were made at the end of a job for work said to be done under additional orders.

"These gentlemen," says Mr. Blashill, "have been misled, and there is no foundation for such statements. In every case the work actually done is ascertained, and everything that is in excess of the original order is allowed for. I have even reviewed my original estimate and raised it where I thought it was insufficient. The result of these processes was the corrected estimate."

Mr. Blashill reiterates the assertion that inspection of the prime cost invoices was persistently refused for weeks, and adds that although on many of the accounts the Department had received allowances of 10 or 15 per cent. from the manufacturer, yet the full price of the invoice was charged as prime cost, while an additional claim of 12½ per cent. was made, and therefore the department intended to make a profit of 25 or 30 per cent. upon those items. That was not what the Council intended. The statement dealt with the "exposure" of bad plumbing and drainage, and referred to the "exhibition" of defective appliances. "Most of these defects," says Mr. Blashill, "were actually discovered and exposed by my officers. Nearly all the specimens were taken out of old buildings before any of my clerks of works came to Spring Gardens; some are dated twenty-five years back, and some were taken out of old buildings bought by the Metropolitan Board of Works."

Examined by Mr. Beachcroft upon this supplementary statement, the witness said that he had no means of knowing whether there would be a loss or not upon works not yet completed, but he believed they were now going on better. With regard to the purchase of materials, he had formed an opinion, gathered from the testimony of others, that the Council's system of purchase of timber by auction was not a success. If he (the witness) were asked to make the purchases he should require some supervision, so that his transactions should be examined so as to prevent their being questioned. He had always understood that there was the greatest possible danger of commissions being given in respect of the purchase of materials, and there was more than a possibility of heavy commissions getting into the hands of the buyers. The Royal Institute of British Architects had long been considering the means of checking the practice.

Mr. Beachcroft: How long will it be necessary to wait to ascertain the success of the Department?—When the present buildings are completed a good means will be afforded of judging.—We shall not have to wait a generation?—No. Do you think it would be safe for the Council to leave the Works Department to make its own estimates?—It would be safe, but not satisfactory from a financial point of view.

In subsequent examination by Mr. Davies, Mr. Fletcher, and other members of the Committee, the witness emphatically contradicted the evidence of Mr. Taylor with regard to several jobs. His evidence, with regard to work done at the Embankment-gardens, Chelsea, and Fimlico shrubberies, appeared to the witness inexplicable. Mr. Taylor said thirty-five new kerbstones that were specified had not been put in, that not a single ounce of sulphur had been used where sulphur had been prescribed, that the ornamental fence was not taken up, and that the painting was badly done. But the kerbstones had not been specified, and everything required to be done had been done, and very well done. The jobs had been carried out under Mr. Sexby, the Superintendent of the Parks Department, and he (Mr. Blashill) had seen them all for himself.

In reply to Mr. Gruning, the witness rebutted a charge made by Mr. Burns as to the use of soft Worlaby stone, instead of hard Mansfield, at Brompton; Mr. Burns's informants were simply mistaken. The soft stone was for another job altogether, and none of it was used at all on the job indicated. He endorsed the statement of Alderman Taylor as to the good quality of the work at the New Cross Fire Station, but it was rubbed work, which was not necessary, and it was more costly.

Mr. Sexby, the superintendent of the Parks Department, who was next called, gave Dr. Collins a list of jobs done under his superinten-

dence, amounting in the aggregate to 168,305, as estimated, and 161,402 in actual cost. The quality of the Council's work was better than contractors' work. The estimates were all prepared in his department. His work differed entirely from building work, which involved a much greater amount of detail. In his department the principle of the direct employment of labour had given rise to no dissatisfaction and no labour disputes. He had 700 men employed, of whom 300 were labourers.

It was expected that this would be the last evidence taken, but at the last moment Mr. Ward, Chairman of the Works Committee, asked permission to put in a statement replying to the charge of withholding all knowledge of the regulation mentioned by Mr. E. White from the members of his Committee. The statement was allowed to be put in, but as it will involve cross-examination, the inquiry was again adjourned, Wednesday, the 24th inst., being fixed for the purpose.

ENGINEERING SOCIETIES.

THE INSTITUTION OF CIVIL ENGINEERS.—At the ordinary meeting of this Institution, on the 23rd inst., Mr. John Wolfe Barry, C.B., F.R.S., the President, in the chair, two communications on "The Main Drainage of London," by Messrs. W. Santo Crimp and J. E. Worth, M.M. Inst. C.E., and on "The Purification of the Thames," by Mr. W. J. Dibdin, were read. In the first paper were described in detail the works carried out in London for the purpose of intercepting the sewage, which formerly passed directly into the river, and conveying it to outfall works at Barking and Crossness, about fourteen miles below London Bridge. The works, designed by the late Sir J. W. Bazalgette, and carried out by him for the late Metropolitan Board of Works, comprised the construction of about 110 miles of intercepting and storm-relief sewers, the former having a final discharging capacity of about 500,000,000 gallons per day, about 2.7 times the present dry weather flow. There were two main pumping-stations on each side of the river, with machinery of an aggregate of 3,000 horsepower, capable of pumping 500,000,000 gallons per day, and a like number of storm-water pumping-stations, capable of pumping directly into the river 150,000,000 gallons per day. The latter were used for preventing flooding in the lower parts of the Metropolis, when a heavy fall of rain occurred at or about the time of the tidal water, when the storm outlets were closed by the tidal water. The works undertaken by the London County Council to improve the pumping machinery, by compounding the steam engines at the principal pumping stations were also described. The outfall works for the purification of the sewage, the dry weather flow of which now exceeded 200,000,000 gallons per day, were next dealt with. They consisted of settling tanks and their accessories for the chemical treatment of the sewage, and the means for removing the sludge produced to the German Ocean. The tanks at Barking contained 20,000,000 gallons, whilst those at Crossness contained 31,000,000. The sludge, amounting to 2,169,000 tons in 1895, was discharged into the open sea at a distance of about fifty miles from the works by a fleet of six steamers, each having a carrying capacity of 1,020 tons. The experimental filters for dealing with the effluent, and capable of effecting a purification of 78 per cent., were mentioned. The question of flood discharges from an area fully built over was referred to, and the details relating to an area of 160 acres were given; it appeared that the flow had reached a rate equal to two-fifths of an inch per hour. The bearing of this question upon the "Separate" system was next referred to, and it was stated that, so far as London was concerned, the system was impracticable. Nine hundred and twenty men were employed in the continuous disposal of the sewage, which amounted to 75,000,000 gallons per annum, the working expenses in 1895 being 104,000, or about 5d. per head per annum. The works now disposed of the sewage from a population of 4½ millions. The results had been the interception from the Thames of vast quantities of filth, which formerly rendered it offensive, and the conversion of the river into a relatively pure estuary. In the second paper the author described first the steps that had been taken in accordance with the scheme adopted by the late Metropolitan Board of Works for the treatment of the London sewage at the outfalls at Barking Creek and Crossness; secondly, the effect of that work in freeing the river from the raw sewage; and

thirdly, the best method of effecting still further improvement. On arrival at the Northern Outfall Works the sewage was screened to remove all large particles, such as rags, &c. After receiving the proper quantity of lime the sewage passed the iron-water station, where the solution of iron sulphate was added. The iron salt was dissolved in a tank of water heated by a steam coil, and the concentrated solution was sufficiently diluted and passed into the already limed sewage. The precipitation was completed in the channels, thirteen in number, about 30 ft. wide, 15 ft. in height, and having an average length of 1,000 ft. The sludge was discharged from these to the sludge settling channels by sweeping the deposit through culverts to the receiving chamber at the engine-house, whence it was pumped into the settling channels. On its way to these the sludge was again passed through gratings to collect rags, &c., which might have escaped the first filth-gratings. The quantity of solid matter extracted by the combined action of these double sets of gratings was between 80 tons and 100 tons per week. A destructor-furnace was built close to the filth hoist for calcination of the refuse. After the sludge had settled and the top-water had been drawn off by means of lowering syphons, the sludge was let into the storage-tanks under the settling channels, whence it was pumped to the ships. The water drawn from the settled sludge was separately treated with lime and iron, and after such treatment it was allowed to settle in the sewage-precipitation channels. At the Southern Outfall Works, Crossness, the precipitation works were more compact. Practically the whole of the lime was in solution. The iron water was made at Crossness by the simple agitation of the crystals of iron salt with water in an ordinary mixing-mill from which the rollers were removed, stirring-arms being substituted in their place, the effect being equally efficacious with that of the steam-coil at the Northern Outfall works. The methods of collecting the sludge, settling it, and loading the ships were practically identical with those at the Northern Outfall. The discharge of the sludge took place in the Barrow Deep, commencing at a point ten miles east of the Nore, about half-way between the Swin Channel and the Princes Channel. As the sludge was discharged 10 ft. under water, and was thus agitated with the sea-water by the action of the twin-screws, the diffusion of the sludge in the water is very complete, so much so that its visible effect was soon lost. The heavy matters soon separated by subsidence, and the animal and vegetable debris was rapidly consumed. Although some 10,000,000 of tons of sludge had now been deposited, the most careful examination failed to detect more than the merest trace, either in dredgings or on the sandbanks, which were now as clean as in 1888. The cost amounted to about 4d. per ton of sludge. The average character of the sewage before and after treatment was set out in tables of monthly averages of daily analyses of samples taken every two hours, day and night, at each outfall during the year 1894. At Crossness, in consequence of the better solution of the lime-water, there was a reduction of the matters held in solution of 17 per cent., a result which agreed closely with the experiments by the author in 1887. At the Northern Outfall the results were not yet so good, but this would doubtless be remedied as soon as the new liming station was erected. Tables showing the averages of daily analyses of the river-water since 1885 were given, and showed that the degree of aeration at high-water had increased from 17.4 per cent. in 1887 to 55.5 per cent. in 1894; and this improvement has been accompanied by a large reduction in the quantity of free ammonia.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on the 23rd inst., the Building Act Committee reported that they had considered the under-mentioned applications under the London Building Act, 1894, and had arrived at the following decisions. Those applications which have been agreed to are granted on certain conditions:—

Lines of Frontages.

Kennington, South.—That consent be given to the erection of a one-story ledge upon part of the open space in front of the Oratory, Brompton-road, on the application of Mr. P. Shaw on behalf of the Very Rev. F. Antrobus and the Fathers of the Oratory.

Narrowoad.—That consent be given to the erection of buildings on the west side of Herne Hill and the east side of Milkwood-road, Lambeth, adjoining the postal-sorting-office, on the application of Messrs. Douglas Young & Co., on behalf of Mr. G. Ballard.

Bethnal Green, North-East.—That consent be given to the erection of a stable and coachhouse, with lean-to, on the south side of Sewardstone-road, next No. 63, on the application of Messrs. Holman & Goodbarham on behalf of Mr. W. T. Payne.

Dulwich.—That consent be given to the erection of a one-story shop on a portion of the forecourt of No. 8, Forest Hill-road, Honor Oak, on the application of Mr. G. F. Grover on behalf of Mr. G. Ferris.

Fulham.—That the application of Dr. Ivor Davis for an extension of the period within which the erection of a porch and two two-story additions to No. 4, Fulmer-road, were required to be completed, be granted, upon condition that the porch and additions referred to be completed within two years from October 15, 1895.

Hampstead.—That consent be given to the erection of a block of residential flats on the east side of Fairhazel-gardens, to flank upon Goldhurst-terrace, on the application of Mr. T. S. Stephens on behalf of Mr. W. H. Pearce.

Holborn.—That consent be given to the erection of an oriel window, at the first floor level, in front of "Hand-in-Hand" public-house, No. 57, High Holborn, on the application of Mr. C. H. Flack, on behalf of Mr. B. F. Lucas.

Kennington, North.—That consent be given to the erection of a covered way upon part of the forecourt of No. 30, Lansdowne-road, Notting Hill, on the application of Mr. L. Karstlake, on behalf of Mr. J. A. Shirreff.

Kennington, South.—That consent be given to the erection of an arch and glass covered way upon part of the forecourt of No. 12, Upper Phillimore Gardens, on the application of Messrs. Shuffrey & Co. on behalf of Mrs. H. Langworthy.

Marylebone, East.—That consent be given to the erection of a balcony at the first floor level in front of No. 66, Wimpole-street, Cavendish-square, on the application of Mr. F. M. Elgood on behalf of Mr. G. J. Elgood.

Marylebone, East.—That consent be given to the erection of a balcony at the first floor level in front of No. 47, Queen Anne-street, Cavendish-square, on the application of Mr. E. Carrivt on behalf of Mr. J. Irwin Palmer.

Rotherhithe.—That consent be given to the erection of a one-story addition to the flank of the "Red Lion" public-house, Deptford Lower-road, also to the erection of two houses with shops adjoining in Rotherhithe New-road, at the corner of Bush-road, on the application of Messrs. Watney & Co., Limited.

Hoxton.—That consent be given to the construction and erection of two enclosed gangways across Jane Shore-court, Shore-ditch, to afford communication between the London Music Hall and the new building on the opposite side of the court, on the application of Mr. F. Matcham on behalf of the proprietor of the hall.

Kennington, South.—That consent be not given to the erection of buildings on the east side of Addison-road, on the site of No. 1, on the application of Mr. E. Bath on behalf of Mr. E. Collins.

Notting Hill.—That consent be not given to the erection of houses on the south side of Poynder's-road, Clapham Park, between Chios House and Cavendish-road, on the application of Messrs. Lee and Pain on behalf of Sir J. Dickson Poynder, Bart.

Dulwich.—That consent be not given to the erection of stables and a one-story van-shed at the rear of No. 1, Croxted-road, West Dulwich, to abut upon Park-road, on the application of Mr. W. H. Duffield on behalf of Mr. G. Dyer.

Hampstead.—That consent be not given to the erection of houses with shops on the north-east side of Edgware-road, between Manstone-road and the site of seven houses with shops northward belonging to Messrs. Bridge & Neal, on the application of Messrs. Tuckett & Son, on behalf of the Trustees of the Cotton Estate.

Islington, North.—That consent be not given to the erection of an addition to a one-story building on part of the forecourt of No. 46, Holloway-road, at the corner of Mercer's-road, on the application of Mr. C. Meaby, on behalf of Mr. G. Lerner.

Islington, West.—That consent be not given to the erection of a two-story addition in front of No. 2, Jackson-road, Holloway-road, on the application of Messrs. New & Son, on behalf of Mr. F. J. Muddiford.

Lewisham.—That consent be not given to the erection of one-story shops on a portion of the forecourts of Nos. 55, 57, 57A, 59, 61, and 61A, Dartmouth-road, Forest Hill, on the further application of Mr. G. Tolley, on behalf of Mr. E. C. Christmas.

Lewisham.—That consent be not given to the erection of five houses on the north side of Catford Hill, and eight houses with projecting bay windows on the west side of Beechfield-road, on the application of Messrs. Phillips & Norfolk.

Lewisham.—That consent be not given to the erection of a pent-roof, with wooden fascia and balustrading, in front of No. 15, Rushey Green, Catford,

on the application of Mr. A. L. Guy, on behalf of Mr. W. Taylor.

St. George, Hanover-square.—That consent be not given to the erection of an iron and glass shelter over part of the public way in front of No. 39, Dover-street, Piccadilly, on the application of Messrs. J. Barker & Co., Limited, on behalf of Paquin, Limited.

St. Pancras, North.—That consent be not given to the erection of fourteen houses on the north-west side of Gordon House-road, with the flank of the easternmost house to abut upon Highgate-road, on the application of Messrs. R. H. and H. Kerr, on behalf of Mr. C. W. Matthews.

Width of Way.

Battersea.—That consent be given to the erection of a two-story addition at the rear of the "Surrey Hounds" public-house, No. 90, St. John's Hill, to abut upon Plough-terrace, on the further application of Mr. J. D'Oyley on behalf of Mr. S. H. Warner.

Deviation from Certified Plans.

Southwark, West.—That sanction be given to certain deviations from the plans certified by the District Surveyor, under Section 43 of the London Building Act, 1894, so far as relates to the proposed erection of the "Eight Bells" public-house, on the site of Nos. 31 and 33, Collingwood-street, and No. 19, Meyrick-street, Blackfriars, on the application of Messrs. Perry & Reed, on behalf of Messrs. Hoare & Co.

Line of Fronts and Width of Way.

Chelsea.—That consent be not given to the erection of a one-story class-room at the Servite Catholic School, Winterton-place, Park-walk, on the application of Mr. J. H. Eastwood on behalf of the Rev. Father Brugnot.

Southwark, West.—That consent be not given to the erection of one-story shops on the forecourts of Nos. 48 and 50, Lambeth-road, St. George-the-Martyr, on the application of Mr. Jesse Phoenix on behalf of Mr. J. Moore.

Walworth.—That consent be not given to the erection of one-story shops on the forecourts of Nos. 282, 284, 286, and 288, East-street, on the application of Messrs. Percy W. Slark & Co.

Width of Way—Space at rear, &c.

† **Finsbury, Central.**—That the Council in the exercise of its powers under the London Building Act, 1894, do not consent to, or allow of, the erection of a dwelling-house, to be inhabited by persons of the working class, on the site of No. 3, Great Bath-street, Farringdon-road, Clerkenwell, with a shop on the ground floor and a three-story oriel window at the first floor level, such building to be at less than the prescribed distance from the centre, and to exceed in height the width of the street, also to have an insufficient open space to the basement and to extend above the diagonal line directed to be drawn by the Act, on the application of Mr. T. W. Donovan on behalf of Mr. A. W. C. Shean.

Width of Way and Height of Buildings.

Deptford.—That consent be not given to the erection of buildings on the east side of Hosier-street and the north side of Creek-street, Greenwich, on the application of Mr. L. Jacob on behalf of Messrs. J. & A. Dandridge.

Width of Way and Construction of Buildings.

† **Bow and Bromley.**—That consent be not given to the construction and erection of a large temporary iron store on the east side of Fawe-street, with the boundary fence at less than the prescribed distance from the centre of that street, and the construction of a temporary iron mess-room on the east side of Morris-road, Poplar, on the application of Messrs. Thompson & Hodge on behalf of Spratt's Patent, Limited.

Conversion of Building, Space at Rear, &c.

Westminster.—That the Council, in the exercise of its powers under the London Building Act, 1894, do not allow the conversion into a dwelling-house, with an irregular open space at the rear, of a portion of a workshop in the yard of No. 81, Page-street, on the application of Mr. W. Brass, on behalf of Mr. J. S. Brown.

Formation of Streets.

Woolwich.—That an order be sealed and issued to the Vestry of Plumstead sanctioning a deviation from the plan approved on June 30, 1895, for the formation or laying out of Waterdale-road, Bostall Wood, Plumstead, by an alteration in the course of a portion of that road.

Fulham.—That the Council do approve of a further variation from the plan sanctioned by it on May 28, 1895, for the formation of certain streets upon Morrison's Farm Estate, Brixdown, Bridge-road, by the abandonment of the formation of Erivane-street and the portion of Settrington-road, north of Woolneigh-street, and the widening of Woolneigh-street to 45 ft., on the application of Mr. W. C. Poole, on behalf of Messrs. Allen & Norris.

Artisans' Dwellings.

Whitechapel.—That the Council do, in the exercise of its powers under Sections 41 and 42 of the

London Building Act, 1894, sanction the amended plans and drawings, dated February 8, 1897, submitted by Mr. I. K. Smith on behalf of Mr. F. Moss, for the construction on the site of Nos. 123 to 147 (odd numbers only), Eack Church-lane, and also partly on the site of the houses and footways in Providence-place, Williams-rents, and Brunswick-place, of two blocks of five-story dwelling-houses, such new buildings to be inhabited by persons of the working class; and further, that the Council, acting under the powers conferred by Section 41 of that Act, do permit the erection of the said new buildings with the proposed open spaces about the same.

Height of buildings, cubical extent and means of escape in case of fire.

Limchouse.—That the Council in the exercise of its powers under sections 49 and 76 of the London Building Act, 1894, do not consent to the erection on the north side of Dod-street of two blocks of cabinet makers' shops of a greater height than the width of that street, to exceed in extent 250,000 cubic feet, and to be used only for the purposes of the trade of a cabinet maker; and that the Council, as empowered by section 63 of that Act, do decline to issue a certificate in respect of the means of escape in case of fire proposed to be provided for the persons dwelling or employed in the top floors of the said buildings, on the application of Mr. J. M. Knight, on behalf of H. Herrmann, Limited.

Means of Escape at Top of High Buildings.

St. George, Hanover-square.—That the Council in the exercise of its powers under section 63 of the London Building Act, 1894, do decline to grant a certificate in respect of the means of escape, in case of fire, proposed to be provided for the persons dwelling or employed in the fifth floor of an addition on the west side of the Berkeley Hotel, No. 77, Piccadilly, at the corner of Berkeley-street, on the application of Mr. R. Griggs on behalf of the Berkeley Hotel Company.

Recommendations marked † are contrary to the views of the Local Authorities.

Correspondence.

To the Editor of THE BUILDER.

THE DRAWING OF "A THIRTEENTH CENTURY ARCHITECT."

SIR,—I am obliged to Mr. Bilson for his information, and must plead guilty to having "forgotten my Viollet-le-Duc." It is not surprising to find that the drawing has been noticed before, and I confined myself to saying that I thought it had not been "exhibited," as it was at the A.A. meeting by a slide exactly reproducing the original. But on comparing this with the illustrations mentioned in your last issue, it would appear that no accurate copy of it has been hitherto available. Viollet-le-Duc gives a sketch of two of the figures, drawn as if they had been sculptured, incorrect in several points, "franchised" almost out of resemblance, and about as like the original as the drawings professing to represent events abroad "from a telegraphic description." Green's illustration is also a free sketch; it gives the whole scene, but the force and character of the original are lost. Gardiner has a more correct but less complete representation; and in not one of these can the real expression and action of the personages be seen.

The mediæval architect is receiving such unkind treatment just now that it is only fair to put him forward exactly as his contemporaries knew him, and not only in "reproductions," which are, unintentionally, rather caricatures than true portraits.

ARTHUR S. FLOWER.

RE PETERBOROUGH CATHEDRAL.

SIR,—It is, I fear, rash for one of the signatories, on whom you have poured so much fine scorn, and by representing them as ignorant, incompetent, and careless (at heart) of the real welfare of the cathedral, have emphasised the better fate of the building in its present hands—to ask whether the facts that you have recently been giving us really bear out this view.

The work of demolition was begun in mid-winter, although there was no urgency in the matter, and it might well have taken place during a more genial season.

Whilst the frost and snow was on the ground, and in face of predictions warning us of a winter of unusual severity, we learn that the clerk of the works is pouring water into the piers, in order to make experiments which should have been postponed till all danger from frost was past.

In your issue of the 13th inst. I gather that the Dean and Chapter—by the purchase of "an old farm house, in order to use the material for piecing the front where new stones are absolutely necessary," are now acting independently and in defiance of their architect.

Seeing how much stress has been laid on their acting in conformity with, and under the direction of, their architect, this is a disconcerting piece of revelation. Mr. Pearson knows, and Mr. Thomson

knows, that old stones should not be taken out of one old building to be used in another. It is impossible to set them without reworking their faces, and the weathered face of an old stone, once removed, can never be reformed. These stones, if by mischance they should be used as proposed, will perish rapidly.

The grounds given for taking down the masonry and rebuilding were to make a permanent restoration; but instead of accepting the inevitable necessities of so doing, the Dean and Chapter hope (it appears) to evade the outcome of their action by putting up a short-lived blind to parry the natural and disappointed comments that will be made on their work.

HALSEY RICARDO.

MODELS OF DESIGNS AND BUILDINGS.

SIR,—Some time ago you sought and published the views of some members of the architectural profession on the desirability of obtaining a better exhibition of current architecture, &c., than is afforded by the space in the architectural room at the Royal Academy. Amongst the opinions given were some in support of exhibiting models of architects' designs and buildings—a feature which has never received consideration at the Royal Academy comparable, for instance, with that given to it in the Salon exhibitions.

It occurs to me that a good opportunity for bringing models of internal and external architectural design and decoration before the profession and the public arises in connexion with the forthcoming International Building Trades' Exhibition at the Agricultural Hall, Islington. If the promoters of that movement made a special effort to collect the models of buildings of interest or importance which British architects could lend them, the rather neglected art of architectural modelling might be somewhat advanced, especially if some of the beautiful and well-finished models of Parisian and other Continental buildings, which have been shown abroad during recent years, could also be obtained.

EDWIN SEWARD.

BERKHAMSTED SCHOOLS CHAPEL.

SIR,—I observe in your issue of the 13th inst. a design for our chapel. As the chapel is very widely known and is very beautiful, I think it right to say that the design which I finally accepted, and by which the chapel was built, is not the one that has been forwarded to you for publication. The accepted design was by Mr. Charles Rew of Berkhamsted.

Berkhamsted, Herts. T. C. FRY.

* * * It will be seen that in the short description (furnished to us by the authors of the design) it was not stated that the chapel had been built, only that the design had been made for it by them; but we think that the authors ought to have made it more clear that the design was a competition one only, and not the selected one. We regret to say that architects are occasionally not so explicit on this point, in such cases, as they should be. On the other hand we may suggest to our correspondent that the selection of a local architect, in what was apparently an open competition, looks rather as if the selection had been influenced by other than merely architectural reasons.—ED.

The Student's Column.

SPECIFICATIONS.—IX.

JOINER—(continued.)

THE doors numbered on plans to be 24 in. folding doors, each leaf in three panels, ovolo moulded both sides with slamming stiles rebated and beaded.

The upper panel in each leaf to be open and prepared for plate glass with mitred shifting beads secured with brass cups and screws. These doors to have 4½ in. by 4 in. chamfered and rebated frame, chamfered and twice rebated transome, and 2 in. ovolo moulded fixed fanlight. The doors to be hung with a pair of 4 in. wrought iron butts to each leaf. Put brass handles, lettered "Pull," p.c. 10s. each, and short helical door-springs on one side, and brass finger plates, p.c. 7s. 6d. each, on the other. No lock to these doors.

The doors numbered on plans to be 24 in. swing doors, each leaf in five panels, moulded both sides, with properly rounded heels to stiles. The middle panel in each leaf to be open and prepared for plate glass, with mitred shifting beads secured with brass cups and screws. These doors to have 6 in. by 4 in. moulded frame, hollow grooved for heel of door. The doors to be hung with spring hinges, p.c. 30s. each, let into boxing framed to finger joints. Put bronzed pull handles, p.c. 15s. each, one pair on each side of doors.

The doors numbered on plans to be

2 ft. 8 in. by 6 ft. 9 in., 2-in. five-panel doors, moulded both sides, hung with a pair of 4-in. wrought-iron butts, and to have 6-in. two-bolt mortice locks and brass furniture, p.c. 7s. 6d. each. The linings to be 1½ in. double rebated linings on wrought, splayed, and beaded grounds, and architrave mouldings out of 4½ in. by 2 in., with blocks the full height of skirting out of 5 in. by 2½ in., shaped to suit architraves.

Stairs.—The stairs to have 1½ in. treads, with rounded nosings and inch risers glued, blocked, and bracketed on 3½ in. by 2 in. fir carriages, 1½ in. moulded outer string, 1½ in. moulded wall string, inch beaded apron linings, curtain step and veneered riser, newels turned and moulded out of 3½ in. by 2 in. selected Riga wainscot, moulded bandrail out of 3 in. by 4 in. selected Riga wainscot, 1½ in. deal turned balusters banded to string and handrail. The newels to be brought below landings, and turned as pendants 6 in. long. The wainscot to be twice oiled with olive oil at completion.

Fireproof Stair.—The stair to be constructed as shown on detail drawing, with rolled steel joists, which will be supplied by Messrs.

at the p.c. sum of £ cut to sizes and delivered on the works. The contractor to put work together, and form stair in concrete of Portland cement and coke breeze in proportion of 1 to 6. This stair to have inch teak treads, with 2 in. teak rounded nosings tongued to same, and secured with stout brass screws to plugs let into concrete, glazed brown tile risers, soffits and ends of steps rendered and set in Keene's cement. The newels to be turned and moulded out of 4½ in. by 4½ in. teak, balusters turned and moulded 2 in. deal, handrail moulded out of 3½ in. by 2½ in. teak. The teak to be left clean from the plane, and not oiled or varnished.

Skylights.—The skylights over to be 2 in. chamfered bar skylights, weathered and throated for condensation, 4 ft. 6 in. by 2 ft. 6 in., fixed to 1½ in. wrought, rebated, and staff headed curbs. Put lead gutter behind skylight, with 1 in. gutter boards and framed bearers.

Trap Doors.—The trap doors over to be 2 ft. 6 in. by 2 ft. in. clear with traps of ¾ in., matched and V-jointed boarding, with two 3½ in. by 1½ in. ledges fitted and hung with a pair of 3 in. wrought-iron butts to inch rebated and staff beaded curb linings tongued at angles.

Step-ladders.—The step-ladder shown on plan of to be formed of 4½ in. by 2 in. treads, with rounded nosings, housed and tenoned to a pair of 9 in. by 3 in. sides. Under top, middle and bottom treads put ½ in. wrought-iron tension bolt with head, nut, and washer. Put 2½ in. deal mop-stick handrail, with 3 in. by 3 in. posts at each end halved and bolted to sides.

Casings.—The steel girders over to be cased with 1½ in. cross-tongued casing, grooved and tongued and staff-headed at angles, and fixed to girders with 3 in. by 2 in. blockings, 18 in. apart, bolted through webs of girders with 7 in. by 3 in., screwed up to casing and joists.

Put inch beaded pipe casings on rebated and beaded grounds to all exposed pipes, and fix same with brass cups and screws to remove easily.

Shelving.—Provide, to be fixed where directed, 100 ft. super. of inch wrought cross-tongued shelving with 1½ in. by 1 in. bearers, and wrought-steel brackets.

Fix where directed in store room 100 ft. super of open lattice shelving, 2 ft. 6 in. wide, of 1½ in. by 1½ in. battens, 3 in. apart, halved and panned, and 1½ in. by 2½ in. bearers 2 ft. apart, carried by 2½ in. by 2½ in. framed posts.

Dresser.—Supply and fix, where shown on plan, in kitchen a deal dresser, 6 ft. wide by 7 ft. 6 in. high, with 1½ in. sides and centre division, 3 in. top on 3½ in. by 1 in. rails framed to sides and centre, with moulded cornice out of 3½ in. by 2 in., three tiers of inch shelves, 5½ in. wide, grooved for plates, and with three dozen brass cup hooks, slab of 2 in. white deal cross-tongued, and in two thicknesses, pegged together, three drawers 7 in. deep inside with 1½ in. fronts, ¾ in. sides, lap dovetailed to front and dovetailed to ¾ in. backs, and grooved and tongued to ¾ in. bottoms, bearers for drawers 3½ in. by 1 in., turned oak drawer handles out of 3 in. by 3 in., 1½ in. cupboard front below drawers in two cupboards, each with a pair of doors hung folding with rebated and beaded stiles, 1½ in. pot board on 3½ in. by 2 in. bearers, shelf in cupboards 18 in. wide, of inch deal cross-tongued. The cupboard doors to be hung on 3 in. wrought-iron butts, and to be fitted with 4 in. cut cupboard locks, and 4 in. neck bolts.

Water-closet Fittings.—Fit up the water-closet

on first-floor in Honduras mahogany, stained and French polished, with 1 in. cross-tongued seat and riser, 1 in. mitre clamped and cross-tongued flap, with rounded nosing and thumb-moulding tongued on, hung with 3 in. brass butts to frame, and with ¾ in. by 5 in. beaded skirting around. The whole to be put together with brass cups and screws to remove easily and fixed on strong deal bracketing. Seat hole to be cut and disbed. Handle hole to be cut and beaded. Supply and fix quadrant shaped Honduras mahogany paper box, 9 in. radius of ¼ in. stuff, with door hung on 1½ in. brass butts and fitted with solid brass turn buckle fastening. (N.B.—Pedestal closets are often supplied with seats. If these are adopted it should be mentioned in Joiner. If something different from the usual type is desired specify it.) The servants' water-closet to have similar fittings but in yellow deal picked for staining, except the seat, which is to be in clean willow.

Bath-Room Fittings.—Fit up bath with stained and French polished 1½ in. Honduras mahogany top, cross-tongued, and with dish perforation and rounded nosing. The enclosure to be 1½ in. deal, panelled and moulded framing, made to remove easily in sections, and fixed with brass cups and screws. Supply and fix cradling for bath of 3½ in. by 2 in. stuff, and assist plumber in fixing.

Fit up towel-rack on wall with cut and shaped ends out of 4½ in. by 1½ in. stained and French polished Honduras mahogany, and two teak rods, 1½ in. diameter, 3 ft. long.

Lavatory.—Fit up the enclosure of lavatory basin with 1½ in. panelled and moulded front, with door hung on a pair of 3 in. brass butts, and fitted with brass turnbuckle fastening. Provide and fix bearers for lavatory basin, and assist plumber in fixing. The top and skirting of lavatory will be in one piece with basin.

Cupboards.—The cupboard in to have 1½ in. framed fronts with a pair of 1½ in. doors hung folding with rebated and beaded stiles, each leaf in three moulded and square panels, and hung with a pair of 4 in. wrought-iron butts. Fit with 4 in. cut cupboard lock, a pair of brass knobs, and a pair of 4 in. neckbolts. Top of cupboard to be ¾ in. and cross-tongued, with rounded nosing and moulding under out of 2½ in. by 1½ in. This cupboard to have one cross-tongued inch shelf, beaded hat-rail 4½ in. by 1 in., with No. 6 wrought-iron hat and cloak hooks.

Picture Moulding.—Put round walls of 3 ft. below bottom of plaster cornice picture-moulding out of 3½ in. by 2 in. plugged and screwed to wall every 18 in. apart.

Wall Panelling.—The panelling in dining-room to be 1½ in. framed and panelled, as shown on detail drawing; the panels in yellow pine in one width, backed with canvas put on with marine glue, the back of panelling to be served over with the glue, the canvas tacked on and stretched tightly, and a hot iron passed over to melt the glue. The cornice to be framed up with 7 in. by 3 in. with dentil course and carved egg and tongue moulding planted on the chair rail moulded out of 4½ in. by 2½ in. tongued on, the skirting moulded out of 9 in. by 2 in., and tongued to floor. The carved frieze to be of sycamore, supplied and carved by Mr. , and to be framed in and fitted to panelling by the contractor. Provide the p.c. sum of for this carved frieze, to be paid to Mr. by the contractor within one month after presentation of the architect's certificate. This panelled work to be fixed to 2½ in. by 1½ in. grounds plugged to wall.

Church Seats.—The seats to be executed in accordance with detail drawing of selected Sequoia of quality equal to that of sample in architect's office. One seat to be worked and approved by the architect before the remainder are commenced. The seats to be fixed to floor (describe method, whether tenoned and screwed, or by means of iron brackets or otherwise).

Hard Woods.—Few architects have the very highly specialised knowledge to be able to distinguish between varieties of the same hard wood from different countries, and although the student might specify a certain wood as, say, white oak, he can hardly be expected to be what he specifies by inspection alone whether therefore, two courses open to him, either to specify that the wood is to be of a quality equal to that of a sample in architect's office, as example given in last clause, or to quote a reliable timber merchant's name and price—thus: The mahogany is to be from Tobacco, of quality equal to sample approved by the architect, and is to be obtained from Messrs. , whose price at inch thick is 7d. per foot super.

Completion.—The contractor is to leave all woodwork clean and perfect, and any work which may show a shrinkage of ¼ in. between any two pieces of wood, or which may crack in the substance of any panel or framing, shall be taken out and reinstated, at the contractor's expense, with sound well-seasoned material. (Clauses of this or similar drastic nature are becoming general in specifications. The use of unseasoned wood is now so common, and the difficulty of detecting it (tilt shrinkage occurs is so difficult, that it is no unusual thing for such defects to make their appearance even before the painting is finished.)

OBITUARY.

MR. ALFRED WILLIAMS.—Information has been received from Johannesburg of the death of Mr. Alfred Williams, brother of Mr. W. Clement Williams, architect and surveyor, Halifax. Deceased, who was 33 years of age, was apprenticed to Messrs. Horsfall & Williams, of Halifax, and was at the time of his death, as stated, a partner in a leading firm of architects in South Africa.

MR. WILLIAM DAVES.—The death of Mr. William Daves, architect, of Manchester, took place on the 16th inst. The deceased was better known to the general public by the nom de plume "Eljier Goff," under which he wrote and published various humorous works some years ago. Mr. Daves was born in Gloucester, in 1840. He was articled in the architectural profession in London in 1858, and subsequently practised in London, Donagh, Birmingham, and Manchester offices until he became partner with Mr. W. H. Hayley, architect, of Manchester, in 1863, only five years from the commencement of his professional career. His first building, won in competition, was a small church school in Olam. He distinguished himself in the competition for the Manchester Town Hall. The following list will show that in many minor competitions he achieved considerably to his laurels—first in cottages for Durham County Permanent Building Society; first in schools, Every-street, Manchester; first in Primitive Methodist chapel and school and house, in Ardwick; second in schools, Vine-street, Manchester; first in schools, Chester-street, Manchester; first in schools, at Beccles, Suffolk; first in Board schools, Abbott-street, Manchester; first in Conservative club buildings, Prestwick; second in church, &c., Collyhurst; and fourth in Gloucester Asylum. Mr. Daves greatest work, undoubtedly, was the design for the Victoria Buildings in this city. His first book, "Eljier Goff's Troubles, Travels, and Other Adventures," appeared in the spring of 1872, and "Eljier Goff's Second Book," "Eljier Goff's Winter of that Year," "Eljier Goff's Christmas Book," "Eljier Goff's Kronicle of a King," which ran through two editions of 5,000 each, was not published until 1878.—*Manchester Courier.*

GENERAL BUILDING NEWS.

NEW THEATRE, GLOUCESTER.—At a recent meeting of the Improvement Committee of the Gloucester City Council plans of a new theatre and opera house which a London syndicate are about to erect on the site occupied by the Municipal Schools in Brunswick-road, were submitted and passed. The plans have been prepared by Mr. John P. Biggs, of London. The exterior materials will be brick and terra cotta. Seating accommodation will be provided for 1,500, and from each seat there will be a clear and uninterrupted view of the stage. The latest lines have been followed in regard to comfort, exits, electric lighting, and ventilation.

S. MARK'S CHURCH, SWINDON.—This church, which was built about fifty years ago, from designs by the late Sir Gilbert Scott, has recently been enlarged by an extra bay to the chancel, a south chapel and a vestry on the north side, with additional space for the organ over. An arcade of three bays divides the chancel from the chapel, and the ceilings of both are painted; the former is of a pointed barrel type, and the latter flat, divided into panels by ribs, having gilt bosses at their intersections. The east window of the chapel is about to be filled with painted glass, and the altar is to be enclosed with riddels, carried by decorated posts. The floor of the chancel is of a temporary character; it is intended that marble should be laid eventually. The contractor for the work was the late Mr. Wiltshire, of Swindon, and the architect, Mr. Temple Moore (of Hampstead), who also designed the screen, stalls, and organ case, which were placed in the church some years ago.

NEW THEATRE FOR WORTHING.—A company has been formed in Worthing for the conversion of the existing assembly rooms into a theatre more in keeping with the requirements of the town. A alterations will be erected to Bath-place. The new front will be of an extensive character, will include the building of a new stage, proscenium, and dress circle, and it is proposed to erect a large hall in connexion with the theatre available for dances, banquets, &c. The work will be carried out from plans prepared by Mr. Alfred T. Cooke, architect, of Worthing.

VICARAGE HOUSE, ST. THOMAS-BY-LAUNCESTON.—The site has just been purchased for the proposed vicarage house for St. Thomas-by-Launceston, and the plans and specifications of the architect, Mr. Otho Peter, of Launceston, have been accepted.

CO-OPERATIVE PREMISES, SCOTTSWOOD, NORTH-UMBERLAND.—The Blaydon Co-operative Society has secured, on what is to be known as Station-road, Scotswood, a site for a branch store, having a frontage of 110 ft., and a depth, the stables being included, of 93 ft. Residences for managers are to be attached, and the second story of the main block is to be devoted to the purposes of education and recreation under the auspices of the society. There is to be a lecture hall measuring 40 ft. by 29 ft., while a space of like dimensions is to be partitioned off to serve as a library and reading and smoke-room. The architect for the new undertaking is Mr. William Glover, Newcastle.

PROMISED NEW CHURCH, ASHBY, NEAR BRIGG.—A movement is on foot for the erection of a new church for Ashby, in the parish of Botesford, near Brigg, Lincolnshire. A site has been secured, and plans for the church have been prepared by Mr. C. Hodgson Fowler, of Durham. The estimated cost is 4,000l., the church to seat 600.

BRIGHTON INSTITUTE, HUNTINGDONSHIRE.—The formal opening of the institute and reading-room at Brampton took place recently. The architect of the building was Mr. John Bird, and Mr. Allen was the builder.

THEATRE, STOKE, STAFFORDSHIRE.—A new theatre, situated in Wolfe-street, Stoke, has just been opened. It consists of a stage with ground and first floor dressing-rooms, orchestra, auditorium, consisting of 2,000 seats on the ground floor; on the first floor, four boxes, circle, back circle, and gallery. Between the ground floor and the floor of the back circle are a refreshment bar and office. The seating accommodation on the ground floor will be for 700, and on the first floor 400; altogether 1,100. The building is from the designs of Messrs. Lyman & Beckett.

FIRMARY, PRESCOT.—On the 18th inst. Mr. William Middleburgh, as Chairman of the Building Committee, laid the foundation stone of the new Prescot infirmary which the Guardians are erecting at a cost of 25,000l., including a new laundry building. There will be four blocks of buildings, all of local brick, with stone dressings and quoins. Two of the blocks will be three stories high, one two stories, and one special block will be built as a maternity ward. The whole will afford accommodation for 300 beds. The architects are Messrs. J. & W. Gandy, St. Helen's; Mr. Fred Brown, St. Helen's; is the builder; while Mr. W. Molyneux, St. Helen's, is erecting the laundry.

CHURCH, BUXTON, DERBYSHIRE.—A new mission church, to accommodate 400 persons, and dedicated to St. Mary the Virgin, was recently opened in Higher Buxton. The building has been erected from designs by Mr. C. Heathcote, architect, Manchester and Buxton, and contains a chancel and two vestries, a porch entrance at the west end, and the seating is by chairs. A panelled altar in oak has been provided, designed by the architect, and made by Mr. F. W. Booth, of Oakdene. The building has been erected by the Patent Wire Wove Roofing Company.

INFIRMARY NURSES' HOME, WORCESTER.—On the 15th inst. the Countess of Coventry laid the foundation stone of the Nurses' Home at the Worcester infirmary. The works are being executed by Messrs. Wood & Sons, Worcester, from the designs of Messrs. Lewis Sheppard & Son. The building, which will cost about 4,000l., is being erected in Wheeley's Gardens, adjacent to the infirmary. It will be in three stories, and thirty-two bedrooms will be provided for sisters and probationers. A covered way will afford direct communication between the home and the infirmary.

NEW WARDS, MONKWEAR MOUTH HOSPITAL, DURHAM.—The new wards of the Monkwearmouth and Southwick Hospital were opened by Lady Elizabeth Williamson on the 16th inst. The extension comprises four wards, viz., the Williamson Ward and the Addison Ward on the ground floor, and the Thompson Ward and the Branfoot Ward on the first floor. The first two are to be reserved for female patients. Altogether twenty-six new beds are to be provided, making a total in the institution of forty-two. The contractor for the work was Mr. J. B. Stott, of Monkwearmouth, and the architects were Messrs. W. & T. R. Milburn, Sunderland.

PUPIL TEACHERS' SCHOOL, CARDIFF.—The new pupil teachers' school at Howard Gardens, Cardiff, was opened recently by Mr. T. E. Ellis, M.P. The school is erected at the rear of the Cardiff School Board offices, Howard Gardens, contiguous to the lecture theatre of the higher grade school, and is a block of buildings 117 ft. long by 42 ft. in width, and two stories in height. The ground floor comprises two class-rooms, each accommodating fifty scholars, with cloak-room and lavatory accommodation. Upon the same floor is situated the gymnasium, and also a student's workshop; these rooms also have lavatory accommodation. The first floor affords accommodation for two class-rooms, each accommodating fifty scholars, the rooms being divided by revolving wood shutters. The art class-room is also situated upon this floor, as well as the teachers' private rooms, store-rooms, cloak-rooms

and lavatories. The buildings are constructed of white pressed brick, relieved with red brick bands and arches. The roofs are covered with green slates and red terra-cotta cresting. The floors throughout are constructed of concrete, with iron joists, and covered with wood blocks. The lavatories throughout have been fitted with Adams' patent lavatories. The buildings have been erected by Messrs. William Thomas & Co., Cardiff, and under the superintendence of the architects, Messrs. J. P. Jones, Richards, & Budgen, Cardiff.

COTTAGE HOSPITAL, GORLESTON, SUFFOLK.—On the 2nd inst. the two new wings which have been added to the Cottage Hospital at Gorleston were opened by the Mayor of Yarmouth (Mr. H. E. Buxton). The architect of the additions is Mr. H. Dudley Arnott, of Gorleston. They consist of two wards for male and female patients respectively, in each of which five beds will be placed. Bath and operating rooms are attached, and improved systems of heating and ventilation have been introduced. The new wings are built of red brick. The builders are Messrs. Read & Curtis, of Yarmouth and Gorleston.

BOARD SCHOOLS, WESTON-SUPER-MARE.—The new Board Schools in the Walliscote-road, Weston-Super-Mare, are being built by Mr. Chas. Addicott, according to plans prepared by Messrs. Price & Wooler, architects. That portion of the building allotted to the infants has just been completed. The hall is 40 ft. by 30 ft. and 23 ft. in height. The floor is laid with wood blocks. The hall is also heated by hot-water radiators. Surrounding the central hall are four class-rooms, 25 ft. by 22 ft., each providing accommodation for sixty-eight scholars. A babies' room has been provided. There are also rooms set apart for the teachers. A gymnasium has been erected. The heating system has been carried out by Messrs. Bryant & Sons. The whole of the structural work has been superintended by Mr. W. A. Hayward, clerk of the works.

ADDITIONS TO HOSPITAL, JOHNSTONE, N.B.—The west part of the Combination Hospital at Johnstone, in the Linwood-road, Johnstone, was recently opened. The extensions have been executed to the plans of Mr. J. L. Cowan, of Glasgow, and have cost over 4,000l. The contractors were:—For building, Keane, Kilwinnoch; joiners, Purdon & Cuthbertson, Kilsbarchan; plastering, M'Queen, Glasgow; heating, M'Cormack & Son, Glasgow; painting, J. M'Connell, Johnstone; engineering and laundry work, Tullis & Co., Clydebank; slating, Marshall, Kilsbarchan.

ISOLATION HOSPITAL, AUGHTON, LANCASHIRE.—On the 9th inst. the Countess of Lathom opened Holly House, Aughton, which has been acquired by the Ormskirk Rural District Council as an Isolation Hospital. The house is situated in four acres of land, and has been laid out for typhoid and scarlet fever cases. Mr. C. S. Beeston has been the architect of the work, and Mr. James Pilkington (Ormskirk and Rainford) the contractor.

NEW INFECTIOUS DISEASES HOSPITAL FOR KIRKCALDY.—At a meeting of the Kirkcaldy Town Council recently the minute of the Committee of the 6th inst. was read, recommending the Authority to adopt the plans for the proposed infectious diseases hospital prepared by Messrs. Campbell, Douglas, & Morrison, Glasgow, which were approved by the Local Government Board, with the exception that the new hospital should accommodate ten more beds—namely, the total cost to be 10,000l., or 277l. 8s. 1d. per bed, the architects coming under an obligation to forego one-half of their commission if the sum estimated is exceeded, excluding, of course, any extras or other work recommended by the Authority during the erection of the hospital. Provost Hutchison moved the approval of the minutes, the motion being seconded by Councillor Orr, and unanimously agreed to.

CHURCH SCHOOL, EWOOD, BLACKBURN.—St. Bartholomew's new school at Ewood was opened recently by Mr. W. H. Hornby, M.P. The building has been erected from plans prepared by Messrs. Cheers & Smith, architects, Blackburn. The school is built of brick. The present building is only a third part of the entire school as it will appear when completed. When the school is completed this part of the building will be the girls' department, the boys' department will be the other wing, and the infants' school will be in the centre. The present accommodation is for 250 scholars, the large room, which has a floor area of 60 ft. by 22 ft., holding 130; and the two class-rooms, each 24 ft. 8 in. square, 60 children each. There are also two cloak-rooms and caretaker's closet, and two entrances to the school.

NEW BAPTIST CHURCH, LANCASTER.—A Baptist church has just been opened in Nelson-street and Victoria-avenue, Lancaster. The building has been built from the plans of Mr. N. G. Lewis, of Lancaster. The church and schools together have cost 5,000l. The structure is in the Gothic style. At the rear of the chancel is an open baptistry. The contractors have been: masonry, Mr. W. Warbrick; joiners' work, Mr. J. Thompson; slating and plastering, Messrs. Hall & Son; plumbing and glazing, Mr. Abbott; painting, Messrs. Meadowcroft & Sons.

HOSPITAL, BLAWARTHILL, N.B.—The Renfrew and Clydebank Joint Hospital at Blawarthill was recently opened. The building has cost about 10,000l. to erect. To the north there is the ad-

ministrative block, which contains the matron's and nurses' rooms, the kitchen, and other necessary offices. To the east and west of this block there are three pavilions. The one for the scarlet fever patients contains sixteen beds, as well as an ante-room with six beds; while the enteric fever pavilion has eight beds, and the isolation pavilion six beds. The heating of the various buildings is on the hot water pressure system. The architect was Mr. Bryden, of Messrs. Clark & Bell, Glasgow; while Mr. Henderson, of Messrs. Duff & Henderson, was the measurer; and Mr. Lees the clerk of works.

RESTORATION OF TOWER, ST. JOHN'S CHURCH, CARDIFF.—The restoration of the tower of the Church of St. John, Cardiff, has just been commenced. Mr. C. B. Fowler is the architect engaged in the work, the contract being in the hands of Mr. G. Shepton. The foundation of the tower of St. John's was laid in 1473, and the architect was one Hart, who designed the towers of Wrexham and St. Stephen's, Bristol. The style is Perpendicular. The tower is 130 ft. high.

BOARD-ROOM, BROUGHTY.—On the 18th inst. the new Board-room in connexion with the additions to the Municipal buildings of Broughty Ferry, Forfar, was formally opened. Mr. A. Johnstone was architect, and the contractors were Messrs. James Scott, mason; J. C. Ellis, joiner; William Webster, painter; J. William Murray, plumber; A. M'Ritchie, plasterer.

OPERATING THEATRE, SWANSEA HOSPITAL.—The building operations in connexion with the new operating theatre at the Swansea Hospital have now been commenced. The new structure will be connected with the hospital from the west corridor, and will overlook Phillips-parade. The theatre itself will be elliptical in shape, its length will be 26 ft. 6 in., breadth 22 ft., and height 16 ft. The contract is in the hands of Mr. Henry Billings. The architects for the work are Messrs. Wilson & Moxham, Swansea.

ADDITIONS TO SCHOOL, WELLINGTON.—A new schoolroom, to accommodate fifty-four infants, has been added to the existing school premises at Wellington, for the School Board, and was opened recently. The new room adjoins the existing class-room, and is divided by folding glass doors; in addition new cloak-room, lavatory, and office accommodation has been added. The new wing is of red brick, with Bath and local stone dressing with string courses. The work has been carried out by Mr. Wm. James, builder, of Bromyard, from the plans and under the superintendence of Mr. Ernest G. Davies, architect, of Hereford.

STOCKPORT INFIRMARY.—At a committee meeting held on the 22nd inst., the subscribers to the Stockport Infirmary decided to suitably commemorate the Queen's record reign by enlarging and improving the present building. Messrs. Woodhouse & Willoughby, of Manchester, were selected as the architects to carry out the work.

SANITARY AND ENGINEERING NEWS.

BRIDGE, NEAR HEDGELEY, NORTHUMBERLAND.—The new bridge erected over the Dubbs Burn, near Hedgeley, has now been taken over by the County Council. Mr. George Reavell, jun., architect, Alnwick, prepared the plans for the structure and its necessary approaches, the waterway being 22 ft. clear, and the roadway 18 ft. between the parapet walls. The contract for the work was let to Messrs. J. & G. Green, of Warkworth. Mr. R. Adamson was clerk of the works. The stone is from the Shepherds Law Quarry.

DRAINAGE SCHEME, SALISBURY.—The Salisbury Rural District Council have adopted a scheme, prepared by Messrs. Fairbank & Son, for the drainage of the parish of Milford-Without-the-Borough, at a cost of 2,200l. The septic tank system is to be used. The details have been referred to the Parish Council and County Council for consideration.

THE TRENT VALLEY SEWERAGE SCHEME, LICHFIELD.—A communication has been received from the Local Government Board, sanctioning the loan of 3,000l. for sewerage works on the Trent Valley-road, Lichfield. The plans were prepared by the City Surveyor, Mr. C. J. Corrie.

GRAVING DOCK ACCOMMODATION, GREENOCK.—Mr. Robert Crawford, Engineer to the Greenock Harbour Trust, who was asked to report on the proposed extension of graving dock accommodation, estimates that it will take about 35,000l. to widen, alter, and lower the bottom of the dock, and that it will take at least fifteen months to carry out the alterations. He further reports that even with this expenditure the requirements of all classes of vessels would not be met. On the question of constructing an entirely new graving dock at an estimated cost of 90,000l., the Harbour Trust is not satisfied that there is any possible traffic sufficient to warrant such a large expenditure.—*Scotsman.*

ABERDEEN GRAVING DOCK.—The Works Committee recommend the Aberdeen Harbour Commissioners to lengthen the dock to 600 ft., and to increase the width to 57 ft., and the depth at spring tides to 23 ft., at a cost of 115,000l., according to plans by Mr. R. G. Nicol, Harbour Engineer. The dock at present is 500 ft. long, 48 ft. wide, and 20 ft. deep.

LOCAL SEWERS IN LONDON.—The Main Drainage Committee of the London County Council have sanctioned the construction of local sewers as follows:—Hackney: 285 ft., 200 ft., and 845 ft. of 12 in. pipe and concrete sewers in Chevet-street, Mabley-street, and proposed new road respectively on the Sidney-road estate, Homerton. Lambeth: 870 ft. of 15 in. pipe and concrete sewer in Auhin-street, Launcelet-street, and Lower-marsh, Waterloo-road. Lee: 875 ft. of 15 in. and 875 ft. of 12 in. pipe and concrete sewers in Green-land, Eitham.

FOREIGN.

FRANCE.—Last week the famous collection of water-colours and pastels of the eighteenth century the work of the brothers Edmond and Jules de Goncourt, was sold at the Hôtel Drouot. The pictures realised the sum of 695,720 francs. —In one of its recent sittings the Chamber of Deputies, in spite of the opposition of the "Commission du Budget," voted by an enormous majority for the freeing of the national museums. —The jury on the Committee of Lady Artists and painters has awarded 10 medals, Dehillemont-Charlon, the first prize of the 1897 Salon. —The "Association Co-opérative d'Alimentation" has just organised a competition for an artistic ticket. The president of the jury is M. Puvis de Chavannes. —M. Charles Garnier, member of the Institute, has been elected president of the jury for French architecture at the International Exhibition at Brussels. Vice-President, M. Vuillemier. —On Friday last, in presence of the "Commissaire General" of the 1900 Exhibition, the taking down of the first truss of the Palais de l'Industrie was effected. The work of demolition is being superintended by M. Daval. Great haste will have to be made if the building is to be entirely demolished before the closing of the Salon and the month of September. —The annual exhibition of young country architects, who call themselves "Amants de la Nature," will open on Sunday (to-morrow) in the Rue de Furstemberg, and will remain open till March 14. —The jury on the open competition for the erection of a Mairie in the town of Brunoy Eave awarded the first prize to an unknown person, whose motto is "Kif Kif"; the second to MM. Charpentier, Bosio, and Ruet; and the third to M. Charles Letrosne. —The municipality of Versailles has just opened a competition for the rebuilding and enlarging of the Hôtel de Ville. The limit of expense is fixed at 1,200,000 fr. The competition closes on June 12. —The jury on the competition for the building of a "Salle des Fêtes" at Argentueil has awarded the first prize to MM. Dufresne, architect, of Argentueil, and M. Cavé, architect, of Cambrai. —A monument has just been inaugurated at Hyères (Var) to the memory of the celebrated preacher Massillon, and presented to the town by M. Alexis Mignon. The monument consists of a bronze statue of Massillon, the work of M. William Pezou, placed on a high pedestal designed by M. Emile Eude, architect. The pedestal is decorated with the arms of the town of Clermont where Massillon died, and of Hyères where he was born. —The municipality of Amiens has decided to build a municipal theatre. —In a hall in the Musée de Feltré at Nantes, a monument has just been inaugurated to the memory of the painter Elie Delaunay. The architectural part of this monument has been executed under the direction of M. Montford, architect, of Nantes. The sculpture is by Chaplain.

GERMANY.—The official reports on the telephone system in Germany show a continual and rapid increase of subscribers and connexions throughout the empire, and though the connexions between the towns are not yet as common as in Sweden, a number of new and important lines have been opened. Berlin has lately been connected by telephone with Copenhagen, a distance of about 500 miles, and with Vienna, a distance of nearly 450 miles. We understand that lines between Berlin and St. Petersburg are contemplated, or already actually in course of construction, also lines between Berlin and Buda Pesth, Brussels, Prague, and Amsterdam respectively. The success of the telephone system in Germany is primarily due to the low rates charged to subscribers. We believe the annual subscription at Berlin is 57, and the most expensive communication with another town, 500 miles distant, does not exceed a thaler, or about 3s. for a conversation of three minutes.

AUSTRIA.—The Austrian Government has decided to purchase a building which has been used for some ten years by its Embassy at St. Petersburg. The Austrian Government, we believe, has its own buildings at Rome, Constantinople, Paris, Berlin, London, and Washington; and an Embassy is being built at the present moment at Peking. The property at St. Petersburg formerly belonged to Mr. Pletovow. —An electric railway is to be built from Vienna to Baden, which is an inland watering-place, about an hour's rail from Vienna. Messrs. Schuckert, of Nuremberg, will be the contractors. The works will be partly on the track of a steam tramway, which runs in the direction of Baden. Another electric railway in Austria will be constructed in the Ruschka district.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. Philip E. Pilditch (Messrs. Pilditch, Chadwick, & Co.), architect, surveyor, and valuer, has removed from Parliament-street to No. 2, Pall Mall East. —Messrs. Fred Braby & Co., makers of constructional ironwork, of Fitzroy Works, London, will, on March 1, open a branch office at Ashton Gate Works, Coronation-road, Bristol. —The partnership between Mr. Edwin O. Sachs and Mr. Woodrow, architects, is terminated, Mr. Woodrow being about to practice separately, and Mr. Sachs continuing his practice at the former address of the firm, 11, Waterloo-place, Pall Mall. —A company has been formed to acquire, and has acquired and taken over as from July 1, 1896, the business lately carried on by Messrs. W. Gradwell & Co. as timber merchants, builders, and contractors, at the Hindpool Saw Mills and the Devonshire Dock Saw Mills and Croosoting Works, both in Barrow-in-Furness, together with the goodwill and buildings, machinery plant, &c., and the benefit of all trade contracts entered into by Messrs. W. Gradwell & Co. The business is now carried on as that of "W. Gradwell & Co., Limited." A few particulars as to the concern may be of interest. The Hindpool Saw Mills consist of about 13,400 square yards of land, with the permanent buildings thereon. These premises have been specially erected and fitted up with all the necessary machinery and plant for carrying on the business of timber merchants and contractors on a large scale. The croosoting business was purchased by Mr. Gradwell in 1892 from the executors of the late Alderman Gradwell, who had carried it on for a great number of years. The Devonshire Dock Saw Mills and Croosote Works consist of about four acres of land. These works are also fitted up with sheds, machinery and plant as saw mills and for croosoting sleepers, telegraph poles, and all descriptions of timber. Adjoining these works there are about four acres of land, with wharf accommodation; this land is used for storing timber. Both the Hindpool Works and the Devonshire Dock Saw Mills and Croosoting Works and adjoining yard are connected with the Furness Railway by sidings, and the latter have ample wharf accommodation on the Devonshire Dock.

CARPENTERS' HALL LECTURES.—The first of a series of lectures at Carpenters' Hall took place on Wednesday night. The lecturer, Professor Roger Smith, took for his subject "Our Ancient Cathedrals." The lecturer began by inviting his audience to make a hasty tour with him among our ancient cathedrals. That we might enjoy the full benefit of the journey he proposed to make a few introductory remarks upon cathedrals in general. The cathedral building period began after the year 1000; in that year the world was expected to come to an end, all building and trading was therefore at a standstill. At the fatal year over, a fresh spirit was given to every direction of life and movement. Cathedral churches sprang up on all sides. This movement was at its height in the thirteenth century, and it is this period that is characterised by more originality of design and poetry of feeling than any other before or since; it had neither the rude strength of the Norman nor the mechanical formalism of the Perpendicular period. Nowadays it is impossible to understand the value our forefathers set upon the possession of these cathedral churches. The cathedral was then the poor man's school, picture gallery, museum—in fact, the centre of his artistic and intellectual, as well as his physical, life. The bishop's power was that of the greatest of princes; the life and well-being of the district depended upon the magnificence of the monastic centre. In our time, however, schools, town halls, gigantic engineering feats, occupied the attention of the European people. Cathedrals are of interest to the enlightened only, and have ceased to be the home and centre of the political and social life of the nation. After examining a typical plan, and comparing individual features in each style with their successive developments, the lecturer concluded his interesting remarks with some beautiful slides showing the interior and exterior of our principal cathedral churches, starting in the northern counties with Durham and finishing with the Norman staircase at Canterbury. Many of the pictures were received with applause, especially that of Peterborough, the lecturer remarking that the only reasonable course of procedure in restoring the front being that decided upon. The lecture next Wednesday was announced to be upon "The Work of the Electric Current," by Prof. Fleming.

RICHMOND HILL.—The dispute between the Thames Conservancy and the Dysart Trustees as to the ownership of the riverside lands between Richmond and Teddington, which form so conspicuous a feature in the beautiful view from Richmond Hill, has now practically been settled by a compromise to which the Thames Conservancy has just given its assent. It accepted by the Dysart Trustees these conditions will preserve the neighbourhood for all time. The lands in dispute embrace an area of 17 a. 1 r. 34 p. The conservators propose that they shall retain a strip 32 ft. wide next the river for topographical purposes, which will absorb 7 a. 2 r. 10 p., and that the remainder, consisting of 9 a. 3 r. 13 p., shall be conveyed to the Dysart Trustees. This proposal has, after negotiation with the Dysart Trustees, been

embodied in an agreement, in which conditions have also been inserted reserving to the public rights of way over the lands, stipulating that no buildings shall ever be erected thereon, and that they shall always be left open and unenclosed. The trustees have also been in negotiation with the Richmond Town Council as to the selling or leasing to the Corporation of Petersham Meadows, another prominent feature in the view from Richmond Hill, and have intimated to the Corporation that whilst under their powers as trustees they could not sell, they were willing to give a lease of the large meadow of twenty-two acres for twenty-one years. —*Morning Post.*

EARTHQUAKES.—On the 12th inst., at the Royal Institution, Professor John Milne, F.R.S., delivered a lecture on "Recent Advances in Seismology." He pointed out that this science had so developed that we were now not only able to study the earthquakes which no one felt, but we had commenced to investigate their relations to geology, which were many, with most promising results so far as geology was concerned. Of the earthquakes we got—and we had a thousand of them a year—half of them came from deep water. The ocean was really the home of our earthquakes. Twenty years ago their study commenced in Japan, with the result that the seismology of the whole country had revolutionised the methods of building in Japan had been entirely altered, so that houses erected on new principles stood, while their neighbours were shattered. The lecturer exhibited a seismic map of Japan, pointing out that it enabled the Japanese to analyse earthquakes, and to give them their proper value. Next he threw on the screen photographs of damage done in the Severn Valley when the recent shocks. Chimneys of ordinary construction were, he pointed out, the first things to go. If any one had been on an elevation and could have looked down on the city of Hereford, he would have seen the chimneys going through kaleidoscopic movements—a wild dance, and to give them their proper value. Next he put a chimney up by itself; it would stand, but if they put it in contact with something which did not vibrate in the same degree it was bound to go. To put a tie-rod to a chimney was as good as taking a pair of scissors and cutting off the chimney at the place where the tie-rod met it.

LYTE'S METALLIC STAIR-TREAD.—A sample of this stair-tread has been forwarded to us. It is formed of steel-cored lead wires about 1/4 in. diameter, laid parallel to each other, and laced together by plain steel cross-wires, after which it is passed through rolls for the purpose of obtaining a smooth surface, while the cross wires prevent the lead being broken away. It seems calculated to give a good foothold (though, of course, this cannot be tested by a small sample), and to be durable, and it is of very neat appearance. Messrs. Easton, Anderson, & Golden are the agents for it.

FORMATION OF A MASTER BUILDERS' ASSOCIATION, LONGRIDGE, LANCASHIRE.—An organisation entitled "The Longridge District Master Builders' Association," has been formed, and become affiliated with the Lancashire Federation of Building Trade Employers. Some twenty-four firms have joined the Association, the objects of which are to promote a good feeling in the trade; to disseminate information regarding trade matters; to obtain more equitable terms in certain cases between architects and builders in reference to contracts, and to enable the employers to deal with trade questions, and generally to safeguard their interests. Mr. J. T. Parker is the President; Mr. W. Almond, the Vice-President; Mr. T. Kay, treasurer; Mr. J. T. Sanderson, secretary. The trade generally is disturbed in consequence of various local rules, and one of these prevents the Longridge masters taking work done into Preston, a restriction which, however, does not apply to Preston builders taking stone to Longridge. Other districts have the same grievance, and the matter has been brought before the Lancashire Federation. —*Preston Herald.*

MANCHESTER SHIP CANAL.—The report for the half-year ending December 31, 1896, states that there has been on the average a steady and continuous increase in the volume of sea-going traffic, although the monthly returns naturally vary considerably as ships make long or quick voyages and the seasons of the various trades are late or early. The greater portion of the increased traffic has consisted of imports. The export trade is from special causes much more difficult to obtain in quantity. The Engineer's report as to works completed that the dredging plant has been continuously engaged in the removal of silt and sewage sludge from the different reaches of the Ship Canal, and the depth of water has been maintained, although (partly as a result of the abnormally wet season) exceptional quantities of material have been deposited in the waterway. The works for the closing of the tidal openings have been proceeded with in accordance with the powers of the Act of Parliament obtained last Session; these works are now so far complete that tidal water will no longer flow into the Canal through the openings. The works required for the construction of the pontoon dock at the new Port, and for the removal of the dam outside the dock, have been completed. The pontoon was successfully moored in the new position in November last. A great improvement in the

waterway has been effected by the removal of the pontoon. At the Latchford Locks the steel gates, which were constructed to enable the upper gates of the 65-ft lock to be removed and repaired, have been fixed in position, and the original greenheart gates are now being reconstructed on the slipway at Thebwall. Considerable additions have been made to the railway lines and sidings and to the paved roadways at the docks. Other works of a similar character, including new sidings at Mode Wheel, are in hand. The slopes of the Canal generally are in good condition.

ROYAL ACADEMY.—The days for receiving works for this year's Royal Academy Exhibition are—for paintings and drawings, Friday, Saturday, and Monday, March 26, 27, and 29; and for sculpture, Tuesday, March 30.

APPOINTMENTS OF SANITARY INSPECTORS.—The Local Government Board has sanctioned the appointments of the following sanitary inspectors:—Mr. E. T. D. Jordan in Shoreditch, Mr. E. Anthony in Paddington, and Mr. W. G. Auger in St. Pancras.

SURVEYORS AND AUCTIONEER'S CLERKS' PROVIDENT ASSOCIATION.—We have received the annual report of this Association up to December 31, 1896. Sixteen proposals were received during last year, of which thirteen were accepted. The whole of the funds show an increase, while the sick allowance payments have been less. The Committee have recently voted a subscription to All Saints Conventual Home, Eastbourne, where a member recovering from illness (if not of an infectious character) may stay for three weeks free of charge.

THE TIMBER TRADE'S BENEVOLENT SOCIETY.—The first meeting of the committee appointed to deal with the affairs of the Timber Trades' Benevolent Society, which was recently founded to commemorate the Diamond Jubilee of the Queen, was held on the 10th inst., at the Cannon-street Hotel, under the presidency of Mr. W. L. P. A special sub-committee was appointed to deal with the rules and regulations. Mr. Atlee, of Messrs. Druce & Atlee, was appointed hon. solicitor; and Mr. W. A. Hill, of 6, Moorgate-street, the secretary.

ELECTRICAL EXHIBITION IN NEWCASTLE.—The Electrical and Engineering and General Trades and Art Exhibition, held in buildings which have been erected in Northumberland-road, Newcastle, was opened on the 18th inst. by the Mayor.

THE FRONTAGE DISPUTE AT STOKES NEWINGTON.—On the 22nd inst. the work undertaken by the London County Council in carrying out the order of Mr. Lane, police magistrate, for the demolition of 7 ft. of a new building at the opening of Prince George-road from Stoke Newington-road, was practically completed. The building was erected 7 ft. beyond the building line as defined by the Superintending Architect of the London County Council, and after the foundations had been put in the Council summoned the builder to the North London Police-court, but the magistrate upheld the builder's case. Notice of appeal was given, and the case was ultimately decided in favour of the Council. In the meantime, however, the building had been completed, and fitted up in a most costly style. The case was remitted from the High Court, and Mr. Lane ordered the demolition of so much of the building as stood out beyond the building line—roughly speaking, 150 ft. by 7 ft. The order was served on the builder, but, though the Council allowed the matter to rest for twelve months, he made no move in the matter, and the Council undertook to do the work themselves. As the structure now stands, it appears to have been taken clean off from end to end. Rafters and iron girders have been cut exactly to the building line. The depth of the structure is now only 13 ft., and it is said to be entirely useless for any purpose. It has been shored up, but as one side of the whole length is open, persons experienced in these matters have expressed the opinion that a gale of wind would complete the work of demolition. It is anticipated that the rest of the building will be removed under the Dangerous Structures Act.—*Morning Advertiser.*

CAPITAL AND LABOUR.

WAGES IN THE LOCAL BUILDING TRADE, MANCHESTER.—On the 15th inst. the master bricksetters in the Swinton, Peodlebury, Moorside, and Clifton districts conceded an advance of a halfpenny per hour to their bricksetters, making the present rate of wage rod, per hour. The labourers have also sought an advance from 6 1/2 to 7 1/2 per hour. From inquiries, however, the employers have ascertained that no such rate obtains anywhere round Manchester, and the notices have been withdrawn.

LEGAL.

LITIGATION OVER ANCIENT LIGHTS IN LINCOLN'S INN.

The case of Debenham v. Forster, Frere, & Co., which occupied the attention of Mr. Justice Siding in the Chancery Division for several days, concluded on the 18th inst. The facts sufficiently appear from the judgment.

His Lordship, in giving judgment, said that the

action was brought to obtain an injunction to restrain an alleged injury to the plaintiffs' ancient lights, the plaintiffs being the owners and lessees of No. 27, Whetstone Park, Lincoln's Inn Fields, and also the lessees of the next house, No. 26, the defendants being owners and occupiers of a house on the opposite side of Whetstone Park, and known as No. 28, Lincoln's Inn Fields. In the autumn of 1895 the defendants proposed to pull down the rear part of their building and to rebuild it, no objection being taken on the part of the plaintiffs down to November 5, 1895, although a hoarding had been erected on the work, and scaffolding had been put up when the rebuilding began some time in the month of September. On November 5, however, complaints were made by the plaintiffs which led to an interview which took place on that day between Mr. Herbert Dyball, the architect for the plaintiffs, and Mr. Eustace Frere, the architect for the defendants. In the course of that interview the height at which the building was to be raised was ascertained, and the future height to which it was to be extended was agreed on. But, unfortunately, the two gentlemen did not agree in their account of the facts as they then stood. According to the evidence of Mr. Dyball—which was borne out by the memorandum which he made at the time—the then height of the defendants' building was 26 ft. 6 in.; but according to the evidence of Mr. Frere it had reached 6 in. higher. Both parties had agreed that it was intended that the height of the building should not go beyond 37 ft. 2 in., and that that height was not ultimately attained. All that had to be done was to complete the building by putting a roof on the flat which stood immediately behind the rear wall, and which, as the evidence stood, would have meant an addition of 4 in. to the height. Speaking roughly, the breadth of Whetstone Park was about 16 ft., the roadway getting a little narrower as it went westward. The plaintiffs complained that six windows had been interfered with—viz. two on the ground floor, and two in the basement of No. 27, and two on the ground floor of No. 26. He considered that the evidence showed undoubtedly that there was, mathematically a certain loss of light to the two windows on the ground floor of No. 27, but the question was, Had the plaintiffs made out an actionable wrong? On that point the evidence of the experts did not help him at all. Not one of the experts, with the exception of Mr. Dyball, senior—who had admitted that he had not been on the locus in quo for many years—was able to give any comparison as to the state of the light as it was enjoyed before, and as it was enjoyed after the alterations complained of. At the present time both Nos. 26 and 27 were occupied by a firm of printers, Messrs. Ford, Chapman, & Co. The only direct evidence as to the diminution of light to those two windows was given by a workman named Elliott, who was employed in sampling, matching, and sorting the paper received. The sorting took place principally in the basement of No. 27, the matching and sampling taking place in the ground floor. Elliott's evidence was to the effect that since the alterations of the defendants he had noticed a difference in the light coming to the ground floor of No. 27. That witness had said that the diminution in light as to those two windows was considerable, and that he had now to go to the door to match his light tints, instead of being able to do that at the cupboard, as he had done before the alterations. The question was, in that serious diminution in the light? The conclusion he (his Lordship) came to with regard to those two windows was that there had been an actionable injury. The evidence given with regard to the windows in the basement of No. 27, and the ground floor of No. 26, seemed to be much weaker. In his opinion it was not a case for a mandatory injunction, and the only remedy to which the plaintiffs were entitled was that of damages. He was asked to assess the damages on the estimate of expert witnesses called by the plaintiffs, who assessed the damages suffered by the plaintiffs at from 200l. to 250l. His Lordship's view was that those witnesses took an exaggerated view of the injury to the plaintiffs. He did not agree with those witnesses that there was any substantial injury done to the basement windows, and he thought that the injury done to the ground floor of No. 27 was very much less than what they considered it to be. The question was what course ought to be taken. It seemed to him that really he had no materials before him on which he could assess the damage to the ground-floor windows of No. 27, and that the proper course was to direct an inquiry as to the damages as to that, the costs of the inquiry to be reserved. He thought that the right order would be, in the circumstances, to give the plaintiffs the costs of the action, except so far as they had been increased by the claim in respect of the windows in the basement of No. 27, and the windows on the ground floor of No. 26.

LITIGATION THROUGH A LANDSLIP.

The case of Sharpe v. Harman came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Lopes and Chitty on the 19th inst., on the appeal of the defendant from the judgment of Mr. Justice Mathew

in the Queen's Bench Division. The action was brought by the plaintiff, a landowner at Hastings, to recover from the defendant, an adjoining landowner, damages for injury to his property, which was caused by a landslip. It appeared that the plaintiff owned some land on a sloping cliff, the defendant being the owner of the land on the cliff just above. In 1859 the plaintiff's predecessor in title built two houses on his land, called Nos. 18 and 19, St. Mary's Terrace, and excavated the soil at the back so as to provide courts for the houses, and built a high wall against the cliff, to prevent the cliff from falling. In 1879, the defendant's predecessor in title built houses on his land above, and for that purpose excavated the soil at the back of his land and built the houses on the land so excavated. The soil excavated amounted to about 70 tons, which he put upon the land in front of his houses, and built a retaining wall, to prevent the earth from slipping down. The base of the wall was made of concrete, and the foundations were built 2 ft. into the natural ground, being sunk about a foot below the top of the plaintiff's wall, but at one side of it. On Dec. 1st, 1895, a landslip occurred at night, the defendant's wall coming down, and carrying with it part of the cliff, and nearly all the plaintiff's wall being destroyed. Mr. Justice Mathew held, upon the evidence given, that the defendant's wall ought to have been built into the solid rock, and that the defendant was therefore liable, and he gave judgment for the plaintiff for 150l. damages. The defendant now appealed.

At the conclusion of the arguments of counsel the Master of the Rolls in giving judgment said that in his opinion the act of the defendant, without any default on the part of the plaintiff, had caused part of the land of the defendant to fall on the plaintiff's land. In his opinion, therefore, the appeal must be dismissed.

The other Lords Justices concurred, and the appeal was accordingly dismissed with costs.

Mr. Witt, Q.C., Mr. R. M. Bry, and Mr. C. F. Lloyd appeared for the appellant; and Mr. Crump, Q.C., and Mr. Clavel Sater for the respondent.

MEETINGS.

FRIDAY, FEBRUARY 26.

Institution of Civil Engineers (Students' Meeting).—Paper to be read:—"Rockers and Expansion-Bearings as applied to Girders of Short Span," by Messrs. A. F. Baynham and F. B. H. Dolree. 8 p.m.
Royal Institution.—Lieut.-Col. C. R. Conder on "Palestine Exploration." 9 p.m.

SATURDAY, FEBRUARY 27.

Builders' Foremen and Clerks of Works' Institution.—Annual Dinner, King's Hall, Holborn Restaurant. 6.30 p.m.
Edinburgh Architectural Association.—Visit to North British Distillery.

MONDAY, MARCH 1.

Royal Institute of British Architects.—(1) Special General Meeting to elect the Royal Gold Medalist for the current year; (2) the Ninth General Meeting (business) for the election of candidates for membership. 8 p.m.
London Institution.—Dr. H. Lewis Jones on "The History of Röntgen's X Rays and their Practical Applications," illustrated by experiments. 5 p.m.
Society of Engineers.—A paper entitled "Notes on the Proposed By-laws of the London County Council with respect to House Drainage," to be read by Mr. J. P. Barber. 7.30 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. H. Newsholme on "Nature of Nuisances, including Nuisances the Abatement of which is Difficult." 8 p.m.
Society of Arts (Lancet Lectures).—Mr. C. F. Cross, F.R.S., on "The Industrial Uses of Cellulose." 11.11. 8 p.m.
Leeds and Yorkshire Architectural Society.—7.30 p.m.
Liverpool Architectural Society.—Paper by Mr. W. E. Willink, entitled "Medieval Trade Guilds." 6 p.m.

TUESDAY, MARCH 2.

Society of Arts (Applied Art Section).—Mr. Matthew Webb on "Gesso." 8 p.m.
Institution of Civil Engineers.—Papers to be further discussed:—(1) "The Main Drainage of London," by Messrs. J. E. Worth and W. Sano Crimp; (2) "The Purification of the Thames," by Mr. W. J. Dibdin. 8 p.m.

WEDNESDAY, MARCH 3.

Royal Archaeological Institute.—Mr. H. P. Fitz-Gerald Marriott on "The Portraits of Pompeii."
Carpenters' Hall, London Wall.—Professor J. A. Fleming on "The Work of the Electric Current," with lantern illustrations and experiments. 8 p.m.
British Archaeological Association.—Mr. Thos. Blashill on "Some Seventeenth Century Records of Absentees from Church." 8 p.m.
Society of Arts.—8 p.m.
Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at the L.C.C. Common Lodging House, Parker-street, Drury-lane. 3 p.m.
Liverpool Engineering Society.—Mr. W. Brodie on "Dock Gates." 8 p.m.
Edinburgh Architectural Association.—Mr. Alexander Drew, C.E., on "The Practical Designing of Iron and Steel Roofing." VI. 8 p.m.
Edinburgh Architectural Society.—Mr. R. S. Lottimer on "The Artistic Work and Influence of William Morris." 8 p.m.

THURSDAY, MARCH 4.

Society of Antiquaries.—Election of Fellows. 8.30 p.m.
Society of Arts.—8 p.m.
Royal Institution.—Professor Percy Gardner, F.R.S., on "Greek History and Egyptian Monuments." I. 3 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. J. Sykes on "Objects and Methods of Inspection." 8 p.m.

COMPETITION, CONTRACTS, AND PUBLIC APPOINTMENTS.

COMPETITION.

Table with columns: Nature of Work, By whom Advertised, Premiums, Dates to be delivered. Includes entries for Police Station, Court House, and Laundry.

CONTRACTS—Continued.

Table with columns: Nature of Work or Materials, By whom Required, Forms of Tender, as Supplied by, Tenders to be delivered. Includes entries for Church Restoration, Fittings, Brewery, Laboratory, and various building works.

CONTRACTS.

Table with columns: Nature of Work or Materials, By whom Required, Forms of Tender, as Supplied by, Tenders to be delivered. Includes entries for Wood Blocks, Street Improvements, Additions to Schools, Sewers, and various building works.

PUBLIC APPOINTMENTS.

Table with columns: Nature of Appointment, By whom Advertised, Salary, Applications to be received. Includes entries for Clerk, Deputy, and Assessor.

Those marked with an asterisk (*) are advertised in this Number. Competitions, p. iv. Contracts, pp. iv, vi, & viii. Public Appointments, pp. xvi, & xix.

Institution of Civil Engineers.—Students' Visit to the Works of the Incandescent Electric Lamp Company, Brook Green, Hammersmith. 2.30 p.m. Society for the Encouragement of the Fine Arts.—Mr. F. H. Evans on "Cathedrals and Ely Cathedrals," with limelight illustrations. 8 p.m. London Illustrations.—The Rev. Canon Benham on "Chenpside," illustrated. 6 p.m.

FRIDAY, MARCH 5.

The Architectural Association.—Dr. F. S. Granger on "Greek Sculpture and Greek Legend," with lantern illustrations. 7.30 p.m. Saturday, March 6. The Architectural Association.—Spring Visit to Her Majesty's Theatre, Haymarket. 2.30 p.m. Sanitary Institute (Incorporated for Sanitary Officers).—Inspection at the Marylebone Stoneyard, Richmond-street, Edgware-road, W. 3 p.m. Sanitary Inspectors' Association.—Annual Dinner, Holborn Restaurant. 6 p.m. Institution of Junior Engineers.—Conversation at the Westminster Palace Hotel. Reception at 7.30 p.m. by the President, Mr. A. R. Binmie, M.Inst.C.E., and Mrs. Binmie.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS. 1,680.—FIRE-GRATES: W. Johnson.—The inventor proposes to construct cottage and bedroom fire-grates so that they can be either used as open grates or converted into cooking ones. For this purpose he provides grates with a movable "cooking plate" at a suitable height over fire, and also a hinged plate to top front bar of grate, provided with a draught-pipe or door. The flue is so formed as to utilize all the heat of the fire. 2,625.—BRICK-DRYING CHAMBERS: E. Thomas.—This invention has for object the means of drying bricks by means of steam or hot water. Walls of kiln are constructed either hollow or traversed by channels, so that the pipes for heating can pass around interior. These are in connexion with a steam boiler or the exhaust pipe of a steam-engine. Floor (composed of a porous composition) is laid on brickwork, so as to leave hollow spaces to admit steam. 3,604.—PREVENTION OF PIPES BURSTING BY FREEZING: H. H. Le Roy.—The inventor connects pipes from main to house by a bib-cock inserted at the outlet end of the valve controlling the service from the main. Freezing and bursting of pipes is thus prevented by drawing off all water contained in pipes beyond the valve controlling the supply from the main. 3,672.—ARTIFICIAL STONE: S. Neffgen.—The inventor takes slaked lime containing as little water as possible, and mixes it with quartz sand, and, if necessary, with argillaceous colouring matter in suitable proportions. The mixture is moulded and the blocks placed in a heating chamber, heated by steam or hot air. Temperature is then raised to about 20 deg. C. in first five or six hours. Heat is slowly raised to about 80 deg. C., reaching this point after twelve hours, and maintained for two or three hours. Temperature is then rapidly raised to 90 deg. C., and the heat maintained for four or six days, according to size of blocks. This process causes the formation of a smooth and solid layer of calcium silicate.

4,577.—WATER WASTE-PREVENTING FLUSHING APPARATUS: S. S. Helley.—The inventor provides a duplex syphon arrangement, the shorter legs being situated on the flushing cisterns. The other legs descend and join each other, then merge into the descending pipe by which the flushing water passes from the cistern and syphons to the closet pan, &c. One of the inlet legs of the syphons in the cistern is provided with a valve, which can be raised in the leg and operated by hand, foot, &c., with the result that both syphons act simultaneously to discharge the water from the cistern to the place to be flushed. 5,024.—CHIMNEY COWLS: F. Rogers.—The inventor contracts top of chimney or shaft, and supports a hood also thereon by suitable arms, the top of this hood being also contracted. In turn this hood supports a helmet by means of arms, lower portion of helmet is made taper, and joins a cylindrical portion of approximately the same diameter as the upper part of hood. Upper portion of helmet also contracted, and furnished with a perforated ring at its orifice. Cowls may consist of any material. 5,683.—DOMESTIC FIRE-GRATES: J. Parkinson.—The inventor hinges the front bars of the grate to one or both sides, so that they can be swung out on their pivots for the purpose of cleaning, moving live coals or cinders from grate, &c. 18,745.—SEWER GAS DESTROYER: W. Eppington.—The inventor's apparatus comprises (1) a portable engine for driving the fan, (2) a sewage gas extractor and destructor, (3) a disinfecter, (4) air-proof mats, and (5) air-proof drop plates. The gas extractor and destructor is a metal cylinder, which is placed directly over the manhole. In the extractor are placed a fan, and fire-bars for a fire near the top of same. Disinfecter is also a metal cylinder, with a bottom of fire-bars, and a perforated shelf for disinfectants, and is thoroughly air-tight. When apparatus is in use in road where defective drainage has been found, the extractor is placed over first manhole, the drop-plates are fixed at all points in the section of sewer being treated, so as to isolate it; the mats are placed over the covers of all the manholes between first and last; and the disinfecter is then placed over shaft of last manhole, with the result that the whole of the sewer gas is under control and can be thoroughly dealt with. 21,836.—WINDOW-SASH ATTACHMENT.—A. J. Baller and Another.—The inventors claim in connexion with ordinary sash windows, the combination of vertically movable sashes, movable in the spaces formed by the usual beads, and provided with counter-balanced weights, which are secured by plates, which plates are provided with recesses in their upper sides and inwardly directed flanges, behind which are placed blocks, with which are connected cords or chains, which are also connected with said weights, said stile and bars being provided with longitudinal grooves, in which cords are placed. Various modifications of the invention are described. NEW APPLICATIONS FOR LETTERS PATENT. FEBRUARY 3.—3,256. R. Leftwich, Flossing-cats.—3,272. G. Knowles, Valve Ventilating Mechanism for Air House Drains and Sewers.—3,310. S. Malfey, Flushing Cistern.—3,342. C. Lucke, Presses for Forming Artificial Stones, Blocks, Tiles, &c. FEBRUARY 9.—3,436. W. Smith, Chimney-pots.—3,463. T. Kilner, Soil, Rain, and other like Pipes. FEBRUARY 10.—7,531. J. Wright, Waste or Slop-water

Closets.—3,571. A. Van der Vigh and Others, Fireproof Buildings.—3,575. B. Russell, Glass Lens for Pavements or Stall-board Lights.—3,585. J. Whittaker, Builders' Scrolling. FEBRUARY 11.—3,560. A. Fry, Watertight Metal Bar for Glass Roofing.—3,562. H. Darrah, Ceiling Roses, &c.—3,604. M. Spear, Supporting and Guiding Sliding Doors.—3,604. J. Hamblet and J. Stanford, Construction of Walls to enable ferns and other plants to be grown thereon, and in brackets for building the walls. FEBRUARY 12.—J. Farley, Joints of Earthenware Pipes, &c.—3,767. D. Pont, Mortaring Machines.—3,784. W. Turner, Graining Tool. FEBRUARY 13.—853. M. Hall, Floors of Rooms and Buildings.—3,850. H. Gibson and W. Iyer, Windows and Window Frames.—3,883. J. Shanks, Cisterns, Sinks, Baths, &c.—3,886. F. Saniter, Imitation Tiles on Metal. FEBRUARY 14.—3,890. Sliding Window Sashes and Sashes of Glass.—3,922. C. Archer, Rotating Shafts, &c., to each other.—3,960. H. Hauser, Rotating Ventilators or Fans.—3,977. W. Byson, Sash Fastener. PROVISIONAL SPECIFICATIONS ACCEPTED. 26,570. M. Adams, Metal Bends.—312. R. Ewing, Joining of Iron and other Metal Pipes.—345. E. and L. Richards, Pushing Cistern Apparatus and Fittings.—729. H. Phillips and S. Wilckens, Vitreous Enamelled Cast Metal as Door Furniture.—1,171. J. Moore, Regulation and Fastening of Window Sashes and Frames.—1,322. Tonks (Limited), J. Whiting, Spring Hinges and Door Springs.—2,047. W. Heisteman, Flushing Apparatus with Movable Syphon for Water-closets.—2,164. W. Drummond, Chimney-pots.—2,220. G. Jennings and Others, Lavatory, Bath, and other Valves.—2,244. Sir J. Smith, Fire Grates.—2,257. W. Bray, Chimney Tops.—2,309. W. Hewitts, Tiles.—2,504. H. Jenkins and W. Addis, Chimney Cows, Chimney and Ventilating Shafts.—2,689. G. Ward, Chimney and Ventilating Shafts.—2,709. T. Drummond, Chimney Cows and Ventilators. COMPLETE SPECIFICATIONS ACCEPTED. Open to opposition for two months. 3,079. F. Newman, Chisel.—3,237. F. O'Donnell, Syphon Flushing Cisterns.—6,460. J. Mearns, Taper Bell Pipe for House Drains.—27,954. J. Penney, Cylindrical Ventilated Window Lights.—27,955. J. Penney, Cylindrical, Vault Lights.—28,480. W. Bursant, Gully, Gutter, or Like Trap.—302. A. Hayward, Window Shutter Fasteners.

SOME RECENT SALES OF REALTY.

Table with columns: Description of Property, Date, and Price. Includes entries for Marlborough Gate, Penrycel, and Highbury.

PAIGNTON.—For works at Primley House, for Mr. H. C. Beifield, Messrs Norman G. Bridgman and Walter H. Bridgman, architects, Torquay, Paignton, and Teignmouth. Quantities by Mr. Vincent Catermole Brown of Paignton.—

Table listing contractors and amounts for Paignton works, including R. Harris, C. & R. E. Drew, E. Pike, H. Webber & Sons, and others.

PAIGNTON.—For erecting a villa residence, for Mr. William Torrey, Messrs Norman G. Bridgman and Walter H. Bridgman, architects, Torquay, Paignton, and Teignmouth. Quantities by Mr. Vincent Catermole Brown, of Paignton.—

Table listing contractors and amounts for Paignton villa residence, including S. Maridge & Curtis, E. Westlake, and others.

PAIGNTON.—For erecting Constitutional Club rooms and business premises, for Mr. Thomas Adams, Mr. Walter G. Coulredo, architect, of Paignton. Quantities by Mr. Vincent Catermole Brown, of Paignton.—

Table listing contractors and amounts for Constitutional Club premises, including E. Westlake, H. P. Bovey, R. Yeo, H. P. Rabich, and H. Webber & Sons.

SLAPTON (S. Devon).—For additions and alterations to "Higher Stairs," for Mr. H. G. Morgan, Mr. H. Vickery, architect, Torcross, Kingsbridge.—

Table listing contractors and amounts for Slapton alterations, including W. Edgecombe and A. Brooking.

SOUTHDOWN SEA.—For sewerage and road-making on the Avenue Estate, Southdown Sea, Mr. Arthur T. A. Bowyer, surveyor, 99, Leadenhall-street, E.C.—

Table listing contractors and amounts for Southdown Sea works, including W. Buxton.

STONDON MASSEY (Essex).—Accepted for additions to "Chivers," Mr. R. Mawhood, architect.—

Table listing contractors and amounts for Stondon Massey, including H. Barlow, Oggar.

TRURO.—Accepted for the execution of work at St. John's Schools, Mr. Wm. Swift, architect, 25, Lemon-street, Truro.—

Table listing contractors and amounts for Truro schools, including H. Tippett, Lemen-street, Truro.

TYNEMOUTH.—For paving, &c., George-street East, and Eleanor-street, Cultercoats, for the Urban District Council, Mr. J. E. Smilie, Borough Surveyor, Tynemouth.—

Table listing contractors and amounts for Tynemouth paving, including G. E. Simpson, Thornton & Co., and others.

WALSALL.—For sewerage, &c., Chapel-street, Blakenall, and Providence-lane, Leamore, for the Corporation.—

Table listing contractors and amounts for Walsall sewerage, including James Atkins, Ryecroft, Walsall, and others.

WELLINGBOROUGH.—For the erection of a technical institute, Council chamber, &c., for the Urban District Council, Messrs. Sturman & Archer, architects, Wellingborough.—

Table listing contractors and amounts for Wellingborough institute, including G. Brown & Son, T. H. Dorman, W. Goodman, and Hacksley Bros.

WIDNES.—For the erection of cemetery chapels, &c., Moss Brook, for the Corporation, Mr. J. S. Sinclair, C.E., Town Hall, Widnes.—

Table listing contractors and amounts for Widnes chapels, including C. Burt, Wm. Widdard, E. Gabbatt, John Matthews, Joseph Kilham, and C. Woods & Son.

LONDON SCHOOL BOARD TENDERS.—At the meeting of the London School Board on Thursday the following lists of tenders were considered:—

Table listing tenders for London School Board, including Scawell-street, W. & G. Cannon, J. Fraser & Son, and others.

"ASHBURNHAM."—Erecting Upper Standard rooms, water closets, &c.:

Table listing contractors and amounts for Ashburnham works, including Holloway Bros., G. S. Williams & Son, W. Shurmer, and others.

PENROSE STREET.—Re-building offices, &c.:

Table listing contractors and amounts for Penrose Street offices, including J. Grover & Son, G. S. Car, I. Carrett, and others.

SHERBROOKE ROAD.—Erecting Higher Standard rooms, &c.:

Table listing contractors and amounts for Sherbrooke Road works, including W. Downs, W. Shurmer, T. Boyce, and others.

Proposed New Drainage By-laws for London.

the Public Health (London) Act 1894, Section 39 (1), the London County Council was instructed to "make by-laws with respect to water-closets, earth-closets, privies, ashpits, cesspools, and receptacles for dung, and the proper accessories thereof in connexion with buildings, whether constructed before or after the passing of this Act." In 1893 these by-laws came into operation, and no sooner have architects and builders become familiar with them than a new set of by-laws relating to water-closets and other matters is proposed. This time, however, power is sought under the far-away Metropolis Management Act 1855, as Section 39 of the more recent Act is not sufficiently comprehensive to include such matters as subsoil drainage, rain-water pipes, and the waste-pipes from baths, sinks, &c.

Certainly the sanitary regulations of London are in an almost hopeless muddle. What with the London County Council, the Commissioners of Sewers, and the forty Vestries—each with its own regulations—matters have come to a pretty pass. The proposed by-laws of the County Council are apparently intended to supersede the regulations of the Vestries and to impose a uniform system of sanitation throughout the whole of the Metropolis with the exception of the City. Perhaps it has been discovered that the regulations of the Vestries were not legal. Be this as it may, the adoption of one set of by-laws applicable to nearly the whole of London is undoubtedly a step in the right direction, and one for which London architects and builders may well be grateful.

The proposed by-laws have been framed for the purpose of regulating the dimensions, form, and mode of construction of the pipes, drains, and other means of communicating with sewers, and the traps and apparatus connected therewith, and also for the purpose of providing for their proper cleansing and repair.

Many of the proposed by-laws are almost identical with existing regulations, either of the Council or of one or other of the Vestries. The first by-law is quite non-contentious, merely stating that subsoil drains must be disconnected from sewers by means of a suitable trap and ventilating opening. The second requires all rain-water pipes to discharge over or into properly-trapped gullies, and prohibits the connexion of water-closets, urinals, slop or other sinks, baths or lavatories, with rain-water pipes; the only objection that can be reasonably made to this is that the waste-pipes from baths and lavatories might be excepted from the prohibition, and a proviso inserted similar to that in the Clerkenwell Vestry's Regulations, namely, "waste-water pipes in the upper floors of premises. . . if connected with rain-water pipes, shall only be with such pipes as are outside the building, and the junctions shall be made at such points outside the building as shall be easily accessible at all times." By-law 3 deals with drains, and comprises ten clauses. Drains may be of stoneware, cast-iron, or "other equally suitable material." Clause 2 gives the thickness of metal for cast-iron pipes, namely, $\frac{1}{8}$ in. for 3-in. pipes, and $\frac{3}{8}$ in. for 4, 5, and 6-in. pipes. Although 3-in. pipes are mentioned, in this clause they can only be used for the branch drains from rain-water pipes, as the following clause provides that all drains used for conveying "sewage" must be not less than 4 in. in diameter. The latter part of the third clause is the one to which the greatest objection will be raised, as it insists upon all sewage-drains being laid on a bed of concrete not less than 6 in. thick, and being "so constructed as to be watertight and to be capable of resisting a pressure of at least 2 ft. head of water," but the existing requirements of some of the Vestries are quite as stringent. The remaining clauses of By-law 3 do not call for comment; they are less exacting than several of the regulations now in force. By-law 4 provides for the usual disconnecting trap and inspection chamber, and By-law 5 prohibits right-angled junctions in drains. The sixth by-law deals with the ventilation of drains, and is an almost *verbatim* copy of the regulations in force in Islington; in one or two places the new by-law is less stringent than that on which it is based, but the size of the ventilation shaft is increased from "three inches" to "that of the drain with which

such pipe or shaft may communicate," unless a soil-pipe, or slop-sink waste, be used as a ventilation shaft, in which case a diameter of $3\frac{1}{2}$ in. will suffice, provided the drain from it be not larger than 4 in. By-law 7 relates to waste-pipes from baths, lavatories, and sinks, and overflows from cisterns, &c., and is unobjectionable. Soil-pipes and their connexions with closets and drains are dealt with in the nine clauses of By-law 8. These follow in the main the existing by-laws of the Council; they are, however, more exacting in respect of the weights of soil-pipes ($3\frac{1}{2}$, 4, 5, and 6-in., lead pipes being increased from 65, 74, 92, and 110 lbs. per 10 ft. length to 73, 83, 104, and 125 lbs.; and $3\frac{1}{2}$, 4, 5, and 6-in. iron pipes being increased from 48, 54, 69, and 84 lbs. per 6 ft. length to 65, 73, 121, and 142 lbs. respectively), and cast-iron soil-pipes are forbidden *inside* buildings; on the other hand, the requirements respecting the position of the open tops of soil-pipes in relation to windows and roofs are simplified to one word, *safe*—the open end shall afford "a *safe* outlet for foul air"—the wire guard at the top is no longer compulsory, and the usual method of jointing pipes, &c., may be superseded by any other "equally suitable and efficient" method. By-law 9 requires the ventilation of the traps of water-closets where more than one are connected with the same soil-pipe; this by-law would be improved by the addition of the words, or "slop-sink" after the word "water-closet," wherever this occurs; it would then be made clear that water-closets and slop-sinks may be connected with the same soil-pipe, provided their traps are properly ventilated. The tenth by-law relates to slop-sinks, and is not immoderate in its requirements. By-law 11 throws on the owner of property the onus of repairing and maintaining "all pipes, drains, and other means of communicating with sewers, and the traps and apparatus connected therewith." This is a regulation which may induce carelessness in tenants and consequently inflict considerable hardship on owners, and we certainly think that reasonable objection may be taken to it. It is merely an application to "pipes, drains . . . traps, and apparatus," of the principle already applied by the Council to "water-closets, earth-closets, privies, ashpits, cesspools, and receptacles for dung," but it is undoubtedly a principle which can be carried too far. The

carelessness of tenants and servants is usually responsible for the choking of traps and frequently for the stoppage of pipes, and we think that justice would be met by making both owner and occupier responsible, so that the owner need not be mulcted where the damage is due to the carelessness of tenants or their servants. The twelfth is the usual "penalty" by-law, and the thirteenth declares that the by-laws shall apply to all *new* sanitary work executed in existing buildings. The by-laws, therefore, are not retrospective; existing arrangements may remain so long, of course, as they are not nuisances.

Doubtless there are some persons who will condemn the proposed by-laws *in toto*; to these, sanitary regulations mean reduced profits and harassing supervision. With this class of men we have no sympathy. Others there are who fear that the stringency of the by-laws will unduly and unnecessarily enhance the cost of building in the Metropolis, and add to the already heavy burdens of householders. Indeed, we have received letters to this effect from several architects, who seem to regard the new regulations as a new tyranny. With the views of these we sympathise to some extent, but at the same time we must point out that sickness is far more expensive than sanitation, and if the regulations are the means of saving *one* person in every house from one illness of even moderate severity, the expense entailed by them will have been well spent. The proposed by-laws, moreover, are less exacting in several respects than many now in force, and, as they have the merit of unifying the regulations throughout the whole of London (with the exception of the comparatively small area of the City), we welcome them as a boon to architects and householders. They are not, perhaps, perfect—what is?—but, on the other hand, they are not unduly exacting. Indeed, they do not impose a cast-iron law in everything, but allow room for variation with varying circumstances and for the adoption of new and improved methods.

ON SOME AMERICAN THEATRE DESIGNS.

AS to the true architectural treatment of the theatre we are still, in England, in an uncertain or what, let us hope, is a transition stage. As far as concerns the construction of the house, the necessity of fire-proof materials, of a fire-resisting curtain, of the structural barrier to be maintained between the auditorium and the stage portion, and of ample exit staircases, we have arrived for the present at such a degree of general agreement that the description of one new theatre, in regard to these practical points, reads much like that of any other. But the architectural treatment mostly takes care of itself; there is no theory in regard to it, and no fixed aim. Nor is this likely to be otherwise as long as theatre-building is merely a commercial problem in the hands of professional experts, whose only aim seems to be to get the house into a paying condition as fast as possible. When public opinion shall be brought to perceive that a theatre offers one of the finest opportunities possible for architectural effect and expression, and that in this respect it is worth while to put such a building into the hands of one of the best

architects of the day, and to allow a sufficiency of time for the maturing of a really fine design, then we may hope to have theatres which will be great architectural works in the highest sense. But evidently the time is not yet.

In this respect the Americans appear to be ahead of us in good intentions at all events. Several of the most important theatres in New York and elsewhere in the States are connected with the names of some of the first American architects. But when we look to them for some examples of characteristic architectural treatment of a theatre, we are obliged to confess to a disappointment.

Mr. Birkmire's small book on the planning and construction of theatres in America,* though it includes plans and also some constructional details which are of interest to architects, is in the main what is generally called a popular work, written in a light and easy style, with the evident aim of rendering the book agreeable and now and then a little sensational to the general reader. Still, it forms an interesting synopsis of the tendency of recent efforts in American theatre architecture, being illustrated with a number of views of the exteriors and interiors of theatres, reproduced from photographs, and therefore so far trustworthy in regard to the architectural treatment and effect of the buildings. And we cannot say that these designs afford us much help towards the development of theatre architecture. The discrepancy between the architectural clothing and the internal purpose and arrangement of the building seems even greater than with us, though in some cases the architecture *per se* is better than we usually see in English theatres.

The Metropolitan Opera House (New York), by Messrs. Cady, Berg, & See, presents the appearance of two great blocks of warehouses or offices, at the two corners of the front, connected by a rather lower central portion. Except that the buildings are not so high in proportion to their width, there is nothing to distinguish it from the common American type of lofty office buildings which we know so well. As the plan of this particular house is not given, it is impossible to say what relation this exterior design may bear to it, but certainly there is nothing whatever in the exterior aspect which in the least suggests a theatre. The conclusion from the appearance in the illustration is that it is really a group of blocks of offices with a theatre hidden somewhere between and behind them. This building, however, is fourteen years old. Abbey's Theatre, at the corner of Broadway and Thirty-Eight-street, is only about three years old, and was the first to be completed since the enactment of the new law relating to the building of theatres, and the law in the case of this theatre, we are told, has been strictly enforced. The exterior presents a square block of building of six stories, with ranges of small windows, suggesting nothing so much as a hotel with an unusually large entrance flanked by columns, which, running through ground and mezzanine stories, leaves a great hole in the centre of the front with by no means good effect. The name "Abbey's Theatre" appears in large letters on the balustrade above the cornice;

certainly the only announcement, to the English eye, that this is a theatre. It is an ugly building, with not even a festive character about it. In this case also the plan is not given; perhaps it was thought that it would show too much. Turning to the new Act, printed at the end of the book, we seem to find some explanation of the design in the provision that under certain circumstances a portion of a theatre building may be used for business purposes. The wording of this paragraph is as follows:—

"When located on a corner lot, that portion of the premises bordering on the side street, and not required for the uses of the theatre, may, if such portion be not more than twenty-five feet in width, be used for offices, stores, or apartments, provided the walls separating this portion from the theatre proper are carried up solidly to and through the roof, and that a fireproof exit is provided for the theatre on each tier, equal to the combined width of exits opening on opposite sides in each tier, communicating with balconies and staircases leading to the street, in manner provided elsewhere in this section: said exit passages shall be entirely cut off by brick walls from said offices, stores, or apartments, and the floors or ceilings in each tier shall be fireproof."

The words "that portion of the premises bordering on the side street" would seem to imply that only one face of the theatre can be thus masked with offices, but the two faces of the building in this case are treated identically, and the whole becomes a warehouse. In fact it is actually described so in the book: "the exterior of the theatre presents a six-story office-building of light stone." That may be good for business, but it is a wretched way of treating a theatre architecturally; and the enactment which affords opportunity for it is in itself a very unadvisable one, on practical as well as architectural grounds.

The Fifth Avenue Theatre, of which Mr. Kimball is the architect, is an exception. Here the main façade is, unfortunately, on the flank and not on the front of the house, which was unavoidable, as what should be the front is built up with houses, and the main entrance is at the side of the building; but the auditorium portion and the stage portion are here well and characteristically treated. The entrance façade is a rich and refined piece of decorative architecture in French Renaissance taste, rather spoiled by the poor columned portico belonging to the former house, which the architect has retained, with more consideration for his predecessor than for himself. The flank of the stage portion adjoining is treated very plainly in strong rusticated work, only connected with the other portion by carrying the cornice and string-courses through, and relieved by a lighter columned attic above. As an example of characteristic treatment of the two portions of the house this is an unusual and excellent piece of architecture. Possibly if this architect had had the advantage of a free site he would have seen the propriety of making some attempt to indicate the theatre form externally in his building. As the site is circumstanced he had not the chance of doing so. But the American theatre architects who deal with free sites do not appear to make any effort in this direction, so far at least as Mr. Birkmire gives us the opportunity of judging.

The huge establishment called Madison-square Garden, by Messrs. McKim, Mead, & White, with its tower modelled on the lines of the Giralda, is a really fine building, pretty

* "The Planning and Construction of American Theatres." By William H. Birkmire. New York: John Wiley & Sons. London: Chapman & Hall.

well known in this country through illustrations; though it certainly suggests a *Hôtel de Ville* rather than a theatre. We observe it stated in regard to the interior that "no attempt has been made at decoration, other than to leave all the construction open to view, and to paint the columns, roof-girders, &c., a light buff tint, and the beauty of the interior resides in the simplicity and in the light and graceful appearance of the construction." It is to be wished that there were more endeavour after this simplicity in the interior treatment of theatres, instead of the over-decoration, generally of a more or less tawdry kind, which meets us everywhere. There is the same want of reticence in most of the interiors figured in this book, though we admit that on the whole the taste in the decorative treatment seems superior to that of the majority of English theatres; only there is too much of it; no repose. It is rather amusing to notice the enthusiasm of the author over the effect of the endless repetitions of the domes in the Castle-square Theatre by means of huge mirrors set over the doors: a source of effect worthy of a restaurant, and rather a nuisance even there.

The constructional arrangements for carrying the galleries without front supports are such as we are familiar with here, and have no special interest for architects. We gather that a great deal more attention is paid to the comfort of the audience in the cheaper portions of the house than is usual in England, upholstered chairs being provided, in some of the theatres at least, even in the upper gallery. The favoured method of ventilation is by a *plenium* actuated by mechanical means, and propelling fresh air into the house under the seats, in one instance through the hollow legs of the chairs. One very peculiar arrangement is mentioned in the Madison-square Theatre—the orchestra is placed on a platform above the stage and on the stage side of the curtain; an arrangement the supposed advantage of which, from any point of view, it is impossible to understand. The new enactment, however, has taken note of it by a clause to the effect that in future any arrangement for the orchestra aloft in this manner shall be on the auditorium side of the proscenium; a provision which, as the author observes, will probably prevent the system ever being employed again.

In the case of the Empire Theatre, in which the entrance to the "open court" required at the side of the building by the legal enactment is reached by a fireproof brick passage or tunnel, the author draws attention to one danger in connexion with such a mode of exit, besides the obvious one of allowing the chance of a crush, viz.: that if the main building had got fairly well on fire any falling beams or girders would crush in the roof of such a passage. However, we are not likely to have any such mode of exit allowed in any theatre in England in the present day.

Plans of most of the theatres mentioned are given, as far as the house itself is concerned, but in general these plans do not include the approaches and exits to and from the street, an omission which destroys a good deal of their value.

The book will be interesting, however, for architects to look at, though it is not specially an architect's book; and Mr. Kimball's treat-

ment of the exterior of the Fifth Avenue Theatre, before referred to, is certainly worth attention.

NOTES.

THE constant recurrence of serious fires during the present winter calls for comment. Ever since the notorious petroleum fire at Purfleet of some six weeks back we have had in rapid succession important conflagrations at Maple's Repositories, in the Borough, in the City, and elsewhere. Except for the sensational and often incorrect reports given in the daily Press, we hear little of these fires and the great risks involved. Little or no interest is taken in the subject by the public in this country, and we are under the impression that little interest is shown by the authorities directly concerned. But such a constant recurrence of fires of a similar nature, their rapid spread, and the usual result of a general "gutting" of the premises concerned, cannot be attributed to mere accident, and it is high time that London, like other cities of importance, should consider the best means of protection against fire in a more serious spirit. Fire protection comprises "fire prevention" as well as "fire extinction," and both these sections should receive careful attention. At present the Building Act alone assists "fire prevention," and the Fire Brigade is entrusted with the fire extinction. We are afraid that the subject of "fire prevention" has as yet only been treated in a most amateur manner, whilst there is ample room for the improvement and development of our Fire Brigade. The St. Mary Axe fire was in itself sufficient cause to institute an inquiry into the protection of the metropolis, for we have had nothing of this kind since Parliament reported on the Metropolitan Fire Brigade in 1877.

WITH reference to Mr. Ricardo's letter in our last, we are authoritatively informed that Mr. Ricardo's remark that the Dean and Chapter were "acting independently of their architect" in regard to one point is an assumption on his part entirely without foundation; as indeed we supposed at the time. Three or four years ago an old farmhouse and farm buildings belonging to the Chapter were taken down. As they were partly built of Barnack rag, it was arranged that all pieces of Barnack rag found in them of sufficient size to be of any future use should pass into the hands of Mr. Thompson, to be used where they would be available in the repair of the cathedral. The matter is long antecedent to the present controversy. We attached no importance to the fact, and merely mentioned it as reported to us by a member of the Institute party who visited Peterborough the other day, but who apparently did not get the story quite correctly. Any pieces used would require careful selection, no doubt; but why should they, with the weathered face outward, decay any more than the probably much older original stones of the front which are to be re-set? As to the rest of Mr. Ricardo's accusations, the portion taken down has suffered nothing from the weather, a temporary roof has been placed where the gable is removed, and all the stone taken down is under cover. Some people, however, are determined that the Dean and

Chapter shall be in the wrong, whatever they do.

THE *Athenaeum* of February 20 reported the discovery at Athens of an ostrakon, or potsherd, bearing the name of Themistokles. Of this curious find we are able—thanks to the *Berliner Philologische Wochenschrift*, February 27—to give our readers some further particulars. The ostrakon in question is a fragment of the brim of a large vessel, of black terra-cotta ware. On its surface has been scratched with a sharp tool the words "Themistokles Phrearrhos" in archaic letters. There can be no question that Themistokles is the famous statesman, and that one of the actual ostraka that condemned him to banishment in B.C. 470 has come to light. Up to the present time only three similar voting ostraka had been discovered, one on the Acropolis, with the name of Megakles, son of Hippokrates, the uncle of Perikles, another, also on the Acropolis, with the name of Xanthippos the father of Perikles, and a third, bearing the same name but found in the Kerameikos. All three are published, and we hope the Themistokles ostrakon will shortly appear. It was found in the excavations being carried on by the German Institute near the Areopagos.

A SMALL publication which was issued by the German "Cremation Society" on the occasion of the National Exhibition at Berlin, has reached us, and from it we see what rapid strides are being made in the cremation movement throughout Germany, or we may even say throughout the whole of Northern Europe. The Society—which, by the bye, has its own building at the Exhibition—works most energetically for its cause, and appears to be actively engaged in furthering the erection of furnaces and mausolea in the different provincial cities of Germany. At Berlin there is a complete equipment at the Central Cemetery, which cost about 1,000*l*. The number of members in the Berlin branch of the Society is 1,600, and there is room for 500 urns in their present mausoleum. The publication includes numerous illustrations of buildings erected in different parts of the country for the Society, more particularly among others that of the crematorium at Hamburg. There are also illustrations of the crematoria at Zürich, at Stockholm, &c., some of which prove that it is quite possible to obtain an agreeable architectural treatment of a crematorium.

THE strike of North Eastern Railway employées, although lasting but a few days, has resulted in unnecessary loss to the extent of some thousands of pounds to the Company, their customers, and to the men themselves. It has demonstrated clearly the futility of such rash and ill-advised proceedings, and forcibly illustrated the great power for good or evil exercised by the leaders of trades unionists. Had Mr. Harford's influence been directed to keeping up hostilities, or had he even adopted a neutral attitude in submitting the terms of armistice to the men, they would undoubtedly be out now, and the trade of Newcastle and other north-eastern ports seriously jeopardised. The North-Eastern officials have also acted very com-

The North Eastern Railway Strike.

mendably, and have proved that compromise is not necessarily incompatible with the preservation of dignity. Of course, much still remains to be settled, but it is a relief to find the parties to the dispute refraining from the unyielding attitude which has prolonged and embittered so many strikes. We are glad to note that Mr. Ritchie stated in the House of Commons on Monday that there are hopeful signs of a settlement without the mediation of the Board of Trade.

The Committee appointed by the Government to consider the question of arranging for places of exhibition for the two Salons until after the close of the Exhibition of 1900 has been holding sittings under the Presidency of M. Poincaré, a former Minister of Fine Arts. The following are the different localities already suggested: 1. a portion of the Tuileries buildings; 2. part of the garden of the Tuileries adjoining the Rue de Rivoli; 3. the Palais Royal; 4. the Place Vauban, behind the Ecole Militaire; 5. the alleys of the Observatoire; 6. the space along the fortifications between the Porte Dauphin and the Porte d'Auteuil; 7. the Ranelagh; 8. the Pelouse de la Muette. Almost all these sites are inadmissible for one reason or another. The neighbourhoods of the Ecole Militaire and the Observatoire are not sufficiently central, and the same objection applies to the fortification line between Auteuil and Passy; and if temporary buildings were established either at the Ranelagh or on the Pelouse de la Muette, there would be a general grumbling from the Paris population. The only two possible sites seem to be at the Tuileries and the Palais Royal; and even in regard to the latter the temporary giving up of the gardens can only be on condition of the consent of the inhabitants of all the houses which surround them; so that the question seems a difficult one.

This exhibition will be opened on the 20th inst. by the Lord Mayor and Sheriffs of London, in its usual quarters at the Agricultural Hall. The formal opening will take place at noon, and at 3 p.m. on the same day the Architectural Association will make a visit to the exhibition. On Monday the 22nd the Association of Municipal and County Engineers are to make a special visit; on the 23rd the annual meeting of the Institution of Clay-workers will be held there; on the 24th there is to be a visit of the Builders' Merchants' Association, and on the 25th a Conference of House Painters and Decorators. There will thus be a good many interests of different kinds centred round the exhibition during its first week of existence. It is announced that the exhibition will contain, besides the usual trade exhibits, objects on loan from South Kensington Museum, the Corporation of London, and the City Companies; and also architects' drawings. The latter element in the last exhibition did not amount to very much; perhaps the management may have been fortunate enough to have obtained more support in that kind from architects for the present exhibition.

The twenty-fifth volume of the "Transactions of the Institution of Civil Engineers of Ireland" contains five papers read at meet-

ings of the Institution, of which that by Mr. Alfred Price on "The Location, Construction, and Equipment of Light or Secondary Railways in Ireland," is perhaps at the moment of the greatest interest. He proves once more that a light railway is not necessarily a narrow gauge one, nor is a normal gauge line of necessity a heavy, costly line; though, of course, the local circumstances of each case must decide the best policy to adopt. Mr. A. Gore Ryder contributes a paper on "Rough Testing of Portland Cement for Practical Men," which is well worth reading by those who have to deal with small quantities of Portland cement, and who therefore cannot incur the expense of the usual laboratory tests. "Recent Advances in Bacterio-Chemical Study of Sewage and other Polluted Waters," by the Curator in the Royal University, Dublin—Mr. W. E. Adeney—is the longest, and to some, no doubt, the most instructive paper. Results of elaborate experiments are given, showing the two successive stages which micro-organisms bring about in the sewage, and also the extent to which atmospheric oxygen is necessary for the natural process of sewage purification. A series of notes by Mr. John Purser Griffith on "Manganese Steel and some of its Uses" details some of the situations in which Mr. Hadfield's most valuable material may be used with great advantage. Were it not for the drawback that it is next to impossible to do anything in the nature of machining on it, manganese steel would, doubtless, come into more general use. The remaining paper by Mr. Karge Parry, on "The Administration of the Irish Sanitary Acts by Local Authorities," points out several weak spots in the Act of 1878, and is of interest to those connected with such work.

The Annual Report of the twenty-second session of the Birmingham Architectural Association records an increase in the number of members, and makes special mention of the work that is being done for architecture by the Birmingham School of Art. Attendance at the classes there is strongly urged on the student members of the Association. In the sketching class, which is reported to have been well maintained this year, the practice of time sketching from photographs has been encouraged as a means of promoting the faculty of rapid sketching out of doors. The Report admits that this method is not all that could be wished; it may be useful to a certain extent, but we should suggest that time sketching from any objects in the round which present a perspective problem—such as a chair, a table, &c., would afford better practice in this sense than sketching from photographs where the perspective is already made to hand. We notice that of the prizes offered by the President for the best set of sketches and measured drawings only the second prize was awarded, as the condition was not fulfilled of accompanying the drawings by a short account of the buildings sketched, a decision which we quite approve of. The requirement that an account should be given of the building sketched is a very useful one. The Report is embellished by several pleasing though slight sketches by members—memorials of the visit of the Association to Oxford.

A GREAT deal has been heard during the last few years of the necessity for widening narrow parts of the Strand, though little has yet been done to effect this. It may seem therefore useless task to point out another place where the congested state of the traffic requires that some measures should be taken to widen the thoroughfare. This is on the Knightsbridge-road, immediately to the east of Albert Gate. The traffic in this place becomes daily in a more congested state. Nor is this surprising, as practically three streams of traffic going west, namely, the main Piccadilly stream, that from Grosvenor place, and that from Park-lane and Hyde Park, all converge at this gully. In the opposite direction come three opposing streams—from Kensington, from South Kensington, and from Sloane-street. The result is that extreme delays and inconveniences arise. This state of things admits of an easy remedy by the widening of this piece of roadway. It is a question of pounds, shillings, and pence. But the growth of London requires that this kind of work should be done if the traffic of the Metropolitan is to be properly conducted.

UNDER the superintendence of Mr. Isaac, Architect and Surveyor to the Society, the cement coating is being picked off the south side of Gray's Inn Hall, so as to expose the red Dutch brick work of the wall and the quoins of the buttresses. The north side was similarly treated five or six years ago. Our passing comment upon the work occasioned some correspondence in our columns for October, 1891. The hall was rebuilt in 1556-9, at a cost of 863*l.* 10*s.* 8*d.*, as is stated in the "Origines Juridicales" of Dugdale, who cites an account (no longer extant) rendered by Sir Gilbert Gerard, Treasurer, in 1559. Until the alterations—we believe by William Wigg—began in 1826, it formed an almost perfect example of its kind and period. The gables were marked by ascending battlements, in step form, of brick; the lateral walls were finished with plain parapets. On the tiled roof stood a wooden lantern in three stages capped by a boldly projecting cornice and a leaden cupola, with ball and vane—a characteristic composition in striking contrast with its sorry successor. The repairs comprised a substitution of slate for tile on the roof, the placing of angle-ledges on the crow's-rests, the covering of these, together with the walls, with compositum or plaster, and the alteration of the arches over the roadway at the west end. On the hall's south side a lavatory has been built between the two buttresses of the eastern bay. The hall windows are unusually rich in armorial bearings; the bay window in the north wall contains some coat-arms set up therein *temp.* Elizabeth, with many others that were engraved for Dugdale's "Origines." These suffered much damage from a subsequent storm; they were reinstated as completely as was then possible, and in 1871 were re-arranged, and protected with antique glass. There is a tradition that the oaken screen, of rich design—the open gallery-front, above, is of later date—and some of the dinner-tables were given to the Inn by Elizabeth. The Society possess a coloured drawing, ascribed to Wigg, showing the hall and chapel from the north, as they appeared before the changes were made to which we refer.

Cheyne-walk, Chelsea.
 The lease of "Queen's House" is offered for sale. It is No. 16, Cheyne-walk, and is believed to have been occupied by Katharine of Braganza—her initials are on the wrought-iron gates—who returned to Portugal *circa* 1692. The handsome, albeit simple, elevation, quite after the style of Wren, has been impaired by the addition of an oriel on the first and second floors beneath the central pediment. In October, 1862, the house was taken by the two Rossettis, Mr. George Meredith and Mr. Algernon Swinburne. The joint occupancy did not endure for long, but Dante Gabriel Rossetti continued to live there until his death in 1882. In the garden he kept his menagerie, and there is the sycamore tree he painted in some of his pictures. In July, 1887, Mr. Holman Hunt unveiled a memorial which Rossetti's intimate friends had set up in the public garden opposite "Queen's House." It consists of a grey granite drinking-fountain, designed by Mr. John P. Seddon, with a quarter-length figure of the poet, an alto-relievo in bronze, modelled by Ford Madox Brown, and is illustrated in the *Builder* of April 17, 1886. A view in Mr. Beaver's "Memorials of Old Chelsea" shows the house with a figure of Mercury rising from the roof.

Suburban Theatres.
 "THE Suburban Theatre" was the subject of an interesting paper read this week before the Playgoers' Club by Mr. Mulholland. The movement in connexion with the suburban theatres is of recent date, and Mr. Mulholland was practically the pioneer with the Camberwell Theatre, opened in 1894. Apart from the greater convenience of the suburban theatres to the inhabitants of the outlying districts, it should be remembered that the modern playhouse, erected on cheaper ground, is more spacious, more comfortable, better ventilated, and better lighted than many of the older central theatres of the Strand district. There is not the slightest doubt that the greater comfort enjoyed in a suburban theatre has much to do with the popularity of these institutions in their respective localities, for it is anything but a pleasure for people travelling from Hammer-smith, Camberwell, or other suburbs, who are already tired by their long journey, to be penned up in some of the structures in which drama is presented to Central London.

Results of Sanitary Inspection.
 THE Report of the Medical Officer for the Leyton Urban District Council gives a proof of the salutary results of house-to-house inspection in such a district. A number of cases are given in a tabulated form in double column, the one column stating the discoveries made as to the insanitary state of property, the other column the remedies applied as a consequence of the action of the authorities. The statement gives a very satisfactory proof of the good effects of careful inspection and official action.

The Paris Exhibition.
 AMONG the various schemes of private projects submitted to the Managing Committee for the Paris Exhibition of 1900, the following are those relating to architecture and construction which have received the sanction of the Committee: the "Palais de la Presse et de la Publicité;" an iron turning pavilion;

a theatrical museum, of which M. Nenot will be the architect; moving platforms for the transportation of visitors (the projectors are MM. Blot, Eugène Hénard, and Thévenet - Le-Blou; restorations of ancient French monuments; a modern house, the "Palais des Femmes"; the "Palais des Joujoux"; the "Rue des Sicles," a street of buildings of various ages; the palace for glass and ceramic work; and lastly the "Encyclopédie Artistique et Géographique," in which each country will be represented by a street or an architectural monument, a proposal of MM. Dezermeaux and Leblanc. Altogether the Exhibition of 1900 promises to be a rather curious collection.

THE ADVANCEMENT OF ARCHITECTURE:
 WITH SOME REMARKS ON THE STUDY OF GOTHIC.

THERE must be an interest in all past architecture, partly on account of its obtrusiveness, and partly because it embalms the knowledge, skill, and taste of a bygone age; but we take a still deeper interest in those particular examples of it, that have excited in us strong emotions we often hardly know why. Some call forth our admiration by their perfection, some by their size, and some by their skill, and when the skill shown is almost superhuman, we are naturally curious to know how it came about. History, however, mostly seizes on those military achievements of nations which give them supremacy and permanence, for, as some learned man very truly said, history is only the history of successful military people, as the unsuccessful are destroyed or absorbed. History, as a rule, takes little or no account of those advances in the arts which add comfort, ease, and elegance to society, and does, too, its main business, the fighting of great battles, very badly indeed. We, however, occasionally catch glimpses of other matters; historians occasionally quote laws which throw a little light on the improvements in husbandry, in food and its cooking, on the clothing and housing of the people, on their furniture, weapons, implements, ornaments, games, and amusements, as well as on those fine arts they cultivate. Our main knowledge of these subjects is, however, owing to occasional notices in works on other subjects, such as Plutarch's Lives, Plato's Dialogues, Aristotle's Ethics, and Politics, &c., and to stray treatises that have come down to us, such as Vitruvius' work on Architecture, the Elder Pliny's Natural History, Pausanias, &c.

Analytical as this age is, you cannot analyse any subject completely until you have the whole of it before you, and though what is known and analysed has thrown more light on deceased architecture than was ever known before, the necessary information to write complete histories of any architecture from Greek downwards is still wanting. Gothic, since its abandonment in Renaissance days, was generally overlooked until the last century. I say generally, for Wren certainly studied its construction. It has, however, points of attraction that are not found in any other phase of architecture, for though lineally descending from Greek architecture through Roman, Byzantine, Romanesque, and Saracenic, it varies so much in form and principle from them that it may be looked on as a new art. It should be attractive as a study, as it went through so many phases during its short existence of little more than 400 years. It is in some respects the most interesting of all architectures, for it made giant strides in construction, and was quite original in its aesthetic presentations and in its emotional effects. In spite of the researches of Professor Willis and Viollet-le-Duc, to speak only of its typical elucidators, there is still a huge body of information wanted to give us due information on the subject. We not only want a vast amount of knowledge of Medieval times in the country or countries that gave Gothic architecture birth, but we also want a much greater knowledge of Saracen records than we have hitherto got. Every schoolboy is unfortunately not like Dr. Thomas Young, who, after correcting his

master's Greek, taught himself Arabic, French, and Hebrew in his spare time. I am loth to make any remark on so great a man as Viollet-le-Duc, but I cannot help thinking that his patriotism ran away with him, for though he admits that the Crusaders, during their stay in Palestine, got advanced geometry from the Saracens, he says that though he has heard much of Saracen influences, he has never found any signs of it in Gothic, but believes that all its peculiarities were due to French invention. I confess that I think he was wrong there, for surely the cusp was got from the Saracens. Some think the Saracens took the idea from the upright tombs excavated in the rocks of Persia, where the sinkings for the head and shoulders made the complete cusp and two half-ones on either side, while others believe it was got from Northern India, where cuspidation was employed at an early date, though what that date was nobody knows. Cusped arches were certainly used by Abd-el-Rahman in his mosque at Cordova, built in the latter part of the eighth century; and the earliest Gothic was without cusps. It never appeared to me that there was much direct adaptation of Saracenic architecture, but a great deal of indirect influence, for we must recollect that the Saracens were probably the most civilised people in the world at the time of the Crusades. The gorgeously of the Court of Muctadir, the magnificence of his palace and its fittings, astonished the ambassadors of Constantine Porphyrogenitus, accustomed as they were to all the splendour of the Byzantine Court; this was early in the tenth century. In the second quarter of the twelfth century, Averrhoes was born, and died towards the end of it. He made the great commentary on Aristotle, spoken of by Dante, a translation of which is said to have been used in the Italian universities until the last century. The late Dr. Middleton heard Aristotle commented on, probably according to Averrhoes, in Arabic at the University of Karoum.

Although Averrhoes was the greatest of the Arab philosophers, he was only the head of many, and the Arabs alone at that time were the great translators of Greek works, which were mostly re-translated into Latin by the Jews, and thus only were Greek works known to Europe, until the revival of Greek in Italy at the end of the fourteenth and the beginning of the fifteenth century. Gemistos Plethon, who was one of the great teachers of Greek in Italy, only died in 1450, and his body now rests in one of the niches in the temple to Isotta at Rimini. It was brought from the Morea by Pandolfo Malatesta.

To surpass the ephemeral architecture of the Saracens was, in my opinion, the aim of the Gothic architects, and I think the lessons the Saracens gave them of producing magical effects by the endless combination and repetition of a few simple forms was not lost on them.

In my third lecture I told you how much the stepped canopies on the centre gable of the portal at Reims were like Saracen stalactite work. Some of the late vaulting at Oxford Cathedral strikes any one familiar with Saracen work as being very Saracenic in appearance, and quite Saracenic in principle; while many lattices and similar patterns might be taken for either Gothic or Saracenic. The Christians, we are thankful to say, were not debarred from the representation of man or beast, and therefore, were not driven, like the Saracens, to wholly devote themselves to forming ornament out of geometrical patterns and a few flowers.

It is most agreeable to find a shoemaker, a baker, or a sword cutter that you go to, conversant with the history and archaeology of his trade, and you think him a praiseworthy person if he knows these things, and is a good tradesman as well, but if he gives you shoes that wring your feet, heavy or gritty bread, or an intemperate sword, you wish he had spent the time he devoted to archaeology in learning his trade.

Architecture makes so many and such varied demands on a man's time that if he be an architectural archaeologist as well he is a phenix.

It must, therefore, strike every one that what an architect first wants to learn are those things that form the very foundation of structural knowledge. That an acquaintance with the forms that were agreeable to nations hundreds or thousands of years ago, can at the best be but agreeable information; unless, indeed, architects are so enamoured of the present taste, as to desire to keep a shop for fancy dress architecture. The so-called Renaissance architects were, as a rule, wholly ignorant of the very foundation and aims of architecture, that of meeting wants in the best and most economic way, of adorning such parts as require adornment with elegantly designed mould-

* Being the fifth Royal Academy Lecture on Architecture this session. Delivered on the 8th ult. by Professor Aitchison, A.R.A.

ings, that tell the tale proper to the building in the climate it is built in. How could men who were goldsmiths, sculptors, painters, or literary men, who knew absolutely nothing of the art of constructing, or of the strength and qualities of materials, and whose aim was solely to make a building look something like what they knew of a Roman building, be real architects. A few of the great geniuses picked up a little superficial knowledge of construction. The Renaissance architects ought to have been at their very best in the great cathedral of the world, St. Peter's. What did they do? I think they made the biggest one, but it was a badly-constructed artistic failure, with about ten times the material a Gothic architect would have required.

Greek architecture, Roman architecture, and Gothic architecture are dead; but, like the discreet statesman, they do not wish it to be known. What is not dead but only sleeping is the method that the barbarians began and continued until at last they became the most skillful builders in stone the world has yet seen. They keenly observed, they accurately deduced, they dared and strove; if a wall tumbled down, they set themselves to find out why. Was it a bad foundation, bad stone, had mortar, or bad workmanship? Or was it insufficient to resist the pressure of the wind? And they did the work over and over again, correcting one or more of the faults they had discovered until it stood; they mostly had near them Roman or Byzantine buildings that had groined vaults, or learnt the art of vaulting from Byzantine builders, and they used these vaults in the narrow aisles of their churches, and roofed the wide naves with wood. These roofs were burnt over and over again by lightning or otherwise, so they tried to vault them in stone. These vaults fell down and partly or wholly destroyed the building. They then tried counterforts and ties without avail, and then they tried binding the whole together with timbers built in the walls; but these rotted and the vault fell again. They noticed that the flat part at the top of the vault was the first to go, so they gradually made them pointed, and eventually found that groined vaults over clearstories could be safely abutted by flying buttresses which carried the thrust into the ground. I should say that they were always short of money, and so bad to study the greatest economy. While they were making these experiments the Abbey schools were teaching their scholars some of the necessary elements—geometry and drawing, the use of the tools for their respective crafts and giving them probably the best information about building that could be got in the civilized world. Towards the end of the twelfth century the architects formed themselves into a trade guild. We must believe that they were then pretty sure of having solved all the main difficulties, but they did not rest and be thankful, but strove to their utmost to improve what had gone before, not always, perhaps, to our satisfaction, but, structurally speaking, they became more and more skillful, and artistically, more and more elaborate and wonderful.

If any one will take the trouble of following the style out from the first ignorance and blundering of the uncivilised barbarians, he will be kept, like they were, in breathless expectancy as to the result of the experiment, although from our greater knowledge we feel sure that the experiment must fail, and when they had mastered the great problems, or as I might say made their wonderful discoveries, we can see the great care that was taken to think out every problem, and to solve it properly, for each step was new. We are struck with their readiness of resource, and with the justness of their provisions.

The difficulties involved in counteracting opposing thrusts of various intensities were very great; and to get all these thrusts to neutralise one another, and to become vertical, was wonderful, but it had to be attained when all these counteracting thrusts were to meet on the top of a slender shaft. There is a central shaft in one of the chapels at Lincoln, I should guess the height of the pillar at 24 ft., and it is 18 in. each way on plan, and hollowed out like a Maltese Cross, and this pier bears the transverse and diagonal ribs of the chapel which is about 40 ft. by 30 ft., the shaft being of polished Purbeck, and it seemed to be upright. We all know how much out of the perpendicular the shafts in the Temple Church of London are. It is in cathedrals or large churches with high naves and clearstories, where forethought and care is most apparent; e.g., where there are attached columns or piers in small stones that are opposite to monolithic columns which bear the transverse ribs of the vault, so that it was necessary to provide for the squeezing of the numerous joints on one side, while the monoliths

on the other side would not squeeze. Similar lessons may be learnt by observing the flying buttresses of small stones corbelled out, and the false bearings to get the sum of the thrusts vertical.

You must, I think, allow that these architects were most skillful.

What would we not give to know the architectural education they received?

I am by no means sure that if by the wave of a magician's wand, thorough knowledge of construction could be given to every student, that the succeeding generation of architects would be able to make buildings that would out rival the Gothic achievements; but architects must have this knowledge to do so, and besides this, it is attainable. The present generation would not learn it in the same slow and extravagant way that the Romanesque and Gothic architects did, they would learn it by mastering statics and the strength of materials in the first place, and by observation and experience they would perfect their theoretical knowledge, and this being done, no one can reasonably doubt that the architects of that generation could exceed in their buildings the height and slenderness of the spire of Strasbourg, or the lantern of St. Ouen; but beside that, it is a scandal that architects should not learn the very foundation of their art, and we must, too, recollect that we have materials in the shape of iron and steel, that are ten times as strong as any material known to the Gothic architects. The hardest granite will crush with 5 tons on the square inch, while cast iron will bear 44 tons. We cannot for a moment believe that if the Gothic architects had possessed such materials they would not have used them. We know that they sought out and found, wherever they worked, the stone most adapted to their purpose; they used soft, fine-grained stone for internal carved work, hard stone for corbels, lintels, &c., and for all places where stiffness was necessary, for instance when they wanted small isolated shafts, they cut them out of hard strata against the bed, and, in England, for the larger but relatively slender shafts they got the material from Purbeck or from the Derbyshire beds of black encaustic marble; for one of their objects was to make the piers as small as possible so as not to interfere with the circulation.

The great problems the Gothic architects had to solve were to ceil their buildings with stone, to remove all the solid parts of the walls so as to have the building all window, except at the buttresses, and in solving this problem they wanted a stone framework to their enormous windows to prevent the lead lights being blown in. They wanted to make the naves of their churches as high as possible, and in solving all these constructive problems they also wanted their buildings to be as beautiful as possible, according to the taste of the time. These problems are the same that we have to solve, and we can solve most of them structurally in a different way; for example, we can get a span by means of iron girders or trusses, so enormously greater than any span we are likely to want, that that difficulty may be said to have been removed. We can use iron columns of a height and slenderness that would dwarf the choir of Beauvais to a cell; but, at present, we have no idea of how to make anything we do beautiful according to the taste of the day, for this excellent reason, that there is no taste and no desire for beauty in any form. It is a utilitarian age, eager for wealth; but when it has got wealth, having no idea of using it in any noble way, but simply in sensual enjoyments. I noticed in some of the addresses of new M.P.s, that they aimed at destroying the last popular surviving visual fine art, painting, as many of them before have tried to destroy architecture. Who will collect pictures if they are to be heavily taxed on going to their owners' successors? Who will build magnificent mansions if they are to be taxed on their cost? The poor, ignorant creatures have not discernment enough to see that the mere building of a magnificent mansion employs thousands of people of every condition, many hundreds of whom are engaged in trades that give scope for their intelligence, invention, and skill, from the meanest bricklayer to the cabinet-maker, the carver, the modeller, and the architect; and leave a work to delight posterity, and to be a perpetual record of the intelligence, skill, and glory of the country. I presume that those who would tax painting would also tax sculpture, so that no visual fine art should exist to charm posterity, and to convey to the distant future a picture of the highest qualities of the day. Do they want to leave no memorials of

England behind them but broken beer-bottles, and the lobster-tins whose contents have been eaten to provoke thirst?

"Invention," says Sir Joshua Reynolds, "is one of the great marks of genius; but if we consult experience, we shall find that it is by being conversant with the inventions of others, that we learn to invent; as, by reading the thoughts of others we learn to think;" and where will architects find more invention than in Gothic architecture?

There is constructive invention and æsthetic invention, and we urgently want both; and in the labours of the Gothic architects these are both combined. You see, not only how they thought and reasoned, and strove to meet the structural difficulties that beset them, but bow at the same time they brought their new constructive inventions into the pale of art. The flying buttress perhaps the greatest, but certainly one of their greatest inventions, was purely structural, and was at first solved in a purely structural way. I was at first a mere plain arch or part of an arch and it was not put exactly in the right place for nearly a century. Many of the cathedrals were obliged to have their early flying buttresses shifted at a later period. The architects of those days were not satisfied with a mere piece of building, put side by side with the elaborate decoration of the rest of their buildings, but turned their flying buttresses into decorative features, and made them, too, only strong enough to do their work when they were new. The effects of the weather have in many cases so weakened them that they have now to be replaced, as the thrusts of the vaults they abutted were threatening ruin to the structure. I strongly recommend you to study the flying buttresses of St. Urban at Troyes. The Gothic vault was another purely structural invention, but the architects gradually inserted more ribs to make these vaults more conducive to effect. You may see how effective they are in Westminster Abbey. At last the ribs made stars and other patterns. The stone framework, or stone sashes of windows, was another purely structural invention, to prevent the lead lights being blown in, and these went through immense changes, from the early geometrical patterns to the last flamboyant. You all know what is sometimes called the leaf window, a rose window, in the south transept of Lincoln. Flamboyant is mostly seen in France, and the patterns are always ingenious, and sometimes beautiful; but they mostly have one, if not two, grand faults when looked at as part of the decoration of the front or sides; the tracery is too thin and the patterns are too small, so that, at the distance, they are seen to take in the whole front or bay. They do not compose with the rest. Their other fault is that they look as if they moved—a distressing fault at all times and in all ornaments. Still, in spite of these drawbacks, they are most wonderful instances of human ingenuity in the pattern, and of skill in the execution.

To know the strivings and inventions of the Gothic architects, I cannot recommend a better nor more fascinating book than Viollet-le-Duc's "Dictionnaire Raisonné," for it is more interesting than half the novels, and is, too, most charmingly illustrated. I must warn you, however, not to believe in every word of it, as if it were Gospel truth, for some of the statements are absolutely incorrect. He was, too, so brilliant a theorist that he was inclined to found theories on very slight and insufficient grounds; but, above all, I must warn you against this error; he was so interested and absorbed in the efforts of the Romanesque and Gothic architects to get all their rules by observation and experience that he always depreciated the science of building. As the science of building is founded on experiments, and the fundamental laws that have been tested, it puts into the hand of youth a weapon of incomparable temper:—

"As Balen's spear through Launcelot's shield
Clove as a ploughshare cleaves the field."

So does the spear of science pierce the armour of ignorance. Experience consists of but a few vague inferences, founded on a few doubtful facts, while the other is founded on numerous exact experiments, from which the law is deduced. I by no means want to decry experience, as it gives us information of the working of causes, inseparable from actual work, that do not exist in scientific experiments. At Amiens we see that the piers that support the triumphal arches have been pushed outwards by the thrust of these arches and the vaults above, and inwards by the thrust of those of the aisles, &c., so you see that experience is

sometimes at fault! Every architect, before he fits to practise, ought to know what weight the ground he builds on will bear on the square foot, what his walls and their loads weigh, and what force of wind will overturn them, the sizes wanted to resist the pressure of earth and water; the proper thickness of arches of different heights and spans, and what their thrusts will be when weighted, and the same of various vaults including domes. He wants to know what square and round pillars will bear, according to their height and diameter, and the various sorts of wood, brick, stone, iron, and steel, of which they are composed; what beams of various materials will bear in cross strain, the struts on trusses, &c.; yet, until the classes of the Architectural Association were started, all this knowledge was supposed to come by nature, if a man could draw the human figure or sketch in perspective.

To become a beautiful architectural draughtsman is a difficult art, but it does not make a man a designer, and to be an excellent designer and a beautiful draughtsman as well, does not make a man an architect. Yet, to make a man a good draughtsman, and to try and make him a designer, is all that has hitherto been taught since Renaissance days.

My most ardent desire is to see architecture brought to life again, and become a progressive art, as it was in Gothic times, and, being an Englishman, with English weaknesses, I should like English architecture to take the lead; but it never can be brought to life unless we go the right way about it. Plato tells us that Pericles wanted his son to be a statesman, and gave him the best education he could, and he so far succeeded that his son could ride on two horses, but he never became a statesman; that seems to be the modern method of teaching architecture. The architect is to know everything but his business.

The Gothic architects used every power of mind they had, and persevered till the thing they aimed at was done. Men are made valuable to themselves and others by determination, perseverance, and assiduity, and by using their brains, and striving, and whatever may be your difficulties—and I know they are so numerous as to be appalling—don't be cowed by them. If you will consider the difficulties that the Romanesque and early Gothic architects were surrounded with, you will not despair. If there is no one to teach you, teach yourselves; "self-taught is well taught." I feel confident that if each of you will do his best, we shall get out of the wood at last; and, mind you, it is a noble task—the noblest task an architect can set himself. Never copy. Be sure that he who stole his brooms ready-made never becomes a good broom-maker; and, once having determined to undertake the task, be not deterred by poverty, neglect, insult, or contempt. The task, once fairly started on, will attract others, and in the long run it will prevail. Let me give you my good wishes, that God may speed you in your task.

The sixth and concluding lecture of this series will be given, not in our next issue, but in that of March 20, as we shall not have space for it in that of March 13.]

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

THE EDUCATIONAL TRAINING OF ARCHITECTS.
A SPECIAL general meeting of this Institute was held at No. 9, Conduit-street, W., on Monday (Professor Aitchison, A.R.A., President, in the chair), for the purpose of electing the Royal Gold Medalist for the current year.

The Chairman moved, and it was unanimously agreed, "That, subject to Her Majesty's gracious sanction, the Royal Gold Medal for the promotion of architecture be presented this year to Mynheer P. J. H. Cuypers (hon. corr. member) for his executed works as an architect."

The ninth general meeting (business) was then held, when the following candidates for membership were elected:

As Fellows: H. C. Charlewood, Newcastle-on-Tyne; J. G. Sanksy, M.A. Cantah, Blackley, Manchester; and J. D. Mould, Manchester.

As Associates: H. W. Bird, Hong Kong; China; C. F. Innocent, Sheffield; A. E. Corbett, London; S. P. Rees, London; C. H. Dorman, Northampton; A. C. Bond, B.A. Oxon, London; G. W. Fraser, Bootle, Liverpool; Delmé G. Moolham, London; C. O. Nelson, London; R. C. Austin, Harrow-on-the-Hill; H. G. Fisher, London and Northampton; and C. S. F. Palmer, Sittingbourne.

Mr. Owen Fleming then moved: "That it be

referred to the Science Standing Committee to consider the desirability of formulating a definite standard size for bricks." Such a recommendation, if carried, might be found to obviate many difficulties met with in practice in building.

The Honorary Secretary, Mr. W. Emerson, formally moved that the proposal be referred to the Science Committee.

Mr. Cooper seconded, and the motion was agreed to.

Mr. William Woodward referred to the subject of the new conditions of contract, and quoted letters from the Master Builders' Association and others to prove that builders would not sign them, and therefore the old conditions should be reverted to.

The Honorary Secretary replied that, at all events, 3,000 copies of the new conditions had been sold by the Institute.

The Chairman then called upon Mr. John Slater to read a paper by Mr. Leopold Eidlitz entitled "The Educational Training of Architects."

Mr. Slater, before reading the paper, said that a few days ago he had received a communication from the Vice-President, Mr. Graham, saying he would be much obliged if he, Mr. Slater, would read the paper by Mr. Eidlitz. The paper was characteristic and essentially American. The Americans were strictly utilitarian people. They had rather a contempt for tradition and traditional usage and they had adopted methods of their own with regard to building, and he was bound to say that with a great deal of what was in the paper he could not personally agree. Mr. Eidlitz was an architect, he believed, practising in New York, and he was the author of a book which was published some years ago, and which was in the Institute Library, on the "Nature and Functions of Art." He (the speaker) had only been able just to glance at this book; it was rather a large one and contained a great deal, no doubt, which was very suggestive, and there were points in this paper which themselves were very suggestive; but when an architect asked people to throw over tradition altogether, and believed that the study of old work was of very little use to the architectural student, and to be put off till after his student days, he was afraid a great many people in England would hardly agree with him. The main point that Mr. Eidlitz seemed to make was that form in architecture should always be connected with a proper relation of points of support to the strain of weights that they had to carry. No doubt there was a great truth in this statement, and he remembered very well that some years ago his friend Mr. Statham read a paper before the Royal Institution in which he very happily commented upon the lack of this element in construction with reference to one of our bridges, where there was a huge projecting pier, of which he (the speaker) thought Mr. Statham gave a diagram, supporting a young lady with a parasol.* No doubt there was a great truth in the fact that their points of support ought to be correlated to the weights they had to bear, and his own opinion was that the disappointing feature of American architecture was very largely due to the fact that these huge, lofty buildings which were erected in the States were constructed solely of iron, the iron supports were cased with stone to look like stone piers, and they had a building of thirteen or fourteen stories high which apparently rested upon a stone pier, which it was perfectly evident was not sufficient to carry it. Now, he did hold most strongly that the supports of a building ought not only to be actually but apparently proportional to the weights they had to carry, or we should not get any pleasure from the aspect of the building which we looked at; but he was afraid if we were to adopt, as the text-book of our architectural studies, or our architectural education, the mere mechanical formulae of proportion of weight to strains we should not clothe the dead bones of buildings with any architectural life at all.

Mr. Slater then read the paper by Mr. Eidlitz, in which, after a few preparatory remarks, it was observed that up to the thirteenth century architects were builders who arrived at progressive methods of construction mainly by practical experiment, the results of which were stored up as rules-of-thumb by guilds and individuals, and modelling and decoration were mainly matters of feeling. During the last century the science of mechanics had been developed, which enabled us to compute with precision the strains caused in all combinations of matter which had served or might serve to form

* There was "no lady in the case," the column was shown as supporting only a small balcony. It was the granite column on a pier of Blackfriars Bridge.—Ed.

constructional elements. A certain distribution of weights being given to be sustained between two points of support, we knew what was the line of pressure caused by those weights, hence what was the form of arch to sustain them with the least amount of material. We could compute the transverse strength of a beam or a lintel, the bending moment of a pillar, or the deflection of either, under loads so small that it could not be measured.

We were all ready to admit that this knowledge was useful, but many of us doubted that it had anything to do with architecture as a fine art. But in architecture, harmony of form could be attained only by a strict observance of the mathematical relation of strains. Harmony of strain meant that stress should be always resisted by a proportionate amount of material, no more, no less. This did not mean that there should be no more material used than was absolutely necessary to perform a given amount of mechanical work, such, for instance, as we considered proper in economic structures, factories, warehouses, tenements, &c.; but whatever the amount of material to be used in a given architectural monument, which, in the opinion of the architect, was commensurate to its character of stability, dignity, and elegance, should be proportionate to actual strains throughout the whole design. To be explicit, each building material sustained a certain amount of strain at the breaking point. The actual strain permitted in any structure in practice was but a fraction of the ultimate strain of the material at the breaking point. This fraction was known as the factor of safety, and should, for the same material, vary in different buildings in accordance with their dignity. The architect might use one factor of safety for a school-house, another for a library, and yet another for a church. The factor of safety so chosen became the keynote of his design, and a constant reference to it insured harmony. Factors of safety varied with the different materials, and more or less depended on limits of elasticity, methods of construction, probable effects of the weather, corrosion, &c. Strain was the sum of weight, its direction, and resulting bending moments. The greater the admissible maximum strain, hence the greater the admissible maximum strain, hence the more elegant the structural forms. In the use of modern rolled iron, form became attenuated far beyond the limits of the forms the architect was familiar with. Mr. Ruskin said, "There is no law, no principle based upon past practice, which may not be overthrown in a moment by the arising of a new condition or the invention of a new material." But there was still the law of mechanics, which could not be overthrown by new conditions or new materials. An example of gross discord was in an existing building (diagram shown) where there were granite columns of the same apparent size, five of them supporting a portico 35 ft. high, and two carrying a wall 300 ft. high. The shafts of the two latter, moreover, consisted of two pieces vertically joined. These two columns carried a load of 480,000 lbs. each, the five similar columns only 40,000 lbs. each. But the two columns with the heavier load concealed iron posts, which the architect had enclosed in pieces of granite to convert them into a form of support known to him in Greek and Renaissance architecture. If the architect did not like the appearance of the iron, a granite column proportioned to the load was perfectly practicable. No new style of architecture could be expected when new conditions and a new material, such as steel, were referred to the Greek portico, instead of to the law of gravitation. The constant study of architectural history was a great stumbling-block to the student of architecture in this respect. The system of the Ecole des Beaux-Arts, which was imitated in many schools outside of France, was utterly subversive of possible logical architecture. Students were required to prepare sketches, often of important architectural monuments, in from six to sixteen hours. Criticism of these designs by teachers admitted transgression against good construction as comparatively pardonable, but insisted on observance of traditional treatment of form as imperative. The study of architectural history should be postponed for a post-graduate course, or should be left for private reading after the academic course was completed. A future text-book of architecture for universities, polytechnic schools, and academics of the art of architecture would doubtless bear the title "The Theory, Practice, and Art of Building." This text-book would assume the student to have attained a mathematical training sufficient to read with comfort and refer to with ease, say Rankine's

"Applied Mechanics," or any other work equivalent to it, at least, as far as statics were concerned. It would contain essays on the subject of modelling (moulding) structural parts, with reference to mechanical work done and the strength and elegance with which it was to be done, when considered in connexion with the dignity of various buildings, and how modelling was affected by the nature of the material used. Also an essay on carved ornament and colour-decoration, and their relation to mechanical function, the character of the structure, and the nature of the material used. All this would be illustrated with diagrams and decorative designs, selected from existing sources, composed anew from natural objects, conventionalised in accordance with the nature of the material. Then there would follow the architectural scales, which, like the scales in music, would serve to train the student preparatory to the work of actual composition. What was meant by architectural scales might be best illustrated by one or more examples, for instance:—Given a pillar of a certain length, and the load it supported in pounds, what would be its sectional area, and what its form, modelling, carved ornament, and colour-decoration (if any) in a warehouse, a public school, a library, a court-house, and a parish church, when the pillar was made of wood, cast-iron, wrought-iron, bronze, brick, sandstone, marble, or granite? The text-book would answer these questions, and illustrate the answers by drawings and diagrams. Assuming the architectural scales to comprise the first part of the text-book, the second part would treat of the construction of single cells, and the combination of these into piles. Monuments thus conceived and designed would be expressive of their meaning and the individuality of their author, they would be harmonious in themselves, and would vary from the forms of the past in the degree as new wants, new material, new methods of construction varied from those handed down to us in history. At present architecture alone, of all human pursuits, retained obsolete forms and neglected underlying principles and organic laws. It must be remembered, however, that this was not the case prior to the fourteenth century. A period of one generation was quite sufficient to initiate renewed rapid progress in architectural art, provided that we were willing to refer it to its true and fundamental principles, and to teach it rationally.

Mr. H. H. Statham said he should be happy to propose a vote of thanks to Mr. Eidlitz for his paper. He had listened to this short paper with a mingled feeling of interest and something of melancholy, as to the latest attempt to found a new and perfect theory for evolving a new style of architecture. There were some valuable suggestions in it, but he feared they would not come to any practical result. What was of some value was the suggestion for an "architectural scale" for giving pupils a problem of this kind: Given a pier, of a certain length, and given the weight it supports, what should be its sectional area and its width? They could go as far as that. Then the author went on to say: "What should be its moulding and its carved ornament?" And that, it appeared to him, had nothing to do with its practical power of strain at all. The paper repeated the old fallacy, that we should endeavour to carry out architecture as people carried it out before the fourteenth century, without any reference to precedent. He wished people could once for all recognise the fact that that was absolutely impossible. We were not in the position of people before the ages of printing. The people who built the fourteenth century cathedrals, the people who evolved Gothic out of round-arch Gothic, worked in a spontaneous way, and without reference to other styles, simply because they knew of nothing else; they did not travel much, and were unacquainted with other places. Now we had before us in books, photographs, and by travel, a knowledge of everything in other countries, and of everything that went before us. Even the Romans had no real knowledge of Greek architecture. Vitruvius wrote about Greek architecture, but it was improbable that he had ever visited Athens. That idea that we could ever practise architecture as it was practised before the era of printing was an illusion, and the sooner it was dropped the better. Some hard things had been said in this paper about the system of the Ecole des Beaux-Arts, which was said to be subversive of true architectural training; but, nevertheless, the late Mr. P. C. Hamerton, one of our ablest and most thoughtful modern art critics, who spent a good many years in France, left it on record as his

decided conviction that there was more living architecture in France at this moment than in any other country in the world; and Hamerton, it must be remembered, was not an architect, and as a critic he was singularly independent and original in his views, and therefore his opinion was of some value. For some years back he (the speaker) had looked annually through the architectural designs at the Salon, and from the original character of some of the designs, as well as of some of the new buildings in and around Paris, he was convinced that the teaching given in the Ecole des Beaux-Arts had not produced such ill results as was supposed. The Gold Medal for Architecture of the Salon last year was awarded to M. Seillier de Gisors for a set of drawings for the new central depot of the Post and Telegraph Office—an eminently practical treatment of a purely technical building, with nothing academical about it. Therefore he did not share the misgivings of Mr. Eidlitz, as to the unhappy results of the teaching of the Ecole des Beaux-Arts. He agreed with him that it was a great advantage to students to direct their minds to the consideration of the stresses in the buildings they designed, and to design in relation to that; but he did not think that it was of any use to try to shut them out from any architectural precedents, because if they were kept from all books and knowledge of architectural history they will have nothing to go upon as a basis for designing at all; and no one generation of men can absolutely originate a style. Mr. Emerson said he had much pleasure in reading the vote of thanks. He thought the teaching of the Ecole des Beaux-Arts, which was essentially that of classical architecture, was really subversive of the architectural problem that Mr. Eidlitz wished to work out, which was a problem of constructing an architectural building of, say, from fifteen to twenty-two stories high. Such a building in America naturally meant a construction of steel or iron, which was an architecture that we ought to study at the present time. In Mr. Cates's absence he would read some remarks written out by him:—

Mr. Cates, in his communication, said that the educational training of architects, with which the Institute was concerned, aimed at fitting the student for the acquisition of the knowledge necessary for the satisfactory practice of his profession in developing his natural artistic and scientific ability, so that he might apply both to the expression of his ideas in design and in the realisation of his conceptions. In the complex conditions of the practice of the day the architect must aim at acquiring the power to attain success in designing buildings which should be convenient and appropriate in arrangement; of stable construction, and of suitable and beautiful design. The first studies of the aspirant should be devoted to a mastery of Classic and Medieval work—intelligently studied, with a thorough acquaintance with form and detail—leaving the Renaissance and later developments to a subsequent period, when he could bring to bear on their consideration the knowledge acquired in the first years of his studies. In both periods the sedulous cultivation of the art of accurate and effective delineation, and of sketching detail and ornament, from buildings and from memory, thus bringing eye and hand and brain into harmonious and mutual action, was of the highest importance. Concurrently with this, the study of the history of the several periods of architectural art was of the greatest value, not as a mere matter of dates and names, but as giving life and interest to the subjects studied, connecting them with the actual social life of the people by whom they were evolved, and with the political, social, and religious influences which controlled their design. It had been well said by Professor Ware:—"If ever you have a new idea, however slight and unimportant it may seem to be, cling to it, cherish it, develop it, and some day you may awaken and find yourself immortal." This immortality was not likely to be attained by the study of the suggested "future text book of the theory, practice, and art of building." The "factor of safety," which it appeared might vary in different buildings, in accordance with their dignity, was apparently the key to this "text book;" but surely the first elements of design dictated that the considerations of form, outline, masses, and stability, in both appearance and fact, must be the essentials to be primarily dealt with, and these, as well as the character of the detail and of the ornament, must be governed by the nature of the material to be employed. The skill and talent of the architect was displayed in his artistic and scientific use of such materials, in accordance with their qualities, and in their application to the best advantage for convenience,

strength, and beauty. No "text book," nor "architectural scales," nor "combination of single cells into piles" would enable the architect to effect this. His success would depend on his application of the capabilities of the materials he used, and would be the greater as he might have been blessed with the divine inspiration of artistic genius, and have cultivated and developed it by earnest study, of which mechanical constructive details would not have occupied the most important part.

Mr. William Woodward said he wished to confine himself to one practical point in this subject. Mr. Slater said that not only should the column or pier carry the superstructure, but it should appear to carry it. In other words, that, supposing with a cast-iron stanchion encased in stone they can carry the superstructure with a diameter of 2 ft. 6 in., Mr. Slater's theory carried into practice would mean, speaking roughly, a pier or column 5 ft. in diameter. That, in the case of a commercial building, would, of course, be a pier which would not be tolerated by the person who had to pay for the building. To his mind it was a perfectly defensible proposition that an architect should take advantage of a cast-iron stanchion, and enclose it with terra-cotta or stone, and thereby reduce the diameter of that column. So long as that column was in proportion, to his mind it was quite a defensible design.

The Chairman said that some seven or eight years ago he happened to pick up Mr. Eidlitz's book on "The Nature and Function of Art, more especially of Architecture," at an old book shop, and was struck by its title. He read it through (no small task, he might say, for it was rather a large book), and found the author was the only person he had ever come across who had a due belief in the importance of art to mankind. He had spoken to a great many artists at various times, but they almost all agreed in the modern maxim that art was solely for delight. Now, Mr. Eidlitz was certainly of opinion that it is one of the great means of education of the masses, that the sort of vague ideas that they got from it were the only ones that they could possibly get; and, as he said, at present it was thought that we could do without art. But it was just as necessary now if they wanted to teach the people as it was two thousand years ago. Well, that alone was a great charm in the book. He could not say that he wholly and entirely agreed with all his remarks about architecture, and, amongst other things, he did not agree with his idea that the whole scheme of architecture can be changed in a generation, or anything like it; but he considered that the paper they had heard was one of the most important papers ever read in that Institute since he had been a member. They knew that one of the great difficulties of architecture was proportion. Now, the proportions of parts originally laid down by the early builders were based on the strength of materials as their experience taught them to use them. He had not the least doubt of that, although he could not prove it. Well, these proportions had now come from study and from their being constantly before us to take a form that was agreeable to our eyes—custom would do that. Mr. Eidlitz had, in his opinion, made architecture take one step forward. He said that you would find that if you took a constant according to the desired appearance of a building, and multiplied by that constant every portion, first calculated for its absolute stability, you would get a proper proportion without any more trouble; and that, in his opinion, was a true as well as a most valuable remark. Mr. Statham's remarks about the effect of things past on the minds of the present generation were certainly perfectly true. He did not think there was anything in Mr. Eidlitz's paper that at all went to show that he was of a different opinion. He agreed with Mr. Eidlitz's remarks about the usual study in our country of what was called historic architecture. As applied now it was perfectly useless, and not only useless but very destructive of any kind of progress, for, as Mr. Ruskin said, studies of old buildings are not to be put into a store-house for use, but into a gallery for study. The thing that we wanted to do, in his opinion, was to express in the taste of the day the things that were wanted. We wanted to arrange a building as exactly as was possible for its purpose; we wanted to make it bear what it should bear in each portion of it, and to give it the ornament which was necessary to convey to persons of our own day an idea of the use to which that building was put, and to evoke the proper emotions, and all these things were more or less embodied in Mr. Eidlitz's paper. But there was

one point with which he could not agree, viz., that not only the rough form, but the absolutely finished form, could be got at by the consideration of strains. That he did not think was the case. Architecture appealed to emotions which no mechanical methods could produce. The only thing he would say about Mr. Statham's remarks was that the Roman architects, and even the earlier Romanesques, were not so absolutely without anything to give them an idea. There then were in most places the Roman ruins. There were the works of the Byzantines; and the Romans themselves, they must recollect, when they became great builders, had conquered all the civilised world—all the whole of the countries round the Mediterranean were portions of the Roman Empire—and therefore they had had a great opportunity of seeing the native architecture of those places. And so the Romanesque architects learnt the little they could from the Roman and Byzantine buildings around them, and what they did then was nothing to what they afterwards accomplished when they had made a tour through Europe, Asia Minor, and Syria; and they must recollect that it was not till 1291 that the Crusaders were eventually driven out of Acre. These people had not only a fine opportunity of seeing a great many things that had been done, but they were also in contact, as well as in conflict, with those people who were then the most civilised in the world—the Saracens. They must have seen an immense quantity of their rather ephemeral works, and he believed it was the endeavour to rival, rather than to imitate them, which gave the peculiar character which Gothic, and especially late Gothic, took.

The Chairman announced that the next meeting would be held on the 15th inst., when Mr. W. H. St. John Hope, M.A., F.S.A., would read a paper on "Heraldry in English Medieval Architecture."

The meeting then terminated.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of this Council was held on Tuesday, Sir Arthur Arnold, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend the Battersea Vestry 13,000*l.* for the purchase of the freehold premises for an electric lighting station; the Hampstead Vestry 8,380*l.* towards the cost of the High-street improvement; the Westminster Vestry 12,400*l.* for local street improvements; the St. George's, Southwark, Vestry 1,050*l.* for the erection of a shelter for persons whose houses are being disinfected; and the Hackney Guardians 19,550*l.* for the erection of casual wards, infirmary, &c.

North Woolwich Drainage.—The Works Committee reported as follows:—

"We have considered the estimate, amounting to 48,000*l.*, and specification submitted for the drainage works at North Woolwich. It has been reported to us that since the estimate was prepared by the Main Drainage Committee on October 1, 1896, the cost of bricks, ironwork, and other materials has considerably increased. We have therefore to report that we are satisfied with the amount of the estimate of 48,000*l.*, subject to an allowance of 1,000*l.*, due to the increased value of materials since the estimate was prepared."

Charges for Water Supply.—The same Committee also reported as follows:—

"We have to report that the following charges have been made for the supply of water at the Lewisham Sewer Works in the districts served by the undermentioned companies:—Kent Waterworks Company, 10*l.* per thousand gallons, after 84,000 gallons have been supplied; for the use of each meter, which includes the supply of 84,000 gallons of water. Lambeth Waterworks Company, 1*s.* per thousand gallons, and 10*s.* 6*d.* per quarter for the use of each meter. We have endeavoured to obtain a reduction of the charges of the Lambeth Waterworks Company, but without success. We have been informed that an estimate, amounting to 6*d.* per thousand gallons, has been obtained from the same company for the supply of water for the Lambeth Baths which are situated in a district also served by the Southwark and Vauxhall Water Company. We report these facts for the information of the Council."

Fleet-street Widening.—The report of the Improvements Committee contained the following paragraph, the consideration of which was adjourned for a week:—

"We have had before us a letter from the City Commissioners of Sewers stating that they propose, with a view to continuing the widening of Fleet-

street, to acquire the freeholds of the properties between Bride-lane and Salisbury-court (Nos. 82 to 97, Fleet-street, but excluding No. 89, in respect of which the Council has already agreed to contribute), and asking the Council to contribute half the cost of the proposed improvement. The present width of the road is about 45 ft., and it is proposed to increase this to 60 ft., the cost of so doing being estimated at 170,780*l.*, but it is probable that that amount will be reduced, as the Commissioners propose, by acquiring the freeholds, to allow some of the short leases to run out. We may point out that the Council has already agreed to contribute half the cost of widening Fleet-street between Ludgate-circus and Bride-lane, and at No. 89, and that the Council, when so agreeing, had regard to the fact that the widening of Fleet-street is necessitated not by local but by general through traffic and from all parts of the county, the street being one of the main thoroughfares of London. The present application is in respect of a proposed widening of the road for a length of about 216 ft. In March, 1896, when the Council agreed to contribute half the cost of widening the portion of Fleet-street between Ludgate-circus and Bride-lane, we made reference to the present proposal, and stated in our report that 'there would still remain two other portions of the street, between Salisbury-court and Temple Bar, having together a length of about 1,100 ft., which at some future time would require to be widened. It is, therefore, evident that the present improvement is only the commencement of a much larger scheme which, in its entirety, will doubtless cost something approaching a million pounds sterling. We must point out, however, that if the Council agree to contribute part of the cost of the improvement at present proposed, it will not necessarily be absolutely committed to contribute towards the cost of the larger scheme.' We may here mention that Ludgate Hill, which is a continuation of Fleet-street, has been widened to 60 ft., and that the late Metropolitan Board and the Council contributed to the cost of the work. We are strongly of opinion that to continue the widening of Fleet-street is a desirable work, and the Council having already admitted the necessity of the improvement, we have decided to recommend the Council to accede to the request of the Commissioners. We may state that the Commissioners have complied with the rules of the Council governing applications for contributions towards the cost of improvements, and are advised that the estimated cost (170,780*l.*) is fair and reasonable. . . . We have sent to the Finance Committee an estimate of the amount required, and we recommend—

"That the estimate of 85,300*l.* submitted by the Finance Committee be approved, and that the Council do contribute on the usual conditions one-half of the cost of widening Fleet-street between Bride-lane and Salisbury-court (Nos. 82 to 97, Fleet-street, but excluding No. 89, in respect of which the Council has already agreed to contribute), as shown by a black line upon the plan submitted by the City Commissioners of Sewers, such contribution not to exceed the sum of 85,300*l.*"

Hackney Wick and Isle of Dogs Relief Sewer.—The Main Drainage Committee reported as follows, the recommendation being agreed to:—

"On March 1, 1892, the Council accepted the tender of Messrs. E. & W. Iles, amounting to 36,600*l.*, for the construction of the Hackney Wick and Isle of Dogs relief sewer. The work was commenced in May, 1892, and completed in May, 1895. During the execution of the work great difficulties were met with in crossing the river Lee at Bromley, inasmuch as the trial borings on which the engineer's estimate and the contractors' tender were based proved to be unreliable when the ground was fully opened, and it was found necessary to deviate the line of sewer from that laid down in the contract. An entirely different method of constructing the sewer had to be adopted in place of that contemplated when the contract was let, and the navigation of the river Lee had to be interfered with, considerable additional expense being incurred thereby. Certain additions were also made to the work specified in connecting the sewer with the low-level sewer. The Engineer now informs us that the account rendered by Messrs. Iles amounts to 52,338*l.* 19*s.* 4*d.*, and that the several claims made by them have been thoroughly inquired into by him, with the result that his award, subject to arithmetical checking by the Comptroller, amounts to 44,059*l.* 10*s.* 5*d.*, of which a sum of 33,700*l.* has already been paid, leaving a balance of 10,359*l.* 10*s.* 5*d.* To meet this expenditure there is a sum of 1,064*l.* 8*s.* available from the estimate adopted by the Council in respect of this work, and it becomes necessary for us therefore to ask the Council to pass an excess vote for the remainder, viz., 8,395*l.* 2*s.* 5*d.* We recommend—that the Council do sanction an additional expenditure of 8,395*l.* 2*s.* 5*d.* in respect of the construction of the Hackney Wick and Isle of Dogs relief sewer, and that, subject to its being checked by the Comptroller, Messrs. Iles' account be settled in accordance with the Engineer's award."

The Works Department.—The Works Department submitted a list of nine jobs, the estimate for which was 23,218*l.* 2*s.* 8*d.* and the actual cost 25,696*l.* 0*s.* 4*d.* Six other works, for which cer-

tificates had not been obtained, were reported to have cost 33,971*l.* 13*s.* 1*d.*, as against the Managers' revised estimate of 32,030*l.* 5*s.* 6*d.* The consideration of the report was postponed for a week.

Re-naming of Streets, &c.—On the motion of Mr. Fox it was agreed (1) "That, in view of the congested state of the foot traffic in many parts of London, it be referred to the General Purposes Committee to consider whether a suggestion should not be made to the Commissioner of Police that notices be placed in the principal thoroughfares requesting pedestrians 'to keep to the right.' (2) That it be referred to the Building Act Committee to consider whether it should not be proposed to the Local Authorities in London that, in cases where streets are re-named, the original name be allowed to remain for at least twelve months after the date at which the new name shall have been affixed in the thoroughfare."

The Council adjourned, after an unusually short sitting, at 5.40 p.m.

THE PROVIDENT INSTITUTION OF BUILDERS' FOREMEN AND CLERKS OF WORKS.

The Annual Dinner of this Institution took place in the King's Hall, Holborn Restaurant, on the 27th ult., Mr. Benjamin J. Greenwood (Messrs. Holliday & Greenwood) occupying the chair. The company numbered 420.

The loyal toast having been honoured, The Chairman proposed the toast of "The Architects and Surveyors," coupled with the name of Mr. G. D. Stevenson. The modern architect, he said, was a man of considerable ingenuity and talent, and in London, what with the law of ancient lights on the one hand and the regulations of the County Council on the other, much skill was requisite in surmounting the difficulties which occurred in the architect's professional life. For both architects and surveyors, builders' foremen and clerks of works felt much esteem.

Mr. Stevenson having briefly replied, Mr. W. H. Sharpington proposed the toast of "Builders and Contractors" or "Builders and Contractors Proper," as he phrased it; and in the course of his remarks he spoke of the difficulties which builders, as well as architects, had to contend with in dealing with ancient lights, &c.

The Chairman, in response, said that those who were not builders and contractors proper were willing and anxious to secure contracts for buildings, but whenever they had occasion to erect a building for themselves they called in an outside contractor to do the work. The difficulties of architects in regard to ancient lights were shared to a large extent by builders, who had many troubles of a similar character to contend with.

Mr. John Beer, Hon. Sec., proposed "The Governors, Trustees, Donors, Honorary Subscribers, and Visitors," coupled with the name of Mr. K. Adams, who, in responding, urged all builders' foremen and clerks of works who were not already members of the Institution to join at once.

The toast of the evening, "The Provident Institution of Builders' Foremen and Clerks of Works" was then proposed by the Chairman. The Institution, he said, existed for the purpose of enabling builders' foremen and clerks of works to make provision for the future, and all men of common sense made such provision; those who did not while they could were a nuisance. The Institution had, during the last fifty-six years, carefully disbursed no less a sum than 10,032*l.* to afflicted members, their widows, and orphans. He hoped that builders' foremen and clerks of works who were not already members of the Institution would join at once—to support it in the day of their prosperity and receive aid from it, if need be, in the day of adversity.

Mr. J. W. H. Bedford, in response, said that during the past year 306*l.* had been distributed to twenty pensioners.

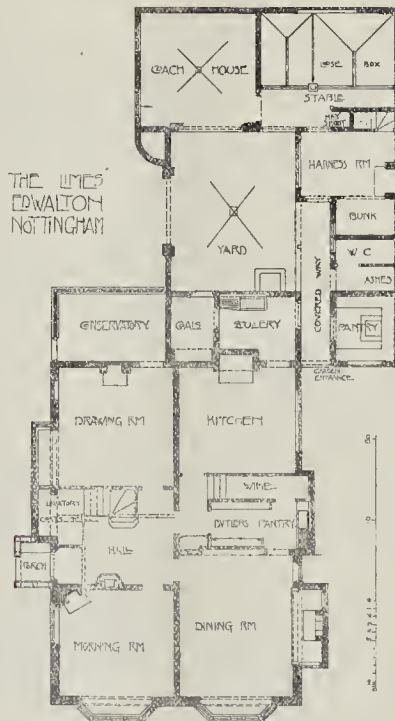

Other toasts were "The Chairman," proposed by Mr. J. Stapleton; and "The Press," proposed by the Chairman and responded to by our representative.

During the evening a list of subscriptions for the coming year was read, the total exceeding 120*l.*, including 15 guineas from the Chairman.

HOME ARTS AND INDUSTRIES.—The third annual exhibition of this Association will be held at the Albert Hall, from May 20 to 24. The exhibits will include the work of the Princess of Wales's classes at Sandringham.

Books.

Ironwork. Part II. By J. STARKIE GARDNER. London: Chapman & Hall. 1896.

THIS small work, published for the Committee of Council on Education, is a continuation of Mr. Gardner's first handbook, and comprises the time from the close of the Medieval period to the end of the eighteenth century, excluding English work. The book is divided into chapters treating each country separately, which is the best arrangement, as the ironwork of each country has a separate character.

Mr. Gardner has the advantage of being fully acquainted with his subject practically as well as historically, and the number of illustrations given render the book an exceedingly intelligible and useful outline of the subject in a small compass. It is curious to notice how restricted a part Italian Renaissance art plays in ironwork, except in a few special localities such as Siena; iron having been regarded apparently as a material more fitted for practical than for decorative work. A fine specimen of a torch-holder, worked with exceedingly free though simple foliage, is given; one of four examples in the South Kensington Museum. Mr. Gardner says—"As these, and the banner-holders, were only allowed as a mark of great distinction to the few, they are generally richly worked." A candlestick from Pistoja, now in the South Kensington Museum, also illustrated, is remarkable both for its grace of line and also because it presents a kind of union of Renaissance gracefulness and refinement with Medieval freedom in detail, the form of leafage being a suggestion from nature treated in a form suitable to ironwork.

The finest achievements of Renaissance Italy in metal work were in chased and Damascened suits of armour; but we presume it is considered that Damascening, being the introduction of other metals upon iron, hardly comes into the subject of pure ironwork; at all events no illustrations of it are given.

The object of the book is obviously historical and illustrative rather than didactic; but some brief guiding criticism as to what is really good or bad in the examples given might well have been added; there is occasionally a remark of the kind, but not often. For instance, the seventeenth century screen, fig. 22, with the vase and naturalistic foliage in the centre of it, is given apparently as an example of a fine piece of work, and without further comment; but it surely should have been pointed out that while the border is good design the central panel is bad in design, and moreover is entirely out of character with the border. This is the more important as one of the frequent mistakes in wrought iron design of to-day is the mingling, in one piece of work, of conventional and realistic foliage. This is even worse, perhaps, than entirely realistic foliage, as the two elements will not blend. Again, the German example, fig. 34 in the book, called "a magnificent window grating," is no doubt splendid workmanship, but it is exceedingly bad design, and though it was right to give it as an example of a type of work, the student should certainly have been warned against it as an artistic model. The answer may be, of course, that there was not space to go into the question of design, and that the book was not intended to teach design; but in that case it would have been well to insert a prefatory note to that effect, and that the reader must not necessarily regard the examples illustrated as models of art, but only as historic illustrations of different types of work. This point is really of importance, for while there is a great deal of revived interest in ironwork, it seems to be exceedingly difficult to get some of our clever ironworkers to appreciate the necessity of unity of style in such work, and especially of avoiding realism in metal foliage.

Little of the German Renaissance ironwork illustrated in the book is good; the best examples are the stirrup and horse-muzzle. A seventeenth century door-knocker (fig. 3) a good piece of free design, is (like so many other designs for this purpose, old and new) bad as a door-knocker, because there is no suggestion of hammer-like power in the knocking portion. The knocker from Jacques Coeur's house (fig. 4) is instructive in comparison, as it really looks like a thing designed to knock with, though it would have been still better if the lower knob, which does the knocking, had been larger and heavier than the upper one, which is only the hinge.

The chapters and illustrations on Spanish and

DRAWINGS FOR THE ROYAL ACADEMY.

As before, we shall be glad to take charge of and deliver at the Royal Academy any drawings sent to us in time to be photographed before the day of delivery, with a view to subsequent publication in this journal and in the "Builder Album of Royal Academy architecture."

We cannot accept any drawings sent to this office later than Saturday morning March 27, before 12 noon.

Architects sending drawings are asked to give special attention to the following requirements of the Royal Academy:—

1. All frames must be gilt.
2. Every drawing must have a label on the back, giving legibly the title and the artist's name and address.
3. Every drawing must have a similar label attached to the frame by a card so as to hang over in front.
4. Every drawing must be accompanied by a

letter addressed to the Secretary of the Royal Academy, and signed by the artist, containing the artist's name and address, and the title or titles of the drawings sent. If more than one drawing is sent they must be distinguished by numbers, and the corresponding number must be repeated in the labels fixed to each drawing.

N.B.—We cannot undertake to supply or affix labels when omitted by the oversight of the sender.

ROYAL SOCIETY OF PAINTERS IN WATER-COLOURS.—This Society has received the Royal consent to the President, and all future Presidents of the Society, wearing a collar and badge, when attending her Majesty's levees and on such other occasions as may appear fitting. The badge, which has been designed and executed by Professor Herkomer, is of solid gold oval in shape, and supports a female figure carved in ivory. Above this, and attached to the chain, is a gold wreath encircling the Royal Crown, to which the badge is linked.

Fig. 3.—A Bad Knocked.

Fig. 4.—A Good Knocked.

duction &c., which may be taken to be the result of experience, and which is for the most part entirely in accordance with our own experience as to method and material. We do not quite understand why the author, in the chapter on etching, should give the first place to the method of drawing the whole subject, partly biting it, and then stopping out the portions which are not to be bitten any more, and only describe as an alternative the method of beginning on the darker portions, and drawing the lighter ones only for the final biting. The latter system saves the trouble of stopping out, and certainly seems the most direct and logical one in a general way. In referring to the difficulty of getting used to see your drawing in light lines on a dark ground (the exposed copper being lighter than the smoked varnish), and to estimate its ultimate effect, which is always a stumbling-block to beginners in etching, (and sometimes to those who are not beginners), Mr. Pennell seems to have overlooked the fact that Hamerton concocted an etching varnish which leaves a white surface and against which the copper shows dark, enabling the artist to see approximately the balance of his darks and lights before biting; it is described, and the method of making it given, in "Etchers and Etching."

We entirely agree with Mr. Pennell in his remark, in the chapter on "Wood-engraving," that the art of engraving round lines made with pen, brush, or pencil, is an easy one compared with that of inventing touch and texture in translating a work in colour into black and white; but while on the subject we should like to have seen a word said in favour of the old system, now nearly superseded from considerations of time and economy, in which the original artist drew the actual lines on the block and the engraver merely cut away between them, a process which, as the author says, "only requires much training and a steady hand," but which makes the engraving the real expression of the artist's line. Now there is little more real "drawing on wood;" the subject is photographed on to the wood and the engraver proceeds practically to draw it, or cut it out; he may be an accomplished artist, but he has not the freedom of line which a man really drawing on wood can have, where the original line can really be as free as in etching. Commercial conditions have altered all this.

Seeing that Mr. Pennell has really a great deal of information and advice to give which is exceedingly useful to beginners in any of the illustrative methods described, it is a pity that he could not be content to convey it in simple and unaffected English, instead of in the kind of off-hand "slapdash" style, freely sprinkled with colloquialisms, which among a certain class of artists seems to be

French ironwork are far more attractive, and Mr. Gardner points out how much there is yet unknown in this country in regard to the glories of Spanish ironwork. Speaking of some of the great balustrade screens (*rejatas*) round the choirs of the Spanish cathedrals, he observes that, as in an example from Avila Cathedral, only the spindle-shaped balusters are forged in solid metal, the pilasters and some of the cornice work being merely of wood cased with thin *repoussé* iron. Many of the objects illustrated in the chapter on France are in every way admirable, until we come to the late Renaissance period, when taste and style became far more questionable. One of these (fig. 1) may serve as a typical example of bad ironwork design, in contrast with the fender and light-holders shown in fig. 2. The examples are all from blocks lent us by the publishers.

The book is generally very well written as well as full of information, but the author has made an absurd mistake in his idea that Othello's sword of "the ice-brook's temper" was a reference by

Shakespeare to the celebrity of the "Innsbruck" weapons. It has nothing to do with Innsbruck; Othello specially says it was "a sword of Spain," and the expression "the ice-brook's temper" refers to the practice of plunging the best sword-blades, red-hot, into ice-cold water, to temper them.

The Illustration of Books: a Manual for the Use of Students. By JOSEPH PENNELL. London: T. Fisher Unwin; 1896.

MR. PENNELL has done such a great amount of book illustration that it may naturally be supposed that he has had experience of most ways of reproducing work, and of making drawings for reproduction; and his book, which deals with line drawing and washed drawings for mechanical reproduction, wood engraving, lithography, etching, and photogravure, contains a great deal of information as to the best materials, the best way of drawing for various methods of repro-

thought a fine way of writing, but which in fact is only a form of literary vulgarity.

Metallic Structures. By JOHN NEWMAN, A.M. Inst. C.E. London: E. & F. N. Spon. 1896.

At the present time there should be few more important subjects for the consideration of the designer of almost every class of structure than the action which the surrounding atmosphere will ultimately have upon it.

We fear it is too often the case, not only with architects, but also with engineers, that the question of the protective coating, on hidden metal work especially, is either left to chance or to the supplier of the material, who, having probably taken his contract at a cutting price, does not spend more than he can help, either on the paint used or its application. If the work is of such an important nature as to require inspection at the maker's works, the inspector generally requires to see it *before* it is painted, and after inspection it is, more often than not, hurriedly painted in the open, "rain or shine," by the cheapest of unskilled piece-work labour.

So little is known by the average engineer and architect about paint and other protective coatings that, beyond specifying that the work is to receive a certain number of coats of "best approved oil paints," very little further notice is taken of what is actually done in what, after all, is of the greatest importance in securing the extended life of the work. A considerable amount of ignorance still unhappily exists as to the galvanic action which certain metals exert upon each other. Not long ago a case came under our notice in which a copper gutter of considerable importance was specified to be put together with *galvanised iron* bolts, and certain fittings were similarly to be galvanised! It is, therefore, an excellent thing when authors conversant with those subjects direct their energies to works on corrosion and its prevention, which has not as yet, we fear, received that consideration which it deserves.

Mr. Newman's book is intended to be "a practical aid book to the safety of works in iron and steel," and contains much useful information. It is, however, somewhat heavy reading, being a volume of 368 pages, closely written, and containing paragraphs extending in some instances over three pages. It seems a pity that authors fail to realise that, although there may be some who can spare the time to read their books from cover to cover, yet, in the majority of cases, the principal use of such works, as we have at present under consideration, is that of reference in particular cases which come under the consideration of the individual reader. It is thus of the greatest importance that the matter dealt with should be classified under head-lines easily recognisable and quickly found. We regret to say that in this respect Mr. Newman fails signally, and as he is somewhat verbose, this fault is accentuated. His somewhat frequent lapses into poetry are also a little irritating, and at first sight it is difficult to see the connexion between Milton's "Paradise Lost" and the prevention of fouling and corrosion in submerged structures.

There is, however, a great deal of very useful matter in the book, which is compiled from many reliable sources of information, as well as from evident personal knowledge, and we therefore recommend it to the notice of those of our readers who wish to be informed on matters in connexion with protective coatings for metal structures, as well as on the important point of knowing good paint from bad.

Practical Tunnelling. By the late D. KINNEAR CLARK. Fourth Edition. London: Crosby Lockwood & Son. 1896.

In the broad sense of the word there is very little new matter that can be written about the making of tunnels, and yet, in detail, the advancement in modern high explosives, in drilling and excavating plant, and in compressed air machinery, has made practically possible works in tunnelling hitherto almost unattainable. At the same time the ever-growing demands for cheap transport for man and his handiworks have created fresh fields for the art of tunnel making.

Tunnelling is not by any means as simple as it may at first sight appear from an inspection of the finished work; nor is it reducible to a hard and fast science to anything like the same extent as are most other engineering feats. And thus it is that the records of what has already been found feasible and satisfactory are of the greatest service to those embarking on fresh enterprises. The

number of engineers in this country is not great who have a practical knowledge of the ins and outs of tunnelling through difficult ground, and the expedients which must be resorted to in order to meet difficulties likely to arise; difficulties which in many cases have to be combated by the contractors' agents or foremen whose efforts are seldom if ever recognised by the public.

A most useful record of the greatest works in tunnelling may be found in the late Mr. D. Kinneare Clark's book, which, in its fourth edition, was greatly extended and nearly brought up to date, by its gifted author, just before his death. The difficulties incidental to tunnelling are not familiar. Technical journals from time to time instance some new success, some fresh achievements of the engineers' skill in tunnel-making, but notwithstanding this, the number of people is small who have a clear grasp of the actual methods employed in overcoming the many difficulties which present themselves from the very outset of such works; and it is thus with the greater regret that we note in passing the recent death of Mr. Greathead, who has done so much in connection with cast-iron tube tunnels. To those resident in London, the works now in progress in connection with the Blackwall Tunnel, the Waterloo and City Railway, and the Central London Railway, are perhaps of greatest interest; the first-mentioned work being, of course, the most difficult to carry out, owing to its great size, and the nearness of the crown of the tunnel to the river bed, which in places threatened to be an almost unsurmountable difficulty. Had it not been for the form of shield used in driving this tunnel, no doubt the work could never have been carried out.

In Mr. Clark's book we find records of all the important tunnels of recent years, both in England and on the Continent, whether for railway, water supply, or subway purposes. The description of the fourth piercing of the Alps by means of the Simplon Tunnel, now in course of construction, which is of more than usual length (twelve and a quarter miles), and the consequent difficulty of ventilation, the possibility of working only from two faces, and the end sections being curved, render it a more than usually interesting case. Reference is also made to the successful invention of Messrs. Fenning & Stannard, which was employed in the construction of the new King's Cross tunnel, resulting in much saving in labour and material. Under this system a short metal lining is formed of needles about 2 in. thick, which, after the work is started, rest upon the outside of the brick lining, provision being made for pushing the needles forward as the excavation proceeds and the lining is inserted. Their front ends are supported on timbering, and the space round the brick lining left by the progressive movement of the needles is filled up by cement grout, introduced through holes in them.

Many other interesting descriptions are also given of tunnelling under various conditions, as well as the methods employing in setting out and levelling, and general rules for construction.

Laxton's Builders' Price Book for 1897. Containing above 72,000 prices. Eighth edition. London: Kelly & Co., Limited. Pp. cvii., 750 and 111.

BOOKS, like men, grow old, and while, undoubtedly, "Laxton's" is still wonderfully young in many respects, traces of hoary age do as undoubtedly grow manifest to the close observer. Perhaps this is especially the case in the section entitled "Smith and Founder," where a description of cast-iron girders appears, and a quite unintelligible table of the loads which cast-iron girders of unknown size and weight will safely bear. Steel riveted girders and stanchions, and steel angles and tees, are conspicuous by their absence. The first three paragraphs of the chapter on "Fireproof Construction" also bear traces of age, and a sentence on page 314 respecting the services to water-closets appears to have been written before the days of separate closet-cisterns. Indeed, to several of the "memoranda" introducing the different branches of builders' work exception might be taken; e.g., under "Ventilation" we read that "the admission of fresh air should undoubtedly be through an external wall, as near the floor and as far from the fireplace as possible. For this purpose air-bricks should be placed in the wall behind the skirting, with a hit-and-miss ventilator let into the skirting to regulate the inlet." Most of these "memoranda" might be omitted with advantage, and with them would vanish nearly all the marks of age to which we have alluded. We notice that the prices for Welsh slating have been

largely increased since the last issue. In the alphabetical list of Yorkshire stone quarries, Kingby has been for the first time included, but, unfortunately, it is printed "Kingly," and is, therefore, not in its proper place in the list.

The book is undoubtedly most useful, but in everything human there is room for improvement, even in "Laxton's." Let us hope that the eighty-first edition will bear fewer marks of antiquity than the eightieth, and will be brought more up to date by the inclusion of a section on Constructional Steel-work. Additional information on terra cotta would also be useful, and on p. 151 the different qualities of oak might be specified and priced.

Kirkpatrick's New System of Carpentry. being an absolutely new departure in this important branch of the mechanic arts. By C. A. KIRKPATRICK, Practical Mechanic. Boston. 1896. London: Sampson Low & Co. 1896.

SUCH is the somewhat startling heading of the title-page, which is further graced by assertions of a similar character, printed in every conceivable variety of type. The introductory chapter deals with this "new system of carpentry," in which the author seems to think highly of being able to obtain the lengths of roof timbers, including valley and hip rafters, from one and the same line. The line mentioned is the level distance from the outer face of the plate to a point plumb beneath the nearest side of the ridge. Our author then goes on to explain this new system, which he seems to imagine a great advantage; but we do not see the improvement on the systems ordinarily in vogue among carpenters.

Yet the author says that he approached them in the "utter dark;" that "the obtaining of many of them was a matter of no small mental strain;" and "in truth, simple as they appear now they are got, the finding of some of them consumed two full days." Little regard to the strict requirements of etymology has been paid in the new names that appear in this "new system." We are afraid that these alone would baffle the comprehension of the intelligent British carpenter.

Architects' Joinery and its Ornamentation. By F. A. FAWKES. Revised edition. London: B. T. Batsford. 1896.

THIS is a revised edition of what may be described as a very superior trade catalogue. It consists of sections of mouldings to door panels, architrave mouldings, dado and picture rails, cornices and ceiling mouldings, skittings, and the like. These are shown in full size, and also in photographs from the finished work, so that one can see the effect of sectional forms when in position, which is just what is wanted.

Various types of doors are shown, and pediments, the design of some of which might be improved. Dado panelling is not forgotten, and there are some really very satisfactory designs for wooden chimney-pieces of a small and unpretending type.

There is one thing in the preface to which we could take exception. It is stated that "the enrichments, which are securely fixed to the wood mouldings, are made of a specially tough composition, which is not liable to crumble, chip, or crack." Is it desirable or necessary, except on the ground of expense, to stick "enrichments" on to wood mouldings made of "composition," whether "specially tough" or not?

Familiar Wild Flowers. By F. E. HULME. Cassell & Company, London, Paris, and Melbourne. 1897.

THIS is a re-issue, as a popular edition, of Mr. Hulme's well-known work, to be complete in twenty-one monthly parts, at 6d. each. The carefully executed coloured illustrations of flowers are thus brought within the means of a very large circle of purchasers.

TRADE CATALOGUES.

WE have received the new catalogue of Messrs. Easton, Anderson, & Goolden, London and Erith. The work executed by this Company is most comprehensive, including as it does "every class of machinery—steam, hydraulic, and electric," many examples of which are set forth in their catalogue. The Company is an amalgamation of Messrs. Easton & Anderson and Messrs. W. T. Goolden & Co., the former having an experience of over seventy years in the manufacture of hydraulic and general machinery, and the latter having devoted their attention to electric

plant. The combination of these two firms should therefore be a strong one, notwithstanding the withdrawal from the business of Dr. William Anderson, C.B., F.R.S., who, in 1864, laid out the Erith works, and who is now Director-General of Ordnance Factories. The Company's works cover an area of some seventeen acres, having both railway connexion and a considerable water frontage on the Thames, and they carry on a considerable home trade in all kinds of hydraulic and waterworks plant, engines, lifts, cordite machinery, electric mining machinery, electric lighting and haulage, cranes, crushing mills, &c. The catalogue comprises some 116 pages, with a large number of illustrations of work actually carried out. Only the smaller class of manufactures are priced, which we consider a wise course, as those given for large machines in a general business catalogue, must as a rule be very misleading. In the matter of lifts, both the hydraulic direct-acting and the hydraulic suspended systems are described and illustrated. A very simple and compact design of electric lift motor and gear is also shown, the advantages of this system of working being pointed out, where the current from an Electric Supply Company is available. The Company also make a good type of hydraulic ram suitable for domestic purposes in several sizes. The catalogue is neatly got up, the various machines being grouped into sections for easy reference. The new catalogue of the Edison and Swan Electric Light Company is a very carefully compiled production and contains many novelties. It shows clearly that the higher voltages adopted by so many supply stations have brought a demand for high insulation fittings. The great improvement shown in the electrical design of these fittings will go far to remove one of the greatest objections to a 200-volt supply from the consumer's point of view. The high insulation lampholders and cut-outs are excellently designed and are a great advance on the older types. The interior of the lampholder consists of one piece of porcelain, into which two metal blocks, fitted with contact plungers, are sunk, thus completely separating the poles and at the same time making contact with the outer metal case impossible. The "anti-shock tumbler switch" is also well adapted for high-voltage supply, and as its price is very little over that of the ordinary switch it ought to be widely used. The section on ship fittings shows the high standard attained by this Company in the manufacture of substantial accessories. On the other hand, the "Ediswan" watch lighting set containing battery, lamp, flexible cord, &c., is cheap and ought to become popular. We have received from "The Lighting Corporation," which is now the holder of the Wenham patents for gas lamps, their illustrated catalogue, in which special attention is given to methods of combining efficient gas-lighting with ventilation. The merits of the Wenham system of gaslight we testified to when the patent was first started; and amid the artificial lights which are endeavouring to contest the palm with electricity it seems likely to keep a prominent place. The catalogue includes also a section illustration of the Company's automatic gas governor, the object of which is to regulate to a uniform volume the consumption of gas in a burner under any variations of pressure. The "Lucal" lamp for contractors appears to be a powerful and economical one for its purpose. The ornamental designs for ventilating globe and half-globe lights are not better than usual, but in every other respect we recommend this catalogue to the attention of those concerned in lighting either public or domestic buildings.—Messrs. Z. D. Berry & Sons send us the illustrated catalogue of their improved radiator for hot water or steam, by which they claim to give greater heating surface per space occupied than is given by any other radiator. The amount of superficial feet of heating surface for each size of radiator is included in the price list.—Messrs. Line & Son, of London and Reading, send us a pamphlet on the advantages of their washable distemper, called "Duresco," which is described as "a full-bodied zinc white, which is ground in a liquid silicate and special varnish of great crum-forming properties." If Messrs. Line & Son will send us a small sample we shall be better able to form an opinion on its value than from a description. If it does all they claim for it it is no doubt well worth attention. We receive also from Messrs. Line & Son their catalogue of wall-papers and decorations in relief. Some of the wall-papers founded on foliage are very good in general design and style, though the firm do not seem to employ any artists of known standing to design them; at all events

they give no designer's name. The catalogue also gives specimens of relief designs in Lincrusta-Walton and "Lignomur," of which a large number of patterns are kept in stock; also of their asbestos "Salamander" decorations for ceilings in relief, and which are recommended as forming a ceiling decoration which is absolutely fireproof.—Messrs. Hamilton & Co. send us their illustrated catalogue of painting brushes, graining tools, and painters' and plumbers' sundries, including paper-hanging tools, brazing and soldering lamps, &c.—Messrs. G. B. Kent & Sons send us their catalogue of painting brushes, both for house-painters' and artists' work.—Mr. Robert D. Stewart (London) sends us his catalogue and price list of paints, colours, oils, varnishes, and also of various special implements for builders, painters, &c.—Messrs. Fierston & Co. (London) send us their catalogue of cast and wrought steel and ironwork, chiefly of constructional character—rolled steel girders, steel plate tanks and doors, fireproof floors, steel columns, iron and steel roofs, &c. They offer also a novelty in the shape of rolled iron mouldings.—Messrs. D. & J. Tullis (Kilbowie, Glasgow), send us a catalogue of laundry machinery manufactured by them, including various types of rotary washing machines. Among the objects described and illustrated is the new patent brass inside shell for rotary washers, which can be fitted to any of their machines. The object is to lessen wear, the rivetting being done from outside only, and all sharp edges are removed from the inside. The catalogue includes also roller ironers, boilers and engines, everything required to complete laundry plant.—Messrs. John Dickinson & Co. (London) send us a set of specimens of papers for wrapping purposes, from thick browns to light papers; a class of article which is of importance to many of our readers in regard to the putting up of drawings, &c.

Correspondence.

To the Editor of THE BUILDER.

THE ARCHITECT'S MODEL.

SIR,—Mr. Edwin Seward's suggestions, that the art of architecture is placed before the general public under somewhat unsatisfactory conditions, is one that will evoke a sympathetic chord in most architect's souls. His practical suggestion for the remedy is one that does not go far enough, perhaps. The people who visit building trades' exhibitions are not altogether those whom we would wish to influence. It seems to me that to fellow-architects, builders, and workmen, we rightly convey our artistic (if any) meaning by means of drawings to scale or perspectives on the flat. We can all imagine the rest for ourselves. The general public, however, do require some further translation; and it does seem probable that a sufficiently adequate translation might be furnished by means of models, certainly made to scale, but not necessarily very elaborate, now constructed at great expense. It is quite true that the criterion of an architect's work must be centred in the buildings he erects, and that there must necessarily be some deception about a mere model. It is, moreover, impossible to give the texture of each material imitated without a large expenditure of both time and money. I believe that the public would forego these disadvantages while thanking us for other advantages furnished them over and above those which are now provided solely by drawings on the flat. I have lately taken some pains to make for my clients simple models of proposed work, and have found from actual experience that greater interest is aroused and their sympathy augmented thereby. I am confident that both young and old prefer to look at an architectural model in place of a drawing wherever practicable. Architects labour under great disadvantages; their finished works are not transferable by train, neither can they inscribe their names legibly or illegibly in the corner of their works. Art, as understood by the general public, must come forth from a studio, and be contained within the limits of a gilt frame. If, therefore, architects do nothing to assert themselves or their art in the same practical manner as do the painter-artists, they have only themselves to blame for the natural consequences. I would therefore suggest that discussions on this matter of models be raised in all architectural societies, but on the idea that any exhibition should stand entirely on its own basis, and not form a mere side-show in an exhibition of a sister art. Heaven helps those who help themselves. I am willing to assist any "trial trip" in the direction of an exhibition, purely architectural, of models (or combination of models and drawings) to the extent of fifty pounds. I cannot say more or do more to any purpose, not being a member of any learned Architectural Insti-

tute or Society, and only personally known to a few fellow architects by the abbreviated name of "PILK."

THE DRAWING OF "A THIRTEENTH CENTURY ARCHITECT."

SIR,—A very good reproduction of the drawing will be found on p. 50 of the *Masonic Magazine*, November, 1891. D. M.

"SKETCHES OF LONDON STREET ARCHITECTURE."

SIR,—In your notice of No. 63, Sloane-street (of which a sketch appears in your last issue) the architect's name is given as Mr. Fairfax B. Wade. This is not correct, as I was the architect.

T. LEONARD WILLIAMS.

* * * We do not understand the meaning of the above letter, as we received the description of the house from Mr. Wade, in what we believe was his own writing.—Ed.

The Student's Column.

SPECIFICATIONS.—X.

JOINER—(continued.)

WE have in the two previous chapters given examples of the mode of specifying the most general items of joiner's work, but there are others less general, but occasionally required, of which it may be useful to the student to have instances, and some of these we now give.

Window Shutters.—The windows numbered on plans to have 1½ in. boxing shutters in leaves three panels high, moulded both sides; the back flaps to be also 1½ in. in leaves three panels high, but moulded and square. The shutters to be full height of windows, and hung with a pair of ¾ in. wrought-iron butts or back flaps, as necessary to each leaf, in 1½ in. cross-tongued and beaded boxings, with architrave moulding out of 3½ in. by 2 in. Each set of shutters to have 1½ in. by ¼ in. steel shutter bar, 3 ft. long, with spring catch fastener and 14 ozs. bell, with spring and clip. All sills to have rebated and beaded joints.

The windows numbered on plans to have 1½ in. boxing shutters, 5 ft. 6 in. high, in two panels, moulded and square each leaf, the back flaps to be 1 in. thick in two panels, square both sides. The shutters to be hung in 1 in. cross-tongued and beaded splayed boxings, with a pair of ¾ in. wrought iron butts or back flaps as necessary to each leaf. Each set of shutters to have 1½ in. by ¼ in. steel shutter bar, 18 in. long, with spring catch fastener. All sills to have rebated joints.

The windows numbered on plans to have 1½ in. moulded and square shutters in two panels each leaf, double hung with best flax lines, and brass hushed axle pulleys in deal-cased frames to match those of sashes. Each pair of shutters to have a 4 in. brass shutter screw and socket, and a pair of brass drop shutter rings, and a pair of 3 in. brass flush shutter lifts to each leaf. The boxing to these shutters to have 1½ in. moulded and square front in two panels tongued to floor, ¾ in. ploughed and tongued back, and 1½ in. hinged cover with rounded nosing, hung with a pair of 2½ in. brass butts.

The windows numbered on plans to have a pair of 1½ in. framed shutters, with solid panels tongued and V-jointed, hung folding with a pair of 4½ in. wrought-iron parliament hinges to casement frames, and fitted with oak blocks plugged to wall, and strong wrought iron cockscrew shutter fastenings, also a pair of 6-in. wrought-iron barrel bolts. Each leaf to have heart-shaped perforation 6 in. by 6 in.

French Casements.—The windows numbered on plans to have 2 in. ovolo moulded French casements, hung folding with hook rebate (or rounded and grooved heels) and moulded weather fillet out of 2½ in. by 1½ in. on meeting stiles, and rounded tongue, 1½ in. thick, on hanging stiles. The bottom rail and sill to have Elliott's weather-bar, p.c. (or specify any other method preferred for keeping out rain between bottom rail and sill). The casements to be hung with a pair of 4 in. wrought iron butts to each leaf to 4½ in. by 4 in. wrought and beaded frame, with hollow groove as water stop 1½ in. wide. Sill to be 6 in. by 4 in. oak, sunk weathered and throated, and fitted with Elliott's weather bar as above mentioned (or otherwise, as the case may be). Put to these casements ½ in. brass espagnolette bolts p.c.

Coach-House Doors.—The doors of coach-

house to be 2½ in., framed, ledged, and braced, the ledges and braces 1½ in. thick, the filling-in of inch matched and V-jointed boarding in half batten widths, stiles, top rail, and braces 5½ in. wide, ledges and bottom rail 9 in. wide. The doors to be hung with a pair of Collinge's gate hinges 3 ft. 6 in. long, to each leaf, to 6 in. by 4½ in. rebated and chamfered frame, and to be fitted with a 12 in. wrought-iron barrel bolt, and 30 in. wrought-iron rod bolt, and 9 in. oak-bound stock-lock.

Stable Doors.—The doors numbered on plans to be 2½ in., framed ledged and braced, the ledges and braces 1½ in. thick, the filling-in of ¾ in. matched and v-jointed boarding in half batten widths, to be hung in two heights with rebated joint to meeting rails, with a pair of 4 in. wrought iron butts to each leaf to 4½ in. by 4 in. rebated and chamfered frame. The doors to be fitted with brass flush-handled stable latch, 6 in. wrought-iron barrel bolt, and 8 in. oak-bound stock-lock.

Cisterns.—Construct cistern to be placed in roof over with 1½ in. cross-tongued and dove-tailed sides and 1½ in. cross-tongued and dove-tailed bottom. The size of cistern to be 4 ft. by 6 ft. by 3 ft. 6 in. internal dimensions. To each internal angle put splayed angle fillet out of 3 in. by 3 in., and leave all internal surfaces fair and clean for plumber. Around outside of cistern, nail tightly-stretched hoop iron 18 gauge inch wide, best quality, three rows 6 in. from top and three rows around middle of height. The cover to this cistern to be ¾ in. matched boarding, made in three divisions each with two ledges 1½ in. by 4½ in. Fix cistern in roof on strong fir bearers, and cut necessary holes and dishings for plumber's work.

Dwarf Cupboards.—The method of specifying these would be similar to that already given for ordinary cupboards, except that the top might be of some hard wood and would be described thus: The top to be of 1½ in. selected Riga wainscot, cross-tongued, and with 1½ in. by 4½ in. ledges on the underside, secured with slotted cups and screws, and buttoned down to framing. The nosing of top to be rounded.

Sliding Partitions.—The sliding partitions in to be 1½ in. framed partitions in (two) divisions, each division in six panels square, the middle panels open and prepared for 26 oz. sheet glass, the others ¾ in. thick. The partitions to be hung from wrought steel rail on brassrunners, with two wheels to each division, and oak threshold 4 in. by 3 in., with small tram rail let in, and steel stubs and plates on lower edge of framing. For the wheels, rails, and stubs provide the p.c. sum of , including carriage and delivery on the works. The contractor is to fix these special items of ironmongery as directed. Each division to have also a pair of brass pull handles, p.c. , and mortice locking-latch, p.c.

(N.B.—There are various patented forms of sliding and folding partitions now on the market which require, usually, some amount of special preparation. The nature of this should be ascertained from the patentee, and specified, and a lump sum provision included for the patentee's work, making it quite clear whether the provision does or does not include for carriage, delivery, fixing, priming, painting or ironmongery.)

Laundry Fittings (domestic).—Fit up laundry with three washing tubs of 1½ in. clean deal wrought h'o'h sides, splayed, and put together with dove-tailed angles in white lead. The size of tubs to be 2 ft. 6 in. by 1 ft. 9 in., and 12 in. deep internally, and to have 2 in. brass plug, washer and waste, and 1½ in. light lead pipe as waste to empty into channel in floor.

Fit up 1½ in. clean deal ironing board, where shown on plan, hung with 1½ pair of 4 in. wrought-iron butts and hanging stile out of 4½ in. by 1½ in., plugged to wall. Put underneath board two folding trussed brackets out of 2½ in. by 1½ in. with heel blocks and pins. Provide two clothes racks, each 5 ft. long by 3 ft. high, with 2 in. by 2½ in. ends, and three rails 1½ in. by 1½ in. morticed and tenoned, and pinned to ends. These racks to have pulleys, lines, and belaying cleats for hoisting to ceiling.

Ironmongery.—In specifying ironmongery it is unwise to follow the example of a bill of quantities and dissociate the items from the parts of the building to which they refer. There are, however, general clauses relating to ironmongery which may be given under the one collective heading. For example, if in the case of locks it is necessary that a master-key shall command the whole, it should be specified that the whole of the locks are to be under one mastership, with (or more, as the case may be) keys to pass.

If sub-master-keys are required for various parts, or if there are several masterships, this should be clearly defined.

As regards quality, it is of little use to specify the best quality or to attempt to define the quality, as this varies, by almost imperceptible gradations, from a very high standard to a very low one. The only really satisfactory method for a young architect to adopt is to put himself into the hands of a trustworthy ironmonger, and include in his specification a fixed price for a fixed quality and article which he has already arranged with the ironmonger. There is, of course, a tariff price for ironmongery, and it would be possible to specify the ironmongery by a p.c. price, leaving the ultimate selection till later; but in this case there is the difficulty that different tradesmen treat the tariff differently, and unless the builder knows, before tendering, through whom the ironmongery is to be bought, his estimate must be speculative unless the architect allows the builder to select the ironmonger—a course which is open to some objections.

GENERAL BUILDING NEWS.

ADDITIONS TO S. GABRIEL'S CHURCH, PIMLICO.—The Bishop of London consecrated, on the 1st inst., the additions which have been made to S. Gabriel's Church, Pimlico. The church is a well-proportioned Gothic building with three aisles, chancel and western tower and spire, but the beauty of the building was not a little disfigured by the unsightly side galleries which have just been removed. The additions, which consist of north and south aisles, a nave, and a choir in memory of the late Rev. Byrner Belcher, the first vicar, a west gallery and a west porch, the gift of Lord Edward Pelham Clinton, have been carried out by Mr. John Thompson, of Peterborough, at a cost of some 6,000l. from the designs of Mr. Arthur Baker, of the firm of Messrs. Baker & Turrill, in harmony with the original design. The extra width given by the additional aisles and the double arcade on each side of the nave have increased the picturesqueness of the interior, which has also been enriched by the groining of the aisle roofs, and by the richly-carved oak front of the west gallery carried on a stone arcade. The chancel has received a new east window, designed by Mr. Kemp.

ENLARGEMENT OF PREMISES, GOLDEN-LANE, LONDON.—Messrs. Suttons, the well known carpenters, are considerably enlarging their premises in Golden-lane, London. The plans have been prepared by Mr. Hamilton, and the contract has been secured by Mr. B. E. Nightingale. The floors of the building are to be fireproof on the Fawcett system, and the structural iron and steel work is being supplied and erected by Messrs. Mark Fawcett & Co.

CAFE, LIVERPOOL.—A cafe in connexion with the Cotton Exchange has just been erected at the corner of the Exchange at Liverpool. The cafe has three entrances, one in Brown's-buildings, one in Rumford-street, and one in Water-street. All the work has been carried out by Messrs. Waring, Limited, Mr. J. F. Doyle, of Liverpool, was the architect.

RESTORATION OF CHURCH, DUFFIELD, DERBYSHIRE.—The contract for this work has been let to Messrs. Bridgeman. The addition of a South Chapel to the existing edifice will be first commenced. The principal alterations to be undertaken are of an internal nature, and comprise a new floor, new oak pews, remodelled heating apparatus, the addition of a chancel screen and organ screen, and paving the chancel with black and white marble, together with extensive decorations. The work will be carried out under the superintendance of Mr. J. Oldrid Scott, F.S.A.

WORKMEN'S DWELLINGS, HORNSEY.—On the 23rd ult., at the Hornsey Urban District Council Offices, Colonel A. G. Dunford, R.E., held a Local Government Board inquiry into the application for sanction to borrow 27,500 for the erection of workmen's dwellings, 2,700l. for purposes of street improvement, 2,770l. for works of sewerage and surface water drainage, and 2,184l. for other works. Mr. E. J. Lovegrove, Surveyor, was in attendance.

RESTORATION OF LANIBEDR CHURCH, BRECONSHIRE.—This church has just been reopened after restoration. The actual work of restoration was commenced in April last, the architect being Mr. J. L. Pearson, R.A. The work has been carried out by Messrs. Luscombe & Son, of Exeter. The whole of the church, with the exception of the tower, has been renovated.

CHURCH, LUNDY ISLAND.—The new church of St. Helena, Lundy Island, is approaching completion. The building is of thirteenth-century style, and it consists of nave, chancel, with north transept, intended as an organ chamber, and vestry. The lower part of the tower (which is 70 ft. high) will serve as an entrance porch, and there is a square turret at the south-east angle of the tower, which gives approach to the belfry, in which is to be a peal of bells. The roofs are of steep pitch, and formed of split stone slabs of Tisbury stone. The building is built of grey granite, with dressings of

Douling stone. In a niche in the tower is a large statue of St. Helena. It is the handiwork of Mr. Harry Hems, of Exeter. The interior walls are lined with red brick throughout, relieved by bands and diaper of blue Staffordshire and cream-coloured Marlard bricks. There is a chancel arch, carried by polished Purbeck marble columns. Two granite stone steps, the work of the workmen of the chancel, and two more to the altar rails. A dwarfed screen of carved stone divides nave and chancel. The altar rails are of oak, upon brass standards. The foot pace, upon which the oak altar stands, is of polished Devon marble. There is a sedilia upon the south side of the sanctuary, and opposite thereto a carved piscina. The east window is a three-light one, filled with stained glass by Messrs. Clayton & Bell, of London. Immediately beneath the window is a carved and sculptured reeded. The super-altar is of polished veined alabaster, and the main portion of the reeded proper consists of three distinct divisions, gabled and crocketed, and divided from each other and flanked by clustered columns of polished Purbeck marble. The sculpture is in exceptionally high relief, the central part representing the Last Supper, whilst that on the dexter side shows the Institution of the Passover, and on the sinister of the Scape Goat. The pulpit is of carved stone, and on the north side, and the font is of the same material, upon a grey granite pedestal. There are encaustic tiles from Lugwardine, Herefordshire, in the chancel and sanctuary floors, and under the seating, which, like the stalls, are of oak, the floors are of wood blocks. The eagle lectern is of oak. The floor of the organ chamber is somewhat lower than is the nave, and is laid with wood blocks. The contractors for the general work are Messrs. Britton & Pickett, builders, of Ilfracombe. The pulpit, altar, screen, font, &c., as well as the sculptured reeded, and other sculpture, are by Messrs. Harry Hems & Sons. The architect is Mr. John Norton, of London.

CATHOLIC CHURCH, FRIZINGTON, CUMBERLAND.—The new church of St. Joseph, Frizington, was opened recently. The new building, which is in Gothic style, stands on the same site as the old one, and is built of brick. The length of the building is 75 ft., the breadth 34 ft. across the body of the church, and 45 ft. across the altar part; the height to the eaves, 14 ft. 6 in., and from eaves to ridge, 17 ft. 6 in. It is lighted by six windows on each side of the nave, and three lancet windows in the north end. Over the vestry on the west of the building is the belfry, 35 ft. high. The church is entered by a porch, with side doors. Over the entrance is an organ gallery. There are two passages leading up the church to the sanctuary, which is entered by three arches—a large one in the centre, 25 ft. 6 in. high and 18 ft. wide; and a smaller one on each side of it. There is seating accommodation for 100 people, the seating being of pine. The lady altar and baptistry are on the left of the high altar; and the vestry is on the right, having an entrance from the adjoining presbytery. Mr. Robert Pearson, of Cleator Moor, prepared the plans, &c., for the erection of the building, and the work was carried out under his supervision. The woodwork was submitted to Mr. Mandrake, and the plumbing work to Mr. Jackson Sumpton. Mr. Millican had the painting; Mr. John Hazzard, Frizington, had charge of the hauling; and Mr. Reuben Pearson had charge of the mason work. The high altar has been executed by Messrs. Boulton & Sons, Cheltenham.

NEW BATHS FOR MORLEY.—The Morley Corporation have decided to erect a set of public baths in the borough. The site selected for the purpose is a sloping piece of ground fronting on to Fountain-street. Out of the fifteen plans submitted in the recent competition, those sent in by Messrs. Holton & Fox, of Dewsbury, have been awarded the first premium, subject to a tender for the execution of the work at 6,000l. (the amount of their estimate) being submitted and approved. In the centre of the front elevation, where the bath superintendent will have his home, the building is to be two stories high. The rest of the structure will be a single story. There will be two entrances to the baths. On the left will be the men's slipper baths—two first-class and four second—two shower baths, a needle bath, and a vapour bath. A visitor to the first-class swimming bath will also enter by this door, and, passing the pay office, beneath the superintendent's house, will turn along a short corridor to the left, where he will find the entrance to the bath-room. The length of the first-class bath will be 65 ft., the breadth 24 ft., and the depth will vary from 3 ft. to 6 ft. The entrance on the right-hand side of the building will lead to the ladies' slipper baths, of which there are to be a similar number to those provided for men. Behind these baths will be the second-class swimming bath of the regulation dimensions (water measure—viz., 75 ft. by 30 ft.). As this bath will often be used for entertainments, a gallery has been provided, running the greater part of the way round the room. Dressing boxes of wood, with slate partitions, are to be arranged on two sides of the room. Both of the swimming baths are to be lined with glazed bricks, and adjoining each will be a small soap bath.

SCHOOL OF ART BUILDING, GLASGOW.—Twelve architects were invited to compete in the competition for a School of Art at Glasgow, and the

result was that the design of Messrs. John Honeyman & Keppie was chosen. The site purchased by the Bellahouston Trustees is that piece of land lying immediately to the north of the Panoramia buildings in Sauchiehall-street, between Dalhousie-street on the east and Scott-street on the west, and having a frontage to Raeburn-street. The building itself will face due north, with a length of 250 ft. and a depth of 77 ft. Owing to the conformation of the ground, the building at its south-west angle will have to be carried by a retaining wall. The plans selected show a three-storied building—a basement and two floors—the ground to the north being excavated to form an area for lighting the lowest floor. The entrance is in Renfrew-street, the main door being situated in the centre of the facade. A service door has also been made in Dalhousie-street for access to a janitor's house and for the reception of material. The staircase of the building is situated in the rear centre, and access to all floors is gained from and by it. The upper floor contains the life rooms (male and female), antique rooms (elementary and advanced), a school museum, and a board room. The middle floor is occupied by ornament, still life, and design rooms, and the school library and lecture theatre. The basement holds the accommodation for modelling (large antique and ornament), architectural rooms, and the technical rooms. In these will be placed a forge, a kiln, and a muffle. The basement also contains a house for a resident janitor, the heating apparatus, and various store-rooms. The administration is placed in the centre of the building and on the first floor. All rooms in which instruction is to be given are lighted from the north, the only light taken from the south being that available for the corridors, which on each floor run from one end of the building to the other, at the southern side of the edifice. The light from the south is obtained by the use of wells, there being no reservation in favour of windows in the southern wall. The general scheme at present contemplating building such portion of the plans as can be erected at a cost of 14,000*l.*

NEW MASONIC HALLS, SELKIRK.—The new Masonic Halls at Selkirk were consecrated on the 19th inst. The halls are situated in the Back Row, adjoining the Volunteer Hall. The principal hall is situated on the second flat, and measures 35 ft. by 20 ft. The under hall is smaller, measuring 25 ft. by 20 ft. M. Hippolyte J. Blanc, Edinburgh, is the architect.

VILLAGE HALL, KNOWLES, LANCASHIRE.—Lord Derby recently opened a village hall at Knowles village. The building was designed by Mr. Leslie, architect on the Derby estate. It contains a hall 60 ft. long (or 75 ft. including the platform) 30 ft. broad, and 37 ft. high to the roof ridge. The roof is of open pitch pine. A gallery occupies one end of the hall, which is seated for 440 persons. There are several cloakrooms, and at one end of the building is a room 30 ft. by 20 ft., with separate entrance door, for the use of the parish council and for small gatherings.

NEW POOR-LAW BUILDINGS, WHITBY.—Some time since the Whitby Poor-Law Union purchased the riverside property in Church-street, Whitby, formerly known as the Phoenix Rooms, for use as a board-room, offices, &c. For nearly a year internal alterations have been in progress, and the interior now contains accommodation for the Guardians and their clerk, also for the Overseers and their assistant, the Rate Collector, Staining Officer, applicants for relief, &c. The architect for the works of renovation and improvement was Mr. E. H. Smiles, of Whitby, and the contractor Mr. J. Brain.

THE NEW CHURCH AT BOLSOVER, DERRYSHIRE.—A public meeting was held at Bolsover recently to consider and decide what steps should be taken towards the restoration of the church, which was destroyed by fire a few weeks ago. Mr. Louis Ambler, of London, who is the architect engaged, submitted plans which he had prepared. There were two schemes suggested:—No. 1, to erect a building on the same lines as the old one, the estimated cost of which was 6,000*l.*, including seating, gasfitting, organ, bells, and other requisites. No. 2 scheme provides for some enlargement and extra seating accommodation for 220 persons. The estimated cost in this case was 9,000*l.*, inclusive. Both estimates included the cost of restoring the chancel. It was resolved that No. 2 scheme be adopted.

FREE PUBLIC LIBRARY, LEYTON.—The old public offices of the Leyton Local Board have been renovated and altered so as to render them suitable for the purposes of a free library. The alterations on the ground floor provide a lending library, reference library, librarian's office, and store-room. There is a new public entrance. On the first floor the old Board-room has been converted into a reading-room, with a lift connecting the lending library. The second floor, with two rooms on the first floor, comprise the librarian's apartments, with bath-room, &c. The work has been done by Coxhead, of Leytonstone, from plans by Mr. Dawson, the Surveyor to the Council. The electric lighting has been carried out by Messrs. Spagnoletti & Crooks. The newsroom of the library, which is the old council chamber transformed, is a hall, 50 ft. by 31 ft.

SANITARY AND ENGINEERING NEWS.

REFUSE DESTROYER FOR YARMOUTH.—An inquiry was held at Yarmouth recently by Colonel A. G. Durnford, R.E., with reference to the proposed expenditure by the Town Council of 10,500*l.*, on the erection of a refuse destructor on the Corporation marshes, between Caister-road and the River Bure. The Borough Surveyor, in the course of his evidence, explained that the estimate was as follows:—Building, 3,150*l.*; chimney, 1,913*l.*; fencing, 204*l.*; ten furnaces, two boilers, and other appliances, 3,365*l.*; 125*l.* charging apparatus, 1,000*l.*; dimker furnaces, 100*l.* The steam generated would be used for the production of electric light. The quantity of refuse guaranteed to be destroyed without forced draught was 75 tons per day, and the quantity collected in the district which the destructor was to serve averaged 65 tons daily. The maximum in the summer time was 85 tons in a day, and he expected the destructor would work up to 85 tons. The building would afford room for extension, as it was intended for fourteen cells.

DRAINAGE OF SIDMOUTH.—Mr. W. A. Ducau, of the Local Government Board, held an inquiry at Sidmouth on the 23rd ult., into the Urban District Council's application to borrow 5,000*l.* for works of sewerage. The Clerk having detailed the facts leading up to the application, stated that the town was now unanimously in favour of Mr. Mansergh's scheme. The Local Government Board had sanctioned a loan of 3,824*l.* for the town sewers, the present application being in regard to the outfall works. Mr. G. R. Strachan (Messrs. Mansergh & Strachan) explained the plans.

PROPOSED DOCK WORKS, THE HARTLEPOOLS.—At a recent meeting of the representatives of the Hartlepool and West Hartlepool Corporations, the Shipowners' Society, and the Chamber of Commerce, held at West Hartlepool, to consider certain proposals for improving the dock and trading facilities of the port, the Mayor of Hartlepool (Councillor Mudd, C.E.) laid a scheme before the meeting, which it is proposed to urge upon the North-Eastern Railway Company to carry out. The project includes a proposal for straightening the deep-water entrance to the harbour; a new fish harbour; a new entrance to the Victoria Dock, 25 ft. wide and 25 ft. deep, to accommodate ships up to 6,000 tons; to heighten and improve the coal spouts; to construct a new dock in the Stake; to enlarge the Central Dock, so as to enable vessels of 600 ft. to be built and launched; to widen No. 4 Graving Dock, so as to accommodate an ironclad; if required; to lay the Jackson Dock to the coal dock, and to construct a new through railway station at West Hartlepool, with main entrance opposite the Municipal Buildings, and make Hartlepool the terminus for south trains.—*North-Eastern Gazette.*

WATER SUPPLY WORKS, WITNEY, OXFORD.—Mr. W. O. E. Meade-King, M.Inst.C.E., an inspector from the Local Government Board, held an inquiry at the Witney Corn Exchange with reference to the application of the Urban District Council to borrow 5,000*l.* for water supply works. Mr. Laitley, the Engineer, attended, and explained the proposed scheme.

SEWAGE DISPOSAL WORKS, KNARESBOROUGH, YORKSHIRE.—An inquiry was held recently at the Urban Council offices at Knaresborough by Colonel Luard, R.E., one of the Local Government Board engineer inspectors, as to the application of the Knaresborough Urban District Council to borrow a further sum of 8,800*l.* for the completion of the main outfall sewerage and sewage disposal works, the total cost of which amounts to 10,000*l.* The Engineer, Mr. D. Balfour, of Newcastle-on-Tyne, explained the scheme, which consists in the laying of two main outfall sewers, both 18 in. in diameter, with a total length of four miles, crossing under the River Nidd by a cast-iron inverted siphon. The disposal works consist of ten acres of land, properly underdrained, and laid out on the intermittent filtration principle. The sewage, on reaching the site, is treated in a chamber with alumino ferric, and, after being thoroughly self-admixed, passes into large precipitation tanks in duplicate, the clarified sewage afterwards passing on to the land. There was no opposition to the scheme.

STAINED GLASS AND DECORATION.

WINDOW, DONCASTER PARISH CHURCH.—The great north transept window in the Doncaster Parish Church, which was destroyed by a gas explosion some time ago, has been filled with new stained glass illustrative of the "Te Deum." The six main lights are filled with three tiers of figures representing Cherubim and Seraphim, apostles, prophets, and martyrs, as well as Saints Ambrose and Augustine, the joint authors of the "Te Deum." The figures are surmounted by canopies of broad and simple design, and along the base of the lights is written in bold black letters, "Te Deum laudamus, te dominum confitemur." The Mowbray window on the south side has been replaced by three lights, containing figures of holy matrons. The whole of the work has been designed and carried out under the direction of the architects (Messrs. Demaïne & Brierley, York), by Messrs. Shrigley & Hunt, of Lancaster and London.—*Yorkshire Post.*

MEMORIAL WINDOW, ALLESLEY CHURCH, COVENTRY.—A new stained glass window has been placed in the north wall of Allesley Church, in memory of the late Mrs. James Maycock, of Coventry. The subject is one suggested by the last chapter of Proverbs, describing the virtues of "The Good Woman." The window has two lights. It was designed by Messrs. Ward & Hughes, London.

FOREIGN.

FRANCE.—The Paris Municipal Council is studying the possibility of establishing an evening museum for workmen who are working in industrial arts. This museum will for the present be installed in the Salle Saint Jean, at the Hôtel de Ville, and the present Director of Fine Arts, has promised to give a set of models of ancient and modern works, drawings, and other works of art, to fill the museum. If this scheme succeeds, other evening museums, accompanied by lectures on industrial art, will be organised in the principal mairies of Paris, particularly in the most crowded neighbourhoods. The Académie des Beaux-Arts has just elected, as foreign corresponding member in the painting section, M. Maccheri, of Rome, in place of the late M. de Fosséca, of Lisbon.—The sale of sculptures, furniture, and works of art of the thirteenth century, belonging to the heirs of the brothers Goncourt, has now realised the sum of 182,000 fr. The Chinese and Japanese collection will be sold from March 8 to 13.—The work of suppressing the last of the waterways to be found in Paris is being carried on. These are in the XIV. and XV. arrondissements, on the line of the Compagnie d'Ouest. The expense is estimated at 5,000,000 francs.—The Poissy Municipal Council has decided to pull down the old mill, close to the Poissy bridge. It was built in 1230 by Queen Blanche of Castille, mother of Saint Louis. This ancient building is now in ruins.—A competition has just been opened for the building of a Palais de Justice at Tizi-Ouzou, in Algeria.—The Municipal Council in Algeria have accepted the scheme for the building of a new Hôtel de Préfecture.—Some important alterations in the town of Marseilles are shortly to be begun. The expense is estimated at 8,000,000 francs. The work is to include the draining and rebuilding the quarters behind the Bourse, between the Rue de la Canebière, Rue de la République, Rue Colbert, and the Cours Béhrauc.—Madame Viollet-le-Duc, widow of the great architect, has just been buried in the cemetery at Passy; she died at Saint Germain at the age of 84.—The death is announced, at the age of 57, of M. Albert Lecoy de la Marche, sous-chef de la section historiques des Archives Nationales. Several works on French art are due to him; amongst them "Études sur l'Académie de France à Rome," fourteen studies on miniatures in France in thirteenth and fourteenth centuries, on the art of illuminating and on religious painting.—The painter Frédéric Lix has just died at the age of 67, after a long illness. He was born at Strasbourg, and came to Paris in order to work in the studios of Drolling and Biennoury. This artist gave himself up at the same time to painting and illustration. As a painter he left pictures depicting Alcaïan life. "La Massillaise en Alsace," "Les Adieux à la Patrie," and historical subjects, such as "Camille Desmoulin au Palais Royal," and "Un drame au Moulin Au," which was exhibited last year at the Champs Elysées salon. His illustrations are innumerable.—The death is announced of M. Jules Louis Bertrand, architect, of Valenciennes, at the age of 60.

GERMANY.—The *Deutsche Bauzeitung* reports that the large national monument which is to be erected at Leipzig will be designed by Bruno Schmitz, and that there will be no further competition for this work.—Seventy-four designs have been sent in for the new palm-houses and gardens for Leipzig, and the first premium of 150*l.* has been awarded to Mr. Edward May, of Frankfurt.—A publication has been issued of illustrations of buildings carried out from the designs and under the supervision of Professor Messel, of whose work we have frequently given illustrations.—A memorial tower is to be erected in honour of the ex-Chancellor Bismarck. A competition has been opened for the design, and Professors Ende, Schwechten, and Otzen are the assessors. The locality for the tower is Apenrade in Schleswig.—An interesting series of competitions has been opened by the East Prussian Architectural Society, with a view of obtaining a series of model designs of villa-residences. There are five competitions, each for a different class of building. Competitions of this description should do much to encourage better planning in the smaller German towns.—The "Kreuz Kirche," at Dresden, was destroyed by fire recently; it has only been lately renovated in the interior at an expenditure of 15,000*l.* The building dates back to 1764. It is understood that the church was insured for 75,000*l.*—We regret to record the death of Herr Baurath Kranke, at the age of seventy-seven; he was long associated with the railway works of the Prussian Government, and his life is the subject of a long obituary notice in our contemporary, the *Central Blatt der Bauverwaltung.*—We regret to record the death also of the well-known cathedral architect, Max Salzmann, who has long been associated

with the Dome at Bremen, the restoration of which was placed in his hands after an important competition held in 1888. Herr Salzmann had only attained his forty-seventh year, and was considered to be one of the most prominent church architects in Germany.—The Association of Brickmakers and Limekiln Owners held its annual meeting at Berlin last month, and at the same time the meetings of the cement manufacturers also took place. As usual at these gatherings, a number of highly interesting lectures were given, and there was much discussion on technical questions of the day.

AUSTRIA.—The Architects' Ball which took place at Vienna last month is considered to have been a great success. Among the visitors was the Archduke Otto of Austria. Professor Otto Wagner was the President of the ball. The Prime Minister was present among other political personages.

According to official contemporaries at Vienna it appears necessary to extend the premises of the Great General Hospital by using the site of some historical barracks. The matter will come before the Austrian Parliament during the present year.—A small section of the Vienna horse tramways has been transformed into electrical tramways with a view of giving this system a trial.—The Continental Gas Company at Vienna has just entered into a contract for 15,000 incandescent gas lights for street lighting.

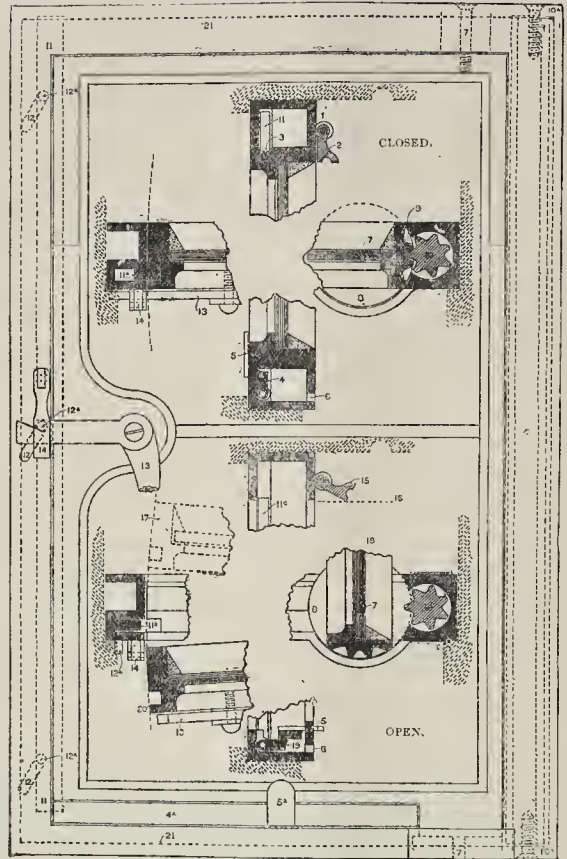

A FIRE IN THE CATHEDRAL AT VERONA.—The ancient cathedral of Verona has had a narrow escape from being destroyed. As it is, damage to the amount of 4,000*l.* has been done, which is covered by insurance; but the old registers in the vestry, some of which dated back to 1503, the altar furniture of gilt wood used on ceremonial occasions, the wax candle offerings at shrines of the past month, objects in silver of the Santa Anna Company, and other furniture were burnt. Fortunately all the most precious objects escaped destruction. The flames were first seen to issue from a window of a room in the building called "De la Cioccolata," because of its serving as a refreshment room for the neophytes.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. Lumleys, of 22, St. James's-street, have instituted monthly sales by auction of shares in trading, manufacturing, gas, water, insurance, and other companies, which do not usually find a market on the Stock Exchange.—Messrs. W. & J. R. Freeman, stone and granite merchants, have opened a new depot in the Great Northern Railway Goods Yard, King's Cross.

GREENWOOD'S TIMBER CALCULATOR.—This is a card to enable the prices of small-sized timber to be determined at a glance, by showing what a certain price per foot cube amounts to per linear foot in various scandlings of timber. The widths and thicknesses are given in cross columns, and the price per linear foot is found at the intersection of the width and thickness columns. The card is arranged so as to apply to twelve different prices per standard and per foot cube. It is likely to save a great deal of labour in computing prices of small timber in estimating, taking out quantities, &c. There should have been some indication on the face of the tables, however, to show that the central columns represent pence and fractions of pence, which is not immediately apparent, though it is sufficiently to be gathered from the explanatory note on the back of the card. It is sold by the inventor, Mr. Harry Greenwood, Mansfield.

AN IMPROVEMENT IN METAL CASEMENTS.—An improvement in the method of manufacture of metal casements, with special regard to the new feature by which the metal casement can be made to open either inwards or outwards, is worth the attention of architects. Formerly there were, as is well known, two kinds of ordinary casements, the one opening outwards and the other inwards. The former is the more usually adopted by architects, but it has the disadvantage of being difficult to clean from within, and when it is adopted in a series of mullions it is necessary that many more are supplied with fittings to open than are actually required. The casement opening inwards, on the other hand, while being easy to clean from the room, has the disadvantage of only being weather-tight at an extra cost, especially in exposed situations, and also interferes with blinds, window drapery, &c., whenever opened for ventilation. The improvement noted above consists in a patent, which has been taken out by the N. A. P. Window Company, of Victoria-street, S.W., by which each casement opens both inwards and outwards. This is effected by various methods, one of which is illustrated in order to explain the system. The border shows the interior elevation and the plans and sections of the casement when closed and open are shown respectively in the upper half and lower half of the window; the slip or tongue (11), is projected by the handle into the groove when the casement is fastened, thereby making a perfectly weather-tight joint for the closing stile. On referring to the other parts of the window in the illustration, it will be noticed they are rendered water-tight in the following manner:—The corrugated rod (10), which is pivoted top and bottom, revolves as the casement

Details of Metal Casement made by the "N. A. P." Window Co.

7. Fivots of casement.
8. Turn-table, enabling casement to revolve freely.
9. Corrugations or teeth, extending from top to bottom of glass stile, one of which always engages a corresponding tooth in the revolving corrugated rod (10) when the casement is closed, and thus secures a water-tight joint.
10. Revolving corrugated rod extending from top to bottom of bunging stile.
- 10a. Fivots of revolving corrugated rod.
11. Slip extending from top to bottom of closing stile, and automatically projected and withdrawn by the closing or opening of the casement handle.
- 11a. Position (automatic) of slip when casement is closed.
- 11b. Position (automatic) of slip when released from handle, enabling casement to be moved inwards and outwards.
12. Guides for pins of slip.
- 12a. Pins of slip—the top and bottom ones being flush with, or slightly below, surface of closing stile, and the centre one projecting and being engaged by notch in latch of handle.
13. Casement handle, the latch of which not only secures the casement in the ordinary way, but also as described in connection with 11 and 12a.
14. Catch for preventing the latch of casement handle being borne down by the weight of the slip.
15. Position (automatic) of head water bar when casement is open for ventilation.
16. Top line of casement when open for ventilation.
17. Casement opening outwards for ventilation.
18. Casement fully open.
19. Water-bar down to enable casement to pass inside for cleansing.
20. Casement opening inside for cleansing.
21. Cement line.

is moved either inwards or outwards, the teeth being in juxtaposition form a close joint. The joint between the head of casement and frame is effectively covered by the automatic bar (2), the action of which is shown in the upper and lower illustrations. The arrangement of the water bar (4) appears simple and effective. The casement is in use at the new Cripplegate Institute, and is about to be used in several buildings in London. The cost appears to be slightly in excess of the ordinary type, but, on the other hand, as fewer casements are required to be opened for cleansing, a saving is effected by this means. The invention, like the other patents taken out by the same firm, deserves our commendation, and we shall be mistaken if it is not largely used by architects in the future.

APPOINTMENT.—It is stated that Mr. W. Wallace Gandy, architect and surveyor, of St. Helens, has just been appointed, out of about 140 applicants, to the position of chief architectural assistant to the Borough Engineer of Accrington.

SOMERSET HOUSE.—A Portland stone wall at the Embankment side of Somerset House, near Waterloo Bridge, has been erected, the work having been

carried out in unison with the prevailing style of architecture of the building. The part thus reclaimed was formerly known as the Dock House, and was in use many years ago as a waterway for the entrance of barges from the river into Somerset House. In addition to the erection of the wall, a large room has been constructed, which will be used as a repository for papers, &c. The work has been carried out under the direction of Mr. Williams, clerk of the works, Royal Courts of Justice.

THE SURVEYORS' INSTITUTION.—The annual dinner of the members of the Surveyors' Institution was held at the Hotel Cecil, Strand, on the 24th ult. Mr. Daniel Watney, the President, occupied the chair, and the company, numbering about 200, included Professor G. Atchison (President of the Royal Institute of British Architects), Mr. C. Oakley, Mr. R. Vigers, Mr. T. M. Rickman, Mr. A. Garrard, Mr. J. F. L. Rolliston, Mr. A. Buck, Mr. C. J. Shoppee, Mr. A. Vernon, Mr. C. Bidwell, Mr. A. Waterhouse, R.A., Mr. E. Windsor Richards (President of the Institute of Mechanical Engineers), Dr. J. H. T. Tudsberg (secretary of the Institute of Civil Engineers), Mr. A. R. Binnie, and

Mr. J. W. Penfold, hon. secretary. After the loyal toasts the President proposed "The Houses of Lords and Commons." Mr. Jesse Collings, M.P., replied. The toast of "The Bench and the Bar," proposed by Mr. C. Oakley, was acknowledged by Mr. Justice Grantham and Mr. E. J. Castle, Q.C. Mr. G. de L. Willis proposed the toast of the evening—"The Surveyors' Institution." He said the Institution was established in the year 1859, and incorporated by royal charter in 1881. The Institution, which was a public authority under the London Building Act, 1894, and other statutes, was now erecting, at a cost of 30,000*l.*, a building in Great George-street for a permanent home. Their membership had risen from 200 in 1869 to nearly 2,800. This year 400 candidates were examined for the Institution certificate. He stated, in conclusion, that the President had provided an endowment of 10*l.* per annum for the best work in the science and practice of forestry. The President responded. The President of the Royal Institute of British Architects and the vice-president of the Royal College of Surgeons responded for the toast of "The Kindred Societies," proposed by Mr. C. J. Shoppee. Other toasts followed.

THE COST OF LONDON BOARD SCHOOLS.—On February 17 last, the Works Committee of the London School Board appointed a Special Sub-Committee to inquire into the cost of the schools now being erected by the Board. The Committee have now received the general report of this Sub-Committee, and have approved the recommendations contained therein, and at the meeting of the Board on the 25th ult. they submitted the report of the Sub-Committee to the Board for their information, together with the recommendations set out below, which, in the opinion of the Committee, are calculated to effect a reduction in the cost of the schools to be erected in future:—"That the Board revert to the old specification in force in 1885-6 for all future schools and enlargements (as suggested by the Architect of the Board), subject to such modifications as the Architect may think it necessary to make, in order to bring the specification up to the present requirements of the Board and the Education Department; and also subject to the further recommendations which are made by the Sub-Committee (see pages 11 to 15 inclusive of the report). That, in future, the brickwork of all piers carrying heavy loads, and also the whole of the external walls, be built in cement, and that internal walls generally be built in mortar. That, in future, the amount which is included in the builder's tender for the supply of glazed brick internal facings be shown on the form of tender as a separate item. That in all building contracts entered into by the Board in future, the quantities shall not form part of the contract. That, in the case of the next six schools erected by the Board upon which the Board's Measuring Surveyor has not commenced any measuring work in connection with the foundations, drainage, &c., the experiment be tried of having the variations on the contract measured up on completion, and the accounts adjusted, by the Quantity Surveyor who took out the original quantities, such adjustment to be completed within a period of six weeks after the completion of the school. That the terms upon which this additional work shall be executed, be the subject of a special arrangement between the Board and the Quantity Surveyors, and that a report be subsequently submitted to the Works Committee showing the comparative cost of the measuring up by the outside Quantity Surveyors, and also by the Board's Measuring Surveyor. That the Quantity Surveyors be required to furnish the Board with all the details and abstracts of their measurements, and also the detailed accounts showing the actual cost of the additions and omissions, for reference if necessary, together with a Summary and Balance Sheet. That, in the above six selected cases, the Architect of the Board be instructed to make the necessary arrangements for measuring the foundations, drainage, &c., during the progress of the work (as has hitherto been done by the Board's Measuring Surveyor), but that the monthly valuations of the work done upon which certificates for payment are given to Contractors during the progress of the work be made by the Board's Measuring Surveyor as at present." A long discussion took place on the subject, and Mr. Diggle reviewed the building policy of the Board at length, and moved that the report go back for further consideration. This was lost by 19 to 18, and a motion (the "previous question") by Mr. Riley, was also negatived; but subsequently a motion to adjourn the debate was adopted.

BERKHAMSTED SCHOOL CHAPEL.—In reference to our comment on Dr. Fry's letter in our last issue, we have been since informed that the executed design was not chosen as the result of a competition, as the phrase "finally accepted design" led us to suppose. Of course in that case our comment on that phase of the matter was not applicable, and we withdraw it.

GESSO.—On Tuesday evening Mr. Matthew Webb gave an excellent practical and critical lecture on "Gesso" at the rooms of the Society of Arts, in connexion with the Applied Art Section. Admitting that it was sometimes not easy to draw the line between stucco and gesso, he thought it was roughly true that gesso was for the brush and stucco for the modelling tool; though the laying on of gesso was, as he showed experimentally, not so much brush-

work as allowing a material to drip from the brush in the line it followed. In the substances usually employed by the gesso worker, all the binding, hardening, and cohesion was given by the hardening of glue and oil; in stucco those ingredients might be injured. It was the difference between carbonate and sulphate of lime, calcium being the metallic basis of both. In gesso proper, whitening or chalk was used, the carbonate, which might be washed away by water; in stucco the sulphate was used, such as plaster of Paris, which would set under water. The various technical difficulties of gesso work were minutely described, and a good many examples exhibited illustrating various points in regard to both the practical nature and artistic use of the material.

THE HISTORY OF THE ARCH.—The ninth of the series of fortnightly lectures at the Glasgow Corporation Galleries on art subjects was delivered recently by Professor F. M. Simpson, of University College, Liverpool, whose subject was, "The History of the Arch." The lecturer began by saying that although the lintel form of construction was older than the arch form, the latter was more ancient than was generally supposed. It was known to and used by the Egyptians 3,000 years before the birth of Christ. The most interesting discovery had been that of the gates of Khor-sabad, in Assyria, which dated from 721 B.C. Both the pointed and semicircular-headed forms were used by the ancients, although the former shape was generally not constructed with radiating voussoirs, but with stones projecting one in front of the other, the joints being horizontal. The god-fathers of the arch were really the Etruscans. From them the Romans learned it, and used it universally in their buildings. All the Roman arches were semicircular, and were constructed on true arch principles. So were the arches used by the Byzantine and Romanesque builders. The pointed form reappeared in the Saracenic work of the ninth and tenth century, and was adopted by the medieval architects to solve certain difficulties in construction—principally those of vaulting over oblong spaces. It was constructed properly with radiating voussoirs, but the old idea that the Gothic men invented the pointed arch was a mistake. At the end of the fourteenth century the arch became again semicircular, and this continued until the Gothic revival at the end of the last century once more brought the pointed form into fashion. The lecture was illustrated with a fine series of lantern slides.—*North British Mail.*

PRESENTATIONS AT AN ANNUAL TRADE DINNER.—The third annual dinner of the heads of departments and representatives of the firm of Messrs. Young & Marten, which took place at the Holborn Restaurant, on the 20th ult., coincided with the 25th anniversary of the firm, and was made the occasion for presentations to Mr. H. H. Marten, the head of the firm, and to Mr. E. M. Edwards, the manager, who each received a testimonial in the form of a piece of silver plate with an appropriate inscription. Mr. B. Carter, in making the presentation to Mr. Marten, congratulated him upon the attainment of the 25th anniversary of the business. Those present were glad of the opportunity of thanking Mr. Marten sincerely for the great kindness and consideration which he had extended to them continually. Mr. E. Montague Edwards, who occupied the vice-chair, next proposed the toast of "The Firm," and coupled with it the name of Mr. H. H. Marten, the proprietor. Mr. T. B. Lupton (manager of the Leytonstone Branch) subsequently made the presentation to Mr. Edwards, congratulating him on the position he had gained, and the share he had had in the practical management and development of the firm for twenty-three years.

DESIGNS FOR INVITATION CARDS, OPENING OF BLACKWELL TUNNEL.—The Bridges Committee of the London County Council are prepared to offer prizes: one of five guineas, one of two guineas, one of one guinea, and seven of ten shillings, for designs in black and white, or in any one colour, for a card of invitation to the ceremony. The designs must be upon thick card, not larger than 12 in. by 8 in., and may, if the competitor please, embody a section of the tunnel, illustrations of which will be sent to intending competitors on application to the Secretary of the Technical Education Board. The prizes will be adjudicated by the art advisers of the Board, and all designs must be received by the Board's Secretary not later than Thursday, March 25. Students in any of the London Schools of Art, or in any of the classes conducted or aided by the Technical Education Board, will be eligible to compete.

CARPENTERS' HALL LECTURES.—A very interesting lecture on the Work of the Electric Current was given by Dr. Fleming on Wednesday evening. Numerous lantern illustrations were shown, and his method of projecting experiments on a screen is a great improvement on the older method of showing them on the lecture table. For example, he projected the mechanism of an electric bell on the screen, and then very clearly explained its action. To illustrate electro-plating, a lead fork was shown on the screen being rapidly coated with lead; as the current was too strong he compared it to a labourer bringing bricks too quickly, so that heaps of loose bricks were soon piled up round the bricklayer. He pointed out that the electrolytic production of aluminium was now a great industry,

A few years ago it cost several shillings an ounce, now it could be bought for 1*s.* 6*d.* a pound. He prophesied that it would soon be as cheap as copper, and that then aluminium ships and girders would be made. The great progress of electric lighting was proved by the fact that the number of lamps connected in London had doubled within the last three years. In the United States, he said that there were 100 miles of electric tramroads working, and that the capital expenditure on electric traction was now over fifty million pounds. He mentioned that all the great practical applications of electricity had sprung out of pure scientific research, and made an eloquent appeal on behalf of pure scientific work as the basis of all advance in the arts. Lord Reay, who took the chair, expressed a hope that the Government would accept the proposal for a National Physical Laboratory, and endorsed Dr. Fleming's remarks on the importance of the search for the truth concerning the forces and mysteries of the world in which we live.

PROPOSED PORTRAIT OF THE EX-PRESIDENT OF THE INSTITUTE OF ARCHITECTS.—The Council of the Royal Institute of British Architects, in furtherance of what they believe to be a very widely-spread wish, have appointed a Committee to take such steps as may be deemed advisable to obtain a portrait of Mr. Francis C. Penrose, F.R.S., to be hung on the walls of the Institute, in recognition of his distinguished services in the cause of architecture, and the admirable manner in which he filled the office of President during the years 1894-96. Subscriptions are invited from members of the Institute. The names of the Committee are Messrs. L. Alma Tadema, Ernest George, Alex. Graham, Ed. W. Mountford, and A. S. Murray.

CAPITAL AND LABOUR.

WAGES IN THE COVENTRY BUILDING TRADE.—At the end of last year the various branches of the building trade in Coventry, except the painters, applied for an increase of wages, and in some cases for alterations, some of an important character, to the working rules. The bricklayers, masons, plasterers, plasterers' labourers, scaffolders, and carpenters and joiners, asked for an increase of 1*d.*, and bricklayers' labourers 3*d.* per hour. The Master Builders' Association, in reply, offered the men half the advance they asked, and in regard to the rules made several concessions, refused demands which they considered ought not to be made, and suggested a few alterations, merely with a view to bringing about uniformity on certain points. The workmen, however, have indicated an unwillingness to accept the financial proposals of the Association, and the replies of some of the societies ignore the attitude of the masters upon the question of suggested alterations to rules. The workmen have agreed to appoint delegates to meet the masters to discuss points upon which there is disagreement, and questions that remain unsettled will go to arbitration. The masters are anxious to meet the men as far as possible, believing, under the circumstances, that they are entitled to some improvement in their position. But they are of opinion that a 1*d.* increase is excessive, and that some of the proposed alterations to the rules would have a consequence disagreeable to both employers and employed. While desiring to act justly to the men, they think it only right to consider the conditions of employment prevailing in the district. In some Warwickshire towns the workmen engaged in the building trade get considerably less than is being received in Coventry, and the concession of such a large advance to workmen, in comparison already most favourably circumstanced, the masters believe might work unfortunately for both parties. In view of the activity in the building trade everything will be done to facilitate a speedy settlement of the dispute, and it is thought unlikely that anything will arise likely to prevent a mutually satisfactory conclusion.—*Coventry Herald.*

THE BRICKLAYERS' AND PLASTERERS' DISPUTE, NEWCASTLE.—The dispute which has existed for more than twelve months between the bricklayers and plasterers, as to which set of tradesmen should do certain cement work, has at last been brought to a termination. Several attempts have from time to time been made to effect a settlement. Recently, at the invitation of Mr. J. W. Dyson, architect, representatives of all the parties to the dispute, together with some of the leading architects, met at the County Hotel for the purpose of discussing the matter in a friendly spirit. At this meeting a suggestion was made by Mr. R. J. Leeson, that two architects, two master builders, two plasterers, and two bricklayers should meet in a round-table conference for the purpose of discussing seriatim the items in dispute. This was unanimously adopted, and the following gentlemen were selected as representatives, viz.:—Messrs. J. W. Dyson and R. J. Leeson, architects; Messrs. Walter Lowry and S. B. Burton, master builders; Messrs. Hope and Drummond, bricklayers; and Messrs. Young and Carron, plasterers. The result has been that a detailed schedule has been agreed upon, defining the particular class of work to be done by each trade. The representatives of the trades and also the master builders have submitted the schedule to their

different societies, and in each case it has been adopted and approved. A further outcome of the conference has been that the gentlemen forming it have been asked by the societies and master builders to act for one year as a Conciliation Board; they have consented to do so, and it has been agreed that all questions in dispute as to cement work should be referred to them for final decision.—*Newcastle Chronicle.*

THE BUILDING TRADE IN GLASGOW.—For some time past the building trade in Glasgow and district has been on the boom, but the zenith seems now to have been reached and a tendency towards decline is beginning to be observed. There is as yet nothing like slackness, but the future prospect is not so brilliant as it was a twelvemonth ago. Wages at present are pretty good. Masons, bricklayers, and joiners are being paid at the rate of 9d. an hour, with 4d. an hour extra for travelling, &c., expenses, when engaged in outlying districts. The joiners are not satisfied with this, and have just sent in an application for 3d. an hour advance, which the masters will have to take into consideration. Plumbers have been in receipt of 81d. an hour, and they are pressing for an increase of 1d. Their demand will be discussed shortly at a joint conference.—*Glasgow Evening Citizen.*

LEGAL.

THE CLAIM AGAINST THE ST. PANCRAS GUARDIANS.

MR. EDWARD RIDLEY, Q.C., the Official Referee, on the 1st inst. resumed the hearing of this claim. The plaintiffs, who are builders' merchants, sue (as trustees of creditors of Mr. Wm. Brooks, builder of Folkestone), the Guardians of the Poor of St. Pancras and their architects, Messrs. A. & C. Harston, for a balance of 24,262*l.*, or, alternatively, 24,262*l.*, alleged to be due on a contract for the completion of the St. Pancras workhouse. The plaintiffs' case is that some years ago the Guardians resolved to reconstruct the workhouse in King's-road, and appointed Messrs. Harston as their architects. The contract for the work was first taken by Messrs. Kirk & Randall, of Woolwich, but disputes arose, and, in 1892, that firm requested to be relieved of further work under the contract. Fresh tenders were invited for the unfinished work, and that of Mr. Wm. Brooks was accepted for 50,861*l.* The work was to occupy fifteen months from May, 1892, but delays arose, and in November, 1894, the work was stopped. Messrs. Drew-Bear, Perks, & Co., of Queen Victoria-street, who supplied the ironwork; Mr. H. Tolput, of Folkestone, who supplied the timber; and Mr. J. Brown, of Cannon-street, who supplied bricks, sued on behalf of creditors for the balance alleged to be due to Mr. Brooks. The net cost of the work executed was stated to be on the first claim 65,479*l.*, plus 10 per cent. profit, 6,547*l.*, making 72,026*l.*. The plaintiffs alleged that Brooks was hindered in what they paid for. He had known of building out of their own pockets to remedy the defect, for the sake of their own reputations. Witness, examined as to the slates, said that those which came up to the job were of very fair quality. It was not true that he made objection to them, but he did complain about some of them being damaged by careless handling. The ridge rolls he found to be very inferior and bad; in fact, they were not "rolls" at all. That was in March, 1893. The rolls should be rounded, but the ones he objected to were more hexagonal in shape. The screw rolls were wrong, there not being sufficient of them. When he objected to those rolls he did so in the exercise of his skill and judgment as an architect. In May, 1893, he saw another lot of rolls on the job, but they were the same as the last. It was not true that he required a better class of goods than was specified. His attention was first called to the galvanised tanks in March, 1893. In April, 1893, he wrote saying that they had better see that the tanks were water-tight before they were hoisted. The tanks were taken backwards and forwards, and then ultimately regalvanised, passed, and used. The tanks were only galvanized once. Four tanks out of seven were objected to. It was perfectly obvious that if the tanks were oxidised or rusty they ought not to go up. In that class of goods rust would extend. He objected to the contractor who ran short of boarding using some of the boarding stuff on the coach-house roof. As the boards had been in use for boarding for three years they were in a very dirty condition. In January, 1893, Poole made a communication to him about twenty-seven sashes and frames. He went and saw them in the stores. They were not, in his opinion, in accordance with the specification, but he passed them, and told Poole to say nothing more about them. At the time he saw them in the stores there were some men there, and

Randall in the stack before making the contract with Brooks. They had, however, neither passed it or rejected it. Witness knew it was sappy, hence his caution in putting the provision relating to sappy boards in the bills of quantities. He had no knowledge of the condemnation by Poole during the time it was in Kirk & Randall's possession. It was part of Brooks' contract to take out the sappy boards which Kirk & Randall had laid. On June 15, 1893, he examined some flooring. Prior to that, he had discovered from Mr. Poole's reports that some objection was being made to the flooring. He examined the flooring on the top floor of "C" Block, when he found a number of boards marked by Poole as being sappy, and they were sappy. He found that the floor was not properly laid or cleaned off properly. He told Fearon that he must take up some of the flooring marked, and that it must be cleaned off and laid properly. Some of the boards were taken up. He had seen the flooring since two or three times. It was in very fair condition now; but still there were a few sappy boards in it, some with as much as an inch of sap in them. That was Kirk & Randall's boarding. It was not true, as Fearon suggested, that he (witness) said that all the boards that Poole had marked should be taken up. He told Fearon that some of them must be. He never told Fearon that he would have to submit to Poole in every detail, and that he would support Poole in everything he did. The objection to sappy timber was that it would not wear, and soon got rotten. Further, it was prohibited in the specification. The witness was next examined as to the old cast iron tank in "K" Block, which had to be taken down and made smaller by removing a tier of plates and putting it up again. The witness said that he examined the plates to see if they were sound, because the specification stipulated that any defective plates had to be replaced by new. He had one of the plates broken to see how far the metal was sound. He came to the conclusion that they were fairly sound, so that he did not ask them to provide any new plates for the tank, and the old plates were used. He did not know that Poole had objected to the plates or tank. Fearon never made any complaint to him about the clipped tank or the way in which the tank had been treated. With reference to the question of the plaster arches in the committee room and the steward's clerk's office, the witness stated that the brickwork was satisfactory, the only complaint being as to a defect in the plastering. That was in October, 1893. Fearon admitted they were defective, and said he would put them right. Fearon made no complaint whatever of the drawing. The defect was that on one side of each arch the curve was broken; there was not a true curve. After the arches were executed by the tinner they were not again condemned. So far as he could he assisted Fearon to get the things right. It was a very simple matter, and Fearon ought not to have required any assistance at all. He had never in thirty years' experience given assistance in such a matter. Examined as to the concrete foundation the witness said that his attention was called to some brick rubbish being used in the trenches. This he considered a very serious thing, as the concrete foundation had to carry the weight of the building. The foundation ought to become a hard, solid mass, but if brick rubbish was put in they were not getting what they paid for. He had known of building out of their own pockets to remedy the defect, for the sake of their own reputations. Witness, examined as to the slates, said that those which came up to the job were of very fair quality. It was not true that he made objection to them, but he did complain about some of them being damaged by careless handling. The ridge rolls he found to be very inferior and bad; in fact, they were not "rolls" at all. That was in March, 1893. The rolls should be rounded, but the ones he objected to were more hexagonal in shape. The screw rolls were wrong, there not being sufficient of them. When he objected to those rolls he did so in the exercise of his skill and judgment as an architect. In May, 1893, he saw another lot of rolls on the job, but they were the same as the last. It was not true that he required a better class of goods than was specified. His attention was first called to the galvanised tanks in March, 1893. In April, 1893, he wrote saying that they had better see that the tanks were water-tight before they were hoisted. The tanks were taken backwards and forwards, and then ultimately regalvanised, passed, and used. The tanks were only galvanized once. Four tanks out of seven were objected to. It was perfectly obvious that if the tanks were oxidised or rusty they ought not to go up. In that class of goods rust would extend. He objected to the contractor who ran short of boarding using some of the boarding stuff on the coach-house roof. As the boards had been in use for boarding for three years they were in a very dirty condition. In January, 1893, Poole made a communication to him about twenty-seven sashes and frames. He went and saw them in the stores. They were not, in his opinion, in accordance with the specification, but he passed them, and told Poole to say nothing more about them. At the time he saw them in the stores there were some men there, and

he was told they were putting right some of the defects. He did make objection to bats being used improperly. He remembered one instance on "H" Block; he found bats, and bats only, being carried up on the scaffold, heaps being on the scaffold, and a number hanging in the work where they ought not to have been. Very few bats were required in an 18-in. wall. He never made any objection to old bricks being used if they were sound old bricks.

The witness produced specimens of old bricks which he had condemned, and specimens of those which he would have passed, and which were taken from a cart as they were being carted away from the works.

As to the lintels, the witness said that some were fixed too high, and he told Fearon that they must be lowered at once. In such a building he never allowed lath and plaster work, nothing but solid walls, and he, therefore, insisted on solid brickwork all through.

Cross-examined by Mr. Bray: He did not admit that he had erected the case; if he had done so it was not from want of experience or care. He generally got Poole's reports at the end of each week, and carefully perused them, and went on the works himself about once a fortnight. Witness knew from Poole's reports that a large quantity of materials was objected to. Some of the materials objected to were afterwards used, but witness had a right to allow inferior material to be used after he had expressed his objections, in the hope that next time the contractors would do better. Witness never told Poole not to make so many objections; they were, indeed, proper so far as he (witness) could see. It was quite probable that exactly the same objections were made to the same materials in Kirk & Randall's time as in Brooks's, and very naturally so. There were a great many disputes in every job where Kirk & Randall were employed, but witness only remembered coming in contact with them on one previous occasion. In this case Kirk & Randall asked to be released from the contract, and witness advised the Guardians to do so. He did not know why they objected to go on, but he did know that at the time prices both of material and labour had gone up.

The witness, further cross-examined by Mr. Bray, said he thought it very unlikely that the reasons put forward by Kirk & Randall for claiming rescission of their contract was the conduct of himself and Poole. It was a common thing to complain about the clerk of the works. Poole was clerk of the works in Kirk & Randall's time. He nominated Poole, but he did not press for his appointment. He had no recollection that the Guardians wished to get some outside person and advertise for him. He might have probably told the Guardians that he knew Poole, and that he (Poole) had been with them for some time. As witness was arbitrator under the contract, the contractors were, no doubt, to some extent in his hands. Poole would see that the builder did not use materials not up to specification, and the work would be stopped until he (witness) adjudicated upon it. If the building were to come on one occasion at any time, witness would have come on one occasion.

Mr. Bray: Fearon states that on several occasions you told him that he must obey Mr. Poole or you would have the work taken down—That I deny; I never told him anything of the kind.

Cross-examination continued: If there were salt in the sand it would show itself on the brickwork as a white fur for some months, but witness could not point to any place in the building where the brickwork showed such marks, nor had he seen any. If the sand were salty the walls would be damp in certain conditions of the weather. Witness could not refer to any place where too fine a quality of sand was used; the fact was the fine sand was mixed with coarser stuff and so did not do much harm.

Mr. Bray asked the witness whether he knew that the Guardians were to give possession of the whole of the site at once.

Mr. English Harrison said that that was a question of construction of the contract.

Mr. Bray: No, it is something to do with the fairness of Mr. Harston.

Mr. Harrison: My contention is that the architect is not responsible for an error of judgment, however grievous the mistakes might be resulting therefrom.

Mr. Bray said that he did not contend that he would be. He wished to show that the contractor could not gain possession of a sufficient portion of the site.

Mr. Harrison said that the architect's conduct could only be impugned on an allegation of fraud.

Mr. Bray said that fraud was not alleged in the case.

The learned Referee said that doubtless the architect, as arbitrator, had to exercise his discretion to the best of his judgment, but if his conduct had been such as to render it impossible for the work under the contract to be continued—he did not say it was so in this case—it would support the plaintiff's contention that the contract had been set aside and a readjustment must be made on *quantum meruit*.

Cross-examination continued: Witness did not consider that any unnecessary delay, so far as he was concerned, took place in giving possession to the contractor. He urged the Guardians from time to time to clear the holdings as speedily as possible,

to allow Brooks to get on. Asked as to the iron work, the witness stated that all the iron merchants when asked to supply a girder an exact weight according to the lists, replied asking for time, as they had not that particular make in stock; witness therefore specified for certain sizes and weights "net"—that was actual, not reputed weights. Witness's objections to the rejected columns and "B" girders were, he maintained, reasonable. He objected to screwing the lugs on the columns instead of them being cast in one piece, because they were not so strong, nor did they look as well. Passing on to the question of brickwork, the witness said he considered the bricks as a whole fair, but he could point out some bad specimens. He did not think the sample of brickwork produced in Court as quite up to the average; it was from the wall of the yard of "H" Block. The stock facing brickwork was as a whole good, although it contained work rejected by Poole. Brickwork might, as a whole, be very good, and yet contain some poor work. Witness heard what Holland and his foreman, George Smith, had said about coming from the Stepney Asylum job in 1893 to St. Pancras to see the brickwork. He would not have sent them over if the brickwork was bad, and, as a matter of fact, witness did not believe he did send them to look at the St. Pancras job. Holland failed soon afterwards, but witness could not say the Holland attributed that to witness. It was very likely that there were similar complaints about bricks, timber, flooring, &c., against Holland as occurred with Brooks. Witness always refused to pass bricks by inspecting them in the barges, as he had often been imposed upon, the bricks under the batches being of a different quality from those that were visible on deck. As to the plastering, the witness said that he claimed the right to have the order and in the particular way he required. Coming to the flooring, the witness said that he knew that many of the boards were sappy, but he allowed the Guardians to take them over and pay for them, for they could be utilised for some other purposes. The flooring had to be stacked before being used, but that did not prevent Brooks from bringing on to the job that he did not know that they were to be stacked for two years. If Poole had said so, it was not in the specification. Brooks gave credit for about a 500*l.* for old bricks, but witness would not allow them to be used except in foundations; he did allow bats to be used for certain purposes, although it was prohibited in the specifications. The nine lintels objected to were 4*in.* to 5*in.* too high; this would be hidden by the lining, but when the plasters were set it would crack at that point. Witness had heard in Court that two of the lintels were left at the high level, but he had not seen them. Witness was pressed as to his objection to the gutters when Poole did not allow them to be used, because Messrs. Macfarlane had by mistake made the sockets inside instead of outside. Witness was asked what difference this would make? He replied that it was not according to the drawings, and the makers admitted it was wrong; after this he should be inclined to think that nothing did matter at all in building matters. The only difference would have been in appearance. Witness did write to the Guardians that the delay in the laundry and other buildings was due to the delay of Messrs. Benham. There were many complaints in Poole's diary as to delay by Messrs. Benham, and Fearon also complained. There was a penalty clause in the contract, and the makers admitted it was claimed. The salt glazed bricks were generally poor, and many were too dark. The ironwork was generally bad, and the timber was one of the weak points.

Re-examined by Mr. English Harrison:—
So far as witness was concerned he had nothing to do with the failure of Holland. He failed in the middle of a contract. The Guardians purchased everything left by Kirk & Randall, except a few broken drain-pipes, and witness put the cautionary clause, as to sappy timbers and facing bricks, to warn any future contractor, knowing, as he did, of the condition of these materials.

Mr. Alfred Arthur Millward examined, said that he was Clerk to the St. Pancras Guardians. He remembered Fearon calling upon him on May 31, 1892, just as the contract was signed. It was not true that he told Fearon that he could not begin the work as nothing was ready, and that nothing had been arranged as to shifting the inmates. As a matter of fact, the Guardians had made arrangements for boarding out the inmates, and arrangements had been made by which the Master of the Workhouse could make vacant the main block in front, or the main portion of it, within twelve hours' notice, so as to allow the builders to proceed. That was now the "B" Block. Witness told Fearon to see the Master of the Workhouse—Captain Miller, and Messrs. Harston who would make the necessary arrangements. He frequently saw Mr. Fearon on the works and was always accessible if required. Until the case was launched, and during the whole of the operations, he never heard a suggestion, either from Brooks or Fearon, that the architects or clerk of the works were acting unfairly or dishonestly.

Mr. Bray: Unfairly. I never used the word dishonestly.
Mr. Moyses remarked that the whole of his

learned friend's cross-examination was directed with a view to show that Mr. Harston had been unfair to such an extent as to amount to dishonesty.

The learned Referee: I think we had better not discuss this subject now. I say there has been no charge against Mr. Harston of dishonesty in this case from beginning to end.

Mr. MacIntyre: It is made in the statement of claim.

The learned Referee: If it is used there it is certainly not used in the sense of fraud or collusion.

Mr. Moyses remarked that in the statement of claim fraud was mentioned no less than seventeen times.

Cross-examined by Mr. Bray.

It was not his business to interfere with the builders. Brooks was not delayed on "K" Block owing to the engineers' work in the laundry—at least the Guardians were assured that they were not. Captain Thomas Miller, the Master of St. Pancras Workhouse, examined by Mr. Moyses, said that he recollects seeing Fearon on the day the contract was signed. Fearon said that he wished to commence operations as soon as possible, and witness told him that he should be ready in two days, and that he would clear the part of the building Fearon wanted to go on with within that time. Arrangements had been made to put the inmates out to other unions. Witness did not say that nothing was ready or arranged. Nor did he hear Mr. Millward say so. It was not true that Fearon was constantly asking him for possession of the old Insane Block. He did not recollect referring Fearon to the architects on any of those matters.

Cross-examined: He had had very few conversations with Fearon, as he had nothing whatever to do with the building or the building operations. Mr. Frederick Purchase, a member of the Board of Guardians, and a member of the Building Committee gave evidence as to never hearing any complaints either at the Board or Committee Meetings that Mr. Harston was acting either unfairly or dishonestly. The witness said that there was no suggestion, to his knowledge, that the contract was being departed from. The Guardians always adhered strictly to the contract.

Cross-examined: It was the duty of the architects representing the Board to watch over the interests of the ratepayers, and to see that the work was carried out according to specification.

Mr. Charles Challen, a member of the Board of Guardians and of the Building Committee, corroborated the evidence of the last witness.

Cross-examined: He may have heard Fearon say that the clerk of the works was obstructing him, but he knew that it was untrue. He left everything to the architects, who were the arbitrators under the contract.

Mr. Boden, a retired builder, the Chairman of the Building Committee, gave evidence as to speaking to Fearon on several occasions. Fearon made the usual contractor's complaints as to the architects and clerk of the works. Witness's reply would be that if a complaint in writing were sent to the Clerk of the Board the matter would be inquired into by the Committee. He did not remember any official complaint being brought before the Board. There was never any complaint which imputed unjust or dishonest dealing on the part of the architects or Poole.

Cross-examined: He knew that Poole was a difficult man to get on with. He believed that Poole thoroughly understood his business and would take a specification and have it carried out to the letter. He might have told Fearon that Mr. Harston would have every line of the specification carried out as it ought to be. Mr. Tilley (Thomas Tilley & Sons, well engineers), who did some work at the workhouse in 1893, denied that his men interfered with or prevented Brooks's men going on with their work.

Mr. Thomas Wm. Youan, foreman to Messrs. Benham, who did the engineering work to the laundry, was called, and said that he had no complaint to find with Poole or Mr. Harston. Mr. Harston required the specification carried out, but if work was properly executed there was never any trouble.

Mr. A. H. Woolley, secretary to Nash & Co., machinists, of Slough, gave evidence as to machine paviers being in October, 1892, 5*s.* dearer than pick stock facings on the field.

Joseph Liveock, who superintended the fixing of lifts at the workhouse, said that whenever his men interfered with any joinery work at the building his firm's carpenters made it good.

Mr. Stephen Dobson, a works manager of the St. Pancras Ironwork Company, who did some ironwork at the workhouse, denied that there was any delay on his company's part in fitting-up, nor was there any interference with any part of the work carried on by Mr. Brooks.

Mr. G. R. Crickmay, architect, of Victoria-street, Westminster, the arbitrator to the Local Government Board, gave evidence as to accompanying Mr. Harston to the workhouse on January 13th last, to examine the work which had been done by Brooks, having with him extracts from the specifications and some of the drawings. The witness said that the bright picked stock bricks were irregular in shape and chipped very much. The labour was fairly good, but the material unsatisfactory. The

red brick facings in C Block were very much knocked about, and the bricks in A Block were knocked about, and had fire cracks in a number of them. The blue bricks were very sandy on the side, and the salt-glazed bricks varied very much in colour. The York stone step in the entrance-hall was very much laminated, and should not have been put there. The flooring-boards he found to be of a very inferior quality, and the sash-frames were not sarked in accordance with the drawings. The joinery work had shrunk very much, which showed that the wood was unseasoned. From what he saw of the work and material there, he thought the architects had been fairly lenient with the builder.

Cross-examined: He considered the specification an ordinary one. Witness was very careful in drawing out a specification. All brickmakers made bad bricks as well as good.

The learned Referee, during the course of Mr. Crickmay's evidence, asked the learned counsel engaged whether the case could be finished by Saturday, and remarked that if it could not it would have to stand over till May.

Mr. English Harrison and Mr. MacIntyre intimated that in all probability the case could be finished by Saturday. Mr. MacIntyre remarked that in certain circumstances he should have to call, on behalf of the architects, three witnesses—Mr. Currey, Mr. Davis, and Mr. McCormick.

The learned Referee said that, subject to what might be said to the contrary by Mr. Bray, he did not see how the architects could be made defendants to the action.

It was arranged that the learned Referee should visit the workhouse before the case terminated to view the work which had been done, he being accompanied by two persons to be nominated by each side to point out what had been done.

Mr. Crickmay, cross-examined by Mr. Hudson, said that although he could not point to any workhouse which was better built than the one in question, he had seen buildings of a similar character which were better built.

At the conclusion of the evidence called on behalf of the Guardians, the learned Referee, on the submission of Mr. MacIntyre, decided that the plaintiffs had made out no case against Messrs. Harston, the architects, there being no evidence that they had been guilty of fraud, dishonesty, or collusion. The learned Referee accordingly entered judgment for Messrs. Harston, but reserved the question of costs.

The case against the Guardians was proceeding when we went to press.

MEETINGS.

FRIDAY, MARCH 5.

The Architectural Association.—Dr. F. S. Granger on "Greek Sculpture and Greek Legend," with lantern illustrations. 7.30 p.m.

SATURDAY, MARCH 6.

The Architectural Association.—Spring Visit to Her Majesty's Theatre, Haymarket. 2.30 p.m.

Sanitary Inspectors' Association.—Annual Dinner, Holborn Restaurant. 6 p.m.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at the Marylebone Stoneyard, Richmond-street, Edgware-road, W. 3 p.m.

Institution of Junior Engineers.—Conversation at the Westminster Palace Hotel. Reception at 7.30 p.m. by the President, Mr. A. R. Binnie, M.Inst.C.E., and Mrs. Binnie.

MONDAY, MARCH 8.

Surveyors' Institution.—The Right Hon. Horace C. Plunkett, M.P., on "Agricultural Co-operation." 8 p.m.

Sanitary Institute (Lectures for Sanitary Officers).—Professor A. Bostock Hill on "Factories, Workshops, and Offensive Trades." 8 p.m.

TUESDAY, MARCH 9.

Institution of Civil Engineers.—Further Discussion on (1) "The Main Drainage of London," by Messrs. J. E. Worth and W. Sauto Crimp; (2) "The Purification of the Thames," by Mr. W. J. Dildin; and (3) paper to be read, time permitting, "The Mond Gas-Producer Plant and its Application," by Mr. H. A. Humphrey. 8 p.m.

Carlisle Architectural, Engineering, and Surveying Society.—Mr. W. Pogson on "Stresses in Ironwork."

WEDNESDAY, MARCH 10.

Carpenters' Hall, London Wall.—Paper by Professor Banister Fletcher, entitled "Is a National Twentieth Century Style of Architecture Probable?" Illustrated. 8 p.m.

Society of Arts.—Mr. Frederick Bathurst on "The Prevention of Fires Due to the Leakage of Electricity." 8 p.m.

Sanitary Institute.—Mr. Baldwin Latham on "Indian Sanitation." 8 p.m.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection of Disinfecting Apparatus and Model Steam Laundry at St. John's Wharf, Fulham. 3.30 p.m.

Architects' Benevolent Society.—Annual General Meeting of Donors and Subscribers. 3 p.m.

St. Paul's Ecological Society.—Mr. J. N. Comper, on "The Reasonableness of the Ornaments Rubric, illustrated by a comparison of the German and English Altars." 7.30 p.m.

THURSDAY, MARCH 11.

Royal Institution.—Professor Percy Gardner, F.S.A., on "Greek History and Extant Monuments." II. 3 p.m.

Society of Antiquaries.—(1) Professor Windle on "Neolithic Implements found in Worcestershire;" (2) Mr. A. Bullard on "Discoveries at the Glastonbury Lake Villages." 8.30 p.m.

CONTRACTS AND PUBLIC APPOINTMENTS.

CONTRACTS.

Table with columns: Nature of Work or Materials, By whom Required, Forms of Tender, &c. Supplied by, and Tenders to be delivered. Includes entries for Bridge Work, Sewage Works, Cottages, and various public buildings.

CONTRACTS—Continued.

Continuation of the Contracts table, listing items like Limestone and Gravelts, Sewage Farm Works, and various engineering and construction projects.

PUBLIC APPOINTMENTS.

Table listing public appointments with columns: Nature of Appointment, By whom Advertised, Salary, and Applications to be in.

Those marked with an asterisk (*) are advertised in this Number. Contracts, pp. iv. vi. & vii. Public Appointments, pp. xvii. & xxi.

Institution of Electrical Engineers.—Mr. H. Benest on "Some Repairs to the South American Company's Cable off Cape Verde 1895 and 1895." 8 p.m.

Royal Institution.—Professor A. Smithells on "The Source of Light in Flames." 9 p.m.

Institution of Civil Engineers (Students' Meetings).—Mr. H. F. Brand on "The Inverness Section of the Inverness and Aviemore Railway." 8 p.m.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Aylebury Dairy Company's Premises, Bayswater, 3 p.m.

Edinburgh Architectural Association.—Visit to Hutton House, West Calder.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS. 2,724.—CIRCULAR SAWS: J. Benton.—The invention consists in the application, in a circular saw bench, of two small horizontal saws to operate upon and take the wood, in whatever breadth may be required, by means of a mechanical attachment to small discs with collars, which slide up and down, as required, on spindles; and also the application of a feed roller, by means of which the wood is fed continuously, and held tight to fence in combination with endless chains and mitre cogs to drive the spindles and automatic feed.

top layer, binding medium, and ground mass. Top layer consists of asphalt powder, brought to a glowing temperature before being introduced into the stone mould. Binding medium consists of Portland cement, pulverised unslaked lime, and ground strass. Ground material consists of a stone of rocky hardness of porous nature, as porous basalt lava, found in the neighbourhood of Laucher Lake and elsewhere, which is used in three degrees of size of particles. These materials, slightly wetted, being introduced into the mould and while the top material is put in very hot, all are subjected to a pressure of about 300 atmospheres. 24,081.—FLUSHING APPARATUS FOR TROUGH CLOSETS, LATRINES, &c.: H. Clay.—To flush basins and troughs and latrine pipes, inventor employs a tank provided with an auxiliary syphon to give an after flow, which tank contains flushing water. Above the tank is a smaller one fed with the large tank by means of a syphon, whereby when the larger tank is full the next discharge from the smaller tank sets up the main syphonic action of the larger one. The said stand-pipe dips into a well below the larger tank and into this are led the flushing pipes. This form of tank is particularly applicable where a periodical flushing is required. 3,354.—CISTERN SYPHONS: H. A. McCornick.—Invention consists in a chamber connected with the discharge pipes, having a plunger, bellows, &c. adjustable so that by a movement a vacuum is caused into which the air from the discharge pipe is drawn, the liquid in the cistern following it, thus causing the discharge. A dip, or valve, &c. prevents air being drawn in through outlet, and the gurgling is prevented by a trumpet mouth to end of syphon. 4,594.—APPARATUS FOR STARTING FLUSHING TANK SYPHONS: J. Jobbins.—In this invention as applied to water closets, the syphon in the flushing tank is put into action through the medium of a piston which fits a cylindrical chamber provided in the flushing pipe and a converted piston-rod, carried through a stuffing-box is extended through the wall into the closet. Other arrangements are also specified.

neys and Flues.—4,048, W. Robinson and S. Brookfield, Cement and Concretes—4,067, H. Harrison, Cutter Heads for Wood-working Machinery.—4,075, C. Tully, Chimney Draught Shield.—4,076, C. Olyphant and A. Cunneen, Stoves or Grates. FEBRUARY 15.—4,441, T. Horn, Window Glass.—4,446, H. Fitzpatrick, Sash Locks or Fasteners.—4,459, H. Brown, Automatically-Locking Sash Holders.—4,492, G. The Architecture of Our Large Provincial Towns.

V.—CARDIFF.

OMEBODY who was not very well posted in his subject once termed Cardiff "a Welsh Chicago," meaning thereby that within a very few years it had sprung from nothingness, and was, in fact, a great town without a past. This certainly is not the case, for there can be no doubt that the gravelly plain lying between the rivers Taff and Rhymney has been occupied by man for at least eighteen centuries, probably much longer.

The Romans had a castrum, or permanent camp, on this plateau (in which a hypocaust, with coins of Trajan, was found). The fortress was quadrangular, defended on three sides by a foss and vallum, and covered on the fourth by the river Taff. The bank or vallum was cased in stone on the outside much in the same fashion as the city wall at Silchester. Such was the beginning of "Cardiff Castle," an edifice whose existence has been interwoven with the history of England. The Marquis of Bute excavated a portion of the Roman work on the Eastern side of the castrum, and there may be seen a rubble wall of from 12 to 15 ft. in height, cased at the bottom with squared stone, which looks as fresh as though it had been built the other day.

When the Romans quitted this fortress the Britons, who took their place, must have lead a stormy life in their bootless endeavour to repel predatory hordes of Irish Gaels, Scandinavians, and Saxons. Some one, we know not whom, seems to have broken down the Roman wall during this period, and so let the soil of the bank slip down and cover the base of the wall, which remained hidden until it was revealed by the recent excavations.

During their tenure of Cardiff the Welsh chieftains, as was their wont, carried on an intestine war. We hear that Cardiff was restored by Morgan, Prince of Glamorgan, some time in the tenth century, but destroyed again. Then a strong fortification was erected by Jestyn, the last native ruler of Glamorgan. Robert Fitz Hamon, Jestyn's conqueror (1090) made this place the *caput* of his barony.

We may feel pretty certain that from the outgoing of the Roman to the incoming of the Norman no building operations of importance were undertaken; the Welshman was not a mason.

Robert Consul, the bastard of King Henry I., married Mabel, daughter and heiress to Fitz Hamon. The Norman portions of Cardiff Castle have always been ascribed to him. We may pretty safely look on the White Tower as his creation.

Nearly ten acres are enclosed by the old Roman bank. In the north-west corner is a mound more than 30 ft. high, with a diameter of 60 yards. On the summit Robert Consul erected his donjon, a polygon of twelve equal sides, 80 ft. in diameter, with pebble walls. In a building attached to this keep, but long since destroyed, Robert Curthose, eldest son of the Conqueror, is said to have been blinded and imprisoned for twenty-eight years. Robert Consul is also believed to have built the mediæval curtain on the summit of the Roman bank, unaware that the original wall still remained buried in the soil. Lord Bute has built upon the Roman wall, leaving open recesses at intervals to show the rubble backing (where the facing is gone), until he reached the level of the foundation of the mediæval curtain on the summit of the bank; as the Norman work is some 10 ft. behind the Roman work, Lord Bute is making a covered way to connect them, and underpinning the Norman wall, so that when the work is finished a visitor can inspect the Roman work from the bottom, or walking on the top of the covered way examine the Norman wall.

Robert Consul's building propensities were no doubt stimulated by the capture of his wife, his son, and himself by Ivor ab Cadivor, who unexpectedly raided Cardiff, stormed the castle, carrying off the Earl and his family prisoners, only releasing them on condition that the Glamorganshire Welsh were allowed unmolested enjoyment of their ancient privileges. This occurred in 1158.

After Consul's time the De Clares became seized of Cardiff Castle, and during their ownership the Black Tower was erected. As it has been excessively restored, it is rather difficult to say whether the architecture is Early English or Decorated.

When Gilbert de Clare fell at Bannockburn, 1314, King Edward II. bestowed the Castle on his favourite, Despenser. After his death it fell to the Beauchamp family, and Richard, Earl of Warwick, is said to have built the tower on the south-western side of "The Lodgings," or habitable portion of the Castle, 1425. There is no doubt it resembles (though on a smaller scale) Guy's Tower at Warwick. To the Beauchamps succeeded the Herberts, Earls of Pembroke, who owned the Castle for many generations. They demolished a great deal of their predecessor's work, and substituted late Perpendicular and Elizabethan for the earlier forms, but the ancients were fully avenged, for the Stuart family have pulled down every stone of the Herbert buildings and erected a modern mansion in place of the mediæval "Lodgings." Within the grounds of Cardiff Castle stood a convent of Grey Friars, founded by Gilbert de Clare, 1280, which was a cell to Bristol, and a convent of Black Friars, founded by Richard de Clare in 1250. The Marquis of Bute has carefully traced out the foundations of these religious houses.

The modern portion of the castle, which constitutes by far the greater part of it, is really the most important architectural work in Cardiff, and is too well known to need any special description here, but a word as to the impression it produces from the present day point of view may not be amiss. It was Burges's pet work; no more con-

Part of Cardiff Castle.

genial task could have been set him than that of erecting a mediæval castle which should be as mediæval as it was possible to make it, and he and most other people who were interested in architecture believed that he was doing a splendid thing. The mediæval revival has gone the way of all revivals; and how does the work look now? Well, if Lord Bute does not regret the money sunk in a dwelling which is only a curiosity, we do not see that any one else need regret it. It is a very interesting and picturesque curiosity. The long lofty blank rampart facing the high road, with only a row of hanging doors in it for reconnoitring foes from, and with nothing behind it but a covered gallery, is an absurdity from a practical point of view, but it is at all events something out of the

common; on the west face, towards the gardens, the square low-roofed towers, looking as if they came out of Viollet-le-Duc, and the bold lead flèche in the centre, make a charming group to see from your hotel window in the morning; it is a sham, in a sense, no doubt, but after all it is a more interesting object, architecturally, than half the large mansions in the country, and certainly its absence would make a great difference in one's impression of Cardiff; standing close on the town, and only a few yards from one of the main roads, it gives a touch of architectural poetry which the neighbourhood does not otherwise supply. Internally it must be confessed, the castle is *passé* altogether; with its narrow corridors and stairs, its doors scarcely more than two feet wide, and its small rooms, it seems a place that no

man of wealth would live in except for a joke. The details of workmanship, however, in doors, windows, &c., are admirable, and are still worthy of study; and it is odd that an architect who could be so practical in small things should have been so unpractical in the design of the principal staircase from the entrance door, where the stairs, very wide from side to side and much too steep in rake, are formed of polished granite steps with very narrow treads and sharp angles, and are positively dangerous, and on this account remain to this day unfinished, the client having recognised that his architect had made a serious mistake in this point at all events. In an artistic sense perhaps the very best things in connexion with the building are the figures of animals on the exterior boundary wall, modelled by Mr.

County of Gloucester Bank, St. Mary-street. (Mr. Pickwell.)

County of Gloucester Bank, Mount Stuart-square. (Mr. Pickwell.)

icholls, and which are remarkable for truthfulness and vigour of execution.

Cardiff itself is a town of very straggling and irregular plan, on a very flat site, and may be said to consist of two portions, Cardiff proper and the Bute Docks. Of the Bute Docks, which, though commercially an outshoot of Cardiff, are quite away from the town, we have given a special account some time since.* The principal buildings are concentrated about High-street and St. Mary-street, which are in a line running nearly north and south, and Westgate-street, which runs north-west at an acute angle with them. St. Mary-street is a fine wide street, and the vista up this and High-street, with the trees and turrets of the castle seen at the top, is a good piece of city scenery. South of the town are the Bute Docks; westward of this the wide and rapid stream of the Taff flows into the harbour, and westward of this again is the modern artisan suburb of Grange-town, reached by crossing the Clarence Bridge, a fine iron bridge on massive stone piers, the centre portion a swing bridge, the two end portions fixed girders; the design of Mr. Harpur, the Borough Engineer. Grange-town, to which we need not return, is built on land which has almost the appearance of being reclaimed marsh land, a good deal of which is still unbuilt on, the roads being raised on it in the form of dykes. The development of the best residential portion of Cardiff has been on the east side, contrary to the almost invariable rule by which towns develop their best neighbourhoods westward; and Newport-road, running out eastwards, with the squares and streets abutting on it, is the upper class neighbourhood, though it has lately been superseded to some extent by the more recently formed suburb of Penarth, a good

way south of the town and on high land overlooking the Bristol Channel and the entrance to the harbour, and connected with the town by a good railway service. Between Penarth and the town is a good deal of open and very low land, in part of which there is some talk of forming a new dock, for which the site is perhaps better suited than for any other purpose.

As Cardiff is a town distinctly in a state of progression, it is not surprising to find in it a good many waste, unfinished, or dilapidated quarters, though these latter are but in a small proportion to the whole area. Generally speaking, it is a clean-looking town, and the fact that stone is cheap and plentiful leads to the extensive employment of this material even in the long streets of small houses in various quarters, so that these houses, monotonous in their long rows of bow-windows, have not the mean appearance that we find in places where brick or cement is mainly used for the humbler class of dwellings. One of the saddest-looking quarters of the town is in the series of small streets abutting on Wood-street, near the Great Western Railway Station, dingy dilapidated cemented houses on either side of dirty streets where the scavenger seems to be unknown; a quarter of the town which urgently calls for rebuilding. One unusual feature is found in the narrow canal which traverses the Castle Gardens and re-appears here and there at the side of a street, running in front of the small houses in Pembroke-terrace, with a grass bank and a row of small trees parallel with it; it is a pleasant surprise to find that this straight artificial water is no stagnant canal, but a swiftly running stream,*

* This canal is fed from the Taff, and makes in fact an artificially-formed branch of it. It is said to follow the line of part of the ancient town moat.

a delightful incident in the middle of a town. In any future improvements or laying out of new streets in this portion of the town, something more ought to be made of this canal, in a more prominent manner; it is not every town that has the good fortune to have such a source of effect at its disposal in the very centre of the houses.

Turning to separate buildings the most important is the Free Library and Museum by Mr. Edwin Seward, which unfortunately stands in rather a back situation near St. Mary-street, flanked only by narrow streets on each side, though the south end fronts on an open space, The Hayes, a kind of minor open-air market with some very dilapidated property on each side of it, where it is to be hoped some new buildings worthy of the situation will be put up presently. The building itself we illustrated at the time of its opening last year,* and therefore do not repeat any illustration of it here; but we may say that it looks much better than the photographs sent to us gave any idea of. The first portion was built some little time since; in adding the more recent portion the whole scheme was aggrandised, and the problem was to give it a rather more stately appearance while conforming the new portion to the design of the other. This has been very successfully done by concentrating the new treatment on the south front facing the open space; at this point alone a columnar order on a large scale has been introduced, giving dignity to this front, but we wish that the window plane on the lower story had been kept back to that of the upper story, giving more depth to the pilasters; the whole would have gained considerably in power of effect. There is some pretty sculpture and carved ornament on the building, and the whole architectural treatment is moreover decidedly

* See Builder of June 27, 1896.

* Builder, December 9, 1893.

Cardiff County Club. (Mr. E. W. M. Corbett.)

"Western Mail" Offices, St. Mary-street, Cardiff. (Messrs. Jones, Richards, & Budgen.)

original and unusual. There is one peculiarity in it which we meet with so often that it seems almost a characteristic of modern Cardiff architecture, viz.: the employment of massive stone transoms binding the two sides of the windows together. It is characteristic generally of Mr. Seward's buildings, which are numerous; and he seems to have impressed his style on the town somewhat as Mr. Waterhouse impressed his on Manchester a good many years ago. It is carried a little too far in some portions of the building, giving the idea of cabinet work on large scale rather than masonry design, but in other cases it serves to give a very solid appearance and expression, though perhaps at the cost of some little interference with light. This cannot be said of the library and reading-rooms, however, which are admirably lighted, fitted, and arranged in every respect.

In High-street and St. Mary-street, which are practically one street, the majority of the noticeable buildings are on the west side. The first to notice in descending the street is Lloyd's Bank by Mr. Chatwin (of Birmingham), of which a sketch is given (p. 241), a Classic front in good taste, though with no very marked character about it; as we may also say of the National Provincial Bank lower down, an Italian front of very agreeable proportions but deficient in originality. The present Post Office building next to it (and grouping rather well with it) is a building in the severe Classic manner, with large rusticated pilasters running through two stories, and rusticated angle columns to the ground-floor windows; simple as it is, this is a more effective kind of building for its purpose than the florid but weak and showy structures which the Post Office is now erecting in so many provincial towns, including Cardiff itself. The Town Hall, of which we give a lithograph, is an old-fashioned piece of Classic architecture designed by Sir Horace Jones; it looks a great deal older than the days of the late respected London City Architect, having apparently suffered a good

deal from weather, but we are assured that it was his design. As will be seen, it is a front not without character in an academical way, and it boasts internally of a well-treated staircase. The entrance to the more recent Municipal Buildings, by Messrs. Seward & Thomas, is in a courtyard between the old Town Hall and the Post-office; the main portion of the Municipal Buildings, as shown in our lithograph, is only seen from Westgate-street, and, as will be gathered, they are so inadequate in every sense (were so from the first, indeed) that the erection of new Municipal Buildings at an early date is inevitable.

The London and Provincial Bank, by Mr. Blessley, is a building of Classic type with some interesting detail, the flank elevation being the best; it shows very strongly marked that Cardiffian tendency to run massive transoms across the windows, to which we have already referred. Mr. Waterhouse's Prudential Assurance next door is one of the smaller offices of the company, a narrow slip of red terra-cotta building with a polished granite basement up to the springing of the ground floor arches, where the terra-cotta is simply set on the granite with no division but the joint.

Lower down the street the small front of the Gloucester Banking Company, by Mr. Pickwell, is one of the best things in the town; there is a good deal of picturesque originality in its treatment of Classic details with Gothic feeling, and the decorative work is good and refined. The "Royal Hotel," by Messrs. Jones, Richards, & Budgen, is in what may be called the usual hotel style, though it is much better than the "Queen's" (the other large hotel in the street), and the south front, with its ground floor arched entrance and the semicircular oriel rising above, is not ineffective; moreover there is less of mere florid show about the building than is usual in hotel architecture. The same architects designed, lower down the street, the offices of the *Western Mail*, of which we give a small sketch; there is a

certain boldness about the effect of the lofty and massive piers going up to a great height on each side, polished granite in the basement and hammer-dressed above, and there is some good metal work in the name-plates. Unfortunately it is a good deal spoiled by the obtrusion of buff brick in the top story; a material which in other instances has been rather an enemy to Cardiff architecture. The large block called the Imperial Offices, partly occupied by the Royal Insurance Company, is a rather imposing piece of "business architecture"; the two end cupolas, with the phoenixes with outstretched wings on the parapet, are effective; the elevation is of course spoiled to some extent by the shop-windows on the ground story, and the coupled granite columns between them do not seem quite to belong to the rest of the design. Mr. Seward is the architect. At the lower angle of the street the Great Western Hotel offers a touching reminiscence of the early days of the Gothic revival.

On the east side of St. Mary-street the buildings are mostly of a more ordinary type. Mr. Seward has a pretty little front of a small hotel, with half-timber work above and white glazed brick below, and higher up the new front of the Central Arcade, by the same architect, is in progress (see lithograph illustration). This is a more important point in the local architecture than might be supposed, as one of the peculiarities of Cardiff is the number of its covered shop arcades, many of them of great length, and the fronts to these are among the architectural features of the streets. In Working-street, a small street not far off, is another arcade front by Mr. Seward, in which half-timber work is employed in bringing a little picturesque effect into a secondary street.

The Bute Docks are reached by the long, dreary, and mean street called Bute-street, in the course of which a dip in the road is made to get under the railway-bridge. This diving of the road under the various branches of railway is one of the incidents of tram-

Unitarian Church, West Grove. (Mr. E. H. Bruton.)

Lloyds Bank. (Mr. Chatwin.)

travelling in Cardiff, where the railway seems to have fixed its levels and the streets have had to make a dip under the bridges, fitting the headway so close that every-thing on the seats of the tram-cars, on the fronts of the bridges, on the wall at each side of each bridge, one reads in large letters the order "Keep your seats while passing under the railway-bridge;" and in fact the limit of head-room is so small that a tall man with a tall hat would have little chance of passing under them with his head-ear at all events uninjured; but tall hats are not apparently much worn in Cardiff, and at all events the inhabitants seem used to the diversion. In connexion with the Bute Docks are to be found two or three of the most important modern buildings in Cardiff. A little before reaching the docks we pass the large block of Messrs. Cory's offices, of which we give a lithograph illustration. The building, designed by Mr. Bruton, shows a large Classic front in stone, of very free treatment, with an order of columns on each side of the centre, with lofty carved bases of Venetian type. There is a certain picturesque character in this front, which has however the defect which we notice in sundry others of the more important buildings in Cardiff, of a want of homogeneous character, of a leading idea in the design; in particular the bay windows on the first floor, between the columns, have little relation in style to the rest of the front, and have besides the defect of looking too much like wooden construction petrified. Facing the harbour—a very good though

not very large natural harbour formed by an inlet from the Bristol Channel, are the new pier-head offices, a large block of brick and terra-cotta buildings designed by Mr. Corbett, and let out in offices to various companies or firms. In the front towards Bute-street the ground story is built of stone in a series of elliptical arches forming large office or shop windows. The opposite side faces towards the large "basin" which forms one portion of the Bute Docks system. Towards the harbour and towards the basin the offices are diversified in outline by three large gables with picturesque curved and stepped outlines in a rather Dutch manner; and as the basin is ordinarily kept with the water only a foot or two below the quay level, the appearance of this building as seen across the expanse of water, looking from the east side of the basin, reminds one still more of a bit of some Dutch town, and has a very picturesque effect; if the detail were better it would be a very satisfactory group for its position; unfortunately in that respect it is somewhat commonplace, and it is injured especially by the number of very large and prominent base terminals on the parapet and at the bases of the gables, which are too large for the situation and injure the scale of the building. Above this some ordinary office buildings of no special architectural type are reflected in the waters of the basin, beyond them is seen a rather characteristic building in brick and random stone facing, with buttresses at the sides, which has all the appearance of a chapel, but turns out to be the Seamen's

Mission, the principal part of the height of which is occupied by a large hall used as a news-room and smoking-room by the sea-faring population of the place. The ecclesiastical aspect of the structure however is justified by the fact that the upper storey is actually a small church, divided into three aisles by wooden story posts rising to the slope of the roof. The building is of an exceedingly simple Gothic design, the main portion being brick, but it is unpretending and suitable to its purpose. Unfortunately the attempts at stained glass in the church portion are very bad.

On the east side of the "basin" entry is one of the most important new buildings in Cardiff, the new Bute Docks Offices by Mr. W. Frame, the harbour front of which is still nearly hidden in scaffolding. This is a red brick and terra-cotta building with a good deal of individuality of style; the harbour front has an important looking entrance doorway with a tower rising above it finished with battlements and a short timber spire or conical roof; at the sides the building has a semi-ecclesiastical appearance, showing a series of buttresses semi-octagon on plan, with ogee finials at the top and large mullioned windows between them; above this the ecclesiastical appearance is confirmed by the addition of an apparent clearstory (really no doubt lights to upper rooms) of coupled lancet windows grouped under segmental arches. On the west side a small subordinate tower, oblong on plan, forms an effective feature; the building as a whole is picturesque, refined and original, and will

Board Schools, Severn road. (Messrs. Jones, Richards, & Budgen.)

Board Schools, Grange Town. (Mr. Bruce Vaughan.)

form an important addition to the harbour architecture.

The general effect of the docks and shipping is striking and picturesque owing to the system which seems to prevail here of keeping the water level of the docks very high, the water being for the most part only about eighteen inches below the quay level, so

that the whole hull of the ship towers above the spectator on shore, with a rather imposing effect. Generally speaking, ships in dock have the appearance of being in a hole. The real object of this high water-level has no doubt been that of economy in construction—saving a certain amount of excavating and lining in making the docks; we should

doubt if it was so convenient for general working; but it certainly has the advantage in picturesque effect, both in regard to the water and shipping.

The Exchange is in the Docks region, in Mount Stuart-square, west of Bute-street, and forms on one side a front with return wings partly enclosing the square. Mr.

Seward is the architect, and the building, of part of which we give a lithograph, is in somewhat similar style to the Library and Museum, though not equal to it; what it wants is a more decisive grouping in subordination to a leading *motif*; the design is somewhat scattered and broken. The side of the square facing the Exchange is very mean, and it is to be hoped will be rebuilt before long. At one angle, however, is the other County of Gloucester Bank, not so good as the one in St. Mary-street by the same architect, but a pleasing building, also however wanting in cohesion of style; the upper story (of buff brick again) does not seem to belong to the lower, the three Classic-looking windows on the flank have no relation to the rest of the design.

Returning to the centre of the town, we go up Westgate-street, branching off from the foot of St. Mary-street, and find on the west side the new Post-office in course of completion, a surprisingly large building for the size of the town (but Cardiff is we believe rather a postal centre), in the showy commonplace phase of Renaissance architecture which has been adopted for the new post-offices generally, and adorned with second-rate sculpture. The seated figures on each side of the central *fronton*, which cannot be seen from a point further off than the other side of the street, are consequently completely distorted by foreshortening. On the same side is Cardiff County Club, a fine-looking red brick house of spacious proportion, of which we give a sketch (p. 240) supplied by the architect (Mr. Corbett) and next to it the rather piquant little Gothic front (or end) of the tennis-court, designed we believe by Mr. Pritchard. The Grand Hotel, higher up the street (not so large a house as its name would imply), by the late G. B. Jones, has a certain style about it, and is perhaps the best piece of hotel architecture in the town. At the corner, in an admirable situation overlooking Cardiff Arms Park on one side and the Castle Gardens on the other, is the large Angel Hotel, for the plain and severe brick exterior of which we believe Mr. Frame is responsible. Hotels are generally far too florid in their architecture; the "Angel" has certainly escaped this fault, but a little more might have been made of a building enjoying such an exceptional situation. It is a pity that the ugly and characterless brick warehouses, too, lower down Westgate-street, were ever allowed to be erected in what is apparently intended to develop into a high-class street.

The few other secular buildings calling for notice are in scattered positions. Westward, on the road leading to Canton Park, we find Mr. Seward's very pleasing Union Workhouse building, which in one sense hardly fulfils its end, for it has such an attractive expression of home-like repose as to suggest that to "end one's days in the workhouse" were desirable rather than the contrary. To make the workhouse unattractive is, we fear, the better though the harsher moral. Like the road to Canton, the road northward to the still more attractive-sounding name of "Cathay" is nearly barren of anything but small houses, with the exception of a rather picturesque Board School not far from the cemetery, which leads us to remark that the size and architectural variety of the Board Schools is another characteristic of Cardiff; they are not built

The Infirmary: End View. (Mr. Edwin Seward.)

Wesleyan Chapel, Charles-street. (Messrs. Jones, Richards, & Budgen.)

by an official architect on one model, but vary very much in style and appearance; we give views of two of them, from drawings lent by the respective architects. The Cardiff cemetery is out in the Cathay direction, where the best thing one notices is neither the chapel nor the monuments, but the large sections of drain pipe set on end with a notice that they are receptacles for paper, waste flowers, &c. The North Road properly so called, running past the east boundary of the Castle grounds, brings us at a corner to Aberdare Hall (see lithograph), by Mr. Wills, of Swansea, an educational establishment of which only one half is now built, but which when completed will be, as the illustration shows, a very pleasing and picturesque building, sufficiently combining the domestic and the college character. It is built of red Bracknell brick with Ruabon terra-cotta dressings. The principal street eastward from High-street, Queen-street, brings us to Park-place, skirting Cathay's Park on one side, and containing on the other side some good houses of a superior class; in this road also the South Wales Institute of Engineers have built unto themselves a satisfactory-looking home in somewhat the same kind of red-brick architecture as Aberdare Hall. Newport-

road, which runs approximately in a line eastward from Queen's-road, and constitutes the principal suburban road, brings us to what is perhaps the best of Mr. Seward's buildings, the Infirmary, a building in a domestic Gothic style which has a character of its own; the small central tower is very graceful in design, and the treatment of the projecting wings, each with a semi-octagonal bay at each side, forms a very pretty and unusual piece of architectural grouping. We regret that we have only a photograph of the end view available, which hardly does justice to the building. Nearly opposite is the best modern church in Cardiff, Mr. Bruce Vaughan's St. James the Great, of which an illustration will be found on one of the lithograph plates. This is a fine solid church with little ornament, the tower and spire forming a fine pyramidal composition; the side of the church shows a clearstory with a single lancet window in each bay, under a wall arch abutting against the buttresses, the aisle windows have geometrical tracery, the north-west porch is effectively treated with a half-timber gable and sculptured angels in the spandrels of the arch. The only point for question is that the wide buttresses of the aisles show the only wide surfaces of ashlar masonry in the design, and hardly appear to belong to the rest; but in the main this is a fine and satisfactory church. In Howard-gardens, not far off, we have the Higher Grade Schools, a rather dull-looking building in buff brick with stone dressings and decorative features, and the School Board Offices, which are not equal to the occasion, and produce the effect (whether correctly or not) of having been two ordinary semi-detached houses with some new windows and other features added to the centre portion.

The parish church of St. John's, near High-street, is a late church with a tower strongly resembling that of St. Stephen's, Bristol, with the same over-sailing angle buttress ornaments projected from the pinnacles; it looks as if it were the work of the same hand. There is not much of interest in the church internally; the Bute Chapel includes a good piece of Renaissance carving, and the modern reredos shows some good sculpture rather too much overshadowed by the arcade overhanging it. The church is undergoing repair and a large new south aisle has been added, Mr. Fowler, we believe, being the architect. The Unitarian church by Mr. Bruton has some originality of character. We give a small illustration of this, as well as of the Wesleyan chapel in Charles-street, by Messrs. Jones, Richards, & Budgen. In the same street is a rather grim-looking Gothic R.C. church by Mr. Pugin, built in a very dark-tinted stone with red terra-cotta dressings, a combination which has a very heavy appearance, and the tracery on the other hand is rather too thin and light for the character of the rest of the building, which however is not one to be passed by without attention. With the exception of St. James the Great, however, church architecture is not so far very well represented in Cardiff.

We look, however, to see a great deal more done before long in the architectural development and advancement of Cardiff. It is obviously a town which is in a state of movement, and there is every probability that a large piece of ground on the west

side of Park-place, part of Castle Gardens, and at present partially occupied by the buildings for last year's exhibition, will before long be available for some important new public buildings, and that we shall see there a Town Hall and Municipal Buildings erected worthy of the growing scale and enterprise of the town, which is now practically the capital of Wales, though not yet, we believe, formally promoted to that position. In an architectural sense the site, which has already been much discussed, is a splendid one for a large group of public buildings, the only defect is that it is not quite near enough to the business centre of the town to seem quite appropriate for the Municipal head quarters. On this point we might offer a suggestion. The old post-office, which will soon be no longer wanted, the old Town Hall, the court between these two buildings, and the space occupied by the present Municipal buildings and the court-yard abutting on Westgate-street, form altogether a pretty large area, and might, if the municipal business could be temporarily accommodated elsewhere, be a sufficient site for a Town Hall which would then occupy the rightful place of a Town Hall, in the main street. The site might perhaps not be thought quite large enough—we have no plan of it to scale, but the idea may be worth considering. On whichever site the new Town Hall is ultimately built, we have little doubt that an effort will be made to render it a really worthy addition to Cardiff architecture.

The suburb of Penarth, to which allusion has been made, contains some good dwelling houses, a church by Messrs. Seddon & Carter, and an interesting little institution known as the Turner Gallery, a private gallery built by a wealthy resident (the late Mr. Pyke Thompson, who died only a few days ago) at the entrance of his grounds, mainly with the object of providing a small Art Museum for the public on Sundays and holidays, the Cardiff Corporation having refused to open the town Museum on Sunday. The small building, designed by Mr. Seward, is decorated externally with some sgraffito figures, and internally contains a most interesting collection of water-colours, etchings, &c., all by good names, and well worth a visit.

One little compliment we may pay to the Municipal authorities in conclusion. We have complained in more than one town of the bad and inefficient naming of the streets. In Cardiff there is no such complaint to be made; the names of streets are systematically and legibly posted up everywhere. This is a small detail in itself, but it is significant. Where one finds obvious small duties of that kind properly attended to by local authorities, one is led to credit them with paying the same attention to the more important matters of municipal regulation.*

NOTES.

The Society for the Protection of Ancient Buildings has now been endeavouring to interfere with the Dean and Chapter of Exeter Cathedral in regard to some repairs that are being carried out on the west front and has been told that the cathedral authorities "do not wish to be brought into relation with them"; a snub which the Secretary immediately communicates to the

* The next of this series of articles on the architecture of Northampton will appear in our issue of April 24.

Times, according to the practice which the Society has of always giving publicity every rebuff it receives. We presume the theory of this is that the S.P.A.B. is a sacred body that any affront offered to must necessarily redound to the discredit of the affronters. The case of Exeter is quite different from that of Peterborough, as it is not a case of structural failure but only of superficial decay; and if the Society had not made itself so obnoxious and absurd in regard to the necessary proceeding at Peterborough, it might have got a standpoint for giving some useful advice at Exeter. It is the totally unreasoning attitude of the S.P.A.B. that stands in its way, and prevents it being listened to on occasions when it might do some good. What is really being done at Exeter is this: the west front is, at its core, the old Norman wall, and the fourteenth century facing of Beer stone is in some places only 3 in. thick and is in such a state that in many places it goes to powder between the fingers. Thus the tracery of some of the windows, and minor details of the arcading, are shredding away; and as far as the tracery is concerned repair is absolutely necessary, unless the windows are to be allowed to fall to pieces. The decayed portions are being renewed externally in Douling stone, doweled into the interior face. It is also proposed to renew the work in the arcade on the north side of the front, and the embattled cornice of the screen. Whether it is necessary or desirable to renew decayed portions which are on a solid wall is a very doubtful matter, on which however we should not like to express a decided opinion without a detailed inspection of the work. This is a point on which the S.P.A.B. might have given useful advice and might have been listened to, but for their unreasonable conduct in other cases. They have made themselves impossible, in fact, and it is entirely their own fault.

WE may congratulate Messrs. Messrs. Harston and the St. Pancras Case. Harston, the architects concerned for the St. Pancras

Guardians, in being exonerated from blame in regard to their treatment of the contractors, a result which was only what we expected. Messrs. Harston are architects possessed of rather exceptional practical knowledge and ability, coupled with a determination to have their work properly carried out in every detail; and architects of that stamp are frequently unpopular with contractors. That their clerk of works was a very exasperating kind of man to work under appears pretty evident, but it does not appear that the architects supported him in an unreasoning or unreasonable manner. At the same time it seems possible that Messrs. Harston, in their aspirations after perfection of materials and workmanship, have occasionally, no doubt with the best intentions, demanded more than, in this imperfect world, they were likely to obtain. The letter from the head of a large brickmaking firm, which we print in another column, seems to point to this conclusion. Our correspondent speaks with the highest respect of Messrs. Harston, but says that his firm have refused for some time back to supply any bricks for their buildings, and he gives the reasons for this. There must evidently be a pretty strong feeling as to the difficulty of satisfying

Messrs. Harston, to induce a large and enterprising firm to refuse business with them.

Excavations at Athens.
 AFTER long delay, owing to the difficulty of buying land in this thickly-populated part of the city, Dr. Dörpfeld has resumed his excavations near the "Theseion." Another house in the Poseidon-street has been bought and pulled down, and beneath it the south wall of the building he conjectures to be the Stoa Basileios has been laid bare. This building is now seen to consist of a hall nearly square in shape, nine metres in breadth. Its cast side has a portico, and from the dowel marks in the stylobate of this portico it is clear that it had six columns. The plan is obviously such as we are accustomed to associate with a small temple, but against this view and in favour of the Stoa Basileios identification are two main arguments. First, the square-shaped hall has in its north wall a small door, a thing unprecedented so far in a Greek temple, and secondly, though this argument is, of course, less strong, topographical considerations are against it. Dr. Dörpfeld himself still clings to the view that the building is the Stoa. The masonry points to the end of the sixth or beginning of the fifth century, and for this date the size of the building is adequate for the official seat of the Archon Basileus. Further there is a basis set against the back wall that would serve well as the foundation of the altar, which must have stood in the Stoa. South of the building a broad stairway leads up to the "Theseion." We hope some more decisive evidence may come to light, as the identification is of great topographical importance.

A Russian Cathedral Competition.
 At St. Petersburg an international competition is being held for a design of a new cathedral at Kronstadt. On the Board of Assessors the Royal Academy, the Official Technical Commission, and the leading architectural and engineering societies are represented, as also the clergy. The competition is instituted by the Government. The cost of the proposed building is limited to 700,000 roubles, and the premiums are 5,000, 2,500, 1,500, and 1,000 roubles respectively. The conditions are very fully drawn up, and specify the materials to be used, the space to be allotted to each pew, the method of heating and ventilating, the difficulties to be contended with in the foundations, &c. There is also a general instruction as to the grouping of the building, the number of bells that are to be placed in the tower, &c. We, however, fail to understand, if the competition is to partake of an international character and the Board of Assessors is so carefully chosen, why there should be no representative from other countries on this body. It is the common mistake in international competitions arranged abroad, and tends to make architects doubtful as to the sincerity of the promoters and their intention to do impartial justice to all competitors. Considering that the competition is an international one, it might be expected that the jury of assessors should also have included at least one or two foreign representatives. This is a frequent weakness in regard to "international" competitions abroad—the jury are all "national"; hence foreign competitors are put at a great disadvantage.

The Institute Prize Subjects.
 THE subjects proposed for the next Soane medallion and the next Essay prize are such as ought to attract a great many competitors from their unusual suggestiveness and interest. The Soane medallion is to be given for the best design for a concert-hall to seat 3,000 persons, with a small chamber concert hall for 300. The Essay is to be a "Review of English Architecture of the Nineteenth Century." Both subjects are of unusual interest; it may be added, perhaps, of unusual difficulty.

German and Russian Technical Colleges.
 THE *Deutsche Bau-zeitung* calls attention to the great increase in the number of students visiting the Technical Colleges throughout Germany. There are at present no less than 10,128 students attending classes, of whom 7,727 are fully matriculated. Ten years ago there was not a third of this number, and five years ago the total was 4,900. The number of visitors from other countries working at German institutions has also been on the increase, particularly the number of Russian students. We find, too, that Russia is following the example set by the German Government in affording a liberal and high-class technical education at a small outlay, the training here referred to being distinct from what is known as "technical education" in this country, for the latter is not given at the Royal Technical Colleges, but in the "Gewerbe-Schulen" and minor "Bau-Schulen." At Kieff the Russian Governor-General has started a movement for erecting a college on the German system, and subscriptions are invited to the extent of a million roubles, more than half of which was at once subscribed by the Municipality, the Exchange, and the neighbouring landowners.

Machinery on the Hire and Purchase System.
 A CASE of much practical interest, though involving somewhat technical legal doctrines, will be found in the decision of the Court of Appeal in *Hobson v. Gorringe*, which was recently reported in the official Law Reports. It has been settled by a long series of judicial decisions that, if machinery is affixed by bolts and nuts to the ground or to brickwork, it becomes part of the freehold, and so if the land is mortgaged it passes with it to the mortgagee. In the present instance a gas-engine to work a sawmill was affixed by bolts and screws to the ground so as to prevent it from rocking. Here, of course, was an instance of machinery, which, being fastened to the freehold, passed with it under a mortgage. But it was contended that there were special circumstances in this case which made it an exception to the general principle. These were that this machine was let out on the hire and purchase system and under one of the usual agreements by which, if the hirer failed to pay the instalments, the lender was entitled to retake possession of the engine. Therefore, it was argued, this machine was excluded from the security which passed to the mortgagee. The Court of Appeal, however, decided that though, as between the lender and the hirer, the former could take back the engine, yet he could not do so as against a mortgagee. In law the engine became a fixture subject to a right in the lender to retake it, but this right was only a personal one acting between the hirer and

the lender, and did not—as the phrase is—run with the land so as to bind a purchaser or mortgagee. This decision, it is obvious, has important consequences for those who hire out machinery, since in many instances heavy machinery must be firmly affixed to the ground in order to work it, while at the same time if it is so fixed the security of the lender or hirer out has gone in case of a mortgage of the freehold, if the freeholder gets into difficulties so as to cause the mortgagee to foreclose and realise his security.

Workmen's Dwellings.
 THE Marquis of Londonderry has again introduced into the House of Lords a Bill to enable Local Authorities to advance money to working men to enable them to buy the freehold or leasehold of their dwellings. The Bill was read a second time on Tuesday last. It will doubtless pass through the Lords, but unless it is made a Government measure in the Commons it is not likely to become law during the present session. We have often expressed our opinion in regard to similar measures. It is impossible to see why the artisan more than the clerk should receive assistance from public funds, and it has been over and over again pointed out that innumerable building societies are doing the work which under this Bill would be done by Local Authorities. If the advance of public funds is properly safeguarded there can be little harm in the proposed legislation, which is, however, very experimental, and very doubtful in principle.

Improved Stage Appliances at Drury Lane.
 SOME years have elapsed since we referred to the installation of improved appliances for the working of our larger stages. Our last remarks were in connection with the Vienna Theatrical Exhibition of 1893. Drury Lane Theatre has now led the way with an installation worked by hydraulic power, and used nightly for transformation purposes in the pantomime "Aladdin." There have been varied minor attempts on earlier occasions by Messrs. Brown, of Edinburgh, and again by Messrs. Clark, Bunnet, & Co., of London, in the Lyric Theatre. In the first instance the theatre in which the appliances were installed unfortunately came to grief, whilst in the Lyric Theatre but little use seems to be made of them. If we are rightly informed, it had frequently been the intention of the late Sir Augustus Harris to improve the appliances of Drury Lane, but their actual installation was postponed owing to the great outlay and the time required for so considerable a change. The appliances which are now in use can only be considered part of the extensive system he finally decided upon installing in sections, but though there is much that requires modification in these new appliances, they should be welcomed as marking material progress in the arrangements of our stage. The installation in this instance comprises two large "bridges" worked by hydraulic rams, and allowing for a see-saw movement. With their assistance it is possible to raise very large weights and to change scenery rapidly. They are at present used for raising a bevy of stage angels in the final scene.

Society of Painter Etchers.
 THE Society has perhaps had better exhibitions than the one of this season, though there are a good many things well worth attention.

The proportion of works which are not true line etchings seems to be decreasing. On the other hand there is a kind of defiant roughness and coarseness of line in some of the works, as in those of Mr. Legros and in Mr. Holroyd's "Storm Cloud" (84), which we do not regard as in the best artistic spirit of etching. Over-refinement in etching is a fault, as losing freedom and character and making it like engraving; gratuitous coarseness of execution is no less a fault of the opposite kind. Other artists exaggerate the contrasts of light and dark, and scrawl over the plate the most portentous skies, as in Mr. Goff's "Destruction of the Old Chain Pier, Brighton" (4), which suggests rather the Destruction of Sodom and Gomorrah, or some equally tremendous incident. Among the best works are M. Hellen's beautiful dry-point portraits and figure-studies; Mr. Goff's etchings (except the one mentioned); Mr. Robertson's "At the Foot of the Cliffs" (32); Mr. Haig's "Cathedral of Palencia" (as an architectural drawing—it is not in the true style of etching); Mr. Nichols's "Looking West" (209); some of Mr. Siocombe's dry-point figure-studies; Mr. R. Bryden's sketches in Spain; and some (but not all) of Mr. Strang's powerful but rather grotesque illustrations to the "Ancient Mariner."

THE result of a competition instituted by the *Magazine of Art*—the subject being a poster

for the *Quiver Magazine*—is an exhibition of picture posters now being held at the hall of the Stationers' Company at Stationers' Hall-court, Ludgate-hill. Upwards of 200 designs were sent in, and are mostly, if not all of them, hung round the walls of the hall, and on screens. Among a great many designs that are obviously unsuitable, both in colour and in want of decorative treatment, there are many excellent examples of an art that has advanced much within the last few years. Three prizes were awarded, the first being to a design signed "Sagittarius," a large quiver of arrows, supported on either side by a female figure. The design is clever in arrangement, but seems to lack breadth as seen from a distance, and if placed at any height above the eye the lettering would hardly tell sufficiently. In this respect the design submitted by "Thide" is, we think, preferable, and deserves a more prominent place than that assigned to it in a somewhat dark corner. Others worth noting are signed "Pandora," "Chancery" — with some well designed figures—"Hearts," "Daffodil," "Kipper," and "Mars." We suppose that the decision to exhibit everything sent in accounts for many being included that are obviously not serious attempts to deal with the subject—we noticed a few that might with advantage have been excluded. The judges were Messrs. John Sparkes, Edwin Bale, R.I., and M. H. Spielmann.

We are asked to make it clear to our readers that this exhibition is only to be open for one week, from the 20th to the 27th inst. inclusive. In our Note last week we referred to its "first week of existence" under the impression that, as before, it would be open for a fortnight at least, but it appears this is not to be the case this year. It is, we presume, supposed that more interest will be shown in visiting it if the time is shortened;

Athene Group from the Pergamon Frieze.

but if such an exhibition is really a good one, we should have said that a week was too short a period. However, the result may show that the management were in the right. We may add that on Saturday, the 27th, Sir Arthur Arnold will distribute the prizes to craftsmen.

THE ARCHITECTURAL ASSOCIATION. GREEK SCULPTURE AND GREEK LEGEND.

An ordinary fortnightly meeting of this Association was held in the Meeting-room of the Royal Institute of British Architects on the 5th instant, Mr. W. H. Seth-Smith, Vice-President in the chair.

The minutes of the last meeting having been read and confirmed, the following gentlemen were elected members of the Association, viz., Messrs. H. W. Currey, S. Holderness, and A. Williamson. Mr. J. G. Sankey, it was also announced, had been reinstated a member.

Mr. H. Howley Sim, junior hon. sec., proposed a vote of thanks to Mr. Owen Fleming for conducting members over the London County Council Working Class Dwellings, Boundary-street, on the occasion of the Spring Visit on the 20th ultimo.

Dr. F. S. Granger then read the following paper on "Greek Sculpture and Greek Legend":—

When I was asked to read a paper before this Association I purposely chose a title of some vagueness, in order that freedom of selection might be left me. Let me begin, then, by marking off beforehand the precise subject of the remarks which, with your indulgence, I am about to offer. The sculpture is that of the Acropolis of Athens; the legend is that of Athena, the divine protector of the Athenians; and both legend and sculpture are so intimately connected with the architecture of the Acropolis that I trust you, as architects, will not regard the time wasted which we shall devote to them.

The Greek temple as a whole—taking the building along with its ornaments—has never been surpassed for excellence of design, perhaps has never been equalled. This does not prevent us from agreeing that, as architecture only—building apart from sculpture—some of the cathedrals and abbeys of the thirteenth century are nobler works than even the Parthenon. But if you take the two together—architecture and sculpture—you must assign the palm to Greece. Interesting and beautiful as medieval sculpture often is, it falls short of the knowledge and technical skill of Greek sculpture. No one can seriously maintain that medieval sculpture, at any rate on this side of the Alps, is comparable to Greek work of the first or even of the second order. And this consideration will affect our estimate of Greek art as a whole. The excellence of the Parthenon, for instance, rests upon a certain balance of subordinate excellences. It is a perfection depending upon harmony. I shall try to show how various the elements were that entered into this harmony; how architecture, sculpture, both applied to a building and standing free, and colour decoration, united together

to express certain religious beliefs, and to answer certain religious ends.

We need not be surprised, therefore, that the work of Stuart and Revett should have led, at the end of last century, to a revival of Greek architecture, and that Vitruvius and Palladio had to yield to the architects of the temples upon the Acropolis. This revival, however, suffered from the defects of most revivals. The architecture of Greek temples was applied to purposes for which it was unadapted. Moreover, the spirit of the style was misunderstood in a most important particular. Colour decoration was left almost out of account. Greek buildings, on the other hand, showed a brilliant scheme of colour in which the white marble surfaces contrasted with the gold, and blue, and vermilion of the sculpture and the mouldings. Hanover Chapel, therefore, of which Mr. Paul Waterhouse has given an interesting account in the "Journal" of the Institute, was not a building in a truly Greek style. Architects have tried to convince themselves that certain rules of proportion are enough to ensure impressiveness of design. But the public takes little interest in the geometrical recipes of which we have heard so much, and here for once the public instinct is correct.

Greek architecture in England has suffered still more seriously from being used without the sculpture, for which the pediments and friezes offer the frame. Reference is sometimes made to the fact that the entrance to the Athenian Acropolis, the Propylæa, had no sculpture in its pediments. There is reason to believe, however, that the original plan included the sculpture. Greek architecture stands, then, in the most intimate relation with the allied arts, and some of its apparent defects arise from the necessities imposed upon it by this relation. A building in the Greek manner, without plastic ornament and without colour, falls as far short of the true spirit of the style as the pale shadows of the Greek after-world over against breathing men and women.

The very fitness of Greek architecture, therefore, for its special purposes, led to its being found unsuitable, under the changed conditions of English life. It furnished very obvious handles for attack to those who admired the medieval styles, and much was said about its imperfections. After these two stages, first of indiscriminate imitation, and then of equally indiscriminate rejection, there is come the third stage, that of the temper that judges, the critical stage. We are ceasing now to take sides, and are trying to understand. There is a very large public—I speak comparatively—which is interested in the development of ancient Greek art, and the studies of several generations of archaeologists are converging upon fairly certain results. I am attempting this evening to focus some of these results upon a familiar field of architectural study, in order that it may appear in its true light. I should be glad to think that we carried away a somewhat clearer idea of the actual achievement of Ictinus and his fellow architects. We owe to Mr. Penrose a more correct idea of the exact structure of the Parthenon. There remain the further and secondary considerations on which I have touched.

The "Mourning Athene": Athens Museum.
(From Gardner's "Handbook of Greek Sculpture.")

fitting tunic, and a mantle is thrown round his shoulders. He holds the lightning in his right hand, and gesticulates with the left, while from his head Athene springs up equipped with shield and spear. Ilithyia, the goddess of childbirth, stands before Zeus, and moves her hand in a characteristic manner. Still further to the right is Ares, the war-god, armed with lance and helmet and with the Medusa shield. Behind the throne Apollo celebrates the joyful event by music on his lyre, and Hermes, the messenger of heaven, with his winged shoes, traveller's cloak, and broad-brimmed hat, is ready to carry the news to Athens.

There is no reason to doubt that the ordinary Athenian believed sincerely in these legends. So strong was their belief that the tyrant Pisistratus took advantage of it, and by a curious device secured his return from exile. He dressed up a tall woman in the attire so familiar to the city, and the people seem to have been deceived into thinking that their divine patroness was recommending them to receive back Pisistratus when he rode to Athens with the pretended Athena by his side. In the height of the glory of the city the same sincere simplicity of belief was still shown. During the building of the Parthenon a wonderful piece of fortune befel, which, says Plutarch, showed that Athene did not hold aloof, but was helping to accomplish the work. A very active and zealous workman slipped and fell from the scaffolding, and was in a condition so dangerous that he was despaired of by the physicians. Pericles was affected painfully by the accident, but was visited by Athene in a dream, and was informed of the remedy. Of this he made use, and the man was healed. In order to record the event, the great statesman erected a statue to the goddess as the giver of health, Athene Hygieia, and the pedestal of this statue, with the inscription, is still to be seen at the entrance to the Acropolis. I do not know why we should accuse Pericles of hypocrisy here; other Athenians of the most brilliant intellectual endowments were characterised by the same devout temper as that which in their descendants struck the Apostle Paul 500 years later. Athens was not only the centre of the profoundest culture; it was also one of the most religious cities in Greece. The conclusion to be drawn is a very important one. It was first and foremost through the religious emotion that the masterpieces of Phidias and his contemporaries affected the average Athenian. Only in the second place was note taken of their perfect workmanship. The rude wooden image in the Erechtheion that fell from Heaven, before which the famous lamp of Callimachus forever burned, was doubtless more revered than the great statue of the neighbouring Parthenon. The artist was not the

It has sometimes seemed to me that when we go back to antiquity, whether of the Greek world or of the Middle Ages, we ought also to carry with us the method and temper of the ancient critics. Matthew Arnold, in his essay upon the "Study of Poetry," has formulated a method which is strikingly in accordance with their precepts. He suggests that the student of poetry should carry in his memory a few fine lines of poetry and apply them as touchstones; not, indeed, because all fine poetry is alike, but because our judgment becomes more acute when it has before it the materials for a comparison. Let us apply this to the criticism of architecture. If we become thoroughly familiar with the design and detail of one or two fine examples in each kind we shall have with us a standard by which we can measure the quality of any work that may be set before us. We shall not, indeed, ask that the details of the building that we are judging shall be like those of the test example. We shall find, however, that the faults of a building of second or third-rate design will be more apparent in the presence of really good work. Such a method, it seems to me, is also the right one for those who are themselves engaged upon design. If the mind is continually refreshed by the study of fine examples, it will become better able to criticise its own work. This is the ancient method of imitation as opposed to the modern. Let us turn back for a moment to Hanover Chapel. We are referred to the temple of Athena at Priene for the details of the external order, and to the Erechtheum for the general proportions of the front. St. Pancras Church goes much further than this. The building is like a composite photograph in which half the buildings of Athens are struggling for the first place. "It is a poor temper," says an ancient critic, "that is content to follow closely that which is being imitated." Hence it may be said of most of the buildings of our Greek revival that they are not in the Greek manner. It may seem a somewhat barren conclusion to this part of my paper, but I

do not know how to express it better than by saying that the distinguishing feature of Greek art is a disinterested love of beauty. In contrast with our modern effort to be striking, or to be edifying, the Greek was content to be confined within the limits of his own art and to seek the beautiful. The pursuit of truth for its own sake, and apart from technical purposes, finds little encouragement in the present; the pursuit of the beautiful finds even less. It is the imperishable glory of the Greek mind that it devoted itself with an enthusiasm that has never been surpassed to these two great ends.

Let us now see how the Greek love of the beautiful found expression in the works of art upon the Athenian Acropolis. This oblong eminence was the centre from which the city spread and contained the sites of the greatest sanctity. It was the Mount Zion of Attica. Long before the Persian invasions, long before the building of the Parthenon and the Erechtheum in the shapes in which we know them, Athene was worshipped upon the sacred spot to the north of the Parthenon. Several legends grew up round the place. According to the belief of the Athenians, Athene had originally to contend with Poseidon, the god of the sea, for the worship of the Athenian state, and the visitors to the Acropolis could see the olive tree which Athene made to spring up as a proof of her power. Her rival Poseidon, to show his power, cleft the rock with his trident and a spring of salt water gushed forth from the place. The King of Athens, who acted as arbitrator, awarded the palm to Athene. The contest was represented in the sculptures of the western pediment of the Parthenon.

The eastern pediment of the same building portrayed the birth of the goddess. According to a quaint old legend, she was born from the head of Zeus. A black figured vase shows us how the event was imagined by the Athenians of the sixth century. Zeus is sitting upon a throne with a lion's head at the back, and a winged sphinx underneath as a support. He is robed in a tight-

master, but the minister of the religious feeling, and ran great risks if he turned aside from his appointed task. Phidias was imprisoned upon a charge of impiety because he had portrayed himself and Pericles upon the reliefs of the great shield of Athens.

As the character of the Athenian State changed, so also did the character of her goddess. When the Athenians were a people of farmers, she was thought to give rains and abundant crops. Hence, in the eastern pediment of the Parthenon she is accompanied by the Hours who bring the harvest season, and by the Sisters of the Dew. As the goddess of the sailor, she contrived the magical vessel in which the Argonauts sailed to find the golden fleece, and her temple on the promontory of Sunium brought comfort to the ships that beat round that dangerous coast. As the patroness of victory she was called Athena Nike, and in order that she might never desert her people she was represented without wings. But the goddess was more than the patroness of the farmer, the merchant, and the soldier; she was the embodiment of wisdom. It was her inspiration that guided Odysseus on his wanderings, and Heracles throughout his labours. This ideal figure which reflected so closely the interests and aspirations of the Athenian state was boldly identified with the democracy, and worship was paid to her as Athene Democratia, the personification of the people. There is a beautiful little relief in the Acropolis Museum: it represents the goddess leaning pensively upon her spear, her eyes fixed upon the memorial stele before her, which may be supposed to contain the names of deceased warriors. This charming design shows that she could sympathise as well as inspire.

We may enter now, perhaps, into the spirit with which the Athenians celebrated every year the birthday of the goddess at the great festival of the Panathenaea, July 28. This began in the early morning with a procession to the Acropolis, in order to offer a new robe, or *peplos*, to the goddess—a piece of saffron cloth embroidered elaborately with the conflict between the gods and the giants. This robe was conveyed in state along the streets to the Acropolis, and there was hung round the great statue, or perhaps before it, as a curtain. Let us take the ideal figure of Athene as a clue, and let us join, so to speak, in the procession of the citizens of Athens. We shall find that the great masterpieces of plastic art are all, as it were, set to the key of this religious ceremony; the main idea of it—the birth, the power, and the honour of Athene—being like a pervading diapason. The sculptures of the Parthenon are not exercises in which merely the skill of the artist is displayed: they are the vehicles of living religious ideas.

As we approach the Acropolis, let us suppose that the magic of fancy has restored to their former splendour the ruins of the entrance and of the temples which lie beyond. By the careful comparison of the actual remains and of the literary evidence, the archaeologists of this century have gradually restored the arrangement of the works of art upon the Acropolis, and we are enabled by their aid to substitute for the existing ruins a picture in which the buildings and the sculpture are united into an harmonious whole. The view is taken from the restoration of Thiersch. One of the most prominent objects was the colossal bronze statue of Athene the Defender, which rose to a height of 25 ft. The point of the spear was visible from a great distance, and the sailors, as they were tacking up the Saronic Gulf from Sunium, kept a look out for the moment at which the familiar landmark should appear across the low hills of the coast. This work has perished, without leaving any visible trace, except a rough representation upon certain coins.

As you pass between the columns of the Propylæa on to the rocky plateau, the eye is caught by the rich colour of the crystalline limestone rock. It is of a heavy red or maroon passing into dark purple or indigo. But in some lights the effect is changed. My first view was gained one evening as the sun was nearing the horizon, and the rays of light, which were almost level, so struck the surface of the limestone that it seemed of a light rose colour. Against this the white columns of the Parthenon stood out with great streaks of dull gold where they were stained by the weather, while, behind the rock and the white marble and the weather stains, the clear evening sky formed a background. In a well-known passage of the *Seven Lamps*, Mr. Ruskin compares to their disadvantage the Greek temples with the coloured architecture of Venice. But nothing can be more

wonderful than the strange flickering of the white marble columns as they seem to flame out against the blue. Over this brilliant foundation, coloured ornament was applied, like a delicate embroidery, to the chief architectural features. As you pace the summit of the Acropolis you can see many a marble moulding still carrying the traces of this.

Colour was applied to sculpture by the Greeks not less systematically than to their buildings. It is curious that the notion of coloured statuary should be so repugnant to the prevailing taste, and yet there is scarcely a museum of classical antiquities in which traces of colour are not to be found. We saw that, for want of colour, Mr. Cockerell's Hanover Chapel, with all its elegance, was not in sympathy with the true spirit of Greek architecture. Let us proceed to note that the modern schools of sculpture, which professedly derive from the antique, were separated from their originals by a similar interval. I do not mean to assert, of course, that such buildings and such sculpture cannot be of the first order without the use of colour, but I venture to maintain that they are parodies rather than imitations, if we view them with respect to their originals. We have no less an authority than that of Praxiteles, the sculptor of the Herms of Olympia, for saying that sculpture is benefited by the application of colour. The recent discovery of the beautiful sarcophagi at Sidon, with their beautiful colouring, has furnished us with a standard by which we may appreciate other works of art that have been less fortunate. "The colour thus applied," says Professor Gardner, "does not obscure the texture of the marble nor the delicacy of the moulding; on the contrary, it makes both more visible by giving a variety to the monotonous whiteness of the surface; it relieves the fatigue otherwise caused by the study of colourless form, and assists the eye to observe many subtleties of modelling which it might otherwise be unable to appreciate." I am quoting from the excellent handbook of Greek sculpture recently published by Macmillan. The author was, until recently, the director of the British School of Archaeology at Athens, and in that capacity has laid many English travellers at Athens under very deep obligations. I had the advantage of Mr. Gardner's company during one or two visits to the Acropolis, and I gladly avail myself of this opportunity of acknowledging my indebtedness. Mr. Gardner has succeeded to the Chair of Archaeology in University College, London. I hope my paper this evening may lead some of the members of the Architectural Association to follow the subject further, and to take advantage of Professor Gardner's courses.

I am supposing that we have now passed by the great bronze statue of Athene, and that we have the Erechtheum on our left. While the modern architect is struck by the irregular disposition of the building, and the refined delicacy of its detail, the Athenian would think of the venerable image of the goddess, of her sacred olive tree, and of the salt water spring of the sea god. The beautiful figures of the southern porch have also a sacred office; they are really representative of the young girls who carried certain sacred baskets in the triumphal procession. Does it not seem as if they, too, were about to fall in with the company, as they stand there with one foot moving forward? If the maidens of the Erechtheum seem to be moving towards us, the figures on the frieze of the Parthenon are keeping pace with us. For between the columns of the Parthenon we catch continually fresh glimpses of a band of sculpture, the marble counterpart of the procession of the Athenian people for ever travelling towards the eastern door. The example is taken from the western frieze, and represents some of the Athenian cavalry. It is specially interesting for the beauty of one of the heads. This type seems to have been imitated widely upon contemporary coinage. But we must not stray very far into the bypaths that open on either side; the procession is still moving on towards the eastern entrance. In the centre of the eastern frieze the chief person in the Athenian hierarchy, the Archon Basileus, receives from a boy the new guardian of the city. When the spectator reached the eastern end of the temple he found overhanging him the great cavernous pediment in which the more than life-size statue stood out from the background with almost oppressive reality. Surely there, on the annual festival, as the horizontal rays lit up the sculpture in the early morning, it would seem as if the mysterious birth of Athene were happening. The crude realism of the vase painting which we studied a short time since could not satisfy the

great artists who worked upon the Parthenon. Fortunately there is a relief, now in Madrid, which enables us to imagine with some likelihood what the central portion of the group must have been. We may suppose the sculptor to have dwelt rather upon the mystical significance of the old legend; the coming forth of a spirit of wisdom from the mind of the supreme god, wisdom strong in the possession of spear and helmet and buckler—with the spirit of victory reaching forth the olive crown in the sure confidence that it would be earned. It would be difficult to exaggerate the influence which this vivid presentation of their patroness exercised upon the Athenian mind; even the most foolish of the Athenian orators must have been sohered, and the most stupid have had some glimmering of intellect, when from the assemblies of the citizens in the plain below they looked up to the Acropolis and thought of all that it meant. When Constantine in his new capital dedicated his great church to the Holy Wisdom—Santa Sophia—the dedication was in striking harmony with the ideal embodied in Athene. If the influence of the goddess floated down from the Acropolis upon the city below, it found its concentrated expression in the great statue of Phidias. Of the statue itself every trace has perished, and we must seek a substitute in the copies that have survived the wreck of the classical civilisation. Of these the most useful is the little statuette found near the Varvakion Gymnasium in Athens, and named from the place of its discovery. "The statue," says Pausanias, who saw it in the second century of the Christian era, "is made of ivory and gold. In the middle of the helmet is a sphinx and on either side there are griffins. The goddess stands erect, clad in a robe which reaches to her feet. On her breast is the head of Medusa wrought in ivory. With one hand she supports a victory of about four cubits in height, and in the other she holds a spear. A shield is placed against her feet, and near the spear is a dragon. On the pedestal the birth of Pandora is represented." The little statuette is concordant enough with the description of Pausanias to make us think it to be a fairly accurate representation of the general composition of Phidias' great work. There are still remaining traces of colour, of red and blue upon the sphinx, and of red upon the eggs. But the statuette falls far short of the style of the original. Let us correct it by reference to a head found near the Acropolis. It is supposed to be copied from the work of Phidias. The eyes have been represented by a bony material inserted in the sockets, and the hollows of the pupils were once filled in with some gem or enamel. The hair was gilt as we may see from some traces, and the head was covered with a helmet. I know scarcely any other object which enables the modern hatter to realise the vivid effect of Greek sculpture; its power "to bring the living features out of marble," a power so poetically figured in the legend of Pygmalion.

With these introductions, let us enter the presence of the great statue as Fergusson, I think, has restored it. The details of the restoration are more or less open to question, and although I trust the drawing fails to do justice to our conception of the goddess, it may serve to concentrate the ideas with which we have been occupied.

Let us sum up our conclusions. We began by observing that the architectural surroundings of Greek sculpture were rendered much more vivid by the help of colour than modern architecture designed in Greek styles would lead us to expect. We noticed, further, that the use of colour in sculpture must have produced an effect somewhat unfamiliar to our modern taste. These two considerations warned us against supposing that we have really fathomed all the meaning of Greek art. We noticed, also, that the real source of the artistic unity of the works of art upon the Acropolis was to be found in certain beliefs of a religious character; beliefs which offer some striking points of resemblance to the medieval beliefs which in their turn found a similar expression in sculpture.

Let us contrast these conditions with the conditions of the present. There now in England is no general and vivid imagination of sacred personages and events to which the artist can appeal, or to which he can minister. I am not concerned to discuss whether such an imagination does or does not deserve cultivation. I am merely stating a fact which is of transcendent importance for the public interest in sculpture. Secondly and lastly, by foregoing the use of colour, the architect and

the sculptor resign the most powerful charm at their disposal. I will ask you to think of the drab stonework, and the dull sculpture of the British Museum façade, and when you have done so, to agree with me that Greek architecture and Greek sculpture have never been really revived in England.

Professor Gardner, in proposing a vote of thanks to the lecturer, said that he was expressing the opinion of the meeting, he was quite sure, in saying that the paper had proved of very great interest indeed. In a paper so full of interest it was difficult to select any one subject to speak about, but perhaps he might devote some remarks to a matter of extreme interest to all of them, and in regard to which Dr. Granger had quoted a few words from his (the speaker's) recent book—viz., as to the application of colour to sculpture and to architecture. Dr. Granger had dealt with this more than once and he agreed with every word that that gentleman had said, though he wished to emphasize more than the lecturer did the loss which had been suffered in sculpture and architecture in England from the absence of colour. Of course, they must remember that conditions in England were very different from those of Greece, and if a Parthenon were to be built in the middle of London exactly like that in Athens it would look very different from that building at the end of ten years, to say nothing of ten centuries, for the soot and dirt of London would soon obscure it. At the same time it must be remembered that the very brilliant light, the dazzling sunlight, of Athens, which many people could not face in summer, necessitated some treatment of the marble. That made a difference between the conditions in London and in Athens. But in a partially white building like those which had recently been built in Athens, if they stood in front of them on a bright, sunny day, nothing could be seen of their form: they saw a dazzling mass of white, from which they were compelled to turn away, and that suggested one of the advantages of colour. When all the details were picked out in colour, then it was possible to look at the Athenian buildings, and appreciate the exquisite surface of the pentelic marble from the contrast with the coloured surfaces around. There was one thing in common between both sculpture and architecture in the application of colour, and he thought that this would explain to some extent the prejudice which some people had against the application of colour. He believed that they were of the opinion that when a material was coloured the colour was applied to obscure an inferior substance—one "gingerbread," or something of the sort. If an opaque colour was laid over the building, that, of course, was the case. In the case of Greek temples, colour was applied in the utmost moderation, and never to a broad surface to any great extent. It was applied to smaller surfaces, and a great surface, such as an architrave, was never covered with colour. In the same way he believed, although the point was disputed, the main surface of a statue was never covered with pigment; only the details were picked out. For instance, the eyes and hair were picked out with colour, and thus enabled one to see the texture between. They were able to speak with confidence as to this, because on the Acropolis a large number of surfaces were found, and in some cases the colour was almost as fresh, apparently, as on the day when it was applied. In the case of a statue it was never the case that the whole of the garment would be painted. Colour was distinctly used simply to throw up by contrast the beauty of the tint. Any one looking at this would not feel the prejudice he had before, because he would see that the colour helped one to appreciate the texture of the marble, and by having small portions of the coloured surface to contrast it with. As to the wonderful sarcophagi at Sidon, at Constantinople, one felt the same about them, and in regard to them it could be seen what an immense amount of expression in the sculpture was owing to the colour. We had a prejudice against painting on sculpture, and we did not like to see the eye painted, but any one who had seen at Sidon these sarcophagi, and the condition of the paintings, would have his prejudice to a great extent removed. The texture of the marble was not at all obscured; one felt that the figures were living in a way in which no white marble could be said to be living. They could say in the words of Æschylus: "In the blankness of the eye all the charm is lost." He, the speaker, felt that very strongly, and he thought it was one of the reasons why sculpture did not appeal to them, for a judicious application of colour was not applied to it. The same remarks applied to Classical

architecture. To erect a Classical building, and to make it purely white, without the addition of colour, was to do a thing which no Greek would have dreamt of doing. They were parodying the Greeks when they left out the colour, which was used in order to make comprehensible the form they gave to their architecture as well as to their sculpture, and a great deal, in short, was lost by the absence of colour. The Greeks also were not averse to using colour on inferior materials as well. They built temples of marble, but also of coarse stone, covered with stucco, coloured freely. The effect was not exactly the same; the colour was not used to throw up by contrast the exquisite effect of the material, but rather to cover it up. He could not help thinking that stucco, used as it was in many of the Greek temples, not left in a dead white, but painted judiciously, and the details picked out in bright brilliant colours (for the Greeks did not use half-tints, but principally red and blue), seemed to be more living, just as the same Classical forms would be more living if we could use the colour decoration which was given by the artist. In conclusion, he desired to say that if any of his hearers who had not time to come to a regular course of lectures at University College would care to call and see his library and apparatus, or to speak about any matter in connexion with Greek art, he would be very glad to see him.

The Chairman asked Professor Gardner why the Greeks used pure colour, rather than secondary colour?

Professor Gardner replied that the question was a very difficult one. He thought himself that it was probably due to the extremely brilliant lighting in Greece. He did not think that any half-tint would gain its effect in the extraordinary brilliantly lighted atmosphere of Greece. It seemed to him that to contrast the white marble and the brilliant blue sky, nothing but the brilliant blue and red seemed to be satisfactory. He was not sure whether the same theory would apply in a Classical building in England. He had seen similar attempts in colour in Athens, where there had been imitations of ancient work carried out by Munich architects, where more half-tints had been used, a duller red and blue, for instance, and he had felt that the duller colours were very unsatisfactory in that brilliant light. Another reason was, perhaps, that the simplicity of the forms required more simple colours; at any rate, the brilliant colours were far more satisfactory.

Mr. Grey Skipwith said that granting that colour was to be used in architecture, and considering the difference between the climates of Athens and London, he should like to hear some expression of opinion from architects as to what modification in colour should be made in London architecture. Coming to London after a long absence, he was very much struck with the gloom and fog and dirt of London. What could architects do under the circumstances? Could they not use some material like glazed tiles or bricks? Or, taking the façade of the British Museum, which really showed under varying lights most wonderful effects, what could architects do with that building by applying colour? Might not the façade be improved by gilding the sculpture and colouring the field of the pediment, by inlaying the frieze of the order with mosaic, or veneering it with polished granite? He did think that the problem had not been properly faced. Even ordinary brick buildings in London might be made to present a warmer surface if the material available were more suitably used. He thought that the Germans as well as ourselves were somewhat deficient in the sense of colour as well as in the knowledge of how to use it. He supposed that no more difficult problem could be found, with the exception perhaps of Sheffield, than how to apply colour to architecture in London.

Mr. G. H. Fellowes-Pryne, in seconding the vote of thanks, said the paper brought before them a new line of thought as regards one of the details of beautiful Grecian art. One of the remarks which appealed to him very strongly was that the sculptures of the Parthenon were not exercises in which merely the skill of the artist was displayed; they were the vehicles of living religious ideals, and that was the kernel, he thought, of the fineness and beauty of Grecian art. It was the religious feeling which they threw into their work; and in Medieval work, although the sculpture work was inferior, yet the same feeling was to be found, for there it existed in a way it had not yet been brought back amongst us. In our sculpture we had been deplorably deficient. He thought the whole motive power of the Greeks consisted in the great religious feeling which they threw into everything they did. [Wherever that

feeling was, there was the motive power, which made the artist work for the great end he had in view. As to Phidias, the praise bestowed on the beauty of his work was quite a secondary consideration; it was something higher than that—viz., the high purpose for which the work was intended. Another thing we might learn was that the artificer and the architect must be more in touch with the work—that the craftsman and architect must feel that the work was not merely carried out for the sake of money and self-glorification. A nobler spirit was at the bottom of the success of the ancient workers. Then as to colour, one of the greatest difficulties in treating sculpture in the present day was to know how far to apply colour. Professor Gardner said that it was never applied to flesh, but to the drapery, the eyes, and the hair. And perhaps that was the best way to treat it, though he thought we had a right sometimes to carry colour a little farther. But the difficulty was to know where to stop, though in London we did not go far enough. As regards materials for use in London, that was a great difficulty. The right material was mosaic, but its use was prohibited by its cost. Most of the glazed brickwork in the market was very unsatisfactory. If a suitable material could be invented, architects would not be slow to avail themselves of it.

Mr. Banister F. Fletcher, in supporting the vote of thanks, said that Dr. Granger had put before them in a few words the whole system which governed the Greeks in the production of some of their finest monuments. The appearance of the Parthenon had most impressed him by moonlight, when the building looked most effective. In regard to Dr. Granger's remarks on architectural criticism, the lecturer had struck out a very proper line, which must appeal to every architect who studied the history of his art, or the notions which evidently guided its production; and he emphasised the importance of studying one building properly and thoroughly from beginning to end rather than gaining a smattering of the styles from several buildings. There was no doubt that any one who had measured up a building from beginning to end would find that the most satisfactory way of working. In regard to the question of studying historical architecture for our own information in regard to modern design, it seemed to him that the study of ancient architecture was really worse than useless, unless they studied it, not as a matter of forms, but as a matter of principles. If they did that, they would not have revivals at all. It was because archaeologists had studied the forms which past civilisation had produced, and had thought they were very beautiful without thinking whether they were bound up with the social conditions of the people who produced them, that revivals had taken place. The question of applying colour to sculpture was not likely to call for much consideration in England, and he did not think that there was much necessity for its application. As Professor Gardner observed, colour on a Greek building was almost necessary if blindness was to be prevented. The Academy at Athens, a modern building, built by a German architect, was of the same marble as the Parthenon, and on a bright day, even in January, the building could scarcely be looked at; and if it were not coloured it would be impossible to do so. But in that respect there was no doubt that the restorations of the Parthenon by the students of the École des Beaux Arts, who went to Rome, were much too laboured: they did not merely colour the metopes, but everything else, and there was no marble left to be seen; whereas the principles which Mr. Penrose had enunciated, of colouring some decorated parts of the building, seemed to be more appropriate. As to the colouring of sculpture in England, one could not help thinking that in the majority of cases it had been a drawback. If they took the coloured architecture of the Gothic period, it never seemed to go well with the sculpture, one reason for which was that with the coarse stone that was used the colour was not effectual, and in internal work it should not be used. But as to external work there was no doubt that with suitable material colour might be employed. But, so far, no one had produced a material which in London could withstand the atmosphere, and the only way to keep a colour was to paint it every year, and that was expensive. There was one material, however, which was used a little, viz., glazed faience, but architects did not seem to care much about it. As to the sarcophagi from Sidon—in the Constantinople Museum, he believed—they were the most wonderful examples of Grecian carving that it was

possible to imagine. Dr. Granger's remarks as to the religion of the Greeks were extremely valuable, and should help them to look at Grecian sculpture from the rational point of view. In regard to the Greek temple, its *raison d'être* seemed to be that it was not only a building for worship, but the museum, the library, &c., and that people went to it, not only for purposes of religion, but in order to enjoy and make use of the museum, &c. In reference to Mr. Prynne's remarks in reference to architects and craftsmen, he did not agree with him. The building of the Parthenon was largely effected by the employment of slaves, and they could not, he thought, have taken much interest in the architecture. As to the question of religion, and the ideal that Dr. Granger touched upon, he remembered reading a book by the late J. A. Symonds on the Italian Renaissance, in which there was a remarkable passage referring to the fact that sculpture and painting, as they were used in the best periods, were practically dead, and that music, the art which the people understood something about, was the art which was going to govern the modern world. There was a great deal in that, especially when one considered that the public generally, while they did not care very much for art, were very sensibly affected by music.

The Chairman, in putting the vote of thanks, said the references to colour were particularly interesting and valuable, and Professor Gardner's remarks on that head would be appreciated by all. The general drift of the paper was not to encourage them to imitate Greek architecture again in England, but to work on much broader principles, and it pointed out that to attempt to import into such a climate as ours a style of architecture indigenous to a sunny country like Greece, was a total mistake. Viewed in that light they would all heartily sympathise with Dr. Granger's remarks. They felt that it was perfectly impossible for them to conform to the condition which the lecturer had laid down, viz., that if Greek architecture was to be imported, it must be imported with its sculpture and its colour. It was clear that it was impossible to do that. First of all there was the difficulty that the sun, the creator of colour, was practically absent from us, and much of that beauty of colour which was seen in the East was the result not only of local colour but of reflected colours, which in such intense sunlight must be seen in the shadow. All that made it quite impossible to produce the same effect in London, even if they put the colour on; and they had better abandon the hope of doing so. The question then arose, if they were to abandon Greek art, which they all admitted was the ideal of refinement, what were they then to do? He thought the only common sense view was to work out our own indigenous styles, and to trust to form rather than colour. Inigo Jones did not realise this at all; he was a classical architect, entirely carried away by his studies in Rome, whereas Wren, who had true genius, seized the idea that variety of outline was all-important, and, although he was actuated by the architectural feelings of his time, he produced most satisfactory results entirely suited to our climate and conditions. He was glad that was the direction in which the architects of the present day were trending, and in this connexion he might mention the New Scotland Yard, which he thought was one of the most perfect examples of what an English public building should be of that type. In that building was to be found the most beautiful sky line, with true classical reserve, and the main lines of the structure appealing to us from whatever point of view we looked at it. Other examples were to be found in the Birmingham Law Courts, and Sheffield Municipal Buildings. The religious inspiration of the Greek work was an extremely interesting question. We had no religious inspiration which could lead us to do work of that kind nor to concentrate our national efforts upon great monuments. As far as our ecclesiastical architecture went we had to recognise that we had to look to variety instead of unity, and we must hope, in seeking to carry out the same principles on which the Greeks worked, the love of beauty and of truth, to try in our individual efforts to produce a large variety of good work where we, as a people, could not get a grand result. As to architectural sculpture, the only really good work which seemed to be done now was carried out in our town halls and public buildings, in regard to which we had municipal inspiration. We had great faith in our municipal institutions, and he looked forward to the time when in every town of England there would be a public building in which the history of the town would be illustrated

in sculpture. That was one end to which legend could inspire them in sculpture, and, as architects, they would rejoice in designing the setting for that sculpture. Of course, there were great ideas which ought to sway us as well as did religious ideas: the gigantic progress of science and the almost miraculous development of scientific research, and that of our national institutions, such as our Navy.

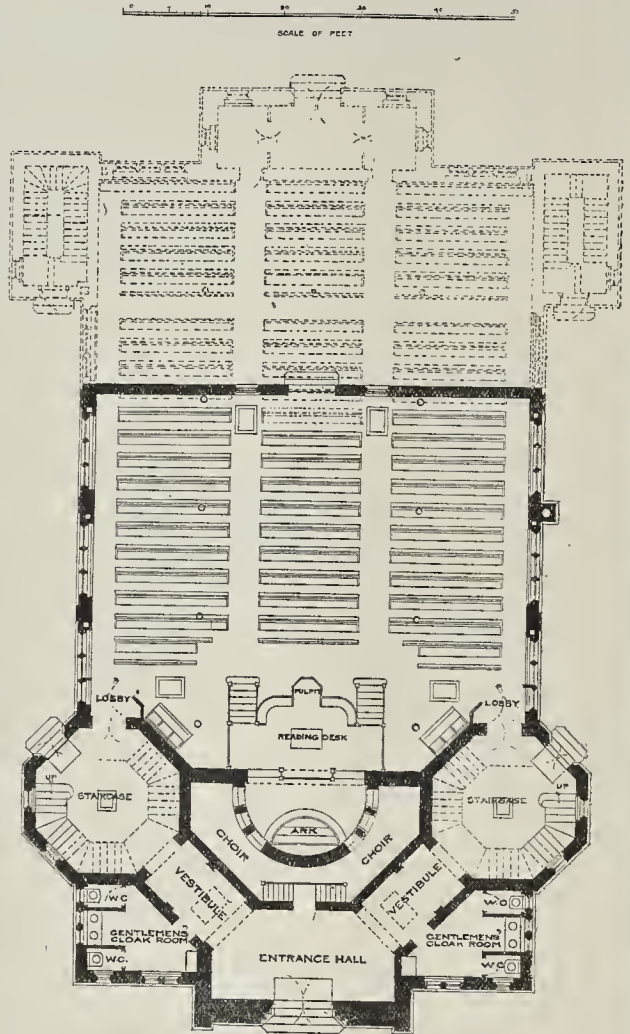

The vote of thanks was then put and carried unanimously.

Dr. Granger, in the course of a brief reply, expressed his thanks to the gentleman who had worked the lantern on that occasion. He no longer spoke as a practising architect, and he, therefore, could not satisfy the desire for more colour in London; we had made our atmosphere and we must sleep under it.

The Chairman announced that the next meeting would be held on the 19th inst., when Mr. J. A. Goch would read a paper entitled "Eighteenth Century Architecture."

The meeting then terminated.

RENOVATION OF ST. MARK'S CHURCH, SOUTH SHIELDS.—After undergoing repairs and renovation, St. Mark's Church, South Shields, was reopened recently. The alterations and improvements have been carried out under the superintendence of Mr. J. H. Morton, architect.

New Synagogue, Cardiff. Plan.

ARCHITECTURE OF CARDIFF.

THE illustrations in the lithograph plates of this week all represent examples of modern architecture in Cardiff, and are referred to in the leading article in the present issue. Two of these, however, being entirely new buildings just in course of erection, viz., the Central Arcade and the new Synagogue, we append the usual more detailed description, which we generally give to an illustration of a new building.

CENTRAL ARCADE, CARDIFF: ST. MARY-STREET ENTRANCE.

These buildings, now approaching completion, will form another connexion between St. Mary-street and the Hayes, and are all arranged for shops of two stories and basement, with the exception of the entrance block shown, which is to be utilised as offices. The St. Mary-street front illustrated is principally in blue and red. The central gable and spandrels over arches are in Guiting stone of an orange tint, the banded work to upper story being in Blue Forest and Guiting stone alternately. The strapwork panels are of

Cattybrook terra-cotta of a warm buff tint, whilst red Aberdeen granite is used for the pilasters flanking the shop fronts. The roof is covered with Belgian green slates.

The buildings are being erected for Mr. David Morgan, who has large business interests in the immediate locality, from the designs of Mr. Edwin Seward, architect; the general contractors being Messrs. E. Turner & Sons.

THE CARDIFF NEW SYNAGOGUE.

The new Synagogue at Cardiff now approaching completion is in Cathedral-road, and takes the place of the old building in East-terrace, erected in 1858, and enlarged in 1874, and which the Jewish community in Cardiff has now outgrown.

The present structure accommodates 241 men on the ground floor and 158 women in the gallery; but provision has been made for extending the building when required at the western end so that it may accommodate a further 191 men on the ground floor and a further 166 women in the gallery, and space has also been reserved at the rear of the site for erecting in the future class-rooms and residences for the minister, reader, and headle. A novel feature of the plan is the arrangement whereby the apse containing the ark is placed at the same end of the building as the main street entrance, this being the only method of securing the necessary eastward aspect for the ark. Another detail of some novelty is the grouping of reading desk and uplift at the same end of the building as the ark. Behind the ark, and enclosed by brass grilles, is the choir; and behind the choir is the main vestibule leading to the ground-floor lobbies and to the two octagonal buildings containing the staircases. Both at ground-floor and at gallery levels accommodation is provided for ladies' and gentlemen's cloak-rooms. The staircases are of stone; the side galleries are carried by steel girders resting upon iron columns, which columns continue up to the level of and carry the clearstoreys.

The apse is covered by a pannelled half-dome. The ark is semi-circular on plan, and is superimposed by a half-domical roof, with a low-level clearstorey over. The reading platform is approached by two flights of stairs.

The whole of the exterior has been carried out in blue pennant stone with Bath stone dressings. The building is heated by Grundy's hot air system, and is lighted by electricity. The architect is Mr. Delissa Joseph, of London, and the contract has been carried out by Mr. William Lissaman, jun., of Cardiff, at 5,164*l.*, Mr. S. Owens being clerk of works.

THE ARCHITECTURAL ASSOCIATION SPRING VISITS:

VISIT TO HER MAJESTY'S THEATRE,
HAYMARKET.

The Third Spring Visit of the session was held at Her Majesty's Theatre, Haymarket, on Saturday, March 6, by the kind permission of Mr. C. J. Phipps, F.S.A., the architect of the building, who received the party numbering over a hundred members, and explained the construction of the building, besides giving much other interesting information. The site is a favourable one for a theatre, being placed at the angle of the Haymarket and Charles-street, and having the Arcade at the rear, the main front being towards the Haymarket where the entrance is situated.

The entrance hall gives direct access to the stalls, which are only slightly below the street level, and from the hall are wide staircases leading to the dress-circle and the large balcony above, the entrance to the pit being in Charles-street.

The main points in the planning of the access to the building are the two separate staircases and exits to each part of the house, and the arrangement of the box-office, which is so placed that it serves the whole of the entrances to the house, and so simplifies and economises the work of the staff.

The auditorium is remarkable for width in proportion to depth, the curve of the galleries on plan being designed as flat as possible; this promises good results, as the distance from the stage to the audience is appreciably diminished. The upper part of the auditorium is divided into dress-circle and balcony, the gallery being situated at the back of the latter, an arrangement which gives an open and spacious appearance as seen from below, owing to the considerable height between the balcony and the ceiling.

The balconies are constructed on the cantilever system, with iron cantilevers and joists, and filled in with concrete; and in these are built brick risers and the tiers formed of concrete. The roof over audi-

torium is of wood, with large queen-post trusses to the under side of which is secured the ceiling of fibrous plaster.

The proscenium opening has a width of 35 ft., which is large in proportion to the size of the theatre, being equal to that at Drury Lane. As a precaution against fire spreading through the roof, from the stage to the auditorium, or *vice versa*, a clear space has been arranged between the proscenium wall and the wall carrying the roof of auditorium, this has been contrived over the arched portion of ceiling, the roof over this being flat.

The proscenium opening is fitted with a fire-proof curtain constructed of light iron framing and covered both sides with asbestos and the space between filled with slag wool, the height is sufficient to allow this to rise clear above the opening, and it will be raised and lowered by hydraulic power, worked with a lever from the prompter's box, the whole weight of the curtain being under five tons.

The lintel over the opening is a solid baulk of fir with brick relieving arch turned over, it having been found by experience that this will stand a greater heat than iron girders in a similar position. The stage has a depth of 60 ft., and is a variation from the usual English method in that the rake has been omitted, the stage being absolutely level; this is the custom on the Continent, also in America. The original reason for the slope appears to have been the height of the "float" of the footlights, which was liable to hide the feet of the performers, but with the present system of electric lighting, when the lights are only some two or three inches above the level of stage, the rake seems to be unnecessary, and the omission of it will be a distinct advantage to the scenic effect, as the perspective effect of a rising stage is always unfortunate.

The floor of the stage is arranged to slide away in sections and to admit of the raising and lowering of scenes unrolled, platforms, &c., and the inspection of the construction enabling this to be accomplished was of considerable interest, the mass of beams, posts, struts, and framing under the stage being at first sight exceedingly complicated. Each so-called "cut" or section of the floor, ranging from 6 in. to 3 ft. wide, is formed of narrow widths of boarding resting in rebate on joist; on a wedge being removed, the end of the section drops down into a groove below, and it is drawn off by cords underneath the side of stage, the scenes or platforms then being hoisted through the space thus left by means of ropes wound on large drums. These "cuts" are known by various names, such as the "Carpet" cut, which is the one next to the footlights, and is used, as the name implies, for drawing the carpet through, thus avoiding the appearance of the old-fashioned red-coated attendants before the curtain. There is also the "Corsican Brothers" cut for the production of the ghost, besides numerous others.

The dressing-rooms are situated on the Charles-street front, and are numerous and well lighted. The fitting and decorating of the theatre had scarcely been commenced at the time of the visit, the only portion completed being the ceiling. The lighting throughout will be by electric light, the supply being from three separate companies, to avoid any chance of failure, and the ventilation will be provided for by mechanical means, fresh air being drawn in by fans worked from the engines in the basement, and filtered before entering the house, and foul air drawn out by similar fans through the cupola on roof. The outside of the building is in the style of the French Renaissance, with a large pavilion at the angle, but the scaffolding has not yet been removed; it is built in Portland stone. The building will seat about 1,500 persons, every one of whom will have a good view of the stage, and the total cost is estimated at between 50,000*l.* and 60,000*l.*

A vote of thanks to Mr. Phipps brought the proceedings of a most interesting visit to a close.

THE COST OF LONDON BOARD SCHOOLS. — The Works Committee of the School Board for London, at the meeting on Thursday last week, reported that in February they appointed a special Sub-Committee to inquire into the cost of the schools now being erected by the Board (see our last issue, page 231). General Moberly (the Chairman of the Works Committee) proposed that the Board should revert to the old specification in force in 1885-6 for the next six schools and enlargements, subject to such modifications as the architect might think it necessary to make, in order to bring the specification up to the present requirements of the Board and Education Department; and also subject to the further recommendations which were made by the Sub-Committee. The proposal was carried.

DRAWINGS FOR THE ROYAL ACADEMY.

As before, we shall be glad to take charge of and deliver at the Royal Academy any drawings sent to us in time to be photographed before the day of delivery, with a view to subsequent publication in this journal and in the "Builder's Album" of Royal Academy architecture.

We cannot accept any drawings sent to this office later than Saturday morning March 27, before 12 noon.

Architects sending drawings are asked to give special attention to the following requirements of the Royal Academy:

1. All frames must be gilt.
2. Every drawing must have a label on the back, giving legibly the title and the artist's name and address.
3. Every drawing must have a similar label attached to the frame by a card so as to hang over in front.
4. Every drawing must be accompanied by a letter addressed to the Secretary of the Royal Academy, and signed by the artist, containing the artist's name and address, and the title or titles of the drawings sent. If more than one drawing is sent they must be distinguished by numbers, and the corresponding number must be repeated in the labels fixed to each drawing.

N.B.—We cannot undertake to supply or affix labels when omitted by the oversight of the sender.

MAGAZINES AND REVIEWS.*

The *Art Journal* commences a series of illustrated articles on "Art in the Home" by Mr. W. Scott Morton, a subject which is getting a little worked out, or at least all such articles seem now to run in one line and present the same type of illustrations. A short article on "L'Art Nouveau" at Paris" gives two or three illustrations of recent work in interior decoration in Paris, from which it appears that there is something of a new and a superior feeling springing up in this class of French work, often bad enough. One could have welcomed a fuller illustration of this subject. The frontispiece is an engraving of Miss Dicksee's very charming picture of Angelica Kauffmann in Reynolds's studio.

The *Artist* contains a great variety of interesting illustrations of decorative work, and includes a useful technical article on "The evolution of half-tone engraving."

The House, a new monthly issued from the office of the *Queen*, deals with various forms of home art work, and has many illustrations of furniture, textiles, and various home objects treated in a decorative manner, but it does not rise beyond what may be called a popular view of the subjects treated of.

In the *Nineteenth Century* a very short article by Mr. G. A. T. Middleton, "On Deliberate Deception in Ancient Buildings," refers especially to Professor Goodyear's attempts to show a frequent effort at deception in Italian buildings, and recommends a study of French and English buildings in order to investigate the same question in regard to them. Mr. Middleton does not press the matter too hard, and seems to admit that Professor Goodyear has claimed too much in some of his Italian studies. It is interesting to ascertain the truth in such a matter, but where the employment of the deception is proved it is no credit to the architects who employed it. We do not see in what sense the vertical curves of the Parthenon could be regarded as giving an impression of greater length, nor do we for a moment believe that they were employed with that object.

Scribner includes an article by Mrs. Pennell, one of the worshippers of Whistler, on the "Master of the Lithograph," with the usual foolish adulation which is really becoming too absurd. "London as seen by C. D. Gibson" contains among its illustrations some very good studies of typical heads in London society of various grades. Under the heading "The Field of Art" are a few thoughts on the subject of "Size in Painting" which are worth attention, and contain we think some truth.

The *Century* contains an article on the new National or Congress Library at Washington, followed by one on the decorative paintings in the same building. Some of these, as illustrated, are very fine and interesting, both in idea and

* The object of these notes is to point out anything in the contents of the current magazines which is of special interest to our readers, with occasional brief criticisms on the views expressed in such articles. When a magazine which has been sent to us is not noticed, it is because that number contains nothing that it is within our province to comment upon.

design, though we cannot help regretting that Mr. Dodge, in his ceiling painting of "Ambition," should have followed the revived style of ceilings with flying figures painted as if seen from underneath, in realistic upward perspective—a vicious style of decorative painting. Mr. Maynard's ceiling, with its four figures painted flat amid a field of conventional decoration, is a much more truly artistic manner of treating a circular domical ceiling.

The *Monde Moderne* contains an article on the Palace of the Popes at Avignon, and one on the "Femmes-Artistes" of France, some of the illustrations to which make us acquainted with lady artists of considerable gifts whose names are not known in England.

The *Quarry*, besides its usual amount of practical information, includes an article on "Aestheticism and Building Stone," in which there is some good criticism as to the relation between the quality of the stone and the character of the work done in it.

In the *Contemporary Review* is an important paper by Mr. T. Ferguson Walker on the subject of "An Irish Channel Tunnel," a scheme often talked of though not heard much about lately. The proposed routes, of which a map is given, are of course between the north-east of Ireland and south-west of Scotland, where the sea distance is less than is perhaps generally realised; the difficulty consists in the existence of a deep depression in the middle, called Beaufort's Dyke, which would have either to be got under or bridged across under water. The existence of such a tunnel would shorten the time occupied in the getting to New York by allowing travellers to train (though by a rather circuitous route) from England to the West of Ireland, but we should doubt if it would be very much used by passengers. For cattle traffic, however, it would be invaluable; and it was worth while at all events to bring the subject forward again.

Longman's Magazine gives a curious account of the history and present customs of the Purbeck Quarries and their working, under the title "A Nineteenth-century Craft Guild."

In the *Pall Mall Magazine* is an article on "Old London Bridge," to say that it is written and illustrated by Mr. Brewer is to say that it is interesting both in an archaeological and artistic sense. There is also an interesting article on "Modern Express Passenger Engines" by Mr. Henry Russell.

The *Cornhill* publishes some "Notes on Lord Leighton" by Mr. Giovanni Cosla, the painter, who seems to have known Leighton well, and gives some interesting and very pleasing stories in illustration of his character, and also (which will interest artists still more) some information as to his manner of working.

In the *Gentleman's Magazine* Dr. N. E. Yerke-Davies, under cover of an article on "Bexhill," gives a good deal of sanitary advice in regard to seaside places and their laying-out, of which however we observe that the most practically valuable portion is a long quotation from another writer, whose name is not given.

The *Windor Magazine* includes an illustrated article on "Making and Laying an Atlantic Cable."

ARCHITECTS' BENEVOLENT SOCIETY.

The Annual General Meeting of this Society was held on Wednesday afternoon, in the Council-room of the Royal Institute of British Architects, the President, Professor Aitchison, A.R.A., occupying the chair.

The minutes of the last meeting having been read and confirmed, the following report of the Council was read and adopted:—

"The Council of the Architects' Benevolent Society in the Reports which they have submitted to the Annual General Meetings during the last few years have been able to comment favourably upon the growing appreciation amongst architects generally of the good work accomplished by its efforts, and of the larger measure of support which it has received. Last year they had to lament the death of some of its oldest and most liberal contributors, and it was to be feared that the income of the Society would suffer a serious diminution in consequence. It is, therefore, with considerable satisfaction that they are able to announce that the progress recently made by the Society has, during the past year, been maintained.

This is to be largely attributed to the appeal issued by Mr. Penrose, the late President, in the early part of last year, to every architect in practice in the United Kingdom. Besides many handsome donations, the appeal was successful in adding some forty new names to the list of annual subscribers, and in obtaining increased subscriptions from some who were already liberal contributors. The Council wish to record their great indebtedness to Mr.

Penrose for the trouble which he took in connexion with the issue of this appeal, penned as it was on the very evening of his departure for Athens.

Still, although the Council have considerable satisfaction in noting the increase of annual subscriptions in recent years, they feel that the sum received is yet inadequate, in view of the fact that applications for assistance are made from all parts of the country; and they would point out that against the sum received last year in annual subscriptions, 460*l.* 15*s.*, no less than 560*l.* 10*s.* was expended in grants, and to this sum should be added 35*l.* advanced by the Honorary Treasurer towards the close of the year, when it was impracticable to convene a Council meeting to relieve the urgent needs of worthy applicants; so that the actual sum expended in relief during the year was 604*l.* 15*s.* This sum, however, does not include the 70*l.* dispensed in pensions, which are paid out of the income derived from investments.

With regard to the capital account, there was a balance at the beginning of the year to its credit of 117*l.* 15*s.* 8*d.*, and during the year the sum of 333*l.* 12*s.* was received in donations. It was, therefore, thought well to increase the investments of the Society by the purchase of 230*l.* Caledonian Railway Four per Cent. Debenture stock, at a cost of 236*l.* 17*s.* 6*d.*, thus leaving a balance in the hands of the bankers on December 31 of 64*l.* 10*s.* 2*d.* This purchase increases the value of the Society's holdings of stock to (at cost) 9,893*l.* 0*s.* 4*d.*, which, with the balance at the bankers, leaves the total capital at 9,877*l.* 10*s.* 6*d.* Successive Councils who have administered the affairs of the Society have for many years made efforts to increase the capital of the Society to 10,000*l.*, and it is a matter of satisfaction that the investments have now practically attained this point of stability, their value, indeed, at market quotations being in excess of this sum.

The Council have to announce, with great regret, that they have received an intimation from Mr. Arthur Cates of his intention of resigning the honorary treasurership, a position which he has held for seven years, and which has enabled him to render invaluable services to the Society. Mr. Cates has not only been a liberal donor and subscriber to the funds of the Society, he has also promoted its usefulness by the exercise of his influence in its behalf, by the time and labour which he has always been willing to expend on its affairs, by the interest which he has taken in cases that have come before the Society for assistance, and by a just appreciation of the most advisable way of helping necessitous applicants. During Mr. Cates's term of office the affairs of the Society have year by year steadily progressed, and it will be no doubt a matter of satisfaction to him to know that he leaves it in a more prosperous condition than when he undertook office. The Council duly recognise that the present favourable position of the Society's affairs is largely due to his administrative qualities. At the same time, while this has been effected, it has not been attained by parsimony in affording relief to applicants, or by want of the proper exercise of beneficent usefulness for which the Society was inaugurated and for which it exists. When Mr. Cates undertook the treasurership the number of subscribers was 208; it is now 309. The amount received in annual subscriptions was 308*l.*; it is now 453*l.* The amount of invested capital was 7,426*l.* 2*s.* 4*d.*; it is now 9,893*l.* 0*s.* 4*d.* It remains to be added that in 1893 Mr. Cates made a personal appeal to the architectural profession for donations and subscriptions, with a gratifying result.

The Council have learned during the year, with deep regret, of the death of Mr. E. H. Dawson, Mr. F. J. Francis, Mr. Horton (of Messrs. Horton & Bridgford), and Mr. G. P. Raggett. They have also to record, with sincere regret, the death of an always helpful friend, and for thirteen years Honorary Secretary of the Society, Mr. William H. White, the late Secretary of the Royal Institute of British Architects.

The following gentlemen, being the five senior members, retire by rotation from the Council, namely: Mr. T. M. Rickman, Mr. R. St. Aubyn Rounieu, Mr. J. T. Wimperis, Mr. Thomas Harris, and Mr. H. C. Boyes. To fill the vacancies caused by these retirements and by the retirement of Mr. W. Hilton Nash, the Council have the pleasure to nominate Mr. Arthur Cates, Mr. Aston Webb, Mr. H. L. Florence, Mr. J. T. Christopher, Mr. Sydney Smirke, and Mr. William Grellier.

To fill the vacancy caused by the retirement of Mr. Arthur Cates, the Council beg to nominate Mr. W. Hilton Nash for the post of Honorary Treasurer.

The Council, in closing this report, desire to express the indebtedness of the Society to the Royal Institute of British Architects for the use of rooms in which to hold their meetings, to the acting secretary (Mr. Herbert G. Taylor), and to the officers for their always attentive courtesy.

Mr. Arthur Cates then read the statement of accounts and balance-sheet, the adoption of which was agreed to.

On the motion of Mr. W. Woodward, seconded by Mr. Collins, it was agreed that a vote of thanks be passed to the out-going members of the Council.

It was also agreed that the Council for the

year of office 1896-'97 be elected as follows:—The President, for the time being, of the R.I.B.A.; Messrs. Kidner, Scamell, King, Inskip, Col. R. W. Edis, Crow, Gruning, Hine, Cates, Aston Webb, Florence, Christopher, Smirke, and Grellier.

Mr. Collins, in seconding the motion, referred to the retirement of Mr. Cates from the office of Hon. Treasurer of the Society, which he regretted very much. It was a great misfortune that more members of the profession did not belong to the Society. Mr. Cates had done a great deal to convince architects of that. In regard to the capital of the Society, he hoped that an effort would be made to increase it by another £5,000, so as to put the Society in a sound position.

The Chairman then proposed that a cordial vote of thanks be passed to Mr. Arthur Cates for the services which he has rendered to the Society as Hon. Treasurer during the past year, and during the seven years that he has held office. The services of Mr. Cates had been of very great value to the Society.

Mr. King seconded the motion, which was unanimously agreed to, and Mr. Cates briefly replied.

Mr. Hilton Nash was then elected Hon. Treasurer. In thanking the meeting for electing him, he remarked that the profession ought to support the Society more than it did. It was suggested some years ago that a dinner should be held for the purpose of assisting the Society, but he was more in favour of a dramatic entertainment. As the Society was affiliated more or less to the Royal Institute of British Architects, was it not entitled to be called Royal also?

Mr. Woodward suggested that it should be made known that small subscriptions would be welcome. There were, no doubt, many young architects who would be willing and able to subscribe small sums.

It was then agreed, that a vote of thanks be passed to Mr. Percival Currey for his services as hon. secretary during the past year, and that he be re-elected to that office; that a vote of thanks be passed to Mr. Henry Hall and Mr. William Woodward for their services as auditors during the past year; and that Messrs. Rickman & Rounieu be elected auditors for the ensuing year. A vote of thanks was also passed to the Royal Institute of British Architects for the use of office accommodation.

A vote of thanks to the Chairman terminated the proceedings.

THE LONDON COUNTY COUNCIL.

The annual statutory meeting of the London County Council was held at the County Hall, Spring Gardens, on Tuesday, Mr. Beachcroft, Deputy-Chairman, presiding.

The *Election of Chairman*.—The first business was the election of a Chairman, and after a long discussion Dr. Collins was elected by a majority of two over Sir Arthur Arnold, the late Chairman. Mr. Beachcroft was then elected Vice-Chairman, and Mr. Torrance Deputy-Chairman.

Loans.—On the recommendation of the Finance Committee, it was agreed to lead the Bethnal Green Vestry 10,200*l.* for paving works, &c.; the Islington Vestry 8,000*l.* towards the purchase of the Cattle Market open space; the Deptford Baths Commissioners 10,000*l.* for the erection of baths and washhouses; and the Shore-ditch Vestry 10,000*l.* for a similar purpose.

Fleet-street Improvement.—On the adjourned Report of the Improvements Committee, which recommended that the estimate of 85,390*l.* submitted by the Finance Committee for the widening of Fleet-street between Bride-lane and Salisbury-court be approved, and that the Council should contribute on the usual conditions one-half of the net cost of widening.

Mr. Charles Harrison, M.P., objected to the recommendation, on the ground that the City was a separate authority, and not a Local Authority as understood in the sense of the Local Authorities who required contributions from the Council towards improvements.

Mr. Westcott pointed out that if Fleet-street had been in any other part of London the Council would have paid the whole of the cost; but the City not only paid half the whole of the cost, but actually paid one-eighth of the whole of the rates of London.

The recommendation was adopted, with only three or four dissentients.

Vauxhall Bridge.—The Bridges Committee recommended that the estimate of 12,800*l.*, submitted by the Finance Committee, of the cost of

* See our last issue, p. 221.

videning the central opening of the Vauxhall temporary bridge, and erecting staging and fixing floating booms be approved; that the work be carried out at an estimated cost of 12,800*l.* by the Council without the intervention of a contractor, and that the drawings, specification, and bill of quantities when completed be referred to the Works Committee for that purpose.

Mr. Boulnois, M.P., moved "that the matter be referred back to the Committee, with instructions to consult an eminent engineer of river-bridge building experience."

Mr. Thornton seconded, but the motion was lost, and the recommendation of the Committee was agreed to.

Additions to Cane Hill Asylum.—On the recommendation of the Asylums Committee, it was agreed that the estimate submitted by the Finance Committee for a stokers' mess-room, four coal bunkers, an additional floor and lavatory to the inspectors' and head attendants' quarters, and the completion of the decoration of the wards, &c., at Cane Hill Asylum, at a cost of 1,460*l.*, be approved.

The Council adjourned soon after seven o'clock.

ARCHITECTURAL SOCIETIES.

LIVERPOOL ARCHITECTURAL SOCIETY.—On the 1st inst., a paper was read before this Society by Mr. W. E. Willink, M.A., on the subject of Medieval Craft Guilds. The paper dealt historically with the subject in discussing the origin and early history of guilds in general, and their sub-division in the thirteenth and fourteenth centuries into Guilds, Merchant and Craft Guilds. The paper then described the regulations and aims of the Craft Guilds at the time of their highest development, and extracts from old records were read showing how they not only encouraged brotherly feeling between man and man, but, above all, served to protect the community by requiring a high standard of excellence in work, and a moderate remuneration. The paper proceeded, by a number of lime-light illustrations reproduced from the sketch-book of a thirteenth century architect, Villard de Honneourt, to show how, in the early middle ages, the Master of the Work took the whole of the branches of construction and design as his sphere of operations, and was able to give his instruction to all the crafts, and went on to relate how the degeneration of the earlier Guilds resulted from the wide introduction of capital, tending more and more to the creation of monopolies, and how the social and political power, which they attained, was accompanied in the building trades by a control of the whole of the processes of design and construction which finally left the architect no opportunity for unifying and harmonising the whole composition. With the introduction at the Renaissance of a new style, for which instruction, as apart from traditional knowledge, was essential, the architect regained his control on the designing of buildings. The paper pointed out, in conclusion, that architects are, at the present day, menaced with the same danger as that which wrecked the profession in the later middle ages. Craftsmen of all kinds were willing to undertake various branches of work from the design to the fixing. It behoved every architect to jealously protect his control over the work entrusted to him by an ability and a willingness to design every part himself.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The monthly meeting of this Society was held, on Tuesday, at the School of Art, Arundel-street, the President, Mr. C. Hadfield, in the chair. A paper was read by Mr. J. B. Mitchell-Withers on "A Tour in Holland." He gave a general description of the main features which occur in the towns, especially in reference to the domestic architecture, which is the principal feature of the country, with a few historical notes, and notes on public buildings, and special objects in the different towns. The principal towns referred to were Rotterdam, Delft, The Hague, Scheveningen, Amsterdam, Dordrecht, Leyden, Haarlem, Hoorn, Alkmaar, and Amhem. The lecturer pointed out the advantages of Holland for a short trip, owing to the ease with which one can get there and the facilities for getting from one place to another. With reference to the domestic architecture, he drew special attention to the gables, with their picturesque outlines and graceful ornament, mentioning incidentally the old-fashioned beams and pulleys, with their quaint roofs projecting from the steep, old-fashioned gables. He gave a short historical account of Holland, showing at what periods activity in architectural design had existed, and

completed his lecture by showing a number of slides illustrating various scenes in the country. Two auditors were appointed—Mr. Edmund Windler, jun., and Mr. J. B. Mitchell-Withers.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—In connexion with this Society a lecture was given at the Leeds Institute, Cook-ridge-street, on the 1st inst., by Mr. T. Butler Wilson, of Leeds, on "Modern House Interiors." The lecturer spoke of the awakening interest on the part of the public in the decoration and furnishing of their houses, and deplored the fact that architects had allowed the direction of these matters to pass out of their hands. He suggested that the reason lay in the apathy of the profession with regard to decorative art, and that their interest had been absorbed almost wholly by structural design. He appealed to his co-workers to conquer this apathy, and recommended a closer study of colour and form, and pointed out that architects in days gone by had not only the control of the design and construction of the house, but also the sole direction of the decoration and furniture. The lecturer further maintained that the architect who made decoration his special study was the best authority to consult on decoration and furnishing, both with regard to their most artistic application and their economic execution, by reason of his power to specify and so obtain competitive tenders as he now did in the construction of the building. The lecturer then proceeded to the consideration of style, colour, and form, and offered some interesting suggestions as to the treatment of wall surfaces, floors, ceilings, and the general disposal of furniture.

GLASGOW ARCHITECTURAL ASSOCIATION.—On the 2nd inst. a meeting of this Association was held, Mr. George S. Hill in the chair, when Mr. D. Theodore Fyfe read a paper on "French Mediaeval Fortifications." In introducing his subject, the essayist pointed out that past work must be studied with respect to the conditions under which it was created. He proceeded to enlarge on the different types of the domain, a chief dwelling, showing how this building developed into the chateau of later times. The essayist gave a description of a number of the best examples, diagrams of which were ranged round the walls, and showed that every part of these fortifications had its origin in the laws of defence. We had the hartzian, which was primarily erected to strengthen the angles of the tower. Then there was the system of wooden hoardings, built out from the walls. The besieged by this means had an overhanging walk to enable them to defend every inch of their walls. To the development of these hoardings we owe the corbelled parapets which afterwards became so common. The essayist concluded by a reference to present-day architecture. If it is to be real, he said, it must be the outcome of an intelligent understanding of the wants of the age.—On the motion of Mr. Alex. M'Gibbon, a hearty vote of thanks was accorded to the essayist. Subsequently, the Chairman brought under the notice of members a question of public architectural interest. This was with regard to the proposal by the Lord Provost to commemorate the attainment of the sixtieth year of her Majesty's reign by altering the present front of the Royal Infirmary, and building a new modern façade, which would possibly project farther into the Square.—Mr. Hill intimated that the committee had already discussed this question, and were strongly of opinion that no such proposed defacement should be allowed to take place, unless the alteration was to be of real lasting benefit to the patients; then no reasonable objection could be urged. The infirmary was a notable piece of architecture, and as it stood was in perfect harmony with its surroundings. Were this proposed alteration to be carried through that would be the case no longer.

EDINBURGH ARCHITECTURAL SOCIETY.—At a meeting of this society on the 3rd inst., Mr. J. A. Williamson in the chair, Mr. R. S. Lorimer delivered a lecture entitled, "Some Notes on the Artistic Work and Influence of William Morris." Mr. Lorimer traced the history of the firm of Wm. Morris & Co. from its foundation, dealt with Mr. Morris as a craftsman, as a teacher and lecturer, as a founder of the Society for the Protection of Ancient Buildings, and as a publisher and printer, and showed some of the books produced at his Kelmscott Printing Press.

GLASGOW PHILOSOPHICAL SOCIETY: ARCHITECTURAL SECTION.—A meeting of the Architectural Section of the Glasgow Philosophical Society was held on the 1st inst., Mr. William M'Bean, vice-president, in the chair, when

Dr. Neil Carmichael read a paper on "House Sanitation." He began by referring to the soil on which houses were built, and said that that under most city houses was invariably charged more or less with coal gas. To prevent the entrance of ground air the whole basement should be laid with concrete or other comparatively impervious material. This should be done in all cases. As to drainage, he said that all appliances for the removal of waste should be placed in shafts or towers shut off by doors from the house proper. This might not be imperatively called for if the pipes and joints were quite sound, but it was so difficult to obtain these conditions that it was advisable the house should be saved from the risk of such defects. In addition to the advantage which there would be from a health point of view, the arrangement would be a good one, because the houses would be easily heated and pipes thus prevented from freezing. Earthenware and clay were porous materials, notwithstanding the surface enamel which there was upon them. What was required in this connexion, however, was a material non-porous in its substance and smooth on its surface. Such a material was glass. In localities and in places where special trades were carried on in impure air consumption was found to prevail. In Glasgow the prevalence of consumption was inversely as the cubic space occupied in the house per head. Cholera had proved one of the greatest blessings of the century, inasmuch as it had enforced the necessity for a pure water supply. It had saved by the general improvement of health vastly more lives than it had destroyed. Consumption should now teach the need for pure air, and so it might ultimately produce an improvement in health as a counterpart to its present ravages. Much, must be done by medical men spreading knowledge, and much by sanitary departments insisting on proper ventilation, but most could be done by architects, who to a very large extent had the solution of the question in their own hands. People talked about draughts, but this was because they were not sufficiently familiar with the presence of pure air. The fact was foul air was infinitely more injurious than the draught. No church, hall, school, or theatre should be allowed to be built unless it had some means of mechanical ventilation. More sunlight was required in cities, with more open spaces, wider streets, and houses so situated and constructed as to admit of a large amount of sunlighted air. In other words, what was wanted was more of the conditions of life and fewer of those which tended to death.—*Glasgow Herald.*

DEVON AND EXETER ARCHITECTURAL SOCIETY.—On Tuesday last week a lecture was given by Mr. C. J. Tait to the members of this society on "The Parthenon." Some very fine lantern slides of the building, as well as of the sculpture now in the British Museum, were shown.

GLASGOW TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—On Friday last week the usual monthly meeting of this Society was held in the College, George-street. Professor Gourlay presided. Mr. A. Lindsay Miller read a paper on the benefits of photography as an aid to the study of architecture, and gave his personal experience of many holidays usefully spent in studying old examples of good work with the aid of the camera. He by no means wished it to take the place of sketching, but where time was limited a combination of the sketch-hook with the camera and measuring would give immensely superior results and enable one to cover six times as much ground. He explained the mode of using the camera and went into the merits of the different lenses, &c., also the processes for finishing the prints, and more especially the making of lantern slides. A number of slides showing examples of the various class of work done by himself, principally relating to architecture, were thrown on the screen.

ARCHAEOLOGICAL SOCIETIES.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—The seventh meeting of the session of this Association was held at the rooms in Sackville-street, Piccadilly, on the 3rd inst., Mr. Compton, V.P., in the chair. A paper was read by Mr. Thomas Blashill entitled "Some Certificates as to Recusants in Holderness," which was full of most interesting information upon a comparatively little known subject. The inconvenience and discomfort our forefathers in the early years of the seventeenth century were subjected to when

they refused to attend religious worship in the churches was curiously exemplified in the many original documents exhibited in illustration of the paper, all of which were about the same date, A.D. 1616. These certificates shed considerable light upon the operation of the law in the centre of Hilderness, which at that time, as the author remarked, "was by its remoteness and by the absence of good roads more than usually secluded from the outside world." The church services were held twice a day on the Sabbath, morning and afternoon usually, but sometimes in the evening, and all persons were expected to attend or to produce a valid excuse. Good excuses were recognised in old age, sickness, or the care of sick persons or young children. Absence from home also was admitted to be a good excuse. Failing such accepted excuses persons absent from church were certified by the churchwardens to the Justices of the Peace and were fined accordingly. Some of the certificates stated how the fines were disposed of.

THE SANITARY INSPECTORS' ASSOCIATION.

The Sanitary Inspectors' Association held its fourteenth annual dinner on Saturday last at the Hoborn Restaurant, when Sir John Hutton, I.C.C., the new President, occupied the chair. The company, which numbered about two hundred, included the Venerable Archdeacon Sinclair, Sir Arthur Arnold, Mr. J. Jacob (Master of the Carpenters' Company), Major-General Moberley, Professor Crookshank, Professor Atfield, Dr. Shirley Murphy, and others. The Paris Society of Hygiene had sent as delegates Dr. Brémont and Mr. C. Nicholson.

After the loyal and national toasts, the President gave the toast of the evening: "Success to the Sanitary Inspectors' Association." He said he regretted that during last year's death had removed that distinguished man, Sir Benjamin Ward Richardson, their late President. The Association had much more than justified its existence. Incorporated in 1891, it numbered, in 1895, 349 members, and at the present date it stood at a figure within a very few of 700, and the last year had been a record one in the number of provincial branches that had joined the Association. The President referred to some of the most important objects they had in view. The first was "The Sanitation Bill," which the Association had joined other municipal officers in promoting in Parliament. Another object of pressing importance was to obtain for sanitary inspectors the privilege which had been granted to medical officers of health, of more fixity in the tenure of their offices. Sanitary inspectors ought not to be subject to the caprices of members of Boards who were not always the best qualified men to sit upon those Boards. It would be infinitely better for the general public if these useful servants and those dependent upon them were protected from some of the many risks of their dangerous calling, and a generous consideration should be given to their claims. A satisfactory feature of their work was that the Association desired to effect a reformation from within. They sought to increase their knowledge and to make their mental equipment equal to the various calls the future would make upon them. The authorities should give them a voice in the examinations prescribed for members of their own body. The time would come when the State would be willing to accede to the claims of the members of an association which was of so much national importance.

Dr. Milton Rhodes proposed the toast of "Local Government," to which Sir Arthur Arnold responded. He contrasted the sanitary work performed in London at the present time by more than 3,000 members of vestries, who all gave their services, with the state of things found at the time when no sanitary inspectors existed, or they had not a proper knowledge of their duty. It was not uncommon forty years ago to find houses of the value of 60*l.* or 80*l.* per annum built over open cesspools, and from a sanitary point of view, the situation of the middle classes was worse than that of some of the races of Africa. But then, as now, men lived somehow, which seemed to prove that bad smells did not kill people. He thought that what people ate and drank rather than what they breathed was often the cause of the mischief. He hoped that sanitary inspectors would get all their just requirements, and that their humanitarian work of preserving the health of the community would flourish and prosper to the great benefit of the people of this country.

Archdeacon Sinclair proposed the toast of "Education." He thought that in this great citadel of education containing 4,000,000 souls more might be done with regard to sanitary science, and that it ought to be taken up as a special subject throughout the whole country. The Sanitary Inspectors' Association had a great opportunity amongst the classes in whose midst their work lay, to whom they could impart a good deal of useful knowledge. The toast was coupled with the name of the Master of the Carpenters' Company, Mr. J. Jacob, who, having briefly replied, Mr. Alderman Dyson, of Windsor, proposed the toast "Science and Art," to which Professor Atfield and Professor Crookshank severally responded. Professor Crookshank said he had reason to be proud of the work of the sanitary inspectors of this country. Their work was of a solid character, and might be regarded as one of the causes of the leading position which this country had taken in sanitary matters among the nations of Europe.

The health of the President was proposed by Mr. F. O. Crump, Q.C., and, at the close of a brief reply made by the Chairman, Mr. H. Thomas (Chief Inspector, Bermondsey) was called up to receive a timepiece and an illuminated address subscribed for by the members, in recognition of his services to the Association as Chairman of the Council during the last three years. Mr. Thomas suitably acknowledged the gift.

To the toast of "The Visitors and Guests," which was the next proposed, Mr. Nicholson, of Paris, responded for the Vice-President and himself, and read the friendly greeting of Dr. de Héra Santa, the viceroy of the President.

The toast of "The Executive," proposed by Dr. Shirley Murphy, was replied to by Mr. W. W. West, the Chairman of the Council, Mr. Raymond, the Hon. Treasurer, and Mr. Tidman, the Hon. Secretary. The Chairman of the Council said that twelve or fourteen years ago the Association had been formed because it was felt that improvements in the status of sanitary inspectors were necessary in the public interest. Thanks greatly to the powerful support of their past Presidents, Sir Edwin Chadwick and Sir B. W. Richardson, they had succeeded to a very considerable extent in gaining their objects, though they had not yet entirely succeeded.

Mr. Raymond and Mr. Tidman, editor of *The Journal*, also replied.

The toast of "The Press" (proposed by Mr. Priddig Teale, of Leeds) having been responded to by our representative, the proceedings closed.

GLASGOW SCHOOL OF ART.—The third lecture of the course on "Hellenic Architecture," by Mr. W. J. Anderson, A.R.I.B.A., was delivered on the 3rd inst., and aimed at presenting a view of the structural development of the archaic Doric style in Sicily and Magna Græcia. After a survey of the historical displacements which resulted on the settlement of the coasts of Southern Greece and Italy, Crete, and Sicily, by Greek tribes, under the influence of Dorian manners and religion, the growth of the Greek city was sketched from its citadel acropolis to the temple-crowned hill of the succeeding period, surrounded by its agora, stoa, theatre, gymnasium, &c. Attention was drawn to the evidences of enlightened design in the setting out of the buildings and the skillfully prepared transition from the natural surroundings to the building itself, and the point was illustrated by views of Gigenti, and its range of great temples. The Doric order was traced in its progress from the archaic reliefs of Selinus to the period following the Persian and Carthaginian wars, and photographs, details, and restorations supplied of the temples of Paestum, Segesta, and the Heræon, at Olympia. Summing up, the lecturer concluded that although grandly proportioned and profoundly impressive, the Doric Temple model was a work of architecture only of the second rank, and that in these buildings there was nothing quite comparable to the refinement, and freedom, and certainty of drawing which characterised the corresponding phase of Ionian architecture. In place of this the Dorians supplied a ponderous and logical stone construction, naively expressive of its wooden origin, and forming a noble frame for figure sculpture, which it was incomplete. The perfection of the following period as attained in the Parthenon and Propylæa was due partly to the fact that the model was adopted by the Athenian Ionians, who, apart from sculpture, combined with it Ionic features, and conferred upon it all the graces of drawing and refinement of tone and proportion which were the result of Ionian art.

PRICED QUANTITIES.—At a special meeting of the Liverpool Master Builders' Association, held at 6, Lord-street, Liverpool, on the 4th inst., the question of sending in priced quantities with estimates was under consideration, and after a general discussion it was unanimously resolved that the members of this Association should not send priced quantities in with their estimates.

COMPETITIONS.

DUDLEY GRAMMAR SCHOOL.—The following is the award of Mr. Arnold Mitchell, of London, the professional adviser appointed by the Governors of the Dudley Grammar School:—First premium of 50*l.* to Messrs. Woodhouse & Willoughby, of King-street, Manchester, the authors of the design numbered 41. The second premium of 20*l.* to Messrs. Forsyth & Maule, of 16, Great Marlborough-street, W., the authors of the design numbered 19. There were fifty-four designs submitted.

MORLEY PUBLIC BATHS.—A meeting of the Morley Town Council was held on the 1st inst., the Mayor (Alderman W. Middlebrook) occupying the chair. At a special meeting of the Council a few weeks ago it was decided to award the first premium for designs for the proposed new public baths to Messrs. Holton & Fox, of Dewsbury (No. 10), and that they be carried out, on condition that a tender was submitted from a contractor to the effect that the baths could be erected for the sum estimated. The Baths Committee now recommended that the design No. 5, selected for the second premium, was best adapted for the requirements of the borough, and that, subject to the author of it producing an approved tender for the amount of his estimate, the baths be erected according to this design. A lengthy and heated discussion took place, and an amendment was proposed and seconded that the recommendation be not accepted. The voting resulted in a tie, thirteen voting for the amendment and thirteen against. The Mayor declined to give his casting vote, and, after further discussion, it was agreed that the Mayor submit the designs Nos. 10 and 5 to a competent arbitrator for his opinion and report.—*Bradford Observer*.

PROPOSED WESLEYAN COLLEGE, SCARBOROUGH.—Five sets of plans were sent in by local architects for the premiums offered (viz., 50*l.* and 25*l.*), in connexion with the proposed Wesleyan College, Scarborough, on the Wapeness Estate, South Cliff. The award has been made, the first premium being awarded to Messrs. Hall, Cooper, & Davis, Westborough, Scarborough; and the second premium to Messrs. Tugwell & Barry, Westborough, Scarborough. ISOLATION HOSPITAL, THE GILROES, LEICESTER.—The Leicester Sanitary Committee had before them on the 5th inst. the report of the assessor, Mr. T. M. Aldwinckle, on the competitive designs for the new isolation hospital to be erected at the Gilroes. The design of Messrs. Blackwell & Thomson has been awarded the first place, that of Mr. Charles Kempton the second place, and that of Messrs. Everard & Pick the third place.

THE NEW HIGHER GRADE SCHOOL, SCARBOROUGH.—We are informed that Mr. Robson, F.S.A., architect to the Education Department, who was asked to judge the plans sent in for the erection of a new Higher Grade School, Scarborough, has made his award. The first place is taken by Messrs. Hall, Cooper, & Davis, Westborough, Scarborough; the second place by Messrs. Demaine & Brierley, York; and the third by Messrs. Marshall & Dick, of Newcastle-on-Tyne.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on the 9th inst., the Building Act Committee reported that they had considered the under-mentioned applications under the London Building Act, 1894, and had arrived at the following decisions. Those applications which have been agreed to are granted on certain conditions:—

Lines of Frontages.

Bermondsey.—That consent be given to the erection of an addition in front of the Cbaucer Board School, Westcott-street, St. George-the-Martyr, Southwark, on the application of Mr. T. J. Bailey on behalf of the School Board for London.

Greenwich.—That consent be given to the erection of a coach-house and stable at Fairhaven, Myceno-road, Blackheath, on the application of Mr. W. T. Walker on behalf of Mr. R. Young.

Hamstead.—That consent be given to the erection of an addition on a portion of the forecourt of a house known as Daydown, No. 7, Netherhall-gardens, South Hamstead, on the further application of Mr. D. Brown on behalf of Mr. L. Sinclair.

Strand.—That consent be given to the erection of an iron and glass shelter in front of the Duke of York's Theatre, St. Martin's-lane, St. Martin-in-the-Fields, on the application of Messrs. Wilkinson, Howlett, & Wilkinson on behalf of the York Dramatic Syndicate, Limited.

Greenwich.—That consent be given to the erec-

tion of one-story shops upon the forecourts of Nos. 44, 46, and 48, Blackwall-lane, on the application of Mr. W. Busbridge.

Worwood.—That the application of Mr. E. R. Barrow for an extension of the periods within which the erection of the houses with shops on a portion of the grounds of The Abbey, No. 70, Herne Hill, were required to be commenced and completed, be granted.

Paddington.—That consent be given to the erection of a one-story workshop on the north side of Horn-road, Harrow-road, on the application of Mr. E. A. Vigers on behalf of Mr. W. Riley.

Packham.—That consent be given to the erection of a building with one story addition in front thereof at No. 8A, Queen's-road, on the application of Messrs. Ramsey & Co. on behalf of Mrs. S. Bonsall.

Hackney, Central.—That consent be not given to the erection of a house with shop on the north side of Blackstone-road, London-fields, to flank upon Lansdowne-road, on the further application of Mr. W. H. Adams.

Paddington, North.—That consent be not given to the erection of a church, with projecting chancel and porches, on the west side of Saltram-crescent, St. Peter's Park, at the corner of Croxley-road, on the application of Mr. A. W. Pite on behalf of the Rev. W. P. Legg, M.A.

Width of Way.

Bethnal Green, South-west.—That consent be given to the erection of an enclosed iron foot-bridge across Thomas-passage, to connect Nos. 216 and 218, Bethnal Green-road with No. 45, Derbyshire-street, on the application of Mr. W. Stone on behalf of Mr. H. Borton.

Kilnerhills.—That consent be given to the erection of two open iron foot-bridges across Pickle Flaring-street, on the further application of Messrs. Barnes-Williams, Ford, & Griffin, on behalf of Messrs. France & Co., Limited.

Kilnerhills.—That consent be given to the erection of an addition to the flank of the King's Arms public-house, No. 257, Tooley-street, to abut upon Three Oak-lane, St. Olave, Southwark, on the application of Messrs. F. J. Eedle & Meyers on behalf of Mr. J. Holt.

Diplford.—That consent be not given to the erection of buildings on the east side of Hoster-street and the north side of Creek-street, Greenwich, on the further application of Mr. L. Jacob on behalf of Messrs. J. & A. Dandridge.

Space at Rear.

Linehouse.—That the Council do, in the exercise of its powers under Section 41 of the London Building Act, 1894, allow a modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of a one-story addition to a stable at Ratcliff Cross Wharf, Broad-street, Ratcliff, with an irregular space at the rear, on the application of Messrs. Bradshaw, Brown, & Co., on behalf of Messrs. P. Machin, Johnson, & Co.

Line of Fronts and Width of Way.

Fulham.—That consent be given to the erection of one-story shops upon part of the forecourts of Nos. 19, 21, 22, 23, 24, 25, and 26, Effie-road, Walham Green, on the application of Mr. E. Scott on behalf of Mr. T. Daves.

Hampstead.—That consent be given to the rebuilding of No. 1, College-road, Havestock Hill, so far as relates to the frontage only, on the application of Mr. C. C. Bradley on behalf of Mr. H. Benjamin.

St. George, Hanover square.—That consent be given to the erection of an inclosed porch on the east side of No. 74, Eaton-terrace, Eaton-square, to abut upon Graham-street, on the application of Mrs. E. J. Allen.

Westminster.—That consent be not given to the erection of buildings with projecting plinths, pilasters, bay window, balcony and porch, at No. 12, Great George-street, at the corner of Little George-street, on the application of Messrs. A. Waterhouse & Son on behalf of the Surveyors' Institution.

Width of Way and Construction of Buildings.

Greenwich.—That consent be given to the construction and erection of open sheds at Durham coal-wharf, River-bank, New Charlton, near Anchor and Hope-lane, with the boundary wall in front of the sheds at less than the prescribed distance from the centre of the road, on the further application of Mr. J. Rowland on behalf of Messrs. Wood Brothers.

Chelsea.—That consent be not given to the erection of a temporary wood and glass show-case on the eastern side of No. 125, King's-road, to abut upon Shawfield-street, on the application of Messrs. Plumsted Brothers.

Formation of Streets.

Clapham.—That an order be sealed and issued to Mr. W. N. Dunn sanctioning the formation or laying out for carriage traffic of new streets, 40 ft. wide, to lead out of the south side of Broomwood-road, Clapham Common (west side), Battersea, on his further application to the Council on behalf of Mr. T. Ingram. That the names Kyle-road in

(continuation), Broxash-road, and Amner-road be approved for the new streets.

Hampstead.—That an order be sealed and issued to Messrs. Tuckett & Son, sanctioning the formation or laying out for carriage traffic of an extension, 50 ft. wide, of Westbere-road, Hampstead, and the widening to 50 ft. of the existing portion of that road, on the application to the Council on behalf of Mr. P. H. G. Powell Cotton.

Wandswoth.—That an order be sealed and issued to Mr. W. Rivett-Carnac, refusing to sanction the formation or laying out for carriage traffic of new streets, each 40 ft. wide, to lead out of Hotham Villas-road and Worple-road, Putney, the widening and adaptation for carriage traffic of a portion of Hotham Villas-road, and the widening of portions of Worple-road, on his application to the Council on behalf of Mr. J. T. Leader.

Cubical Extent.

Finbury, Central.—That, subject to the provisions of Section 76 of the London Building Act, 1894, the consent of the Council be given to the erection on the west side of Berry-street, at the corner of Little Sutton-street, Clerkenwell, of an addition to a fermenting-house, such addition to exceed in extent 250,000 but not 450,000 cubic feet, and to be used only for the purposes of the trade of a brewer, on the application of Mr. W. Bradford, on behalf of the Cannon Brewery Company, Limited.

Recommendations marked † are contrary to the views of the Local Authorities.

Correspondence.

To the Editor of THE BUILDER.

DISCOVERY OF ROMAN REMAINS.

SIR,—I learn by a letter from Mr. George Allis, of Lincoln, to whose care and archeological enthusiasm are due the preservation of the columns of an important Roman Stoa near the famous Newport Archway, that one of the two bases which were wanting to complete the north and south line of the colonnade was excavated, through the liberality of a lady (whose name, however, he does not mention), on March 9; and he was in hopes that the other would not fail to be discovered before the end of this week.

F. C. PENROSE.

68, St. Paul's Churchyard.

CLAIM AGAINST THE ST. PANCRAS GUARDIANS.

SIR,—My attention has been called to Mr. Harston's evidence in this case on the question of brick. I have had an opportunity of reading the short-hand-writer's notes. In his cross-examination Mr. Harston stated that my firm, Messrs. Eastwood & Co., Limited, were not makers, but simply bought their bricks from a lot of little brickmakers. As this was stated publicly in open Court, and reported in your columns, I should be grateful if you would allow me to inform Mr. Harston, and others who may have the same opinion, that we are brick-makers, manufacturing bricks in our fields at the following places:—Shoeburyness, Essex; Otterham, Rainham, Kent; Halstow, Newington, Kent; Sittingbourne, Kent; Faversham, Kent; Teynham, Kent; West Drayton, Middlesex; Arlesey, Bedfordshire. Our make last year was 83 millions.

I feel sure that Mr. Harston, whose character for integrity, justice, and fairness is so well known, must have made this statement not knowing the above facts. His ignorance may, perhaps, have arisen from our invariably declining to supply bricks to any builder for work under Mr. Harston. He specifies stock facings to be: "The best gold-burned, hard, square-facing bricks, uniform in colour, specially picked in the brickyard, to be they know locally as picked stocks, bright stocks, paviors, mainly, or by any other designation." It is impossible for any brickmaker to supply such a brick.

GEORGE E. WRAGGE.

MODEL COTTAGES.

SIR,—Can you or any of your numerous readers tell me of a block of, say, six artistic model cottages, near London, if possible, with three bedrooms, that have been put up for something under 1,000? If you can, you will greatly oblige me as I am interested in a scheme for building some in this district.

HORACE BARRY.

Limpfield, Surrey, March 7, 1897.

"SKETCHES OF LONDON STREET ARCHITECTURE."

SIR,—My attention has been called to a letter of Mr. J. L. Williams in the *Builder* of March 6, in which he claims that he was the architect of 63, Sloane-street.

It is true that Mr. Williams was a paid assistant in my office at the time the work was done. He came to me as a boy some fifteen years ago and has

been in no other office, but a few months ago I found it necessary to dismiss him.

He has no more right to call himself the architect of this work than any man's assistant or clerk has to claim the credit of the work of his principal.

F. B. WADE.

The Student's Column.

SPECIFICATIONS.—XI.

FOUNDER AND SMITH.

MATERIALS.—The cast iron to be of clean, sound castings, sharp and sound, perfectly fair, and out of winding, free from cinder, boney-comb, blow-holes, and other defects. No stopping up or plugging cast on any cast-iron work is to be permitted. None of the constructive cast-iron work is to be painted until after delivery on the site. All columns are to be cast vertically and in dry sand and of even thickness; and to be subjected to such tests as the architect shall direct at the expense of the contractor. All castings to be rejected if found to be in any place as much as 10 per cent. thinner than they should be, as required by the drawings or specification. The castings to be of soft grey pig-iron of the second melting. All bearings are to be planed smooth.

The constructive wrought iron to be equal in quality to Staffordshire iron of "best" quality, and capable of bearing a tensile strain of 25 tons per square inch of sectional area before fracture, and a strain of 10 tons without permanent set, and to be tested if required by the architect at the expense of the contractor. All bolt and rivet holes to be carefully drilled (if punched holes are to be allowed it should be stated), and all bolts to be of wrought-iron with strong, clean Whitworth threads of uniform pitch, and all exposed heads to be hexagonal. All screwed work to have proper internal as well as external threads.

All rivets to be capable of being bent double either hot or cold without cracking.

The steel to be of the best mild steel capable of bearing a tensile strain of not less than 30 tons to the square inch, nor more than 35 tons. The contraction of area at point of fracture shall be at least 40 per cent.

All steel work required to be bent must be bent cold where practicable. Steel is not to be hammered cold, but all bendings required are to be done by pressure.

Work in Other Trades.—Supply and assist to fix all bolts, tie-rods, and other iron-work required in other trades.

Eaves Gutters.—The eaves-gutters and other rain-water goods to be of Macfarlane's manufacture, of medium weight ("heavy" or "light" if desired). Put to all eaves where shown cast iron moulded eaves-gutters to the following sections, as numbered in Macfarlane's list (give full list of the different sections for different situations). The eaves-gutters to be properly bolted together in red lead cement, and fixed with strong, large-headed screws to the woodwork. All eaves-gutters to have outlets cast on, and such stopped ends mitres returned ends, &c., as may be required. All outlets in eaves-gutters to have strong galvanised wire gratings.

Rain-water Pipes.—The rain-water pipes to be placed where shown on the drawings, and to be 3 1/2 in. internal diameter, fixed to stand 2 in. clear of walls with Macfarlane's special clips and bats. The heads of rain-water pipes to be of selected patterns, for which provide the p.c. sum of 10s. each. Each rain-water pipe to have the necessary swan neck and plinth bends, and a cast-iron shoe at foot discharging over a gully.

Columns.—The iron columns on ground floor to be hollow, 6 in. diameter, of 3/8 in. metal, with plain caps and bases. The face of caps and bases to be planed true. (Specify the bolts or coach screws, which would be necessary for fixing the base and cap.)

Rolled Iron Joists.—Supply and fix in position the following rolled iron joists of the size and weights described; the whole to be of English manufacture, and no Belgian joists to be used. (Give a tabular list of the joists, their long-h, size, position, and weight, thus.) No. 3 rolled iron joists, 15 in. by 5 in., weight 51 lb. per foot run over ground floor of school room at first-floor level. Similarly describe the steel girders and sraunchons.

Iron Railings.—Put over area to basement wrought-iron framed horizontal railing, with 1 1/2 in. by 1/2 in. frame, 1 1/2 in. by 1/2 in. bars, 6 in. apart, fixed to a stone curb with lugs let in and run with lead.

Put at the side of basement steps wrought-iron framed railing, with $1\frac{1}{2}$ in. by $\frac{3}{4}$ in. rounded rail with scroll end, and $\frac{1}{2}$ in. by $\frac{3}{4}$ in. bars 6 in. apart, let into mortises in stone curb, and run with Spence's metal. The guard bars to kitchen windows to be framed, and the whole height of windows, with $\frac{3}{4}$ in. by $\frac{3}{4}$ in. square bars, placed angleways 6 in. from centre to centre. Two horizontal rails, $2\frac{1}{2}$ in. by $\frac{3}{4}$ in.; the bottom end of bars to be framed to bottom of rail, the upper end to pass through rail and finish with pointed ends. The ends of rails to be 18 in. longer than opening, built into wall, split and turned up and down at ends.

Provide the p.c. sum of 200*l.* (two hundred pounds) for front railing, which is to be made and fixed by a smith to be appointed by the architect. The contractor is to prepare stone coping for fixing by cutting number 64 mortises for inch bars 3 in. deep.

Iron Staircase.—Provide the p.c. sum of 15*l.* (fifteen pounds) for circular iron staircase 4 ft. 6 in. diameter and fix same in position, shown on drawing. The staircase to be supplied by Messrs. _____, to whom the contractor is to pay the p.c. sum of _____ allowed within one month after the production of the architect's certificate.

Iron Casements.—Provide the p.c. sum of _____ for iron casements to windows numbered _____ on plans. These casements are to be properly and truly fixed by the contractor, but will be supplied by Messrs. _____ to whom the contractor is to pay the provisional sum within fourteen days after production of the architect's certificate.

Stoves and Ranges.—Provide the p.c. sum of 25*l.* (twenty-five pounds) for kitchen and the p.c. sum of 50*l.* (fifty pounds) for No 10 stoves, all of which are to be supplied by the firm to be selected by the architect, and to be fixed by the contractor.

Copper.—Provide and set in brickwork as shown on plan, in scullery a 24 in. copper copper weighing not less than 22 lb., with the necessary furnace work and flues with soot doors to chimney stack. The brickwork of coppers to be built in blue lias lime mortar, and rendered round the outside in Portland cement. Provide deal pegged copper lid 2 in. thick in two thicknesses, with cut handle out of $1\frac{1}{2}$ in. deal.

Chimney Bars.—Provide the wrought-iron chimney bars for fireplace openings as specified in the Bricklayer.

Coal Plate.—Provide Hayward's improved safety coal plate, No. 1 D, 14 in. outside diameter, with circular protecting ring for rebated perforation in York stone cover over coalshed.

Strong-room Door.—Provide p.c. sum of _____ for strong-room door and frame, size of door opening 2 ft. 6 in. by 6 ft. 6 in., and build in same to brickwork and stone threshold.

Ornamental Balusters to Staircase.—The principal staircase to have ornamental cast-iron balusters, as shown on detail drawings. Short balusters to weigh 14 lbs. each, long ones 18 lbs. All to be finely cast with lugs let into mortises in stone steps, and run with Spence's metal. The tops fitted to top rail of wrought iron, $1\frac{1}{2}$ in. by $\frac{3}{4}$ in., and screwed through same to oak hand-rail. The newel to be malleable iron cast from turned wood pattern one-tenth larger than size of finished newel as shown on detailed drawing.

Lightning Conductor.—Provide and fix along ridge to _____ ft. run of copper tape lightning conductor $1\frac{1}{2}$ in. by $\frac{3}{8}$ in. with four lightning rods of thick copper tube with platinum points p.c. _____ *l.* each. The copper tape to be secured to ridge with strong copper holdfasts, and to be carried down to ground with tape of the same scantling, securely attached to the building by strong copper holdfasts, and the lower end to be taken 6 ft. below the surface of ground and attached to copper plate $\frac{1}{2}$ in. thick and 2 ft. by 2 ft.; the hole 3 ft. square to be filled in to the height of 2 ft. with gas coke, and the remainder to surface of ground with large s'ize gravel or ballast. Provide the sum of two guineas p.c. for testing this lightning conductor when completed to the satisfaction of the expert, to be appointed by the architect.

Lift.—Provide the sum of _____ *l.* p.c. to be paid to Messrs. _____ for hand-power passenger lift, this sum to include delivery and fixing by Messrs. _____. But the contractor is to allow for attendance upon Messrs. _____ workmen, and for any scaffolding, ladders, or staging that may be required.

Corrugated Iron Roofing.—Roof over covered playground to be carried out as shown on detail drawing, in No. 18 gauge galvanised tinned

corrugated iron sheets; bent to curve, and put together with galvanised wrought-iron $\frac{1}{2}$ in. by $\frac{3}{4}$ in. bolts and nuts, edges and ends of sheets being properly punched for same. The roof trusses to be executed as shown on drawings with $\frac{3}{8}$ in. by $\frac{3}{4}$ in. by $\frac{1}{2}$ in. steel ribs, and 1 in. circular tie rods (if eaves, gutters, and iron water-pipes are required, specify them as desired).

Stable Fittings.—Provide the p.c. sum of _____ *l.* for No. _____ enamelled iron mangers, 6 ft. long, No. 3 ft. angular enamelled iron mangers, No. _____ galvanised iron hay-racks, No. _____ sets of steel divisions, with heel pillars, moulded ramped top rail, bottom sill, and matched boarding. Fix all these fittings in the position shown on drawings.

Provide the p.c. sum of _____ *l.* for enclosures, and doors to loose boxes, and fix same. Provide the p.c. sum of _____ *l.* for No. _____ enamelled iron lettered name-plates, to be fixed to wall with plugs and screws.

Ventilation to Stable.—Provide the p.c. sum of _____ *l.* for self-acting exhaust ventilator, to be supplied by Messrs. _____, and fixed by the contractor in turret shown over roof of stable, and connect same to zinc-lined air shaft 18 in. by 18 in. internal dimensions, formed with $1\frac{1}{2}$ in. deal casing dovetailed at angles, and connected to hollow beam fixed on stable ceiling. This hollow beam to be 12 in. by 6 in. internal dimensions, formed with inch wrought deal bottoms and tops, sides to have $3\frac{1}{2}$ in. by 1 in. wrought deal styles 18 in. apart, dovetailed to top and bottom, and filled in with perforated sheet zinc No. 2,542 in Messrs. Farnillo's catalogue.

Wrought-Iron Scrapers.—The doors numbered _____ on plans to have ornamental wrought-iron scrapers, as shown on detail drawing, with steel plates riveted to uprights which are to be let into mortises in York-stone base and run with lead.

OBITUARY.

MR. A. REID.—Mr. Alexander Reid, architect, of Messrs. Reid & Wittet, Elgin, died on the 4th inst. Deceased was over eighty years of age, and for the last half-century was one of the best known architects in the North. At the opening of his career in Elgin he was the only architect between Aberdeen and Inverness. Along with his late brother, William, he designed a large number of leading houses and mansions in Elgin and all over the North.—*Edinburgh Evening News.*

M. HENRI PILLE.—This able painter has just died in Paris, at the age of fifty-three, by a sudden illness and in full possession of his powers. He was a pupil of Felix Barrias, and made his first appearance in the Salon in 1864 with a pen-drawing, "Edmond Winston." He continued to exhibit annually after this. Among his most original works were "Marie Stuart at Lochleven," "Sybille of Cleves," "Flemish Interior of the Seventeenth Century," "Sancho Panza Recounting his Exploits," the portrait of Coquelin *admet*, and many others, including a remarkable illustration of a scene from "Quentin Durward." He was most widely known to the general public by his pen-drawings and book illustrations. He had a great deal of archaeological knowledge, and excelled in the reproduction of costume, architectural detail and ornament of the Middle Ages.

GENERAL BUILDING NEWS.

NEW FRONT, ALHAMBRA.—On Tuesday, the entrance to the new front of the Alhambra, in Charing Cross-road, was opened by a special matinee. Although the interior decoration is not yet quite completed, a good idea of the building can now be obtained. The whole front is built of stone from the Bath stone quarries, the lower facade, about 42 ft. in width, consists of three entrance doors, the whole framed by a heavy moulding in red Aberdeen granite. The style of the building is Moorish, and it looks rather like a renovated fragment of Seville transported to the middle of London. The interior decoration is very ornate; the ceiling decoration of the vestibule is similar to that of the Viceroys' Palace at Cairo; on all sides are columns of Sicilian marbles, and elaborate pendings in Pavonazza and Devonshire marbles. Mr. W. M. Bruton was the architect, and Mr. H. L. Holloway the contractor.

BATHS, MARYLEBONE.—On Saturday last the new public baths and washhouses at Marylebone, were opened by the Duke and Duchess of York. The building has been erected on the site of the old structure. The front of the building is faced with Portland stone up to the first floor level, and above that with red bricks relieved with Portland stone dressings. There are four swimming baths, two warm baths, a public washhouse and laundry to accommodate seventy-four women, establishment laundry, boiler house, engine room, administrative offices, waiting-rooms, and superintendent's apartments. The Pompeian bath is so constructed that in winter it can be boarded over and

converted into a gymnasium. The screen and central pay office in the entrance hall are of polished mahogany. The mosaic floor was laid by Messrs. Minton & Co., of Conduit-street, W., who also executed the tile pavings and wall linings, including the swimming baths and the hand-painted panels, and of the first-class (Pompeian) bath. The more ornamental of the wrought-iron gates, railings, &c., were supplied by Messrs. Brown & Co., of Birmingham. The contractor for the erection of the building was Mr. Charles Wall, of Chelsea. The engineering work has been executed by Messrs. J. & F. May, and the electrical works by Mr. L. Alwyn. Mr. F. W. Lee was the clerk of works. The architect was Mr. A. Saxon Snell.

NEW FIRE STATION, EDINBURGH.—At a meeting of the Plans and Works Committee of Edinburgh Town Council, on the 4th inst., Mr. Morham, the City Architect, submitted plans for the new central fire station at the south-west corner of the Cattle Market. These show buildings three stories in height in the Renaissance style, with a high tower in the rear. The design comprises an engine-house for four fire-engines, stabling for six horses, duty-room, private office for the clerk in charge, fire station gymnasium, recreation room, and baths for the firemen, workshops for the engineers, joiners, and painters, quarters for nine single men and dwelling-houses for twenty-one married men, residence for the firemaster, a bost-tower, and stores and boiler-houses. Mr. Morham also submitted plans showing the suggested rearrangement of the Cattle Market in consequence of the erection of the new fire station. A plan has likewise been prepared showing how, in the event of the Cattle Market being removed altogether from its present site, the ground might be made available for feuing, with an access from Lauriston. It is suggested that tenements of houses might be erected on the north and east sides, leaving the remainder of the space for recreation and drill purposes. The estimated cost of the buildings, exclusive of the site, is 23,500*l.*

NEW MARINA THEATRE, LOWESTOFT.—The old Rink at Lowestoft has been entirely converted into a play-house. The walls constitute nearly the whole of the old building that has been utilised for the new. The plans for the alterations were prepared by Messrs. R. F. Brett & Son, Lowestoft.

HOSPITAL, CHICKENLY WOOD, YORKSHIRE.—At a meeting of the Dewsbury and District Joint Infectious Hospital Board, on the 4th inst., Mr. G. A. Fox, of the firm of Messrs. Holton & Fox, was appointed the architect of the infectious hospital which it is proposed to erect at Chickenly Wood. Mr. S. Wood (the chairman) explained that it was only proposed to erect buildings to meet present requirements at a cost of about 15,000*l.* The total estimate for the work, as shown by the plans, is over 30,000*l.*

PROPOSED PUBLIC BUILDINGS, WORKSOP.—The plans of the new Free Library and Municipal Buildings, presented at a recent meeting of the Urban Council and approved, were designed and prepared by Mr. T. Kidd, the Engineer and Surveyor to the Council. The buildings will be irregularly rectangular in plan, with frontages to Watson-road and Newcastle-street, the latter containing the principal entrance—to the public offices—and the former the entrance to the Free Library. Both entrances will, however, be in direct communication, and serve also as exits in case of such an emergency as fire. In the basement will be the muniment and strong-room, and the heating chambers and coal and general storage rooms. On the ground floor will be a new and general reading room overlooking Watson-road, and abutting thereon will be the librarian's room, lending library, borrowers' lobby, reference library, ladies' room, and proper conveniences. On the Newcastle-street side will be the Clerk's and Burial Board offices. Over the news room, on the first floor will be a council chamber, a councillors' retiring and deputa-tion room, a large committee room, a book store, lavatories, &c., and fronting Newcastle-street, the Surveyor's offices, with storage above.

TOWER OF ST. OSWALD'S CHURCH, FLAMBOROUGH.—The Bishop of Hull laid the foundation stone of a new tower to St. Oswald's Church, Flamborough, recently. The work is being carried out by Messrs. Bowman & Sons, of Stamford, according to the designs of Mr. Hodgson Fowler, of Durham. A clock and bells are in contemplation, and if these are placed in the tower the total cost will be between 14,000*l.* and 1,600*l.*

FEVER HOSPITAL, EDINBURGH.—The Public Health Committee of Edinburgh Town Council have instructed Mr. Morham, City Superintendent of Works, to complete the plans and specifications of the new City Hospital, and to obtain estimates for the work. A Sub-Committee was also appointed to consult with Mr. Morham, with powers to obtain such special advice as they might require in regard to heating, electric lighting, and such matters.

PREMISES, PINSTONE-STREET, SHEFFIELD.—The building development of Pinstone-street will soon be completed, as the last plot of vacant land, at the corner of Charles-street—opposite the Empire Palace—has been purchased by a company from the Corporation, and a block of shops and dwelling-houses are in course of erection thereon. The block will consist of seven shops and a restaurant five

shops will be in Pinstone-street, one at the corner of Pinstone-street and Charles-street, and one shop and a restaurant in Charles-street. The buildings will be of brick, with stone dressings. The contract is for £10,000 without the land. Messrs. Holmes & Watson are the architects, and Messrs. G. Longden the contractors.

REAL ASSURANCE OFFICES, DUNDEE.—The contract for the mason and iron work of the new Pearl Assurance Offices in Dundee has been placed with Messrs. D. & A. Powrie, builders, Dundee. The contract price of the new structure is between 3,000*l.* and 4,000*l.* Building operations have already been begun. The architects are Messrs. C. & L. Ower.

POLICE STATION, PAIGNTON.—The Devon Standing Joint Committee have accepted the tender of Messrs. Dart & Pollard, contractors, for the erection of a new police station and sessions hall in Palace-avenue, Paignton. The building will comprise a three-cell station, with married and single men's quarters, and a large sessions room. It will be built of red brick, with Bath stone dressings, and red tiled roof. The cost will be 3,600*l.* The plans are by Mr. E. H. Harbottle, architect, of Exeter.

Y.W.C.A. BUILDINGS, LOWE BRIDGE.—The memorial stones were laid recently of the new home of the Lowestoft Young Women's Christian Association, on Regent-road. The architect is Mr. Alfred Clarke, C.E.

CONGREGATIONAL CHURCH, PRESTATYN, FLINTSHIRE.—The newly-erected Welsh Congregational church at Prestatyn has been opened for public worship. The building has been erected on a site in Victoria-avenue, from plans prepared by Mr. Richard Owen, of Liverpool. The contractor was Mr. E. D. Jones.

BOARD SCHOOLS, CARNARVON.—The Education Department have approved of the plans prepared by Mr. R. L. Jones, of the new Board School proposed to be erected on the Pavilion field.

THE COUNTY SCHOOL, CARNARVON.—The County Governing Body have approved of the plans of the new county school buildings for Carnarvon. Mr. R. L. Jones is the architect.

ALTERATIONS TO TRINITY CONGREGATIONAL CHURCH, DEWSBURY.—Alterations and additions are to be made in connexion with this church. It is proposed to erect a wing on the east side of the church, which will allow of an enlarged infants' classroom in the basement and provide a new open staircase from the school to the church. The whole of the gallery at the north end of the sacred edifice, and where the organ is now located, will be taken out and a new floor for the instrument, which will be 5 ft. 3 in. above the ground floor level of the church. A new minister's vestry, as well as a new deacons' vestry, will be added, with entrance hall, &c. A new mahogany pulpit is to be constructed, and the members of the choir will be on the ground floor to the right and left of the minister. On the gallery floor there will be a new class room and a church parlour, with ladies' lavatory, &c. The new partition at the north end of the church will have Corinthian pilasters, and there will be a moulded arch over the organ. The ceilings of the various rooms will be divided into panels by moulded plaster ribs. Messrs. Kirk & Sons, Dewsbury and Huddersfield, who are the architects, will superintend the works. The successful contractors are as follows:—Mason's work, Messrs. C. Whitehead & Sons, Ravenshoepe works, Messrs. Fothergill & Schofield, Batley; Carr, Plasterer; Mr. Samuel Crawshaw, Batley; plumber, Mr. F. Newsome, Dewsbury; and painter, Mr. Ned Ramsden, Batley Carr. The total cost of the works will entail an expenditure of about 2,500*l.*

CATHOLIC CHURCH, DERBY.—On the 25th ult. St. Joseph's new church, Mill Hill, Derby, was opened. The new church is of brick and stone, being faced outside with pressed bricks, with Bath stone dressings. The building consists of nave, north and south transepts, sanctuary, lady chapel, and baptistry, with north porch, vestry, and octagon belfry. The main entrance is at the west front in Gordon-road. The octagon belfry rises to a height of 56 ft., and it comprises a spiral staircase leading to the choir gallery. A bell is fixed at the top. The east or sanctuary end in Moore-street contains a circular tracery window; the other windows in the church are double lancet, and are all glazed with tinted cathedral glass. A covered gateway leads from the presbytery to the north porch. Inside the church is 92 ft. long, the sanctuary being 18 ft. long and 23 ft. wide. The width of the nave is 30 ft., and, including transepts, 49 ft. The choir gallery is at the west end. The benches are of pitch pine, and the church will hold about 450 people. The floors are covered with wood blocks on cement, excepting the sanctuary, which is covered with Goodwin's sanitary tiles, with blue York stone steps leading from the nave. The roof has pitch pine principals, with double collar beams and arch ribs. The rafters are deal boarded on the top, and covered outside with Broseley tiles. The inside stone arches, &c., are of Bath stone, and the walls are faced in Parian cement. The building is heated by hot water pipes, and is lighted by radiators, the heating chamber being under the baptistry. Mr. J. Hart of Corby, Grantnam, was the architect, and Mr. J. Clarke, of Nottingham, was the builder.

ACCIDENT WARD, MERTHYR HOSPITAL.—The Merthyr General Hospital has been extended by the recently-completed provision of an accident ward on the western side of the building. The designs of the late Mr. T. C. Wakeling were accepted for its construction, and in May, 1894, the contract was given to Mr. Richard Lloyd, of Cefn. The architect died before the work had far advanced, and after his death its supervision was undertaken by Messrs. James & Morgan, of Merthyr. Externally the ward is built of red and buff Ebbw Vale bricks, with Loughborough stone dressings. The entrance is from Gwaelodyarth-lane. The door opens into a vestibule, floored with encaustic tiles, and fitted with hot and cold baths, the windows by which it is lighted being of stained glass. The vestibule contains a padded receiving-table, upon which patients are placed immediately upon their admission. The walls are the same as in the ward, which is entered by means of folding doors. In the ward itself accommodation is provided for five beds. It is heated by Musgrave's patent stove, fitted with electric bells, and ventilated by Boyle's patent automatic induced current extractor, with fresh air inlet wall brackets. Folding doors separate it from the operating chamber; and there is direct communication with the night nurses' room.

RESTAURANT, EXETER.—The ground-floor of Gifford's Hotel, High-street, Exeter, has just been converted into a restaurant. The work has been carried out by Exeter tradesmen, from the designs and under the superintendence of Mr. J. Archibald Lucas, architect, of Exeter. The general contractors were Messrs. Tree & Bailey, the decorator Mr. R. J. Mills, the plumbers and gasfitters Messrs. Hubber & Son, and the carvers Messrs. Hams & Sons.

MUNICIPAL BUILDINGS, CONWAY.—At the Conway Council meeting on the 3rd inst., Dr. Prichard (Mayor) in the chair, the Surveyor (Mr. Farrington) submitted plans for converting the old Market-hall into new municipal buildings, with a market hall and public hall, and armoury for the volunteers. He explained that the Council had had a loan of 2,500*l.* sanctioned for the work. Dr. Morgan moved that tenders be obtained at once. Alderman H. Hughes seconded the resolution, which was carried; and it was agreed to try and obtain the adjoining property to carry out the scheme.

CHURCH, CASTLEBAR, IRELAND.—On the 2nd inst. the Rev. Father Lyons turned the first sod of Castlebar new church. The new church will be erected in close proximity to the old one. Mr. Walter Doolin, C.E., Dublin, is the architect.

BUSINESS PREMISES, DUBLIN.—The premises at 46, Mary-street, at the corner of Jarvis-street, Dublin, have been entirely reconstructed. The building covers an area of nearly 4,000 ft., and has been erected from plans prepared by Mr. W. Kaye Parry, of Dublin. The contractors were Messrs. Joseph Pemberton and Son, and all the plumbing work has been executed by Mr. T. W. Little.

LOUISE MARGARET HOSPITAL, ALDERSHOT.—The memorial stone of a new hospital for the wives and children of soldiers in the district was laid at Aldershot recently by the Duchess of Connaught. The hospital is to be built on the south-east side of Thorn Hill, on a prolongation of a frontage line of the Cambridge Hospital, but inclining slightly to the north, owing to the configuration of the ground, and at a height of 350 ft. above the sea level. The building will provide accommodation for fifty-three beds. There will be two two-story blocks containing six wards, and two one-story blocks containing five small wards and an isolation ward. An administrative block will contain the matrons' and nurses' quarters, surgery, and all necessary offices. The joinery and fittings are to be of pitch pine, including the floors, with the exception of those of the corridors, which are to be of wood blocks laid upon concrete. The work is being carried out by Messrs. G. G. Wallis & Sons, of Maldstone, under the superintendence of Mr. C. J. Slade.

ST. GEORGE'S CHURCH, STOCKPORT.—The Bishop of Chester recently consecrated St. George's Church, Heavily, Stockport. The church is of Runcorn stone. It has a central tower and spire of the height of 230 ft. The nave is 29 ft. wide and 112 ft. long inside, with north and south aisles each 19 ft. 3 in. in width. The chancel is 28 ft. 6 in. wide and 68 ft. long, the westernmost portion being under the central tower, with a morning chapel on the north side, and on the south the organ chamber opening into the tower, with the vestries (choir and clergy) farther east of the organ chamber. The total length of the church is 180 ft., and the total width across the aisles is 75 ft. The nave, which has a clearstory of twelve windows on each side and a triforium, is 57 ft. high to the wall plate, the aisles being 37 ft. The architects were Messrs. Austin & Paley, of Lancaster. Messrs. Thornton & Sons, of Liverpool, carried out the masonry, and Mr. Hindmarsh was clerk of the works.

INDUSTRIAL INSURANCE.—The report of the Prudential Assurance Company states that in the Industrial Branch "the premiums received during the past year have amounted to 4,570,793*l.*, an increase of 22,168*l.* over the previous year." This looks as if insurance among the industrial section of the population was steadily on the increase.

SANITARY AND ENGINEERING NEWS.

SEWERAGE SCHEME, LYTHAM, LANCASHIRE.—The Lytham Council, on the 4th inst., amended its application for sanction to borrow 5,500*l.* on account of sewage disposal works, and made it 6,500*l.*, the former amount being insufficient to meet the latest estimate. This includes the putting down of a destructor. It was also resolved to enter upon an expenditure of 2,829*l.* on the drainage of the west end of the town, and Mr. Henry Bancroft was appointed engineer for this scheme.

PIERS, MORECAMBE.—Messrs. Magnall & Littlewood, architects, are now engaged on two piers and three pavilions for Morecambe.

PUBLIC IMPROVEMENTS, SCARBOROUGH.—Colonel Hasted, R.E. (Engineering Inspector), and Mr. E. P. Burd (Inspector of Local Loans, Acts, and By-laws), held an inquiry at the Scarborough Town Hall, on the 3rd inst., with reference to the application of the Corporation for a provisional order. The Corporation seeks powers, among other things, to borrow moneys for the construction of the Marine Drive and sea-wall authorised by the Act of 1889, and for other purposes connected therewith. The Town Clerk explained that under the Act of 1889 the Corporation obtained powers to borrow 70,000*l.* for the construction of the drive and wall, but when they received the tenders they found that this sum would be exceeded, as there were several additional works to be done at the instance of the Board of Trade and the Commissioners of Woods and Forests in order to meet the Scarborough Harbour Commissioners and the local fishermen. The borrowing of the additional 10,000*l.* had been sanctioned by a poll of ratepayers in October last. Mr. J. E. Everett (the engineer for the construction of the drive and wall), in explaining the works to the Inspectors, said that the estimated cost of the whole scheme was now 73,457*l.* Colonel Hasted: Is there any chance of your getting the work completed in two years?—Mr. Everett: Yes; we shall have three summers. Colonel Hasted: You cannot do much before June this year?—Mr. Everett: No; but we shall go on preparing concrete blocks and so on. The next question was as to enabling the Corporation in the case of new buildings or buildings without proper closet accommodation, if in either case a sufficient sewer and water supply are reasonably available, to require that such buildings shall be provided with water-closets.

FOREIGN.

FRANCE.—M. Chancel, head architect at the Elysée, has been ordered to make designs for the enlarging of the Presidential Palace in preparation for the fêtes that the President will give at the time of the 1900 Exhibition. The principal feature will be a large reception hall by the side of the Avenue Marigny.—An exhibition of china will be held at the Palais des Beaux-Arts from May 15 to July 31. It will be under the Presidency of M. Georges Berger, President of the "Union Centrale des Arts Décoratifs."—Some new negotiations have been entered into between the State and the Department of the Seine on the subject of the wall round Paris and the military zone. In consequence of this the barracks of the Ecole Militaire, and the Duplex and Quai d'Orsay quarters, will all be demolished, and will be replaced by buildings bordering the road between the Porte de la Famine and the Porte de Versailles. This will assist towards the total destruction of the Paris fortifications.—There is an exhibition of painting and sculpture by Russian artists at 97, Rue de Rome, and another exhibition of the works of Jean Veber at the Georges Petit gallery.—M. Brésson has gained the first premium at the open competition for the Hôtel de Ville at Brunoy.—The artist M. Donnât has just received a gold medal from the Académie des Beaux-Arts at Florence.—A committee has just been formed with a view of raising subscriptions for the erection of a monument in honour of Petrarch, to be placed near the fountain of Vaulouse, where there is a bust of the celebrated "Laure de Noves" by M. Clovis Hugues.—The Municipal Council of Lyons have decided to make several roads and squares in place of the old fortifications on the left bank of the Rhône.—A statue of Péronnet, the engineer who built the bridge at Neuilly, is to be erected at Neuilly at the expense of the town and State.—M. Eugène Leseur, architect, of Sens, has just died. He was a member of the "Société des Architectes de l'Yonne."

—The death is announced of Marius Dieudonné, (sculptor), Keeper of the Museum at Arles. Amongst his works may be mentioned, "Le Serpent d'Airain," bought by the State at the Salon of 1890, a colossal statue on the clock tower at Trinquetailles, and a marble bust of Bossuet, in the court of the school at Arles.

GERMANY.—The Amalgamated Societies of German Architects and Civil Engineers will hold their annual business meeting of delegates at Rothenburg on August 27 and 28. Herr Süßleben is President for the year 1897; the secretary is Herr Hinckenburg.—A founding hospital and school is to be erected at Berlin in accordance with a bequest of approximately 40,000*l.*, and the Municipality will take over the management of this new institution. The bequest has been

the subject of much litigation since 1802. Rapid progress is being made with the erection of the national monument to William I, opposite the "Schloss" at Berlin. Every effort is being made in order to unveil the monument on March 22, in honour of the hundredth anniversary of the birthday of the deceased.—The Arts and Crafts Association at Berlin has opened the exhibition of modern glass windows, which, according to the German Press, is considered to be very successful.—Some memorial tablets are being prepared as a record of the founding of the German gunboat *Hitts*, which happened last year on the China Station.—It has now been definitely decided to erect a memorial to the Emperor Frederic at the "Museum Island" at Berlin. The bridge to the island will be rebuilt to accord with the arrangements for the monument, and the Municipality has voted 10,000*l.* for this purpose.—Considerable attention is being given at Berlin to a scheme for connecting the whole of the suburbs by an electric district railway.—The "Potsdamer Platz" at Berlin is to be modified, the heavy traffic at this point making it impossible to keep to the old plan of the square. The exact re-arrangement of the square is the subject of much discussion in the local press.—The city of Lubek has framed a series of regulations for the better protection of historical monuments in that city. The code is so framed as to give the authorities very extensive powers. A curator has been appointed to make an inventory of everything of historical interest at Lubek.—An important Roman graveyard has been discovered off the old Roman road on the left bank of the River Eisbach; 205 graves have already been uncovered, and a large number of coins, seals, and household utensils have been found.—The Avenue of Victory, for which the Emperor has ordered a number of statues which he will give as a present to the Municipality of Berlin, is to be rearranged with a view of affording good positions for the sculpture.—The suburb at Grunewald, near Berlin, is to have its own Bismarck monument, owing to the old forest having been a favourite resort with the ex-Chancellor.—We understand that further extensions of the important observatory placed at Potsdam are to be taken in hand immediately, and that the foundations for another large telescope will be laid next month.—AUSTRIA.—Some new people's baths are to be erected at a cost of 5,000*l.* for the Municipality of Vienna; the system adopted is that of providing a large number of shower baths, and 100 will be installed to begin with.—The Emperor of Austria has accorded a number of distinctions in connexion with the completion of the new buildings of the Graz University, and neither architect, nor the contractors, nor sculptors have been forgotten. Baurab Rezonni is in charge of the work.—A kind of "people's palace" is to be erected in a suburb of Vienna, with assembly rooms, concert rooms, restaurants, &c. Mr. Roth will be the architect. There will also probably be a new suburban theatre at Vienna; the building itself will cost about 500,000 florins; the site is to be provided by the Municipality.—Vienna will next year have a so-called "Common-Welfare" Exhibition, and preparations are being energetically made. There will be a model theatre for an audience of about 1,800, in which plays relating to social problems will be given.—The Barons Albert and Nathaniel Rothschild have given a large sum of money for the erection of a new Synagogue at Vienna.—A large number of historical buildings in the town will be demolished directly after Easter, in connexion with the extensive city improvements which are to be carried out at Vienna.—The well-known suburb Frazensbad is to have new waterworks, new sewage, and electric light.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. Arthur E. Street is moving, on Lady Day, from 119, Cavendish-place, to 214, Bryanston-square, W.

GREEK HISTORY AND MONUMENTS.—The opening lecture of a course treating of "Greek History and Extant Monuments" was given on the 4th inst. at the Royal Institution, by Professor Percy Gardner, L.R.D., F.S.A. He commenced by remarking that archaeology served as a handmaid to history, and that by its means the general knowledge and appreciation of past days was made more easy and distinct. Modern archaeology was nothing if not scientific. The force which had changed the older antiquarianism into the newer evolution was that of evolution, which had ranged in an ordered whole the monuments preserved in the museums of different countries. The critical tendency had dealt hardly with the ancient writers, and their value as authorities was much diminished. A check on modern scepticism was furnished by the researches of archaeology, which dealt with things that could be seen and felt. Archaeological data not only assisted in the sifting of historical narrative, but also supplied a background to the theatre on which the historical drama was played, and as such was a great help to the imagination. Professor Gardner then went on to refer to the result of museum work in the field of numismatics and of painting, and to describe with the help of lantern slides the recent excavations of the French at Delphi, pointing o

the gain that had thence resulted to the student of Greek history.

DUBLIN BUILDERS' ASSOCIATION ANNUAL DINNER.—The annual dinner of the Dublin Master Builders' Association took place recently at Jury's Hotel. A company numbering about ninety assembled. The Right Hon. Alderman Meade, J.L.D., presided. The Chairman first gave the toast "The Queen." Sir Charles Cameron, in proposing the toast of "The Master Builders' Association," said from what he knew of the Association of Master Builders he could say it was composed of craftsmen of the highest order. Alderman Meade, President, responded. He said that as an Association they were face to face with a very serious condition of affairs in the spring of last year when they had to deal with a disagreement with their workmen, and during that time the work of the Association had been well and satisfactorily done. He was happy to say that they had drawn up a satisfactory system of working, and the men were now working with a better heart than before the strike, and under such rules as would, in his opinion, make it unlikely that they would hear of a strike again for many a long year. They also hoped to have rules adopted between the builders and architects, which would probably put an end to those little differences which sometimes culminated in the law courts; and he was sure when that was done there would be a court of appeal between the builders and the architects that would be able to settle all differences. The Hon. Secretary of the Association (Mr. Good) also responded. The Chairman gave the toast of "The Guests," and called upon Mr. T. Drew, President of the Royal Institute of Architects of Ireland; Mr. Orpen, President of the Architectural Association; Mr. Spencer Hart, City Engineer; Mr. W. A. Craig, J.P.; and Mr. Maurice Brooks. Mr. Drew, in the course of his reply, said that architects and builders had worked cordially together. The builders had now become organised, and the architects had a body with whom they could deal. That showed one good that had arisen from the great strike of last year, which was probably one of the best things that had taken place in Dublin for a long time. Other toasts followed.

STATUE AT THE WELSH CHURCH, CARDIFF.—A new statue has just been unveiled at Eglwys Dewi Sant, Cardiff, by Lord Tredegar. The figure is carved in Portland stone, and represents Dew Sant in the full vestments of a Celtic bishop of early times, with a crown instead of a mitre. The architect is Mr. E. M. Bruce Vaughan.

DECORATION OF ST. PAUL'S CHURCH, HULLERSFIELD.—This building, after being closed for several weeks for renovation, was reopened recently. The scheme of decoration, which is chiefly in warm terra-cotta hues, was prepared by Mr. Isaac Hordern, of Edgerton, who also has designed and given a reredos. The paintings on the reredos are the work of Mr. A. O. Hemming, of London. Electric light, with 205 lamps, has been installed in the church.

REREDOS, ST. MICHAEL'S CHURCH, HEADINGLEY, LEEDS.—A reredos has just been placed in the side chapel of St. Michael's church, Headingley. The reredos has been designed by Mr. M. Pearson, R.A., the architect of the church, and executed by Messrs. Clayton & Bell, London.

BIRMINGHAM MASTER PLUMBERS' ASSOCIATION.—The members of the Birmingham and District Master Plumbers' Association held their first annual dinner at the Colonnade Hotel, on the 3rd inst. The Association, which is a branch of the National Association, was formed in 1805 to advance the interests of the trade. Mr. G. Osborn, President of the branch, occupied the chair. The toast of the National Association was submitted by the President, who said that the Association had not existed very long, but it could boast of a membership of about 800. Its object was to place the plumbing trade on a higher footing than it had hitherto occupied, and to bring about a higher class of work. Mr. J. Peattie responded. The society had now forty-five branches, with a membership of between 700 and 800. There were over 2,270 registered master plumbers in Great Britain and Ireland. That number did not represent more than one-tenth of the number of master plumbers practising. They ought, therefore, not to be satisfied until they had at least 2,200 members of their Association. Incidentally, he remarked that they must strive to show architects the necessity of receiving separate tenders for plumbing work. If this were done the work would come into the proper quarter. Mr. Peattie also proposed the toast of the Birmingham and District Branch. Mr. Hill, in acknowledging the toast, said they were negotiating with the Birmingham Corporation and trying to devise some method of authorising plumbers. They did not want people in the trade who had no knowledge of it. Other toasts were honoured.

ANNUAL REPORT OF THE PEABODY FUND.—In this, the thirty-second annual Report, it is stated that the net gain of the year, from rents and interest, has been 28,787*l.* 4*s.* 1*d.* The sum given by Mr. Peabody was, in 1862, 150,000*l.*; in 1866, 100,000*l.*; in 1868, 100,000*l.*; and received by bequest from him in 1873, 150,000*l.*; making a total of 500,000*l.*, to which has been added money received for rent and interest, 698,126*l.* 0*s.* 9*d.*, making the total fund on

December 31 last 1,198,126*l.* 0*s.* 9*d.* Of the 85,000*l.* advanced by the Bank of England, as stated in the last report, the trustees have repaid 31,000*l.*, leaving a balance of 54,000*l.* still due. The capital expenditure on land and buildings to the end of the year was 1,250,390*l.* 10*s.* 8*d.* The whole of the repairs for the year amounting to 11,000*l.* 5*s.* 1*d.*, which include extensive structural and drainage alterations at Islington, Old Fye-street, and Stamford-street, have been charged to income as formerly. At the end of the year the trustees had provided for the artisan and labouring poor of London 11,367 rooms, besides bath-rooms, laundries, and lavatories. These rooms comprised 5,121 separate dwellings, viz.:—53 of four rooms, 1,784 of three rooms, 2,429 of two rooms, and 825 of one room. The average weekly earnings of the head of each family in residence at the close of the year was 17*l.* 3*s.* 5*d.* The average rent of each dwelling was 4*s.* 9*d.* a week, and of each room 2*s.* 2*d.* Therein in all cases includes the free use of water, laundries, sculleries, and bath-rooms.

BUILDING IN UGANDA.—According to a recent report on the Trade and Industry of Uganda, by Mr. E. I. L. Berkeley, issued as a Parliamentary paper, the proceedings of the Administration in regard to building in burnt bricks and roofing with tiles are being followed with keen interest, and a number of Waganda are permitted to join the work-yard for the purpose of learning. Several chiefs have already built for themselves very creditable houses with sun-dried bricks and thatched roofs, and preparations are being made for at least a score of new buildings on more skilled principles, amongst them a large central office and court house for the native administration. The natives show a great aptitude in carpentry, and with the introduction of better tools and particularly, in time, of saw mills, the industry will make great progress. They are also experts in iron-working, and though the industry was more flourishing before the wars that in recent years have ravaged the country, it is now rapidly recovering its activity, and will greatly improve under the example of the skilled workmen recently brought by the Administration from India. They also make a very good class of pottery, and show evidence of marked and continuous improvement in the art.

DUNDEE MASTER BUILDERS' ASSOCIATION: DINNER.—The annual dinner of the Dundee Master Builders' Association was held in the Queen's Hotel on the 4th inst. There were about seventy gentlemen present, and Mr. John F. Shaw, the President, occupied the chair. The Chairman proposed the usual loyal and patriotic toasts. Mr. W. Low proposed "The Lord Provost, Magistrates, and City Council," and Bailie Robertson replied. Lord Dean Guld Paul, in proposing "The Building Trade," said the building trades of the city had for some time been very prosperous, and it was a pleasure to think that, for a considerable time to come, there was likely to be as prosperous times for these trades. Within the past fortnight applications had been made to the Town Council for the opening up of four or five new streets in Dundee, which showed there was to be a considerable boom in the building trade for a year or two. The Chairman, in responding, acknowledged that the building trade had been very prosperous during the past year. When he came to Dundee about forty years ago he worked sixty hours per week for 16*s.*, and he was now paying men 1*l.* 16*s.* for fifty-one hours. Provisions were as cheap now as they were then, but house rents were dearer. About forty years ago they would have got two rooms in Dundee for 5*l.* or 5*l.* 10*s.*, but they would now have to pay 8*l.* or 9*l.* for that accommodation. There was no doubt that the high wages paid to the men in the building trade raised the prices of property, but there were many trades in the city in which the wages had not risen in the same proportion. However, he hoped that good trade would continue, for there was nothing more satisfactory to masters and men than that there should be plenty of work. Mr. W. Alexander proposed "The Trade and Commerce of Dundee," and Convener Bell replied. The other toasts included—"Representatives from other Cities," "The Timber Trade," "The Quarrymasters," "The Legal Profession," &c.

THE SHIP LIFT, DORTMUND.—The ship lift, which is an important feature of the new canal between Dortmund and Ems Harbours, is fully described in a publication issued by Messrs. Ernst & Sohn, of Berlin. It is written by Mr. B. Gerdaun, and illustrated by diagrams taken from the working plans. We have already had occasion to refer to this ingenious piece of mechanism for overcoming what would otherwise have been the necessity for constructing a series of locks.

THE DOCK GATES OF LIVERPOOL.—At a meeting of the Liverpool Engineering Society, held on the 3rd inst. at the Royal Institution, Mr. S. B. Cottrell, President, in the chair, a paper was read by Mr. William Brodie on "Dock Gates." The lecturer mentioned that the old Liverpool dock was constructed in 1705, but that dock gates might have been constructed much earlier if required, as gates were used for canal locks in Europe as early as the fourteenth century. A novel and very special form

* "Das Schiffshewerk bei Henrichsburg am Canal von Dortmund nach den Emsbäfen." By B. Gerdaun. Berlin: Ernst & Sohn.

of gate was that in use at Messrs. Clover, Clayton, & Co.'s yard, Birkenhead, consisting of an iron frame approximately rectangular, covered with sheet iron, and turning on a horizontal hinge in the bottom of the entrance. The clapping faces of the gates were formed of pitch-pine baulks, with india-rubber sheeting to ensure water-tightness, and the gates were opened by being lowered by wire ropes into a horizontal position outside the sill, and below its level. The lecturer considered this a new, interesting, and bold departure from the precedent of the ordinary two-leaved wooden gates seen in the Liverpool docks, and which he proceeded to describe. The materials used for gates have been timber, timber and wrought iron combined, wrought iron alone, and steel. Timber has been exclusively used for the Liverpool gates. Oak was long the favourite material, and most of the docks gates of the port have been constructed of that wood. A former engineer to the Liverpool docks, Mr. Jesse Hartley, curing the dock extensions, spent a good deal of time periodically travelling about England looking for suitable wood. Oak has now been supplanted by greenheart, which is to be obtained in better lengths, and which resists the attacks of sea worms. After the reading of the paper a discussion ensued, which was adjourned until the 17th inst., on the motion of Dr. Hele-Shaw.

MONUMENT TO THE LATE MR. HAMILTON MACALLUM. A memorial of the late Mr. Hamilton Macallum, in the form of a monument of Portland stone and a bust by Mr. Onslow Ford, R.A., was unveiled at Beer, South Devon, on Saturday last. The memorial was unveiled by Professor Herkomer, R.A., in the presence of Mr. Macwhirter, R.A., Mr. Onslow Ford, R.A., and Mr. Colin Hunter, R.A.

LECTURES AT CARPENTERS' HALL.—The third of these lectures, entitled, "Is a National Twentieth Century Style of Architecture Probable?" was delivered on Wednesday, by Professor Banister Fletcher, and did not prove so interesting as the subject had led us to expect. The lecturer spoke of the various fantastic eccentricities of recent times, which the originators had boldly proclaimed to be the style of the future; these future models had died a natural death, and the Professor pointed out that any attempts to produce a style in any other way than by the development of the architecture of the past would result in a similar failure. He then proceeded to trace the development of the successive styles from the Parthenon to Westminster Abbey, in each instance pointing out the motives that had prompted the workmen to stray from the models before them. But if the lecturer disappointed his audience at all, it was by maintaining a severe silence upon the architecture of to-day; no light was thrown upon the vexed question of a modern style of architecture, the Professor contenting himself by expressing the popular sentiments of the profession, and remarking that until the public took some interest in the building of their towns and private houses the progress in architecture would be a slow one. Much thought and attention was given to science at the present time—probably no branch of learning had made such rapid advances—but in a reign remarkable for the encouragement of art and science, architecture was comparatively neglected and ignored. Next Wednesday the lecture will be upon "The Chemistry of Certain Metals Used in Building Construction," by Professor J. M. Thomson.

CAPITAL AND LABOUR.

DISPUTE IN THE BUILDING TRADE AT LEANDUNNO.—The stonemasons of Leandunno have struck work in consequence of their demand for an advance of 4s. 6d. a week being refused. The plasterers have also come out on strike for a similar reason.

LEGAL.

THE CLAIM AGAINST THE ST. PANCRAS GUARDIANS.

MR. RIDDLEY, Q.C., the Official Referee, resumed the hearing of his claim this week. It will be remembered that the plaintiffs, the trustees of creditors of Mr. Wm. Brooks, builder, of Folkestone, sued the Guardians of the Poor of St. Pancras and their architects, Messrs. A. & C. Harston, for a balance of 24,226*l.*, or, alternatively, 24,262*l.*, alleged to be due on a contract for the completion of the St. Pancras workhouse. The plaintiff's case was that some years ago the Guardians resolved to reconstruct the workhouse in King's-road, and appointed Messrs. Harston as their architects. The contract for the work was at first taken by Messrs. Kirk & Randall, of Woolwich, but disputes arose, and in 1892 the firm requested to be relieved of further work under the contract. Fresh tenders were invited for the unfinished work, and that of Brooks was accepted. For 50,861*l.* the work was to occupy fifteen months from May, 1892, but delays arose, and in Nov. 1894, the work was stopped. Messrs. Drew-Bear, Perks & Co., of Queen Victoria-street, who

supplied the ironwork; Mr. H. Tolpitt, of Folscombe, who supplied the timber; and Mr. J. Brown, of Cannon-street, who supplied bricks, sued on behalf of creditors for the balance alleged to be due to Mr. Brooks. The net cost of the work executed was stated to be on the first claim 65,479*l.*, plus 10 per cent. profit, 6,547*l.*, making 72,026*l.*, of which 47,800*l.* had been received under the architects' certificates, leaving a balance of 24,226*l.*. In the alternative claim the net cost of the work executed was estimated at 65,479*l.*, plus 10 per cent. profit was reckoned on the contract price of 50,861*l.*, which, with other amounts claimed, brought the alternative claim to 24,262*l.* The plaintiffs alleged that Brooks was hindered from continuing and completing the contract by the action of Mr. George Poole, the clerk of the works, who interfered without sufficient cause, and condemned materials supplied wholesale. It was also further alleged that the architects were seldom on the works, and that the interference of the clerk of the works caused needlessly a net loss to Brooks of 2,526*l.* in addition to 193*l.*, the value of the materials left by Kirk & Randall and not permitted to be used. The defendants generally denied the charges against the clerk of the works, and alleged that Brooks had not carried out his undertaking to complete the work left unfinished by Kirk & Randall. The Guardians further relied on the Public Authorities Protection Act, 1893, as being a defence, inasmuch as the matters referred to in the action occurred more than six months before the action was brought. Messrs. Harston, the other defendants, pleaded that they were not liable, and said that they had received no complaints from Poole with respect to the manner in which the works were being carried out by Mr. Brooks. Upon the conclusion of the evidence called on behalf of the Guardians, however, the learned Referee decided that, as the plaintiffs had failed to make out that Messrs. Harston had been guilty of fraud, dishonesty, or collusion, those gentlemen were entitled by law to judgment, but he reserved the question of costs. Reports of the case have appeared in the *Builder* of November 21 and 23, and December 5, 1895, and January 23 and 31, and March 6 last.

Mr. Reginald Bray and M. A. A. Hudson appeared as counsel for the plaintiffs; Mr. English Fitzroy and Mr. W. Moses for the Guardians; and Mr. MacIntyre and Mr. R. W. Turner for the architects.

Mr. English Harrison, in addressing the learned Referee on behalf of the Guardians, submitted that the builders had made out no case as against his clients of anything done by Messrs. Harston with regard to the condemnation of materials, as not being in accordance with the specifications. He (Mr. Harrison) also wished to point out that the action of Mr. Poole, who was under the terms of the contract, solely the inspector and assistant of the architects, could give the plaintiffs no cause of action against the Guardians. The evidence of the Guardians proved that they did not interfere in any way whatever. The evidence also made it perfectly clear that the decisions of Mr. Harston had always from first to last been acquiesced in by the builder. Mr. Boden (the Chairman of the Building Committee), had said that when a complaint was made to him on the matter, he told Fearon that if he wanted to make any complaint he was to write a letter to the Clerk to the Board, and then it would be dealt with. Fearon had never taken that course at all, and from first to last brought no complaint—excluding the hand-rail matter—before the Board or the Building Committee, and therefore had always acquiesced in the decisions of Mr. Harston. From time to time when Poole had expressed his non-approval of the work, one of two things had happened; in some cases Fearon had gone on using the material, or left the work in without taking any further trouble at all. On the other hand, there were instances where Poole served a written notice on the builder in the terms of the provisions of the contract that he would not allow certain materials to be used. In some cases Mr. Harston did not agree with Poole, and over-ruled him, and in other cases agreed with the views of Poole, and decided against Fearon. He (Mr. Harrison) therefore submitted that as all those matters had been dealt with and settled under the contract, the learned Referee could not enter into them. It must, he said, also be recollected that there was no guarantee in the contract anywhere on behalf of the employers that Messrs. Harston would properly superintend the work, although the work was to be done to their satisfaction. The plaintiffs asked that the contract should be set aside altogether, and that a totally different set of obligations should be substituted in the place of those obligations which had been signed, sealed, and delivered by them in their contract. That course would lead to considerable danger unless it were done under the most exceptional and extraordinary circumstances. There could be no doubt that all the parties had acted upon the supposition that the contract was absolutely binding upon them and that the terms were to be fulfilled by all of them. At the time that there were disputes and friction about columns, sand, bricks, and so on, and Mr. Harston was enforcing certain rights under the contract, Fearon never went to the Guardians and suggested that he was not being properly treated, and therefore the Guardians had not the slightest idea that anything improper

was going on. It was not fair to the Guardians to keep them in the dark and try to make them liable afterwards. It seemed to the learned Counsel a most monstrous thing for the plaintiffs to assert that they were not bound by the terms of the contract, having regard to the fact that they persuaded the Guardians to go on with it, and got the Guardians to advance them more money under the contract than they were entitled to obtain. It was said that the conduct of Poole and the conduct of Mr. Harston was the cause of the contract being set aside, and a reason why the Guardians should have obligations put upon them which they never understood. If the builder acquiesced in what Poole said, he could not afterwards turn round on the employer and complain that Poole told him to do a thing which he had no right to do, and that he (the builder) went and did it. It seemed a startling proposition to say that a document which was under seal could be got rid of in that way.

The learned Referee: If the contract is made impossible of performance there is an end of it. If you make a contract with me, and then put it out of my power to perform it, that is an end of the contract. You cannot complain of my not performing the contract if you put it out of my power to do so.

Mr. English Harrison, continuing, contended that inasmuch as the parties had acquiesced in and acted on the contract from first to last, they were bound by the terms of it, and that the proper course for the learned Referee to take would be ascertain what damages (if any) the plaintiffs would be entitled to for breaches of the contract, and what those breaches (if any) were.

Mr. Bray, in the course of his reply, said that the question of acquiescence did not enter into the case at all, and that in the special circumstances the contract had ceased to exist. The learned counsel having dealt in detail with the figures in the claim, said that it was suggested the plaintiffs had employed an incompetent foreman, but he contended that if ever there was a competent man for the work, that man was Mr. Fearon. He impressed upon the learned Referee the fact that the work in question cost over 20,000*l.* more than was anticipated, and, therefore, the assumption was, he said, that the circumstances were altered. He asked the learned Referee to find on the evidence that the contractor was prevented from taking possession of the site, and that it was not the contractor who neglected to do so. Dealing with the conduct of Poole, the clerk of the works, the learned counsel asked the learned Referee to find that that gentleman had condemned materials which he knew perfectly well were sufficient. This he probably did in some cases to get better materials than he was entitled to, and in others might be attributed purely to temper.

The learned Referee: I think he did. I don't think that anybody who recollected him in the witness-box could deny what they say on the other side, viz., that they ought to have treated this man, who lost his temper, with contempt, or gone to the architects. I should like to know how you deal with that point. Although Fearon says that Mr. Harston informed him that he should always support the clerk of the works, that was not until June, 1893. Why did not Fearon go to Mr. Harston?

Mr. Bray replied that his answer to that was that it was not a practical remedy, inasmuch as it would take three or four days to get the attendance of the architect, the work being suspended in the meantime, and therefore it was better and saved expense for the contractor to give way to Poole than to go to the architect. It did not rest there, however, as Poole, like all other clerks of the works, had the ear of the architect, and it was therefore no use for the contractor to struggle against it. Although the charge of fraud or dishonesty of the architects had gone, he did not abate one atom from the suggestion that he had made throughout, that the architects had been unreasonable and grossly unreasonable. The architects in delegating their functions in the main to Poole, had not exercised their discretion in the matters in question, but had left them to be entirely governed by Poole. Mr. Bray concluded his address by asking the learned Referee to find that the plaintiffs had proved their case up to the hilt, and were entitled to a *quantum meruit*.

The learned Referee intimated that he should take a few days to consider his judgment.

Judgment reserved accordingly. In our report of the case last week, we should have stated that Mr. Henry Currey, F.R.I.B.A., architect of St. Thomas's Hospital, was present in court to give evidence for the defendants, but that he was not called.

ALLEGED OBSTRUCTION OF ANCIENT LIGHTS IN WALES.

The case of Jones v. Jones came before Mr. Justice North in the Chancery Division on the 5th inst., it being a motion by Mrs. Elizabeth W. Jones to restrain the defendant, Mr. Harry Jones, until the trial of the action, or further order, from erecting a building in High-street, Aberavon, in the county of Glamorgan, in such a way as to darken or obstruct the plaintiff's ancient lights.

Mr. Swinfen Eady, Q.C., in opening the motion, stated that the plaintiff's house was No. 10, High-street, Aberavon.

Mr. Ingle Joyce, who appeared for the defendant,

nterposed and suggested that the matter should be sent for trial at the Glamorganshire Assizes, which would come on next June. If the other side did not consent to that course being adopted he should ask his Lordship to make an order to that effect, which he had power to do under the rules.

Mr. Eady said that as to the obstruction there could be no question. The defendant's old building, which was immediately opposite the plaintiff's, was only 22 ft. high and that had been pulled down, and the defendant was proposing to erect a building 43 ft. high up to the coping, with an additional 4 ft. 9 in. to the top of the roof. The defendant said that the plaintiff's lights were not ancient. The plaintiff's house had been rebuilt, but at the time it was taken down the contractor who did the work took the exact bearings of the windows and doors, and he had made an affidavit to the effect that the lights of the new building corresponded with the lights of the old. That was met by a mere denial on the part of the defendant that the plaintiff's lights were ancient lights.

Mr. Justice North asked whether many witnesses would be called at the trial.

Mr. Ingle Joyce replied in the affirmative.

Mr. Eady remarked that the issue would be a very simple one. The plaintiff's house was rebuilt in 1892, and there would be no difficulty in proving the position of the lights of the old building. He would prefer the case being tried in London.

Mr. Ingle Joyce said that if his clients were to be prevented from going on with their building until the trial they would like the trial as soon as possible.

Mr. Justice North said there was every probability of the case being reached before June.

Mr. Eady then produced a plan of the windows of the plaintiff's old building, and contended that there could be no question that the plaintiff's ancient lights would be interfered with, and that he was entitled to an interim injunction.

After some further discussion, it was arranged that the action should be set down at once for trial, the motion to stand over till the first motion day in June. It was also arranged that the defendant should not go on with his building, the plaintiff giving an undertaking in damages.

ALLEGED INTERFERENCE WITH ANCIENT LIGHTS AT LEEDS.

The case of Taylor v. the New Brigiate Arcade Company came before Mr. Justice North in the Chancery Division on the 6th inst. It being motion on behalf of the plaintiff for an injunction to restrain the defendant company from building so as to interfere with the plaintiff's ancient lights at Leeds. The defendants, whilst denying that the plaintiff's lights were ancient, or that his building had been blocked, undertook not to build any higher pending the trial of the action, which was ordered to be set down at once at the forthcoming Leeds Assizes. It was pointed out that Leeds was the last town in the circuit, whereupon his Lordship suggested that the motion should stand till the first motion day next sittings, when the parties would be able to ascertain where they would be likely to obtain the speediest hearing.

Order accordingly.

THE LIVERPOOL CORPORATION AND ARTIFICIAL STONE MANUFACTURE: CASE IN THE COURT OF APPEAL.

The case of the Adamant Stone and Paving Company, Limited, v. The Liverpool Corporation came before the Court of Appeal composed of Lords Justices Lindley, A. L. Smith, & Righty, on the appeal of the defendants from an order of Mr. Justice Romer in the Chancery Division dated November 23 last. The action was brought by the Company to restrain the Corporation from infringing two patents, No. 8,747 of 1884, and another patent of 1893 granted to Alexander Maclean for the making of artificial stone from cement and other substances. According to the earlier patent, porous moulds were used, and the water was squeezed from the enclosed material by the application of very heavy pressure, and the plaintiff Company contended that the mixture of dust-destroyer, clinker with Portland cement and subjecting it to pressure in a filter press by the defendants was an infringement of their patent. Mr. Justice Romer held that the patent of 1884 was valid on the ground that it was novel, good subject matter, had not been anticipated, and that it had been infringed. The learned judge, however, held that the patent of 1893 was invalid for want of proper subject matter, and no question was raised as to that on the appeal. The case was reported in the Builder of December 5 last.

The arguments on the appeal occupied the attention of their lordships for some days, and on the 6th inst. it was ordered to stand over until after the adjournment with a view to a settlement, and the appeal was then withdrawn in accordance with an arrangement between the parties the terms of which did not transpire.

Mr. Fletcher Moulton, Q.C., Mr. Bousfield, Q.C., and Mr. C. E. E. Jenkins were counsel for the appellants, and Mr. Roger Wallace, Q.C., Mr. A. J. Walter, and Mr. H. Spensley for the respondents.

MEETINGS.

FRIDAY, MARCH 12. Royal Institution.—Professor A. Westminster on "The Source of Light in Flames." 9 p.m. Institution of Junior Engineers (Westminster Palace Hotel).—Paper to be read and discussed: "The Protection of Buildings, &c., from Fire," by Mr. W. R. Beckett. 8 p.m. Institution of Civil Engineers (Students' Meeting).—Mr. H. F. Brand on "The Inverness Section of the Inverness and Aviemore Railway." 8 p.m.

SATURDAY, MARCH 13. Sanitary Institute (Demonstrations for Sanitary Officers). Inspection at Aylesbury Dairy Company's Premises, Bayswater. 3 p.m. Edinburgh Architectural Association.—Visit to Hatton House, West Calder.

MONDAY, MARCH 15. Royal Institute of British Architects.—Mr. W. H. St. John Hope, M.A., F.S.A., on "Heraldry in English Medieval Architecture." 8 p.m. Sanitary Institute (Lectures for Sanitary Officers).—8 p.m. Society of Arts (Cantor Lecture).—Professor W. C. Roberts-Austen, F.R.S., on "Alloys." 1. 4. 30 p.m. Leeds and Halifax Society.—Exhibition of Institute Drawings, and nomination of officers. 7. 30 p.m.

TUESDAY, MARCH 16. Institution of Civil Engineers.—Discussion upon "The Main Drainage of London" and "The Purification of the Thames." To be continued and concluded. Also paper on "The Mond Gas Producer Plant and its Application," by Mr. H. A. Humphrey. 8 p.m. Society of Arts (Foreign and Colonial Section).—8 p.m. Devon and Exeter Architectural Society.—A lecture on "Architectural Photography" will be given at the Athenaeum, Exeter, by Mr. Charles Cole.

WEDNESDAY, MARCH 17. British Archaeological Association.—(1) Mrs. Collier on "The Old Church and Glass at Mead, Wiltshire." (2) Mr. H. Styr Cuming "On Mead and Mead Vessels." 8 p.m. Society of Arts.—8 p.m. Carpenter's Hall, London Hall.—Professor J. M. Thompson on "The Chemistry of Certain Metals used in Building Construction." 8 p.m. Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of the members. 8 p.m. Sanitary Institute (Lectures for Sanitary Officers).—Inspection at the L.C.C. ABSTRACTS OF PATENTS.

RECENT PATENTS.

2,726.—CHIMNEY AND VENTILATING SHAFT, A. ROSSIGNOL.—This invention concerns the application of air shafts (constructed of any suitable material) to any chimney, air flue, &c., to counteract tendency to down draught. The air shaft would be carried from any convenient place (if possible, from an air propelling fan, or from any wind) to the top or exit of any chimney, flue, &c., and thereby cause an upward current inside the chimney, &c. 2,660.—FASTENING CORDS, CHAINS, &c., TO WINDOW METAL PLATE. J. LUNSDON.—The invention consists in a metal plate for fixing to sash, &c., having two raised sides, between which the cord or chain, &c., is placed. In each of these sides is a tapered groove, into which is put a metal wedge, provided with two teeth, which pierce the cord, chain, &c., into a square slot in the metal plate, thereby holding them firmly there as long as any pressure is used. 2,691.—BUILDING COLUMNS, BEAMS AND GIRDERS: J. A. BLAIN.—The inventor separates the J of iron or steel bars used in the construction of building columns, &c., of the lattice or similar type, by bars curved or dish'd in cross section in order to stiffen them. In a lattice column, for example, he employs two or more bars of curved section to form longitudinal channels, and connects thereby, crimped,

zigzag, or sinuous strips rivetted to them so as to bind them together.

6,095.—WASTE WATER CLOSERS: J. J. GREEN AND ANOTHER.—This invention concerns water-closets which "tippers" are employed and emptied intermittently by waste water or otherwise. When these tippers have been emptied by the action of water weight, they oscillate back to their normal position against a buffer. This buffer inventors propose to make of a combination of layers of wood and India-rubber, to prevent breakages and lessen wear and tear on the tippers, which come into contact with the top edge of tipper, which comes into contact with the buffer, wider or thicker. They also propose to make the mouth of the pipe, connected with the bottom of the tipper box, crescent-shaped, or somewhat of D form.

6,891.—BUILDING BLOCKS: C. WALL.—A box or mould is made of the shape and size desired for blocks. Sufficient inventors' facing fractions are laid face downwards in this. On these are placed stock bricks or other suitable backing material; cement and sand mixed with water to a weak consistency is then poured in, and the mould immersed in water and block allowed to set. The facing fractions with grooves on the top and bottom, are of different thicknesses in alternate courses, and may be of any material or size.

7,227.—BUILDING BLOCKS: C. WALL.—A mould is made suitable thickness of wall and special requirements. At the bottom of mould is put a layer of cement, coarse stuff, on top of this is put a backing of stock brick or other suitable material, and cement and sand mixed with water to a weak consistency is then poured in, filling interstices and covering surface of brick. When the block is then immersed in water and allowed to set. Surface may be finished off smooth, or left rough for a setting coat.

7,232.—WINDOW SASHES AND FRAMES: F. DE J. CLERE.—Relate to sashes that are cast in concrete, coarse stuff, on pivots to revolve. Inventor retains pivots at one or near centre of sash, but fixes parting and staff beads permanently to frame after sash has been put in position. The pivots work in sliding blocks, which correspond in length of the height of the sash, and are made with V-shaped faces, and pressed by springs into a corresponding groove in the sash. When the top or bottom of the sash is pushed up, the pivots, by the force back the sliding blocks into their grooves, and leave the sash free to revolve. When returned to its normal position, the pivots in the sash will again recede into the sliding blocks, and form a joint to exclude wind, rain, and dust.

NEW APPLICATIONS FOR LETTERS PATENT.

Ecclesiastical Zoology.

LN the year 1125, St. Bernard of Clairvaux, writing to William, Abbot of St. Thierry, asks, "What mean those ridiculous monstrosities in the courts of cloisters; those filthy apes, those fierce lions, those monstrous centaurs, those half-men, those spotted tigers, those fighting soldiers and horn-blowing hunters; many bodies under one head, or many heads on one body; here a serpent's tail attached to a quadruped, there a quadruped's head on a fish; here a beast presenting the fore-parts of a horse, and dragging after it the rear of a goat; there a horned animal with the hind parts of a horse?" It is a question which must have suggested itself to many, when surveying the wealth of imagery on a Norman doorway or the misereres of Beverley, Boston, or Bristol. What does it all mean? How did it get into churches of all places? Where did it come from? To the last question a full answer cannot yet be given; much more investigation and many comparisons must first be made. The second question is answered to a considerable extent, and the first question at length, in Professor Evans's interesting and erudite volume on "Animal Symbolism in Ecclesiastical Architecture."

This zoological imagery unquestionably mounts back to an immense antiquity. Some of it has been imported, almost unaltered, direct from the primitive myths of the Egyptians, on whose sepulchral monuments the Supreme Judge is seen determining the worth of souls by weight, and condemning each, in accordance with the theory of metempsychosis, to be re-embodied in the animal form for which it has fitted itself by its manner of life in its previous existence. In Christian art the Archangel Michael and Satan are usually the protagonists in the scene; but at Autun and Saint Lô the scales are held by the hand of God reaching out of the clouds. At Bourges Satan is trying to cheat; he has put his foot

in the scale, while one of his imps is pulling at it from below. In Egypt again was celebrated on the 23rd of April the slaying of

Fig. 1. Weighing Souls (Bourges Cathedral).

Seth-Typhon, a personification of the desert-demon, drought, sterility, famine and death, by Horus, the vivifying and fertilising principle. Bas-reliefs in the Louvre and the British Museum depict the god as a mounted warrior thrusting his spear into the neck of a crocodile. The myth spread to Syria and Asia Minor, whence the Crusaders obtained it, and adopted St. George as their patron against the Mussulman's dragon. The crocodile has become a dragon; but on one of the two famous columns in the Piazzetta of St. Mark's, Venice, may be seen St. Theodore and a crocodile.

Nor are there wanting survivals of a form of religion of an antiquity perhaps equally remote, that of sun-worship. Christmas, Epiphany, Easter, Whitsuntide, the Midsummer Feast of St. John, are all survivals of a solar or stellar cult. Most of all does this come out in the legend of the Phoenix. She lives in a far-away Arcadia in the East till five hundred years are overpast, when she flies to Heliopolis in Egypt, and burns herself upon the high altar in the Temple of the Sun. When the priest comes on the

Fig. 2. The Phoenix.

next day to offer sacrifice, he removes the ashes from the altar, and finds therein a small worm of exceedingly sweet odour, which in three days develops into a young bird; on the fourth, in full size and plumage, she greets the priest returns to her home. In Jewish writings and the Phoenix is often

mentioned. On Roman cinerary urns, with peculiar appropriateness when the body had been cremated, she is often sculptured with the inscription "Dis Manibus." Thence the bird passes to the sarcophagi, and the mosaics both of Rome and Byzantium; for, as Lactantius writes, "she has gained eternal life by the boon and blessing of death." Finally, as Phoenix is Greek both for the bird and for the date-palm, the latter becomes, by a diseased etymology, a sacred tree. St. Jerome and the Septuagint translate a passage from Job, "I shall die in my nest, and shall multiply my days like a date-palm." Hence the palm-trees on the sarcophagus of St. Apollinare in Classe, Ravenna.

A far more important source of Christian symbolism is to be found, as was to be expected, in classical mythology. In the early days of Christianity there was naturally much "accommodation." Deities and rites which could not be expelled forthwith were Christianised—coated over with an allegorical import. An especial favourite was Orpheus, from his descent into Hell to rescue imprisoned Eurydice. Even Bacchus and all his train are pressed into Christian service; for Christ was the vine, and the Church a vineyard. In the mosaics of the tomb of Constantine's daughter at Rome is a charming representation of the vintage, with little Pagan genii treading the grapes. Amor and Psyche are taken as emblems of the love of God and the human soul; the golden apples guarded by a dragon in the garden of the Hesperides typify the tree of knowledge in the Garden of Eden; Mercury, or Hermes, is not only the conductor of souls, but, with a ram on his shoulder, represents the Good Shepherd. The Sibyls become Christian prophetesses on Giotto's tower, and the bronze gates of Ghiberti in Florence, and on the pavement of Siena Cathedral; Virgil's Fourth Eclogue takes its place in Christian sculptures. Theseus and the Minotaur typify David and Goliath; Pyramus and Thisbe find their way into Bale Cathedral, one does not quite see how. The peacock of Juno, and of the Roman empresses, becomes the favourite Byzantine symbol of immortality; for, says St. Augustine: "Quis nisi Deus dedit carni pavonis mortui ne putresceret?" Ulysses sailing past the Isle of the Sirens becomes the ship of the Church, with the ears of its crew stopped to

* "Animal Symbolism in Ecclesiastical Architecture." By E. F. Evans. (Heinemann, 1896.)

the temptations of the flesh. The centaurs, like most of the ecclesiastical monsters, enter into heraldry also. They are usually armed with bow and arrow, and are annoying the believer with "the fiery darts of the wicked." This sagittary appears in the arms of King Stephen, and may serve to date the font of West Rounton and the chancel-arch of the little church of Adel. In all cases the centaur is a personification of unbridled animal impulses and passions.

More ancient, however, than classical mythology, even than sun worship and Egyptian eschatology, is the piteous deprecatory beast worship, a survival of that hard time when prehistoric man, equipped not yet with axe of iron or bronze, perhaps unprovided yet with weapon of rude or polished stone, covered before the beasts of the forest, terrified at the monstrous dimensions of the elephant and the mammoth, shuddering at the appalling night howls of the hyena, the lion's tremendous roar, the ravening fang of the boar, the gleaming eye of the bear, filled with an uncanny awe and a superstitious dread of provoking the enmity even of the ape, the hare and the fox. The woods were full of horrors to him, mysterious and malignant creatures capable of inflicting injury by occult and magical influences, and therefore not to be irritated or enraged in any way; not to be named, but addressed as broad-brow, flash-eye, forest-brother. Wild stories were invented, circulated, perpetuated. This went on for ages. Aristotle stands out alone, a scientific naturalist 2,000 years ahead of his times. What the mediæval mind thought of Aristotle may be gathered from the voracious "Lay of Aristotle" represented in many a cloister, where the grave philosopher is perambulating the lawn on all fours, with a lady mounted on his back.

Fig. 4. The "Lay of Aristotle" (St. Jean, Lyons).

The Greek writers, Ctesias and Megasthenes, on the other hand, and the Roman Pliny, recorded every zoological marvel they could hear of. From one source or other, the early Christian zoologist had a plentiful stock of material. The Talmud had declared that "he who interprets the sculpture literally is a liar and a blasphemous." Philo of Alexandria, half Jew, half Hellenist, had given an esoteric treatment to the Mosaic records. Origen recognised in the Scriptures a threefold sense, literal, moral, and spiritual. What was true of the Bible narrative generally was true of the Bible animals; they were moral beasts; and what was true of them was true of animals in general, and of plants, too. When Solomon spake of all trees, and of beasts and fowl and fishes, he did not write botanical treatises, but moralities. And what was

true of genuine, was true of imaginary creatures also; else the believer must have rejected the apocalyptic monsters of St. John

Fig. 3.—The Sirens (Psalter of Isabella of France).

the Divine. All this was justified by such sayings as that of Job: "Ask the beast and it shall teach thee; and the birds of heaven, and they will tell thee." Gradually all this crystallised into a collection of some fifty moral beasts, called The Physiologus; *i.e.*, The Naturalist; or sometimes the Book of Beasts, or the Bestiary. The Physiologus is at least as early as the fifth century, and was translated into Latin, Ethiopic, Arabic, Armenian, Syriac, Anglo-Saxon, and all the principal Germanic and Romance languages. Probably no book was so popular in the Middle Ages. And, unlike most literature, it was translated into dialect, and thus became everywhere the possession of the common people. Everybody knew the moral beasts; and a representation of one of them on a capital or a bench end; a reference to another, in a sermon or a song, was caught up at once, and relished by man, woman, and child. That is why mediæval architecture, especially in the eleventh and twelfth centuries, teems with zoological sculpture, to us a mystery and often an offence, but once a lesson understood and appreciated of all the common people.

Here are a few specimens of the Physiologus. It is the nature of the lion to howl over the newborn cubs for three days till the tremendous roar awakes them to life. "So Christ on the third day was raised from the dead." It is also the nature of the lion, though it is not generally known, to sleep with his eyes open. "So our Lord slept with his body on the Cross, but awoke at the right hand of the Father." Hence a brace of lions is often seen in front of Italian or German churches, or mounted on pedestals, as wakeful guardians of the sanctuary. A survival of this idea is found by some in the Landseer lions of Trafalgar-square. But as the devil walketh about as a roaring lion, seeking whom he may devour, the lion is also a symbol of evil; and when the whole

weight of a porch or a pulpit is placed on his back, as at Pisa and Siena, it is plain that he typifies Satan not merely subdued, but pressed into the service of Christianity. The unicorn can be captured by one method only, which may be seen in Boston church, *viz.*, by decking a virgin with beautiful ornaments and seating her in a solitary part of the forest; when the unicorn runs up, lays his head on her lap and falls asleep; then the hunters come up and catch him. So Christ "has raised up a horn of salvation for us;" the mighty ones of the world were unable to lay hold of Him, until He abode in the womb of the Virgin Mary.

The existence of the animal was authenticated by numerous horns, fabricated from the tusks of the narwhal, just as the griffin's claws shown in the churches of Hildesheim, Cologne, and Gran are nothing but horns of the Caffirian buffalo. The elephant cannot bend its knees. Hunters saw the tree almost asunder against which the beast leans at night; the elephant falls and cannot rise. So Adam "fell through a tree." This peculiarity of the elephant finds a parallel in Julius Cæsar's description of the Gallic elk. Elephant and howdah are seen in a Beverley miserere. The eagle can gaze at the bright sun without blinking, and carries the eaglets on its wings upwards and compels them to look on the shining orb; those who can do so with steadfast eyes it rears; but lets the others fall to the ground. So none can behold the face of God but Christ and his elect. This scene is portrayed at Alne, in Forfarshire and Worcestershire, Capua and Lyons. The whale remains stationary on the surface of the water till his back is covered with mould, in which large forests grow. Mariners land, cook their dinner as on an isle, and in a moment are engulfed. The whale is the devil. For the moral stories of the remora, the pelican, the panther, the otter, the beaver, the partridge, the charadrius, and the rest of this strange menagerie, the reader must refer to Professor Evans's entertaining pages. Incredible, now-a-days, the state of mind may seem which invented or believed such a farrago of nonsense; but it had the support of Clement of Alexandria, Augustine, Origen, Chrysostom, Jerome, Isidorus; whose test of evidence can have been none but that of Tertullian, "Credo quia absurdum."

As we have seen, the Physiologus was the great source of eleventh and twelfth century imagery. Later on another monstrous pack of animals, apes, pigs, asses, goats, rushed into the sacred building. The Physiologus was not the only source of zoological instruction. In the thirteenth and fourteenth centuries the same treatment was applied to the immensely popular romance of Reynard the Fox, and other beast ethics. But the object of the artist was different. Hitherto it had been to instruct, to preach, to edify, to present scriptural truth in concrete form, intelligible to those who could not read. Now, the object was not so much to edify, as to satirise and ridicule. Carving and sculpture became weapons of offence, wielded by Christian against Christian. Monks hated

Fig. 5.—Hunting the Unicorn (Old German Engraving).

friars, and despised the secular clergy, our parish priests; the parish priests owed the loss of the great tithes of many of their churches

the monks, and of marriage and confessional fees to the friars, who undersold them: the parish priest hated monk and friar alike. So in the misereres of Beverley Minster, the clergy, who there were secular canons, depicted the Black Friars and Grey Friars, who were very active in the town about 1520, and were about as popular with the clergy as the Salvation Army is now, as foxes with friars' habits. The authorities of St. Mary's Church, in the same town, reserve their satire for the Cistercian Monks, having probably suffered from the neighbourhood of the Abbey of Meaux. Here there are foxes at a lectern reading the lessons; foxes with crosiers, each with a goose in his hood; and a man riding a goat with a rabbit under his arm, a suggestive reference to monastic immorality. Nor was the new weapon confined to the broad field of ecclesiastical humbug in its very numerous varieties. That huge humbug, the mediæval doctor, finds his right place in the carvings. The profession of minstrel also, once so honourable, seems to have sunk into the deepest disrepute; pigs and dogs and cats and asses play fiddles, harps, lutes, and organs. The coarseness and obscenity of many of these later representations, even in the misereres or cloisters of a nunnery, is indescribable. But perhaps the harm of it has been overstated. It is quite a modern fashion to call a spade some other name.

Another source of animal symbolism in later times is to be found in travellers' tales, especially of monstrous births. Hence the legend of that extraordinary freak of nature, the Papal ass; hence also the sea-bishop caught in the Baltic, A.D. 1453, and the monk-calf, born A.D. 1522. Another source is to be found in fables and popular proverbs—the fox and the crane, the cat waiting for the mice to put a bell on it, a man shearing swine, and the like.

From one source or other, every bird and beast that did exist and did not exist found its way into the church. "First they took possession of the chancel, the chapels, and the pulpit, and finally overran the whole building, nesting in capitals, creeping along cornices, squatting on balustrades, peeping out of illuminated windows, peering over portals, grimacing as gargoyles from the roof." Every reader, layman or cleric, architect or archaeologist, will find instruction and entertainment in the glimpse which Professor Evans has given us of that strange, far-off, mediæval world.

EXPERT EVIDENCE.

IN a recent number of the *Builder* a letter of a correspondent was published which criticised adversely some evidence which was given by an expert in a law suit, of which our correspondent was a spectator. There is, no doubt, a popular dislike of what is called expert evidence. This arises very largely from the wide difference between expert opinion in the valuation of properties for the purpose of compensation, or in regard to the assessment of damages. To a large extent experts have only themselves to thank for this state of the public mind. It may, perhaps, therefore be desirable to consider what should be the frame of mind which an expert, whether architect or surveyor, should take up when he is called

on by a person who is at variance with another. In one word, he should look at the matter judicially. He is called in as a person having a special knowledge of a subject, with the object of giving as nearly as he can a true opinion.

Now, we make no doubt that among high-class practitioners this is the frame of mind in which the question is approached in the first instance. But in most cases also it is equally certain that when the matter gets into the Law Courts this frame of mind is changed. It is a well-known practice among bankers to keep new coin for those who have to pay legacy duty at Somerset House; and, in like manner, surveyors, when they put on the character of witnesses, take up the opinions of partisans. This is altogether wrong, and it largely tends to deprive expert evidence of its value and to make it much more expensive and, consequently, adds to the cost of litigation. For it is clear that if one expert differs widely from another he must be supported by further evidence if his testimony is to carry weight. The result is that when lands and houses have to be valued by a jury or an arbitrator it is constantly the practice to call three or four experts on each side, each of whom supports the contention of the side to which he is attached. A house cannot be truly worth both 5,000*l.* and 10,000*l.*, and this is the kind of radical difference which is constantly witnessed. It is obvious that if six men assert their opinion that a property is worth the former sum, and six others assert that it is worth the latter, the frame of mind which permits of this difference is not judicial. The result, of course, is that persons whose duty it is to decide what is the true sum, in nine cases out of ten regard each opinion not as a true one, but as indicative of a figure either greater or less than the person who states it expects the property to fetch. This has become a system, with the result that the public have fallen into a frame of mind which regards the assertions of experts as wholly untrue, and that judges and arbitrators are led to regard the evidence of experts with great suspicion.

This is not a satisfactory thing for professional men, who, when they give evidence in a court of law or in the room of an arbitrator, should be regarded as persons who come to give testimony which may be thoroughly relied upon. We fear that, so far as the valuation of buildings and property goes, the present practice of giving what may be termed partisan valuations, has become so fixed that it can hardly be given up without danger to the interests of land and house owners. Because, if a surveyor were now to come and state a figure something near the true one, the jury or body who have to give a final verdict would not regard it from the right point of view, but would proceed to discount it in the usual manner. But in other matters experts may very well adopt throughout a dispute a more judicial attitude. Thus in questions which relate to the interference with light, it has not been unusual to see dismal pictures of the results of a new building on the light of an old one put forward by those who are acting on behalf of the dominant owner. On the other hand, the way in which the height of buildings is minimised is also equally misleading. This is not as it should be, and

those who are called on in this class of disputes can, and should, endeavour to prevent themselves from becoming partisans. It is not an unusual thing for us to receive reports of light and air cases in which it is stated that Mr. A. B., architect, appeared for one side, and Mr. C. D. for the other, as if they were counsel or solicitor. This shows the kind of non-judicial frame of mind in which these disputes are too often approached, and which too often also results in costly litigation instead of in a reasonable and business-like compromise.

There is also some misapprehension in light and air cases in regard to the value of expert evidence. A surveyor is not a better judge of a pure matter of fact than is any other intelligent person. But it is to be noticed that in this class of law suit, architects and surveyors are often asked to testify to matters of fact with a view to the judge regarding their evidence as that of experts, when in truth they do no more than state actual facts. If, for example, the light to a jeweller's shop window be interfered with, the jeweller or persons in this kind of business are experts in regard to the effect of the alleged diminution of light. But an architect or surveyor is only in the same position as any other intelligent man, and it is very undesirable for an architect or surveyor under such circumstances to allow himself to be called as a witness as an expert. In truth, the more careful experts are in allowing themselves to become witnesses, and the more judicial a frame of mind they take up, the better it will be in the long run for all parties.

The above remarks on the subject of expert evidence have been confined as far as possible to its relation to litigation which more immediately interests our readers. But in every profession in which experts are to be found the same faults are observable. In Admiralty litigation, surveyors and shipbrokers are, we believe, found to differ widely and absurdly in regard to the value of ships, and any official connected with the legal department of the large railway companies can give any amount of instances of extraordinary differences of opinion among medical men as to the possibility of the ultimate recovery of persons injured in railway accidents. It must not, therefore, be supposed that architects and surveyors are in this respect different from experts of other professions.

NOTES.

The London
Water
Question.

THE manner in which the Government deal with the water question is deplorable.

It has been announced in the House of Commons that the Government are about to appoint a Royal Commission to investigate more especially areas and terms of purchase. If there was to be a Royal Commission, why was it not appointed at the beginning of last session, when it might long ago have been at work? But we cannot see that a Royal Commission is required. What is needed is adherence by the Government to one of two lines of policy, either to create a special body to manage the water-supply of London, or to hand it over to the County Council. If there is difficulty about the extent of the central area, that is a matter to be settled by the Cabinet. It is not a question for a Royal Commission, which is needed to

collect facts. The actual state of matters in regard to the water question is thoroughly known, and we can only regard the appointment of a Royal Commission as a weak and useless device to postpone the taking in hand of a troublesome question.

It is as well that our Government, who are for letting the South Kensington Museum buildings remain in their present discreditable condition, apparently, for an indefinite period, should be aware that they are making themselves an object of derision in other countries where national buildings are considered a matter of some importance. The *Central Blatt der Bauverwaltung*, in a recent issue, speaks contemptuously of the manner in which the completion of our Museum buildings has been put on one side time after time, without even the slightest promise of attention to it, and expresses the opinion (probably quite correctly) that such a procedure would be impossible in any Continental capital.

ONE of the principal events in connexion with the ceremonies being held at Berlin this week will be the unveiling of the equestrian statue to the Emperor William I. which forms the central feature of the "National Monument" erected opposite the Royal Castle, and to which we have frequently referred. The monument is now nearly completed, the equestrian statue, the principal side figures, and the colonnade being in position, and there is only the bas-reliefs in connexion with this colonnade wanting. The monument figures as a national memorial, and yet it is difficult to imagine a more unpopular piece of work, quite independent of its merits as a work of art. The public did not wish for a small equestrian statue opposite the Castle, by which it is dwarfed, and where it was backed by the river Spree with its unsightly barge traffic. What they wanted was a pantheon in the "Thiergarten," and both the general public and artists would have welcomed even a modification of that scheme. The memorial embodies only the wishes of the present Emperor, and no doubt affords a better outlook from his Castle than the old buildings which have been destroyed to make room for it.

The managing body of the Paris Exhibition for 1900 is about to open a competition for the best form and construction for the circular railway which is to connect the various portions of the Exhibition. In addition to this general line of railway communication, there is to be a special railway track laid down for experiments in various methods of traction. These may prove of considerable interest.

The fact, recorded in our "General Building News" column, that it has been found necessary to call a meeting, and consider the means of acquiring funds for the repair of the stonework and the roof, and also that it is proposed at the same time to decorate the interior of this church, may well be considered a matter of interest beyond the limits of the parish. The church is one of the three that we have by Wren's pupil Hawksmoor, and one of the

fifty churches built under the provisions of the special Act passed in Queen Anne's reign. Most persons outside the architectural profession are not aware that the peculiar design of the tower was an attempt, though an erroneous one, to realise the design of the Mausoleum of Halicarnassus. The bad condition of the stonework has in fact been painfully apparent for some time, and we may well ask how it came to be so long neglected by the parish authorities. We may add that those in charge of the fabric should be careful what kind of decorator they admit into it. A work of this kind should not be undertaken but with the advice of some eminent architect well skilled in classic architecture. The church will clearly lend itself to a decorative scheme of the highest order.

THE Medical Officer and Surveyor of the St. James's Vestry (Westminster) Vestry have jointly reported on the proposed new by-laws in regard to drainage proposed by the London County Council, and make some good suggestions, especially in regard to the simplification of clauses, as may be seen by the following examples:—

CLAUSES AS DRAFTED. 2.—Every person who shall erect a new building, and shall provide, in connexion with such building, a pipe or channel for the purpose of conveying to any sewer any water that may fall on the roof, shall cause such pipe or channel to discharge over a properly trapped gully or into such gully above the level of the water in the trap thereof.

He shall not cause any such pipe or channel to be so constructed as to receive into such pipe or channel any solid or liquid matter from any water-closet, urinal, slop or other sink, bath, or lavatory.

PROPOSED SUBSTITUTION. 2.—Rain water shall be discharged over or into a properly trapped gully so that sewer air shall not ascend into any rain water pipe.

No rain water pipe shall receive any urinary or feculent matter.

The tendency to voluminous wording in documents of this kind is increasing, and increases the difficulty on the part of the average householder in finding out what he is really required to do. As to the second quotation the St. James's Vestry Report objects, as we did, that to prohibit wastewater from baths, lavatories, and sinks discharging into rain water heads would be "oppressive and unnecessary." There are some other conditions also, as we have already pointed out, which are somewhat excessive. But the objections raised to the proposed By-laws in general seem to take rather too much the form of a complaint against the extra trouble and expense they will involve, an argument which we do not think is much to the purpose where the provisions are salutary in themselves.

The Report of this Association for the year 1896 gives, as usual, a record of their successful work in the way of securing open spaces for the public, or laying out and improving them after they have been acquired. The Association, among other good works, contributed 1,000*l.* towards the formation of the recreation ground on Battersea Wharf, and have laid out, or contributed largely towards the laying out, of several other places of public recreation, chiefly formed out of disused burial grounds. This year the Association accompany their Report with an extra circular announcing the appointment of a Committee to provide for the formation or securing of public parks and

open spaces in connexion with provincial towns, as a commemoration of the Queen's reign.

THE mysterious accident by which a labourer employed by the Hampstead Vestry lost his life when cleaning out a transformer substation, shows that it is impossible to take too great precautions when dealing with high electrical pressures. It was only recently that the Board of Trade insisted that the cases of the transformers should be put in direct connexion with the earth. When this was done, one would have thought that it would be perfectly safe to step on the case. What the accident proves, however, is that the resistance of the man's body, for some reason or other, was comparable to the resistance of the wire path to earth. As he was holding the ladder with damp hands, and making good contact with the transformer case with a damp boot, no very high difference of potential would have been required to give a fatal shock. The case having come into connexion with the high potential main, a considerable current must have been flowing along the earth wire, heating it and drying the soil round it, hence this path might well offer a comparatively speaking, large resistance to the electric current. We shall be interested to know what plan the Board of Trade will adopt to make the recurrence of such an accident impossible. Mr. S. Z. de Ferranti, whose experience with high pressures is second to none, has advocated for some time the necessity of having a cover to the transformer substation which, when lifted, automatically cuts off the high tension. As in Hampstead alone there are twenty-four of these substations, and water has often to be syphoned out of them, we think that the Board of Trade ought to insist on these covers being adopted.

It is announced that Sir Arthur Blomfield has prepared the plans for a massive tower to be built at the south-west end of St. Mary's, Chatham, as part of a scheme of complete restoration, at an estimated cost of 8,000*l.* With the exception of the chancel and side chapel, which were rebuilt eight years ago in the Early English style, after the same architect's designs, the present structure consists for the most part of the rebuilding in 1788, but it still retains some features of the original church. St. Mary's, standing on the chalk cliff, above the Ordnance Wharf and Old Dock, formerly appertained to, and was served by, the Black Canons of SS. Mary and Nicholas Priory at Leeds, near Maidstone, upon whom it had been bestowed by their founder, Robert de Crevecoeur, or Crouchheart, *temp.* Henry I.* At the Suppression the King gave it to the Dean and Chapter of Rochester. The first church was destroyed by fire and rebuilt 1316-20; in 1635 the Navy Commissioners repaired the fabric, reconstructed and enlarged the west end, and erected a small western tower. In 1689 Benjamin Ruffhead, anchor-smith, gave some branch and other ironwork. In pulling down the old chancel there were found, amongst materials that had been used for filling the east window, some finely-sculptured fragments, one of them being a mutilated figure of the Virgin and Child,

* For Leeds, and the Crevecoeurs, see "A.A. Vacation Visits," *Builder*, August 3, 1889.

supposed to be that of Our Lady of Chatham, of which Lombard gives a curious account in his "Perambulation of Kent." In St. Mary's was set up an inscription in memory of Steven Borough, *obit* 1584, the Arctic explorer, to whom is credited the discovery of the passage to Archangel.

THE Rochester Town Council Eastgate House, Rochester, have agreed to acquire, for the purposes of a museum and public library as a memorial of the Queen's reign, this highly interesting relic of the old city. Eastgate House—the "Nun's House" of Dickens's unfinished "Mystery of Edwin Drood"—stands in the High-street, near the site of the East Gate of the wall, and Williamson's school erected on the filling-up of the ditch. Constructed of timber and stucco, it is remarkable for the irregularity of its outline and plan, and for the fine wooden chimney-pieces, carved woodwork, and enriched ceilings within. On a beam in one of the principal rooms is cut "1691;" the house, though, is believed to be of an earlier date. The six-sided turret staircase has a projecting saddle-back roof, in strange contrast with the roof of the adjacent hexagonal bay which almost conceals the gable behind it.

It appears that M. Bartholdi the sculptor (if one can use the word in this case) of the colossal "Liberty" at the entrance of New York Harbour, and also of the rather mediocre monument to Gambetta at Ville d'Avray, claims also to be the real author of the design of the Palais de Longchamp at Marseilles, of which M. Espérandieu is the reputed architect, and has incited the Société des Artistes Français to address a remonstrance to the authorities at Marseilles in regard to the omission of any mention of M. Bartholdi's share in the work. M. Allar, the Mayor of Marseilles, repudiates the claim energetically, declaring that he is in possession of documents which constitute a full answer to M. Bartholdi's unfounded pretensions, in which for our own part we certainly have very little faith. M. Bartholdi is an artist who has always shown a great anxiety to keep himself in evidence.

THE eightieth exhibition of this Institute, at the Gallery in Piccadilly, contains some very charming works, which however must be looked for mostly among the smaller and less conspicuous drawings. The President, however, has made a real success with his "Jessie" (165), not only a most beautiful face but one which really looks the character, though his Shylock is a respectable old nonentity. His larger figure, "Rosalind" (345) is a beautiful piece of colour and costume, arranged on a figure which is certainly not Shakespeare's heroine. A new architectural artist of high talent appears in the Honorary member, Count Seckendorff, whose drawings of Roman remains, the "Forum" (44) especially, are admirable. Mr. Fulleylove is hardly at his best in his large view of Athens (365), which is interesting rather in a topographical than artistic sense. There is much humour in Mr. Dollman's "Dogma" (175), spoiled by the disagreeable woolly texture of some of the faces. After these, the main interest of the exhibition lies in the land-

scapes. Mr. Joseph Knight sends a large work, "O'er Moor and Fell" (257), one of the finest specimens of a manner from which he never departs, but in which, within its limits, he is always successful. Among smaller works which must be looked for, but which are worth looking for, are Mr. John White's "Village Street, Branscombe" (157), Mr. Max Ludby's "Close of Day" (154), with a grand warm-coloured cloud resting on the horizon; Mr. C. E. Johnson's "Break of Day" (140), Mr. Colman's "Tender Light of Afternoon" (96) and two beautifully refined little landscapes by Miss Squire (91 and 97). Mr. Alfred Parsons' bright and brilliant view of old "Warley Place" in the midst of its garden (67) is among the more prominent works, as also Mr. Wimperis's "High Down, Dartmoor" (161), also Mr. Austen Brown's "Ste. Geneviève" (234) a picture evidently painted under French inspiration and training; Mr. W. Rainey's children dancing in a field, under the title "A Ring of Roses" (292); Mr. Bernard Evans's "Fountains Abbey" (327), a large and rather too solid drawing, but with a certain power; and Mr. Weedon's "Hayfield, Pulborough" (373), a work in a broad style and with a very fine sky. The West Gallery is occupied with older works, "Royal Institute Art Union Prizes," including some good examples of Prout, and some not very remarkable ones of Varley, Holland, and some other old names. The two best things in this part of the collection are Mr. Wimperis's "Arundel Castle" (78) and Mr. Harrison's exceedingly beautiful and real coast scene under the title "The Rising Moon" (103), which could hardly be surpassed in its way.

At the Goupil Gallery is a collection of landscapes by James Maris, one of those modern Dutch painters with whom landscape painting is not so much a representation of nature as a representation of one special type of effect which they read into nature, and to which they always adhere. The deadness and coldness of colour in the land portion of his works is almost depressing; on the other hand his skies are often very fine, and rendered in a manner entirely his own. The large painting entitled "Seaweed Harvest," a narrow strip of beach with a great mass of clouds above it, is splendid; and some of the smaller works are very interesting, though the impression of the whole collection is rather monotonous.

THE ADVANCEMENT OF ARCHITECTURE.*

In my last lecture I pointed out how the Gothic architects dealt with one new feature, viz. the flying buttress, how it was at first a plain piece of structural work, and how it was gradually brought into an ornamental feature. This was more or less the case with every new feature. The Early Gothic window was a plain lancet. Sometimes three were grouped together—of course, for light, the two side ones being lower; when there were two together they were both embraced by one arch, doubtless for good structural reasons, and, as light was the object, a circular opening was made in the spandrel over the central shaft, which practically became a mullion, and this circular opening was mostly adorned with a trefoil or a quatrefoil. The columns were gradually diminished as much as possible, and the heads were eventually filled with geometric tracery. We know in our own English

* Being the sixth and concluding Royal Academy Lecture on Architecture this session. Delivered on the 17th ult. by Professor Aitchison, A.R.A.

Gothic that this was called the Geometrical period.

It is curious, with all the desire for novelty that characterised the whole Gothic period, how conservative the architects were; they never substituted a new form for an old one until the old one interfered with the proper development of their new aim. The original divisions of the windows were shafts, made slenderer and slenderer, until at length they were superseded by the plain moulded bars we call mullions, which were continued and bent into tracery. It was by development rather than by anything absolutely new that the astonishing results of the latest phase were obtained; for instance, the gables of porches or doorways were made higher and higher, until they ran above the central rose window of the west end, and were pierced to admit light. At Amiens the finial of the flat gable of the central porch only runs up a little above the string of the ground story, though it is raised by the figure of an angel blowing a trumpet. At Reims, the high-pointed gable is surmounted by a finial with a cross on the top, just level with the centre circle of the great west rose window. At St. Wulfrand the thin point and finial run high up into the west window. At the Cathedral of Rouen the gable, as seen in perspective, cuts the great rose window in two, and its finial reaches on to the upper archivolt above the circular rose. At Notre Dame de l'Épine, as seen in perspective, the tops of the two finials of the gables run above the crowning string on to the battlements.

The buttresses were originally merely structural, to resist thrusts or to stiffen walls, with plain sets off and water tables. As the architects got more and more skilled in construction, they seemed to have developed a stronger taste for ornate structures; you may be sure that this was appreciated, and was more and more wanted. You must remember that though architecture had passed from the hands of the clergy into the hands of the laity, the clergy had not lost their taste for it, but had only seen themselves surpassed by superior talent and skill, and besides as the people were getting richer and more fastidious as soon as they were organised into trade guilds, the clergy must have heard of their appreciation of more ornate buildings. At the Cathedral of Notre Dame at Paris, the buttresses were still plain, but in the west front the architect had put an ornamental note in each, by means of a niche with a statue, the niche being made by two projecting columns covered by a roof. The architect, too, had carried the arcade of Kings across each buttress and done the same in the upper arcade. At Amiens, owing to the projection of the porches, the lower stories of the buttresses were brought forward too, they were arcaded on the face and at the level of the string of the ground floor octagonal spires were put on them and angle pinnacles.

At Reims the portals came in front of the buttresses, and the face of the buttress above the portal was arcaded with a triple arcade to the level of the first floor string; above that an oedicle for a statue was formed by an arch on two columns and was capped with a spire and pinnacles as at Amiens, and like them the spires ran up into the gallery of Kings, the finials reaching to the top of the pedestals on which the kings stand. At St. Wulfrand the buttresses project considerably before the jambs of the portals and are square for a certain height, and then are set anglewise and are hollowed into niches on both the diagonal faces, and have statues with canopies over them, whose spires are tufted with crockets; above the canopy is a gable with a tufted finial bearing on its top the stand for another statue with a canopy over it, the finial of which runs up and divides the angle buttress which is gabled, and the spire over this dies against the square face of the buttress above, about the level of the middle of the rose tracery of the west window. The same sort of buttresses, but even more elaborate, projects in front of the portals at Rouen. In late French Gothic the canopies form an important ornamental feature.

The only other things I know that make up the sum total of the external architectural ornamentation are the pierced balustrades. I may here point out a motive at Rouen Cathedral I never noticed elsewhere, that the balustrade to the highest open gallery has its top line diversified by each alternate space of the arcade being formed into a canopy, this is very like the semi-octagon projection in the window lattices at Cairo, used for keeping the water bottle cool. I never was in the gallery at

Roman, and so can only speak of its appearance from below, but all these new methods of ornamenting show the tendency of first turning necessities into ornament, and then developing and multiplying the ornamental features.

The arced or panelling of the plain surfaces of stonework, the filling in of gables with tracery, sometimes blind and sometimes pierced, the new mouldings, the modelling of piers and jambs, and the sculpture, and I may add the development of the fringes, like those round the porches at Amiens, end the list. I may say, however, that by making the sides of the arches of the fringes vertical, as is done in late work, gives them a Sarcenic look, like the stacchites to the arches of the Alhambra. I have so often adverted to the Gothic mouldings that it is needless to repeat my remarks that they were studied to tell in a misty climate, as the Greek ones were to be effective in a sunny climate. The modelling of piers is the result of the stepped arches and the logical desire of the Romanesque architects to have a separate column to support every separate rib. Not being a sculptor I say nothing of the carved work.

Before the end of the twelfth century the Romanesque sculptors had taken their floral ornament from the leaves, plants, and flowers that were native to the parts where they were building, and evidently copied their figures from the natives, too; but that particular floral ornament we call a crocket became a distinguishing feature of Gothic. You may notice that the old spire at Chartres has no crockets, but in the new one not only the spire, but every pinnacle, is crocketed.

As a rule, the outside of buildings tell nothing of their internal structure, and I do not mean by that their shapes, for the apses and chevets are striking enough. St. Bacchus at Constantinople, often called the little St. Sophia, might, as far as its outside is concerned, be a printing-office or a Dissenting chapel, in spite of its domed inside.

It was the Byzantine custom to utilise the space between the buttresses, as was ultimately done at Notre Dame; but this is not the case in vaulted Gothic structures, as a new principle had been introduced of counteracting thrusts from the inside by the external thrusts of the flying buttress, as, with the exception of the west front and the north and south ends of the transept, every bay of vaulting is shored up outside by flying buttresses. It will, therefore, be best to say something of the vaulting before making the final remarks.

I mentioned the vaults in my last lecture, but it may not be amiss to repeat my remarks. The vault was confined in the first instance to transverse, diagonal, and wall ribs, each pair forming an arch. The ribs at first being merely beaded at the edges, but these were gradually turned into mouldings, and in England smaller ribs, under the name liernes were multiplied, and a ridge rib introduced, possibly to make the filling in easier, and eventually the spaces were so small as to be filled with thin stones, scribed and fitted in. Short ribs, tiercerons, were also inserted, set at an angle to the liernes, forming stars in the middle, the horizontal section of the solid part of the vault being polygonal, with curved faces. Gradually the horizontal section became circular, and the ribs got so small and numerous that it was easier to make the horizontal section of the solid round, and to work the ribs out of the voussours, than to use ribs and panels. These were called fan vaults, and are still constructively valuable in brickwork, as they save the waste of time and expense in cutting the groin points, as well as the weakening of the vault. I have used them for basement vaults. These fan vaults were often used with pendants, as at Henry VII.'s Chapel and elsewhere. As construction and as mason's work these fan vaults were most wonderful, but, aesthetically, the monotony of the repetition of arches and cusps is sickening. I have often wondered why this form of vault was not used now, only carved with something interesting, instead of being covered with the everlasting cusps. Of course, at first sight, the stellar vault is striking, and so is the fan vault, and those with pendants are more astonishing still. In fact, to those unacquainted with the method of support, they are unwarvellous. But interminable repetition is beyond human endurance. Though all the leaves of a tree arc, roughly speaking, alike, no two are exactly the same, nor in the same position. The Greeks realised the advantage of this device of nature and

acted on the lesson; so that we never tire of looking at the Parthenon.

Now, as before, all the external features of a building are the walls and roof, and the walls are only necessarily pierced by doors and windows. The Greek temples, if Dr. Dörpfeld is right, were alone without windows, and every habitation must at least have one chimney for the cooking-fire, or a hole in the roof for the escape of the smoke. It is a matter of genius as to how these walls and roofs, these windows and doors are to be treated to make the whole building interesting or beautiful. We should be grateful to the Saracens and to the Medævals for showing us the possibility of making them striking, effective, and beautiful, in a new way, and showing us that every form of beauty was not exhausted by the efforts of their predecessors. Architecture is really the creation of religion. It is much more for pleasing his deity than himself, that man has built all the most famous buildings in the world. As soon as the savages that over-ran the Roman Empire were nominally converted to Christianity, their main object was to have temples built as large, grand, and stable as their wealth and the skill at their command would permit, and when the architects were skilful enough to enable them to show their enthusiasm, lanterns, towers, and spires were added to every abbey, church, or cathedral, and the whole was covered with every form of ornament that they admired.

The Greeks did not, so far as I know, make any improvements in structural art. Their temples, as far as their construction went, were no advance on Stonehenge; but they were a tasteful people, who loved the beautiful, and they made the most perfect temples the world has yet seen, where every artistic touch still tells its tale as well as it did when it was new. The Romans were greater than the Greeks in everything that we call practical. They saw the advantage of the arch, and used it as it never had been used before; they saw the advantages of architecture, and there was no country they conquered and kept that is not enriched with it. They learnt the art of building in rubble—or, if you prefer it, in concrete—faced with stone or burnt brick, so that there was no place they stayed in where the main material was not to their hands. There is in Tunisia an aqueduct, some 70 ft. high in parts, that is built of the soil of the country mixed with lime, and cast into huge blocks; but then they had the taxes of the then civilised world for their revenue, armies of slaves, excellent roads, and the power of requisitioning the population wherever they stayed. They were admirable planners and most excellent builders, and, of course, could choose their architects from the cleverest of all the tributary nations, and they always succeeded in getting dignity and magnificence in their buildings. The Byzantines were Romans, with a larger admixture of Greeks and Orientals, and they perfected the dome on pendentives and invented domes on drums. The Saracens were savages when they emerged from Arabia, but with a passion for literature and some skill in it, they deeply studied Greek philosophy, and Greek and Hindoo, arithmetic and geometry, mathematics, and eventually developed a new style that has captivated mankind by its gorgeous and magical effects. The various savages who over-ran the Western part of the Roman empire, as soon as they settled down began to practise building and showed an energy, perseverance, a power of observation and logical deduction that has never been surpassed, if it has ever been equalled. In less than a century after the taking of Jerusalem, in 1099 A.D., they became original and daring architects, and eventually the most skilful the world has yet seen, but how any one can suppose that they were not indebted to the Saracens for their methods is beyond my comprehension. The magnificent Norseman showed a passion for the massive and the grand. If you will go from the nave of Southwell or Gloucester into the choir, you go from the grand and gloomy work of giants to the exquisite skill of pigmies. Where did the ideal of all this mysterious elaboration and slightness come from but from the admiration of Saracen work?

I daresay most excellent reasons could be given why the great epochs of architectural art cannot occur again, and particularly in the immediate future; for there is always some good reason to be given for any bad practice; men can say that "so-and-so, with no more knowledge than I, made a comfortable income by keeping an architectural fancy

dress shop, and that a few have made their fortunes at it;" but as I addressed you as poets in structure, so I continue.

If we want to imitate the Gothic architects in creating a new style, we must at least learn all that can be learnt, and strive all we can, before we are in a position to say that a new style is impossible.

No one can say that there is no poetry left in this age. I believe no age is absolutely wanting in the elements of poetry, but it may want the man gifted with perfect utterance to make it known and acknowledged.

When I was a student I took in Viollet le Duc's "Dictionary." There is one short remark in it that it will not be amiss to quote—"The constructors of those days sought without ceasing, and routine had no hold on them; in searching they found, they advanced, and never said 'We have arrived, let us stop here.'" This seems to me to be good teaching to follow. We at present want an architecture of our own time, a new architecture; this is a good wish. But we must know how a new architecture is found. Let us see how it was found in the Middle Ages, and to do this we must begin at the beginning with the Romanesque architects. I did more or less describe their efforts until they found out the pointed arch, the vaulting ribs, and the flying buttresses. They had learnt all they could, they had observed the various strengths and qualities of stone, they had reasoned on every step they took, they had dared and striven, and they had become more or less masters of descriptive geometry, which in itself is a great training to the mind. They had to set out full-sized diagrams on the floor prepared for them, of every piece of work that required accuracy, and to draw out every moulding full size in section; but besides this, they had to get out the forms the mouldings took when the joint came on to a horizontal line, for the masons to cut their templates from. Every piece of stone was completely worked before it was carried up to its place, and the architect had to see that the work was properly executed and bonded, and that the rubble filling was properly put in, or else, especially in high walls, there would sure to be settlements, but this was not all, for until the schools had turned out efficient workmen and foremen in each trade, the architect had to arrange the necessary scaffolding, and draw out all the centring for the arches and ribs, besides having to look after the quarrying of the stone, and its conveyance to the work, and the proper economy in cutting it, and this did not apply to the stone alone, but to every material used, so that the architect was very properly called, "The Master of the Work;" but probably when the communes were constituted and made up of trade guilds in the latter part of the twelfth century, the different trades were well versed in the knowledge of their arts. The bottom half of the circle of the west rose window at Reims, which is 4 ft. in diameter with open spandrels, was no easy task to joint, when there was only one light circle in each corner to support it, and besides its own weight, it had at least half the tracery to carry. The cause of invention or the capacity for the production of æsthetic effect by individuals is impossible to discover, and if it should happen that a new style should come about, we cannot foresee what form it will take, but I think we can say that it will not take the form of Gothic, for ornamental geometry is not the passion of the present day. I think the cultivated would now prefer the Palace at Brescia to anything Gothic. It is doubtful if any new grand style is likely to be developed in the immediate future; for the embodying of any great idea in building is very remote from the thoughts of the present day. The embodiment of every great idea came as naturally to the people of the Middle Ages as sending a letter to the papers comes now, and the Church schools of those days represented all the education that was to be had, technical and other. The clergy were a protection from the arbitrary power of feudal lords, and pointed out the way to Heaven, while the Church offered all the innocent delights that were then known. The exercise of architecture and all the sister arts, as well as the sumptuary ones, offered the most perfect intellectual exercise without fear of the dungeon or the stake; consequently to endow the church with excellence and beauty offered not only the highest but the most cogent motives. All I can now say is this, that before we can hope for a new style, we must acquire the knowledge of construction possessed by the engineers, skill in planning, and the proper dis-

position of light and shade. With this as a foundation we can only hope the poetic inspiration may come to enable us to clothe the necessary forms with an elegance more perfect than the world has yet seen.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

HERALDRY IN ENGLISH MEDIEVAL ARCHITECTURE.

A MEETING of this Institute was held on Monday, at No. 9, Conduit-street, Mr. Aston Webb, Vice-President, in the chair.

The minutes having been taken as read, Mr. W. H. St. John Hope read a paper entitled "Heraldry in English Medieval Architecture," of which the following is an abstract:—

Mr. St. John Hope said he should confine himself to the historical period beginning with the accession of Henry III., in 1216, and ending with the death of Henry VIII., in 1547. The applications of heraldry to architecture in this period were so numerous that it was not easy to deal with them in any degree of connexion. Arms, hedges, crests, and supporters were freely used in every conceivable way, and on every reasonable place. Whether the building were ecclesiastical, domestic, or secular was immaterial; there was no difference in the treatment of the heraldry nor limitation of its use. The earliest applications of armorial insignia were purely of a personal character, to distinguish a man from his fellows when all were alike disguised in their war harness. These insignia usually took the form of a device painted upon the wearer's shield or attached to his headpiece. Heraldry, consequently, is met with first in buildings, in the form of painted or sculptured shields on the monumental effigies of departed warriors. The value of armorial shields as a mode of picture-writing soon suggested itself when heraldry became a science, and the association of them with architecture formed at once a beautiful form of decoration and a speaking historical record. The wall arcades of the nave aisles, and the tombs of Queen Eleanor and William de Valence, in the abbey church of Westminster, furnish the earliest and most charming examples of this combination. Another admirable thirteenth-century example is the gatehouse of Kirkham Priory, Yorkshire. In the new nave of York Minster, of about the same period, various benefactors to the church are commemorated, after the Westminster fashion, by their shields of arms, thirty-two in all, sculptured, two to a bay, in the spandrels of the pier arches. A somewhat similar arrangement occurs at St. Albans in the beautiful decorated bays of the nave, built after the partial fall of the south side in 1323. In the north of England there were numerous fourteenth-century buildings showing heraldic decoration with the architecture—for instance, Bothal Castle, Alnwick Castle, Hilton Castle, co. Durham, Lamley Castle, the Lion Tower at Warkworth, and Micklegate Bar, York. The presbytery and choir of York Minster contain in the spandrels of the pier arches a series of sculptured shields similar to those in the nave, and the great arches of the central lantern tower are also adorned with large and fine examples of the sculptured shields of arms of the builders and others. Taken as a whole, the fourteenth century, except perhaps in Yorkshire, was not very prolific in buildings decorated with heraldry; but it produced a magnificent series of monuments, many of so elaborate a character as to form distinct features of the churches wherein they stand. The more notable examples were enumerated and illustrated by the author of the paper. The so-called Perpendicular style was very prolific in heraldic ornament and decoration, which was especially seen in East Anglia, where almost every large church of the period is lavishly decorated with heraldry. Several examples were described. Fine displays of heraldry existed in many of the ornate fireplaces of the fifteenth century, notably at Tattershall, in Lincolnshire, and the Bishop's palace at Exeter. The fifteenth century, like the fourteenth, was rich in heraldic monuments, and brought into fashion those beautiful stone structures that combine the monument with the chantry chapel, of which examples exist at Tewkesbury, St. Albans, Salisbury, Winchester, and elsewhere, one of the finest in design, as it is most remarkable in construction, being the bridge-like structure in Westminster Abbey church, in memory of Henry V., whose tomb stands beneath it. Much of the architectural heraldry of the first part of the sixteenth century is simply a continuation of that which preceded

it. In large and costly buildings, however, the increased richness of the architecture was accompanied by a corresponding outburst of heraldic display, as in Henry VII.'s Chapel at Westminster (in particular the bronze doors), King's College Chapel, Cambridge; St. George's Chapel, Windsor; and Hampton Court. Selecting a few typical architectural features, such as spandrels, bosses of vaults, &c., Mr. Hope proceeded to show the influence the introduction of heraldry had had upon their ultimate development, citing numerous existing examples. In conclusion, the author discussed, by the light of medieval examples, the artistic treatment of heraldry in its application to architecture, shields, crests, supporters, and various other features being dealt with in detail. The lecture was illustrated by a large number of lantern slides and coloured photographs of stall-plates of Knights of the Order of the Garter in St. George's Chapel at Windsor.

Mr. J. A. Gotch, in proposing a vote of thanks to the lecturer, said that he had been much struck with the very interesting series of views which had been thrown upon the screen by Mr. Hope. The later examples exhibited had pleased him, on the whole, more than the earlier ones. That was largely due to looking at the subject from the decorative point of view. Of course, the earlier heraldry, the more heraldic it was, in a certain sense—that was to say, the nearer the stream was to its fount the purer it was. The older the shields and devices were the simpler they were, but for pure interest of design, as apart from merely stating the fact, it seemed to him that some of the shields of a later period struck him as being most beautiful and most ingenious. There were not only the heraldic facts portrayed, but it was done in such a very charming way, and they had not only the alliances and interesting history given, but the actual skill and ingenuity of the designer, and the evident love with which he did his work, displayed before them. So with that tomb in Henry VII.'s chapel. He did not think that all the illustrations thrown upon the screen there was any more charming example than that of the arms of England in bronze work. A more elegant supporter than that greyhound he did not think one could ever see, and the elegant way in which the arms were displayed, with the whole of the field voided, was most ingenious, because of course, as a rule in drawing heraldry, the various badges were drawn entirely separate; but in order to have them supported when in the shield; all these things had to be shown, and the ingenious way in which that was done without confusing the charges was certainly most interesting. Then, if one might be allowed a bit of criticism on the designs of men who used to design far better than we could at the present day, one would perhaps venture to say that in some of the Tudor work at King's College Chapel, for instance, the badges seemed to a certain extent a little bit coarse and out of scale with the charges on the shield, because the badge itself was perhaps as large in area as the shield. Then there was one thing which he thought one could gather from the series of views thrown on the screen, and that was as to the great advantage there was in studying heraldry, not only in the flat but in the round. He thought they could learn something with respect to the charges and so on in heraldry perhaps better by having to model the shield than simply drawing it, because then one got to know, in a measure, how the shield must have been constructed, and therefore how the charges which a shield bears were logically placed one in relation to the other. Mr. Hope said a good deal about the freedom there was in heraldry, and that certainly appeared to him to be one of the great things at which modern designers ought to aim. Certainly great freedom was taken by the old designers, but that freedom was entirely lost in the last century and the century before that. Mr. Hope said that the only shape of a shield devoted to one purpose was the lozenge which was devoted to ladies. It was a curious thing, in considering the origin of heraldry, viz., that these were badges or insignia which were worn by the knights enveloped in cumbersome armour, that ladies should ever have thought of indulging in heraldic badges. He supposed for some time after its inception heraldry took a little departure from the strict course which it ought to have followed in its pure developments, and became not only useful but also decorative, and the ladies seized every opportunity that was presented to them of applying such decoration to their already decorated persons. One very curious instance of the use which ladies made of heraldic devices

was in Spain, in which ladies who were unmarried displayed a shield in which one half was devoted to their paternal coat, and the other half was left blank on which to put the arms of their husbands. Those, we were told, were called the arms of expectancy. Apart altogether from the decorative point of heraldry, architects especially should find it exceedingly useful from the amount of light it threw upon history. Very often the only clue one had to the date of the building lay in the shields with which it was adorned, and so, altogether apart from the pleasure one had in fine drawing, its historical use was a great point. On one of the slides some shields were charged, not with arms at all, but with letters and figures, and that was an interesting thing to notice. Even in medieval times the shield was of a shape which would be devoted entirely to heraldic bearings, one would think, but it was used in that instance to carry letters and initials.

Mr. J. J. Stevenson seconded the vote of thanks. On one point in Mr. Hope's lecture he was in doubt, viz., in regard to that gentleman's remark that heraldry began in the thirteenth century. He (the speaker) thought it was as old as the human race. Heraldry must have begun long before letters. It was simply a picturesque manner of writing one's name, and belonged to the same class of things as signs of public-houses and so on, invented for the sake of people who could not read. We had a modern example of old heraldic things in the case of modern merchandise signs. Then another thing might be looked at in that light. He could never understand why it should be called bumptious and upsetting and presuming to put up one's family sign, but we must take care that what we did put up we had a right to put up. But in reference to that, and the modern coat of arms, there was the difficulty of the helmet. We did not wear helmets nowadays, or we might put a crest on a top hat. But how could people's names be represented on a plate, or a shield, or anything else, without putting up a helmet? He desired to make heraldry a practically modern thing. It certainly ought to be a modern thing. He did not in the least see that we should not keep up that beautiful old picturesque way of writing our names in that way. As to the origin of crests that was rather an archaeological question, but when one looked at crests one saw they were of enormous size. The crest of the Black Prince in Canterbury Cathedral was a real leopard. He thought every architect ought to know that the mere form of the shield was no matter of importance whatever—it was a matter of mere fashion. In fact, those marks were often put on a coat—at least, we often heard of coats of arms, and in coats of arms they would not take the form of a shield but be simply dispersed over it. Mr. St. John Hope had referred to St. John's College, Cambridge. He (the speaker) was fortunate enough to be the discoverer of the chimney in the other college, which Lady Margaret built, viz., Christ's College. On it there were marguerites for Margaret, and the name and title, and a lot of little things about a couple of inches square, all over the chimney piece. There was one remark he would make on the whole, viz., that he thought if heraldry was merely a way of writing one's name he did not see why people should be taxed for doing that.

Mr. Hugh Stannus said that Mr. Stevenson had mentioned the shrinking from using coats-of-arms on the part of clients as being an assumption of too much; and he had found the same feeling; but when a man was of ancient blood or good family, then it was a pity he did not allow it to be stated. And when a man was "a new man," even then he might have a coat-of-arms, on proper application to the Herald's College. With regard to the helmet, he was always in favour of using it over the shield, with the wreath and mantling falling from it. The whole, when complete, was much more beautiful for decorative treatment. All heraldry was a conventional method of stating a certain fact, and if the conventional method of putting the arms on a shield were adopted he saw no reason why the helmet and its accessories should not be shown. The use of the helmet further gave an opportunity for having a boss or lump coming over the flat shield; and this bossing was the very essence and life of relief-work. With regard to the main question, he thought architects might look upon the subject from two points of view. First of all, Heraldry was introduced to give information, to tell a story as to who were the personages who lived there, who erected the building, who was buried there, or who had been the benefactor generally. That, of course, was the Storiational side of Heraldry.

It was useful to give some statement or story, and to us now it was often the only means of learning dates and names. From the second point of view—that of decoration (and architects had to look at it decoratively more than as matter of Storiatio)—there were certain definite principles which governed its introduction. We wish to tell the story; but also to tell it in an artistic manner. He thought that when heraldry was introduced in architecture, then of course it must be subordinate to the principles that govern architecture; and those would be such principles as would require that the shield and all its accessories should show a sense of the shape in which they were enclosed, whether a frieze or spandrel or any other panel; and that, further, they should have some sense of the surface on which they are applied. In the ordinary case of work in relief, Diapering made the surface a tone lower, by reason of the shadow cast upon the ground from the projecting parts. Therefore it was necessary, when a man desired to emphasise the changes, that he should diaper the ground. The folds of the mantling also “force-up” the flat shield, by contrast. That was entirely independent of the question of colour, because probably architectural or external heraldry would be considered as a matter of relief rather than of colour. He told a little story that Mr. St. John Hope had somewhat derided modern heraldry, as he had seen some in Mr. John Clayton’s studio, and also by Mr. T. R. Spence, and there was some good work by Pugin, which, in his judgment, was quite as fine as any heraldry that ever was done in the old times. Of course they had not done it “off their own bat,” so to say, but by study of the old work; and he ventured to think that by the careful study of the examples of the old work, modern architects, as a body, might hope to emulate, and perhaps to equal it. This, however, could only be done by earnest and loving study.

Mr. J. D. Crace said that in reference to the question of the abuse of the crest independent of its surroundings, it was interesting for a moment to consider what relation the crest and mantling and the helmet had to each other. The crest was probably stitched or fastened to that which became the mantling. All that was bound to the helmet; the cloth was bound to it by the wreath or chaplet or coronet, as the case might be, and the helmet was the solid body on which the cloth with the crest attached was bound by the wreath. That was why it was seen in the seals exhibited on the screen, flying behind as the knight rode rapidly forward. A great deal of the freedom which Mr. Hope had fortunately brought before the architects was due probably to a very thorough knowledge of the general principles of heraldry, and of the meaning of the insignia of heraldry. Freedom was a dangerous thing to adopt by those who had not gone through the mill of real education. We saw that in art every day, and it was displayed more completely than one cared to think. Those magnificent examples of the gateways of King’s and St. John’s Colleges at Cambridge, and the still finer examples of those magnificent blazons or heraldry devised outside some of the great gates in Spain, where heraldry was carried to a wonderfully rich perfection, and where they formed the decorations of such noble spaces as the great spaces between two round towers of the gateway, where there were areas of 15 or 20 ft. square, covered with the shields and supporters of the sovereign who was represented—brought those great spaces covered with ornamentation with a meaning worthy of attention. It was well to bear in mind, where a man was anxious to infuse a meaning of some kind into the ornamentation of his building, that it could be done by heraldic devices in such cases as municipal buildings or state buildings, or buildings for public purposes, or even in some cases buildings for private purposes. They were each interesting in their own way. He had noticed that Mr. Hope said, in showing them the bronze gates of Henry VII.’s tomb, that it was to be wished that such work could be done nowadays. The speaker did not know whether Mr. Hope had ever seen the beautiful brass gates which formed the entrance between the House of Lords Lobby and the House of Lords, but he thought upon the whole they bore a very wonderfully good comparison even with Henry VII. gates, and they were done forty years ago by Hardman from Pugin’s drawings, and were well worthy of admiration in themselves as showing that there was the practical ability to produce such things if there was only the knowledge to

plan them and the demand for them. It was interesting with reference to the tester for the tomb of Henry IV. at Canterbury Cathedral, which was decorated in colour with heraldic devices and mottoes, to find that that was decorated on three separate occasions, and they could follow very distinctly the three periods at which it was redecorated, and certainly none of them could be later than the time of Henry VIII. That showed that much care had been taken to keep up the character and appearance of that monument.

The Chairman, in putting the vote of thanks, said that architects must look to experts in heraldry if any improvement in modern heraldry were to take place. But architects were fully alive to the importance of this matter in conjunction with their own art. They realised very fully that the poetry and the history of their buildings must always, in point of detail at any rate, largely depend upon the introduction of heraldic devices. One recognised very well in the little almshouses outside the town the value of the small heraldic panel over the gateway, just as much as one recognised the magnificent result in the great castle or the stately church. With regard to modern architecture, they had an excellent example of general heraldic treatment in the Houses of Parliament. The way heraldry had been there introduced, principally by Pugin, over the whole of the building, not only into the architecture, but also the way in which the charges were placed in the shields and the general execution of the detail, was a wonderfully good example of modern heraldry, of which architects might well be proud.

The vote of thanks was then put and carried unanimously.

Mr. St. John Hope, in reply, said he began his paper with the understanding that most of his hearers understood all of what he might call the elements of heraldry, and, as the title of the paper said, he had simply proposed to deal with the associations of it in connexion with architecture. So it did not matter to him whether heraldry began in the twelfth century or whether it originated at a very much earlier period, or whether the heraldry seen on Greek vases was worth while bringing into notice. The question of the use of heraldry by ladies was, of course, a purely archaeological one and not architectural. It no doubt originated when heraldry became hereditary. At first arms were not hereditary and crests were not for a long time, and mottoes were not hereditary even now; but when heraldry became hereditary and every house had its own arms, it was used in slightly different ways by the different male members of the family, because they might be the founders of branches of the house. Then ladies used it, but as they did not found branches of a house but a lady sometimes assisted to found a branch of another house, they did not make any difference in the paternal arms, as did the sons. Even the use of the lozenge was not restricted to the ladies. He had mentioned the case of the monument of William de Valence, where the remaining portion of the bedplate of the effigy was adorned with beautiful enamelled lozenges with the arms of England and De Valence on them. Mr. Stevenson objected very much to the use of a helmet, on the principle that we did not wear helmets nowadays, and Mr. Stannus had reminded him that we did not bear shields, but he would like to remind Mr. Stevenson (what he had already tried to make quite clear) that if they once took the crest off a helmet it ceased to be a crest, because the very word crest means a plume or something erect on the head of a bird or beast, and so the first crests were such things as plumes and the heads of birds. With regard to the size of crests, of course it sounded absurd to talk of a man having a lion for his crest, but a man did not have a full-sized lion, he had only a model of one. That poor dilapidated leopard which surmounts the Black Prince’s helmet at Canterbury was made after his death, and was part of the paraphernalia that was borne at his funeral. It was nevertheless a real crest, made of leather, and covered with gesso work. With regard to the fixing of crests, on such of the few old helmets as we had we found that, in addition to the holes that were made to fix the lining inside the helmet, and the cushion that carried the weight on the man’s head, there were certain extra holes that had nothing to do with the lining and padding, and were obviously made for fixing on the crest. The other holes were generally arranged in pairs, because a lace came through them, which was tied with a little bow outside, but these other holes were distributed regularly round the top, and were no doubt used for fixing the torse and the crest that rose from within it.

Mr. Hope did not consider it came within the scope of his paper to talk of that magnificent modern heraldry in the Houses of Parliament; and, of course, it was obvious to any one how very beautiful the heraldry was. But then, Pugin, who was entirely responsible for it, was a man who was simply soaked with medievalism of every kind, and to draw those beasts and shields and those beautiful badges and so on was as much a second nature to him as it was to the man who carved those beautiful shields in the spandrels of the arcades in the Abbey. Foreign heraldry he had not time to go into, otherwise it was possible to say just as much about the heraldry of Spain or France or Germany as could be said about the heraldry of England; but in discussing the heraldry of one country they were practically describing that of other countries as well because just as there was one prevailing kind of architecture which went through Europe at any particular time, so there was one particular kind of heraldry. The rich heraldry of Spain could, of course, be paralleled in a less splendid degree by examples in our own country; but there was this difference in the heraldry of England and that of Germany or Spain, it did not run riot to quite the extent that foreign heraldry did. The German heraldry was magnificent in itself, and beautifully picturesque, but it seemed to run into extravagances that the English heralds and heraldic artists altogether kept free from. In Spain this was, perhaps, less so than in Germany, and he very much wished that somebody who has been in Spain and knows its buildings would write a paper upon Spanish architectural heraldry, and illustrate it by a series of lantern slides.

The Chairman announced that the next meeting would be held on the 29th inst., when Mr. J. A. Gotch would read a paper on “Heraldry of the Renaissance in England.” The meeting then terminated.

COMPETITIONS.

ASYLUM AT PURDYSHURN.—We are informed on reliable authority that the author of the successful plan for this asylum is Mr. Anthony T. Jackson, of Corn Market. Some eight or nine plans were submitted, all by local architects, as stipulated in the conditions of the competition. That by Mr. Jackson, which bore the motto “Alpha,” was placed first by the assessor, Mr. Sidney Mitchell, architect, of Edinburgh, and the governors selected this plan. We understand that the design bearing the motto “Efficiency and Economy,” and submitted by Messrs. J. J. Phillips & Son, of 61, Royal-avenue, was placed second by the assessor; and the plan marked “150,” by Mr. John Lanyon, M.Inst. C.E., of 111, Royal-avenue, third. Mr. Jackson may practically be regarded as the architect to the Asylum Board, as he has done a great deal of work for them, and is well known to the members.—*Belfast News-Letter.*

CONSOLIDATED INVESTMENT COMPANY’S BUILDINGS, JOHANNESBURG.—The plans for the Johannesburg Consolidated Investment Company’s new buildings in Johannesburg were submitted to public competition in July some time ago. The result has now been declared. Mr. G. W. Nicolay is the successful architect. The new buildings to be erected on Commissioner, Eloff, Market, and Joubert-streets will consist of a theatre, hotel, Turkish baths, and a large number of shops with frontages to the streets named and to the two arcades which run through the block from Market-street to Commissioner-street, and from Eloff-street to Joubert-street respectively.

ARCHITECTURAL SOCIETIES.

NORTHERN ARCHITECTURAL ASSOCIATION.—On the 10th inst., at the Meeting-room, Art Gallery, Newcastle, the annual meeting of the Northern Architectural Association was held, under the presidency of Mr. Archibald Dunn. The Secretary (Mr. A. B. Plummer) read the report of the thirty-eighth session, which stated that since last year seven members, nine associates, and six students had been elected, and the roll now stood:—Members, 51; Associates, 61; Students, 39; Total, 151. The report also dealt at considerable length with the meetings held during the year. The Treasurer’s report showed a balance in hand of 77. 10s. 7d. The reports were adopted, and on the motion of Mr. J. W. Taylor, a vote of thanks was accorded to the retiring President (Mr. A. S. Dunn) for his services during the year. Mr. F. W. Rich was elected President for the ensuing year, and the other officers were appointed.

SKETCHES OF LONDON STREET ARCHITECTURE.—XI.:

HOUSE IN HANS-CRESCENT.

THIS is the corner house of a row of eight houses, all different, which have been erected in Hans-crescent from the designs of Messrs. Read & Macdonald, for the Belgravian Land Company, who have lately made great alterations in the immediate neighbourhood in pulling down slums, widening streets, and rebuilding with houses of good design.

THE CAMERA CLUB.

THE practical applications of photography in the arts are now so important that new methods and apparatus deserve careful attention by our readers. The Camera Club has always been among the first to take up any new invention, and is always ready to give help and advice to enable the inventor to perfect it.

On the 10th inst., a complimentary dinner was given to Mr. R. W. Cox on his retirement from the post of honorary secretary of the Club. Mr. Macbell Smith, the Chairman, after regretting the absence of Captain Abney, their President, pointed out that the Camera Club was not an exclusive body of photographers who demanded a diploma photograph from all candidates, but that it welcomed every one interested, however modestly, in photography, who was duly proposed. Professor Armstrong referred to the educational advantages of the Club, and said that lectures and exhibitions were held, on an average, twice a week throughout the session, and that any one, by looking at their programmes for the last five years, would see how fortunate they were in securing distinguished men to give them papers.

After the dinner the guests inspected the rooms of the Club, and Mr. Ives exhibited by means of his "Kromscopes" some exceedingly clever stereoscopic photographs in colours. Downstairs there are a large number of dark rooms, and we noticed an ingenious arrangement for printing photographs which we believe is novel. A powerful arc lamp is hung eccentrically above a table on which the printing frames are resting by means of an ordinary bottle-jack, and thus the lamp is kept rotating all the time the photographs are being printed. This secures a uniform distribution of light over the print, and enables a large number of photographs to be printed in a very short time, quite irrespective of the weather.

A most interesting demonstration of X-ray work was given by Mr. H. H. P. Fowles, who was one of the earliest workers on the practical applications of these rays. He has been experimenting for a long time to see if they can be employed for detecting differences and imperfections in various kinds of woods. His results, so far, are chiefly negative, but he says that there is a large field for research still unexplored. He showed how specimens of bad jointing in electric wiring could be at once detected by means of a fluorescent screen, and how the same method could be applied for finding defects in cabinet work, such as hidden nails and screws where there ought to be none.

CHEMISTRY OF METALS USED IN BUILDING CONSTRUCTION.

THE fourth lecture on matters connected with building given at Carpenters' Hall was delivered on Wednesday evening last by Professor J. M. Thomson (King's College), the chair being taken by Sir F. Abel. By a series of simple experiments, and by means of the lantern and screen, the differences between metallic and non-metallic bodies were illustrated, and the chief properties of certain metals, particularly iron, lead, zinc, and copper, were elucidated. In one experiment a bar composed of two metals, on being exposed to flame for a few minutes was seen to bend and curl up in a remarkable manner. This effect was due, it was explained, to the fact that certain metals expanded a great deal more than others, and if two metals, with different expansive powers, were compounded, they got, by the application of heat, the curve seen in the experiment. It was necessary to know the differing physical properties of metals in order to apply each to its most appropriate use in structural operations. Among the most important of these properties was tenacity, which copper possessed in a high degree, and in a still greater degree, silver and gold. The softness and want of tenacity were, on the other hand, the properties that made lead valuable. Being soft it could be easily bent into

Sketches of London Street Architecture.—XI. House in Hans-crescent. Messrs. Read & Macdonald, Architects.

any required form, and lead was also of the highest value because it was less readily affected by acids than most other metals. To illustrate the property of fusibility, a metal was shown which quickly softened and became fused in water heated to the boiling point. An alloy might be made of two metals in such a way as to fuse more easily than either metal would fuse separately, a property of which the greatest use was made in type metal. The methods of deriving various metals from their ores were illustrated by pictures thrown upon the screen of furnaces of various kinds, from the simple fusion processes of the bismuth liquation furnace and the lead ore furnace to the improved forms of the modern blast furnace and furnaces for reducing metals by various gases, or by compounding them with other metals and by electrolysis. In one interesting experiment the use of lead in the form of an oxide, in cheapening the process of reduction, was shown in operation before the audience. A quantity of Condy's Fluid, which has the property of being very highly oxygenated, was placed in connexion with a retort containing a small quantity of the ore to be reduced and

under the influence of the flame. It was seen to become gradually more and more colourless as it parted with the permanganate and the oxygen to the fusing metal. The effect of electrolysis was shown in another interesting experiment, in which a bar of iron was made to take up a covering of yellow metal (copper) and a white metal (mercury). The causes of the readiness of iron to oxidise or rust, and the unreadiness of some other metals to oxidise were shown by other experiments. Iron in its most elementary or lowest state was quite colourless and difficult to oxidise. The fact that some sandstones, at first white, would, after the lapse of years, turn brown in blotches, was due to the iron in an elementary form contained in them. The more rapid action of pure water on lead than ordinary tap water was shown in another experiment, the slower action of tap water being attributed to the fact that the lead obtained a covering from water which was not absolutely pure that protected it from further oxidation, while the oxidation was more continuous in the purest water because the metal could get no such covering to protect it. This difference was much less observable with

House of Jacques Cœur, Bourges.—The Entrance. From a Sketch by Mr. M. Starmar Hack.

copper and iron than with lead. One of the last experiments showed the advantage of giving to iron or other metal a coating of zinc or tin, and the cases were pointed out in which tinned metal was superior to metal covered with zinc. The difference in the action of chlorine and noxious vapours such as sulphuric acid was illustrated and explained by the Professor in concluding his lecture.

HOUSE OF JACQUES CŒUR, BOURGES.

THIS celebrated house, built in the second half of the fifteenth century, adjoins the Roman ramparts of the town, three of whose towers have been incorporated in the building.

In the niche over the principal entrance there was formerly a statue of Charles VII., and looking out of the sham windows on either side there still remain the sculptured heads of two servants.

The octagonal tower in the courtyard contains, as do two others on the same side, a spiral staircase. The hearts and scallop shells which appear so frequently in the ornament come from the coat of arms of Jacques Cœur.

M. STARMER HACK.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of this Council was held on Tuesday, in the County Hall, Spring Gardens, Dr. Collins, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend the Stoke Newington Vestry 6,000*l.* for paving works; the Greenwich District Board 1,900*l.* for the construction of an underground convenience; the Newington Baths Commissioners 7,000*l.* for the erection of baths and wash-houses; and the St. Pancras Vestry 90,460*l.* to enable them to pay off existing bond debts on special paving trusts.

The Chemist to the Council.—The General Purposes Committee brought up the following report, the recommendation being agreed to after some discussion:—

"We have to report that Mr. W. J. Dibdin has, in a letter dated March 2, 1897, expressed a wish to resign his position as chemist to the Council. Mr. Dibdin states that he has for some time past been desirous of engaging in private practice, and as the resolutions passed by the Council from time to time deny him that privilege, he has therefore been compelled to consider his position, and finds that he is well advised in tendering his resignation. We feel sure that it will be with considerable regret that the Council will lose the services of so valuable and able an official. We understand that Mr. Dibdin does not desire that his resignation should take effect until about three months' time. We recommend—That the Council do accept with regret the resignation of Mr. Dibdin of his appointment of chemist to the Council, and that the resignation do take effect as from June 30, 1897."

The Works Committee.—The consideration of

House of Jacques Cour, Bourges.—An Angle of the Courtyard.
From a Sketch by Mr. M. Starmer Huck.

said one of the complaints made against the Committee was that they had not reported on works completed up till the end of November. That was what the Committee wanted to do, but the Council refused to allow them to carry the report up to that date. Mr. Boulnois complained of the meagreness of the report, but it seemed to him that it was too full for many members to read, judging from the nature of their criticisms. They were constantly being told that they had made a loss on certain jobs, but when they made a profit nothing was heard of it. On the last two workmen's dwellings they made a profit of £1,500, but none of their opponents wanted to refer to that when they could point to a job on which there had been a loss. This sort of treatment seemed to him to be very unfair.

The amendment was carried on a show of hands, and on a division it was also carried by 55 votes to 54.

Combined Drains.—The following adjourned report of the Main Drainage Committee was brought up, and the recommendation was agreed to:—

"In connexion with the question of the liability of Local Authorities to repair combined drains, reference has frequently to be made to the records in the custody of the Council of the proceedings of the various Commissioners of Sewers which existed between December, 1847, and December, 1885, prior to the constitution of the Metropolitan Board of Works. In contested cases between Local Authorities and owners of houses having combined drains, it is necessary to ascertain whether any applications were received for permission to lay down such drains, and whether such applications were sanctioned and confirmed by the Commissioners. We are informed, however, that the applications are very imperfectly indexed, and that to find one that may be required often entails a great deal of labour and inconvenience. In view of the difficulty thus experienced several of the Local Authorities have urged upon us the desirability of having a proper index prepared. After carefully considering the matter we are of opinion that the request should be acceded to so that the applications may be readily referred to. It is estimated that the cost of the work will not exceed £500, for which expenditure provision is made in the estimates for the ensuing financial year. We recommend:—That the Council do sanction the expenditure of a sum not exceeding £500, in connexion with the preparation of an index of the applications referred to."

Improvements.—The Improvements Committee recommended, and it was agreed:—

"That the estimate of £2,500, submitted by the Finance Committee be approved, and that the Council do give its consent to and do contribute on the usual conditions one-half of the net cost of the widening of Upper Richmond-road, near Union Church, proposed to be undertaken by the Wandsworth District Board, and shown upon the plan approved by the Improvements Committee on December 15, 1896, such contribution not to exceed the sum of £2,550." And

"That the estimate of £1,233, submitted by the Finance Committee be approved, and that the Council do contribute on the usual conditions one-half of the net cost of the proposed widening of High-street, Plumstead, between Nos. 1 to 34, as shown upon the plan forwarded by the Vestry of Plumstead on January 22, 1897, such contribution not to exceed the sum of £1,233."

The Water Supply Question.—On the recommendation of the Water Committee that the engineer be instructed to proceed with the plans and sections of the Wye portion of the Welsh scheme of water supply, and that they be authorised to incur an expenditure of £1,500, for this purpose during the financial year,

Mr. R. A. Robertson moved that it be referred back. He said in view of the recent action of the Government and the House of Commons they were not within measurable distance of going to Wales for an additional supply, and, therefore, he did not think it advisable to spend any large sum in surveys. If many years hence they had to go to Wales, the reports now obtained would be obsolete. The Welsh water was very soft and was impregnated with lead, and he believed the people of London had come to the conclusion that there was no need for going such a long distance to find a supply. If the water of London was properly treated, there would be no better supply of water for the Metropolis, especially if it were softened and purified by the lime process.

Dr. Longstaff seconded the amendment.

Mr. Idris said there was urgent need of going on with the surveys, for other towns were asking for power to obtain water from Wales, and were spoiling the area suggested for London. It was because London was always so behind other towns that the ratepayers had to pay so much. —

Sir John Lubbock, M.P., supported the pro-

the adjourned report of the Works Committee, of the half-yearly return of completed works, was then resumed. The Committee submitted a list of nine jobs, the estimate for which was £23,218*l.* 2*s.* 8*d.* and the actual cost £25,696*l.* 0*s.* 4*d.* Six other works, for which certificates had not been obtained, were reported to have cost £33,971*l.* 13*s.* 1*d.*, as against the Managers' revised estimate of £32,030*l.* 5*s.* 6*d.* The total value of work executed in the six months was £149,000*l.* Taking the whole of the works carried out by the Committee since its formation, there was a profit to the Council of £6,566*l.* 5*s.* 8*d.*

Last week Mr. Porter moved, and Mr. Cohen seconded, to refer the report back with instructions to the Committee to prepare a fuller and better report.

Mr. Boulnois, M.P., said the whole report was meagre and unsatisfactory. An analysis of the work of the Committee showed that the experiment had been a failure. He should like to see the department abolished, but he was afraid from the tone of the many Councillors that his desire

was not likely to be realised within a reasonable time. If the department was not to be abolished then he hoped the Committee would confine their care to such work as might be profitable.

Mr. J. Burns, M.P., pointed to the big profits made in the jobbing works as counterbalancing the loss on other jobs, and complained of the unfairness of some of Mr. Boulnois's criticisms.

Mr. E. White said the report was inaccurate and misleading. The ratepayers had to pay £5,000 more for inferior work than they would have had to pay for good work if contractors had been employed. As to the jobbing work, if an account were rendered for labour only a loss would invariably be shown. The profit was on material supplied by the department to the different Committees. As to the loss on the Shelton-street dwellings of £2,751*l.*, a further sum of £144*l.* would have to be added for pavement works.

Sir J. B. Maple, M.P., said the Committee ought to submit a balance-sheet on the capital account of the department.

Mr. Ward, late Chairman of the Committee,

posals of the Committee. The amount was small, and it was important that they should learn all they could about these areas. He thought, however, that the Committee were somewhat inconsistent in their action.

The amendment having been negated, the recommendation was adopted by a large majority.

Horton Asylum Foundations.—The Asylums Committee reported as follows:—

"We have to report for the information of the Council that in response to our invitation for tenders for the above based on a schedule of prices, we received the following:—

	£.	s.	d.
Leslie & Co. ...	54,059	6	7
W. Cumliffe ...	52,699	10	5
C. Wall ...	53,791	17	0
H. Wilcock & Co. ...	51,190	11	8
J. Shillit e & Son ...	57,215	5	5
S. Kavanaeh ...	57,339	12	0
Lawrence & Sons ...	57,658	6	6
J. Jackson ...	58,663	13	4
H. Lwatt ...	59,480	9	0
Pedrette & Co. ...	63,622	14	2
B. Cooke & Co. ...	65,350	1	8
Kirk, Knight, & Co. ...	65,571	0	0
Martin Wells & Co. ...	67,200	0	0

and that Messrs Leslie's tender being the lowest, we have accepted the same, and instructed the solicitor to complete the contract. It may be within the Council's recollection that the plans of this asylum are a duplication of the Heath Asylum, Bexley, the foundations of which were estimated to amount to 32,732l. It may, therefore, be stated in explanation of the difference in amount that the site at Bexley has a subsoil of gravel and sand, while the character of the Horton site is such that the architect considered it necessary to give instructions for the quantities to be increased by 40 per cent., representing a sum of 13,022l. A further explanation of the difference in the estimated cost of the two works is the increased cost of bricks, estimated at 4,800l."

The Council, having transacted other business, adjourned at 7 o'clock.

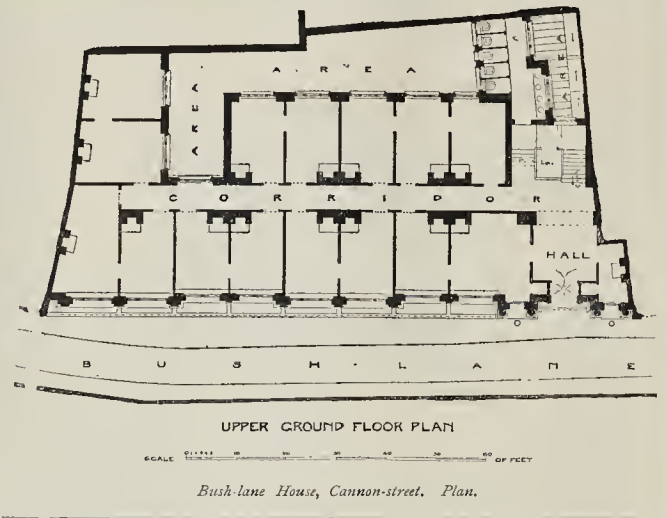

Illustrations.

ST. WULFRAN, ABBEVILLE.

THIS church, like Beauvais Cathedral, is but a torso; if completed, it would have been a cathedral of the first rank, and one of the most beautiful. It was commenced in 1488, but the work was interrupted in 1539. A choir was added in the seventeenth century. The earlier work includes the façade and a nave 31 metres long, and the same in height. The central door is covered with sculptured scenes from the life of the Virgin, presented by a rich shopkeeper of Abbeville in 1550. The three western portals, once populous with statuary, are crowned by lofty, pierced gables, above which is an open parapet. The great western window is not a simple rose, but a rose resting on a group of lower lights. Higher up is another open parapet, and then the gable of the nave, with three colossal statues of the Virgin, St. Wulfran, and St. Nicholas. Higher still rise the upper stages of the towers, pierced with long double windows, and terminating in an open parapet 53 metres from the ground. The inner western angles of the towers are flanked by turrets. A staircase turret runs up the southern tower, and is the only weak point in one of the finest façades in France. A drawing of the south doorway, by Mr. H. Wilson, appeared in the *Builder* of September 19, 1891.

ST. RIQUIER, SOMME.

THIS church, now parochial, was once attached to the famous abbey of St. Riquier, which gave the Church twenty-seven Popes, 200 Cardinals, and more than 500 Bishops. It is a work of the latter part of the fifteenth and of the sixteenth century. Its west portal is a veritable recondo. In the tympanum is a Jesse-tree; above, the Holy Trinity, represented as at St. Wulfran, Abbeville, and surrounded by colossal figures of the Apostles. Above are three statues representing the crowning of the Virgin. Between the tower-windows is a statue of St. Michael, with Adam and Eve on one side, Moses and David on the other. The tower is flanked by charming octagonal turrets for staircases. The side portals are covered with Renaissance arabesques. The church is in the shape of a Latin cross, with apse, ambulatory, and a chevet of eleven chapels. The church contains much fine woodwork, and Byzantine reliquaries. St. Riquier lived late in the

Bush-lane House, Cannon-street, Plan.

fourth century; in later times the offerings at his shrine amounted to more than 80,000l. per annum; hence the richness and the profusion of the sculptured ornament.

PALAZZO COMUNALE, PIACENZA.

THE Palazzo forms one side of the Piazza dei Cavalli at Piacenza, and its end elevations look upon streets leading into the corners of the piazza. At the rear is a court, two sides of which have windows similar in detail to those of the front.

The building was begun about 1280. The lower portion is in red and white limestone; the remainder is in brick and terra cotta.

It will be noticed that the windows all vary in detail, and the two ends of the building also differ.

The illustration is from a drawing by Mr. M. Starmer Mack.

SKETCH AT BURGOS.

We devoted an article and some photographic illustrations to Burgos Cathedral in the *Builder* of January 25 of last year. We are glad to supplement this by Mr. Hack's excellent sketch of the two towers rising above the houses, which shows them from a different point of view from our former illustrations.

The west front was begun about 1220. The open spires were added, it is said, by John of Cologne in the fifteenth century; they are 300 ft. high. The central lantern, an octagon on plan and 180 ft. high, is carried on four circular piers. It was finished about 1567, the architect being Juan de Vallejo.

No. 1, CONDUIT-STREET.

THIS is the front elevation of the proposed new shop building at No. 1, Conduit-street, W. The ground floor will be used as two shops, whilst the first and second floors are planned for a series of trying-on rooms (the shop being a tailor's), and the upper part of the building as workshops.

The materials to be used in the front are Farcham red sandfaced bricks with Ancaster stone dressings, and the roof will be covered with Westmoreland green slates. Mr. H. Huntly-Gordon is the architect.

BUSH-LANE HOUSE, CANNON-STREET, E.C.

THIS is a block of professional and commercial offices, situated one door from Cannon-street, and occupying a ground area of about 6,000 ft.

The building has a frontage to Bush-lane of about 115 ft., and the elevation has been carried out in red bricks, with Portland stone cornices, caps, bases, and sills.

The entrance feature, however, which forms the subject of the illustration, and which is conspicuous from Cannon-street, has been carried out entirely in Portland stone.

The building comprises lower ground and upper ground floors, first, second, third, and fourth floors, and contains ninety-six rooms on

the various floors, which are served by a stone staircase and by a Waygood passenger lift.

On each half-landing there are extensive ranges of water-closets and lavatory basins.

The whole of the floors are fireproof, and each room, with one exception, on each floor, has separate access to the corridor, as illustrated by the plan published.

The entire building is lighted by electricity.

The amount of the contract was 18,000l. The contractor was Mr. H. Lovatt, of Wolverhampton; and the architect, Mr. Delissa Joseph, of London.

NEW ROOM AT "THE WOOD."

THIS is a sketch of the interior of a new room forming part of some additions to an old house on Sydenham Hill known as "The Wood," now the residence of Mr. Alderman Newton. This room is 30 ft. square and about 18 ft. high, and is intended to be used as a billiard-room and also for music. It is lighted by two large windows on the east and west sides. Opposite the fireplace is a gallery approached on either side by stairs, the gallery communicating also with a group of rooms on the first floor.

The ribs of the ceiling, the cornice, wall-nings, stairs, gallery, and overmantel are of dark oak, executed by Messrs. Waller & Co.; the stone and marble fireplace was carried out by Messrs. Farmer & Brindley; the general building work was done by Messrs. John Allen & Sons. Mr. C. H. M. Mileham is the architect.

DRAWINGS FOR THE ROYAL ACADEMY.

As before, we shall be glad to take charge of and deliver at the Royal Academy any drawings sent to us in time to be photographed before the day of delivery, with a view to subsequent publication in this journal and in the "*Builder* Album of Royal Academy architecture."

We cannot accept any drawings sent to this office later than Saturday morning March 27, before 12 noon.

Architects sending drawings are asked to give special attention to the following requirements of the Royal Academy:—

1. All frames must be gilt.
2. Every drawing must have a label on the back, giving legibly the title and the artist's name and address.
3. Every drawing must have a similar label attached to the frame by a card so as to hang over in front.
4. Every drawing must be accompanied by a letter addressed to the Secretary of the Royal Academy, and signed by the artist, containing the artist's name and address, and the title or titles of the drawings sent. If more than one drawing is sent they must be distinguished by numbers, and the corresponding number must be repeated in the labels fixed to each drawing.

N.B.—We cannot undertake to supply or affix labels when omitted by the oversight of the sender.

ARCHÆOLOGICAL SOCIETIES.

LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.—The second winter meeting of this society was held on the 9th inst. at the London Institution, Finsbury-circus, when Dr. Freshfield occupied the chair. There was an exhibition of Roman and other pottery, &c., discovered during the past month in excavating the new Central London Electric Railway. Among other objects exhibited was a very beautiful and delicate goblet of Venetian glass, which is believed to be the most perfect specimen yet discovered in the City; it has a richly-moulded stem, and is probably sixteenth century work, and was discovered in an old well about 16 ft. below the surface. There were also two money-boxes of glazed buff ware, and a Delft plate beautifully painted in colours of blue, green, orange, and yellow; likewise a Bellarmine jug in glazed earthenware, minus the neck, but the body had an armorial medallion and shield and other devices. A three-legged pipkin, a two-handled tyg or loving-cup, and an engraved brass spur were also shown. All these relics are now located in the Guildhall Museum. Mr. E. H. Freshfield, hon. sec., also exhibited an old beadle's staff-head in silver, which had been lent to him from the Birmingham Assay Office. He said it was supposed to belong to the parish of St. Magdalene, Bermondsey, and would be returned to its proper owners. He read the Latin inscription in it. Mr. Deputy White proposed a vote of thanks to Mr. H. C. Richards, M.P., for his exertions and success in preventing the demolition of St. Mildred's Church, Bread-street, for the purposes of the City and West-End Railway. This was carried unanimously. The Rev. J. D. Mullins then read a paper on "The Parish of St. Stephen, Coleman-street; its Church and Records." The church of St. Stephen was first heard of in 1180, and was no doubt for some years a chapel-of-ease to St. Olave's, Jewry. In 1456 it became an independent parish, and the vicar was paid 117 per annum. Mr. Mullins produced several interesting church registers containing references to the devastations of the Plague in this parish, and drew attention to Dr. Freshfield's book containing exhaustive references to the history of the church since the Plague. This church was destroyed in the Great Fire, 1666, and rebuilt by Wren, as we now see it, in 1676.

SOCIETY OF ANTIQUARIES.—At the ordinary meeting on March 11, Dr. Edwin Freshfield, Treasurer, in the chair, Dr. Windle exhibited a collection of Neolithic flint implements found in the parish of Tardebigge, Worcestershire. Mr. A. Bullied read an account, illustrated by lantern slides, of the discoveries made during the past season in the late-Celtic lake village at Glastonbury.

Books.

A Handbook of Greek Sculpture. By E. H. Gardner. Parts I. and II. Macmillan, 1897.

WE specially recommend this handbook of Professor Ernest Gardner to our readers because of one distinctive feature which marks it out from the rest of the numerous handbooks and histories of Greek art constantly appearing. In his introduction—by far the most valuable part of the whole work—the author devotes a section to the materials and processes of Greek sculpture. These are matters too often neglected by the student, matters also in which the material for study is not very easily accessible. It is no uncommon case to find a student well posted up in the literary facts of his subject, in the statements of Pausanias, the art criticisms of Lucian, and yet ignorant or careless of, e.g., such matters as the distinction between the coarse-grained "island" marble and that which comes from Pentelicus, or again the bluish marble of Hymettus and the local Peiraos stone. Such distinctions as these, easy enough of detection once fairly and squarely pointed out, are the actualities on which the dating and classifying of ancient sculpture must rest, and yet for the simple reason that archeology has so far been treated as the "handmaid of literary scholarship," they have found no place hitherto in student's manuals. In the course of this introduction, Professor Gardner deals further in detail with such questions as the casting of a bronze statue, and the use of pointing from a finished model—questions usually relegated to the professional sculptor. How needful this sort of knowledge is is shown by the simple fact that an important fragment of the west pediment of the Parthenon lay for three-quarters of a century in the British Museum, undetected by generations of archaeologists, till a sculptor's eye restored it to its right position. Archaeologists need not and cannot become practical sculptors and architects, but, until they take the trouble to acquire some knowledge of the technical proceedings of both, they not only ignore valuable evidence but run the risk of writing nonsense intolerable to the expert.

We wish that we could say the remainder of Professor Gardner's book was half as interesting or as original in method as his Introduction, but, once the History fairly begun, it becomes heavy reading. It is, however, best to recognise at once that all the various faculties needed to make up the ideal author on a subject so composite as Greek sculpture cannot be found in one man. The author who delights in the details of technical procedure is pretty sure to flag in interest when he comes to the interpretation of monuments. The Introduction is so valuable that no student can afford to leave himself without the book, but in the "History" proper he will not find much that is new, and still less that in point of treatment is fresh or stimulating. We regret that Part II. was not delayed another year, which would have allowed the author to include, as he had originally intended, the sculptures from Delphi. The reliefs from the Treasury of the Siphnians and from the Boetians, not to mention the bronze statue of "Hiero," are so remarkable, in some respects so novel, that, once published, all books in which they are wanting must fall out of date. Professor Gardner thinks that pending their full publication by the French authorities it would be "rash to include them in a Handbook like this." In this he is true to his general principle; he has "attempted to confine himself to such facts or theories as have already met with general acceptance among archaeologists, or such as seem to rest upon evidence that cannot easily be shaken by new discoveries or future controversies." This confines the book within very narrow, if perhaps prudent, limits, and it certainly does "provide the student with a framework into which he can easily fit all the knowledge that he may acquire from subsequent reading and observation."

Beauty and Art. By ALDAM HEATON. London: W. Heinemann, 1897.

The book published under this attractive but rather high sounding title is not an essay on the higher æsthetics, but merely a small collection of essays or lectures on some points in connexion with decorative art: "Taste," "Beauty in Form and Colour," "Decoration of the House," "Fabrics," and "Furniture and decoration of the eighteenth century," being the subjects of the several chapters. The title of the book is therefore rather misleading; it suggests a treatise of a much more serious and philosophical kind. There are many things in it that one quite agrees with, but they are not new for the most part.

The most original point in the book is that which Mr. Heaton makes in regard to the contrast between a surface of a certain general colour in nature, and the same colour (so-called) as it is generally seen in manufactured materials; or rather, he is original in his method of illustrating the subject. He takes as an example from nature the bell-gentian as "about as crude a piece of violent colour" as one can find in nature. He examines this flower by small squares at a time, by means of a card pierced with the slits for the purpose, and shows that "in this startlingly blue flower not one half is coloured as a careless observer would suppose the whole to be. . . . The exceeding blueness of a gentian arises from the fact that all these greyish and partially blue and green tints lead up to the fierce blue of the lip; it is a splendid instance of the force of gradation, the blueness of the blue being all the bluer to our eyes because of the dullness of the other tints." Then he points out that a lady who has made up her mind to a bright blue dress buys the whole quantity of one tint.

The same examination is made of some other natural colours, with the view of showing practically that in nature colours are always gradated; the lesson being to avoid raw and crude expanses of colour. We may observe however, that some textile materials, though their actual colour when extended may be all the same, have the quality of making gradated tones when used in folds. One has only to recall Gainsborough's "Blue Boy," and how little blue pigment there actually is in it.

In the chapter on "Taste" we quite agree with the author in his view of the bad quality of French taste generally, and there is probably a good deal of truth in his conclusion that the low level of taste in France is largely due to the influence of mere fashion in women's dress, which extends its baneful influence to other things, and leads people to consider taste in design only as a matter of novelty in fashion. The contrast between the English country house, "inartistic for the most part, but unpretentious" (not always), and the modern French house, is not a bit too strong. The modern French "maison de campagne" is one of the most detestable kinds of erection to be met with in the whole history of architecture (if it can be called by that name).

In the chapter on "Eighteenth Century and Furniture and Decoration" the general reader may find some useful truths in regard to the much overrated name and productions of Chippendale, who has become latterly a fashion with people who have nothing to guide them but fashion.

Spon's Architects' and Builders' Price Book, with Useful Memoranda and Tables. By W. YOUNG, Architect. Twenty-fourth Edition. London: E. & F. N. Spon, Limited, 1897. Pp. lxxi., and 416.

THIS is a rival of "Laxton's Price Book;" younger, indeed, but still old enough to have lost some of its pristine freshness. The "useful memoranda" on "Drains and Sewers" are a generation old, and permit rain-water pipes to be used for drain-ventilation, while they make no mention of iron drains, disconnecting traps, and inspection chambers, flushing tanks, and other details now considered "useful" by sanitarians. The memoranda on "Girders" also reveal their antiquity, larger sections of joists being now rolled than are given in the tables, and more economical forms of girders being used than that shown in fig. 28. Under "Columns," some useful information on cast-iron columns and stanchions is given, but steel stanchions are not mentioned. May we ask what "useful" purpose is served by the inclusion in a "price-book" of the dimensions of cathedrals, illustrations of Gothic mouldings and the Five Orders, and the symbols of saints? Would it not be as well if the space given to these and other extraneous matters were occupied by the prices of bath-boilers, copper cylinders, wet gas-meters, iron drain-pipes and soil-pipes of various weights (glass-lined and otherwise) with bends, junctions, traps, &c., gas-fittings (incandescent, regenerative, ordinary, &c.), blocks of artificial stone other than paving, salt-glazed bricks and sinks, special fire-resisting floors and partitions, and other details of building construction, for which architects and builders may now search the price-book in vain? Surely the quotations for D-traps and small brick drains might now be spared. In the next edition we hope that the disorder which has gradually developed throughout the book will be greatly reduced, if not entirely removed; e.g., prices of enamelled bricks appear in four different places, 173 (not 174, as stated in the index), 183, 184, and 393; and Westmoreland slates at pages 205 and 393. Many of the prices in the book are very high. The "prime cost" of Portland cement "at works" is certainly not 36s. 6d.; this price includes for 10 or 11 bags, for each of which an allowance of one shilling will be made on its return, and even after allowing this, the price is too high.

Our intention is not to condemn the book but to improve it. It possesses several excellent features and contains much useful information, but more care in revision must be exercised and greater assiduity displayed in trying to keep the book up-to-date, if it is to be of much use to those persons for whom it is intended.

TRADE CATALOGUES.

MESSRS. LONGDEN & CO. (Sheffield and London) send us their illustrated supplementary catalogue of grates, fenders, &c. Most of these are of an ornamental character, and we have pleasure in recommending them for the general good taste shown in the designs, and the perception which they show as to what can and cannot be done in cast iron work; a praise which unhappily one can very rarely give to catalogue illustrations of this kind. With the cast work there is combined a good deal of hammered work

* On page 163 we are told that "a reliable price cannot as yet be given," but this is one of the sentences that need revision.

in brass and copper, and there is nothing florid or over-done in any of the designs. Architects who wish to select grates in stock may be recommended to this catalogue. It includes also an illustration of a ventilating radiator with air tubes for heating by convection.—Messrs. Messenger & Co. (Loughborough and London), send us their catalogue of conservatories and glass houses generally, with illustrations of a number of houses built by them. The book is, however, more than a mere catalogue, as it contains a good deal of practical information in regard to the construction of conservatories, the points to be specially attended to, &c. Messrs. Messenger appear to abide by the old system of puttied glass, and give their reasons, which are worth consideration, though they may not be entirely convincing.

Correspondence.

To the Editor of THE BUILDER.

CARDIFF ARCHITECTURE.

SIR,—I notice in the *Builder* of the 13th inst., illustrating Cardiff, that the two banks for the County of Gloucester Banking Company are described as being the work of Mr. Pickwell. I beg to inform you that these buildings were carried out by the firm of Jacobs & Pickwell, architects and engineers, and that the designs and the whole of the drawings, specifications, and quantities were done by me. This applies also to all other architectural work done in Cardiff, Penarth, and neighbourhood by the firm of Jacobs & Pickwell. I may add that Mr. Pickwell is a civil engineer. I shall feel obliged by your referring to this in your next issue. B. S. JACOBS.

Hull, March 16, 1897.
* * * The mistake, if it be one, is not our fault. Our representative saw Mr. Pickwell, who did not give any other name than his own in connexion with the buildings.—ED.

COLLECTING AREA FOR A RAINWATER TANK.

SIR,—I wish to know what is the best and cheapest covering for a large area—say 1,000 square yards—with the idea of catching the rainfall on its surface and storing the water for use. In this instance it is intended to assist the supply of water for stock on a farm where water is otherwise only obtainable from a well 250 ft. deep. The labour of raising sufficient water from this well for a large number of cattle is consequently enormous. It is usual in such cases to cover a considerable area of the side of a hill or slope with some kind of pavement, and to collect the rain falling on this in a large tank. The "catch" or area covered in this instance is on the side of a chalk hill. The chalk is on the surface. The best covering I can think of is a layer of tar pavement or asphalt 1½ in. thick; but I am afraid this pavement would destroy itself by its expansion and contraction. The only check to this would be by inserting ½ in. wood slips at intervals of 6 ft. to take the expansion and then this would necessitate making the site of comparatively even gradient. I should be glad to hear the experience or views of any of your readers. I should also be glad to know what would be the best composition of a tar or asphalt pavement such as I propose.

HOMO.

"SKETCHES OF LONDON STREET ARCHITECTURE."

SIR,—I have no wish to encroach on your space, as Mr. Wade has done, with matters of purely personal interest, but it is obvious that I cannot let the matter rest as it is. It is quite true I was a "paid assistant" in his office at the time, but he has omitted to state that I was carrying on a private practice with his consent.

Mr. Wade's statement, "a few months ago I found it necessary to dismiss him," is contrary to the facts, which are as follows:—On October 27 of last year, while I was away from town on Mr. Wade's business, a private letter of mine from a client was opened and answered by my principals, to the effect that the said letter had been addressed in error to their chief draughtsman, and that they would undertake the work. Naturally, I at once gave Mr. Wade notice, on receipt of which he sent me a letter of dismissal.

That I was architect of the house in question is proved by the following facts:—1. I designed and detailed the house entirely in my spare time. As compensation for time spent in necessary supervision during office hours, I obtained 40l. for Mr. Wade from my client. 2. Accounts and certificates for this work were signed by me. 3. In the documents prepared for the purposes of a law suit, which was pending between my client and the builder, I am referred to as architect.

J. LEONARD WILLIAMS.

The Student's Column.

SPECIFICATIONS.—XII.

HOT WATER FITTER.

HERE are two distinct branches of work which come under this heading. First, the supply of hot water to be laid on for use; and second, the provision of heating apparatus, in which the hot water is used simply as a means of transmitting heat. Attempts have sometimes been made to combine these two functions in one apparatus, but the result has never been entirely satisfactory; and it is far better to keep the two distinct, each with its separate arrangement of pipes, &c.

We will therefore give examples of methods of specifying the works for the two different purposes.

In the supply of hot water for domestic purposes there are two opposing systems, under one or other of which various installations are generally classed. First, the cylinder system, which is certainly the safer and most generally adopted; and second, the older tank system. We will commence with the specification of the work required for domestic purposes with the former system.

Hot Water Supply.—The hot water supply to be fitted up on the cylinder system in accordance with the following details, and is to be tested to the satisfaction of the architect before being approved:—

Boiler.—The boiler is to be a welded wrought-iron hot boiler, ½ in. metal, to hold gallons, properly set on fire-bricks to form flue under and at back of same and is to be provided with two manholes, with cast-iron plates and screws. Particular care is to be taken that the manhole covers are absolutely watertight.

Cylinder.—The cylinder is to be a galvanised wrought-iron hot-water cylinder to hold gallons, of ½ in. plate, with wrought-iron manhole plate bolted over the manhole with gun-metal bolts, tapped and screwed with inside strengthening plate (or if preferred an elliptical plate with external iron bridge piece may be specified). The cylinder to be fixed in kitchen in position where directed on strong T iron brackets built into the wall. The cylinder is to be enclosed with ¾ in. polished mahogany lagging leaving a space of 2 in. clear between the cylinder and lagging, which is to be filled with slag wool. The lagging to be secured with brass hasins 1½ in. wide tightened up with screws. Top and bottom of cylinder enclosures to be ¾ in. polished mahogany with rounded nosing.

Pipes.—All the pipes for hot-water work to be wrought welded steam-pipes, each to be fixed to stand 1 in. free from wall and supported on neat brackets of wrought-iron, screwed to blocks plugged to the wall, provision being made for expansion and contraction. No elbows are to be used, but bends on an easy sweep. Branch pipes in all cases to have a bend next to T union. The circulating pipes between boiler and cylinder to be 1½ in. pipes, the main circulating pipes 1¼ in., the supply to bath to be 1 in., and to the lavatory basins and sinks ¾ in.

In fitting pipes to boiler and cylinder special care is to be taken that the boiler is fixed level, and that no pipes project into the interior of either the boiler or cylinder. The boiler is to be tapped and screwed for pipes which are to have back nut screwed on outside. The connections of pipes to cylinder are to have bosses riveted on for screwing to pipe. The arrangement of pipes where connected to cylinder to be carried out as sketched in margin.

Safety Valves.—The boiler is to be fitted with a dead weight safety valve of approved pattern, arranged to open under pressure of lbs. to the inch. (The pressure will be, of course, arranged to suit the head of water in each case.) We now proceed with the specification of work for hot-water supply on the tank system.

Hot-water Supply.—The hot-water supply to be fitted up on the tank system in accordance with the following details, and is to be tested to the satisfaction of the architect before being approved.

Boiler.—The boiler is to be a welded wrought-iron saddle boiler ¾ in. metal to hold gallons; properly set on solid base of firebricks with flue carried up to back of same, and is to be provided with manhole on top with cast-iron plates and screws. Particular care is to be taken that the manhole cover is absolutely watertight.

Tank.—The hot-water tank is to be a galvanised wrought-iron tank, to hold fifty gallons, of 14 E.W.G. thickness, with wrought-iron manhole

and plate bolted over the manhole. The tank to be placed in where directed on strong T iron brackets built into the wall. Fit up the supply to same with cast-iron cistern and cover, size 15 in. by 7½ in. by 10½ in.

Pipes.—All the pipes for hot-water work to be welded steam-pipes, each to be fixed to stand 1 in. free from wall, and supported on neat wrought-iron brackets, screwed and plugged to the wall, provision being made for expansion and contraction. No elbows are to be used, but bends of an easy sweep. Branch pipes in all cases to have a bend next to T union. The circulating pipes between boiler and tank to be 1½ in. pipes, the supply to bath to be 1 in., and to lavatory basins and sink ¾ in. The supply pipe from cold-water cistern to feed cistern to be 1½ in., with full way brass ball valves with copper ball. The pipe between the cistern and hot-water tank to be also 1½ in., and to have the necessary dip below hot-water tank. The overflow from cistern to be 1½ in. with full way brass screw union. In fitting pipes to boiler special care is to be taken that the boiler is fixed level, and that no pipes project into the interior. The boiler is to be properly tapped and screwed for pipes which are to have back nut screwed on outside.

Safety Valve.—The boiler is to be fitted with dead-weight safety-valve, of approved pattern, arranged to open under a pressure of lbs. to the square inch.

We can now take some examples of the method of specifying work for hot-water heating. These may be carried out on either the low-pressure system or high-pressure system.

Heating Apparatus.—The heating apparatus to be fitted up on the low-pressure system in accordance with the following details, and is to be tested to the satisfaction of the architect before being approved.

Boiler.—The character of the boiler will depend upon the amount of work which it is required to do, and may vary from a small wrought plain welded saddle boiler to a large Lancashire or Cornish tubular boiler.

Pipes.—The pipes generally used are either 4 in. cast iron or 3 in. wrought iron. The specifications should stipulate which is to be used, and should specially provide that the size of pipe mentioned, whether 4 in. or 3 in., is to be internal diameter, and that pipes are not to be less than specified diameter. Also the weight per yard run should be given, which may be, say, 30 lbs. per yard for 4 in. cast iron pipes. Cast iron pipes would generally be used only where the pressure is moderate, say, up to 25 ft. head of water, for the sake of the joints.

Joints.—Specifications should state what kind is to be used, whether socket joints or flange joints, such as Jones's improved flanged pipe joints, or Jones's improved expansion joints, which are some of the best up to a head of about 25 ft. of water.

Valves.—Enumerate the valves required; state their position, and describe whether throttle valves, screw-down valves, screw slide valves, or (if wrought-iron pipes) gun-metal valves.

Feed Cistern.—Feed cistern to be a cast-iron cistern (state size, which would vary with the amount of pipe, as it will serve for expansion cistern. Of course, the greater the length of pipe the more expansion must be provided). Feed cistern should have 1 in. supply from cold water cistern with full way gun-metal ball valve and copper ball, and 2 in. overflow with full way gun-metal screw union.

In specifying work for the high-pressure system of heating, the architect must determine whether expansion tube is to be used, which is the better where a very high temperature is required in the pipes, or whether a relief valve is to be employed instead, which admits of the apparatus being worked at a lower pressure, and consequently a lower temperature, and under these circumstances has many advantages. The specification might run thus:—

Heating Apparatus.—The heating apparatus of to be fitted up on the high-pressure system according to the following details, and is to be tested to a pressure of lbs. to the square inch, to the satisfaction of the architect before being approved. The pipes are to be ¾ in. bore welded steam barrel, ft. of which is to be coiled round furnace for heating. The furnace to be built in fire bricks, one and a half bricks thick, domed over at top with ft. super of fire-bars, and the necessary furnace-doors, dampers, flue and soot doors. Specify the size of expansion tube, which will depend upon the amount of pipe. The expansion for a temperature of 300 deg. is 1/10th quantity of water in the

whole apparatus. This amount, of course, must be increased for a higher temperature or decreased for lower. Specify the position of filling tube with its cap, and any stop-cocks required.

GENERAL BUILDING NEWS.

ST. GEORGE'S CHURCH, BLOOMSBURY.—On the 12th inst., a meeting of the parishioners of this church and others was held in the Vestry-hall of the parish, the Rev. A. B. Boyd Carpenter, presiding. From a statement made by him, and endorsed by Mr. C. Fitzroy Doll, the architect who has been consulted, and who has made a thorough examination of the fabric, it appears that the necessity for considerable repair is urgent. The stonework is decayed and dangerous, and the lead roof is faulty and admits water—as may be seen from the inside—in many places. The inside is exceedingly dirty, and whilst repainting it is proposed to add little or much (as funds allow) of what may be called decoration. The cost of repairs and some decoration is estimated at least 5,000*l.* This sum the meeting pledged itself to endeavour to secure. Subscriptions may be sent to the London and Westminster Bank, 214, Holborn, or the senior churchwarden, Mr. T. H. D. Berridge, 49, Rutland-gate, S.W.

PARISH CHURCH RENOVATIONS, KINGSWOOD, BRISTOL.—At a public meeting held on the 18th inst. it was decided to carry out the plans for the full scheme of the Parish Church renovation prepared by Mr. E. H. Lingen Barker, of London and Hereford. The scheme embraces practically new nave, aisles, chancel, organ chamber, and two porches, and new floors and fittings. The floor of the western tower will be utilised as a choir vestry. The accommodation is for 675 worshippers. **WESTMINSTER OF CORPORAION BATHS, ABERDEEN.**—On Monday last the Aberdeen Town Council resolved to extend the bathing-station at the sea beach at a cost of about 6,000*l.*, according to plans by Mr. John Rust, jun., City Architect. The additions include a swimming-pond, 100 ft. long and 40 ft. wide. The pond is to be placed under the present ground level to the south of the existing pavilion, and will be constructed at such a level as to fill by gravitation at high-water and discharge at low-water. The roof will be formed on steel girders and concrete arches, with cupola lights on the top above the level of the ground, and seats round the cupolas to protect them. There will also be twelve additional plunge baths, making twenty-eight in all. A proposition to add a suite of four rooms for Turkish baths was dropped.

BROAD SANCTUARY CHAMBERS, WESTMINSTER.—This block of offices, now approaching completion, is being executed for the directors of the Westminster Palace Hotel Company, at a cost of 10,000*l.* Messrs. L. Whitehead & Co. are the contractors. The fireproof floors have been supplied by Messrs. Homan & Rodgers; the heating and plumbing is carried out by Mr. William Dodds; the electric lighting by Messrs. Edmundson; the lifts by Messrs. Easton, Anderson, & Golden; and the iron-work by Messrs. Starkie, Gardener, & Co.

MISSION HALL, ABERDEEN.—Plans have been lodged with the Burgh Surveyor for mission premises proposed to be built in West North-street for the Belmont-street Congregational Church. Messrs. B. & W. Architects.

CONSERVATIVE CLUB, HEATON PARK, NEAR MANCHESTER.—On the 11th inst. the first sod was cut on the site of a new club-house which is to be erected in the Heaton Park district of Prestwich. The building, which is from the plans of Mr. Lodge, architect, will cost about 1,000*l.*

MISSION CHURCH, VRON, DENBIGH.—A new mission church was recently dedicated by the Bishop of St. Asaph at Vron. The church, which is dedicated to St. Alban, has been built of red brick. It is in the Romanesque style. The east end has a semi-circular apse. The roofs are covered with blue slate, capped by red ridges. Internally the church consists of nave 50 ft. by 26 ft. 6 in., chancel 16 ft. by 26 ft. 6 in. The porch is on the south side, and a vestry, with a sitting chamber under, on the north. A roof screen and roof of pitch pine extends the entire width of the west end of the chancel, and screens of similar design are placed to the north and south side of same, over the latter of which it is proposed to ultimately construct a small organ loft. The chancel stalls are also of pitch-pine, whilst inside the rail the altar is of painted English oak covered with a stone slab, and a small credence table and re-table of grey stone are fixed. The curved roof of the apse is plain, plastered with a view to future decoration. The church has been designed by Mr. Howell Davies, architect, Wrexham, and carried out by Messrs. Thomas Rogers & Son, builders, Brynbo.

NEW OFFICES FOR ABERDEEN PARISH COUNCIL.—The Aberdeen Parish Council have adopted the report of the Works Committee recommending the erection of new offices for the Council in Union-terrace. Plans have been prepared by Mr. A. Marshall Mackenzie, A.R.S.A. The structure will have a frontage to Union-terrace of 68 ft., and the front elevation will be 55 ft. from the street level. In the basement floor charter-room accommodation will be provided, and provision made for cellarage

and heating apparatus. The ground floor is entered from Union-terrace by a flight of four steps. To the right is the chief inspector's room, orphan inspector's office, and clerks' room; while to the left are situated the office of the first assistant inspector, the strong-room accommodation and rooms for the outdoor inspectors, medical officers, &c. On the first floor is a collectors' office, a room for the Sheriff-officer, cloak-rooms, and a store for the clothing required for the outdoor poor, and a small committee room. The Council chamber, which measures 48 ft. by 36, is on the second floor. There are a chairman's room, cloak-rooms for ladies and gentlemen, and a committee room immediately adjoining the Council Chamber. The elevation to Union-terrace will be of grey granite. Exclusive of furnishings the offices are estimated to cost 6,000*l.*

BAPTIST CHURCH, CHISWICK.—A new Baptist church in Annandale-road, Chiswick, has just been opened. Accommodation is provided in the church for 493 adults, or for a mixed congregation of 625 persons, and in the schools and classrooms for 300 children. The buildings consist of church, assembly room, two vestries, and five classrooms, with lavatories, dressings, and the internal fittings are of pitch pine. The architect was Mr. John Wills, of Derby, and the builders Messrs. Steward & Son, of Wallington.

CHURCH EXTENSION, NEMPNETT, NEAR BRISTOL.—On the 10th inst., the parish church at Nempnett was reopened after alteration, &c. The church as it existed before the recent alterations had a chancel communicating with the nave by a pointed arch, and having in its east wall a single coloured window with "The Resurrection" as its subject. The scheme just completed has involved the removal of the chancel with the arch, and has resulted in the creation of a larger chancel, carried up to the height of the nave, but separated from it by a carved roof-screen. Besides this, on the north of the new chancel, has been built a side chapel, or vestry. In the erection of this vestry a large part of the stone of the old chancel has been used; the archway which joins it to the chancel is the old chancel arch again set up. The new chancel is built of local stone. Dundry stone has been used as dressings. Two side lights have been added to the east window, the subject of one being Moses uplifting the serpent, and that of the other Abraham about to offer up his son Isaac as a sacrifice. The alterations have been carried out from the designs of Mr. Buckle, by Mr. John Flower, Diocesan Architect.

OFFICES, LANCASHIRE INSURANCE CO., BIRMINGHAM.—New offices for the Lancashire Insurance Company have just been erected at the corner of Bennett's Hill and Waterloo-street. The architect is Mr. J. A. Chatwin. The site is that formerly occupied by the Inland Revenue Office.

LYCEUM THEATRE, SHEFFIELD.—Plans for the alteration of City Theatre, Tudor-street, Sheffield, have been prepared by Mr. W. G. R. Sprague, of London. One of the chief external alterations of the theatre (which is to be called the Lyceum) will be at the corner of Arundel-street, where a tower will be erected. The main entrance will be at this point, and near will be a crush-room. The frontages abutting on Tudor-street and Arundel-street will be treated with Portland cement. The present exits will be retained, and in addition several others constructed. The construction of the auditorium will be of steel or iron, encased in concrete. The main roof over the auditorium will also be of steel or iron and concrete, overlaid with asphalt, and the new floors will be of similar construction. In the new entrances, exits, and corridors, granite-cement will be used, and the staircases will be of ample width, and arranged so that there will be no necessity for winders. The building is to be fitted throughout with electric light, in addition to gas. Retiring-rooms for ladies and gentlemen, as well as lounges, will be provided on each floor. The pit lounge will be in the basement. The ground-floor will be laid out for the pit proper and pit-stalls, the stalls being approached from the dress-circle entrance. The pit will have separate entrances and exits. The stalls are to accommodate 112 persons, and the pit 550. The circle is to be divided, the front portion being the dress-circle proper, and containing 142 seats. The back part, which will have a separate entrance, will be known as the balcony, and will seat about 160 people. The gallery will be entirely re-arranged. It will be capable of accommodating 650 persons. The private boxes will be made to seat 32 persons. The crush-room and principal vestibules will be at the Arundel-street corner of the building. Outside the theatre a covered glass awning is to be erected at the central entrance, and also at the side entrance in Arundel-street. The cost of the alterations will be about 15,000*l.*

CHAPEL, HAZEL GROVE, CHESHIRE.—On the 8th inst. the new Primitive Methodist Chapel, London-road, Hazel Grove, was opened. The building is of brick, with stone facings. The interior of the chapel is 60 ft. long and 30 ft. wide. A portion has been partitioned off for use as a Sunday school or for meetings. The executors of the late Mr. Wild were employed to carry out the building work, and Messrs. Pierce, of Stockport, were the architects.

INKPEN CHURCH, HUNGERFORD, BERKS.—The ancient church of St. Michael and All Angels at Inkpen, which has been in the hands of the

restorers for over twelve months, was recently reopened. The works have been carried out by Messrs. George Elms & Son, contractors, of Benham, Newbury, under the direction of Mr. Clapton Crabbe Rolfe, architect, of Oxford, and formerly of Reading. The new carved oak roof screen has been constructed almost entirely of oak grown upon the estate at Inkpen. This work is by Messrs. Harry Hems & Sons, of Exeter.

WESLEYAN CHAPEL, MOUNTSERRREL.—The memorial stones of the New Wesleyan Chapel at Mountserrrel were laid recently. The church is placed 30 ft. back from the road, and is 52 ft. by 31 ft. 4 in. inside and 38 ft. 7 in. across the transepts. It will seat 265 adults, or a mixed congregation of 350 persons. In front there is an outside porch. At the rear there is a chancel and an organ chamber. There are also porches connecting the church with two vestries. The church is built of brick, and the front is faced with granite. The schoolroom is at the rear of the church, 40 ft. by 26 ft., and will seat 200 children. There is also a class-room and infants' room, and provision for extension by the addition of nine rooms. The architect is Mr. John Wills, of Derby, and the builders are Messrs. Scurr, Jowett, & Co., of Barrow-on-Soar.

NEW SCHOOLS, BIRKENHEAD.—At the last meeting of the Birkenhead School Board Mr. T. W. Cuthbert, of Birkenhead, was appointed architect for new school buildings to be erected in Well-lane, at the south of the borough.

HOSPITAL, ARMAGH LUNATIC ASYLUM, IRELAND.—The new detached hospital at Armagh Lunatic Asylum is planned to accommodate one hundred and fifty patients under special treatment, together with the necessary attendants and staff. The general arrangements of the buildings are, viz.:

—A central block, arranged for administration, with apartments for officer in charge; visitors' rooms (male and female), a dining-room in the centre, with kitchen, servery, scullery, stores, &c., &c. From this central block there are corridors, 17 ft. wide, extending right and left to the wing buildings, which are at the east and west extremities. From the north walls of these corridors are communications with the bathrooms, lavatories, linen closets, storerooms, shoerooms, and sanitary conveniences; also a stair to each wing, leading to the dormitories and rooms on the first floor. The wing buildings are situated at the extremities of these corridors and day-rooms. Extending towards the south are infirmary day-rooms and dormitory combined, for the reception of patients who are too weak to move from their beds. Extending towards the north of the wing buildings are a number of single rooms, a padded-room for each wing, and an associated dormitory on the ground floor for epileptics. At the extremities of each of these male and female wing buildings there is a small separation hospital ward, with nurses' quarters, &c., all isolated from the rest of the buildings. Armagh limestone has been used for external walls and ashlar works. All the outside walls have brick lining, and a hollow space between the main wall and the brick lining. The staircases are all fireproof and with concrete steps, fitted with Mason's treads. The ventilation and heating is arranged by Musgrave & Co. on the plenum system. The buildings have been carried out by Messrs. McLaughlin & Harvey, of Belfast—from the plans and under the supervision of Messrs. J. J. Phillips & Son, Belfast.

NEW CHURCH, DARNCONNAH, AVRSHERE.—The new church at Darnconna, in Achninleck Parish, has just been opened. The church has been built from designs by Mr. R. S. Ingram, Kilmarnock, and is in the Gothic style. The outside walls are of Ballochmyle red sandstone, while inside white Kilwinning stone has been used. The interior has an open timber roof, and is heated by means of hot-water pipes. There is accommodation for about 300 worshippers. A manse adjoins the church. The whole building cost about 3,000*l.*

SANITARY AND ENGINEERING NEWS.

WATER SUPPLY, MILVERTON.—These works were opened on the 1st inst. They were designed by Messrs. Taylor & Crimp, of Westminster, the contractors being Messrs. Tabor & Hinchcliffe, of Cambridge.

SKELTON AND BROTTON SEWERAGE.—At a recent meeting of the Skelton and Brotton Urban District Council it was reported by the engineer that the scheme of main sewerage and sewage disposal had been completed by the contractor, Mr. J. Carrick, of Durham, within the time allowed by the County Court order. About twelve months ago an injunction was obtained from the Court by the Saltburn Urban District Council to prevent the pollution of the Skelton Beck, which flows through the pleasure gardens at Saltburn. After an inquiry by the Local Government Board by the late Mr. W. J. B. Clerke, M.Inst.C.E., whose sanction to a loan of 15,000*l.* was obtained, a start was made with the work which is now completed. The scheme is from the design of Mr. D. Balfour, M.Inst.C.E., of Newcastle-on-Tyne, and comprises about ten miles of 24, 18, 15, 12, and 9-in. freelay and cast iron pipe sewers, with manhole and lamp-hole shafts, automatic flushing chambers, cast-iron valley crossings, &c. The freelay pipe joints are made partly with Hasall's patent water-tight joint, and partly

with gaskin and cement. The work consists of a combined intercepting scheme for carrying the whole of the sewage from the ten villages in the district, which have a population of 10,000, to a point at the top of the cliffs on the coast at Cranedale Spout, where the cliffs, 200 ft. in height, have had a tunnel driven, with a gradient of one in two from the beach to the top of the same, and lined with bricks, in which are laid cast-iron pipes, connected by easy bends to the outfall sewer on the beach, which is carried 700 yds. out to sea. This sewer is of cast-iron, laid in a trench in the rock on the beach and embedded in concrete, cast-iron inspection chambers being placed on the outfall, and indicated by means of cast-iron posts. A large number of float experiments were made to ascertain the proper point of discharge, so that there could be no nuisance from reflux sludge, and ultimately a point to the north-west of Huntcliffe promontory, 700 yds. from the cliff, was decided on, being at extreme low water, and where it is found the sewage at all states of the tide is carried out to sea. The work has been completed for less than the engineer's original estimate.

PAIL & WATER CARRIAGE SYSTEM, CHORLEY.—On the 9th inst. Mr. E. P. Burd, Inspector of the Local Government Board, held an inquiry in the Chorley Council Chamber with regard to an application of the Council for a provisional order for sanction to borrow 10,000l. for purposes of converting the present pail system of closet accommodation to that of the water carriage system, and to so alter or amend the Chorley Improvement Act of 1871 as to enable them to do so. The Town Clerk (Mr. Wills) stated that the total indebtedness of the borough was 116,650l., and the population was estimated at 25,000. He pointed out what had been done by the late Board of Commissioners, who adopted the pail system, and stated that application was made in 1890 to form a control depot for excreta in water, to obviate the vans going through the town, but it was refused by the Local Government Board, who recommended the adoption of the water carriage system. The Corporation, acting upon that recommendation, and under pressure from the County Council, spent 16,000l. in sewage precipitation works. The removal of the pails weekly cost 1,300l. a year, and the same amount to carry on the sewage works, and it was with the object of saving half that and for improving the sanitary condition of the borough that the Council decided upon the conversion. They offered to do the work of connexion with the sewers if the owners of property found the material. Councillor J. W. Stone spoke of the advantage that would accrue to the town. The Borough Surveyor and Medical Officer also gave evidence. Mr. Kellville, solicitor, appeared for a number of property owners, and called evidence in opposition to the scheme, as being one of a most expensive character, and likely to prove ruinous to many owners of old cottages.

SEWAGE DISPOSAL, WORCESTER.—For the premiums offered by the Worcester City Council for the best scheme of sewage disposal for the city, there are twenty-two competitors who have sent in designs and plans, and these are now under examination by Mr. Chatterton, the assessor appointed by the Council.

LOCAL SEWERS, LONDON.—The Main Drainage Committee of the London County Council have sanctioned, subject to a condition recommended by the Engineer, the construction of local sewers as follows:—Hampstead: 750 ft. of 12-in. pipe sewer in proposed new road, between Haverstock Hill and Lawn-road. Fulham: 950 ft. of 12-in. pipe and concrete sewer in proposed new road, to be called Fitz George-avenue, between Auril-road and North-end-road. Plumstead: 80 ft. of 9-in. pipe sewer in Kirk-lane, 230 ft. of 12-in. ditto in Palmerston-road, and 200 ft. of 12-in. ditto in Plum-lane. St. Saviour's: 420 ft. of 12-in. pipe and concrete sewer in Park-street.

FOREIGN.

FRANCE.—The ancient church of St. Pierre on Montmartre is to be demolished in a few weeks, on account of the dangerous condition of the building. It is to be replaced by a new church, of which M. Baudot will probably be the architect. The New Salon will open this year, at the Champ de Mars, on April 23, and close on June 30. The old Salon will open on April 25, at the Palais de l'Industrie. A certain number of the painters who call themselves "Symbolists," most of whom have already taken part in the "Rose Croix" exhibitions, have organised, at the Georges Petit Gallery, a special exhibition under the title "L'Électrique," among the members are MM. Assolant de Bontevre, Maurice Chabas, and Darras. The sale of Chinese and Japanese *objets d'art* from the Goncourt collection has realised 236,676 francs. The total amount realised from all the departments of the sale was 1,162,952 francs. At Versailles the Salle des Etats Généraux, which has been closed for many years, has just been reopened to the public. There have been placed there, among other works, the "Combat de la platière" by De Neuville, and the "Charge de Reischolien" by M. Aimé Morot. There is also to be seen there a picture hitherto unknown to the public, representing the interview between Napoleon and the Emperor Alexander on the Niemen.

The exhibition of models for the monument to Pasteur which is to be erected at Dôle is now open in the foyer of the theatre there. Fifteen designs have been sent in. The bell-tower of the church at Montprimal, near Bourdeaux, has been blown down in one of the recent gales. The Department of Fine Arts has addressed a circular letter to all the Prefects of Departments in reference to the repair of works of art which have been placed by the State in the various provincial museums. As a good deal of mischief has been done by incompetent repairs or restorations, the Department from this time will take all such work under its own direction; the municipal authorities and curators of museums are to confine themselves to notifying to the Government what repairs are wanting to any works in their charge. The French Government is about to establish a railway in Madagascar.—It has been decided that the statue of Beaumarchais, the work of M. Clausade, is to be inaugurated on April 27, the anniversary of the first representation of "Mariage de Figaro." The monument erected at St. Maurice to the memory of Delacroix is to be inaugurated in May next.

GERMANY.—According to the report of the Association of Ground Landlords at Berlin there has now been a considerable increase in the building activity throughout the capital, whilst the number of houses and tenements standing empty has decreased. There has been too large a supply in comparison with the demand for tenements during the last few years, but this has now been remedied.—The national memorial to Emperor William will be practically ready for the celebration at the end of the month.—The new General Post Office at Berlin is now almost complete, the galleries to be devoted to the Post Office museum are also ready for the hands of the builders. The collections will be housed in a large central hall surrounded by galleries. Plans and elevations of the leading post-offices throughout Germany will be exhibited.—The new "Potsdamer" bridge at Berlin is to be taken in hand at once, and the plans have been laid before the Emperor.—The new models for the Helmholtz monument are now exhibited at Berlin. The selection for the commission rests between the sculptors Herter, Otto Lessing, and Janensch.—Further important improvements are to be made on the west façade of the Royal castle at Berlin, and Professor Otto Lessing has been commissioned to execute a number of historical semi-reliefs for panels which are empty at present.—The memorial church to Emperor William, which was inaugurated in Berlin with considerable ceremony, was not complete on that occasion. Various pieces of sculpture are now being prepared, and these will be put in position shortly. Among the more important works will be statues of Luther and Melancthon, by Professor Otto Lessing.—The *National Zeitung* of Berlin has published an important article on competitions for monuments, as the many competitions for memorials and monuments are giving rise to serious complaints among artists generally. Sculptors in Germany consider that the expense connected with the preparations of large-sized models is quite out of proportion to the premiums generally offered, and it is proposed to increase the number of premiums considerably above the three or four now generally given. Elaborate street decorations are to be made in connexion with the festivities which will take place at Berlin on the anniversary of the Emperor William's birthday, and the City Architect, Herr Ludwig Hoffmann, has been entrusted with the supervision of this work.—A number of improvements are to be made on the thoroughfare to be taken in hand is from Schoeneberg to Steltzig. A broad avenue is to be formed with a roadway 65 ft. wide. The cost of the improvement is 20,000l.—The Arts and Crafts Museum at Berlin is repeating its very practical arrangement of organising a special exhibition of objects obtained during the last six months.—A number of minor competitions have been opened in connexion with the Horticultural Exhibition at Hamburg, which will be held this year. Premiums will be offered for the best designs for garden furniture, verandah fittings, flower-boxes, &c., with the view of encouraging better taste in connexion with gardening.—Altona, near Hamburg, is to have a new museum, and a number of premiums have been offered in connexion with the competition to be held for the design. There will be four premiums of 150l., four of 100l., and two of 50l.—We understand there will be a machinery exhibition at Munich during 1898, and a competition has been held with a view of obtaining suitable designs for laying out the grounds and erecting the necessary preparations on the banks of the River Isar.—Government are already being made by the German Government for a thoroughly representative collection at the Paris International Exhibition of 1900. One of the first committees formed is that of the Arts and Crafts section, and all the leading men connected with the Arts and Crafts movement have been elected to serve, including Baurath Ihne, Baurath Heydn, Baurath Kyllmann, and Herr Hoffacker, among Berlin architects.—The premium known as the Schinkel Studentship has been awarded to Mr. Hausmann. There were sixteen candidates, and the subject was "A County Hall." Three designs were also honourably mentioned. The

subject of the Engineers' Competition arranged under similar auspices by the "Arkitekten Verein" was "A Local Railway," and the premium has been awarded to Mr. Schimpf.—Active preparations are being made in Berlin for the ceremonies which will be held during the next few days, and particularly for the celebration on the 22nd. Nearly all the public bodies are commemorating the event in some particular form, and the Academy of Arts will hold a special public meeting on the 20th, on which day the Art Exhibition, representing the work of the last hundred years, will be opened. On the 22nd inst. there will be a great popular procession, for which the central feature will be a triumphal car representing "Germania." On the 23rd inst., we understand, there will be a further small historical procession, arranged by the artists of Berlin. The decorations throughout the streets are progressing rapidly under the supervision of the City Architect.

AUSTRIA AND HUNGARY.—A lecture on the new street improvements at Vienna was recently given at the Architects and Engineers' Society of the capital by engineer Riehl, in which the programme of the Improvement Committee was explained.—The old exhibition grounds at Vienna are not considered to be sufficiently extensive for the large number of exhibits which are to be sent in for the exhibition of 1898, and it is hence probable that they will have to be extended, and part of the public grounds of the Prater park will be taken in hand. A considerable building will be building a chapel of considerable dimensions at the central cemetery of the town.—Owing to the closing of the "Hofburg" theatre for alterations, the idea of having a new Court Theatre, devoted entirely to chamber plays, is again the subject of discussion, and it is not unlikely that the Emperor will encourage the scheme.—A number of temporary bridges are being constructed at Vienna in connexion with the laying of the new Metropolitan railway.—It is not unlikely that the Municipality of Vienna will found a new municipal bank for which the necessary buildings may have to be taken in hand shortly. The buildings of the Alland Sanatorium are progressing rapidly, and it is probable that they will be ready by the end of the year.—The Municipality of Vienna has decided not to encourage private enterprise in respect to laying new tramways, as they propose taking all this class of work in hand themselves. It is for this reason that several schemes put before the authorities by private companies have not found favour.—A new suburban theatre is to be erected at Vienna with a view of furthering the party interests of certain municipal politicians, and considerable subscriptions have been raised for this purpose.—One of the large life insurers' accident insurance companies is having some artisans' dwellings erected at Trieste and has voted 100,000 florins towards this purpose. It is the intention of the company to see if artisans' dwellings can be made a comparatively profitable investment in that town.—The well-known Hungarian summer resort Pletyan is to have some extensive baths, which are being erected for the coming season.

MISCELLANEOUS.

LYCH GATE, PENWORTHAM CHURCH, LANCA-SHIRE.—A lych gate has recently been erected at Penwortham Church to the memory of the late Wm. Adam Fildes and his wife Dorothy Ann. The structure is from designs by Mr. A. T. Nutt, architect, Windsor, and has been carried out under the supervision of Mr. W. Morley. It is of Gothic design. The carved work has been executed by Messrs. H. Miles & Son, Lancaster.

THE INSTITUTE OF SANITARY ENGINEERS.—Mr. William Spinks, Assoc. M. Inst. C.E., Lecturer on Sanitary Engineering, Yorkshire College (Victoria University), has been elected President of the Institute of Sanitary Engineers for the ensuing year. The membership of the Institute now numbers over 450.

PROPOSED FEDERATION OF MASTER BUILDERS' ASSOCIATIONS.—A meeting was held at the offices of the Bristol Master Builders' Association, Guildhall, Bristol, on the 10th inst., for the purpose of considering the question of the formation of a federation of the master builders' associations in the West of England and South Wales. Mr. A. Kraus, President of the Bristol Association, who was elected to the chair, said the subject of a federation for the district was first broached to him by Mr. Rider, of London, the Chairman of the National Association of Master Builders of Great Britain, at the last half-yearly meeting of that Association, in a short time ago at Blackburn, and acting upon that suggestion, he had taken the liberty of calling them together that day to consider the matter, and he trusted that something practical would be the outcome of the meeting. After the rules governing a similar federation now existing in Lancashire had been read, a long discussion ensued, in which all present took part, and eventually Mr. James E. Turner (Cardiff) moved, and Mr. E. J. B. Mercer (Bath) seconded, and it was resolved unanimously, "That it is desirable to establish a master builders' federation of the associations in the various towns and localities in the West of England and South Wales." The next resolution put forward was, "That such federation be organised upon the lines of the Lancashire federation." This was moved by Mr. W. M. Blackburn (Newport), and

ended by Mr. H. J. Spiller (Taunton), and carried *in con.* Mr. James E. Turner (Cardiff) then proposed, and Mr. George Humphreys (Bristol) seconded, "That the delegates meeting here to-day port to their associations the principles adopted at its meeting, and that the rules of the Lancashire Association be forwarded to the secretaries of the various associations invited here for their guidance in the matter, with a request to report the views of their associations thereon to the convenor of this meeting at an early date, with the view of another meeting being called as soon as possible." His resolution, on being put to the meeting, was carried unanimously. The meeting closed with a vote of thanks to Mr. Krauss.

COURT OF COMMON COUNCIL.—On the 17th inst. meeting of the Court of Common Council was held at Guildhall, the Lord Mayor presiding. Replying to a question, Mr. Deputy Chairman of the Health Committee, said that the annulment of the Royal Exchange would shortly be decorated by fresco by Mr. Seymour Lucas, A.R.A., depicting William the Conqueror giving the Charter to the Citizens, which the Corporation had commissioned. The Mercers' Company had commissioned Mr. E. Crofts, A.R.A., to paint a panel of the opening of the First Royal Exchange by Queen Elizabeth. Sir Samuel Montagu, M.P., had commissioned Mr. Solomon J. Solomon, A.R.A., to paint a panel of "Charles I. Demanding the Surrender of the Five Members at the Guildhall," and Mr. Carl Meyer had ordered Mr. Sigismund Goetz to paint "The Offer of the Crown to King Richard III. by Cardinal Beaufort." A long discussion it was opened, at the instance of Mr. Alderman Trevelyan, to open the forthcoming loan exhibition of pictures at the Art Gallery at Guildhall on Sunday afternoons.

FONT FOR THE OLD CHURCH, ARROATH.—It is stated that a presentation is to be made to the Old Church in the form of a baptismal font of alabaster, which will be placed in position at an early date. The font is from a design by Mr. Burnett, A.R.S.A., architect of the Old Church.

CENTRAL ASSOCIATION OF MASTER BUILDERS OF LONDON.—Mr. William Shepherd has been elected President of this Association for the ensuing year. Mr. J. B. Greenwood and Mr. Thomas Gregory are elected the Vice-Presidents, and Mr. Charles Wall, Treasurer.

GREEK HISTORY AND MONUMENTS.—Professor Percy Gardner delivered the second of his course of lectures on "Greek History and Extant Monuments" at the Royal Institution last week. He dealt mainly with the Athenian Acropolis as a background of history, starting from the devastation of the Acropolis by the Persians in 480 B.C., and working backwards. The lecturer dwelt on the account given by Herodotus of the Persian occupation, which resulted in the Athenians abandoning their city to the ruthless vengeance of the invaders, to whom nothing was sacred. The evidence of the historians could now be supplemented by the yet more truthful records on rock, marble, and bronze, for recent excavations brought the monuments of old to light and completed the tale of the wreck of all works of interest and value. The Persians and the consequent restoration of Athens, which the Athenians returned they had lofty ideas and plans, and intended to replace the old buildings with grander ones of marble. Modern excavations enabled us to recompose temples, to set up votive images, sometimes even on their own pedestals, and to trace the development of Athens from century to century. When the Persians destroyed the Acropolis they were probably unaware of the existence of any earlier monuments than those which they were destroying. We now know that the history of Athens began at a period that was as remote to Herodotus as his time was to ours. Recent excavations revealed to us successive phases of the history of the capital of Greece. The earliest stratum showed bronze walls, graves, and terra-cottas; the second, Mycenaean pottery and palace walls, and the use of Erechtheus known to Homer; the third took us to the period when the Kings gave way to Athena and the Acropolis was made sacred to the gods. The Greeks gave the name of the Pelagic age to all the early monuments that they could not assign to any definite period. Professor Gardner then attempted to reconstruct ancient Athens at different periods. The first fixed historical landmark was the age of Pisistratus. Before his time the Acropolis was still a fortress. Pisistratus erected a temple, or the Acropolis, in honour of Athena, and some walling built by him on the road up to the temple still remained. The ground plan and style of the Peisistratid Temple are clearly apparent. In the Age of the Tyrants the early temples were little more than a wall. It is still about 600 B.C. that the age of stone began to the age of marble. Pictures of various paintings, the low gables which crowned the fronts of the buildings, were thrown on the screen, and the restorations suggested by archaeologists shown. These showed the fondness of the sculptors for monstrous forms, to which they were more inclined owing to the form of the pediment, which suggested to the artist the display of serpents and monsters. The lecturer then went on to speak of the discovery by Studniczka of the design and part of the substance of the pedimental group erected by Pisistratus

over the doors of the Temple of Athena. Professor Gardner said that within the last few days a young German student had followed up these discoveries, and had reproduced the design of the whole of the figures in the pediment.—*Daily News.*

CAPITAL AND LABOUR.

THE BUILDING TRADE DISPUTE AT BLYTH.—The dispute between the Blyth bricklayers and the master builders, which commenced on January 12, has been terminated. Mr. John Hood, the secretary of the Blyth Branch of the Operative Bricklayers' Society, received a communication from the Blyth Master Builders' Association stating that the demand for a reduction from 95s. to 9d. per hour would be withdrawn. It was in consequence of this demand and a notice of certain alterations in the working rules that the bricklayers came out. The code of working rules remains the same with this exception, that instead of an unrestricted number of apprentices, as heretofore, no more than one apprentice to every four bricklayers will be allowed, the number of apprentices engaged by any one firm not to exceed four.

LABOUR IN THE BUILDING TRADE DURING FEBRUARY.—According to the *Labour Gazette*, employment in the building trades has improved. The percentage of unemployed in unions making returns for February was 2'0, compared with 2'4 in January, and 2'5 per cent. in February, 1896. Six disputes occurred during the month, involving 334 workpeople. Most of the disputes have been settled.

LEGAL.

THE CLAIM AGAINST THE ST. PANCRAS GUARDIANS.

JUDGMENT.

MR. RIDLEY, Q.C., the Official Referee, delivered a considered judgment in this claim on the 17th inst. It will be remembered that the plaintiffs, the trustees of creditors of Mr. William Brooks, a builder and contractor of Folkestone, sued the Guardians of the Poor of St. Pancras, and their architects, Messrs. A. & C. Harston, for a balance of 24,262*l.*, or, alternatively, 24,262*l.*, alleged to be due on a contract for the completion of the St. Pancras work-house. The plaintiffs' case was that some years ago the Guardians resolved to reconstruct the work-house in King's-road, and appointed Messrs. Harston as their architects. The contract for the work was at first taken by Messrs. Kirk & Randall of Woolwich, but disputes arose, and in 1892 that firm requested to be relieved of further work under the contract. Fresh tenders were then invited for the unfinished work, and that of Brooks was accepted for 50,861*l.* The work was to occupy fifteen months from May, 1892, but delays arose, and in November, 1892, the work was stopped. Messrs. Drew Bear, Perks & Co., of Queen Victoria-street, who supplied the ironwork; Mr. H. Tolpitt, of Folkestone, who supplied the timber; and Mr. J. Brown of Cannon-street, who supplied bricks, sued on behalf of creditors for the balance alleged to be due to Mr. Brooks. The net cost of the work executed was stated to be on the first claim 65,479*l.*, plus 10 per cent. profit, 7,203*l.*, making 72,682*l.*, of which 47,800*l.* had been received under the architects' certificates, leaving a balance of 24,262*l.* In the alternative claim the net cost of the work executed was estimated at 65,479*l.* as before, but the 10 per cent. profit was reckoned on the contract price of 50,861*l.*, which with other amounts claimed brought the alternative claim to 24,262*l.* The plaintiffs alleged that Brooks was hindered from continuing and completing the contract by the action of Mr. George Poole, the clerk of the works, who interfered without sufficient cause and condemned materials supplied wholesale. It was also further alleged that the architects were seldom on the works, and that the interference of the clerk of the works caused needless a net loss to Brooks of 2,526*l.*, in addition to 193*l.*, the value of the materials left by Messrs. Kirk & Randall, and not permitted to be used. The defendants generally denied the charges against the clerk of the works, and alleged that Brooks had not carried out his undertaking to complete the work left unfinished by Kirk & Randall. The Guardians further relied on the Public Authorities Protection Act, 1893, as being a defence, inasmuch as the matters referred to in the action occurred more than six months before the action was brought. Messrs. Harston, the other defendants, pleaded that they were not liable, and said that they had received no complaints from Poole with respect to the manner in which the works were being carried out by Mr. Brooks. Upon the conclusion of the evidence called on behalf of the Guardians, however, the learned Referee decided that, as the plaintiffs had failed to make out that Messrs. Harston had been guilty of fraud, dishonesty, or collusion, those gentlemen were entitled by law to judgment; but he reserved the question of costs. Reports of the case have appeared in the *Builder* of November 21 and 28 and December 5, 1896, and January 23 and 30 and March 6 and 13 last.

Mr. Reginald Bray and Mr. A. A. Hudson ap-

peared as counsel for the plaintiffs; Mr. English Harrison and Mr. W. W. Moyses for the Guardians; and Mr. McIntyre and Mr. R. W. Turner for the architects.

The learned Referee, in giving judgment, said that the case was a remarkable one in some respects, first of all in the details which had to be considered, and secondly in regard to the circumstances of the contract itself and all the incidents which arose during the performance of the job in question. In the course of the case the question arose as to what was the position of the architect, and he (the learned Referee) gave his opinion that he could not do otherwise than absolve him from the consequences of the action on the ground that there was no evidence that he had been guilty of fraud, dishonesty, or collusion, and therefore that the action was not maintainable against him. That was still his opinion, and Mr. Harston was entitled to the full benefit of it, but he was bound to say that he felt most strongly that the decisions given by Mr. Harston as arbitrator under the contract were not capable of justification. He accepted, however, Mr. Harston's word on oath that in doing what he did, he acted to the best of his ability as arbitrator under the contract. Mr. Harston had stated that in his opinion it would not have been fair if any other arbitrator had been appointed under the clause contained in the contract. He (the learned Referee) did not understand that. Unfair to whom? Certainly not to the builder. Then was it unfair to the Guardians? Not at all, unless they had a right to expect from Mr. Harston a more favourable decision than they would expect from somebody else who was in an independent position. Then was it unfair to Mr. Harston? Certainly not, unless he was afraid of the judgment of an independent arbitrator on his specification. He left the question of Mr. Harston there and would proceed to direct himself to answer the questions suggested by Mr. Bray, on behalf of the builder and his trustees, and whether or not they were entitled to recover from the Guardians anything beyond the contract price which was stated in the contracts, adding, of course, the payments which might be allowed for extras on the orders given by the architect. It was clear, he thought, that the Guardians were not liable to pay the plaintiffs in respect of damages due to any acts of the arbitrator, unless they interfered in the matter and induced him to give decisions in their favour. If they did that, that would be in a way collusion between the Guardians and the architect, of which, as he had said, there was not any evidence in that case. It was perfectly clear to his mind that the Guardians, through their Building Committee, acted properly in the matter; abstained from interfering with the architect, accepted his decisions, and relied on him. He did not think it was true that Brooks or Pearson never complained to them. That they did not recall it, he would accept, but he thought on the balance of evidence the fact was that they did complain on certain occasions.

The learned Referee referred to the decision of the late Mr. Justice Mellor in the case of *Roberts v. Bury Improvement Commissioners*, given in 1870, and upheld by the Court of Appeal, reported in Hudson's Law of Building Contracts, in which it was held that, where undue interference by the architect in his capacity of arbitrator delayed the performance of the contract by the builder, the builder had no remedy against the employer or the architect except in the case of collusion between them (which was not shown in the present case), but where the duties of the architect were those of agent, his defaults were those of his employer. The learned Referee said that he felt bound by that decision on that part of the case. But Mr. Bray, however, had said that, apart from the conduct of the architect, apart from the fact that the Guardians never interfered, there still might be a liability on the Guardians, if independent of that, either by their default the contractor was not put in a position to perform, or was prevented from performing, the contract, or without that default circumstances had arisen which made it impossible for him to carry out the contract. It might be that things might happen which in the result would occasion a totally different state of things than those intended. Was that so in the present case, and if so was it caused by the default of the Guardians? He had to be a little careful about that because Mr. Harrison had very strenuously contended throughout the case that his clients were without any blame in the matter. It was, therefore, his duty to go very carefully into the matter before arriving at a decision. Having done so, he had come to the conclusion that the most important thing to be noticed was the delay in giving the contractor possession of the site. After carefully considering all the conditions of the contract together, he was of opinion that the contractor had a right to immediate possession of the site. He would not say that the contractor would have had a right to complain to the Guardians in respect of trifling matters as if some of the inmates of the workhouse had still remained, but he thought it was the duty of the Guardians to give immediate possession under the contract. The contractor, however, got possession of the site piecemeal. He got possession of C block at the beginning of July, of B block on two different occasions early and late in August, of H block in August and September, of K block on February

21, 1893, and of A Block either in March of that year or in June—in March according to the defendants' case; in June according to the builder's case. Was it the builder's fault that he did not get possession? On the defendants' behalf it was argued that it was his fault, and that he had nothing to do but to say he would have it, and he would have had it. After referring to the evidence of Mr. Millward and Captain Miller on this part of the case, the learned Referee said that he did not think there was any cause of complaint as to Fearon not commencing the work. Poole's diary said nothing about the default of the contractor in taking possession. Then came the period when the builder was broken and the creditors took up the job. That was on April 10. At that time one would expect the subject to be discussed, as the fifteen months, within which time the work was to have been completed, was far advanced. If, for instance, Mr. Harston really thought that it was the fault of the builder in not taking possession, it was easy for him to say so to the Guardians or the trustees, but he did not do anything of the kind, but wrote a letter to the trustees in which he said, "I am very pleased to hear you have tied over the difficulty." In the present case he (the learned Referee) could not understand how it could be for the benefit of Brooks, Fearon, or the trustees to make delays. If anyone found a man scamping the work and putting in bad stuff, they would think naturally that a man who did one thing badly would do another thing badly, and that they had got a man who did not know his trade. It was therefore important to see what really had taken place. He (the learned Referee) was aware that there were two or three bad bits of wood in the roof of the workhouse, because he had seen them. He was aware that some of the flooring boards downstairs had warped, and would not fit. He thought he saw about six. He also might mention the fact that one piece of brickwork in the wall at the back of Block H—the last bit finished—was somewhat inferior work. He remembered also that in one of the dwelling-rooms there was a sappy board or two, but otherwise the job was a very good job, even that in the rejected columns, of which they had heard so much. He could not help thinking it was a good building for the purpose, and he hoped it would be found so.

The learned Referee said that Poole did not fail in taking objections to materials, but when all was said and done he did not believe he got better bricks on the job by so doing. He thought that where so many objections were taken, and so much material was rejected, that an architect ran the risk that the builder would somehow or other escape observation, and put in some work which would not pass, in order to make himself right in the contract. He, however, did not find that in the present case, although he should have expected that with a too strict architect the work somewhere would become scamped. Was it not a fair deduction to make upon the evidence on that part of the case that it was not Fearon or Brooks who was in default for not commencing the work at the proper time, but the fault of the Guardians, or of those who represented them? The other breaches of contract alleged had all some existence in fact, but none of them appeared to him to be of the same importance as the breach of the condition giving the contractor the possession of the site. The matter of the temporary entrance, the interference by workmen under other contractors made it difficult to complete the job. Again, the allegations as to Poole constantly making objections to the work, and constantly and arbitrarily interfering, made it almost impossible for the contractor to carry out the job. He would not go through the whole history of Poole. He had no doubt that Poole condemned the first consignment of goods which came on the works in order to get a better article by so doing. As to the facing bricks he believed that Poole objected to every brick which came on the job in order to get a better one out of Fearon, and that was his guiding principle throughout. The learned Referee, in passing on to the alleged wholesale marking of bricks by Poole on C block said, that nobody could believe that Poole did not lose his temper on that occasion. Poole, he considered, was one of the very worst witnesses he had ever come across. He was not, however, prepared to hold that for everything Poole did the Guardians were responsible. He did not base the opinion he had formed on the case upon what Poole did, but he based it on the fact that by the deliberate failure to give possession of the site the Guardians had rendered it impossible for the contractor to perform the contract. On a large job like the present, where there were several buildings of magnitude to be erected, it was of the greatest consequence to the contractor that he should carry them on all together and do the work in a particular order, and when he lost that advantage during the first two or three months of the contract he could never regain it. The contractor could not raise his labour or men by going from one place to another as he should have been able to do, the result being that his labour bill was increased. In those circumstances the materials were ordered before they could be used and had to be stored, and by the storage were damaged and rendered subject to rejection. In fact, the work which could have been done cheaply, if done at the right time, would necessarily cost more if done at the wrong time. He

thought in the present case that the breach of duty on the part of the Guardians did absolve the contractor to a certain extent from the provisions of the contract, and in any case he was entitled to say that he was not responsible in respect of that breach of contract. If that state of things was right, the contractor would be entitled, it seemed to him (the learned Referee) to almost the same measure of damages he would get if he said that the contract was at an end, and he would sue for the value of the work done. He did not say it was precisely the same, but he could not make out what the difference was. In the present case there was no evidence on which he could rely to show what the work actually cost. He thought, however, that he might take it that it was very much in excess of the contract price. He did not think that it was less than 45 per cent. above the money expected to be spent on such a contract. That was an enormous sum on such a job. He thought that Mr. Brooks, Mr. Fearon, and the trustees had done their best to get right materials. Some of the materials rejected ought not to have been rejected, and the contractor ought not, therefore, to be visited with any blame on that score. That being so, he thought the decision in the case ought to be in favour of the plaintiffs. But there was one further point to be considered. Mr. Harrison took the point that the plaintiffs acquiesced in the existence of the contract long after the breaches had arisen, submitted to be paid by the certificates of the architects, and as the contractor and the trustees had so elected to be bound by the contract, they could not then come and say that they were not so bound. He did not think that that argument applied. He did not see in what respect the Guardians had altered their position under the contract in the consequence of the architect or engineer, or one. What would they have done if the contractor had acted otherwise? He did not know, and it was not necessary for him to determine that, because it appeared in the report of the case of *Bush v. the Trustees of the Port and Town of Whitehaven*, decided in 1888, and upheld on appeal, that the contractor in that case did the same thing, viz., he accepted the decision of the architect or engineer, and got the money under the contract, and the court held he was entitled to say "I have got all the contract gives me, but I am entitled to something more." He (the learned Referee) thought, therefore, he ought to follow the ruling of Mr. Justice Cave in that case, and for those reasons he was of opinion that there ought to be a judgment for the plaintiffs against the Guardians, and that there ought to be a judgment for the architects with costs. He had thought at one time that although Messrs. Harston had got judgment they ought not to have their costs, but he now thought that would be taking a stronger step than he had a right to take. He had expressly stated what he thought of what Mr. Harston had done; but he thought he should not be right in using the discretion which he had in saying they ought to pay the costs of having been brought there. He thought they must have judgment with costs, but that the Guardians must pay the costs of Mr. Brooks and the trustees. The amount as to which judgment against the Guardians should be entered must remain undecided, because he had not had the opportunity, and he had not endeavoured to arrive at the precise sum. He thought it might require a rather exhaustive inquiry to find out what the damages were, and he hoped that whatever course the parties might take in arriving at a decision on this point, they would not find it necessary to go into another inquiry, but would be able to adopt a course which would not involve the necessity of more money being spent in costs. He decided that the contractor must recover something, and he hoped it would not be necessary to have an inquiry into that matter. If there were an appeal in the matter, the question would not arise unless his decision stood, and in that case he trusted it would not be necessary to have a further inquiry and a further expenditure of money. The learned Referee concluded his remarks by thanking counsel for the great assistance they had given him throughout the case.

Mr. Harrison said that he did not know whether the learned Referee had set aside the contract, or whether he was going to issue an inquiry as to the breaches. If the contract were to be set aside, of course his clients would like a little time to consider what they would do. It could not be a sort of double-edged inquiry where the question of damages was concerned. If the contract were to be set aside the plaintiffs would be entitled to their *quantum meruit*.

The learned Referee said he thought the contract had been set aside; but if not, he could not make out what the difference in the damages was.

Mr. Harrison said that if that was so, and the learned Referee's decision was that the contract was set aside, he should ask him to formulate his judgment, and give his clients a few days to consider it, because, with regard to the *quantum meruit*, he thought the Guardians would like to take that further.

The learned Referee: By all means. I will give you a stay of execution.

Mr. Harrison asked the learned Referee to give his clients his decision in a formal shape.

The learned Referee: I will sign it and send it to the office. Of course I will do that. The shorthand writer will have taken down what I said.

Mr. Harrison: I am not going to ask you to write it out, but would something which I can appeal from at once. We can get the decision very soon.

Continuing, Mr. Harrison said that the contract being set aside was a very serious thing for the Guardians.

Mr. Bray: What I understand your judgment to be is that the contract is set aside, and we are entitled to *quantum meruit* for the work done, and the damages to be ascertained hereafter, and that judgment should be entered for Messrs. Harstons, the architects, as against the plaintiffs with costs. A stay of execution was granted for fourteen days to enable the Guardians to consider whether they would appeal from the decision.

The learned Referee said that he should put in the formal judgment that he thought that the plaintiffs were entitled to substantial damages.

After some further discussion the learned Referee directed that judgment should be entered for the plaintiffs as against the Guardians with costs, the damages to be ascertained hereafter, and that judgment should be entered for Messrs. Harstons, the architects, as against the plaintiffs with costs. A stay of execution was granted for fourteen days to enable the Guardians to consider whether they would appeal from the decision.

POINT UNDER THE METROPOLIS MANAGEMENT ACTS:

CASE IN THE COURT OF APPEAL.

The case of *Apley v. the Lambeth Vestry* came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Lopes and Chitty, on the 15th inst., it being an appeal by the defendants from the judgment of Mr. Justice Hawkins, in the Queen's Bench Division, in an action brought for a *mandamus* calling upon the defendants to repair and cleanse certain sewage or drainage pipes, which conveyed the drainage of four houses, the question for determination being whether the pipes in question were sewers, in which case the defendants would be bound to repair and cleanse them, or whether they were drains, in which case the owners of the houses would be bound to keep them in repair. By Section 250 of the Metropolis Management Act, 1855, the word "sewer" means and includes sewers and drains of every description except drains to which the word "drain" interpreted as it is in the section applies. The word "drain" means and includes any drain of and used for the drainage of one building only, or premises within the said curtilage, and made merely for the purpose of communicating with a cesspool or other like receptacle for drainage, or with a sewer into which the drainage of two or more buildings or premises occupied by different persons is conveyed; and shall also include any drain for draining any group or block of houses by a combined operation under the order of any vestry or district board." Section 112 of the Metropolis Management Act, 1862, extends the definition of "drain," so as to include "any drain for draining a group or block of houses by a combined operation laid or constructed before January 1, 1856, pursuant to the order or direction or with the sanction or approval of the Metropolitan Commissioners of Sewers." In the present case the houses were built in the year 1838, and the pipes were laid at the same time, and the drainage as then constructed remained till the present time. The drainage authorities at that date were the Commissioners of Sewers of Surrey and Kent. The Metropolitan Commissioners of Sewers were created in 1848 by the Statute 11 and 12 Vic. cap. 112. Mr. Justice Hawkins held that the pipes were not drains within section 112 of the Act of 1862, and were therefore sewers, and he decided that the plaintiff was entitled to the *mandamus* he asked for.

The Court, after hearing arguments by Counsel for the appellants, and without calling upon Counsel for the respondent, upheld the judgment of Mr. Justice Hawkins and dismissed the appeal with costs.

Mr. Macmorran, Q.C., and Mr. Muir Mackenzie appeared for the appellants; and Mr. McCall, Q.C., and Mr. Morton Smith for the respondent.

MEETINGS.

FRIDAY, MARCH 19.

The Architectural Association.—Mr. J. A. Gotch on "Eighteenth Century Work." 7.30 p.m.

SATURDAY, MARCH 20.

The Architectural Association.—Spring Visit to the Building Trades Exhibition, Agriculture Hall, 3 p.m.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Friern Barnet Sewage Works, 3 p.m.

British Institute of Certified Carpenters (Carpenters Hall).—Visit to the Building Trades Exhibition, Agriculture Hall, 6 p.m.

MONDAY, MARCH 22.

Society of Arts (Lectures).—Professor W. Chandler Roberts-Austen, on "Alloys." II. 4.30 p.m.

Surveyors Institution.—Mr. C. H. Hooper on "Fruit Growing as an Auxiliary to Agriculture." 8 p.m.

Sanitary Institute (Lectures for Sanitary Officers).—Professor W. H. Corfield on "Water-supply, Drinking Water, Pollution of Water." 8 p.m.

TUESDAY, MARCH 23.

Institution of Civil Engineers.—Paper to be discussed, The Modern Gas-Producer's Plant and its Application, by Mr. H. B. Benson, paper on "Some Remarks on the Carbide Architectural, Engineering, and Surveying Society.—Mr. F. H. Newman on "The Development of the Modern Gas Engine."

WEDNESDAY, MARCH 24.

Society of Arts.—Mr. W. B. Eison on "The Transmission of Power by Alternating Electric Currents." 8 p.m. Carpenters' Hall, London Wall.—Mr. J. Wright, lecture on "Practical Plumbers' Work." 8 p.m. Institution of Civil Engineers (Special Meeting).—Mr. G. Sims Woodhead will repeat the Film "James Watson's" Lecture on Bacteriology." 4 p.m. Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection of Disinfecting and Filtering Appliances at J. Deffries & Sons, Limited, Houndsditch. p.m.

THURSDAY, MARCH 25.

Society of Antiquaries.—Mr. C. E. Keyser, M.A., S.A., on "The Figures of Saints found on Devonshire Tiles." 8.30 p.m. Society for the Encouragement of the Fine Arts.—In Conversation, at the Galleries of the Royal Institute of Painters in Water Colours, Piccadilly. 8.30 p.m. Institution of Electrical Engineers.—Continuation of discussion on Mr. H. Benson's paper on "Some Remarks on the South American Company's Cable of Cape Verde, 1893 and 1895." 8 p.m. Sanitary Institute (Lectures and Demonstrations for Sanitary Officers).—(1) Inspection of the Metropolitan Asylum for the Insane, York-road, N. 3 p.m. (2) Demonstration of Disinfectant Meats, at the Parkes' Museum, by Dr. V. A. Bond. 8 p.m.

FRIDAY, MARCH 26.

Institution of Civil Engineers (Students' Meeting).—Mr. W. J. Griffiths on "The Re-signalling of the Liverpool-street Terminus of the Great Eastern Railway." 8 p.m.

SATURDAY, MARCH 27.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Harrison & Barber's Knacker Yard, Whitechapel. 3 p.m. Edinburgh Architectural Association.—Visit to Middle Church, Church, to East Calder Church, and to Calder House.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

5,679.—CHISELS: F. W. Newman. This invention relates to chisels for cutting the corners in window sash frames, and is intended to prevent the chisel from striking and bending. Inventor makes an iron holder of convenient size (usually about 8 in. x 1 in.), with a tang at one end to receive handle, and at the other a slot of convenient depth through entire width of holder. Into this a thin cutting blade is fitted, which may be further secured by screws, bolts, or rivets. 27,954.—EXTENSION SLIDING CISTERN: J. P. O'Donnell. Inventor claims, in a syphon flushing cistern, the rounding the dome, cylinder, or bell surrounding the end-pipe and a syphon leg or pipe in one existing of the standpipe. Plus projecting from the cylinder and a slither pin, also projecting from the handle casting, form the means, by the usual hook or lever, of raising the cylinder. The two suction pipes give a double means of discharge, which is thereby accelerated, while the cistern is much more silent, and of more certain sympathetic action is secured. 27,955.—VENTILATED WINDOW LIGHTS: J. G. Penry. This invention relates to window glass for upper sashes inventor forms one of perforations between the rows of internal projecting ribs and external projecting bosses. From the natural tendency of the air to rise to the top of these vertical ribs, the inner motion of the apertures, the oblique surfaces of the prism above the perforations will deflect the ascending air in an upward direction. 27,955.—VAULT LIGHTS: J. G. Penry. Inventor claims the combination of a vault light having reflecting surfaces calculated to reflect the light and direct it against the front of the basement beneath, with a refracting light for window in the front of the basement to take the light and refract it in a line somewhere parallel with the length of the basement. 29,459.—GUILLEY, GREASE, AND LIQUID TRAYS: W. Durant. The shell of the tray is constructed as usual with a lip and a strainer. Above the strainer is placed a grid, which is carried by a dished annulus provided with an inlet for the channel pipe. The annulus may be moved so as to allow drainage to enter from any side. An inspection door is provided. This tray may be employed in any situation, the annulus, or adjustable top, obviating the necessity of having an inlet for the channel pipe, specifically constructed for the position in which the tray is set, while the inspection door permits ready access to the interior. 302.—WINDOW SHUTTERS: A. R. Hayward. This invention relates to a shutter consisting of a back plate, a sliding rod, slot, loose tongue, and rivetted pin, so arranged and combined that the window shutter shuts over the turned rod and the tongue drops down in such wise that the shutter can only be opened again from the inside. NEW APPLICATIONS FOR LETTERS PATENT. MARCH 1.—5,386. H. Jardine, Stone Cutting Tools.—Mr. J. Jolly, 14, Collyer Quay, Singapore. 5,411. W. H. Clayton, Ventilator.—G. B. Bevan, Foundation for the Heating of Domestic Fireplaces, &c.—5,439. W. Wilkinson, Paving Blocks, Tiles, &c. MARCH 2.—5,472. W. Webb, Window Sash Cord Clips.—5,432. E. Collins, Securing Door Knobs on their Spindles.—5,435. C. Jones, Glazing Roofs, Skylights, &c.—5,515. F. Ryan and others, Apparatus for Fixing and Building up Windows.—5,529. D. Wallace, Water-closets, Flushing Tanks.—5,543. Williamson, Sash Fastener.—5,547. M. Abbott, Fastener for Windows.—5,575. R. Balaban, Bricks. MARCH 3.—5,593. A. Buckton, Tilette (substitute for earthenware tiles).—5,611. J. Hutchinson, Earthenware Tiles.—5,658. J. Owen, Appliances for House Painters' Pipes.—5,675. A. Wakelind, Sanitary and other Pipes. MARCH 4.—5,714. H. Johnston, Fitting-up Electric Bells.—5,738. A. Clifford, Flushing Tank or Waste Water Preventer.—5,804. W. Boatwright, Chimney Cowl.—5,816. T. Lacey, Fire Heaters. MARCH 5.—5,839. T. Kemp, Drain Pipe Inspection Cover and Frame.—5,858. C. Miller, Combined Door Lifter and Holder.—5,883. W. Osment, Sliding Window Sashes.—5,929. T. J. Sawyer, Saws. MARCH 6.—5,947. E. Evans, Additions to Sink and Kindred Sanitary Pipes.—5,977. A. Gibbins, Door Lock and Indicator. PROVISIONAL SPECIFICATIONS ACCEPTED. 359. J. Pawsey and G. Glasscock, Water Waste-preventing or Flushing Apparatus.—3,372. G. Knowles, Valve Ventilating Manhole Cover for House Drains and Sewers.—5,230. S. Maffey, Flushing Cisterns.—3,453. T. Kihner, Soil, Rain, and other like Pipes.—3,531. Waste or Slop Water-closets, J. Wright, London.—3,684. M. Spear, Supporting and Guiding Sliding Doors.—3,889. F. Saniter, Imitation Tiles on Metal.—3,977. W. Bryson, Sash-fastener.—4,074. P. Robb, Machinery for Sawing or Cutting Wood and other Material.—4,290. J. Jeffreys, Ventilating Fans. COMPLETE SPECIFICATIONS ACCEPTED. Open to opposition for two months. 4,665. P. Funck and L. Schmidt, Preventing Damage Through the Bursting of Water Pipes.—5,270. W. Wilson, Glass, Pans and analogous vessels.—2,419. F. Ziegler, Grindstones.—23,465. W. Eckstein and J. Willmore, Cellar Flaps.—724. G. Crapper and M. Wharum, Automatic Syphon Flushing Tanks.—2,304. W. McDougall, Window Sash Fastener. SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT. February 25.—By BAKER & SONS. The "Uglification" of London.

THE author of "Alice in Wonderland" makes one of his characters point out that, if to make anything more beautiful is to "beautify it," why should not making it more ugly be said to "uglify it?" And certainly no word could describe various works which have been carried out in London and its suburbs, of late years, so appropriately as the word "uglification"—uglification by the addition of hideous objects, and also by the destruction of those which were beautiful. While we wait from month to month and from year to year in the vain expectation of beholding the beautification of London wrought about by the realisation of almost innumerable promised "improvements," it is sad to contemplate the painful fact that the "uglification" of our capital progresses by leaps and bounds.

We do not deny that improvements have been carried out, and when fine buildings have been erected no one has been more ready than we have been to draw attention to the fact. But what we wish to point out is the unfortunate circumstance that while we build up with the right hand we pull down with the left.

The uglification of London is so patent a fact that we can scarcely conceive any one denying it. If so, let such a one go and stand upon London Bridge, and look towards St. Paul's, what will he see? A most interesting and striking view disfigured and half obliterated by a hideous railway terminus. Or let him look towards Westminster from Waterloo Bridge, where another ugly station blocks out the view, and where vast hotels rise up to a preposterous height which imparts no dignity to their design and does not even impress one, except as a dimension, and simply serves to dwarf and diminish the size of everything within sight. Let our spectator then look at the bridges which the last quarter of a century has added, and compare them with London Bridge or Waterloo Bridge, and he will see how in our grandfathers' days they possessed the art of building fine bridges, and how we seem almost to have lost it. What a noble feature

such a bridge as Waterloo or London is when built across a mighty river, but how contemptible, from an art point of view, such a structure may be when riddled about with Brummagem-Gothic tracery executed in cast iron, or adorned with huge granite columns supporting nothing or propped up upon vast gas-pipes stuck on end. Samples of each kind "uglify" our river and spoil the effect of beautiful bridges left to us by previous generations.

Walk through the City, "Tell the towers thereof." Alas! you will find them sadly diminished—twenty-five have disappeared, most of them fine works by Wren. Has not this been a master stroke of uglification?

But let us proceed eastward. We shall find the one interesting object in the interminable row of dull streets is threatened with destruction. Bow Church is certainly not a noble example of mediæval architecture, or a specially brilliant piece of design, but its grey, weather-beaten tower comes upon us like the face of an old friend, and it reminds us that not so many years back here was a pleasant London suburb, with fine substantial houses, dignified dwellings of retired city merchants, surrounded by large walled gardens; all are now gone, and the old church is it appears also to become a thing of the past. The tower, at least, ought to be spared.

And now to proceed to the "West End" of London. Let us just walk through that handsome line of thoroughfare with which London was adorned in our grandfathers' days, connecting the beautiful park at the north of the town with that of the south—Regent's Park with St. James's Park. Now we say advisedly that no greater improvement was ever effected in this city than the construction of that line of street, consisting of Gloucester-crescent, Portland-place, Langham-place, Regent-street, the Quadrant, and Waterloo-place. The Regent-street and Waterloo-place sections were carried out from Nash's designs, and the general idea was excellent; unfortunately it was the fashion of that day to do everything in plaster which ought to have been in stone, but the total effect was very striking, the strongly-marked horizontal sky-lines causing these streets to form a very appreciable contrast with Oxford-street, which always was, and will be, an irregular street. But only consider the various "uglifications" which have impaired this, one of the greatest London

improvements carried out in former days, and for which our day is responsible. To begin with, when Langham-place was built it was not possible to carry it in one straight line with Portland-place, but to prevent the idea of the thoroughfares coming to an end at this spot, Nash placed his church, All Souls, obliquely, and furnished it with a circular portico so as to round off the corner and give the idea of the continuation of the thoroughfare south.

Now, what has been done here of late years? A vast hotel has been erected right at the end of Portland-place, just doing the very thing that Nash had so carefully avoided. What is the consequence? Portland-place looks like a "cul-de-sac," and the whole continuity of the great scheme of our grandfathers' days is ruined. We are not now in any way referring to the design of the hotel in question, but simply to its position. Langham-place is not much altered, but when we come to the Circus (Oxford-street), we notice that all kinds of additions have been made to the houses; here a Mansard roof has been stuck on one house, next door a row of dormers, over the way a wretched iron-cresting, further on a whole new story has been added on to two houses, whereas the one between them is left in its original condition, suggesting a pleasant comparison to a mouth with a tooth knocked out. Where are poor Nash's Classical outlines? But this is as nothing compared to the next item, the greatest crime against London architecture perpetrated in our day, the destruction of Hanover Chapel. How this can have been allowed is unintelligible; that this building, the work of the greatest Classical architect of the century, a most striking design, so happily located, that when we now look at that part of Regent-street we are astonished to find that it was, apart from Cockerell's building, the poorest portion of the whole thoroughfare. It is no new idea that the best things do not receive their full appreciation until they have passed away. Now, when too late, we see how much was owing to Cockerell's fine church. Much is now talked about "originality in architecture," but it is a strange thing that two of the most "original" works of the century should be Cockerell's Hanover Chapel and Augustus Pugin's Ramsgate Church. Neither of the men knew that they were original; both thought they were working according to strict rules of precedent, yet in spite of the severe laws with

Old Bow Church Tower (threatened).

Hanover Chapel, Regent street (now destroyed).

"Uglification" Rampant: a new Suburban street.

"Uglification" in Progress: Woodhouse Park being destroyed.

which they bound themselves down, the gift of originality could not be concealed, and was perhaps the more brilliant from the absence of all striving to attain it. Is it not always so in art? Cockerell and Pugin could not understand one another, and were severe upon each other's work, but in the year 1851 Clarkson Stanfield introduced them to one another; they spent hours in conversation, and each expressed afterwards to Stanfield the same opinion of his former opponent in the same words—"The man is a thorough artist!"

To return, however, to our painful task, a few steps lead us to the "Quadrant," another happy thought of Nash's for the continuation of this fine line of thoroughfare. But the colonnade which gave it half its effect is gone; it was argued that it was a refuge for bad characters, and so the colonnade was destroyed, without, it is to be feared, the beneficial effect on public morals which was supposed to justify its destruction.

At the end of the Quadrant we arrive at what was once a well-planned Circus, still called "Regent-circus, Piccadilly." It should be called "The Labyrinth," for anything more confusing or puzzling it would be difficult to conceive. It would appear as though

a number of buildings had been placed in a bag and then thrown out "higgledy-piggledy," each inscribed with the words "no connexion with next door;" yet this was supposed to be "an improvement!"

Another matter which is very disfiguring to the whole neighbourhood must be touched upon, and that is the absurd practice of painting houses in the same group different colours. It is not uncommon to find two houses which have a pediment in common, the one painted white and the other damson jam colour; and as the junction takes place in the middle of the pediment the effect is remarkable for its independence of treatment, but is certainly far from pleasing.

We would just ask the question, also, why so many fairly good buildings are pulled down years before their site is required—Carrington House, for instance—leaving great shabby hoarded-up spaces. There is one such in Victoria-street, which has been so long abandoned that quite a luxurious growth of blackberry bushes and brambles covers it.

If "uglification" is seen in the City and the West End, this is as nothing to its gambols in the suburbs. In these unfortunate regions, the local builder may, indeed, sing, "I am monarch of all I survey!" Down go beauti-

ful groups of trees, well-built old-fashioned houses, and pleasant groves, to give way to "genteel residences," "depôts," "establishments," gin-palaces, &c. The jerry builder has absolutely invented a new language to describe his operations in these parts, and we fear our dictionaries will have to be corrected for his convenience, because directly these places are built over, the trees cut down and destroyed, and their places occupied by pavements and planted with lamp-posts, they are nominated "Parks," "Groves," "Avenues," "Gardens," &c. It is quite evident that we must reform our language, and we suggest the following, corrections to our future dictionary compilers:—

"Park."—A district covered closely with houses, but without either grass or trees.

"Grove."—A street of shops with plenty of flaring gaslights.

"Garden."—A collection of houses without a scrap of ground attached to them.

"Avenue."—Two rows of houses opposite each other with lamp-posts planted at intervals.

In these desirable regions we find uglification in its most advanced stage—firstly destructive, and afterwards creative. Look at Woodhouse Park, Shepherd's Bush, and

the beautiful groups of trees falling beneath the axe, the pleasant, old-fashioned houses pulled down, and the pretty gardens rooted up; then look round the neighbourhood, or prolong your stroll towards Willesden or Fulham, and contemplate the new streets. Houses turned out by the thousand—the same design repeated over and over again; the same dreadful porch, with its arch formed of thin slabs of stone; the same wretchedly carved caps, with "stiff leaved" foliage; the same bow window, which no one can sit in; the same water-closet turret; the same architrave, cornice, ridge tile, finial, &c.; and last, but not least, the same hateful, would-be "picturesque irregularity," repeated over and over again. Now the constant repetition of *regular* architectural forms may become monotonous, though it does not always do so; a colonnade of classical columns may be of any length without wearying the eye, and their constant repetition often gives an impression of grandeur; but the constant reproduction of any irregular design—such, for instance, as a turret at one corner, or of a gable, or porch out of the centre—is simply maddening.

It might have been thought that "stucco" Bayswater had reached the architectural bathos. Notting Hill, however, revealed a lower stratum; for now, alas, the jerry-builder has discovered the "picturesque" and the "original" in architecture. The old-fashioned builder built up his "compo fronts" and porticos after having studied his "book of classical patterns" and looked through his collection of "moulds," and then he turned out his "neat shop-front" or "desirable villa residence," ornamented with cornice No. 1, "window architrave No. 5," "Doric portico and caps No. 3," and so on. Now, as these things were generally copied from fairly decent classical examples, although of course the effect was dull, yet it was not repulsive. One knew what to expect, and did not take the trouble to look at it; but the ridiculous pretentiousness of the latest kind of small suburban residences must attract your attention, and when the thing is repeated a hundred times over it makes one detest it.

Cannot the modern builder be got to return to his "Classical pattern books," or, if not, will not our architects bring out some "sheets of samples" which will bear constant repetition, and not be either "picturesque" or "original"?

Mr. T. G. Jackson tells us that the jerry-builder is a necessity of the age, and that we cannot do without him even if we would; but surely some means might be found of restraining his "picturesqueness," and confining his "originality" within decent bounds; or is his "freely treated Gothic" and "modified Queen Anne" to pursue its maddening course unchecked? Unfortunately, not only are these structures so ridiculous in themselves, but they utterly ruin the effect of everything else in their neighbourhood. We know a well-designed, quiet Gothic church, which was built a few years back, when it was surrounded by old-fashioned villas, and the general effect was pleasing. But during the last year or so these villas have given way to houses of the "picturesque-original" jerry type, and the poor church is like a good man fallen into bad company.

We may be told—"if you want really to see the beautifications of London, wait until you see the Strand widened; the new public

offices built in Whitehall; the ugly block removed between King-street and Whitehall; the grand new street to Holborn; the new bridge over the Thames; the approaches made to the Tower Bridge; the new front to South Kensington Museum erected, etc., etc." Alas, we reply, we are not immortal! Rome, we know, was not built in a day, and probably if the Romans had spent all their time in quarrelling about "Betterment," Rome might never have been begun. It is really a very humiliating fact that the past quarter of a century has effected less in Metropolitan improvements than any of the three previous quarters, and there seems little reason to hope that the next twenty-five years will effect more than the past has done. The same evils are still at work; the same absurd introduction of political combinations into questions of art and construction; the same local jealousies and corporation squabbles, the same system of delaying all action by unreasonable opposition continue, and are likely to be fruitful of as much harm in the future as they have been in the past. If something is not done, and that quickly, in the way of, at least, *commencing* the numerous promised improvements of London, the present time may leave behind it as a record and memorial that it was—

A PERIOD
WHICH
DISFIGURED THE FINEST THOROUGHFARE IN
LONDON;
RUINED ITS SUBURBS,
MADE A MESS IN ST. JOHN'S WOOD,
CREATED CONFUSION AT ONE END OF PICCADILLY,
AND A DESERT AT THE OTHER;
ERECTED A HUGE BRIDGE WITHOUT APPROACHES!
AND
PRESERVED HOLYWELL-STREET
FOR
THE ADMIRATION
OF
SUCCEEDING AGES!

NOTES.

Vienna Houses of Parliament. AT Vienna considerable alterations are being made in the Houses of Parliament, which were erected from the design of Hansen, as it is necessary to find accommodation for no less than seventy-two new members above the number of 356 originally provided for. According to the new elections this extra number of seats will have to be provided for almost immediately, and, according to an old statute, it is necessary to find sitting accommodation for all members. Of course the hall is not to be altered architecturally, and the modifications will only be in the seats and in the gangways, but it is curious to observe that whilst in this country it was considered an advantage to provide a smaller Council chamber, with a view of not unnecessarily straining the voices of speakers, nearly all Continental countries have elected to have large semicircular halls with a rostrum in the centre for the orator. It appears curious, from our point of view, to increase the sitting accommodation at Vienna, for it is unlikely, excepting on special occasions, that anything like the whole number of members are ever present at a debate.

London County Council Schemes. THE Council will apply to Parliament in the current session for a further Bill relating to their capital expenditure during six months from April 1 next, and to cognate purposes.

The principal projects included within the proposed measure have already been described from time to time in our columns, so it will be unnecessary to say more than that they comprise the following objects:—The provision of sites for a Council chamber and offices, for lunatic asylums, for workshops and a central store, for technical schools, and for stations for gas meter testing-houses and the verification and stamping of weights and measures; the acquisition of the freehold of Fairseat House, Waterlow Park (Highgate), and of White House, Hackney Marsh; the rebuilding of Highgate Archway, and Vauxhall, Isle of Dogs, and Lea bridges; electric lighting on Victoria Embankment, Embankment Gardens, and Waterloo and Westminster Bridges; purchase of tramways; new main and relief sewers, with precipitation works; improvements at Wood-lane, Hammersmith, and Ben Jonson and Blackstock roads, Islington; open spaces; and various schemes under the Housing of the Working Classes Act, 1890.

Street Decoration at Berlin. ONE of the most noticeable features of the festivities at Berlin was the excellence of the general street decorations and particularly of the "Via Triumphalis." It would have been well if some of those entrusted with the arrangement of the Jubilee festivities could have seen what has been done in this respect, thanks to efficient organisation and much voluntary assistance on the part of German architects and artists, who are always ready to help on such occasions. Ever since the sombre decorations for the funeral *cortège* of the late Emperor William I. in 1887 particular attention has been given to street decorations throughout Germany, and we have seen much that was excellent on the occasion of the opening of the North Sea Baltic Canal, the visit of the Russian Emperor to Breslau, and elsewhere. The "Via Triumphalis," in this case, was from the designs of the City Architect, Herr Ludwig Hoffman, and extended along the thoroughfare "Unter den Linden" and to the castle. The central scheme was a stretch of 400 yards in the vicinity of the late Emperor's palace, opposite the monument to Frederick the Great. The scheme included a number of well-proportioned obelisks, and the framing of the more important monuments of this thoroughfare by large painted canopies; on either side of the Guard's house, close to the Palace, there were pillars with many symbols of German military power, whilst nearer the castle there were similar pillars representing Germany's maritime interests. The principal feature opposite the castle was an obelisk 120 ft. high, with decorations symbolical of the German Empire and its various minor States. Throughout the thoroughfare the decoration of lamp-posts and flagstaves was exceedingly carefully managed, and a very stately effect obtained.

American Patents. A NEW patent law comes into operation in the United States on January 1 next. Its object is to prevent delays and injustice to persons who are unable to take out patents because some other man has a patent in what may be termed a process of incubation. By the new Act the patenting abroad by other parties, or the publishing of the invention in any country more than two years before the

application for an American patent will be fatal to the latter. Again, the application on an invention patented abroad must be filed within seven months of the earliest foreign application. The time also for appealing against an order of an Examiner who refuses an application for a patent has been shortened from two years to one year. The Act should be studied by all those interested in patents, and persons who cannot get it readily may obtain a short *résumé* of its provisions in a single sheet issued by Messrs. Thompson & Co., patent agents, of London, Liverpool, and other towns.

It is to be regretted, though it is not surprising, that the interview last week between Lord Penrhyn and some representatives of his workmen has had no result. The actual point of disagreement appears to be the refusal of Lord Penrhyn to recognise a committee as a body representing the workmen in his quarries. This committee, the workmen contend, as we understand, is to be a permanent body, acting as a representative, and in some sense, governing body. That is to say, all complaints from the workmen to the employer are to be approved and to be put forward by it. We are unable to see why Lord Penrhyn objects to this body. If it has not the confidence of the men its composition will be changed, and its existence cannot prevent a workman who may be dissatisfied with it from putting forward his complaints individually. It is clear again that a workman who may have a genuine cause of complaint is much more likely to have his grievance redressed if it is put forward by a committee representing the great body of workmen than if he acts by himself. It is impossible to form an accurate opinion of the merits of the controversy without a close study of the notes of the interview. But from the report of the *Times* correspondent, who appears to have made himself acquainted with all that took place, it seems clear that each side is fighting for a principle, and that no compromise is likely to take place without the intervention of a disinterested party.

A FEW weeks back we had occasion to remark on an international competition for the design of a cathedral at Cronstadt, and to call attention to the advisability of having foreign representatives where there is a committee of assessors. We are glad to see, however, that there appears to have been a very fair distribution of premiums by an essentially Russian jury on the occasion of an international competition for the design of a new municipal theatre at Kiev. The first premium has been given to Professor Schroeter, of St. Petersburg, the second to a well-known German theatre specialist, Mr. H. Seeling. Mr. C. Sada, of Milan, has received the third premium, whilst the architect of the new Stockholm Opera House, Mr. Anderberg, has received the fourth. An extra premium was given to Mr. Weber, of Moscow. It almost seems, in fact, as if there were a kind of conscious intention to divide the premiums impartially among different nationalities. This is at all events better than the usual result of "international" competitions, in which the premiums are generally all given to architects belonging to the nation promoting the

competition. The competition in question was for a theatre of 1,500 seats, costing 450,000 roubles. The jury comprised four Russian architects, two civil engineers, and three laymen of the Corporation.

IN excavating for the foundations of a church at Yzeuse in France (Department of Allier), France, some blocks of stone have been discovered carved with bas-reliefs which are said to represent a "gigantomachia," and which are judged, from fragments of inscriptions on them, to have belonged to a Temple of Minerva. The stones have been "classified" by the "Commission des Monuments Historiques," and the excavations have been placed in charge of Père Lacroix, the well-known archaeologist, in the hope of finding further remains.

ON the occasion of the celebration of the 100th anniversary of the birthday of the Emperor William I. a motion has been put in the Imperial House of Parliament to erect a Pantheon as a memorial to the many soldiers who fell in the Franco-Prussian war. Though this motion found favour in the Upper House, it was considered advisable to postpone its discussion in the Lower House, owing to a strong opposition against the scheme. As we recorded last week, a Pantheon has long been considered a fitting national memorial to the late Emperor, but it is doubtful if the nation as a whole desires a monument in this form especially dedicated to the memory of the Franco-Prussian war.

THIS was the title of a lecture delivered at the Imperial Institute on Monday, by Dr. W. Schlich, C.I.E., Professor of Forestry at the Royal Indian Engineering College, Coopers Hill, in which a mass of interesting and suggestive statistics was given relating to the imports and exports of timber into and from the several parts of the British Empire, &c. The lecture was evidently the result of much inquiry on the subject, and as the task of collecting reliable information is no light one, owing to the extent of the British Empire and for other reasons, Dr. Schlich is to be congratulated upon the completeness of his inquiry. From some tables prepared by the lecturer it appears that the net imports into the Empire for the period 1890-94 were of the value of 14,021,000*l.*, this being an increase in the six years of 2,293,000*l.* The United Kingdom took, of course, the bulk, and the timber imported into Great Britain and Ireland from all sources for the year 1894 was of the total value of 18,423,539*l.* The most interesting feature of the lecture was Dr. Schlich's opinion that at no distant date all the countries that now export timber in large quantities were likely, for several reasons, to require all the timber they can produce for their own requirements, while in some cases they would need to import it, as in some instances they do now, from any country that might be willing to supply. That being so, what will then be the position of the United Kingdom? And what steps can be taken for supplying the home market in view of this probable falling off in the foreign or colonial supply? The lecturer suggested

that the State might do much good by affording assistance for the equipment of a proper forestry school, where scientific forestry could be taught. The Crown forests should also be managed on economical principles, so as to serve as models to private grovers, while monetary advances, at low rates of interest, might be given for the purpose of planting surplus lands, and on certain conditions the Government might buy land and plant themselves. In the lecturer's opinion these and other steps might result in the production of a permanent supply of timber for these islands, as well as in giving work to a larger population, and also keeping in the country large sums of money which now go abroad. With some of the lecturer's conclusions we are inclined to disagree, but most of his statements appear to be well founded.

WE understand that the new Surrey Commercial Docks, works are being carried out by Messrs. S. Pearson & Son, under Mr. J. Wolfe Barry's directions, Mr. W. Bennett being the resident engineer. The operations include an enlargement (845 ft. by 450 ft.) of the old Greenland Dock, and new locks for that dock and the Surrey Canal. The Commercial Docks have their origin in the "Howland Great Wet Dock," built circa 1660, covering about 10 acres, and named after the Howlands of Streatham. Elizabeth, daughter and co-heir of John Howland, brought the property in marriage to the second Duke of Bedford (1695), in whose house it continued until 1763, when it was purchased by John and William Wells. Being at that time the only wet dock on the river, it had long served for the Greenland whale vessels; enlarged in 1807, it was used for the Baltic trade. Two or three years later the old Commercial Docks Company was established by the Act 50 Geo. III., c. 207. The present company's premises consist, we learn, of nine docks, with timber ponds, having a water area of 187 acres, and 260 acres of wharfage. It seems that the first dock was made at the spot (close by Cuckold's Point) where it is supposed had been the entrance into the canal or trench cut by Canute to Lambeth, as a passage-way for his galleys when he besieged London. The canal's actual course has been investigated by various authorities, who are not quite in agreement. Maitland mentions the discovery, by the river on excavating for the dock, of bundles of willow, hazel and other rods, laid endwise and fastened down with stakes.

EVERY year, for five years back, the annual horse show at the Palais de l'Industrie, Paris, has been made the occasion of a contemporaneous exhibition, in the same building, of a series of pictures and drawings in which the horse is the principal subject. The exhibition this year is much better than its predecessors; amateur work has been kept out and the standard considerably raised, and there are some fine works among the collection. Among those that are worth special mention are a sketch by M. Checa; a large water colour by M. Georges Bussion, representing the harnessing of a team; some studies by M. Gerôme, &c. There are also some good studies in equine sculpture.

A very interesting exhibition of animal studies by Mr. John M. Swan is on view at the

Fine Art Society's Gallery. The collection consists mainly of slight sketches and studies made from animals, as a preparation for finished pictures, but on that account they have a special interest, as being the immediate memorandum of the animal's attitude or movement made on the spot. Two in particular may be named as especially fine, the "Tigress Walking" (1), in which the idea of movement is admirably conveyed—one can almost see the undulation of body as the animal walks; and the "Study of a Lioness" (48) lying down, which is remarkable for the monumental grandeur of its lines.

THE ARCHITECTURAL ASSOCIATION: EIGHTEENTH CENTURY WORK.

The ordinary fortnightly meeting of this Association was held on the 19th inst., in the Meeting room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, Mr. W. H. Seth-Smith, Vice-President, in the chair. The minutes of the last meeting having been read and confirmed, Mr. F. Bowles was elected a member.

Mr. Howley Sim, Junior Hon. Secretary, then proposed a vote of thanks to Mr. C. J. Phipps for conducting members of the Association over Her Majesty's Theatre, Haymarket, on the 6th inst.

The vote of thanks was cordially agreed to. The Chairman said he wished to express his regret at the absence of their President, who was still in the East. He also announced the receipt of a letter from Mr. John Belcher in reference to the meeting that night.

In the course of his letter Mr. Belcher said that the subject for discussion that evening was one in which he was very much interested, and with his friend, Mr. Macartney, he was preparing for publication some typical examples of what he had termed "Later Renaissance Architecture in England." In fact, they had endeavoured to follow up the work so well done by Mr. Gotch with the early Renaissance, which he had made his special study. No doubt the study of good examples of each period of architecture was beneficial and helpful, as something could be learned from them of the principles which governed true design—seeking out the good and rejecting the bad, for abuses would be found in every period. The later Renaissance was as open to these as the picturesque efforts of the early Renaissance. Without particularising either, he (Mr. Belcher) was not without hope that by directing some attention to the works of the later Renaissance we might correct the extravagant and excessive use of ornament which had vitiated the public taste of late years, and so promote an increased regard for proportion and a greater simplicity and refinement of style.

Mr. Gotch then read the following paper on "Eighteenth Century Work" :—

The eighteenth century saw the final development of that great movement in art which began in the early years of the sixteenth. When mankind had once made up its mind that the masterpieces of Italy were the only examples to be followed, nothing but time and determination were wanted to produce in all the lands of Europe a general sameness of appearance and treatment in every branch of art. In no art was copyism so contagious as in architecture, and in no art was it so injurious. For architecture is essentially a constructional art, a fact which the eighteenth did not realise, and a fact which wants no little reiteration at the present time when there seems to be a tendency to neglect construction for the more attractive accessory arts, and to desert the stately queen for her more lively handmaids. A constructional art, to be healthy and natural, must develop from within, and not from without.

Architecture in the eighteenth century was the Five Orders and nothing more. An old Roman, called Vitruvius, who had been dead seventeen hundred years, was Dictator, and those of his followers who differed from his precepts, although sometimes excused on account of their success, were admonished to be careful how they risked any deviation from the paths of perfection pointed out by him. Gothic architecture was despised and regarded as barbarous. It was not that the votaries of the art preferred a Classic dress to a

Gothic: for them the buildings erected in the Middle Ages were not architecture at all. The "Gothick Order," as they called it, is described by one of them as "the Folly and very Ape of Architecture." Such an attitude of mind is hardly intelligible to us who recognise Gothic architecture as at once the most logical and daring form of construction that man has yet employed. It is hardly less difficult to understand how they can have failed to be impressed with the majestic solemnity of a great Gothic Cathedral; and yet they did fail—even such cultivated men as Evelyn and Addison. The phrase about the "very Ape of Architecture" occurs in a treatise by a lively Frenchman, M. Freart; and, considering the subject, a very entertaining treatise it is. But Evelyn's views were those of a sagacious, unimpassioned Englishman, and are worth quoting at some length as illustrating the standpoint from which the early eighteenth century looked at the subject. In treating of architecture, he says :—

"It is the Antient Greek and Roman Architecture only which is here Intended, as most entirely answering all those Perfections requir'd in a Faultless and Accomplish'd Building; such as for so many Ages were so Renowned and Reputed, by the Universal Suffrages of the Civiliz'd World, and would doubtless have still subsisted . . . had not the Goths, Vandals, and other Barbarous Nations Subverted and Demolish'd them . . . Introducing in their stead, a certain Fantastical and Licentious manner of Building, which we have since call'd Modern (or Gothic rather) Congestions of Heavy, Dark, Melancholy and Monkish Piles, without any just Proportion, Use or Beauty, compar'd with the truly Antient; So as when we meet with the greatest Industry, and expensive Carving, full of Fret and lamentable Imagery; sparing neither of Pains nor Cost; a Judicious Spectator is rather Distracted and quite Confounded, than touch'd with that Admiration, which results from the true and just Symmetric, regular Proportion, Union and Disposition; Great and Noble manner, which those August and Glorious Fabrics of the Antients still Produce.

"It was after the Irruption, and Swarms of those Truculent People from the North . . . when instead of those Beautiful Orders . . . they set up those Slender and Misquine Pillars, or rather bundles of Staves, and other incongruous Props, to support incumbent weights, and pondrous Arched Roofs, without Entablature; and the 'not without great Industry . . . nor altogether Naked of Gaudy Sculpture, trile and busy Carvings; 'tis such as rather Gluts the Eye, than Gratifies and Pleases it with any reasonable Satisfaction: For Proof of this (without Travelling far abroad) I dare report my self to any Man of Judgment, and that has the least Taste of Order and Magnificence; if after he has look'd a while upon King Henry the VIII's Chappel at Westminster; Gaz'd on its Sharp Angles, Jetties, Narrow Lights, lame Statues, Lace and other Cut-work and Crinkle Crankle; and shall then turn his Eyes on the Banqueting-House built at White-Hall by Inego Jones after the Antient manner; or on what his Majesties present Surveyor Sir Christopher Wren has lately advanc'd at St. Paul's and compare them judiciously without Partiality and Prejudice; and then Pronounce, which of the two Manners strikes the Understanding as well as the Eye with the more Majesty, and Solemn Greatness. . . . In this sort have they, and their Followers ever since fill'd, not all Europe alone, but Asia and Africa besides, with Mountains of Stone, vast and Gigantic Buildings indeed; but not Worthy the name of Architecture: Witness . . . what are yet standing at Westminster, Canterbury, Salisbury, Peterborow, Ely, Wells, Beverley, Lincoln, Gloucester, York, Durham, and most Cathedrals and Minsters."

Thus far Evelyn. That Addison had no clearer insight into the nature of architecture will be seen from the 415th *Spectator*, where he says :—

"Let any one reflect on the disposition of mind he finds in himself at his first entrance into the Pantheon at Rome, and how the imagination is fill'd with something great and amazing; and, at the same time, consider how little, in proportion, he is affect'd with the inside of a Gothic cathedral, though it be five times larger than the other; which can arise from nothing else but the greatness of the manner in the one and the meanness in the other."

The fact is that architecture to them was, as already said, the Five Orders and nothing more—to some of them less indeed, since they only admitted the claims of two out of the five grudgingly and of necessity. Architecture, in their opinion, dealt almost exclusively with the external appearance, and they dismiss in few sentences such considerations as the disposition of rooms. Planning to them meant first and foremost the arrangement of their building in regard to its appearance, not in regard to the functions it had to fulfil. Broadly speaking, a well-designed building is as much a product of evolution as natural scenery or the forms of plants and animals. Natural scenery is almost entirely governed by the geological formation of

the district. Plants and animals have assumed their various forms chiefly as the result of the necessities of their growth, which, again, are dictated by the functions they have to fulfil. And so it is—or ought to be—with a building. Architecture is not only the art of building finely, it is the art of building finely in order to comply with certain specific conditions.

This notion of architecture was unthought of by the eighteenth century, brilliant though it was; and so the chief aim of its architects was to dazzle and impress the spectator, not to please and satisfy the indweller. Lord Chesterfield told General Wade, for whom the Earl of Burlington had designed an inconvenient though handsome house in Burlington-street, "if he could not live in it to his ease, he had better take a house over against it and look at it;" a piece of advice by which many a nobleman might have profited.

It has been observed that when people take to writing about art they have ceased to practise it to perfection. So long as it is, so to speak, spontaneous, its followers need no directions; it carries them along, they do not force it. But when its natural vitality is spent, and its followers are no longer borne unwittingly onwards, then spring up more or less gifted observers, who point out the ancient tracks and show how they may be continued; but unless among them be some who know what kind of force went to the making of the tracks, and can kindle the fire to produce the force, all the most accurate and beautiful drawings of those splendid vestigia will not enable one single one to be repeated.

Ever since the beginning of the sixteenth century—that is, for two hundred years before our period—Europe had been studying the footsteps of the Romans. For more than half that time England had thrown herself into the pursuit, and now the patient efforts of many writers were to be rewarded, and it was to be the aim of every generous patron and every architect of ability to make our English buildings as much like those of Italy as they could. Architectural design was to be a matter of rule and compass. What could be easier? The text-books gave the proportions, not only of the modern buildings of Italy—or rather the proportions of the Orders which adorned them—but also of some ancient ones upon which the sacred eye of Vitruvius himself must have rested.

Macauley has observed that during the latter part of the seventeenth century, and the early part of the eighteenth the heroic couplet was so much in vogue, and was brought to such perfection by constant use that every poetaster could employ it with as much facility as Pope himself. So it was in architectural design. The rules were so well known that it required no genius to use them—nobody expected any skill in planning—and so the same dull propriety characterised every building that was put up. Just as in poetry it is not the polished form of the verses that marks the true poet, but the ideas contained in them; so in architecture it is not the correct marshalling of columns, and the "nice conduct" of entablatures that must be our criterion, but the manner in which the whole building satisfies and expresses the wants which it is supposed to supply. Judged by this standard, how many of the designs in Campbell's "Vitruvius Britannicus" would come within the category of true architecture? And yet those volumes contain nearly all the larger houses built in the first half of the eighteenth century. One of his designs Campbell introduces thus: "This design of my invention in the Theatrical stile is most humbly dedicated to Tobias Jenkyn, Esq." The Theatrical style, he tells us "admits of more gaiety than is proper either for the Temple or Palatial style," and in that word *theatrical* lies the key to much of the designing of the period. It is all more or less theatrical, done to impress the beholder; just as in the second half of the century, the laying out of gardens and grounds was contrived with the aim of producing the effects found in the pictures of Claude Lorraine and other landscape painters, down even to the introduction of artificial ruins.

In describing the plan of his house in the theatrical style dedicated to Tobias Jenkyn, Esq., Campbell dwells not on the convenience of arrangement, not on the cheerful aspect of the rooms or any special contrivance for the comfort of the inhabitants, or whatever goes to make a house a home, but on the proportions of his principal apartments. "Here," says he, "is the double and single cube, the hall being 27 ft. by 54 ft. Here is 18 ft. by 27 ft., which is the sequi altera, and 21 ft. by 27 ft., the sequi tertia, and you pass gradually from the larger to the lesser;" all of which may have satisfied the wants and aspirations of Tobias Jenkyn, Esq., but do

not compensate his descendants for the absence of those arrangements which make daily life tolerable.

The needs of daily life went but a little way to model the great houses of that time. Architectural grouping, in order to impress the beholder, often led to dividing the mansion into separate blocks, one for the family rooms and State apartments, one for the kitchens and servants, and one for the stables. The kitchen, therefore, would be hundreds of feet off the dining-room, a drawback against which Evelyn warned his readers, "or else," says he, "besides other inconveniences, perhaps some of the Dishes may straggle, by the way." Sometimes the servants' quarters were located in two detached blocks hundreds of feet apart, balancing the composition, of which the family rooms formed the centre, and joined to the latter by open colonnades. How the service of the house could be carried on with the two halves of the staff separated from each other by a five or ten minutes' walk is not very clear; but of course the mansions were not built for the servants, but a little for the family itself, more for its grand guests, and most for the casual spectator who was to admire the lordly pile as he passed by.

The servants had to put up with what accommodation they could get. Their hall might be a vaulted underground room lighted only by areas, as at Buckland in Berkshire, and their bedroom windows might look out on to the back of the parapet. The butler might have to sleep in a room without any outside wall and no direct light and air. But in those days servants were merely servants, and could hardly expect to be exempt from suffering for architectural effect when their employers were content to suffer as well, though in less degree. And they must have suffered, for, wholly apart from considerations of bad service, the family were often located in a low basement with all the weight of the State apartments over their heads. Their rooms were not contrived to catch the morning sun, or to get a splendid view, or, indeed, for any particular purpose relating especially to them; but they were arranged to fill up the space beneath the great rooms of State, and if they were comfortable, it was more by good luck than good management.

The architects of those days were, in fact, more or less of amateurs, and the kind of architecture in demand was such as amateurs could supply. Pre-eminent among them—at any rate in social position—was the Earl of Burlington; and when we consider this fact for a moment, can we be surprised at the amount of unreal and theatrical design that was produced? Who could expect an Earl to concern himself with the niceties of household planning? No wonder that General Wade received that advice from Lord Chesterfield to take a house over against his new mansion and look at it. Yet all through the century Lord Burlington was looked up to as the greatest patron of art that England had ever produced, and especially of architecture. Horace Walpole extols his taste and his ability, he "had every quality of a genius and artist, except envy; yet, withal, he cannot disguise from himself that Ripley, who was an architect by occupation (or, as they were still called in those days, a surveyor)" "in the mechanic part, and in the disposition of apartments and conveniences, was superior to the Earl himself."

Pope, of whom Lord Burlington was a patron, satirizes Ripley more than once, but then Ripley did not belong to Pope's faction. Pope himself, in one of his epistles, points out a way in architecture which no one seems to have followed, not even the nobleman to whom the epistle was addressed. Writing to Lord Burlington, he says—

You show us Rome was glorious, not profuse,
And pompous buildings once were things of use.

And again:—

Something there is more needful than Expense,
And something previous ev'n to taste—'tis Sense:
Good sense, which only is the gift of Heav'n,
And tho' no science, fairly worth the seven.

Towards the end of the epistle he reverts to the same text:—

'Tis use alone that sanctifies Expense;
And splendour horrors all her days from Sense.

It is rather amusing that a sermon founded on such an excellent text should contain so much that is at variance with it. Nor can we help smiling at the Earl's work should be supposed to embody the principles here laid down, when we remember poor General Wade's house, or the villa at Chiswick, beautiful no doubt in grouping and proportion, but of which Lord Hervey said,

"The house was too small to inhabit, and too large to hang to one's watch." Walpole, who records this witticism, has some remarks on the house which are worth repeating. It is "a model of taste," he says, "though not without faults, some of which are occasioned by too strict adherence to rules and symmetry. Such are too many correspondent doors in spaces so contracted; chimneys between windows, and, which is worse, windows between chimneys; and vestibules, however beautiful, yet too little secured from the damps of this climate. . . . The ground apartment is rather a diminutive catacomb, than a library in a northern latitude." Then he adds a few sentences which throw some light on one of the motives that actuated the eighteenth century.

"The larger court, dignified by picturesque cedars, and the classic scenery of the small court that unites the old and the new house, are more worth seeing than many fragments of ancient grandeur, which our travellers visit under all the dangers attendant on long voyages." There you have it—"the classic scenery," and the "fragments of ancient grandeur," which were to be rivalled by English villas.

It is from the opinions of men who lived in the eighteenth century that we can best gather the motives that underlay their actions, and, therefore, a further quotation from Walpole may be excused:—"It was in this reign" (of George II.) he says, "that architecture resumed all her rights. Noble publications of Palladio, Jones, and the antique, recalled her to true principles and correct taste; she found men of genius to execute her rules, and patrons to countenance their labours. She found more, and what Rome could not boast, men of the first rank who contributed to embellish their country by buildings of their own design in the purest style of antique composition." We have seen one of these men of the first rank, Lord Burlington, and what he did. Another was Lord Pembroke, and he is worth singling out because, according to Walpole, "no man had a purer taste in building than Earl Henry, of which he gave a few specimens, besides his work at Wilton." Now his work at the house at Wilton is about as dull as anything can be, and far behind the "theatrical bridge" as Walpole calls it, which he threw over his river. This bridge is less objectionable than the other "theatrical" work of the time inasmuch as it imposes no special inconvenience on any one, but whether a bridge of this kind is in harmony with English scenery is a debatable question.

Taste, of course, was the great requisite in that age. Lady Teazle endeavoured to acquire it along with other fashionable accomplishments, to her husband's great scorn—what had she, a country-bred girl, to do with elegant expenses and fashion before she married him? "For my part," replies the lady, "I should think you would like to have your wife thought a woman of taste." "Taste!" cries her husband. "Zounds, madam, you had no taste when you married me."

The extravagancies of the second quarter of the eighteenth century sprang from an indulgence in taste apart from considerations of propriety, and it was the often-mentioned Lord Burlington who led to them, partly by his own work and partly by his publication of the designs of Inigo Jones and Palladio's antiquities of Rome. But it only wants a comparison of Inigo Jones's work with that of Burlington and his successors, or a comparison of Wren's with theirs, to see how those two men were really architects, while the others were but amateurs dabbling in what they did not thoroughly understand, and into the details of which they scorned to enter.

But while we cannot but feel that in the true essentials of architecture they were sadly lacking, yet we must concede that they produced striking results. One of these fine palaces, when it was surrounded by its original gardens, must have been remarkably imposing. Take Blenheim, for instance. If we regard it as a home, we must be disappointed; but as the dwelling of a great noble, living in state and surrounded with all its attendant ceremony, receiving other great nobles with their retinues, and housing them in more magnificence than comfort, in these respects it has much to claim our commendation. There is much excuse for it in the fact that it was a gift from the nation to its greatest son; it had to be splendid at all costs—yet it did not meet universal appreciation even in those days, as witness the lines of Swift:—

"'Tis very fine;
But where d'ye sleep, or where d'ye dine?
I find, by all you have been telling,
It is a house, but not a dwelling."

Great as the progress in architecture has been within the last forty years, it has either been imitative or eclectic. We want it to be neither, for imitation architecture proclaims that we admit the superiority of our predecessors and eclecticism is but the pillaging of former architectures and rearranging the pieces; while what is wanted is either a new creation or a new and superior development, just as man is a superior development of the monkey, or even as the Apollo Belvedere or the Venus of Milo are superior developments of the average man and woman. We have insisted in these lectures on a much more complete and thorough knowledge of the art of construction than at present exists among us; because this is the foundation of our constructive art, and without a solid foundation no permanent monument will stand, but besides this an accurate knowledge of the strains on certain features gives the rough form they, or parts of them, must take; we saw in Byzantine that the abacus of columns had to be deeper and wider to support larger piers and greater weight; that the cap had sometimes to be cubic and only superficially carved to convey the weight to the shaft. The stone rings to connect the lengths of thin shafts together, in Gothic have been turned into ornamental features. Structural knowledge, however, is far from being all that we want. We know we want this knowledge, and we also know that it may be acquired, but we at least equally want, if we do not more greatly want, creative genius, either to create something new and original or to develop that which has gone before, as Nature does, or has done, in all her works. This power however, on the aesthetic side we know not how to attain; all we know is that it is the offspring of deep emotions, high aspirations, and intrepid resolves in the nation, acting on a certain love and skill in the artists. The successful resistance to the Persian invasion caused all the fine arts in Athens to blossom; and if you will consider the circumstances of the Saracen, Gothic, and Renaissance epochs, you will see that the arts were forced into blossom by important national achievements; and that the artists of the period only wanted this stimulus to make them achieve their brilliant successes. As individuals, artists can only contribute in a small degree to such intellectual upheavals. Their business, however, is to be ready for them. We may hope that in a short time every student will have a thorough acquaintance with construction and materials, and will have learned the art of moulding to suit the climate. We also hope that each student will strive to develop the shaping of forms so as to captivate the most refined taste, so that when the flood comes that will again float the bark of architecture, so long stranded, they may be ready to man her and steer her to new discoveries and new conquests; so that the twentieth century may be one of the most flourishing architectural epochs the world has yet seen. In that epoch I feel sure that those who were Royal Academy students will not be the least conspicuous.

But when these grandiose ideas were applied to the houses of ordinary noblemen, much as they may have been cherished at the time, those nobleman's descendants find it hard to live in their palaces, and hard to maintain them.

There is not time enough on the present occasion to dwell much on the gardens that surrounded these great houses, but they were an acknowledged part of the general design, and now that they have in most cases disappeared, the vast houses lacking their support seem more wanting in common sense than they otherwise would. Among the illustrations in Campbell's "Virivivus Britannicus," which may be considered as the epitome of the period under discussion, there are not a few showing the lay-outs round the great houses, but they were founded partly on Dutch and partly on French examples. It was, however, probably Versailles that set the example to our English nobility, though nothing was done here on so vast a scale. The Duke of Montagu, who was Ambassador at the French Court for a number of years at the end of the seventeenth century, occupied the first few years of the eighteenth, after his return, in "erecting his seat at Boughton, in Northamptonshire, after the pattern, and as his dimensions would allow, after the very model of Versailles." It must be admitted that Boughton House is a very plain copy or rather reminiscence of Versailles; at the same time, its garden and wildernesses were of unusual magnificence and size, and adorned with numerous statues and a considerable extent of canals and ornamental water, enlivened by jets d'eau quite in the manner of Versailles as recorded in prints.

The house itself, although of a rather plain and sombre cast, is interesting as an almost unaltered example of an eighteenth century mansion, simply though richly furnished. Its floors are polished, its walls panelled in large panels surrounded by a bold bolection moulding, the doors are lofty and set in thick walls, the chimney-pieces are simple and massive, and surround wide and deeply recessed open fireplaces. The ceilings (verry many of them) by that rather dull painter, Verrio; still, they impart a large amount of character to the place. Here and there is a panelled room, or a fine chimney-piece of a hundred years before, showing that the house was not erected entirely new by the dual ambassador. The walls are hung with ancient portraits and pictures, and the floors are full of ancient furniture. Through the heavy sashes one looks out on to the undulating park, and the long and lofty rows of trees which form part of the celebrated avenues. There are attics innumerable scattered in every direction, and approached by staircases where the handrail is mitred round the plain square newels, and twisted balusters join it to the swelling string. Through these attics you may go, and down a different staircase, to find yourself in a room that you thought was a furlong off on the other side of the house. Altogether an interesting place, and one that gives a good idea of the haphazard arrangement of a large eighteenth century house.

At any rate Boughton House was a home which did not inhabitate all the year round—even the state rooms; which is more than can be said of any of its contemporaries. Nevertheless, with all their drawbacks these places were stately. The plans look gorgeous on paper, and so do the sections showing the internal decoration. The effect of the places themselves is, perhaps, rather depressing on the ordinary person, the grandeur a little too obvious—there is no such feeling of homeliness as in the many panelled rooms of the early seventeenth century; but when all is said, and fact remains that the architects of the latter time had a very definite aim in what they did, and they achieved it.

When we leave the mansions of the nobility, and come down to the houses of the squire or the well-to-do merchant, we find ourselves in a much pleasanter atmosphere. They have a quiet dignity about them which is decidedly restful and attractive, especially those of the first quarter of the century. In later times the portico idea became too prevalent, which consisted in affixing to the front of an otherwise plain house some variation of the columned front of an ancient temple. But the earlier houses, with wide corniced eaves, simple horizontal strings dividing the rows of sash windows, and combing with the quoins that emphasise the angles; these will no doubt long continue to form the model for houses of similar use and capacity. It is just a question whether this is quite the type that suits the present age; for our wants seem to grow always more complex, and to require a more plastic style than one depending for its effect on strict symmetry and unbroken horizontal lines.

If we cannot take a wholly sympathetic view of the purely architectural work of the eighteenth century—at any rate, in its more notable examples—neither can we forget that we are indebted to it for much that is suggestive in the work that embellished the architecture, especially in wood and iron. The ironwork of that period has never been equalled in England, and it lends an air of distinction not only to great houses like Drayton, in Northamptonshire, but to little suburban villas at Hamptonstead. The joiner's work of the time is full of suggestions. The sash-window alone was enough to revolutionise architectural treatment, and the far-reaching effects of mitred mouldings are impossible to follow. Through all the changes of two centuries these two facts have remained with us—sash windows and mitred mouldings—and there seems no immediate prospect of their being superseded. The work of the plasterer was not so admirable as that of the joiner. He had become too expert, and was able to perform prodigies of modelling and high relief, which finally undid him, and he and his art perished together.

If we are to seek inspiration from the work of the eighteenth century, we shall find it in two directions. First, in the grand schemes of house and garden combined, and in the general grandeur of treatment bestowed upon the great houses of the time. Not that we are to copy either blindly; but it is very desirable to realise how much the house and its surroundings depend upon each other; and equally desirable to learn how a grandeur of manner may be acquired. Secondly, in the sober and simple houses, where the plain-

ness of the general appearance is sometimes unexpectedly broken by the quaint treatment of a door or a chimney, and where the joiner's work is full of homely lessons.

It is often from the vernacular architecture of the country that we can get the most useful hints; whereas it is the palatial architecture that gives its stamp to the period, and goes to furnish the text-books. The one is for show first, and use second; the other is for use first, and show second. The palatial architecture of the eighteenth century was surely given to us more as a warning than as an example; but it is worthy of attention, just as all phases of architecture are which have acquired any hold on public affection, and we are not likely, in view of our present methods of study, to fall into that attitude of mind towards any style which Evelyn exhibited towards Gothic. If we bear in mind that architecture must develop from within, and not from without, we shall never again become the slaves of a foreign and a dead hand as our forefathers were in the eighteenth century, but we shall go forward, as we are indeed at the present time going forward, on different paths perhaps, and at different rates of speed—sometimes not without sharp divergence of opinion as to the propriety of particular steps—but always towards the same goal—the ennobling of our *Alma Mater*, the Mother-Art of the world.

Mr. J. M. Brydon, in proposing a vote of thanks to Mr. Gotch, said that the eighteenth century, in much of its literature, was a century of satire, and Mr. Gotch's paper had been a genuine satire of the architects of that century. It was a question whether a satirist really appreciated what he was talking about, or whether he skimmed over the surface for the sake of turning an epigram or making a neat remark. Some of Mr. Gotch's remarks were excellent, but, if he might say so without offence, the lecturer had skimmed over the surface a little too much. To understand the meaning of what they had heard that evening—of the grandeur of the palaces and the homeliness of some middle-class houses—they must project themselves back into the society and life of the eighteenth century. It had been called the Augustan age in England, and in literature and art, and in arms to some extent, that was perfectly true; and the result of that was the seeking after magnificence which had to be expressed in the houses of the great, who lived in a state which our nobles would find very uncomfortable. The first thing that the nobles and princes of the land demanded was not a home but a palace. It was very difficult to make a palace homely in all its parts, though all their dwelling rooms were not on the basement, as might be inferred from Mr. Gotch's remarks; but still the main parts of the house, as at Blenheim and at Castle Howard and one or two others, were built for display and magnificence, for the maintenance of a great army of servants of all kinds, and all the paraphernalia that went to make up the *mise en scène*. Out of that grew the disposition of their plan, which was also the result of a desire for display and magnificence. Beside that characteristic of the eighteenth century, there was another, viz., the extraordinary commercial revival which took place, one of the results of which was the South Sea Bubble, and various other speculations by which people lost money; but people also made money, and there was created in the eighteenth century what we called the middle class. One of the first things desired by the successful merchant was a suitable house to live in, and consequently some of the smaller and more homely houses, some of which had been illustrated that evening, were built for the accommodation of successful commercial men. If there was one thing more than another that was characteristic of these middle-class houses, it was their homeliness and their comfort; they were eminently "livable" houses. When one found oneself inside such a house, the feeling was produced of a homely country gentleman's house, and that impression was stamped on the building inside and out. In the eighteenth century the buildings produced were often very beautiful compositions. In fact, they were models of proportion, both external and internal. The architects were not, in his opinion, tied to the five Orders—in point of fact, if the Orders were studied, it would be found that they were used in a very loose manner, without the least regard to the proportions of the ancients, except in the stately colonnade or portico of church or palace. In the exterior, particularly, of those houses, the rooms were models of proportion—their length and breadth and height satisfied the

cultivated tastes of the people who lived in them. He thought that proportion was one of the first elements of architecture, and without it architecture would be of a very poor description. The same ideas of proportion were noticeable in the exteriors. Even the palaces, illustrations of which had been exhibited that evening, possessed proportion and well-balanced parts. Sir Joshua Reynolds, no mean critic, had referred to Sir John Vanbrugh as a master of proportion. He knew exactly the necessary size and shapes of the different parts of the house in order to fit the dwellings to the site which was at his disposal. The laying out of the site was of very considerable importance, and, as they had seen that evening, the houses of the period were admirably adapted to their surroundings. He thought that might fairly be claimed to be the outcome of a long-continued effort to make the house in harmony with its site, and that that effort culminated, to a certain extent, in the elaborate gardens which were attached to the houses. Of course, to keep up one of these establishments and its surroundings a great deal of money was required, and he was afraid, without being disrespectful to any of the nobility, that some of these stately mansions were in the hands of people who were not rich enough to properly maintain them, though if the buildings suffered in consequence, that was no fault of their architects. The admirable woodwork, ironwork and plasterwork of the period were excellent studies in design, and also in manipulation—in workmanship. They had all the feeling of the artist workman. In his opinion this work had created a great English school, and to call such work Italian—work that had been the national style for 200 years—was straining the point a good deal. It was just as truly English as the Gothic architecture of the fourteenth century, which prevailed here, in contradistinction to the foreign Gothic of the same period. He somewhat objected to Mr. Gotch's use of the word "theatrical," especially in regard to the bridge at Wilton. If any one saw that bridge with the foliage, &c., about it on a summer day, he would feel that such a term was misapplied. The bridge had been copied by Wood, of Bath, but even the copy of the bridge had something of the English feeling and an absence of "theatrical" style. As to Lord Burlington, the age was one of letters, and no gentleman of culture was considered to have his education complete unless he knew something of art and, most of all, of architecture. He wished that modern education embraced the same subjects, for he felt that if it did the architecture of the country would be improved, because a demand would arise on the part of cultured clients for a higher order of art. The learned patron of architecture did not exist to-day, and the consequence was that there was no one to fashion and correct the public taste. In regard to the Villa at Chiswick, it was not a house to live in continually, but a place where its owner could spend a few days of quiet. It faced the river, and exactly expressed its purpose of a riverside house.

Mr. E. W. Mountford, in seconding the vote of thanks, said that Mr. Gotch's paper was one of the most interesting he had ever heard, and it showed that Mr. Gotch had read a great deal on the subject. He felt that they would all agree with Mr. Gotch rather than with Mr. Brydon in regard to eighteenth century houses. He did not profess to have such a knowledge of the period as Mr. Brydon possessed, but he might say that the houses of the period did not appeal to him, except from the outside. The palatial rooms were very grand to look at, but they must have been very uncomfortable to live in, and in some of the examples the extraordinary height of the rooms, even where there was no particular grandeur of architecture, must have made them very uncomfortable residences. He was thinking of a house at Easton-Neston, in Northamptonshire, which was attributed to Wren, like a good many houses he never saw. The family rooms were on the ground floor, but the smaller rooms, where the occupants generally lived, were made the same height as the others, the average height being about 18 ft. A room of that height did not suggest comfort. As to Blenheim, architects were told they ought to admire it, but he was bound to say that he did not admire it altogether. The whole atmosphere of the place was excessively aristocratic. He quite agreed with Mr. Brydon that the smaller houses of the period were very comfortable. It was his lot to spend his younger days in a house built in the early part of the eighteenth century, and a most comfortable house it was. The rooms were all panelled, and the doors had only two panels.

An air of quiet simplicity was a characteristic of most of the smaller houses of that period. They had one or two failings, one being the occasional mistake of the architects in keeping the roofs below the parapets. That was an architectural mistake which often occasioned much trouble in snowy and had weather. They were very well planned, as a rule, and frequently were exceedingly beautiful, though towards the end of the century the deterioration began which culminated in this century.

Mr. H. Lovegrove said that the illustrations which accompanied Mr. Gotch's paper were admirable, but Mr. Gotch had not referred to small houses in streets at the end of the eighteenth century. One thing about them was the paneled walls, the joinery of which was of excellent description. What usually struck him was the smallness of the rooms of the houses. The front room on the ground floor, which was used as a dining or a drawing-room, usually had one portion of it taken up by a great chimney breast, and in the back-room a large portion was occupied by an angle fireplace, and the rooms were very lofty as well as very small. The execution of the plasterwork was very good. He was interested very much in thinking of their meeting that night to discuss such a subject, for some thirty years ago, in the days of the pupillage of some of them, the study of such a subject was altogether discouraged. They were told to read Parker and Kickman rather than to give attention to the subject. But one could not help thinking now that the interiors of the houses of the period suited the vernacular joinery and furniture better than modern Gothic.

Mr. H. W. Pratt said that they were indebted to Mr. Gotch for pointing out the advantages and disadvantages of the palatial and the more homely styles of the eighteenth century. One thing had struck him, and that was that the middle-class people did not attempt to ape the nobles in a palatial style in their residences, and that was a tendency which we did not follow, for nowadays there was an inclination to imitate the palatial style of building in our smaller residences. He thought we might take a lesson from the eighteenth century, and maintain that characteristic homeliness of treatment which, combined with taste and simplicity, was really very charming. In looking at the excellent illustrations which Mr. Gotch had brought before them that night he could not help thinking that some of the rather grand buildings which they had seen, however much they might be called "theatrical" in style, and, however much they might fail in the matter of convenience, really represented a wonderful mastery of plan and grouping, apart altogether from convenience. Some lessons might be learned from such examples in that respect, however much we might condemn them in others. The architects of the period combined something which should make us call them certainly more than amateur designers or architects. As Mr. Gotch had said, no one could imagine the effect which some of these enormous buildings and their lay outs would present, unless we used a balloon for the purpose of inspection; for the immense space occupied by the buildings made it impossible to realise the whole idea of the plan. It was external architecture really, and in studying the disposition of these buildings the modern architect must learn carefully what to follow and what to avoid.

Mr. Howley Sim, in supporting the vote of thanks, asked Mr. Gotch if, in the course of his researches, he had discovered the date of the first sash window. It seemed to him (the speaker) to mark a very important epoch in the history of architecture, for the whole of the style seems to have depended upon it. He thought that the character of the people of the time had been overlooked in previous studies of the eighteenth century architecture. They were not a people in a hurry, like ourselves, and they had plenty of time to think about and carry on their avocations. Absolute convenience in the matter of quick service, and in the disposition of their service rooms, was not considered of the same importance as it is now. The modern idea was convenience in the house first of all; in the eighteenth century it was only the second object sought after. Then, pleasure was gained by a house of tolerable convenience which called forth admiration. With regard to the study of the style, he did not think that it should be reproduced to any extent now, for it did not express our wants. As had been said, a great deal of beauty was to be found in the ironwork, plaster work, and joinery. As regards the joinery, half the charm of joinery disappeared when it was turned out by machine, instead of

by hand, as it was to-day. But, of course, we could not give up machine-made joinery, as it would be absurd to go back to hand-worked mouldings, for instance. Had the eighteenth century had the opportunity, no doubt they would have used the machinery for the purpose. He would like to ask Mr. Gotch another question: What was the earliest example of mitred mouldings?

The Chairman, in putting the vote of thanks to the meeting, said that it was a curious enquiry as to the great difference of opinion in regard to the Gothic and Classic styles. The revolution of feeling in regard to the two styles in the two periods represented by Evelyn and Pugin respectively was extraordinary. He could account for it in no other way than Mr. Gotch had, viz., that both parties, but especially the eighteenth century party, had lost sight of the fact that architecture was a constructional art. The great fact for the architect of to-day to remember was that he was living in an age when common sense was required above all things. He did not know that anything had struck him more when at Vicenza than the steady deterioration noticeable in Palladio's work. It seemed to him, the speaker, that when an architect adopted a style such as the Roman, considered that to be perfection, and went on copying in that style, he deteriorated very rapidly. If Palladio's architecture had been founded on common sense principles, and such principles as guided the great *quattro cento* architects of Italy, a very different result would have been seen, for the man had great judgment and a great sense of proportion.

He, the speaker, had been dealing with a very good example of an eighteenth century house, Hare Hall, near Komford. The house was not palatial, but was planned on the usual palatial style. The whole of the ground floor rooms were less than 8 ft. 6 in. high, and the first floor was devoted to the state apartments. The attics were the only bedrooms, and the windows in them were placed so high that one could only just look out. The house, which was built about 1763, was faced with Portland stone. On the other side of the road, in grounds of about the same size, was Gidea Hall, which was a perfect type of the early eighteenth-century house, built of a kind of brindle brick and dressings of a brighter red brick, with carved stone cornice. One defect it possessed was a flat roof. He had been recently speaking to a successful business man who had employed the same architect on several occasions, and for which architect he had a very high opinion. In the opinion of his business friend, that architect always succeeded in making the sides of a house as beautiful as the front. His buildings were excellently planned, and his houses were always comfortable. It struck him, the speaker, that common-sense results of that kind were what appealed to the public, and would do more to popularise architecture than anything else. Machinery, he thought, was likely to be of use in regard to the production of circular work, at almost the same price as straight work, and this was an important consideration. In some of the old houses of Lincoln's Inn-fields, and elsewhere in London, the staircases, plaster-work, ironwork, and chimney-pieces, were of very beautiful workmanship indeed.

The vote of thanks was then put to the meeting and carried unanimously.

Mr. Gotch, in reply, said that he feared he had not done justice to the eighteenth-century work as a whole, but he had been dealing with the text-book architecture of that period. When we came to examine the work of the eighteenth century, and especially the big work, defects and shortcomings were revealed, and, whatever might be said in favour of the grand treatment of architecture, he should still maintain that the groundwork, the bedrock on which architecture rested, was utility. It was no good to say "here is a beautiful house" which, no matter what the proportion or the design, when examined as a house, was a complete failure. In so far as it did not satisfy the purpose for which it was built, to that extent it was a failure. A thing to be a work of art must fulfil the purpose for which it was designed and for which it was wanted. If it were claimed that these large palaces were merely for show he would agree, but as dwellings they were failures, and as failures they were considered by many people who lived at the time of their erection. He could sit down and write another paper on eighteenth-century work which would contain very little but praise, and he would take as his theme the smaller houses of the time, where there was no great effort made, where people did not want state and grandeur, but where they wanted homely comfort. As a rule that was achieved, but a curious fact was that

the names of the architects of these houses had vanished. In regard to Mr. Brydson's exception to the use of the word "theatrical," the word was Walpole's, who was a contemporary. He was afraid he could not give the date of the first sash window, or of the first mitred mouldings, but he thought the sash window made its appearance somewhere about Charles II.'s time (about 1675), and the mitred moulding preceded that by about fifty years. Mr. Gotch then drew attention to the various drawings which were exhibited, which included the collection of drawings made by Lord Burlington, from the Devonshire Burlington collection in the Institute Library—a collection very little known. From some of these drawings it was perfectly evident that the convenience of disposition of the house was not considered at all. A collection of rooms, none of which were named, were grouped to look well on paper, and with the object of their making an harmonious exterior. As far as he could discover, that was as far as Burlington and his school devoted themselves to "scientific" planning.

The Chairman announced that the next meeting would be held on April 2, when Mr. T. G. Jackson, R.A., would read a paper on "Architecture in Relation to the Crafts." The meeting then terminated.

ARCHITECTURAL ASSOCIATION

SPRING VISITS:

BUILDING TRADES EXHIBITION.

THE fourth visit of the current session was paid to the Building Trades Exhibition at the Agricultural Hall, by the kind permission of Mr. H. Greville Montgomery, and a large number of members availed themselves of the opportunity of inspecting it.

The occasion was much appreciated by the members attending, as being a distinctly valuable opportunity for comparing the specialities of the various firms, which is practically only possible on some such occasion when they are collected together under one roof, and a vast amount of information could be obtained in a short time by a little careful study.

To students this applies with particular force, as it was possible to see models of a whole system of drainage, together with all the actual parts, and then compare it both as regards general principles and details with an adjacent arrangement; a form of study which may have been new to students even when the exhibits themselves were not novel. In the same way the various patents and methods of fire-resisting construction of floors and partitions could be compared and the drawbacks and advantages duly noted; whilst any information as to sizes, strength, and cost could be easily obtained.

A hearty vote of thanks to Mr. Greville Montgomery terminated the Visit, which, though slightly differing from the usual proceeding of inspecting a building in progress, was amply justified by the exceedingly valuable and interesting information which was placed at the disposal of the members.

THE BUILDING TRADES EXHIBITION.

THE Lord Mayor, accompanied by the Lady Mayoress and the Sheriffs, opened the Building Trades Exhibition on Saturday last week, at the Agricultural Hall, Islington. The ceremony took place in the eastern gallery, and amongst those present were Sir Arthur Blomfield, A.R.A., Mr. George Frampton, A.R.A., The Technical Attaché to the German Embassy, Mr. Charles Barry, Mr. H. H. Collins, Major Leslie, Major Isaacs, Mr. Douglas Matthews, Mr. Lewis Angel, Mr. T. M. Rickman, Mr. E. Benedict, Mr. Thomas Blashill, Mr. J. Belcher, Mr. Shadbolt (Master of the Masons' Company), Professor Banister Fletcher and Mr. H. Greville Montgomery, the manager.

Professor Banister Fletcher, Chairman of the Consultative Council, in proposing a vote of thanks to the Lord Mayor for attending that day and opening the exhibition, said that the interest the Lord Mayor took in technical and handicraft education was not a recent growth. In explaining the origin of the handicraft competition which would commence at the exhibition that day, he said that such competitions were started five years ago experimentally. It was thought that open competition free to all would stimulate men to better work, that it would be of advantage that those not so advanced in practical knowledge should thus have

an opportunity of watching day by day the work done, and that both would be advantaged by seeing during their resting time the best materials, appliances, and inventions connected with the trades, and also the works of art lent for the exhibit by the Science and Art Department, by the Corporation of London, by City Companies, and others. The medals and prizes included those given by the Worshipful Company of Carpenters and also that of the Joiners. The number of competitors was more than double that in the last competition, which itself had more than double that of its predecessor. As there was every prospect of the number continuing to increase now that the competitions were well established and had proved a success, and were appreciated by the men, monetary help would be needed to enable them to continue this valuable and growing work.

Sir A. Blomfield seconded the vote of thanks, and said that as an architect he was greatly interested in every matter connected with the advancement of technical education of the trades and crafts associated with the building trade.

The vote of thanks having been unanimously agreed to,

The Lord Mayor, in reply, said it was most desirable that people should have fit, proper, and commodious houses to live in, and above all that the sanitary arrangements therein should be complete. He thought there was little doubt that the decrease in the mortality of the human race was nearly as much attributable to the advances made in sanitation, and to the manner in which the regulations were carried out, as to the enormous strides of science, not only in therapeutics but in surgery, and the whole art of healing. It was curious that, whereas nearly everything was but a mere reproduction of the inventions of the Egyptians, Greeks, and Romans, there had been designed in England a structure more remarkable than any known in ancient history. This was the Crystal Palace. When it was determined to hold the Great Exhibition a discussion arose as to how it should be housed. Joseph Paxton submitted a design of glass and iron, which was not only thoroughly original in idea, but, having been successfully carried out, was a monument to the imaginative genius of the building trade in Great Britain. The more such an exhibition as that at the Agricultural Hall could be fostered the more would people help to beautify the city of which they were so proud, and the more would they make their homes sanitary and comfortable.

Mr. Thomas Blashill proposed, and Mr. E. Benedict seconded, a vote of thanks to the Sheriffs, and, this being agreed to, Alderman Sheriff Ritchie replied.

The company then proceeded round the building, and inspected some of the exhibits.

A luncheon was given subsequently, Mr. H. Greville Montgomery presiding.

Professor Banister Fletcher, in proposing the toast of "The Chairman," said that Mr. Montgomery had very wisely rejected extraneous exhibits, and, in his opinion, the present exhibition was the best of the kind that had been held at the Agricultural Hall.

The Chairman, in response, said that they did not intend to hold a Building Trades Exhibition next year, but they hoped two years, hence to hold another.

Mr. Arnold Statham then proposed "The Consultative Committee," coupled with the names of Mr. Charles Barry, and Mr. H. Phillips Fletcher, one of the hon. secretaries, both of whom replied.

Other toasts were "The Press," proposed by Mr. Henniker Heaton, M.P., and "The Chairman of the Executive Committee," proposed by Mr. H. H. Collins, and responded to by Professor B. Fletcher.

The Exhibition.

The exhibition is undoubtedly a better one than most of its predecessors, but it still has the defect of being rather a shop for the display of wares than an exhibition for illustrating progress and new ideas in building work and inventions, which is what it ought to be. We still find in various quarters the stands of the same firms in the same place as at last exhibition, and with little difference in their contents from what we saw two years ago. The interval is not long enough. If the exhibition is to be really what it ought to be, an illustration of progress and of new ideas, once in five years is quite as often as it is any use to hold it. There would then be some chance that each exhibition would be of real value. Added to that there ought to be a complete stoppage put on the touting and buttonholing nuisance, which is more prevalent than ever. It is

impossible to look with attention at any exhibit without having a man pushing circulars into your hand and wanting to retail to you all the merits of his exhibit and what eminent architects have said about it, &c., &c. Just imagine such proceedings at, for instance, the Arts and Crafts Exhibition. If the Building Trades Exhibition is ever to take the place which it undoubtedly might take, this kind of procedure ought to be sternly stopped, as the management could certainly stop it if they tried. We may observe also that there is no improvement in regard to the system, or want of system, of arrangement and cataloguing. The catalogue defines exhibits as being in "Row A," "Row B," &c., but these "rows" are not lettered up anywhere in the building, nor is there any key plan attached to the catalogue. It is impossible to know where to find anything that one may see mentioned in the catalogue, or where to find the catalogue description of anything one sees, except by the tedious process of finding the exhibitor's name in the alphabetical index and then turning to the page. It would be perfectly possible to classify the exhibits and arrange the catalogue so that everything could be easily found; it is only a want of system that stands in the way.

In remarking on special exhibits, we may most suitably commence with the class of materials for building comprised under the head of

Stone, Brick, and Terra-cotta.

The exhibits of quarry productions are, for the most part, confined to surveyors' materials, and some well-known firms send small samples of road-metal, kerbs, chips, and the like. The exhibition is decidedly weak in stands of building stone, though stone as a whole is rather better represented than on the last occasion.

In regard to road-metal the Mountsorrel Granite Company and the Enderby and Stoney Stanton Granite Company represented the macadam of Leicestershire, there being several samples also of fine chippings and sand—the finer screenings from the "jaw-breakers" in the conversion of the stone by machinery; the same firms have a few specimens of granite kerbs, setts, and dressed granite. The Glyn, Ruabon, have a small stand on which is shown the peculiar road macadam from that part of North Wales. The material is remarkable as being employed instead of brass for machinery bearings. That particular class of stone is very rare in this country; it may be described as an amygdaloidal trachyte, and occurs as a broad dyke or vein running through Lower Palaeozoic rocks. Darbishes, Limited, have a small exhibit of the celebrated Penmaen-mawr stone consisting of setts, channels, macadam chippings, sand for concrete, flags, &c. It will be remembered that this material is not a granite, but an entaste diorite, and occurs as an intrusive mass, near Conway; from its general appearance it might readily be mistaken for basalt. The old Radnor Company, Limited, of Kingston, Herefordshire, has a stand displaying some small samples of channel stone, &c., whilst the Westbury Iron Company, Limited, of Coleford, near Bath, showed the capabilities of Carboniferous Limestone for road-metalling and asphaltting purposes. Tough blue whinstone from Whitehead, near Belfast, broken for macadam, and chips is shown by Mr. C. W. Cooper. Mr. C. Souton exhibits Cherbourg quartzite from the Montmatre and Le Mottere quarries; that from the former has a crushing strength of 2,908 kilogr. per square centimeter. The stone appeared to break clean, and may be compared with the Hartshill quartzite from the neighbourhood of Nunenton.

In regard to building stones and marbles, the exhibit of the Barton Limestone Company, of Melsonby, via Darlington, was interesting as introducing a stone that has hitherto only been used chiefly for metallurgical purposes and macadam. Now it is polished as marble and is employed also as a general building and engineering stone. It reminds us somewhat of the well-known Hopton Wood stone, but can be readily distinguished by its different tints. It is a Carboniferous limestone composed almost entirely of the stems of crinoids, and the divers positions in which these lay give a characteristic pattern to the material. There are two principal kinds of the stone. One is very light in tint (a greyish yellow) and there is barely enough colour to throw the fossils in relief; the other is light grey also, but the crinoid stems, &c., are outlined in light blue. We much prefer the latter to the former for ornamental purposes. The use of the stone for rockeries and the like is well shown in this new exhibit. The beautiful marbles of Derbyshire were represented by the effective display of Messrs. Twigg & Company, of

Ashford. The dark-tinted crinoid comes out well in the chimney-pieces and balusters shown; whilst the black marble, so different to the majority of stones that are called by that name, are in reality black, jet black, and is one of the most remarkable stones in England. Thin sections of that also show that it is made up of small crinoid remains. The marbles from this locality are noted as not being highly coloured; the prevailing tints are grey, ranging from very light yellowish grey up to the black alluded to, though a little red staining may occasionally be seen. The different sized crinoids found in each variety of marble are characteristic, and give the local names to the materials. Messrs. David & Sant, Limited, of Coleford, Glos., have a good exhibit of Forest of Dean stone; the samples are uniform in tint and take a fine air. The stone supplied is in three tints, viz., blue, grey, and red, and the firm has over fifty quarries. Ketton oolite is represented from the quarries of Messrs. T. C. Molesworth & Co., who state that its absorbing power is about 14 per cent., whilst the crushing weight is 1½ tons per square inch. Mr. J. Rooke, of Weldon Grange, near Kettering, exhibited samples of Weldon stone, which is also an excellent material. Amongst other building stone exhibits were:—Messrs. B. Graham & Sons, of Huddersfield, moulded yellow sandstone from Crosland Moor quarries; Messrs. J. Riddiough & Son, of Bradford, samples from Bolton Wood quarries, Frizinghall; Messrs. Thos. Obank and Sons, Idle, near Bradford, York stone, ashlar and delphstone sawn and worked; Messrs. J. Farrar & Sons, Southwam, Halifax, hard blue stone from Bell Dean quarries, Thornton, &c.; Mr. Wm. Wilson, samples of paving materials from quarries in the neighbourhood of Kilsyth, Stirling. Messrs. Baird & Stevenson, of Carlton-place, Glasgow, show six 8-in. cubes of freestone from different parts of Scotland.

Slates are fairly well represented, but they are mostly of foreign origin. Those from America are exhibited by Messrs. Iles & Co., of Peckham, and Mr. C. H. Broodbank, of Martin's-lane, Cannon-street; the last-mentioned has also many samples of slate from Angers, France, as well as Irish paving and building stone. The house erected by the former firm, lined and roofed with American slate, was very effective, but we cannot say that any of the American material shown takes such fine, straight cleavage as do our best Welsh slates. In regard to tint, what are on view appear uniform and leave nothing to be desired in that respect, and we were particularly struck by the tea-green samples shown by Mr. Broodbank. The Abercrombie Slates Quarry Company, Limited, of Machynlleth, has a good exhibit of both slates and slabs. The "silver-grey" slates especially appear to be very sound, and to be practically free from pyrites.

Of artificial stones there are plenty. The Victoria Stone Company once more show the kind of work they are turning out, and enable us to compare their artificial ashlar and mouldings with those made of Portland and red and yellow Mansfield stones, as well as their application in various kinds of architectural work. The Sandstone Syndicate, of London, has erected a door, way and balustrade in white artificial sandstone which do credit to the material. The Paten, Indurated Stone Company, Limited, of Millwall, has various samples of silicated concrete work. The Imperial Stone Company, Limited, of Greenwich, make a goodly display of their various artificial productions, including a large stone arch, vases, slabs, drain-pipes, &c. The Marble (Moreau-Rae) Syndicate, Limited, of Lots-road, Chelsea, exhibit the capabilities of artificial marble for the purposes of decoration. Examples are shown of its application to stair-cases, dados, mantelpieces, table-tops, balustrading, columns, &c. The "marble" is white limestone, absorbent enough in the first place to take on varnish streaks and colours produced chemically, the whole being subsequently indurated. Although almost any desired tints may be induced to form, and the result is not bad, no one could mistake the material for true marble. "Petrifite," described in our columns a short time since, is one of the novelties of the exhibition. The Val de Travers Asphalt Paving Company, Limited, show several forms of paving blocks; and the applications of Callender's bitumen damp course were illustrated by models.

The brick and terra-cotta exhibits were not particularly novel, and there is very little to say about them, though many leading firms are exhibiting. Messrs. Candy, of Newton Abbot, have a large stand of stoneware, glazed and fire-bricks; Messrs. J. Grayson, Lowood, & Co.,

Limited, of Sheffield, have silica and ganister bricks; and a good show is made by the Worcester Fire Clay and Blue Brick Company, Limited, who have also sanitary clay goods of every description; the National Opalite Glazed Brick and Tile Syndicate, Limited, show the application of an artificial opal for veneering bricks, tiles, &c. Watson's patent Improved Roofing Tiles are on view, and show the effect on roofs produced by longitudinal grooves in tiles, the idea being to prevent rain-water from splashing up underneath or between the tiles when the latter are firmly secured. These tiles, we understand, are made from Broseley and Staffordshire clays. Amongst several other firms exhibiting bricks and terra-cotta are Mr. F. Jewson, of Earith, near St. Ives, Hunts, whose yellow bricks, wire cut, indicate a mean strength of 1785 tons per square foot; Messrs. S. & E. Collier, of Grovelands Potteries, Reading, flower vases, seed pans, brackets, &c.; Messrs. Wood & Ivery, blue Staffordshire bricks; Mr. E. Holwill, Temple-chambers, glazed bricks and tiles; Mr. Mark Gentry, Hedingham, Essex, red hand-pressed and hand-made facings, rubbers, and moulded bricks; the Castle Fire-brick Company, Limited, of Northop, Flintshire; the United Kingdom Terra-cotta Fire and Sound Proof Brick Company, Limited; Mr. W. T. Chapman, terra-cotta works, Cleethorpes, Lincs; and Messrs. Joseph Cliff & Sons, of Wortley, Leeds, who have a fine display of glazed bricks, sinks, dove-tailed bricks, lavatory basins, &c.

Drainage and Sanitation.

In this section several important improvements are shown, and we are inclined to think that this department is one of the strongest in the exhibition.

The Albion Clay Company, Limited, have gone to considerable trouble and expense over their exhibit, which will, however, we think, amply repay them, in that visitors may see some of their important improvements at a glance. From an educational standpoint also, the complete system of drainage which the Albion Company have laid out is also to be commended. This system contains all the latest inventions of the company, and one can see how each is suited to its position and purpose. We may briefly enumerate some of them: The drain-pipes are those known as Sykes' patent joint pipes, made of granite stoneware. The joint is formed of a thick plastic composition, which sets in water, and it set between the socket end of one pipe and the spigot end of the adjoining one. The material is formed so as to screw one into the other, which gives the necessary play should any settlement take place. They are undoubtedly an improvement on an ordinary cement joint.

Sykes' patent sewer-gas interceptor consists of an intercepting trap placed in a chamber and hermetically sealed. Channel pipes are entirely avoided by the use of patent screw stoppers fitted to the pipes in such a way that they can be got at with ease by means of rods. By this system it is impossible for the chamber to fill with sewage and become a foul cesspool, the splashing of sewage and the insanitary conditions of an ordinary manhole which relies on an "air-tight" cover is thus avoided. The one weak point in an ordinary system of drainage is the manhole, and Sykes' patent interceptor seems to have rendered this state of things unnecessary. It is especially suitable for vaults or basements which are used in towns as offices.

Sykes' patent yard gully is of good form and possesses in port quantities of large grate area to take away storm water, small surface of water exposed, and cleansing arm fitted with a screw stopper of the same character as the pipes already described. They are also supplied with back and side inlets to receive rain water pipes.

A very complete exhibit is also made of inspection pipes and blocks. The inspection shoes for rain-water and soil pipes are excellent, and supply a much-needed want. The foot of the soil-pipe at its junction with the earthenware is a place which is liable to get clogged, and to remedy this and enable it to be easily accessible, a block is formed with flat bottom to rest on concrete, the upper part being fitted with removable screw stopper rendered air-tight by having a good fillet of Russian tallow in the socket before screwing up. An ordinary screw stopper inspection for insertion in the drain at different points is also shown. "Sykes' Improved Disconnecting Slipper" has been designed to meet the requirements of the Local Government Board to discharge sink and bath wastes and rain-water pipes 1 ft. 6 in. from the gully in order to prevent noxious gases escaping through the pipes into the dwelling. It is an improvement on the ordinary gully. We

have no space to speak more fully of the exhibits of the Albion Fireclay Company except to remark generally of the care with which the exhibit is planned.

Messrs. George Jennings & Co. exhibit drain-pipes and also the well-known Stanford patent joints.

Mr. George Freeman exhibits a working model of Freeman & Shoesmith's system of close-sealed house-drainage, which, we are informed, has been adopted by the Brighton Corporation. It is an attempt to render manholes less offensive and dangerous by having no channel pipes in them. The pipes are whole bore, covered with cement, and, where necessary, an inspection eye formed by inserting a piece of glass in the pipe, covered with a cement joint. It does not appear so good a method as the screw-stopped mentioned above.

Messrs. Charles W. Ontram & Co. exhibit a patent coupling for water-closet flush and soil-pipes, consisting of a split brass collar and the "Aquarius" wash-down closet, the chief feature of which is that the joint between the soil-pipe and closet is made on the drain side of the trap, and, being well below the trap level, this insures that it is left sound. The outlet of the earthenware trap is surrounded with an annular groove, or recess, into which the spigot of bend or junction is inserted. The joint itself is made by simply pouring in liquid cement until the groove is full. This form of closet adapts itself to any form of outlet, as 8 lb. lead hends with brass collars wiped on are supplied. It seems that the joint would be sound, but there is always an objection, in our opinion, to having a lead pipe within the house, as a nail hole or other abrasion readily admits sewer-gas.

Messrs. Dent & Hellyer have only one exhibit, the "Bi-syphon" four-gallon flush hospital pan and slop sink, which seems to effectively answer its purpose.

Messrs. Joseph Cliff & Sons exhibit some of their well-known porcelain baths and sinks, also white glazed channels and socket-jointed pipes.

Messrs. Broad & Co. show, amongst other things, a sink with tinned copper strainer of a somewhat novel form; a patent locking stopper for intercepting trap; and their impervious Bristol ware pipes, which, it is maintained, are superior to tested stoneware pipes, being made of a closer description of clay.

Haywood & Co. Limited, show various sanitary pipes and connexions, especially their patent lock-joint formed by means of a rebate.

John Knowles & Co. have an important exhibit, and a rather important test of the "Vitrifine" stoneware pipes is published by them. It was made by W. H. Stanger, M.Inst. C.E., on three 6-in. pipes. Two of these burst at an internal hydraulic pressure of 250 lbs. per square inch, while the third stood the abnormally high pressure of 625 lbs. per square inch before it burst.

The "Loco" Drainage Apparatus Company, Limited, have some very useful sanitary fittings, such as baths, lavatories, &c. Of these the self-cleansing overflow pipes seem worthy of note. The system consists of a syphonic arrangement which is attached to the waste-pipe in such a way that when the water in a basin has reached a certain height it automatically empties itself by means of the waste-pipe. The foul accumulation of soapy matter within overflow pipes is thus avoided, and the apparatus seems sufficiently simple to render it unlikely to get out of order. Other manufacturers of the same company we have previously spoken of, especially the "Deflector" bends for the junction at the soil pipes, which seems well adapted to lead the sewage well into the horizontal drain.

The "Loco Cement Badger," for drawing through each drain pipe as laid, in order to ensure the removal of cement "crumbs" from the interior of newly laid drains, is useful. It is provided with a flexible shaft in order to enable it to be pulled round curves.

Messrs. Yates, Haywood & Co., show some of their well-known baths and fittings of excellent manufacture.

Messrs. G. & T. Haigh also exhibit some excellently finished glazed sinks.

The Sanitary Bath Co., Limited, have on view their patent steel clad copper baths, of the same price as ordinary galvanised iron. They have the advantage of requiring neither painting nor enamelling, no wood casings are used for the accumulation of dirt, and it is said—though we do not see that we can endorse the opinion—that it does not cool the water as iron or porcelain does. Surely earthenware is one of the best non-conducting materials for baths.

The baths are certainly preferable in every way to enamelled iron, and the combined bath and lavatory basin should be of use in small houses.

Messrs. Candy & Co. have an important stall of improvements in drain pipes for surface drainage, and we noticed especially their buff vitrified Olympia stable bricks for surface drainage, similar to the buff vitreous stable bricks used by the War Department for cavalry stables.

Messrs. T. Mitchell & Co. have an interesting collection of sanitary improvements. We note especially Cassell's patent wash-basin range for schools, reformatories, factories, public works, &c., where large numbers of people have to wash in a short space of time. The invention consists of a trough in the bottom of which are formed a number of small basins just large enough to admit of immersing the hands freely; a copper pipe passing below is connected to the bottom of each basin by a brass inlet. When, at washing time, the attendant turns on the water supply, it fills each basin and overflows all round the rim into the trough, whence it is discharged by a grated outlet to the drain.

Messrs. Mitchell's drain testing and cleaning appliances are worthy of inspection, as also Chisholm's patent pneumatic system as applied to lavatory basins. In these the water is sustained in the basin by an air-lock formed between two traps. If the water reaches a level within $\frac{1}{2}$ in. of the basin top, it overcomes the air-lock and is immediately emptied, the discharge being syphonic in action; the trap and waste pipe are, therefore, well cleaned out every time the basin is used.

Moule's Patent Earth Closet Company, Limited, have an exhibit of their well-known dry-earth closets. No new improvements are to be noted, but the working models are excellent as a means of explaining the system which is shown as applied to the military depots, schools, light-houses, and coastguard stations; a large number are also fitted to torpedo-boats, as it is found the most sanitary way of dealing with excreta on board ship.

Roberts' vertical rain-water separator, which is exhibited, has often been mentioned in our columns; it still seems to be less known than it should, as it is a most useful contrivance for ensuring a fairly clean rain water supply.

Messrs. Sutton & Company exhibit their patent stoneware channel blocks, which differ from channel pipes in being of thicker section and bedded solid on concrete. The blocks are interchangeable, and the rebated joints enable a solid construction to be effected. They are made in silted stoneware, and are highly glazed with special salt-glazed enamel. The same firm also show Rayner's key joint and double socket pipes, of which there are two types, one with an inner composition and the other without. The pipes are self-centring, and the cement is inserted by means of "pour holes" on the upper side.

Mr. J. Kemp exhibits a working model of what he calls "an improved system of house drainage," in which the object seems to be to do without manholes, their place being supplied by means of pipes being brought to the surface, so that, in the words of the inventor, "the whole of drain can be rodded from water-closet pans, sink gullies, and to and through intercepting trap to main sewer in road from ground surface." We confess we see rather a retrogression than not in this "new and improved system." The long pipes cropping up at intervals along the drain to the ground surface cannot be properly ventilated, and although they are covered by an inspection eye which may or may not be air-tight, the principle is not one which recommends itself to us, and is not an advance in sanitary science. We doubt if any Sanitary Authority would pass it.

Messrs. Geo. Skey & Co. have a good exhibit of salt glazed drain pipes, traps, and interceptors.

Among gully traps of a different type are those shown by Messrs. G. & F. Conzans. They are specially constructed to prevent the back flow of tidal or storm water by means of a movable floating copper ball which seals the pipe if a back flow of sewage occurs. In cases of dry weather where the water in the trap is liable to evaporate, the ball lowers itself to the bottom of the trap and is said to form a seal in this position, though we doubt whether sewer gas would be stopped in such a case. We think that the inventors have perhaps claimed too much in this particular, but it is a useful invention as regards the back flow of sewage.

Durran's "kallio" cistern is an improvement in household cisterns used for drinking water, possessed of an air-tight cover and arranged so that the water is discharged into it by sprinklers,

thus thoroughly covering the sides of the cistern each time. It is certainly an improvement on the ordinary cistern, to which dirt and dust have free access, and in cases where a constant supply is not to be obtained, is almost necessary. With a constant supply, however, it is always best to take drinking water direct from the main.

Mr. A. T. Cooper exhibits a simple and effective vacuum pump for use in unstopping drains.

Windows.

Turning to improvements in windows, we think that the days of the ordinary double-hung sash should be numbered. Up to within five years ago it has withstood all efforts at reform, when the N.A.P. Window Company introduced their system for enabling the outside of the window to be cleaned without risking the life of the cleaner. The N.A.P. are represented at the Exhibition, and we have so lately described their system with illustrations,* that we need not refer to it again. The other systems are many of them founded on the N.A.P. principles, but vary in details.

Mason's reversible window consists of top and bottom sash, which do not slide up and down, but incline inwards for ventilation. Each sash is hung on patent centres, and it can be opened and fixed at any angle by means of a patent sash-fastening with long bar. It might be described as really a casement, with the advantage which a sash possesses for ventilation.

Mr. Laurance Senger shows his system for reversible windows, but he has an improvement by means of which the sashes are locked when closed or in any position, so that they may be left partly open for ventilation with safety, which is an improvement. This is effected by means of levers, placed at the sides of the windows, no sash-fastener being used.

Another good invention of the same character, but different in detail, is that known as "Jones's Fittings." These are easily fitted to ordinary sashes already erected. Part of one inside bead is hinged to allow the bottom sash to be taken out of frame, part of one parting bead is of brass or iron, attached to the pulley stile with pins; the cords are attached to the lower part of sash stiles, and act as centres to reverse the sashes. King Edward's Grammar School at Birmingham and other places have been recently fitted up with these, which appear simple and effective.

An ingenious invention for doing away with weights in sash windows is shown by Mr. W. Foster. In this a spring is attached to the sash, which works up and down on a rack, against which it presses sufficiently hard to hold it in any position.

Whipping's patent is another which we need not further describe.

Among metal casements, the exhibit of George Wragge contains some excellent workmanship in steel, iron, and bronze casements. The designs for fittings—such as handles, &c., are above the average.

Miscellaneous.

There is not very much exhibited in the way of fireproof floors; Picking's interlocking twin-arch floor we believe we noticed in the last exhibition. Potter's fireproof floor, of which we give a small section, has a freelay tubular

Potter's Fireproof Floor.

covering to the lower flange of the iron joist, the concrete is carried on corrugated iron bent to an arch form. This is a simple and light floor. We do not remember to have seen before the floor exhibited by the Pease's Tubular Construction Syndicate, of which we give a section as used for concrete and for boarded floors; the bearers con-

Pease's Tubular Floor, with concrete filling.

sist of galvanised troughs of nearly circular section. The same firm exhibit also a very workmanlike portable house, constructed in long panels with a slightly curved section (the convex outward), the panels are of wood-pulp board with

a waterproof covering, clipped into an open-joint tube at the meeting edges; this is worth attention. In this connexion, or because it is close by, we may mention the exhibit of the Granite

Pease's Tubular Floor, carrying wooden floor.

Silicon Plaster Co., who show a remarkable hard and quick setting plaster carried on wire mesh.

In regard to damp-courses, one of the most interesting is that known as "Callender's Pure Bitumen Damp Course." It is a composition of Trinidad asphalt on a framework of jute. It is very pliable, and of course absolutely waterproof. It has been used extensively on the District Railway extension from the Mansion House to Aldgate, the new Waterloo and City Railway, the Tower Bridge, and is also being used as a lining to water reservoirs. It is practically jointless, and is used as an ordinary damp-course in buildings, and also as a covering to existing damp walls. A model of a brick wall standing in water is shown, and is a good illustration of the way in which the water soaked up by bricks is stopped by the damp-course. The material is also used as a covering for flat roofs. Messrs. Anderson & Son, Limited, exhibit some samples of a foundation felt or damp-course, which is made in slabs 2 ft. 8 in. long and of various thicknesses to suit the wall. Its price, 12d. per square foot, should make it as cheap as any damp-course.

In regard to floor coverings, the Exhibition is comparatively weak, but a very good exhibit is the "Perfected" system of wood block flooring (Charteris & Longley Patents) by which each block is held to its neighbour by dovetail rebates and tongues formed all round the lower edges. It is simple, and therefore superior to the systems which depend on dowels, which may be left out by workmen. Some good combinations of different woods are shown in various patterns. Many of the New Zealand examples should come into use. The Cork Pavement Company show some examples of their pavement. It is made of cork and bitumen; its qualities are stated to be non-absorbent, noiseless, warm, and elastic. It has been used for drill halls and churches, and also for roadways, as at Liverpool-street Station. Lyte's Metallic Woven Tread Company show their patent, which we have before described, and which consists of lead run in between iron weaving, and fixed in squares of about 1 1/4 in. in a metallic hacking for stair treads. It has been used at Sloane-square Station, among other places.

Wilson & Co.'s patent "safety" pavement lights are an improvement on the ordinary pavement lights, which are objectionable because of the projecting ironwork. In this case the iron divisions are filled in with lead, which is flush with the surface of the glass. Some roof-lights are also shown. In these the condensation water is led off by small gutters formed in the ironwork supporting the glass, and the glass being of arched form, this enables it to be accomplished easily.

There is a small collection only of locks, and the stand of Messrs. Joseph Kaye & Sons is, as usual, interesting in new inventions and adaptations. Some of the locks and fastenings for exits doors in theatres and the like show improvements, especially in meeting the requirements of the London County Council and other bodies for automatic opening, and the exhibit is worth inspection.

Machinery.

The machinery at this exhibition does not, as such, possess much interest. It consists mainly of brickmaking apparatus, two sets of exhibits of wood-working machinery, a few gas engines, and a portable steam-engine. Oil engines are conspicuous by their absence, which is to be regretted, as, for outlying jobs, we should have thought they would be found very useful in building operations.

Of the gas engines, that shown by A. Dougill & Co., Limited, of Leeds, struck us as worthy of notice. It is a 15 nominal h.p. "Otto" engine, giving 36 brake h.p., and is fitted with Green's self-starter, which appeared to work remarkably well. It is claimed that the governor is very

sensitive, and suitable for electric light service. The absence of the peculiar noise made by the Crossley engines on the ignition stroke is very marked. The "Smithfield" gas engine, made by Thos. Green & Son, Limited, of Leeds and London, drives a small electric light installation with good results, and seems suitable for this purpose. The "Stockport" engine driving the exhibits of Mr. Sidney Butler does not call for any comment.

The one and only steam engine is sent by the well-known firm of Messrs. Ransome, Sims, & Jefferies, Limited, of Ipswich. It is a 20-h.p. portable, and is of the usual pattern supplied by these high-class makers.

There are two exhibits of electric fans, viz., the Blackman Ventilating Company, London; and Messrs. Matthews & Yates, Limited, London. The motor of the Blackman fan seems very cumbersome, and, being placed round the axis of the fan, of necessity considerably impairs the efficiency of the machine. In the Cyclone fan by Matthews & Yates, Limited, the motor is much smaller and less open to objection; but in each case there is room for improvement in detail both as regards appearance and design.

The brick-making plant shown by Mr. William Johnson and others is not of very general interest, and comprises wire-cutting machines, presses—both hand and driven—and also crushers. At Mr. Sidney Butler's stand may be seen wood-working machinery for planing, squaring up, chamfering, thickening, straight and circular moulding, sawing and morticing; a very handy little tool being shown for trying-up and planing.

Messrs. J. Sagar & Co., of Halifax, have machines on exhibit for similar purposes, together with an automatic plane-iron grinder, suitable for knives up to 26 in. long, which should be found a very useful adjunct to planing machines.

Electrical Work.

It is surprising that electrical firms have not taken more advantage of this exhibition, as the few firms who do exhibit have been well patronised. The two rival firms of Messrs. Matthews & Yates, and the Blackman Ventilating Company have attractive exhibits. The Blackman Company exhibit various new types of motors and fans. In their old type the armature spun on the circumference of the fan, and this type is still retained when a small slow speed fan is desired. The objection to this type according to their rivals, and it seems a real theoretical objection, is that the armature obstructs a larger volume of air than if it revolved near the axis of rotation. This objection, however, does not apply to their new type which is a thoroughly satisfactory motor and fan.

Messrs. Matthews & Yates have an instructive exhibit of cyclone "air propellers" and "blowers," actuated by electric motors. They are very efficient and economical, and are now getting well-known. Both firms are prepared to fix fans with alternate current motors in buildings connected with a supply of alternating current, and to guarantee their efficient action. They also exhibit alternating current motors. This is very satisfactory, as efficient single phase alternating current motors are thought by many electrical engineers to exist only in theory. We were disappointed not to see any of the ceiling fans so common in America, as we believe there is an opening for them in this country.

Messrs. Callender & Company's electrical exhibit will well repay study. The Callender-Webber conduit system was one of the earliest as it is one of the best methods used for laying down electric cables. The Chelsea Company used these conduits as early as October, 1888, and although many improvements in detail have been made since, yet the main principle remains the same. Models are also shown illustrating the Callender solid bitumen system, used amongst others by the Charing Cross Company. The methods of making connexion with a concentric main are well illustrated.

The samples of cable exhibited show what great advances have recently been made in their manufacture. Samples are shown of the three conductors of a three-wire supply station contained in one cable, and yet insulated from one another, and of triple concentric cables. We were particularly struck with a sample of "locked coil" armoured cable which is used by the Guildford Electric Light Company. It consisted of a concentric cable insulated with bituminous fibre, then sheathed with lead, and on this there is a solid bed of compounded yarn on which two wide ribbons of mild steel are wound spirally, and it is finally protected by jute yarn well impregnated with a preservative compound. A cable like this could be placed directly in the

* See *Builder* for March 6, 1897, p. 230.

ground, as we understand has been done at Guildford, no skilled labour being necessary except for jointing, and hence there need be very little interruption of traffic, and it is at the same time more economical than the ordinary methods. It would be well if the company published details of the specific insulation of the vulcanised bitumen. To say that it is less than india-rubber conveys very little information, as, according to Mr. Preece, nearly every insulating material has a less specific insulation than india-rubber.

Heating and Ventilation.

In connexion with ventilation and heating there is very little to be seen in the exhibition, and less still that is new.

Messrs. Ewart & Sons have some new forms of ventilators, embracing, however, old principles, but showing good workmanship. The "Crown" ventilator is a very simple arrangement of louvres, and the "Victoria" ventilator is a revolving cowl in which the current is produced by the revolving blades, but abandoning the older form of Archimedean screw.

Mr. Thomas Potterton exhibits his arrangement of hoilers for supplying hot water and also warming the house from the kitchen fire, but that, of course, is not new. He also shows some good safety valves for domestic boilers—the special value of which is the opportunity they offer of examining and testing the action of the valve by means of hollow spindle and cock.

Messrs. Matthews & Yates, Limited, show some fans, both of radial and centrifugal type, with electric motors combined. There is, of course, nothing particularly new in this, but the arrangement and work are fairly satisfactory. The same may also be said of the well-known Blackman Fans.

In stores there is very little that is new. Messrs. Yates, Hayward, & Co. have an improvement on the now usually adopted type of kitchener with lifting fire, in which the lifting arrangement is independent of a rack, and works by a weighted quadrant.

A simple, cheap, and at the same time good, form of safety valve for kitchen hoilers is exhibited by Messrs. Docking & Co., under the name of the "Croydon" safety valve, the essential feature of which is that a metal cone is so arranged as to burst at a desired pressure of from 50 to 65 lbs., and so relieve the tension on the boiler.

Artistic and Decorative.

Among the objects which are of artistic interest there is in the gallery a very interesting series of exhibits. The loan exhibition of architectural drawings is not very large, nor does it include many eminent names; but Mr. J. P. Seddon has a remarkable exhibit, including a number of exceedingly fine drawings and designs, some of which are well known to architects, also a large number of slight but free and clever water-colour sketches, a large fireplace and over-mantel in walnut wood with mosaic panels, &c., of original and effective design in an architectural sense; we do not think the walnut wood goes quite well with the mosaic. He shows also designs for stained glass and some bits of executed glass in Rust's material, which has the merit of presenting rich and varied tints of each colour, instead of a merely flat tint and monotonous colour. The advantage of treating glass in this way is that so much may be done with it without interfering with the surface by any laid-on pigment. There is also exhibited a remarkable cabinet carried out a good many years ago from Mr. Seddon's design, with figure subjects in the panels painted by Madox Brown, Rossetti, and other eminent painters. Mr. Seddon's exhibit also includes some of the decorative details for St. Peter's, Thanet, which was re-opened the other day after decoration from his designs and under his superintendence. Further down, the Carpenter's Company have lent a collection of the models and practical work done by their students. Then we find more architectural drawings (miscellaneous) and a collection of designs and models of the Tower Bridge and of buildings carried out for the Corporation of London—the Council Chamber of the Guildhall, the Guildhall School of Music, &c. South Kensington has lent a small but interesting selection of old work, including a remarkably fine carved wooden frieze and cornice from an eighteenth-century house; a fine lead cistern with raised floral ornament; and downstairs there is also, lent by the Museum, a very fine Classic doorway from a house in Great Ormond-street.

On the other side of the gallery is the most interesting artistic exhibit of all, that of the productions of the Della Robbia Ware Company, of Birkenhead, of which Mr. Harold Rathbone is

the manager and was to a great extent the initiator. This is a most successful revival of an old artistic process, shown in a great many very good designs, and we would draw the attention of architects to the opportunities afforded them here for indestructible and washable sculpture and modelled decoration, with or without colour.

Among the trade exhibits there is naturally not much that comes under the head of artistic interest. The best exhibit in this sense is that of Mr. John White, whose grates and wooden mantels, designed by Mr. Lethaby and Mr. Quennell, have character and originality. Some of the mantels in the collection of Messrs. Bratt, Colbran & Co., who have a very large show at the top of the hall, are good in design and in the colour effect of the tiles combined with them. Among decorative tile work Messrs. Mensaeco & Co. exhibit reproductions of Saracenic detail in wall tiles which are made at Granada of materials found in that neighbourhood, and they have succeeded in giving these a remarkably fine colour and subdued lustre, while we are assured that the colour is so far incorporated in the tiles that it is practically indestructible. Messrs. Pilkington have some one in their firm who has a feeling for delicacy of line and colour in tile design, or they have known where to go for designs; some of their exhibits are exceedingly good in this sense. The Anaglypta Company and Messrs. John Lane & Sons exhibit a good class of wall decorations.

Among materials or processes which lend themselves to decorative work is that of the Mural Decorative Company, who exhibit decoration in what appears to be plaster, but which is a material lighter than plaster and apparently harder and less brittle. The United Asbestos Patent Company show specimens of incombustible material moulded into decorative panels and ceilings with the effect of rather coarse plaster work, as the material does not apparently allow of sharp definition; but for large spaces and for decorations on a large scale this would be no drawback—it might even be an advantage. The Opalite Company and the Opal Tile and Decorations Company are two different firms which exhibit what seems to be practically the same thing, viz.: thin glazed tile surfaces for affixing to walls, giving them the appearance of glazed brick. We should be rather afraid of these thin slabs coming off; it is true that in that case they can be replaced much more easily than a glazed brick. "Emdeca" appears to be an employment of zinc plaques for ceilings and walls in imitation of tiles; the method may be useful in getting a decorative surface, but why imitate tiles? The "Cameo Wood Working Company" treats wood under pressure with steel dies so as to produce the effect of a light-coloured carved wood in low relief inlaid into a darker ground; and though we fear we cannot agree that it produces an effect "quite equal to superior wood-carving," it has its merits. A good deal is done with it for decorative wooden covers for electric wires.

There is little wrought iron work; the general character of that exhibited by Mr. Geo. Wragge is good, and has the merit of being comparatively broad and simple in style. The exhibit by the Expanded Metal Company serves to show that this material combines light appearance with strength, for metal fencing, &c., in an unusual degree.

Illustrations.

ALBI CATHEDRAL.

THE foundations of the present cathedral of Albi, which is dedicated to St. Cecilia, were laid in 1282; and the main building was completed late in the fourteenth century. The whole, as it now stands, was finished in the last years of the fifteenth and the early part of the sixteenth century, when the rich and picturesque south porch, or baldachino, was erected together with the stone rood-loft and choir screen, the stalls, and the frescoes. This varied workmanship renders Albi particularly interesting; in the porch, screens, and rood-loft the influence of the Gothic of Northern France makes itself felt; the statuary and carving in wood and stone are Flemish; the frescoes are Italian. Moreover, the cathedral is not only a church, but a fortress. The great west tower is nothing but a donjon keep. The exterior buttresses rise from a glacis, vertically, in the shape of semicircular flanking towers; these towers are connected by an embattled machiolated parapet. The whole aspect of the cathedral, externally, is castellated;

military, not ecclesiastical. In fact, the cathedral is only one member of a chain of military works which, including also the fortified palace of the Archbishop, extend to the ramparts which crown the escarpments that rise to the north from the Tarn. The fierce religious struggles which ended in the extermination of the Albigenes give the key to this striking exterior as well as to those of such churches as Les Stes. Maries and Esnandes. Internally, the cathedral is Gothic, but it is not the Gothic of England and Northern France. To begin with, the whole church is brick, except the window tracery. Then there are no aisles; simply one vast nave 60 ft. wide. Moreover, the buttresses are almost entirely internal; but inside the church, and it is no small merit of this system of construction, that the principal members on which the stability of the intersecting vaults depends are shielded from the weather. It is Gothic indeed; but it is no derivative of the basilicas of the early Christians of Rome, or of the Romanesque monsters of the eleventh and twelfth centuries. It is simply the basilica of Maecentius or the Hermæ of Caracalla translated into thirteenth century Gothic. These Roman-Gothic buildings of the South of France deserve much more attention than they have received; and it may well be that from study of these, rather than of the trite types of Northern Gothic, our modern churches might gain greatly in freshness and power. At any rate, they are far more suitable for congregational worship than the well-worn basilican plan. Great aisleless churches of this character may be seen also at Comminges, Lodive, Ferrignan, Condom, Caracassonne, Gallac, Montpezat, and Moissac.

The view given in this illustration is of a portion of the interior arcaded treatment between the buttresses, and close to the end of the choir screen, and is reproduced, with the permission of author and publisher, from a portfolio of large illustrations of French architecture issued by Herr Cornelius Gurlitt, under the title "Die Baukunst Frankreichs," and noticed in another column of this issue. The view shows what an amount of rich and delicate detail is combined with the solid and massive construction of Albi Cathedral.

ILLUSTRATIONS OF EIGHTEENTH CENTURY WORK.

THE illustrations on this plate are published in connexion with Mr. Gotch's paper read at the Architectural Association, and printed on another page, on Eighteenth Century work.

The view of Versailles is reduced from an old French print, and is of some interest in showing, though in a somewhat crude manner, the complete laying out of the grounds and buildings at the time they were constructed.

The photographs from Drayton show the picturesque entrance gates, with the very finely treated eagles on the piers, and the elegant entrance doorway from the inner court.

CHURCH OF ST. OSWALD.

INTERNAL EASTWARD VIEW.

THIS was a competitive design for a church on a flat and open site, to be built in brick with Monk's Park stone piers, mullions, and tracery, &c., and to seat, with supplementary chairs (not shown on plan), 700 people. The organ gallery to be placed over the morning chapel, and approached by a stair-turret at south-east angle.

The internal roof was to be a boarded and ribbed wagon vault. Sedan or other grey-green slates were to be used for external covering. The walls to be faced externally with red stock bricks.

The plan was arranged to make the most of the congregational area. The cost is estimated at about £8,000. E. P. WARREN.

THE CROFT, HIND HEAD :

THIS house was built a few years ago near the highest part of the Hind Head. The bricks and tiles were of the district, the former being the many-coloured clamp-burnt ones from the fields of Messrs. Gammon, of Petersfield, who built the house, and who also made the tiles, which are of a soft, rich colour. Drinking water to be obtained from a deep well, the general supply for bath, kitchen boiler, &c., being rain water, pumped up. The architect was Mr. E. J. May, of London.

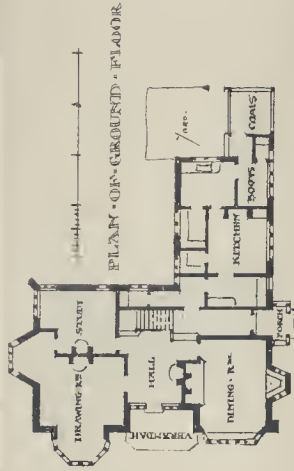

RESIDENTIAL FLATS, GREEN-STREET, W.

THIS building has been erected from the designs of Messrs. Henry S. Legg & Son, architects, of London, and consists of business premises on the ground floor and basement, entered from North

Audley-street, and residential flats over, approached from Green-street. Each suite has its servants' rooms on the top floor, with separate staircase. The building is faced with brown Portland stone and red bricks, and the roof covered with green Westmoreland slates. Messrs. Bywaters are the contractors.

DRAWINGS FOR THE ROYAL ACADEMY.

As before, we shall be glad to take charge of and deliver at the Royal Academy any drawings sent to us in time to be photographed before the day of delivery, with a view to subsequent publication in this journal and in the "Builder Album of Royal Academy architecture."

We cannot accept any drawings sent to this office later than Saturday morning March 27, before 12 noon.

Architects sending drawings are asked to give special attention to the following requirements of the Royal Academy:—

1. All frames must be gilt.
2. Every drawing must have a label on the back, giving legibly the title and the artist's name and address.
3. Every drawing must have a similar label attached to the frame by a card so as to hang over in front.
4. Every drawing must be accompanied by a letter addressed to the Secretary of the Royal Academy, and signed by the artist, containing the artist's name and address, and the title or titles of the drawings sent. If more than one drawing is sent they must be distinguished by numbers, and the corresponding number must be repeated in the labels fixed to each drawing.

N.B.—We cannot undertake to supply or affix labels when omitted by the oversight of the sender.

ARCHITECTURAL SOCIETIES.

ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.—The eighth meeting for this session of the Discussion Section of the Architectural Association, took place at 56, Great Marlborough-street, W., on the 24th ult., when Mr. Henry Rose read a paper on "Dodges." Mr. Rose explained that he intended to draw attention to clever expedients in building, not to nefarious practices. The perfection of a "dodge" was its simplicity; a simple "dodge" was often far more effective than a "patent," the real utility of the latter being often very doubtful. Mr. Rose referred to "dodges" of nature and of primitive man, and also described many simple but highly useful ones in connection with building. In the discussion which followed many descriptions were given of "dodges" useful and "dodges" of doubtful utility. A hearty vote of thanks was accorded to Mr. Rose for his paper.—On the 10th inst. Mr. C. V. Johnson read a paper on "The Canons of Architectural Criticism," in which he drew attention to the necessity for criticism, and of rules by which criticism should be guided. Buildings were not to be judged by empirical rules of proportion nor on archaeological grounds. Design should be based upon study of historical principles, not of historical form, and upon the requirements and ideals of the present time. The questions the critic had to ask were whether the plan was in perfect conformity with the requirements of the building; whether the parts were so disposed as to make the most of their artistic possibilities in the way of contrast of masses, of lines, of voids and solids, and of light and shade; whether the construction was truthfully expressed or whether features designed for other circumstances were imported and used in positions for which they were totally unfit, and in which they were unmeaning; whether the design was in keeping with the importance of the building; and finally, whether it was, as a whole, harmonious and in unison. The importance of proportion and of scale were touched upon, and a warning given against criticising details apart from, and forgetful of, the whole composition. Sublimity and dignity were praised and preferred to picturesqueness and grace. Finally, various constructive forms were discussed as to their artistic capabilities, and the author gave it as his opinion that no materials could be said to be inartistic, but that what was at fault was the lack of capacity of using the materials in an artistic manner by the artist himself.—The next and last meeting of the session will take place on April 28, at 7 p.m., at the same place, when Mr. Edward Thornton will read a paper on "Elementary School Architecture."

EDINBURGH ARCHITECTURAL ASSOCIATION.—The Edinburgh Architectural Association visited on the 13th inst. the Parish Church and Calder House, Mid-Calder, by permission of the Rev. J. D. Moir Porteous and Lord Torphichen, under the leadership of Mr. A. Hunter Crawford. The church at Mid-Calder is of early foundation, probably twelfth century, and the present building is of the sixteenth century, with modern additions. Attention having been drawn to the architectural features and the armorial devices, the party, after a thorough examination of the building, proceeded to Calder House. After Mr. Crawford had given an historical description of the house, which partly dates from the thirteenth century, and contains many very valuable paintings, the party was shown through the house by Lord Torphichen, who drew attention to various features of interest, and especially to the paintings in the drawing-room, formerly the large hall. The visit was brought to a close by a vote of thanks, proposed by Dr. Rowand Anderson, to Lord Torphichen and the Rev. J. D. Moir Porteous. St. Cuthbert's, East Calder, was also visited. This ruin is of twelfth century date, and the south wall and two gables are still partly standing.

ARCHITECTURAL SECTION, GLASGOW PHILOSOPHICAL SOCIETY.—Under the auspices of the Architectural Section of this Society, Mr. David Barclay, architect, delivered a lecture recently on "The Architectural Outlook." The lecturer said that former ages had left a legacy of great works in architecture which were possible under the conditions of civilisation then existing. But present conditions of civilisation, while spreading culture and comfort and art surroundings among the people, were not likely to demand, and, therefore, would not give opportunities for creating buildings which would rival those of the past. Facilities for studying the past and for art and science education were greater at the present than at any former period, and a high level of artistic ability was very general, and must tend to a higher average of good work. The highest level, however, would depend on genius—to which education alone did not prove an open Sesame. The conditions of the abused system of architectural competition had reached as low a level as possible, and showed some chance of mending, and in the meantime, and immediate future, there was an abundance of work in which he hoped all might have some share and do something for art that would leave a good impression of the times of the good Queen Victoria. At the close Mr. Barclay received a cordial vote of thanks. At the annual business meeting of the branch Mr. McGregor Chalmers was re-elected President; Messrs. McBean and Carlton, vice-presidents; Mr. William Ilowitt, treasurer; and Mr. Lindsay Miller, secretary.

GLASGOW SCHOOL OF ART.—The fourth lecture of the course on "Hellenic Architecture" was delivered last week by Mr. W. J. Anderson, the subject being "The Culmination in Attica," with special reference to two temples of Athens. The situation of Athens in the bi-polar system of Dorian and Ionian life led to a coalescence of the elements of each, a fact to be read not only in the adoption of each order, but in the details of almost any one example in Athens. In the first place two types were selected for analysis and contrast, the temple of Athene Polias, or the Parthenon, and the shrine of Athene Nike, better known as the temple of Wingless Victory. Of the former, its relation to the older temples, its plan, purpose, lighting, decoration, &c., according to recent investigations of Dr. Dörpfeld, were explained, and Pausanias' description supplemented by various restorations of the interior, with its great image of gold and ivory. The architectural design evinced in the arrangement of the Panathenaic procession was noted, the subjects of the pediment sculptures studied with the aid of photographs and restoring, and the researches of Mr. Penrose into its details, optical refinements, and proportions were summarised.

DEVON AND EXETER ARCHITECTURAL SOCIETY.—In connexion with the Exeter Branch of the Devon and Exeter Architectural Society, a lecture was recently given at the Athenaeum, Exeter, by Mr. Charles Cole, President of the Exeter Camera Club, on "Architectural Photography." There was a preliminary description of the camera, with hints upon its manipulation, especially with regard to the lines and planes of buildings. The lecturer advocated making photography at once a handmaid of architecture, as well as a companion, for it gave the architect immense facilities for studying the buildings of other countries, and delineated faithfully examples of both ancient and modern work. The old

buildings should be kept in mind for those who followed, and surely this was legitimate work for the architect; but they should hand down pictures of how they lived, and what their streets looked like now, together with the dress of the people and street trades and sights. The use of the camera in cases of easement was shown. In regard to sketching and kindred matters, Mr. Cole did not think the camera should take the place of sketch books and pencil, but they might be used in conjunction. To sketch well was for architects a necessity. There was no doubt that some possessed the faculty more than others, and every architect amongst his other acquisitions should have an intuitive love for, and a knowledge of, where to look for the beautiful. He claimed for photography, if used aright, and with an earnest desire to turn out good work, that the operator would naturally turn to picture-making, and therein was a great field of learning. The architect must possess and train the faculty of artistic sight. Pictures were to be found in everything, and amidst most unpromising surroundings. A large number of lantern slides were shown on the screen. A vote of thanks was proposed by the Vice-President (Mr. James Crocker) and seconded by Mr. C. J. Tait.

COMPETITIONS.

CENTRAL FIRE-ENGINE STATION, ABERDEEN.—On the recommendation of the Referee, Mr. Munce, Belfast, the first premium (50*l.*) in this local competition has been awarded to Mr. A. I. L. Mackinnon, architect, Union-street, and the second (25*l.*) to Mr. J. A. Oeg Allan, architect, View-terrace. The buildings in the design placed first will be of granite. The total cost, including accommodation for lighting and weights and measures departments, is estimated at 10,400*l.* The first premium merges in ordinary commission if Mr. Mackinnon is selected as architect of the station.

WORKHOUSE, SHOREHAM.—At a recent meeting of the Steyning Board of Guardians the question of employing an architect in respect of the proposed new workhouse at Kingston-by-Sea was discussed. A report of the committee was received in which nothing was recommended as to the appointment of an architect.—Mr. Woodman moved that architects in practice in the towns of Brighton or Hove be publicly invited to send competitive plans for the proposed new workhouse. Mr. Bates seconded. As an amendment Mr. Washington proposed that Messrs. Clayton & Black, of Brighton, be nominated for engagement. Mr. Grandy seconded. In the discussion which ensued Mr. Woodman withdrew his resolution, and Mr. Washington's proposition became the motion before the Board. As an amendment to this, Mr. Woodman proposed that the services of an expert be sought. On being put five only voted for the amendment, Mr. Washington's proposition being carried.

ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—At the meeting of this Institution on the 12th inst., a paper on "The Protection of Buildings from Fire" was read by Mr. W. Rushworth Beckton, Chief Engineer of the Hotel Cecil. The author said that the all-important question of protection from fire, though essentially engineers' work, was too often left in the hands of less experienced persons without due regard to the peculiar circumstances of the case. On the other hand, when this experience was available, it was sometimes overruled by the architect or some higher authority who would not allow the decorations to be interfered with, the result being that the apparatus (if provided at all) was placed in some obscure position, at once losing its necessary characteristic of accessibility. Notice was given in the paper of first-aid appliances, of which the primary object was the confinement of a conflagration to the seat of outbreak, or extinguishing it in its first stages. In selecting the system to be employed, consideration should be given to the form and description of building—its content, the assistance available upon emergencies, and occasionally the nature and contents of surrounding properties. Irrespective of the circumstances attending the building, or the apparatus to be employed, water was generally accepted as the most useful agent for the extinction of fire. Its source and extent of supply were, therefore, questions of the highest importance. In all cases the supply should be duplicated by an ample storage, sufficiently elevated to give the required

head. In illustration of this method a diagram was exhibited, in which the fire main was shown connected to an elevated tank by a valve equal in area to the main, automatically closing by a float rising with the water level in the tank, and in like manner opening upon the pressure in the main being released by the opening of a hydrant (or sprinkler) at a time when the primary source of supply failed. In referring to the insufficient pressure obtainable upon upper floors, the author showed how this could be augmented by various apparatus. In buildings where hydraulic power was used, and the ordinary supply was at too low a pressure for fire purposes, the principle of the injector could be employed to increase it. In selecting positions for hydrants, &c., due regard should be paid to the escape of the operator in the event of his efforts being of no avail. As many buildings of most approved fireproof construction had been utterly demolished by the ravages of fire, it might be averred that no edifice was really fireproof, though the endeavours to achieve this ideal construction had resulted in increasing to a very great extent the facility of confining a conflagration to where it had broken out. Fireproof doors were usually made of iron, but these were found to buckle under severe heat, causing openings through which flame and sparks could pass. An improvement was found in building the doors in layers of wood battens firmly braced together at cross grains, and sheathed with thin tinned steel plates so interlocked as to allow for expansion—yet excluding the air from the wood. Doors of this description had stood very severe tests, showing only a very shallow charring of the timber.

ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—The eighth meeting of the session of this Association was held on the 17th inst., Mr. C. H. Compton, V.P., in the chair. The hon. secretary announced that it had been decided to hold the Congress this year at Conway, upon the invitation of the Mayor and Corporation. Mrs. Collier read a paper on the church and painted glass at Bowness-on-Windermere, which edifice, she said, appeared not to have received as much notice from antiquaries as it deserved. The church is dedicated to St. Martin, but the actual date of its erection is not recorded. It is a very ancient structure, and some of the materials employed in its construction have been traced to Roman origin, and were probably brought from a Roman station which is known to have been established in the neighbourhood. Like most of the churches in the Lake district it is simple and rudimentary in construction, consisting (until the recent additions) of a nave and aisles, chancel, and a low, square, embattled tower at the west end. The east window is of late Perpendicular work without tracery or other enrichment, and the arches, capital and base of the columns, are equally devoid of all ornamentation, and until recently were covered with successive coats of whitewash. In the year 1864 some curious inscriptions and texts were accidentally discovered painted on the walls beneath the coats of whitewash. They consist of quotations from Robert Openshaw's catechism, and relate to the Sacraments of Baptism and the Lord's Supper, and belong to the time of James I. The chief feature of interest in the church is the painted glass in the east window, which was brought into prominent notice during the process of restoration in 1873. This glass is considered by competent authorities to date from about the year 1480, and to have been originally in the Priory of Cartmel, near Grange, whence it was removed to Bowness about 1528. A second paper was read by Mr. Patrick, hon. sec., in the absence of the author, Mr. H. Syer Cuming, upon "Mead and Mead Vessels." The author traced the origin of the beverage known as mead or methglin, so much appreciated by the Britannie tribes and the Teutonic nations, from the hydromel of the Classic age. The vessels in which the methglin was stored, and in which it was brought to table, were particularly described, and drawings illustrative of examples of mead cups and pots, several of which are in the author's collection, were exhibited. These vessels are reported to have been in early ages amongst the Celtic chieftains of gold and silver, and jewelled, as well as of glass, but those which have come down to our days are made of various woods wrought out of single blocks of beech, oak, elm, pine, walnut, willow, sycamore, and yew, sometimes ornamented with incised lines, and some bearing dates and initials.

SOME DIRECTORIES FOR 1897.

We have received from Messrs. Knight & Co. (Fleet-street), a copy of the "Local Government Directory, Almanac and Guide for 1897," which is a neat, compact, and well-arranged edition of a very useful work. The volume includes the following lists:—Unions formed by the Poor Law Commissioners and the Poor Law Board, and Places under Local Acts; Town and Urban District Councils (including County Borough Councils); Rural District Councils, Parish Councils, Metropolitan Sanitary Authorities; School Boards, Burial Boards, &c. The information contained in this form, as to officers, populations, &c., appears to be very complete, and for purposes of reference by those concerned in local government matters the work is specially useful.

Sell's "Directory of Registered Telegraphic Addresses for 1897" (Henry Sell, Fleet-street), is the twelfth annual issue of a work which is compiled from official lists supplied by the authority of the Postmaster-General. More than 40,000 new registrations, alterations, &c., have been made since the last issue was printed, and in order to maintain the usefulness of the work the publisher issues supplements from time to time during the year. In addition to the various articles on British trade and foreign competition, there are included articles and figures for 1895 and 1896 relating to the following industries:—Iron and Steel, Coal, Petroleum, Textiles, Chemicals, &c. The directory contains other information of general interest.

"The Electrical Trades Directory and Handbook for 1897" (The Electrician Printing and Publishing Co., Limited, Salisbury-court, Fleet-street) is the fifteenth annual issue of a useful book of reference. The issue contains, for the first time, a large sheet table, giving technical particulars of the electric railways and tramways of the United Kingdom; regulations regarding the free supply of incandescent electric lamps; the new regulations of the London County Council for electric meter testing; tables relating to water power, British coal, dry saturated steam, hydraulic heads, feed water heating, gear gearing, &c.; the Buda-Pesth (1896) revision of the International Telegraph Tariffs, which come into effect on July 1 next; a sheet table, giving particulars of the electricity supply stations of the United Kingdom; a revised digest of the law of electric lighting; a digest of the law of electric power (for traction purposes), &c. The book contains other information of interest to the electrical industries. The directorial division consists of over 700 pages, containing a list of individuals and firms engaged in electrical science, engineering, and industry throughout the world.

Whitaker's "Titled Persons" for 1897 is a new work, designed as a companion to Whitaker's Almanac, and its get up is similar to that of the well-known almanac. The ordinary contents of a peerage, baronetage and knighthood, including Dowager Ladies and Titled Issue, are given under a single alphabet; and to this is prefixed an extended list of the Royal Family, together with descriptive and explanatory information. An alphabetical list of country seats is a noticeable feature. The price of the work is half-a-crown.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of this Council was held on Tuesday, in the County Hall, Spring Gardens, Dr. Collins, Chairman, presiding.

Loan.—On the recommendation of the Finance Committee it was agreed to lend the Clerkenwell Vestry 2,900l. for wood-paving works.

Battersea Park-road.—On the recommendation of the Improvements Committee it was agreed that the estimate of 6,241l. 10s., submitted by the Finance Committee, be approved, and that the Council do contribute on the usual conditions three-fourths of the net cost of the widening of Battersea Park-road, between Bridge-road and Carlton-grove, as shown upon the plan forwarded by the Vestry of Battersea, such contribution not to exceed the sum of 6,241l. 10s.

Lincoln Inn Fields, Railings.—The Parks and Open Spaces Committee brought up a report containing the following paragraph, the recommendation, after some discussion, being agreed to:—

"The boundary railing of Lincoln's Inn Fields garden is in urgent need of repair and painting, and the dwarf wall on which it is mounted is also much out of repair. In carrying out these works it is our intention that the present characteristics of the railing and wall shall be preserved as far as possible. We propose, however, for the convenience of the public,

to widen to 7 ft. the existing gateways, which are only 3 ft. 6 in. in width. The length of the railing is about 2,100 ft., and the money necessary to cover the cost of its repair is provided in the estimates for the year. We recommend—that the Council do approve the estimate submitted by the Finance Committee, and do authorise an expenditure of 600l. for the repair and painting of the boundary railing and repairing the kerb of the same at Lincoln's Inn Fields; that the work be executed without the intervention of a contractor, and that the estimate, plan, specification, &c., be referred to the Works Committee accordingly; but that in the event of that Committee not being satisfied as to the sufficiency of the estimate, the Parks Committee be authorised to invite tenders for the work."

Street Improvement (London) Bill.—The report of the Parliamentary Committee contained the following paragraph, the recommendation being agreed to:—

"On June 9, 1896, the Council, on the recommendation of the Improvements Committee, referred it to us to consider and report as to the desirability of embodying in a Bill in the next session of Parliament a clause to the effect that the Council should have henceforth the same compulsory powers of acquiring land for the purpose of improving streets in the County of London as the City Commissioners of Sewers and the district boards, and vestries in London now have under the Act 57 Geo. III., cap. 29. We reported on the reference on January 26 last, and were instructed by the Council to prepare a Bill. We have accordingly had a Bill prepared which in our opinion meets the case, and we have ordered a copy to be sent to each member of the Council. We recommend that the Streets Improvement (London) Bill, as circulated, be approved, and that we be authorised to take the necessary steps for its introduction as a public Bill."

Common Shelters.—The Public Health Committee brought up the following report:—

"We have from time to time had under consideration the question whether common shelters which are not subject to the Common Lodging Houses Acts should be brought within the provisions of these Acts, and with a view to obtaining some information concerning the several shelters in London, Mr. Young, our Inspector, was instructed to inspect premises in which poor people are temporarily provided with night accommodation in rooms which they occupy in common. In submitting Dr. Young's report, the medical officer points out that the premises inspected comprise numerous institutions which differ in their primary object as well as in the character of the accommodation they provide. Some aim especially at the reformation of the character of the inmates, providing them with a temporary home with a view to bringing them under wholesome influences; others have as their principal object the provision of a shelter for necessitous persons, although the moral improvement of the inmates is not lost sight of. In the former especially, efforts are made to assist the inmates in finding work, and in some work is provided for them on the premises. After stating the result of Dr. Young's inspection as regards cleanliness, air space and water-closet accommodation, the Medical Officer gives his conclusions as follows:—'While fully recognising, therefore, the value of the work which is done in connexion with these shelters, I think Dr. Young's report shows the necessity for subjecting those which are found to be inadequate to regulations which shall prevent the accommodation they provide falling below a certain minimum. The fact that they are not carried on for profit does not appear to me to be sufficient reason for exempting them from the requirement that their dormitories shall not be overcrowded, that the opportunities for cleanliness shall be adequate, and the water-closet accommodation of a proper kind. There would, however, be further advantage in the exercise of control over these places such as would ensure that they were fit for the purposes of a shelter before they are actually occupied. Premises are sometimes taken for this purpose which have been erected for an entirely different object, and knowledge is required to determine whether they can be properly adapted for use as shelters. This knowledge has sometimes been wanting, and hence unsatisfactory conditions are found to exist which might have been prevented. Probably the best course to adopt is an application to Parliament for the amendment of the definition of a common lodging-house, so as to bring common shelters within the provisions of the Common Lodging Houses Acts, notwithstanding that the houses are not used for the purposes of profit. An alternative method would be to empower sanitary authorities to regulate shelters much in the same manner as they can houses let in lodgings.' The Council on the 9th inst. authorised us to communicate with the Home Secretary with regard to the amendment of the law relating to common lodging-houses in London, and we are considering the question of shelters in this connexion. As the medical officer's report contains valuable information on this important question, we think it should be placed before the Council and the public, and we have therefore given instructions for copies to be sent to each member of the Council and placed on sale. We recommend that the course taken be approved."

The report was referred back, in order that a fuller report might be prepared.

New Theatre (Norris-street).—The Theatres and Music-halls Committee reported as follows, with recommendations being agreed to:—

"On June 30 last the Council approved of two drawings, dated May 14 and June 16, 1896, submitted by Mr. W. Emden, on behalf of Mr. Henry Jana, showing a site upon which it was proposed to erect a building to be known as the Regent Theatre. In our report on the subject we pointed out that the site of the theatre had a frontage of about 66 ft. 9 in. to Norris-street and of 98 ft. 6 in. to St. Alban's-place, Haymarket; that Norris-street was 28 ft. 6 in. in width, but would be increased to 30 ft. in front of the theatre; and, further, that St. Alban's-place was 41 ft. 2 in. in width. Mr. Phipps subsequently submitted drawings on behalf of Sir Henry Brownrigg, and our report thereon recommending their approval was referred back to us, in order that we might consult the solicitor as to the legal position of the Council in the matter. We have found it necessary, therefore, to reconsider the whole question of the site, and as instructed we have obtained the opinion of the solicitor as to whether it does or does not comply with the Council's regulations. He advises us that in his opinion the site does not comply with the regulations as the thoroughfares on which its boundaries are not thoroughfares 40 ft. and 30 ft. wide as required by such regulations. Having regard to the opinion of the solicitor we now recommend:—

(a) That the resolution of the Council of June 30, 1896, approving the two drawings, dated May 14 and June 16, 1896, be rescinded.

(b) That the Clerk be instructed to forward to Mr. Phipps a copy of the resolution rescinding the approval of the drawings, and to intimate that the Council will be unable to grant a certificate under the Metropolitan Management and Building Acts Amendment Act, 1895, for a theatre on the site in question."

The Works Committee.—In answer to a question by Mr. Cohen, Mr. Hoare, Chairman of the Works Committee, said that the Works Department had refused sixty-one works, the total estimate for which was 142,000*l.* Mr. Cohen subsequently asked for details, and the Chairman of the Committee promised to give the matter his attention.

The Council, having transacted other business, adjourned at twenty minutes to eight o'clock.

THE INSTITUTE OF BUILDERS.

THE thirteenth annual general meeting of the Institute of Builders (Incorporated) was held at the offices, 31, Bedford-street, Strand, W.C., on the 23rd inst., Mr. Geo. Haward Trollope, the President, in the chair.

The following report, on the motion of the Chairman, was received and adopted:—

"In presenting their thirteenth annual report the Council have to record, with great regret, the death of Mr. W. H. Cowlin, of Bristol.

In view of the course taken by the Royal Institute of British Architects in issuing, on their own account, an agreement and conditions for building contracts in a form which the Council of this Institute were unable to approve, the Council have thought it desirable, in the interests of the members of this Institute and the trade generally, to print a form of agreement to be used with the conditions of contract agreed between the Royal Institute of British Architects and the Builders' Society in 1870, which, as the members are aware, have been in constant use ever since. The first prints of these conditions have, however, been corrected as was necessary to bring them up to date in the references to Acts of Parliament and authorities passed or constituted since they were first agreed.

The Council have during the past year been in correspondence with the Surveyors' Institution, with reference to the growing practice among quantity surveyors not to take out in their quantities the labour upon stone-work; but they regret to say that the Council of the Institution do not see their way to taking any action in the matter. They, however, consider it a practice to be deprecated, and state that their examinations include the preparation of quantities in which the whole of the labour in stone-work has to be given in detail, and they think this to be a sufficient indication of their views on the subject.

The Council during the past year were called upon by her Majesty's Office of Works to nominate a quantity surveyor, to act with the surveyor appointed by that Department in preparing the bills of quantities for a new post-office for the Western Central District of London.

The Council desire to express their obligations to the various committees.

The audited accounts of the Institute and the Benevolent Fund will, as usual, be submitted to the meeting.

In accordance with the Articles of Association the President, Mr. Geo. Haward Trollope; one of the Vice-Presidents, Mr. Joseph Randall; the Treasurer, Mr. George Plucknett; the auditors, Mr. Ernest S. Rider and Mr. J. W. Duffield; and four members of

the Council, Messrs. George Burt, G. N. Watts, S. Wheeler, and Geo. Williams retire, but are eligible for re-election; and one other vacancy on the Council remains to be filled by the election of some member at the general meeting. It will also be necessary to elect two auditors, as Mr. Duffield does not seek re-election."

The Secretary (Mr. R. S. Henshaw) then read the audited accounts for the past year, which were adopted. A vote of thanks was tendered to Mr. Trollope for his services as President, and Mr. William Shepherd was elected President for the year 1897-8. Mr. Joseph Randall was re-elected a Vice-President and Mr. George Plucknett treasurer, the following members being elected on the Council, Messrs. George Burt, Thomas Hall, George Kett, Geo. Nelson Watts, Samuel Wheeler and George Williams. Mr. Ernest S. Rider and Mr. Fred Dove, jun., were elected auditors for the ensuing year.

PRACTICAL PLUMBERS' WORK.

THE last of the present course of lectures on matters connected with building at Carpenters' Hall, was delivered on Wednesday by Mr. J. Wright Clarke, whose subject was "Practical Plumbers' Work." The chair was occupied by Alderman Sir Stuart Knill.

The lecturer said that the plumber of to-day was not called upon to do artistic lead-work, though, if architects would design such work, there would be found plumbers capable of executing it. Some excellent lead-work was occasionally carried out at the present time, but, unfortunately, there was very little call for artistic work. His lecture would be confined to practical plumbing as applied to buildings, and sanitary plumbing would not be dealt with. With the aid of a large number of diagrams, of models, and specimens of lead pipes, the lecturer then referred in detail to the proper and improper methods of dealing with roofs, soil pipes, joints, sinks, closets, &c., his remarks applying to such matters as covering the ridge roll of roofs, flashings, drips (which should never be less than 2 in. deep, 2 1/2 in. being better), lead flats, secret gutters, soakers, hips to roofs, covering roofs, gutters, dormers, trap doors, and skylights, &c. In referring to square soil pipes, he remarked that they were sometimes preferred for the sake of appearance, but round pipes were better, since they kept cleaner than square pipes.

The Chairman, in proposing a vote of thanks to the lecturer, said that it was quite evident that some of the past work was of a most artistic character. The remains of the Romans showed that there were some beautiful bits of plumbing to be found underground. Plumbers' work of the time of the Middle Ages showed beautiful ornamentation.

As the lecturer had remarked, plumbers depended now upon the architects for their designs, but in olden times that was not the case. The plumber then, like all other workmen, was an artist, and undertook his own work, and aimed at carrying out his work in the most beautiful manner he could. Whatever a man's work might be, he ought to strive to become an artist in doing that work. If that spirit animated plumbers and others to-day, lead work would be executed as it was in the times he had referred to. In conclusion, he mentioned a course of lectures arranged by the Carpenters' Company on Carpentry and Joinery, to be delivered on the Wednesdays from April 28 to May 26.

Books.

Die Baukunst Frankreichs. By CORNELIUS GUKLITT. Dresden: J. Bleyl. London: B. T. Batsford.

THIS is so far simply a portfolio of illustrations by the Lichtdruck process, issued under the editorship of Herr Guklitt; whether any letterpress is to follow at a later date does not appear. It contains however very finely executed illustrations of ancient buildings some of which have not yet been rendered commonplace by frequent illustration. Among them are the Porte Naine at Besançon, among Renaissance remains, and the remarkable gate of the Capitul at Toulouse, with its curious and characteristic sculpture; a fine house in the Rue des Forges at Dijon, enriched with sculptured wreaths and swags remarkable for their boldness and high relief; and the Hôtel de Monnaies at Avignon, now the Conservatoire of Music.

Among the illustrations of Gothic work there is a fine and very clear photograph of the interior

of Angoulême Cathedral, and another of part of the interior of Albi, a reproduction of which appears among our plates this week. Mr. Batsford is the agent for the publication in England.

Sanitary House Drainage; its Principles and Practice. By T. E. COLEMAN, Surveyor Royal Engineer Civil Staff, M.San.I. London: E. & F. N. Spon. 1896. Pp. xx. and 186, and 97 illustrations.

THIS little book can be recommended for its lucidity, terseness, and general correctness. It covers practically the whole field of ordinary house-drainage and what are generally termed "sanitary fittings," but the information on some points is somewhat meagre; for example, the only washing-up sinks which are mentioned are of stoneware. Here and there we notice the tendency, not uncommon in books on sanitation, to lay down rules which cannot possibly be universally applied and which are more exacting than need be; if every drain-ventilating shaft must be at "a minimum horizontal distance of 18 ft. from any chimney," then farewell staves or chimneys, and farewell Mr. Coleman's frontispiece. Among the "general principles" of drainage, it would be well to include another to the effect that the drains must have a sufficient inclination in the right direction, otherwise "the degree of perfection in which these general principles are carried out will [not] be the measure of the sanitary efficacy of the whole." Soil-pipes less than 4 in. in diameter are now often used. These, however, are details. The book is well illustrated, well printed, and contains a complete index, and is worth buying and studying.

Lockwood's Builders', Architects', Contractors', and Engineers' Price-Book for 1897. Edited by FRANCIS T. W. MILLER, A.R.I.B.A. London: Crosby, Lockwood, & Son. Pp. 516, 200, and clvii.

THIS is undoubtedly the most ably and carefully edited of the three price-books for 1897. In almost every respect the book is up-to-date; it is not without its shortcomings (e.g., no prices are given of copper boilers, copper cylinders, concealed roof-ventilators), but the shortcomings are certainly few in number—unless we take the editor and publisher seriously when they term it an "engineers'" price-book; then, indeed, we should have to draw up a most formidable list of omissions. The "Legal Notes and Memoranda" are clear, concise, and useful, and the supplement of 200 pages on the London Building Act (1894), and other enactments and by-laws in force in London, with "an Introduction, Notes, Cases, and Index," by Alexander J. David, B.A., Barrister-at-Law, will be of service to Metropolitan architects and builders. We can recommend the book, but it would be all the more trustworthy if many of the prices were reduced considerably; many of them are 50 per cent. higher than the ordinary prices which builders accept for good work. This fault, however, is common to all the price books.

A Practical Manual of Building Societies, with Tables. By ARTHUR FAWCETT, Accountant. London: W. B. Whittingham, Ltd. 1896.

THIS work is one which will be useful to officers of building societies. It deals with these bodies, to quote from the preface, "from an arithmetical and statistical point of view." It is concerned not with law but with figures. Thus, pages 62-67 are filled with a repayment table; pages 68-99 are occupied with a revenue account table. The ordinary subscriber to a building society cannot be expected to trouble himself with such details as these, but those who are responsible for the conduct of these societies are bound to understand all the details necessary for efficient management, and it is to this class that this work properly appeals.

Rating: Principles, Practice, Procedure. By P. MICHAEL FARADAY, Rating Surveyor. The Legal Matter Revised by STANLEY A. LATHAM, LL.B., Barrister. London: Estates Gazette Office. 1896.

IT may be doubted whether there is any need for a new book on the subject of rating. If there is, it arises chiefly from the size to which standard works on this subject have grown, and from the want of material which is noticeable in mere handbooks. The work before us has distinctly a merit in this respect; it is fairly full, it states principles, and gives legal references; but it is eminently a book which can well be used by a person who is not a lawyer. There is nothing

more noticeable in regard to this branch of law than the way in which judges have had to decide economic and social questions which are, in truth, fully as capable of being decided by a layman as by a lawyer. Thus, by 6 & 7 Vict., c. 36, literary societies are exempt from being rated. The question then arises, What is a literary society? A judge is no better able to decide this than any other well-educated man. Mr. Faraday treats of this point in his chapter on "Exemptions," and any one who reads it can in a short time obtain a clear idea of the general scheme of exemptions from local taxation. The work is sensible and readable, and its material is comprised in a moderate space.

Correspondence.

To the Editor of THE BUILDER.

HERALDRY IN ARCHITECTURE.

SIR,—As a student of heraldry from my boyhood, it was a real trouble to me to be unable to hear Mr. St. John Hope's paper, but, thanks to your report of it, I am able to realise the treat that I missed, and the excellent discussion provoked by it is a most healthy sign.

In my thirty years' practice it has always been my aim to introduce heraldry wherever I can do so suitably and worthily, but the dislike shown by many well-bred Englishmen to its introduction is both amazing and inexplicable. So different, indeed, to our German cousins, who use it so freely. In Ulm Cathedral, for instance, the shields, helmets, and tilting spears of the Ritters appear, as also on the pews of the tradesfolk. I would like to mention other foreign examples: to wit, the tombs of the prince-bishops at Mayence, full of fine composition and beautiful modelling; the churches and house-fronts in Rotenburg, on the Tauber; the shields in the vaulting of Bayonne Cathedral; in the house of Jacques Cœur, at Bourges; in the Château of Meillant; in the restored Château of Pierrefonds. Nor are we without good modern examples at Cardiff Castle, Easington Park, Combe Abbey, &c.

With regard to the origin of the lozenge used by ladies, surely the reason is that the term "spinster," denoting the old occupation of the fair sex, is set forth by its similitude to the distaff when wound up, a manor in France being described as "en quenouille" when owned by a lady. But perhaps a better account may be forthcoming.

I venture to think that no detail in buildings can be made more interesting, telling, and beautiful (in competent hands full of the science of heraldry) than that which is founded on heraldic lines, it being necessarily full of meaning, which much modern ornament is not.

Fugin, Burges, and Nesfield are names connected with heraldry, of whose works we may be justly proud.

As a rule (of course there are exceptions to it) one may say that the arches of the 13th, 14th, and 15th centuries, when inverted, represent very fairly the shields of those periods: as a factor in "l'art de vérifier les dates," this is worth remembering.

It is good to know that Mr. St. John Hope's paper is to be followed by one on the same subject by Mr. Gochy; and he is a master of it. His own county of Northampton (mine also in the past) is well to the fore in noble examples in churches, houses, tombs, and buildings, and, being nearest to our own day may do much to influence it for good.

E. SWINFEN HARRIS.

COLLECTING AREA FOR A RAIN-WATER TANK.

SIR—Your correspondent "Homo" will probably find that the best covering surface is the chalk itself, stripped of all vegetable soil, and beaten by the hoofs of horses, or "punned" into consistency in the same way as are the bottoms of the small ponds common on the South Downs. It would, of course, require to be kept clean, and renewed occasionally, but would be infinitely cheaper than any artificial covering.—Your obedient servant,

FRANK SILBY.

"SKETCHES OF LONDON STREET ARCHITECTURE."

SIR,—I was sorry to read the letters from Mr. J. S. Williams, in which he asserts himself as the architect of 63, Sloane-street. I was called in as an expert in a recent dispute between the builder and the owner of 63, Sloane-street, and on no occasion was the fact disputed that Mr. Wade was the architect. Mr. F. B. Wade was referred to in the builder's affidavits as the architect and Mr. J. E. Williams as his assistant. Applications for payments and instructions were made to Mr. F. B. Wade, and I saw drawings with notes in Mr. Wade's handwriting.

J. I. WILLIAMS.

Mansion House Farm, Croydon, Surrey.

The Student's Column.

SPECIFICATIONS.—XIII.

GAS FITTER.

THE usual way of specifying gas fitters work is as follows:—The gas to be laid on from the Company's mains to the meter in with ½-in. patent strong galvanised wrought-iron welded tube, jointed in red lead cement with all the necessary bends, elbows, T's, crosses, junctions, stopped ends, diminishing sockets, nipples, and other necessary fittings. The gas tubing to be stout composition pipes soldered at joints, and the gas is to be laid on to the following points. The situation of the various lights are then enumerated and the gas fitter is left to use his own discretion as to the size of pipes and method of running. This can hardly be considered satisfactory, as it leaves the way open for the contractor who intends to scamp the work, and does not give a fair chance to the man whose aim is to carry out his work properly.

Another method specially favoured by quantity surveyors is to specify approximately the lengths of piping required, and to enumerate the number of fittings at p.c. prices, leaving all the details to be settled when the building is in progress by the architect. Still another way of getting over the difficulty is to put the work into the hands of a trustworthy gasfitter as a sub-contractor, and include the amount of his prices as a provisional sum in the specification.

Assuming, however, that the student will desire to know how to specify gas fitters' work with the same degree of care that he devotes to the work of other trades we may proceed as follows, taking some hints from the useful little handbook published by Messrs. James Stott & Co.

Meter and Service.—The contractor is to give notice to the Gas Company, and obtain from them a properly stamped dry-gas meter for lights, and fix same on inch deal shelf, supported on wrought-iron brackets in , and shall pay all fees for connecting the service from the main to meter by the Gas Company.

Pipes.—The pipes are to be wrought-iron welded tubing, with all necessary bends, tees, angles, and connexions, and of the weights, and screwed to the standard threads, as shown on schedule below, and are to be capable, when fitted, of resisting an internal pressure of 60 lbs. to the square inch.

Int. Diam. Pipe.	Weight per 100 ft.			Threads per inch.
	cwts.	qrs.	lbs.	
1/4	0	1	14	19
3/8	0	2	6	19
1/2	0	3	6	19
3/4	1	0	22	14
1	1	3	0	11
1 1/4	2	1	11	11
1 1/2	2	3	7	11
2	3	3	21	11
2 1/2	5	0	6	11
3	6	0	20	11

Int. Diam. Pipe.	Weight per Ten Elbows.		Weight per Ten Tees.	
	lbs.	ozs.	lbs.	ozs.
1/4	1	7	1	8
3/8	1	13	2	4
1/2	2	15	3	0
3/4	4	6	5	4
1	6	4	7	10
1 1/4	10	4	12	15
1 1/2	15	8	16	7
2	22	6	27	0
2 1/2	46	2	50	15
3	73	8	85	5

The contractor is to supply all bends, elbows, sockets, tees, hack-nuts, nipples, plugs, caps, wall-hooks, pipe-clips, screws and other material necessary. Bends are to be used in place of elbows wherever possible, and where it is necessary to use elbows they are to be of the pattern known as "round elbows." The pipes are to be stayed by wall-hooks or clips at intervals as stated below.

1/4 in., 3/8 in., and 1/2 in. pipes, one stay every 6 ft.	
3/4 in., 1 in., and 1 1/4 in. "	9 ft.
1 1/2 in., 2 in., 2 1/2 in., and 3 in. "	12 ft.

If composition pipes are to be used they should be specified of the following weights:—

Int. Diam. of pipe.	Weight per yard.	
	lbs.	ozs.
1/4	0	13
3/8	1	0
1/2	1	5
3/4	1	10
1	2	2
1 1/4	3	4
1 1/2	4	4
2	5	8
2 1/2	5	12

(If there is any length of piping underground should preferably be of cast-iron, or if the pipes are of wrought iron they should be protected in wooden box troughing, packed with dry sand, and flushed with hot pitch.)

No pipes are to be hedged in plaster or in walls but they are to be kept 1 in. clear from finished surfaces of walls and ceilings. (This is highly desirable for the sake of the pipes, and for the detection of any leakage that may subsequently occur. But if considered unsightly, the architect will use his own discretion as to casing, or even bedding the pipes in the plaster.) The gas fitter is to obtain the approval of the architect to all lines of piping, and is not to cut away any joists or other woodwork, except as may be special allowed by the architect. (Of course, the way of arranging for gas fitting is to supply drawings showings where pipes are to be placed, but this is very seldom done.) Floor boards over pipes to be fitted to remove easily, and fixed with brass cups and screws.

Syphon-Bar.—All gas-pipes are to be laid with a slight inclination towards the meter, and a cast-iron syphon-hox with sockets for pipes, capacity four gallons each, fitted with lock lid bolted to flange, and provided with 1/2 in. wrought-iron suction pipe, is to be fixed where directed near to meter.

Governors.—Provide and fix where directed No. 1 1/2 in. Stott's self-acting gas-governor. No. 2 in., and No. 3 in. ditto.

Stop Cocks.—Provide and fix where directed the following stop-cocks. (Give list for various sizes.) These are to be strong, brass full-weight stop-cocks, square headed with loose keys, with brass screw unions to pipes.

Lines of Piping.—The piping to main from to to be 1 1/2 in. wrought-iron gas barrel, with 1 in. secondary mains from to to 3/4 in. branches from to to 1/2 in. nipples to . In laying piping any pipes that have to be bent shall be first heated to redness and bent whilst hot. Care is to be taken that the sectional area of pipes is not diminished, and no piping will be passed unless it is of full diameter. Joints are to be strongly screwed up, and made firm and gas-tight with white lead and hemp.

Fittings.—Provide and fix No. two arm wrought iron pendants, 3/4 in. by 3/4 in. by 60 in. long, No. two arm bronzed brass pendant 1 in. by 3/4 in. by 54 in. long, No. single jointed bronzed brass brackets 3/4 in. by 13 in. long, No. stiff wrought-iron brackets 3/4 in. by 10 in. long, and allow the sum of p.c. fee fittings to be selected by the architect to be fixed in the following rooms. (Give a list of the points where the selected fittings are to be used.) The contractor is to provide storage for all fittings when delivered on the premises as well as the pipes, etc., which he may himself supply, and to protect same from rust or other damage.

Painting.—All wrought-iron pipes and fittings to be absolutely clean and free from rust before painting, and each to receive one coat of red lead and boiled oil mixed in small quantities and applied whilst fresh before being fixed, and the interior of the pipes to be painted with red lead and boiled oil and two coats of lead paint afterwards, also before fixing. The exteriors to be painted after fixing with three coats in good lead and oil colours of approved tints, as directed by the architect.

Testing.—Provide the sum of two guineas to be paid for testing the gas fittings by the expert to be appointed by the architect, who will not approve gas fitting until such testing has been done, and the expert's fee paid.

N.B.—In arranging the gas fittings for churches and schools and other public buildings it is generally desirable to provide for by-passes, and the student should therefore specify where he desires these, that No. 1 in. brass cocks and by-passes are to be fixed where directed, the cocks to be lever taps with chains, stating whether brass or iron chains, and stout brass tablets marked "On" and "Off" respectively. Provision must also be made for lamplighters' torches.

When sliding pendants are used with the ordinary water tub arrangements, it is well to specify that a small quantity of olive oil should be poured on top of the water in order to prevent evaporation.

GENERAL BUILDING NEWS.

NEW THEATRE, TUNBRIDGE WELLS.—A syndicate has been formed to erect a new theatre at Tunbridge Wells. Mr. John P. Briggs, of London, has been appointed architect.

SCHOOLS, WHITWELL, DERBYSHIRE.—On the 13th inst. the Duke of Portland laid the memorial stone of new voluntary schools at Whitwell. The buildings comprise an infants' school for 300 scholars, senior departments for 150 girls, and the same number of boys, who will be taught separately, two residences, one for the master, and one for the mistress, together with covered playground and all the necessary out-offices. Gothic is the style adopted, and the schools will be erected in red brick with Mansfield stone dressings, while the roofs will be covered with red tiles. Mr. Joseph Smith, of Hartshead, Sheffield, is the architect, and Mr. J. Collingham, of Langwith, the contractor.

POLICE STATION, WELLINGTON.—This building occupies a position at the corner of Church-street and Plough-road. It is built with Lilleshal pressed bricks, and Grimsbill stone dressings, and is in the Italian style, with the new arms of the county surmounting the principal facade. On the ground-floor there is a charge office, and an office for the superintendent immediately adjoining. In close proximity to the charge office, and adjacent to the same, are four cells. A staircase is provided leading from the cell corridor to the dock in the court above. Adjacent to the cells is a prisoners' airing yard surrounded by high walls. On the first floor there is a Petty Sessions Court with a slightly raised gallery at one end for the public, and a witnesses' waiting-room, and solicitors' retiring-room, with lavatory accommodation adjoining. Adjacent to the Bench is a retiring-room, with lavatory accommodation, for the use of the magistrates. The public entrance to the court is from Church-street, and there is a private entrance for the magistrates from Plough-road. There is a house adjoining for the superintendent or sergeant in charge, and in the rear there are a large drill-yard and a stable and gig-house. The whole of the public part of the building is warmed on the high-pressure hot-water principle. The court roof and fittings are of red deal, stained and varnished. Mr. A. Roper, of Wellington, has carried out the work, under the superintendence of Mr. A. T. Davies, the County Surveyor, and his chief assistant, Mr. M. S. Stobbs.

SCHOOL, PITCHCOCH, PERTH.—From thirty-two competitive designs submitted for a new central school, Pitchoch, that by Mr. C. S. Robertson, architect, Perth, was selected. The building is one story in height and Gothic in style. Its general shape may be described as resembling the letter L, the court forming the back or west side of the school, which will be about 160 ft. in length on either side. The main elevation faces the east. The main entrances for the boys and girls are separate. The cloak-rooms and lavatories are placed near the main entrances. Rooms for the headmaster and for the teachers are also near the main entrances. Each classroom has separate doors for boys and girls, but separate entrances and passages leading to them. The infants' classroom is divided by a movable glass partition into two classrooms in the same wing are similarly divided. The secondary department consists of one large classroom, occupying part of the front on the east elevation of the building. It is proposed to heat the school by means of hot-water pipes on the low-pressure system. The heating chamber is placed in the basement. The school is designed to accommodate 620 scholars. The total cost is estimated at about 6,000.

CATHOLIC CHURCH, DUNDEE.—On the 17th inst., the foundation stone of a new church was laid on a site at the corner of Arthurstone-terrace and Maitland-street, Dundee. The architect is Mr. T. M. Cappon, of Dundee. The church, which will accommodate 800 persons, is to be built of red stone from Ayrshire, while the rubble is to come from Berry Muthrie, near Forfar. So far, the mason contract has been fixed, and it has been entrusted to Mr. Wm. Bannet, Dundee.

RACECOURSE BUILDINGS, LINCOLN.—The improvements on the Carlholme, Lincoln, have now been completed. The improvements effected are to the east of the Grand Stand, which is situated on the south side of the racecourse. The old wooden stands have been pulled down, and in their place has been erected a brick structure, with iron stanchions, steel girders, and a roof of corrugated iron. The stand will accommodate 2,500 persons. At the east end of the stand entrance is gained to a refreshment-bar, 56 ft. by 38 ft. A kitchen serves the luncheon-room on one side, and a dining-room, 38 ft. by 26 ft., on the other. Accommodation has been provided for ladies. Behind the stand at the east end are the police-office cells. East of Tattersall's ring is a saddling paddock occupying about a third of an acre, with brick and tiled shed for exercising horses in inclement weather. The architects of the new stand were Messrs. W.

Mortimer & Son, Lincoln; and the builders were Messrs. Wright & Son, Lincoln, the contract price, exclusive of the saddling paddock, being over 3,000.

ALTERATIONS, ST. BLAZEY CHURCH, CORNWALL.—Tenders having been invited for re-roofing and internal alterations of St. Blaze Church, from plans by Mr. Sedding, of Plymouth, eight tenders have been received. That of Messrs. Hobbs & Bartlett, Callington, 535/6, ros., has been accepted.

WESLEYAN CHURCH, ALREWAS, STAFFORDSHIRE.—The foundation stones of the new Wesleyan church and school, Alrewas, were laid recently. The building will be of red brick, relieved with stone dressings. The plan of the church is cruciform, and the transepts and vestries connect into the school which runs parallel, forming a quadrangle. There will be an apse, with pulpit at the side, and another feature of the building will be the open-timbered hammer-beam roof. Entrance will be made by means of a narthex, extending the whole width of the front of the building. The church will accommodate 300 persons, and the Sunday school 250. The cost of the building is estimated at 1,025, and the contractor is Mr. H. Kershaw, Burton-on-Trent. Messrs. Gordon, Lowther, and Ganton, of London, are the architects.

NEW SCHOOLS AND CHAPEL, LEEDS.—Foundations of new schools and chapel, in connexion with Oxford-place Wesleyan Methodist Chapel, Leeds, have just been laid. The joint architects are Mr. George F. Danby and Mr. William H. Thorp. If funds had permitted of the erection of an entirely new structure, the chapel building would have been raised to a considerable height, with the floor elevated on a basement stage. As it is, the old boundary-wall and entrance-gates will be removed, the ground-floor raised 15 in., and a flight of steps front, giving access to the principal entrance-porch in the centre of the facade, and also to the two side entrances. The building will be carried up to an additional height of about 24 ft. from the main cornice level by means of a central pedimented gable, and cupolas at either side, crowning corner pavilions. The leading features of the front will consist of a rusticated ground-floor stage, with piers, banded alternately with brick and stone ashlar work, marking the angles of the corner pavilions and the central gable; a bold projecting central porch, with a segmental arched canopy carried on rusticated piers, and coupled Ionic columns; and two square-headed side-entrances, with circular fanlights and carved spandrels. The upper first-floor stage will be embellished by coupled and single columns, with carved composite capitals of a Renaissance character, carrying a bold entablature, with a projecting cornice. A three-light window in the central gable will be surmounted above the cornice level by a moulded, rusticated arch, the tympanum of which will be filled in with a moulded circular light and carved side panels. The synd hall, which will be brought up to the frontage line, will be connected with the principal front by means of a quadrant. A tower about 170 ft. in height will form a leading feature in the block. On the plan it is square-shaped up to the top of the stage immediately above the eaves of the main building, with rusticated angle piers and carved scroll terminals, and it is then surmounted by an octagonal belfry stage with open arched sides, carrying an ogee-shaped, domical roof. A treatment similar to that of the central gable of the chapel will be employed at the gable end of the lecture hall. The Park-lane elevation of the chapel will be re-faced with brick and stone work, with a pavilion at the south-west angle, with a lead-domed roof and two projecting central bays, with rusticated pilasters carrying moulded cornices and pedimented gables. The new Sunday-school building, fronting Oxford-road, is designed to harmonise with the chapel renovation, but its design is of a more domestic type. The principal block, with high-pitched roof over the large schoolroom, will have gables at either end, with moulded curved sides and pediments, and two small gables in the centre of the front, to relieve the eaves line. The first floor stage will be treated with rusticated projecting pilasters. When completed, the school, which is to be lighted by electricity, will accommodate 660 children. It is estimated that the total cost of the alterations and extensions will be 18,000.

LIBERAL CLUB, DEWSBURY.—On the 20th inst. Mr. Oldroyd, M.P., opened a new club-house in Boothroyd-lane, Dewsbury, named the Gladstone Liberal Club, and which has been erected from designs by Messrs. D. & W. Thornton, architects, of Dewsbury.

ST. MARY'S CHURCH, OXFORD.—The sum of 1,750/6 is to be spent on the restoration of the pinnacles and battlements of the nave of St. Mary's (the University) Church, in accordance with the design of Mr. T. G. Jackson, R.A.

CHURCH AND SCHOOLS, PARKGATE, NEAR CHESTER.—New church and schools are being erected on the Parade, Parkgate, according to the plans and under the superintendence of Messrs. Frederick Fraser and Warburton, architects, Warrington. The cost of the building is estimated at 9,000. Further extensions to the schools are contemplated over the above sum, and the architects are preparing plans. These include the erection of

a large covered playground, roofed in a single span of 100 ft. The contractor for the work is Mr. Wm. Fleming, of Neston.

TENNEN-STREET MISSION HALL AND SCHOOLS, BELFAST.—The new schools connected with Donegal-street Independent Church were recently opened. The architect of the building is Mr. T. H. McCall, and the builder Mr. George Alexander. The upper part is to be used for Sabbath-school and mission work, and the lower as day-schools.

NEW CHURCH FOR FLOOKBURGH, LANCASTHIRE.—The parish of Flookburgh, Cark-in-Carmel, is to be provided with a new church. Plans of the projected structure have been prepared by Messrs. Austin & Paley, architects, of Lancaster.

CONGREGATIONAL CHURCH, STAFFORD.—This building has just been reopened after alterations, &c. It has been lengthened 15 ft. A new front has been erected. The stone portico, which for many years formed the entrance to the old Infirmary at Stafford, has been adapted to the new front of the building. The interior has been almost rebuilt. A new rostrum and platform have been erected; the organ has been brought from the gallery to the ground floor, and is placed to the left of the minister; the galleries are entirely new; as are also the windows, which are filled with leaded lights of tinted glass. There is now a vestibule with double doors. The building is lighted by the electric light, which has been installed by Messrs. Lea, Son & Co., of Shrewsbury. The architects were Messrs. Inghal & Son, of Birmingham, and the builder Mr. J. Biggs, of the same city. The painting has been done by Mr. Adams, of Stafford, and the organ has been enlarged and re-erected by the original builder, Mr. Banfield, of Birmingham.

THE USHER HALL, EDINBURGH.—The special committee of Edinburgh Town Council, charged with the duty of looking out for a suitable site for the Usher Hall had before them on the 15th inst. sketch plans of the Charlotte-square and Music Hall sites, prepared by Councillor Cameron, and based on the information supplied by Mr. Morham, the City Architect, as to what was necessary to be provided in a desirable scheme. After considering the two sets of plans, the Lord Provost moved that the sub-committee should now report to the Lord Provost's committee as to the present position of the matter, and recommending the adoption of the site on the north side of Charlotte-square, which, it was said, could be acquired at a cost not exceeding that of any other eligible site in the city. Dean of Guild Miller seconded the motion. Treasurer McCreae moved, and Mr. Telfer seconded, delay, but the motion was carried by a majority of six to two. The general scheme approved by the sub-committee contemplates the erection of the building on the area covered by the seven centre houses of the north side of Charlotte-square, the east and west wings, each containing two houses, being left as at present. A carriage-way at the level of Charlotte-square, 30 ft. wide, will be carried round the proposed block, giving direct access to and egress from all parts of the buildings. The sketch plans show on the street level a large central hall, about the size of the grand ball of St. Andrew's Halls, Glasgow. On the first-floor level there will be a grand corridor, or crush space, reached by double central stairs. A horse-shoe balcony will run round three sides of the grand hall, and a second gallery can be introduced if thought desirable. The central hall is flanked on either side by a chamber concert hall and another small hall, each with accommodation for between 400 and 500, and a spacious vestibule affords direct access to the inner lobbies. On the first-floor level, galleries for art or social purposes run the whole length of the east and west sides of the building. Although the halls were shown *en suite* on the plans, the arrangements are such that each of the halls can be used for separate gatherings at one and the same time without causing inconvenience, and all the halls can be approached by the grand entrance, besides their own side entrances. Ample accommodation is provided for reception-rooms, cloak-rooms, service-rooms, &c. The fall of the ground at the north side of the square gives facilities for a basement floor, where the heating and ventilating apparatus can be placed, as well as the necessary stores.—*Edinburgh Dispatch.*

ST. AUGUSTINE'S, KILBURN.—We are glad to learn that there is a probability of the tower and spire of Mr. Pearson's fine church at Kilburn being at length completed.

BOARD SCHOOLS, GREAT BENTLEY, ESSEX.—New schools for the Great Bentley School Board have just been opened near Bentley Railway Station. The school and master's residence are built of red brick relieved with Bath-stone dressings. The roofs are covered with brown Broseley tiles, and octagonal cloak-rooms are situate at the north and south ends. The schools have accommodation for 274 children, together with a board-room. The large room contains accommodation for 150, and is so arranged that on removal of a glass partition the room is enlarged to 22 ft. by 58 ft., with three entrances. The babies' room contains accommodation for fifty-four infants, and the boys' class-room for sixty. Round each of the rooms runs a wooden dado, and the corridors have a dado of salt-glazed brick. The flooring is of wood blocks, and Hoyle's foul-air exits and Johns' fresh-air inlets have been used throughout. The school-master's house adjoins

the schools. The architect for the schools is Mr. J. W. Start, F.S.I., of Colchester and Harwich, and the contractor Mr. E. West, of Chelmsford.

SANITARY AND ENGINEERING NEWS.

HALIFAX SEWAGE WORKS.—At the Halifax Town Hall recently Major-General H. D. Crozer, R.E., conducted an inquiry on behalf of the Local Government Board into applications by the Corporation to borrow 32,000*l.* for purposes of sewerage and sewage disposal, 25,000*l.* for waterworks purposes, and 364*l.* for swing doors for the New Markets. The Town Clerk (Mr. K. Walton) appeared for the Corporation. The Borough Engineer (Mr. E. R. S. Escott) was called, and presented the various details of estimated expenditure.

WHITBY IMPROVEMENTS.—On the 18th inst. Col. W. Langston Coke, M.Inst.C.E., held an inquiry at the Urban District Council Chamber, Whitby, respecting the Council's application for authority to borrow 2,500*l.* for the construction of new roads on the West Cliff. Mr. T. K. Scott, Town Surveyor, produced plans of the improvements, after which evidence was given in favour of the proposal.

WATER SUPPLY, BELPER.—An inquiry was held in the High-street School, Belper, recently, by Mr. F. H. Tullock, M.Inst.C.E., one of the Inspectors of the Local Government Board. The District Council had made application for a loan of 8,400*l.* to lay mains and pipes in connexion with the water supply. The Engineers (Messrs. C. & F. W. Hodson), and the Clerk of the works (Mr. Samples) were in attendance. The plans were laid before the Inspector.

SEWERAGE OF PEMBROKE.—At a meeting of the Pembroke Town Council recently, the scheme for the sewerage of Pembroke, submitted by Messrs. F. Beesley & Sons, Westminster, with some modifications respecting the outfall, was adopted, and it was decided to submit it to the Local Government Board forthwith. The works will cost about 6,000*l.*

SEWERAGE SCHEME, CAMBRIDGE.—A Local Government Inquiry was conducted at the Guildhall, Cambridge, recently, by Col. J. T. Marsh, R.E. The subject was the application of the Town Council for sanction to borrow 25,000*l.* for works of sewerage and sewage disposal. There were present Messrs. J. E. L. Whitehead (Town Clerk), J. T. Wood (Engineer to the Works), and E. W. Harry (Borough Surveyor). There was no opposition.

ELECTRIC AND GAS LIGHTING AT DOUGLAS.—The Douglas (Isle of Man) Town Council, with a view to the better lighting of the bay front and the main thoroughfare to Woodbourne, on the outskirts of the town, invited tenders from the Electric Power Company for lighting by powerful arc lamps, and from the gas company by the most approved incandescent system. The former offers to light, free of all cost to the town, the promenade, main artery and thoroughfare to Woodbourne, with 67 arc-lamps of 1,200 candle power. In return they ask for leave to work the bay tramway with electric trolley cars, power to lay mains for private lighting, and to lay tramways to the railway station. On sale of the current they will pay 5 per cent. of the gross income, and 15 per cent. of the gross income of the North Quay tramway. The gas company offers to light the promenade with 120 double candle Wellsbach burners for 120*l.* a year, and the remainder of the town at a correspondingly low price.

PROPOSED NEW BRIDGE AT KEW.—For the last three years the Middlesex County Council and the Surrey County Council have been negotiating terms for the erection of a new bridge across the Thames at Kew. A short time ago it was announced that terms had been arranged between the two County Councils, and that the building of the new bridge would be proceeded with forthwith. Now, however, an intimation has been received stating that an unexpected hitch has occurred. It had been decided that the gradients of the new bridge should be one in forty, but it is found that in order to get such a gradient it will be necessary to raise the road crossing the foot of the bridge 6 ft., which will cut off access to a hotel on one side, and to some business premises on the other, and also seriously interfere with other rights of property. It appears that the only way to get out of the difficulty is to get a special Act of Parliament passed, and it is now too late to do that this year.

BUILDING A RAILWAY BRIDGE IN THIRTEEN HOURS.—At Loughborough, Leicestershire, south of the station, an old bridge was recently demolished, a new one constructed, and the metals relaid for the heavy week-day traffic in the metals space of thirteen hours. The work became imperative to prevent the line being flooded during a period of exceptionally heavy rains. The new bridge is of steel, and the special feature connected with it is that no less than eight arches are constructed in its piece, the whole being supported by steel pillars instead of brick abutments as heretofore. The work was done under the superintendence of Mr. Lorey, the Midland Railway Company's resident engineer at Leicester.

RANDY MERE RESERVOIR.—Messrs. Parker & Sharp, contractors of York, have been given the contract for the lining of the floor and sides of this reservoir with concrete; the work to be completed in twelve months.

FOREIGN.

FRANCE.—The Jury on Architectural exhibits at the Champ de Mars Salon this year is composed of MM. Chaîne, Sauvageot, and Benouville, with MM. Gout and Plumet as Supplementary Jurors.—M. Chaplain, Member of the Institute, who succeeded M. Coutan, sculptor, as artistic director of the Sèvres Manufactory, has resigned his post. It will now be taken by M. Sandier, who has for several months been the head of the decoration works. The new Director is an architect. In America, where he has built several large hotels, he has made great use of *chromique* in architecture. He has also been attached to a large manufactory in the East.—The new buildings of the Museum reserved for comparative anatomy and paleontology will shortly be opened. They were built by M. Dutert, and are in the Rue de Buffon; the principal facade is in the Boulevard de l'Hôpital.—The annual exhibition of the pupils of the Académie Julian in the Rue Lafitte is announced, and also the exhibition of pastels by M. Albert Bussy in the Durand Gallery.—M. Raoul Verlet has just finished the monument in honour of Guy de Maupassant, which will be exhibited at the Salon, and is afterwards to be erected in the Parc Monceau, close to the Natunachie.—The Municipal Council of Nancy has asked the Government to establish a complete system of fortifications round the town. The pretty facade of the old chapel of Notre Dame de Galles at Cosne is being destroyed. It dates from the eleventh century.—There is a question of preserving in a State museum the decorative group which crowns the central pavilion of the Palais de l'Industrie; also the large bas-relief under the arch of the entrance door of the Palais. These two works were executed in 1854 by MM. Elias Robert and Vilain.—The town of Châlons-sur-Marne has just opened a competition for the enlargement of the College Communal. The expense is estimated at 400,000 francs.—M. Ferdinand Faivre, sculptor, pupil of MM. Cavellier and G. Barrias, has just been commissioned by the Egyptian Government to decorate the new museum of antiquities at Cairo. For the principal door there will be two caryatides, 4 metres 75 centimetres in height, symbolising "Haute" and "Basse Egypte."—The town of Avignon has just opened a competition for the building of a central market in this town. The expense is estimated at 400,000 francs.—The "Société historique" of Passy and Auteuil have taken the initiative of erecting a monument at the Ranelagh, commemorating the visit of the Emperor and Empress of Russia. This monument, which is to be executed by M. Gustave Michel, sculptor (grand prix at the 1896 Salon), will be five metres high.—The French Archeological Congress will hold its sixty-fourth session at Nîmes from May 18 to May 25.

GERMANY.—We are pleased to be able to record the fact that the Emperor William has not forgotten architects and sculptors in his list of honours on the occasion of the ceremonies at Berlin. The Court sculptor, Professor Reinhold Begas, has been given the Cross of the Hohenzollern Order; his brother, Carl Legas of Cassel, and his assistants—Messrs. Bernewitz, Casper, Felderhoff, Gootz, and Waegener have received distinctions and likewise architect, Gustav Halmbauer. "Baurath" Werner of Berlin has received an order. The clerk of works, foremen, and contractors, on the Emperor William I.'s monument have also not been forgotten.—A considerable amount of sculpture has been ordered for the Houses of Parliament at Berlin, in which the interior decorations are as yet far from complete. Professor Walat, the architect, has also already given several commissions for the fresco work.—No less than fifteen groups of sculpture have now been ordered by the Emperor for the Avenue of Victory. From an official report we see that the monument to the Emperor Frederick, which has been erected by voluntary subscription on the battlefield of Worth, has cost nearly 12,500*l.*—The Municipality of Berlin are considering the erection of four more bridges over the waterways in their city. There is to be a new Aisen bridge at a cost of about 25,000*l.* There is to be a bridge at the Ross Strasse costing about 8,000*l.*, and the Mockern will be a fourth bridge costing about 22,000*l.* The extent of the building operations in the City Engineer's Department, more particularly in respect to bridges, is remarkable.—Considerable improvements are to be made to the main thoroughfare of Berlin "Unter den Linden" in the neighbourhood of the Opera House, which itself is also to undergo further considerable alterations. It is not improbable that the wings which were added to the Opera House, which would certainly be an advantage as the accommodation in this building is very cramped. The new wings will encroach on certain side thoroughfares which the Municipality will, however, present to the Royal owner of the building.—The annual Schinkel celebration took place recently under the auspices of the Berlin Architectural Society, and was followed by a banquet.—We have to record the death of Overbaurath Mathies at Munich, who held a leading position in the Office of Works for the Bavarian Government since 1882; also that of Professor Kopp, whose work was particularly

associated with the Royal Technical College at Stuttgart. He was a sculptor by profession, and a master of architectural modelling and bas-relief work. The sculpture carried out in his studio will be found on most of the principal buildings at Stuttgart.—There will be the usual Annual Art Exhibition this year, and the exhibition building near the Lehn-Strasse will perhaps use the influential committee of artists representing the Royal Academy and the various artist associations will form the executive of the show.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. Smith, Brodick, & Lowther, architects, have removed from Cogan-chambers, Hull, to York-chambers, 77, Lowgate, in the same city.—Messrs. Easton, Anderson, & Golden are changing their address this week from 3, Whitehall-place to Broad Sanitary-chambers, S.W. They have given up their office at 22, Billiter-street.

ROMAN LINCOLN.—Digging commenced on the 15th inst. for the remaining column of the Roman colonnade, which it was expected would be found under the pavement in front of Mr. W. Blaz's shop in the Bail, and in the course of the day the workmen made a discovery of quite an unexpected character. It was thought that perhaps this pillar might have been a double one, to correspond with the one next it on the north, but it was found to be a triple column. The main shaft appears to be exactly in a line with the columns previously exposed, and it is larger than the other two, into both of which it is set almost at right angles. A singular feature of this triple column is that the mouldings on each are of a different kind from the others. The discovery of this column tends to support the view held by the late Precursor Venables, that these extra shafts were introduced in order to give an air of strength and solidity to the corners of the building rather than to remedy some failure in the architecture of the portico, which latter was regarded as the more likely when the first double column was discovered. The thirteen columns of the colonnade is now known to have consisted, stand as follows:—The first column to the north, and which was the first discovered, is a double column standing east and west; then, at intervals of about 16 ft., are four single columns; next is a double column standing north and south, and then comes the triple column just unearthed, five single columns at similar distances, and then two double columns, both standing north and south; four more single columns, and finally, at the south end, a double column, standing east and west. With one exception, therefore, all the twin columns stand one way. Plans of the latest discovery are being made by Mr. H. H. Dunn, architect, Lincoln, and will be deposited at the Corporation offices. Mr. Dunn has also made a coloured drawing of the beautiful tessellated paving found the previous week, and it is understood that the Corporation intend making further excavations at the place where this was discovered.—*Lincoln Mercury.*

SOUTHEND PIER WORKS.—A special meeting of the Southend Town Council was held on the 16th inst. to seal the supplemental contract for the pier works. The Town Clerk said the agreement was that Messrs. Murdoch & Cameron should go on under a fresh contract, with Mr. Brunless as the engineer; but if any fresh question arose it was to be referred to a separate engineer as referee. Sufficient of the work was to be finished for the steamboats to use the pier by the Friday before WhitSun, and the whole within sixteen weeks. If they failed to complete the work, the Corporation could step in and remove the work done near the old pier-head, and the contractors would forfeit 1,000*l.* If the work were done, a bonus of 2,000*l.* was to be given to the contractor. The original security of 1,700*l.* had been replaced by a fresh bond of 2,000*l.* The contractors were to employ a competent foreman, and if they failed to do so, the Engineer could employ one and charge the firm with the expense. The terms of the contract were more stringent than those of the old one, and in the Corporation's favour. There was to be no more law over it; every question was to be settled by arbitration. The supplemental contract was subsequently sealed.

GREEK HISTORY AND MONUMENTS.—In the third and last series of lectures on "Greek History and Extant Monuments," Professor Percy Gardner, at the Royal Institution, recently pointed out how in ancient Athens, political history ran parallel to the development of art and religion, and each completed the other. After the Persian war the Athenians came back to their city in no conservative spirit. The first thing they did was to rebuild the city walls, and they took the materials ready to hand, including fragments of columns, sculptural monuments, &c. Then they turned their attention to the Acropolis, and the buildings which they erected were still the admiration of the world. The history of the great temples was very striking. One of the first of the gods to be honoured was Pan, whose grotto was set up in gratitude for his supposed interference on their behalf at the battle of Marathon. The wooden statue of Athena, carefully preserved, was safely removed, and Themistocles evolved a project for a new temple, but his plans were stopped by his fall. Pericles

and he had a great opportunity, and, in spite of protests as to the use of money intended for defence being used in this manner, continued the work, assisted by the great sculptor Phedias. A great bronze statue of Athena, standing 40 ft. high, on a base of 10 ft., was the first monument given to all sorts of artificers and workmen. The Parthenon, with its statues, carvings, &c., gave an ideal summary of Athenian history. In succeeding years a more conservative spirit set in, but still every great event commemorated by some addition to the glories of this unique structure. Greek art lay at the root of all art; it represented outward from the growth of the nation, its poetry, religion, martial enterprises, and politics, and was therefore worthy of the respect and closest study.

ABERDEEN GRANITE ASSOCIATION.—The annual assembly of this Association took place in Douglas Hotel, Aberdeen, on the 19th inst. Councillor Boddie, in proposing "The Town and Trade of Aberdeen" referred to the large demand for polished granite fronts for London and the provinces. Baillie Taggart, who presided at supper, replying for the toast of "The Association," spoke of the proposed granite statue of Hygieia for Duthie Park, and said the Association were to present to the Aberdeen Art Gallery and Museum a collection of different granites as a permanent exhibit.

REEREDS, NEWTON FLOTMAN CHURCH, NORFOLK.—A memorial reered in stone (a gift to the church) was dedicated a short time since by the Bishop of Thetford at Newton Flotman. The design of the reered was by Mr. Lee, architect, London. The stonework and carving of the diaper work which fills the panels has been executed by Mr. A. W. Peritt, Long Stratton.

FIRE AT BUILDERS' PREMISES.—Shortly after one o'clock on the morning of the 22nd inst. an outbreak of fire occurred on premises in Warren Lane, Woodwich, occupied by Messrs. Kirk & Randall, builders. The fire originated in the boiler-house on the ground floor, and in a short time the flames were spreading right and left, threatening to involve the whole building, which consisted of three floors, measuring 100 ft. one way by 300 ft. the other. A watchman, however, was on duty, and, getting a hydrant to work, he held the flames in check until the arrival of the firemen from the Woolwich and Shooter's Hill stations. Two more hydrants were then requisitioned, and within an hour the outbreak was under control.

OLD ARCHWAY, CHESTER.—The old archway of St. Michael's Church, Chester, is being preserved. The archway, or gateway, once formed the entrance from Bridge-street row to St. Michael's Church, Chester, and was taken down in 1852, when the church was rebuilt. It consists of two periods of architecture, two-thirds being Norman work, while the doorway proper is about 400 years later. It has now been removed to the corner of Grosvenor Park called the Quarry, where another arch, which belonged to St. Mary's Nunnery, has found a resting place since 1820.

THE IMPROVEMENT OF A HIGHLAND ESTATE.—A scheme of improvement has just been carried out on the Highland estate of Loch Rosque, in Ross-shire, the property of Mr. Bignold. A considerable amount of money has been expended in beautifying the grounds around the mansion house, but the principal feature of the improvement has been the planting with forest trees on the hills for miles along the Achanault and Gairloch roads. The plans and designs, so far as the mansion house is concerned, were furnished by Mr. Carruthers, architect, Inverness.

OLD ARCHITECTURE IN LIVERPOOL.—At a recent meeting of the Liverpool Teachers' Guild at University College, Professor F. M. Simpson, M.A., a Professor of Architecture, lectured on "Old Architecture in Liverpool." The lecturer dealt chiefly with eighteenth century architecture, as it was during that century that Liverpool, through its increasing trade with America and the West Indies, grew most rapidly. Rows of houses were built on what were then outskirts, but are now in the middle of the town. Such houses are found in Great George-square, Hanover-street and Duke-street, Islington, St. Anne-street, and St. Paul's-square. Round the cathedral the best old houses are seen, though many of them have been knocked down to make room for modern warehouses. The lecturer described the appearance of these eighteenth century houses, which, externally, are plain, even severe. The very important fact on account of the eye is the doorway, and although the principle is the same in all, the variety in design, slight as it is, is positively amazing. In front of the house were generally cast-iron railings and ornamental lamp standards, often masterpieces of the smith's craft. But, throughout all, the feeling left upon the mind is very important, on account of the good proportions of their different parts. This effect is produced by the size and shape of the windows. They were buildings suited to the people who lived in them, and to the times in which they lived—simple but stately, plain but refined. Professor Simpson then showed a series of slides, as examples of good proportions and discreet use of ornament. Photographs of well-known houses were then thrown on the screen to illustrate the beauty of the eighteenth century doorways, steps, gables, and iron railings. These included houses in Slater-street, Kent-street,

Duke-street, Hanover-street, Great George-square, Daulby-street, Parliament-street, Union-street, and the almshouses near Arrad-street. The lecturer also showed some slides of the Cathedral, Town Hall, and Blue Coat School, and said that the latter was probably the oldest domestic building in the town, and the one which gave him most pleasure as an architect.

THE WIDENING OF FLEET-STREET.—On Tuesday next, the 30th inst., at the Commissioners of Sewers, Mr. Alderman Treloar will move that the necessary notices be served to acquire all interests in all the premises (fifteen houses) between Ludgate-circus and Salisbury-court, so that this important improvement may be at once proceeded with. The London County Council has agreed to pay 85,350*l.* towards the cost of this portion of the improvement, which, if adopted, will make Fleet-street 60 ft. wide, adding 16 ft. to the width from Ludgate-circus to Salisbury-court, that is to say, for 320 ft. of its length. The entire length of Fleet-street from Temple Bar to Ludgate-circus is 1,670 ft., so that the proposal is to widen at once about one-fifth of the whole length of the street.

DAGNALL PARK ESTATE, SELHURST, SURREY.—This freehold estate, adjoining Selhurst station, has recently been disposed of, and the purchaser has retained Messrs. Pralgraves, 12, Victoria-street, S.W., as architects and surveyors for the extensive building operations to be commenced immediately.

THE CITY WALLS, EXETER.—On April 5 a length of about one hundred and ninety feet of the old city walls of Exeter is to be put up for auction, in connexion with surrounding land. We presume this means the destruction of the wall. About one-third of the city is still surrounded by its old wall.

PRESBYTERIAN ROYAL ACADEMY PICTURES.—We have in type the estimated table of dimensions of various Cathedrals, but we are obliged to postpone it on account of the space required for the Building Exhibition article.

LEGAL.

IMPORTANT POINT UNDER A BUILDING CONTRACT:

CASE IN THE COURT OF APPEAL.

The case of Dadd v. Churton came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Lopes and Chitty, on the 20th inst., it being an action brought by a builder in the Whitechurch County Court against the building owner to recover the balance due under a building contract. The defendant admitted the claim, but he contended that he was entitled to recover 50*l.* as liquidated damages for delay in completing the work. It appeared that by the contract the plaintiff undertook to make certain alterations and additions to the defendant's house for 664*l.*, as set forth in the specification, and according to the general conditions annexed thereto. By Clause 1 of the general conditions "the whole of the works and any other works that may be ordered as additions to this contract are to be executed and completed in the best and most workmanlike manner, and with the best materials of their several kinds, and everything to be done to the full spirit and intent of this contract, which is intended to comprise everything necessary to the perfect completion of the works. Every part of the works to be done to the satisfaction of the architect, and their direction to be followed in every respect, and their opinion on all questions relating to the works or contract to be final and conclusive." Clause 4:—"Any authority given by the architects for any alteration or addition in or to the works is not to vitiate the contract, but all additions, omissions, or variations made in carrying out the works for which a price may not have been previously agreed upon are to be measured and valued and certified for by the architects and added to or deducted from the amount of the contract as the case may be according to the detailed schedule of prices on which the contract was formed. The schedule of prices to apply to all deductions and to additions up to 15 per cent. above the amount of the contract; any additional works beyond 15 per cent. above the amount of the contract and any item to which the schedule of prices does not apply to be allowed for at such prices as the architects may consider fair and reasonable." Clause 24:—"The whole of the works to be completed by June 1, 1892, under a penalty of 2*l.* per week for every week that any part of the works remains unfinished after that date as liquidated damages." It transpired that the extra works to the amount of 2*l.* 18*s.* 8*d.* were ordered, and the total works were not completed until twenty-seven weeks after the time specified for completion. The defendant, after allowing two weeks' additional time for the completion of the extra works ordered, counterclaimed for 50*l.* being 2*l.* per week for twenty-five weeks, as liquidated damages for the delay in completion. The learned County Court Judge held that the ordering of the extra works was a waiver of the stipulation to pay damages for delay, and gave judgment for the plaintiff on the counterclaim. In the Divisional Court Mr. Justice Wills agreed with the learned County Court Judge, while Mr. Justice Wright differed, the judgment of the learned County Court Judge therefore standing. The defendant now appealed.

At the conclusion of the arguments of counsel the Master of the Rolls, in giving judgment, said that the extra work admittedly delayed the completion beyond the time that would have been occupied in executing the specified works. The contract gave the building owner the right to call upon the builder to do extra works. A recognised rule had been laid down in "Holme v. Guppy," that if the building owner ordered extra works beyond the specified works which increased the time necessary for completion, the building owner was disabled from claiming penalties for delay in completion. If that were not so it would be a most unreasonable burden to put upon the builder to do extra works, and then if the whole works were not completed within the specified time to claim the specified penalties from him. Again, it was laid down in "Westwood v. the Secretary of State for India" that the fact that the contract entitled the building owner to call upon the builder to do extra works did not prevent the application of the above rule. Then came the case of "Jones v. St. John's College," which was an exception to that rule. In that case it was stated in the pleadings that the builder had agreed that if extra works were ordered to conclude the entire works within the stipulated time. The Court held that if the builder were foolish enough to agree to that, even though it became impossible to complete the works within the time, he must take the consequences. In the present case the builder did not by the agreement undertake such a foolish responsibility. The rule of construction was that if a particular construction allowed of an unreasonable result the court would be slow to adopt that construction. In the case of "Jones v. St. John's College" the contract was set out in the pleadings and admitted on demurrer. The present contract could not be reconstructed as was the contract in Jones's case. Therefore, the building owner, if entitled by the contract to order extra works, had by ordering the extra works deprived himself of the right to claim the penalties. They would, therefore, adopt the judgment of Mr. Justice Wills in preference to that of Mr. Justice Wright.

The Lords Justices concurred, and the appeal was accordingly dismissed with costs.

Mr. E. H. Lloyd appeared as counsel for the defendant (the appellant) and Mr. Loehnis for the plaintiff (the respondent).

THE WORKING CLASS DWELLING SECTIONS OF THE LONDON BUILDING ACT SUCCESSFULLY EVADED.

At the Worship-street Police-court, on the 17th inst., Mr. Hyman Davis, builder and property owner, of 65, Bishopsgate-street Without, appeared before Mr. Haden Corser in answer to a summons taken out by the London County Council for having failed to comply with a notice calling upon him to set back the front wall of No. 105, Brick-lane, Spital-fields, so that every part thereof should be at a distance in every direction not less than the "prescribed distance" from the centre of the roadway (viz. 20 ft.) in accordance with Sections 13, 14, and 200 of the London Building Act, 1894, the said house having recently been erected at a distance of only 12 ft. 1 in. from the centre of the roadway to a height exceeding the width of the street, and being alleged to be now occupied by persons of the working class.

Mr. E. Sagar Berry, in opening the case for the London County Council, drew the magistrate's attention to the fact that there was no definition in the London Building Act of the term "persons of the working class," but referred him to the definition embodied in Section 75 of the Housing of the Working Classes Act, 1890, which limited the term "letting for habitation by persons of the working class" for the purposes of that section to "letting a house or part of a house at a rent not exceeding in London 20*l.* a year." There was, however, a further definition which might be of assistance, namely, that contained in the Standing Orders of the House of Commons, and embodied in the South-Eastern Railway Company's Act, 1896, and many other Railway Companies' Acts, which was as follows:—"The expression 'labouring class' means and includes mechanics, artisans, labourers, and others working for wages; hawkers, costermongers, persons not working for wages, but working at some trade or handicraft without employing others except members of their own family, and persons other than domestic servants whose income does not exceed an average of 30*s.* a week, and the families of such persons who may be residing with them." He then pointed out the conditions under which a builder was entitled to build within the prescribed distance, as set forth in Sub-Section 5 of Section 13, viz., that where it was desired to alter or re-erect a building existing either at the commencement of the Act, or at any time within seven years previously, and which stood within the prescribed distance, it was permitted by the Act to do so, provided that the builder got the plans of the old building certified by the District Surveyor; but the privilege in Sub-Section 5 was restricted by the following proviso:—"Provided always that no dwelling house to be inhabited or adapted to be inhabited by persons of the working class shall without the consent of the Council be erected or re-erected within the prescribed distance to a height

exceeding the distance of the front or nearest external wall of such building from the opposite side of such street, and that no building or structure shall be converted into such dwelling house within the prescribed distance so as to exceed such height." He contended that Mr. Davis had lost the privilege conferred by that section inasmuch as the building had been erected within the prescribed distance to a height exceeding the width of the street, and was now occupied by persons of the working class, and that by Section 206 the exemption or privilege enjoyed ceased when the building became used by persons of the working class and the building thereupon became subject to the provisions of Section 13 (r). He also contended that this was not an alteration or re-erection within the meaning of Section 13 (s), inasmuch as the owner had erected eleven houses, each four stories high, with no back yards, on a site previously occupied by ten houses, each three stories high and each having a back yard. The case against No. 105 was taken as a test case, the Council contending that the decision in such case would govern each of the remaining ten houses of the block.

Mr. Arthur Crow, District Surveyor for Spitalfields, was then called, and stated that the house in question was one of a row of eleven houses erected by Messrs. Davis Bros. in 1895, from plans prepared by Mr. H. H. Collins. The site of the present houses was formerly occupied by ten houses, each of three stories, and having yards at the rear. The plans of those old houses were duly certified by him, in accordance with Section 13 (5) of the Act. (The certified plans were then put in evidence.) He examined the plans of the new buildings, and approved them, on the understanding that the houses were not designed for persons of the working class. The accommodation shown by Mr. Collins' plans included a shop and back room on the ground floor, and three floors over, with two rooms on each floor. The buildings were duly proceeded with and inspected by him from time to time. On January 23, 1896, he found that six houses had been roofed in, and were being fitted up for occupation—that in each house the back rooms on each floor were prepared to receive ranges, and that in No. 107 ranges had been fitted on the ground and first floors. On January 24 he served notices of irregularity, which were produced, objecting to the houses under Secs. 13 and 41, on the ground that they were being adapted for working-class dwellings. In reply he received a letter from Mr. Collins, which he produced, stating, *inter alia*, that, "as you must be aware, these buildings have never been erected for, nor are they intended for, the occupation of the artisan and labouring classes." Thereupon he consulted the Council's advisers, and, having regard to that letter, no action was taken. In October last his attention was called to the houses, and he inspected them and found that they were sublet to various sub-tenants. Dealing with No. 105, the whole house was let by Mr. Davis to Israel Cohen, a working clockmaker, at 2*l.* a week, who, with his wife and family, occupied the ground floor. Each floor above was sublet by Cohen to a separate family at 8*s.* 6*d.*, 8*s.*, and 6*s.* a week respectively. Each sub-tenant was a cabinet maker by trade. He put in a plan, showing the house as at present existing.

In cross-examination by Mr. Marshall Hall, who appeared for Mr. Davis, witness said, assuming the house to be a working-class dwelling, it did not infringe the Act as regards the line on which it fronted, but the party walls were not coincident with the old party walls; that he made a return to the Council of the houses when they were roofed in; that he had been paid his fees as District Surveyor; that he thought the house was adapted for persons of the working class because it and the others in the block were so occupied.

Mr. Thomas Blashill, Superintending Architect of the London County Council, said that he had seen the house in question; that Brick-lane was a highway; that the Council had given no consent to the building, which was inside the prescribed distance.

In cross-examination witness said that if the Council's views were correct a very large number of East End houses and some West End houses in poor class neighbourhoods would be affected by it.

Inspector Harvey, of the Whitechapel District Board of Works, said he had inspected the houses on several occasions. He confirmed the District Surveyor as to the occupation, and added that in No. 111 the two upper floors (four rooms) were occupied by a man to whom they were sublet at 15*s.* per week, with his wife and three children and ten lodgers. At No. 115 there were three single room sub-tenancies, two by a laundress and an office charwoman, each paying 3*s.* 6*d.* a week rent.

In reply to the Magistrate he said the cooking in the upstairs rooms was done at open stoves. There were two water-closets in each house.

Dr. Loane, Medical Officer of Health for Whitechapel, said he had visited the houses, and he produced some photographs of them.

The tenant Cohen and one sub-tenant were called and corroborated as to rents and occupations.

The tenancy agreement with Cohen was produced together with his rent-book, containing rules to be observed by the tenants.

The Magistrate in giving judgment, with out calling

on Mr. Marshall Hall, said:—"The question I have to decide is whether the houses are within the meaning of Section 13 (5) of the Building Act, 'dwelling houses to be inhabited or adapted to be inhabited by persons of the working class.' If they are, they are within the prescribed limits and must be set back. If they are not they may remain. There is nothing to guide me as to what is meant by 'persons of the working class,' except Section 75 of the Housing of the Working Classes Act, 1890. If this is to be a guide, it is a money guide—viz., an annual rent of 20*l.* for a house or part of a house. I must, however, look at the facts of the case. I need not go through the various sections, since the parties agree that what I have to decide is whether this house is a house to be inhabited or adapted to be inhabited by persons of the working class. I should mention the South-Eastern Railway Company's Act of 1895." (The Magistrate then read the section which is quoted above.) "That section seems as if, after exhausting every class named therein, any one else earning less than 30*s.* a week was of the labouring class. The person to whom this house is let is Cohen, at a rent of 2*l.* a week. He is a watchmaker, and occupies the ground floor. Above are first and second floors and a floor in the roof. The house is set out as a house would be in Piccadilly if designed for a shop with living rooms over. How could you erect differently a shop with living rooms over? I must not look at the passing character of the tenants, but at the house. Every place of bricks and mortar can be lived in by persons of the working class if they can afford it. Cohen has grossly overcrowded his premises, which are occupied by persons who work with their hands for their daily bread, but that cannot alter the intention of Davis when he built the house—it cannot alter the character of the house. The Legislature intended houses for persons of the working class to have reasonable provision of air-space in front, because more people live on the premises. Davis says 'I don't want the working class.' I must find that these houses are not houses to be inhabited or adapted to be inhabited by persons of the working class. The people living there are, in my judgment, persons of the working class. Many rooms are occupied by persons—strictly and accurately described as persons of the working class."

The summons was accordingly dismissed with ten guineas costs, the magistrate expressing his readiness to state a case for the superior court. The defendant's counsel said that defendant would himself like to have a case stated.

LONDON COUNTY COUNCIL v. FAULKES.

Mr. d'Eyncourt gave his decision on the 23rd inst. at the North London Police-court in the case of the "London County Council v. Faulkes." The defendant in this case is the freeholder of the Willows Estate, Park-lane, Stoke Newington, and he was summoned at the instance of the Council for forming and laying out a road on the north side of Carylford-road, which did not communicate at each end with public carriage-ways, without the consent of the Council. The Council, on the 14th fortnight ago, Mr. Chilvers appearing for the Council, and Mr. Macmotan, with him Mr. Salter, for the defendant. It was admitted that prior to the London Building Act of 1894 the defendant could have laid out the new street in the way he proposed, but this Act of Parliament made it necessary that a new street should communicate with public carriage-ways at each end, and that the consent of the Council must also be obtained. The defence raised was that the new street had been commenced prior to the Act of 1894 coming into operation. The evidence showed that openings were left in the line of houses in Carylford-road when they were put up in 1894, and that the flank walls of the houses abutting on these openings were finished off as corner houses, and that the garden fences were made as outside-fences would be. It was also alleged for the defence that the spaces through the openings had been partly made up as "builder's roads" in 1894. On the other hand, it was said that the openings had simply been left and hoarded up, and that so far from the proposed roadways being made up, the opening had simply been used for the storage of hard core, &c., for use in the making up of Carylford-road. No attempt to lay out the new street was made until November last.

In giving his decision, Mr. d'Eyncourt said that there could be no doubt that if the present Building Act had been in force a hundred years ago, London would have been a much finer place than it is now.

The question, however, for him to decide was whether the present work had been commenced before the Act of 1894 came into operation. There was no doubt that the plans were sent in before that time, and those plans contained a spur street which the defendant did not press, and to which the Council had a right to object. The Council, however, offered the defendant no assistance in the matter, as they only sent an indefinite objection, which the defendant might naturally take to apply only to the spur street. Without the spur street the circumstances were identical with those existing in the case of "The London County Council v. Edmondson" (decided by the

judges against the Council), and he concurred in it that the judges had said in that case. As in the case, the new street was to be made in crescent form, both ends coming into one carriage-way. Was this new street commenced before the end of 1894? He should hold that it was, for the reason as stated in the evidence that the four corner houses were finished as corner houses, and the garden fences were a foot higher than those between the ordinary gardens. It was clearly the intention of the defendant to lay out the new street when he was building Carylford-road early in 1894. Under these circumstances he should dismiss the summons.

Mr. Salter asked for costs, saying that the defendant had cost 30 guineas. They asked the magistrate to grant 15 guineas costs.

Mr. d'Eyncourt granted 12*l.* 12*s.* costs.

Mr. Chilvers asked the magistrate to state a case for the superior Court.

Mr. d'Eyncourt said he would consider the application.—*Morning Advertiser.*

BUILDING TRESPASS IN CHEAPSIDE: ACTION IN THE CHANCERY DIVISION.

MR. JUSTICE NORTH, in the Chancery Division on the 23rd inst., delivered a considered judgment in the case of "The Aerated Bread Company v. Shephard." It being an action brought by the plaintiffs, the lessees of No. 51, Cheapside, for an alleged trespass in connexion with work done in rebuilding the adjoining premises, No. 52, Cheapside, by the owner, the defendant. It appeared that the wall between the premises, Nos. 51 and 52, Cheapside, was a party-wall within the meaning of the Metropolitan Building Acts, the matter in dispute being whether the wall was a party-wall in the sense that there was a common ownership, or whether the wall was, as the learned Judge held, entirely the property of the plaintiffs, subject to easements of supports. A question was also raised, on the construction of the London Building Act, 1894, Section 64 (18), which provides that all chimney-flues are to be surrounded by new brickwork of a certain thickness, the defendant having put chimney-flues against the plaintiff's party-wall. These flues were constructed of actual new brick on three sides only. The two ends were bonded into the party-wall, the face of the party-wall itself forming the fourth side of the flue. The plaintiffs alleged that the London Building Act of 1894 had not been complied with; but the defendant's expert witness, on the contrary, asserted that in his opinion it had, because the party wall, being sound and in good condition, was to be considered new brickwork within the meaning of the Act.

His Lordship, in giving judgment, said that he considered this construction of the statute to be absurd, and held that the defendant had not complied with the Act, which required the brickwork to be new at the time of the construction of the flues, although the District Surveyor had passed the work. He did not, however, consider it necessary, in the circumstances, to grant a mandatory injunction. His Lordship having decided the main issues in favour of the plaintiffs, gave them the general costs of the action.

Order accordingly. Mr. Swinfen Eady, Q.C., and Mr. W. F. Hamilton appeared as counsel for the plaintiff company; and Mr. Cozens-Hardy, Q.C., and Mr. Ingle Joyce for the defendant.

MEETINGS.

FRIDAY, MARCH 26.

Institution of Civil Engineers (Students' Meeting).—Mr. W. J. Griffin on "The Re-Signalling of the Liverpool Street Terminus of the Great Eastern Railway." 8 p.m.

SATURDAY, MARCH 27.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Harrison & Barber's Knacker Yard, Whitechapel. 3 p.m.

London and Provincial Builders' Foremen's Association (Memorial Hall, Farringdon-road, E.C.).—Mr. F. Chessell on "Technical Education." 7 p.m.

Edinburgh Architectural Association.—Visit to Hatton House, Midlothian.

MONDAY, MARCH 29.

Royal Institute of British Architects.—Mr. J. A. Gotch on "Heraldry of the Renaissance in England." 8 p.m.

Society of Arts (Cantor Lectures).—Professor W. Chandler Roberts-Austen on "Alloys." III. 4.30 p.m.

Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. Priestley on "Ventilation, Warming, and Lighting." 8 p.m.

Leeds and Yorkshire Architectural Society.—Annual Report to be read, and Officers elected. 7.30 p.m.

TUESDAY, MARCH 30.

Society of Arts (Applied Art Section).—Mr. W. R. Leithy on "Lead Work." 8 p.m.

Institution of Civil Engineers.—Mr. Henry W. Ravenshaw on "Electric Lifts and Cranes." 8 p.m.

Auctioneers' Institute.—Mr. E. J. Harper on "Some Effects of the Incidence of Rates upon Landed Property." 8 p.m.

WEDNESDAY, MARCH 31.

Society of Arts.—Mr. G. L. Hillier on "Cycling—Historical and Practical." 8 p.m.

Builders' Foremen and Clerks of Works' Institution.—Quarterly meeting of the Directors. 8 p.m.

Sanitary Institute (Demonstration for Sanitary Officers) - Inspection in the Parish of St. George's, Liverpool...

Liverpool Engineering Society - Mr. Joseph Corbett on "Sewage Sludge Removal and Shipment."

Thursday, April 1. Society of Antiquaries - 8.30 p.m. Sanitary Institute (Lectures for Sanitary Officers) - Mr. J. Wallace Pegeas on "Principles of Calculating Areas, Volumes, &c., Interpretation of Plans and Sections to Scale."

Institution of Civil Engineers - Students' Visit to the Generating Station of the City of London Electric Lighting Company, Bankside, S.E. 8.30 p.m.

Friday, April 2. The Architectural Association - Mr. T. G. Jackson, R.A., on "Architecture in Relation to the Crafts."

Royal Institution - Mr. C. T. Heycock, M.A., on "Metallic Alloys and the Theory of Solution."

British Institute of Certified Carpenters - Special Meeting at Carpenter's Hall, 6 p.m. Paper by Mr. T. G. Lloyd on "Ancient and Historical Carpentry."

Saturday, April 3. Sanitary Institute (Demonstration for Sanitary Officers) - Inspection of the Aylesbury Dairy Company's premises, Bayswater, 3 p.m. Sanitary Inspectors' Association - 6 p.m. British Institute of Certified Carpenters - Special Meeting at Carpenter's Hall, 6 p.m. Paper by Mr. T. G. Lloyd on "Ancient and Historical Carpentry."

RECENT PATENTS: ABSTRACTS OF SPECIFICATIONS. 4,105 - PUG MILL FOR BRICKS, &c.; D. Doyle and another - The several improvements claimed by inventor, consist in (1) lubricating the interior surface of the mill...

5,310 - LAVATORY AND WATER-CLOSET APPARATUS; F. Hulke - In order to obtain a combination lavatory, water-closet, urinal, and slop sink, inventor adapts a pedestal closet, with a hinged seat to fold back, so as to be used for urinal or slop sink. On the back of the fixed portion of seat a trough is provided to receive contents of lavatory basin when emptied. Inventor makes a lavatory hinged at back to fold upwards, when water-closet is to be used, and to be there secured by springs. Separate supply cisterns, with overflow pipe, are provided.

8,531 - CHIMNEY POT OR VENTILATOR; H. W. Swain - The chimney pot or ventilator, constructed as a fixture, is made in chambers on an obtuse angle, the flueway or shaft tapering downwards. Around the basal portion of each obtuse-angled chamber is a series of round apertures. The base of the ventilator, or pot, is square, and on each side of the square base a gully trap, the whole arrangement being conducive to driving the smoke or hot air upwards.

20,207 - GULLY TRAPS; J. Richards - Inventor claims (1) a gully trap, having the cover consisting of a movable grid and a fixed part, provided with an aperture or apertures for extending into the trap a fall pipe or pipes, receiving water from gutters or other sources; and (2) the same trap, but the method of delivering the waste water from a fall pipe, &c., into the trap below its cover, by extending pipe or pipes through a suitable aperture or apertures.

26,233 - DRAIN PLUG AND HOOPER FOR TESTING DRAINS IN SECTIONS; W. Neighbour - Inventor adopts a drain plug with enlarged waterway, provided with an air escape tube, with cup, also a galvanised hopper, detachable. It is claimed that this will obviate the old method of puddling with clay for bends for the purpose of testing drains in sections with water.

26,437 - PAVEMENT LIGHTS; J. A. Willmore - Inventor claims (1) the application and use of tiles or plates, either solid or perforated, composed of lead or other suitable metal or alloy, in combination with glass and cement or asphalt, to form the top surface of pavement lights, &c., and (2) the application of lead with projecting pins made of suitable metal in combination with glass and cement or asphalt for same purpose. As none of the iron trap, except its outside edge, comes within a certain distance of the top surface, the tendency of pedestrians to slip on pavement lights, cellar flaps, coal plates, &c., is greatly reduced.

29,916 - THE GRATES; G. C. St. John - (1) A grate in the form of a series of the straight-spaces being greatly in excess of the metal presented to the direct action of the heat, whereby a strong upward draught will be generated and durability secured; (2) a similar grate, having raised portions at the air openings constituting fuel supports; and (3) an endless travelling grate, constituting a plurality of open-work grate surfaces, with a frame enclosing each.

NEW PATENTS FOR LETTERS PATENT. MARCH 8 - 6,050, A. Rider and E. Russell, Sliding Sash Windows - 6,056, The Wilkinson Sword Co., Ltd. MARCH 9 - 6,113, F. Lynde, Flushing Cisterns, - 6,121, J. Taylor, Removing Steam and Vapours from Buildings, and for Promoting Ventilation, applicable also for the prevention of draught in chimneys - 6,159, T. F. Brimley, Ladder Grip and Scaffold Rest - 6,138, J. Skinner, Chimney Ventilating Cowl, &c. - 6,143, J. Smith, Self-Locking Window Sash Fastener - 6,171, L. Hanks, Gully Traps - 6,201, J. Noel, Chimney and Ventilator Tops - 6,216, W. Hughes, Machines for Marbling Paper - 6,224, E. Taylor, Sash Fasteners.

MARCH 10 - 6,230, W. Phillips, Combined Stay and Fastener for Sliding and Revolving Windows - 6,248, J. Vidal, Flushing of Water Closets - 6,275, W. Edwards and E. Runtz, Flooring and Floor Construction - 6,300, F. Chapman, Blocks for Paving Wood - 6,310, W. Gadden, Window Fastener - 6,320, J. B. Sanson, Manufacture of White Lead - 6,328, A. Henström, Ventilating and Air Exhausting Apparatus.

MARCH 11 - 6,347, A. and J. Moore, Equalize Firing Kinds - 6,354, J. Ralls, Noiselessly Filling Flushing Cisterns, &c. - 6,385, J. Ralls, Discharging Apparatus connected with Flushing Cisterns, &c. - 6,413, D. and J. Burgess, Concrete Paving, &c. - 6,426, F. Golby, Door Hinges - 6,450, W. Reid and F. Crosland, Lime or Cement Kinds - 6,467, H. Lake, Moulding Block for Forming Plates for Building Purposes - 6,468, J. Oldham, Saws.

MARCH 12 - 6,500, H. Sowerby, Saw Blades for Sawing Stone - 6,522, E. Wollard, Ventilating Gear for Green-houses - 6,524, F. Daw, Casement Fastening - 6,526, C. Armstrong, Buffers and Fittings of Automatic Tiling for Waste Water-closets - 6,577, S. Buck, Ridge Tiles, &c. - 6,579, G. Siehle, Floors or Flooring.

MARCH 13 - 6,590, J. Davis and Others, Sanitary Pipe Machines - 6,643, J. Rendle, Roof Glazing - 6,649, D. Campbell, Holes and Spindles of Door Locks - 6,650, J. Johnson, Water-closets - 6,657, A. Parmacot, Water-Waste Preventers - 6,676, J. Westhead, Combined Plumber's or Soldering Iron, and Lamp for Heating same - 6,693, A. Testas, Band Sawing Machines.

PROVISIONAL SPECIFICATIONS ACCEPTED. 2,530, J. Robertson, Dove-tailed Wooden Structures, &c. - 2,583, W. Dawson and A. Burn, Rule Saws - 4,199, H. Barnett, Casement Windows - 4,205, A. Murdoch, Glasgow, Fire Grates - 4,383, A. Bucknall, Constructing Portable and other Wooden Buildings, also applicable to Floors and other parts of Buildings of any kind - 4,658, J. Hussey, Plumber's Pat. &c. - 4,659, W. Freshwick, Door Spring - 4,745, J. Feare, Ventilators - 4,960, E. Coding, Drain Pipes.

COMPLETE SPECIFICATIONS ACCEPTED. Open to opposition for two months. 7,059, J. Hamilton, Roof Ladders and Stairing - 9,363, E. Laroche, Stoves - 9,518, E. Palmer, Reaching by a Lateral Movement Elevated parts of Buildings and other Erections for the purpose of Repairing such Buildings and other erections, and for Painting, &c. - 12,314, F. Erice, Flushing Cisterns - 23,731, J. Eirick, Chimney-top Smoke Preventer and Extract Ventilator - 25,521, R. Birtley, Drain Pipes and Traps.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

MARCH 11 - By Fenn & Co. (at Dedham), Dedham, Essex - Burket's road, &c., enclosing 12 lands, and two tenements, 37 a. 1 r. 29 p. 6. £1,000 Cooper's lane, "The Park Farm," 16 a. 3 r. 28 p. 6. 540 Enclosure of land, 8 a. 1 r. 26 p. 6. 215 A House and land, 31 p. 7. 300

By W. Sherborne Abbey.

F the three chief points of interest in Sherborne—the minster, the castle, and the school—the minster stands first both for its extent and beauty of detail and from the fact that to it is to be ascribed the existence of the other two and the town itself. In the early years of the eighth century St. Ealdhelm founded a cathedral, and made Sherborne the centre of a diocese which comprised most, if not all, Wessex. Round this necessarily grew a city, and at one time—in the following century—for nearly a score of years it was the capital of the Western Kingdom. In the Saxon minster were buried Æthelbald and Æthelberht, and the site of their graves is still marked in the church floor by a modern brass. The castle in its turn was also a palace, and Roger of Caen not only rebuilt the minster, but founded the palace, if Ealdhelm had not already built one on the site. Again, attached to the monastery was a school, and from this grew the Sherborne School of the Tudors, and the more extensive buildings of recent years, which place Sherborne among the great public schools of the country. Whatever may have been the original extent of Ealdhelm's Church, only a doorway remains, now incorporated with the west wall of the nave at the end of the north aisle, but this fragment proves that the line of Ealdhelm's west wall was retained by Roger of Caen, when, in 1107, he commenced rebuilding the minster in the Norman style. The Benedictine rule had been introduced in 998 by King Æthelred "the Unready," and the arrangements and planning of Roger's Church thus partook of the characteristics of the churches of that order of monks. As in other Benedictine churches throughout the country, the piers of the central tower remain, as well as the walls of the transepts and most of those in the nave. Roger's Church consisted of a nave of five bays with aisles, a central tower with transepts, each transept having a square-ended chapel projecting on its east side, and a presbytery, most probably of similar extent to the present one. Over the

crossing was a tower, and foundations at the west end of the nave, at one time revealed, seem to point to the former existence of a porch and tower at the west end of the nave. There is a porch on the south side of the nave in its westernmost bay, having its counterpart at Great Malvern, where, however, the porch has been included in the later scheme and rebuilt in Perpendicular times. In the Early English period a chapel was added on the north side of the presbytery, attached also to the Norman chapel of the north transept, and at the east end of the church a Lady Chapel was erected. The first-mentioned, known as "Bishop Roger's Chapel," still remains perfect. The western bay only, however, of the three bays that formed the Lady Chapel remain and are now built into a later building, part of the school that was built on the site, presumably at the Dissolution. Beyond the insertion of four Decorated windows in the north aisle of the nave, nothing seems to have been done to the church until the Perpendicular period. But in the later years of the fourteenth century the Church of All Hallows was built at the west end of the minster, divided from it by a passage or porch. A portion of the nave had been, in common with many of the monasteries of the order, given up to the parishioners, and had its parish altar against the west face of the rood screen. A font was placed in this part of the building for the baptism of the children of the town. The erection of All Hallows, however, was followed by the placing of a font in the new parish church, and the doorway at the end of the south aisle of the minster having been narrowed by the monks, and their font removed to another part of the nave, great ill-feeling between monks and laity resulted. The decision of the Bishop of Sarum, who was appealed to, seems, however, to have been disregarded by both parties, and in the early part of the fifteenth century a riot took place, aggravated in great measure by the destruction of the font in All Hallows by a certain butcher named Walter Gallor.

At this period the eastern arm was undergoing that transformation from Norman to rich Perpendicular which was, during succeeding years, to be carried throughout the fabric. It was, according to Leland, covered with a temporary roof of thatch, and a fire-arrow shot by a priest of All Hallows

during the riot set fire to that part of the building and considerably injured both the choir and central tower. This was in 1437, during the abbacy of Abbot Bradford, the rebuilding having been commenced by Abbot John Brunyng (1415). The new work was of a very elaborate character, and when the scheme was completed by Abbot Ramsam (1475) the whole church was elaborately vaulted in stone and richly decorated. In the first portion of the work—the rebuilding of the presbytery by Abbot Bradford—all the Norman work of Roger of Caen seems to have been removed with the exception of the portion of the north wall against which the thirteenth century chapel abutted. There is in all probability not much difference between the extent of the Norman and the Perpendicular presbyteries, so far as their main dimensions went. The Perpendicular presbytery was designed in three bays, with aisles, and an Eastern aisle or ambulatory, and the clearstory was lighted by six-light windows, and a fine east window of nine lights. Below this was a reredos, which divided the presbytery completely from the ambulatory. This portion of the church on the outside was supported by flying buttresses to resist the thrust of the vaulting. The vaulting itself was of a most elaborate description, thickly studded with elaborately-carved bosses, the whole being of Ham Hill stone. On the exterior, panelled parapets were carried round the whole, relieved by pinnacles. The traces of the fire are very clear in the walls of the tower and presbytery, and the warm reddish hue that has been given to the Ham stone has added much, doubtless, to its natural beauty of colour. The central tower was rebuilt, but only one stage above the parapets of the church, this, no doubt, being very largely due to a fear that the Norman work below would not support a heavier weight.* As it is, the western arch of the crossing is much depressed, and additional support was given by an arch in the transept, which shows on our exterior view.

Abbot Ramsam, in 1475, dealt with the Norman work at Sherborne much after the manner of William of Wykeham's treatment of Winchester. He left the Norman columns of the nave and the outer walls of the aisles

* The tower should be compared with the central tower of Milton Abbey, in the same county.

and west front, and surrounded the former and encased the latter in Perpendicular work richly panelled. His clearstory was designed to a large extent independently of the arcade below, and the spacing of the windows does not at either end coincide with that of the arcade.

A chapel at the east end of the north choir aisle and one equal in length with the Lady Chapel on its south side, and also the Sepulchre Chapel east of the south transept, had formed part of the work of Abbot Bradford. Abbot Ramsam presumably built the chapel of St. Katherine on the west side of the south transept. The "Wyckham" Chapel had also been vaulted in Perpendicular times. Abbot Ramsam's west window was filled in in its lower stage where the roof of the porch came against it.* The Monastery was on the north side and many of its buildings still exist incorporated with the buildings of the new school.

At the Dissolution the Abbey passed into the hands of Sir John Horsey, of Clifton Maybank (an interesting house still partly remaining, near Yeovil Junction), who in turn sold it to the townspeople for 250*l.*, and it then became the parish church.

In the present century, by the munificence of the Digby family, of Sherborne Castle, this beautiful church has been well restored by Messrs. Carpenter, Slater, & Ingelow during a period ranging from 1848 to 1884. In 1848 the nave was dealt with by Mr. Carpenter, in 1856 the choir was restored by Mr. Slater, and in 1884 the central tower was strengthened and repaired by Messrs. Carpenter & Ingelow. The general character and appearance of the exterior will be best understood by reference to the view taken from the south-east, given in our full page plate in the present issue. The elaborate work of the presbytery and its aisles is in strong contrast to the severity of the Norman work of the transept—one of the Norman windows will be noticed high up on the east face. The transept buttresses were strengthened in Perpendicular times. The Norman porch—the upper part a restoration—is just visible in the view, behind the transept. The general design of the nave is similar to that of the choir, and has panelled parapets throughout. The effect of the interior, with its elaborate roof, is very fine; and the various bosses, shields, and rebuses in the nave are alone worthy of careful study. We here give sketches of some of the rebuses in the nave—a scroll with "Sam" in large letters, and a ram holding a similar scroll, for Abbot Ramsam; an owl in an initial D, with a pastoral staff, supposed to be the rebus of Bishop Oldham, of Exeter; and the still more curious device of a cockatrice (*anguis*) in a ton, with the initials T. L., for Thomas Langton (Bishop of St. David's, 1483; of Sarum, 1485; and of Winchester, 1493†).

There are various shields also with the arms of the abbey *gu* a cross *ar*: on dexter side a pastoral staff *or* (see illustration), and those of the abbots at Cerne, Abbotsbury, Milton (all in Dorsetshire), and the See of St. David's, with which Sherborne was connected. Many more of interest will be found in the roof of the nave, including the pelican of Bishop Fox, of Winchester.

* At Great Malvern this feature also occurs, but it was pierced with small apertures, to give a view of the church from the monastic buildings, which extended across the front.

† See Wildman's "History of Sherborne," p. 24.

There are some monuments and effigies in the church of considerable interest. The early inscribed canopy and head of effigy in the north aisle (placed on a modern tomb) of Abbot Clement, 1163, is interesting, and also another effigy in the next bay adjoining. In the chapel of St. Katherine is a very beautiful effigy, now unfortunately partly built into the wall, with angels guarding the pillow. The effigy holds a very beautifully designed pastoral staff recently exposed by the enthusiastic verger of the abbey church.

The effigy is evidently of late thirteenth or early fourteenth century date. At the east end of the north aisle of the presbytery is a modern brass marking the place of burial of the two Saxon kings, Æthelbald and Æthelberht. In the Wykeham chapel is the monument of Sir John Horsey and his son—another Sir John—to whom the abbey passed at the Dissolution. And there is here some interlacing Norman arcading (see illustration). In "Bishop Roger's" chapel is also Norman work on the south side, an

Sherborne
Abbey: Interior of
the Wickham Chapel.

eastern triplet, and many mural monuments brought from various parts of the church. This chapel is now used as a vestry.

In the centre of St. Katherine's Chapel is a large late monument, commemorating John Lewston, Esquire, and his wife, Joane, 1584 and 1597, with their arms, and those of families connected with them, while in the south transept is a large monument to John, third Earl of Bristol, and against the south wall a mural monument to two children of William Lord Digby, with lines by Pope.

Of the ancient fittings, ten stalls, with quaintly carved misericords remain, and are set between the columns of the first bay of the presbytery. In front of these are the modern stalls. The pulpit, lectern, and font are likewise new.

The curious front of what remains of the Chapel of St. Mary-le-Bow, decorated with a late panel and series of shields, with initials and coats of arms, shows in our exterior view.

This was originally the head master's house. The large panel is filled with the arms of Edward VI., and below are shields bearing the arms of "Bishop Jewel of Sarum, of Horsey of Clifton Maybank, of Leweston of Leweston, Mullens of Westhall, and Thornhill of Thornhill."* Below again are eighteen shields, two defaced, with initials of the Governors of the School.

* Wildman, History of Sherborne, p. 41.

Of the monastery the sacristy remains, adjoining the north transept, the guesten hall with its cellars, fifteenth century with a fine roof; the abbots' lodging and kitchen on the north side of the cloister court, and the fifteenth century Abbot's Hall, also with a good roof, standing on a twelfth century crypt, or undercroft. The refectory, and buildings on the east side of the cloister, and the cloister itself, have disappeared. The conduit, formerly in the centre, now stands in the market place. It is of late Perpendicular date. Near it are remains of the Abbey gateway. With the exception of portions of the north wall with its wall shafts, the Church of All Hallows has been swept away.

Of smaller details, attention should be given to the panel on the south face of one of the buttresses on the north side of the west doorway, with a carving of the rood, and also some curious little kneeling figures introduced in the quatrefoils of the parapet of the south aisle, at its west end, and between the south-west angle and the south porch. Some of the gargoyles, too, are very grotesque. The town of Sherborne still retains many interesting old houses; at the south-west corner of the churchyard is the Hospital of St. John, and some little distance south-east of the town are the ruins of Roger de Caen's Castle, and the later house which now forms the residence of the

Digbys, a family whose munificence in rescuing the church from dilapidation and ruin will always be held in grateful remembrance of those who take interest in the preservation of our national monuments. The ground plan given in the present number has been kindly lent to us by Mr. B. Ingelow, and the monuments and vaulting have been added. A view of the school buildings showing some of the monastic buildings was given in the *Builder*, September 3, 1881; and on August 18, 1883, an architectural account was given of the Abbey Church, in connexion with the visit of the Architectural Association Excursion to Yeovil and its district. "A Short History of Sherborne" has recently been written by Mr. W. B. Wildman, and from it the explanation of the rebuses given in the present article has been taken, and other information, duly acknowledged in its place.

THE BLOOMSBURY ESTATE.

WE publish among our illustrations this week a sketch of the alterations about to be made to the exterior aspect of the houses in Russell-square, a sample of the various "improvements" which we are assured are being carried out on the ducal estate of which it forms a portion. The drawing was to have been accompanied by a *couleur de rose* description of the beauties and blessings of Bloomsbury, and the still more glorious future promised for its privileged tenants in view of the various improvements which are in hand. The document we fear, would only be in its right place in our advertising columns; at all events we prefer to give our own opinion about Bloomsbury and its improvements rather than that of the Duke's agents.

We do not know that it can be said that Bloomsbury was at any time a fashionable neighbourhood—not as any West End neighbourhood has been; but it was undoubtedly in its earlier days much more thought of as a residential neighbourhood than it is at present; people have drifted away from it in the course of one of those fluctuations which come over inhabited London from time to time, no one knows exactly why, and lead to a "set" in a new direction for residence. In Bedford-square, the most westerly of the squares, we are informed that houses are almost going begging; yet these are excellent houses, and nearer to the centre of things in London than many of the new residential neighbourhoods in the far west. And Bloomsbury unquestionably has recommendations which, if they are realised, might very well lead to a set back again in that direction. For one thing, it is probably the healthiest part of London; doctors say so at all events, and we believe statistics bear them out. It is also exceptionally well provided with open spaces, the squares forming such a relatively large proportion of the area—35 acres out of a total of 175 being open squares. The houses are for the most part very well built, and moreover they are planned internally with much greater variety than would be expected from the monotonous exterior appearance of most of the streets and squares. In a row of houses which have exactly the same repetition of doors and windows it will be found often that no two are planned exactly alike; people had more sense in that respect then than they commonly have now. The draw-

backs to the houses are that they are deficient and old-fashioned in sanitary planning; in some of the largest houses in the squares the water-closet will be found in the middle of the house with no opening to the outer air; and that the bedroom accommodation is in many of them deficient in proportion to the size of the house; everything is sacrificed to the sitting-rooms. This is a defect which in many cases cannot very well be got over, but the sanitary arrangements can be, and to some extent have been, improved, and to carry out this improvement thoroughly ought to be the first object of the managers of the estate.

The most is not made of the square gardens, they are for the most part very badly laid out; they have the compensating advantage that some of them at least contain very fine trees, but they might be made much more ornamental and attractive than they are.

Unfortunately the "improvement" ideas of the Bedford Estate Office seem mostly to run in wrong directions. They are to a great extent spoiling the neighbourhood by fancied improvements, the real object of which is to squeeze every pound of rental that can be got out of the land. With this object a great part of the property between Gower-street and Tottenham Court-road has been covered with lofty blocks of "flats" placed as close as they can be got. One or two of these are good buildings, but they are overcrowding the land. Overcrowding is not the less overcrowding because it is done vertically rather than horizontally. If this over-building of high "mansions" goes on, Bloomsbury will soon cease to be the healthiest part of London, and the Bedford Office will have defeated its own object. To make Bedford Court Mansions a considerable open space has been built over, and several trees cut down. To cut down trees which are growing in the middle of London is little short of a crime.

The manner of improving the houses is more than questionable. "It is proposed," we are told, "not to rebuild the houses" (this applies to the squares mainly) "but to treat their fronts architecturally with porches, bay-windows, friezes, cornices, and window dressings, all in light buff terra cotta, new railings and balconettes will complete the exterior. Each block is being treated as a separate unit, the centre and wing houses being carried up an additional story, imparting variety to the present rather monotonous skyline, as well as affording needed additional bedroom accommodation to some of the larger class of houses where the reception rooms are now somewhat disproportionately large."

This last proposal is a practical one enough; but the proposal to tinker up the house fronts with terra-cotta dressings &c., is as absurd as it is unnecessary, and a foolish expenditure of money which might be better employed. The houses as they exist have a certain character of their own which had much better be left to them. Of this the Bedford Estate Office seems to have no perception at all. In Gower-street, for example, the houses originally all had those ornamental fan-lights, variously and often very gracefully designed, which were a characteristic of the period when they were built. Nearly all these have been removed and blank sheets of plate-glass substituted. The doors of a number of the houses on the west

side have been encased with heavy clumsy-looking stone framework, which quite destroys the original character of the houses, and on the east side an attempt has been made to give new dignity to some of the larger houses by absurd flat stone pilasters plastered against the walls. Why could they not let the old brick fronts alone? However plain, they were in much better taste than these clumsy additions.

One of the means whereby Bloomsbury is to be rendered more attractive is to deprive tenants of their private gardens by removing the garden walls and throwing them all into one garden for the whole block. This has been done in one place, and is threatened in others. The object is to make the general neighbourhood look more attractive in appearance. It does not seem to have occurred to the Bedford Office that to many people living in London the possession of a fairly sized private garden which they can call their own is one of the greatest of blessings, and that in doing away with this advantage they are actually injuring their own property and lowering its value and attraction to possible tenants. If they cannot see that, they will find plenty of people, we imagine, to tell them so.

Unfortunately, if all we hear is true, the wishes of the tenants are the last motive the Bedford Estate office ever takes account of. It happens that a good many architects live in Bloomsbury, and hence we hear a good deal about their complaints, and several of them who have communicated with us evidently consider that living on the Bedford Estate is pretty well equivalent to living under a despotism. The form of lease granted to tenants is in itself a document which reads as if residents on the estate were to be the serfs rather than the tenants of the Duke of Bedford; it ought to be revised by Act of Parliament. It may be admitted that the lessors do not use all the powers the form of lease puts into their hands; but it is nevertheless a fact that we have had evidence from many quarters that the Bedford Office is regarded as being arbitrary and high handed in its dealings with tenants to an extent which is a legitimate source of complaint; and if the Duke of Bedford wishes his Bloomsbury Estate to come into its old favour as a residential neighbourhood, he would do wisely to inquire into the causes of the very strong feeling which obviously exists as to the policy and practice of his office, and to get some information from the tenants' side as well as from that of the estate agent.

NOTES.

In the House of Commons on Tuesday the Government announced the terms of the reference to the Royal Commission on the London water supply. After perusing it, we are a little astonished that the Government does not refer all its business to a Royal Commission. The first point of inquiry is whether it is desirable that the undertakings of the water companies should be acquired and managed either by one or by several authorities, and if so on what terms. If not, whether additional powers should be given to the Local Authorities to control the water companies. This is simply to give up the forming of a policy by a Government, since it is now left to a

Royal Commission to make up the mind of the Government. This is the long and short of the matter. Let it be remembered also that last session the Government had a policy, namely, to establish a central public authority to which the management of the water supply should be intrusted. Now that policy is given up, and this extraordinary Government, which was to do such great things for the people, can only ask a dozen gentlemen called a Royal Commission to discover a policy for it.

Austrian
Architects
and the
Government.

THE Council of the Architectural section in the Vienna Association of Artists have sent in a petition to the Government to take in hand a larger number of public buildings. Attention is drawn to the fact that a large number of the Government institutions are housed in tenement buildings at high rentals, and that there would be economy if the Government became its own landlord to a greater extent. The petition points out that since the great epoch of Government architecture some twenty years back, when the Houses of Parliament, the Town Hall, and the other great modern monuments of Vienna were erected, the architecture of the capital city has deteriorated owing to building operations having been practically confined to private enterprise, and building speculation of the worst sort. It is not unlikely that the Government will seriously consider this petition, as there is a strong feeling in Vienna on the subject.

"Structure" in
the London
Building Act.

THE case of *Venne v. McDonell*, which is reported in the author's *rised Law Reports* (1897, 1 Q.B.D. 421) should be carefully read by all persons who have to do with London buildings. It was an appeal to a Divisional Court from the decision of a magistrate, and has an importance beyond the interests of the persons concerned in it. The directors of the Agricultural Hall, at Islington, have a movable seating, which can be taken away when it is not needed, and is replaced if necessary, and fixed by screws and bolts being let into sockets attached to the pillars. It was alleged by the proper District Surveyor that the seating was a "building, structure, or work" within the meaning of Section 145 of the Building Act, 1894, and that, therefore, notice should be given to the District Surveyor before it was put up. The Court, however, did not take this view, and held that it was not such a structure as was contemplated by this part of the Act. If it were, said the Court, "no person could put up a fixed cupboard or a fitted bookcase in his house without giving notice to the District Surveyor and without being subject to his supervision." It is obvious that the Act intended to mean by the word "structure" in this part of the Act something of the same general nature and character as a building. That is to say, this word must be construed keeping in view the context. Thus, in Section 164 the expression "the regulation of lamps, signs, or other structures" is to be found. It is an odd use of the word "structure," but there can be no doubt that in this place "structure" means something in the nature of a sign or a lamp. In the part of the Act which has to do with the erection of buildings it means something in the nature of a building, not a movable row of seats.

The Purified Petroleum Fire.
 IN connexion with the proceedings of the Petroleum Committee at the House of Commons, it is curious to find that practically the only exhaustive technical report in the large petroleum fire that occurred at Purfleet in January is to be found in a German contemporary, from the pen of Chief Officer Westphalen, of the Hamburg Fire Brigade. His notes are, moreover, illustrated by a sketch plan of the petroleum stores and the fire, and they contain many valuable hints on the treatment of petroleum fires. It would appear that the Senate of Hamburg, being much interested in the prevention of fires, have given their Chief Officer a kind of general commission to attend any conflagration, the results of which he may consider deserving the attention of the Local Authorities, and although Hamburg is twenty-four hours' distance from London, it would also appear that the officer actually reached the scene of the fire before any of our leading fire experts, including the Chief Officers of the Metropolitan Fire Brigade, had considered it worth their while to personally look into the matter, it not actually being part of their duties to do so. The London Brigade had, it is true, sent one of their fire floats to this fire, but they had been worked by a foreman. Mr. Westphalen appears to consider the preventative measures in his city somewhat excessive; further, he considers that the risk of explosion in a well-constructed petroleum tank can only be very slight, and that a fire brigade can risk attacking a conflagration of its description at close quarters. It seems somewhat curious that we should hear all this from abroad in connexion with a fire so close to London.

The Sanitary Condition of Great Yarmouth.
 THE case of Durrant v. the Corporation of Great Yarmouth, recently decided in the Law Courts, is of interest from the light which it throws on the condition of some of our so-called health resorts. The action was brought by the executors of a gentleman who it was admitted died from typhoid fever in March of last year, contracted through drinking impure water from a well in Great Yarmouth. This well, it is alleged by the plaintiffs, was contaminated by leakage from a new sewer which was being made in Queen-street, in which was the house occupied by the deceased gentleman. It was clear, however, from the evidence, and the jury so found, that the well in question was not contaminated by this sewer, which was 36 ft. from the surface. There was ample poison within due reach, for within 16 ft. of the well was one closet, and within 27 ft. was another closet from which liquid excreta oozed up through the pavement. Of the well itself the Inspector of Nuisances said that the brickwork of the well was defective, and that there was slimy incrustated matter on its old standing. The Public Analyst stated, and this is perhaps the most remarkable evidence in the whole case, that he had examined as many as three hundred wells in Great Yarmouth, and they were all unwholesome. This statement shows conclusively the frightfully unhealthy state of this seaside town. If there are other wells in Queen-street and in Yarmouth like that described in this case, all we can say is that any one who goes to this town does so in

peril of his life. The facts elicited during the course of this trial show very conclusively that the Sanitary Authority of every town which calls itself a health resort should make periodical sanitary surveys, and give certificates of sanitation to such persons as own houses which are in a proper sanitary state, and strangers should be warned that they cannot safely go to a house which is not so certified. A person who intends to occupy a whole house for some length of time will, if he be prudent, have it examined for himself; but the stranger who visits Yarmouth or a similar town for a few weeks only cannot well have such a survey made. At any rate, however, the incomer now knows that Yarmouth is an unsafe place.

THE Botanical Society has
 A New Observatory offered the Astronomical Society a site for an observatory in the Botanical Gardens, which appears to be considered a very suitable position by the astronomers, who are likely to be the best judges. It has the advantages undoubtedly of being central, of showing a fair horizon, and of being better removed from smoke and disturbances of the ground than perhaps any other site which is available within London. The question is now as to acquiring funds for erecting the building.

LORD RAYLEIGH'S fourth lecture on "Electricity and Electrical Vibrations" at the Royal Institution was a very interesting one. He gave experimental illustrations of many anomalous phenomena due to the mutual actions and reactions of circuits carrying alternating currents. He showed how an alternating current, when it comes to a divided circuit, may sometimes split itself up in such a way that the subdivided currents may be greater than the main current. The reason of this apparently startling result is that some of the currents in the divided circuits are flowing in one direction and some in the other. At any instant their algebraic sum is exactly equal to the current in the main, but individually they may be hundreds of times greater. In other words the inductance of the branched circuits causes raging whirlpools of current in these circuits. Lord Rayleigh gave an excellent illustration of the oscillatory nature of the spark in a Leyden jar discharge. He altered the inductance of the path of the discharge and showed how this changed the note of the spark. The lecturer said that the presence of iron in the core of the transformer made the theory of transformer designing very difficult, and pointed out that if copper were a perfect conductor all theoretical difficulties would vanish. We think that no transformer designer will agree that iron makes the theory difficult. The approximate formulæ he uses would cease to be true if he had an air-core transformer to deal with, and the formulæ that would come in their place would astound him by their length and complication. In conclusion, Lord Rayleigh showed some of the most striking of Mr. Tesla's experiments on high frequency currents.

In his lecture on "Leadwork" at the Society of Arts on Tuesday, Mr. W. R. Lethaby made a protest in favour of the trial of cast

lead in place of milled lead, which he characterised as a wretched substitute. Cast lead, he urged, is certainly more durable, more easily bossed up, has a beautiful surface, and he finds, contrary to what he used to suppose, that it whitens by exposure like old lead. All this we think is true; the last statement we are ready to take on Mr. Lethaby's evidence; but does Mr. Lethaby maintain that cast lead, with its chance of small holes in casting, is as safe a material for roofing as milled lead?

St. Thomas's Church and Parish, Southwark. By a Bill which has been introduced into the House of Lords, the Corporation of London, as Governors of St. Thomas's Hospital, propose to effect a union of this ecclesiastical parish with that of St. Saviour, the united parishes to constitute one benefice and cure, and to convey their estate and interest in the church and adjoining land to the Ecclesiastical Commissioners. It is proposed also to empower the Commissioners to either pull down the church and sell its materials, or convert it into a chapter-house for the collegiate church of St. Saviour, or otherwise appropriate the building to some purpose authorised by the Act. The church, which represents the (old) hospital chapel, as re-dedicated to St. Thomas-the-Apostle, was rebuilt, with a tower, of red brick, at a cost of 3,000*l.*, in the year 1702, Sir Robert Clayton being then president of the hospital. It does not present any architectural features of especial interest; there is a view of it, by E. Cole, in Maitland's "London" (1756). Next to it stood the treasurer's house, the two forming the south side of the middle court of the former hospital buildings, which were closed in 1862, their site being taken, on an award of 296,000*l.*, for the railway extension to Charing Cross. We gave some historical particulars of the origin of the hospital, which at the Suppression was a religious foundation, dedicated to St. Thomas of Canterbury, and of the parish, co-extensive with the earlier precincts, in our "Notes" of March 9, 1895, and June 20, 1896.

An old Tavern, Fetter-lane. WE understand that the old tavern, by sign of the "Magpie and Stump," in Fetter-lane, one of the many for which that thoroughfare was once famous, will shortly be pulled down. It stands on the east side, opposite Norwich-court (formerly Magpie-yard) and the "White Horse." It claims to have been established in the year 1605, and to have been a chosen haunt of Otway and Dryden (who, it is said, lived for awhile in two houses, as opposite neighbours, in the Lane*), and of Hobbes, of Malmesbury, Dr. Harvey, and Cowley. In the earlier half of the current century it was much frequented by prizefighters and their following. The story goes that in a room of the "Magpie and Stump" Edmund Waller, Nathaniel Tomkins (his brother-in-law), and Challoner, concocting their plot for delivering the City to the Royalist party, were overheard by a servant of Tomkins, who betrayed them to Praise-God Barebone, the leather-seller, or skinner, of Fleet-street. The Barebone family owned property in this part of London; it is said that some houses

* See the *Builder* of Jan. 10 and 17, 1891, and (with illustration) of Jan. 24, 1891.

on the site of the Outer Temple were built by Dr. Nicholas Barebone, son of the above-named, and that the house built by Wren for the Royal Society, between Fleur-de-Lys and Two Crane courts, was erected on their land.

A DESIGN by Messrs. Watson, of the Goldsmith Memorial, Forgnoy. Youghal, has been chosen for a window, in memory of the poet, which the subscribers intend to place in the parish church of Forgnoy (or Ferney), near Mullingar. Goldsmith was born (1728) in the village of Pallas (or Pallasmore), on the river Inny, within that parish. The house wherein he was born—it has been pulled down—stood two miles distant from the church. In 1730 his father obtained the cure of Kilkenny West, and removed to a house and farm at Lissoy, distant about eight miles from Pallas, which the poet doubtlessly had in mind when he wrote some stanzas of his "Deserted Village." There is a separate project on foot for fixing a memorial window in his honour in St. Saviour's, Southwark, in reference to the fact that soon after he first came to London, Goldsmith practised during some months in 1756-7 as a poor doctor to the poor in Bankside.

The Haymarket Galleries. THE two picture galleries next door to each other in the Haymarket, Messrs. Arthur Tooth & Son's and Mr. McLean's, opened their spring exhibitions simultaneously on Monday. At Messrs. Tooth's Gallery the most noticeable incident is the re-appearance of Mr. Holman Hunt's extraordinary picture "Dolce far Niente," the portrait of a masculine-looking woman in a very striking costume which is painted with immense force of colour, seated in a room the details of which are seen reflected in a convex mirror. It is a thing that gives one quite a start to come upon in the midst of an average dealer's exhibition. The flesh-painting is bad and the whole picture undeniably ugly, and yet with a power about it which puts it quite out of the category of ordinary pictures. Among other works exhibited is a charming figure by M. Dagnan-Bouveret, "Vespers;" Mr. Dendy Sadler's "Morning Gossip," in which the admirably painted accessories are perhaps of more interest than the figures; Mr. David Farquharson's "Looking towards Harrow," a landscape in a broader style than most works we have seen from him; M. Munkacsy's "Tête-à-Tête," a commonplace work in his brilliant but superficial style, and a scene in which Mr. Heffner endeavours to persuade us that scenery "On the Norfolk Broads" has exactly the same colour and tone as the scenes in Bavarian marshland which he has often painted; in other words, Mr. Heffner has only one effect under various titles. In the small room is an interesting collection of old water-colours, with a few modern ones. At Mr. McLean's Gallery many will be interested to see again Mr. H. W. B. Davis's beautiful "Springtime," exhibited three or four years ago at the Academy under the title "Elderberry." Mr. Godward's "Andromeda" is a pretty figure study, with the name of Andromeda unnecessarily tacked to it. Among other works there are M. Vastagh's fine life-size head of a lion; M. Bouguereau's "Spring," like many other works by the same artist; M. Neuhy's "Fisherman's Family," an imitation of Israel's; Marie Dieterle's "Cows in a

Meadow," and C. Werterbeck's "Scene [in Holland]," both excellent works of their kind; a fine specimen of the sea-pieces of Clays, and a small marble sculpture group by M. Dalou.

A NUMBER of minor exhibitions Exhibitions open among which may be mentioned especially that of the works of M. O. de Champeaux, at the Cercle Artistique in Rue Volney. This exhibition includes about seventy oil paintings—landscapes, sea-pieces, and flower paintings—besides some thirty large water-colours. It is the outcome of ten years' persevering labour and a good deal of foreign travel. Among the landscapes we may mention especially "Road near Autun," "Sunset in Galway Bay," "The lagoon, Chioggia," "Twilight effect at San Giorgio Maggiore," and some decorative panels of chrysanthemums, roses, and other flowers. At the Mancini Gallery M. Gustave Colin exhibits a series of paintings of coast scenes in Spain and the neighbourhood of the Pyrenees,

remarkable for their force of treatment and showing that age has not robbed this gifted painter of any of his powers of observation or of painting. In the Gallery at the Champs Elysées the "Société Artistique des Amateurs" holds its exhibition. There are no great works, certainly, among these five hundred paintings, but there are some interesting pictures by the Duchesse de Chartres, the Comtesse de Flandre, Mlle de Caraman-Chimay (who works in pastel), and others, and some good sculptures by the Comte de Passage. The exhibition, though an amateur one, is worth a visit.

DIMENSIONS OF SOME MEDÆVAL BUILDINGS.

In publishing Professor Aitchison's series of Royal Academy lectures on "The Advancement of Architecture," we mentioned that we would give as an appendix at the end of them the list of dimensions of some English and French cathedrals which the Professor had prepared in connexion with these lectures.

We now give them as follows. It will be understood that this is Professor Aitchison's list, not ours, and that we give it on his responsibility, and as a portion of his lectures.

DIMENSIONS OF SOME ENGLISH CATHEDRALS, ARRANGED ACCORDING TO AREA.

Name.	Area.	Length.	Span.	Height of Nave.	Height of West Towers.	Height of Central Tower.	East End.	Trans-sept.	Aisles to Trans-septs.
York	72,860	486	45	101	196	193	square	1	2
Lincoln	66,900	481	39	82	206	262	square	2	west, none; east, one.
Winchester ...	64,200	526	32	78	...	140	square recessed	1	2
Ely	53,480	517	34	72	215	...	square	1	2
Westminster ...	61,729	505	35	103	225	...	circular, with lady chapel	1	2
Durham	46,000	473	32	70	138	216	square	2	middle transept & one east aisle.
Salisbury	44,400	450	32	84	...	404	square recessed	2	one aisle each.
Canterbury ...	43,515	574	39	80	157	229	circular	2	none.
Peterborough ...	55,790	426	35	81	154	143	square, but circular end to choir	1	one east aisle.
Norwich	49,572	408	28	72	...	313
Worcester	47,950	394	32	68	...	196
Gloucester	40,572	359	32	73	...	127
Exeter	34,800	498	35	67	...	225	circular, with lady chapel	1	none.
Wells	38,980	393	34	69	140
	29,070	371	32	67	125	165	apse	2	middle, two aisles south, no aisles east.

In the above list the dimensions in thick figures are from Fergusson, the remainder from Lord Grimthorpe.

DIMENSIONS OF SOME FRENCH CATHEDRALS, ARRANGED ACCORDING TO LENGTH.

Name.	Area.	Length.	Span.	Height of Nave.	Height of West Towers.	Height of Central Tower.	End.	Trans-septs.	Aisles to Trans-septs.
Le Mans	492	...	ft. in. 111 6	semi-circular with 7 chapels	1	...
Reims	45,550	485	47	123 0	272	...	apsidal: 5 chapels	1	...
Amiens	67,475	435	46	140 0	N. 223 S. 205	422	wooden steeple, apsidal: 7 chapels	1	2
Chartres	60,709	415	46	106 0	N. 403 S. 365	...	semi-circular: 3 apses	1	2
Nôtre Dame	51,460	410	46	112 0	204	...	apsidal: 9 chapels	1	...
Troyes	68,261	400	42	semi-circular: 5 chapels	1	2
Evreux	54,950	368	21	72 7	...	142 9	...	1	...
Soissons	54,103	328	...	109 0	semi-circular: 7 chapels	1	2
Clermont	328	...	109 0	1	...
Beauvais	37,230	263	45	153 0	semi-circular: 7 chapels	1	...
Strasbourg	36,700	250	...	101 0	468	1	...
Coutances	242	...	87 0	semi-circular: one chapel	1	...
Laon	square	1	2
St. Peter's, Rome	150,000	710	80*	154 0	Pediment 155 cupolas 246	Dome 443	square internally: apsidal externally	1	...

* According to Letarouilly, 85 ft.

In the above list the dimensions in thick figures are from Lord Grimthorpe, the remainder from Fergusson and other sources.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

HERALDRY OF THE RENAISSANCE IN ENGLAND.

The eleventh general meeting (ordinary) of this Institute for the present session was held on the 20th ult., at No. 9, Conduit-street, Professor Aitchison, A.R.A., President, occupying the chair.

The minutes of the last meeting having been taken as read, Mr. J. A. Gotch read a paper entitled, "Heraldry of the Renaissance in England," of which the following is an abstract:—

Mr. Gotch said that in dealing with the subject of heraldry before an audience of architects, he proposed to approach it from the decorative side, not from the scientific; for architects were not likely to be called upon to grant arms to their clients, but they might have to draw them; and to do this successfully it was essential to know something of decorative heraldry. After quoting various references to heraldry in Renaissance literature, and especially advertising to the curious fancy prevailing at one time for finding or inventing coats-of-arms for scriptural characters, saints, and even for the Saviour, Mr. Gotch referred to one law as to the granting of arms laid down by Sir John Ferne in his "Blazon of Gentrie," whereby it seemed that while professors of "the seven liberal arts" were not unworthy of having arms granted to them, the followers of "the seven mechanical sciences" were quite outside the pale. As architecture was one of the mechanical sciences, their case, as mere architects at any rate, was hopeless, for Sir John Ferne was emphatic. "Although it be true," he says, "which I erst sayde: (that mechanical sciences, with their professors, be debarred the preheminance of Gentrye: which opinion, if any one would overthrow, let him look for this, that my friends Barth, with his codes and textes, will easily confounde his rashnes and ignorance.) Yet I have not denied but that some notable collateral merite and worthines may be in the mechanical man, that he shall duly obtayne a coat-of-arms: But not by the meere practice of his mechanical trade." Let them endeavour to be thankful for small mercies. When the posthumous granting of arms to persons who could have had no concern with them was considered, they could realise how far heraldry had travelled from its original starting-point three centuries before. From being matters of daily practical use, armorial bearings had come to be what certain rudimentary organs of many animals were, a mere indication of particular ancestry: and so by implication a mark of gentility. The next inevitable stage was crystallisation. Rules were laid down which shared the fate of many other rules if blindly adhered to: instead of being guides they became goals; the origin of armorial bearings being forgotten, the application of them tended to become illogical, and heraldry gradually declined both as a science and as a decorative art. The drawing became too realistic, and lost its proper conventional treatment; the bearings were depicted in the round instead of the flat. Draughtsmen were too well instructed in general matters, they had got to know what live lions really looked like; they were familiar with many animals and things which their ancestors knew chiefly by conjecture, and they utilised their knowledge to the detriment of their design. The eighteenth century squires gradually fell out of the habit of adorning their houses with heraldry, which became little more than a matter of book-plates. Another cause of deterioration in heraldic drawing arose directly from the change in the object of heraldry, namely, its becoming an indication of ancient descent, leading to a multiplication of quarterings, which so reduced the scale of each coat as to render spirited drawing impossible. There was in the hall at Fawsley, in Northamptonshire, an achievement of the Knights', containing 334 quarters, which was 330 too many for decorative effect. But although the heraldry of the Renaissance contained within itself the germs of its own decay, it flourished vigorously enough. The designers of the time loved to avail themselves of it in all materials and in all connexions. There was hardly a building of the period of Elizabeth and James that had not its owner's arms carved conspicuously upon it. Apart altogether from its decorative aspect, heraldry was most useful in historical research. Many a clue was afforded by the presence of a shield or a badge in a building which had outlived its story. Take, for instance, Rushton

Hall. There we found two gables alike in design, but bearing different shields, one with the Trefoils of Tresham, the other with the cocks of Cockayne. How much did that difference imply! It meant the downfall of the first family through complicity in Gunpowder Plot, and the succession of the second to the house and estate, and not only its succession, but its taking up and continuing the enlargement of the house in the old spirit and on the old lines of design. Or, again, take the ninety shields on Rothwell Market-house, all bearing the arms of families connected with the county. Why did some of those shields appear. It was impossible to say; but the fact of their being there pointed to a connexion with the county yet to be discovered. The shields on Rothwell Market-house brought us to another point, and that was the drawing of the charges; for there it was done with such vigour and grace as to be a pleasure to look at, apart altogether from the heraldic signification. The animals were fierce and wild and strong, and looked as if they had lived in the forest; not like their descendants of a century or two later, which had become tamed and docile, and fit to lie on the hearthrug. That was in the time of the Georges, when rules and regulations had broken their spirits. There were, of course, certain rules and regulations which had to be observed, but, within their limits, the more freedom the better; in fact, freedom was essential to decorative effect. The characteristic charge that distinguished the coat must be preserved, but within that limit it might be treated according to the taste of the designer. For instance, a lion rampant must always be made a lion rampant, but there was no need to have his head and his four legs in precisely the same relation to each other, nor need his tail always take the same curve. These things might be varied according to the space to be filled. [A very good instance was shown in the lantern illustrations afterwards, of two lions, one designed to fill an upright space, the other for a square space.] The treatment of the crest and wreath on the helm, and the mantling, should be founded on logic, at any rate, if not strictly logical; that was to say, the crest and wreath must accompany the helmet, and not float in mid-air just above the shield. The mantling must be treated as a kind of cloth puggaree, with two sides, which usually were of different colours. When supporters were introduced they ought to stand upon something more substantial than the edge of the ribbon which displayed the motto. They should also look as though they were actually supporting the shield and helm. Heraldic drawing was not an easy matter. The designer must be a skilful draughtsman, combining vigour of pencil with a strong feeling for anatomy; so that if an animal had to be drawn its particular characteristics might be presented in a truthful though conventional way, with as few strokes as possible.

Mr. J. M. Brydon, in proposing a vote of thanks to Mr. Gotch for his paper, said that, as an architect, he knew most of heraldry as applied to architecture, and that he knew very little about it scientifically. That night they had had their attention directed to heraldry, not only in the method of it, but in the sequence in which it should be applied in a decorative sense. Mr. Gotch, at the beginning of his paper had settled, or rather Sir John Ferne did, a vexed question. They had all heard of the controversy as to whether architecture is a profession or an art. It seemed to be neither; it was a "mechanical contrivance," and architects are all mechanics. He presumed that the "mechanic" of that day signified what "craftsman" does in this, and he was quite willing to accept that gentleman's dictum, and be a "craftsman," and as "craftsmen" heraldry must appeal to architects in two aspects—the historical aspect and the decorative aspect. It was evident from many of the illustrations of shields exhibited that it would be almost impossible to decipher the history of places in which they are embazoned but for the heraldry which is on them, and in that aspect they were deeply interesting, not only to the architect but to the archaeologist. The decorative side, of course, was the one that appealed to them most strongly, and the method in which Mr. Gotch had shown how shields ought to be filled by quarterings, and how the supporters ought to stand on something more substantial was, in a decorative sense, of great value and use to all students of architecture, who, of course, in their

practice were constantly using arms in their buildings, either in carving or in stained glass. There was one thing that had struck him in the magnificent decorative ceiling at Earlshall, in Fifeshire. This ceiling, he believed, was done by Sir William Bruce, who was architect to Charles I., and who carried out the modern part of Holyrood Palace. It was due to him that the county of Kinross was turned into a county and detached from Fifeshire, and the same man built a magnificent palace or house, which he hoped the King would occupy, but, unfortunately, he did not live to do so. In colour it was very fine, and he was glad to hear that since its restoration it had been taken such great care of, and that only the old work that they were perfectly sure of had been restored, and that they had not invented anything new. There was one example that Mr. Gotch had given of the two pictures from De Vaux. His (the speaker's) opinion was that the coat of arms was Lord Richard Neape's. Judging from the style of the carving purely and simply, it seemed to him that the panel that contained the arms had been carved later than the rest of it.

Mr. St. John Hope, in seconding the vote of thanks, said he quite agreed in the remarks that Mr. Gotch had made with regard to the rules which had brought heraldry into such disrepute, because, as Mr. Gotch pointed out, those rules had served to bring heraldry into a crystallised condition, and had destroyed its freedom, and all the fine art of it seemed to have more or less disappeared. And the same with the drawing from the round. All the ancient heraldry was simply painted in flat in outline, and when it began to assume the sculptured form, as one saw in the shields in Westminster Abbey, it was still kept in such low relief that it was only just out of the flat condition. Also, with regard to quarterings, there could be no doubt, as Mr. Gotch had pointed out, that the multiplication of quarterings was entirely destructive of a great deal of the artistic beauty of ancient heraldry. He supposed that multiplication of quarterings arose through the practice of representing first of all a quarter shield upon a shield that was already quartered. That would bring in eight quarters, and then, when the son of that man and his wife, whose arms were so represented, quartered them in turn, that further complicated matters, and if the gentleman who then became the possessor of that shield in turn married an heiress, he inherited further quarterings, and so they eventually reached that dreadful state of things that was seen in the quartered shield at Fawsley with 334 quarterings. The value of heraldry in dating buildings was one that could only be appreciated when one had taken the trouble to work it out for himself. A fortnight ago he exhibited a lantern slide of that beautiful gateway of Kirkham Priory. No date had been assigned to that in any book that he was aware of; but he happened to be called upon to write a paper upon Kirkham Priory, and it struck him with regard to the heraldry on that gateway that it was arranged on some kind of system, and that if the clue to that were found, one possibly might arrive at the date of the production; and he soon found, from the examination of the shields, that they represented alliances. From those alliances it was easy to prove—or, at any rate, suggest with a strong show of probability—a date within a very few years of which the old gateway was built. As Mr. Gotch had said, to draw heraldry properly one must become soaked with heraldic art; and one of the very best sources from which heraldic art may be learned was that of seals. It was unfortunate that the places where the seals were to be found were so difficult of access. There was a very large collection at the British Museum, which might be studied after a fashion. There ought to be a huge collection, much the same as the one which the Society of Antiquaries was fortunate enough in possessing, of casts of seals. They cost very little to make, and there ought to be such a collection at South Kensington, that one could take out drawer after drawer of seals, and arrange them in any order he pleased, so long as he restored them to their proper places.

Mr. H. H. Statham said he should like to join in the expression of thanks to Mr. Gotch for his paper, and more particularly so because he knew nothing about heraldry, and therefore had benefited all the more. There were one or two conclusions he came to, having regard to what Mr. Gotch mentioned was the title of the last paper—"Heraldry in Connexion with Archi-

Sketches of London Street Architecture.—XII. No. 83, New Bond-street.
Mr. W. A. S. Benson, Architect.

ecture." He quite agreed that heraldry, in a retrospective sense, was a most valuable aid, as Mr. St. John Hope has said, in studying the chronology of buildings; but as a modern subject heraldry was now only a kind of pastime, though a very picturesque one. The real use of it had gone. The original use of heraldry was to distinguish a man when his face was covered by a helmet, so as to prevent his own friends knocking him on the head by mistake. He was not quite able to follow all the enthusiasm of the lovers of heraldry in regard to the drawing of all the examples they had seen. Some of these lions, which were said to be so beautiful, seemed to him to be more curious than beautiful. But he was rather struck with this, in regard to the fact that heraldic animals of the best kind were conventional and not real, that the species were not numerous, and if we had to draw new coats of arms in the present day there was certainly a field for the youthful designer who took up heraldry for evolving some new forms as improvements or variations upon the orthodox griffin and lion. One remark he would add as to the question of "Heraldry in Relation to Architec-

ture." In the first illustration shown, that of the gateway at Holdenby, they might have noticed in the design of that gateway that the masonic design in the upper part of it was a preparation for a place to put the heraldic coat of arms in. The gateway was surmounted by a large circular mass with a panel, which was of no use except to display the heraldry. Now, it struck him that in most of the other cases the architecture had no particular reference to the display of the heraldry. The coat of arms was put on wherever it was found convenient. In the Holdenby Abbey Gate there was a real sense of the architectural design being affected by the desire to display a coat of arms. Now, if people were going to use heraldic devices as part of architectural ornament, that was one point to bear in mind, that the architectural effect was much greater when it appeared that the architecture and the heraldry had been planned together, and that the architectural design actually provided for the heraldry from the first.

The vote of thanks was carried unanimously. Mr. Gotch said that as to Mr. Statham's remarks about new species, if heraldry was to be

continued, it seemed to him that the line upon which the modern herald must go was to take the modern animal and conventionalise him not shutting his eyes to the knowledge that we had in the present day, but taking the animal and making him conventional very much in the same way in which the last slide showed the dog, which was a very modern dog, but treated in quite a conventional and vigorous way. When one came to an allegorical animal like a griffin or a unicorn there was, of course, a modern representation of it, and no modern specimen to be found in a museum, and he did not know what they were to do there. He thought they must depend entirely upon their invention. To Mr. St. John Hope he was indebted for many suggestions which he had been able to avail himself of. Mr. Hop had kindly put at his disposal the beautiful seals which were part of the series at the Society of Antiquaries.

The Chairman said that the next meeting would be held on April 12, when Mr. H. F. Statham would read a paper on "The New Government Offices Scheme."

The meeting then terminated.

SKETCHES OF LONDON STREET ARCHITECTURE.—XII.

No. 83, NEW BOND-STREET.

THIS front was designed by Mr. W. A. S. Benson. The stone used is Chiltern, in large blocks. The arch is a real one of red roofing tiles and through stone voussoirs, but there is a bond iron girder above and below the carved cornice. The front stands on the stone pier and not upon stanchions. The setting back of the top gable was intended to disguise the fact that No. 83 is considerably the loftiest house in the row.

The dominating condition of the design was that it was desirable to carry three floors back to the full depth of 63 ft., about 40 ft. of which had to be lighted from the front.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At a recent meeting of the London County Council the Building Act Committee reported that they had considered the under-mentioned applications under the London Building Act, 1894, and had arrived at the following decisions. Those applications which have been agreed to are granted on certain conditions:—

Lines of Frontages.

Westminster.—That consent be given to the erection of two blocks of residential flats, Nos. 1 & 2, Morpeth-mansions, Morpeth-terrace, Victoria-street, with bay windows and open porticoes, on the further application of Mr. G. Baines on behalf of Mr. G. Martin.

Fulham.—That consent be given to the erection of a two-story building on the south-east side of Harwood-terrace, to abut upon Imperial-road, on the further application of Mr. C. Collins.

Newington, West.—That consent be given to the erection of additional stories upon the shops in front of Nos. 338, 340, and 342, Walworth-road, by which the height of the buildings will be increased to 41 ft., on the application of Mr. E. H. Payne on behalf of Messrs. Grose Brothers.

Paddington, South.—That consent be given to the erection of an iron and glass covered way in front of No. 1, Southwick-street, Hyde Park-square, on the application (further considered) of Messrs. R. Hogg & Son.

Peckham.—That consent be given to the erection of two houses with one-story shops in front, next No. 648, Old Kent-road, at the corner of Ethand-road, on the application of Messrs. Holman & Goodham on behalf of the Royal London Friendly Society.

Strand.—That consent be given to the erection of an iron and glass shelter over part of the footway in front of Her Majesty's Theatre in the Haymarket and Charles-street, St. James's, on the application of Mr. C. J. Phipps on behalf of Mr. H. Beerbohm Tree.

Battersea.—That consent be not given to the erection of an enclosed porch to a proposed parish-room next the Vicarage, Prince of Wales-road, on the application of the Rev. G. Harcourt.

Clapham.—That consent be not given to the erection of a church in North Side, Clapham Common, at the corner of Lavender-gardens, on the application of Messrs. W. & C. A. Bassett Smith.

Beckenham.—That consent be not given to the erection of a one-story shopfront to Nos. 98 and 100, Beckenham-road, Penge, on the application of Mr. W. Theobalds on behalf of Mr. B. Grant.

Hackney, South.—That consent be not given to the erection of one-story shops upon part of the

occurents of Nos. 206, 208, 210, 212, 214, 216, 218, 220, 222, 224, and 226, Morning-lane, on the further application of Mr. W. Hall on behalf of Mr. T. W. Wheeler.

Norwood.—That consent be not given to the erection of houses with one-story shops on the west side of Norwood road, between Ulls-water-street and Harpenden street, on the application of Mr. H. G. Brace on behalf of Mr. H. Prvor.

Wandsworth.—That consent be not given to the erection of a signboard in front of No. 40, Bedford Hill-road, Balham, on the application of Mr. C. C. Dunne.

Woodhick.—That consent be not given to the frontage of fourteen new houses and also to the proposed frontage line of other cottages to be erected northward of those houses on the west side of Chislehurst-lane, Eltham, on the application of Mr. A. G. Wright on behalf of Mr. J. Bass.

Width of Way.

Bow and Bromley.—That consent be given to the erection of an addition to a factory on the south side of The Mill-lane, Bromley, at less than the prescribed distance from the centre of the road, on the application of Messrs. Wigg, Oliver, & Hudson on behalf of Messrs. Kembal, Bishop & Co.

Hackney, South.—That consent be given to the retention of a one-story stable erected at the rear of No. 50, Eaton-place, Wells-street, at less than the prescribed distance from the centre of the road, on the application of Mr. A. G. Hutchings on behalf of Mr. P. Stoneham.

Islington, North.—That consent be given to the erection of a block of stables on the west side of Hercules-place, Holloway, with portions of the stables flanking upon Bowman's-mews and Bowman's place respectively, at less than the prescribed distance from the centre of each of those streets, on the application of Mr. J. C. Connelly.

Rotherhithe.—That consent be given to the erection of a one-story building on the north side of Rotherhithe-street, adjacent to Globe Wharf, at less than the prescribed distance from the centre of the road, on the application of Mr. A. R. Stenning on behalf of Messrs. Quirk, Barton & Co.

Westminster.—That consent be given to the erection of a building on the site of Nos. 71, 73, 75, 77, 79, 81 and 83, Vincent-square, at less than the prescribed distance from the centre of the road, on the application of Mr. E. Dru-Drury on behalf of Messrs. William Sugg & Co.

St. Pancras, North.—That consent be not given to the erection of three blocks of residential flats on the west side of Highgate-road, between Greenwood-place and Clerkenwell-lane, with the boundary or fence of the northernmost block at less than the prescribed distance from the centre of that lane, on the application of Messrs. E. J. Bellord & Co., on behalf of Messrs. Read Brothers, as no reason is seen why the boundary of the block next Carker's-lane should not be set back the statutory distance from the centre of that lane; and moreover, the ends of the several blocks next Highgate-road would, if erected as shown on the plan now submitted, be about 6 ft. in advance of the general line of buildings in that road as defined recently by the Superintendent Architect, under Section 22 of the London Building Act, 1894.

Open Space about Buildings.

Chelsea.—That sanction be given to certain deviations from the plan certified by the District Surveyor, under Section 43 of the London Building Act, 1894, so far as relates to the proposed rebuilding of a two-story stable at No. 5, Cheyne-mews, Cheyne-walk, on the application of Mr. E. W. Parker on behalf of Messrs. Sprake, Foreman, & Son.

Greenwich.—That the Council do, in the exercise of its powers under Section 41 (1) (vi.) of the London Building Act, 1894, allow a modification of the provisions of that section with regard to open spaces about buildings, so far as relates only to the proposed erection of No. 1, St. Clair-villas, Charlton-road, Blackheath, with an irregular space at rear, on the application of Messrs. Walker & Johnson on behalf of Mr. Allan Walker.

Hampstead.—That sanction be given to certain deviations from the plan certified by the District Surveyor, under Section 43 of the London Building Act, 1894, so far as relates to the proposed erection of a two-story addition on the site of a conservatory at Friedenheim, No. 8, Upper Avenue-road, St. John's Wood, on the application of Messrs. Hayward & Son on behalf of Miss F. M. Davidson.

St. George, Hanover-square.—That the Council do, in the exercise of its powers under Section 41 (1) (v.) of the London Building Act, 1894, permit the erection of an addition, 20 ft. high, on a portion of the open space at the rear of No. 60, Eaton-terrace, at the corner of Chester-terrace, on the application of Mr. W. A. Large on behalf of Mr. W. H. James.

Line of Frontage and Deviation from Certified Plan.

Marylebone, East.—That sanction be not given to certain deviations from the plan certified by the District Surveyor, under Section 43 of the London Building Act, 1894, so far as relates to the proposed erection of a four-story dwelling-house on the site of a stable and portion of a garden at the rear of No. 147, Harley-street, at the corner of Marylebone-road, and that the Council, in the exercise of its powers under

Section 22 of the Act, do not consent to the proposed frontage of the said dwelling-house, on the application of Messrs. Davis & Emanuel, on behalf of Mr. Barrow Emanuel.

Deviation from Certified Plans.

Bermondsey.—That sanction be not given to certain deviations from the plan certified by the District Surveyor, under Section 43 of the London Building Act, 1894, so far as relates to the proposed rebuilding of No. 33, Old Kent-road, on the application of Messrs. Battley, Sons, & Holmes.

Line of Fronts and Width of Way.

Greenwich.—That consent be not given to the erection of buildings on the north side of Ashburnham-road, the east side of Egerton-road, and the south side of Greenwich-road, on the application of Mr. W. T. Sawyer, on behalf of Queen Elizabeth College, Greenwich.

Width of Way and Construction of Buildings.

Deptford.—That consent be given to the construction and erection of an iron building, on the north side of Blackhorse-road, with the boundary or fence in front of such building at less than the prescribed distance from the centre of the road, on the further application of Messrs. Humphrys, Tennant, & Co.

Formation of Streets.

Fulham.—That an order be sealed and issued to Mr. C. Watkins, sanctioning the formation or laying out of a street 50 ft. wide for carriage traffic, to lead from North End-road into Auril-road, on his application to the Council on behalf of Mr. C. J. Knowles. That the name Fitz-George-avenue be approved for the new street.

Leisham.—That an order be sealed and issued to Mr. J. Norton, sanctioning a deviation from the plan approved on December 4, 1893, for the formation or laying-out for carriage-traffic of Rhymead, Molesworth-street, on his further application to the Council on behalf of Mr. E. MacF. Patterson.

Hampstead.—That an order be sealed and issued to Mr. W. Willett, sanctioning the formation or laying-out of a carriage-way approach, 20 ft. wide, to three houses on the south side of Elsworth-road, Avenue-road, on his application to the Council.

Wandsworth.—That an order be sealed and issued to Mr. H. H. Church, refusing to sanction the formation or laying-out of one street 50 ft. wide, and of six streets 40 ft. wide for carriage traffic on the Church-field estate on the north side of High-street, Plumstead, and the widening of portions of Church-manoorway and High-street in connexion with such new streets, on his application to the Council, on behalf of Queen's College, Oxford.

Fulham.—That an order be sealed and issued to Mr. W. C. Poole, refusing to sanction the formation or laying-out for carriage traffic of new streets, each 40 ft. wide, on the Sandsend estate, Townmead-road, on his application to the Council on behalf of Mr. J. Wilson.

Means of Escape at Top of High Buildings.

St. George, Hanover-square.—That the Council, in the exercise of its powers under Section 63 of the London Building Act, 1894, do grant a certificate in respect of the means of escape, in case of fire, proposed to be provided for the persons dwelling or employed in the fifth floor of an addition on the east side of the Berkeley Hotel, No. 77, Piccadilly, at the corner of Berkeley-street, on the application of Mr. R. Griggs on behalf of the Berkeley Hotel Company.

Cubical Extent.

Peckham.—That the consent of the Council be not given to a building on the site of Nos. 37, 39, and 41, Rye-lane, and premises at the rear, fronting upon Hanover Park, such building to exceed in extent 250,000, but not 450,000 cubic feet, and to be used only for the purposes of the trade of a draper and furniture dealer, on the application of Messrs. H. Jarvis & Son, on behalf of Messrs. Jones & Higgins.

Strand.—That consent be not given to a proposed addition to the Adelaide Gallery restaurant, No. 436, Strand, on the site of No. 9, King William-street, the building and addition together exceeding in extent 450,000 cubic feet, and to be used only for the purposes of the trade of the restaurant, on the application of Mr. W. Barnard Binhey, on behalf of Messrs. A. & S. Gatti.

Building for the Supply of Electricity.

St. George, Hanover-square.—That the Council do not approve of the plans, dated February 26, 1897, submitted with the application of Mr. C. S. Peach, on behalf of the Westminster Electric Supply Corporation, Limited, for the construction of an addition to a generating-station for electricity in Eccleston-place, Eccleston-street, Buckingham-palace-road, and that the Council do not authorise the erection of such generating station and works as shown upon the said plans, it being considered that the risk of fire extending to the adjacent buildings would be increased by the inclosure, by means of a temporary iron screen, of a portion of the southern end of the proposed addition.

The Building Act Committee brought up the following recommendations at the meeting of the Council on Tuesday:—

Lines of Frontage.

Wandsworth.—That consent be given to the erection of a covered way on the west side of Angle-

holme, East Hill, to abut upon Acris-street, on the further application of Mr. W. H. George, on behalf of Dr. P. H. Davies.

St. Pancras, West.—That consent be not given to the erection of a two-story building at the rear of Nos. 36, 37, and 38, Chalk Farm-road, to abut upon Harmond-street, on the application (further considered) of Messrs. Thorpe and Furniss, on behalf of Messrs. Thomson and James.

Hackney, South.—That consent be not given to the erection of a three-story warehouse on the north-east side, and partly upon the site, of No. 23, Fremont-street, Victoria Park-road, on the application of Mr. J. Morris.

Width of Way.

Southwark, West.—That consent be given to the erection of a two-story addition in front of Vestey's (late Hanbury's) wharf, Upper Ground-street, Blackfriars, with the forecourt boundary at less than the prescribed distance from the centre of the roadway, on the application of the Union Cold Storage Company.

Space at Rear of and Projections from Buildings.

Hackney, Central.—That consent be not given to the erection of five blocks of residential flats on the east side of Clapton-square, at the corner of Clapton-passage, with a four-story high window at the north-west angle of the blocks; and that the Council, in the exercise of its powers under Section 41 (1) of the London Building Act, 1894, do not allow the erection of the said residential flats with an insufficient space at the rear of three of the blocks, on the application of Messrs. Crewe and Hammond, on behalf of the Metropolitan House Investment and Agency Company, Limited.

Means of Escape at Top of High Buildings.

Southwark, West.—That the Council, in the exercise of its powers under Section 63 of the London Building Act, 1894, do grant a certificate in respect of the means of escape, in case of fire, proposed to be provided for the persons dwelling or employed in the top floor of a warehouse at Vestey's (late Hanbury's) wharf, Upper Ground-street, on the further application of Mr. A. W. Osborn, on behalf of Messrs. Vestey Brothers.

Recommendations marked *are contrary to the views of the Local Authorities.*

THE LONDON COUNTY COUNCIL.

The ordinary weekly meeting of this Council was held on Tuesday at the County Hall, Spring-gardens, Dr. Collins, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend the Bermondsey Vestry 3,000l. for wood, York, and granite paving works; the Lambeth Vestry, 10,000l. towards the cost of erecting baths and washhouses; and the Metropolitan Asylums Board 100,000l. towards the cost of erecting, fitting-up, and furnishing the Grove Hospital, Tooting.

Hydrant and Fire-Mug Indicators.—It was agreed that the Chief Officer be authorised to give orders to Messrs. S. Pontifex & Co. for the supply and fixing of not more than 3,000 hydrant indicator tablets, and 1,000 glass fire-mug indicator tablets, and for the execution in the latter case of the necessary re-glazing.

Southwark and Vauxhall Water Bill.—The Parliamentary Committee recommended the Council to allow them to oppose the Southwark and Vauxhall Water Company's Bill, by which the Company propose to increase their daily indraught from the Thames from 24,500,000 gallons to 45,000,000 gallons. The Committee reported: "It is proposed that the Act shall remain in force for eight years and no longer, but subsequent provisions of the clause providing for this, if passed in its present form, would indicate and justify the grant to the Company of further powers of making works so as to admit of their impounding and taking the water in perpetuity. We are of opinion that the general effect of the Bill would be to create a very large increase in the value of the undertaking, while this increased value is to be gained at the mere cost of an Act of Parliament transferring to the Company water which is public property, and in the flow of which London is very largely interested."

Lord Onslow moved an amendment to petition against the Bill on standing orders.

Mr. Harris seconded the amendment, which was supported by Mr. Beachcroft.

An equal vote having been taken for and against the amendment it was declared lost, and the Council divided on the Committee's recommendation, which was carried by 58 votes to 50.

Other Water Bills.—With regard to the East London and New River Water Companies' Bills, the Committee reported:—"We have

directed the Parliamentary agent to ask Mr. Stuart or some other member of Parliament to move an instruction to the Select Committee on the Bills, to insert a provision that nothing contained in them should be deemed to enhance the price to be paid in the event of the purchase of the Companies' undertakings by a public authority. The Staines Reservoirs Act of last session contains such a clause, and it seems to us only reasonable that the Bills of the East London and New River Companies should be placed on the same footing."

The action of the Committee was approved. **Result of Legal Proceedings.**—The Building Act Committee recommended, and it was agreed, that the solicitor do take the necessary steps, by means of an appeal against the magistrate's decision in the Brick-lane, Spitalfields, case* for obtaining a decision of the High Court upon the question of the meaning to be attached to the expression "houses to be inhabited or adapted to be inhabited by persons of the working class" used in Sections 13 (5) and 41 of the London Building Act, 1894.

Queen's Jubilee Procession—Temporary Structures.—The report of the same Committee contained the following paragraph:—

"We anticipate that in connexion with the Royal Procession, arranged for June 22 next, many temporary structures for the accommodation of sight-seers will be erected along the line of route; and we have accordingly made arrangements to ensure, as far as possible, the safety of the public. Notices are to be left at each house, and posted in prominent situations, in the line of route outside the City of London, intimating that, under Sections 83 and 84 of the London Building Act, 1894, the erection of temporary structures is unlawful unless the Council's licence shall have been first obtained, and that balconies intended to be used on the occasion should be shored up to prevent risk of accident. An advertisement in similar terms is to be inserted in the *Times* and two other London newspapers. The District Surveyors of the districts concerned have been requested to arrange for extra assistance to enable proper supervision to be exercised over the erection of the structures; and the Council's Works Department will arrange to deal promptly with any structures that may be found dangerous. We think that the adoption of these precautions will sufficiently guard against the possibility of accident from defective construction."

Tramway Purchase.—The adjourned report of the Highways Committee in respect to the purchase by the Council of the North Metropolitan and London Street Tramways Companies again came up. The Committee recommended:—"That the Council do approve the form of agreement and the form of lease (and the schedules attached thereto, showing the hours of labour and rates of wages of employees) prepared by the Highways Committee in accordance with the resolution of the Council of December 23, 1896, with regard to the purchase and lease of the North Metropolitan and London Street Tramways Companies' lines and depôts in the County of London; that so soon as the prices to be paid for the depôts and other buildings shall have been agreed, or fixed under an award of an arbitrator, such amounts be inserted in the agreement; and that the seal of the Council be affixed to such agreement when so completed."

Mr. Baker moved as an amendment, "That the lessees will not fix or place any advertisements or announcements in or upon any carriage in use upon the tramways in such a manner as to obscure light or prevent free vision, and in particular will not in any way cover either in whole or in part any window at the ends or sides, or in the doors of such carriages."

The amendment was defeated, after a long discussion, by a large majority. Mr. Steadman next moved, "That the third schedule be amended so as to provide that in all cases the hours of labour of the employees be reduced to eight per day, or forty-eight per week."

Mr. Westcott strongly opposed this amendment. The men did not want the hours of labour interfered with, and such a proviso would entail an extra expenditure on the leasing Company of 50,000l. a year.

While this discussion was proceeding the Council was counted out at twenty minutes to eight o'clock.

PROPOSED NEW MUSIC-HALL AT MIDDLESBROUGH.—It is proposed to erect a new theatre of varieties on the site of the circus in Corporation-road, Middlesbrough, with side entrances in Dunning-street and Pine-street. Plans have been prepared by Mr. Ernest Runtz, of London.

* See report of the case in our last issue, page 305.

Plan of Monument to the Emperor William I. at Kyffhäuser.

E.—Barossa Court.
F.—Gallery.
G.—Monument.

Illustrations.

ABBEYS OF GREAT BRITAIN.—No. 21: SHERBORNE.*

THE view here given of the Abbey Church at Sherborne is drawn for this series of illustrations by Mr. Roland W. Paul. The plan is based on one kindly lent to us by Messrs. Carpenter & Ingelow, and corrected or filled up in some details by Mr. Paul, from special measurements.

For further information with regard to the history and architecture of the church the reader is referred to the first article in the present issue.

THE EMPEROR WILLIAM MONUMENT AT THE KYFFHÄUSER.

THE monuments which are being erected in various parts of Germany to the memory of the first German Emperor, or in memory of the results of the Franco-Prussian War (and the two subjects are intimately related), whether we altogether admire them or not, may be said to be among the most characteristic architectural works recently erected in Germany. We are here referring especially not to the monuments erected in city squares, which are more in accordance with the usual type of such designs, but to those massive and rocklike structures which are erected here and there in the midst of the country, on the side of a hill, or in some other prominent position. One of these, that at the Porta Westphalia, was illustrated in our New Year's number this year; and we now give an illustration of another monument, in very similar style, just erected on the Kyffhäuser. The treatment and detail of these monuments is no doubt somewhat coarse in design, but it cannot be denied that there is a certain power and originality displayed in their general treatment.

Both the Kyffhäuser and the Porta Westphalia monuments were designed by Professor Bruno Schmitz, of Berlin; the sculptural accessories having in each case been carried out by sculptors of repute working in collaboration with the architect but in subordination to his general idea. In the monument now illustrated the sculpture is by MM. Nicholas Geiger, Emil Hundrieser, and August Vogel.

The situation of the monument is on a hill between the Hartz and the Thuringia forests, and the plan explains the arrangement of terraces which lead up to the central feature, which, as will be seen, is in the form of a tower, at the base of which stands an equestrian statue of the late Emperor. The legends of

* The series of the "Abbeys of Great Britain" is continued this month with illustrations of "Sherborne Abbey." The next of the series (Esoyham) will appear in the number to be published on July 3, 1897.

Barbarossa, which are so closely associated with Imperial Germany, are referred to in the monument; thus we find the figure of Barbarossa in his cave, overlooking a cemetery, which has been very cleverly arranged.

The cost of the monument was 65,000l.; the original estimate for the competition design having been 40,000l. We can only add to the responsibility of the design rests in every way with the architect, whilst the actual execution was in the hands of Herr Lindemann, the work being spread over five years. Herr Hundrieser was responsible for the equestrian statue, Herr Geiger modelled the figure of Barbarossa, and the bas-relief work was in the hands of Herr Vogel.

ALTERATIONS TO RUSSELL-SQUARE.

THIS drawing is not, we confess, of much architectural interest, but it may be of interest in another sense, as showing the alterations which are proposed to be carried out in what though not a fashionable square, may be considered nevertheless to be one of the best-known squares in London, and as being an indication we presume, of the method of treatment which it is proposed to apply to others of the large squares on the Bedford estate.

The drawing shows the north side of the square as remodelled, a small sketch also showing the original form of the row of houses. The work is being carried out by Mr. Philip Bilditch, as surveyor to the Bedford estate.

Some further comments on Bloomsbury at its proposed improvements will be found on another page.

** We regret to find that a few copies of last week's issue, owing to a mistake, were sent out without the plate of illustrations of Mr. Gotch's lecture, and with duplicate impressions of another plate. Any one who would apply to the publisher can be supplied with a copy of the missing plate which ought to have been inserted.

COMPETITIONS.

PARISH COUNCIL OFFICES, BRECHIN.—The Brechin Parish Council some time ago resolved to erect offices wholly for their own use, and plans from various architects were recently considered. After discussing the respective merits of the plans, those prepared by Mr. I. Wishart Galloway, of Brechin, were adopted.

SCHOOL, DUMFRIES.—Plans have been accepted by the Dumfries Burgh School Board for a new elementary school. The selected plans are by Mr. A. B. Crombie, architect, Dumfries.

BELFAST CITY HALL PLANS.—The minutes of the meeting of the Belfast Corporation committee held on the 22nd ult., at which the assessor's award for the new Belfast City Hall was formally accepted, came up for confirma-

V. PAUL

in, we believe, on the 1st inst. Until then the aid of Messrs. Thomas & Son, 7, Queen Anne's Gate, Westminster, cannot be said to have been finally selected. Alderman Wilson is handed to the Town Clerk a notice of objection postponing the erection of a City hall, and Alderman McConnell is also strongly opposed to proceeding any further with the latter at present.

ARCHITECTURAL SOCIETIES.

CARLISLE ARCHITECTURAL, ENGINEERING, AND SURVEYING SOCIETY.—A meeting of this society was held in the Town Hall on the 3rd ult. A paper on the "Development of the Gas Engine," by Mr. F. H. Jewman, Assistant Gas Manager, on the "Origin by describing the history and construction of the earlier gas engines and the attempts to improve them, exhibiting drawings of the typical engines up to the present time, also describing the various ways adopted for starting large engines, and the use of gas producers or the same.

GLASGOW INSTITUTE OF ARCHITECTS.—The usual quarterly meeting of this Institute was held in the rooms, Pitt-street, on the 25th ult., Mr. John James Burnet, A.R.S., President, in the chair. The President reported that the Council had remitted the question as to the lighting of the lower church of Glasgow Cathedral to a committee of Council. He also reported that the Corporation of Sheffield had appointed a jury of three members of the Sheffield Society of Architects as assessors to adjudicate their competitive plans, and that it had been remitted to a committee of Council to consider the position of this Institute with regard to architectural competitions. The President also intimated that the Council had appointed himself and the Vice-President as delegates to attend a meeting of the Sanitary Congress to be held at Leeds in September. Mr. Colin Menzies was elected a member of the Institute.

EDINBURGH ARCHITECTURAL ASSOCIATION.—The Edinburgh Architectural Association met on the 17th ult, the President, Dr. Rowand Anderson, in the chair. After preliminary business, Mr. David J. Vallance, curator of the Museum of Science and Art, delivered a lecture on "Decorative Woodwork," chiefly taken from the Peyre collection recently acquired by the nation. The lecture for the most part was devoted to an exposition and exhibition by means of lantern photos of the collection of French woodwork recently acquired from M. Emile Peyre, of Paris. By a fortunate arrangement which enables Edinburgh and Dublin to share in such important additions to the art treasures of the nation as are conveniently divisible, the Edinburgh Museum and 1,300 of the purchase price, and Dublin a similar sum, each Museum receiving an equivalent share of the specimens, while the remainder found a home at South Kensington. The addition of a share of the Peyre collection to the furniture and woodwork in the Edinburgh Museum coincided, fortunately, with a structural change in the interior of the building, for this change has provided a suitable place for the display in collected form of all the decorative woodwork. At the north-east corner of the Museum there was, until recently, a hall which for many years has scarcely ever been used for the primary purpose for which it was designed. Some time ago the Director, Sir Robert Murdoch Smith, in view of the growth of the collections and of the certain necessity of their requiring at no distant day rearrangement and separation into sections, determined to make an effort to have this long closed hall put into such condition that its area might be added to the exhibition space of the Museum. His efforts were eventually successful. A floor of concrete, supported by iron girders and pillars, was laid and tiled on a level with, and in the same manner as, the rest of the Museum. The space below this floor forms an ample apartment for unpacking and storage, and to add to its convenience a large door has been broken through the wall facing West College-street. This alteration, which has been in progress for several months, under the charge of Her Majesty's Office of Works, has only now been completed. The new hall, when it is opened to the public, will be devoted to the display of the collection of furniture and woodwork in the Museum, and it was to a few of the specimens that would find a place there that Mr. Vallance directed attention. The lecturer then proceeded to show a

number of illustrations of decorative woodwork taken from the Peyre collection, arranged so as to show the changes of style from the Gothic days of the fifteenth century on to the modern decoration of the Regency and Louis XV. time.—*Scotsman.*

ARCHÆOLOGICAL SOCIETIES.

SURREY ARCHÆOLOGICAL SOCIETY.—The forty-second annual meeting of this Society took place on the 24th ult, at 8, Danes' Inn, Strand. The President, Viscount Midleton, occupied the chair. Mr. J. F. Eastwood moved, and Mr. P. Norman seconded, the adoption of the statement of accounts, which was agreed to. Viscount Midleton then moved the adoption of the report of Council, which stated that this was the forty-second annual report of the Society. The annual excursion was held on Wednesday, July 15, 1896, the meeting place being East Grinstead, whence Lingfield and Crowhurst were visited (see the *Builder*, July 25). The part of the Society's Collections (vol. 13, part 1) for the year 1896, was duly issued to all members not in arrears with their subscriptions. In this part are valuable papers by Mr. J. L. André, F.S.A.; Mr. F. L. Griffith, F.S.A.; Mr. F. Lasham; Mr. Philip Norman, F.S.A.; and Mr. S. W. Kershaw, F.S.A. The catalogue of church plate is still being continued by the Rev. T. S. Cooper, F.S.A., and the extracts from Surrey wills by Mr. F. A. Crisp, F.S.A. The Council regrets to report that the deficit on the yearly account shows a slight increase; this is partly owing to the increased cost which has fallen upon the Society since the loss of the part tenancy of the London and Middlesex Archæological Society. Up to the present the Society has been unable to secure another tenant. In order to lessen this deficit and to keep the annual expenditure within the annual income, it will be necessary, unless a large addition can be made to the number of annual subscribers, to cut down the size of the collections and reduce the number of illustrations. To a certain extent this has already been done, as the following table shows:—Cost of collections in 1890, 87*l.*; 1891, 120*l.*; 1892, 100*l.*; 1893, 97*l.*; 1894, 77*l.*; 1895, 74*l.*; and in 1896, 54*l.* To further reduce the expenditure on this item will only tend to impair the efficiency of the Society's work. The losses by death and resignation have been unusually heavy during the past year, and the number of new members elected has only been small. The number of members now stands at 297, viz.: annual, 202; life, 93; honorary, 2. During the year 7 new members were elected, viz.: 5 annual and 2 life, 3 life and 5 annual. By resignation, 10 members. Total 18. Loss over gain, 17. The Council for some time past has had under consideration the advisability of raising the life composition, as at the present rate of interest the composition is found to be unremunerative. It is therefore proposed to submit to the general meeting a resolution making the life composition 7*l.* 10*s.* instead of 5*l.* as at present. Of this sum it is proposed to fund 5*l.*, and to treat the balance as current account. Mr. Mill Stephenson, one of the hon. secretaries, finding that he is no longer able to give the time and attention required for the Society, will not offer himself for re-election. The Council desires to express its great regret at the loss of the services of Mr. Stephenson, which have been of great value to the Society. Mr. Ralph Nevill, F.S.A., seconded the adoption of the report, which was carried unanimously. The following gentlemen, Lieut.-Col. Godwin-Austen, F.R.S., Rev. R. M. Blackist, M.A., Hon. G. C. Brodrick, D.C.L., and Messrs. Robert Hovenden, F.S.A., J. J. Howard, LL.D., A. J. Style, and John Watney, F.S.A., were re-elected members of the Council, and Mr. Mill Stephenson was also elected on the Council to supply a vacancy. The retiring auditors, Messrs. C. T. Davis and W. F. Potter were also re-elected, as likewise the collector, Mr. W. P. Ivatts. The Rev. T. S. Cooper was re-elected Hon. Secretary. The Chairman proposed a vote of thanks to Mr. Mill Stephenson, and spoke highly of the way in which he had carried out his duties. Mr. R. Nevill seconded, and said Mr. Stephenson was not only a good business man, but a skilled antiquarian. This was carried. The meeting was then made special, and on the motion of Mr. R. Nevill, the following resolution was adopted:—"That the Life Composition be raised from 5*l.* to 7*l.* 10*s.* with the usual entrance fee, and that the sum

of 5*l.* be invested, and the balance treated as current account." The proceedings terminated with a vote of thanks to the Chairman.

ENGINEERING SOCIETIES.

THE INSTITUTION OF CIVIL ENGINEERS.—At the ordinary meeting of this Institution on the 30th ult, Mr. John Wolfe Barry, C.B., F.R.S., the President, in the chair, the paper read was on "Electric Lifts and Cranes," by Mr. Henry W. Ravenshaw. This communication referred to the application of the electric motor to the working of lifts and cranes. Where hydraulic power was available, its simplicity afforded many advantages, although in the ordinary form of hydraulic motor as great an amount of water was used with a light load as with a heavy one. The electric motor, however, only absorbed current in proportion to the work developed, and this fact alone justified its application in certain cases. The chief requirements of the motor were sparkless commutation, self-adjusting brushes, and automatic lubrication. Shunt machines were generally used on account of their regular speed with varying loads; a few turns of series winding were, however, sometimes added to give prompt starting. Worn-gearing was employed, and gave compactness and silent running, with a quick pitch for the worm; ball-bearings and an oil-bath were recommended. To give good results, however, the ball-races must be of high-class steel, and be ground perfectly true after hardening. A special form of rope-drum, made by Messrs. Easton, Anderson, & Goolden, Limited, and the Sprague screw elevator with ball-nut, were described. The regulating gear should provide prompt and accurate control, absence of jerks, small current consumption, and regular speed. Resistance was necessary in the circuit of the motor at starting to prevent a great rush of current; and this should be controlled automatically, as it was impossible for the attendant to tell the position of the switch when a hand-rope was used. The automatic controller used by the Otis Company was described, as well as an arrangement controlled by a centrifugal governor which had been designed and used by the author. Magnetic brakes were advocated, the cage being automatically stopped when the current was accidentally broken. The magnet should be fitted with non-conductive resistances to prevent sparking on breaking the circuit. Tests of an Otis elevator and a curve showing the energy consumed under varying loads were given. Electric cranes presented several marked advantages over those driven mechanically, owing to the flexibility of the control of the motor and the simplicity of the conductors for transmitting the power. The relative advantages of the use of a separate motor for each motion, and of a single motor and friction-clutches were discussed, the mechanical simplicity in the one case and the electrical simplicity in the other enabling either system to be used with good results. Tests were given of a 20-ton electric crane at Woolwich Arsenal, arranged on the single motor principle, friction-clutches being used to actuate the various movements. The collectors for the current, with the method used for insulating them, were described. Owing to the special requirements of this crane much gearing was necessary, and a heavy chain-block, weighing nearly two tons, was fitted. The efficiency was thus reduced, especially at light loads, and the horse-power delivered to the load, as well as that delivered to the block, was given to enable the mechanical losses to be more readily obtained. A total efficiency of 53.42 per cent. was obtained when the load on the hook only was considered, and of 58.28 per cent. when the weight of the block was included in the load. To drive the outer carriage at the rate of 54 ft. per minute, 8.4 c.h.p. was required, and 10.2 c.h.p. to traverse the load radially at the rate of 32.4 ft. per minute, both with a load of twenty tons.

LECTURE HALL, &c., PRESBYTERIAN CHURCH, ROATH PARK, GLAMORGANSHIRE.—The memorial stone of the new lecture-hall, school-room, and classrooms for the Presbyterian Church of England, which are to be erected on a site near Roath Park, was laid recently by Lord Windsor. The church and schoolrooms, &c., will have a frontage to Wellfield-road, the style of the buildings being Early English. The architects are Messrs. Habershon & Fawcaker, and the contractors Messrs. Knox & Wells.

Books.

Chemistry for Engineers and Manufacturers.
Vol. II. By Messrs. BERTRAM BLOUNT and
A. G. BLOKAM. C. Griffin & Co.

THIS is a well-written volume, devoted to the chemistry of manufacturing processes, and forms the companion volume to the "Chemistry of Engineering, Building, and Metallurgy," noticed some time since in these columns. The chapters on lime, cement, and clay industries merit special attention. We are reminded that commercial lime of good quality contains 85 to 90 per cent. free oxide of calcium, the remainder being calcium carbonate left unburnt or re-formed by exposure to air, calcium hydroxide (from absorption of moisture after burning), and calcium silicates and aluminates produced by the action of the lime on the siliceous constituents of the limestone and fuel ash.

The principles which underlie the setting of common mortar are clearly explained. When freshly slaked lime is allowed to dry, it sets to a hard mass, which, however, is considerably smaller in volume than the wet lime, and therefore, forms shrinkage-cracks. Admixture with sand prevents this. This first stage or "setting" depends on the general property of very finely divided amorphous substances, such as kaolin, of drying to a hard caked mass. This change takes place with lime, and then a further hardening occurs, due to the absorption of carbonic anhydride from the air, a coating of calcium carbonate being formed, the insolubility of which makes the mortar permanent under ordinary weather conditions. In brick walls access of air is so slow that uncarbonated lime remains in the interior for years. The desirability of carefully slaking the free lime in hydraulic limes by cautious addition of water, as is the custom in France, is referred to, otherwise there is danger of the slaking continuing after the cement has partially set, causing disruptive strains. In conclusion, we confidently recommend this volume as a practical, and not overloaded text book, of great value to students.

Supplementary Volume to Thermo-dynamics.
By J. PARKER, M.A. London: Sampson Low, Marston, & Co. 1896.

THIS volume is supplementary to the treatise on Thermo-dynamics which we reviewed last summer. It consists of ten chapters, which treat of various difficult problems in dynamics and physics. We are at a loss to understand for whose benefit the book has been written, and the preface gives us no help. The reader is irritated occasionally by a want of lucidity and a certain vagueness of statement. The last chapter is a recapitulation of the chief points of novelty or importance (in Mr. Parker's opinion) contained in this and the preceding volume. The following extract shows how closely its style approaches that of the "Shorter Catechism" taught to Scotch school children:—

"Q. What has Carnot's principle to do with tidal friction?"

"A. Carnot's principle leads directly to the theory of exchanges and the theory of tidal friction" (Articles 49, 71, 72).

Evidently, in the author's opinion, Thermo-dynamics is the parent science whose importance has been overlooked in this age of haste and worry.

There is a great deal about electricity in this book, mostly in disjointed fragments, which prove that Mr. Parker is not well read in technical electrical literature. He says, for example, that the position of the brushes on the commutator of a dynamo depends on the speed of the machine. This statement needs considerable qualification. It is shown that Lenz's law, in a case where it is not applicable, fails to give us the direction of the induced current. This is scarcely instructive. The author often assumes that his readers are ignorant of the most elementary electrical facts, and yet he defines inductances, and gives expressions for the electro-magnetic energy of circuits. Chapter 8, entitled "A case of Induction," gave us a great deal of trouble. When the sliding wire is protected by an iron cylinder and moves on the rails we understand Mr. Parker to say that it does not cut any lines of force. We fail to make sense of this. The rest of the chapter is a description of how to make a continuous current dynamo which has no commutator and needs only two collecting rings. It took us a considerable time to find this out, as the dynamo

is of a purely academic design. It was disappointing to find out that it is vitiated by a fallacy, and that in practice or theory the electrical output would be zero. We would not advise Mr. Parker to proceed with the designing of dynamos of this type before he has read descriptions of the Siemens Electroplater, the Forbes', and the Oerlikon dynamos, which have no commutator, and yet produce a continuous current. The efficiency of unipolar dynamos is, however, doubtful. This volume, like its predecessor, proves that the author has ability, but he has certainly not succeeded in writing either an interesting or a useful book.

Manual of Electrical Undertakings. 1896.
EMILE GARCKE, M.I.E.E. London: P. S. King & Son.

THIS book contains the accounts and other particulars of many electrical undertakings. They are arranged under the headings of Telegraph, Telephone, Electricity Supply, Traction, &c. Some interesting historical matter is included, and a very complete list of all the electrical companies registered in each year since 1856. Under the heading of Electricity Supply, there are a good many omissions. No mention is made of the supply stations at Aberystwith, Ayr, Bury, Bray, Cardiff, Exeter, Kingston-on-Thames, Shorefield, South Shields, or Walsall. Again, in describing the systems of electricity supply adopted, brevity is often obtained only by becoming ambiguous and inaccurate. For example, we are told that at Portsmouth the system is "Horizontal Turbo-generators coupled direct to Ferranti and Parsons dynamos." It is true there is a Parsons steam turbine coupled to a dynamo, but nearly all the rest of the plant consists of horizontal compound engines coupled direct to Ferranti alternators. In giving accounts of the traction companies, there is no mention of the various systems adopted, although such accounts would be of far greater general interest than in the case of electric lighting companies. However, for a work of this kind, it is remarkably free from errors, and can be recommended to all business firms and everyone financially interested in electricity.

Chemical Recipes, being One Thousand Modern Formule for Producing all Kinds of Colours and other Chemical Compositions. By THE ATLAS CHEMICAL COMPANY, Sunderland.

THIS is the third edition of a useful collection of chemical recipes, which has met with remarkable success. It is essentially a trade compilation, and none the worse for that, the information all through bearing the stamp of practicality. In a compact volume of nearly 400 pages, provided with a capital index, reliable and practical manufacturing details are given for the preparation of paints, dyes, varnishes, stains, fireproof compositions, greases, oils, lubricants, putties, lacquers, &c., which will be found invaluable to many of our readers.

We are glad to see that stress is laid upon the necessity for using as the basis of the majority of paints only the purest white lead of the very finest quality. White lead should also be kept in a perfectly dry place until required for use, or it will seriously deteriorate in quality. The same remarks apply to red lead and to litharge when these substances are employed. We can heartily recommend this book as one of the best compilations of practical recipes in existence.

The Practical Polish and Varnish Maker. By H. C. STANDAGE. Spon.

THIS is a compilation of receipts and formulae, and general information useful to makers and users of varnishes and kindred preparations. The object of the book is stated by the writer to be to make available information which will enable an intelligent mechanic to prepare successfully his own polishes, varnishes, lacquers, and japans. So far as we have been able to test the particulars given, the author seems to have done his work with care and discrimination.

The most important part of the work is that devoted to the fabrication of varnishes for special purposes. We are reminded that the following qualities must be taken into account in estimating the value of a varnish:—Quickness in drying, hardness of film, toughness of film, amount of gloss, permanence of gloss, and resistance to effects of weather. It is no easy matter to secure in the highest degree the

right combination of desirable qualities. There is nothing in which attention to the minutest details, and the skill which comes only after long practical experience, count for more, than in varnish making. For these reasons the professional manufacturer will always have the advantage of amateur and casual concoctors of these preparations. Allowing for this, Mr. Standage's book will be found very useful and suggestive to many.

Correspondence.

To the Editor of THE BUILDER.

A SOCIETY OF DESIGNERS.

SIR,—Will you permit me, while thanking you for the very kind reference to my lecture on "Design and Designers during her Majesty's Reign," which I gave at the Society for the Encouragement of the Fine Arts on February 25, to give the date, 1886 (not 1871), when I made an unsuccessful attempt to form a "Society of Designers." This was achieved however, by the combination of a few of the younger men as recently as 1896 in the executive of the Society of Designers, of which I have the honour to be President.

This Society, which must benefit designers and the art of design, cannot pretend to meet altogether the requirements of design as a national expression of the art, and I am now at work on a scheme for organising and establishing a national institute of design, and hope that I may rely on your valuable assistance when the time arrives for the matter to be brought before the notice of the public and manufacturers, upon whose support I rely.

Will you allow me also to point out that the names of Randolph Caldecott and William Morris were mentioned as typical names of the past in connexion with design. Throughout my lecture I confined my remarks entirely to deceased designers. The name of Mr. Walter Crane I ventured to give as the one departure from this rule.

GEO. C. HARTÉ.
. The term "Society of Designers" does not seem a very happy one. Every painter of a picture is a designer. "Society of Decorative Artists" or "Decorative Designers," would be more applicable.—ED.

WAXING FLOORS.

SIR,—Perhaps some of your correspondents interested in polishing methods would tell me if there is any special way of waxing floors with paraffin wax instead of the ordinary beeswax? Also if any special implement is used, and where it may be had?—VISCOUS.

The Student's Column.

SPECIFICATIONS.—XIV.

BELL-HANGER.

THERE are various methods in vogue in bell-hanging, of which the principal are:—

- A.—By means of wires and cranks.
- B.—Electric bells.
- C.—Pneumatic bells.

Commencing with the first, they should be specified as follows:—

Bells.—The bells to be of various tones, and an average weight of 14 oz., with steel spring and brass tee-plate, and back spring carriage, each fitted with pendulum and indicator, and fixed on bell-board placed in position where directed in kitchen.

Bell Board.—The bell-board to be 1½ in mahogany, French polished (or deal), with small ovolo moulding on edge, and with name of room written under each bell, showing to which it belongs. Size of bell-board to be by (number of) bells.

Wires and Fittings.—The wires to be No. B.W.G. (size may vary from about No. 10 to No. 15), well stretched, and fitted in concealed zinc tubing, with the necessary cranks, purchases, and levers (or, if the student likes to be very exact, he may specify number and nature of fittings to each bell).

Bells and Pulls.—Supply and fix the following bells and pulls. The whole list should then be given of the various rooms, with the number of bells and pulls to each, together with their position, and also the situation where the bells are to ring. As for example:—

Drawing-room.—No. 1 bell, with two-lever pull, to ring in kitchen.

Bedroom.—No. 1 bell, with ceiling pull, to ring in kitchen.

Boudoir.—No. 1 bell, with lever-pull, to ring in kitchen.

No. 1 bell, with lever-pull, to ring in house-keeper's-room.

The pulls to have iron boxes and mouth-pieces, and to be of the following p.c. value. (Give list of the pulls of each kind, with their p.c. value, including, of course, the street-door pull.)

Electric Bells.—There are various ways in which these can be arranged. Perhaps the most useful, at any rate for domestic work, is to have a single bell with indicator, and here again there are varieties. Some indicators have pendulum movements, others have a mechanical replacement, and others, again, have electric replacement. The specification should state: The bells to be electric, and to be fitted up with one good-toned bell of 3 oz. weight, and indicator box of polished mahogany, with gold lettered glass screen, fitted with relay and mechanical replacement to ring from No. points. The wires to be No. 18 B.W.G., best quality copper wire, tinned, insulated with gutta percha, double covered with cotton, and afterwards varnished and enclosed in zinc tubes. The insulation is not to be stripped back beyond points of connexion.

Buttons and Pushes.—Give a list of the various buttons and their situation specifying whether they are to be rosewood, ebony, china, or other material, and stipulate that they are to have German silver springs with platinum contacts; also enumerate the pendant pear presses, state of what wood they are to be made, and the length of flexible silk covered wire, and whether two, three, or four-strand bell-cord.

Battery.—The battery to be a Leclanché Battery, with No. porous cells, properly charged, and with zincs, &c. complete. Each cell of battery to have an E.M.F. of not less than 1½ volts. If there are to be any switch connexions, state where they are to be, as, for instance, the bell from the front-door may have a switch connexion, so that at night time it may ring in the servants' bed room, or on an upper landing, instead of in the kitchen. Similarly with some of the bells from bed rooms, bath rooms, and dressing rooms. State where the battery is to be placed, and specify its shelf or enclosure, if any is required. The battery should not be placed under the floor boards, as is sometimes done, but at the same time should be secure from too ready access to the middle-some. A small cupboard, with lock and key, and space for keeping a spare stock of sal ammoniac, and even other material, is a good arrangement. A glass panelled door is also an advantage, so that the cells can be seen.

Testing.—Provide the sum of 2l. 2s. to be paid for testing the electric bells and fittings by the expert to be appointed by the architect, who will not approve the electric bells until such testing has been done, and the expert's fee paid.

Pneumatic Bells.—Bells are to be fitted up on the pneumatic system by Messrs. whose p.c. price for this work is which amount is to be paid to them by the contractor within one month after the production of the architect's certificate. The bells will be fitted up before the plastering is done, and particular care is to be taken by the contractor that no damage is done to tubes, boxings, or other work in connexion with the bells.

N.B.—As pneumatic bell-fitting is rather out of the ordinary run, it is advisable to get a price from a reliable firm, and include that as a provisional amount, especially as the primary essential to successful working is careful workmanship and high quality in material.

Speaking Tubes.—Fit up speaking tubes from to with $\frac{3}{4}$ in. composition tubes (for other size, according to circumstances; $\frac{3}{4}$ in. is a good average. Zinc or copper tube may be used, but, taking all things into consideration, composition tube is generally the most satisfactory).

All bends in speaking tubes to be in cast zinc (or brass), and the tubes are to be finished at ends with brass screw collars, oval mouth-pieces, and whistles, with indicators (state whether the mouthpieces are to be in cocus wood, ivory, ebony, or boxwood). The ends of speaking tubes in to have silk braided flexible tubing, 3 ft. long, with brass clips, and $\frac{1}{2}$ in. mahogany board. (If, as may sometimes occur, any ends are to have mouth-pieces only, without whistles, enumerate them separately. Generally indicators are advisable with all whistles, but where there is only one whistle at any point, the indicator may be omitted if there is no danger of confusion).

Telephones.—It is scarcely advisable to specify telephone work for the ordinary contractor to find a sub-contractor who will do the work at the cheapest rate, and it is better for the archi-

tect to select the firm who are to actually do the work, and to include their price as a provisional amount. Should, however, the student be disposed to specify his work in detail he must deal with the following parts:—The receiver, the transmitter, the battery, the wiring, and, desirably, the lightning protector. The receiver and transmitter are usually, though not necessarily, in one instrument, the Gower-Bell, the Bell-Blake, and the Ader being all good examples. The battery is of the Leclanché pattern usually for private installations, with which alone we are dealing, and the cells should be for telephone work of the agglomerate block form rather than porous cells. The number of cells depends of course upon the length of wiring, and hence the electrical resistance. The E.M.F. of a Leclanché cell when newly fitted should be 1.6 volts. The wiring should be of No. 16 B.W.G. copper wire, tinned and insulated as described for electric bells. Switches should be provided where required. A fee for testing by an expert should be included. If our student architect chooses to qualify himself for the testing he is of course entitled to a distinct fee, as it means not only the necessary knowledge but the expenditure of capital in the purchase of delicate instruments.

OBITUARY.

M. EDMOND YON.—This eminent French landscape painter has died just at the moment when he was about to open an exhibition of his works at the Georges Petit Gallery. He was born in 1841, and was first known as a wood engraver and etcher for illustrated publications, but subsequently devoted himself exclusively to landscape painting, an art which he followed for thirty years, in oil, water-colour, and pastel. He was born at Montmartre at a time when that region was still a rural suburb, and, like Michel, devoted some of his early studies to views in its neighbourhood; but he subsequently painted in Holland, Normandy, and the South of France. The Luxembourg possesses a good example of his work, the Pont Valenti at Cahors; and he also painted a decorative landscape in the Hôtel de Ville of Paris.

M. HENRI GUÉRARD.—We have also to announce the death of this eminent engraver, who was president of the "Société des Peintres Graveurs," and one of the most brilliant representatives of the modern school of engraving. He excelled especially in the reproduction of paintings by the old masters, but also showed high powers as an original artist in engraving, both on wood and copper. He had made a large collection of paintings and other works of art, and was the inventor of the process called "pyrogravure."

THE REV. DR. SPARROW SIMPSON.—We have to record with regret the death of the Rev. Librarian of St. Paul's Cathedral, who was an archaeologist with a good deal of special knowledge, particularly in regard to the great cathedral with which he was associated, as well as in connection with other matters relating to the history of old London and its buildings. His historical knowledge about St. Paul's he had embodied in a book entitled "Gleanings from Old St. Paul's." Dr. Simpson was Rector of St. Vedast, Foster-lane, in the history of which church he had taken also great interest.

GENERAL BUILDING NEWS.

PROPOSED ADDITIONS TO SCHOOLS, BRONBURN, NEAR EDINBURGH.—Additions and alterations to these buildings are to be carried out. A new front of two stories, with ornamental central gable, and a dressed stone porch, have been designed for the addition. The architects for the additions are Messrs. Lendebetter & Fairley, of Edinburgh.

CLUB BUILDINGS, SOUTH SHIELDS.—New premises are about to be erected in Catherine-street, South Shields, to serve as a club for the Unionists of the Borough. The building will be four stories in height, with a frontage of 40 ft. and a depth of 55 ft. On the ground floor will be an entrance hall, with a broad staircase leading to the first floor. On one side of the hall there will be a reading room, while on the other side is a smoke room. To the rear of these rooms will be the cloak-room. The walls will be of glazed bricks. Beyond these again are the lavatories. On the first floor will be a billiard-room, 48 ft. long by 40 ft. wide, in which it is intended to place three tables. Above this will be situated the assembly room, of similar dimensions to the room below, and this is capable of being divided into three smaller rooms by collapsible partitions. The top of the building will be set apart for caretaker's quarters. A lift will run from the basement to the upper story, having communication with each floor. The whole of the basement will be utilised as cellars. The hall, cloak and other rooms will be heated by a system of steam coils, and the whole of the doors and woodwork will be of dark Spanish mahogany. The entrance from the street to the hall is reached by a lobby,

with bay windows on either side. The whole of the front up to the first floor windows will be of glazed faience work, and above this terra-cotta dressings, while the walls will be of deep red brick. The building has been designed by Mr. J. H. Morton, architect, South Shields.

PROPOSED DRILL HALL, BLAIRGOWRIE, PERTH.—Messrs. L. & J. Falconer, architects, Blairgowrie and Fort William, have completed plans for a proposed new Drill Hall at Fort William. The new building will be 115 ft. by 36 ft., and will comprise drill hall, armoury, orderly room, lavatories, &c.

MISSION CHURCH, OLDBURY.—On the 23rd ult. the foundation stones of a new mission church at Tat Bank were laid. The new church is to be erected in the Gothic style, at a cost of 1,000l., and will accommodate 250 persons. Mr. Lavender, Walsall, is the architect, and Mr. Kendrick, Walsall, the builder.

HEATH MEMORIAL CONVALESCENT HOME, LLANFAIRFECHAN.—On the 25th ult. these buildings, erected at Llanfairfechan (on a site overlooking Conway Bay), as a memorial to the late Mr. Robert Heath, were formally opened. The building, which is of local stone, with dressed stone facings and lined with bricks, comprises a three-storied block, containing day-rooms and dormitories for the accommodation of fifty patients, with suitable offices and servants' rooms, and a suite of rooms for the matron, advantage having been taken of the fall of the ground towards the sea to construct a basement floor. It contains a bagatelle-room, the dining-hall, lavatory, kitchen, scullery, larders, boot-room, &c. The rooms are provided with open fireplaces, and the corridors and principal rooms are heated by Messrs. S. N. Haden's low-pressure hot-water pipes. Bath-rooms are provided on each floor, and the sanitary fittings are by Messrs. Twyford, of Hanley. A gate lodge, with a washhouse and laundry connected to it by a covered way, has been built adjacent to the building. Mr. Thomas Bower, of Nantwich, is the architect, and Mr. Jobn Gallimore, of Newcastle, Staffordshire, the builder.

BUSINESS PREMISES, INVERNESS.—A block of buildings is to be erected in Academy-street, Inverness, by the trustees of the late Messrs. Strothers. The new block, which is to cost 7,000l., will have a frontage of 70 ft. to Academy-street, and a frontage of 50 ft. to the railway thoroughfare. On the ground floor of the building, which is to be four stories in height, there will be four large shops with cellars underneath. The first floor will be divided out into offices. The second floor will be similarly laid out, while the third floor will be constructed for family occupation. Both elevations will be faced in red sandstone from Ayrshire. The architect is Mr. William Mackintosh. The successful contractors are—Mason, Mr. Alexander Junor; carpenter, Mr. Peter Cameron; slaters, Messrs. James Gray & Son; plumber, Mr. A. J. Russell; plasterers, Fowler & Kennedy; painter, Mr. John Munro; and blacksmiths, the Rose-street Foundry Company, Inverness.

OPERATING THEATRE, SWANSEA HOSPITAL.—The foundation-stone has just been laid of a new operating theatre at the Swansea Hospital. The theatre is connected with the west corridor of the hospital, and is provided with two ante-rooms opening into the theatre, which is elliptic in form, and measures 26 ft. 6 in. by 22 ft. The walls are carried up to a height of 12 ft. All the sanitary fittings are to be supplied by Messrs. Adams & Co. The exterior of the building is designed to be in character with the present hospital. The contract has been entrusted to Mr. Henry Billings. The architects are Messrs. Wilson & Moxham.

HALL, EAST FREE CHURCH, BRECHIN.—A new hall has recently been erected at the East Free Church, Brechin. In the hall, accommodation is provided for 200 persons, and there is, besides, a vestry, with lavatory, &c., and a small scullery for the convenience of social meetings. Towards the street the building presents a gable containing a four-light window, filled with stained glass from the studio of Messrs. Ballantine & Gardiner, Edinburgh. The following contractors carried out the work from the designs and under the superintendence of Mr. T. Martin Cappon, architect, of Dundee and Brechin:—Mason work, D. A. Crabb; joiner work, George Ogilvie; plumber work, Charles Middleton & Sons; plaster work, J. & C. Thomson; slater work, James Scott; painting and glazing, J. C. Middleton; heating, A. L. Peacock.

FREE LIBRARY, THORNHIEBANK, RENFREWSHIRE.—The Free Library, built as a memorial to the late Mr. Alexander Crum, of Thornhiebank, has just been handed over to its trustees by Sir John Stirling Maxwell, Bart., M.P. The library is situated immediately opposite the Thornhiebank Print Works. The reading-room is 24 ft. by 48 ft. Behind the reading-room is a book store. Dr. Rowand Anderson, Edinburgh, was the architect of the building.

CO-OPERATIVE PREMISES, SACRISTON, DURHAM.—A branch of the Annfield Plain Co-operative Society was opened at Sacriston recently. There are five departments, with frontages to the Plaworth-road, the whole extending 200 ft. Over the shops is a hall providing seating accommodation for 700 persons, and behind is a yard with manager's house, warehouses, slaughter-house, stabling, and other out-offices. The whole are built of stone. The buildings, which have been designed by Mr. G. T.,

Wilson, of Blackhill, and erected by Mr. T. Hilton of Bishop Auckland, cost between 5,000*l.* and 6,000*l.*

GOLF CLUB-HOUSE FOR PETERHEAD.—The Committee of the Peterhead Golf Club have accepted the offer of Messrs. G. Scott & Son to erect a new club-house at Craigevan Links on the site of the former club-house recently destroyed by fire. The club-house is to be built from designs of Mr. James Taylor, jun.

BIBLE CHRISTIAN CHAPEL, EAST COWES.—A new Bible Christian Chapel has just been opened at East Cowes. The windows are of cathedral glass. Messrs. W. Brading & Son were the contractors, and the architect was Mr. J. Newnam.

FACTORY, NORTHAMPTON.—A new shoe factory for Messrs. Derham Brothers has been built on an elevated position on Brockton-street, near the Queen's Park Estate. The building has been erected, and the whole of the mechanical appliances arranged, in accordance with the plans of Messrs. Mosley & Anderson, of Northampton. The contract for building has been carried out by Mr. Robert Cosford; and the heating apparatus has been constructed by Mr. A. Marriott, of Higham Ferrers. The factory is lighted by electricity produced on the premises from plant laid down by Messrs. Whitney, Smith, & Co.

RUSTINGTON CONVALESCENT HOME, SUSSEX.—The Rustington Convalescent Home was opened recently by the Bishop of Chichester. The home is entirely for working men from all parts. It has been erected by Mr. Henry Harben, of Hampstead, at a cost exceeding 50,000*l.*, and Mr. Harben has also provided an endowment of 20,000*l.* The home is based chiefly on the separate system; there are seventeen rooms with one bed, ten with two beds, and two with four beds. It is lighted by electricity, stands in grounds of over nine acres, is set back 250*ft.* from the esplanade, and has a frontage of over 170*ft.* It is in the Georgian style, the architect being Mr. Frederick Wheeler, of London. The electric lighting is by Messrs. Drake & Gorham, from the designs and under the superintendence of Mr. W. H. Preece, C.B.; and Messrs. Bostel & Sons, of London, have done the plumbing and engineering work.

BREWERY, DUNDEEN, EDINBURGH.—A new brewery, for Messrs. Blyth & Cameron, has just been erected at Dunnington, from plans prepared by Mr. P. L. Henderson, Edinburgh.

MASONIC HALL, GLASGOW.—The new Masonic Temple, which has been built to accommodate the Glasgow brethren of the craft, was recently thrown open for public inspection. The site is on the north side of West Regent-street, and two buildings have been erected on it, the one fronting the street and the other on the back portion of the ground. The former has been almost entirely arranged in suites of offices. The other one is devoted entirely to masonic purposes. The designs were prepared by Mr. J. L. Cowan, who has adopted a free treatment, of the English Renaissance. The building is four stories in height. The basement is occupied by reception, cloak, and ladies' rooms, with a purveyor's kitchen, as well as a machinery-room containing the appliances for mechanical heating and ventilation. On the street level a hall has been constructed 144*ft.* long by 3*ft.* wide. There is a dado panelled in stained wood 9*ft.* high, and above the walls are treated somewhat elaborately, with capitals between the windows, which run round three sides. The lights are semi-circular headed, and are filled with stained glass on which are displayed the arms of Grand Lodge, the Provincial Grand Lodge, the arms of the City and various masonic symbols. The hall is seated for 400 persons. On the next floor there is a lodge-room 45*ft.* by 26*ft.*, and a large adjacent room with committee, smoking, and other rooms. There is a lesser lodge-room above, 30*ft.* by 24*ft.*, and there are a store-room and caretaker's house of three apartments on the top floor. The total expenditure was about 16,000*l.*

RENOVATION OF ST. IVES WESLEYAN CHAPEL.—St. Ives Wesleyan Chapel was re-opened on the 25th ult., after renovation. The pillars which stood in the centre of the chapel have been removed, and an iron roof now spans the entire building. The body of the chapel has been re-joined, and new pitch-pine seats have been fixed throughout. The gallery has also been re-joined with pews similar to those below, and the floors have been rearranged. Mr. O. Caldwell, of Penzance, is the architect, and Mr. W. J. Winn, of Helston, the contractor.

RENOVATION OF HAMPRESTON CHURCH, DORSETSHIRE.—The ancient parish church of All Saints, Hampreston, which has been undergoing complete renovation, was recently re-opened by the Bishop of Salisbury. The foundations throughout have been underpinned, the galleries taken down, a north aisle and porch of fourteenth century design and an organ chamber erected; the walls throughout have been straightened and re-cased with local red stone, the chancel arch heightened, the tower with its west window opened to view, with the old font on its floor, thus providing a baptistry; the nave roof has

been brought into sight, the chancel roof boarded in oak with carved bosses, the entire floor re-laid with wood block; and heating apparatus provided. The entire church has also been re-seated, while every ancient feature has been carefully preserved and re-instated. The restoration has been carried out by Messrs. Merrick & Son, builders, under the instruction of Mr. Romaine-Walker, of London.

ADDITIONS TO THE DRILL HALL, BRECHIN.—Additions are being made to this building. The new portion provides, on the ground-floor, two ante-rooms with lavatories, &c., and on the first floor a large officers' room and a lounge-room for the men, besides a wide balcony overlooking the hall, running the full width of the building. The exterior is somewhat richly treated with pilasters and stepped gable. The architect is Mr. T. Martin Cappon, of Dundee and Brechin, and the following are the contractors:—Mason, D. A. Crabb; joiners, Wm. Black & Son; plumbers, James Kincaid & Son; plasterer, James Gibson; slater, Wm. Fraser.

DRILL HALL, MONTROSE.—A new hall has just been erected for the accommodation of the Montrose detachment of the 2nd V.B.G.H. Plans were prepared by Mr. John Sim, C.E. The main hall is 77*ft.* by 58*ft.*, the roof being in one span. It is 23*ft.* high to the wall beam, and 30*ft.* to the crown of roof. Two 8*ft.* wide double doors give access to the old hall. At the end of the hall, fronting the street, an armoury, clothing store, lavatory, &c., have been provided, while the Instructor's house occupies the floor above that. The contractors were—Masons, Messrs. Ford & Son; joiner, Mr. John Davidson; plumber, Mr. A. Taylor; plasterer, Mr. Burness—all of Montrose. The contracts amounted to a total of 2,300*l.*

FREE GARDENERS' HALL, EDINBURGH.—The new Free Gardeners' Hall, in Picardy-place, Edinburgh, has just been opened. A spacious reception-room, or saloon, occupies the front part of the ground floor, and in the rear is the large hall, which is capable of accommodating an audience of over 500 people. Over the entrance to the hall is a small gallery, which is reached by a staircase from the inner hall. The two upper floors of the main building are planned to suit the requirements of the Society, and the basement will be used for commercial purposes, being entered from the lane at the back. The whole of the building is lighted by electricity. Altogether the premises have cost about 5,000*l.* Messrs. Dunn & Findlay were the architects.

COUNTY SCHOOL FOR GIRLS, BANGOR.—The memorial-stone of the Bangor County School for Girls has just been laid. The school, which will provide accommodation for 100 girls, is being built to the plans of Mr. J. H. Phillips, of Cardiff, the contractors being Messrs. P. & J. Williams, Upper Bangor.

ST. PAUL'S U.P. CHURCH, ABERDEEN.—The new church in Rosemount Viaduct, for the St. Paul's U.P. congregation has just been opened. The building has accommodation for 650 worshippers. A gallery runs right round the church, that portion behind the pulpit at the east end being set apart for the choir. In the basement are three halls, the largest capable of accommodating about 250 persons. A house for the church office is also provided in the basement. The contractor for the church, which will cost between 5,000*l.* and 6,000*l.*, were—Mason work, Leslie Smith; joiner, Hendry & Keith; painter, William Philip; plasterer, W. Ross; plumber, John Thom; heating apparatus and electric light installation, Shirras, Laing, & Co. The architects were Messrs. Ellis & Wilson.

BANK, HIGH-STREET, BELFAST.—New bank buildings have just been erected in High-street, Belfast, for the National Bank Limited. The general contractors were Messrs. H. & J. Martin, and the architect was Mr. W. Batt, of Belfast.

OFFICES OF THE NORWICH AND LONDON ACCIDENT ASSOCIATION.—This company will remove into new offices at 13, Waterloo-place (as their West-end offices), as soon as necessary alterations, decorations, &c., are carried out. The electric-lighting installation is being done by Mr. King, of Maidstone; the fittings by Mr. B. E. Nightingale, of Lambeth; the fascia lettering by Messrs. Clarkson Bros.; and the builders' work by Mr. H. S. Stephens, under the superintendence of Mr. Alfred E. Nightingale, architect.

ALTERATIONS AT ST. GEORGE THE MARTYR, SOUTHAMPTON.—A new ceiling has been erected in place of the old one, which was seriously impaired, if not actually unsafe. The design represents cherubs joining in the "Te Deum." The work has been carried out by Messrs. Bridgeman from the designs of Mr. Basil Champneys. The material used is carton-pierre. There is a frieze, including in its decorations the arms of various City companies which have contributed towards the cost, and those of London and the Borough of Southwark. The electric light has been installed by Messrs. Benson, of Bond-street, and the church has been cleaned and painted throughout.

SEVERN END, NEAR WORCESTER.—The quaint old residence of Sir Edmund Lechmere, Bart., which was nearly destroyed by fire last October, is now Messrs. Lewis Sheppard & Son, architects, Worcester. Messrs. Collins & Godfrey, of Tewkesbury, are the builders.

CHURCH OF ST. GILES, ROWLEY REGIS.—Plans for the rebuilding of the church and tower of St.

Giles, Rowley Regis, Staffordshire, at a cost of about 10,000*l.*, have been submitted and approved. Messrs. Lewis Sheppard & Son, Worcester, are the architects.

SANITARY AND ENGINEERING NEWS.

WATER SUPPLY, MORPETH COUNTY ASYLUM.—The Asylum Committee of the Northumberland County Council have accepted the plan of Mr. D. Balfour, M.Inst.C.E., of Newcastle, to prepare plans for and report on, a gravitation scheme of water supply for the County Asylum at Morpeth, to be procured from Upland Springs, six miles north of Morpeth, and delivered into an elevation tower for distribution.

SEWAGE PURIFICATION, MORPETH.—A special meeting of the Morpeth Town Council was held recently in the Town Hall, the Mayor, Councillor Anderson, presiding, when a report and plan were submitted by Mr. D. Balfour, M.Inst.C.E., of Newcastle, on the bacteriological purification of sewage. It was agreed to defer further consideration to another meeting of the Council.

CARSHALTON SEWERAGE SCHEME.—On Saturday, March 27, the foundation stone of the main pumping station and sewage disposal works in connexion with the sewerage of the Carshalton Urban District was laid by Mr. J. Tyler, Chairman of the Urban District Council. The works of which this was the inauguration have been contemplated for a considerable time. Mr. Baldwin Latham was first called in by the then local authority in May, 1892, to report as to the drainage of the town. He then advised them to take their sewage to a site of fifty-one acres in the parish of Mitcham, to which practically the whole of the sewage of the district would flow by gravitation, and there purify it by brood irrigation. Parliamentary powers were obtained in 1893 for the compulsory purchase of this site, but, owing to the strenuous opposition of the landowners, it was thought that the acquisition of this site would be very costly, so that the District Council abandoned the scheme and called upon Mr. Baldwin Latham to report on three sites which had been offered to them. Of these the present site of 20 acres on the west side of Wrythe Green-lane, in their own district, was selected, the small area necessitating some system of chemical treatment, and, owing to the levels of the ground, the sewage of two-thirds of the present population requires to be pumped. Further, a few houses will be drained into the Croxson Rural District Council's sewers. In the scheme in course of construction the sewage from the district is brought on to the site by two main sewers—high and low level. The high-level sewer, which drains a larger area, although at present a smaller population than the lower, is at the works an 18-in. pipe sewer, with an inclination of 1 in 600. It is at a sufficiently high level to discharge into a channel outside the building. The low-level sewer, which deals with that part of the district too low to drain into the other, is at the works an 18-in. pipe sewer with an inclination of 1 in 700. It flows into a pump well, and the sewage is raised 50*ft.* into the channel into which the high-level sewage flows by a duplicate set of three-throw pumps worked by 6-h.p. gas-engines and controlled by automatic hydraulic controlling gear, which puts the pumps in and out of gear as required, and has been used with much success at Rhyll. About ten low-lying houses on this sewer drain into a pump well under the Hackbridge-road, where the sewage is to be lifted 10*ft.* by a set in duplicate of Latham, Lengerke, & Riggs's automatic hydraulic pumps, worked by water from the Water Company's mains, which water is afterwards used for fishing. The sewage passing along the channel outside the buildings passes through a 12-ft. Latham's sewage extractor into a sewage-mixing channel, where lime in solution and sulphate of ammonia are added, then through continuous flow-settling tanks, of which three are provided, two always being in use, while the third is being emptied and cleaned. It then passes through artificial filters of 12 acres area, constructed in the same manner as those put down by Mr. Baldwin Latham at Friern Barnet Sewage Works in 1886. The effluent from these filters, to further purify it, is passed over the land and thence taken into the River Wandale at about 5,000 yards above Deeds' Mill by a 24-in. brick barrel drain 900 yards in length. The buildings at the works will be a block consisting of an engine-house containing the gas engines for the pumps, and two 13-h.p. gas engines to drive the machinery for chemical treatment and sludge pressing; a treatment house containing the necessary machinery for grinding the lime, pumping water, lifting, mixing, and pumping the sludge, all of which is driven from a main shaft by friction gear; also the extractor and duplicate 12-h.p. gas engine to drive it. A press-house, containing three sludge presses and cloth-washing machine; water tower, with tank; chemical stores, workshop, and offices, and two six-roomed cottages for attendants. They will be built of London stocks, ornamented with red brick gauged arches, corbels, and courses, with terra-cotta sprinklers and keystones, and bay roofs. The total estimated cost of the works is about 35,000*l.*

STAINED GLASS AND DECORATION.

WINDOW, ST. MARY'S PARISH CHURCH, LYNN.—A third light window has recently been fixed in the north aisle of this church, in memory of the late Mrs. Battersby, of Lynn Hall. It is from the studio of Mr. E. Kempe, London.

WINDOW, QUEENSTOWN, SOUTH AFRICA.—The large west window of St. Michael and All Angels' Church, Queenstown, South Africa, has just been filled with stained glass in memory of Sarah Agnew, the subject representing the Ascension of Our Lord. The work was carried out by Messrs. W. James & Co., of London.

MEMORIAL WINDOW, NEWCASTLE-UNDER-LYME.—A stained-glass window has just been dedicated at St. Giles' Parish Church, Newcastle-under-Lyme. The window has been supplied by Messrs. Hardman & Co., of Birmingham, the cost being about 1,000l. The design, occupying the seven principal lights is the Crucifixion.

FOREIGN.

FRANCE.—The jury of painting at the Champs Elysées Saloon have admitted only 1,600 pictures this year, as against the 2,400 admitted last year. There is a question of placing for the time being, all the exhibitions and competitions of the Salons in the garden of the Palais Royal, which will be altered for the purpose, whilst the new palace is being built in the Champs Elysées.—The annual exhibition of "Pastellistes Français" was inaugurated on Thursday last, April 1, by the President of the Republic.—The Government has just laid before the Chamber of Deputies a new project for the restoration of the Cour des Comptes. Abandoning the idea of rebuilding the old palace on the Quai d'Orsay, where it is now proposed to build a new station for the Chemin de Fer d'Orléans, the State intends to place the Cour des Comptes in the Rue Cambon, and at the same time install the Museum of Decorative Arts in the Pavillon Marsan.

The "Société des Artistes Indépendants" has opened its thirteenth exhibition, on Friday last, April 2, at the Palais des Arts Libéraux, at the Champ de Mars.—The town of Argenteuil has just opened a competition for the erection of a Hôtel de Ville and a Justice de Paix.—M. Cordonnier, sculptor, is at work on the monument to Pasteur which is to be erected at Lille, on the Place Philippe le Bon, in the centre of the University quarter. This monument consists of a female figure symbolising Science, who holds on her knees a young child whom she is inoculating with the virus for rabies. The inauguration of this monument will take place in June, 1898.—The sculptor, A. Lenoir, has been commissioned to execute the monument to Edmond de Goncourt commissioned for the town of Nancy.

The monument to the poet, Paul Verlaine, which is also to be erected in this town, will be executed by M. Carrière.—The death is announced, at the age of 46, of M. Xavier Ferrand, architect, of Cannes, brother of Stanislas Ferrand, architect, Conseiller-General of the Seine and Editor of *Le Bâtiment*. It is to M. Xavier Ferrand that Cannes owes its splendid system of drainage, which is now being carried out.—The death is also announced of M. Thibault, architect, of Paris.—The director of *Bâtiments Civils* has ordered the immense scaffolding to be erected again round the Arc de Triomphe, which were removed at the time of the Imperial Russian visit to Paris. M. Esquié, the architect who is directing the restorations of the monument, calculates that it will take about ten months to finish the necessary repairs.

GERMANY.—Statues are to be erected at the Royal Technical College of Alfred Krupp, the great iron founder, and of Siemens, the electrician.—The National Gallery at Berlin will henceforward be under the same administration which has control of the Government Museums in Prussia.—We understand that the "Cross Church," which was burned down at Dresden some time back, is to be re-erected at once, and the builders are already at work.—In connexion with the competition for the design of a new synagogue at Chemnitz seventy designs have been sent in. The premium has been awarded to a local architect.—The central administration of the Court theatres at Berlin are to occupy some special offices in the Dorsten-strasse, which is not far distant from the Royal Opera House.—The city of Basle will be the scene of several interesting ceremonies during the autumn, in relation to the celebration of the 400th anniversary of the birthday of Holbein, who was born in 1497. At the same time, the popular German painter, Arnold Böcklin, will be celebrating his seventieth birthday in the same city. Distinguished artists, who have been much divided of late years, and have held various exhibitions representing their different coteries, will this year unite for a general exhibition under the auspices of the Bavarian Government, an influential central council having been formed representing the various interests. The Government has undertaken to invite foreign artists to send exhibits.—The seventieth birthday of the German sculptor, Kopf, is being celebrated at Berlin. One of his best-known works is an excellent bust of the late Emperor William, belonging to the National Gallery at Berlin.—The late Herr Salzmann's place as cathedral architect at Bremen will be filled by Herr Ehrhardt, of Berlin, who is a well-known authority

on German church architecture.—We are pleased to record the able manner in which the Berlin Metropolitan Railways managed the traffic during the festivities early this week. It appears that the number of tickets sold was quite unprecedented; that there was no hitch anywhere. The automatic ticket distributors were found exceedingly useful, penny tickets being sold by these machines.—The weight of the Equestrian Statue of the new National Monument is 1,770 cwt. The whole of the bronze work is by Messrs. Gladenbeck and Messrs. Martin & Piltzing. We notice that all the students at the Royal Technical College at Berlin, with their Professors, took a prominent part in the celebrations.—In connexion with the great ceremonial at the Academy of Arts, a banquet was arranged for the Royal Academicians, at which Professor Otzen, the well-known architect, was entrusted with the principal oration.—At Charlottenburg the municipality recently decided to construct its own electrical works, and has voted for this purpose a loan of 850,000l.—Rapid progress is being made with the new Schöneberg Bridge at Berlin.—Recently there was considerable discussion in the Berlin Municipality as to the advisability of changing the entire system of horse tramways into electrical tramways, and the arrangement of a uniform charge for all distances one penny per ride.

AUSTRIA.—A new theatre, the "Urania," is to be erected at Vienna, on the principle of the similar institution at Berlin, and will be a solely for the presentation of scientific research in a popular form.—"Excursions to the Moon" will be subject of the first production.—Rapid progress appears now to be made on the municipal gas-works, and a large number of tenders are being constantly invited for different parts of the town. Nearly all the commissions, however, go to Austrian firms.—Following the example of Germany, the Austrian Government has decided to arrange for a good representation of its industries and arts at the Paris International Exhibition of 1900, and the general commissioner who has been selected to represent the authorities will have an influential committee to assist him.

WESTERN AUSTRALIA.—The Melbourne Trades Hall Council has received from the secretary of the Builders' Labourers' Society in Perth a letter describing the condition of the building trade and the position of working men in Western Australia. The letter stated that the wages for carpenters were 11s. per day; bricklayers, 12s.; plasterers, 11s.; and builders' labourers, 9s. All the trades were demanding 1s. per day extra, with the exception of the bricklayers, and it that was not agreed to a general strike was certain, both in Perth and Fremantle. The rates quoted might seem high, but the purchasing power of wages was exceedingly small there, and 6s. per day in Victoria or New South Wales would purchase more of the necessities of life than 10s. in Western Australia. Lately the price of provisions had gone up to famine rates, and as much as 17. per week was charged for a miserable three-roomed house, situated on sand-hills, with no roads and no regular supply of water, with the thermometer registering from 100 deg. to 108 deg. in the shade. A man with a wife and three children could not secure the necessities of life under 2l. 10s. per week.—*Morning Post*.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. H. O. Cresswell has changed his address from 30, Gray's-inn, Strand to 17, Buckingham-street, Adelphi, W.C.

"SKETCHES OF LONDON STREET ARCHITECTURE."—In regard to the correspondence in our columns as to the disputed authorship of the design of the house in Sloane-street shown in our issue of February 27, we have received a letter from Mr. Fairfax B. We, adhering absolutely to the statements in his former letter, and stating that as he wished to have no further communication with Mr. Williams either directly or indirectly he should take no further notice of any of his remarks except to take legal action against him. We have also received a letter from Mr. Francis, a draughtsman in Mr. Wade's office, confirming Mr. Wade's statement. We cannot print any more letters on the subject.

EXCAVATIONS IN THE BAIL, LINCOLN.—Digging operations were recently commenced close beneath the foundations of Mr. Wilson Blaze's house, to ascertain whether the column known to exist there is double, as has hitherto been supposed, or triple, like its neighbour unearthed a short time since.

ESTIMATES, 1897-8.—In the estimates for the twelve months ending March 31, next year, provision is made for "votes required for 1897-98," for sums in respect of the Record Office additional buildings, 30,000l. (3,887l. for completion), the Patent Office extension, 11,350l. (70,794l. for completion), the Admiralty extension, 40,600l. gross (55,938l. for completion), and the General Register House, Scotland, extension, 13,000l. (20,500l. for completion). The expenditure upon the new Admiralty buildings is given as being 183,247l. up to the end of November last. There is a vote of 3,000l. for completing (at a revised total estimate of 23,900l.), a new laboratory on the ground near Clement's Inn, instead of that at Somerset House. For the Survey of the United Kingdom an approximate amount of

220,571l. is assigned; the calculated cost of completion being a further sum of 3,244,435l. The survey will include the finishing of the new series of 1-in. maps, of the general revision of the 6-in. and 25-in. maps of Great Britain, which it is expected will be accomplished in thirteen years hence, and of the re-surveys of the counties of Scotland and Ireland to the 6-in. and 25-in. scales respectively.

We notice, moreover, a vote of 150l. for the maintenance and repair of the keeper's house, the boundary-walls, and the well-house, of Carisbrooke Castle. The castle, which, we understand, is in course of repair, as a memorial to H.R.H. the late Prince Henry of Battenberg, Governor of the Isle of Wight, was reconstructed temp. Elizabeth; and the keep was erected originally by, it is said, Cardif's nephew, Wightgar, circa 535. William Fitz-Osborne, lord of Wight, Carisbrooke, improved the defences in the eleventh century; the outworks of Elizabeth's reign were planned by Genebella, an Italian, who made the fortifications of Antwerp, destroyed forty years ago.

ROMAN REMAINS NEAR NUNEATON.—An interesting discovery has just been made at Hartshill, on the great Roman road running from London to Chester. One station, Manducandun, fell within the county of Warwick, and is now occupied by the village of Mancetter. Since 1773 there have been numerous discoveries indicative of the Roman occupation. About four years ago a Roman kiln was discovered, but the importance of the discovery was not realised until too late, and the work was too much destroyed to be of value or allow of a systematic examination. Recently, however, on the large side of the roadway, at what was known as the Caldecote Quarries, a second kiln was found, and in the uncovering very little damage was done. Other indications led to a careful search, and a third kiln, in a wonderful state of preservation, was unearthed. A quantity of pottery remains have been found, chiefly of the dark-blue slate colour, including a perfect specimen of a cinerary urn about 5 in. high. The kilns, which were discovered about 10 in. below the turf, are oval in form, and about 48 in. by 60 in.—*Sheffield Independent*.

ROYAL EXCHANGE PANEL PICTURES.—The clerk of the Merchant Taylors' Company and the clerk of the Skinners' Company write to us to say that, in addition to the gifts of pictures referred to in our last issue, the Merchant Taylors' Company and the Skinners' Company have jointly commissioned Mr. E. A. Abbey, A.R.A., to paint a picture commemorating an incident connected with the feud between these ancient Guilds, which was afterwards the subject of the well-known award of Lord Mayor Billesdon in 1484. We believe that Mr. Abbey, who is not in England at the present time, has not yet submitted his design for the approval of the two Companies and the Gresham Committee.

REFUSE DESTROYER, SHEFFIELD.—The Sheffield Corporation have built in the neighbourhood of Lumley-street, Attercliffe, a refuse destructor. The members of the Health Committee recently inspected the building, which was described by Mr. C. F. Wike, City Surveyor. The building has been erected by Messrs. Longden, at a cost of 6,000l., and the contract for the ironwork and cells was given to Messrs. Goddard, Massey, & Warner, of Nottingham. It has been necessary to make an approach road, paved with granite, at a cost of 4,000l. The road is built on girders and brick arches, and forms the roof for stores and workshops, a boiler-house and mortar-mills, the intention being to convert the cellars made in the destructor into mortar for building purposes. The Lumley-street approach level, but an entrance has also been arranged on the lower level. In connexion with the destructor is a weigh-house, and the depth of the foundation has been utilised in making a mess-room for the workmen. At present only six cells have been attached to the destructor. These will deal with 10 tons of ashpit refuse per day, but six more cells can easily be added on the other side. The flue is a specially designed one, and contains a chamber to capture the dust and deposit which might otherwise escape by the chimney. The shaft is 180 ft. high, but it is so designed that another 20 ft. or 30 ft. can be added to it.

THE SANITARY INSTITUTE.—At the annual meeting, held on the 24th ult., the Duke of Cambridge was re-elected President. Professor W. H. Corfield and Mr. Thomas Salt were elected new Vice-Presidents to fill the vacancies caused by the death of Sir George M. Humphry, of Cambridge, and Sir J. Russell Reynolds, President of the Royal College of Physicians. The report of the Council on the year's work was read.

IPSWICH BUILDING TRADES ASSOCIATION.—The annual dinner of the Ipswich Building Trades Association was held at the Crown and Anchor Hotel recently, the Chairman being Mr. A. Coe. In giving "The Town and Trade of Ipswich," Mr. C. E. Whitmarsh expressed pleasure that all differences in the building trade had by compromise been amicably settled. Mr. C. Borrett responded. Mr. Councilor Catchpole, in giving "Success to the Ipswich Builders' and Walton Building Trades Association," referred to the work performed during the past year. They had settled all matters without recourse to any drastic measures on the part of masters or employes, but he counselled the men to be tolerant in minor details, and not to create difficulties where no question of principle was concerned. He strongly

advocated the system of apprenticeship to all classes of their workmen. The Chairman and Mr. W. S. Clark replied, the former giving personal reminiscences of his early connexion with the building trade. His object during his year of office would be to increase the power of the Society, and he hoped that new members would join them, and so enable their Association to speak the united mind of the building trade. The toast of "The Chairman and Officers" was given by Mr. S. Kenney. Other toasts followed.

KENT BRICKMAKERS.—Monday, the 15th ult., marked the commencement of the brickmaking season, being an earlier period than usual. On that day also commenced an increased rate of wages, the principal employers having decided to give their workpeople a rise of 10 per cent. for the season. This will have the effect of causing a sum amounting to close upon 40,000, to be spent in wages in the Kent and Essex districts over and above the wages earned in the brickmaking districts last year. This healthy state of the brick industry is due to a steady and increasing demand for Kent bricks in the London market, the stock at the various yards having been almost worked out. At Sittingbourne, which is the centre of the Kentish brickmaking industry, a good season is anticipated, the prospects being brighter than at any period since the memorable lock-out.—*Kentish Express.*

GLASGOW BUILDING TRADES EXCHANGE.—At a general meeting of the Glasgow Building Trades Exchange on the 25th ult. in the rooms, 30, Gordon-street, a paper was read by Mr. William Oliphant on the subject, "Why is Scotland Fifty Years Behind in Heating and Ventilating?" Mr. Oliphant said that America to-day enjoyed what was beyond question the best heating, ventilating, and cooling appliances in the civilised world, and is indebted to her gifted Scottish citizens for most of them. He strongly advocated the adoption in Scotland of the American system of cooking and plumbing apparatus. He strongly advocated the American system of ranges for cooking on account of their cleanliness, facility for working, and economy of fuel. In America the greenhouse system of heating by a series of pipes had been abolished, and radiators were now generally adopted.

CO-OPERATIVE STORES, CASTLE NORTHWICH, CHESHIRE.—New co-operative stores have been opened at Castle Northwich. The new premises have been built from the plans of Mr. W. D. T. Mumford, architect, of Preston. Mr. T. Leicester, Northwich, was the builder.

THE BUILDING TRADES EXHIBITION.—Sir Arthur Arnold, who was accompanied by Lady Arnold, distributed the prizes on Saturday last to the successful craftsmen in the handicrafts' competitions held in connexion with the Building Trades' Exhibition at the Royal Agricultural Hall. The chair was taken by Professor Banister Fletcher, who remarked that the competitions in handicrafts had been most successful, and nearly 200 workmen had entered for them. Their object was to improve the standard of work for all schools and shops so as to benefit both the workman and the trade, and to enable this country to compete with foreign nations on more equal terms. Sir Arthur Arnold, after distributing the prizes, said that it was a matter of the highest importance that the building trade should be carried on in an enlightened and intelligent manner, and since the work in the workshops was more mechanical than it used to be, it was good to afford them such opportunities as these to display their talent and ability. Sanitary reform was once in a very different position to the one it held at present, but there was still further advance to be made, and he had seen examples in this exhibition of what might be done in the future. The proceedings terminated with the usual votes of thanks. Among those present were Messrs. Charles Barry, Thomas Blashill, Lewis Angell, Greville Montgomery, E. Benedict, C.E., and other members of the Consulting Council.

THE BUILDING TRADES EXHIBITION.—In mentioning last week the exhibits which bore on artistic work in this exhibition we had no intention of omitting any mention of the exhibit of Messrs. Diespcker & Co., whose mosaic work is well known. This and perhaps one or two other omissions which we should not have voluntarily made are to be traced to the want of proper system in the arrangement and cataloguing, a matter of which exhibitors have complained as well as ourselves. In regard to this subject we may observe that some exhibitors appear to think that the fact of their having put up a stand at the Building Trades Exhibition, even if it contains only what has been seen over and over again, gives them a definite right to claim a notice in our columns. In regard to that we have merely to remark that we undertake to give a critical notice of things specially worth notice, and not to furnish a catalogue of the contents of the exhibition, which our readers do not require.

THE INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.—The twenty-third voluntary pass examination of candidates for the office of Municipal Engineers and Surveyors to District Councils carried out by this Association was held at the Institution of Civil Engineers, Great George-street, Westminster, S.W., on Friday and Saturday, March 26 and 27. Thirty-six candidates presented themselves for examination, the written portion of which was taken on the first day. The greater part of the second day was

occupied with the *viva voce* portion of the examination. The examiners were: 1. For engineering as applied to municipal work, A. M. Fowler, M.Inst.C.E. (past President); 2. Building construction, W. G. Laws, M.Inst.C.E. (past President); 3. Sanitary science, L. De Courcy Meade, M.Inst.C.E. (past President); 4. Public health law, C. Jones, M.Inst.C.E. (past President). Mr. Laws was the superintendent examiner. The next examination will be held in Birmingham on October 1 and 2, applications for which must be received by the secretary on or before September 5.

ENGINEERING CONTRACT DISPUTE.—A dispute has been pending in the High Court of Justice for some time between Messrs. Murdoch & Cameron, Limited, of London and Glasgow, engineers and contractors for public works, and the Corporation of Southend-on-Sea, over the erection of a promenade pier there, the contract price of which is about 20,000, and, in consequence, work has been suspended during the last five or six weeks. Sir William Arrol, with Mr. John Waugh, C.E., and Mr. William Jeffrey, M.Inst.C.E., having visited and inspected the pier and reported favourably as to the state of the work and the probability of the pier being ready for the ensuing season's traffic, terms have been arranged between the Corporation and the contractors, who are to receive 2,000, in addition to their original contract price. The action has been taken out of court, and work on the pier has been resumed under the direction of Mr. J. Wolfe Barry, the newly-appointed engineer for the Corporation.

APATHETIC WORKMEN.—Lecturing on Saturday last on "Technical Instruction in the Building Trade" at a meeting of the London and Provincial Builders' Foremen's Association, at the Memorial Hall, Mr. F. Chessel observed that if our artisans and workmen would show themselves willing to take up the subject of technical education in earnest there were numbers of workers who were willing to give them every assistance. But the workmen seemed too apathetic. He had often spoken to them on the subject, but he never met with such remarks as "We can't be all foremen," or "We have not time," and frequently similar excuses. He spoke from experience. He taught classes gratuitously for three years, and was sorry to say, with very unsatisfactory results. He often thought trade unions might have a vast influence in the furtherance of technical education. If only one-tenth of the energy now employed in the promotion of petty disputes was expended on the advancement of technical education not only would the individual workman reap the benefit, but so also would the community at large.

FIRE AT CHESTER TOWN HALL.—A disastrous fire occurred at Chester Town Hall last Saturday night. The outbreak commenced in the roof of the northern wing, which was quickly enveloped in flames, and despite the efforts of the City Volunteer Fire Brigade the fire spread with alarming rapidity. Part of the roof fell, and the Council Chamber was completely destroyed. The flames were prevented from spreading to the tower and other parts of the building. With two exceptions, portraits of City authorities and members of the Grosvenor family were saved. The civic plate and muniments stored in a fireproof room were only slightly damaged by water. The foundation-stone of the Town Hall was laid in October, 1865. The building is of stone.

CAPITAL AND LABOUR.

THE PLASTERING TRADE DISPUTE, DOUGLAS.—The situation of the dispute in the plastering trade of Douglas remains unchanged, and people may now make up their minds that no settlement will be arrived at before the end of the summer—if then. It is obvious that the jobs which have been stopped these last sixteen weeks cannot be finished for the season, and both masters and men have therefore resigned themselves philosophically to their fate. The Management Committee of the Masters' Federation have met a deputation from the men to consider the latter's final proposals, but, after a long discussion, no agreement could be come to.—*Manx Sun.*

LEGAL.

ARCHITECT AND BUILDER: SERIOUS ALLEGATIONS.

CASE IN THE QUEEN'S BENCH DIVISION.

THE case of Homer and Another v. Herbert came before Mr. Justice Vaughan Williams, sitting without a jury in the Queen's Bench Division, on the 26th ult., it being an action brought by Messrs. Homer & Ridler, architects and surveyors, carrying on business at No. 35, Bucklersbury, E.C., to recover from Mr. William Herbert, a builder, residing in East-bourne-terrace, Paddington, the sum of 512 10s., the balance of fees the plaintiffs alleged as being due to them from the defendant.

Mr. Howell appeared as counsel for the plaintiffs; and Mr. William Moyses and Mr. Heber Hart for the defendant.

It appeared from the opening statement of Mr. Howell that the plaintiffs, as architects, advised Mr. John Roycroft, the freeholder of certain land in the Ardville-road, Brixton, who proposed to erect on the same blocks of residential flats. In October, 1894, the defendant was introduced to Mr. Homer

by a Mr. Barnes, a surveyor, with a view to his undertaking the building of a block of the flats. Mr. Homer showed the defendant the plans and had been erected at that time, telling the defendant that the cost of building each block was about 3,000. Mr. Homer told the defendant the terms of the building agreement that Mr. Roycroft would enter into, the sums he would advance on certificates, and so on. He also told him that his firm's fees as architects would be at the rate of 3l. 3s. per cent. on the gross cost of the building, which would amount to 113l. 8s.; but in order to make it even money he would reduce his fees to 112l. 10s., that being the amount the other builders had paid them for the same work. The learned counsel stated that architects' usual fees were 2½ per cent. for the plans and specifications, and 2½ per cent. for superintendence; but in the present case the architects were only to superintend the work until the roof was reached, and a mortgage could be obtained by the builder, who, at that time, had the right to call for a lease from the building owner. After some further negotiations the defendant executed the building agreement between himself and Mr. Roycroft and also signed two specifications prepared by the plaintiffs, the last clause of which stipulated that the builder should pay the architects' fees at the rate of 3l. 3s. per cent. on the gross cost of the building, the same to be deducted by the lessor on the sums advanced by him and by him paid to the architects. After that the defendant commenced the work, Mr. Roycroft making the advances according to the building agreement, deducting from the advance on August 23, 1895, 11l., and on September 27, 24l. This was not the full amount the plaintiffs were entitled to, but they did not exact it then at the defendant's request. In October, 1895, the building had reached the condition when the builder was entitled to call upon the building owner for a lease. The plaintiffs at this time wrote to the defendant reminding him that 77l. 10s. was due to them for fees and asking him to pay it on account. The defendant did not reply to that letter, but the building owner, out of the next advance to the defendant, deducted for the plaintiffs a further sum of 25l. In May, 1896, Mr. Homer heard that the defendant was getting a mortgage upon his building, whereupon he wrote asking that the balance of his firm's fees should be remitted. The defendant replied to that letter declining in regard to the defendant's abusive expressions in regard to the plaintiffs. On June 24, 1896, the plaintiffs having been unsuccessful in obtaining their fees, issued a writ, and in July signed judgment against the defendant for the amount due. Subsequently the plaintiffs, not being able to get payment, instituted proceedings in bankruptcy against the defendant, who then came before the court and filed certain affidavits alleging that his then solicitor had been negligent, and he succeeded in getting the judgment set aside. On November 13, 1896, the plaintiffs received an abusive letter-card from the defendant.

Mr. Edward Chas. Homer, the senior partner in the plaintiff firm, gave evidence substantially bearing out the opening statement of counsel. The witness stated that he was present when the defendant signed the building agreement, and saw him sign the two specifications.

Cross-examined by Mr. Moyses: He was both an architect and surveyor. All he received from Mr. Roycroft was 25s., half a year's ground rent for letting the land of the block in question. Before the defendant came on the scene a builder named Legge had done some work on the site on which the defendant was to build. Mr. Roycroft deducted from the first advance to the defendant 70s. for the work done by Legge, and the defendant told Mr. Roycroft charged 6 per cent. for advances. He would not believe that the building cost only 2,000.

His Lordship interposed during the cross-examination of the witness, and said that he knew that architects were well paid, as he had seen the scale of the Institute. (To the witness) What do you say you did for 112l.? You copied it, appears, the old specifications and plans, but that is not a very troublesome thing. In addition to that he said the witness seemed to have gone a few times to look at the job.

The Witness remarked that the plans had to be altered and amended, and several copies made afterwards.

His Lordship: It seems to me to be a high percentage to get for the job. Under the scale of the Institute, if I remember rightly, it begins by saying that the architect shall receive 5 per cent. on the cost of the work executed; and then it says, "2½ per cent. upon the signing of the plans, and 2½ per cent. on the completion of the work." So the outcome of it is that 2½ per cent. goes to the plans, and 2½ per cent. goes to the superintendence.

Mr. Moyses: And then it expressly says that, in cases of repetition, the scale is to be less.

The Witness: May I say that when we did the plans for the previous builder he never paid us anything at all?

His Lordship: That may be so. Mr. Legge may not have paid you, but it is not the custom of the architectural profession, if they should charge their customers who do pay high fees in order to make up for those who do not pay. I think that doctrine is limited to the profession of tailoring.

Mr. Knight, a surveyor, gave evidence as to visiting the building in question for the purpose of estimating the gross cost of the same. The witness said that the cost at £2,512.

Cross-examined: His firm were surveyors, but not architects. He had not taken out quantities of the building in question as he had no time to do so.

In taking the survey he had estimated at 74 per cubic foot, which he did not consider too high a price for the building.

His Lordship: I used to remember the figures pretty well. Warehouses, 44 s.; ordinary villa residences, 6d.; 10 s. 6d. is a good price for it.

The Witness: If you wanted a jerry building: The Defendant, in his evidence, said that at the first interview he had with Mr. Homer he was not down copies of the plans or specifications.

Cross-examined: He had not taken out quantities of the building in question as he had no time to do so. In taking the survey he had estimated at 74 per cubic foot, which he did not consider too high a price for the building.

His Lordship: Are you quite sure of that? The Witness: I am quite sure.

Cross-examination continued: He began to build without any specification at all, and went on building for two months before he saw one.

Mr. Howell called the attention of the witness to an affidavit he had sworn in opposition to the plaintiff's signing judgment under Order XIV. In that affidavit the witness stated that he had never had a specification given to him, and also in another paragraph that he might have signed a specification, but that he did not recollect it.

By his Lordship's direction the witness was again asked the specification which it was alleged by the plaintiffs contained his signature. The witness, after again examining it said that he could not say that it was his signature.

His Lordship: Ah, but you cannot say it is not. The witness replied that he was quite sure that it was not his signature.

His Lordship asked the witness to sign his name on a piece of paper, and after he had done so the learned judge suggested that the witness should have another look at the signature on the specification. The witness again examined the signature on the specification, but adhered to his former evidence on the subject.

Mr. Frank Barnes, a surveyor, residing at No. 8, Colville-road, Bayswater, gave evidence as to introducing the defendant to Mr. Homer. The witness stated that at the first interview nothing was said about the building costing 3,600l., nor about Mr. Homer's fees. No specification was produced at that meeting. Mr. Homer did mention to the witness that his charges would be 3l. 3s. per cent.; but that was after the signing of the building agreement. Herbert did not sign the specification to his knowledge. He did not think that the signature on the specification produced was defendant's writing. He understood that the 3l. 3s. per cent. was to be paid on the amount of the advances from Mr. Roycroft, and that they were to be deducted as they went along. He should say that the cost of the building in question at the outside was 2,000l. or 2,200l.

His Lordship, in giving judgment, said that he had no real doubt that the signature to the flimsy specification was the signature of Mr. Herbert, and that Mr. Herbert knew it was, but he had very considerable doubt as to when that signature was appended and he was inclined to believe Mr. Herbert when he said that he had no recollection of signing that document at the meeting at the solicitors. Mr. Barnes had denied that it was then signed, and Mr. Barnes struck him as being a witness of truth. If the document in question was signed at that time why did not Mr. Wootton (Mr. Roycroft's solicitor) who witnessed Mr. Herbert's signature to the agreement also witness his signature to the specification. He could not understand also why the plaintiffs had not called either Mr. Wootton, Mr. Roycroft, or Mr. Roycroft, junior. The effect of his evidence upon him was that at the meeting in October mention was made that Mr. Homer's fees would be 3l. 3s. per cent., but he did not think that there was any mention of the sum of 112l. 10s. or of the 3,600l. He preferred to take Mr. Barnes's evidence on that point, and the inference he drew was that Mr. Herbert was perfectly well aware when he took up the matter that he would have to pay the architects' fees, and that their fees would be 3l. 3s. per cent., not on the advances, but upon the cost of the building. In the result, his lordship fixed the plaintiffs' remuneration at 94l. 10s., which, after giving credit for 60l. deducted for the plaintiffs by Mr. Roycroft out of the advances, left 34l. 10s. as the balance then due, for which amount he ordered judgment to be entered. His lordship said that he should have been disposed to have given Mr. Herbert at least some portion of the costs, inasmuch as Mr. Homer had failed in proving the special agreement which he alleged, but he should not do that as Mr. Herbert was not staunch enough in the witness-box to resist the temptation of telling only part of the truth instead of the whole truth. For those reasons he should not give costs to either side. Judgment was accordingly entered for the plaintiffs for 34l. 10s. without costs.

MEETINGS.

FRIDAY, APRIL 2.

The Architectural Association.—Mr. T. G. Jackson, R.A., on "Architecture in Relation to the Crafts," 7.30 p.m.

Royal Institution.—Mr. C. T. Heycock, M.A., on "Metallic Alloys and the Theory of Solution," 9 p.m.

Institution of Junior Engineers.—Paper to be read and discussed:—"Cycle Construction," by Mr. A. W. Marshall, 8 p.m.

SATURDAY, APRIL 3.

The Architectural Association.—Fifth Spring Visit, to the Royal Palace Hotel Extension, High-street, Kensington, 3 p.m. A visit will subsequently be made to 27, High-street.

St. Paul's Ecological Society.—Visit to the following City Churches, conducted by Mr. George H. Birch, F.S.A.:—St. Stephen, Walbrook, at 3 p.m.; St. Swithun, London Stone, at 3.45 p.m.; and St. Mary Abchurch, at 4.30 p.m.

Sanitary Institute (Lectures for Sanitary Officers).—Inspection at Aylesbury Dairy Company's premises, Hayswater, 3 p.m.

Sanitary Inspectors' Association.—Mr. T. W. Crocker on "Nuisances from Certain Offensive Trades," 6 p.m.

British Institute of Certified Carpenters.—Special Meeting at Carpenter's Hall, at 6 p.m. Paper by Mr. T. M. G. Lloyd on "Ancient and Historical Carpentry," 8 p.m.

MONDAY, APRIL 5.

The Surveyors' Institution.—Mr. Walter Simms on "London: An Appreciation," 8 p.m.

Society of Engineers.—Mr. P. M. Faraday on "The Rating of Electric Undertakings," 7.30 p.m.

Victoria Institute.—The Bishop of Ballarat on "Australian Aboriginal Art," 4.30 p.m.

Society of Arts (Lectures for Lecturers).—Professor W. Chandler Roberts-Austen on "Alloys," IV, 4.30 p.m.

Sanitary Institute (Lectures for Sanitary Officers).—Professor T. Roger Smith on "Sanitary Building Construction," 8 p.m.

Liverpool Architectural Society.—Mr. W. Henman on "Hospital Construction." Illustrated by Working Drawings, 8c. 6 p.m.

TUESDAY, APRIL 6.

Builders' Clerks' Benevolent Institution.—Annual Dinner, King's Hall, Holborn Restaurant, 6 p.m.

Institution of Civil Engineers.—(1) Further discussion on Mr. Henry W. Ravenshaw's paper on "Electric Lifts and Cranes," (2) the permitting Messrs. David Hill and Maurice Filman on "The Blackwall Tunnel," 8 p.m.

WEDNESDAY, APRIL 7.

Royal Archaeological Institute, of Great Britain and Ireland.—(A) Viscount Dillon on "An Inventory of Arms and Armour Belonging to Thomas Duke of Gloucester, in 1399," (B) Mr. C. E. Keyser, M.A., F.S.A., on "Aldersham Church, Berkshire," 4 p.m.

Manchester Health Protection Society.—Public meeting to form a society for the protection of the wild and natural beauty of Hampstead Heath.—Drill Hall, Heath-street, 8.30 p.m.

Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of the members, 8 p.m.

Sanitary Institute (Demonstrations for Sanitary Officers).—(1) Inspection at the Disinfecting Station, Chelsea, 2 p.m. (2) Inspection of the West London Paper Mill Company's Works, Fallopian Wharf, Loal-road, Chelsea, 4 p.m.

Edinburgh Architectural Society.—Mr. W. J. Anderson on "The Origins of Greek Architecture," 8 p.m.

Dundee Institute of Architecture, Science, and Art.—Exhibition of the Institute of Architects' prize drawings for 1896, and students' testimonies of study. Remarks on the drawings by the President, Mr. L. Over, and others, 8 p.m.

THURSDAY, APRIL 8.

Sanitary Institute (Lectures for Sanitary Officers).—Mr. J. Wright Clarke on "Details of Plumbers' Work," 8 p.m.

Society for the Encouragement of the Fine Arts.—Mr. Seymour Lucas, A.R.A., on "Making a Picture," 8 p.m.

FRIDAY, APRIL 9.

Institution of Civil Engineers (Students' Meeting).—Mr. Harold Herridge on "Poole Harbour," 8 p.m.

SATURDAY, APRIL 10.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at the Sewage and Destructor Works, Edin., 2.30 p.m.

Edinburgh Architectural Association.—(1) Visit to Niddrie Tower. (2) Visit to Duntarvie Castle.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

6,571.—WATER-CLOSETS: H. P. Thompson.—Inventor claims (1) the combination with a water-closet seat and with the seat so that the pad is compelled to yield under pressure; (2) the combination with the foregoing of depending brackets upon the seat, plates intermediate of brackets and pads; (3) the combination with the foregoing of yielding plates, carried by the bowl and provided with lugs and brackets, provided with recesses designed to be engaged by said lugs; and (4) a slight modification of same.

6,092.—SLIDING AND REVERSIBLE SASHES: J. Shaw.—Invention consists of outer window frame, sliding frame, sashes pivoted to revolve vertically or horizontally, made of wood or other material, with suitable fastening, racks and pinions for same.

7,023.—ROOF GLAZING: J. Mellor.—Invention relates to the system of horticultural glazing described in the specification of Patent No. 8,259 of 1884. By present modification inventor proposes to reduce the iron or steel bar of a cross section with a sheath of an alloy of lead and tin or other non-corrosive metal. This sheath is provided with longitudinal side flanges, which can be bent down at their edges to rest on the upper surface of the glass, thus securing a roof impervious to rain, &c., without the use of putty or paint.

8,400.—AUTOMATIC DOOR-CLOSING DEVICES: J. Cuggia.—Invention consists in securing automatic action in door closing (whether of one or two leaved doors) by means of cords and counterweights; the latter being so arranged as to be invisible.

10,372.—VENTILATOR: H. Mestren and Another.—The material part of invention is a peculiar dispersing blast or jet-pipe needing but little water. The blast or jet-pipe has on its lower part a small hole, and is provided internally with spiral ribs of vulcanized india-rubber, which imparts to the water jet a rotary motion. Between jet and blast pipe and the upper part, which is screwed into the water-supply pipe, is placed a fine hair sieve to detain impurities. Each ventilator is provided with two such blast pipes projecting into the elbow pipes, which form the ventilator itself.

25,027.—FLOOR CONSTRUCTION: F. L. P. Kadeck.—Invention consists in floor construction in an intermediate layer between the joists, consisting of a wire-netting interlarded, a sheet or cardboard layer consisting of overlapping strips, the edges of the cardboard layer and wire-netting being secured to the joists by means of planks (or angle irons) and a filling of sand or the like above the cardboard.

28,664.—MECHANISM FOR OPENING WINDOW SASHES, &c.: D. Fletcher.—The chief object of this invention is to enable an invalid to control ventilation while in bed. The invention consists in a sash-lifting, lowering and locking mechanism the combination of a lid, having a locking lug with a drum, handle wheel, and cords, the cords being connected to window-sash. The use of the device is not confined to invalids, nor is vent-raising out of the question.

30,109.—FIRE GRATES: J. D. Hood.—The object of this invention is to enable the air admitted to the under side of the glowing fuel supported on the grate used to become very highly heated before reaching the acid fuel. The inventor obtains this by forming certain of the "furnace" or "air" bars of the bottom of the grate with "lugs" or vertical projections, either solid or perforated, straight or curved. Thus each pair of bars and air bars, with their lugs, form an air-chamber or passage from the front into the body of the fire.

NEW APPLICATIONS FOR LETTERS PATENT.

MARCH 15.—6,701, J. Peckover, Stone Slabs, —6,750, A. Gibbon, Flushing Closets, —6,761, S. Christmas, Device for Exhibiting Wall Paper Patterns, &c.

MARCH 16.—6,834, W. Thompson, Constructing Cased Windows, —6,859, J. Kuhler, Press for Making Tiles, and Blotting or Water Colour Decorations, &c.—7,169, J. Shanks, Trough Closets or Latrines.

The Church of Brou-en-Bresse.

IN a suburb of the little town of Bourg, in Burgundy, twenty-three miles from Mâcon, en route to Mount Cenis and Turin, is one of the most remarkable of the later Gothic churches of Europe, built at an interesting period when architecture was in rapid transition from Gothic to Renaissance. It derives additional interest from the fact that it is all of one date and style; there is no break in the unity of the design; architecture, statuary, tombs, stalls, pulpit, rood-screen, reredos, glass, pavements, were all executed between 1511 and 1536. It is a monument and memorial of the love and piety of Margaret of Austria, for her mother-in-law, Margaret of Bourbon; and yet more for her husband, Philibert, Duke of Savoy. The story, well known through Arnold's poem, is that Philip II., Duke of Savoy, broke his arm when hunting, in 1490; and Margaret, his wife, vowed to build a Benedictine abbey and church if he recovered. He recovered; but she died three years after, before she could fulfil her vow. Her daughter-in-law thereupon undertook to accomplish the project of the Duchess.

Margaret of Austria, the real foundress, played a very important part in European affairs; and her office of Governor of the Netherlands brought her into close connexion with the foreign policy of our own country. She was the daughter of Maximilian I., Emperor of Germany, and Archduchess of Burgundy; the Emperor, Charles V. of Spain, was her nephew. This explains the Imperial scale and splendour of the church; its location in Burgundy; and the fact that it is a Flemish church, indeed, almost the only Flemish church in France. Margaret sent her own subjects from the Netherlands to do the work; architect, sculptors, and probably the workmen, were Flemish. The architect was Van Beughen, or Van Boglem; he is said to have copied, but to have greatly improved on, the work of Antwerp Cathedral. The chief sculptor was Conrad Meyt. There has been found at Lille the original agreement between

the foundress and Conrad for the execution of the statues of Philip and the two Margarets; it is dated 1526; its specifications are closely followed in the existing tombs. The whole church is a memorial to the love of Philip and the two Margarets; the initials P. and M. are everywhere, interwoven with daisies or constructed of the cordon which the Duke was entitled to wear. Everywhere daisies, or rather, marguerites, are carved; in fact, the whole church is a glorification of marguerites. There is still kept up the pretty custom of adorning the altars with marguerites; all the year round marguerites are grown for the purpose in the adjacent convent. Constantly repeated, too, is Margaret of Austria's proud punning motto: "Fortune infortune forte une," which may English: "Come weal, come woe, I fear no foe." Margaret did not live to complete her work, and it was handed over to Augustinian instead of Benedictine monks. To save the church from the destruction in the French Revolution, by which it was menaced, it is said to have been filled with hay by the people of Bourg. It is now a National Monument; and was sumptuously restored by M. Dupasquier, who published a large monograph on it, containing plan and details and some fine chromolithographs of the pavement and the glass. In 1856 the vaults were discovered, belonging to the three tombs, and it was found that the two Margarets had not been buried in their own vaults, but in that of Philip le Beau. "In their deaths they were not divided."

The church is, internally, 230 ft. long, 98 ft. 6 in. broad, and 65 ft. 6 in. high. It consists of a southern tower, nave, aisles, and chapels of four bays; transept of two bays, with eastern aisles; choir and aisles of three bays, and pentagonal apse. On either side of the choir are magnificent stalls; it is separated from the nave by a broad and massive rood-screen (see illustrations; plate 3). In the middle of the eastern part of the choir is the tomb of Philip le Beau; it is the cynosure and masterpiece of the whole building; but owing to the heavy railings which surround it it is inaccessible to the photographer. (Plate 4.) Above, on a slab of black marble, rests the duke, an effigy in white marble, represented in all the pomp and splendour of life, in armour, his head resting on an embroidered cushion, a lion at his feet gripping the scabbard of his sword

in most life-like fashion. On his left is the tomb of the foundress, Margaret, his wife; towards her his head inclines. On his right is the tomb of his mother, Margaret of Bourbon; his clasped hands lean towards her. The slab rests on twelve pillars, exquisitely sculptured and containing figures of the Sibyls in alabaster. Round him stand six delightful little boys in white marble, bearing epitaph and arms; the Pagan genii of the Renaissance. Below he appears dead, shorn of all his mundane splendour, a corpse, naked, but for a cincture round the waist; a wonderful study in anatomy. Both the other tombs have canopies. (Plates 5 and 6.) That on his right represents Margaret of Bourbon; above, with ducal mantle, and with crown on her head, her greyhound at her feet, her face turned towards her son; below, she appears in her shroud, dead, with hair unbound. The tomb on his left is that of the foundress, represented also above, as in life, below, in death. In the Lady Chapel, which occupies the eastern bay of the north aisle, is a marvellous reredos in alabaster—18 ft. high and 13 ft. broad; and so deep that it admits, among other things, of a representation of Our Lady's four-post bedstead, whose frieze and cresting are curiously like Elizabethan work. The reredos contains scenes from the life of the Virgin; its great dimensions, and the wealth and minuteness of the work in it, remind us of the retabes of Spain, of which, at that time, the Netherlands were a dependency. In the same chapel is a superb window, representing the Assumption of the Virgin; the Father and the Son are shown in most realistic, but reverent fashion, placing the crown on her head. The glass of this window is in drawing and colour one of the finest examples of later work. Magnificent heraldic windows are to be seen in the choir; two of them are shown in colours by M. Dupasquier, who has an admirable plate of the pavement, chiefly pale blues and pale greens. Carved work is everywhere. Capitals, archivolts, the mouldings of piers, buttresses, and ribs, gables and cornices, windows and doors, are a mass of leafage and bloom, always solid, massive, and vigorous, always original and interesting. Equally spirited is the zoology; a kid munching a cabbage-leaf, a lion's cub wearily yawning, a crowd of little beasts scratching their wings or biting their tails, monsters bearing up heavy gargoyles, dwarfs

and masks grimacing, sleeping, playing, eating, drinking, reading, meditating, praying, all alive. Less Gothic, but still more beautiful, is the figure sculpture, especially the mourners round the base of the tombs. They comprise the Sibyls as well as the saints who were patrons of the defunct. Thanks to the strong iron railings, this work is in a remarkable state of preservation.

The church of Brou is compared by Mr. Fergusson with the chapel of San Juan de los Reyes at Toledo, built by Ferdinand and Isabella for themselves, and with Henry VII.'s chapel at Westminster. All are royal sepulchral chapels; they are nearly contemporaneous; their founders were among the richest and most prosperous sovereigns in Europe. All that wealth could do was lavished on their ornamentation. With these great sepulchral chapels Gothic architecture perished, not in decadence, but in meridional splendour. The interior of Brou is simple and, on the whole, restrained, though Van Boglem could not resist the temptation of turning the trefoils in the parapet of his rood-screen upside down, by way of novelty. (Plate 3.) It is just this desire for novelty which makes the last days of Gothic so fascinating to many of us just now. In the crowning and culminating period of Gothic architecture there is much uniformity. After Amiens and Rheims one knows what to expect at Beauvais and Cologne; after the Percy shrine at Beverley, there is no great novelty in the arcading of the Lady Chapel at Ely. The charm of the unexpected is absent. But at periods of transition—as from Romanesque to Gothic, between 1245 and 1300, and from Northern Gothic to Renaissance in the sixteenth century—one never knows what to expect; there is no longer any recognised legitimate path; every one is experimentalising; men are obliged to use their wits; the work is fresh and original and vigorous; always interesting, however wrong-headed. In Brou, however, after all, there is, setting aside the figure sculpture, very little Renaissance feeling. It is really a late Gothic design produced by a clever man too proud and ambitious to be a mere copyist; anxious to show off his cleverness; determined at any cost to be original. See how he plays with the façade. (Plate 1.) It is simply a series of little jokes in stone. The restraint which he has to some extent imposed upon himself in the interior of the building, he throws to the winds in the façade. Take the tower. There would be no credit to be gained for originality if he had built two western towers as at Notre Dame de l'Épine, or one western tower as at St. Riquier, or three towers like those of St. Ouen, or a single central tower. So he locates his tower in an extraordinary position, south of the centre of the choir. Delightful, too, is the central gable with its gentle curves; while by way of contrast, the gables of the aisles are straight-sided, with flying buttresses plumped down anyhow on to the inner side of each. Then he designs for the window of the aisle-gable a spherical triangle; and finding that his flying buttress would thrust it out, he slices off one half, and just leaves it so. It is just these little quips and cranks which endear a late design to us; a man of genius may perpetrate them, but no one else. It was certainly a genius who designed the Church of Brou-en-Bresse.

THE REPORT OF THE L.C.C. WORKS COMMITTEE.

E give on another page the recommendations arrived at by the majority of the members of the Special Committee appointed to inquire into the causes of the recent scandal in connexion with the Works Department of the London County Council. It will be seen that they affirm the principle that some definite organisation for the direct employment of labour and the direct execution of public works by the Council is desirable, but not exactly in the form of a works department. They evidently think that the Works Department is too numerous a body for the purpose of directing the carrying out of building work; moreover, that its constitution is very bad, as it is generally composed of two sections of members of about equal numbers who have opposite ways of thinking and opposite sympathies in regard to labour policy. That is only saying that the vice which has run through the whole attitude of the London County Council in regard to building work, that of thinking of the carrying out of a special social policy rather than of the best way of getting work done, has been present in the most marked form in the Works Committee itself. It would be strange indeed if large building works, especially of a complicated nature, were efficiently carried out under the management of a body so constituted. The Special Committee propose to substitute for this unwieldy and semi-political Works Committee a Works Board of nine members, one from each of nine committees named, and a Works manager, who would be subject to the control of the Works Board, would conduct all operations of the department, to whom estimates for proposed works should be referred, and who would report progress from time to time to the Board, which would in turn report progress to the Council. This would no doubt be an improvement on the Works Department, as hitherto constituted. The matter of the manipulation of the accounts does not turn out to be any worse than what we have heard of already, and has evidently arisen not from the desire of any one to put money unlawfully into his pocket, but merely from the desire to conceal the fact that in some cases the department was an economical failure, and that more instead of less money was being spent than would probably have been spent under the ordinary system of receiving tenders from outside contractors.

This, however, is all part of the same vice, that of making the execution of building work subservient to the demands of a policy. It is impossible to resist the conclusion that if the County Council, or a certain proportion of them, had not been so anxious to promote the cause of the working man, which may be a very good cause in itself but which they were not elected in order to support, better work and better terms, taken all round, would have been obtained from ordinary contractors, and there would have been no suggestion or excuse for the foundation of a Works Department at all. The County Council clogged their contracts with conditions which independent contractors did not like, and which some of them regarded as offensive to their self-respect as well as injurious to their business interests; contractors began to refuse tendering for County

Council work; and then came the idea that if builders were recusant the County Council would be its own builder, and carry on work in accordance with its own policy.

We do not think that either the Council or the ratepayers have reason to be very well satisfied with the result, nor do we seem particularly satisfied with the Special Committee's Report. It is a half-hearted document, evidently drawn up with the intention of making the best of a bad job. In our opinion the minority Report, issued by four members of the Committee, Mr. Beachcroft, Mr. J. S. Fletcher, Dr. Longstaff, and Sir Godfrey Lushington, is by far the most important document of the two, and gives the impression of representing the views of persons who want to say the truth about the question rather than to smooth matters over and prop up a particular policy. With this should be taken the special statement by Mr. Gruning, and we advise those who are interested in the subject to pay attention to these two documents, which are much more instructive than the main Report. Indeed it is impossible to reconcile some of the opinions expressed in the main Report with some of the statements of fact made by Mr. Gruning. The Report quotes some statements of Mr. Gruning and omits others of equal importance. It quotes him as saying that the buildings erected under the Works Department "were structurally sound and substantially and well built," but omits a mention of his repeated condemnation of the joinery in the Council buildings, as roughly executed, made of unseasoned wood in many cases, &c. Why the failures should especially be shown in the joinery it is very easy to understand, but it seems to point partly to mistakes or carelessness in the purchase of material.

The general question as to whether public building works can be carried on by a Corporation with greater efficiency than through outside contractors is put thus by Mr. Gruning:—

"The initial difficulty which arises in carrying out works or factories by a Corporation is that no one can be made responsible in a pecuniary sense for non-success or loss, nor does any one derive profit from success otherwise than in reputation.

In this sense the greatest incentive of all to success, *viz.*, the desire of gain, is entirely absent."

The desire, on the other hand, to escape moral liability for losses has been clearly shown, by the incident of the fictitious transfers, which led to the appointment of this Committee of Inquiry.

I assume that the objects of a Corporation carrying on works or factories for producing buildings or goods required in preference to contracting for or purchasing them, are twofold, *viz.*—

1. To obtain better results as to quality.
2. To economise the funds with which a Corporation is entrusted by the ratepayers.

If neither of these objects is attained, the only result is the waste of time, thought, and labour devoted gratuitously to the service of a Corporation by the elected representatives of the constituency."

Mr. Gruning considers, in regard to the second question, that a Works Department ought to save the profit of the contractor; but the statistics given certainly do not tend to confirm this view. Some other light is thrown on this subject by the Minority Report. "A contractor would not have spent 40,000*l.* on workshops where no high-class work was to be done. . . . The workmen, and especially the skilled workmen, showed a lack of energy over their work, apparently considering that less was

* The italics are ours.

to be expected of them towards a municipality—a tendency which, in Mr. Binnie's opinion, can never be entirely overcome." With regard to trades-unions, and the position professedly taken up by the Council, that the interests of trades-unions and employers were to be equally considered, and that the Council was to hold the balance between unionists and non-unionists, the Minority remark "If this was the intention, we must say it has been but imperfectly realised."

An important point touched on in the Minority Report is in regard to the difference in the complication of architectural work as compared with such work as tunnels, sewers, &c., in consequence of which it is suggested that engineering works of that nature may be successfully carried out by a Works Department, but not architectural works.

The following are the recommendations of the Minority Report:—

1. That the Works Department be placed under the Chief Engineer.
2. That no works, whether estimated or "jobbing," be undertaken which come within the definition of architectural works.
3. That the Works Committee be abolished.
4. That the Chief Engineer be responsible to the Spending Committee for the execution of all works undertaken by the Council.
5. That for the purpose of financial control a Sub-Committee of the Finance Committee be formed, to be styled 'The Works Branch of the Finance Committee.'
6. That all materials be purchased by the Chief Engineer, who shall be responsible to the Finance Sub-Committee for the same and also for the custody of all stores.
7. That the Central works, so far as they are not required, be disposed of.
8. That the system of tendering by selected firms be adopted wherever practicable.
9. That the form of contract be revised so as to remove the main objections raised before the Committee on behalf of the contractors.
10. That the above recommendations be not held to restrict the Parks Committee from undertaking, with the sanction of the Council, such works as have hitherto been carried out by that Committee."

We confess that we think this is much the more sensible and practical Report of the two, and its recommendations much more in the public interest.

NOTES.

The North-Eastern Railway Co. and all concerned are to be congratulated upon having steered clear of a great strike. Since we referred to the matter a few weeks ago,* the fate of the arbitration proposals has several times trembled in the balance; and a very little "stiffening" on either side might have resulted in a prolonged and bitter struggle. It is, therefore, greatly to the credit both of the management and the men that they refrained from adopting an unyielding attitude, eventually agreeing to submit most of the disputed points to arbitration. This decision will come as a great relief to the North-Eastern shareholders and to the commercial community of the districts affected, the latter of whom have just had a foretaste of the disastrous results of a suspension of work, while the former are not likely to have forgotten the effect upon their dividends of former great labour struggles in the North of England. Nor will the general public neglect to note with satisfaction the decision to resort to arbitration, as affording another proof that the superiority of common-sense methods of

approaching disputes of this nature is becoming increasingly recognised.

REFERRING to the Kyffhäuser Monument, illustrated in the preceding number, we observe, from our official German contemporary, the *Centralblatt der Bauverwaltung* of Saturday last, that there is a scheme on foot to arrange some extensive grounds for the purposes of great fêtes and ceremonies, and also for athletic competitions, somewhat like the Olympia ground at Athens, and the site selected is in the valley at the foot of this memorial. The illustrations in the *Centralblatt* show a large amphitheatre facing the monument, and flanked by viaducts crossing the valley. Accommodation is to be provided for three or four hundred thousand people, and the dimensions of the ring proper are 470 mètres by 314 mètres. A special committee has been formed, in which Herr W. Boeckmann, late of the firm of architects Messrs. Ende & Boeckmann, together with Professor Bruno Schmitz, are among the more prominent members. A small pamphlet has been issued in their name, describing the object of this new institution.

The Municipal Council of Paris has formally recorded its vote in favour of the installation of the annual Salons, till after the 1900 Exhibition, in the garden of the Palais Royal. According to the approved scheme drawn up by M. Pinat, architect, the necessary structures will include two large parallel galleries terminated by four pavilions surmounted by small domes. These two galleries will be connected, in the middle of the garden, by a "Salle des Fêtes," of rectangular form, occupying the position now occupied by the central basin. These two galleries will contain thirty separate rooms with a total floor area of 4,094 square mètres, and a wall surface of 7,466 mètres. These constructions will only occupy about a fifth part of the area of the gardens, and will be designed to harmonise architecturally with the Palais Royal buildings. Other schemes have been presented by M. Delort de Gléon and M. Bivort, but they were passed over as more difficult to carry out and more costly.

The last number of the *Bulletin de Correspondance Hellénique* contains the full publication of the theatre of Delos recently excavated by the French. In addition to the detailed plan, two very interesting views of the present state of the ruins as now exposed are given. This theatre, as is well known, presents special peculiarities unparalleled elsewhere. The *skene* building is surrounded on all four sides by a colonnade, and shows no traces of having had any internal divisions. Moreover, unlike the theatres of Athens and Epidaurus, there are no *paraskenia*; this is the more noticeable, as inscriptions have been found relating to the theatre, in which *paraskenia* are mentioned. The inscriptions can only be explained on the supposition that temporary wooden *paraskenia* are referred to. The theatre of Delos is discussed in Dr. Dörpfeld's great work on the Greek theatre, to which we hope to return on a later occasion. His plans are necessarily not so detailed as those now given to the public. Dr. Dörpfeld finds in the Delos theatre new

confirmation of his "logeion" theory, but in the *Bulletin* M. Chamonard arrives at a different conclusion.

The Congress of Classical Archæology which was to have been held this month at Athens, and to which we drew attention some weeks ago, is now definitely postponed till the autumn. M. Homolle, the Director of the French School, suggests the end of September or beginning of October, by which time it is hoped Cretan complications may be resolved. September will perhaps, as a vacation month, secure a larger attendance, but the autumn heat, which at Athens is intense, will be apt to paralyse effort, and is even not without risks to those unacclimatised. Meantime, the *Athenæum* of April 3 reports that the antiquities at Candia are in some danger. As among them are some very curious unpublished *psiltoi* adorned with mythological subjects, this is much to be deplored.

In last Saturday's lecture at the Royal Institution Lord Rayleigh first considered the various methods of measuring the frequency of rapidly alternating currents, and then showed some interesting experiments illustrating their action. He described a method of measuring frequencies as high as a million per second by means of a polished steel mirror and a photographic plate, the mirror being made to rotate rapidly by a powerful alternating current magnet. In a great many cases, however, the frequencies are so high that they can only be calculated mathematically from the known constants of the apparatus producing the vibrations, and cannot be actually measured. Hertz's experiment of how the light produced by the sparks from an induction coil increased the spark produced in a resonating coil near it, excited great interest. When a plate of glass was interposed the sparks ceased almost entirely, but when a quartz lens was used, so as to concentrate the ultra violet light on the spark gap, the sparks were large and brilliant. An experiment, due to Professor J. J. Thomson, was also shown, of how a coil, carrying a high frequency current, produced by electromagnetic induction a ring of light inside an exhausted bulb containing traces of vapour. In this case the path of the discharge was wholly gaseous, and there was no anode or cathode. Lord Rayleigh is certainly to be congratulated on the choice of his experiments, as they bring into prominence most interesting points connected with electrical theory.

The recent prevalence of typhoid fever and other infectious diseases in Chelmsford has led to the preparation of a special report to the local Government Board, prepared by Dr. Richard J. Reece. From this Report it appears that the main evil in Chelmsford is deficiency and (under some conditions of weather) uncertainty in the water supply, which is drawn from three sources, an artesian well and two natural springs. The artesian well has not yielded as much as was at first expected, and of the springs, one is liable to contamination, the other to fluctuation as to quantity. The distribution of water is very unsatisfactorily carried out (partly no

* See p. 215, ante.

doubt in the effort to economise an inadequate supply); "many houses are supplied from a single cistern, furnished with a tap and placed in a yard common to the houses, or at some spot accessible to the inhabitants. When these cisterns are empty the people are without water, unless they have access to one of the many pumps of which mention will be made hereafter. In many houses that are separately supplied the cistern is placed over the closet, and from this the domestic supply is drawn, as well as the water for flushing the closet." The provision for excrement removal is not so bad as we frequently find recorded in such reports, but there is evidently a great deal that requires amending; badly constructed water-closets with insufficient supply of water; ashpit privies which, though cleared by the public authority, are not cleared often enough. But insufficient water supply is evidently the leading evil at Chelmsford. The pumps referred to in the above quotation—pumps drawing from private wells—are the resource of inhabitants who cannot get a sufficient or regular supply of water from the public sources; and the water of these private wells is often contaminated.

The interesting paper by Mr. Baylor, on "Recent Developments in Electric Traction Appliances," which was read on Wednesday evening at the Institution of Electric Engineers, is a most important one. We have heard too much lately of the opinions of Town Councillors on electric traction after their trips abroad, and too little of expert testimony. Mr. Baylor first drew attention to the growing practice of driving the electric generator direct instead of by ropes or belts, and rightly pointed out that not only is the efficiency of the plant increased by direct coupling, but also, since it requires less space, the buildings may be smaller and less expensive. There are a few engineers who still consider the direct coupling of traction units unsafe practice, but seeing that there is some 300,000 h.p. of such machinery in successful operation, they will probably soon change their views. Mr. Baylor's remarks on the overhead trolley were thoroughly sensible, and devoid of any special pleading. His arguments in favour of alternating current systems as against three-wire systems we did not quite agree with. Professor Kennedy has recommended a three-wire system for the Brompton and Piccadilly underground electric railway. The most valuable and novel part of the paper was on electric brakes. The old emergency electric brake put a great strain on the motor and spur gearing; often the gear wheels were stripped and the armature burnt out. The new electric brake replaces mechanical brakes altogether; there is no wearing of the wheels by a brake-shoe, skidding is impossible, and there is very little strain on the gearing and armature.

The business with this sign, now known as "Martin's Bank," and previously as that of "Martin & Co.," is believed to be the oldest private bank in the City, and to represent the business house in that street of Thomas Gresham, whose crest forms its sign. The rear portion of the present premises, in Change-alley, was built in 1874,

"The Grass-hopper," Lombard-street.

after the designs of Mr. R. Norman Shaw, R.A. They stand upon the site of the old "Garraway's" Coffee House, burnt, together with "Jonathan's" and "Robin's," in March, 1748. The late Mr. J. Bidolph Martin published, in 1892, an illustrated history of the firm, to which he was admitted as a partner in 1864. It is said that Matthew, father of Jane, Shore, goldsmith, kept his shop, more than four hundred years ago, on the spot where is now the bank's public office; there was a Martin, a goldsmith, in Queen Elizabeth's reign; but as the chronicle comes down to the times of Duncombe, Kent, the Blackwells, the Leavers, and the Stones it runs with a surer tale.

The Guildhall Exhibition. The Exhibition this year at the Guildhall has a special interest, as it is intended to be a representative exhibition of the art of Queen Victoria's reign. It is not in this respect a complete or all-round one, but it affords interesting opportunity of comparing one's present impression of works of the earlier period of the reign with the impression they made on their first appearance, and we shall return to it in this sense.

The Minor Exhibitions in London. The exhibition of the New English Art Club at the Dudley Gallery is much as usual—a collection of ugly and eccentric works, with a few clever and powerful things interspersed among them. Mr. Furse has two or three brilliant and broadly-executed portraits, of which that of Mrs. Marshall (37) is the best as a picture, but the general effect is much better than the painting of the head and hands. Mr. Guthrie's "Vanity Fair" (70) lent by the Corporation of Glasgow, is an exceedingly clever sketch on a large scale, rather than a picture. One or two members have made experiments in architectural subjects; Mr. Walter Sickert sends a large elevation (one may call it) of St. Mark's, Venice, flat in appearance and dull in colour; Mr. G. Thomson paints Westminster Abbey with more force, though the picture certainly does not represent the colour or appearance of the building as we have ever seen it. Mr. Lindner's experiment with sea surface is not successful in "Christchurch Bay"; it looks like sea with patches of some coloured stuff floating on it. Among things that one could find pleasure in may be mentioned Mr. Fred Brown's "The Mirror" (87), a real picture; Mr. Buxton Knight's "Autumn's Threshold" (88), fine in colour though rather ragged-looking; Miss Fanner's "The Chestnut Tree" (98), with a fine sky and light in it; and M. Renoir's "Tête d'enfant" (115). At 14, Brook-street is to be seen a very different exhibition, that of about seventy works by Mr. Legros, full of originality, power, and expression. Among the five oil paintings "Femmes en Prière" was seen some years ago at the New Gallery; it is a most interesting and remarkable study of character and expression in faces and figures. The "Effet du Matin" is a fine and truthful representation of a landscape under early morning light, before sunrise. The drawings include many effective and original landscape studies, in a method peculiar to the artist—a mixture of wash and pen line; there are also some interesting studies of figures and heads. The two or three studies called "La Mort," each grouping a nude girl with a figure of Death, have a

remarkable and weird effect, and are admirably drawn. The collection is one which should not be neglected.

THE third exhibition of the Minor Exhibitions in Paris. "Pastellistes" is the most brilliant they have given. It includes about 150 pastels, of which thirteen are exhibited by M. Besnard among the most remarkable things he has ever produced. Among them the "Femme Drapée," the "Collier," and the "Jeune Espagnole" are especially fine, both in drawing and colour, and they are free from the tendency to sensational exaggeration which has often been the weak point in this artist's works. There are some fine portraits, by M. Georges Callot, a good one by Mme. Madeline Lemaire, some scenes in rustic life by M. Lhermitte, flower paintings by M. Elliot, and various admirable landscapes by MM. Pierre Lagarde, Billotte, Nozal, Montenard and Gaston Guignard. The "Artistes Indépendants" have also opened their exhibition in the Palais des Arts Libéraux, but of this the less said the better. This exhibition was formerly amusing, in a way, from its eccentricity, but now even this attraction has departed, and the collection is simply dull.

THE ARCHITECTURAL ASSOCIATION: ARCHITECTURE IN RELATION TO THE CRAFTS.

An ordinary fortnightly meeting of this Association was held on the 2nd inst., in the Meeting-room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, Mr. W. H. Seth Smith, Vice-President, presiding. The minutes of the previous meeting having been read and confirmed, and Messrs. W. M. How and W. H. Purchase having been elected members of the Association, Mr. E. Howley Sim, Junior Hon. Sec., proposed a vote of thanks to Mr. R. Greville Montgomery for allowing the members to visit the recent Building Trades Exhibition, and for providing tea on the occasion.

The vote of thanks having been cordially agreed to, and Mr. Banister F. Fletcher having announced some donations to the library, the Chairman read the House-list for the coming session, as follows:—

House-List for New Session.

President, Mr. H. W. Pratt; Vice-Presidents, Messrs. B. F. Fletcher and A. H. Hart; Committee (ten to be elected), Messrs. R. S. Balour, W. D. Caröe, H. B. Creswell, A. S. Flower, F. T. W. Goldsmith, C. de Gruchy, F. G. F. Hooper, E. H. Parkes, H. Passmore, Beresford Pite, G. H. F. Pryme, W. H. Seth Smith, J. W. Stonhold, A. B. Thomas, and J. L. Williams; Hon. Treasurer, H. W. Pratt; Hon. Librarian, C. H. Freeman; Hon. Secs., E. H. Sim and G. B. Carvill; other officers: Hon. Solicitor, W. H. Jamieson; Hon. Assistant Librarian, E. W. M. Wonnocott; Hon. Auditors, M. Garbutt and H. P. G. Maule; Assistant Sec. and Registrar, D. G. Driver.

Mr. T. G. Jackson, R.A., then read the following paper, entitled "Architecture in Relation to the Crafts":—

It used to be the fashion for any one writing or speaking on architecture to cite Vitruvius as the authority for what he said. The writings of Vitruvius are no longer regarded by everybody as the gospel of architecture, and, indeed, are now perhaps rarely read by architectural students. And, yet, on the present occasion I cannot do better than take as a text the opening passages of his treatise which seem to apply very aptly to the subject for discussion to-night.

Vitruvius distinguishes at the outset between practice and theory in architecture, and goes on to point out that architects who are mere handicraftsmen without literary training are unable to give any reason for what they do, while those who trust only to theory and book learning without practical training seem to grasp at a shadow, and not reality.

An architect, he says, must be properly trained in both fields. He must be both ingenious and teachable, for neither will vit

without training, nor training without wit make him perfect artist. He must be a skillful draughtsman, a learned geometer, a not ignorant of optics, instructed in arithmetic, a good historian, and a diligent student of philosophy. He must understand music; he must know something of medicine; he must be familiar with the decisions of the lawyers; he must understand astrology and astronomy. This is a formidable programme, and if one night, without profanity, speak disrespectfully of writer who has hitherto been considered almost sacred, one would almost be tempted to say he was writing nonsense. The first part of his list is, no doubt, necessary enough, and as to the latter part, when we come to his explanations, we find that they do not make so much demand on the student as at first sight they seem to do. The usefulness of his historical lore is to enable the architect to explain the meaning of some of his ornaments, and to tell the inquirer that the figures of Caryatides which were used as columns, were derived from the matrons of Caryas, a Peloponnesian city, who were carried into slavery because their country had sided with the Persians against the Greeks. Philosophy is needful to him only in the same way that it is needful to everybody—to prevent him being arrogant, and make him just, honest, and temperate. As for music, he seems to require it principally for testing, by the note they give, the strain of the ropes of catapults and military engines. His knowledge of medicine should be sufficient to guide him to avoid wholesome sites and bad water. As for his knowledge of law, Vitruvius seems to think he ought always to be an expert in questions of party-walls, rights of drainage, and light and air. After this long enumeration of matters requisite for an architect, Vitruvius draws the line. Pythius, the architect of the temple of Minerva at Priene, had said that an architect should be able to excel in all the arts, and in each to surpass those who made that art their especial study. Vitruvius thinks Pythius does a great deal too far. An architect, he says, neither need be, nor can be, such a grammarian as Aristarchus, but he must not be unlettered; he need not be a musician like Aristoxenus, but he must not be without musical sense; nor need he be a painter like Apelles, but he must not be unskilled in drawing; nor need he be a sculptor like Myron or Polycletus, but he must not be ignorant of the plastic art; nor, finally, has he to be a doctor like Hippocrates, but he must not be without knowledge of the laws of health; nor in other studies need he excel as a specialist, but he must not be wholly unskilled in any of them. To say that architects should excel in all these things is to demand an impossibility because it is only now and then that a man can excel in one art even if he pursues no other. Pythius therefore is clearly wrong, and has one astray because he has not made a proper distinction between practice and theory. Therefore, says Vitruvius, he seems to have one quite enough in these several branches of study, who has a fair knowledge of those arts and theories of them which are necessary to architecture, so that if he should be called upon to pass judgment upon or to approve these matters and arts he should not be found wanting.

Vitruvius, therefore, waters down, as he goes on, the somewhat strong dose which at first he seems determined to administer to the student of architecture, as a tonic necessary to his constitutional well-being. A general theoretical knowledge of the various crafts, which it will be his business to direct, sufficient familiarity with them all to prevent his passing indifferent work on the part of those who work under him, seems to be the measure of the practical requirements necessary to an architect, according to the Roman authority.

On the other hand, we have the dictum of the Greek architect, Pythius, who says that the architect must not only have this general theoretical knowledge, but must be actually skilled in the practice of all the arts which he has to deal with; and not only that, but superior in each one of them to the specialist who follows only that single art.

Which of the two is to be our guide? Shall we be satisfied to be proficient in the theory of our art, learning it from books and lectures, and merely acquainting ourselves with practical work in a general way, enough to enable us to understand our specifications, and order the work properly, and detect flagrant instances of inferior workmanship and bad material; or

are we with Pythius, to put our hands to the work ourselves, and not only design but help to execute it; to train ourselves to be master craftsmen as well as superintendents and directors of other men's labour?

For many generations past the former of the two methods has been the order of the day. Most of us who have reached or passed middle age have been brought up under it, and if we have, to any extent, departed from it, it has been of our own initiation that we have done so.

That this plan was not that in vogue during the best periods of modern European art is well known. It was not in that way that the architects, or building-artists of the Renaissance, in its earlier and more independent days, or those of the middle ages worked. They would have been at a loss how to go on if you had parted them from their building and their workmen, and shut them up with a drawing-board and a T square, and asked them to make their designs and convey their instructions by means solely of drawings. Their method was that of Pythius rather than that of Vitruvius, whose gospel, fortunately had not in their day obtained currency, or been placed on the canon of inspired authorship.

I need not tell you that of late years there has been a revulsion against what I will call the Roman method of practising architecture in favour of the Greek. Many of us have been preaching against the strictly professional view of architecture, and urging that a man cannot be expected to produce good designs who seldom or never comes into contact with the materials out of which his designs have to be constructed. We have argued that it is from the handling of material that suggestions in design can most readily be gathered. That reading about processes in building, or any of the arts which go to make up a building, will never teach a man how to make the most of his opportunity, how to use his material to the best advantage, how to economise labour so as to avoid wasting it to no purpose, and how to design in accordance with the natural qualities of stone, iron, or wood with which he has to deal. We have tried to impress on the student that an hour spent in the workshop or on the scaffolding will often teach him more than a week spent in a library. We have gone still further, and tried to persuade students not only to go and see how things are done, but actually to put their own hands to the work, and to become handicraftsmen in one or more of the many arts with which as architects it is incumbent on them to be familiar, and of which it is necessary the technicalities should be understood by any one who undertakes to design for them.

These proposals, however revolutionary they appear to the advocates of the old-established professional system, according to which architecture has so long been practised among us, are still, it is clear, very far from bringing us again to the methods of the architects of four hundred or five hundred years ago, to say nothing of those of the Greek architect whose demands seem to Vitruvius so extravagant. The contracts which Bishops and Chapters and others who intended building on an important scale made with their architects bound them down rigidly to a much more constant and intimate association with their work than a modern architect would submit to. The architect bound himself to come with his family and live in the place where he was to build, to engage workmen, and see that they did all that was necessary to be done, to work with his own hands, both in building and in sculpturing, as befitted a good sculptor, and a master of the art of stone-cutting. He was also to go to the quarries as often as was necessary, and arrange for the quarrying of the stone. Furthermore, he was bound for the term of so many years, during which the building was to be constructed, not to undertake any other work without the special leave of his employers, or a majority of them, or if he were engaged on some other building in the same or a neighbouring place, the time he should devote to each was strictly specified. Finally, he bound himself to supervise as chief master builder and superintendent all the labourers, builders, master workmen, and handicraftsmen employed on the building, and to supply them with such dimensions, orders, and methods as would be required during the progress of the works. For all this he was to receive a fixed annual salary, to which was sometimes added a gown or two gowns in the year, and perhaps a house was provided for him to live in with his family.

The architect of those days, therefore, was a superior clerk of works, as we should call him, with this radical difference, that he had no master over him, sitting most of his time in an office perhaps 100 miles away, directing him by the penny post what to do, and sending him drawings to show him how to do it. Imagine a modern clerk of works to have had the training of an architect as well as that of a tradesman in one of the handicrafts, that is to say, to have the skill to design the work he directs; or, what is the same thing, imagine a modern architect to have learned one or more of the manual trades, and to choose to go and superintend one of his own buildings as his own clerk of works, and you have the nearest approach to the architect who designed and raised the mighty structures of the past, which it is our aim to rival, and our despair to surpass. He would necessarily be a mason to begin with, for masonry is the king of all the trades, the one which all the rest follow, and the one which, blending itself, as it does, imperceptibly with sculpture—which is but a refinement of masonry—passes without any visible or marked transition into the higher region of fine art. In olden time sculptors and architects were the same persons, or, at least, though there were sculptors who were not architects, there were probably no architects who were not sculptors, capable of designing the carved work of their buildings, and of executing the most important parts of it—notably the figure-work—with their own hands.

Let us for a few minutes try to realise in our own persons what it would be like to practise architecture after this fashion. Let us shut our eyes to the present and try to open them again in the days of, say, Henry VI. or Lorenzo dei Medici. The dingy office in a London street vanishes from our sight. Away go the high stools, the drawing-boards, the dusty piles and rolls of paper, for—oh! blessed release—there will be no more working drawings to make, and little drawing of any kind whatever. The office bell will no longer send a shock through our nerves, announcing the coming of a visitor to interrupt us at the most critical period of a design. The approach of post-time will no longer drive us into a frenzy to get off arrears of correspondence that cannot be postponed any longer, for we shall have little reason to write to any one. Our employers will be on the spot with ourselves, and an occasional conference on the building itself will make much letter-writing unnecessary. Away, too, goes all that tedious necessity of long railway journeys which dissipate our time, and exhaust, perhaps four hours in travelling for every hour we have to spend on the work at the end of it. Our work will now be all under our eyes, or near at hand, and the hours wasted in the railway carriage will be employed to good purpose on our growing building. Away, too, go the long specifications, the contracts with builders, the lynx-like supervision required to keep their performance up to their engagements, for we shall, either be our own contractors, or else have workmen under us employed and paid directly by our own employer.

Relieved of all these official and commercial occupations in which I venture to say most of us—do what we will—find half, and more than half, our time spent, we shall pass our working days clad in the workman's blouse, setting out our work on the ground, drawing such simple diagrams as will give the workman the proportions and dimensions of the several parts, marking out the mason's moulds, perhaps taking the mallet and chisel out of his hand to show him practically how we want certain parts finished, trying on the building itself as we can nowhere else see the scale and proper character of our sculptured ornament, without doubt doing so much of it ourselves as will give the clue to the subordinate carvers, and probably finishing some of the most important parts with our own hands. Conceive the sureness and confidence with which we should work. There would be none of that experimental and hesitating anxiety which makes us doubt after drawing out a design whether it will come out as we intend in actual execution. No! there is the building itself on which to try experiments. When the thing is going wrong we can stop it at once and correct our original device and substitute something better; and there will be no contractor to worry us for an "extra" on the inevitable plea that the new way is more expensive than that for which he contracted. And so our building will rise, and as it nears completion, and the scaffolding comes down, and

we stand with hands behind us, and head thrown back, to see our creation as it emerges in its maiden whiteness from the enveloping veil of poles and planks, we shall feel that it is indeed our creation, the work of our own brain, and in a measure of our own hands, in a way that no architect can quite feel now about any of his creations, however much pains he may have devoted to them.

This, gentlemen, I venture to think, will appear in eyes of many of you—certainly to the younger men among you in whose bosoms the stirrings of art have all their youthful freshness—an attractive picture. Can we realise it at the present day? Or, if that is impossible, how near can we get to it?

Can we get back to it? Well, of course, we cannot do it in a hurry. But can we expect ever to get back to the old system at all? I think not. It would be putting the hands of time back too far. Changes of system do not come about without some reason in the natures of things and of men, and to neglect the conditions of modern life in art while we admit their supreme influence in other fields would be not only unpractical but unphilosophical. Take, for instance, the matter of working drawings. The drawings used in olden time were of the slightest and most conventional kind. Even in Wren's time working drawings such as we make for every detail were not found necessary when competent workmen were employed. When sending his small scale plans and directions for the library at Trinity College, Cambridge, Wren adds, "I suppose you have good masons; however, I would willingly take a further pains to give all the mouldings in great; you are scrupulous in small matters, and you must pardon us, the architects are as great pedants as critics and heralds." In his day there were trained schools of masons and joiners who had traditions of their own, and could be trusted to apply them. The architect gave them the size of the door, the scale and amount of ornament he wished to use in the doorcase, and the workman had sufficient skill to fill up the details of the sketch and to realise the architect's intentions as he would have them. So with the masons: to give them the moulding "in great" would, Wren seems to imply, be unnecessary if the men were good craftsmen. But where are the workmen nowadays who could be trusted to do this? It is easy to imagine the result if we tried the experiment.

There are very many architects who do try the experiment of dispensing with working drawings, not from any desire to return to the older system of work as being better, but simply from the wish to save themselves trouble, or else in order to save their time for more lucrative occupations which have little or nothing to do with architecture. Some of them employ a ghost, and the ghost naturally takes little interest in a work which is neither his entirely, nor anybody's entirely, and the details come off badly. Others dispense with the ghost, and leave all the details to a contractor. One builder told me that when he applied to an architect for details of a certain work, the only answer he got was, "Take it and do it, and don't bother me about it." In another case the builder told me the only full-size details furnished him by the architect of a building which cost 6,000l. were those of a cellar door and a coal-shoot, and that he—the builder—himself made all the other working drawings, and did not even go through the form of showing them to the architect. Now, I need not tell you that, whatever may have been the case in the days of Sir Christopher Wren, there is no school of workmen nowadays capable of filling in the details on a general design given them by an architect. Nor need I tell you that it is on the details of a design that its success depends for its ultimate appreciation, no less than on the general conception; for no grandeur of idea, or originality of scheme, will make a good building if it is badly carried out in its details. An amateur may and often does have good conceptions in the mass, but it is only the artist who can carry them out into execution successfully, because he alone is capable of contriving the parts out of which the whole general idea is built up. It may be imagined, therefore, what kind of architecture results from the method I have described when the nominal architect gives only the rough idea of the building, and leaves the details to men who have had no artistic training whatever. Indeed, there is no need for imagination in the case, for the streets of London are lined with buildings erected on this system, expensive and costly buildings very

commonly, for the worst modern architecture is the most gorgeously decorated, and lavish expenditure on ornament is the last resource of an incompetent designer.

But if neither builder nor workman can be trusted to supply proper details for the carrying out of an architectural design what conclusion is left to us but that they must be done by the architect? How is he to supply them? Of course, he might, like the old men, go and live on the work, and give the details to the workmen by word of mouth, or by example, or by setting out the moulds and dimensions with his own hands. I do not know how many of you are prepared to follow your craft in this way. You would only be able to look after one, or at the most, two or three, buildings at a time, and though you would save the expense of an office, I fear 5 per cent. would not enable you to earn much more than a bare livelihood. Drawings, I fear, are, and must remain, a necessity if an architect is to have his designs carried out as he intends, and if he wishes to have full justice done to them.

Again, there are many buildings in modern times involving intricacies of plan which must be carefully plotted on paper and could be contrived in no other way. Old buildings were very simple, and in their plans there was very little variety. One manor house was arranged very like another manor house, and one cathedral or church on much the same general lines as another. Those buildings of our own day which retain this simplicity of plan could be built without drawings just as the old ones were. It would be easy enough to build a great church from foundations to cap-stone of spire without a single drawing but such rough diagrams as the designer would need to enable him to put the parts of his building together. But when we come to such elaborate buildings as the modern town halls, or technical schools, or boarding houses of our public schools, or theatres, or when we have to deal with confined and scantily lit sites, as in the streets of London, careful and elaborate plans are a necessity, and the drawing office indispensable. There is no prospect whatever of our being able to build in the future without drawings, and we may dismiss as impracticable all hope of superseding them by supervision and direction on the spot, and of being able to shut up our offices and take to the building sheds and the scaffolding.

But admitting all this—acknowledging, as I fear we must, that the necessities of modern system are too strong for us, and that we must, in the main, go on as we are now doing, is there nothing we can do to place ourselves more in touch with the handicrafts? If we cannot go the whole way, may we not go part of the way to meet those workmen on a common footing with whom, whether indirectly or directly, we cannot help co-operating in the carrying out of our designs? If we cannot, as Pythius would have us, excel in all the arts, so as to surpass in each one of them the skilled workman who has followed that one alone, and made himself master of it, surely we may, without being unreasonable, demand of our architects that they shall at least not design things without knowing how they are to be made. Nor is it unreasonable to ask us to be better masons, better joiners and carpenters, better smiths and better plasterers than the men who follow those callings and do nothing else, is it unreasonable to demand that every architect should so far familiarise himself, by actual observation and inquiry, with every one of these trades, that he may know how to make designs suitable to the material employed and the way of employing them? And yet we are all our lives designing things without knowing how they are made. How is it possible we should, not in our ignorance, give a world of unnecessary trouble to the workman, cause a deal of needless expense to our employer, and miss altogether that propriety in design which arises from proper use of material, because the proper use of it is unknown to us? Take, for instance, the case of wrought-iron work. Every architect is called upon constantly to design such simple things as railings, grills, balustrades, in that material. He draws, probably, something after good examples that he has seen; perhaps he tries to improve on them and design something new, and if he knows nothing of smith's work except from books and drawings and such sketches as he has made of his own, the alterations he makes very likely make what was very easy into something very difficult, if not impossible; and even if the workman gets over the difficulty

by some troublesome device of his own, the labour involved is thrown away, and might have been saved by a little knowledge on the part of the designer. Those who have seen designed ironwork on paper, and never seen made, would be astounded to find how very differently it was done from what might have been imagined, and how very much more simply their design might have been done. I altering it a little. I wonder how many in your room have any idea how so simple a thing as the ordinary forked baluster is made, with one foot to be let into the stone for each pair of balusters. I confess I did not know till the other day, when I wished to vary the form of the thing so as to give it a little more character, but began to doubt as I went on whether the smith could make it. So I went to the forge and had some experiments made, and found that the usual process was quite unlike what I had imagined. Another advantage of the visit was, that I was able to suggest to the smith other ways of doing it, and before we finished we had made a forked baluster in four different ways, and found out what was the easiest and cheapest. This seemed to me an instance of the way in which designer and workman can help one another; the designer, from having seen his way to fresh possibilities, while the workman, from habit, had not thought of doing anything but what he was used to.

Let it be a rule, therefore, with every architect never to design anything without knowing whether his design is practicable, and practicable according to the received traditions of the craft concerned.

But may we go no further than this? May we not require that he should be able to put his own hand to the work as a handicraftsman in one or more of the trades over which he has to exercise control in the ordinary discharge of his duties?

There are some trades of which it is obvious such knowledge as an architect can derive from observation is enough. Going through the trades in the specification according to the order, we begin with *Excavator*. It is, I think, obvious that a man would not improve himself in architecture by going to work in the trenches with pick, shovel, and wheelbarrow.

Next comes *Bricklayer and Waller*. I once built a brick wall, but I do not know that I learned much from it, except that bricklaying was not so easy as it looked, and that if it were hard to keep a true upright it was still harder to keep a true level. The bricklayer to whom I showed my wall when it was done could not say that he thought it strong but very ugly. I do not know that I should advise any of you to follow my example.

Carpentry and Joinery are more within the reach of every one, and a course of training on the bench may safely be recommended to a man who has to do with building as supreme usefulness.

I need not go through all the trades, but *Masonry* brings us near to the very centre of architecture. To be a practical mason would not in my opinion be so useful an accomplishment for an architect as skill in joiner's work. The ordinary problems of stone-cutting can, I think, be understood without actually handling the chisel and mallet. But masonry, as I have said, melts insensibly into sculpture, and is not always easy to say where masonry ends and sculpture begins. What will you do when you come to the carving of your building, and of course, come you must in a building of any importance? If you only care for quantity and not for quality you can, of course, leave it to many do, to the carver, and simply get an estimate and leave him to do his best, which in that case may be also his worst. But you will not, I am sure, if you are in earnest, be content with so perfunctory and vicarious way of bestowing on your work its principal adornment. You will have your own notion of the scale, the character, and the finish of your carved work; you will feel that the outline of your sculptured capitals is as important as the profile of your mouldings, that the play of light and shade in your foliage string-course or your enriched frieze was an important element in your design; you will desire for your sculpture an historic character, illustrating the purpose and circumstances of your building; and above all you will feel that the same feeling which you have impressed on the purely architectural part of your design must be carried into the sculpture, decoration, or the unity of the effect will be marred. You must impress yourself on the work as you have done on the rest.

How are you to do this? You may spend hours standing over the sculptor or watching him model what is afterwards to be carved, and tire both him and yourself by suggestions and counter-suggestions which perhaps end in mere mediocrity and dullness, because though both of you want something different you do not want the same thing and are unable to explain your meaning to one another. But if you were able to finger the clay yourself you could realise to yourself your own intention, and explain it to him perfectly, and in this way you would succeed in getting what you want as you can in no other.

Every architectural student, therefore, ought to learn to model. He will find it of the greatest service to him in his future career, not only in enabling him to explain his meaning to those artists who will collaborate with him, but also in fixing and correcting his own loose ideas of sculptured decoration, and helping him to secure for it that character which will correspond to his intention. If he goes on to carve so much the better; for my part I should like to see the callings of sculptor and architect rolled into one.

As to the other crafts time forbids me to speak more at length. Every man, be he artist or not, should, like the ancient Jews, be taught some handicraft; and to us architects such an accomplishment would naturally be doubly useful. We cannot expect that an architect should have actual manual experience of them all, still less can we require, with the Greek writer, that he should have mastered them all. But we have a right to demand that he shall by actual observation acquaint himself with the methods and difficulties of them all, not from books but from the workmen, not in the library but in the workshop. Let him never make a design without knowing how it will be carried out, and if in doubt let him go with it to the workshop, the building shed, or the forge; let him consult the men who are to make it, and then correct or alter his design to suit the difficulties of material and workmanship. In this way we may expect to infuse a new life into our architecture and to awake it from its torpor. The knowledge you will acquire in this way will not be of a kind to be tested by examination, or to enable you to win prizes and scholarships, but you may feel assured it will be the means of making you better artists individually, and of advancing the art of your country as a whole.

Mr. Owen Fleming, in proposing a vote of thanks to Mr. Jackson, said that he had listened with very great pleasure to a most thoughtful investigation of the problems that faced modern architects who were anxious to put into their work the same spirit that we found and admired in ancient work and that we missed and deplored, speaking of it as a whole, in modern work. We realised the very great difficulties that lay in the way of any return to the almost idyllic picture of medieval times which Mr. Jackson had sketched out. He (the speaker) knew of one old student of the Association, Mr. Detmar Blow, who had given up some excellent opportunities of becoming a good paper architect, and had articulated himself to a firm of masons and had worked on actual building. He believed that Mr. Blow was of opinion that his future work would certainly be better for the experience thus gained. There were a few other architects, though they could be counted on the fingers of one hand, who had been self-sacrificing enough to take a similar course. Having regard to modern conditions—to the intricacies of planning referred to by Mr. Jackson, and to a matter to which Mr. Jackson had not referred, but which had always been a great difficulty with him (the speaker), viz., the problem of getting an estimate before one began to build (which seemed to him to be impossible under any system of building without careful drawings)—with these difficulties before one he did not think we could hope to return to the ways of the past. But he thought there were things we could and should do, and it would be interesting to consider what the Association had done and could do. They would remember the old voluntary system that wanted organising and bringing into form. That was done after some years of hard work, with the aid of a man whom the Association would never forget, viz., Mr. Leonard Stokes. But having taken the course they did, they found that they had gone a little too far, and that they had not sufficiently pro-

vided for the practical side of an architect's work, and in consequence they found, much to their regret, that some well-known architects whom they wished to carry with them were rather opposed to them. Mr. Stokes and his colleagues therefore sought some method of bringing the views of those gentlemen into harmony with the system that had been drawn up, and then followed the memorable conference at which they arrived at a *modus vivendi* which would have enabled them to carry forward a general system acceptable to all architects. Their action, however, was ill-understood, and some very unpleasant years elapsed, during which some of those who had done women's service for the Association were given their *congé*, while the new scheme seemed to be falling somewhat into the hard-and-fast lines of the *Ecoles des Beaux-Arts*. This course, however, did not give satisfaction, and an endeavour was made to induce those governing the Association to see that a purely academic form of education was likely to injure rather than improve architecture and building, and he thought that much had since been done in the direction of that view. Among the Visitors to their Studio their older friends were now reinforced by men like Mr. Jackson, Mr. Prior, Mr. Lethaby, Mr. Ricardo, Mr. Voysey, and others—in fact, nearly all those who were earnestly desirous of carrying forward a practical scheme of education. Last year at the School of Design and Handicraft they began a new system, and, instead of trying in a scrappy way to sketch out building after building month after month, they resolved to take one building and work it out thoroughly, dealing with each material separately. The system was fairly successful, and this year it had been developed, and when the work of that school came to be exhibited, as it would be within the next two or three months, his hearers would feel encouraged at the result, and would begin to think that the right course was being pursued. This year they had deliberately put on one side the reproduction of past forms. What was aimed at was to study the material—to get at the real thing and the possibilities of the material with which they had to deal. When this was satisfactorily done, then their drawings would be simply diagrams illustrating as far as was necessary how certain materials ought to be treated. They had been working, owing to the kindness of Mr. Lethaby, at the new School of Arts and Crafts, which was going to do a very great deal towards the improvement of artistic handicraft. They had been working in stone and lead, and some of the recent results were thoroughly satisfactory. He thought that the Association had arrived at a critical period of its existence, and he feared that there would be a struggle between those who believed in the academic method of treating architecture and those who believed in the practical. He did not object to examination as examination. He had spent years in preparing for the Institute Examination himself, but though he did not know it then, he now thought that those years had not been used to the best advantage. But, for all that, he did not wish to evade the Examination; as they had to pass it, let them get through and be done with the matter, and then turn their attention to real architecture and building. Mr. Lethaby had recently told him that they had practically only to ask the Technical Board and good workshops would be placed at their disposal, and he (the speaker) hoped that some possible system would be adopted by means of which those workshops could be incorporated in the Association's new premises. It did seem to him to be essential that the workshops should be on the premises, so that when they entered their premises they would have oral demonstration that real handiwork was being carried on. Architectural students would then feel as engineering students do, viz., that they were part of a living, working profession. If the Association endeavoured to produce paper architects simply and solely, they would be taking a retrograde step which would do very great harm to English architecture. It was interesting to consider how the Association could move in the direction of the solution of what he supposed was the greatest question that architects had to consider.

Mr. H. W. Pratt, in seconding the vote of thanks, said he had been much interested in hearing Mr. Jackson state so clearly and so moderately what architects should undertake in the way of handicraft work. They had been

more and more led to believe that an architect's education was not sufficient unless he had a very considerable knowledge of almost every handicraft with which he would have anything to do; and although Mr. Jackson would like architects to know as much as possible of those trades, yet he supposed that Mr. Jackson meant that every architect should be specially taught some handicraft, and he, no doubt, would agree that a proper knowledge of one handicraft would be better than a smattering of many. There was, no doubt, a tendency, and technical schools seemed to have exhibited it, in the direction of the acquisition of a smattering of handicraft work, which led to the students going about their work in an amateurish sort of way. He would be very sorry indeed if technical education on these lines should be taken up by architects. He thought that if an architect in his student days took up masonry, or carpentry, and confined himself to one or the other, he would fulfil all the conditions that might be reasonably expected of him. There was no doubt that there were many interesting allied trades of which an architect should have some, if not a considerable, knowledge; but unless architects were able to get two years' work into one, it would be impossible for them to attempt to thoroughly learn all these subsidiary trades. To follow successfully and satisfactorily one trade would do an architect a great deal of good, while to attempt more would probably be harmful. The Association, although it had not yet accomplished much, was moving in the right direction. Mr. Jackson had referred to the need of modelling in an architect's work, and he (the speaker) would commend to the students their modelling class, which was one of the best classes they had, and which was under the direction of Mr. Pomeroy. That work, he was glad to say, was being actually carried on in their own premises, but it would be a very large undertaking to set up carpentry shops, forges, and so on. The idea was pleasing, but the practicability of carrying it out was quite beyond their reach, though the sympathy of the committee was entirely in that direction; and whether they established workshops themselves, or whether they secured facilities for their students elsewhere, there was no doubt whatever that students ought to be more intimately connected with the handicrafts. He thought the Association might do more in this direction even at the present time, viz., by visiting workshops. No doubt it was a little difficult to arrange, but at the same time, next to actual working, it was an advantage to visit workshops while work was being carried on. The illustration which Mr. Jackson had given them in his own life was very interesting. Members of the Association might, if they had facilities given them of visiting workshops more often, derive a vast amount of knowledge in this way, and what would be difficult to obtain in any other way. He was glad to hear from Mr. Jackson how an architect should get his work carried out, especially when he replied to those who said there was no necessity for an architect to put his designs on paper. Mr. Jackson looked at the matter in a common-sense way. There was no doubt that at the present time no one was able to carry out work satisfactorily without the supervision of a master mind, and as a means to an end an architect's ideas had to be put on paper. There was no doubt that if they studied and followed some particular trade, and if they used their observation in acquiring knowledge of other trades, they would be doing much to realise the objects they had in view, one of which was to know how to work and treat materials in which they were designing. Architects in past days usually had to confine themselves to one work at a time, and he did not suppose that many architects of the present day would object to a more equal distribution. He remembered that the large building at Virginia Water for Holloway was carried out under rather unusual circumstances, like those which prevailed, in fact, in past times, for Mr. Crossland, the architect, and his whole staff resided on the spot until the building was completed. This was an opportunity, however, which did not often occur. Mr. Jackson's paper would set them thinking as to how far they could go in that direction. Mr. Jackson's ideal was a very high one, but he had brought it down to attainable limits, and he (the speaker) felt sure that they would do their best to forward the movement by combining with the crafts for the development of architecture as a whole.

Mr. C. H. Brodie, in supporting the vote of thanks, said that young architects should all try to go as clerks of works for some time upon buildings being erected. If young architects were to do this, and were to see the erection of a building from the excavation to the finish, the result would be very satisfactory; no architect, in fact, was thoroughly competent unless he had had such opportunities. An architect clerk of works, especially one with artistic leanings, would make it his business to go into workshops to see the different parts of a structure made in different materials. In reference to engineers, they as a body knew much more about their work than architects, and that result was obtained because engineers were bound to spend a portion of their time as students on works in progress; and until architects did that he thought they would be as blind men leading the blind. In addition, of course, the young architect might take up some handicraft; but, at least, he should be upon one building during the whole time of its erection.

Mr. Banister F. Fletcher said that he thought Mr. Jackson had given them, in a rather more moderate way than many of them expected, certain of the views he had expressed in a recent book which he had published. The historical part of Mr. Jackson's address, in which he dealt with the old architects or masons, was interesting; but the difficulty seemed to be to know exactly what those men were, and how they carried out their work. We had no really direct evidence, as far as he was aware, as to who really made the designs for the mediæval cathedrals. He was inclined to think that the "workmen element" was rather to be remarked by its absence in the designs in question. He was inclined to think that there was an intellectual element which we were not able to get at, because few drawings prepared in those times had reached us. It seemed to him that there must have been some more responsible authority, and some person of greater knowledge, than could be expected from a mason, for instance. Of course, these remarks related to the historical part of the paper, and so far as the architects of to-day were concerned those remarks were of little use, because architects lived under different conditions, and they could not possibly practise the ways of the past. The other part of Mr. Jackson's paper, insisting on the knowledge of materials, they must all agree with, because it was evident that architects could not satisfactorily design in any material unless they knew what the qualities of the material were. The question about which there would be differences of opinion was as to how that knowledge should be obtained. He was inclined to think that no evidence had been shown that it was necessary for an architect to work at any trade. Of course, if an architect had anything to design he could go to a workshop and witness the process of carrying out designs in the material which he desired to use, and if the architect had not sufficient intellectual capacity to observe the particular qualities which the material possessed, he, the speaker, did not think that such knowledge could be gained at the bench. A parallel could be instituted with music. As far as he knew the great composers were not great executants. The great composer looked at the question from the composer's point of view rather than from the performer's. We ought to know what was the practice of great architects of the past 200 years. That period contained the names of very eminent men, and was it known that they ever worked in workshops? Did Wren ever work at the bench? Was it known that Pugin, Barry, Scott, or Street ever hammered away at a piece of stone or ever did any carving? Mr. Fleming was always interesting because he always looked at the matter from one point of view. He had referred to the reproductions of past forms, but he, the speaker, did not know how any one could design architecture without the reproduction of past form. It seemed to him very wrong to teach students to do so because there was nothing else for them to do. If Mr. Fleming, in prohibiting the use of past forms, would supply a code for new ones they would all be very thankful to him. It was like saying that no one should use words which were employed two hundred years ago. Architects did not take forms and use them as they were used in the past; the forms were used in a different way, just as the English language was spoken in a different way from the time of Shakespeare, for instance. As to Mr. Fleming's reference to the academic *versus* the prac-

tical architect, he (the speaker) was always dubious about the practical man. Was Mr. Norman Shaw a practical or an academic architect? He was rather inclined to think of Mr. Shaw as an academic architect, and yet, if they looked at Mr. Shaw's joinery, they would see that, although he never worked at the bench, his work had been put together in a masterly way. Could the Paris Opera House have been designed by any one but an academic architect? Suppose that a Paris Opera House had been designed by a "practical" architect, should we feel satisfied with the result? An architect was a man who had to use his head, and when he was able to do that, and could plan buildings properly, he might turn his attention, though it would be late in life, to bench work. Architects were expected to know everything, and the opinion of Vitruvius as to what an architect should know was a moderate one compared with that of modern educationists. Then there was the client's point of view; an architect should take care to remember that. Having got a client, if they were not careful to remember his point of view, they would probably never get another. They could not get rid of the fact that in the nineteenth century an architect was very largely, although Mr. Jackson would not agree with that, a business man. A client expected an architect to be able to protect him, and if architects did not do that they would be neglecting one of the principal duties for which they were employed.

Mr. E. W. Allfrey said that one very difficult question was as to how far an architect should go in endeavouring to acquire a knowledge of the crafts. Given a complicated modern building, with carving and decorative work to be done, and other requirements, either the architect must design and do that work himself, or else he must leave it to his workmen. If the architect were to design the work himself, of course he must have a very large knowledge of those crafts to which the work belonged; whereas, if he left the work to the workmen, had work very often resulted. It seemed to him that an architect should have a general knowledge and should stand as a critic to his workmen, rather than be a craftsman himself. The architect must be a highly-educated man, and he must be able to see where his workmen were at fault; and when they were, to be able to put them right. He did not think it was necessary for the architect to go very far into the actual craftsman's side of his work. Another point was as to how far an architect should carry his training, and at what age he should begin his work as an architect; and how far was it good for an architect to have a general or a University training? He had had the advantage of a University training, and he sometimes thought that he would have done better to have commenced his work as an architect at an earlier age. A University training put off the day when an architect could commence his professional career.

The Chairman, in putting the vote of thanks, said it had been a great advantage to them to have had Mr. Jackson's views expressed in his admirable paper. It was particularly interesting, because Mr. Jackson took a very leading part in advocating a particular line of training, and his views might differ somewhat from others who had equally at heart the progress of our national architecture. From whatever point of view this educational question was discussed, they could all claim that the one object they had in view was the progress of the art of architecture. He was sure that Mr. Jackson's paper would contribute to that end, because it was so moderate and practical in its suggestions. The contrast which Mr. Jackson drew between the Greek and Roman schools was very interesting, and he (the speaker) gathered from the paper that Mr. Jackson differed from both, and would take a medium course (which course might best be illustrated by the *quattro cento* Italian work). He really advocated that we should be more sculptors than we are, and perhaps rather follow the general training which the sculptor-architects of Italy enjoyed. He did not know that we should be satisfied with that training; but there was no doubt as to its effect upon detail in the times he was referring to. Whatever might be our feelings as to their general proportions and outlines, no doubt could exist as to the exquisite beauty of the detail which that period produced. Any training which leads us in the direction of producing anything like the same result was to be striven for. Mr. Jackson's illustration of how

fresh suggestions and results might be obtained by witnessing the methods of work was a particularly good one. He (the speaker) had found it of advantage to him to do the same. He did not know what Mr. Fleming meant by his reference to the coming struggle in the Association. He saw no sign of an struggle against the methods on which Mr. Fleming had suggested the training should proceed, for as far as he could see the training of the young architect had become more and more practical and had gone more in the direction desired by Mr. Jackson, to whom he owed a great deal for so heartily throwing himself into their work and becoming one of their visitors. He did not know that we could point to anything much better as a result of the training which Mr. Jackson advocated than some of that gentleman's own work. Mr. Jackson considered that they ought to devote more time to practical training in the way of learning a trade, but it was thought better by the Association to take a medium course. It was quite impracticable, he thought, they would admit, to give, say, a year—anything less than a year was of much good—in a joiner's shop, for instance. They could not afford the time. He was strongly in favour of taking modelling, and no doubt if a man were a good modeller a great deal would follow. The system of training which they aimed at in the Association was a combination of design and handicraft. Of course every young architect who had a chance would do well in his first work to reside on the spot so as to be present to conduct the work in person. If he could not do that he should endeavour to get work as a clerk of works. In reference to Mr. Allfrey's remarks about University career he (the Chairman) could not help thinking that the few extra years which a man usually spent at a University were invaluable in broadening the mind.

The vote of thanks was then put to the meeting and carried unanimously. Mr. Jackson, in reply, said he had always looked upon the Association as one of the most hopeful institutions for the advancement of architecture that we had. The Association had always taken a practical view of things, and they were now, with their Studio, and with the relations they had established with the School of Arts and Crafts, carrying out what he thought was the training of an architect in the very best possible way. As to the difficulty of getting access to workshops, he had an opportunity recently of visiting the Art School at Birmingham. There the principle had been adopted of establishing schools of such a kind that every designer could go and see his work carried out himself. That seemed to him to be an admirable arrangement, and he wished that other art schools in the country would do the same. These additions to the curriculum of an ordinary art school were invaluable, and he hoped that something of the kind would be arranged for the Association. Mr. Fleming had apparently advised his hearers to get through the Institute examination as quickly as possible, so that they might return to more profitable pursuits. Mr. Fleming should have given them his reasons for passing the examination at all. As the examination was a matter only to be got through and done with, surely it would be better to leave it alone altogether; and for students to turn their attention at once to workshops and practical work. As to Mr. Pratt's fear that the classes of technical schools would lead to no more than a smattering of knowledge of several trades, he felt that it would be of advantage thoroughly to master one craft, at all events, so as to understand some of the difficulties entailed in working on any given material; but he saw no objection to a student knowing something of many other trades. They could hardly fail to master one trade without getting suggestions as to difficulties in others, and the knowledge which they thus acquired would prevent them making mistakes. He always recommended his pupils to finish their training by working on a building, either as a clerk of works or by putting themselves under clerks of works, and those pupils who had done that had never failed to derive great benefit from that course. They saw all the crafts at work; and they gained knowledge in that way which they could never acquire when working in an office. Mr. Fletcher doubted whether the "workman element" was so strong in the ancient buildings as had been suggested. The matter was not altogether clear, for we did not know the whole circumstances under which buildings were carried

out, but we had certain names, and we knew that many of the workmen were superior men. There were workmen and workmen, and it was the skilled workman who came to the front and qualified himself, and it was to him, he thought, that we must attribute the designs which we all admired. It was difficult to know what part the great men, whose names we possessed, played on the building. As to Mr. Fletcher's illustration about the great composers, he might remind that gentleman of Mozart, Mendelssohn, Bach, Handel, who were the greatest performers of their day, so that this illustration rather supported his (the speaker's) side of the question.

Mr. Fletcher said that his point was that the architect of to-day was in the position of a conductor who controlled all the musicians.

Mr. Jackson: But he also controls the music. He might quote Viollet-le-Duc, who was a practical craftsman. As to Mr. Allfrey's remarks, so far from agreeing with him that a University training was a drawback, he always found that pupils who came to him from a University learned much more quickly than others.

The Chairman announced that the next meeting would be held on the 30th inst., when Mr. Hugh Stannus would read a paper entitled "The Classic Cornice."

The meeting then terminated.

The Members' Soiree.—The members' soiree will take place at the St. George's Hall, Langham-place, W., on Thursday, May 6, at 8 p.m., when a musical play, entitled "The Bounds of Art," written by Mr. H. B. Creswell, with music composed by Mr. Leonard Butler, will be presented.

MAGAZINES AND REVIEWS.*

THE *Art Journal* contains an interesting, we might say a learned article by Mr. Claude Phillips, on the important collection of pictures at Longford Castle, chiefly Dutch; at least all those dealt with in this section of the article are by Dutch painters. An article by Mr. L. B. Starr on the Mouchrabieh cabinet work of Cairo, gives a description of the structure of this class of work, with some illustrations. A very interesting and rather novel article is that by Mr. W. E. Osborn, on "The Possibilities of the Poplar," the artistic possibilities of course, which the author illustrates in some very effective sketches.

The *Easter Art Annual*, in connexion with the *Art Journal*, is devoted to the life and work of Sir E. J. Poynter. We are glad to welcome a collective account and illustration of the work of the new President of the Royal Academy, one of the finest figure designers of our time; and perhaps some of these works strike one even more from their excellence in drawing and design when shown in black and white. The beautiful little picture, "High Noon," is shown in a most effective reproduction. One of the principal illustrations is from "The Ides of March," a very poetical work which hardly received the attention it deserved on its first appearance. It is a pity the "Ionian Dance" was not reproduced photographically, the line engraving does not do justice to the exquisite grace of the dancing figure. In the literary portion of the issue we observe a reference to Sir E. Poynter's opinion as to the English system of keeping the student so long at casts before he is allowed to draw from the life, which he condemns on the ground that the student cannot properly understand the merits or meaning of the cast without the knowledge of the living figure. Sir E. Poynter therefore always preferred the French system, under which the student had to make only a few studies from casts to get his hand in, and was then set without more delay to the serious study of the life.

In the *Engineering Magazine* Mr. Geo. H. Paine chooses a very good subject in "The Value of Quiet and Beautiful Streets." He considers streets in connexion with the City architecture, and tags his illustrations with some pity and suggestive comments; under a view of Broadway for instance—"Streets are used by all and should interest all. Pavements are not for vehicles only. Many other interests are involved," from which the reader

* The object of these notes is to point out anything in the contents of the current magazines which is of special interest to our readers, with occasional brief criticisms on the views expressed in such articles. When a magazine which has been sent to us is not noticed, it is because that number contains nothing that it is within our province to comment upon.

will gather that Broadway is not one of the streets selected as happy examples. Under the view of a street in Cairo, without pavement—"Such streets are used for necessity, not for pleasure." Under a view of the Piazzetta, Venice—"The pavements of many Italian cities are laid as part of the city architecture, for beauty and utility." There are many good ideas in this article. The subject of "Materials and Methods for Fireproof Construction" is treated by Mr. Scanlan. It naturally bears more on American practice than English.

Scribner contains a highly appreciative article by Mr. Cosmo Monkhouse on the works and the genius of Mr. Orchardson. We are glad to see an article doing full justice to this remarkable and original painter, whose real powers are by no means fully appreciated by his countrymen in general. The third article on "London as seen by C. D. Gibson" is concerned with the Parks, but entirely with their occupants, not with the Parks themselves. Mr. Gibson's sketches are however very clever. An illustration by Mr. William Hole of the transformation scene in "Dr. Jekyll," which forms the frontispiece to the number, is clever, but it is a nearly impossible scene to treat pictorially. From a paragraph in "The Field of Art" we learn that the demand for pictorial decoration to buildings is rapidly on the increase in America, and we are glad to see that the writer of the article protests against the absurd jumbling of schools and styles in the Paris Hotel de Ville paintings, and insists on the necessity of unity in a scheme of decoration for a great building.

The *Century* contains an article on "A new American Sculptor," Mr. G. Grey Barnard. This class of articles in the American magazines is too much permeated by the predetermination to write up modern American Art, and to produce a whole string of new geniuses; but some of the works illustrated, more especially "Brothers," do seem to imply that Mr. Barnard has some original genius and a method of his own. By far the most interesting series of articles in the *Century* at present are the military ones entitled "Campaigning with Grant," which do not come within our sphere, but this week they are prefaced by an engraving of the great mausoleum which the country is raising in honour of Grant, a very grand affair indeed, but entirely deficient in originality, unless it is considered original to hoist a circular Ionic colonnaded building on to the roof of a Greek Doric Temple.

In the *Cornhill Magazine* is an article on "The Cost of Country Houses"; not a very satisfactory one to architects, as the tendency of it is to show that keeping a large country house costs a great deal more than people generally expect, and that therefore it is not wise, in one's own interest, to build a large house; a melancholy conclusion. It is admitted, however, that the man who builds and keeps up a large country house and park generally confers an immense benefit on the neighbourhood around him; so there is an encouragement at least to philanthropists to spend money on themselves, on the *sic vos non vobis* principle.

The *Atlantic Monthly* contains a most interesting communication by Professor Lowell on "Mercury in the Light of Recent Discoveries," some of which are very recent. The main result is that Mercury is in the same position in reference to the Sun that the Moon is in reference to the Earth; it has no revolution on its axis, and turns the same face always to the Sun; that, like the Moon, it is "dead," and this deadness Professor Lowell connects with the stoppage of revolution on the axis, the result of the "brake" effect of tidal friction, which has stopped the Moon and Mercury in their revolution, and is in slow progress of stopping that of the Earth. And after that, what?

In *Macmillan* the "Leaves from the Journals of Landscape Painter" does not in itself deal very much with art, but it will interest many readers, when they find that the "landscape painter" was no other than Edward Lear, better known to the world at large as the maker of nonsense verses for the delight of children. In a short notice prefixed to the article it is mentioned that Murchison observed of Lear's sketches that they always told him the geology of a country, though Lear knew nothing of geology; a high compliment at all events to the artist's fidelity of observation.

In *London Society* the lady known in literature under the name of "John Strange Winter" is writing a series of articles on "The Ideal House," chiefly concerned with questions

of taste in regard to furniture and decoration, and written very much from a woman's point of view. The following account of an assemblage of colours at a concert in a private house is amusing:—

"The double drawing-rooms were papered with flame-yellow, the curtains to the many windows were bright scarlet. The divisions between the two rooms were draped with velvet curtains, and were a red of a wholly different tone. The carpet was a deep soft crimson, the chairs, mostly gilded, were upholstered in broad crimson and white striped satin, or in rich red silk damask which went with nothing near it. There were a few pictures, small oil-paintings, hung well below the eye-line, and the only ornaments were blue and gold Sevres, such things as clocks and candelabra, under glass shades. All the sofa cushions were of a brilliant turquoise blue!

The two footmen who hovered in and out wore bright pink stockings and magenta plush breeches. The hostess—a very florid woman—wore a gown of deep crimson satin (wholly different in tone to all the other reds in the room) quite unrelieved by any softening lace or trimming. One daughter wore a lavender dress, the other two had pretty summer frocks of bright apple green."

The *Pall Mall Magazine* contains an illustrated article on Levens Hall (of which the celebrated garden is better known in illustrations than the interior of the house), and another on the town and the lace of Honiton.

In the *Gentleman's Magazine* Mr. Jas. Cassidy, under the heading "Ceramic Art at Derby," gives a description of a visit to some of the great pottery factories at Derby.

In *Knowledge* a serial article on "English Medals" is commenced by Mr. G. F. Hill, with illustrations from a good many early medals. An essay on the "Age of Mountains," with diagram sections, by Professor Lohley, comes to its second chapter in this number.

The *Land Magazine* is a new publication, dealing with matters affecting landed interests. There ought to be room for such a magazine, and the articles appear to be thoughtful and well written. Among the subjects treated are "Forestry in Switzerland," "The New Agricultural Holdings Act," and "The Cadastral Survey of France."

The *Quarry* devotes an article to the subject of "Serpentine 'Alabaster' and Porphyry."

NEW GOVERNMENT LABORATORY.

FOR many years past the analysis of samples of various kinds of drugs, tobacco, beer, worts, tinctures, &c., has been conducted in the upper part of the Inland Revenue portion of Somerset House, but the space occupied by the laboratory being required to meet the growth of the Inland Revenue Department, it was decided to erect a separate building on a piece of vacant land in close proximity to the new Bankruptcy Offices and King's College Hospital.

The new Laboratory, which is now almost completed, is approached from the Strand through Clement's Inn. The ground-floor contains a waiting-room, rooms for the Principal and Deputy Principal, reference library, and the following laboratories:—Crown Contracts, Reference Sample, and Research. Near the entrance is the main staircase leading to the first floor, which contains rooms for Superintending Analyst, for the examination of tobacco, polariscope room, and a laboratory, 40 ft. by 43 ft., for beer, worts, spirits, and tinctures. A museum and rooms for photographic and other purposes occupy the second floor. In the basement are storerooms for scientific apparatus, chemicals, &c., hydrometer, and standardisation of instruments room. Water analysis and bacteriological laboratory, space for steam boiler, pumps, &c., coal vaults, and refrigerating room.

The vitiated air in the various rooms and laboratories is drawn by down-cast pipe-flues to a main vitiated air-channel formed under the basement floor, and thence is extracted through the exhaust shaft with the aid of a powerful up-cast steam ventilating fan.

With a view to economy in the supply of water for experimental purposes to the large laboratory on first floor, a special collecting tank has been constructed in the basement, from which the water is pumped into high-level tanks for re-use. Special plant is also being laid down for the production, by means of compressed carbonic acid, of ice and super-cooled water for maintaining the proper temperature of the supply, and for the purposes of a cold store.

The building is warmed by radiators supplied by steam at low pressure, and arrange-

ments have been made for the supply of fresh air by means of flues constructed in the floors.

The floors and ceilings throughout are of fireproof construction, and provision is being made for electric lighting, pneumatic bells, and speaking tubes. Lavatory accommodation is provided on basement, ground, and first floors.

All the laboratories, staircases, corridors, water-closets, and areas are lined with white glazed bricks. The external elevations, which are plain and unpretentious, have red facing bricks from Bracknell, Bucks, and dressings of Portland stone.

The following are some of the firms employed—Mr. B. E. Nightingale, builder; Messrs. M. Fawcett & Co., for the fireproof floors and ceilings; Mr. J. F. Ebner, for mosaic and wood block flooring; Messrs. Wilkinson & Co., granolithic paving; Mr. J. Jeffreys, warming apparatus; Messrs. Gimson & Co., for cast-iron tanks; the Hydraulic Engineering Company, for lift; Messrs. Mowlem & Co., for working benches, presses, &c.; Messrs. Clements, Jencks & Co., for H₂S and other closets, and for various special fittings; Messrs. Hall & Co., for ice-making and cooling plant. The work is being carried out from the plans, &c., and under the directions of Mr. J. Taylor, C.B., of H.M. Office of Works, at a total estimated cost of 23,500*l.*

Illustrations.

THE CHURCH OF BROU-EN-BRESSE, BOURG.

THE name of this church, at all events in its shorter form "The Church of Brou," has become a familiar sound to English ears from Matthew Arnold's popular and in many respects very beautiful poem under that title. The poem has also had the result of giving to many persons an entirely false idea as to the building. Arnold seems to have laid hold of the story, which took his fancy for poetic treatment, without having seen the building or got any information about it. Consequently he conveys to his readers the idea of this being a humble though beautiful country church on an out-of-the-way site, whereas it is a building of the scale of a second class cathedral, standing at the gates of a city, and of immense elaboration of detail. Nor do the sculptured figures of the "princely pair" repose side by side on the same monument, as the poetic imagination represents them.

The church, however, is a remarkable one in some ways, and some illustrations of it, as a building much better known by name than it is in fact, may be of interest.

The illustrations, which are from photographs, comprise a general view of the west front; the detail of the west door; the choir-screen or *jube*; the tomb of Margaret of Austria, the foundress; another view of this, showing two other tombs through the vista of the arch; and the tomb of Margaret of Bourbon.

Some historical and critical remarks on the church will be found in a special article in the present issue.

THE "DÉPÔT CENTRALE DES POSTES ET TELEGRAPHES," PARIS.

THIS vast establishment, only a portion of which has yet been carried out, has been built after the plans and under the direction of M. Seclier de Gisors, on a site in the Boulevard Brune, near the Ceinture railway. According to the general scheme adopted in 1880 by the Post and Telegraph Department, the building was to include workshops for the manufacture of telegraph materials and of postage-stamps, also a department for testing, a chemical laboratory, a gallery for machines to be used as prime movers, and all the necessary buildings for offices, administration, and the lodging of the resident staff.

The entire buildings occupy an area of 7,827 square metres. All the buildings are or will be erected on specially prepared foundations, in the forming of which 226 pits have been sunk and filled with concrete, to the depth of 7½ metres. The foundations and sub-soil structure generally is in *maçonné*—we give the French designation, as there is considerable uncertainty, in this as in many other cases of technical terms, in regard to the precise English equivalent in meaning. The plinth is of Lérouville stone, and the bulk of the walling above that is in Bourgogne and Belleville bricks, with dressings in Villiers-Adam stone. The constructional portion of the

floors is of iron, and the roofs of the workshops; the other roofs are of iron and timber combined; all covered with Choisy tiles. The interior woodwork is in oak and pine.

The whole building is warmed on the low-pressure hot-water system, each portion of the building having an independent system. There are fire hydrants at forty different stations, supplied by a Worthington pump.

The total cost of the building will be 2,184,136 francs, about 34*l.* francs per square metre of construction.

The buildings were commenced in June 1892, and completed in March 1895.

The illustration only shows a portion of the exterior, sufficient to indicate the plain and severely practical character of the architecture employed. That there is no scale to the plan and section is due to the unfortunate habit, which is almost universal among French architects, of putting no drawn-out scale on their drawings, but only stating in writing what the scale is. Consequently, when copies of the drawings reach one in the form of reduced photographs, the statement of scale is of course useless.

The complete geometrical elevations, plans, and sections, drawn with the greatest care and to a large scale, formed a prominent exhibit in the architectural room of the Salon last year, and gained the architect the award of the gold medal of the year for architecture.

ARCHITECTURAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—The Edinburgh Architectural Association visited on the 27th ult., Hatton House, Midlothian, by permission of the proprietor, the Earl of Morton, and the tenant, Mr. James McKelvie, under the leadership of Mr. Thomas Ross, F.S.A. The house, it was explained, has a massive central keep, with later additions round it. In the time of Robert II. John de Hatton was proprietor, and in a few years it passed to the Lauder family, the Lauders of the Bass, in whose hands it remained for several centuries. Early in the seventeenth century Charles Maitland, brother of the Earl of Lauderdale, became proprietor, and began the extensive additions of which much remains. He appeared to a certain extent to have copied his brother's manner of laying out the gardens at Ham, and the work which was carried on by his successor had made the house with its gardens, terraces, sundials, and statuary, one of the most interesting and pleasant in its own part of the country. Mr. Ross expressed his indebtedness for many of his descriptive and historical notes to Mr. J. R. Findlay, at one time tenant of Hatton, and who, he said, prepared an interesting monograph. On the motion of Dr. Rowand Anderson, a vote of thanks was awarded to the proprietor and to the tenant for permitting the visit, and to Mr. Ross for conducting the party.

GLASGOW SCHOOL OF ART.—The fifth lecture of the supplementary course on "Hellenic Architecture," by Mr. W. L. Anderson, architect, was delivered last week in the School. Continuing the subject of the "Culmination in Attica," the lecturer looked away from the historical and social influences which, though none the less real, were beyond the purview of the artist of the time, and endeavoured to take the standpoint of the master confronted with a particular problem. Applying this treatment to the Propylæa, the object of the building was considered; the nature of its site; the alignment which Mnesicles, its architect, decided upon in its relation to the Parthenon and to the Acropolis wall, the angle of which its axis bisected. This central position appears also to have been designed to give within the gates a *stoa* of equal length on each side, and without, two halls occupying each the same space, but of a varying arrangement controlled by the position of the bastion carrying the Nike temple. The various obstacles preventing the accomplishment of the scheme, and resulting in the present irregular arrangement, were considered, in so far as they can be read in the building itself; while the fitness of the architecture, and the beauty of its details and painted decorations were shown by many illustrations. The Erechtem was treated similarly, and from its arrangement and other circumstances, regarded as a *megaron* in honour of Erechtes, a monument and museum of many cults rather than a temple of one or two; and in addition to photographs of its present state, restorations of its exterior and interior, and of its relation to the complete Acropolis, were supplied. Additional examples of the culmination in Attica

were illustrated in the Hall of Initiation into the Eleusinian mysteries, and the Temple of Apollo at Phigalia, the latter being included on the ground that it was the work of a great Athenian architect. The second part of the lecture was devoted to the Greek theatre and games; the buildings of the theatre, the stadium and the palestra; and in this connexion were shown and explained plans and restorations of the huge assemblage of buildings at Olympia, the apotheosis of athletics.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The members of this Society paid a visit on Saturday afternoon last to the new buildings of the Prudential Assurance Company, in Pinstone-street, Sheffield, by the arrangement of the architects, Messrs. Alfred Waterhouse & Sons. Mr. Haigh (the clerk of works), as the representative of the architect, conducted the party over the building, and explained the various arrangements, and the materials employed, and answered a number of questions asked by some of the younger members during their examination of the building.

ENGINEERING SOCIETIES.

INSTITUTION OF CIVIL ENGINEERS.—At the ordinary meeting of this Institution, on the 6th inst., Mr. John Wolfe Barry, C.B., F.R.S., the President, in the chair, the paper read was "The Blackwall Tunnel," by Mr. David Hall and Mr. Maurice Fitzmaurice. Communication between the north and south banks of the Thames below London Bridge was very poor, the paper stated, and many attempts had been made during the last hundred years to give greater facilities for crossing. Tunnels had been begun between Tilbury and Gravesend in 1798, and between Limehouse and Rotherhithe in 1805, while Brunel's great tunnel between Wapping and Rotherhithe was begun in 1825 and finished in 1841. Various other schemes for tunnels had been brought forward, but that at Blackwall was the only one which had been commenced. The contract for the work was let in 1891 for £71,000*l.*, and operations were started early in 1892. The entrance to the tunnel on the north side of the river was in the East India Dock road, close to the East India Dock gate, while at the south side the entrance was in East Greenwich. The total length of the tunnel was 6,200 ft., of which about one-half was "cast-iron lined," the remainder being "cut and cover" and "open approach." A considerable amount of work was necessary for the diversion and reconstruction of main and branch sewers which were interfered with by the tunnel. The open approach at each extremity of the tunnel was constructed with concrete and brick retaining walls with a facing of white glazed bricks and a concrete invert. A layer of asphalt was carried round it to ensure watertightness. The cut-and-cover work consisted of four or five rings of brickwork in cement and was circular in section; it was backed with a minimum of 2 ft. of concrete, and a layer of asphalt was interposed between the brickwork and concrete. There were four shafts on the line of the tunnel, and these were placed at the horizontal or vertical changes of direction. They were constructed of steel and iron double-skinned caissons, of 58 ft. external and 48 ft. internal diameter. They had also an internal lining of white glazed brickwork. Two openings for the tunnel were provided in each caisson, which were closed when sinking by easily removable iron plugs. Air-tight floors were placed above the tunnel openings, so that compressed air could be used either while sinking or while the tunnel was being driven through. Two of the shafts had been sunk by keeping the water pumped down and excavating inside in the ordinary way; one by excavating the material (gravel) by a grab worked from a crane on the top, and the fourth partly by grab and partly by manual excavation. In both the latter cases, however, the concrete and iron floors at the bottom of the shafts had to be inserted under compressed air. The "iron-lined" portion of the tunnel was constructed by means of a shield, and compressed air had been used for nearly the whole length of the pressure varying between a few pounds and about twenty-seven pounds above the atmospheric pressure. The external diameter of the cast-iron lining was 27 ft., and the internal diameter 25 ft. and 25 ft. 4 in., each ring of lining forming a length of 2 ft. 6 in. of tunnel. There were fourteen segments and one key-piece in each ring; all the sides of the

gments were planed, and all the joints caulked. The internal lining consisted of 4 to 1 concrete with glazed-lime facing. The tunnel was driven rough materials of a very mixed nature, trying between hard water-tight clay and loose ballast in direct communication with the river. Near the centre of the river the mel passed within 5 ft. of the river bed, but in some distance on each side of this point a layer of clay 10 ft. thick had been shot from opper-barges to facilitate operations. On two occasions the tunnel was flooded by sudden blow-outs and the consequent inrush of water. The shield used was 27 ft. 8 in. in external diameter, and 19 ft. 6 in. long. It was shoved forward by hydraulic jacks which exerted at times a total pressure of over 5,000 tons. It carried two hydraulic erectors for placing the cast-iron segments. Every precaution was taken in the construction of the shield to minimise the result of accident from a sudden inrush of water, and provision was made for working with either a closed or open face. A very large air-compressing plant was required to maintain the supply of air, and at times as much as 10,000 cubic feet per minute was pumped into the tunnel. The roadway, which was 16 ft. wide, was carried on a brick arch, which formed the roof of a subway for pipes, electric-light wires, &c., and a footpath 3 ft. wide was provided on either side. An electric light installation had been erected for the permanent illumination of the tunnel and the supply of current for working the drainage-pumps, &c.—It was announced at the same meeting that thirteen associate members had been transferred to the class of members. It was reported that twenty-six candidates had been admitted as students. The last ballot of the session resulted in the election of ten members and of sixty-nine associate members.

THE SANITARY INSPECTORS' ASSOCIATION.

At the April general meeting of this Association, held on the 3rd inst. at Carpenters' Hall, Mr. Charles Seale-Hayne, M.P., was elected an honorary member, and twenty-two new ordinary members were added to the roll.

A paper on "Nuisances from Certain Offensive Trades" was read by Mr. T. W. Crocker (West Ham Board), in which a number of suggestions were made for the improvement of the methods used in certain industries carried on in the district in which the lecturer was engaged. There were many trades of an exceedingly offensive character which did not come within the official meaning of the term "Offensive Trades," such as that of brick-burning, which, in a test case, had been excluded from the category, although evidence of "noxious fumes" was tendered, because the Court held that this business was not named in the section and was not analogous to any of those named. It seemed to follow from the result of this test case, that only trades in which animal matters were dealt with came under the category of "Offensive Trades," as defined by the Public Health Acts of 1875 and 1891. With regard to certain of these trades, the processes used in which were described, the lecturer expressed the opinion that the nuisances arising from them might in most cases be minimised, and in some altogether prevented, by the adoption of suitable appliances, and by improved forms of buildings or apparatus. With proper fire arrangements noxious fumes might be burnt up before discharge, and even where they could not thus be completely cremated, they might be rendered harmless by building tall chimney shafts instead of dwarf ones.

A conference on "Tenure of Office" was afterwards initiated by Mr. G. T. Dee (Westminster).

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Dr. Collins, Chairman, presiding.

The Works Department.—The Finance Committee recommended, and it was agreed, (a) That the amount to be charged (in lieu of rent) to the Works Department for interest on and repayment of original capital outlay on the central wharf and buildings for the year ending March 31, 1897, be 4,135l. 10s. 3d. (b) That the amount of interest to be charged to the Works Department on working capital during the present financial year be 1,915l.

The report of the Special Committee appointed to inquire into the management and financial position of the department since its inception, and as to its future prospects, was printed in the agenda paper. A statement, in the nature of a "minority" report, has been prepared by four members of the Committee, but this was not printed with the report of the other members of the Committee. We are unable to print the whole of the report in our columns, owing to its length; but we give the recommendations of the Committee, and on another page some comments on the subject will be found.

The following are the Committee's recommendations:—

(a) That in the opinion of the Council some definite organisation for the direct employment of labour and the direct execution of public works by the Council under the superintendence of its own officers is desirable and beneficial.

(b) That a Works Board be substituted for the Works Committee, such board to be elected forthwith, one member to be nominated by and from each of the following Committees:—Finance, Asylums, Bridges, Fire Brigade, Highways, Improvements, Main Drainage, Parks, and Housing of the Working Classes; and that in future years the election of members of the board do take place at the meeting of these Committees next to March 31.

(c) That any Committee desiring to propose to the Council the carrying out of any works without the intervention of a contractor, shall, in the first instance, obtain an estimate from the proper officer and then refer such estimate to the Works Board for their consideration before reporting to the Council.

(d) That the Works Manager shall, unless in any case otherwise ordered, carry into execution all works which the Council resolves to execute without the intervention of a contractor.

(e) That when the Council wishes to execute any works without the intervention of a contractor, the plans, specification, and estimate shall, unless otherwise ordered by the Council, be thereupon referred to the Works Manager.

(f) That the Works Manager shall be responsible to the Works Board, and the board shall report from time to time to the Council.

(g) That this report be referred to the General Purposes Committee, and that it be an instruction to that Committee to amend the standing orders in accordance with the foregoing recommendations.

(h) That it be referred to the General Purposes Committee to make further amendment of the standing orders by the insertion of words coupling the unions of employers, where such exist, with the trades unions, in reference to the rates of wages and hours of labour.

(i) That it be referred to the General Purposes Committee to make further amendment of the standing orders by omitting provisions giving powers to the clerk of the Council to direct examination of the books of any one contracting with the Council for the execution of works, other than the time-sheets or books or wages-sheets or books.

(j) That the statement of Mr. Edwin Waterhouse be referred to the comptroller for report upon each and all of his suggestions with reference to the accounts, and that the comptroller's report be referred to the General Purposes Committee with a view to the adoption of Mr. Waterhouse's recommendations.

Mr. Beachcroft moved that the consideration of the report of the Special Committee be adjourned over the Easter recess.

Mr. Boulnois, M.P., inquired how it was that the report of the Committee had alone been sent to the Press, while that of the minority had been withheld.

Mr. Beachcroft said it was a pure accident that the report of the minority was not sent.

Mr. E. White asked whether any statement would be made as to why the late manager of the Works Department was not called to give evidence before the Committee.

Alderman Beachcroft thought the question scarcely in order.

The motion was agreed to.

Tramway Purchase.—The discussion on the report of the Highways Committee on this matter was resumed, the recommendations, which we printed last week, page 320, being eventually agreed to.

Queen's Jubilee Procession: Temporary Structures.—Mr. Cornwall, referring to the report of the Building Acts Committee regarding the erection of temporary structures for the accommodation of sightseers desirous of viewing the Royal procession on June 22,* said he hoped that private stands in private houses would not be unduly interfered with, except to take precautions to prevent loss of life.

Major Probyn thought too much care could not be taken for the prevention of accidents,

even such as might only involve a broken limb.

Mr. Payne (Chairman of the Committee) said the Council would only take steps with regard to dangerous structures, and would not oppressively exercise their authority. As they were advised, their control extended not only to outdoor structures, but also to in-door stands and platforms, and it would be necessary that that control and supervision should not be neglected. The District Surveyors had been instructed to inquire and report upon the stands proposed to be erected, and upon these reports a system of inspection would be arranged.

Salaries of Inspectors in the Public Health Department.—On the recommendation of the Public Health Committee, it was agreed that the scale of salaries of the above-mentioned inspectors appointed by the Council under the Public Health (London) Act, 1891, be altered so that they may rise continuously by annual increments of 10l. to the maximum of 250l. per annum.

Sanitary Condition of Clerkenwell.—The same Committee reported as follows:—

"After some correspondence with the Vestry of Clerkenwell on the question of the adequacy of their sanitary staff, we thought it well that an inquiry should be made by one of the Council's Assistant Medical Officers of Health into the sanitary condition and administration of the parish. An inquiry was accordingly made by Dr. Young, and the Medical Officer has submitted to us Dr. Young's report, which shows that the staff, as it existed at the time of his inquiry, appeared to be inadequate for the proper performance of the duties devolving upon the Sanitary Authority. Dr. Young is, however, not prepared to assert that the appointment of a clerk to the Sanitary Department, which was contemplated, would not be found sufficient for immediate purposes, and it is right, therefore, that further experience should be gained before the appointment of an additional Sanitary Inspector is recommended by the Council. The following is a brief summary of the matters to which Dr. Young considers the attention of the Vestry should be given:—1. The existence in houses of defective conditions. For the most part these are of such a character as to be readily capable of remedy under the powers given by the provisions of the Public Health (London) Act. 2. The existence of courts and alleys which are narrow and badly arranged, and of houses which are old and worn out. Concerning these the Vestry should see the necessity of applying for closing orders or taking other proceedings under the Housing of the Working Classes Act. 3. The existence of a considerable number of houses in the district occupied by members of more than one family. Many of these are not of such a character as to need frequent periodic inspections. Others again are not so well circumstanced as regards the conditions in which they are kept, and these need registration and regulation under the provisions of section 94 of the Public Health (London) Act. 4. The absence of a register containing a complete list of the workshops in the district, and setting out the condition of these premises. The preparation of such a register should be proceeded with forthwith. 5. The failure of the present system of house refuse collection to ensure its removal every week from all premises. A reorganisation of the system should at once be undertaken so as to ensure this object. 6. The desirability of requiring in the by-laws as to houses let in lodgings a minimum cubic space per head of 400 ft. in rooms occupied by day and by night, instead of 350 ft., which is stated to be the amount specified in the draft by-laws. We have had the report printed and have sent copies to the Vestry with a request for their observations thereon. We propose to report again to the Council after a reply has been received. In the meantime we have given instructions for copies of the report to be sent to members of the Council, and to be placed on sale."

Opening of Blackwall Tunnel.—The Bridges Committee recommended, and it was agreed, that 2,500l. be expended on the arrangements for opening Blackwall Tunnel, by the Prince of Wales on May 22.

Vauxhall Bridge.—On the report of the Corporate Property Committee, it was agreed:— "That Watney's Wharf and the Bridge House, Vauxhall, be utilised for the purpose of the reconstruction of Vauxhall Bridge, and that the sum of 2,500l. be fixed as the value of the land for that purpose."

The Finance Committee incidentally reported that the total cost of rebuilding Vauxhall Bridge is estimated at 484,000l., and the votes already passed on account amount to a total of 116,622l. 4s.

Ground Plan of Loudon.—The same Committee recommended, and it was agreed, that a further sum of 600l. be expended in connexion with the preparation of the ground plan of Loudon. At present 1,670 estates have been defined upon the sheets, and 134 estates are still to be dealt with.

* See our last issue, page 320.

Paving-work, Clerkenwell Fire Station.—On the recommendation of the Fire Brigade Committee, it was agreed that the tender of Messrs. G. S. Munday & Sons to execute for 205/ the paving-work required at the Clerkenwell station be accepted.

Supply of Gravel, Parliament Hill and Waterloo Park.—On the recommendation of the Parks and Open Spaces Committee, it was agreed that the Council do rescind its resolution to enter into a contract with Messrs. Ballard, Limited, to supply gravel at the rate of 7s. 6d. and 6s. 10d. per cubic yard for Parliament Hill and Waterloo Park respectively, and do authorise the Committee to obtain the material from Mr. H. Barnaby, at the rate of 7s. 6d. and 7s. per cubic yard for these places respectively; and that the solicitor do take the necessary steps in the matter.

Inspection of Railway Stations.—The Parliamentary Committee reported:—

"The Council on January 29, 1895, referred it to us to take the necessary measures for the introduction of a public Bill in the session of 1896 for the following purposes:—(a) To give the Council, for the purpose of enabling it to make representations under the Railway and Canal Traffic Act, 1888, power to inspect from time to time the stations of every railway company in the county of London; (b) to require each railway company, before constructing a new station or reconstructing or altering an existing station in the county of London, to submit plans of the proposed works to the Council for its approval; and (c) to prohibit the erection or alteration of any station otherwise than in accordance with the plans approved by the Council. We have had a Bill drafted to carry out the resolution, but we fear that there is no prospect of its passing in the present session of Parliament. We accordingly recommend that the Bill be not introduced this session."

Colonel Ford said it was very important to give the Council such powers.

The report having been adopted, the Council adjourned.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION: ANNUAL DINNER.

THE nineteenth annual dinner of this Institution was held on Tuesday in the King's Hall, Holborn Restaurant, the chair being occupied by the President, Mr. Thomas Hall (Hall, Beddall, & Co.), who was supported by Messrs. T. E. Colcutt, W. Woodward, B. E. Nightingale (retiring President), Thomas F. Rider, W. R. F. Freeman, J. Howard Colls, Robert Downs, C. Bussell, Joseph Clayton, F. H. Reed, Stanley Clarke, T. Stirling, H. T. Stirling, A. Ritchie, J. P., Henry Lovegrove, Quincey de Quincey, W. T. Farthing, and the Secretary, Mr. H. J. Wheatley.

The loyal and patriotic toasts having been honoured (Mr. R. Downs proposing, and Major Roe replying for, the "Navy, Army, and Reserve Forces").

The Chairman proposed the toast of the evening, "The Builders' Clerks' Benevolent Institution." The Institution, he said, was founded in 1866 with the object of granting pensions and temporary relief to necessitous clerks and their widows, and for the maintenance and education of their children, the pensions of clerks being 25/ and their widows 20/ a year. Already forty-three pensioners had been elected, twenty of whom were still upon the books. Further, a great deal of good had been done in granting temporary relief in necessitous cases. The total amount paid in this respect amounted to 6,800/. In no case, however, had the committee granted more than 10/ to any one man in one year. The total expenditure last year on account of the relief fund was 467/, and the income arising from annual subscriptions and dividends was only 248/., the balance having been met by the donations received at their last dinner. Their reserve fund was 3,400/., and the committee were most anxious not to reduce that, as they did not consider it any too large. Those present would see, therefore, how largely the institution depended upon the donations received at the annual dinner. Knowing that, he hoped those present would contribute as generously as they were able. Speaking to builders' clerks in particular, he engaged the Institution as a means of providing against bad times, and making provision for their widows and orphan children. As to the orphan fund, eight children had been presented by the Institution. The benefits of the Institution were extended to non-subscribers, but builders' clerks who had been subscribers, and who required assistance, were entitled to ten votes for each guinea given.

Mr. W. R. Freeman then proposed "The Architects and Surveyors," and in doing so referred to the close connexion between architects and surveyors and builders. In regard to architects, they were improving the architecture of the country, which was much more pleasing to look upon now than it was at the beginning of the century. The work of quantity surveyors was of considerable importance to builders.

Mr. Woodward, in replying for the architects, said that it was quite true that during the last quarter of a century great improvements had been made in planning, decoration, construction, and in sanitation, and the architecture of London, in particular, had greatly improved. Speaking of the 1894 London Building Act, he said that some of the clauses were so difficult to interpret that he hoped the time was not far distant when the Act would be amended and some of the clauses reconciled.

Mr. H. Lovegrove replied for the surveyors, and said that he thought they were beginning to understand the Building Act, and, on the whole, he thought it was an Act which tended to improve building in London. The Act controlled the jerry builder, as a Building Act should. The Act caused hardships, but, on the whole, it worked well, and architects and others should try to understand it.

Mr. A. Ritchie proposed the toast of "The Builders," and in doing so referred to three classes of builders, viz., the jerry builder, the gentleman builder, and the practical builder, the practical builders being the men whom they esteemed. In regard to the London County Council, it was satisfactory to find from the report of the Special Committee appointed to inquire into the Works Department of that body, that it was recommended to amend the standing orders by the insertion of words coupling the unions of employers, where such existed, with the trades unions, in reference to the rates of wages and hours of labour.

Mr. Howard Colls, in response, said that builders did not always receive the recognition they should. In particular he thought that builders should receive suitable recognition whenever they carried out satisfactorily large and important works.

Other toasts were: "The Merchants," proposed by Mr. Ellis Marsland and responded to by Mr. J. Fraser; "The President," proposed by Mr. T. F. Rider, the Chairman, responding; "The Past Presidents," proposed by Mr. E. Brooks, treasurer, and responded to by Mr. B. E. Nightingale; and "The Visitors," proposed by Mr. F. S. Oldham, and coupled with the name of our representative, who responded.

During the evening the Secretary read a list of subscriptions and donations promised, the total amounting to over £380.

Correspondence.

To the Editor of THE BUILDER.

ARCHITECTURE ON THE BEDFORD ESTATE.

SIR,—You will, I trust, allow me to express my perfect sympathy and agreement with your article in the last issue of the *Builder*, evoked by the extraordinary design—illustrated in that number—for the rejuvenation of Bedford-square. It is, unfortunately, but a fraction of that ever spreading process of the "vulgification," or, as it might well be called, "vulgarisation," of London, whose first unpleasant essays we are now witnessing, and which seems to drink in its ideals from the plate-glass and terracotta fripperies of the gin-palace. It is difficult to estimate the exact proportions of ignorance and stupidity—one must also add vanity—which direct these efforts. There is hardly a quiet or dignified corner of London in which the works of the last-century architect or builder, as the case may be, are not in process of being either wholly destroyed or else hopelessly degraded by the intrusion of incongruous neighbours. From the manner in which he thrusts his uneasy compilations into the company of the sober and well-calculated compositions of a bygone age, one might imagine that the modern architect believes himself to be possessed of a style of his own, whereas it is, I fear, the truth that he is for the most part too ignorant to appreciate the merits of what he destroys, and too conceited to intelligently copy even the examples that stand side by side with his own laboured inventions. Whether in Gray's Inn, in Lincoln's Inn-fields, or in the other parts of Westminster and Bloomsbury, these unpleasant contrasts between old and new—so little to the credit of the new—are being perpetually presented to us. It does not follow, as you so well

point out, that in order to make a house more satisfactory or more commodious, it is necessary at the same time to make it hideous. But it is to be feared that the vanity of the individual architect which impels him to intrude his own personality, the cost of artistic unity, and makes him study rather how to display his own cleverness than how to produce work which shall harmonise with what already exists, only too often precludes the possibility of altering (or adding) without at the same time deforming.

I only wish I could persuade myself that protest, however vigorous, could have any effect in diminishing the abuses of which you so justly complain. It has always seemed to me that the rationale of modern domestic architecture should be, and can be, placed on some sounder foundation than the boasting phrase, "I don't know what is beautiful, but I know what I like." That that combined expression of dignity, repose, and domesticity which a dwelling house should by rights possess, perfectly capable of being settled on a sounder basis than this humiliating axiom, I most sincerely believe, though, in view of the great distance which moderate taste has travelled from its former better regulated position, it would be impossible to demonstrate this in the space of a single letter, even of a very long one.

But, in the meanwhile, it is certainly the duty of all who are in the least degree careful of the beauty of our Metropolis, to protest against such transmutations as are projected on the Bedford Estate and to protest with vigour.

AMBROSE M. POYNTER.

* * * We do not know that Mr. Poynter's reference to the modern architect are entirely correct in this case; our complaint rather is that the houses and other buildings are being remodelled according to the ideas of the Bedford Estate Surveyors. Two of the new blocks of flats between Gower-street and Tottenham-court-road are in a good though simple and unpretentious style of architecture. Bedford Court Mansions, for which the exterior design was made by Mr. Vigers, and another block (of which we forget the name) by Mr. Brydon. These are quite unobjectionable architecturally; the objection to them is that they are part of the system of over-building; crowding the ground and shutting out light and air. If the Bedford Estate official architecture the visitor may form a good idea by looking at the treatment of the high wall bounding the new road north of Bedford Court Mansions which has been made ornamental (?) to increase the attractiveness of the neighbourhood.—ED.

VENNER V. McDONELL.

"STRUCTURE" IN THE LONDON BUILDING ACT.

SIR,—Referring to your article on the appeal verdict in connection with the above, in last week's issue of the *Builder*, may I be allowed to say a few words, as I am persuaded that not one in twenty of those who read the result of the appeal realised the circumstances of the case. The "structures" in question were not exactly as described—"movable seats" merely, but certain stagings or galleries of the ordinary type, averaging perhaps 13 ft. in height, and accommodating some thousands of people. The only difference, practically, between these erections and others of a similar kind—say those to be erected for the Queen's celebration (both having to be sanctioned by the London County Council, directly or by their officers) was that (a) they had been previously used; and (b) that, in the case of the one of which a model was shown, certain preparations had been made in the building itself, in the shape of eyes or sockets, for fixing such possible future constructions. For the upper staging, at the gallery level, of which as I pointed out, no model was shown, but which nevertheless contained nearly half of these seats, no such provision had been made—a point which, however, did not come into the evidence.

The Military Tournament, for which they were required, being an exhibition of which I could not plead ignorance, and in connexion with which, in the event of an accident, I might be called to account, I was desirous to have the question of my responsibility or otherwise settled.

The Act (Section 78) (Section 78) says:—"Every public building, including . . . every structure and work constructed or done in connexion with, or for the purposes of the same, shall be constructed in such manner as may be approved by the District Surveyor," which I took as applying to workmanship and materials, as well as to design, careless execution or improper or damaged materials being likely to mar the best scheme. In this view the magistrate at the first hearing appeared to coincide. It was distinctly brought out, and to this I call particular attention, that the whole point of the case lay in the fact that the structures in question were (as was admitted) in a public building, and consequently subject to special legislation; yet what is the astonishing conclusion arrived at in the verdict? This is that if the first finding was correct—viz., that stagings for thousands of people so erected in a public building required the supervision of the District Surveyor, then (*mirabile dictu*) it followed that "no person could put up a fixed cupboard or a fitted bookcase in his house without giving notice to the District Surveyor, and without being subject to his supervision!"

Really, comment seems almost superfluous. This will say, however, that whilst to put the staging erected for the Military Tournament (always crowded in every part) on the par with the fixing of bookcase is sufficiently startling; to make the latter irrelevant comparison of such a structure, appearing to be in almost the largest public building in the kingdom, with the fixing of a bookcase or cupboard in a private house, with which, of course, has absolutely nothing to do, is perfectly absurd.

GEORGE McDONELL.

. We think Mr. McDonnell misunderstands the point of the comparison made by the Court. We like it that it was only intended to show that the two cases would come legally under the same category. Practically, no doubt, there is much in Mr. McDonnell's argument; but in a legal sense we do not see how a detached framed seating, removable when required without taking it to pieces, can properly come under the head of a "structure" in the sense in which the word is used in the Building Act.—Ed.

ST. NICHOLAS, KEYINGHAM.

SIR,—May I beg space to call the attention of archaeologists and lovers of old churches to the deplorable condition of St. Nicholas, Keyingham, Holderness?

The building consists of nave and aisles, tower, hancel, and chantry chapel. The condition of the north aisle is very serious indeed; the west wall without shows several wide cracks, one of which separates the coping-stones of the battlement by six inches. The east wall is merged, and the secondary apertures, rising from the springs of the first arches, are all out of line, while the whole window seems to be falling outwards. The cracks thus formed show inside as well; the north wall bulges in one place and leans considerably, and the rain drips in through the roof, which is broken in several places with the drain.

Can nothing be done to save this beautiful old church from ruin? Holderness has many such historic remains, but England cannot afford to lose one of them. The neighbouring churches of Winestead, Patrington (Decorative and Perpendicular, with an eastern "sepulchre") and Hedon (Norman, Early English, and onwards), have been put into good and careful hands; cannot something now be done for St. Nicholas? The Vicar, Mr. Tomlinson, or Mr. B. Mundell, Mount Pleasant, Keyingham, E. Yorks, will be glad to facilitate in every possible way the researches of any one interested enough to visit and investigate the place, and I sincerely hope this appeal may stimulate some archaeologists to such action.

HARRY LOWRIERSON.

A PARTY-WALL QUESTION.

SIR,—A, in erecting a building, agrees with B, owner of adjoining land, to build a party-wall half on B's ground and half on A's, with the understanding that when B builds he shall pay A half cost of party-wall. B later on builds, and decides to carry his building higher than that of A, and claims the right to build on the whole thickness of the party-wall as A has done; but A says he cannot use more than one half without paying compensation. Which is right?

"NEWPORT."

The Student's Column.

SPECIFICATIONS.—XV.

ELECTRIC WIRING.

EARLY all large installations are put in the hands of a consulting engineer. He, to prevent disagreement or confusion, draws up a set of rules and conditions called the "Specification." No departure from it by the contractor is allowed without the consulting engineer's permission, and the contractor is not compelled to do any work not specified in it. As a rule, therefore, it goes as much into detail as possible. For the benefit of the readers of this column, we append the general form and wording of a specification for the installation of the electric light in a private residence in the West End. For the sake of brevity, we have omitted the upper floors.

The contract will be preceded by certain general clauses which do not differ in intention and effect from those usually attached to any other contract for building work; but there are other clauses which it is advisable to attach specially to a contract for electric wiring, in view of the special nature of the work, and the serious risks which must arise from any incompetent performance of the work. Such are the following:—

All the work mentioned in this specification shall be executed and completed by workmen of undoubted competency, efficiency, and good conduct, and no part of the work shall be done by task work. The Contractor shall not make

any sub-contract for the execution of the whole or any part of the work to any person whatsoever, without the express permission in writing of the engineer.

Then will follow clauses of much the same character as in a general specification, empowering the engineer to condemn and require the removal of any improper material or such as is not in accordance with the specification, providing for the recovery at law of losses caused by bad work, or the proportionate deduction from the sum to be paid to the contractor, for carrying out the work without delay and without interference with the work of other contractors, and for the compulsory discharge of incompetent foremen or workmen.

Upon the signing of the contract, the contractor shall supply any sample of material or workmanship hereinafter described that the engineer may demand.

The contractor shall at all times keep on the work a copy of the plans and specifications, drawings and measuring instruments, and such apparatus as shall be necessary for making any test of the work that the engineer may demand.

The contractor shall guarantee to maintain and uphold the work in perfect condition, both electrical and mechanical, for the time of twelve calendar months from the date of the completion of the contract.

Then follow the usual provisions as to payment, and as to the action to be taken in case of the death or insolvency of the contractor, which need not be specially gone into.

Description of Work, Quality of Materials, &c.

Cable Mains and Branch Leads.—All mains, sub-mains, and branch leads shall be of copper, having a guaranteed conductivity of at least 98 per cent pure copper, according to Mathiessen's standard, and they shall be insulated with pure and vulcanised india-rubber and taped; the whole vulcanised waterproof so that the insulation of the said mains, sub-mains, and branch leads shall be 2,000 megohms per statute mile, and shall be equal to Henley's Class A cables.

No main, sub-main, or branch lead shall consist of a single wire, but shall be composed of small wires stranded together, and the size of each main, sub-main, or branch lead shall be so proportioned that when the maximum current is passing, no more than 600 amperes per square inch section is flowing through any conductor. The smallest sized wires to be used shall be $\frac{3}{16}$. The sizes of other branch leads, other than $\frac{3}{16}$, are shown in schedule A.

The sizes of mains and sub-mains are shown in schedule B.

Joints.—Joints under floors, or in any inaccessible position, are to be absolutely avoided. The ends of the mains, sub-mains, and branch leads, before being connected to switches, fittings, and fuse boards, &c., shall be carefully stripped of all braiding and felt, care being taken not to injure the rubber insulation, to a distance of at least 3 in., and the exposed rubber shall be carefully cleaned with naphtha, and in no case shall bare wire come in contact with other than the provided metal connexion of fitting, but shall be protected by its vulcanised rubber covering.

Piping.—All wires or cables shall be run in seamless tempered steel pipes preferably well insulated on the inside, of approved design, in continuous lengths, with all necessary angles and bends soldered thereto. After these pipes are fixed, they shall be painted with a good coat of oil paint. Samples of these pipes shall be sent to the building, and tested and approved by the engineer for resistance to nails, &c. The pipes on top floor are to be run in the roof, and the switch wires are to be run in lacerated brass tubes, for this floor only.

Wall Boxes.—Where the pipes project beyond the point where the branch leads, sub-mains, or mains are drawn from them, a teak block shall be fixed to the wall over the end of the pipe. Where the tubes or casings enter these blocks, they shall be connected with rubber or a suitable compound. These blocks shall serve as fixings for brackets and switches and plugs.

Where mains, sub-mains, or branch leads are run through brick walls or concrete floors, they shall be enclosed in extra strong large steel pipes.

Distributing Boards.—Every branch lead shall be run on both poles, from a point on a double pole distributing fuse-board, so constructed that the boards are built up of separate pieces of metallic conductor, and bars of same mounted

on separate pieces of porcelain—one pair for each point—the porcelain being so shaped that one end forms a fireproof division separating the poles. The whole to be enclosed in a hard wood box with glass front, and fitted with lock and key of approved make. The size of these boards are shown in Schedule C, and they are to be obtained from Messrs. Z. & Co.

All points on these boards must be labelled with approved ivory tablets.

Samples of these boards are to be submitted for the engineer's approval.

In fixing these boards a fillet of hard wood shall be attached to the wall, and the boards secured to same, having a sheet of india-rubber, $\frac{1}{8}$ in. thick, placed between them.

Provide and fix all necessary clip fuses with porcelain backs.

Double Pole Switch.—Provide and fix a double pole switch, quick make and break, mounted on porcelain, to be enclosed in a hard wood or iron box, with glass front and lock and key. This switch shall be capable of carrying 50 amps. of current at 200 volts pressure.

Main Switch Distributing Board.—Provide and fix a main switch distributing board, consisting of two pieces of slate of best quality, channelled on both sides and through all holes, and separated by a hard wood fire bar, on which shall be fixed, connected to suitable copper omnibus bars of correct section, three 20 ampere D.P. switches (properly labelled with ivory tablets).

The whole to be enclosed in a hard wood case, with glass front, and provided with a lock and key of approved make.

A sketch of this board must be sent in with tender, for the engineer's approval.

Single Pole Switches.—Every light shown in schedule A shall be provided with a quick make and break switch of the "Tumler" type, mounted on a porcelain base, and provided with an extra heavy metallic cover to be selected.

These switches must be constructed that there is no possibility of contact between the outside cover and the live contacts.

A sample of these switches shall be submitted to the engineer for his approval.

Switches in places to be assigned by the engineer may be mounted on hard wood blocks, with moulded edges of approved design.

Wall Plugs.—Provide all necessary wall plugs of approved make.

Distribution.—At a point in the basement, to be fixed by the Electric Supply Co., and at which they will fix their cut-out, the main 10/18, having loops left for meter connection, shall be carried to the double pole switch, and from thence to the three switch distribution board. From each of these switches a 7/18 sub-main is to rise to the three boards coloured blue, red, and green on the diagram, from which boards all points of similar colours are to be run on both poles.

Note.—All wires are to be drawn into pipes after plastering is complete, and so that they can be drawn out again if necessary.

Tests.—At such times as the engineer may demand, tests of the work shall be made by the contractor, both for continuity and insulation between the poles and to the earth, and the final test being made at a pressure of 200 volts, shall be such that it meets with the entire satisfaction of the engineer, of the Electric Supply Company, and of the Fire Office.

Provisions.—Provide the sum of 10l. p.c.v. for extra wiring, &c., to be deducted in full, or in part if not required.

Provide the sum of — p.c.v. to be paid to the engineer for copies of plans and specifications.

Notes.—The contractor shall do all the necessary cutting away and shall make good in the best Parian cement, to the engineer's and architect's entire satisfaction, but so as to avoid disturbing the existing arrangements, and shall work to the engineer's express instructions.

All local switches shall be fixed on lock side of door, or where the engineer may direct.

When convenient, more than one pair of conductors may be run in one pipe, and for the purpose of identification, the contractor shall in every case run all the positive leads with red, and all the negative with black wires and cables.

The contractor at the finish of the work shall clean up and remove all debris and superfluous material, &c., that has been caused

during the progress of the work, and shall leave all to the satisfaction of the engineer.

SCHEDULE A.

Position of Point.	No. of Points.	Size of Lead other than 3/32.	Description.	Switches.
First Floor.				
Drawing-room...	2	7/32	6 pendants	6
Ground Floor.				
Dining-room...	1	7/32	1 4-lt. electro-roller...	2
Morning-room...	1	—	—	—
Billiard-room...	1	7/32	6-lt. fitting...	2
Water-closet...	1	—	Pendant...	1
Passage...	2	—	2 pendants	2

These prime cost values include complete fittings, including lamp-holders and fixing; sketches are to be submitted on demand, and the whole or any part of the values may be omitted at the option of the employer.

SCHEDULE C.

Mains, 19/18.	Submain to basement,	7/18.
	ground-floor, 7/18.	
	first-floor, 7/18.	

SCHEDULE D.

DISTRIBUTION BOARDS.			
Main, 3 way.	25 amp.	Switches and fuses.	250 volts
Basement,	10 way board.		
Ground-floor, 12 "			
First-floor, 14 "		This board to have four ways arranged for master switch	

SCHEDULE E.

BELLS.
One push, p.c.v., 15s., to be fixed at entrance. Vulcanised wires to be run in compo tubes to two 6-in. gongs; one in basement passage and one second-floor. A suitable battery to be provided.

OBITUARY.

MR. R. S. PARKER.—The death has just occurred of Mr. R. S. Parker, the principal in the firm of Patman & Fotheringham, builders and contractors, Islington. The business will be carried on in future by Mr. James F. Parker, and Mr. Alfred E. Parker.

MR. HOPE M'LACHLAN.—We greatly regret to have to record the death of this talented and original landscape painter, who had made a mark of his own in contemporary landscape painting, and for the last few years one learned to look out for his contributions to the Academy and other exhibitions as things which were sure to have some original interest. Mr. M'Lachlan delighted in studies of special effect of composition and light in landscape, especially effects of storm or of twilight and even night. He treated such scenes in an exceedingly broad and massive manner, and with rather an ignoring of local colour; and sometimes no doubt, "breadth" was carried a little too near to roughness of execution; but there was always a stamp of power on his work.

GENERAL BUILDING NEWS.

WESLEYAN CHAPEL, BARNSELY.—The new chapel of the Wesleyan Reform body, at Doncaster-road, Barnsley, was opened on the 1st inst. The new chapel will accommodate some 400 worshippers. It has been built from the designs of Messrs. Senior & Clegg, architects, at a total cost of something over 1,000l.

ST. MARY'S MONASTERY, KINCOLL, PERTH.—This building was begun in the year 1867, when the house, consisting of dormitories, refectory, library, kitchen, &c., was erected. In the following year the church, monastery, chapel, and crypt were built, and now the novitiates' wing, consisting of dormitories, common-room, library, and oratory, has been completed. The church has sitting accommodation for 200; the house has apartments for the Fathers, and large dormitories for lay and other brethren, while the new wing provides thirteen rooms for novitiates, and dormitories and other accommoda-

tion for the brethren. The new wing also contains an oratory and library, and a lecture-room for the novitiates. The whole of the buildings have been heated on the low pressure hot-water system, with large pipes round the outside walls and radiators where required, a new drainage system has been carried out, and alterations in the grounds and terraces have been made. The construction of the original building, church, and novitiates' wing cost about 20,000l., exclusive of the site, altar decoration, furnishings, and fittings. The original building and church were designed by the late Mr. Andrew Heiton, and the novitiates' wing by Mr. A. G. Heiton, Perth. The following local tradesmen were employed in the execution of the recent works:—Mason, Messrs. W. & C. Duncan; joiner, Mr. P. Johnston; slater, Mr. J. Carmichael; plumber, Mr. J. McLeish; plasterer, Mr. A. McRitchie; painter, Mr. G. Muirhead; glazier, Mr. C. Alexander; grates, Mr. A. McGregor; roadways, &c., Messrs. W. & R. Taylor.

PUBLIC BATHS, KINGSTON.—The foundation stone has just been laid, in Wood-street, Kingston, of new public baths. The inside measurement of the bath-house is 107 ft. in length and 46 ft. in width. The swimming pond is 90 ft. by 30 ft. The dressing boxes on either side will number fifty-one, with foot-space in front; and above these is a gallery, 8 ft. 6 in. high, extending all round the bath, to be used for witnessing swimming entertainments, &c. The pond will be supplied by a well at the rear of the building, and water will also be laid on from the company's main. The deep end of the bath is to be 6 ft. 6 in., and the shallow end 3 ft. 6 in. The floor is to be paved with glazed bricks and the sides with white glazed tiles. Lighting will be from lanterns in the roof, and electric light. Sixteen slipper baths will be provided, first and second class, each supplied with hot and cold water. The building is being erected by the Council of Kingston, from plans by Messrs. Francis S. S. and M. B. Adams, with the aid of Mr. Hessel Tilman, as professional adviser and expert. The frontage of the baths in Wood-street will have three entrances to the main building and one to the gallery only, and there is to be an extra exit opening out to Thames-street. Mr. C. J. Parker is clerk of the works representing the Corporation.

THREE LIBRARY, WICK.—The foundation stone of the Carnegie Free Public Library, Wick, was laid recently. The building will occupy a site on the elevated open space in front of Sinclair-terrace. Plans for the new building were prepared by Messrs. Leadbetter & Fairley, Edinburgh, which provide libraries, reading and recreation rooms, and a museum. The cost will be nearly 4,000l., and the contracts for the various parts of the work have been entered into. The total number of volumes provided for is 8,400.

A NEW WELSH CHURCH FOR LONDON.—A new church and mission buildings, dedicated to St. David, and erected near Paddington-green, has just been opened. The new building, which is capable of seating about 400 people, has been designed by Mr. C. Evans Vaughan in the Gothic style. Under the church proper is a hall, which is used as a Sunday school, and during the week for meetings and concerts. At the back of this hall are the caretaker's rooms.

CHURCH, BEAMINSTER, DORESHIRE.—On the 29th ult. the new church of St. Mary, West Fordington, was dedicated by the Bishop of the Diocese. Plans were prepared by Mr. C. E. Ponting, F.S.A., of Marlborough, and the work has been carried out by Mr. H. Hoskings, of Hungerford, Wilts. The new church has a total length to the apex of 135 ft., the length of the nave is 95 ft., and its breadth 42 ft. The church is constructed of corrugated iron, on a framework of wood, and the interior is plastered. The roof is surmounted by a bell turret.

NEW THEATRE, COVENTRY.—A movement is on foot at Coventry to build a second theatre, to be called the New Grand Theatre of Varieties, on the site of the old Theatre Royal, Smithford-street, the frontage being brought up to the level of the street. The plans for the new building have been prepared by Mr. W. G. Sprague, architect, London.

NEW WESLEYAN SCHOOL CHAPEL, BROAD-HEATH, ALTRICHAM.—The memorial stones of the new school chapel at Broadheath were laid recently. The school, it is estimated, will accommodate between five and six hundred scholars. The large room will seat about 350 persons. There will be three class rooms and an infants' room. Behind the platform vestries will be placed. A gallery and three class rooms are arranged for the front of the building, and these will be flanked on each side by the staircase and principal entrance. Rooms for storage, the heating chamber, &c., will be provided in the basement of the building. Externally the front and side elevations will be faced with red stock bricks with terra cotta mouldings, &c. It is proposed to cover the roofs with red Runbon tiles, and the vaulting turret with oak shingling. The floors inside will be of pitchpine, and will also be of screens, gallery front, and roof timbers. The architect is Mr. A. W. Smith, of Manchester, and the principal contractor, Mr. J. E. Dean, of Sale.

NEW POST OFFICE, ABERFELDY, PERTH.—The new post office in Dunkeld-street, Aberfeldy, was opened for public business on the 29th ult. The public office is 18 by 15 ft., the sorting-room 27 ft. 6 in. by 10 ft., and the telegraph-room 16 by 18. The

contractors were:—Mason, Mr. John McNaughton; joiner, Mr. Donald Reid; plasterer, Mr. John Scott; slater, Mr. Alexander Robertson; plumber, A. Menzies; architect, Mr. William Bell, C.E.

CATHOLIC CHURCH, HEATON NORRIS, LANGLISHIRE.—The foundation stone has just been laid. Heaton Norris of the new St. Mary's Roman Catholic Chapel. The architects are Messrs. Pugh & Pugin, of London, and the builder is Mr. Joseph Heaton Norris. The building will be in the Gothic style, and will accommodate 200 people. It will be 92 ft. 8 in. long from wall to wall, and 40 ft. wide. The cost is estimated at about 4,000l.

THE PROPOSED MUNICIPAL BUILDINGS, LLANDUDNO.—A meeting of the Llandudno Urban District Council was held recently to discuss the question of the erection of the proposed municipal buildings. The majority of the members were strongly opposed to spending 14,000l., the original estimate being 10,000l. Mr. T. T. Marks moved, and Mr. Beveseconded, that a committee of seven be appointed to meet Mr. Silcock, the architect, at an early date with a view to altering the elevation, using a different kind of stone, and generally reducing the cost, so that it should not exceed 12,000l. Mr. E. J. Sarson moved an amendment, and it was seconded, that it is not expedient to spend more than 10,000l. on municipal buildings. Mr. Marks's resolution was carried.

ADDITIONS TO CATERHAM ASYLUM.—An ordinary meeting of the managers of the Metropolitan Asylum District was held at the County Hall, Spring Gardens, London, on the 27th ult. Sir E. H. Galsworthy, the Chairman of the Board, presiding. The Board elected the tender of Mr. Solder, Hipwell, & Wisbeck, to erect for the sum of 3,000l. a home for the female attendants at the Caterham Asylum, in accordance with the plans and specifications prepared by Mr. E. T. Hall, architect. The architect's final estimate of the work was 5,000l. Plans were approved for the erection of a new pavilion, to contain twenty-eight beds, at the South-Western Hospital, and in the main engineering work required in connexion with the extension works, in course of progress at the Western Hospital. The architect's estimate of the cost of the erection of the pavilion was 5,745l., and of the engineering work 4,000l.

ENLARGEMENT OF ST. MATTHEW'S MISSION CHURCH, MONMOUTH GREEN, WOLVERHAMPTON.—Alterations and additions are now being carried out at the Mission Church, Monmouth Green. A change is being added to the front of the building, and new schoolroom provided at the back. The partition-wall that separated the old schoolroom from the mission has been taken away and the two rooms thrown into one. The transformation of the building into a church is being carried out under the supervision of Mr. Lovender, architect, and the contractors are Messrs. Halfpenny Bros., builders.

INFECTIOUS DISEASES HOSPITAL, HAM GREEN, BRISTOL.—The new infectious diseases hospital, Ham Green is approaching completion. The building is being erected from the designs of Mr. Yabbieom, City Engineer. The plan provides for four wards and an isolation ward, and each ward a separate building with a space of 40 ft. between each. There will be seventeen beds in each of the four wards, while the isolation ward is divided into four apartments with two beds in each. The Ham Green mansion is being fitted up to serve as the head-quarters, with accommodation for the resident doctor and the staff of nurses, attendants, &c. The total cost will be about 27,000l. The buildings have been planned with a view to possible extensions. The buildings are of red brick, with freestone dressings.

THE NEW CAMBRIDGE THEATRE OF VARIETIES.—The new Cambridge Theatre of Varieties, at the Guildhall School of Music, laid the foundation stone on the 31st ult., of the new building which is to take the place of the old Cambridge Music Hall in Commercial-street, E., destroyed by fire in January last year. The new hall is to be in the Moorish style, of red brick, with Bath stone dressings, and designed by Mr. Henry Percival, architect, London, and will accommodate an audience of about 2,500. Every part of the building will be provided with gas, distinct exits and fire-proof staircases. The pit and stall floor will be about 10 ft. below the level of Commercial-street; the first circle will be about the street level, with a gallery above. The building, which will cost 25,000l., will be supplied with hot water coils for heating purposes, and will be lighted by electricity.

POLICE-STATION, COVENTRY.—Colonel John O'Hanlon, R.E., Local Government Inspector, recently held an inquiry into the application by the Corporation to borrow 4,571l. for new police buildings. Mr. H. Quick, the architect, gave evidence as to the details of the scheme.

LIBRARY, ST. GEORGE, BRISTOL.—Mr. Francis Wills has prepared designs for the new public library for St. George. The structure is to be built of Cattybrook bricks, with Ham Hill stone dressings. The library buildings will have a frontage about 78 ft., and a depth 75 ft. or less. The building will be heated by hot-water apparatus by Messrs. J. Crispin & Sons, of Bristol. The cost is estimated, will be not far short of 6,000l. Mr. Frank Cowlin is the contractor.

NAVAL ENGINEERING COLLEGE KEYHAM.—New south wing has just been added to this college.

FOREIGN.

FRANCE.—By order of the Minister of Public Instruction and Fine Arts, the designing and modelling courts of the Ecole des Beaux Arts, the library, and the galleries of this establishment will henceforth be opened to girls and young women between the ages of fifteen and thirty, who will be able to produce (with a certificate of identity), a certificate given by an artist showing that they are qualified to compete for entrance. From Monday last the Louvre and Luxembourg Museums are to be opened from nine in the morning till five in the evening, the Cluny and Versailles from eleven till five, and the Sevres and Gobelins manufactories from twelve till five.—The medallion of Alfred Darcel, late Director of the Cluny Museum, has just been placed in one of the halls: it has been modelled by Madame Albazzi.—The "Societe Historique d'Antiquite de Passy" have opened a subscription to erect on the lawn at Ranelagh, near the Gare de Passy, a monument commemorating the arrival of the Emperor and Empress of Russia. The monument is to be executed by Gustave Michel, sculptor.—The Municipal Council in Paris has just opened a limited competition between the artists Carriere, Lenolle, Victor Prost, and Maurice Eltort, for the decoration of the ceiling of the library of the Municipal Council at the Hotel de Ville. The judgment will be given at the end of June.—The destruction of the old bridge of Limay is announced. It is well known amongst the landscape painters and archaeologists.—The Municipal Council of Paris are endeavouring to preserve part of the church of Saint Pierre de Montmartre, the destruction of which had been decided upon.—An important exhibition of china will be opened on May 15 at the Palais des Beaux Arts in the Champ de Mars.—A national exhibition of industry and fine arts will be held at Rennes on May 2, and kept open three months.—There is a talk of erecting a new Hippodrome, larger and better designed than the old building in the Avenue d'Alma, in the neighbourhood of the Place Clichy, on the site now occupied by the Convent of the Sacre Coeur.

GERMANY.—The Government are considering the advisability of selling the old Botanical Gardens at Berlin for building purposes. The value of the ground is estimated at 800,000l.—The Prussian Government is now considering the advisability of extending the Central State Hospital at Berlin, and a Bill has been presented to this effect.—Negotiations are now being carried on energetically as to the entire revision of the Berlin Building Act, and one of the principal points now under discussion is that of the minimum superficial area to be left as courtyards in city property.—At the Schinkel Celebration, which was held under the auspices of the Architectural Society of Berlin, the Minister of Public Works presented the medals, whilst Herr Zekeli delivered the oration.—A large hospital is to be erected at Lichtenfelde, near Berlin.—Professor Reinhold Beggs arranged a very unique celebration at his studio on the completion of the national monument, which included the representation of a satirical play, dealing with the art questions of the day, written by the manager of the Court play-house.—The post of City Engineer at Berlin has now been filled by Herr Krause, of Stettin. There were a number of candidates, but his appointment was by 111 votes against 71 for the next candidate. Herr Krause held the post of City Architect at Stettin since 1860.—Westphalia is to have a county hall, and a competition has been held with the view of obtaining a suitable design. The Town Hall at Munich is to be considerably enlarged at a cost of nearly 200,000l. Professor Hanbrisser will be the architect of this addition, and he was also of the original building. The new works will be spread over five years.—We regret to record the death of Professor Wagner, of Darmstadt, who was closely associated with the work of the Technical College of that city for over twenty-eight years.

AUSTRIA.—The Vienna Municipality is at last closing some of the many insanitary basement dwellings which have long been a disgrace to the city.—We notice that the Government scheme of covering in a part of the old River Wien, with the view of running a new Danubian Railway on the line of this water-way, has had the approval of the Municipality.—There is to be a monument erected to the Emperor Joseph at Baden, a summer resort close to Vienna.—The Council Chamber of the Houses of Parliament at Vienna is to have a new system of lighting.—The respective Governments of Austria and Germany have now decided on a direct line of telephone between Budapest and Berlin.—The annual Art Exhibition at the Central Society of Artists of Vienna has been opened. This year it is a very small exhibition, only 430 pictures having been hung. There is a small section for sculpture and architecture. The Emperor visited the Exhibition on its opening.—It has practically been decided by the representatives of the Amalgamated Society of Artists of Austria to erect a special art exhibition building, and the site selected is that of the old Franz Josef Barracks. A temporary building is first to be erected, and the Municipality has put the ground at the disposal of the promoters free of charge for the next ten years, after which, however, a ground rent will have to be paid in the event of the larger structure being carried out.

ZURICH.—Four miles distance from Zurich, in a place called Schlieren, extraordinary activity is being displayed in the construction of the works of the North-Eastern Railway and the gasworks. A new city is rising, in which some thousands of operatives will very shortly take up residence. It is expected that this little town will contribute to prevent the augmentation of the population of Zurich for at least a few years.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. F. Britton, Builder, has removed from Leconfield-road to 459, Caledonian-road, London, N.

GOOD FRIDAY WEEK.—Next week, in consequence of the Easter holidays, we go to press a day earlier than usual. All communications for the Editor must reach him by first post on Wednesday morning, except lists of tenders, which will be moved up to 10 a.m. of the same day.

DECORATIVE PANELS, BIRMINGHAM TOWN HALL.

—The Estate Committee report the gift, from Mr. Alderman Kenrick, M.P., of four panels, designed and executed by students of the School of Art, for the further decoration of the Town Hall. The titles of the panels and the names of the artists are as follows: "Instrumental Music," by Mr. Sidney H. Meteyard; "Vocal Music," by Mr. Henry A. Payne; "Lench's Trust Almshouses," by Miss Kate E. Binne; "Dr. Sacheverel," by Mr. Bernard Sleigh.—*Birmingham Post.*

A DISCLAIMER.—Messrs. Grover & Grover, Ltd., of Paxton-road, Tottenham, ask us to state that Henry Grover, builder, of Enfield Highway, is not and has not been at any time connected with their firm.

THE WIDENING OF FLEET-STREET.—On the 30th ult. the Commissioners of Sewers held their usual fortnightly meeting at the Guildhall, Mr. H. G. Swallman in the chair.—Alderman Treloar, with reference to the widening of Fleet-street, moved:—"That it be an instruction to the Finance and Improvement Committee to take the necessary steps to acquire, as speedily as possible, all interests in the properties needed for widening Fleet-street between Bride-lane and Salisbury-court." He said that the cost of this improvement was estimated to be somewhere near 100,000l., of which sum the London County Council had agreed to pay half. When Ludgate Hill was widened by 10 ft. it took thirty years to complete the improvement by the process adopted. The same method was being suggested in the Fleet-street widening, but he thought that a more expeditious mode should be carried out. At present notices were served on freeholders with a view of acquiring their interests, while the leases were allowed to expire by lapse of time. That way of going to work necessarily took a long time, much to the detriment of public interest. His proposal was that the leaseholders as well as freeholders should be bought out at once, so as to complete the improvement in a reasonable time.—After a short discussion the motion was agreed to almost unanimously.

DISCOVERY OF AN ANCIENT DOORWAY IN COLEHILL, TAMWORTH.—In the course of the excavations which are being made at the corner of Church-street and Colehill, for the purpose of erecting new premises for the Tamworth Co-operative Society, the men employed by Mr. E. Williams, the contractor, came across the stone step and jambs of an old doorway, the hotel having disappeared. The doorway faced Colehill, and the step was about 4 ft. or 8 ft. below the present level of the street. The jambs were rudely ornamented.

ANNUAL DINNER, INSTITUTION OF CIVIL ENGINEERS.—The annual dinner of the Institution of Civil Engineers took place on the 31st ult. in the Hall of the Merchant Taylors' Company, Threadneedle-street, Mr. J. Wolfe Barry presiding over a large gathering of members and guests. The usual loyal and patriotic toasts were duly honoured, and the Duke of Teck briefly acknowledged that of "The Prince and Princess of Wales and the other members of the Royal Family." The President next proposed "Her Majesty's Ministers," and Lord G. Hamilton replied. The toast of "The House of Commons" was then given by the President, the Lord Chancellor responding for the Lords, and the Speaker replying for the House of Commons. The President having proposed "Health and Prosperity to the Merchant Taylors' Company," and Major-General Sim having acknowledged the toast, Sir L. Simmons gave the toast of "The Institution." The President, in the course of his reply, remarked that the Institution had on the previous day by a unanimous vote adopted a new departure, and from that time forward admission to the organisation would be gained either by scientific examination or by the submission of some valuable paper or thesis. He thought this new departure would be of very great value to the world at large, as it would be a guarantee that the members and associate members of the Institution had a grounding in that scientific knowledge on which all civil engineering must always be based. It would also be of great value to the Institution as a body by raising it to its proper position, and enabling it to keep pace with those developments of scientific research which were being constantly brought to light. The company then separated.

RESTORATION OF THE PENDEDE TOWER, DUNFERMLINE.—When Mr. Andrew Carnegie visited his native city in the summer of last year, he suggested that the Pendede Tower, which at one time formed the connecting building between the Royal Palace and the Abbey, should be repaired and converted into a tower for Dunfermline curios. The suggestion was placed before H.M. Office of Works by a local committee, and the office sanctioned the scheme, and appointed one of its officers, Mr. Hawks, to superintend the work. What remains of the tower is 47 ft. in height, 35 ft. in length from north to south, 15 ft. in breadth at the northern end, 18 ft. 6 in. at the southern arch. The lower flat consists of three rooms, and the upper room, or museum proper, is 26 ft. 6 in. from north to south and 13 ft. 6 in. from east to west. The windows in the lower flat have been filled in with cathedral glass, and in the museum the Dunfermline arms and the Scottish Lion are emblazoned on the north and south windows respectively. The floors have been all laid with pavement, and an oak stair leading from the basement to the upper flat has been introduced.—*Glasgow Herald.*

THE SANITARY INSTITUTE.—We have received the annual report of this Institute, in presenting which the Council observe that what is now needed is not so much an awakening of the public as to the necessity for combating preventible diseases, as the imparting of instruction in the best methods to be employed in accomplishing this important task. They have endeavoured to meet this need by developing the educational value of the meetings, lectures, and demonstrations at the Institute, and by improvements in the permanent museum and exhibitions, while throughout the country the congresses held by the Institute, and the exhibitions connected with them, are rapidly increasing in importance, and in the influence that they have on matters connected with the wide field of sanitary science. A sketch map, showing the centres to which the work of the Institute has been extended, is given at the end of the report.

APPOINTMENT OF SANITARY INSPECTORS.—The Local Government Board has sanctioned the appointment of Messrs. H. F. Bridal and J. Peers as Sanitary Inspectors in the parishes of Bethnal Green and Islington respectively.

HAMPSTEAD HEATH PROTECTION SOCIETY.—On Wednesday, Mr. E. Brodie Hoare, M.P., presided at a public meeting at the Drill Hall, Hampstead, called for the purpose of forming a society for the protection of Hampstead Heath and the preservation of its natural beauties. Amongst those who have already promised to join the society are the Duke of Westminster, who has consented to become the patron, Sir Walter Besant, Miss Octavia Hill, Messrs. W. B. Richmond, R.A., Norman Shaw, R.A., David Murray, A.R.A., Mr. Samuel Hoare, M.P., seven other members of Parliament, the Bishop of Exeter, &c. The Chairman advocated the desirability of interfering as little as possible with the natural beauty, the natural growth of plants and shrubs, and the natural bird life, on the heath, and also impressed upon those present the necessity of working in harmony with the London County Council.—Mr. E. E. Lake, churchwarden of the parish, moved "That it is desirable to forthwith form a Society for the protection of Hampstead Heath and the protection of its natural beauties." Mr. J. Hardestad seconded. The Chairman read a letter from the Hampstead Art Society, expressing their sympathy with the object of the meeting. Mr. J. B. Wilkin said that the resolution was "too arduous" for him. He considered that great credit was due to the London County Council for the work they had done in making the heath and Parliament Hill fields accessible to the public. He contended that the people of Hampstead, or many of them, were selfish, and did not like to see good footpaths, which enabled the people of London to get about the heath freely. The resolution was carried unanimously, and it was afterwards decided to call the Society the Hampstead Heath Protection Society.

ARCHITECTURAL ASSOCIATION SPRING VISITS.—We are obliged to hold over the account of the visit last Saturday, which reached us too late to find space for it.

CAPITAL AND LABOUR.

THE DISPUTE BETWEEN MASTER BUILDERS AND OPERATIVE BRICKLAYERS, WOLVERHAMPTON.—At a meeting held at the Star and Garter Hotel, on March 17, the representatives of the Master Builders' Association met the representatives of the Operative Bricklayers' Society in order to try and come to some amicable arrangement of the points in dispute, and so avert a strike on the part of the bricklayers. We understand that it was decided by the members representing the workmen to accept the terms offered upon their behalf. The settlement gives the men an advance of one halfpenny per hour in wages, an hour for dinner during part of the short time in winter (in place of half an hour), half a mile less walking distance, improved conditions as to overtime and lodgings, and also provisions as to giving notice of alteration of rules. The settlement arrived at was laid before the members of the branch on the 24th ult., when they expressed themselves as perfectly satisfied with the settlement arrived at by their representatives. The new rules come into force on the first day of May.—*Midland Counties Express.*

LEGAL.

APPEAL AGAINST A DISTRICT SURVEYOR.

THE 30th ult., the case of Bodley v. Marsland, a case of considerable interest to builders, before Mr. Hopkins at the Lambeth Police Court. It was an appeal under Section 150 of the Building Act, 1894, by Mr. Bodley, as builder proposing building at No. 7, Allyn-road, Park Lane, Camberwell, against an objection made by Ellis Marsland, the District Surveyor of Camberwell. Mr. Blackwell, barrister, who appeared for the appellant (instructed by Mr. Francis Howse) appeared, in opening the case, that on January 28, 1897, Mr. Bodley served upon Mr. Marsland notice required by Section 145 of the London Building Act, 1894, of intention to make an addition to the premises, 7, Allyn-road. The effect of the addition, if carried out, would have been to increase the area of the building beyond ten squares to bring the building within Section 74 (2) of the Building Act. Mr. Marsland refused his consent to alteration unless the portion of the premises as a shop was separated from the part used as dwelling house by fire-proof floors. As the effect this would have been to involve very considerable expense, it was determined to modify the plan, instead of building an annex to the existing premises, to build a separate structure, the new building, however, separated from the existing only by about a space of 9 in. Mr. Marsland agreed to have regarded this as an attempt to bring Section 74 and stated that the written notice objection he had given would apply also to the modified plan. Accordingly a summons was taken out by the Section and the parties appeared before the learned magistrate. Mr. Marsland cross-examined the witnesses to show as there was a door in the existing building, and as proposed to put a door in the new building, two buildings would be united by the openings, he called attention to Section 77 of the Act, which meant that section supported his view. Blackwell, in reply, submitted that two buildings could not be united merely by making openings two walls, unless the two walls were in physical contact with one another. Two houses on opposite sides of a street were not united by the fact that there were doorways precisely opposite to one another. The idea that it could be so could not, he thought, have entered the mind of any man who was a District Surveyor. The learned Magistrate adopted this view, and made an order disallowing the District Surveyor's objection to the plans submitted.

* The foregoing account is furnished to us by Messrs. Howse & Co., the appellants. Accepting it as correct statement of the facts, we have no doubt that the judgment of the magistrate is technically correct, and that as the law stands he could have decided otherwise; but we do not think it clear is very creditable to the appellant. It appears to us to be an evasion, through a technicality, of the essential intent of the Building Act, D.

A BUILDER AND HIS PLANS: CASE IN THE COURT OF APPEAL.

THE case of Smith v. The Chorley Rural District Council came before the Court of Appeal, composed of Lord Justice Lindley, Lord Justice Lopes, and Mr. Justice Chitty, on the 5th inst., it being an appeal by the plaintiff from a judgment of Mr. Justice Kennedy in action brought by the plaintiff, a builder at Chorley, for a mandamus to compel the Council to approve the plans of a house in Back-lane, Chorley, Cheshire, he, however, it declined to do on the ground that the house was built in the street 24 ft. in width of 36 ft. 6 in., which was the minimum width allowed by the by-laws. The plaintiff's contention was that Back-lane was not a new street. The case was tried before his Lordship and a special jury who found that Back-lane was not a new street. Lordship, however, on further consideration, held that an action for a mandamus would not lie, proper remedy, if any, being, by an application for a prerogative writ of mandamus. He therefore refused judgment for the defendants. On the conclusion of the arguments of counsel, the Lordship, in giving judgment, said that the defendants, a local tribunal, which admittedly had jurisdiction to consider whether they would approve the plans of a house laid before them, had not determined that question. The plans were laid before them, not that they might ministerially signify their approval, but that they might say whether in honest exercise of their jurisdiction they would approve or disapprove of them. It was admitted that the defendants honestly considered the question, and that they were not negligent in doing so. The question, however, was whether they had determined that question. The plaintiff brought the present action for a mandamus to compel them to alter their decision and to

approve of the plans. Mr. Justice Kennedy had thought it better not to withdraw from the jury the question of whether or not it was a new street, and the jury had found that it was not a new street; but upon further consideration the learned judge came to the conclusion that there was no question for the jury, and entered judgment for the defendants. In his (the Master of the Rolls) opinion no appeal lay from the decision of the local tribunal acting honestly within their jurisdiction; and therefore there was no question for the jury, and the action could not be maintained. The Lords Justices concurred, and the appeal was accordingly dismissed with costs. Mr. E. Sutton appeared as counsel for the appellant, and Mr. C. A. Russell, Q.C., and Mr. F. H. Mellor for the respondents.

PIRACY OF AN ARCHITECT'S DRAWINGS.

THIS case, which was brought by Mr. James Neale, F.R.I.B.A., and a Fellow of the Society of Antiquaries, against Messrs. Harmer & Harley and Architecture for publishing some of Mr. Neale's drawings from his work on St. Alban's Abbey, and which was reported in the Builder of February 20 last, when Mr. Neale obtained an *interim* injunction against Architecture, was again before Mr. Justice Kekewich on the 3rd inst. The defendants decided not to further contest the case, and agreed that Mr. Neale should have a perpetual injunction restraining the defendants, Messrs. Harmer & Harley and Architecture, the publishers and proprietors of a paper entitled Architecture, from printing, publishing, selling, delivering, or otherwise disposing of any copies of that magazine containing any drawings or plans copied from "The Abbey Church of St. Alban," a work published by the plaintiff and duly registered as copyright; and that the defendants would pay damages and all costs. Mr. Justice Kekewich made an order accordingly. We understand the costs and damages considerably exceed £200.

MEETINGS.

FRIDAY, APRIL 9.

Institution of Civil Engineers. (Students' Meeting).—Mr. Harold Berridge on "Poole Harbour," 8 p.m.

SATURDAY, APRIL 10.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at the Sewage and District Works, Kaling, 2.30 p.m.

Edinburgh Architectural Association.—(1) Visit to Niddrie Tower. (2) Visit to Duntarvie Castle.

MONDAY, APRIL 12.

Royal Institute of British Architects.—Mr. H. H. Stratham on "The New Government Offices Scheme," 8 p.m.

Clerks of Works' Association (Carpenters' Hall).—Fifteenth Annual Meeting, 7.30.

Sanitary Institute (Lectures for Sanitary Officers).—Dr. G. Reid on "Sanitary Appliances," 8 p.m.

TUESDAY, APRIL 13.

Institution of Civil Engineers.—Paper to be discussed: "The Blackwall Tunnel," by Messrs. David Hay and Maurice Fitzmaurice, 8 p.m.

WEDNESDAY, APRIL 14.

Liverpool Engineering Society.—(1) Nomination of Council and Officers. (2) Mr. G. Farrer on "Sinking of Small Harbours and the Effect of a Stream of Water," 8 p.m.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection of Artisans' Dwellings, Boundary-street area, Bethnal Green, 3 p.m.

THURSDAY, APRIL 15.

Devon and Exeter Architectural Society (Plymouth, Excess Branch).—Address by Chairman, Mr. C. King, 7.30 p.m.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

4,604.—APPLIANCE FOR BURST WATER PIPES: P. Blackwell and Another.—Invention consists in a device for the prevention of damage consequent upon the bursting of water pipes, being the combination of a flap provided with an electrical contact-piece, introduced into the supply-pipe, by means of the main cock, and means for electrically releasing the cock, which is so weighted as then to close automatically, such releasing mechanism being caused to act by an electric current the circuit of which is completed on the bursting or fracture of a pipe. The releasing mechanism consists of a bent lever, with weight, arranged on the main cock. 4,780.—FLUE OR CHIMNEY: W. R. Berridge.—In a flue or chimney, preferably of metal, inventor constructs the shafts in two parts, the upper part of the uptake being fixed, and the lower part of the uptake being free to slide telescopically either within the upper part of the uptake or around the outside of the same. The lower portion of the chimney may be suspended and counterpoised by means of balance-weights, pulleys, and cords. 5,270.—GLUE POTS, &c.: W. H. Wilson.—Inventor forms the glue-pot (or analogous vessel) of an oval or elliptical shape, and provided with the usual water-jacket and handles, the bottom of the glue-pot being sunk or dished at one end to collect the sediment, this sinkage being provided with a grid. Wires or bars are fitted across the pot to wipe brush on, and an upright rod is fixed at side to suspend brush from, while a shelf in pot prevents brush dipping too deeply when in use. 9,149.—GRINDSTONES: P. A. Ziegner.—Inventor proposes to make grindstones (superior to the natural stones) of the following composition: Washed sand from pits, 60 parts; chloride of magnesium, at 35 deg. Beaumé, 20 parts; magnesite (calcined magnesite), 10 parts; gypsum, 2 parts.

This pasty mess is cast in moulds of size and shape desired, and, when dry, taken out. 23,465.—CELLAR FLAPS: W. Eckstein and Another.—In order to open and close the large and heavy iron and close cellar flaps now in use, inventor hinges to each flap a quadrantal rack, passing through a guide-box attached to frame to which flaps are hinged. In this box is a worm which can be operated by a rod, and, by its rotation, the rack and flap connected can be raised or lowered safely. 724.—AUTOMATIC SYPHON FLUSHING TANKS: W. C. Cramer and Another.—Object of invention is to ensure the starting of the siphons of automatic flushing tanks exactly there is a sufficient head of water therein. For this purpose, in an automatic syphon flushing tank they provide the top of the syphon with a float-operated air valve. 3,204.—WINDOW SASH FASTENER: J. W. McDougall.—To secure sash windows, prevent rattling, &c., inventor adopts a fastener consisting of a bolt sliding in a bracket fixed to one sash, and having a pin to engage with a catch upon a bracket on the other sash, and holding the sashes together by a spring.

NEW APPLICATIONS FOR LETTERS PATENT.

MARCH 22.—7,365, W. Wilson, Sliding Sockets for Shop Window Fittings. MARCH 23.—7,445, W. Farleigh, Fire Grates.—7,493, H. Crane, Floor Brains.—7,495, A. Fleischmann, Door Locks.—7,505, J. Rollers, Window Fasteners.—7,509, H. J. Janghans, Wood Stain.—7,561, A. Ansell, Casements.—7,575, F. Starace, Windows. F. Lane, Slewing Crosscut Sawing Machine. MARCH 24.—7,594, F. Lane, Slewing Crosscut Sawing Machine. MARCH 25.—7,667, J. Sheppard and F. Dashiwood, Construction of Walls, Partitions, and other Structures, and the form of Bricks or Tiles for the same, and in the manner of setting such and other Bricks or Tiles immediately after Moulding in Hacks for Drying.—7,662 and 7,623, W. Whitehead, Recording and Checking Workmen's Time.—7,694, R. Cuffield, Window Sash Fasteners.—7,709, W. Gates and J. Green, Connecting Junctions and Bends to Main Drain Pipe. MARCH 26.—7,808, W. Borrowes, Grip Plates for Attaching Hangers, Brackets, or other Attachments to Girders, Rolled Joists, or Beams.—7,830, W. Taylor, Chimney Cowl. MARCH 27.—7,931, C. Greenhalgh, Waste Water Closets.—7,937, H. Parker, Pedestal Bracket Seats for Water Closets.—7,976, T. Sloan, Machines for the Manufacture of Wood Screens.

PROVISIONAL SPECIFICATIONS ACCEPTED.

11,944, L. Gorisse, Door Checks.—2,245, W. Pretty, Sash Fastener.—2,292, W. Greenwood, Sliding Bolt Fastening for Doors, Windows, &c.—5,482, E. Collier, Securing Door Knobs to their Spindles.—5,692, A. Walker, Sanitary and other Pipes.—5,804, W. Hoatwright, Chimney Cowl.—5,816, T. Lilley, Fire Hearths.—5,922, T. Moody, Saws.—6,050, A. Rider and E. Russell, Sliding Sash Windows.—6,066, The Wilkinson Sword Company, Limited, Door Locks.—6,113, F. Lynde, Flushing Cisterns.—6,171, L. Haaks, Gully Traps.—6,224, E. Taylor, Sash Fasteners.—6,213, D. and J. Burgess, Concrete Paving, &c.—6,607, H. Lake, Moulding Box for forming Plaster for Building purposes.—6,577, S. Buck, Ridge and other Tiles.—6,649, D. Campbell, Handles and Spindles of Door Locks.—6,701, J. Peckover, Stone Saws.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months. 6,282, W. Johnson, Sliding Pivoted Window Sashes.—7,666, A. Hoeking, Waste or Slop-water Closets.—8,487, F. Pickford, Flat Whitewash and like Brushes.—8,887, J. Rigby, Tiles, Slabs, Wallings, &c.—10,586, J. Simpson, Fitted Hearths or Flooring for domestic Fire-places and other uses.—80, E. Edwards, Surfaces of Walls and Ceilings to receive Plaster without Laths, &c.—1,725, J. Watson, Sash Fastener.

In Committee of Supply.

THE occasions when the House of Commons goes into Committee on the question of Supply are usually, from our point of view, instructive, and sometimes amusing. It is then that we learn something of what various members really think on questions of art and architecture, and we gather something of what is in contemplation in regard to such subjects from the replies extracted from Government officials, who in answering the questions with which they are plied are compelled to set out something of what is going on behind the scenes, and occasionally let out more than they intend.

In the present instance the deductions to be made from the debate of Friday last week are in some respects more satisfactory than usual. The report at least shows that there are some members in the House who have some sympathy with art, and who are impatient at the grudging spirit and the indefinite delay shown in regard to the carrying out of important public buildings. Among others we may welcome an ally in the person of Sir J. Leng, the member for Dundee, who, on the motion to complete the sum of 25,000*l.* for the Admiralty buildings, inquired "whether it was intended to continue the same style as the present offices, a mixture of brick and stone. Generally speaking," he said, "our buildings were puny and lacking in everything of an impressive and imposing character, and in this respect were in complete contrast with the public buildings in the capitals of Europe. He trusted that the buildings erected in the future for the use of the nation would be such as we should be proud of." We are much indebted to Sir J. Leng for his intervention, and hope that his voice will be heard again in defence of the cause of public architecture. Of course he could hardly expect that the new wing of the Admiralty would differ in style from the one already built, and possibly he was quite aware of that; but the opportunity was a perfectly legitimate one for a demonstration on the subject. The First Commissioner made the best of it; he was obliged to admit that he

did not altogether differ from the member for Dundee, all he could say was that it was unfair for members to judge of the building by one wing; but we fear the finished aspect of it will not make the case much better.

In regard to the South Kensington Museum we are glad to see that a somewhat general feeling of indignation seems to have been at length aroused, since three members, Mr. Lough, Mr. Bartley, and Sir F. Powell, successively attacked the subject in tolerably spirited language. Mr. Lough asked for an assurance that steps would be taken without delay to complete the South Kensington buildings; Mr. Bartley said that "it was a scandal that the buildings which had been inaugurated by the Prince Consort should be left in such a disgraceful condition in the Jubilee Year of her Majesty's reign." Sir F. Powell used language as plain and as much to the point. The excuse which is now made for the delay is to a certain extent a plausible one, viz.: that a Committee is at present inquiring into the whole administration of South Kensington. But we do not see what that has to do with the completion of the galleries. We presume that there is no intention of suppressing South Kensington; the inquiry is into the manner in which the work connected with it is carried on; the galleries require completion, whatever may be the changes made in the duties and responsibilities of the staff; and we confess that this plea seems to us rather like a subterfuge, a pleasant excuse for delay. There were points of some importance, however, evoked in the discussion. Mr. John Burns observed that South Kensington was paying 4,400*l.* a year rent for certain galleries in Exhibition-road formerly connected with the Imperial Institute, and he urged that the Imperial Institute, which was a total failure, should be handed over to South Kensington. We may point out that this would not abrogate the duty of completing the South Kensington building, but we confess to a considerable sympathy with the feeling that the Imperial Institute would be much better utilised as an art museum or some kind than it is at present: as an institution, it is certainly a manifest failure. The other point, which occurred in the First Commissioner's reply, was that there was a recommendation that part of the staff at South Kensington should be put under the roof of the Education Department at Whitehall; and that "as the Office of Works were

now having plans prepared for new Government offices at Whitehall, provision would be made for sufficiently large Education offices to have any additional staff that might have to be placed there." These are rather ominous words, and we should like to know what they mean. Are we to understand that the new buildings are being secretly designed in the recesses of the Office of Works, without any public opinion upon them being invited? It sounds rather too like it; at all events some explanation would be welcome.

It is gratifying to see that there is serious talk of completing the decoration of the central hall of the Houses of Parliament with mosaic, and that no opposition was offered to the suggestion; but how slowly do things of this kind move in England! For how many years has that one mosaic of Sir E. Poynter's faced the three empty spaces opposite in the roof of that hall? Mr. Burns referred with appreciation to the mosaics at St. Paul's and to their texture and effect, and suggested that the new work in the House should be carried out in the same manner and by the same hands, and appealed also to the First Commissioner to make an effort to keep together the small school of English mosaic craftsmen who had been employed at St. Paul's Cathedral; a suggestion with which the First Commissioner expressed himself entirely in sympathy. So are we; but it must be remembered that the one mosaic is already there, executed in the flat style, and that the other three, executed in the style employed at St. Paul's, would certainly not harmonise with it; it will look so different from them that it will make a patch in the decorative scheme; and as it would be barbarous to remove Mr. Poynter's design now, which is a very fine piece of work, it appears to us that the other three spaces must be treated in the same manner, to produce any satisfactory decorative effect.

As to some other matters that were discussed, it is satisfactory to learn that there is no probability at present of the Parks being disfigured by the formation of special cycling tracks, though we agree with Mr. McLaren that one portion of the Mall might be set apart for cyclists; that is, one longitudinal belt, and we also entirely agree with him in thinking that the opportunities furnished by the Mall for making an attractive promenade are entirely thrown away; in fact it is, as he says, a desert.

Perhaps the best thing in the whole debate was the contribution to it of the Member for King's Lynn, who innocently observed that St. James's Palace was a very ugly collection of buildings on one of the best sites in London, and asked "whether there was any intention of demolishing it and erecting in its place a building with greater pretension to architectural beauty?" The desire of some people to wipe out the history of the country, or at least of the capital, is a curious phenomenon. It is satisfactory to record that Mr. Bowles received no encouragement.

THE REPORT ON THE ELECTRIC FATALITY AT HAMPSTEAD.

MAJOR CARDEW'S report on the death of a labourer employed on the electric lighting works of the Hampstead Vestry raises several questions deserving of serious consideration. About the accident itself there is now no mystery. We suggested at the time that the case of the transformer must have been earthed in a totally inefficient manner. It now appears that the "earth" consisted of connecting the case by a wire to an iron bolt let into the wall of the transformer chamber. For any one pretending to be an electrician to consider this an "earth" displays an alarming ignorance, which we are afraid is by no means uncommon in central stations. Another point brought out by Major Cardew is that no effective precautions were taken to insulate the high tension wire from the case.

In the description of the system approved by the Board of Trade under the Hampstead Electric Lighting Order efficient means of guarding against all accidents from shock are specified, and every one will share Major Cardew's regret that these precautions were not carried out. It appears that there is a real necessity for Government Inspectors to supervise and control the carrying out of the precautions specified by electric light undertakers. Under the Factory Acts inspectors are appointed to guard employes from other recognised dangers, and this Hampstead accident proves that a little Government supervision would have saved this man's life. There is not much use in the Board of Trade drawing up rules and regulations, if their staff is so insufficient that they cannot possibly see whether they are carried out or not. Their rules are broken every day, and even when they find this out they rarely interfere, unless the supply is in obviously incompetent hands. There are many things, however, at small central stations that the Board of Trade ought to have altered. Some of the switchboards, for example, as at present erected, could easily become death traps. If all the cases in which electric light employes got severe burns and shocks were reported, the necessity of inspectors would be at once recognised. Several cases have come to our knowledge in which the employe was only saved by the presence of mind of an electrician near him, his muscles having become rigid so that he could not make any effort to save himself, death being only the question of a few seconds. In some cases the fall breaks his contact, and so a fatal issue is averted. It is obvious that this dangerous state of affairs

should not be allowed to continue, and the sooner the Government increases its staff of Electric Light Inspectors the better it will be for the welfare of the electrical industry.

Major Cardew's recommendations to the Hampstead Vestry, although good, are by no means final. We are sorry that an automatic switch, worked by the cover of the substation, is not made compulsory. When accumulators and armatures are in danger, there is no limit to the number of ingenious interlocking keys that electricians devise. A little government pressure could easily turn some of this ingenuity in the direction of safety devices. Another omission in the report is that there is no specification of what is meant by an earth connexion. Electricians will go on sticking a wire into the ground until they are informed officially that this is not an "earth" connexion.

"Earthing," as is well known, is by no means an absolute protection, and we are sorry to see that the Board of Trade is beginning to regard it more favourably. Major Cardew recommends that the iron ladder be connected to the transformer cases. If this is done the first shower of rain after a long spell of dry weather would make it dangerous for any one to step with one foot on the cover of the substation whilst the other was on the damp ground, provided, of course, that one of the cases made contact with the high tension wire.

There have recently been invented several kinds of heat-indicating paints, which change colour at different temperatures. It is a pity that no one has yet invented an electric indicating paint, which would change colour when it got dangerously charged with electricity. Until such a paint is invented we are afraid that it is almost impossible to completely safeguard a workman ignorant of the laws of electricity, when working in a confined space surrounded by conductors which may accidentally become charged to a high pressure. Such gross carelessness, however, as has been shown to have occurred at Hampstead in carrying out reasonable precautions, minutely specified, ought to be severely reprimanded and be made impossible in the future by effective government supervision.

NOTES.

New London Railways. THE Committee of the House of Commons, which has for some time had under consideration the two rival schemes, the Brompton and Piccadilly-circus Railway and the City and West End Railway, has rejected the latter scheme and approved the former. The line sanctioned by the Committee, subject to possible modifications of details, may be regarded as a branch of the present District Railway from South Kensington to Piccadilly-circus. According to the scheme at present, the connection between the old line and the new lines at South Kensington is a matter for future arrangement. But it is obvious that there will ultimately be such a junction. The line which has been rejected was to run from Hammersmith to Cannon-street: it was thus a distinct rival to the present Metropolitan District line, whereas the railway which has been sanctioned will be a feeder to the older line. It is clear that before another decade is past, London will have underneath it a network of subterranean lines, and we cannot but think that the great

railway companies which run from London to the north and south have been shortsighted in not bringing forward a joint scheme by which these railways might have been united by underground lines, and by which traffic could be carried from north to south without any break at the Metropolis.

THE Department of Fine Arts, Opera Comique, has arranged for the interior decoration of this important

theatre. M. Benjamin-Constant is to decorate the ceiling of the auditorium with a representation of three principal creations of modern opera—Manon, Carmen, and Mignon, as well as a group of figures symbolising Fame and Posterity distributing crowns. The panels of the two large staircases giving access to the foyer vestibule are entrusted to M. Olivier Merson, who will paint there representations of Poetry, Music, and Song, and to M. François Flameng, who is to paint "The Dance" and "Dramatic Poetry." The former subject will be represented by a modern ballet with personages of Italian comedy; and Dramatic Poetry by a scene representing Sophocles attending a rehearsal of his "Œdipus" in the Theatre of Bacchus. The decoration of the foyer vestibule itself has been entrusted to M. Joseph Blanc, who is to represent "Pantomime." M. Aimé Morot takes the ceiling of the foyer, where he will paint a representation of the arrival of the Russian Sovereigns in Paris. MM. Raphael Collin and Edouard Toudouze will decorate the two small salons at the two extremities of the foyer; the first with a subject symbolising Poetic Inspiration, Truth, Drama, the Dance, and the Ode; the second artist will take the subject of satiric drama, in which will be represented a sumptuous ballet in costumes of the thirteenth century.

THE *Berliner Philologische* reports a fortunate "find" in the Gulf of Corinth. A fisherman in the little bay of Livadostowo (a village in the innermost north-east corner of the gulf, close to where the ancient Creusa is supposed to have stood) has brought to light the fragments of a bronze figure a little over half life size. From an inscription on the basis, it appears that the statue represented Poseidon. The bearded head is the portion best preserved, and it is reported to be closely analogous to the bearded bronze head found in the Acropolis; if this be correct it belongs to the sixth century B.C. Unfortunately, the rest of the statue, *i.e.*, the nude standing body of the god, is so fragmentary and so much corroded that it is doubtful if even the most careful cleaning and piecing can make much of it. It is not reported whether the fisherman was actually fishing, or found the statue washed up on the shore.

THE respondent in this important case of Venner *vs.* McDonell. McDonell favoured us with a letter on the subject of the Note which appeared in this journal on the case on April 3. We are always glad to receive communications on such matters as these, since they indicate the points on which persons interested are not clear. Mr. McDonell in his letter left out of sight

the main ground on which the decision as to the meaning of the word "structure" in Sec. 145 of the London Building Act proceeded, and dwelt on Sec. 78. In our previous Note we referred only to the main point; it may be desirable, therefore, to say a word about Sec. 78, which is to the effect that every public building, including the walls, floors, galleries, &c., "shall be constructed in such manner as may be approved by the District Surveyor." Upon this point the decision is as follows:—"The Act of 1894 is not retrospective, the approval of the Surveyor there made a condition precedent to the use of the building as a public building refers to an approval to be given at the outset once and for all, and afterwards the only part of the section which could apply is the last clause, which says that no work likely to affect the building shall be done to or on the building without approval." We do not think that this is 'work done to or on the building,' and if it were, it is not suggested that it is, "likely to affect it." This, of course, is a question of fact; the main interest in this decision is that which we previously noted, namely, the light thrown on the meaning of the word "structure." We may perhaps add that the whole judgment is well worth perusal in full, since it is that of two of the ablest lawyers on the Bench, both of whom had large experience in matters affecting local government; Mr. Justice Wright, whilst at the Bar, being responsible for most of the cases on behalf of the Government.

Drainage of Surface Water on Roads.

THE case of *Durrant v. the Branksome Urban District Council*, in which Mr. Justice North has just delivered a judgment after taking time to consider it, is of much importance to Local Authorities. We confess that, in our opinion, the point, however important, presents little difficulty. According to Section 15 of the Public Health Act, 1875, "every Local Authority shall . . . cause to be made such sewers as may be necessary for effectually draining their district." The question then arose in the present case whether a Local Authority had the right to construct sewers, or rather drains, to carry off the surface-water from roads and let them empty themselves into a stream so that it became at times full and turbid. Where a stream like the Bourne at Bournemouth has become in its lower parts to some extent artificial in character an extra quantity of storm-water may be troublesome. It is obvious, however, that under natural circumstances a stream is a species of main drain for pure rain water. It is equally clear that the Public Health Act, 1875, recognises this, since Section 17 only prohibits a Local Authority from conveying into "any natural stream or water-course . . . sewage or filthy water." The decision of Mr. Justice North that the Local Authority had the right to drain the surface water from roads under their control into the adjoining streams was therefore obviously right.

The Royal Mint.

THE Treasury have prepared an additional estimate of £1,100,000 for an enlargement of the melting-house at the Royal Mint, which is required to meet increased demands for coinage. The existing buildings were opened in 1811, in place of the old works at the

Tower*: the design, begun by Johnson, was completed by Sir Robert Smirke. They occupy the site of the Victualling Office, established under the Navy Board in 1683, where had been King Edward III.'s Abbey of St. Mary de Grace, or East Minster, granted to Sir Arthur Darcie, who pulled it down *circa* 1540: see J. Gwynne's plan, 1766, and our "Note" of June 6, 1891, upon the Hodgkin Collection of views, plans, &c., lent to the Naval Exhibition of that year. The Abbey, whose value Dugdale assesses at 5,406*l.* per annum, was erected within a new churchyard of the Holy Trinity, which one John Colly had made during a pestilence in Edward III.'s reign.

The New Bridge over the Seine.

THE foundations for the Alexandre III. bridge have been commenced by the preparation for the sinking and foundations for the caissons which are to form, on each side of the river, the bearings for the bridge. The caissons are expected to be placed in a few months; and the engineers, MM. Résal and Alby, think that the whole work of the foundations can be completed during the present year. The placing of the steel portion of the bridge will be accomplished in 1898, and in the following year the architectural and decorative portion of the work, which has been entrusted to two architects, MM. Cassieu-Bernard and Cousin, will be completed. The architects have already made their preliminary studies for the work.

In the last of his Royal Institution lectures on "Electricity and Electrical Vibrations," Lord Rayleigh considered the electro-magnetic theory of light. Maxwell showed that, in studying optics and electricity, we were finding out the properties of the ether from two different points of view. This theory, however, was not generally accepted until Hertz had succeeded in getting electric vibrations of such short wave lengths that they could be refracted and polarised experimentally. The shortest electric vibrations yet produced had a frequency of about fifty thousand million per second, but still there was an enormous difference between these vibrations and the largest light vibrations, which had a frequency of 400 million million per second. To bridge over this gap would probably be the work of the next generation of physical investigators. His description of Lodge's coherer and of Rutherford's polarised relay were listened to attentively, as it was interesting to hear Lord Rayleigh's opinion on these methods of telegraphy without wires. He said that the Rutherford relay had been successfully tried up to a distance of a mile, and he thought that it had a great future before it. He explained the action of the coherer by pointing out the analogy with what happened when two jets of water hit one another. They ordinarily rebounded, but when an electrified rod was brought near them they coalesced into a single jet. In the same way the iron filings in the coherer made better electrical contact with one another when electrical waves impinged on them. Using a coherer Lodge has shown how easily electrical waves pass hundreds of feet through the walls and floors of houses.

* See the *Builder*, December 5, 1894, for an account of W. Aitchison's "Survey," February 26, 1895, and an earlier "profile."

Electricity Supply at 200 Volts.

MANY electricians are surprised that electricity supply at 200 volts is making such rapid progress in this country. To find out the reason of this we must go back to the initial success at Bradford, where the change over was made very skilfully by a bribe of new lamps. After a little time, according to Mr. Gibbings, the Engineer in the Bradford Corporation, an impression gained ground that for some reason or other certain consumers were being more highly favoured than others. "This, of course, made matters very smooth, and in no single instance was opposition offered." Hence the change over was effected by trading on the ignorance of the consumers. As new lamps burn brightly at first, and the supply may have been steadier, those consumers who had taken the higher voltage, finding that they had committed an irrevocable act, were naturally like the fox in the fable, loud in their praises of the new condition, in order to get others to follow suit. It could not have been better done if it had been the result of a deep laid plan, and other corporations are now pushing their electric sales by similar discreditable tactics. We can see that with direct current it is of great advantage to the companies to supply at 200 volts, but with alternating current the advantage is altogether problematical. Yet Blackpool, Bolton, Cardiff, Kingston-on-Thames, and Southport are supplying, or are about to supply, consumers at 200 volts alternating. We think it is a mistake on the part of these corporations, for, amongst other reasons we might mention, the present systems of distribution from alternating current sub-stations are capable of great improvement.

Guildhall School of Music.

It is stated that the Court of Common Council have agreed to enlarge, at an estimated cost of 20,500*l.*, the Guildhall School of Music, near Tudor-street, Blackfriars. The present buildings, of which we published a view, with plans, on September 5, 1885, were opened in December, 1886, having been erected after the designs of Sir Horace Jones, at a cost of about 22,000*l.* They replaced the School of Music established by the Corporation in Aldermanbury in 1880, which had its beginning in the Guildhall Orchestral Society, founded in January of the previous year. They contain forty-two class-rooms, and on the second floor a spacious practice-room, 70 ft. by 28 ft., somewhat like the old concert hall, Surrey Gardens, of which Sir Horace Jones was the architect.

Theatre Architecture of the Victorian Era.

UNDER this heading there is to be a special exhibition at Earl's Court, in connexion with what is called the "Victorian Era Exhibition," with the object of illustrating the development of theatre-building during the last sixty years, including such technical improvements as refer to iron construction, lighting, ventilation, and stage appliances. A number of architects have consented to lend drawings and photographs, and the arrangement of the whole has been undertaken by Mr. Edwin O. Sachs, who has made a special study of theatre architecture, and who will be glad to hear of the offer of any further loans in the way of illustrative drawings. Nothing is said as to models; we should suggest that models, whether of stage machinery or of entire sections of theatres,

would be very useful. The practical interest of such an exhibition ought to be considerable; and one can only regret that in this country the art of architecture is so poorly represented in theatre buildings.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

THE NEW GOVERNMENT OFFICES SCHEME.

An ordinary fortnightly meeting of this Institute was held on Monday, at No. 9, Conduit-street, Regent-street, Professor Aitchison, A.R.A., President, in the chair.

The minutes of the previous meeting having been taken as read, Mr. H. H. Statham read a paper on "The New Government Offices Scheme," of which the following is an abstract.

Mr. Statham said that in that room they were bound to consider the treatment of Government offices from an architectural point of view, both in regard to the most effective treatment of the buildings themselves, as an important element in our national architecture, and to those questions of alignment of streets which came under the general head of what were called "public improvements." The subject was one of national importance. In order to appreciate the present position it would be well to look back a little. It was obviously important both for architectural effect and convenience of communication, that Government offices should be concentrated, and should be rebuilt from time to time in accordance with a definite scheme to which each new building would be a contribution. Such a scheme, on the grandest scale, had been drawn out by Sir Charles Barry in 1857, not only for the concentration of the Government offices, but for the improved laying out of the whole Westminster and Whitehall district. The greater part of that scheme was now rendered impossible by what had been done in a piecemeal way since; it was melancholy now to look at that plan and think what splendid possibilities had been lost, but he wished to draw attention to it and to include it in the Institute Journal, partly because it was well at least to have before our eyes a great ideal, and also because, as he would show, one or two points in it were still capable of realisation. In 1856 took place the great competition, open to the world, for a plan for the concentration of the Government Offices and for special designs for War Office and Foreign Office buildings, as the result of which the War Office, though there was the most urgent need for it, was abandoned, and Sir Gilbert Scott received the commission for the Foreign Office. It had been attempted to show that the Foreign Office was a complete failure, and a proof of the mistake of erecting palatial Government offices designed by an outside architect; but this was exaggeration; the faults which it had could easily be avoided in a future case; it was at all events a dignified building, and its quadrangle, of the dimensions of 240 ft. by 170 ft., was on such a scale as to have a really fine effect. The argument that such buildings would be better produced by the official surveyors of the Office of Works was sufficiently answered by the buildings which were so produced, notably the Post Offices, which were nearly all in a poor and commonplace style of architecture. In 1882 the competition for new War and Admiralty offices was announced, not on the Great George-street site, as had been expected, but on a site near Spring Gardens, in which a part of the new building, for economy and to avoid purchasing some street property on the west side of Whitehall, was relegated to the rear of the houses. The opportunity afforded for widening the upper end of Whitehall by throwing back the west line of the street, pressed on the Committee of eminent architects, was entirely ignored. The next step was that this scheme was abandoned, the building of the War Office was again postponed, and the Committee of 1887 reported that the Admiralty could be economically provided for by retaining and adding to the old Admiralty buildings. He could not understand how any Government could sanction the retaining of a building with such an interior as that of the old Admiralty; nothing short of entirely gutting it could enable it to be made a satisfactory building, and the architectural exterior was not worth that. The new buildings,

though well planned, represented a design originally commonplace though rich and costly, cut down to a cheap brick structure with stone dressings; the superficial richness being removed, only the commonplace remained. As a building for the administration of the greatest naval power in the world, it was little short of a disgrace to the nation. Coming to the Parliament-street site, the new proposed buildings there would be well situated parallel with the Foreign Office, but in order to produce their proper effect the design ought to range in its main lines with that of the Foreign Office and harmonise with it in character; to erect an inferior type of building would be to destroy the whole architectural effect. The alternative proposal to set back the Parliament-street part of the new buildings at an oblique angle, merely with the object of getting a full view of Westminster Abbey from a point eighty yards higher up Parliament-street, was absurd; it would be spoiling the whole building and throwing away part of a site, already too small, for an almost imaginary benefit. Coming to the question of the War Office, the fact that the money had been voted for the Carrington House site surely did not hind the Government either to build war offices and no other on that site, or to decline enlarging the site by the purchase of further property. It would be quite possible still to build the war offices on the Downing-street site, and to provide for the departments, now on that site, on the Carrington House site. This would realise, with some modification, Barry's fine conception of the War Office and the Admiralty Office as symmetrical blocks on either side of the parade ground, the Horse Guards in the centre. Probably none of the buildings on the Downing-street site could be permanently retained in such a case—the interior of the Treasury building even was too old-fashioned to retain; but the little domed vestibule of Dover House ought to be respected in any case, and could easily be worked into a new building. The vote for the Carrington House site had been unexpectedly taken; it was distinctly promised that the Committee would hold further sittings first, and it might be observed that for the first time, he believed, no architectural evidence at all had been taken on a scheme so important in the architectural embellishment of the capital. The official plan for the building on this site was a double mistake. In the first place, the shape of the building was to be settled by the irregular shape of the intersecting streets. That was an estate agent's and not an architect's way of planning; it was reducing what ought to be a national architectural work to the level of a block of flats or a monster hotel. In the next place, the site would be overbuilt both for architectural effect and sanitary conditions; the largest quadrangle, into which rooms would look, was only 105 by 100 feet, for a building five stories high. They might compare that in their minds with the quadrangle of the Foreign Office, the same height and 240 by 170 feet; or a model which he had there would show the facts still better. There was nothing to prevent acquiring some further property north of Whitehall-place, and treating that portion of the building in symmetrical architectural relation with the courtyard of the old Admiralty, if that really was to be retained. There was no objection to building up Whitehall-place; it was shown that it was now an unnecessary street as far as traffic connexion was concerned. The rest of the building could be planned symmetrically on the site, the greater portion of the Carrington House site, the building line on the south side being brought in a little so as to make Horse Guards Avenue central with the Horse Guards, as it always ought to have been. It was absurd that a street facing a famous building and named after it should have been laid down out of centre with it; such a plan would be laughed at in Paris, but in London the alignment of streets and buildings was utterly ignored. Having got the extra width, they might then also make Horse Guards Avenue a real "avenue" by planting two lines of trees in it. When on the subject of what might be done, it was fascinating to go a little further and sketch out a really stately scheme for the combined treatment of the Admiralty and War Office. Suppose the old Admiralty removed; the new block already built might be lengthened southward a little, and returned towards Whitehall, with a similar northern block built on the foundations now being laid. On the centre of the fourth side of the quadrangle thus formed, facing Whitehall, would be the First Lords

House, with a columned screen and entrance on each side of it. Opposite to this we would hup up all the east side of Whitehall up to Craig's-court, and plan the War Office with a similar but shallower courtyard facing the quadrangle of the Admiralty, and the Commander-in-Chief's house or staff offices in the centre, facing the First Lord's House. The new block of the Admiralty would be retained in its interior plan but faced with stone to form part of a new and superior architectural design. The whole west side of Whitehall up to Charing Cross would be set back on a new line to give it an equal width all the way up, and above all to connect it with the axial line of Trafalgar-square, the Charles I. statue being moved a few feet to get it also on the point of meeting of the axis of Whitehall and the Square. The Mall would be continued through in a straight line into Charing Cross, the space between that and the Admiralty being occupied by street buildings forming the offices of the Woods and Forests and one or two other small departments. Speaking of that reminded him that the official plan showed the Mall continued through in the same way, but evidence had been given before the recent Committee, by Police-Superintendent Beard, that it would be bad for heavy traffic to come out of the Mall on to the slope of Charing Cross, that the exit ought to be taken up at an angle into Trafalgar Square. This however was beside the mark; if the Mall were to be given up to heavy traffic it had better remain closed, and the very object of opening it was the straight vista along it. He had spoken plainly on the matter of the buildings, because it was a subject of national importance. Architecture was not everything, but in history it would be observed that the effort to produce great buildings was coincident with the greatness and ambition of a nation in other respects; it was when a people was going down hill that national architecture was neglected. This looked bad for us, when we got to the point that the attitude of our Government towards architecture reminded us of Mephistopheles' definition of himself—"I am that which says 'no' to everything." Let them try to realise what would be the difference to London if the Houses of Parliament, after the fire, had been rebuilt in a mere utilitarian manner by the Office of Works, as was at first intended, instead of our having the present grand building. The Government Offices question was only the same thing on a smaller scale. The Government had one chance yet left to do something fine with a War Office, something to atone for the long series of blunders with public buildings in this country, in regard to which one might say, "They have made us a by-word among the people, a very scorn and derision to them that are round about us."

Mr. H. W. Brewer said the general feeling of most Englishmen was that we were not to have public buildings, and it had been so for many years. For instance, it was a well-known fact that the objection to enlarging and making proper provision for the increased requirements of the Houses of Parliament led to the fire. Well, that catastrophe did take place, and it seemed for a certain time to have brought our countrymen rather from the error of their ways, and they seemed then to have come to the conclusion that we ought to have something like public buildings. However, even about that time there was a very terrible example of what happened in England from the neglect of providing proper public buildings. At that period the records of this country were kept in about sixteen or eighteen different places; and probably nothing would have been done to build the new Record Office had it not been that a Committee of the House of Commons met which had some of these records brought before them to see what they were like. They tried to open three or four, unsuccessfully at first; when at last they did succeed, they found the skeletons complete of three great rats, and the consequence was that after a time we got the Record Office, which, of course, ought to have been supplied years before; because a gentleman told him the other day that he had gone into a printed list of documents which ought to be in the Record Office, and he found that considerably more than a third of them had disappeared. Certainly, the old Admiralty building was not very interesting; but there was one part of it he would regret to see destroyed, and that was the Board-room, probably the only thing there worth preserving. In conclusion, he moved a vote of thanks to

Mr. Statham for his very admirable and most interesting paper.

Mr. William Woodward said Mr. Statham had not only been very hard indeed upon the Office of Works, but distinctly unfair. With regard to these plans Mr. Statham knew that they were prepared most rapidly in order to be proposed before the Select Committee which sat last year. Mr. Taylor stated that the plans were only made as sketch ideas, and were not to be taken as indicating the careful thought of the Office of Works. Then again, with regard to the architecture, it was very easy for any gentleman to get up and complain of the architecture of the Office of Works, or of any other office; but let him invite the gentlemen in that room to compare the architecture of the Office of Works with the architecture of three of their most distinguished architects, with regard to the erection of public buildings in London. As to Mr. Statham's alternative block plan for occupying the Carrington House site, he thought it far inferior to the Office of Works plan and hoped he should never see such a plan as that carried out. The larger of the proposed plans which Mr. Statham had sketched in the illustrations was one that there was no chance of ever seeing carried out, and for his part he thought that the placing of an official house in the centre of one side of the quadrangle, as shown in that plan, would have the worst possible effect. As to Dover House, it was a wretched concern, and it was absurd for any one to talk of its being worth preserving. He trusted the Government would pursue its course in the Select Committee now sitting, or which would be sitting shortly, and that it would give attention to men so fully qualified in planning as the Government Office of Works, and that the architecture this time at least, perhaps the last time, would be left to architects to show the Government what they could do in the way of exterior design. After these perhaps violent remarks he should wish to second the vote of thanks to Mr. Statham, because, although he disagreed with him, he was one of those who admired the care and attention and the time which he must have expended on this subject.

Mr. Mountford said that Mr. Statham referred slightly to the widening of the Mall and the necessity for carrying it right through in its whole width, instead of being narrowed to 70 ft. as shown upon that plan. It was perfectly obvious that if it was to be carried through at all it ought to be carried through for its whole width; and, furthermore, it should certainly be turned northward at the east end in order to continue to some extent the line of the Strand. Going south it did strike one that while the Government was about the subject at all it was most desirable to remove the Bank which Mr. Statham had referred to and widen the whole street in a westerly direction, and to bring the north end of the street central with the Central Column and Trafalgar Square, and the National Gallery in the centre. Coming to the War Office site, he did not quite agree with Mr. Statham in objecting so very strongly to that angle which was shown on the plan. No doubt a rectangle was better; but, supposing the site was so valuable, he did not see much harm in taking advantage of it in that way. The widening of the street on the south side of the proposed site would undoubtedly be a great advantage, especially when we got the Horse Guards in central with it. It seemed to him that Mr. Statham's sketch, Fig. 8, was really a grand idea in the way he had placed the Admiralty and War Office and surrounding buildings; it was something much grander than they were likely to get, he was afraid. Going to the very southern point of the street he agreed with what Mr. Statham said as to the extremely bad effect of setting back the proposed new building at that angle shown on one of the diagrams, but he could imagine that the effect might be improved if it were set back entirely, so as to widen the street. So far as he understood Mr. Statham's paper he agreed with everything he said, and that if they could persuade the Government to regard the public buildings as a matter of national importance, and not as a mere utilitarian scheme for housing certain departments, it would be a great thing for England and a still greater thing for London.

Mr. W. D. Carie said that the plan, fig. 8, pleased him very much indeed. There was no reason why Whitehall place should exist as a street, and there seemed to him to be a splendid opportunity of doing a really fine thing, as Mr. Statham suggested, even at the expense of keeping the present or partially

proposed new Admiralty. One of the curious results of this cheeseparing policy would be, beyond question, if the figures were compared, that this present scheme when it was completed would cost the nation actually more money than the original scheme which Messrs. Leeming & Leeming had prepared. One of the chief questions that must soon be dealt with was, what was to be done with these Admiralty buildings? His own view was that possibly the best improvement that could take place would be to build a narrow frontage and fill up the front of the courtyard. There was one point in connexion with Mr. Statham's plan, fig. 8, which perhaps was worthy of notice. They all, without exception, had the greatest regard and admiration for the Horse Guards, and in dealing with the Admiralty or with any building that came in connexion with the Horse Guards, one was inclined to fear that a large building five stories high might have the effect of making the Horse Guards look as if it ought to be put in a glass case; and that it would be injured by a high and lofty building being brought up close to the flank. With regard to the plan of the Parliament-street block, he could not help thinking that really the best treatment of it would be to leave out that circular corner, and the small courtyard just within that circular corner, and keep the front to the line of Parliament Square, and get rid of the unsatisfactory effect of the circular corner of a large building.

Mr. John Burns, M.P., said that he had not expected to hear either the Select Committee or the Office of Works criticised to the extent they had been by this paper, but his withers were unwrung, and he was not particularly concerned about the Office of Works, who seemed, both inside this building and outside of it, to be capable of defending themselves. He did not intend to follow the reader of the paper into the details of the various plans he had submitted for the reorganisation and general improvement of Government buildings; but, as a member of the Sites Committee he desired to show that they were not such vandals as the reader of the paper suggested. His presence here indicated a desire for information, and he wanted to deal with this question, not so much as a member of the Sites Committee as a citizen of London, and one who was anxious to see not only the improvement of Government buildings and their concentration and consolidation, which, from the point of view of economy, had to be considered, but a reorganisation of Government buildings from the point of view of architectural harmony and beauty. And first, let him say that it was not the intention of the Committee to exclude outside architects in the giving of evidence; they might take it from him that not only was it not meant to do so, but that he should demand that outside architects should be invited to give their views. In fact, he would suggest to the Institute of British Architects that on the question of the improvement of Government buildings and the completion of the public buildings that ought to be on the land between the National Portrait Gallery, say, and Lambeth Bridge (his ambition led him as far as that), they should elect a council of architects, resident or practising in London, to formulate their views, not on small details as to what the blocks of buildings individually should be, but as to how the space—say, between the National Portrait Gallery and the Houses of Parliament could be best utilised for Government buildings. If they were to do that, and were to select two of their number to represent the broad, general view of the architects upon that matter, he was sure it was not too late for their suggestions to have that weight and that authority that they undoubtedly would have, coming from such a body. Roughly let him give his views, as one of the Committee. He was not in favour of Mr. Statham's plan any more than of the Office of Works plan. He would suggest that Mr. Statham and the Office of Works should be put into competition with all the architects who liked to compete for the best block of buildings on land that was not now built upon, and for the completion of those buildings that were only partly finished. He believed the result of such competition would lead to the production of the best buildings, which only they ought to have. He could tell the reader of the paper that on the matter of vista, incline, and approaches to whatever buildings were built upon those sites, they were not going to be influenced by the evidence of a Superintendent of police, who certainly had but little weight in the points suggested by the reader of the paper. Roughly

this was his view; that from Charing Cross right down to King's-street they should have a fine sweep of Government buildings; the frontage, the height, the style, and the character of which he would leave to architects. More than that, if it was possible to be done, he was in favour of pulling down No. 10, Downing-street, notwithstanding the political and personal associations connected with that building, and of having an easy incline into the park, and on the site of the present Downing-street office, a building in keeping with Sir Charles Barry's original plan, which he accepted almost down to every detail; that they should clear the Treasury out of its present buildings and have a War Office erected where the Treasury and Dover House now were, leaving the Admiralty to the right hand side when looking towards the park. With regard to the Great George-street site, he believed it was not even now too late for the Government to be able to buy the whole property, including the Civil Engineers building (which he was very sorry was erected on that particular site), and running right down to Storey's-gate with those Government offices that were not only desired but for the completion of which Great George-street and Storey's-gate, from an architectural point of view, never ought to have been allowed to have gone out of Government hands. Coming to the Carrington House site, it was no secret that he strongly opposed its adoption for the War Office, and would continue to do so. He believed that on that site they ought to have other offices instead of the War Office. With regard to the approaches at Charing Cross he had only this to say: he was divided as to whether they should accept Mr. Statham's view and make the statue of Charles I. the objective or Nelson's Column. He had a preference for making Nelson's Column the objective from the rear. He did not attach much importance to the 50,000, or 150,000, that might be necessary to be spent in pulling down either one or both of the banks.

He believed, speaking that if the Government were strongly and properly approached, the House of Commons could be educated up to the necessity, ere it was too late, of dealing with this Government Office problem broadly, boldly, and generously. He believed that the Institute of Architects could, even now at the eleventh hour, do a great deal of good in that direction. On the broad general plan indicated in Mr. Statham's paper, many of the Sites Committee (not all of them) were practically agreed, and as to rates and money, he never allowed himself to be influenced by such considerations in discharging any public duty. He would suggest to Mr. Statham, in conclusion, that he get the Institute of Architects to adopt his plan and suggestions as the basis for discussion amongst themselves, to take the whole of the suggested government plan as only tentative, and that Mr. Statham's paper should be the basis of a series of suggestions from the London architects, who should select two of their number as witnesses to go before the Committee; and he believed that if it was put, say, a little more harmoniously, and if the architects were not inclined to take up the animated view that politicians alone, he was led to believe, indulged in, he had no doubt that Mr. Statham's paper would have done a great deal of good. Certainly any proposition that would lead to Parliament-street, and the House of Commons, and the approaches to our National Portrait Gallery, and to Trafalgar-square being improved would have his hearty support, and ere it was too late he asked them to buckle on their armour and not to be frightened at politicians, but to go before them in the interest of the beautification of London and the convenience of Government Departments.

The President said that unfortunately neither the public nor the politicians had that view of the importance of public architecture that distinguished some of the small republics from antiquity. When they reflected that a small town like Florence, by the month of its Council, desired that when it rebuilt its cathedral it should be a finer building than any that had ever been put up by the Greeks or Romans, that no expense should be spared, and that everything that was the best and most costly should be done by men with the greatest skill—if we could make our politicians see the importance of architecture to the country, I do not think that they would fall short of these ancient trading burghers of Florence. And he felt to a certain extent hopeful of this country. It was almost always the case when it was in the hands of persons of the middle

class, or of moderate means, that they took a comparatively small view of anything that had to be done; but when they applied to the whole nation, when every man felt that he would be raised by the excellence of the buildings and arrangements made, and that every foreigner who came here would be delighted with the views we have to give them then, it would not only strike him and all his friends and fellow citizens, but all the people in the country; then we might look forward to a finer scope than had hitherto been offered to the country. Simplicity was the great basis of everything great that had been done in any fine art in the world; less work was done on Greek buildings that had been the admiration of the world since they have been built, than on the things that were done to-day. To make the Nelson Column the centre of anything would be one of the greatest possible mistakes. What they ought to do with it was to put it into Leicester-square. It was a bad thing in itself, and it dwarfed the National Gallery. If it were put up in Leicester-square, it would look excellent, and he could not say the statue of Shakespeare did.
