Mr. Statham, in reply, said that with regard to his friend Mr. Brewer's remark about the board-room of the Admiralty, he agreed, but one could not go into details in a paper that was getting long already; otherwise he should have said that what was valuable in the board-room, the carving, could be preserved and placed elsewhere. The model he exhibited was perfectly right with the exception that Mr. Taylor, he believed, objected to the lofty proportions of the main floor at the Foreign Office, and if he built the new offices would probably make it rather lower, but that could not make a material difference in the height. The official War Office plan was not a mere sketch, the position of the small courts showed that it had been considered in reference to the position of corridors and rooms, and he had no doubt it represented what the Office of Works would carry out if left to themselves. As to Dover House, if any one could go into the circular vestibule, and not see that it was a beautiful and charming architectural work, he was sorry for him. He was speaking, of course, for those who knew something of architectural design. As to the Mall, to which Mr. Mountford referred, it was not a question of what you saw from the Mall, but of what you see on looking into it. He wanted to see the beautiful vista of trees brought into Charing Cross. He was glad that Mr. Mountford was so complimentary to scheme 8, but these must not be considered as any finished expression of what he could or would do; they were sketched out, roughly, while he was writing the paper, and the reason he brought them forward was that he had always held that an architect when reading a paper to architects should be prepared to show how he would do a thing, and not merely find fault with other schemes; or otherwise it was a mere opinion in the air, with nothing to support it. As to setting back the proposed new building from the line of the Foreign Office, he thought if that were done it would be necessary to set back the east side of Parliament-street also, to make a symmetrical plan; but there was, no doubt, something in that suggestion. He quite agreed with Mr. Caröe about the circular corner shown in the Parliament-street; official architects seemed never tired of circular corners, the effect of which was often not good. He assured Mr. Burns he did not consider him a "Vandal;" on the contrary, he had observed many times with pleasure that Mr. Burns was on the side of aesthetics, and thanked him for coming there. But when he defended the Committee, and said that he had not excluded outside architects, he (the speaker) complained that they had passed the vote for the site without having sat again or called any architectural evidence, and he himself had actually been told by one of the Committee that it was now too late to discuss it.

Mr. Burns said that the Committee died with the Session, and it was not their fault that they had to recommend that a certain sum of money should go through. But as the Committee had been reappointed they would resume their deliberations, and Mr. Statham might rely upon it that he would not be excluded.

Mr. Statham said he was very glad to hear it. He was glad to find, too, that Mr. Burns really took his view as to the Carrington House site. Mr. Burns said that they might do a great deal

Staircase, Lordington Manor House.

of good if they put their views more "harmoniously." Well, his experience respecting any matter regarding Art was that you were never listened to unless you spoke very decisively; if you only put a thing in a moderate manner people did not mind you, but if you put it pretty strongly you might be listened to.

The vote of thanks having been put and carried, the Chairman announced that the annual general meeting would be held on May 3.

LORDINGTON MANOR HOUSE, SUSSEX.

This historical house was erected towards the end of the fifteenth century by Sir Richard Pole, K.G., a descendant of Cadwallader, the last British King, a cousin of Henry VII., who made him Esquire of the Royal Body Guard, Governor of Harlech Castle, Sheriff of Merionethshire, Steward of Montgomery, and also created him a Knight of the Garter. Sir Richard served the King in the wars in Scotland in 1497. During the reign of Henry VIII. this manor house formed a place of great interest, and was associated throughout the sixteenth century with the illustrious and distinguished family of Pole. Sir Richard was a son of the "last of the Plantagenets," was connected with the most distinguished personages of his time, and in 1495 he married Lady Margaret, a niece of Edward IV., her father being George Duke of Clarence, her mother a daughter of the "King Maker," Richard Earl of Warwick. She had four sons and a daughter. After her husband's demise, and in the fifth year of the reign of Henry VIII., she petitioned Parliament to be restored to rank as being the only sister of Edward Earl of Warwick and Salisbury, her mother being a daughter of the Earl of Salisbury, and succeeded in obtaining full right to the rank and title of the Countess of Salisbury. In May, 1530, this lady was attainted of high treason, and was beheaded within the precincts of the Tower in May, 1541, at which period her son,

Sir Geoffrey Pole, is said to have resided at Lordington.

The old panelling in the house, and the carved work in the principal staircase, bears sufficient testimony to their occupancy—the bear, with dragons *sejant*, the Tudor cognizance, to be also seen in Chichester Cathedral; the badge of Henry VII., and also of Henry VIII.; and the badge of the Earl of Warwick, who was so conspicuous in the Wars of the Roses. The red dragon, the ensign of the last British king, was adopted by Henry VII., and retained by the Poles as an emblem of their ancestry.

A portion of the eastern end of the house was pulled down in 1845, but sufficient remained to indicate what the original design had been. With ponds well supplied with carp and perch, an abundance of trout in the stream of the Ems flowing below Downs and Racton Park, with Lordington Woods in the rear, this place would seem to have possessed great charms. In 1608 the Pole family sold the property, which eventually passed to Thomas Peckham Phipps, who devised it to his godson, Admiral Sir Phipps Hornby, G.C.B., who saw much active service between 1797 and 1816. Sir Phipps married a daughter of Lieutenant-General Sir John Burgoyne, and on his death in 1807 the property passed to his son, the late Admiral of the Fleet, Sir Geoffrey Thomas Phipps Hornby, who commenced the restoration of this house in November, 1804, but did not survive to see the work completed.

Like Grafton Hall, a fine old example in Cheshire, and many other historical places one could mention, this fine old house had for many years been partly occupied as a farmhouse; its restoration is entirely due to the energy and spirit of the late Sir Geoffrey, who was much interested in the place. The work has been carried out by Messrs. Poate & Son, of Westbourne, from the designs and under the direction of Mr. John Birch, architect, London,

Lordington Manor House.

Lordington Manor House.

TRAMWAYS AND ASPHALT PAVING.

The Board of Works for the Holborn district are to be congratulated upon their open-mindedness in the action which they have recently taken, in connexion with the petition from the residents of that noisy thoroughfare, Theobald's-road, who are asking for something quieter for their roadway than granite setts.

The Board were prepared to meet the wishes of the inhabitants by substituting asphalt, but as the North Metropolitan Tramway Company run along Theobald's-road it was feared that the asphalt would become disintegrated by the vibration of the tram lines, and it was therefore decided to benefit by the experience obtained on the Continent before anything was done.

Mr. Lewis H. Isaacs was, therefore, instructed to proceed to Berlin, where it was reported that asphalt had been successfully used in connexion with tram lines.

He has just reported the result of his visit to that city. It appears that in the first instance pieces of stone about 4 in. wide and of a depth equal to the tram-rail were tried, as a margin to the rails, but without success.

The system now found satisfactory is to use a rail 6 in. deep, with a 4½ in. bottom flange, similar to that already laid along the Theobald's-road (which, however, is 1 in. deeper). The bottom flange of the rail is laid upon a layer of mastic asphalt, ¾ in. thick, and the same material 2 in. wide is placed next the rail, on each side of the head. The theory is that the mastic asphalt acts as a cushion, and receives the vibration occasioned by the passage of wheeled traffic proceeding over the surface of the road.

The result of this system of laying has, after two years' trial, turned out most satisfactory. The asphalt does not disintegrate near the rails; but everything seems to depend upon the rigidity of the rails. In Berlin the fish-plates have three bolts on each side of the joint, which the engineers think essential for a sound connexion. In England two only are generally used.

At siding points and crossings the Berlin authorities still introduce stone edging, but of somewhat large size (as much as 18 in. deep) because of the difficulty of making these portions of the road sufficiently rigid.

It is satisfactory to note from the report of Mr. Isaacs that his reception at Berlin was of the most cordial description, and that every facility was afforded him to obtain the information he was in search of.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Dr. Collins, Chairman, presiding.

Temporary Structures and the Jubilee Procession.—Mr. Beachcroft, in reply to Mr. Westcott, said arrangements had been made with the Office of Works to reserve a portion of the site on the north side of Trafalgar-square for the erection of a stand for the accommodation of members of the Council on Jubilee Day.

Lord Onslow inquired of the Chairman of the Building Act Committee whether the Committee would, in cases where there was no thoroughfare for wheeled traffic, make any variation in their regulations prohibiting the erection of stands across the public way, and whether, if they could not see their way to do that, they would consent to the erection by Local Authorities of stands, provided that adequate provision be made for the passage of traffic underneath them.

Mr. Payne, in reply, said the Committee would firmly recommend the Council not to allow any encroachment on the footways, but there were some cases where there would be some encroachment on public rights. Those cases would be considered on their merits, and would be referred to the police to see whether there was a possibility of their being granted. He thought there would be no objection to the erection of stands in thoroughfares which were in view, but not in the actual line, of procession.

Sky Signs.—Mr. Payne, replying to Mr. Lawson, said all the existing sky signs would be removed as soon as the licences granted to the owners expired. He anticipated it would be a year or two before all came down.

The Works Department.—The Establishment Committee recommended—(a) That a charge

of 850*l.* be made to the Works Department in respect of salaries and expenses at the central offices for the year ended March 31, 1897. (b) That a sum of 96*l.* 10*s.* be allowed to the Works Department in respect of the same period for extra cost incurred in supplying details of estimated cost of jobbing works in pursuance of the Council's resolution of June 19, 1894.—Lord Onslow asked a question with reference to the estimated and actual cost of works completed by the Works Committee, and not deeming the reply given by Mr. Hoare, the Chairman of the Works Committee, to the effect that every effort would be made to get the reports completed in time, as satisfactory, he moved an amendment requesting the Committee to bring up a report of the estimated and actual cost of all works completed up to March 31, so that it might be discussed with the report of the Special Committee of Inquiry on May 18.

Mr. Ward, late Chairman of the Works Committee said it would be quite impossible to have all the accounts ready by the date proposed.

The Rev. Fleming Williams opposed the amendment, and accused the Moderates of wishing to raise a bogus discussion, in order to hide the humiliating defeat they had sustained in regard to their charges against the Works Committee.

Mr. Cohen said it would be impossible for the Council to have an adequate discussion without the information asked for.

Mr. Hoare, Chairman of the Committee, said he was not sure that something would not be done in the direction indicated by the amendment, but it would not be possible to carry it out in its entirety. At present the Committee could not always carry out the orders of the Council, and an alteration would have to be made in the standing orders before they would be able to do so.

Mr. E. White said that some of the works had been completed for six months, and the cost must be ascertainable. The whole policy of the department up to the present time had been most unsound.

Mr. J. Burns, M.P., saw no reason for binding the Committee to a fixed and arbitrary date. On Lord Onslow's simple-looking amendment they had had clouds of insinuations and showers of suspicion. The Moderates had already found their mare's nest, and it was because they had realised the truth of his prediction some weeks ago that they were now chasing another mare's nest. The course the Moderates had been pursuing was to make damaging statements which, immediately they had served their purpose in the Council and in the Press, were withdrawn. Their purpose was solely to damage the Works Committee. If Lord Onslow was in earnest let him alter his amendment by substituting for March 31 the latest possible date. By binding the Committee to March 31 they would prevent their bringing up accounts of works which would refute the charges that had been made.

Lord Onslow accepted Mr. Burns's suggestion; and the amendment thus altered was agreed to.

Council's List of Wages.—The Works Committee reported as follows:—"The Central Association of Master Builders return the rate of wages of wood working machinists at 10*d.* to 11*d.* per hour. The rate given in the Council's list for machinists employed in working the trying up machine, vertical spindle and hand-saw, is 11*d.* per hour, but we find that this rate is slightly above that in practice obtained. We therefore recommend—That the rate of wages in the Council's list for machinists working the following machines be altered from '11*d.*' to '10*d.* to 11*d.*' per hour.—'Trying up machine, tenoning machine, and hand saw.'"

"Having received an inquiry from the Asylums Committee with reference to the rate of wages to be paid to labourers employed in the engineering trade, we have ascertained that the wages paid by several engineering firms varies from 4*½**s.* to 6*d.* per hour. As we consider that the rate should not be lower than 6*d.*, we recommend—That the rate of wages of labourers employed in the engineering trade, viz., 6*d.* per hour, be included in the Council's list."

The recommendations were agreed to.

Dangerous Structures—Result of Legal Proceedings.—The Building Act Committee reported as follows:—"The recommendation being agreed to—"

"The premises No. 25, Brushfield-street, Old Artillery Ground, having been reported as in a dangerous state, the usual notice was served upon the owner. After service of notice the owner required arbitration under Section 107 (2) of the London Building Act; but owing to certain circumstances the meeting between the district surveyor and the surveyor appointed by the owner did not

take place within the seven days after the notice for arbitration, as, we are advised, the Act requires. Consequently a summons was taken out, and at the hearing of the case it was contended, on behalf of the owner, that the time specified in the section only applied to the appointment of his surveyor, and that the time for arbitration was, under the Arbitration Act, 1889, unlimited. The magistrate adopted this view and dismissed the summons ordered the Council to pay seven guineas costs. The decision, if undisturbed, would affect considerably the operations of the Council, having regard to the large number of notices served under the dangerous structures provisions in Part IX. of the Building Act. Upon consideration of the matter we came to the conclusion that the point, which is likely to continually arise in practice, whether arbitration proceedings under Section 107 of the Act are limited as regards the time within which the surveyors must report and the arbitrator make his award, and another point which also arises, namely, whether the Arbitration Act applies to such proceedings, ought to be submitted for the consideration of the High Court. We therefore directed the solicitor to ask the magistrate to state a special case, which he has since done. As the points raised are of considerable importance, we recommend:—

"That the solicitor do take the necessary measures, by means of an appeal from the magistrate's decision in the case above referred to, for obtaining the opinion of the High Court upon the points raised with reference to the conduct of arbitration proceedings under Section 107 of the London Building Act, 1894."

Millbank Prison Site.—The Housing of the Working Classes Committee reported as follows, the recommendation being agreed to:—

"We have had under consideration the question of providing central administrative buildings in connexion with the erection of the dwellings on the portion of the Millbank site acquired by the Council, and we have instructed the architect to proceed with the preparation of the necessary preliminary plans to be submitted for our approval. These buildings comprise a central laundry, superintendent's office and house, rent office, &c. It is necessary that a preliminary estimate of 200*l.* to cover the cost of plans and incidental expenses in connexion therewith should be obtained, and we have accordingly submitted such estimate to the Finance Committee. We recommend that the preliminary estimate of 200*l.* in respect of plans, &c., for central administrative buildings to be erected on the Millbank estate, submitted by the Finance Committee, be approved."

The Steps of St. Martin's Church.—The Improvements Committee reported that they had had under consideration a letter from the Vestry of St. Martin-in-the-Fields, forwarding a plan showing a suggested widening of St. Martin's place by the alteration of the steps in front of St. Martin's Church, and asking the Council to undertake the work as a county improvement. They had also received a letter from the Society for the Protection of Ancient Buildings, objecting to the proposal to alter the steps of the church. There were at present two flights of steps in front of the church with a terrace or landing between, and the proposal was to abolish the terrace and to make one continuous flight of steps, and so increase the width of footway between the steps and the carriageway from the present width of 5 ft. 6 in. to about 9 ft., the cost of the work being estimated at 700*l.* It appeared to them, however, that merely to widen the footway would be of little use, and that if any widening was required opposite the church, it was needed quite as much for the carriageway as for the footway. They had, therefore, had before them several plans, prepared by the Council's engineer and the architect, providing for a widening of both the carriageway and the footway. To obtain this greater width it would be necessary either to set back the steps to a position within the line of the columns fronting the church, or to substitute for the steps a vertical wall on the west side of the columns. The only other method appeared to be the setting back of the church about 30 ft. further to the east, which would involve the rebuilding of portions of the edifice. To all these suggestions, however, there were objections. It had been pointed out that the traffic was frequently congested owing to the fact that omnibuses stop in front of the church, but that was an evil which could be remedied by the police authorities. The several architectural societies would offer strenuous opposition to any alteration of the present architectural appearance of the building. Moreover, the existing steps were much worn, and would before long require to be renewed, a work which would doubtless be undertaken by the church authorities. After full consideration of all the facts, they recom-

ended—"That the Vestry of St. Martin-in-the-Field be informed that the Council is not prepared to undertake as a county improvement the suggested widening of St. Martin's place by the alteration of the steps in front of Martin's Church."

Major Probyn moved to refer the matter back for further consideration to see if something could not be done with these steps.

Mr. Wettenhall seconded.

Mr. Staveland hoped that the architect effect of the church would not be interfered with. To simply get rid of the terrace was a very small improvement, and a wider scheme could seriously interfere with the architectural appearance of the church.

The amendment was rejected, and the recommendation of the Committee agreed to.

Trinity-square, Whitechapel.—Mr. Lawson moved to refer it to the Parks Committee to consider and report upon the expediency of maintaining Trinity-square, Whitechapel, as a public garden.

In the course of the discussion on the motion was pointed out that there was not an open space within a mile of this spot. The following words were added to the motion, "and to consult with the Local Authority thereon;" and it was then adopted.

The Council at its rising adjourned till May 11.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on Tuesday, the Building Act Committee reported that they had considered the undermentioned applications under the London Building Act, 1894, and had arrived at the following decisions. Those applications which have been agreed to are granted on certain conditions:—

Lines of Frontage.

Levisham.—That consent be given to the erection of one-story shops upon part of the forecourts of Nos. 1 and 2, Herbert-villas, Catford Bridge, on the either application of Mr. A. L. Guy.

Boya and Bromley.—That consent be given to the erection of a new factory at Wick-lane Works, Old Ford-road, Bow, on the application of Mr. F. M. Biddop on behalf of Messrs. Allan, Cookshat & Co.

Leppford.—That consent be given to the erection of one-story building in front of No. 283, and to the erection of two four-story buildings at Nos. 285 and 287, New-cross-road, on the application of Mr. L. Jacob on behalf of Mr. J. S. Clegg.

Deplford.—That consent be given to the rebuilding of a one-story building on the west side of and adjoining the "Five Bells" tavern, Nos. 153 and 155, Greenway-road, Greenwich, on the application of Messrs. F. J. Eedle & Meyers, on behalf of Mr. F. James.

Dalkeith.—That consent be given to the erection of one-story shops upon part of the forecourts of Nos. 103, 105, and 107, Maple-road, Penge, on the application of Mr. E. Watkins.

Leppford.—That consent be given to the erection of a one-story shop upon part of the forecourt of No. 43, Penton-street, Pentonville, on the application of Mr. H. H. Tasker on behalf of Mr. J. Gibson.

Hampstead.—That consent be given to the erection of a block of residential flats with projecting bay windows on the west side of West End-lane, between No. 93 and a house known as The Chimes, on the application of Messrs. Palgrave on behalf of Mr. E. Cornish.

Hampstead.—That consent be given to the rebuilding of Nos. 42, 44, and 46, High-road, Kilburn, with the main fronts advanced to the line of the present one-story shops, on the application of Messrs. Edmondson & Gabriel on behalf of the London and North-Western Banking Company.

Hampstead.—That consent be given to the erection of two one-story coal offices on the west side of Finchley-road, adjoining the Finchley-road Station of the London and North-Western Railway Company, on the application of Mr. A. Whitelaw on behalf of the Company.

Holborn.—That consent be given to the erection of a building with a projecting porch and bay windows, on the site of Nos. 150, 152, and 154, Southampton-road, Bloomsbury, on the application of Mr. G. D. Martin, on behalf of Mr. E. G. Marshall.

Levisham.—That consent be given to the erection of one-story shops on a portion of the forecourts of Nos. 57, 57A, 59, 61, and 61A, Dartmouth-road, Forest Hill, on further application of Mr. G. Tolley on behalf of Mr. E. C. Christmas.

Levisham.—That consent be given to the erection of one-story shops upon the forecourts of Nos. 32, 34, 36, 38, and 40, Lendon-road (formerly Nos. 2, 3, 4, 5, and 6, Whitechapel-road), Forest Hill, on the application of Mr. E. C. Beaumont, on behalf of the Freehold and Leasehold Investment Company, Limited.

Puddington, South.—That consent be given to the re-building to an advanced frontage of Nos. 123, 125, and 127, Queen's-road, Bayswater, with projecting bays and one-story shops, on the application of Mr. C. G. Maylard, on behalf of Mr. H. Gibbon.

Rothemith.—That consent be given to the erection of an open iron footbridge over Church-passage to connect Messrs. Dudin & Sons' premises on each side of that street, on the application of Messrs. W. A. Cripp & Sons.

St. George, Hammer-square.—That consent be given to the erection of an open porch and balcony in front of No. 37, Charles-street, Mayfair, on the application of Mr. J. Garlick, on behalf of Messrs. Garlick & Horton.

St. Pancras, North.—That consent be given to the erection of a one-story bar addition in front of the "Bull and Gate" public-house, No. 389, Kentish Town-road, on the application of Mr. A. J. Perriam, on behalf of Mr. H. Morgan.

Westminster.—That consent be given to the erection of a porch to a building at Albert-gate, Knightsbridge, to flank upon Seville-street, on the application of Mr. H. L. Florence, on behalf of Messrs. Woodland Brothers.

Strand. (a) That consent be given to the erection of an iron and glass shelter at the entrance to St. James's Hall, Piccadilly, on the application of Mr. W. Emden. (b) That so much of the application as relates to the erection of an iron-and-glass shelter at the entrance to St. James's Restaurant, Piccadilly, be not acceded to, as the Council is not prepared to permit the erection of structures of the character proposed, except for public buildings.

Clapham.—That consent be not given to the erection of seven three-story houses with bay windows and of two one-story shops on the south-east side of Queen's-road, Battersea Park, on the application of Mr. W. Pencock.

Hackney, North.—That consent be not given to the erection of ten houses on the west side of Park-lane, Stoke Newington, with the boundary fence at the rear at less than the prescribed distance from the centre of Aden-terrace, on the application of Mr. T. Pryor.

Islington, East.—That consent be not given to the erection of a block of five-story residential flats with two five-story bay windows between Nos. 20 and 21, Richmond-village, Seven Sisters-road, on the application of Mr. W. L. Kellaway, on behalf of Mr. F. Nicholls.

Levisham.—That consent be not given to the erection of a house with shop on the north-east side of Engleheart-road, to flank upon Jutland-road, on the application of Mr. H. J. Miller, on behalf of Mr. F. Belts.

Levisham.—That consent be not given to the erection of a building on the site of Nos. 306 and 308, Brockley-road, with the flank of the new building to abut upon Comerford-road, on the further application of Mr. J. Webster, on behalf of Mr. J. Ciappell.

Levisham.—That consent be not given to the erection of a house on the north side of Adamsmill-road, Sydenham, with the flank and a projecting bay to abut upon Nierlwald-road, on the application of Mr. A. J. Dorrell.

Norwood.—That consent be not given to the rebuilding of the "George Canning" public-house, Effra-road, Brixton, with the flank to abut upon Water-lane, on the further application of Messrs. Tanson & Co., on behalf of Mr. G. Gibbert.

Norwood.—That consent be not given to the erection of a mission-hall on the east side of Elder-road, West Norwood, on the application of Mr. J. C. Wright, on behalf of the Rev. H. Cooper.

Strand.—That consent be not given to the erection of an iron and glass covered way at the entrance to the Spitten Beer Restaurant, Shrewsbury-avenue, St. James's, on the application of Mr. W. J. Parker on behalf of Mr. G. Sedlmayer.

Wandsworth.—That consent be not given to the erection of three houses, with one-story shops in front, on the east side of Balham-road, upon part of the site of Nos. 109 and 201, on the application of Mr. W. C. Poole on behalf of Mr. J. Stone.

Clapham.—That consent be not given to the erection of houses on the east side of Cavendish-road, and also on the south side of Poynder's-road, between Chios House and Cavendish-road, on the further application of Messrs. Lee & Pain on behalf of Sir J. D. Poynder, Bart., M.P.

Width of Way.

Lincolshire.—That consent be given to the erection of a covered way and one-story office building at Ratcliff Cross Wharf, Broad-street, at less than the prescribed distance from the centre of that street, on the application of Messrs. Bradshaw, Brown, & Co., on behalf of Messrs. Pincheon, Johnson, & Co.

Deplford.—That consent be given to the erection of buildings on the east side of Hosier-street, Creek-street, Greenwich, on the further application of Mr. L. Jacob on behalf of Messrs. J. & A. Dandridge.

Lincolshire.—That consent be given to the erection of a one-story stable in a yard at No. 43, Broad-street, Ratcliff, at less than the prescribed distance from the centre of the road, on the application of Mr. C. Dinch on behalf of Messrs. Charrington, Sells, Dale, & Co.

Pophar.—That consent be given to the erection of two houses on the north side of Minmill-street,

Millwall, at the corner of Alpha-road, at less than the prescribed distance from the centre of each street and road respectively, on the further application of Messrs. J. & S. F. Clarkson on behalf of Mr. W. Legg.

Peckham.—That consent be not given to the erection of a dwelling house on the west side of an unauthorised street, known as Waxeney-avenue, Peckham-rve, with the flank of such house to abut upon Solomon's-passage, on the application of Mr. H. Long.

Bethnal Green, South West.—That consent be not given to the erection of a warehouse on the site of No. 53, Church-row, Bethnal Green-road, on the application of Mr. W. Stone on behalf of Mr. E. Atkins.

Hackney, Central.—That consent be not given to the erection of a three-story workshop, at the rear of No. 383, Kingsland-road, to abut upon the east side of Derby-road, Kingsland, on the application of Mr. K. Wakely.

Space at Rear.

Hampstead.—That the Council do, in the exercise of its powers under Section 41 (1) (iv.) (b) of the London Building Act, 1894, permit the erection of a building not exceeding 30 feet high on part of the open space at the rear of a house and shop on the west side of South-end Green, at the corner of Pond-street, on the application of Mr. C. Bell, on behalf of Messrs. Chessum & Sons.

Puddington, North.—That the Council do allow the erection of fifteen blocks of residential flats on the south side of Lauderdale-road, Maiden-vale, with the diagonal line of such buildings drawn in conformity with the rules of Section 47 (1) (iii) (b) of the London Building Act, 1894, but with open spaces at the rear not in accordance with the provisions of that Act, on the application of Messrs. Boehmer & Gibbs, on behalf of Mr. H. J. Cave.

Rothemith.—That the Council do, in the exercise of its powers under Section 41 of the London Building Act, 1894, allow a modification of the provisions of that Section with regard to open spaces about buildings, so far as relates to the proposed rebuilding of the "King of Prussia" public-house, Tooley-street, on the site of No. 186 and of two cottages abutting upon Parish-street, with an irregular space at the rear of the new building, on the application of Mr. E. Wilkinson, on behalf of Mr. W. C. Bessel.

Deviation from certified plans.

Southwark, West.—That sanction be given to certain deviations from the plan certified by the District Surveyor, under Section 43 of the London Building Act, 1894, so far as relates to the proposed building of No. 6, Surrey-row, Blackfriars-road, on the application of Mr. W. H. Cowlishaw, on behalf of Miss L. Fowler.

Line of Fronts and Width of Way.

Pophar.—That consent be given to the erection of a factory on the east side of Dove Common-lane, on the application of Messrs. J. & S. Flint-Clarkson, on behalf of Messrs. W. Pearce & Son.

Fulham.—That consent be not given to the rebuilding of the Hand and Flower public-house, No. 617, King's-road, with the flank abutting upon Edith-row, on the application of Messrs. Gardiner & Theobald, on behalf of Mr. A. W. Rice.

Hammersmith.—That consent be not given to the erection of three blocks of dwellings with projecting bay windows, to be inhabited by persons of the working-class, on the west side of Queen-street, between No. 34 and Church-lane, on the application of Mr. E. Sage, on behalf of Mr. W. Moss.

Kensington.—That consent be not given to the erection of a block of residential chambers on the site of No. 59, Drayton Gardens, with the boundary at the rear of the premises at less than the prescribed distance from the centre of Thistle Grove-lane, on the application of Mr. J. Norton, on behalf of Mr. T. Boyce.

Peckham.—That consent be not given to the erection of nine houses, with projecting bay windows, on the west side of Lower-park-road, and also of eight houses with similar bays on the south side of Commercial-road, on the site of Nos. 72, 74, 76, 78, 80, 82, 84, 86, 88, and 90, Lower-park-road, on the application of Messrs. Benison & Bargman, on behalf of Mr. Pennack.

Waltham.—That consent be not given to the erection of one-story shops on the forecourt of Nos. 282, 284, 286, and 288, East-street, on the further application of Messrs. P. W. Slark & Co.

Width of Way and Cubical Extent.

Whitechapel.—That the Council, in the exercise of its powers under section 13 of the London Building Act, 1894, do consent to the erection of a one-story addition on the west side of an ale-store, at the Albion Brewery, Brady-street, to flank upon Bath-street, and to the re-erection of the boundary or fence at less than the prescribed distance from the centre of Bath-street, and the retention of the forecourt boundary wall in Brady-street within 20 ft. from the centre of that street; and that subject to the provisions of Section 76 of that Act, the Council do consent to the erection of the proposed one-story addition, whereby each of the two divisions of the ale-store will exceed in extent 250,000 but not 450,000 cubic feet, such building to be used only for the purposes of the trade of a brewer, on the appli-

cation of Mr. R. Spence, on behalf of Messrs. Mann, Crossman, & Paulin.

Formation of Streets.

Clapham.—That an order be sealed and issued to Mr. C. J. Bentley, refusing to sanction the formation or laying out of a street, 40 ft. wide, for carriage traffic, to lead out of the south side of Nightingale-lane into Temperley-road, Wandsworth, on his further application to the Council.

Clapham.—That an order be sealed and issued to Messrs. Lee & Pain, refusing to sanction the formation or laying out for carriage traffic of new streets, 40 ft. wide, on the site of a house with grounds known as Bygrove House, and to lead out of the south side of Poynder's-road, Clapham Park, on the application to the Council, on behalf of Sir J. D. Poynder, Bart, M.P.

Hoxton.—That no order be made with respect to the application of Messrs. Clapham, Fitch, & Co., on behalf of the Governors of the Bishopsgate Foundation, for the Council's approval of a proposed scheme for widening to 40 ft. a portion of Shepherdess-place, City-road, Shoreditch, in connexion with the rebuilding of the Eagle public-house.

Norwood.—That an order be sealed and issued to Messrs. Cobb & Bottrill, refusing to sanction the formation or laying out for carriage traffic of three streets, 40 ft. wide, on the Meadowbank estate, to lead out of the east side of Knight's Hill-road, West Norwood, on the application to the Council, on behalf of the Land Mortgage Investment and Agency Company, Limited.

Wandsworth.—That an order be sealed and issued to Mr. S. G. Warner, refusing to sanction the formation or laying out for carriage traffic of a new street, 40 ft. wide, on the Spencer Lodge Estate, to lead out of Roehampton-lane into High-street, Roehampton, on his application to the Council.

Wandsworth.—That the Council do not approve of a variation from the plan sanctioned on November 21, 1873, for the formation of Parkmore-road, Balham, by the abandonment of the formation of the portion of that road eastward of Culverden-road, and the widening to 12 ft. 6 in. of the footpath leading from the latter road to Tooting Bee Common, on the application of Mr. A. Wellings, on behalf of Mr. H. Groombridge.

Means of Escape from Top of High Buildings.

Chelsea.—That the Council do, in the exercise of its powers under Section 63 of the London Building Act, 1894, decline to grant a certificate in respect of the means of escape, in case of fire proposed to be provided for the persons dwelling or employed in the fifth floor of a block of residential flats, with shops on the ground floor, on the north side of Basil-street, Hans-road, Brompton-road, on the application of Mr. C. W. Stephens, on behalf of Harrod's Stores, Limited.

Cubical Extent and Construction of Building.

Woolwich.—That, subject to the provisions of Section 76 of the London Building Act, 1894, the consent of the Council be given to the erection and construction on the south side of Harrington-road of a building to exceed in extent 250,000 but not 450,000 cubic feet, and to be used only for the purposes of the manufacture of electrical locomotives and other large electrical machinery, on the application of Mr. J. R. Brittle on behalf of Messrs. Siemens Brothers & Co., Limited.

Buildings for the Supply of Electricity.

St. George, Hanover-square.—That the Council do approve of the plans, dated April 1, 1897, submitted with the further application of Mr. C. S. Peach on behalf of the Westminster Electric Supply Corporation, Limited, for the construction of an addition to a generating station for electricity in Eccleston-place, Eccleston-street, Buckingham Palace-road.

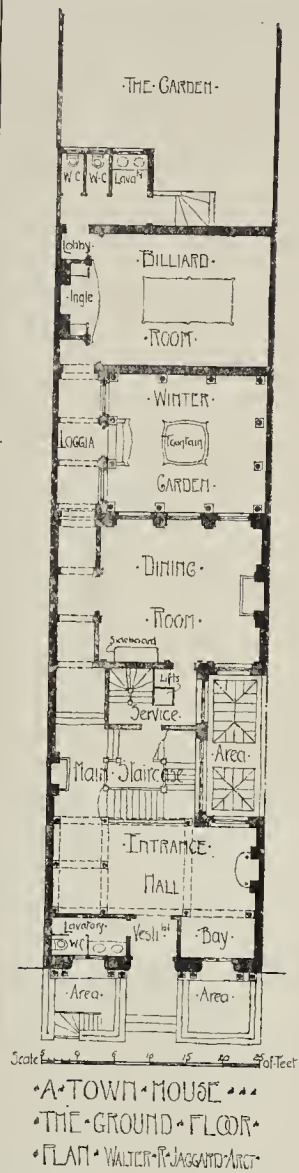

St. George, Hanover-square.—That the Council do approve of the plans, dated March 12 and 13, 1897, respectively, submitted with the application of Mr. C. S. Peach on behalf of the Westminster Electric Supply Corporation, Limited, for the construction of an addition on the north side of the generating station and works on the site of Nos. 87, 89, and 91, Davies-street, Oxford-street.

Recommendations marked * are contrary to the views of the Local Authorities.

Illustrations.

ALVASTON HALL.

HIS house has been practically rebuilt on the site of the old Hall of the Lords of Alvaston, of which probably not a vestige remains. The property was purchased by A. Knowles, Esq., and the reconstruction is not yet quite completed. A new story was added in solid sunken construction filled in with brick and cemented with Spa facing. The large hall is of oak with wood-ceiling and oak-panelled dado and frieze. The dining-room is also of oak stained dark. In the chimney piece is a beautiful portrait by Hoppner, the frame designed with the rest of the work. The drawing-room is panelled up to the frieze and

* A TOWN HOUSE
* THE GROUND FLOOR
* PLAN BY WALTER R. JAGGARD ARCHT.

Painted white. All doors are of dark mahogany, with specially designed bronze furniture and hinges. The ceilings to dining- and drawing-rooms and also that of the boudoir are in plaster all specially designed and carried out by Hindshaw, of Manchester, Mr. Cooper having executed the modelling. All the moulds have been destroyed. The billiard-room is finished in Cyprus wood stained a greenish tone. Panels in the frieze modelled in plaster, each panel illustrating a sporting subject, also modelled by Mr. Cooper. All floors on ground floor are either of oak or parquet executed by Messrs. Turpin and some by Messrs. Ebner. The entire house is heated by hot-water coils and pipes by Messrs. Harlowe, of Stockport. Large new stables, &c., have also been built. The contractor is Mr. Gresty, of Willaston, and the work has been carried out by his foreman, Mr. T. Fenna. The panelling of dining-room and hall dado were made by Messrs. Garnett, of Warrington. The stained glass by Messrs. Sutherland, of Manchester.

The ornamental metal work by Mr. G. Wragge, also of Manchester. The wood-carving by Mr. Millson, and the stable fittings by Musgraves. The whole under the superintendence of architects, Messrs. E. Salomons, F.R.I.B.A. and A. Steinhilber. The cost will be about 16,000l.

NEW THEATRE, DEPTFORD.

THE above theatre is now in course of erection on the site at the corner of New Cross-road and Tanner's Hill. The front to New Cross-road, and the return to Tanner's Hill, will be carried out in white Portland stone, and the continuation of the frontage in Tanner's Hill will be executed in dark red brick and stone dressings.

The auditorium will be constructed entirely of steel and concrete, and will be absolutely fire-resisting. The decorations will be carried out in the Renaissance style, and the electric light will be introduced in decorative manner into the scheme of decoration.

The building will be lighted with the electric light throughout, supplied by its own plant, and, as a further safeguard for the audience, gas will be laid on for use in the event of the electric light failing. A complete system of hydrants and heating on the low-pressure system is to be provided.

The theatre will be luxuriously furnished and generally equipped. The cost of the main structure, exclusive of the decorations or other sub-contracts, is 21,150l.

The theatre will be one of the largest in London, accommodating, as it will, upwards of 3,500 persons.

Mr. Walter Wallis, of Balham, is the general contractor, the clerk of works is Mr. Moss, and the general foreman Mr. Calvert. The building is being erected from the plans of Mr. W. G. R. Sprague. Beyond the actual space occupied by the theatre there is a large area at the rear which will be utilised for building the engine-house, heating-chambers, scenery stores, and painting-rooms, thus completely isolating the theatre from all danger of fire.

A TOWN HOUSE.

BY MR. WALTER R. JAGGARD.

THIS front was a design made as an alternative to the design for a house front by the same architect published in the *Builder* of September 12, 1896. The materials are to be red sand bricks and Ham Hill stone; the roof to be covered with Broseley tiles.

The study is an attempt to gain dignity of appearance by using large plain surfaces, and to obtain the necessary richness of effect by carving the large flat mouldings.

YIEWSLEY CHURCH.

THE drawing shows the interior of the proposed new nave. The present church is a quiet little modern Gothic building, a nave and apsidal chancel only, and was built about thirty years ago. It is considered too small to serve as a nucleus for the enlargements, and is therefore to be made into the north aisle of the new church, a large nave and chancel being added on the south side. The scheme has been modified since this drawing was made by the introduction of a square tower and flèche in the place of the south transept. The work will all be kept very simple and plain, and the materials are to be stock bricks, Bath stone, and tile roofs, which are to be ceiled inside. The work is estimated to cost about 3,000l.

CHARLES A. NICHOLSON.

COMPETITIONS.

COLCHESTER NEW TOWN HALL.—The minutes of the Municipal Offices (Special) Committee of the Colchester Town Council, submitted at a recent meeting of the Council, embodied the report of the Sub-Committee, which showed that the Town Clerk and Borough Surveyor had been instructed to confer with the other officers as to the allotment and furnishing of the rooms at the temporary offices. They had resolved to invite Messrs. E. W. Mountford, B. Binyon (Ipswich), H. T. Hare, J. Belcher, J. Brydon, and Beresford Pite to prepare and submit competitive designs and estimates, and in event of one of them declining, to invite Mr. Burgess, of London. Mr. A. Waterhouse, R.A., having declined to act as assessor at a fee of fifty guineas, Mr. Norman

aw, R.A., had accepted. It had been resolved unanimously to leave it open to architects to submit designs. Messrs. Binyon, Pite, Fisher, and Brydon had accepted the invitation. Mr. Mountford conditionally to the travelling expenses of the successful architect and the time for drawings extended to June or July; and Mr. Hare had promised to do plans, but trusted the time might be extended to the end of June. The Committee therefore resolved that the travelling expenses of the successful architect be allowed, in addition to commission, and that the time be extended to June 30. The report was adopted at the meeting of the Council.

ARCHITECTURAL SOCIETIES.

GLASGOW ARCHITECTURAL ASSOCIATION.—At a meeting of the Glasgow Architectural Association, held in their rooms, 187, Pitt-street, the 6th inst., Mr. Tait Conner in the chair, Mr. Wm. Fraser read a paper on "The Influence of Economics on Architecture." He showed that he had effect the present land tenure had on architecture; how, especially where leases of a limited period existed, the buildings were built only to last out the lease. How building for profit and not for use tends to depreciate art, as the great proportion of the buildings in Glasgow are erected by the speculative builder, whose aim is to make a profit, and not erect the best building that he can. He showed also how the unequal distribution of wealth, competition, and the sub-division of labour, were against the appreciation of good architecture and unfavourable to thoughtful design and good workmanship. The remedy suggested was collectivism, which, he said, could give greater opportunities for good architecture, as building would only be erected if required, and not as profitable speculations. There would be no glaring inequalities in wealth, with the ostentation of riches and the degradation of poverty. The worker would be well fed and be sure of his work, and could therefore take greater delight in it and produce better work. There would be no need for work being cut down to the cheapest point to make things pay, for buildings would be erected for the good of the community, who would take a delight in seeing their own property safe. On the motion of Mr. Jas. Craigie hearty vote of thanks was accorded to the essayist.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Under the leadership of Mr. Hippolyte Blanc, the members of this Association on Saturday last week visited Niddry and Dunrobin Castles. The former, situated in Kirkcaldy parish, Mr. Blanc described as a fair example of an early keep, one showing the first development from the simple square tower. The doorway in the inner angle enters upon a circular staircase leading to the several towers, now in ruin. The walls average 9 ft. thick. The foundation of the tower was ascribed to George, fourth Lord Seton, probably in the last quarter of the fifteenth century. The castle receives prominence in history as having in 1568 afforded shelter and protection to Queen Mary. During the troublous times of Charles I. and II. the Castle and lands passed to the family of Hope-uton, the Castle being the title of Baron Niddry to Lord Hope-uton. Dunrobin Castle, situated in Abercorn parish, Mr. Blanc explained was a residential mansion house of about 100 years later date than Niddry. It presents a large rectangular building, 80 ft. long, facing south, with projecting wings at the extremes on the north side. This castle was in marked contrast to Niddry, the walls being so much thinner. There was much evidence to associate the period of foundation with the end of the sixteenth or beginning of the seventeenth century. The castle continued habitable until quite recently, and is now in ruin.

ARCHÆOLOGICAL SOCIETIES.

ROYAL ARCHÆOLOGICAL INSTITUTE.—At the general meeting of this Institute on the 7th inst., Judge Baylis, Vice-President, in the chair, Mr. E. Keyser, Squire and Lord of the Manor of Aldermaston, read a paper on "Aldermaston church, Berkshire." He gave a brief description of the distinguished personages who were lords of the Manor and owners of the Aldermaston Estates, and then described the church and the necessary repair which had been recently carried out at his expense under the

direction of Mr. E. Doran Webb, F.S.A. The church was probably built about 1120 on the site of the earlier one mentioned in the Domesday survey, and it was enlarged about the years 1260-1300, and in the fifteenth century, and additions were made to it about 1660, and at the beginning of the present century, when it was unfortunately thoroughly beautified. The mural paintings representing St. Christopher, and probably two scenes from the life of St. Nicholas, found last year in the South Chapel and elsewhere; the old glass, two panels representing the Annunciation and Coronation of the Virgin, dating from the middle of the thirteenth century, and numerous armorial shields, inserted by Sir Humphry Forster, circa 1540; and the various tombs and brasses, notably, the fine alabaster monument of Sir George Forster, and Elizabeth his wife, who died in 1520, were minutely described. An interesting discussion afterwards took place, in which Messrs. W. H. St. John Hope, Mill Stephenson, E. Doran Webb, P. H. Norman, and G. E. Fox, pointed out the various peculiarities and particular objects of interest, more especially with regard to the tomb of Sir George Forster. Some excellent rubbings of the brasses and inscriptions and photographs of the monument, mural paintings, and Norman west doorway were exhibited by Messrs. Mill Stephenson, A. H. Lyell, and the writer of the paper.

Correspondence.

To the Editor of THE BUILDER.

VENNER v. McDONELL.

"STRUCTURE" IN THE LONDON BUILDING ACT. SIR.—I regret to have to ask to be allowed to add to what I have already said, but, unless a perfectly false impression is to be created, it is absolutely necessary I should do so.

In your comment, you suppose that the court, in putting the fixing of the galleries and seating for the Military Tournament on a par with that of a cupboard in any man's house, meant only to show that the two cases would come *legally* under the same category; but that is just what I contest, the latter being in a private house and absolutely exempt from the District Surveyor's control, the former in a *public building*, and under special legislation. It is under this legislation only that I could be supposed to have any responsibility.

You further say, very naturally, following the wording of the judgment, you do not see how, in a legal sense, a detached framed seating, removable when required without taking it to pieces can properly come under the head of a "structure" in the sense in which the word is used in the Building Act; and with this I perfectly agree, and had that been a fair description of the staging I should never have dreamed of raising the point.

The principal erection (of which a model was shown) was a gallery, on posts, with stalls for horses under it, and so far from having the character ascribed to it, it was in separate parts, which, excepting that they were marked to save trouble, had to be put together practically as they would be were the structure entirely new.

I think you will allow this materially alters the case.

GEO. McDONELL.

* See our Note on the subject on p. 352-3.—ED.

"BODLEY v. MARSLAND."

SIR.—Mr. Blackwell's report to you of the above case (page 347 *ante*) is on the main facts quite correct. So that builders may now evade the very beneficial effects of Section 74 (2), I must dissent from his deduction that none but a District Surveyor could have arrived at the conclusion that the buildings were united, for, seeing that the Building Act was primarily intended to prevent the spread of fire, and Section 74 (2) particularly so, I should like to retort that none but a lawyer could see no difference between 9 in. and 6 ft. But these are the kind of impractical decisions we have to put up with at the Police-court. If, however, the Magistrate is satisfied, I am content.

ELLIS MARSLAND.

SHERBORNE ABBEY.

SIR.—It may interest some of your readers to learn that Allhallows Church, which was attached to the west end of the abbey church, possessed a tower with a peal of bells of its own. This tower, together with the other materials of Allhallows, was sold for building stone during the years 1542-1551, as I discovered from the old parish accounts, which I examined last Christmas. So far as I know, the fact of the existence of this tower had never been noticed before, at any rate for the last 300 years.

The site of this tower was at the west end of Allhallows, so far as I can judge; it certainly was not over the passage or porch which divided Allhallows from the abbey church.

Supposing the tower was at the west end of

Allhallows, the outline of the two churches must to some extent have resembled that of Wimborne Minster on a larger scale. That is to say, we had in Sherborne that rare combination of a central and one western tower.

W. B. WILDMAN.

Sherborne.

A DILAPIDATED HOUSE AT SHEPHERD'S BUSH.

SIR.—Kindly allow me to call attention to the disgraceful, and, from a sanitary point of view, dangerous state of one of a block of five freehold houses—No. 20—in Warbeck-road, Shepherd's Bush. There is no provision for carrying off rain-water, and the house has evidently never been finished, the roof of the bay-window is parting company with the main building; the windows, broken and dirty, are blocked up with planks and plate-racks; the fanlight over the door is unglazed, and the street-gate lock has rusted to pieces, the chain and padlock fastening the gate being almost useless from exposure to the weather.

This house has been left thus for years, and I think the authorities ought to summon the freeholder to either put the house into decent and habitable repair, or to pull it down altogether, and that immediately.

DOMITS.

The Student's Column.

SPECIFICATIONS.—XVI.

ELECTRIC WIRING (continued)

WOOD CASINGS.—All cases and covers, except those specially mentioned afterwards, to be of the best American whitewood, the covers being fastened to the casings with screws. When casings are covered with plaster they must be coated inside and outside with shellac varnish. Whenever casings pass through floors they must be protected by a covering of sheet iron extending two inches below the floor and four inches above it. In the dining-room and library the casings must be of oak, and in the drawing-room and hound of walnut, moulded to match the existing fittings. Patterns of the moulded covers must be submitted for the approval of the architect.

When there is no public supply of electricity, a power-house containing a combined mechanical and electrical power plant is necessary. The plant can be packed into very little space, so that some outhouse can usually be found that will serve for this purpose. Of course, a great variety of cases arise, and engineers must be guided by circumstances in each special case. The combinations of steam engines, oil engines, gas engines, steam turbines, water turbines, &c., with dynamos and accumulators are almost endless. Where space is limited, a favourite plan is to have a dynamo direct driven from a steam engine or turbine. A combined steam turbine and dynamo occupies less space than any other plant. It is a good rule, however, never to try experiments with any new prime mover or dynamo, whatever theoretical justification you think you have, and however long the guarantee of the makers. We have had experience with a theoretically perfect gas engine, which ran beautifully for six months, and then its explosions began to make alarming noises, sometimes as loud as a cannon firing. The contractors removed it, and put in one of an older type, but, naturally, there was an interruption of the supply, and the household were put to some inconvenience.

Steam Engine and Boiler.—One h.p. nominal vertical engine and boiler complete, with all fittings and variable expansion gear. It must make revolutions per minute and be fitted with disc fly wheel for direct coupling to the dynamo. The variation in speed from no load to full load shall not exceed 10 per cent. The makers are to deliver and erect the engine and boiler at the power house to the satisfaction of the consulting engineer, who may require them to perform any tests on their efficiency or to demonstrate their silent running.

The Foundations for Engine.—The foundations for the engine will be built by our builder according to the drawings and specifications of the makers of the engine. Our builder will also give all necessary assistance in the way of labourers and scaffolding for the erection of the engine, &c.

[The foundations for direct connected outfits extend under both engine and dynamo.]

Gas-Engine.—One h.p. nominal gas-engine complete, with fly-wheel and water reservoir.

Oil Engine.—One h.p. nominal oil

engine with cistern, igniting apparatus, vaporiser, air-pump, and all appliances.

Dynamo (For two hundred 16-c.p. lamps).—One dynamo having an output of 14 kilowatts when the armature is making revolutions per minute. It must be compound wound with a special switch so that it can be run either as a compound machine for running the lamps direct or as a shunt machine for charging accumulators. When run as a compound machine the E.M.F. between its terminals is to be 105 volts at no load and not less than 103 volts at full load.

The dynamo to have a sliding cast-iron bed-plate with brackets and tightening screws and to be supplied with adjustable sight-feed lubricators.

Armature.—The core to be made of the softest charcoal iron discs. The windings must be wound in separate sections on the core, and be well insulated from it. They must in addition be protected by some varnish which cannot be injured by oil.

Field Magnets.—To be of wrought iron, the magnet coils to be wound on wrought-iron cases which can be slipped on and off the field magnets. The insulation of the wires forming the coils to be mechanically strong and the insulation resistance between the coils and the framework of the machine to be greater than one megohm when tested by an Evershed Ohmmeter at 200 volts.

Commutator.—Of pure copper hard-drawn. The copper segments must be so constructed that it will be easy to replace them if necessary.

Brushes.—Of copper, carbon tipped.

Spindle.—Of best mild steel.

Copper.—All copper used in the construction must have a conductivity of at least 100 per cent. (Matthiessen's Standard).

The dynamo must be guaranteed to be capable of giving an output of 14 kilowatts running continuously for twelve hours without sparking on the commutator or undue heating of the armature or magnet coils. At this load also its mechanical efficiency must be guaranteed to be not less than 85 per cent.

The above dynamo is capable of supplying current to 200 16-c.p. lamps at once, but if we have a battery of accumulators as well, then by keeping the dynamo running during the day charging the accumulators, and then using them in addition to the dynamo at night we could supply 600 or 800 lamps.

Accumulators.—A battery of fifty-five accumulators in glass cells capable of supplying 400 16-c.p. 100 volt lamps with current for four hours. Each cell must have a wooden tray supported by glass insulators of mushroom pattern and a glass cover. A guarantee for at least two years must be given, and the cost of maintenance and repairs should be stated.

Battery Switchboard.—This switchboard must contain two dynamo fuses, one dynamo switch, one battery-charging switch, one battery discharging switch, one current indicator, one automatic cut-out, one shunt-regulating switch, one volt meter with switch for same, one ammeter with a special switch, by means of which the current in the dynamo, battery, or mains can be read, two circuit fuses, and one circuit switch.

All the above to be mounted on a plain slate slab, with an oak frame and a plate-glass front, with lock and key. All connections to be made from behind, and thimbles to be provided for cable connections. Every fitting of the board that carries current must be of copper, and the current density must in no case exceed 500 amperes per square inch of contact surface.

It is to be made for 300 amperes.

A drawing of the switchboard to be submitted for the approval of the engineer.

Arc Lamps.—Four 10 ampere arc lamps will be required to run two in series from the 100-volt circuit. The mechanism must be simple and strong, and the volts at the terminals and the watts in the arc must remain constant within 2 per cent. when using a 16 mm. cored carbon for the positive, and a 9 mm. solid rod for the negative carbon.

Motor.—One 6 h.p. shunt motor will be required for turning a line of shafting in the workshop. It is to be run direct from the 100-volt circuit and great regularity of speed is essential. The direction of rotation must be capable of being reversed, and the load is of a very intermittent character. Carbon brushes must be used, and the motor must be enclosed in a fire-proof case. A reversing and a regulating switch and starting resistances to be included in the estimate. When the output is 6 h.p., the efficiency must be at least 70 per

cent, but trustworthiness and mechanical strength will be considered of greater importance than high efficiency.

Electric Ventilator.—The fan to be able to remove 1,500 cubic feet of air per minute when working at full speed. The motor not to take more than 2 amperes at 100 volts, and be fixed noiselessly. A speed regulator to be used.

Combined Motor and Domestic Pump.—The pump must be able to deliver 1,000 gallons per hour to a height of 70 ft., and the motor must not take more than 25 amperes at 100 volts when working at full load. The necessary starting switch and resistance to be included in the estimate.

Telephones.

Sometimes in large hotels, warehouses, flats, &c., telephones are wanted to be fixed up between various rooms. At one time there was a very prevalent belief that telephones were difficult to put up and maintain, but now almost any one who has had experience with ordinary electric bell fitting is prepared to erect them. The convenience and cheapness of indoor telephones has made this branch of business not only profitable to the contractors, but very satisfactory to the users. Suppose that four rooms have to be connected with a central room, and with one another, then the following may be a help when making a specification.

Microphones.—Four combination sets, each consisting of a transmitter with a granular carbon, large watch receiver, circular electric bell mounted on walnut board with battery box containing two No. 2 dry cells. One desk combination set with transmitter, automatic switch ringing key and electric bell, one watch receiver, and one wall plug and cord.

Exchange Annunciator.—One four-line board with plug and cord. Plate-glass front with mechanical replacement. Terminals on the top of the annunciator. The case to be made of polished walnut. It must be suitable for a metallic circuit system.

Batteries.—In addition to the batteries on the microphone boards, one four-cell Leclanché battery with agglomerate blocks will be required. The cells to be of three-pint size, and to be enclosed in a painted wood box with heavy brass terminals.

Wire.—No. 20 indiarubber, double cotton covered and paraffined copper wire to be used. When wires go through plaster, they must be protected by zinc tubing.

When a country house has to be connected with another more than half a mile off, a magneto call-bell is necessary.

Magneto Machines and Bells.—Two combination sets each consisting of a best quality triple magnet, magneto generator, and two bells, transmitter with an automatic switch and a watch receiver. All fitted on a walnut board with a box containing 2 dry cells. On the top of the magneto machine-box a metal comb lightning arrester to be fixed so as to protect the instruments.

Out of doors it is usual to have the line partly aerial and partly underground.

Underground Work.—One mile of 2/20 twin telephone copper wire, well insulated and lead covered. A sample of the wire to be submitted for approval.

Overhead Work.—Four miles 220 yards of No. 16 phosphor bronze wire (or No. 16 mangan copper wire). All joints made when erecting to be soldered, resin being used as a flux.

Wood Poles.—Forty-two light poles of best Norwegian fir, well creosoted. Each to be 30 ft. long, diameter at the top to be not greater than 4½ in. or less than 5 in., and the diameter 5 ft. from the butt to be not less than 8 in. An effective lightning arrester shall be placed on every pole and connected to the ground. (Creosoted poles cannot be properly painted, as the oil oozes through; but unprotected poles are soon attacked by wet rot at the ground line in this country.)

Insulators.—(In specifying for insulators it is well to remember that mechanical strength is quite as important as good electrical insulating properties.)

For over-house work, pole brackets, chimney brackets, wall brackets—to be made of galvanised malleable cast iron, and well blacked. Bolts, straps, and swivels of galvanised wrought iron.

Electric Bells.

For electric bells in large houses, hotels, clubs, &c., many firms quote at so much per push or per hole in the indicator, the price depending on the difficulty of fitting and on

the quality of the material used. The general price depends also on the size of the order, for a twelve-roomed house 25s. per push is about the average price. It is, however, most satisfactory to have a plan of the wiring drawn up and to specify that the wiring be done strictly according to the plan.

Specification for a private house.—**General Conditions**.—The same as in all specifications, but it is important to add that on the completion of the work the whole installation must be given up in perfect working order, and that if for any reason the cells burst during the first six months after the completion of the order they must be replaced at the expense of the contractor.

Specification of quality of material, &c..—**Wires**.—All wires to be No. 20 tinned copper wire, covered with pure indiarubber, then double cotton covered and paraffined. In the wiring, all wires leading from the positive pole of the battery to have a red covering, all from the negative pole to have a black covering, and all wires not directly connected to the battery to have a white covering.

Tubes.—To be of zinc, of sufficient section to contain easily the wires along the various paths.

Staples.—Any staples used must be insulated.

Wall Blocks.—A teak block to be driven into the wall and fixed at every point in the diagram where a push or switch is indicated.

Pushes.—The tops of all pushes must be unscrewed. They must have large ivory plungers, and be fitted with ebonite backs and platinum pointed springs. Specimens, which must harmonise as much as possible with the door furniture of each room, to be submitted to the architect for his approval.

Front Door Pushes.—The front door and servants' door pushes must have water-tight barrels containing the contacts, and be mounted on a mahogany block.

Two-way Switches.—One plug switch, marked A on diagram, just inside the front door, to be mounted on an ebonite base. Another, marked B, is in the bedroom. When plug is in one position on A, it makes a circuit with the front door bell downstairs; in the other position, it makes a circuit with the upstairs bell. Every night and morning the positions of the plugs are changed. The plug in the best bedroom is to enable any one there to ring either upstairs or downstairs from the push.

Batteries.—Six Leclanché batteries (quarter size) with agglomerate blocks, in two painted wood boxes, with heavy brass terminals, screwed on them.

Trembling Bells.—Three bells will be required, two in the kitchen passage, and another on the top landing. The front door bell to have a sheep gong 6 in. in diameter, and an indicator drop with mechanical replacement. The other bell in the kitchen passage, and the one on the top landing, to have a cast bell-metal nickelled gong, 4 in. in diameter. The bells must be of best quality and highly finished. They must be contained in solid polished walnut cases, with bevelled edges, covers with brass screws, large, high terminals and brass eyelets, all lacquered. The springs must be of the best tempered steel, and the contacts of platinum.

Indicators.—One fourteen-number indicator and one three-number indicator, each with mechanical replacement. They must be in walnut cases, dovetailed and fitted with plate glass and enamelled zinc fronts. The names of the rooms to be written on the zinc screens in black enamel. On the small screen:—Front door, best bedroom, kitchen. On the large screen placed in kitchen passage:—Back-door, hall, drawing room, &c.

Lightning Conductors.

A drawing has to be prepared showing exactly the path of the lightning conductor, and where points have to be affixed.

Specification for a church steeple.—**Conductor**.—To be of copper tape, 1 in. broad and ¼ in. thick; 110 ft. of it will be required. It must be fastened to the walls in the position shown in diagram by copper clips and nails. A copper coupling must also be provided to fasten the tape on to the elevation tube, and a copper saddle for the apex.

Elevation Tube.—To be of copper, 6 ft. long and 1 in. in diameter, screwed at both ends.

Points.—Elevation copper rod to have four sharp multiple points on it.

Earth.—The earth plate to be of copper 6 square feet in area and ¼ in. thick. The plate to be buried at the point indicated on

diagram and surrounded with a load of
or a country house, &c. —
galvanised iron rope $\frac{1}{8}$ in. in diameter
led run up two corners of the house, and
the highest points of the roof, single
is of iron nickel-plated being taken off at
various points marked in the diagram and
final care being taken to protect the kitchen
metal. The earth plate to be galvanised
to square feet in area and $\frac{1}{16}$ in. in thick.

GENERAL BUILDING NEWS.

ETHELREDRA'S CHURCH, FULHAM.—The first
ion of St. Ethelredra's church, which has been
ted on a site in the Fulham Palace-road, near
Bishop's-avenue, was consecrated on the 9th
by the Bishop of London. The portion of the
ch completed consists of three bays of the nave,
a temporary east end and choir fittings. The
re cost has been under 4,000l., and there is seat-
accommodation for 500 persons. The estimated
of the completed building is over 8,000l. Mr.
I. Skipworth, of London, is the architect, and the
ders were Messrs. Holloway Bros., of Battersea.
strations of the building appeared in our issue
May 18, 1895, when we gave a short description
he building.

NEW PRUDENTIAL OFFICES, SHEFFIELD.—The
New Prudential Assurance Company
occupy a corner site in Pinstone-street, adjoin-
St. Paul's-churchyard. The lower stage of the
ernal elevation consists of a colonnade of pilasters
mounted by an entablature which runs the whole
th of the facade. The frontage, which is five
rs in height, is composed of Edwards's red
icks and red sandstone facings, &c. There are two
cks, three on the left leading into the Prudential
npany's offices. The right hand entrance
ces access to a staircase and a lift leading
wards to a restaurant, and upwards to a
ies of offices (to be let off), and to the
ard and other rooms connected with the
stant. All the sets of rooms on the upper floors
nd directly of the staircase landing, and the pas-
ger lift communicates with the same landing on
very floor. The general contractors are Messrs.
orge Longden & Son, to whom, under the super-
ence of Mr. Thos. Haigh, the principal share of
he work has been entrusted. The other sub-con-
ractors are:—Plumbing and glazing, J. B. Corrie &
hield; sanitary fittings, &c., Morris &
n, Manchester; steel work in floors, Hand-
ys, Derby; cement stairs, A. Walker, Leeds;
ramic Mosaic floors, Craven, Dunsill, & Co.;
namental ironwork, Hart, Son, & Peard, London;
etric lighting, Belshaw & Co., London; tiling
d slating roofs, Proctor, Sheffield; heating,
hwell & Nesbit, Leicester; gannets, casements,
hical & Co., Brimley; ranges, hot plates, and
arbro' grates, Steel & Garland, Sheffield; orna-
ental ceilings and wood mantelpieces, Shuffrey &
h, London; locks and furniture, James Gibbons,
olverhampton; headlights, J. V. Kowland & Co.,
verpool; plastering, Hodkin & Jones, Sheffield.
he cost of the building and the land is 25,000l.,
he architects were Messrs. Alfred Waterhouse,
A. & Son.

THEATRE OF VARIETIES, PLYMOUTH.—The com-
tees of the Plymouth Town Council and the
nehouse District Council, have before them plans
of a music-hall. Messrs. J. T. Wimperis & Arber,
hitects, of London, have prepared the plans for a
ndicate. The frontage, including Thomas's Great
estern Hotel, and main entrance, are in the
rough of Plymouth, and cover over 3,000 ft. super-
icial, whilst the stage and main body of the
all, covering upwards of 10,000 ft. superficial, will
be in Stonehouse, the gallery entrance and the main
its being located in Phoenix-street. It is under-
ood that the proposed new hall will cost upwards
f 45,000l.

SUNDAY SCHOOL, KEIGHLEY.—The foundation
ones have just been laid of a new Congregational
unday School, to be erected at the junction of the
akworth-road and Fell-lane, Keighley. The new
ilding will include an assembly-room, 52 ft. by
0 ft., three class-rooms, and a kitchen. The
hitect is Mr. John Haggas, of Keighley. The
ove is estimated at 11,100l.

CHURCH SCHOOLS, BATH.—The foundation stone
as just been laid of new Church schools, Bath.
he new schools are to be erected on a portion of
he site of the old building and adjoining land.
hey will accommodate 730 scholars, and are
lanned in three departments, the infants occupying
he ground floor, the boys and girls being placed
bove. Each department will consist of a large
choolroom and two class-rooms separated from it by
lazed partitions. The school buildings throughout
will be heated by hot water. The plans have been
epared by Mr. C. Brvan Oliver, architect, and the
uilder are Messrs. Jacob Long & Sons, whose
ender of 5,274l. was accepted.

BUILDING IN PAISLEY.—A building boom has
been going on in Paisley for over twelve months,
nd on the 7th inst. seventeen plans were submitted
to the Dean of Guild Court. Most of the plans
were for large tenements and villa residences. Plans

were also passed for a new technical college for
Paisley, the estimated cost being 20,000l. The
building trade in Paisley was never so busy as at
present. There is not an idle mason, bricklayer,
joiner, or painter in the town.—*Edinburgh Evening
News.*

CONSTITUTIONAL CLUB, NOTTINGHAM.—The
foundation stones of the Nottingham and County
Constitutional Club, Market-street, have just been
laid. Mr. A. R. Calvert, of Nottingham, is the
architect.

**PROPOSED CHILDREN'S WING FOR LOWESTOFT
HOSPITAL.**—The Committee of Management of the
Lowestoft Hospital had before them at a recent
meeting the offer to erect a children's wing. Plans
were submitted by the architect, Mr. W. J. Roberts.
The designs are for a ward and six cots, and an
isolation ward containing two cots, together with
lavatories, bath-rooms, sculleries, &c. It is proposed
to build the wing at the west end of the hospital,
along Alexandra-road, taking up a portion of the
present garden.

SCHOOL, NEW SEAHAM.—On the 8th inst. a new
school for infants was opened at New Seaham, from
plans prepared by Mr. W. Forster.

GIRLS' SCHOOL, ST. CLEMENT'S, WORCESTER.—
Earl Beauchamp recently opened a new schoolroom
at St. Clement's Girls' School, Worcester. The
room added is 41 ft. by 25 ft., and is over the present
Infants' School, the roof of which was raised
14 ft. The work has been carried out by Messrs.
Jos. Wood & Sons, from the plans of Mr. A. H.
Parker.

CATHOLIC CHURCH, KIRBY, CHESHIRE.—The
foundation-stone of a new Catholic Church, which
will be known as St. Agnes Church, was
recently laid at Kirby. At present it is only in-
tended to build the aisles, nave, and transepts of
the edifice, at a cost of between 1,500l. and 2,000l.,
but eventually it is intended to build a presbytery
and to further extend the dimensions of the church.
The plans for the church have been prepared by Mr.
E. Kirby. The contractor for the building is Mr.
R. Allen, of Birkenhead.

EMPIRE THEATRE, GLASGOW.—The new theatre
which has been built by the Glasgow Empire Palace
Company, to take the place of the old Gaiety
Theatre, has now been completed. It is situated
in Sauchiehall-street and West Nile-street. The
plans were prepared by Mr. Frank Matcham. The
elevations are faced with Dumfriesshire freestone,
of a light red colour. The front to Sauchiehall-
street contains four shops, with show-rooms above,
and in the centre are the entrances to the principal
parts of the theatre. The building will accommo-
date altogether 2,158 persons, divided in the follow-
ing manner:—Stalls, 156; pit, 655; dress circle, 220;
upper circle, 377; gallery, 750; private boxes, 50.
The total expenditure on the reconstruction of the
theatre will be about 30,000l.

WESLEYAN SCHOOLS, LOCKWOOD, YORKSHIRE.—
Memorial stones were laid recently of a new school
at Lockwood, A.D. B. Stocks is the architect. The
chapel and new school adjoin the Lockwood Board
Schools.

ASSEMBLY ROOMS, &c., FEATHERSTONE, YORKS.—
The Directors of the Featherstone Assembly
Rooms and Institute Company, Limited, have
accepted the tender of Messrs. Jackson, Bros., con-
tractors, Goole, for the whole of the work. The
architects are Messrs. Garside and Keyworth of
Pontefract.

RESTORATION OF THIRSK PARISH CHURCH.—The
architect of the proposed restoration of the exterior
of St. Mary's at Thirsk and the Cathedral Church of
the Archdeaconry of Cleveland is Mr. C. Hodgson
Fowler, F.S.A., of Durham.

NEW TELEPHONE EXCHANGE, BIRMINGHAM.—
The new Telephone Exchange is situated at the
corner of Newhall-street and Edmund-street. The
site has an area of about 830 square yards, having a
frontage of about thirty-five yards to Edmund-
street, and about twenty-five to Newhall-street.
The building is one of four stories, and has been
executed in Ribston red brick and terra-cotta. The
facade is divided by bold piers, with decorative
treatment of the upper portion, which consists of
arches and gables ornamented with moulded terra-
cotta. The main entrance to the building is
through a wide arched doorway in Newhall-street,
which wrought-iron gates are being prepared by
Messrs. Brawn & Co. The Telephone Company
propose to lay out of the ground floor, where there are
eight rooms suitable for offices, and a group of four
rooms, with separate entrance in Newhall-street.
There are also six rooms which are proposed to be
let as offices upon the first floor. The remainder of
the building the company retain for their own use.
In the basement are the apartments of the local
keeper, and eight rooms allotted to the local
manager's staff. Upon the first floor the provincial
superintendent and the district manager will have
their offices, while the second floor is chiefly devoted
to the largest apartment in the building—the actual
"exchange" or switch-room. A portion of this will
be partitioned off as dining and recreation rooms for
the girls employed at the Exchange, but these,
when necessary, can be absorbed, so as to
increase the length of the switch room from
68 ft. to 95 ft. The apartment has a width of 40 ft.,
and will accommodate about 200 operators. There
will be lavatory and cloak-room accommodation,
and the operators will have their own private

entrance and staircase. The new building has been
designed by Messrs. Martin & Chamberlain, and has
been carried out by Mr. Thomas Rowbotham,
builder.

**PROPOSED ENLARGEMENT OF CHARTHAM
ASYLUM, CANTERBURY.**—A public inquiry was held
in the Board-room at Chartham Asylum recently,
by Mr. W. A. Ducat, the inspector appointed for
the purpose by the Local Government Board,
respecting the application by the County Council
for permission to borrow a loan for the enlargement
of the asylum. There were also present, amongst
others, Mr. Prosser, Clerk to the Kent County
Council, and Mr. Jennings, architect. Mr. Prosser
spoke in support of the application of the loan, the
amount of which was 44,000l.

POST OFFICE, WOLVERHAMPTON.—A new post-
office in Lichfield-street, Wolverhampton, has just
been opened. The architect was Mr. H. Tanner, of
the Board of Works, London, and the contract for
the work was entrusted to Mr. Henry Lovatt,
builder, Wolverhampton. The total cost is estimated
at about 15,000l.

TECHNICAL SCHOOL, LOWESTOFT.—At Lowestoft
Town Hall recently, Colonel Albert Smith, R.E.,
one of the Inspectors of the Local Government
Board, held an inquiry with regard to the applica-
tion of the Town Council for a loan of 5,000l. for
the erection of a new technical school. The cost of
the fittings, and apparatus will be upwards of
7,000l. Mr. G. W. Leighton, of Ipswich, is the
architect.

PRIMITIVE METHODIST CHURCH, HEeley.—The
Primitive Methodists in Ann's-road, Heeley, have
just built a new church, Sunday school, and insti-
tute. Mr. W. J. Taylor was architect for the build-
ings, Mr. J. Mason did the mason's work, Mr.
Thomas Lee the joinery, Mr. Braithwaite the
plumbing, Mr. Puttall the decorating, and Messrs.
Wright Brothers placed the installation of heating
apparatus.

CATTLE MART, BELFAST.—A new cattle mart has
just been built at Belfast on a site adjoining Stewart-
street and Stanfield-street. The length of the pre-
mises is about 300 ft., while the width is 80 ft.
The building was designed by Mr. R. I. Catwell, C.E.,
the contractors being Messrs. McLaughlin &
Harvey. Messrs. Misgrave supplied the heating
apparatus and fittings for the ring; the tyre fittings
were supplied by Messrs. Houston & Hamilton;
Mr. Galloway executed the painting, and the plum-
ing work was entrusted to Mr. Harrison McCloy.

**EXTENSION OF HEELY PARISH CHURCH, YORK-
SHIRE.**—The Jubilee of Heeley parish church, York-
shire, is being commemorated by an extension of the church.
The scheme now being carried out consists of the
erection of a south aisle, which will make the church
uniform, and provide accommodation for about 150
more worshippers. The length of the aisle is 66 ft.,
and the width 15 ft., and, wherever possible, the old
stones will be utilised. The porch has been re-
moved and rebuilt with necessary alterations. The
cost of the whole scheme is 1,200l. Mr. J. D.
Webster is the architect, and Messrs. J. Bee & Son
are the contractors. The woodwork is entrusted to
Messrs. J. Badger & Son, the plumbing to Mr. F.
Hickson, and the painting and decorating to Messrs.
Johnson & Appleyard, and Messrs. Newton,
Chambers, & Co. are providing the heating
apparatus.

SANITARY AND ENGINEERING NEWS.

THE OLDHAM WATERWORKS MANAGEMENT.—
The Waterworks Committee of the Oldham Cor-
poration have had before them a tabulated list of
the eighty-seven applications sent in for this position,
and now the number has been reduced to six.

The selected candidates are as follows: R. C. Frain,
C.E., Deputy Engineer of the Staffordshire Potteries
Waterworks Company; C. T. Lyman, Assistant
Borough Surveyor and Engineer, Aberdeen; C. J.
Batley, Assistant Waterworks Engineer, Bury; C.
Henzell, Resident Engineer of the Newcastle and
Gateshead Waterworks; W. A. Legg, Resident
Engineer of the Birmingham Corporation Water-
works, Rhayader; and A. A. Garside, Assistant
Waterworks Engineer, Cardiff.

NEW WORKS, ABERDEEN HARBOUR.—The
Harbour Board has resolved to erect two goods
sheds on Regent Quay, to be of two stories in height,
one 250 ft. long by 50 ft. wide, the other 150 ft. long
by 50 ft. wide. The respective costs are 6,565l. and
3,040l. The designs are by Mr. R. G. Nicol, harbour
engineer.

Mr. H. H. Wake, engineer to the River
Wear Commissioners, has been requested to advise
on the scheme of the resident engineer as to
Aberdeen Graving Dock.

ELECTRIC LIGHTING NEWS.

ELECTRIC LIGHTING, CARDIFF.—Alderman
Jacobs presided over a special meeting of the Cardiff
Electric Lighting Committee that was held at the
Town Hall, Cardiff, recently. A report was read
from Mr. Applebee with reference to the extension
of the electric lighting plant. Referring to ques-
tions, Mr. Applebee, electrical engineer, said that
the present plant, in addition to the plant now on

order, would supply power enough to light 17,000 lamps. The number of lamps now being supplied was 14,000, and they had orders which would amount to another 3,000, so that when the plant now on order was laid down they would only have had enough for present demands. In reply to further questions, the Engineer said that they had no spare machine in case of an accident happening. What he would really recommend was the purchase of two more machines, each capable of lighting 8,000 lamps. This would allow for a total output of 33,000 lamps. The makers of the best machinery were all so busy now that they would not be able to supply machines until twelve months after they were ordered. On the motion of Councillor Evans, seconded by Councillor Brain, it was resolved to instruct Mr. Applebee and Mr. Harpur, Borough Engineer, to go into the matter and present specifications, &c., as speedily as possible.

ELECTRIC LIGHT, BOSTON DOCK, LINCOLNSHIRE.—At a special meeting of the Boston Harbour Trust recently, tenders were received for the provision of an electric light installation at Boston Dock. The scheme was prepared by Mr. Adrian Collins, A.M.I.N.E.C.E., and includes the provision of eight arc lamps of 2,000 candle power, thirty-nine 10-candle power lamps for public lighting, and sixty-nine 16-candle power lamps for private lighting. Eight tenders were received, and that of Messrs. Spagnoletti & Crookes, of London, at 1,682l. 13s. 11d. was accepted.

FOREIGN.

FRANCE.—A small exhibition, composed of paintings and sculptures of animals, is shortly to be held in the Palais des Machines (Champ de Mars), where there is now a general agricultural competition going on.—A delegation of the "Société des Amis des Monuments Parisiens," under the direction of M. Charles Normand, architect, has just been examining the state of the church of St. Pierre de Montmartre, which the Municipality of Paris wishes to destroy. After a thorough examination, they have declared it quite possible to restore the building without a very great expenditure of money.—A new square is to be made in the centre of Paris, at the angle of the Rue Réaumur, the Rue d'Aboukir, and the Rue du Petit Carreau.—The Congress of Architects will be held this year from the 18th to the 22nd of June at Lille. The Congress will visit Lille, Roubaix, and Tourcoing on the 10th, 20th, and 21st. It is probable that two days will be given up to visiting Brussels and Antwerp.—Count Pozzo di Borgo has just offered to the town of St. Cloud the necessary ground to make three large streets near the Gare de Montretout. These streets will quite alter this part; the names to be given to them are Avenue Pozzo di Borgo, Avenue Crillon, and Avenue Montesquieu.—On Sunday last, at Clichy, the inauguration of the new covered market took place. It is built partly of iron, partly of stone, each façade has a large door ornamented with sculptures. The building does credit to M. Sichel, the architect, and estate agent of the town of Clichy. The cost has been 182,000 francs.—The municipality of Nancy is shortly to proceed with the rebuilding of the St. Julien Hospital. The cost is estimated at 1,040,000 francs.—The "Société Académique d'Architecture de Lyon" has just chosen, for the open competition this year, the following subjects:—"For architecture, 'A Circus';" for archaeology, "The Restoration of the Roman Amphitheatre at Fourvière."—A new line of railway is to be established in the Departments of Nievre and the Côte d'Or, between Corbigny and Saulieu, with an extension from Corbigny to Chitry-les-Mines.—It is announced that Alfred Lanson, sculptor, and Prix de Rome, only forty-seven years of age, has been seized with general paralysis, and has been placed in a "Maison de Santé."—M. Paul Giffard, engineer, to whom is due the invention of the freezing machines by the dilation of atmospheric air, has just died at Nice at the age of sixty.

GERMANY.—We understand that the fees for examinations held at the technical colleges of Prussia will be raised for all foreigners visiting the classes.—Particulars have now been published of the extensions intended at the State Hospital of Berlin, which is to undergo considerable alterations, and have better accommodation, both for the patients, and for the purposes of scientific research. On examining the long list of alterations suggested, it appears that the work practically means the entire reconstruction of this enormous block of buildings, excepting the section known as the "Women's Hospital," the Administration block, and the Barracks of Professor Koch's Institute.—Professor Herter has now obtained the commission for the Helmholz monument for the University garden, for which there was a limited competition among sculptors.—The historical building known as the "Old Post Office," in the Königstrasse at Berlin, is to be pulled down, and the site has been sold for 90,000l.—There has been a considerable rearrangement of the pictures at the National Gallery, and the halls, which have been closed for some considerable time, have now again been opened. Much of the sculpture has also been rearranged.—There appears to have been the same difficulty in obtaining

seats in windows overlooking the National Monument at Berlin on the occasion of the ceremonies, as will be the case in London for the Jubilee. The highest price paid for seats, however, is reported to be 5l. There were a large number of grand stands on which seats were obtainable for 1l.—Considerable alterations have been taken in hand at the Alexander-street Station at Berlin, which has long been too small for its purpose. A series of art-guide-books, known as "the German Glaciers," is being published at Leipzig, and the first volume on architecture has been issued. Herr G. Ebe, a well-known architect, is the author.—An exhibition has been opened by the Historical Society of Berlin, at which a number of paintings and mementoes of the Emperor William I. are shown; some of the portraits of Manzel, Lenbach, and Krueger are particularly interesting.—On the occasion of the special meeting at the Royal Academy held at the time of the ceremonies, the principal oration was by the Minister of Education, Herr Gossler, and treated of the advancement of the Arts during the reign of the Emperor William I.—The competition for the design of a bridge over the Elbe, near Hamburg, has been decided, and the first premium has been awarded to Messrs. Harkort, Schneider, & Thiel, the former being an ironfounder at Duisburg, the second a contractor of Berlin, and the last-named an architect practising in Hamburg. In the same way the second premium was given to the design signed by a contractor, a firm of engineers, and an architect, the latter in this case being Professor Steir, of Hanover. There was a very influential jury of assessors, under the presidency of Herr Baensch, of Berlin.—A competition has been opened at Goerlitz for the design of a new town hall, and 400l. has been offered in premiums.—A medal has been struck in connexion with the celebrations at Berlin last month, and it appears that the Emperor has ordered some five hundred thousand of these medals to be distributed amongst those who participated in the festivities.—A monument to the Emperor Frederick is to be erected at Wiesbaden, the sculptor being Herr Uphues. The Dowager Empress Frederick has visited the works of the founders, Messrs. Martin & Piltzing, to see the progress made, and the unveiling of the memorial will probably take place in October next.—Herr Max Broemel has been giving a lecture at Berlin on the various Continental exhibitions of last year, more especially as regards their financial aspect, which we have already explained was not very satisfactory. It would appear that six and a half million visitors attended last year's Berlin Exhibition, as compared with the thirty-two millions of visitors in 1886.—Budapest had three and a half million visitors, Geneva two and a quarter million, Nuremberg two million, Dresden one million, and Stuttgart half a million. Curious to say, the Stuttgart Exhibition was the only one financially successful in Germany, making a profit of 25,000l.—Messrs. Krupp, the great ironfounders, are about to take up ship-building, having lately bought the "Germania" Dockyard at Gaarden. These docks are to be considerably extended, and a permanent staff of 4,000 men will be engaged up to the present time Messrs. Armstrong have alone been able to build and arm a ship completely, but they will now apparently have a rival.—Messrs. Siemens & Halske, the great electrical specialists at Berlin, are to celebrate the fiftieth anniversary of their existence, including their branches at Vienna, at St. Petersburg, and elsewhere, there are 15,000 employees depending on their electrical trade.—The Government Architectural Studentship has this year been divided equally between Herr Strantzky, of Dresden, and Herr Werdelmann, of Breslau. The premium is awarded under the auspices of the Prussian Royal Academy, and has a value of somewhat over 500l.—In the *Centralblatt der Bauverwaltung*, we observe a somewhat belated article on the Peterborough Cathedral controversy, but we are pleased to find that the subject has been impartially treated, and the facts described with a better knowledge of our local requirement and peculiarities than used to be the case. There are a number of useful hints in the article, and, though we are afraid that there is an equal amount of restriction and practicality in Germany, we can certainly learn much from that country as far as the organisation of official control over public monuments is concerned, with its system of provincial custodians, &c.—The Boissonnet studentship of the Royal Technical College at Berlin has been awarded to Herr Paul Lehmann, a quæstor, of Muehlhausen; the subject is "The Development of the Modern Town Hall." His official residence is to be erected at Berlin for the Presidents of the Upper and Lower Houses of the German Imperial Parliament, and 50,000l. will be voted for the purchasing of the freehold of the new block.—A monument is to be erected as a memorial to the great German naturalist, Johannes Mueller. A site has been given for the purpose at Coblenz-on-the-Rhine.—A semi-official paragraph is being circulated in the German Press warning householders against the dangers of electric light installation, as a considerable number of fires have lately occurred in Berlin, either owing to bad workmanship or neglect.—Further alterations are to take place in the arrangement of the picture collections at the National Gallery at Berlin, and

the upper floor will shortly be closed for that purpose.—We regret to record the death of Mr. Arnold Borsig, a member of the great firm of ironfounders at Berlin, for whom Schinkel built the central works, a building with some considerable architectural pretensions. His death was caused by an explosion in one of his mines which he was inspecting.—The German Colonies Authorities propose building a church at Dar-es-Salaam, and a voluntary subscription has been organised for the carrying out of the Baurath Steinbrecht recently read an interesting paper upon the further development in the restoration of the Marienberg Castle at Berlin, and it would appear that considerable alterations will have to be carried out before the work is complete.—The National Monument to Emperor William I. which was lately unveiled, is again in the hands of the sculptors, who are completing the bas-reliefs.—We understand that Stettin is to have a Society of Architects and Engineers for members of the professions resident in Pommernania, which province has 1,600,000 inhabitants. At the provisional meeting sixty-five members entered their names, and M. Tobian was elected President.—We understand that the articles of Constantine Lipsius, who held the chair of Architectural Professor at the Dresden Academy on Semper's retirement, will be shortly issued as an illustrated publication.—We observe from our contemporary, *Deutsche Bauzeitung*, that one of the most popular positions advocated for the proposed memorial to the German soldiers who fell in the Franco-Prussian war is opposite the new Houses of Parliament, at Berlin.

AUSTRIA.—The gardens of the Horticultural Society at Vienna will probably be destroyed by the Municipality running a new thoroughfare over their grounds in connexion with the new street improvement.—The well-known central station of the Ambulance Association at Vienna will be pulled down this summer on account of various street improvements. This building has been considered to be a model structure for its purpose, and is planned not unlike a fire brigade station, as the horsed ambulances have to turn out with a few seconds' notice. The Szecheny monument is to be unveiled at Oedenburg during May.—A competition has been opened at Graz for a large sanatorium.—The very excellent exhibition buildings of the great exhibition held at Budapest last year are to be illustrated in a publication issued under the direction of Herr Zoltan Balaiz, a young architect who was associated with the arrangements of the grounds of a new Society of Austrian Artists will be formed at Vienna.—The proposed alterations of the thoroughfare around the historical Karl Church, already referred to in an earlier number, have now been practically settled, and it appears that the proposed street improvements will greatly add to the beauty of this part of the town, and give the church a far better aspect than has hitherto been the case.—At the Vienna Architectural Society the extensive improvement of Vienna continues to be the subject of considerable discussion, and at the first lecture of this month, when Herr Hubtz was the lecturer, these improvements around the Karl Church were very energetically discussed.—We recall the record of the well-known sculptor, Joseph Weitzmann, who was the oldest of the Vienna artists. He was particularly associated with the architectural bas-relief work of a number of important buildings.—Vienna is to have a monument as a memorial to Gutenberg, and the Emperor has subscribed 1,500 florins towards its erection.—A remarkable theft of valuable pictures from the Hungarian National Gallery is reported, and it would appear that the originals were replaced by copies, so that the theft was not noticed for some little time.—We hear of an interesting invention from Vienna of portable barrack buildings, of considerable lightness, which can be put together without the use of any tools, and we understand that these will be used for army and hospital purposes by the Austrian Government, to replace tents in many instances. The inventor is Mr. Bruemer.

THE INTERNATIONAL EXHIBITION OF ART AT VENICE.—The second of a series of International Art Exhibitions to be held at Venice every three years is appointed to be opened on the Saturday next, but as the usual difficulties are occurring in late arrivals, and proper location of a mass of exhibits, it may be delayed until May 2. The buildings in which it is arranged are the Palaces della Permanente and della Zecca (or Mint), where twelve large rooms have been prepared; the surrounding park has been embellished for the occasion by freshly planted gardens, many Italian kiosks, and other necessary additions. The sections are as follows:—Italian, French, Spanish, Belgian, Dutch, Russian, German, Austro-Hungarian, Anglo-Saxon (England, Scotland, America), Scandinavian (Denmark, Sweden, Norway), and Japanese. The last section comprises a private collection, and works which are coming direct from Japan. The prizes to be given are:—For the best work by an Italian artist, as previously exhibited, £400 (10,000 lire); by the Municipality of Venice; for the best work by a foreign artist, not hitherto exhibited, 400l., by the citizens of Venice; the Government of the province of Venice, and the Savings Bank, each provide 200l., and the Municipality of Marano 100l., for prizes for which Italian

foreign artists have the right to compete; the latter, Max Liebermann, offers a prize of 1000 francs to the artist of the provinces who obtains the highest number of votes in the provincial exhibitions, and the Communes of the provinces give 50 francs for Italian artists' competitions. With such incentives there is little doubt of the exhibition being completely successful. In sculpture, Butili sends a full-size model of the statue of a warrior, which is to be erected at Legaano. This work, which most imposing in its conception, and well worthy of the illustrious artist, has been anxiously expected many years. The work contributed by Enlilotti is a colossal Sampson.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS. Messrs. B. Cooke & Co. have removed their offices from Phoenix Wharf, Battersea, to 10, Victoria-street, Westminster.

LIVERPOOL CITY STREETS AND PASSAGES.—On the 8th inst. at the Liverpool Town Hall, Mr. E. P. Reid, Inspector of the Local Government Board, laid an inquiry into the application by the Liverpool Corporation for power to modify their building regulations so that new streets shall have a minimum width of 30 ft., and back passages a minimum width of 9 ft. Mr. W. Pierce, assistant Town Clerk, appeared in support of the application, and Mr. A. G. Cole for about seventy property owners, who opposed the proposed increase in the width of passages. Mr. Pierce, in stating the case for the Corporation, said that the existing bye-laws, framed under the Liverpool Sanitary Amendment Act of 1849, required all new streets to be of not less width than 30 ft., and back passages of not less than 3 ft., except when exceeding 100 yards in length. In the latter case the minimum width must be 4 ft. In 1865, when the boundaries of the city were extended, it was decided to extend the streets of West Derby, and to alter the bye-laws in force required a width of 30 ft. for streets, and 9 ft. for back passages; and similarly in Toxteth and Walton the least width of streets allowed was 30 ft., although there was no regulations as to passages. What was now proposed was to apply to the whole of the extended city the regulations as to streets and passages in West Derby, and to the districts of West Derby, in which these regulations had not involved hardship. He understood that the Liverpool Land and House Owners' Association, the Liverpool Architectural Society, the Liverpool Master Builders' Association, and the North Liverpool, Bootle, &c., Property Association, in June last held a joint conference to consider these and other proposals for the Corporation. Certain proposals of a contentious nature were taken exception to by these associations, and the Corporation had decided not to proceed with them. As regarded the width of streets, however, the conference approved of the minimum of 30 ft., provided the regulation applied only to new streets and not to the rebuilding of old streets. As to back passages, the same meeting agreed the 9 ft. width, provided the Corporation would adopt and maintain such passages in repair. These suggestions the Corporation agreed to, but the Local Government Board was of opinion that the adoption of the passages was a matter of arrangement between the Corporation and property owners. He was authorised to say that the Corporation would take care to maintain such passages if constructed to their satisfaction.—Several witnesses were then called for the Corporation. Mr. Boutinos, City Engineer, stated that 9 ft. back passages were desirable as facilitating scavenging, and as promoting public health. Mr. Steele produced plans with a view to show that the new regulation would bring the streets to a width of 30 ft. nearer, since the eaves of each row of houses were at an angle of 45 deg. from the foot of the backyard wall or the opposite row. It was, however, pointed out by Mr. Pierce that the amount of yard space, 150 square ft., was not to be diminished. Mr. T. T. Wainwright and Mr. T. H. Walker, architects, both spoke of the 9 ft. passages as conducing to nuisances, and the annoyance to tenants. Mr. F. Stewart, architect and surveyor to Lord Salisbury, and Mr. W. F. Beavan, house agent and auctioneer, gave similar evidence. Mr. Steph Wilson, as a property owner, also opposed the application as curtailing backyard space, and causing accumulations of refuse.

BRIDE'S ALLEY IMPROVEMENT SCHEME, DUBLIN.—The 7th inst. Mr. Charles Brian Smyth, C.E., Local Government Board Inspector, held an inquiry at the Dublin City Hall regarding the proposed Bride's-alleys improvement scheme. Mr. McCarthy, City Engineer, submitted a plan of the proposed work. The Corporation, he said, proposed to acquire the area between Nicholas-street and Bride-street, bounded on the south by Bride's-alleys, and on the north by the Church of St. Peter's. It was proposed to move the houses in that area, and to erect new dwellings in accordance with the plans submitted. The area was nearly three acres. In 1864 there were forty-four houses in the area comprised in the scheme, occupied by 800 persons. A great many of the houses had been razed since that time. The Corporation proposed to widen Bride-street and Nicholas-street, and to erect new dwellings in those streets and also in Bride's-alleys. Under the new scheme there would be 128 separate tenements, each of which would accommodate a family. Each

tenement would be provided with separate sanitary arrangements. The tenements would be, in his opinion, most suitable for artisans. Mr. Hartly, City Engineer, said that they were widening both Patrick-street and Nicholas-street. No objection had been taken to the scheme.

FEDERATION OF MASTER BUILDERS' ASSOCIATIONS, BRISTOL.—A conference of representative master builders of Bristol, the West of England, and South Wales was held on the 6th inst. in Bristol for the purpose of considering the advisability or otherwise of forming a Federation for the district. The chair was occupied by Mr. A. Krauss, President of the Master Builders' Association, who was supported by Mr. W. Church (Vice-Chairman), Messrs. G. Humphreys, C. A. Hayes, R. Wilkins & Son, and A. S. Scull; Cardiff was represented by Mr. W. Simonds and Mr. James E. Turner; Bath, by Mr. Jesse Hayward and Mr. C. H. Long; Weston-super-Mare, by Mr. W. Dyer and Mr. C. Addinot; Taunton, Mr. A. J. Speller; Bridgewater, Mr. J. Harris and Mr. W. H. Ketch. The Chairman, in opening the proceedings, said he had received letters from several other localities expressing sympathy with the movement. The meeting proceeded to the discussion of the rules for the Federation, the principles of which are conciliatory to the operatives, and provide that in all cases of dispute with them the Federation should do its utmost by arbitration or otherwise to avoid strikes or lock-outs. If the operatives refuse any equitable settlement of the dispute affecting any member of the Federation, the matter will be brought before the Executive Committee, and if they decide that the members affected are to be supported, each branch and every member thereof will do their utmost to bring the dispute to a successful issue. The general constitution will consist of a union of district associations connected with the building trade throughout the districts referred to, and also such individual members of the trade as are not members of any district associations. The mode of election of representatives and the government of the Federation were thoroughly discussed, and it was arranged that the rules as submitted at the meeting should be printed and circulated amongst the various associations, and that the first meeting of the Federation should be held in Bristol on May 18. A vote of thanks to the Chairman terminated the proceedings.

THE CITY COMMISSION OF SEWERS.—On the 13th inst. at the Guildhall, the Commissioners of Sewers held their usual fortnightly meeting, Mr. H. G. Smallman in the chair. The report of the Finance and Improvement Committee stated, "That having further considered their report of January 20 last relative to the proposed widening of the eastern and Widgegate-street, they again recommend that, as the London County Council declined to contribute towards the cost, no further action be taken in the matter, and that the vacant land belonging to the Commission on the north-eastern side of the new thoroughfare be now offered for sale by auction." After some discussion, the report was referred back to the Committee for further consideration. The Streets Committee reported, "That relative to the applications to erect a stand and balcony for June 22 in London House-yard and Gresham-place respectively, they recommend that the Commission refuse to consent to any such erections upon or over the public ways." Mr. Miller moved an amendment, and Mr. Deputy Dowling seconded, "That permission be given to Messrs. Hitchcock, Williams, & Co., London House Yard, to erect a stand," saying that the proceeds were to be given to several charities. Mr. Morton, M.P., objected on the ground that if their consent were granted there would be such a number of applications sent in that it would be impossible to grant all, and that they would be convicted of favouritism. After some further discussion, the amendment was rejected by a large majority, and a similar recommendation with reference to Gresham-place was also rejected, the report of the Committee being adopted.

THE ART UNION OF LONDON.—We are requested to announce that the Art Union of London, 112, Strand, has no connexion with any other institution professing to have the same objects.

NEW LIGHT RAILWAY, ABERDEEN.—The Light Railway Commissioners, after a local inquiry on the 9th inst., have passed the Great North of Scotland Railway Company's Scheme for a light railway to Skene and Echt.

ANCIENT CARPENTRY.—The British Institute of Certified Carpenters held a special meeting on the 3rd inst. at Carpenters' Hall, London Wall, to hear a paper read by the hon. secretary, Mr. T. M. G. Lloyd, on "Ancient and Historical Carpentry." Mr. Lloyd said that the oldest specimens of the craft were in the British Museum, one of them being an Egyptian door and the other a coffin.

PHOTOGRAPHY AND ARCHITECTURE.—A meeting of the Edinburgh Photographic Society was held in the Society's rooms, 38, Castle-street, on the 7th inst., when Mr. Hippolyte J. Blanc, R.S.A., delivered an address on "Photography as an Aid to the Architect." It was largely owing to the employment of the camera that the architecture of Great Britain during the last 25 years undergone such rapid changes. The architect shared liberally in the facilities for travel, and by means of the camera there had been brought under his notice excellent representations of what was best in the architecture of other

countries. It was chiefly as a means of instruction in itself, and as an education to others, that he ventured to advocate the architect making photography an indispensable study in co-relation to his art.

DISCOVERY AT THE GREY FRIARS MONASTERY, CARDIFF.—A very interesting find was made a few days ago at the Grey Friars Monastery, Cardiff, the ruins of which are being excavated on behalf of Lord Bute and under the direction of Mr. C. B. Fowler, architect. At the north-west corner of the church of the monastery, outside, but close to the north wall, there was found, about 4 ft. beneath the surface, some 200 pieces of original fourteenth century glass, which, no doubt, formed one of the windows of the church, and was bidden or thrown in a heap at this spot when the church was demolished. All the pieces have been carefully taken out.—*Hibern Mail.*

CRYSTAL PALACE SCHOOL OF ENGINEERING.—On the 9th inst. the distribution of prizes and certificates in connexion with the Crystal Palace School of Engineering took place. Mr. J. Head occupied the chair, and others present included Mr. J. W. Helms and Mr. J. Furness (examiners), Mr. J. W. Wilson (principal), Mr. J. Wilson jun., Mr. R. G. Hodgson, and Mr. Gardiner. In addressing the students the chairman said he would suggest that the students before him should take for their motto, "Noblesse oblige." Engineers should always endeavour to keep themselves like sharp instruments always in order and ready for work. Pluck was a most necessary attribute in their profession, and he urged them never to be discouraged by failure, for blunders taught them to avoid a repetition of failure. A vast field was open for engineering enterprise, and one which struck him was the opportunity for further utilising the energy stored in coal, of which only at present 14 per cent. was developed in the steam engine.

THE ELECTRICAL ENGINEERS' STATION DIRECTORY.—This is a useful publication for those interested in the application of electrical power in cities and by public bodies. The towns or localities are given in alphabetical order, and under each heading is a statement of the particulars of the system in use, with the area and population of the town or district served. A list is added of stations contemplated, and of applications for the current year; and a reprint of the Board of Trade regulations in regard to electric installations. The Directory is issued by Biggs & Son, Salisbury-court.

AMERICAN PUBLIC HEALTH ASSOCIATION.—This Association will hold its twenty-fifth annual meeting at Philadelphia on October 26 to 29 of this year. The Executive Committee have selected a number of subjects for special consideration. The following are those which will be of interest to our readers:—The Pollution of Water-Supplies; The Disposal of Garbage and Refuse; The Relation of Forestry to Public Health; Public Health Legislation; River Conservancy Boards of Supervision; Sanitation, with special reference to Drainage, Plumbing, and Ventilation of Public and Private Buildings; Existing Sanitary Municipal Organisations of the countries belonging to the Association, with a view to a Report upon the most successful in Practical Results. Papers presented later than nine o'clock a.m., of Monday preceding the meeting will not be placed in the programme, as the entire programme for the week will be printed on Monday preceding the first day of the session, which is on Tuesday. The Secretary is Dr. Irving A. Watson, Concord, N.H., and the Chairman of the Committee for local arrangements Dr. Benjamin Lee, 1532, Pine-street, Philadelphia.

THE GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE.—The undernoted buildings have been visited on the past five Saturday afternoons by the students attending Professor Gourlay's classes in architecture and building construction:—A new brick-kiln of the Hoffman type, at Seedhill, near Paisley; Mr. R. W. Forsyth's new warehouse, Renfield-street, Glasgow, by Mr. John James Burnet, architect, Glasgow; Miss Cranston's new restaurant, Buchanan-street, Glasgow, by Mr. George Washington-Brown, architect, of Edinburgh; Langside-road United Presbyterian Church, Glasgow, by Mr. John B. Wilson, architect, Glasgow; The New Art Galleries and Museum, Kelvingrove Park, Glasgow, by Messrs. Simpson & Milner-Allen, architects, of London. There was a good attendance at all these visits.

PETROLEUM LIGHTING AND CONSTANT SUPPLY.—A novel apparatus for regulating the supply of oil to several lamps from a common reservoir has recently been introduced by the Petroleum Lighting Syndicate, Limited, of 43, Cannon-street, E.C. In the case of a country mansion lighted by oil the reservoir is placed on the roof, and the whole of the pipes in the house are fed from it. To prevent overflow of oil in the lamps, a regulator is placed on each level, and will serve for every lamp on that level. Thus, suppose the lighting were arranged on six levels in the house, six regulators would be required. In the case of a single room, provided all the lights were on one level, in alignment with, or slightly below the regulator, only one of these latter would be required, but if the lamp brackets were at irregular heights from the floor, no two of them being on the same level, then as many regulators would be wanted as there were lamps. The system is particularly suitable for oil chandeliers. The regulator is of

simple construction, consisting of a float working in a closed cylindrical chamber through the medium of a column of mercury. The action of this float is automatic; it regulates the supply to the cylindrical chamber from which the oil is drawn by the lamps. These latter have no reservoirs, the oil being supplied to the wicks direct from the common regulator. The advantages of this system, which is certainly very ingenious, may be summarised as follows:—It obviates the necessity of supplying each lamp with oil, the whole being supplied from a common reservoir; it minimises the risk of fire or other accidents, as each lamp merely has a saturated wick, whilst there is no chance of explosion on lighting, or on turning the light out; the system is clean, and we could detect no smell from the lamps in a small room which had been lighted for several hours by seven lamps. Having to provide several regulators where lamps were not on a common level might, at first sight, be regarded as unfavourable to the system; but the regulators are remarkably cheap. The invention appears to be very useful.

BUILDING TRADES DINNER, MANCHESTER.—The annual dinner of the Building Trades Association of Manchester, Salford, and district took place on the 1st inst. at the Albion Hotel, Manchester. In the unavoidable absence of the President, Mr. Councilor Holland (Bricklayers' Association), the Vice-President, Mr. George Macfarlane (Joiners and Builders' Association), took the chair, and in proposing the toast of "The Lancashire Federation of Building Trade Employers," said they had the pleasure to have with them as guests that evening a deputation from the organisation referred to in the toast. Their object was to advocate the adhesion of the trades represented in the Manchester Association with the Lancashire Federation. The Council of the Manchester combination had already considered the matter, and looked favourably on the proposal. The demands made upon the employers in the various trades had become so frequent, and often so unreasonable, that the organisation on a wide and comprehensive scale for the purposes of defence was becoming more and more an urgent necessity, and it seemed to him that the scheme of the Lancashire Federation met immediate requirements and deserved general and unqualified support. Mr. W. Cuillière, in responding, explained that the Lancashire Federation was not antagonistic to the National Association, nor did they propose to invade in any degree the ground covered by the older body. They felt that a local combination covering a sufficiently wide area, and devoting itself exclusively to local interests, could render valuable services to the trades, supplementary to those rendered by the National Association. Nearly all the towns in the county had joined the Federation, and the only place of importance necessary to complete their organisation was Manchester. He made a strong appeal to the constituent trades of the Manchester Association to join the Federation. Messrs. Storrs and Tomlinson spoke to the same effect.

CAPITAL AND LABOUR.

THE BIRMINGHAM BUILDING TRADE.—Recent negotiations between Birmingham building firms and the builders' labourers have resulted in a rearrangement of working conditions. In the future the men are to be allowed time and a half for working on Bank Holiday, instead of ordinary time. Walking time is to be allowed at the rate of three miles when the job is two and a-half miles from Stephenson-place. An attempt was made to obtain time and a half pay after five o'clock instead of six as at present, but this was abandoned, and a notice of an advance of wages was also withdrawn after a comparison of the Birmingham rates with those paid in other towns.

STRIKE OF PLUMBERS AT SCARBOROUGH.—All the working plumbers in Scarborough, numbering about fifty, left work on the 3rd inst., with the determination not to return until the master plumbers would concede them an advance of one penny per hour on their present wages—7½d. Some time ago the masters offered their workmen one halfpenny (making eightpence per hour), but this would not satisfy the men.

STRIKE OF CARPENTERS AT TAVISTOCK.—Members of the Amalgamated Society of Carpenters and Joiners at Tavistock, on December 30 last, gave notice to their employers that on April 1 they would require an increase of wages to 6½d. per hour. The present rate is from 5d. to 5½d. an hour. Since the notice there has been some correspondence between the employers and the men, but no proposal having been made to the men, the men have gone out on strike in support of their demand. There are eighteen society men out, and a few non-union men are also keeping from work.

THE BUILDING TRADE DISPUTE IN DOUGLAS.—The Douglas joiners have sent notices to the masters for an advance of wages from 28s. to 32s. a week. This demand has been influenced through some of the Masters' Federation employing non-union men to do fibrous plaster work at 33s. a week, and boycotting union men. The consequence is that most of the latter are coming out on strike in support of those

who have been boycotted. The plasterers on strike have passed a resolution not to return to work until the joiners' question is settled.—*Liverpool Courier.*

LEGAL.

THE CLAIM AGAINST THE ST. PANCRAS GUARDIANS:

SUCCESSFUL APPEAL BY THE DEFENDANTS

THE case of *Drew Bear & Co. v. the Guardians of the Poor of St. Pancras* came before a Divisional Court of Queen's Bench, composed of Mr. Justice Grantham and Mr. Justice Wright, on the 13th inst. on the appeal of the defendants from the judgment of Mr. Edward Ridley, Q.C., the Official Referee delivered on the 17th ult. In this case it will be remembered that the plaintiffs, the trustees of creditors of Mr. Wm. Brooks, a builder and contractor of Folkestone, sued the Guardians of the Poor of St. Pancras and their architects, Messrs. A. & C. Harston for a balance of 24,226l. or, alternatively, 24,262l., alleged to be due on a contract for the completion of the St. Pancras Workhouse. The plaintiffs' case was that some years ago the Guardians resolved to reconstruct the Workhouse in King's-road and appointed Messrs. Harston as their architects. The contract for the work was at first taken by Messrs. Kirk & Randall, of Woolwich, but disputes arose and in 1892 that firm requested to be relieved of further work under the contract. Fresh tenders were then invited for the unfinished work, and that of Brooks was accepted for 50,861l. The work was to occupy fifteen months from May, 1892, but delays arose, and in November, 1894, the work was stopped. Messrs. Drew Bear, Perks, & Co., of Queen Victoria-street, who supplied the ironwork, Mr. H. Tolpatt, of Folkestone, who supplied timber, and Mr. J. Brown, of Cannon-street, who supplied bricks, sued on behalf of creditors for the balance alleged to be due to Mr. Brooks. The net cost of the work executed was stated to be on the first claim 65,479l., plus 10 per cent. profit, 6,547l., making 72,026l., of which 47,800l. had been received under the architects' certificates leaving a balance of 24,226l. In the alternative claim the net cost of the work executed was estimated at 65,479l., as before, but the 10 per cent. profit was reckoned on the contract price of 50,861l., which, with other amounts claimed, brought the alternative claim to 24,592l. The plaintiffs alleged that Brooks was hindered from continuing and completing the contract by the action of Mr. George Poole, the clerk of the works, who interfered without sufficient cause and condemned materials supplied wholesale. It was also further alleged that the architects were seldom on the works, and that the interference of the clerk of the works caused needlessly a net loss to Brooks of 2,526l. in addition to 193l. the value of the materials left by Messrs. Kirk & Randall, and not permitted to be used. The defendants generally denied the charges against the clerk of the works, and alleged that Brooks had not carried out his undertaking to complete the work left unfinished by Kirk & Randall. The Guardians further relied on the Public Authorities Protection Act, 1893, as being a defence, inasmuch as the matters referred to in the action occurred more than six months before the action was brought. Messrs. Harston, the other defendants, pleaded that they were not liable, and said that they had received no complaints from Poole with respect to the manner in which the works were being carried out by Brooks. The learned Referee decided that, inasmuch as the plaintiffs had failed to make out that Messrs. Harston had been guilty of fraud, dishonesty, or collusion, those gentlemen were entitled to judgment as against the plaintiffs, with costs. He, however, decided that the contract entered into between the plaintiffs and the Guardians, owing to the special circumstances of the case, had been set aside, and that the plaintiffs were entitled to *quantum meruit*, or, in the alternative, to substantial damages, to be ascertained at some future time, and he, therefore, gave judgment for the plaintiffs as against the Guardians, with costs. The Guardians now appealed from this decision on the ground that the judgment and the findings upon which it was based were erroneous in fact and in law, and that there was no evidence, or any sufficient evidence, to justify the learned Referee in finding either that the plaintiffs' contract with the Guardians was set aside, or that the plaintiffs were entitled to substantial or any damages, or to any allowances or allowances not duly provided for in the contract.

Mr. English Harrison and Mr. Wm. Moyses appeared as counsel for the appellants (the Guardians), and Mr. R. M. Bray and Mr. A. A. Hudson for the respondents (the plaintiffs).

At the conclusion of the arguments of counsel the Court allowed the appeal.

Mr. Justice Grantham, in giving judgment, said that he and his learned brother both felt that the case must go back or be re-opened, so far as it related to the action against the Guardians. He (the learned Judge) had read the judgment of the learned Referee very carefully, and he could not help feeling that throughout the learned Referee's own view of the case was that, owing to alterations in the contract—in getting possession of the site and so on—the plaintiffs were justified in claiming on

quantum meruit. The case of *Bush v. the Trustees of the Port and Town of Whitehaven*, which learned Referee felt bound by, in his opinion, did not apply to the present case. The circumstances of the case of *Bush v. the Trustees of the Port and Town of Whitehaven* were entirely different to the circumstances in the present case. There might have been some delay in giving the builder possession of the site which might have occasioned some expense to him, but he was bound to that he could not read the contract in any way suggested by Mr. Bray, viz., that Brooks was entitled to have the entire area given up to him absolutely, so that he could have the whole work in progress at the same time. He could see any justification for that. If there had been delay, and the contractor had been damaged by the contractor was entitled to damages for delay; but in his opinion there was no ground for claiming on *quantum meruit*. In those circumstances he thought that the judgment of the learned Referee must be set aside, so far, at least, as the question was concerned.

Mr. Justice Wright said that he was of the same opinion. The learned Referee had told them facts upon which he based his judgment; but it did not seem to him (Mr. Justice Wright), that he justified him in holding that the case of *Bush v. the Trustees of the Port and Town of Whitehaven* was applicable to the present case. In the case of *Bush v. the Trustees of the Port and Town of Whitehaven* there was abundant evidence to satisfy the jury that the plaintiff and the defendants permitted the works to go on under the understanding that the contract was to be under altered conditions. There was no suggestion of that in the present case.

Mr. Justice Wright said that the decision of the Court came to was that the judgment against the Guardians must be set aside, and practically there must be a new trial. The question to be determined was, what form the new trial should take.

Mr. Harrison said that he should like to go before another Referee.

Mr. Justice Wright remarked that he should like to think Mr. Ridley would care to try the case again.

Mr. Harrison said that he was ready to agree with his learned friend on a gentleman to try the case.

Mr. Bray replied that he should like to take the opinion of the Court of Appeal on the point that before the Court, and therefore the question of naming a gentleman to try the case would not arise at present.

In the result their Lordships ordered that judgment obtained by the plaintiffs against the Guardians should be set aside, with costs, there being a stay of execution for three weeks, with a view to the plaintiffs appealing from this decision of the Court of Appeal.

TYERMAN V. MARSLAND.

MR. DENMAN gave his decision at the Lambeth Police-court on the 9th inst. in the case of *Tyerman v. Marsland*, which raised a question of some interest to builders. It was an appeal by Tyerman, a builder, against a notice of objection served upon him by Mr. Ellis Marsland, District Surveyor, in connexion with some alterations which the appellant is carrying out at the "General Hospital," Park-road, Pocklington.

Mr. Passmore appeared for Mr. Tyerman, appellant, and Mr. Marsland conducted his own case.

It appeared that the public-house in question was used partly for the purposes of trade and partly for the purposes of a dwelling-house, and the notice served by the District Surveyor was based upon Section 2 of Section 74 of the London Building Act, 1894, which provides that in every building exceeding ten squares in area used in part for purposes of trade and in part as a dwelling-house, the part used for the purposes of trade or manufacture shall be separated from the part used as a dwelling-house by walls and floors constructed of fire-resisting materials, and that all passages, staircases, and other means of approach to the part used as a dwelling-house shall be constructed through of fire-resisting materials. Mr. Marsland relied upon Section 207 and 209 of the Act as connecting the building with Section 74. The first Section provides that shall not be lawful to make any alteration of a building in such manner that when so altered it will by reason of such alteration, not be in conformity with the provisions of the Act applicable to a building. Section 209 provided, "that every addition to or alteration of a building, and any other work made or done for any purpose in, to, or upon a building (except that of necessary repair affecting the construction of any external or party wall) shall, so far as regards such addition or alteration or other work, be subject to the provisions of this Act, and of by-laws thereunder relating to buildings."

On behalf of Mr. Tyerman, the appellant, I. Passmore submitted that the words "By reason of such alteration," in Section 207 entirely exempt the building in question from the provisions of Section 74, Sub-Section 2. He took it that Section 207 would apply to a case where the existing building had been less than ten squares in area or which had been used solely for the purposes of trade and solely for the purposes of a dwelling-house, and v

altered into a house which was to be used for the purpose of trade and as a dwelling, but in this case neither of such alterations being made. Practically the only alteration was being made was a direct staircase. A house alterations in the district of the County cell, and the question had never been suggested by any other of the District Surveyors. Denman, who had reserved judgment, said in opinion that the case was settled by the order under the earlier Act in "Scott v. Legge" (L.R. 10 Q.B. 355). The wording of the section of the Act is the same as that in the present case, and he has no reason for supposing that this Act was intended to apply to buildings which could not have dealt with under the earlier Act. The District Surveyor's notice would accordingly be set aside.—*Building Advertiser.*

REGGED BEGGING-LETTER IMPOSTERS

Bow-street Police-court, on the 6th inst., was Charles Stewart and Francis Stewart, father and son, of Waverley-road, Tottenham, were fined for obtaining money and goods by false names. Mr. Francis Thomas William Miller, an agent of Bedford Park, stated that on March 27, 1900, a prisoner went to him with a letter from another. The writer stated that he was in the prisoner's employment as foreman in 1885, and was just recovering from a severe attack of pleurisy. He represented that he had received an offer of £100, but had pawned all his clothes and tools, and was afraid he would be unable to accept it unless he could get his goods out of pawn. The writer complied with a pathetic reference to his little children. A witness afterwards found that the prisoner's name as to having been foreman was untrue, and the boy called again he was arrested. The prisoner was remanded for seven years. The prisoners remanded.

MEETINGS.

- WEDNESDAY, APRIL 22.
Children's Foremen and Clerks' of Works' Institution.—Monthly meeting of the members. 8 p.m.
Ingham Architectural Association.—Exhibition of drawings of old Scottish work by students of Applied Art, and notes on same by Messrs. Smith and Ransauy, next students.

Sanitary Institute (Lectures for Sanitary Officers).—J. Wallace, "Peggs on Principles of Calculating and Cubic Spaces, &c.; Interpretation of Plans and Notes to Scale." 8 p.m.
London Institute of Architecture, Science, and Art.—W. McGregor on "Heating by Steam and Hot Water." 8 p.m.

RECENT PATENTS.

- ABSTRACTS OF SPECIFICATIONS.
1959.—ROOF LADDERS AND STAGING: J. R. Hamilton. Invention consists in (1) a roof ladder and staging, fitted with a propelling gear, which is portable and unattached to the building and requires no fixture to support it or assist it in its descent; and (2) a roof ladder and staging on which a person may stand and propel himself along the roof of a building, ladders, &c., without the use of any ladder track.
1963.—STOVES: E. Laroche.—Inventor claims a safety stove, comprising a hermetically closed body, in which combustion takes place, and which is provided with two petticoat closing doors; and an outer jacket, which is surrounded by the said inner body, and between which the inner body air entering from the outside of the stove is heated before passing into the same room, through a series of baffles, and various accessories for supplying air, and for admitting fresh air, &c., &c.
1968.—LATERAL MOVEMENT STAGING FOR BUILDERS, &c.: E. J. Palmer.—Invention consists in a mode of supporting cradles, boats, platforms, &c., with

capability of easy lateral adjustment from within, the same said means consisting of a wire rope extended horizontally by cantilevers, or other means of support, in combination with sheaved hangers or blocks running upon the said wire rope, and a hauling line or rope connected to said hangers and suitably guided.

19,374.—FLUSHING CISTERNS: F. Price.—Inventor proposes to provide a means whereby more than one flush may be effected from one filling of a cistern, if under any circumstances the supply from the main should be stopped, also, to provide means whereby the quantity of each flush may be determinable, adjustable, and equal, or nearly so. In order to secure these advantages, inventor provides a flushing system divided by a partition, so as to form a supply chamber and flushing chamber. The latter is partly filled by a hollow tank, at one end of which a siphon is connected for conveying the contents of the supply chamber to the flushing chamber. Means are provided for operating the siphon.
23,731.—CHIMNEY-TOP SMOKE-PREVENTER AND EXTRACT VENTILATOR: J. Erick.—The chimney top, constructed of any material, is a vertical shaft of 6 in. diameter, with its upper portion tapering to 6 in. at top. On this fits the extract ventilator, formed of nine curved louvers of semicircular section, spaced at intervals around shaft, and either vertical, tapering inward at top, or bell cut at any angle up to 45 deg., the point where the louvers surround top of lower shaft.

25,521.—DRAIN-PIPES AND TRAPS: R. C. Birtley.—Invention consists in (1) the introduction of a detachable cover joint to all sanitary pipes, &c., to secure a water-tight joint (2) each pipe can be laid and connected to the next one with Portland cement, &c., and the portion cut out of pipe forms a hand-hole to a thoroughly flush joint when laid, and a means for surveyor's inspection and (3) with detachable cover a broken pipe can be replaced without disconnecting or disturbing other pipes.

NEW APPLICATIONS FOR LETTERS PATENT.

- MARCH 20.—3,002, J. Pinnington, Sash Frame.—3,047, J. Brayton, Window Catches and Fasteners.

The Architecture of our large Provincial Towns.

VI.—NORTHAMPTON.

NORTHAMPTON is pleasantly situated on the southern slope of a hill in a bend of the river Nene, and claims to have existed before the Roman occupation. Of this direct proof is wanting; but there is nothing inherently improbable in the supposition, and as no one can disprove the claim any perhaps pass; especially as the question would hardly, in any case, affect the present architectural aspect of its streets. There are no Roman remains; the site is set to the north of the first defensive line of those invaders, and they never seem to have occupied it. The history of the town commences with a record of marauding Danes, who, notwithstanding its great distance from the sea base, occupied it for three or four years early in the tenth century, and burned it in the course of another raid about a century later. Whether the structures they destroyed, or those which more immediately succeeded them, had any sort of architectural interest we are never likely to know; probably not: there is no record of any building till towards the end of the eleventh century when the castle was erected by Simon de Liz, a Norman adventurer.

The foundation of this fortress," says James Mackenzie,* "is connected with the history of a bad Norman woman, the untutored Judith, daughter of the Conqueror's first sister, Adeliza." This woman betrayed the king the part taken by her English husband, Waltheof, in a conspiracy of some

of the Norman nobles. Waltheof, who was Earl of Northumberland, Northampton, and Huntingdon, was beheaded, and Judith was ordered to marry Simon de St. Liz, but refused on account of his lameness; whereupon her husband's property, including sixteen houses in Northampton, was confiscated and given to Simon.

This little domestic scandal was, architecturally speaking, the making of Northampton. St. Liz seems to have had the disease so dear to architects, the building fever. He not only erected a castle on the high mound by the river to the west of the now Royal borough, but, if tradition and certain chroniclers are to be believed, surrounded the town with embattled walls, rebuilt the Priory of St. Andrew, and erected the still existing churches of St. Peter and the Holy Sepulchre, besides endowing All Hallows, now called All Saints, and other churches with considerable landed property.* Whether he really did all this, or having gained a name as a builder was afterwards credited with some things he did not do, he at any rate made Northampton a place of considerable importance and a favourite stronghold of the Norman and earlier Plantagenet kings. During the twelfth and thirteenth centuries the castle was the scene of many picturesque and historic events, but in the fourteenth it fell into decay, and became, like so many others, merely a gaol, and so remained until 1662 when the greater part was demolished by order of the king together with the walls and gates of the town. The last traces of the structure were recently destroyed by the London and North-Western Railway Company, and their new station, a building of no architectural importance, now stands upon a part of the site. All that is to be seen at the present time is a wall next the street, on Black Lion Hill, built of some of the old stones, and, inserted in it, a pointed arch of plain squared masonry

which once formed the head of a postern gate.

The approximate position of the old walls may be detected on merely glancing at a map of the town, where it will be seen clearly marked by a continuous line of streets which runs from the gas works on the south, past the infirmary on the east, to the barracks on the north; the circuit being completed by the river on the west and part of the south sides. At the same time it will be noticed that the town, exclusive of detached suburbs, now covers rather more than three times the area of the mediæval borough, and that the greater part by far of the growth has been on the east side, between the racecourse on the north and the Billing road on the south. No particle of the fortifications now remains, and of the greatest of the other works attributed to Simon de St. Liz, St. Andrew's Priory, the name alone survives attached to a church built on a part of the site, near the north end of the old town, in 1841.

The church of the Holy Sepulchre was erected on the apex of the hill, to the north-east of the city and only just within the wall. The main piers and a large part of the outside wall of the circular nave survive, almost hidden externally between the later additions on the east and west (see sketch, fig. 1, for which we are indebted to a Northampton architect, Mr. Herbert Norman). The work is very plain, without any of the rich detail seen at St. Peter's, which is, no doubt, the origin of the suggestion that it was built about 1070, six years before the conspiracy which gave St. Liz, its reputed founder, the property, and a quarter of a century before the first crusade, which made this form of church popular, if, so far as France and England were concerned, it did not originate it. It seems unquestionable that the many circular churches of this age and similarly dedicated, including the Church of the Holy Sepulchre at Jerusalem erected during the Christian occupation, derived their form and arrange-

* It is said he also built Fotheringay Castle.

"The Castles of England; their Story and Structure," p. 30.

ment directly from the so-called "Dome of the Rock," built by Constantine over the supposed true sepulchre, and not merely in a general way to the sepulchral edifices of the lower empire, and that they were expressions of the prevailing idea of the age. St. Liz was a Crusader, and if he built this church he probably did so subsequently to his return to England after the fall of Jerusalem in 1099. Perhaps it was a thank-offering for his safe return: there is nothing in the work itself to suggest an earlier date. The columns in the circular church average about 3 ft. 10 in. in diameter, and, including the cap and base, are, roughly speaking, 14 ft. high; the central space is about 30 ft. across in the clear, and the surrounding aisle 11 ft. The arches, sharply pointed, and the octagonal wall upon them are of Perpendicular date and coeval with the small clearstory windows. The high tower arch, taking the place of the original west door, is also Perpendicular, and the arches to the aisles and to the later nave Decorated; the jambs, however, which carry the latter are Transition work.

The aspect of this interior, with its eight great columns, is exceedingly solemn and impressive, and before the insertion of the three Decorated windows in the outer wall the dim light must have made it far more so. In the massive rubble-built outer wall, 8 ft. up, are the remains of the string-course under the windows, and some indications of great interest and suggestiveness. The wall leans outwards considerably almost all round, and there are obvious indications of wide-splayed Norman windows having been built up; but more suggestive still is a set-off of 15 in. or 18 in. on the inside, at a height of between 4 ft. and 5 ft. above the springing of the pier arches, and about the same distance below the eaves. It seems clear that the aisle was originally covered with a barrel vault, springing above the heads of the semicircular pier arches (which would have had a rise of about 4 ft.), and probably heavily and clumsily built. The large windows may have been built up to strengthen the wall when this vault began to thrust it out, but without much effect, and eventually the vault fell, or was taken down. This must have happened during the round-arched period, for the smaller windows which took the place of the large ones, and one of which remains, are of that form, and so are those irregularly inserted and still existing in the wall above the set-off, in positions they could not have occupied while the vault remained. That there was, as usual, a chancel to the church, and that it occupied the position of the later rectangular nave, and was of the same width, is shown by the remains of the original windows in the north wall above the arcade. The height of these windows suggests that the floor may have been originally level with that of the circular part, and has been raised, necessitating the steps which now lead from one to the other.

The length of the chancel is indicated by the external corbel-table, still to be seen in its original position in the north aisle: on the south side it seems to have been rebuilt. A north aisle was added in the Transition period, for the responds of the arcade, with beautifully carved caps, remain. The second north aisle was built, and the pier and arches of the nave arcade renewed, apparently towards the end of the thirteenth cen-

tury, but the work is of the poor and clumsy kind which the men of even that period were sometimes capable of doing. The church was equally unfortunate in the Decorated period, when the south arcade was inserted or rebuilt in an extraordinary manner with piers and arches that are equally ugly, but do not in any other way accord with one another. Towards the end of this period, however, the nave arcades were lengthened by the insertion of a third arch on each side, and the three arches opening into the round church were rebuilt in a much better style; it was probably at the same time that the large windows in the round church were inserted. The tower and spire form a very telling piece of Perpendicular work, on account of its situation visible from many parts of the town and neighbourhood: the spire has the delicate outline and light effect so especially acceptable in such a feature, and its lines are cleverly continued to the ground by well-shaped angle buttresses. Its appearance is possibly none the worse at a little distance for the absence of the pinnacles, which have disappeared. The north aisle and eastern bay of the rectangular nave have been rebuilt, and a chancel with aisles and organ chamber added by Sir Gilbert Scott, in a rich and even rather florid manner. His fancy for parti-coloured material has found an outlet in the use of alternate courses and voussours of white Bath stone and the strong orange-coloured Duston stone of the neighbourhood; a combination not unpleasing in itself, but which contrasts in a rather too striking manner with the stern simplicity of the round church. If the architect of the work had not been Sir Gilbert Scott, some people might have been disposed to quarrel with the archaeological consistency of some of the mouldings and so on; but apart from the feeling that it is perhaps a little "overdone," no one can dispute its beauty. The woodwork, some of which is inlaid, is hardly more satisfactory than other conscientious efforts to apply early Gothic mouldings to wooden screens and stalls, but that only goes to show that most such efforts are mistaken. The church is surrounded by a large churchyard, and is well seen from all sides except the north. The western exit to Sheep-street is by a good modern lychgate, the woodwork of which is rich but rather thin looking.

If St. Peter's, the other Norman church of the town, which stands to the south-west of the position formerly occupied by the castle, and on the south side of the main thoroughfare from the west, was founded by the original Simon de St. Liz, he either did not proceed far with it, or his work has disappeared. The nave, which is apparently the earliest work remaining, must, unless we are much mistaken, have been built in the first part of King Henry the Second's reign, not earlier, that is to say, than 1150. It is one of the richest examples of Norman work in any parish church in the country, and in excellent preservation. The span is about 17 ft., and the length over 90 ft., exclusive of the tower; the aisles are barely 7 ft. wide, and parts of their outer walls are, no doubt, original, though they have been considerably raised, and are now pierced with Decorated and Perpendicular windows, and supported by buttresses of all periods. The arcades are of eight bays, of which the three at the east end no doubt always, as now, were

included in the choir. The first, third and fifth piers from the west end are clusters, with shallow sections of the inside shafts running up through the clearstory, supporting the roof principals, and dividing the nave into two double bays and a single one at the west end. The clearstory windows are small, symmetrically disposed inside, and worked into a continuous arcade outside, the other arches being blanks. The nave arches bear deeply-cut chevron ornaments; the caps, including the abacus mouldings, are richly carved, and the neckings cut into cables of various patterns; the plain shafts have moulded bands about halfway up, on which are also cable ornaments. It is noticeable that whereas the banded shafts are built of large drums, the others are in small stones, several in each course. The long, narrow nave and chancel, all under one roof, the solid style, and heavy, rich ornamentation, produce an effect of stability and magnificence combined, not attained by the builders of any other age with the use only of rough freestone and coarse workmanship. The west tower (fig. 3), opens to the church by an arch of the full width of the nave—wide that the thick tower walls have had to be thinned to get it in. It is of three orders richly carved on the face towards the church like the pier arches; and it is noticeable that the jamb shafts do not very well fit the positions, that the stone jointing against the side walls is bad, and that the wall over the arch projects over the clearstory window. Outside—apart from the belfry stage, which is of a different coloured stone, and obviously late workmanship—the indications equally point to the tower having been built at a later date than the body of the church, and of old materials; or that it has been rebuilt or largely altered. The finished workmanship of the banded masonry in the lower part, and the fact that it is carried across the ends of the aisle (which it fits badly); the wider and irregular spacing of the arcades, which continue those in the clearstory; the fact that this arcade is not carried across the west front, but that the stones of an enriched Norman arch of three orders are here built in instead; and the detail of the upper arcade, indicating another date of work altogether, are all noticeable. It would be rash to speculate positively, but it may be suggested that the nave and aisles were originally one bay longer, making three complete double bays; and that by accident or design this last bay was destroyed, and the tower built partly on the site, the old materials being used up. The arch stones built in over the west window no doubt belonged to the original west door, and the incised band which occurs only on the south side may have been the string over it. Sir Gilbert Scott took down the Perpendicular east wall of the church, and lengthened it by about 15 ft., building on what he held to be the original foundations. He found many fragments of original work and used them again with great skill in a new east wall, designed in a masterly manner in perfect harmony with the old work. The font is an exceptionally charming piece of Decorated work, an octagonal prism in form, and very similar in design and detail to the Eleanor cross. There is a good modern oak reredos framing a painting of the crucifixion, but Scott's screen-work is little more successful than that noticed at the Church of the Holy

pulchre, and the timbers of the trussed
 ter roof look thin and paltry over the solid
 Norman stonework. Externally, the long
 e of the roof and clearstory arcades, and

the low solid-looking tower, are very satis-
 factory and restful.

Although not within the town, Queen
 Eleanor's cross is, after the two Norman

churches, the most interesting relic of
 mediæval Northampton architecture. It has
 been so frequently described and is so well
 known that no account of it is necessary.

Fig. 7.—The County Hall

It stands on a hill about a mile to the south of the town in an exposed situation beside the main London road, and has stood there, exposed to the weather and the chance of ill-treatment from mischievously-disposed travellers, for just over 600 years. Although erected between 1291 and 1294, it is in the fully developed Decorated style, and covered with delicate mouldings and carving. The top pinnacle with the cross is gone, possibly broken off by some Puritan iconoclast, but otherwise the monument is, all things considered, in a really marvellous state of preservation. The cusps of the niches are much decayed and two of the principal figures have each lost a hand; but the features are visible and one face is almost perfect; while all the rich foliage and crockets, the cresting, the pinnacles and the coats of arms, are still sharp and clear. Little appears to have been done by way of repair beyond a little stopping, apparently with Roman cement: it seems to owe its preservation only to the

good qualities of the stone and of the many generations of travellers on the road. The only other survival from the Middle Ages which is of much interest is St. John's Hospital, a little oasis, though possibly a damp one, in the architectural wilderness of Bridge-street. It is said to have been founded in 1138, but the two buildings of which it now consists appear to belong to the Early English period. They are both gabled structures, standing one at the side and the other at the bottom of a little courtyard. The former, the hospital proper, is now divided up by a floor and partitions, with irregularly inserted square-headed windows, but it appears to have been originally of one story only, and to have been entered from the end now, and perhaps originally also, abutting on the street by a doorway at present half buried by the raising of the ground. The Perpendicular windows at the further end of this building, as well as the west window and door of the chapel, are

insertions; the little turret on the chapel gable is modern, and is quite unworthy of its position. The only inhabitant at present is a caretaker. St. Giles's Church, a large cruciform edifice at the east end of the mediæval town near the walls, though dating also from the twelfth century, has been so frequently altered and so badly restored after the fall of the tower in 1613 that it is not now a very interesting building. St. Gilbert Scott found traces of no less than four roofs, including the seventeenth century one, erected when a great part of the church was rebuilt. His own restoration seems to have been very partial, and insufficient to add a modern interest. The chief remnant of the original structure are the west and north doorways and the eastern arch of the tower; the one lancet window in the sanctuary and the remains of two more are the most likely relics of the first alteration or addition. The church possesses a pretty little Jacobean pulpit.

The dawn of the Renaissance in Northampton is represented by the remains of two houses of the Elizabethan period. One of them, at the north-east corner of the Market-square, bears, besides some interesting coats of arms, the date 1595; which may well have been that of its erection or completion; and it is, without doubt, the one house mentioned as having escaped the great fire of 1675 that destroyed all the centre of the town. It has plain mullioned windows and three large dormers with ogeeables; but the front is now covered with a thick coating of paint, and has, besides, lost much of its beauty through the destruction of the ground story, in which were a characteristic doorway and bay window, now replaced by a modern shop front. The other, the house known as the Haselrig Mansion, on the south side of Marefair, the main western thoroughfare, is more interesting. It also is of two stories, besides three large dormers, but is said originally to have been longer and to have had five, a statement to which the greater width and importance of the existing easternmost dormer gives some support. The setting forward of the dormers on heavy corbels is peculiar and unusual, and the projection of the door and window dressings in front of the wall face is noticeable, though by no means unique; there is no feature one can point to in proof of such a theory, but the general appearance in some way suggests that the present form and details of the front are not original, but alterations of an older structure.

All Saints, the principal church of Northampton (fig. 6), situated to the south of the Market-place at the crossing of the main streets through the town, was destroyed, with the exception of the tower, in the great fire already mentioned, and instead of the cruciform Gothic edifice, there is now on the east side of the tower a Renaissance church with a square nave, strongly reminiscent in idea and detail of Wren's London churches, with some of the earlier of which it is contemporary, having been opened in 1680. The pendentives of the dome are carried by four finely proportioned stone columns with boldly carved Ionic capitals, and the plaster ceiling, of four elliptical vaults forming the arms of a cross and four bays with flat ceilings in the corners, is, as well as the dome, ornamented with bold, well-proportioned mouldings and rich modelling in high relief. The whole design is conceived in the large and simple manner and pervaded by the fine feeling for form and proportion characteristic of Wren and his school, and is worthy of more appreciation than the town, rightly proud of its two old Norman churches, seems able to spare it. The narrow chancel seems contemporary with the nave, and has some equally fine plaster modelling in the ceiling and good panelled dados of the same date on the side walls. It has been much modernised and spoiled, especially by injudicious colouring, the insertion of a sun-light of the usual pattern and an attempt to decorate the walls in harmony with the ceiling by covering them with modelled plaster ornaments, which, however, have not the scale, nor the relief, nor the fine form of the original. The one piece of good modern work is the reredos. Across the west front stretches a long portico, which may or may not have been a part of the first design for rebuilding

Fig. 8.

—it was not completed until Queen Anne's reign—but which adds a breadth and dignity to the front that would otherwise be wanting, and makes it worthy of its important situation. The inharmonious tracery in the windows is probably an insertion of the present century. The arches on the four faces of the old tower are remarkable; they look as if they must thrust out the angles, as indeed they have done to some extent, and one can hardly understand the builders of the Middle Ages erecting them. The cornice of the tower and all above it are parts of the rebuilding.

Another relic of the same period is the interior of the old Crown Court, at the back of the County Hall, which has a modelled plaster ceiling of similar but even better design and execution than that in the church, and bolection moulded woodwork, now quite black, with large raised panels and little well-proportioned Ionic columns. The County Hall, facing the south side of All Saints' churchyard, is another building of the same age, said to have been designed by Sir Roger Norwich, an amateur architect; a statement any credible explanation of which must shear away its strict veracity. The interior might perhaps have been the work of a skilful mechanic, though hardly of a gentleman amateur; but the exterior is obviously the design of an architect of more than average culture and skill, who knew very well not only what he wanted done but how to get it done, for the workmanship is as excellent as the design is dignified and pleasing. The building adjoining the County Hall in George-row, and now used as offices in connexion with it, is probably about a century later in date, and, some of the details of the one being imitated from the other, it is easy to compare the two, and to note the immense superiority of the older example. The order used in the later work has three-quarter columns of a curious flattened sec-

tion, which gives them a ridiculous appearance of being put upon a shelf where they have not room to stand. In the rear of this building is Mr. Edmund Lav's new County Council chamber, a semi-octagonal room with a high oak dado, surmounted by an arcade above which are a series of rectangular windows and recesses separated by pilasters, which in the corners become three-quarter columns. The seats and desks for the Councilors are arranged in a semicircle, with a raised dock for the public behind, facing the chair and Aldermen's bench, which occupy the long side; a well-arranged and well-lighted room for its purpose, but the ceiling is, perhaps, too much cut up by the panelling. In Market-square, the cornice of the Peacock Hotel and a couple of well-proportioned Ionic pilasters on the front of a house on the south side seem to mark the buildings to which they belong as having been erected soon after the fire, and one of the houses at the corner of Gold-street, now being demolished to make way for a new bank, was probably of about the same date; fortunately Mr. Herbert Norman has preserved the recollection of it in the sketch shown as fig. 8.

There are some relics of the eighteenth century in Sheep-street in several deeply-recessed doorways with the characteristic panelled linings, flanked by wooden columns and pilasters, and surmounted by pediments—such doorways as are almost always charming, partly because the details and proportions are almost always good. The same class of work, though of a poorer description, and some of it probably belonging to the early part of the present century, is to be seen in several parts of the town. But the best example is a small house in the upper part of St. Giles's-street—No. 71—a little two-story symmetrical brick building with deep bay windows, flush frames, quoins, and a good cornice and doorway.

The Greek revival of the present century

is only represented by two buildings in Northampton—the Northamptonshire Union Bank in The Drapery, by Mr. E. F. Law, and some business premises on the north side of Goldstreet. They are both important fronts with an order running through the first and second floors, and, if not very interesting, are distinguished by breadth, a fine sense of scale, and, on the whole, good detail. The Greek character of the bank is, however, rather marred by the incongruity of its rusticated basement and its balustrades. The front of the College-street chapel (see lithograph), built in 1862, has the same general idea in its design, but is without the refined detail, and is altogether rather "Palladian" than classic. The Corn Exchange, on the Parade, built in 1850, and the Capital and Counties Bank (Mr. E. F. Law) next to it, are still more frankly Renaissance in style, though there is still the same breadth and scale. The Corn Exchange has a Roman Ionic order *in antis* running through the upper floors with a rusticated ground floor, which, however, is disastrously weakened in effect by three great arches. The rich frieze and well-proportioned cornice are carried on across the bank front, which is the more satisfactory of the two, owing chiefly to its more solid ground story. It probably rather gains by the absence of the order, and the consequent increase of unbroken wall spaces. The corn market at the back of the Exchange building is a large bare hall of no architectural interest.

The principal monument in Northampton of the earlier Gothic revival is the little Roman Catholic chapel of St. Felix at the north end of the town, on the Kingsthorpe road, built by the elder Pugin in 1843 in the Decorated style. The details of the work are not perhaps calculated to entirely satisfy the critics of an age which has learnt so much about Gothic architecture since, but it is a remarkable proof of the mastery which that great leader had laboriously acquired over a hitherto unrecognised style. The great cathedral church added to the chapel by the architect's son in 1863 is, unfortunately, almost as remarkable for its lack of feeling. Nazareth House, the Roman Catholic charitable institution adjacent, though severe and almost prison-like in its aspect, is an admirable piece of work, in strong contrast with the trivialities of the cathedral, and dependant for its effect upon the simple and natural grouping of the windows and large dormers.

Northampton owes by far the most important of its modern architectural monuments, the Town Hall, to the Gothic revival. The eastern part of this building (see lithograph), which stands on the north side of St. Giles's-square, close to the centre of the town, was commenced in 1861 from the design of the late Mr. E. W. Godwin, and the western part in 1889 from those of Messrs. M. H. Holding, of Northampton, and A. W. Jeffery, of Hastings. Mr. Holding informs us that while Mr. Jeffery designed the internal arrangements, he alone is responsible for the street front. The building is two stories high (exclusive of the extra one in the tower and main gable), and the front, which is extremely rich in effect, is altogether fifteen bays long, of which eight belong to the addition. The general disposition of the original front is Italian, and the details are of the early French character popularised by Burges. It

Fig. 9.—House, Abingdon-avenue. Messrs. Mosley & Anderson.

is perhaps the most successful front of its class ever erected, and its success is obviously due to the resourceful expedients by which Godwin succeeded in retaining some of the best points in his Italian models, and in finding some compensation for what he was obliged to lose. The most important of these expedients are the broad recessed portico by which the deep shadow is obtained under three, at any rate, of the ground floor arches, and the long, strongly marked, horizontal lines, emphasised by the bands of orange stone, the Duston stone which gives so much warmth and variety to most buildings in the town. The great breadth of wall space in the upper part of the Italian buildings was unattainable in our climate, but the many curved lines of the window heads are carefully neutralised by the vertical masses of the statues and canopies. The projecting balcony to the centre window, which breaks the monotonous flatness of the front, though a small feature, is an important element in the general success. The carved panels, judiciously placed under the protection and in the favourable semi-light of the arch heads of the ground floor, are stiff and formal in design, and less decorative in effect than the fuller and more naturally carved panels of the later work. The tower is no doubt a failure; something of the kind was wanted in the position, but it need not have been so thin and commonplace. The best feature of Mr. Holding's work is the fine broad gable with flanking pinnacles, a good piece of design in itself, with which he has, as it were, echoed the tower. It is unfortunate that it was necessary to make a second centre to the front, but difficult to see how it could have been avoided, or how it could have been done with less injury to the general appearance of the building. The Town Hall itself is in the rear of the three easternmost bays and is a rather remarkable room. lofty, but not very large, it is almost bare of mouldings and carved ornaments, but richly and very successfully decorated with colour on the bare brickwork; and cleverly lighted by large circular openings in the lower part of the roof, which is in two slopes, the

lower one, in which the openings are forming a sort of mansard. The glass is grisaille with a little strong colour introduced, and has an extremely rich effect. There is a stage at the north end and an organ gallery at the other, both opening to the hall by semicircular arches. The decoration is graduated from dull and generally cold tones and simple forms on the lower parts to great richness in the roof, where it culminates in a fine series of coats of arms over the windows, surmounted by canopies and finials which branch out and spread up to the ridge. The general idea of the exterior of the building is carried into the corridors, staircase, and new Council Chamber, and would have a rather cold effect but for the large admixture of Duston stone with its warm tones. Mr. Jeffery's Council Chamber is a particularly dignified and characteristically Gothic apartment, with arched stone walls and a vaulted ceiling.

Next to the Town Hall on the west is a very successful office front by Mr. Holding in rubbed brickwork with flush window frames; a restrained, well-proportioned example of the so-called Queen Anne style which even the tawdry vases on the parapets cannot spoil. The Stamford, Spalding, and Boston Bank opposite (see lithograph), is a simple, dignified stone building of Renaissance character. Near this, in Guildhall-road, is the Opera House—a pretty miniature theatre by Mr. Phipps—with a narrow little street front, mainly taken up by a recessed portico of three arches, and in quieter and better taste than is usual with theatre architecture. In the old business centre of the town are singularly few buildings of recent date. The only one that calls for notice is the "Admiral Rodney" Inn in The Drapery by Messrs. Dorman & Stevenson, a building with a rough-cast top story and gables and a very wide bay window to the first floor. The picturesque elements of the design are well kept under control, and prevented from looking too broken up by long, strongly marked white wood cornices. In Goldstreet the most architectural modern building is No. 8, by Mr. S. J. Newman; a high gabled front with three quadrant cornered oriel windows running up through the first and

Fig. 10.—St. Edmund's Parochial Buildings and Mission Hall. Mr. M. H. Holding.

second floors, and a good doorway: with lighter and more elegant mouldings it would have been an exceedingly striking design. No. 14, at the corner of College-street Messrs. Dorman & Stevenson, is an effective piece of work with good detail and well-shaped gables (fig. 5), its balance rather upset by the very common mistake of making the angle turret too high and important. The quiet little front of the Grand Hotel opposite (see lithograph), by Mr. Chas. Dorman, is more dignified and less obtrusive than hotels usually are. Nos. 47 and 49, by Mr. Edmund Law, are two large glass shop-fronts, two stories high, with a range of windows and two large gables above. Such a façade could not be expected to be altogether satisfactory, but the upper part, crowded though it is with small detail, certainly has a very spirited effect. All the western part of the town, south of Gold-street to the river, and north as far as building extends, is a region almost entirely of small houses, relieved only by a few factories, and the usual allowance of schools and places of worship of various denominations. The older buildings of architectural interest have already been noticed. By far the best of the recent ones is St. Paul's Church (see lithograph), by Mr. M. H. Holding, at the northern extremity. The walls externally are of the hard, rough Kingsthorpe stone in thin courses, which gives an extremely pleasant surface and sense of scale, and it has well-marked vertical lines and character, with buttresses of good outline, and high,

narrow windows; the detail is of the Decorated period, and the tracery in the window heads is a little too crowded; the interior is as lofty in effect as the outside, and it is altogether a very satisfactory building. In the north-eastern district, near the Militia Stores, is the Military-road school, the best and one of the most recent of the Northampton Board Schools. It is a one-story building, chiefly remarkable for its satisfactory and symmetrical grouping. St. Lawrence's church, in Duke-street, is a red brick structure with lancet windows, unremarkable outside but very satisfactory in the interior, which has a fine spaciousness to which the lofty clearstory largely contributes: the aisles are merely passages, a rather extravagant arrangement, but generally effective. In the same street, and not far off at the corner of Newland, are two new factories by Messrs. Mosley & Anderson (see lithograph), which are good examples of the use that may be made of very simple elements of design, chiefly in these cases large wooden mullioned windows with elliptical relieving arches over them, slightly projecting piers, a broad band of white stone and a cornice introduced where most useful. They are evidently inspired by Dutch examples. In the same direction, but nearer the middle of the town in Wood-street are the offices of Messrs. Birdsall & Son, designed by Mr. Thomas Garratt, a little over full of features but exceedingly well grouped, in good taste and with excellent detail. Abington-street is fast becoming the most

important one in Northampton, owing to its being the main thoroughfare to the new quarter which has grouped itself about the Kettering and Wellingborough roads. In passing up it the first building to notice is the Masonic Hall, a structure of the heavy aggressively Gothic type of which the world has rather tired. No. 9, a little two-storied front in rubbed brick and stone, better suits the taste of the day, and is a very pretty, well-balanced production; it is a pity the end windows could not have been kept further from the corners. The Post Office is not an inspiring structure; but in Fish-street, which connects Abington-street with St. Giles's-street, are two recent buildings, the new front of the Working Men's Club, and the "Fish Inn" (Mr. Fred. Dorman), that are worthy of mention. The former is only a narrow strip that owes its success mainly to the artistic lengthening of the vertical lines of its first-floor windows to balance the strongly-marked horizontal band under them; but it is altogether very well arranged and detailed. The "Fish Inn" is similar in character to the "Admiral Rodney" in The Drapery, and not much less successful, but the windows take away too much of the wall surface, and the angle turret is tall and upsets the balance. Returning to Abington-street, the most important building in it, and one of the largest in Northampton, is the Convent of the Sisters of Notre Dame; an immense mass of white bricks, in the erection of which, unfortunately, the architecture seems to have been forgotten—unless the porch is meant

for a sort of aside to the effect—"This is a Gothic building." Goodyear Chambers, at the corner of Lower Mounts, by Mr. Edmund Law, has some architectural pretension, and the new porch and front of the grammar school is not wanting in merit. At the entrance to Abington-square (with the exception of the market all the squares in Northampton are triangles), on the north side, are two new office fronts, the first of which is a pleasing piece of work and, if compared with the other, is an object lesson in the aesthetic advantage obtained by dividing up window space. It is almost all window, the piers being of the smallest, but owing to the use of mullions and transoms the excess does not offend the eye as in the other. At the corner of Abington-avenue a very pleasing quietly-treated little house is to be noted (fig. 9), by Messrs. Mosley & Anderson. In Abington-square, where the roads to Wellingborough and Kettering part, is a terracotta statue of Mr. Bradlaugh, his coat-tails appropriately supported by a stump. On the Wellingborough-road the only architecturally interesting buildings are a charming little mission hall, attached to St. Edmund's Church (fig. 10), and Messrs. Mansfield's shoe factory. To the former Mr. Holding acted as honorary architect; it is built with the thin courses of rough stone used at St. Paul's and in his other churches, and has genuine half-timbered gables and richly traceried barge boards. Inside, the roof is carried on stone arches instead of principals, an arrangement which seems a rather useless affectation. The building altogether is an extremely satisfactory one but we do not know that the stone arches have much to do with this result. Messrs. Mansfield's factory (Mr. Chas. Dorman) is the most architectural in Northampton; in its external symmetrical grouping and details it rather recalls the Military-road Board school. The middle block is of two stories, however, with three broad gables. The style is quasi-Jacobean. Perhaps the best bits of design are the neat little detached lodges at the ends.

At the first corner in the Kettering-road, where it turns towards the north, Mr. Dorman is erecting a new Unitarian chapel. The scaffolding has just been taken down, and reveals a very good piece of design in the "flowing" Decorated style, the rich octagonal bell-turret being especially good. It will be the best piece of Nonconformist architecture in Northampton. A little off the road, just short of the racecourse, is St. Michael's Church, by Mr. George Vials, a low, short, broad-proportioned, aisleless edifice with double transepts, in the lancet style, cleverly planned for congregational purposes, and not ineffective internally. Opposite the racecourse are a number of new houses of the better class, similar in their character and variety to those now erected in the neighbourhood of all large towns. One or two of them are good of their kind, but hardly call for special notice. At the extreme end of this district is the largest and most important of the modern churches in Northampton, St. Matthew's, by Mr. M. H. Holding (see lithograph). It has the same aspiring lines and lofty character as St. Paul's, and is faced externally with the same pleasant rough material, but the detail is very much more elaborate and the window tracery more successful. Internally the facing throughout is of white Bath stone,

which has a somewhat cold effect; the nave and aisle roofs are carried on stone arches crossing the space from side to side, very light but still too massive-looking for what they have to support. The apsidal choir is vaulted in stone, and there is a vaulted baptistry under the west gallery. Though some of the architectural detail is rather wanting in interest and character the general effect is very good. The alabaster altar table and font are good and very elaborate pieces of work, and the wrought-iron screens are excellent. In St. Giles's-street there are some good "Queen Anne" houses by Mr. Holding; one of them, 71A, is especially quiet and pleasant looking. Along the Billing-road, beyond the bare uninteresting infirmary, is another modern residential quarter where there are a few houses of some architectural merit, the most interesting being a house by Mr. E. W. Godwin, a very clever attempt, perhaps the best ever made, to carry out the great idea of the Gothic revivalists; that is, to do as the builders of the thirteenth century might have been expected to do if faced by modern problems. It is notable that the windows are square-headed and without mullions, and that there is no gable to the front (though there is a very high-pitched one at the side); the main feature is a very high-pitched hipped roof, with a large chimney stalk crossing its ridge, and overhanging eaves cut through by a small dormer, which has also a hipped roof. Nestling up against this main block, and intended to balance the large dormer of the wing on the other side, is a circular turret, but a small and subordinated one—not the great aggressive mass which other architects have used with disastrous effect in similar cases. One must not omit to mention the Chapel of St. Andrew's Hospital in the extreme west, a small but very beautiful example of Sir Gilbert Scott's style.

The suburbs beyond the river have little of architectural interest in them beyond another good church, St. Mary's, by Mr. Holding. Northampton is extending mainly towards the north and east, over the hill, and the low land on the south and west is only coming into use very slowly and for poor districts.*

NOTES.

Vitruvius Disestablished. AFTER being taught to doubt the personal existence of Homer, and to question whether Shakespeare was the real author of the plays given under his name, one cannot be surprised to find that the sceptical criticism has extended to architectural works, and that the book ascribed to an architect of the Augustan era named Vitruvius is now stated to be a compilation of the third century fictitiously dedicated to Augustus. This is the view of a Danish critic, Professor Ussing, in reference to which Professor Aitchison contributes a comment to the *Journal* of the Institute, and another to the *Athenæum*, the latter with the object of inviting the opinion of learned Latinists as to the evidence of date afforded by the language and style of "Vitruvius." Professor Ussing's strongest point is his assertion that chapters 19 and 21 of "Vitruvius" are translations from Athenæus,

* The next of this series of articles, on the architecture of Leicester, will appear in our issue of June 5.

a writer of the third century; we have not yet had the proof of this; but if it is proved Professor Aitchison suggests the explanation that these chapters may have been subsequently added to or bound up with the original work. It will be interesting to see what Latin scholars have to say on the philological aspect of the question; but we are not inclined to feel very much faith in Professor Ussing's destructive criticism, regarding it rather as one more instance of the prevalent passion in the present day for reviewing old literary creeds of every kind coupled with the desire of scholars to have each a new theory of his own. In the meantime we may say that there appear to us to be two points of internal evidence decidedly in favour of Vitruvius. One is, the unaffected and genuine character of the reflections in the Introductory chapter which seem written far too much in earnest to be the writing of a literary forger acting in part. Another point is, why does Vitruvius in speaking of circular buildings in Rome omit all mention of so remarkable and prominent a building as the Pantheon? As we now know for certain that the Pantheon was not (as formerly supposed) the work of Agrippa, but of Hadrian, this omission of it is quite explained on the received theory of the date of "Vitruvius" as the Pantheon was not then in existence. An architectural writer in the third century, with his attention chiefly directed to Roman buildings, could hardly have ignored it.

German Post-Office Architecture.

By the death of Dr. Von Stephan, the popular Post-master of Berlin, who has been the supreme authority in all postal matters in the German Empire since 1870, Germany loses not only an energetic post-office manager, but also one who takes interest in the architectural treatment of the various buildings erected under his rule. It was part of Dr. Von Stephan's ambition to have his Department effectively represented by buildings of architectural pretensions. The Italian Renaissance style was advocated by him for all larger towns, whilst Pomeranian brickwork was used for the post-offices in all minor localities. Though much of the work was done by a special Office of Works, belonging to his Department, he was much in favour of placing commissions in the hands of local architects, sometimes arranging limited competitions. The result of his work is that Germany has the finest set of post-offices in the world, not only as regards practical planning, but also in respect to their architectural treatment. We may add that the new General Post Office building at Berlin, which will be ready in a few weeks, will contain an Architectural Museum, with drawings and models of nearly every post-office in Germany.

Mycenæan Remains.

THE Swedish archaeologist, Dr. S. Wide, has been conducting excavations at Aphidna, in North Attica, which promise to add an interesting chapter to the history of "Mycenæan" civilisation. The ancient Aphidna, which Demosthenes mentions ("De Corona," 238) as one of the five most important fortified places of Attica, is a rocky plateau, rising abruptly out of the surrounding plain to a height of 365 metres above the sea. It is known to the modern Greeks as Koroni.

On this acropolis itself are distinct traces—pottery and the like—of a "Mycenæan" settlement; but it is a large grave tumulus below the acropolis that Dr. Wide has specially investigated. A remarkable feature of this tumulus is the large number of graves beneath it which consisted simply of the huge vases known as "pithoi." The custom of burying in pithoi is of course known in Greece: isolated instances occur in the Dipylon graves in the Cerameicus, with vases of the geometric style, also at Thoricus and in Corfu; but here we have the prevailing custom, not the exception. The general conclusion as to the date of the tumulus drawn by Dr. Wide is that it is contemporary with the Mycænæan "culture" of the Aphidna acropolis, and that we have in the pithoi and geometric wares accompanying them the art and burial customs of the peasants who lived in the plains and were ruled over by the Mycænæan princes in the acropolis above.

Austrian Archaeological Institute. The Emperor has sanctioned the formation of an Austrian Archaeological Institute at Vienna, to date from January 1, 1898. The purpose of the new institution is primarily the supervision of all archaeological research work undertaken by the Government; further, the control of all Government archaeological collections, and the control of any subsidised excavations undertaken by Austrians outside of Government territory. The new institution is to undertake certain publications, and to arrange various private and official journeys, also some studentships, &c. The Emperor will nominate the President of the Institute, who will fulfil the functions of a managing director, and there will be four Government secretaries at his disposal, two of whom are to be stationed at Athens and in the East respectively. There will be a General Council, consisting of the University Professors of Archaeology, the custodians of the Government collections, and a number of experts and amateurs nominated annually by the Minister of Education. This seems to indicate an awakening on the part of the Austrian Government to a sense of the value of archaeological studies.

Delphi Sculptures. It has often happened that the design on a Greek vase has thrown light on the interpretation of a motive in Greek sculpture, but for the first time, we believe, an instance of the reverse process has occurred. A slab from the recently-discovered frieze of the Treasury of Siphnians, at Delphi, has thrown light on a black-figured vase found in the Acropolis at Athens, a portion of the design of which had hitherto defied all attempts at interpretation. The vase in question depicted what was obviously a gigantic machine, but standing near a figure with the name Epialtes were two large black objects something like the coils of much-inflated snakes, on the nature of which no archaeologist—French, German, American, or English—of the numbers who examined the vase could conjecture the meaning. This meaning, by comparison with the Delphi frieze becomes instantly clear. Æolus (inscribed) is on the Delphi frieze holding two great wind-bags or bellows, one of which he is in the act of opening, and it is these two great bellows that are

depicted on the vase; one is still inflated, the other deflated, hence the difference in size and appearance. The bellows are fastened by wooden pincers similar to those still in use in Germany for fastening the apertures of sacks. The interpretation is due to Dr. Hartwig, who publishes the vase in the last number of the *Bulletin de Correspondance Hellénique*.

Mycenæan Antiquities at Pylos. In the same number of the *Bulletin* appears a brief report of researches made at Pylos in the grotto variously called by the names grotto of Hermes or grotto of Nestor. M. Laurent, of the French School, has brought to light there a number of fragments of vase-painting of various epochs, which promise to be of considerable importance for the "Mycenæan" question. The fragments are pre-Mycenæan, late Mycænæan geometric and post geometric. The geometric vases are not without interest, as it is well known nothing of the sort was found at Olympia. The Western Peloponnesos has been, so far, found singularly poor in Mycænæan antiquities, and yet we should have expected that, at least in Triphylia, the Minyans from Iolcos would have left traces of their civilisation. Towards the west, the extreme points where Mycænæan civilisation has left traces, are, so far, the west slope of Taygetos and the islands of Ithaca and Cephalonia. It is interesting to note that these Pylos discoveries have been made incidentally on a journey, the main object of which was to investigate the condition of Byzantine antiquities in the Morea.

Sewage Irrigation. WHEN we find an author commencing a treatise in favour of sewage irrigation with the observation that "every community . . . is confronted with *practically the same difficulties*,"* and concluding it with the statement that "the question is not so much whether sewage-farming or chemical treatment is theoretically the right way to dispose of town-sewage, but rather whether in a particular case the one method is more likely than the other to give good results, *as every case requires to be dealt with on its particular merits*,"** we are led to think that the author is not very sure of his ground. The treatise from which we have quoted is, however, better as a whole than the quotations. It is a reprint of a paper on "The present status of sewage irrigation in Europe and America," read by Mr. H. Alfred Roehling before the Sanitary Congress at Newcastle in September last. The author quotes from various authorities statements in favour of sewage-farms, and gives plans showing the position of the sewage-farms in the neighbourhood of Berlin and Paris. One of his authorities is Mr. Allen Hazen, the Massachusetts investigator, but this is an unfortunate quotation for Mr. Roehling, for Mr. Hazen's testimony is in favour, not of sewage-farms, but of "intermittent filtration through sand," and this reveals Mr. Roehling's bias: he entirely ignores the question of purification by means of artificial filters, a method which—now that the principles of purification are more thoroughly understood—is coming more and more into successful operation. Still, every one will agree with

* The italics are ours.

the author's conclusion that "every case requires to be dealt with on its particular merits."

Continental Slaughter-houses. WE have frequently had occasion to refer to the erection of large central slaughter-houses, combined with meat markets, throughout Germany, and, to a certain extent, in Austria and Hungary; and it would appear that throughout those countries the authorities are fully alive to the advantages of centralisation outside their towns, whenever a good railway connexion is available, so as to allow for rapid transit to the retail tradesmen. We have previously remarked on the works of this class at Berlin and at Leipsig, and our German contemporary, the *Zeitschrift für Bauwesen* recently contained an interesting article on the new slaughter-houses at Cologne, from the pen of Herr Rudolf Schulze. It appears that the establishment includes thirty blocks of buildings, costing together nearly 300,000*l.*, and that in this case a building for the Central Meat Exchange has also been added, besides the usual market, the separate slaughter-houses for the different classes of animals, the cooling-rooms, tannery, lard manufactory, &c. A line of rails, with six sidings, has been taken right into the enclosure, and there is ample room for extensions. To those interested in the question of slaughter-houses, a visit to the more modern institutions of the Continent may be recommended, and they will find many examples both of good planning and satisfactory architectural treatment.

MR. W. WHITAKER, F.R.S., has done good service in publishing a supplementary account of Essex well-sections*, which is very superior to any that has preceded it. In addition to the usual information as to the nature and correlation of the geological deposits passed through, we find several interesting comments on the quantity of water obtained, together with several chemical analyses, and at least one result of bacteriological examination. But we are not satisfied. In the first place, sufficient attention is not always paid to locating the exact site of each well. Thus, "A little northward of the church," "Sir W. Gilbey's fruit farm," "Station-road," "Perry's farm," and the mere mention of the village in which the well occurs, is hardly enough. No doubt on visiting the different localities it would not be difficult to find each well; but it would be far more useful if each site could be referred to a particular plot of land as defined, and sometimes numbered, on the 6-in. maps of the Ordnance Survey. The term "farm" often applies to a large tract of country, and in view of the frequently undulating and hilly districts which might be comprised within it, the height of the orifice of the well above O.D. (an important matter in estimating the thickness of the uppermost beds to be passed through) should always be indicated. Then, again, the chemical analyses given might be interpolated more frequently even though the information was not supplied by the person who communicated the analysis to the author. Nevertheless, although the account might be improved upon in several ways, engineers

* *Essex Naturalist*, Vol. ix., pp. 12, 190.

are very much indebted to Mr. Whitaker for what he has done, and it is to be hoped, now that he has retired from the Geological Survey, that he will be able to find more time to collect and publish similar (if not improved) details concerning the water and well-sections of other counties; but we trust they will not be buried in the "transactions" of small local societies.

At the Society of Fine Arts are the new collections. The water colours and paintings of "Landscape and Lagoon" in England and in Italy, by Mr. Graham Petrie, show a fine sense of effects of colour and light expressed in a very broad free style of execution. Among the English scenes, "Showery Weather, Fittleworth" (13) is one of the best, remarkable especially for a very fine sky. Though there is no detail to speak of in any of them, architecture is well treated in several of the views, especially in "A November Morning, Venice" (50), a corner of the amphibious city, in which the various tones of the buildings are admirably real; and in "Rome from the Corsini Garden" (3) St. Peter's, yellow in the sunshine, sparkles in the distance between the dark stems of trees in the foreground. "Winter in Venice" (60) shows Venice in rather a new light, and looks cold and dreary enough. "The Euganean Hills from Venice" (68) is a fine bit of atmospheric effect of sea and sky. There is much to enjoy in the whole collection, which exhibits a great deal of original talent. Mr. C. H. Shannon's lithographs and drawings in red and black chalk are in some cases almost too slight for exhibition—only that it is becoming the fashion to exhibit mere scrawls of this kind. Some of the studies of nude figures, such as "Ministrants" and "Shell-gatherers," which are meant to be idealised and poetic, have a partially ludicrous effect owing to the starved and angular character of the figures. The most completely successful sketches are some of the more realistic and prosaic examples; "L'homme au manteau," for instance (why this affectation of French titles?), a half-length of a seated figure in a cloak, and "Le Fumeur," a figure of similar character; both these are admirable. The collection is a rather odd mixture of cleverness and eccentricity.

Illustrations.

NORTHAMPTON ARCHITECTURE.

THE lithograph plates this week illustrate various buildings in Northampton, and are nearly all referred to in the leading article in this number, on the architecture of Northampton.

We are indebted to Mr. Holding for the loan of an excellent drawing of the Town Hall, of the later portion of which he was architect, and also for his drawing of St. Paul's Church. The other illustrations include the same architect's St. Matthew's Church (from a photograph); Mr. Charles Dorman's very quiet and pleasing design of the new wing of St. Andrew's Hospital; Mr. W. Hull's classic design of College-street Chapel; two characteristic warehouses by Messrs. Mosley & Anderson; Masonic buildings, by Messrs. Ingman & Shaw; the Grand Hotel, and the Stamford, Spalding, and Boston Bank, by Mr. Charles Dorman, and some new premises in Gold-street by Mr. S. J. Newman; the latter the only entirely new building in the collection.

Some other buildings, old and new, are also illustrated by sketches printed along with the leading article.

COMPETITIONS.

TECHNICAL SCHOOL, BOOTLE.—At a recent meeting of Bootle Town Council, Alderman Johnson submitted the report of the Free Library and Museum Committee on the new technical school, and moved resolutions fixing the corner of Balliol-road and Pembroke-road as the site for the school, sanctioning 16,800*l.* as the expenditure to be incurred for building and furnishing, authorising the obtaining of competitive plans at premiums of 50, 30, and 20 guineas for the three best, and authorising the engagement of an architect to advise on the plans. Councillor J. J. Mack seconded, and the resolutions were carried.

THE ARCHITECTURAL ASSOCIATION SPRING VISITS:

THE ROYAL PALACE HOTEL EXTENSION, ETC., KENSINGTON.

The fifth visit of the session* was paid to the Royal Palace Hotel Extension, High-street, Kensington, by permission of the architects, Messrs. Legg & Son.

The new portion of the building visited comprises, chiefly, large ballroom and banqueting hall, the upper part being devoted to additional bedroom accommodation for the hotel. The ball room is situated on the ground floor, and is approached through a small entrance hall, the men's cloak room being in the basement and the ladies' on the first floor; the room measures 74 ft. long by 48 ft. wide, and will be one of the largest dancing-rooms in London. The lower part of the walls is panelled in light oak, and the upper part covered with modelled fibrous plaster, which will be decorated in white and gold. The chief point of interest is, perhaps, the floor, which is supported on steel springs to add to the spring of it for dancing; the floor is of wainscot oak laid on joists in the usual manner, and these rest on long beams, the ends of which are bolted into an iron crutch, which is supported on either side by a strong spiral spring 3 in. in diameter, and 6 in. long, fitting into a circular sinking in the crutch, and also into another iron casting resting on the concrete floor. There is sufficient space allowed for the bearer to spring an inch; an indiarubber stop is inserted to prevent any jar, and indiarubber stopping is also placed between the outer edge of the floor and the wall to make a tight joint. On the first floor is a lounge, and the banqueting hall is situated on the second floor; this is 60 ft. long by 34 ft. wide, and is placed over the exact centre of the hall room, the latter being lighted by curved skylights on either side; the whole of the weight of the banqueting hall being carried on steel girders 2 ft. 6 in. deep, which are curved to follow the line of the cove of the ceiling under a decidedly daring piece of construction, the dead weight on each girder being over 100 tons. The decoration of the hall is similar to the ball room. The walls of the main staircase and lounge and rooms adjoining are to be covered with Japanese paper of a very fine design. The building is warmed throughout with hot air, heated in the basement and carried by means of flues to gratings at sides of floors of rooms. Externally the building continues the treatment of the hotel, but the height of it has been considerably reduced, owing to rights of light of adjoining property.

A visit was afterwards paid to No. 27, High-street, Kensington, to inspect some shop premises and small flats being erected from the designs of Messrs. Banister Fletcher. The premises consist of a show room on the ground floor and basement, and residential flats above. The open timber roof to back of show room is executed in "Columbian Pine," being better adapted to carving; it can also be obtained of sufficient size for long columns. The floors, stairs, and partitions throughout are of breeze concrete, composed of pan breeze from electric works, and Portland cement, mixed in the proportion of three to one. The partitions are only three inches thick—a great economy of space. The staircase has tile risers, fixed to a mastic composition, and teak treads. The window openings are fitted with N.A.P. steel casements, and are arranged to open either in or out.

Externally the front has a large bay window resting on the architrave of the shop front, the main wall being kept back to allow for balconies on the upper floor, and also for tile

panels on the return walls. Lawrence's bricks have been used, with Kelson stone for the facings, which, although rather coarse in grain for carved work, will resist the effect of the London atmosphere. The visit, although not so well attended as on previous occasions, was of decidedly an interesting character.

ARCHITECTURAL SOCIETIES.

LIVERPOOL ARCHITECTURAL ASSOCIATION. At the seventh ordinary meeting of the present session of the Liverpool Architectural Society a paper was read by Mr. W. Henman, entitled "Hospital Construction," which was illustrated by working drawings, &c. Mr. Henman said that hospitals and infirmaries might be regarded as health manufactories, and the arrangement of their plan should, as in ordinary manufactories, be principally considered with a view to the perfection of the work carried on. The great disadvantage of the pavilion system was the distance of one portion of the buildings from the other, entailing exceptional labour in supervision and great cost in building. If thorough ventilation could be otherwise secured, then the buildings might be more massed together and the cost reduced.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE.—The annual spring visits in connexion with the Architectural and Building Construction Classes were made a few days ago, the places selected for special study this year being Edinburgh and Chester. The visit to the former city took place on the 19th inst., when a party of about thirty students was conducted by Professor Gourlay, who had made arrangements for studying the more important works of architectural interest—ancient and modern—in Edinburgh, including St. Giles's Cathedral, St. Mary's Cathedral, St. Margaret's Chapel in the Castle, and the McEwan Hall, while the Museum of Science and Art received much attention in respect of its interesting collection of architectural and other remains. The visit to Chester was made by a party of ten students under the guidance of Mr. James Lochhead, and extended over four days, which time was principally spent in studying by sketching, measuring, and photographing in and about the Cathedral, St. John's Church, and the numerous half-timber houses and fronts with which the city abounds, and of which the time at disposal only permitted too brief an examination.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The annual general meeting of this Society was held on the 13th inst. in the Library at the School of Art, Mr. Charles Hadfield, the President, in the chair. Mr. C. J. Innocent (hon. secretary) read the tenth annual report of the Council, which stated that the membership had continued to increase. There are at present 34 Fellows, 37 Associates, 12 students, 5 honorary members, and 18 lay members, making the total number of members 108, as against 103 at the end of the previous year. The Council record with regret the death of Mr. James Hall, who has been a fellow of the Society from its commencement. The ordinary meetings have been exceptionally well attended throughout the session, and very able lectures have been delivered by Mr. J. D. Leader, F.S.A. (honorary member), on "A Study in Domesday;" by Dr. Sorby, F.R.S. (honorary member), on "The Structure and Durability of Building Stones and Bricks;" by Mr. Beresford Pitt, on "The Study of Architectural Design," by Mr. John Slater, on "The Buildings of the Ancients;" and by Mr. J. B. Mitchell-Withers, on "A Tour in Holland." Professor Ripper, principal of the Sheffield Technical School, has made a number of test of bricks at the request of the Council of the Society, and reported fully upon them. The Royal Institute of British Architects made number of elaborate experiments in brickwork to the expense of which the Sheffield Society contributed; and samples of the bricks used in those experiments were sent down, and they were carefully tested by Professor Ripper, in comparison with a number of local bricks of several makers. The report was read on the same evening as Dr. Sorby delivered his lecture. The members of the Society had very enjoyable excursion in June last to Wenworth Woodhouse, where, by the kindness of Earl Fitzwilliam, the family apartments and the kitchen offices, cellars, stables, gardens, &c. were all open to the visitors. The new church and the old church were inspected, also the mausoleum, with its sculpture by Nolcker

* The publication of this account has been unavoidably delayed.

arrangements are in progress for an excursion to Chatsworth in June with special facilities. Another competition in school board work has produced some dissatisfaction, and the Council of the Society has presented some suggestions to the Sheffield School Board on the subject of competitions. A deputation, consisting of Messrs. C. Hadfield, E. M. Gibbs, and C. J. Innocent, was courteously received by the Chairman of the Board and the Chairman of the Buildings Committee, who promised that the suggestions should have consideration. It is not yet known to what extent they may be adopted. There has been a competition for a public building in the city in which members of the Society who are in practice were invited to compete. The subject was a fire brigade and police station in West Bar, and the Corporation appointed three assessors, viz., Mr. C. Hadfield (President), Mr. E. M. Gibbs (ex-president), and Mr. C. J. Innocent (hon. sec. and past president), who have prepared the instructions to the competitors, and who are now engaged on an examination of the designs submitted. A suggestion has been made that the Society should join other allied societies in the employment by the Institute of a lecturer to give a series of lectures to the students of each society in preparation for the examination, and the Council have expressed their willingness to join in the scheme. The question of the election of Fellows of the Royal Institute of British Architects has been very carefully and repeatedly considered by the Council, at the request of the Institute, and some of the recommendations have been incorporated in the scheme which has been adopted. It has been decided to join the Royal Institute of British Architects and its other allied societies in an address of congratulation to her most gracious Majesty the Queen on the attainment of the sixtieth year of her reign. The statement of accounts was read, and showed a balance in hand of 437.75. 6d. This statement and the annual report were unanimously adopted. Mr. Mitchell Withers and Mr. E. Winder, jun., were then elected scrutineers for the election of officers, which resulted in the following elections:—President, Mr. R. W. Fowler; vice-president, Mr. Joseph Smith; treasurer, Mr. F. Fowler; honorary secretary, Mr. C. J. Innocent; Council, Messrs. A. Smith Denton, H. W. Lockwood, W. F. Hemsoll, T. Winder, and W. C. Fenton. A vote of thanks was passed to the retiring officers for their services during the past year.

THE "WHITE HALL," BERLIN CASTLE.

The principal Court festivities in connection with the recent anniversary celebration at Berlin were held at the historical "White Hall" in the Royal castle. This hall, like many other parts of the castle, has been the subject of constant attention by the German Emperor, who is gradually remodelling that part of the block which is devoted to receptions and his private apartments. The alterations to the "White Hall" are those which are of the greatest architectural importance. It will be seen from the plans that the improvements on the old arrangements have been material, quite independent of any alteration in the architectural treatment of this part of the building. The old "White Hall" has practically been enlarged, its principal staircase altered, a large ante-room added, and a better communication obtained to the picture gallery; there have also been improvements in regard to the general service in this block.

The works were of a most difficult nature, entailing the breaking down of enormous masses of old brickwork, and the foundations gave a good deal of trouble. Altogether the various alterations may be considered to have spread over four years, and they are not yet complete, as much of the work that is intended to be in marble has for the present been done in plastering or woodwork, so that the hall can be used. As to the architectural treatment of the hall, it represents the taste of the "Berlin school" some ten years back, and is Academic and uninteresting. The Court Building Department practically acted as architects, but much of the work, particularly in respect to the decorations, was entrusted to the Court architect, Herr Ihne.

SCHOOL, DENNY, STIRLING.—Denny new public school, erected at a cost of about 7,000*l.*, to accommodate 226 scholars, was opened on the 13th inst. Mr. Mitchell, Coatbridge, was the architect of the school.

TRADE CATALOGUES.

MR. SIDNEY STRAKER, London, sends us his catalogue of oil motors for road vehicles. He has hit upon a good idea in proposing to supply coach-makers with motors, leaving them to supply the vehicles themselves. We have not seen any of the motors at work, but from the somewhat scanty details furnished, we gather that they possess the same disqualification which other motors of this class possess, viz., want of balance in the reciprocating parts. An oil engine, even when bolted to a solid bed, is not by any means free from vibration, and it is therefore a matter of wonder to us how, in a motor carriage, where the engine is mounted on springs, any degree of comfort can be

expected, and it is in this direction of balancing that the only hope of general utility lies in the future. As regards the noise of exhaust, Mr. Straker uses on the exhaust pipe what he terms "silencers," which consist of two small cylinders with partly-closed ends, connected by a short piece of tube, which are claimed to reduce "the shock of explosive engines to a noiseless state without creating back pressure." The motors are made either to work with light or heavy oils. In the latter case we presume the question of smell would not be so obtrusive. A four-horse power double cylinder engine works at 400 revolutions per minute, with a variation of 30 per cent. Its weight is 200 lbs., and that of the circulating water from 100 to

180 lbs. The ignition is by means of electricity. Mr. Straker states that the engines now put forward are the result of over two years' experimenting, and that they have been proved "to be entirely suited for road traction." If this is so, we congratulate him, as they must be very much in advance of anything we have yet seen in the streets of London.—Messrs. Kirchner & Co., London, send us their December catalogue of builder's, joiner's, and cabinetmaker's wood-working machines. Apparently these are of German make though the name of the place of manufacture does not appear anywhere. The machines described are of considerable variety, but we do not notice any very great novelty or superiority as compared with machines made in this country for similar purposes. Of the tools illustrated, perhaps the best are the molders for panels and spiral work. No prices are given, so that we cannot compare them with those of our best English makers.—In a recent notice (March 6) of trade catalogues we observed that Messrs. Line & Son did not appear to employ known decorative artists to design their papers. They draw our attention to the fact that on a separate page they state that the catalogue includes designs by Messrs. Voysey, Furniss, Brophy, Batley, Willcox, the late Arthur Silver, and other eminent designers. We had not noticed that, but our point was that the designer's name was not given in connexion with the separate designs, as we think it should be.—Messrs. Hayward Bros. & Eckstein send us their new catalogue of various forms of prism lights for basements, which are well known; the catalogue also includes illustrations of mixed tile and lens lights, arranged so as to present a decorative appearance; concrete face pavement lights; stall-board lights, patent cellar flaps, self-locking coal plates, &c.

Correspondence.

To the Editor of THE BUILDER.

THE R.I.B.A. ELECTIONS.

SIR.—The list of members officially nominated to serve upon the Council and Standing Committees of the Institute has just been issued.

On the four committees there are sixty-four positions to be filled up, and for these no less than sixty existing committee-men are self-nominated. This is unfair to those who wish to take their turn, and contrary to the best interests of the Institute.

There is, unfortunately, a tendency causing members of the Institute to vote for those candidates who have asterisks before their names in the balloting lists, these indicating existing members. Still more unfortunately, not one-fourth of the members trouble to vote at all, probably on account of those repeated self-nominations which tend to keep out a reasonably fair proportion of new men and fresh ideas. Surely it should be compulsory that a few, each year, of office holders should not be eligible for re-election, that others may have a chance.

With regard to the Council, matters are even worse—the President, Vice-Presidents, Secretary, and Members of Council number twenty-four persons, and no less than twenty-three of these gentlemen have (officially) re-nominated themselves for election; therefore, having in view the manifest advantages of the asterisk prefix, there is but little prospect that the new names will appear in the new Council.

If all the members throughout the country would take the trouble to vote, the result of the elections might tend to bring new men in, who would restore the Institute to its former condition of prosperity.

Although the income of the Institute is vastly greater than when I joined it, more than twenty years ago, yet its publications are now not to be compared with what were given in the past; we used to have a yearly, handsome, and large volume, beautifully illustrated; but now merely a fortnightly journal, with a higher price marked on its outside cover than its contents usually warrant.

AN ARCHITECT FROM YORK.

London.

THE LATE MR. C. CHALONER OGLE, ARCHITECT.

SIR.—The correspondent of the *Daily News* in Thessaly, in a letter from Volo, states that "a pro-

minent street in that town bears to-day the name of Charles Ogle, in grateful memory of the heroic death of an English war correspondent, who was killed with the insurgents."

This statement is erroneous so far as Charles Ogle is concerned, and does his memory an injustice. Charles Chaloner Ogle was a young architect of great promise, who, while travelling in Greece for the purposes of study, was appointed special correspondent of the *Times*, and while acting in that capacity was murdered by the emissaries of Amouss Aga, a major in the Turkish Army, and Chief of the Police in Thessaly (which was at that time under Turkish rule), between Volo and Macrinizta, at the latter end of March, 1878.

It is true that the Turkish authorities, before they were taxed with the murder, endeavoured to show that Mr. Ogle had taken part in the insurrection, and even went to the length of placing a musket in his dead hands to encourage this belief; but it was conclusively proved at the time that Mr. Ogle left Volo for Macrinizta with no other arms than a light switch, and that he was alone. Mr. Delayanni, in a letter to Mr. Gennadius, printed in the *Times* of April 4, 1878, writes:—"Le correspondant du *Times*, Mr. Ogle, était parti sans armes de Volo jeudi soir pour Macrinizta. Trois jours après les chefs ottomans envoyèrent à Hobart Paacha son passeport, en lui notifiant que son cadavre avait été trouvé à Macrinizta avec un fusil entre les bras; mais on a tout lieu de croire que Mr. Ogle a été assassiné par les irréguliers d'Amouss Aga, auquel quelques jours auparavant Mr. Ogle avait adressé des vives remontrances pour les massacres de Boulgréni. Il est certain que Macrinizta était occupé par les Turcs lorsque Mr. Ogle s'y rendit."

Amouss Aga treacherously lured ten of the headmen of Macrinizta into his camp by a promise of protection, and basely murdered them. Mr. Ogle describes in one of his letters to the *Times* that he had seen the half-burned bodies of the murdered men and had told Amouss Aga to his face what he had seen. This imprudence, there seems to be little doubt, cost Mr. Ogle his life.

I have no wish to detract from Mr. Ogle's merit, who fell as heroically as if he had died on the battlefield; but it is due to his memory that he was murdered by the Turks, and that he was not killed, as stated by the *Daily News* correspondent, with the insurgents.

JOHN HEBB.

* * * The above was written for insertion in our columns last week, but arrived too late.

The Student's Column.

SPECIFICATIONS.—XVII.

PLASTERER.

MATERIALS.—All laths to be of the thickness known as "lath and half," rent out of sound Baltic fir, batted at joints, with joints frequently broken, and well nailed with galvanised iron nails. (If any special patent lathing is to be used, specify this).—Lathing throughout to be "Jintin" patent metal lathing to be obtained from Hayward Bros. & Eckstein, and nailed in accordance with the instructions of the patentees with wire nails not more than 3 in. apart.

The lime to be fresh well burnt stone lime (or chalk lime if allowed), free from clinders, and to be run into putty at least one month before being used.

The sand to be clean and sharp and to be washed if required. Hair to be sound, long, black, ox hair, well beaten up when dry and thoroughly incorporated with the mortar.

Coarse Stuff.—Coarse stuff to be composed of three parts by measure of sand to one part of lime, and 9 lbs. of hair to be added to every yard cube.

Floating and Setting Coats.—The floating coat to be two-thirds fine stuff and one-third sand. Setting coat to be of fine stuff. The prick-up coat is to be carefully tested with plumb-line and straight-edge, and all depressions properly brought up to level of the surface before the floating coat is laid on. The floating coat is to be laid and worked from carefully-prepared screeds.

Ceilings.—The ceiling of the room to be lath, plaster, and set, all the remaining ceilings to be lath, plaster, float, and set.

Walls.—All inner faces of walls and half-brick partitions to be render float and set, and all quarter partitions lath, plaster, float, and set. The plaster to be continued behind skirtings. Walls of the room to be finished with dingd surface.

Angles.—Put rounded angles in Keene's cement to all salient angles internally.

Cornices and Mouldings.—The cornices and mouldings to be run in gauged stuff, composed of four parts putty to one part plaster of Paris. The cornices in the room to be in girth. (Give a list of all the cornices for the various rooms,

specifying the girth of each. If any are to have enrichments, particularise them, and give p.c. price per foot run for the enrichments.) All moulded plaster-work to be executed in accordance with the architects' full size details, and the mouldings are to be run from sharp cut zinc templates. Wherever required by the mouldings, the plastering is to be dibbled out, or angles roughly cut off brickwork as may be necessary.

Portland Cement.—Run the skirtings Portland cement, finished with bold trowelling. (Specify any further work there may be internally in Portland cement, as, for example, apron round the sinks.)

External Plastering.—External plastering may be carried out in Portland cement, limo stucco, or in rough cast. For external plastering a quick setting Portland cement is desirable, weighing between 90 lb. and 100 lb. per struck bushel, as quickness of setting is usually more desirable than great ultimate strength. It is generally advisable that Portland cement work should be completed at one operation rather than in successive coats. Specify the situation where Portland cement work is to be used and the surface with which each is to be finished. When Portland cement is laid in number of coats it is absolutely necessary that each successive coat should be laid on before the previous coat is dry, and this must be well scratched to form the key. The brickwork should be well wetted before the first coat is applied.

Trowelled Stucco.—This is intended to produce surfaces which can be subsequently painted and a smoother face is therefore required. It should be specified thus:—Walls of the room to be rendered and set in trowelled stucco composed of two parts of fine stuff to one part of very fine clean sand and finished with a wet trowel to a perfectly smooth face.

Rough Cast.—Walls of the room to be rendered in Portland cement, finished with rough cast coat of lime and small pebbles or fine gravel mixed together in a pail with a small quantity of Russian tallow and yellow ochre coloring. (This is one method of executing rough cast, but there is also another which should be more properly called pebble dash, and specify this).—Walls of the room to be rendered in

Portland cement and floated with lime stucco after which clean pebbles well washed in painful of water, and taken out wet are to be thrown on the surface of the wet stucco, and lightly beaten in with a wet trowel. (The stucco may be tinted, or the pebble dash may be applied direct to the cement rendering, in such an effect be desired.)

Sgraffito Work.—The Sgraffito work on the walls of the room is to be executed in the following manner:—First a coat of rendering in Portland cement in the proportion of two parts of sand to one of cement. Then a second coat floated in the room tinted plaster stucco, and when this is nearly dry a third setting coat of lime putty is to be laid on, not to exceed ½ in. thick, and whilst this is wet and soft the cartoon previously perforated is to be applied, and the design pounced through, and the necessary parts cut away, revealing the tinted stucco coat beneath. (If a variety of tints are to be used in the floating coat, this should be specified, but when the work is of this nature it is generally a little beyond the province of the ordinary plasterer, as considerable care is required in laying the tinted coat.)

Cut or Stamped Plaster Work.—This, although called stamped plaster, is really or properly described as cut plaster work, as stamps are ordinarily not employed. The work is generally done in a somewhat similar manner to Sgraffito, save that it is not necessary for the plaster to be floated coat to be tinted, and the work is frequently carried out without a setting coat of lime putty. It may also be carried out in Portland cement work if in small pieces.

Distemping.—The walls of the room to be twice distempored to an approved tint. (If particularly delicate colours are to be used, or very bright white, it is advisable to specify that starch should be employed for making the distemper instead of size.) All walls and ceilings before being distempored, are to be carefully stopped, rubbed down, and sized. The ceilings are to be distempored white, broken with a small amount of yellow ochre, instead of black.

Twice Lime White.—The walls of the room to be pointed with a neat flush joint, and twice lime whitened.

Pugging to Floors.—Lay on sound boarding

specified in "Joiner," under the whole of first and second floors with pugging composed of equal parts of lime, sand, and chopped hay laid dry, 2 in. thick.

Keene's and other Cements.—Specify the walls and ceilings, if any, which are to be in Keene's cement, distinguishing those which are to be first of all rendered in Portland cement if this is to be done. Keene's and Parian cement may be used as a finishing coat on ordinary lime plaster, but adamant, granite, and some other patent cements it is inadvisable to do in this way. Therefore when the specification says that a particular piece of work is to be finished in Keene's cement, it may be taken to imply that ordinary lime plastering forms the ground for the Keene's. In specifying adamant plaster, &c., it is advisable not to use the word finished, but to specify the number of coats, and say that the work is to be plastered in adamant (or other plaster), particularising the brands which the manufacturers recommend for particular work. So also if the Keene's cement finished coat is to be laid on coarser Keene's beneath.

Modelling and Casting.—Provide the p.c. sum of for modelling and casting ornamental work in . This price is to include delivery on the premises, but the contractor is to allow for fixing in addition.

The Paving.—This is very often included under the heading of the plasterer's trade, and should be specified thus:—The entrance hall and approach are to be paved with Messrs. files, p.c. 12s. per yard super, delivered at the works, and the tiling is to be laid by the contractor on 6-in. bed of concrete floated in cement; and the tiling is to be laid and jointed in cement. (If the tiling is to be laid in anything of an elaborate pattern, it is generally preferable to let the p.c. price include the cost of laying, this being done by the manufacturer's workmen.)

Wall Tiling and Mosaic Work.—This may be dealt with in a similar manner to the floor tiling. That is, if quite plain and straightforward, the p.c. price to be for the material only, which will be fixed by the contractor, but if elaborate let the p.c. price include the fixing.

Glass Linings to Walls.—The various forms of opaque glass which are now being introduced for wall linings are generally best fixed by the manufacturer's workmen, as they require care, and it is not every contractor who has men capable of doing the work.

Making Good.—The contractor is to cut out defective plaster work, whether from blowing or other causes, and to make good such defects in Keene's cement.

GENERAL BUILDING NEWS.

NEW GENERAL INFIRMARY BUILDINGS, STAFFORD.—A block of new buildings in connexion with the Staffordshire General Infirmary has been erected at Stafford. The cost of the enlargement has been about 20,000. Mr. Aston Webb, of London, is the architect. It was decided to pull down all the old buildings with the exception of the central portion, and to devote this to administrative purposes, and nurses' and servants' accommodation. The provision for patients has been entirely rebuilt, and is disconnected by open corridors from the central or administrative block, and in two pavilions to the north and south, making an elevation towards the high road of 370 ft. in length. The patients are provided for in four large wards, facing east and west, and containing fourteen beds each, a children's ward of twelve beds, three isolation wards of two beds each, three isolation wards of one bed, and two day-rooms, making a total of eighty beds. Detached sanitary blocks are provided at the ends of the large wards, and the whole are built on arches. Attached to the north block is a new operating theatre, served with a patients' lift, and with a preparation room adjoining. Each block is reached by a stone staircase, and at the further end is an external escape in case of fire. The out-patients' department, with its dispensary, consultation, and examination rooms, is placed under a portion of the south block, and a mortuary and post-mortem room have been arranged in the grounds. In the centre block are the kitchens, doctors', nurses', and servants' dining-rooms. On the ground floor are situate entrance and board room, receiving-room for patients, doctors' and matrons' rooms, while on the first floor are nurses' cubicles and sisters' and nurses' sitting-rooms, and on the floor over servants' bedrooms. The sitting-rooms are fitted with hot-water radiators, the large wards having a combination of an open stove and hot water. The air is extracted by means of flues in the walls, collected in flues in the roof, and finished with Kite's extract ventilators. The walls of the wards have all their corners rounded and finished in Keene's cement and

painted. The floors are laid in polished oak. Externally the walls generally have been faced with rough-cast, red brick facings being employed round the window and door openings. A new central porch has also been erected, and a new boundary wall and entrance gate to the road. The work has been carried out in two contracts, the first being the north wing, which was built by Mr. Epley, of Stafford; the second, including the south wing, the isolation and children's wards, and the remodeling of the central block, being carried out by Mr. J. Getting, of Shrewsbury. Mr. Peabworth and Mr. Tanner have acted as clerks of works. An illustration of the infirmary, as remodelled, appeared in our issue of July 27, 1895.

Y.M.C.A. BUILDING, HAMILTON, N.B.—On the 10th inst. the memorial stone of the Hamilton Young Men's Christian Association Institute was laid by Bailie Dreghorn, Glasgow. The building has been designed by Mr. Alexander Gillen, architect. It is situated in Gateside-street, and will consist of a structure three stories high, the first two floors being devoted to the uses of the Association, while the upper flat will be let for residential purposes.

DRILL HALL, RADCLIFFE, BURY, LANCASHIRE.—A new drill hall has been erected in Crow-lane, Ramsbottom, for the K Company of the 2nd V.B. the East Lancashire Regiment, at a cost of 2,000. The plans for the new hall were prepared by Mr. T. Nuttall, of Bury, and Mr. C. Brierley is the builder.

SCHOOL, KITTYBREWSTER, ABERDEEN.—A new school is to be built for the Aberdeen School Board in the Kittybrewster district. The school building will have a frontage of 108 ft. 6 in. to Great Northern-road, and will consist of three floors. It will accommodate about 1,100 children, exclusive of the extra apartments for cookery, scientific gymnastics, &c., and is expected to cost about 10,000. The plans have been prepared by Messrs. Brown & Watt. The school will be built of granite.

SUNDAY SCHOOLS, PENRITH.—New Wesleyan Sunday schools were opened at Penrith recently. The large central hall of the school is 58 ft. by 32 ft. to the north of the large hall are six small class-rooms, and to the west of the second entrance is an infant school room 52 ft. by 16 ft., with a gallery at one end. Over this is the ladies' sewing-room, of the same dimensions. The contractors are:—Masonry, Messrs. T. & W. Forester; joiner's work, Mr. J. Brown; slating, Mr. J. Bailey; plumbing, plastering, &c., Messrs. J. & W. Scott; hot-water heating apparatus, Messrs. Dinning & Cook, Newcastle-on-Tyne. The architects are Messrs. G. Watson & Son.

FREE CHURCH, KYLEKIN, INVERNESS.—This church was opened by the Earl of Moray recently. The building is constructed with Whinstone and faced with Appleross freestone. The contractors were:—Mason, Malcolm McIntosh, Portree; carpenters, Mackenzie & McLean, Portree; painters, Fraser & Gillis, Portree; slaters, Fraser & Co., Inverness; plumbers, McIntosh & Co., Inverness; and the architect was Mr. Wm. McDonald.

BREWERY, BLACKFORD, PERTHSHIRE.—A new brewery has been erected at Blackford for Mr. W. B. Thomson. A siding is to be brought from Blackford Station into the brewery. The malt and hop store, combined, is a building 50 ft. long by 30 ft. wide, and four stories high, and is fitted with elevators and all the necessary machinery for lifting grain from the railway to the respective floors above. The ground floor of this building is used as a cooperage, mill-house, and engine-room. The brewing house adjoins this building, and is 30 ft. long by 20 ft. wide and five stories high. The copper house adjoining the brewing house and is three stories high. The cooler house stretches west from this building. It is 70 ft. long by 28 ft. wide and two stories high. The tun room at the west end of the cooler house is a building 72 ft. long by 42 ft. wide and two stories high. Large maltings are to be erected to the north of the present buildings and will adjoin the malt store. To the east of the brewery has been erected an aerated water manufactory. The building is 104 ft. long by 60 ft. wide and two stories high. The whole of the buildings are to be lighted by electricity. The brewery was designed by Messrs. Russel & Spence, architects and engineers, Glasgow; and the contractors were:—Mason work, Messrs. Taylor Macgregor, Blackford; joiners, Messrs. Taylor & Scotch, Blackford; plasterer, Mr. Grant, Alloa; slater, Mr. Ramsay, Perth; iron work, beams, and columns, Mr. Mather, Edinburgh; iron tanks, reservoirs, &c., Mr. Davie, Stirling; copper work, Mr. Willison, Alloa; tuns, Mr. Clark, Clackmannan; engine, Mr. Cochrane, Barrhead; and boiler, Mr. Sinclair, Perth.

Y.M.C.A. BUILDINGS, BELFAST.—New buildings have just been erected at Belfast for the Young Men's Christian Association. The site extends along Wellington-place, a distance of 86 ft., and more than 230 ft. from front to rear in Wellington-street. The main entrance vestibule is 10 ft. wide by 170 ft. long, and extends along one side of the block from Wellington-place to the ground hall. Halfway from the vestibule is an entrance to the gymnasium, which is also approached by another separate passage leading from Wellington-place. A feature in the principal frontage is formed by the ground floor entrance and shops. Over the doorway rises the octagonal tower to

a height of 100 ft. A large acutely pointed gable adjacent to the tower rises to a similar height. Octagonal turrets placed between the gables have conical roofs of copper. The great hall, 82 ft. by 60 ft., seating about 1,700 people, with galleries round three sides, has a platform at one end. The gymnasium is 90 ft. by 50 ft., a gallery extends round all the sides. The minor hall, 76 ft. by 30 ft., is placed on the first floor. The general secretary's office is located between the principal corridor and the gymnasium, adjoining the central staircase, which lends right up to the top of the building. On the first floor is situated the reading-room. On the ground floor are reception rooms, 42 ft. by 20 ft., and 36 ft. by 20 ft., in addition to a number of offices to be let. These latter are continued on the two next floors. The third floor contains a series of class-rooms. On the upper floor are the culinary apartments. A special photographic gallery is provided on this floor. On the ground floor is a café, which extends from Wellington-place backwards 70 ft. Adjacent to the restaurant are two shops. Messrs. Misgrave & Co., Limited, have erected the heating apparatus and the special iron roofs and gate at main porch. The plumbing and gasfitting contract has been carried out by Mr. John Dowling, Messrs. W. T. Coates & Son have done the electric lighting work, under the direction of Mr. J. H. Greenhall as consulting engineer. The electric supply is obtained from the City Corporation works. Messrs. Ebner & Co., London, have laid the marble mosaic flooring. The marble of porch has been executed by Messrs. Purdy & Millard. Messrs. Robert Patterson and Sons have supplied the locks and fastenings; Messrs. Riddle & Co. and Messrs. Reed & Kyle the grates and chimneys. The electrical contractors for the works were Messrs. W. Macdonald & Son. Messrs. Young & Mackenzie are the architects.

PREMISES FOR THE SCOTTISH PROVIDENT INSTITUTION, BELFAST.—New buildings are to be erected in Donegall-square, Belfast, for the directors of the Scottish Provident Institution. The new buildings will occupy a space of about 100 ft. square, leaving the remainder for future development. They will be in the Palladian style of Italian architecture, executed in white stone, with a lofty columnar order, resting on a rusticated stylobate, and crowned with moulded cornice and balustrade above 80 ft. in height. An octagonal dome placed at the angle will rise 120 ft. Below it will be placed the separate entrance to the insurance office, another porch, with electric lift and stone staircase, accommodating the various suites of offices on the upper floors. The plans of the entire block have been prepared by the architects, Messrs. Young & Mackenzie, of Belfast.

SHOOTING LODGE, PITCARNIC, N.B.—A new shooting lodge is being erected at Pitcarnic. The lodge is being built at an elevation of 750 ft. above the sea level. The building will be two stories in height. The accommodation will consist of three public rooms, with ten bedrooms, four servants' bedrooms, and other offices. Stables with four stalls and two loose boxes are also to be erected, together with coachman's house, gamekeeper's cottage, and kennels. The total cost will be about 3,000. Plans, &c., were prepared by Mr. John Leonard, architect, Edinburgh, under whose personal superintendence the work is being carried out.

SCHOOL BUILDINGS, SHEFFIELD.—At the last meeting of the Sheffield School Board, the minutes of the Buildings Committee contained the following items, which were passed:—Tenders have been obtained for additions and alterations to Gleadless-road School, in accordance with plans and specifications prepared by Mr. Innocent, and the Committee recommended that the tender of Mr. J. Lister, for the sum of 6,291, be accepted, subject to the architect being satisfied as to his sub-contractors, and also subject to the approval of the Education Department. Tenders have been obtained for alterations to Crookesmoor School, for the purpose of improving the lighting of the manual instruction workshop, and the Committee recommended that the tender of Messrs. Ash, Son, & Biggin be accepted.

SANITARY AND ENGINEERING NEWS.

DRY DOCK, FRASERBURGH, N.B.—A dry dock has just been opened in Balalava Harbour, Fraserburgh. The harbour as now formed will have an area of 12½ acres. Up to three years ago fishing boats were not able to gain access to either the north or south harbours of Fraserburgh unless the state of the tide was favourable, and at half tide the Balalava Harbour was practically inaccessible. The works under the contract consisted of the deepening of Balalava Harbour, so that there would be in 17 ft. of water in ordinary spring tides, and from 6 to 18—on an average 7½ ft.—at low water. In addition to the deepening works had to be carried out in the way of construction of jetties, &c. A new jetty had to be built from the steamboat quay, opposite the lifeboat jetty, which was lengthened, as was also the new guard jetty, and between these there was an opening of 90 ft. Further to the Balalava Harbour is a jetty which leaves the entrance to the new dry dock 45 ft. wide. The new dry dock has an area of 3½ acres. Messrs. Abernethy & Son, London, were the engineers, and Messrs. Price and Wills, London, were the contractors, and Mr. Fitzgibbon was the resident engineer.

SEWAGE OF SALFORD.—On the 14th inst., at the twelfth meeting of the current session of the Liverpool Engineering Society, over which Mr. S. B. Cottrell presided, Mr. Joseph Corbett, Borough Engineer of Salford, read a paper, the subject of which was "Sewage Sludge Removal and Shipment." Dealing first with the removal of the sewer silt, he said they had in Salford, as in most old towns, a great number of ancient, badly-constructed sewers, with deficient falls, where silt accumulated continually under ordinary conditions, and where the scouring effects of storm water were insufficient to clear away the aggregations of silt. The sumps they had in use must be condemned on sanitary grounds, as being a kind of cesspool, where foul gases were evolved; but at any rate they were not so bad as sewers choked with silt, and, if frequently emptied, were not seriously objectionable. After some six hours in sewage tanks, the tank effluent was run out to the Ship Canal, almost perfectly clear and colourless, but still containing 110 tons of solid matter. Of this only four tons were then in suspension, and much that was formerly in suspension was then in solution, and thus invisible; 81 tons of mineral matter in solution, chiefly salts, and almost perfectly harmless; and 25 tons of organic matter—that was, animal or vegetable matter, more or less putrescible, but rendered quiescent for the time by the 20 tons of chemicals used. After describing the work done by the sludge steamer *Salford*, he said the Salford boat had now run the two years, and he found that in fine weather she could make five trips per week (her record trip was 10½ hours from wharf to wharf again), and, allowing for the necessary time for repairs, &c., and for delays by fog and rough weather, she would run about forty-two weeks each year, averaging more than four trips per week, say 180 trips per year; thus disposing of 108,000 tons of sludge at a cost of about a cool, a year. The cost was thus about 9d. per ton, and this covered a journey about thirty-four miles along the Ship Canal, and thirty miles along the Mersey and to the North-West Lightship, where her cargo was discharged in eighteen fathoms depth of water in a strong tide-way, where it was quickly dispersed and rendered practically imperceptible within a few hours. So cheap and effective was this process, as compared with any alternative available in their inland towns, that he felt sure we should see within a few years many sludge steamers passing out from the various ports throughout the country; and probably also hopper steamers carrying excavated earth and other inoffensive refuse, for which it was now difficult in many places to find "tips." As the system increased in extent it might be requisite to order the steamers to proceed to deeper water than at present, but that would not greatly enhance the cost. He therefore came to the conclusion that, whatever future improvements might be made in the modes of removing sewer silt and tank sludge, we had now in all probability reached the best and most economical means for its final disposal by shipping it to the deep sea.

SEWERAGE WORKS, &c., ECCLES.—Mr. R. Walton, inspector to the Local Government Board, held an inquiry on the 14th inst. at the Eccles Town Hall, with reference to an application of the Town Council to borrow \$159l. for works of sewerage, 900l. for the construction of underground conveniences at Eccles and Barton, 739l. for repairing Barton Lane—the main thoroughfare to the Ship Canal—275l. for the laying-out of a bowling green on the Recreation Ground, and 217l. for works of private street improvement in Vernon Avenue. The Surveyor (Mr. A. C. Turley) explained the nature of the works to be carried out, and said that the sewage farm at Saltee, to which the sewage would be diverted, was 72 acres in extent, and the working of the farm had hitherto been successful. The inspector afterwards visited the site of the proposed works.

SEWERAGE SCHEMES, HARTBURN AND FAIRFIELD, STOCKTON.—The Stockton Rural District Council at their last meeting had under consideration a report from Mr. D. Ballour, of Newcastle-on-Tyne and Edinburgh, of alternate schemes for the efficient sewerage of Hartburn and Fairfield in their district. The scheme comprises the necessary main sewers in conjunction with an outfall sewer delivering to the nearest point of the River Tees, where sufficiently tidal, after passing through subsiding tanks.

STAINED GLASS AND DECORATION.

WINDOW, ST. GILES'S CHURCH, NEWCASTLE.—The large east window in the chancel of St. Giles's Parish Church has been filled with stained glass as a memorial to the late Alderman W. Mellard, Mayor of Newcastle in 1856 and 1877. The principal subject of the window is the Crucifixion, and the work has been executed by Messrs. Hardman & Co., of Birmingham.

WINDOW, PULHAM ST. MARY CHURCH.—The only remaining plain window in the chancel of St. Mary's Church, on the south side, has just been filled in with stained glass. The representation was designed by Messrs. Burlison & Grylls, of London, and inserted by Mr. A. Palmer, builder.

WINDOWS, CANTERBURY CATHEDRAL.—Two new stained-glass windows have just been inserted in the north transept of Canterbury Cathedral. The windows have been executed by Messrs. Powell, of Whitefriars.

WINDOW, LLANGELYN CHURCH.—The three-light window at the east end of Llangelynn Church, Llywngwrl, has recently been filled with stained glass. The work has been carried out by Messrs. Hardman & Co., of Birmingham, under the direction of Messrs. R. Gillart & Sons, architects, Machynlleth.

DECORATION OF THE NATIONAL PORTRAIT GALLERY, EDINBURGH.—For some time past the Board of Trustees for Manufactures have been engaged in maturing a scheme for the decoration of the National Portrait Gallery. Several additional statues for the niches in the façade were commissioned, and those of Dunbar, David Hume, and James Watt are now in the hands of the sculptors. An anonymous friend has just handed to the Board a sum of 300l. for a statue of Henry Raeburn, the portrait painter, the execution of which has been entrusted to Mr. Fitzcarrick Macgillivray, A.R.S.A. The architect, Dr. Rowand Anderson, has been occupied in arranging for the ornamentation of the capitals of the pillars in the central hall, some of them after designs of selected pupils in the School of Applied Art, and these are now being proceeded with. The lighting of the hall having been found somewhat defective, a wall which separated three small rooms in front of the building from the ambulatory is in course of being taken down and open archways substituted. For the mural decoration of the central hall and ambulatory with this addition, the Board have decided upon a scheme illustrative of Scottish history, the commission for which they have entrusted to Mr. William Hole, R.S.A., the fee to be carried out by Mr. Hole, who has already been paid him for the work shall, if possible, be completed under the superintendence of the Board in the course of three years from this time, Mr. Hole being entitled to employ such competent assistants as he may find necessary to ensure the work being carried out with efficiency and dispatch. Mr. Hole has executed a remarkable series of paintings of this class in St. James Episcopal Church, Inverleith-row.—*Scotsman.*

FOREIGN.

FRANCE.—The "Académie des Inscriptions et Belles Lettres" has passed a resolution to demand from the Department of Fine Art the entire preservation of the church of St. Pierre at Montmartre.

—At the Ecole des Beaux Arts, in the architectural competition among the First Class, medals have been awarded to M. Carlier (pupil of M. Ginain) and M. Blot and M. Saint-Ginest, pupils of M. Laloux.—M. Fontaine, the sculptor, has completed a bust of the Art critic H. de Lamoignon, intended for his tomb in Père Lachaise.—M. Georges Cain, the painter, has been appointed joint curator of the Carnaval Museum.—The Gobelin's manufactory has just completed a tapestry after a cartoon by M. Jean Paul Laurens, representing a scene at Tournai in the fifteenth century. The tapestry is intended for the National Library.—There is talk of raising a monument in Paris to the memory of Vieuxtemps, the celebrated violin player.

—M. Rodin, the sculptor, has at last completed his model for the monument to be erected to Balzac on the Place du Palais Royal. Balzac is represented standing, his arms crossed, looking at the "Comédie Humaine," the principal personages of which pass before him.—As the result of a competition, M. Auguste Maillart, the sculptor, has been commissioned to execute a monument to Captain Méraud, who was killed in the Soudan. It is to be erected at Lunel.—The railway company at present is about to commence the works for the establishment of a line to form a direct communication between Versailles and Rouen.—The Municipality of Paris it about to take in hand a series of excavations to determine the true line of the ancient Roman road which connected Lutetia with the towns in the centre of Gaul.

—Five new lines of railway are to be shortly constructed by the Paris, Lyons, and Mediterranean railway company in the Saône-et-Loire department. These lines will connect Bourbon-Lancy with Toulon, by Arroux; Autun with Corcelles; Macon with Fleuryville; Saint Bonnet with Montcau-lès-Mines; and Saint-Marcel with Martin-en-Bresse.

—The "Ouest" railway company on its part is making a new line in Brittany, between Carnaix and Chateaulin, and another between Renneville and Coutances.—A rope railway, which will be a great convenience to tourists, is to be made at the Baths station of Mont Dore, between the Meynardier bridge and the high plateau known under the name of the "Salon du Capucin."—The death is announced of M. Veron, a landscape painter who enjoyed some reputation in his day.—The Municipality of Corbeil has resolved to preserve and restore, at its own cost, the curious "Saint-Spire" gateway dating from the thirteenth century, which the engineers of the "Ponts et Chaussées" wish to destroy for the purpose of widening a street.

TRADE SUBSCRIPTIONS TO THE JUBILEE CELEBRATION.—Mr. A. Kellett (Willesden) has invited subscriptions among the workmen employed on his various contracts towards the Prince of Wales's Hospital Fund, promising an addition of a shilling on his own part to each individual subscription. The proposal has been well responded to, 67l. having been collected from the workmen on five jobs.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. Jackson & Tillie, of Belfast, whose design was selected in the competition for the Purdysham Lunatic Asylum, Belfast, have taken into partnership Mr. Godfrey W. Ferguson, of the firm of above-named work.

MESSRS. DOULTON'S SHOW-ROOMS.—Messrs. Doulton have enlarged their show-room space at the Lambeth Potteries, by the arrangement of one or two new rooms for this purpose. Among the more recent additions to their productions is the formation of a semi-glazed stoneware, called by them "Carrara" enamelled stoneware, which allows of the use of this class of exceedingly hard and weather-proof material for exterior work, without the drawback of the highly glazed and polished effect of the ordinary glazed stoneware. This material is being extensively used at the new building for the Birbeck Bank now being erected at Southampton-buildings, Chancery-lane, of which we shall give a further description shortly.

The show-room for glazed ware mantelpieces and fire-places has been rearranged, and a new show-room has been added for the illustration of their more recent introductions in sanitary wares and fittings. Among these may be mentioned the "Silent Arrangement" for cisterns, in which the audible suction at the end of the syphon limb at the close of the discharge is successfully masked by a very simple arrangement; and a new form of the "Simplicious" valve, a combination of the pedestal and valve principle, combining the advantages of both classes. The basin and trap being entirely of ware, a large body of water is retained in the basin, and, owing to the depth of water in the trap, even should the valve be left open the pan itself can never be dry, the flushing being done by a simple waste preventer.

The Patent Bath has an arrangement for a quick waste to the bath, and instead of the old-fashioned standing waste being encased and almost impossible to get at for cleansing, it is in this case exposed, being fitted in a recess at the end of the bath; it is glass enamelled inside, in order to as far as possible prevent fouling, and can be easily removed and cleaned. This form of waste is also applicable to lavatory basins. Another improvement is the application of vitreous and white porcelain enamels to iron baths, so as to obtain the advantages of an earthenware bath at a considerably lower cost. First-class metallic enamel can be had in either French grey or light green colours. Glass enamelled iron pipes.—The adoption of this improvement gives a very smooth surface to the interior of the pipe. Waverley Basin.—This is a large recessed lavatory basin with removable standing waste and a quick discharge.

A new sink, the "No. 515 Sink," is also to be noticed, in which all parts are exposed, so that no obnoxious matter can remain unseen, as is often the case when an enclosure is used. Several of these sanitary improvements, and also the "Carrara" stoneware, are worth the attention of architects.

MONUMENT TO CABOT, BRISTOL.—The design accepted for the Cabot monument to be erected in Bristol is by Mr. W. V. Gough, of Bristol. It provides for a square structure divided into two stages, each being relieved by an ornamental balustrade. The floor of the upper balcony is 75 ft. from the base, and above this is an octagonal spire of 30 ft., surmounted by a globe and a figure of Peace. There is a circular staircase to the first stage, and a spiral staircase has been designed for the second stage. The spire will be a bare white cone, and it is proposed that there shall be four panels, with bronze bas-reliefs filled with suitable inscriptions.

NATIONAL FREE LABOUR ASSOCIATION.—A special general conference of Metropolitan and provincial delegates of the National Free Labour Association was held on Wednesday last week in the Memorial Hall, Farringdon-street, to protest against picketing and industrial intimidation, and to urge upon Parliament the necessity for amending the Conspiracy and Protection of Property Act, 1875. Mr. John Chandler, President of the Association, occupied the chair. The Secretary (Mr. W. Collinson) having given a résumé of the work of the Association during the last four years in regard to picketing, the Chairman, in opening the proceedings, admitted the just right of combination, but he said they did complain when the liberty they claimed for themselves and others degenerated into licence. They intended to agitate persistently for the abolition of the clause in the Act which permitted picketing. Mr. J. G. Ritson (Hill) then moved a resolution urging that an amendment of the "Conspiracy and Protection of Property Act, 1875," was imperative, and that the necessary relief would follow the repeal of Clause 2, Section 7 of that Act. Mr. James Francis (St. George's-in-the-East) seconded the motion, giving various instances of acts of violence during the London dock strike in 1886. Mr. J. Simpson (Peterborough) and Mr. W. Ellis (Newcastle-on-Tyne) supported the resolution, which was adopted. On the motion of Mr. A. Smith (Manchester), seconded by Mr. P. McAuliffe (Dublin), it was decided to request the Secretary of State for the Home Department to receive a deputation from the National Free Labour Association on the subject of the suggested amendment.

PRESTON MASTER BUILDERS' ASSOCIATION.—The fourteenth half-yearly general meeting of this Association

ation was held at the Castle Hotel, Market-place, on the 7th inst. The President, Mr. J. G. Christian, occupied the chair. After the minutes were read and confirmed, Mr. John Tomlinson, the secretary, read the report, which stated that during the past months seventeen new members had joined, making the total number on the books thirty-six. Discussions with the operatives had been cordial during that period, and there had been very few disputes, even of a minor nature. Two of the anomalies, the bricklayers and flaggers and slaters, are asking for advances of wages from May 1st, but nothing definite had yet been decided. In the case of the flaggers and slaters, the employers had previously asked for a change to payment by the hour instead of the day, with a fixed rate for starting and leaving off work in the winter months. The report then reviewed at some length the work of the Lancashire Federation and National Association, to which the local society is affiliated, and also referred to negotiations with the Corporation with respect to their works department, which it was hoped would have a satisfactory ending. On the motion of Mr. J. Swarbrick, seconded by Mr. T. Park, the report was adopted. Mr. John Christian was nominated for the vacancy on the Council of the National Association caused by the death of the late Mr. Walmsley, and Messrs. Christian and T. H. Kellert were elected to represent the Association on the Executive Committee of the Lancashire Federation. It was decided to nominate Mr. James Stows, of Stalbridge, for the presidency of the Lancashire Federation, and to nominate Mr. John Tomlinson for re-election as the secretary. A resolution from the National Association regarding the desirableness of County Councils encouraging the teaching of plastering, &c., in their schools was considered, and on the motion of the Chairman, the members of the Association, with Mr. W. H. Hetherington, were elected a consultative committee to consider the matter and place themselves in communication with the governing body of the Preston Technical School, if considered advisable, with a view to engrafting technical instruction for building trade apprentices.

W. H. HETHERINGTON, HATFIELD CHURCH, YORKSHIRE.—A new oak pulpit has been placed in Hatfield Church. The designs were by Mr. T. S. Broadrick, of Hull, and the work has been executed by Messrs. Hewitt & Son, of Beverley. The oak screen has been restored, and the work has been done by the firm.

APPOINTMENT OF OLDHAM WATERWORKS MANAGER.—A special meeting of the Waterworks Committee of the Oldham Corporation was held recently at the Town Hall, for the purpose of appointing a successor to Mr. Wm. Watts, F.G.S., as Assistant Engineer and Manager of the Oldham Waterworks. Mr. Henszell, a Newcastle engineer, was elected a short time since to the position, but he subsequently refused the appointment. The Committee now interviewed the following four selected candidates: Messrs. J. C. Varley, Oldham; G. J. Varley, Resident Waterworks Engineer to the Batley Corporation; Charles James Batley, Assistant Waterworks Engineer, Bury; and Wm. Ingham, Waterworks Engineer to the Torquay Corporation. Mr. Batley was subsequently appointed.

ELECTRIC LIGHT WORKS, HARRINGTON.—On the 15th inst. the new electric light works were opened at Harrogate. The works are placed on the Corporation irrigation farm, on the Ripon-road. The total power represented in the plant is some fifty horse-power. The Borough lighting is effected through two trunk mains, each capable of transmitting a 250-horse-power current; but, to reduce the working pressure for domestic lighting, five underground chambers have been provided, located at convenient parts of the town, and in these transformers have been placed which convert the 2,000 volt pressure current into one of 200 volts. About three miles of low-pressure cable has been laid down, and it is laid from 15 in. to 18 in. under pavement. It is estimated that some 6,400 eight-horse-power lamps will be required for the use of private consumers, and facilities have been made at electric-light stations for considerable extensions in this direction. The public places lighted are Lion-square, the New Baths, the Victoria Baths, Market Hall, the Corporation Offices, and the Free Library. The whole of the works in connexion with the installation of electric light have been carried out under the supervision of Mr. G. W. Wilby, Borough Electrical Engineer. The price to be charged for the light is 6d. per unit. Messrs. S. Z. Martini, Limited, of Hollinswood, near Manchester, the contractors for the engine, and the same firm also fixed the dynamo and switch gear. The lamps and boilers have been supplied by Messrs. J. H. B. & Co., of Bradford, and the transformers by the British Electrical Company, Prescott; and the transformers by the Brush Company. The total cost of the works has been about 25,000l.

ENCROACHMENTS ON OPEN SPACES ABOUT BEDFORD.—At a meeting of the St. Pancras Vestry on the 14th inst., Dr. J. F. Sykes, D.Sc., in the chair, reported on the encroachments upon open spaces about buildings. He pointed out that in the London Building Act, 1894, although by Section 40 it was provided that a new domestic building, with a habitable basement, should have an open space of less than 100 square feet, old houses possessing

yards, areas, or open spaces at the back or front, or both, were being rebuilt in such a manner as to entirely cover the whole ground area two or three stories up, leaving not a particle of open space, not even a shaft for the purpose of allowing the drainage to discharge in the open. Hence the health conditions of domestic buildings in London would rapidly become worse, and the by-laws, regulations, and directions of the County Council and the sanitary authorities, which were all devised so as to cause drainage to be excluded from or to be placed outside of domestic buildings, were rendered useless by a Building Act which enabled a domestic building to embrace the whole of the drainage of the premises within its external walls. The matter wore an even more serious aspect when considered on a wider basis. The words "open space" originally bore the common meaning of ground space; to most persons they still bore that common-sense meaning, and Parliament had attached that meaning to the words in the Open Spaces Acts. But in the later Buildings Acts the provision of open spaces had successively been lifted from the basement to the ground floor, thence over the ground floor to sixteen feet above the ground level, and in due time might be made by future acts of Parliament to ascend higher, so that eventually a house might be held to have supplied the necessary open space on the roof top instead of at the ground level. Dr. Sykes finally submitted that it was only by tracing the result to its logical conclusion that the past, present, and prospective perversion in the Building Acts of the meaning of "open space" could be fully understood, and the seriousness of the position realised. On the motion of Mr. F. Durant, it was ordered that a copy of Dr. Sykes's report should be sent to all the other London Vestries and District Boards and their observations invited.

EXHIBITION OF ARTS AND CRAFTS AT WOLVERHAMPTON.—An exhibition of arts and crafts, including furniture, tapestry, book-binding and illustrations, jewellery, pottery, glass, &c., in the North and East lower rooms of the Art Gallery, Wolverhampton, was opened recently. The exhibition comprises original drawings by Burne Jones, artistic metal work, a complete set of William Morris's books, and also some tapestry. Among the exhibits is a sundial, which has been designed by Mr. Ashbee, and is to be placed in the grounds of Colonel Shaw-Hellier at Wombourne.

GLASGOW ARCHEOLOGICAL SOCIETY.—The last meeting for the session of this Society was held in the Philosophical Institution, Bath-street, on the 15th inst. Dr. David Murray presiding. Mr. John Orr exhibited the upper stone of a quern found near Glasgow Green, and perforated stones found in the Clyde near Rutherglen Bridge. Mr. Macgregor Chalmers read a paper on the "Vaulting of the Lower Church of Glasgow Cathedral," in which he criticised the theory promulgated recently by Mr. T. L. Watson. A careful examination of the building showed that there was no evidence that there had been any intention to carry out any design other than that existing in the centre aisle. It was found that mouldings which were described as late insertions and of late date were actually wrought on the same stone as mouldings described as of early workmanship, and it was found that the early thirteenth century walls were designed to carry thirteenth century ribs, which were now claimed as alterations of 200 years later. The new plan proposed and described as the plan originally designed was very commonplace, and was quite unworthy of the great artist to whom we owed our cathedral. The fact that this structure was a church and not a crypt had been overlooked, as well as the significant character of the shrine of St. Mungo. The evidence of the building left no room for doubt that whilst some part of the work betrayed want of skill, the present design was as originally projected.—*Glasgow Herald.*

PORTSMOUTH MASTER BUILDERS' ASSOCIATION.—The Borough of Portsmouth Master Builders' Association held a special meeting at the "Sussex Hotel," Landport, on the 14th inst., for the purpose of presenting a testimonial to Mr. J. H. Corke, J.P., ex-President of the Association. In making the presentation, the President, Mr. C. Dye, remarked that the members had met to officially recognise the services of their esteemed ex-President, Mr. Councilor J. H. Corke. Mr. Corke commenced business in Portsmouth as a contractor twenty years ago, and had carried on an extensive business in the borough ever since. Mr. Corke entered the Town Council fifteen years ago as a member for St. Bartholomew's Ward, and he had been returned unopposed ever since. He was Vice-President of the Town Hall Building Committee, and was one of nine appointed to visit the Town Halls in other places to make a selection for Portsmouth. Mr. Corke ever since the Builders' Association fifteen years ago, and had occupied the Presidential chair eight times. In conclusion, Mr. Dye asked Mr. Corke to accept from the Association a silver bowl and centre piece. The inscription on the bowl was as follows:—"Presented to J. H. Corke, Esq., J.P., by the employers of labour in connexion with the building trade in Portsmouth, as a token of their esteem, and in recognition of his valuable services rendered to the Master Builders' Association, April 14th, 1897." In returning thanks, Mr. Corke alluded to the presentation of a silver tea and coffee service to him by the Association seven years

ago. He retired from the chairmanship, not from any desire to shirk his responsibility, but simply owing to ill-health. He promised to continue to do all he could to promote its interest. It was most gratifying to him to see so many old friends present, and he especially thanked the Mayor for coming among them. "The Health of the Mayor" was drunk, and his Worship briefly replied.

CAPITAL AND LABOUR.

THE PLASTERERS' AND BRICKLAYERS' DISPUTE IN LEICESTER.—The conference held between representatives of the local Plasterers' and Bricklayers' Societies, under the presidency of Councillor T. Smith, has resulted in an amicable settlement of the dispute between the parties. Meetings of the two societies were held, and at both the terms of settlement drawn up at the conference referred to were adopted in their entirety, viz., that all *in situ* work and rendering of all rain-water eissons and flats to water closets be done by bricklayers; (2) that all screeding and hearths be done by plasterers; and (3) that wherever a plasterer is engaged on any job the bricklayer shall not do any kind of plastering.—*Leicester Post.*

MEETINGS.

SATURDAY, APRIL 24.
Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Beddington Swange Farm, Crystal Palace.
Sanitary Inspectors' Association (Western Branch).—Meeting at Weston-super-Mare.
Incorporated Association of Municipal and County Engineers.—Home Counties' District Meeting, to be held at Dover.
Northern Architectural Association.—Excursion meeting at Messrs. W. Harriman & Co.'s works, Blydenham, Mr. W. H. Allen to read a paper on "Fireclay Manufactures."
Edinburgh Architectural Association.—Visit (1) to Baveland Castle, Balerno; (2) Lennox Tower.

MONDAY, APRIL 26.
Surveyors' Institution.—Mr. W. H. Payne (Barrister-at-Law), L.C.C., on "Local Authorities and the Building Laws," 8 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Professor Henry Robinson on "Sewerage and Sewage Disposal," 8 p.m.

TUESDAY, APRIL 27.
Society of Arts (Applied Art Section).—Dr. J. W. L. Glaisher on "Deli Ware," 8 p.m.
Institution of Civil Engineers.—Annual general meeting, of corporate members only, to receive the report of the Council, and to elect the Council and auditors for the ensuing year, 8 p.m.
The Auctioneers' Institute.—Mr. H. Bushell on "The Practical Application of the Principles and Law of Dilapidations," 8 p.m.

WEDNESDAY, APRIL 28.
Society of Arts.—Mr. R. H. Jones on "Asbestos and Asbestic," with some Account of the Recent Discovery of the latter at Danville, in Lower Canada," 8 p.m.
Institution of Mechanical Engineers.—Ordinary General Meeting, Mr. Leslie S. Robinson on "Mechanical Propulsion on Canals," 7.30 p.m.
Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at the East London Waterworks, Lea Bridge, 3 p.m.
Liverpool Engineering Society.—Annual General Meeting, Mr. E. A. H. Shaw on "Portland Cement," 8 p.m.

THURSDAY, APRIL 29.
Sanitary Institute (Lectures for Sanitary Officers).—Mr. Charles Mason on "Scavenging; Disposal of House Refuse," 8 p.m.
Society of Antiquaries. 8.30 p.m.

FRIDAY, APRIL 30.
The Architectural Association.—Mr. Hugh Stannus on "The Classic Cornice," 7.30 p.m.
Royal Institution.—Professor J. J. Thomson on "Cathode Rays," 9 p.m.
Institution of Mechanical Engineers.—Ordinary General Meeting (continued). Paper by Mr. W. G. Walker, entitled "Experiments on Propeller Ventilating Fans, and on the electric motor driving them," 7.30 p.m.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.
6,613.—T-SQUARE: J. Graus.—This invention consists in a T-square with adjustable head, for the purpose of rapidly setting and automatically retaining it in any desired angular position. The square consists of a head and blade, having attached, by means of a segmental rack, an auxiliary head, the main head capable of being locked at any desired angle to the auxiliary one by means of pawls under the influence of springs. Microscopic adjusting the pawls afford the means of the most delicate adjustment.
7,770.—KILNS FOR BURNING BRICK, TILES, POTTERY, &c.: J. West and Another.—The subject of this invention is a kiln for burning bricks, tiles, and such like with gasolene gas, in which various kilns of a set are worked in rotation so that the air for combustion is heated by mixing with the gas and unburnt goods is heated before the products of combustion from another kiln. The inventor claims the peculiar arrangement of flues and dampers whereby fires are maintained and regulated along both sides of the kiln as delineated in his drawings. Also a method of conveying the gases from the top of the chambers to the chimney.
8,823.—PANS OF WASTE OR SLOP WATER TANKS: J. E. Place and Another. The basin or pan is constructed with curved inlet (with baffle), dished bottom, broad top, and outlet terminating immediately under the edge of the pan (so that the trap is close under the edge of the outlet), and a central foot.
26,335.—CONCRETE BRIDGES: G. A. Geisel.—The inventor claims his bridge entirely of concrete, the arch thereof con-

COMPETITION, CONTRACTS, AND PUBLIC APPOINTMENTS.

Table with columns: COMPETITION (Nature of Work, By whom Advertised, Premiums, Designs to be delivered) and CONTRACTS (Nature of Work or Material, By whom Required, Forms of Tender, Ac. Supplied, Tenders to be delivered). Includes various construction projects like bridges, schools, and houses.

PUBLIC APPOINTMENTS.

Table with columns: Nature of Appointment, By whom Advertised, Salary, Applications to be in. Lists various public roles and their associated salaries.

Those marked with an asterisk (*) are advertised in this number. Competitions, iv. Contract, pp. iv, vi, viii, & xxi. Public Appointments, pp. xviii, & xxi.

sisting of three pieces and four joints. The bridge consists of abutments, haunches (comprising voussoirs of concrete, bonded together and with cushions of asphalt, or with lead inserted between the adjacent faces of haunches and skew-backs of the abutments).

NEW APPLICATIONS FOR LETTERS PATENT. APRIL 5.—8,668, G. Biny and H. Hill, Wood Screws, Casing Screws, &c.—8,651, T. Woodhouse, Syphon Flushing Cisterns, &c.—8,652, J. Cooper and F. Bensly, Step and other Treads, &c.—8,657, J. Shanks, Water-closets, &c.—8,656, P. Phillips, Fillings for Coating Wood Before Painting Same.—8,668, F. Haidick, Platforms or Balconies for Use on Houses and other Buildings.

F. Crosland, Lime or Cement Kilns.—6,569, H. Scoweroll, Saw Blades used for Sowing Stone.—6,522, E. Woodland, Ventilating Gear for Greenhouses, &c.—6,524, F. Dew, Casement Fastenings.—7,115, S. Pugs, Cows for Chimneys, &c.—7,160, J. Shanks, Trough Closets or Latrines.—7,268, H. Clay, Water-closets, and Flushing Apparatus therefor.—7,445, W. Farleigh, Fire-grates.—7,657, J. Shepperson and F. Duxwood, Wall Fastenings, &c. and Bricks or Tiles for same.—7,694, R. Cuthbert, Window Sash Fasteners.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT. APRIL 5.—By REBBECK BROS. (at Bournemouth). Bournemouth, Haunts.—Bathurst, 'Burley Lodge,' and half an acre, u.t. 66 yrs., g.t. 81. 10s. £3,000 Cambridge-rd., 'The Holme,' t. 120f. 3,605 Surrey-rd., 'Mentone,' t. 1, 90f. 1,440 Current-rd., 'Glenbrook,' and half an acre, t. 1, 80f. 1,600 APRIL 7.—By W. J. PIERCE & THORPE (at Foster's Booth). Eastcote, Northants.—Freehold farmhouse, and 33a. or. 39 p. f. 715 Enclosures of land, 2a. 1. 31 p. f. 445 By W. R. NICHOLS & Co. (at Chessham). Chessham, Bucks.—'Cherry Trees Farm,' and a building site adjoining, 20a. 37. 1 p. f. 1,225 Five freehold building sites, 26a. 27. 2 p. f. 600 APRIL 8.—By CALVERT & BRIGGS (at Briggs). Scawby, Lincs.—'Lincoln Hill Farm,' 52a. 31. f. 1,850 Two freehold cottages 'at Acton' 775 By Messrs. SUGDEN & Co. (at Acton). Acton, Norfolk.—A freehold house and warehouse. 220 By N. EASTON & SON (at Goolle). Swinestick, Ect., Yorks.—A freehold farm, 125a. 11. 22 p. 7,000 Enclosures of land, 20a. 0. 12 p. f. 1,055 By W. DEW & SONS (at Bettws-y-Coed). Snowdon, Carnarvon.—'The Pen-y-Gwryd Hotel' and 8 a. u.t. 24 yrs., g.t. 150. 1,625 By THOMPSON & Co. (at Amxminster). WALSALL.—Accepted for the erection of foreman's house, Sec. Brick Gateworks, for the Corporation. Quantities by Mr. F. G. Hughes, Birmingham.— Thomas Tildesley, Walsall. £1,479 (Five tenders received).

WEST HAM.—For the erection of sewage pumping engine and boiler houses, and electric lighting buildings, Abbey Wood, Stratford, for the Town Council. Mr. Lewis Angell, Engineer, 1 Own Hall, Stratford, E.— Portland Artificial stone. £3,599 47-13-0

Table with 2 columns: Contractor Name and Amount. Includes J. Jackson, Shillito & Son, Munday & Son, H. Cooke & Co., Chessum & Sons, G. Sharpe, C. Gray Hill, Gregar & Son.

WINDSOR.—Accepted for making-up, &c., Bolton-road, for the Town Council. T. Kelly, Windsor. £230 (Borough Surveyor's estimate, £255).

WINDSOR.—For new mission hall, Old Windsor, Berks. Mr. J. W. Oakes, architect, Epsom.— G. Gray, C. Buckeridge, Cooper & Son, W. Beauchamp.

LONDON SCHOOL BOARD TENDERS. At a recent meeting of the London School Board, the Works Committee submitted the following lists of tenders:—

Painting the Exteriors of the following Schools, between April 24 and May 31, 1897.

BRUNSWICK ROAD.— T. H. Jackson, D. Gibb & Co., J. Kybett.

BUCKINGHAM STREET.— F. Britton, Stevens Bros., W. Hornett.

DARBY STREET.—Painting and repairs:— W. J. Hack, J. F. Holliday, W. Hornett.

FAST LANE.— W. Hornett, H. Ling, H. J. Williams, W. & H. Castle, B. E. Nightingale.

GOODSON ROAD.— C. Barker, W. & H. Castle, H. J. Williams, F. Holliday & Greenwood, T. Crews.

GRAFTON ROAD.— F. Britton, F. T. Chisholm, C. Barker, T. Crews.

MACLEAY CRESCENT.— McCormick & Son, S. H. Cornfield, W. Chappell, W. Hornett.

"HIGHWAY" SCHOOL.— J. T. Robey, J. F. Holliday, D. Gibb & Co., A. W. Derby.

C. B. N. SNEWIN MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and TIMBER MERCHANT, Nos. 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, & 17, RACK HILL, HATTON GARDEN, and 29, RAY STREET, FARRINGTON ROAD, E.C.

LATIMER ROAD.— G. H. Sealey, H. C. Clifton, W. Brown, G. Foxley, H. Somerset & Son.

OLDRIDGE ROAD.— A. J. Acworth, H. Brown, Rice & Son, E. Flood, E. T. Page.

PRIORY GROVE.— G. Gurling, T. Hooper, Star & Son, H. Mallett, K. E. Williams & Sons.

WALLER ROAD.— J. & A. Oldman, W. Banks, C. Gurling.

WILTON ROAD.— W. Lawrence, W. & C. Bonyer, T. Nicholson, W. Silk & Son.

SOUTHAMPTON STREET.—Rebuilding offices and providing drainage:— Lathley Bros., J. Garrett & Son, G. Parker, Johnson & Co.

TERMS OF SUBSCRIPTION. "THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom, at the rate of 9s. per annum.

SUBSCRIBERS IN LONDON AND THE SUBURBS, (by prepaying at the Publishing Office, 79s. per annum or 4s. 6d. per quarter), can ensure receiving "The Builder," by Friday Morning's Post.

W. H. Lascelles & Co., 121, BUNHILL ROW, LONDON, E.C. Telephone No. 270.

HIGH-CLASS JOINERY, LASCELLES' CONCRETE Architects' Designs are carried out with the greatest care.

CONSERVATORIES, GREENHOUSES, WOODEN BUILDINGS, Bank, Office, & Shop Fittings, CHURCH BENCHES & PULPITS, ESTIMATES GIVEN ON APPLICATION.

TO CORRESPONDENTS. M. and F. J. D.-W. W. J. C. (Amounts should have been stated).—W. H. H. (Below our limit).—T. C. R. S. (It depends entirely on the distance of the two buildings, the angle of light, and the question of "ancient light" rights in the existing building. No opinion could be given except on a survey).

THE BATH STONE FIRMS, Ltd. BATH, FOR ALL THE PROVED KINDS OF BATH STONE. FLUATE, for Hardening, Waterproofing, and Preserving Building Materials.

HAM HILL STONE. DOULTING STONE. The Ham Hill and Doulting Stone Co. (Incorporating The Ham Hill Stone Co. and C. Trask & Sons, The Doulting Stone Co.) Chief Office:—Norton, Stoke-under-Ham, Somerset. London Agent:—Mr. E. A. Williams, 16, Craven-street, Strand.

Asphalte.—The Seyssel and Metallic Lava Asphalte Company (Mr. H. Glenn), Office, 42, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tun-rooms, and terraces. Asphalte Contractors to the Forth Bridge Co. [ADVT.]

SPRAGUE & CO. LITHOGRAPHERS AND PRINTERS. Estate Plans and Particulars of Sale promptly executed. 4 & 5, East Harding-st., Fetter-lane, E.C. [ADVT.]

QUANTITIES, &c., LITHOGRAPHED accurately and with despatch. METCHIM & SON, 20, Parliament-st. S.W. "QUANTITY SURVEYORS' TABLES," For 1897, price 6d. post 7d. In leather 1/- Post 1/1 [ADVT.]

PILKINGTON & CO. (ESTABLISHED 1838), MONUMENT CHAMBERS, KING WILLIAM STREET, LONDON, E.C. Registered Trade Mark.

Polonceau Asphalte. PATENT ASPHALTE and FELT ROOFING. ACID-RESISTING ASPHALTE. WHITE SILICA PAVING. SEYSSSEL ASPHALTE.

ERNEST MATHEWS & CO. 61, ST. MARY AXE, LONDON, E.C. CONTRACTORS TO H.M. GOVERNMENT FOR SLATES AND SLATE BATHS. PERMANENT GREEN SLATES, AS USED ON THE LAW COURTS AND OTHER PUBLIC BUILDINGS. ROOFING SLATES SLATE SLABWORK OF EVERY DESCRIPTION. MARBLE & ENAMELLED SLATE CHIMNEY-PEGS, OF EVERY DESCRIPTION, PLAIN AND ENAMELLED. Marble and Enamelled Slate Lavatory Tops and Fittings complete, Slate Cisterns, Shelves, and Urinals. Works—Aberllefenny, North Wales. Midland Wharf, Bow. Head Office and only City Address, 61, ST. MARY AXE, E.C. SEND FOR ILLUSTRATED PRICE LIST

Architecture at the Academy and the Salon.

THE French Salon, the Old Salon at the Palais de l'Industrie, has opened its doors earlier than usual this year, earlier even than was at first announced, for the two

Salons each endeavour to forestall the other, and the previously-announced date of April 25 for the opening of the old Salon was subsequently altered to the 20th. Consequently we can compare the architectural exhibits there and at the Royal Academy in the same article; but as we must conclude our remarks on the French drawings in this article, it will be more convenient to give them the precedence.

The architectural drawings at the Old Salon at Paris consist of much the usual assortment; a great set of classical restoration drawings on a very large scale; a certain number of large and finely executed drawings which for the most part are obviously either designs submitted in competitions for buildings or academical studies; a number of drawings and sketches of ancient work, including some exceedingly fine and highly-finished examples of architectural illustration; and here and there a few drawings of buildings which appear to be *bona fide* commissions, either executed or about to be executed. Owing to the preponderance of the academical element, and the extent to which exhibits of this class seem to be confined to certain school forms of design, one receives the impression that each year's exhibition is almost the same as the last. It is true that last year there was an exception in the fact that the leading set of drawings of the year represented a large practical structure, the Post and Telegraph Dépôt;* but this was a very occasional feature. The great defect of the Salon architectural department is that in spite of the beauty of many of the drawings, which in this respect are far beyond what is generally seen at the Academy, the collection is hardly at all representative of the current architectural work of the day, and there seems to be no attempt to render it so.

The leading set of drawings this year is M. Pontremoli's series representing the remains at Pergamos and their restoration; an "envoi de Rome" which has before been mentioned in our columns. The principal drawing is a geometrical elevation of the whole collection of temples, altars, &c., a huge drawing about fourteen feet long, the whole beautifully executed, but when compared with the equally careful drawing of the actual remains it must be admitted that the faculty of imagination plays a large part in the restorations carried out by the students of the Villa Medici. A large detail drawing shows the Altis with its now celebrated alto-relief sculpture restored—and here there is room for other faculties than those of imagination—and an Ionic colonnade over it with wall-paintings in the rear of the columns. Over the central altar rises a slab carved with interlaced serpents; what is the meaning of the black pyramidal shaped mass on each side of this, looking like a hipped roof butting against the central block, is not very apparent. However, the drawings are a very fine set, and M. Pontremoli has no doubt made his mark with them as a French architectural student of the first rank.

Two models appear in the architectural room, which appear to represent work that is really in contemplation. One is a plaster sketch of a design by M. Deperties (architect) and M. d'Ilzsch (sculptor) for a monument to Puget, and is a clever and spirited piece of work of Louis Quatorze detail, forming an oblong mass, flat in the rear and semicircular at the front, the general shape being apparently suggested by that of the ship or ship's prow which forms the crown of the design. In front, under the said prow, is the figure of Puget in an energetic attitude, mallet in hand; at the back is a panel for inscriptions, partly protected by a semi-dome carried out on consoles. The details generally are bold and effective in character. The other model represents a design for a fountain by M. Bartholdi, with a memorial portrait figure at the top; the whole design is also represented by a full-size model in the sculpture court. The design is original; the centre portion is supported by four flying buttresses of elliptical line springing from pedestals on the outer rim of the main basin; the defect of the design is that the Classic tabernacle or shrine in the centre, on the top of which the

figure stands, is insufficient in scale for the figure; the arches in it, which are designed as arches for entrance, are only three-fourths the height of the figure above, so that figure and architecture belong to entirely different scales. We should say that M. Bartholdi, who is professedly a sculptor, has not had the assistance of an architect in this design.

Among the large competition designs already referred to, the only one that is worth special remark is that by MM. L. P. Blanc and A. Marcel, described in the catalogue as "Gare Centrale de Bucarest," but which is obviously only a competition scheme, as it is one that unfortunately no railway company would carry out; unfortunately, for it is a very fine and remarkable design of its class. The elevation, on a large scale and drawn and tinted in the usual complete and effective French manner, shows an immense rusticated stone front, with three great arches divided by massive plaster-like piers, and corresponding to the three parallel semi-circular iron roofs of the interior. At the base of each pier is a buttress semi-circular on plan, carrying a globe which forms a pedestal for a sculptured figure. The whole composition is crowned with a large cantilever cornice with a frieze of Classic ornament interspersed with shields. The perspective view of the interior of the station shows an effective treatment with a series of iron and glass domes and pendentives. There are of course complete plans and sections, and the whole forms not only a splendid set of drawings but a really fine conception for the architectural treatment of a terminal railway station. M. Blanc also exhibits an equally large elevation for the University of Jassy (Roumania), but this is a cold and heavy Classic composition, looking like anything rather than a university.

Among the drawings in the large architectural room is another remarkable set by M. A. Auguste Marcel, called in the catalogue "Salle de Fêtes à Paris," but on the drawings "Galerie Japonaise." "Japanesque" would perhaps be the more fitting adjective, although the exterior does seem to be a treatment in Japanese timber construction carefully imitated. Internally the sections show a perfect riot of detail and colour which may be called a French version of Japanese detail. It is a *tour de force* of coloured architectural drawing; every detail,

* Illustrated in *The Builder* for April 10, 1897.

down to the elaborately carved cabinets and their contents, being minutely made out.

As usual, the less important architectural contributions are ranged along one of the galleries adjoining the central one of the exhibition. M. Mesnager's "Rendezvous de Chasse," a hunting pavilion in classic style, very much resembles other designs for the same kind of building which we have seen in former exhibitions; but it is worth attention as showing a power of adapting French Renaissance details to a design which exactly expresses what it is intended for—a kind of state hunting-box for a nobleman's domain; it cannot be taken for anything but what it is, though it is far removed from the style in which a building of this description would be treated in England. M. Jasson's "Hospice de Vieillards, à Saint-Julien," appears to be one of the few sets of drawings representing actual commissions; this is in the very plain architectural style which the French architects of to-day affect for hospitals, schools, asylums, &c., all which are treated pretty much alike; plain brick or stone buildings with no ornament except perhaps, as here, a coloured frieze in tiles or terra-cotta. The plan, forming three sides of a quadrangle, is worth note in regard to the fact that the side wings are not joined on to the cross one, but an opening is left between the buildings at the angle, showing a perception of the principal sanitary objection to the complete quadrangle form of plan. M. Legresle's "Un Sanatorium pour des Enfants" shows the same kind of architectural character; a sanatorium for children, in the French idea, being properly treated so as to look as like a mill or factory as possible. M. Rigault's "Propriété de M. D—, à Saint-Etienne" is another of the practicable designs, and consists of two or three apartment houses adjoining each other, which show a little variation from the usual French type of town house of this class: two of the houses, forming one design, have a classic stone front, the remaining portion of the block is Gothic in type and executed in brick with stone dressings, and with a very large corbelled-out turret running up the front; there is nothing remarkable in the design except in the fact of the architect having ventured to depart from the usual *maison-à-loyer* type of French front. The French *maison de campagne* appears in all its horrors in M. Hervey-Picard's design under that title. M. Vernon's "Villa à Saint-Priest" is a more pleasing example, which is to say that it varies from the usual type of French villa, and has less gimcrack about it. A small perspective interior of the new Salon at the Casino at Monte Carlo, by M. Henri Schmit, which might easily pass unnoticed among the large drawings by which it is surrounded, shows a pleasing and bold treatment of a large room with an elliptical arch on each face, carrying an iron and glass dome of very low section; considering that this is for a casino it shows an unusual and praiseworthy absence of fussiness or pretence in detail, and is a good bit of design of its kind. The competition design for a "Caserné des Sapeurs-Pompiers" at Montmartre, by MM. Lecamp & Robert, is worth attention as an attempt, in a solid and monumental-looking design, to adapt classic architectural features to a barrack, while preserving a suitable simplicity and ruggedness of general character. M. Lafon's "Maison de Cam-

pagne à Alais" is refreshing from its simplicity of style, and rather amusing to the English eye from its *maître* of plan, with the little kitchen and the water-closet next to it and opening out of the same lobby, &c. As we have mentioned the realistic and prosaic treatment common in designs for asylums and other such institutions, we may mention by contrast M. Tony Garnier's design for a "Sanatorium pour les officiers et soldats convalescents des armées de terre et de mer," a wild dream of terraces and pavilions extended in long perspective by the borders of the sea.

The addition to the "Crédit Lyonnais," by M. Bouwens-van-der-boeyen, is a good piece of practical business architecture, the flank elevation consisting of massive stone piers the whole space between which is filled in by an iron construction of floors and windows; it does not make so effective an exterior as the Americans produce with their stone casings to steel constructions, but it has at least the merit of being a genuine construction, the stone piers being an actual support to the work and not a casing. The "Banque Russe, pour le commerce étranger, Paris," by M. Brincourt, is another practical building, with a large iron roof of which both a model and section are shown; the triangular space between tie-rods and rafters is apparently intended to be hermetically sealed and is marked on the section "espace d'air confiné." Is this supposed to be a defence against variations of temperature?

Of the modern churches, of which there are two or three examples, the less said the better. The church at Etang-Vergy, by M. Saint-Père, is a design which to English eyes is almost shocking in its bare cast-iron hardness of style and detail and the feeble manner in which the buttresses are planted on anyhow; the only bit with any character is the much-entassid spire with large moulded ribs and alternate bands of brick and stone; this feature is ugly enough too, but not quite commonplace. M. Woog's church at Cesson, St. Brieuc, is a little better, but the quasi-Gothic of the modern French country church is as repellent to English taste as the quasi-picturesque of the *maison de campagne*. Among the restoration drawings of churches are one or two interesting exhibits, among them the set of drawings of the restoration of the Byzantine church of Mervaka, near Argos, by M. Léon Chesnay. These show a church with a centre cupola of the usual late Byzantine type, the body of the church being apparently built of a warm yellowish stone on an irregularly coursed base of large blocks of grey marble, the colour and effect of the materials being very well shown in the drawings, which show also on each face the restoration of a square arched porch, of which only the wall-corbels of the arches actually remain. M. Mandin exhibits the drawings for the restoration and enlargement of the little French Byzantine church at Issac, a small domed church without aisles, as usual in that type of early French architecture, in which it is proposed to reface the jambs of all the openings, to add apses forming transepts to the third bay, and to add a new west porch and façade of a simple kind. No realistic perspective view is shown, the drawings are all geometrical, and form an interesting little set, but it is to be feared that not much of

the interest of the actual building will be left when the work is done.

Of decorative design there is never much to be seen at the Salon, and that little seldom good; this year however there is one fine piece of work, the "Projet de Salon de réception dans un palais princier," by M. Carré, a longitudinal section of a classic *salon* with coupled columns at intervals, differing from the ordinary French classic design in the amount of rich colour introduced into it in marbles and inlays, the effect of which is beautifully shown on the drawing. Besides this, the best bit of decorative work is a design for the treatment of the wooden ceiling of the hall at the Château de Plessis-Barbe, by M. Bodin, which is quiet and in good taste. A curious example of French taste is seen in the design for a sepulchral monument, "Monument funéraire de famille," a little marble chapel with large bronze crucifix affixed to the wall over the doorway; the general design is of a type which is familiar to us in modern French works of this kind, and which has the merit of monumental solidity and a certain solemnity of expression, but in this case all marred by the unlucky treatment of the sides of the monument in imitation of the folds of a hearse-cloth which at once vulgarises the whole design. In England we should only expect to find this kind of thing among the marble-mason of Euston-road.

It is when we come to the illustrative drawings that we have to bow our diminished heads before the excellence of the French work. This use of the art of architectural drawing the French architects have certainly brought to perfection. To look at the set of drawings of Château Goulaine by M. Chaussepied seems almost as good as having seen the building itself; colour and texture of walling, and every little detail of the work are shown in such realistic perfection. It is to be wished that the English architectural students who compete for "measured drawings" prizes could see some of these French illustrative drawings, and realise how far they go beyond anything for which prizes are given at the Institute. Among other drawings of the same class may be mentioned the beautiful studies of antique fragments by M. Eustache, the series of copies of the mural paintings of the churches of Peribleptos and Pantanassa, at Mistra, by M. Yperman, the large water-colours of the mural paintings of the Sybils at Amiens, by M. Guédy; and the splendid highly finished perspective drawing of the cathedral of Rodez, by M. Pailhès. On the contrary it must be admitted that in small and more rapid sketches and studies of buildings of the spot the French exhibits are hardly up to our level; they do not show the same feeling for touch and effect as we find in the work of English architectural sketchers. The best are the collection of sketches in the Ile-de-France, Picardie, and Champagne, by M. Grellet.

At the New Salon there are no architectural drawings worth speaking of, but a good deal of furniture and of the class of things called generally "objets d'art," the New Salon making a feature of representing decorative arts and crafts, which the Old Salon (like the Royal Academy) seems to make a point of ignoring. There is little, however, among the furniture and room decoration which would appeal to English sym-

pathies. The fault of the French in these things is that they are too clever; they cannot be content with simplicity of line and structure, everything is restless and condecorated. There is a large and much gilded Gothic high altar erected by M. Paul Gout, which however is more striking from its size and splendour of gilding than from any higher quality. M. Roche makes a new suggestion in his model of a cupola formed of translucent faience through which the light passes, the lower portion forming a series of translucent figures: but it is one thing to do this in a model, another thing to carry it out on a large scale. For a small space—the skylight to a vestibule for instance, something might be done with it. Among the stained glass exhibited is a brilliant and effective window by M. Carot, intended for the staircase of the Mairie at Verreux, and consisting almost entirely of a mass of flowers grouped naturally, only treated in a flat manner; the design, which shows a glimpse of a landscape between the flowers, is entitled "Le Printemps à Verreux." Among the objects in cases placed in the central gallery are many clever things and much beautiful workmanship, happily marred by the trail of the article de Paris" almost everywhere. Among the exceptions are M. Brateau's exhibits of pewter goblets, &c.; a very pretty ring in gold, silver, and iron by M. Arabin, the gold portion being a minute female figure—there is a "Renaissance" brook about this little bit of work; a case of pottery by M. Dammouse, of fine form and colour; a very fine cloisonné enamel vase by Mr. Heaton; some good stoneware by M. Hanneney; some very pretty and delicate blown glass by M. Koepping; various small objects in enamel by M. Thesmar, of most delicate workmanship but spoiled by bad colour; and a case of goldsmith's work and jewellery by M. Nocq, including a hand mirror of which the handle is formed by a nude figure of Narcissus placed as if looking into the mirror; a pretty fancy.

It is an extraordinary change from the large spaces and vast drawings at the Salon to the one little architectural room at the Royal Academy, with its pretty collection of cabinet pictures of architecture. There is nothing of plan or construction of buildings to be learned here; none of that learned and complete setting forth of a building in all its parts and details which we find at the Salon. Such sets of drawings, for instance, as that of the Bucharest railway station design above referred to; and the illustrations of ancient work are little more than sketches compared with the monumental drawings of the French architects. On the other hand there is this to be said for our collection, that it is far less academical; it shows, within its limits, greater variety of aim and style; and moreover it does represent, as far as it goes, the architectural work of the day, it gives some indication of what kind of buildings are being carried out. In general sense the collection is equal to the average in regard to drawing and design, though few important buildings are illustrated, the drawings mostly representing rather small works. The central place is occupied by a fine line drawing bearing the names of Mr. Norman Shaw and Mr. J. F. Boyle, in which we should think the former is the larger collaborator, for the design looks like another edition of new Scotland

Yard, even down to the detail of changing suddenly from stone to brick walling without the intervention of a moulding. It is called simply "New Buildings, Liverpool," and we are left to imagine the purpose of the block, though it has a very police-like or prison-like appearance, emphasised by the plain massive cantilevers carrying an iron gallery which runs round the building and abuts against the corbelled-out angle turrets, where doors communicate with it. Without knowing what the building is intended for, it is impossible to form any judgment as to the propriety of its architectural expression. On either side of this are two large water-colour drawings exhibited in the names respectively of Mr. C. W. Whall and Mr. H. Wilson, but which are both Mr. Wilson's drawing. The former represents the east end of the private chapel at Lanark, of which we published some illustrations last year, and which represents the work of Mr. Wilson and Mr. Whall in collaboration. The drawing is of course a fine and bold one in general effect, though it does not show the detail very well. The drawing bearing Mr. Wilson's name is a representation of the new staircase at Welbeck Abbey, and is a splendid piece of colour effect, but it does not convey to us very well what is the actual nature of the work; it is not very easy to tell, for instance, whether the figure work and ornament shown in balustrades and other portions is carving in relief in coloured marbles, or painted or inlaid colour decoration. A French drawing would leave us in no doubt as to this, though it might not have the vigour and freedom of Mr. Wilson's water-colour work. The general style of the work seems to arise from an aim at novelty of effect by using some accepted features of architecture without their usual adjuncts; a row of colonnettes carrying nothing, and square angle newels cut off short at the top with no moulding or finish, but with a statuette perched on them. The kind of effect produced is certainly novel, but we think it wants architectural refinement, and that it is a kind of novelty people may presently tire of. However, it is at all events a splendid drawing.

The two special characteristics of this year's architectural show are that plans are even more rare than ever, things in this respect getting worse instead of better; and that there is an unusual proportion of church architecture, so much so that one is inclined to think that the hanging committee (if there is one for architecture, which we have always doubted), finding a good many church designs sent in, determined to hang as many of them as possible, by way of giving a certain special character to this year's exhibition. This being so, we may devote the short remainder of this article to a few words on the churches, reserving other subjects for a future number. The most prominent church drawing is the exterior perspective of St. George's, Stockport, by Messrs. Austin & Paley (1790), a fine solid pyramidal group with a large centre tower and spire; the tower, though broken up a good deal with buttresses and panelling, shows a great proportion of solid wall which gives it a very monumental appearance, and the considerable falling in of the angle lines adds to the effect of solidity while leading the composition up to the spire. The general style is perpendicular Gothic but with some special treatment, as seen in the square-

headed windows with labels over them in the transept. The authors have fully realised the value of masses of solid wall here and there in the design. It is noticeable, by the way, that the lights in the spire are not carried up vertically in the usual "lucarne" form, but open flush with the raking surface of the spire, and this contributes very much to the solid effect of the design. The interior, shown in a large drawing at the other end of the room, represents the usual orthodox modern Gothic.

In other church designs we see evidence of a desire after originality and novelty. Mr. Matar's large drawing of the west front of Holy Trinity Church, Southport, (1796), shows a design evidently somewhat influenced by the late Mr. Sedding. The front is flanked by octagonal turrets, panelled above and finishing in little cupolas. There is a large west window between, the centre mullion of which is too heavy and out of scale with the other detail. The church shows a very plainly treated north tower in the rear, with the clock face formed of open metal framing placed like a spider's web over one of the windows. There is a variety in this, and it gets rid of the sometimes too prominent feature of the round clock-face forming a spot on the design; but it is not convenient to read the time by. Beneath this Mr. Mountford's "St. Michael, Southfields" (1795) has been intentionally placed, as an example of a different manner of treating the west front with angle turrets, which have here a less Gothic and a more "campanile" appearance. The large arch overhanging the west window abuts on each side against one face of the octagon turret. There is no tower. Mr. Brooks's "St. Peter, Hornsey" (1766), which was published in the *Builder* of August 15, 1896, shows another form of the west turret church without tower; here the turrets are square with an octagon stage at the top, out of which rises a leaded spirelet or spike, after a fashion now prevalent, but which looks a little too much like an architectural afterthought.

There is an evidently growing taste for simplicity in church design, as compared with the day when every church was an assemblage of crockets and finials. We see this in Mr. Spooner's quiet drawing of the "West Front of St. Michael and All Angels, Little Ilford" (1,788), with its narthex forming a lean-to stopped by the two deep buttresses, and the seven-light west window in the middle of a plain wall, with no tracery, the lights carried straight up to the window arch and merely cusped at the head. (To this church there is actually a plan). Other demonstrations in favour of simplicity we see in such designs as Mr. Temple Moore's "St. Peter's, Barnsley" (1,744), with its tracery windows of Decorated style inserted in plain walls between flat buttresses of Norman make; and in Mr. Shackle's design for a church at Exeter, (1,820), where the windows end right up against a single moulding which is all that separates them from the roof. This is carrying naïveté rather too far. In a "Proposed Memorial Church" (1,745) Messrs. Clark & Hutchinson have made a spirited attempt at a new style, with square blind masses of wall at angles of tower and transept, campanile-like battering turrets flanking the west end, and other peculiar features, not without considerable effect; but the centre feature at the crossing, looking like a

joss-house with a pole stuck on it, had better be revised if the building is to be carried out.

Of other church designs we may mention Mr. Prynne's church at Elland (1,741), a very satisfactory piece of modern Early English in orthodox style; Messrs. Murray & Mallows's "Granard Presbyterian Church, Putney" (1,752), with a battering tower and a brick spire, the nave being under one roof but clearstory windows formed by large low dormers rising from the middle of the roof slope (not a very good effect); Mr. Nicholson's "Proposed new Nave and Chancel, Yiewsley Church," an exterior view showing some picturesque treatment of the tower; Mr. Walters's "St. Peter's, East Grinstead" (1,783), which may be called an orthodox modern Norman church; Mr. Goldie's interior of St. Alban's, Blackburn (1,803), a "passage-aisle" church with a very plain arcade with flat soffits, and a lofty clearstory which forms in fact the main lighting of the interior; the same architect's "Hawkesyard Priory" and Church (1,842), illustrated not long since in the *Builder*; Mr. Skipworth's very pretty competitive design for the new church at Cockington (1,871); and Mr. Crawford Hick's interior of St. Aidan's, Leeds (1,903), a modern basilica with a round-arched arcade carried on short columns with Corinthian capitals—a kind of rather too palpable imitation of early Romanesque combinations.

We may observe that the business of making show drawings for the Academy seems as active as ever, and is especially noticeable in some of the church designs. There are several which at first glance impress one as being the work of the same architect, the fact being merely that they are all got up in the same manner by the same draughtsman. It is rather amusing, and rather a satire on the whole method pursued in connexion with the architectural room at the Royal Academy, to reflect that if the architects of these churches had each sent in *his own* drawing, showing the building sufficiently but without the practised *ad captandum* manner of the professional draughtsman, they would probably not have been hung the selection depending, as it obviously does, on drawing in the first instance and design only in the second place.

NOTES.

THE Berlin Building Regulations, which have been so unpopular, are under revision, and we have had an opportunity of seeing a draft of the new Code. Perhaps the most important feature for the Berlin freeholder will be the modified requirements in respect to the covering of the area of any given plot. According to the new arrangement a division of the site into zones is allowed for, and the depth of each zone is measured from the frontage line. On the first zone, the whole of the area may be covered; in the second zone a large proportion may be covered according to circumstances, and in the third only a smaller portion; but in the actual execution of the building, a calculation will be made of how much of the area may be covered according to the zone system, whilst the actual position of any structure will not be restricted to any particular position on the site; that is to say, subject to certain conditions, a specific super-

ficial area may not be exceeded, but the actual laying out of the site remains with the owner. Formerly this was not the case. At Berlin the building regulations are practically subject to the police initiative and control, and from an English point of view it appears amusing that the police authorities should draft their regulations and publish them without taking the views of the freeholders, their representatives, architects, or any others concerned in building matters. If we understand rightly, the Municipality has scarcely had a voice in the matter, and has only obtained the right of framing resolutions on the draft regulations after very considerable trouble. This explains much in respect to the frequent change in the regulations at Berlin, and the constant friction caused both by the wording of the code and its administration.

WE have referred from time to time to the custom of the German Government of attaching architects and engineers to their foreign Embassies, and we observe from the *Centralblatt der Bauverwaltung* that a further series of their reports is now available. The list which has now been issued includes reports from America, France, Russia, Austria, and the Netherlands, but most of them are chiefly of interest to engineers. Great Britain is not represented on this list, as the post at the German Embassy in London was long vacant, and has only lately been filled. Of some eighty reports specified, those that would appear to interest architects most this time happen to be from Russia. They are records of the Arts and Crafts movement in that country, on archaeological research in South Russia, on the development of the City of Odessa, its harbour, and other similar subjects. We also find that the Exhibition at Nischni-Novgorod has been treated of, and lastly, the anniversary of the Architectural Society of St. Petersburg. In regard to Austria, some of the most interesting reports appear to be in connexion with the Exhibition that was held at Buda-Pesth last year. It is to be regretted that architecture is not better represented in these valuable records, though we are at least glad to know that the German Government has sent an architect representative to their London Embassy.

Is the temporary removal of a protection to persons against injury by a dangerous machine a defect within the meaning of the Employers' Liability Act? This was practically the question which had to be decided by the Queen's Bench Division and by the Court of Appeal in *Tate v. Latham & Son*. At the defendant's saw mills was a circular saw, part of the disc of it was below and part above the table. The bench was fitted with a shutter to protect persons from injury by the lower part of the saw and when this shutter was in its place the machinery was complete. But it was removed from time to time, not only for the necessary purpose of taking away the sawdust from under the bench, but apparently also out of mere carelessness, merely because it was in the sawyer's way. The consequence was that the plaintiff—a boy—slipped under the bench and injured his foot. Both Courts came to the conclusion that there was a defect within the meaning of the Act. They were unable to draw a distinction

between a case in which a guard was never fixed in position, which would clearly have been a defect, and one in which it was sometimes not fixed. In each instance, there was "a defect in the condition of the machinery or plant." It may seem hard that employers should suffer for the negligence of their work-people, but it is obvious that were the law not so, those who, like the boy who was injured in the present case, would have to work under much more dangerous conditions than they do at present.

Art Education for Women.

AS the result of a decree of the French Government under date of April 3, in regard to the admission of women to the classes at the *Ecole des Beaux-Arts*, it is now arranged that sixty female students, between the ages of eighteen and twenty-five, may enter; their names for admission to the school on giving the requisite proofs of artistic acquirement. Those who are passed by the examiners will be placed on the same footing as the male students and will follow the same course of study, theoretical and practical. For the present, and until it is seen whether the number of female students is sufficient to warrant the erection of special rooms for them, they will work with the men, except in the anatomical lectures, which will be given for women in the mornings and for men in the evenings.

Mycenaean Architecture.

IN the current number of the *Jahrbuch* of the German Archaeological Society (xi. 4), Dr. Ferdinand Noack begins a series of "Studies in Greek Architecture," which promise to be of considerable importance. The first instalment of these studies deals entirely with architecture of the "Mycenaean" period in its relation to the development of later styles. It is impossible in the space of a brief note to do more than call attention to the interest of the questions discussed and note one or two salient points. Since the excavations of 1893-94 at Hissarlik, all questions of Trojan, and with it of Mycenaean chronology, have necessarily entered on a new phase, and from a consideration of these excavations, Dr. Noack draws a conclusion that, if it be correct, is of the first importance. He believes that the city known as Troja VI., in its thorough-going use of stone, shows a break in the development of the technique of the older cities, whereas at Tiryns, Argos, and Mycenae, we have the consistent development of the wood and clay technique shown in the primitive city known as Troja II. Starting from this principle, he proceeds to demonstrate his theory that the features of Ionic architecture arise, like those of the Doric style, from "Mycenaean" structural conditions, and are not due, as has often been supposed, to any external Oriental impulse. The Ionic style branched out, he believes, from a common root with the Doric, but its main peculiarities are due to the introduction of stone as a building material. Another point of interest he raises is this. It has been usual to regard the peripteral colonnade of a Greek temple as a later additional ornament. Dr. Noack believes it to have been the primary and only distinction between the house of a god and an ordinary dwelling-house. Later when this distinction was clearly fixed, it

could safely be omitted. The house for the image of the god became, of course, a necessity only in days when the conception of the god was anthropomorphic. A temple was superfluous for the semi-animal worship we know to have prevailed in early "Mycenaean" times. The paper is at least well worth attention.

Hospital Improvements at Berlin.
 IN connexion with the proposed extensions and alterations of the State Hospital at Berlin, the Botanical Gardens, which are Government property and are on a valuable site in the Potsdam suburb, will be sold, and though much of the ground is to be kept as an open space, the authorities expect to make a profit of 300,000*l.* by the sale, after providing new gardens outside the town. This money will be at once utilised for the hospital improvements, whilst another 500,000*l.* which is considered necessary will be spread over five years, it not being possible to take the whole of the work in hand simultaneously. The hospital "improvements" (curious to observe) will involve a considerable reduction of the number of wards and beds, for, whilst there are 1,824 cases under treatment at present, the improvements and the great outlay will only allow henceforward for 1,247 beds to be in use. This reduction is considerable, and it is sure to make itself felt at Berlin; but in that case it will not be the State that has to provide for the larger accommodation, but the Municipality. It is also noticeable that, though there will be greater facilities for the students, the number of cases in the instruction wards will have to be reduced; for this section, which now holds 445 beds, is only to have 360. To outsiders, it would appear that the ambition of the Prussian Government is to provide modern accommodation for a smaller number of patients, and improved facilities for study to a lesser number of students, rather than to allow the present overcrowded state that exists at the National Hospital. This seems to be a step in the right direction, though the Municipality may grumble at having to build further hospitals, and some medical students may have to go elsewhere to learn their profession.

Niagara Falls.
 A GREAT deal has been written lately about the two immense Power Companies, one on the Canadian and the other on the American side of the Niagara Falls, but the most of what has been written has been based on the sanguine hopes of excitable electricians. In view, therefore, of the newspaper comments on other power companies, such as those projected for the Nile Rapids and the Zambesi Falls, a little survey of what has actually been done at Niagara is instructive. On the American side the Niagara Falls Power Company is working at a loss, although over a million pounds has been spent and no rental has been paid to the State. On the Canadian side, the Canadian Niagara Power Company have been paying a rental of 5,000*l.* per annum for the last five years for the privilege of having a lease of the Falls subject to the obligation that they will have made water connections for the development of 25,000 horse-power on or before November 1, 1898, and yet they have petitioned for an extension of time of eighteen months. The reason

given is that the transmission of electricity to great distances is still in the experimental stage, and that there is no immediate prospect of a market for a large supply near the Falls. Their petition will probably be granted, but as the total cost will come to nearly a million pounds, there is no chance of it paying its way—at least not for many years. Those English lawyers and electricians who got the concession from the Canadian Government were lucky to find capitalists to take it off their hands.

Institution of Electrical Engineers.
 MR. BAYLOR'S paper on "Electric Traction" gave rise to an animated discussion recently, at the Institution of Electrical Engineers, showing that electricians are keenly alive to the importance of this new branch of their industry. Several of the speakers thought that in this country sufficient attention was not paid to the most important point in every electric traction scheme, namely, the "bonding" of the rails. A lack of attention to this point might lead to most disastrous results as to the future of the industry. In the United States, where vested interests were not nearly so important, leakage and the consequent electrolysis had made great havoc with the gas and water-pipes. Mr. Preece stated that quite recently a Post Office cable containing thirty telegraph wires had suddenly broken down, and on investigation it was found that part of the lead sheathing had been completely eaten away by a leakage of current from the City and South London Railway. A striking divergence of opinion was shown as to the merits of the three-wire system, but nothing that was said altered our opinion as to the real advantages offered by this method. Mr. Ravorth read a paper on "The Generation of Electrical Energy for Tramways," in which he raised many debatable questions. He stated that it would pay an electric light central station to supply the power for a small electric tramway at a penny per unit.

"Asbestic" plaster.
 THE paper read by Mr. R. H. Jones at a meeting of the Society of Arts, held on Wednesday last, entitled "Asbestos and Asbestic: with some account of the recent discovery of the latter at Danville, in Lower Canada," was a curious mixture of pseudo-scientific statements and advertisement, interspersed with some really valuable observations on the uses of the two materials mentioned. With asbestos every one is familiar, and it is unnecessary to describe it, but "asbestic" is not so well known. The term is applied to that part of the serpentine rock which remains after the richer veins of asbestos have been extracted from it. This remainder is purely a fibrous material of altered serpentine. It has many uses in the building trades, and is extensively employed in America. It may be pulverised and converted into a cement or plaster; being composed exclusively of asbestos, the plaster is both fireproof and a non-conductor of heat and of sound. Amongst other attributes it is also elastic, and is said not to chip; it will adhere to metal or glass. In plastering, a coating of rough asbestic is first applied with a trowel, and when dry this is surfaced over with a superior quality of the same substance, which has a polished appearance when finished. The cost of the asbestic is

given as about the same as that of good lime and sand plaster. Asbestic paper, used more particularly for building purposes, is another manufactured product of this fibrous serpentine; it is intended to compete with wood and straw pulp paper as now used in the building trades. The principal qualities of this variety of asbestos are its being fireproof and its insulating properties; it is said to possess the same attributes as asbestos in these respects.

Delft Ware.
 IN the lecture by Dr. Glaisher on Tuesday evening, at the Society of Arts, on "Delft Ware," the lecturer (as usual) used the term in a generic sense and did not confine it to ware manufactured at Delft only. Mentioning that it was in the first instance derived from Italian Majolica, Dr. Glaisher remarked on its absorbent and spongy surface and the rapid painting consequently required on it. The best Delft ware was in blue and white only, and the coloured specimens could not be compared to the blue and white. The white was formed by oxide of tin. The manufacture of Delft ware was then traced historically, from its commencement in 1600 at the town itself, whence it was carried to Rouen, where in 1673 there were eleven factories, employing 2,000 workmen. Nevers was also an important centre from about 1618 to well into the nineteenth century. It was partly in consequence of the French clay not being so absorbent that over-elaboration was the result, the painting not having to be done so quickly—an important instance of the influence of material on art. The ware also formed a ready means of storiation, and the history of the French Revolution, it was pointed out, was in this manner told by French potters; but the subjects treated show a great variety, and the surface was as freely used for pictorial work as canvas, and the work, though seeming coarse on a close inspection, has a very good decorative effect at a proper distance. The manufacture of genuine Delft seems to have stopped about 1850. The lecture was made very interesting by the fact that Dr. Glaisher exhibited some rather remarkable specimens from his own private collection, as also some fine examples from South Kensington.

Scotland-yard.
 THIS name recalls a time when the land of the Strathclyde Welsh formed a territorial fief, and Lothian an English earldom, in respect whereof the King of Scotland owed allegiance to the English king. The spot itself was formerly known as "Scotland." It is said that Eadgar bestowed it upon Kenneth III. for a palace for the King of Scots when he came southwards to render homage, as vassal, to the Crown. William the Lion (ob. 1214) is believed to be the last Scottish sovereign who lived there; but in the palace on that site Henry VIII. entertained his sister Margaret after her first husband's death on Flodden Field. In later years it became the home of Milton, Vanbrugh, Beau Peilding, Inigo Jones, Sir John Denham, and Wren, for there was the official residence of his Majesty's Surveyor of the Works. The Palace Court, constituted by letters patent of 1664, was removed thither from Southwark in 1801, to the place where—we gather—was then the headquarters of the Metropolitan Police (1829). The Court, abolished in 1849, was served by judges and officers

of the ancient Marshalsea Court of the Queen's House, being one of record for causes arising within twelve miles, the City excepted, around the sovereign's palace at Whitehall.

It is stated that the inhabitants of Stoke Pogis have decided to commemorate the Queen's reign by "renovating their parish church" of Stoke Pogis, and that they propose to "shingle the tower with oak shingles, and generally to improve the interior of the edifice." We quote these details from the *Times*. If the church requires repair, by all means let any necessary work be done, but all lovers of English literature may fairly dread the work of "renovating" a parish church around which are gathered more poetic associations than about any other country church in England. "The ivy-mantled tower," the quiet graveyard, are familiar to all to whom English poetry is a living and perpetual treasure. A restored church would take away from Stoke Pogis its greatest charm. If work is necessary for the preservation of the building, it must be done, but it would be pure vandalism to alter the character of an edifice which, as it stands, is a monument of one of the greatest of English writers.

THE NEW GALLERY.

THE NEW Gallery Exhibition, regarded as a whole, will hardly, we fear, arouse much enthusiasm; there are few notable pictures by leading artists, and a good many mediocre and uninteresting works bearing unknown or little-known names.

Among the important works the finest is Mr. Watts's "Paris on Ida" (106), a quite new treatment of the ancient legend, representing not the three goddesses but Paris alone, and the effect which the vision had on him. He kneels in wonder and rapture; the presence of the goddess is only indicated by a golden haze behind the tree on the right, the picture evidently being suggested by the passage in Tennyson's "Gnone":—

"On the tree tops a crested peacock lit,
And o'er him flowed a golden cloud, and leant
Upon him, slowly dropping fragrant dew,
Then first I heard the voice of her, to whom
Coming thro' Heaven, like a light that grows
Larger and clearer, with one mind the Gods
Rise up for reverence."

The figure of Paris is of antique and ideal type, both in drawing and colour: a treatment quite in place in an illustration of a purely ideal legend. It is a work in Mr. Watts's finest style, besides embodying a very original ideal. The other important work is Sir E. Burne-Jones's "The Pilgrim of Love" (134), one of the best pictures he has painted lately, and one in which the figures, or the principal one at any rate, have a little more action and energy than we are accustomed to see in the works of this artist. As far as subject and meaning go the picture is very much a counterpart of Mr. Watts's "Love and Life," only that the figures are draped and mediævalised. Love, in light-coloured garments, and a large dart in his hand, steps forward planting one foot on the base of a ruined Gothic pier (what symbolism there may be in this escapes us), and, half turning, gives his hand to a figure in dark drapery just emerging from a thicket of thorns. Here, of course, the allegorical meaning is plain enough, and the painting in other respects shows the well-known style of its author, the usual delicate and placid heads with long narrow chins, and the usual dreamy atmosphere pervading it.

Beyond these two works there is not a single figure subject of the first rank. Mr. Philip Burne-Jones's large and rather ghastly picture "The Vampire" (15), has a certain power, especially in the look of the opened lips and teeth of the pretty spectre; but those who remember the description of the Vampire in "The Giaour" will hardly get much of a shudder out of Mr. Burne-Jones's explication of the superstition. Mr. Waterhouse's "Mariana in the South" is an interesting addition to the

list of Tennysonian subjects which this artist has painted; Mariana kneels before a circular mirror in a gray wooden frame, in the midst of a large bare hall paved with black and white slabs; at the back a gleam of light comes through the partly opened door and through its bottle-glass panes; but the desolation of the poem is hardly realised in the picture except in the one point of the reflection of the face of the figure in the mirror, where we are shown the expression of hopelessness which could not be fully realised in the profile face of the figure itself. This reflected unhappiness is no doubt a powerful incident in the picture, which in other respects is finely and carefully painted. The same may be said emphatically of Mr. Collier's "Queen Guenevere's Maying" (202), a large picture with half a white horse in it and half of Guenevere and of some other figures, Guenevere seated astride on her horse, as no doubt the author of the Legend of King Arthur imagined her, though the attitude rather shocks the associations of the modern reader of Idylls of the King; but the picture does not interest one, it is altogether too artificial, smooth, and conventional, nor does one discern the joy of May in the Queen's face. Mr. Ollivier's life size allegorical picture of "Thoughtless Chance and Thoughtful Destiny" (232) will do very well as a moral allegory, and has the merit of good colour, but one cannot call it a very striking work. The "Expulsion from Eden," a large work at the end of the north room, is merely a piece of commonplace.

Among works which are a combination of landscape and figures the most noticeable is Mr. Wetherbee's "Dawn the Rosy Fingered" (201), a seaside pastoral at the first light of dawn, with sheep and sleeping shepherd, "Dawn" being represented by a nude female figure with a profusion of light golden hair, stepping over the grass towards the flock. Her head is backed by the light of the dawn over the cold dark sea, but the dawn and the figure seem hardly sufficiently connected, and the figure is somewhat too real for an allegorical apparition. The real strength of the picture lies in the landscape effect. Mr. Arthur Lemon's "Strange Sails" (53) is an original little work, a coast scene where three savage-looking men on barebacked horses contemplate the approach of some distant boats with evidently unfriendly intentions; the bleak coast and the uncouth figures blend into an effective composition.

Among portraits the finest is perhaps Mr. Shannon's "Lord Ross" (240), a young lad of very strongly-marked and characteristic physiognomy, grouped with a fine black hound. Mr. Tule's "Miss Ritson" (107) is a fine and bold executed life-size portrait of a young lady, and Mr. Tadema sends a small very refined whole length portrait of Mr. Maurice Sons playing the violin. Mr. Sargent has a large full-length portrait (245) of a lady who ought to be known by some such name as "Blowsabella" out of an Elizabethan pastoral, though not in pastoral costume; it is not a work that one would imagine gave very much satisfaction to the sitter. Mr. Shannon's portrait of the "Marchioness of Granby" (33) suggests a St. Veronica, for her head seems to belong to and to be painted upon the oval panel in the rear, and seems somehow unconnected with the body.

There are some good landscapes, some of the best of which, however, rather tend towards experiments in special effects than to the representation of nature as she exists. Mr. East's "Idyll of Spring" (239), for instance, is a brilliant effect of bright light and colour and blossoms, but rather an ideal than an actual or possible scene; and Mr. Fred Hall's "The Drinking Pool" (10), a work painted evidently under French influence, is admirable as far as the cattle are concerned, but as far as the landscape goes it is an experiment towards producing an effect of light and colour to which truth of actual fact and colour is sacrificed. A far more pleasing and successful "landscape and cattle" picture is Mr. Arnesby Brown's "Above the Bay" (177), a very beautiful and delicate pastoral. Mr. Adrian Stokes's "Untrodden Peaks" (28), an Alpine snow scene, is interesting and quite removed from commonplace, as one might expect, and perhaps the colour and apparently woolly texture of the snow is true under a certain condition of light and atmosphere, but it hardly convinces one of its truth. Mr. Parsons's "Allotments" (210) is a flat landscape with a large expanse of sky, pretty but rather weak and sentimental in style, a defect which appears the more marked by con-

trast with Mr. Thorne Waite's fine bold landscape "Would-be Trespassers" (220), which hangs as a pendant to it on the walls, and rather kills it. Among smaller landscapes which are powerful and effective are Mr. Wimperis's "A Rough Heath" (54), with a very fine sky; Mr. Padgett's "A Village in Holland" (62) which might almost pass not only for a Dutch scene but a Dutch painting; and the same artist's "On the Dunes, Pas de Calais" (88), a very complete little work in which the solitary figure and the scene seem entirely to go together, and which shows a fine drifting stormy sky.

Architectural design is represented (as it was last year) by one drawing exhibited by Mr. Robson; but the pictorial treatment of architectural subjects is represented by a small fine painting of part of the front of a Renaissance church by Mr. Logsdail (206), and by a good watercolour drawing of Canterbury Cathedral by Mr. Newton Benet, hung in the balcony.

Sculpture can hardly be said to be well represented. The largest work, a seated statue of the Queen grouped with two small children, by the Countess Feodora Gleichen, is dignified in effect, and among the smaller exhibits are two very graceful bronze figures, "Evening" by Mr. Toit, and "Pensée" by Mr. Pomeroy.

THE WESTMINSTER COCKPITS.

ON obtaining possession of Wolsey's palace Henry VIII. made many additions to what had been York Place. The enlargement comprised sundry "lodgings," a tennis-court, bowling-alley, and a cockpit—all on the Park or west side of the main street. For access to these he built across the road two gate-houses, King-street Gate at the south-west corner of the Privy Garden and a little south from the tennis-court, and Whitehall Gate, designed by Holbein (at a spot in alignment with the south return of the later Banqueting House, which was known also as the Cockpit Gate). The Cockpit gave a name, too, to the apartments occupied by Philip Herbert, fourth Earl of Pembroke, who saw from his window Charles I. pass along St. James's Park to the scaffold, and died there on January 23, 1649-50. On February 25, that same year (see the Commons' Journal *passim*), it was "resolved that the Lord Lieutenant of Ireland have the use of the lodgings called the Cockpit." Cromwell's letter to his wife, announcing his victory at Dunbar, is addressed to her at the Cockpit. Then, shortly before the Restoration, the lodging is given to General Monk, and Charles II. confirms his occupation therein. The *London Gazette*, Nos. 432-4, 1670, records:—"Dyed at his apartment in the Cockpit, his Grace, George, Duke of Albemarle." To Monk succeeded Villiers, Duke of Buckingham. The situation of the rooms, pleasantly placed, overlooking the Park and the old Tilt-yard, is clearly defined in Fisher's plan of Whitehall Palace, surveyed before Monk's death, and afterwards published by Vertue. According to that plan the Duke of Albemarle's rooms covered the ground now occupied by the houses in Downing-street, the private garden, and the Treasury buildings, which have a frontage to the Horse Guards parade-ground, once the Tilt-yard. The plan plots "The Cockpit"—a large square room within which is an eight-sided pit or amphitheatre. Moreover, in Newcourt's map, engraved by Faithorne (1658), is depicted, by the south-west corner of the Cockpit Gate, a detached building, octagonal on plan, of two floors, with pointed roof. The two sites of the plan and map are identical. We may safely say, then, in response to Lord Rosebery's recent appeal, that the Whitehall Cockpit is now covered by that block, erected circa 1740, of the Treasury buildings, by Kent, which stands northwards of the First Lord's official residence, and overlooks the Horse Guards Parade-ground; and wherein, we believe, the Cabinet still usually assembles for council. The Cockpit lodgings were entered from the street by a passage which corresponds with the existing main entry to the Treasury Chambers, and from the Park by another corresponding with the present passage from the Parade-ground into Downing-street. Next north to the passage into the main street, is marked on the plan "The Tennis Court," where is now the south portion of the old

* Site cleared in 1723. Kent's full design was for a central portion with two wings, the entire front to have fifteen windows in a row. Only the central portion, and part of each wing, were built.

Sketches of London Street Architecture—XIII. No. 40, Berkeley-square. Messrs. Ernest George & Peto, Architects.

the Council in the Cockpit, March, 1711. In their "New Remarks," 1728, the parish clerks cite "the Royal Tennis Court," together with "the Cockpit, in which is the Treasury and the Offices of the Secretaries of State, the Wardrobe, and the Plantation Office," also the adjacent "Cockpit-street, by Whitehall," as lying within the verge of the King's Court, for which the Marshalsea Court, latterly removed to Scotland-yard, exercised jurisdiction. Reports of the Historical MSS. Commissioners contain numerous references for a survival of the name of "Cockpit" on the site we indicate above; the Privy Council minutes upon the duel between Lord Mohun and the Duke of Hamilton are written "at the Cockpit," November 18-23, 1712; a letter of Secretary Craggs is dated January 9, 1720-1, "at the Cockpit;" Walpole writes letters there in 1752. The name remained, indeed, within the memory of living persons. We have found mention of a "Cockpit-court" in the rate-books for 1707 of St. Anne's, Soho, Leicester Fields division; the name occurs often in maps and surveys of the last two centuries; the "Cockpit Theatre," near Great Wild-street, St. Giles-in-the-Fields, was converted into a playhouse, the Phoenix, temp. James I., and so became the precursor of Killigrew's Theatre, opened April, 1663, in Drury-lane.

SKETCHES OF LONDON STREET ARCHITECTURE:

NO. XLII.—40, BERKELEY-SQUARE, W.

THIS town house was built for Mr. W. S. Salting in 1891, by Messrs. Ernest George & Peto. The front, with its large gable, is of brown Portland stone; the stone balcony comes well outside the drawing-room windows, and a feature of this front is the space between the drawing-room windows and the windows above, and this is accounted for by the treatment of the drawing-rooms, the front one having a large coved or wagon ceiling, while the back portion of the same room is kept square with pilasters and cornices. These rooms are treated in a later manner than the rest of the house, following the Louis Quatorze period.

For the size of the house the hall has considerable dignity, with its marble walls, columns, and staircase, the latter leading straight up in the centre of the hall.

The dining-room and library have Italian walnut panelling chimneys, &c., the latter room having a ceiling of small coffering.

In the marble walls of the hall the doors are of walnut inlaid.

The iron grilles about the entrance door, as also the other metal work in the house, including interesting locks, were executed by Messrs. Starkie, Gardner & Co.; Messrs. Melhier & Co. executed most of the decorative work.

ENGINEERING SOCIETIES.

THE INSTITUTION OF CIVIL ENGINEERS.—The annual general meeting of this Institution was held on the 27th ult., Mr. J. Wolfe Barry, C.B., President, in the chair. The report of the Council on the proceedings of the Institution during the past year was read by the Secretary. The most important matter which had occupied attention was the alteration of the by-laws so as to supplement the existing regulations by the introduction of a test, by examination, of the general and scientific knowledge of candidates for election into the class of associate members. The proposals of the Council having been sanctioned by the general meeting held on March 30, arrangements for giving effect to the new rules were under consideration, and would, it was expected, be settled shortly. Other minor alterations had been made, and a copy of the by-laws thus amended and revised would be placed in the hands of all belonging to the Institution. With a view to promote the interests of many of the country members who were unable to attend the weekly meetings, arrangements had been made to hold a general conference of the Institution in London on May 25, 26, and 27, which it was hoped would satisfy a need that had been felt in an increasing degree with the expansion of the Institution. Since the last annual general meeting, Mr. James Forrest had retired from the post of secretary, which he had held for forty years, and had been appointed Honorary Secretary. An appreciation of Mr. Forrest's services extracted from the President's inaugural address was inserted in the report. Mr. Forrest

buildings (facing Whitehall) altered by Soane, and after him by Sir Charles Barry. Soane proposed to carry his design further southwards by a similar block or wing, with a triumphal arch between the two at the Park end of Downing-street. Soane's model may be seen in his Museum; the north block encases Wolsey's Great Hall; his plans show the Cockpit as we see it in Fisher's.

Charles II assigned the Cockpit rooms to the Treasury Commissioners, and from "the Cockpit" many of their earlier minutes are dated; yet they seem to have served for residence as late as 1691, in which year, we read, "the Princess Anne has left the Cockpit . . . and gone out to live at Sion House." Cromwell issued his edict against cock-fighting in 1654; the sport was soon revived, for in or about 1660 the State Cockpit was in James-street, Bedford-row, where mains were fought until 1752; the name has been preserved there

in Cockpit-yard. The King built another cockpit in Birdcage-walk, near the old Cockpit-steps leading from Dartmouth-street into the Park. The site will be seen in Rocque's map (and it seems to be marked in Horwood's of 1799) close by the present Irish Office. The county and other mains were fought there until 1816, when the Governors of Christ's Hospital, with a then rare humanity, refused to renew the lease for that purpose. So another cockpit was established in Tuiton-street, Westminster (latterly the St. John's Institute), which was abandoned some eleven or twelve years afterwards for one by name of the New Cockpit Royal, in Little Grosvenor-street, Millbank. Eventually the Act 5 and 6, William IV., c. 59, declared the sport to be illegal. Hatton's "New View," 1708, describes the Treasury Office as kept at the Cockpit; the Wentworth Papers refer to Guiscard's attempt upon Harley's life at a meeting of

The "Meadow-Flowers" Wall Paper. Designed by Mr. Walter Crane for Messrs. Jeffrey & Co. (see next page).

had been succeeded in the secretaryship by Dr. J. H. T. Tudsbury, who had for several years acted as his principal assistant. During the past year, two honorary members, thirty-seven members, 279 associate members, and 14 associates had been elected into the Institution, being a total of 332; while by death, resignation, and erasure, 158 names had disappeared from the register. The roll now numbered 6,204, as against 6,030 at the corresponding date last year. There were also 886 students attached to the Institution, so that the total number borne on the books on March 31, 1897, was 7,090. The income was 22,285*l.* 8*s.* 10*d.*, and 15,417*l.* 10*s.* had been received on capital account to meet the expenditure on the new building. The trust funds had realised 466*l.* The expenditure had been 40,394*l.* 8*s.* 9*d.* of which about one-half represented the normal expenses of the year, the balance being incurred principally

in connexion with the new building, while the expenditure on Trust Funds account had absorbed 468*l.* 11*s.* 11*d.* The liability of the Institution to various taxes having been repeatedly questioned, the Council had taken legal advice upon the matter and proposed to act thereon. The effect of the alteration initiated last year in the period of the session had been to make the meetings cover exactly six months, from November to April both inclusive. During the past session twenty-two ordinary meetings were held, at which fifteen papers were read and discussed, the opening night being, as usual, devoted to the delivery of the President's address, and to the presentation of the medals and premiums. The fifth "James Forrest" lecture was given on March 18 by Dr. G. Sims Woodhead, the subject being "Bacteriology," and aroused such interest that it was repeated on March 25.

Nine supplemental meetings for students had been held during the session, and six visits to engineering works had been made. The local Associations of Students at Manchester, Glasgow, Birmingham, Newcastle-on-Tyne, and Leeds, continued to do good work. The Engineering Conference, in which the students would be permitted to take part, would afford an opportunity for members of that class to assemble as usual in London in the month of May. The collection of paintings had been augmented by the presentation, by his son, Mr. Henry Vignoles, of a portrait of the late Mr. Charles Blacker Vignoles, Past-President. Since the date of the last report the rooms had been completed and decorated, and the final stage of the operations contingent upon the rebuilding of the premises would be reached during the recess, when the arrangement of the large and ever-increasing stock of publica-

Corstorphine Church. (From a sketch by Mr. J. Watson.)

tions and documents would be completed. It was announced that the following gentlemen had been elected to form the Council for 1897-98.—President, J. Wolfe Barry, C.B.; Vice-Presidents, W. H. Preece, C.B., Sir Douglas Fox, James Mansergh and Sir William Anderson, K.C.B.; Other Members of Council.—Alex. R. Binnie, Henry Deane, W. R. Galbraith, George Graham, J. C. Hawkshaw, Charles Hawksley, John Hopkinson, Jun., Alex. B. W. Kennedy, John Kennedy, George Fosbery Lyster, Sir Guildford L. Molesworth, K.C.I.E., Captain Sir Andrew Noble, K.C.B., B. B. Stoney, F. W. Webb, Sir William H. White, K.C.B., Sir E. Leader Williams, Horace Bell, T. Forster Brown, G. H. Hill, J. C. Inglis, and William Matthews.

SOME NEW WALL PAPERS.

The improvement in design and colouring which has been taking place in English wall papers of recent years is one of the most satisfactory points in considering modern decoration. While so many branches of the art have deteriorated or been allowed to pander to meretricious taste, the best designers and manufacturers of wall papers have steadily set before themselves an ideal of better design and

more harmonious colouring. We are reminded of this by some new designs and methods lately introduced by Messrs. Jeffrey & Co., of Essex-road, Islington.

One of these is the new washable sanitary paper which, made by a new process, is not to be distinguished in appearance from an ordinary paper. The best hand-printed papers by the same firm are mostly excellent. The "meadow-flowers" paper designed by Mr. Walter Crane to be used with the "may-tree" frieze, is a successful example, and, as executed in deep blues and greens, has a sober and quiet effect which is pleasing (see p. 398).

For a design of a totally different kind, the "Falcon" paper and "Diana" frieze, by Mr. Ingram Taylor, is very decorative in effect. The falcons are worked into an all-over conventional pattern in the filling, while in the frieze the running figure of the huntress in flowing robes, chasing the stag, is almost Greek in feeling. Messrs. Jeffrey have also introduced what is known as an "extension," so that the procession is not spoiled by having the figures bent round the angles of a room, but can be properly ended by the insertion of a filling suitably treated.

Mr. Heywood Sumner's floral trellis design, in which greens, blues, and pink predominate,

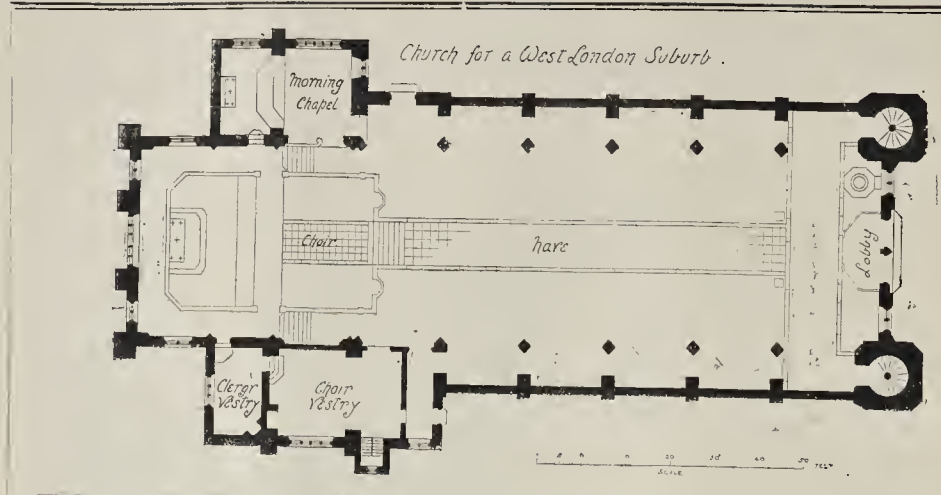

is of a different and more open pattern, but suitable in certain cases.

A new feature is Mr. Lewis Day's scheme for a staircase treatment, and we should not omit Mr. Stephen Webb's "poppy" ceiling, a conventional treatment round a circle in a square, and slightly in relief, which can be had plain white or painted. It is made in a new tough material called "relievo," which Messrs. Jeffrey have just introduced.

The "Jubilee" paper has quite a decorative effect, and is rich and sumptuous in character, and has very cleverly wedged into the design all the insignia and paraphernalia of Royalty and Empire which the present year is to honour.

CORSTORPHINE CHURCH.

This quaint little Church of Corstorphine is situated about three miles west of Edinburgh, between the Pentland and Corstorphine Hills. It takes the form of a cross on plan with an additional transept on one of the sides. A portion of the roof is still covered with old grey flagstones. Part of the structure belongs to a chapel which was founded towards the end of the fourteenth century. JOHN WATSON.

Illustrations.

A GRAIN SILO AT GREENWICH.

THIS building is being erected at Greenwich by Mr. S. P. Mumford as an extension to his steam flour mills, for the purpose of storing the grain to be made into flour.

It consists of twenty-three brick bins, average 9 ft. square and 47 ft. deep, each capable of holding about 370 quarters of wheat, with three open floors below and one above. The wheat is brought in barges in bulk, and raised by means of steam elevators, shown in the view, and is in its progress automatically weighed and partly sifted before being put into the bins. As it is required it is taken from the bins, and washed, cleaned, and ground, passing through numberless processes before it is sent out as flour, and without having been touched by hand from its arrival in the barge to its departure in the cart.

The foundations, which stand in the Deptford Creek, were put in by tide work, and have to carry a great weight; the wheat being stored in bulk in the bins or silos, no sacks are used.

The total height of the building from the river bed is 127 ft.

An attempt has been made to express in the exterior the use of the building. The circular lights under the main cornice give light to the bins.

The whole is built in cement with chain bond in the walls, the river wall is faced with blue bricks, and the upper portion with stocks and red brick dressings and ornament.

The work is being carried out by Messrs. Jerrard & Son, of Lewisham, the work of works being Mr. John Cropley, the machiner, being supplied by Mr. Henry Simon, of Manchester.

The building is a good example of the application of architectural treatment to a utilitarian structure. The architect is Mr. Aston Webb.

CHATEAU DE BULLON.

This is the country residence of M. Jas. Tissot, the well-known French painter, near Besançon, in the south-east of France. The château was originally built about the beginning of the eighteenth century, and has recently been considerably enlarged and remodelled. The view shows the garden front. The wings, the arcade, and the enclosure of the fountain or garden court, are all new, as well as the semicircular portico in the centre of the entrance front. It is built of stone quarried on the estate, of a warm white toning to a blue grey in colour, very hard and firm in texture. The enclosure walls are of red brick with dressings of the same stone. The work has been carried out by M. Pateu, contractor, of Besançon, with M. Vieille, of Besançon, as resident architect.

Close to the château on the right is M. Tissot's studio, illustrated in the *Builder* of

Grain Silo at Greenwich. Plan through Silos.

June 15, 1895, and behind the trees on the left are the new stables and other buildings. Around the house and studio an extensive formal garden is now being laid out, in excavating for which the remains of the old Abbey de Bullon, of which this is the traditional site, were uncovered. Portions of several of the nave piers were found *in situ*, with their archaic carved capitals of about the tenth century, and these have been carefully preserved.

The site is a very fine one in the Jura country, in the valley of the Loue, a splendid river flowing at the foot of the high wooded rocks seen in the background of the view, which is from a sketch made on the spot.

J. M. BRYDON.

CHURCH FOR A WEST LONDON SUBURB: WEST ELEVATION.

This is a design for a supposititious site, and similar in conception and general treatment to that for St. Oswald's, Fulham, but much larger, and with a western gallery reached by two flanking turrets, which appear in the drawing now reproduced.

This church was intended to seat 1,000 people.

E. P. WARREN.

portions of the three lights, are represented in crimson and purple robes, as martyrs, standing beneath the trees of Paradise. Their martyrs are depicted below.

In the lower panels all the small figures appear in different reds and crimson; while white glass is used for the martyrs themselves. In painting the glass I have used as little as possible, leaving the surface, which is beautiful texture, perfectly clear in the lights.

MARY LOWNDES.

NEW STORE, FORT SALISBURY,
RHODESIA.

THINGS connected with Rhodesia are of interest just now, and we give here a sketch of a new warehouse built at Fort Salisbury on the design of an English architect, Mr. W. Cooksey.

The building is a new store for the Manica Trading Company, and is the first of several to be built in other towns to replace the existing galvanised iron buildings.

The whole of the joinery has been executed by Messrs. Josoline & Young, of Borough High-street, London. The constructional iron and steel work has been executed by Messrs. Brownlie & Murray, of Glasgow, the rain-water gutters, spouts, &c., by Messrs. Thomas Elsey. The glass, brass furniture, and other fittings have all been sent from our country, including the hoist, which has been supplied by Messrs. Arnold Goodwin & Sons, Southark. The building itself is to be faced with a very good local red brick.

ARCHITECTURAL SOCIETIES.

ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.—At the tenth meeting of the Discussion Section of the Architectural Association for this session, which was held at 59, Great Marlborough-street, W., on March 24, a series of short papers was read on "The Progress of Architecture during the Reign of Queen Victoria." Progress in architectural art was dealt with by Mr. H. R. Appelbee, who described the dead Classicism which was just giving way at the beginning of the reign of the archeology of the Gothic revival,

which soon became rampant, only to be succeeded at a later period by a resuscitation of Renaissance architecture more or less archeological. The Crystal Palace was perhaps the one unique building of the reign. At the present time, on looking back, we might believe that progress had been made through these various revivals towards a fresher and more original style, of which the present time showed some hopeful signs.—Progress in construction was interestingly spoken of by Mr. Matt. Garbutt in his paper, in which the influences of steam power, machinery, iron, and terra cotta, were noticed. These forces and materials, together with the revived use of concrete, had enormously advanced the constructive arts.—Mr. C. H. Strange read a very interesting paper on the architectural literature of the period, in which he noticed the very great influence of books illustrating both foreign and domestic work; and the not less important bearing on architecture of the new and vigorous thought of the times, as expressed in the writings of Carlyle and Tennyson, Ruskin and Browning, of the results of the vast amount of research and erudition contained in the voluminous records of the various learned and scientific societies; and of the lectures and essays of such men as Barry, Viollet-le-Duc, and William Morris.—Progress in sanitation was next recapitulated in a paper by Mr. A. E. Young, who read a letter containing the reminiscences of a sanitary engineer in practice forty years ago. The old conditions of water supply, heating of buildings, lighting, ventilation, drainage, and sewage disposal were compared with those now existing; while the enormous increase of protective legislation in connexion with building and with the housing of the working classes and such matters was noticed.

—Mr. A. W. Waddington read a paper which dealt with progress in architectural education, as seen in the Architectural Association and other kindred institutions, whose sole or partial object was the study of architecture with a view to its advancement. For the architectural student of fifty years ago the works of Vitruvius, Palladio, and one or two others may be said to have contained the whole gospel architectural. At the present time text-books of design and construction were innumerable, while the institutions, whose main object was

the training of students for the practice of architecture, had mostly sprung up within the present reign—until at the present time the greatly-increased facilities for travel, sketching, reading, and otherwise gaining architectural knowledge were so numerous that we were fully justified in deeming that progress in this department had been very great.—The meeting was adjourned till April 7 when the papers were discussed and commented upon. The two meetings were productive of a very interesting review of the progress that has been achieved in matters architectural during the Queen's reign, which has been so marked by advance in every department of civilised life.

EDINBURGH ARCHITECTURAL ASSOCIATION.

—At an ordinary meeting of the Edinburgh Architectural Association, held on the 21st ult. in the Royal Institution—Dr. R. Rowand Anderson, President, in the chair—a large number of drawings of old Scottish work by students of the Applied Art School were exhibited, and explanatory historical and architectural notes on them were read by Mr. J. Forbes Smith and Mr. Ramsay Traquair, students. Among the subjects of the drawings were Holyrood Abbey, Craigmillar Castle, Argyll's Lodging at Stirling, and Cowane's Hospital. The Chairman, in proposing a vote of thanks to Messrs. Ramsay Traquair and Smith for their communications on the interesting buildings they had been studying, said that the Association, in devoting one of its evenings to an exhibition of the work of the students of the Applied Art School, was desirous to make it known, especially to the young men who were to follow applied art, that the Association was doing its best for them, because it made annually a handsome subscription from its limited means to forward the cause of education, and it desired to make it known that it did not limit its subscription to benefiting those only who were to follow architecture, but that it gave its support to a school which, in carrying out its system of education, made no distinction between the architect and all other art workers—that was to say, that the scholarships and other awards at the disposal of the school could be obtained and held by the decorator, the sculptor, and any other art worker equally with the architect. The Association also desired to emphasise the great importance of the study of ancient work, in all its departments, as a true

foundation for the future work of the artist. Work of the character they saw that night might be described as analogous to anatomy in the study of medicine. They brought the student into actual contact with work of all kinds. He was taught to dissect, to analyse, and to work out for himself all the reasons that gave rise to the various features he saw in buildings. All artists of eminence had recognised that the study and the analysis of ancient work were among the most important factors in the education of all art workers, and the Association desired to make it known as widely as possible that the Applied Art School held out every inducement to students, within its, he was sorry to say, somewhat limited means, to come and perfect their education.

DEVON AND EXETER ARCHITECTURAL SOCIETY.—The annual meeting of the Plymouth, Devonport, and Stonehouse branch of this Society was held at Plymouth School of Art on the 22nd ult. Mr. Charles King presiding. The report was considered satisfactory, meetings and excursions having been held at regular intervals during the year, and several matters of considerable importance to the local members of the profession have been discussed. The Chairman, in his address, expressed the hope that the members would make the coming season even more satisfactory, and spoke of the desirability of an *esprit de corps* among the members of the profession generally. The ballot for the election of officers resulted as follows: Chairman, Mr. C. King, re-elected; Committee, Messrs. H. G. Luff, M. A. Bazeley, B. P. Shires, J. H. Dwelley (re-elected), and A. G. Bewes; Hon. Secretary and Treasurer, Edgar M. Leest, re-elected. Votes of thanks were passed to the retiring officers, on the motion of Messrs. Shires and Bazeley.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE.—**ARCHITECTURAL CRAFTSMEN'S SOCIETY.**—Under the auspices of this Society, a paper was recently read on "Steel and its Use in Structures" by Mr. Kendrick Edwards. Mr. James Lochhead presided. The paper treated fully of the Siemens system of steel manufacture, and the treatment of steel ingots in the cogging mill. Mr. Edwards then compared the relative values of steel and iron, with reference to weight and cost for the same strength, showing the decided advantage for most purposes of steel over iron. In connexion with structures many practical details were discussed, as showing faults and points to be avoided in everyday work, as well as the theoretical correctness of design, and in connexion with this the lecturer asked for more attention on the part of architects and engineers to the matter of calculations and detail. A discussion followed, in which Professor Gourlay took part, and in closing it the Chairman proposed a vote of thanks to Mr. Edwards for his paper.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A HOME Counties District Meeting of the members of the Incorporated Association of Municipal and County Engineers was held at the Town Hall, Dover, on the 24th ult.

Mr. F. J. C. May, C.E., of Brighton, presided, and amongst those present were Messrs. Santo Crimp, London; W. Weaver, Kensington; Norrington, Lambeth; J. P. Barber, Islington; Dodd, Wandsworth; Savage, West Ham; Lafan, Twickenham; T. Cole, Westminster; Secretary; Mann, Sevenoaks; Campbell, Canterbury; Blair, St. Pancras; E. Pritchard, Birmingham; Hooley, Nottingham; Fowler, Manchester; Price, Birmingham; Yabbicom, Bristol, &c.

The Mayor of Dover having offered the members of the Association a hearty welcome to the town,

On the proposition of the President, Mr. Lafan, of Twickenham, was re-elected honorary district secretary.

Mr. H. E. Stilgoe, Borough Engineer, then read a paper on "Some of the Public Works of Dover." The paper was mainly descriptive of the arrangements made for scavenging the town. Hitherto the work has been carried out under contract. The house refuse had been collected every day, the pails containing the same being placed on the edge of the pavement or within the forecourts, where such existed, early in the morning, and for the most part removed by ten o'clock. The contract system was by no means good. First, the horses, carts, &c., were anything but a credit to the

town; secondly, there had been in the past a difficulty in getting the work done as expeditiously and regularly as it should be, particularly with regard to the collection and disposal of house refuse. The Council had, consequently, determined to undertake the work themselves, with their own staff of horses, carts, and men. The present cost of the work by contract was 3,372*l.*, and the estimated future cost 4,112*l.* It would, therefore, be seen that the estimated annual cost by the direct contract system was 740*l.* in excess of that of the contract system. The amounts of the contracts for this work had been increasing steadily year by year, and the slight additional expenditure which might be expected under the direct control system was well balanced by the greater efficiency.

The President said he greatly approved of the daily system of collecting house refuse, though he had not been able to adopt it at Brighton, where the collection was made weekly. He congratulated the Dover Corporation upon having taken the advanced step of a daily collection. The second principle in the paper appeared to be the collection of refuse and the scavenging of the streets by a staff in the direct employ of the Corporation, as against the system of doing the work by contract. On that point he felt very strongly that the work should be entirely in the hands of the Corporation.

Mr. Collins, Norwich, thought the Corporation had no power to compel householders to put the refuse outside the houses; though he admitted that when they had to go into the houses to collect the refuse it made it a very slow process.

Mr. Read, Gloucester, said a similar system was in operation at Gloucester.

Mr. Campbell, Canterbury, said he was greatly in favour of the Corporation's undertaking this work themselves, as hired men were not so directly under control as their own staff.

Mr. Weaver, Kensington, admitted that there was not the slightest doubt that men working for contractors would do more work than men working for Corporations; but, at the same time, he argued that the work was never so efficiently done. The Corporation would have to face an increased cost, but they would have the work much better done.

Mr. Barber, Islington, said he also agreed that the work would be much more efficiently done by the Corporation employing their own staff.

Mr. Yabbicom, Bristol, said that five years ago the Corporation of that city undertook such work, and the change had been made with very satisfactory results.

A vote of thanks was unanimously accorded to Mr. Stilgoe for his paper.

Mr. Stilgoe then read a paper on the Dover Corporation electric tramways. He said the rapid development of building operations on the new estates being laid out in the borough, and the advance of commercial enterprise in connexion with the coalfields and the proposed new national harbour at Dover, had made the construction of tramways in the town almost a necessity, particularly from the point of view of conveying the working population to and from their work, and for the general convenience of the public. A Provisional Order was obtained, and subsequently confirmed by the Tramways Orders Confirmation Act, 1896. This Act gave the Corporation, as promoters, the power to work the tramways by horse or mechanical traction (except steam locomotives), and the power which had never been granted to a Local Authority before, viz., that of working the tramways. The gauge was 3 ft. 6 in., and was decided by the narrowness of one or two of the streets through which the line passed; but in the interests of economy of the initial cost of permanent way he would have recommended it in preference to a broader gauge. They had adopted the electric overhead trolley system of traction. Acting on the advice of their electrical adviser, Mr. S. Sellon, who had carefully considered the question of whether it would be more advantageous for the Corporation to have its own power station or to take the necessary current from the Dover Electricity Supply Company, they entered into an agreement with that Company to provide all the power required for working the tramways at a price of 3*d.* per Board of Trade unit, subject to reductions on a sliding scale as the consumption of energy increased. This installation possessed features of unusual interest which deserved the careful study of all interested in the success of either tramways or electric lighting stations. The well-known disadvantage that all electric supply stations

laboured under was the want of a day load, and the consequent length of time that the plant was not only not earning a dividend, but that its stand-by losses were constituting an actual drawback to the dividend-earning capacity of the undertaking. Tramways, on the other hand, found the inevitable fixed charges in connexion with a generating station (and particularly with those of smaller size) were a serious consideration, and made it possible for a tramway to purchase its supply of electric energy from an electric lighting station at a price which while yielding them a fair profit, would be below the cost at which the tramway could generate its own electricity. The Dover Corporation was the first body which had practically grasped the economic possibilities of the problem before them, and the Dover tramways would be the first tramways to be worked from an existing electric lighting station. This pioneer movement and its results would be watched with much interest by all municipalities interested in the success of their electric lighting stations.

The President said that some time ago Brighton turned out in thousands to meet the great display of motor-cars from London, but the thing ended in fiasco, and only five cars reached there. But the idea of the motor-car was growing, and some enterprising men in Brighton proposed to have motor char-a-bancs to take people to the Dyke; but the motor had not been licensed.

Mr. Yabbicom, Bristol, said that in Bristol the overhead electric system was appreciated, but it was a disfigurement of the streets. Though the Bristol Company had not succeeded in obtaining the extension which they had hoped for, the public had taken the matter up, and they hoped, by bringing pressure to bear upon the Corporation by the ratepayers, to get an extension of the system.

Mr. E. Pritchard, Birmingham, approved the Dover policy of municipalising the tramways. He believed they had a thoroughly workable system; but as a result of the electric lighting plant not belonging to the Corporation, they were going to pay what he considered the excessive sum of 3*d.* per unit for the electric power.

Mr. Lobley, Hanley, said that a good deal had been said about the appearance of overhead wires, but it was a remarkable thing that every deputation which had gone abroad had come back converted to the trolley wire (Mr. Price: "No")—not Birmingham. He was prejudiced himself some time ago, but after he had been in Boston twenty-four hours, he had ceased to notice the trolley wire. He could not agree that the conduit system was the best. With regard to cost of electricity, he would be glad to get 1*d.* per unit in Hanley.

Mr. Price, Birmingham, said he had been fortunate enough to be one of the deputations which visited the Continent recently to investigate the various systems of electric traction. The result of their investigation was that they would not on any condition sanction overhead wires in Birmingham. In Birmingham they had been engaged for years in removing wires from the streets; it would be folly to go back and put wires in the streets. He agreed that, commercially, the overhead system was economical; it was cheap to install, and the cost of working was not greater than any other system. The difference of initial cost had been somewhat exaggerated. The cost of equipping a good overhead system was 7,000*l.* a mile; and a good conduit system had been put down for 10,000*l.* a mile. The price charged per unit for electricity was not more than 1*d.* anywhere on the Continent.

A paper by Mr. A. T. Walmisley, C.E., Engineer to the Dover Harbour Board, on groynes, was taken as read. In the course of his paper, the author remarked that the ambition of every maritime town under municipal control was to combine the maximum advantages of a seaport with a minimum of its dangers. This fact gave primary importance to the maintenance of cliff faces, the retention of a foreshore, and the execution of such works of protection as were necessary to secure these objects. A shingle beach was the natural protection of a coast, as the most erosion and the greatest encroachments of the sea occurred in places where shingle was deficient, or where groynes were not properly maintained; but where groynes had been properly set out and maintained they had exerted an influence to protect a coast or wall against which they abutted. They should, as a rule, be directed towards the prevailing

gerous wind, and if the coast suffered from quarters, say, from south-east and south-west winds, land ties on each side of the groynes could be introduced. Care must be taken to give ample strength at the intersection of the inclination of the groyne with the level of high water, ordinary spring tides, owing to the momentum of the waves being greatest at the end of the tide. While there was no subject dependent upon local circumstances as the instruction to be adopted for a groyne, he directed attention to examples of groynes with their verticals, and also with iron verticals, the latter generally consisting of double railway rails with 3 in. or 4 in. planking intervening to a box groyne system, suitable for situations where a broad base foundation was needed, the case of timber bolted between old rails practice had sometimes been to weld the metals together at the point, necessitating expense of heavy labour. At Sandgate this was obviated by the introduction of an improved pile point, devised by Mr. Stilgoe, and patented by him. The point or shoe was made with a V-shaped head, from whose flange a link contrived to receive the vertical railway metals which were connected therewith by bolts. A system of open groynes, which had been advocated by Mr. A. Dowson, consisted of uprights driven into the foreshore, having horizontal gratings attached to them, which it is alleged trapped and retained the shingle. The author preferred the addition of diagonal boarding as well as longitudinal boarding, which aided to prevent apertures in a groyne where shingle could work through, and also served in exposed situations to tie the groyne well both at the head and foot. The storm angle beach upon the south coast was approximately 1 in 10, and this formed a ruling precedent for intermediate groynes upon a fore-re. The critical time was after a gale of wind in winter. Groynes did not create a danger; they only arrested it, and this arrested danger was judiciously arranged. There was no doubt that when, by their aid, beach could be raised, the erosion of cliffs was reduced to a minimum by the check upon the wave action which otherwise would dash against an unprotected cliff. In conclusion, the author said that the danger arising from groynes should be escaped attention. They produced ill as well as good effects, because it not infrequently happened, that whilst sand and shingle might be collected upon the windward side of the groyne, all such accumulations were simultaneously prevented from taking place on the leeward side. Hence the situation and direction of the groynes to a foreshore should be studied on all points of view.

During the day the members visited and inspected the new harbour works, the electric light works, the new town depot and stables, and the tramways which are in course of construction. The Mayor of Dover entertained the members to luncheon at the Town Hall.

FIRE-CLAY MANUFACTURES.

THIS was the title of a paper read by Mr. V. H. Allen before the Northern Architectural Association on the 24th ult., at Messrs. Harrisons' Works, Blaydon-on-Tyne.

After a few preliminary remarks, the author proceeded to deal with the raw material, fire-clay. "A good fire-clay," he said, "should have a uniform texture, a somewhat greasy feel, and be free from impurities. Silica and alumina are the chief substances of which fire-clay is composed. The proportions of these substances vary very much in the clays obtained in Northumberland and Durham; but I should consider a fair average to be as follows—50 to 55 per cent. of silica and 30 to 37 per cent. of alumina.

The great bulk of the clay raised is used in the manufacture of fire-bricks for heat-resisting purposes, but of this class of manufacture I do not propose further to refer.

There is a fire-clay of very fine quality, and of many respects different from that which I have just spoken of. This clay is found apart altogether from the coal measures. It is also different in colour, being of a reddish-brown tint instead of a slate grey. It possesses a very dense body when burned, similar to that of stoneware. The outcrop of this clay is found and worked a little to the north of Corbridge.

I will next speak of the treatment of clay. It is delivered out of the pits mostly in large, hard pieces, and has to be ground into a powder of varying degrees of fineness or

roughness, according to the article into which it is to be manufactured. If for heat-standing purposes, it has to be ground what we term 'rough'; if for treatment for salt-glazed goods it has to be ground finer, and if for white or cane goods it has to be ground finer still, and for this latter purpose carefully selected so that no nodules of iron-stone may be left in the clay, as in that case it would fuse at the great heat in burning, and spoil the goods. The modern method of grinding is as follows—The lumps of clay are tipped into a perforated pan mill some 8 ft. to 9 ft. in diameter. This pan revolves, and revolving within this pan are two metal rollers. The clay is carried under the rollers by the revolutions of the pan, and is thus crushed by degrees into powder which gradually finds its way through the perforations in the bottom of the pan. Underneath the perforated bottom of this pan is a cast iron saucer, which receives the powdered clay thus passed through the perforated mill. It is then carried round by an iron arm, so arranged that all the ground clay is forced into a well or huge pocket a little below and at one side of the foundation of the mill. Working down into this are the elevators which fill themselves with the ground clay, and carry it up to a higher story any height that may be required, and then empty themselves into a shoot, which conveys the clay into a riddle.

This riddle is hexagonal in form, say 7 ft. or 8 ft. long and 3 ft. or 4 ft. in diameter. This is kept revolving, and its action in so doing allows the fine clay to pass through the wire forming the riddle into a further shoot, which, in its turn, delivers the clay of the required degree of fineness to wherever it may be wanted. The wire of these riddles is of varying degrees of fineness, in some cases fifteen meshes to the inch, in others only five meshes to the inch. Whatever particles of clay are too large to pass through the riddle or sieve (for practically the riddle is only a large sieve) are returned to a separate shoot, that, in its turn, conveys the rejected particles of clay back to the pan-mill to be re-ground.

The clay that has been passed through the riddle and delivered to its destination is now ready for mixing. For this purpose it is put into a pan-mill with a *solid* bottom. This pan-mill also revolves, and has within it two revolving rollers. A sufficient quantity of clay is put in, and as this is being done water is added to reduce it to a plastic condition. The metal rollers passing over this wet clay knead, prepare, and give it body, the required stiffness being regulated by the supply of water to the clay. The men in charge of this mill can tell by experience when the clay is ready for the machine or mould. It is then taken out and ready for manufacture.

There are other methods of preparing the clay, but the foregoing is the most modern, and I believe the most effective. In the manufacture of all the varied articles made by my firm, the clay is prepared up to this stage for every one of them in the same way, rough, medium, or fine clay going through the same process, but not through the same riddle.

I have now to describe how the various goods are manufactured from the prepared clay. Firstly, I will take the process of manufacturing sanitary pipes. These are all made by a properly constructed pipe machine, which consists of (1) a steam cylinder, (2) a clay cylinder, (3) a contrivance for forming the inside of the pipe, (4) another for forming the outside of the pipe, and (5) one for moulding the inside and the outside of the sockets.

The steam cylinder stands on a metal frame placed on the strong beams or girders of the first floor. Immediately below this floor is placed the clay cylinder. Between the steam and the clay cylinders is a space of about 18 in., through which the prepared clay is thrown into the mouth of the clay cylinder by boys. Attached to the piston of the steam cylinder is a metal disc, termed a plunger, which works through into the clay cylinder and forces the clay down until it forms a pipe. At the underside of the clay cylinder an apparatus is fixed for shaping the pipe. This consists firstly of a cone or core, which is attached to the end of a strong rod passing down the centre of the cylinder. These cores are the exact size of the internal diameter of the pipe to be manufactured. This, you see, determines the inside size; and, secondly, a large square cast-iron plate, with a circular piece cut out of the centre, equal in size to the diameter of the outside of the pipe, regulates the thickness of the pipe. This we term the die plate, and it is fitted

on to the frame work of the lower and outside portion of the clay cylinder. These die plates correspond in every case with the size of the before-named cores, so that when the core and the die plate are both accurately fitted into the bottom of the clay cylinder, you have an open space through which the clay emerges equal to the section of the pipe to be manufactured.

But before the pipe can be manufactured, the socket of the pipe has to be formed, and small though the socket may be in proportion to the pipe, it is much more difficult to manufacture, and takes a much higher power to press than the pipe itself, inasmuch as you have to press the thin wall of clay round a corner, so to speak, and then down the length of the socket. Several moulds are provided, internal and external. The internal mould is a thick ring, in shape the exact reverse of the inside of the socket; this is placed directly under the core previously described, and held there until securely locked. The external mould is made in two halves, and obviously the exact reverse of the internal mould; these are worked in grooves attached to the underside of the die-plate, and are brought together by a lever. The contrivance holds all the mould, internal and external, together.

When the socket moulds are in position, steam is applied by a lever, and the clay is forced down the clay cylinder through the space between the solid core and the circular edge of the die-plate right into the socket mould. When this socket mould is filled, the two halves forming the external mould are released. The internal mould remains. Steam is applied again, and the pipe is delivered to its required length, then cut off with fine wire. There is no joint whatever between the socket and the body of the pipe, the supply of clay being continuous; it is then carried away by the men to the flats to be dressed, dried, and made ready for burning. Every size of pipe requires its own size of cone, die-plate, and socket moulds.

Out of the pipe machines such as I have described, any sized pipe, 2 in. to 24 in. in diameter, can be made—some fifteen or sixteen different sizes. Special machines are constructed to make pipes up to 36 in. in diameter. Pipe machines are largely constructed in Leeds. When the pipes are what we term 'white,' or 'bone dry,' they are set in the kiln. We have found the best kind of kiln for burning pipes to be the circular kiln. These have fires all around them, so that there is every chance of the whole kiln getting equal heat. The pipes are protected from the flash of the fire by an internal wall running up 1 ft. or 2 ft. above the fire. The top of the wall all round the kiln is utilised for setting goods on to be burned, excepting the portion directly in front of the fire.

These kilns are known as down-draught kilns. The heat ascends to the top of the kiln, but as there is no outlet there, it is drawn by the draught of the chimney down through the pipes and through the bottom of the kiln (the arrangement of which is known as a riddle bottom) to a central well, and thence through underground flues to the chimney.

When the kiln is as full as possible the door gap is built up, the fires are lighted, and the heat got up very slowly. In the course of three or four days the kiln comes to its full heat, which is so intense that, looking into it at this stage, you can see every part of the kiln with startling clearness.

And now comes one of the most interesting events of all the process of the manufacture of a pipe, that is, the imparting to it of the brown gloss or glaze with which you are all so familiar in a sanitary pipe. This is done by throwing into the kiln, at almost its greatest stage of heat, a few barrowfuls of common salt. The temperature of the kiln is so high at the "burning off" that the volatile salt is at once converted into vapour, which completely surrounds all the exposed surface of pipes, &c., in the kiln, and there is consequently a reaction of the vapour on the silica of the clay bodies. The agent which promotes the action of the silica and common salt is the aqueous vapour which is always present in the flames of the furnace. The oxygen of the water produces soda with the sodium of the common salt, while the hydrogen combines with the chlorine, and is evolved as hydrochloric acid. The soda then enters into combination with the silica and forms the glaze. This may be termed a coat of soda glass, or in other words, the salt, subject to the great heat, instantly vapourises and covers every particle

of exposed surface. The first application puts on to the articles in the kiln a preparatory coat of glaze, and successive charges at different periods add to the thickness and lustre of the gloss, until sometimes we get what is almost equal to a coat of glass. After the last application of salt the kiln is finished, as far as the burning is concerned. All air inlets are closed up, and the kiln is allowed to cool down very carefully. Some idea of the time occupied in this process may be of interest to you, so I will give you a fair average of same—

Time of drying on flat 2 days.
Time from lighting the kiln to setting it off full fire..... 2 days.
(Termed *soakings*.)
Time under full fire 1 day.
Time for cooling 2 days.

Total..... 7 days.

This average applies more particularly to our own case; other manufacturers generally require more time, according to the nature of the clay. Before leaving the manufacture of pipes let me say that they are made in two different thicknesses, viz., one-tenth and one-twelfth of the internal diameter, the former to meet the requirements of certain engineers, who regularly specify them, and the latter for general use, where not otherwise specified. Bends are made from the pipe machine. Junctions are formed by sticking the size of junction required on to the pipe. Very quick bends, traps, interceptors, and specialities, are made from plaster moulds.

We will next speak of the manufacture of glazed bricks. The clay for these is prepared as previously described, then delivered to a moulder, who moulds them from a brass mould in the usual way; as soon as they are sufficiently stiffened they are pressed in a hand or steam press, laid on the flats to dry, and when quite dry are put into the kilns and burnt to what is known as biscuit heat, or only a moderate degree of hardness; they are then brought out of the kilns again to be prepared, dipped with body and glaze, and made ready for the final burning. As very few have any idea of the number of times these bricks have to be handled before they finally emerge from the kiln, fit and ready for sale, I will describe the method fully. Up to this time each brick has been handled in the process thus described about ten times, and they have, in the following, to be handled a further ten times, so you have for a total, say, twenty times for each brick to pass through a workman's hands.

The bricks are now sorted, brushed clear of all dust, and put on to a long board in patches of four or five in close contact; a boy dips a brush in water and rubs over the face or other portion to be afterwards glazed; another boy follows with a brush dipped in a certain preparation termed "tint," and brushes the bricks to fill up the pores and form a groundwork for the next process, which is the dipping of the brick in the first tint (a mixture of ball clay, &c.), of the consistency of something like cream; this is of a very tenacious and adhesive character, and completes the groundwork. It is then dipped in a mixture of about the same consistency named "body," which determines the colour of the brick; this largely consists of china clay, which gives a dead white colour.

The brick now receives its final dip in the glaze itself (a preparation of felspar, Cornish stone, &c.). But with these repeated brushings and dips there is a superfluous substance on both sides and ends of the bricks that has to be removed, or otherwise the bricks would stick together in burning, or if they did not you would have an edge that would be highly objectionable. This has to be cut patiently off every brick before it can be set in the kiln; this being done, the kiln is filled and burnt again. It takes about five or six days to burn the kiln off, and then a further week to cool it down. Quick cooling is apt to cause crazing. The whole process of glazed brick making requires the utmost care; the proportions of the different minerals of each of the three preparations forming the tint, the body, and the glaze, have to be most accurately weighed out; a mistake in any one of these would be serious. The raw materials forming these are put into tanks containing water to steep; then the whole mixture has to be sieved and resieved through gradually finer sieves until a very fine liquid is obtained. Further, the consistency of this has to be regulated by weight, viz.: 27, 28, 29, or 30 oz. to a pint. One of these weights will be fixed according to circumstances; half an ounce heavier

or lighter will have a disastrous effect. Take the case of the glaze: if it is the slightest degree, or say $\frac{1}{2}$ oz. heavier than the fixed weight, the bricks may come out crazed. If it is $\frac{1}{2}$ oz. lighter, there will be little or no glaze on the brick. To get coloured glazed bricks, we use prepared stains to produce the required colour. Some of these are applied to the body as in blue glazed bricks; some are applied to the glaze, as in chocolate or brown bricks.

Cane and white glazed kitchen and scullery sinks are made from moulds. After they are out of the moulds they are squared and dressed up, and when they are required to be made white the body determining this is brushed on with specially made brushes. It will take five or six coats of this white body to cover the clay perfectly, and give the necessary tone of whiteness, but you cannot apply more than two coats per day. The sinks must be made quite dry, or as we term it, "bone dry," before the glaze can be applied. There are two systems in the trade for glazing sinks. One system is by twice firing, or biscuiting, then glazing as in the case of the bricks; in this case the glaze is thrown on to the sink in its biscuit stage, and then reburnt and glazed, or in some works the glaze is applied by immersing the sink in the glaze and then burning it. The other method is by one burning only. We adopt this latter system. In this case the glaze is brushed on in a similar way to the body. Every particle of moisture has to be expelled before putting the sink into the kilns. Each system has its own advantage and its drawbacks, and you have to be guided by local circumstances as to which to adopt.

In the matter of kilns, sink kilns are quite different from the well-known Newcastle, or the round kiln; they are termed muffled kilns, and are constructed so that no flame may reach the contents. The heat goes all round the kiln between the outer and inner arches, and gradually but effectually penetrates through the walls and floor of the inner arch. The utmost care has to be exercised in the burning of these kilns, first of all to apply the heat very gradually, and then to determine the exact moment when it is burnt sufficiently.

Just as we are assured 'there is a tide in the affairs of men, which, taken at the flood, leads on to fortune,' so there is a moment in the burning of sinks, which, if seized, crowns the effort with success; or missed, ends in partial, or complete, failure. To enable us to attain this much desired end, small trial pieces are inserted in the kiln with the sinks, and drawn out from time to time until the crucial moment arrives, when it is declared to be finished. The kiln has then to be cooled down most carefully, which takes about six or seven days.

Channel pipes and bends, for which a great demand has arisen in late years, are made out of plaster moulds; the number of moulds required is enormous. The body and the glaze, in the case of these articles, can be run on; they are dried and burnt with the sinks. Fireclay water-closets are made in plaster moulds, accurately fitted together, the body and glaze applied as in the case of sinks and bends; they are also burnt in a similar manner to sinks. Majolica glazed bricks differ from ordinary glazed bricks in their manufacture in one or two particulars:—1st. The body beneath the glaze is for the purpose of obtaining a fine surface, not so much for determining colour. 2nd. The glaze is very soft, and runs at a much less heat. 3rd. There is no waste to be cut off the edges of the bricks; it overlaps without interfering with the utility of the brick. 4th. Each brick has to be set face up and burnt independently of the other, and also in a muffled kiln.

COMPETITIONS.

GOVAN TOWN HALL.—At a meeting of Govan Commissioners, held on the 14th ult., it was decided to award the first places to the plans marked respectively G, E, and O of those submitted in response to the Commissioners' invitation for competitive plans for the erection of the proposed Burch Hall. The premiums offered were 100*l.*, 50*l.*, and 25*l.*, and all three have gone to Glasgow architects. Messrs. J. Thomson & Sandilands, 241, West George-street, take first place with G plan, Messrs. Thomas Dykes & Robertson, 65, West Regent-street, second place with E plan, and Mr. W. H. Howie, 134, West Regent-street, third place with O plan. The estimated cost of the building according to the plan adopted is 23,000*l.*

CONSERVATIVE CLUB, NUNEATON, WARWICKSHIRE.—The successful architect in this competition is Mr. C. W. Smith, Market-place, Grantham.

Correspondence.

To the Editor of THE BUILDER.

THE R.I.B.A. ELECTIONS.

SIR,—As the truth of the statement that a large proportion of the members do not vote at the annual elections for the Council has been questioned, following are the actual figures from the Institute *Journal* in reference to the last election—

There were only 498 envelopes containing the voting papers, and twenty-nine of these were spoiled by informality. No candidate obtained more than 301 votes, although the total number of members with voting powers was then 1,581; therefore, no less than 1,113 neglected or refused to send in voting papers.

It is to be hoped that there will be more vote this year, and that they will consider that six members of the Council, with twelve existing members, is a fair proportion.

The best way to secure this result would obviously be to "plump" for new candidates only, for it is absolutely certain that twelve at least of the ones will be returned.

"AN ARCHITECT FROM YORK."

April 28, 1897.

SIR,—The fact that sixty existing members (out of sixty-four) have nominated themselves for the Standing Committees should be widely known. The best thing to be done under the circumstances was to "plump" for new candidates, as in any case a large proportion of existing members must necessarily be returned.

As seven members of the existing Council are renominated for eighteen seats, it is desirable that a number vote, and for new men only. The existing seventeen members will, no doubt, be well looked after by their own friends, and, as they have renominated themselves, will, probably, also vote for each other; but a few of them should make place for new blood.

A LONDON ASSOCIATE.

MORLEY BATHS COMPETITION.

SIR,—I should be greatly obliged if you could (through the influence of your paper) get to know the result of the Morley Baths Competition. The designs were sent in before the end of January; deposit of 10*s.* was made for conditions, which was to have been returned on receipt of bona-fidesigns. It is now virtually the end of April, three months have gone, and not a word have we heard except through a traveller of a Leeds fireclay firm, who was at my office in February, and confidentially stated that Messrs. Holton & Fox, of Dewsbury, were the winners. The following week this was published in your paper, and a week or so later it was stated that another design was proposed, as the design of Messrs. Holton & Fox had not come out according to estimate. (Here note that the conditions gave no amount, or even any suggestion of the sum to be spent.) This brings me to about the third week in February, since when we have been in total darkness as to the scheme.

In your issue of January 2, an architect wrote you enclosing copy of correspondence which passed between himself and the Borough Surveyor of Morley, which, he considered, threw a doubt upon the fairness of this competition. Under any circumstances, I think, it is quite time the result was known, and plans and deposits returned to the unsuccessful competitors.

A COMPETITOR.

The Student's Column.

SPECIFICATIONS.—XVIII,

PLUMBER.

It is usual to keep separate the external and internal plumbing, and to commence with the specification of the external work.

Materials.—The whole of the sheet lead to be the best new pig lead, properly milled and free from all defects, to be weighed whenever required at the contractor's expense, and to weigh the specified weight. The contractor is to supply all necessary solder, lead hooks, copper nails, &c., required in laying lead work. Solder is not to be used in fixing external lead work save where absolutely necessary, but lead clips of not less than 6 lbs. lead are to be used; and for securing edges turned into joints of brickwork, as in aprons and flashings, lead wedges are to be used, and joints are to be pointed in cement. The zinc to be Vieille Montagne zinc, and it is to be supplied and laid by Braby's, of Euston-road, London, with holding-down clips, improved solid stoppings and ridge plates. No soldering or other rigid fastening is to be externally used. (If th

hitect has reason to believe that the con- tor will employ a competent zinc layer, not lumber, it may not be necessary to stipulate it the work shall be done by Brabys'. But it very important that zinc should not be laid th rigid fastenings, so as to be perfectly free expand and contract. Neither copper nor nailing must, of course, be used for zinc

Lead in Flats and Gutters.—Lay the flat over with 7 lb. lead, laid to a fall of 1 1/2 in. ft. with 2 1/2 in. rolls, 3 ft. apart, centre to stre, and cross-rebated drips 10 ft. apart, as on plan. The drips in all cases to be in. deep, and the ends of rolls to be properly ssed. The gutters to main roof to be laid th 7 lb. lead, 9 in. wide in narrowest part, d turned up 9 in. under slating, and dressed er tilting fillet. The cesspools to be of 7 lb. d, 8 in. by 8 in., inside dimensions, and 6 in. ep, with a 3 ft. length of 3 1/2 in. bent draw d pipe of the substance of 7 lb. lead, with ed end soldered to bed of cesspool, which is e dressed into dish and rebated peration. These bent lead pipes are to dis- arge into heads of rain-water pipes.

Lead Valleys.—The valleys of main roof o be laid with 6 lb. lead, 18 in. wide, dressed der slates, and over tilting fillet; the joints eams to be lapped and welded.
Flashings.—Where lead roof abuts against ickwork the lead is to be turned up 5 in., and ver flashings 6 in. wide of 5 lb. lead are to e led, turned into joints of brickwork 1 1/2 in., here the sloping edges of roofs abut against rical sides of dormer, put lead secret gutter n. wide of 5 lb. lead, covered with 5 lb. lead shing, 6 in. wide, with 4 in. laps. This flash- g to be close copper nailed to boarded sides of dormer cheeks.

Cheeks of Dormers.—The dormers on of to have their cheeks covered with 6 lb. ad, secured to boarding with close copper iling at top, and soldered dots and screws, o, 3, to each cheek.

Chimney Gutters.—The gutter at back of imneys to be of a minimum width of 6 in., id with 6 lb. lead, turned up 5 in. against ickwork, and with cover flashings of 5 lb. ad, 6 in. wide, fixed in a similar manner to ose before described.

Aprons.—Put aprons, 12 in. wide, of 5 lb. lead, all chimneys and dormers.

Soakers.—Put soakers or secret gutter to hips already described under "slater."
Skylight.—Specify the lead work round the skylight in a similar manner to that already ven for chimney stacks; that is, lead gutter a top, apron at bottom, and soakers or secret uler at side, either with or without flashings.

Lead Sills.—Cover the sills of with lb. lead, properly-dressed round same, cop- eral at top edge, and with bossed ends to rojections.

Pomnels of Hips.—Cover the pomnels of ipped with 6 lb. lead, beaten up, bossed, and tted to wooden hip knob on roof in accord- ce with detail.

Lead Rain-water Pipes.—The rain-water pipes to be 3/4 in. drawn lead pipes, weighing 3 lbs. per foot run, and each to have ornamental lead caps and tucks purposely made in accordance with detail. The heads to be of lb. lead, bossed, beaten up, and cut in accordance with detail, and each to have No. 2 pieces of strong 3/4 in. lead pipe as stiffeners cross top, to take long coach screws for fixing. The coach screws to have hexagonal eads, and to be covered with ornamental ad bosses, as shown on detail, soldered on.

Lead Eaves Gutters.—Dress the eaves gutters in stone cornice of main roof with 7 lb. ad laid to fall of 1 in. in 10 ft., the joints to be apped and welded, lead to be dressed over one cornice projecting 1/2 in. beyond top corner, slightly turned up, secured to stone work, with lead plugs and screws and sol- dered dots 3 ft. apart, and taken up 9 in. under slating. The cesspools to be formed as already escribed for lead gutters.

Zinc Flats.—Flat over to be covered with No. 15 gauge Vieille Montagne zinc, laid to fall of 1 1/2 in. in 10 ft., with capped rolls 3 ft. 10 in. from centre to centre. Drips to be 3/4 in. deep cross rebated and 7 ft. apart.

Zinc Gutters.—Lay the gutters to with No. 15 gauge Vieille Montagne zinc of a minimum width of 9 in., laid to a fall of 1 1/2 in. in 10 ft., turned up under slates 9 in. on each side, eured with holding down clips. Drips to be 3/4 in. deep cross rebated and 7 ft. apart. The cesspools to be in 5 lb. lead, 8 in. by 8 in., inside dimensions, and 6 in. deep, with a 3 ft.

length of 3 1/2 in. bent pipe of 6 lb. lead to dis- charge into head of water pipe.

Zinc Eaves Gutters.—These are by no means to be recommended, but if used should be specified thus: Eaves gutters to be O.G. moulded 4 in. eaves gutters of No. 15 gauge Vieille Montagne zinc with stiffening tubes 3 ft. apart, and fixed to fascia with large-headed zinc nails.

Internal Plumber.

Lead Pipes.—The pipes to be of the follow- ing weights per yard run:—

Wastes:—1 in. 7 1/2 lbs.
1 1/2 in. 15 lbs.
2 in. 18 lbs.
2 1/2 in. 24 lbs.

The services and supplies:—

1/2 in. 6 lbs.
3/4 in. 9 lbs.
1 in. 12 lbs.
1 1/4 in. 16 lbs.
1 1/2 in. 24 lbs.

Taps.—All the taps to be of quality brass, or gun-metal taps, and unless otherwise de- scribed, the bilh and stop-cocks to be "full- way" high-pressure screw down valves. The ball valves to be of the make known as "equi- librium." All bilh-taps to have screw ferrules, and all stop-cocks screw unions, so that the taps may be removed for repairs without breaking the joints in the pipes.

Fin-lined Pipes.—The whole of the pipes used for cold water supply to be wrought-iron, block fin-lined pipes known as Walker's Patent Health Water Pipe, to be obtained of

and to be put together in accordance with the instructions of the patentee; (or) the whole of the pipes used for cold water supply to be block fin-lined lead pipe, the joints of which are to be formed with gun-metal linings and screwed sockets, the pipe ends being tinned to linings.

Joints.—All joints in lead pipes are to be wiped soldered joints, and no blow pipe or bit joints are to be used.

Pipe Fixing.—All horizontal pipes are to be fixed on 1 1/2 in. by 3 in. wrought and splayed fillets, plugged to wall with hollow groove on top side for pipe to lie in, and each to be laid with a fall towards the rising main, so that pipes may be emptied from draw-off tap at bottom of same.

Vertical pipes are to be fixed by face tacks, and not by pipe clips or wall-hooks. Water pipes in roof are to be cased with 3/4 in. deal casing, 6 in. by 6 in., clear inside, packed with slag wool. (Or they may be encased with felt or other good non-conductor, so as to preserve them from frost as far as possible.)

OBITUARY.

M. PAUL BLONDEL.—This eminent French archi- tect, a former pensionnaire of the French Academy at Rome, and official architect to the Louvre, has just died at the age of fifty. He was a native of Paris, and after studying as a pupil in the atelier of M. Daubigny and at the Ecole des Beaux-Arts, he obtained the Prix de Rome in 1870, and sent home a number of fine drawings, among which his restoration of the Temple of Fortune at Preneste gave him at once a reputation. The "Direction des Bâtimens Civils" found in him a learned, helpful, and energetic official. But he carried out also a number of works in private practice, of which the most important are the Furtado-Heine Dispensary, some large private residences at Mul- house, a Chateau near Limoges, the monument to Etienne Doleat at Paris (in collaboration with M. Guilbert, the sculptor) &c. At the Louvre, where he succeeded M. Guillaume, he commenced the work of rearranging the salle des Etats. Though M. Blondel was known to have been suffering more or less for some time from a local ailment, it was never supposed that his life was in danger, and his comparatively early decease has come as a painful surprise to his friends and the French architectural profession generally.

Mr. J. GARDNER.—Mr. J. Gardner, architect, of Cheriton-place, Folkestone, died somewhat suddenly on the 19th ult. Deceased was well known as one of the leading architects in the town, and designed most of the modern ecclesiastical edifices in Folkestone. The funeral took place on the 20th ult. —Kentish Express.

GENERAL BUILDING NEWS.

THE JUBILEE PAVILION, ST. PAUL'S CHURCH- YARD.—The huge pavilion to be erected for the Diamond Jubilee Celebration by Mr. J. N. Maskelyne in St. Paul's Churchyard, on the site now occupied by Messrs. James Spence & Co.'s premises, has been designed by Mr. J. G. Buckle. The pavilion will consist of four tiers, and will seat about two thousand persons. A distinguishing feature will be the substitution of inclined approaches to the tiers

in lieu of the usual steps. The pavilion has also been designed so as to permit of the several parts being prepared and brought upon the site ready for fixing. There will be ladies' retiring rooms at each tier level, and refreshment saloon, lounge, smoking-room, and lavatories in the basement. The cost, including decorations, will be about 4,000l.

TOWN HALL, ROTTERHAM.—The new Town Hall at Rotterham was opened on the 28th ult. The architects of the building were Messrs. J. Murray and F. Foster, whose designs were selected in competition. The building, which is in the Renaissance style, has a frontage of 53 ft. to Lower-road, a return frontage of 161 ft. to Neptune-street, and a frontage of 54 ft. to Moodie-street. It contains, besides the usual offices and a Coroner's Court, a Council Chamber and a public hall, with sitting accommodation for 900 persons. The building has been wired by the Brush Electrical Engineering Co. for the purpose of lighting it by electricity at a future date, and the combination gas and electric fittings have been supplied by Messrs Charles Smith, Sons, & Co., Limited, as have also the locks and ironmongery throughout. The heating is by hot water on the low pressure system by means of a Gurney boiler, carried out by Messrs. Palowkar & Sons; and the fire hydrants and fire extinguishing apparatus have been provided by Messrs. Ham, Baker, & Co. The ventilators have been supplied by Messrs. Kite & Co.; the speaking tubes by the Homaconic Tube Co.; and the chimney-pieces by Messrs. Shuttley & Co. Mr. John Carter has officiated as clerk of works, and Mr. Diprose as general foreman. The whole contract for the works has been carried out by Mr. Howell J. Williams. The furniture has been supplied from the designs of the architects by Messrs. Atkinson & Co. An illustration of the building and a short description appeared in our issue for March 16, 1895. BOARD OF SCHOOLS, GLASGOW.—On the 23rd ult. Rosemount Public School, Milburn-street, Garnag Hill, Glasgow, was opened by Sir John Neilson Cuthbertson. The school is erected on a site at the highest point of Garnag Hill. The site has a considerable fall from front to back. The drill-hall, janitor's house, and heating and ventilating apparatus have been placed on the lower level facing eastwards. The school and class-rooms, sixteen in number, and varying in size from accom- modation for 173 to sixty-two scholars, are grouped round the central hall on two floors, and provide places for fully 1,203 children. The walls are of red sandstone from Ballochmyle quarries, finished in squared rubble with polished dressings. The play-grounds are laid with tar-macadam paving. The total cost, exclusive of site, is expected to come within 13,000l. Mr. J. B. Wilson, of Glasgow, was the architect.

CATHOLIC CHURCH, BIRKDALE.—The Roman Catholic Bishop of Liverpool (the Right Rev. Dr. Whiteside) laid the foundation stone of the new church of St. Teresa, Birkdale, on the 25th ult. The building will be Gothic in design, the architects being Messrs. Simott, Simott, & Powell, and the contractors Messrs. Fairbridge & Hatch, of Birkdale.

ALTERATIONS, DUNBAR PARISH CHURCH.—The alterations at Dunbar Parish Church have been accomplished. The whole of the interior has been removed, and the large area has been sub-divided into nave and aisles by means of an arcade of five arches and pillars on each side. A semi-octagonal apse has been thrown out at the east end, opening into the nave with a large chancel arch, and having a minister's vestry on one side and an organ chamber on the other. Two of the apse windows contain stained glass. The nave ceiling has been opened out and raised. The tracery front of the old gallery has been worked into the front of the end gallery, and the steps of the old stairs have been used again in the staircases. The Dunbar monument now stands on the floor level of the church, against the east wall of the north aisle, completely restored. The work has been carried out from the designs, and under the supervision, of Messrs. W. & J. Hay, architects, of Liverpool, by Messrs. Robert Hall & Co., of Gala- shiels, and by local tradesmen.—Glasgow Herald.

PUBLIC HALL, KIBBINGROVE.—The foundation- stones of the new Victoria Hall and Public Offices, about to be erected by the Urban District Council, were laid on the 22nd ult. It is proposed to erect buildings for the accommodation of the Council, and a hall for public meetings, &c., a fire station, and a town yard. Messrs. Wood & Hutchings, of Unstall, are the architects; and the tender of Mr. Charles Cope, of Unstall, for 2,060l., has been accepted.

HALL, ORMOND QUAY PRESBYTERIAN CHURCH, DUBLIN.—A new hall has just been opened in con- nexion with this building. It has been erected from the designs and under the superintendence of Mr. W. M. Mitchell, architect, the contractor being Mr. John Good.

SCHOOLS, LLANRWST, NORTH WALES.—A new County Intermediate School for girls is to be built, and additions made to the boys' school at Llanrwst, North Wales, from the plans and under the superin- tendence of Mr. H. Teather, of Cardiff.

CHILDREN'S HOME, FORMBY, LANCASHIRE.—A children's home has just been opened at Formby for the Church of England Incorporated Society for Waifs and Strays. The building, a brick structure, is situated in Andrew's-lane. On the ground floor there is a recreation-room 33 ft. by 10 ft., and dining

room 24 ft. by 16 ft., also matron's room, kitchen, scullery, pantry, laundry, washhouse, and the usual outbuildings. Upstairs there is a dormitory containing eighteen beds, a smaller one containing twelve beds, and a ward for sick children containing four beds; also matron's and servants' bedrooms. There is one bathroom and latrines on the ground floor for boys and on the bedroom floor for girls, and the latrines are outside in a covered yard. The building was designed by and the contract carried out under the personal superintendence of Mr. J. H. Havelock Sutton, of Liverpool and Formby, and the work was executed by Messrs. J. & G. Chappell, builders, of Walton.

WESLEYAN CHAPEL, IRTHLINGBOROUGH.—On Good Friday the new Wesleyan Methodist Chapel, which has just been erected at Irtlingborough, was opened for public worship. The new building has been built from plans by Mr. John Wills, and the contractors were Messrs. E. Brown & Son, of Wellingborough. The heating work, &c., has been executed by Mr. Marriott, of Higham Ferrers.

NEW GOVERNMENT OFFICES, DERBY.—The new Government offices, which have been erected at Derby for the accommodation of the County Court and Inland Revenue officials, were recently opened. The elevation of the building is in brick and terracotta. Ascending the steps from St. Peter's Churchyard, the visitor to the new premises enters a corridor extending the full length of the building. On his right are the registrar's and clerks' offices, and on the left the Inland Revenue offices, with a private room for the collector. Beyond are solicitors' rooms, stores, and jury rooms. A semi-circular stone staircase leads to the upper floor, on which will be found a registrar's court, measuring 48 ft. by 30 ft., and a smaller judge's court. The registrar has also a private office adjoining the bankruptcy department. Overlooking the street are private rooms for the Supervisor of Inland Revenue and Surveyor of Taxes. In the basement are caretaker's quarters, heating room, County Court, and revenue stores. The general office of the County Court is large enough for a numerous staff. In both courts ample provision is made for solicitors. The judge has a private apartment connected with the Bench. The building is illuminated by electricity, and is heated on the low pressure hot-water system. The boiler is situated in the basement. This work has been done by Messrs. J. G. & J. S. Ellis, Limited, of Sheffield. The premises have been erected by Mr. Wm. Eaton, of Derby. The architect was Mr. Tanner, of H.M. Office of Works.

WELSH BAPTIST CHAPEL, CARDIFF.—The tender of Mr. Jonathan Lewis, Cadoxton, has been accepted for the erection of the new Salem Welsh Baptist Chapel, Barry Docks. Mr. E. Jenkin Williams, Cardiff, is the architect.

WESLEYAN CHAPEL, ASHOPTON, DERBYSHIRE.—On the 22nd ult. a new Wesleyan chapel and school was opened at Ashopton. The work had been carried out by Messrs. Alfred & Hedley Hill, of Tidswell and Litton, and the architect was Mr. Herbert W. Lockwood, of Sheffield.

RESTORATION OF LESLIE PARISH CHURCH, ABERDEEN.—This church was reopened recently, after undergoing alterations. The plans for the restoration were prepared by Mr. Marshall Mackenzie, Aberdeen, and the work was carried out under his personal supervision. The style of the reconstruction and decorations is in the Renaissance, in keeping with the original building. The whole of the seating has been renewed and re-arranged. The entrance to the church is now from the west end, instead of from the east end, as formerly. A vestry has been formed at the entrance. The pulpit has been placed on a raised platform at the east end, and on this platform is also a Communion table. All the woodwork is of pitch pine.

THEATRE, SWINDON.—A new theatre is to be built at Swindon. It is to be erected at New Swindon, from designs prepared by Messrs. R. Milverton Drake & J. M. Pizey, architects, of Bristol. The theatre will accommodate about 1,600 persons. Three sides of the theatre abut on public streets. Externally the building will be of brick and freestone. It is to be called the Queen's Theatre, and will be opened about the beginning of October.

GROVE HALL, WANSTEAD, ESSEX.—The new building known as Grove Hall, Wanstead, was opened recently. The building has cost upwards of 2,500l., and it will seat over 500 people. The architect was Mr. E. N. Whitaker, and the builder Mr. J. Jolliffe.

METHODIST FREE CHURCH, BELLINGHAM, NORTHUMBERLAND. The opening of the new Methodist Free Church and School, Bellingham, took place on the 10th ult. The buildings are of stone, in the Gothic style. The block of buildings includes a chapel to seat 400 persons, a schoolroom, two vestries, lavatory, &c., heating chamber, and storage room. The ventilation of the chapel has been carried out by Messrs. Stott & Co., of Oldham. The schoolroom and chapel are heated throughout by hot water pipes. The contractors for the work are:—Masons, Mr. Isaac Welton, of Birtley; joiners, Mr. James Aynsley, of Bellingham; slater, Mr. J. Hewitson, Newcastle-on-Tyne; plasterer, Mr. A. Charlton, of Birtley; painter and glazier, Messrs. Forbes & Son, of Birtley; plumber, Mr. W. M. Smith, of Hexham; and heating, Mr. R. Vaux, of

Sunderland. The plans were supplied by Mr. W. Welton, of Humshaugh.

PRIMITIVE METHODIST CHURCH, NEWCASTLE.—The foundation-stones of a Primitive Methodist Church for the west end of Newcastle were recently laid. In 1887 a site was secured in Kingsley-terrace, Arthur's Hill, and it is upon this that the new church is now being erected from the designs, selected in a limited competition, of Messrs. Marshall Dick, architects, Newcastle. The hall in connexion with the church is placed below the building and is not sunk into the ground as a basement, and the school is entered from the street level on the Normanton-terrace side. The main entrance to the church is from the north end, at the junction of Kingsley-terrace and Normanton-terrace, and is approached by a flight of stone steps, which give access to a vestibule, communicating with the tower stairs and entrance, which is at the north-west corner. The church consists of nave and transepts, containing the bulk of the sittings on the ground floor, a small gallery, only accommodating about ninety, occupying the north end over the entrance vestibule, &c. The total accommodation is for about 500. The windows to the church are long trifoliate-headed lights, those in the main gable being grouped in pairs within a hooded arch. An organ chamber is provided, with arched opening facing into the west transept, where the choir is also to be situated. In the rear, on the church level, are arranged the church parlour, the minister's vestry, and the stewards' room, whilst a staircase communicates with a side entrance in Kingsley-terrace and with the other rooms below. The stone used is from the Kenton and Windy Nook quarries, the exterior being rock-faced with chiselled quoins and dressings. The seating of the church is to be of Oregon pine, stained and varnished; and the floors of hall, &c., of wood blocks on concrete. The heating is to be by low-pressure hot-water. The buildings throughout are to be lighted by electric light. Mr. T. Hutchinson, Newcastle, is the contractor for the work.

SCHOOLS, YNSYBYWL, GLAMORGANSHIRE.—The Crebyn Ddn Infant Schools have just been opened. The schools, which cost 1,070l., were built by Mr. Thomas Hughes, Mountain Ash, from plans prepared by Mr. Arthur O. Evans, Pontypriid.

NEW BONDED WAREHOUSE, ABERDEEN.—The Shore Porters' Society have decided to carry out additions to their warehouses in Shore-lane. The new structure will be one of six stories in height. The architect of the warehouses is Mr. R. G. Wilson.

PROPOSED CHURCH, DUBLIN.—It is proposed to erect a new parochial church for Teanogue, Dublin. Mr. W. H. Byrne has been appointed architect. The building will be in the Romanesque style, with nave, side aisles, and transepts, and its cost without a spire is estimated at about 12,000l.

WESLEYAN SUNDAY SCHOOLS, HULL.—On the 21st ult. the new Sunday Schools built in connexion with Queen's-road Wesleyan Chapel, Beverley-road, Hull, were opened. The arrangement of the building is on the central-hall plan, with class-rooms surrounding the same on the ground and first floor. Accommodation in the central-hall is arranged for about 700 scholars. Attached there are an infants' schoolroom, and twelve class-rooms of various sizes, a church parlour, minister's vestry, and the usual kitchen and offices. The cost of the building is about 3,500l. The architects are Messrs. Gelder & Kitchen, and the builders, Messrs. Colley & Levitt, and Messrs. Hodson & Hebblewhite.

ST. MATTHEW'S PAROCHIAL HALL, BOOTLE.—The memorial stone of St. Matthew's Parochial Hall, Bootle, was laid on the 20th ult. The plans for the new hall were originally designed by the late Mr. Charles Aldridge, and are being carried out under the superintendence of Messrs. Willink & Thicknesse, Liverpool. The contractors are Messrs. G. Woods & Son. That portion of the building at present contracted for will provide a hall capable of accommodating about 400 people. This hall can be divided by folding doors so as to make one part available as a working men's club, and leave the other part available for meetings. There will be a large room for a young men's club, and an apartment for the Young Women's Bible Class. The upper portion, which the committee are not in a position to undertake at present, will provide a large entertainment hall, with a gallery.

ORANGE HALL, BELFAST.—The foundation-stone has just been laid of the West Belfast Orange Hall, situate in the Shankill-road. The frontage is 46 ft. 8 in., next the main road, and extends from front to back along Brookmount-street 105 ft. From the front entrance vestibule a corridor 6 ft. wide extends down the centre, and communicates with side entrance at the rear. The front entrance vestibule contains the staircase to the large hall, and behind, on the left, the lodge and ante-rooms, and on the right are the reading, card, ante, and box rooms, as well as back staircase, lavatories, hall, kitchen, yard, and, at the further end, a house for the caretaker. A wide stair at front, and another at rear, will give access to the large hall, which is 62 ft. long, including gallery, and 36 ft. wide. In front there will be a gallery about 12 ft. wide, having stewards' room under, moveable platform at end of hall, and ladies and gentlemen's retiring-rooms at rear. The architect is Mr. William Batt, of Belfast, and the works will be carried out by Messrs. Campbell & Lowry.

SANITARY AND ENGINEERING NEWS.

DRAINAGE OF FALMOUTH.—Mr. Breerton, C.E., in reference to the drainage of Falmouth, recommends an expenditure of about 8,000l., in providing a main and enlarged tank at the Market Strand, further seaward; also filling in the light behind Market Strand, down to Messrs. Carne's premises, a draining the adjacent houses into the tank instead of the foreshore.

SEWAGE WORKS, RAWMARSH.—On the 23rd ult. Col. J. C. Marsh, as Inspector of the Local Government Board, held a public inquiry in the Court Hall, Rawmarsh, relative to an application by the Rawmarsh Urban District Council for sanction to borrow 4,500l. for purposes of sewage disposal works. Mr. J. Platts is engineer of the sewage works.

WATER SUPPLY, MELROSE.—The opening ceremony in connexion with the supplementary water supply to the burgh of Melrose was performed on the 20th ult. by the Duke of Buccleuch. After consideration of the engineer's reports, the Commissioners decided upon the springs of Allanshaws and Lauder Common, which will yield from 90,000 to 150,000 gallons per day. The water is conveyed by lead pipes to regulating chambers. There are three of these regulating chambers on Allanshaws connected by 5-in. cast-iron pipes. The water from the lower regulating chamber is conveyed to service reservoir south of Melrose in a cast-iron main, consisting of 5-in., 6-in., and 7-in. diameter cast-iron pipes. Owing to the height of the source above Melrose, it was found necessary to break the pressure, and this is done by a break pressure chamber. In order to supply the asylum with water the service reservoir has been constructed on a site acquired by the Commissioners from the Duke of Buccleuch, adjoining the public road to the south of the asylum grounds. This service reservoir, the water level of which is below the level of the natural surface of the ground, is constructed of concrete, having a semicircular roof, the whole being covered with soil. It is 100 ft. long by 24 ft. wide, and has a depth of 10 ft. of water, giving a capacity when full of 150,000 gallons. The total length of cast-iron main from Allanshaws to the service reservoir is about ten miles, and the length of fire clay piping on Allanshaws and Lauder Common conveying the water from the springs to the regulating chambers, is about two miles. The total cost of the scheme will be about 10,000l. The engineer is Messrs. Belfrage & Carfrae, Edinburgh, and the following are the contractors for the different contracts:—Laying cast-iron main and distributing pipes and constructing service reservoir, Messrs. John McKnight & Son, Edinburgh; developing springs and laying fireclay pipes on Allanshaws and Lauder Common, Mr. George Spence, Stow; supplying cast-iron pipes, Messrs. D. Y. Stewart & Co., Glasgow; supplying valves, hydrants, street valves, &c., The Glenfield Company, Limited, Kilmarnock.

STAINED GLASS AND DECORATION.

WINDOW, ORMISTON CHURCH, NEAR EDINBURGH.—A memorial stained-glass window has just been erected in the Parish Church, at Ormiston. The window was executed at the studios of Messrs. A. Ballantine & Gardiner, Edinburgh.

WINDOWS, ST. CUTHBERT'S CHURCH, NEWCASTLE.—On the 17th ult., in St. Cuthbert's Church, Newcastle, two stained-glass windows, placed in the church in remembrance of the late Mr. Arthur B. Gibson, the architect of the church, and his children Rex and Phoebe, by his wife and sisters, were unveiled. Messrs. Morris & Co., have executed the design, which was by Sir Edward Burne-Jones.

WINDOW, HOLY TRINITY CHURCH, RAMSGATE.—In memory of Lady Wills, a stained glass window has been placed in the east end of Holy Trinity Church, Ramsgate. The window is illustrative of the nativity and scenes in the Saviour's early life. The window has been designed and executed by Messrs. Joseph Bell & Sons, of Bristol.

RENOVATION, SHEEPWASH PARISH CHURCH, DEVONSHIRE.—The decoration of the parish church of St. Laurence has now been completed. The work has been designed and executed by Messrs. Fox & Son, of Plymouth; the wood carving is by Mr. Herbert Read, of Exeter.

FOREIGN.

FRANCE.—A monument has just been inaugurated at Nantes by the President of the Republic, in the memory of the "Enfants de la Loire Inferieure morts pour la Patrie." This monument is the design of M. Corroyer, and is composed of a four-sided pedestal ornamented with four figures at the angles, representing soldiers of different regiments, executed by MM. Le Bourg and Allouard. It is surmounted by an allegorical group by M. V. Barau. Tomorrow (Sunday) the monument raised by subscription to the memory of Charlet is to be inaugurated. It is the work of Alexandre Charpentier, sculptor, and is placed in the square of Denfert-Rochereau. The Direction des Beaux-Arts has just converted the little chapel of the Gobetins Manufactory into a museum. A set of water-colours and drawings have been placed there, which have been valuable in the execution of the tapestries.—The Municipality of

lontreuil-sous-Bois (near Paris) is proposing to erect a statue to Pierre de Montereau, the celebrated architect of the Middle Ages, by the Sainte Genevieve. The committee on the Victor Hugo monument have decided that the monument, which is the work of M. Ernest Barrias, shall be exhibited at the 1900 Exhibition. It will be placed out of doors in front of one of the Palaces, and it will then be possible to judge of the effect on it of its surroundings. The inauguration will not take place till 1902.—The first church at Chesnay, in the Faubourg de Versailles; the first stone has just been laid; the church is to have a fine stone steeple.—The new Museum of Algerian Antiquities at Mustapha Superieur, close to the Governor-General's palace, was just inaugurated. It is situated in the midst of a beautiful park which is one of the prettiest walks in the environs of Algiers.—In turning up the roadway in the Rue Saint Jacques, between the Fontaine and the Lycée Louis le Grand, portions of the Roman road have been brought to light which connected Lutetia with Genabum (Orleans), and with the centre of Gaul.—The first bronze in the Chenavard Competition, at the Ecole des Beaux-Arts, has been awarded to M. Sirois, pupil of M. Moynan, architect; M. Dehaudt, pupil of the same architect, has gained the second prize; and the third has been awarded to M. Hulot, pupil of M. Marcel Lambert.—The death is announced of M. Charles-Olivier de Penne, a well-known and admirable French animal-painter. He was born in 1831, and was a pupil of Léon Cogniet and Charles Jacques, and obtained second Prix de Rome in 1857, and a silver medal and the Cross of the Legion in the 1880 Exhibition. Among his principal works may be named "Un Cerf forcé," "Chieus Vendéens," "Pendant la Chasse," "Cerf à l'Eau," and "Relais"; the two latter of which are at present to be seen at the Old Salon.

GERMANY.—The proposed alterations at the State Hospital at Berlin, to which we referred recently. It appears that the total expenditure will be larger than at first anticipated, amounting to over eleven million marks, or 550,000l. Of this sum about 450,000l. will be devoted to the hospital proper, whilst the other amounts will be spent on various schemes in connexion with the establishment.—We notice with considerable interest that a technical contemporary in Germany seems to be seriously taking up the subject of fire-protection, and is illustrating various configurations, with plans and sketches.—The Society of German Engineers will hold its thirty-eighth annual meeting at Cassel on June 14 next, when a large number of important papers are to be read.—A number of churches are being erected at Lichterfelde, near Berlin, and the German Empress is taking particular interest in their erection.—The thoroughfare at Berlin, known as "Am Kupfergraben," is to have material alterations, together with several other of the thoroughfares on the river front. A considerable expenditure is also to be incurred on several new bridges in connexion with these improvements.—There is some fear of an impending strike in the building trades at Berlin, during the present summer.—The Annual Art Exhibition, which is to be opened at Berlin on May 1, will this year have a specially national character, as there are only a few exhibits from other countries.

AUSTRIA.—A new Architectural Society has been formed at Vienna, and will be called "Verein von Baumeister in Oesterreich." The first meeting has been held under the presidency of Herr Kroes, when a paper was held by Herr Stigler, on the defects in Austrian building operations.—The Royal Technical College at Vienna has received a bequest of 10,000 florins, by the will of the deceased railway engineer, Viktor Kueferle. The sum is to be used for travelling studentships.—Excursions are being regularly undertaken by the students of the Vienna Technical College, under the guidance of their professors, and this year one of the more important for engineers left Vienna on the 15th inst. for the German seaport towns, and for Antwerp. There were sixty students, under the guidance of Privy Councillor Von Hartmann.—A historical little theatre at Vienne, which might be expected with our Sadlers Wells Theatre, will cease to exist after this month. It was known as the Rudolphseher Theatre.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. Deards, of Victoria Works, Harlow, Essex, has appointed Mr. T. A. Scott, of 14, Fitzroy-avenue, Belfast, as his sole agent for the North of Ireland for Deards' patent "Self-locking" glazing system.

TRADE NEWS.—Messrs. Hayward Bros. & Eckstein have secured the contract for supplying iron staircases for the same building.—The Anaglypta Company (Dartven & London) are making a boldly designed commemorative panel of the Queen's reign, showing the Royal Arms and a medallion portrait of the Queen.—Mr. G. W. G. The Corporation of Darwin have decided to extend the use of Poharite at their sewage works,

and four additional filters are now to be laid with Poharite.

THE CARPENTERS' COMPANY.—In consequence of the death of Alderman Sir William Lawrence, the Carpenters' Company have postponed their forthcoming dinner, and also their projected ball.

APPOINTMENT OF CLERK OF WORKS.—Mr. J. H. Verrell has been appointed clerk of works to supervise the construction of the foundations of Horton Asylum, Epsom, for the London County Council.

THE BUILDERS' CLERKS' BENEVOLENT INSTITUTION.—At the monthly committee meeting of the Builders' Clerks' Benevolent Institution (of which Mr. Thomas Hall, of the firm of Messrs. Hall, Beddall, & Co., the successors to Messrs. Lawrence & Sons, is President at the present time), reference was made to the death of Sir William Lawrence, the first President of the Institution (1866), and the committee decided to instruct their secretary, Mr. H. J. Wheatley, to write to the surviving members of the family, expressing their sincere regret for and deep sympathy with them in the great loss sustained. "To the late Sir William," Mr. Wheatley's letter continued, "this Institution is very deeply indebted indeed, as to his original encouragement and great influence must be attributed the striking success resulting from his original effort made. Such services were at the time, and continue to be, very highly appreciated."

CONFERENCE OF SLATERS AND TILERS.—The triennial conference of the Amalgamated Society of Slaters and Tilers has just been held in Newcastle. There are 1,100 members in the society, located in thirty-nine towns in England, and one in Ireland. The delegates, who numbered twenty-six, were welcomed to Newcastle by the general secretary, Mr. J. Burn. Mr. Geo. Baker, of York, was appointed Chairman of the conference, with Mr. Timmins, of Liverpool, in the vice-chair.

POPE'S VILLA, TWICKENHAM.—An interesting discovery, says the *Starry Mirror*, has been made at Pope's Villa, Twickenham, the residence of Mr. H. Lansdowne, M.P. The villa, which stands on the river bank, is being altered, and on removing a thick coating of concrete from a stone over one of the entrances a deeply-carved inscription was found. This reads:—"On this spot stood, until 1809, the house of Alexander Pope. The grotto that formed its basement still remains. 1848."

DISCOVERY OF ROMAN REMAINS, WINCHESTER.—During the progress of the excavations and operations for new roads, drains, &c., now being carried out in a field on the east side of High-street, under the supervision of Mr. A. Frampton, architect, many evidences, says the *Salisbury Journal*, of Roman or Romano-British Winchester have come to light. There can be no doubt that somewhere in the field are the remains of one or more Roman villas.

THE AMALGAMATED SOCIETY OF CARPENTERS AND JOINERS.—The annual report of this society, just issued, shows that there has been a net gain of seventeen branches, making a total of 799 at the close of the year. The number of members admitted was 8,635, and, after allowing for deaths and exclusions, a gain appeared of 4,476, making the present membership 29,000. The receipts from those in employment amounted to 126,577. 10s. 10½d., and disbursements to 99,993. 16s. 1d., thereby enabling the society to increase its cash balance from 79,422. 10s. 7d. to 105,956. 5s. 4½d., the largest amount accumulated during any year of the society's history.

A STATUE OF DARWIN FOR SHREWSBURY.—Messrs. Henderson & Webster, Aberdeen, are progressing with the manufacture of a pedestal in polished emerald pearl granite for a statue of the late Charles Darwin. The statue is to be placed in the open space in front of the Free Library in the town of Shrewsbury, where Darwin was born, and of the famous Grammar School of which he was an alumnus. The granite pedestal is 4 ft. 6 in. high, and will stand on two steps, probably of Aberdeen granite. The statue itself will represent Darwin in a sitting posture, and will be of bronze, 6 ft. 6 in. high, so that the total height from the ground level will be 12 ft. The sculptor is Mr. Horace Montford, London. The base of the pedestal is 4 ft. 8 in. in width, and in front, both of the base and die, is a semi-circular projection. The extreme length of the die is 6 ft. 3 in. It is formed out of a single block, 6 tons in weight.—*Aberdeen Journal*.

CAPITAL AND LABOUR.

BUILDING TRADE DISPUTE, LEEK.—A meeting of employers and workmen has just been held at the "Swan" Hotel. Messrs. J. Mathews, J. Heath, and T. Grace, with Mr. Bowden, Burslem and district secretary, represented the masters. Notices had been given by the bricklayers for a rise of a halfpenny per hour, and for the apprentice rule to read "One apprentice to five journeymen," instead of one to three, as now. The masters had given notice for a reduction of a halfpenny per hour, and for notices of alterations to be given on January 1 instead of February 14, and to take effect on May 1 instead of May 14. After considerable discussion it was arranged that the masters should give a further per hour rise, the men agreeing to the rule as to notices being altered to January 1, and the rule as to apprentices to remain as now, the above arrangements to be for three years.

WAGES IN THE BUILDING TRADE AT PORTSMOUTH

—The Council of the Master Builders' Association had before them, at a special meeting recently, an application from the carpenters in the borough for an increase in their wages of a halfpenny per hour. Last summer there was a long strike of carpenters and painters, but eventually they returned to work on the old terms, the carpenters intimating they should again press their claims in the spring. Their notice expired on the 1st inst. (to-day). It appears that all the master builders in the borough have been consulted on the question, and they are unanimously of opinion, it is stated, that the increase of a halfpenny an hour should not be given.

THE BUILDING TRADES, STAFFORDSHIRE.—The building trade shows further signs of improvement, and all classes of operatives are working well, full time being general. Bricklayers have no members out of employment, and joiners are working overtime at a number of jobs. There is a general demand for joiners not only in the Potteries, but in most of the surrounding towns. Plumbers and painters are very busy. Bricklayers' labourers are much better employed, there being less out of work than has been the case for months past. At Leek all branches of the trade are busy, particularly joiners and bricklayers. At Stafford trade is moderate, with no operatives out of employment. At Crewe all departments are working well.

STRIKE IN THE BIRMINGHAM BRICK TRADE.—A general strike has taken place among the brick-makers of Birmingham, and between 400 and 500 men are out. The local building trade is at present exceptionally brisk, and if the strike is persevered with much inconvenience will certainly be felt. The point of difference seems very small, viz., whether an advance of 3d. per hour should take effect at once or a week hence, but a great deal of bitter feeling has been raised between the parties. Negotiations have been going on for some time past for a readjustment of the prices, and from the information we have received, it seems that the men broke off the negotiations when there was a prospect of an amicable settlement being arrived at by their leaders. The men appear to have become impatient at what they considered the unwarranted delay in coming to terms.—*Liverpool Courier*.

NEWPORT CARPENTERS AND JOINERS.—The Newport members of the Amalgamated Society of Carpenters and Joiners having failed to obtain from the master builders of the town a schedule of concessions, including the shortening of working hours on Saturdays, percentage on all overtime after full day's work, prompt payment of wages, better provision for keeping tools in order, and the determination of holidays by a board consisting of an equal number of employers and workmen, have passed the following resolution:—"That on and after the first Saturday in May, 1897, it is the opinion of this meeting that a strike is undesirable, but that our members refrain from working after five p.m. on weekdays and one p.m. on Saturdays—under a penalty, for the first offence, of 10s.; second offence, 11.; third offence, 21., or expelled the Society—until such time as the Newport Master Builders' Association consent to be placed upon our rule-book the proposed alterations as contained in the percentage for overtime; also any member knowing of another member working and not reporting to his Branch Secretary will be liable to the same penalty."—*Western Mail*.

MEETINGS.

- FRIDAY, APRIL 30.
 - The Architectural Association.—Mr. Hugh Stannus on "The Classic Cornicé." 7.30 p.m.
 - Royal Institution. Professor J. J. Thomson on "Cathode Rays." 9 p.m.
 - Institution of Mechanical Engineers.—Ordinary General Meeting (continued).—Paper by Mr. W. G. Walker, entitled "Experiments on Propeller Ventilating Fans, and on the Electric Motor Driving Them." 7.30 p.m.
- SATURDAY, MAY 1.
 - The Architectural Association.—Sixth Spring Visit, new Fever Hospital, Lewisham.
 - Royal Institution.—The Rev. J. P. Mahaffy on "The Greek Theatre According to Recent Discoveries."—10.30 p.m.
 - St. Paul's Ecclesiastical Society.—Visit to the Church of St. Saviour, Southwark, under the guidance of Mr. G. H. Birch, F.S.A., at 3 p.m.
 - Institution of Junior Engineers.—Visit to Blackwall Tunnel Works. 3 p.m.
 - Sanitary Inspectors' Association.—Mr. W. H. Grigg on "The Proposed Drainage By-laws for the Metropolis." 6 p.m.
 - Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at the Sewage Outfall Works, Barking.
- MONDAY, MAY 3.
 - Royal Institute of British Architects.—Annual General Meeting. 8 p.m.
 - Society of Arts (Cantor Lectures).—Mr. Lewis F. Day on "Design in Lettering."—I. 6.30 p.m.
 - Society of Engineers.—Mr. H. G. Connor on "Automatic Gas Station Governors." 7.30 p.m.
 - Liverpool Architectural Society.—Annual General Meeting. Closing address by the President, Mr. G. Braddley. 6 p.m.
- WEDNESDAY, MAY 5.
 - The Architectural Association.—Banquet to Celebrate the Jubilee of the Association, to be held at the Troadero Restaurant, Piccadilly—circus. 7 p.m.
 - Carpenters' Company Lectures.—(Carpenters' Hall, London Wall).—Lectures on Carpentry and Joinery.

COMPETITION, CONTRACTS, AND PUBLIC APPOINTMENTS.

COMPETITION.

Table with 4 columns: Nature of Work, By whom Advertised, Premiums, Designs to be delivered. Includes 'Designs for Schools' by Chesterfield Sch. Bd.

CONTRACTS—Continued.

Table with 5 columns: Nature of Work or Materials, By whom Advertised, Form of Tender, &c. Supplied by, Tenders to be delivered. Includes 'Paving and Channel Keel' by West Ham Council.

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Form of Tender, &c. Supplied by, Tenders to be delivered. Includes 'Hall and Offices, Northgate' by Market Weighton Parish Council.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Required, Salary, Applications to be in. Includes 'Clerk of Works' by Leicester Corp.

Those marked with an asterisk (*) are advertised in this number. Competition, iv. Contracts, pp. iv. vi. viii. & xxi. Public Appointments, pp. xviii. & xxi.

Professor Banister Fletcher on "Timber Roofs; also Composite Roofs." 8 p.m.
Royal Archaeological Institute—(1) Mr. Talfourd Ely on "Vreaths." (2) Paper by Professor T. McKenny Hughes, entitled "A Comparison of Flint Implements of Paleolithic and Neolithic Age." 4 p.m.
Society of Arts.—Mr. C. E. D. Black on "The Railway to India." 8 p.m.
Builders' Foremen and Clerks of Works Institution.—Ordinary Meeting of the Members. 8 p.m.
Edinburgh Architectural Society.—Mr. J. J. Henderson on "Cement and Concrete." 8 p.m.
THURSDAY, MAY 6.
The Architectural Association.—Conference to be held at No. 9, Conduit-street, when subjects connected with the policy of the Association and also the question of suitable accommodation will be discussed. A collection of drawings made by past students in the class to be exhibited. 3 p.m.
Annual Soiree, St. George's Hall, Langham-place. 8 p.m.
Society for the Encouragement of the Fine Arts.—Second Conversation at the Galleries of the Royal Society of British Artists, Suffolk-street.
Society of Antiquaries. 8.30 p.m.
FRIDAY, MAY 7.
Institution of Junior Engineers.—Mr. L. G. Ferreira on "Electrical Railway Signalling." 8 p.m.
SATURDAY, MAY 8.
Royal Institution.—The Rev. J. P. Mahaffy on "The Greek Theatre According to Recent Discoveries."—II. 3 p.m.
Edinburgh Architectural Association.—Visit to Hope House Policies.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.
6,282.—SLIDING PIVOTTED WINDOW SASHES: H. Johnson.—In order to obtain a self-balancing reversible window-sash in a manner that may be applied to the existing plan of window, and even to existing window, inventor hangs sashes with galvanised steel wires, &c., fixes lower corners of upper sash, then brought over pulleys and fixed to the centre (or bottom) of lower sash. Two metal bars are sunk in edgways between sash stile, and a double stile and several other small adjuncts are provided.
7,566.—WASTE OR SLOP WATER-CLOSETS: A. Hocking.—The object of the invention is to render it impossible for any article to get lodged in the basin of the water-closet or push down the shaft of an earth closet. Invention claims the improved arrangement and construction of an apparatus to prevent any blockage of closets by adopting a longitudinal diaphragm, a movable flap of terra-cotta, and other items of apparatus.
8,456.—FLAT WHITENASH BRUSHES: T. J. Pickford.—The handle of brush is slightly tapered at top; the binding for bristles, &c., consists of sheet metal, tapering, with small holes along top for the linking of the binding wire. After wire is linked through the holes, cement is poured on the roots of the bristles.
8,807.—TILES, SLABS, WALLINGS, &c.: J. S. Rigby.—Inventor forms tiles, slabs, &c., of earthenware, glass, terra-cotta, &c., with indents and projections which are

not at right angles with surface, but hang over. These may be arranged in different directions, and may be produced in a coat of fluxing material applied to one surface of the tile, slab, &c.
10,586.—TILED HEARTHES FOR DOMESTIC FIREPLACES, &c.: J. Simpson.—The inventor provides a hearth capable of removal by constructing a frame of angle iron (wrought or cast) of the shape of hearth, with a sheet metal base riveted thereto, on which tiles may be arranged in pattern as desired.
9,080.—SURFACES TO RECEIVE PLASTER: E. Edwards.—This invention consists in the use of longitudinally grooved boards, the grooves having inclined sides, so that they are of dovetailed section. Grooved surface is left rough. The boards are nailed to rafters, studs, or other timbers.
7,725.—SASH FASTENERS: J. H. Watson.—This invention comprises a counterpoised and swinging catch arm, loosely mounted or pivoted to a bracket, &c., on one of the meeting bars, and arranged to swing forward and to overhang the edge of other bar on bars coming together, and to be pushed back on bars approaching each other. In another form the catch arm is actuated by a spring. Inventor also claims other combinations on same principle.
NEW APPLICATIONS FOR LETTERS PATENT.
APRIL 12.—9,223, W. Greenwood, Safety Chain Fastenings for DOORS.—9,239, A. Ansell, Sliding Sashes and Frames.—9,237, J. Douglas, Ventilator.—9,279, S. Lawrence, Sash Fasteners.—9,271, S. Lawrence, Raising and Lowering of Window Sashes, &c.—9,272, G. Young, Tool for Forming Grooves in Wood, &c.—9,315, C. Richardson, Asphaltic Pavements, &c.—9,316, L. Kasson, Paving Compositions.
APRIL 13.—9,317, W. Jackson, Window Sashes or Frames.—9,413, E. Blumenau, Counterjoint Bits.—9,447, J. and S. Benke, Compositions or Paints for Preserving Structures.—9,465, J. Kaiser and J. Willbrand, Door Fastenings.—9,466, J. Kaiser and J. Willbrand, Door Fastenings.
APRIL 14.—9,479, J. Brinkler, Self-closing Door Hinge.—9,494, J. Grislain, Thermo-Automatic Water Waste Exhauster.—9,549, G. Burt, Machinery for Boring Tunnels.—9,551, A. Austin and E. Caporn, Door Fastener, &c.—9,557, H. Burr on Bars coming together, and to be pushed back on bars approaching each other. In another form the catch arm is actuated by a spring. Inventor also claims other combinations on same principle.
APRIL 15.—9,567, R. Reeves, Treatment of Sewer Air or other Obnoxious Gases, and also Sewage Matter During Transit in Drains.
APRIL 16.—9,617, J. Cresswell, Inlet Ventilator.—9,622, H. Craig, Syphon Water Closets.—9,627, W. Osment, Sliding Window Sashes.—9,650, W. Allman and J. Cope, Heating Buildings and other Places by the Circulation of Hot Water.—9,658, W. Drayson, Mechanism for Starting the Syphons of Flushing Cisterns.
APRIL 17.—9,725, J. Moore, Regulation and Fastening of Window Sashes in their Frames.—9,726, H. Doullon, Joints of Stoneware Pipes.—9,768, J. Slater, Pedestal Water Closets.—9,799, C. Connock, Adjustable Chiffon Fence.
PROVISIONAL SPECIFICATIONS ACCEPTED.
5,714, H. Johnston, Fitting up Electric Bells.—7,709, W. Oates and J. Green, Connecting Junctions and Main Drain Pipes.—7,931, C. Greenhall, Waste Water Closets.—7,937, H. Parker, Pedestal Bracket Seats for Water Closets, &c.—8,216, H. Lloyd, Sewer Drains, &c.—8,154, F. Holton and T. Morley, Window Frame and

Sashes.—8,256, A. Habershon, Fireplaces.—8,269, J. Sayers, Artificial Stone.—8,481, M. Ahern, Bricks, Tiles, &c.—8,625, J. Cooper and F. Hensley, Step and other Platforms, Platforms or Balconies for use on Houses and other Buildings.
COMPLETE SPECIFICATIONS ACCEPTED.
Open to opposition for two months.
8,265, T. Rhodes and others, Flushing Closets, &c.—9,497, R. Ellis, Window Fasteners.—1,944, L. Corisse, Door Hinges, &c.—13,065, A. Pollard, Cleaning Paint or Varnish Brushes, &c.—2,750, E. Evans, Sash and Window Fasteners.—25,880, A. van der Vygh and others, Fireproof Artificial Stone.—3,724, W. Turner, Graining Tool.—4,141, H. Horn, Window Glass.—5,439, W. Wilkinson, Paving Blocks, Tiles, &c.—6,426, F. Galby, Door Hinges.

SOME RECENT SALES OF PROPERTY.

Table with 3 columns: Property Name, Date, Price. Includes 'ESTATE EXCHANGE REPORT' for April 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30.

PRICES CURRENT OF MATERIALS.

Table listing prices for various materials including timber, iron, copper, and other building supplies with columns for item names and prices.

COSSPORT (Hants).—For alterations, &c., at the workhouse, Park road, for the Abstinence Board of Guardians. Mr. H. A. F. Smith, architect, Starchambers, High-street, Gosport. Quantities by the architect.

HALE END (Essex).—For mission hall at Hale End, Chingford. Mr. F. Bosenham, architect.—Estimated £1,200. W. Shurmer, 1, 1893.

HANWELL.—For the erection of eight semi-detached villarecidence, 51, Spokes-road, for Drayton Park Syndicate.—J. Christie, Kensington-road Station, W. Estimated £2,600. [No competition.]

ILFORD.—For rebuilding the "Angel Hotel," Ilford. Mr. H. W. Wakley, architect.—Estimated £8,450. J. Ferrard & Son, 2, 1897.

IPSWICH.—For additions to Tower House, for the School Board, Mr. J. S. Corder, architect, Tower-street, Ipswich. Quantities by Mr. J. S. Corder, architect, Tower-street, Ipswich. Estimated £2,500. J. Kenney, 2, 1897.

KINGS LYNN.—For the ironwork for a grain warehouse, "Bentick" Dock.—About 320 tons wrought iron at per ton. Estimated £1,200. L. Barker & Co., 1, 1897.

LEYTON.—For rebuilding the "King William IV." public-house, High-street, Leyton, Messrs. Shaker & King, architects.—Estimated £5,514. J. Anley, 2, 1897.

LEYTONSTONE.—For new premises for the London and Provincial Banking Company, Mr. A. R. Barker, architect.—Estimated £6,394. Patman & Fotheringham, 5, 1897.

LONDON.—For the erection of works at Gainsborough-road, Victoria Park, for Messrs. G. Ellis & Co. Mr. W. H. Duffield, architect. Quantities supplied. Estimated £1,780. J. Anley, 2, 1897.

LONDON.—For the erection of warehouse, Hope Wharf, Rotherhithe, S.E., for Mr. A. F. Gardner, Mr. A. R. Stening, architect. Quantities supplied. Estimated £1,300. Outwater & Co., 2, 1897.

LONDON.—For erecting a new police-station at Poplar for the Receiver for the Metropolitan Police District, Mr. J. Dixon Bullen, architect. Quantities by Mr. W. H. Thurgood.—Estimated £10,840. Higgs & Gill, 1, 1897.

LONDON.—For proposed work for Caning Town Congregational Church, Mr. F. Troup, architect.—Estimated £1,115. Maddison, 1, 1897.

LONDON.—For alterations and shop-fittings, Home and Colonial Stores, 4, Station Parade, Horseley Rise, Mr. Robert Willey, architect.—Estimated £240. E. Houghton & Son, Strand Green, accepted.

LONDON.—For pulling down and re-erecting "The Prince George" public-house, Hillingdon-street, Waltham, for Messrs. Barclay, Perkins & Co. Limited, Mr. George Hubbard, architect, 23, Finsbury-circuit, E.C. Estimated £1,000. Halam Bros., 4, 1897.

LONDON.—Accepted for new doctor's room and consulting at the Poland-street Workhouse, for the Guardians of the Westminster Union, Messrs. John Waldram & Son, surveyors, 22, Buckingham-street, W.C. Estimated £1,200. J. Johnson & Manners, 1, 1897.

LONDON.—For the erection of a warehouse in Ironmonger-lane, E.C., for Mr. Salmon, Mr. George Waymouth, architect, 23, Monagrate-street, E.C. Quantities by Mr. A. Paul & Quality.—Estimated £1,200. J. Anley, 2, 1897.

LONDON.—For alterations, &c., at the "White Hart" Hotel, New Cross-road, Messrs. Edicks & Meyers, architects.—Estimated £3,650. J. Anley, 2, 1897.

LONDON.—For alterations, &c., at the "The Cat and Mutton" public-house, London Fields, N., for Mr. H. S. Locke, Mr. Henry Roberts, architect, 13, Lewisham-street, S.E. Estimated £735. Taylor, 1, 1897.

LONDON.—For alterations to Nos. 20 and 21, Bunhill-row, City, Mr. Walter Stiel, architect, 5, Queen Victoria-street.—Estimated £590. Lascelles & Co., 6, 1897.

LONDON.—For bar-fittings at the "Coach and Horses" Inn, Broad-street, Lambeth, S.E., for Nalder & Colley's Brewery Company, Limited, Messrs. R. M. Churt & Son, architects, Union Bank Chambers, Croydon.—Estimated £240. Sage, 1, 1897.

LONDON.—For alterations, &c., at "The Cat and Mutton" public-house, London Fields, N., for Mr. H. S. Locke, Mr. Henry Roberts, architect, 13, Lewisham-street, S.E. Estimated £735. Taylor, 1, 1897.

LONDON.—For the erection of a gate lodge, Dulleston, for Major-General Bond, Mr. W. E. Finkerton, architect, 8, Diamond Derry.—Estimated £145. Joseph Colburn, Strand, Robert Colburn, 65, road, Derry (accepted), 1, 1897.

SPITAL.—For the erection of a block of fifteen houses, Promenade, for Messrs. Boston, Mr. J. L. Miller, architect, 39, Ride Hill, Berwick-on-Tweed.—Estimated £1,200. Messrs. D. Storrar & Son, 1, 1897.

HENDERSON BROS.—For alterations, &c., at "The Cat and Mutton" public-house, London Fields, N., for Mr. H. S. Locke, Mr. Henry Roberts, architect, 13, Lewisham-street, S.E. Estimated £735. Taylor, 1, 1897.

LONDON.—For alterations, &c., at "The Cat and Mutton" public-house, London Fields, N., for Mr. H. S. Locke, Mr. Henry Roberts, architect, 13, Lewisham-street, S.E. Estimated £735. Taylor, 1, 1897.

LONDON.—For alterations, &c., at "The Cat and Mutton" public-house, London Fields, N., for Mr. H. S. Locke, Mr. Henry Roberts, architect, 13, Lewisham-street, S.E. Estimated £735. Taylor, 1, 1897.

LONDON.—For alterations, &c., at "The Cat and Mutton" public-house, London Fields, N., for Mr. H. S. Locke, Mr. Henry Roberts, architect, 13, Lewisham-street, S.E. Estimated £735. Taylor, 1, 1897.

LONDON.—For alterations, &c., at the "White Hart" Hotel, New Cross-road, Messrs. Edicks & Meyers, architects.—Estimated £3,650. J. Anley, 2, 1897.

LONDON.—For alterations, &c., at the "The Cat and Mutton" public-house, London Fields, N., for Mr. H. S. Locke, Mr. Henry Roberts, architect, 13, Lewisham-street, S.E. Estimated £735. Taylor, 1, 1897.

LONDON.—For alterations, &c., at the "The Cat and Mutton" public-house, London Fields, N., for Mr. H. S. Locke, Mr. Henry Roberts, architect, 13, Lewisham-street, S.E. Estimated £735. Taylor, 1, 1897.

LONDON.—For alterations, &c., at the "The Cat and Mutton" public-house, London Fields, N., for Mr. H. S. Locke, Mr. Henry Roberts, architect, 13, Lewisham-street, S.E. Estimated £735. Taylor, 1, 1897.

LONDON.—For alterations, &c., at the "The Cat and Mutton" public-house, London Fields, N., for Mr. H. S. Locke, Mr. Henry Roberts, architect, 13, Lewisham-street, S.E. Estimated £735. Taylor, 1, 1897.

LONDON.—For alterations, &c., at the "The Cat and Mutton" public-house, London Fields, N., for Mr. H. S. Locke, Mr. Henry Roberts, architect, 13, Lewisham-street, S.E. Estimated £735. Taylor, 1, 1897.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday, N.B.—We cannot publish Tenders unless authenticated by the name and address of the sender; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under £100, unless in some exceptional cases and for special reasons.

BANFF.—For the erection of police-stations, for the County Council, Mr. F. D. Robertson, architect, 95, Mid-street, Keith.—Craigleith Police-station.

Masonry.—Wm. Alexander & Sons, Dufftown, £233 0 0. Carpentry.—Peter Day, Fochinis, Perthshire, 123 0 0. Slating.—Alexander Tough, Craigleith, 49 10 0. Plumbering.—R. K. Rathie, Keith, 8 0 0. Roofing.—James Munro, Aberdeen, 12 7 0. Painting.—Robert G. Grant, Aberdeen, 5 4 0.

John Gilroy, Dufftown, £310 0 0. Carpentry.—James Day, Fochinis, Perthshire, 123 0 0. Slating.—James Warren, Ballinloch, 45 12 0. Plastering.—Hime Brown, Dufftown, 23 10 0. Roofing.—R. K. Rathie, Keith, 29 19 0. Painting.—Garden & Ward, Dufftown, 7 0 0. Heating.—Robert Tindall, Aberdeen, 13 0 0.

Dufftown Police-station, £605 10 0.

Masonry.—Wm. Alexander & Sons, Dufftown, £233 0 0. Carpentry.—Wm. Russell, Fife Keith, 184 7 0. Slating.—John Wilson, Dufftown, 47 9 0. Roofing.—Sutherland & Reid, Keith, 29 19 0. Painting.—R. K. Rathie, Keith, 19 10 0. Heating.—Garden & Ward, Dufftown, 7 0 0. Heating.—Robert Tindall, Aberdeen, 13 12 6.

BARNSTAPLE.—For the construction of a concrete impounding sewer, Cross-street, for the Town Council, Mr. H. Masterton, engineer, Brompton-street, Barnstaple. James Nuttall, £100. W. C. Shaddock, 5, Hills, 100. J. Parnester, £80. Wm. Plymouthe, £147. H. Burgess, 50.

BRANDON (Suffolk).—For additions, &c., to school buildings, High-street, for the School Board, Messrs. E. Boardman & Son, architects, Queen-street, Norwich.—Estimated £1,500. Parsons & Sons, £1,295. J. C. Fryer, £1,450. W. D. H. Veil, £1,024. J. G. Cowell, Seham, £1,500. W. T. Newton & Sons, 1, 588. Cambroghishe, £1,483. 0.

BROMLEY.—For erection of the "Royal Bell" hotel, Bromley, Kent, Mr. A. Saunders, architect.—Estimated £28,070. P. & F. J. Wood, £28,070. R. Hansen, £28,070. W. D. Howe, £18,000. Walls & Son, £20,400. Cosby, £18,420. W. Shurmer, £19,890. Patman & Fotheringham, £17,825. F. & H. Higgs, 12, 1897.

CARDIFF.—For the erection of new bottling stores at the Temple Quay, for the School Board, Messrs. Veall & Sant, architects. Quantities by the architects:—Estimated £1,539. W. Thomas & Co., £1,295. Turner & Son, £1,539. J. B. & J. W. Jones, £1,295. Cadwallader & Hockridge, £1,000. Henry Gibson, £1,800. S. Clewton & Son, £2,238. H. Venning, £1,896. John Gibson, £993. W. Symonds & Co., £1,820. J. & H. Madge, £1,918. James Allardice, £1,798. F. & H. Higgs, Accepted.

DORCHESTER.—Accepted for building a house in the Cornwall-road, Dorchester, Mr. A. L. T. Tully, architect, 16, Cornhill, Dorchester.—Estimated £1,650.

The Builder.

The Lesson of the Paris Fire.

THE catastrophe at Paris, with the particulars of which our readers will have become fully acquainted from the daily papers, is one of the most terrible fire disasters of modern times; and as it took place

under circumstances somewhat unusual it forms one more of those tragical warnings which we receive from time to time, drawing our attention afresh to the necessity of being on our guard against fire on all occasions when our crowds are congregated within any kind of structure from which there is not easy and ample exit.

In 1831 we had the "Ring" Theatre fire, on December 8, at which there were over 450 fatalities, whilst on March 23 in the same year, nearly 200 people had been killed at the fire in the Municipal Theatre at Nice. In 1837, on May 25, there were 115 fatalities in connexion with the fire at the Opéra Comique, Paris, and in the same year we had a catastrophe at Exeter with 86 people killed and a large number injured. In the above four instances the buildings were theatres proper, substantially built, and though perhaps defective in planning and construction, must be considered *bona fide* substantial structures. We have had innumerable cases throughout the world, and more particularly in the United States, where theatres were used for other purposes, such as fêtes or bazaars, and were destroyed with a larger or smaller number of fatal results. Again, we have had temporary theatres, built either in half-timber work, in corrugated iron, or practically entirely of match-boarding, and these have been used either for dramatic performances or other purposes. The building in the Rue Jean Goujon, Paris, was essentially a temporary wooden structure, and it was being partly used for some performances, and partly as a bazaar with all the paraphernalia of stalls and booths, with light canvas divisions, &c. The exact number of deaths has not yet been officially reported, but it would appear that about 125 have been killed, and that there have been further a large number injured. The exact cause of the outbreak does not appear to

have been yet determined, for reports of equal authenticity, speak of the fire having been caused by a petroleum lamp on the one hand, and on the other by the electric installation. The exact plan of the building is also not yet forthcoming, but it would appear that the arrangement was that of a shed 150 ft. long, with only one main entrance known to the general public, and some extra entrances and exits, one of which had been used by a limited number of stallholders, whilst the others were either entirely unknown or so hidden away as to be quite useless.

As far as we are concerned, the exact details of the results are comparatively unimportant, and are rather matter for the daily papers, and it is only our intention to point out the great risk of temporary buildings on the one hand, and on the other the danger of using rooms unsuited in plan for bazaars, public entertainments, or similar functions.

The great danger of the temporary building is that its light construction and the flimsy decorations used so facilitate a spread of fire that the audience has no time to reach the exits, and becomes at once so frightened that the very worst state of panic ensues immediately on the outbreak. Where the structure is a substantial one, the flames do not appear so terrible in the initial stages of an outbreak, and the large proportion of an audience generally gains the open quietly without any considerable difficulty or crush. That part of the audience which is on the ground level almost invariably escapes unscathed, whilst the occupants of the upper tiers in a theatre, or the balcony in a concert-room, run the greater risk. In the present case it appears that the whole of the visitors were on the ground level, and that it was on account of the enormous rapidity of the spread of fire in the temporary structure that the panic immediately became so serious and so many lives were lost. One might almost say that the identical fire, occurring in a similar room which had been substantially constructed, would not have caused the same terrible panic, nor the same number of fatalities, given the same class of visitors. As regards the visitors, we may add that it is an important point to remember, in the consideration of the Paris fire, that whilst, on the one hand, the majority belonged to the educated classes, who are

generally considered less emotional and excited in times of danger, we have, on the other hand, to deal with a nation which is known for its excitability. A great authority on theatre fires has always attributed our immunity from catastrophes to a great extent to the presence of mind of English men and English women, shown both in facing a danger or in effecting a rapid exit. There is not the slightest doubt that a Frenchman or an Italian would under the same circumstances behave differently to an Englishman or a Norwegian. Nearly all the theatre fires that occur in London are prevented from spreading by the presence of mind of the employes.

As regards the use of buildings for the purposes of public entertainments, when they are not suitable for large gatherings, we may take the opportunity of warning our public authorities as to the great responsibilities they incur in allowing a large concourse of people in their town halls or assembly rooms, for such purposes as bazaars, when a quantity of easily inflammable material is collected, the presence of which was not contemplated in the original provision against danger from fire. Such assembly rooms, which are often situated on a first floor level, very frequently only have one approach. A large council chamber, situated on the first floor of a municipal building, does not lend itself to the purposes of a bazaar, however handsomely it may be decorated. Considerable attention has been given to the safety of theatres, but there are many public halls throughout the country which have been sadly neglected, and we know of many assembly rooms which, besides being badly planned, show such elementary defects as to have doors opening inwards.

In this year of continual celebration, our public halls are being used to a great extent for various kinds of festivities, and it would be well if some immediate steps were taken to abolish many of the minor defects in the various places of entertainment, before the lesson of the Paris catastrophe is forgotten. As regards the general arrangement and planning of new public halls, or the material alteration of existing ones, it would, perhaps, be advisable to postpone the improvements until some definite policy has been arrived at, by which the work can be done syste-

matically and continuously, in such a manner as to fulfil reasonable requirements, without causing unnecessary friction. The whole of our theatre regulations are conceived in a somewhat casual spirit, according to the amount of interest shown in various localities. London has a set of regulations at present, many of which are serviceable, and can be used in the provinces. The details of these regulations are, however, frequently changed or the code is read differently from time to time. What we require is a model set of regulations applicable to the whole country, firstly for theatres, secondly for music-halls, thirdly for concert rooms and assembly halls, and fourthly for the many classes of public halls or rooms, not forgetting the swimming-bath, which is used for dances or other entertainments during the winter season. Such model regulations have been framed by other nations, and in many instances they have either been officially recommended to the Local Authorities or have become law. Austria has a set of model regulations applicable to the whole country, and similarly Prussia. At present we are afraid that private interests generally take precedence of those of the audience, excepting only in the metropolis and in a few of our larger provincial cities. The occurrence of the great catastrophes in 1881 and 1887 resulted in the improvement of our London regulations. We trust that the lesson of the Paris Bazaar will result in further improvements, more particularly as far as our public halls are concerned, not only in London but throughout the kingdom.

As we have already said, the actual details of the catastrophe at Paris are of but little direct interest, and we scarcely think that the official inquiry by the French Government will show any results of particular value. The catastrophe is, however, an object lesson in many respects for other classes of buildings than theatres or public halls. We may particularly point out the danger of temporary exhibition buildings, in which large numbers of people congregate, and which require special facilities for exit. Even such substantial structures as our Royal Academy building should not be forgotten, for it is terrible to think what would occur in the case of a panic whilst the picture galleries are crowded. Our churches also frequently show material defects in planning, and it should not be forgotten that panics arise in places of worship, though there need not be necessarily any fire to cause the alarm. The safety of the public, in all classes of building, deserves more attention than has been accorded to it, and if it is too difficult or complicated to frame the necessary regulations and enforce better buildings we, at least, trust that architects will be sufficiently conscientious to consider the dangers they may create by bad planning, quite apart from the responsibility thrown upon them should a catastrophe occur in one of their buildings.

But the main and most important lesson of the recent Paris fire is, that temporary structures require to be brought under rules and regulations in regard to danger from fire, quite as much as permanent buildings. In many forms of temporary structures for festivities or shows the arrangements are such that exit is easy in all directions. But where it is not, the danger is far greater than in a permanent structure, in consequence of the usually inflammable nature of the materials.

THE ROYAL ACADEMY EXHIBITION.

THE opening of the Royal Academy still remains the most interesting artistic event of the year, though it is impossible not to feel painfully conscious of the gaps which recent losses have left. With no Leighton picture, no Millais picture, and Mr. Tadema's principal work not appearing in its usual place on the walls, Gallery III. is indeed shorn of much of its ancient honours; nor is there anything to fill the vacant places. Outside of portraiture, there is not a single work which can be called a great or a leading picture this year. If pictures of the first rank are wanting, however, the second rank shows a considerable proportion of good and interesting works; and two or three well-known painters have surpassed their previous efforts.

It is a year of portraits, in some sense; not that there are more than usual, but that the portraits are on the whole the finest works exhibited, and are interesting for their curious diversity of style and treatment. Foremost among them may be mentioned the two by M. Benjamin-Constant: Mr. Frederick Ayer (47) and the Earl of Ava (194), the latter presented to Lord Dufferin on his retirement from the French Embassy. These are examples of the highest class of simply realistic portraiture, with no attempt to make any special pictorial effect by treatment of the costume or accessories or by any special code of colour; the last-named is an especially fine and dignified work: in both cases the heads are beautifully painted. Mr. Herkomer shows the "superb" order of portrait in that of Mrs. E. Bourke (241), in black dress with red roses at her bosom, a crimson curtain behind, and posed in an attitude of remarkable ease and dignity. With this one may contrast Mr. Shannon's portrait of Mrs. George Peck (404), painted as if to show with how little detail, with how broad a sweep of the brush, a portrait can be sufficiently finished for resemblance, while still preserving the character of a sketch on a large scale. Mr. Sargent's principal portrait, in Gallery III., Mrs. Carl Meyer (291), shows in an even exaggerated form his frequent habit of adopting a very high sight line for a seated portrait, so that from the ordinary point of view the sofa and the figure (as suggested in the humorous sketch in *Punch*) appear to be slipping down an inclined plane. The method enables the painter to give a great deal of the detail of carpet and sofa cover, but it produces a false and unpleasant perspective effect. In other respects this is a brilliant and effective portrait of a lady's face and arms and a mass of white satin dress. Mr. Orchardson's portraits are studies in colour, in which sometimes, as in his portrait of Mrs. Tullis (410) the colour combination, where the main elements are a primrose dress and a light grey background, and the general effect, seem to have received more attention than the painting of the face. His best portrait is that of the Provost of Oriel (355), admirable both in colour and character. Among other noticeable portraits are Mr. Fildes's of Mr. Donaldson (29), the hands and face in which are finished with extreme care and delicacy; Mr. Briton Riviere's of "Mrs. Methold and her Deerhounds" (233), in which, however, the dogs are the most important and successful element in the picture; Mr. Hugh Riviere's of the Rev. Canon Ainger (339)

and Mr. Poynter's of Mr. Sidney Colvin, remarkable mainly as excellent likenesses (which, as Mr. Collier says, is after all one of the objects of a portrait); Mr. Herkomer's "Madonna: a portrait" (625), a fine forcibly painted figure of a brunette relieved against a nearly white background; Mr. Shannon's brilliant and fine sketch, rather than picture, of a little girl, "Jill," in a picturesque costume (639), and M. Léon Comerre's very French portrait of a very French lady (942). We may also include among portraits Mr. Collier's admirable painting of "The Whist-players" (992), four young men in evening dress seated round a table, lighted by artificial light; in the sense of completeness of execution and realisation of the painter's object this is one of the best pictures in the Academy.

Among figure pictures of the ideal class, of which there are not many, Mr. Frank Dicksee makes a distinct success in "Dawn" (147), represented by a nude figure in rosy light, with some light drapery floating away behind, appearing over a globe symbolical of the earth, while the darkly draped figure of Night comes down into the foreground. The picture is not great or powerful, but it is bright in effect and poetic in feeling. Two painters surprise us by works out of their usual track. Mr. Arthur Hacker has symbolised the death of the firstborn of Egypt by a night picture (23) of an ancient white-walled town through which floats a figure in long red drapery, holding in one hand an outstretched sword and hiding her eyes with the other arm. The painter has succeeded in giving an awful and Fate-like character to the figure, and the picture is an impressive one, and becomes more so as it is studied. Mr. Dollman, who has been known hitherto mainly as a painter of humorous *genre* pictures, surprises us still more with a painting of the old subject of the "Temptation of St. Anthony" (445), which has this new element in it, that the temptress displays not merely the attraction of physical beauty but of a most alluring tenderness of expression which is very well conveyed, and makes the picture a rather striking one, which keeps a hold on the memory. Mr. Logsdail, again, the painter of Venetian architecture and figures, comes before us with a life-size group of Sterne and Maria from the "Sentimental Journey" (564), a fairly interesting work, though neither the genius nor the capability of malice of Sterne are quite realised in the countenance of the man. We may also number among the surprises of the year the appearance of Mr. Hook and Mr. Colin Hunter as portrait-painters, the former with a portrait of his son (308), the latter with a graceful and expressive portrait of a lady (619). Once more, Mr. F. D. Millet, the painter of Georgian interiors, has made a sudden excursion to ancient Rome, and in a work entitled "Youth" (994) shows us two Roman lovers with their backs to the spectator, the lady's head turned sufficiently to show the profile of a face of exquisite beauty. This branching out of various clever painters from a well-worn track into a perfectly new one is an interesting feature of the exhibition, and offers a wholesome example to the many who are too prone to confine themselves to repeating one successful experiment in picture-making.

Among well-known artists who keep to their usual class of subject Mr. Orchardson

is foremost with his admirable scene in an eighteenth century French (?) drawing-room (227) where three men vie with one another in making themselves agreeable to a lady of very graceful and dignified figure. As usual, the colour effect is entirely original and the painter's own, and the accessories most carefully studied—notice the careful perspective drawing of the large carpet pattern; the three men are also very well differentiated. Mr. Alma-Tadema's "Watching" (173) is chiefly interesting, as usual, not for the figure but for her surroundings, especially the very characteristic-looking marble seat and the circular mirror with all the elaborate detail of the frame worked out in perspective. But this smaller work in Gallery IX. (the room of cabinet pictures), "Her Eyes are with her Thoughts, and they are Far Away" (769), though here again the figure does not come up to the idea suggested, is the more pleasing and complete work as a whole. Mr. Poynter exhibits a semi-architectural picture in which a "Message" (299), is delivered, in the shape of a written note, by one of two Roman young ladies who stand on the balcony of a columned building close to a port; the mast of a ship rises between the spectator and the balcony, and a man clinging to it receives the "message." The painting of the architectural details is careful and solid, but surely the cross-bars of the balustrade (the well-known Roman form of balustrade) are too thin; if made of marble, they look as if they would snap with a slight blow. While on architectural subjects, we should recognise the force and truth of Mr. Logsdail's picture of "The Bronze Horses of St. Mark's" (252), taken from the balcony and showing the side-view only of the horses, their partially gilded surfaces stained and defaced by time and weather. This is a very real work of its class, and the same painter's "Winter Morning on the Molo, Venice" (454) is another good architectural picture.

Mr. Godward, in his large profile nude of "Venus Binding her Hair" (664), has not come up to his great success of last year in "Campaspe," though it is a good learnedly painted work. As to Mr. Waterhouse's "Hylas and the Nymphs" (307) and Mr. Hacker's "Sea Maiden" (688) one does not know what the painters are aiming at; the former is an antique legend represented by mediæval women, and except in regard to colour has no attractiveness or beauty at all: as to the other it is difficult to tell whether the nude girl is meant to be a real or a supernatural or nymph-like personage; if the latter, her interlocutor seems to take the apparition in a very matter-of-fact manner. This is one of a class of pictures with which painters vex us; pictures which have not sufficient beauty to make them interesting on that account alone, and in which apart from that consideration there is no point or meaning. On the other hand, Mr. Bridgman's "Bacchanti" (133), a crowd of leaping figures, has a great deal to recommend it; it is full of spirit, energy, and fine drawing, and is one of the best things its author has exhibited at the Academy. Another success of the year in the shape of a classic idyll is Mr. Draper's "Calypso's Isle" (39), as much a sea-piece as a figure-picture, certainly, in which a half-nude figure who reminds us of Etty sits with her back to the spectator at the edge of a dark sea which reminds us of Mr. Somerscales,

and probably would not have been painted had not he shown the way; this is a striking and very successful work.

Among the pictures which endeavour to realise for us scenes in fiction or in history, the most important, in regard to scale and ambition at all events, is Mr. Abbey's play-scene in Hamlet (477), which however is a sad disappointment after his brilliant success with the scene from Richard III. last year. It is chiefly remarkable as an effort at archaeological realism, and perhaps for the portrayal of the king, a weak shuffling creature such as we may imagine him to have been; but the principal figures, those of Hamlet and Ophelia, certainly add nothing to our conception of the characters; Ophelia is not even beautiful, as we must certainly suppose her to have been; nor is the story told with dramatic point; in short, for Mr. Abbey, the picture is a failure. Of battle pictures there are several, among which decisively the best is Mr. Crofts' spirited painting of an episode of the attack on Hougoumont (196); the rest are mere stage work. Mr. Caton Woodville, in his "Fuentes d'Onoro" (940), has fallen into the trap set by Mr. Muybridge for painters of animals in motion, and in his endeavour to realise some of the attitudes recorded by instantaneous photography reminds us of what we heard an eminent painter remark at Mr. Muybridge's lecture at the Royal Institution some years ago, that these photographed attitudes of horses are of little use to painters, since they represent attitudes which are too momentary for the eye to take in, and therefore produce a false effect when registered permanently on canvas. Miss Kemp-Welch has done far better than this in her large picture of "Colt-hunting in the New Forest" (346), which comes near to reminding us (*longo intervallo*) of Rosa Bonheur. Lady Butler's Albura picture (to return to the battle pictures) may be very patriotic, but it is a very bad painting. Mr. Gow makes a real and effective scene out of Napoleon "On the way to exile" (221), showing the arrival of the Emperor at Rochefort in 1815; the drawback to it is that the face at the carriage window is hardly that of Napoleon; otherwise the picture is carefully studied. Mr. Boughton's rather large picture of "After Midnight Mass, Fifteenth Century" (278) shows some people, including high dignitaries, emerging from a cathedral into a wide level snow-covered road which looks just like a modern well-kept street, while the architecture, which is weak to a degree, looks like modern Gothic except that it is treated as old stonework, the painter apparently forgetting, as painters constantly do forget in these cases, that a building of the style that he shows would have been a nearly new one at that epoch. Mr. Lemon's group of Don Quixote and his squire (534) is a better than average representation of the famous pair.

Among paintings of humble life Mr. La Thangue's "Travelling Harvesters" (439) is one of the best; it is unnecessarily large (life size), and shows two or three rustic figures carrying bundles, coming up from a river side in warm evening light; there is a fine and true effect of atmosphere in the picture, and the figures are carefully studied types; still, it is not what we call a "picture" in the higher artistic sense, and in this sense the same artist has aimed higher in his "Gleaners" (1081), which we like still better

than the other, though in one sense there is less work in it. Mr. Stanhope Forbes has not made much out of his "Christmas Eve" (405), a village street with "waits" playing on brass instruments, and the church tower scene at the end of the vista; there is little of interest or character in the figures.

Mr. Melton Fisher gets a good deal of interest out of the representation of "A Children's Picnic" (647), not merely in the representation of child character but in his peculiar treatment of colour and light, by which a year or two ago he raised a shopping scene at a haberdasher's to the level of ideal art; this is not so much a representation as a translation of the scene into its pictorial elements. It seems too large however for the subject; at least, we do not know who would care to possess a picture of that size of such a subject. A rather interesting and more typical picture is that by Mr. Charles Sims entitled "Childhood" (1022), at first sight merely a crowd of children holiday-making in a meadow partially shaded by trees; but on closer inspection it is to be perceived that there is a certain amount of significant allegory in it; the work embodies a rather new idea, and contains moreover a great deal of incident; it is a picture that will lead one to look out for future works by the artist. We were nearly forgetting Mr. Arthur Hughes, who paints with his accustomed delicate and slightly unreal colour a wood landscape in the midst of which is a rural maiden dressing her very red hair, and calls it appropriately "Audrey's Toilet" (115); but it is not a subject to show Mr. Hughes at his best; his style, however he may finish and heighten up the detail, is not that of realism; his essential power lies in the treatment of scenes containing some poetic symbolism, as in some which have adorned the walls of the Academy in former years, and he would do better for himself to keep to that class of subjects; no doubt in this work there are charming passages, but it is not effective as a whole.

Among paintings which cannot be very well classified and which have some special merit and individuality of their own the following should not be overlooked: Mr. Mouat Loudan's "Butterflies" (117), a picture of a child in a long skirted-dress dancing, which is an original effort in colour if rather ungainly in design; Mr. R. Brough's "Fantasie en Folie" (138), a seated half length of a girl in a brown dress looking at a Chinese grotesque—a very clever thing; Mme. Ronner's admirable cat picture, "A Cosy Corner" (377); Mr. Tuke's "Beside Green Waters" (462) two nude lads with a curious and inexplicable background to the scene—not Mr. Tuke at his best, but worth attention; Mr. Lorimer's "A Dance" (497) a very pretty domestic lamplight scene; Mr. Clausen's "The Old Barn" (52), notable for the degree of suggestion of detail and texture in an apparently very unfinished manner; Mr. Margetson's "The Sea Hath its Pearls" (670); Mr. Jacomb-Hood's "The Little Swineherd" (678), in which the boy seems to have strayed out of Mr. J. M. Swan's domains; Mr. Wylie's "Barry Docks" (695); Mr. Kennington's "Maternity" (947); and Mr. T. Graham's "Crusoe Prisoner of the Sallee Rover" (1015), a very bright piece of sunlight and colour.

As to the landscapes, there is the shortcoming usual in our English landscape paintings; they are too pretty, too merely pictures

of scenes you can walk into. The broadest in style, the nearest approach to something like a grand landscape, is Mr. Parsons' "The Star that Bids the Shepherd Fold" (146), which has not the special qualities that have made him popular with exhibition-goers, but has higher ones, and is the best landscape we remember to have seen of his. Mr. North's picture which hangs as a pendant to it is an interesting but somewhat conventional work. Mr. David Murray's landscapes show the influence of French sympathy and study in his manner of treating detail, but the French breadth and power are not there, and perhaps the best of his works, after all, is the "prettiest," "Deeside" (476), for it fulfils all it seems to aim at, which the two Hampstead pictures do not. Mr. H. W. B. Davis's "Flowery May" (240) is rather like a repetition of his last year's picture, except that a cow is introduced as an addition to the sheep; this is a beautiful and brilliant painting of realistic landscape, but whether it fulfils all that landscape was instituted for is another question. His smaller work, "The Banks of the Upper Wye" (602), contains an exquisitely painted bit of distance. Among other landscapes Mr. Waterlow's small upright "A Tranquil Stream" (83) is a really artistic work with a very fine sky; Mr. Leslie's "The Day of Rest" (269) shows no doubt a very hard conventional style of tree-painting, and yet there is a repose about it which one cannot deny even while not liking the style; Mr. Weiss's "In the South Downs" (402) is a picture to be looked at; Mr. Arnesby Brown's "Herald of Night" (434) is a charming pastoral; Mr. Ridley Corbet, in "Vespers" (459), produces a successful imitation of Signor Costa's style; Mr. Alfred East's "Silence of Morning" (597) suggests the silence but hardly the colour of morning; Mr. Mark Fisher, in "Out of Harness" (641), paints landscape and horses in his usual forcible and original manner; Mr. C. W. Wyllie in "Rickmaking" (1047) shows a charmingly composed and very complete little work; and Mr. Johnson, in "A corner of Old England" (1060), a remarkably real bit of foreground, not overpainted. In sea pictures Mr. Brett's chief work, "The South Stack Lighthouse; the Wind Athwart the Tide" (384) shows a grand coast and a splendid realisation of the tone and general look of sea water, but there seems something of manner about the isolated foaming crests which seem to crop up here and there in a way that is rather artificial, as is the shape and curl of the waves; it strikes us that Mr. Brett produced more really natural seas a few years ago than he produces now; there is something like a trick of effect. Mr. Hemy has a fine powerful storm scene in "Lost" (334), in which the treatment and colour of the sea rather remind one of some of Mr. Hook's pictures, but with a difference. Mr. Hook, by the way, seems for the present to have nearly deserted the sea and gone up country; his "Low Water at the Tidal Crossing" (340) is his best work, and Mr. Brett's best, we are inclined to think, is the beautiful little picture in Gallery IX, "Whitshell Point" (858).

Of the sculpture we shall have something to say on another occasion.

WINDOW, UTOXETER CHURCH.—Another stained glass window has just been inserted in the parish church, Utoxeter. The work has been executed by Messrs Ward & Hughes, of London.

NOTES.

The New Employers' Liability Bill.
THE Home Secretary on Monday last introduced the Employers' Liability Bill of the Government. We shall take an early opportunity of calling attention to the Bill in detail. Meanwhile, it is desirable to point out that, although the Bill is limited to certain trades, it is a very important step in regard to the law of this subject. It embodies an entirely new principle, that is to say that a workman shall receive compensation for all accidents by which during the course of employment he may be injured. It matters not whether such accident is, so to say, purely accidental, or whether it is caused by the negligence of some one in authority over the injured person, or by a fellow-workman. As soon as the accident has occurred, and injury has thereby been caused, the right to compensation according to the scale in the Bill arises. It is also important to bear in mind that this right to compensation arises even if there has been contributory negligence on the part of the injured person, which negligence has helped to bring about the accident and consequent injury. This, it will be obvious, is a change in the law which will require ample discussion and consideration.

The Postal Improvements.

THERE was one feature of the Budget Speech last week of great importance to the commercial community, and of considerable interest to all classes, which merits a passing reference. We have been so accustomed to regard postal reforms as something to be wrung from a slow-moving and somewhat unwilling Department by means of long-continued importunity, that the announcement made by the Chancellor of the Exchequer comes as a gratifying surprise. It is more than reform, it is revolution. When it becomes an accomplished fact we shall no longer have to trouble ourselves as to whether a bulky missive weighs more than an ounce—or even two ounces, or three. It will have to be a very long letter to cost more than a penny, and as business houses will be enabled to enclose circulars and patterns with ordinary letters up to 4 ozs. without extra expense in postage, there will doubtless be more work for printers, and we shall require larger waste-paper baskets. As to the Post Office officials, the letter-carriers will hardly appreciate the change, but to sorters and examiners the absolute removal of all distinctions between letters and other postal packets will be an incalculable relief. The reduction on foreign and colonial letters, and in the parcel-post rates, will be greatly appreciated; but the substitution of a 4 ozs. for a 1 oz. minimum for a penny letter undoubtedly marks an era in postal reform. It is rather appropriate that this change is to come into operation on a historic date—Jubilee day.

Improvements in Westminster.

WE read that a petition has been addressed to the House of Commons for leave to introduce a Bill for effecting some comprehensive improvements within the parishes of St. Margaret and St. John, together with an extension of the Embankment as far as Lambeth Bridge. The Bill will provide for a wide clearance in the insanitary area lying between Horseferry-road and Victoria-street (east end), an avenue from the Victoria

Tower to Horseferry-road, and the laying out of a square in front of the Church House, Great Smith-street. It is proposed, further, to make a new street leading into Smith-square, and thus to open out the view of St. John's Church. All the improvements proposed in this Bill, and more besides, we may observe, were suggested years ago in an article in our columns (*Builder*, Sept. 2, 1878), accompanied by a sketch plan.*

The New Secretary of the Institute.

THE Council of the Institute of Architects have appointed as Secretary Mr. J. W. Locke, who was present at the annual meeting on Monday last and was introduced to the meeting by the President. There is every reason to think that in accepting Mr. Locke's application the Council have secured the services of an accomplished and cultivated gentleman, who will in every way be a worthy official representative of the Institute. Mr. Locke is a graduate of St. John's College, Cambridge, where he took honours in mathematics, and has since been engaged in teaching and literary work. It is perhaps to some extent to be regretted that for the first time the office of Secretary of the Institute of Architects is filled by one who is not an architect, which is a departure from ancient precedent; at the same time it must be admitted that there is nothing in the duties of the Secretary which imperatively calls for architectural knowledge, and the fact that the original provision under the old Charter, that the Secretary must be a Fellow of the Institute, was abrogated when the revision of the Charter and By-laws was made in 1880, indicates that there was some idea at the time that it might be convenient to leave the future choice unfettered in this respect.

Disfiguring the National Gallery.

IT is to be feared that, however bright London may look on June 22, it will for some time before and after the date be greatly disfigured. A hideous hoarding is already arising round the National Gallery, so that the many visitors to London will see the Trafalgar-square spoilt in appearance weeks before the day of rejoicing arrives. It is difficult to understand why this work should be commenced so soon, since to erect hoardings and temporary seats is work that is done every day all over England in a very short time.

Christ Church, Birmingham.

MOST people who have visited Birmingham will probably remember Christ Church, the classic church with a spire (a little reminding one of All Souls', Langham-place) which stands in a commanding position at an angle of two streets, opposite the Municipal Buildings. It is proposed by the ecclesiastical authorities to sell this church, or rather the site and materials, in order to raise a fund for providing two extra curates in the district, and building another church in some quarter where, it is asserted, it is more wanted. This seems to be the commencement in Birmingham of the same policy which has been pursued in regard to a good many City churches in London. Christ Church is not a Wren church, but it is a fairly dignified building in a remarkable situation, and

* Since the above was in type we learn that the Standing Orders Committee have not agreed to the introduction of the Bill this Session.

architectural landmark of the city, and we are informed moreover that it has an average congregation of 900, with nearly all seats free. Under these circumstances it seems a very undesirable proceeding to remove a church like this, and destroy an important architectural feature of the town, and we certainly hope that the proposal of the ecclesiastical authorities will not be sanctioned.

Mr. J. G. FRAZER'S long-looked-for edition of "Pausanias" is at last definitely announced for October. The work has far outrun the expected dimensions, and is to appear in six volumes, at six guineas net; but subscribers who send in their names before August 31 can obtain it for five. We are glad to see that Mr. Frazer intends his book for the educated public generally, and not merely for specialists. He rightly says: "It seemed to me that every educated person must have some interest in picturing to himself how ancient Greece, the mother of so much of our modern civilization, may have looked, if not in her meridian splendour, at least in the peaceful evening of her day, while she was still rich in the artistic beauties of the past. . . . Hence, I have been at pains to write as simply and clearly as I could, to avoid all unnecessary technicalities, and to give all quotations from Greek and their foreign languages in English." Mr. Frazer not only translates and comments on his author, but also supplements him. He gives detailed descriptions—often illustrated with plans—of many important remains of antiquity which Pausanias, from one cause or another, omitted to notice or describe. Such are the sacred precinct of Eleusis, the remains of Thoricus, Icaria, and Aphidna, the Temple of Athene at Ægina, the prehistoric palaces of Tyrnus and Mycenæ, the stædia of Herodes Atticus at Olympia, and a host of other antiquities.

It may be of interest to English architects to know that an International Congress of Architects is to be held at Brussels on the occasion of the International Exhibition which has just been opened. The dates selected are August 28 and September 22, and the meetings will be held under the auspices of the Central Society of Architects. The programme of the proceedings has not yet been quite definitely decided on, but it would appear that a number of important subjects will be under discussion, and that the social side of the gathering has not been forgotten. As regards the International Exhibition, we are but too forcibly reminded that it was the King of the Belgians, who, not many years back, vetoed what he called the opening of an exhibition of packing cases, and refused to attend any further ceremonies in connexion with shows of this description unless the majority of the exhibits were in position. What at present an exhibition of packing cases at Brussels, was hence opened without any ceremony, and it will not be probably until June that the King will pay his first official visit to the grounds, nor will it be worth the while of a foreigner to visit the Exhibition before June 15. As far as the arrangement of this Exhibition is concerned, and the representation of various countries, we have every reason to believe

that it will be an unusually successful one, as everything has been carefully thought out, and the various Governments or public bodies concerned have been unusually liberal. Perhaps one of the most interesting exhibits is the presentation of a railway constructed on the Mona Rail System, at an outlay of about 25,000*l.*; the line is nearly three miles long. An exhibit of two hundred house flags of English shipping countries is particularly picturesque. As regards the Art Section, we would only here note that the catalogue shows six hundred and fifty exhibits by British artists.

At Berlin the so-called "International" Art Exhibition has been opened, but this year it will again be found that the works of art represented are mostly of German origin, and that there is scarcely any claim for the ambitious title "international." At Munich the great annual "International" Art Exhibition will also soon be opening its doors; and here, as usual, the exhibits are of a somewhat more cosmopolitan character. Dresden has been equally ambitious, and also announces an "International" Art Exhibition, but with, unfortunately, little more claim to this name than Berlin. We cannot understand why Germany is always so desirous of giving its regular exhibitions a pretended "international" character, unless it is that the decadence in German painting causes the general public to desire to see some work of better type. If this is the case, however, it would be far more advisable to have a *bonâ fide* international exhibition in the country once in five or ten years. The constant sequence of minor "international" exhibitions in two or three towns has become tiresome to the foreign artists concerned, and if we judge from the architectural room alone, it is rare, indeed, that any country is represented in such a way as to give the visitor any idea of what is being done in that part of the world.

This report was a pleasant surprise for us. We have been often deceived by splendidly printed and illustrated Corporation Reports on Electric Traction which turned out to be of no value; but Birmingham is to be congratulated on having such an able Public Works Committee, and the intelligent manner in which the Sub-committee have examined the tramway systems in the numerous towns they visited is deserving of all praise. The Report is most interesting reading, and we agree with almost everything in it. We would like to make long quotations from it, but shall have to content ourselves with referring every one to the Report itself. The general conclusion at which the Committee arrived is that no consent be given for the erection of overhead wires in any part of the city. They say that less objectionable and equally efficient methods of applying electricity to the working of tramways are available at a reasonable cost. Dr. John Hopkinson, whom no one can accuse of being prejudiced against overhead systems, was present at the meeting of the Sub-committee, and heartily endorsed their conclusions. We are glad that the views we have always advocated are at last beginning to prevail in this country. We may mention that the municipal authorities at Paris, Vienna,

Berlin, Rome, Brussels, &c., do not allow overhead wires in central thoroughfares. It will surprise some people to learn that in New York they are laying down fifty miles of conduit this year, because permission for overhead wires cannot be obtained.

THE strength of this exhibition, as usual, lies in the landscapes, of which two of the most remarkable are Mr. Philip's "Island of Rum, from the Sands of Arisaig" (124), a very solidly painted landscape, with an expanse of undulating sand in the foreground and the blue rocky heights of the island in the distance, and Mr. Eyre Walker's "The Gladness of a Summer Day" (132), a bright landscape with a mass of white flowers in the foreground, which really answers to its title. Mr. R. W. Allan's "Home from the Meadows" (28) is interesting for its treatment of the water, which in manner rather reminds one of Clays; all his contributions are marked by his usual breadth of style and pure colour, except perhaps "Fresh from the Sea" (68), which, despite its title, is rather deficient in freshness. Mrs. Allingham is at her usual level of excellence in "Old Kentish Inn" (7) and "A Blue-bell Hollow" (113). Mr. Tom Lloyd's two principal works are experiments in effects of lighting; "A Dance at the Hall" (63) shows a park at night in the snow, an old house with all the windows lit up, and a group of deer in the foreground attracted by the lights; in "A Winter Afternoon" (165), we have again an old house with the windows ruddy not with transmitted but with reflected light: a more difficult thing to represent with pigments, and hardly so successful. Among other landscapes worth special attention are Mr. Waterlow's "Hillside, Connemara" (53); Mr. Albert Goodwin's large Indian scene, "The Jumna and the Taj Mahal, from Agra Fort" (116); Mr. Cuthbert Rigby's "Dinner Hour at the Quarries" (143); Mr. Walter Field's "Hampstead Heath" (162), a fine landscape though with rather a dingy sky, and Mr. Thorne Waite's "The Misty Downs" (133). Mr. Albert Goodwin is combining towns or buildings with landscape effect with his usual delicacy of colour, as in "Bamborough Castle" (31), and "Spiez, Lake Thun" (96), or with more powerful effect in "Whitby Abbey" (183). Among other works in which architecture is prominent are various drawings by Mr. Rooke, chiefly of streets and cathedrals in France, in which architecture is treated pictorially rather than architecturally. Among the few figure subjects Sir John Gilbert's "A Standard Bearer" (119) is one of the best and most effective examples of a *motif* which he has often repeated. Sir Francis Powell, in "A Glimpse of the Sea" (106), goes out of his usual course to show us, not the sea, but a pretty picture of two children looking at it over a wall. Mr. Bulleid's "At the Well Callirhoe" (177) is little more than a repetition of previous studies of the same kind. Mr. Melville, the impressionist member who represents a crowd of persons by dabs of colour in the midst of white spaces, is here again with a larger work than before, "A Spanish Bull Fight" (186); but, in spite of its exceeding cleverness and brilliant colour, the enlarging of the scale brings out the weaknesses of his method in a rather formidable manner.

Society of
Painters in
Water Colours.

Brussels
International
Exhibition.

The Birmingham
Tramway Trac-
tion Report.

A remarkable Picture Exhibition. An exhibition entirely composed of paintings of women and children has been organised at the *École des Beaux-Arts*, Paris, for a charitable object. All schools and all epochs are represented in this remarkable exhibition, from Ambrogio de Predis and Ghirlandajo to Meissonier. There are many fine examples of Rembrandt, Van Dyck, and Franz Hals; Velasquez and Goya are equally well represented, and the works of the French school include examples of Clouet, Largillière, Chardin, La Tour, Greuze, Fragonard, David, Ingres, Dubufe, Delaunay, and Cabanel. For the first time also, we believe, the English School of the eighteenth century and that of the commencement of the nineteenth have found a worthy representation in a French retrospective exhibition, which includes examples of Gainsborough, Reynolds, Romney, Hoppner, Lawrence, and Landseer, and the collection in this sense is said to have been quite a revelation to French visitors. The exhibition, which contains nearly 300 pictures, was formally inaugurated by the President on May 1; it is open to the public till the 23rd of this month.

ONE can only mention the last new exhibition at the gallery of the Society of Fine Arts, consisting of a collection of cabinet pictures of over-dressed women by Mr. Jan van Beers, to express our regret that a gallery which has hitherto maintained a high artistic standard in its exhibitions should have opened its doors to this class of work. That there is a superficial cleverness of technique in Mr. Van Beers's paintings cannot be denied; but from an artistic point of view they are commonplace, and from another point of view vulgar—or worse than vulgar; the art of the *demimonde*.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the Sixty-third Annual General Meeting (the Thirteenth General Meeting of the Session) of this Institute, held on the 3rd inst., Professor Aitchison, A.R.A., President, in the Chair,

The Hon. Secretary announced the decease of Mr. Arthur Baker, Fellow, and M. Charles Alfred Chastel de Boynville, Associate.

The Hon. Secretary also announced the decease of Mr. Henry Markby, the Institute solicitor, and stated that the Council had authorised the Secretaries sending a letter of condolence to his partners.

The Hon. Secretary announced that Mr. Charles G. Maylard, of London, had been reinstated an Associate in compliance with By-law 20.

The report of the Council for the official year 1896-97, a copy of which had been issued previously to every member resident in the United Kingdom, having been submitted and taken as read, the Chairman formally moved its adoption, which was seconded by Mr. Aston Webb, F.S.A., Vice-President. The same having been discussed, the report of the auditors was read, whereupon it was resolved, *nem. con.*, that the report of the Council for the official year 1896-97 be approved and adopted. The following are some of the salient points in the report:—

The Council elected on June 8, 1896, have held twenty-two meetings. The Committees of Council for the consideration of matters connected with professional practice, finance, and library administration, and for the award of the Royal Gold Medal, have held twelve meetings.

During the official year 18 Fellows (of whom 11 were previously Associates), 40 Associates (of whom 18 were Students), and 8 Hon. Associates have been elected. The number of Fellows is now 602, as against 594, and the number of Associates 986, as against 968 at the corresponding period last year. The number

of Hon. Associates remains the same, namely 55."

After mentioning the losses by death during the year, the Report continues:—"The Council deeply deplore the loss of their Secretary, William H. White, who was appointed in the year 1878, and held the office until the time of his death, a period of eighteen years. During that period the membership of the Institute largely increased, the present system of examinations came into operation, and the responsibilities of the chief administrative officer were in other ways augmented. Mr. White devoted himself to his duties with the utmost zeal, bringing into play all the forces of a naturally energetic temperament in promoting the knowledge of architecture and the welfare of the Institute whose interests he had so much at heart, and especially in maintaining cordial relations between it and kindred societies abroad. Mr. White's illness prevented his attending personally, except intermittently, at the Institute after the beginning of last year, although he maintained his interest in its affairs until the last, and his place will be very difficult to fill. The vacancy has been advertised, and out of fifty-seven candidates the Council have selected Mr. William J. Locke, B.A. Cantab., who will enter on his duties after Easter; and they have also appointed Mr. Herbert G. Tayler as Assistant-Secretary. During the vacancy in the Secretaryship an unusual amount of work has been thrown upon the Hon. Secretary, and the Council desire to record their indebtedness to him for so kindly carrying it out, and also for the willing assistance rendered by the whole of the staff. The Council also desire to express their acknowledgments to Mr. Alex. Graham, F.S.A., Vice-President, for his services as Hon. Editor since Mr. White's decease.

The Institute has lost a warm friend and generous benefactor in the late David Brandon. It will be remembered that the preparation and printing of the Library Catalogue issued to members in 1889 was due to his generosity, and he has supplemented this by a munificent bequest of 1,000*l.* A legacy of 100*l.* has also been received from the executors of the late David Mocatta. Both amounts have been invested, and the income will be of great service in the work of the Institute.

The preliminary examinations of June and November, 1896, were held in London, Manchester, and Bristol, with the result that 165 gentlemen have been registered as Probationers. At the same time intermediate examinations were held in London and Manchester, with the result that 68 Probationers have been registered as Students. There are now 872 Probationers and 798 Students on the respective registers. The final and special examination qualifying for candidature as Associate was held in London and Manchester in June, and in London only in November last, when of the 76 candidates examined, 35 passed.

The Asphelt Prize was awarded to Mr. T. Denton Brooks (A.), he having most highly distinguished himself among the thirty-five gentlemen who qualified during the year for candidature as Associate.

The prize offered by Mr. Arthur Cates for the best set of testimonies of study submitted by Students for admission to the final examination was awarded to Mr. C. S. F. Palmer (A.), who qualified for candidature as Associate in November, 1896.

The Council desire to record their indebtedness to the Allied Societies at Manchester and Bristol, under whose charge examinations have been conducted during the official year; as well as their obligation for the gratuitous services rendered by the London Board of Examiners.

A statutory examination was held in October last, when certificates of competency to act as District Surveyor in London were granted to Mr. O. C. Hills (A.) and Mr. George Tolley; and a certificate of competency to act as Building Surveyor under local authorities to Mr. J. H. Dunn.

The Royal Gold Medal for the promotion of architecture was presented to Mr. Ernest George, Vice-President, in June last. For the current year Mynheer P. J. H. Cuyper (Hon. Corr. M.), of Amsterdam, has been selected for the honour, for his executed works as an architect, and her Majesty the Queen has graciously signified approval.

Selections from the premiated drawings and specimens of testimonies of study submitted by candidates for admission to the inter-

mediate and final examinations are being exhibited under the charge of the Allied Societies at Birmingham, Leicester, Nottingham, Sheffield, Leeds, York, Newcastle, London, Glasgow, Liverpool, Dublin, Bristol, and Exeter, in the order named. Among these are drawings of Melrose Abbey by Mr. F. J. Wass, Institute Medallist; perspective and details of Provincial Hall, by Mr. J. A. R. Inglis (A.), Somme Medallist; measured drawings and sketches by Mr. William Haywood, Pugin Student; coloured studies by Mr. A. E. Henderson, the Owen Jones Student; coloured studies by Mr. A. Griffith (B.A. Oxon), to whom the second of the Aldwinckle Studentship was awarded; and a design for a bay of a church by Mr. S. K. Greenslade (A.), Grissell Medallist. These were accompanied by selections from the drawings of Mr. J. A. Swan, Mr. C. H. Holden, Mr. C. de Gruchy, and Mr. W. E. Dobson, to whom subsidiary prizes were awarded; and by specimens of work submitted by Mr. H. L. Anderson for admission to the Intermediate examination, and by Messrs. A. G. Bond (A.), G. W. Frazer (A.), and C. S. F. Palmer (A.) for admission to the Final examination.

In accordance with the decision of the Council, a Conference followed by the Annual Dinner was held in Manchester, in response to a request from the Manchester Society, on May 20 last. Mr. Penrose, the then President, presided, and was supported by some of the principal public officials of Manchester, as well as by members of the Council and of the Institute generally. The Council were assisted in the arrangements by the Manchester Society, and the visit was a great success.

Early in the official year the President received a communication from the Right Hon. Joseph Chamberlain, Secretary of State for the Colonial Department, asking him to submit the names of three or four architects to furnish designs for new public buildings to be erected at Kingston, Jamaica. A notice was inserted in the *Journal* calling attention to the matter and inviting applications from members of the Institute and others. A selection was made from those sent in, and forwarded to the Colonial Office, and an intimation was in due course received that Mr. W. H. Harrison (F.) had been selected to carry out the work.

The Special Committee appointed in December, 1895, to consider the question of the nomination and election of Fellows have, after numerous meetings and consultation with the Allied Societies, reported to the Council, who have adopted the suggestions made, and these will be submitted to the general body at a special general meeting on May 31.

A communication was received in June last from the Board of Regents, the governing body of the University of California, stating that it had been decided to prepare a programme for "a general competition for a permanent comprehensive, and grand plan of the grounds and buildings of the University of California at Berkeley," and asking for suggestions with respect to the preparation of such programme. The matter was referred to the Competition Committee, who have drawn up some suggestions which it is hoped will contribute to the successful issue of the Competition.

The present Jubilee year is also the Jubilee of the Architectural Association, and the Council are glad to have the opportunity of expressing their appreciation of the efforts of that body in the cause of architectural education.

This is followed by the Reports of the various Standing Committees. In the Report of the Art Standing Committee it is mentioned that the threatened demolition of the Trinity Almshouses by the Trinity House Corporation had been averted, the Charity Commissioner having refused their sanction to the scheme.

St. Mary Woolnoth has also escaped its threatened destruction, and in this matter also the action of the Committee greatly assisted to avert the destruction of the church.

The Committee, having taken much interest in the proposed site for the intended new County Hall for London, were invited to an informal conference with some of the principal members of the County Council, and certain of the head officials. In regard to the preservation of old buildings, at the invitation of the London County Council, the Committee consented to prepare a list of buildings in London which may be said to possess historic and architectural interest. Afterwards the London County Council themselves called a meeting for the consideration of the subject, to which the Committee were invited to send three representatives. The conference was held on

December 4, 1896, and after considerable discussion it was decided that it is desirable to prepare a register of the old buildings, and that a general committee should be formed of the various Societies represented at the conference, the matter being left in the hands of the London County Council. In regard to Vauxhall Bridge, the Chairman of the Bridges Committee has promised that a model of the proposed new bridge shall be made and submitted for the inspection of the Committee. The question of Carfax Tower, Oxford, and of the removal of the steps before St. Martin's Church were also among the subjects considered by the Committee. In the former case they reported that the Tower was destitute of architectural interest, and required remodelling; in the latter case they reported against there being any necessity for the removal of the steps.

In the Report of the Literature Committee it is stated that the Committee have arranged for the printing of the catalogue of the Loan Library as a separate publication. They have had under consideration the expediency of printing a supplement to the catalogue of the Reference Library, to be bound up with the Brandon Catalogue. The question of reprinting the series of papers on "Brickwork Tests" and on "Heraldry" is under consideration.

The Committee have been able out of "The White Bequest" to add several valuable works to the Reference Library, and to make an important extension of the Loan Library, to the development of which much attention has been paid.

Mr. Alexander Beazeley, the Librarian, having resigned at the end of last year, the Librarian's report has been made by Mr. Rindolf Dircks, Acting-Librarian, and states that during the twelve months ending March 31 of the present year 154 volumes and 54 pamphlets were added to the library, exclusive of periodicals, reports, and transactions of societies, and parts of works issued in serial form now in progress; and exclusive of the collection of books presented by Colonel G. A. White in fulfilment of the wishes of Mr. William H. White, the late Secretary of the Royal Institute.

The number of volumes presented to the Reference Library was 112, and to the Loan Library 12. The works purchased comprise 24 volumes for the Reference Library, and 6 volumes for the Loan Library.

Of drawings, prints, and photographs 74 sheets and 6 volumes were presented, exclusive of the White donation.

In the report of the Practice Standing Committee, it is mentioned that the question of the payment of architects' fees by fire offices in connexion with the reinstatement of buildings after fires has been further considered by the Committee. After correspondence and negotiations with the principal insurance companies through their Association, a report thereon was submitted to the Council, and was published in the *Journal* of February 4 last.

Letters were referred to the Committee by the Council respecting architects participating in the commission of quantity surveyors, also respecting charges and duties of architects and other matters, and reports have been made thereon to the Council.

The proposed new by-laws of the London County Council regarding drains were considered, and a report thereon, suggesting amendments, was made to the Council. The amended paper on the subject of the professional charges of architects prepared by a sub-committee has received much attention, and is still under consideration.

In the report of the Science Standing Committee it is stated that a further series of experiments in brickwork testing is in hand. These have reference more particularly to brickwork in walls as distinguished from those previously held in regard to brickwork in piers, and the Committee hope, in due course, to issue in pamphlet form the results of the whole series of experiments.

The Committee assisted in judging in the draughtsmanship competitions recently held at the Building Trades Exhibition, and are glad to be able to express their satisfaction at the success that has attended the competitions. They desire to record their opinion as to the value of these competitions. There was a marked increase in the number of competitors in each grade, and the quality of the work done was distinctly in advance of the previous competitions.

Referring to the inquiry as to the acoustical properties of different buildings mentioned in

the Committee's last report, a number of questions relating to the subject were issued to members of the Institute in the *Journal* (No. 6, vol. iii., p. 100, January 23, 1896); but the replies that have been received have not at present been sufficient to enable the Committee to deal with the subject.

In connection with the Jubilee celebration, on the motion of Mr. Delissa Joseph, seconded by Mr. H. Heathcote Statham, it was resolved, "That it be recommended to the Council to consider the advisability of holding an exhibition, or issuing a publication dealing with the progress of architecture during the sixty years of the Queen's reign, and report thereon to the general body."

The lists of attendances of members at the several meetings of the Council and Standing Committees during the official year having been submitted and taken as read, the following members were appointed scrutineers to direct the election of the Council and Standing Committees for the ensuing year of office, and report the result thereof to the business general meeting of June 14, namely—*Fellows*: Frederick Todd, R. E. Chisholm, Zeph King, and five other Fellows to be appointed by the Council. *Associates*: E. R. Barrow, Francis Hooper, R. Skeleton Balfour, S. W. Cranfield, H. H. Langston, and H. Vaughan Lancaster.

Messrs. Edmund Woodthorpe and Owen Fleming, to whom a vote of thanks was accorded for their services as auditors, were again nominated to that office for the ensuing year.

The Statutory Board of Examiners were re-appointed as follows—Messrs. Lewis Angell, Francis Chambers, George Elkington, Professor Banister Fletcher, Ebenezer Gregg, F. W. H. Hunt, E. B. T. Anson, Professor Kerr, J. Douglass Mathews, Lacy W. Ridge, Professor T. Roger Smith, Messrs. Benj. Tabberer and T. H. Watson.

In connexion with the statutory examinations, the Chairman announced that an examination had been held on April 29 and 30; that only one candidate attended, and he failed to pass.

The President having introduced to the meeting Mr. William J. Locke, B.A. Cantab., the newly-appointed Secretary of the Institute, the proceedings closed.

THE ARCHITECTURAL ASSOCIATION: THE CLASSIC CORNICICE.

An ordinary fortnightly meeting of this Association was held in the Meeting Room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, W., on the 20th ultimo, Mr. Beresford Pite, President, occupying the chair.

The minutes of the last meeting having been read and confirmed, the Chairman announced that the following gentlemen had been reinstated members of the Association, viz., Messrs. E. Duc Drury, S. R. J. Smith, A. H. R. Tension, Keith, D. Young, and H. Gray Robins.

The Chairman also announced that, since the Committee's House List had been published, Messrs. T. W. Aldwinckle and J. Murray had been nominated as Committee-men.

On the motion of Mr. E. Howley Sim, the following gentlemen were appointed scrutineers in the election of officers for the ensuing session, viz., Messrs. Brodie, Garhat, Jones, and Wilkinson.

On the motion of Mr. Sim, a vote of thanks was accorded to Messrs. Legg & Son for allowing the members to visit the Royal Palace Hotel Extension, Kensington, and to Messrs. Banister Fletcher for allowing members to visit No. 27, High-street, Kensington.

The Chairman announced that a Water-colour Class would commence on Saturday, the 8th instant. Mr. A. W. Weedon will conduct the class.

Mr. Hugh Stannus then delivered a lecture entitled "The Classic Cornice," his remarks being limited to the profiling of the cornice; such aspects of the question as enrichments, modulations, &c., not being dealt with. The lecturer exhibited a number of diagrams, and as much of his lecture referred to them it is impossible to give a report of his remarks, though we print a few of his general comments. In the course of his remarks the lecturer said that it was one of the greatest misfortunes for architecture that Palladio ever published the Orders, and gave accurate measurements for every little fillet, and every part about it, for the result had been that the Orders had become stereotyped and canonical. As to the cornice, it was

a collection of mouldings used always in a certain position, and composed of a certain number of members. It had a constructive function and an aesthetic value. In connexion with this part of the subject, a paper, full of information, had been read before that Association by Mr. H. H. Statham on May 14, 1888, which was published in the *Builder* for May 12 and 19 of that year, and he would advise all students to read that address. It was necessary to say a few things about mouldings themselves. There were the ovolo and the ogee. Ordinary people made the ovolo a quadrant, but there was the objection that anything that suggested tangentiality to a horizontal line looked exceedingly bad in a cornice. It was very much better, therefore, to make it rather higher than it was wide; and that applied also to the cyma recta. As to the ogee, it should not have the two halves exactly alike in size. The ogee had a character of its own, and the way to express that character was to make the convex larger than the hollow or concave part. The projection of the ogee in the same way might be varied. He hoped that mouldings would be treated as though they were clay or wax in their hands.

As to the cavetto, the same remark as to horizontality applied to it; the cavetto should not be made merely a quadrant. As to the cyma recta, the essence of it was its hollow part, and he therefore made the hollow part twice or three times as large as the other. In reference to fillets, Mr. Stannus remarked that by the treatment of fillets he would sooner judge of a man's ability in profiling than by his treatment of anything else. They should not be made the same size, but in reference to the functions they had to perform. It was with fillets like chess: the man who took care of his pawns won the game, and the man who looked after the fillets made a good moulding. As to the bead, there was not much value attached to it in profiling, because of its neutral character.

It had the same projection at the top as at the bottom, and it did not influence the profiling of the cornice one way or the other. Beading was put in not because it was necessary, but because it gave an additional line of enrichment and refinement. As to the fascia, or band, that usually projected from the general vertical surface of the building. It was, however, not always vertical, but sometimes battered, the Greeks being the first to introduce battering. Mouldings, when they were placed together for the purpose of supporting anything, formed a group. It might be said that two or more mouldings made a group, and that two or more groups made a cornice. In designing groups, there were certain considerations to be borne in mind. They must distinguish the groups, and separate one from the other; another point was that they must avoid indecision. One very good way of avoiding that was never to have in any moulding, or in any group, more than two curves. There were examples in Greek work with three curves, but the use of three curves had always been a premonitory symptom of the setting in of decadence in all styles. All styles began with a single simple curve; then followed the double curvature, and with the triple curvature came decadence. Another point was to avoid equality of size. The Greeks got over the difficulty admirably, for the equality was destroyed by enrichment. Good profiling was an inheritance of centuries of experiments, and indicated the vast amount of thought that had been bestowed upon the matter.

The Chairman, in inviting discussion, said that the subject which Mr. Stannus had introduced to their notice was a practical one, about which all who had to design found difficulties sooner or later. Mouldings were the measure of a man. Street used to speak of the subject as "the art and science of moulding." One could always tell an architect's capacity, his artistic capacity, his native sense of beauty, as well as the habit of his mind (whether he was industrious, careful, or patient, or whether he was stupid) by an examination of his mouldings. As a rule a client did not interfere with the mouldings an architect designed. The client did not pay him for them, and in many cases he would sooner have a trade stock pattern than one designed by an architect. But the world would not so judge. Mouldings were something more than an architect's handwriting; they were the matter he wrote. Most of them had to design mouldings, even if they were of such simple a character as occurred in bedroom cornices, but they never dreamed for a moment that there was anything like the philosophy,

logic, and science contained in the subject of mouldings until they had heard Mr. Stannus. Architects who were designing cornices as part of their daily work had no idea of the facts that underlay their daily work. There was thus a connection between logic and fancy, although they seemed far apart. Alfred Stevens had the sense of beauty as a divine gift, and he evolved excellent cornices, apparently with that easy certainty of hand and mind that marked genius. What would Mr. Stannus suggest as the best course of study to train the eye and the hand in designing beautiful cornices? The analysis he had given them that night was very interesting and important, but was it a practical method for the student to accept in order to enable him to produce beautiful cornices? He was quite sure that Mr. Stannus felt the importance of freehand-feeling in the cornice, though he had not given expression to that. Street preached the gospel of instinct rather than the gospel of mathematics, and he said that freedom of hand underlaid every Greek moulding. He (the speaker) thought that for every-day students no better advice could be given than to throw away the compasses and to trust to the hand. With regard to the cultivation of a proper sense of beauty in a curved line, there was only one perennial fount to which they all turned with anything like comfort, and that was to the curves of the human figure. If any architect could have some knowledge of what underlay anatomical drawing, even if he had not facility in it himself, he would understand that all curves were not fractions of circles; that there was an underlying beauty of curved composition in either the whole or in part of the human form; any single line of the human form was subtle and beautiful in its curvature, and was absolutely indefinable by a mathematical arrangement. They were bound to draw with the hand, and until they did they could not know what beautiful curves were. The engineers' curves, contrasted with these, were like darkness contrasted with light. Until they were able to understand and appreciate this they would be oblivious of the fundamental necessities of designing a cornice. Let them take the archaic Greek statuary—the marble from Ægina, for instance, where the curves were stiff and hard—and trace the development from the archaic to the fully-developed lines of the Venus of Milo—the Periclean era. In this way they would learn how a sense of these curves gradually laid hold of a really intellectual nation, and if they were to pass from such a high period of Greek art to the Roman revival of Greek art, where these curves became coarse and sensuous, they would notice how a curved line might become debased. At the Renaissance they would find in Michelangelo's work something which even Stevens could only emulate, but not excel—a remarkable squareness of line and angles of a most acute character, all expressed in curves of power and delicacy. Mr. Hamo Thornycroft, in one of the few lectures which he delivered at the Royal Academy some years ago, pointed out that a large curve, or a small section of a large curve, indicated greatness, or strength, or power, because it was a section or a fragment of a great surface, or a great sphere. The eye saw a flat curve and unconsciously continued it until it enclosed a large area. He thought that the remarks of Mr. Stannus would lead them to see that there was a great deal of useful study in the cornice which they had hitherto not been aware of.

Mr. Brodie briefly proposed a vote of thanks to Mr. Stannus.

Mr. Banister F. Fletcher, in seconding the vote of thanks, said that Mr. Stannus had given them a philosophical discourse on the principles which should guide them in designing a cornice, and although they might have had some idea of the principles, still they were in the habit of basing their designs for such features upon what had been done before, without thinking of any practical reason for so doing. He should like to express his agreement with one of the Chairman's remarks, viz., as to the value to architects of drawing from the nude. He, the speaker, went through a two years course, and he fully agreed that until a student had gone to such classes he had really no idea of the beauty and value of curves in any position. He would strongly advise all students to go through a course, and in so doing, not to make laboured studies of the figure, but rather to do rapid studies and to do plenty of them. In that way one got more freedom. He hoped that Mr. Stannus would be prevailed upon to treat Gothic mouldings or strings in the same

way. A similar discourse on the principles of Gothic mouldings would form an equally interesting paper. If Mr. Stannus would publish some of the illustrations with his paper they would be able to study more at leisure the principles which he had enunciated.

Mr. Hampden W. Pratt said that there was certainly no more material for a future lecture by Mr. Stannus. They would like to hear something about the enrichments of cornices, for instance. He would like to ask Mr. Stannus whether, in designing external cornices, Alfred Stevens designed them in profile, as they were seen on the angle? It was more often the practice to design them on the square, and to trust to a certain amount of experience as to what the effect would be. It seemed very necessary that in important positions the design of cornices should be carefully studied, but it was too often noticeable that the matter was overlooked on the part of architects. They, too, frequently omitted to consider the effect projections had on the angle. In the case of chimney-caps, where there was a certain form of cornice, in five cases out of six they were a great deal too heavy, and not at all in proportion to the chimney stack. That was because they had never been studied in relation to their position and in regard to the mitred angle. With regard to the freehand treatment of mouldings, it seemed particularly incorrect to draw them with compasses; to draw them with the hand afforded an excellent training for the eye. It was absurd for any one to draw a full-sized moulding with compasses, though whether it were wrong for young students to do so he was not prepared to say.

The vote of thanks was then put to the meeting and carried unanimously.

Mr. Stannus, in reply, said that as Stevens drawing the profiles with "easy certainty," he could assure them that it was not "easy" certainty at all. In the little drawings by that artist which had been exhibited that evening it would be seen that Stevens tried one feature four or five times over. He (the speaker) possessed sketches which showed that Stevens had tried a feature a hundred and fifty times, on three or four sheets, before he determined the design. After many trials, some of which seemed to an onlooker like accidents, the right "accident" was chosen. Some one had said that all inventions were matters of accident; and he remembered the reply to that remark, "Yes! but some people have more accidents than others." It was so with profiling. All art work consisted in trying over and over again. Probably each of the Stevens sketches would be considered beautiful in our eyes, but they did not satisfy Stevens in the same way. As to the best course of study, there was really no royal road; constant study for many years was all that he knew. The student must study the best examples; copy every bit of Greek moulding, study Stevens' work, and thirteenth-century Gothic, and in so doing he would find that in these three periods the artist worked in the same spirit. There was exactly the same idea running through all their work. In these three periods it would be seen what a parallelism—what a similarity of thought there was. As to freehand work, he had emphasised that over and over again. The bow-compasses should be discarded, and mouldings should be profiled by hand. Street, Barry, Scott, and Sedding did so. Sedding had a theory that even tracery should be drawn by hand. More of our artistic work ought to be done by freehand. As to geometrical curves in Greek profiles: he had taken the opportunity of speaking to Mr. Penrose on the subject. He had said to Mr. Penrose, "You have told us that these mouldings are conic-sections; but may it not be that the people had refined eyes, and had drawn them by mere draughtsmanship—mere subtlety of eye?" Mr. Penrose replied that probably the people drew at first in freehand, by subtlety of eye and perfection of observation, but when they came to make the complete working drawings for the profile then they chose that conic-section, whether a parabola, hyperbola, or other curve, which was nearest in curvature to the freehand sketch; and then they described it by geometrical methods. There, however, he ventured to differ from Mr. Penrose, for he thought they were drawn solely by freehand. At the time the Parthenon was built the Greeks had been making fine vase-profiles for perhaps 150 years. Students should go to the British Museum, draw the vases, and realise what a profundity of knowledge there was in the profiling of them; how they were exactly right and had the quality

of all true art, viz., inevitableness. And yet each curve of each vase had been the result of a great many efforts. The Greeks saw all these excellent results, and people whose eyes were trained to observe beautiful curves in one kind of work could not tolerate bad curves in another; hence their appreciation of the beauty of the restrained curvature in their architectural mouldings. As to studying the nude form, the necessity of drawing from the human figure could not be emphasised too much. If they could draw the human figure they could draw any curve. With regard to the request that he should continue the subject and show the application of his method to Gothic mouldings, he would remark that there was an excellent book on Gothic mouldings by Paley, which was edited by Mr. Fawcett, of Cambridge, and he advised students to get that; and also to read Viollet-le-Duc on the subject in the *Dictionnaire* and the *Entretiens*. As to external cornices, Stevens sketched his cornice in perspective on the mitre. If it looked well on the mitre it was certain to look well at the normal section. He (the speaker) generally sketched it in the normal profile and then projected it to the mitred profile. The effect of the soffit, as seen in perspective, was another point that was not always enough considered. Palladio always showed the section of the soffit in his elevations; and in his (the speaker's) opinion that was the way to draw a cornice.

The Chairman announced that the next ordinary meeting would be held on the 21st inst., when Mr. Hellyer would read a paper on "Plumbing and Sanitary Work," with practical demonstrations and lantern illustrations.

The meeting then terminated.

THE ARCHITECTURAL ASSOCIATION: JUBILEE BANQUET.

THE completion of fifty years of existence of the Architectural Association was celebrated on Wednesday by a banquet at the Trocadero Restaurant, Piccadilly-circus. Mr. Beresford Pite, President, occupied the chair, and there were present amongst others: Viscount Halifax, the Bishop of London, Mr. H. C. Richards, M.P., Professor George Aitchison, A.R.A., Dr. A. S. Murray, Messrs. W. H. St. John Hope, J. Jacob (Master of the Carpenters' Company), W. J. Cloake (Master of the Painters' Company), H. W. Pratt (President-elect), H. Lovegrove, J. M. Brydon, Alex. Graham, W. H. Seth-Smith, T. E. Colcutt, G. H. T. Pryme, Paul Waterhouse, H. Tanner, W. M. Fawcett, F. W. Pomerooy, J. Sulman, and the following Past-Presidents:—Professor Kerr, Messrs. J. Edmeston, T. M. Rickman, J. S. Quiller, J. D. Mathews, T. Norton, R. Plunbe, T. Roger Smith, H. L. Florence, T. Blashill, J. H. Christian, H. C. Boyes, T. H. Watson, Aston Webb, John Slater, Leonard Stokes, H. O. Cresswell, E. W. Mountford, J. A. Gotch, F. T. Baggallay, S. F. Clark, W. D. Caroe, Cole A. Adams, H. D. Scarsle-Wood, and W. White. The following past Hon. Secretaries were also present: J. P. Seddon, J. K. Collins, and T. W. Goodman. The following representatives of provincial societies were also present: Messrs. J. Ely (Manchester), C. Hadfield (Sheffield), W. Henman (Birmingham), S. P. Pick (Leicester), and E. B. Vaughan (Cardiff).

The Royal toast having been honoured the President remarking that the Victorian era was the greatest era of English history, and consequently the greatest era of English architecture).

The President proposed the toast of "The Church." The connexion, he said, that existed between the profession of architecture and the Church was a connexion which had appealed to every enthusiastic architectural student of this land. That connexion was an exceedingly difficult one to define. The enthusiasm which ecclesiastical architecture arouses was due primarily to the magnificent character of our national ecclesiastical art. In asking to what was due the permanent character of this art, they were face to face with a difficulty in definition. He ventured to suggest that what connected Church history and the art of architecture in their minds was their admiration of our national cathedrals and our village churches. No class of architecture aroused their enthusiasm in the manner in which ecclesiastical architecture did. Their sketch-books were full from the time they could draw arches in perspective, with views of our cathedrals. But there were other subjects connected with ecclesiastical architecture

that linked themselves with their minds on that occasion, and they were conscious that where the Church was in a prosperous condition, ecclesiastical architecture was in a prosperous condition also—that the magnificence of the thirteenth century in England was proverbial. We were scarcely yet beyond the reach and glamour of its revival. But whether it was from the thirteenth century to the Elizabethan era, in the heyday of English literature and intellect—in the days of Bacon and Shakespeare—there was being fostered under those influences such life and such work as that of Inigo Jones and of Christopher Wren, which culminated in the architectural masterpieces of the Reformation. In the history of the Association, in the recollection of the Past-Presidents (whom they were delighted to welcome on that occasion) there had been conflicts of taste and opinions and battles of styles: there had been championships of the thirteenth century and other centuries, but we had come to a time when we could look dispassionately upon the works of the past.

The Bishop of London, in replying, said all, to whatever profession they belonged or vocation they pursued, felt under a debt of exceeding gratitude to architects. But there was this difference between the Church and other professions, that whereas everybody else wanted architecture which was adapted simply to household convenience, the Church wanted architecture which was adapted to the expression of ideas. And it was simply and solely, he ventured to think, because the Church stood in that peculiar position to architecture, that it inspired the architect to perform those mighty works to which the President had referred. The dwelling-house was split up for the purposes of convenience into small rooms. Even if they took a mighty block of buildings for municipal and other purposes, that again, however plentiful might be the opportunities for art which it offered in facade and external arrangements, had an interior which was split up again into a number of comparatively small rooms. A church was the only building which directly challenged an architect to do his very best. Outside and inside alike it was one mighty span. It offered space and largeness, things so absolutely necessary for the development of any great art, and for adapting all the various forms of ornament to the point of view from which they had to be seen. It called upon artists, not only in their spiritual and moral nature, which made so large a part of any art, but also in their capacity for simple structural development.

It had given them unrivalled opportunities, of which they had so very worthily made use in the past as in the present. Since he had come to London he had been struck by the exceeding resourcefulness of the modern architect. Before he came to this diocese he used to admire ancient art; he was becoming so far modern that he admired modern architecture. The immense growth of this great city had called for the architect's work in every possible way, and as he walked about his diocese he saw many modern churches which, from their very quality of resourcefulness, called for his warmest admiration. Our modern buildings required, first of all, adaptation to site, which was unknown in ancient times. In old days a man had as much room as he needed, and could do what he chose in it. Nowadays our architects were very often called upon to make use of a site which at first seemed exceedingly unpromising. He was struck by their great capacity for using the opportunities afforded them, and adapting them, as well as they could be adapted, to the purposes for which they were needed. Higher praise than that could not be given to any art. After all, vitality consisted in making use of opportunities. Very often they cast a gloss of romance over the past which they denied to the present. Very often they attributed to the past high imagination and elevated aspirations, and considered the present as somewhat prosaic. He was not quite sure that any one who studied deeply the history of our great cathedrals would come to that conclusion. Those buildings had not been adapted to the needs of a vast population to be provided for in two years. They were built, to begin with, for a very scanty population indeed, almost without any relation whatever to the people who dwelt around it. But, then, it must be remembered that these great cathedrals were built for pilgrims, and were of enormous size and exceeding beauty simply as an advertisement, that they

might draw pilgrims from the other shop, which was not nearly so attractive. A great deal of the history of our cathedrals might really be explained in that way. Very often neighbouring cathedrals consciously competed one against another. They had honoured the toast of "The Church," but as it often stood to them in the relation of an employer, it doubtless embodied reminiscences of a vast amount of unintelligent criticism. But it should be remembered that the clergyman was, after all, subject to those behind him, and had frequently to make bricks without straw in endeavouring to meet the demands of an increasing population.

Lord Halifax, in proposing the toast of the "Architectural Association," spoke of the value of architectural art in ordinary houses, and of the difference between mere edifices to protect the inmates from the rain, and houses which brought to those who lived in them the glow and colour of the sunshine outside. And among the many improvements which the Queen's reign had witnessed he thought there were few in which the advance was more marked than in the architecture of the ordinary house. In the proper education of the young architect he wished that the Association might be successful. The influence of the house upon its inhabitants was very great, and it was important that architects should be trained to construct buildings that would be suitable in every respect. As to the annual excursion of the Association, he noticed that a man for whom he had much respect and admiration used to attend those outings, viz., the late J. D. Sedding. He ventured to suggest that friends of the Association might be permitted, in the capacity of hon. members, to join in those excursions. He hoped that at the end of another fifty years the Association might be celebrating its centenary, and that English art might have progressed even more in that time than it had in the past fifty years.

The President, in response, first drank himself to the prosperity of the Association. They would understand something of the interest of the occasion, something of the memories that underlay their gathering, and something of the hope they had for the future in reflecting that they were gathered to commemorate their fiftieth anniversary. At the outset they were a little group of about a dozen students that during a term of years suffered many vicissitudes, though they never lapsed into apathy; but through the assistance of those who founded their Association and who had, throughout the whole of their lives, given their best interest and power to its work, the Association had survived, developed, and had done its work, and their position now was, that instead of being a little body of architectural draughtsmen, unknown to the world, meeting in offices, kindly lent for the occasion, they now included in their ranks the whole body of architectural students of the country, and some of their students, having been their office bearers and obtained the dignities which the Association had to offer, had, through their works, won the admiration of their generation. The Past-Presidents of the Association, the vice-Presidents, and hon. secretaries included those who were recognised as leaders of the profession. That was a condition to be proud of: the hopes of the founders had been more than realised. Their present meeting was unique, ideal, for they had with them their first President, Prof. Kerr, who was not the momentary representative of the Association, but he was the Association in the sense of Jubilee. Prof. Kerr had maintained his interest in and friendship for the Association, and he had aided with his judgment, and he was present on that occasion to witness the success with which his early efforts had been attended. But Prof. Kerr was not alone in that distinction, for they had with them that evening those who were associated with him in the initiation of the Association. They had with them so distinguished an architectural draughtsman, who was a true friend of artists, viz., Mr. J. R. Collins, who, in the early days of the Association, was one of its important office bearers. There was also present Mr. J. P. Seddon, who, with Mr. Collins, was hon. sec. in the earliest days of the Association. There was something in these facts which made them feel that they were in the presence of the Association as it was fifty years ago, and as it is at the present time. In thinking of the chartered royal body, which took upon itself the official exercise of those duties which devolved upon a representative body of a profession hampered

with the dignity of its golden ornaments, they saw that its leaders were Association men. Mr. Arthur Cates was unable through illness to be present with them that night, but he was the life and spirit of the Association in the days when he was its hon. secretary, and at the time when his educational knowledge foresaw the necessity for some qualifying test for students. The Institute had initiated the examinations, but the Institute without the Association—the examining body without the students to be examined—would have had a very poor chance of conducting its examinations successfully. The Association supplied the material, and while they looked with gratitude to the Institute they were inclined to think that the Institute was the Association—with an important difference. The present condition of the Association was that, though all who joined them did not remain life members—who he wished they did—large numbers who joined did so for the educational facilities which the Association offered in its studio and classes, and for the unrivalled friendships, &c., which could be formed within its ranks; and though some left its ranks when they left London or advanced in life, the Association numbered at the present time 1,200 active members, and there passed through its classes annually about 200 students. If they added to that number those who participated in the educational facilities of the ordinary meetings of the Association, its excursions, &c., it would be realised that the large majority of members were still active members. The Association had few needs: it supplied itself with the teachers and with the taught, but they had one burning need, and one which would appeal to all those who considered the position to which the Association had attained. They greatly needed what it was hoped their Jubilee celebrations would enable them to obtain, some building, some centre, which would be an architectural embodiment of the work of the Association, and of their present class aims. He would like, on behalf of all their past Presidents, on behalf of the present committee, and on behalf of all who were connected with the work, to appeal very earnestly to their successful brethren in the profession, and to their friends at large, to help them provide the means of acquiring suitable premises in which to conduct their work. They had premises now, but they were very much overcrowded, and those who knew their present studio, and knew how they had to conduct their classes and other means of education apart from their premises, and those who knew the generosity with which the Institute had placed its rooms at the disposal of the Association, would see that premises were needed which would provide them with large and suitable studios, classrooms, and library accommodation for their invaluable lending library, which had been the means of providing young architects with indispensable literature.

Professor Kerr, in proposing the toast of "The Royal Academy, the Royal Institute of British Architects and Kindred Societies," asked Mr. Collins and Mr. Seddon to stand with him in memory of old times. He said that the Association, in its connexion with other societies, was on its highest ground. He spoke first of the Institute as their headquarters of organisation, and the Institute had always been very friendly towards the Association and had assisted it in various ways. At the present day it recognised the Association as the junior Institute of the profession more expressly by reserving one seat at its Council for a member of the Association. The Institute represented the profession of architecture throughout the Queen's dominions, and it would be in the recollection of many of them that its operations were divided into four sections: art, science, literature, and practice. In regard to art they claimed connexion with the Royal Academy, which was the representative of art in *cazalis*, and among the young men who constituted a considerable portion of the Association, their aspirations naturally tended in the direction of the Academy, and he did not see why any young man should be discouraged in cherishing that aspiration. One thing he had always ventured to uphold was the encouragement of self-conceit, because he considered that was an important agent founded by nature for the advancement of youth. The Royal Academy cherished three arts, and only three, though he thought the time would soon come when it would cherish others. The reason why the Academy did so was that the system of the three Fine Arts was simply the system of the Italian Renaissance in the sixteenth century

Amongst those three arts, architecture took a prominent place, though not so prominent as it used to do, because artists now were a little inclined to say that architects were a little in the way; but the time was when architects, instead of being in the way, were very much at the head of art. He could not forget Michelangelo, who could not only model David and paint the Sistine Chapel, but he could construct the dome of St. Peter's and fortify Florence. As to science, he thought the Association should do homage to that great institution so peculiarly English, the Institution of Civil Engineers, which represented building science *in excelsis*. He thought that students should be encouraged to study science more profoundly than they did, but as it was they were bound to recognise in the Institution of Civil Engineers that perfection in mathematical science in which no architect ought to be deficient. As to literature, they were allied in that respect to the Society of Antiquaries, which represented at its best, amongst other things, the historic literature of their profession, and no profession in the world, perhaps, had a better history than the architect's. He could not very well say anything about practice at that meeting, but he wanted the young men of the Association to bear in mind that they were allied to all these departments of human intelligence. It had been observed that very seldom indeed were the scientific and the artistic intellects combined in one individual. There was Goethe and Michaelangelo, but an architect combined all their characteristics, though, of course, not to the same brilliant extent. But at all events architects should bear in mind that they had to some extent to combine in their work both art and science. The public required plain, practical, common-sense and good workmanship, and architects could not do better than study the apparently rival elements of their profession as a means of satisfying the English public. The function of the Architectural Association was education, and during the whole of the fifty years of their existence they had that one end in view.

Professor Aitchison, A.R.A., who responded for the Royal Academy and the Institute of Architects, said that the Academy was one of the first bodies that gave instruction to young architects, and this was due to an architect, Sir William Chambers. But this was at the end of the Renaissance period when the revival of Gothic had hardly been thought of—although it had been thought of, for in so popular a book as "Tom Jones" there was reference to a house, "a Gothic structure which almost rivals the beauties of Greek architecture." The Renaissance architects—if he might call them that, for they were not architects at all, and had no idea of what architecture meant—they were very accomplished men, almost all having been goldsmiths, while some had risen to be sculptors and painters, and what they conferred upon architecture was no doubt one of the greatest boons that had ever been conferred upon it. The Royal Academy had adhered to their old belief that if a man could draw the human figure and was nimble with his fingers he might do any artistic work. In the present day we were taking unfortunately a different view of architecture, and thought that this was not the best way to produce men of the greatest excellence in the art. As to the Institute, of which he had again, by the kindness of his fellow architects, been appointed President, that body had done what it could for architects and architecture, and with the Association a more practical view was adopted in teaching young men of the profession the necessary knowledge of their art. He hoped that Professor Kerr's words would be remembered, viz., that architecture is a constructive art, and that without a knowledge, and a very good knowledge, of construction, architecture could not be expected to make the progress that it once did. He (the speaker) was a member of the Association at the time of Professor Kerr's presidency. They were all of them looking forward not to the resurrection of any old or bygone style but the creation of a modern style. He did not see why architecture should not become again a progressive art, as it was at one time, if they once turned their attention to pursuing it in a proper way. Religion had been a great stimulus to all the Fine Art of the world. It was upon temples, mosques, and churches that architecture had lavished its greatest skill and shown its greatest power. This, however, was not wholly due to the religious feeling of the people, for there was something of a more

mundane character to account for the erection of buildings for purposes of public worship. The temples of the ancients were also banks of deposit, and there was no doubt that a very fine temple of elegant proportions and impressive appearance caused more people to bank their money there than did temples of a less important appearance. What architects had to do was to cultivate their faculties and study those things which were necessary in the progress of their profession, and he had no doubt that if the attention of the Association was sufficiently directed to those matters which were absolutely necessary for architects to study, there would, as a result, be a new style that was fitted to the taste of the present day. He did not think that the powers that be had a proper idea of the importance of architecture to a nation. Almost all the other triumphs of the human intellect were movable, or they could be absorbed by other nations, as the work of poets, for instance, but with architecture this was not so, though the work of the architect would remain to point out the character of the people who lived at the time of his work. Badly as architects were recompensed, they were paid still worse in gratitude and honour. There was little admiration for architecture in this country. A successful painter was sought after, but few people thought much of a successful architect; that was not the way to encourage an art which was of so much importance to a nation.

Mr. J. Ely (Manchester Society of Architects) responded for the allied societies, and said that the provincial architectural societies were kindred societies to the Association in name, profession, and in the objects they had in view. The Institute was concerned more in the professional side of the architect's work and the Association with the educational, but in the kindred societies these two branches were combined. The objects of the societies allied to the Institute were uniformity of practice, professional integrity, the advance of architecture, friendly communications, mutual advice and assistance in cases of disputes or professional jealousies, educational facilities for students, and the formation of libraries. All these aims had been intensified, and their achievement had been rendered more certain by the alliance with the central body in London. The examinations of the Institute had been of great use to students in guiding them, not only in the course of study they ought to pursue, but in showing them their shortcomings. The Institute, in bringing the examinations into the provinces, had afforded great assistance in guiding students. There were sixteen kindred societies allied to the Institute, and the total number of members of all of them was a little over 1,000—a considerable number considering that they were scattered all over the country. Dr. Murray then proposed "Literature," and in doing so referred to the solace to busy men which books afforded. He had recently read a book by Mr. Palgrave on "Landscape in Poetry," and he wondered why there had not been done a similar work on "Architecture in Poetry."

Mr. J. A. Gotch, in reply, said that he sometimes hoped that some one might, one day, write about architecture in such colours as would appeal even to the ordinary employer, though to do that the ordinary architectural literature would have to some extent to be avoided, for it was no use offering the ordinary public technical terms. Architecture was something more than drains; there was a poetry about it, and there was something higher than piling bricks upon bricks or stones upon stones. He rejoiced that there was a more catholic spirit now in regard to the different styles. In his opinion this was due to literature, and he looked forward to the time, so great was our catholicity now, when a book would be written about the architecture of Gower-street. He trusted that they would avoid clinging too firmly to the past. The future must be something different, and on different lines to the past, and it was one of the functions of literature to bring that state of things about. He objected to London holding the whole architectural genius of the nation, and one of the ambitions of the Association should be to send educated architects into all parts of the country, so that in all parts of the land buildings which had the mark of culture upon them might be put up.

Mr. John Slater then proposed "The Visitors," and, in doing so, remarked that the Association

had always done its work in an unassuming manner, and had never strained after publicity. He wished that there were more opportunities of friendly intercourse between architects and other branches of the profession and the general public, because meetings of that kind would go a long way to remove the misconceptions which existed as to the duties of an architect, his method of conducting business, and his charges. It had been the practice of the Association to have an annual dinner, and as a rule the guests had been members of the profession of architecture. In future, could not their invitations be extended? Architecture was, he was afraid, *caviare* to the general, but he was glad to say that there had been some enlightenment in this respect. One of the most interesting signs in the past few years had been the action of the Universities of Cambridge and London in including architecture in their course of lectures in their Extension schemes. He had been engaged as Examiner for the two Universities, and he had been struck with the interest shown in architecture by the non-professional students who had attended the lectures, though, no doubt, their interest had related to architecture of the past. He was glad that the Bishop of London was beginning to be interested in the architecture of the present, but the Bishop would have a great deal to do if he wished to imbue the whole of his diocese with that view. He was told that at the Royal Academy the other day, when the galleries were crowded, the architectural room had one occupant—an old gentleman who had gone there to take a nap.

The name of Mr. H. C. Richards, M.P., Chairman of the Society for the Protection of City Churches, was coupled with the toast, and Mr. Richards briefly replied.

Mr. Aston Webb gave the concluding toast: "The President-elect," remarking that the work of the President of the Association was now of a very different character from what it was in previous years. In regard to the matter of new premises, no doubt the past Presidents and others would be ready and anxious to do what they could to properly house the Association.

Mr. Pratt, in response, said that there was much to encourage the Association in regard to its future work. They could learn a lesson from the past in what to avoid and what to imitate.

The proceedings then terminated.

THE ARCHITECTURAL ASSOCIATION SPRING VISITS:

PARK HOSPITAL, LEWISHAM.

The sixth and last Spring Visit of the current session was paid to the Park Hospital, Hither Green, Lewisham, by kind permission of the architect, Mr. Edwin T. Hall, who conducted the party of some fifty members over the building.

The hospital was visited by the Association at an earlier period in its construction, and a full description of the building appeared in the *Builder* of July 18, 1896. It is the largest fever hospital in the kingdom: it occupies twenty acres of ground, and provides accommodation for 530 beds and a staff of 380.

Some of the sanitary details were of especial interest, including the arrangement of man-holes with solid hrcley bottom cast in one piece, and the stop-slips, with a special apparatus for cleansing utensils invented by the architect.

The ward chimney-stacks also attracted attention, being covered with faience, giving a bright effect, and being so arranged that all sweeping is done from the basement.

The heating is with hot-water radiators treated by steam, and the ventilation entirely natural, no mechanical means being used. Electric light is fitted throughout.

After having inspected the building, the members were hospitably entertained by Mr. Hall, to whom was accorded a hearty vote of thanks.

BROMPTON AND PICCADILLY-CIRCUS RAILWAY.—The Bill for this line was read a third time in the House of Commons on April 29. The projected line will have terminal stations at Air-street, Piccadilly, and the south end of Exhibition-road, Brompton, with subways and foot-passages beneath Piccadilly at Air-street and Dover-street. It is to be worked by electricity or such other motive-power as the Board of Trade may sanction; if by the former, by cables or wires, with a generating station at Swan Wharf, Chelsea Creek.

* A series of articles on this subject, with numerous quotations, appeared in the *Builder* a good many years ago.—Ed.

Illustrations.

NEW BUILDINGS, LIVERPOOL.

THESE buildings are being built for Mr. Thos. H. Ismay, and are intended to be occupied, in part, by the well-known White Star Steamship Company.

The site, at the bottom of James-street and fronting to the Goree Piazza, has a commanding view of the River Mersey, from which the building is an object of considerable importance, owing to its boldness of parts and its great height above the surrounding buildings.

The materials are Aberdeen granite for the base, red Ruabon brick facings, Portland stone dressings, and green roofing slates from Lord Penrhyn's slate quarries, at Bethesda, near Bangor.

The floors are fireproof throughout on Messrs. Mark Fawcett & Co.'s system. The entrance-hall and staircase are faced with polished grey granite, and form a worthy entrance to the various offices. There are two electric elevators, and arrangements are made for a mail chute with a letter-box on each floor.

There are spacious vaults in the sub-basement, and on the upper floors there are toilet arrangements for both males and females on separate floors, with keeper's residence on the upper floor.

The works have been executed by Messrs. J. Henshaw & Sons, of Liverpool, under the supervision of Mr. Allen Lloyd, clerk of works. The architects are Mr. R. Norman Shaw, R.A., and Mr. J. F. Doyle. The drawing is exhibited at the Royal Academy.

HER MAJESTY'S THEATRE, HAY-MARKET.

WE give a view of the exterior of this theatre, reproduced from the drawing at present hung in the architectural room at the Royal Academy. We should have preferred to have added the plan and section, which are, of course, of much importance in a theatre, but the architect objects to their publication.

The theatre is arranged for an audience divided into five different classes. On the ground floor, level with the street, are the orchestra stalls, pit stalls, and the pit; the first floor will be devoted to the dress circle and family circle; the second tier consists of the

upper circle, amphitheatre, and the gallery behind.

The five doorways in the centre of the Haymarket façade underneath the loggia open into a vestibule exclusively for the use of the two classes of the stalls and the dress and family circles, and the stalls have a third way out, level with the pavement in Charles-street; the pit has one entrance in the Haymarket and another in Charles-street; the upper circle and the gallery have the same; that is to say, five classes of audience have each two distinct ways out, opening into different streets.

Every division of the audience has cloak-room accommodation and refreshment saloons. The staircases to the upper tiers are of the uniform width of 4 ft. 6 in., those to stalls and dress circle 6 ft., formed of concrete, with a rise of only 6 in., no flight having more than twelve steps.

The stage and auditorium are entirely separate, there being two party walls, and an open space between them 9 ft. wide. There is a fire-resisting curtain covering the whole of the proscenium opening, which can be taken up without rolling. Water is laid on from high-pressure mains, and hydrants are placed on either side of the theatre on each level.

The theatre and annexes are lighted by electric light from three centres, so that should one fail the other systems are always available.

The style adopted for the auditorium is that of Louis XIV. There are private boxes on each of the tiers adjoining the proscenium, separated from it and other parts of the house by marble columns.

In arranging the warming and ventilation it is intended that the theatre should be kept at a uniform temperature of 62 deg. all through summer and winter. In the basement is a large chamber containing a very powerful fan, which pumps air into the theatre after passing round hot-water coils. From this hot chamber pipes and ducts are conveyed to every part of the auditorium, and from openings in the higher portion of the ceiling shafts are taken directly up to the roof, where exhaust fans are placed. It is computed that 10,000 cubic feet of fresh air will pass through the theatre every minute, warm in winter and cold in summer.

Radiators warmed by hot water are constructed on every tier and every corridor leading to the auditorium, especially with a view to prevent cold currents of air entering in from

the different doorways. The fans are worked by electric motors.

The theatre has been constructed from the designs and under the direction of Mr. C. J. Phipps, F.S.A., architect.

For the internal decorations and scheme of colour Mr. R. Walker has been associated with Mr. Phipps.

The various firms who have done work are as follows:—Mr. H. Lovatt, the general builder's work; Messrs. R. Moreland & Sons, the steel and iron construction; Messrs. Jackson & Sons, the fibrous plaster ornamentation of the interior; Mr. Edward Bell, the painting, papering, and gilding; Mr. Black, the figure panels on the ceiling; Messrs. Waring, the upholstery, curtains, and carpets; Mr. Wadman, the arm-chairs in the stalls and dress circle; Messrs. Platt & Son, the pit seats; Messrs. Lyon, the upper circle seats; Mr. E. A. Beer, the hot-water appliances, warming and ventilating; Mr. Starkie Gardiner, the wrought iron shelter; Messrs. Bellman, Ivey & Carter, the scagliola marble; Messrs. E. & E. Taylor, the iron curtain; Mr. Duffy, the parquet wood-block flooring; Mr. Davison, the marble flooring and mosaic; Messrs. Ewart, the copper work on dome; Mr. White has superintended the construction of the stage; Messrs. Merryweather & Co., fire mains and hydrants. The whole of the electrical work has been under the direction of Mr. E. Wingfield Bowles, and executed by the following firms:—Messrs. Johnson & Phillips; Cox, Walker, & Co.; Rashleigh, Phipps, & Co.; the Chlorite Electrical Storage Co.; B. Verity & Sons. The chandelier and brackets were made in Paris. Messrs. G. R. Tasker & Sons have been the quantity surveyors and measurers. Mr. J. Emblin Walker has been clerk of the works.

NEW PARISH INSTITUTE FOR ST. MARY'S PORTSEA.

THE plan of this building includes, on the ground floor three large class-rooms, two capable of subdivision, and a smaller class-room at the back; kitchen, scullery, and larder for teas only; lavatories, and two staircases. On the basement are lavatories for men, a boiler-room, and coal-cellar. The upper floor is to include a hall, 102 ft. by 40 ft. internal measurements, with a raised stage at the north end, 19 ft. by 15 ft. 6 in., with a dressing-room and serving-room on either side, and a smaller

class-room at the back. The hall is to have a semicircular barrel ceiling with intersecting vaults for the windows, and will be carried on steel principals. The floor will be fireproof. The materials will be dark local bricks with gauged red brick and stone dressings, tiled roof with a wood modillion cornice projecting 2 ft. 9 in. to the outer edge of the eaves gutter. The height to the ridge from the ground line is to be 34 ft., and to the final ball of the cupola 70 ft. Mr. Reginald Blomfield is the architect. The drawing is exhibited at the Royal Academy.

ST. MARK'S CHURCH, PLUMSTEAD COMMON, S.E.

This church is somewhat unusual in plan inasmuch as the church is on the first floor with a large hall under, capable of seating 550 persons, a form of plan which the architect has successfully adopted in other churches which he has built.

The church itself is designed to seat about 650 people. It is approached from a loggia by two wide, open, stone staircases, and a feature on the landing is the outside projecting pulpit.

The building is well sited on very high ground, and has an ample site on which it is intended to build a vicarage. The materials are red bricks and Portland stone dressings.

The church, when finished, will cost upwards of 12,000*l.*, exclusive of interior decorations.

The architect is Mr. Richard J. Lovell London, and the builders, Messrs. L. H. & R. Roberts, of Islington.

SKETCHES IN FRANCE.

THE illustrations of that most picturesque French province, Brittany, are selected from a number of sketches made last autumn. St. Malo is a most interesting old town both architecturally and historically. At one time it must have been a very rich town, evidence of which remains in the large old Renaissance houses with their wonderfully massive chimneys, once inhabited by the rich Indian merchants. Tradition says their money was principally made in privateering. The cathedral is an interesting and in many respects a fine building, particularly the spire, built a few years ago. Some of the most picturesque streets are so narrow and the houses so high that it is impossible to get a satisfactory sketch of them. The Maison Duguay-Trouin being opposite a street with a small open place, I was fortunate in being able to get a good view of it. There was nothing interesting in the interior. The house is inhabited by a number of the lowest and poorest class. There are some beautiful lead lights in the upper portion of the windows of the top stories, varied in design. The other view in St. Malo I selected simply for its general picturesque quality. The only point of historical interest connected with it, that I know of, is that I had luncheon in the restaurant on the first floor.

Morlaix is another of those old towns full of interest and picturesque architecture, but with the exception of two lovely François I. oak staircases there is little or no really good art.

A dominant feature, which can be seen from all over the town, is the railway viaduct, 180 ft. high, built on two tiers of arches. It is simple in design, and (as the French usually do) they have put the right thing in the right place.

In late years the inhabitants appear to have awakened to the fact of the picturesque and attractiveness of their town, and have carefully restored several old houses, more particularly by stripping the façades of a covering of small states which I presume were put on to keep the weather out, perhaps some time last century.

The old house in the illustration is now covered in this way, and I took the liberty of divesting it of its waterproof coat and restoring it (in anticipation) to its original state. The old projecting timbers and windows have not been disturbed, so I had only to put in the woodwork, and from evidence I had from similar work about (the adjoining house remains in its original state) I feel pretty sure that we see it as it was originally designed. The other sketch is from Mont St. Michel, that most unique spot full of absorbing interest. The sketch is taken in the main and almost only street in the Rock, and close to the entrance gates.

The sketches were done on the spot. The original drawings are now being exhibited at the New Gallery. E. S.

COMPETITIONS.

HIGHER GRADE SCHOOLS, WOOD GREEN.—The assessor, Mr. E. R. Robson, has awarded the first place in this competition to the designs submitted by Mr. A. M. Butler, of 16, Finsbury-circus, E.C. The Tottenham School Board has agreed to accept the award, subject to some necessary conditions.

GRAMMAR SCHOOL, KNARESBOROUGH.—We understand that Mr. W. D. Carde has placed first the plans submitted by Mr. George H. Barrowcliff, architect, of Loughborough, in public competition for the Knaresborough Grammar School, designed to accommodate 100 scholars, thirty boarders, with head master's house and a complete technical school.

ARCHITECTURAL SOCIETIES.

LIVERPOOL ARCHITECTURAL SOCIETY.—The annual general meeting of the Liverpool Architectural Society was held at the Law Library, Union-court, on the 3rd inst. The annual report, presented by Professor Simpson (Hon. Secretary), and Arnold Thornely (Assistant Hon. Secretary), stated that the number of members was 121, and included 52 Fellows, 22 Associates, 29 students, and 18 honorary members. The ordinary meetings had been much better attended than in previous years. The Council regretted the retirement of Mr. H. L. Beckwith from the position of Honorary Secretary, which he had held for a period of seven years. It was hoped by the Council that they would be able to suitably celebrate the jubilee of the Society during the next session, and to establish a travelling studentship to be awarded at the end of each session. The statement of accounts presented by the Treasurer, Mr. James Dod, showed cash in hand 26*l.* 3*s.* 3*d.* on the general account, and 36*l.* 19*s.* 5*d.* on the library account. The following Officers and Council were elected for the fifth session:—President, Mr. W. E. Willink; Vice-Presidents, Messrs. E. A. Ould and J. Woolfall; Hon. Secretary, Professor Simpson; Assistant Hon. Secretary, Mr. Arnold Thornely; Hon. Treasurer, Mr. James Dod; Hon. Librarian, Mr. J. W. Blakey; Council—Messrs. H. L. Beckwith, G. Bradbury, T. E. Eccles, H. Hartley, H. A. Mearns, E. A. Ould, and J. Woolfall (Fellows), and J. W. Blakey and F. E. P. Edwards (Associates). Mr. George Bradbury, in a short address, said that as a mark of the jubilee year of their Society, which was the oldest of the kind in the kingdom, a special effort should be made during the next session to increase their membership, and thereby increase the importance of their Society, whilst endeavours should also be made to increase the usefulness of the Society to its members. On the motion of Mr. W. E. Willink, a cordial vote of thanks was awarded Mr. Bradbury for the great services rendered by him to the Society during the past year as President.

ARCHÆOLOGICAL SOCIETIES.

DURHAM AND NORTHUMBERLAND ARCHÆOLOGICAL AND ARCHITECTURAL SOCIETY.—The annual meeting of the members of the Archæological and Architectural Society of Durham and Northumberland was held in one of the University Lecture Rooms, Durham, on the 26th ult., the President (the Rev. Dr. Greenwell) in the chair. The Treasurer (Mr. J. G. Gradon) presented the annual balance-sheet, which was adopted. The officers were re-elected, with the addition of Lord Barnard and the Dean of Durham to the committee. The President suggested that the Society visit the following places during the ensuing summer:—Day meetings—1. Streatham and Barnard Castle. 2. Loughorsley, Brinkburn Priory, and Long Framlington. 3. Catterick Church and Easby Abbey. 4. Haughton Castle, Chipchase Castle, and Simonhurn Church. 5. Two days' meeting, Lincoln. The programme was approved. The President afterwards delivered his annual address. He congratulated the Society upon the issue of another part of their "Transactions," which contained some very interesting and valuable papers. There was one by Mr. Wilson on the recent discoveries at the east end of the cathedral. He might say that the same gentleman had been making careful and extensive measurements of the cathedral, principally with regard to the vaulting. In this respect Durham Cathedral occupied a very exalted position indeed. Mr. Wilson had made a careful study of the matter,

and he was satisfied that the vaulting of the choir was of the year 1104, the date they had hitherto assigned to it. Proceeding, the President referred to the additions which had been made to the collection of pre-Conquest monumental stones in the Library from Gainford, Darlington, and other places. After giving a survey of the outdoor meetings of last year, the President referred to the Norman gallery of Durham Castle. He had hoped that by this time it would have been cleared of students, but the authorities had been obliged, on account of the lack of accommodation, to use the gallery for rooms. He still held the same view—that it was in danger of being burned down—and, of course, they laughed at him. He could not help thinking that the Norman gallery, constructed as it was entirely of wood, if the present use of it was continued, would sooner or later take fire, and in that event nothing could save the castle from absolute destruction. All men of culture must be actuated by feelings of great regard for a building of such importance. He hoped the University authorities would take steps to preserve the Norman gallery from such a catastrophe as fire. A vote of thanks to the President closed the proceedings.

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday, the 3rd inst., Mr. G. Maxwell Lawford, President, in the chair, a paper was read by Mr. Henry O'Connor (Vice-President), entitled "Automatic Gas Station Governors." The author first explained the need for the station governor in a gasworks, and pointed out that the pattern now in use, and being manufactured by many firms, was practically the same as that made fifty years ago. He then described the working and the method of finding the weights necessary for throwing certain pressures, and proceeded to explain the necessity of the parabolic form of cone. He then described the most notable of the suggestions made from time to time to improve the working of the governors, such as the double cone governor, the equilibrium single cone governor, the governor with a separate loading bell worked at a distance from the cone bell, water loaded governors, the double bell and cone equilibrium governor, the throttle-valve governor, and governors with parallel side valves. The use of clockwork for the purpose of regulating the time of the loading and unloading of the bell was noticed, and also the loss due to uneven pressures. A new method of automatically loading governors according to the absolute requirements of the district was described, with details of several ways in which that might be carried out. The advantages of this system were pointed out, and a method of approximately registering the output of gas by the variations in pressure was suggested.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

The Association of Municipal and County Engineers held a Yorkshire district meeting at Ripon, on the 1st inst. The meeting brought together a large number of members representing towns in the north of England. Mr. E. R. S. Escott, C.E., of Halifax, presided in the unavoidable absence of the President (Mr. May, of Brighton), and amongst those present were Messrs. J. Curtwright, Bury; S. S. Platt, Rochdale; A. Creer, York; Wike, Sheffield; Stead, Harrogate; T. Cole, Westminster (secretary); Hopkinson, Keighley; W. Edson, Ripon; Roundthwaite, Sunderland; Howcroft, Redcar; T. W. Stainthorpe, Eton; Baker, Middlesbrough; Spencer, Newcastle-on-Tyne.

The Mayor (Mr. T. Williamson) offered the Association a hearty welcome to Ripon. He said the city had the long Municipal life of 1,000 years, but they boasted that that antiquity had led to no loss of vitality.

On the proposition of Mr. Creer, York, seconded by Mr. Wike, Sheffield, Mr. T. W. Stainthorpe, of Eton, was unanimously re-elected as honorary secretary for the Yorkshire district.

Mr. H. A. Johnson, Engineer to the City Council, read a paper on the Ripon City Sewerage and Sewage Disposal Works. Mr. Johnson said that although a general scheme of sewerage and sewage disposal was only now being completed, the Council had not been supine in respect to sanitary matters, as the first steps in

mexion with the sewerage of the city on modern principles were taken upwards of twenty years ago. The scheme prepared at that time did not commend itself to the Council, and was timely abandoned; the difficulty of devising a satisfactory scheme being chiefly caused by a low-lying portion of the city near the railway station. For some years the matter lay dormant, and the Council constructed the works necessitated by the growth of the city and paid for them out of revenue. These conditions, however, did not long survive the establishment of the West Riding County Council, and at a very early stage of that authority's existence, they gave a somewhat preliminary notice to the City Council that they had adopted measures for the purification of the sewage, which was then passing direct into the river Ure. The Sanitary Committee had paid considerable attention to the subject, and in visiting many sewage disposal works at other localities had come to the conclusion that the sewage of Ripon could be satisfactorily purified by land filtration only. The sewage of the city was almost entirely domestic, there being only the trade refuse water from one brewery and one or two tannery works to be considered, and the purification was, therefore, a much simpler matter than in many of the small manufacturing towns. Early in 1894 the Council commissioned Mr. E. Preston, C.E., with whom he (Mr. Johnson) was engaged as managing assistant, and the scheme now being carried out was presented to the Council and adopted by them. The Local Government Board assented to the borrowing of 10,000*l.* for the purpose, and the works were immediately put in hand. The city boundary embraced 1,500 acres, and the present population was estimated at about 5,500; but as the census returns during the last two decades showed a very slow rate of increase—less than 1 per cent. per annum—the disposal works were designed to deal with an assumed population of 10,000 persons. The city was chiefly built on rising ground, and the configuration of the town necessitated two main intercepting sewers. These sewers had been constructed with the flattest gradients allowable—consistent with their being self-cleansing—in order to collect the sewage from as large an area as possible, and deliver it by gravitation, and thus reduce the amount of sewage which had to be pumped. The main outfall sewer was a 24-in. diameter barrel sewer with a gradient of 1 in 750, this form being adopted owing to the shallow depth of sewer available, and had a discharging capacity which, in addition to the ordinary flow of domestic sewage, would allow for one-third of an inch of rainfall per day for an area of 375 acres. This area was about 10 per cent. in excess of the present area built upon, and the provision made was sufficient to ensure the sewage being delivered at the disposal works, and the storm overflows not to come into use until very large dilution had taken place. The southern intercepting sewer followed the course of the River Skiff, and in the lower part of its length was laid in duplicate on both banks, but for a distance of some 100 yards at its upper end it was found advisable to lay the sewer in the river bed, on account of the numerous branch drains which were to be connected. Most of this work was completed during last summer, the river being conveyed in wooden shoots for 100 yards at a time, and the river bed laid bare between baffle dams built across its course. The whole of the intercepting sewers had been completed, and when the contracts now in hand were completed, practically the whole of the sewage of the city would have been diverted from the river, and dealt with at the filtration works. The sewage from the low-lying portion of the city, which came from about 250 houses, was taken by two main sewers to a pump well constructed in the gas-works yard, and was to be lifted into the northern intercepting sewer by means of a Gwynne's 14-in. invincible centrifugal pumping-engine. The height of the lift was only 20ft., and as the pump would be supplied by the existing boiler, the cost of pumping would be a very small additional expense. They had a total area of 30 acres of land available for sewage purification purposes. The cost of the land was 14*l.* per acre, and easements had been obtained at a cost of 2*s.* 7*d.* per yard. The sewage was delivered direct on to the land without any treatment beyond passing through a small catch-pit, where the heavier matter was deposited, and pumped by hand into sludge-pits

Twelve acres had been levelled and under-drained; the subsoil was proved to be well suited for the purpose of filtration, and a working depth of 6 ft. was available above the ordinary level of the River Ure, into which the main subsoil drains discharged. The sewage was distributed by means of underground carriers provided with distributing manholes, and could be turned on to any one or all the plots. The area laid out had been leased to a firm of willow-growers for a term of ten years, at a rental of 1*l.* per acre; the Council undertaking to dispose of the sludge from the catch-pits, and the lessees being under stringent conditions as to the distribution of the sewage. The total expenditure to date was about 10,000*l.* for works, and 3,000*l.* for land.

Mr. Escott, Halifax, opened the discussion on the paper. He said he had no doubt a fall of 1 in 750 was a cleansing fall, but in other towns they would think twice before they made a sewer with that gradient, unless they had a very good force of water to keep the sewer clean. Then, again, he noticed that provision was made for only one-third of an inch of rainfall per day to pass through the sewers, which was not a very liberal amount. He regarded the leasing of the land to willow-growers as a very good proceeding.

Mr. Platt, Rochdale, said he thought it was quite possible to make a sewer with a gradient of 1 in 750 self-cleansing. He had one laid at a gradient of 1 in 2,000, and there had been no trouble with it. He congratulated the town upon the cheapness with which the easements had been obtained; also upon the cost of the works, which they could not expect to carry out at the same rate per head as larger towns. They had acquired more land than was usual in proportion to population, but that was a good provision. He did not agree with the idea of willow-growing on the land. His experience of it was unsatisfactory. It was too early to ask how it was working, but he was afraid the roots of the willows would get into the drains.

Mr. Roundthwaite, Sunderland, said he agreed with Mr. Escott that the gradient of the sewer under such conditions was utterly unsatisfactory. Perhaps Mr. Johnson would give them some idea of the storm-water overflows. He only made provision for one-third of an inch of rainfall in twenty-four hours, which seemed very little unless the storm overflows were very capacious.

Mr. Spencer, Newcastle-on-Tyne, remarked that in this instance the County Council appeared to have been of some use. It was generally considered that the only attainment of County Councils was to raise the rates, but they now appeared to have turned their attention to the purification of the streams and rivers of the country, and were doing a useful work. With regard to the gradient of the sewers, he thought if the sewers were well looked after the gradient would be found practically workable. He thought the Authorities were to be congratulated that such a small sum was to be paid for easements, and the land-owners must also be congratulated upon the liberal spirit in which they had met the Authorities.

Mr. Wike, Sheffield, said he would like to know whether they had any difficulty with the West Riding Conservancy Board as to the admission of water from the storm overflows into the river. He had recently been fixing a number of storm overflows in Sheffield, and the medical officer for the county had been very much on the alert, and he was afraid they would have some trouble, although the sewage, when it got into the river, would be very largely diluted. As to the gradient of the sewer, he had laid sewers at gradients varying from 1 in 6 to 1 in 880, and was now putting one down at 1 in 1,500. He had not the slightest fear of its being ineffective.

Mr. Baker, Middlesbrough, said he was of opinion that the land laid out would be found insufficient in a few years.

A vote of thanks having been accorded to Mr. Johnson for his paper, that gentleman replied to the various questions raised in the discussion. He explained, with reference to the gradient, that it was impossible to have any other gradient unless they were going to pump the whole of the sewage. He explained, with reference to the limited provision for storm water, that the old sewers were left in and were being used to take storm water.

Mr. W. Edson, City Surveyor, presented a paper on "Twenty-five Years of Municipal Work in Ripon." He first described the water works which are situate at Lumley Moor, about

six miles west of the city, and which comprise a drainage area of over 600 acres. The capacity of the reservoir, when full, was 94 million gallons, with a depth of 35 ft. The Corporation were bound to supply 100,000 gallons of water per day as compensation to the various mill owners and other parties interested along the stream. The filter-beds were situated in the valley a little below the reservoir embankment. They had an area of 8,712 ft., and were constructed of cement concrete. The reservoir was elliptical, constructed of cement concrete; it had a holding capacity of 780,000 gallons. It was estimated that with an average rainfall of 32 in. there would be an available daily supply of 554,000 gallons, which was more than ample for present requirements, leaving a good margin for the future growth of the district within the supply area. With regard to street improvements, nearly all the works under this heading had been carried out during the last twenty-five years, and although the amount expended might seem small, yet, considering the comparatively small population and rateable value of the city, it would compare favourably with larger and more prosperous centres. It was obvious that a large number of these improvements were of themselves not very extensive, nor requiring a large amount of engineering skill to carry them out, but they had all contributed to the improvement of the city and to the convenience and comfort of the citizens. In 1890 a bathing pavilion was erected on the bank of the River Ure, at a cost of 440*l.* There were nineteen dressing-boxes with wood partitions, seats, doors, &c. The river banks had been piled the length of pavilion, and a platform constructed about 12 in. above the summer level of the river, which was approached by three flights of steps from the dressing-boxes. In 1865 the City Council purchased the gas-works from a private company for the sum of 9,614*l.*, and had since expended a further sum of 8,386 in extensions and improvements. Very great improvements had been made in the sanitary condition of the city within the last twenty years, and now that a new sewerage and sewage disposal scheme was on the point of completion, the city might be considered up-to-date, at any rate so far as its drainage and water supply were concerned, which were two of the most important from a health point of view.

The Mayor entertained the members to light refreshments, and the afternoon was occupied with visits to Fountains Abbey, the Cathedral, and other places of interest.

SANITARY INSPECTORS' ASSOCIATION.

At the meeting of this Association held on the 1st inst. a paper on "The Proposed Drainage By-laws for the Metropolis" was read by Mr. W. H. Grigg (Fulham), Vice-Chairman of the Association.

The lecturer remarked that since the chaotic state of the drainage by-laws as administered in the metropolis had been pointed out to the members of the Association by their Hon. Secretary, Mr. E. Tidman, in a paper read by him in 1880, but little improvement had taken place, notwithstanding the passing, since that time, of the "Public Health Act of 1891" and the promulgation in 1893 of new drainage regulations under the Act by the London County Council. Certain doubtful provisions, some defects, and a long series of omissions were pointed out in the paper for the purpose of eliciting the opinions of the practical men who formed the majority at the meeting. Among doubtful points was the imperative requirement by By-law 4 of an interceptor, or syphon trap, in all cases between the sewer and the house drain. It was a matter for very serious consideration whether this should be insisted on, because it was found that stoppages in the drains almost invariably occurred at the interceptor, and because every house with an interceptor was increasing the volume of the exhalations from main sewer gratings. Another doubtful provision was that of By-law 9, which compelled the use of drawn lead for soil pipes in all new buildings. Every inspector knew that in certain cases heavy iron for pipes was to be preferred.

Upon this point, as the discussion eventually proved, there was much diversity of opinion among sanitary inspectors. Mr. Fairchild (Wandsbury) and Mr. Young (Battersea) agreed in the opinion that, certainly for

indoor pipes, lead was preferable to iron. It had been found that iron, even of great thickness, used as pipes, had been eaten almost away in a few years. The inside of a lead pipe, it was claimed, was always smooth, while the inside of an iron pipe was always more or less rough, and would, therefore, be more likely to retain the germs of disease. Mr. Pettit (Kensington), on the other hand, contended that soil pipes should not be inside, but outside houses in all cases, and that for outside pipes iron was quite as good as lead.

On other points raised by the paper there was no difference of opinion. All agreed that there should be an uniform code of by-laws, and that the evil should be made impossible which arose from the contradictory decisions of magistrates—sometimes given even in the same court and within a few days of each other. There was nothing in the existing by-laws to prohibit rain-water pipes or waste-pipes from baths or certain sinks from being connected to ventilating pipes. This was an omission that ought to be rectified. The definitions of materials, their weights, and the methods of jointing were insufficient, and there was a lack of continuity in methods and requirements which was a cause of many difficulties in the case of unsympathetic owners. In such cases the retort was too obvious where sanitary inspectors had to call upon owners to perform certain necessary works. What guarantee have we that in a year's time some one will not come and condemn this work after it has been done, on account of some new "fad"? According to By-law 12 the regulations only applied to existing buildings in respect of new work. It was from defective drainage in old houses that the greatest dangers to public health were found, and the absence of regulations controlling repairs and reconstructions of existing premises caused an enormous waste of effort. There was no provision for the submission of plans, sections, and elevations for approval by the Local Authority before commencing any work; the fall of drains was left unspecified; there was no penalty for covering up work before it was approved by officers of the Local Authority; no compulsory provision was made for inspection chambers, and the construction of gulches, traps, &c., was not specified.

A cordial vote of thanks was afterwards given to Mr. Grigg on the motion of the Chairman (Mr. W. W. West), supported by Messrs. Fairchild, Young, Bush, Pettit, and other members. During the proceedings ten new members were elected.

TRIBUNAL OF APPEAL.

A SITTING of the Tribunal of Appeal, the members of which are Mr. Arthur Cates (President), Mr. J. W. Penfold and Mr. A. A. Hudson, was held at the temporary offices, Savoy Hill, on the 5th inst., to hear two appeals made by Mr. W. T. Read, owner of property in Highgate-road, against decisions of the London County Council.

The appellant was represented by Mr. Glen, the London County Council by Mr. Seager Berry, and Mr. W. W. Blair, C.E., attended to watch the case on behalf of the Local Authority, the St. Pancras Vestry.

In the first case, Mr. W. T. Read, an owner of property on the south-western side of Highgate-road, between Greenwood-place and Lady Somerset-road, upon which he was desirous of erecting buildings for residential flats, to be let at moderate rentals, appealed against the certificate of the superintending architect of the L.C.C. given in answer to the statutory application made by the appellant on February 20 last. The superintending architect had taken for his definition of the general line of buildings, the fronts of the houses measured at the height of the first floor and in only one portion of the road—and upon this datum gave his certificate, provided that the clear width of 21 ft. was maintained from the centre of the roadway. The appellant now produced plans to show that at No. 37 on the south side of Greenwood-place, the clear width at the ground floor, where projecting shops existed, was 15 ft. 6 in., and on the left 17 ft. 9 in.

Mr. Glen, on behalf of the owner, contended that there was no real reason in the present case to set back the line of the ground floor. It would be a hardship for the owner of the property in this particular section to be bound by the proposed definition, while in another portion—perhaps merely on the other side of the road—people would be allowed in some cases to build right up to the line of the road.

The President of the Tribunal said they had that morning inspected portions of Highgate-road, and had found great differences in the line of front in different portions of the road.

Mr. Glen: Therefore, the line is very irregular, and I respectfully ask the Tribunal to say that the line suggested by the plans more correctly repre-

sents the general line of buildings than that adopted by the superintending architect.

Mr. W. T. Read having been sworn, said, in answer to Mr. Glen, that the certificate from the superintending architect, dated March 8, laid down a line that would prevent him from carrying out the plans which he put in, and which showed, as required, the distance of the general line of existing buildings. They proposed to throw 2 ft. into the public way, beyond that which would be required if the narrowest portions of the road were considered.

The President: You show the line setting back 13 ft., and the superintending architect demands 21 ft.

Witness: Yes, but there is a slight error. The distance we propose is really 15 ft. 6 in.

Mr. Berry: How old is the property?

Witness: The houses themselves are very old, but the shops (which project) are new.

Mr. Blair (Engineer, St. Pancras Vestry) here stated that application had been made to the Vestry in the usual form, and, in view of the particular site, the Committee which considered the application was of opinion that the line might be approved. The Committee, therefore, did not object to the scheme submitted, and they said so to the County Council.

Mr. Berry, for the County Council, said the difficulty raised by the claim to take in the projecting shops was a point for the Tribunal to decide. The most important question was what general consideration should determine the portion of the street that should be taken, in defining the general line. What evidence should be brought before the Tribunal to enable it to decide what portion of the road ought to be taken? He would have to point out that this road on the other side of Lady Somerset-road was 47 ft. or 48 ft. wide. He submitted that it would be necessary to take into consideration the character of the road.

The President: The certificate does not specify any particular block, but only Highgate-road. I should like to know exactly the particulars with regard to the portion from Nos. 55 to 71 shops.

Mr. Berry: They were built as additions, and he could not say what were the particulars.

The President: The superintending architect has adopted the line existing before the shops were built. It appears to have been the view taken by him since 1890, that shops were mere projections. The question is of extreme—of pressing—importance, but whether it should be decided upon the present case is a matter for consideration. I suggest that you should confer with Mr. Glen on the subject. Speaking as individuals only, we think the proposal to give two feet to the public way is reasonable. It is a question of law which the Tribunal would rather not decide. What we want is to get the best terms for the public advantage.

Mr. Berry: As the point whether the shops or the house fronts should be considered the general line of buildings has been raised, I ask the Tribunal to adjourn the case. It is possible that the Council has not had its attention drawn to that point. I ask for an adjournment, in order to see whether any arrangement can be made, and, in the meantime, I will ask the Council to reconsider whether the appeal should be opposed.

Mr. Glen: I accept the adjournment if the decision of the Council be arrived at forthwith.

Appeal adjourned accordingly.

The second appeal was by the same owner against the decision of the London County Council, in the matter of the erection of proposed residential flats on the west side of Highgate-road, between Greenwood-place and Carker's-lane. The same council were engaged in the case, and Mr. Blair again appeared on behalf of the St. Pancras Vestry.

Mr. Glen, after citing Sub-section 5 and other portions of the London Building Act, stated that, although in this case his client had paid all the fees required, the District Surveyor still withheld the certificate. Mr. Read was the owner of all the land between Greenwood-place and Carker's-lane on both sides of the road, the Midland Railway Company having a right of passage. Carker's-lane had been stopped up from a certain point since the railway was made, but another portion had been retained by the Vestry. Mr. Read was of opinion that, whether the road was held to be public or private property, the Vestry would be satisfied if the road were entirely stopped up, and his client believed he had the right to build upon it.

Mr. Berry: Until the road is closed the County Council has rights over it.

Mr. Glen: All my client desires is to make an area for the purpose of getting light and air, which he cannot do unless he is allowed to take this road. Mr. Read, he added, desired to substitute on the south side of Carker's-lane an area for the boarded fence, the existing boundary of the lane, which was previously a brick wall, the foundation portion of the wall still remaining. If he obtained the certificate of the District Surveyor his client would be entitled to make the alterations, which were necessary, because Carker's-lane went out from the main road with a rising incline, and unless the proposed area were constructed, the light would be blocked out. The question for the Tribunal was whether permission should be withheld.

Mr. Read was sworn, and in answer to questions from Mr. Glen, the particulars given were proved.

No portion of the work would be less than 20 ft. from the centre of the road, and he wished to do nothing without the full concurrence of the County Council. A letter from Mr. Blinshill, dated March 20, was produced, in which he withheld consent, stating that the County Council could see no reason why the boundary should not be set back.

Mr. Glen: What would be the effect of setting back the boundary?—It would curtail the air space, because the blocks would be nearer together.

Mr. Berry: You want the County Council to do something that the Act will not allow, or you cannot carry out your plans. The witness explained that the boundary wall was 8 ft. or 9 ft. from the pavement, that his plot had a frontage of 40 ft. close to the lane, and a depth of 150 ft. That the road led to nowhere except the witness's stables and the Midland Railway Company's property, and that the whole question of the proprietorship of the road was in doubt.

Mr. Blair stated that the St. Pancras authorities made no objection to Mr. Read's proposal, which they considered a wise one.

Mr. Berry maintained that whether a boundary wall entitled Mr. Read to retain the land or not, it did not give any such right under Sub-section 5 of the Act. A boundary wall could not be a structure. The point was that if the wall was not a structure it could give no right to the road.

Mr. Glen agreed that Sub-section 5 was intended to prevent encroachment on streets, but they were only proposing to put up something where a building was before, and there was no reason in this case for the County Council's opposition. What his client asked was only reasonable.

The President eventually announced that the Tribunal would consider its decision and declare it in due course.

The proceedings then closed.

Correspondence.

To the Editor of THE BUILDER.

ROYAL ACADEMY ARCHITECTURAL DRAWINGS.

SIR—I should be delighted to be the author of the actual drawing of the east end of the private chapel, Douglas Castle, but it happens to be Mr. Whall's own drawing, and you will allow me to say it deserves more praise than has commonly been given to it.

H. WILSON.

** We beg Mr. Whall's pardon; the general style of execution being very similar to Mr. Wilson's, and the drawing hung with his, we were under the impression that he had made a drawing of Mr. Whall's credos.—E.D.

The Student's Column.

SPECIFICATIONS.—XIX.

PLUMBER.

Internal Work (continued).

COMPANY'S REGULATIONS.—The internal plumbing work is to be carried out in accordance with the regulations of the Water Company, and is to be completed to the satisfaction of their inspector.

Connexion with Main.—Give the necessary notices to the Water Company, and pay their charges for making connexion with main, and make good roads and footways to the satisfaction of the Local Authorities.

Stop-cocks. Supply and fix where directed in main from company's pipe, 1-in. heavy brass high-pressure screw-down stop-cock, with tee key, and 6-in. stone-ware pipe as boxing, carried up to surface of ground and closed with screw cap fitted in with Russian tallow. Supply and fix to each supply-pipe from cistern full-way brass high-pressure screw-down stop-cock of the size of pipe in which it occurs.

Rising Main.—Lay 1-in. pipe from company's main to cistern in , and fit same with 1-in. brass high-pressure equilibrium ball valve with copper ball. (If there is more than one cistern, the size of the rising main to each with its ball valve, must of course be specified.)

Cisterns.—Supply and fix in roof over a galvanised wrought-iron riveted cistern, 6 ft. by 3 ft. by 3 ft. with angle iron stiffeners round bottom, top, and angles and wrought-iron cross-stay, and all necessary perforations for supplies and waste. Supply to this cistern 1 in. deal cross-tongued and ledged cistern cover in two pieces, on 2½ in. by 2 in. bearers. Fit to the cistern 1½ in. overflow, with brass cistern connector (or 1½ in. boiler screw union). The overflow to be taken out through the roof to discharge on front with 5 lbs. lead soaker where pipe passes through roof.

Draw-off Tap for Emptying.—At foot of rising air supply and fix $\frac{3}{4}$ in. brass screw-down high-pressure bib cock, with square-headed handle and loose spanner for emptying rising main, same to discharge over gulvy.

Supply Pipes.—Run supply pipes from cistern follows:—(Give a list of the supplies, stating the size, from a cistern to various points of supply) bath, lavatories, water-closets, &c.) The supply pipes to be connected to cistern with brass washer and waste with fly nut and union full way" of the size of the respective pipes.

Lavatory.—Fit up the lavatory with Messrs. Lavatory fittings as No. in their catalogue p.c. with hot and cold supply taps, the price of which is included in the p.c. already quoted. Supply and fix $\frac{1}{2}$ in. waste pipe from lavatory with drawn lead syphon trap below same, fitted with brass screw cap for cleaning. This waste is to be taken to discharge into slipper shown on plan.

Bath.—Supply and fix where shown on plans Messrs. tinned copper bath (or other as may be selected) No. in their catalogue p.c. The hot, cold, and waste valves and fittings of this bath to be of Messrs. manufacture, as No. in their catalogue p.c.

Run $\frac{1}{2}$ in. waste pipe from bath, with drawn lead syphon trap below same fitted with screw cap for cleaning. This waste is to discharge into slipper shown on plan.

Housemaid's Sink.—Supply and fix where shown on plan Messrs. housemaid's sink as No. in their catalogue, &c.

Run 2 in. waste pipe from housemaid's sink with drawn lead syphon trap below same, fitted with screw cap for cleaning, which waste is to discharge into a slipper shown on plan. (Or as an alternative may be specified thus.) The housemaid's sink to be of $1\frac{1}{2}$ in. cross-tongued deal sides and bottom dovetailed at angles, the angles filled in with splayed lead, the angles filled in with splayed lead, the sink to be lined with 6 lbs. lead with soldered angles and copper nailed over top. The waste to have $\frac{1}{2}$ in. brass plug and chain and cohweb grating with brass washer and waste.

Water-Closets.—The water-closet on first floor to be fitted with Messrs. water-closet apparatus as No. in their catalogue p.c. with polished mahogany seat and strong galvanised wrought-iron bearers fixed to brickwork. The price of water-closet, already quoted, includes the seat and bearers (or does not include the seat and bearers as the case may be). The water supply to this water-closet to be laid on with $\frac{1}{4}$ in. lead pipe from water waste-preventer on iron brackets fitted 7 ft. above the seat of water-closet. The water waste-preventer to be Messrs. manufactured as No. in their list p.c.

Run $\frac{3}{4}$ in. lead pipe from water waste-preventer through wall to overflow. The water-closet apparatus to be connected with the vertical soil-pipe by 4 in. drawn lead soil-pipe, weight 10 lbs. per foot run. Similarly describe the other water-closet apparatus.

Safes.—Put beneath each water-closet apparatus on first floor, also beneath bath and housemaid's sink, a safe of $\frac{1}{2}$ lbs. lead, that under water-closet to be on floor, that under housemaid's sink by , and that under bath by , each to be turned up 4 in. at back and each end and in front to rest over $\frac{3}{4}$ in. by 3 in. splayed fillet and nailed with copper nails. Each safe to have 14 in. lead waste carried 6 in. through outer wall and finished with 14 in. brass flap soldered in.

Butler's Sink.—Supply and fix where shown on plan in butler's pantry, a lead-lined sink similar to that already described for housemaid's sink, the size being 2 ft. 6 in. by 1 ft. 6 in. by 1 ft. The waste from this to be as described for housemaid's sink.

Soil Pipes.—The soil pipes to be 4-in. drawn lead soil pipes, weight 10 lbs. per foot, secured to wall with tacks soldered on and to be carried up 2 ft. above eaves in a perfectly straight line, and finished with copper wire globular grating 5 in. diameter soldered in (or if desired one of the numerous forms of ventilators in the market may be specified to be fitted at head of soil pipe). The lower end of soil pipe to be soldered to brass flanged collar and cemented to socket of drain pipe.

Iron Soil Pipes.—The soil pipes from water-closets to be 4-in. heavy cast-iron socketed pipes of Messrs. Macfarlane's manufacture, enamelled inside, the joints made with oakum and run with lead and caulked. Y junctions to be

put for connexion of lead soil pipes from water-closets, and the upper portion to be continued and carried up to a height of 3 ft. above the cornices in a straight line, and finished with copper wire globular cover. (N.B.—Where there is a series of water-closets on different floors connected with the same soil pipe, it is necessary to specify a light lead 14-in. air pipe to trap in order to prevent same from being siphoned).

Hydrants.—Lay on water-supply to hydrants direct from main with $2\frac{1}{2}$ in. cast-iron pipe, weight 30 lbs. per 6 ft. length. Put together with lead-caulked joints. Provide the sum of £ p.c. to be paid to Messrs. for hydrant fittings, hose, nozzle, &c.

Testing.—The whole of the plumber's work to be tested at completion, to the satisfaction of the architect, all pipes being filled with water, and to stand without loss for six hours.

OBITUARY.

MR. W. FORSTER.—Mr. William Forster, architect to the Marquis of Londonderry at Seaham Harbour, Major in the 2nd Durham Volunteer Artillery, died on the 26th ult., at the age of sixty-four years.

GENERAL BUILDING NEWS.

CATHOLIC CHURCH, TECCONAUGHT, CROSSGAR, CO. DOW.—On the 25th ult. the Rev. Dr. Henry laid the foundation-stone of a new church at Tecconought, in the parish of Kilmore, near Crossgar. The site upon which the church is being erected is at the junction of two roads—the new and old roads to Ballynahinch. The style adopted by the architect (Mr. J. J. McDonnell) is Gothic of a late period, and on plan the church shows a nave 32 ft. wide by 80 ft. long; the east end is spanned by a chancel arch, and the sanctuary projects beyond this 16 ft. A sacristy, 15 ft. by 12 ft., is in communication with the latter. A gallery to accommodate one hundred people, in addition to the choir space, is placed in the west end, approached by a staircase entered direct from the entrance porch—the latter, semi-octagonal in form, besides serving as a porch, is made to receive the baptismal font without encroaching on floor space. The side-walls, which are 25 ft. high to eave course, are divided into five bays on each side by projecting buttresses, and each bay has a two light window; the west gable is pierced with one two-light, and having a single light window on each side, while the east end has three single light windows, and each will be glazed with lead lights. The main entrance is in the west end, through a projecting gabled airway. The roof will be wagon-shaped. The contractors for the work are Messrs. Fitzpatrick Brothers, Limited, Belfast.

LIBERAL CLUB, KEIGHLEY.—The directors of the Keighley Liberal Club Company, Limited, met recently to further consider the competitive plans for a new club-house, to be erected on the site in Devonshire-street and Scott-street. The work was done by Messrs. John Judson & Moore, of Keighley, were appointed architects for the new premises. The club-house will be of two stories except for a large billiard-room, which will be only one story. On the ground floor a news-room, smoke-room, card-room, conversation-room, library, &c., will be provided. The first floor will be mainly devoted to an assembly-room, but on this floor accommodation will also be found for the Women's Liberal Association. Curator's premises and offices for letting will be erected on the frontage to Scott-street. The entrance to the club will be at the junction of Scott-street and Devonshire-street.

FORESTERS' HALL, RYDE, ISLE OF WIGHT.—The memorial stones were laid recently by the Mayor of Ryde and Miss Brigstocke of the new Foresters' hall, which is in course of erection in Warwick-street by Mr. Isaac Barton, from designs by Mr. John I. Barton. The elevation is in red brick with Bath stone dressings. On either side of the large entrance-hall are ante-rooms, with lavatories, &c. The gallery is over the ante-rooms and is reached by a staircase from the entrance-hall. The hall is 60 ft. long, clear of the gallery, and 32 ft. wide. Under the hall there are a large kitchen, scullery, &c., and heating-chamber. The hall and gallery will seat 800.

NEW BOARD SCHOOL, NOTTINGHAM.—The Mayor of Nottingham (Ald. E. H. Fraser, J.P.) recently opened the new Board School which has been erected in St. Leonards-street. The building will accommodate 364 boys and girls in the rooms on the two floors, and provision has been made for future enlargement, if necessary, to the extent of 240 places. In addition to the class-rooms and central halls, which latter will be used as assembly-rooms, the school is provided with a swimming bath in the basement, and there are playgrounds for both boys and girls, provided with play-sheds. The contractor is Mr. William Maule, who has erected the buildings under the superintendence of Mr. A. H. Goodall, architect, and Mr. W. H. Price was the clerk of the works. It is estimated that the total cost of the school will be a little over 6,000.

CHURCH, DOLPHINHOLME, NEAR LANCASTER.—It is intended to rebuild St. Mark's Church, Dolphinholme, near Lancaster, and Messrs. Austin & Paley, architects, of Lancaster, have prepared plans for the proposed new structure.

SCIENCE AND ART BUILDINGS, LYDNEY, GLOUCESTERSHIRE.—New Science and Art buildings have been erected at Lydney, from plans prepared by Mr. Howard Howells, architect, of Lydney. Messrs. Moses Kear & Sons, of Coleford, were the contractors. The front elevation is towards the High-street, and in extent the building is 54 ft. by 53 ft. and there is a custodian's cottage in the rear. On the ground floor there is a main hall, billiard-room, reading-room, library, smoking-room, and offices. This floor is the Lydney Institute section. The first floor, which will be used purely for science and art teaching, consists of an elementary art room, an advanced art room, modelling room, and lecture theatre, chemical laboratory, and offices. The walls of the building are of Forest red stone, with Bath stone dressings, and tiled with Broseley tiles. The cost of the building has been 2,300.

PRIMITIVE METHODIST CHURCH, LYMM.—The foundation stone has just been laid of a new building for the Primitive Methodists of Lymm. The interior of the new chapel will be 49 ft. long by 20 ft. wide, and 29 ft. high to the ceiling. There will be a vestibule at the front, and the rear of the building will be semi-circular, with space for the choir, organ, communion table, &c. A vestry is placed over the heating chamber. The floor of the chapel will be 9 ft. above the roadway, and will be approached by twelve steps. The architect is Mr. J. D. Mould, of Manchester and Bury, and the contractor, Mr. Henry Thomason, of Lymm.

BUILDING IN BLACKPOOL.—At the last meeting of the Building Plans Committee, Blackpool, eighty-one plans came under consideration, and of these fifty were approved and thirty-one disapproved.

ST. ANDREWS UNIVERSITY MEDICAL SCHOOL, N.B.—A medical school is to be erected for St. Andrew's University. The site of the buildings is within St. Mary's College grounds, adjoining Queens-terrace and West Bury-lane. The building is in the Elizabethan style, and there will be accommodation for four professors, viz., physiology, anatomy, materia medica, and botany. There will also be two lecture-rooms, open to all students, besides museums, workrooms, and private rooms for the use of the professors. The tower is not to be erected in the meantime. Mr. Gillespie, St. Andrews, is the architect.

BUILDINGS IN HIGH-STREET, SHEFFIELD.—The contract has now been accepted for the largest block of buildings in High-street, Mr. John Walsh having made arrangements with Messrs. George Longden & Son, contractors, for the erection of his new buildings. The amount exceeds 61,000. The frontage will extend not only along High-street, but also along Mulberry-street. Messrs. Flockton & Gibbs are the architects.—*Sheffield Independent.*

BOYS' SCHOOL, BENTHAM.—New boys' schools have just been opened at High Bentham. The old boys' school has been transformed into a master's house, and the new school immediately adjoins it. The architects are Messrs. Harrison, Hall, & Moore, Lancaster. Accommodation is provided for eighty boys.

METHODIST CHAPEL, YARM, YORKSHIRE.—On the 29th ult. the foundation stone was laid at Yarm of a new Primitive Methodist Chapel. The new structure is to be 45 ft. long, 32 ft. wide, and 21 ft. high, and will accommodate 200 worshippers. The old building will now be used as a schoolroom. Messrs. Perks & Co. of Stockton, are the principal contractors for the new building. The total cost, inclusive of land, will be about 1,260. Mr. T. W. T. Richardson, Stockton, is the architect.

CONGREGATIONAL CHURCH, LIVERPOOL.—The new Congregational Church in Hartington-road, Liverpool, has just been opened. The church consists of nave and transepts, with tower and spire at the narrow extremity of the site. The other end is finished with a short apse. The church at present will accommodate about 500 worshippers, with provision for future enlargement by means of a large end gallery and two smaller ones in the transepts to accommodate about 200 more. The church is heated by hot-water apparatus supplied by Messrs. Dargen, Williams, & Co. The whole of the work has been carried out from the designs and under the supervision of Messrs. W. & J. Hay, architects, by Messrs. J. Paterson & Son, the general contractors; the others being Mr. Tyson, for brickwork; Mr. George Parker, mason; Mr. Johnstone, slater and plasterer; Mr. Thomas Lea, joiner and plumber; and Messrs. Williams & Watson, glaziers.

ALTERATIONS TO ABERDEEN THEATRE.—Her Majesty's Theatre, Aberdeen, is to undergo structural alterations and improvements. The plans will be prepared by Mr. Frank Matcham, and the carrying out of the work will be superintended by Mr. Alexander Brown.

SCHOOL, QUORN, LEICESTERSHIRE.—On the 28th ult. new buildings at Rawlins' Grammar School were opened at Quorn. The material used in the construction was Mountsorrel granite, with cream terra-cotta dressings, and lined on the inside with brickwork. The master's house contains dining and drawing-rooms, study, and five bedrooms, boys' dormitory, and dining hall. Kitchen

accommodation has been made so as to provide for boys attending the school from adjacent parishes. The master's house and the school-room are connected by a corridor. The main schoolroom is 41 ft. by 21 ft., and 19 ft. high to the ceiling, with a pine principal. There is a class-room, with boys' entrance, and cloak-room. At a distance of 50 ft. from the main building to the rear is a technical school. The sloyd-room is 50 ft. by 13 ft., and has been fitted with ten benches. On the first floor is the physical and chemical laboratory, with demonstrating-room. Messrs. Messenger & Company, Loughborough, carried out the heating work of the buildings, which is by hot-water apparatus, supplemented by open fireplaces. The general contractors were Messrs. W. Moss & Son, Loughborough; the joiner's work being in the hands of Mr. John Sanders, of Quorn. The fitting up of the technical school was carried out by Mr. C. A. Dobson, of Loughborough; and the whole work was under the supervision of and from plans by Mr. G. H. Barrowcliff, Loughborough.

HOTEL, TROON, Ayr.—The Duchess of Portland recently opened a new hotel at Troon. The building contains about seventy rooms. The architects were Messrs. James Salmon & Son, of Glasgow.

SCHOOL BUILDINGS, PORTMADOC.—New intermediate schools have just been opened at Portmadoc. The buildings are arranged with boys' and girls' entrances at either end, with cloak-rooms and lavatories adjoining each entrance. There are three ordinary class-rooms provided for the boys on the eastern side of the front, and two for the girls on the western side, with a large assembly hall, to accommodate all the students, in the centre. Chemical and physical laboratories, with a preparation and balance room, are provided for the use of both sexes. At the end of the girls' north corridor is placed a cookery kitchen, with scullery, &c., and a laundry. Playfields in both playgrounds are provided, and a large workshop for mechanical instruction is built. The class-rooms are planned to accommodate twenty students in each. The buildings are built of local stone. The architect is Mr. W. H. Dashwood Caple, of Cardiff, and the buildings have been built by Messrs. William Jones & Evan Humphreys, of Portmadoc, the amount of whose contract was 2,676l. Mr. Robert Roberts has acted as clerk of the works.

MUSIC HALL, BRIXTON.—Brixton is to have a music hall. A site has been acquired opposite the Turkish Baths in the Carlton-grove, and plans for the new building, which will be styled "The Empress," have been prepared by Messrs. Wydon & Long. The hall, which will be capable of seating nearly 3,000 people, will necessitate an outlay of between 17,000l. and 18,000l.—*South London Press.*

EASTLEIGH BOARD SCHOOL, SOUTHAMPTON.—The new Board school in Chamberlayne-road, Eastleigh, has just been opened. It has been erected from plans prepared by Messrs. Mitchell, Son, & Gutteridge. The school is planned on the central hall system.

CHURCH, KILKENNY.—The foundation-stone of St. John's Church, Kilkenny, has just been laid. The architect of the building is Mr. Wm. Hague, of Dublin. The church will be 168 ft. in length, and 72 ft. wide, having, in the interior, nave, aisles, side chapels, apse, and sacristy. A special external feature is a tower rising from the floor level to the height of 238 ft.

NEW CATHEDRAL LIBRARY, HEREFORD.—On the 30th ult. the Archbishop of Canterbury opened the new library and meeting-room attached to the Hereford Cathedral. The Archbishop also unveiled a memorial to the late Bishop Hampden (1848-1868) in the south transept of the cathedral. The cathedral library is erected on the original site of the medieval library, which stood from 1480 to 1830. The site was occupied from 1760 to 1834 by a brick building used for the grammar school, and for the triennial meetings of the Three Choirs. It is at the western end of the Bishop's cloisters, and forms a commencement of the south cloisters, which formerly extended up to the old west end of the cathedral. The plans were drawn by Sir Arthur Blomfield, and the work has been carried out by Mr. John Thompson, of Peterborough. The room is rectangular in shape. The three bays in the south cloisters have been restored, too, in memory of the late Canon Philpot and the late Rev. F. T. Havergal respectively, and the third is associated with the commemoration of the Diamond Jubilee.

LIBERAL CLUB, ALLERTON, YORKSHIRE.—The memorial-stone of a new Liberal Club was laid at Allerton by Mr. J. C. Horsfall recently. The contracts for the various works required have been let to the following firms:—Mason, Mr. Thomas Haigh; Joiner, Mr. John Foster; plumbers, Messrs. Haigh & Slater; plasterer, Mr. James Drake; slaters, Messrs. Hill & Nelson; painter, Mr. Walker Priestley. The architects are Messrs. Fairbank & Wall, of Bradford.

LADIES' GOLF HOUSE, TROON, Ayr.—A ladies' golf house, Troon, has just been opened by the Duchess of Portland. Accommodation is provided for ladies, girls, and boys. The ground story is built of red freestone, and the upper story will be rough cast on face with timber work forming panels. The roofs are to be covered with green slates and red ridge tiling. The cost will be about 1,000l. Mr. H. Clifford, Glasgow, is the architect.

SANITARY AND ENGINEERING NEWS.

SEWAGE SCHEME, DROFIELD, DERBYSHIRE.—Messrs. T. Margerison & Son, Dronfield, have obtained the tender for carrying out the Drofield sewage scheme. Mr. G. White, Mexborough, is the engineer.

NEW WATER SUPPLY, WORTHING.—The Duke of Cambridge visited Worthing on the 26th ult. for the purpose of inaugurating the new water supply, the works connected with which have been carried out by the town authorities, together with other sanitary improvements, at a total cost of over 100,000l. The water is drawn from a well at the foot of the South Downs. The well is 115 ft. deep from the original ground surface, and it is sunk through 60 ft. of loamy clay and sand and 50 ft. of solid chalk. The engines and pumps used for raising the water are in duplicate, each being capable of doing the work required for the supply of the town. When running at their ordinary speed each will raise 1,000 gallons per minute from the bottom of the well to the main reservoir on the Downs, the reservoir itself being capable of holding 2,000,000 gallons. The yield has been tested, and an average of 1,500,000 gallons a day, it is stated, can be depended upon, which, at the rate of thirty gallons per head per day, will be sufficient for the supply of 50,000 persons. The resident population of the town is now about 10,000. The walls of the reservoir are constructed of layers of concrete asphalt and hard brick. The engineer for the water-supply works has been Mr. James Mansergh.

DRY DOCK, SWANSEA.—The construction of the new graving docks at the Prince of Wales's Dock, Swansea, by the representatives of the late Mr. T. A. Walker, contractor, was commenced on the 26th ult., it being arranged to construct two docks—one of 450 ft. in length. The contractor is Mr. Nott, and the engineer Mr. A. P. Dix.

FOLESHILL SEWERAGE AND SEWAGE DISPOSAL.—The scheme of sewerage and sewage disposal, prepared by Mr. H. Bertram Nicholls, C.E., of Birmingham, for the parish of Foleshill, has been approved and adopted at the hands of the Rural District Council of Foleshill. The estimated cost of the engineering work is 24,010l.

WATERWORKS, TROON.—The Duchess of Portland opened the new waterworks at Troon on the 30th ult. The new supply is derived from the western and southern slopes of the Dundonald hills. The storage reservoir has been constructed in The Glen. The area of land draining directly into the reservoir is 88 acres, and it is estimated that the area will yield, during a dry year, 28 million gallons of water, while the area of the catchwater conduit is 183 acres, and it is calculated that 20 million gallons of water per annum will be got from it. By an extension of the catchwater conduit, an additional quantity of 15 million gallons of water can be got when necessary. The water level of the reservoir when full will be 108 ft. above the sea, and the maximum depth 31 ft., the area covered by water being 11 acres. The reservoir will contain 48 million gallons of water, or sufficient to give a supply of 240,000 gallons per day to Troon during a period of 200 days. The embankment of the reservoir is 800 ft. in length, with a height of 30 ft. at the centre, and is composed of 75,000 tons of earthwork, puddle clay, and stone pitching. The filters are two in number, each 60 ft. in length by 54 ft. in width, and are capable of filtering 240,000 gallons of water per day. The water passes from the filters into a circular clear-water tank 70 ft. in diameter and 11 ft. in depth, the storage capacity of this tank being 250,000 gallons. The cope level at the filters and tank is 107 ft. above the sea. The piping to Troon measures 4,410 yards, or 2½ miles, and is capable of providing a supply at the rate of 30,000 gallons per hour. Mr. W. R. Copland was engineer of the works.

CASTLE EDEN COLLIERY WATER SUPPLY.—At a meeting of the Easington Rural District Council a scheme for the supply of water for Castle Eden was submitted by the Engineer, Mr. D. Halfour, M.Inst.C.E., of Newcastle and Edinburgh. The work consists in pumping water from a duplicate well or staple at the colliery to service tanks situate near Dean Leazes Farm at sufficient altitude to give an excellent pressure, and from thence the water will be distributed in cast-iron mains for supplying the inhabitants. The scheme was adopted subject to a satisfactory arrangement being come to with the owner of the staple.

STAINED GLASS AND DECORATION.

WINDOWS, MORLEY CHURCH.—On Easter-day a new east window was dedicated in St. Andrew's Church, Morley. The subject is taken from the "Te Deum." The window is by Messrs. Burlison & Grylls.

WINDOW, WHITLEY CHURCH, YORKSHIRE.—The Bishop of Ripon recently dedicated a window at the Church of the Ascension, Whitley, which has been erected by the parishioners to the memory of the late vicar, the Rev. William Valentine, M.A. The work has been carried out by Messrs. James Powell & Sons, of London. The window consists of five lights.

WINDOW, BABY CHURCH.—The chancel window of Baby Church, near Doncaster, has been filled with a memorial window with the Crucifixion and

figures of the Virgin and St. John, and the south window of the chancel and window near the pulpit with figures of Our Lord as "The Good Shepherd" and as "The Light of the World." They are from the studio of Mr. T. W. Cann, Smeethwick, near Birmingham.

WINDOW, EYE CHURCH.—A new stained glass memorial window has been placed in Eye Church. The subject is "Christ blessing children." The work has been executed by Mr. H. A. Hymers, of Chelsea.

FOREIGN.

FRANCE.—The monument erected by public subscription to the memory of Charlet was inaugurated last Sunday. This monument, which is the work of Alexandre Charpentier, sculptor, is erected in the Square Denfert Rochereau. It consists of a stone column surmounted by the Gallic cock in bronze, and ornamented by a medallion of Charlet, also in bronze. An old Grenadier of the First Empire leans against the column, looking at a child who kneels at the foot of the monument, and personifies a popular type constantly met with in this artist's work. The two figures are in stone.—This week the 10th annual exhibition of the "Acadellistes Français" has been inaugurated.—The destruction of the central dome in the Champs de Mars is soon to be begun.—A monument in honour of Adolphe Adam, the musical composer, is shortly to be inaugurated at Longjumeau. The monument, the work of Paul Fournier (who was also the author of the statue of Shakespeare in the Boulevard Haussmann), consists of a pedestal surmounted by a bust of Adam. A figure representing the "Postillon de Longjumeau" from Adam's well-known opera, leans against the pedestal, which is decorated with a cartouche of a palm and lyre.—From June 1 to 7 an Exhibition of Fine Arts will be held at Amiens. A similar exhibition will be held at Rouen from the 10th to the 20th.—The Government are executing some important works in the Maritime Alps for the collecting of the water in the mountainous districts. The expense of the work is estimated at 1,450,000 francs.—An electric and funicular tramway is shortly to be made between Clermont-Ferrand and the summit of Puy de Pôme.—The death of the sculptor Emile Lambert has been announced. He was a pupil of Franceschi, and author of the "Voltaire" which decorates the court of the Mairie of the IXth arrondissement. He received honourable mentions in 1883, 1885, and 1886, and the Legion of Honour in 1866.—The death of M. Claude Marie Giron, architect, in Paris, is also announced. He was born in 1862. He entered the Ecole des Beaux-Arts in 1884, after having worked with M. Paul Blondel. He received the diploma of architect in 1891.—We have heard of the sudden death of M. Gaston Hénard, architect, at the age of 54. He was the pupil of his father and of the Ecole des Beaux-Arts. During the exhibition of 1889 he filled the post of first Inspector.—The death of M. Forthgott, for the works of the Palais des Beaux-Arts and the Arts Libéraux at the Champ de Mars. He received the Cross of the Legion of Honour. He was a brother of Eugène Hénard, who is commissioned to build the Palais de l'Electricité in the 1900 Exhibition.

GERMANY.—The historical Sternthor at Bonn is to be taken down and reconstructed.—There is to be considerable alterations at the old Pfister Castle at Oppeln, which is to be turned into a block of modern offices for Government purposes.—The Bellevue street, near Berlin, has decided on the erection of a Memorial Tower in memory of the late Emperor William, and the design will be by Bauarth Schwichten. The height of the tower will be 56 metres, and it will stand on a hill known as the Karlsberg.—A large terminus station at Berlin belonging to the Stettin Railway is to be rebuilt. A large provisional station is being erected, and will be used from May 1. The building operations will spread over three years.—A Schiller Museum is to be erected at Marbach on lines not dissimilar to those of the museum in connexion with the Memorial Theatre to Shakespeare at Stratford-on-Avon. Some 100,000 marks have already been collected, or nearly 9,500l.—We understand that the archaeological research party at Worms has been making considerable progress of late in the excavation of Roman remains.

AUSTRIA.—A Memorial Church is to be erected at Vienna on the occasion of the anniversary of the Emperor's reign, and the foundation-stone has been laid with some ceremony. The cost of this memorial church will be 130,000 florins, and the spire will be 56 metres high. The architects are Messrs. Bach & Schoene.—A special committee has been appointed by the Municipality at Vienna to consider the advisability of constructing two new electric tramways, running respectively from the city to the Prater Park, and from the city to the Central Cemetery; perhaps the most important feature about this work will be its execution by a Municipal building department.

SYDNEY.—A new industry, it is stated the first large undertaking of the kind in New South Wales, is about being started in Tamworth for the malting of colonial barley. The works are being built by

essrs. Britten & Co, from designs by Messrs. Kinder & Sons, architects, London.
CALCUTTA.—We observe that the Lieutenant-governor has appointed a Committee to inquire into and report as to the necessity of a Building Act for Calcutta. The Commission will be presided over by Mr. Justice Trevelyan, and the members include Messrs. H. H. Risley, J. H. Glass, H. C. Williams, A. J. Hughes, W. Banks-Gwyther, Dr. Lyon, and Babus Kalinath Mitter and Nalin Chait Sircar.—*Capital.*

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.
 —The partnership between Mr. Samuel Walker and Mr. Ernest Runtz is dissolved, and Mr. Runtz has moved to 10, 11, and 12, Walbrook, E.C.

CLAYTON OLD HALL, NEAR MANCHESTER.—On 26th ult. a number of members of the Lancashire and Cheshire Antiquarian Society paid a visit to Clayton Old Hall, the ancient residence of Humphrey the Great, near Manchester. After the moat, the grounds, and the exterior of the old mansion had been inspected, a meeting was held indoors, when a paper was read by Mr. E. Williams on the connexion of the Chetham family with the hall and the earlier history of the place.—In the discussion which followed, Mr. R. Marsden said there secured an inclination of the part of some members of the City Council to demolish the hall, and he thought they should express an opinion on the subject.—Mr. Williams said he was a member of the Council for nine years, and he induced the Parks Committee to become the purchasers of the building and its surroundings. He believed it was their intention to buy out the land, to clear the ground and public objects, to remove the influence of the various learned societies of Manchester would be brought to bear to prevent, if possible, the destruction and removal of the hall.—Mr. Albert Nicholson moved the adoption of a resolution in which the meeting expressed the opinion that Clayton Old Hall, with its moat and bridge, should be preserved, and requested the Council to arrange for proper repairs to be carried out, and for the building to be used, if possible, as a permanent museum and picture gallery. Mr. Thomas Letherbrow seconded the resolution, and it was adopted.

THE SCOTTISH BUILDING TRADES' FEDERATION.
 —The half-yearly meeting of the Scottish Building Trades' Federation was held in Lamb's Hotel, Dundee, on the 29th ult. Mr. John Adam, Glasgow, the President, occupied the chair. Mr. James L. Selkirk, Glasgow, the Secretary and Treasurer, read the Executive's half-yearly report, in the course of which it was stated that the Committee charged with the question of the general form of contracts having, in accordance with the instructions of the annual meeting in October last, issued to each of the various local Associations for their consideration and report a copy of the draft form prepared by them, it was found that the general opinion was in favour of a shorter and more equitable form; and it was intimated to the Executive that the Dundee Association had resolved to prepare such a document, the Executive resolved to await its completion before taking any further steps in the matter.

The general working by-laws would receive the early attention of the Executive. There was urgent need for a clear and satisfactory set of rules applicable to the whole country. On the whole, the Executive considered that the progress of the Federation during the short period of its existence had been exceedingly satisfactory. Employers all over the country had come to realise more fully than ever the urgent necessity for thorough organisation, and were heartily co-operating in this important work. Other matters falling within the scope of the Federation's objects will continue to receive the best attention of the Executive.—The President, in moving the adoption of the report, remarked with regard to the general form of contract that different parts of the country had different modes of working, and consequently this matter would require careful consideration. They would try to embody the best parts of all suggestions into the general form. With regard to the reports on the state of trade, he thought it would be much better if these were made quarterly. Employers, if they needed men, could not know in what locality to go to get them.—Mr. Farquhar said they should try and remove all differences between builders and the smaller trades. They in Aberdeen were all federated, and he had urged upon his branch the desirability of having frequent interchange of opinions.—The President said there was a feeling in Glasgow that the different trades were about as big organisations as could be properly worked. Although these Associations were working independently as far as their own trades were concerned, he did not think it was from a feeling of jealousy that they were not joined together, but just from a feeling that each Association was quite big enough to work properly. He might point out that in Glasgow, having the Building Trades' Exchange, the building trades really acted in amalgamation. The Exchange included, not only members of the building trades, but also architects and measurers, manufacturers and merchants.—Mr. McGillivray, Glasgow, said the Exchange was of great benefit to all connected with the building trade in Glasgow.—Mr. D. R. Calder

Arbroath, remarked that they were met there as a Federation, and it seemed to him that Glasgow should stick to the Federation. The Building Exchange was a grand thing, no doubt, but they were desirous that the Federation should be a grander thing than the Exchange, for it was a national institution.—A draft of a general form of contract was submitted, and the clauses were gone over *seriatim*. Several alterations were made, and the matter was ultimately remitted to a Committee to further consider and bring up a report at next meeting. It was unanimously agreed, under the form to have a neutral arbiter appointed to decide any difference between architect and contractor, and to have a fixed system of settling accounts. In case of any department of work in course of execution being suspended in consequence of a strike on the part of the workmen or general lock-out connected with such department of work, it is provided that the period fixed for the completion of the work shall be extended by a further working period corresponding to the time during which the work had been delayed by the strike, and during such extended period a penalty shall not be exigible.—It was decided to hold the next meeting of the Federation in Glasgow. This was all the business, and the delegates were afterwards entertained at luncheon by the Dundee Builders' Association.

TECHNICAL EDUCATION AND THE BUILDING TRADES.—The Technical Education Board has decided to form a special sub-committee to inquire into the best method of developing technical education in connexion with the building trades. As the building trades embrace a considerable portion of the population of London, it is felt to be of special importance that all possible steps should be taken to extend the work of technical education among members of the trades, and to seek their advice and co-operation in the matter. The National Association of Operative Plasterers has shown its anxiety to work in conjunction with the Board in providing instruction for the younger members of the trade, and it is hoped that a class for plasterers at New Cross will be started before long upon the same lines as the class which has recently been inaugurated at Hammersmith. The children of members of the building trades achieve a marked success in the competition for the Board's junior county scholarships. As many as seventy-one out of the 600 scholarships awarded during last year, *ie.* 11.8 per cent, fell to the building trades; no other group of manual trades obtained more than thirty-one scholarships, or 5.2 per cent. The great majority of the parents or scholars are journeymen; this fact is due to the operation of the Board's income limit.—*Technical Education Gazette.*

EXETER CATHEDRAL.—Messrs. T. B. Worth & Co., photographers, send us specimens of the large and very fine collotypes of Exeter Cathedral, an exterior and an interior, which are among the best photographic illustrations of cathedrals that we have seen.

THE REGISTRATION OF PLUMBERS.—A deputation of representatives of the National Registration of Plumbers' movement from the principal towns of Scotland, including Edinburgh, Glasgow, Aberdeen, Dundee, Inverness, and Dumfries, waited on the Scottish members of Parliament in the House of Commons recently to urge them to use their influence to obtain the passing of the Bill for the Registration of Plumbers now before Parliament. Mr. Crawford, in introducing the deputation, said that the movement had caught on, that it was supported by public opinion and the trade, and that there was a great necessity for legislation of this kind which would enable the public to distinguish between qualified and unqualified men. Other speakers pointed out that the towns of Edinburgh and Glasgow had petitioned in favour of the Bill.

INTERNATIONAL CONGRESS ON TECHNICAL EDUCATION.—An International Congress on Technical Education will be held in London during the month of June. The Congress will be opened on June 15, and will close on Friday, June 18. The Congress has been invited by the Society of Arts to meet in this country, and the meetings will be held in the Society's large hall. The Congress will be opened at 11 a.m. on Tuesday, June 15, by an address from the President, the Duke of Devonshire, K.G., and from the President of the last Congress, M. le Professeur Leo Saignat. The subjects for discussion at the Congress will include—1. Advanced technical education, 2. Secondary technical education, 3. Advanced commercial education, 4. Secondary commercial education.

HOULEY'S ELECTRO-CHEMICAL FLUE AND STOVE CLEANER.—This is a wonderful firework, which generates a gas, charged with electricity, that decomposes the soot, destroy all combustible matter, and causes it to pass out with the draught, leaving the pipe both free and clean. All this for sixpence, and without the intervention of the sweep. The prospect is an alluring one, but, alas, the instrument proved to be a sort of large cartridge, containing a core of zinc, and a dilute sulphuric acid, crystalline mixture, in which sulphur largely predominated. When used as directed there was a good deal of fizz and splutter, but the mysterious gas "charged with electricity" ignored the soot most obstinately, and passed away, to add, doubtless, to the burdens of our ill-used atmosphere. As a sort of mild squib for use on Guy Fawkes' Day, or in the "jubilee" bonfires, the "Electro-Chemical Flue and

Stove Cleaner" may find its vocation, but it cannot be regarded as a serious means of dealing with the great soot problem.—*Chimney-sweeping as a profitable vocation has a long lease of life before it yet.*

A NEW TAP.—The Lambeth Brass and Iron Company send us a specimen of a gun metal tap containing some important improvements in regard to qualities of strength and endurance. There is a substantial square, working thread cut upon the spindle, and the cover is dropped to receive several worms of the thread when the valve is shut off, as the severe strain happens at its closing. The disc is made to revolve upon the spindle, and thus is not weakened at the connexion; and the asbestos disc is capped to prevent its spreading out and being cut through by the seating. The handle is of black buffalo-horn as a non-conductor of heat, and is attached to the spindle by a special mechanism invented by the manufacturers. The whole, except the handle, is of gun-metal, and appears to be a very strong and efficient tap. The inventors have distinguished it under the name of the "Unicus" tap.

GERMAN HORTICULTURAL BUILDINGS.—The new Botanical Gardens for Berlin are to be laid out in the suburb of Dahlem, and all the modern requirements have been most carefully considered. Some horticultural buildings which have been erected at the Botanical Gardens in Magdeburg, also call for attention, for though there is no doubt that England has long taken the lead in construction of this class of work, our neighbours, by dint of copying and improvement in detail, are making rapid progress. Magdeburg buildings are the subject of an illustrated article in the *Zeitschrift für Bauesen*, and from the particulars we observe that over 10,000,000 were expended on the block, which is very cleverly planned and picturesquely laid out. The Palm-house is the most important, and occupies the central position, and on either side there is a gallery for ferneries. There are separate wings for the different classes of flowers, each of which is kept in a separate gallery. Messrs. Peters & Jansen, of the Municipal Building Department, were the architects. At Berlin, besides the gardens and the new hothouses, there is to be a Botanical School and accommodation for a Pharmaceutical Institute, with 240 students. The public hothouses alone will cost 75,000, and the Botanical Museum 40,000. The principal hothouses will be divided into fourteen sections, covering a superficial area of nearly 6,000 square metres, while some special houses for purposes of scientific research will cover 1,700 square metres.

CAPITAL AND LABOUR.

THE LONDON BUILDING TRADE.—The Central Association of Master Builders of London on Tuesday received at their offices in Bedford-street, Strand, a deputation of representatives of the various societies of labourers when the questions of wages and a new code of working rules were discussed. It was agreed, it is stated, that from June 1 next the wages of labourers should be increased by 1/2d. per hour, and that the new code of working rules should come into operation from the same date.

STRIKE OF CARPENTERS AT DUDLEY.—A meeting of the carpenters and joiners on strike in Dudley and district was held recently at the Windmill Inn, Stafford-street. It was stated by the various speakers that the members of the Dudley Branch of the Amalgamated Society of Carpenters and Joiners gave three months' notice for an advance in wages of 1d. per hour, but the concession was not granted by the employers, and a strike was commenced on April 5. Prior to the decision to come out on strike the employers offered to advance the pay from 7d. to 7 1/2d. per hour, and eventually the men's deputation agreed to compromise the matter at 7 3/4d. to come into operation at once, but the masters declined to exceed their previous offer. Advances had taken place all round the district, the Wolverhampton rate now being 8 1/2d., West Bromwich 8 1/2d., Walsall 8 1/2d. It was suggested that pickets should be appointed to watch the works and the railway station. A resolution was unanimously carried to the effect that they still adhered to their demands of 8d. per day and the adoption of a new code of rules.

STRIKE OF BUILDERS' LABOURERS, WINCHESTER.—The strike of builders' labourers which took place recently has been settled, the men resuming work after receiving 1/2d. per hour advance.

STONEMASONS' WAGES, LANCASTER.—At a conference between master builders and representatives of the stonemasons at Lancaster it was decided to grant the latter an increase of wages at the rate of 1/2d. per hour. Some other concessions were granted. The employers gave notice of their demand six months ago.

LEGAL.

A DISTRICT COUNCIL AND ITS BY-LAWS.

IN the Queen's Bench Division, on the 1st inst., Mr. Justice Wright and Mr. Justice Bruce, sitting as a Divisional Court, had before them the case of the Wetherby District Council v. Hewling.

Mr. Scott Fox and Mr. Hobson appeared as counsel for the District Council, and Mr. Compton for Mr. Hewling.

Mr. Compton said that the case came before their Lordships on January 12 last upon a case stated by Magistrates, arising out of an information for the

alleged laying out of a new street within the district of the Wetherby District Council and contrary to its by-laws. The Court sent the case back to the Magistrates, directing that only so much of the information was retained as alleged the laying out of a new street. They further said that the Justices were bound by a former conviction if, after hearing counsel, they thought that former conviction involved the decision that this was the laying out of a new street, but if the former decision did not bind them the question was whether under all the circumstances of the case they thought, as a matter of fact, that the respondent when he began to execute a building plan which would, when finished, constitute the road a street. The matter again went before the Magistrates on February 4, both parties being represented by counsel, and after a very long hearing the Justices found that the former conviction did not involve the finding that this was a new street, and they saw no reason to alter their previous decision that it was not a new street. The learned counsel therefore asked that the appeal of the District Council should be dismissed with the usual costs. Mr. Scott Fox said that at the end of a long hearing the Magistrates expressly said they made no order as to costs. It was obvious that the case was one of complication in which the original hearing was not satisfactory, and it was necessary that there should be further investigation. He therefore asked, under the circumstances, that no order should be given against the District Council.

Mr. Justice Wright: We think the respondent is entitled to have the appeal dismissed with costs, but that he ought to have no costs of the rehearing below. Order accordingly.

ACTION BY CONTRACTORS IN THE QUEEN'S BENCH DIVISION.

THE case of Jones v. the Earl's Court Arcade, Limited, came before Mr. Justice Grantham and a common jury on the 20th ult., it being an action by Messrs. Walter Jones & Sons, engineers and contractors at Bow, to recover from the defendants 265l. 17s. 6d., the balance alleged to be due in respect of the building of a bridge at Earl's Court. The defendants, by their pleadings, admitted the claim to the extent of 137l. 48s., but they counter-claimed for 600l. penalties incurred in consequence of six weeks' delay in completing the work contracted for. Mr. Robson, Q.C., and Mr. Lynden Bell were

counsel for the plaintiffs, and Mr. Bucknill, Q.C., and Mr. Acland for the defendants.

The plaintiffs' case was that in November, 1895, Mr. Inure Kirairy wished a bridge to be constructed at Earl's Court, and asked the plaintiffs if they would tender for it. The bridge was to cross the Midland Railway Company's line, and it was to connect the Western Gardens with the Imperial Gardens. The plaintiffs were willing to do this; the price was to be 3,400l., and the work was to be completed by April 15, 1896. Owing to a variety of things the contract was not signed by the defendants until February 6, 1896, and then it transpired that the plans for the bridge were not accurate, and the bridge had to be altered in various ways, it being lengthened to the extent of 10ft. 10in. The plaintiffs did not get the amended plans of defendant's engineer until February 18, and the last tracings were not supplied until the 21st. Then, again, there was delay in the defendants' getting permission from the Midland Railway Company to cross their line, so that the plaintiffs could not commence work on the bridge until February 24, 1896. Subsequently to this the defendants required various alterations to be made in the construction of the bridge, and the plaintiffs contended that those various circumstances relieved them from the penalties imposed by the contract for delay in the completion of the work. It was added that what had happened rendered it impossible to complete the bridge in time, though the plaintiffs did their utmost to attain that object.

After hearing the evidence the learned Judge intimated that in his opinion the defendants could not recover in respect of the penalties.

A verdict was entered for the plaintiffs for 210l. and also for the plaintiffs upon a counter-claim for 280l. in respect of loss of rent for shops upon the bridge.

Judgment accordingly.

MEETINGS.

- FRIDAY, MAY 7. Institution of Junior Engineers.—Mr. L. G. Ferreira on "Electrical Railway Signalling." 8 p.m. SATURDAY, MAY 8. Royal Institution.—The Rev. J. P. Mahaffy on "The Greek Theatre according to Recent Discoveries."—II. 3 p.m. Edinburgh Architectural Association.—Visit to Hopewell House Policies.

MONDAY, MAY 10.

- Society of Arts (Cantor Lectures).—Mr. Lewis F. Day on "Design in Lettering."—II. 8 p.m. Surveyor's Institute.—Discussion on Mr. J. H. Redman's paper entitled "Some Legal Incidents of Tenancies of Urban Property, as Illustrated by Recent Decisions." 8 p.m.

TUESDAY, MAY 11.

- Society of Arts (Applied Art Section).—Mr. G. Clulow on "A Half Century of Line Engraving, 1820-1820." 8 p.m.

WEDNESDAY, MAY 12.

- Institute of Builders.—Annual Dinner, to be held at the "Troadero," Piccadilly Circus, W. 6 p.m. Carpenters' Company Lectures (Carpenters' Hall, London Wall).—Lectures on Carpentry and Joinery. RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

- 7,295.—DRAIN TESTS: J. W. Conding.—This invention consists in a tubular vessel of metal, glass, &c., closed at end by metal discs and a ball of indiarubber, drawn together by string, fitted with external spring of indiarubber, &c., said constituents being held in position by wire, and hermetically sealed in tinfall or other substance. Invention to be used thus:—Unwind string and lay vessel in trap, lay back the tin or wire, holding string while pouring pan of water into trap, which passes vessel into drain, when seal is broken and contents evacuated. 17,229.—SCREW ADAPTED FOR STONE, BRICKS, &c.: H. Schwartzenhauer.—In order to produce a screw which shall screw into stone, brick, &c., as readily as into wood, inventor provides on a screw bolt, as in the ordinary wood

deep threads, the ribs of which are of prismatic sec-
On the ribs are formed, by means of which the
edges are produced. At place where screw is to be
a hole is drilled, preferably with a stone drill,
screw is introduced into this it cuts its way.

BRIDGES FOR USE IN CORNERS, ANGLES,
By M. H. T. This invention consists in a brace,
a V-gulde, substantially right-angled, and mechanism
therein for driving a bit so arranged that the
of the handle may turn in a corner without
the face of the blade surface is used.

MATERIALS FOR FLOORS, PLASTERING, CELL-
WALLS, &c. O. K. VANNER—This invention consists
in the composition of a material called by inventor "Pep-
Pep" the composition of which is a general rule—1
part of chloride of magnesium, 20 per cent. paper or
residue, and 30 per cent. water. In the mixing, a
quantity of chloride of magnesium is placed in a
of oil and diluted with water after which solution is
with the paper or asbestos lathing.

DOOR HINGES: H. THUER—In order to insure
oil and permit lifting of the door, inventors
hinge hangers into two portions, and provides an
point of junction.

GLAZED BRICKS: W. D. CHIFF—Invention
consists in (a) glazed bricks, characterized by having, in
to the glaze on the face, a glaze about 1/2 in. to
to wide on the edges or sides of the bricks, and ends
the glazed face; and (b) in the manufacture: the
the first glazing, the face of the brick is colouring
then scraping body of adjoining edge, and after
ing face of brick for about 1/2 in. to 3/4 in. below
of the glaze bath, so as to leave a coating on sides
of the brick.

DOOR HINGES OR STOPS: E. A. HAUSER—
invention consists in the combination of a semicircular
a trough, a spiral spring, and a buffer of india-
rubber. The hinge, because of its weight, remains
ive under tension, located at a dead centre. But
the trough be depressed by a foot or other means,
spring immediately asserts itself, and brings the rubber
stiff the floor of the room.

C. & C. Berrell 1,255

LONDON.—For alterations to No. 6, Warwick-street, Belgravia,
S.W. 8, for Mr. A. J. Palmer. Mr. A. Howard, surveyor, The Outer
Temple, Strand.—

Coleman Johnson & Co. £295
L. E. Smith 275

LONDON.—For erecting the Grand Jubilee Pavilion in St. Paul's
Churchyard, for Mr. S. N. Maskelyne. Mr. J. G. Buckle, architect,
Quantities supplied—

Coleman Johnson & Co. £4,023
W. G. Minter 3,881

LONDON.—Accepted for the erection of lavatories at Albion House, 325, City-road, for the Central Finsbury Liberal and Radical Club. J. Milton, Brixton.....£103 8

MALDON (Essex).—For the erection of two pairs of cottages, Heybridge Basin, for Mr. Cusney. Mr. P. M. Beaumont, architect, Maldon.— £200 Thomas Widding, Maldon* £200 Ernest West..... £200 * Accepted for one pair of cottages for £200.

MIDDLESBROUGH.—For additions, &c., to shop premises, Albert-road, for Mr. Holness. Mr. W. G. Roberts, architect, 61, Albert-road, Middlesbrough:—

Table with columns for contractor names and amounts. Includes entries for Hudson Bros., Perks & Son, Allison Bros., Baker Bros., Lambert & Son, and Walton & Gartwalte.

PENRITH.—For the construction of sewerage works, Threlfold, for the Rural District Council of Penrith. Mr. C. A. Sandford Fawcett, engineer, 1, Victoria-street, Westminster:— J. Graham, Lazonby, N.S.O., Cumberland.....£487

PLYMOUTH.—For re-building the "North Ark," Inn, Salish-street, Mr. B. F. Shires, architect, Central Exchange, Plymouth:— Jno. Goad & Co.....£2,800 Andrews.....£4,100 Laphone & Co.....£4,700 Blake.....£4,980 Trevena.....£4,241 Kerwill.....£3,985 Palmer.....£4,120 Cole, A. N., Stonehouse* £3,795 * Freeman accepted. £500 Extra decorative work.....£500

PURLEY.—For the erection of a detached villa residence and billiard-room at Purley, Messrs. Dale & Gaddson, architects, 8, Union-court, Old Broad-street, E.C.4.— Cultit & Co.....£5,850 Marriage.....£5,975 Hoare & Sons.....£5,334 Walls.....£4,925 West.....£5,334 Bullock & Co.....£4,884 * Accepted.

REDRUTH.—For the erection of Laboratory, &c., for the Committee of the Science and Art Schools, Mr. S. Hill, architect, Redruth:—

Table with columns for contractor names and amounts. Includes entries for W. H. Gray, R. Jacob, E. Salter, J. Roberts, and T. Willoughby.

REDRUTH.—For the erection of the first section of the Infirmary buildings at the workhouse, for the Union Guardians. Mr. Sampson Hill, architect, Redruth. Quantities by architect:— Moyle & Mitchell.....£2,847 0 0 Ope & Hodge, Red. Jno. Odgers.....£2,924 0 0 sub (accepted) £2,656 0 0 A. Cusick.....£2,793 0 0 White & Thomas.....£2,598 0 0 Ope & Roberts.....£2,598 0 0 Crowan (withdrawn) 2,456 rs 8 [Architect's estimate, £2,600]

STONEHOUSE (Plymouth).—Accepted for housing seven 30-gallon spout vats and twelve 50-gallon spout vats, wine bins, office, &c., at the West India House. Mr. B. Prestley Shires, architect, Central Exchange, Plymouth:— Jno. Goad & Co., Plymouth.....£146

STRATFORD.—For new business premises, Stratford Broadway, for Mr. G. H. Leavey. Mr. George E. Bond, architect, Redcote:— Fearnley & Farrow.....£3,168 C. E. Skinner.....£5,950 Perry & Co.....£2,207 H. L. Holloway, Deptford* 6,950 * Accepted.

TUNBRIDGE WELLS.—For the erection of swimming and slipper baths, for the Corporation. Mr. T. E. W. Mellor, C.E., Town Hall, Tunbridge Wells. Quantities by Mr. G. Norroo, Tunbridge Wells:— Davis & Leamy.....£2,447 Longley & Co., Crawley* 7,985 Award.....£2,625 * Accepted.

C. B. N. SNEWIN MAHOAGANY, WAINSCOT, WALNUT, TEAK, VENEER, and TIMBER MERCHANT, Nos. 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, & 17, BACK HILL, HATTON GARDEN, and 25, BAY STREET, FARRINGTON ROAD, E.C. THE LARGEST STOCK OF ALL KINDS OF WOODS IN EVERY THICKNESS, DRY, AND FIT FOR IMMEDIATE USE. Telephone, 65, 274 Holborn. Tele. Address: "SNEWIN," London.

SWILLAND near IPSWICH.—Accepted for rebuilding the tower, Swilland Church. Mr. J. S. Corder, architect, Tower-street, Ipswich:— English, Coddanham.....£270

TONBRIDGE (Kent).—For the execution of street works, Barden and North-cote-roads, &c., for the Urban District Council. Mr. W. L. Bradley, engineer, 83, High-street, Tonbridge:—

Table with columns for contractor names and amounts. Includes entries for R. Langridge, C. Brothwood, and R. Langridge.

WAKEFIELD.—For the erection of dwelling house, Stanley road, for Mr. David Stephenson, Jun. Mr. W. Wildge, architect, 10, Wood-street, Wakefield. Quantities by architect:— Westgate Common, Wakefield.....£175 0 0 Slating—J. Hingworth, Bank-street.....17 17 6 Plastering—T. C. Fattersall, Trinity Church Gates.....23 14 8 Tiling—J. Lacey, Eastmoor, Wakefield.....72 17 0 Plumbing and Gasfitting—F. E. Mosley, Northgate.....47 0 0 Painting—B. Hayner & Son, Southgate.....5 0 0 £241 9 2

WITHAM (Essex).—For the erection of an infirmary at South Metropolitan District School, for the managers. Mr. F. Whitmore, architect, Chelmsford. Quantities by Mr. J. L. Parmenter, Ipswich:— Everett & Son.....£3,975 Geo. Gilwood & Sons.....£3,737 Sims Parmenter.....3,974 Frost West, Chelms. Robt. Gilling.....3,842 Ford* 3,700 J. B. Smith & Sons.....3,792 * Accepted.

TO CORRESPONDENTS. C. & C. B. E.—T. V. (We cannot publish lists of tenders unless amounts are stated, or the work is carried out in a schedule of prices). G. & K. (Amounts should have been stated). NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications beyond the limit which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses. Any communication to write an article is given subject to the approval of the article, when written by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

W. H. Lascelles & Co., 121, BUNHILL ROW, LONDON, E.C. Telephone No. 270. HIGH-CLASS JOINERY, LASCELLES' CONCRETE Architects' Designs are carried out with the greatest care. CONSERVATORIES, GREENHOUSES, WOODEN BUILDINGS, Bank, Office, & Shop Fittings. CHURCH BENCHES & PULPITS. ESTIMATES GIVEN ON APPLICATION.

TERMS OF SUBSCRIPTION. "THE BUILDER" (Published Weekly) is supplied DIRECT to the Office to residents in any part of the United Kingdom, at a rate of 9s. per annum PREPAID. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, &c., 25s. per annum Remittances payable to DOUGLAS FOURDRINER should be addressed to the publisher of "THE BUILDER," No. 46, Cannon-street, W.C.

SUBSCRIBERS IN LONDON and the SUBURBS, prepaying at the Publishing Office, 9s. per annum (4s. 9d. per quarter), can ensure receiving "The Builder" by Friday Morning's Post.

THE BATH STONE FIRMS, Ltd. BATH. FOR ALL THE PROVED KINDS OF BATH STONE. FLUATE, for Hardening, Waterproofing, and Preserving Building Materials.

HAM HILL STONE. DOULTING STONE. The Ham Hill and Douling Stone Co. (Incorporating The Ham Hill Stone Co. and C. Trask & Son The Douling Stone Co.) Chief Office:—Norton, Stoke-under-Ham, Somerset. London Agent:—Mr. E. A. Williams, 16, Craven-street, Strand.

Asphalte.—The Szeysell and Metallic Lvs Asphaltic Company (Mr. H. Glenn), Office, 41, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floor, flat roofs, stables, cow-sheds and milk-room granaries, tan-rooms, and terraces. The Workmen's Compensation Bill.

E have already briefly noted the cardinal principle of this Bill, but we must revert to it again before considering some of its more important details. What is the leading principle of English law by reason of which one man is entitled to recover damages from another if the former has been injured? It is that the person who has caused the injury has been guilty of some act of negligence: in other words, a man is not liable to pay damages in respect of what is popularly called an "accident," that is to say, an injury not caused by negligence. In the first instance this principle was confined within narrow limits: it has since been extended so that if the servant of A is guilty of a negligent act, A has to pay damages. What has been a constant defence to such actions for personal injuries is, that the injured person has been guilty of "contributory negligence"; that is to say, has himself helped, so to speak, to bring about the act causing the injury. Another well-known defence has also been recognised, that the injury was caused by the act of a fellow servant, and that, consequently, by reason of what is known as the doctrine of "common employment," the injured person could not recover damages from his employer. There is said to be an implied understanding, which is a pure legal fiction, that when a workman enters on some kind of employment, he takes the risk of injury from his fellow workmen. It is this legal doctrine which has for some time past been in a tottering state.

What is the change of principle to be produced by the Bill recently introduced by the Home Secretary? It is that an employer is to be liable for all injuries received by a workman in the course of his work, whether these injuries have been caused with or without negligence on the part of the person who has caused them, and with or without contributory negligence on the part of the workman. If this Bill becomes law a workman will not in the future have to show that there is evidence of negligence, he will simply have to show that he has been injured. This is

a most important change, and one exceedingly favourable to the working classes. Nor do we think that the extension of the employer's liability to cases of pure accident is likely to be injurious to masters. The doctrine of "common employment" was doomed. It will add but little to the employer's financial liability if he has also to pay compensation for pure accident. It is the public who is really the body upon whom the cost of these liabilities falls. Any extra expense in the nature of insurance premiums which an employer may have to pay, whether he insures with a third party or whether he has an insurance fund of his own, must ultimately be borne by the public, that is by the buyer, in the shape of some increased cost in the article or work done.

On the other hand, a great mass of litigation, necessarily on the whole costly, both to employer and workman, has been caused by the necessity of proving negligence in order to obtain compensation. This litigation will now be unnecessary, and in the aggregate the saving of legal costs will go far to pay insurance premiums. It has been said that the Bill does not touch the doctrine of common employment. It does not in so many words, but when it makes an employer liable for any injury caused to a workman, it abolishes it in principle.

But it must be borne in mind that the action of this Bill is confined to certain trades. It is only a limited Bill, it applies "only to employment on, in, or about a railway, factory, mine, quarry, or engineering work." To the readers of the *Builder*, the words "engineering work" are of the utmost importance—what is their definition? It is to be found in Sec. 2, Sub-Sec. 2. It "means any work of construction of a railroad, harbour, dock, canal, or sewer, and includes any building or other work in which machinery driven by steam, water, or other mechanical power is used for the purpose of the construction thereof." It is obvious that this definition must give rise to considerable debate in Parliament, and we think it will have to be made wider. For example, as it at present stands it would appear that if a house is being built and a steam crane is used for raising materials, a workman employed on the spot would be within the Act; if, on the other hand, there is no steam crane, but one worked by manual power, then the workman will not be within the Act. Is it statesmanlike to bring in a

measure which is, in this respect, so obviously one which cannot be at all a final measure, and in regard to which there will be continual agitation? We do not believe it is. If there is to be this wide change in the law, it should be made applicable to all trades in which there is the smallest risk—as shown by experience—to life or limb.

It is next desirable to refer to the question of compensation. In the first place it is to be noted that an employer is not to be liable unless a workman is disabled for at least two weeks from earning full wages. If he has satisfied this condition, then he becomes entitled to a weekly payment during incapacity, not exceeding 50 per cent. of his weekly earnings, such weekly payment not to exceed 1*l*. In other words, the workman receives not a lump sum as is now the case, but a weekly pension. There is a good deal to be said on this point. One objection to it appears to be that it may cause in the aggregate a considerable trouble to employers in case of removal, illness, and so forth, and we are inclined to think that it might be desirable to add some machinery for capitalising these weekly sums, under proper safeguards. The question also arises whether the Bill refers sufficiently clearly to cases where a man may be so injured as to be unable to follow his ordinary occupation, but is yet capable of earning a small weekly wage. For the words of the Bill are "in case of incapacity for work," a phrase which appears to refer only to total incapacity. If the amount of the pension cannot be agreed upon between the employer and workman, then it must be referred to arbitration.

We must now come to the case of the death of a workman; if he leaves dependents the amount of compensation shall be "a sum equal to the earnings during the three years next preceding the injury, or the sum of 150*l*., whichever of those sums is the larger, but not exceeding in any case 300*l*." We fail to see any reason for the introduction of the sum of 150*l*. The aggregate of three years' wages seems a reasonable solution of the point, and if this sum does not reach 150*l*., why increase it to this amount? If, however, a workman leaves no dependents, all that the employer has to pay is "the reasonable expenses of his medical attendance and burial, not exceeding 10*l*." No Bill or Act is ever without ambiguity, and it is doubtful, according to the phraseology, whether the 10*l*. is limited to the expenses

of burial only. We presume that is the intention. The particular sub-section appears to suggest that all employers should be anxious to have unmarried workmen, especially if they are also orphans. But it is not—as it stands—quite a satisfactory section. If a man dies after lying ill for three weeks, is nothing to be paid for nursing and lodging, or is he to receive his £1 a week in respect of this time? More clearness is required on this point.

It is sufficient to add to what has already been said in regard to this question of compensation, that there is to be no litigation in the ordinary sense. Differences are to be referred to a committee of employers and workmen, if such committee exists capable of settling such disputes. If either party objects or there is no such committee, the parties may agree on a single arbitrator, and in default of such agreement the case may be settled by a County Court Judge or by a person nominated by him. Here, again, the question arises whether expense and delay would not be saved if a local arbitrator for particular trades were appointed for special districts by each County Court Judge.

We have, in conclusion, only to remark that a workman may contract himself out of this Act if the Registrar of Friendly Societies certifies that the scheme of compensation agreed on by the master and workmen is not less favourable to the workmen than that under the provisions of the Act, which, it may be well to add, does not take away the injured workman's legal right to bring an action in case of negligence against an employer, though he may not proceed both under the Act and in the Law Courts. But if workmen are to be given in the future the great advantage of compensation for all injuries, whether caused by negligence or not, should they be allowed to harass masters by actions in the Law Courts? If this Act is passed in its present form a workman may, in the case of an injury caused without negligence, obtain compensation under the Act. He may, on another occasion, if he again receives an injury, but this time through the negligence, say, of his employer's foreman, sue his master in a law court. It would be to the advantage of all parties to take away the workman's right to proceed to litigation in return for the benefit of compensation for accident without negligence, and where he himself has contributed, by his own want of care, to the injury.

PICTURES AT THE PARIS SALONS.

As has been before observed in our columns, this is the last year that the Old Salon will be held in the building which it has occupied for so many years; and as a portion of the Palais de l'Industrie is already in process of demolition, the exhibition this year, the pictorial portion of it at least, is confined within narrower limits than before, and the number of pictures proportionately reduced. One might have expected to find, accordingly, that the standard of work would be proportionately higher than usual, but unfortunately the reverse is the case; as far as paintings are concerned it is the worst Salon for a good many years back, and this appears to be the general opinion in Paris itself. One hardly knows what French painting is coming to, when one contemplates not only the number of commonplace paintings which, though respectably good, are of little in-

terest, but also the alarming number of those which are positively bad and vulgar, and which one wonders that any jury of artists could consent to hang. The New Salon is better; the proportion of interesting works is larger, and there is nothing so violently bad as some of those at the Old Salon; but the sad reflection of Parisian critics is that so many of the best pictures there are by foreign artists.

Still, among the best pictures of the year we do find something beyond what we can see in England. Such figure painting as we see in M. Gervais' "Titania and Bottom," such a combination of learned drawing and splendid colouring of the nude figure, is not to be found out of France at present. The drawback to it is that it is entirely out of keeping with the feeling of Shakspeare's poetic play; the figures are not fairies, the scene in no way belongs to the Midsummer Night's Dream; it is the perfection of execution without the imaginative faculty. On the other hand, M. Henri Martin, in "Vers l'Abime," has carried his fancy past the region of the imaginative into that of the grotesque: a motley crowd of scraggy-looking figures, all mixed up in a kind of "hash" together, stumble and slide down a bare desert hill after a sinister figure in diaphanous black drapery who probably personifies Vice, and in that light is a striking conception enough, but the effect of the whole is rather ludicrous than impressive, and for M. Martin the picture is on the whole a catastrophe.

Among the figure pictures which are completely successful in action, drawing, and composition nothing takes a higher place than M^{me}. Demont-Breton's "A l'Eau," a sturdy half-clad peasant woman carrying one child and dragging along another resisting urchin by the hand towards the sea-margin; a painting of truly masculine power and energy, totally without sentiment, which impresses one at once both with its power of drawing and of the representation of action, and the consummate skill shown in the composition of the group. After Rosa Bonheur, M^{me}. Demont-Breton is certainly the first lady artist of the day, and in fact cannot be grouped with lady artists; she takes her place quite irrespective of any question of sex. There is in fact far more of feminine character in M. Bouguereau's sentimental picture entitled "Compassion," a figure of Christ on the Cross grouped with another figure of a man who places his head with an expression of love and sympathy against the body of the crucified figure; there is a good deal of pathos in the head, but somehow the picture strikes one as theatrical in conception and not prompted by genuine feeling; it draws a great deal of attention from the crowd, which is probably the kind of success which the painter aimed at.

As usual, decorative paintings on a large scale are tolerably frequent, and remind one of the great advantages which French artists enjoy in living under a Government which gives them commissions and opportunities of this kind. But we do not find any such striking works in this category as we have seen in some previous years. Curiously enough, by far the most successful is in the shape of that usually doubtful kind of production a decorative landscape, "Le Lauraguais," by M. Jean Paul Laurens. This is a remarkable painting of a hilly undulating pastoral landscape, with oxen ploughing near

the foreground; it may be called "decorative" only in the sense that it is painted in a rather hard conventional manner, with little attempt at atmospheric effect, and one result of this is that the middle distance hill, rising like a great billow in the middle of the picture, does not seem to recede sufficiently from the foreground, and has too flat and upright effect; but for all that there is a grandeur of style and design about the work which takes it quite out of the ordinary category of decorative landscape, and it is one of the most powerful things of the year, and we may again observe, one of a kind of paintings which are not to be had in this country. M. Arus has attempted a decorative view of a town, an immense long canvas, only decorative in the sense of presenting a flat fresco-like style in light colours; it is a panoramic view of the town of Alfortville, and is intended to decorate the Mairie of the same place; but what is the value, in any sense, of a flat imitation on the walls of the Mairie of the town which can be seen outside, it is difficult to understand. Among the figure pictures intended as decoration the largest and most ambitious is M. Ehrmann's "La Renaissance," intended for execution as a tapestry at the Gobelins, for the decoration of the Salle de Mazarin at the Bibliothèque Nationale; a "robustious" kind of work with a number of portrait figures of Renaissance artists in the foreground, and some stout and solid allegorical female figures enthroned or floating in the rear; the Château of Chambord appears on the right of the composition. Its destination as a cartoon for tapestry may account for a rather forced scheme of colour, and no doubt it would look better in tapestry than in painting, but it is on the whole a huge piece of commonplace. M. Marioton exhibits a ceiling painting, "L'Art Évoquant la Beauté," one of the ceiling pictures with an upward perspective: "Art" bestriding a white horse seen foreshortened and with its heels kicking out of the picture; but it has the merit of being a real ceiling painting, and would look better in its proper position than it does on the wall. One requirement in a ceiling picture is that it should not have any distinctly "this-side-up" quality in the composition, otherwise the spectator is puzzled as to how to look at it; hence floating or flying figures are more in place than standing ones; this at least M. Marioton clearly recognises. M. Roussel's "Maternité," a picture for the decoration of the Salle de Mariage of the Mairie at Charenton, is a pretty and pleasing family group with a decorative border of ornament.

As usual, the Salon includes a certain proportion of those large ceremonial pictures which are commissioned by the Government as records of important events or ceremonies. M. Detaille has been laid hold of for one of these works, the funeral ceremony of Pasteur, with the President in the centre receiving the cortège, and he has made as much of it, perhaps, as can well be made of such a subject. M. Béroud has a large work representing the visit of the Russian Emperor to Napoleon's tomb in the Invalides, which, if not "commandé," is evidently a bid for a State order; and M. Brouillet has painted the scene of the reception of the same monarch at the French Academy, which is interesting for the portraits it includes, and also as showing the interior of a rather celebrated

room. But these are rather works of business than art.

M. Gerôme has not added to his great reputation much by his picture of Christ's entry into Jerusalem, a scene without the walls of the city, showing a crowd coming out to meet the Saviour, and the path laid with clothes and branches as described in the Bible. It gives the old subject from a new point of view, perhaps, a new *mise-en-scène* one may say, but after all the most striking figures in the picture are the white ass and the foal, and one has rather the idea that it was painted for the sake of these. His other picture is also a Biblical one, the "Flight into Egypt," a moonlight scene in the desert, with the well-known group limply discerned in the foreground. M. Bonnat's principal work is a painting, rather hard, of an eagle preying on a hare; it is not an interesting work. M. Raphaël Collin again is disappointing, his "Biblis" being a very ordinary small nude study.

The State, in its purchases, seems to lean towards subject pictures, or, if landscapes, those of the topographical order, giving an accurate representation of some foreign place. Among the figure pictures officially purchased is a rather interesting and unusual one by M. Buland, "Devant les Reliques," showing a family of bourgeois persons kneeling with an expression of unintelligent but sincere devotion before an altar with a reliquary on it; there is a good deal of character in this, which is an odd picture to see purchased by a Government so little religious, or so anti-religious, as that of France at present; still more oddly, another State purchase is M. Henri Royer's "Communiantes." Is this a policy of conciliating the Church? Among other figure subjects M. Henner sends the eternal half-length woman with sad eyes, rusty hair, and red drapery; and the late M. Benner is represented by one of his nymph pictures, "Sous les Ombres"; not one of his best. Mr. Harcourt's picture of the leper's wife insisting on accompanying her husband in his exile, which was exhibited in London either at the Academy or the New Gallery, we forget which, is here, and holds its place very well by the side of many French subject pictures that seem more sensational but less sincere.

The portrait of the year is the large one by M. Benjamin-Constant of the Duc d'Aumale seated on a bench in a park amid warmly-lighted foliage, a portrait rather melancholy in itself, and which has become more so from the recent circumstances of the unexpected death of the subject of it. There seems something unsatisfactory in the pose of the head, but in the main it is a fine picture and worthy of the painter. Generally speaking, portraits are not very strong this year. M. Glaise has a half-length of M. Saint-Saëns, hard, realistic, and effective in a way, but not conveying any expression of genius. M. Bonnat exhibits a forcibly painted realistic head of a well-known member of the French Academy, whose physiognomy is certainly the reverse of attractive. Two portraits of ladies by M. Baschet are exceedingly pretty—that is the word. M. Lefebvre's portrait of the "Comte B. de C—" is a costume portrait of the first force, showing the gentleman in a long frockcoat and furred overcoat, standing in a super-magnificent attitude, with an ornamental walking-cane in his hand; the same artist has a very highly-finished portrait of a lady in a splendid costume; but in

each case the head is hardly painted and deficient in the appearance of life. One of the more pleasing portraits is a rather *déjà-gé* one by M. Amas of a young man seated sideways before an easel; the hands very carefully studied. M. Benjamin-Constant has another portrait, that of M. Chauchard, a strongly painted realistic work with a curious treatment of the profuse grey beard which is not satisfactory. There are other portraits, of ladies chiefly, of considerable merit and interest, but hardly to be called remarkable.

In pure landscape painting there is hardly any work so noticeable as the decorative landscape by M. Laurens before referred to; there are however a certain number of good landscapes, and a few of special excellence. M. Harpignies has nothing so remarkable or ambitious as his great landscape on the Loire last year (which however was very dead in colour in spite of its grand design), but one of his two small landscapes, "Solitude," has a grand quality both of design and colour, and somehow looks like an "old master." The landscape with most individuality and most carefully worked out is M. Quignon's "Pommiers en Fleurs," one of those foreground landscapes in which he excels, most simple in subject, a mere lane and trees between two fields, but quite perfect as a representation of nature; all the detail fully indicated without losing breadth. Another with the same kind of merit in a lesser degree is M. Armand Guéry's "Les Coquelicots," a flat meadow with a gay foreground of poppies, and little bit of distance. With the exception of Harpignies, the French seem to be strongest in landscapes the less subject they have; when they get a fine scene with water and hills they seem, in the Salon examples at least, to trust more to the quality of the scene itself than the treatment of it. Mr. Smith-Lewis, a native of the United States and now a painter more French, so to speak, than a Frenchman, has one of his huge pictures of cattle, life size, driven into a pool by a Brittany peasant woman; this is really a capital cattle picture, but it is impossible to imagine who buys pictures of such subjects on this immense scale. Sea painting is no better than usual; one or two of the *marines* exhibited are perfectly ridiculous; and even M. Tattegrain, a painter of exceptional ability and who can paint smooth seas very well, fails in his large and ambitious picture "Sauvetage en plein mer;" he has got the look of the movement and run of the sea before a gale, but not the forms of sea waves; the whole thing is unreal.

There are, as usual, some first-rate still life pictures, a branch of art in which the French surpass every one else. One of the most notable is a figure picture in which the interest nevertheless is mainly in the realistic painting of the accessories, "La Ménagère," by M. Joseph Bail, a woman in a red bodice filling pickle jars; it is much too large, but in the brilliancy of execution of detail it is almost like an old Dutch picture magnified.

Passing over the sculpture for the present, and turning to the New Salon, we first have to lament the absence of M. Puvis de Chavannes, whose grand decorative pictures have been features in this Salon ever since it was started. Other decorative paintings there are, but not of this calibre. In the staircase hall hangs M. Victor Prouvé's "La Vie," for the staircase of the Mairie at Issy-les-Moulineaux, a long landscape with a group of lovers and dancing peasant girls

on the right, the story continued through the family group in the centre to that where the lovers appear as grand-parents on the left; the colour is warm though subdued; the picture decorative in effect but with human interest. Similar efforts at decorative painting of real life are to be found in the gallery, but they are not successful in proportion to the space they occupy. In the way of allegorical decoration M. Dubufe has a large picture for the Sorbonne Library, with the motto "Et Scientia quoque poesis erit," with the usual people seated on clouds, but it is not very attractive, and moreover is unintelligible without the explanation appended. M. Lerolle's "Douce Journée" is a satisfactory and very pleasing effort at decorative landscape, with a definite attempt at combining artificial line with natural effect; the landscape, with its dark purple hills, lake, and lawn foreground, running mainly into horizontal lines, the tall tree stems forming vertical lines cutting across them, except in the centre, where a little open space is partially emphasised by the three seated figures on grass. Though not powerful, this is a work that is successful in its aim and pleasant to the eye. M. Gervex contributes the largest painting in the exhibition, another of those "Commandé par l'État," showing the distribution of awards at the Paris Exhibition of 1889; an illustration that comes rather late in the day, but which no doubt occupied a long time in painting, if only from the mere labour of covering such an expanse of canvas. It is reasonable enough that a Government should employ its leading artists to commemorate important events in this manner; but, as before observed, this is business and not pleasure, either to the spectator or (one may suppose) to the artist, except in a financial light.

Speaking generally, there are a larger proportion of works that are worth attention at the New Salon than at the Old, but none so good as the best at the Old Salon. There is a considerable amount of work which represents special ideas, special experiments in painting, whether in subject or treatment; sometimes far too experimental, at other times of considerable interest. It must be admitted, however, that some of the experiments have been seen for two or three successive years under different names, as in the pictures of M. Gandara, M. La Touche, and M. Carrière. The latter last year painted a theatre scene as if looked at through a mist, a ghost of a picture rather than a real one; he now takes the Crucifixion as a vehicle for the same treatment. There is a certain heartlessness and want of reverence about thus laying hold on such a subject merely for an experiment in effect. M. La Touche, like M. Henri Martin, has carried to exaggeration what was at first really an original style in regard to colour and conception of subjects half decorative, half symbolical. His colour is still fine, but his subjects verge on absurdity.

M. Carolus Duran, as usual, has a series of works at the New Salon, and if his portraits of Parisian ladies in rich costumes are not this year quite as brilliant and remarkable as on some previous occasions, he nevertheless shows an extraordinary versatility of powers, his contributions including portraits, landscape, and still-life. The two landscapes, although small and rather slight in execution, are very beautiful and true in effect. M. Besnard's portraits, though rather eccentric in style and treatment, are original and

effective. The exhibition includes some very charming landscapes, among them Mr. H. V. B. Davis's Academy picture of last year, which is well hung and evidently much appreciated; yet one cannot help feeling that it wants breadth and freedom of style in comparison with some of the best of the French landscapes in the gallery, such as M. Courtens' "Derniers Rayons," for instance, and some others. The New Salon contains also a good many groups of small and delicate landscape paintings, such as those of M. René Billotte, M. Jettel, and others, which find a chance to be seen and appreciated here, but which would be completely killed amid the crowded and much larger works in the Old Salon. Among what may be called the experiments are the various eccentric but clever works of M. Picard, who has a perception of the poetry of colour, at all events; and the curious studies of heads and figures in a flat conventional manner, by M. Botkine, a Russian who has struck out a new fancy in paintings which look rather as if intended to be copied in needlework; but they are certainly clever. A special room is assigned to an exhibition of the drawings and illustrative designs of M. Boutet de Monvel, which are full of clever design and delicate or humorous fancy; this collection should not be overlooked amid the larger and more prominent paintings which form the bulk of the exhibition.

NOTES.

The Proposed Chelsea Embankment. THE fact that the Select Committee of the House of Commons have thrown out the first proposal in the London County Council Improvements Bill, to extend the Chelsea Embankment and widen Cheyne Walk, comes rather as a surprise, and will no doubt be a gratification to those architects and artists who have opposed the scheme on the ground that it would destroy the picturesque character of Chelsea Reach. No one, we imagine, will suppose that we are indifferent to questions of picturesqueness, and we sympathise very much in one sense with the feelings of those who opposed the proposal; but we are by no means convinced that they are in the right. In spite of recent improvements in the state of the Thames, we cannot conceive that a low-water foreshore in the tidal portion of the Thames can be otherwise than a place of deposit of unwholesome matter. It is enough to remark the smell which comes from the water in Chelsea Reach when churned up by the paddles of the steamers* to come to Ben Jonson's conclusion—

"All is not sweet, all is not sound."

We have no doubt that if the first portion of the Thames Embankment were still unmade, and the Bill brought in for it now, there would be many persons ready to lament the destruction of the picturesqueness of the old foreshore; yet the Thames Embankment is undoubtedly the greatest London improvement of the century. We are inclined to think that the Embankment will eventually be carried past Chelsea, in spite of the present check, and that it will be better that it should be.

* We had occasion to notice this not very long since, in going up the river in one of the steamers, at a point opposite Chelsea, where the smell from the water was almost unbearable.

The Château of Chantilly. By the death of the Duc d'Aumale the Château of Chantilly in its entirety—

woods, lawns, waters, buildings and all which they contain, a collection of paintings, trophies, books, artistic objects of all kinds,—becomes the property of the Institute of France. The terms of the donation are that nothing shall be altered or modified in the exterior or interior architecture of the Château, in the Pavillon d'Enghien and the Pavillon de Sylvie, in the tennis court or in the three little chapels. The whole estate is to be preserved in its present form and to be accessible to the public during two days in the week, as well as the collections of works of art. It is indeed a splendid gift to have left to a nation.

Bronze Charioter from Delphi. THE latest issue of "Archæologischer Anzeiger" contains a prototype—indifferent in quality, but still most welcome—of the great "find" of last year at Delphi—the bronze statue of the charioteer. The statue, it will be remembered, was discovered last May,

to the north of the Sacred Way, between the Temple of Apollo and the theatre, and though only fragmentary is in parts in better preservation than any other bronze statue that remains to us. It belongs, moreover, to a period of special interest, *i.e.*, that immediately after the Persian war—just before the period of perfect maturity. The statue was at first connected with Hiero, tyrant of Syracuse, and on the basis which almost certainly belongs to it stands the name of Polyzalos, brother of Hiero, but as this name obviously is inscribed over some other previously erased, the question is still unsettled. Anyhow, we must give up the idea that the statue is a portrait of either Hiero or his brother; to represent a great tyrant as his own charioteer would not have been consonant with Greek convention. Happily this does not diminish the great artistic beauty of the work, which, seen even in a poor prototype, is impressive, both by its wonderful dignity and simplicity, and also by a softness and charm that is enhanced by the long drapery of the charioteer. Most people at first glance would take the statue to represent a woman.

Drawings Exhibited by the Architectural Association. THE small collection of drawings exhibited at 9, Conduit-street in connexion with the Jubilee celebration of the Architectural Association, and arranged in approximately chronological order, is of considerable interest. Among the earliest are Allom's brilliant sepia-tinted competition drawings for the Manchester Town Hall. Near these is one of Mr. Street's pen drawings of a portion of a church, with wide masses of buttress. Under date 1850-60 are some beautiful sketches by Mr. Waterhouse, on tinted paper, a water-colour by Mr. Seddon of part of St. Mark's, and Burges's extraordinary sketch for a fountain, a thing of defiant originality both in design and execution. Under 1860-70 are a good many small drawings by Mr. Tarver, and Mr. Florence's fine elevation of a gold medal design, tinted in the French manner. Under 1870-80 we have early drawings by Mr. Aston Webb, Mr. Baggallay, and Mr. Marvin. In the next decade we

see a considerably greater tendency towards the use of pencil drawing, and an increase in delicacy in the use of it, as shown in drawing by Mr. Horsley and Mr. Needham Wilson. Mr. Pitt's elevation of "El Dorado," and Mr. Brewer's grand composition called "Deserted" are also among this set. In the tea-room are still later drawings, including, among others, Cathedral and Abbey drawing (*Builder* series) by Mr. Mitchell, Mr. Beggs, Mr. Bidlake, and Mr. MacLaren, water-colour drawings of a pulpit, monument, &c. by Mr. A. E. Street, and Mr. Millard's admirable plans of Wickham Hall.

The Scandinavian Exhibition at Stockholm. AT Stockholm an important Exhibition of Scandinavian Arts and Industries will be

opened next month, and it is seldom indeed that the promoters of an exhibition of this description are able to obtain a site so beautifully situated as that of the Djurgården. Swedish work will be primarily represented, but the exhibits of Norway and Denmark will also take up a considerable space, whilst the Baltic Provinces of Russia are also to have a section. The site is well laid out, and the buildings are far above the average; the most important of the latter is the Industrial Hall, designed by Messrs. Boberg & Liljekvist, the central feature of which is a large cupola, flanked by four towers. The Art Exhibition Hall, by Mr. Boberg, and the Fishery Hall, by Mr. Theburn, are exceedingly effective, and of considerable architectural merit. We may say that the arrangements for this exhibition have been in the hands of an executive committee, in which painters and architects were well represented, and where the committee men are expected to participate in the management, instead of simply appearing as figure-heads, which is so often the case in similar enterprises. This exhibition will probably be worth a visit.

"Non-Flammable" Wood. ON Tuesday last (the 11th inst.) some interesting experiments were carried out on the site

of old Millbank Prison to demonstrate the non-inflammability of different kinds of wood, when the latter has been treated by the special process of the "Non-Flammable Wood Syndicate, Limited," Victoria-street, Westminster. The experiments were organised for the Office of Works, and the Prince of Wales and many leading architects were present. Two buildings had been erected, one of the prepared wood and the other of the same kind of wood not prepared. Large fires were kindled against a wall of each building, and the structure of wood in its ordinary condition was rapidly burned down. That of "non-flammable" wood was considerably charred in the process, and the wood in immediate contact with the blocks that were kindled perished, but none of the prepared wood, fierce as the heat was, actually caught fire. In the interior of the building several objects were placed amidst shavings and pieces of wood saturated with oil; but although the fire without burned strongly for half an hour, these inflammable substances did not become ignited, and, in fact, the interior of the structure was comparatively cool at the conclusion of the demonstration. A fire was then kindled within the building, where a box of the prepared wood, containing

ocket-books and the like, had been placed. The fierce heat did not burn this box, the outside only becoming charred, and on being opened the contents were found uninjured—the box was described as a wooden safe. The process for rendering the wood incombustible consists essentially of two parts: the removal of sap and the application of chemical preparations to the emptied spaces. This is effected by alternate exhaustion and steam treatment, the chemicals being forced into the wood at a high temperature. The prepared wood is subsequently dried; most varieties are not in any way altered in appearance by the process. "Non-flammable" wood has already been largely adopted in America, and, judging from the success of the experiments made on Tuesday last, the material has a great future. The nature of the impregnating chemicals was not disclosed.

An important paper has recently been read to the American Institute of Electrical Engineers by Messrs. Crehore & Squier on a new method of rapidly transmitting intelligence by alternating currents. From the theoretical considerations given, and the experiments they have done on a line thirteen miles long, it is clear that it is a practical invention, although, no doubt, many difficulties will have to be got over before they can apply their "synchronograph" to long distances. The transmitter is automatic, and is fed by means of a prepared perforated paper tape, which is driven by the alternator. The receivers described are most ingenious, and one of them completely gets over the difficulties caused by inertia by making the electric current act on a beam of light. This beam is polarised, and after passing through a Nicol's prism, falls on a rapidly rotating photographic plate. The magnetic impulses transmitted along the wire rotate the plane of polarisation of the light, and hence the light passing through the analyser varies in intensity, and this variation is shown plainly on the photographic plate. They calculate that a speed of 6,000 words per minute could be obtained by means of this apparatus on a single line connecting Chicago and New York. Such a speed, of course, would revolutionise telegraphy, but although theoretically possible, it is a little premature to talk of speeds even one-tenth as quick as the above as being practically possible.

DR. WYNTER BLYTH, the Sanitary Officer of Marylebone, has been experimenting with a new disinfectant, formic aldehyde, the results of which are described in the last issue of the Sanitary Chronicles of the Parish of Marylebone. The statement seems to show that formic aldehyde is slightly more destructive to bacilli than sulphur, and has no more effect on materials, such as textiles, which it is desired should not be spoiled in the process of fumigation. Several specimens of materials which had been exposed to its action during fumigation are appended to the report, which is of considerable interest. Another convenience in the use of formic aldehyde is that after fumigation it was possible to enter the room almost immediately, while in the room which was fumigated with sulphur, for the purposes of comparison, it was impossible to enter the room so as to

open the windows for nearly an hour after three unsuccessful attempts having been made during the time. The whole description of the experiment can be read in the printed report, copies of which can no doubt be obtained by those who desire full information in regard to it.

WE read in a daily contemporary that this famous tavern is offered for sale. The "Rainbow" has a history that begins with the closing years of the Commonwealth, and claims to be the second, or third, coffee-house established in London. J. Y. Akerman describes a halfpenny token bearing the name, with this sign, of James Farr, and date 1666. Farr, a barber, had been presented, as Hatton tells us in his "New View," by the Inquest of St. Dunstan's-in-the-West, in 1657, "for making and selling a sort of liquor called coffee, as a great nuisance and prejudice of the neighbourhood." He records, too, that the Phoenix Fire Insurance office (established *circa* 1682, by Dr. Nicholas Barebone and others) was at the "Rainbow," in the first decade of the eighteenth century. In Farr's time the house by that sign was also occupied by Samuel Speed, the printer.

THE Fine Art Society has had a great piece of good fortune in acquiring possession of such a remarkable collection of miniatures as that of Mr. Lumsden Propert, which is now on view at their galleries, though it seems a pity that such a collection should not have been secured as a whole for the nation, instead of being put up to be dispersed by separate sales. The rush after them at the private view last Saturday arose no doubt mainly from their historic interest as portraits; but to those interested in miniature painting as an art the exhibition offers an unusual opportunity for seeing in one room a collection illustrating almost all styles of miniature painting and all the eminent names in the art, arranged in approximately chronological order. There are also some cabinet pictures of considerable value, mostly portraits, but including also a beautiful Virgin and Child by Memling, painted on a sunk panel with the frame moulded out of the same piece, and curiously decorated with painted flowers and insects. The whole collection, both in the historic and artistic sense, is well worth a visit.

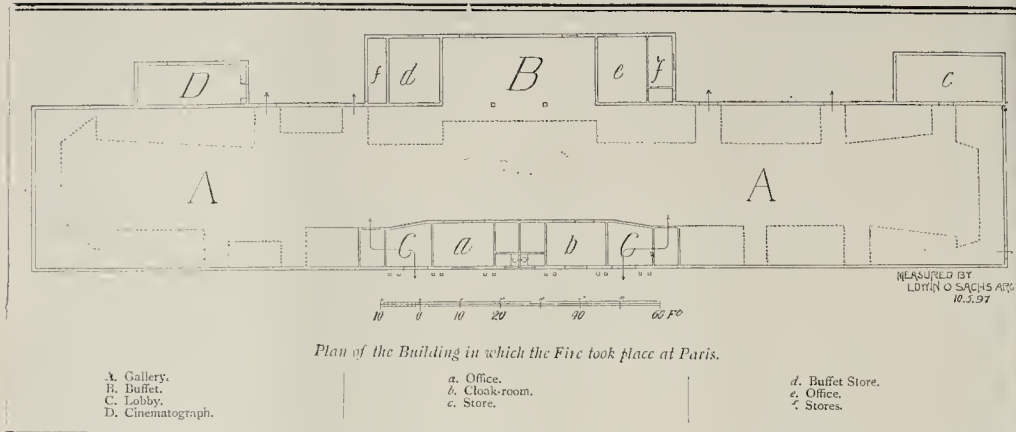

THERE is an air of pretence and sensationalism about the exhibition of Japanese paintings by Mr. Menpes at Messrs. Dowdeswell's gallery. The specially-coloured hangings, the awning through which the light is allowed to penetrate (and which had the effect of giving the gallery the temperature of a hot-house) the small squares of painting in the middle of large expanses of black frame, contribute to give the whole the effect of a theatrically got-up show rather than an artistic exhibition; and the painting is as tricky as the get-up. Some of the little studies of Japanese figures are very good; the larger ones are mainly remarkable for ugliness of effect and coarseness of execution. The Japanese actor figures in an amusing manner in some of the studies, and the one entitled "The Stencil Cutters" (40) gives a vivid idea of the absorption of the workman in the minute elaboration of a Japanese stencil pattern.

An interior called "The Foundry Kitchen" (12) is superior to most of the others in general effect of light and colour. Some so-called landscapes have the effect of being produced by dabbing sponges, dipped in colour, on a piece of blotting-paper. Mr. Menpes could, we believe, have done much better things than most of what this exhibition includes; has done better ones, in fact; but as it is, the whole thing is only a form of commercial venture intended to appeal to the fashionable taste for curiosities and oddities in painting, and as such it seems to attain its purpose.

WHILST a crowd of persons were elbowing each other to look at the last-named exhibition, a dozen or so of visitors in Messrs. Goupil's Gallery could study at their ease the works of a true artist, M. Billotte, whose small landscapes are not of the kind that draw a fashionable audience, but they will appeal to all who can appreciate truth of feeling and breadth and force of execution in landscape painting. Though all the works are of small size, they have not the character of what are called cabinet pictures; they are painted in a large free manner in which more attention is paid to general truth of colour and effect than to minute detail. Among those which are specially admirable are "Cliffs at Quiberville;" "The Square Tower Cliffs at La Rochelle," in which both the structure of the landscape and the effect of air and light in the evening sky are beautifully conveyed; "Morning in the Plain at Rueil;" "A Farm House, Eure;" "Moonlight, Quarries of La Folie," one of the most real moonlight pictures we have ever seen, but with no tricks of effect—it is the result of careful study and knowing what to do with the materials; "Evening in the Marshes," and "Road to Carrière St. Denis." But almost every picture in the collection is worth looking at.

WE have elsewhere given a short report of the Soirée of the Architectural Association, but we should like to congratulate the Association specially on the great improvement in the style and taste of the little drama, of home manufacture, which forms the principal item of the entertainment on these occasions. We must confess that we thought the humour of these Soirée plays in former years very much below the mark; in fact it could hardly merit the title of humour at all. In the play produced the last two years (for this year's was practically a repetition of the last) there is a notable improvement; it is quite a different style of thing; moreover, a good deal of the musical setting is very pleasing, and some of the singing was excellent. The hits at some contemporary theatrical performances, which formed the principal element of novelty in this year's play, were also very neatly put in.

WE have received a copy of a paper by Mr. T. Butler Wilson, read before the Leeds and Yorkshire Architectural Society in March, on "Modern House Interiors," the main point of which is one which has often been urged before, that architects should take, or should be allowed to take, a larger part in the arrangement of the decoration and furniture of the houses which they build. Mr. Wilson says—
"How is a modern house interior evolved?"

Usually the architect is called in, and plans the building with its several rooms, their structural fittings, such as doors, windows, and mantels. He is then politely bowed out, under an impression that his duties have now ended, and that he has rendered all the assistance in his power. The 'Art' decorator then appears upon the scene, and carries out a scheme of decoration in accordance with his own predilections, and, more frequently than not, in a manner totally opposed to the structural work of the architect."

This is quite true, and where a house has been carefully designed with a special architectural feeling about it, it is very vexatious to the architect to see it spoiled. But the question is not so simple as it may at first sight appear. It depends very much on the client; if he has perceptions on the subject he will wish for the architect's assistance; but as we presume the architect does not desire to do a great deal of additional work *gratis*, he is hardly in a position to say to the client, "pray employ me further; it will be to your advantage." Mr. Wilson's suggestion that when the architect is employed on a house his first duty is to make a psychological study of his client, in order to make the house an expression of his character and taste, we fear might have its ludicrous side. Suppose the client got wind of this idea, one can imagine his feeling, every time his architect tried to engage him in conversation—"Ah! this is part of the psychological study!"

SOCIETY OF ARTS.—On Tuesday evening Mr. G. Clulow read a paper on "A Half Century of Line Engraving, 1780-1830." Although he did not claim for England a first place in that art, he maintained that during the fifty years between 1780 and 1830 England had formed a distinct school of engravers, of which we were justly proud; their work would always rank with that of the little masters of Germany. After giving a description of the most ordinary incised work, as seen upon a visiting-card, the lecturer explained the more complicated methods of engravers, and showed illustrations of engraved work, and of the combination of engraved and etched work. The slides were greatly appreciated, and much astonishment was afterwards expressed at the beauty of line work that would bear enlarging sixty or seventy diameters. Mr. Clulow dwelt lovingly over the work after Stothard, Reynolds, and Turner, by such men as Allen, Fox, Goodall, Robinson, and others, and pointed out how indebted the arts of painting and architecture were to the engravers who educated the eye by their appreciation of composition and form. Indeed, many painters had reason to be grateful to the men who had so indelibly engraved their work, and Turner himself cannot be said to have reason for complaint. Mr. Clulow merely opened the subject up, and an interesting discussion followed his paper.

FURTHER NOTES ON THE PARIS FIRE.

The reports on the lamentable fire at Paris, which have been continuously appearing in the daily press, have been so confusing and, in many instances, so incorrect, that the presentation of some of the principal facts, as seen from an architect's point of view, should be of value to those entrusted with the safety of our public places of amusement. First, as to the site. The Rue Jean Goujon is situated between the Champs Elysées and the Seine, and it runs on to the Place de l'Alma. The exact frontage of the site is 90 metres, and its average depth 45 metres. Only the front portion of the site was occupied by the temporary building in which the bazaar was held, for the dimensions of the structure were 78 metres by 13 metres, and the front wall stood on the frontage line. At the back of the building the ground was hence uncovered to the extent of 90 metres by 32 metres, and there was a passage from the thoroughfare to this back land of nearly 11 metres width, for, as already observed, the structure did not occupy the whole frontage. The site was hemmed in on three sides by the walls of adjoining houses or by garden walls. In the case of the Hotel du Palais, some of its windows overlooked the site, and it was from a staircase window, six feet above the ground level, that a number of people were saved off the back land.

The building had only lately been put up, and had at first been used for some theatrical performances, with a stage, rows of seats on a sloping floor, and an electrical installation. The stage and the seating were cleared away and the electrical light installation was apparently disconnected, when the promoters of the bazaar took possession. No architect had been employed to design the building; a well-known firm of builders, who had been frequently associated in carrying out large schemes of street decorations in Paris, having set out and executed the structure for 12,000 francs. We understand that the builders were particularly anxious to be economical, in view of the charitable purpose to which the building was to be put. The materials employed only cost them 6,000 francs out of the contract sum; they consisted only of timber, tarred paper or felt, and glass.

The plan here given shows the shape of the building, which was practically in the form of a gallery with some back additions. The walls were formed by a number of strong uprights, faced and lined with match-boarding. The roof was supported by a number of trusses of light construction, and the upper part (on either side of the ridge) was glazed, whilst the lower part was covered in with tarred paper or felt. All fixed partitions were of light wood boards on wood sleepers. The plan shows the arrangement of the stalls, the decoration of which was effected by some old canvas scenery, which was exceedingly dry and worn. The roof was hidden by a large velarium running the whole length of the gallery. There were two principal entrance doors from the thoroughfare, three steps above the street level, and measuring each 2 metres in width. There were four smaller emergency doors at the back, and two small service doors to the side and back respectively. Of the service doors, only one

was known to the stallholders, and of the emergency exits apparently also only one, *i.e.*, the door leading through the open space to the entrance of the cinematograph room. As the French Government intends holding an inquiry, it is not our intention to criticise the arrangements, but to let the facts and the plan explain themselves, as far as the structure and its equipment are concerned.

As regards the progress of the fire, there is no longer any doubt that it originated in connexion with the cinematograph, though the exact cause has not yet been proved. As will be seen from the plan, no direct communication between this room and the hall is shown, but there is no doubt that the flames in the hall were first perceived at the back of the stall abutting on to this room. There was a considerable draught in the hall, and the fire apparently immediately made headway in the direction of one of the front entrances. The velarium at once caught fire, and on the glass in the roof breaking from the heat, the burning strips of the canvas fell on the ladies below, igniting their dresses. The fire ran along the velarium as if it were tinder. The canvas fronts of the stalls then became involved, and within a few minutes the whole building was in a blaze. Those of the visitors who were at the cinematograph end of the hall were apparently cut off, and no one appears to have had the idea of trying to break through the light walls which imprisoned them. The store at the opposite end of the hall, which had been used for cloak-room purposes, was likewise the scene of a number of deaths, as many crowded into this room by mistake, thinking it led to an exit. The other deaths appear to have occurred just inside of the two entrances that were most known, in all probability owing to their becoming blocked.

There is no doubt that the panic was exceptional, this being due, in great measure, to so many of the ladies' dresses having caught fire from the falling of the velarium. Of those who effected their escape to the back land, only few appear to have attempted to get round the building to the main thoroughfare. Many seem to have succumbed in their attempts to escape through the hotel window. As the grass in the further corners of the back land is still green, and some trees overlooking the site have only been slightly singed, a fearful state of panic must have prevailed to have prevented those who had the opportunity from sheltering themselves at a distance of quite 100 ft. from the burning building. On going over the ground, and looking at the plan, there is yet much which needs explanation in connexion with this dreadful catastrophe. We are afraid that what appears at present inexplicable must be ascribed to the fearful state of panic that must have prevailed, and the panic, we would repeat, must have been due, above all, to the fatal velarium.

TOWER, SS. MARY AND MODWEN'S CATHOLIC CHURCH, BURTON.—The new tower recently added to the church of SS. Mary and Modwen, in Guild-street, Burton, was dedicated recently. The tower, with campanile, has been erected in a style to harmonise with the body of the church. The tower, which measures 14 ft. square at the base, rises to a height of 56 ft., the octagonal stone campanile with its spire and cross bringing the total to 98 ft. 6 in. above the pavement. The architect was Mr. G. Mills, Derby, and the builder Mr. George Hodges.

ARCHITECTURE AT THE ROYAL ACADEMY.—II.

The architecture of public buildings, institutions, and business buildings, is not very largely represented this year, the space being all taken by churches. Plans are not to be seen at all except in a very few instances.

Taking the works in the order of hanging, we come first on a design for a school at Woburn, by Mr. Arthur S. Jones (1,757; no plan). This is a geometrical drawing which works well; it is in a very simple and unpretentious style of architecture, but looks as if it might be effective; the four large arched openings in the basement, two on each side of centre, and which presumably give access to a covered playground, have a bold effect, and are balanced by the tall windows and gables immediately over them, the line of small windows between the upper and lower stories uniting the whole together. In the absence of a plan it is, however, impossible to say how far these features arise out of the disposition of the mass. Mr. Aston Webb's simple and unpretentious design for the French Protestant School (London) is illustrated in the present number; it is accompanied by a small plan, which is better than nothing, and is sufficient to explain the design. No. 1,766 shows the perspective view of the new theatre in the Haymarket, which was illustrated in our pages last week. It represents the usual type of theatre architecture of the day, and that is about all that can be said about it. Neither plan nor section are given.

Mr. Ernest Runtz's Royal Music Hall, Holborn (1,761), shows much better architecture than we generally find in music-halls; the upper portion is like many other buildings in the free classic style of the day; the ground story shows deeply recessed solid piers, and there is a little special interest given to this portion of the exterior by the varied treatment of the two end bays, one on the left including a segmental bay window, that on the right being filled in quite differently, the two openings divided by a pier trying coupled colonnettes, with rather little effect. (No plan.)

Mr. Lansdown's "Mission Building, Theodolite-street, New Kent-road" (1,770) is illustrated by a good little water-colour drawing; of the building itself there is little to say, except that it seems simple and appropriate to its purpose (no plan).

Mr. Jas. C. Watt's "Design for a Mausoleum" (1,780) is a pretty and rather unusual bit of work; the drawings show a small octagon roofed with a dome; the gray masonry (granite?) is relieved by a wide band and some panels of lighter yellowish stone. There is a good deal of coloured decoration, partly in the shape of mosaic in the interior of the dome, and partly in the insertion of circular panels of coloured marble in the frieze, inserted at intervals in the midst of a general design of carved scroll work. This is a pretty little design and the drawings are very neatly executed.

Mr. Waterhouse's perspective view of the Carver's Institution (1,793; no plan) occupies a prominent position on the walls. The principal block, fronting Great George-street, has a large cantilever cornice which marks it out from the remaining portion of the group, and a balcony over the ground-floor windows carried on large boldly projecting consoles. The projecting porch, on columns and with a segmental solid stone (or terra cotta) roof, is connected to the rest of the front by a projecting bay immediately above it. The employment both of strongly marked horizontal and vertical features gives a great deal of solidity of aspect to the building, which will certainly have a powerful effect when completed. The absence of a plan renders it impossible to judge what is the intention of the grouping of the different sections or blocks, to which the building is divided, and which do not have a motive founded on the uses of the various portions of the plan.

Mr. Cappin's competition design for the Jeffan Institute, Forfar (1,799) deserves a passing mention as a picturesque street front, owing something no doubt to Mr. Colcutt, and we next come to the finest design for a public building in the room, Mr. Caroe's competition design for the Liverpool Technical School. This is a beautifully executed Indian ink drawing (1,818; no plan) which gives full effect to a design both dignified and graceful in its general character. The treatment of the flank of the building is particularly picturesque and effective. The ground story shows a series of semi-

circular openings in rusticated masonry between each of these is a pedestal and panel with sculpture, which is very well and delicately shown on the drawing; above is a row of nearly plain Italian windows with sculptured panels under them, and above them a mass of plain walling, very effective by contrast, and obviously marking the top-lighted museum portion of the plan. The end, with its conventional pilasters, is not quite so interesting as the side elevation; the cupola is elegantly designed. The detail elevation of the flank is shown under No. 1,831.

Mr. Hare's Presbyterian College, Cambridge (1,829), is illustrated in a lithograph in this number. As will be seen, it is a carefully and compactly planned building, though we wish an indication of the compass point had been added to the plan, as, from the nature of the plan, the question of aspect will obviously be of some importance in regard to many of the rooms. The design has the quiet home-like expression proper to collegiate architecture, and the tower is effectively treated. With this may be compared the second premiated design for the same building, by Mr. H. Seth-Smith (1,839), though it is difficult to compare the plans, as Mr. Seth-Smith's is so perfectly different not merely in detail but in general shape as to lead to the conclusion that site boundaries were not specially defined for the competitors. The general effect of the design, which is in more or less collegiate Gothic style, is suitable and pleasing, and the author perhaps follows more correctly the traditions of University architecture in making the principal entry under the tower, which in Mr. Hare's design only marks a secondary entrance. The Dining Hall is placed on the first floor in a block at right angles to the main building, and the kitchen and scullery occupy the lower portion of the block; there may be no practical objection to this, but the architectural treatment of the exterior does not suggest sufficiently the utilitarian employment of the lower story of this buttressed and rather ecclesiastical-looking bit of building. The fireplace in the kitchen would certainly be insufficiently lighted.

Mr. Tiltman exhibits the perspective of his Kennington-road Public Baths (1,837; no plan), which has the merit of suggesting a Public Baths building in the disposition of wall and windows, and is sufficiently architecturally effective, in a general sense, for a building of that class, though we do not like the character of the detail. Mr. Runtz's "Empire Palace of Varieties, Middlesborough" (1,847; no plan) is much more pleasing architecture than Palaces of Varieties generally show; the large masses of blank wall at each end of the front are well contrasted with the pretty treatment of the windows in the centre portion, and the angle cupolas are picturesque. Mr. Colcutt's additions to the Savoy Hotel (1,850) are illustrated in the *Builder* of July 11, 1896; architecturally it is merely the treatment of the side of a courtyard on which some new additions are made; it is a bold piece of work, with a series of deep round arches carried by pannelled square columns on the ground story, and a range of mullioned windows divided by pilasters over this, overhanging and carried on corbels which seem rather too heavy and massive to be in character with the rest of the work; or rather, perhaps, the panning of the columns and arches below gives to that part of the work a rather light appearance in comparison with what is over it; if the ground story had been treated in a heavier and more massive manner the total effect would have been better. Mr. J. Murray Robertson's "Lochee Free Library and Baths" (1,854; no plan) is a pretty looking gabled building with a circular tower-looking addition effectively added at one end; the lower portion of the building is brick the upper (probably) terra-cotta. Mr. R. T. Blomfield's picturesque design for the Parish Institute, Portsea (1,860; no plan), was published in our issue of last week; he exhibits also a design for the new Girl's School, Hammersmith (1,858; no plan), a block of E shape, with the faces of each the three arms treated with an elliptical pediment and pilasters in such a manner as to make the whole end of each block a design in itself; the treatment is very simple, but it all hangs together well.

In Mr. Jackson's New Boarding Houses for Westminster School we at last have a plan forming an integral part of the exhibit (1,874), and showing two boarding houses and their adjuncts arranged side by side on a rather long slip of ground, with a division wall running down the centre; the studies are placed at the back towards the playground

enclosure, which is good for quiet (as playground and studies are not used at the same time); the day rooms are in front; perhaps the fact of their having a north light was unavoidable, but it makes a dull room; though it may be repented that the sunlight will form an attraction in the studies, and promote their use. The building is a very plain brick one, in what may be called Queen Anne style, with dressings of darker brick (we like this much better than stone dressings), the only ornament is the rather jejune one of cut-brick festoons hanging from the eaves between the windows and appearing to carry cartouches hung to them. This is not a very "researched" form of architectural detail, and to say truth the exhibit is not a very important or striking one as a representation of the work of an architectural "K.A. elect." one had looked for rather more from Mr. Jackson.

Messrs. Ernest George & Yates show perspectives of the interior of Claridge's Hotel (1,884), the hall of which, vaulted with elliptical arches, has a sufficiently spacious and dignified appearance. Mr. Applebe exhibits a small "Study for Municipal Buildings" (1,897; no plan) which groups well, though not possessing any special originality. Mr. H. R. Gardner's "Market Hall" (1,898), we presume a student's competition design, wants unity of treatment; it is too scattered and the details do not harmonise. Messrs. H. S. Legg & Son's new ballroom for the Royal Palace Hotel, South Kensington (1,907), is a handsome room, somewhat better architecturally than hotel entertainment rooms generally are. Mr. Vigers's "Bonded Stores, Vauxhall (1,904; no plan), is illustrated in this number—the second illustration of buildings for Dock business that we have been able to give within a few weeks; it is satisfactory to find that those concerned in such buildings are beginning to think it worth while to employ architects to design them. Sir T. N. Deane and Sons exhibit a small drawing for a large building, a design for a hotel for Cork (1,913; no plan); this is a bold and picturesque building, in the treatment of the right hand portion especially, and it is the more to be regretted that there is no plan to explain and justify this picturesque piece of architectural grouping. Mr. Belcher's perspective sketch of a design for a Mausoleum (1,916) we shall illustrate shortly, with the interior perspective also, which was sent but has not been hung; there is no plan to this, but the design is so simple it hardly requires one; and though the detail is very plain, except the little bits of bas-relief sculpture inserted in the piers flanking the entrance, there is a distinctly marked originality about it. Messrs. Wimperis & Arber's large interior of the Princess Restaurant (1,917), with a crowd of people dining, is an imposing drawing no doubt, but it is hardly a kind of thing to find place in the architectural room of the Royal Academy.

THE ARCHITECTURAL ASSOCIATION: JUBILEE CONFERENCE.

A CONFERENCE of this Association was held at the rooms of the Royal Institute of British Architects, Conduit-street, on the 6th inst., in connexion with the Jubilee commemoration of the Association. Mr. Beresford Pite, the President, occupied the chair, and among those present to take part in the conference were Mr. Hampton W. Pratt (President-Elect), Mr. Hy. Lovegrove, Mr. Wm. White, F.S.A., Mr. W. R. Lethaby, Mr. C. E. Bateman, Mr. T. Sulman, Mr. Cole Adams, Mr. Scaries-Wood, Mr. W. Pite, Professor Roger Smith, Mr. T. M. Rickman, Mr. W. H. Seth-Smith, Mr. J. B. Seddon, the Honorary Secretaries, Mr. Banister F. Fletcher and Mr. Howley Sim, and several representatives of provincial societies.

It was proposed that short ten-minute papers should be read upon points in the Association's work, which are exciting special interest at the present time, with a view to elicit in a conversational discussion the views of the members of the Association.

Upon the first point, "The work of the Technical Institutes as related to the Architectural Association," Mr. Beresford Pite, in opening the discussion, said the extension of institutions for giving technical instruction, similar in some respects to that which the Architectural Association had to provide, had created special difficulties during recent years. The Architectural Association had to provide certain courses of instruction necessary in order to pass the Institute's Examinations, and in

doing this it had now to compete against classes for technical instruction given at University College, King's College, and numerous Polytechnics and similar institutions which had access to sources of income to which the Architectural Association had not access. County Councils had distributed large sums of money as subsidies to such institutions, out of special funds placed at their disposal. These subsidised institutions had to make the best possible use they could of the subsidies, and to satisfy examining visitors from time to time with regard to the results obtained. The way in which the subsidies worked to the prejudice of the Architectural Association was shown by every-day experience. The student at a Polytechnic could obtain for a shilling instruction which the Association could not give for less than half a guinea—and besides, their members' subscription and entrance fees amounted to a three-guineas premium before they paid their half-guinea fee. The committee had had to reduce the fees to their instructors, and although the fees now sufficed to pay the instructors, there was no margin whatever. They had to provide office accommodation and the expenses of administration from other sources. What was to be done? The students of technical Institutes possessed some of the advantages of an ideal training. They could go into the workshops which some of the Institutes possessed and apply their theoretical instruction in practice. For these reasons students were drawn away from the work of the Architectural Association. They could not well now retire from the position they had taken up before the rise of these new Institutes. Then what was to be the future scope of the Association in the face of technical Institutes? Should they place themselves in line with them? Should they by putting themselves under the same conditions as the Polytechnics sacrifice their freedom? Or should they continue on their own lines to do the best they could, and trust to their superior methods and their prestige?

Mr. Wm. White, F.S.A., in opening the discussion, observed that it would be a pity to merge the Architectural Association into another and different class of institution. They should remain independent in order to feel above the level of mere schools. He advocated the policy of retaining their freedom. It might perhaps be possible to devise for their classes some form of endowment.

The President: The Association has no endowment whatever.

The discussion afterwards turned upon the character of the instruction given in the classes at the Polytechnics, its efficiency, and how far it was artistic or merely elementary.

Mr. Pite thought that few of the students belonging to the Association went to these technical classes.

Mr. H. D. Searles-Wood said it would hardly suit members of the Architectural Association to mix with the students of such Institutes. They were of a totally different class. There was great diversity among these schools. While in London they had generally been well organised, there were others in some parts of the provinces in which the instruction was very inferior, and in which the teachers were a laughing-stock. It was not to be expected that their students (members of the Architectural Association) would care to mix with the students at these schools.

Mr. W. White thought that perhaps some of their own classes might be given up in order that more time could be devoted to real training in art. He would like to know if any Architectural Association men went to the classes at South Kensington. His impression was that those in attendance there were quite of a different class.

Mr. Pite said that so long as "cram" was accepted as knowledge, the technical Institutes would flourish, because they offered instruction at microscopic fees. Those not born to wealth would go to the Polytechnics, but they were the kind of men the Association wanted.

Mr. J. E. Drower observed that the most important advantage which members of the Architectural Association had was the opportunity of forming good associations and lasting friendships. This was well worth the extra cost, and it was a question whether it was advisable even to consider the possibility of applying for subsidies. It was conceivable that a man by attendance at a technical institute might become a quantity surveyor. But the architectural student, although he ought to know something about taking out quantities, had to take up many other subjects, and must

know many other things than quantities. If they were to go in for a grant for this specific subject they would have to produce specific results, and to make their students mere surveyors of quantities. He (the speaker) had some knowledge of Polytechnics—acquired while examiner there—and he was of opinion that a Polytechnic education was not calculated to produce good architects.

Mr. H. W. Pratt, who also opposed any suggested change of policy, said it would lead to the giving up of their exclusive privileges, and eventually wreck the Association. The Architectural Association had a work of its own to do which no aided institute could perform. All who were present at the recent dinner would admit that through the Architectural Association, they got much more than they could get in a technical institute or in schools of any kind. He hoped it would be possible to carry on their work, and yet give their students technical training. They might drop some outside subjects, such as geology, which few took up, in favour of going into workshops. If they were to drop certain subjects and go in more for design, drawing, and the art side of the Association, they would succeed in strengthening and building up their institute, and they would be keeping themselves together as a class. Under the suggested change it would be more easy for them to get levelled down than levelled up.

Professor Roger Smith observed that the object of a technical institute should be to train artisans, but that was not the object of their Association. It was not necessary to have an artisan's knowledge in order to make a good design, and a man might be a good artisan without being much of an artist; a joiner, for instance, might be a good artisan but not know the art side of his work. He trusted that the Architectural Association would remain an association for training architects and artists rather than artisans.

Other speakers pointed out that such a change would require an Act of Parliament, and that it would reduce them from an architectural association to a school.

The President closed the discussion of the first subject with the observation that the main point brought out by the discussion was that a man who joined the Architectural Association joined it to get instruction and for other purposes. With respect to changes that might be required to be made from time to time, they had always found that when a thing was really wanted it could be got. If a few men banded themselves together to demand anything that was within the power of the Association they would get it.

Mr. Pite read a paper upon the third point, "What subjects should be compulsory in an architectural examination, and what studies supplementary." Speaking broadly, it might be said that the ultimate result, if not the aim, of an architectural examination was to close the ranks against incompetent men. It was necessary that an architect should be a good builder and an honest builder, and therefore a preliminary examination should be made compulsory; but whether he was capable of designing beautifully was another matter, which it was perhaps not possible to ascertain by a preliminary examination. He wished to suggest to the conference for discussion that it should be admitted as a necessary and essential qualification of an architect that he should be a good builder, and that the interest of the public demanded that he should be a good builder. The course should therefore include a knowledge of constructional practice and a knowledge of correct drawing. But from the earlier examinations might be removed subjects connected with high art, the object of which was to take a review of the whole history and practice of the human race. In other words, they should remove architectural history and design. The object of the examiner, at a certain stage, should be merely to satisfy himself that the men he examined would make architects in whom the public would have a right to trust. Then, what was to be done with other subjects, which might be called honours subjects? They were, no doubt, essential to the finished architect, but not to the architect considered merely as the servant of the public. They might have an intermediate art as well as a science examination associated with an honours course. In this examination a knowledge of ornament and design might be required, and some knowledge of ornamentation in its historical forms. In an honours examination they could require a knowledge of high art. Science and

practice would have to be strengthened. The final examination might include questions of art history, of criticism, of Greek archaeology, and tests of knowledge of perspective, artistic draughtsmanship, water-colour drawing, and design. The gain to the Association of such a scheme would be increased thoroughness of work, and results more satisfactory to the students and more satisfactory to their clients. The study should be carried beyond examination point. They had only to look round that exhibition to see how much more slight—more *short-hand*—he might say—was the practice of the present of former times. It was of vast importance for them to be able thus to measure progress. At the present day they sketched instead of designed. Those architectural subjects which he called supplementary were yet in the far distance. It was absurd to put a limit on study, and members of the Architectural Association should desire to carry on their education as far as possible. They must continue to study, and to encourage this would not be possible to have a *grand prix*? Should they not have something to offer to students who had passed all the examinations? By providing an honours class they might enable architects to gain a higher position in the world. They might give them a status such as was gained by men who passed in honours at the Universities, and they might help their students to get a better status in the Institute.

Mr. H. Lovegrove, who opened the discussion, feared that the demands of examination under such a scheme would be so great that few members would be able to find the time necessary to satisfy them all.

Mr. W. White thought the scientific branches of their art should be held the most important. They should teach the "science of the art" just as in music the student of counterpoint was taught all that pertained to the art of music. That there was a science in the art of the architect was shown by the old architects whose fine proportions showed that they were perfectly acquainted with the science of geometry.

Mr. Pite said they could get, and had a right to get, from every student such definition and accuracy as would make them feel that he could produce, when called upon, accurate drawings of all kinds of details of construction. An honours course would prevent the tendency shown by too many students to settle down after passing their obligatory examinations.

Mr. H. W. Pratt said that a man having passed such an examination was generally counted good enough for the post of surveyor or builder, but not for that of an architect. Still, he thought the President, in his proposed examination scheme, had gone to extremes in the other direction.

Other speakers thought the scheme would tend to bring older members more into touch with each other and with the younger members, and would tend to keep them longer in the ranks of the students. What was wanted was that the architect should be educated up to a point that could not be easily defied.

The President, in closing the discussion, said there was a natural reaction which induced many men, after passing an examination, to cease further effort, but no man should be dubbed an architect simply because he had passed the obligatory examination in building construction. Under the proposed scheme he would have to go on to the higher examinations. The examination point was satisfactory so far as construction went, but not so far as art was concerned. The whole profession would suffer a shock if the designs done in examinations were exhibited, and if examining boards were to show all that were sent in, the whole scheme of examinations would be damned.

The conference then closed, and the members were invited to partake of light refreshments, which had been provided by the committee.

The Soirée.

The Soirée of the Association was held on Thursday evening, May 6, at St. George's Hall, when a large number of members and friends, including ladies, assembled to witness the usual musical play. It was announced some time ago that a new play had been written for the occasion, but owing to unavoidable circumstances its presentation was deferred, and an adaptation of "The Celestial Institute," last year's play, was given instead. It is satisfactory to remark that, though the burlesque, was

most a repetition of last year's play, the rest of the occasion was well sustained, for the new songs and topical allusions had been worked into the play, the performers acted in parts with considerable success, and the picturesque ensemble which attracted attention had been given. The title of the burlesque this year was "The Institute Abroad," a sphere of that body's activities having been transferred from Paris to Algeria. For some of the details of the play we must refer our readers to our account of the "Celestial Institute" in the *Builder* for May 23, 1896; the marriage of the members of the Institute Council to the architectural girl students, the election of the President, the proposed architectural stores and the cinematograph were points which were again dealt with. Mr. Alfred Stanton made an excellent Sultan (the braggadocio the "Emperor" in last year's play being done a good deal of) and Mr. G. B. Carvill was successful as "Blarney Barnooley," a London adventurer and company promoter, in the similar part of "Svevalli" which took last year. The meeting of the Institute, at which the Librarian took the chair and the President arrived, was very successfully managed, while the allusions to some of the papers read at the ordinary meetings of the Association were well received. The following are the characters:—John Jones, Mr. H. Seton Harris; Patrick McBrowne, Mr. W. W. Furlong; Archie Robinson, Mr. S. Constanduros (A.A. Travelling Students); Blarney Barnooley (a London adventurer and company promoter); G. B. Carvill, the Sultan, Mr. Alfred Stanton; the Secretary of the Institute, Mr. Frank Collins; the Librarian of the Institute, Mr. F. D. Clapham; members of the Council, E. S. Collins, Mr. A. Cox, Mr. Frank Lay, Mr. H. A. Neubronner, Mr. John Ormrod, Mr. H. Turner; members of the Sultan's body-guard, Mr. F. P. Allworth, Mr. Arthur Kelly; Moorish boys, D. Carvill, P. Albert, S. Elston, J. E. Collins; Zorah, Miss Grace Wyld; Lah, Miss Ada Verbury; Moorish girls, students of the Institute—Casina, Miss E. Black; Cassana, Miss Carvill; Bamama, Miss Dolly Wade; Pajama, Mr. K. Rimell; Sasa, Miss Ethel Selvig; Lulu, Miss Ethel Williams; and Blarney (Barnooley's ward), Miss Blanche Fig. The stage manager and author was G. B. Carvill, assisted by Mr. F. D. Clapham, and others.

The Annual Excursion.

The twenty-eighth annual excursion of the Association will take place from August 9 to 14, the district chosen this year is Lancashire, further particulars of the excursion will appear in "Architectural Association Notes." Members wishing to join should communicate about delay to Mr. W. Talbot Brown, The Bure, Wellingborough, hon. sec. for the excursion.

MAGAZINES AND REVIEWS.*

THE *Edinburgh Review* contains a very interesting and charmingly-written essay on "The Sculptured Tombs of Hellas," the authorship of which it is not difficult to guess. The essay of monuments spoken of, as the writer remarks, though not the work of great artists, have a traditional grand manner about them. They are as a class admirable examples of those qualities we expect from the Greeks, stately, restrained, good taste; as such they strike us by the contrast with our own sepulchral monuments. Moreover they are in the main easy to interpret, and—which is no small element in their popularity, they strike an unexpected domestic note." The article, a review of a good many various books on the subject, sketches the character of various groups of such monuments, touching lightly on one or two disputed points, and forms a very good *resumé* of the present state of this field of Greek archaeology. Another article, under the title, "Painters behind the scenes," is a somewhat sarcastic review of several books of the lives or reminiscences of painters, in which the main deduction drawn is that the painter behind the scenes is not always a person who claims very much veneration on intellectual grounds, and in fact that painting is more of a mere business than is

* The object of these notes is to point out anything in the contents of the current magazines which is of special interest to our readers, with occasional brief criticisms on the views expressed in such articles. When a magazine which has been sent to us is not noticed, it is because that number contains nothing that is within our province to comment upon.

commonly supposed. The only painter whose biography (among those reviewed) really raises him in our estimation higher than the mere contemplation of his pictures would have placed him, is Jean Francois Millet; though the reviewer considers that Millet's art, after many years of undeserved neglect, has latterly been the object of a reaction of feeling which has caused it to be somewhat over-rated.

The *Quarterly Review* contains a well-written article on "Modern French Art," a review of its present position and of the works of some of the leading artists of the last quarter of a century. The author speaks strongly in regard to the great place now occupied in France by decorative painting. Referring to the reaction against realism in art and literature in France, he observes "one important result of this revived idealism is the new impulse which has been given to decorative art. . . . It may be, in the future, architecture, sculpture and painting, will all combine to form one great and harmonious whole. It is a branch of art that is capable of vast developments, and, as Dr. Mither suggests, may be destined to exercise an important influence on the coming age. Meanwhile there can be no doubt that mural painting is practised with greater success in France at the present time than in any other country." The author does not add, as he might and should have done, that one great cause of the French superiority in this branch of art is the encouragement given to it by the French Government. In England artists hardly get a chance to do anything of the kind.

The *Art Journal* continues the description and illustration of the contents of "A Northern Home," which appears, among other attractions, to contain some exceptionally good eighteenth-century furniture. Mr. O'Fallon contributes a short notice, accompanying four illustrations, of a "Virgil Shield" designed by Mr. John Watkins and executed by Mr. Thomas Spall. It is obviously a very fine piece of silversmith's work, and the groups of figures illustrated are designed with much vigour; but the employment of a series of architectural pilasters, radiating like the spokes of a wheel, to divide the subjects of the circular bas-relief, appears to us to be quite a misappropriation of architectural detail, besides giving to the design a series of harsh lines which had been much better avoided in silversmith's work. Mr. Claude Phillips's article on the collection of pictures at Longford Castle is continued, dealing this month with the Italian pictures, of which four are illustrated. Some very pretty sketches of Plymouth and its neighbourhood by Mr. R. Hoskin, accompany an article on Plymouth by Mr. Radford. The frontispiece is a reproduction of Mr. Frith's Railway Station, which it appears now forms part of what is called "The Holloway College Collection;" a picture which, we think, might have been allowed to die a natural death.

The *Magazine of Art* contains an article on Sir E. J. Poynter's studies, illustrated by a good many reproductions which, as might be expected, are of considerable interest. One is glad to see that more attention is being paid to the work of the learned and intellectual painter who is now at the head of the Royal Academy. An article in the same number deals with that interesting English mansion Kedleston Hall, with illustrations by Mr. Fulleylove. It is a pity that the plan, which is unique in its way, was not included.

The *Essex Review* (quarterly) contains a longer and more interesting article than usual, in its series of "Essex Churches" by Mr. F. Chancellor, the church described and illustrated being that of Felsted. Miss Fell Smith contributes the second of a series of articles on "Picturesque Essex," dealing with Thaxted, and illustrated by some good sketches. We observe that the date on the cover of this issue is January, but it is the latest number of the *Essex Review* that has reached us.

The *Century* contains three articles, grouped together, on the subject of scientific kite-flying, describing experiments made in America in the use of special forms of kite with the object of getting meteorological data, of lifting persons from the ground for observations, and of photographing from cameras attached to kites. The articles and diagrams are of considerable interest, though it does not seem that much practical progress has been made as yet. We should think the risk in lifting men would be considerable, from the chance of a sudden failure of wind.

Scribner contains nothing this month of artistic or technical interest except under the

usual heading of "The Field of Art," one of the paragraphs in which consists of an appeal for a more serious treatment of the art of theatre scene-painting, as one not unworthy of the efforts of eminent artists, if regarded from the right point of view. The concluding sentence seems to imply that England is regarded as having to some extent taken a lead in this direction.

Harper has a short article by Mr. Corbin on "Two Undescribed Portraits of Shakspeare," the Droschout engraving and the "Ely Palace Portrait" which hangs in Shakspeare's house, or rather the house in which he was born. Are they really "undescribed?" In America perhaps; hardly in England, we imagine. The Droschout portrait carries its refutation in its face; Shakspeare never could have been so weak-looking a man as that. An article on "English Country-House Life" concerns us all more or less, for it is an endeavour to render more familiar to American readers the ways and etiquette of English country-house visiting, which apparently are occasionally a puzzle to the American visitor; it is written with a great deal of pleasant humour and sufficient knowledge of the subject. Mr. G. W. Smalley is the author.

The *Revue Générale* contains an interesting article by M. J. G. Freson, "A Budapest," a review of the impression made by the city and its buildings. M. Freson speaks with great admiration of the new Houses of Parliament, which, he observes, recalls the Palace at Westminster, "la seule construction en Europe auquel il serait comparable." This is true, and indeed the plan of the Budapest Houses of Parliament is evidently imitated from ours, and perhaps something of the general treatment; but the architecture is not nearly so refined. It has the merit, on the other hand, that the position of the two Chambers is externally shown in the design; the want of this is the one serious criticism that can be made on Barry's building.

The *Pall Mall Magazine* contains an illustrated article on Mount Edgecumbe house.

In the *Gentleman's Magazine* there is an article on "St. Mary Redcliffe," not however architectural, but dealing with the history of some of the monuments and the persons connected with them.

The *Genealogical Magazine* is a new journal of "Family History, Heraldry, and Pedigrees" appearing for the first time this month; we presume it is to be issued monthly. It has no direct connexion with our class of subjects, except that it gives some attention to heraldic matters, and the present issue contains illustrations of two coats of arms, those of Legh of Lyme and those of Nelson. The subject of family history becomes also, of course, of interest on some occasions as throwing light on the architectural history of buildings erected or altered by the family.

THE SURVEYORS' INSTITUTION:

PROFESSIONAL EXAMINATIONS, 1897.

THE following student candidates have passed the examination for the Professional Associateship:—

J. H. Addie, Welshpool; B. B. Baddeley, London; J. G. Bickford,* London; H. Bowden, Newport, Barnstaple; W. N. Brackett, Orsett, Grays; H. H. P. Burgess, London; F. H. Burrows, Ashford; C. F. Cargill, Masham; C. W. Clarke, Leeds; W. Clarkson, jun., London; W. Denton, Sheffield; J. H. Dunt, London; A. Elliott, Liskeard; A. C. Ellis, Highgate; J. H. Furnledge, Middleton Stone, Bicester; A. E. Gayer, Bristol; D. F. Goldsmith, Hordean; H. N. Gray, Forest Gate; H. B. Harrison, Chippenham; A. F. Howland, Amersham; J. M. Kerr,† Llanidloes; H. J. T. Kibblewhite, London; E. G. Lomax, Kensington; H. Mitchellson, Dresden, Stoke-on-Trent; F. E. Molyneux, South Croxdon; W. Paice, Egham; P. Peebles, Albury; J. R. Pinger, Malmesbury; F. A. Pinfold, London; C. H. Price, London; R. E. Robinson, London; L. S. Simpson, Newport Pagnell; F. C. W. Stacey, London; H. P. Stimson, London; H. C. Stokes, London; E. T. Walton, London; H. C. Waterfield, London; J. P. Wilton, Liverpool; E. B. Fitz-Herbert Wright, Leek Wootton.

The following non-student candidates have also passed the examination for the Professional Associateship:—

F. S. Appleby, Waverley, Liverpool; F. R. Benson, Harnage House, near Shrewsbury; L. T. Bigg, Mortimer; J. B. Bird, London; C. Blackshaw, London; E. H. Blake, Tooting; C. Butler, Huddersfield; H. Carpmael, London; C. L. Cassin, Catterdill Hill; G. Chipp, York; H. A. Cobbe,

* Special Prize, 1897.

† Institution Prize, 1897.

York; F. R. Cooke, Leek Wootton; W. G. Cope, London; T. J. Council, London; W. T. Creswell, Aldershot; C. T. Cronk, London; C. O. Cushen, Woodford; C. J. T. Dadd, London; T. S. Dangerfield, London; R. B. Davidson, St. Helen's; B. M. Douglas, Wrentham; W. A. Farnham, London; E. Greenwood, Richmond, Surrey; J. E. Harrison, Allestree; T. W. A. Hayward, Weston-super-Mare; W. A. Head, London; H. O. Holloway, Bristol; H. L. Johnson, New Brighton; W. P. Knatchbull, Hellingbourne; W. B. Leather, Leeds; A. W. Loft-house, Middlesbrough; H. J. M. Mackenzie, Thetford; R. C. Marchant, Clifton, Bristol; C. M. Mayne, London; R. M. Ogilvie, Hayward's Heath; A. C. Parnacott, Penge; H. McA. Peppercorne, Wye; P. E. Ridley, London; T. R. Robinson, Wye; F. C. Ruddle, London; B. M. St. Aubyn, Clowance, near Camborne; H. C. Salt, Bingley; A. S. E. Sedgwick, London; R. H. Seel, Cardiff; H. Shearburn, Collingham, Newark; J. H. Shearer, Exeter; C. A. M. Skues, South Croydon; S. A. Smith*, London; H. C. Snow, Leicester; J. C. Southcombe, Barnstaple; G. Stanford, Ealing; E. R. Stoneham, Erith; B. Swanwick, Cirencester; H. S. Thompson, Birmingham; A. F. A. Trehearne, Putney; B. E. Turner, Wye; D. Turner, Wye; H. Turner, Cardiff; L. J. Veit, Wolverhampton; J. Weatheritt, London; J. S. Wein, South Shields; D. S. Williams, Mountain Ash; R. S. Woolf, Penrith; J. F. H. Wrightson, Downton; T. J. Young, Wye.

The following Professional Associates have passed the Fellowship Examination in Division IV.:-

P. Allen, Croydon; L. T. Ashenden, Canterbury; H. Bentley, Teddington; H. G. W. Brinsley, Gipsy Hill; W. T. Cox, Maidstone; H. W. Daniel, Burton-on-Trent; W. Easter, King's Lynn; H. P. Fletcher, London; E. C. Foster, London; T. S. Fraser, Glasgow; J. S. Garner, Uxbridge; A. Goulding, London; E. H. Green, London; F. A. Green*, London; J. H. Hall, Middlesbrough; H. C. Heasler, Richmond, Surrey; H. P. Homan, Rochester; E. W. Hooper, Huntingdon; W. Jarman, London; A. P. Jenkin, Redruth; W. Jenner, Hove; P. H. Kingsford, Folkestone; C. J. Lake, London; E. E. A. Lee, London; J. A. Lucas, Exeter; A. J. Martin, Clelmsford; C. E. Mercer, London; H. Nuttall, Bury; F. W. Pearce, Wimbledon; W. Phillips, Plymouth; F. W. D. Pinney, Birmingham; C. A. Riffell, Guildford; H. M. Rogers, London; G. A. Sexton, London; H. H. Skipper, London; C. G. Smith, London; J. G. Tate, Tonbridge; W. S. Walker†, London; J. D. Wallis, Manchester; J. H. W. Wheeler, London; E. V. Whitaker, St. Albans; P. Whitton, London.

The following candidates have passed the direct Fellowship Examination in Division V.:-

C. Harrison, Burton-upon-Trent; W. D. Hollis, Leeds; S. E. Isted, Ryde, I. of W.

THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A MIDLAND Counties district meeting of the Association of Municipal and County Engineers was held at the Local Board Offices, Market Harborough, on the 8th inst. Mr. F. J. C. May, C.E., of Brighton, President, occupied the chair, and amongst those present were Messrs. W. Weaver, Kensington; J. P. Barber, Islington; Savage, West Ham; W. Mann, Sevenoaks; Cooper, Wimbledon; J. T. Eayrs, Birmingham; Greatrex, West Bromwich; Silcock, King's Lynn; A. T. Davis, Shrewsbury; J. W. Walshaw, Peterborough; Colonel Jones, V.C.; C. F. Marston, Sutton Coldfield; E. G. Mawbey, Leicester; C. C. Hooley, Nottingham; and others.

The President having acknowledged the reception accorded to the Association by the Local Authorities, announced with regret the resignation by Mr. A. T. Davis, County Surveyor of Shropshire, of the office of Honorary Secretary for the Midland district. He proposed a vote of thanks to Mr. Davis for the services which he had rendered in that capacity for the past ten years.

Mr. J. T. Eayrs seconded the vote of thanks, which was accorded by acclamation, and suitably acknowledged by Mr. Davis.

On the proposition of Mr. Eayrs, seconded by Mr. Marston, Mr. J. S. Pickering, Borough Surveyor of Nuneaton, was appointed to fill the vacancy created in the Hon. Secretaryship of the district.

Mr. H. G. Coales, Engineer to the Urban District Council, then read a paper on the Public Works of Market Harborough. Mr. Coales gave details of the various public works, and of the population, rateable value, and mortality statistics of the town. He said the by-

laws provided for a street of not less width than 36 ft., but the Council pass a street of a width of 30 ft., provided the houses on both sides are set back 6 ft. from the street, making the air space 12 ft. The district was entirely re-drained in 1881 by Mr. Mawbey, at a cost of about 18,000l.; and in 1890 a water scheme was carried out by Mr. Everard, of Leicester, at a cost of 24,000l., which gave the town a water supply second to none in the country. The gas works were in the hands of a private company, but the Council were at the present moment negotiating for the purchase of the same. Previous to the formation of the Local Board the sewage of the district was discharged into the river Welland at a point below the town. In 1882, twelve acres of land were purchased for the purposes of sewage disposal, of which nine and a half acres were laid out on the intermittent downward filtration system. In 1889 two small settling tanks were put in at the outfall of the main sewer from the town to catch the grosser matter coming down. By 1894, with the vastly increased supply of sewage to be dealt with consequent upon the new water supply and the development of the district, it became absolutely necessary to provide additional means of purification. Two fields of pasture were accordingly purchased adjoining the lower end of the old sewage farm, forty-seven acres in extent, at the price of 84l. per acre. Nine acres of this land were unavailable for sewage owing to their natural position; about five acres were taken up by embankments, &c., leaving thirty-three acres available for sewage. The new land was kept as pasture, and worked on the broad irrigation system. The land was drained in a similar way to ordinary agricultural land with common tiles. A 9-inch socket pipe effluent drain, with inspection chambers, was laid at the lower end of the farm to pick up the land drains. The sludge from the settling tank was raised by means of chain-pumps, and when dry was sold to the farmers for 2s. per ton. The character of the subsoil varied, part of it being a loamy clay and the remainder of a more sandy nature. The average depth of the drains was only about 3 ft. Market Harborough was favourably situated as regards levels, and pumping was avoided both for water supply and sewage disposal. On several occasions money had been raised by private subscription for the widening, deepening, and straightening of the River Welland, and of late years no serious floods had occurred. In February last the nearest approach to a bad flood which had been experienced for seventeen years occurred, but no houses in Market Harborough were flooded, although the flood water made its appearance in the main street. A subject which, in his opinion, was too much neglected by that Association. Local Authorities had no power to compel the riparian owners to move in the matter; yet a Local Authority might expend money in watering a highway, and might compel an owner to cut a hedge adjoining such highway. Were floods of less consequence than dusty or dirty roads? With regard to sanitary matters he said the Council did not insist on flushing cisterns if efficient hand flushing was practised.

Mr. E. G. Mawbey, Leicester, in opening the discussion, congratulated the town upon the progress it was making. The increase of population during the past seven years had been 38 per cent., which was considerable. They had a splendid water supply and an excellent sewerage system and sewage disposal works. He congratulated the town upon having the land system of sewage disposal. A great many schemes and inventions had been brought out of late years, but there was nothing that beat the land for sewage disposal.

Mr. J. T. Eayrs, Birmingham, said he took exception to allowing streets to be made 30 ft. wide when the by-laws stipulated for 36 ft. It was a great mistake to go behind the by-laws, and he believed the public could obtain a mandamus to compel them to carry out the by-laws. Further, how could they expect the builders to comply with the by-laws in other respects if they themselves went behind them.

Mr. Barber, Islington, said he had also made a mark against the paragraph referring to the width of the streets. As Market Harborough was growing, and might in time become a populous centre, it was desirable that the Council should look ahead and try to see that the streets were made a proper width as provided in the by-laws; otherwise there would

be a great difficulty to face in the future, and a large amount of compensation to pay for land which at the present time ought to be given up to the public. He also thought they were a little in arrears of present day sanitation when the Council did not insist on flushing systems for water-closets if efficient hand-flushing was practised. He did not see how it was possible for the sanitary officers, unless they made very frequent visits indeed, to see that the closets were properly flushed.

Mr. W. Weaver, Kensington, having expressed the opinion that the streets ought to be a minimum width of 40 ft., said he would like to congratulate the district upon not having a School Board. It must be a happy state of things.

Mr. Walshaw, Peterborough, said he was sorry to say they had a system of hand-flushing of closets in Peterborough with houses built previous to the adoption of the model by-laws, and his experience of such closets was a very unpleasant one. He contended that the foul emanations from the manholes in the street were due to the inefficient way in which the closets were flushed. He was pleased to say they had now adopted the three-gallon system.

Mr. Pickering, Nuneaton, said he found that every sewage farm was condemned. The only point as to which he thought there might be no doubt as to the efficiency of the farm was the depth of the drains. He could hardly believe that drains of an average depth of 3 ft. would give good results. That struck him as a weak point in the system.

Mr. Mann, Sevenoaks, thought the provision made for infectious diseases rather meagre, and he took it that smallpox was the only disease for which accommodation was provided.

Mr. Coales said the hospital had never been used for anything but smallpox.

Mr. Dawson, Banbury, asked if the River Conservators sent their inspectors to take an analysis of the effluent regularly, and whether the analysis was satisfactory.

Mr. A. T. Davis, Shrewsbury, speaking with reference to the depth of drains on the sewage farm, said his opinion was that with depths so shallow as 3 ft. they could not get a properly purified effluent. He also deprecated the hand-flushing of water-closets.

Mr. Cooper, Wimbledon, thought it was rather soon to say anything about the depth of the drains before they knew the line of the land, and whether the sewage got two cleanings or had to trust to one.

Mr. Coales briefly replied to the various points raised in the discussion. He said that although the Council had passed roads of 30 ft. in width, with a 6 ft. building line on each side, the plans were now being sent in for roads of greater width. They did not analyse the effluent from the sewage farm, but they thought it a very good one. They had no complaints no Conservancy Board, and no inspectors to see them. With regard to the under drainage when they laid out the farm they trusted to the existing land-drains, but they found they required some little assistance, and they put in drains at an average depth of 3 ft. The land was rather flat, and they could not get the full of the effluent into the river if the drains were any deeper.

The President expressed the opinion that no system of sewers would be efficient so long as they were flushed by hand. The greatest nuisance would arise at the manholes from these inefficiently flushed closets, and he would strongly recommend that a three-gallon flush be insisted upon.

Mr. H. G. Coales then submitted a second paper on "Public Baths for a Small Town." He said these baths were opened in October last and were built from his designs. The initial problem was how to carry out good baths for 2,000l. The Council presented a good site for the purpose, which had the great advantage of adjoining the Council offices, to which a caretaker's house was attached. The accommodation to be provided was simplified to swimming bath, slipper bath, pay office, and attendant's room, laundry and boiler-house. A swimming bath of 75 ft. by 25 ft. was decided upon, with a depth of 7 ft. of water at the deep end, and 3 ft. 6 in. at the shallow end of the bath. There were twenty-four dressing-boxes, with a wooden gallery over. The partitions between the boxes were 5 ft. high. The bath walls were of the following average section: 10 in. Portland cement concrete, 1½ in. common red bricks in cement mortar, ½ in. cement mortar rendering, ¼ in. neat cement skimming, and

* Driver Prize, 1897, and Penfold Silver Medal, 1897.

† Penfold Gold Medal, 1897.

‡ Crawford Prize, 1897.

4 in. best white glazed brick lining in cement mortar. Two lines of blue glazed bricks were run longitudinally down the bath floor for the assistance of those swimming under water. The bath walls were finished by 2-in. round-nosed York coping. The floor was of the following average section: 8 in. of Portland cement concrete, 1½ in. cement mortar rendering, ½ in. neat cement skimming, and 3 in. best white glazed brick lining in cement mortar. There was a hollow galvanised iron handrail around the swimming bath, which served an additional purpose in circulating the water. The handrail was perforated and provided with aerators, by means of which air was mixed with the water in the bath, and it was claimed that the water was thereby freshened and purified. To the right of the entrance hall was a door leading to four private slipper baths, with a water-closet attached. Each room was fitted with an enamelled iron bath, with hot and cold water laid on. To the left of the entrance hall was the pay office and attendant's room. The Roster system of heating was adopted, the warmed water from an annular heater issuing from three gun-metal spreaders at equal distances up the centre line of bath. By this system bathers could not be scalded, and the temperature of the water was uniformly raised with no cold patches. The cost was £1,102., and they expected to spend another £50. upon a new boiler, making a total cost of £1,152.

Mr. Barber, Islington, expressed a preference for asphalt rendering to cement as less likely to be affected by leakage.

Mr. Eavrs, Birmingham, said they would be especially interested when visiting the baths to see the way in which the water was aerated.

On the proposition of the President, seconded by Mr. Mawbey, Leicester, a hearty vote of thanks was accorded to Mr. Coales for his papers.

Mr. Coales entertained the members attending the meeting to luncheon, and the remainder of the day was occupied in inspecting the baths, the sewage farm, and the Burn Mill Hill service reservoir. At the conclusion of the visits the members were entertained to tea by Mr. S. Symington, late Chairman of the Baths Committee.

THE INSTITUTE OF BUILDERS:
ANNUAL DINNER.

The Annual Dinner of the Institute of Builders was held at the Trocadero Restaurant, Piccadilly Circus, on Wednesday evening. The President of the Institute, Mr. W. Shepherd, occupied the chair, and amongst those present were: Messrs. Rowland Plumbé, H. H. Statham, James Edmeston, F. May, J.P., J. M. Burt, J.P., J. Jacobs (the Master of the Carpenters' Company), J. Howard Colls, F. J. Dove, G. H. Trollope, H. H. Bartlett, G. Kett, J.P.; J. Randall, C. Wall, W. Scrivener, and others.

The loyal toasts having been honoured, Mr. J. Mowlem Burt proposed "The Navy, Army and Auxiliary Forces," coupled with the name of Major Gilks, who responded.

In giving the toast of "The Institute of Builders," the President referred to the origin of the Institute, mentioning that it was first known as the "Builders' Society." It was felt, however, that that body was too exclusive, and efforts were made to widen its sphere of influence. The members of the building industry who founded the Institute were actuated by the best of motives, viz., to raise the status of members of the industry, and they evidently thought that a builder had something more than a mere money-making instinct, and that he wanted a *locus standi* amongst other similar bodies. Membership of the Institute was not confined to builders in the Metropolis, and in their ranks they had several influential provincial master builders. The Institute did not take any part in the relations between the masters and the men. The Central Association of Master Builders did that; but they looked after the larger interests of the industry. No doubt the founders of the Institute had in view meetings like that which he was addressing, and a very useful purpose was served by such gatherings, for nothing contributed more to a better understanding between men than meetings where business was not discussed, and they could meet on common ground. The Institute was able, owing to its standing, to foster and develop the interests of the members of the building industry—the largest industry in the Metropolis. They were endeavouring to impress upon builders the

importance of consolidating themselves and assisting the efforts of the Institute; but that was not an easy task, for the circumstances under which the industry was carried on, and the severe competition of the time, made it difficult to bring people together and make them realise that there was an interest common to all.

Mr. Howard Colls then proposed the toast of the "Architects and Surveyors," coupled with the name of Mr. Rowland Plumbé. In the course of his remarks he said that their trade was passing through a very curious phase. There had been no limited liability companies floated lately amongst the leading business in London, and architects could congratulate themselves that in dealing with ordinary firms they had some one personally to deal with their work; but builders were now faced with the opposition of firms who called themselves builders, but who had no claim to that title. Various stores, for instance, composed of directors who knew nothing about the trade, represented to their customers that neither architects nor builders were needed and that work could be done better by the stores. He did not think that would last long, and he was sure that architects would be better pleased to deal with men who understood their business.

Mr. Plumbé, in response, said that he agreed with the President that meetings like that did much good in enabling men to understand each other, and architects and builders in particular. Architects were sensible of the difficulties builders had to contend with at the present time, principally in regard to labour, and architects did all they could to meet those difficulties in the best possible way. The labour difficulty was not by any means at an end, and at a later time, when the crisis had to be faced, he believed that architects would gladly assist builders to get through their troubles.

The Chairman then proposed the toast of "The Carpenters' Company," coupled with the name of Mr. Jacobs, the Master, and referred to the assistance which the Company had afforded in promoting technical education amongst those engaged in the building trade.

Mr. Jacobs having briefly replied, Mr. Dove proposed the toast of "The President," who responded.

The next, and last toast, was "The Visitors," proposed by the Chairman, and coupled with the name of Mr. H. H. Statham, who briefly replied, thanking the Institute for their hospitality to the visitors.

The proceedings then concluded.

ARCHITECTURAL SOCIETIES.

GLASGOW ARCHITECTURAL ASSOCIATION.—At a meeting of this Association, on Tuesday, the 4th inst., Mr. Geo. S. Hill, Vice-President, in the chair, Mr. W. J. Anderson read a paper on the "Acropolis of Athens in the Light of Recent Researches." He, in the first place, showed the kinship of the primitive Acropolis of Troy, Tiryns, Mycene, and Athens, and the indications at Athens of the pre-Homeric era, to be superseded by that of Hellenic Greece. The buildings of this period were severally considered in their purpose, the ancient temple of Athene Polias, the Parthenon of Pericles, the entrance gates of the Propylaea, the Megaron of Erechthens, and his museum or Heroon. The present aspect of the buildings, their architectural details, and their former magnificence, were shown by a large number of lantern views and restorations.

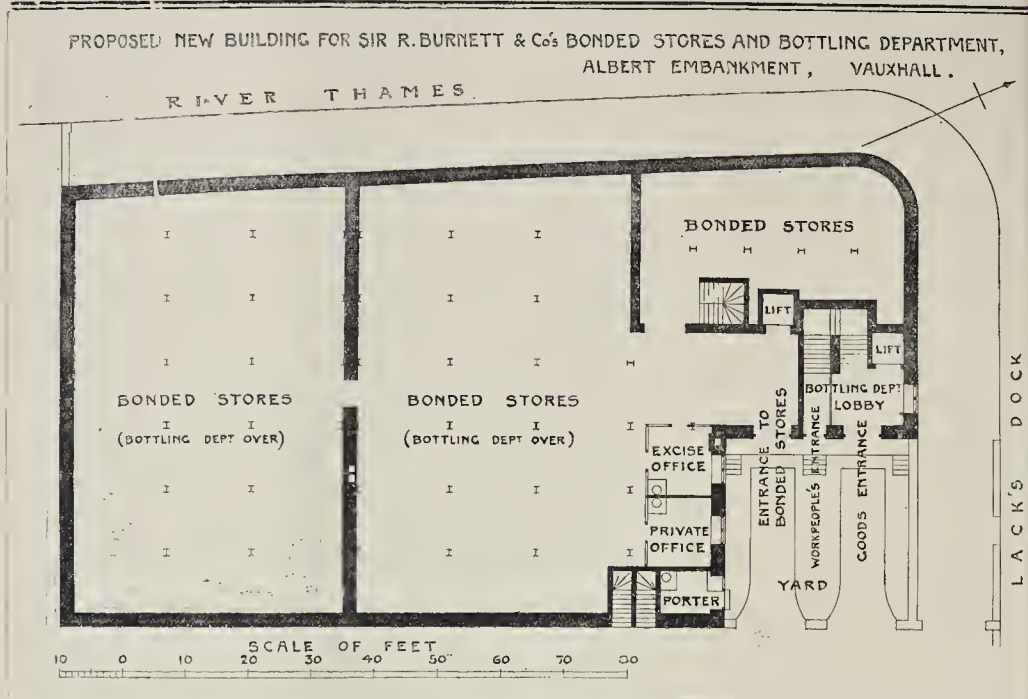

ARCHÆOLOGICAL SOCIETIES.

ARCHÆOLOGICAL INSTITUTE.—At the general meeting of this Institute on the 5th inst., Mr. James Hilton, Hon. Treasurer, in the chair, Mr. Tailourd Ely read a paper on "Wreaths and Garland," with especial reference to Greek and Roman usages. He pointed out that the modern English limit the use of wreaths to funeral purposes, whereas among the ancients the wreath was a sign of feasting and joy. Religion originally prompted the use of the garland, which may have been connected with the widespread belief in the supernatural powers of trees and plants. Wreaths were employed as bandages to assuage headache resulting from debauch; and certain plants, as the myrtle and the rose, were believed to exercise a prophylactic power against the effects of wine. The Greeks, too, were fully sensible of the beauty of flowers, and floral decoration played a great part in Greek poetry, from Sappho downwards. Among the early Romans, on the contrary, the use of wreaths in public was

strictly limited to religious functions, and marks of distinction connected with services performed to the State, such marks of distinction being in great part derived from the Etruscans, who made great use of wreaths. In Greece, the simple wreath of olive, &c., as a reward for athletes, superseded the prizes of intrinsic value offered in heroic times. In the fifth, and still more in the fourth century, crowns, usually of gold, were awarded to successful statesmen or warriors. Wreaths of laurel, myrtle, vine-leaves, or flowers were commonly worn at *symposia*, and were thus represented on vases. For the most part, of course, these wreaths had perished; but some had been preserved in Egypt. The manufacture of garlands gave employment to many, and its processes were depicted in several Pompeian pictures. Gold crowns were frequently modelled in the form of leaves, as ivy, &c. Other materials for wreaths were wool, and artificial leaves and flowers of horn or silk. Mr. Ely exhibited photographs of paintings and casts of coins in illustration of his paper. Professor T. McKenny Hughes then read a paper on "A Comparison of Flint Implements of the Palæolithic and Neolithic Age." He exhibited a series of flints in illustration of the view that in their earlier stage of manufacture the Palæolithic and Neolithic implements passed through the very same stages—that is to say, that a block of flint was first rough-dressed by both Palæolithic and Neolithic people into the same general form, and that the Neolithic men merely proceeded further on the same lines, afterwards finding out the way to grind the edge, and finally the whole implement. He pointed out that, with few exceptions, all Neolithic-worked flints were found on the surface or in artificial excavations; whereas, as a rule, Palæolithic implements were found in deposits which seemed to be due to the sweeping down into hollows or river terraces of surface soils in or on which the implements and other stones lay. In the river gravels the flints did not owe their shape to the action of running water, but had that variety of character and colour which showed that they were due to sub-aerial weathering; and the amount of subsequent attrition that they had undergone was very small. Fracture was, therefore, the rule, not the exception, in all river gravels, so that the flints were sub-angular and quite unlike the symmetrical flint pebbles of a sea beach. All the irregular fractures produced by accident on surface flints may be referred to two principal groups—the fracture produced by blows and those due to unequal expansion and contraction from changes of temperature and amount of moisture. They are found, as might be expected, in the flints of the terrace and plateau gravels, and if a flint got wedged in, these fractures would be commonly repeated along the exposed edge in a manner suggestive of design or use. In this way he explained the so-called Palæoliths.

COMPETITIONS.

WINTER GARDENS AND CONCERT-ROOM, FELIXSTOWE.—The Felixstowe Spa and Winter Garden Company invited, some time ago, plans and estimates for laying out about 800 ft. of the cliffs and grounds beneath the present public gardens, for the building of a pavilion or other erection available for concerts or winter gardens, with reading and refreshment rooms, and lavatories and cloak-rooms, and with or without bath, club, and billiard rooms. The cost was not to exceed 15,000l., and a premium of 50l. was offered for the drawing placed first in the order of merit, and 15l. for the drawing placed second. The Committee has been advised by Mr. E. C. Frere, of London, and upon his report have awarded, out of eight competitors, the first premium to Mr. Brightwen Binyon, of Ipswich, and the second to Mr. George William Leighton, of Ipswich and Felixstowe, and arrangements are being made to carry out the work. Mr. Binyon's plan provides for a central building, containing billiard, refreshment, and cloak rooms, over which is a large concert hall or winter garden, with reading, smoking, and dining rooms, facing the sea, and opening on to a promenade along the front of the site, under which is arranged beach houses, that could take the place of the present bathing-huts. The concert hall is lighted principally from the top by a glass pavilion roof, having a promenade round, with a band stand and wind shelters to the front. The buildings and grounds are entered from the beach in the centre, and also from

the cliff gardens. The grounds have been divided into three, and the building so arranged that it can be carried out in sections:—The first, the centre portion, containing the concert hall and beach huts; the second, the portion to the west of the zig-zag containing the spa and baths, and also a continuation of the promenade; and the third portion consisting of a continuation of the promenade to the east, as far as the end of the site. The beach huts would be suited for swimming, boating, or rowing clubs. The design has been arranged with the view to the subsequent building of a pier, starting from the level of the promenade at the centre of the range of buildings, and the grounds are laid out with paths and tennis courts, with summer huts and seats at convenient places. According to Mr. Leighton's designs, the winter garden and concert pavilion, the latter's internal dimensions being 80 ft. by 52 ft., are placed in the centre of the main building. It has a fine sea frontage, and the roof is covered with glass. It is in the shape of an irregular octagon, with long sides, and there is a deep stage or orchestra on one side. Cloak-rooms and lavatories are placed in convenient positions, with pavilion and dressing-rooms for the artists. Billiard, card, reading, ladies' refreshment and pump rooms are all provided, and the whole of the flat roof forms a promenade, with band stands or kiosks. The style adopted in the design is Classical, and there is a long colonnaded terrace or verandah extending along the front. Salt-water swimming baths for ladies and gentlemen are shown in a separate building at the eastern point of the cliff. Both designs show that the buildings will be of red brick and stone. The following are the names of those who sent in plans: Messrs. G. H. Elphick, Broad-street, E.C.; Ernest Herber, 32, Bedford-row, W.C.; F. E. Robinson, 13, Victoria-street, S.W.; Mawson & Gibson, Windermere; J. H. Wright, Ipswich; H. W. Roberts, Newmarket.

LIVERPOOL ENGINEERING SOCIETY.—At the annual meeting of the Liverpool Engineering Society, at the Royal Institution, Colquhoun-street—Mr. S. B. Cottrell presiding—the annual report, which was adopted, showed that the additions to the roll of the society during the year had been forty-nine, compared with sixty-one in the previous session. At the present date the number of members of all classes is 363. During the evening Mr. S. B. Cottrell was heartily thanked for his services as President during the year, and Mr. George Farren, M.Inst.C.E., was elected his successor.

Illustrations.

PRESBYTERIAN COLLEGE, CAMBRIDGE.

HIS new College, which is to be called Westminster College, is now being erected on a fine site of about three acres in Madingley-road, and near the new portion of St. John's College. The accommodation consists of class-rooms with a large library over, twenty-six sets of students' rooms, dining-hall, senate room, principal's house, &c.

The materials used are red facing bricks with Clipsham stone dressings, the roofs being covered with Colleyweston stone slates. The whole of the construction is fireproof, and the majority of the joinery and the open timber roofs to dining-hall and library are to be of wainscot. Mr. Shint, of Cambridge, is the contractor.

The design was selected in a limited competition about eighteen months ago. Mr. H. T. Hare is the architect. The drawing is exhibited at the Royal Academy.

SCULPTURE FOR OXFORD TOWN HALL.

THESE two figures, typical respectively of "Industry" and "Sloth," are at present exhibited in a prominent position in the Octagon Hall at the Royal Academy. They form two of a series of figures executed by the sculptor, Mr. F. E. E. Schenck, for the Town Hall at Oxford, of which, as our readers will remember, Mr. H. T. Hare is the architect, and which was opened on Wednesday last by the Prince of Wales.

The series of figures, in a position about eighteen feet from the ground, is continued round three sides of the Town Hall. In the Lecture Room at the Royal Academy are exhibited also six sketch designs of some of the figures.

The two here illustrated form very good examples of sculpture applied to architecture, being both decorative in effect and also having a distinct and appropriate signification.

PROPOSED NEW BONDED STORES, VAUXHALL.

THIS building is proposed to be erected by Sir R. Burnett & Co. to replace their present building on the Surrey approach to Vauxhall Bridge, which will shortly be pulled down by

the London County Council for improving the approach to the new bridge, the site for the new building being close by on a wharf facing the river, and behind Messrs. Burnett's distillery. It consists of four floors, the basement and ground floors being used for the bonded stores, and other two floors for bottling and packing, &c., both sections having their offices, excise offices, and power lifts and cranes. The spirit vats are to be in the upper part of the building, to supply the bottling departments, the vats being lilled from a gallery above in connexion with a lift from the bottling department below. There is a piece of wharf running between the building and the river and round by the creek, to facilitate loading and unloading barges.

The building is to be faced with red bricks, with stone copings to the parapets, the roof of green slates with half-round red tile ridges and lead hips. The frames, mullions, and transoms to windows are of wood, and the whole of the floors and staircases are of fireproof construction. ALLAN F. VIGERS.

NEW SCHOOLS FOR THE FRENCH PROTESTANT CHURCH OF LONDON, SOHO SQUARE.

THESE schools are about to be erected on a site in Noel-street, Soho, recently acquired by the trustees of the French Protestant Church, of Soho-square, near which they will be conveniently placed.

The building will provide space for 212 children and residence for the master. On the ground-floor room for eighty-two infants is provided, on the first floor eighty girls, and on the second floor eighty boys. The lavatories, cloak-rooms, and water-closets are in a spare building in the rear, the closet blocks being in all cases aerially disconnected. The exterior will be faced with Luton bricks and bright red dressings, the cornice, strings, &c., being in red terra-cotta and the roof of Westmoreland slates to accord with the colour and materials used in the church. Mr. Aston Webb is the architect, and the drawing is exhibited at the Royal Academy.

ALEXANDER THOMSON STUDENTSHIP DRAWINGS.

THE Alexander Thomson Studentship bears the name of the late eminent Glasgow architect who, from his predilection for a Greek character of detail in his buildings, and the ability which he showed in adapting Greek

details to modern architecture, was often spoken of as "Greek Thomson." He left a fund to found this studentship for the furtherance of the study of ancient Classic architecture. The value of the studentship is 60*l.*, and it is open for competition every third year to any architectural students in the United Kingdom, between the ages of 18 and 25.

The last holder of the studentship is Mr. G. A. Paterson, of Glasgow, and the drawings are reproduced from a portion of his work in connexion with it. One of them consists of measured drawings of one of Alexander Thomson's best works, the United Presbyterian Church in St. Vincent-street, Glasgow. The other sheet is a design for a memorial chapel in the same school of architecture.

The chapel is designed to seat 100 persons, with space for a monument. The author writes:—

"The site is open, and the area available is 20,000 superficial feet, but the ground covered by the building proper does not exceed 5,000 superficial feet.

The design is treated in an early Classic style, the detail being principally of Egyptian character. A dome has been introduced to give it a monumental appearance. The main entrance is through a front porch (on either side of which there is a cloak-room) into an inner vestibule which contains the font. The vestries are on one side and the corresponding space on the opposite side is utilised for the monument.

The organ is placed above the ambulatory in the choir, and the heating chamber is in the space below.

The materials suggested are principally marble and mosaic."

THE LONDON COUNTY COUNCIL.

This Council re-assembled on Tuesday at Spring-gardens, for the first meeting after the Easter recess, Dr. Collins, Chairman, presiding.

Louis.—On the recommendation of the Finance Committee it was agreed to lend the Kensington Guardians 2,700*l.* towards defraying the cost of erecting new buildings at the workhouse in Marles-road; the Guardians of St. Olave's Union 13,800*l.* for the purchase of a site at Ladywell upon which to erect buildings for the aged poor; the Paddington Guardians 19,000*l.* for the purchase of a site and the erection of casual wards; the St. Giles District Board 3,500*l.* for the construction of an underground convenience in High Holborn; the Battersea Vestry 5,000*l.* for the erection of baths and wash-houses; and the Hackney Vestry 17,620*l.* for the erection of baths and wash-houses.

The Estimates.—Lord Welby, in moving the reception of the Report of the Finance Committee, explained the estimates for the coming year. The net expenditure for 1897-98 was calculated at 2,718,556*l.*, as compared with 2,433,000*l.* for 1896-97. As London was growing year by year it must be anticipated that the estimates would increase as time went on. It was satisfactory to know that the expenditure, as a rule, fell short of the estimates. The net debt of the Council on March 31, 1896, was 37,941,704*l.*; the rateable value of London on April 6, 1895, was 34,221,830*l.*

Fires in Theatres.—Upon the reception of the report of the Theatres and Music Halls Committee.

Mr. Fardell, M.P., called attention to an alleged report of a conference of the chief officers of the Metropolitan Fire Brigade and others, said to have been held on the 5th inst., consequent upon the fire in Paris. It stated that reference was made to the state of the gallery entrances of the London theatres, and the opinion was expressed that they were a public danger on account of the distance of the pay-boxes from the actual entrances. The officers were asserted to have expressed the unanimous opinion that the pay-boxes should be close to the entrances. He ventured to think that that was a most important and serious statement, and he now desired to ask the Chairman of the Theatres Committee whether he could give the Council an assurance that the statements were erroneous, and whether he would communicate with the Chairman of the Fire Brigade Committee with reference to steps being taken to prevent the publication of similar sensational statements before there had been submitted an official report by the chief officer of the brigade.

Mr. Kemnant, Chairman of the Theatres Committee, in answer to Mr. Fardell, said the published statement was an erroneous one. The barriers near the pay-boxes in the theatres were so constructed as to prevent crushing and accident upon the ingress of the audience, and not to offer any obstruction to their egress.

On the report of the Building Act Committee,

Sir A. Arnold asked whether the powers of the Building Act afforded security against the occurrence in London of such a calamity as that which had taken place in Paris.

Mr. Payne, Chairman of the Committee, replied that a building such as that described in the Press, in which a bazaar was held in Paris, could not be lawfully erected or used for any public purpose in London. Buildings of a temporary character required the licence of the Council, under Section 84 of the London Building Act, but such licence was not given unless the construction and the means of exit in case of panic were quite satisfactory. There was, however, at present nothing to prevent the use of any permanent building as a bazaar, the contents of which might be as dangerous as those in the Paris fire, so long as neither music, dancing, nor entertainments of the like kind, nor stage plays, formed part of the proceedings at the bazaar.

On the motion of Mr. Dickinson, the following resolution was unanimously agreed to:—

"That it be referred to the Theatres and Music Halls Committee to report what security is afforded by the existing law to the public against fire and panic in charitable bazaars and other similar gatherings, and, if necessary, to make suitable recommendations to the Council for the amendment of the law."

Proposed Lodging-House for Women.—On the motion of Mr. Beachcroft (Vice-Chairman), the Public Health and the Housing Committees were instructed to report as to accommodation for women and children in London shelters and common lodging-houses, and as to whether the Council, having already established a model lodging-house for men, should not now construct a house (to serve in like manner as a model) for the accommodation of women alone or of women and children. The motion was agreed to.

The Council soon after adjourned.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on Tuesday, the Building Act Committee reported that they had considered the unmentioned applications under the London Building Act, 1894, and had arrived at the following decisions:—Those applications which have been agreed to are granted on certain conditions:—

Poplar.—That consent be given to the erection of an addition on the south side of West India Dock Station to overhang West India Dock-road, on the application of Mr. J. Wilson on behalf of the Great Eastern Railway Company.

Marylebone, East.—That consent be given to the erection of two iron and glass shelters in front of the Oxford Music-hall, Oxford-street, on the application of Mr. H. Lundy on behalf of the Oxford Music-hall, Limited.

St. George, Hanover-square.—That consent be given to the erection of a pediment and blocking to the porch at No. 15, Old Bond-street, on the application of Messrs. J. T. Wimperis & Arber, on behalf of Messrs. Lawrie.

Lewisham.—That consent be given to the erection of a porch in front of Cecil House, Westwood-road, Sewardston, on the application of Mr. J. Johnson on behalf of Mr. J. Pearson.

Marylebone, West.—That consent be given to the erection of an iron and glass covered way over part of the forecourt of No. 26, Abercorn-place, St. John's Wood, on the application of Messrs. W. Densham & Sons on behalf of Mrs. Margaret Lean.

Paddington, North.—That consent be given to the rebuilding of the bank premises, No. 2, Egham-avenue, at the corner of Harrow-road, on the application of Messrs. Edmeston & Gabriel on behalf of the National Bank, Limited.

St. George, Hanover-square.—That consent be given to the erection of a portico and balcony in front of No. 2, Great Stanhope-street, on the further application of Messrs. Matthews, Rogers, & Co.

St. George, Hanover-square.—That consent be given to the erection of a balcony at the first-floor level, in front of No. 18, Park-lane, on the application of Mr. G. Lethbridge on behalf of Mr. W. Wright.

Strand.—That consent be given to the erection of an oriel window at the first-floor level in front of No. 31, Foubert's-place, Regent-street, on the appli-

cation of Messrs. Goodwyn & Sons on behalf of Mr. C. Soderberg.

Peckham.—That consent be given to the erection of a porch and covered way at the new relief-station, No. 106, Peckham Park-road, to be built upon Bird-in-Bush-road, on the further application of Mr. R. P. Whellock on behalf of the Guardians of the Poor of the Parish of Camberwell.

Westminster.—That consent be given to the erection of an addition with projecting bay windows and porches at Members' Mansions, No. 36, Victoria-street, at the corner of Great Chapel-street, on the application of Messrs. J. & A. E. Bull on behalf of Mr. J. B. Martin.

St. George, Hanover-square.—That consent be not given to the erection of two iron and glass shelters at the entrances to the Berkeley Hotel from Piccadilly and Berkeley-street respectively, on the application of Mr. R. Griggs on behalf of the Berkeley Hotel Company, Limited; as, apart from other objections, it is considered undesirable to agree to the principle of covering over portions of the public way as proposed, although it might be of great public utility if, as a general practice, footways of suitably designed streets were so covered.

Brixton.—That consent be not given to the building of the Perseverance public-house, No. 51, Vassall-road, North Brixton, with the flank of the building to abut upon Clivessell-road, on the application of Messrs. Eedle & Meyers on behalf of Mr. W. S. Penny.

Strand.—That consent be not given to the erection of an iron and glass shelter in front of the Tivoli Music-hall, Strand, on the application of Mr. W. F. Farthing on behalf of the New Tivoli Company, Limited.

Width of Way.

Bermondsey.—That consent be given to the erection of a two-story latrine addition on the east side of Holy Trinity Schools at less than the prescribed distance from the centre of Parkers-row, Dockhead, on the application of Mr. E. Cross on behalf of the Trustees of the schools.

Kensington, South.—That consent be not given to the erection of a workshop and stables at the rear of Nos. 5, 6, and 8, Park-terrace, Earl's Court-road, to abut upon Warwick-street and Sutton-street, respectively, on the application of Mr. F. E. Williams on behalf of Messrs. Harman, Pickett, & Floyd.

Space at Rear.

Finsbury, Central.—That the Council in the exercise of its powers under Sections 13 and 41 of the London Building Act, 1894, do not consent to, nor permit of, the erection of buildings adapted to be inhabited by persons of the working class, with shops on the ground floor, on a portion of lot 37 and on lots 39, 40, 41, 42 and 43 of the Council's land in Rosebery-avenue, Clerkenwell, with portions of the buildings at less than the prescribed distance from the centre of Jellie's-yard and Garmant-mews, and exceeding in height the width of those streets respectively, and also with irregular open spaces at the rear of the new buildings, as shown upon the plans submitted with the application of Mr. F. Smith on behalf of Mr. H. Royley.

Line of Fronts and Width of Way.

Poplar.—That consent be not given to the erection of a building on the north side of Prestage-street, to abut also upon Brunswick-street, with the forecourt boundary or fence in the position shown upon the plan submitted with the application of Mr. R. J. Beale on behalf of Mr. P. Hart.

Camberwell, North.—That consent be not given to the erection of a two-story building at the rear of the Duke of Clarence public-house, No. 181, Camberwell-road, to abut upon New Church-road, on the application of Messrs. F. J. Eedle & Meyers on behalf of Mr. A. E. Garrard.

Width of Way and Space at Rear.

Kensington, South.—That sanction be not given to certain deviations from the plan certified by the District Surveyor under Section 43 of the London Building Act, 1894, so far as relates to the proposed rebuilding and extension of a house known as Hillside, on the east side of New-road, Aubrey-walk (formerly Notting Hill-grove), Notting Hill, and that consent be not given to the erection of such building and of a two-story stable in connexion therewith, on the application of Mr. T. Arnold on behalf of Mr. H. Robson.

Formation of Street.

Peckham.—That an order be sealed and issued to Mr. F. A. Powell, sanctioning the formation or laying out of a street, 40 ft. wide, for carriage traffic, to lead from Surrey-road into Ivyton-road, Nutham, on his application to the Council on behalf of Mr. H. Ford. That the name Surrey-road (in continuation) be approved for the new street.

NEW PUBLIC HALLS, SELKIRK.—The new public halls for Selkirk, which have been named the Victoria Halls, have been erected and handed over to the town. The building comprises a large central hall with a suite of retiring-rooms and other accessories; a smaller hall, and a caretaker's house. It is situated in a central position at the east end of the High-street. The total cost is over 7,000*l.* The architect is Mr. H. J. Blane, Edinburgh.

Correspondence.

To the Editor of THE BUILDER.

R.I.B.A. ELECTIONS.

SIR,—I have ascertained from an Institute paper that between May 5, 1896, and May 3, 1897, twenty-eight meetings of the Council were held, but no less than sixteen of the members each attended only on an average of $2\frac{2}{3}$ occasions.

Five never attended, four of them went each to one meeting, and two of them were seen twice, yet all but one or two of these sixteen members are nominated for re-election.

But one of those members of the Council, who never attended any one of the Council sittings, atoned for his twenty-eight absences therefrom by his presence at the Institute dinner at Manchester, when he proposed the toast of "Architecture and the Sister Arts." A FELLOW OF THE INSTITUTE.

* * * To be quite fair, our correspondent should have mentioned that the gentleman who attended none of the Council meetings but attended the Manchester dinner, and proposed the toast referred to, was (as we find on reference to our report of the dinner) an eminent architect from Dublin, whose position on the Council was in the nature of an *ex officio* one, as the representative of one of the Allied Societies, and who was not one of the elected members of Council. The representatives of Allied Societies (generally Presidents of those Societies) are added to the Council in a complimentary spirit, and are not so much asked to attend the Council meetings as given the right to attend if they wish. As the Manchester dinner was a special occasion, representative members of the Institute were rather pressed to be present if possible. That appears to be the true statement of the case.—ED.

A POINT IN AMERICAN ARCHITECTURAL HISTORY.

SIR,—Information is earnestly desired concerning Peter Harrison, of York, said to have been a pupil of Sir John Vanbrugh (a statement in which I have little belief), and to have assisted in completing or decorating Blenheim Palace. At any rate, he came to New England, and erected, *cir.* 1750, some of the finest public buildings and churches of the colonial days, much more in the style of Gibbs than of Vanbrugh. His life and work in the colonies is somewhat known, but the time that he spent before going thither is apparently a blank. Can any one illuminate the darkness? S. F. BATCHELDER.
Old Cambridge, Mass., U.S.A.,
April 21, 1897.

ROYAL ACADEMY EXHIBITION.

SIR,—Owing to a clerical error, Mr. Arthur R. G. Fenning's name was omitted from the catalogue of architectural illustrations now in the Academy, as being joint architect with me of the design for the New Presbyterian College at Cambridge.

In justice to him I shall therefore feel greatly obliged if you can find space to insert this letter in your next issue.

W. HOWARD SETH-SMITH.

PRESERVATION OF WOOD.

SIR,—Can any of your readers say what proportion of slaked lime to tar is most to be recommended for the preservation of wood out of doors, and should this mixture be applied hot or cold? S. B. P.

The Student's Column.

SPECIFICATIONS.—XX.
GLAZIER.

Quality of Materials.—It is a very usual thing to specify that "all glass is to be of the best description, clear from all bubbles and other imperfections," but as a matter of fact this stipulation is seldom strictly adhered to in the carrying out of the work. It is, in fact, one of those general and loosely-worded requisitions for the very highest quality, which are not intended to be acted upon either by the architect or builder. It is, therefore, more satisfactory to indicate precisely the quality which is desired. Thus, for example, sheet glass is made in six qualities, which are known respectively as Picture A, Picture B, Best, Seconds, Thirds, and Fourths. The Picture quality alone is that which is really altogether free from bubbles, and also as flat as can be made. The other qualities differ in their variation from perfect flatness and perfect freedom from bubbles. It would, therefore, be better and more satisfactory to put in a clause such as the following:—All the glass to be of the precise quality described in the specification, to be well puttied and back puttied except where

otherwise described, and to be sprigged where required. (Spriggs are made in two sizes, $\frac{1}{4}$ in. and $\frac{1}{2}$ in.; but it is hardly necessary to specify which size is to be used save in exceptional circumstances). For large panes of glass and skylights it may be as well to specify that the glass is to be puttied with Thermo plastic putty. For glazing to iron, hard putty should be specified thus:—"the iron sashes are to be glazed with hard putty composed of oil and red and white lead." Under this heading should be described the manner in which the edges of glass in door panels are to be bedded, whether in india-rubber, wash-leather, felt, or flannel. A general clause would apply thus:—All the glazed panels in doors to have the edges bedded and to be bedded in double thickness of white Welsh flannel and fixed with beads, secured with brass cups and screws (or brass screws only, or bradded in for cheap work). In specifying plate glass be sure to indicate whether patent plate or British plate is to be used; patent plate being really sheet glass polished on both sides. Patent plate is made in three qualities: best, seconds, and thirds, and two colours of which the "crystal" or "usual" is the better for window glazing, as it is harder. In British polished plate glass there are three qualities: ordinary, best, and silvering, the latter being only used for looking glasses, as a general rule.

Sheet Glass.—The windows numbered to on plans to be glazed with 26 oz. sheet glass of "seconds" quality. The windows of scullery to be glazed with 21 oz. sheet glass of "thirds" quality. The windows of larder and pantry to be glazed with 21 oz. sheet glass of "thirds" quality ground on one side.

Rough Plate.—The borrowed light between scullery and corridor to be glazed with rough cast plate $\frac{1}{4}$ in. thick (this is the cheapest variety of plate glass, and there is only one quality but of different thicknesses). Skylight over to be glazed with $\frac{1}{4}$ in. plain rough rolled plate. The roof of conservatory is also to be glazed with the same glass.

Polished Plate Glass.—The windows of reception-rooms, numbered to on plans, to be glazed with British polished plate glass about $\frac{1}{4}$ in. thick, of "best" quality, fixed with beads secured with brass cups and screws.

Embossed Glass.—Specify whether this is to be ordinary embossed, or whether the design is to be worked by sand-blast.

Coloured Glass.—Specify whether the glass is to be coloured sheet with flashed colours, stating the weight, 16 oz., 21 oz., &c., or whether pot-metal or rolled cathedral glass; particularise the colours that are to be used, as the price of glass varies with the colouring.

Lead Lights.—Specify whether the work is to be carried out with broad comes or narrow comes. The kind and quality of glass to be used, and state if it is to be fixed with stout copper wire bands to wrought iron saddle bars, the diameter and distance apart of which is to be stated, and explain whether the glass is to be bedded in mastic cement or in white lead.

Iron Casements.—Specify these thus: The windows numbered to on plans to have iron casements of Messrs. manufacture as No. in their list p.c. price l. Gunmetal casements and other specially made articles of this kind should also be specified in a similar manner as provisional items.

Crown Glass.—This is now but seldom used except for the sake of the centre blob or "bullion," and even these are less in favour than they were twenty years ago. The qualities of crown glass are classified as with sheet glass. Specification may be thus: The windows numbered to on plans to be glazed with flattened crown glass of "seconds" quality, the small panes having each a "bullion" cut from centre of table.

Doors.—The doors numbered to on plans to have the centre panel glazed with patent plate glass of "second" quality and No. 4 thickness (the thicknesses are No. 1 to No. 4, weighing about 13 oz. to 24 oz. per ft. super) ground on one side.

The doors numbered to on plans to have the upper panel glazed with British polished plate glass of "best" quality and about $\frac{1}{4}$ in. thickness in one square.

Bent Glass.—The windows of circular bay in drawing-room to be glazed with British polished plate glass of "best" quality and about $\frac{1}{2}$ in. thickness, bent to accurately follow curve of bay (which is 15 ft. radius).

Completion.—Clean and polish all glass and leave same perfect at completion.

Paper-Hanger.

The best way to deal with this trade is as follows:—

The paper hangings are to be of Messrs. manufacture, and the several rooms are to be hung with paper of the list price value quoted in the following schedule:—
Dining-room 5s. per piece.
Drawing-room 6s. per piece.
Bed-room (No. 1) 2s. 6d. per piece, &c., &c.

Dados, Friezes, and Borders.—Mention expressly which rooms are to have dados, friezes, and borders, and give the width of each.

Hanging of Papers.—All walls which are to be papered are to be rubbed down, stopped, sized, and prepared for paper-hanger. The walls of the following rooms are to be hung with lining paper before the wall paper is hung: Dining-room, drawing-room. All papers are to be cut close.

Damp Walls.—If there is any danger of any of the walls being damp, care must be taken to specify the selected precautionary devices, such as thin sheet-lead or tin-foil, tarred paper, or battening and canvas, or whatever else may be preferred by the architect. In specifying canvas and battening mention that the nails are to be painted and covered over with strips of common paper before the papering is done.

Varnishing Papers.—The wall-paper of staircase to be twice sized and once varnished with good copal varnish (or French oil varnish if the paper is of a delicate colour).

Painting Papers.—Flock paper of ceiling of drawing-room is to be twice sized and painted in three coats of good oil colours to an approved light vellum tint, and flatted.

Zinc Eaves Gutters.—It has been suggested by a practical zinc worker that the durability of zinc gutters is greatly increased by the stiffening tubes being used at closer intervals than was mentioned in accordance with usual practice in our chapter of last week, and that screws are better than nails for fixing. This suggestion undoubtedly makes for higher class work and for this we may therefore specify "The eaves gutters to be O.G. moulded, 4 in. eaves gutters of No. 15 gauge Vieille Montagne zinc with stiffening tubes 12 in. apart and secured to fascia with 5 in. galvanized round-headed screws through each tube." Such a construction will give the zinc its full chance of durability.

OBITUARY.

DR. KARL VON LUETZOW.—We regret to announce the death of this learned Professor, who held the chair of Art History at the Royal Academy of Arts at Vienna, and was particularly active in all questions relating to the architectural improvement of the Austrian capital. Dr. Luetzow for many years contributed to the Art Press of his country, and his criticisms in the *Neue Freie Presse*, the leading Austrian daily, played a more important part in the Art circles of his country than he perhaps generally the case. It was in that journal that the deceased Professor also published his scathing criticisms on the Berlin Houses of Parliament, and German architecture generally, and drew upon himself and his Austrian confreres a great deal of abuse. Of his various publications in book form we may mention especially his "Denkmaeler der Kunst" (in collaboration with Luehke) and his "Monuments of Church Architecture."

GENERAL BUILDING NEWS.

OXFORD MUNICIPAL BUILDINGS.—On Tuesday the Prince of Wales opened the new Municipal Buildings which have been erected at Oxford. The architect of the buildings is Mr. H. T. Hare, and Mr. Chappell, of Pimlico, was the builder. Illustrations of the building have been published in the *Builder* for July 9, 1895, and August 19, 1895.

ART GALLERY, BATHS.—A meeting of the General Committee, who have charge of the arrangements for the erection of an Art Gallery was held at the Bath Guildhall on the 4th inst. The recommendation of the Building Committee that Mr. J. M. Brydon be appointed architect was agreed to.

THEATRE, SHEFFIELD.—It is stated that the directors of the Sheffield Lyceum Theatre have let to Messrs. George Longden & Son, Neepsend, the contract for the reconstruction and alteration of the Old City Theatre, which is to be reopened under the name of the Lyceum Theatre. The contract is 10,900l. The architect is Mr. W. G. R. Sprague, of London.

BOARD SCHOOL, PENKHULL, STAFFORDSHIRE.—On the 3rd inst. a new mixed Board school was opened at Penkhull. The school is built on the central hall principle, with three class-rooms on either side and one at the end. The building occupies a position at the junction of Princes-road

and Penkhill-street. It provides accommodation for 470 children. The exterior is marked by two towers over the entrances, with carved cement friezes, the rest of the work being of brick, with stone sparingly used. The walls inside are plastered, and have tiled dados, supplied by Messrs. Milton, Hollins, & Co. Mr. T. Godwin is the contractor for the building. The heating is by Messrs. R. Dawson & Co., of Stalybridge. Messrs. R. Scrivener & Co., of Hanley, are the architects.

ST. MARY'S SCHOOLS, ROCHEDALE.—The new day and Sunday schools built in Redcross-street by the parishioners of St. Mary's, Wardleworth, were opened recently. The architects are Messrs. Oliver & Leeson, of Newcastle, the builders being Messrs. W. A. Peters & Sons. In the basement there is an infants' schoolroom with gallery, two class-rooms, a teachers' room and a couple of cloak-rooms. At each end of the building there is a staircase leading to the upper story, and halfway up each of these staircases is a cloak-room. At the top of each staircase is an entrance to the large schoolroom. To the right of this room there is another class-room. The accommodation is for close upon 700 children; and the cost of the building has been about 4,500l.

SCHOOL, BYNEA, CARMARTHEN.—A Board school to accommodate 400 children was opened at Bynnea recently, erected from plans prepared by Mr. J. B. Morgan, architect, of the same town.

PLANNED NEW BOYS' SCHOOL, CARDIFF.—At a meeting of the Governors of the Cardiff Intermediate Schools, recently, recommendations were received from the Building Committee to the effect (1) that in view of the Governors securing within a reasonable period a site for the boys' school in Calfways Park the Committee recommends the erection of temporary premises, at a cost of from 1,500l. to 2,000l., upon the site already acquired in Newport-road; (2) that the Clerk be authorised to instruct Mr. George Thomas, architect, to prepare plans of temporary premises to accommodate 300 pupils, with chemical and physical laboratories in addition for thirty pupils in each; (3) that the plans be designed for the erection of the proposed temporary premises on a portion of the Newport-road site which will not be required if, and when, permanent buildings have to be built on the said site. The recommendations were agreed to.

WESLEYAN SUNDAY SCHOOLS, BRADLEY, NEAR BIRMINGHAM.—The memorial stones of the new Wesleyan Sunday schools which are being erected in Hallgreen-street, Bradley, at a cost of 2,500l., were laid on the 3rd inst. The building will accommodate over 700 scholars. It will be executed with best bricks, terra-cotta, and Hollington stone, from designs by Mr. R. J. Rowe, architect, Bilston.

FREE CHURCH, NEW CUMNOCK, Ayrshire.—This church is about to be built to accommodate over 400 sitters. It is planned with a nave and one side aisle, the aisle being separated from the nave by an arcade of three pointed arches of dressed stone, supported by piers and responds, which are also of dressed stone. The entrance is through a double porch which, with the main gable of the nave and its traceried windows, the broad flanking buttresses, and the bell tower, form the principal external features of the design. The roof will be of open timber construction. The sanctum, vestry, and lavatory are provided. The church will be heated by low-pressure hot-water pipes. The whole seating accommodation will be entirely on the ground floor. A manse is also to be built. Mr. James Kennedy Hunter, Ayr, is architect for both the church and the manse, and contracts for both have recently been awarded to the following contractors:—Mason work, Mr. A. Beattie, New Cumnock; joiner work, Mr. D. Mathieson, New Cumnock; slater and plumber work, Messrs. W. Auld & Son, Ayr; plaster work, Messrs. M. Campbell & Son, Cairnrie; heating work, Messrs. Boyd & Sons, Paisley; glazier work, The Glass Stainers Company, Glasgow. The cost of church and manse will be about 2,500l.

MEMORIAL HALL AND SCHOOLS, MAESTEG, GLANORGANSHIRE.—Mrs. J. T. North, widow of the late Colonel North, laid the foundation stones of North's Memorial Hall at Maesteg recently, and on the same day Mrs. J. Boyd Harvey opened the new central schools. The cost of the memorial hall will be about 1,500l. The buildings will follow the same plan, and will consist of a library, reading-room, committee-rooms, and billiard-rooms. The main room will be 58 ft. by 29 ft. The site is opposite the Town Hall, on the Maesteg Uchaf Estate. The new central schools are on the same estate. The new school buildings afford accommodation for 1,016 children, and consist of boys', girls', and infants' departments. The contracts for the schools and the memorial hall are Messrs. Rattray & Jenkins, and Mr. E. W. Burnett, Tondri, is the architect.

RESTORATION OF PARISH CHURCH, ROPLEY, HAMPSHIRE.—The parish church of Ropley has just been reopened after restoration. Messrs. J. H. & E. Dyer, of Alton, were the builders, and Mr. G. O. Scott, of London, the contracting architect; and Mr. Charles T. Miles, architect, of Bournemouth, prepared the plans of the alterations. The tower has had new buttresses placed at the bottom, and the belfry covered with oak and louver boards. The old oak interior framework remains, but has been strengthened wherever necessary. A new east window has been placed in the south transept, and

it is intended to replace the other window, also one in the tower. The north transept has been elongated by half its length, while the whole of the west end has been encased with flint and Bath stone, and new windows in the fourteenth century style have been put in. In the interior the floor is laid with wood blocks, the chancel tiled by Messrs. Godwin & Hewitt, of Hereford, and fitted with oak choir stalls by Messrs. Dyer. The communion rail has been altered and refixed, and the old communion table and chair remains. The roof has been repaired and partly retiled, and inside is covered with pitch pine boards with moulded ribs. The font has been removed from the east end of the north transept to the west end of the nave. The sifting accommodation is for about 265. The gallery at the west end has been entirely taken away. The pulpit, by Messrs. Cox, of London, is in oak.—*Hampshire Chronicle.*

PUBLIC HALL, HEACHAM, NORFOLK.—The new public hall, which has been erected at Heacham, was opened recently. The architects were Messrs. Milne & Hall, of London. Mr. Nelson, of Hunstanton, was the contractor.

BOARD SCHOOL, TENDRING, ESSEX.—The Board school at Tendring was erected at a cost of 2,300l. This sum also covered the cost of a teachers' six-roomed cottage, which stands on the same piece of ground. The builder was Mr. Sanders, of Dovercourt, and the architect was Mr. Stevens.

AUCTION ROOMS, SHEFFIELD.—New auction rooms for Messrs. Nicholson, Greaves, Barber, and Hastings have been erected at the junction of High-street and Fargate, Sheffield. The architects were Messrs. Flockton, Gibbs, & Flockton. On each side of the entrance hall are the private offices of the firm. At the end of the entrance hall there is the best of the auction rooms, lighted from the top. It has a length of 54 ft., and an average width of 28 ft. From this apartment are reached another auction room and an office for the clerks, these together being 63 ft. 6 in. long, and 22 ft. wide. In the basement there is a store room cut out of the rock. It is lined with white glazed bricks. There is also a strong room. One of the carpenter's houses occupy the upper stories of the front part of the building.

CHURCH, BURNLEY, LANCASHIRE.—On the 4th inst., the new Church of St. Catherine, which has been built in Todmorden-road, Burnley, was consecrated by the Bishop of Manchester. The total cost is 8,150l. The building consists of a nave, which, with the transepts and western gallery, is of seven bays of a total length of 67 ft., and a clear span of 51 ft., widened at its eastern end to 66 ft., where the transepts occur. There are no aisles. A lofty arch opens out at the east end to the polygonal sanctuary, the windows of which are high up above the roofs of the adjoining vestries. The chancel, raised three steps above the nave, is arranged in line with the transepts, and is marked off by a low wall and wooden screen surmounted by wrought-ironwork. The morning chapel is in the south transept; there is an outside door and porch in close proximity for the use of those attending the weekday services. The main entrance is at the west end. The nave is seated with open benches, and altogether there is accommodation for 675 adults. The altar is of oak, with carved panels. It stands under a lofty baldachin of hammered iron. The pulpit and Bible lectern are made quite open, and form part of the screen which mark off the chancel. Panels are left in the walls under the nave windows, which it is hoped will be filled with painting, bas-reliefs, or mosaics. There is similar preparation for future adornment round the walls of the sanctuary. The work has been designed by Mr. Meland Taylor.

BATHS, SHOREDITCH.—The foundation stone has been laid of the baths and washhouses in Pittfield-street, Shoreditch. The first-class swimming-bath will be 100 ft. long by 40 ft. wide, with a depth of water graduating from 6 ft. 6 in. to 3 ft. 6 in. Round the "pond" will be a wide gangway, and dressing-room accommodation, and as the hall will, in the winter, be available for meetings, concerts, &c., it was thought expedient to provide six separate exits from the ground floor and four from the gallery. There will also be a second-class swimming-bath, 75 ft. by 35 ft., which in the cold weather will be found suitable for gymnastics. The laundry will be well fitted, and there will be fifty-six slipper baths for men and twenty for women. 15,700l. was paid for the land on which the baths will be erected, and the contract for the buildings amounts to 35,393l. Messrs. Spalding & Cross and Mr. Henry T. Hare are the architects, and Mr. C. Gray Hill is the builder. Adjoining the baths are the vestry dust destructor and electric lighting station. In the same block of buildings there will also be the Free Library.

BUILDING WORK, ROYAL HOSPITAL, SHEFFIELD.—The nurses' home at this hospital has been completed for some time, and now another part of the scheme for reconstructing the hospital is to be proceeded with. This is the building of the block to front West-street, which will form the principal entrance to the hospital. The plans of the architect, Mr. C. Hadfield, have been approved, and the work of actual building will shortly be begun. The new premises will be four stories high, and with a frontage to West-street of about 100 ft. From West-street the visitor will pass into the main entrance hall, through a doorway 18 ft. high, and

from this point access will be gained to any part of the hospital premises. The offices of the secretary will be on the ground floor, near the entrance, and in close proximity will be located the offices of the house surgeon and the matron, and the entrance for tradesmen bringing goods will be in the neighbourhood. It is also intended to have a hydraulic lift on the ground floor. The first floor above is to contain accommodation for the house surgeon and house physician, the dining-room for the staff, and other rooms. The ophthalmic ward will be the most important apartment on the second floor, and on the summit of the building the kitchens, larders, store-rooms, &c., are to be arranged.

GRAMMAR SCHOOL, WISBECH.—The foundation stone was laid recently of the new Grammar School, Wisbech. The portion of the building which, for want of money, for the present remains in abeyance, is the central block, or the three-storied portion of the building adjoining the house. The new premises in course of erection consist of a school, 45 ft. by 21 ft., with open timber roof. The interior of the schoolroom is to be paved round to the level of the windows—about 7 ft.—and the walling above is finished in red brickwork. The south side of the school has a corridor extending its whole length, from which access is obtained to two class-rooms, each 18 ft. by 16 ft. At the further end of the corridor, the space is occupied by the ordinary entrance for the day boys, and by the laboratory and science department. The whole floor of these rooms is laid with wood blocks. The new buildings are all finished in red brick with Ancaster stone dressings. The builders are Messrs. Rands & Son, of Wisbech, and Messrs. Miller & Sons are executing the stone work, whilst Mr. H. A. Ellis, of Cambridge, is acting as clerk of the works. The architect is Mr. W. M. Fawcett, M.A.

WESLEYAN CHURCH, BURLEY, YORKSHIRE.—The foundation stone of a new Wesleyan church was laid at Burley recently. The site is in Cardigan-lane. The buildings have been designed by Mr. G. F. Danby, architect, of Leeds. They comprise a chapel, schoolroom, infants' room, church parlour, minister's room, and twelve vestries or class-rooms. The chapel is being built of stone, lined with brick, while all the internal woodwork will be of pitch pine. A leading feature of the front elevation will be a double doorway with granite columns, carved capitals, and moulded arches, terminating in a gable. Over this there is to be a five-light traceried window. At the south-east corner a tower and spire will rise to a height of 110 ft. Inside the tower there will be a stone staircase leading to the gallery in the chapel, and a similar staircase will be provided at the opposite corner of the building. The chapel is to be 84 ft. long, 48 ft. across the nave, and 57 ft. across the transepts. Accommodation will be provided for 480 persons on the ground floor, and for 720 in the gallery. The chancel will be separated from the chapel by a moulded arch, supported on granite columns, with carved bases and capitals. The open-timbered roof will, in the centre, rise to a height of 40 ft. In heating the premises, the low-pressure hot-water system is to be applied. The contracts at present let amount to about 6,000l. The contractors are:—Mr. C. Myers, masonry; Messrs. Leitchard & Son, joinery; Mr. H. Boston, plumbing and glazing; and Messrs. J. Atkinson & Son, slating.

PRESBYTERIAN CHURCH, BERWICK, NORTHUMBRIA.—On the 2nd inst. St. Andrew's Church, Berwick, was opened for public worship. The building, for which the architect was Mr. William Gray, Berwick, is in the early Gothic style, and it seats for 306 people, but provision is made for the construction of galleries, if these should at any time be required.

PROPOSED RECONSTRUCTION OF Y.M.C.A. BUILDINGS, ABERDEEN.—It is proposed to reconstruct these buildings, plans showing the proposed work having been prepared by Mr. W. L. Henderson.

NEW SCHOOLS, GRESHAM, NORFOLK.—The contracts and conveyance of land for the new schools at Gresham are now all settled. Mr. H. J. Green is the architect, and Mr. T. H. Blyth, of Foulsham, the builder.

CONVALESCENT HOME, GRANGE-OVER-SANDS.—The new Convalescent Home, at Grange-over-Sands, was opened on the 7th inst. It has been erected for the Friendly Societies of the North Eastern Counties, and is built of the local limestone, with red sandstone dressings, and is covered with blue Welsh slate. It is built on the pavilion system. A short description of the building appeared in our issue for October 10, 1896, page 295. The cost of the Home is about 3,000l., and the contractors for the works are:—Mr. Enoch Denny, Grange-over-Sands, contracting, slating, and plastering; Messrs. Nelson Brothers, Kendal, carpenter and joiner work; and Mr. Lawrence Avery, Kendal, plumbing, painting, and glazing. The plans and specifications were prepared by Mr. John Hutton, architect, Kendal, under whose superintendence the work is being carried out.

WESLEYAN CHURCH, BRIGHTSIDE, YORKSHIRE.—The foundation stone has just been laid at Brightside of a Wesleyan chapel. The new building, which faces Deane-street, will comprise a chapel to seat 340, with nave and transepts and a small gallery at the end, also class-rooms for Sunday school and church work, a kitchen fitted up for the preparation of teas, &c., and other conveniences. Separate entrances are provided for church and school purposes. The structure is designed in the

late Gothic style, and is to be faced externally with Durnford Bridge wallstone with ashlar dressings, the windows having traciced heads with leaded glass. The work is being carried out by the general contractors, Messrs. B. Powell & Sons, at a cost of a little below 2,000l., and under the superintendence of the architect, Mr. W. J. Hale, of Sheffield.

POLICE BUILDINGS, MOTHERWELL, LANARKSHIRE.—On the 4th inst. sketch plans of proposed new police buildings for Motherwell were submitted at the monthly meeting of the Burgh Commissioners. The new buildings are to be three stories in height, and will be situated in Clyde-street, on the site of the present County Police Office. Mr. Alexander Cullen, F.S.A., Motherwell, is the architect, and the estimated cost is 6,000l.

PREBYTERIAN CHURCH, HELEN'S BAY, CO. DOWN.—On the 9th inst. the new Presbyterian Church erected at Helen's Bay was opened. The new church is built of silurian stone from the Ballygowan quarries, and faced with white granite from Scabblo. Messrs. Young & McKenzie are the architects, and Mr. Wm. Kerr the builder.

PROPOSED NURSES' HOME, SWANSEA.—A town's meeting called by the Mayor of Swansea was held at the Town-hall, Swansea, recently, at which the Mayor moved:—"That this town's meeting of burgoesses of Swansea hereby heartily pledges itself to do all in its power to promote the Swansea Jubilee benevolent effort known as the Victoria Home for Nurses at the Swansea Hospital." Mr. J. Coke Fowler seconded, and the resolution was carried. Plans by Messrs. Buckley, Wilson, and Glindenning Moxon, Swansea, were before the meeting to provide a building at a total cost of 5,000l.

SANITARY AND ENGINEERING NEWS.

NEW WATERWORKS, HAVERHILL.—These waterworks, which were commenced in 1864, have just been opened. The supply is from a well 103 ft. deep and 7 ft. 6 in. diameter, lined with 9 in. brickwork in cement, and an outside cast-iron cylinder down to a depth of 25 ft. from the top of the well. There is also an 8 in. borehole from bottom of well to a depth of 150 ft., making a total depth of 253 ft. into the chalk. There are also two adits 25 ft. long, 7 ft. high, 5 ft. wide. There are two 12-horse power gas engines, and the water is forced from the well by means of a pump to a tank which is alternately compressed into one chamber and exhausted from another; when the latter chamber is filled an automatic valve reverses the suction and compression so that the chamber which was last filled is discharged by compressed air, and the pressure that remains in the discharged vessel is brought back into the air compressor, consequently the power is not lost. All the machinery is in the engine-room, and none moving in the well except the valves in the pipes. The capacity of the plant enables 10,000 gallons an hour to be pumped from the well. There is a brick and concrete covered reservoir with a capacity of 150,000 gallons, also two concrete settling tanks, each of a capacity of 100,000. There is a red brick engine-house and cottage, and there are more than four miles been expended in carrying out the scheme. The contractor was Mr. Henry Roberts, of West Bromwich; and the engineer, Mr. Thos. Cockrill. The clerk of works was Mr. Wm. Lindley Catlin.

LOCAL SEWERS IN LONDON.—The Main Drainage Committee of the London County Council have sanctioned, subject to conditions recommended by the engineer, the construction of local sewers as follows:—Battersea: 350 ft. of 2 ft. 6 in. by 2 ft. half brick and concrete sewer in Cringle-street, Battersea Park-road; 350 ft. of 12-in. pipe and concrete sewer in Shellwood-road, Latchmere-road; 600 ft., 1,130 ft., and 1,000 ft. of 12-in. pipe and concrete sewers in Anner-road, Broxash-road, and Kytie-road, respectively, Clapham Common Estate, Lambeth; 184 ft. and 924 ft. of 12-in. pipe and concrete sewers in Durham-road and Martell-road, respectively, West Norwood; Paddington: 150 ft. of 9-in. pipe sewer and 500 ft. of 3 ft. 9 in. by 2 ft. 6 in. brick sewer in Ashworth-road, Elgin-avenue, and 165 ft. of 9-in. pipe sewer and 400 ft. of 3 ft. 9 in. by 2 ft. 6 in. brick sewer in Biddulph-road, and Lauderdale-road. Plumstead: 200 ft. of 9-in. pipe and concrete sewer in Ennis-road. Poplar: 122 ft., 280 ft., 120 ft., and 142 ft. of 9-in. pipe and concrete sewers in Duke-street, Lea-Parade, Salter's-buildings and West-street, respectively. St. Luke, Middlesex; 105 ft. of 18-in. pipe and concrete sewer in Lendsen-place, Golden-lane.

STAINED GLASS AND DECORATION.

WINDOW, BELMONT CHURCH, HILLHEAD, LANARKSHIRE.—A two-light stained glass window has just been fixed in this church by Messrs. McCulloch & Co., of Glasgow. The window has been presented to the church by Mr. Alexander Ferguson. The subject represented is the "Adoration."

MEMORIAL WINDOW, EARLS COLNE, ESSEX.—A stained glass window, the figures in which represent Sancta Lucina and Sancta Dorcas, has been placed in the south side of the parish church of Earls Colne by Dr. John Taylor, as a memorial of his deceased parents. The window, which consists of

two panels, has been made by Messrs. Clayton & Bell.

MEMORIAL WINDOWS, SHEEPY CHURCH, NEAR TAMWORTH.—The dedication of two stained glass memorial windows in the nave of All Saints' Church, Sheepy, to the memory of the late Mr. C. B. Lowe and the Rev. Hubert Lowe, took place recently. The windows are by Mr. C. E. Kempe. The figures in the first window are Daniel and St. Stephen, and the "Raising of Lazarus" underneath; in the second window, Isaiah and St. John the Evangelist, and the scene, "Behold the Lamb of God," beneath.

WINDOW, ST. MARY'S CHURCH, NEWRY.—On the 8th inst., at St. Mary's Church, Newry, a memorial stained-glass window was dedicated. The chancel window represents the Ascension, with five scenes from the parable of the Good Samaritan underneath, and in the tracery above the Abbot of Newry, St. Patrick, the four Archangels, and the emblems of the four Evangelists. The work is by Mr. A. O. Hemming, London.

REVERIES, ST. MARK'S, BATH.—A stone oreredos, with marble and alabaster enrichments, has just been erected in St. Mark's Church, Bath, from the design of Mr. S. J. G. Stone, architect, of Bath. The reveries has been carried out at Messrs. Jones & Willis's works, Horsey.

WINDOWS, TILLINGHAM CHURCH, ESSEX.—Seven stained glass windows have just been placed in the parish church of Tillingham. The windows are the work of Mr. F. Drake, of Exeter.

FOREIGN.

FRANCE.—The Trocadero Palace is to undergo some important alterations for the future exhibition. The large bays of the arched galleries which surround the Salle des Fêtes, and which open in the direction of the Champ de Mars are to be glazed and the ends to be closed by doors, making a closed in and warmed promenade for the concert-goers. There is also some talk of making at the end of the galleries two new Salles des Fêtes, but this project, which has been suggested by M. Bourdais, the architect, is not favourably received by the "Direction des Bâtimens civils," as it is considered that it will encroach too much on the Square du Trocadero. The "Société Nationale des Architectes Français" has opened its sixth annual competition, the subject of which is "Un Hôtel pour Sociétés Savantes ou Artistiques dans une ville de moyenne importance."—It is announced that an exhibition of modern medals will shortly be organised at the Bibliothèque Nationale. An interesting retrospective exhibition has just been organised in the Salons of the Société Saint Jean, Rue des Saints Pères. This exhibition contains about one hundred pictures of the French, Flemish, and Dutch schools, besides numbers of drawings and objects of all kinds which have been taken from various collections.—In the Georges Petit gallery there is an exhibition of the complete illustrations for the life of Christ by M. James Tissot. In the Gallery des Artistes Modernes there is an exhibition of the pictures and drawings of the late Louis Cabat, and an exhibition of old pictures, and views of Pompeii, by M. Gusman, at the Ecole des Beaux-Arts.—There is talk of reproducing in Gobelin's tapestry the principal pictures of Paul Baudry, which decorate the Paris Opera House.—The new buildings of the Mairie of Courbevoie are to be inaugurated on the 22nd inst.—On the borders of a well-known little lake at Vaux-de-Cernay a monument in memory of the landscape painter, Pelouse, who died four years ago, is to be inaugurated next Wednesday. He constantly painted in the neighbourhood of this site.—It is understood that the Municipality of Carcassonne intends widening the narrow and picturesque streets of this old town.

—The following is a list of the works executed this year in the architectural section by the students of the Villa Medici. They are now exhibited in Rome, and will eventually come to the Ecole des Beaux-Arts:—M. Bertone (fourth year), Restoration of the Temple of Baal, at Palmyra; M. Chaussonniche (third year), studies of the Temple of Mars and of a house of the fifteenth century; M. Recoura (second year), studies from a tomb in the Church of Ara-Cochi, and studies from the antique; M. Patouillard (first year), studies from the Temple of Concord; M. Pille (first year), a capital from the stadium recently discovered on the Palatine, in its actual state and in restoration.

GERMANY.—Considerable works are to be taken in hand at Heligoland, both with the view of protecting the shore from encroachments by the sea and with a view of using the island for surgical purposes.—There is to be an important Horticultural Exhibition at Berlin this summer, and the gardens of last year's Industrial Exhibition in the Treptow Park will be used for this purpose. A number of last year's exhibition buildings will be re-used for showing hot-house plants, and there will also be a section for scientific research. There will be a number of foreign exhibitors.—The post of Secretary to the Prussian Royal Academy, which became vacant on the death of Professor Hans Müller, is to be filled by Professor Dobbert. The post of second secretary, which became vacant on the death of Professor Spitta, some time back, will not be filled for the present.—A limited competition is to be opened for the designs

of the two statues of Siemens and Knupp, which are to be erected at the Royal Technical College.—It has now been definitely decided to erect the Provincial Museum on the Markisee-place, near the Waisen-Brücke, and the commission has been entrusted to the city architect, Herr Ludwig Hoffmann. Pomeranian brickwork will be a feature of the architectural treatment.—An important competition has been opened at Leipzig for the new Home of the Great Booksellers' Guild, of which Oskar von Haser is the President. The building will have an important site, and will cost 30,000l. There will be three premiums and some extra premiums, the first having a value of 175l. There will be a jury of seven assessors, three of whom are architects.—Schlottenberg, near Berlin, is to have a new town-hall, and the competition which has been opened allows for five premiums, the first of which has a value of 500l., the second 300l., and the third 200l. Here, again, there will be an influential Committee of Assessors, numbering nine members, of whom five are architects, including Messrs. Ende, Wallot, and Otzen.—We have much pleasure in recording the anniversary lately celebrated by the leading architectural book publishers at Berlin, Messrs. Wasmuth, whose influence on the development of modern German architecture has, no doubt, been important. It is only to be regretted that the publications favoured by this firm are either all too academic for the English architect, or do not show sufficient discrimination in the illustrations.

AUSTRIA.—A special Act for facilitating the compulsory purchase of property, is being framed in connexion with the great street improvements which are being undertaken at Vienna.—We hear of a competition for a Fire Station at Laibach, which will be held under the auspices of the Vienna Architectural Society. This is one of the first instances in which this class of building has been the subject of a competition, though there is certainly room for improvement in the planning of such establishments.—Sculpture at the annual Vienna Art Exhibition appears to be very well represented this year, and one of the principal marble works is an allegorical figure, representing "Architecture" in mourning, destined for the tombstone of the late Baron Hassenauer. The sculptor is Johannes Benk.—The ten principal city divisions of Vienna are to have the incandescent gas-light for street illumination; the work will probably be taken in hand at once.—A strike of the brickmakers is expected at Vienna and in the districts just outside of the capital.—Throughout the various building trades there appears to be some disposition to strike for higher wages, but there is by no means the activity in building that would lead one to expect such a movement.—The reconstruction of the auditorium of the Hofburg Theatre has now been commenced.—At Buda-Pest there has again been a case of stealing pictures from art galleries, this time from the Annual Art Exhibition of that city.

NORWAY.—An important competition has been decided at Christiania in connexion with a scheme for a new central station for that city. The first premium in this case has been given to Messrs. Gleim & Eyde, engineers, practising in Hamburg and Lubek respectively. The second premium was given to Messrs. Havesladt & Contag, of Berlin; and the third premium to two engineers practising at Altona, near Hamburg. It is indeed rare that we find an international competition in which all three premiums are awarded to foreigners, and it speaks well for the straightforward policy of the assessors, who, failing to find a good design by a countryman, were not afraid to brave public opinion in giving the premiums to strangers. It is, however, curious that all three premiums should have been awarded to Germans in a practical completion of this description. We notice that the assessors were seven in number, of whom three were laymen and four engineers; of the four engineers, one was "Baurath" Schwering, of Berlin. The value of the first premium was 10,000 crowns.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. Beresford Pite has removed his offices from 20, Hanover-square to 48, Harley-street.—The Hon. Victorian Stone Contractors have removed their Head Office from Kingsland-road to 11, 12, and 13, Hamilton House, Bishopsgate-street Within, E.C.

TRADE NEWS.—Messrs. Moinzer & Co. (London) have received the order for laying down marble mosaic paving in the Gallery of British Art.

ENGINEERING APPOINTMENT.—We are informed that Mr. E. W. Ives, C.E., of Derby, has been appointed Consulting Engineer to the Rural District Council of Lichfield.

WATFORD URBAN DISTRICT COUNCIL.—Mr. C. P. Ayres, of Watford, Herts, architect and surveyor, has been elected Chairman of the Watford Urban District Council, and has been duly sworn in as a Magistrate for the County.

LECTURES ON SANITATION.—Two of the series of lectures on sanitation arranged for under the auspices of the Cardiff Technical School, were delivered at the University College recently. These lectures are intended not only to interest the general public, but at the same time to include the special instruction required by those desirous of obtaining knowledge of the duties of sanitary

officers. The first was by Dr. P. Rhys Griffiths, London, his subject being "Ventilation, Heating, and Lighting." He showed how atmospheric air varied very considerably in courts, narrow streets, open spaces in large manufacturing towns, and in the country, pointing out the nature and character of air in back-to-back houses. He subsequently dealt with the question of the amount of air which it was considered should be allowed to each individual in a living room. The total limit of impurity should be six volumes of carbonic acid gas in 10,000 volumes of air, and in order that this might not be exceeded it was necessary that each individual should be supplied with 5,000 cubic feet of pure atmospheric air every hour. With reference to the space required for each individual, he said the minimum cubic measurement had been stated to be 1,000 cubic feet. He pointed out, however, that cubic space was a fallacious basis to go upon, and that it was essential that each individual should have sufficient floor space. Any height above 12 ft. in a room was ignored for ventilation purposes. Lastly, he described the method of practically examining the ventilation of any sort of building, illustrations being given on the screen by flashlight. The lecturer was heartily thanked.—Mr. Edwin Seward, Cardiff, delivered the second lecture in the evening on "Sanitary Building Construction." The lecturer pointed out the disadvantages in the planning of large buildings of not allowing for plenty of free air round their various parts; and in dealing with the evils of damp, &c., as agencies for unhealthiness and decay, spoke of the plentiful and consistent use of fresh air as the best antidote which modern sanitation had discovered. Each wall, which was open to the atmosphere below and through for the passage of air, floors should admit it, and, if timbers should be open to it, and drains would be harmless as long as air was properly admitted and passed through them. The injury to public health by making up ground levels with town refuse for building on was referred to, and an interesting series of lantern slide views were given to show the evils, one being omitted, "The villas of the future on the refuse of the past." In a low-lying district such as Cardiff, made-up soil of that kind was a double evil, and tended to make building sites of higher altitude near Cardiff more and more requisite for maintaining good health returns for the district. Speaking more definitely of Cardiff, he said that while the town had a nominal altitude of something less than 40 ft. above the mean tide level, it was surrounded with conditions which tended to depression and enervation, leading often to debility of body and opening the way for greater evils, far more than if the place were on a rising ground 100 ft. or 200 ft. higher. Consequently, the precautions he had mentioned, and which might bring even the worst of the atmosphere into play, were worthy of the attention of the local authorities.

PROPERTIES FOR SALE.—In July next the Duart Castle and Sealbaird estates, extending over 2,400 acres, with a seaboard of nearly fifteen miles, in the Island of Mull. The ruins of Duart Castle, a stronghold of the Macleans, stand upon a promontory at the eastern entrance of the Sound, between Loch Duart and Maclester Bay. It is believed that the keep was built by Lachlan Maclean, who in 1266, married a daughter of the first Lord of the Isles. Measuring 65 ft. by 46 ft. on plan, it has walls from 10 ft. to 15 ft. thick, those on the north and west sides rising almost sheer with the face of the rock, and the east wall, in which is a narrow stair, being against the wall of the earlier enceinte. The doorways and windows have round-headed heads. The enceinte, or courtyard, 80 ft. by 65 ft. is entered from the south, through an opening 6 ft. wide (since narrowed), with a pointed arch, swelling on the angle. It encloses the remains of a dwelling-house, supposed to have been erected by Sir Lachlan Maclean, Bart., who died there in 1660. In their "Castellated and Domestic Architecture of Scotland," Messrs. Macgibbon & Ross assign Duart to the fourteenth century, and characterise it as one of the most extensive and powerful castles of the west.

—In June next is to be sold Barton House, Warwickshire, which—though it seems upon slender data—is ascribed to Inigo Jones. Dugdale traces the history of the property from the Underhills, Denham, and Boreham, purchased by Walter, son to Sir Nicholas Overbury, of Bourton-on-the-Hill, in James I.'s reign, "whom said Walter," he says, "rebuilt the manor house of stone, in such sort as it now is."—Ladhams House, Goudhurst, Kent, the seat of the late Sir George Jessel, Master of the Rolls; and Shovswell, in the parish of Etchingham, Sussex, which was the family so named from the beginning of Edward I.'s reign until that of William III., and includes a reputed hunting-house of King John.

SANITARY INSPECTORS' CONFERENCE, DEVONSHIRE.—A general meeting of the Yorkshire branch of the Sanitary Inspectors' Association took place on the 8th inst. at the Town Hall, Dewsbury. The proceedings commenced with a meeting of the Council of the Association, and, business over, his Worship held a reception. Members were present from Bradford, Halifax, Leeds, Huddersfield, Batley, Morley, Hull, Barnsley, &c. The Corporation provided char-a-bancs, in which the members of the Association were driven to the sewage farm at Mitchell Laithes, Southth. The estate is 188½ acres in extent, and 60 acres are taken up with filter beds,

&c. The sewage of the town and the greater part of that from Southth Upper is treated on the farm, and in Dewsbury there are about 1,200 water-closets dealt with. Next the members and others returned to the Town Hall, where luncheon was provided in the Exchange Hall by the Mayor. At the close his Worship gave the toast of "the Queen," which was duly honoured, and he next proposed "The Yorkshire Sanitary Inspectors' Association; Yorkshire Branch." On the motion of Mr. Savill (Halifax), seconded by Mr. Wilkinson, the thanks of the meeting were given to the Mayor and Corporation for their hospitality.—The Corporation refuse-destroyer, erected by Messrs. Beaman & Deas, of Warrington, was next visited. Returning to the Town Hall, a meeting, presided over by Mr. Pridgin Teale, of Leeds, was opened, and a discussion took place upon cottage sanitation in rural districts. The Chairman stated what had been done by the Royal Agricultural Society to have the subject properly dealt with in a pamphlet for public use in country places. Incidentally, he asked what was done in Dewsbury in the matter of back-to-back houses. He was told by the Mayor, and also by Alderman Kilburn, that such were prohibited being erected in Dewsbury, the latter, however, explaining how, by the construction of blocks of four cottages, cheap and yet sanitary dwellings could be built. A general discussion followed, and in it there took part Mr. Denham (Tadcaster and District), Mr. Wilkinson (Altofts), Mr. Holmes (Wakefield), Chief Sanitary Inspector to the West Riding County Council, Mr. George Darley (Leeds), Mr. Lindley (Batley), Mr. Highmore (Ripon), and Mr. Dearden (Hemsworth). The hope was expressed that the Corporation of Leeds would give up the practice of building back-to-back houses. The discussion having closed, the Mayor mentioned what had been done in Dewsbury to promote the health and well-being of the borough, mentioning especially the efficiency of the refuse destructor and of the sewage disposal works, and the excellence and magnitude of the public baths, which he stated were largely used, not only by the people of the town, but those of the villages adjoining; the electric lighting and the waterworks were amongst the best in the country, and had cost £334,374. The Mayor and Corporation officials were thanked for their hospitality and kindness to the Association, and Mr. Pridgin Teale for his services in the chair.

ARTS AND CRAFTS EXHIBITION, MAIDSTONE.—The fifth annual exhibition of art work, &c., open to all amateurs of the town and postal district of Maidstone, was held at the Hollingworth Hall Church Institute recently.

NEW DIRECT LINE FROM LONDON TO SOUTH WALES.—A Local Government Board inquiry was held recently at Bristol, relative to the proposed erection of an infectious hospital beyond the northern boundary of the city. Mr. Charles Kishington, Divisional Inspector of the Great Western Railway Company, objected to the scheme. The company proposed to make forthwith a new line to provide direct communication between London and South Wales, cutting off Bristol. At Patchway, in the Gloucester side of the Severn tunnel, five miles from Bristol, traffic would be concentrated between all parts of South Wales, London, and Bristol. It was likely that 100 engines would be employed at this new depot, requiring a permanent staff of 300 men. The navies engaged at the construction of the line would be accommodated in huts, but the hands engaged permanently would have to live adjacent to the works. In addition to the houses required, fifteen acres would be built upon for engine sheds.

TEMPORARY STRUCTURES FOR THE JUBILEE CELEBRATION.—In the House of Commons on the 10th inst. Mr. Hogan asked the Home Secretary whether, in the interests of the public safety, special precautions would be taken to guard against the hasty erection of stands along the route of the Jubilee procession; and whether it was intended to insist on all such stands being officially inspected, and strictly limited to a prescribed number of occupants. The Home Secretary said, in reply: "This is a matter with which the London County Council have power to deal, except with regard to that portion of the route that lies within the City, under the London Building Act of 1894. The County Council, I understand, have given notice by means of advertisements, placards, and in other ways, that temporary structures cannot be erected to be used on the day of the procession, and that balconies intended to be used should be properly shored up. They have also made arrangements for the examination of the plans of such structures, and for proper supervision being exercised over their erection. Tools and materials will be kept in readiness at certain points for dealing promptly with any dangerous structures. Similar precautions will be taken by the City authorities."

A SPECIAL MORTUARY COFFIN.—From the annual report of the Medical Officer of Health for Marylebone we learn that the parish mortuary has been supplied with a patent coffin for the reception of the extremely decomposed corpses that from time to time are received. Since the patent coffin was supplied in the winter months, it has not yet been sufficiently tried to give an opinion as to its merits. The coffin may be described as a large shell, large enough to receive another coffin within it. The coffin lid is trapped by means of a groove in the walls of the coffin, which groove may be filled with a disinfecting liquid; in short, the arrangement is

very similar to an inspection chamber cover. Any gases which may be evolved pass away through a small vent tube, which can be led into the outer air.

A DÜRER SOCIETY.—A Society under this title has been formed for the purpose of reproducing, by modern *fac simile* processes, the works of Albert Dürer and his school. It proposes to issue in the first instance a series of faithful copies of the engravings, woodcuts, and drawings of these artists, and to include such paintings as have not been published in a satisfactory form, or are, from some other reasons, inaccessible. A number of plates will also be devoted to illustrating the relations of German with Italian art during the fifteenth and sixteenth centuries. A portfolio will be issued annually, containing from fifteen to twenty-five subjects, accompanied by text. Among the members of the Committee of the Society are Mr. Walter Craze, Mr. G. J. Frampton, A.R.A., Mr. Selwyn Image, Mr. Frank Short, &c. The issue of plates will be limited to two hundred and fifty subscribers.

HOME ARTS AND INDUSTRIES ASSOCIATION.—The Thirteenth Annual Exhibition of this Association will be held at the Albert Hall on Thursday, May 20, and following days. There will be spinning competitions in flax and wool on the opening day; also a competition in lace-making, the prizes for which will all be given by the Blenheim-street Spinning and Weaving School. Specimens of wood-carving, inlaying, repoussé metal work, pottery, cut and embossed leather work, handspun linen, woolen and silk fabrics, embroidery, smocking, knitting, bookbinding, &c., &c. will be sent from various classes belonging to the Association. A picture by Mr. W. B. Richmond, R.A., presented by him to the Home Arts and Industries Association, will be exhibited. Demonstrations will be given in wood-carving, inlay, metal repoussé, leather embossing, bookbinding, lace-making, embroidery, spinning and weaving, and a potter will be at work during the exhibition.

CAPITAL AND LABOUR.

THE LONDON BUILDING TRADE.—As we stated last week, it has been agreed by the Central Association of Master Builders of London that, from June 1 next, the wages of labourers shall be spinning 1½d. per hour. The new code of working rules, to come into operation on the same date, are as follows:—(1) That the working hours in summer shall be 50 per week for 40 weeks. That during twelve weeks of winter, commencing on the second Monday in November, the working hours shall be for the first three weeks, the working hours shall be 47 hours per week, and during the six middle weeks 44 hours per week. Hours of labour, summer, for forty weeks.—First five days of each week, 6.30 a.m. to 8 a.m., 8.30 a.m. to 12 noon, 1 p.m. to 5 p.m.; Saturdays, 6.30 a.m. to 8 a.m., 8.30 a.m. to 12 noon; equal to 50 hours per week. Winter, for twelve weeks, for three weeks commencing the second Monday in November.—First five days of each week, 7 a.m. to 8 a.m., 8.30 a.m. to 12 noon, 1.30 p.m. to 4.30 p.m.; Saturdays, 7 a.m. to 8 a.m., 8.30 a.m. to 12 noon; equal to 47 hours per week. For the next six weeks.—First five days of each week, 8 a.m. to 12 noon, 12.30 p.m. to 4.30 p.m.; Saturdays, 8 a.m. to 12 noon; equal to 44 hours per week. For the following three weeks.—First five days of each week, 7 a.m. to 8 a.m., 8.30 a.m. to 12 noon, 1.30 p.m. to 4.30 p.m.; Saturdays, 7 a.m. to 8 a.m., 8.30 a.m. to 12 noon; equal to 47 hours per week. (2) That the present rate of wages shall be advanced 1½d. per hour on June 1, 1897. (3) That overtime when worked at the request of employers, but not otherwise, shall be paid at the following rates, namely:—From 7 p.m. to 10 p.m., time and a half; after 10 p.m., double time. No overtime shall be reckoned until each full day has been made, except where time is lost by stress of weather. On Saturday the pay for overtime, from noon to 4 p.m., shall be time and a half; and after 4 p.m., and Sunday, double time. Christmas Day shall be paid for the same as Sunday. Workmen engaged on a night gang shall be paid 1d. per hour in addition to the ordinary rate of wages. (4) That one hour's notice be given or one hour's time be paid by either party, on determining an engagement. All wages due shall be paid at the expiration of such notice, or walking time if sent to yard. In the event of more than ten per cent. of the workmen of the trade employed at the job giving notice to leave during any one day (except Saturday), they shall not be entitled to receive their money until noon on the following day. (5) That men who are sent from the shop to a job, including those engaged in London and sent to the country, shall be allowed as expenses, 6d. per day for any distance over six miles from the shop or job, exclusive of travelling expenses, time occupied in travelling, and lodging money. (6) That payment of wages shall commence at noon, or as soon thereafter as practicable, on Saturday, and shall be paid on the job. But if otherwise arranged, walking time at the rate of three miles per hour shall be allowed to get to the pay-table at twelve noon. (7) That employers shall provide where practicable, and reasonable, a suitable place for the workmen to have their meals on the works, with a labourer to assist in preparing them. (8) That wages earned after leaving-off time on Friday, and Saturday, only shall be kept in hand as back time. (9) That the term

"London District" shall mean twelve miles radius from Charing Cross. (10) That in case of any dispute arising under these rules which cannot be settled by the employer and employe, no strike shall take place, but such dispute shall be referred to and decided by the Board of Conciliation, whose decision shall be final. Provided that no objection shall be taken to any workman in consequence of his belonging or not belonging to any trade society. (11) That six months' notice on either side shall terminate the foregoing rules.

CARPENTERS AND PLASTERERS' STRIKE, PLYMOUTH.—Carpenters, plasterers, and labourers, of the Three Towns, to the number of about 1,400, have come out on strike. The masters assert that they have done all they could in reason to bring about an amicable settlement. One of the demands, a 1d. an hour rise, the masters offered to grant in twelve months. As that was not accepted the masters, to avoid a strike, expressed themselves willing to grant the rise in six months. As that was also refused, the masters resolved to adhere to the old rate of pay. The conditions which the men have sought to impose in regard to apprentices are also resisted. The carpenters and plasterers will receive 15s. per week from their respective unions. The men hold that the time is ripe for the strike on account of the large amount of work in the town, but this the masters generally deny.

STRIKE OF SLATERS, ABERDEEN.—The operative slaters in Aberdeen are again on strike over a question of by-laws. As an exceptional amount of house-building is in progress, and a record number of plans of new buildings for approval were before the last weekly meeting of the Corporation's Plans Committee, the cessation of work, if continued for any time, will occasion much inconvenience.

BRICKLAYERS' STRIKE, NORTHWICH.—The bricklayers in the Northwich district, numbering about 150, have come out on strike for an advance of 1d. per hour. They now receive 8d., which they claim is 2d. per hour below Manchester prices, and 1d. and 1½d. less than the wages in Altrincham and Sale respectively.

PLASTERING TRADE DISPUTE, DOUGLAS.—The monthly meeting of the Douglas Master Builders' Federation was held at Corkill's, recently. The Sectional Committee, dealing with the plastering trade dispute, recommended the Federation to grant the plasterers and plasterers' labourers the wages they asked, it being understood that, as the labourers had opened their books to the men already working, all other cause of dispute was at an end. But the Federation rejected, by a large majority, the Sectional Committee's proposals, still adhering to their former resolution to pay the men by the hour. Worked out, the hour system gives the men an opportunity of earning more money in the winter and less in the summer; on an average for the year, the wages would be about the same as now. Regarding the masters' rule, which the men say gives sections to settle disputes, it is pointed out that the rule distinctly provides that all decisions by sections are subject to confirmation by the whole body. The Federation agreed to meet the joiners, as requested, and appointed a deputation for the purpose. They are determined not to deviate from the overtures made to the joiners some months ago, offering 30s. a week, commencing May, instead of 25s.; but, understand, that as the joiners have some grievance about men who have been discharged, an interview can do no harm. The other business was purely formal. A question is pending which is likely to cause some little friction in the Federation. Many members are objecting to the master builders supplying materials to them, when acting as sub-contractors, because that only allows their margin of profit to be made out of the workmen. The issue is looked upon with interest, as the builders are strongly represented in the Federation. Others, again, are agitating for an extension of the powers of sectional committees, and letting each settle the disputes which it is deputed to deal with.—*Manchester Sun.*

THE BIRKENHEAD BUILDING TRADE.—The master builders of Birkenhead have acceded to the notice given some six months since by the joiners to cease work on Saturdays at noon. It appears that the masters would have granted this concession twelve months ago had all the branches in the building trade desired it. But some of the branches did not want to lose the half-hour's pay.

THE ARBITRATION IN THE NORTH STAFFORDSHIRE BUILDING TRADE.—Sir William Markby's award, as arbitrator in the dispute between the carpenters and joiners and the employers of North Staffordshire, with reference to the apprentice system, and also the question of wages, on which the men asked for an advance of 1d. per hour, and the employers a reduction of the same amount, has been received. Sir William is of opinion that the alteration in Rule 7 asked for by the masters as to apprenticeship should not be made, nor does he allow the alteration in the same rule asked for by the men. He adds the following to the rules:—

"Any builder having more apprentices than are authorised by this rule, owing to the dismissal of journeymen through slackness of trade, will not be allowed to take on any more apprentices until the number has been reduced below the standard set forth in the foregoing clause." As to wages, Sir William does not think any sufficient ground has been shown for a reduction, but, on the other hand,

is not prepared to fix the rate of wages for carpenter and joiners in the district as high as 9d. With the exception of London, that was the highest rate paid in England, and it was only reached in a few places. Upon the whole, he thinks he is justified in placing the carpenters and joiners in the same position as he had already placed the bricklayers, and he awarded them 8½d. instead of 8d. per hour.—*Birmingham Gazette.*

STRIKE IN THE BUILDING TRADE AT PRESTON.—About seventy bricklayers are affected by the strike which has taken place at Preston for an advance of 1d. per hour in wages, the smallness of the number being due to the fact that several masters are paying the amount pending a settlement. Negotiations have been in progress between the master builders and the operatives, and the employers have offered an advance of ½d. per hour on the present wage of 9d., but conditionally that the men agree to a revision of the apprentice rule. The bricklayers' labourers have also left work for an increase from 6d. to 7d. per hour and a code of working rules, neither of which requests the masters entertain.

PAINTERS' STRIKE, NORTH SHIELDS.—The painters of North Shields have come out on strike, owing to the masters having declined to accede to their request for an advance in wages. For some time past endeavours have been made to effect a settlement without resorting to a strike. Their original demand was for an advance from 8½d. to 9d. per hour, but the men ultimately agreed to accept 8½d. per hour. The masters held a meeting, and their decision was to adhere to the present pay of 8½d. an hour, but to offer that the matter should be the subject of arbitration.

LEGAL.

MOOT POINT UNDER THE LONDON BUILDING ACT, 1894: CASE IN THE DIVISIONAL COURT.

The case of the Queen v. the London County Council, *ex parte* Webster, came before a Divisional Court of Queen's Bench, composed of Mr. Justice Hawkins and Mr. Justice Wright, on the 10th inst. Mr. Horace Avory said that he appeared to show cause against a rule *nisi* for a mandamus directed to the London County Council, requiring them to hear and determine an application under Section 13 of the London Building Act, 1894, to give their consent to the retention of a wall enclosing a yard to certain stables in Pearson's-avenue, Deptford, the short point being whether the Court could order the Council to hear the application for their consent to the erection of something after it had been erected, contrary to the terms of the Act. The learned counsel said that his answer to it, put shortly, was that the Council had no power to give their consent to an erection which had been put up contrary to the Act *ex post facto*.

Mr. Justice Hawkins: It is a matter of discretion of the Council?

Mr. Avory: Yes, but it is a matter of law as to whether the Council are bound to hear an application after the erection has been put up. My contention is that they are not bound to hear it, and that the Act clearly contemplates that the application must be made before the building is commenced. The learned counsel (continuing) said that the case so far as they were necessary for the discussion, were shortly as follows:—The applicant, Mrs. Webster, was the owner of a piece of land abutting upon a street called Pearson's-avenue, which was a high road open to carriage traffic. In February, 1896, the builder gave notice that he was going to build certain stables on this piece of land. There had been no building on the land before, but it had been enclosed by an old wooden fence, and immediately after the giving of that notice, the wooden fence was pulled down, and a brick boundary wall built in its place, which was within the prescribed distance from the centre of the highway. Sub-section 1 of Section 13 of the Act laid down that "No person shall erect any new building or new structure, or any part thereof, or extend any building or structure, or any part thereof, in such manner that any external wall of any such building or structure, or (if there be a forecourt or other space between such external wall and the roadway) any part of the external fence or boundary of such forecourt or other space, shall, without the consent in writing of the Council, be in any direction at a distance less than the prescribed distance from the centre of the roadway of any street or way (being a highway)."

By Section 5 (the definition of "wall"), "the prescribed distance" meant 20 ft. from the centre of the roadway, where such roadway was used for the purpose of carriage traffic, so that under Sub-section 1 of Section 13, the external fence or boundary wall could not be erected without the consent in writing of the Council at a distance of less than 20 ft. from the centre of the roadway. Sub-section 2 of Section 13 provided that "Where the Council, after consulting the Local Authority, shall deem it expedient in the public interest, either by reason of the length or importance of the street or way, or by reason of the street or way forming, or being so situated as to be likely to form part of an important line of communication, or for other sufficient reason, that the prescribed distance from the centre of the roadway of any such street or way should, where such roadway is used for the purpose of carriage

traffic, be greater than 20 ft., it shall be lawful for the Council to determine that the prescribed distance shall be such greater distance, not exceeding 30 ft. from the centre of the roadway of such street or way on either side, or both sides, as the Council shall see fit to determine." That sub-section was material as affecting Sub-section 3, which enacted that "In case the person intending to erect, form, or extend any such building, structure, forecourt, or space shall be dissatisfied with the determination of the Council that the prescribed distance from the centre of such roadway, and subject to such conditions and terms (if any) as they may think proper to sanction, provided that the giving of such consent by the Council shall not in any way affect any rights of the owners of adjoining land. Before giving such consent the Council shall communicate to the Local Authority their intention to give the same. Any person dissatisfied with the determination of the Council under this sub-section may appeal to the tribunal of appeal." By Section 12, "In every case where any new building or new structure is erected at a distance in any direction from the centre of the roadway of any street or way less than the distance permitted under this part of this Act, or contrary to the conditions and terms (if any) subject to which the Council or the tribunal of appeal has sanctioned the erection of such building, the Council may serve a notice upon the owner or occupier of the said building or structure, or upon the builder, requiring him to cause such building, structure, forecourt, or space, or any part thereof to be set back so that every part of any external wall of such building or structure, or of the external fence or boundary of such forecourt or space shall be at a distance in every direction from the centre of the roadway of such street or way not less than the distance so permitted, and shall be in accordance with such conditions and terms (if any) as the Council or the tribunal of appeal may have prescribed." The pre-emptory clause under which proceedings were taken was Section 200. The learned counsel said that a summons was first of all taken out against the builder, and he was convicted by the magistrate, there being no appeal from that conviction. The wall not being removed, a second summons was then taken out against the builder for continuing penalties, but that was dismissed, on the ground that the builder had ceased to have control of the building. Then, upon its being found that Mrs. Webster was the owner, a summons was taken out against her for continuing penalties for having kept up the wall in question. The first time the application was made to the Council to give their consent to the building and the retention of the wall, but he (Mr. Avory) submitted that no such thing was contemplated by the Act at all, and that the application must be made before the person erected the building.

Mr. Justice Hawkins asked if there was any mode by which the Council could consider the matter and say they would not require the wall to be pulled down, because they could give their consent subject to certain conditions, or any conditions they might like.

Mr. Avory replied that the Council had exercised their discretion. A penal notice was served on Mrs. Webster requiring her to set the wall back.

Mr. Justice Wright: What is the foundation for the notion that the Council are bound to hear the applicant before saying "Yes" or "No"?

Mr. MacMorran, Q.C. (appearing with Mr. R. J. Drake in support of the rule), replied that he was not saying that the Council were bound to hear the applicant, but they had to say "Yes" or "No."

Mr. Avory said that the Council had already said "No" in the most emphatic way it could, because it had taken proceedings against the builder for having erected the wall without the consent of the Council, and having done that, notice was served under Section 14, on Mrs. Webster, requiring her to set the wall back. She then made an application for the first time, under Sub-section 4 of Section 13, to ask the Council to give their consent, and they declined to do so, saying it was too late for the matter to be entertained. Thereupon a summons was taken out against Mrs. Webster, and then it was that she asked the magistrate to adjourn the case, saying she was going to apply for this rule. She then obtained the rule to ask the Court to make the Council consent to a thing which they had refused to do, and which he (Mr. Avory) said was an application she was not entitled to make, and certainly not entitled to compel the Council to hear after the law had been broken by putting up the erection without their consent.

Mr. MacMorran said that, assuming there had been an infringement (which he did not admit) and after the penal notice had been served upon the applicant requiring her to set back the wall, she applied to the Council under Sub-section 4 of Section 13, setting out the circumstances under which the wall had been erected and asking for the consent of the Council to have it retained. It was

within the jurisdiction of the Council to say they would give no consent and they had done so. The officers of the Council refused to allow the matter to go before the Council at all, and when the applicant could get no answer she appealed to the Tribunal of Appeal constituted by the Act. Before that Tribunal of course it was necessary for the applicant to show that this was a case in which consent might properly be given. The members of the Tribunal went and visited the place and were prepared to hear the case. When, however, the applicant got before the Tribunal objection was taken by the solicitor to the Council that the matter had never been before it or considered by it, and therefore he considered there was no "determination" as required by the Section. The proper course for the applicant was to apply for a mandamus. The Tribunal, while deciding that it had no alternative but to dismiss the appeal, said they considered it was a case which ought to have been taken to its merits. The applicant then came to that court, and the (Mr. MacMorran) contended that she was entitled to go to the Tribunal of Appeal to have the case fought on the merits. If the applicant had no merits, so much the worse for her, but she had the right to ask the Council for consent. Although the Council might decline an application the applicant had a right to have a mandamus. The applicant wanted for the Tribunal of Appeal on the matter.

Mr. Justice Hawkins: Ought we to grant a mandamus for the mere purpose of giving you the right to appeal? Mr. MacMorran: If we have the right to ask for a consent, "Yes." If we could possibly erect this without a consent, I put it to the Court, if it is not an undue restriction of the enabling Section of the Act, why you can apply for such consent beforehand, but yet you cannot get it if by any chance you have erected what might have been consented to beforehand.

After further arguments, Mr. Justice Hawkins, in giving judgment, said that he was of opinion that the Council ought not to make the rule absolute, and he seemed to him that it ought not to do so on every short and simple ground. The Sections and Sub-sections in question must be read together and read together they could not entertain any doubt that Section 13 prohibited the erection of any new building or new structure, unless the consent in writing of the Council had been previously given to such erection, and that Sub-section 4 of that Section was introduced for the purpose of enabling the Council to modify this positive enactment, and when they thought expedient "consent to the erection, formation, or extension of any building, structure, forecourt, or space, at a distance less than the prescribed distance from the centre of the roadway" as therein satisfied in his own mind, the intention of the legislature was to give under Sub-section 4 to the Council the power to give under Sub-section 4, to be given before the erection took place. He thought, therefore, that the structure which was limited to be illegal and in contravention of the provisions of the Act, must be looked upon, for the purposes of the inquiry, as being an illegal structure. He did not think that the Council of Section 13 was intended to compel the Council to consider any matter in the building, without its consent, had been improperly erected beyond the prescribed distance from the centre of the highway. Although it might be that if the Council thought fit not to enforce penalties, but to sanction a building as far as possible, they might be content to do so, but he did not think that the Court had power by mandamus to order them to entertain such an application. He was of opinion that there was a good deal to be said as to the reason why the matter was pressed by the County Council. If they were, in a case of this description, to grant their consent, or rather to be asked to grant their consent to entertain the question or whether they would grant that consent to a building which was illegally constructed, of course would be an application to legalise that which was not legal, which he did not think the Court had power to do. If the Court were to grant the mandamus he could see how the Council would be loaded with similar applications by persons who were not entitled to do so, and he thought that they were doing an illegal thing in the first instance, and one consisting of the good nature of the persons who considered those things to give their consent afterwards, he thought that the rule ought to be discharged.

Mr. Justice Wright concurred, and the rule was accordingly discharged with costs.

MEETINGS.

FRIDAY, MAY 14.

Royal Institution.—Professor H. Dixon on "Explosion and its Causes," 9 p.m.
 Anticongressors' Institute.—Annual Dinner, Hotel Cecil, 9 p.m.

SATURDAY, MAY 15.

Royal Institution.—The Rev. J. P. Mahaffy on "The Book Theatre According to Recent Discoveries," III. 8 p.m.
 Rev. Paul's Ecological Society.—Visit to the Charterhouse, conducted by the Rev. H. V. Le Bus, at 3.30 p.m.
 London and Provincial Builders' Foremen's Association (Gloucester Hall, Farringdon-road).—Visit to the

works now in progress at the Asylums' Board's New Hospital, Hillier-green.

MONDAY, MAY 17.

Royal Institute of British Architects.—Mr. F. C. Penrose on "The Parthenon and the Earthquake of 1894," 8 p.m.
 Society of Arts (Cantor Lectures).—Mr. Lewis F. Day on "Design in Lettering," III. 8 p.m.

WEDNESDAY, MAY 19.

Carpenters' Hall, London Wall (Lectures on Carpentry and Joinery).—Mr. James Bartlett on "The Setting Out and Construction of Staircases, and Joists in Joinery," 8 p.m.
 Society of Arts.—Dr. Percy F. Frankland on "London Water Supply," 8 p.m.
 Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of the members, 8 p.m.
 Edinburgh Architectural Society.—Paper by Mr. D. McLeod Craik, 8 p.m.

THURSDAY, MAY 20.

Society of Antiquaries.—8.30 p.m.

FRIDAY, MAY 21.

The Architectural Association.—Mr. S. S. Hellyer on "Plumbing and Sanitary Work" with Demonstrations, 7.30 p.m.
 Royal Institution.—The Right Hon. Lord Kelvin on "Contact Electricity of Metals," 9 p.m.

SATURDAY, MAY 22.

Edinburgh Architectural Association.—Visits: (i) to The Llanes, (ii) to Glasgow.
 Northern Architectural Association.—Visit to Castle Eden.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

9,100.—MATERIAL AS SUBSTITUTE FOR WOOD: J. C. North.—In order to produce a rigid, inflexible, fire-resistant, and waterproof material, which may with advantage be substituted for wood, the inventor saturates a fabric—say Canton flannel—with a gum resin, such as "gum shellac," "gum chapel," or the like, in a melted state, and subjects the whole to about 150 lbs. pressure. The inventor prefers to pass material through a vat of melted gum, and, after hardening, pass it through heated pressure rolls.
 9,084.—MACHINE FOR THE MANUFACTURE OF ROOFING TILES OR SLABS: C. Wick.—This invention relates to machinery of the kind to which was granted Letters Patent, No. 25,065, December 24, 1894, and consists of, in such a machine, the combination of a frame to contain the body of the material to form the tile, a rabbit frame hinged to turn down on the clay, a slide mounted in inclined grids upon such frame, and provided with a projecting rim adapted to enter the clay and form an undercut water groove therein, and means for depressing the slide, &c., for forming depression in the clay to receive storm fastenings.
 9,083.—HAMMERS, AXES, PICKS, AND OTHER TOOLS: M. Hillar and Others.—In order to secure the heads of heavy tools from flying off when in use, the inventor adapts a handle (of wood or otherwise) formed with a longitudinal hole, and extending through the bore of the handle, and means for fastening the end of the rod with the handle to prevent the slipping of the wedge.
 12,799.—SPARE TREADS, &c.: F. Sage.—The inventor adopts a stair tread in which the grain of the wood of which it is made, lies approximately in the direction of the movement of the feet on the tread, in place of transversely to it as is now usual.

2,491.—SYRION DISCHARGE FITTINGS FOR WATER-CLOSETS, &c.: S. Robertson.—The inventor claims the combination of parts constituting the principle starting or producing syphon action by means of two or more water valves or in locks or seals on the leg of syphon, discharge, soil, or other pipe.
 2,490.—BACK OF TILES, BRICKS, &c.: J. Jeffrey and Another.—The inventors claim the application to the backs of clay tiles, bricks, briquettes, &c., of one or more undercuts, or incisions, at acute angles, placed at intervals or in lines, curved, diagonal, triangular, or parallel, the said incisions being produced by a block plate or die with projections or teeth.

5,387.—PIRE GRATE: Sir John Smith.—The inventor forms grate of hollow fire bars or air channels of a tapering inverted trough or angular form in cross section, slotted hole for the admission of air to the body of the fuel, and either projecting into the body of the fuel or not doing so, according to form of invention. Inventor proposes to introduce these improved bars either at bottom, front, back, or side of any grate, fire-place, or furnace, although preferably at bottom.

NEW APPLICATIONS FOR LETTERS PATENT.

APRIL 26.—10,287, C. Lash, Edges for Asphalt and Similar Roofs.—10,297, A. Weston, Window Fastener.—10,301, R. Ewing, Joists of Earthenware and other Pipes.—10,309, C. The Blackwall Tunnel.

THE Blackwall Tunnel is now a completed work, and is to be officially opened to-day (Saturday) by the Prince of Wales. It will doubtless be remembered that the scheme, as carried out, is the outcome of an Act obtained by the late Metropolitan Board of Works in 1887. The original proposal, however, was for a tunnel of 15 ft. internal diameter to accommodate foot passengers, and two additional tunnels for vehicles. A contract was actually let for the passenger tunnel, but on the London County Council coming into existence, fresh views were put forward resulting in the present work for accommodating both passenger and vehicles, the external diameter of the tunnel being 27 ft. This gives two footways of 3 ft. 1½ in. on each side of a 16 ft. roadway, with a headway of 17 ft. 7½ in. at the centre.

The Blackwall Tunnel is situated six miles below London Bridge, one and a half below Greenwich, and three miles above Woolwich, and will give a ready means of communication between the districts of Poplar and the East and West India Docks on the north, and the neighbourhood of Greenwich and Woolwich on the south. Although in 1887 Messrs. S. Pearson & Son were entrusted by the Metropolitan Board of Works with the execution of the original scheme, it was not till the end of 1891 that the revised works were finally let to them, for the lump sum of 871,000*l.*, which amount, we are glad to hear, has not been exceeded, in fact certain modifications in the original design have resulted in a considerable economy.

Starting on the Middlesex side from the East India Dock-road the tunnel is entered by an open approach 875 ft. long, after which the tunnel extends 1,694 ft., with a gradient of 1 in 33.4 until the horizontal portion, 221 ft. long, under the river, is reached. The south approach tunnel, with a gradient of 1 in 36.2, is 1,549 ft. long, with an open approach of 860 ft., making the total length a little over one mile. The approach gradients, though somewhat steep, are no worse than that of the Haymarket, and they were, of course, determined by the

existing thoroughfares to be served, and the minimum distance under the bed of the river at which it was possible to drive the shield. Even with the level fixed upon, only 5 ft. 6 in. of gravel rests on the top of the tunnel at one portion of the river bed. This portion of the work was fraught with the very greatest difficulty, and its successful accomplishment is, perhaps, one of the most creditable engineering feats of the day.

The tunnel is circular in cross-section, being made of an outer cast-iron skin 2 in. thick, in fourteen segments, bolted together, forming rings 2 ft. 6 in. long. The metal skin is lined with cement concrete, faced with white glazed tiles. The roadway is 16 ft. wide, formed of asphalt under the river, and granite setts on the approaches. The space under the road is mainly formed into a subway for the accommodation of pipes, and for purposes of ventilating.

The cast-iron lining rendered practicable a great part of the work which, in fact, could not have been made without it. The system requires the use of a shield or wrought cutting edge portion, capable of being forced forward, as the excavation proceeds, by means of hydraulic jacks pressing against the already formed tunnel. The shield is made to overlap (outside) the end of the cast-iron lining, so that fresh rings can be added from time to time as the work progresses, and the shield travels forward. Compressed air was necessary to keep back the drainage water within reasonable limits, and air locks had, therefore, to be formed in the shield, for the passage through it of the workmen and excavated materials.

The employment of a cast-iron lining has the following advantages:—

1. As each ring is completed it is at once ready to receive the full pressure of the ground.
2. It is easily and quickly erected, as much as 12 ft. 6 in. having been completed in twenty-four hours.
3. A smaller external diameter is required for a given internal size of tunnel, thus saving excavation.
4. It can be readily made watertight from within.
5. Settlements are avoided by quickly filling in the small extra space excavated with grout, forced in under pressure.

The precise system adopted in driving the tunnel is not new in detail, except the

hydraulic erectors for fixing the lining segments in place; but, taken as a whole, the work is remarkable as being the largest shield-driven tunnel ever constructed. It is the only example of a tunnel which has been driven through gravel under a river bed, and that too, within the almost incredibly small space of 5 ft. 6 in. from it.

This performance required the very greatest skill and care. Large quantities of clay in bags were placed on the bed of the river for a width of 150 ft. in the neighbourhood of the shield in order to prevent the escape of the compressed air as far as possible, and to check the inrush of water into the shield. Notwithstanding every precaution, however, the river bed was twice blown up by the air, the water being shot up to a height of about 20 ft. The tunnel very quickly partly filled with water, but owing to the excellent and complete precautions taken, the workmen escaped without hurt or injury.

It is worthy of note that much of the clay tipped on the bed of the river found its way downwards, as the gravel was excavated, and was removed from the workings in the shield. This fortunately facilitated operations to a very great extent. It is notable that so delicate were the required adjustments of air pressure that, as the tide rose and fell, so had the pressure to be increased or diminished, in order to avoid drowning out, on the one hand, or blowing up the river bed on the other.

The difficulty of this part of the work on the tunnel may be gauged from the slow progress made, which was at the rate of only 10 in. per day of the most arduous labour, contrasted with a progress of 12 ft. 6 in. when passing through clay. Notwithstanding all obstacles, however, the river portion of the tunnel only occupied thirteen months to complete.

Some idea of the magnitude of the work may be gathered from the following figures. The shield weighs upwards of 220 tons, and required at times a force to be exerted by the hydraulic rams of something like 5,000 tons to push it forward through the wet sand and gravel. During one day of twenty-four hours over 300 cubic yards of material were frequently excavated and passed through the air lock, also 75 tons of lining have been erected and grouted. This result could only have been attained by the most perfect

organisation and system on the part of those in charge of the work.

There are four vertical shafts leading from the tunnel, two on each side of the river. They are 48 ft. internal and 58 ft. external diameter, and are placed on the centre line of the tunnel. One shaft on each side of the river is provided with a spiral staircase 6 ft. wide, for the convenience of those near the river bank. The shield was lowered down the southern shaft, and completed the whole of the tunnel right across the river to within 432 ft. of the northern end, where it was built in, the remainder of the work being "cut and cover." The tunnel is lighted throughout by electricity, provision being made for artificial ventilation should it prove desirable. Owing to the admirable provision made for ventilation, and the use of a compressed air sick chamber, for treating the men affected by working under pressure, no lives were lost during the work of driving the tunnel, and there were only three cases of any permanent ill effects. When we consider that the working pressure frequently reached 37 lbs. per square inch, and when we remember the very high death rate which, unfortunately, usually accompanies working under such a pressure, we think the very highest praise is due to those whose careful study of the subject has resulted in such a wonderful lowering of mortality amongst the workmen.

Whichever aspect of this great work we turn to, whether it be the engineering view of the case, its organisation, or the care bestowed upon the welfare of those engaged upon it, we cannot but be struck with the great ability displayed. We think we shall not be far wrong if we give the major credit of this achievement to Mr. E. W. Moir, Messrs. S. Pearson & Son's able engineer, who, as Sir Weetman Pearson has publicly stated, was practically given a free hand in organising and designing [the special plant required for the job. Mr. Moir's experience with working under compressed air originated at the Forth Bridge when sinking the caissons, and later when constructing the still unfinished tunnel under the Hudson River.

The permanent work has been designed and carried out for the London County Council by their Engineer-in-Chief, Mr. Alexander R. Binnie, M.Inst.C.E., with Sir Benjamin Baker and the late Mr. J. H. Greathed as consulting engineers. Mr. David Hay and Mr. Maurice Fitzmaurice acted as resident engineers; and for the contractors, Mr. E. H. Tabor, Mr. G. H. Halden, and Messrs. Everitt and Collingridge were chief assistants under Mr. Moir. It must be a pleasure for these gentlemen to have their names for ever associated with a work carried through from start to finish with such ability, determination, and success.

SCULPTURE AT THE ACADEMY AND THE SALONS.

HERE is no doubt that both at Burlington House and at the Champs Elysées the sculpture is this year the best portion of the exhibition. At the Royal Academy there is, it is true, no great work, but there are a large proportion of works of no little interest and artistic vitality. English sculpture as compared with French is generally smaller in scale and less bold in conception; on the other hand, it often shows a refinement of design and detail, especially in small works,

peculiarly its own. A point for remark in this year's exhibition is the considerable number of successful works by lady sculptors.

Of the sculpture in the Central Hall we have already illustrated the two works which are especially architectural in character, Mr. Schenck's "Industry" and "Sloth," part of the decorative sculpture for the Oxford Town Hall. These, which are to be placed in re-entering angles of the building, have the repose of effect and largeness of style which is fitting for decorative sculpture; in a moral point of view it is perhaps to be regretted that "Sloth" is a better composed and more attractive figure, artistically, than "Industry." In the Lecture Room is a small sketch of a series of six of the figures to go between the spandrels of the arches; one or two of these are a little extravagant in attitude, with one foot thrust against the haunch of the archivolt moulding; in an architectural sense they would be better for a little more repose of line.

As usual, some of the principal larger figures of the year are placed in the central portion of the Lecture Room. Of those which embody a poetical idea the most striking is Mr. Lucchesi's group entitled "The Mountain of Fame," where a female figure representing Fame, and holding out a wreath, is posed with that of a man sword in hand, who, with one foot planted on the higher ground, stretches up his left arm parallel with her right to grasp the wreath; this parallel action of the two arms is very effective, as also the contrast between the mocking countenance of the "Fame" and earnest expression of the other face. This is a work which it would be well worth while to carry out full size; the figures are about half life-size. Mr. Bertram Mackennal's "Oceana" is another very poetic figure, not less so because its meaning is less definite and precise; it is a nude figure of very fine and pure design, symbolising Ocean or representing an ocean nymph; there is a great individuality of character about it. Mr. Fehr's "Invocation to the Goddess of Love" is a well-designed figure which has a rather curious effect from the artificial treatment of the hair contrasting with the otherwise unadorned nudity of the figure—apparently it is meant for an ancient Egyptian woman; the odd effect of the head-dress secures attention to the work but does not improve its beauty. Mrs. Gell's "Isis," in the Central Hall, is another Egyptian subject, though of a very different stamp, a deity on a pedestal formed by a truncated cone, with wings growing from her waist, which are outstretched in front of her; it is this attitude of the wings which gives its main effect to the work. In the Central Hall is also Mr. Natorp's "Atalanta," a bronze replica of an exhibit of last year, a very well-modelled figure in a very difficult attitude, running and half-stooping sideways; her rather long legs are no doubt in character with Atalanta; a good example of the class of sculpture which interests us mainly as an able piece of modelling, though destitute of sentiment. Illustrations of these five works will be found on one of our lithograph sheets. Among figures of the same class as the last named is Mr. Colton's remarkable work "The Image Finder," a nude figure of a powerful man with a very barbarous physiognomy, who, firmly planted on both feet with his legs apart, drags with all his force at a long piece of cloth which he

has hauled over his shoulders, and the lower end of which is attached to the head of an antique statue half embedded in the soil. The motif of the work is an odd one, but it is a capital example of the representation of energy and force of action, and is perhaps the ablest thing that its author has produced. Among other figures which represent simple modelling without any imaginative element is Mr. Armstead's "Playmates" in the Lecture Room, which in character rather recalls Sir F. Leighton's little bronze entitled "Needless Alarms;" like that work, it is a study of the thin and undeveloped figure of a young girl. A stooping figure of a boy playing at marbles, by Miss Ella Curtois (Central Hall) has the same kind of interest, and is a spirited and clever work.

It is to a lady also that we owe one of the most original poetic works in the Gallery, "At the Gates of the Past," by Miss Esther M. Moore, a lady who is steadily rising in the ranks, and has not before exhibited any work so important as this. It represents a nude female figure partly turned away from the spectator and with her face turned sadly towards the "Gate" in question, which is symbolised by a bold and decorative design of flowing curves and scrolls with spaces between—a piece of drapery hanging vertically against the gate, partially behind the figure, serves to steady its lines and connect the composition. The figure is perhaps a little conventional in modelling, rather too sinuous in its lines; but the whole work is remarkable for its combination of poetic idealism with decorative effect. At the foot of the panel which forms the frame to it are engraved some lines from Browning's fine poem "The Statue and the Bust," the passage commencing—

"So, while these wait the Trump of Doom,
How do their spirits pass, I wonder,
Nights and days in the narrow room?"

The passage gives the key to the sentiment of the work, of which we hope to give an illustration after the Academy is closed, the photograph that has been taken of it so far being on too small a scale to do it justice*. Among other figure subjects in the Central Hall which deal with subjects of imagination is Mr. Simonds's bronze of "The Swan Girl," a nude figure grouped with two swans; this is graceful, especially as viewed from the right side of the figure, where the head and shoulders make very charming lines, but it strikes us that the sculptor has followed too literally the figure of a rather thin and ill-developed model; the torso is poor and the upper arms lean; and the sentiment of the work is rather spoiled thereby. The object of the nude figure in art is surely beauty, before anything else; where beauty is wanting, the *raison d'être* of the figure is wanting. A young sculptor, Mr. Wheatley, has got a good place on the walls with an alto-relief of Prometheus and the vulture; the bird is modelled with great spirit, but the conception of Prometheus is quite inadequate; he is a thin aged man struggling in terror and with his mouth wide open; a sad contrast to the sublime Titan of Æschylus and Shelley. Artists too often seem to undertake to illus-

It is one of the examples of the habitual discourtesy of the Royal Academy, in its corporate capacity, both to exhibitors and to the public, that they will allow no photograph of a work to be taken while it is on exhibition, although this might be perfectly well done before the doors are open in the morning, without inconveniencing any one. Two sculptors wished to have special photographs of their work made for publication in this journal, but they are not allowed. At the Paris Salon, in a similar case, every facility would have been given them.

trate Classic legends, or at least to give their name to a work, without having at all realised the poetry of the legend.

The most architectural work among the sculpture is Mr. Onslow Ford's Jowett Memorial, to be placed in Balliol College Chapel, an illustration of which will be found among our lithographs. Though we have given it to a comparatively large size, it is really a very small work, a kind of bijou monument, in which the recumbent figure of the late Master of Balliol is modelled in silver, with a gold mosaic background, and all the remainder of the work is composed of variously-coloured marbles and other materials. It may be questioned whether it does not look a little too much like a model of a larger work, and whether a larger treatment of a design with fewer parts would not have been more effective. However, it is unquestionably a very pretty work, and illustrates the faculty which Mr. Ford has already shown in other monuments of combining architectural and decorative detail with sculpture, a field in which there is still much to be done.

In the beautiful art of bas-relief, which one is sometimes tempted to think the last refinement of sculpture, there are some very charming works, the finest of which is undoubtedly Mr. Thomas's "Hero and Leander," of which we give an illustration; another work which illustrates the union of decorative line with poetic sentiment. The balanced attitude in which the two recumbent figures are depicted is not a natural one, it is carefully contrived to follow the lines of the panel, but it is sufficiently natural under the conditions of the design, which is all one has a right to demand; the business of ideal sculpture is not to imitate nature, but to adapt nature to artistic conditions. Mr. Walker's "Death of the Firstborn" is a good bas-relief, also more or less symbolical, but not so simple or with so much artistic unity as the last named. Mr. Goscombe John exhibits a metal bas-relief in very low relief, in a marble frame, a memorial to the late Canon Guy (not "Grey," as printed in the catalogue); a work which suggests something new in decorative effect. Miss Giles's alabaster group identified with a line from Shelley (the application of which we do not quite understand) is a delicate work in detail but wants coherence as a whole, and has a little too much realistic touch in some of the details. Miss Rope exhibits a prettily composed group of "Children bringing flowers to the Holy Child" (see illustration), "A Guardian Angel" which we have before illustrated (see *Builder* for July 20, 1895), and a spirited little relief entitled "A Dream of the Sea," which is perhaps the best of the three, though of course it is not the most popular in subject.

Among busts there are some fine ones, and it is remarkable how changed this department of the exhibition is since the days when whole rows of uninteresting and commonplace portrait busts formed a feature of the Academy Exhibitions. Now we find portrait busts of high artistic interest, such as Mr. Goscombe John's "Mrs. Cory" and Mr. Mackenall's "Miss Dunham," remarkable for its broad free handling and the decorative treatment of the pedestal and the dress over the shoulders, which, by a pretty fancy, is half conventionalised into sculptural ornament. We have also ideal busts, such as

Mr. Drury's charming "Age of Innocence" * and others which might be mentioned. In purely decorative art there are two or three things to be noted. Mr. Gilbert, who seems to have almost given up sculpture proper for goldsmiths' work, exhibits a gold medal for annual presentation at St. Bartholomew's Hospital, which designers of that kind of work should look at for its noble simplicity of design on a small scale; and a large ewer and rose water dish, silver, with a St. George and the Dragon on the top in various coloured materials. It may be a question whether Mr. Gilbert is not pursuing freedom of line in this kind of work a little towards the point of losing definite line altogether; the ewer has a little too much the appearance of having been in the fire till it was half melted, and then taken out and cleaned up. A little bit of work by Mr. Reynolds Stephens, a silver bon-bon dish of very simple design, with a figure at each end leaning back against it, should not be passed over.

The sculpture at the Salon is of course of less immediate interest than that at our own exhibition, and it would be hardly possible, besides, to attempt anything like a review of that vast assemblage of marble and plaster figures in the central court of the Palais de l'Industrie; one can only take account of a few works and of the general tendency displayed. The general level of French sculpture this year is far higher than that of painting, and moreover a certain tendency towards grotesque and sensational subjects, which threatened to invade the sculpture salon two or three years ago, seems happily on the decline, and the majority of the work exhibited is of a fine and sculpturesque character. M. Verlet's monument to Maupassant, indeed, with its colossal young woman in a modern dress seated with a book in her hand, appeals only to the popular mind, and is moreover far too big for its subject; but it is an exception among the leading works of this year. We see the higher class of monumental sculpture in M. Mercier's beautiful monument to Madame Carvalho; a figure in low relief on the face of a stele, with hands upraised, the whole artistic style of which reminds one rather of the Greek funeral stela, which is nearly the highest praise one could give it. A monument by M. Puech, in which a winged female figure leans against a stele carrying a bust of the deceased person, and tenderly puts her arm round it, is another example of the fine feeling which French sculptors can bring to bear upon works of this kind; and it may be observed that in their favourite employment of a bust or medallion portrait only of the person commemorated, instead of a whole figure, they at once escape the ever recurring difficulty of modern costume in a full-length monumental figure; a lesson which it is to be wished were more followed in England.

As with the pictures, a great deal of the sculpture at the Salon is on a larger scale than we ever have room for in London. In comparison with the extent of the exhibition there is perhaps less variety of style and subject than at the Academy, and there are not wanting works in which the nude figure is used in violent and forced attitudes; but on the other hand there are not a few works showing real grandeur both of thought and

* We will illustrate this shortly; the photographs which have been taken give too much shadow under the chin and spoil the effect; the artist has kindly had another one taken from the plaster model.

execution. M. Falguière, whose principal work always faces the main entrance, has this year tried an equestrian figure, "Poetry" seated on a winged horse; there is a great style about it, but we have seen finer heads on this sculptor's figures. Among works which are specially interesting from their poetic significance in the use of the figure may be named such as M. Vital Cornu's "Spleen," a beautiful nude figure half crouching under the shadow of a rock which seems to weigh her down; M. Dormay's "Le Soir," a colossal male figure seated and looking forward into the night (that is evidently the idea) with an abstracted expression; M. Brenner's pathetic group of Adam and Eve; M. Roze's "The Republic bringing Children up to Instruction," a part of a projected monument—the figure of the Republic very calm and noble in style; M. Icard's group of the Foolish Virgins, under the title "Trop Tard!" a group of nude figures in various attitudes of despair, one of them wildly beating a great knocker on the closed door; M. Perron's "L'Epave," a fine figure of a man with hair blown in the wind, about to step into the sea; and M. Capiet's "La Désespérance," a figure of a seated woman bending her head disconsolately over a broken anchor. These and others exhibit a great deal of that novelty and impressiveness of idea which renders French sculpture so interesting. We see also some fine examples of the treatment of human labour in sculpture, which has had much attention from the French of late, such as M. Hugues's "Un Potier," a powerful nude man seated and turning a vase on the wheel, and M. Houdain's "La Pesée," two men, apparently of primeval type, throwing their whole weight on a lever to raise something from the ground. The pre-Adamite man is a favourite subject of late, and M. Frémiet returns to it with his group of a man who has killed a bear and drags off the cub by its ears; M. Frémiet is always life-like and spirited, but is apt, as in this case, to be rather brutal. M. Peyre has devoted himself to realising the architect of the Sainte-Chapelle, Pierre de Montreuil, a seated monkish figure holding a model of the chapel; if this is intended for a monument to be erected somewhere it is very suitable, but as sculpture it is certainly not interesting in itself.

Sculpture occupies a much smaller place at the Champ de Mars Salon, but there are three noticeable works there. One of these is a large bronze group by M. Dalou, "The Triumph of Silenus," which looks exactly like a picture by Rubens done into sculpture; a description which will at once indicate that it is not, in the true sense, a very sculpturesque work. Then there is the full size execution in stone of the dead figures and the angel watching over them, forming the lower portion of that immortal work (for we think it can never be forgotten) of M. Bartholomé, the "Monument aux Morts" for Pere la Chaise; and lastly, a charming fancy by M. d'Ilzsch, nine life-size heads in coloured wax symbolising the nine Symphonies of Beethoven; a kind of idea one would never expect to meet with from any but a French artist, and which certainly seems a great puzzle to the English visitors.

CITY HOSPITAL, COLINTON MAINS, EDINBURGH.
—A new hospital is being erected at Colinton Mains, from plans prepared by Mr. Morham. Provision will be made for 600 beds.

NOTES.

St. Bartholomew's, Smithfield.
THE Restoration Committee of
 St. Bartholomew's, Smithfield, is a body whose untiring energy now presents us with a fresh pleasant surprise every few years. There was a long pause after the first restoration in 1863-66, but since 1884 the work of rescue—for that is, perhaps, the best term to use—has gone on almost uninterruptedly, and in '86, '92, '93, and '95, successively, we have had to record the opening up and rededication of different parts of the building. The latest portion restored to use is the Lady Chapel, which was reopened on Tuesday last by the Bishop of London, as a morning service chapel. Any one who saw the poor old mutilated and desecrated building prior to 1863, without transepts, the lower part buried, a school in the triforium, and a factory on the site of the Lady Chapel, and projecting into the apse, would have found it difficult to believe that before the end of the century it would be described, as the bishop described it in his sermon, as "the most beautiful church in London." Whether the description is just or not may be, to some extent, a matter of opinion; but it is certainly one of the most beautiful, as well as one of the most interesting, of London churches; the oldest, except the chapel in the Tower, and well worth the care and the money which have been spent upon it, and that which, it is to be hoped, will yet be spent—for much remains to be done. It is satisfactory to see that the Committee pride themselves upon the preservation of all worked stone in the restorations they undertake; and we think Mr. Aston Webb, their architect, may as justly congratulate himself upon the success with which he has preserved the spirit of the old work, and the harmony of the whole, without condescending to any ridiculous attempt to make his modern rebuilding and repairs look as if they were parts of the original.

Dr. Rowand Anderson on Architectural Education.
THERE is a great deal in Dr. Rowand Anderson's address to the Edinburgh Architectural Association (a portion of which is reported on another page) with which we sympathise; more especially his remarks towards the close of the address, in which he maintained, quite rightly, that the founding of such places as hospitals and infirmaries as memorials of the Jubilee Year was a very one-sided measure, and that what was much more wanted was some provision for enabling the poorer classes to have more happiness, more of the enjoyment of beautiful things in their lives, than they have a chance of obtaining at present. But Dr. Anderson's remarks on the education of architects and on the movement for the registration of plumbers, are what we call wrongheaded. We have no doubt that the Registration movement for plumbers has been productive of a great deal of improvement in the general capacity of plumbers to do their work efficiently, and in rooting out the inefficient ones. And we do not know that there is any abstract objection to the registration of architects; the objection to recent attempts to bring it about lay more in the faulty and absurd manner in which it was proposed to be carried out. Dr. Anderson repeats the old objection, met and disposed of long ago, that you cannot examine people in art. No sensible person ever wished to do so. Architecture is more than an art, it is construction also, and there

is nothing illogical in having a system to test the knowledge and efficiency of those who are to construct buildings—so far as construction is concerned. To a great extent registration of architects practically exists in France, and the French are in most respects a much more artistic nation than the English.

The Under-ground Railways and the Jubilee.
WHILE precautions against accidents in the temporary stands and balconies and along the route of the Procession on June 22 are being taken, we may express a hope that the authorities have not overlooked the Metropolitan Railways. The crowds on both the District and the Metropolitan lines are likely to be extraordinary, but most of the stations are, in regard to approaches and platforms, singularly unfitted for large crowds. The staircases are too narrow, and a severe pressure from the top might easily cause accidents, either by forcing passengers off the platforms on to the lines, or crushing those that are lowest against the barriers. It appears to be obvious that, having regard to the inadequacy of the platforms and stations, barriers should be placed outside so as to prevent more than a certain number of passengers from being in the stations at one time.

Balconies on Jubilee Day.
 It is to be hoped also that there will be some inspection or examination of balconies on the line of route of the procession on June 22, as there is no doubt that many of these will be crowded in an exceptional manner, and that they have probably been originally constructed with no view to their supporting any great weight; indeed, the construction of balconies in the older houses is probably often of a very flimsy and unscientific character. Unless this matter is looked to, we fear there will be some bad accidents from the fall of balconies.

Bacteria in London Water.
THE paper read on Wednesday last (19th inst), by Dr. Percy Frankland, F.R.S., at a meeting of the Society of Arts, entitled "The London Water Supply," was an interesting summary of the progress made during the last thirteen years in the scientific examination of the water supplied to the metropolis, but it contained much controversial matter which was largely dismissed as though the theories involved were facts, and we cannot help thinking that some of the statements made are misleading. We are told that the aim of a bacteriological examination of water is not so much to detect the presence of harmful bacteria as to ascertain to what extent filtration removes bacteria generally; and we are again asked to believe that the percentage method is the best one for gauging the quality of water. The author's experiments show that by storage-subsidence and filtration the London water companies remove from 97 to 99 per cent. of the bacteria which were contained in the ordinary river water. We may observe, however, that these figures are not borne out by other investigators, though every one admits, of course, that the water is improved by being filtered. Dr. Frankland relies on the percentage method, as the search for harmful bacteria in potable water is like the proverbial "hunt for a needle in a haystack." But the fact that harmful bacteria are difficult

to find by methods at present adopted does not warrant examiners in giving up the hunt. There is the other side of the question, namely, that bacteria which do no harm may as well be allowed to remain in the water. For, in any case, assuming that filtration on the large scale, as practised by the companies, really does remove up to 99 per cent. of the bacteria, the water no sooner emerges from the filter bed than it is replenished by micro-organisms in the water-main and service-pipes, and, in fact, as many bacteria may be found in it by the time it reaches the consumer as were there before filtration. For a bacteriological examination of water to possess any real value, we maintain that it must be able to distinguish between harmful and harmless bacteria, and to indicate when the former are present. The percentage method is of little or no use in serious work.

The Institution of Electrical Engineers.
THE discussion on Mr. Raworth's paper on the "Generation of Electrical Energy for Tramways," at the Institution of Electrical Engineers last week, did not greatly advance our knowledge. Mr. Carter showed that Mr. Raworth's amendment of Willans's law could hardly be taken seriously. Various speakers talked of the iniquities of Corporations in wanting to sell their power at outrageous rates to tramway companies, but hardly anything was said worth repeating. The few members who remained to hear Professor Sylvanus Thompson read Mr. Trotter's paper on "Disturbance of Submarine Cable Working by Electric Tramways" were, however, repaid for having had to sit through such an uninteresting debate. The paper, although a little obscure on one or two points, was excellent and most instructive. It was an account of the disturbances caused in the cable of the Eastern and South African Telegraph Company by the electric tramway started at Capetown last autumn. The disturbances were so serious that, for some months, it was impossible to read the tape of the siphon recorder, although one could tell from the tape when the electric cars started and stopped. A great many ingenious remedies were tried, but the only successful one and the one finally adopted was to take a cable from the receiving office at Capetown five miles out to sea directly over the old cable and put the far end of it to earth.

Our Insanitary Rural Districts.
A REPORT by Dr. St. George Mivart to the Local Government Board on the recent prevalence of diphtheria in Huntingfield and Halesworth, in the Blything Rural District, states in regard to Huntingfield that the two worst dwellings were two cottages adjacent to the schoolhouse, and the property of the parish. A little group known as "Crossway Cottages" are ownerless at present; "the late owner at his death bequeathed them to a relative, who renounced the legacy owing to the state they were in." The inhabitants of this group of cottages have no water for drinking purposes other than that which they can obtain from a stock-pond close by, which was in a filthy condition. The village is supplied exclusively from wells, which are generally dry-steined and fitted with hand-pumps. Since the epidemic, privies have been, generally speaking, put into better repair, but they are generally placed as near to "the Brook" as possible, and

the watercourse is used from time to time as sewer by emptying excremental matter into it.

Universal complaint was made of Huntly Brook, the condition of it and the sewer given off from it in dry weather being most offensive. In Halesworth the cottages are of flint built, and so out of general repair as to be unfit for habitation. They have no "through" ventilation at all, having no windows at the back. There is no public water service for any part of the town, and no regular system of drainage. The inhabitants obtain drinking-water from wells, a great number of which have been condemned by the Authority, and others, though not condemned, are so notoriously unwholesome as to be shunned by the cottagers. In some of the dry-stained wells the process of free soakage into them of liquid from the ground around and on the higher level could be seen going on actively.

St. Pancras Works Department.

THE Report of the Chairman of the St. Pancras Works Committee touches on two or three important points. One of these is the discovery recently of so many quasi-sewers, that is to say, defective combined drainages, and the Report expresses regret at the failure to obtain amendment of the Interpretation Clause on this point, the attempt having met with a serious check owing to the withdrawal of the Public Health (Sewers and Drains) Bill by its promoters, on account of its inherent defects," a sad reflection on the capacity of those functionaries who pretended to devise a remedy for the difficulty." In regard to street paving the Report sums up very adversely to asphalt, maintaining that "by the use of close-jointed Australian wood we get all the advantages of asphalt without its attendant dangers;" we think this is putting it rather too strongly; asphalt is a much more sanitary pavement than wood in a crowded city; whether its advantages are sufficient to outweigh this is the great advantage is another question. We observe that the Report speaks very strongly about the present bad accommodation for the Parochial Staff; some of the offices have been improved, but the fact still remains, in the words of the Report, that "one of the principal and most extensive parishes in the Metropolis is the worst provided with municipal offices."

Low-street, the (old) Police Station.

THE lease to the Commissioners of Police having expired, the old Station in Bow-street is now being converted by Messrs. Howard & Co., of Russell-street, Covent Garden, into premises for, we are informed, Messrs. Elder, Dempster and Co, of Long-acre, fruit salesmen. On the building of a new Police-court and offices between Broad and Marllett courts, the old Station was adapted for constables' lodgings, and when the lease fell in about a year since, quarters for unmarried men were established in the Park's-buildings, St. Giles's High-street. In one of the cells, now demolished, was a boundary mark of the parishes of St. Martin-in-the-Fields and St. Paul, Covent Garden. The site, we understand, is on the Bedford-square, as was that of the former Police-court opposite, pulled down after the opening of the new Court—Mr. John Taylor, architect, of which we published plans and a view on June 21, 1879. A Police-court was

first established in Bow-street in 1749; the house there, for long occupied by Sir John Fielding, and wherein his brother wrote "Tom Jones," was sacked and burnt by the "No Popery" rioters on Tuesday, June 6, 1780. Its successor, Nos. 4 and 4A, had railings with terminals in the shape of Roman fasces.

THE Council of Almoners of the "Old Bell," Holborn.

Christ's Hospital offer for sale a building lease of the site—about 7,200 ft. super—now occupied by Nos. 123-4, Holborn, subject to rebuilding at an outlay of not less than 10,000*l.* No. 123, the "Old Bell," is one of the very few remaining inns in London which retain their old wooden galleries and "boxes"—those features may be seen around two sides of the courtyard of the "Old Bell."* We are informed that the front portion of the premises was built in 1720; the inner courtyard is of a much earlier date. On the south wall, facing Holborn, is a tablet bearing the coat-arms of Fowler, of Islington; the Fowlers were lords of the manor of Barnsbury. The same arms were affixed to what is believed to have been a lodge of Sir Thomas Fowler's house in Cross-street, Islington, in a ceiling of which were the Royal arms, with E. R. and "1595" in stucco, also the initials F. T. I. (for Thomas and Jane Fowler) with fleurs-de-llys and other ornamentation. The "Old Bell" has been tenanted for some while past by the Bunyer family. The lease will run for eighty years from next Michaelmas, at a ground-rent of 750*l.* per annum.

THE so-called "Exhibition of Dramatic and Musical Art" at the Grafton Gallery.

The Grafton Gallery can hardly be taken very seriously. The title is a misnomer to begin with. The exhibition consists mainly of a number of portraits of eminent actors of the past and present, with a very few portraits of musicians interspersed; pictures of scenes from various old plays introducing portraits of the actors, and some cases of relics, autographs, and presentation objects. A few good and well-known recent portraits of modern actors and musicians are to be found there, which have been seen in recent years in other exhibitions. The majority of the older pictures are more interesting in a historical than an artistic sense, though a few celebrated works are to be found; Lawrence's melodramatic portrait of Kemble as "Hamlet," Hogarth's "Garrick as Richard III," the Stratford-on-Avon portrait of Garrick by Gainsborough, and the same artist's "Miss Linley (Mrs. Sheridan) and her Brother," and Reynolds's "Garrick between Tragedy and Comedy," which it appears is now the property of Sir Henry Irving. Among the most important modern theatrical portraits are Millais' of Mr. Hare; Mr. Sargent's "Miss Ellen Terry as Lady Macbeth," and Mr. Whistler's "Sir Henry Irving as Philip II," a very characteristic work. Perhaps the two items of most special interest in the gallery are a miniature of Beethoven as a boy (about the age of sixteen apparently), which we have never seen before, and which, if authentic (though we rather doubt it), is of great value; and Zoffany's scene from "The Alchemist," with Garrick as "Abel Druggier,"

* The "Black Bull," next adjoining had similar galleries, removed some years ago for tenements.

his most celebrated comedy part. The picture gives a vivid impression of Garrick's power of facial expression. A collection of old play-bills in the back gallery is of some interest. But the exhibition as a whole is a curiosity show rather than an art-exhibition.

THOSE who predicted that the introduction of female students at the École des Beaux-Arts would be a troublesome matter to carry out have proved to be only too much in the right. The young "gentlemen" who work in the ateliers of painting sculpture and engraving have raised an insurrection against the movement, and gave vent to their feelings by chivalrously mobbing the girl students as they emerged from their classes, and pursuing them with shouts of ridicule as far as the Rue Buonaparte, where they had to take refuge in shops while the "agents de police" arrested the most prominent of the rioters. M. Dubois, the Director, has ordered the closing of all the ateliers pending the decision of the Department of Public Instruction as to the course to be taken. The architectural students are not implicated, not however we fear because they are necessarily more orderly than the rest, but because their work at the schools takes place at a different hour. That some such result was to be feared from the general character and habits of the École des Beaux-Arts students was predicted in one of our letters from Paris some time since, in alluding to the proposal to admit female students; and if the plan is to be carried out it is evident that the Government will have to take severe measures to enforce order.

ROYAL SOCIETY CONVERSAZIONE.

ALTHOUGH the exhibits at the conversazione of the Royal Society at Burlington House on Wednesday last (10th inst.) were more varied and interesting than usual from a general standpoint, there were comparatively few which call for a notice in our columns.

The most remarkable exhibits, perhaps, were those relating to the micro-structure of alloys, a method of investigation suggested, and we may add to some extent dealt with, in the columns of the *Builder* two or three years ago in a series of articles in our "Student's Column." Mr. J. E. Stead, of Middlesbrough, had a number of photographs illustrating the micro-structure of alloys of lead and antimony, tin and antimony, tin and phosphorus, tin and arsenic; tin, antimony, and copper; and tin, arsenic, and antimony. These demonstrated the fact that when fluid mixtures of metals and non-metals cool down from the liquid to the solid state, crystals of definite chemical composition fall out of solution, and may be clearly seen under the microscope after the polished surfaces have been etched by dilute acids, or tinted with suitable re-agents. This condition has been demonstrated by Professor Roberts-Austen by an entirely different method of research. The last-mentioned observer exhibited an apparatus consisting of a microscope and camera arranged for obtaining photographs of metals and alloys under high magnification. The illustrations accompanying this demonstrated the existence of carbon in steel, including the diamond form of carbon. Messrs. C. T. Heycock and F. H. Neville showed some X-ray photographs of sodium-gold alloys, proving that crystals both of gold and sodium occur in the mass, although the alloys appear to be homogeneous. The importance of a knowledge of the structure of mixed metals and alloys generally cannot be over-rated, though but very little is at present known, in spite of the impetus given by Sorby's researches in reference to the structure of steel some years ago. Apart from the scientific interest attaching to the three exhibits mentioned, as throwing light on the genesis of crystallisation, and the demonstration as to how far metallic alloys may be crystalline substances or merely mechanical mixtures, they

are of much practical importance. It will be perfectly possible in time, no doubt, to impart greater strength to many alloys by inducing direction in crystallisation in them, and by turning a granular into a more or less fibrous form. But, in these exhibits, we did not notice any attempt to study micro-structure of the metals after these latter had been subjected to great pressure; judging from analogy in regard to rock-structure, that method of research would have still greater beneficial effects, as pressure is as much an agent in modifying crystallisation as is rapidly incooling—we suggest this to the exhibitors who appear to have approached their subject from one side only. Many of the structures now, for the first time, demonstrated to occur in alloys, may be paralleled in the vitreous, devitrified, and hemi-crystalline igneous rocks, and in slags. Not the least interesting circumstance is the resemblance between the etched surfaces of the alloys and that of meteorites.

Passing to the electrical exhibits, which were numerous, as usual, we may note that by Mr. J. W. Swan, demonstrating stress effects produced by electric discharges on the surface of a viscous mixture of resin and oil. Mr. J. Wimshurst had a powerful electrical influence machine with twenty-four discs, each three feet in diameter; they were so arranged as to furnish three poles, one of which may be negatively charged, the other two poles positively charged, or, at pleasure, the reverse order may be followed; by this arrangement two separate streams of discharge may be in use at the same moment. Cathode and X-rays were well in evidence in the exhibit by Mr. A. A. C. Swinton, which showed, amongst other things, that the penetrative value of the X-rays is independent of the material of which the anti-cathode surface is made; not so, however, the quantity of the X-rays, which is greatest with anti-cathode surfaces of high atomic weight. Dr. Gore showed an apparatus for investigating the influence of proximity of substances on voltaic action.

In other demonstrations of physics we noticed a model of a Hertz wave transmission exhibited by Professor Silvanus Thompson. This model was a simple wave-motion apparatus, transmitting a transverse vibration along a row of leaden balls suspended so that each ball gives a portion of its energy at each oscillation to the next in the series. The oscillator is a heavy suspended mass, to which a blow is given; the resonator is a circle of brass hung on a trifilar suspension. Both oscillator and resonator were timed to the same period. Messrs. E. Edser and H. Stansfield exhibited an apparatus showing the phase change of light reflected at a glass-silver surface; Mr. J. Gould made some experiments on the transmutation of sound vibration; and Mons. C. E. Guillaume, of the Bureau International des Poids et Mesures, exhibited a compensated pendulum of nickel steel, also the results of experiments with highly dilatible and nearly non-dilatible nickel steel.

An improved hatchet planimeter was shown by Mr. E. K. Scott. In this instrument the hatchet edge or keel consists of a sharp-edged wheel, thus avoiding cutting the paper and side-slip, and, by reducing friction, enabling irregularities of the figure to be readily followed. The same exhibitor also had an instrument for describing arcs of circles of large radius, called cyclograph, principally intended to take the place of the wooden curves commonly used. It can be adjusted instantly to give any radius of curvature. The curve traced out is not an approximation, but it is truly an arc of a circle.

There were a larger number of natural history objects than has been usual in recent years.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

THE PARTHENON AND THE EARTHQUAKE OF 1894.

A MEETING of the Royal Institute of British Architects was held at No. 9, Conduit-street, Regent-street, on Monday, Professor Aitchison, A.R.A., President, in the chair.

The minutes of the last meeting having been taken as read, Mr. F. C. Penrose, past President, read a paper entitled "The Parthenon and the Earthquake of 1894," of which the following is an abstract—

Mr. Penrose said he had undertaken to describe the result of his recent examination of the Parthenon, the object of which was to advise the Greek Minister of Public Instruction,

and the Archaeological Society of Athens, as to certain repairs which were required in consequence of the damage done to the building by the earthquake of 1894. Three international consulting architects—namely, Mr. Penrose himself, Professor Dürm (of Karlsruhe), and M. Lucien Magne (of Paris)—had been appointed to confer with a local committee, presided over by M. Cavadias, the Government Superintendent of Antiquities, and consisting of several Greek members of the Athens Archaeological Society and some associated members including Dr. Dörpfeld, M. Troump, a resident French architect, and the Government engineer, M. Balanos, who was to superintend the repairs.

Having referred at some length to the principal events which had reduced the building to its present insecure condition, and also to what he considered the ill-advised re-erection of some of the damaged portions of columns, Mr. Penrose went on to say that when he arrived at Athens last year Professor Dürm and M. Magne had already made their reports. The former had gone very fully into the question of the defects and remedies, and his report was a valuable contribution to the study of the subject. That of M. Magne was a brilliant and well-illustrated memoir on the construction and ornaments of the temple rather than a more technical report on the defects and remedies; but he called attention to one very important detail, namely, the instability of the angles of the pediments. The local committee had already made arrangements for several 14 ft. architrave stones being prepared on Mount Pentelicus. The part of the temple which demanded the most immediate attention was the hexastyle portico of the Posticum. The state of the Posticum was such that it was impossible to execute any satisfactory repair without replacing at least five of the architrave stones. Of the six columns composing the portico, four only were free; two of them were more or less embedded in the mass of masonry containing a staircase which was once surmounted by a Turkish minaret. This mass secured the southern columniation. The architraves supported by the four free columns consisted of twelve stones. Of these twelve, only five were free from very great defects; but if five of them could be replaced with new material, two could be so pinned together to their neighbours that they might be supported sufficiently well. The worst defects were on the eastern side of the portico. With one exception the western stones were sound, which was fortunate, as they supported the portion of the Panathenaic frieze still left on the temple. With regard to the defective one—namely, that which once connected the north-eastern column with its neighbour—the simplest remedy would have been to replace it with new; but its removal would endanger a portion of the precious sculptures, and it would have to be keyed to a new stone placed alongside of it. Professor Dürm in his report suggested that the reason of this part being in so much worse condition than any other was that the original builders had used for an interior part of the fabric a very much worse material than they had provided for the exterior. It was true that the marble of these architraves was more streaky than could be found on the exterior; but streaky marble of similar quality had endured well on the temple of Jupiter Olympius. Another and more effective cause could be assigned to it, namely, fire, which had consumed all the inflammable part of the structure, and had very much calcined the whole of the superstructure of the Posticum, as the state of the surface of the marble showed. It had also weakened the lintel of the great western door, and some of the columns of the Posticum, especially on the eastern side, had also suffered. Many portions of the capitals and of the architrave stones in this part retained traces of iron plugs, which could only have been used to fix some material for the purpose of repairing the surfaces which had been split off by the action of fire. This completely explained why the architrave stones of this portion of the building, although much less subject to ordinary weather vicissitudes, had become so much more cracked than those of the peristyle. A large piece from the middle inter-columniation fell down in the earthquake of 1894, split off apparently at an ancient flaw. The course of deep stones above the architrave, which formed the back of the Panathenaic frieze, and ranged with it in level, was also very much cracked and dislocated, so much so that only two pieces in the whole length were in a fit condition to be retained.

These pieces, however, were neither so difficult to handle nor to replace as the main architrave stones, which had a length of about 13 ft. 9 in. each.

The lecturer then referred to the difficulties attending the removal of the condemned blocks and fixing those which were to replace them, and showed by the aid of diagrams how the operation could be performed. With regard to the lintel of the great western door, the two ends remained in the wall, but the rest was gone, and the place was occupied by an exceedingly unsightly brick arch. This, it was hoped, would be replaced by marble; but there was not the slightest prospect of a 20-ft. beam being found, nor could it be brought to Athens with existing appliances. The plan recommended by the lecturer, and accepted by the Athenian Committee, and by Mr. Penrose's French and German colleagues, was explained by a diagram. The insecure condition of the angles of the temple was to be traced to the great over-hanging stones which supported the angular acroteria having a tendency to slip downwards and drag the neighbouring portions of the superstructure with them. The worst crack in the architrave was over the north-west angle column, where, owing to the fall of a large piece at the corner of the abacus, the bearing of the outer stone of the architrave was reduced to little more than a point. Between the fourth and fifth columns, reckoning from the south, a crack through the architrave had been produced by a cannon-shot, and the abacus of the fourth column had been so much shattered that it gave a bearing to no more than about half the thickness of the architraves which rested upon it. The exfoliation of iron cramps connecting the architrave stones at the top had also injured all but one of the vertical joints, but beyond the brackings of the large splinters which had fallen, the injury at these places did not seem likely to extend. Among the diagrams shown by the lecturer was one illustrating the curious construction of parts, and another showing how the angles could be secured from slipping by connecting the great horizontal corner-stones by means of strong gun-metal cramps with the main cornice at a sufficient distance, so as to provide an adequate amount of weight to resist the tendency to slip. Few of the new stones proposed to be introduced would make any difference in the general view of the temple, and scarcely any of the steel or bronze work; and the new stone could be stained with copperas so as to be almost indistinguishable from some of the old time-stained marble.

Professor Ernest Gardner, in opening the discussion, said he was in Athens at the time of the 1894 earthquake, and the first thing he did was to go to the Acropolis to see the fragments that had fallen from the architraves of the columns. Some three or four years before that an International Commission was appointed, on which he served, which was for quite different purposes from those of the present Commission, whose work was concerned with the architectural necessities of the restoration. It was a Commission to consider the Parthenon from the aesthetic point of view, and to decide what was desirable in the way of restoration, and of clearing away more recent additions, and so on; and on that occasion he visited a good many of the buildings. As to the result of the earthquake, he certainly confirmed one point which Mr. Penrose mentioned. As regards these fragments, certainly the damage was not done by the earthquake itself. He examined the fragments very carefully from this point of view immediately after they had fallen, and there was hardly any trace of new fractures upon them; in fact, the greater part of the surface within the cracks was overgrown even with lichen, and it was considerably discoloured, so that it was obvious that the cracks were old ones, and the pieces were hanging on, almost by chance, and the slightest shake was bound to bring them down. The earthquake really did good by calling the attention of everybody to the extremely precarious condition of the building, especially of the corners, and the architraves and other portions. But certainly from the appearance of the blocks as they had fallen nobody could imagine that the earthquake had really broken anything at all; they were simply hanging very loosely, and they would fall at the very lightest shake. There were, however, two or three points as to which

should like to ask a question of Mr. Penrose, the first was as to the foundation of the minaret, the lower part of the minaret, the great eastern door, and the columns, and the innering of the great door. As regards the columns and the possibility of their re-erection Mr. Penrose had already spoken in a tenour which he was quite sure was in accordance with the general feeling of that meeting, nothing could be more discordant, and even doubts, than those kind of mangled remains of columns that had been built up again upon the north side of the Parthenon. The reason it was of course well known to all architects, that it was impossible to place the pieces of a fluted column one above another after they had been fluted. The fluting in the Greek buildings was made after the columns were erected. The result of any attempts to build them up again was most disastrous, as he was sure everybody would agree who had seen some columns. To compare those mangled remains of columns built up with those not so, one felt how hideous they were; and he thought it would be quite impossible to rebuild a whole of the Parthenon. There was not material for it unless they cut a great many wall blocks, and he did not suppose that any one would propose that; and to cut a few blocks would simply destroy the symmetry of the building. The explosion had produced a kind of symmetry of the columns descending on each end towards the middle. He wished that Mr. Penrose had recommended that those columns set up should be pulled down again; certainly they disfigured the building very much as they stood now with brick patches that had been put into them. With regard to the great western door, now covered by a brick arch supported with an iron support below, which was extremely ugly, he was very glad to see that there is a proposal to replace that in a much more adequate manner. What he should like to ask in regard to that was, What would Mr. Penrose propose as regards the sides of that door? The present jambs of the door, on which the brick arch rested, were put inside the original jambs of the door. These were thin casings which were put up, most probably when the Parthenon was converted into a church; and he remembered it was proposed some three or four years ago, if possible, to remove those iron jambs. He did not know whether it could be considered desirable, either from the architectural or historical point of view, to move them; but there was one consideration, that the blocks which had been built in by those who altered the Parthenon into a church had long inscriptions on the back of them which were at present hidden, and those inscriptions would be a most valuable document from a historical point of view. Of course, he would say, Do not damage the building in any way; but he should like to hear the opinion of Mr. Penrose as to the advisability or possibility of removing them. There was another point as to which Mr. Penrose had already expressed an opinion—at least, by implication—and that was as to the lower part of the minaret that still remained. Mr. Penrose said might possibly be that the staircase—this great block of masonry containing the staircase might belong to the time of the Christian church, and not belong to the mosque necessarily. It afforded a great deal of support to defective architraves there. He (the speaker) remembered it was discussed some four or five years ago whether that should be removed as being a later addition. He expressed a very strong opinion from the historical point of view that it was undesirable to remove it. They did not notice this masonry in the outside, and certainly, after what they had heard from Mr. Penrose, it would be a serious danger to the building to remove it. He thought, on the whole, the amount of newness and the amount of restoration that was necessary must be very reassuring to most of the Parthenon carefully must have been extremely alarmed at the cracks all over the building, and at the most inadequate way in which the heavy blocks were supported.

Mr. Phéné Spiers said that it had been of the greatest interest to hear from Mr. Penrose that he recollected so clearly the dimensions and the work he did fifty years ago, and which had led his name so connected with the building. (The speaker) felt when he visited Athens all the different dimensions that could be made had been made. It was impossible in any direction to adopt the motto of Wm.

Burges, "To measure and plot on the spot." In the speaker's days "to measure and plot on the spot" was not a recommendation made to every student, as it was now. He had been looking carefully at the drawings again, and the photographs. He saw, as a matter of fact, that there had been very little change in the structure. All the stones of the west front, the angle stones, seemed to be very much the same. Slight differences which were to be met with were near to the north-east angle. The crack there seemed to have been increased a great deal since he was there, and there must have been some greater damage done to the abacus of the columns than what was seen in his drawings. There were two questions he should like to ask Mr. Penrose, as he did not quite follow him. Mr. Penrose spoke of certain stones being laid on the tiles. He supposed Mr. Penrose meant the marble tiles.

Mr. Penrose: Yes.

Mr. Phéné Spiers: The other question he wished to ask him was, What was the actual cause of the discolouration of certain parts of the sculpture? What those beautiful yellow tones were due to? Whether to the decomposition of the material of the marble or to discolouration of the iron dowels inside, or to lichen? He did not think it had ever been analysed to find out what its composition was like. There was one thing which struck him when drawing the east front, and that was the trace remaining of the shields there. The shields, originally gold, replaced by bronze about the third century before Christ, and taken away in our era; but although so many years had passed—more than fifteen hundred years—a trace of them was still visible. He was sure they must all have heard with the very greatest pleasure that their President and Mr. Penrose were both asked to form part of this International Committee, and they felt that in the proposition Mr. Penrose had made he had dealt with the building in a sparing way as far as the restorations were concerned. Mr. Spiers then proposed a vote of thanks to Mr. Penrose for the detailed account of his discoveries and for the drawings which he had made so as to show what he proposed to be the restorations.

Mr. T. J. Willson seconded the vote of thanks, and said that the whole architectural world might be congratulated on the fact that the damage to the Parthenon by reason of the earthquake was not so bad as they thought it was. They had the testimony from Athens that pieces had come down, but they were not actually split at the time of the earthquake—they were old cracks. He hoped that Mr. Penrose would find that all the repairs and cautions which he had recommended would be realised.

Mr. John Hebb said that when he came into the room he had some apprehension that what had been done, or was proposed to be done, might be mischievous to that wonderful monument which every age had admired; but he had been most agreeably reassured by the very lucid statement that Mr. Penrose had made of the methods he had employed for repairing, and not for restoring, the Parthenon. He was very gratified to find that he reprobated that very unwise attempt to set up any of the frustums of the columns. There was no doubt about it that this course could only result in injury to the building. As to the general procedure which had been employed, he was cordially in harmony with it. He thought nothing could have been better than the ingenious way in which the architrave was raised and the lintels were placed underneath. He was not afraid of seeing the brick arch that was placed over the western doorway; that was unquestionably a modern repair; but he should certainly feel great diffidence about colouring the marble so as to make it imitate the colour of the old work; he thought anything of that sort was an extremely risky proceeding. Nature would soon colour the marble, or, at any rate, if not soon (he saw that Mr. Penrose shook his head) Nature had a wonderful habit of taking old buildings to itself, and of colouring them in harmony with the landscape, and he should hope that in a short time this would take place. He hoped Mr. Penrose would forgive him for these merely trivial criticisms, as he was cordially in agreement with him as to the way he and his colleagues had carried out the work of restoration.

Mr. Hugh Stannus said that, while accepting Mr. Penrose's suggestions, and thanking him for them, he desired to submit for consideration whether this restoration of the Parthenon

might not be carried one or two steps further." Mr. Penrose had suggested also the covering up of the tops of the walls and the iron work, and protecting them, of course, from the disintegration produced by plants or moisture. He remembered that many of the walls of Pompeii were covered with tiles. That, of course, was a very proper thing at Pompeii, because the walls themselves were brick and there was a certain fitness and sympathy between the tiles and the bricks of the walls. But in the case of the Parthenon, if the tops of the walls were rendered in cement so as to throw the rain off, that would protect them for many years to come; and taking advantage of that interesting little staircase in the south-western angle of the Opisthodomus one might arrange for periodical inspection of the whole of the tops of the walls. He should also like to ask whether we might not only retain the columns that had been re-erected since the Bavarian kingship, but also re-erect such columns as exist in the frustra lying on the ground. In dealing with the Parthenon we ought to think, not what an "anti-scrape" would propose, but what Iktinos would wish in the present condition of affairs. We had the materials for half the number of columns; and he would suggest that such as we had might be put up. Undoubtedly they were damaged at the joints, and they knew that when first built up and the flutes carved in them, they had microscopic joints; but these broken joints, when the columns were built up, would be similar to other broken joints up and down the Parthenon. He would go one step further. He would like the cella wall itself to be built up all round. One felt that a building which was intended to be one great whole was in two pieces. He would like those two pieces to be joined even by a wall of sandstone, so that they might have that solid mass against the sky as it was left in the year 438 B.C. If the cella wall were joined it would have two advantages in addition to what he had just spoken of, viz., the making of one grand group on the horizontal line against the sky which should compose with the lines and contour of the Acropolis itself; and a grand mass against which the columns would tell as light against dark. And if it were a solid wall made of the same thickness as the old wall, they might bring gun-metal stay-rods to the top of the columns so that they should be steady.

Mr. Alex. Payne said that, in his opinion, if anybody could restore those columns that had fallen down into the same state as the columns that had never fallen down, then possibly there would not be any objection to putting them up again. But anybody looking at the Parthenon could pick out in a minute those two or three columns on the north side which had been built up, on account of the bad fitting of the joints; there was a stone and then a slight variation, and then another stone and another slight variation. The whole had a jagged outline, very different from the perfect columns, which appeared as if made of a single stone. The case was different with the columns which had been cut into to get out the metal dowels, but in which the original outline was not disturbed. The restored columns in this case, with their jagged outlines, certainly destroyed the harmony of the building. If these columns could be set up like the others no one could object. Comparing some photographs taken during a visit to Athens twelve years back with Mr. Penrose's drawings, he desired to ask Mr. Penrose a few questions. Taking the west front in his photograph, part of the top of the capital of the two right-hand columns was gone. The third column was just like Mr. Penrose's drawing. The fourth column likewise, but (he supposed it was the effect of the earthquake) the central lintel at the time he got that photograph was comparatively perfect except for the cannon-shot. The next two were like the photograph; but as to the last one, the corner of the capital appeared to have gone since the photograph was taken. He desired to mention an additional advantage in the Elgin Marbles being safe in the British Museum, and that is, that not only was the Parthenon subjected to bombardment, but the Turkish soldiers made the figures that remained targets for practice!

Mr. J. M. Brydon asked how much of the frieze of the cella still remained. Mr. Penrose incidentally referred to part of it remaining on the western portico. But how much actually did remain—was there one end of it nearly complete, or what? With regard to the frieze, it

must have struck many of them how it was that the Greeks spent so much skill and labour on it where it was so badly seen; that was to say, it was placed up inside of a wall behind a colonnade at which one had to look up at a very acute angle to see it, in a very imperfect light—it might be a reflected light. It had been suggested that when Pericles had the Parthenon designed originally it was designed as a cella wall with a portico at each end, and the frieze was in the external wall, but finding that the public money that he used so well came in in great quantities, the design was altered, and he made it more magnificent by adding the porticoes all round, and a certain support was given to that in the fact that the outward portico was not in alignment with the inner portico. The eight pillars at each end were not quite in line with the six behind. He would like to hear Mr. Penrose's opinion on that point; it was entirely a German theory.

The Chairman said, it appeared to him to be a very sad thing that the Greek Government had not covered over the portion that was now left uncovered between the outer porticoes and the Posticum where the portion of the Panathenaic frieze still remained. There were torrential rains occasionally in Greece, and, of course, this more or less soaked into the marble. The consequence was that the whole of the surface of this marble was gradually being destroyed, and if merely colours were put on it would be a very expensive thing to do. Of course this Panathenaic frieze was seen in a reflected light; if left open to the sky they got another effect altogether.

Mr. F. C. Penrose, in reply, said that Prof. Gardner had asked particularly about the inner lining of the great doorway. He (the speaker) had always supposed that it was desirable not to disturb any historical part of the building where it did not greatly interfere with the classical, and even then with very great compunction. For instance, it did not refer to the Parthenon exactly, but he was extremely sad that the Frankish tower was taken down, and with such feelings he should regret that that inner lining of the great doorway, which explained itself perfectly, should be taken down; but there should be no difficulty in taking out any pieces of it that might contain valuable inscriptions, and putting them back again after noting them. As to the suggestion of covering over the lintel with marble beams, to which he had already called their attention, they were supposed entirely to rest upon the old wall without any help from this inner casing. Of new stones that would be visible there would be very little indeed. There would be of the front of the Posticum portico not one stone. It would be when they got inside and looked up that it would be possible to see them from the inside. Between the Opisthodomus walls and the column, but not generally, no doubt the lintel of the great door would be seen, and that was the only one. Mr. Spiers had asked about the cracks. He paid a great deal of attention to that during his stay at Athens and this he was able to do by means of ladders, and in these he did not find any change at all from cracks which he had measured and very carefully recorded in 1846; but the rest he examined by binocular, and he could not satisfy himself that there had been any alterations. There was a very remarkable difference of colour in the surface covered by the shields; but they might suppose that those shields, especially the bronze shields, might have been there down to a tolerably late date, and therefore 500 or 600 years of natural discoloration went on outside them and not inside them. He thought that was enough to account for the difference of the stone inside and outside. The discoloration entirely came from the iron, which was invisible in the fresh Pentelic marble, but which was present in all marble when brought out by the oxygen and other vapours of the air. The Pentelic marble was the natural marble to use both on account of its local value and from the fact that it was more easily accessible.

A Member: Is there any Pentelic marble which will serve?

Mr. Penrose: The colours of the metallic marble would suit the old when it is a little timeworn, but originally the Pentelic marble was certainly stained. They had records that staining was used on marble, and the fresh marble was almost unsupportably bright in the Attic sunshine. Therefore time had given them an advantage on the building which the ancients never had in that one

respect. The covering up for the protection of the iron which he had supposed to be done with cement, and which the Committee were anxious to do, was simply pointing with cement, a very quiet and dull cement (because that had been duly discussed) on the top of the joints. He had already pretty well brought forward his own opinion as to the propriety of reinstating of the ancient columns, however done. There were several capitals on the west front which, he had no doubt, were in a worse state of repair than was shown in the drawings exhibited, those fractures only being noted on them which seemed to affect the stability. Of the sculptured frieze a very small return remained on the south side; over one columniation, he thought, a matter of fourteen or fifteen feet. Then it went as far as the fifth column of the hexastyle portico of the posticum, and there it was broken off. If the covering this portion over could be done efficiently, and without looking modern and weak and poor, there would be a great advantage to the sculptures, no doubt, in doing so. He had no doubt that the marble, if protected above, as it was, by the overhanging moulding, would bear a great many centuries of disintegration from Attic storms and tempests.

The Chairman then put the vote of thanks to Mr. Penrose, which was carried unanimously.

The Chairman announced that a special general meeting will be held on the 31st inst. for the consideration of the report of the Council on the election of candidates for fellowship.

The meeting then terminated.

The Annual Dinner.

Owing to the Diamond Jubilee celebrations in London and the provinces, and the probable inconvenience to country members in attending the annual dinner, which was proposed to be held on June 17, the Council have considered it desirable to postpone it till next November.

DR. ROWAND ANDERSON'S ADDRESS TO EDINBURGH ARCHITECTS.

AT the annual general meeting of the Edinburgh Architectural Association, held on the 12th inst., after the general business had been disposed of, Dr. Rowand Anderson delivered his valedictory address. In the few remarks he had to make before resigning his office of President, he did not feel he could do better than recapitulate, and, if possible, emphasise some of the questions he had dealt with from that chair. When he took office two years ago, one of the questions prominently before the profession was that of education, combined with efforts to make their application a close one. He explained his views fully to them, and he had heard nothing on the other side since to lead him to think differently. At the bottom of this controversy lay a misconception of the nature of their business as compared with the professions of divinity, law, and medicine. The divine had to subscribe to a creed, his historical and philosophical knowledge of which must be tested. The lawyer had to administer the laws of the country according to the fixed principles and form of those laws, and his qualifying knowledge of such must be ascertained. The physician or surgeon had to deal with disease in all its forms, and none could be successful unless he had acquired an intimate knowledge of the anatomy and functions of the body and all its parts, as also of the experience of the past and the various methods used in combating disease. They had not to provide what the public wanted in the same sense as a picture painter or dealer, or as an architect, in designing a house or other building, had to meet the individual wants and desires of a client. The public dealt with architects on a totally different footing. While it was true that a client might go to one architect rather than to another, because he was known or believed to be a better educated man in his work than others, yet, taken generally, the architect was but the interpreter of the public idea of art at any given time, and he had to provide what the public wanted and was prepared to pay for. No compulsory examination or diploma could alter this. The law could not and would not protect the public from bad art, because the public could and must at all times protect itself, and if it got bad art it got what it wanted, and the only thing it was able to appreciate. The one hope for art—and he spoke of art in its widest sense—was an

educated public. When the public were able to distinguish good from bad, and when they came to look at art not as a question of mere ornament and as a thing apart from structural and functional truth, then the bad architect would naturally disappear, and no artificial aid would perpetuate his kind, or find work for him. While little had been heard lately of converting the architect into a certified professional man, their friend, the registered plumber, was still well to the front, and he was now asking the Legislature to pass a Registration Bill as a means of protecting the public health against the ravages of the incompetent man. How the passing of such an Act could do this he could not comprehend. If the Legislature could ensure plumbers good prices for their work, they might be something in it. That registration would show that a man was competent, and a guarantee to the public that good work would be done, was a fallacy. Nothing could make a good plumber or any other tradesman but employment on good work and under competent foreman and master, and receiving proper payment for his work. Stuffing a lad with a lot of data about his work would no more make a good plumber than attending a class on navigation would qualify one to take a ship to sea. So far from the public requiring to be protected against the inferior plumber, it was the respectable plumber who required to be protected against the public. The keen and excessive competition which was stimulated by the demand for cheap work, the pitting of men of substance, experience, and character against men who had not these qualifications, was the real cause of bad work, and until that state of things was altered the registered plumber would only intensify the present unsatisfactory state of things. This claim to protect the public health was rather an arrogant one. The plumber was only a link in the chain, and if registration was necessary for him, it was equally so for other tradesmen. The mason and the Irish labourer who laid the drains were in every respect as important to the plumber, as far as health was concerned. The State could not protect the public from incompetent tradesmen unless it controlled both parties to the contract—that was to say, the work and the price to be paid for it, and attempt to do this would, of course, be absurdity. He had looked over the Plumber Registration Bill, and all he could see in it was an arrangement for the appointment of secretaries, treasurers, and auditors, and the collection of fees, but nothing whatever would add to the protection of the public or ensure a higher standard of work, and for that very good reason, which knocked the bottom out of the whole thing, that no provision could be made for insuring payment for good work. But the State could do a good deal of work which was already bearing good fruit in improving everything that concerned public health, and structures of all kinds, and by the appointment of public health officers, the passing of Public Health and Pollution Acts, and by the powers conferred on health officers, borough engineers, and sanitary inspectors. The enforcement by law of these Acts alike against the public, the plumber, and the architect was the true and only way of bringing about a better state of things. While he was entirely opposed to all artificial distinction, hall-marking of a man because he had undergone an examination on subjects which were admittedly not those that tested the real qualifications that fitted a man for his calling, he was all in favour of education. Give every young man a fair opportunity of equipping himself for his life's work; then let him swim or sink on his own merits or want them. The young man who had good sense in him would educate himself up to the standard of his time because he knew that to do was the only passport to success. But this must provide the means of his doing this, and as far as art work was concerned, that was the reason for establishing their Applied Art School. Now that he had said something about the public, he had something to say about the public. Their Association did a good deal for the public. They did not exist, like other associations, for the benefit of the architect only. Their strong point was that they existed chiefly for the benefit of architecture and allied arts. The association of a large number of non-professional members in their midst was a feature that he hoped would never be surrendered. The more they could interest the public in art, the better for them and for art, and if all other institutes and associations would

do as they did, the architect and his work would be better understood and appreciated. This was an eventful year in the history of their country; it marked a long period of progress, prosperity, and comparative peace under the beneficent reign of their gracious Sovereign Queen Victoria, and in all those benefits they had shared. A great advance in architecture, and, indeed, in all the arts, had taken place during her Majesty's reign; and much of the improvement might be attributed to the direct influence and fostering care of the late Prince Consort. This Association was, therefore, in common with all the subjects of the British Empire, greatly interested in the question of the day as to the most fitting expression to be given to this thanksgiving and Jubilee for the long and prosperous reign of her Most Gracious Majesty. He was aware that the suggestion which commended itself most highly at this time was the equipment or endowment of institutions for the relief of the sick and suffering. But, apart from the fact that infirmaries, hospitals, and kindred institutions commanded at all times national sympathy and support, irrespective of any special occasion like the present, he would like to point out that this was to a certain extent beginning at the wrong end. There was a well-known proverb which said that prevention was better than cure. Applying it to this case, he said—Do something to keep the people healthy and happy in mind and body, and there would be less need for infirmaries, nursing associations, &c. He would, therefore, like in a word or two to repeat what he dwelt on at greater length in a former address regarding the provision of a suitable place for amusement and relaxation for the masses of people whose means did not admit of their procuring such for themselves. In his opinion nothing could better mark this year of Jubilee, or be more in accordance with the expressed wish of her Majesty and the touching letter of the Princess of Wales—in which she pleaded that when schools, hospitals, and other charitable institutions had been properly provided for, the poor should not be forgotten—than the inauguration of a movement to bring into the lives of those whose means were only sufficient for the bare necessities some of that brightness and pleasure which were the outcome of comfortable and cheerful surroundings and innocent recreation. He thought that the institution of a great free place of recreation for the people would be found to have the most potent influence, not only in preserving the people from many habits which led to loss of health, but in refining and educating them, and in promoting that cheerfulness and contentment of mind which was the enemy of all social disturbances; and he did not think that the municipality could in this year of Jubilee enter on any scheme which would have more far-reaching or more beneficial effects.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Dr. Collins, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend the Battersea Vestry 1,700*l.* towards the cost of providing sanitary conveniences at Battersea Park, and the Wandsworth and Clapham Guardians 5,100*l.* towards the cost of furnishing the Home for aged and infirm at Tooting.

The Architect's Department.—The General Purposes Committee reported as follows, the recommendation being agreed to:—

"On May 19 last year the Council adopted the following report:—On December 10 last we reported that Mr. Blashill, the Superintending Architect, had attained the age of sixty-five years, and on our recommendation the Council passed the following resolution, viz.—"That, as the retirement of Mr. Blashill would cause inconvenience to the public service, he do continue to hold his appointment for another year, and that it be referred to the General Purposes Committee to report what (if any) changes in the work of the Architect's Department it is now desirable, under the circumstances, to make." A sub-committee whom we appointed for the purpose of dealing with the above reference have been going thoroughly into the whole question of the present organisation of the Architect's Department. We have had an interim report from the Sub-Committee, from which it would appear that some rearrangement of the duties devolving upon the Department is necessary. We have, however, recently received from the Housing of the Working Classes Committee the following resolution, passed by that Committee, viz.—"That, having regard to the rearrangement of the work of the Architect's Department now under the consideration of the General Purposes Committee, it is not desirable to make the Architect responsible for the planning and designing of working-class dwellings to be erected by or for the Council, and that accordingly (any former resolution of the Committee notwithstanding) outside architects should for the present be employed for all such dwellings, except those on the remaining sites on the Boundary Street area, and on the Brook-street, Cable-street, and Cotton-street sites." We concur in the proposal of the Housing Committee, and, as it will be carried out probably affect the problem of reorganising the department, we think that before taking any definite step in the matter of reorganisation it would be well to wait and see the result of the arrangement. We have accordingly adjourned the further consideration of the question of reorganising the Architect's Department for six months, and we recommend:—"That the course taken be approved." The six months having expired, we have again had the matter under consideration. We have received a further resolution from the Housing Committee as follows:—"That, having regard to the fact that sketch plans for the dwellings proposed to be erected on the area comprised in the Mill-lane, Deptford, scheme, have been prepared by the Council's architect, and that such plans are satisfactory to the committee, the committee's previous resolutions on the subject of the employment of outside architects be amended, so that the architect may be instructed to proceed with the working drawings in accordance with such sketch plans, and that the architect be instructed accordingly." We will therefore be seen that the view of the Housing Committee have, to a considerable extent, changed with regard to the preparation of plans, &c., for the erection of artisans' dwellings. We have also had before us the proposals of the Establishment Committee referred to in the report of that committee to the Council with regard to the promotion of unclassified officers. The result of opinion that was expressed in regard to the views of the Housing Committee now tending towards the constructional work as regards the artisans' dwellings remaining, to a certain extent at any rate, with the architect of the Council, there is no need at the present time for making any important change in the organisation of the Architect's Department, and that, therefore, so far as they relate to the classification of duties the proposals of the Establishment Committee might be adopted. We recommend—

That no change be made at present in the organisation of the Architect's department.

The adjourned report of the Establishment Committee relating to the promotion of unclassified officers, contained the following paragraph relating to the Architect's Department, the recommendations being agreed to:—

There are at present in this department six unclassified officials, viz.—Building Act Branch—Assistant Architect, 700*l.*; Chief Clerk, 500*l.*; one Senior Assistant, 450*l.*; one Senior Assistant, 350*l.*; Dangerous Structures Branch—Senior Assistant, 400*l.*; Street Nomenclature Branch—None. Theatres and Music-halls Branch—None. Works and Improvements Branch—None. Fire Brigade Branch—Chief Assistant, 475*l.* Housing of Working Classes Branch—None. The question of the organisation of the Architect's Department is under the consideration of the General Purposes Committee, but we have thought it well, while dealing with the other departments, to also consider the position of the unclassified officials of the department. In doing so, however, it has been impossible to avoid dealing with the question of organisation, and we have forwarded our proposals to the General Purposes Committee. The main question of reorganisation has been in connexion with the constructional section of the department, which arose from the proposal that some of the work should be given to outside architects. This proposal was initiated by the Housing of the Working Classes Committee, but since it was intimated that committee have, we understand, to a large extent modified their opinion. This will doubtless facilitate dealing with the question of re-organisation. The work of the department consists of three classes, which may be described as follows:—(1) The administration of the London Building Act, 1894. This includes all dealings with streets and buildings, the examination of the returns of district surveyors, dealing with dangerous structures, and the naming and numbering of streets. (2) The administration of the Act relating to the safety of the public in theatres and music-halls, and of workpeople in factories, workshops and laundries. With this class of work is connected at present the architectural questions arising out of public improvements, questions of loans to local authorities, and the reporting upon designs for buildings upon the Council's land. (3) The design and superintendence of erection of new buildings for the fire brigade, for the housing of the working classes, and for parks, coroners' courts, weights and measures offices, gas-meter testing-stations, and for other purposes. The maintenance of the Council's offices, and fire-brigade stations, and the preparation of schemes under the Housing of the Working Classes Act. We recommend—

(1) That the Superintending Architect do remain, as now the responsible head of the whole department;

(2) That there be a chief assistant architect in place of the present assistant architect, and a chief clerk as at present;

(3) That the work of the department be considered as apportioned between two divisions—(A) the administrative division, and (B) the constructional division, as follows:—

I. Administrative division:—(1) Streets and buildings branch—Chief assistant architect, 500*l.* to 700*l.*; Chief clerk, 350*l.* to 500*l.* (2) Dangerous structures branch—One senior assistant, 400*l.* to 450*l.* (3) Street nomenclature branch—One assistant (first class), 300*l.* (4) Theatres, &c., branch—One senior assistant, 300*l.* to 400*l.* (5) Factories and workshops and improvements branch (including for the time being matters connected with corporate property and improvements and applications for loans or for contributions towards improvements)—One senior assistant, 300*l.* to 400*l.* II. Constructional division:—(1) Fire brigade branch—One assistant architect, 350*l.* to 500*l.* (2) Housing branch—One assistant architect, 350*l.* to 500*l.* (3) General branch—One assistant architect, 350*l.* to 500*l.*

Sale of Plans of Schemes.

The General Purposes Committee also reported as follows, the recommendation being carried:—

"The Housing of the Working Classes Committee have informed us that they have decided that plans of schemes under the Housing of the Working Classes Act, 1890, should be supplied to persons interested therein at a charge which they are advised would cover the cost of preparing and lithographing the plans; and they have suggested that, in view of the fact that there are various plans other than those of schemes under the Housing Act, it might be desirable that arrangements should be made whereby copies of all such plans might be supplied to persons interested at a reasonable charge. We have had reports thereon from the officers of the Council, and have come to the conclusion that the suggestion of the Housing Committee might be adopted. We think, however, that it is of importance, having regard to the nature of the plans proposed to be placed on sale, that all sales should be effected by one department only, and that that department should be the valuer's, which is the one mostly concerned. We recommend—

"That lithographed plans of improvements and schemes be sold, subject to the direction of the officers of the Council, at a price to be fixed in each case by the committee concerned, and that the custody and sale of such plans be left in the hands of the valuer of the Council."

The Works Department.—Sir A. Arnold, Chairman of the Special Committee of Inquiry into the Works Department of the Council, stated that he intended to postpone for a week the motion that the Report of the Special Committee be received.

The Improvements Committee recommended:—

"That the working drawings, specification, and estimate of the cost (9,153*l.*) of the paving and other works required for the new street from Evelyn-street to Creek-road, Deptford, be referred to the Works Committee with a view to the work being carried out without the intervention of a contractor, but that in the event of that committee not being satisfied with the sufficiency of the estimate, the Improvements Committee be authorised to invite tenders for the execution of the work."

Mr. Marks, M.P., moved that the consideration of the committee's recommendation be adjourned.

Mr. Campbell seconded the amendment.

The Council divided, and the amendment was rejected by 54 votes to 49.

Mr. Westcott thereupon moved a further amendment to refer the matter back, in order that tenders might be invited.

Lord Onslow seconded the amendment.

Mr. Hoare observed that the Works Department had not yet been condemned. He thought the Council would save money by entrusting this work to the department, which was now rather short of employment, if it could be undertaken at anything like a reasonable estimate. It was only common-sense to send a certain amount of work to the department, in order to keep it fairly employed.

Mr. Burns, M.P., said this was just the kind of work which the department had been able to execute at a profit. He hoped therefore it would be allowed to go there; indeed, it had hitherto been automatically customary to send such work to the Works Department.

Mr. Boulnois, M.P., said that the Council had been too automatic in these matters in the past, being actuated by a blind belief that the execution of the works would come out in agreement with the estimates. It was now known, however, that in several instances the estimates had been enormously exceeded. The half-yearly report of the Works Committee, and almost the whole agenda of the Council for that day, bristled with indictments against the department, and he thought the Council should pause before entrusting any further work to the department.

Lord Mountmorres supported the amendment, and deprecated any attempt by the Progressives to prejudice the Council's verdict on the Works Department by giving the department another job meanwhile. Their policy

was to heap work upon the department, with the view of ultimately saying that the stake in the department was so large that it could not conveniently be abolished.

The Council divided, and the amendment was rejected by 57 votes to 50.

The recommendation of the Committee was then agreed to.

On the report of the Works Committee, Lord Onslow asked that a return of the works completed, up to the latest possible date, should be circulated to councillors before being placed upon the agenda.

Dr. Longstaff inquired whether it was a fact that the manager of the Works Department had been ordered to sell a quantity of timber of the estimated value of 2,000*l.*, such timber having been four years in stock, but being of so inferior a quality as to be useless to the Council.

Mr. Hoare replied that the return referred to by Lord Onslow would be circulated the following day. As to the timber, the suggestion of the hon. member was not correct, but the manager had been ordered to report what timber unsuitable for its purpose the Council had now in stock.

The consideration of the half-yearly return of works completed by the department was postponed with the other matters affecting the department.

The Council's List of Wages.—The Works Committee reported as follows, the recommendation being agreed to:—

"The Central Association of Master Builders of London having informed us that at a meeting of the master builders of London and the representatives of the labourers and navvies, held on May 4, 1897, it was decided that the rate of wages of labourers and navvies employed in the building trade should be raised on June 1, 1897, from 6½*d.* to 7*d.* per hour, we have to recommend—That the rate of wages of labourers and navvies employed in the building trade given in the Council's list be altered on June 1 next from 6½*d.* to 7*d.* per hour."

Cases Decided by the Tribunal of Appeal.—The Building Act Committee reported as follows:—

"We have to report, for the information of the Council, that the Tribunal of Appeal has allowed the appeal made by Messrs. Perry & Reid, on behalf of Messrs. Hoare & Co., against the following condition attached to the Council's consent to the erection of the 'Eight Bells' public-house, at the corner of Collingwood-street and Meymott-street—'that the portion of the new building on the site of No. 19, Meymott-street and a part of the kitchen at the rear of the public-house do not exceed 16 ft. in height'—and has otherwise varied the Council's order, and that the Tribunal has allowed the appellants' costs in the matter. The reason for the decision appears to have been that the Tribunal was of opinion that the condition was more onerous than the conditions prescribed by the Act for domestic buildings erected after January 1, 1895, in a street laid out before the Act came into operation, inasmuch as the condition made by the Council in this case appeared to require an open space about 16 ft. wide, and the Tribunal considered that the Act only required 10 ft. The Tribunal was also of opinion that the owners had a legal right to build to the height they wished if 10-ft. air-space were left at the rear above the height of 16 ft.; and the order of the Tribunal, in effect, allows the owners to cover the 10-ft. rear air-space with a building 32 ft. high."

Mr. Emden asked if the cases heard before the Tribunal could not be printed for the use of professional men.

Mr. Payne (the Chairman of the Committee) replied that when sufficient cases had been heard they could be printed as suggested.

Having transacted other business, the Council adjourned.

ARCHITECTURAL SOCIETIES.

THE EDINBURGH ARCHITECTURAL ASSOCIATION.—The Edinburgh Architectural Association recently visited Hopton House. Dr. Rowand Anderson pointed out that the house had apparently been the work of three hands, the western side being erected in the beginning of the eighteenth century by the first Earl, who employed Sir William Bruce of Kinross as his architect, the side wings with the connecting colonnades being by William Adam, father of the brothers Adam, and the attic story and east front being perhaps the work of other hands.—The annual general meeting of the Association was held on the 12th inst. in the Royal Institution, The Mound—Dr. Rowand Anderson, the retiring President, in the chair. Several reports were submitted to the meeting. Office-bearers were elected for the forthcoming

year as follows:—President, Mr. Thomas Ross, F.S.A., Scot.; Vice-Presidents, Mr. John Watson, architect, and Mr. James Bruce, W.S.; Hon. Secretary, Mr. T. Fairbairn; Hon. Excursion and Syllabus Secretary, Mr. A. Hunter Crawford, architect; Treasurer, Mr. John Johnston, C.A.; and members of Council, Messrs. J. A. Carrae, J. D. Cairns, the Rev. P. M. Herford, David Robertson, A.R.S.A.; William Rae Macdonald; and R. Morham. It was reported that at this time the membership stood at 302, which was practically the same as at the end of the year 1895-96. Dr. Anderson then delivered his valedictory address, a report of which will be found on another page.

DEVON AND EXETER ARCHITECTURAL SOCIETY.—The Devon and Exeter Architectural Society held its annual meeting at Devonport on the 15th inst. Mr. Arnold Thorne (President) occupying the chair. Messrs. Anstis, G. Bewes, Harbottle Reed, and B. P. Shires were elected from associate members to members, and Mr. Geo. H. Lake was elected an associate. The financial statement showed that, after an expenditure of 38*l.* 12*s.*, there was a credit balance of 2*l.* 8*s.* in hand. The annual report of the Council, presented by Mr. Harbottle Reed (Hon. Sec., Exeter), stated:—The Plymouth, Devonport, and Stonehouse branch having asked for support in their action with regard to paid officials undertaking private work, they were authorised to send the following letter to the various Local Authorities:—"The architects practising in Plymouth, Devonport, and Stonehouse and surrounding district, as represented by the Three Towns branch of the Devon and Exeter Architectural Society, humbly submit to the various Local Authorities in the district that professional men labour under great hardship and disadvantage from the fact that some of the officials and their assistants in the employ of such Local Authorities are in the habit of undertaking a large amount of private work which should be executed by professional men in private practice. They submit that this is prejudicial, not only to private professional interests, but also to public interests, inasmuch as all public servants ought to occupy a perfectly impartial and disinterested position in the administration of their departments. They venture to hope that the various authorities will take such steps as they think necessary to prevent effectually the continuance of this practice. They would also suggest that those Authorities which require plans to be submitted should discourage the acceptance of any plan not signed by an architect or surveyor." At the general meeting the prize offered for a measured drawing by pupil associates was adjudged to that submitted by Mr. J. H. Vincent, Plymouth. It was resolved that the prize should be again offered. The Royal Institute of British Architects having asked the allied societies to join in the presentation of an address to her Majesty the Queen on the occasion of the Diamond Jubilee, the Council signified their intention of identifying themselves with it. The roll of membership now stands as follows:—Members in 1897, 48, against 43 in 1896; associate members, 11, against 13; and honorary members, 4, against 3; a total of 79, against 70. The report having been adopted, Mr. E. M. Leest (Local Hon. Sec.) moved that the rules be altered so as to admit architects who are not eligible as members, and all assistants who have duly served articles and are over twenty-one years of age, as associate members of the Society. He pointed out that, under the present system, assistants of any standing were classed with students. Mr. Luff seconded *pro forma*. The motion was negatived. The Chairman in his address said the report was an indication of the growth and vitality of the Society. His address was now a valedictory one, and in their new President he was sure they would elect one whose services would reflect lustre on the office and distinction on the Society. The profession laboured under various disabilities, and whether the Registration Bill was the best remedy, he was not prepared to enter upon. They suffered from undue competition from men who were not restrained by any rules, who had no obligations of esprit de corps, and who felt themselves entitled to tout for work unblushingly, and who offered to do work at less than the rates which those present considered were properly remunerative, eking out their earnings by following callings which were not, in their opinion, of a nature likely to dignify the profession of architecture. The Chairman then moved that Mr. J. Hine, F.R.I.B.A., be President of the Society for the

ensuing year. Mr. Luff seconded, and it was carried by acclamation. Mr. J. Crocker, F.R.I.B.A. (Exeter), was re-appointed Vice-President. Mr. C. King was appointed to the Council, vice Mr. Hine; and Messrs. G. S. Bridgman (Paignton) and Tate were elected to fill vacancies. Votes of thanks to the retiring Chairman and to the officers were unanimously agreed to. The members at the conclusion of the meeting drove to the Keyham extension works, where they were received by Mr. Elliot, the Superintending Engineer.

Illustrations.

CHURCH AND MISSION ROOM, SEUGHENYDD.

THE illustration shows a characteristic form of church of the South Wales mining districts, where many such buildings have been erected during the last few years. In this case, as in most others of the same class, one of the main objects has been to provide large accommodation for a comparatively small outlay.

The church is arranged to seat 500 persons, and the walls are of native stone with yellow dressings, the roofs being covered with green slates.

The cost of the church and room will be about 4,000*l.* The contractors are Messrs. Cox & Burdo, and the architect Mr. E. M. Bruce Vaughan, both of Cardiff.

SCULPTURE AT THE ROYAL ACADEMY.

THE illustrations of sculpture at the Royal Academy are mostly from photographs kindly supplied to us by the artists, whose names are given under the respective illustrations. The works are all mentioned and commented on in the article on another page, on "Sculpture at the Academy and the Salons," and we need not therefore say more in regard to them here. There are one or two other important sculptural works of which we shall be able probably to give illustrations at a later date.

DESIGN FOR A MAUSOLEUM.

THIS design, the exterior perspective of which is exhibited at the Royal Academy, is for a mausoleum to be erected in Warwickshire, to be carried out in Portland stone. The interior is arranged for five monuments.

Externally the building is to be surrounded by a dry moat and approached by a bridge.

The architect is Mr. John Belcher, who sent us a plan of the building, which unfortunately arrived too late for publication. It is very simple. There are four internal piers near the angles of the central space, which is domed; the piers leave an aisle round them, the angle spaces of which have domical roofs.

THE TRIBUNAL OF APPEAL.

THE Tribunal of Appeal, Mr. Arthur Caves presiding, sat at the temporary offices, Savoy Hill, on Wednesday last week, to hear an appeal made by the Rev. Sir Talbot H. B. Baker and the Governors and President of Queen Charlotte's Lying-in Hospital, against a certificate of the Superintending Architect of Metropolitan Buildings, dated March 30, 1897.

The appellants were represented by Mr. Glen, and the Superintending Architect by Mr. Graham Berry. The Marylebone Vestry was represented by its Chairman, Major A. J. Hopkins, the certificate appealed against being in respect of buildings on the north side of Marylebone-road.

In his opening statement, Mr. Glen said his client, the Rev. Sir Talbot Baker, owned the freehold of ten houses on the north side of Marylebone-road, three of which were held on lease by his other clients, the Governors of the hospital. The Marylebone-road, formerly known as the New-road, was made under a statute passed in 1756, to connect Islington with the Edgware-road. It contained a stipulation that no building should be erected within 50 ft. of the roadway. That statute was repealed by Section 75 of the Metropolitan Management Act (1862), the road thenceforth coming under Section 22 of the new Act, the effect of which was to prevent buildings being erected so as to project beyond a general line. Application was made in March, 1890, to the London County Council by Sir Talbot Baker for permission to erect buildings on that site. That application was referred, by the Council, to the Marylebone Vestry, which recommended the Building Act Committee to accept a scheme fixing the general line of buildings at a distance of 7 ft. at the western end and 15 ft. at the eastern end, beyond

line of the old buildings. The Council rejected his application under the impression that the title of 1756 was still in force. In 1864 the owner made a fresh application, which the Committee approved and recommended to the London County Council, but owing to opposition in the Council the Committee subsequently withdrew the recommendation. In his scheme the owner proposed to give up 3,350 superficial feet of land to the public, and in a minute dated January, 1867, the Building Act Committee itself pointed out that if the application was granted it would effect a great improvement. The minute added that the scheme appeared to be desirable, particularly as it was likely that the new station of the Manchester, Sheffield, and Lincolnshire Railway would be made in the immediate vicinity. Notwithstanding this, when the matter again came before the Council in January 1868, a recommendation was adopted that the consent of the Council be not given. This necessitated an application for the certificate of the Superintending Architect. But the portion of the road selected by the architect for his demilition extended beyond the site, and it fixed the general line of the demilition 50 feet from the highway. Against that decision the owner now appealed, and the Ordnance map of the portion of the Marylebone-road in question was put in to show that the decision was not correct in fact. Mr. Glen submitted that if the line taken was extended beyond the site at all, that portion of the road west of the site as far as Edge-road could not be set aside. He contended that the Superintending Architect was wrong in making 50 ft. as the distance, because in portions west of the site, the buildings came close up to the pavement. To follow out the line of the Superintending Architect would penalise the appellant, because it would compel him to set back the buildings 50 ft. from the centre of the highway, as against buildings along other portions of the road which were only 80 ft. from the centre. At the western end of the road the buildings set back only 5 ft., while at the Metropolitan Railway Station they were no distance at all from the pavement.

Mr. Glen called as his first witness Mr. Gruning, architect, who said the line laid down by the Superintending Architect did not represent the general line of buildings. The witness had laid down the plans put in two alternative lines—one short and straight, showing the true line of buildings opposite the site in question, and the other much longer with tangential curves following the contour of the road. In reply to Mr. Graham Berry, the witness said that even assuming that the Superintending Architect had taken the right portion of the road, his demilition was still incorrect because he left out of consideration the links which occurred at the road. In the part taken it was admitted that in some parts of the road the majority of the houses were set back 50 ft., but on the shorter line marked on the plan extending past twenty-two houses, eight of them had fore-courts of only 5 ft.

Mr. J. Bolton deposed to making the applications in 1867 and 1869. He agreed with the evidence of Mr. Gruning.

Mr. F. W. Hunt, Surveyor to the Portland Estate, deposed to making in 1864 the application that had been referred to the Marylebone Vestry. A minute of the Building Act Committee of November 24 recommended the scheme to be approved, but it was withdrawn later, the reason given being merely that it was considered inexpedient. By concessions from the Metropolitan Board of Works the building line had been advanced at Oxford and Cambridge Mansions, Madame Tussaud's, and other places, while Baker-street station had been brought right up to the pavement.

Major Hopkins on behalf of his Vestry had no objection to the scheme which proposed a line setting back 7 ft. at one end and 15 ft. at the other, in fact the Vestry approved it, because it would throw 12 ft. into the roadway. The question of the building line did not go before the Vestry. They only considered the advantage of the public. He was not in a position to go beyond that statement.

Mr. Graham Berry said he was instructed to support the certificate of the Superintending Architect. The Council considered this a most important act. He must very seriously ask the Tribunal to consider whether they would allow these buildings to come forward. The corner which the architect had selected was a very suitable point from which to consider the general line.

Mr. Glen said that by the repeal of the old Act, the law practically said, You are only prohibited from building if in doing so you come in advance of the general line of the street. The Tribunal had not to consider the Act of 1756, but it was for the Tribunal to decide how much of a street should be taken in defining a general line. Once the line was defined by the Tribunal there could be no encroachment. No one could come in front of it. The line laid down would govern all future cases.

The Chairman inquired whether there was any possibility of a compromise being arrived at. The appellants virtually said, If you will allow us to come up to the line we propose, we will give so much land to the public, and the Committee had declared that this was a desirable thing to be done. Major Hopkins suggested that if the decision of the Tribunal was postponed till a further application could be made to the County Council, the matter might be arranged.

Mr. Graham Berry said that he would not take the initiative, but he would raise no objection to that course.

The Chairman said, if both sides were willing, the Tribunal would suspend its decision, say, for a fortnight, to enable the parties to agree.

A brief consultation which then took place not producing the desired result, Mr. Cates announced that the Tribunal would at once consider its decision, and communicate it to the parties interested.

Correspondence.

To the Editor of THE BUILDER.

FORM OF BUILDING AGREEMENT.

SIR,—The attention of the Council of the Royal Institute of British Architects having been drawn to that part of the report, contained in your issue of March 27, of a general meeting of the Institute of Builders regarding the issue by this Institute, "on their own account," of an agreement and conditions of building contract, I am instructed by them to make the following statement:—

A form of "heads of conditions" settled in 1870, which was not, and did not purport to be, a set of conditions available for use, but only "heads" or suggestions, having been found to be obsolete in some respects, and deficient in many particulars on which disputes had been found likely to arise, the Practice Standing Committee of the Institute, some six or seven years ago, decided to prepare a document suitable for general use, and invited the Institute of Builders to negotiate with them with a view to agreeing on the form. This invitation was accepted, and for nearly five years the Committee was in constant communication with the Institute of Builders, and conferences were held between the two bodies.

All the conditions were agreed upon save two or three. But, as it was found impossible to come to terms over these two or three conditions, after repeated efforts to effect a settlement negotiations were broken off and the Royal Institute issued the new form.

In the report of the Institute of Builders published by you, it is stated that the Council of that body have taken certain steps "in the interests of the Members of that Institute and the trade generally."

The architects, in what they did, had to consider not only the interests of the builder, but also those of the employer—the other party to the contract—their sole endeavour being to act justly between the employer and the builder.

The Standing Committee were advised all through by Messrs. Waterhouse, Winterbottom & Harrison, solicitors, who in their turn were advised by counsel.

Afterwards the Council of the Royal Institute independently sent the draft form to Messrs. Markby, Stewart & Co., the solicitors to the Royal Institute, by whom it was settled and approved.

The instructions given to the solicitors from the first were to make a form of contract which should be strictly fair as between employer and builder.

It is of course quite conceivable that the builders might desire certain alterations in the document in their favour, but it is equally conceivable that the employers might desire alterations in the other direction.

Before the issue of the new form the Royal Institute gave notice to the Institute of Builders that they no longer sanctioned the old "heads" of 1870. Notwithstanding this reputation, and without mentioning the fact, the Institute of Builders now state that they have prepared fresh prints of these 1870 conditions, but have "corrected" them "to bring them up to date."

Since the publication of the new form by the Royal Institute of British Architects a year and a half ago, some thousands of copies have been sold—an evidence that the form is greatly appreciated.

W. J. LOCKE,
Secretary, Royal Institute of
British Architects.

R.I.B.A. ELECTIONS.

SIR,—There is one aspect of the question which does not seem to have been noticed by your correspondents "from York" and elsewhere, viz. That the nomination by the Council is always made from among those Fellows and Associates who have either in the Institute or the Architectural Association, rendered active and valuable services. There are, for instance, on the Institute Council at present

no fewer than eight Past Presidents of the Architectural Association, and they, with the other members, have acted for years on minor Institute Committees. By the laws of the R.I.B.A. the Council are requested to put in nomination at least twenty-two names, from among whom only eighteen can be voted for. In searching for new names, the Council naturally select those of members who have already worked on Committees and are therefore acquainted with the work of the Institute. Mr. Brooks, Mr. Aston Webb, and Mr. Graham would, I suppose, be recognised at once as valuable members. Mr. Wormum and Mr. Keith D. Young have acted for years on the Board of Examiners, and Mr. W. Young on the Art Standing Committee, giving up to the work of those committees a vast amount of valuable time, and Mr. Statham in the papers and lectures given to the Architectural Association, and by his frequent communications on important subjects to the Institute, shown the great interest he takes in the working of those two societies. But what have Mr. Bibby or Mr. Delissa Joseph done? They have never been members of the Architectural Association, and they have never served on any of the Institute Committees; it is doubtful whether they ever attend even the Institute meetings. There is no reason why Mr. Joseph should not have rendered valuable services on the Board of Examiners, and if he will now join the Board, in four or five years time he may have some claim on the votes of the members. Mr. Bibby, I believe, gave up active practice two years ago, and is now, I am informed, a clerk in the Architectural Department of the London County Council. Surely he cannot be regarded as a representative of the practising architects of the Institute, whether Fellows or Associates.

Y.
* * But as the Council have proposed the names of Mr. Delissa Joseph and Mr. Bibby, we presume, on the argument in the foregoing letter, that they had a good reason for doing so. We may add that Mr. Delissa Joseph was present at the last annual general meeting at all events, for he was the mover of a resolution on that occasion, as our correspondent should have been aware.—ED.

SIR,—In reference to your note at the foot of my letter published in the *Builder* of this day, may I direct attention to another aspect of the matter?

There are sixteen architectural societies allied to the Institute, but only nine of these, at a time, are allowed representatives upon the Council, and this is by an election under the provisions of By-law 30. Last year there was no contest, but on previous occasions three or four representatives of societies were defeated.

As, therefore, four representatives of allied societies did not attend even one of the twenty-eight meetings of the Council held last session, there is good reason why they should retire in favour of the defeated representatives of other allied societies.

But what those who are acting with me demand is that there shall be periodical retirements from each class of the Council, and that, after his third year of office, each member shall withdraw, unless elected as a Vice-President.

We are, therefore, voting only for the seven new candidates, leaving the present members of the Council and the friends of the old system to decide as to which eleven, or more, candidates shall be selected from the existing Council to remain in office.

A FELLOW OF THE INSTITUTE.
London, May 15, 1897.

The Student's Column.

SPECIFICATIONS.—XXI.

PAINTER.

MATERIALS.—(In specifying the materials for the painter's trade it should be noted that the highest quality is not that described as "Best.") The oil colours are to be prepared with genuine old white lead and genuine Baltic linseed oil. The paint to be mixed on the premises, and all the materials to be tested, as the architect may direct, at the expense of the contractor. Each coat to be of a different tint, and the finishing coats to be in approved tints.

The wood is to be well rubbed down to a smooth face after each coat of colour; and no coat of paint is to be followed by another until it has been seen and approved by the architect. The varnish is to be obtained from Messrs.

at the following p.c. price:—
Per Gal.

Hard oak varnish, at the p.c.
price of
Pale oak varnish
Copal varnish
French oil varnish

It is always desirable to specify a given make of varnish with the p.c. price; as it is almost impossible for the architect to determine the precise quality of any varnish

that may be brought upon the premises by the contractor.)

Ironwork.—All ironwork before being painted is to be thoroughly cleaned, and if necessary pickled and all rust and scale completely removed.

All ironwork is to have the first coat painted with red lead and oil mixed in small quantities and used fresh.

All ironwork is to have the first red lead coat and two subsequent coats applied before the work is fixed, and the finishing coat only is to be applied after fixing.

The whole of the external ironwork is to be painted with three coats of oil colours after the first red-lead coat, and is to be finished in the following colours. (Describe the various colours which are to be used for various parts of the work, unless the same kind of tint is to be used throughout, in which case, of course, it would be necessary only to mention the one tint.) Eaves gutters are to be painted inside as well as out, and the interior of the rain-water pipes is also to be painted (if desired).

The iron railings to boundary wall to be painted in three coats of Wolston's Torbay paint.

The internal ironwork is to be painted with three coats before fixing, and where visible one coat after fixing.

Woodwork.—All woodwork before being painted is to be knotted, stopped, and primed. The knotting to be used is to be red-lead and size knotting, allowed to remain on at least forty-eight hours, and then rubbed down smooth. No patent knotting is on any account to be used. (This, of course, is a matter for the judgment of the individual architect to determine whether or not he is prepared to allow the use of patent knotting.)

No woodwork is to be sized before priming, but the priming coat is to be mixed with oil.

The paint for external woodwork to be mixed with boiled oil, that for the internal with raw oil.

Paint the external woodwork in four coats of oil colour of the following tints. (Give a list of the various tints which are to be used, and the work to which they apply.)

The internal woodwork to be painted as follows:—The woodwork in drawing-room and dining-room to be painted in four coats of oil colour to approved tints in party colours, and afterwards varnished with copal varnish.

Woodwork of morning-room and smoking-room to be painted in four coats of oil colour, gaine imitation walnut, and varnished with pale oak varnish.

Woodwork of offices to be painted in four coats of oil colour of approved tints and varnished with hard oak varnish.

The woodwork of staircase to be twice sized and twice varnished with hard oak varnish, as long a time as possible being left between the two coats of varnish.

Similarly specify any other variations there may be in the method of carrying out the painting of the internal woodwork.

Painted Walls.—The walls of principal staircase are to be painted in as many coats of thin oil colour as may be required to enable the work to bear out over the whole surface, after which they are to receive two coats further of oil colour, and to be finished with a flatted coat to approved tint.

Oiling Woodwork.—The wrought wainscot woodwork is to be brushed down with a clean, soft brush, and once oiled with a coat of olive oil.

French and other Polish.—The mahogany woodwork in is to be stained and French-polished to match an approved sample. The woodwork of is to be dull polished with egg-shell gloss. Woodwork of is to be ebionised and polished.

Gilding.—The surface of is to be dead gilded in oil size with best English double gold. (Gilding of woodwork is done in oil size, that of plaster in water size.)

Stencil Decorations.—Frieze in is to receive stencil decoration, full-size cartoons of which will be supplied by the architect, and they are to be prepared and cut out by the contractor and returned to the architect after using. The ties in stencilling are not to be painted out but to be left. (If the stencilling is to be done in more than one colour it should be stated.) The workman in stencilling is not to attempt to produce an even tone of colour, but to leave same in a naturally broken state.

Lettering.—The following lettering is to be included in the contract and carried out as

directed. The letters on glass panels of doors to offices to have the following names in block letters $\frac{1}{2}$ in. high in black. (Describe also any other lettering stating the material on which the lettering is to be, the size of the letter, character of the alphabet, and the colour of the lettering.)

Completion.—Touch up all painted work on completion, make good all defects, and leave perfect; black stoves, scrub floors, clean windows; and leave the whole of the premises clean and ready for occupation.

OBITUARY.

MR. JOSEPH KYLE.—Mr. Joseph Kyle, of Newcastle and Barnard Castle, contractor, died at his residence at the latter place on the 13th inst., in his eightieth year.

MR. JOHN HUTCHINSON.—On the 9th inst. the death took place at his residence, Prudhoe-terrace, Tynemouth, of Mr. John Hutchinson, a local builder and contractor. The deceased was sixty-three years of age.

GENERAL BUILDING NEWS.

ST. MARYLEBONE WORKHOUSE.—NEW ADMINISTRATIVE BLOCK AND SPECIAL WARDS.—In consequence of their dilapidated and insanitary state and irregular disposition, the Guardians decided to pull down all the remaining parts of the old workhouse in Northumberland-street, Marylebone, W., and to erect new administrative and ward blocks on the site. The total accommodation will be thereby increased to 1,000 inmates of all classes. The reconstruction of the workhouse was commenced thirty years ago, when the first new chronic ward blocks were erected from the designs of Mr. H. Saxon Snell, who was also responsible for all the other new buildings on the site, including the laundry and Guardians' offices. The sick poor were removed from the workhouse about fifteen years ago to the Marylebone Infirmary, erected at Notting Hill from Mr. Snell's designs. The new administrative block, of which the foundation-stone was laid on the 10th inst. by Mr. Edward White, L.C.C., Chairman of the Visiting Committee, is placed in the centre of the site, opposite the entrance gates. The building comprises the following accommodation, viz.: Visiting committee room, with inmates' waiting rooms attached; offices for master, matron, clerks, &c.; general kitchen for cooking for the whole of the establishment; dining hall to seat over 1,000; matron's stores; needle and work rooms; men's work rooms, tailors' and bootmakers' shops, &c. All the above are on the ground floor. The basement is almost entirely devoted to extensive kitchen and general store rooms. There is a bakery also, to be fitted with four of Mason's patent ovens; also boiler, engine rooms, &c. On the first floor there will be a chapel to seat 500. This (and also the dining hall) will be faced internally almost entirely with coloured glazed bricks. The first and second floors of the north and south wings will be devoted to temporary sick and lying-in and convalescent wards. The whole of the building throughout will be finished in the best manner. All walls of corridors and staircases are faced with glazed bricks or tiles, and the floors are fireproof, finished in tiles or mosaic. The buildings generally will be faced externally with white Arlesley facings, relieved with thin red bands. The front of the chapel and the offices beneath will be faced with red pressed bricks relieved with Portland stone dressings. The old chiming clock and bells have been preserved, and will be re-erected over the east end of the chapel. It is hoped that the buildings will be completed and opened in May next. The building is being carried out by Mr. Charles Wall, of Chelsea, whose contract for the work amounts to 48,500l. The architect is Mr. Alfred Saxon Snell, and the clerk of works is Mr. Frederick W. Lee.

NEW SYNAGOGUE, CARDIFF.—The new synagogue in Cathedral-road, Cardiff, an illustration and description of which appeared in our issue for March 13, was opened on the 12th inst. The architect of the building was Mr. Deliss Joseph, of London, and the contract was carried out by Mr. W. Lissaman, jun., of Cardiff, at 5,164l.

TRAYN'S SCHOOL, CARDIFF.—At a meeting of the joint committee of the Cardiff and Barry School Boards last week the sketch plans prepared by Mr. W. H. Dashwood Caple, architect, of Cardiff, for this school were approved, and the architect was instructed to proceed with the contract drawings. The proposed school is to be erected jointly by the Cardiff and Barry School Boards, and is roughly estimated to cost 15,000l.

NEW CHURCH, CLYDEBANK, GLASGOW.—A new church has just been opened under the auspices of the Evangelical Union congregation of Clydebank. The edifice, which occupies a site at the corner of Dumbarton-road and Miller-street, is to be known as the Morrison Memorial. The buildings, which are of Ballochmyle red sandstone, are two stories in height, comprising a large hall and other rooms on the ground or semi-basement floor, while the church proper is above. The structure has been designed by, and carried out from plans of, Messrs. Steel & Balfour, architects, Glasgow.

BUILDING IN ABERDEEN.—At a meeting of the Plans Committee of the Aberdeen Town Council held on the 6th inst., plans were submitted for approval of twenty-four new buildings and extensions in various parts of the city. Among the plans were those of a new north aisle for St. John's Episcopal Church, Crown-terrace. Mr. Arthur Clyne is architect for this extension.

GOLF CLUB HOUSE, EDINBURGH.—Lord Rosebery opened, on the 11th inst., the new club house of the Edinburgh Burgess Golfing Society, which has been erected at the entrance to their green at Barnton, and in immediate proximity to Craigmoad Brig Station. Mr. K. M. Cameron was the architect, and the building is in the Early English style. The club house is for the most part two stories in height. The chief apartment on the ground floor is a dining-hall, 50 ft. by 30 ft., with arched ceiling. On the opposite side of the vestibule is a smoking-room, 26 ft. by 22 ft., and on the same level are an office for the secretary and a drying-room; and, in addition to lavatory accommodation, a box-room, with 650 boxes. This room is an annex, one story in height. It is lighted from the roof, so that the whole wall space is available for boxes. Upstairs there is a billiard-room, a ladies' room, and committee and card rooms. The total cost of the club-house will be between 5,000 and 6,000l.

ODDFELLOWS' HALL, STONEHOUSE.—New headquarters for the South Devon district of the Ancient Independent Order of Oddfellows (Kent Unity) have been opened at Stonehouse. The premises are situated in Edgcombe-street, at the corner of Market-street. On the right of the entrance is the district office, and in the same locality are ladies' and gentlemen's cloak-rooms, a card-room, lavatories, &c. In the basement are the kitchen and sculleries; and on the first-floor is a hall capable of accommodating from 250 to 300 people. A platform has been built at one end of the hall, and beneath this an emergency door leads to Market-street. In other parts of the building are ante-rooms, a lodge-room, and quarters for the caretakers. The builder is Mr. A. N. Coles, and the architect Mr. A. W. Dehnam.

MANSON ON THE TROUP ESTATE, NEAR ABERDEEN.—Mr. W. Davidson, New Pittligo, has been entrusted with the contract for the mason work of a new mansion-house for the laird of Troup. Mr. R. G. Wilson, Aberdeen, is architect.

GOLF CLUB, MURRAYFIELD, EDINBURGH.—A golf clubhouse is to be erected on a site at the top of the road leading from the Kavelston Dykes to Murrayfield, and will consist of a general room, 31 ft. by 19 ft. 6 in., ladies' room, and gentlemen's room, with lavatory accommodation off each, kitchen, &c., with a verandah 9 ft. 6 in. wide round three sides of the building. The walls will be constructed of brick, with a dado of pressed facing brick, the upper portion covered with red tiles. The architects are Messrs. Cooper & Taylor.

SCHOOLS, STONEHAVEN.—Plans have just been sanctioned for the erection of additions to the Episcopal Schools. These comprise large class-rooms, teachers' retiring room, cloak room, and lavatories, also new staircases. The elevation to High-street is of Gothic design, and the front finishing is to be of Brechin stone. All the inside finishing is to be of pitch pine. The architect is Mr. J. Augustus Soutar, Aberdeen.

LIBRARY, EDINBURGH.—The first of the Nelson Hall and Public Branch Libraries, to be erected by the Nelson Trustees in connexion with the Public Library Committee, has just been completed. The site of this building, which will be called the Nelson Hall and West Branch Library, is at the corner of Murdoch-terrace and Dundee-street. The Nelson Hall occupies the whole of the west side of the building, and will be used as a news-room and recreation-room. It measures 75 ft. long, 33 ft. wide, and 37 ft. high. The library is in the centre of the building. The upper floor consists of staff workroom, committee-room, and a hall for small meetings. Above this and facing the south is the caretaker's house. The work has been superintended and carried out by Mr. Harry R. Taylor, architect, of Messrs. Lessels & Taylor.

BOARD SCHOOLS, IVER, BUCKS.—New Board schools, erected at a cost of 4,000l., have just been opened at Iver. The schools are designed with separate departments for boys, girls, and infants, and contain accommodation for 565 children, in three blocks. Each contains a school room to hold 100 children, and large class-rooms, with cloak-rooms and lavatories. Double entrances are provided for each block, and board and teachers' rooms are provided. Covered playsheds have been built for use in wet weather. A master's house has been built on the site facing the High-road, designed to correspond with the school buildings. The infant school and class room have been designed for use as an assembly hall for concerts, &c. The works have been carried out from the designs, and under the superintendence of, Messrs. Eves & Hardman, of Uxbridge, and have been erected by Messrs. Fasnidge & Son, builders and contractors, of Uxbridge.

CATHOLIC SCHOOLS, BLACKBURN.—The foundation stone of new day schools in connexion with St. Anne's Roman Catholic Church, Blackburn, was laid recently. The building, which is being erected by Messrs. Keeley & Sons, contractors, Blackburn, from plans prepared by Mr. Oswald C. Hill, will be

of two stories. The infants and boys' departments, and two class-rooms for boys, will be on the ground floor, while upstairs will be the girls' school. Accommodation will be provided for 1,000 scholars, and, including furnishing, the building will cost 7,000l.

PROPOSED CRAMIE HALL, PERTH.—It is proposed to erect a Public Hall in the Craig district of Perth. The hall will be about 57 ft. by 28 ft. 6 in., and will accommodate 350 persons, with space for a platform at one end. At the east end there will be one or two minor rooms and lavatory accommodation. The architect is Mr. George Young, Perth.

BOARD SCHOOLS, WHEATLEY, DONCASTER.—On the 13th inst. new schools were opened at Wheatley. The contract amounted to 2,660l. The builders were Messrs. Mullins & Richardson, and the architects Messrs. Athron & Beck, of Doncaster.

ADDITIONS TO ST. PAUL'S CHURCH, DERBY.—At St. Paul's Church, Derby, the foundation stone of the new aisle has been laid by Lady Haslan. The cost of the addition will be about 800l. The new aisle will accommodate about a hundred extra worshippers. Like the original portion of the fabric, the new part will be of Cobeneth stone. The architect is Mr. Percy Curry, Derby; and the contractors being Messrs. Joseph Parker & Son, of Derby.

PRUDENTIAL BUILDINGS, NOTTINGHAM.—The new buildings of the Prudential Assurance Company, Ltd., which form the junction of King-street and Queens-street, Nottingham, are now open. The principal entrance is surmounted by a tower and spire. The architects were Messrs. A. Waterhouse & Son, and the builder was Mr. J. Hutchinson. There are entrances to the building on each side of the upper end of the slope, from King-street and from Queen-street. A great portion of the building is covered with slate. Prudential Company occupy the main floor, which also contains the departments of the resident inspector and the district inspectors. The building externally has a plinth of red Aberdeen granite 9 ft. high at the tower end, with facings above of red Burmantofts terra-cotta and red bricks of special size. The tower roof is of lead, but on the other parts of the roof red Knaob tiles form the covering, with slate on the internal slopes.

PROPOSED NEW WORKHOUSE, HUNTSLEY, YORKSHIRE.—The Huntsley Board of Guardians, at their meeting on the 5th inst., further discussed the desirability of erecting a new workhouse for the Union. Block plans, prepared by Mr. E. J. Dodgshin, architect, were submitted by the Visiting Committee, showing how the area of the present site might be adapted for the erection of the proposed buildings. Explaining the two plans to the Board, Dr. Hawkyard (Chairman of the Visiting Committee) said that one design showed a workhouse on what was known as the pavilion system. The administration block was in the centre of the building, while the porter's lodge and receiving-rooms were in Hillside road. The rear of the workhouse were the laundry and the infirmary, the latter being only 15 ft. from the Midland Railway. Then provision was made for the erection of a row of cottages for aged couples. The vagrant wards were right at the back. This new workhouse would provide accommodation for 280, while there would be room in the infirmary for 20 beds. The suggestion of the second plan was for a less costly building, though one which would lend itself better to classification purposes. Both schemes embraced three-storied buildings. The only part of the present structure proposed to be preserved was the lunatic ward. It was agreed to appoint a committee, consisting of the whole Board, to consider the question.

ALL SAINTS' CHURCH, CHILCOMB, HAMPSHIRE.—The first portion of this church, comprising of the two western bays, was dedicated by the Bishop of Guildford on Assension Day, 1890, and on Good Friday, 1891, the second portion, consisting of the nave and side aisle, with a roughly boarded east end, was first used for service. The erection of the chancel has now been finished. The edifice, however, is not yet complete, for eventually a tower and vestries will be added. The church is of thirteenth century character, and consists of nave, 23 ft. wide by 64 ft. long; side aisle, 21 ft. wide and 80 ft. long; chancel, 22 ft. wide and 38 ft. long, the walls being 23 ft. to wall-plate and over 40 ft. to points of roof inside. The roof is of Memel timber boarded with rich pine on the back of the rafters. The angles are of chalk from Mr. L. J. Carter's quarries, the walls of rough chalk, faced outside with flint and plastered inside; the altar is raised seven steps above the nave, and a low plain wall divides the nave from the chancel. The architect is Mr. J. L. Pearson, R.A., and the builders, Messrs. Shillitoe, of Bury St. Edmunds. The fittings—altar table, rails, desks, and raneling at the east end—are of old Cathedral oak from the nave roof of the Cathedral, and are the work of Messrs. Thomas & Co., from designs by Mr. G. H. Kitchen; the gas fittings and pendants with brackets in the altar rails were entrusted to Messrs. Dicks & Sons—Hampshire Chronicle.

REOPENING OF LANKESHAM PARISH CHURCH.—The opening of Lankesham Parish Church has just been reported after restoration, and the new altar, memorial pulpit, and windows have been dedicated. The restoration, which was carried out at a cost exceeding 1,000l., embraced the clearing away of the old square pews and replacing them with new ones, laying new floors, building a new chancel arch,

opening out the transept, and the removal of the plaster ceilings from the nave, transept, and chancel, exposing to view the original mediæval oak roof, which it was found necessary to repair. The pulpit was designed by the architect, and executed by Mr. Clarke, of Landaff. The windows are the work of Mr. Savill, of London. The architect was Mr. C. B. Fowler, Cardiff, and the contractor Mr. W. A. James, Cowbridge. During the progress of the work many interesting remains were discovered, amongst them being the altar slab found under one of the angles of the tower, and the crypt, containing over 200 human skeletons, besides other interesting relics of mediæval times.

ADDITIONS TO WESLEYAN METHODIST CHURCH, MARSDEN, YORKSHIRE.—Memorial stones were laid recently of new vestries, &c., at Marsden Wesleyan Chapel. It is proposed to lengthen the chapel 15 ft., the sitting accommodation being increased about 130 sittings, and to add an organ recess, minister's vestry, choir vestry, and lavatories. The additions to the school consist of a young men's class-room, a young women's class-room, four small class-rooms, and an addition of 15 ft. to the length of the present assembly room; also a kitchen, with lift; heating chamber, and an open stone staircase. The increased school accommodation will be for 220. The new buildings will be built of local stone, in character with the existing chapel. The work is being carried out by the following contractors:—Masons, Whitehead, Fielding, & Bradbury; joiner, James Schofield; plasterer, painter, and concreter, John Bottomley; plumber, F. Goodall; ironfounders, R. Taylor & Sons, all of Marsden; and slaters, Pickles Bros., of Huddersfield, from the plans, and under the superintendence, of Messrs. John Kirk & Sons, architects, Huddersfield and Dewsbury. The total outlay will be about 12,000l.

FREE LIBRARY, MOSS SIDE, LANCASHIRE.—The public free library and news-room which has been erected by the Free Libraries Committee of the Moss Side District Council was opened recently by the Marquis of Lorne, M.P. The building has been erected from designs prepared by Mr. Acton, the Surveyor to the District Council, the cost being about 2,500l. It includes a large public room, which may be used for meetings, concerts, &c.; a library and news-room; and, in the basement, classrooms, in which some of the technical instruction classes held under the District Council may be carried on.

PROPOSED PRIMITIVE METHODIST CHURCH, NEW BROMPTON.—The Primitive Methodists of New Brompton purpose to celebrate the Diamond Jubilee by erecting a new church. The proposed building will seat over 400 persons. Mr. E. J. Hammond, of New Brompton, is the architect for the new church.

CATHOLIC SCHOOL-CHAPEL, BOOTHSTOWN, TYLDESLEY, LANCASHIRE.—A new Catholic school-chapel at Oak Lea, Chadock-lane, Tyldesley, has just been opened. It has been planned for a mixed school, and consists of a schoolroom 48 ft. by 22 ft., and divided from it by sliding glass partition is a class-room 27 ft. by 18 ft., with porches and cloak-rooms for boys, girls, and infants, and the usual offices. A portion of the building will be screened off as a sanctuary. The architects were Messrs. Simons, Simons, & Powell, of Manchester, and the contractor, Mr. Frank Clarke, St. Helens.

PRIMITIVE METHODIST CHURCH, TREDGAR.—The memorial stones of a new church now being erected in Walter-street, Tredgar, for the Primitive Methodists, were laid recently. The architect is Mr. W. S. Williams, Tredgar.

PARCHAL INSTITUTE FOR ST. JOHN'S, CHATHAM.—The foundation stone of the new Parchical Institute and Victoria Soup Kitchen, in course of erection in Pagitt-street, Ordnance-place, for the parish of St. John's, Chatham, was laid recently. The building will comprise a hall 43 ft. long by 20 ft., soup kitchen, scullery, stores, lavatory and offices. The architect is Mr. E. W. Betts, and Mr. E. W. Filley is the builder.

PROPOSED NEW HOTEL, SHOEBURYNES.—Mr. Edward Wright, architect, is preparing for Messrs. Baillie & Co., of London, the drawings for an hotel, which is to be situated in front of the railway station. The building is to be a three story one, and it is estimated that it will cost between 7,000l. and 8,000l.

NEW THEATRE, IPSWICH.—A Theatre of Varieties is to be erected at Ipswich. The Grand Hotel and Theatre of Varieties Company, Limited, will acquire the Grand Hotel at Ipswich, and will establish on a convenient site adjacent what will be known as the Grand Theatre of Varieties. Mr. Frank Matcham is to be the architect of the theatre. The hotel itself is to be enlarged by the erection of a wing.

BOARD SCHOOL BUILDINGS, BARTON, NEWPORT, ISLE OF WIGHT.—The new school buildings at Barton have just been opened. The new erection, constructed at the east end of and adjoining the Barton boys' school, provides accommodation for 280 girls, whilst the boys' department has been extended so as to accommodate eleven pupils, more pupils. The building is built of red brick, with both stone dressings and slate roof. The girls' school comprises the main room, 48 ft. by 22 ft., and three class-rooms to accommodate 104, 72, 48, and 30 respectively. The interior fittings are of pitch pine, supplied by Mr. G. F. Quinton. There is a detached building consisting of lavatory, sanitary offices, and

a large play shed. The buildings have been constructed by Mr. T. Jenkins, under the supervision of Mr. E. A. Swane, of Messrs. Swane & Clark, architects. The contract price was 2,351l.

SANITARY AND ENGINEERING NEWS.

SANITARY MATTERS, NEWCASTLE.—The City Engineer of Newcastle, Mr. W. G. Laws, has issued a report for the year ended March 25, 1897, to the Town Improvement and Sanitary Committees of the Newcastle Corporation. He gives the particulars of work done for and money spent by the two committees, so far as the Engineer's department is concerned. The report deals in detail with sewers, private drains, paving and flagging, paving roads, macadam roads, scavenging, street watering, &c. Under the head of scavenging, Mr. Laws says there has been no great amount of unemployed labour to provide for. "Indeed, the applications for work have been fewer than usual, and during the winter every one who applied was put on;" and even then, adds Mr. Laws, "we could have taken more men." The paper nuisance is again referred to. It is, if anything, increasing, and complaints of the untidy state of the streets arising therefrom are more numerous. At the refuse-destroyer at Byker, 20,016 tons were burnt, at a cost of 757l. 7s. 9d., or a fraction over 8½d. per ton. From Mitford-street, 22,374 tons of refuse were sent to sea, at a cost of 1,700l., or is. 6½d. per ton. As to the water supply, the report states:—"Owing to the wet season, the reservoirs have been full for the first time since 1893, viz., on March 24 and 25, when there were 3,062 millions in store, so that for the coming year we are fairly safe. There are signs, however, that the yearly increase in the daily consumption has been fully maintained." A series of tables is appended to the report. The population of the city in 1896-97 was 238,000, the rateable value was 1,075,153l., and the Town Improvement and Sanitary Committee's expenditure was 68,022d. per head, or 1s. 26d. in the £. There are known to exist in the city 42 miles 1,248 yards of brick and stone sewers. There are, besides, 6 miles 1,401 yards of oval drain pipes, 113 miles 620 yards of circular pipes. Including drains for surface water only, the total mileage of sewers is 166. There are 5,000 manholes. Newcastle has 36 miles 827 yards of macadam roads, 82 miles 1,066 yards of paved front streets, and 43 miles 1,500 yards of paved back streets; giving a total of 126 miles 806 yards of formed streets and roads. There are 11 miles 1,602 yards of unpaved front and back streets. There are 29,931 water closets, as compared with 44,917 privy pans and 2,770 privies and ashpits. There are 4,076 dry ashpits, 15,154 ashbins in yards, 305 ashbins cleaned from small doors in back streets, and 4,330 tubs set out in front of shops, with the shop refuse, &c. With a population in the city of 217,555, there were 30,521 inhabited houses, the average number of people in each house being 7.13. The parks and open spaces in the city cover an area of 2,268 acres, the churchyards and cemeteries 78 acres, and the private grounds and open spaces 26 acres.

LOCAL SEWERS IN LONDON.—The Main Drainage Committee of the London County Council have sanctioned, subject to a condition recommended by the Engineer, the construction of local sewers as follows:—Birkenhead (detached)—885 ft., 400 ft., 655 ft., 2,605 ft., 7,085 ft., 1,920 ft., and 475 ft. of 6-in. pipe sewers in Alexandra Park-road, Barnard's Hill, Birkbeck-road, Colney Hatch-lane, Middleton-road, Muswell-avenue, and Muswell-road respectively, and 375 ft. of 12-in. pipe sewer for surface water only in Colney Hatch-lane. St. Martin-in-the-Fields—247 ft. of 4 ft. by 2 ft. 8 in. brick sewer in Bedfordbury.

STAINED GLASS AND DECORATION.

WINDOW, PARISH CHURCH, YOULGRAVE.—A memorial stained glass window has been fixed in the chancel of this church by the family of the late Rev. R. C. Roy, M.A. The window was designed by Sir E. Burne-Jones, the subject being St. James, St. Peter, and St. John. It was supplied by Messrs. Morris & Co., of Merton Abbey, Surrey.

WINDOW, ST. JOHN'S CHURCH, LOWER CAVERSHAM, READING.—The large east window in St. John's Church, Lower Caversham, has been filled with stained glass. The window was dedicated by the Bishop of Reading recently. The subject in the three centre lights illustrates the adoration of the Magi. In the two side lights are figures representing St. Peter and St. John. Immediately over the centre in the upper part of the window, surrounded by rich tracery, is another light in which is represented our Lord in majesty. The window has been executed by Mr. Arthur J. Dix, London.

SCREEN, BEAUFLET CHURCH, HANTS.—A wrought-iron screen has been placed on the dwarf-wall separating the choir from the body of this church. The work is from the design of Sir Arthur Blomfield, and is executed by Messrs. Hart, Peard, & Co., of London. The screen or rail is 2 ft. 6 in. high on the 2 ft. wall. It is divided into twelve panels, six on each side of a pair of gates, which open inwards to the choir.

FOREIGN.

FRANCE.—The regulations for the 1900 Exhibition have just been published. According to this document the exhibition will open on April 15, 1900—that is to say, fifteen days earlier than in 1889—and will close on November 5. To the contemporary exhibition will be added a retrospective exhibition, showing the progress accomplished since 1860. The products will be grouped in eighteen groups, and subdivided into 120 classes. The prices of admission will be decided by the Commissariat-Général before February 1, 1899.—The Daru staircase in the Louvre Museum has been finished; and the work of altering the Salle des Etats, where are hung the series of large pictures by Rubens, is now being carried on. Unfortunately there is not money enough to finish all these works for some years. The new architect who has the superintending of the work in place of the late M. Paul Blondel, is M. Gaston Redon, "grand prix de Rome" in 1882, and professor of architecture at the Ecole des Beaux Arts. It was he who designed the Casino at Royau. He received in 1890 the "medaille d'honneur" at the Salon for his splendid restoration of the Temple of Eschbeck. For two years he was architect to the Gobelins.—Owing to the liberality of Madame de Castellane (*née* Gould), a large permanent building is to be erected on the site of the Charity Bazaar which was burnt a few days ago. There is to be a chapel adjoining, in memory of the terrible event.—The pupils of the Ecole des Beaux Arts, belonging to the outside studio of the late Paul Blondel, have just chosen, as a successor to their late master, M. Scellier de Gisors, who obtained the "medaille d'honneur" at the Salon of 1896 for the "Dépôt des postes and telegraphes," of which we published an illustration last month.—The journal *Le Bâtiment* has opened a public competition between architects and French constructors, for "Construction démontable, incombustible, et à bon marché." For several years the work of building a tower to surmount the Abbey of Mont Saint Michel has been going on. This granite tower is at last finished, and now a wooden spire 40 metres high is being made. It is to have on the top a statue of St. Michel in bronze, 4 metres high, the work of M. Fremiet.—There is talk of an English Society which has just been formed with a view to finishing the Boulevard Haussmann, the cost of which is estimated at 35,000,000 francs for compensations, and 25,000,000 for construction.—Important works are to be undertaken for the improvement and enlargement of the Hospital at Macon. The expense is to be limited to 130,000 francs.—A committee, presided over by M. Puvion de Chavannes, has just decided the competition opened by the "Association Co-operative des Sciences, des Lettres et des Arts" for the designing of art tickets. The first prize has been awarded equally to M. Payen and M. Wilder.—The death is announced, at the age of seventy-eight, of M. Louis Renaud, member of the "Société Centrale des Architectes," and pupil of Léon Vaudoyer. His long and honourable career was almost entirely given up to the works of the company of the Chemin-de-fer d'Orléans, to which he was the principal architect. He built the Administrative buildings for the company in the Rue de Londres, and the new Gare d'Orléans, on the Quai d'Austerlitz and the Boulevard de la Gare.

GERMANY.—We record with regret the resignation of Professor Ende from the architectural chair at the Royal Technical College at Berlin. Professor Ende, who has again been elected President of the Prussian Royal Academy of Arts, has lately suffered from ill health, and will have to reduce the scope of his work. The old firm of Messrs. Ende & Boeckmann has practically ceased to exist.—The Society of Berlin Artists have definitely decided to take new premises in the Bellevue Strasse. The existing building, on their new site, will be materially altered under the direction of Mr. Hoffacker.—At the Arts and Crafts Museum, a special Exhibition of Drawings of the new Imperial Law Courts at Leipzig has been opened. There are one hundred and eight architectural drawings by the architect, Herr Ludwig Hoffmann, and thirteen sketches by Mr. Seliger; a number of photographs have also been exhibited.—The design of the new monument at Dresden, in honour of King Albert of Saxony, has been the subject of a competition. The first premium has been awarded to Professor Baumbeck, at Berlin, a sculptor of considerable repute.—The new City Engineer at Berlin, Herr Krause, has entered on the duties of his office.—It is understood that Prince Bismarck proposes erecting a mausoleum for his family at Frederichsruh.—The Art Exhibition at the Lehrte station has now been opened. There was no ceremony of particular importance in connection with the opening.

AUSTRIA.—The well-known outdoor establishment in the Austrian capital, known as "Venice in Vienna," has again been opened, and this time shows a well-arranged miniature picture of the Grand Canal.—Rapid progress is being made with the new Metropolitan Railway at Vienna, and there is considerable probability of the new line being opened at an earlier date than was originally expected. There is little doubt that the new railway will entirely change the traffic arrangement in Vienna, and that the old

omnibuses, which have long been an eyesore to the capital, will have to make room for this new means of communication, and for the new electric tramways.—Vienna is to follow the example of Berlin, in erecting a number of new churches, and a special commission has been nominated under the auspices of the Government to decide on the sites for the new places of worship.

RUSSIA.—An International Competition for a Grand Stand on the racecourse, near Moscow, has been decided, and the first premium will be awarded to M. Klein, of that city. The second premium was awarded to a Moscow firm of architects, and the third to a firm practising at St. Petersburg. The amount to be expended on the grand stand had been limited to 350,000 roubles, and accommodation is to be afforded for 3,000 spectators. The grand stand in Russia is not the kind of erection we are used to under that title, but a substantial structure, with reception rooms, &c., for the Sporting Club, under whose auspices the competition was arranged. Though the competition was an International one, there do not appear to have been many candidates from foreign countries, nor were foreigners represented on the Committee of the Assessors, though the jury were composed of fifteen members. There were nine architects on this Committee, and six laymen, and the competition conditions had been framed by the Moscow Architectural Society. The premiums are of the value of 3,000, 2,000, and 1,000 roubles respectively.

BOMBAY.—The *Times of India* states that a syndicate has been formed for obtaining a concession for the erection of blocks of dwelling-houses in Bombay for the labouring classes.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The business of Messrs. Richard Moreland & Son, engineers of No. 3, Old-street, Aldersgate, has been incorporated as a Limited Liability Company. Mr. David Elder is the Secretary.—Messrs. F. A. Putz and Co., 11, Queen Victoria-street, have been appointed sole agents for the United Kingdom for the "Verminige Electrica Actien-Gesellschaft" in Vienna.—By the death of Mr. Chas. Hall, the managing partner of the Rugby Portland Cement Company, the position of works' manager became vacant, and the directors of the company have unanimously selected Mr. Isaac Brooks for the post. Mr. Brooks had been actively engaged assisting Mr. Hall for upwards of twenty-five years, and the success of the firm was in no small measure due to his energy and enterprise.

THE SANITARY INSTITUTE.—At an examination in practical sanitary science held in London on May 7 and 8, the following twelve candidates were granted a certificate in practical sanitary science:—S. I. Adams, Southend-on-Sea; F. W. Bradley, Cockfosters, New Barnet; E. H. Collier, Ipswich; W. P. Costain, Blundellsands; F. W. Jarman, Croydon; W. H. Knight, Hornsey; A. Morrison, Edinburgh; J. Sanderson, Islington, N.; A. Styles, New Cross, S.E.; A. A. Turfitt, Aberdeen; S. Walkden, Tavistock; A. Wigley, Newington Green-road, N.

KING'S COLLEGE, LONDON.—The annual dinner of Old Students of King's College, London, will be held at the Holborn Restaurant on Monday, June 28, when Lord Kelvin will take the chair. The Duke of Cambridge, K.G., has intimated his intention of being present.

EMPLOYERS' LIABILITY AND THE BUILDING TRADE.—Lord Claud Hamilton presided on Thursday last week at the annual meeting of the Employers' Liability Assurance Corporation, Limited, at Winchester-house. In moving the adoption of the report, the Chairman referred to the new Bill dealing with the question of Employers' Liability, which had been introduced into Parliament by the Home Secretary. Although it was not proposed, he said, to interfere with the existing Acts of Parliament, the new measure introduced a principle which was scarcely contemplated by the general public. It contained clauses of far-reaching character, and imposed responsibilities on employers far in excess of any hitherto known in this country. He had no doubt that in the present temper of the House of Commons the Bill would become law during the session, and although various trades were exempted from the provisions of the measure, there was every prospect that vigorous attempts would be made to bring certain dangerous trades under the operation of the Act. If, for instance, the building trade was included, he did not see how any small builder in the country could continue to exist without availing himself of the benefits offered by insurance. One serious accident would be sufficient to exhaust all his capital, and send him to his bankers for a very extensive loan. In the event of the building trade being included in the provisions of the new Bill, it was evident that every builder would be compelled to insure against his liability for accidents.

SANITARY INSPECTORS' MEETING IN LIVERPOOL.—The first meeting of the eleven sanitary inspectors of the North Western and Midland Sanitary Inspectors' Association, founded in 1887, was held on the 8th inst., at the Royal Institution, Colquhoun-street, under the presidency of the newly-elected Chairman, Mr. William Urquhart, Chief Sanitary Inspector, Crewe, who delivered an address. He said that the past year of the Association had been most successful, not the least pleasant feature of which had been the

amalgamation of the Stafford Association with their own. The Association now numbered over 200 members, and would be known in future as the North Western and Midland Sanitary Inspectors' Association. Sanitary science was making rapid progress, and it was absolutely necessary for the members to keep themselves up to date. Local governing bodies had largely ceased to look upon medical officers of health and sanitary inspectors who deviated in the slightest degree from the beaten track as cranks or faddists, and were beginning to recognise that in the great majority of cases, by the adoption of sanitary precautions a vast amount of sickness could be prevented, and even death itself almost indefinitely postponed. He hoped that before long the Education Department would insist upon at least the rudiments of hygienic science being taught in every elementary school under their control. The speaker next alluded to the small remuneration paid to sanitary inspectors compared with the risk and importance of the work which they had to perform, to the Scotch Public Health Bill now before Parliament, the Plumbers' Registration Bill, and to the proposed amendments in the Food and Drugs Act, and, as these measures all tended in the right direction, they must wish them success. He also urged that pressure should be brought to bear on parliamentary representatives with a view of securing their help towards the passing of the Local Authorities' Superannuation Bill. On the proposition of Mr. E. Worrall, seconded by Dr. M. Young, a vote of thanks was given to the Chairman for his address.

ROMAN REMAINS IN THE CITY.—Recent excavations for building purposes in Queen Victoria-street, near the corner of Walbrook, have resulted in the discovery, about 26 ft. below the surface, of a small but interesting group of relics of the Roman occupation of the City. This "find" consists of a Laguna, a bronze balance, and a large iron nail. The Laguna is a gracefully-formed, two-handled vase of fine buff ware, about 8 in. high by 7 in. at its greatest diameter. The neck is simply ornamented with two parallel grooves, and a single groove runs down the centre of each handle. The balance, or *libra*, is made of bright yellow bronze, and is about 14 in. in length.—*Standard*.

PULPIT, CANTERBURY CATHEDRAL.—On the 15th inst. Dean Farrer inaugurated a pulpit of carved English oak, which has been erected in the nave of Canterbury Cathedral to the memory of the late Dean Payne Smith. The pulpit was designed by Mr. G. F. Bodley, A.R.A.

CARDIFF BUILDING BY-LAWS.—The sub-committee appointed to consider the new building by-laws for the Borough of Cardiff submitted their report to the Public Works Committee recently. The sub-committee had held eight meetings, and had pursued a policy of making as few alterations as possible in the models, with a view of expediting the passing of the by-laws. Among the recommendations of the sub-committee were the following:—Every person who shall lay out a new street, which shall be intended for use as a carriage road, which by reason of its length or importance, or in consequence of its forming or being so situated as to be likely to form part of an important line of communication, shall, if called upon by the Council, make such a street of a width not less than 60 ft. Every person who shall lay out a new street, not being a continuation of an existing street, and not being intended to form part of an important line of communication, which shall be intended for use as a carriage-road, shall so lay out such street that the width thereof shall be 40 ft. at the least. Every person who shall lay out a new street which shall be a continuation of any existing street which is of a greater width than 40 ft., and which shall be intended for use as a carriage road, shall so lay out such new street that it shall be of the same width as the street of which it is the continuation. The recommendations were adopted.

DIAMOND JUBILEE FOUNTAINS.—The Diamond Jubilee has brought many orders to Aberdeen for granite fountains. Drinking fountains have been, or are being, constructed for Bristol and Manchester (Beswick Park), and for the following villages and small towns in Scotland:—Stonhaven, Craik, Tillycultry, St. Andrews, Rosneath, Aberchirch, Torphins, &c. An ornamental fountain is being made for Manchester standing on a three-stepped platform 34 ft. across at ground level. A memorial fountain has likewise just been sent to Penrith, and a 600 ft. ornamental fountain is being manufactured for a town in the South of England.

APPOINTMENT OF SANITARY INSPECTORS.—The Local Government Board has sanctioned the appointment of Messrs. F. H. Hudson, N. Males, and A. H. Gray as sanitary inspectors in Hampstead, Kensington, and Lewisham respectively, and the re-appointment of the sanitary inspectors in Camberwell.

THE WOOL INDUSTRIES OF CANADA.—This is a volume issued by the *Timber Trades Journal*, giving a good deal of information as to the work done in timber cutting and working in various districts in Canada, with some account of the principal firms concerned in the trade.

PUNCH AND THE JUBILEE.—Messrs. Bradbury, Agnew, & Co. are preparing a collection of cartoons from *Punch*, illustrative of events in the long reign in which her Majesty's personal connexion has suggested the subject for the week's picture. "To-by,

M.P., has written the letterpress explanatory of each cartoon, in its continuity forming a record of the Queen's reign. "The Queen and Mr. Punch," which will be published on June 1, contains sixty pictures by Leech, Tenniel, and Linley Sambourne. The last-named artist has drawn a special picture of the Queen for the cover of the book.

NEW CROSS, HARTLAND.—A new cross, with a square gabled head and octagonal shaft of Portland stone, was erected last week in Hartland Churchyard, on the old foundation of the three Churchyard cross. The cross, including the three steps and the base, is fifteen feet in height, and the carving was executed by Messrs. Farmer & Brindley, who took for their base of operations the "History of Hartland, its Church and Abbey," by the Vicar of Hartland, Exeter. Underneath the old base were discovered a silver coin of Queen Elizabeth's reign, an old Saxon font, and an altar slab, with five crosses, on which the font rested. A portion of the font was found four feet below the surface. On the side of the second step of the new cross is the inscription, "Restored 1897." The first step rests on the original base of the altar slab, on a new block of cement concrete.

CAPITAL AND LABOUR.

PLASTERERS' STRIKE, LIVERPOOL.—The plasterers in Liverpool gave six months' notice, expiring on May 1 last, to the employers for an advance of 7½d. per hour, from 9d. to 9½d., and a new code of rules, the chief amongst which were clauses limiting the number of apprentices on any one job, and that plasterers to be allowed to do plasterer's work (which the operatives contended includes cement flooring, floating for tiles and wood blocks). Several meetings have been held between the masters and men, and as a result thereof the employers made an offer to the operatives for an advance in wages to 9½d. per hour, the present code of rules as worked out by the other trades being offered, with an undertaking that only plasterers be employed by master plasterers to do plasterer's work, concrete and cement flooring, floating for tiles and wood blocks to be considered the work of specialists, and that all apprentices be bound. This was refused, and the men to the number of about 150 ceased work on May 1. A further offer by the masters to submit the whole matter to arbitration was also declined.

THE CARPENTERS' AND PLASTERERS' STRIKE, PLYMOUTH AND NEIGHBOURHOOD.—There is very little to report in reference to the strike of carpenters and plasterers in the Three Towns. The master builders met at the Central Exchange on the 13th inst., and held a protracted debate upon the communication from the Plymouth Chamber of Commerce suggesting that the matters in dispute between the masters and men should be submitted to the Standing Conciliation Committee for settlement. General approval of adopting this course was expressed by the speakers. A resolution formally accepting the offer of the Chamber was unanimously adopted, but it was made conditional that before any representations—which it was required should deal with the whole of the points at issue and as they affected all the trades concerned in the dispute—were laid before the Conciliation Committee an arbitrator to be mutually agreed upon should be appointed.—In conjunction with the plasterers, several carpenters have signified their intention of starting building operations at St. Budeaux at an early date.

STRIKE IN THE BUILDING TRADE, REDHILL.—In pursuance of a notice given to the masters by the men employed in this district six months ago, about 200 carpenters and bricklayers have ceased work in the Redhill district. Some twelve months ago, it seems, it was decided to ask for an advance of 7½d. per hour, but on the representation of the masters the matter was not pressed. A local society was afterwards formed and a code of working rules drawn up and submitted to the masters, together with a demand for an additional 1d. per hour, to take effect at the expiration of six months. That period expired on May 1.

THE PLUMBERS' STRIKE, SCARBOROUGH.—The strike of plumbers at Scarborough is at an end, the masters having agreed to pay the men 8d. an hour, which is 7½d. advance on the old rate of pay. They have further consented to give another advance of 7½d. per hour twelve months hence.

LEICESTER STONEMASONS AND THEIR EMPLOYERS.—As the result of negotiations which have recently been taking place between the Leicester operative stonemasons and their employers, an advance of wages, amounting to a halfpenny per hour, dating from the present month, has been agreed upon. In future stonemasons will receive 9d. instead of 8½d. per hour, and stonemasons' labourers are advanced from 6d. to 6½d. per hour. Some new regulations have also been agreed to by the employers, the most important of which is the limitation of apprentices to practically one to each firm. In future, too, all boys employed in the trade must be properly apprenticed.

JOINERS' WAGES, MIDDLETON.—The Middleton master joiners having been approached by their men, have consented to an advance of one halfpenny per hour, which brings the rate of pay up to 8½d. per hour.

MASONS' AND PLASTERERS' STRIKE, WESTON-SUPER-MARE.—The masons and plasterers of

Weston have come out on strike. The masons some time ago demanded an increase in their rate of pay, insisting upon 8d. an hour instead of 7d., and a fifty-four instead of a fifty-six and a half hours' week. The plasterers have practically been forced into idleness in consequence of the action of the masons in resolving to reduce their scale of pay from 7½d. to 7d. The struggle promises to be a prolonged one, as both sides are determined to hold out. It is asserted, however, that the masters might have effected a compromise so far as the masons are concerned, as they would have been satisfied with being met half-way. Work at the new Council offices has ceased to a large extent as a result of the strike.—*Weston-super-Mare Gazette.*

SLATERS' STRIKE, ABERDEEN.—This strike is almost over, most of the employers having agreed to the by-laws put forward by the men.

THE PRESTON BUILDING TRADES DISPUTE.—The stoppage in the Preston building trade, owing to the strike of the bricklayers for an advance of 1d. per hour, still continues, and many important contracts are at a complete standstill. As this is the busy season, and there is a great demand for labour, a number of workmen have left the town for various parts of the country in quest of employment.—*Preston Herald.*

BRICKLAYERS' WAGES, TYLDSELEY, LANCASHIRE.—The master builders and contractors in Tyldesley and Atherton have acceded to the request of the Bricklayers' Society for an advance in wages from 9d. to 9½d. per hour.

BUILDING TRADES, ST. IVES, CORNWALL.—Masters and men engaged in the building trades at St. Ives met recently. Mr. James Burrell, who was voted to the chair, explained that the object of the meeting was to discuss the advisability of ceasing work at one o'clock on Saturday, and adopting the hour system. It was elicited that the majority of the men were agreeable to work on the hour system at 5½d. per hour, the short hours to commence six weeks before Christmas, and finish six weeks after Christmas. Replying to a question, the Chairman said 5½d. per hour would only be paid to competent men. After considerable discussion, the meeting decided to act on the suggestion of Councillor John Pearce, and appoint a committee representing the various trades, draw up a code of rules and regulations, and submit the matter to the masters for consideration.

JOINERS' STRIKE, CREWE.—Following the strike of painters, the joiners of Crewe have struck work for an advance of 7½d. an hour in their wages. Several of the masters have conceded their demand, but others hold out.

THE BUILDING TRADE IN PORTADOWN.—The members of the Portadown Branch of the Bricklayers' Society recently made a demand on their employers for an increase of wages and a reduction of the hours of labour. The notice having expired, a conference of the masters and men was held in the Town Hall for the purpose of endeavouring to arrange an amicable settlement, and thereby avert a strike. The men asked that their wages be advanced from 6½d. to 7½d. an hour, and that the hours of labour be reduced from fifty-seven to fifty-six hours a week. After discussing the matter for an hour and a half the masters offered to increase the wages to 7d. an hour for a fifty-six hours' week, which the deputation representing the men unanimously agreed to accept.

WORKING RULES FOR BRICKLAYERS, BARRY.—A meeting of the Barry Master Builders' Association was held at the Glamorgan Restaurant, Barry Docks, recently. The codes of working rules for bricklayers and for navvies and general labourers, which had been amicably settled with the Bricklayers' Society and the Navvies' and General Labourers' Union respectively, were signed. A communication was read from the Carpenters' Society bearing upon the new code of working rules, and the Secretary (Mr. E. E. Bryant) was instructed to reply to the same.

SETTLEMENT OF THE BLACKPOOL DISPUTE.—The labour difficulties at Blackpool have been smoothed over. It was arranged at a recent meeting of the master builders, plumbers, painters, &c., that a lock-out should not be enforced. The joiner over whom the dispute originated resigned his position, and the whole body of strikers, comprising bricklayers, joiners, plasterers, painters, &c., will return to work. The dispute has been in progress about a month.—*Liverpool Mercury.*

LEGAL.

A QUESTION OF LIGHT.

CASE IN THE DIVISIONAL COURT.

THE case of *Brawn v. Revitt* came before a Divisional Court of Queen's Bench composed of Mr. Justice Day and Mr. Justice Lawrence on the 17th inst., it being the plaintiff's appeal from the decision of the learned County Court Judge of Northampton, dismissing his action brought on account of an alleged injury caused to the light of his house by the defendant's building.

Mr. Levett, Q.C. and Mr. Geo. Henderson appeared for the appellant, and Mr. Stanger, Q.C., and Mr. Ryland Atkins for the respondent.

Mr. Levett stated that there was no dispute as to the facts that defendant had erected a building on certain property near Northampton, which had

obstructed the plaintiff's light, and which he had objected for ten years prior to the erection of the premises belonging to the defendant. The question in the case was what grant of light by virtue of the Conveyancing Act passed to the plaintiff by the conveyance of the property. The learned County Court Judge decided the matter on the authority of a case which he thought precluded his coming to any other conclusion, but the learned counsel stated that a recent decision in the Court of Appeal was clearly in favour of Mr. Brawn being entitled to the rights he claimed.

Their Lordships, after hearing Mr. Stanger on behalf of the respondent, dismissed the appeal with costs.

THE CLAIM AGAINST THE ST. PANCRAS GUARDIANS:

CASE IN THE COURT OF APPEAL.

THE case of *Drew-Bear & Co. v. the Guardians of the Poor of St. Pancras* came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices A. L. Smith and Chitty, on the 17th inst., it being the appeal of the plaintiffs from the decision of a Divisional Court of Queen's Bench, consisting of Mr. Justice Grantam and Mr. Justice Wright, on the 13th ult. The history of the case is as follows:—The plaintiffs, the trustees of creditors of Mr. Wm. Brooks, a builder and contractor of Folkestone, sued the Guardians and their architects, Messrs. A. & C. Harston, for a balance of 24,267l. or alternatively 24,262l., alleged to be due on a contract for the completion of the St. Pancras Workhouse. The plaintiffs' case was that, some years ago, the Guardians resolved to reconstruct the Workhouse in King's-road, and appointed the Messrs. Harston as their architects. The contract for the work was at first taken by Messrs. Kirk & Randall, of Woolwich, but disputes having arisen, that firm requested to be relieved of further work under the contract. Fresh tenders were then invited for the unfinished work, and that of Brooks was then accepted for 50,861l. The work was to occupy fifteen months from May, 1892, but delays arose, and in November, 1894, the work was stopped. Messrs. Drew-Bear, Perks, & Co., of Queen Victoria-street, who supplied the ironwork, Mr. H. Tolputt, of Folkestone, who supplied timber, Mr. J. Brown, of Cannon-street, who supplied bricks, sued on behalf of creditors for the balance alleged to be due to Mr. Brooks. The net cost of the work executed was stated to be on the first claim 65,479l., plus 10 per cent. profit, 6,547l., making 72,026l., of which 47,800l. had been received under the architect's certificates, leaving a balance of 24,226l. In the alternative claim the net cost of the work executed was estimated at 65,479l. as before, but the 10 per cent. profit was reckoned on the contract price of 50,861l., which, with other amounts claimed, brought the alternative claim to 24,262l. The plaintiffs alleged that Brooks was hindered from continuing and completing the contract by the action of Mr. Geo. Poole, the clerk of the works, who interfered without sufficient cause, and condemned material supplied wholesale. It was also further alleged that the architect was hindered from the works, and that the interference of the clerk of the works caused needlessly a net loss to Brooks of 2,520l., in addition to 103l. (value of the materials left by Messrs. Kirk & Randall, and not permitted to be used). The defendants generally denied the charges against the clerk of the works, and alleged that Brooks had not carried out his undertaking to complete the work left unfinished by Messrs. Kirk & Randall. The Guardians further relied on the Public Authorities Protection Act, 1893, as being a defence, inasmuch as the matters referred to in the action occurred more than six months before the action was brought. Messrs. Harston, and the other defendants, pleaded that they were not liable, and said that they had received no complaints from Poole with respect to the manner in which the works were being carried out by Brooks. Sir Edward Ridley (now Mr. Justice Ridley), then the Official Receiver before whom the case was tried, decided that inasmuch as the plaintiffs had failed to make out that Messrs. Harston had been guilty of fraud, dishonesty, or collusion, those gentlemen were entitled to judgment as against the plaintiffs, with costs. He, however, decided that the contract entered into between the plaintiffs and the Guardians, owing to the special circumstances of the case, had been set aside, and that the plaintiffs were entitled to *quantum meruit*, or in the alternative to substantial damages, to be ascertained at some future time, and he therefore gave judgment for the plaintiffs as against the Guardians, with costs. The Guardians appealed from this decision to the Divisional Court on the ground that the judgment and findings upon which it was based were erroneous in fact and in law, and that there was no evidence or any sufficient evidence to justify Sir Edward Ridley in finding either that the plaintiffs' contract with the Guardians was set aside, or that the plaintiffs were entitled to substantial or any damages, or to any damages or allowances not duly provided for in the contract. The Divisional Court decided that the case of *Bush v. The Trustees of the Port and Town of Whitehaven*, which Sir Edward Ridley felt bound by, did not apply to the present case, and that, although the contractor might be entitled to

damages for delay in giving him possession of the site, there was no ground for claiming on *quantum meruit*. Upon these grounds the Court directed that the judgment against the Guardians must be set aside, and that there must be a new trial. The plaintiffs now appealed from this decision.

Sir R. T. Reid, Q.C., M.P., Mr. R. M. Bray, and Mr. A. A. Hudson appeared as counsel for the appellants (the plaintiffs); and Mr. Bosanquet, Q.C., Mr. English Harrison, and Mr. Wm. Moyes for the respondents (the Guardians).

Sir R. T. Reid, in opening the case for the appellants, said that the arbitration occupied the attention of Sir Edward Ridley for no fewer than twenty-two days, and it would obviously be a very serious matter if all the complicated issues raised should have to be gone over again. The learned counsel, after stating the facts of the case to their Lordships, said that very voluminous evidence was given, and in the result Sir Edward Ridley decided that while as arbitrator under the contract, were not capable of justification, he was acting to the best of his ability as arbitrator under the contract, and that as there was no evidence that he had been guilty of fraud, dishonesty, or collusion, the action was not maintainable against him. The action, therefore, as regarded the architects, was dismissed with costs, and this the learned counsel said he would freely admit was against him. As to the Guardians, Sir E. Ridley decided that the delay in giving possession of the site entitled the contractor to set aside the contract, and held that the plaintiffs were entitled to claim on a *quantum meruit*, or alternatively to damages, which would have to be determined at some future time. It should be borne in mind that the damages had not yet been assessed, but he believed it would be admitted that the damages accruing for not giving up the site at the specified time had been agreed at about 1,400l. No express finding appeared in the judgment as to the clerk of the works, although in the course of the case Sir Edward Ridley spoke strongly as to his conduct and evidence.

The Master of the Rolls said that the Guardians would be liable for the acts of the clerk of the works if he was dishonest.

Sir Robert Reid agreed that that would be so, but repeated that in his judgment Sir Edw. Ridley did not express any opinion on the point. The crucial point in the decision of Sir Edw. Ridley was that owing to the alterations in the contract the plaintiffs were justified in claiming on *quantum meruit*.

The Master of the Rolls: I should think *quantum meruit* represents measure and value.

Sir Robert Reid agreed, and said that under the circumstances *quantum meruit* would be the legal, and "measure and value" the ordinary building phrase. Continuing the learned counsel said that when the Guardians moved before the Divisional Court no attempt was made before that Court to go into the evidence, but their Lordships stated that on the legal argument they had made up their minds that the judgment must be set aside, and the case re-heard by another Official Referee.

Lord Justice Chitty said that of course the case could not go before Sir Edw. Ridley, as he was now Mr. Justice Ridley.

Sir Robert Reid said that when the judgment of the Divisional Court was pronounced Sir Edw. Ridley was still an Official Referee. In answer to the Master of the Rolls the learned counsel added that in any case the damages and amounts due would have to be ascertained by the process of *quantum meruit*. He contended that the judgment of the Divisional Court was wrong, and submitted that the judgment of Sir Edward Ridley should be ordered to stand.

Mr. Reginald Bray having followed on the same side.

Mr. Bosanquet argued that the original complaint of the plaintiffs did not so much refer to the delay in giving possession, but to the interference of the clerk of works and architects, and that the learned Referee, in confining his attention in his judgment to the former matter, had misdirected himself.

The Master of the Rolls, in giving judgment, said the action had to be considered just as if the builder had himself gone on with the contract in lieu of his creditors having finished it. The work had been done, and unless something had arisen to the contrary, the agreed price must be paid. But the plaintiff had said, first of all, that he was not bound by such agreed price, but that there had been breaches of contract by the Guardians, or by those for whom they were responsible, and that those breaches were to such an extent and of such importance that the original agreement was inapplicable, and that the case, therefore, was allowed to be taken as if no contract had existed. The new agreement, if that were true, was that the builder had done work for the creditors with their assent, and, of course, expecting to be paid. But what was to be paid? Under that new agreement there was no fixed price; and if that contention were true it would be work done upon the terms that labour was to be paid for, without anything having been said as to the terms. That would be a *quantum meruit*. But the plaintiff here went further. He said that he had an alternative cause of action, and that, supposing the contract was to stand good, he was entitled to be paid the agreed price, with damages beyond, for

such breaches of contract. The case also charged certain architects as independent defendants with fraudulent conduct in their office, and there was a clause which foolishly and without any justification charged the Guardians with fraudulent conduct also. This case was tried before the then Official Referee, Mr. Ridley, Q.C., as he then was, just as if it had gone before a judge without a jury. When the case came before him, the foolish allegation as to fraud by the Guardians was never opened, and was never relied on as part of the case against them. The plaintiffs did, however, labour to show that the architect had acted fraudulently. How? Partly when he was called on to arbitrate between the builder and the Guardians, and partly by giving orders as to the works as architect and not as arbitrator, and in that acting fraudulently; and they charged the clerk of works with having fraudulently colluded with the architect. If the parties had done nothing more it would have been the duty of Mr. Ridley not only to try the question of liability, but that if he held there was a liability to have gone on and tried the question of damages. But the parties agreed that the Referee should try the question of liability first, the damages to stand over. The question before the Court was not whether there was evidence of this or that thing, but whether it agreed with the decision to which Mr. Ridley came. Mr. Ridley held that there had been breaches of contract so extensive as to have made the condition of things under which the work was done so different that the original contract was done away with, and that it was done upon the terms that the plaintiff should be paid a *quantum meruit* sum. Assuming that the Official Referee was right, his holding that there were very considerable breaches of the contract by the defendants, there was an alteration of the work to be done. But the Court did not agree with the extreme view that Mr. Ridley took, that the work was so altered in nature that the original contract was not applicable to it. The breach did not go to that length. Therefore, he (the Master of the Rolls) could not agree with Mr. Ridley that the payment for the work done was to be on a *quantum meruit* basis in that sense. But there was the alternative case which was attempted to be proved before Mr. Ridley—that against the architect for fraud. That action failed. Mr. Ridley held that the architect was entitled to the costs of the action, brought against him individually. Neither side had appealed against that decision, and it must stand. Then Mr. Ridley found that there had been a breach of the contract by the Guardians in giving possession of No. 2 Section, and this breach entitled the plaintiffs to damages. This contract for No. 2 Section was a written one, and there was no great difficulty in construing it. It was clear to him (the Master of the Rolls) that the Guardians undertook to give up the whole site immediately, and he could see no ground for saying that they were only to give the builder the possession of such portions as he asked for. They did not give it him on May 31, 1892, and Mr. Ridley had found that the builder did complain. It was said that he did not complain to the Guardians themselves; but how was the builder to know what their names were or where they were to be found. He did complain to the clerk of the works, and as the Guardians did not then give possession they were responsible, as they had broken the contract. He (the builder) must show the date when the work accrued, and supposing that they existed, they would be such as if he had entered into contracts on the faith of this being given up to him immediately and had suffered by being obliged to pay for materials at once and not when wanted. Then if he engaged labour he had to pay the labourers and they would be on his hands. Further, materials would be seriously damaged by being kept and not used. It must be taken that there was some damage. But the plaintiffs said that they were further inconvenienced by not having open space in which to work and by interference by other contractors. This might well be one head of damage. They also said that the architect delayed them in their work in two ways; by giving wrong orders with regard to the work, and by compelling them to do work that was already been completed. But they forgot that the work was "all to be done to the satisfaction of the architect," and that however erroneously the architect might have exercised that duty, the builder could not sue the Guardians for that, as they had abandoned the charge of fraud. Then they said that the clerk of works improperly objected to work. They put it "dishonestly." He could not see any ground for a charge of dishonesty; but that the clerk of works acted obstinately and erroneously as far as it was possible for him to act, he (the Master of the Rolls) believed, and this coincided with Mr. Ridley's view. But if the clerk of works acted wrongly the builder ought to have referred that misconduct of his to the architect to act as arbitrator. If it was said, that by doing so the builder found himself in slavery he ought to have considered that when he entered into the contract. He could not recover by any default of the clerk of the works against the Guardians. Therefore, the only damages in respect of which the builder was entitled were such damages as he could prove to be the result of delay in giving possession, and for interference by other contractors. Therefore, he (the Master of the Rolls) did not agree

in the whole decision of Mr. Ridley; but as to the alternative case he thought he (Mr. Ridley) was right in finding liability on behalf of the defendants. Then, by consent of the parties, the amount of that liability had yet to be considered, but it ought to be proved by plaintiff in the way suggested. The mode they adopted in that appeal, namely, to say "The contract price was 50,000l.; the doing of the work cost 70,000l., therefore the damages must be the difference between 50,000l. and 70,000l." This was altogether wrong. As to the decision of the Divisional Court, he (the Master of the Rolls) did not desire to say anything more disrespectful of it than this: that he did not understand it. Even if he did, on what possible grounds, when a case had been decided by a judge without a jury, when he had heard all the evidence, when he came to a conclusion upon that evidence and certain findings, could he be said to have done that because they did not agree with him as they thought he was wrong, that therefore there should be a new trial, in which all the evidence would have to be gone over again? He could not think that that was the right way to deal with the case which had been decided by a judge who had duly considered, and had come to a conclusion, right or wrong, upon the evidence before him. The result was that the plaintiffs before Mr. Ridley did prove a cause of action. They proved a contract and a breach of that contract; therefore it was a simple case which had now to be tried, namely, what was the amount of damages on the question of liability. Then Mr. Ridley had decided that the defendants were to pay all costs. That Court did not interfere with the decision of such a judge as to costs unless they thought that he had determined the costs upon a wrong principle. Now, he could not help thinking that Mr. Ridley did make his order as to costs upon the broad footing that he thought that this contract was wholly done away with, and that, therefore, payment was to be on a *quantum meruit*. Inasmuch as he (the Master of the Rolls) had ventured not to agree with Mr. Ridley in that, he thought the costs must have been given on a wrong principle. The defendants must pay the general costs of the cause; they would have to pay all costs of evidence given on the question whether there was delay; they would have necessarily at the end to pay all these costs, whatever might be the amount of damage which the plaintiffs might recover, but they ought not to pay any costs in respect of the charge of fraud which the plaintiffs brought against the architects nor on any resulting claim for delay caused by such fraud. The architects claim for costs must be taxed at once, including the costs of that motion. With regard to the costs of this appeal, as between the plaintiffs and defendants, their lordships thought the decision of the court below was wrong. Sir Robert Reid had urged that the decision of Mr. Ridley was right. Therefore, as on the whole both sides half won and half lost, there ought to be no costs on either side of this appeal.

Lord Justice A. L. Smith, in concurring, said that the case of *Bush v. Whitehaven Commissioners*, on which Mr. Ridley had relied, did not apply.

Lord Justice Chitty also concurred. The Master of the Rolls added that the Court had paid no attention at all, except to wonder at it, to the objection that was made that Mr. Ridley would not properly try this case if it went before him again.

In reply to Mr. Bosanquet his Lordship added that the costs of the Divisional Court belonged to Sir Robert Reid. Mr. Bosanquet's client had pressed the judges to give a decision which was absolutely wrong. There was a horribly bad lord.

Mr. Bosanquet: I could not help that, my lord.

The Master of the Rolls: Oh yes, you could; you did it, I am sure you did.

Mr. Bosanquet: I was not there myself, but I will take the responsibility.

The Master of the Rolls said the respondents must pay the costs in the Court below.

The appeal was accordingly allowed, with the costs as stated.

MEETINGS.

FRIDAY, MAY 21.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters of communications beyond mere news items, which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses. Any communication to a contributor to write an article is given subject to the approval of the editor, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

Fireproof Buildings.

THE importance of having reliable information upon the fire-resisting capacities of various forms of construction is becoming more and more apparent. The term "fire-proof" denotes

class of construction in which no structural member is combustible; but at the same time the fact is fully appreciated that fire may cause complete wreck without actual combustion of the structure. When we consider for a moment that during last year there were on the average three serious fires every week in London alone, causing the sacrifice of many lives, it is a subject for astonishment that so little has been done in this country to gain any useful knowledge as to the kind of construction best calculated to offer the greatest resistance to destruction from this cause.

Both in America and on the Continent much attention has been given to the subject, but the efforts of those interested have been mostly directed to carrying out experiments, generally on a rather small scale. Naturally a good deal of useful information has been gained in this way, but it would be much more serviceable to examine the effects of the actual conflagrations that occur so frequently than to first cause a fire—which necessarily must be of limited dimensions—and then note its effect upon small specimens of girders and columns brought intentionally into contact with it.

It is to be regretted that when an extensive fire occurs the lessons it is capable of teaching us are practically ignored, and that while every effort is made to extinguish it, no attempt is undertaken to discover how the various parts of the building behaved during the conflagration. We are much in need of reliable information, presented in a scientific manner, as to the relative advantages of using cast iron, wrought iron, or steel for girders and columns, obtained from actual experiences. In addition to this the behaviour of the various forms of concrete floors, when subjected to fire, should be examined and recorded, as well as the value of protective materials, and many other matters of minor interest. The

whole of this information is offered to us at nearly every large fire that occurs, and it is remarkable—considering the vast interests at stake—that no earnest attempt is made to profit by these occasions to gain some definite idea as to the best system of fire-proof construction to adopt.

Any investigation of this nature would, of course, have to be undertaken with the permission of, and in conjunction with, the Metropolitan Fire Brigade, who no doubt would allow some authorised person, thoroughly acquainted with his duties, to examine the various parts of the so-called "fire-proof" buildings, after a fire, or as far as possible during its occurrence.

In this way architects and engineers would be furnished with a report upon the fire-resisting properties of various forms of construction, and would be in possession of reliable information, obtained from actual experience.

An attempt is now being made in America, as we see from Mr. S. A. Reed's very interesting communication to the "Journal of the Franklin Institute" last November, to obtain data concerning the fire-resisting properties of buildings composed of steel or iron columns and girders. A co-operative committee of three was formed a year ago, representing officially the principal associations of fire insurance underwriters, the Architectural League, and the American Society of Mechanical Engineers. This Committee has done little more so far than to construct its plant, and to make a beginning of its tests, but it will ultimately, we think, furnish us with some very valuable information.

The Committee proposes to investigate and examine in order of importance how fire affects:—

- 1st. The skeleton of a building;
- 2nd. The floor and roof arches;
- 3rd. Walls and partitions regarded as fire stops.

It will also pay much attention to the effect of protective material or armour for steel or ironwork.

The varieties of fireproof construction have reference mainly to the various devices for floor arches spanning the space between the steel beams, and these are largely the subject of patent rights. A number of fire and water tests have already been made, and are still being made on floor-arches by those persons interested in them;

but the investigation of the protection of the skeleton of a building has not called forth the activity of patentees, and the heavy expense necessary has prevented others interested in the subject from going very thoroughly into the matter. The Committee above referred to have, however, decided to pay particular attention to the stability of the steel framework of a burning building, and have decided to make their tests on a full working scale and under the actual conditions, as far as possible, which would obtain in a fire. They propose to use gas as fuel, and to work at three typical temperatures, these to represent three typical classes of ordeal that buildings are likely to be called upon to sustain according to their location and occupancy, and to test each to destruction if possible.

From the data that will be obtained the Committee hope to be able to state the requirements for a standard building, for the particular set of conditions, internal and external, which the building has to meet; and to be a standard, it must, of course, contemplate all fire possibilities, even the most remote, pertaining to these conditions.

The testing plant was only completed in the early part of last year, but since that time several tests on unprotected columns have been made, the result of which we give in the table on the following page.

Even from the above few tests, it is evident that iron or steel must be covered by a sufficient thickness of some non-combustible material of slow heat-conducting quality, and having mechanical properties which are not seriously altered by high temperatures, if the buildings of which they form a part are to be preserved from destruction by fire.

This armour must be mechanically attached, so that neither heat, water, or falling objects can seriously impair it.

It is interesting to note that tests on cast-iron columns show that the popular idea that such columns shatter like glass when rapidly cooled by water is erroneous, and that apparently there is no particular choice between unprotected cast-iron and steel columns as to their fire value. Both yield by bending at a red heat about in the same manner, and eventually double up, although the cast-iron columns appear to continue to resist—that is, to retain their sustaining power throughout the period of bending; whereas the steel columns cease almost entirely to resist, and

STRENGTH OF COLUMNS SUBJECTED TO HIGH TEMPERATURES.

Section.		Height of Col.	Breaking Load, Tons.	Working Load, Tons.	
	Steel. 42 bars, 4 in. by $\frac{3}{8}$ in. by $\frac{1}{16}$ in. } = 1435 □ 1 plate 6½ in. by $\frac{3}{8}$ in.	14 ft.	342	80	With a test load of 48 tons and a temperature of 1,200 deg. F., the column bent after 85 minutes.
	Steel. 2 c bars, 10 in. by 15½ lbs. } = 150 □ 2 plates 12 in. by ½ in.	14 ft.	303	85	
	Cast Iron. 8 in. diameter 1 in thick = 22 □	13 ft.	—	90	With a test load of 85 tons and a temperature of 1,100 deg. F., the column bent after 70 min. (no water applied). With a test load of 85 tons and a temperature of 1,550 deg. F., the column bent after 35 min. (no water applied).
	Do.	Do.	Do.	Do.	

lose practically all their sustaining power as soon as buckling begins.

Within the last two or three years some valuable experiments have been made in Vienna, under the supervision of the City Surveyor, with the object of testing the efficiency of protection of ironwork against fire, and incidentally to determine the relative fire-resisting properties of various building materials.

A brick chamber, 12 ft. by 8 ft. and 11 ft. 6 in. high, was constructed, the walls being lined with various building stones and other materials. In the centre of this chamber was erected an iron column, consisting of two channel bars, 5½ in. by 2½ in., placed back to back, with a clear space between them of 2½ in., and cross-braced with small lattice bars. Test bars, composed of different alloys, melting at various points between 150° F. and 165° F., were placed in the space between the channels, and the column was subsequently inclosed in brickwork in mortar, unpainted, forming a pier 18½ in. square, the brick casing having a thickness of 6 in.

The building was covered with a fireproof roof, formed of tiles on wrought-iron joists, and concrete. The column was loaded to the extent of 14.4 tons, which was equivalent to 3½ tons per square inch.

The fuel was piled equally all over the floor to a depth of about 3 ft., and the firing was maintained at its full intensity for two hours and a half, and then kept on one side of the building, with the object of testing the effect of unequal heating. The fire brigade then commenced playing upon the roof and inside walls and column; but the heat to be subdued was so intense that the interior of the chamber could not be examined until the following day.

It was then found that the corners of the brick pier were crumbled to the extent of 1¼ in. to 1½ in., and several roof tiles were split. The brickwork was wet throughout. Generally speaking, the walls remained vertical, and the iron column was quite uninjured. The test-bar fusing at the lowest temperature of the series (150° F.) was the only one in which there was any appearance of partial melting, so that it was evident that the brick casing was amply sufficient for the protection of the column. The brickwork surface stood very well, but most of the stones were honeycombed or granulated, and the plaster-surface afforded no resistance sufficient to be taken into consideration.

An interesting example of a large fire, from

which considerable information respecting the stability of iron columns and girders subjected to intense heat was obtained, occurred a few years ago in Berlin. A large warehouse, recently erected and substantially constructed in stone and iron in the manner generally considered as "fire-proof," was destroyed in a very short time, in spite of every effort to save it. The opportunity was taken in this case to institute a complete and systematic official examination into the conditions under which the collapse and destruction of the building occurred, and the practical lesson to be learnt from the event.

The building, which was six stories in height, was a rectangular block 141 ft. long by 95 ft. wide, with a central courtyard. A substantial cross wall with iron doors separated the structure into two distinct parts. The floor girders, about 14 in. deep, were placed 8 ft. apart, and the ceilings were vaulted between them in the usual manner. The main girders were 18 in. deep, with a span of 17 ft., and rested on brackets on the cast-iron columns, being bolted end to end. The cast-iron columns bolted together through the several floors ranged in size from 9 in. diameter and 1½ in. in thickness on the ground floor, to 4½ in. diameter and ¾ in. thickness on the top floor.

The fire was caused by some workmen upsetting a lamp on the third floor, and by the time the firemen arrived the flames had full hold of the building. The chief cause of the destruction of the building was the failure of the columns, and the consequent collapse of the floors, and although the flooring material itself was but little injured, the columns were nearly all more or less distorted. Of ninety-nine columns, twenty-two escaped injury, thirty-nine were injured, but remained standing; and thirty-eight disappeared from their places and were traced among the debris.

The result of the official examination was that the Committee recommended especially that the loads on all columns should be central as far as possible, and that lugs and brackets should be dispensed with wherever they can be avoided; that the ends of all girders should have sufficient free play for elongation and contraction; and that the connexions of girders over the columns should be strong enough (in case of necessity) to hold the flooring together, even if one column collapsed.

The above example furnishes an instance of an official investigation taking place after

a large conflagration, and we think it must be admitted that until we adopt some such system ourselves, we shall make but little progress in the construction of really fire-proof buildings.

PATENTS: NOVELTY AND THE FIRST INVENTOR.

HE interest in the question of patents becomes keener year by year. It is seldom that we are without some work on this subject before us. On the present occasion it is the full and complete book which was published by Mr. Lewis Edmunds in 1890, and of which a second edition is now issued.* There are many persons who prefer smaller books than this, but for a complete work the present cannot be considered unduly voluminous. It would not—for a standard work—be possible to be more concise, and the authors of this edition deserve credit for not increasing the size of the volume over that which was published seven years ago. For it is obvious that the field of patents grows annually wider, and even in a work which deals with general principles it is necessary to illustrate rules by copious examples.

The publication of this very complete book affords an opportunity for stating some of the results of legal decisions to the present date, which in the aggregate have formulated the principles by which the novelty of an invention is to be tested, and by which it may be discovered who is the first inventor. These are, of course, only two portions of the subject of patents, but they are of the first importance, and the fact that a large and well-defined body of law has now been created in these and other points of principle leads us to hope that occasion will soon be found for codifying the law of patents. Such a code would be of immense practical value, for in truth every inventor ought to know the general principles of patent law in the country where he contemplates the taking out of a patent. Such a code would also lead to a greater similitude of the law in different countries: on no subject is it more desirable that there should be international agreement.

It is the novelty of an invention which entitles the person who introduces it to the public to protection by means of a patent for a certain number of years. If the so-called invention is not new, the reason for its protection has gone. The public gets nothing in return for the monopoly which it grants to an individual. Want of novelty in an invention, if a thing which is known before may be called an invention, may arise from two distinct sets of facts. A so-called invention may be to all intents and purposes the same as one already known, or it may be that the state of general knowledge is such that persons conversant with the subject to which the so-called invention relates, would be able to make what is alleged to be an invention. It is impossible to state in detail the various ways in which a so-called invention may be similar to one which has gone before; the variety and number of modern machines is alone sufficient to show how each case must be considered on its own merits. But two divisions in principle may be formulated.

* The Law and Practice of Letters Patent for Inventions. By Lewis Edmunds, D.Sc., Q.C. Second edition by T. M. Stevens, Barrister. London: Stevens & Sons, 1897.

the invention may have been anticipated in fact; that is to say, the thing may have actually been manufactured. Or, again, it may be on paper; in other words, the idea may have been described, but it may not have been made into a working thing. But here we must be in mind an important qualification. For a prior description will not avoid a subsequent patent unless it be sufficiently clear to enable those conversant with the subject to produce the thing invented without any experiment or further assistance than can be got from the paper itself." Again, to elucidate the qualification itself "the description must be so clear that an intelligent workman reading it will deduce the invention and the way to make it." The late Mr. Justice Grove, in addition to being an eminent lawyer, was a distinguished man of science, has left what may be called a definition of the "intelligent workman." It may be usefully produced: In a case once tried before him, the late Judge used these words, "Persons versed in the trade, skilful, and well acquainted with the trade (I might even say it, perhaps, to those in the trade who are most skilled); the higher class of skilled workmen." It will be seen from these two statements of principle upon what a comparatively clear basis the actual law on this point rests, and how easily it might be simplified. The real difficulty arises when the principles have to be applied to troublesome facts.

We must now turn to the second main division which involves the question of the state of general knowledge. This is, perhaps, a more difficult part of the subject. It is well exemplified in a statement by the late Sir George Jessel, a lawyer of great breadth and acuteness of mind, "When you say a thing is known to the public and part of common knowledge, of course you do not mean that every individual member of the public knows it. What is meant is, that if it is a manufacture connected with a particular trade, the people of the trade shall know something about it; if it is a thing connected with a chemical invention, people connected with chemistry all know something about it." The truth is that this is a pure question of fact. Any person who has to decide the question must look at the circumstances of the time, the formation of experts, the character of standard works, and other sources of knowledge, and he must ask himself whether, having regard to all these facts, the state of knowledge is such that the element of novelty is absent from the alleged invention.

Assuming that the invention is a novelty, the claimant for the patent the true and the first inventor? In other words, is he the actual discoverer, for no other person is allowed to obtain this monopoly. This, of course, is a question of fact: One point may be emphasised, that in one sense the first inventor, in the eye of the law, to use an Irishism, need not be the first inventor in fact. That is to say, if something has been discovered by another, but the discovery has never been divulged, he who independently discovers the same thing and is the first to disclose it to apply for a patent which is eventually granted, is the true and first inventor. The practical lesson from this rule is obvious: A person reasonably believes that he has invented something new, he ought not to keep it to himself, but should apply as soon

as possible for a patent. In these days, many active and ingenious minds are at work, more especially in mechanical affairs, and no one can tell how quickly some discovery by one man may not be followed by a similar one which has occurred to another person.

NOTES.

The Workmen's Compensation Bill. AN important announcement was made by Mr. Chamberlain during the first night's discussion of the Workmen's Compensation Bill in Committee. He stated that it was intended that the building trade should be included in the Bill. As we pointed out when discussing the measure at length, some workmen engaged in building work appeared to be included, since the Bill applied, as originally drafted, to works where machinery was used. Sir Charles Dilke has an amendment on the paper to the effect that buildings which are over 30 ft. in height shall come within the Bill. This Mr. Chamberlain says will be accepted by the Government. But the amendment cannot stop there. At any rate, if it be limited in this respect at present, it is certain to be amplified at some future and not distant time. One thing, therefore, is clear from the recent discussions in Committee, and that is that the workmen and employers engaged in building work will come within the range of this measure.

South Kensington Museum. It is to be hoped that the Report of the Select Committee on the Museums of the Science and Art Department may have some influence in leading to the completion of the South Kensington Museum. Neither Parliament nor the public care anything about the matter on architectural grounds, but the fact that the collection is in danger from fire, owing to the existence of so many temporary buildings of combustible material in connexion with it, may possibly lead to a conclusion that the completion of the building in a solid and monumental manner had better not be delayed. The following is the emphatic language of the Report of the Committee on this point:—

"That the principal structural alterations necessary for the protection of the collections from fire have not been made appears to be due to the fact that the completion of the permanent buildings of the South Kensington Museum has always been in the contemplation of successive Governments as the true remedy for the danger of destructions from fire which hangs over the collection so long as they have to be partly housed in the present temporary structures."

This necessity of providing buildings suitable for the exhibition of the objects of art and science collected at South Kensington has been long under the consideration of successive Governments. Your committee regard it as their immediate duty to lay before the House of Commons by means of an interim report their very strong opinion that permanent buildings for the adequate accommodation of the collections at the South Kensington Museum should be proceeded with without delay. They are of opinion that it will be a source of grave discredit to the country if the settlement of this matter, which has been the subject of consideration by Government for many years, and of endless correspondence between the departments concerned, is any longer delayed."

Mr. Preece on Electrical Transmission. MR. PREECE read an interesting paper on Tuesday at the Engineering Conference on "The Transmission of Power by Electricity."

He commenced by lamenting the energy running to waste in grinding stones, changing river beds, and carving the surface of the earth into hills and valleys. The utilisation of this energy at centres of civilisation would mean, he said, keeping permanent the face of nature; a way of looking at the matter which, in view of the recent agitation about the destruction of waterfalls for power purposes, caused considerable amusement. In regard to the utilisation of the Nile Cataracts, he said that it was perfectly possible to utilise this waste energy in Cairo and its neighbourhood, but we ought first to consider how the cost of doing this would compare with that of bringing fuel from England. The question of burning coal at the pit's mouth and then transporting the energy extracted as electric currents to London was in his opinion not worth considering at present. For workshop and home use electricity ought to be far more widely used in England, for although the horse was far more efficient than an electric machine in converting fuel into energy, yet the cost of its upkeep and its depreciation made it the least efficient of machines. We disagree with Mr. Preece when he says that dynamos and motors are now commercially made at moderate prices, with efficiencies of from ninety-four to ninety-six per cent. We never heard of a motor at a moderate price with an efficiency greater than eighty-five per cent.

Lord Leighton's House. It is to be hoped that the offer of Lord Leighton's house and its contents to the public which has been generously made by his sisters will be accepted, and that the people of Kensington will take measures to obtain sufficient funds to keep it up. It is very desirable that this should be a local matter. We hear a good deal at the present time of forming separate municipalities for various parts of the Metropolis. The real vitality of any such separate bodies must arise from local public spirit. The present is an opportunity for Kensington to show what it can do to maintain a home of art without going to the rest of London for financial assistance.

Annual of the "British School." THE Committee of the British School at Athens have this year wisely decided to allow their "Annual" to be purchased by the outside public at the moderate price of half-a-guinea. The number contains, besides the report of the Managing Committee and a selection of papers read at the School, some very valuable communications which it is well to make as widely accessible as possible. We have, e.g., a paper by Mr. Arthur Evans on Goules in Crete, the "City of Zeus," of which there are remains above ground more extensive than those of any other prehistoric city on Hellenic soil. The paper is illustrated by a plan by Mr. Myres, and by eleven figures in the text. We can only here call attention to its paramount importance in relation to the whole "Mycenæan" question. Other important papers of special interest to architects are those on the Byzantine Churches of Melos, by Mr. Fletcher and Mr. Kitson, students of the School, and on the antiquities of Cyrene, by Mr. Weld Blundell. Some account is also given of the excavations at Melos, still in process, of which fuller particulars are to appear in the forthcoming

number of the *Hellenic Journal*. These preliminary reports appearing, as they can, with greater promptitude, fully in themselves justify the existence of the "Annual."

SEVERAL papers on the "Transmission of Power" were read last Tuesday before those members of the Institution of Civil Engineers who were able to attend the "Engineering Conference" which was held in the beginning of the week in Westminster. The transmission of power by water was dealt with by Mr. E. B. Ellington, M.Inst.C.E., and in the course of his remarks he pointed out that 75 per cent. of the power supplied at the central station ought to be realised over an area of four square miles, although, as the designs of the machines vary with the purposes to which the power is applied, the 75 per cent. may often drop very considerably. Dr. John Hopkinson, in treating of the transmission of power by electricity, drew attention to the fact that when transmission is to be made to long distances, as from where there exists a great water power to the points at which that power can be used, then electricity was the agent to be employed. It is inevitable that, with electrical transmission of power, high speeds of rotation must be used, and for many purposes this is inconvenient; for example for lifts and cranes working at a slow speed. But, notwithstanding the fact that there seems undoubtedly to be many places where hydraulic transmission will permanently be better suited to the purpose than electrical transmission, there can be no doubt that there are many cases in which, at the present day, hydraulic transmission is used which will ultimately be effected by electrical transmission of power—as, for instance, in our ships of war. The consequences of the destruction of a steam or water-pipe by a projectile would be extremely serious, whereas the breaking of the continuity of an electrical conductor would be easily and quickly made good.

Lord Kelvin
on Contact
Electricity.

LAST week's Friday's lecture at the Royal Institution by Lord Kelvin was a most important one. He began by showing an experiment which conclusively proved Volta's theory that when a zinc plate and a copper plate were put in contact, one became charged with positive electricity and the other with negative. Although he had shown this experiment fifty years ago at Glasgow University, yet an immense amount of ingenuity had been wasted recently in trying to explain away this phenomenon. He considered that Volta was absolutely right, and made an appeal to physicists to study Volta's work seriously. A very interesting and novel experiment was shown. A plate of uranium was connected to one terminal of an electrometer, and was then touched by a plate of aluminium. It was seen by the deflection of the spot of light that the uranium plate became at first positively electrified; it then gradually lost its charge and became negatively electrified. Lord Kelvin could suggest no explanation of this very mysterious experiment. Another interesting topic touched upon was Becquerel's discovery of the radiation given off by uranium. This radiation is very feeble, but photographs of coins, &c., taken by its means were thrown on a screen. He stated that it had been con-

clusively proved that this radiation was not due to phosphorescence, or the slow radiation of light previously absorbed, and he could give no explanation of it. Lord Kelvin was slightly discursive, but he was listened to most eagerly, and his points were rapidly taken up by an appreciative audience.

Actions for
Obstruction
of Light.

It is surprising that by this time all points in regard to the law as to the obstruction of light have not been cleared up. On the contrary, from time to time, new ones spring up. Thus, for example, in the recent decision of *Jenks v. Lord Clifden* we find an important question settled. The so-called Civil Procedure Act of 1833 states that an action may be maintained against the executors of any person deceased for any wrong committed by him in his lifetime to another in respect to his property, real or personal, so as such injury shall have been committed within six months before such person's death, and the action is brought within six months after the executors have entered on their duties. Whether or not an action for obstruction of light could be brought under this section does not seem to have been decided until the recent decision of Mr. Justice Kekewich. This judge decided that, under the above statute, a person whose light is obstructed may bring his action against the representative of a deceased person just as if the latter were alive, but under certain limitations, which are that the damages for the obstruction must be confined to such as were incurred during six months preceding the death of what we may call the wrongdoer, and that the proceedings are brought within six months of the appointment of the executor the action is maintainable. From a practical point of view we may be inclined to doubt if it is worth going to law to recover damages in respect of an obstruction for six months, which can hardly be what lawyers would term substantial damages.

Water-
supply
Disputes.

MR. JAMES MANSERGH, Chairman of the "Waterworks, Sewerage, and Gasworks" Section of the Engineering Conference, read a paper before the Section on Tuesday last, entitled "The Law and Allocation of Underground Water." The communication dealt, principally, with a very interesting contest which has been going on before a Commons Committee within the last few weeks as to the rights possessed by the public in underground water. The Corporation of Newark have recently sunk a well into the pebble beds of the New Red Sandstone at Farnsfield and obtained a satisfactory supply therefrom; the Nottingham Corporation, desirous of increasing their water supply, sought to sink wells in a position regarded by the Newark authorities as being certain to cut off a portion of the water which, under ordinary conditions, would reach their pumping station. Other and minor public bodies were also interested in the matter; but it became practically a contest between the Newark and Nottingham Corporations. In the end, the Bill of the latter body was curtailed, and power was given to Nottingham to construct only a well many miles away from Farnsfield, the closer ones proposed being struck out; whilst the Newark Corporation, which sought by their Bill to secure a protective zone of four miles radius around their well, within which no

other Authority should sink a well to obtain water to be taken away outside that area, succeeded in getting the boundary fixed merely by the present limits of supply. The decision may not be confirmed by the House of Lords, but it is interesting as showing the present muddled state of the law in reference to underground supplies of water, and the uncertainties attending "expert evidence." One of the principal points in the case was as to whether a certain stream had been to some extent dried up as a consequence of the pumping from the water-bearing strata for years in its neighbourhood, or whether it was due simply to natural causes. The evidence on this was most conflicting, and it is safe to assume that so little is at present known concerning the distribution and movement of underground water in that part of England that the evidence on either side was not worth much. We entirely agree with Mr. Mansergh that the question of the amount of percolation into ground of varying geological character requires a great deal more attention than it has hitherto received.

This Institute, latterly occupied as a club and reading-rooms, was closed a few days ago; the property, library, and other effects will shortly be sold. On the laying out of the Bedford and Foundling Hospital estates in the Long Fields, north of Bedford House and Montague House, James Burton, who was largely employed by Francis, and his brother John, Dukes of Bedford, projected the erection of a suite of assembly rooms. He obtained a ninety-eight years' lease from Michaelmas, 1799, at a ground-rent of 10*l.* per annum, of a site described as "part of the ground lately taken in exchange of the Foundling Hospital, and also part of the said Duke's private road" (Woburn-place). The interior was burnt in 1802; in February, 1804, the premises were opened under licence for music and dancing, the large room—75 ft. by 26 ft., and 30 ft. high—being appropriated to balls and concerts. As the speculation did not succeed, Burton proposed to establish a literary and scientific society after the mode of the Royal and London Institutions. Sir James Scarlett (Lord Abinger) and Sir Samuel Romilly were leading members of the committee, who gave Burton 2,700*l.* and 200 shares for his interest. Large sums have been expended from time to time upon the buildings; in 1812-3 the committee spent 2,500*l.* upon alterations and repairs, by Thomas Cubitt, under the direction of John Shaw, the architect. In 1825, E. W. Brayley, F.S.A., was appointed secretary and librarian. There is a large picture by Haydon of Xenophon and the Ten Thousand first seeing the sea from Mount Theches, exhibited in the Egyptian Hall, 1832. The then Duke of Bedford won the painting, valued at 800 guineas, in a raffle at the "Thatched House" Club, 1836, and presented it to the Institution. The west wing, originally the bath-rooms, and the vaults, have long been let to a firm of wine merchants.

Pennant's
"London."

A FINE copy of this work was sold, for 35*l.*, at the recent dispersal, at Christie's, of the Bessborough Library. It forms one of the twelve copies that were printed on large paper; it is bound in six interleaved volumes, extensively illustrated with 2,070 engravings,

&c., collected by Lord Bessborough. The similar copy, also in six volumes, in the Soane Museum, was bought for 600 guineas at the sale of the effects of Fauntleroy, partner in the banking firm of Marsh, Sibbald, & Co., of Berners-street, executed for fraudulent transfers of stock on November 30, 1824. Another copy, after the same kind, but bound in several volumes, containing many valuable water-colour drawings, and known as the Crowle Pennant, is in the Prints Department, British Museum.

Architecture and the Press. THE daily papers of Thursday offered a characteristic example of the attitude of the daily Press (of London especially) in regard to architectural questions. Some of them gave a long report of the evidence of Mr. Shaw Lefevre on Wednesday before the Government Office Sites Committee. At the same sitting two architect witnesses, one of whom had given special attention to the subject, gave evidence at considerable length; but the evidence of architects on such a subject is not of course worth reporting.

ARCHITECTURE AT THE ROYAL ACADEMY.—III.

DOMESTIC architecture is not largely represented among the Academy drawings of the year, and not by the design of any house of the first order of importance; in fact, the majority of the designs exhibited are for small houses, bungalows, or lodges. Generally speaking, the collection, as far as it goes, tends to show that the prevalence of English taste in house architecture is increasingly in favour of simplicity and quiet picturesqueness of treatment. This is a good deal better than the gawgaw domestic architecture so prevalent in France and Germany; though it may be questioned whether we are not going too far in the direction of mere picturesqueness; and there are some little contrivances for obtaining it—a window formed in an outer angle of the wall, a window on a curved plan appearing to support an overhanging floor or eaves over it, &c.—which are becoming commonplace, and have almost lost their power to attract attention. Scarcely any of the designs for houses show plans, and those which do show no compass indication. The question of aspect of rooms is so all-important in a dwelling-house that it is extraordinary how architects can go on, year after year, exhibiting drawings of houses without providing any means by which any one can judge whether they are well-planned or well-arranged houses, or whether the picturesqueness of the design and grouping is or is not in accordance with practical requirements.

The best drawing among the domestic architecture exhibits is Messrs. Niven & Wigglesworth's view of a portion of the house named "Kincardine," Deeside (1,030), which was illustrated more fully in the *Builder* some little time since, and as this is obviously only intended as a view of a picturesque angle of the house for the sake of a picture, it may be admitted that in this case a plan was hardly necessary. The present drawing is among our illustrations in this issue. The picturesqueness is obtained, though the portion of the house shown here is, it must be admitted, a little too much of a mere imitation of Scotch castellated Gothic. Another of the larger drawings exhibited is that of Shiplon Hall (1,834), by Mr. H. E. Farmer, which is also published among our illustrations of this week; but it appears from the interesting communication from the architect under the head of "Illustrations," on another page, that this is an old building to which the architects have merely been making some repairs and a few slight additions. The drawing conveys the impression of an old building, no doubt, but the habit of getting up drawings of modern houses so as to make them look like ancient buildings is so common nowadays that one can never take a drawing as a criterion on this point without further information. It is a pleasing representation of a very picturesque old house.

Mr. Ravenscroft's "House and Stabling at Maidenhatch" (1,821) is one of the larger drawings, and shows a L-shaped brick house with

chimneys and dressings of darker or redder brick, and a large block of stabling with a tower near to it; the drawing is a landscape with a house in it rather than an architectural drawing, and the house has not much character, though the plan might afford more matter for interest if we had one. Mr. Aston Webb exhibits a large pen-and-ink drawing of the "Additions to Paddockhurst, Sussex" (1,836), with a small sketch plan. The additions consist of a dining room and a winter garden, the latter with its length placed across the plan, and marked by angle turrets, between which a little decorative effect is got by a balcony with open tracery on either side and a solid panel with a sundial in the centre, the dial flanked by two bas-relief figures. Beyond this building extends a long conservatory which has the unusual merit of being treated at the sides with solid buttresses and arches so as to appear a part of the architecture of the house, instead of being, as a conservatory in general is, a mere wood and glass excrescence. This is altogether a good piece of work.

Mr. J. J. Stevenson's "Houses in South-street, Mayfair" (1,825; no plan) have a dignified appearance and a certain special character owing to the introduction of semi-octagon bays built of stone, at each angle, the intermediate portion of the walls being of brick. These bays are connected above the ground floor by a balustraded balcony, the cornices carrying which, in the left-hand house at all events, look too small and weak for good architectural effect. The houses have very high green-slatted roofs, which give character, but are not the best kind of provision to make for attics. Of somewhat the same class of work, though with less character, are Mr. Neale's "Houses erected at Hampstead" (1,786; no plan).

Messrs. Bateman & Bateman's "Vectis Lodge," published in the present issue, is one of those drawings which hardly require a plan, as it is really only a billiard-room—the interior and the two sides. As explained under the head of "Illustrations," the large bay window had its origin in the practical necessity of giving more space for playing. The interior of the room, with its panelled wainscoting and the decorative frieze above and the open beams and joists, has a good solid effect.

Some other minor examples of domestic architecture may be noticed in the order of hanging. Mr. Doran Webb's "County Hotel, Salisbury" (1,749) is a picturesque country town hotel, though the projecting chimney breast on the upper portion of the front looks rather awkward. Mr. Paxton Watson's "First Lodge, Lea Park" (1,754) is a very pleasing specimen of a Park Lodge, the circular turret with its small cupola roof looks however as if it ought to have been carried a little higher to clear the general roof line. Mr. Garner's "New House at Hampstead" (1,755) is a queer bit of house architecture with mullioned windows inserted in large spaces of the wall, and the entrance flanked by columns which carry nothing, a use of this feature which looks rather as if the architect wanted to put something there and did not quite know what else to put. None of the three last-named drawings show plans. "An Artisan's Room" (1,763), by Mr. Barry Parker, is praiseworthy as an attempt to put a little interest into a cottage room with a stair ascending at one side of it. In Mr. R. A. Brigg's "House at Quarry Woods, Marlow" (1,776), we come at last to a plan, but we regret that it is not a very satisfactory one; the hall and passage upstairs must be deficient in light, and the plan shows the barbarous arrangement of the water-closet in the bath-room, which ought not to be tolerated in the most unambitious residence. The house is picturesque, but shown in a very roughly-executed pencil drawing; though, as we have always said, architectural exhibits ought not to be chosen mainly for drawing, architects might take a little more trouble as to drawing than is shown in this and some other house drawings of the year, some of which are little more than rough sketches.

Mr. Larnar Sugden's "Hillmorton House, Rugby" (1,791; no plan), we illustrated recently; a good deal of picturesque character is obtained by the free and varied lines assumed by the wall terminations. Messrs. Silcock & Reay's "Country House, Bath" (1,789), has a sketch plan but no names to the rooms; apparently the three principal sitting rooms are placed *en suite* and facing the same way (there is no compass), which is rather a naive manner of planning. The house is one of the larger ones illustrated, and has some good points archi-

tecturally; it is a solidly designed stone house with mullioned windows, and with the back entrance door at an outer angle, oddly emphasised by three short thick columns supporting the walls over it and leaving small porch between them. Mr. Voysey's "House near Guildford" (1,797) is a really interesting and picturesque little building, treated in a peculiar manner, the walls all white (rough-cast?), roofs of green slates, and the window dressings and mullions of apparently a warm-tinted yellowish stone, but the drawing, which has fully drawn-out plans, is hung too high to be properly examined or for the plans to be understood. Why an evidently carefully executed piece of work like this should be skied, while drawings of the roughest description are put on the line, is one of the inexplicable mysteries of hanging in the architectural room. Mr. Redfern's "Gatehouse and Master's Lodgings, Abingdon School" (1,805) also has plans and is also too high to be seen. In "The Living Room, Woodcote, Church Stretton" (1,814), Messrs. Parker & Unwin show an interior with a good deal of character, with a large boldly treated ingle nook, though there is a little of that affectation of plainness and solidity and unadorned brick-work which is a fashion set by some of the American house architects, and is capable of being overdone. Mr. Sydney Perks's "House near Banstead" (1,817; no plan) is a pretty country house, the two round arches (door and window) make an effective basement for the half-timber gable above them. Mr. Watson's "House at Walton-on-Thames" (1,862) we give an illustration of; it is a picturesque little nest, and for a small house the plan is well arranged. Mr. F. W. Bedford's "Shireoak Dene, Headingly" (1,864; no plan), is a good little water colour showing a house in the old plain brick style with white painted wood-work, very well carried out in its way. Mr. Seth-Smith's "New House at Eastcote, Pinner" (1,869; no plan) shows a characteristic contrast of red brick and white surface in the walling, with an accompaniment of clipped hedges, &c.; a little too much affectation of old fashion about it, the long square chimney growing out of a set-off reminding one of the sketches in "Harding's first drawing book." Among other things we can only just mention Messrs. Heskest & Stokes' "Billiard Room, Piggott's Manor" (1,880), a room with a segmental plaster ceiling with a large Elizabethan strap pattern over it, and columns screening off the dais; Mr. Allen's "The Mount, Cookham" (1,886; no plan), a pretty water-colour of a brick and timber building; Messrs. Niven & Wigglesworth's "Nethercliffe, Walton-on-Thames" (1,901; no plan) a very plainly treated shingled house with a long roof-ridge, and the end treated with half timber work; Mr. Briggs's "House at Crowborough" (1,908), a much better plan than the other, with a good deal of originality in architectural treatment and disposition of the rooms; and Mr. Vigers's "Rowgardens Wood" (1,912; no plan) a plain house with a certain amount of character, and diversified with a well laid out formal garden in front of it.

Among the houses illustrated in the Academy there is a good deal of picturesqueness and pleasing character exhibited; but it is much to be regretted that we have not drawings of more important works in domestic architecture, of which there must be many going on. And we must emphatically repeat that an illustration of a dwelling-house without a plan is no illustration at all.

IN PARLIAMENT.—On the 18th inst. was read for the first time a Bill to authorise the acquisition of Churchyard Bottom Wood, Highgate, for purposes of an open space and recreation ground. The Ecclesiastical Commissioners offer to sell the fifty-two acres of woodland for 25,000l., provided it be preserved as an open space. Towards that sum the residents around have subscribed about 3,000l., the Middlesex County Council have voted a sum not exceeding 5,000l., provided that Parliamentary powers be obtained to enable them to do so, the Local Board has voted 10,000l., and the Islington Vestry 2,000l.—A Select Committee have passed the Bill for a railway, seven miles long, at an estimated cost of 2,9,792l. to join the London and North-Western at Watford with the Great Northern at Edgware, and having a branch line to the Midland at Mill Hill. Mr. Woodall's Committee have passed as "proved," the preamble of a Bill to empower the Metropolitan District Company to make an underground railway, mostly beneath their existing line, from Earl's-court station to the Mansion House, at a cost of 1,700,000l., to be worked by electricity, or cable, or steam-power, 500,000l. being appropriated to electrical works.

THE ARCHITECTURAL ASSOCIATION:
PLUMBING AND SANITARY WORK.

AN ordinary fortnightly meeting of this Association, and the last for the present session, was held on Friday evening, the 21st inst., in the Meeting-room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, Mr. Beresford Pite, President, in the chair.

The minutes of the previous meeting having been read and confirmed, the following gentlemen were elected members of the Association, viz., Messrs. S. Bridges, J. S. Collings, and G. L. Elkington. It was also announced that Messrs. Arthur Cates and S. C. Baker had been reinstated as members. A letter from Mr. Arthur Cates on the subject of his reinstatement was read by the Chairman, in which Mr. Cates remarked that having taken an active part in the work of the Association during the first ten years of its existence, he was pleased, forty years after retiring therefrom, to resume his membership.

Mr. E. Howley Sim, Junior Hon. Sec., proposed a vote of thanks to Mr. E. T. Hall for allowing members to visit the Park Hospital on the 1st inst., and for entertaining them to tea. The motion having been agreed to unanimously.

Mr. Banister F. Fletcher, Senior Hon. Sec., proposed a vote of thanks to the Entertainments Committee and to others who assisted, for the excellent entertainment which they provided at St. George's Hall on the occasion of the recent Soirée. Those who worked on the occasion were to be thanked for the amount of time they had bestowed on an entertainment which was as good as any other that had been given by the committee lately.

The vote of thanks having been cordially agreed to,

The Chairman said he had much pleasure in announcing that the Royal Institute of British Architects had, for the sixth year, made a grant of roof, towards the educational work of the Association. He desired to move that the best thanks of the Association be forwarded to the Council of the Royal Institute of British Architects for their grant, and also for permitting the Association to use their meeting-room. The motion was agreed to unanimously.

The Chairman then announced that Mr. Keith D. Young, who was recently reinstated as a member, had made a donation of two guineas toward the library fund. On his motion a vote of thanks was passed to Mr. Young.

The Chairman then read the Scrutineers' report on the election of officers for 1897-8, which stated that 305 sealed envelopes containing voting papers had been received, of which number four were informal and invalid. The following is the result of the election:—

President, Mr. Hampden W. Pratt, 292 votes.
Vice-Presidents, Messrs. Banister F. Fletcher, 288, and A. H. Hart, 295.

Committee: Messrs. A. Beresford Pite, 237; G. H. F. Prynne, 222; R. S. Balfour, 219; F. G. F. Hooper, 214; F. T. W. Goldsmith, 182; W. H. Seth-Smith, 176; H. B. Creswell, 103; C. de Gruchy, 139; T. W. Aldwinkle, jun., 144; W. D. Caröe, 142.

Hon. Treasurer, Mr. Hampden W. Pratt, 297.
Hon. Librarian, Mr. C. H. Freeman, 297.

Hon. Secretaries, Messrs. E. Howley Sim, 204; and G. B. Carvill, 295.

The above form the Committee.

The other officers elected were: Hon. Solicitor, Mr. W. H. Jamieson; Hon. Assistant Librarian, Mr. E. W. M. Wouacott; Hon. Auditors, Messrs. M. Garbutt and H. P. G. Maule; and Assistant Secretary and Registrar, Mr. D. G. Driver.

On the motion of Mr. E. Howley Sim a vote of thanks was accorded to the scrutineers, Messrs. C. H. Brodie, M. Garbutt, G. W. Jones, and H. D. Wilkinson.

The Chairman announced that the A.A. Travelling Studentship for 1897 had been awarded to Mr. E. H. Evans. The Prizes Sub-Committee in their report stated that the finished drawings by Mr. Waring exhibited great care, but the Committee were unanimous in awarding the prize to Mr. Evans.

The Chairman then called upon Mr. S. S. Helver to read a paper on "Plumbing and Sanitary Arrangements," part of which, and some of the illustrations which accompanied it we give this week. The remainder of the paper, and additional diagrams, will appear next week.

The subject of this paper is too large and the time too short to admit of any adornment, even if I had the power, but as to this I am not

troubled, knowing well enough how learned you all are in the art of embellishment, and that any deficiency of mine in this respect will readily enough be made good by you.

Holding the strings of his client's purse, money naturally becomes an important factor with the architect. He ever wants to accomplish so much for so little, and somehow money does not increase in value as the years go by—the wages world makes a shrinkage in it. I should like, therefore, to comfort your minds at the outset by saying—speaking obviously apart from the increase in plumbers' wages, which applies to all the other building trades—that the sanitary plumbers' work of to-day costs but little more relatively than did the insanitary work of two or three decades ago.

The additional cost for better treatment and arrangement, for better ventilation of the soil-pipes and waste-pipes, is largely met by the adoption of more simple methods, by the use of cheaper traps, smaller waste-pipes and soil-pipes; also by the use of fewer cisterns and cisterns of smaller size and of a less expensive character; and, further, by the difference in the market price of materials, lead especially being much cheaper now than it was a quarter of a century ago. I will give you an instance by throwing upon the screen illustrations showing the insanitary method of treating a valve-closet thirty to forty years ago, and the sanitary method as generally practised to-day by those proficient in the craft of plumbers' work. The excess of work is so marked in the old method that I need not go into figures to show its greater cost.

No doubt the many improvements which have been made in the best kinds of valve-closets have increased their cost, but this is met by the simplification of certain parts, and by the use of plainer basins, a simple white satisfying for most places now; for we no longer require to study colours in our water-closets—we have our art schools for that—nor do we now seek for closet-basins with looking-glass bottoms.

I think I ought to say that there are older methods of treating the valve-closet than the one just shown, that being considered (half a century ago) an improvement upon the treatment it first received in the latter part of the last century and the earlier part of this. For instance, in the illustration just shown the waste-pipe from the safe is trapped independently of the closet trap, a weeping-pipe from the closet service is turned into it for charging the trap with water every time the closet is used; whereas in the earlier method the waste-pipe from the safe was connected with the closet trap, as in fact was also the waste-pipe from the cistern. In the earliest method of all, these two latter dangers were non-existent: the closets having no safes under them no waste-pipes were required; and as the water was generally pumped up into the closet cisterns where situated above the basements, there was no such need for cistern wastes, especially as the water, instead of overflowing the cistern, could run away through the wire-pipe of the service box into the closet basin, and through the overflow pipe of the latter into the closet trap and out into the soil-pipe. In an illustration later on we shall see how this was done. But I am departing from my subject.

In the old method the Bramah closet was supplied by means of a spring-valve, a spoon or sioce-valve, or a round drop-valve soldered to a lead service-box, the latter kind being the one just shown, but such details do not in any way upset our conclusions as to the greater amount of labour involved in the old method than in the new.

That carries us a long way, for it mattered not whether a valve-closet or a pan-closet were adopted; the plumber's work was just the same in both, the service-box only being a little larger in the former case than in the latter. For good houses the best plumbers used to consider the Bramah closet the proper kind for the principal water-closets, and the pan-closet for more common use and for servants' use indoors, and sometimes also for the upper servants' use in the yard or area, though the water-closet in the latter places was generally fitted with the well-known long hopper-closet. I will say nothing about the cost of the latter, excepting to remind you that it was cheap and advertising; but I do not hesitate to say that the insanitary pan-closet, with its D-trap and other belongings, cost more than the sanitary pedestal wash-down closets of to-day.

In this reference to the relative cost of the modern method of plumbers' work with that of the old, I am not, of course, taking into con-

sideration the additional comforts and luxuries if I may so call them—elaborate baths and luxurious lavatories. If people want sitz, spray, and shower baths, they must expect to pay for them, as they do for their motor cars and bicycles. However, I should be sorry to convey the impression that because the prices of certain materials have been reduced, and the work to certain water-closets simplified, that plumbers' work now costs next to nothing; for there is a very important factor yet to be considered—viz., the labour—the *crux* which generally baffles the best of estimators. Plumbers' wages in London are at the rate of about one-fifth more than they were a quarter of a century ago, and I should think four-fifths more than when the Queen began to reign. The men do not receive this amount of increase in their weekly wage, for they do not work so many hours now. I am saying nothing against this advance in wages. Intelligent, industrious labour should be properly paid for.

The first great requisite in a house is its water supply, for, in my opinion, as I said twenty years ago, no house can be considered safe to live in which is supplied with unwholesome water. If it were possible to get at the actual facts it would often be found that many a case of illness, and death, arose from bad water rather than from bad drains, from water supplied in an impure state, or which had been allowed to become contaminated in its storage. Therefore, when water has to be stored great care should be taken to see that it cannot be rendered impure by its surroundings, cannot be contaminated by the effluvia from water-closets, the emanations from ventilating-pipes, soil-pipes, and drains, or from the vitiated air of bedrooms and living-rooms. One hardly expected to have required any further restrictions, but our accountant actually saw two hobbledoys bathing in a cistern the other day. The illustration before you faithfully represents what I fancied, from his face when he told me) amused him as much as astonished him. A proper cistern-room should be provided with lights and openings to and from the external air, and the cisterns should be so arranged that they may be readily and periodically cleansed. For this latter purpose—in addition to any overflow-pipe required by the water company—a cleansing waste-pipe should be so fixed that the cistern, or cisterns, may not only be emptied, but rinsed out with clean water from the ball-valve. To prevent the possibility of such pipes becoming conductors of bad air to the cisterns, great care should be taken to see that their discharging ends are kept well away from open traps, sinks, gullies, and places where foul air could enter them. It ought to be superfluous to say this after so much that has been written on the matter, but only very recently I came upon an error of the kind we are now considering in a nobleman's mansion, the work having been done but a year or two ago. I will show it upon the screen. The cistern-waste is taken into the head of a long length of 3-in. cast-iron pipe, which, at the time I saw it, was in a very foul state, receiving, as it did, the discharges from a general sink (fig. 1). That the waste-pipe from the sink would become fouled was pretty well understood by the authorities, for it was trapped rightly enough, though it was not ventilated; but neither the cistern-waste nor the overflow-pipe from the bath had any trap in them, although they delivered into the same head as the sink-waste. Of course trapping these pipes would be of no value, for there would be no water passing through them to keep the traps charged. I could add to such examples and give others of a more serious kind. We shall see some instances of how the cistern water can be contaminated, later on in connexion with other matters; but I must pass on to consider the important method of supplying cisterns with water.

Apart from the great saving in cost by having a constant supply instead of an intermittent, enabling as it does the use of smaller rising-mains, and cisterns of a smaller size, and fewer in number, there is the great advantage of keeping the communication-pipes from the companies' mains always charged with water, and thus preventing them from becoming communication-pipes in another sense—from becoming, in fact, air tubes or passages for communicating disease germs.

In the case of an intermittent supply, under favourable circumstances, directly the water is turned off from the main in the street the lower cisterns on the system would be supplied as they were drawn from by the water left in the mains; and it requires no great effort of one's

Fig. 1.

Fig. 2.

imagination to conceive of streets sufficiently sloping for such pipes to be quickly emptied, and to remain so daily for perhaps twenty hours out of the twenty-four. In such cases—the rising-mains in large houses being often of 1½-in. bore, and even larger—the air, infected or otherwise, would pass at times even through such restricted passages from one part of a house to that of another; and also from one house to another under favourable circumstances (fig. 2).

As the water subsided in the communication-pipes, air would enter them through the open ball-valves, nature abhorring a vacuum. And the air which would be thus sucked into the pipes would come, of course, from the air which surrounded the cisterns, and where such cisterns were in open contact with the air from bedrooms and water-closets, as shown on the screen, which represents a suburban house, of which there are perhaps hundreds like it, it could hardly be pure, and might be dangerous. The upper cistern is practically quite open to the bedroom, for a badly fitted door would be no barrier, and the lower cistern is not only exposed to the air of the scullery, but also to the water-closet which opens into the scullery. No doubt any air currents set up through the empty main in the street and the communication pipes to the houses would be induced by the difference in the temperature of the different houses, one house being often much warmer than another.

Fortunately there is a redeeming point in most things, and notwithstanding that specifications direct that rising-mains shall be laid in a manner to empty themselves, they are not often so treated, circumstances intervene, and "the best laid schemes of mice and men gang

afit a-gley"; the street main, for instance, stands higher than the point of ascension of the rising-main. But in cases where houses stand on much higher levels than the street main no doubt such communication pipes would empty back into the main in the street or road, and in streets or roads with a steep fall, as shown, the main with the water turned off would soon become empty.

With a constant supply the main and the communication-pipes would practically remain always charged with water, and no such risk as we have been considering would be likely to take place.

Cisterns with a constant supply can be of much smaller size than when the supply is intermittent; and generally one cistern in such cases suffices for a house with a fair-sized family. The size, of course, must depend upon circumstances. It should be equal to the keeping of all the services from it going at one time, or the service-pipe to it must be of a bore sufficiently large to supply the water at about the same speed that it can be drawn from the cistern.

Where there is only one cistern in a house and it is also made to supply the hot water circulation, the cold water services from it, for all other purposes, should be so connected that a body of water is always retained in the cistern to keep the hot water system going, in case the water should be turned off from the main for a little while; especially should this be the case when the hot water circulation is on the tank-system.

Also, with a constant supply there is the further advantage of being able so draw directly from the company's main, and the water supplied to the table in this way will be

found to be much cooler and nicer in every way, provided that the water in the company's main is pure and wholesome. For this purpose ½-in. lead pipe will be found to be quite large enough. When the water is soft, and would be likely to act on lead, block-tin, or tin-lined lead pipe should be used, or tin-lined wrought-iron pipe if the water company will allow it.

Where the water would act on lead it would also act on galvanised iron, therefore the storage cisterns in such cases should be of cast iron or wrought iron limewhitened inside, and the cisterns for storing water for dietetic purposes would be nicer in earthenware, white enamelled inside.

Great care is required in selecting the course for the service-pipe—the communication-pipe from the company's main. The pipe should never be laid under or near a soil drain, or in any trench in which had or surface water could collect; for even though there may never be any restriction in the pipe to allow water surrounding it to be sucked into it, in case of any hole or defect in the pipe such water may find its way into it when the water is turned off from the main, and be forced up into the cisterns when the water is turned on again.

Where such pipes cannot be kept at least 2 ft. under ground, then, in positions where they would be liable to very severe frost, they should be laid in a trough or box made of creosoted wood filled up to the top edges of the sides with hot pitch, with which might be mixed a little Stockholm tar and some sharp sand. No lead or iron pipe should be allowed to come in contact with lime, and when such pipes pass through clay soil they should be well tarred over or be embedded in ashes or cocoanut fibre, which will also be helpful in protecting them from frost.

If plumbers' work inside our houses ended here we should not have much to fear from noxious gases in our homes, but civilisation calls for certain conveniences to be placed indoors, and I must confess that it is most comfortable to one's mind, if feeling a little "out of sorts" on going to bed, to know that if taken ill, one will not have to light a lantern as in the olden times and go out into the night air.

Now I know of no reason, beyond that of incapacity, why a water-closet should not be fixed inside a house with absolute safety, safer and sweeter, in fact, than a night stool in one's bedroom, the use of which, when all the servants are in bed, would leave its presence painfully present for the rest of the night. But it is not so much a question of a night-stool *versus* a water-closet, or a privy or water-closet situated out of doors *versus* a water-closet indoors; for the outside convenience, by bad arrangement, may render it and the air surrounding the house more unhealthy than even an insanitary water-closet indoors. The important question is: Can a water-closet be so

fitted up that it may be used with absolute safety in any position or place it may reasonably be required, either outside or inside a house? Well, gentlemen, if I could not answer that question in the affirmative, I should not be here to-night.

Living on an island, we naturally believe in isolation. We isolate all clean water pipes such as safe-wastes, cistern wastes, and overflow pipes, by making them discharge into the open air. We also isolate all dirty water waste pipes, such as bath wastes, sink wastes, and lavatory wastes, by exposing their discharging ends to the air outside the house, and in this matter we stand ahead of all other nations, not excepting even America. In some cases, we also isolate soil-pipes, by "disconnecting" them from old and filthy soil drains, safeguarding them from the air in the drain, and giving to each soil pipe a separate inlet and outlet for continuous ventilation.

We go further than this, for we not only isolate the drain of one house from that of another, by disconnecting both from the common sewer, but in some cases we disconnect one section or wing of a building from that of another, excluding any infected air which may be in one section from another, and providing independent ventilation to each section, taking care, however, that no length of drain shaft remain unventilated.

And we not only isolate the main carriers, the sanitary wings are now isolated from the general building. And the water-closet apartments are not only isolated, but the water-closets. The "Corbel" and the "Bracket" closets have been specially introduced to isolate them from the floor as well as from the walls, an illustration of which is now before you (fig. 3).

But isolation is not everything; our ships of war still count for something. A water-closet may be as isolated as a sentry-box, and yet be dangerous, for in this sanitary age no water-closet can be pronounced sanitary in the highest degree which cannot be used and left in itself and in all its parts as clean and wholesome as it was before usage.

To compare various points and features of the great variety of water-closets and flushing-cisterns which now exist would require several evenings, and to attempt this to-night would only tend to the confusion of our minds on a subject simple enough in itself, but which, owing to the multifarious patterns of the many manufacturers, has become a little complicated.

In passing over many water-closets which have been introduced during the last ten or twenty years we shall not miss much, for the majority of them are as noisy and as unsightly as some of the new motor-cars, and to the olfactory nerves are just as objectionable as the pan-closet they were meant to supersede. I propose, therefore, to confine my remarks to a few kinds, viz., the valve-closet, the "Syphonic," the "Wash-down," and the "Wash-out," but before doing so let me mention the several points which I consider essential to a good water-closet.

1. It should hold a body of water large enough and deep enough to quite submerge the faeces.

2. It should have no parts or places in it where faecal matters could cling to or accumulate upon.

3. It should have a water-seal of at least $\frac{1}{2}$ in. for trapping off the soil-pipe.

4. It should be so constructed that the whole of its contents may be changed by a flush of two gallons of water, and its interior parts well washed.

5. And in the case of earthenware closets having their basin and trap in one piece, its connection with the soil-pipe or drains should be readily seen.

Now if we examine the general kind of "wash-out" closets, we shall see that they all more or less fail in some one or more of these important points. In the majority of such closets, if not in all of them, it will be found that the water held in the bottom of the basin is too shallow to cover the faeces, the consequence being that the portion which is not submerged throws off a vapour—its temperature being generally greatly higher than the air of the apartment—which soon fills the place with an odour, objectionable to the then occupier, and most repulsive to the next comer immediately following. So pronounced is this, that on making an examination it is rarely necessary for a sanitarian to do more than put his head into an apartment where this kind of closet is fixed, to know that it is a "wash-out."

Then in this kind of closet the flush of water

is made to break up the faeces in the best possible way for throwing their odours into the apartment, and instead of spending its full force upon the sides of the basin and upon the trap, it is chiefly spent in clearing the bottom of the basin. There is also the evil of a large exposed surface between the weir of the basin and the water-seal of the trap, a part which will generally be found to be in a filthy state.

Having dismissed the "wash-out" kind of closet, let us now see what can be said for its next of kin, the pedestal "wash-down" kind. There is a very great variety of them with several points common to them all, and yet they differ so much in certain essential features that, like Jeremiah's figs, "the good are very good indeed, the rest are not fit for pigs." In one particular they all stand at a disadvantage with the "wash-out," viz., that their exposed surface of water is smaller. But the best of their kind may be said to pretty well embody the points required in a good general sanitary water-closet. They are to be had of many a manufacturer, each one claiming some feature or advantage not possessed by others.

In the example before you my assistant will soil over the whole of its interior exposed surface and will test it with a dozen pieces of paper, using only two gallons of water, and you will see that the closet and trap will be left free of the matters put into them. And as it is more difficult sometimes with such closets to wash out a few pieces of paper of the size of postage stamps, he will try it again and show you that the closet stands both tests equally well.

Several varieties of "Syphonic" closets are now in the market, the main object with them all being to provide a larger exposed surface of water than can be given to the "wash-down" kind; but though such closets excel the "wash-down" closets in this particular, they are not so satisfactory in some other points. The majority are not so simple, nor so reliable in their action with only a two-gallon flush of water, and some of them are complicated in their supply and discharge arrangements.

In testing such closets with a pailful of water emptied quickly into them, I have seen them left with a much reduced water-seal even when they have not been attached to a soil-pipe; and how they would withstand the action of syphonage when fixed in about the middle part of a stack of soil-pipe 80 or 100 ft. high, I should hardly like to say, but I should be apprehensive of the result.

I know of an instance where a syphonic closet was put into use during the time its soil-pipe was under a smoke test, and the smoke escaped through it into the water-closet apartment. But, perhaps, this is hardly to be wondered at, for under certain conditions, the contents of the closet are syphoned out very vigorously, so much so that the water-seal of the trap would often be broken in the action.

The emptying of a pailful of slops into such closets not only syphons out their previous contents, but the added slops as well, leaving the basins practically empty, in which state they would at times be used when the faeces would fall upon dry basins; for, no doubt, the servants would not always remember to pull the flushing handle after emptying the slops, especially as there would be no necessity to do so to get rid of the slops.

Then, unlike a valve-closet, the water held in the basin is in continuous contact with the air in the soil-pipe, but this is the same in "wash-down" closets.

Then I think when the water is limited to two-gallons it is important that the whole of such a flush should be utilised for washing down the walls of the basin and cleansing the trap; but in the majority of the syphonic closets it will be found that part of the flush is used for starting the syphon in a compartment outside the basin.

Then a close examination of the majority of such closets when in action will show that their sides are not properly rinsed, and that in consequence particles of matter are left adhering to the surfaces, and that even some of the rinsed water is returned back into the closet when the syphonic action has been broken. But, of course, a second flush would make this all right. It is better that such closets should have a flush of not less than about three gallons.

Before I pass away from the classes of water-closets which may, and which often are, connected to soil-pipes and drains by imperfect joints, I should like to say, as strongly as I can,

that no closet or trap having a breakable outlet, such as earthenware, should be connected to a soil-pipe or drain in a manner that will not admit of a ready inspection.

I now come naturally enough to valve-closets, the prince of water-closets for private use, and for places where such a convenience is not used for several days together and when the supply of water is not limited to two gallons. The "Bramah" valve-closet was invented by Joseph Bramah, of London, in 1778, but it has been much improved upon since then, especially during the last ten or twenty years. In turning out some drawers recently, I came across a printed circular of a valve-closet, by the founder of my business, which was established upwards of a century and a-half ago, and I have thought it of sufficient interest to reproduce upon the screen to-night for you to see. It was printed by T. Bensley in about 1790, I think. His printing press was next to Dr. Johnson's house in Bolt-court. If you look at the type you will see that the long S is used, and the Caslon Foundry abandoned that form of letter in 1785.

The illustration shows a D-trap under the closet, but according to the text this trap was at that time called an "Air" trap; and although they seem to have preferred that its position should be immediately under the floor of the closet, they do not seem to have been very particular about this, for in the directions for fixing, it is specified to be "fixed under the floor of the closet, if the joists are of sufficient depth to allow it, if not it may be fixed at the bottom of the funnel-pipe." It is interesting to notice that at this time soil-pipe was called "Funnel-pipe"—the name by which it is still called by some old plumbers—and, what is still more interesting, as shown by the circular, the conservatism of that day was very strong, for they stored the sewage in cesspools built at the bottom of funnel-pipes inside their houses. But they saw a danger in this, unless matters were well suppressed, for the specification states that "great care must be taken to make properly good round the bottom of the funnel-pipe where it enters the drain or cesspool so as to entirely prevent the foul air from being emitted." There is nothing said about the ventilation of the soil-pipe or of the cesspool, the authorities were content to "bottle up" such matters, and there was wisdom in this with so much storage of sewage in closet trap and cesspool.

But I must return to my subject. I have called the best kind of valve-closets the prince of water-closets, and I have done so because I know of no other which embraces so many good points. It has a larger and a deeper body of water than any other closet, for receiving a motion, submerging it, and carrying it away in what I have called elsewhere a "water envelope," whilst the valve which keeps the water in the basin enables its sides to be so extended that they are practically protected from the dejecta, no matter what state the body may be in. And to protect the flushing rim of water-closets I have recently introduced a receding rim.

Then, with the attached supply valve, at the same moment of time the closet is discharged, a very vigorous flush of water is made to cleanse the whole of the interior of the closet together with its trap; and not only so, the sides of the basin are rinsed down at the same time, so that not a vestige of foreign matter may remain behind.

Then the valve-closet is superior to all other closets, whether of the "wash-out," "wash-down" or "syphonic" kind, in that its basin water—the water which is open to the apartment and the house—is separated from the water which stands in the closet-trap, in fact is "disconnected" from the water which is exposed to the air in the soil-pipe, as shown in section upon the screen, which is an illustration of a valve-closet which I have had specially made for fixing upon fire-proof floors, and places where it is desirable that the floor under the closet should remain intact.

There is also another great advantage attending a good valve-closet, viz.: with an efficient lead trap under it having a wiped soldered joint to the lead soil-pipe there will ever be a reliable connexion with the soil-pipe, and a reliable water-seal; so reliable that the trap and its jointing may be depended upon for many generations.

In the case of earthenware closets with earthenware traps in one piece—the pedestal kind—or in two pieces, it is not so; for there is not only the risk of a breakdown of the connexion with the soil-pipe, but there is also

the risk of the breakage of the closet itself, its trap or its basin part, which would mean a defective water-seal or no protection at all from the soil-pipe air, pending the changing of the closet for a new one.

I know that some authorities have been content to fix valve-closets without a trap between the closet and the soil-pipe, but it is astonishing what may be done in the name of sanitation. Now, though something may be said in favour of fixing a valve-closet without a trap on a very short length of soil-pipe, which has its discharging end open to the air, what can be said in favour of such a closet fixed upon a long length of soil-pipe into which other valve-closets discharge with no trap to any of them? And yet scores have not so fixed. Only within the last few months I know of such cases where the closets have had to be re-antennated.

I will not insult you by arguing in favour of fixing traps under water-closets—that is a sound principle conceded by us all; but I shall be glad of your attention whilst I demonstrate the fact that a round pipe-trap—the syphon-trap, the kind often fixed in ignorance of its behaviour—under certain circumstances loses its water-seal, and for a time ceases its work of safeguarding the house from the soil-pipe, and perhaps the drain as well. It seems a waste of words to say that if a trap be necessary at all it should be of that kind which could be relied upon under any condition to which it would be liable.

With a round-pipe or syphon trap the discharges pass through it in so unbroken a form and with so much momentum—gained in the fall from the closet basin—that the combined action of syphonage and momentum is not arrested in time to leave sufficient water in the trap to re-seal it.

With an "Anti D-trap," as I shall show you by one or two tests, the water is just sufficiently broken up at the outlet of the trap to retard both the action of momentum and syphonage, for ensuring the retention of an efficient water-seal, no matter how small or how large a body of water may be sent through it, whilst to ensure an entire change of the previous contents of the trap its body part is purposely made smaller than its inlet, and so it holds about 40 per cent. less than a 4-in. syphon-trap I need hardly say which is the more wholesome of the two, although both kinds may be considered as self-cleansing. By the favour of the Worshipful Company of Plumbers have here an apparatus which the company fitted up at King's College in connexion with their museum and workshops there, for the extension of the technical training of student plumbers. I have had a photograph taken of the apparatus, and before demonstrating will show it upon the screen.

Next to the importance of an efficient trap to a water-closet is an efficient water supply, for the best closet in the world may not only be spoiled, but may be ruined by the want of water. I expect two gallons of water to carry a motion through the closet trap, branch oil-pipe, the vertical stack, and a long length of branch drain to reach the main carrier, and not leave a vestige of filth behind, is expecting too much. The fact is, if the water flush is to be efficient it must be made to depend somewhat upon circumstances, upon the necessities of the case, and that only where water is scarce, or where it is imperative to economise its use in order to maintain a general supply to the house, should it be limited to two gallons.

Two gallons of water with an efficient flushing cistern may fairly suffice for the best kind of wash-down pedestal closets with small water areas, when they are situated near to the main carriers with a general flow of water in them, or into which copious flushes are automatically and frequently delivered. But two gallons of water are insufficient for water-closets which hold a good body of water, especially when they stand or are fixed at any great distance from the main drain, that is, if the soil-pipes, drains, and ventilating-pipes are all to be kept clean and wholesome. In my own house—I pay by meter—I have valve-closets for the best closets with the water supply so arranged that each user may give a flush of two, three, or four gallons very rapidly and at pleasure, and during the thirteen years that I have occupied the house I have never had to pay extra on that account. I say this to encourage Water Companies in giving a larger licence to consumers.

As only, however, two gallons of water are allowed by most Companies, it is most impor-

tant that this quantity should be utilised in the best possible way, and as there are flushing-cisterns and flushing-cisterns, only the most efficient should be used. You all know well enough what difference there is in their discharging power; I have here one taking not quite five seconds to discharge, the size of the flushing pipe being 1½ in. and the cistern being nearly noiseless. With a noisy advertiser in a house, it is vain for any person to pretend he only left the room to get a pocket-handkerchief. Such fittings are most unpleasant to relating dispositions, and they ought not to be fixed in private houses. I was dining a month or two ago at a friend's house, and wishing to give a second flush to the closet, I waited four minutes by my watch for the flushing cistern to fill; when I left it was still filling, and I dare say by this time it is ready for the second flush.

A properly-fitted valve-closet with an attached supply-valve and bellows regulator, is the least noisy of all water-closets, and when it is so fitted up that the lid of the enclosure can be pulled down before the handle is pulled, it is practically noiseless in its action. The next slide will show a view of such a closet. It is so arranged in my house, where, for the sake of convenience and for good general flushing when necessary, the service to it is taken from the general service-pipe to other fittings. When this is properly done I do not see how any contamination can take place, but as it is most difficult to always rely upon things being properly done, it is better to separate the water-closet supply from all other services. When the cistern for this purpose would have to be fixed in the water-closet apartment it should be kept as small as practicable, holding only about half a dozen gallons of water, so that its entire contents may be frequently changed, for, notwithstanding any lid it may have, the effluvia of the apartment would gain access to the water and taint it. Where a good flush is desired, and the head of water would be under 5 ft. or 6 ft., the service-pipe to the closet should be of 2-in. bore.

If we were not influenced by fashion, or carried away by the current of things, I should wonder much why pedestal closets with narrow ring seats ever came into vogue for the best closets in private houses, especially for ladies' use, for I suppose the least observant must know that it is cleaner and nicer for a lady's dress, especially with a long skirt, to rest upon the dusted seat of an enclosure rather than upon the floor, remembering what closet floors are like at times. With a table-top closet basin protecting the enclosed space, and with an air-tight joint to the top of a nicely-fitted enclosure, as shown upon the screen, not only is the vapour excluded from the space inside the enclosure, but dust, and the sweepings of the apartment, as well. And with such an arrangement no cold draughts can blow upon the person using the closet. And even for the use of men, when they are feeble or advanced in years, a table-top pedestal closet affords a better means for raising themselves from the closet than the ring-seat, allowing them, as it does, a firm place to rest their hands upon, as shown by the closet illustrated upon the screen.

Before leaving the subject of water-closets, I ought to say something on the apartments in which they are fixed, though there is no time for more than a word or two. The apartment in itself, apart from the closet, may become an accumulator or disseminator of disease. Dark and dangerous water-closet apartments may be found with the aid of a candle in the interior parts of old mansions with no natural light or ventilation. The vapour generated in them, or escaping from the closet apparatus, may be as difficult to remove as air out of a bottle.

One side of a water-closet apartment should at least stand next the external air, having a window in it reaching up to the ceiling, as was shown in the last slide but one, and as is shown in this case also. Where it would be much used it should be provided with independent ventilation, should have, in fact, an air inlet and an air outlet.

It is important that the walls and ceiling should be made practically air-tight, and that there should be no places or parts about them where dust could collect and accumulate. And in public water-closets, and in water-closets which would be liable to be used as urinals, the floors should be impervious.

For the best water-closets with enclosures, as just shown, and for table-top valve-closets in private houses and important positions, a floor of solid marble from wall to wall, or to a point 6 in. or so beyond the sides and front of

pedestal closets, is very desirable, as shown. The marble is sunk a little to catch any little leakage of the supply-valve, should such ever occur, and carry it away by an overflow pipe fixed to the floor, and discharging into the open air. Where marble cannot be afforded, the boarded floor inside the enclosure should be protected by a lead safe to which the lead trap under the valve-closet should be soldered. I should just say here that the overflow pipe from the safe being a clean water-pipe can be utilised for introducing a constant stream of fresh air into the apartment; but when this is done in exposed positions, the grated opening in the marble floor should be kept outside the enclosure, so that the incoming air, when frosty, may not come directly in contact with the service pipe, service valve, or closet basin.*

In inviting discussion, the Chairman said they were exceedingly indebted to Mr. Hellyer, not only for bestowing so much time on his lecture, but for one of the most instructive papers which had ever been read before them.

Mr. F. G. K. Hooper, in proposing a vote of thanks, said that a paper of so valuable a character, should be of great use in extending the knowledge of plumbing work and of sanitary science. At the present time sanitarians might take some credit for the fact that the Queen was able to commemorate so long a reign. It was interesting to recall the fact that, through the wisdom of the late Prince Consort, early in the reign the Royal palaces were examined by experts and put, so far as was possible at that time, in a sanitary condition. Had such work been more general, it was not too much to suggest that the life of the Prince himself might have been prolonged, and the Prince of Wales might have been spared his very serious illness. At the same time we were saddened in considering the shortness of life of men and women at the other end of the social scale. The early mortality among the artisan classes was to a large extent preventable. The fact that the death rate was so high amongst this class was an injury to the whole community. Sanitarians might rejoice in what they had done, and were doing, to preserve the lives of the people, but it was melancholy to have to maintain diseased men and women in work-houses, hospitals, &c., who, instead of suffering, would be strong and healthy and giving their lives to the community had their homes been more wholesome and their habits more wise. If all like the Queen, were lovers of fresh air, the effect would be alike favourable to all. Many of the points which Mr. Hellyer had alluded to they would all take to heart. People at the present time did not consider sufficiently the ventilation in the ordinary dwelling house. The staircase, for instance, which was a means of communication, was rarely properly ventilated. If it were, much less would be heard of draughts and bad odours.

Mr. G. H. Fellowes Pryme, in seconding the vote of thanks, said that he agreed with what Mr. Hooper had said as to badly ventilated workmen's dwelling-houses; but the small suburban dwelling-house was in an equally bad state. In suburbs like Ealing, and, of course, elsewhere, the sanitation of supposed sanitary houses was abominable. He had recently been called in to examine a house which had been pronounced satisfactory by a "sanitary surveyor," and as the result of the ordinary smoke test, the house was found to be in a most defective condition. Another point he would like to refer to was as to the number of theories amongst architects as to what constituted the best sanitary arrangements, which caused the opinion of the sanitary expert to be sought after. As a result, there was springing up a class of men known as "sanitary surveyors." He recently knew of a case where the charges for the "sanitary surveyor" were 15 per cent. on an expenditure of over 1,000l., the sanitary surveyor replying, in answer to remonstrances, that it was generally agreed that the charges of the sanitary expert should be higher than those of the architect for mere architecture. He could not help thinking that more attention should be given to matters of sanitation on ships. Any one who had travelled by sea, especially in the smaller ships, would know how insanitary were the closets in ships, regular pestiferous breeding boxes. In the

* Owing to pressure of other matter, we are obliged to hold over the remainder of this paper, and some additional diagrams, until next week.

Atlantic once, in a rough sea, the water did not go down, but came up one of the closets in use, with results better imagined than described.

Mr. W. E. Bland (Newcastle) said that he was expressing the opinions of sanitarians in the north when he stated how much he appreciated Mr. Hellyer's work. One important matter which the lecturer had referred to was as to the valve closets having the water in the basin separate from that in the trap. That was a point which he had not noticed previously, although he had been a lecturer on plumbing for eight or nine years.

Mr. J. Osborne Smith said that that meeting came very opportunely after their recent Jubilee dinner, when it was said, as it was often said, that drains were not architecture. That was possibly true, for there were many things which were not architecture in that sense, although they were parts of a building; but he thought the suggestion was a wrong one, and the meaning conveyed in that phrase was the wrong advice to give to students. Architecture was the formation, the designing and production, of beautiful buildings; but a building could not be regarded as either beautiful or perfect unless it was also healthy; unless they paid attention to that portion of the practical work connected with architecture and produced reasonably healthy buildings, they had not considered sufficiently the interest of the client, nor done what they had been paid 5 per cent. for doing. He agreed with Mr. Prynne that architects should not let this practical work get into the hands of sanitary surveyors, since it was work which architects ought to look after themselves. He regretted that clients had frequently gone to him complaining of the inconvenience suffered in regard to defective drainage due to the want of attention on the part of architects. One reason of this was that insufficient attention was given to simple matters, and adequate expenditure was not incurred at the right moment. Expenditure was often lavish on parts of the building that were to be seen and the hidden parts were often sacrificed in consequence. When students were designing buildings they could put the closets and lavatories in the right places if they thoroughly understood the principles on which they were working.

The Chairman, in putting the vote of thanks, said that it had been well said that genius was the capacity for taking pains, of which they had had a lesson that night. He could not help thinking that if they wanted to learn a lesson thoroughly they should go to the very best authority they could find. One thing that made them happy in the present day was that sanitary science was approaching to a state of finality. The science now, from being complex was becoming simple, and he hoped that it would not be long before the denser bodies of the country, Local Boards, &c., would find that it was necessary to give some other form of finality in these matters than to say that their by-law must be complied with at all costs. We might, perhaps, some day get even a simpler form of valve-closet than that which was recommended at present, but the diagram which Mr. Hellyer had shown them that evening would make them feel that they were one step nearer to perfection. As an Association they ought to join with other bodies in emphasising the need of a codification of by-laws on sanitary matters. Let them, as architects, all remember that a house is a machine, and a very important machine—not a box with ornamental fronts, but a machine in which people had to spend their lives—in which they had to live and die. Architects had to accommodate people in health and sickness, and at the last moment of their existence, and no part of the habitations of the people was unworthy of an architect's skill and care. He, as an artist, must thank Mr. Hellyer for getting rid of the ornamental basin, and for the good taste displayed in the models brought there that evening. Nothing was in worse taste than the fluted or the foliated closet. If they, as architects, were to send deprecatory post-cards to the makers who sent them such specimens, perhaps there would be less of such work manufactured.

The vote of thanks having been put and agreed to unanimously, Mr. Hellyer, in reply, said he was glad that architects took so much interest in sanitation. He believed it was a question for architects, and that was why he was present that evening. In his opinion a house was not complete unless it was made healthy. Architects could do a great deal to aid the plumber, and for the

health of the country, by studying sanitation up to a point; they did not need to go into all the details—in fact they would not be able to do that, for so extensive was the subject, and so extensive were the phases of an architect's work that it would be impossible to do so.

The Chairman having announced that the meeting was adjourned "until the annual excursion," the proceedings terminated.

THE INSTITUTION OF CIVIL ENGINEERS: CONFERENCE OF MEMBERS.

A THREE days' conference of the members of this Institution was opened on Tuesday at the Westminster Town Hall, and in the Guildhall, Westminster.

The opening meeting was held in the Town Hall, Westminster, when the President, Mr. J. Wolfe Barry, addressed a large audience. After a few opening remarks, he glanced at the history of the Institution since its formation in 1818. He said that its ramifications extended not only to every city and town of the United Kingdom, but its members and representatives were to be found in every country to which British enterprise had extended. From the small beginning of 1818—which had not attained to a growth of 200 members of all classes in 1828, they had increased by leaps and bounds, so that they now numbered 6,200 members, associate members, and associates, and 900 students, making a total roll of 7,100. Of the 5,000 members, associate members, associates, and students in the United Kingdom, 1,050 of all classes were living or practising in the Metropolis. In many of the great towns of the Kingdom they had important local associations directly connected with the Institution. The number of members and associate members in the various local associations was as follows:—Birmingham and the neighbourhood, about 200; Glasgow, 150; Manchester, 200; Newcastle-on-Tyne, 120; Leeds, 150. It was with the view of further strengthening the bonds of union that the Congress of this year had been instituted; and he hoped, not only that it would have the results which they all had so much at heart, but that it might be the precursor of many more annual gatherings of a similar nature. Apart from visits, their desire had been to encourage, by means of short papers read at the meetings of the Sections, an interchange of ideas and the imparting of the most recent information on all the multifarious subjects which together were included in the expression civil engineering. Thus they had found that seven Sections naturally presented themselves as indicating that amount of specialising which in practice their profession found desirable. The Sections into which the Congress was divided were as follows:—1. Railways.—Chairman, Sir B. Baker. 2. Harbours, Docks, and Canals.—Chairman, Mr. Harrison Hayter. 3. Machinery and the Transmission of Power.—Chairman, Sir Frederick Bramwell. 4. Mining and Metallurgy.—Chairman, Mr. Forster Brown. 5. Shipbuilding.—Chairman, Sir William White. 6. Waterworks, Sewerage, and Gasworks.—Chairman, Mr. James Mansergh. 7. Applications of Electricity.—Chairman, Mr. W. H. Preece. The papers to be read at these various Sections were all short, and each was to be looked on more as introducing a subject for discussion than an exhaustive dealing with the matter in hand. The idea which they had had in view was to encourage by all means the conversational interchange of ideas and knowledge rather than any set debates. He thought that engineers as a body were always ready to give their brethren the benefit of any experience or knowledge which they might have happened to gain. He did not think that theirs was an acrimonious profession. They might have their contests before tribunals of various kinds, but he thought they were free of mean jealousies and of what he might almost call the crime of importing personal animosities into their professional struggles. Again, they thought that a Congress would be very beneficial as bringing about an acquaintance with the personality, as well as with the work, of so many who up to now had not had the advantage of meeting each other. He should like it to be distinctly understood that any repetitions of that Congress, so far as his views and the views of the present Council were concerned, would be like this—namely, a Metropolitan Congress. It was not intended to be a peripatetic Congress, meeting this year in London, and another year else-

where. The object which they had before them was to bring those who live out of London into London, not to take Londoners and others elsewhere. London was so large that it was naturally the centre to which all local associations could occasionally turn with advantage to themselves and with manifest benefit to Londoners. Further, it contained the home of the Institution, associated not only with so much of present interest, but still more with the important memories of the past—with Telford, Walker, Rennie, the two Stephensons, Brunel, Locke, Vignoles, and others who had gone before, and with so many of the fathers of the profession who, happily, still adorned their Society. The home, further, contained their unrivalled library and a fund of engineering information. Lastly, by arranging the Congress at the usual time for their annual conversation, they were able to meet socially and to show some hospitality to their brethren. All these considerations pointed, in his opinion, unmistakably to London as their rallying point, and he saw no reason for any other arrangement. In conclusion the President said:—"Let me once more speak to everybody of a hearty welcome, and permit me now to dismiss you to the work of the various Sections, with the earnest hope that this Congress may be a conspicuous landmark of the progress of our noble profession and in the usefulness of our Institution, which has had, and I am persuaded will have, so fine a career of usefulness."

At the close of the President's Address, Sir F. Bramwell took the chair, and the following papers were read and discussed:—Mr. W. H. Preece on "The Transmission of Power by Electricity"; Mr. E. B. Ellington, C.E., on "The Transmission of Power by Water"; Dr. E. Hopkinson (for Mr. John Hopkinson jun.), on "The Transmission of Power."

The Section for Railways met in the Council Chamber at Westminster Town Hall, under the chairmanship of Sir B. Baker. Papers were read by Mr. H. Coperthwaite on "Rail and Permanent Way," and by Mr. F. W. Webb on "Permanent Way."

The Waterworks, Sewerage, and Gas Works Section sat in the Council Chamber at the Guildhall, Westminster, under the presidency of Mr. James Mansergh, who read a paper on the "Law and Allocation of Underground Water," which we refer to in another column.

The Section for Mining and Metallurgy met in the Committee Room of the Guildhall, Westminster, and papers were read on "Water in Pits during Sinking" by Mr. J. B. Simpson; "Deep Levels in Mining Practice" by Mr. Bennett Brough, and "Deep Mining in Cornwall" by Mr. W. Thomas.

In the Shipbuilding Section, presided over by Sir W. H. White, and the Section for Harbours, Docks, and Canals, papers on various departments were also read, discussion ensuing.

In the afternoon visits were paid to various engineering works in the vicinity of London.

In the evening there was a reception by the President and the Council, at which over a thousand members and guests were present. The interior of the new building was filled with pictures on loan and models of engineering works.

The Conference was resumed on Wednesday and Thursday.

COMPETITIONS.

NURSES' HOME, WANDSWORTH.—The first premium (50 gs.) in this competition has been awarded to the design bearing the motto "Nightingale," by Messrs. Lansdell & Harrison, of 12, Compton-terrace, Highbury, N. second (20 gs.) to the design bearing the motto "Florence Nightingale," by Mr. F. W. Goldsmith, of 1, Verulam Buildings, Gray's Inn, W.C.; and the third (10 gs.) to the design bearing the motto "Victoria," by Messrs. Gould-Wills & Bulman, of "Inglenook," 4 Sisters-avenue, Clapham Common, S.W. The number of designs sent in was sixteen.

TOWN HALL, ENNISKILLEN.—In the competition for a new town hall at Enniskillen, Ireland the first premiated design is by Messrs. Anthony Scott & Son, Drogheda; the second by Mr. W. Kaye Parry, 35, Dame-street, Dublin; and the third by Mr. Thomas Roe, 1, Lombard-street, Belfast. The assessor was Mr. Thomas Drew R.H.A., who, in his report, stated that "The anonymity of the competitors has been most successfully preserved. I rejoice to say that in my examination I have had not the slightest hint or impression as to the identity of an

competitor. It is rarely that architects meet with such absolutely fair circumstances; and the conduct of this competition by the Commissioners of Enniskillen will, I trust, at its conclusion be quoted as realising what a fair competition ought to be." Nineteen designs in all were submitted.

POLICE STATION, HALIFAX.—In regard to his competition we learn that out of the seven sets of plans sent in the choice lies between the plans signed "Victorina" and those signed "V. R."

NURSES' HOME, WANDSWORTH.—We understand that the design of Messrs. Lansell & Harrison, of Highbury, has been selected in open competition by the Guardians of Wandsworth and Clapham Union for the proposed Nurses' Home at their infirmary, and has been forwarded to the Local Government Board for their approval. The estimated cost is between 2,000*l.* and 10,000*l.*

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A LANCASHIRE district meeting of the members of the Association of Municipal and County Engineers was held at Rochdale, on Saturday, the 22nd inst. Mr. F. J. C. May, C.E., of Brighton, President, occupied the chair, and amongst those present were Messrs. J. Cartwright, Bury; Walker, Croxson; J. P. Barber, Slington; Cooper, Wimbledon; J. T. Eayrs, Birmingham; J. Lobley, Hanley; J. C. Pickering, Nuneaton; Willbourne, Middleton; Cooke, Lancaster; Royle, Strelford; Cox, Bradford; Taylor, Newburn-on-Tyne; E. R. S. Escott, Halifax; Bulton, Burnley, and others.

The Mayor (Mr. Turner) offered the Association a very hearty welcome to Rochdale.

The President read a letter from Mr. Bulton, of Burnley, resigning his position as Secretary for the Lancashire District, which was accepted with regret.

On the proposition of Mr. Cartwright, Bury, seconded by Mr. Platt, Rochdale, Mr. Cooke, of Lancaster, was appointed to fill the vacancy.

Mr. S. S. Platt, C.E., Borough Engineer, read a paper on "Some of the Municipal Works of Rochdale." Describing the Town Hall, he said the building is in the rich domestic Gothic style, resembling some of the mediæval town halls of the Continent, and was erected from the designs of Mr. W. H. Crossland. The original cost of the building was about 150,000*l.* The foundation stone was laid in March, 1886, by the late Mr. John Bright. The extreme length of the building is 92 yards, its greatest width 41 yards, and it covers an area of 3,000 yards. The easterly end is occupied with the municipal apartments and offices. The central portion is occupied by a magnificent hall with hammer-beam roof somewhat like Westminster Hall. It will seat 1,200 persons, and is much used for public meetings, balls and concerts. The council room extends the whole width of the building and is 60 ft. by 24 ft. The upper floor at the easterly end is occupied as a School of Art. The westerly end contains the Police Department and includes a Borough Court. On April 10, 1883, a serious fire occurred which destroyed the ornamental spire and seriously damaged the stone tower supporting it, and he had the unpleasant duty of razing the tower to within about 30 ft. of the ground. Mr. A. Waterhouse, R.A., was called in, and the present tower and the restoration of the building adjoining it was designed and carried out by him, the site of the tower being moved about 15 yards in an easterly direction, leaving a porte cochère between that and the main building. The general plan of the technical school is in the form of the letter L. In the angle are placed the weaving sheds, north lighted, and so arranged that any future extension can be grouped round the same. The structure averages three stories in height, and covers an area of 1,010 square yards. The basement floor comprises a weaving shed, 53 ft. by 32 ft., for hand and power looms, a weaving class-room for sixty students, a cotton spinning class-room for forty-five students, an engineering class-room for fifty students, practical plumbing, wood turning, &c. On the ground floor, besides the necessary rooms for secretary, committee-room, teachers' common room, and students' common room, there are three large class-rooms, averaging accommodation for fifty students each. The whole of the first floor is devoted to the study of chemistry and dyeing, comprising a laboratory for eighty students, balance room, sulphuretted hydrogen

room, store and reagent room, together with a chemical lecture theatre for ninety students; also a preparation room adjacent to same. A dye-house, with experimental tables to accommodate twelve students, is at the far end of the corridor farthest from the staircase. The chemical laboratory is fitted with working benches for both elementary and advanced students, demonstrators' raised platform and table, and is well and correctly lighted by large mullioned windows. Internally the building is finished in a simple yet substantial manner, with fireproof floors to corridors and elsewhere as found desirable. Externally the building is faced with red Raabon stock bricks having terracotta dressings and other enriched work. The building is wholly required for science, commercial, and technical classes, and was completed and opened in 1893 at a total cost of £11,500, the architects being Messrs. Woodhouse & Willoughby, of Manchester. The schools is the outcome of subscriptions raised in the Jubilee year, and was one of the first handed under the 1891 Act, and is managed by a committee of twenty-four, fourteen of whom are appointed by and are members of the Town Council, and ten are appointed by the original subscribers, of which latter representatives he had been one since the inception of the school. After the serious fire at the Town Hall in 1883 it was decided to remove the Free Library therefrom and to erect a building specially for the purpose. He was entrusted with the designing and carrying out of the work. The building is all one story, with a basement on the northerly side, and covers an area of 650 square yards. The design is domestic Gothic, the materials used being Yorkshire parpouts with Yorkshire stone dressings. Passing through the vestibule the visitor can enter through doorways on either side, and from the entrance hall access on the right hand side leads to a large reading-room, and on the left hand side to a reading-room devoted jointly to ladies and boys. The arrangements are planned so as to afford complete supervision of the several departments by the officials of the library. The total cost of the building and fittings was 5,000*l.* In the early part of last year the committee decided to introduce the electric light, and he had recently completed this installation with the assistance of Mr. G. R. Peers, of Manchester, as consulting electrical engineer. The several rooms had been fitted up with 144 16-candle-power lamps and six 25-candle-power lamps, and opportunity had been taken to introduce an exhaust fan in the large reading-room, driven by an electric motor fixed in the ceiling for the purpose of ventilation on foggy or heavy days, when the air of the room could be changed in a few minutes. It was not possible in such a short period of working to give a reliable statement as to the comparative cost of electric light *versus* gas, but, so far, the results are very satisfactory, both as to efficiency and cost of working. The new fire-station is in Alfred-street, and beside engine-house, there are superintendent's house and nine firemen's dwellings. The actual cost of the station was 5,000*l.*, and was carried out from his designs and under his direction. About 1880 the Corporation purchased the Roch Mills and Half Acre estates, containing an area of about eighty acres, for the purpose of a sewage farm, at a cost of 26,421*l.*; but of this area about thirty-one acres includes the river, roads, buildings, and hill-side land, which is not available for sewage treatment, leaving a net area of forty-nine acres of filtration plots upon which the sewage could be disposed of. The present dry-weather flow is 2,000 gallons from an estimated population of 50,000. When the whole of the sewers tributary to these outfalls are completed it was estimated the dry-weather flow would be 2,300,000 gallons daily from a population of about 75,000. The sewage from the sudden outfall had, since October, 1890, been dealt with in three precipitation tanks, having a total capacity of 300,000 gallons; and in order to deal with an increased quantity in future an additional tank of 100,000 gallons capacity was shortly to be erected. Since June, 1888, the sewage from the Roch outfall had been dealt with on the area laid out for intermittent filtration without previous treatment in tanks, but the volume had so increased, and the quality of the sewage so materially altered by the addition of manufacturing refuse, as to render the land incapable of dealing satisfactorily with it; hence the necessity for an increase of filtration area and for previous treatment in tanks for the pre-

cipitation of the solid matter in the sewage. For the former purpose an additional area of suitable land, eleven and a quarter acres in extent, had been acquired, the whole of which was available for filtration areas, making in all sixty acres of filtration areas. The distribution of the sewage on the farm was from chambers connected by large earthenware pipes with iron pipes at river crossings, and thence along grips provided by a grip plough, these grips being moved from year to year to suit the working of the land. The crops grown included Italian rye grass, turnips, cabbage, and mangolds. The new works opened in September last were the precipitation tanks and plant for dealing with abstracted solid matter. The tanks consist of two roughing tanks, each of 705,000 gallons capacity, and six precipitation-tanks, each of 200,000 gallons, or rather more than the present dry weather flow. By an arrangement of weir penstocks the top water level of the tanks can be raised 1 ft., thereby increasing weir total capacity by about 275,000 gallons. The tanks had been planned to allow future extension whenever required, but the provision made is believed to be ample for many years to come. The tanks are worked on the system of continuous flow, and during storm flow they can be worked in two or more sets as may be found advisable to ensure the best result. The clarified sewage on leaving the tanks passes through a regulating chamber, whence it is distributed on to the filtration areas, the effluent being discharged at several points into the river. The sludge, which contains 90 per cent. of moisture, is forced under a pressure of 100 lbs. to the square inch in presses. The resultant cake contains about 60 per cent. of moisture. At present the amount of pressed sludge averages 150 tons a week, which he considered somewhat abnormal for a tributary population of 50,000, with only about 700 water-closets in use, and the excreta of the population collected on the pail system. The total cost of the tanks, building, and pressing plant was 23,000*l.*, and with the cost of land and laying out, and about 3,000*l.* worth of work to complete the scheme, would bring up the total cost for disposal works to about 72,000*l.*, or 1*l.* per head of the present population.

The President said the subjects treated in the paper were of great interest to municipal engineers. He must say they were of special interest to himself, as he was enlarging and practically rebuilding the Town Hall, building technical schools, had prepared plans for new Free Library, Art Gallery, and Museum, and at the last meeting of the Watch Committee received instructions to build a new fire station at Brighton.

Mr. Walker, Croxson, said that in the Free Library at Croxson they had adopted what was known as the open-access system. It was at first very much opposed, as it was feared they would lose a large number of books, but the system had now been working for twelve months, and they had not lost a single book. There was no doubt the adoption of the open-access system had increased the usefulness of the Library.

Mr. Platt said the "open-access" system of library management was new to him, but he did not think it would be suitable for Rochdale.

A visit was then paid to the new Technical School, the special point of interest being the Key system of ventilation. In answer to questions, Mr. Platt said it was an expensive system to put in, but its working was perfect. The air could be changed in the rooms every ten minutes and was so diffused that those in the rooms never felt any draught.

The Mayor of Rochdale entertained the members to luncheon in the Assembly-room at the Town Hall, and the afternoon was occupied with visits to the Brigade station (where the response to a test fire call was made in the remarkable time of twelve seconds), the Free Library, and the Sewage Farm. Mr. Platt explained the various details of the working arrangements.

GOLDER'S HILL, HAMPSTEAD.—The trustees under the will of the late Sir Spencer Wells, Bart., offer for sale this property, situated on the west side of the Heath, near North End, and renowned for the beauty of its grounds, which extend over thirty-six acres. Golder's Hill was the home for three years of Mark Akenside, author of "The Pleasures of Imagination" and other poems, it being the residence of his friend and patron, Jeremiah Dyson. In January, 1748, Akenside, through Dyson's liberality, took a house and practised in Bloomsbury-square.

Illustrations.

KINCARDINE, N.B.

A COMPLETE view of this mansion was published in the *Builder* of July 6, 1895. The present drawing, now hung on the walls of the Royal Academy, is a sketch from one of the windows of the tower, and looks towards the south-west gable and turrets.

The balcony commands an exceptionally beautiful view of Deeside. The walls are rough cast with rock-faced Corrennie granite dressings, the roofs being slated with Tilberthwaite green slates.

Messrs. Niven & Wigglesworth are the architects.

SHIPTON HALL, SALOP.

This is a charming Elizabethan house, standing firmly erect in vigorous old age, overlooking the beautiful Corve Dale, about midway between Bridgnorth and Ludlow, the ancient home of the Mittons, a Shropshire family of renown.

The hall is built in a grey coloured freestone, laid in regular courses of varying heights, with a very fine joint, and the work is weathered with delightful patches of a greenish grey tint, and a warmer effect on the stone mullioned windows. The older portion of the hall is covered with stone slates, and the tall chimney shafts, with their V shaped projections and projecting courses, are built in thin bricks. This form of chimney shaft occurs very frequently on work of this period in Shropshire.

One of the great charms of Shipton Hall is that in most of the windows of the Elizabethan portion of the building the original small diamond panes are intact, and that where they no longer remain, modern glass with its blank and most disastrous effect on the general appearance of such a building has not superseded them, but the original panes, removed more than a century ago, have been replaced by small rectangular panes in old lead work, which is not out of harmony with the architecture. Long may Shipton be spared the degradation of plate glass.

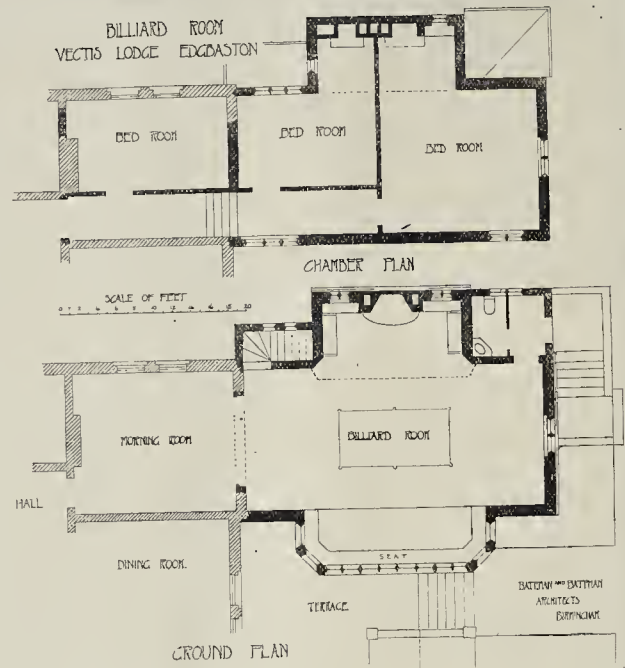

A further object of great interest and historical value, giving to this ancient manor-house a great amount of dignity and importance, is the old stone dove-cot or pigeon-house, which stands on the high ground embedded in the trees on the right-hand side of the picture. It is a very rare example, being a circular stone tower with a conical roof surmounted by an exceedingly graceful oak turret and having a great revolving ladder within swinging from the centre and affording access to the thousand homes of the birds of other days. When it is remembered that only a lord of the manor or a rector was allowed to possess one of these buildings, it will be seen that the presence of one of so early a date indicates a house of ancient importance.

The spirit of so-called "restoration" which often effectually destroys the ancient character of old architecture has not invaded Shipton, and "the new owner has not cut down the trees and the ivy is not replaced with stucco," but has wisely contented himself with making a few necessary repairs, and the opening out of existing windows which were bricked up at the back (probably in the days of the window tax); a very ugly rain-water pipe which cut the tower in about equal heights has been removed. The present roof of stone slates which covers the oldest portion of the building, and is a vital element of the ancient character of the building, has been carefully repaired with similar materials. In repairing the stonework the disturbing effect of the usual bricklayers' "cut" and projecting joint has been avoided.

The new entrance gates have been made upon the lines of the old portions of those which existed formerly. It is proposed to complete the north wing, which was begun in Georgian times, by providing a billiard-room, gun room, &c., in keeping with the Georgian work, with new sash windows set in the brickwork. The hall is panelled throughout with arched openings to the rooms and staircase hall leading therefrom.

The drawing-room and morning-room are panelled with secret recesses therein in the chimney breasts and between the rooms and the hall. The upper rooms are also panelled.

The repairs have been carried out by the

owner under the advice of Messrs. J. H. Hickton and H. E. Farmer, architects, of Walsall.

VECTIS LODGE, EDGBASTON.

The addition to this house, shown by the illustrations, consists of a billiard-room and two bedrooms over. Owing to the width of the morning-room, and its roof being only 15 ft. 10 in., playing space for a billiard table is provided by throwing out a large bay window on the one side and a fireplace recess on the other (15 ft. wide and 7 ft. 6 in. deep), which, with the gallery over, gives some interest to the room. The floor, framing, &c., are in oak, and the frieze adopted is a wall paper of Messrs. Watts, Limited, designed by Mr. Bodley, A.R.A. The bedrooms over are panelled up to the springing of barrel ceilings arranged in the roof.

Mr. John Bowen, of Balsall Heath, has carried out the works from the designs of the architects, Messrs. Bateman & Bateman, of Birmingham and London.

The drawing is exhibited at the Royal Academy.

COTTAGES, HEATHWAITE.

THESE are good specimens of cottage architecture, in which a certain special character is obtained by the introduction of the plain sloping buttresses at the angle and on each side of the door; and in other respects there is a good deal of character about the small building, of which Messrs. Mawson & Gibson are the architects.

HOUSE, WALTON-ON-THAMES.

THIS slight sketch of a slight little house, by Mr. John Watson, is hung at the Royal Academy, and is referred to in our article of to-day on another page.

THE BLACKWALL TUNNEL.—The new Tunnel under the Thames, which will afford a ready means of communication between the districts of Poplar and the East and West India Docks on the north, and the neighbourhood of Greenwich and Woolwich on the south, was opened last Saturday by the Prince of Wales. In our last issue an article descriptive of the new work will be found, but we omitted to mention that the bulk of the glazed bricks used was supplied by Messrs. John Hall & Co., of Stourbridge, while the electric light work was carried out by Messrs. Laing, Wharton, & Down, Limited, of London. In the design of the entrance houses, the Council's architect, Mr. T. Blashill, was associated with Mr. Alex. R. Binnie, the chief engineer.

ARCHITECTURAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.

—The Edinburgh Architectural Association visited on Saturday last The Binns and Midhope, Linlithgowshire, by permission of Mr. J. Cornwall Dalryell and the Earl of Hopetoun. Mr. Thomas Ross, F.S.A., Scot., in describing The Binns, said that it occupied a charming situation on the summit of a low ridge of hills to the south of Blackness Castle. On plan it formed three sides of a square, the east wing being the oldest part, and probably dating from the sixteenth century, and the north and west wings from the seventeenth century. One, at any rate, of the fine plaster ceilings seemed to be by the same hand that executed those at Moray House, Edinburgh. The Dalryells of The Binns were descended from the Dalryells of Dalryell, and they acquired The Binns towards the end of the sixteenth century. General Dalryell took a most prominent part in the events of the seventeenth century, dying a very old man in 1685, in spite of a large reward being offered for him, dead or alive. Mr. Ross, in his description of Midhope, said it was a lofty mansion-house situated in a picturesque dell, and quite hidden from view till one was almost within call of it. Oblong on plan, it was erected at three distinct periods. The whole basement was vaulted, and a small newel stair in the older part and a fine oak stair in the later gave access to the upper floors. Alexander Drummond, second son of Alexander Drummond of Earnock, was the first laird of Midhope, and in the beginning of the seventeenth century the property passed into the hands of the Livingstone family, who probably built the eastern parts.—On the motion of Dr. Rowand Anderson, a vote of thanks was passed to Mr. Dalryell, the Earl of Hopetoun, and the leader of the visits, Mr. Thomas Ross.

THE ARCHITECTURAL ASSOCIATION OF IRELAND.—The closing meeting of the winter session of this Association was held in the Grosvenor Hotel, Westland-row, the President, Mr. R. Caulfield Orpen, in the chair. The meeting was held for the purpose of receiving a report from the Committee and arranging business details. The report dealt with the work of the past session and included statements dealing with the classes established. The progress was considered to be highly satisfactory, the Association having a membership of over 100, seven new members having joined recently. A vote of thanks was passed to the Council of the Royal Hibernian Academy

for their kindness in granting the use of the Academy house for the purpose of holding the annual conversation. It is intended that the work of the Association shall not entirely lapse during the summer, as visits will be paid on Saturday afternoons to buildings and places of interest in and around Dublin.

CENTRAL BUILDING, STOCKHOLM EXHIBITION.

This is a sketch showing the central feature of the principal building for the Scandinavian Exhibition at Stockholm, which was opened this week. We are indebted for to an architect at Stockholm, Mr. C. Adlersparre.

AN EXHIBITION OF POSTERS.

An exhibition of designs for posters should be sufficiently attractive and interesting to the public, for it is the one modern art, excepting architecture, which they have thrust upon them wherever a new building is being erected. In fact, if ever a Committee of Public Taste were to be appointed, their deliberations would consist largely in regard to posters. A poster, from its very nature, must be looked at; it is an advertising medium designed to catch the public eye, and the only thing we can expect is that it may do so without offending our artistic susceptibilities—that it may effect its legitimate purpose without hurting us.

The exhibition of posters now on view at St. Bride's Institute is an excellent one. It is a one-man exhibition, and consists of original designs for posters by Mr. Louis Rhoad, of New York, but formerly of the Wedgwood Pottery. There is also an absence of bad drawing and impossible proportions of the human figure, which are to be seen on some boardings in London. As a whole, the exhibition has strong points for our praise; the drawing of the figures, their decorative accessories, and their gorgeous colouring are certainly to be commended. The artist has certainly borne in mind that the first purpose of a poster is that it may be seen from a distance, and we must not be led away by the somewhat glaring effect produced by being seen together in a small room. Mr. Rhoad has

a liking for the draped figure, which seems very suitable for the purpose, while for colouring, schemes of greens, blues, and violets predominate.

We may enumerate among the more noticeable of the designs the one for a champagne brand, a single figure subject draped in blue and green only. Design and handicraft represented by two seated draped figures, with coloured draperies and elaborate surface pattern. Another of the same type is that of a Gentlewoman's Magazine, with four standing figures representing instruction, pleasure, fashion, and the fine arts. The drapery folds are excellent and the colouring rich and harmonious, classic Ionic columns being introduced between each. The design for flower and vegetable seeds is in a far lighter key, the dresses of the figures being left nearly white, and the whole scheme worked from that. "Pure milk" is represented by a milk-maid in a light satisfactory key, and seems almost to emphasise the fact it is best to have few figures and to keep them of a certain size; there is apt to be confusion otherwise when seen from a distance.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of this Council was held on Tuesday in the County Hall, Spring-gardens, Dr. Collins, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend the Hampstead Vestry 6,315*l.* for street improvements; the Fulham Vestry 3,385*l.* for street improvements; the Limehouse District Board 800*l.* for providing an infectious diseases shelter; the St. Pancras Guardians 1,000*l.* for works at St. Anne's Home.

The Works Department.—The whole of the sitting was taken up with a debate on the Works Department, the discussion being directed chiefly to the recommendations of the Special Committee appointed to inquire into the working of the Department and to an amendment moved by Lord Onslow. In our issue for April to we made some comments on the report of the Special Committee, whose recommendations were as follows:—

(a) That in the opinion of the Council some definite organisation for the direct employment of labour and the direct execution of public works by

the Council under the superintendence of its own officers is desirable and beneficial.

(b) That a Works Board be substituted for the Works Committee, such Board to be elected forthwith, one member to be nominated by and from each of the following committees: Finance, Asylums, Bridges, Fire Brigade, Highways, Improvements, Main Drainage, Parks, and Housing of the Working Classes; and that in future years the election of members of the Board do take place at the meeting of these committees next to March 31.

(c) That any Committee desiring to propose to the Council the carrying out of any works without the intervention of a contractor, shall, in the first instance, obtain an estimate from the proper officer and then refer such estimate to the Works Board for their consideration before reporting to the Council.

(d) That the Works Manager shall, unless in any case otherwise ordered, carry into execution all works which the Council resolves to execute without the intervention of a contractor.

(e) That when the Council wishes to execute any works without the intervention of a contractor, the plans, specification, and estimate shall, unless otherwise ordered by the Council, be thereupon referred to the Works Manager.

(f) That the Works Manager shall be responsible to the Works Board, and the Board shall report from time to time to the Council.

(g) That this report be referred to the General Purposes Committee, and that it be an instruction to that Committee to amend the standing orders in accordance with the foregoing recommendations.

(h) That it be referred to the General Purposes Committee to make further amendment of the standing orders by the insertion of words coupling the unions of employers where such exist with the trades unions, in reference to the rates of wages and hours of labour.

(i) That it be referred to the General Purposes Committee to make further amendment of the standing orders by omitting provisions giving powers to the Clerk of the Council to direct examination of the books of any one contracting with the Council for the execution of works, other than the time-sheets or books or wages-sheets or books.

(j) That the statement of Mr. Edwin Waterhouse be referred to the comptroller for report upon each and all of his suggestions with reference to the accounts, and that the comptroller's report be referred to the General Purposes Committee with a view to the adoption of Mr. Waterhouse's recommendations.

Since the report was first brought up, the Works Committee has submitted some fresh returns of completed works, which show that certain losses have been incurred on a few of the undertakings, while a report dated May 17 shows that work estimated to cost 61,701*l.* has cost 70,782*l.* In regard to the work for the foundations of the Heath Asylum, Bexley, the revised estimate was for 31,833*l.*, and the approximate actual cost 37,574*l.* It is further stated that the Architect has not certified this account, on the ground that the damage caused by frost has not yet been repaired. Another work, the Wandie branch sewer, has cost 11,873*l.*, the revised estimate being 9,670*l.* The Manager, Mr. W. Adams, in his report on these returns, says the excess, in his opinion, has been due in great measure to the low prices accepted by the Works Department. In the case of the Heath Asylum foundations, the detailed prices were prepared by the Architect, and referred and accepted by the Works Department. The preliminaries were not priced, but a lump sum of 300*l.* was put down for the clerk of works' office and men's conveniences, whereas the actual value, as he estimated it, is some 1,000*l.* more.

Sir Arthur Arnold, Chairman of the Special Committee, moved the reception of the report. He said he subscribed to every line of the report which he now presented. The Committee were unanimous in finding that the labour policy of the Council had an important connexion with the inception of the Works Department. That portion of the report contained a severe indictment of the policy of the Council in the beginning of 1892 in regard to their dealings with labour, and especially in regard to their dealings with contractors. The Committee stated that the position of the contractors of London in regard to the Council was not at present the most advantageous to the service of the public, and one of the main foundations of the report was a desire that there should be a rectification in that respect. He was not in favour of a large undertaking of architectural works by the Department; but he specially warned the Council not to deprive itself at this juncture, and whilst its relations with contractors remained as at present, of the means of carrying out any work at all.

The reception of the report was agreed to, and the returns of the Works Department were also received.

The Earl of Onslow then moved the following Amendment to Recommendation (a):—"That the Council, being satisfied from the evidence submitted and the further Report of the Works Committee that work executed for it by the Works Department is not superior in quality to that executed by contractors, and that considerable loss has been sustained in consequence of the operations of the Works Department, resolves that no further work shall be entrusted to that Department; and that it be referred to the General Purposes Committee to consider and report as to the arrangements necessary for the due completion of the works in hand and for dealing with the central works in Belvedere-road." He said that all the members of the Committee without exception came to the conclusion that the Works Department of the Works Committee as at present constituted was not in a satisfactory condition. The Council could continue matters as they were, substituting some other authority for the Works Committee, or consider what it would substitute for it. It was agreed on all hands that a body consisting for the most part of amateurs and gentlemen who had many other avocations to pursue could not give the time necessary for the conduct of a vast contractor's work. Under the circumstances, they might be astonished, not that the proceedings of the Works Committee had been so disastrous, but that they had not been very much more so. That was largely due to the industry of the late Chairman, Mr. Ward. From the latest returns they knew that there had been a loss of 6,708*l.*, to which he was afraid he must add probable loss on uncompleted works—estimated at 11,000*l.* Therefore there was a grand total loss of 17,700*l.* What was the use of a department which could not take work without incurring a loss. Had the working classes been benefited? No one could say they had, because all respectable contractors were now willing to pay the same rates that the Council paid. In 1892 no doubt a stand had been made by contractors against those rates, but that condition of things had passed away. He would not advise that the present system might be done away with entirely. It was not necessary for them to pass a self-denying ordinance, and say that they would never at any time directly employ labour to carry out the work of the Council. They had another alternative, which was that, while maintaining freedom of action to employ direct labour, they should abolish both the Works Committee and the Works Department. He had not long ago thought that course unnecessary, but he had entirely altered his opinion since reading the last two returns recently issued by the Works Committee. He held that the reason of the failure of the Department was its anxiety and greed to grab every sort of work so that it should not fall into the hands of contractors. They had spent upwards of 100,000*l.* on their works at Belvedere-road in order to be carpenters and joiners, when experts told them that they had never seen such infamous joinery as that done by the Council. With regard to wages, he pointed out that the wages paid by the Department were the same as those paid by any respectable contractor, and where was the advantage of saddling the ratepayers with a large loss so long as they retained, as they must do, the wages clauses in all their contracts? What the Council had been seeking to do was to carry on a gigantic contractor's business. It had failed to do what never had been attempted by any public authority or municipality. The Department had been exceptionally favoured; it had been allowed to pick its jobs; it had made no bad debts; it had large discounts for cash; it required no capital to pay its workmen; it had unlimited power to borrow; and the result had been nothing but indifferent work, falsification of accounts, and a ruinous cost to the ratepayers. If there had been any saving made by the Department, it would have justified its existence; but, on the contrary, it had been a lamentable failure, and he asked the Council to apply to the Department the phrase so often in the mouths of Progressive opponents of the House of Lords, that it was useless, dangerous, and ought to be abolished.

Sir Godfrey Lushington seconded the amendment, and pointed out that, in striking the loss that had resulted from the existence of the Works Department, they must take into account not merely the difference between cost and

estimates, but also the probable amount of profit that the contractor would have made. As to the jobbing works, which came out favourably to the Department, he thought the schedule of prices, which, for purposes of comparison, served as the estimate, was too high. He believed the loss incurred by the Department arose from the fact that under a model employer the men had not worked as well as they were made to do by the contractors. Therefore he felt that the Department, instead of doing the working man good, had inflicted a moral injury upon him.

Mr. McKinnon Wood said he was well aware that the report of the Special Committee had been a disappointment to the Moderates. There was no atom of evidence in support of the statement that there had been instigation of the clerical irregularities. Lord Onslow had professed to mention the actual loss that had been incurred. He (the speaker) did not believe Lord Onslow knew what was the actual loss. If he did, no one else did. In regard to some of the items, Lord Onslow had been dealing with works of which the accounts had not been completed, and in reference to which the final estimates had not been drawn up. He (Mr. Wood) had always demurred to a comparison between estimate and cost being the test of the Department's efficiency. The true test was associated with the question of quality. To prove the excellence of the Department's work there was plenty of expert and Moderate evidence, and as to the work of contractors, did councillors forget the experiences of certain large municipalities, and of the London School Board? The comparison between cost and estimate was specially illusory because of the difference in the treatment meted out to the Department and the contractors. Last year work was done by a contractor for which the estimate amounted to 36,000*l.* The contractor, no doubt properly, claimed 52,000*l.*, and after the ordinary formalities of arbitration, he received 44,000*l.* If the ideal was that the Department should do the work 10 per cent. below the lowest cutting contractor, by all means let the Department go.

The Deputy Chairman (Mr. Torrance) held that the Works Department had amply justified its creation, and the blunders and losses were, he felt, largely due to the composition of the Committee. In possessing such a Department, the Council was only doing what other municipal bodies of less importance had long done. Mr. Cohen, M.P., in supporting the amendment, said the Department had had a fair trial for some years with the assistance of a chairman who had been absolutely devoted to its interests, and, in spite of that, it had been a lamentable failure.

Sir Arthur Arnold strongly condemned the position taken up by Lord Onslow and Sir Godfrey Lushington. He asked them where they would have been had they, in face of the labour policy of the Council, of which he did not entirely approve, been without a Works Department, and with nothing between them and the enraged contractors of London? He pointed out that the Council had been animated too much by partisanship, mentioning that in the case of an excess charge by a contractor at the Isle of Dogs, the Council passed the vote without a word, but in the case of the Works Department in similar circumstances, they debated such a thing not as a matter of construction, but as matters of principle. The jobbing works had been the best test of the Works Department. Every witness who came before the Special Committee had condemned the Works Committee because of the quarrels among its members. It was absurd for Lord Onslow to talk of 210,000*l.* as a gigantic turnover; it was a trifle to the turnover of much smaller municipalities.

Sir J. Blundell Maple, M.P., in supporting the amendment, said he considered the late manager a most honest and capable man. He was now in his (the speaker's) employment at a salary of from half to a third as much again as he had received from the Council, and he considered him a cheap man.

Having arranged to meet at 3 o'clock on Friday to dispose of the recommendations of the Committee, the Council adjourned soon after 7 o'clock.

SCOTT MEMORIAL, WESTMINSTER ABBEY.—A bust of Sir Walter Scott has been placed in Poets' Corner of Westminster Abbey immediately adjoining the monument of the Duke of Argyll. The bust is a copy of the Chantry bust at Abbotsford, and is the work of the Scottish sculptor, Mr. Hutchinson.

Correspondence.

To the Editor of THE BUILDER.

R.I.B.A. ELECTIONS.

SIR,—As your correspondent "Y" has mentioned me in your issue of this day, kindly permit me to state that I did not give up practice two years ago, but in 1888, and that I am not employed by the London County Council in the way stated, or in any other manner inconsistent with the profession of architecture; were it otherwise, I might have become liable to suspension or expulsion, under the provisions of By-law 22 of the Royal Institute of British Architects.

The Register of Fellows and Associates contains the names of about sixty architects who are officials in her Majesty's service, or engaged upon the staffs of County Councils and other public authorities (exclusive of Metropolitan District Surveyors and members in public employment but giving private addresses), and it is not unreasonable to suppose that some of these would prefer to be represented on the Council of the Royal Institute of British Architects by one of themselves rather than by practising architects only.

The Dundee and York Allied Societies of the Royal Institute of British Architects number, altogether, only two Associates and four Fellows, yet these six gentlemen may be represented on the Council of the Institute by two of their number (one for each Society), therefore, proportionately, architects in public offices are insufficiently represented.

GEORGE H. BIBBY.

SIR,—There is probably not one of the twenty-four candidates for the eighteen seats on the Council who would not fill the position in a satisfactory manner, but it is useless to nominate and elect those of them who will not or cannot find time to attend to the duties. It is for this reason alone that the claims of the new candidates are supported by so many members of the Institute.

Your correspondent, "Y" asks, "What have Mr. George H. Bibby and Mr. Delissa Joseph done that they should be nominated as candidates for the Council?"

In reply; they and the other new candidates have signed undertakings to serve on the Council should they be elected, and all have therefore bound themselves to give reasonable attendances at the meetings, and, incidentally, to set forth an example for the non-attending members to emulate, for many of them neither represent themselves at the meetings or the Fellows and Associates who took the trouble to vote for them.

Your correspondent "Y" admits that Mr. Joseph would be an acquisition as a member of the Board of Examiners, and, if so, he is surely most suitable as a candidate for the Council. With regard to Mr. Geo. H. Bibby (who has been a member of the Royal Institute of British Architects for more than twenty years), it may be said that he is the author of many books and articles upon architectural subjects, and that these have been very extensively published in England and America, and in *The Surveyor* of this day appears an illustrated article from his pen, under the title of "Old English Land Surveying," which contains some curious notes upon ancient measures of lengths and areas, which will be read with interest.

A LONDON ASSOCIATE.

SIR,—I beg to call attention to an erroneous statement that appeared in your last issue, p. 463, in an editorial note under a letter signed "Y," to the effect that the names of Mr. Delissa Joseph and Mr. Bibby were proposed by the Council of the Royal Institute of British Architects as candidates for election to that body.

These two gentlemen were each nominated, independently of the Council, by seven subscribing members, according to By-law 30.

W. J. LOCKE,

May 24, 1897.

* * * As the names appeared in the voting list issued by the Council, we supposed that the Council had selected them in the ordinary course.—ED.

THE ELECTION OF FELLOWS AT THE INSTITUTE.

SIR,—Allow me, through your columns, to call the attention of members of the Institute to the importance of the issues raised by the report of the Special Committee on Election of Fellows, which comes before the meeting on Monday evening next; and to earnestly request all those who have the interests of the Institute at heart to attend this meeting.

H. V. LANCHESTER,
Hon. Sec., R.I.B.A. Associates' Committee.

THE QUESTION OF EXAMINATION IN ARCHITECTURE.

SIR,—Referring to the report in your issue of the 15th inst. of the Jubilee Conference of the Architectural Association, and to the President's somewhat

revolutionary suggestion with respect to the Institute Examinations. Mr. Pite is always interesting, and he was careful to state that his proposals were merely his personal views; but I feel so convinced that he had not, in this instance, thought out the effects of his scheme, that I think it desirable to point out one or two results which appear to me on the very surface to be absolutely fatal to his proposal.

When he defends the principle of compulsory examinations on the ground of closing the ranks against incompetent men—the public being entitled to some guarantee of proper training on the part of those to whose care their health and wealth is confided—all unprejudiced minds must agree with him; but how he can advocate a building-science course, merely as a qualification for Associateship for the Royal Institute of British Architects I fail altogether to see. The certain effect would be to flood the Institute with mere builders.

The average employer doubtless seeks our advice mainly for utilitarian reasons; but, fortunately, in a large, and I hope an increasing, number of instances, he employs us because, in addition to a builder's knowledge, we are supposed to have taste in design.

This is the sentiment we all wish to encourage. It is the only hope for national architecture of a high type, and the way we can achieve our object is to prove that all who profess to be architects are men of taste and culture in design. We must, of course, possess those practical and business qualifications which the public very naturally place even before beauty. The public claim a guarantee of both the science and the art sides of our work, which are indissolubly wedded and cannot be divorced in considering any test of qualifying study.

The Institute has wisely recognised this principle in the examination of its candidates, and alternative actions may be made in the system, the two sides must stand or fall together so long as the Institute professes to be a body of architects, of which the membership carries with it a guarantee of adequate training. So strongly have I always felt that some test of study in drawing and design must be included in the Examination, that if I believed one or other of the two sides (building science and art) must go to the wall, I would say retain the art and let the science go. Test every candidate for admission to our ranks as to this first and most important qualification, without which he can never be an architect at all. Let us make sure whether the candidate's mind is one adapted to an artistic calling. To exclude at an early date men who do not give elementary promise of such suitability is to render the greatest service possible to our art, to the man, and to the public.

I maintain emphatically that a fair test of adequate study in drawing and design is as possible as are test examinations in the science of building construction, and that careful tests creditably passed should, and do, ordinarily qualify for practice, and therefore for membership of the Royal Institute of British Architects, and of any other society endeavouring to promote and ennoble our art.

It may reasonably be held that the Progressive Examinations are not yet satisfactory. They are, however, a work which, in view of the demand made by the Architectural Association in its petition of 1855, reprinted in our Jubilee number of the Architectural Association "Notes."

It is now the duty of the Architectural Association, as the teaching body, to support the Royal Institute of British Architects in making an ideal examination. With this end in view, two steps appear to me of primary importance. First, to get a much stronger representation of the Architectural Association teachers on the Board of Examiners; and, secondly, to reconstitute the Court of Adjudication in design and drawing. Such a delicate and all-important task should not be entrusted to any one examiner, but to a carefully selected sub-committee of the standing Art Committee, possibly with the Art Committee as a court of appeal.

All this does not preclude the adoption of an honours course in design, such as Mr. Beresford Pite suggests as a qualification for Fellowship.

W. HOWARD SETH-SMITH.

The Student's Column.

SPECIFICATIONS.—XXII. CONDITIONS OF CONTRACT.

THE conditions of contracts are very frequently modelled upon the headings prepared by the Royal Institute of British Architects and the London Builders' Society in 1870; or on the schedule prepared by the Institute in 1895, which latter, however, does not meet with the complete approval of the builders; and the student may, if he thinks fit, adopt one or the other of these models. Or he may, if he prefer, adopt the suggested headings which we now give.

No. 1.—The contractor shall execute and completely finish in a good, substantial, and workmanlike manner, in accordance with the directions, and to the satisfaction, of the archi-

tect, the several works shown and described in the drawings and specification, and such further drawings, details, and instructions as may from time to time be given by the architect in explanation. The contractors hereby admit that the said plans and specification are sufficient for their intended purposes, and that the works can be successfully executed in accordance therewith, without any additional or extra work other than such work as is necessarily implied therein, or to be inferred therefrom upon a fair and liberal construction. In case of any apparent discrepancy between the drawings and specification, the architect is to decide which shall be followed. (Before the contract is signed the contractors should have ample opportunity of examining drawings and specification, and all necessary details should be prepared and furnished before the signing of the contract.) The new conditions of the Institute provide for an infringement of this desirable rule by stipulating that the architect shall furnish details within a certain time after the receipt of request for same.) A complete copy of the drawings and specification shall be furnished by the architect free of cost to the contractors, and shall be kept on the works until completion of the contract, for the joint use of the contractors and the architect, or their representatives.

No. 2.—The contractors shall commence the said works within one week after date of signing of the contract, and shall actively prosecute the same from day to day until the same works shall in all respects be completed within months from the date of such signing of the contract as aforesaid, provided always that in case the contractors shall be prevented from complying with this article by any strike, lock-out, or combination by or among the workmen, or by any exceptionally inclement weather, or other causes that in the judgment of the architect may be beyond the contractors' control, the architect shall extend the time for completion of the works for such period as he may think fit, and in the event of any such delay occurring the contractors shall at once inform the architect of the fact in writing, and request him to make such extension of the time for completion.

No. 3.—The contractors are to set out the works and are to be responsible for any errors that may arise, either in the original setting out or during the progress of the works and are to amend such errors whenever required so to do by the architect.

No. 4.—All materials to be used in the said works, although not particularly mentioned in the specification and, save as otherwise provided by the specification, or as may hereafter be otherwise required in writing by the architect, shall be supplied and furnished by the contractors.

No. 5.—All materials and workmanship shall be of precisely the kind and quality described in the specification, and the contractors shall, upon the request of the architect, furnish him with vouchers, or apply such tests as he may direct to prove that the materials and workmanship are such as are specified.

No. 6.—The contractors shall within one week from the completion of the said works remove all scaffolding, plant, materials, and rubbish from the premises, and leave premises in a clean and proper state.

No. 7.—The architect is to have at all times access to the works, which are to be under his control, with power to order any deviation therein, or extra works he may consider necessary. The clerk of works is in his absence to be considered his deputy, and the reasonable directions of the clerk of works are to be attended to by the contractors, subject to appeal to the architect. And the contractors shall afford the clerk of works every reasonable facility for examining the works and materials. The clerk of works shall have no power to direct any variation in the contract, or to give orders for any extra works. The architect may require the contractors to dismiss the foreman or any person employed on the works who may be incompetent or misconduct himself, and such person shall not be again employed on the works without the architect's consent. The contractors are not to sublet the works, or any part thereof, without the consent, in writing, of the architect.

No. 8.—The contractors are not to deviate from the drawings or specification unless upon the directions of the architect shown by an order in writing, or by any plan or drawing expressly given and signed by the architect as an extra or variation or unless required to com-

ply with the provisions of any Act of Parliament or the requirements of any local authority. No charge for day work is to be allowed as such unless a written authority by the architect shall expressly say it is to be done as day work, or unless the work cannot, from its character, be reasonably valued by measurements. All vouchers for day work are to be delivered to the architect within fourteen days after the work may have been executed.

No. 9.—Any variation made in carrying out the works is not to vitiate the contract, but the value of any such variation, for which a price may not have been previously given and agreed upon is to be measured and valued and certified for by the architect, and added to or deducted from the amount of contract. For the purposes of valuation of such variation the Bill of Quantities and prices therein are to be used as a basis of estimate. And for this purpose a verified copy of the original priced bills of quantities shall be deposited with the architect within one week after the signing of the contract.

No. 10.—All materials, including scaffolding, tools, implements, machinery, plant, and effects, which may from time to time during the progress of the works be in, upon, or about the premises for use in the said works, shall be deemed to be the absolute property of the employer. But the contractors shall, notwithstanding, be solely responsible for the loss or destruction thereof, and for any damage which may happen thereto by fire, tempest, or any other cause whatsoever, and the contractors shall likewise be liable to make good all damage which may happen to persons or things from any cause whatever during the progress of the works. The contractors are not to bring upon the premises any other materials, scaffolding, tools, implements, machinery, plant, or other matters except those which are actually required for the carrying out of these works.

No. 11.—In executing the said works, the contractors shall not go into possession of, enter upon, or in any way use any part of the land or premises the property of the employer other than that which the architect shall have given permission for the contractors to enter upon for carrying out the said works.

No. 12.—The architect shall have all power to require the removal from the premises of all materials which in his opinion are not in accordance with the specification or the instructions of the architect, and to require the substitution of proper materials or workmanship in accordance with the drawings and specification or instructions. And the contractors shall forthwith carry out such order or requirements. The contractors shall, when so requested by the architect, within such time as the architect shall name, open for inspection any work covered up. And in the event of the contractors refusing or neglecting to comply with such request, the architect may employ any other person or persons to open up the same.

No. 13.—In case at any time during the progress of the works any unnecessary delay shall, in the opinion of the architect, occur in the carrying on of the same, and the architect shall give to the contractors, or leave at their then or last-known place of abode or business, or on the said premises, a written notice to proceed with the said works, and the contractors shall not so proceed to the satisfaction of the architect within fourteen days after such notice shall have been so given or left; or in case the contractors shall at any time or times neglect or omit to pull down or remove any work or materials which the architect shall have certified in writing to be defective or not according to contract within five days after written notice so to do shall have been given to them by the architect, or left as aforesaid, or within such further time as may be specified in the notice; or in case the contractor shall assign, sub-let, or charge this contract, or any part thereof, without the permission of the architect; then and in such case the employer shall be at liberty, without vitiating this contract, to take the said works wholly or partially out of the hands of the contractors and to employ any other person or persons to execute the same, and for that purpose to take possession of and use all materials, scaffolding, plant, tools, implements and goods on or about the said works, and all expenses or damages thereby incurred shall be ascertained and certified by the architect, and shall be paid by the contractors to the employer.

No. 14.—The contractors shall maintain and keep the works in good and permanent repair,

state, and condition, to the satisfaction of the architect, for months after the date, when the architect shall certify that the works have been completed in a satisfactory manner. And any defects, shrinkage, or other faults in the works which may appear within such time from the completion of the building, are to be amended and made good by the contractors at their own cost, and in case of default the employer may employ and pay other persons to amend and make good such defects, shrinkage, or other faults or damage.

No. 15.—Any cost incurred by the employer in carrying out any works for which by this contract he is entitled to employ any other person or persons in default of the contractors, may be recovered by the employer from the contractors, or deducted from any money or monies that may be due to the contractors from the employer.

TRADE CATALOGUES.

MESSRS. MOSSÉS & MITCHELL send us a price list and description of their "vulcanised fibre" and some of the uses to which it can be put, most of which are well known; but we may mention their "Insulating Saddle Staples" for use in fastening electric-light conductors and telephone and messenger wires. The insulating saddle is treated with a moisture-repelling compound, which also coats the metal in such a way as to prevent corrosion and the leakage which would ordinarily take place where the old form of metal staple is used. It is claimed that these possess all the strength of metal staples, and do not abrade the insulation on the wires.

The General Electric Company send a monthly leaflet of their electric apparatus, which is intended to form a serial statement of their improvements, new apparatus, or alterations in prices. Messrs. Buck & Hickman (London) send us their new and very extensive illustrated and priced catalogue of patent and improved tools and machinery for tool-working. This includes boring and tapping machines, lathes for various purposes (slight-cutting, brass-finishing, turning and chasing, facing pipe-flanges, &c.), turners' and brass-finishers' tool-boxes, milling machines, planing machines, shaping and drilling machines, punching and shearing machines, saws of all kinds, gas and steam engines, saw-benches, hand-saws, and combination band and circular saw machines. Great attention seems to have been paid to the band-saws, which include several special contrivances, such as a steel compensating spring, to allow for the free expansion and contraction of the saw while at work, and in the band and circular saw machine a patent arrangement of countershaft for driving, whereby two separate motions are obtained from one countershaft, so that the workman can use instantly either the band-saw or the circular saw. Besides these the catalogue illustrates plate-bending machines, carving tools, paint-mills, pumps, in short everything that can be required to stock a large workshop establishment. The Stuart's Granolithic Stone Co. (London) send us an album (the "Granolithic Souvenir") containing a number of illustrations of their works, with photographs of various tests of their material, and also of buildings in which the material has been used. Among other things there is a photograph of a granolithic slab 10 ft square which is stated to have carried twenty-two tons without any sign of failure.

Messrs. Powis Bale & Co. (London) send us List No. 2 of their stone-working machinery, illustrating circular and horizontal stone-sawing machines, rock drills, stone moulding and planing machines: marble turning lathe, &c. Messrs. G. A. Harvey & Co. (London) send a large catalogue of metal work for various purposes—chimneys, water-heaters, weather vanes, snow guards, zinc roofing tiles, ventilators, corn-bins, buckets, stove pipes; also plant for farms and country houses, such as hutchies, pigeon-cotes, cattle troughs, &c.; and an immense variety of perforated zinc patterns.

Messrs. Lumby, Son, & Wood (Halifax) send us a supplementary catalogue under the title, "Our 1897 Specialities," including various forms of boiler, among others the "Marlor" boiler, which is designed so that any sediment in the boiler falls below the fire bars, where it cannot injure the boiler, and where special means of flushing and drawing off are provided. One of the best things in the catalogue, and one of general application, is the non-radiating nickelled handle, which does not get hot, and has moreover a very neat appearance. The

Expanded Metal Co. (London) send us a pamphlet explaining and illustrating the various methods in which this material can be usefully applied in construction. It contains a good deal of practical information in a small space, and will be of use to architects who intend to make use of expanded metal in fireproof and other constructions.—Mr. John P. White (Pyghill Works, Bedford) sends us a catalogue of some of his grates and chimney pieces, the illustrations to which are quite above the ordinary catalogue level, being artistic drawings of good designs by known artists. The main practical object of the publication is to recommend and describe the "Porcellis Fire Screen and Blower," an arrangement by which a descending sheet of brass, running up and down in grooves at either side of the grate, and counterbalanced by weights, like an ordinary sash window, is made available as a screen to a non-lighted fire, or as a blower (when required) to a lighted one.—Messrs. Strode & Co. send us a book of devices and mottoes for illumination, both for gas and electric light, suitable to the festivities of next month.—Messrs. Alfred Chapman send us a print of the Diamond Jubilee wall decoration which they have prepared; a good piece of decorative design working in the symbolical flowers of England, Scotland, and Ireland.—Mr. W. J. Pethybridge (London) sends us some specimens of papers made by him as specially suitable for colotype printing.

Messrs. Winstone & Co. send us a catalogue of grates and ranges, which appear to be very good in a practical sense, though the ornamental designs have little to recommend them. There appear to be some new contrivances for raising and lowering the fires in ranges with greater convenience. Among the special objects illustrated is a revolving or reversible fire-grate for gas or coal, according to which side is turned to the front.—Messrs. Adams & Co. send us their new catalogue of sanitary appliances, which as usual is admirably got up, and contains illustrations of some important improvements and new patents. Among these may be mentioned the Helios pedestal closet, which is a valve closet made entirely in glazed earthenware, valve and all; the "Helios" lavatory range, especially intended for schools for strength and cleanliness combined, the basins are carried on solid glazed-ware pedestals, and with glazed-ware pillar waste pipes; the "Hadley" anti-siphonic trap, which is said to render the syphoning out of the seal water impossible, by means of an enlargement on the upcast arm of the syphon, containing sufficient water to compensate for loss; and the glazed-ware tubs, in sets, for public washhouses. We may point out that in the designs for lavatory ranges, the plain and massive-looking designs, such as are shown on pages 42 and 47, are far superior in appearance, for all situations, than those which are intended to be ornamental, as on pages 46, 48, and 49; architects would certainly prefer the plainer ones.

OBITUARY.

SIR A. W. FRANKS.—By the death of Sir A. Wollaston Franks, K.C.B., which took place in London on Friday last week, after an illness of some weeks' duration, the Society of Antiquaries has lost its President, and the archaeological world one of its most learned exponents. Augustus Wollaston Franks was born at Geneva in 1826, and was educated at Eton, and at Trinity College, Cambridge, where he graduated in 1850. His antiquarian tastes had then already begun to develop themselves, and within a few months of taking his degree he published an excellent "Book of Ornamental Glazings Quarries." In 1851, he entered the British Museum, as an assistant in the Department of Antiquities, under Mr. Hawkins, the then keeper. The miscellaneous character of the collections with which Mr. Franks thus became associated diverted his attention from architectural antiquities, and henceforth his mind was given to the acquisition of that vast store of knowledge of all branches of archaeology, for which he afterwards became so distinguished. In 1853, Mr. Franks was elected Fellow of the Society of Antiquaries. The *Proceedings* of the Society show how regularly he attended its meetings and how numerous and varied were the objects of interest which he constantly exhibited and discussed. In 1858, on the resignation of Sir Henry Ellis, he was unanimously elected to the responsible post of Director of the Society, an office he held until 1867, and again from 1872 to 1880. In 1862, Mr. Franks was unanimously chosen President of the Society, which distinguished position he continued to hold until his death. Of Mr. Franks's official connexion with the British Museum, that institution affords abundant evidence. Through his

personal influence with their owners, the splendid "Christy, Burges, Slade, and Henderson collections" were bequeathed to the nation, and to them were added, by his own generosity, the valuable series of Oriental and English pottery and porcelain. Of the numerous gifts which from time to time he filled up gaps or materially augmented defective groups, it is impossible to speak in detail, for there is hardly a case in the Department over which he presided which does not contain examples of his liberality. His unostentatious munificence, as well as his valuable services, were fairly recognised in 1888 by his creation as Companion of the Order of the Bath, and in 1894 he was promoted to be Knight Commander of the same Order. Sir Wollaston Franks retired from the British Museum in 1895, but did not long enjoy his well-earned leisure. He was in his seventy-second year at the time of his death.

Mr. C. J. Phipps.—We regret to have to record the sudden and unexpected death of this architect, whose name has become so well known in connexion chiefly with theatre architecture. Mr. Charles John Phipps, F.S.A., was born at Bath in the year 1835. He was articled with Messrs. Wilson & Fuller, architects, of that city, and remained in their office until June, 1857. Almost immediately he commenced practice for himself, and in 1862 he successfully competed for the design for the rebuilding of the Bath Theatre. This theatre proving so successful, other work of a similar kind soon followed, and for the last thirty years Mr. Phipps has been constantly engaged in building new theatres in London and the provinces and elsewhere. Of his recent works the new buildings now in course of construction in the Haymarket rank as the most important. Of this building one portion, namely, Her Majesty's Theatre, has been completed, and the rest is rapidly progressing. Amongst the works executed in London by Mr. Phipps were the following theatres and concert-halls:—The Queen's, Long Acre (now pulled down); the Gaiety; the Vaudeville; the Strand; Sadlers Wells; the Variety, Hoxton; the Haymarket; the Savoy; the Princesses; the Prince of Wales; the Shaftesbury; the Lyric; Hengler's Cirque (subsequently altered by the architect into the National Skating Palace); the Theatre of the Lyric Club; the Queen's Hall (jointly with Mr. Knightley); and Her Majesty's Theatre, Haymarket (just completed). In the provinces he erected theatres at Bath, Bristol, Plymouth, Torquay, Brighton, Eastbourne, Swansea, Worcester, Nottingham, Portsmouth, Sheffield, South Shields, Darlington, Hastings, Leicester, (the Opera House), Northampton (the Opera House), Limerick (the Opera House), Liverpool (the Rotunda and the reconstruction of the Alexandra Theatre), Wolverhampton, and Dover. In Scotland he built, at Edinburgh, the Theatre Royal (first rebuilding, 1873; second rebuilding, 1883); and the Lyceum Theatre; at Glasgow, the Theatre Royal (first rebuilding, 1880; second rebuilding, 1895); at Dumfries, the Theatre Royal; at Aberdeen, the Opera House. In Ireland he built, at Dublin, the Gaiety Theatre and the Leinster Hall; at Belfast, the Theatre Royal; at Londonderry, the Theatre Royal; and at Cork, the Theatre Royal and Opera House. Among other public buildings erected from his designs may be named the Devonshire Club, the Lyric Club, the Gaiety Restaurant, the Star Life Assurance Society's offices, the "Star and Garter Hotel" (new pavilion), the Savoy Turkish Baths, &c.

MR. DAVID GREIG.—The death took place, on the 20th inst., at his residence, Queen's-crescent, Edinburgh, after a short illness, of Mr. David Greig, senior partner of the firm of David Greig & Co., builders, Spittalfield-crescent. He was a member of the Dean of Guild Court.

GENERAL BUILDING NEWS.

THE NEW TOWN HALL, SHEFFIELD.—On the 21st inst., the new Town Hall at Sheffield was opened by the Queen. Illustrations and descriptions of the building have appeared in our issues for June 28, 1890; June 20, 1891; July 11, 1891; and May 21, 1892; while illustrations of the sculptured frieze appeared on July 13 and November 16, 1895. An illustration of the entrance gates was also given in our issue of February 13 this year. The architect was Mr. E. W. Mountford, and the sculpture work was by Mr. F. W. Pomeroy.

REPAIR OF LINLITHGOW PALACE.—Following the course adopted for the past two or three years, the Government have voted another sum for the repair and preservation of Linlithgow Palace. In past years the work has consisted in repairing more dilapidated parts of the ancient structure, such as relaying the floors, renewing the wall heads, &c. This year it is intended to direct attention to the north side of the building and to repair and improve the walls, which in recent years have shown signs of rapid decay. The object of the Board of Works in carrying out these repairs is to have the historical "pile" put into a proper state of preservation.—*Glasgow Evening Times*.

BATT'S HOTEL, DOVER-STREET.—This hotel has been recently undergoing extensive alteration and renovation. In place of a stable and other out-buildings in the rear, a dining-room, kitchen, and service rooms have been built. Messrs. Hilder & Edge, of Great Pulteney-street, have carried out

this work, including the redecoration of the whole of the building. The following specialists have also been employed.—Messrs. Smith & Stevens have supplied passenger and dinner lifts; Messrs. Dent & Hellyer have fitted up entirely new sanitary fittings throughout, and have laid a new system of drainage; electric lighting has been installed by Messrs. Laing, Wain & Dixon, electric bells and telephones by Mr. C. E. Zimard, and hot water, cooling and heating apparatus by Messrs. Charles Heap & Co. Mr. R. Griggs is the architect.

BERKELEY HOTEL, PICCADILLY.—On the 12th inst. this hotel and restaurant was reopened to the public, having been closed since the beginning of December last. During this interval extensive structural alterations have been made in the old portion of the building, and a new portion, seven stories in height, and covering the site of 73 and 74, Piccadilly, has been added. In the old portion the improvements include the enlargement of the restaurant by removing the main walls on the ground floor, a rearrangement of the basement, the introduction of an electric passenger-lift, and complete redecoration. In the new portion an entrance hall to the restaurant, a lounge and cloak rooms, have been provided on the ground floor, and suites of rooms, including reception, bed, and dressing rooms, with bath room, &c., on each upper floor. The whole of the basement of the new portion has been designed and constructed and carried out by Mr. T. Stevens, South Molton-street. The general contractors were Messrs. Kirk & Rhindall, of Woolwich, who, commencing at the beginning of the year, have carried out and completed the whole of the work in five months. The fireproof floors were executed by Messrs. Dennett & Ingle; the decorations generally by Messrs. Campbell Smith & Co.; the sheet metal of the restaurant and entrance by Messrs. Warrings; the passenger and service lifts by the Otis Elevator Company; the cooking range by Messrs. Cuban Freres, of Paris; the smaller cooking apparatus and kitchen fittings generally, also the steam and hot water services and electric lighting, by Messrs. Strode & Co.; the fittings for the electric light being supplied by Messrs. Kir & Randall, and they have also provided an automatic hot water supply for the hotel of over 1,000 gals. per hour if required; the electric bells and telephones by Messrs. Jackson & Coleby; the plumbing, drainage, and sanitary fittings by Messrs. Dent & Hellyer; and the new furniture by Messrs. Morris, King, & Norton, of Birmingham. Mr. T. S. Inglis was the clerk of works. The architect is Mr. Robert Griggs (London).

THE NEW WORKHOUSE QUESTION, HUNTSLEY.—At a meeting a few days ago of the Hunslet Board of Guardians the question of the erection of a new workhouse was again discussed at length. Mr. J. Farrar moved that the committee (Mr. Dodgshun) be requested to complete the plan of the suggested alterations on the existing workhouse, to show the alterations in the children's ward, and the additional accommodation to be obtained, and also to prepare plans for the erection of new vagrant wards. He said it was premature to propose that they should erect a new workhouse at a cost of 40,000, or 50,000.—Mr. Hargreaves, in reply to the resolution, said that in his opinion the new workhouse would cost nearer 50,000, than 40,000. The proposed alterations on the present workhouse would provide additional accommodation for thirty-six adults, fifteen children, and eight old persons.—Dr. Hawkyard asked the mover and seconder of the resolution if they would agree to substitute this motion:—"That Mr. Dodgshun be asked to prepare plans to show new receiving wards, new tramp wards, how the present workhouse could be extended so as to give more room for the old men, and to provide a larger kitchen and new bath-rooms, and how the school building could be adapted for fifteen children, and the rest of the building be adapted for hospital purposes, with suitable accommodation for nurses." Mr. Farrar and Mr. Hargreaves agreed to accept this resolution, and after some further discussion the resolution was carried.

POLICE BUILDINGS, KILMARNOCK.—Plans have been prepared by Mr. Walter W. Reid, and have been approved of, for the erection of the new police buildings in Sturrock-street, Kilmarnock. The external walls are to be built of white stone. On the ground-floor there will be the Chief Constable's room, charge-room, guard-room, production-room, lavatory accommodation, and eight cells. The court-room will be in the upper flat, access for the public being obtained by an entrance from Market-lane, which is a private street, off Sturrock-street for the use of the magistrates and witnesses. There is also a room for the magistrates, and separate rooms for male and female witnesses. Eight cells are situated in this flat, and lavatory accommodation is likewise provided there. The building will be heated with hot-water pipes, the heating-system being in the basement, where there is also a lamp-room.

ALTERATIONS AT EAST FREE CHURCH, PETERHEAD.—Operations have been commenced for the

entire reconstruction and renovation of the interior of the Free Church, St. Peter-street, Peterhead. The scheme comprises the reslating of the church, reconstructing the interior, building a suitable hall and vestry, &c. The architects are Messrs. J. & R. M. Millan, Aberdeen, and the contractors are a messrs. work, Wm. Hendon, Peterhead; joiner work, J. B. Dickie, Peterhead; slater, Wm. Simpson, Peterhead; plasterer, Wm. Shand, Peterhead; plumber, John Ferguson, Peterhead; painter, George Cran, Peterhead; glazier, Edward Copland, Aberdeen.

PRESBYTERIAN CHURCH, WALTON, LANCASHIRE.—The foundation stone of a new Presbyterian Church was laid recently at the corner of Rice-lane and Orrell-lane, Walton. The building scheme includes purchase of site, erection of lecture hall, with requisite committee-rooms, &c., and church. The material used will be Yorkshire shoddies, with red stone dressings, and the principal entrances will be through an open porch, minor porch, and vestibule, as well as through cloisters, &c. The inside length of the church will be 75 ft.; the breadth across the body of the edifice, 37 ft. 6 in.; across the transepts, 40 ft. 6 in.; and the size of the organ chamber will be 10 ft. by 9 ft. About 450 sittings will be provided, and the plans permit the future erection of a gallery to give accommodation for another 100 seats. A vestry, session-house, infants' room, and ladies' room are included, and connected with the adjoining lecture hall being obtained by two staircases, the hall being 50 ft. by 31 ft. 6 in., and capable of seating 300 persons. The contractors are Messrs. J. & G. Chappell; the masonry is in the hands of Mr. James M'Dermot; and the architect is Mr. R. G. Sykes.

ST. LUKE'S CHURCH, DEEPFASH, ROCHDALE.—The eastern portion of this church (consisting of chancel, transepts, organ chamber, vestries, &c.) was erected some ten years ago, and building operations have just been commenced of the new portion. The work now being erected consists of a nave, side aisles, &c., to be used as passages only, and a baptistry at the west end. The principal entrance is through a porch on the south side, while the other entrances are also provided on the north. The aisles and baptistry are divided from the nave by a lofty arcade, the baptistry floor being raised above the nave level. Externally and internally the church will be faced with small pressed bricks, relieved with red Rainhill stone dressings. The roofs will be covered with green slates, and the windows are to be filled with tinted ecclesiastical glass. The internal woodwork is to be of pitch-pine, unvarnished, the floors of the aisles and baptistry to be tiled, the latter with encaustic tiles in ornamental designs. The style adopted is Early English. The works are being carried out from the designs, and under the supervision of Mr. K. Knill-Freeman, of Bolton and Manchester, the architect for the formerly-erected portion.

BAPTIST CHURCH, BELFAST.—Three memorial-stones were laid recently of a new Baptist church, which is in course of erection on the Antrim-road, Belfast. The church and schools are built of Belfast perforated brick, with red sandstone dressings, and consist of a church, a school, a play area, and school to accommodate 300 children, with vestries and lavatories attached. On either side of the main entrance are the entrances to the main gallery, which extends across the end of the church. The principal feature of the interior is the baptistry arrangements, which consist of large baptistry lined with marble and porcelite, the steps leading directly from the vestry doors, and immediately behind the baptistry is an ornamental Gothic screen, partly supporting the choir gallery, the steps to which lead up from behind the screen. These arrangements are all contained within a large chancel-like recess, separated from the main body of the church by a large flat arch of moulded brick and stone. The school building has kitchen arrangements and yard. The cost of both buildings is 3,700. The architect is Mr. J. A. Hanna, of Belfast, and the contractors are Messrs. Henry Laverty & Sons. Messrs. Musgrave & Co. supply the heating apparatus, and the plumbing work is being done by Mr. J. J. Milliken, Belfast.

HOME FOR NURSES, SWANSEA.—It is proposed to celebrate the Jubilee at Swansea by erecting in connexion with the hospital a home for nurses. It is intended to build the new block of buildings at the rear of the administrative block and connected with it by a corridor. In the basement it is proposed to provide the heating apparatus. On the ground floor accommodation is provided for eight nurses. On the first floor accommodation is provided for fifteen nurses. Overlooking the lawn will be a verandah and a small tower at the corner of the building, which will be used as a ventilation shaft. The plans for this work have been prepared by Messrs. Wilson & Moxham, architects, who are now carrying out the new operating theatre at the hospital.

ST. PETER'S CHURCH, TORRY, ABERDEEN.—The new Episcopal church of St. Peter is at present in course of erection on the north side of Victoria-road, Torry. The building, when completed, will consist of nave, with porches on the north and south sides; chancel, with a chapel and bell-turret on the south; and sacristy and choir vestry on the north side. With the exception of the window tracery, which will be of freestone, the whole of the exterior stone-work will be of pink granite, the general surface of the walls of thin split-faced courses. The roof,

covered with Scotch slates, will be continuous over nave and chancel, its apex being 68 ft. from the floor of the nave. The height of the nave walls will be 47 ft. The nave is 4 ft. 6 in. lower than the level of Victoria-road, with steps at the west end down from that level extending the whole width of nave and aisles. The nave arcade consists of five arches with piers 10 ft. apart and 26 ft. 3 in. from the floor to the springing. These piers are attached to the aisle wall by internal buttresses. The division between nave and chancel is marked by a pier 5 ft. 6 in. wide, and pierced with doorway for a roof lift, reached by a turret stair on the south, and also from the organ-gallery on the north side. The altar is raised twelve steps above the nave floor. The south aisle of the nave leads by steps up to the side chapel, 38 ft. by 15 ft., which will be divided from the chancel by an iron grille. This chapel will have a separate door from Victoria-road. The north aisle continues by the side of the chancel, and is connected with it by a few steps. The upper part of the church will be lighted by a series of eight clearstory windows on either side and a wheel window in the west gable 11 ft. in diameter. The total length of the church internally is 116 ft. 6 in., the extreme width 52 ft. 6 in., and it will provide accommodation for about 500 persons. The contractor for the organ-gallery is Mr. John Morgan, Aberdeen, and the architects are Messrs. Kinross & Tarbolton, Edinburgh.

PREMISES, MARKET-STREET, EDINBURGH.—New premises for Mr. Macpherson, of the Cockburn Hotel, Edinburgh, are to be erected in Market-street. The building has been designed in the Baronial style. It is to be used in connection with the hotel to replace the premises in Cockburn-street which the city has acquired, the ground being necessary for the proposed extension of the Council Chambers. The new premises will be lighted by electricity, and heated by hot water, as well as by open fires. The architect under whose directions the work will be carried out is Mr. John G. Adam.

SESSION HALL, HALE END, ESSEX.—The foundation stone has just been laid at Hale End, by Mrs. Andrew Johnston, of a new Union Mission Hall. The new building is being erected at the back of the present hall. It is to be of red brick with stone facings, and is to have a slate roof boarded inside. The premises comprise the hall itself, which is 50 ft. by 34 ft., and is to accommodate 400 persons. The entrance to the hall from outside is by a porch. In the rear are three class-rooms and a kitchen. The architect is Mr. Boreham, of London, and the builders Messrs. Thos. Osborne & Sons, Woodford.

PUBLIC SCHOOL, YOKER, NEAR GLASGOW.—This school is in course of erection in Elgin-street, Yoker, for the Old Kilpatrick School. The building is three stories in height, the ground floor being utilised for the infant department and the First Standard, while the other standards are located on the first and second floors. The headmaster and mistress have their private rooms on the ground floor in close proximity to the respective entrances for boys and girls, while the rooms are also provided for the male and female assistants on each floor. On the upper floor a portion will be utilised as a cookery room, and there is also provision in the way of cloak rooms and other offices for both scholars and teachers. The cost is estimated at about 13,000, and accommodation will be given for some 1,250 scholars. The whole work is being carried out from the plans of Mr. Henry Higgins, jun., architect, Glasgow.

PROPOSED NEW MUSIC HALL FOR WOLVERHAMPTON.—A special session for transferring licences was held at the Wolverhampton Police Court on the 22nd inst., when an application was made for the sanction of various alterations to the Empire Music Hall and Vaults, Queen-square and Cheapside. Mr. Ward, of the firm of Messrs. Owen & Ward, who is the architect of the proposed building, said that there would be nine entrances, and no doorway would be of less width than 5 ft. There would be a front in Cheapside in a way the Public Works Committee would suggest. The building would be lighted by electricity, but there would be a supply of gas in case the electric light should fail. It was explained that the Borough Surveyor was satisfied with the plans, but had suggested a fire screen, which would be provided. The cost will be 42,000. The magistrates retired to consider the matter, and on their return the Mayor said that the application had been unanimously granted by the magistrates, on the understanding that the provisions in Cheapside must be satisfactory to the Public Works Committee.

PROPOSED NEW TECHNICAL SCHOOLS, SWANSEA.—It is proposed to erect new Technical Schools at Swansea, iron plans prepared by Mr. H. Wills. The two new buildings to be erected comprise accommodation for the teaching of chemistry, metallurgy, physics, engineering, and also for intermediate purposes. They will form an L-shaped block to the south-west of the existing buildings, to which they will be connected with a covered cloister, and with which they will be built in harmony. The new buildings will also comprise accommodation for the caretaker, and a Committee room. The technical portion of the new schools will cost about 9,000, and the fittings and apparatus about 4,500.

SAVINGS BANK, KEYHAM, DEVONSHIRE.—Branch premises for the Union Savings Bank at Keyham are being erected by the contractor, Mr. William

Littleton. The architect is Mr. Henry George Luff, of Devonport.

ALTERATIONS TO A BANK, REIGATE.—The London and County Bank has recently been altered and improved. The work has been executed by local firms, and Messrs. Baker & Penfold were the architects, and Mr. R. Killick was the builder. Messrs. R. Penfold & Son did the stone masonry.

NEW CHURCH, PENARTH.—The new English Congregational Church at Penarth, was opened a few days ago. The most noticeable feature externally is the tower at the right-hand corner of the main building, which is surmounted by a spire rising to a height of 112 ft. The spire is built chiefly of Bath stone, whilst the church, schoolroom, vestries, and offices are carried out in grey Newbridge stone, with the quoins of Bath stone. The church building is capable of accommodating 600 adults, and consists of a nave and chancel, the latter raised above the floor of the nave, and within it are placed the choir stalls with the organ facing the congregation. At the northern side of the chancel arch is the pulpit of mahogany and pitch pine, the whole of the seating being of this wood with mahogany mouldings. There are no galleries, with the exception of a small one over the vestibule. Messrs. Habershon & Fawcner, architects, Newport and Cardiff, prepared the designs of the structure; and Mr. D. G. Price, Penarth, carried out the work. The entire cost of the building is about 6,500l.

BUSINESS PREMISES, ABERDEEN.—New premises are to be erected for Messrs. Sangster & Henderson in Broad-street, Aberdeen. The buildings were designed by Mr. R. G. Wilson, architect; and the contractors are—Masonry, Messrs. Pringle & Slessor; carpentry, Messrs. Watt & Clark; slating, Mr. James Wilson; plastering, Mr. George Gibb; painting and glazing, Messrs. J. Garvie & Sons; ironwork, Messrs. McKinnon & Co.

CHURCH, HYSON GREEN, NOTTINGHAMSHIRE.—On the 20th inst. Lady Laura Kidding laid the foundation-stone of a new church on Bobbers Mill-road, Hyson Green. The church, which is to seat 600, is being built of Bath stone and bricks from Loughborough and Sibley. Inside, the building will be 110 ft. long, 52 ft. broad, and 43 ft. high to the top of the nave roof, and the church will be lighted by a large window at the west end, and by windows in the aisles and clearstories. The architects are Messrs. Christian, Caröe, & Purday, of London; and the builders Messrs. J. Norris & Sons, of Ascot.

BUSINESS PREMISES, NEWCASTLE.—Messrs. H. & A. Hunter, livery stable proprietors and job masters, Newcastle, have just enlarged their premises. The additions have been made in communication with the existing building behind Trinity Church, New Bridge-street, one entrance being from the old yard and the other from Higham-place. The sale yard is 100 ft. long by 33 ft. wide. On the right side of the entrance is a ladies' waiting room and lavatory, and on the opposite side are the caretaker's house and the harness rooms, with a store room above. For the sale yard light is obtained from an iron-girdered glass roof, 40 ft. high. On the left side of the yard are ten loose-boxes, and on the right side there are fourteen stalls. Altogether on the ground floor there are fifty stalls and boxes. At the west end of the sale yard is a store room, also the engine room, properly fitted out to raise the patent hoist and run the dynamo for the electric light throughout the building. Over the loose-boxes on the ground floor is a large balcony for visitors, 90 ft. long by 8 ft. wide; and another balcony on the opposite side, to be reserved for ladies, 100 ft. long by 4 ft. 6 in. wide. The stable on the first floor, with access from the ground floor, is 114 ft. long by 30 ft. wide, with stalls, and contains boxes for thirty-eight horses. Adjoining is a granary, 51 ft. by 24 ft., with an apartment for the general office. On the second floor is a carriage repository, 114 ft. by 31 ft., in direct communication with the hoist, and another granary, 50 ft. by 24 ft., and a similar loft above this room is situated on the third floor. Mr. W. Lister Newcombe, Newcastle, was the architect; the chief constructor, including the stable fittings, was Mr. W. Machlin; the cement floors have been laid by Messrs. W. B. Wilkinson & Co.; the plumbing by Mr. Rowell; the metal castings by Messrs. Swinney Brothers, Morpeth; the iron roofs by Messrs. Hindson, Gateshead; the painting and colouring by Messrs. Richardson, Newcastle; the stoves and hardware by Messrs. Eady & Sons, Newcastle; the hoists by the Otis Company; the gas engine and shafting by the Otto Company, Newcastle; and the electric lighting by the Corlett Electric Company, Newcastle; while Mr. C. Dixon was clerk of the works.

RESTORATION OF BISHOP'S WALTHAM PARISH CHURCH, HANTS.—For some time past structural repairs have been in progress at the parish church of St. Peter's, Bishop's Waltham. The main outlines of the work of restoration are as follows:—The south gallery with the three dormer windows specially put in to light it have been removed, and a new arcade built to agree with the northern arcade, thus bringing the two aisles into harmony. The columns carrying the arches of the twelfth century north arcade, which, owing to the spreading of the main roof, had been pushed out of the upright, have also been rebuilt on a substantial foundation, and solid stone piers have taken the place of hollow

ones. New plates have been inserted to carry the roofs of the nave and aisles, and the rafters bolted thereto, and tie rods have been fixed to keep these roofs, as well as that of the chancel, from spreading. The old flooring has been removed, and the earth having been excavated to some depth and replaced by concrete, wood blocks have been laid all over the church on a cement foundation. The chancel arch, which was formerly much distorted, has been put into shape, one side of the arch having to be entirely rebuilt. The chancel roof has had to be entirely stripped, as many of the rafters were decayed. These have been replaced, and the roof re-tiled. The outer side of the roof of the south aisle has been similarly treated. The hot-water pipes have been placed under the level of the floor, and a new and more powerful boiler supplied. The small gallery has been fitted up for the school children. The old Communion rails have been cleaned and scraped to show the plain oak, and are in keeping with the pulpit and the new choir stalls, which are of plain oak and of local handiwork, having been carried out by Mr. Charles Churcher. The work has been done under the superintendence of Mr. T. G. Jackson, R.A., and his clerk of works, Mr. Moxford.—*Hampshire Chronicle.*

NEW INFIRMARY, PAISLEY.—The memorial stone of the new infirmary being erected in Paisley was laid recently. The infirmary is being erected in Barbour Park, Calside, from plans prepared by Mr. T. Graham Abercrombie, Paisley. It consists generally of two stories and attics, with the front portions of the wings, and also the central blocks slightly jutting out from the main building. The number of beds provided will be between 140 and 150, and there are different departments for children and for men and women. The cost, it is understood, will be 72,000l.

PARISH ROOM, ELY.—A meeting was held at the Vicarage, Ely, recently, when it was decided to build a Parish Room in commemoration of the Queen's Diamond Jubilee at a cost of 800l. The room will accommodate 350 persons. The architects (Messrs. James and Sweet-Escott, of Cardiff) were instructed to proceed with the plans and to invite tenders for the erection of the building upon a site given by Lord Windsor, situate at the back of the post-office.

IMPROVEMENTS AT HUTTON CASTLE, BERWICKSHIRE.—Improvements are being carried out at Hutton Castle, Berwickshire, the property of Lord Tweedmouth. Two new approaches to the castle have been made, and a lodge has been constructed at the west drive. Lord Tweedmouth intends to provide additional bed-room accommodation and buildings for servants, &c. Further stable accommodation will also be erected, but arrangements have not yet been made for these. The old tower is to be made habitable, the centre part being raised one story. The new portions will have asphalt roofs, with embrasures and parapets. There will also be internal alterations. The architect is Mr. George Duns, of Duns, and the contractors for the work in the centre part of the building are—Mason, Henry Steel, Greenlaw; glazier, James Crombie, Duns; slater and plasterer, William Fortune, Chirnside; plumber, Abel Ford, Coldstream.

PRIMITIVE METHODIST CHURCH, BROOKWOOD, SURREY.—Memorial stones of a new Primitive Methodist church and hall were laid at Brookwood recently. The building will be of brick, with Bath stone dressings, and will be in the Gothic style. It will be 45 ft. long by 30 ft. wide, and the schoolroom will provide seating accommodation for 450 persons. Included in the building are an entrance vestibule, gallery, minister's and deacons' vestries, schoolroom, and some half-dozen class-rooms, with a tower 50 ft. high. The total cost of erection is estimated at 1,700l. Messrs. Aiken & Greene, of Plaistow, are the builders, and the architect is Mr. Clark Hallam, Stepney Green.

SANITARY CHAMBERS, GLASGOW.—New sanitary chambers have been erected at Glasgow, at the junction of Cochrane-street and Montrose-street. Practically the whole of the ground floor is devoted to the Sanitary Inspector and his staff, &c. The only exceptions are the south-west corner, which is devoted to the vaccination department, and comprises rooms for the office and waiting and operating rooms; and the north-east corner, where there is a room in which suspected patients may be isolated until examined. On the first floor the Medical Officer of Health, and the junior officer, have their rooms, and accommodation is also provided for the veterinary surgeon and the other medical assistants. The rest of the story, and also the greater part of the second floor, is occupied by the inspecting sanitary officers. Those for each district of the city have a room set apart for their use. A caretaker's house is also provided, and the large square tower which surmounts the building is used as a chemical laboratory. The principal novelty in connexion with the chambers is the proposed bacteriological department. Also on the second floor is an exhibition room, where it is proposed to show and test all forms of sanitary appliances which may be submitted to the Sanitary Inspector for his opinion. The site for the chambers cost 11,000l., and the buildings about 19,000l.

EMPIRE THEATRE OF VARIETIES, OLDHAM.—This building is in course of erection on the site formerly occupied by Retiro House, at the corner of York-hire-street and of Waterloo-street. There are two

entrances to the pit of the new structure, each 10 ft. wide, and two each 6 ft. wide to the circle, all from Waterloo-street. In addition to these, there are two exits to the pit, each 7 ft. 6 in. wide, one into Woolcoat-street and one into Retiro-street. All steps and passages to exits are of fire-proof construction. There are three private boxes on either side of the proscenium opening. The box staircases also lead to the orchestra stalls, and from these staircases, and at the stage level, a means of access to the stage is provided for the use of the orchestra. The proscenium opening is to be provided with a fire-proof asbestos curtain, and all openings between the stage and any other part of the house will be covered by iron doors. The circle is carried on steel stanchions, girders, and cantilevers. There will be seating accommodation in the pit stalls for close upon 2,000, and in the circle and boxes for about 600. At the back of the pit and under the footpath in Waterloo-street is a refreshment bar about 40 ft. long, and at either end of this there are lavatories, &c. Both the pit floor and the circle are made with a fall towards the stage. All round the back of the circle is a promenade about 7 ft. 6 in. wide, and behind this again, divided from the auditorium by an arcade, are refreshment bars, cloak-rooms, lavatories, &c., for both ladies and gentlemen. The refreshment bars are raised four steps above the promenade floor, so that a view of the stage can be obtained through the arcade. A store-room is provided beneath each bar. The board-room will be placed in the central tower, and access thereto will be obtained by means of a staircase leading from the larger bar in the circle. The electric light will be adopted throughout, and, in addition, a large sun-burner will be provided. The front elevation is of rough brick covered with cement, relieved with moulded cornices, strings, and architraves. There will be a glazed verandah along the whole of the front, with ornamented pediment in the centre glazed with leaded lights. This verandah will be supported on wrought-iron cantilevers. The stage is at the Retiro-street end. On either side will be the artists' dressing-rooms, each room being supplied with lavatory, with hot and cold water. There will be two staircases on either side for access to these rooms. The manager's office is situated over the boxes on the prompt side, and will be connected by means of telephones with every part of the house. The building will be heated by hot water. The work is being carried out from the designs and under the superintendence of Mr. Sidney Stott, architect, Oldham.

DEAF AND BLIND SCHOOL, PENKHLIN, STAFFORDSHIRE.—A school for the deaf and blind was recently opened at Penkhill. The institution is built within the grounds of Josiah Spode, the potter. The mansion on the site, built in 1803, has now been converted into the administrative department of the new blind and deaf school. New buildings have been added to the rear of it, or eastwards, for the deaf children, and to the right or southwards, for the blind. From the circular entrance the main vestibule is reached, with the visitors' room on the left. The staircase hall is lighted from the dome, and from this extend corridors left and right, that to the left giving access to the kitchens, stores, teachers' sitting and dining rooms, &c., with the laundry and technical instruction room running at right angles. The corridor to the right gives access to the master's dining-room and office and to the rooms devoted to the blind, consisting of day-rooms, class-rooms, music-rooms, and teachers' sitting-room. In the auditorium, with master's drawing-room and general bath-room on the right, and the large dining-hall on the left. At the head of this corridor is the central hall, with class-rooms on either side for the deaf children, and extending right and left are also corridors, terminated by the day-rooms for the deaf children, the left hand being for boys and the right for girls. From the boys' day-room on the left access is gained to the technical instruction rooms. From the corridors fireproof stairs reach up to the various dormitories and masters' and servants' bed-rooms. Over the laundry and technical instruction rooms are the sick wards, consisting of two rooms, with nurses' room between, with bath-room and conveniences cut off by cross ventilation from the rest of the institute. The ceiling of the old house has been utilised, a portion being capable of being fixed as a work-room for the blind, and the hot-water heater for the supply of hot-water to baths, housemaids' sinks, &c., being placed in another portion, the rest being used as stores. A dispensary, lavatory, and conveniences, both upstairs and down, are provided. The floors of all corridors are fireproof except those in the master's part upstairs. The walls of all corridors (except to master's part) are of brick, and the staircases have tiled dados, and the whole building is heated by steam. Inlet ventilation is provided by means of Tobin brackets, and the foul air is extracted by tubes running from the ceilings into high towers (in which are placed water storage tanks) or by flues run up with the chimneys. The central hall is fitted with gymnastic appliances. There is accommodation for 150 children, and the necessary teaching and servant staff. The principal contractors for the several works were as follows:—Buildings, part of fittings, gasworks, and water mains, Mr. J. R. Yoxall, of Stoke; heating, Messrs. Dawson & Co., of Stalybridge; hot water and painting to old portion, Messrs. J. Bickley & Co., of Hanley; engine and boiler, Messrs. Thomas

Shore & Son, Hanley; sanitary appliances, Twyford, Limited, Hanley; the dados, Messrs. Milnes, Hollins, & Co., Stoke. The whole of the work has been carried out under the superintendence of Messrs. R. Scrivener & Sons, architects, Hanley. The total cost has been about 20,000.

SANITARY AND ENGINEERING NEWS.

SEWAGE SCHEME, WHITWORTH, LANCASHIRE.—The new sewage purification works of the Whitworth Urban District Council, which have been constructed at Tonacliffe, Whitworth, by Messrs. Hinitt and Murphy, C.E., of Manchester, were opened on the 12th inst. The outfall sewers and the main sewers laid through the district are of a total length of 8½ miles, and there are several miles of branch sewers now being laid which will, when executed, provide the district with a complete system of sewerage. The system of treatment of sewage adopted for these works is one of chemical purification in settling tanks combined with subsequent filtration through artificial filter beds. The works, as designed, provide for extension, if required.

RAILWAY, BUDLEIGH SALTERTON.—The new Budleigh Salterton Railway was opened on the 14th inst. The line joins the Sidmouth branch, which is connected with the London and South-Western Railway at Tipton St. John. Thence to Salterton the single rails run through the valley of the Otter to the sea. There are at present only two stations, one called Budleigh, which provides for East Budleigh and Otterton, and the other called Salterton, which provides for the Sidmouth branch. The line is for goods traffic at Newton Poppleford and Colatze Raleigh, and at the former place a station will in all probability shortly be built. The length of the line is 6 miles 4 chains, and it has been constructed under the direction of the engineer, Mr. W. Clarke, C.E., by Messrs. Lucas & Aird.

SEWERAGE SCHEME, BARMBY MOOR DISTRICT, POCKLINGTON.—The Pocklington Rural District Council have instructed Mr. D. Balfour, M.Inst.C.E., of Newcastle, the engineer for the Urban Scheme of Main Sewerage and Sewage Disposal for the town of Pocklington, to prepare plans and report on a scheme for the drainage of Barmby Moor District, to be connected to the above by arrangement with the Urban Council.

SEWAGE SCHEME, WOKINGHAM.—Mr. F. H. Tulloch, Local Government Board Inspector, attended at the Town Hall, Wokingham, recently, and held an inquiry into the subject matter of an application to the Local Government Board by the Town Council of Wokingham, for special permission to borrow 5,000l. for works on the sewerage and surface water drainage. Those present included Mr. J. May (Town Clerk), Mr. J. Manley (Borough Surveyor), and Mr. A. G. Bates (Gas Works Manager).

SEWAGE WORKS, BRADFORD.—Mr. Renzi Walton, C.E., Inspector to the Local Government Board, held an inquiry in the Council Chamber, at the Bradford Town Hall, recently, into the application by the Bradford Corporation to borrow 50,000l. for works of sewerage and drainage. The Town Clerk (Mr. Geo. McGuire) appeared on behalf of the Corporation in support of the application, and he was attended by Mr. J. H. Cox, Borough Surveyor, and others. The Town Clerk said the works for which the application had been made might be described as follows:—The proposed scheme would comprise new ones required for the drainage of districts in the borough, new sewers to replace old sewers which were no longer suitable, and special relief sewers for the carrying off of storm water. From time to time 282,000ft. had been expended in the construction of sewers alone, in accordance with the main sewerage scheme of Bradford, and these works were distinct from sewage disposal works. That total amount had all been expended, and 50,000l. was required to go on with the scheme.

SEWAGE DISPOSAL WORKS, ALNWICK.—The new sewage disposal works at Alnwick have just been opened. The scheme just completed was decided on after an inspection of the sewage disposal works at twenty-three different places by Mr. Geoffrey Wilson, Town Surveyor, and various deputations with him. It consisted, in the first place, of making provision for the diversion of storm and surface waters from the main sewers in the town into existing storm water culverts; and the diversion of the regular flow of sewage into the new high level intercepting sewers and its purification by precipitation in settling tanks and filtration of the clarified water through oyster beds, the filtered water from the under drainage being discharged into the river by a new outfall below the Bog Mill, three-quarters of a mile below the old outfall, and more than half a mile above Hawkhill Bridge. The plans for the new works were prepared by Mr. Wilby and Mr. James Moir has acted as inspector of works under him, and Mr. R. Hudson, of Sunderland, has been the contractor.

LOCAL SEWERS IN LONDON.—The Main Drainage Committee of the London County Council have sanctioned the construction of the following local sewers:—(1) 450 ft. of 12-in. pipe and concrete sewers in Dewbury-street, St. Leonard's-road respectively. St. Marylebone: 980 ft. of 4 ft. by 2 ft. 8 in. brick and concrete sewer and

950 ft. of 12-in. pipe sewer from Bradley-terrace along the east, south, and west sides of Clarendon-square by Hayes-place and Harewood-place to Marylebone-road on the site of the proposed station and hotel buildings of the Manchester, Sheffield, and Lincolnshire Railway.

FOREIGN.

FRANCE.—A special committee has been appointed to organise, for the 1900 Exhibition, the retrospective exhibitions of Fine Art and Decorative Art. It includes among its members MM. Roger Ballin, Baudouin, Bouvard, Ralph Brown, Corroyer, Dulert, Ch. Garnier, and other well-known architects and artists. M. Ch. Yriarte, the eminent architect, is also a member of the committee.—The students of the Ecole des Beaux Arts are making a formal complaint as to the construction and planning of the "loges," originally intended for sixty students, and now often containing from 250 to 300; a wooden structure, too, on the third story of the building, with only very small exits, &c.—The Société Centrale des Architectes has awarded commemorative medals to three artisans, M. Piquet, M. Melles, and M. Couvreur, for their courage in rescuing a number of persons from the late fire at the risk of their own lives.—M. Huet, the Inspector-general who succeeded Alphonse as Inspector-general of "Ponts et Chaussées," is retired, and there is some difficulty about finding an adequate successor to him. An engineer will probably be chosen, though most of the work is more within the province of an architect.—At the Salon, M. Harnpignes has obtained the "medaille d'honneur" for painting. M. Harnpignes was born in 1819, at Valenciennes, and studied at the Académie des Beaux Arts in the Salon of 1853; since when he has exhibited every year. The medal for sculpture has been awarded to M. Mathurin-Moreau, whose remarkable work "Les Exilés" was published in the *Builder* some years ago. He was born at Dijon in 1822, and was a pupil of his father first, and then of Ramey and Dumont. At Cologne he was an architect under the name of M. de Harnpignes, but M. Pontremol came near obtaining it.—The Société Centrale des Architectes has lost one of its original members, M. Charles Clément Le Coeur, who has just died at the age of 92, at Pau, where he had founded a local Art Society and organised a museum of which he acted as curator. He wrote a learned work on the architectural curiosities of Béarn.

GERMANY.—There was an interesting ceremony at Munich in connexion with the inauguration of the New Central Law Courts. The architect of the building is Professor Frederic Chiersch, who received a distinction on the occasion of the opening, from the hands of the Prince Regent. Two garrison churches, however, have been completed at Berlin, and their inauguration took place with considerable ceremonial. One of the garrison churches is for the Catholic community, and the other for the Lutherans. Both buildings are of considerable importance, and we shall take an early opportunity of referring to them again. At Cologne a factory has been completed on a rising bank building, for a branch of the German Reichbank; the Gothic style has been adopted. Mr. Hasak is the architect.—We notice from the advertisement columns of our German contemporaries that a competition is being arranged at Munich for a model design for villa residences, and premiums of the value of 500l. are offered. The assessors include Professor Frederic Chiersch.—We regret to record the death of a very popular architect, Herr Mathias Berger.—We notice from our official contemporary of Berlin, that there will be a first vote of 2,500l. for preliminary expenses in connexion with the representation of Germany at the Paris International Exhibition. The total of the vote, which will be spread over three years, is to be 25,000l.—There is to be a new casino at Wiesbaden, and a competition has been opened for sketch designs. The programme of the competition has been framed under the auspices of the Municipality; Messrs. Ende, of Berlin, Waldf, of Dresden, and Thiersch, of Munich, having been called in as advisers. These gentlemen will also act as assessors. The premiums are for 300l., 200l., 100l., and 50l. in value.—The Statistical Office at Berlin has just issued some particulars regarding the number of theatres in Prussia, their accommodation, &c. It appears that the largest theatre in Prussia is the Frankfurt Opera House, which has 1,000 seats, whilst the New Private Theatre at Berlin has 1,800 seats. There are apparently thirty theatres which have accommodation for under 1,000, and about twenty-five that can hold an audience of 1,000 to 1,500.

—From an article in the *Deutsche Bauzeitung*, it appears that the reconstruction of the bridges over the River Spree has practically been completed, and that the new bridge shortly to be constructed at this place will be the Aisen bridge, which will cost 25,000l. At present the principal bridge in course of construction is the one on the line of the Potsdammer-street.—To those interested in modern horticultural buildings we would call attention to an article in the *Centralblatt für Bauverwaltung* of May 22, with illustrations of the new conservatory in the Botanical Gardens, which are being hid out by the Government.

THE CAPE.—Owing to the building depression on the Rand large numbers of artisans are coming down South. Most of the men are shipping directly home, though a certain number remain in Cape Town, where the building trade is just now brisk, and the demand for labour in excess of the supply. The City Club at Cape Town is about to be rebuilt at a cost of 45,000l., the architect being Mr. Herbert Baker, by whom the work was won by open competition. Under the same architect the rebuilding of Mr. Rhodes's house is far advanced, the contract sum being about 40,000l. A large new hotel has been commenced at Cape Town in the upper part of the City, under the auspices of the Castle Mail Company, the architects being Messrs. Dunn & Watson, of London. The design has been most carefully prepared, and will be a welcome addition to the architecture of the city. The same architects' design for the Castle Company's own office in Adderley-street has just been completed, and both in appearance and quality of building is far ahead of any in the Colony hitherto erected by private enterprise.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. Whitelegg & Whittaker, architects, Manchester, have removed from their former address to Somerset Buildings, 19, Etna-street, Manchester.—Mr. Arthur Blomfield Jackson, who was in partnership with the late Mr. C. J. Phipps, and has been associated with him in his more recent works, will carry on the practice at the same address (26, Mecklenburg-square).

TRADE NEWS.—The directors of Stuarts Granolithic Stone Company, Limited, Regent Dock, London, Birmingham, and Edinburgh, recommend a dividend of 10 per cent. for the year ending 31st Dec. 1896.—**THE JUBILEE CELEBRATIONS.**—In the House of Commons, on Tuesday, the Home Secretary, replying to Mr. Hogan, said he had no definite information respecting the intention to crowd the roofs and front rooms of numerous old buildings along the route of the Jubilee procession. There was no law to prevent persons of inviting as many guests as they liked to their own houses, but the County Council, with whom he had been in constant communication, had considerable powers with regard to dangerous structures, and he had very good reason to know that they were quite alive to their responsibility in this matter.

CHURCH STRUCK BY LIGHTNING.—St. Clement's Church, Leigh, Essex, was struck by lightning, Tuesday afternoon. The turret and belfry were entirely wrecked, and the church was filled with smoke, while the clock was demolished. A large quantity of debris blocked the steeple stairs. Three large stained-glass windows were broken. The damage is estimated at 1,000l.

THE CONSISTORY COURT.—At a sitting of the Court, in St. Paul's, on the 19th inst., Dr. Tristram, Q.C., Diocesan Chancellor, granted faculties for the erection by the Corporation, and by several City Companies, of seats in St. Paul's-churchyard, for the Queen's procession on June 22. He granted similar borrowings in respect of St. Mary-le-Strand, St. Dunstan-in-the-West, and St. Clement Danes churchyards. It was stated that a well-known contractor would pay 5,750l. for the privilege at St. Clement Danes, and that the money would be devoted to the repair and adornment of the church.

EXTENSION OF THE ELECTRIC LIGHTING WORKS, &c., HANLEY.—Colonel J. T. Marsh, one of the inspectors of the Local Government Board, recently held an inquiry at the Town Hall into three applications made by the Hanley Town Council. The first was to borrow 15,000l. for the extension of the electricity works, the second to borrow 5,000l. for the completion of the park, and the third was to borrow 800l. for providing underground conveniences at the top of Broad-street. There were present, amongst others, Messrs. A. Challinor (Town Clerk), J. Lobley (Borough Surveyor), Sutherland and Cowell (Electrical Engineers), Burton (Assistant Surveyor), and Mawson (Park Designer). The Town Clerk, in making the application, stated that in February, 1893, the Local Government Board sanctioned the borrowing of 21,000l. for providing plant, machinery, and apparatus for supplying electric light, under the Order of 1891, and since then other loans had been sanctioned, bringing the total expended up to date to 46,110l. If the present application was granted the total capital would be 61,110l. The demand for the light was continually increasing, and he could not expect consumers to testify to their appreciation of the illuminating system.

THE STRAND IMPROVEMENT SCHEME, &c.—The Select Committee of the House of Commons, of which Mr. Rankin is Chairman, resumed consideration of the omnibus Bill of the London County Council, under which it was proposed to widen the Strand, and to remove the block of houses between the church of St. Mary-le-Strand and St. Clement Danes. Mr. Littler, Q.C., and Mr. Freeman, Q.C., having addressed the Committee, the room was cleared. On the re-admission of the public, the Chairman said: "The Committee consider that the preamble of the Bill, as far as relates to the Strand improvement scheme, has been proved. With regard to the principle of the Bill, they are of opinion that it is not in itself unjust, but in the present scheme they consider it can only be justly

and usefully applied to those properties which have a frontage upon the north side of Holywell-street. They also consider that the new street, being of great width, will require refuges in the middle in various places, and they also wish to call attention to the alteration, without stating what it should be, which will be necessary in sub-Clause 1 of Clause 41, which is the definition of the area over which betterment should be placed.—The Committee then proceeded to consider the remaining portion of the Bill which related to the widening of Tottenham Court-road, at the Oxford-street end, by the removal of the east side of Tottenham Court-road and Boziers-court. By this proposal the western side of Boziers-court will become the western side of the widened thoroughfare. Mr. Talbot, representing the County Council, said that, having regard to the decision just given, the Council would only seek to impose the improvement charge upon the property which, after the removal of the block, would front upon the widened portion of the road, the property between the southern corner of Tottenham Court-road and Hanway-street. The Council's advisers felt that the case of the eastern side of Tottenham Court-road was so analogous to the case of the south side of the Strand that they could not ask the Committee to include it in the betterment area. The Chairman announced that they found the preamble of this part of the Bill also proved.

ARCHITECTS AND BUILDERS.—On the 18th inst., Mr. Fred. E. Weatherly delivered an address on "Contracts" to the members of the Bristol Master Builders' Association, in the Board-room of the Chamber of Commerce. Mr. A. Kruss, President of the Association, was in the chair, and Mr. Weatherly said he must first express his indebtedness to Mr. Hudson's book on building contracts. He referred to the peculiarities distinguishing building contracts from ordinary contracts, pointing out that they were full of complexity, of risk, and multiplicity of detail. It was not fair to construe building contracts in the same bald, hard and fast way that other contracts were construed. He called attention to the architect's position as master of the situation, being the valuer, who decided all disputes, and whose decision was final. Moreover, he was the judge of his own work. He was the agent of only one party to the contract, and his decisions could not be impeached except on a charge of fraud, which was, rightly, a terribly difficult charge to support. The arbitration clause was therefore of vital importance. No one would dispute that architects were men of the greatest skill and integrity, and in Bristol and the West of England things seemed to work smoothly between architects and builders. It was not against the best and capable men that they had to guard themselves, but against the young and inexperienced. The very powers given to architects by the common forms of building contracts were precisely what might cause friction and even ruin to builders and disaster to employers in cases where the architect was young and inexperienced, and where ignorance and perhaps temper or wounded vanity might promote friction. He enlarged on the fact that an architect did not guarantee that his drawings were correct, his plans feasible, or his calculations accurate; and the builder had no remedy if he undertook to carry out a contract according to a plan which was afterwards proved to be incorrect. He ventured to think too great power was placed in the hands of the architect. Builders had to fight in order that the drawings and plans should be guaranteed by the architect or his employer; and if they were not correct it should not be the builder who should suffer. He referred in some detail to the form of contract, specially dealing with the relation of the architect and builder, and calling attention to important matters which were excepted in the reference to arbitration. He understood there had been endeavours on the part of builders to frame an arbitration clause which should be reasonable and fair to both parties. Unfortunately, however reasonable builders might think that clause was, he understood that the Institute of Architects refused to accept it. It seemed to him, however, that the contract form they desired showed them to be very long-suffering, as they might reasonably ask for more than they did. He also dealt with several points of interest to builders in connexion with contracts. What all persons desired was some form of contract which should enable all parties to work with the greatest harmony and with the greatest spirit of independence, without one party having undue power over the other. A hearty vote of thanks was given to Mr. Weatherly for his address.—*Bristol Times.*

OLD ROMAN ROAD AT STROOD.—For some time past traces of the old Roman road have been discovered in Rochester and Strood. The road was first exposed at the foot of Star Hill, and it has been seen at intervals all along the street. Portions of it were turned up a week or two since, at the foot of Rochester Bridge, near by the Castle Club, while during the excavating operations now going on in connexion with the storm water drainage works at High-street, Strood, the workmen have been constantly throwing out portions of the paving all along from the foot of Rochester Bridge. Near to the railway bridge, in the centre of the High-street, they came across the Roman road, about 3 ft. from

the surface. It is in a most perfect state. Wheel ruts are discernible, and it is thought that on the road being opened further in the direction of Station-road, the other wheel ruts will be discovered and the origin of the Roman wagon thereby established beyond all doubt. An interesting point of the discovery is that it shows the construction of the road throughout, and illustrates what the place was like before the Romans made the road. The land was undoubtedly marsh, and before the paving was laid, oak piles were driven so as to form a foundation, and then by a very careful method of preparation the road was laid sufficiently high so as to bring it up to the level of the old Roman bridge across the river. Mr. George Payne, F.S.A., has inspected the spot, and taken measurements. He has also numbered certain of the stones with a view to the same being preserved for exhibition in the Rochester Museum.—*Chatham News.*

DINNER, BRIGHTON MASTER BUILDERS.—The annual dinner of the Brighton Association of Master Builders was held on the 20th inst., at the Clarence Rooms, Hôtel Metropole, Brighton. Alderman Botting, J.P., Chairman of the Association, presided. After dinner the loyal toast was honoured at the invitation of the Chairman. Mr. J. K. Nye proposed "The Mayor and Corporation," and Alderman Davey responded. Mr. G. S. Godfree proposed "The Association of Master Builders." He said he understood the Association was formed not so much for the protection of the master builders as for the protection of the workmen of the town. The Chairman, in responding, said it was quite true that the Association was not formed for the purpose of fighting the workmen of the town. One and all were prepared to say that on no occasion had they had a serious difference with their own men, but they had frequently been interfered with from outside. The men, wisely or unwisely, had joined unions which called upon them at certain times to strike, and he thought the masters had been inclined more to pity them than to blame them. There was much that was good in the unions, but the abuse was that at certain times when they could make good money the men were called out and hounded to remain idle. Their men in Brighton were called out under such circumstances four years ago, and that Association was then formed—as much to protect their workmen as themselves; and from that time to the present there was the best of feeling between the masters and the workmen. The difficulties were raised always by certain men who got their living out of the workmen, and who went over the country disturbing the peace between masters and workmen wherever they could. There was only one name to call it, and that was a bad form of Socialism. There was a good form of Socialism where there was a desire to elevate men generally, and lift them to a better position. He thought it possible they might have a repetition of strikes in the country, because the union leaders watched for prosperity, and regarded the time when workshops were full of work as the proper one for a strike. The master builders must, therefore, be prepared for it was where they were not ready that strikes were declared, and if they kept together as they had done during the past four years he did not think there would be any trouble in Brighton. Referring to the new Employers Liability Bill, he said he hoped the Association in London, of which theirs was a branch, would be very proper one for a strike in resisting the extension of the Bill to the building trade. Up to the present moment the Bill was restricted to what were called dangerous trades; but there was no doubt that in Committee a very strong attempt would be made to make the building trade also responsible for all accidents. Where there was carelessness on the part of the master builder he was certain he ought to pay, for every precaution should be taken for the safety of the men, and he was certain that in Brighton generally that was done, but an attempt would doubtless be made to saddle the employer with all responsibility, however much the workman was to blame for carelessness.—Councillor Wilson proposed "The Visitors," for whom Mr. Howard Gates responded. Mr. Parsons proposed "The Chairman," Alderman Botting responding.—Councillor Holloway proposed "The Vice-Chairman." Mr. Lynn, in responding, said he knew a case in which an apprentice got heavy damages against his employer. The law costs broke the employer, and the apprentice, after a brief holiday, returned, and set up in his place.—Mr. Garrett and Mr. Parsons also responded.

ORGAN, ST. SAVIOUR'S COLLEGIATE CHURCH, BOROUGH.—The Bishop of Southwark dedicated, on the 10th inst., a new organ at St. Saviour's Collegiate Church, Borough. The organ has been built by Messrs. Lewis & Co., Brixton. The case was designed by Sir Arthur Blomfield, A.R.A.

ARCHÆOLOGICAL DISCOVERY, IPSWICH.—A discovery of exceptional archaeological interest has been made in Fore-street, Ipswich. Men have been engaged pulling down some old premises occupied by Messrs. Martin & Newby, and when they came to the wall at the back they discovered two rough piers, about 4 ft. thick, constructed of flint and York stone put together with Roman cement. It was with the greatest difficulty that they could break away any portion, but the space round was cleared, and Mr. Watling, the archaeologist, had no hesitation in declaring that the piers were once part

of the East Gate of the town. The width of the gate, according to the space between these remains, was about 17 ft., but the height must be speculative, as the piers do not stand more than 6 ft. high. The brick wall was apparently built on the old town wall, which was connected with the piers, and which, it is evident, runs each side under the existing wall. This was built about 1700, and the bricks are in a splendid state of preservation. They are perfectly smooth, and very much the same shape as those in use at the present day, though, if anything, a trifle shorter than those of more recent date taken from the top of the wall.—*East Anglian Times.*

CAPITAL AND LABOUR.

CARPENTERS' DISPUTE, LONDON.—A large number of the carpenters employed by Messrs. Waller & Co., of Belgrave-square, and Messrs. Allen & Co., in the erection of Jubilee grand stands at Charing Cross street, were on Wednesday in consequence of the refusal of the employers to concede them an advance of 2d. per hour on their present rate of wages. Upwards of 120 workmen were employed on the two undertakings, and in all cases they were in the receipt of wages equivalent to 10d. an hour, which is the recognised trade unit rate for London carpenters. A large section of the workmen, however, appeared to have grown suddenly dissatisfied with these terms, and justified their attitude by a reference to other cases in London where workmen are being paid a higher rate of wages for this class of "emergency" work. The works foreman for the contractors refused to accede to their request, and consequently the dissatisfied workmen, numbering over fifty, left work. The works foreman states on behalf of the contractors that no notice has been given them of the demand, which they considered altogether unreasonable.

THE STRIKE IN THE PLYMOUTH BUILDING TRADE.—The representatives of the Plymouth Master Builders' Association are canvassing through the three Western counties for carpenters and plasterers. Several more men whom they have induced to agree to the terms of the agreement with which each delegate is armed have arrived in the town, and, it is stated have been put to work.

IPSWICH BUILDING TRADE STRIKE.—Neither parties to the dispute in the Ipswich building trade have made any advances towards a settlement of the carpenters' and joiners' strike. The men are gradually going away to other places, some thirty or more having left, and to members of the Society strike pay of 15s. per week has been distributed. Somewhat to their surprise, it is stated, non-Society members who have come out were also paid—the married men at the rate of 11s. per week, and single men 8s.

THE CARLISLE JOINERS' STRIKE.—The strike amongst the joiners still continues and the prospects of a settlement seem as remote as ever. No overtures have been made by either side, and the ranks of the strikers are being thinned daily by departures to other towns. Of the 142 men who came out seventy-two have now left and commenced work elsewhere, and seventy remain in the city. Of the numbers who have left it is stated that only two are receiving less than 9d. an hour.—*Carlisle Journal.*

THE CARPENTERS' STRIKE AT DUDLEY.—A meeting of the carpenters and joiners of Dudley and district, amongst whom a strike is now existing, was held in the Windmill Inn, Old Mill-street, Dudley, a few days ago. Mr. H. Crump said that that was the seventh week of the strike, which had been declared for the purpose of securing an advance from 7d. to 8d. per hour, and the adoption of a code of working rules. Mr. J. Matthews (Birmingham), who presided, expressed surprise that the Dudley employers should have so long resisted the very moderate demands of the men. The wages at Birmingham were 9d. per hour, and in Wolverhampton they were 8½d., but Dudley had long been notorious for under payment in the various trades.—Mr. George Wilson proposed "That we, the carpenters of Dudley and district, are still determined to remain firm to our demands of 8d. per hour and code of working rules, and pledge ourselves to use every legitimate means to bring the same to a successful issue."—Mr. B. Round seconded the motion, which was supported by Mr. Vaughan (Wolverhampton), Mr. G. Davis (Birmingham), and Mr. Davies (Wolverhampton), the delegates, giving the men on strike assurance of continued help from the surrounding districts, and pointing out that even in Wednesday and Darlaston the carpenters had had an advance. The resolution was carried unanimously.—Mr. H. Crump proposed "That we, the members of the building trade of Dudley, protest against the action of the Sanitary Committee of the Dudley Town Council, in allowing the fair wages clause to be violated by the employment of underpaid labour on contracts, and urge upon all members to use every means to secure representatives who will see that the objects of the fair contracts resolution are carried into effect." Mr. Joseph Round seconded the resolution, which was carried.

STRIKE OF BUILDERS' LABOURERS, OMAGH.—The labourers engaged in the erection of the new asylum, the new infirmary, and the new Roman Catholic Church in Omagh have struck for an advance of

wages. The men at present have a wage of 12s. per week, and are demanding a rise of a halfpenny an hour.—Freeman's Journal.

MEETINGS.

FRIDAY, MAY 28.
Royal Institution.—Professor Moissan on "The Isolation of Fluorine." With experiments. 9 p.m.

SATURDAY, MAY 29.
Lewisham Antiquarian Society and St. Paul's Ecclesiastical Society.—Afternoon meeting at Pullborough and Hardham, 5 p.m.
London and Provincial Builders' Foremen's Association.—Monthly Meeting, the Memorial Hall, Farringdon-street. 7.30.

MONDAY, MAY 31.
Royal Institute of British Architects.—Special General Meeting to receive the Report of the Council on the Election of Candidates for Fellowship. 8 p.m.
Surveyors' Institution.—Annual General Meeting to receive the Report of the Council and the announcement of the result of the election of officers for the ensuing year. 3 p.m.

WEDNESDAY, JUNE 2.
Royal Archaeological Institute.—Viscount Dillon, and Mr. W. St. John Hope, M.A., on "An Inventory of Arms and Armour belonging to Thomas, Duke of Gloucester, in 1399." (2) Mr. James Hilton, F.S.A., on "The Coronation Stone at Westminster." 4 p.m.
London and Provincial Builders' Foremen's Association.—Paper by Mr. T. Cain Hughes, entitled "Notes on North Lanca-shire." 8 p.m.
Builders' Foremen and Clerks' Work Institution.—Ordinary meeting of the members. 8 p.m.

THURSDAY, JUNE 3.
Society of Antiquaries.—Ballot for the election of Officers. 8 p.m.
Royal Institution.—Professor Dewar on "Liquid Air as an Agent of Research." II. 3 p.m.
Northern Architectural Association.—Annual Exhibition. 5 p.m.

FRIDAY, JUNE 4.
Royal Institution.—Mr. W. H. Prece C.B., F.R.S., on "Signalling through Space without Wires." 9 p.m.

SATURDAY, JUNE 5.
Edinburgh Architectural Association.—Visit to Torphichen Church.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

8,614.—WATER-CLOSERS, TRAPS AND MOUNDS: P. J. Davies.—The inventor claims (1) the construction and casing in one piece (except capping piece) of simple siphonic traps of lead, with or without diaphragm; (2) casting lead siphons in one or more pieces to be cast in one piece, or in connection with the bit of hinge, and thereby setting up friction resistance to the action of the hinge. Other combinations of a hinge "with an adjustable spring are described and claimed.

10,940.—HINGES AND SIMILAR MECHANISMS: H. Hyde.—The inventor claims a hinge for controlling the action of all kinds of doors, with an adjustable spring, which, when the door is opened and closed, is compressed or extended, as the case may be, by the action of an eccentric surface, cam, or their equivalent, formed upon or affixed to, or in connection with, the bit of hinge, and thereby setting up friction resistance to the action of the hinge. Other combinations of a hinge "with an adjustable spring are described and claimed.

11,612.—ATTACHMENT FOR USE IN MOULDING: R. J. Bell.—The attachment is designed to cut a mould and a fret, if required, at one operation. Attachment consists of a piece of steel, one end of which is screwed on revolving cutter stock, the other end of conical shape, and terminating in a parallel spindle of small diameter, the point being shaped like a wood-boring bit. A slot is formed through the central part of attachment. In this slot the moulding cutter is placed, and secured by a set screw. In action the design is passed on the wood, and the stock carrying attachment is set in motion. The piece of wood is now forced down upon the bit-shaped end of the attachment, and, by a species of routing action, the pattern is cut out. Duplicates from the work thus cut can readily be obtained, and frets cut in the ordinary way by the saw can be moulded by this invention.

13,845.—METALLIC LATTICE: B. E. W. Siffon.—In order to form a cheap and portable lattice for fencing and other purposes, inventor connects two series of metal strips so that they expand into the usual diamond-shaped lattice form; but at each crossing point of the strips he forms aperture in strips for rivet of a somewhat elongated form, and adopts between the strips a distance piece or washer, connecting the three thicknesses at such crossing by a rivet. This expedient allows of a certain amount of "play" or self-adjustment, and subserves several purposes. 21,444.—SPINNING SAVING: M. Hines & J. Peckover.—Inventor aims in his mechanism at supporting the spinning operation upon and carrying it along in a smooth, steady manner, securing a uniform pressure, spacing, and holding sweater under trying conditions, and at the same time, and redistributing it to saws, uniformly maintaining slabs in their true position, regulating water supply, and securing general economy and efficiency. For these purposes, inventor designs a stone-sawing machine the combination with a frame having three trackways of front and middle saws arranged to travel on the lower and narrower of the said ways, and a rear car mounted to travel on the highest and wider trackway, and adapted to pass the said middle car. An endless carrier provided with plates or buckets conveys the abraded material from the kerfs and discharges it at points above the stone.

21,445.—CUTTING COWLS: H. E. Carr.—Inventor constructs his cowls, either of metal or earthenware, with an outside straight pipe and an inside straight pipe of smaller diameter, having a fixed or movable double cone on top of the small pipe inside. Cone may be a fixture or may rise and fall on a sliding rod.

NEW APPLICATIONS FOR LETTERS PATENT.
MAY 10.—11,541, D. Williams and E. Davies, Gas, Smoke, and Foul Air Extractor.—11,542, J. Thompson,

Dust Excluder and Ventilator for Sliding Windows.—11,577, G. Westgarth, Window Fastener.
MAY 11.—11,653, J. Lawrence, Gully Trap Applicable to all Traps.—11,673, J. Cole, Window Sash Fasteners.—11,687, G. Healey, Sash Fasteners.—11,689, R. Roberts, Sash Fasteners.—11,715, W. Henley and others, Apparatus for Use in Erecting Buildings and other Structures of Concrete.

MAY 12.—11,771, H. Groomie and J. Wynes, Self-Controlling Screw.—11,831, J. Wood, Window Sash Fasteners.—11,841, G. Scholefield, Bolts or Fastenings.—11,845, H. Alexander, Machine for Pressing Strips.—11,846, G. Ashford, Fasteners for Window Sashes, Fanlights, Casements, &c.—11,925, E. Smith, Stoneware or Earthenware pipes.—11,925, H. Coward, Construction of Fireproof Doors.—11,925, J. Jensen, Fire Grates.—11,943, T. Farley, Sash Fasteners.—11,954, T. Palmer, Brick-making and Pressing Machinery.
MAY 14.—11,975, H. Minnie, Ornamenting Wood.—11,990, F. Schacht, Door Checks or Holders.—12,006, A. Constable, Stop Gates for Sewage and Irrigation Purposes and for Flushing Manholes in Sewers.
MAY 15.—12,015, R. Vevers, Window Frames.—12,070, C. Lancaster, Wood Screws, &c.

PROVISIONAL SPECIFICATIONS ACCEPTED.

5,738, A. Clifford, Flushing Tank or Waste Water Preventer.—10,736, J. E. Keane, Scaffold Cramps.—9,447, J. R. S. Black, Compositions and Paints for Preserving Structures.—10,000, C. Fischer, Catches or Fasteners for Sash and Folding Windows, &c.—10,471, T. Holford, Window Sash Fasteners.—10,520, G. Ashwell, Sash Fasteners.—10,556, J. Colman, Windows.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

10,690, F. Lynde, Lavatory Basins, &c.—11,384, G. Taylor, Chimney Flues.—12,229, A. Logan, Stall Flooring.—12,570, W. Griffiths, Means for holding ajar Doors, Window Casements, &c.—4,779, W. Wise, Enabling Bolts and the Shafts of various Articles to be easily secured in Wood.—10,000, C. Fischer, Catches or Fasteners for Sash and Folding Windows, &c.—10,471, T. Holford, Window Sash Fasteners.—10,520, G. Ashwell, Sash Fasteners.—10,556, J. Colman, Windows.

SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.

May 6.—By DOUGLAS YOUNG & Co. (at Sutton). Sutton, Surrey.—Lenham-rd., forty plots of building land, f. 53,397 and f. 3,850.
Berhill-st., twenty-seven plots of building land, f. 1,378.
Lichfield-rd., nine plots of building land, f. 728.
Warwick-rd., eleven plots of building land, f. 831.
By W. G. WOODS & Co. HAYWARD (at Chippenham). Laocock, Wilts.—"The Laocock Brewery," f. with twenty-one public and beer houses attached. 26,600.
By HENRY HENNING (at Birmingham). Bordesley, Edgb., Warwick.—17, 18 and 19, Victoria-st., f. 725.
14, 15 and 16, Victoria-st., ut. 724 yrs., g.r. 44, 100, and 100. 445.
Handsworth, Edgb., f. 10 (odd), Furney-rd., ut. 73 yrs., g.r. 111. 1,359.
Edgbaston, Warwick.—Willow-av., &c., twelve building plots, f. 738.
By O. SMITH (at Plymouth). Halberton, &c., Devon.—"Luson Farm," 123 a. 4,318.
"Brownstone Farm," 176 a. 1 r. 7 p. 4,450.
Enclosures of land, 14 a. 0 r. 33 p. f. 490.
Four cottages, blacksmith's shop, and 1 a. 1 r. 5 p. f. 585.
May 7.—By W. W. READ & Co. Holborn.—High Holborn, one-tenth share of figr. 250l., reversion to 74 yrs. 675.
High Beech.—Lippett's Hill, a plot of land, 3 a. 2 r. 21 p. f. 500.
Buckhart Hill.—Queen's-rd., figr. 124, reversion in 80 yrs. 380.
Old-rd., "The Bull Headed Stag" p-h., and 2 a. f. 1,000.
Palmerston-rd., a plot of building land, f. 910.
Palmerston-rd., "Fairview," and half an acre, f. 2,600.
Blackheath.—69, Humbler's-rd., f. 354.
By WYATT & SON (at Southampton). Southampton.—Jail-st., &c., a freehold building site, area 4,900 sq. ft. 4,200.
113 and 115, Priory-rd., f. 359.
85 and 87, Duke's-rd., with a plot of land, f. 750 (odd), Kent-rd., with a plot of land, part f. and part f. 665 yrs., g.r. 71, 168. 330.
75, Kent-rd., f. 975.

The Architecture of our large Provincial Towns.

VII.—LEICESTER.

ALTHOUGH Leicester is a town with a historic past crowded with great names and important events which have left their marks upon the political, social, and religious life of the country; and although there is no lack of interest in its mediæval structures and remains; it is not of the past that the visitor is apt to think most, who notes the activity and prosperity indicated by its crowded thoroughfares and handsome modern buildings. If the life and trade of the nineteenth century had passed Leicester by, it might have become a place of pilgrimage for the archeologist and the tourist; as things are the chief pilgrims are commercial travellers, whose visits have little to do with the buildings of the past, but a great deal, although they perhaps do not think of it, with those of the present and future. Old Leicester covered a very considerable area for a mediæval town; but it was only about a sixth or a seventh the size of the present one, which has spread mainly along the valleys and up the sides of the hills to the south and east, and, though only to a comparatively small extent, across the river to the west. It was protected by walls on the south and east, and by the River Soar on the other two sides; the castle being strongly posted, on a hill overlooking the river, at the south-west corner. The oldest part is no doubt the poor district on the low ground in the bend of the stream, through which the new, dismal, black brick viaduct of the Manchester and Sheffield railway is being carried. Immediately under this viaduct is the only piece of Roman workmanship remaining, except the ruined wall near St. Nicholas'

Church: it is merely a piece of mosaic pavement of ordinary geometrical pattern, but the workmanship is exceptionally good, and it is being carefully housed in a well-lighted chamber.

The main streets of modern Leicester converge upon an irregular open space called the East Gates, whence tramways run along the principal thoroughfares to the outskirts: by Gallowtree Gate, Granby-street, and the London-road, to the south; by Humberstone Gate and the Humberstone-road to the east; and by Belgrave Gate and the Belgrave-road to the north-east. The old main street, High-street, which runs westward, though still an important business thoroughfare, is narrow; and so is Churchgate, leading north. Gallowtree Gate and the region just west of it is the present centre of the town. Here are not only the Market-place and the Municipal buildings, but the clubs, banks, insurance offices, and most of the good shops. There is a minor residential quarter growing up on the hill west of the river, but the principal one is to the south on both sides of the London-road. This may be said to begin at the railway station; indeed, the whole region south-east of the railway is mainly residential, the average size and importance of the houses increasing as the hill is ascended and the distance from the centre increased, until in the extreme south are what are practically large country residences. A pretty feature of the town is the "New Walk," a broad asphalted footway, planted with trees and mainly bordered by old-fashioned residences and small gardens, which runs from Belvoir-street almost in the middle of the business region, to Victoria Park on the outskirts. Of the three parks, Victoria Park is an open common on the summit of the southern hill, and Spinney Hill Park a newly laid out public garden on a steep slope facing the south, in the midst of a thickly-populated neighbourhood, where it must be much appreciated. Abbey Park is older, prettier, and better grown, and is on the large island to the north. The refreshment pavilions in both the last-named have

some architectural pretension and picturesque-ness, though the one in Spinney Hill Park, by Mr. Stockdale Harrison, is hardly equal to some of his more serious designs.

There is certainly in Leicester architecture a more strongly marked tendency to good taste, as opposed to mere costly ornament, than is usually found in towns where the commercial element is the most important; but there is an equally strongly marked tendency among tenants to cover up good architecture with huge name-boards and advertisements, which seems, to say the least of it, a great pity. The natural building material of the country seems to be a red brick, of which every kind and tint is to be seen (including, unfortunately, the pallid, shiny kind that is so important an element in the dreary aspect of most poor neighbourhoods in the Midlands). Notwithstanding the presence of various stones and terra-cotta and an unusually large sprinkling of modern half-timber work, Leicester is essentially a red brick town.

The principal public civil edifice, the Municipal Buildings, erected by Mr. F. J. Hames in 1874-76 as the result of a competition, is itself a "Queen Anne" red brick structure of good character; not, perhaps, very imposing or monumental, and rather too much based upon domestic examples to have a very official expression; but designed in quiet, good taste, for the most part, and well grouped. The most striking and satisfactory features in the front are the end bays of the middle block, with their long windows; and the least satisfactory is the centre bay, which has an ugly-shaped opening on the first floor and a gable with a very weak outline. The long balcony, carried on enormous corbels, is exceedingly helpful in pulling the design together, and in marking the ground story with a good deep shadow. The tower is well placed, and the concentration of features in the upper part effective, though the detail is not, perhaps, very interesting. The building is conveniently planned, but is said to be already too small for the business of the town, and a new Town Hall is in

St. Margaret's Church.

Courtyard, Old Town Hall.

contemplation. A great part of it is taken up by the Crown and Nisi Prius Courts, which occupy nearly all the space within the main corridor, and are fine rooms, with natural oak fittings very tastefully designed. The Council Chamber is at the north-west corner, and is also a fine room. The small square in front is laid out as a public garden, in the middle of which is a small bronze fountain. The Old Town Hall is a small hall, with an open roof of rough-hewn timbers, and a range of windows in the upper part of the wall similar in character and arrangement to most of the earlier halls of the mediæval guilds. It belonged to the Guild of Corpus Christi before it was purchased by the Corporation of the town, and is said to have been erected in 1350, though no more than a part of the entrance end can be of quite so early a date. The Mayor's parlour, facing the end of the picturesque little courtyard, is said to have been added in 1636; but it is possible this was only an alteration; its carcase, and that of the building now occupied by the old library, opposite, have all the appearance of being parts of the original building. The rooms occupied by the library in particular have been formed by dividing up a large upper apartment, which, from its position, may be suspected of having been the dormitory. The Mayor's parlour is a fine old panelled room with a magnificent chimney-piece, and fragments of some beautiful and probably very old yellow stained glass in the windows; it is kept apparently as a show place only, and the hall itself seems given

over to cooking classes, and is filled up with lumber and cooking apparatus.

The assizes are still held, as they have been for centuries, in the great hall of the castle, but the alterations made in 1831 have covered up all there may be of architectural interest within, while outside it is buried behind a plain square block erected in the last century, and by other buildings; all that is now to be seen of the hall is the top of the roof rising behind them, decorated with four great iron ventilators. A ruined gateway, and a remnant of curtain wall, complete what is left of this historic castle, for the second gate, now called the magazine gateway, is of very late date and not built for defence, and is (probably rightly) conjectured to have been connected with the collegiate church that once stood in the Newarke. The Market Hall, with the Corn Exchange on the upper floor, stands on the west side of the irregular-shaped Market-place, and is a stucco building of no great interest, within or without, although the clock turret is picturesque at a little distance. The finely conceived double stone stairway to the Corn Exchange, designed by Mr. Ordish, is, however, a very excellent piece of work, well worthy of the town and of its prominent position. The East Gates clock tower, erected in 1868, by Messrs. Goddard, Paget, & Goddard, is a very ornate structure, much more satisfactory in its general conception than in its details, but a picturesque object, which no visitor to the town is likely to forget. The Corporation gas and electric light offices in Millstone-lane were originally erected in a rather heavy

Gothic style; but Mr. Edward Burgess has recently made a very interestingly-designed and imposing addition to the structure. The chief feature is a massive-looking, octagonal angle tower or pavilion, very plain in the lower part, except as regards a small window over the door, but breaking into a mass of pretty French Renaissance detail at the top. The upper stories of the flanks are formed into recesses separated by polygonal brick piers and brought forward again in the form of bay windows. The ground story is of stone and unbroken, and there is a broad, plain frieze and a cornice. It is all very largely and simply conceived and beautifully detailed, and is altogether a very pleasing piece of work. The Waterworks office, in Market-street, by Mr. Charles Baker, is a little building of early Gothic character, in better taste and with less exaggerated detail than is usual in that class of work. The only other structure connected with the government of the town which calls for notice is the pump-house of the drainage pumping station, which is, contrary to all precedent, a very satisfactory piece of architecture; a good square, solid-looking structure with a large upper range of windows and strongly-marked angle piers, a fine sense of scale and withal interesting detail; it was designed by Mr. Stockdale Harrison. Of this we shall give an illustration shortly.

Of the remaining public secular buildings, the old News Rooms in Granby-street and the Central Free Library in Belvoir-street, are monuments of the Greek revival; as is also the Phoenix Fire Office, near the latter.

External Stairs to Corn Exchange. By the late Mr. Ordish.

Such work is not perhaps interesting, but as against much that is done now, it does strike one as having style, and its refined and scholarly details worthy of recognition. The Assembly Rooms in Hotel-street has a tame stone front of the Adam period. The cab-yard of the Midland Railway Station has a new red brick and terra-cotta screen wall next the street, which might have been more satisfactory if rather more care had been taken with the outline of the clock turret and the curvature of the arches. The best of the branch free libraries is that in Narborough-road in the western suburb, by Mr. Stockdale Harrison; a striking little Dutch Renaissance structure of some originality, and, except as regards the tower and the vases on the gate-posts, adequately detailed. The main entrance door is especially satisfactory, and the interior is well lighted and well, if plainly, fitted. The Post Office, in Granby-street, is a heavy-looking erection, apparently intended to be Perpendicular in style, but with exaggerated details. The new building beside the Midland Station, not yet occupied, is, however, rather better; very hard and unsympathetic, but in good taste and fairly well detailed. The museum at the corner of the New Walk and Hastings-street is in the form of a Classic temple with a tetrastyle portico of enormous Tuscan columns: it is perhaps needless to say that it is really a two-storied building. Connected with it is the Art Gallery, which makes no architectural pretension, but is well lighted and contains some good pictures and prints; among others, several interesting records of old Leicester architecture.

In virtue of their architectural importance,

the coffee-houses designed by Mr. Edward Burgess for the Leicester Coffee House Company deserve to be mentioned first among the commercial buildings in the town. The two principal ones are the new "Victoria" in Granby-street and the one in the East Gates, built in 1885. The latter is a picturesque, gabled red brick and half-timber corner building, with red tile roofs and well-designed chimneys. The windows of the upper floor are large quadrant-cornered oriels under a boldly projecting broad plaster frieze supporting the eaves, and on the ridge is a timber ventilating turret of squat proportions. The dark coloured paint, of which Mr. Burgess seems fond, makes the upper parts look a little heavy, but, as a whole, it is an exceeding satisfactory piece of work. The "Victoria" is an unusually original and effective stone building, standing, unfortunately, in a narrow street where it is not well seen, and where its most prominent feature—a high conical roof, finishing with a small domed turret—is almost lost. The style is French Renaissance, and the roof is cut into by a characteristic dormer three stories high, and is flanked by large turrets. A deep shadow over the ground story is obtained by recessing the whole of the centre part of that level. Some of the details are eccentric, and not equal in effect to the general arrangement. The "Rutland," in Humberstone Gate, is a quiet, restrained design, with plain gables and mullioned windows of Elizabethan character. The "Albert," in Belgrave Gate, is rather heavy, with large scale details, and altogether less satisfactory than the others. The only two of the hotels that need be noticed are the

"Royal," the new wing of which, by Messrs. Everard & Pick, facing the garden in front of the Municipal Buildings, has a well-designed and not over assertive red brick front, with a stone ground story and good dormers, and the "Wyvern," by Mr. Wakerley, of which we give a lithograph illustration. Of the two principal political clubs, the Liberal, in Municipal-square, is architecturally the more interesting. It is another of Mr. Burgess's François I. designs, with high pitched roofs, large windows, and high dormers.

The banks are respectable but uninteresting buildings; even the neat little new entrance to the Northamptonshire Union Bank in Gallowtree Gate is spoiled architecturally on close examination by indifferent detail. The Prudential Assurance Company's offices in the same street, presumably by Mr. Waterhouse, is a characteristic red brick and terra-cotta building, with a red granite flush plinth reaching to the springing level of the arches over the ground floor windows. The front of the Alliance Assurance Company's premises in Horsefair-street, by Messrs. Goddard, Paget & Goddard, is quietly and well designed, the treatment being most successful in the lower part. Of shop fronts, the most commanding on the irregular north-west side of the market-place is No. 38, by Mr. Charles Baker; and the most striking on the east side is No. 57, a new and very charming piece of work by Mr. Stockdale Harrison, in which good use is made of the momentarily fashionable, and certainly effective feature, of ranges of windows deeply recessed between columns. The details, including a

Technical and Art Schools. (Messrs. Everard & Pick.)

little architectural carving, are good, and distributed with taste and judgment. This front stands between two older ones of some merit, by Messrs. Goddard, Paget and Goddard, and Messrs. R. J. and J. Goodacre respectively; the dormers of the latter being especially pleasing. In the centre of the market-place is a gilt statue of the fifth Duke of Rutland, erected in memory of his having been for fifty years Lord Lieutenant of the county; it is a fair piece of work, and now that the gilding is weather-stained, it is rather pleasant looking than otherwise.

At the bottom of Gallowtree Gate is the buff terra-cotta front of Messrs. Thomas Cook & Son's offices, by Messrs. Goddard, Paget & Goddard, consisting, on the first floor, which is the most successful part, of four deeply-recessed elliptical arches, divided by Italian Renaissance three-quarter columns, with an upper story of mullioned windows, above which are four small equal gables, pierced by circles; the detail is very good, and the whole front decidedly effective. In Granby-street, next to the Co-operative Society's premises, is a very charming little two-storied, gabled, white wood front to a hairdresser's shop, as excellent in detail as in idea. The Co-operative Society have premises in both High-street and Granby-street; the former are of little interest, but the latter is a fairly effective structure in the French Renaissance style, and would probably look even better but for the extreme smallness of some of the mouldings. Opposite to a great aggressive stucco building a little farther up the street, is a block of shops, with a series of quiet gables in red brick and Mansfield stone, designed in very good taste; and still farther, at the corner of Campbell-street, a new block, with an excellently designed and detailed half-timber upper part, by Messrs. R. J. and J. Goodacre, forming a pleasant contrast to the

imposing and gorgeous Wyvern Hotel next door. The best piece of modern architecture in High-street is that which forms 81 and 83; a pair of very plain and simple gabled fronts, with broad windows to the first floor slightly projecting in a flat segmental curve. There is very little in them, but everything is good and the effect is decidedly pleasing. No. 95, which is still unfinished, has some bold and well-proportioned features, and looks as if it would be a very satisfactory piece of work. The upper part of the large draper's shop at the corner of Belvoir-street and Market-street is a bold and remarkable design by the late Mr. Isaac Barradale, consisting of a heavy-looking overhanging timber gable, flanked by equally bold dormers, and surmounting a stone oriel or turret on the angle: it is very striking, but far less satisfactory than the quiet and broadly treated house next door in Market-street by the same architect, with its white sun-shutters and projecting rough-cast top story. In Halford-street there is a rather restless but effective stone front to a tailor's premises, with deeply recessed windows round which rustications of somewhat too small a size are used; one feels regret in looking at it that, for want of a trifle more quiet and sense of scale, it falls just short of being a really first-rate piece of work. No. 12, Grey Friars, is a pretty and rather curious little office front, we believe by Mr. Barradale. What little there is of the main front wall is of a dull red terra-cotta; but nearly the whole of the upper part is a projection of white wood-work filled in with rough-cast and crowned with a double gable; and the ground floor is largely door and window, with grey terra-cotta dressings and quaint little pilasters. Just opposite is a larger office building of rather more ordinary half-timber character, but well treated, with broad windows and long, strongly marked cornices.

It is so rarely that factory architecture even aims at anything more than the satisfaction of practical requirements in the simplest possible way, that buildings of the kind which are really fine architectural monuments come upon one as pleasant surprises. Of such there are at least two in Leicester. The older is the Atlas Works, in Campbell-street, by Mr. Barradale. It is a four-story red brick building with three tall crow's-foot gables in the manner of the Dutch waterside warehouses. The windows are square headed within shallow arched recesses, the heads filled with the characteristic bold brick cusping and tracery. It is a fine piece of design, even apart from the skill with which the general character and details of the original examples are imitated. The other is Messrs. Faire Brothers' new premises, in Rutland-street, from which the scaffolding was just being removed in April. Whatever the opponents of terra-cotta may say, this is a really delightful example of the appropriate and pleasing use of the material. The ground story, with the exception of the entrance door, and the projecting end bays, are severely plain, but the space above and between these is filled with ranges of coupled windows, very richly detailed and deeply recessed between massive-looking piers which support a strongly marked and rich cornice carrying a high balustrade. Behind this balustrade, and crowning the design, is an attic of wide semicircular-headed windows. Mr. Edward Burgess is the architect of the building, and in this case, while abandoning the great dormers and other stock features of his favourite François I. style, he has certainly made a very charming use of its details and ornaments.

Leicester is almost as fortunate in its ecclesiastical as in its commercial architecture. It has five Mediaeval churches, two of which are exceptionally interesting; no less

Additions to the Royal Hotel. (Messrs. Evcard & Pick.)

Dwelling House (Mr. E. Burgess). St. John's Church (Sir Gilbert Scott).

han four by Sir Gilbert Scott, all of which are good, and one by Mr. Street; besides at least one recent one of great excellence. St. Mary's "in the Castle," is generally considered the most interesting of the old churches, though we think St. Margaret's may fairly dispute the position with it. St. Mary's is said to have been built in 1107, and to have been partly rebuilt and enlarged towards the east by Robert Bossu, the son of the founder. As a matter of fact there seem to have been two enlargements eastwards before the end of the Norman period. The only part of the original structure remaining is the lower part of the walls at the west end, and this has been cut through on the north and south to form the Early English arcades. The later and richer Norman work at the east end is, however, almost intact. The nave and chancel are under one roof and make a long narrow interior; the north aisle is very narrow, but the south, which is of the Decorated period, is about twice the width of the nave and nearly as high; the striking effect of the interior is no doubt due to the strong contrast thus introduced between the proportions of the two main parts. The position of the tower is peculiar: except for the west wall it stands wholly

within the south aisle, within 3 ft. of the Early English nave arcade with which it seems to be contemporary; from the fact that it is open to the church on all sides this would seem to be an original arrangement, but it is hard to say what can have been the object of blocking up one side of the church in this way. The open roofs are handsome flat-pitched ones of the Perpendicular period, and there is an upper range of Perpendicular windows to the broad aisle evidently inserted to improve the light, which, even with them, is not too good. Sir Gilbert Scott restored the church, and the beautiful choir screen, pulpit, lectern, and stalls, and the fine east window of the south aisle are presumably his work. The fine church of St. Margaret is very little damaged by either neglect or restoration, and the history of the main portion is more clearly readable than that of any of the other old churches. It appears to have been originally built in the Transition period as a cruciform edifice with a very low nave arcade and narrow aisles; one of the responds of the nave arcades remains. Early in the fourteenth century the south transept was obliterated by rebuilding the nave arcade of the same height as the old transept arch, and the aisle of the same width and height as

the transept itself. Then the north side was treated in the same way, and, finally in the Perpendicular period, a clearstory with three-light windows was added. The magnificent tower, chancel, and south porch are also of the Perpendicular period. It is almost certain that the tower (date 1444) takes the place of an earlier one, for the fourteenth century respond of the north arcade remains, and the aisles (of the same date) to which it is opened by Perpendicular arches, overlap it. In erecting the tower the builders seem to have let down the end arch of the south arcade and rebuilt it. The present rich fifteenth century chancel took the place of an earlier and smaller one, as shown by the triangular lights over the chancel arch. The east window and the niches flanking it are later insertions, or the whole east wall has been rebuilt; both the form and the tracery of the window are poor, and not much better than the gaudy glass they frame. The vicar informs us that the old stalls are now in Aston Church, Birmingham, and he would much like to obtain their restoration, but has not hitherto succeeded. He seems to take a great and understanding interest in his fine old church. There is a room over the south porch with a fireplace and two hagioscopes,

Shop, Market-street. (The late Mr. Isaac Barradale.)

Business Premises, High-street. (Messrs. Blackwell & Thomson.)

one of which looks directly across the church; towards what object it is difficult to guess, unless it was one of those paintings of St. Christopher which sometimes faced the main entrance of a church. There are traces of a stair-turret on the north-west side of the chancel arch; the doorway visible in the upper part of the nave wall may have been for access to the aisle roofs; it is too high to have been used to get on to the rood gallery. In the chancel is an altar-tomb on which there is a very well executed alabaster effigy of Penny, Abbot of Leicester and Bishop of Carlisle and Bangor, who died in 1519.

St. Martin's, a large cruciform church with a lofty spire at the crossing, though said to be a very early church, rebuilt in 1400, is, so far as internal and external appearances go, almost entirely a modern Gothic revival structure; which is hardly surprising, seeing that it was in the hands of Mr. R. Brandon for over twenty years. The chief original remains are the north doorway, a poor piece of work; the curious and beautiful wooden vault of the north porch; and some of the inner or rear arches of the south aisle windows, with their shafts and caps. Mr. Pearson is now building a new two-storied south porch, and renewing the outer arches and tracery of the south windows. However regrettable from a historic point of view Mr. Brandon's restorations may be, the architectural results, with some notable exceptions, such as the corbels of the nave roof, are very fairly satisfactory. There are a good many rich

and interesting monumental slabs in the church. St. Nicholas's is an obviously ancient edifice, but it has been so often, and almost always barbarously, altered and repaired that there is very little purely architectural interest left. Even its history is difficult to trace. Roman bricks are visible in the walls in several places, notably in the arches of two little openings, formerly windows, in the nave, and in some "herring-bone" work on the outside of the tower. The little round arches at the crossing, on which the tower stands, and their imposts, are plain and heavy, but the masonry over them is neatly squared, and contrasts with the rough rubble work of the side walls. The parapet of the tower and the corbel table and intersecting arcade under it are original, but the parapet has been spoiled by raising on it in modern times. The place of the south nave arcade is taken by one gigantic rough brick arch. In the chancel are some Early English details of poor character, which have some appearance of being insertions—possibly the body of the work is earlier. The building owes little to such modern work as has been done to it, and the north transept is a positive outrage on an edifice the age of which should inspire some respect. All Saints' Church, in High Cross-street, has suffered a good deal from modern restoration; the only certain trace of the original Norman edifice now visible is the inner order of the west door. The lower part of the tower is said also to be original, but it has been cased externally; its angle buttresses are of the odd circular

form of those to the tower of St. Peter's, Northampton, but of a single shaft instead of three. The Early English jambs of the arches to the tower and chancel seem to be original, and have the fillet on the shaft running up over the bell of the cap—a curious feature which Mr. Brandon has copied at St. Martin's. The richly-carved font is Early English, and of the same curious and unusual form as that at St. Mary's. The pulpit is a roughly-carved but rich piece of Perpendicular woodwork, with a Reformation cornice and modern stone base. The roofs are fair examples of fifteenth-century work, a good deal restored. The church has a rather cold, uncared-for look, partly due to damp stains in the plaster, but a good deal also to the horrible yellow-grained nave seating, and the equally objectionable varnished modern seating and match-boarded dado in the aisles. The east window of the south aisle is filled with good modern glass.

The earliest of the churches built by Sir Gilbert Scott in Leicester is St. John's, near the Midland Station, opened in 1854. It consists of a short nave of four bays with wide aisles and no clearstory, a chancel with a polygonal apse and short transepts, of which the east one (the chancel is to the south) is a tower and the other an organ chamber. It is, like many churches by the same architect, rather dark. Outside, the most striking feature is a well-proportioned tower and spire, the latter with unusually short broaches. The church is one of the many which cause a sigh of regret that Scott's good taste, which guided him so

splendidly in dealing with forms and proportions, did not prevent his spoiling his work by a mixture—sometimes an incongruous mixture—of various coloured materials. St. John's fine spire is quite spoiled by its red and white banded masonry, and the body of the church is vexed with bands of soft yellow stone introduced in the red granite rubble walling. St. Andrew's is a small aisleless church with shallow transepts, a chancel with a round apse, and a gabled bell turret at the west end. It is faced inside and out with various coloured bricks in diapers, which spoil an otherwise pretty little building by their restlessness. The chief feature is an open roof carried on double arched principals. St. Matthew's, another cheap church for a poor district, is a less original building consisting of three almost equal aisles. It is faced outside, like St. John's, with red granite, the quoins and window dressings being of white ashlar and red bricks! St. Saviour's, on the Spinney Hill, is the latest, as well as the largest and most architecturally successful, of Scott's Leicester churches; it was opened in 1877. It is faced almost entirely, inside and out, with red bricks, stone being very sparingly used except in the spire, which is wholly of that material; even the piers of the nave arcades are of brick. The spire is an irregular octagon on plan, with very small broaches to bring it to the square of the massive-looking tower. The richly carved intersecting arcade and the rose window on the west front are very striking, and lead to a good effect inside also. The crossing is vaulted in brick on stone ribs, and the chancel has a wooden vaulted ceiling. The four great round, polished granite shafts at the crossing seem to strike a jarring note, but on the whole the architect seems to have freed himself for once, with surprising effect, from both the "precedents" and the private theories which often cramped his great abilities and led his taste astray. The most marked feature of St. Peter's, (by Mr. G. E. Street), is the effectiveness of all the mouldings and details; the proportions are rather low, and, in one particular, the planning appears to the unsophisticated observer clumsy, though very likely it was well thought out and deliberately introduced. We refer to the arrangement whereby the transepts embrace a bay of the nave, of the same width as the others, and another very narrow bay which is thrown into the chancel. The church has a small western transept with the tower in the middle of it forming an extension of the nave. The nave piers are of an unusual and interesting section, but there is a slip where the label moulds of the arcades are allowed to intersect the lower part of the string over them very awkwardly.

Among the other modern churches, that of the Holy Trinity, originally built by Mr Sydney Smirke, and altered in 1855 by Messrs. Flint & Wickes, and again in 1871 by Mr. S. S. Teulon, deserves to be mentioned for its spacious and striking interior and fine coffered ceiling, as well as for the clever and pleasing way in which the shallow sanctuary and little side passages have been added in a sort of Romanesque style, which harmonises surprisingly well with the original severely Classic work. The church stands at an irregularly-shaped corner, and the entrances are very neatly and cleverly planned. Of the two churches by

Shop Front. (Messrs. R. J. & J. Goodacre.)

Mr. Christian, St. Mark's, in Belgrave Gate, is rather dull and heavy looking; it is built in the severe lancet style, of a hard blue stone, and has a spire with a rather exaggerated entasis. The other, in the western suburb, is a short low-proportioned red brick edifice of good but severe character, the most satisfactory feature being a solid-looking square tower with a high-pitched slate roof. The best of the more recent churches is that of St. John the Baptist, in Clarendon Park-road, south of Victoria Park (Messrs. Goddard & Paget). The interior of the nave especially is a remarkably pleasing piece of work. It is of lofty proportions, and flanked by low double ambulatories, and triforium galleries formed in the depth of the buttresses. It is lined with white and very pale yellow bricks in bands, which harmonise with the stone of the piers, window-dressings, &c., and look very soft and pleasant. There is a

deep west gallery over the baptistry and narthex. The chancel is less successful; the east wall is very much broken up, and the side galleries are heavy looking, but there is beautifully coloured and well designed glass in the windows. The exterior is faced with red brick and stone, and has character in its proportions, and good detail, but is not so striking as the interior. Of the numerous other places of worship it is only possible to mention a few. St. Stephen's Presbyterian Church, in the upper part of the New Walk, is a well-proportioned and detailed modern Gothic building in the Geometrical style, and would be even better but for the poor, thin-looking tower. The Melbourne Hall (Independent) is an original octagonal edifice, with a high, conical roof; severely plain in character, but impressive externally from its mass, and internally from its spaciousness; the roof is carried by plain

Warehouse, Campbell-street. (The late Mr. Isaac Barradale.)

Warehouse, Belvoir-street. (Mr. J. Tait.)

timber framed principals, meeting in the centre, with a plaster ceiling halfway up the cone, and on the rafters between the principals. The Clarendon Park Congregational Church on the London-road, by Mr. J. Tait, is remarkable for the fine feature at the west-end, which, for want of a better word, one must describe as a broad, low tower, covering all the west end of the building, and culminating in a rich belfry stage, nine arches wide.

There are several large schools in Leicester which are architecturally interesting, of which the Wyggeston charity is responsible for two—the "hospital" has been removed to the outskirts into a building of no interest—the boys' school and the girls'. The former is in an Early Gothic style, and is by Mr. Charles Baker. The latter, by Mr. E. Burgess, is a pleasant, quiet, red brick and stone gable building, with mullioned windows and quaint battlements, in Humberstone Gate. It is set back from the road, and its most prominent features are a nicely-proportioned double gable, and a pretty little half-timber entrance lodge. The Melbourne-road board school is a large, simple, characteristic-looking block, built of a strong-coloured brick, the most striking features of which are the great hall, with its large semi-circular headed windows and well-marked external cornice, and a lofty turret terminating in a quaint and picturesque belfry with battered sides. The Medway-street board school, also by Mr. Burgess, is a more elaborate building, rather rich in fact for a board school, built of good plastic red bricks

with Jacobean details, and exceedingly well grouped. The new technical school is a palatial building in the Newark by Messrs. Everard & Pick. It is a good piece of work of red brick and stone, and some of the details are of quite unusual excellence; but it is entirely spoiled by gigantic windows of great sheets of plate glass set in poor little thin mullions. If such windows were a *sine qua non* it would have been better to have erected a perfectly plain front, and saved one the pain of seeing a good building spoiled; for it is only too well known that no architectural talent has yet solved the problem of making such windows presentable.

Domestic work, though we take it last, and cannot spare much space to speak of it, is by no means the least important section of the architecture of Leicester. There are not many old houses left; Leicester is too prosperous a place not to have rebuilt the greater part; but at the south end of the town, on both sides of the London-road, are an immense number of architecturally good modern residences of all sizes, some of them of quite exceptional merit. The two principal old houses in the Newark, the one called the Chantry House and the large gabled one next to it, have been so mutilated and covered up, the one with ivy and the other with stucco, that there is not much of architectural interest left; but a good wrought iron gate to the latter is noticeable. The old Trinity Hospital close by, too, was so terribly "restored" in George III.'s reign that nothing remains to attract the eye but

the chapel. The only house here worth notice for itself is a little square red brick eighteenth century one, facing the castle gate from beyond the technical school: it is to be hoped that the students may be able to learn from it something of the æsthetic value of repose and scale and surface. No. 19, Friar-lane is a larger house of a similar kind, with a good cornice and central pediment over a "Venetian" window. Round St. Martin's Churchyard are also some old houses with good doorways, notably two on the east side; and there is one with an old walled garden in High Cross-street, nearly opposite All Saints' Church.

The first modern building to notice, on leaving the business part of the town by the London-road, is a pleasant-looking house opposite the railway station, built by Mr. Burgess, with rough-cast in the upper part and projecting oriels and gables; the dark-coloured paint and black bricks introduced tend to make it a little heavy, but it is a very attractive little residence. In the district, on the west of the road before arriving at Victoria Park, a house in the modern picturesque style, built by Mr. Isaac Barradale, at the corner of West Walk and Princess-street, strikes one especially, on account of its solid, real-looking, half-timber work and well-shaped large bay window and chimney stalk. A block of four houses near the top of Regent-road also make a very good group, and almost all the houses in the row at the top of the New Walk are above the average; among the forest of timber gables, however, the buildings that are content to trust to solid

brick and stone, provided they are well proportioned and detailed, strike one as the more restful and dignified. Beyond the Park, at the corner of Knighton Park-road and St. Mary's-road, is a prettily-grouped low, half-timbered house; and nearly opposite to it a still better grouped large brick one, in which the cheap effects of rough-cast, tile-hanging, and the like are scrupulously avoided; it is, however, a little spoiled by some weak cut-brick angle piers in the upper parts. There are several good small houses in the lower part of Springfield-road, notably "Ivydene," with a broadly-treated brick gable and stone parapet, and the pair of houses next door with four equal rough-cast gables, a long white wood cornice and a broad balcony; "Tyndale," opposite, is also noticeable for its original and satisfactory treatment. Ratcliffe-road, at the extreme end of the suburb, is mainly taken up by a few large houses of a superior class, all with very good architectural character; the most striking buildings in the road, however, are two little gentlemen's cottages; the one plain almost to affectation, with roofs of a very rough grey slate, and plain square white window-frames, but admirably grouped and proportioned; the other, "The Knowie," a low oblong building with double-curved brick gables at the ends, and a row of casement-windows under the eaves, brought together by placing delicately ornamented plaster panels between them; it has also a large square bay projecting over the porch with a long, low, projecting window beside it. On the other side of the London-road the most noticeable building is a symmetrical block of four houses in Stonegate-road, with great rough-cast covers under the eaves, and some good chimneys.

In conclusion, there is one little thing in Leicester which is not a building, but is certainly worthy of the architect's notice. It is a very fine pair of wrought-iron gates and posts, probably of seventeenth century workmanship, standing just within the wall of the General Infirmary in Oxford-street. They are, unfortunately, sadly in want of repair, and apparently fast rusting away.*

NOTES.

We noted last week the fact that the Government intended to include builders in the Workmen's Compensation Bill. On Tuesday, the Home Secretary brought in his amendment, by which the Bill is made applicable to "employment in, on, or about any building exceeding 30 ft. in height, which is being constructed or repaired by means of a scaffolding, or on which machinery driven by steam, water, or other mechanical power is being used for the purpose of the construction, demolition, or repair thereof." Considerable discussion took place as to the limitations in this clause, and it was urged that workmen on small and low buildings should be brought within it. We are entirely in sympathy with these objections. The clause should not be limited as it is. The fact that the majority of men working on buildings will come within the operation of the Act only makes the needless exclusion of a small minority more unjust. Moreover, if the clause had been made applicable to any building which is being constructed, demolished, or repaired,

there would be no probability of the litigation which will be caused by the clause in its present form.

THE annual report of this interesting but little known museum (little known at least to general sightseers) seems to show that it is becoming more appreciated, at all events as a place of study. The number of ordinary visitors for the last three years was as follows: in 1894, 3512; in 1895, 4940; in 1896, 4860; but the number of students in the same years was, respectively, 12, 107, and 209. We are informed that, with the permission of the trustees, the museum has been thrown open on Saturday afternoons to various clubs, technical classes, and institutes, the various societies having the museum and its contents described to them by the Curator. This privilege seems to have been so very fully appreciated, that in several cases the members asked to be allowed to pay a second visit; about nineteen different societies availed themselves of this permission. It may be added that on students' days and private days the museum is practically never closed, for all foreigners and strangers in London are invariably admitted on presentation of their cards, while the general public have but to write for tickets, and they can also view it on closed days; but as there are no attendants present during the period the museum is closed to the public, or on private days, it is necessary to give sufficient notice to the Curator. Visitors to London who have any interest in architecture and archaeology should not omit to see the Soane Museum, not only for the contents but for the house itself, which is exceedingly ingenious and original in its planning and arrangement.

FROM the *Deutsche Bauzeitung* we learn that the principal Architectural Students' Society, known as "The Motiv," will celebrate the fiftieth anniversary of its existence on June 9. It is a curious coincidence that this Society should have been founded in the same year as our Architectural Association. It appears, however, that the initiative for the formation of this Society was not due to independent architectural pupils, as was the case in London, but to some proposals of the popular master of the old Building Academy at Berlin, the late Professor William Stier. Though classes are not arranged on the same lines as those of the Architectural Association, since Berlin has its Royal Technical College, with its Government classes, and the members of the Society are almost all students at this institution, there is also a policy of mutual assistance in connexion with the official examination. The members of "The Motiv" have their "coaching" class, their executive publishes model examination papers and a catechism, and much is done to help those who are backward, &c. "The Motiv" will commence its anniversary celebration with a memorial service at the grave of Professor Stier, and there will afterwards be various official and social gatherings. As in the case of the Architectural Association, there will be a special Jubilee number of the Society's publication. It would be interesting to have the exact date of the formation of "The Motiv," as it appears that both the London Society and the Berlin one were started in the same month.

Ownership of Architect's Drawings. THE Margate School Board have adopted rather a shabby line of behaviour towards their architect, Mr. R. Dalby Reeve, in informing him that the balance of the account due to him for the Cross-street and Salmstone Schools would be paid when he had handed over the plans to the Committee. Such a line of action is tantamount to an admission by the Committee that they knew they were exceeding their powers, or suspected so, and therefore put the screw on the architect, so to speak, to induce him to do what they could not compel him to do by regular means. Mr. Reeve, in a reasonable and sensible letter in reply, showed that he had never been led to expect such a demand, and argued that the drawings were by custom the architect's property; that he had made a special study of school-planning, and was not to be expected to give up the results of his study for use by other persons; that moreover the drawings contained memoranda which were of use to him and of no use to the Committee. His position, we observe, was strongly supported by several members of the Board, but ultimately it was decided that the legal aspect of the question should be discussed in private by the General Purposes Committee. So far there can be no doubt that the Margate School Board have put themselves in the wrong, whatever view may be taken of the legal question. If they have a legal right to the plans they could have obtained them without the expedient, undignified as regards themselves and uncorporate to the architect, of declining to pay till they had possession of them; if they have no legal right to them, they are endeavouring to entrap the architect into foregoing his just claim by a threat to withhold the money justly due to him, until he complies with their wishes. In either sense it is not a very creditable business.

Right to Light. THE recent decision of the Court of Appeal in *Broomfield v. Willamys* may be regarded as a useful explanatory case in the law of light. There is no principle more clear than that a grantor may not derogate from his own grant, that is to say, in the case of the sale of a house a vendor may not afterwards, if he owns the adjoining land, obstruct the lights of the house which he has sold. But there have been some exceptions grafted on this principle, as, for example, that when the purchaser well knew that the adjoining land was to be built upon, subject only to this, that there was to be a passage of 20 ft. between the new buildings of the grantor and the house sold to the grantee, the latter could not object to the obstruction of the light. This has caused an impression that if a purchaser knows that the adjoining land is "building land" he must not complain if his lights are presently obstructed. The case to which we refer has put matters into a more accurate state. Referring to the cases which seem to have modified the general principle, Lord Justice Lindley said that they do not throw any doubt upon it, but that they show that on clear evidence this right may in particular cases be modified or limited. In the present instance, while the defendant was able to show that the plaintiff knew that houses were to be built on adjoining land, he was not able to show that there was any understanding that the light of the house sold was to

* The next of this series of articles, on the architecture of Derby, will appear in our issue of July 17.

be seriously obstructed; on the contrary it was shown that the defendant had built higher and closer than was in contemplation. The result of the case is, therefore, that the mere fact of a purchaser knowing that adjoining land will be ultimately built on does not constitute acquiescence in a future obstruction.

THE Factory and Workshops Act, 1895, is almost throughout a statute which its title properly describes. But in Section 23, Sub-Section 2, there is to be found a provision which ought not to have been in this Act, but should have been placed in a short statute by itself. It states that the provisions of the Act with respect to notices of accidents and the formal investigation of accidents shall have effect as if the word "factory" included "any building which exceeds 30 ft. in height and which is being constructed or repaired by means of a scaffolding," and any similar building "in which more than twenty persons, not being domestic servants, are employed for wages." The employer of the workmen in the first case, and the owner of the building in the second, is to be regarded as the owner of the factory for the special purpose of notice. For the provisions in regard to it we have to go back to Section 18 of the Act. Briefly stated, these provisions are to the effect that when an accident occurs which causes loss of life or such injury to a workman that he is unable to attend for three working days, notice shall be sent to the inspector of factories for the district, under a penalty of 5*l*. The notice must contain the residence of the person injured, and the place to which he has been removed. We call attention to this matter since we believe that large numbers of persons engaged in the building trade, and also in other occupations, are—as is most natural—still ignorant of these provisions of this Act. As we have already said, it is absurd for these directions to be placed in a Factory Act, since they are of very general application, and might without difficulty have been placed in a short statute which could have been called the Notices of Accidents Act, and which might very well have been made applicable to all building and similar work.

MR. MORDEY'S paper on Dynamos, read before the Institution of Electrical Engineers on May 20, was the most important paper read to that Society this year. Although there was not much in it that was absolutely novel, yet the clear and convincing way in which the advantages of toothed armatures were stated, and the methods for getting rid of sparking at the commutator were pointed out, mark a new departure both in the theory and practice of dynamo construction. In this country smooth-cored armatures are more common because the collection at the brushes is so good. Toothed armatures, as ordinarily wound, give rise to violent sparking at full load, and the regulation is not good. On the other hand, there are many advantages, both electrical and mechanical, which the toothed kind has as compared with the smooth-core type. In the United States the 500-volt railway generators have almost all toothed armatures, and on the Continent this kind is generally preferred. Mr. Mordey's methods of overcoming sparking are so simple and elegant that it is surprising that no one thought of them before.

They may not be applicable to large machines of low voltage, such as are used in electro-plating work, but for dynamos of moderate size, say twenty or thirty horsepower, they are easily applied.

PROFESSOR MASON, in an interesting lecture on "Sanitary Problems connected with Municipal Water Supply," delivered before the Franklin Institute of Philadelphia, has tried to estimate the annual saving which would accrue to the people of that city, if one disease alone—typhoid fever—were eliminated. Assessing the value of each human being at 2,000 *dols.*, the cost of each funeral at 25 *dols.*, the lost wages of convalescents for 43 days at 43 *dols.*, and the cost of nursing and doctor's bills at 25 *dols.* per case, he finds that the total annual tax levied by typhoid fever upon the City of Philadelphia is no less than 1,392,226 *dols.*, or, roughly speaking, 280,000*l.*, and concludes that "public works which could eliminate a reasonable fraction of this great tax, would certainly pay for themselves in the course of a few years, even though they were originally expensive." There is no better investment for a community than good water, coupled with good drainage; and in reference to this, Professor Mason devotes considerable space to the subject of the purification of water, discussing the influences of agitation, aeration, sedimentation, and higher organic life in the self-purification of water, and the rule is laid down that "the rate of self-purification of water varies directly as the amount of contamination." It is interesting to find that Professor Mason places the old world before the new in the matter of water-supply, and even goes so far as to poke fun at his countrymen for scrutinising "the water offered them in foreign capitals, when what they are in the habit of drinking at home would not be tolerated for an instant in the great cities of Europe."

WE are glad to see that the auditor of the Local Government Board has surcharged the Amphyll Urban District Council the amount paid to a "water diviner." It is difficult to understand the childish state of mind, which, at the present day, can seriously believe in the virtue of the divining rod. It is a relic of mediæval ignorance, which the education and the science of the nineteenth century has not yet quite destroyed. It may be asked by the stupid, but well-meaning persons, who believe that a man can be guided to a spring of water by a piece of stick, how it comes that water is sometimes found in spots indicated by the stick. The answer is that it is usually mere accident. As a matter of fact, water may often be obtained in smaller or larger quantities in many pieces of land, and if a passer-by were to walk twenty yards into a given field, and borings were made at the end of the twenty yards, it is quite possible that a supply of water may be found. If the person who accidentally hits on the place happens to be a water diviner, the finding of the water is set down to the virtue of the stick. Again, also, we hear nothing of the diviner's bad shots. In other cases, a man with a keen eye may often notice circumstances in the vegetation or formation of a field which will indicate that water is at hand. Here, again, the discovery is set down

to the wonderful rod. It may appear to sensible persons unnecessary to point out these things, but when we find apparently sane persons, intrusted with local management, believers in this ancient folly, it is as well to try and show up the nonsense; and how easy it is, either by accident or observation, to indicate a spot where borings will touch water.

THE Committee for the Survey of the Memorials of Greater London (a rather fanciful title) have put forth a report of their progress during the last two years. Some 1,000 drawings, photographs, or sketches have been made of ancient objects of interest in London. The first publication of the Committee was the monograph on Trinity Hospital, Mile End, which we noticed at the time of its appearance, and which represents the form and character which will be adhered to in all the future publications. The Committee has monographs in preparation on the Old Palace of Bromley-by-Bow; Aldgate Church; Hill Hall and the work of John of Padua; Bow Church; Mile End-road; the Great House at Leyton, and Essex House, Bow.

THE Earl of Romney has decided to sell his mansion, and park of about 500 acres, known as The Mote, distant one mile from Maidstone. The moated castle of the Leybourne family passed in turn to the Shoffords, Dillons, Burghershes, and Widvilles. To Richard de Widville, father of Edward IV.'s queen-consort, succeeded Sir Thomas Wyatt, of Allington Castle, the statesman and poet, to whom Henry VIII. granted in capite by knight's service the Manor of Maidstone. On his son's attainder, 1554, it was granted by Queen Mary to her kinsman, Cardinal Pole. It subsequently devolved upon Sir Humphrey Tufton, Bart., ancestor of the Earls of Thanet. Sir John Tufton, *obit* 1685, bequeathed The Mote to his niece, who alienated it to Sir John Marsham, Bart., whose descendant, Sir Robert, was elevated Lord Romney. He married a daughter of Admiral Sir Cloudesley Shovel; their grandson, advanced Earl of Romney on June 22, 1801, built the present house (*vide* J. P. Neale's view, in his "Seats"); his wife Frances, Lord Egremont's daughter, exercised her remarkable taste in landscape gardening in laying out the grounds, where a Doric temple commemorates the review by George III., on August 1, 1779, of 5,300 Kentish Volunteers. Marsham and Romney streets, Westminster, took their names from this family.

AT Messrs. Waring's, in Oxford-street, an exhibition is being held of ancient tapestries and embroideries, chiefly Italian and Spanish of the sixteenth and seventeenth centuries. Prominent among the exhibits are several vestments of very beautiful designs—two chasubles of yellow brocade, ornamented with figures of saints under semi-circular canopies, the intervening spaces being filled by well-designed arabesques. A frontal of late Italian workmanship is remarkable for the delicacy of the colour and arrangement of the flowers introduced, the whole worked on a pale cream background. A super-frontal and an altar frontal have heraldic shields introduced,

the latter bearing arms crowned by a cardinal's hat, and a cope from the Indo-Portuguese settlement of Goa has a curious representation of Adam, Eve, and the Serpent in the centre. Three panels from a series of four represent scriptural scenes—the "Magi," "Flight into Egypt," the "Presentation in the Temple." A hanging of green plush, embroidered with an elaborate border in silver thread, and a double shield in the centre with the arms of the Franciscans surmounted by a crown, is also worthy of notice, and there are also numerous smaller pieces of work which will be of interest to visitors to the Exhibition.

A CORRESPONDENT sends us a Brilliant Chance cutting from the *Halifax Guardian* with an advertisement of the Hipperholme Urban District Council, inviting competitive designs for the new offices which they propose to erect at a cost of 2,000*l.* "A premium of 10*l.* is offered for the successful design, which is to become the property of the Council" (the italics are ours). Not a word is said even as to employing the successful architect on the building. In other words, the Hipperholme District Council invite architects to give them work of the value of 50*l.* (drawings without supervision) for 10*l.*, with the additional privilege of seeing their work spoiled, if there is anything good in it, by being carried out by some one else—probably an official surveyor.

SILCHESTER.

The exhibition at the rooms of the Society of Antiquaries, Burlington House, in connexion with the excavation of the Roman City of Silchester in Hampshire has, for the past six years, been one of the most interesting archaeological events of the season, and this year, the seventh of the series, the interest is well maintained, although, perhaps, of not the same architectural importance as in one or two former years. The system of excavating the city in divisions or insule was continued during 1896, and those marked XV. and XVI. on the plan were dealt with. They are on the west side of the city, Insula XV. being bounded on its west side by the city wall, while Insula XVI. is surrounded on all its four sides by streets. The foundations of several blocks of buildings were discovered in Insula XV., and from the presence of a large number of pits and hearths, and furnaces over certain portions of the area, it is supposed that it was devoted to the dyeing industry. "A large area"—we quote from the report—"in the northern part of the insula, wherein were neither buildings nor pits, was perhaps used as a bleaching ground." Two wells were also discovered on the east side of the insula, one of which contained the remarkable wooden tub which we illustrate. It measures roughly in its present state nearly 3 ft. in diameter at its base, and between 3 ft. and 4 ft. in height. It was successfully raised from the well in which it was found, but the bands of birchwood by which it was held together were lost in the process, owing to decay. It stands on a rough wooden platform of four logs, also shown in the sketch. The tub will, with other objects of interest, be removed in due course to the Reading Museum. On the south side of this insula there was a large house of the "corridor" type, and in the adjoining insula were three more houses, one a large one of the "courtyard" type, a smaller one of the "corridor" type, with remains of the hypocaust, and traces of a third of the same type on the south side of the insula. As, however, there seem to have been no important, if any, discoveries of pavements or other architectural details, these houses do not call for special description, interesting as they of course are when considered as a part of the arrangement and planning of the city as a whole. A line of pipe was discovered running east and west along the south side of the two insule, and on its being followed to the city wall one of the lesser gates to the city was unearthed. Accord-

ing to the report, "it had a single opening 12 ft. wide, the jambs of which were standing to a height of over 6 ft. The roadway to it had subsequently been raised, and the gate reduced to 7 ft. in width by blocking it with masonry." "This gate seems to have been "approached by a wooden bridge over the ditch." Besides the two insule already described, excavations were carried out south of the parish graveyard, its extension having been decided upon in this direction. Traces of a small house were found, and a small piece of worked porphyry. Among the many objects of interest found during the excavations are a considerable number of jars, pots, and other pottery, some good bowls of Samian ware, and a bronze jug, simple in form, with a delicately ornamented handle. This and one or two of the pots are illustrated amongst our sketches. They are reduced from measured drawings, and the leading dimensions are added. One, a small fragment of the rim of a bowl, shows a delicate treatment of leaf ornament which is very effective.

The two fragments of mosaic glass are of very beautiful colour. Both have a yellowish ornament on a rich dark blue ground. The centre of the large irregular-shaped markings on the larger piece of glass is green, with a thin border of red. It may be compared with the beautiful little glass bowl in last year's exhibition, which we illustrated at the time, although the glass in this case appears more opaque. A small capital and two fragments of moulded stone are given. In addition to these are a large number of bladebones of sheep, found in a large pit in Insula XVI. with circular perforations, said to have been "used in the manufacture of counters." There are many bronze ornaments, two small bells of the same material, and four gilt brooches. It will be seen that the result of last year's work is by no means unimportant, and the interest of the exhibition is largely increased by the many beautifully-coloured drawings made by Mr. G. E. Fox of the pavements and other architectural points of interest found at various times during the progress of the works.

CHURCH, LITTLE ILFORD.—The foundation stone of the new church of Saint Michael and All Angels, Romford-road, Ilford, has just been laid. The new church is to be built in the Perpendicular style, somewhat freely treated, and is to cost 6,000*l.* The architect is Mr. Charles Spooner, and the builder Mr. John Gaynor.

THEATRE ARCHITECTURE AT THE VICTORIAN ERA EXHIBITION.

In this country it is most unusual to find architecture represented in any of the many exhibitions that are held annually to illustrate the advancement in some specific art or industry, and it is hence a matter of congratulation, and a step in the right direction, that the construction of theatre buildings has not been forgotten in the Drama Section at Earl's Court. This section, without its architectural room, would have given but an incomplete idea of the progress made in the presentation of our plays, for there is no doubt that the rendering of modern drama is, to a great extent, dependent on the equipment of the structure in which both artist and audience are temporarily housed.

The management of the Drama Section of the Victorian Era Exhibition was in the hands of a small but representative Committee of Actors, under the presidency of Sir Henry Irving, with Mr. Pinner and Mr. Clement Scott to attend to the literary side, Mr. Edwin O. Sachs as the architect member, and Mr. Austin Brereton as secretary. The scope of the section is comprehensive, and the exhibits vary from notable manuscripts in show-cases to the full-size representation of the complete mounting of the Drury Lane pantomime of last Christmas. In respect to the Architectural Room, which practically comprises a hall 40 ft. by 20 ft., with a small annex, it would, perhaps, be as well to quote from the catalogue, which says that "this special collection was arranged particularly in view of the great progress made in theatre planning and construction during the latter half of the Victorian Era, and that care has been taken to include every class of building, the various departments of construction, and the work of all architects who have been conspicuously associated with the erection of our playhouses."

The number of exhibits in the Architectural Room is approximately 250, and these have been divided under the following headings:—

1. Important London and Provincial Theatres of to-day, and the principal Playhouses at the commencement of the Victorian Era.
2. Examples of Playhouses representing the work of Theatre Architects of the last twenty years.
3. An example of Modern Theatre Construction in its most advanced form.

4. Examples of Theatre-Construction, fittings and appliances.
 5. Architectural, Technical, and Legal Publications on Theatre Construction.
- About eighty of the exhibits belong to Group I., and about 100 to Group II.

Commencing with the first group, the central feature comprises three sepia drawings of the elevations of Drury-lane Theatre, of the Covent Garden Opera House, and the old "Her Majesty's" Theatre, all being copies from the original designs. There are also three sheets of plans showing the area level, and some photographs of Covent Garden and Drury Lane, as they now stand. Over these exhibits, which are lent by Mr. Sachs, are two long sheets, showing the block plans of some forty modern playhouses in London and the provinces, drawn to a uniform scale, for the purposes of the exhibition. It is curious to observe the great variety in the location of our theatres, the difference in superficial area and shape. There are only a few examples of theatres standing on isolated sites, and having a symmetrical plan. This does not speak well for the importance attached to the suitable housing of the drama. The central feature is flanked by a number of proof plates from "Modern Opera Houses and Theatres," which we have already had occasion to refer to, and by a collection of photographs taken inside London Theatres, and showing the principal features of each auditorium. These photographs are excellent in themselves, but form a sad proof of the want of architectural feeling shown in almost all of our London Theatres. If the typical theatre architect were to call himself a theatre surveyor, and openly entrust the architectural treatment to men who have the necessary capabilities for design, it would be a step in the right direction, although it is, of course, not pleasant to acknowledge that a class of building which should rank among the first in the structures of to-day has, as yet, scarcely ever been carried out by a prominent member of the profession. We only know of one recent instance, where Mr. Colcutt was called in to design the exterior of the Palace Theatre of Varieties, and where a better policy was adopted, and then there was of course also the single instance of a competition, *i.e.*, for the Shakespeare Memorial Theatre.

Turning to the second group in the Architectural Room, which is intended to represent work by architects associated with theatre construction, we find that the principal position has been accorded to the Shakespeare Memorial Theatre, just referred to. There is a large perspective of the Memorial Tower, which we remember in an Academy Exhibition; a coloured view of the principal staircase; some photographs, and a set of copies from working drawings, with two very excellent details of the construction of the Tower. The winners of the competition design were Messrs. Unsworth & Dodgshun, and on the retirement of Mr. Dodgshun, Mr. Unsworth executed the work.

Next in importance in this group is a very representative collection sent by Messrs. Darbyshire & Smith of Manchester, who seem to have grasped the spirit of this exhibition more than any of the other exhibitors, and have shown particularly clear drawings of the principal plans and sections of their theatres, supplementing them by some views. As regards the architectural treatment of their exhibits, not very much is to be said; the best is the Palace Theatre of Varieties at Manchester, which deserves notice, though the façade of the building and the detail of the interior do not accord with the fine conception of the plan. Of other buildings by these architects, we notice the New Exeter Theatre, and then also the design of the so-called "Irving Safety Theatre," which we remember having heard of after the fire at the Paris Opera Comique. The catalogue explains that the principles of this "safety plan" were defined by Sir Henry Irving and the architects, and although there is nothing particularly novel in the design, the clearness of the plan is excellent.

Another important exhibit in this group is a collection of work by the late Mr. C. J. Phipps, who, shortly before his death, sent a number of plans of the Gaiety Theatre, the Wolverhampton Theatre, the Prince of Wales' Theatre, and others; also a very complete set of drawings with perspectives, colour studies, &c., and photographs of the Lyric Theatre in London, and two plans and a printed perspective of Mr. Tree's new theatre. The collection is exceedingly representative of the deceased architect's work, and some of the colour studies, as for instance,

of the Gaiety Theatre, and the Lyceum Theatre, merit attention.

There is also a separate collection of photographs, only of theatres by Mr. Matcham, but as the latter has unfortunately not sent any plans, which, to our mind, would have been far more interesting than the photographs of the plastic decoration, this series is only of minor importance. Messrs. Wylson & Long have sent some particularly excellent photographs of their work in various music halls and theatres, and they have the merit of being the only exhibitors who have sent a model of some importance. Their design for the hall of the Blackpool Winter Gardens is well illustrated by a large 6-ft. model, cleverly executed by Mr. Boekbinder, and it is a pity that there are not other models of this description at the Exhibition. The work of Messrs. Wylson & Long is somewhat distributed; the principal photographs and some perspectives having been hung in the principal room, whilst the large model and their working drawings occupy space in an annex.

Before leaving the principal room it would, however, be well to add that there are two show cases with publications belonging to Group V. These include some interesting Parliamentary prints from Her Majesty's Stationery Office. Mr. B. T. Batsford has lent "Machinery in Theatres," and "An Historical and Descriptive Account of London Theatres," the frontispiece of the latter being an excellent representation of the old Drury Lane Theatre. Mr. Batsford has also exhibited a copy of "Modern Opera Houses and Theatres," in a special binding. There are various minor publications from other publishers. Some space at the end of the principal room is occupied by a large frame with records by Mr. Sachs of notable theatre fires which have occurred in England during the Victorian Era, and these are supplemented by various sketches.

In the small Annex, which is as yet in an unfinished state, we find an interesting collection of drawings of the Palace Theatre of Varieties, or, as it was originally known, Mr. D'Oyley Carte's "English Opera House." This is apparently the example for group 3. Mr. Colcutt's line drawing of the front elevation takes up the principal position, and with it a perspective and some reproductions from sketches. On either side there is a collection copied from working drawings showing various parts of the construction. In this room, too, are provisionally hung various engineering drawings of Iron Curtains, Stage construction, Hydraulic Machinery, &c., but this portion was quite incomplete on the opening day.

CANTERBURY CATHEDRAL.

On Saturday last the Chapter House was reopened after repairs carried out under the supervision of Sir A. Blomfield, and after decoration by Mr. A. O. Hemming under that architect's directions. The object in the decoration has been only to repaint what was there before, according to the remains of colour found on the work.

Sir A. Blomfield has kindly sent us the following account of the state of the building, and the work done—

"The roof of the Chapter House is of peculiar construction—framed with crossed rafters, about 7½ in. by 7½ in., without any principals, the rafters being about 164 in. apart on the average. On the whole, the timbers were found in wonderfully sound condition, but nearly all the plates, and many of the rafter feet, were completely rotten, the effect of leakage. All decayed timbers and chimsy repairs in fir and deal have been removed, and have been replaced with well-seasoned oak. A great deal of the old timber is chestnut. Whether from that cause or not, I cannot say, but I never saw a roof so singularly free from dust and cobwebs. The boarded ceiling underneath was found to be almost entirely rotten, though most of the ribs were sound enough to be retained. They were all, however, very imperfect, large pieces having completely disappeared, and many parts roughly repaired, indeed. All has now been put into a state of thorough and substantial repair in oak.

The walls, windows, &c., which, from long neglect and exposure to the weather had got into a very bad state, have been carefully repaired; the Purbeck marble shafts, many of which had disappeared altogether, have been replaced with new, the old being retained where possible; and generally the building

has been treated as one which is again to be made use of, and not one which is to be regarded simply as an interesting but useless ruin.

The floor, which is at present a fruitful source of damp in certain conditions of the weather, is to be relaid with Hopton Wood stone on a bed of concrete. The present floor is composed of various stones and other materials of heterogeneous nature, roughly laid, without any plan or design, on the earth. Although among these stones are the matrices of some magnificent brasses, they have all been brought from elsewhere—some from the nave of the Cathedral, and it cannot be said that the present floor is, in any sense, hallowed by antiquity.

The decorations, which have been carried out, under the architect's directions, by Mr. Hemming, the artist of the new east window, are in nearly every respect simply a reproduction of what was actually found on the ceiling, walls, and arcading. In the very few particulars which were not clearly prescribed by what was found, the endeavour has been to introduce nothing incongruous."

The east window, by Mr. Hemming, which was unveiled on the same day by the Prince of Wales, contains twenty-one figures of historical personages, selected for their immediate connexion with Canterbury; these are Queen Bertha, St. Augustine, King Ethelbert, Archbishop Theodore, St. Alphege, Archbishop Lanfranc, St. Anselm, St. Thomas à Becket, Henry III., Archbishop Stephen Langton, St. Edmund, Edward I., Edward the Black Prince, Archbishop Simon of Sudbury, Henry IV., Henry VIII., Archbishop Cranmer, Archbishop Laud, Archbishop Tillotson, Queen Victoria, and Archbishop Benson. The portraits are accompanied by the arms of England at the time of their reign, and other accessories of interest. The window is the gift of the Freemasons of Kent.

THE LANDING PLACE OF AUGUSTINE

On July 2 the bishops who attend the Lambeth Conference will visit the place where Augustine is believed to have landed in Thanet. The generally-accepted spot lies within an easy walk from Minster, native place of Thorne, the Saxon monk, or from Sandwich. Starting, for instance, from the latter town at the Davis, or David's, Gate on the quay, and crossing the new bridge which spans the Wantsum (or Stour) one stands in Stenhose, or Stonar—the supposed Lapis Tituli of the Roman occupation in Thanet, the then island which Pope Gregory, with his fondness for word-playing, called the *Angulus Angliae*. On the left hand rises from the river's remoter bank a high bluff, or cliff, crowned by the walls of Richborough, the Rutupiae of a time when it formed a sea-haven and fort established by Vespasian and Severus. Under foot, and stretching for three miles in a straight line across the marshes that lie within a bow of the Wantsum, is the road leading almost due northwards to Ebbe's Fleet, and thence, skirting Pegwell Bay, to Ramsgate. About half-way to Ebbe's Fleet are Shellness and the "Red Lion" inn, where a ferry affords access to Richborough. The Ebbe's Fleet coastguard station stands solitary in the Stone Lees marshes at a point three miles distant from Sandwich, and four from Ramsgate: hard by is the object of our quest.

A road from the turnpike gate-house leads to Minster; going north-west we gain the field where, reputedly, Augustine and his forty monks from Gregory's convent on the Caelian Hill made their landing, A.D. 597. A memorial stone erected by the late Lord Granville in 1884 stands just half a mile from the present shore and one mile from Ebbe's Fleet, towards Ramsgate. It is believed that the interview between the missionaries and Æthelberht and his wife, Bertha, daughter of the Frankish Chariberht, King of Paris, took place at a slight eminence in Cotmanfield—the modern Cottington. The king and his retinue remained on the mainland, on the river's, or rather estuary's, right bank; fearing magic or enchantment, he stipulated that the meeting should be in the open air, and that running water should flow between him and the strange emissaries from Rome. We may smile at his superstition; we must approve the hospitable and tolerant, albeit guarded, language of his memorable reply to the preacher's appeal. Then, giving Augustine leave to cross the water, he accorded him further audience beneath the walls of

Rupprester, or Richborough. Thence he invites the visitors to his own Kentish capital. As they, carrying aloft a silver cross and a painted picture of Christ, come within view of Bertha's chapel, dedicated to St. Martin of Tours, on the hill outside Canterbury, the monks break forth into a litany of supplication, and cries of praise.

For their first abiding-place Æthelberht assigns to them Stapel or Stable Gate, by a pagan temple close to the present St. Alphage's Church. On June 2, Whitsun-day, he is baptised in his consort's church. Augustine rededicated the heathen fane to St. Pancras, and there, in his own abbey of SS. Peter and Paul, was he buried A.D. 613, together with Bertha and her bishop, Luidhard. Thither, too, they removed from Reculver the body of the king who had given Augustine welcome and protection. It is fitting that the abbey should now be a missionary college, and that Lanfranc's cathedral has arisen over the ruins of Augustine's pristine foundation of Christ Church, a testimony to the second, and lasting, reception of the new faith.

THE LONDON COUNTY COUNCIL.

A SPECIAL meeting of the London County Council was held on Friday last week at the County Hall, Spring-gardens (Dr. Collins, Chairman, presiding) to further consider the adjourned report of the Special Committee on the Works Department. The recommendations of the Committee were printed in our last issue, as well as an amendment on recommendation (a), which was moved by Lord Onslow, and seconded by Sir G. Lushington, to the effect that no further work should be entrusted to the Department, and that it should be referred to the General Purposes Committee to consider and report as to the arrangements necessary for the due completion of the works in hand, and for dealing with the central works in Belvedere-road.

Mr. Hoare, Chairman of the Works Committee, resumed the debate, remarking that Lord Onslow first of all said that he was in love with the system of direct employment, and then, by his amendment, sought to prevent the Council directly employing labour.

Mr. Roberts said that in those instances in which the Works Department had failed, it had been through mismanagement and not through any inherent defect in the Department. He believed the Department could yet be made a fair success. No doubt it had suffered through the underpaying of officials, but upon the whole he believed that the works executed by the Department were more substantial than those carried out by contractors. If Lord Onslow's amendment were adopted, the considerable loss already incurred would be enlarged to a huge deficit, which would be a scandal to London; and he hoped the Moderate Party would not be allowed to bring about that result. He therefore opposed the amendment.

Mr. Beachcroft, Vice-Chairman of the Council, supported the amendment, which he urged was the only logical conclusion to the state of affairs disclosed by the inquiry. The confidence of the Council in the Works Department had been destroyed, and it appeared that while nothing was gained by the establishment of the Department, considerable danger was involved in its continuance. The main issue was as to the maintenance of the workpeople; but was it necessary for the enforcement of the principle of direct employment, to which both parties were more or less committed, that there should be a Works Department at all? Could they not do the same in all their Committees as the Parks Committee and the Fire Brigade Committee had done?

Colonel Legge contended that the Department had had a fair trial, and had failed. Mr. Shaw Lefevre said that it would be most unwise to revert to the contract system. The heads of Government departments had experienced the unwisdom of putting all its work out to contract, and had in fact been obliged to do a good deal of their work by direct employment. He was convinced that the employment of direct labour was an advantage to a municipality like theirs, and also an advantage to labour. It was true that the Department's figures showed a small loss, but it was nothing in comparison to what the loss had been had they given the work to contractors.

Mr. Steadman quoted figures to show that loss on works during the present Council was due largely to the policy adopted by the Moderate party of starving the Works Depart-

ment. Any one who knew anything about the works which the Department had done must admit that London had good value for its money, certainly very much better value than contractors would have given for a bigger amount.

Colonel Rotton said that the Department should be dealt with in the manner proposed by Lord Onslow, leaving the work which could best be executed by direct labour to be carried out departmentally.

Mr. Dickinson thought the intentions of the Moderates might very well be gauged by the words in which Lord Onslow concluded his speech, "The Works Department is useless, dangerous, and ought to be abolished." He was quite unable to understand why they took up that position, because it was never suggested to the Committee of Inquiry that the Department ought to be abolished. It was said that new facts had come to light since the inquiry closed, which had led the Moderates to change their opinions, but that was not the case, for every one of the so-called new facts was anticipated, and stated by Mr. E. White before the Committee. What, then, was the reason for this change of front?

Dr. Longstaff said that the very fact that the members of the Council were elected was the chief reason why they should not carry on this Works Department. If the House of Commons were to interfere with the work carried on by the different Government departments, it would probably fail as the Council had failed. Having made a loss by the Department, let the Council acknowledge it, and make an end of the Department. The Moderate Party were not responsible for this foolish investment.

Mr. Costelloe held that the amendment was essentially hostile to the system of direct employment. No doubt there were difficulties in the management of a great business which was not under the personal control of proprietors, but he believed those difficulties could be overcome if the loyal co-operation of all parties were secured. The Council should not wantonly throw away 100,000*l.* in order to put themselves in the hands of contractors, but should rather find some means of exercising a more efficient control over the Department.

Mr. E. Hubbard, M.P., said he was of opinion that the direct employment of labour to a large extent by an elected body like the Council was likely to have a prejudicial effect, because the workmen they employed, having votes, became a privileged class.

Lord Tweedmouth appealed to the two parties in the Council to come to some agreement whereby the Department might be maintained. He protested against abolishing it at a great loss to the ratepayers, and suggested that the Council would do itself harm by displaying a weak and vacillating policy in such an important matter.

Upon the motion of Mr. Taylor, the debate was adjourned to Tuesday.

At the usual meeting, on Tuesday, the debate was resumed by Mr. Antrobus, who supported the amendment.

Mr. H. Marks, M.P., contended that the reports of Mr. Waterhouse and Mr. Gruning were themselves a conclusive indictment of the Works Department in its present form. He denied that the abolition of the Department would be a death blow to direct labour. Direct employment of labour existed before the Department was created, and he wanted to see it continued, but it should be direct employment of all the workmen in London.

Mr. Taylor, in opposing the amendment, declared that it was based on fallacy and misrepresentation. The Department had done two great things: it had improved the standard of workmanship, and it had compelled the contractors to do better work than they had been in the habit of doing. He pointed out that the tenders of contractors were nearly all in excess of the architect's estimate, and he complained that it was on the original estimates that the Works Department had been judged. They had never been treated by the present Council so well as contractors had been treated. In spite of all the difficulties that had been put in their way they had saved money for the ratepayers in more than one direction, they had given better work than contractors would have given, and they had broken down one of the worst monopolies that ever existed.

Mr. E. White contended that the Department had proved a failure, and that the loss on the year ending March next would be found to be more than 30,000*l.* It was said that the Depart-

ment's strong point was jobbing work, but he held that there had been a loss in the jobbing works. Although the last year would be found to be the most disastrous in the history of the Department, the loss would be nothing in comparison to what would be incurred in the current year.

Mr. Ward said he admitted that the loss shown by the various reports of the Works Committee amounted to nearly 17,000*l.*, but there was a bill for extras amounting to 4,000*l.*, which must be deducted. Then there ought to be a further deduction of 3,000*l.*, which had been paid off capital account. The loss, therefore, was only 10,000*l.* or about 1½ per cent. When, eighteen months ago, the Committee brought up a report showing a profit of 1½ per cent., they were told it was so trivial and that it was not worth thinking about, but when the profit was turned to a loss of 1½ per cent. it was termed a London County Council scandal. He thought the Council did not appreciate the difficult position in which the Works Committee were placed. During the last month from 30,000*l.* to 40,000*l.* worth of work had been given out to contract, and the result was the Department was left with only 3,500*l.* worth of building works in hand. The capital charges were 20,000*l.* a year, and it must be expected that a loss would be shown if this policy of starvation went on.

After some remarks from Mr. Elliott the Council, on a show of hands, rejected the amendment by 54 to 47, but the result of a division was a tie, 62 voting for the amendment and the same number against.

The Chairman declined to give a casting vote, and declared the amendment not carried.

Dr. Longstaff then moved as an amendment on the first Recommendation of the Special Committee, "That, in the opinion of the Council, some definite organisation for the direct employment of labour, and the direct execution of public works by the Council, under the superintendence of its own officers, is desirable and beneficial, that the following words be added:—"Provided that such organisation shall not be entrusted with the carrying out of any works of an architectural character." He contended that the evidence before the Committee showed that the Department could not, with advantage, undertake work of an architectural character.

Sir J. Lubbock, M.P., seconded the amendment.

Sir A. Arnold suggested that some arrangement, in view of the recent vote, should be come to, and he asked Dr. Longstaff to withdraw his amendment. The amendment was, in fact, unnecessary, because it was in the power of the Council always to decide what work should go to the Department. It was also difficult to decide what was and what was not engineering work as contrasted with architectural work. He hoped the amendment would not be pressed, in view of the fact that he would have to consider carefully what should be done with the report of the Special Committee.

Sir J. Blundell Maple, M.P., said he was opposed to the amendment, which would fetter the hands of the Department.

After further discussion, the amendment was withdrawn.

A division on the first Recommendation of the Special Committee was shortly afterwards taken, the result again being a tie, 56 voting for and 56 against the Recommendation.

The Chairman again declined to give a casting vote, and

Sir A. Arnold said he did not regard the loss of Recommendation A as effective, and he would consent to an adjournment over the recess of all the Recommendations from B to I.

Colonel Hughes moved to that effect, and this was agreed to. Recommendation J, which was formal, was accepted without discussion.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend the Greenwich District Board 2,400*l.* towards paying the cost of the Evelyn-street improvement; the Chelsea Vestry 7,000*l.* for wood and asphalt paving; the Fulham Vestry 5,700*l.* for wood paving; the Linehouse District Board 7,000*l.* for granite and York paving; and the St. Pancras Vestry 2,945*l.*, the balance required to complete an electric light installation.

A Coat of Arms for the Council.—On the recommendation of the General Purposes Committee, the following recommendation was agreed to:—"That it be referred to us to consider and report as to the desirability of steps

being taken for obtaining a coat of arms for the Council."

Dangerous Structure Proceedings in Arbitration Cases.—The Building Act Committee reported as follows:—

"On April 13 last the Council decided to obtain the decision of the High Court upon two most important points which had arisen, and appeared likely to constantly arise in legal proceedings in connexion with dangerous structures, namely (a) whether arbitration proceedings under Section 107 of the London Building Act are limited as regards the time within which the surveyors must report and the arbitrator make his award, and (b) whether the Arbitration Act, 1886, applies to such proceedings. The case came before the High Court on May 11, when, after hearing arguments of counsel, the Court expressed the opinion that the case would be best dealt with by an order that all proceedings should be dropped, and by the Court giving an opinion, for future guidance, upon the meaning of Section 107 of the London Building Act. The Court relieved the Council from paying the costs ordered by the magistrate in the case on which the question arose. The Court endorsed the view taken by the Council, that if an owner should require arbitration under the section he must give seven days' notice to the Council, and at the same time appoint an independent surveyor to report in conjunction with the district surveyor within seven days from the receipt by the Council of notice of appointment of the owner's surveyor, and that if the two surveyors appoint an arbitrator before they enter upon the matter and fail to agree all or any of the matters in dispute within such seven days, the matters not agreed thereupon fall within the jurisdiction of the arbitrator, who must make his award within fourteen days. Of course, a difficulty might arise if one of the surveyors or the arbitrator should be incapacitated within the times named; but this could be overcome by an order being obtained from the High Court under the Arbitration Act."

Westbourne-Park Railway Bridge.—The Improvements Committee recommended, and it was agreed,

"That the estimate of 4,500l., submitted by the Finance Committee, be approved, and that the Council do consent to be a party to a clause in the Great Western Railway Company's Bill now before Parliament, authorising the company to extend and improve the bridge carrying the road over the railway at Westbourne Park station, on the following conditions—(a) that the Council shall contribute one-fourth of the net cost of the work, such contribution not to exceed the sum of 4,500l.; (b) that the bridge shall be constructed in accordance with plans to be previously submitted to and approved by the Council; and (c) that room for one line of vehicles and a footway not less than 8 ft. wide shall be reserved for the use of the public during the progress of the works."

Temporary Structures for the Jubilee Celebrations.—The Building Act Committee reported that up to the present time 496 applications had been received for licences in respect of temporary structures for the accommodation of persons desiring to see the Jubilee Procession on June 22. Of these, 328 had been granted and 33 refused, while the remainder were under consideration. Applicants had in all cases been cautioned to prevent the overcrowding of the stands and to adopt proper precautions against risk of fire. The local authorities of the thoroughfares in the line of route of the procession outside the City of London had been requested not to license, except in urgent cases, the erection of hoardings or gantries between the present time and June 22, and in such cases to make it a condition of consent that unless the Council's licence be first obtained the structure shall not be used for the accommodation of persons to view the procession.

The Fire Brigade Committee reported that numerous questions having been asked as to the Fire Brigade arrangements on the occasion of her Majesty's Jubilee Procession on June 22, they thought it well to state, in order to allay public anxiety, that they had conferred on the subject with the chief officer, who had proposed a scheme which would ensure the prompt attendance of firemen with life-saving and fire-extinguishing appliances in the event of fire on the route of the Procession. As the thoroughfares along which the Procession would pass would probably be so thronged that it would be almost impracticable for vehicles to pass through the crowd, it was proposed to have engines and horse fire-escapes at various points with which the Brigade was in telephonic communication, and the chief officer was by their direction in consultation with the Commissioner of Police of the Metropolis with a view to determining the exact positions in which the appliances should stand.

The Council subsequently adjourned for the Whitsuntide holidays until Monday, June 28.

Illustrations.

THE illustrations this week are entirely devoted to the architecture of Leicester, which forms the subject of the leading article in this issue, as the seventh of our series of articles on "The Architecture of our large Provincial Towns."

The buildings illustrated in the plates are the Municipal Buildings (two illustrations); the Victoria Coffee-house, one of a class of buildings which form almost a feature in the town; and two sheets of miscellaneous smaller illustrations of Leicester buildings, including, on the one sheet, the Liberal Club, a Congregational Church, St. John's Church, Knighton (inferior), a dwelling house ("Knighton Spinneys") and a warehouse; and on the other sheet, the offices of the Alliance Assurance Company, the Wyggestone Hospital Girls' School, a Shoe Factory, the Wyeven Hotel, and two more of the Leicester coffee-houses. The names of the architects of each building are given on the plates.

THE ARCHITECTURAL ASSOCIATION: PLUMBING AND SANITARY WORK.*

I NOW come to soil-pipes. According to the by-laws of the London County Council, under seal dated June, 1893, all soil-pipes in buildings erected after that date are to be outside. Now, although I have done, perhaps, as much as anybody to encourage the fixing of soil-pipes outside, and still prefer such pipes to be outside, I have never slavishly chained myself down to such a restriction, and I think it is a pity the by-law should be so stringent, or that architects and plumbers should be so hampered: for it requires no great imaginative power to conceive of circumstances where the disadvantages would be greater than the advantages.

If it is a question of durability and sanitariness, in certain cases a soil-pipe fixed inside a house would be more durable and more sanitary than if fixed outside.

When they are situated on south fronts, where no shadow protects them, they often become so hot that the naked hand cannot be kept upon them; and their variation in temperature, from mid-day to midnight in the summer months, would be three times greater than upon pipes fixed inside or with a northerly aspect. The strain upon the joints of iron pipes and the unequal expansion and contraction of lead pipe would tell much upon their durability. And, of course, in such cases sewage matters would adhere and dry upon the soil-pipe in a different manner to that upon a pipe which did not become so heated, and it would, therefore, be less sanitary, unless, indeed, the water-closets upon it were well flushed at every usage by more than the Water Companies' restricted two-gallons.

Then, in certain cases, it is most difficult to find a good course for an outside pipe, free from a doorway or a pilaster, free from mouldings and enrichments; difficult to prevent it disfiguring the building. Of course I am sensibly alive to the fact that such pipes may often be made to improve the elevation, but that they are always so treated I will not attempt to prove to this Association. So ugly are they at times that one fancies they must lower the value of the property on which they are fixed. I have had some photographs taken of a few such, and will show some upon the screen. They are to be seen here, there, and everywhere in hideous fashions, being fixed neither vertically nor horizontally, nor in any pleasing line, crossing chimney breasts, coming over stringings, cornices, roof gutters, and parapets, going up to the roof over all the obstacles of their course victorious.

Then often no attempt is taken to disguise their purpose. Branches from water-closets are brought out, and carried along on the face of the wall to the main pipe; whereas, a little alteration of the water-closet apartment, or a little shifting of the water-closet, or a little graceful bending of the main pipe, or a dexterous treatment of the branches, and they could have been brought through the wall, and soldered to the back of the pipe, where they would never be seen. The poor arrangement now shown is a photograph of such a pipe,

* Being the second half of a paper read before the Architectural Association, on the 21st ult., by Mr. S. S. Hellyer. We printed the first part of the paper in our last issue, page 478.

showing its ugly advertising water-closet branch as recently fixed on the face of a house in one of the best streets in the medical world (fig. 4). I will now show you a stack, where the branches are brought in at the back of the pipe, and though it was fixed ten years ago you will see how well it stands and how well it looks—the photograph of this was only taken the other day.

Now as to the material of which soil-pipes should consist. For my own house, though I were as rich as Croesus, I should be content with lead pipe, and I should prefer it to any other kind of pipe that I know. I should be satisfied that the pipe was more wholesome than iron, being easier cleaned, and more durable, being less corrosive, and that its wiped soldered joints could be more relied upon than even the caulked lead joints of east-iron pipe, and remembering that they are much fewer in number, there being at least two more joints with iron pipe than with lead in every closet branch. In fact, when the main pipe is of iron and the branches of lead there would be four joints to every junction, as shown; for the London County Council rightly enough require such connexions to be made with a brass ferrule, as shown. But whether the branch be of lead or iron the joint with the iron junction should never be allowed to come into the wall as shown in the next photograph. Then, with iron pipe there would also be more joints on the main pipe; lead pipe being made in 6 ft. or 12 ft. lengths to suit circumstances, and the iron pipe as generally used in 6 ft. lengths (fig. 5).

Then the character of lead pipe compels the plumber to connect the ends neatly and nicely together, if he is to make a well-wiped soldered joint upon them, and with such yielding material as lead he has no difficulty in doing this, for he can bend or boss or alter either end at will, and rasp them to a great nicety; whereas, with a rigid spigot or socket end of a cast-iron pipe, what can he do when the two pipes do not come together in true correspondence in their interior surfaces, or when he has been a little out in his measurements? The pipe may be a little too long, or too short, but he cannot alter the socket, nor can he tamper with the spigot without destroying the bead or shoulder which is to keep the caulking material from getting into the interior of the pipe. Indeed, he may aggravate the case in caulking in the lead, by shifting the upper pipe away from its true bore with the lower pipe, and so leave a shoulder inside for matters to catch and collect upon. At any rate, such connexions often afford places for particles of filth to accumulate in, and though this may not mean much in one joint, in the aggregate—in the tens of thousands of joints—if all the soil-pipes of a large town or city were of iron, it would mean something. I mean that a stack of iron soil-pipe with several water-closets upon it would not be so free from smell as it would be if it were of lead with precisely similar closets and water flushing.

In my house in Newcastle-street there is a stack of 4 in. soldered seamless lead soil-pipe which was fixed more than a century ago, and I see no reason why it should not last as long again. It is made of cast sheet lead about $\frac{1}{2}$ in. thick, and for you to see its present condition I have had two pieces cut out of its lower part and photographed. The piece showing its exterior is splashed over with the many whitewashings given to the cellar during the century, but as you see, the pipe is quite sound and good, and fairly clean in its interior, as shown by the other piece. A Bramah closet, similar to the one shown earlier in the evening, discharged into it on the second floor, and was, I expect, in daily use for three-quarters of a century, when it was changed, together with its D-trap, for a "Vortex" closet, since when it has only been in use six days out of seven. It is interesting to know that the apartment, though well lighted has only a borrowed light, viz., through a glazed fan-light and semi-glazed door, both of which open into the staircase for access and ventilation, just under a well-ventilated lantern light.

But we all know how well lead pipe stands the London atmosphere. I will show you a photograph of a lead R. W. head and pipe which was fixed on the old Dining Hall of Staple Inn in 1653, and also of another head and stack which was fixed on the Chambers in the same Inn in 1720, both being in very good condition to-day. I will also show you a photograph of a stack of lead soil-pipe, fixed in 1881, and that of another fixed in 1888, both being

straight and good to-day, and showing no sign of deterioration.

To prevent sagging and "telescoping," lead soil-pipes should be well supported about every 5 ft. with a pair of tacks, and the strength of the pipe should be equal to sheet lead weighing 8 lbs. to the superficial foot.

For every unsoaked soldered joint on lead soil-pipe, I should expect to find a thousand unsoaked cement joints in cast-iron pipe, and even when a joint is made with great care in iron pipe, after a time it is liable to breakage by the expansion and contraction of the pipes as shown. The pipe generally used is of insufficient strength, and is liable to fracture like that shown, which shows a defective joint with its fellow pipe and also with that of the drain.

But I have no desire to unfairly decry iron soil-pipe, especially when such pipes are of good strength ($1\frac{1}{2}$ -in. metal for outside situations), and the joints are well and carefully made with blue lead or Spence's metal. In fact where hot water is discharged into a soil-pipe, lead pipe with soldered joints would not stand the continual strain of expansion and contraction; and, therefore, iron pipe would be much preferable in such cases. But, in my opinion, hot water ought never to be discharged into soil-pipes, their temperature should never be so raised. I know well enough that in America not only are the baths and lavatories discharged into soil-pipes, but also the sinks; but we can afford to treat plumbers' work more sanitarily; we can carry the waste-pipes from such fittings through the external walls to open air and discharge them into intercepting traps, for we are not subject to such severe frosts.

All soil-pipes, no matter of what material they are made, should be carried up at least full-bore to the highest parts of the roof, where the air coming out of them would have no chance of getting into the house, and where the wind from any point would blow over them to carry the bad air away. I think it is only right to say that this matter is now much more considered by the authorities than used to be the case, but I am going to show you directly a few instances of bad treatment where the pipes have been recently fixed, some even this year. The photographs will be sufficiently graphic to need no words of mine to point out the evils. It will readily be seen how the emanations of soil-pipes and drain ventilation pipes can contaminate the cistern water, or enter a house through its windows or chimneys; and how even though people may be friendly and neighbourly enough on the lower part of their houses, they are not really so in the upper part. The air from the soil-pipe of one house being allowed to enter the window of the other house and poisoning the air within, as shown in the illustration (fig. 6).

Now, as to the size of a soil-pipe. Before determining the size of the pipe, it is important to know what it has to do. If in addition to its work of carrying away the discharges of a tier of water-closets, it has also to act as a ventilator to the drain, it ought not to be less than 4 in. And if no syphonic action is to take place in it, that is if no anti-syphonage pipe is fixed to its trapped branches, it should be of larger bore still—5-in. or 6-in pipe. And even this size would not be large enough to prevent syphonage when the air had to come down a

long length of piping, as in the case of a very high building—was of a bore still larger, for the air to pass down the pipe free from friction, and in a body sufficiently large to prevent a vacuum.

When no anti-syphonage-pipe is fixed, and the main soil-pipe is only $3\frac{1}{2}$ in. or 4 in. bore, it is of paramount importance that only water-closets which have special traps should be fixed, which means a deeper seal and a larger body of water. Now, except in the case of valve-closets, as we have already seen, the water-seal of a closet is in open contact with the air in the soil-pipe and the drain; and where the closet is not in constant use the water held in its trap would become tainted and surcharged with gases. It is, therefore, important that the whole of this water should be changed every time the closet is used, and I confess that I do not see how this is to be done satisfactorily with a two-gallon flush, if the water-seal of the closet-trap is to be of a depth great enough to withstand the action of syphonage without the aid of an anti-syphonage-pipe, and the closet is to be left with its full water-seal.

Moreover, without anti-syphonage pipes there would be no ventilation of the closet branches, no matter how long they might be. In fact, such branches would be like inverted bottles, for there would be no escape for the gases in them, except by diffusion or by passing through the water-seals of the closet to the house.

To show the power of such pent up gases I have had a lantern slide made of a photograph

which I had taken the other day of the interior part of a piece of lead-pipe which was branched into a stack of soil-pipe about fifteen years ago. As you see the lower half, which carried off the matters sent into it, is practically intact; but the upper half, the part exposed to the gases and vapour, is eaten through in many places. The main soil-pipe on which it was fixed was open full bore to the air about 50 ft. above it, and for a few years it was trapped off from an old drain with which it was connected, when it was reconnected without a trap to a system of drains which had several other open soil-pipes upon it for ventilation. [The piece of lead water main shown in the photograph has nothing to do with it. It is, as you see, quite perfect, though it is supposed to have been in use at Hampton Court Palace over 350 years.] It will be found with an anti-syphonage pipe of 2-in. bore, that a 3½-in. or 4-in. soil-pipe will answer very well for a tier of many closets, except in the case of very high buildings. And, as the London County Council allow nothing smaller than 3½ in., and require 4 in. when it is connected with a 4-in. drain, I say nothing about smaller sizes.

I have no time to add much to what has already been said or implied on ventilation. The ocean of air surrounding every house ought not to make it too difficult to give full and free ventilation to every soil-pipe, waste-pipe, and drain; and in such a manner that no air coming out of either outlet or inlet of the system should enter the house or be breathed before it has been well broken up and purified.

When many stacks of soil-pipe are directly connected to one large system of drains, having only one low-level inlet upon it, viz., at its "disconnection chamber" with the sewer, the several stacks will not have such currents of air in them as they would if each drain into which each stack discharged had its own independent inlet, especially when all the stacks are of equal height, and the air in them is about equipoised, though there is generally some different influence acting on one pipe more than another, difference of temperature, wind, or weather. When no such influence exists the vapour will at times go up and down the pipes for hours together in a sort of see-saw movement. Backwards and forwards in the dark drains the injurious microbes may move, playing a sort of hide-and-seek; for I know little of their behaviour and less of their habits, except that I believe that light is not conducive of their longevity, and that fresh air annihilates them. But I must mind what I say, for are we all not made up of microbes? So I say no more on ventilation, except to remind you that, like money, there can rarely be too much of it where it is most needed. I have had some photographs taken of badly positioned ventilating terminals from soil-pipes and drains, and will show them upon the screen, pouring their emanations into windows, cisterns, chimneys, &c.

Knowing that our time to-night would be too short to cover the whole field of sanitary plumber's work, I thought it better to pretty closely survey the parts looked at rather than give a galloping glance over the whole area. I shall therefore only call your attention to but one or two matters more.

The by-laws of certain district councils require the "waste-pipe from every bath, sink or lavatory, the overflow-pipe from any cistern and from every safe under any bath or water-closet, and every pipe for carrying off waste water, shall be taken through an external wall, and discharge in the open air over a channel leading to a trapped gully grating at least 18 in. distant;" that is, such authorities prefer in sanitary methods to sanitary ones; for such treatment is sure to lead to a nuisance in some such way as shewn by the slides taken from two original photographs.

Soap-suds and bits of soap will generally be found decomposing and throwing off bad air, and often bits of paper, orange peel, hair, and the like, will also be there, blocking up the grating, offending the eye, and needing almost daily attention to keep clean. The ground, too, surrounding such gullies will often be found to be quite sodden with splashings and overflows. Whereas, with such waste-pipes made to discharge into self-cleansing intercepting traps just under the grating, no mess would be made, and no attention needed to keep the surroundings clean. And when such waste-pipes were properly trapped and ventilated their air disconnection would be all that could be desired. I will show the two methods (fig. 7).

No doubt some years ago there was a reason

for keeping the discharging ends of the waste-pipes well above a gully when the latter was generally a little cesspool in itself, and when waste-pipes were often fixed without traps, in which condition they acted as ventilators to the house. But no such reason exists now that self-cleansing intercepting traps are generally fixed, and that the waste-pipes are trapped. And yet only the other day a Board Surveyor, against his own judgment, caused some waste-pipes to be altered, because they delivered under the grating of a drain-interceptor, instead of over it; that, too, notwithstanding the fact that each waste-pipe was trapped. A soil-pipe may discharge directly into a drain, which may have no air disconnection within several hundred feet of the soil-pipe, although there be but the water-seal of the closet trap between the drain and the house; but for a waste-pipe to have its air-disconnection under a grating—oh, blissful ignorance!

No sink, bath, lavatory, or other fixture through which dirty water may be emptied, should be fixed without a trap of a self-cleansing kind, and one that will, when properly ventilated, retain an efficient seal no matter how large the body of water may be which is sent through it. And to prevent the discharges of one fixture backwashing up into the waste-pipe of another and fouling it, each fixture should have its own separate trap, which should be situated as close to it as practicable, so that the piece of outlet pipe—standing between the house and the seal of the trap—may be as short as possible. I have so good an example of the very reverse of this that I have had it photographed for you to see. It is a 9 in. D, with no less than seven waste-pipes connected with it. Less than a year ago it was doing duty in one of the greatest University Colleges of the country, receiving as it did the waste-pipe from a cistern, a bath, a drip-sink, a lavatory, a bath safe, and other pipes.

As only a very short length of unventilated waste-pipe is sufficient to cause syphonage, the upper ends of such pipes as well as their discharging ends should be carried through the external walls to the open air. To show how small a fall suffices for this, I have here a little lavatory with a 1½ in. syphon trap and a short length of 1½ in. waste-pipe, with its discharging end standing only a little below the bottom of the lavatory trap, and yet the drop is sufficient to set up syphonage and to leave the trap practically unsealed with but a small discharge from the basin.

I was staying at an hotel in Germany last year, and noticing a horrible smell in a lavatory more than once, I searched out its cause and found that the lavatory trap was most easily syphoned, in a similar manner to that just demonstrated; for although it was connected with a soil-pipe, the latter was about 7 in. bore and could not, therefore, have caused the syphonage. It arose from its own unventilated waste-pipe.

Opening up the upper end of a waste-pipe to the air not only prevents syphonage, it also ventilates the pipe and keeps it wholesome. Where more than one trap is connected to a waste-pipe through which quick discharges may pass, it is not sufficient for the upper end of the main pipe to be carried through full bore to the open air to prevent syphonage; each individual trap must be ventilated—must have an anti-syphonage pipe, in fact.

I think most authorities are now alive to the value of providing quick discharging arrangements to baths, sinks, and lavatories, though only the other day I came across a small wash-hand basin which took nearly one minute to empty. A 5 ft. 6 in. bath ought to empty under two minutes, and where it would be in daily use, and was situated near the head of the drain, as the chief means of flushing it, it might be made to empty in one minute, a 3-in. waste-valve being fixed to the bath for the purpose, and the trap and waste-pipe of equal bore.

I have no time to say more than a word or two on drains. When circumstances require a soil drain to be fixed inside a house, or outside it, where a leakage from it would find its way into the house or under the footings, I should strongly prefer it to be of cast-iron, with caulked lead joints, rather than of stoneware—whatever kind of joint might be adopted—the thickness of the cast-iron pipe being not less than ¾ in. in its thinnest part for 4 in. or 5 in. drains, and greater still for drains of larger size.

I know that some authorities still prefer stoneware drains to iron, even for fixing inside a house. I had an argument with one only last year, but "a man convinced against his will is

of the same opinion still." I think it would be almost impossible to find anywhere a stoneware drain of any great length inside a house absolutely water-tight from end to end, which has been in use for, say, fifteen years. Even when every precaution has been taken, and a stoneware drain has been very carefully laid, and its joints specially made, one could not be certain how long it would remain perfect. After many years of existence there may only be a slight leakage in it, but if that occurs inside a house it will be sufficient to create great unrest in the minds of sensitive inhabitants, even if no illnesses arise from it. And the misfortune in such cases is that such leakage or leakages are generally difficult to repair, and are practically impossible of repair without danger of doing further injury to the drain.

I have just had a cast-iron soil drain examined which was fixed inside a house in the City twenty-six or twenty-seven years ago by my firm. The pipe is of water-main strength, and is suspended from the ceiling joists in the basement. Both the pipe and the caulked lead joints were found in excellent condition, nothing having been done to them from the time they were executed, except that in white-washing the basement the drain had also been white-washed from time to time.

In 1881 I had some manholes built in brick and cement on the first floor of my offices as examples, together with some sanitary fittings, and a specimen length of iron drain. I had a photograph taken of certain parts before their removal last year, and you will see that the iron pipe and the caulked lead joints are quite good, and show no sign of wear, though they were experimented with for fifteen years. Also you will see from the same photograph, that though apparently no action has taken place between the lead and the Portland cement, which connected a piece of lead soil-pipe to the stoneware drain, the cement joint shows that there was no real adhesion of the cement to the glaze of the stoneware socket, and this accounts for the leakage which quickly showed itself when tested with water.

Notwithstanding that many authorities require that even cast-iron drains should be embedded in concrete, I consider such treatment a wicked waste of money, for with a pipe of proper strength all the support it needs is from its under-side, except in very exceptional cases, and this is best done by brick piers built on concrete bases, with a stone or concrete resting slab for the pipe to nicely fit in, or by making a continuous bed for the drain in Portland cement concrete. This arrangement readily admits of the removal of the earth surrounding the drains and the joints, for any future examination of the pipe, and for recaulking of the joints when necessary. When such drains are encased in concrete the cost of cutting away the concrete to find out a leakage or to get at the joints would lead to great expense and do damage to the drain.

Where practicable, instead of laying an iron drain in the ground, where it is inside a house, it is better that it should be carried on the face of some wall, or be suspended from a floor, or be carried in a subway, or have a tunnel or creeping trench specially built for it, in brick and cement, with openings into it only from the external air, so that the drain may be readily examined, and in the latter case be completely isolated from the house.

The many improvements in sanitary plumbers' work which I have brought before you to-night, or to which I have alluded, as well as many others which I have had no time even to mention, have almost entirely been made during the latter half of the long and magnificent reign of her Majesty, whose Diamond Jubilee we are going to so gloriously celebrate next month. And when dipping my pen into the ink-bottle to write the finishing words of this paper, it occurred to me that instead of attempting any kind of peroration, the better thing to do would be to drop the pen for the pencil, and portray in a sort of transformation piece the progress of plumbers' work between 1837 and 1897.

Before showing this set-piece, which my draughtsman has so well got out, I should like to remind you of the great power you possess for raising and maintaining the standard of plumbers' work. Other authorities may desire it, may even expect it; but architects, from their privileged position as advisers, and as the designers and directors of building works, can demand it, can to a large extent secure it, by providing for it in their specifications, and by being prepared to properly pay for it.

And though plumbers may not everywhere throughout the country be equal to the demand for very high-class work, they will be much stimulated by the desire of architects for such work. At any rate, more than any other class, more even than medical men—who have so nobly and so disinterestedly done so much for the craft, for sanitation—can the architect aid the plumber in making our homes healthy to live in.

When the hand-worker—greatly interested in his work—produces with skill and intelligence what was required of him, what was portrayed to him by the head-worker, he is ever-so-much helped by some appreciative acknowledgment, however slight, and a word of praise to the deserving—how good it is! Like mercy it is twice blessed. Gentlemen, in your works may it be your privilege to make the workers happy in their work.

HOUSE SANITATION.

THIS was the title of a short paper read on the 26th ult. by Mr. Rogers Field, B.A., at the Engineering Conference of the Institution of Civil Engineers. The paper was read before the "Waterworks, Sewerage, and Gasworks" section, and was as follows:—

"In these days, when so many small tradesmen call themselves Sanitary Engineers, to say nothing of large firms of the most different kinds, such as builders, house agents, house furnishers, general purveyors, &c., an educated civil engineer is half inclined to think that it will be best to fight shy of house-sanitation. This would, however, be quite a wrong view to take of the matter, as numerous points connected with it are pre-eminently ones for a civil engineer to deal with, besides which, in the increasingly important subject of municipal work, it is absolutely essential that the engineer should have a complete grasp of house sanitation. The question is, therefore, clearly a proper one for Members of the Institution to discuss, but all that can be done in these brief notes is to refer to the principles which govern it, and to a few of the features most interesting to engineers.

In the twenty-one years which have elapsed since the writer drew up the Uppingham Regulations for House Drainage (which were about the first ones of the kind embodied in by-laws allowed by the Local Government Board), great advances have taken place in house-sanitation. The principles which govern the question, however, remain much the same, and the advances are chiefly in the appreciation of the necessity of greater thoroughness about carrying out these principles, and in improvements as to the structural details necessary for this purpose.

The first question which suggests itself is water-supply. The guiding principle is evidently that there should be an ample supply of pure water to the house, and that the appliances for distribution should be so arranged that the water cannot be contaminated before it is used. In ordinary town houses the water is delivered to the house from the public water-supply, so that the question is chiefly one of detail as to the distribution inside the house; but many of the details involved are of the greatest importance, though there is not time to refer to them here. In houses in the country and in large institutions other considerations arise. Frequently an independent supply has to be obtained, and the possible sources of contamination are more numerous and insidious. For instance, if the water is obtained from a well, this may furnish a supply of good quality as long as only a small quantity of water is pumped, whereas if the pumping is largely increased the water may be drawn from a greater distance where sources of contamination exist. This introduces the whole question of hydrogeology, and the cone of depression in the underground water caused by pumping under various conditions. Again, if any of the water-mains or pipes are leaky and pass through contaminated ground, they may when partially or wholly emptied for any purpose sink in contamination, and thus cause a local pollution of the water-supply. This introduces the question of the various ways of ascertaining whether leakages exist in water-mains.

The next question which suggests itself is drainage. The two chief guiding principles briefly stated are:—

(1) That all foul matter directly it is produced must be rapidly and completely removed from the house.

(2) That there must never be any passage of air from the drains or waste pipes into the house.

The first principle is most important and far reaching, and goes to the root of sanitation. If carefully thought over, it will be seen that absolute compliance with this principle would involve there being no leaky drains, no polluted subsoil and no production of foul gases in the drains from decomposing organic matter. In order, however, to effect this result even approximately, the compliance with the principle must extend to every detail of the drainage and sanitary arrangements, and this involves attention to an immense number of points of which it is only possible to mention one or two.

The drainage must be carefully designed so as to be self-cleansing and readily accessible. In the case of large mansions and institutions the engineer's skill will be specially valuable about this, and will frequently produce results which would otherwise not be obtained. For instance, where there is difficulty about fall, it is quite remarkable what can be done by careful design by a hydraulic engineer, now that he has the help of self-acting flushing appliances. Moreover, it is impossible to be too particular about the construction and the testing of the drains to ensure not only that they are true and water-tight when completed, but that they will remain so. This permanence of the work is a very important question. It is now becoming more and more the practice to subject drainage to periodical examination and testing, and the experience thus gained has shown that stoneware drains, which were thoroughly sound when laid, frequently do not remain so for many years. To get over this drawback, the writer has found it advantageous to use heavy cast-iron pipes for drains instead of stoneware pipes.

All the sanitary apparatus, traps, &c., must also be self-cleansing. Formerly this was very far from being the case, and although there has been a great improvement lately, there is still not infrequently retention of foul matter in hidden parts of the apparatus requiring a minute examination and testing to detect. Many traps are also not of a self-cleansing form. Another most important point is that all pipes and apparatus should be readily accessible.

Proceeding to the second principle—that there should never be any passage of air from the drains or waste pipes into the house—this is also very far-reaching. First, there is the question of isolating the house-drains from the public sewer or outfall drain by means of a "disconnecting chamber." If careful attention is paid to various details, such as the design of the manhole, the form of trap, the rapid discharge of water from the house-fittings, &c., it will be found that, practically speaking, no retention of foul matter takes place in the trap. Next there is the question of the position of the drains, soil-pipes, and waste-pipes, which should clearly be kept outside the house wherever possible. Then there are the questions of the "disconnection" of the waste-pipes from the drains, and of the ventilation of the drains, &c., involving a number of subsidiary questions, which it is impossible even to name.

The last matter which will be referred to is the condition of the gas-pipes and fittings. This appears at first sight comparatively unimportant, but it is not so. Gas-pipes and fittings are, as a rule, more or less leaky, and allow a constant escape of gas to take place into the house. Professor Corfield has shown how slight escapes of coal-gas may cause serious outbreaks of sore throat, and the writer and other people have had similar experience. It is also not at all unusual for offensive smells to be attributed to defective drainage, which are really due to escapes of gas. The pipes and fitting should always be tested by pumping air into them, and watching the result on a pressure gauge.

In conclusion, the writer would say that on a review of the various advances which have taken place in house sanitation during the last twenty-one years, one of the most important in his opinion is the general practice which has grown up of applying searching tests to every detail of the work, and in this connexion he would specially refer to the method of testing by air under pressure, which was brought forward by Mr. Charles Hawksley at the International Health Exhibition, 1884. For soil pipes this method of testing is particularly useful."

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At a recent meeting of the London County Council, the Building Act Committee reported that they had considered the undermentioned applications under the London Building Act, 1894, and had arrived at the following decisions. Those applications which have been agreed to are granted on certain conditions:—

Lines of Frontage.

Hammersmith.—That consent be given to the erection of a one-story addition to Eaton Laundry, to abut upon Hadyn Park-road, Starch Green, on the application of Messrs. Johnstone Brothers on behalf of the London and Brighton Laundries, Limited.

Bethnal Green, North-east.—That consent be given to the erection of a building over the gateway between Nos. 33 and 35, Bonner-road, on the application of Messrs. Holman and Goddham on behalf of the Rev. T. B. Stephenson.

Clapham.—That consent be given to the erection of St. Barnabas Church, North Side, Clapham Common, at the corner of Lavender Gardens, Battersea, on the further application of Messrs. W. & C. A. Basset Smith.

Deptford.—That consent be given to the erection of a projecting shop-front at No. 112, Woodpecker-road, New Cross, on the application of Mr. E. Crosse on behalf of Mr. A. Hyde.

Fulham.—That consent be given to the erection of seven houses with shops on the south side of New King's-road between Eagle's-lane and Eelbrook Pavement, on a portion of the garden of the rear of Nos. 1, 2, 5, and 6, Peterborough Villas, on the application of Mr. R. Groom on behalf of Mr. J. Nichols.

Hammersmith.—That consent be given to the erection of a one-story bar addition in front of the "British Queen" public-house, No. 77, Goldhawk-road, at the corner of Richard-street, on the application of Mr. J. H. Richardson on behalf of Mr. A. Keene.

Hampstead.—That consent be given to the erection of a two-story oriel window, at the first-floor level, in front of the Hampstead Public Baths, Finchley-road, on the application of Messrs. Spalding & Cross, on behalf of the Vestry of Hampstead.

Islington, North.—That consent be given to the erection of a one-story shop upon part of the forecourt of No. 159, Stroud Green-road, on the application of Mr. L. Pither on behalf of Mr. W. G. Swan.

Islington, North.—That consent be given to the erection of a temporary wooden show-case in the grounds of Tufnel Park Cycle School, Tufnel Park-road, on the application of Mr. H. J. Grimwade.

Islington, North.—That consent be given to the erection of a projecting shop-front at No. 96, St. John's-road, Upper Holloway, on the application of Mr. G. K. Deakin on behalf of Mr. G. Soole and Miss E. Soole.

Kensington, North.—That consent be given to the erection of a glass and iron covered way over part of the forecourt of No. 22, Pembroke-villas, on the application of Mr. M. E. Collins.

Levisham.—That consent be given to the erection of a dwelling-house on the west side of Silvermere (formerly Schieckburgh) road, at the corner of Bradgate-road, on the application of Mr. F. Witt on behalf of Messrs. Johnson & Aldridge.

Levisham.—That consent be given to the erection of eleven houses on the south side of The Retreat, Catford-road, with the flanks of the eastern and westernmost buildings in advance of the houses in Nelgarde-road and Doggett-road respectively, on the application of Mr. F. Witt on behalf of Messrs. Johnson & Aldridge.

Linehouse.—That consent be given to a glass and iron porch erected in front of the Eastern Hotel, East India-dock-road, on the application of Mr. Bruce J. Capell, on behalf of Messrs. Truman, Hanbury, Buxton & Co.

Pertham.—That consent be given to the erection of nine houses, with projecting bay windows, on the west side of Lower Park-road, of eight houses with similar bays on the south side of Commercial-road, on the site of Nos. 72, 74, 76, 78, 80, 82, 84, 86, 88, and 90, Lower Park-road, and the widening of portions of Commercial-road, Lower Park-road, and Park-row, on the further application of Messrs. Benson & Bagman on behalf of Mr. Pennack.

Strand.—That consent be given to the erection of a glass and iron pent roof over the entrance doorway to No. 3, Cleveland-row, St. James's, on the application of Mr. R. S. Wornum on behalf of Colonel F. A. Lucas.

Strand.—That consent be given to the erection of two oriel windows in front of the "Catherine Wheel" public-house, Nos. 41 and 45, Great Windmill-street, St. James's, on the application of Mr. W. M. Bruton.

Westminster.—That consent be given to the erection of a building with projecting porches and bay windows on the site of No. 54, Parliament-street, and to abut at the rear upon Cannon-row, on the further application of Mr. A. Williams on behalf of Messrs. Grundy & Co.

Woodwich.—That consent be given to the erection of fourteen new houses, and also to the proposed

frontage line of other cottages to be erected northward of those houses, on the west side of Chislehurst-lane, Eltham, on the further application of Mr. A. G. Wright on behalf of Mr. J. Bass.

Lambeth, North.—That consent be not given to the erection of a one-story addition in front of the Ship public-house, No. 171, Kennington-road, on the further application of Mr. J. C. Jackson, on behalf of Mr. W. Chicken.

Bermondsey.—That consent be not given to the erection of a building on the east side of Route-road, between Nos. 54 and 58, on the application of Messrs. Mark W. King & Sons on behalf of Mr. T. J. Lipton.

Bow and Bromley.—That consent be not given to the construction and erection of a temporary wood and iron mission-hall, with projecting porch, on a plot of ground adjoining No. 148, Usher-road, Old Ford-road, on the application of Messrs. Holman and Goodham, on behalf of the "Out and Out" mission.

Brixton.—That consent be not given to the erection of a new building on the site of a house with yard at rear on the west side of Carlton-grove, Brixton-road, to abut upon Brighton-terrace, on the application of Messrs. Wyllson & Long, on behalf of Mr. Burney.

Clapham.—That consent be not given to the erection of three houses with bay windows in North-side, Clapham-common, at the corner of Judburgh-road, Battersea, on the further application of Mr. J. Stanbury.

Dulwich.—That consent be not given to the erection of a one-story addition to the office at Westwood House, No. 47, East Dulwich-road, Goose-green, on the application of Mr. F. A. Powell, on behalf of Messrs. Buxley & Co., Limited.

Dulwich.—That consent be not given to the erection of a building, with a one-story projection on the ground floor, on the north side of Lordship-lane, at the corner of Bassano-street, East Dulwich, on the application of Mr. E. J. Stevens on behalf of Messrs. Golden.

Greenwich.—That consent be not given to the erection of three houses with shops on the north-east side of Blackwall-lane, at the corner of Grenfell-street, East Greenwich, on the application of Mr. C. J. Heryet.

Greenwich.—That consent be not given to the erection of dwelling-houses on the north side of Ashburnham-road, on the further application of Mr. W. T. Sawyer on behalf of the President and Governors of Queen Elizabeth's College, Greenwich.

Hackney, Central.—That consent be not given to the erection of a house with shop on the north side of Blackstone-road, London-fields, to flank upon Lansdowne-road, on the further application of Mr. W. H. Adams.

Hackney, North.—That consent be not given to the erection of two two-story bay windows in front of No. 250, Green-lanes, Stoke Newington, on the application of Mr. F. W. Pearce on behalf of Mr. G. Hand.

Holborn.—That consent be not given to the erection of porches, bay windows, turrets, balconies and other projections, at the Hotel Russell, on the east side of Russell-square, St. Giles-in-the-Fields, between Bernard-street and Guildford-street, abutting at the rear upon The Colonnade, on the application of Mr. C. Fitzroy Doll on behalf of Messrs. H. Frederick and Co.

Horton.—That consent be not given to the erection of a building on the site of five houses, with forecourts, on the east side of Clifton-street, between Worship-street, and No. 9, Holywell-row, Shoreditch, on the application of Mr. J. Grove Johnson.

Kensington, South.—That consent be not given to the erection of residential flats to be known as Addison-gardens-mansions, on the east side of Addison-road, on the site of No. 1, on the joint application of Messrs. J. N. Mason & Co., on behalf of Mr. E. Collins, and Messrs. Garrard, James & Wolfe, on behalf of Mr. F. Radford.

Lewisham.—That consent be not given to the erection of two houses on the north side of Bradgate-road, Catford-road, and of two other houses on the south side of a road skirting Ladywell recreation-ground, such four houses to flank upon Doggett-road and Silvermere-road respectively, on the application of Mr. F. Witt on behalf of Messrs. Johnson & Aldridge.

Norwood.—That consent be not given to the erection of houses with shops on the west side of Norwood-road, between Ullswater-street and Harpenden-street, on the further application of Mr. H. G. Bruce on behalf of Mr. H. Fryor.

Paddington, South.—That consent be not given to the erection of an oriel window on the north side of a house on the east side of Bark-place, at the corner of Caroline-place, on the application of Mr. W. Rolfe on behalf of Mr. C. F. Kealey.

Paddington, South.—That consent be not given to the erection of a glass and iron covered way over part of the footway in front of the Norfolk-square Hotel, London-street, on the application of Messrs. Treadwell & Martin, on behalf of Mr. R. Baker.

St. George, Hanover-square.—That consent be not given to the enclosure of the sides of the open portico at No. 21, Chester-square, on the application of Messrs. Hailey & Co. on behalf of Mr. T. Frampton.

Wandsworth.—That consent be not given to the

erection of shop-fronts to Nos. 206 and 208, Upper Richmond-road, Putney, on the application of Mr. T. Jones.

Strand.—That no order be made with respect to the application of Mr. W. G. R. Sprague, on behalf of Mrs. C. Wilmot, for the consent of the Council to the retention of two glass and iron shelters erected over the public way in front of the Olympic Theatre, Wych-street, Strand.

Width of Way.

Brixton.—That consent be given to the erection of a two-story building on part of the yard at the rear of the "Plough" public-house, No. 66, Coldharbour-lane, at less than the prescribed distance from the centre of Denmark-road, on the application of Messrs. Eedle & Meyers on behalf of Mr. C. M. Harris.

Hinbury, Central.—That consent be given to the erection of No. 3, Jerusalem-court, St. John-street, Clerkenwell, on the application of Mr. A. Walke.

Hackney, Central.—That consent be given to the erection of a three-story workshop at the rear of No. 383, Kingsland-road, to abut upon the east side of Derby-road, on the application (further considered) of Mr. R. Wakely.

Lambeth, North.—That consent be given to the erection of buildings at the rear of the "Ship" public-house (No. 171) and No. 169, Kennington-road, to abut upon Ship-lane, on the application of Mr. J. C. Jackson on behalf of Mr. W. Chicken.

Newington, West.—That consent be given to the erection of an addition at the rear of the "Artichoke" public-house, No. 55, Newington-caneway, to abut upon Devonshire-street at less than the prescribed distance from the centre of the road, on the application of Mr. W. J. Ryland on behalf of Mr. E. Colvin.

St. George-in-the-East.—That consent be given to the erection of the Passmore Edwards Public Library on the site of Nos. 234, 236, and 238, Cable-street, with the flank of the new building abutting upon Prospect-place and the forecourt boundary next Cable-street, at less than the prescribed distance from the centre of those streets respectively, on the application of Mr. Maurice B. Adams on behalf of the Library Commissioners for St. George-in-the-East.

Strand.—That consent be given to the erection of a theatre on the east side of Charing Cross-road, St. Martin-in-the-Fields, between the two western entrances to St. Martin's-court, and the widening of portions of that court, on the application of Mr. W. G. R. Sprague on behalf of Mr. Charles Wyndham.

Bermondsey.—That consent be not given to the rebuilding of the "Samson Castle" public-house, No. 211, Grange-road, to abut upon Grigg's-place, on the application of Mr. T. H. Smith, on behalf of Mr. Alderman J. C. Bell.

Open Space about Buildings.

Hampstead.—That consent be given to the erection of a four-story turret at the south-east angle of a block of residential flats on the north side of Finchley-road, at the corner of Langland-gardens, on the further application of Messrs. Bochmer & Gibbs, on behalf of Mr. E. A. Cave.

Deviation from Certified Plan.

Marylebone, East.—That sanction be given to certain deviations from the plan certified by the District Surveyor, under Section 43 of the London Building Act, 1894, so far as relates to the proposed erection of a four-story dwelling-house on the site of a stable and portion of a garden at the rear of No. 147, Harley-street, at the corner of Marylebone-road, on the further application of Messrs. Davis & Emanuel, on behalf of Mr. Barrow Emanuel.

Line of Fronts and Width of Way.

Fulham.—That consent be given to the rebuilding of the "Hand and Flower" public-house, No. 67, King's-road, with the flank abutting upon Edith-row, on the further application of Messrs. Gardiner & Theobald on behalf of Mr. A. W. Rice.

Hammersmith.—That consent be given to the erection of buildings with projecting fifth pilasters, bay window, balcony and porch, at No. 12, Great George-street, at the corner of Little George-street, the second application (further considered) of Messrs. A. Waterhouse & Son on behalf of the Surveyors' Institution.

Brixton.—That consent be not given to the erection of shops upon the forecourts of Nos. 18, 20, 22, 24, 26, and 28, Coldharbour-lane, on the application of Mr. J. T. Holmes on behalf of Mr. H. Wood and Mr. J. L. Purdy.

Clapham.—That consent be not given to the erection of a two-story addition to St. George's Schools, New-road, Battersea, on the application of Messrs. Chambers & Deves on behalf of the trustees of the schools.

Norwood.—That consent be not given to the erection of a house with shop on the north side of Durham-road, at the corner of Woodcote-place, West Norwood, on the application of Messrs. Wallis & Smith on behalf of Mr. T. J. Wallis. That Messrs. Wallis & Smith be informed, however, that the Council will be prepared to consider an application for consent to the erection of the proposed building if accompanied by an amended plan, showing the ground in front of the main portion of the building,

in each of the streets referred to as to be dedicated to the use of the public.

Wandsworth.—That consent be not given to the frontage of a two-story addition, in course of erection at a laundry building on the south side of Putney Bridge-road, and at less than the prescribed distance from the centre of Oxford-road, on the application of Mr. R. Avis.

Formation of Streets.

Clapham.—That an order be sealed and issued to Mr. C. J. Bentley, sanctioning the formation or laying out of a street, 40 ft. wide, for carriage traffic to lead out of the south side of Nightingale-lane into Temperley-road, Wandsworth, on his further application to the Council on behalf of himself and Mr. J. C. Hill. That the name Blandfields-street be approved for the new street.

Lewisham.—That an order be sealed and issued to Mr. W. Hunt, refusing to sanction the formation or laying out for carriage traffic of a street, varying in width from 10 to 38 ft., to lead out of the north side of Beacon-road, Hither Green, on his application to the Council on behalf of Mr. J. Brown.

Lewisham.—That an order be sealed and issued to Mr. H. Woodham, refusing to sanction the formation or laying out for carriage traffic of a street, 40 ft. wide, to lead out of the south-west side of Brownhill-road, Catford, on his application to the Council.

Wandsworth.—That an order be sealed and issued to Mr. A. Wellings, refusing to sanction the formation or laying out for carriage traffic of new streets, each 40 ft. wide, on the Furzedown Park estate, Mitcham-lane, Streatham, on his application to the Council.

Height of Buildings.

Southwark, East.—That consent be not given to the erection of a block of buildings on the south side of Lavington-street, to exceed in height the width of the street, on the application of Mr. Herbert O. Ellis, on behalf of Messrs. Harmsworth Brothers, Limited, as no reason is seen why the rules of the London Building Act, 1894, restricting the height of certain buildings, should not in this case be strictly observed.

Lines of Frontage.

Chelsea.—That consent be given to the erection of a porch in front of a block of buildings to be known as Chelsea-court, Chelsea Embankment, on the application of Mr. Delissa Joseph on behalf of Mr. H. Lovatt.

Lewisham.—That consent be given to the erection of six houses, with projecting bay windows, on the south side of Lewisham High-road, between Sandrock-road and a footpath leading to Hilly Fields, on the application of Mr. W. A. Finch on behalf of Mr. E. T. Bagnall.

Islington, East.—That consent be not given to the erection of a block of residential flats on the north side of Ronald's-road, Highbury, on part of the garden at the rear of No. 1, Highbury-terrace, on the application of Mr. G. D. Martin on behalf of Mr. T. H. Martin.

Hackney, North.—That consent be given to the erection of an addition to the present one-story building at the rear of No. 108, Evering-road, Stoke Newington, abutting upon Mauv-road, on the application (further considered) of Mr. T. F. Dobell on behalf of Mr. T. Young.

Hackney, South.—That consent be given to the erection of houses on the east side of High-road, Upper Clapton, on the application of Mr. G. R. Woodruff.

Hackney, North.—That consent be given to the erection of one-story additions at the rear of No. 64, Church-street, Stoke Newington, to abut upon Fleetwood-street, on the application of Mr. S. Goodall on behalf of Mr. A. Woodgate.

Peckham.—That consent be given to the erection of a covered sideway at No. 217, Peckham Rye, to abut upon Rye Hill Park, on the application of Mr. B. W. Sheffield on behalf of Captain W. T. C. Brewer, R.N.

St. George, Hanover-square.—That consent be given to the erection of an oriel window over the gateway to a stable-yard on the south side of Lambeth-mews, Mayfair, on the application of Mr. W. E. MacCarthy on behalf of the Marquess of Lansdowne.

Hampstead.—That consent be given to the erection of two one-story coal-offices on the west side of Finchley-road, adjoining the Finchley-road Station of the London and North-Western Railway Company, on the application (further considered) of Mr. A. Whitehaw, on behalf of the Company.

Hendon.—That consent be not given to the erection of a one-story addition in front of the "North Briton" public-house, No. 10, New North-road, Shoreditch, on the application (further considered) of Messrs. Newton & Keene on behalf of Mr. W. Edwards.

Dulwich.—That consent be not given to the erection of a pair of villa residences on the east side of Herne Hill, and the erection of houses with shops on the north side of Half Moon-lane, and on the east side of Herne Hill, on the application of Mr. C. Barry on behalf of Mr. G. A. Young.

Holborn.—That consent be not given to the erection of a bay window with projecting balcony at the first floor level, in front of No. 27, Russell-square, Bloomsbury, on the application of Mr. J. Macvicar Anderson; as having regard to the

objections raised by the tenant of the adjoining house southward, it is considered that the bay window should not exceed in extent the limit specified in Section 73, Rule 5, of the London Building Act, 1894.

Paddington, South.—That consent be given to the rebuilding of Nos. 123, 125, and 127, Queen's-road, Bayswater, with bay windows in front of the new buildings, on the further application of Mr. C. G. Maylard on behalf of Mr. H. Gibbon.

Width of Way and Height of Building.
Strand.—That consent be given to the erection of a building on the south side of Bream's-buildings, Chancery-lane, Holborn, exceeding in height the width of the street, on the application of Mr. R. M. Roe on behalf of the Bishopric of Chichester estate and Mr. C. F. Crowder.

Lines of Fronts and Width of Way.
Hackney, South.—That consent be given to the erection of an additional story upon the present one-story shops at Nos. 120 and 122, Morning-lane, to flank upon Back-lane, on the further application of Mr. J. Hamilton on behalf of Mr. E. Stevens.

Hickney, North.—That consent be given to the frontage of nine houses with bay-windows on the west side of Park-lane, Stoke Newington, and the widening of a portion of Aden-terrace, on the further application of Mr. T. Pryor.

Kennington.—That consent be given to the erection of a block of residential chambers on the site of No. 50, Drayton-gardens, on the further application of Mr. J. Norton on behalf of Mr. T. Boyce.

Line of Fronts and Conversion of Buildings.
Southwark, West.—(a) That consent be given to the erection of a residential addition upon the forecourt of No. 42, St. George's-road, St. George-the-Martyr, on the application of Mr. J. Stone.
(b) That so much of the application as relates to the other alterations proposed to be carried out at No. 42, St. George's-road, and the conversion of a portion of the building into a stable be not acceded to, as upon sanitary grounds there is grave objection to the proposed stable.

Means of Escape from Top of High Buildings.
Chelsea.—That the Council, in the exercise of its powers under Section 63 of the London Building Act, 1894, do grant a certificate in respect of the means of escape, in a case of fire, proposed to be provided for the persons dwelling or employed in the fifth floor of a block of residential flats with shops on the ground floor, on the North side of Basil-street, Hans-road, Brompton-road, on the application of Mr. C. W. Stephens on behalf of Harrod's Stores, Limited.

Width of Way.
Hampstead.—That consent be given to the erection of a house on the south-west side of Rosslyn Hill, flanking upon Shepherd's-walk, on the application of Mr. J. Gibbons Sankey on behalf of Mr. S. Wales.

Open Space about Buildings.
Dulwich.—That the Council, in the exercise of its powers under Part V. of the London Building Act, 1894, do not permit the erection of a sawmill with workshop over, and of a nine-stall stable with forage store above, in a yard at the rear of Nos. 9, 10, and 11, Provincial-terrace, Green-lanes, Penge, without an open space at the rear of the new buildings, on the application of Mr. Horace E. Davey on behalf of Mr. F. H. Leader.

Formation of Streets.
Fulham.—That an order be sealed and issued to Mr. W. C. Poole, refusing to sanction the formation or laying out for carriage traffic of new streets, each 40 ft. wide, on the Sands-end estate, Townmead-road, on his further application to the Council on behalf of Mr. J. Wilson.

Dulwich.—That an order be sealed and issued to Mr. A. Keen, refusing to sanction the formation or laying out for carriage traffic of a new street, 40 ft. wide, to lead out of the east side of Oakhurst-grove into East Dulwich-road, on his application to the Council on behalf of Mr. W. B. Chamberlin and Miss S. E. Chamberlin.

Wandsworth.—That an order be sealed and issued to Mr. S. G. Warner, refusing to sanction the formation or laying out for carriage traffic of new streets, each 40 ft. wide, on the Spencer Lodge Estate, between Roehampton-lane and High-street, Roehampton, on his further application to the Council.

Wandsworth.—That consent be given to the erection of sixteen semi-detached houses on the north side of Waverree-road, Streatham Hill, on the application of Mr. F. Nesbitt Kemp on behalf of Mrs. Wyatt Coffey.

Recommendations marked † are contrary to the views of the Local Authority.

SHEFFIELD TOWN HALL.—In connexion with this building, which, as we have already stated, was formally opened on the 21st ult., we should mention that the successful carrying out of the work has been very much assisted by the ability and attention of the clerk of works, Mr. T. R. Scales, of Liverpool, who has acted in that capacity during the entire progress of the building. Mr. Brightmore, the mason's foreman, also deserves mention.

Correspondence.

To the Editor of THE BUILDER.

FORM OF BUILDING AGREEMENT.

SIR,—The attention of the Council of the Institute of Builders has been called to a letter from the Royal Institute of British Architects in your issue of the 22nd ult., under the above heading, and I am instructed to request that you will be good enough to allow this letter, giving the views of the Institute of Builders, to appear in your next issue.

In the year 1890, the Royal Institute of British Architects desired to arrange with this Institute a new form of contract to supersede the form settled between the architects and builders in 1871, and which has since that time been in constant use.

The builders were not anxious for any alteration in the old form, as it was well understood by both architects and builders; but, at the instance of the architects, they discussed the form of contract submitted to them, and the negotiations extended over a period of some four or five years.

This Institute, with a desire to meet the views of the architects, reluctantly assented to adopt the phraseology upon which the architects laid great stress in various portions of the contract, expressly on the condition that the Arbitration Clause should obtain conditions favourable to builders and unfavourable to the employers. Their desire throughout was to secure a fair and equitable contract as between the parties, leaving the architect to take his proper responsibility, and in such a form as to minimise the chance of litigation and to protect themselves when necessary against arbitrary and unreasonable conduct, possibly on the part of an architect or his client, the employer, or the work.

When the time came for settling the Arbitration Clause this Institute were advised by Sir Richard Webster and Mr. A. A. Hudson that the form of Arbitration Clause which the architects, after long discussion, required the builders to accept would not give the builders the protection they required, and that they should, therefore, decline to adopt it. The architects, however, were equally determined not to adopt the Arbitration Clause in the form the builders were advised was necessary for their protection, and thereupon the negotiations were broken off.

The 1871 conditions of contracts having been agreed between the Royal Institute of British Architects and the Builders Society, the Council of this Institute consider that they are entitled to refer to them as the only set of conditions upon which an agreement has ever been come to. It is not quite fair to suggest that the objections made on behalf of this Institute were prompted solely by their desire to obtain conditions favourable to builders and unfavourable to the employers. Their desire throughout was to secure a fair and equitable contract as between the parties, leaving the architect to take his proper responsibility, and in such a form as to minimise the chance of litigation and to protect themselves when necessary against arbitrary and unreasonable conduct, possibly on the part of an architect or his client, the employer, or the work.

Seeing that the Judges of the High Court have so frequently commented on the stringency and unfairness of building contracts, and that a builder's capital and reputation are often at stake, it is only right that the builder should endeavour to insist upon a form of contract which will safeguard his interests.

When the new form of contract was issued by the Royal Institute of British Architects the Council of this Institute received many inquiries on the subject; and a circular was issued explaining the position and advising members to continue to use the 1871 conditions, which have since been reprinted with slight verbal amendments rendered necessary by recent legislation.

A short form of agreement similar in terms to that adopted by the Royal Institute of British Architects has, in order to insure uniformity been printed and prefixed to the old 1871 conditions, so as to make it a complete document, and, in this form, it is now being extensively used.

R. S. HENSHAW,
Secretary, Institute of Builders.

WATER-CLOSET PLUMBING.

SIR,—I keenly appreciate the contributions of Mr. Hellyer to sanitary science, but think that either certain facts have escaped his notice, or his advocacy of the valve closet blinds him to their existence. To begin with, every valve closet must have an overflow, and in the face of this fact it is futile to insist on the point that the water in the basin is disconnected from the air in the soil pipe, for the water in the overflow is no better off than the water in the basin of a "wash down." Whatever make of closet we discuss, we must come back to the fact that one part or another depends purely and simply on the water seal of a trap.

Though small in size, the overflow and its trap are particularly objectionable from the fact that there is no means of cleaning them. Where there is illness in a house the consequences of this may be serious; as, for instance, when a nurse empties the contents of a sputum into the basin and the overflow becomes fouled with tubercular sputum before she has time to flush the apparatus. Sputum is not easily disinfected and, once it adheres, requires force to remove it.

It has occasionally been my lot to visit a number of occupied houses consecutively, and I generally find that where the valve closet prevails about half

the basins have no water in them, whereas in old districts where the pan closet still survives, the latter is almost invariably "doing its best"; and this has led me to think that when the bad old pan closet was abolished for new work, it was dropped rather on account of the deficiencies of the badly designed container and filthy D trap than for any fault of the pan *per se*. Furthermore, I am of opinion that if a specialist like Mr. Hellyer would set himself to design a closet with a pan valve instead of a hermetically sealing valve, and with the advantages of a modern trap and new form of container of the valve chamber pattern, he would produce something better than any closet now on the market; for, as we cannot avoid the water seal altogether, it would be much better to have the latter open to view, while at the same time we should gain immensely by the abolition of the overflow, and by having a valve which would not be liable to fail through the adhesion of a particle of paper.

With the window closed, or nearly closed, and a rapid movement of the water-closet door, I have succeeded in partially untrapping a valve closet overflow, and in some cases, I have no doubt, it may be absolutely untrapped through the air of the water-closet becoming for a moment under high pressure. This may apply to other traps, but is an additional reason for having the water seal in sight.

I am aware that the objections I urge may be largely overcome by special instructions as to usage, but what is wanted is a design of closet which, in the hands of average workmanship, can be relied on to give good results when used by inexperienced and careless people.

NORMAN WRIGHT.

Boscombe, May 31, 1897.

The Student's Column.

SPECIFICATIONS.—XXIII.

CONDITIONS OF CONTRACT (continued).

Art. 16.—The building from the commencement of the works to the completion of the same is to be under the contractors' charge, and they are to be responsible for and make good all injuries or damages which may occur to the works or to any person or things occasioned by fire, or by causes over which the contractors shall have control. And they are to hold the employer indemnified against any claims for injuries to persons or property which may happen from any neglect, default, want of proper care, or misconduct on the part of the contractors, or of any one in their employ. The contractors shall also be responsible for all injuries caused to the works by lightning, frost, or other interference of weather, and shall make good and re-instate all damage caused by the same.

Art. 17.—The contractors are to insure, in an office approved by the architect, the buildings and works against loss by fire, in the joint names of the employer and contractors, for the full value of the works executed. And they shall, upon request, deposit with the architect the policy and receipts for the premiums paid for such insurance. In case of neglect of the contractors to insure or to deposit with the architect the policy and receipts for the premiums, the employer shall have power to insure and deduct the amount of premiums from the amount payable to the contractors. All moneys received under any such policies shall be applied in or towards rebuilding or repairation of the building destroyed or injured, and shall be paid to the contractors by instalments on the certificates of the architect when such rebuilding or repairation of the buildings shall have been carried out. In the event of any damage by fire the architect shall determine and set out in writing the extension of time which the contractors shall be allowed for carrying out the rebuilding or repairation of the premises.

Art. 18.—The employer shall at all times have free access to the works and shall have full power to send upon the premises any other person or persons to execute any works not included in this contract, and the architect shall have power to send upon the premises any other person or persons he may select to carry out any works for which provisional sums are included in the specification. And the contractors are to afford every reasonable facility during working hours to such person or persons. And the contractors are to be responsible for any damage that may happen or to any work executed by such person or persons in the absence of such person or persons when such works may have been completed.

Art. 19.—If the contractors shall make default in completing the works within the time allowed by clause No. 2, or within any extension of time allowed by the architect for the completion of

the works, then the contractors shall pay or allow to the employer, as and by way of liquidated and agreed damages, the sum of £ per week for each and every week during which they shall be so in default until the whole works shall be so completed, provided that the architect shall certify, in writing, that the works could have been completed by the said date, or within the said extended time.

No. 20.—When the value of the works executed and fixed, and not included in any former certificate, shall from time to time amount to the sum of £ , the contractors shall be entitled, upon the certificate of the architect, to receive payment at the rate of 75 per cent. upon such value, until the difference between such percentage and such value shall amount to a sum equal to per cent. upon the amount of the contract, after which time the contractors shall be entitled, on the certificate of the architect, to receive payment in full for all works executed and fixed, and not included in any former payment. And when the works shall be completed, or possession of the building shall have been given to the employer, the contractors shall be entitled to receive one-half of the amount remaining due in the opinion of the architect, and the contractors shall be entitled to receive the balance of any moneys due and payable to them under the contract, within months from the completion of the works, or from the date of giving up possession to the employer. A certificate of the architect, or award of a referee or referees or umpire, showing the amount of the final balance due to the contractors, is to be conclusive evidence of the completion of the works. But no certificate is to relieve the contractors from their liability to amend and make good any defects or other faults as provided in these conditions.

No. 21.—If the employer shall make default in paying any moneys to which the contractors may become entitled for days after the amount thereof shall have been certified by the architect or determined by arbitration, or if the works be delayed for months by or under any proceedings by any other parties against the employer, the contractors are to be at liberty to suspend the works and to determine the contract by notice in writing to the architect, and to recover from the employer payment for all works executed, and for any loss upon goods or materials supplied, purchased, or prepared for the works, whether they are delivered on the ground or not.

No. 22.—The amounts included in the specification as prime cost amounts are to mean the sums paid after deduction of all trade discounts, but not deducting bona-fide cash discount. In the event of such provisional sums not being expended, or being only partially expended, the contractors shall only be entitled to receive a proportionate amount of their profit on such provisional sums based upon the profits shown in the prices included in the original and deposited bills of quantities. The contractors shall provide and erect all necessary scaffolding and the attendance of labourers and craftsmen, as may be necessary for the purposes of preparation or cutting away for or making good after the persons employed by the architect in the expenditure of such provisional sums.

No. 23.—In the event of any dispute or difference arising between the employer or the architect on his behalf and the contractors as to the amount that ought to be added to or deducted from the contract sum by reason of any additions, omissions, or variations, or in respect of the amounts of any certificate, or of an allowance of extra time for non-completion of the contract; or as to any other matter or thing arising under or out of this contract, except as to matters left to the sole decision or requisition of the architect by the specification or these conditions, then such dispute or difference shall be referred from time to time without any suit-at-law or equity to the arbitration and final decision of architect. Or in the event of his death, or unwillingness or inability to act, then of an architect, being a Fellow of the Royal Institute of British Architects, to be appointed on request of either party by the President, at the time being, of the Royal Institute of British Architects, and the award of such arbitrator shall be final and binding on all parties. And the award of such arbitrator shall be equivalent to a certificate of the architect, and the contractor shall be paid accordingly.

No. 24.—The costs of and incidental to any such reference shall be in the discretion of the

arbitrator, whose decision shall be final and binding upon all parties without any power of appeal, and this submission may be made a rule of any division of the High Court of Justice upon the application of either party.

To complete the documents forming the contract, and in addition to the drawings, specification, and conditions, there should also be a short agreement, a form for which has been prepared by the Institute, or it may be in some such form as follows:—

This Agreement, made and entered into this day of , between , of , hereinafter called the employer, of the one part, and , of , hereinafter called the contractors, of the other part; *Witnesseth* that for and in consideration of the sum of £ being paid by the said employer to the said contractors the said contractors hereby agree to carry out and perform all the necessary works required in the erection of on a site situate , and more particularly and fully shown and described in the drawings numbered to , and in the specification prepared by , the architect referred to in such specification. And the said contractors further agree to abide by and be satisfied with the conditions of contract appended to such specification, and to carry out the whole of such works in accordance with such conditions, and to the satisfaction of the said architect. And the said employer agrees to pay to the said contractors the sum of money hereinbefore mentioned, when such works shall have been carried out, and shall have been certified by the said architect to have been completed in accordance with such conditions of contract, and to his satisfaction. *As witness* the hands of the said parties this day of Signed in the presence of

OBITUARY.

M. FRANCAIS.—This well-known French landscape-painter, one of the most eminent of modern artists, has just died at the age of eighty-three. Francais was born at Plombières in 1814, in very humble circumstances, and began life as a shop-boy, but subsequently found his way to the atelier of Gigoux, and afterwards studied under Corot. He began his career as a portrait painter, but subsequently devoted himself almost entirely to landscape combined with groups of figures. He received medals in various exhibitions even before he reached the height of his reputation, which may be said to have culminated with the exhibition of "Daphnis et Chloe" in 1872; the picture is now in the Luxembourg Museum. In 1890 he received the "Médaille d'Honneur" at the Salon, the first time it had ever been given to a landscape painter. Among his principal works may be named "Macbeth" (1838), "Jardin Antique" (1841), "Saint-Cloud," in collaboration with Meissonier (1846); "Le Baptême du Christ," and "Adam et Eve chassés de Paradis" (in the church of La Trinité); and numerous illustrations for Tasso, the Marianne, and other poets. He continued the practice of his art almost to the last moment, having this year exhibited two works at the Salon, "Les Etangs de Cernay" and a scene in the Vosges. He was the last representative of the old school of French painting of the earlier half of the century, and his name fills an important place in the history of modern French art.

MR. CLEMENT MUNDAY.—The death of Mr. Clement Munday, eldest son of the senior partner in the firm of G. Munday & Sons, Trinity-square, E.C., took place on the 29th ult., at his residence at Beckenham. The deceased was a partner in the firm, with which he had been actively connected for twenty-seven years.

GENERAL BUILDING NEWS.

THE ROYAL LONDON OPHTHALMIC HOSPITAL.—The new buildings now being erected for the work of this hospital, so long carried on at Moorfields, occupy a site more than twice the extent of the present one, having frontages to City-road, Caynton-street and Peckers-street. The new hospital will provide accommodation for 154 beds, with a very spacious and complete out-patient department. The whole of the latter department is on the ground floor, and is so arranged that patients in no case cross each other, and the access from one part to the other is made as simple as possible, a point of the utmost importance where the majority of the patients are more or less blind. The out-patient department is, as far as possible, separated from the rest of the hospital. A separate system of warming and ventilation has been devised for the out-patient department, and is being carried out by Messrs. Ashwell & Nesbitt. It is a combination of propulsion and extraction, the motive power in each case being provided by water motors supplied by the

Hydraulic Power Company mains. The building is being erected by Messrs. Grover & Sons, the fire-proof floors being supplied by Messrs. Fawcett & Co., the plumbing work by Messrs. Dent & Hellyer, and the lifts by the Otis Elevator Company. The plans have been prepared by Messrs. Young & Hall, and Mr. C. K. Bedells, Surveyor to the hospital, is associated with Mr. Keith Young as joint architect.

WESTMINSTER THEOLOGICAL COLLEGE, CAMBRIDGE.—The foundation-stone of the Westminster Theological College, Cambridge, was laid on the 25th ult. The architect is Mr. H. T. Hare. An illustration and a short description of the building appeared in our issue for May 15.

NEW CHAPEL, BRIERLEY HILL, STAFFS.—The foundation stone for the New Primitive Methodist Chapel to be erected here was laid on Monday, the 24th ult. The building is planned all on one floor, with the nave floor on a sloping plane and the choir elevated at the rear of the rostrum and communion. At the side of the choir is the minister's vestry, and a covered way therefrom leads to the existing church, which will be used hereafter as a Sunday School. The interior of the church will be finished in plaster work with a wood dado, the seating to be executed in pitch pine slightly stained, the roof work left clean from the plane and varnished, and the principals to be stained green. The exterior is to be executed in Ruabon bricks and terra-cotta. The architects are Messrs. Hickton & Farmer, of Walsall.

THEATRE OF VARIETIES, DALSTON.—A theatre of varieties is to be erected at Dalston, the architects being Messrs. Wylson & Long. The builders will be Messrs. Kirk & Kirk, whose tender of 14,500*l.* has been accepted.

CHURCH SCHOOLS, ST. JOHN THE DIVINE, CLAPHAM RISE.—At a recent meeting of the Building Committee for the schools, it was decided to rebuild the boys' and girls' school on a new corner site in Union-road and Baskett-street as a Jubilee commemoration. Mr. Philip A. Robson, of Westminster, was instructed to prepare plans of a simple character at the earliest date possible.

NEW PROMENADE, PENZANCE.—The new promenade will be completed and opened in July. It consists of a 3½ in. *in situ* paving, and is of Penlee Elvan stone. The contractor is Mr. James Runnells, of Penzance, and Mr. White, of Plymouth, is the clerk of works. Mr. S. Smith is the general foreman. The engineer is Mr. G. H. Small, of Penzance.

BUSINESS PREMISES, ABERDEEN.—New premises are to be erected in Union-street, on the west side of St. Catherine's Wynd, Aberdeen, for Messrs. Sangster & Henderson, drapers. The block will be five stories high, in addition to basement and attics, and communication between all the floors will be afforded by a lift, in addition to staircases. The building was designed by Mr. R. G. Wilson, architect, and the contractors are—messrs. Messrs. Pringle & Slessor; carpenters, Messrs. Watt & Clark; slater, Mr. James Wilson; plasterer, Mr. George Gibb; painter and glazier work, Messrs. J. Garvie & Sons; ironwork, Messrs. McKinnon & Co.

OFFICES, SOUTH MARKET-STREET, ABERDEEN.—New offices have been erected in South Market-street, Aberdeen, for the Seaton Brick and Tile Company. The architects are Messrs. Ellis & Wilson, Aberdeen, and Messrs. J. & J. Ross, Aberdeen, are contractors for the mason work.

PROPOSED ALHAMBRA THEATRE, BLACKPOOL.—It is proposed to erect at Blackpool a new Alhambra, the architect being Messrs. Wylson & Long, London. The theatre is to accommodate 3,000 persons. The circus is to hold 2,000 persons, and the ballroom will be 136 ft. by 69 ft. The cost of the new buildings, furnishing, &c., is expected to amount to 100,000*l.*

HOTEL, BELLE-VUE, DUNBAR.—This building has just been erected at Dunbar. The hotel stands in about 2½ acres of ground. Designed by Messrs. Dunn & Findlay, architects, Edinburgh, the building, which has a frontage of 120 ft., is Scottish Baronial in style, the front being harled and faced with Dumfries stone. The main dining-room, furnished in old oak, will be capable of accommodating about 100 persons, apart from a smaller dining-room intended for day visitors particularly. A feature has also been made of the ladies' drawing-rooms, which is furnished in Chipendale. Apart from five or six separate suites of rooms, some of them on the ground floor, the house will contain fifty bedrooms.

WESLEYAN CHAPEL, MADRON, CORNWALL.—A new Wesleyan Chapel is being erected at Madron. The new chapel will occupy the old site at Wesley Rock. At a cost of £1,800, and according to plans drawn by Mr. J. Wills, of Derby, a building to hold 380 on the ground floor will be raised, 70 ft. long by 54 ft. There will be four entrances.

BOARD SCHOOL, SUMMIT, LANCASHIRE.—This school has just been opened. It takes the place of the old Wesleyan School. Messrs. Preston and Dryland were the contractors, and Messrs. Butterworth and Duncan the architects. The school has been planned as a central day school, to accommodate 425 scholars; but at present provision has been made for only 245 scholars. These will be accommodated as follow:—90 in what will become the central hall, but is now the principal school-room; two classrooms for 48 scholars each, and an infants' room for 60 scholars.

BAPTIST CHAPEL, WIMBLEDON.—The memorial stone has just been laid of a new Baptist chapel, in the Queen's-road, Wimbledon. The chapel has been erected from designs by Mr. John Willis, of Derby, and is being built by Mr. D. Stewart, of Wallington. It will be 78 ft. long by 41 ft. 6 in. wide, with 12 ft. additional space for organ chamber and orchestra. Light galleries are to be constructed at one end and on either side, and accommodation will be provided for 770 adults, or a mixed congregation of 1,020 persons. Two vestries will be built at the rear with lavatories, &c., and heating chamber under. The glazing throughout is to be in clamber glass. The baptistry will be lined with marble. The church will be connected with the present building both in the front and rear, so that children can pass from the school-room to their place in the church under cover. The heating will be effected by means of hot water pipes. The total cost of the work is 4,750l.

MEDICAL SCHOOL BUILDINGS, GUY'S HOSPITAL, LONDON.—The Prince of Wales visiting Guy's Hospital on the 26th ult. for the purpose of opening the new medical school buildings. The entire building is designed to provide under one roof all the accommodation required by the medical school, with the exception of the chemical and physical, public health, and bacteriological laboratories recently erected in the building designed for the buildings. The part of the building opened on the 26th forms about one-third of the whole structure, and consists of the three lower floors of the south or left wing. The lowest floor is really a half-basement. Descending a short flight of steps, one reaches a corridor running the length of the building. On the left is the lecture room, and opposite to it the lecturers' entrance to the theatre. In the rear is the theatre, the task set before the architect, Mr. J. H. T. Woodd, was to provide a theatre in which an ordinary lecture audience of 100 should be compactly arranged, and in which, on rare occasions, 400 or 500 persons could be comfortably accommodated. This has been practically accomplished by the provision of a gallery, the seating accommodation of which falls not far short of that afforded by the main auditorium, and which, being supported without pillars, does not interfere in any way with the comfort and view of those sitting beneath it. The space beneath the upper tiers of seats has been utilised to provide three dark lecture rooms. The first of these is designed for the reception of the spectrophotometer, polarimeter, and spectroscopy, for the use of those engaged in chemical work. The other two rooms are intended for galvanometric and photographic work. In the basement are two class rooms, each of which will accommodate about 40 students in tutorial classes or for physiological and pathological chemistry. The students' rest-rooms of this floor is occupied by store rooms and by the heating chamber. Ascending the staircase at the north end of the building, one reaches a landing from which open two entrances to the main body of the building on this floor is occupied by the laboratories and preparation rooms for physiological and pathological chemistry. The students' rest-rooms are 70 ft. long by 30 ft. wide, and is fitted with transverse chemical benches with sinks and stands for reagents. On the same floor are three small rooms, specially fitted up as a balance room, a calorimeter room, and a gas room. On the top floor the whole of the north end of the building is occupied by the laboratory and preparation room for normal and abnormal histology. Here the preparation room is smaller than is the case in the chemical department, and the students' laboratory is 80 ft. long. On this floor there is also a small workshop, to be fitted with lathe and carpenter's bench, adjoining the histology room. These buildings have been erected at the cost of the staff of the medical school, and have entailed an expense of about 12,000l. It is estimated that a further sum of 35,000l. will be required for the completion of the scheme.—*Times*.

WESLEYAN CHAPEL, WHITTLE-LE-WOODS, LANCASHIRE.—This building has just been erected, from plans prepared by Mr. W. H. Disney, Messrs. Buxendale & Sons, of Chorley, are the contractors. There will be sitting accommodation for 280 persons. All the benches or pews are of pitch pine. The chapel was built of Accrington brick, with Yorkshire stone dressings, at a cost of 1,800l. Underneath the chapel there is erected a parochial room which will serve as a school-room.

FREE LIBRARY, BODMIN.—A new free library was opened at Bodmin by the Right Hon. Leonard Courtney, M.P., on the 24th ult. The building is built of local stone, with Bath stone dressings. The contractor was Mr. Trehane, and the architect Mr. Sillins Treval.

BANK BUILDINGS, LLANDUDNO.—The Metropolitan Bank of England and Wales, Limited, has just opened the new offices which have been erected at Mostyn-street, Llandudno, on the site of the old premises. The reconstruction has been carried out from the design of Mr. Humphreys, Mr. T. Jones being the contractor.

ICE-MAKING FACTORY, NORTH SHELDON.—The Corporation of North Shields have recently built, on the western boundary of the Fish Quay, a block of premises, which have been leased by the Northern Counties' Ice-Making and Cold Stores Company, Limited. The new building has a river frontage of 120 ft., and is 36 ft. in breadth. The building has been erected under the supervision of the Borough

Surveyor (Mr. J. F. Smiffle) by Messrs. W. Johnson & Sons. Mr. J. T. Cackett, architect, Newcastle, has represented the Ice Company, and Mr. T. B. Johns has been clerk of works.

PRESBYTERIAN CHURCH, SALTNEY FERRY.—The English Presbyterian Church at Saltney Ferry was opened recently. It provides accommodation for 200, and comprises porch, church, vestry, out-offices, &c. The whole has been carried out by Messrs. George Wright & Sons, contractors, of Kelsall, under the superintendence of the architects, Messrs. John H. Davies & Sons, Chester.

FIRE STATION, QUEEN'S PARK, GLASGOW.—The new Queen's Park Fire Station is now practically completed. It is now some eighteen months since the erection was begun of the block of buildings bounded on the north by Allison-street, on the east by Craigie-street, on the south by Prince Edward-street, and on the west by an unnamed lane—a block which accommodates the police, the fire-extinction, and the lighting departments for the district. The total cost of the buildings for the three departments will be about 18,000l. Mr. A. B. Macdonald, the City Engineer, was the architect. The buildings are in the Scotch Baronial style. The principal building, constructed of freestone, has a frontage to Allison-street of 54 ft. in length, while it extends back a distance of 40 ft. in the basement floor is an apartment for the accommodation of a steam fire-engine and a hose and ladder carriage. Adjoining this, on the east, is the watching-room. Alongside the watching-room is a broad path giving access to the court behind, and from which there is also a stair to the upper floors of the building. In the rear of the basement is a ball-room and lavatory, as well as a store. On the first floor are two dwelling-houses. On the second floor, and again on the third or upper floor, are three houses. Behind the front building are two-story buildings of white-facaded brick. These comprise two houses, a stable to accommodate three horses, a workshop, a recreation room, and a couple of washing-houses. A tower, 40 ft. in height, has been built to carry a fire hose after a fire. The contractor for the masonry was Mr. Robert Murdoch, while the late Mr. Archibald Hood, jun., and his executors, have been responsible for the joinery.

DISPENSARY, YORK.—The foundation-stone of the new York Dispensary was laid by the Lord Mayor of York on the 1st inst. The building will be in the Classic style, similar in design to adjoining offices. The main entrance will be in the centre, and the patients' entrance is at the side. It will be a three-story building, 48 ft. in height, with a frontage of 73 ft. On the ground floor there will be three consulting rooms, the dispensary, and the waiting-room. On the first floor will be the apartments of the resident medical staff, and three parts of the upper floor will consist of rooms for the maternity cases, the remainder being the servants' apartments. Mr. Thomas Rawling is the contractor for the brick and stone work, and Mr. W. Bellerby for the carpentry. The architect is Mr. E. Kirby, of Liverpool.

NEW U.P. CHURCH, LANGSIDE, GLASGOW.—The new U.P. church in Langside was opened on the 21st ult. The new church is situate on the site of the old, at the corner of Langside-road and Stevenson Drive, the principal front being to Langside-road. The main entrance is by a projected porch at the base of a tower which is placed at the north-east corner, and the church internally is divided into nave and side aisles, with galleries at sides and end. The side galleries and main roof are supported on moulded iron columns, which rise the full height from the floor. The roof is entirely of timber, with dressed main couples, partly filled in with moulded tracery. The session-house and vestry buildings form an attached group at the end of the Stevenson Drive front, and the hall buildings are at the south-west corner of the site. The church has been seated to accommodate 780 worshippers, the hall 300, and two class-rooms forty each. The buildings have been designed by Mr. John B. Wilson, Glasgow.

CO-OPERATIVE STORES, DONCASTER.—New buildings, erected by the Doncaster Co-operative Society, on Station-road, at a cost of 18,000l., were opened on the 27th ult. The premises were designed by Messrs. Athron and Beck, architects, Doncaster, the contractors, whose contract amounted to 10,400l., being Messrs. Arnold & Son, Doncaster.

CHURCH, TARMONBARRY, CO. ROSCOMMON.—A new church has just been erected at Tarmonbarry from the design of Mr. Kilgallon, of Sligo, by Mr. Fee, of Longford. The high altar is of white Carrara marble, with green pillars. The side altars and font are of Caen stone and marble, from the establishment of Mr. O'Neill. There are several stained glass windows, supplied by Mr. Richardson, of Messrs. Carlisle & Wilson, Belfast.

PEOPLE'S HOMES, LIVERPOOL.—A company has been formed at Liverpool for the purpose of erecting a "home" similar to the Rowton Home at King's Cross. A site, having frontages to three streets, has been secured in Bevington Bush. At present the ground is occupied by a disused brewery and five courts of squatted property. These will be removed and replaced by a brick and terra-cotta building six stories in height, designed to accommodate 580 lodgers: 454 men and 132 women. The home, which will have a frontage of upwards of 100 ft. to Bevington Bush, and still larger frontages to the side streets, is to occupy an area of 2,200

square yards. It has been designed by Messrs. C. O. Ellison & Co., architects.

PROPOSED THEATRE OF VARIETIES, PLYMOUTH.—This building is to be erected from the designs of Mr. W. H. Arber (Messrs. Wimperis & Arber), of London, and will have a frontage of 140 ft. to the London-street, and a frontage of similar length in Phoenix-street.

NEW CO-OPERATIVE STORES, CHURCH-STREET, WARRINGTON.—New premises for the Warrington Co-operative Society have been erected at the junction of Church-street and Fennel-street. Plans were prepared by Mr. William Owen, architect, and the building contract was let to Messrs. Collin & Son. The basement of the building will be 60 ft. by 43 ft. On the ground floor there will be two large shops for groceries and provisions, and a warehouse in Fennel-street, with a hoist at back and front. Over the shops there will be a warehouse the size of the basement.

TOWER, NOLTON CHURCH, BRIDGEND.—The tower of Nolton Church, Bridgend, is to be started to be finished and surmounted by a stone spire. The architect who will superintend the work is Mr. F. R. Kempson.

BOARD SCHOOL, MARDEN, KENT.—Schools, to provide accommodation for 400 children, have been erected at Marden. There are three departments—boys, girls, and infants—which are under one roof, but each has a separate entrance. A large central hall for the girls' and infants' schools has been provided. The architect is Mr. H. J. Jeffery, of Ashford, and the builders are Messrs. Mancktelow Bros., Horsmorden.

ATHLETIC CLUB, EDINBURGH.—The George Watson's College Athletic Club, Edinburgh, was recently opened. The architect was Mr. T. F. Paterson.

PAVILION FOR THE NATIONAL EISTEDDFFOD, NEWPORT.—The pavilion in which the National Eisteddoffod of the present year is to be held will occupy about one-half of the Cattle Market, Newport, and will consist of an orchestra, surrounded by a semicircular auditorium for 17,000 people. Mr. G. Martin is the contractor, of Newport. Mr. Benjamin Lawrence is the architect.

BUSINESS PREMISES, SOUTHAMPTON.—Premises for drapery, millinery, &c., have been erected on part of the site of Blenheim House, at the Tranway Junction, Southampton. The architect was Mr. Walter Storer, of London, while the fittings were by Messrs. Haskins & Company. The shop proper, on the ground floor, has a length of about 100 ft.

COUNTY COURT, & OFFICES, WARRINGTON.—New County Court and Indian Revenue offices are being erected at Warrington, near the Gymnasium. The external elevations are of red brick and buff terra-cotta. The architect is Mr. Henry Tanner, of Her Majesty's Office of Works, and the builders, Messrs. Beckett & Company.

SUNDAY SCHOOL, OLD HILL, NEAR BIRMINGHAM.—The trustees of the schools in connexion with the Primitive Methodist Tabernacle, Old Hill, have decided to adopt plans prepared by Mr. A. Ramsell, architect, of Dudley, of a proposed new Sunday school and class-room.

METHODIST MISSION HALL, WARRINGTON.—A new mission-hall in Brick-street, Warrington, has just been opened. The building is of Ruabon bricks with York stone settings. The main hall measures 50 ft. by 33 ft., is 24 ft. high, and will accommodate 400 people. The builder was Mr. Mounfield, and the architect Mr. Stephen Dale.

CHAPEL AND MISSION BUILDINGS, WARRINGTON.—The foundation stone of St. Clement's Chapel and mission buildings, Bank-street, Warrington, has just been laid. Mr. William Owen is architect, the builders being Messrs. Richard Beckett & Co. The main feature is to be the mission chapel, and attached to it will be accommodation for Sunday school, meetings, and workmen's club. The chapel will be 46 ft. long by 31 ft. wide, with chancel in addition, with roof averaging 25 ft. in height. The mission room will have a length of 64 ft. and an average width of 23 ft., as well as two class-rooms covering an area of 34 ft. by 20 ft.

OPHARMACEUTICAL SCHOOLS, PURLEY.—The memorial stone of the J. R. Roberts School, Purley, was laid on the 24th ult. The architect is Mr. J. Kingwell Cole, London. The new building, which is to be a school for the boys, will cost about 7,000l.

SWEDENBORGIAN CHURCH, BLACKBURN.—The new Swedenborgian Church in Anvil-street, Blackburn, was opened recently. The new place of worship has been erected on the site of the old church, at a cost of about 2,250l., the material being brick and terra-cotta. The church affords accommodation for about 275 persons. Mr. Walter Stirrup, Blackburn, is the architect.

RESTORATION OF WICKEN CHURCH, NORTHAMPTONSHIRE.—This church, near Stony Stratford, was recently reopened after restoration. The east wall of the chancel has been taken down and the chancel lengthened. A new transept has been erected on the south side of the chancel with new arches opening out into the chancel and into the south aisle. A new pulpit has been erected, the whole of the church has been re-seated with new open seats in wainscot oak, with traceried ends. The chancel has been re-filled with new prayer desks and choir stalls, all in carved and traceried wainscot oak, and among the carvings of the poppy heads of the former have been introduced the arms of the

province of Canterbury and the diocese of Peterborough. The new rail rails are of wrought-iron work. The reredos is of oak. The contractor was Mr. H. Martin, and the architect Mr. M. H. Holding, both of Northampton. Mr. S. L. Reynolds, of Northampton, executed all the carving.

NEW WING, SAMARITAN HOSPITAL, BELFAST.—A new wing has been added to the Samaritan Hospital, Lisburn-road, Belfast. The wing contains two new wards, in separate stories, one above the other. Each ward will accommodate four, or, in an emergency five, beds, and, although accessible from the principle stair, is cut out from the main building. Each ward has a separate bathroom, lavatory, and other accessories for its own use. In the ground floor of the new wing are two bedrooms for the nurses, and also a dining and sitting room for their use. In addition to the new wing, improvements have been made in other parts of the hospital. The various appliances both in this part and the new wing were supplied by Messrs. Doulton & Co. and Shanks & Co. Below the new lavatories, &c., a dispensary has been formed. The various works have been carried out from the designs and under the direction of Mr. F. W. Lockwood, architect, and the general contract was by Mr. James Kidd.

TURKISH BATHS, EXETER.—On the 27th ult. the foundation stone was laid at Exeter of the Turkish Baths, which are being erected on a site adjoining the Rougemont Hotel. On the ground floor will be a large cooling-room, 36 ft. by 20 ft., in which will be placed divans, lounges, and dressing boxes. The hot rooms will be three in number. The shampooing room will be fitted with douche and other appliances, and a plunge bath will be provided. With the Rougemont Hotel the Baths will be connected by a span bridge. The architects are Messrs. Rilling & Tonar, of Exeter.

CONGREGATIONAL CHURCH, CROSBY, LANCA-SHIRE.—The foundation stone of the new Crosby Congregational Church was laid recently. The new building is situate on a site at the corner of Mersey-road and Eshe-road. In the new church there will be accommodation for about 650 people. Messrs. Douglas & Fordham, of Chester, are the architects. The estimated cost of the building is 5,700l.

SCHOOLS, DURSLEY, GLOUCESTERSHIRE.—The contract for the Victoria Commemoration Schools has been let to Messrs. S. Bloodworth & Son, contractors, of Dursley, on 1,750l. This is exclusive of the cost of the site and of the furnishing. The schools have been designed by, and will be erected under the supervision of, Mr. Wm. Paul, architect, of Totterdown, Bristol.

EDINBURGH BUILDING TRADE.—In Edinburgh Dean of Guild Court, on the 27th ult., there were forty-five applications, and twenty-two of these were granted. Warrant was granted to the Edinburgh Pavilion Theatre (Limited) for the erection of a front building at Grove-street; the Eastern Amateur Rowing Club to erect a boathouse at foot of Pitt-street, Portobello; the Royal Association for Incurables, to take down existing buildings at Causewayside to erect chapel and mortuary; James Smiles and others, laboratory at Blandfield Works, Lower Broughton-road; and to the St. Cuthbert's Co-operative Association (Limited) to take down old and erect new buildings at Lauriston-street.

OFFICES, WEST HARTLEPOOL.—Messrs. Furness, Withy, & Co. are making additions to their offices at West Hartlepool. When completed the offices will cover twice the amount of space they now occupy. The frontage in George-street is to have an additional 50 ft., making in all 100 ft. On the ground floor there will be a general office, 30 ft. by 25 ft., and a number of private offices and strong rooms. The staircase is to be of stone, with wrought-iron balusters. On the first floor is a dining-room. Adjoining is a serving-room, which communicates with the kitchen above by means of a lift. There is also an estate office. On the third floor are store-rooms, and underneath the whole of the building are cellars. The whole of the work is being carried out from designs and under the superintendence of Messrs. Barnes & Coates, architects, West Hartlepool. The contractors are Messrs. Joseph Howe & Co., of West Hartlepool.

THEATRE OF VARIETIES, SOUTHAMPTON.—The foundation stone of the new Royal York Theatre of Varieties, Southampton, has just been laid. The new hall will be 60 ft. in width, and will have seating accommodation for 2,200 people. The architect is Mr. Walter Emden, of London, and Messrs. Beer & Gash are the contractors.

ALTERATIONS AT THE NOTTINGHAM THEATRE ROYAL.—Alterations to this building are being carried out from the designs and under the superintendence of Mr. Frank Matcham, of London. Mr. Greenman is acting as clerk of works, and the contractor is Mr. Henry Vickers, of Nottingham.

CITY PARISH COUNCIL OFFICES, ABERDEEN.—Among the plans sanctioned on the 20th ult. by the Plans Committee of Aberdeen Town Council were those of the new offices to be erected in Union-terrace for the City Parish Council. The building will occupy a site at the corner of the lane leading from Union-terrace to Diamond-street. The ground floor and first floor form a rusticated basement to the second, or principal, floor, on which will be the Council chamber. The main doorway in the centre of the building extends to the height of the second floor, and is formed by two rusticated

columns, which support a carved pediment projecting beyond the line of the structure. A flight of granite steps lead from the main entrance to a vestibule. From the vestibule a staircase gives access to the upper floors. The ground floor is occupied by an office for the collector of rates, a collector's room, porter's office, medical officer's room, and dispensary. A waiting room for the accommodation of recipients of relief leads off the end of the vestibule. There is also a sheriff officer's room on the ground floor. The apartments on the first floor include rooms for the inspector and his assistants, the outdoor inspector, orphan inspector, clerks, &c. The second, or principal, floor is mainly occupied by the Council chamber, which measures 38 ft. by 30 ft., and a large committee room. On the second floor there are also a chairman's room, anteroom, and waiting room, while adjoining these are cloak rooms, &c. The attics will be used as a residence for the caretaker, and the basement floor as a furniture store and charter room. Hand lifts will run from the basement to the top of the building. The plans have been prepared by Mr. A. Marshall Mackenzie, A.R.S.A., and the contractors for the work are—Messrs. Mason, Messrs. George Fordyce & Co.; joiner—Messrs. Hendry & Keith; plasterer, Messrs. Stephen & Gibb; plumber, Mr. Peter Stewart; painter, Messrs. John Mason & Son; slater, Mr. George Farquhar; heating, Mr. Robert Tindall; ironwork, Messrs. W. M'Kinnon & Co.; electric bells, &c., Messrs. Shirras, Laing & Co.; electric lighting, Mr. P. C. Middleton.

LIBRARY, BRISTOL.—The foundation stone of the St. George Public Library, to be called the Victoria Library, was laid recently. The building will cost about 5,000l. or 6,000l., and it has been designed by Mr. Frank Wills. The building will have a frontage of 70 ft. The lending library, the librarian's room, and the boys' department will be divided from the main portion of the hall by arcading of Ham Hill stone. The building will be of Gattybrook bricks, with Ham Hill stone dressings. The structure will be heated with hot water apparatus supplied by Messrs. J. Crispin & Sons, and the builders are Messrs. W. Cowlin & Son.

PRIMITIVE METHODIST CHAPEL, SOUTH WIMBLEDON.—The Primitive Methodist Chapel, which has been erected in Quick-road, South Wimbledon, was opened on the 26th ult. The building comprises, besides the chapel, a lecture hall, situated at the rear. The former is 60 ft. long by 37 ft. broad, with a height from floor to ceiling of 25 ft., and will accommodate 300 persons. The front elevation is built of red bricks, relieved with stone dressings, and polished granite columns with capitals. Messrs. Bates and Pearce's hot air system will be used for heating the chapel, and Messrs. Pickup and Co.'s system has been adopted for lighting and ventilating purposes. The lecture hall, which will accommodate 100 persons, measures 37 ft. by 20 ft., and has two doors communicating with the chapel. The architect for the new buildings is Mr. W. Wray, of Canning Town, and the contractors are Messrs. Atkins & Green, of West Ham.

SANITARY AND ENGINEERING NEWS.

PUBLIC IMPROVEMENTS, THE HARTLEPOOLS.—On the 25th ult. Mr. F. H. Lubbock, M.Inst.C.E., Local Government Board Inspector, held an inquiry into an application by the Town Council for sanction to borrow 3,000l. for improvements at the sea front at Seaton Carew, 2,400l. for the purpose of a building for County Court purposes, 425l. for tarpauling footpaths at the park, and 105l. for the provision of a steam roller. The Surveyor (Mr. Brown) explained the plans of the alterations and improvements at Seaton Carew, and in regard to the County Court the Town Clerk stated that the Corporation proposed to purchase the Druids' Hall for 2,400l., and make the necessary alterations to fit the building for County Court purposes.

SEWERAGE SCHEME, WEDNESFIELD.—At St. Thomas's Schools, Wednesfield, on the 20th ult. Colonel W. Langton Coke, M.Inst.C.E., held an inquiry on behalf of the Local Government Board concerning the application of the Wednesfield District Council for power to borrow 7,500l. for sewerage works and sewage disposal. Mr. R. E. W. Berrington, the engineer, explained the scheme, and the Inspector visited the site.

STAINED GLASS AND DECORATION.

WINDOW, FALKLAND CHURCH, FIFESHIRE.—The large east window of this church has just been filled with stained glass. The work has been carried out by Messrs. A. Ballantine & Gardner, of Edinburgh.

MEMORIAL WINDOW, CRATCHE CHURCH, BALMORAL.—Messrs. J. R. Clayton & A. Bell, of London, have just placed in the church at Cratlie, Balmoral, a window executed at the command of the Queen, in memory of Prince Henry of Battenberg. The work represents an angelic figure rising from the sea. At the base is displayed the arms of the late Prince.

WINDOW, BRADFELD CHURCH, YORKSHIRE.—A stained-glass window has been placed in Bradfield Parish Church. The new window is from the studio of Messrs. Joseph Bell & Sons, Bristol and consists of three lights.

FOREIGN.

FRANCE.—The Conseil Supérieur des Beaux-Arts has awarded the Salon prize to M. Desbordes-Valle, who exhibited a marble statue of "Job," and an alto-relief in plaster, "Pastorale," at the Palais de l'Industrie this year.—The jury of the Champs Elysees Salon has awarded the Marie Bashkirtseff prize to M. G. Lemaître for his picture "Derniers Beaux Jours."—The Champs Elysees Salon closes on June 10, the Champ de Mars on June 30. The Ecole des Beaux-Arts, which was closed by the Government on account of the sad incident already mentioned by the *Builder*, will be reopened on June 14.—The new Pont Mirabeau will be inaugurated on July 13 by the President; also the Hospice Boucaut.—A monument in honour of Eugène Delacroix, the painter, is to be inaugurated some time during this month. It has been erected by the Conseil Général de la Seine. This monument, which has been executed under the direction of Jacques Lesquoux, architect, consists of a stele, which is ornamented with a palm, a palette, and brushes, in bronze, for which the sculptor, M. Hermica, made the model. On the stele will be placed the bust of the painter, modelled after that made by M. Dalou for the Jardin du Luxembourg.—M. Bertone, architect, Grand Prix de Rome, has just received the Prix Jarry and the pension founded by the Comtesse de Caen, on his leaving the Villa Medici. This pension, which lasts three years, is given with the Prix Jarry to the pupil who has fulfilled all the demands imposed on the competition for the Prix de Rome.—The Ecole des Beaux-Arts at Algiers will shortly be rebuilt at an expense of about a million francs, opposite the future Hôtel de la Préfecture, which is to be built on the esplanade Bab-el-Oued. The State will bear a part of the cost.—A new line of railway is shortly to be begun between Dieppe and Havre by Caux, Orville, and Fécamp.—M. Charles Babet, member of the Union Syndicats des Architectes Français, has just been elected Architect to the town of Cannes in place of the late M. Xavier Ferrand.—The building of the terminus station on the Chemin de Fer d'Orléans, which was to have been erected on the site of the Cour des Comptes, has been rejected by the Municipal Council of Paris by 54 votes against 12. Nevertheless, this important question has been actually submitted to the Chamber of Deputies, the majority of whom seem favourable to the scheme.—The death of the Jewish painter Edouard Brandon, at the age of 66 years, is announced. He was a pupil of Picot and Montford, and made a specialty of synagogic scenes. He exhibited this year a number of pictures and drawings reproduced from Jewish and Italian types.

GERMANY.—It appears that a special commission has been formed at Berlin with a view of framing new regulations for the protection of assembly rooms and public halls under the auspices of the Government, and that the whole of the places of entertainment throughout Prussia are to be carefully examined, and reports will be sent into the Government, inasmuch as the monument to Prince Bismarck was unveiled in the Grunewald, near Berlin, last month. The ex-Chancellor is represented in civilian attire, and the statue measures nearly 8 ft. in height, standing on a granite pediment of about 7 ft. The sculptor is Herr Max Klein.—The sale of the old Botanical Gardens in the Potsdammer suburb of Berlin will considerably influence the value of a suburban property. It is estimated that there will be about 115,000 square metres of building land coming into the market (after the deduction of nearly 2,500 square metres for new thoroughfares, the regulation of frontages, &c.). At the present time about 15l. per square metre has been paid for freeholds on main thoroughfares in this district, and about half the amount on roads of minor importance. Forty-eight thousand metres of the Botanical Gardens will be reserved as a small municipal park, this part of the site having been sold for a nominal sum to the city of Berlin. As the Municipality is to spend nearly 100,000l. on this park and the surrounding roads, it is expected that an average of 10l. per square metre will be paid for the various plots. This would mean that the Government will make about 700,000l. by the transaction.—The Potsdammer bridge is being carried out with all despatch. The structure consists of two parallel bridges, with a well of some few feet width between the two. The bridges will be of considerable architectural pretension, and the plastic decorations will be carried out by the leading sculptors.—It is not unlikely that Berlin will shortly have an underground railway, or, as it is officially called by the Berlin authorities, an "under-pavement railway." This railway will be worked by electricity and laid on similar lines to that at Buda-Pesth. The contractors who are taking the matter up are Messrs. Siemens & Halske. The idea is to connect the centre of the city near the castle of the Potsdammer district. Both the Government and Emperor have sanctioned the scheme.—The suburb of Charlottenburg is to have an important Town Hall; a site has been selected for it in one of the principal thoroughfares known as the Berlin High-road. It will have a frontage of nearly 200 ft., and the competition which has been opened for its design allows for premiums to the extent of 1,250l.—Several commissions have been given by the Emperor for a set of monuments which are to be erected in the

Victory-avenue. The scheme, taken as a whole will be a very imposing one, and the Emperor has carefully selected his sculptors.—Eberfeld is also to have a monument to the ex-Chancellor Bismarck, and Professor Brunow, of Berlin, has just completed the model which will show the figure of Bismarck nearly twice life-size, standing on a tall pedestal. The monument is to be ready by April 1, 1898.

AUSTRIA.—The memorial to Maria Theresa was unveiled at Presburg last month by the Emperor of Austria.—In connection with the regulation of the Danube Canal at Vienna, considerable works are to be taken in hand for a proposed harbour for the inland water-way traffic.—The Municipality has now finally decided to sanction two new electric tramways running from the city into the suburbs, and we understand that Messrs. Siemens & Halske are the contractors.—A large fountain by the sculptor Hellmer, on the Michael's-place, has now been completed.—There have been frequent disturbances of late at Vienna in connexion with the building trade, and one firm of contractors alone has recently had to lock out 1,500 men owing to certain differences. A general strike is expected in the course of this year, especially at Vienna.

It has been found difficult with the Viennese reservoir and waterworks in Tullnbarbach. A Commissioner of Experts has been lately examining these works, and has declared them to be dangerous, and it appears that there is a considerable difficulty in remedying the defects.

KIMBERLEY.—Just now there is a regular building being going on in all directions. New brick houses are rising up in all the streets and around the town. The days of tin shanties are departing.—*Natal Mercury.*

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ASSOCIATIONS.—The firm of Aldam Heaton & Co., Bloomsbury-street, will open in a few days a branch establishment at 89, Mount-street, Grosvenor-square, with show rooms for the exhibition of designs and decorative furnishing work.—Messrs. Widnell & Trollope, surveyors, have removed from 13, Parliament-street, to Broad Sanctuary Chambers, The Mall, Westminster.

APPOINTMENT.—Mr. A. A. Garside, who has been chief assistant to Mr. J. A. B. Williams, of Cardiff, has just been selected by the Corporation of Sheffield as assistant engineer for the Little Don Valley Works.

TENEMENTS AND LODGING-HOUSES. **MANCHESTER.** On the 25th ult. the Manchester Town Hall, Colonel J. T. Marsh held an inquiry on behalf of the Local Government Board with regard to the application of the Corporation for permission to borrow money for the purpose of erecting tenement dwellings and a lodging-house. It is estimated that the new buildings will cost about 75,000l., but as the Corporation has surplus borrowing power the Board was only asked to sanction the raising of 23,000l. It is proposed to erect tenement dwellings in the neighbourhood of Oldham-street, Chester-street, and Post-street, and a lodging-house for men in Harrison-street. Mr. Alderman Walton Smith (Chairman of the Sanitary Board) spoke in support of the application. He said that the total number of persons displaced in Manchester by the various improvement and reconstruction schemes was 2,584, and provision had been made for 1,206. Therefore provision was still required for 1,288 persons. Mr. T. de Courcy Meade, City Surveyor, explained to Colonel Marsh the details of the proposed buildings. Other evidence having been given, Colonel Marsh visited the different areas referred to.

LIBRARY, &c., BIRMINGHAM.—Colonel W. Langton Coke, one of the inspectors of the Local Government Board, attended at the Council House, Birmingham, on the 25th ult., to hold an inquiry relative to the application of the City Council for sanction to borrow 15,000l. for the alteration and extension of the Deritend Branch Library, and 600l. for laying out the land adjoining Cannon Hill Park recently presented to the city by Mr. J. C. Holder. Mr. J. A. Cossins (Messrs. Cossins, Pencock, & Bewlay) produced and explained plans which he had prepared for the extension. Subsequently the inspector visited the site in question.

THE JOSEPH THOMSON MEMORIAL.—This memorial is now nearly completed, and it is proposed that it should be unveiled at Thomson's native town, Thornhill, near Dumfries, on Tuesday, June 8. The memorial, which has been designed by the sculptor, Mr. Charles M'Bride, of Edinburgh, is of Classical style, and is in the form of an obelisk, the pedestal. The four sides are panelled. One is occupied by a bas-relief representing a female figure of Fame upholding a map of Africa, with palm trees, and Mount Kilima-Njaro in the background. The pedestal is further decorated with masks representing the heads of lions. The whole is surmounted by a bust in bronze of Joseph Thomson.—*Edinburgh Evening Dispatch.*

THE BRICK TRADE OF WORKSOP.—It is indeed many years since the brick-making trade was in so flourishing a condition as at present, and there is every prospect that it will continue for a considerable time, because of the number of new buildings in course of erection, and the proposed building of others. Indeed in all parts of the town

the building fever is raging, and it would be a hard matter to predict any abatement.—*Reform Times.*

THE NOTTINGHAM WATER SUPPLY.—The Nottingham Borough Authority have found it necessary to issue a notice to the inhabitants requesting them to avoid using water except where absolutely necessary, as the present demand upon the sources of supply for the town and district largely exceeds the yield of all the wells now belonging to the undertaking. The notice adds that unless an immediate reduction of such demand is made, there will be a failure of water within a few days, and consumers will have to be put upon a short supply. The Works and Ways Committee have decided to discontinue watering the streets. Since the issue of the notice, however, there has been a good deal of rain.

JUBILEE DECORATIONS.—The Lieutenants-Walton send us some illustrations of decorations prepared in their well-known material, including a medallion portrait of the Queen, the Royal Arms, and other heraldic insignia.

THE BLACKWALL TUNNEL.—The following is an official list of the principal sub-contractors who executed work at the Blackwall Tunnel, which was opened recently for the traffic of Water. We did not receive the list in time to print it last week.—All castings for tunnel lining: The British Hydraulic Foundry Co., Glasgow; shield and permanent pumps for drainage: Messrs. Easton, Anderson, & Golden, Britl; wrought-iron and steel caisson for shafts: The Thames Iron Works, London; hydraulic rams for driving the caissons: Walker & Co., Leeds; air-compressing plant: Messrs. Walker Bros., Wigan, The Ingersole Sergeant Drill Co., J. Slee & Co., Glasgow, and The Haslam Engineering Co.; white glazed bricks: John Hall & Co., Stourbridge; Joseph Brook & Son, Halifax, and The Farley Iron Co., Leeds; white glazed tiles: Messrs. T. & R. Boote, Burslem; red bricks: High Brooms Brick Co., Tunbridge Wells; polished granite, granite setts, and granite kerb: John Eyle, Aberdeen; granite channel and York paving: Messrs. A. & J. Manuelle, London; asphaltic paving: The Val de Travers Asphalt Co.; cement: J. Bayley, White Bros., & Co., Gillingham, and J. C. Barron & Co., London; hydraulic and steam pipes, &c.: Messrs. Lloyd & Lloyd, Birmingham; hydraulic line for erecting: Messrs. Grayson, & Lakin, Warwick; boilers: Messrs. Darg, Paxman, & Co., Colchester, and J. Penman & Co., Glasgow. The entrance houses were built by Messrs. Dove Bros., London. The contractors for the electric light installation were:—Electric lighting: Messrs. Laing, Wharton, & Downs; incandescent lamps: Edison & Swan Electric Light Co.; boilers for electric lighting: Messrs. Fraser & Fraser, Bromley-by-Bow.

BISHOP'S CHAIR, ST. JOHN THE EVANGELIST'S CHURCH, WALTON.—The new Bishop's chair, which has just been placed within the sanctuary of St. John the Evangelist's Church, Walton, has been designed by Mr. E. H. T. G. Latham, architect, of Liverpool. The new episcopal chair is framed in massive English oak. The back is carried high, terminating with a crocketed gable. Within the tympanum is a shield bearing the arms of the see of Liverpool, surmounted by a bishop's mitre. In the back rail, amidst carved foliage, occurs the date, 1897. The addition has been made by Messrs. Harry Hems & Sons, of Exeter.

THE SIDONS STATUE.—The Sidons Memorial Committee met on the 29th ult. at Paddington Vestry Hall, when arrangements were made for unveiling, on Monday, the 14th of this month, the new statue of Mrs. Sarah Sidons, executed by Mr. Chavilland according to a design approved by the late Lord Leighton. The Vestry has given a site for the memorial on Paddington-green, within a few yards of Paddington's old cemetery.

LANCASHIRE FEDERATION OF BUILDING TRADE EMPLOYERS.—The fourth half-yearly meeting of this Association was held at Barnley, on the 1st inst. The President, Mr. Cunliffe, Bolton, was in the chair, and there was a large attendance of representatives. The minutes of the last meeting were read and confirmed, and the President moved the adoption of the report. The Secretary's report stated that one local association at Warrington had joined during the half year, but as two of their smaller branches had become for a time disorganised the strength of the Federation remained about the same as before. The relations with the operatives were reviewed at some length. The report was adopted and ordered to be printed and circulated; and the treasurer's accounts, which showed a large balance in favour of the Federation, were presented and the balance sheet approved. Mr. James Storr, of Stalybridge, was unanimously elected President for the ensuing year; and W. Cunliffe, Bolton, Vice-President; Mr. J. H. Thompson, Bury, hon. treasurer; and Messrs. W. Shepherd, Rochdale, and J. Tinline, Bury, hon. auditors. The Secretary, Mr. John Tomlinson, Preston, whose two years' term of office expired, was unanimously re-elected for a similar period. The New Employers' Liability Bill was considered, and it was deemed advisable that the executive should take into consideration the best means of protecting the members, either by the formation of an Accident Insurance Company on mutual lines, or by endeavouring to obtain more favourable terms for federated employers.

PENRYN SLATE QUARRIES.—We regret to find that the strike at the Penryn Quarries seems as far

as ever from a settlement. Up to last Saturday both sides were sanguine about coming to an agreement, but the tone adopted at the Bethesda meeting, and subsequent disturbances by some of the least responsible of the men at the head agents' house, have widened the breach considerably. So far the trade has not suffered from the reduced supply of slates as much as might have been expected, the rise in the price of bricks and other causes having delayed building operations; and foreign slates are not making the headway their sellers anticipated, partly owing to the prejudice against them on account of bad quality in the past, and partly owing to merchants being required to buy before they are landed, and so having no remedy for breakage, short cut, &c.

EXAMINATIONS IN CARPENTRY AND JOINERY.—The Carpenters' Company hold their annual examination in these subjects this month. A large number of candidates is expected.

THE LATE MR. C. J. PHIPPS.—Mr. T. E. Knightley writes to deny that the Queen's Hall was carried out under his and the late Mr. Phipps' joint supervision, as stated in our obituary notice of the latter. He states that Mr. Phipps had retired from participation in the work before the building was actually commenced.

THE PROPOSED SCOTTISH NATIONAL BUILDING TRADES FEDERATION.—A meeting of delegates representing seven trades connected with the building industry of Scotland was held in the Trades Hall, Glasford-street, recently, for the purpose of forming a Scottish National Building Trades Federation. At a conference held on February 13 a committee was appointed to draft rules for the basis of such a federation. The following trades were represented:—Amalgamated joiners, slaters, painters, glaziers, bricklayers, plumbers, National Labourers' Union, and one delegate from the Associated Joiners. The swallow operatives and the tile layers sent in notices of willingness to join the federation. Mr. John Hardie (painters), Glasgow, was elected chairman of the conference, and Mr. T. Anderson (Amalgamated Joiners), Glasgow, was elected secretary. The proposed rules as drawn up by the committee were submitted, and it was agreed to establish a Scottish National Building Trades Federation, and that the rules as submitted be the basis of the federation for the first year. A committee was appointed to complete the business of the past conferences, and convene the first annual meeting of the federation to be held in Glasgow on the third Saturday of August, at which the Executive Council of the federation is to be elected.

CAPITAL AND LABOUR.

THE CARPENTERS' DISPUTE, LONDON.—The carpenters employed in the erection of many of the stands along the line of route of the Jubilee procession have, it is stated, forwarded a demand to the masters for an increase of wages amounting to 20 per cent. The three Carpenters' Unions to which the men are affiliated have refused to sanction the demand, but, notwithstanding this fact, the workmen employed on the stands at Charing Cross and St. Martin's-in-the-Fields came out on strike, as we announced last week, in consequence of the masters declining to grant the increase in wages. The movement has threatened, it is stated, to become general, and the majority of the masters have declined to pay their men 1s. per hour for 14d. overtime. The men engaged at Charing Cross decided to resume work, the masters having given an assurance that the demand made by their employes would be favourably considered.

THE PLYMOUTH BUILDING STRIKE.—At a large meeting of masons in the Co-operative Hall, Plymouth, on the 25th ult., a deputation of four members from the Master Builders' Association attended for the purpose of treating, if possible, with the men, they having given notice for rd. an hour advance in wages in October, and alterations in rules in their code. The masters offered at the meeting a rise of 1d. in October, the 12 o'clock rule on Saturday, half an hour for breakfast throughout the year, and half an hour for dinner during December and 14d. overtime, and one hour for the rest of the year. With regard to the other proposed rules of the new code affecting apprentices, the worked-stone and tied-work questions, the delegates from the Master Builders' Association had nothing to submit. The meeting decided not to accept the offer of the employers, directly on the ground that they had not considered the code of rules in its entirety, the masters' proposals being looked upon as premature. Certain of the rules ignored by the masters are held by the masons to be worth contending for.

BUILDING TRADES, STAFFORDSHIRE.—The building trade is good in all the Pottery towns, and there are no operative bricklayers or joiners out of work at the northern end of the district, but a small percentage is unemployed at the Stoke end. There are no large contracts on hand as yet in the district, but an enormous business is being done in artisans' dwellings. This is particularly noticeable at Burslem, for, in the neighbourhood of the park, a new town is growing rapidly. The painters are still out on strike, and so far there are no signs of a settlement, the employers' offer of arbitration having been refused by the operatives. This is un-

fortunate, for if the Board of Trade had been asked to appoint an arbitrator, there is no doubt that an able and conscientious man would have been selected, and a settlement might have been effected in the same manner as the bricklayers' and joiners' difficulty. At Crew's the building trade is good, but a dispute has occurred as to wages. At Leek, trade is good, and at Stafford there are no operatives out of work.—*Staffordshire Sentinel*.

JOINERS' STRIKE, WHISTON, LANCASHIRE.—A settlement of the strike of the joiners employed at the new Whiston Infirmary was effected on the 28th ult. Representatives of the men and masters had a conference at the North-Western Hotel, Liverpool. Mr. Willink, of the firm of Messrs. Willink & Thicknesse, architects, Liverpool, acting as arbitrator, when it was decided that the men were in the Liverpool district, and as a consequence they have resumed work at 6d. per hour, instead of 5½d. as hitherto.

THE CARLISLE JOINERS' STRIKE.—A meeting of the Masters' Association was held recently at the Viaduct Hotel, Carlisle, when it was decided to adhere to the offer previously made to the men, namely, to increase their wages from 7½d. to 7½d. an hour and to reduce the hours to forty-seven a week in winter, and to advertise for men to fill the vacant places. A master joiner in the city, who is not a member of the Masters' Association, has agreed, it is stated, to employ some of the men on strike at 8d. an hour.

THE BUILDING STRIKE IN IPSWICH.—There is no change to report in regard to this strike. Some of the men have left Ipswich for various large commercial centres.

THE REIGATE AND DISTRICT BUILDING TRADE STRIKE.—The carpenters and joiners, bricklayers and labourers, who went out on strike a few weeks ago, in consequence of their employers having refused (1) a demand for increased wages at the rate of a penny per hour all round; and (2) to accept a code of Trade Union rules based upon those now in force in London, have returned to work. The men's committee received a suggestion from one of the master builders with a view to effecting a compromise. The committee according proposed to the Secretary of the Masters' Association that the men should receive an halfpenny per hour increase, and start work immediately; and that on September 1 they should receive a further halfpenny, and on the same date the masters to recognise a code of working rules. The masters met, and it was decided to offer the men "a halfpenny increase in full settlement of their claims." A meeting of the men took place subsequently, and it was resolved, by a large majority, to accept the master's offer.

LEGAL.

THE LONDON COUNTY COUNCIL AND THE ROWTON HOUSES.

An interesting point was raised in a case which was decided on the 25th ult. in the Lambeth Police-court. The London County Council applied for penalties against Rowton Houses (Limited) for not obeying a notice served upon them by the Council under the London Building Act, 1894, Section 14. The building in respect of which the complaint arose was Rowton Houses, Churchyard-row, Newington. Mr. Hopkins said there was no dispute about the facts; it was admitted that every fact necessary to raise the question must be found against the defendants. The allegation which concerned him was that the defendants' building was so high as to infringe the last proviso but one of Sub-section 5 of Section 13 of the London Building Act, 1894, and if that proviso applied the building was certainly too high by many feet. If, say, the Gordon Hotels Company had done exactly what the defendants had done in the matter, and, after complying with the requirements of the statute, as the defendants complied with them, had erected on that very site one of their palaces, he thought it must be admitted that they might have gone to any height they pleased, and that no question could have arisen as to the height under the proviso, because the Gordon Hotels could not be said to be within it. For all the purposes of the London Building Act he could see no possible difference between, say, the Gordon Hotels Company building, a rich man's hotel, and Rowton Houses, Limited, building, a poor man's hotel. He was strongly of opinion that all the real merits were with the defendants, and he dismissed the summonses. Mr. Hopkins allowed 15s. 15s. costs.—*Times*.

MEETINGS.

FRIDAY, JUNE 4.
Royal Institution.—Mr. W. H. Pease, C.B., F.R.S., on "Signalling through Space without Wires." 9 p.m.

SATURDAY, JUNE 5.
Edinburgh Architectural Association.—Visit to Torphichen Church.
Incorporated Association of Municipal and County Engineers.—Meeting at Eastbourne.

WEDNESDAY, JUNE 9.
Northern Architectural Association.—Visit to the Leeds Steel Works, Limited, to view the manufacture of Steel in its various processes, from the Ore to the finished Gilder.

THURSDAY, JUNE 10.
Society for the Encouragement of the Fine Arts.—Third Convergence, to be held in the Courts of the Museum of Science and Art, South Kensington. 8.30 p.m.
Royal Institution.—Professor Dewar on "Liquid Air as an Agent of Research." III. 3 p.m.

SATURDAY, JUNE 12.
Incorporated Association of Municipal and County Engineers.—Meeting at Llandudno.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

8,852.—**MANIPULATING VENTILATORS, SASHES, &c.**: J. G. Walker.—Relates to a method of operating ventilators, sashes, doors, &c., placed in positions not easily accessible. Inventor conveys the necessary power by a liquid or gaseous fluid, conveyed through pipes, and acting on a piston moving in a cylinder.
9,164.—**SHUTTING WOODEN SASHES**: H. Vichalon.—In windows of the type specified, the inventor pivots to sash two sliding sashes, in combination with a bolt adapted to be moved to secure sash against sliding in window frame and to allow of sash being moved or conversely to be moved so that sliding sashes are free to move, but sash is secured from swinging.
10,620.—**ROOFING PLATES OR SHEETS**: Alfred J. P. Whelan.—In roofing plates of steel, iron, or other metal, inventor provides each with an upwardly projecting flange at one edge, and at opposite edge a groove to receive such flange of another plate so that inter-locking is secured.
13,316.—**FASTENERS FOR WINDOWS**: A. Breton and J. Duboué.—Relates to fasteners for windows, in which a catch and locking plate are employed. Inventor adopts a cam for the withdrawal of a spring bolt on a cord being obliquely pulled.
12,436.—**KILNS FOR BRICKS, POTTERY, &c.**: H. E. Mason.—Inventor claims in such kilns the combination of side air flues and side gas flues, supplied with air and gas from separate flues, such supply being regulated by valves or dampers.
4,810.—**TESTING DRAIN PIPES**: L. Moxes.—Claim consists in a method of discovering and locating leaks by the employment of cold fumes produced by volatile chemicals forced into the pipes by pneumatic pressure.
4,720.—**TILES FOR KILN FLOORS**: E. E. Bailey.—In floors of small kilns, &c., where the T joints used are inverted and tiles rest on flanges, the inventor proposes to form tiles with undercut edges, so that they come into more intimate contact with the girder.
8,928.—**ANTI-RATTLING DEVICE FOR WINDOWS**: J. H. Haslett.—Inventor claims in such windows a device in window frame by side of sash and pressing against it sufficiently tight to prevent rattling while permitting free movement.

NEW APPLICATIONS FOR LETTERS PATENT.

MAY 17.—12,125, W. Stokes and Others, Joists for Brick, Cement, Stone, or Wood Arches, Kings, Slabs, or Ricks.—12,143, J. Stevenson, Self-acting Window Fastener.—12,155, G. Phillips, Window Fastener.—12,200, G. Hunt, Platform for Use with Ladders, &c.
MAY 18.—12,241, E. Waddington, Brick Making.—12,242, A. Fordyce, Fireproof Construction.—12,255, J. Poste, Controlling the Movements of Doors.—12,272, H. Hope, Fastener for Window Casements.—12,283, J. Heaton and Others, Parquetty Floors, &c.—12,289, W. Hoffmann, Door Lock.—12,307, D. Evans and J. Jones, Window Sash Fastener.—12,308, E. Nash, Window Sash Fastener.—12,310, J. Austin, Window Sash Fastener.—12,312, W. Garnham, Window Sash Fastener.—12,335, C. Reichert, Adjustable Saw-filing Guides.
MAY 19.—12,351, B. Bridgwater, Chimney Tops.—12,354, F. Allen, Gate Latch or Fastener.—12,414, G. Woollocroft and H. Todd, Brick and Tile Making Machines.—12,423, J. Dixon, Electric Bell Pushes, &c.
MAY 20.—12,471, J. Bull, Panic or Analogous Bolt for the Doors of Theatres and other Public Buildings.—12,472, V. Mahler, Opening and Closing Windows.—12,475, A. Wrang and others, Dies for Making Bricks, &c.—12,478, R. Chamberlain, Sash Cord Fastenings.—12,492, A. Holden, Mixture for Whitewashing, Distemping, &c.—12,500, G. Janeway, Window Fastener.—12,537, E. and A. Hobman, Kilns or Ovens for Burning or Drying Bricks, Tiles, &c.—12,552, A. and C. Milinaire Ben, Metal Sheets for Roofs, Floors, Partitions, Girders, &c.
MAY 21.—12,563, J. Scaife and R. Wood, Conveyers for Wood Working Machines.—12,570, W. Maguire, Decorating Tiles, &c.
MAY 22.—12,674, A. Cushin, Securing Door-Knobs to their roses.—12,677, F. Collins, Hinges for Doors, Windows, &c.—12,699, J. Johnsons, Movable Partitions for Stables, &c.—12,702, R. Griffiths and A. Palmer, Window Sashes and Frames.—12,708, J. Duckett, R. Duckett, and J. Duckett, Water-closets.—12,717, W. Monnan, Window Sash Fastener.—12,719, E. Thomas, Sash Fastener.—12,720, S. Francis, Sash Fastener.—12,722, J. Cracker, Sash Fasteners.—12,724, G. Aikman, Sash Fastener.—12,725, R. Price, Sash Fastener.—12,743, G. Hall, Mixing Plaster and Cement by Machinery.

PROVISIONAL SPECIFICATIONS ACCEPTED.

9,137, J. Seward, Combined Latch and Bolt for Doors, Windows, &c.—9,622, H. Craig, Siphon Water Closets.—10,329, E. Martin, Gully Traps, &c.—10,479, W. Godfrey, Sewer Traps for Waste Pipes, &c.—10,493, R. Armitage and J. Cobb, Kilns for Manufacturing Bricks.—10,610, W. Water, Wedges to Prevent Rotation of I. Persons, Windows, &c.—10,683, H. Braun and R. Gross, Portable Door Fastener.—10,878, M. Holt, Sliding Windows, &c.—10,912, W. Tillmanns, Iron Roof.—10,924, F. Hulbrand, Catch or Fastening for Doors, &c.—10,931, J. Persons, Window Fastener.—11,050, J. Robb, Door Handles.—11,069, T. Watson, Roofs or Coverings for Brick-kilns.—11,093, W. David, Sash Fasteners.—11,138, C. Calloch, Band Saws.—11,238, A. Murray, Sheet Material as a Substitute for Glass.—11,343, R. Ayre and Craven Dundell & Co., Ltd., Pottery Kilns or Ovens.—11,354, J. Golding, Tiles.—11,365, T. Jamieson, Ventilators.—11,494, F. Lynde,

Lavatories, Baths, &c.—11,541, J. Thompson, Dust Excluder and Ventilator for Sliding Windows.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

11,392, E. Fletcher and others, Fastener for Downy Sponges, &c.—12,046, J. Edmundson, Sanitary Appliances.—12,165, G. Ridon, Window Sashes and Frames.—13,684, R. Walbrook and A. Wells, Apparatus for Coating Surfaces with Paint, &c.—16,938, K. Sutherland, Window Sashes.—1,384, W. Goodall, and C. Soar, Sockets of Pipes for Sewerage and other purposes.

A Revised View of Italian Renaissance Architecture.

HE history of the influence of the architecture of the Italian Renaissance upon English architecture in the more modern period, exhibits rather a curious variation in one point of view.

In the days of our fathers and grandfathers Italian architecture stood as the symbol for what was correct, refined, and Academic in the application of the classic orders to modern architecture. Palladio was its great name, attaining in England an almost proverbial influence as a kind of architectural high-priest, such as he hardly attained in any other country. Alberti, Vignola, and Serlio were admitted though lesser lights in the same form of art. When the late Sir William Tite founded his prize for the encouragement of the study of Italian architecture, it was unquestionably this academical idea of it that was in his mind; he wished to promote the study of and taste for a correct application of the Orders, as an antidote to the threatening irruption of Gothic tastes. That the expression "Italian Renaissance architecture" could stand for much which is fanciful, original, and picturesque, is an idea which would almost have startled the older generations who just preceded the Gothic revival. But the younger generation of Englishmen of the present day, without philosophising much on the matter, have begun tacitly to find this out for themselves; their sketch books tell the tale, filled as they are often with bits of picturesque and unbacked architectural combination and detail; unlawful incidents, such as would find no place in the Vitruvian or Palladian scheme of architectural design. It is partly on this account that even those whose natural leanings are towards mediævalism or what is akin to it have ceased to regard Renaissance architecture in that spirit of contempt and aversion of which Pugin first set the example, and to which Ruskin afterwards gave voice in his eloquent but absurdly exaggerated language. Even the scholastic architecture of the Italian Renaissance is now regarded with some

respect by those who decline to take it as a guide; but our eyes have begun to be much more opened to the fact that there is a great deal in Italian Renaissance architecture which is much more than scholastic, and that the generation of mediævalists who poured contempt upon it were only contemplating one phase of Italian architecture, and that not the most interesting.

Mr. Anderson's book on "the architecture of the Renaissance of Italy" * is not therefore a new gospel on the subject: it is only a revised analysis to suit a position already tacitly taken up. But such a book was certainly required. The existing popular text-books, such as Fergusson's, take the old view of Italian Renaissance architecture as essentially an academic form of art; it was desirable that there should be a book for students and the public which would express the more comprehensive view of the subject which is now beginning to prevail. This therefore, is the excuse for the production of a small book on so great a subject as the architectural Renaissance in Italy; not to pretend to exhaust the subject, but to present it to the student from a new point of view.

The most important feature in Mr. Anderson's book is the emphasis which he lays on the earlier works of Renaissance architecture, which have been comparatively neglected by previous writers, who have regarded them merely as examples of incompleting progress towards the development of a purely classical style. Italian architecture, in fact, has till lately meant to the majority of architectural students the architecture of academic laws and the use of the Orders, and the student has been invited to concentrate his whole attention on the more symmetrical and imitative buildings of the later period, to the ignoring of the in many cases far more interesting and virile work of the earlier Renaissance. Thus has arisen the critical mistake of regarding the Italian Renaissance as merely an imitative period. That in the later Renaissance there was a good deal of cold imitation of Roman detail is true enough, and also that it was, as far as we know, the first time in the history of the art in which architects went back to

* "The Architecture of the Renaissance in Italy: a general view for the use of students and others." By William J. Anderson, architect, A.R.I.B.A., director of architecture and lecturer at the Glasgow School of Art. London: B. T. Batsford: 1896.

the imitation of the details of an ancient style many centuries before them; so far the Renaissance marked a new era in architecture, a new method of procedure; but even in regard to this later and more scholastic Renaissance, though the details were borrowed, the main design was not; and the works, for instance, of Palladio, Peruzzi, and Sansovino, each represent a distinct principle of architectural treatment;

"Michelangelo's dome, that had hung the Pantheon [in heaven,"

was not a copy of the Pantheon. But in the earlier days of the Renaissance this scholastic imitation had not been systematised; the architects, under the influence of the revival of learning, no doubt turned to the remains of Roman art and drew inspiration from them and made use of some of their materials, but it was a use made in an exceedingly free spirit, in buildings many of which were entirely new architectural creations. The falsity of that view of the Renaissance as a merely imitative school of architecture has been commented on more than once in our pages; and we are glad to find an able and thoughtful critic like Mr. Anderson promulgating the same view:—

"It is true with regard to the details or materials of its composition that in the Roman Forum, or the Palatine Hall, or among the ruins of the Baths of Caracalla, one may find not merely the prototypes, but the approximate forms, nearly every feature which goes to compose the church or palace built fourteen or fifteen centuries afterwards. With as much truth, however, may it be said that originality has never been displayed to greater degree than by the architects of the Early Italian Renaissance, and that considered in relation to the previous direction of all architectural effort for centuries, the interiors of the Capella del Pazzi, San Lorenzo, and Santo Spirito—all churches of Brunelleschi—are real works of genius. . . . In every way it becomes clear that those who consider the architecture of the Renaissance as merely an imitative style, and place it in a different category from all which precedes it, do so with a little truth and more error. If the Italians of the fifteenth century took the Roman forms and details as a basis, they built up a new style as different from the Roman as the Roman was from the Greek. There is, for example, a far wider gap between the Renaissance church and the Roman temple than between the Roman and Grecian temples; and such buildings as the Palazzi Strozzi and Grimani are unique, and have no relation of an imitative kind to anything in classic times."

This is no more than the truth, and it is well to have it set forth so plainly, not only

for architectural students, who may use the book as an introduction to the study of Renaissance architecture, but also for those of the public who may be induced to read it, and who are accustomed to follow with too implicit belief Ruskin's absurd and overacted denunciation of all Renaissance architecture as a sham. There is, however, one important point which might have been referred to in the Introduction (from which the above quotation is taken), viz., the extent to which architecture became a personal art at the Renaissance. It is not more the style of the country or of the age that we recognise in a Renaissance palace or church, than the treatment and manner of the special architect whose work it was. This fact represents the most marked and unquestionable distinction between the condition of architecture at the Renaissance as compared with any earlier period the works of which are known to us. There may be two or three ancient buildings which have the air of individual taste and intellect strongly marked on them. The Erechtheion is one. St. Sophia seems to have owed its grand design to the personal genius of its architect, since we know of no precisely analogous building before it. There is Peterborough west front; a distinctly individual idea. But in general both the Greek temple and the Gothic cathedral affect us as manifestations of an impersonal architecture, carried out according to a received programme. With the great Renaissance buildings it is different; they are each stamped by the personal character and predilection of their architect. Mr. Anderson seems hardly to have realised, or at least to have pointed out, this essential fact with sufficient emphasis, though he does lay stress on the influence of the personal genius of Brunelleschi.

This latter great architect can only partly be claimed by the Renaissance, for Santa Maria at Florence was essentially a mediæval building, and Brunelleschi's dome a mediæval dome, more like an octagonal vault than a dome, and pointed in section. It was in some of his smaller works that Brunelleschi fairly took up the new form of architecture. It is curious, and it is an evidence of the free and unfettered manner in which architecture was at this time practised, that while Brunelleschi was following classic examples in some of these smaller works, the Riccardi Palace was commenced, and the Strozzi even a good deal later; buildings which are in most respects far more mediæval than classic in feeling, the only effect decisively classic about them being the huge and strongly marked cornice, which was proportioned not to an Order, but to the whole height of the building. In drawing attention to the grandeur and great projection of these cornices, the author omits to show by a section what exceedingly artificial and unstructural creations they were; the cornices actually overhang to a much greater extent than the width of the walls, so that they must be cramped down; we do not know whether any one has had the opportunity or the curiosity to examine into this, but a published section of the Strozzi palace, which we may assume to be fairly correct, gives one a most uncomfortable idea as to the seating of the cornice on the wall.

Still more strange does it seem that almost simultaneously with the erection of buildings of such massive grandeur and breadth of treatment as these two palaces, Alberti should have thought that he was bettering

architecture by the production of so tame and flat though elegant a piece of commonplace as the Rucellai palace, that parent of pilasters, a building which represents the wrong side, the pedantic side, of Renaissance architecture, and seems like a prophecy of what it was to come to in the later period, when too much learning and the desire of reproducing Roman work had flattened and dulled the real life out of the architecture. The fact, however, that Alberti cared to do this kind of thing of his own personal motive and apart from any general tendency at that time to architectural pedantry, is another proof of the extent to which architecture had come to be governed by the personal taste of the individual architect.

The scope and object of Mr. Anderson's five chapters or lectures is to show that Italian Renaissance architecture was really of far more interest, originality, and variety, during the earlier period which has been least studied and illustrated, and when the idea of Classic precedent was less predominant, than in the later period of Michelangelo, Palladio, and Vignola, when precedent was all-powerful; a period which has been commonly regarded as the culmination of the Italian Renaissance in architecture, whereas Mr. Anderson frankly heads his last chapter "Palladio and the Decline." There are in fact plenty of architects, in the present day, even those of Classic tendencies and sympathies, who will agree with him in this view—who have in fact long agreed with it; but we are not aware that it has been so defiantly propounded in a text-book before. Mr. Anderson begins with "The Fifteenth Century in Florence," the chapter which, along with the Introduction, we have been hitherto considering. This is followed by a parallel chapter on the "Early Renaissance out of Florence," touching on such examples as the Certosa, and on the work of Bramante, who, if the Santa Maria della Grazie at Milan is really his, could be as original and as free from the trammels of classic precedent as the architects of the early Florentine palaces. In his liking for covering the surface of archivolts and pilasters with carving, slightly confined by a thin fillet, he anticipates some of the feeling and peculiar effect of the *plateresque* school in Spain. With this we are directed also to the earlier work in Venice and the North Italian cities, which, as the author truly observes, is even stronger evidence than the Florentine work against the charge that Renaissance architecture was merely imitative. The next chapter deals with the central period and the culmination in Rome, where, by the way, Bramante, in the last period of his career, seems to have become converted to pedantry and the pilaster ideal, and did with the Cancellaria Palace as poor a feat as Alberti with the Rucellai, as far as general vigour of architectural conception is concerned, though no doubt some of the details are beautifully refined. One important element, however, illustrated in the Cancellaria and elsewhere, which the author draws special attention to, is the variation in the spacing of the pilasters, by which they are divided up into wider and narrower intercolumniations alternately. The work of Peruzzi is also largely illustrated and described in this chapter, in which also we naturally come upon the subject of St. Peter's and the dealings with it of San Gallo, Raffaello, Bramante, Peruzzi, and Michelangelo. "Roman influence in the north of

Italy" forms the subject of the succeeding chapter; the last, as already mentioned, being occupied with "Palladio and the Decline." Palladio the author classes as undoubtedly the cleverest man of the late Renaissance, an architect of fine perceptions and no little originality. The praise of the latter epithet he, perhaps, hardly deserves; at least, where he was original, it was by no means always in the best manner. The author comments on the fictitious importance which his name has obtained in England: "Why he should be better known and more honoured than Brunelleschi, Bramante, Peruzzi, or Sanmicheli, it is difficult to understand, unless it be that he showed what could be done on a small scale and with simple and cheap materials." That would, no doubt, be one reason for his being dear to people who erect buildings in this country. Whatever the cause, it is certain that with many old-fashioned Englishmen, to this day, the name of Palladio is a kind of synonym for architecture.

The book makes a very good summary of the subject in a small compass, and the numerous illustrations, mostly reproduced from photographs, serve to give a very fair panorama on a small scale of the salient qualities of the principal classes of architectural monuments of the Renaissance.* It may be recommended as an introductory book both to students and the laity. Among special points of criticism we are glad to see that the author repudiates the now popular idea that a painter's or a sculptor's training makes the best architect. The fact that a few of the great architects of the world had found their way into the art through a sculptor's or painter's studio, only shows, as he observes, that special capacity will assert itself and find its true outlet. "Many painters and sculptors made poor architects, and hundreds of them never indicated any architectural skill whatever. The best of the architects were those who laid aside everything for their art, and became no longer painters and sculptors but architects." And this is really the common sense of the matter. We also entirely concur in the advice to look after small works of the Renaissance as attentively as after the great buildings, as the smaller ones may often be found to be the most perfect examples of the art. Lastly, we may draw attention to the important distinction which the author suggests between the art of the Renaissance and "the fleeting revivals of styles in modern days." "Had the Italian church builders of the sixteenth century pursued the architectural methods of the English Gothic revivalists of the last generation, they would have attempted to reproduce the temples, or at least the law court or Basilica, or the form of the Roman houses where the earliest Christian churches assembled. This was not their method, and where their arrangements were not virtually original, designed to meet the wants of the time, they were developments of Mediæval or Gothic practice, that is, of the period immediately preceding." That is perfectly true, and it is a distinction often lost sight of by those who rank the great architectural movement of the Italian Renaissance with an ordinary "revival."

* This system of illustration by reproductions of photographs, which is now becoming fashionable in books on architecture, no doubt saves time and trouble, and is in a sense more trustworthy than drawing, but it does not give a book the same interest, especially when the perspective is seriously distorted by the photograph.

THE EFFECT OF EXTRA WORK ON THE DATE OF THE COMPLETION OF BUILDING CONTRACTS.

It is very seldom that what may be called a pure point of building law comes before the Court of Appeal, so rare, indeed, that even if the recent decision in the case of *Dodd v. Churton* (Law Reports, 1897, 1, Q.B.D., p. 562) were on a point of less importance than it is it would be worthy of some attention. But the practical value of the case in question makes it desirable that it should receive detailed notice.

There is no point in building arrangements more vital than the question of the date of the completion of a contract. It is one which too often gives rise to much disagreement, more especially when some work extra to the original contract has been done. No prudent building owner will fail to have a date for the completion of the work inserted in a contract, and also have a scale of penalties to be paid by the builder added in case the latter does not complete the work by the specified date. In the simple but rather exceptional case of a contract which is completed without extras there can be, as a rule, no difficulty on this point. If the work is not done by the date which is specified, then the builder has to pay the penalties under the contract.

But nine-tenths of the building contracts of the present day are not completed as originally entered into—some extra work is almost certain to be ordered. It is then that complications frequently arise, since it is obvious that the completion of the work by a specified date may be prevented if the building owner requires extra work to be done. The non-completion necessarily brings the question of the penalties to the front, and it is here that there has been some uncertainty as to the law, which the recent case of *Dodd v. Churton* appears to have finally cleared up. In *Holme v. Guppy*, which was decided in 1838, and also in *Thornhill v. Neats*, decided in 1860, the ordering of extra works and their execution by the builder was held to wholly put an end to the penalty clause in the contract. In *Legge v. Harlock*, decided in 1848, it was held that the result of the extra work was "to enable the builder to have an allowance made in respect of the days necessarily occupied in the execution of the additional work" (see *Roscoe's "Digest of Building Cases,"* 3rd ed., p. 58). This decision, it is obvious, has an important practical result, different from that of the two first-named cases, since, in them the question of penalties was wholly put an end to. But, as pointed out in the work from which the above extract is taken, according to the contract in *Legge v. Harlock*, if extra works were ordered, they were to be finished in a reasonable time. In other words, the question of the date of the completion of extra works was provided for in the contract.

In 1870 we get to a case in which the date of the completion of any extra works was specified with a will, since the builder bound himself to complete the contract, extras included, by the original date. The Court of Queen's Bench held that if a man was foolish enough to bind himself under a penalty to do something which was impossible he must be held to his bargain. In the recent case of *Dodd v. Churton* there were the usual circumstances. There was a date fixed for completion of the contract; extras

were ordered—these delayed the completion of the contract. The value of these additional works was 22*l.* 8*s.* 8*d.*, and it was said that a reasonable extension of time would have been a fortnight, but the builder did not, in fact, complete the contract for twenty-seven weeks beyond the date originally specified for its completion. The building owner consequently claimed penalties for twenty-five weeks. But in the argument of the case, the middle course, as it may be called, which had been adopted by the building owner, seems to have been thrown over by his counsel, since he relied on the *St. John's College* case, and argued that the true construction of the contract was that the builder had undertaken to do the original and any extra work by the specified date. On the other hand, the counsel for the builder argued that the case was within the general rule, namely, that the building owner by ordering extras had put a complete end to the penalty clause.

This was the view taken by the Court of Appeal, who held that the *Oxford* case was exceptional, and that unless a contract in clear words stated that extras were to be completed by the date originally specified then that this case did not apply, and that there was no date fixed for the completion of the contract. This decision is no doubt sound law, but it is rather hard on the building owner, and we think that the Court, while holding that the penalty clause was put an end to so far as regards the date originally fixed, yet might have implied a contract to finish the work in a reasonable time. It is absurd that extras, which properly lengthen the time of execution of a contract, we will say, for fourteen days, should allow a builder to delay the completion for perhaps fourteen weeks.

What is the practical matter, then, for parties to building contracts to bear in mind, having regard to these various decisions? One thing is clear, that no builder should bind himself by such mad conditions as in the *St. John's College* case. In *Legge v. Harlock* we find the reasonable solution—there should be a stipulation in the contract that extra works, if any are ordered, shall be completed in a reasonable time: or in such additional time as may be allowed by the architect. This is fair to both parties, whereas the rule laid down in *Dodd v. Churton* is not fair from a common-sense point of view to the building owner. As we read it, the meaning of Clause 15 of the conditions agreed upon by the Institute and by the Central Association of Master Builders is in accord with the decision in *Legge v. Harlock*. The recent decision of the Court of Appeal shows how desirable it is for well-known conditions to be used in building contracts, and not those which are drawn by some lawyer who is probably unaware of the various decisions on these technical questions.

NOTES.

In a communication to the *Age of the Earth*. Victoria Institute the other day, Lord Kelvin discussed the "Age of the Earth as an abode fitted for life," in which, however, we fail to find any new data that could be utilised in the solution of the problem. The date of the solidification of the earth he now places between twenty and thirty million years ago, and he arrives at

this date by judging of "the properties of rocks and by underground temperatures." This last is delightfully vague, and when we begin to know something of underground temperatures we may be able to follow the Glasgow Professor; as it is we are in daily expectation of having our views on that subject modified by new discoveries, for during the past few years very divergent results have been obtained in actual practice as to the rate of increase of underground temperature. And if the deductions are mainly based on the "properties of rocks" (presumably igneous), we shall be glad to learn of any two authorities who are in agreement with each other respecting the temperature under which any holo-crystalline rock has settled down. Lord Kelvin is a champion antagonist of the doctrine of uniformity in geology, and, although it is not fashionable, we are rather inclined to agree with him on that point. At the same time, it is difficult to reconcile the grounds for that antagonism with the mathematical progression demanded by his calculations. If "seventeen million years" have elapsed since the beginning of Cambrian time, biologists will want more than double that for the estimate of the date of the first appearance of life on the globe. These oldest fossiliferous rocks contain the remains of some of the most highly organised invertebrata, and some of the genera have very little altered up to the present day. The study of the phylogeny of Lower Palaeozoic life renders it impossible for the paleontologist to accept any estimate of time for the evolution of pre-Cambrian life. We do not follow Lord Kelvin, therefore, in his observations on the biological aspect of the problem. At the risk of being included amongst the "antiquated geologists of thirty years ago," we venture to suggest that more facts are wanted before any scientist is warranted in attempting to fix the date of the appearance of life on the globe. The younger school of geologists also will have none of these precious theories, which, as a rule, have no shadow of foundation in fact to rest upon; and Lord Kelvin is hardly correct in stating that geologists "no longer consider the question of absolute dates as outside their province."

A CORRESPONDENT in the *Times* makes a rather exaggerated suggestion as to the danger of an extensive fire if one of the temporary scaffolds on the line of route of the procession caught fire. To say that "a chance spark or an unextinguished match would quickly set them alight" is hardly true. Thick wooden joists and planking are not easily set on fire by a burning match falling on them. Such danger from fire as there might be would rather arise from a match falling on any accumulation of shavings or paper, or other easily inflammable material, accumulated in the spaces under and behind the staging. These spaces, which will be invisible and not to be got at during the procession day, ought to be carefully examined and cleared of rubbish the evening before the 22nd. If that were properly done the danger from fire would be hardly appreciable. What we should feel more anxious about is the stability of some of the scaffolds under the pressure of a crowded mass of persons all striving to lean as

near the front as possible; we do not refer to the scaffolds erected in steps on a slope—those are safe enough—but to some of the very high narrow stagings which we observe are getting erected against nearly the whole height of some of the street buildings. These ought to be securely tied into the buildings behind them, and we feel some doubt whether this has been adequately done in all cases, people being naturally anxious to damage their buildings as little as possible. But the whole of these erections are liable to the supervision of the District Surveyors, so that we may hope they will be well looked after.

THE Committee which is charged with the arrangement of the Paris Exhibition of 1900, has drawn up its scheme for the "retrospective" exhibition of Fine Art and the exhibition of Decorative Art, in its main lines at least. According to the programme, drawn up by M. Molinier (assistant-director of the Louvre), the Retrospective Exhibition will have the whole of the small palace at the Champs Elysées and part of the large palace on the line of the Avenue d'Antin. In the small palace will be collected objects of decorative and industrial art from the earliest date to 1800, classed in twelve series according to chronological succession. The upper portion of the Retrospective Exhibition will include works of art from 1800 to 1839, installed in a portion of the large palace; sculpture on the ground floor; painting and industrial art on the upper floor. This portion of the exhibition will be divided into five parts, corresponding to the First Empire, the Restoration, the reign of Louis Philippe, the Second Empire, and the modern Republic. Between the different galleries will be rooms for visitors to rest, furnished in various styles so as to illustrate the progress and change of style in furniture design. In connexion with the subject of the Exhibition, it may be mentioned that it appears now to be definitely settled that the annual Salons, until after the 1900 Exhibition, are to be accommodated in the Galerie des Machines.

A LONG letter on this subject from the Bishop of Chester, in Monday's *Times*, is gratifying as indicating that the labours of the Joint Committee of the Institute of Architects and the College of Organists, appointed some years ago to consider the question of the best position of the choir and organ in churches, are not entirely thrown away, and that their Report, though not final in its nature, is now influencing clerical opinion. The Bishop quotes largely from this Report, and with evident approval; but when he refers to the conservatism of architects as standing in the way of improvement, we are inclined to suggest that it is rather the conservatism of the clergy that is at fault. The scheme of the chancel choir is undoubtedly favoured by the clerical party from the idea that there is a traditional ritualistic propriety in it, and we imagine that in many cases an architect would not be allowed to dispense with the long chancel and the choir stalls in it, even if he wished to do so. Yet the idea of the traditional propriety of the arrangement is only illusory; it dates from the days when the choir were also the clergy, and were a segregated body. In the present day the lay choristers should be more properly regarded as a portion of the congregation. The

Bishop of Chester seems to be fully persuaded of the unsuitability, on musical grounds, of the "organ-chamber" (it is something to have got that opinion on record from an ecclesiastical dignitary), and evidently favours the idea of a west-end organ with a choir on either side of the nave, which we have long regarded as the true solution. The choir are then really in a position to lead congregational singing, and a large organ has at the same time a chance of being heard with its best effect.

THE Royal Institution was crowded on Friday evening last week, when Mr. Preece gave a lecture on "Signalling Through Space Without Wires." He first described a primitive system which was successfully used to signal across the Sound of Mull when the submarine cable broke down in 1895. The principle employed was that currents in a long straight wire induce currents in a long wire parallel to it, even when they are many miles apart. Another system described was that of communicating with lightships by means of a cable coiled at the bottom of the sea under the ship. The currents in this cable were to induce currents in another independent cable coiled round the ship. This method, however, was a failure, as the currents induced in the iron hull of the ship screened the coils from one another. He then described Signor Marconi's system, about which it now appears much needless mystery has been made. It was found to be a modification of a Hertz oscillator and a Lodge coherer. It was stated that by its aid signals were transmitted across the Bristol Channel between Penarth and Brean Down, a distance of nearly nine miles. He also said that secrecy could be perfectly obtained by its use, as only a receiver tuned to the particular frequency would respond to the signals. We do not see, however, what is to prevent any one from tuning a receiver until it answered the P.O. signals. It is well known to mathematicians that the resonance of such a receiver is not at all marked, and that it will respond to electric waves throughout a wide range of frequency. For shipping and lighthouse purposes this system has a future before it, and it will be interesting to see whether the Post Office or private enterprise will be the more successful in adapting Hertz's and Lodge's discoveries to practical work.

A Central Railway Station.

A RUMOUR was set afloat last week that the Midland Railway Company were negotiating for the purchase of the site of the Foundling Hospital, with a view to erect on it a central station. This report, we are glad to hear, has now been contradicted by the Company. The idea is one, however, which must take practical form sooner or later. The position of the termini of the Great Western, the North Western, and of the other lines which end north of Euston-road, is quite an anachronism at the present time. In the same way the terminus of the South Western is extremely inconvenient. We have therefore no doubt at all that, cost what it may, one or more central stations will, sooner or later, be seen in London. It does not necessarily follow that all trains will arrive at or start from this point, but that there will be some concentration of traffic partially, at any rate, in a

central place, we feel no doubt whatever. It is to be hoped, however, that it will not be at the cost of destroying a building of so much historic interest as the Foundling Hospital, and filling up one of the open spaces of London.

The Public Health Act.

A SOMEWHAT curious point in regard to by-laws under the Public Health Act, 1875, was decided shortly before the Courts rose for the Whitsun Vacation. It was declared by a by-law that any person who should construct a sewer should place it at least 50 ft. from the building with which it was connected. Various objections were taken to what was an unreasonable by-law, and that it could not apply to alterations to old buildings. These the Court brushed aside, they were not tenable. A third objection was overruled, but not in so satisfactory a manner. How was a cesspool to be made 50 ft. from a house if the owner of it did not possess the ground to this extent? The answer given was that if this were so the cesspool could not be made in the case of a new house, and in the case of an old one the owner was not bound to construct a new cesspool. It is, however, hardly conducive to improved sanitation to allow cesspools to remain at less than a given distance from houses, if in the case of new buildings they are to be at some specified distance away. It is also to be observed that in the case in question the old cesspool was 3 ft. from the house, and was closed by order of the Inspector of Nuisances, so that the owner was not a voluntary agent in the matter. As regards new houses in streets, a by-law such as that which was under discussion in *Simmons v. the Malling Rural District Council* appears to contemplate a system of drainage and not isolated cesspools.

Electric Lighting by Reflection.

IN a new banqueting hall in connexion with the Royal Palace Hotel, Kensington, an experiment has been tried which was recommended years ago in our columns, in the early days of electric lighting, viz.: lighting a room by reflection from the ceiling, the actual lights being concealed. In the room in question some hundreds of 16-candle-power lamps are hidden under the cornice and the light is thrown on to the ceiling and thence reflected down into the room. The work was carried out by Messrs. Donnison, Berlyn, Sillem, & Co. Of course a certain amount of light is wasted in the reflection, but the glare of the lamps is removed from the eye, and there is also the pleasing effect produced of a light from no apparent artificial source—a kind of daylight effect.

A Cause of Leak in a Dry Dock.

THE *Scientific American* in a recent issue gives some information as to a leak in the dry dock in Brooklyn Navy Yard, and its probable cause, which may be of interest to engineers. Water had been percolating into the dock beneath the apron which extends from the outer sill into the entrance channel. The apron consists of two layers of 12 by 6 timber on a bed of concrete and piling, with sheet piling 12 by 8 on the side towards the entrance. A diver sent down to examine found that a hole had been torn open at the outer edge of the apron, exposing the underlying bed of concrete, and that a large hole had been formed in the bottom

Section of Apron, Brooklyn Dry Dock.

itud of the channel round the damaged portion. The following is given as the probable explanation:

"The construction of the dock was carried on from the inshore end toward the channel, and the apron was built while there was yet a couple of hundred feet of solid ground between it and the Wallabout channel. The removal of this material was done by a floating steam dredge, and it is supposed that in excavating the channel near the apron the bucket caught the edge of the apron, tearing up the sheet piling and breaking away a portion of the concrete and the timber flooring. The water was now free to enter beneath the concrete floor and work its way along the sides of the dock. Under the great head of from 26 to 29 ft., the pressure upon the structure would be enormous, and would easily account for the bursting in of the walls on the occasion already referred to."

We give a reduced copy of the diagram accompanying the description. The dotted lines enclose the portion which was damaged as described.

A CORRESPONDENT, well known in India, draws attention to the indifferent manner in which we treat artistic gifts from loyal and distinguished Indian subjects of the Empress, as especially exemplified in the case of the Gwalior Gateway, a remarkable piece of work by Indian artisans, executed at the cost of the Maharajah Scindia of Gwalior and presented by him to the South Kensington Museum. This gateway was illustrated in the *Builder* eleven years ago (in our issue of July 3, 1886) by a beautifully executed engraving by Mr. J. D. Cooper, the gateway being then temporarily placed in the Indian and Colonial Exhibition held that year. It might have been hoped that such a costly and beautiful piece of work as this, the gift of an Indian Prince and the work of Indian artisans, might have had a permanent and conspicuous place in the South Kensington Museum. Instead of that, it has been ever since stowed away, in pieces and wrapped in cloths, in a lumber-room. What makes matters worse is that, but for a hint given to the Maharajah that South Kensington would be glad of the work, a fine site would have been given to it in Calcutta. At the time when we are inviting strangers from India to the celebration of the Jubilee of the Sovereign one of whose titles is "Empress of India," this is a very charming specimen of the way in which we treat munificent artistic gifts from our Indian tributaries.

THE drawings executed in the Architectural Association Students' Designs School of Design during the session 1896-7, which have been on view for a

few days at 56, Great Marlborough-street, show a highly creditable degree of invention and originality. The subject given to the junior students was "A Westmoreland Hill Church." Most of the students seem to have aimed at producing what ought to be the essential qualities of a country church in a hill district—simplicity of design and solidity of construction, with rather low and wide proportions. The prevalent defect in the general character of the designs is, perhaps, that, in aiming at simplicity, ecclesiastical character has been rather lost sight of, and some of the designs have consequently a rather too utilitarian character. The gable end of Mr. G. S. Nicol's design, with its stepped coping executed in large flat thin stones, suggests very well the kind of work which can be carried out with local materials. The weathervane to this is a good design, and generally speaking, the metal details in several of the designs show a good deal of fancy and originality, as in the hinges in Mr. Hawes's design, with birds *en silhouette* as if seated on them; Mr. Green's design for a hanging lamp, in a flat circle of gilt metal with decorative foliage inside it, also kept flat; the scraper is also well treated. Mr. Brierley adopts a slip vane with lateen sails, the hull treated with double sides of metal so as to give a modelled representation of a hull, but this we think out of place in a vane, which, for its practical purpose, should be kept as flat as possible. What is the point of the "emu's egg" hung beneath the lamp in the same set of drawings; is it decorative or "symbolical?" The general character of a hill church is perhaps best given in Mr. Reckitt's sketch, with its wide-spreading low-pitched roof and short buttressed tower. As the work of young students there is enough in these designs to show a great deal of promise for the future. The few drawings by the Advanced Class of Design, hung in the passage, were, we presume, a selection only; they are, as might be expected, less fanciful and more practical in character; the only remarkably original suggestion is that for a country Bank entrance, by Mr. G. C. Carter, with a bas-relief in marble overhanging the doorway in an odd but effective fashion; the remainder of the front is only like an ordinary brick house, and wants the character of a Bank.

THIS great decorative painter has now happily entirely recovered from his illness, and

has been able to send to the Champ de Mars exhibition, during the last few days, his new cartoon for a portion of the decoration which he is commissioned to carry out

at the Panthéon.* The composition, which is divided into three parts, represents the legend of Ste. Geneviève coming to revictual Paris when besieged by Clovis. The compartment on the left shows the long procession of starving people coming out from the besieged city. In the centre Ste. Geneviève stands in a boat leading a flotilla laden with food. In the third, or right-hand portion of the picture, men are shown disembarking the cargo from the ships. It is hoped that this fine work will be exhibited in its completed form next year. The study of it makes one again regret the unfortunate division of the decoration of the Panthéon among different artists of different schools. The whole work ought to have been put in the hands of M. Puvis de Chavannes.

ARCHITECTURE AT THE ROYAL ACADEMY.—IV.

DECORATIVE work is not very largely represented in the architectural room this year. We find under this head, however, two important pieces of design for church furniture or fitting. One of these is Mr. Carøe's design for a bishop's throne (1,750), a pencil drawing, lightly tinted, and very delicately though not laboriously finished, showing a wooden structure in the orthodox canopy form of a bishop's tomb, gothic in general outline and feeling, but with a certain amount of eclectic freedom in the details: the general effect is very satisfactory, rich in detail and sufficiently constructive. The other design of the same class is Mr. Pearson's rood screen for Bristol cathedral (1,924), a rather heavily worked pencil elevation showing an erection with three large ogee arches with heavy cusping, with canopied figures and open tracery panels above; the dwarf wall on which the woodwork rests is treated with geometrical tracery, and the same kind of geometric tracery repeated in the wrought iron gates. General effect—dignified and solid but not very interesting. Some less important works of the same class show more character, notably Mr. Eden's rood screen for Bilsland Church Cornwall (1,808), the lower part in light tracery compartments, the upper portion panelled solid and forming a background for two coloured figures in relief looking up towards the central cross, and two figures of cherubim, one at each side. There is such a curiously old-world look about this little bit of work that we inquired whether it was actually new work or a representation of an old reredos; but it is new and not yet finished, and is creditable to the fancy and feeling of its designer. Mr. Lacy is also original, but not in a way we like so much, in his design for proposed screens and decoration for All Saints, Cambridge Circus (1,774), which shows a plain thinly built wooden arcade, apparently painted on with foliage or some other light decorative device in colour on the white ground; this, as well as the framing of the centre gates, looks bright and piquant but certainly rather gay and secular. Mr. Rose's "New Altar St. Mary's Chaddesden" (1,819) is a sketch of an interior in which we see more of the chancel screen than the altar; the screen is effectively treated in a quiet way, with tracery at the top of the panels, so treated and truncated as to give the effect of a straight carved band along the top; the cross-barred iron grating in the openings between the mullions of the screen has rather an odd effect in combination with the woodwork. In the drawing of the new stalls, organ-case, and screen for Kington Church (1,800), Mr. John Belcher shews a small organ case very like a Renaissance one, and which has at all events the merit of exhibiting that simplicity of idea and free flow of line which characterises many of the old English organ cases of the period from which this is imitated. Mr. Joass exhibits a reredos in gesso and colour (1,915), the lower portion in large picture panels with decorative borders between them; the upper line of the whole is treated in bold reversed

* This fact again illustrates the difference between the reasonable and courteous treatment of artists by French exhibition juries, compared with the red-tape system of snubbing prevalent at the Royal Academy. Imagine any artist presuming to ask the Academy to let him send in a work when the Show was half over, because he had been too unwell to finish it before!

curves, enclosing figure subjects on a gilt ground; the general effect is very good and somewhat new.

Among secular designs of decorative work there is Mr. Shaw's sketch for bronze gates (1,779), a powerful "blend" of figures and scroll work producing a rich and very well filled up design, which would have a dignified effect in execution; the only thing we do not quite like is the cresting, which looks a little too accidental in character, and is thus out of keeping with the very symmetrical design of the rest. Mr. Pawley's design for wrought iron gates for Dacre Court (1,790) has the defect of not exactly showing which are the gates—the opening portion, whether it is between the pilasters (as they may be called) or whether these are part of the gate. A gate and grille should show the distinction between the actual swinging gate and the standing portion of the metal work. The broad band of scroll-work over the top has a good effect, suggesting a kind of entablature to the pilaster forms. Mr. Dymoke Wilkinson shows "a suggested drawing-room fireplace in coloured gesso-duro, stained alabaster, and gilded bronze" (1,867), but all this colour is only described in the margin, not shown on the drawing. We do not like the double curve of the top of the fireplace opening; it is weak and unstructural. Mr. Christopher Carter's design for a font in cast and decorated lead (1,872), which we accidentally passed over among the ecclesiastical work, is a really original and clever piece of design, though we cannot think the material a very happy one to use for a font. There is a fancy for lead-work, however, now, and it is natural that we should find attempts made to apply it where it has not been applied before. Messrs. Waring exhibit a very good free sketch in pencil of a Dining Room in Dutch Renaissance manner (1,926), the general effect is just roughed out, and no detail finished; its chief interest is as a capital piece of pencil work. Mr. L. Turner exhibits a design for a carved wood panel (1,910), that is, a pencil drawing for a piece of naturalistic wood carving in high relief; a rather odd exhibit; it would seem so much better to have exhibited the carving itself. Mr. Beresford Pite's three doorways of street houses adorned with sculpture (1,826-7-8) may be considered as coming under the head of decorative work; they have all been illustrated in our pages from photographs, but the architect's own freely-handled water-colour drawing gives them a new interest, and we are glad to see them grouped together, as a suggestion of what might be done with our street entrances by the union of architectural detail and sculpture.

Of stained-glass design there is not very much, and hardly anything that calls for special remark; Mr. W. Aikman's two designs for single-light windows, "The Birds of the Bible" (1,909) and the "Tree of Life" (1,911) have the appearance of original designs, but cannot be well seen, as they are small drawings and hung rather high. There is some originality of treatment too, in Mr. Fisher's east window for Thornghumbald Church (1,877), the glass above and below the figure subject being treated in plain leaded squares with decorative emblems in them; the whole looking perhaps rather more like a domestic window for the entrance hall of a house than a church window. Mr. E. Ingram Taylor's design for a painted frieze (1,840), a bold piece of conventional foliage work, looks however more like a design for wall paper than painting. Mr. Pinhorn Wood's "Design for a Nursery Frieze" (1,866) may pass as such, there is not perhaps very much "design" in it, but it would look bright and pretty, which is the main point in nursery decoration. Mr. Tennant Potter exhibits a good bit of illuminated work under the title "Mercy" (1,866), a central figure with a minutely diapered gold background, surrounded by a wide border in boldly coloured foliage.

Among drawings of ancient work Mr. H. C. Corlette contributes several careful measured and coloured drawings of the decoration of St. Savin, including a complete coloured section of the church, with its long, cylindrical Romanesque columns, each coloured differently. The details of painted decoration, which are given to a larger scale, are very interesting, and almost Greek in precision and purity of line. Mr. C. A. Nicholson contributes an effective monochrome water-colour drawing of the portal of St. Sauveur, Dinan (1,778). Mr. A. E. Henderson has given well

Sketches of London Street Architecture.—XIV. Nos. 2 and 3, Balfour-Place, W. Messrs. Balfour & Turner, Architects.

the character of the interior decorative work and furniture in Or San Michele, Florence and in the Capella Palatina, Palermo (1,809, 1,815), but his best exhibit is a small and delicate water-colour drawing of a group of columns at the south-west angle of St. Mark's (1,816). This is an exceptional little bit of illustrative work, and is one of the best things in the room. Mr. Brewer sends his pencil drawing of the interior of the western choir at Bamberg Cathedral, which has been illustrated in our lithograph pages; it is in pencil, and seems rather to show that this is not a very good medium to use where an effect of dark shadow is required over a considerable part of the work, as in the centre portion of this drawing, which has a rather loaded effect; the portions in light are very successfully and freely handled. Lastly, Mr. Corlette contributes also a very careful and highly-finished water-colour drawing of the curious painted sculpture of the late medieval period, in Albi Cathedral, figures which have the appearance of large dolls stuck in among the architecture, worth careful record as curiosities, but hardly in any other light.

This concludes our notes of a collection which on the whole can hardly be said to be equal to the average interest of the Academy architectural room.

THE '91 ART CLUB.—This club will hold its Annual Exhibition of Members' Works at Clifford's Gallery, 21, Haymarket, during the latter part of the month.

SKETCHES OF LONDON STREET ARCHITECTURE.—XIV.

NOS. 2 AND 3, BALFOUR-PLACE, W.

THESE houses were erected in 1802. The materials used were red Suffolk bricks with brown Portland stone dressings. The only unusual feature which needs explanation is that there are three floors at the front of the house, taking up the same height as two floors at the back; i.e., the kitchens are 14 ft. 6 in. high and dining-room 14 ft., whereas the heights of the rooms in front are—basement 0 ft. 3 in., hall 9 ft. 9 in., and library 8 ft. 9 in., thus bringing the front and back drawing-rooms on the floor above, on one level.

The area railings are of wrought iron and the balcony railings cast iron.

Messrs. Balfour & Turner are the architects.

CHOLERA HOSPITAL FOR CARDIFF AND BARRY.—The official inspection previous to the taking over of the new cholera hospital on Flat Holm Island by the Cardiff Corporation was made recently by the Health Committee. The hospital buildings consist of a ward pavilion and a laundry block. The pavilion contains two wards, each 36 ft. long, 24 ft. wide, and 14 ft. 6 in. high, providing together accommodation for twelve patients. The buildings are constructed of local stone, quarried on the island. There has also been erected a crematorium for disposing of the bodies of any patients who may die of cholera. The whole of the work has been carried out by Messrs. Cadwallader & Hockridge, of Cardiff, from the designs and specifications of the Borough Engineer, Mr. W. Harpur. The cost of the work was nearly 3,000.

THE LATE MR. GILBERT SCOTT :
BY AN OLD PUPIL.

[FOR three or four weeks back we have been endeavouring to persuade one or other of Mr. Gilbert Scott's former pupils or friends to write out some short but reliable account of the life and work of an architect who, though of remarkable and exceptional ability, was little known in the general architectural world. Generally speaking, we have found the personal friends of a deceased architect or artist very glad to have an opportunity of putting on record what they knew of him. It is an odd exception in this case that, while all those who knew Mr. Scott seem to have had the highest admiration of his powers, each of them seemed unwilling, for some reason, to put any record of him in writing, and desirous to turn over the task to some one else. It is owing, therefore, to the backwardness of Mr. Scott's own friends, and not to any indifference on our part, that we have had to postpone for so long giving any account of his work. The following, from one of his old pupils, at last reached us, just too late for insertion in our last issue] :—

In the late George Gilbert Scott, the architectural profession has lost one who, though little heard of in recent years, was during the later sixties and seventies one of the leading men of what was then known as the New School; and who, though he never sought a wide practice, has left several notable buildings, which entitle him to a high position among those who have taken part in the architectural development of the closing part of the century. Mr. Scott was among those who were first attracted by the beauties of the later English Gothic and Early Renaissance styles, which had been neglected, and to some extent despised, during the rage after everything early and foreign.

One of Mr. Scott's earliest works, the restoration of the Hall and the Combination-room of Peter House, Cambridge, well illustrates his thorough knowledge of, and insight into, the manner and feeling which inspired our old builders, while at the same time possessing a freshness and originality which raise it out of the province of the more or less skilful copyist. The furniture and fittings were in this case fortunately left to the direction of the architect, and form a most pleasing and artistic whole, thoroughly in keeping with its place and purpose.

Mr. Scott carried out other work at Cambridge during the active years of his professional career. The restoration of the Hall at Christ College must be mentioned, together with the enlargement of the chapel at Pembroke, interesting as being the earliest recorded work of Sir Christopher Wren. There is also a new court at St. John's, Oxford, by Mr. Scott; and at Pembroke, Cambridge. Both these latter buildings are, unusually fine specimens of their class.

In domestic architecture Mr. Scott's most important work was Garboldisham Hall, Norfolk, a well-designed building in the later Jacobean style peculiar to the district. One of his most characteristic works of this class was the vicarage house at Milverton, not to mention a number of less important buildings, all showing the same thoughtful and vigorous style.

Mr. Scott's name, however, will be chiefly remembered by his ecclesiastical work. A considerable number of old churches in different parts of the country have been restored by him with the same skilful care; and, at the time when they were mostly done, contrasted strongly, in their conservative spirit, with the too common methods of so-called restoration. The writer well remembers the impression made on him by the first of Mr. Scott's works of this kind which he saw—the church at Nunburnholme, Yorkshire. Instead of the usual sweeping away of everything interesting and the bungled copying of the old work, which, as a rule, made Yorkshire restorations a byword twenty-five years ago, the old church remained strong and serviceable, and with its history unimpaired, and with such new work as it was necessary to introduce designed and executed in thorough harmony with the old.

Of new churches by Mr. Scott, probably the best known is the stately fabric of St. Agnes, Kensington. The church at Milverton is another characteristic example of his work, as is also All Hallows, Southwark. The completion of the transepts and choir of the Cathedral of Saint John's, Newfoundland, was carried out from Mr. Scott's designs, after the death of his father, Sir Gilbert Scott. Mr. Scott's larges

ecclesiastical work is the still unfinished Roman Catholic Church at Norwich. This church Mr. Scott designed in the thirteenth-century style of English Gothic, instead of taking his inspiration from the later works of the fourteenth and fifteenth centuries, as had been his previous general practice. In its present unfinished state, it is hardly possible to judge fairly of the exterior of this fine building, but the interior of the nave is certainly one of the best specimens of modern English architecture.

In 1881 Mr. Scott published his "History of English Church Architecture," a volume of much research and information. He was also the author of several papers chiefly bearing on architectural subjects. He also took an active interest in the improved production of stained glass and of textile fabrics for ecclesiastical and domestic purposes.

Mr. Scott was a distinguished member of the University of Cambridge. He was the successful competitor for the Burney Prize, first in the Moral Science Tripos of his year, and was, in consequence, elected Fellow of Jesus College.

ARCHAEOLOGICAL SOCIETIES.

ARCHAEOLOGICAL INSTITUTE.—At the general meeting, on the 2nd inst., of this Institute, Judge Baylis, V.P., in the chair, Mr. H. W. Seton-Karr exhibited a large series of flint implements from the lost flint-mines of Egypt discovered by him in November last in the Eastern desert, between ten and thirty miles from the Nile, in the Wady el Sheik district. Many of the implements, he said, are new to science. The mines resemble ruined cities, and have a central work-place where most of the objects were found. They consist of flint ornaments, truncheon-shaped implements, clubs, axes, javelin-points, sickles, and variously-shaped knives. He also exhibited flint implements found during the last expedition to East Africa. Mr. Seton-Karr discovered a long, low hill in a plain, which may have been a paleolithic city, judging by the thousands of large weapons he found in a perfect condition. It is situated near Jalelo, about one hundred miles from Berbera. This is the first instance of such a discovery, and the first time prehistoric implements have been found in tropical Africa, and may throw much light on the question of the original home of the human race. A paper by Lord Dillon, President, and Mr. W. H. St. John Hope was read on the contents of an inventory of cloths of arras and other tapestries, beds, vestments, and books for the chapel, silver vessels, &c., books, garments, arms, and armour belonging to Thomas of Woodstock, Duke of Gloucester, K.G., and seized in his Castle of Pleshy, in Essex, December 13, 21 Richard II. (1397), with their values as shown in the accounts of the Escheator for the counties of Essex and Herts. Mr. J. Hilton then read a paper on the Coronation stone at Westminster Abbey giving an outline of the story attached to it, as related by Holinshed in his chronicles circa 1577, and gathered by him out of earlier Scottish legends and records which say that the stone came from Palestine to Egypt, and was carried to Egypt, Ireland, and Iona. The particulars, as related, gained implicit belief in Scotland, involving as they did a prophetic Latin couplet, that the Scottish reign should follow the destination of the stone. The paper then recited the views of modern investigators and critics, showing that the early story is fabulous down to the time when a certain stone found its way to Dunstaffnage Castle, in Argyllshire, where, for a considerable period it was used as the seat of the Scottish kings, who were crowned there. The stone was conveyed for similar use and better preservation to Scone in Perthshire, by King Kenneth, circa 834 A.D., and as it is said the prophetic verses were, by his order, engraved upon it. In the year 1296 Edward I., King of England, removed the stone to Westminster. The inscription is quoted in a chronicle written as early as 1389, or nearly two centuries before the birth of James VI., in whom is claimed the fulfilment of the prophecy, and since his time, and probably much earlier, sovereigns of England have been crowned when seated on it. Geological evidence shows that the stone is of Scottish origin. The paper brought together for the first time all that appears in scattered sources for or against the story, whether of fable, legend, or fact. A very curious light is thrown on the prophetic character of the Latin couplet, by a tract in the British Museum Library, dated 1681, wherein

the words are printed as a chronogram, involving the mundane date of the birth of James VI., the first of the Scottish race to reign over England, a document hitherto unnoticed by the writers on the subject of the Coronation stone. Mr. Hilton put it on record for whatever it may be worth. It certainly is not a prediction written after the event. The paper concluded with remarks on the present condition of the Coronation chair.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—On the 2nd inst. an interesting ceremony took place at the last Council meeting of this Association for the session 1896-97, the occasion being the presentation to Dr. W. de Gray Birch of an address and testimonial from some of the members and friends on his retirement from the post of Honorary Secretary and Editor of the Journal of the Association. The Marquis of Bute, V.P., occupied the chair, and after a few words expressive of his interest in the science of archaeology, and of his long friendship with and appreciation of Dr. Birch, handed him the gift, which consisted of a handsome gold demihunter watch. Dr. Birch suitably replied. It may be interesting to mention that Dr. Birch has worked with the British Archaeological Association for upwards of twenty-two years, being a most indefatigable Honorary Secretary and an untiring Editor of the Journal, which may be said to comprise in the twenty-two volumes which mark his period of service notices of all that has, in a prominent form, transpired in archaeology. At the evening meeting—Mr. Thos. Blashill, hon. treasurer, in the chair—a large collection of rare and beautiful miniatures was exhibited by Mr. B. Nathan, many of which are of historical interest. Amongst the more prominent were a miniature of Lady William Russell, by Englehart; a miniature of Lady Penelope Fitzgerald, by Plomer; a miniature of Marie Louise, Princess of Orange; a box, with enamel of the marriage of Marie Antoinette with the Dauphin, afterwards Louis XVI.; a circular miniature by Grege; a large miniature of Madame Vestris, by Plimer; a Limoges enamel of the Virgin and Child, from the Bohn Collection. In all, there were some thirty-six exhibits. A paper was read by Mr. Patrick, hon. secretary, in the absence of the author, Mr. T. Cann Hughes, entitled "Notes from North Lancashire," in which the ancient charters of Lancaster and the Borough seals were described. The earliest existent document is that of John, Earl of Moreton, dated 1193. The mayor's seal of the Borough is believed to be of the reign of Henry IV. or V., and bears in its centre three towers, each triple turreted, with a lion passant gardant, crowned, and a fleur de lis. The ancient stocks of the town are preserved at the Town Clerk's office, together with a series of ale and spirit measures, said to have been made from guns captured from the Spanish Armada. There are very many ancient door-heads in and about Lancaster, some of them having curious designs of fish and other emblems. The Rev. H. J. Dukinfield Astley, M.A., the newly appointed hon. sec. and editor, was introduced to the meeting and commenced his duties.

ARCHITECTURAL SOCIETIES.

GLASGOW ARCHITECTURAL ASSOCIATION.—The annual business meeting of this Association was held in the rooms, 187, Pitt-street, on the 1st inst., Mr. Wm. Tait Conner, President, in the chair. The Secretary's and Treasurer's reports were read and unanimously approved. The following gentlemen were elected officers-bearers for the ensuing session:—Mr. Jas. A. Morris, Hon. President; Mr. Wm. Tait Conner, Hon. President; Mr. John Fairweather and Mr. George S. Hill, Vice-Presidents; Mr. Charles E. Whitelaw and Mr. James Salmon, Hon. Joint-Secretaries; Mr. Robert J. Walker, Hon. Treasurer; Mr. Hugh Dale, Hon. Librarian; General Committee, Mr. John Arthur, Mr. Walter Tucker, Mr. Alex. Wingate, and Mr. Alex. McGibbon. The travelling studentship prize for 1896-97 was awarded to Mr. Geo. Edward Walker.

RESTORATION OF PRIMITIVE METHODIST CHURCH, WATTON, NORFOLK.—This building has just been reopened after restoration. Mr. A. F. Scott, of Norwich, was the architect for the work, which was carried out by Messrs. Adcock & Sons. Both the church and schoolroom adjoining have been fitted with hot-water apparatus by Messrs. Reeve & Sons, of Norwich.

ONE OF A COLLECTION OF ENGLISH AND FLEMISH PANELS OF THE 15TH AND 16TH CENTURIES.

PANEL FROM A CHEST. FRENCH. END OF THE 14TH CENTURY.

CARVED PANELS FROM SOUTH KENSINGTON MUSEUM.

THESE two panels are respectively good examples of the rather stiff and symmetrical decorative panel carving of fourteenth century Gothic, and of the free style of late Gothic Flemish carving. The long-tongued leaves of the Flemish example show a kind of form frequently found in late Flemish and German work, and which is effective as giving occasion for a great deal of freedom and flow of line in the design. In the main curves of the stems we see almost the beginning of the Renaissance feeling, though this is contradicted by the little incident of the naturalistic butt-end of the scroll.

THE INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A HOME Counties District Meeting of this Association was held on Saturday last week, at Eastbourne.

The members met at the Town Hall, where brakes were taken and the party visited the Flood Prevention Works, the Destructor and the Shone Ejector Station.

The members subsequently returned to the Town Hall to luncheon, which was provided by the Mayor of Eastbourne, after which a meeting, presided over by the President, Mr. F. J. C. May, of Brighton, was held, amongst those present being Messrs. C. H. Cooper, Wimbledon; Fowler, Manchester; Pritchard, Birmingham; J. P. Barber, Islington; T. Walker, Croydon; W. H. Savage, East Ham; Dodd, Wandswoth; Thomas, Buckingham; C. J. Lawson, Southgate; J. P. Norrington, Lambeth; Mason, St. Martin's-in-the-Fields; T. H. Yabbicom, Bristol; W. Weaver, Kensington; Laffan, Twickenham; and others.

A paper by Mr. R. M. Gloyne, the Borough Engineer, and entitled, "Construction of the Most Recent Flood Prevention Works in Eastbourne" was, for want of time, taken as read.

Mr. Gloyne, in the course of his paper, stated that the works had been designed and are being executed for the purpose of obviating, in the future, the periodical flooding to which the town has, in parts, been subject in the past in times of heavy or continuous rainfall. The cause of this flooding was undoubtedly the extremely rapid development of the high, and the flat level of the low-lying portions of the borough. In 1891 two surface-water schemes were adopted, one for the western or high-lying portion, and one for the eastern or low-lying portion of the borough, the combined cost of these being some 15,000*l.*, and in addition a sum of nearly 6,000*l.* for further plant required at the Ejector station. The author commenced his duties at Eastbourne in 1893, and the first experience he had of flooding was some three months afterwards, when Terminus-road was nearly 9 in. deep in water. It had been expected that when the construction of the 1891 schemes was finished, complete immunity from flooding would be obtained, and on being confronted with a repetition of the former evils,

The Council resolved to obtain the highest expert advice. They consequently called in Mr. Henry Law, M.Inst.C.E., of Westminster, and, acting upon his report and advice, they resolved to carry out the scheme he designed, and without any contractor, and under the author's immediate control. The total cost of the works is estimated at \$5,000., of which some 70,000. is now being spent, leaving the balance for a purely surface-water scheme to be carried out afterwards. The work now in hand consists broadly of the abandonment of the two existing 3 ft. diameter brick sewers across the Crumbles, and the substitution of two lines of 4 ft. 6 in. diameter cast-iron pipes with turned and bored joints; an entirely new high-level sewer 4 ft. 6 in. diameter, constructed of 4 ft. 6 in. cast-iron pipes through the water-logged beach, and of concrete and iron pipes of 4 ft. 6 in. internal diameter through the town; and the displacement of a portion of the existing 3 ft. diameter brick high-level sewer by cast-iron pipes 4 ft. 9½ in. diameter with turned and bored joints. The author then deals with the subject under the following heads—(a) Depot arrangements; (b) Outfall at Langney Point; (c) Valve chamber at Langney Point; (d) Three parallel lines of cast-iron pipes of 4 ft. 6 in. diameter laid across the Crumbles in the same trench; (e) Concrete sewer 4 ft. 6 in. diameter; (f) 4 ft. 6 in. and 4 ft. 9½ in. diameter cast-iron pipes laid in Terminus-road; (g) Regulating chamber. The author fixed upon a site for a depot immediately adjoining a beach road leading from the main road to Penveney, to Langney Fort, and adjacent to a single railway line upon which trains of wagons are run to and from ballast holes on the Crumbles.

The outfall proper consists of three parallel lines of 4 ft. 6 in. cast-iron pipes, 12 ft. working length, 1½ in. metal, with turned and bored joints, the sockets being 5½ in. deep, and the band on the spigot ends of nearly corresponding width. These pipes run 260 ft. into the sea, and each line terminates with a horizontal bend to throw the flow of sewage eastward. To place these lines of pipes in position a pier of whole timber piles was constructed seaward. These piles were spaced longitudinally 12 ft. between centres, and transversely 28 ft. 6 in. from centre to centre, each pair being braced across at the top with half-timbers bolted through the main piles by 1½ in. bolts. Each alternate pair of piles was cross-braced with half-timbers similarly secured to the main piles and to one another. The piles were connected longitudinally by whole timber runners with butt joints, these latter being secured by 3 in. wooden fish plates and 1½ in. bolts. The runners were securely dogged to the piles and bolted through the horizontal braces. Upon them were spiked railway metals, upon which the gantry spanning the trench and carrying the pipes to their proper position was worked. This gantry was framed of 12 in. by 12 in. and 12 in. by 6 in. timbers, and upon the top cross-pieces were spiked metals carrying a travelling jenny, upon which were secured two crabs, each capable of lifting 3 tons direct from the drum. Both traveller and gantry were worked by toothed gear from one side, and as the former ran at right angles to the latter, any spot in the trench was commanded. Sheet piling 12 in. by 6 in. was put in between the main piles for 16 bays shoreward, and also across the ends of the pier, and from the space so enclosed the sand, &c., where necessary, was excavated to its proper level, and concrete in bags substituted by a diver. Upon the concrete so placed the pipes were laid, being carried out by the gantry. The seaward end of the outfall for a distance of about 150 ft. inland is incased in concrete 2 ft. thick at the top, and practically forms a low concrete groyne, through which run 3 parallel pipes, 4 ft. by 6 in. diameter. For 215 ft. from the sea end the inclination is 1 in 40, and then to cross under the existing high-level sewer, the remainder is dead level, the difficulty of working in turned and bored joints to two different gradients being surmounted by using a make-up length of concrete. The high-level brick sewer was some distance above the new outfall, and being in rather a dilapidated condition, great care was necessary to prevent its bursting and flooding the trench. The shingle surrounding it was excavated across the trench in sections, and each end so exposed was close lagged all round the outside of the brickwork, the laggings being encircled by wrought-iron bands secured by bolts and nuts, and tightly

wedged up. As each section was finished so far, it was slung up to 16 in. square baulks stretching across the trench, the chains being wedged up as lightly as possible. On completion of the pipe line underneath, a stiff timber was laid across on the pipes, and another placed immediately over it underneath the brick sewer, and secured in position by puncheons. The low-level sewer had to be cut into to allow the new work to be put in. Each line of pipes had to be treated separately, and the old brickwork made good before the next was touched.

The valve chamber is of concrete, 20 ft. internal diameter at the bottom, and 28 ft. at the top. The circular walls are 3 ft. thick, although where the pipes had to pierce them they were originally constructed 18 in. thick, the difference being made up after the pipes had been fixed. This structure was built up on the beach on a cast-iron curb, 35 ft. diameter outside, composed of twenty-four segments accurately fitting together, and afterwards sunk into position by excavating from inside. The author believes this is the first instance of a concrete cylinder being so treated. The cast-iron curb was first set level on polling boards in the beach, and bolted up in segments, the outside and inside soldiers were then erected and bolted together at the top in pairs, and also connected round the circumference of the chamber. Shutters, 3 ft. deep, of 2-in. stuff nailed to ledges cut to the proper radius were worked in between the soldiers, the cavity so made being filled in with 6 to 1 concrete. The shutters were 6 ft. 4 in. long for the outside, and 5 ft. 2 in. for the inside of the work. As each layer of concrete became set, the shutters were moved up, being kept in their new position by upright struts placed underneath. The face of each shutter, when altered, was brushed over with a composition called "concrete composition," which effectually prevented any sticking or adhesion between the timber and the concrete. In each layer of concrete a V-shaped groove was formed on the top surface to act as a key for the succeeding one. In this manner the walls were carried up almost to their full height when a regrettable accident occurred, resulting in the partial collapse of the chamber. The action of spring tides aided by south-west winds undermined the curb on which the structure was built, the result being that two sections broke, and portions of the concrete walls came down, leaving other portions standing, although very badly cracked, and others quite intact. About one-half the chamber was involved. The cracked portions of concrete were thrown down, and together with those already on the ground, were placed in a position to act as a breakwater. Fortunately, there was nothing straight about the broken faces of the perfect portion, and by taking advantage of this, jumping holes in the yard-wide faces, letting in curved iron bands, careful washing, ramming the new concrete into every nook and cranny, and grouting each layer thoroughly in at the joints, a most successful mend was made. When the reconstruction had been effected and the new work carried up to its height, the chamber much resembled a Martello tower without its roof. Three weeks were allowed to elapse before a commencement was made with lowering by internal excavation, of which the first thing to be done was to remove the boards upon which the curb rested. These were taken out bay by bay on opposite sides of the chamber, so that when all had been removed, the whole weight of the walls rested on the cutting edge of the curb. Square timbers were thrown across the top, and partially cemented in to secure them. From each of these depended two stages hung to iron rods hooked over the timbers, and these, together with another on tremles on the beach, gave sufficient lift to throw the material out. By continually excavating the shingle from inside and throwing out by the means just described, the chamber gradually settled down to its proper level by its own weight, and as the walls were tapered one foot in the total height to skewback level no difficulty was experienced as regards earth binding. When the structure had been sunk low enough, the bottom had to be put in. The level of this is 18½ ft. below H.W.O.S.T., and precautions had, of course, to be taken to prevent the sea damaging the newly laid concrete. This work was commenced by excavating the shingle under the cast-iron curb to its full depth below the 18-in. horizontal flange, and substituting sugar-bags filled with dry concrete material, bay by bay, working alternately on

opposite sides of the chamber. It is being tidal work, the inflowing water caused the cement and beach to set in the bags, and proper care was taken not to disturb the beach in the bays adjoining the one which had been last dealt with, until the author was satisfied that the concrete material was sufficiently compact and hard. To facilitate the operation of excavating, a No. 9 pulsometer pump, driven by a 20 horse-power portable boiler, was slung inside the chamber, and the suction-pipe carried down below the bottom of the floor. Towards the sump formed to receive this pipe ran drains of stoneware pipes, roughly laid down and not jointed, into which other drains formed with large boulders, &c., delivered the water from all round the circumference of the chamber. When the curb had been packed and underpinned with concrete all round, the floor, 2 ft. thick, was put in in sections and in two layers. The necessary withdrawal of the pump rendered it requisite to deal last with this particular portion, and sufficient time was allowed to elapse beforehand to preclude the possibility of the tide blowing up the floor when its free ingress through the sump hole was stopped. In anticipation of this closing, an iron cylinder with circular flange at the top was cast, of sufficient diameter to contain the suction pipe as well as a thickness of concrete, and placed in position. A cover plate, with bolts, nuts, &c., was also provided, to slip on to the flange of the cylinder and bolt down to it, and one long tide, the pump and suction were withdrawn, the sump plugged with concrete, the cover plate bolted down and weighted with 12 in. of concrete put into the proper floor level, this concrete being itself burdened with railway metal and other material, to keep it in its place. Complete success resulted from these endeavours, and no blowing or unsoundness has been observed in any part of the floor. Some weeks afterwards the dome was put on. The ribs for this were carried on a single upright in the middle of the chamber, and on soldiers placed at intervals round the interior and strutted from the central pillar. The necessary laggings having been cut and shaped, were nailed on forming a complete centre for the concrete. This is 2 ft. thick at the crown, and 3 ft. at the skewback. Access to the interior of the chamber is obtained through a manhole at the top, to the frame of which is affixed an iron ladder stayed to the walls inside by wrought-iron rods.

The trench for 4 ft. 6 in. cast-iron pipes was commenced right away from the chamber for a certain depth, and then a dumpling left beyond which the excavation proceeded to its full depth. The author then described the timbering, and the objects of the three lines of pipes.

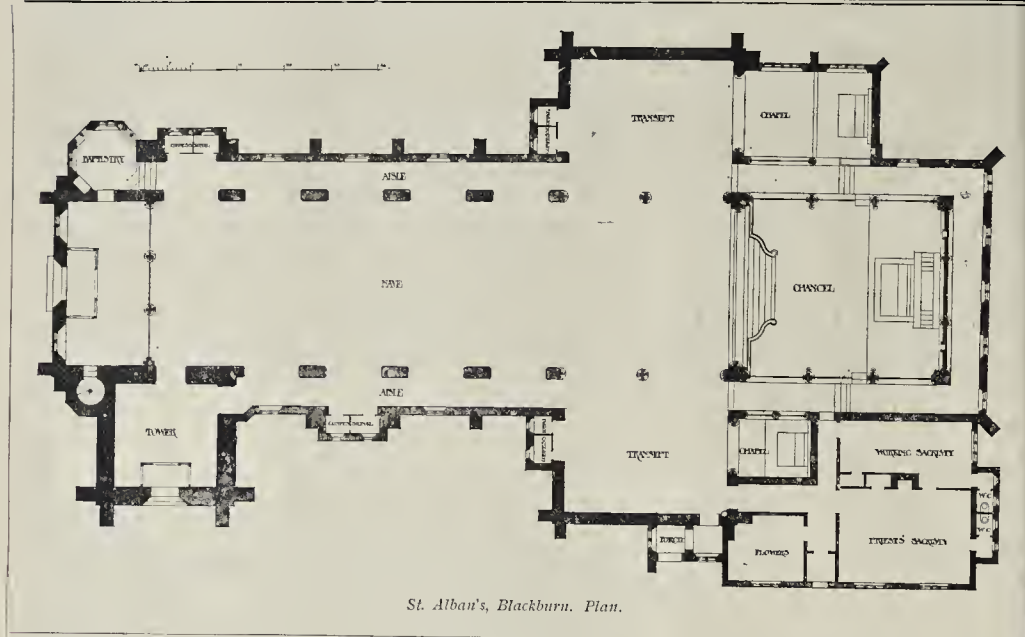

The concrete sewer was commenced near its future junction with the pipes, enough space being left for a making-up piece, and was speedily carried through Latimer-road as far as St. Aubyn's road. The ground was all of beach, rendering close timbering with runners necessary, but some compensation was obtained in that the excavated material was for a considerable length suitable for concrete work. The author then detailed the method of construction. The whole of the concrete was mixed in the proportions of 4½ of beach and 1½ of sand to 1 of cement. The manholes were formed in concrete, and are 4 ft. 6 in. diameter, with walls 12 in. thick. A wrought-iron ladder is fixed in each one, and for covering-in, 7-in. York landings are used with manhole frame and cover.

The cast-iron sewer, Terminus-road, and regulating apparatus, consists of cast-iron pipes, similar in all respects to those being laid in across the Crumbles, except that one portion is larger in diameter to the extent of 33 in. The method of working was also similar to that now in use on the Crumbles.

The President then invited discussion upon the paper.

Mr. Walker, in proposing a vote of thanks to Mr. Gloyne, said he was in favour of clay ballast for making concrete. Some care was necessary in making the concrete, but he had obtained some excellent results with clay ballast.

Mr. Pritchard, past President, seconded the vote of thanks, and said, in reference to administrative work as against work carried out by contractors, if administrative work could be carried out by the London County Council, or any other public body, as well as the work they

St. Alban's, Blackburn. Plan.

were considering, there would be no occasion for fault-finding.

Mr. Fowler, past President, asked what the height was of the pipes above ordnance datum. In regard to Shone's system, it gave him pleasure to see that day the work which Mr. Shone had carried out. The system was adopted more now than it used to be, but even now it was not known all that Shone's ejector could do. He was adopting the system in several places.

Mr. Barber referred to the construction of the valve chamber, and said that too often irresponsible critics were able to interfere in the work of competent men. He was much struck with the timbering of the trench, which was an excellent piece of work.

Mr. Mason asked why a grab was not used in the excavation, and whether it was possible to know how the cost of the work would compare with contractors' work.

Mr. Lañan asked why there were three separate sewers instead of one equal to the capacity of the three?

The President then put the vote of thanks, which was cordially agreed to.

Mr. Gloyne, in reply, said that he did not intend to touch upon the vexed question of contractors' work *versus* that carried out by administration, though he might say that when the work at Eastbourne was completed, the cost would probably be on the right side. A grab had been tried, but it did not answer because of the large boulders met with during the excavation. As to why three separate sewers were used instead of one, two of the sewers were to replace existing high- and low-level brick sewers, and the other was a prolongation of the new concrete sewer which had been carried out through the town. At Manchester he had had much experience with ballast as concrete, and at Davyhulme, in the tanks where it was used, it had answered admirably.

On the motion of Mr. Mann, seconded by Mr. Fowler, a vote of thanks was accorded to the Mayor and Corporation of Eastbourne for the facilities given to the members during the visit.

The members then proceeded to the seawall works now in course of construction at Splash Point, where they were received by Mr. T. Wilkinson, the contractor for the works.

BAPTIST CHURCH, HEATON.—A new Baptist church has been erected in the Heaton-road, from plans prepared by Alderman W. H. Dunn, of Gateshead. The contract was let to Mr. W. A. Laws, of Heaton. The new church, which is built in red brick with stone facings and mouldings, will seat 750 persons, and will cost 3,451.

Illustrations.

DESIGN FOR THE NEW BELFAST MUNICIPAL BUILDINGS.

THE illustrations show the perspective view, elevations, plan and section of the design by Messrs. Thomas & Son, of London, which has just been selected in the competition for new municipal buildings for Belfast.

The building will abut (at the south) on the road forming the south side of Donegal-square, and the business entrance to the building will be through the drive from that road.

The principal front faces the principal street of Belfast, which runs northward from the centre of the road forming the north side of the square. The principal feature of this façade is designed within the limit of view obtained from any point in the principal street, which extends for a considerable distance from the square.

The site is at present a public garden, and as far as possible this is to be retained. The building permits the retention of most of the trees on the site.

By the adoption of a drive from the back the point of approach to the building is centralised under the dome, whether approached from the front or the back.

The "Rates" and "Gas" departments are directly accessible from the street, without traversing the rest of the building.

The general arrangement of the principal rooms is the outcome of a desire that they should form a suite of reception rooms for municipal functions, and at the same time permit the great hall and refreshment room being shut off and let for public purposes.

In carrying out the building we may suggest one small alteration which may be made with advantage; the wall of the corridor where the ladies' and gentlemen's retiring-rooms are shown, on each side of the octagonal entrance hall, should be set back so as to leave a small vestibule in front of these rooms. To open lavatories with only a single door straight out of the corridor, in the way proposed in the plan as shown here, is rather an uncivilised kind of planning.

ST. ALBAN'S, BLACKBURN.

We give the interior and exterior perspective views and a plan of this church, which is being erected at Blackburn from the design of Mr. E. Goldie, and is to seat 1,000 persons. It is to be built of local stone, and roofed with Westmoreland slates.

The church, as will be seen, is planned on

the modern system of reducing the side aisles only to narrow passages for access, and the plain and massive manner in which the arcade is treated renders it architecturally a kind of basement on which the more decorative portion of the composition rests. The effect is good though the piers are rather large as a matter of convenience in arranging and getting at the seats.

The flooring under the seats is to be wood block, the aisles tiled, and the chancel and side chapels laid with mosaic. The roof internally is a plain barrel vault of wood divided into bays by stone arches; the chancel and side aisles are to have wood groining.

It is proposed to spend 20,000*l.* on the church and sacristies, exclusive of tower and fittings. The lighting is to be by electric light. It is proposed at some future time to make a special feature of the high altar and reredos, which will practically fill up the whole of the east end; the high altar being made more prominent by being raised some 4 ft. 6 in. above the nave floor level.

The church will stand in a prominent position, being free of buildings on all sides, and having a large open space in front.

The interior perspective is at present exhibited at the Royal Academy.

MAGAZINES AND REVIEWS.*

THE bulk of the June number of the *Art Journal* is occupied with an illustrated review of the Royal Academy Exhibition, by Mr. A. C. R. Carter; a well-written and judicious piece of criticism. There is also an article on the New Gallery Exhibition, and a continuation of the series of articles on "The Royal Academy in the Present Century," dealing this month with the works of James Ward and Henry Bone, the latter a name little remembered now; he was a painter on porcelain and enamel. The principal plates are illustrations of Mr. Gregory's "Boulter's Lock" and Mr. Waterhouse's "Hylas and the Nymphs," from the Royal Academy Exhibition.

The *Magazine of Art* has also its article on the Royal Academy. The writer considers there are five works supreme in the present exhibition, Mr. Abbey's scene from Hamlet being one of them—a ruling in which we cannot concur. The most interesting article is a

* The object of these notes is to point out anything in the contents of the current magazines which is of special interest to our readers, with occasional brief criticisms on the views expressed in such articles. When a magazine which has been sent to us is not noticed, it is because that number contains nothing that it is within our province to comment upon.

PLAN AND SECTION.

survey of the work of Mr. Reynolds-Stephens' collection of illustrations showing that he is an unusually all-round artist, succeeding as well in decorative work as in painting. His charming design for a silver bonbonnière, in the sculpture-room, we have already noticed.

In the *Architectural Record* Professor Good-year continues his series of articles in which he is endeavouring to prove that all the faulty setting out in various Renaissance buildings is due to intention and a system. The argument appears to us to get more preposterous as it goes on. Mr. Barr Ferree contributes Part X. of his valuable series on "French Cathedrals." Mr. J. Beverley Robinson contributes an article on "Modern Vault Construction," meaning thereby the construction of vaulted strong-rooms. The works of Messrs. Cady, Berg & See, the well-known firm of American architects, are the subject of an article by Mr. Montgomery Schuyler. The most original work of theirs illustrated is the Jarvis Hall of Science, with its round towers at the angles; a building aptly expressing in its severe style of treatment the practical purpose for which it was erected.

The *National Review* includes an article by Mr. H. H. Statham on "London as a Jubilee City," a review of the architectural merits and defects of London, and its want of the qualities of space and stateliness which should distinguish a capital city. Mr. D. S. MacColl contributes a short article on the Royal Academy, not dealing with individual pictures, but with the spirit and management of the Academy generally, and in a very severe tone, though we do not know that there is anything said that is not true enough. We cordially concur in the strong comment on the attitude of the Academy towards the late Alfred Hunt. The writer suggests that some of the injustices and very extraordinary refusals of work by men of real talent which occur perhaps every year, are the result not of jealousy or ill-feeling but of "sheer over-worked incapability of dealing with the mass of claimants." This is a charitable view which is perhaps more true than would be generally suspected.

The *Century* devotes an article to an important sculpture memorial which we were not acquainted with, a military memorial to Colonel Shaw, who was killed in the American War. The composition is a remarkable one, a bas-relief showing the officer on horseback among his troops, as if walking past the archway formed by the frame of the sculpture. The rest of the article is occupied by some account of the works of the sculptor, Mr. St. Gaudens, who appears to be an artist of no ordinary gifts and versatility. Readers will remember his portrait bas-relief of Stevenson the novelist, exhibited in London a year or two ago. Some of his designs for monumental and architectural sculptured figures are strikingly original. The same number contains an article on "A great modern observatory," that at Harvard.

Under the heading the "Field of Art" *Scribner* gives some pithy remarks on the influence of tradition in architecture, winding up with the conclusion, in which we entirely concur, that "since the beginning of the world no man has ever designed a good building independently of tradition." The same number contains a description and a good many illustrations of the new Library of Congress, of which we may have more to say.

The *Fortnightly* contains an article by Mr. H. H. Statham on "The Paris Salons."

Knowledge contains an article by Mr. R. G. Blaine, M.Inst.C.E., on Progress in Mechanical Science during the Queen's reign. Professor Lobley's series of articles on "The Age of Mountains," with sections of strata, is continued.

The *Cornhill* contains an article on "St. Paul's," chiefly on the monuments. The writer's artistic and architectural perceptions may be judged of from the fact that he waxes eloquent over "the superb recesses which seem really to have transformed the character of the whole interior of the building." It has indeed! That kind of remark is a typical example of the perception of the general English public on matters of this kind.

The *English Illustrated* contains an article on the Ben Nevis Observatory and the work done there.

The *Pall Mall Magazine* contains an illustrated article on Lyme Hall, the celebrated

Shop Door, Bristol.

house of "The Leghs of Lyne," in Cheshire; and one on "Hyde Park in Days gone by," with reproductions of some old engravings of the place and its former habitues.

SHOP DOOR, BRISTOL.

This is an illustration of a decoratively treated door in a new shop front in Bristol (at the bend in the street below College Green), of which Mr. Milverton Drake is the architect.

The plinth and base to the pedestals are in Labrador granite; the pedestals and lower portion of the piers are granite, with bronze bands dividing the granite from the upper portion in red Mansfield stone. The fascia plates are of solid bronze with aluminium letters.

Correspondence.

To the Editor of THE BUILDER.

R.I.B.A. ELECTIONS.

SIR,—Kindly allow me to remind members of the R.I.B.A. that the adjourned discussion on the election of Fellows follows the ordinary business on Monday next, and that it is most desirable that all those taking exception to any of the proposals should attend.

H. V. LANCHESTER,
Hon. Sec. Associates' Committee.

WATER-CLOSET PLUMBING.

SIR,—In my previous letter I omitted to mention that in quite numerous cases the air cock of a valve closet is so badly adjusted that the water of the basin never reaches the overflow. In these cases the overflow is either trapped with "slops" or not trapped at all.

NORMAN WRIGHT.

The Student's Column.

SPECIFICATIONS.—XXIV.

ALTERATIONS.

IN specifying work that has to be done to carry out alterations, it is a great mistake to attempt to divide the work strictly into the several trades as is ordinarily done in specifying for new work. It is far better to specify the whole work connected with any particular piece of alteration, dealing with the work in all trades.

As it frequently happens in carrying out alterations that part of the premises only can be given up to the builder at one time, it is important to express clearly to what extent and at what times the builder will be allowed to have access to the different parts of the premises. There will, therefore, generally have to be some special clause defining the *modus operandi*, thus:—

Contractors are to commence with the additions to the existing buildings shown on the plans. These are to be completely finished, and possession of the same given up by the day of

The existing building consists of three distinct blocks, the work in each of which is to be carried out and completed before the contractors can be allowed to enter upon the others. Commencing with the building nearest the street the blocks are designated as follows:—Front block, central block, and rear block. The contractors will be allowed to commence work in the front block one week after giving up possession of the new additions. The works in the front block are then to be entirely completed, and possession of the same given up by the day of

In a similar manner the contractors will be allowed to enter upon the central block one week after possession has been given up of the front block. The works

of the central block are to be completed by the day of , and the contractor will be allowed to enter upon the rear block one week after possession has been given up of the central block.

The contractors are to provide, fix, and remove temporary efficient screens of canvas and paper to shut off parts of the buildings in which they are working from those in the occupation of the employer.

The names of rooms, &c., shown on plans are their new designation.

State whether the contractors are to be allowed to make use of water and gas, but stipulate that they are to pay for same, and arrange how the amount of payment is to be fixed. Specify if any temporary corridors or staircases or passage-ways are necessary, how these are to be arranged, and in what way they are to be formed. Also that the contractors are to remove same and make good any damage that may be caused.

The general description of quality of materials and workmanship should precede the detailed specification of the various works that are to be carried out in the various parts—of some typical items of which examples will now be given.

Front Block.

Basement.—Carefully take out and remove the present window of the heading chamber together with the arch and sill, and brick up opening with 18-in. brickwork in cement, properly bonded to old work for which toothings are to be drawn, and pin up over same to old work. Fill up area outside old window opening with hard dry brick rubbish, finished with 6-in. bed of Portland cement concrete floated in cement to receive new tile floor above. Cut out opening for new window where shown on plan, &c. (Describe all the works connected with this new window opening in all trades).

Ground Floor.—Form opening in cross wall of new entrance hall 7 ft. by 9 ft. extreme. Make good jambs in brickwork in cement, and turn relieving arch over in three half brick rings in cement, angles roughly chamfered to receive new plaster moulded arch. Make good flooring through opening to match existing floor.

Form jambs of new opening in two-coat work in Keene's cement finished with rounded angles, and run in Keene's cement moulded arch 18 in. girth to detail. Make good plastering of existing walls to the new opening, and provide and the short piece of skirting to each jamb to match, and properly mitred to the old skirting of rooms.

Remove the present staircase and make good the plastering and flooring. Cut away wall on each side of existing opening to form new opening 10 ft. wide and 9 ft. high; make good jambs in brickwork in cement. Insert a Bressummer formed of No. 3 9 in. by 3 in. deals bolted together with $\frac{3}{4}$ in. bolts to carry wall over, and resting on 3 in. tooled York template at each end. Fill in the opening thus formed with 2 in. framed, panelled, and moulded partitions, the upper part open and prepared for glass with mitred shifting beads fitted with brass caps and screws, and glazed with British polished plate glass about $\frac{1}{4}$ in. thick, bedded in flannel. Form door in same to match partition, hung with a pair of 4 in. wrought-iron butts, and fitted with 6 in. mortice locks, p.c. 7s. 6d., with brass furniture both sides. Make good all work disturbed around new opening.

Take down and remove the existing wall separating from Shore up upper portion of wall, and insert rolled steel girder, weight lbs. per foot run, to be obtained from Messrs. , cost of which is included in the p.c. amount provided for iron work. Build in to receive ends of girder 3-in. tooled York templates, 14 in. by 9 in. Fix under middle of this girder cast-iron column, 6 in. diameter, ft. long, weighing lbs., which will also be supplied by Messrs. , and the price of which is also included in the provisional amount already referred to. Excavate for and form good and firm foundation for this column of 18-in. bed of Portland cement concrete, 3 ft. 6 in. by 3 ft. 6 in., as shown on plan, the bottom of same being 3 ft. below level of floor, and build on same 14-in. pier in blue Staffordshire bricks in cement, covered with 4-in. tooled York stone base to receive iron column, which is to be bedded on a sheet of 7-lb. lead. (Continue description of works connected with this alteration by describing the treatment to be adopted in casing or otherwise of the steel girder and column.)

Cellar.—In the formation of new cellar shown on plan the existing external wall of scullery is to be underpinned in the following manner. The whole of the footings and concrete under existing wall are to be removed, and the new wall of cellar is to be carried up as shown on section in 18 in. work in cement tightly pinned up to lowest course of existing wall with slates, tiles, or hard stone in cement. The concrete under the new wall is to be composed of five parts of ballast to two parts of sand, and one part cement by measure. This work is to be carried out in one yard lengths, alternate lengths throughout the length of wall to be first of all built, completed, and pinned up, and then followed by the remaining lengths which are to be tooled and bonded to those first built up. All brickwork in underpinning is to have buttered joints and to be fully flushed up at each course. (If there is damp ground on other side of the wall which is going to be underpinned it will, of course, be necessary to specify the precise method of guarding against this difficulty.)

Raising Roof of Shed.—Remove the roof of shed between scullery and boundary wall, take off coping and top course of wall, and raise same a height of 3 ft. 6 in., as shown on drawings, in brickwork in cement, and form zinc flat over shed, with $\frac{1}{2}$ in. by 2 in. rafters on 4 in. by 3 in. plates, and covered with inch rough boarding, with edges shot for zinc, and cover same with No. 15 gauge Vieille Montagne zinc, with 2 1/2 in. drips and 2 1/2 in. rolls where shown on plan. Put to this roof inch wrought and beaded fascia, and 4 in. ogee moulded cast-iron eaves gutter, and 3 in. rain-water pipe discharging into slipper shown on plan.

Removal of Sink and Drain.—Remove sink in present scullery, take out and remove the whole of the drain from same for its entire length under the existing building, sprinkle bottom and sides of trench of same with fresh burnt lime at the rate of one bushel to the yard. Ram bottom of trench and fill in with lime concrete up to, and make good, present cement floor of scullery. Search for junction of drain from this sink with main drain in yard, and cut off and disconnect the old drain from scullery sink. Clean out with brush the length of drain, disconnect and afterwards sweep through same a bushel of fresh lime and hermetically seal ends of this old drain with slates and cement. The water supplies to this scullery sink are to be diverted to supply new sink described among general works under "Plumber."

First Floor Water-closet.—Take down and remove the present pan closet together with seat and other fittings, disconnect and remove supply pipe to same and waste preventer of cistern. The connexion with main cistern to serve for supply to new water-closet, but with this exception the whole of the plumbing connected with the present water-closet is to be taken down and removed. Take out and remove present soil pipe and casing, also the drain for same running under present library, the trench of which is to be treated in a similar manner to that described for scullery sink. Take down and remove present dwarf partitions between water-closet and bath-room; take up the floor of present water-closet and relay with new 1 1/2 in. yellow deal tongued flooring. Make good plastering, skirting, and any other works disturbed. (Then proceed to specify the work of the new water-closet in the ordinary way.)

Cold Larder.—Excavate site of new cold larder to a depth of 2 ft. below corridor floor, and form trenches for foundations of new walls to the depth shown on drawings. The concrete of these foundations to be as described for new additions. Cut a chase $\frac{1}{2}$ in. wide, and $\frac{1}{2}$ in. deep in old wall, where new walls of cold larder join them. Carry up new wall in good, hard stock bricks, the work generally to match adjoining work. The damp course to be as specified for new additions. The external walls of cold larder to be built where shown as cavity walls of two sections, the outer $\frac{1}{2}$ in. thick, with 2 1/2 in. cavity, and the sections are to be bonded with wrought-iron wall ties, tarred and sanded before being used, and built in 3 ft. apart in every third course. The window opening to have gauged arch in red brick, and red brick on edge sill, set in cement, with double tile course under projecting $\frac{1}{2}$ in. from face of wall. Window opening to have 9 in. by 3 in. lintel, $\frac{1}{2}$ in. by 3 in. rebated, and twice chamfered, casement frame, with 5 in. by 4 in. sunk, weathered, and throated oak sill. The sashes to be 2-in. ovolo

moulded casements, hung to open inwards, with a pair of 3-in. wrought iron butts, and fitted with strong malleable iron cocks-pur casement fastening and strong 18-in. malleable iron casement staybar fastening. Fix outside frame fine perforated zinc, No. 15 gauge, with the top edge turned outwards, about $\frac{1}{2}$ in. from top. Floor of this larder to be formed with 6-in. square red tiles, laid and jointed in cement on bed of 6-in. concrete, and the necessary dry brick rubbish to bring up level of same. Cut and form opening for doorway to larder in 14-in. old wall, build in 3-in. lintel, with rough removing arch over, in two half brick rings in cement. Put solid door frame, $\frac{1}{2}$ in. by 4 in., rebated and twice rounded, with wrought iron dowel pins let into 3-in. tooled York stone, threshold 14 in. wide, back jointed to old and new floor. The door to be 1 1/2 in. 4-panel moulded and square door, hung with a pair of 4-in. wrought iron butts, and fitted with rim lock and brass furniture, p.c.

Form roof over cold larder with 6 in. by 6 in. timbers cut diagonally and laid as shown on section, as support for concrete roof composed of five parts of coke breeze to one part of Portland cement, and finished with Portland cement face neatly floated to current. Provide and fix $\frac{1}{2}$ in. ogee moulded cast iron eaves gutter, with 3 in. rain-water pipes, and connect with rain-water drain. Fit up round larder three tiers of 1 in. rubbed slate shelving, 12 in. wide, as shown on plan, with rounded edge and rounded angle next doorway. The shelving to be carried on No. 12 in. wrought iron brackets plugged to wall. Provide and screw into roof timbers No. 12 1/2 in. screw hooks where directed. (Specify also method in which the walls and ceilings are to be plastered or otherwise treated.)

The description of painting and decorative work can usually be included in the general specification unless they are specially varied.)

OBITUARY.

MR. T. P. MARTIN.—The death of Mr. T. P. Martin, architect and surveyor, of Swansea took place recently at Colerford, where he was on a visit. Mr. Martin was a native of Swansea. When the Corporation several years ago decided to put the control of the roads under a separate department Mr. Martin was elected road superintendent, and on resigning this position about seventeen years ago he commenced practice as an architect and surveyor.

GENERAL BUILDING NEWS.

EXTENSION OF PREMISES, NEWCASTLE. — The premises of Messrs. T. Pumphrey & Sons, of the Cloth Market, Newcastle, have been extended. The whole of the ground floor cafe has been appropriated to the use of smokers, and for the convenience of ladies and non-smokers a room on the first floor has been provided, access to which is gained by means of a staircase leading from the front shop. There is a ladies' cloak room in connexion with the upstairs' apartment, and the windows are filled with stained glass. Electric light is used throughout. Plumbing and heating arrangements have been carried out by Messrs. Henry Walker & Sons, and the decorations are by Mr. G. G. Laidler. The general contract work was carried out by Mr. Jackson, the whole of the alterations having been made from designs by Messrs. Oliver and Leeson, architects.

Y.M.C.A. BUILDINGS, READING. — The new Y.M.C.A. Buildings, in Friar-street, Reading, were opened recently by Sir George Williams. The buildings have been erected from the designs of Mr. F. W. Albury, architect, of Reading. The frontage to Friar-street is 28 ft., but the return frontage to Merchant's-place is 83 ft. The front portion of the building is five stories high, while the back part is of two stories. The whole site is basemented. The building contains a kitchen, bath and dressing rooms, lavatories, and a gymnasium, the latter being about 40 ft. by 24 ft. high, with a gallery all round. On the ground story is a restaurant, an entrance lobby and vestibule, and staircase hall on the level of the gallery of the gymnasium, with a second entrance from Merchant's-place. There is a separate entrance to the gymnasium. On the first floor is a lecture hall, with seating accommodation for about 200. There are also a reading room, and a secretary's office on the first floor. The second story consists of rooms available for classes or games and a parlour. The upper floor is appropriated to the resident caretaker. Mr. Fidler was assisted in the erection of the building by his foreman, Mr. Blackwell, who generally superintended the works. The brickwork was executed by Mr. H. W. Godwin, the granite work of the lower story was supplied by Messrs. Heslop & Wilson, of Aberdeen, the stonework by the Corsham Quarrying Company, the principal staircase by Mr. Alfred Walker, of Leeds, the joinery by Mr. Elliot, of Newbury, the stove

and chimney pieces, baths, and lavatories, by Messrs. Callas, Reading, the heating arrangements by Messrs. Devy & Son, and the painting and ornamental glazing by Mr. Harry Child.

PROPOSED TOWER, ST. JOHN'S CHURCH, CARLISLE.—It is proposed to erect a new tower for St. John's Church, Carlisle, from the designs of Mr. Higginson, architect, as a Diamond Jubilee memorial.

UNITARIAN SUNDAY SCHOOL, GATEacre, LIVERPOOL.—The opening of the new Sunday school in connexion with Gateacre United Reformed Chapel, took place recently. The new building is situated near to the chapel, and is a brick structure, with stone facings, erected from the designs of Messrs. F. and G. Holme, architects, Liverpool, by Mr. G. Dale, of Gateacre. It includes a room capable of holding 200 persons, and two other rooms, with the usual accessories.

METHODIST CONNEXION CHAPEL, HARFIELD, STAFFORDSHIRE.—The contract for the new Methodist chapel at Harfield, which is situated on the Shelton New-road, has been placed in the hands of Mr. Cornes, Hanley. The architect for the work is Mr. Ambrose Wood, of Hanley. The building will consist of a sanctuary and chapel, containing two vestries and a choir gallery. The front will be faced with red brick, and the chapel will seat 200 people.

WESLEYAN CHAPEL, CHELMSFORD.—On the 2nd inst. the memorial stones were laid of new Wesleyan chapel and schools in the High-street, Chelmsford. Mr. J. H. West, of the firm, is the contractor, and the architects are Messrs. Gordon, Lowther, & Gunton, of London. The new buildings, which are being erected on a site adjoining the stone bridge, will comprise a chapel capable of seating 650 adults on the ground floor, with a gallery over the north and west end of the nave. There will also be a children's gallery in each transept capable of holding 100. The west end of the chapel will face the High-street, and at the rear will be the boys' and girls' Sunday Schools.

NEW Y.W.C.A. BUILDINGS, LOWESTOFT.—The new Y.W.C.A. buildings, which have been built in Regent-road, Lowestoft, have just been opened. The architect is Mr. Clarke, of Lowestoft, and the builders, Messrs. Brett & Sons, of Lowestoft.

NORTH OF SCOTLAND BANK HEAD OFFICE.—Alterations are being carried out at the head office of the North of Scotland Bank, Aberdeen. The work is being carried out under the direction of Mr. Marshall Mackenzie, A.R.S.A. The walls of the vestibule are to be lined with polished granite slabs. The polished dado will extend from the floor to a height of about 8 ft., and the jambs and lintels of the two doorways are also to be made of polished granite. Granites of three different shades will be used, namely, from Rubislaw, Kennay, and Corennie quarries. This part of the work has been entrusted to Messrs. J. Macdonald & Co., Limited. Messrs. James Bannoachie & Sons, have undertaken the internal decorative work.

ST. THOMAS'S INFANT SCHOOL, HUDDERSFIELD.—A new infant school in connexion with St. Thomas's Day Schools, Manchester-road, erected by the firm of Messrs. Starkey Bros. (Limited), in Regent-road, is the Canon Snowden, M.A., was opened recently. The school, which occupies a site near the west end of the church, is Early English in style. It will accommodate 125 children. The architect is Mr. T. H. Farrar, of Halifax, and the contractors (all of Huddersfield) are—Messrs. John Graham & Sons, masons; Messrs. Moody Broadbent & Sons, joiners; Messrs. Crossley & Gold, plumbers; Mr. W. P. Lovitt, slater and plasterer; and Mr. S. Kendall, painter.

RE-OPENING OF SKELMORLE U.P. CHURCH.—This church, after alterations and enlargement, has been re-opened. The additions to the church comprise a chancel and a transept, which have been carried out from the designs by Mr. William Leiper, Glasgow. The sitting accommodation has been increased to nearly 600 sittings. The organ has been reconstructed and added to by Messrs. Merrilless & Son, of Glasgow. The contractor for the mason work was Mr. William Steel, builder, Greenock; joiner work, Messrs. Hutchison & Grant, Glasgow; plumber work, Messrs. Archibald Watson & Co., Glasgow; painter work, Messrs. A. & J. Scott, Glasgow and Skelmorlie; plaster work, Mr. Quinton Tannock, Greenock; glazier work, Mr. George Hunter, Glasgow; smith work, Messrs. George Adam & Son, Glasgow; heating, by Messrs. James Boyd & Sons, Paisley; tile and marble work, by Messrs. Keen & Wainrop, Glasgow. Mr. James Mair acted as clerk of works.

CATHOLIC APOSTOLIC CHURCH, BUXTON.—This building, erected in Darwin-avenue from the designs of Mr. W. R. Bryden, of Buxton, has just been opened. It will accommodate about 150 people.

NEW FREE CHURCH, FEARN, ROSS-SHIRE.—A new church for the Free congregation of Fearn was opened recently. There is a nave and two transepts, while galleries extend around the greater portion of the church. Siting accommodation is provided for between 800 and 900 persons, and there is also a hall adjoining which contains seats for Mr. Macdonald, Liverpool.

CONGREGATIONAL CHURCH, PONKEY, RHOS-LLANERCHRUGOG.—A new Welsh Congregational Church was recently opened in Bank-street, Ponkey. The chapel is built of red Ruabon facing bricks and

terra cotta, part of the facade being of Cefn freestone. The size of the chapel is about 48 ft. by 36 ft., and the vestry is 20 ft. by 15 ft. There is also a boiler-room measuring 12 ft. by 10 ft., and the chapel has sitting accommodation for about 230. The cost is about 1,100. The architect is Mr. Gummow, Wrexham, and the builder, Mr. J. Davies, Ruabon.

PROPOSED PUBLIC BUILDINGS, ILFORD.—At the Ilford Urban District Council offices, recently, Col. A. C. Smith, R.E., held a Local Government Board inquiry into the application of the Council to borrow 15,000*l.* for the provision of public buildings, comprising a large hall, offices, and technical institute and library; 2,275*l.* for purposes of street improvements; 740*l.* for purposes of public baths; and 620*l.* for works of sewerage. There were present amongst others, the Clerk to the Council (Mr. J. W. Benton), the Surveyor (Mr. Shaw), the Sanitary Inspector (Mr. King), and Mr. B. Woolard, the Architect for the proposed buildings.

WESLEYAN CHURCH, SMETHWICK.—A new Wesleyan church, which has been erected in Waterloo-road, Smethwick, was opened on the 3rd inst. The church is built upon a site fronting Waterloo and Sycamore-roads, and it is constructed of brickwork, with stone dressings, the interior walls being finished with plain (coloured a neutral tint) and stone, and the roofs covered with red tiles. The main entrance-porch faces Waterloo-road. This gives access to lobbies. A similar and separate entrance situated in the tower, and immediately adjoining, gives access to the gallery by a staircase. The plan of the church consists of nave, with aisles and chancel, in which seats are arranged for the choir. The organ-chamber is placed on one side of the chancel, and the ministers' vestry upon the opposite side; also the choir vestry, with lavatory accommodation. The church is about 90 ft. in length, 45 ft. in width (inclusive of aisles), and 31 ft. high. The floor is laid to a gradient towards the pulpit. The seating accommodation is for about 650 persons. The aisles have been laid with wood blocks, and the floors of the entrance-porch, lobbies, passage at rear of chancel, lavatories, &c. are laid with tessellated tiles. A feature of the exterior is a stone spire springing from a tower situated next the main entrance, and rising to about 80 ft. in height. The interior woodwork is of pitch-pine, and the roof of nave, aisles, and chancel are open-framed. The heating, upon the low-pressure system, is by Messrs. Holden & Son. The wrought-iron fencing and gasfittings have been carried out by Mr. Edwin Glover. The stained glass throughout has been supplied by M. T. H. Hays, of Smethwick. The builders were Messrs. J. Harley & Son, of Smethwick, and the architects were Messrs. Ewen & J. Alfred Harper, of Birmingham. The cost of the structure is about 3,500*l.*

FREE LIBRARY, CAMBRIDGE.—A branch library has been erected near the railway bridge, Mill-road, Cambridge. The building is carried out in red brickwork, red terra-cotta, and red Mansfield stone, with a slate roof. The building consists of one large room 107 ft. long by 24 ft. wide. On the north side there are eight large windows, the top portion being arranged to open, and in addition, there is a lantern, with glazed side and end lights, turning the whole length of the building. The whole of the building is heated by hot water on the low pressure system. The floor, except over the basement, consists of wood blocks. A lobby has been arranged with eight doors, giving separate entrance to the reading room and lending library, and is paved with oak wood blocks. Over the entrance there is a gable. On each side of the gable a lion in red Mansfield stone, supporting a shield with the Borough arms thereon, is fixed. The architect was Mr. F. Waters, and the builders were Messrs. Coulson & Loftis.

SANITARY AND ENGINEERING NEWS.

LOUGHBOROUGH SEWAGE WORKS, &c.—The members of the Birmingham branch of the Institution of Civil Engineers visited the works at Loughborough for the disposal of the sewage and refuse of the town, recently carried out by Mr. A. W. Cross, C.E., the late Borough Surveyor. The party was met and conducted over the works by Mr. A. H. Walker, C.E., the Borough Surveyor, and Mr. A. S. Butterworth, C.E., of Coventry, the late resident engineer. The afternoon was occupied by a drive to the Swithland reservoir and waterworks of the Leicester Corporation, where luncheon was provided by Mr. B. Eversard, C.E., the engineer for the works. Having spent some time there, the drive was continued by the Hall Gates Storage Reservoir to the Cropstone Waterworks, after inspecting which, under the guidance of Mr. F. Griffith, C.E., the party proceeded to Leicester.

WEDNESFIELD SEWERAGE SCHEME.—Col. Coke, Inspector to the Local Government Board, held an inquiry at Wednesfield recently respecting an application of the District Council to borrow 7,500*l.* for sewerage works. Mr. J. W. Stirk, Clerk to the Council, and Mr. Berrington, engineer for the works, appeared in support of the application, and Dr Reid represented the County Council. The proposed works were explained, and there was no opposition to the scheme.

NEW RESERVOIR, BATH WATER WORKS.—On the 8th inst., in the Monkswold Valley, about seven miles to the north-east of Bath, and on the borders of Gloucestershire and Somerset, the new reservoir constructed by the Bath Town Council was opened by the Mayor (Mr. G. Woodvijs). The work is over nine acres in extent, and contains 51,000,000 gallons. Mr. W. Fox, of Westminster, has been the engineer, and Messrs. W. Neave & Son, of Paddington, the contractors. The reservoir has cost over 35,000*l.* No filtering beds are provided, but a carefully fitted straining well is constructed at the point of outlet.

STAINED GLASS AND DECORATION.

MEMORIAL WINDOWS, ST. THOMAS'S CHURCH, DOUGLAS.—A stained glass window, in memory of Mrs. Jane Dalby, of Douglas, is to be erected in the church of St. Thomas. Communion rails, which are part of a scheme for the redecoration of the chancel of the church, are also to be placed in the building. An engraved medallion, also, of the Queen's head is to be put up at the entrance to the chancel in commemoration of the Diamond Jubilee. The medallion is to be erected by Messrs. Gawthrop & Sayre, of London; and the window is being constructed by Messrs. Heaton, Butler, & Bayne, London.

WINDOW, GODMANCHESTER CHURCH.—Another of the windows on the south side of the Parish Church has been filled with stained glass to the memory of the late General Baumgarten. It is a three-light window. The work has been carried out by Messrs. Morris & Co., of Merton, Surrey, and the design is by Sir E. Burne-Jones.

WINDOW, CHURCH OF MARSEKE-SWALEDALE, YORKSHIRE.—The Bishop of Richmond recently visited Marske-in-Swaedale for the purpose of unveiling a window, which has been placed in the village church by Mrs. Cameron, of West Hartlepool, in memory of her husband, the late Colonel Cameron. The work has been carried out by Messrs. Percy Bacon Bros., London.

FOREIGN.

FRANCE.—M. Huet, the principal director of Public Works at Paris, has just retired, and the department is now going to be divided into two distinct services: one including the public roads, the drainage, and water-works—in a word, all that belongs to the technical part of engineering (M. Deiraune will be at the head of this department); the other will include the foot-ways, the promenades, all architectural works, and works of Art. At the head of this department will be M. Bouvard, the architect of the 1900 Exhibition.—**M. Ernest Barrias**, sculptor, has been commissioned to execute the monument to the celebrated chemist Lavoisier, which is being erected by public subscription, and will be placed in the Place de la Madeleine, on the axis of the Rue Tronchet.—At the Ecole des Beaux Arts, the jury on the first class architectural competition has awarded the first medals to MM. Perret and Paul Guadet, pupils of MM. Guadet and Paulin; Garret and Barber, pupils of MM. Blondel and Scellier de Gisors; and Philipps, pupil of M. Pascal.—**M. Denis Puchet**, the sculptor, has finished the model of the monument of Saint-Beuve. He has represented the famous critic in a meditative attitude. The pedestal, which has been designed by M. Scellier de Gisors, will be treated in a sober architectural manner, and simply ornamented with some inscriptions. This monument is intended for the Luxembourg gardens.—A new Lycée is being completed at Saint Germain-en-Laye, and will be inaugurated next October.—The municipality of Sens has just opened a competition for the erection of a new Hotel de Ville, which is to be placed on the site of the present Mairie. The minimum expense is calculated at 300,000 francs. The competition will be closed on September 15.—The definite installation of the new Musée Cernuschi has necessitated the rearrangement of several halls which had been given up to Japanese and Chinese china. The alterations will be finished by the month of October.—It is quite decided that a commemorative chapel shall be erected on the site of the terrible catastrophe in the Rue Jean Goujon.

GERMANY.—There seems to be an increasing tendency at Berlin for speculative builders to engage a number of small contractors to carry out various parts of their work, and in the event of financial difficulties, the latter mostly become seriously involved. As a rule the small contractor is an artisan or a foreman who has made some headway in his trade, and it is very regrettable that he should constantly be made the dupe of the speculator. It is curious that the paternal Government at Berlin has not found some means to prevent the constant repetition of this kind of thing.—The German Press is congratulating the Berlin authorities on having been able to buy the picture by Holbein, which was lately sold in London, and they very rightly express their wonder at our parting with one picture after another by artists whose work is not particularly well represented in this country.—The foundation stone has been laid of the first of three new churches at Lichterfelde, being erected under the patronage of the Empress. The architect is

Herr Dolbach, who will carry out the building in the Gothic style. The church is to be set free.—We have referred to the new Berlin Building Act dividing the superficial area of every site into "zones," each of which can only be built on to a certain extent. The definitions of these "zones" are now under discussion, and there appears to be considerable variance as to the amount of ground to be left uncovered on building sites in the city proper. The Government proposes that a "zone" of six metres, taken parallel to the frontage line, can be built on to the extent of 100 per cent., and a following "zone" of twenty-six metres may be covered to the extent of 70 per cent., whilst ground further back from the street than thirty-two metres is only to be built on to the extent of 60 per cent. The Municipality, on the other hand, advise that the first "zone" should have a depth of seven metres, and the second to have thirty-one metres, and they also wish the proportion to be increased in the second instance to 80 per cent.—It is not improbable that the old Castle of the clerical Knights at Mayence will be shortly restored. A commission has been formed to report on the matter. We understand that the Municipality of Mayence has voted 30,000*l.* for the purpose, and that the Local Government has proposed an additional vote of 15,000*l.*—Lübeck is to have an equestrian statue of Emperor William I. An influential committee will act as assessors, and premiums to the extent of 300*l.* are to be awarded. A similar monument is to be erected at Eisenach, from the designs of Herr Zeysig.—The annual meeting of the Deputies of the Amalgamated Societies of German Architects is to be held at Kottenburg this year on the 10th and 11th of September. The meeting has had to be postponed owing to the military manoeuvres taking place in that district during August.—There is a considerable feeling at Berlin that the old Building Academy, which is a particularly ugly structure, should be pulled down, as it spoils the aspect of the Castle, the new cathedral, and the monument to Emperor William.—We regret to record the death of the oldest German architect, Franz Mertens, who died last month at the age of ninety, and whose work had a considerable influence in the development of modern German architecture.

SYDNEY.—On April 15 the Public Works Committee further examined Mr. W. L. Vernon, Government Architect, with regard to the proposed Parliament Buildings. The model of the buildings shown in the private room of the Committee was partly explained by Mr. Vernon, but his examination had not concluded when the Committee rose. The cost of the buildings alone would be 530,000*l.* The basement would be of trachite, and the remaining portion of the best Sydney sandstone. He would like the whole building to be of trachite, but there was the question of cost. The internal walls would be of brick, but in the more public parts he would recommend the use of colonial marble. For this, however, it would be necessary to offer some inducement to quarry-owners to open up their quarries. The height of the dome would be about 200 ft.—*Sydney Morning Herald.*

MISCELLANEOUS.

AN ANTIQUARIAN SOCIETY FOR NOTTS.—The Duke of St. Albans presided over a meeting at Nottingham, on the 1st inst., when the Thornton Society, an antiquarian organisation for Nottingham and Notts, was formally inaugurated. The objects of the society were explained by Mr. Phillimore. It was proposed to have a simple working constitution, with rules similar to those of the Bristol and Gloucester Archaeological Society, and the objects of the society were, in the first instance, to watch over antiquarian remains in the county, so that no harm be done to them, whether they were historical or mediæval in character. It was also proposed to have excursions, the first to Thornton; and many old and valuable documents had been presented to the society. The Duke of St. Albans proposed the formation of the society, and expressed his pleasure that such an organisation was about to come into existence in Notts, where there were many objects of antiquarian interest. There was now a house at Red Hill, in the parish of Daybrook, which few knew was once the residence of the Bourbon family for hunting purposes during the French war. All these small things, as time went on were forgotten, but a society of that kind would keep them still in the light. The Mayor of Nottingham seconded, and the proposition was carried.

TEMPLE BAR AND STATE PAGEANTS.—Messrs. Partridge & Cooper have sent us a short pamphlet on this subject, written by Mr. Henry Johnson and illustrated by Miss Elsie M. Cluff, which will be of some interest at this moment. It is well written and the illustrations are good.

WICKEN CHURCH, NORTHAMPTONSHIRE.—Referring to our paragraph as to the restoration of this church (page 517 and 6) Mr. E. Swinfen writes to say that though it is quite true that the "rederos is of oak," that part of the work does not belong to the present restoration but was given to the church some twenty years ago, being carried out by his designs, and decorated by Messrs. Clayton & Bell.

A "SELF-SHARPENING" PENCIL.—The makers of the "Blaisdell self-sharpening paper pencil" have sent us some specimens for our opinion. The title is as misleading as such catch expressions usually are. The "self-sharpening" portions are only the holder or covering of the pencil, which, instead of cedar wood, is made of paper, tightly rolled in spirals, portions of which are detachable at regular distances with the point of a penknife, and that section of the paper can then be unrolled and more lead uncovered. It saves the trouble of cutting the wood and the litter of splinters, but the business of sharpening the lead is of course left just as before; and when the patentees state in their circular that with this pencil "the fingers are not soiled with blacklead" in cutting, they are stating what they must know perfectly well is not the fact. The Blaisdell pencil is a clever invention and has real advantages, and it is a pity the patentees should have thought it necessary to state imaginary ones which do not exist. We may observe that the pencil is a good deal heavier than a cedar-mounted one of the same size.

ELECTRIC LIGHT SUPPLY, MANCHESTER.—The Manchester Corporation having applied to the Local Government Board for sanction to borrow 130,000*l.* for the purpose of extending the electric lighting works and system, Colonel J. T. Marsh, R.E., held an inquiry in the Mayor's Parlour recently. It was stated that the present demand for the electric light in Manchester far exceeds the supply. The capacity of the plant was equivalent to the supply of current represented by 128,000 lamps of eight-candle power, but the demand for the current down to a very recent date was represented by 161,504 lamps, showing a deficiency of 33,504 lamps. The principal new works proposed to be constructed consisted of two direct driven electric generators of 2,500 horse power, six Lancashire boilers, similar to those already provided, and five tubular boilers; also two economisers, each having 480 tubes. In addition to these works a very large outlay upon additional mains would be necessary. On March 31st the total outlay on electric lighting was 309,107*l.* 10*s.* 10*d.*, and the estimated cost of works which were included in previous applications for loans, and which had not yet been executed, was 49,800*l.* 0*s.* 2*d.* The further estimated outlay was 130,000*l.*, making a total of 548,907*l.* Alderman Higginbottom then explained the electric lighting scheme in detail. Dealing with the varying capacity of the plant he said that in 1893 it was 40,000 eight-candle lamps, that in 1894 it was increased by 19,000 lamps, and that in 1895 and 1896 up to March, 1897, it was increased by 72,000 lamps, making a total of 128,000 lamps. Another side of the progress was shown as follows:—In 1893 there were 280 consumers and 32,716 lamps; in December, 1894, the consumers were 624 and the lamps 60,298; in December, 1895, the consumers were 1018 and the lamps connected 92,209; in December, 1896, the consumers were 1406 and the lamps 133,504; and on May of this year the consumers were 1620 and the lamps connected 147,068. There were also awaiting connexion 52 customers and 14,520 lamps, making the total number of consumers connected and awaiting connexion 1676, and the number of lamps connected and awaiting connexion was 161,504. Comparing the consumption of last year with the year ending March, 1896, there was an increase of no less than 973,678 units, or 34 per cent. The whole of the consumption, amounting to 2,775,107, last year was, said Alderman Higginbottom, for private purposes. Public lighting of the three squares had, however, given great satisfaction. The cost of lighting the three squares was 70*l.* a year less than the cost of 63*l.*

NORTHERN ARCHITECTURAL ASSOCIATION: VISIT TO THE LEEDS STEEL WORKS.—The Directors of these works, having invited the members and practising associates of the Northern Architectural Association to visit their works on the 9th inst., to view the manufacture of steel in its various processes from the ore to the finished girder, a large party of architects accepted the invitation. The company placed three saloon carriages at the architects' disposal, and provided lunch upon arrival and carriages to convey the party to the works and back to the station. The Leeds Steel Works received its present title, and was registered as a limited company, in 1888, but previously was known as "The Airedale Iron and Steel Works." Mr. Walter Scott, of Newcastle-on-Tyne, has purchased from time to time the property of the other partners, and may now be practically termed owner of the works, which cover an area of twenty-five acres, the yearly output being 70,000 tons of steel, and the wage roll amounts to 70,000*l.* per annum. The stocking ground is commanded by a 10-ton travelling crane, which has a span of nearly 100 ft. The sheds and yards are intersected by railway lines, on which six locomotive engines and eight steam travelling cranes are continuously at work. The electric light is in full use throughout the night. Mr. Walter Scott, together with Mr. Vaughan, conducted the party through the works.

STREET IMPROVEMENT, MIDDLESBROUGH.—In the minutes of the Streets Committee, presented to the Middlesbrough Town Council, estimates prepared by Mr. Baker, Borough Engineer, for three schemes of street improvement in connexion with the tramways extension were submitted. The streets

named are Ferry-road, Durham-street, Cleveland-street, Queen's-square, Albert Bridge, Exchange-terrace, Albert-road, Grange-road, Linthorpe-road, Linthorpe-square, Harthorpe-crescent, Bridge-street East, Dock-street, Zeland-road, Marton-road, Corporation-road, Newport-road (including relaying set paving), Parliament-road, Calvert-street, Oxford-road, and North Ormesby-road. The first estimate is for paving across the whole width scorie bricks on concrete, with new channels, relaying kerbs, new kerbs and gullies where required—dedicated streets, 27,004*l.* 12*s.* Estimate No. 2.—For macadam, with new channels, relaying kerbs, new kerbs and gullies where required—dedicated streets, 9,720*l.* 5*s.*; undedicated streets, 1,233*l.* 15*s.* 6*d.*; total, 10,953*l.* 0*s.* 6*d.* Estimate No. 3.—Ordinary macadam, with new channels, relaying kerbs, and gullies where required—dedicated streets, 7,146*l.* 13*s.*; undedicated streets, 899*l.* 14*s.* 6*d.*; total, 8,045*l.* 7*s.* 6*d.*

CAPITAL AND LABOUR.

THE THREE TOWNS BUILDING STRIKE.—The Master Builders' Association have received a communication from the Carpenters' Strike Committee dated July 1. The Carpenters state, "We are willing to meet a deputation of your members to discuss trade rules without prejudice. As regards your resolution, 'mobbing' of carpenters, we deny it, and coming from men of the world we cannot think it was seriously meant." With reference to the general bearing of the dispute with the carpenters, the Association by letter advised the members of a circular sent round to the builders who have men on strike, that there are working for them at the present time more than 200 non-society carpenters, exclusive of a considerable number of apprentices, many of whom are competent workmen. Carpenters are still reported to be coming into the town. The notice given by the Exeter branch of the Amalgamated Society of Carpenters and Joiners for id. an hour rise in wages expires on July 1. At present they receive 6*d.* an hour, being 1/2*d.* less than the carpenters in the Three Towns.

EDINBURGH PLUMBERS' WAGES.—A meeting of the Edinburgh branch of the United Operative Plumbers' Association of Scotland was held recently in the Oddfellows' Hall, Edinburgh, to consider the reply from the employers regarding the proposed by-laws. The operatives had previously requested a standard rate of wages of 8*d.* per hour. The masters, however, offered 8 1/2*d.* per hour according to ability for first-class men, and it was agreed to accept this offer, which is to take effect as from July 1. The masters have also conceded time and a quarter for holidays, and they have agreed to adhere to the old rule as to work outside a two-mile radius. A by-law as to arbitration between employers and employed in the event of disputes has been passed as amended by the masters, with the restriction that twelve days be allowed for the completion of the negotiations. A request that three months' notice instead of six months' be necessary before any alterations on the by-laws take effect has been granted by the masters giving the date for their coming into operation at February 1.

THE DISPUTE IN THE NORTHWICH BUILDING TRADE.—On the 3rd inst. the dispute between the Northwich and district bricklayers and their employers was practically settled. With the exception of two of the master builders, all the firms in the district have conceded an advance of 1*d.* per hour, making 9*d.* instead of 8*d.* This is the amount demanded by the men, who have been on strike some weeks.

THREATENED STRIKE OF DUNDEE MASONS.—A meeting of the operative masons of Dundee was held in Plumbers' Hall, Bain-square, Dundee, on the 4th inst., to consider upon a course of action in view of the refusal of the employers to grant an increase of 3*d.* per hour upon the present rate of wages. It was intimated at an early stage of the proceedings that one firm had granted the advance desired. After a discussion, lasting fully two hours, it was decided to test the feeling of the meeting as to whether the men should enforce their demands. The vote was taken by ballot, when it was resolved to come out on strike, and to remain out until the increase should be granted. The number of men affected by the strike is between 500 and 600. The present rate of wages is 9*d.* for hewers, 8 1/2*d.* per hour, and for builders, 9*d.* per hour. At a private meeting of the master builders of Dundee, held the same night, unknown to the operatives, the wages question was again considered, and it was ultimately resolved, it is stated, to raise the wages by 3*d.* per hour to hewers and builders.

NEWCASTLE MASONS AND THEIR HOURS.—A demand having been made by the masons of Newcastle and district to have the working hours reduced to 4 1/2 per week, a meeting of master builders was held at the offices of their Association recently, and it was decided that they could not agree to the proposed alterations.

THE KEIGHLEY BUILDERS' STRIKE.—The Mayor of Keighley recently called together five representatives of the master builders, and five of the labourers now on strike, in order to ascertain the possibility of a settlement. The parties met at the Crown

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

COMPETITIONS.

Table with 4 columns: Nature of Work, By whom Advertised, Premiums, and Date to be delivered. Includes entries for Municipal Buildings, Art Gallery, and Library.

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, and Date to be delivered. Includes entries for alterations, pipe sewers, granites, and various building works.

CONTRACTS—Continued.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, and Date to be delivered. Continues from the previous contracts section with entries for chimneys, foundations, and various building materials.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, and Applications to be in. Includes entries for Clerk of Works and Architectural Assistant.

Those marked with an asterisk (*) are advertised in this number. Competitions, iv. Contracts, pp. iv, vi, viii, & xix. Public Appointments, pp. xvi, & xix.

Large table of land advertisements with columns for location, details, and price. Includes entries for Fulham, Wandsworth, Tottenham, and various other areas.

Lambeth—16 and 24, Vaushall walk, r. 794 1/2; also l.g.r. 84, ut. 39 yrs, g.r. 127. ...

Hammer-smith—21, Upper Mall, with wharf, &c, r. 387. ...

Old Ford—78, Armagh rd., ut. 58 yrs, g.r. 41. ...

Chesham, Herts.—"The Old Parsonage" and 14 1/2 ft. ...

Hammer-smith—23, Andover rd., ut. 64 1/2 yrs, g.r. 34. ...

Hackney—30, Lansdowne-rd, r. 236; and 83, r. 394. ...

Contractors used in these lists.—P. g.r. for frehold ground rent; l.g.r. for ground-rent; r. for rent; e.r. for estimated rental; u. for unexpired term; p.a. for per annum; s. for square feet; sq. for ground or sq. for square; pl. for place; ter. for terrace; cres. for crescent; yd. for yard, &c.

PRICES CURRENT OF MATERIALS.

Table listing various materials such as timber, iron, and steel with their respective prices and specifications.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 2.30 p.m. on Thursdays, N.B.—We cannot publish Tenders unless authenticated by the name and address of the sender; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is given for any list in which the lowest Tender is under £200, unless for exceptional cases and for special reasons.]

BRIDGNORTH.—For erecting new schools, Higley, for the Higley School Board. Messrs. R. Scrivenor & Sons, architects, 5, Swan...

BRENTWOOD.—For alterations and additions to "The Essex Arms Hotel" Brentwood, for Mr. Mersham, M. J. E. Pinder, architect, Bridge House, South Tottenham, N.—C. E. Todd...

BURTON LATIMER (Northants).—For the erection of a coffee-house and club, for the Burton Latimer Coffee-house, Limited. Messrs. Colles & Fotheringham, architects, Cross Exchange, Market Harborough. Quantities by the architects:—

CHESSHUNT.—For the erection of three villa residences at Cheshunt, for Mr. G. C. Jones, surveyor, Chessington, Essex.—James Riches, 39, Strand, £2,500; James Gillingham, 1, Cavoy, £2,500; J. Haydon, £2,300; C. F. Robinson, Junr., £2,300.

CROMER (Norfolk).—For the erection of a boiler and exhaustor house, &c., for the Gas and Coke Company, Limited, Mr. Percy Collett, C.E., 55, Parliament-street, Westminster, S.W.:

DONEGAL (Ireland).—For the construction of reservoirs and water supply works, for the Union Guardians, Mr. J. L. Denehish, Messrs. C.E. Town Hall, Newry:

HASTINGS.—For the erection of school buildings, Priory road, West Hill, for the U.D. School Board, Mr. F. St. Humphreys, architect, 6, Trinity-street, Hastings:

LONDON.—For new premises at Vine-street, for the Receiver for the Metropolitan Police District, Mr. J. Dixon Butler, Architect. Quantities by Mr. W. H. Thorneycroft:

LONDON.—For alterations to "The White Hart," Rivington-street, Shoreditch, Mr. G. C. Page, architect, 83, Olveston-street, monger lane, E.C. 1:

LONDON.—Accepted for providing and fixing twenty-nine new gold deal window frames at the Wesleyan Chapel, William-street, Westlich, Mr. W. Whincop, architect:—

LONDON.—For alterations to Messrs. Fulring & Son's furniture depository, Woodwich, Mr. J. O. Cook, architect:—

LONDON.—For building new warehouses, Nos. 30 and 32, Farningford-road, for Messrs. John Greenwood & Son, Messrs. Bacon & Lobb, architects, 4, Cophall-chambers, E.C. 1:

LONDON.—For the proposed erection of new casual wards at Paddington, for the Parish of Paddington, Mr. F. J. Smith, architect, Westminster:

LONDON.—For addition and alteration to "The Devon Arms," Marsh-street, Hackney, Mr. Harry Roberts, architect, Lewisham:

LONDON.—For alterations to "The Jolly Sailors," Rotherhithe, Mr. H. Roberts, architect:—

LONDON.—For building warehouse, Cross Keys-croft, London wall, E.C., for Mr. Gerard J. Mathieson, Messrs. Barnes Williams, Barris & Gillin, architects:—

LONDON.—For the erection of club premises, Old Charlton, S.E., for the Charlton Swimming Club, Mr. John Rawland, architect, 24, The Village, Old Charlton:

LONDON.—For the construction of water-works, &c., for the Union Guardians, Mr. R. H. Dorman, County Surveyor, Armagh:—

BRIGHTON.—For work paving, &c., New-road and part of North-street, for the Town Council, Mr. F. J. C. May, C.E., Town Hall, Brighton:—

Table comparing tender prices for paving and construction work in Brighton, listing items like 'Providing and laying 9 in. by 3 in. laying 9 in. by 3 in.' and prices per square yard.

MANORHAMPTON (Ireland).—For the construction of water-works, &c., for the Union Guardians, Mr. R. H. Dorman, County Surveyor, Armagh:—

LONDON.—For new shop front, marble work, &c., at 8, Charlton-street, S.W., for Mr. A. J. Palmer, Mr. Alfred Howard, surveyor, 15, The Outer Temple, Strand:—

LONDON.—For building new skittle saloon at "The Grove Tavern," Lordship-lane, Dalwell, for Mr. Frain:—

LONDON.—For various decorative and sanitary repairs at 54, Newton-square, East, for Mr. W. Morley & Lettis, surveyors, 185, East's Court-road, S.W.:

LONDON.—For new drainage and entire renewal of internal sanitary arrangements, hot-water services, &c., at 165, East's Court-road, Messrs. J. W. Morley & Lettis, surveyors, 185, East's Court-road, S.W.:

LONDON.—For alterations to the "Vale of Health" Hotel, Huppstead, N.W., for Mr. Chas. Peters, Mr. Albert E. Prichard, architect, 8, Broad-street Buildings, E.C. 1:—

LONDON.—Accepted for erecting new coachbuilders' shop at Messrs. Durrance Bros., East-road, E.C. 1:—

LONDON.—For rebuilding the "White Hart," Rivington-street, Shoreditch, Mr. G. C. Page, architect, 83, Olveston-street, monger lane, E.C. 1:—

LONDON.—Accepted for providing and fixing twenty-nine new gold deal window frames at the Wesleyan Chapel, William-street, Westlich, Mr. W. Whincop, architect:—

LONDON.—For alterations to Messrs. Fulring & Son's furniture depository, Woodwich, Mr. J. O. Cook, architect:—

LONDON.—For building new warehouses, Nos. 30 and 32, Farningford-road, for Messrs. John Greenwood & Son, Messrs. Bacon & Lobb, architects, 4, Cophall-chambers, E.C. 1:—

LONDON.—Accepted for constructing a new power lift at Abbey Buildings, Westminster, for Mr. W. P. Mitchell:—

LONDON.—Accepted for alterations, additions, and new sanitary works, &c., at No. 154, Marlborough-road, Mr. C. Stanley Teuch, architect:—

LONDON.—Accepted for alterations, &c., to "The Victoria," Kensal Rise, Mr. H. W. Budd, architect:—

LONDON.—For alterations and additions to the "Crown and Shears" public-house, Muttons, E.C., for Messrs. Hoare & Co., Limited, Messrs. Perry & Reed, architects, 9, John-street, Adelphi, W.C. 1:—

LONDON.—Accepted for erecting house and stables, Steele-rd., Tottenham, for Mr. A. Woodward, Mr. J. E. Pinder, architect, 18, Bridge House, South Tottenham, N.—

MANORHAMPTON (Ireland).—For the construction of water-works, &c., for the Union Guardians, Mr. R. H. Dorman, County Surveyor, Armagh:—

Table comparing tender prices for paving and construction work in Brighton, listing items like 'Providing and laying 9 in. by 3 in. laying 9 in. by 3 in.' and prices per square yard.

MARNHILL (Dorset).—For the erection of a bridge, Little King's Mill, for the Dorset County Council. Mr. W. J. Fletcher, C.E., County Surveyor, Wimborne:—

Table with 2 columns: Name and Amount. Includes R. Curtis, S. Curtis, H. Bartlett, Dorman, Lang, & Co., N. Harris, Bridport.

MIDDLESBROUGH.—For the erection of a large block of business premises (exclusive of all fixtures and fittings). Linthorpe-road, for the Co-operative Society, Limited. Mr. W. G. Roberts, architect, 6, Albert-road, Middlesbrough:—

PENGE.—Accepted for making up Phoenix-road and laying sewer and drains for Mr. W. R. Quested. Mr. Albert E. Fridmore, surveyor, 2, Broad Street-buildings, E.C. 1:—

PETERSFIELD (Hants).—For the construction of a reservoir, or the Urban District Council. Mr. H. T. Keates, surveyor, Petersfield:—

PONTYPOOL.—For the erection of house and shop, Crane-street, for Messrs. Wood & Co., Mr. N. M. Brown, architect, Somerset-road, Newport, Mon.:—

ST. ALBANS.—For erecting a house in Hill Side-road, for Mr. T. H. Johnson. Mr. Griffith, architect, London:—

ST. ALBANS.—For a pair of semi-detached villa-residences, Upper Witley-road. Mr. S. D. Edmunds, architect, 50, Hill-street, St. Albans:—

SOUTHEND-ON-SEA.—Accepted for the erection of a pair of houses. Mr. Arthur T. A. Bowyer, architect, 92, Leadenhall-street, E.C. 3:—

STOKE-ON-TRENT.—For making new streets for the North Staffordshire Cricket and Athletic Club, Limited, at Stoke-on-Trent:—

SURBITON.—For decorative and sanitary works to Newbury House, Beaufort-road, Surbiton, Surrey, for Miss E. Forster. Mr. Walter J. Ebbetts, architect, Savoy House, 115, Strand, W.C. 2:—

SUTTON.—For additions and alterations to Stanley House, Mulgrave-road, Sutton, Surrey, for Mr. Wm. Berrell, C.E. Mr. Walter J. Ebbetts, architect, Savoy House, 115, Strand, W.C. 2:—

TICEHURST (Sussex).—Accepted for the erection of a Wesleyan Chapel. Quantities by Mr. A. Wither, Parock, architect and surveyor, 66, St. Anne's-hill, Wandsworth, S.W. 1:—

C. B. N. SNEWIN MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and TIMBER MERCHANT, Nos. 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, & 17, BACK HILL, HATTON GARDEN, and 29, RAY STREET, FARRINGTON ROAD, E.C.

WALTHAMSTOW.—For erecting lavatories and additions to Grosvenor House, Hoe-street, for the Urban District Council of Walthamstow. Mr. Geo. W. Holmes, Engineer:—

Table with 2 columns: Name and Amount. Includes Barratt & Power, W. Lawrence, Waltham Abbey, Stuart & Dayman.

WEALDSTONE (Middlesex).—For the erection of a factory at Wealdstone, Harrow, for Messrs. Hamilton & Co., Messrs. G. R. Tassell & Sons, surveyors, 30, John-street, Bedford-row, W.C. 2:—

WORKINGTON.—Accepted for additions to Victoria Schools, for the Workington School Board. Messrs. W. J. Scott & Co., architects, Victoria-buildings, Workington:—

TO CORRESPONDENTS. A. H.—S. W.—W. C.—A. E. P.—Amounts should have been stated.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications.

Any communication to a contributor to write an article is given subject to the approval of the article when written, by the Editor, who retains the right to reject it if unsatisfactory.

TERMS OF SUBSCRIPTION. "THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom, at the rate of 10s. per annum PREPAID.

SUBSCRIBERS IN LONDON AND THE SUBURBS, (by prepaying at the Publishing Office, 192, per annum or 4s. 6d. per quarter), can ensure receiving "The Builder," by Friday Morning's Post.

Recent Excavations on the Roman Wall in Northumberland.

URING the past three years extensive explorations have been made on the line of the Roman Wall in Northumberland by a committee formed in connexion with the

Newcastle Society of Antiquaries. Sections through the Vallum, or earth wall, extending to the Murus or stone Wall,* were made at Heddon on the Wall and Down Hill, and the evidence furnished by the use of the spade proved fatal to the theories of many of the local antiquaries as to the origin and use of the Vallum, which still remains a mystery that can only be solved by systematic and careful sections made at various points over a large extent of its course. By far the most important work done by this committee is the excavation which, during the past two years, has been in progress at Æsica.

A list of stations on the line of the Wall is given in the "Notitia," a Roman army-list of not later date than the early part of the fifth century. The names of twenty-three stations are mentioned, commencing at Wallsend (Segedunum), the eastern extremity of the Wall, and going westward. Eleven of these stations in direct sequence have been satisfactorily identified by inscriptions discovered in the camps, of which Æsica is the ninth. Considerable doubt exists as to the identity of many of the other twelve camps mentioned, which lie towards the western end of the Wall.

The best access to Æsica is from Haltwhistle, a station on the Newcastle and Carlisle Railway, from which it is distant about two and a half miles almost due north. It is approached by a road which zigzags up a steep hillside at the east end of the village. On arriving at the summit of the hill the outlook to the north is a picturesque and an interesting one. Stretching away to the far distance, eastward, over the moorland, lie

the almost white line of the military road from Newcastle to Carlisle, made by General Wade in 1752, not many years after the suppression of the last Jacobite Rebellion, and the parallel green lines of the ditch and mounds of the Vallum, or earth wall, which forms the southern portion of the barrier drawn by the Romans from the Tyne to the Solway.

A little further north an outcrop of basaltic rock, known locally as the Great Whin Roll, stretches away in wave after wave to the next Roman camp, Borcovicus, finding its highest point at Winshields, 1,230 ft. above the sea-level, and carrying in an almost unbroken line the Roman Murus, or stone Wall, which crests its steep hills, and clings to the precipitous sides of the rugged gaps which separate them.

Deep down in the glen below, the Haltwhistle burn rushes dark and full of the peaty waters from the moorland wastes where it takes its source. Close to the bridge by which Wade's road crosses the stream are seen the lines of an important Roman camp yet unexcavated, which may furnish future explorers with interesting evidence as to the nature of the Roman occupation of the north of England before the building of the Wall, it having been made to defend the defile of the Haltwhistle burn before the erection of the Wall and the camp of Æsica on its north side, which would render it useless and cause its abandonment.

Passing alongside the steep southern rampart of this camp, and crossing the burn at a ford, may be traced the line of the Stanegate, an early Roman road in existence long before either Vallum or Murus. Further to the west the Devil's Teeth—as the Nine Nicks of Thirwall, a range of basaltic hills, are locally called—rear their bold crests, culminating in Mucklebank, the highest of the range, on the western flank of which an interesting wall turret was excavated in 1892 (by Mr. J. P. Gibson). While the Murus caps the crest of all these hills, the Vallum pursues a direct and straight line from camp to camp in the valley immediately to the south of the range. The gray distance on the line of the horizon is filled with the heath-clad slopes of the Tyndale Fells, and beyond lies Crossfell, a northern outlier of the Pennine range. Æsica lies about a mile to the north, on the southern slope of a gentle hill, of which it covers about 3½ acres.

It is most convenient to describe it by commencing at the principal or southern gateway (Porta Decumana) and proceeding around the inside of the camp walls.

The arrangement usual in most of the camps on the line of the Wall is here departed from, as the south gateway is not placed at the centre of the southern rampart, but at a point considerably to the east of it. A road leading to the modern farmhouse, which stands in the north-east angle of the camp, has almost entirely destroyed the double portals of the gateway, but the lower portions of the guard chambers on each side of it still remain, the masonry of that to the east being of earlier and more substantial work than that of the western one; in the latter was found a large hoard of very fine fibule, rings, chains, and other articles of jewellery, at about 2 ft. from the floor level. Probably they were the possessions and adornments of the wife of the Præfect of the cohort of Spanish auxiliary troops (*Cohors Secunda Astorum*), which was so long quartered at this camp, and were gathered together during one of the Caledonian raids, ready to be carried away by their owner, who was, doubtless, overwhelmed in the destruction of the guardhouse tower, where she had taken shelter in readiness to quit the camp.

Adjoining the east end of the eastern guard chamber is a circular chamber of masonry, with a small flue, containing soot, leading into the bottom of it. A similar chamber exists at Borcovicus, in almost the same relative position to the south gateway there, which Dr. Bruce suggested was a mediæval kiln for drying corn, erected by some moss-trooper, who had made the building his residence. As another was also found at the principal gateway of Amboglanna, it seems improbable that three moss-troopers should occupy the gateways of three Roman camps, a considerable distance apart, and should erect three kilns in them. The small size of the chamber would render it of little or no use for such a purpose as drying corn, so that there can be little doubt that these are, like the rest of the buildings, entirely of Roman origin.

A trench was driven in 1894 along the southern intervallum without any satisfactory result, but at the south-east corner of the camp is the base of an angle turret, which is rounded on its outer face and square on its inner face, like the angle turrets in other

* In this article the great stone wall, extending from Tyne to Solway, and known as the *Murus*, which is frequently also described as "Hadrian's Wall," is distinguished from other walls by the use of a capital W. The controversial question as to who was its builder is left untouched by the writer.

camp. It stands at present 6 ft. high. From its north side to the western gateway of the camp the inner face of the wall stands perfect to about the same height, and has been cleared of soil down to its plinth. The existence of a western gateway at *Æsica* was doubted by Dr. Bruce, and even by Mr. McLauchlan, an engineer who about the middle of the present century spent two years in a careful and systematic survey of the wall and its camps, which was made and published at the cost of the Duke of Northumberland. The discovery of this gateway, which far surpasses in interest any previously found on the line of the wall, clears up some points hitherto obscure, and adds much to our knowledge of the Roman occupation of the North. It is built on the usual plan, having two inner and two outer portals separated by pillars of heavy masonry, and it is flanked on each side by the base of a tower which was used as a guard chamber. In this, much more clearly than in any previous excavation *per lineam vallis*, can be traced the flow and ebb of the successive Roman invasions, three periods of building and three epochs of disaster and destruction being clearly visible on the existing remains. The different quality and character of the masonry used in these successive periods is very marked. The earliest, seen in the lower portion of the southern guard chamber and the portals of the gateway, consists of massive well-squared stones. The original floors were found overlaid with debris containing much charcoal, pointing clearly to the first destruction of the camp by fire. This debris had not been cleared away, but had been levelled down, and the floors of the second occupation, which were formed of flagstones, were laid upon it. Some alterations were then made in the plan of the gateway, the southern outer portal having been built up with roughly squared stones, and the northern portal much widened by cutting away a portion of the central pillar. Two sets of pivot holes for the gates still remain, those of the second occupation being on a level of 18 in. higher than those of the first. At a much less interval above the second floors are found those of the third period, pointing to a shorter lapse of time between the second destruction and re-occupation of the camp than existed between the first expulsion and re-entry of the Romans. [See the lithograph illustrations in the present issue, from photographs of various portions of the remains.]

During the third occupation the north remaining portal had been entirely blocked up by what appears to have been the base of a tower, occupying the site of both portals, and placed on the debris of the second destruction, many feet above the earliest floor level. Rubble work is employed in the final building up of the north portal. A number of sugarloaf-shaped stones, about 15 in. high, have been found among the fallen stones at the angle and gateway towers, and have probably been used as corner pinnacles to the towers; if so used they might, in an emergency, be detached from their position and hurled down on any foe attacking the walls.

Between the west gateway and the north-west angle of the camp is an extensive range of buildings erected against the inside of the western wall. Behind a stone trough near a hearth in one of these, which seems to have been a smithy, were unearthed about

twenty silver denarii of the earlier Emperors. In an adjoining building a quantity of charred wheat was found, the grains of which still retained their shape. Possibly this was the identical granary referred to in an inscription found in this part of the camp in 1767, which stated that a granary, which had become ruinous through age, had been restored during the reign of Severus Alexander by the second cohort of the Astures. The consuls' names given show the date of the inscription to be A.D. 225.

Specially interesting is the point where, at the north-west angle turret, the great Wall joins the camp. In exploring this corner at first it seemed as if a modern field road, which had been made right through it, had destroyed it; but on cutting deeper the foundation of the western side was found, and the north, south, and east walls remained standing nearly 5 ft. high.

The masonry of this angle turret and that of the Wall were found to be of similar character, and bonded into each other. It had been suggested that if this angle turret proved to be of the same masonry as the Wall, it would certainly join it at right angles, as the walls of the mile castles which were built along with the Wall invariably do, instead of the Wall striking the rounded camp angle at a tangent, as it does at Borcovicus, where this arrangement as often been cited as proving the Wall to be of later date than the camp, as is doubtless the case there.

It does not, however, follow that evidence based on a rounded angle turret *alone*, as is the case at *Æsica*, is sufficient to prove the camp earlier than the wall, as a little consideration of the different uses of mile castles and camp angle turrets will show. The mile castles are walled enclosures about 60 ft. square placed against the south side of the wall, which always forms their northern boundary. They are placed at intervals approximating as closely to a Roman mile as the selection of a suitable site permitted. For their north and south sides they have arched gateways with roads running through them, which formed the only communication with the country beyond the wall, except that afforded by the gateways of the camps. Inside them have been found traces of wooden erections that would afford shelter to the guards who kept watch in them, and relieved the sentries posted on the wall at intervals of three hours. As the sentries' roadway on the top of the wall would be carried over the top of the northern arched gateways, it is improbable that the mile castles would be higher than the wall itself, and there would be no advantage in making any other than a simple right-angled junction between wall and mile castle.

In the various representations still existent of camps on the Trajan and Antonine columns at Rome, their angle towers and those of the gateways are always shown considerably higher than the ramparts connecting them. The very large accumulations of fallen masonry found on the sites of the angle and gateway towers at *Æsica* prove that the same arrangement existed there.

An engine of war placed on the north-west tower would enfilade not merely the north and west walls of the camp, but also a considerable stretch of the great Wall to the west of the camp. The rounded angle would give additional strength to the portion of the tower exposed above the Wall, and would also render more easy the training of

a ballista or other engine placed on the top of the tower, especially when it was being used at short ranges. The finding of a large heap of rounded stones, suitable to be used as missiles, at the base of this tower, seems to make it certain that it served as a platform for a small ballista.

These reasons seem sufficient to account for the usual plan of having rounded corners to each angle of the camp having not been departed from, even when Wall and camp were built simultaneously, as seems to have been the case at *Æsica*, without taking into account the spirit of military red tapeism which probably exercised an influence even in the well organised armies of Rome.

The extensive quarrying of the north wall of the camp in search of building materials for the erection of the present farmhouse has made it impossible to get a satisfactory plan of the north or Prætorian gateway of the camp, but sufficient remains were found to prove that it was opposite to the south gateway and, like it, was placed much nearer to the eastern than to the western rampart.

A large vaulted chamber cleared out near the centre of the camp bore traces of previous exploration.

The excavations have so far been chiefly confined to the line of the camp, ramparts, and gateways, except in the north-west quarter of the camp, where a long trench revealed many traces of buildings of poor masonry made from reused materials during the latter part of the Roman occupation. As it was found impossible to keep the whole of the excavated ground permanently open, these were measured, laid down in the plan, and covered up again.

During the course of the excavations, large quantities of pottery were turned up, chiefly consisting of the grey smother-kiln ware, made in the neighbourhood of Upchurch, where an area of twenty-four square miles, covered with potters' debris, shows the extent and importance of the Roman potteries formerly existing there.

A few small fragments of the particoloured Durobrivian ware and much of the beautiful red Samian ware were also found. Two fragments of the latter had on them, scratched through the glaze, graffiti of names of centurions that have also been found on centurial stones in that district. Millstones were found, varying in size, from those that could be turned by a female slave up to those that would have required an ox or ass to drive them. Most of them were made of the local grits, but a few of them were "made in Germany" of the volcanic rock found near Andernach, where an extensive manufactory of millstones from the same stone still exists. Unfortunately, no altars were discovered, and the fragments of inscribed stones turned up were few and unimportant, the portions of the camp explored being those least likely to furnish buildings containing important inscriptions. In addition to the hoard of jewelry found in the south gateway, many bronze objects, such as fibulae, buckles, studs, and cooking utensils, were turned up and removed to the Black Gate Museum, at Newcastle; among them, a brooch in the form of a hare, which is ornamented with blue enamel, and is almost an exact replica of one at present in Chester Museum.

Weapons and implements of iron, much corroded, were turned up in great profusion—among them a sickle similar in shape to

those recently rendered obsolete by the use of machinery in the reaping field—but much smaller in size. The fashion in which the Romans used their sickle is shown on the Trajan column, where a reaper is represented turning down the corn and striking it with a sharp-edged sickle. It seems odd that in Ireland, where no Roman settlements existed, this fashion should have been followed, while in the north of England the serrated sickle which was used by being drawn through the standing corn towards the reaper was most common.

Lack of funds prevented the Excavation Committee from continuing its work during last summer, but it is hoped that donations may be forthcoming to enable them this summer to resume their work in the central portion of the Camp, where possibly the Forum and the Prætorium may still be found.

NOTES.

Election of Fellows of the Institute.

THE tendency of the resolutions passed on this subject at the meeting of the Institute

on Monday last (which resolutions are given in another column), will be, we hope, to draw closer the bonds between the Institute and the Allied Societies in the provinces, which is in every respect to be desired. The two most important resolutions are those which empower the Council to elect, without ballot, a practising architect unanimously recommended by the representative architectural society of his district, and to similarly elect the President or President-elect of any allied societies, "who are eligible and apply for admission." The first-named resolution has tacked to it the saving clause (not included in the resolution as originally proposed) "his work being of sufficient merit," which leaves to the Council the option of rejecting the application on the ground of insufficient merit shown in the candidate's own work as exhibited in his own drawings. With this proviso, it is not likely that the power thus given to the Council will be used in favour of any one who is not a desirable addition to the ranks of the Fellows, and it will meet a not unreasonable complaint raised, we believe, by some of the Allied Societies, that an architect whom they recommended from a full knowledge of his work and acquirements was liable to be voted against, on some mere ground of policy, by London members who in reality knew nothing about him. It is to be hoped that another recommendation included in the same set of resolutions, viz.: "that it is desirable that Associates who are eligible should come forward for election as Fellows," will not be overlooked by those to whom it applies. To those who make what seems to us the rather selfish objection that they will gain nothing by becoming Fellows, it may be replied that they will benefit the Institute of which they are members, and therefore themselves indirectly—if it is necessary to use the argument of self-interest. But surely there are motives a little higher than that to be considered.

Judicial Wrath against Architects.
THE report of the case of Moorwood, Sons & Co. v. George Longden & Son, which will be found in our legal column, affords another significant example of the stereotyped hostility of the Bench towards archi-

fects, and the apparent incapability on the part of learned judges to understand the architect's position as between client and tradesman. The architect in this case selected certain goods from the plaintiffs for a building in his charge, stating the names of the contractors who were to pay for them. For some reason, which does not become evident in the report of the case, the defendants demurred to or deferred payment, and the plaintiffs brought an action to recover the money. On the architect admitting that he ordered the goods, the judge tells him he ought to pay for them, and indulges in an absurd tirade against the "tyranny" of architects and the folly of tradespeople in trusting them. The matter is of course perfectly simple; the architect must select the goods, as he is the only judge of what is best for his client; and unless he ordered something not provided for in the contract, which does not appear to have been the case in this instance, the contractor repudiated his responsibilities. Whereupon the judge abuses the architect.

MUCH has been said in respect to the many temporary structures which have been erected on the occasion of the Jubilee celebrations, and which, quite irrespective of the control exercised by the London County Council as regards the construction, must be considered highly unsatisfactory on account of the materials used, and the lack of proper facilities for entrance and exit. It would, however, be well to call attention to the fact that so many of our more permanent structures, which resemble in many ways the provisional grand stands complained of, are distinctly dangerous, and here we have particularly in mind the vast expanse of seating accommodation provided at the Crystal Palace on the occasion of the Handel Festival. Any one who has watched the departure of an audience after the performance, will have been struck by the great difficulty encountered in reaching the open, especially from the back of the area and the galleries; and what is here said as regards the audience, holds good for the performers on the amphitheatrical staging. It is unnecessary to specify in detail the many faults in regard to complicated entrances, insufficient staircases, &c.; and how easily a fire could originate in this structure, and how rapidly it would spread. Take, for instance, the open boarding of the floor with its accumulation of filth and dust alone. People will smoke in the Crystal Palace, although it is prohibited, and a match thrown in an unfortunate manner between the boards, might easily cause a conflagration. Of course, the Crystal Palace Company have a certain equipment of fire appliances, and also a staff of firemen; there is further a small station of the M.F.B. adjoining the Crystal Palace grounds, but of what avail would the firemen and their appliances be should an outbreak occur whilst the Handel Festival was going on? Whose duty is it to control the safety of a building of this description? There are other buildings also, notably the Agricultural Hall, which has a staging during the Military Tournament of particularly inflammable character, and where the facilities for approach and exit are also much too scant in case of panic. It is high time that Parliament should give attention to the protection

of the public at its entertainments, and the nomination of a Royal Commission of Inquiry, as has already been done in other countries, since the Paris Bazaar fire, would not be out of place.

The Water Bill.

A CORRESPONDENT of the *Times* has within the last few days published some suggestive criticisms of the Government's new Water Bill. He asks why, if public money is to be spent in assisting those who use water to carry on litigation against water companies, the principle should not also be extended to litigation with railway companies and other public bodies? Why, also, is the Bill to be confined to the Metropolis? Why is the person who lives in a provincial town, where the water supply is in the hands of a company, not to have the assistance of public funds? The fact is that the Bill is a barefaced stopgap. The Government have no policy in regard to the water supply of London, and hope by means of this Bill, and by the appointment of a Royal Commission, to put off the question for an indefinite time.

The Cambrian Railway Accident.

IT would appear from the Inquiry into the lamentable disaster on the Cambrian railway that it was not due, as was naturally supposed at the outset, to the effect upon the rails of the sudden change of temperature. It is, of course, essential that special attention should be paid to the gauge of the line when the temperature is variable, but the theory that the gauge had been affected by the heat has, unhappily, to be discarded for one reflecting still more seriously upon the officials responsible for the stability of the permanent way. The Board of Trade Inspector has not hesitated to express his opinion that the road generally was in a very unfit condition for running heavy traffic, and spoke very strongly on the subject on the opening day of the Inquiry. This opinion of Colonel Yorke's may have been subsequently somewhat modified, and the previous good record of the Cambrian line makes one hesitate to think that the permanent way has been habitually kept in a dangerously loose and unstable condition. The other theory which has been put forward to account for the derailment of the carriages—the injudicious sandwiching of a light van between heavier vehicles—again reflects upon the officials concerned: and the accident evidently cannot be regarded as an unavoidable one. The evidence at the Board of Trade Inquiry, which concluded on Tuesday, was rather contradictory, and anything but reassuring.

Student's Work in Joinery.

THE exhibition of specimens of practical work of candidates at the Technological Examinations, lately held by the City and Guilds Institute, shows some painstaking work. In the examination in carpentry and joinery this is specially to be noted. These form part of the Honours Examination, it being compulsory to pass in practical work for this certificate. There are about 150 exhibits, and the subjects chosen range over a wide area. We notice especially such subjects as ventilation turrets, roof trusses of all kinds, various types of domes and pendentives, and different forms of staircases, while joints of different types are largely entered. There is still a tendency on the part of some can-

didates to cover bad workmanship by varnishing their exhibits, although the regulations point this out as a defect. A vestibule screen shows some excellent workmanship, marred by, or rather wasted, on a very poor design, and it seems a question whether it would not be kinder to supply good working designs in this section, rather than encourage craftsmen to execute works which are detrimental to the progress of artistic feeling in the craft, or else to insist that some good "old example" should be copied. Why the study of old work should be confined to architects we know not, since it is evident that great good would accrue to the craft of carpentry and joinery if the "classics" of the subject were practically studied. However, we may congratulate the City and Guilds Institute on being the means of inducing craftsmen to produce works which, so far as workmanship is concerned, are indeed excellent. The work in other sections, such as Plumbing, Cabinet-making, Weaving, Plasterers' Work, and Bookbinding, does not call for special note, beyond the passing remark that we should like to see these subjects more generally taken up by the apprentices and others working in the trades.

PROFESSOR McKendrick's paper in the Proceedings of the Royal Society of Edinburgh on "The Skin as a Telephone Receiver" contains an account of an important application of electricity. By a very simple apparatus, deaf people can perceive sounds by their fingers, and thus replace, to a certain extent, the sense of hearing. A microphone transmitter is put in series with the primary of an induction coil, and wires from the secondary terminals dip into tumblers containing salt water. Sounds made in the room cause currents in the microphone circuit, and these currents induce currents at a higher pressure in the secondary coil which are readily perceived by the thrills they give the fingers. Musical sounds are particularly easy to recognise. It is possible to teach a perfectly deaf person to discriminate between all the various thrills and so enable him to replace by touch the sense of hearing. This experiment can be easily verified, and although the sense of touch is not very sensitive to electric currents, yet Professor McKendrick's device of a microphone and an induction coil magnify the effects so as to make even the slightest differences in sound apparent. It seems also as if we were within a measurable distance of "seeing by touch." The electric resistance of a selenium cell is very sensitive to light, and so by a somewhat similar arrangement we could tell the amount of illumination in a room by the shock felt on touching the terminals of an electric circuit containing this cell. This, however, is only a very small step in the direction of solving this beneficent problem.

We read that the Corporation of Tamworth have bought this ancient castle for 3,000*l.* of the Marquess Townshend, a descendant of the first Marquess, High Steward of the borough, the celebrated military commander to whom Quebec surrendered after the victory won by General Wolfe. The castle has its origin in a Mercian fortress, the stronghold of Offa, Ceruulf, Beornwulf, and other kings of

Mercia, who there had a mint. Having been dismantled by the Danes, it was reinstated by Ethelfleda, daughter of Alfred the Great, who also erected the keep of the castle which formed, during a long period, the seat of the over-lords of Tamworth. William I. bestowed it upon Robert Marmion, of Fontenay; it passed, 1291, to the Frevilles, then to the house of Ferrers, and so, by marriage, to Lord Townshend.

Some Jubilee Decorations.

THE designs for the illuminations and decorations in celebration of her Majesty's Diamond Jubilee which have been on view at the Imperial Institute are interesting. They are exhibited by Messrs. Defries Bros., Limited, and are executed principally by their chief artist, Mr. F. Felloe, the chief exception being that by Professor Legros for the Bank of England. The designs are executed on dark grey paper, producing a night effect, the colouring being effected by "body" colour. The novelty in the decorations generally may be said to be a laudable desire for decoration by day, and illumination by night, and for work which has any permanency this seems quite right, and the combined system is a novelty in all the schemes exhibited. Many of the schemes designed have not been carried out, owing, in some instances, to cost. In some of these which were designed for the street only, the street lamps were to be made use of, and it seems a pity that some comprehensive scheme of this sort could not have been attempted. Fleet-street and Ludgate Hill are being treated with square columns, coloured purple and gold, and mounted by tall tripods bearing flowers. In a similar way Temple Bar was to have been treated, but the scheme fell through. Marlborough House gateway is to be treated in cut crystal formed as laurel leaves, and in an arched form. One of the more ambitious schemes is that of the Gresham Life Assurance Office. The Company's arms are employed. The Royal arms, with crown and laurel branches, are placed centrally, and formed of cut crystal; while at the angles of the building are shields bearing the monogram V.R.I., with panels of 1837—1897. We have no room to refer to the many schemes which are exhibited for semi-public buildings. Of all the schemes, that for the Bank of England is, in its main lines, most effective. It consists of a series of small lamps, made into festoons, and placed along the whole front. Over the main entrance is placed a crystal medallion, with the monogram V.R.I. and dates. Beyond the illuminations is an allegorical painting on canvas, with a backing of wood, by Professor Legros, of a figure of Britannia in a chariot drawn by two horses, flanked by children holding dates. Figures representing Industry and Commerce appear on either side of the chariot. The height of the central group is 20 ft. Along the parapet on either side are stars with crystal and amber points, and the angles of the building are treated with two immense Grecian honeysuckle ornaments in deep ruby colour, the scrolls being finished in amber. The whole design differs from many of the others because the architectural lines of the building are interfered with, which is an unnecessary thing to do; otherwise we should regard this as the most successful of the schemes which Messrs. Defries have executed. Many of the designs

have been well thought out and show a great improvement on those carried out at the last Jubilee ceremonials.

Society of Fine Arts.

THERE are two new collections of water-colour drawings on view at the Society of Fine Arts Gallery this week. Mr. F. A. Rawlence's series illustrative of the Riviera seem specially intended to convey the idea of brilliancy of colour in the vegetation, in which they are very successful in spite of a rather marked mannerism of style. The collection includes a few architectural subjects, of which the best is "The East Gate, Bordighera" (36). The pictorial element is not very strong in most of the drawings, but "The Campanile, Camparossa" (59) is an exception in this respect, and is a striking composition. The collection by Signor Carliandi, of drawings of Rome and the Tiber Valley, belongs to a much higher order of work. From the interesting preface to the catalogue, written by the artist, we gather that he has had a special and life-long knowledge of the Campagna, and that De Wint is his artistic ideal. His drawings show the influence of De Wint both in their broad and grand style and in a rather sober reticence of colour, in regard to which the drawings may perhaps be considered rather as translations of the scene into his own artistic scheme than as accurate representations of the colour of the actual scenes. That, however, is quite a legitimate standpoint for a painter to take; he records his own impression of the scenes in accordance with his own artistic ideal, and gives us a picture of the grandeur and desolation of the environs of ancient Rome, as in "My Favourite Tomb on the Appia," "On the Pavement of the Via Latina" (33 and 34), "The Remains of the Imperial Palace at Ostia" (1), "The Street of the Tombs at Ostia" (10), &c. The treatment of the sky in many of the drawings is exceedingly fine; notice especially "Autumn Tints on the Appia" (14). "The first peep of St. Peter's from the Castel Giubileo" (17) is a fine and poetic work; a shallow slow river in the foreground, and the great cathedral forming a dark purple dot in the distance. This is a collection of drawings which should not be overlooked, the work of a powerful and original artist, deeply impressed with the melancholy interest of the scenes he portrays—scenes haunted by the ghost of Imperial Rome.

THE Goupil Gallery exhibits a collection of small landscapes by Mr. J. Buxton Knight, an artist with a very broad style which occasionally becomes exaggerated into what may be called roughness of execution and a too palpable loading on of pigment. For instance, in "Blue Bell Wood" (14) it strikes one that, for an artist who professes to paint direct from nature, there is a great lack of the brightness of colour which one would find in the actual scene; the bluebells are not blue enough. But Mr. Knight is a fine painter of scenes in which an extent of country combined with a large expanse of sky form the main elements, as we see in "The Golf Ground" (3), "At Worthing" (36), "Gipsy Land" (48), showing an exceedingly fine sky, and "Morning on the Common" (45), a true effect of morning light, when one gets far enough away to lose the look of paint. "Greenwich

Hospital" (28) is an exceptionally good water-colour sketch of the building seen from the river.

The Handel Festival.

THE Twelfth Triennial Handel Festival at the Crystal Palace,

as far as the first two days are concerned (the third performance will not have taken place till after these remarks are in print), has been one of the most successful in an artistic sense, both in regard to chorus and solos. The performance of the *Messiah* on Monday may be said to have been an exceptionally good one; and when it is considered that the size of the orchestra is such that chorus-singers at one side cannot hear the voices of those at the other side until an appreciable interval after the sound has been emitted, and that conscientious attention to the bâton can alone give a chance of keeping perfect time together, the clear execution of such a chorus as "All we like sheep" by this immense mass of singers was a remarkable feat. The "Selection Day" on Wednesday introduced two or three very fine compositions, both among choruses and airs, which are not often heard; but the loss of our great English organist, the late Mr. Best, was much felt in the organ concerto. The seating of the auditorium has been improved by raising the back portion of the area on a slope. Of course the acoustic conditions of the place of performance, both in regard to its structure and its plan, are unfavourable; a great deal of sound escapes which ought to be reflected and concentrated towards the audience; and of course the best and most intelligible execution of music is not to be attained with so numerous and unwieldy a chorus, and in a space far too large for the adequate hearing of solo voices. But, on the other hand, at special points in the choruses such stupendous effects are realised that it is worth while to have them from time to time, in spite of all contingent drawbacks. The "Hallelujah" chorus in the *Messiah*, for instance, the broad, simple, and massive character of which renders it so suitable for performance by an immense body of voices, attained a sublimity of effect which was quite overwhelming, and which we do not think can have been realised under any other circumstances.

ROYAL SOCIETY CONVERSAZIONE.

The June soirée of the Royal Society, held on Wednesday last at Burlington House, was, as usual on "ladies' night," a complete success. This year the evening was, more than ever, given over to effective displays, in which electricity played the most conspicuous part. It was natural that at this season the most ancient of learned societies should decorate the entrance hall to its apartments with tokens of loyalty to the Sovereign, and "Vivat Victoria Regina" was written large in tubes filled with the recently-discovered elements, argon and helium.

Lord Kelvin showed the electrical effects of uranium, more particularly the work done (which he calls quasi-"perpetual motion") by contact between uranium and zinc, or aluminium, or air. Experiments on cathode and some analogous rays were exhibited by Professor Silvanus Thompson; the most interesting, perhaps, from a scientific point of view, were the "diacathodic" rays, which are non-deflectable and evoke a dark orange fluorescence in glass, in a tube in which the ordinary cathodic rays are directed against a gauze screen which is itself negatively electrified: the diacathodic rays pass through as a blue cone. Dr. Alexander Muirhead had an exhibit reminding us that Dr. Oliver Lodge practised signalling by Hertz

waves, but the Branly tube was now adapted to a Kelvin recorder. Experiments with Röntgen rays were made by Mr. Campbell Swinton, who demonstrated that the penetrative value of the X-rays produced by a focus tube can be varied without altering the vacuum by altering the distance between the cathode and anti-cathode, or by varying the size of the cathode, or by altering the position of the cathode relatively to the glass walls of the tube, or by means of a variable magnetic field. The same experimenter, amongst many other things, exhibited an improved adjustable tube for practical X-ray work, with which it is easy to obtain rays of exactly the best penetrative value for any special purpose as required, and also to maintain this penetrative value at any desired degree. This latter is eminently satisfactory as furnishing a clue to a method of standardising the power of penetration by the rays. Messrs. Carver and Barnard showed some experiments, illustrating a new method of controlling the electric arc in its application to photomicrography, by which, absolute constancy in the position of the source of light is secured. Interesting electric figures were exhibited by Lord Armstrong, showing the effect produced by discharges over surfaces of a resinous or bituminous nature. The discharge leaves no appearance on the surface until dusted with sulphur and red lead, when the positive parts of the figure come into view in yellow tints, and the negative in red. An exhibit of a somewhat similar character, showing static effects produced by convective electric discharges, was made by Mr. J. W. Swan. Dr. J. H. Gladstone and Mr. W. H. Hibberd had photographs illustrating the absorption of Röntgen rays by certain elements and their compounds, including carbon and various hydrocarbons, copper and its oxides, ferrous and ferric chlorides, mercury proto- and peracetate, lithium, bromide, &c. Two induction coil contact makers and breakers, designed by Sir David Salomon, gave excellent results.

One of the most interesting exhibits, from our standpoint, was that of Mr. A. F. Bilderbeck Gomes, consisting of four examples of Bonnard's process of colour photography. By the action of light passing through a positive print upon a surface coated with treacle and bichromate of potash, the surface is rendered more or less sticky according to the action of the light. Metallic oxide pigments are dusted on in a certain order, and adhere in their proper places. The film is then made consistent by the use of a preparation of collodion, it is floated off the surface, and whilst wet and elastic, applied to the surface of any piece of porcelain. It is then burnt in as in the ordinary method of hand painting. Considerable skill is required in dusting on the metallic pigments at the right moment, and the colours have to be "touched up," but the process is fairly rapid, a quarter of an hour being sufficient to finish the whole, even where twelve or fourteen colours have to be applied. Sir H. Trueman Wood exhibited illustrations of the Dansac-Chassagne process of producing photographs in colours, but much of the interest was lost in the circumstance that the details of the method are not known at present. Photographic prints (silver) are treated with a solution containing albumen and certain metallic chlorides, and afterwards with blue, green, and red colouring materials. The process is stated to be entirely automatic.

Messrs. Edser & Stansfield exhibited an apparatus showing the phase change of light reflected at a glass silver surface. It consisted of a modification of Michelson's differential refractometer, the interfering rays being reflected at the back surfaces of the end mirrors. Mr. Shelford Bidwell illustrated a peculiar phenomenon brought about by rotating discs, demonstrating apparent transformations of colour. This has recently been described in the "Proceedings of the Royal Society" (May 13, 1897). The phenomenon depends upon the rapid production of negative after-images under curious conditions. In a thin metal disc there is cut an opening having the form of a sector of about 60 deg.; the front surface of the remainder of the disc is divided radially into two equal portions, one of which is made black and the other white. The disc is illuminated by a good light, and is caused to rotate in such a direction that the open sector is preceded by black and followed by white. A coloured object placed behind the rotating disc, and viewed intermittently through the open sector, appears to assume a tint complementary to its actual hue. Thus, for example,

a picture of a rose represented as having a green flower and red leaves is seen as a pink flower with green leaves.

Crystals of diamonds, separated from carbonised iron, produced with certain modifications by the method described by M. Moissan, were exhibited by Professor Roberts-Austen.

It is not within our province to describe the natural history exhibits; but Professor H. G. Seeley exhibited a micro-section of a tooth of a theriodont reptile, which goes far to show that that division of the reptilia is closely related to certain mammals included amongst the marsupials.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS: ANNUAL ELECTIONS.

At the business general meeting of this Institute, on the 14th inst., the Council for the year of office 1897-98 were declared to be duly elected as follows:—

President.—Professor Aitchison, A.R.A.
Vice-Presidents.—William Milner Fawcett, M.A.Cantab, F.S.A.; Henry Louis Florence; Ernest George; and Edward Augustus Gruning.

Hon. Secretary.—William Emerson.
Members of Council.—John Belcher; Thomas Blashill; James Brooks; John McKean Brydon; William Douglas Caröe, M.A.Cantab, F.S.A.; Thomas William Cutler; Campbell Douglas, Glasgow; John Alfred Gutch, F.S.A.; Kettering; Alexander Graham, F.S.A.; Charles Hadfield, Sheffield; Benjamin Ingelow; Edward William Mountford; John Slater, B.A.Lond.; Richard Phené Spiers, F.S.A.; Henry Heathcote Slatman; Paul Waterhouse, M.A.Oxon.; Aston Webb, F.S.A.; and Ralph Selden Wornum.

Associate-Members of Council.—Edward Guy Dawber and Arthur Smyth Flower, M.A. Oxon, F.S.A.

Representatives of Allied Societies.—William Larkins Bernard, Bristol Society; Albert Nelson Bromley, Nottingham Society; Thomas Drew, R.H.A., Royal Institute of Ireland; John Ely, Manchester Society; Leslie Ower, Dundee Institute; Henry Perkin, York Society; Arnold Thorne, Devon and Exeter Society; and Edwin Montgomery Bruce Vaughan, Cardiff, South Wales, and Monmouthshire Society.

Representative of the Architectural Association (London).—Hampton William Pratt.

At the same meeting the following Fellows and Associates were declared duly elected to serve on the respective Standing Committees for the ensuing year of office, viz:—

ART STANDING COMMITTEE.

Fellows.—John Macvicar Anderson; John Belcher; James Brooks; John McKean Brydon; William Douglas Caröe, M.A.Cantab, F.S.A.; Ernest George; Edward William Mountford; Beresford Pite; Alfred Waterhouse, R.A.; and William Young.

Associates.—Robert Shekleton Balfour; Edward Guy Dawber; Owen Fleming; James Sivewright Gibson; Henry Thomas Hare; and John William Simpson.

LITERATURE STANDING COMMITTEE.

Fellows.—Henry Louis Florence; Alexander Graham, F.S.A.; Benjamin Ingelow; John Tavenor Perry; William Alfred Pite; Sydney Smirke; Richard Phené Spiers, F.S.A.; Charles Harrison Townsend; William Frederick Unsworth; and Paul Waterhouse, M.A.Oxon.

Associates.—Arthur Thomas Bolton; Arthur Smyth Flower, M.A.Oxon, F.S.A.; Andrew Noble Prentice; Ravenscroft Elsey Smith; Leslie Waterhouse, M.A.Cantab.; and Percy Scott Worthington, M.A.Oxon.

PRACTICE STANDING COMMITTEE.

Fellows.—Thomas Batterbury; Henry Cowell Boyes; Samuel Flint Clarkson; Edwin Thomas Hall; Thomas Harris; Alexander Henry Kersey; Joseph Douglas Mathews; Walter Hilton Nash; Lacy William Ridge; and Edmund Woodthorpe, M.A.Oxon.

Associates.—William H. Atkin-Berry; Francis Thos. Wilberforce Goldsmith; Frederick Henry Appleton Hardcastle; Henry Thomas Hare; and George Richards Julian; and Augustus William Tanner.

SCIENCE STANDING COMMITTEE.

Fellows.—Lewis Angell, M.Inst.C.E.; Frederic Richard Farrow; John Salmon Quilter; Herbert Duncan Searles-Wood; William Howard Seth-Smith; Percival Gordon Smith; Lewis Solomon; William Charles Street,

Assoc.Inst.C.E.; Benjamin Tabberer; and Keith Downes Young.

Associates.—Henry William Burrows; Max Clarke; Robert Langton Cole; Bernard John Dicksee; Matthew Garbutt, Assoc.M.Inst.C.E.; and George Pearson.

The following candidates for membership were elected by show of hands under by-law 9, viz.:—As Fellows: E. A. Ram (Hong Kong), S. P. Silcock (Warrington), G. E. Halliday (Cardiff), F. G. F. Hooper; as Associates: E. A. Jolliffe, E. H. Payne, E. Nicholson, J. Saunders (Oldham), H. T. Porter; as Hon. Associates: H. W. Brewer, J. Lewis Thomas, Sir J. D. Linton, President of the Royal Institute of Painters in Water Colours; as Hon. Corr. Members: Jean Jacques Winders (Antwerp), A. C. Arthur, Comte de Marsy (Compiègne, France), Jean Theophile Homolle (Paris).

An adjourned special general meeting was then held, Mr. Aston Webb, F.S.A., vice-president, in the chair.

The Chairman opened the proceedings with a statement detailing the reasons for the appointment of the Fellows Committee, briefly sketched the proceedings at the meetings of the committee and the conferences with allied societies, and concluded with a description of the modifications introduced into the report by the Council in deference to the views expressed by members at the meeting of the 31st ult.

Mr. H. Vaughan Lanchester having withdrawn the amendment moved by him at the last meeting, that the report be referred back to the Council, the various clauses of the report were discussed *seriatim*, with the result that it was

Resolved.—That the form of voting papers be altered, so that the names on the list voted against have to be crossed out.

That attention be called to the requirements of the Council as to the drawings, &c., to accompany an application for Fellowship.

That it is desirable that Associates who are eligible should come forward for election as Fellows.

That when the Council of the Institute receive a unanimous recommendation formally submitted by the Council of any Allied Society that a practising member of the profession in their district is eligible and worthy of being elected a Fellow, the Council shall have power to elect him, his work being of sufficient merit.

On this and the two following resolutions the Chairman ruled that, under the terms of the Charter, Associates were debarred from voting; the vote therefore was restricted to Fellows.

It was further

Resolved, That power be given to the Council to admit annually to the Fellowship, without ballot, the President or President-elect of any or all of the Allied Societies who are eligible and apply for admission.

That the Council dispense with the payment of an entrance-fee in the case of non-Metropolitan Fellows during the pleasure of the Council.

That a room be utilised as a tea and smoking room, and that no books from the Institute library be consulted therein with the exception of periodicals and the professional journals.

That it is desirable to hold periodical conferences, meetings, and dinners, a certain proportion thereof to take place in the provinces, with a view to promoting more friendly intercourse with the allied Societies.

That the allied Societies be invited to arrange, when possible, the date of election of their officers and the duration of their sessions, so as to correspond with those of the Institute.

The Chairman, having moved the adoption of the report as altered and amended, and a section of the meeting being opposed to the passing of the resolution numbered 5 in the report (fourth on the amended list set out above), suggested the limitation of the power to elect conferred on the Council by that clause to a period of five years. The clause was then added to as follows: "And further that the operation of the by-law embodying this resolution be limited to a term of five years." The report was then put as a whole, and carried by forty-four votes to twenty-five.

The alterations in the by-laws required to carry out the resolutions arrived at were hereupon put to the meeting, and it was

Resolved, that the following paragraph be added to By-law 9:—

Provided always that when the Council of the Institute receive a unanimous recommendation formally submitted by the Council of any Allied Society that a practising member of the profession in their district is eligible and worthy of being elected a Fellow, the Council shall have power to elect him, his work being of sufficient merit, and that the operation of this provision be limited to a term of five years. The Council may also admit annually to the Fellowship, without ballot, the

President or President-elect of any or all of the allied societies who may be eligible and apply for admission.

It was further Resolved.—That clause (a), By-law 15, be added to as follows:—

Provided always that the Council may, during their pleasure, dispense with the payment of an entrance fee in the case of non-Metropolitan Fellows.

A motion by Mr. Seth-Smith, that a further resolution be added to the report, not being seconded, was dropped.

The proceedings then closed.

The above report has been abstracted from the R.I.B.A. Journal.

INTERNATIONAL CONGRESS ON EDUCATION.

THE fourth International Congress on Technical Education, following that held in 1895 at Bordeaux, and the previous congresses held in Paris in 1880 and Bordeaux 1886, began in London on Tuesday last at the Society of Arts. At the opening M. Léo Saignat, President of the 1895 congress, presided, giving place, after a brief address in French, to the Duke of Devonshire, the new President. In welcoming the foreign delegates, particularly M. Saignat, of Bordeaux, and M. Jacques Siegfried, of Paris, the Duke explained the very different relations in which the Government of this country stands towards educational questions from the more direct official relations which other Governments held towards them. It was now admitted that there were some good points about our own methods, but all Englishmen admitted that we had much to learn from other countries—France, Holland, Germany, Switzerland, America, &c.

The papers of the first day's sitting related chiefly to chemistry.

At the second sitting, Sir John Donnelly presiding, Sir Phillip Magnus read the first paper, "Theory and Practice in Trade Teaching." Some "arts and crafts," said the lecturer, could be taught properly in school, and in Ireland and such countries where trade had languished such schools for carefully selected trades would probably prove serviceable. The great majority of industries were best acquired in the factory and shop, the instruction of the technical school being only supplementary. The Germans were still in the elementary stage of trade teaching, but were beginning to recognise the value of practical work, and of the necessity of a good equipment of suitable appliances in their schools. The City Guilds of London Institute had tried to solve the difficult problem of science teaching to artisans in various ways, and their later experiments in inducing young artisans and apprentices to take up a course of preliminary instruction in which the principles of science were presented in relation to the practice of certain trades had succeeded fairly well. Preliminary courses had been arranged in electrical engineering and lighting, and for apprentices in plumbing and certain other branches of the building trade.

Mr. Sidney H. Wells (principal, Battersea Polytechnic) in the next paper, dealing with the "Training of Technical Teachers," showed that the greatest difficulty encountered was the provision of satisfactory teachers. He had endeavoured to overcome the difficulty by formulating a scheme of scholarships for training instructors in the trades of bricklayers, carpenters, painters, house decorators, masons, plasterers, and plumbers, giving free admission to evening classes for two, three, or four years, with text-books and materials provided. For twelve scholarships offered only nine applicants were found suitable, and two had relinquished their scholarships in the first month. The remaining seven would have their scholarships renewed next year, and others would be awarded in the coming session. Reference was made to a method adopted at some institutes where a professional man or a trained teacher gave the instruction in conjunction with a workshop instructor. Classes in plasterers' work, for example, would be taken by practical teachers engaged in the trade, the instruction being under the direction of the art-master, or classes in brickwork would be conducted under the supervision of an architect, by a practical bricklayer. But such schemes were necessarily costly, and their efficiency depended largely on the training and qualifications of the art-master or architect.

A discussion upon the two papers followed, in which Mr. Woodward (Birmingham), Pro-

fessor Ayrton, and Professor Silvanus Thompson, of the City and Guilds Institute, Dr. Dunn, Mr. Alderman Park (Ashton-under-Lyne), Professor Garnett, Professor J. H. Reynolds (Manchester), and Mr. Mundella, M.P., took part. The views of the lecturers were generally approved.

Professor Reynolds pointed out that when artisan students presented themselves they were often lamentably deficient in the elements of knowledge. He knew of 250 plumbers who had applied for admission to the technical schools of Manchester who knew nothing about drawing and could not do the simplest sum in arithmetic.

Mr. Mundella, M.P., confirmed the experience of Professor Reynolds. It was the fact that students presented themselves at these special classes who knew nothing of drawing and had never had a pencil in their hands. They ought to urge upon Parliament the necessity of prolonging the school age, as in other countries.

The President, in winding up the discussion, said he thought the words in the Technical Instruction Act forbidding the teaching of trades in schools were often misunderstood. The intention of the Act was probably only to prevent the teaching of the practice of any trade or profession. They were not to give such training as tended to develop rapidly and skill, which was the province of the training given to a journeyman or a craftsman. One of the papers presented in the afternoon was by Mr. Edwin O. Sachs on "A German Technical College from an English Point of View," which we print on another page.

Papers were also read in the afternoon, when Mr. Mundella, M.P., took the chair, on "Technical Education in Württemberg" by Herr von Diefenbach, on "Limitations to Technical Instruction" by Sir Joshua Fitch, and two in French, the first on "Technical and Commercial Education in Belgium" by Mons. Edouard Séve (Consul General), and the second on "Private Initiative in Professional Education in Belgium."

In another section, over which Mr. J. W. Sugg (Master of the Clothworkers' Company) presided, papers on "Agricultural Education" by Mr. F. J. Lloyd (King's College), and "Practical Training in Agriculture" by Mr. Harold E. Moore were read and discussed in the morning, and they were followed in the afternoon by a paper on "Technical Education in Architecture and the Building Trades" by Mr. W. R. Lethaby, and by papers on Technical Education in connexion with watch and clock making, electrotyping and kindred industries, glass manufacture, gold and silver trades, &c.

Mr. Lethaby said he recognised no distinction between architecture and building, and defined architecture as "the result of the association of the several building trades." According to this view, the architecture of the Middle Ages was the masonry and carpentry, the smithing and plumbing, and so forth, brought together in the wonderful works of that period. Modern English architecture was the whole product of the current customs of building in England, and London architecture the mass of building from Bow to Putney, and from Hoxton to New Cross. It was in the multitude of ordinary and characteristic buildings rather than in a few exceptional ones that what was typical of London architecture would be found. The question of technical education in architecture was, therefore, not a mere academic one, but one of enormous practical importance to humanity and civilisation.

Architecture, equally with literature, was a form of expression. Literature was but the written word, architecture was the builded word. In architectural thought our modern relation to facts was exactly represented by our current building speech, revealed to ourselves in the corrugated iron shed, the mean meeting-house, the restored cathedral, the sham Gothic church, the sham Renaissance town-hall, the dull workhouse, the silly villa, and the general vulgarity of our streets. In the Middle Ages the masons' and carpenters' guilds were faculties or colleges of education in those arts, and every town was, so to say, a craft university. Corporations of masons, carpenters, and the like, were established in the towns; each craft aspired to have a college hall. The universities themselves had been well named by a recent historian "Scholars' Guilds." The guild which recognised all the customs of its trade guaranteed the relations of the apprentice and the master craftsman with whom he was placed; but he was really apprenticed to the craft as a whole, and ultimately to the

city, whose freedom he engaged to take up. He was, in fact, a graduate of his craft college, and wore its robes. At a later stage the apprentice became a companion or a bachelor of his art, or by producing a masterpiece, the thesis of his craft, he was admitted a master. Only then was he permitted to become an employer of labour or was admitted as one of the governing body of his college. As a citizen, City dignities were then open to him. He might become the master in building some abbey or cathedral, or as King's mason become a member of the royal household, the acknowledged great artist of his time in mason-craft. With such a system was it so very wonderful, after all, that the buildings of the middle ages, which were indeed wonderful, should have been produced? In the modern architecture of London our less noble ideals and less perfect systems were as perfectly reflected in a vast mass of common building produced by farming out to a financial agent called a contractor, who employed to do the work gangs of men having no say in the matter and who, for the most part, had "picked up" their trade. The general sordidness of the building was diversified here and there by a careful design done out of an architect's head, after study of the real mason's art of the past.

The change began when that great wave of reaction set in at the beginning of the 16th century—the revival of learning. Roman law and Roman antiquities were ransacked for pretexts by the new scholars, and scholarship in Roman art was used as a lever to thrust out the customs of the crafts as held by the guilds. Drawing-master designers, commercial travellers in art, coming from Italy, hung about the Courts of France, Germany, and England, and the old master-masons who held the living tradition of the building art were displaced by men who were painters rather than masons. From that time the architect became a painter or a drawing-master of buildings, rather than a graduate of the shops.

On the question of technical schools and craft education, the lecturer said we must break with the literary view of education, according to which the chief end of man was to count statistics and read newspapers. Literary education was only one of a dozen avenues to culture. Craft excellence must once more be made an object of ambition, through which the craftsman, as such, might reach to some of the world's rewards. The only reward obtainable in a craft must not be the getting out of it.

Mr. Lethaby concluded his paper with the following peroration:—

"The architect of the past (best represented by the building foreman of the present) was a mason or carpenter, and I am convinced that ultimately the great crafts should largely reabsorb the architect. In the meantime, however, although the path must be opened out by which the able practical mason and carpenter may become directors of building, it is necessary to educate a class who are specially brought up to direct crafts they do not practise, so that they may direct them as little capriciously as may be. The youth intended for an architect should in every case pass through the elementary stages of the masonry and carpentry schools along with the masons and carpenters, and he should have the run of all the other craft schools under certain conditions. He should, moreover, in a special school of Building, consider the crafts in combination and the conditions and traditions of the several types of arrangement suitable for different classes of buildings. As a return of courtesy and service the school of architecture should be open to the craftsman who wished to know something of building as a whole. The architect's special work is to be an expert in arranging and combining. The quality and details of the masonry are necessarily mason's matters; the curls and twists of the ironwork are the blacksmith's business; plumbing, sanitary and ornamental, is plumber's work; it is a ruinous policy which, instead of throwing on them the responsibility in their several trades, stirs up their instinct to get the better of clerks of works and architects. The architect's essential function is not to guarantee the quality of materials and workmanship he does not fully understand; it is not to design ornament out of his head so that materials which he has never wrought with his hands may be tortured into a semblance of his intention by mechanical workmen; his true function is to arrange and

contrive highly specialised buildings, to act as an intelligence department for the several crafts, and as one having a knowledge of building as a whole to advise his employers. At the present time building should be plain, straightforward, sound, and, as far as may be, reasonable; mere plinths and even baldness do not insult us like heartless bedizenment, or the assumption of the trappings of antiquity."

The sections on Thursday were mainly occupied with questions of the work of County Councils, Polytechnics, Evening Schools, and Commercial Education, the Congress concluding on Friday with papers and discussions by ladies on the technical education of girls and women in the sittings of Section A, papers and discussions on Technical Education in British colonies and dependencies in Section B, and by the concluding general meeting of the Congress.

ARCHITECTURE AT A GERMAN TECHNICAL COLLEGE: FROM AN ENGLISH POINT OF VIEW.*

WHEN I handed in the title of this paper, I was under the impression that the time available for reading it would have been the conventional one hour generally given to a lecture, and I had intended making an attempt to describe the chief features of a well-known German Technical College in all its departments. As it has been found necessary, however, to reduce the time available for each paper to twenty minutes, I am afraid that I shall have to confine my remarks to one of the sections of the institution with which I am to deal.

This institution is the Royal Technical College at Berlin, which, to my mind, is the leading establishment of its kind to be found in the German Empire, or, for the matter of that, in German-speaking countries, Austria included, and the section to which I shall devote my remarks more especially will be the Architectural School or division of that institution. As an architect who has studied there and has enjoyed the facilities of this special division it will be easily understood that I should give preference to the department of which I have had considerable personal experience.

In the first place I would give a brief outline of the origin of this institution. The Berlin Technical College, as it now stands, has been in existence for only thirteen years, for it is since 1884 that it has occupied the premises it now holds. The scheme of organisation on which the establishment was based dates, however, from 1879, the intervening period being utilised chiefly for the preparation of the necessary buildings, which were designed and executed on a lavish scale. The present nature of the institution has grown out of an amalgamation of the old Architectural Academy at Berlin and the Engineering Academy of the same city, which previously had separate existences. They had passed through similar phases of development, both having during the early years of the present century. These establishments were reorganised under the Prussian Government, and both were owned and practically managed as the property of the Prussian people. The new institution is also essentially a Prussian one, on which the Government of that country spends annually a considerable sum of money, and this point as to the ownership of the original, and subsequently of the new, establishment is an important feature to be remembered.

The old Architectural Academy to which I have just referred, though only in working order in the opening days of the present century, officially dates from April 8, 1799, when a charter for a new "Bauschule" literally, "Building School" or better, School of Building Construction, was signed by the then reigning king, Frederick William II. Its organisation was primarily intended for the education of architects and surveyors who proposed entering Government service. The first curriculum of this early period included no less than twenty-three subjects, and, though the qualifications for entry to the classes consisted almost solely in the possession of a good character and elementary education, the scope of the instruction was by no means limited. I should, perhaps, add that this institution was one of the first of its kind on the Continent. The old "Building School" very soon became popular, and consequently its development was

rapid; so much so, indeed, that greater restrictions had to be placed on those wishing to become students. A few years later we hear that one year's practical experience in an architect's or surveyor's office was a primary condition for attendance at these classes. In 1801 no less than fifty pupils attended the schools, and in 1806 the number had risen to seventy. Here I would particularly emphasise the fact that the establishment embodied only the requirements indicated by its title; it was a building school pure and simple—not an architectural school in the modern sense. The classes were essentially of a practical nature. Architecture, as an art, and design, from an artist's point of view, were subjects dealt with by the Prussian Royal Academy of Art, which had then, as it has now, its architectural studio, and to which members of the "Bauschule" might belong. It was not until the year 1828, when Professor Stier was one of the leading masters of the old establishment, that the art side of an architectural education received the attention that it had long merited from the executive, and soon after, in 1835, more suitable accommodation for the development of this side was found in an extensive block specially erected by Schinkel. In 1849 the "Building School" underwent reorganisation, and became a bona-fide architectural academy, managed on university lines, and with all the freedom traditionally associated with German university life; and this not only refers to the organisation of the establishment as such, but also, on the one hand, to the spirit with which the masters treated students, and, on the other, to the manner in which the students applied themselves to their studies. The organisation of 1849 practically remained unchanged until the great amalgamation of 1879 already alluded to. Throughout this period the courses were followed by an examination which entitled the successful candidate to certain claims for Government employment, and gave him the title of a Government architect, even if he did not choose to avail himself of a public office, but preferred to practise privately as an architect or surveyor.

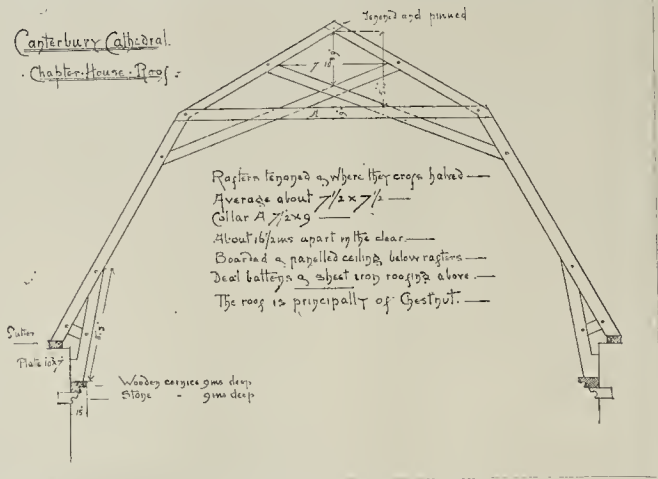

It would lead me too far were I to touch in a similar manner on the interesting development of the Engineering Academy, and hence I shall only note that in 1827 it was first known under the title of the Berlin Technical School. Its development was, as I have said, not unlike that of the Architectural Academy, both as regards classes, conditions of entry, and so on, while in 1850 it was similarly reorganised on university lines, and from that date became an engineering academy proper. Mechanical and mining engineering, naval architecture, and chemistry were comprised in its programme, and each of these sections was, to a certain extent, regarded as a separate department of the establishment.

The amalgamation of these two Academies took place, as stated, in 1879, and resulted in the establishment of the Royal Technical College, which in every way possesses a university status, and is in no way to be compared to what we term a "Technical College" in this country. In order that the college may offer the best opportunities for the most efficient education, the executive retains the leading men of the time for its professorial chairs. The social and educational status of the student is high, for every candidate is expected to have enjoyed a superior education at a first-class school. From a German point of view, the expense of sending a youth to this college is by no means a small matter, though it may seem slight in comparison with English university fees. The whole time of the student has to be given up to his college work, a full course of instruction occupying four years, or perhaps longer. The Royal Technical College has its five distinct branches, i.e. (1) Architecture; (2) Civil Engineering; (3) Mechanical Engineering; (4) Mining Engineering, Chemistry, and Mineralogy; (5) General Technical Science. Each division has its distinct head, who is generally a *savant* of considerable experience elected from among the body of professors of the section in question; and the Chancellor, Vice-Chancellor, and General Council of the establishment are elected on similar lines, subject to the approval of the Government and the sanction of the Sovereign. The professorships are in the gift of the King, the tutorships are granted by the Executive. The students rank with university students, and their characteristics and pastimes are almost identical. The Royal Technical College is housed in what is doubtless the

* A Paper read by Mr. Edwin O. Sachs, on Wednesday, the 16th Inst., at the Congress on Technical Education in London.

finest building ever devoted to an educational establishment of this description; in fact, it is quite a palace, having considerable architectural pretensions. It cannot be too much impressed on those who have witnessed our technical classes carried on in almost squalid surroundings, how important it is that we should give to technical students a home which in every way embodies the achievements of this age of progress in technical science, and does credit to the period of architecture to which it belongs. I should much like to describe the beautiful building and its practical equipment, which might well serve as a model to the world, though its conception is perhaps almost too elaborate and too costly from an economic point of view. I must, however, content myself with saying that its dimensions are approximately 700 ft. by 300, that it has five courts, of which the central one is covered in, and that it has four stories, all of considerable height. Its lecture-rooms are spacious and numerous, and its class-rooms and studios thoroughly serviceable and well lighted. The number of students for which it was intended was 2,000, and to-day, although there are 2,913 on the books, it still admirably fulfils its purpose; but the popularity which its educational facilities have won for it, will, no doubt, soon compel a considerable extension being made. Of these 2,913 students I should here, perhaps at once add, that there are only 306 architectural students fully matriculated, with 221 non-matriculated, making in all 527, whilst the mechanical engineers number together nearly 1,300. I should also, perhaps, add that there are a considerable number of foreigners among the students, Russia, for instance, regularly sending a large contingent.

But, turning now to the courses available for students of the architectural section, I ought first to say that, besides the subjects taught in the architectural division proper, much that is valuable is to be learned from the civil engineer's department, in the general technical classes, &c., and special facilities are afforded to the architectural student for attending suitable lectures in other sections. The architectural division has eight ordinary and twelve extraordinary professors and fifteen tutors, headed, as I have said before, by a divisional chief elected from among the professors. The courses available include a large number of different lectures on various periods of architectural and art history; further, elementary and advanced drawing, freehand, perspective, geometrical, and architectural draughtsmanship, water-colour work and modelling. Then, again, there are classes for the general planning of private dwellings and public buildings of all descriptions, for design in various specific styles, and for divers purposes, the designing of ornament, of furniture, of lead-glazing, metal-work, &c. In addition to these, there are exhaustive lectures on the evolution of particular features in design, such as that of ornament; while among the more practical subjects every form of construction is taught, from the simplest brickwork to the most complicated iron roofing. The characteristics of different materials are also important subjects dealt with, as are heating and ventilation. Special forms of building are also treated as separate subjects, as well as the various equipments. For instance, we find lectures on the necessary appliances for hospitals, prisons, and libraries. Building legislation is, moreover, not overlooked. Turning to the lectures which are given in other sections, we find those on mathematics, physics, statics, geology, chemistry, book-keeping, and general elementary law, included in the curriculum of the general science division, and in another department the housing of the working classes—in fact, there are few German requirements which are not fully attended to at this college. I use the expression "German requirements" advisedly, for sanitation, which really occupies a very secondary position in a German architectural practice, receives scant treatment at this institution. And again, the measuring up and sketching on the spot, which we consider so important, the German architect does not appear to appreciate, and, as a subject of study, it is almost overlooked in the Berlin curriculum. Of course, the student has to select his own subjects, and to distribute them over the four years which he spends at the Technical College, and if we turn at random to the list of subjects taken up by a first year man on, say, Tuesday, we may probably find that in the forenoon he attends lectures of an hour each in mathematics, elementary construction, and a class in elementary

drawing; and in the afternoon, perhaps a lecture of one hour on geology or materials, followed by a class of elementary draughtsmanship of from two to three hours duration, including, say, instruction in the classic orders. If we were then to take a fourth year's student's list for the same day, we might, on the other hand, find a two hours' lecture on the history of architecture, and a two hours' class on design in the Renaissance style; then in the afternoon he may give a couple of hours to practical design, such as the planning of public buildings, and attend an hour's lecture on heating and ventilation. From these examples it will be seen that in the earlier stages of the Berlin student's work, he seeks to obtain a foundation in draughtsmanship and science, while at the latter end of his course, he devotes most of his time to the designing of buildings, some historical study, and to gaining a knowledge of special equipment. It would no doubt be interesting to follow the architectural student's career from year to year or from term to term, but this would take too long, and I therefore only quote a couple of examples from a student's time table.

But now, after these historical and descriptive notes on the Royal Technical College at Berlin, I would ask if there are any advantages in the system of architectural education adopted by the Prussian Government. To my mind, though the opportunities for study are delightful, there is obviously something wanting in the whole system. Every preparation is made for the student to obtain knowledge, yet the result is by no means as satisfactory as might be expected. Does not this arise primarily from the student starting fresh from school without any previous elementary practical knowledge of construction? He has never been on a building in course of erection, and does not know the difference between a piece of oak and a piece of deal. Further, owing to his not having seen an actual moulding cut, he has no idea of the method of its production. For four long years he spends nearly the whole of his time in theoretical study, and, as far as my own experience goes, there are but few men who utilise even the smallest part of their leisure in getting some idea of the nature of practical work. Does not a school where merely the theory of architecture is taught have a tendency to produce an architect of an academic character, though, of course, there may be the usual exceptions of brilliant and talented men, or those who are ambitious and energetic and who do not follow the lines laid down for them? Do not many of the masters, too, in such a school soon lose all touch with practical work, and, though brilliant scientists or historians, on receiving their professorship, do not they lose all sympathy with the movements of the time, and even, by going through the same course regularly year by year, become mechanical and uninteresting in their methods, inspiring no enthusiasm in their pupils whatever? I think there can be little doubt that, as at Berlin, for instance, so always the best and most popular masters are those

who keep in constant touch with current thought and practice.

As to the remedy for any unsatisfactory results, would it not be advisable that a boy should have a whole year's practical work in an office, with the run of some works for at least six months before he starts his elementary studies at the college, and should not every six months of theoretical study be interspersed with three months of practical work? Should not lessons in the measurement of existing buildings, to enable the student to grasp the appearance of what he is putting on paper? Would it not be well, too, that the instructors in design, construction, and in special equipment, should one and all be men actually in extensive practice, and that such subjects as history, the elementary sciences, and freehand drawing, should be left to men whose vocation is chiefly to impart knowledge, yet who should be compelled to keep themselves abreast of modern progress?

We have had under consideration an establishment organised on the most elaborate lines, in which there is but little left to improve, as far as the syllabus of the classes is concerned. The Berlin Technical College has been on its trial for over twelve years, and the results, to my mind, are not at all proportionate to the amount of time and money expended by the architectural student and the Prussian Government. Indeed, as the Berlin Technical College is in many respects a model to those advocating architectural education, so it must also serve as a warning to those extremists who would advocate merely theoretic study as the primary basis of a training in architecture and its actual practice. Much as we can learn from leading men in special technical subjects, the Berlin College only too plainly shows what harm can be done by taking an able man entirely away from his profession and thus preventing him from keeping in touch with that practical work which brought him into prominence.

I would conclude by saying that the architectural school at the Royal Technical College of Berlin is an institution well worthy of our attention, and in many respects of our imitation; but, at the same time, we must observe the disadvantages of too theoretical an education, and its evil effect upon a student destined for actual practice. What I have said with regard to the architectural school, I believe, holds good in many respects for the several engineering divisions of the same college.

CHAPTER-HOUSE ROOF, CANTERBURY CATHEDRAL.

THE accompanying diagram is a measured sketch of the section of the ancient roof of the Chapter-House at Canterbury Cathedral, kindly communicated to us by Sir A. Blomfield.

Some remarks in regard to the roof will be found in a communication from Sir A. Blomfield in our issue of June 5 (page 508, ante).

THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A NORTH WALES district meeting of the members of the Incorporated Association of Municipal and County Engineers was held at Llandudno last Saturday. Mr. F. J. C. May, C.E., of Brighton, President, occupied the chair, and amongst those present were Messrs. H. Percy Boulnois, Liverpool; S. S. Platt, Rochdale; Gamage, Dudley; Farrington, Conway; Jones, Colwyn Bay; Lobley, Hanley; Shawe, Crewe, and others.

Mr. E. Jones, Chairman of the District Council, extended a very hearty welcome to the members to Llandudno, and spoke of the important work of Municipal Engineers in promoting the health, comfort, convenience, and general welfare of the community. He believed there had been a greater advance in engineering science during the Queen's long reign than in any other profession.

The President, in acknowledging the reception, thanked the Chairman of the District Council for the kind way in which he had received the members of the Association, and said that since his previous visit to Llandudno he had come to the conclusion that the local authority was pursuing a wise and liberal policy with regard to the interests of the town.

Mr. E. P. Stephenson, Assoc.M.Inst.C.E., Engineer to the District Council, read a paper on the Municipal Works of Llandudno. He said that the present resident population was estimated at 9,000, and its visiting population in the height of the season, which lasted practically from Whitsunfide to October, was about 16,000 to 18,000. The town was rapidly growing in size, the population in 1871 being 3,605; in 1882, 4,839; in 1891, 7,333; and at present was estimated at 9,000. Almost all building operations were carried on during the winter, and during the present year 121 houses were in progress up to date. The death rate, including the visiting population, was, last year, 17.4 per thousand. The town was governed by an Urban District Council, and the area under that control was 2,838 acres in extent. It had a rateable value of 73,739l., and the total improvement and highway rates for last year were 3s. 3d. in the pound. Previous to 1875 the town was supplied with water from springs on the Great Orme, the hill at the northern end of the town, the summit of which was 679 ft. above Ordnance datum; these supplies, however, becoming inadequate for the increasing population, powers were obtained for a more extensive supply, and the then Improvement Commissioners went into the Welsh hills for their water. They had purchased two lakes, Dulyn, 36 acres, and Melynllyn, 18 acres, with a surrounding watershed of 1,300 acres. The water was said to be as pure as that of Loch Katrine. Dulyn formed the chief supply, and was tapped at a depth of 12 ft. from the overflow giving an available store of 118 million gallons. Melynllyn was also tapped, under his direction, in 1895 to a depth of 4 ft. 3 in. and connected to Dulyn, giving an additional quantity of 21 million gallons. The rainfall in these hills was very great, averaging 97 in. per annum, and owing to the natural formation of Dulyn and the ground below it would be a very easy and comparatively inexpensive matter either to raise the present embankment or to form another but artificial lake on land already belonging to the Council. The water was carried by gravitation for a distance of four miles to a small service reservoir at Llanbedr. Though the town was possessed of such a splendid water supply at its source it had been found by actual experience that during certain portions of the day it was impossible with a 9-inch main to deliver sufficient water in Llandudno, and this being the case the present Council had decided to lay down in four sections a new main, 15 in. in diameter, alongside the existing main. This consisted of a total length of 3 miles 3 furlongs of 15-inch main, including a diversion across the River Conway, over a new bridge which was now nearly completed at Tal-y-Cafn. This diversion answered two purposes—it lessened the length of the main and increased the supply, and also placed the town in a more secure condition as regarded its supply, as the chief water main would then go over the river instead of under it as at present. Other extensions, however, beyond these were necessary, and the Council intended so soon as the supply was increased to supply water to points at higher altitudes than those they at present reached,

chiefly on the Great Orme. The sewage scheme was carried out by Mr. Baldwin Latham as engineer, in 1874, the sewage being discharged into the sea on the Conway Bay side of the town by a main outfall 21 in. in diameter, and carried to a point about 1,200 yd. seaward. When the state of the tide would not allow of discharge the sewage was temporarily stored in an egg-shaped tank sewer. Owing, again, to the increase of the town he (Mr. Stephenson) was instructed in 1893 to give a report upon the sewerage system. This report was referred to Mr. J. T. Wood, of Liverpool, and the joint result was the decision to materially extend the system, mainly upon the original lines adopted by Mr. Baldwin Latham. It was decided (1) to construct a 4 ft. 6 in. by 3 ft. relieving sewer from the uppermost end of the existing tank sewer to take all the sewage from the eastern end of the town; (2) to construct a new and enlarged outfall 27 in. instead of 21 in. in diameter; (3) to make provision for pumping to be used in case of emergency, and raising the sewage so as to discharge into the outfall during any period of high water; (4) to divert a quantity of rain-water finding its way into the sewers. Contracts had been let for the whole of the work, with the exception of the pumping, respecting which there was great diversity of opinion. The private drainage of the town was, on the whole, fair; but very great improvement was now being made under an energetic Sanitary Committee and a capable sanitary inspector. It had been his desire since he left Liverpool to adopt the system of "private flushing" which obtained in that city, viz., to flush every house drain at short periodical intervals free of charge, and he hoped now that the above extensions were carried out, and so soon as the first section of the new water main was laid, to inaugurate a flushing gang to do this work. The gasworks were also the property of the Council, and the average annual profit on the gas and water undertakings for the past ten years had been 677l. Though the gasworks belonged to the town the Council were of opinion that the electric light was also a necessity, and it had now been definitely decided to dispose of the house refuse by destructors in connexion with the electric-light station. Mr. A. H. Preece had been engaged by the Council to carry out the electrical portion of the scheme, and the combined destructor and electric-light station would consist of four destructor cells placed in pairs, back to back, three boilers, one of which would be hand fired, three engines and dynamos and condenser, battery room, offices, stores, and other accessories. The capacity of the plant would be sufficient for 10,000 8-candle power lamps, with fifty street lamps burning at one time. A small infectious diseases hospital had been erected, and with extensions contemplated would give provision for twenty-eight beds. The provision of a public slaughter-house had been under the consideration of the Council for years, and at last the matter had taken definite shape, and plans had been prepared. There was still, however, very considerable opposition to the scheme, many of the butchers in the town desiring that a series of private slaughter-houses under one roof should be erected, which should otherwise be under the entire control of the Council. As there were still so many conflicting interests at work in connexion with the scheme, it remained in abeyance; but as the land had been purchased, and it was the opinion of the Council that there should be a public slaughter-house, and that all private slaughter-houses should be abolished, he hoped that the scheme would shortly be an accomplished fact. Owing to land in Llandudno being so dear, and the consequent dearth of suitable houses for working men, the Council, in 1895, adopted the "Housing of the Working Classes Act, and under this Act were now completing nineteen workmen's cottages. Each cottage consisted of a living room and three bedrooms, with scullery, water-closet, pantry, and coal-house, and would cost, with the land, roads, and sewers, when completed, about 210l. per house. It was expected that they would be let at from 5s. to 6s. per house, per week. There had already been 100 applications for the nineteen cottages, and as the Council were somewhat divided in opinion as to whether they should be let to genuine working men or to those families which were at present living in rooms, or, in some instances, in somewhat insanitary buildings which were being gradually done

away with, there was likely to be considerable discussion before settlement. The means which, so far, had been taken to protect the promenade, and this only in the worst places, had been to construct a series of concrete steps from the promenade level to the shore level, the total length so far constructed, averaging eight steps, was 104 yards; and the cost, including an approach way to the shore, was 512l. Ash wattling had also been used with success near the pier. It was, however, his opinion that some more drastic measure would shortly be necessary to retain the sand and shingle, which appeared to be leaving the bay. The footpaths were asphalted at a cost of 1s. 3d. per yard.

The President said that the system of flushing of private house drains was one which commended itself very strongly to him. He had endeavoured to adopt it, and so far successfully. The Council had acted boldly in taking the question of lighting into their hands, both for gas and electricity. He thought they were wise in proposing to utilise what heat they could obtain from the destructors for electric light, but no doubt they would have to supplement that by other means, as he did not think they would get sufficient. There was no question as to the opposition of butchers to an abattoir. Three years ago they opened one in Brighton, and he was sorry to say up to the present it had not been a success.

Mr. Boulnois, Liverpool, who proposed a vote of thanks to Mr. Stephenson for his paper, said that the flushing of private drains had been carried on very successfully in Liverpool. Not only did the flushing remove any obstructions in the drains, but it acted as a very excellent detective as to whether anything was wrong or not—in fact, it was one of the best inspections they could make as to the condition of the drains. They had in Liverpool a considerable number of gangs consisting of three or four men under an intelligent ganger; the town was divided into sections, and each house visited in turn, a record being kept and coloured on a map in the office. Every house drain was flushed twice a year, at a cost of between 3,000l. and 4,000l.

Mr. Platt, Rochdale, seconded the vote of thanks, which was unanimously carried.

The members attending the meeting then drove to the Penmaenmawr granite quarries of Messrs. Darbyshire, Limited. Mr. Darbyshire personally conducted the party over the quarries, the various levels being reached by the mountain railway, sections of which are constructed at a grade of 1 in 3½. The various sections of the work, including the cutting of sets, blasting of the rock, and cleaning of road metal were inspected. At the close of the inspection the members were entertained to luncheon in a marquee erected in the grounds of Mr. Darbyshire's residence. Mr. Darbyshire, who presided, proposed the health of the President, who responded. Mr. May remarked that they had had a great educational treat in their visit to the works. The amount of engineering skill and intellect with which the works had been designed and carried out must be patent to all. Mr. Lobley, Hanley, proposed the health of Messrs. Darbyshire, Limited, to which the host responded. On the return to Llandudno, a visit was paid to Conway Castle, Mr. Farrington, Borough Engineer, acting as guide.

CHOIR SEATS, ROTHERHAM PARISH CHURCH.—On the 14th inst. the Archbishop of York dedicated new choir seats and chancel screen erected in the Rotherham Parish Church. The scheme also included the re-hanging of the bells, the renovation of the gas coronas and standards, and other improvements. The screen is about 5 ft. 7 in. high, and is executed in Austrian oak. In design the character of the existing carved woodwork of the church has been followed. It is divided, one part being on the north side and the other on the south side of the entrance to the chancel. The old temporary seats, which were poor and inadequate, have been cleared away, and new stalls and platform provided. Two carved seats and desks out of the transepts have been reused for the purpose of the choir, and the new work has been made to harmonise with them. The whole of the woodwork has been entrusted to Messrs. Johnson & Appleby, of Rotherham and Sheffield, from designs by, and under the superintendence of, Mr. James E. Knight, architect, of Rotherham. The contract for the re-hanging of the bells has been placed with Messrs. Mellaby, of Barnby Dun.

VILLAGE HALL, BOWDEN, ROTHERHAM.—A new village hall has just been opened at Bowden, near St. Boswells. Mr. John Wallace, Edinburgh, was the architect.

Illustrations.

CARVED WOOD PANEL.

THIS design was made for the central panel of a small folding fireplace screen, to be carved in English walnut. It is intended to hide a grate when no fire is in it. The drawing is by Mr. Laurence A. Turner, and is exhibited in the Architectural room at the Royal Academy.

WESLEYAN CHAPEL, CROSBY, NEAR LIVERPOOL.

THE great changes in this neighbourhood causing the chapel at Great Crosby, built some twenty-five or thirty years ago, to be in an unsuitable position for the religious work of the district, it was decided to pull down the chapel and erect a new one at Crosby, nearer the railway station at Blundell Sands and Crosby, utilising the old chapel as much as possible for the school-room or lecture-room at the rear of the new chapel.

The building is designed to accommodate about 700 worshippers, and has considerable accommodation in vestries and class-rooms, and a small gallery at the end over the narthex, or main entrance.

The work is externally of Yorkshire stone shoddies, with dressed ashlar quoins and dressings. The construction of the walls gives deep reveals to all window and door openings.

The whole of the woodwork is of selected pitch pine, the roof and principals being all from the tool, and not stained or varnished.

The chancel, of Caen stone dressing, is finished with an arcade and reredos, carved by Mr. Joseph Rogerson. The windows of the chancel are of grisaille work, with a centre subject window by Mr. J. Haldam Heaton. The organ was built by Messrs. Gray & Davidson. The heating is by hot water by Messrs. J. R. Cooper & Sons, the principle adopted being radiators in all the windows under the sills, and well warming the corridors and entrances, to secure a thoroughly-warmed chapel without draughts.

The general contractor was Mr. Samuel Webster, and the clerk of works Mr. S. Gunning. The architect is Mr. J. Francis Doyle, Liverpool, under whose direction the work was carried out.

The drawing is exhibited in the Architectural room at the Royal Academy.

PORTIONS OF REMAINS OF THE ROMAN WALL, NORTHUMBERLAND.

THESE illustrations, reproduced from photographs, are given in connexion with the first article in this issue, on the subject of recent exploration and excavation at the Roman wall of Northumberland.

Owing to a mistake for which we are not responsible, the first illustration is described on some of the plates as "showing portholes of second occupation." It should be "pivot-holes," but the correction arrived too late for insertion in all the copies of the lithograph.

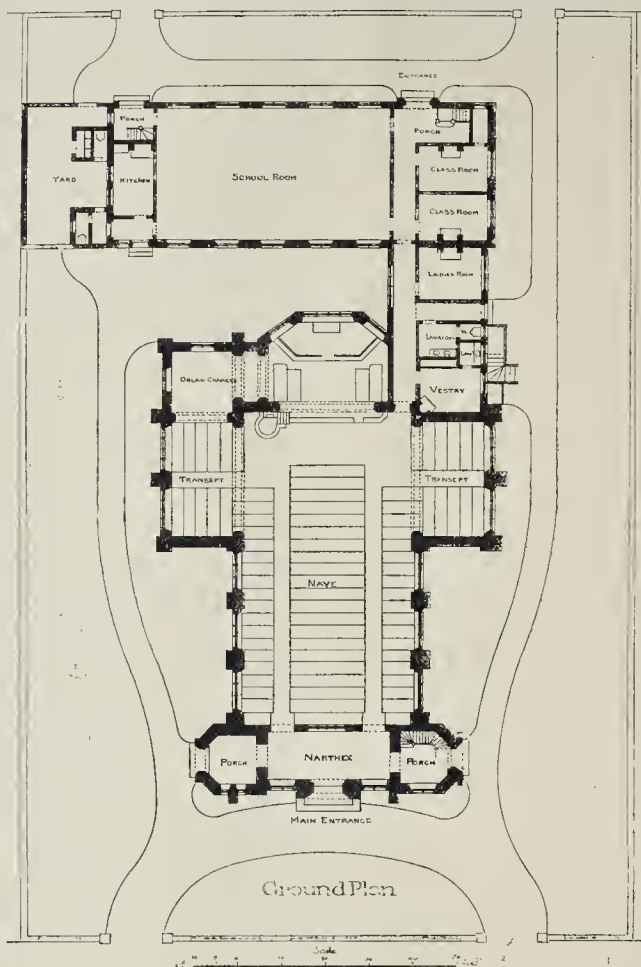

DESIGN FOR THE NATIONAL TELEPHONE COMPANY'S OFFICES.

THIS was a design submitted in competition for the proposed offices of the National Telephone Company, at the corner of Wellington-street. The building was to contain five shops on the ground floor, with basements under; the floors above being all offices, with lavatories, &c., with the exception of the top floor, which was to contain a suite for the caretaker.

There are three offices shown in the court building, which is only one floor, and eight in the back building, four stories, two offices on a floor; and there is a lift to all the floors in the main building.

It was proposed to face the building with red brick, with all the dressings in Portland stone, including the pilasters, which were to have unpolished gray granite bases; also a green slate roof. All the wood-work to be painted white, with the exception of the shop-fronts and entrance doors, which were to be of oak. The competition was limited to six, and the building not to exceed 10,000l.

The design is by Mr. A. F. Vigers, and we regret, from an architectural point of view, that it was not selected, as it is a more satisfactory though less showy example of street architect-

Engineers in 1880. He then described a plant which has recently been erected by Mr. Taylor, of Montreal, giving an increased efficiency of 10 per cent. He gave in detail the method of impregnating the water with minute bubbles of air, the improvement being entirely due to this feature, and pointed out the alterations necessary, being confident of obtaining 75 per cent. of the power at command. He also gave records of the trials conducted, and has computed the various hydraulic losses in the apparatus. He summarised the advantages of adopting this principle as follows:—1. The compression takes place isothermally. 2. The initial outlay, repairs, and working expenses are less than by any other means. 3. It is suitable for adoption in the case of low waterfalls. He claimed that these advantages far outweighed the objections of sinking a shaft.

TRADE CATALOGUES.

Messrs. SHANKS & Co. (Barrhead, Glasgow) send us their handsomely got up catalogue of sanitary appliances, mostly intended for ships, this firm making a special feature of this kind of work for shipping. They show various forms of solid pedestal closets with lugs for screwing to the deck, all those for sea-going ships being valve closets; washdown closets being unsuitable, as the rolling of the ship tends to empty the traps. Besides these, there are illustrations of folding lavatories for ships, baths, urinals, &c., and storm-valves for guarding the outlets. Messrs. Thos. Crapper & Co. (Chelsea) send us their catalogue of sanitary ware, which includes some special features—among these are the "Kenon" disconnecting trap, in which the flow through the trap is quickened by making the channel at this point of egg-shape section, and the white glazed bricks for inspection-chamber floors, giving a glazed convex surface between the walls and centre channel, curving towards the channel. They also show an intermediate supply cistern for valve closets, rightly observing that this is essential, even for a valve closet, where the water-closet supply is drawn from a general cistern. Messrs. H. W. Caslon & Co. send us their illustrated catalogue of printing materials, which are sold by them as agents for the Hamilton Manufacturing Company of Wisconsin, and are said to bear practical testimony to the superiority of American printers' joinery as compared with that manufactured in this country. Of this, of course, use is the test. The catalogue includes rule and type cases, galley cabinets, "a noiseless forme trolley," composing frames, type-cabinets of many forms, steam and hand presses, &c. Among the minor articles is a panelled backing for large electros, specially made of selected wood to preclude warping. Messrs. B. Finch & Co. (Lambeth) send us their "Supplement to Finch's Diary for 1897," giving illustrations of several important sanitary articles, intended more especially for hospitals, among which may be mentioned the "Hospital Slop Sink with Drainer," of curved section with a three-gallon wash-out flush operating from the rim, and leak drainer fitted into a slot, which can be removed when required, and which when in position is washed by each flush. The white porcelain fire-clay sink with a fluted drainer of the same material is also worth attention, and the Hospital Bath valve by which hot water cannot be introduced without first introducing cold, the object being to prevent the possibility of scalding, or of cracking the porcelain bath, by the sudden introduction of overheated water. It is to be noticed that the illustrations of all the articles are given in a practical manner by plans and sections drawn in line, not by the shaded and pictorial illustrations often found in catalogues of sanitary ware, and which are of no use except to attract the eye. Messrs. Bullock (Bermundsey) send us their catalogue of ranges and stoves, including the "Westonian" cheap range, which appears very compact and simply arranged. A small portable range (1007) is also a convenient and apparently well-arranged one, and there are other articles of interest in the catalogue. Messrs. Waring send us an illustrated catalogue of an apparently rather remarkable collection of antique furniture, tapestries, embroideries, brocades, &c., removed from old castles, churches, and convents, chiefly in Spain and Italy. The illustrations include, among other things, a remarkable vestment of the eighth century, and a fine Dutch "Net," or ship centrepiece, besides many interesting examples of Renaissance tapestries, &c.

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday, the 14th inst., Mr. G. Maxwell Lawford, President, in the chair, a paper was read by Professor Herbert W. Umney, on "The Compression of Air by the direct action of Water." The author, by way of introduction, referred to the importance of obtaining compressed air by the simplest possible means. In particular he called attention to the best of all methods, being the only one whereby the compression takes place isothermally. The idea, however, he observed, was not a new one. He referred to the ancient methods in use in Spain, and stated the general principle underlying the system. He then directed special attention to the plant erected by Mr. Frizell, of New York, which gave an efficiency of 52 per cent. when tested. He stated that an abstract of these experiments was recorded in the proceedings of the Institution of Civil

ture than the building in course of erection on the site.

"NETHERCLIFFE," WALTON-ON-THAMES.

The view shows the garden front of a wayside house at Walton-on-Thames. The walls are of red brick; the upper story and roof are tile hung.

Mr. James Smith, of Walton-on-Thames, was the builder, and Messrs. Niven & Wigglesworth the architects.

The illustration is from the drawing now exhibited at the Royal Academy.

BAPTIST CHAPEL, FLECKNEY, LEICESTERSHIRE.—The foundation-stone has just been laid of a new Baptist Chapel, Fleckney. Mr. George Starkey, of Leicester, is the architect. The erection covers the site of the old one, the chapel itself being estimated to seat, with the galleries, 250, whilst provision in the upper and lower schoolrooms is made for 200 scholars. The builder is Mr. E. Gamble, of Fleckney.

Correspondence.

To the Editor of THE BUILDER.

THE ASSOCIATES' (R.I.B.A.) VOTE.

SIR,—The decision of the Chairman at last Monday's meeting was so unexpected and so extraordinary that I trust you will permit both Fellows and Associates to express their opinion thereon, a course they were naturally prevented from taking at that meeting.

The words of the Charter (Clause 28) are, to my mind, very clear, and I thought I had secured the only possible interpretation of them from the President at the previous meeting (May 31). The clause says that Associates may not vote "in respect of the making and adopting, altering, revising, suspending, or rescinding of any by-law." The question is, can that possibly affect the Associates' right to vote on a resolution giving the Council, as from the whole body of the Institute, the right to do a certain thing? When the question of altering the by-law to give effect to this direction to the Council came up for decision, the Associates, it is clear, could not vote, and the paper issued to us containing the resolutions was quite correctly drawn up and clearly contemplated the different conditions. For at the top of page 54 on that paper I read, "In the event of the foregoing resolutions being carried it will be necessary to alter certain by-laws;" and then follow the suggested alterations. Upon these no Associate could, of course, vote.

The Chairman's ruling is so far-reaching that I trust the Associates will take the matter into court, and get a proper decision on it, and I shall be very glad to subscribe to a fund for this purpose. For what is the situation now? We are forbidden to vote on a recommendation to the Council to do anything which will involve the alteration of a by-law. In fact, the Chairman has read into the Charter words that do not exist there, and he now makes us ineligible to vote, not only "in the making, altering, &c." of a by-law as intended by the Charter, but in any matter which involves the making, altering, &c.

That his ruling will be maintained by any court of law I do not for a moment believe, and I trust that steps will be taken to upset it. The matter under discussion on Monday was of the smallest importance, but some other time this ruling may be accepted as a precedent, and the gravest injustice perpetrated. Surely the Council itself cannot wish the ruling of one man, however well meaning, to upset the clear intention of the Charter. That they have no such wish I believe, or the resolutions, &c., on the paper would not have been printed in the form—the correct form—in which they reached us.

I shall anxiously await a pronouncement of the new Council on the subject.

C. H. BRODIE.

** The point is certainly one open to difference of opinion, but we do not think the conclusion is by any means so obvious as our correspondent seems to consider it. It may certainly be argued that if Associate members vote for a proposal involving the change of a by-law, they are practically voting for the change of the by-law, and that it is contrary to the spirit of the Charter if not to the letter. This, we presume, was the view that the Chairman took on Monday.—E.D.

THE POSITION OF THE ORGAN IN CHURCHES.

SIR,—In a "Note" in your last issue referring to the above question you say it is the "Conservatism" of the clergy which stands in the way of improvement. Now, a mania for turning everything upside down and inside out, coupled with an almost insane hatred of everything savouring in the slightest degree of antiquity (and especially of the detested and detestable eighteenth century), can hardly, I think, properly be called "Conservatism." Yet these have undoubtedly been the prevailing characteristics of the clergy of the Church of England during the past thirty years or so. "Conservatism" would have led them to retain the organ at the west end, where it had been placed for at least many hundreds of years.

Let us console ourselves with the reflection that though "fads" may endure for a day, common sense generally triumphs in the long run.

H. E. T.

ELECTRIC LIGHTING BY REFLECTION.

SIR,—My attention has been called to your remarks re the electric lighting at the Royal Palace Hotel, in your issue of the 12th inst. The whole of this work was arranged by me and carried out to my specification and under my supervision by the firm of Messrs. Donnison, Berlin, & Co., electrical contractors. I quite agree with your views as to the form of reflected lighting being used where the architectural details of a building permit; but I have experienced difficulty in persuading my clients to adopt this system, as they regarded it in the nature of a costly experiment, with little chance of a successful result. However, having now, in spite of some opposition, installed it in a public building, I have no doubt but that the arrangement will be more generally used.

ADRIAN COLLINS.

SIR,—If I have not already occupied too much of your valuable space, I shall be glad of a little more to reply to the two letters of your correspondent, Mr. Norman Wight. In calling attention, in my paper before the Architectural Association, to the advantages of a valve-closet, I was, of course, referring to an up-to-date valve closet, and had more especially the "Optimus" closet in my mind; but the latter being a patent of mine, I was desirous of saying nothing in reference to it that might have even the semblance of an advertisement. Evidently Mr. Wight has never seen this closet, and it may interest him to know that the overflow trap is made to discharge into a ventilated pipe above the level of the basin-valve—i.e., into a pipe which is open to the air just outside the external wall of the closet, which pipe not only ventilates the "valve-box," but prevents any action upon the water seal of the overflow trap. Moreover, this trap in practice is rarely, if ever, fouled, for the overflow arm being open downwards from the top, affording a ready means of inspection and access, and the flushing rim of the basin being continued around it, the overflow trap is thoroughly flushed out every time the closet handle is pulled, and quite independently of any water which may be held in the basin.

The Student's Column.

SPECIFICATIONS.—XXV.
REPAIRS.

REPAIRS.
IN writing a specification for repairs the student must be careful not to confuse this with a specification or, more properly, a schedule of dilapidations. The latter is generally written with inclusiveness as its chief quality, and is, therefore, usually vague rather than definite. As a guide to the method of specifying repairs our best plan will be to proceed through the various trades, noting especially matters in which this class of specification differs from that for a new building.

Bricklayer.

Defective Walls.—Describe the extent to which these are to be taken down and rebuilt; as for example:—Take down the upper part of front wall to a distance of 12 ft. 6 in. below top of parapet; and rebuild in 9-in. work in mortar to the same height as before. (Describe the kind of pointing. State if the old bricks from the pulling down are to be re-used.)

Pointing to Walls.—Describe the extent to which walls are to be pointed, where and how they are to be cleaned, if they are to be stained or coloured, and the description of pointing.

Pointing to Door and Window Frames.—State that the old pointing is to be raked out, and specify whether the new pointing is to be in lime and hair or in cement.

Resetting Stoves and Ranges.—State that the stoves and ranges which are to be reset are to be taken out and reset. The throating, flaunchings, covings, &c., being made good.

Chimney-pots.—State how many and what description, and make it clear whether they are to be in replacement of broken ones, or whether they are to be additional. In the former case the old flaunchings ought to be removed in order to make a sound job of the setting of the new pots.

Mason.

Describe what stonework requires to be taken out and renewed, what is capable of being pieced, and what merely requires to be taken down and rebuilt. In the case of copings and other masonry continued in long lengths, it would frequently happen that part only requires renewing to a greater or lesser extent, and then the specification should define how much is to be renewed or repaired, as the case may be; as the common slipshod practice of specifying that the defective parts are to be taken out and renewed is likely to lead to difficulties, especially if competitive tenders are being invited from builders.

If the necessary repair or renewal of any work is of a very extensive character, it may be necessary to provide and specify shoring during the progress of the work.

In the case of worn steps, define whether they are to be taken out and entirely renewed or turned over and re-dressed, or whether pieces may be let in, or whether, if broken, they may be merely re-jointed and cramped.

Paving would generally require to be taken up and relaid to current, with probably a new foundation and some part at least (query what part) should be renewed.

Slater and Tiler.

Specify how much, if any, of the roofing material is to be taken off and relaid, or whether

merely the broken and defective slates or tiles are to be renewed. Also specify the renewal of pointing and torching to tiling, and the resetting and possibly the renewing of ridges and retiling.

Carpenter and Joiner.

The repairs in this trade are comparatively easy to specify, as generally speaking it is a case of entire renewal of broken or defective parts. Perhaps the most frequent exception to this is in the case of treads of stairs where the necessities of the case may sometimes be met by renewing the nosing only. In any case where dry-rot exists the entire removal of all parts of the woodwork however slightly affected must be stringently enforced, and, of course, proper and adequate ventilation would have to be arranged.

The ironmongery is equally simple. If any which has to be renewed is to match any old work this must be specially mentioned as even if the patterns are simple they may be old-fashioned, and considerable difficulty may be experienced in matching. A careful estimator would make a considerable addition to the price of work which is to be matched.

Smith and Foundry.

In this trade again repairs in the strict sense are almost out of the question. It is generally a question of renewal. Even in the case of stoves and ranges, which comprise by far the greater part of the repairs strictly so called in this trade, it is often cheaper and more satisfactory to renew the defective part, except in those cases where a special casting has to be dealt with.

Rain-water pipes, eaves gutters, and other rain-water goods are, of course, quite irreplaceable. In the case of ornamental balconies, balustrades and railings, it is a matter of importance to have the defective parts as a general rule replaced by others to match the remainder of the work, and this must therefore be clearly stipulated.

Whatever repairs in this trade are specified, the student must be quite sure that the repairs are possible, and cheaper than renewal, and should carefully explain in the specification the manner in which the repair is to be executed. Thus the student might consider the various ways in which the repair might be performed to a wrought iron railing, the feet of the upright bars of which have been let into stone and run with lead, and have become decayed by galvanic action and rust. This is a condition of things which frequently exists, and is capable of several various methods of repair other than complete renewal.

Plasterer.

Ceilings.—Specify to what extent defective ceilings are to be cut down, whether or not the lathing is to be renewed, and what description of plastering is to be carried out.

Walls and Partitions.—Specify these in a similar way.

Cornices.—Define whether the whole of the cornices are to be renewed, or whether part only needs to be re-run, or whether stopping of cracks will meet the case. As regards enrichments, specify that they are to match those existing, or whether entirely new enrichments are to be put in.

Distemping.—Specify washing down and stopping, and clear-coating if necessary. Particularly if enrichments are to be soaked and cleaned out, specify that they are to be cleaned of all whitewash down to plaster.

External Work.—Make it clear whether repairs are to be in similar materials to the existing, which may be of lime stucco, or Roman cement, or whether it is to be done in Portland cement. Remember that patching up of defective external plastering is generally a very unsatisfactory performance, and usually has to be very speedily repeated.

Plumber and Zinc Worker.

The repair of external lead and zinc work generally consists simply of soldering. If this is what is desired it should be so stated, but if a more satisfactory and permanent repair is wanted, then partial or complete renewal of the lead or zinc must be specified. State, if the old lead is to be removed, what is to be done with it, whether the contractor is to take it away, in which case the most satisfactory and equitable proceeding is for the contractor to quote a price per cwt. which he will allow for the old lead, and for it to be weighed when stripped from the roofs. In dealing with internal work, repairs may be needed to joints or to pipes, the latter generally would be a ques-

tion of renewal. With regard to fittings define precisely whether any or all are to be renewed or whether new washers or regrinding or other repair will satisfy the case.

Be careful to include a stipulation for cleaning of gutters and flats in external work, and of traps and safes in internal work.

Painter, Glazier, and Paperhanger.

The most important point for the student to define with regard to painter's work is the extent of the preparation for the paint, whether a mere washing down and sizing is sufficient, or whether rubbing down with pumice stone or burning off or removing with pickle are to be employed. When the work is preparatory the painting will then generally be on similar lines, as far as the specification is concerned, to that of new work.

In the glazier's work repairs generally consist of hacking out and renewing broken glass, and the specification should define what constitutes a break. It is a very common practice to assume that one crack in a pane of glass is not a break, but that two cracks do constitute a broken pane. The removal and making good of decayed putty is also to be specified where required; and the cementings and attachments of lead lights, of course making it clear what quality of cementing material and connexion are required. In specifying repairs for paperhanger, in all good work, the walls, of course, would be stripped to the plaster, then stopped and sized before re-papering. Specify if the papering can be repaired with paper to match, which will only be likely be the case when the papering has been comparatively recently done, as patterns are rapidly superseded. Careful householders often preserve a piece or two of paper for repairs, but as that hung on the walls usually fades, the precaution to be complete should include the hanging up of the paper exposed to the light.

GENERAL BUILDING NEWS.

ST. JOHN THE BAPTIST CHURCH, NEW SPRINGS, LANCASHIRE.—This new church was consecrated recently by Dr. Lyle, Lord Bishop of Liverpool. The architect, in his description of the building, says that the plan of the new church is unusual. There are no nave aisles, but a broad nave, which is drawn to an apsidal ending towards the east. The centre arch of the apse opens into the chancel. The side skew arches open respectively into the north and south chancel aisles. The south chancel aisle is regarded as a choir, the services in which only comparatively few take part, but it is so arranged that its occupants can join in the service when the church is full. Near this chapel is a door. The north chancel aisle, marked off from chancel and nave by arched traceried screens, is divided into clergy and choir vestries and organ chamber. At the west end is a music gallery, the lower story is a choir, the nave floor, and forms the baptistry. On the north side, near the west end, is the main entrance porch, provided with a narrow side door (in addition to the wide front door). The chancel arch is carried on massive circular pillars, flanked by the two side arches of the apse. The east window has three lights, a brick chimney and traceried above. Below the window is a recess of stone, with a central medallion of stone containing a sculpture of the Agnus. The chancel is of three bays—three arches on each side—the two westernmost, north and south, respectively opening into the chancel aisles. Looking west from the chancel steps is seen the arch of the baptistry with a wide one-light window beyond. The east chancel window is similar glass in patterns, with symbols and devices; but the centre light, which is 3 ft. wide, is filled with stained glass, the work and the gift of Messrs. Heaton, Butler, & Bayne. The subject is the baptism of Our Lord by St. John the Baptist. This is essentially a brick church. The design is entirely of a modern character. It is not at all a design for a stone building just carried out in brick. Brick is accepted as a dignified and worthy material, and is treated as brick should be treated, simply and unaffectedly. Even the window tracery is for the most part brick, with just a little relief in stone, where stone is constructionally better. Outside the larger plain wall spaces. At the west end of the chancel is a dwarf brick wall, carrying a low screen or cresting of ironwork, which is continued around the pulpit, the ironwork of the pulpit being a little fuller and more ornate. A slight wrought-iron arch emphasises the entrance to the chancel. The Bible lectern is attached to and forms part of the low iron screen. In the four open arches at the side of the chancel are arched and traceried wooden screens. The tower is covered with a quadrilateral green slated roof. The chancel roof is somewhat higher than the nave, high enough to admit of a clerestory above the aisle roof. An east window in the north chancel aisle is so contrived as to light the organist's key-board. The heating is by hot water. The

churchyard is fenced in by brick walls and piers, with wrought-iron railings and gates. The gas fittings are of wrought iron. The fittings generally are of pitch pine. The work throughout has been designed and superintended by Mr. Medland Taylor, the architect, of Manchester. Mr. C. B. Holmes was the builder. The church will seat 400 adults, but on special occasions seventy more might be accommodated. The contracts amount to 5,230l. The church has been built with varied tints of Runcorn stone, and the bricks of the inside are Ruabon, with red facings round the windows, whilst the other portions of the walls are gold and buff. The bricks of the outside are from the Wigan Coal and Iron Company's works.

JOHN ROBINSON MEMORIAL CHURCH, GAINSBOROUGH.—The dedication services in connexion with the John Robinson Memorial Church, Gainsborough, were initiated on the 9th inst. The site, which comprises 1,777 square yards, cost 1,510l., the total cost being slightly over 7,000l. The principal entrance, in the main road, is a large double door, under a elliptical arch supported on stone shafts with carved capitals. Above this is a seven-light window, the head being of elliptical form, and the upper part filled with tracery. There are two turrets on the front elevation, terminating in stone octagonal heads. The building is of red brick with bands of stone work, and the heads, sills and other sills are of stone. The roof is covered with Westmoreland slate. A fleche is placed on the ridge, in which is placed the ventilator. There are projecting buttresses on the sides of the building. Sitting accommodation is provided for 600 adults. Three doorways in front and sides give admission into the church, and additional exits down organ and vestry stairs. The gallery for the organ is approached by a separate staircase from the outside. The minister's vestry is immediately behind the rostrum, and is provided with a private entrance. The deacons' vestry is near the ministers' vestry. The light columns supporting the galleries are continued up and support the roof, which is of open timber roof with wrought-iron principals, &c. The lecture hall at the rear of the church provides accommodation for seating 300 adults. Class rooms are arranged round the hall which will be used for the Sunday School. There is an infants' school provided. The architects were Messrs. R. C. and E. R. Sutton, of Nottingham.

PROPOSED NEW EXCHANGE, NEWCASTLE.—It is proposed to erect an Exchange at Quayside, Newcastle, from plans prepared by Mr. C. T. Marshall, architect, Newcastle. On the ground floor there will be an entrance hall from the Quayside, having a small office for the porter commanding the main entrance. There is an ante-room or vestibule about 40 ft. long and 20 ft. in breadth. Next there will be a reading-room, which will be about 53 ft. long and 28 ft. broad. The Exchange Hall will be 110 ft. in length, 47 ft. in breadth, and 30 ft. in height to the cornice, and about 40 ft. to the top of the domes. A row of seven telephone-rooms with small office for telephone clerk will be at one end of the hall. On the other end also will be a Board-room, a book-room about 50 ft. in length, and offices for secretary and clerks, and for callers, letters, &c. On the upper floors in the rear rooms will be provided for club-rooms, smoking-rooms, &c., with kitchen and residence for caretaker on the top floor.

CHURCH SCHOOL, FACIT, LANCASHIRE.—On the 11th inst. the foundation stone of a new infants' schoolroom for St. John's day school, Facit, was laid. Mr. F. Rodley is the architect, and the contractor is Mr. John Dyer.

THE GLASGOW BUILDING TRADE.—At a recent sitting of the Glasgow Dean of Guild Court, thirty-five applications were considered, and linings were granted for upwards of 100,000l. worth of new property. Adding to that amount the value of the work passed at last Court day, the new linings granted for the month reaches the total of 184,000l. The chief linings were those granted to the Baltic Chambers, Limited, who received permission to erect a block of offices in Wellington, Cadogan, and Holm-streets in Glasgow, at a cost of 38,500l.; to Rev. James Stalker, D.D., and the deacons, as trustees of Free St. Matthew's Church, Glasgow, who received permission to erect a church and hall in Garscube-road, Glasgow, at a cost of 5,000l.; to David S. Cargill, merchant, Glasgow, and the trustees of the Glasgow Church Co-operative Society, who were granted a lining to erect a church and hall at the corner of Doncaster and Hinshaw-streets, Glasgow, to be called St. Cuthbert's Church; to the trustees of the Association for Infirmary Children, who received permission to make alterations on East Park Home, Maryhill, and to the Glasgow Eastern Co-operative Society, who were granted a lining for tenements of dwelling houses on the south-west side of Baltic-street, Bridgeton, Glasgow. The remaining linings were mostly for tenements of shops and dwelling-houses in various quarters of the city.

CAFÉ, BEXHILL-ON-SEA.—The Royal Café Restaurant, Devonshire-road, Bexhill-on-Sea, was opened recently. The building has been erected from plans prepared by Mr. G. H. Gray, architect, by Messrs. Sanders & Co., builders.

DUDFIELD MEMORIAL HALL, SOUTHWARK.—The memorial-stones have just been laid of the Dudfield

Memorial Hall, which will be added on to the existing Lansdowne-place Ragged School. The new Hall, which has been designed by Messrs. Searle and Hayes, and which is being built by Messrs. Holliday and Greenwood, of Brixton, will accommodate some 500 children.

CHURCH, NEWELL.—The new Church of St. Michael and All Angels, Pen Mill, Yeovil, was opened on the 11th inst. The building was commenced about two years ago, and is in the Perpendicular style. It consists of a chancel, nave, aisles, and side chapel, and a tower at the south-west corner. It is built of Hamhill stone. The walls are made of pitch-pine, while the flooring is composed of solid blocks, with tiled aisles and chancel. The carving has been done by Mr. Harry Hems, of Exeter. There are three panels at the chief altar, with representations of the Incarnation, Crucifixion, and the Entombment of our Lord. The church has already cost over 8,000l. The architect is Mr. J. Nicholson Johnston of Yeovil. The contractor has been Mr. Willard, of Bridgewater, and Mr. Henry Moore, of Frome has been the clerk of the works.

SCHOOLS, LEEDS.—New day schools, which have been erected in connexion with St. Luke's Church, North-street, Leeds, were opened on the 11th inst. The schools have been built on the site of the old system, with the classrooms arranged on either side. There are four class-rooms, each 25 ft. by 20 ft., and two 28 ft. by 20 ft. The central hall is 60 ft. by 28 ft., and at the south end, opposite the entrances, is a raised platform, divided from it by patent swivel partitions, so as to form a teachers' room, or a platform and stage when the schools are being used for theatrical or public purposes. Entrance to the schools is gained by two porches and lavatories, 18 ft. by 10 ft., which are built close up to the Skinner-lane frontage. The building is heated by means of hot-water pipes and coils. The schools have been erected from the designs and under the superintendence of Messrs. Smith & Swedale, architects, Leeds.

NEW CONVALESCENT HOME, GRANGE-OVER-SANDS.—This home is built of local limestone, with red sandstone dressings, and is covered with blue Welsh slates. It is on the pavilion plan, with the administrative block in the centre, and the dormitory and dining room wings on each side of the centre of the letter L. At present only the administrative block and one wing have been built. The accommodation includes a dining hall for seventy persons, day room, 27 ft. long by 22 ft. wide, with a large bay window overlooking the sea, with win dow sills also to the south, and a glazed door leading out on to the verandah and into the grounds. There is a private entrance from the verandah to the front, with entrance hall and dining room on ground floor, and a private staircase to the sitting and three bed rooms on the first and second floors, being connected with the main block on each floor by a glazed door. From the entrance hall the main staircase leads immediately to the first and second floors, well lighted by windows on each landing. There are four dormitories, divided into sleeping compartments by boarded partitions, 7 ft. high, to accommodate 32 men, warmed by a service of hot water pipes, running round each dormitory, passing through each sleeping compartment, and kept at an even temperature. Fresh air is brought in by tubes placed in the external walls. The ventilated air is taken off at the ceiling level into pipe flues built in the walls and carried up to the roof. The cost of the home is about 3,000l., and the contractors for the works are Mr. Enoch Denny, Grange-over-Sands, walling, slating, and plastering; Messrs. Nelson Bros, Kendal, carpenter and joiner; and Mr. Lawrence Airey, Kendal, plumbing, painting, and glazing. Mr. J. Hutton, Kendal, is the architect.

RESTORATION OF CHURCH, NEAR BILLINGBOROUGH, LINCOLNSHIRE.—The church of St. James at Askeby, near Billingborough, which has been undergoing restoration for some time, was reopened on the 8th inst. by the Bishop of Lincoln. The interior of the church has been almost entirely remodelled to plans prepared by the late Mr. James Fowler, of Louth, and since carried out under the superintendence of his son, Mr. R. Fowler. The contractors were Messrs. Walter & Hensman, of Horncastle.

ADDITIONS TO ALLOA ACADEMY.—A new secondary department in connexion with Alloa Academy has just been completed. The building has been erected from plans prepared by Mr. R. Bryden, architect, Glasgow. The new building is two stories in height. Internally the centre is occupied by a rectangular hall, rising through both stories, with galleries round it on the upper floor, and lighted by a glazed cupola and end window. The hall communicates at either side with the entrance doors and staircases for boys and girls, and gives access on the ground floor area and from the gallery to all the class-rooms in the building. The staircases are separated from the hall by arches formed with stone columns and pilasters. The stairs are wide and of easy gradients, and are lined with tiles. Cloak-room accommodation is provided for the entrances for both boys and girls, and a special cloak-room is on the upper floor for senior girls. The accommodation for scholars on the ground floor comprises four separate class-rooms. On the upper floor special class-rooms are arranged for technical education. These comprise a chemical laboratory with

working benches, in connexion with which a balance-room and chemical store-room are provided. Adjoining the laboratory a lecture-room has been planned. The cookery class-room is reached directly from the girls' staircase. The north end of the upper part of the building is wholly occupied by drawing class-rooms and cast-room. There are two teachers' rooms provided in the building. The principal contractors for the different works were:—Mason, Mr. J. Philp, Tillicoultry; joiners, Messrs. A. Mitchell & Son; plumber, Mr. James Philp; plasterer, Mr. J. Walker, Alva; painter, Mr. J. Robertson, Alton.

BAPTIST CHAPEL, BARRY.—Foundation stones of a new Welsh Baptist Chapel were laid at Barry Dock recently. The building will be constructed chiefly of native stone, with red Dean Forest stone dressings. It is designed in the Gothic style, will be 50 ft long and 40 ft wide in the main building, with galleries provided, and will be sufficient to accommodate about 750 worshippers. The designs were prepared by Mr. Jenkin Williams, Cardiff, and the contract for executing the work has been secured by Mr. Jonathan Lewis, Cadoxton.

COTTAGE HOSPITAL, ACTON.—The foundation stone of a cottage hospital at Acton was laid on the 9th inst. by Lady Rothschild. The building has been designed by Mr. C. Bell. The main wards are at each side, one for males and one for females, each containing four beds and a cot, and there will be a room for convalescents, an operating-room, hospital dispensary, accommodation for matron and nurses, and administrative offices. Above will be seven rooms, available as bedrooms or as special rooms for patients.

WESLEYAN CHAPEL, ECCLESFIELD, YORKSHIRE.—Memorial stones of a new Wesleyan chapel at Ecclesfield were laid recently. The new edifice, which has been designed by Mr. H. W. Lockwood, of Sheffield, and is being built by Messrs. J. Mastin & Son, also of Sheffield, will be 75 ft long, with a breadth, at the widest part, of 57 ft, and across the nave of 43 ft. It is to consist of a nave and transepts, with a large organ and choir gallery, and will accommodate on the ground floor and in the gallery, which occupies three sides, 650 worshippers. At the rear are vestries, lavatories, &c. Right and left of a central vestibule are wide stone staircases leading to the gallery, and forming semicircular bays. The cost of the new chapel will be 2,350l.

METAL EXCHANGE, SWANSEA.—The new Swansea Metal Exchange was opened on the 8th inst. The building was designed by Mr. H. W. Wills, and the contract was given to Mr. Thomas Davies, the total cost of the building being 3,500l. The Exchange is built in Queen Anne style, and carried out in red brickwork, with stone dressings. The main entrance is from Fisher-street. The corridor is tiled, and leads into the large Exchange, the inside of which is 50 ft by 40 ft, and 20 ft high, and has a curved elliptical roof. The building also contains two other rooms. The roof is covered with tin plates.

WESLEYAN CHURCH, HULL.—The foundation stone was laid on the 10th inst. of the extension of the Sunday school and church premises of the Coltman-street Wesleyan Church, Hull. A portion of the walls of the old school remains, and also several class-rooms. There is to be a central hall of 50 ft by 37 ft, with a gallery around it. This has been made to accommodate about 750 scholars. The infants' class-room is to be 33 ft 6 in. by 23 ft 6 in., in addition to which there will be a young women's class-room, with a young men's class-room on the first floor the same size. Seventeen class-rooms of various sizes are also provided for. The central hall is made with an open timber roof. Separate staircases are provided for boys and girls. The contract was given to Mr. George Houlton, and amounted to 2,671l., the work being under the supervision of Messrs. Gelder & Kitchen, architects.

SCHOOL, KILSYTH, STIRLING.—The Burgh School Board have agreed to erect a new infant school in the Burgh Academy grounds capable of holding 600 pupils. Mr. Robt. Hay has been appointed architect.

CATHOLIC SCHOOL, LEYLAND, LANCASHIRE.—The memorial stone of the new day school in connexion with St. Mary's Mission, Leyland, was laid recently. The cost of the building will be about 1,000l. Mr. J. A. Seward, of Preston is the architect; Mr. Thomas Jackson, of Leyland, the builder; and the joinery work is in the hands of Mr. James Tomlinson, of Leyland. The school will accommodate some 250 scholars. The building externally is faced with Accrington bricks and Longridge stone dressings.

PARISH ROOM FOR ST. MARK'S CHURCH, ST. HELENS.—Colonel Gamble, C.B., proposes to celebrate the Jubilee in connexion with St. Mark's parish, St. Helens, by presenting the vicar and parishioners with a parish room and caretaker's house, which will cost over 1,500l. Mr. James Gales has drawn plans for the parish room, which is to be erected on the space between St. Mark's Church and the Park Hotel. The contract for the buildings has been secured by Mr. Peter Tickle, builder, for 1,400l.

SOCIETY OF ANTIQUARIANS FOR CHAPEL-EN-LE-FRITH.—It has been decided to form a society in Chapel-en-le-Frith known as the Chapel-en-le-Frith Antiquarian and Research Society. Mr. W. Brailsford Bunting is President of the new Society.

SANITARY AND ENGINEERING NEWS.

EXTENSION OF BERWICK WATERWORKS.—On the 8th inst. the extension of the waterworks at Tweedmouth for supplying Berwick with an increased supply of water was formally opened by the Mayor and Town Council of Berwick. The work, which has been carried out by Messrs. Leslie & Reid, C.E., Edinburgh, has cost about 5,000l., and the daily yield of water now exceeds 4,000 gallons.

WATER SUPPLY, BALLATER, ABERDEEN.—There has just been completed at Ballater the laying of a duplicate water main for the supply of the burgh from the river Gairn. The work has cost 1,000l., and has been carried out under the supervision of Messrs. Jenkins & Murr, Aberdeen.

BRIDGE, KINRAIG, INVERNESS.—On the 12th inst. the new bridge over the Spey at Kinraig was opened. The engineer for the bridge was Mr. Mackenzie, and Mr. Fraser was the contractor.

DRAINAGE & C., BRIGHTLINGSEA, ESSEX.—Colonel W. Langton Coke has just held a Local Government Board inquiry in reference to a scheme of drainage and sewage disposal prepared by Messrs. Thomas & Taylor, civil engineers, of the same name. The amount of the loan applied for is 6,000l. There was strong opposition to the point at which the Council proposed to place the effluent outlet pipe; but at a little extra cost the pipe is to be extended to a more suitable point. The system of sewage disposal to be adopted is that of the Universal Company, Derby.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. F. T. Verity, architect, has removed from 11, Fernside-street, to 7, Seville-street, Beccles, Suffolk. The firm of Messrs. Kierlmeier & Co., manufacturers of sawmill and woodworking machinery, of Leipzig (with branches at Paris, Milan, Moscow, Zurich, London, Manchester, Stockholm, Barcelona, Vienna, Budapest, and Melbourne), has been formed into a private limited company.

POTTERIES, & C., MASTER BUILDERS' ASSOCIATION.—The Potteries, Newcastle, and Beccles branches of the National Builders' Association held their eighth annual picnic recently, the locale selected this year being Matlock, Haddon Hall, and Chatsworth. The members of the Association and friends to the number of 110 first visited Matlock Bath. After lunch, eight breaks were requisitioned, and the party drove to Chatsworth and back by the circular route, passing via Gella and Haddon Hall. At Matlock Bath the party dined. The arrangements for the picnic were made by Mr. James Bowden, secretary. Before leaving Matlock a vote of thanks was accorded to Mr. Bowden for the arrangements he had made, and to the caterers for their services. Mr. James Bowden, in responding, said, in relation to the Workmen's Compensation Bill now before Parliament, it was not that they objected to compensation, but they desired that litigation should be reduced to a minimum. In the Bill they found there were many difficulties which would make litigation so rife that they were afraid that in the future there would not be much peace for builders or men unless there was an alteration. Those matters had been considered, and by the exertions of the committee eight or nine clauses had been passed by the House in a way which he thought would satisfy both employer and employee.

THE JOSEPH THOMSON MEMORIAL.—The memorial which has been erected to Mr. Joseph Thomson, the African traveller, at his native village, Thornhill, in Dumfriesshire, was unveiled on the 8th inst. by Mr. Charles Robert Mackenzie, E.C.B., President of the Royal Geographical Society. The memorial was designed by Mr. Charles M. Brice, sculptor, Edinburgh. It consists of a bronze bust set upon a truncated obelisk pedestal made of red freestone from the adjacent Gatelawbridge quarry, the pedestal being raised on three steps. The front panel is occupied with a bas-relief in bronze representing the figure of Esau displaying a map of Africa, with palm trees, and Mount Kilimanjaro in the background. The south panel bears an inscription. Mr. Thomson's work and exploration is recounted on the north panel.

CARDIFF CORPORATION CONTRACTS AND SUB-LETTING.—At the Public Works Committee of the Cardiff Corporation recently, Councillor Crossman directed attention to the alleged violation of contract by Mr. Symonds in the Liverpool wall contract, the complaint being that he got the coping-stone ready dressed from Messrs. Turner & Sons, and this, it was contended, was a violation of the clause in the contract prohibiting sub-contracting. The Town Clerk had written to Mr. Symonds calling attention to the matter, and in the course of his reply Mr. Symonds stated that he had bought the coping ready prepared. He had also bought the additional iron railings ready-made. If that was sub-contracting it would be sub-contracting to go into a timber-yard and buy a bundle of mouldings or a square of prepared flooring; or to an ironfounder's for a girder or a length of rainwater goods. It transpired that the coping-stone had been dressed in Cardiff, and the Chairman doubted whether this could fairly be described as "sub-letting." Councillor Crossman maintained that the clause would be useless if one builder was permitted to sub-let to another in this manner. A man taking a building contract under the Corporation was required by the

clause in the contract to do all the building work himself. Councillor E. Thomas argued that the object of the clause was to do away with the middleman system, which was a curse and an evil in every way. Councillor Veall moved that the Town Clerk be asked to give his opinion as to whether Mr. Symonds' action was a violation or not of the sub-contracting clause. If it was, then they would know how to act. Councillor Veall's motion was eventually agreed to.

PROPOSED MODEL DWELLINGS, SUNDERLAND.—At a monthly meeting of the Sunderland Town Council, held in the Town Hall, Sunderland, on the 9th inst., the Health Committee recommended that certain amended drawings for workmen's dwellings in what is known as the Hat Case area, be adopted, and that, subject to the approval of the Local Government Board, the architects be instructed to prepare the necessary working drawings, and that the Committee be authorised to arrange to have the quantities taken and obtain the necessary tenders. The Hat Case area is a district which was freed by the Council some three years ago as an insanitary area which should be dealt with under the Housing of the Working Classes Act. The houses on it have been demolished, displacing about 480 people. Alderman Harrison, in submitting the report of the Health Committee, showed that the scheme represented by the drawings referred to in the report provided for the housing of 454 people, but wide streets would be run through the area. There would be three blocks of buildings, one containing sixty two-roomed tenements, to let at 3s. 6d. a week, a second containing twenty-four three-roomed tenements to let at 4s. 3d. a week, and twelve one-roomed tenements to let at 2s. a week; and the third containing eleven two-roomed tenements to let at 3s. 6d. a week, and one one-roomed tenement to let at 2s. a week. The recommendation of the Committee was adopted.

TRAMWAY SCHEME, HALIFAX.—Colonel C. H. Luard, R.E., Local Government Board Inspector, held an inquiry at the Town Hall, Halifax, on the 9th inst., in respect to an application from the Corporation for sanction to borrow a sum of 10,300l. for purposes connected with the electric tramway scheme, and 1,633l. for the purposes of street improvements. Mr. Wilmshurst, engineer, submitted plans showing the route of the mains which it is proposed to lay up Horton-street from the railway station, Ward's End, Commercial-street, George-street, Bull Green, King Cross-road, King Cross-street, Silver-street, a portion of Crown-street, Swine Market, Gibbet-street, and up to Highwood Well. The Borough Engineer (Mr. Escott) gave the particulars with respect to the proposed improvements which were to take place in Lister-lane, Shay-lane, Gibbet-street, and Thrum Hall-lane.

STATUE, WEST HARTLEPOOL.—There has just been unveiled in Church-street, West Hartlepool, by the Marquis of Londonderry, K.G., the bronze statue of the late Mr. Ralph Ward-Jackson, the first M.P. for the borough. The statue was designed by Mr. Onslow Ford, R.A., and is of bronze, 8½ ft. in height. It was cast by Messrs. Rovini & Pavanotti, London. The figure is in an oratorical attitude, standing upon a 7-ft. pedestal of Portland stone.

The square is adorned with bronze shields. **A POLYTECHNIC FOR HACKNEY.**—Under the presidency of the Lord Chief Justice, Lord Russell of Killowen, a meeting was held on the 17th inst. at the Hackney Town Hall, under the auspices of the Vestry of Hackney and the Technical Education Board of the London County Council, to consider the steps to be taken for the establishment of a technical institute for Hackney. Mr. G. B. Holmes moved the first resolution, which recognised the obligation which lay upon the community of Hackney to give its workers the most efficient scientific and technical training possible in order to equip them most fully for their duty in life, and pledged the meeting to promote the foundation of a Technical Institute or Polytechnic Institute in Hackney. In the course of his speech Mr. Holmes mentioned that it was calculated that 12,000l. would be required to start the Polytechnic. The motion was supported by Sir A. Scoble, M.P., and passed unanimously. A number of other gentlemen addressed the meeting, and resolutions were adopted providing that a public subscription should be started and a committee appointed.

LIVERPOOL. SECTIONS IN ARCHITECTURE AND APPLIED ARTS.—The annual exhibition of selected works done by the students of the City of Liverpool School of Architecture and Applied Arts during the past session was opened recently in the Applied Art Building, University College. The exhibits include architectural drawings and designs by first and second year men and more advanced students, modelling from the life, designs for fabrics, wall-papers, book-plates, stained glass, posters, &c., and many sketches submitted for the Sketch Club competitions. There are some specimens of wood-carving, and a few examples of wrought iron work. The department of architecture is under the direction of Professor Simpson, the principal of the schools. As regards the department of modelling and sculpture, the main feature is the prominence given to direct study from the life. The following is the list of prize-winners.—Modelling from the life (Telephones): 1, A. H. Griffiths; 2, J. H. Morcom. Head from life: 1, C. Grosfield. Panel design: 1,

A. H. Griffith; 4 W. Webb. Panel design (special prizes): 1, R. Murray; 2, F. Vassett; extra prize, G. Shaw. Cast: 1, T. Rowan; 2, H. B. Bar. Drawing from the life (day): 1, L. Crossfield; (evening): 1, A. Jenks. Drapery: 1, R. Warrington. Set of designs: 1, C. A. Walker, who also shows some plates, &c., designed and made by her for the Della Robbia Company; 2, E. Jackson. Design (evening): C. E. Prescott. Design of ornament: 1, M. Carline; 2, J. Williams (extra prize). R. Roberts. Wrought iron: 1, E. Barstow and J. Lowe (equal); 2, H. Vogt. Junior: 1, W. Hawthorne. The prizes in the architectural department have not been awarded, the session in that subject being still in progress. Some additions will be made to the classes of the school next session, which commences on October 21. Amongst others, Mr. R. L. Rathbone will hold a class in copper and brass work.

PUBLIC IMPROVEMENTS, KEIGHLEY.—On behalf of the Local Government Board, Colonel John Ord Hasted held an inquiry on the 15th inst. at the Council Chamber, Keighley, into the application of the Companies Act, 1862, to borrow for the improvement of 500 ft. Amongst those present were Mr. W. M. Hopkinson, Surveyor; Mr. John Laycock, Gas Engineer; and Mr. Geo. Burr, Town Clerk. The Highways and Streets Improvement Committee sought borrowing powers in respect to an estimated expenditure of 39,597l. upon improvements in North-riding and street-widening on Broadford-road to Aireworth, together with the erection of a girder bridge. The Gas Committee applied for 10,650l. in order to enlarge the two holders at Thwaites, and thus increase their storage capacity from 1,440,000 cubic ft. to 2,386,000 cubic ft.

THE LOWER CHURCH OF GLASGOW CATHEDRAL.—A meeting, convened by Mr. P. Macgregor Burns, architect, in the Lower Church of Glasgow Cathedral, on the 8th inst., for the purpose of examining the plan and vaultings. Mr. Chalmers said that it was desirable in the interests of students of art and history that the plan and the vaulting of the Lower Church should be thoroughly examined by men sufficient in number and of recognized talent. The subject was first brought before the public notice by Mr. T. L. Watson in a paper which he read on November 18, 1895. He (Mr. Chalmers) had criticised that paper before the Archeological Society in April last, but it was thought by many that the present meeting ought to be held. Mr. Watson's main point was that the centre aisle of the Lower Church was intended in the original design to be formed into three narrow aisles by two rows of pillars, and that such was the case he held to have "demonstrated beyond the possibility of doubt." The lecturer held that such a plan possessed no constructive or artistic merit, and he thought it was unlikely to have occurred to the designer of the beautiful cathedral. The span of the side aisles was 11 ft. 8 1/2 in. According to his newly invented plan the span of the three centre aisles would require to have been only 5 ft. The east end of the church being divided into four compartments, the junction of this part of the design with five aisles on the west would have been most objectionable. Moreover, in Mr. Watson's plan the peculiarly significant feature of the shrine of Saint Mungo was utterly forgotten. Mr. Chalmers then proceeded to show that Mr. Watson's attempt to group the various sections of mouldings, and to assign dates to these groups, was fallacious. Mr. Watson also omitted to refer to the mouldings of the pillars, which ought, according to his own theory, to have advanced as well as the mouldings of the arches. Nor was his theory of the demolition of the old choir, and the method described as having been followed in the erection of the structure, in accordance with the evidence to be actually found in the building. The stones at the springing of the vaulting ribs above the capitals of the pillars of the north aisle were then minutely examined. Here Mr. Chalmers did not rely on his own statements. By his request Mr. David McGibbon, Mr. Campbell Douglas, and Mr. Peter Anderson, builder, made an examination in presence of the company. Where Mr. Watson had stated that the moulding was of later date and an insertion in the older work the examiners agreed that they belonged to the original masonry. It was found that mouldings which were said to have been removed had never really existed. It was also found that the slight imperfection in the direction of the vaulting ribs was most apparent at the very spots where, were Mr. Watson's plan correct, no imperfection would have been present. Where Mr. Watson's theory had been followed for about 200 years and certain vaulting ribs introduced as afterthoughts, the examination showed that the ribs were part of the original structure, designed for when the very walls were being erected. Mr. Watson's suggestion that the middle windows of the Lower Church had been left incomplete in order that the stonework for the whole structure should be brought in was also held to be fallacious. Every thing pointed to the west end as having been the direction from which the stonework came.—Mr. David McGibbon moved a vote of thanks to Mr. Chalmers. There now remained no doubt that the beautiful Lower Church existed at present as originally designed by the great architect who had planned the Cathedral. Sir Henry Barry seconded, and the vote of thanks was agreed to.—*Glasgow Herald*

WOOD-CARVING EXHIBITION IN NORTHAMPTON.—The annual exhibition of the work of the students of the various wood-carving, &c., classes, held under the auspices of the Northamptonshire County Council, was held at the Northampton and County Modern and Technical School recently. Classes are now held at ten centres in the county, as follows, the figures in parentheses indicating the number of years the class has been in existence.—Towcester (1), Long Buckby (3), Earls Barton (3), Watford (1), Woodford (1), Broughton (1), East Haddon (2), Desborough (3), Easton-on-the-Hill (3), and Higham Ferrers (2), the subjects taught being wood-carving and woodwork, including joinery. All the above centres were represented at the exhibition.

BIRMINGHAM AND MIDLAND INSTITUTE ARCHEOLOGICAL SECTION.—On the 12th inst., a party of members of the archeological section of the Birmingham and Midland Institute and their friends visited The Nash, the seat of Sir Richard Temple, Bart. After reaching Worcester a drive of six miles brought the company to their destination, where they were received by their host. The house presents the appearance of a delightful ivy-clad Elizabethan minor house, and the great part of it would be correctly so described. But the original mansion must be of much earlier date, as may be seen by the enormous thickness of the wall in certain places—capacious closets being actually enclosed in them. Several of the rooms are of great interest, being practically unchanged since the days of Shakespeare, and in the great hall is particularly conspicuous. The old Elizabethan oak panelling, which, after being painted most of the colours of the rainbow, has been carefully restored to its original simplicity by the present owner, is yet more recent than the singularly fine ceiling in elaborate plaster work, and the books for supporting the tapestry, which the Duke of Devonshire discovered in the course of recent renovations. The ornament is an elaborate and beautiful religious subject, apparently Italian. The hall is also a very fine room, and there are peculiarities in the domed ceilings of two apartments and in other internal arrangements which are deserving of careful study. The bedrooms are delightfully quaint, unsuspected in shape, prodigal of unlooked-for corners, and suggestive of perfect comfort.—*Birmingham Post.*

ACCIDENTS TO CARPENTERS.—Two serious accidents occurred on the 14th inst. to carpenters engaged in the erection of stands to view the Jubilee procession. The first case was that of William Martin, who was engaged carpentering at King's College Hospital, in Finsbury-churchyard, He suddenly slipped and fell, and before he reached the ground was bounced from one piece of scaffolding to another, which caused injuries of a serious character. He was at once attended to by two members of the St. John's Ambulance Association, and afterwards removed to St. Bartholomew's Hospital, where he now lies in a precarious condition, he having broken his left arm, besides injuring his head. The second case was that of George Tucker, who was working on the grand stand being erected outside St. Clement Danes Church, in the Strand. He missed his footing and fell to the ground, a distance of over 40 feet. When taken up he was found to be unconscious, and was at once removed to King's College Hospital on an ambulance.

EXTENSION OF ELECTRIC LIGHTING IN LIVERPOOL.—The Lighting Committee of the Liverpool Corporation met on the 11th inst. in the Municipal Buildings, Dale-street, when it was decided to extend the electric mains to Granby-street at a cost of 387l.; to Park-road and Cornhill, at a cost of 377l.; to Oxford-street, at a cost of 187l.; and to Smithdown-road, at a cost of 60l. The Municipal Electrical Association wrote that they propose visiting Liverpool on July 1, and intimated their desire to inspect the electric lighting arrangements in the city. Permission for this purpose was granted.

THE SIDDON'S STATUE.—The ceremony of unveiling the white marble statue of Mrs. Siddons on Paddington-green, within a short distance of her burial place, was performed on the 14th inst. by Sir Henry Irving. The statue has been modelled by Messrs. Farmer & Brindley after a design by the French sculptor, M. Chavalland.

THE PARKS AND GALLERIES COMMITTEE OF GLASGOW.—The Parks and Galleries Committee of Glasgow Town Council, to whom remits were made regarding the proposed Exhibition in 1901, met on the 14th inst., and agreed that, after the guarantee fund amounted to 50,000l., steps should be taken to form an Exhibition Association to carry out the project.

WINDY, FLEX BOURTON CHURCH, SOMERSETSHIRE.—A stained glass window has just been placed in this church. The design consists of three figures—St. John, St. Peter, and St. James—each depicted with his respective emblem. The window is the design and work of Messrs. Joseph Bell & Son, of Bristol.

CAPITAL AND LABOUR.

THE THREE TOWNS' BUILDING STRIKE.—The position of affairs in this strike is practically unaltered. The Master Builders' Association have considered the request of the Labourers' Strike Committee that deputations from both bodies should meet with a view to a settlement. The

Association, however, came to the conclusion that no purpose could be served by such a meeting, as they were not disposed to make any concessions to the men, there being no lack of labourers in the town. It was also resolved, at the request of the Carpenters' Society, to permit a deputation from the Association to attend a meeting of the general body of carpenters, and also to receive a deputation from the society at a meeting of builders to clear up any points in the dispute that may be at present misapprehended.

THE STRIKE OF TYNESIDE STONEMASONS.—A meeting of the members of the Newcastle, Gosforth, and District Operative Stonemasons' Society was held at the Lovaine Hall, St. Mary's-place, Newcastle, on the 11th inst., Councillor W. Flynn presiding. "One of the audience moved: 'That we resolve to stand fast by our original demand for the shortening of our working hours, believing that it is made in the best and highest interest of trades unionism.' This having been seconded, Mr. W. Fisher gave a resumé of the dispute, and mentioned that for the past twenty-two years no financial progress had been made. There were seventy-one men in England where the men worked less than thirty hours a week. The local employers had refused to meet the masons with a view to considering the case. Although the Association was "unanimous in refusing the men's demands" at least seven prominent members of the Association had agreed to the demands of the men, and their employees were not at work. Only 100 men were now out on strike. That the men were sincere in their demand for an eight hours' day was shown by the fact that they would be sacrificing 4s. 15d. a week in wages by the change. The men had sufficient funds in the Society to last them the whole of this year, so they could not be beaten in a day or two. The proposition was carried. The meeting also expressed itself in favour of a proposition to "leave" themselves for 3s. a week in order to aid those who were out of work.

THE DISPUTE IN THE OXFORD BUILDING TRADE.—In the absence of any satisfactory settlement of the recent dispute between the builders in Oxford and the carpenters and joiners the men ceased work recently. The demand of the employees is for an increase of wages, from 7 1/2d. to 8d. per hour, and further desire the signatures of the builders to the code of working rules fixed by the late Conciliation Board. The rules were signed by many employers at the time of their adoption, but the contract then entered into between the contending parties has long since for some cause come to an end, and it is now sought to again put the rules in force. Owing to contingencies that have arisen in the interim there is no longer any combination or organisation amongst the builders, and the Master Builders' Association, formed at the time of the inception of the Conciliation Board, has been allowed to die a natural death. The men maintain that the code of rules agreed upon by the Amalgamated Society of Carpenters and Joiners and the General Union of Carpenters jointly constitute a fair basis of agreement between the parties and that they are of a similar character to those usually existing in other centres of the building trade. On the other hand, so far as we have been able to ascertain, the position of the masters, or at least the majority of them, is that they decline to concede the union of Carpenters reserve to themselves the right to deal individually with their employees and hence the deadlock. It is said that the builders also have strong objections to the principle of a uniform or standard rate of wages. The number of men out on strike is said to be about 120, twelve only of whom have yet left Oxford for work in other towns, although the men claim that the reason more have not sought employment elsewhere is the prospect which they feel there exists of an early and satisfactory settlement of the matter.—*Jackon's Oxford Journal.*

THE CARLISLE JOINERS' STRIKE.—The joiners' strike in Carlisle has terminated. Six weeks ago the men came out for an advance of three farthings an hour and a reduction of the number of hours of work to the extent of four per week in summer and seven in winter. A meeting of the Masters' Association was recently held in the Viaduct Hotel, and a deputation from the men were present. It was finally decided to grant the men the reduction of hours asked for, and an advance of one-halfpenny per hour.

LEGAL.

BUILDERS AND ARCHITECTS.

His Honour Judge Waddy, Q.C., had before him in the Sheffield County Court on the 11th inst., an action which had been remitted from the High Court. Plaintiffs in the case were Moorwood, Sons and Co., ironfounders, of Harleston Works, Sheffield, and defendants George Longden and Son, builders and contractors, Neepsend, and the action was brought to recover 54l. 18s. 3d. the price of goods, consisting of shoves and lead weights, sold by plaintiffs to defendants. The plaintiffs were represented by Mr. Waugh, barrister, of Bradford (instructed by Clegg and Sons) and Mr. T. E. Ellison (instructed by Alderson, Son and Dust) represented the defendants.

Mr. Waugh, in opening the case, said, on September 6, 1895, Messrs. Longden & Son, the defendants, entered into a contract with the Chairman and

Weekly Board of the Sheffield Royal Hospital for the erection of certain buildings in connection with the extension of the hospital.

Mr. Elison, on the other hand, first contended that the defendants were not directly liable for the goods.

Mr. Charles Hadfield, architect for the alterations and extensions in connexion with the Royal Hospital, said he ordered the goods as the architect,

His Honour: Then who do you consider ought to pay for the goods in the case, for you ordered them?

Witness: Well, if you look at it as a strict matter of business, I ought to pay, but I have already expressed that I ordered the goods as the agent of the Royal Hospital authorities.

His Honour: So do I think you ought to pay. Witness: But that would not be at all fair to the

architect to make him pay for the goods he ordered as an agent. Of course, it would not make a penny difference to him, but he takes this course because it is the customary one, and if the principals ordered the goods direct they would often get a lot of rubbish which the architect would not have.

Mr. Elison, for the defence, urged that there was no agreement on the part of his clients with plaintiffs to pay for the goods, and such an undertaking must be proved if plaintiffs were to succeed in the action.

Mr. James Longden, head of the defendant firm, said a clerk from plaintiffs' firm came to the office and said he had a certificate. Witness directed him to go to the cashier, and personally he did not see the certificate.

His Honour, in giving judgment, said on previous occasions and in other places he had felt called upon to express his astonishment that in these days of enlightenment, contractors and builders should be such stupid and absolutely helpless people as to give themselves up with their throats wide open to be comfortably and happily cut by the architects by whom they were bound.

On the other hand the architects argued that this was the only way in which building operations could be carried out, and that it was necessary to have absolutely unfettered discretion in some one man's hands, so that he could exercise his brains when any unforeseen change or contingency in the course of trade took place.

MEETINGS.

FRIDAY, JUNE 18. Carpenter's Hall, London Wall.—Examination in Carpentry and Joinery. 9.30.

SATURDAY, JUNE 19. Carpenter's Hall, London Wall.—Examination in Carpentry and Joinery. 2.30. Edinburgh Architectural Association.—Annual Excursion: Visit to (1) Linlithgow Palace, (2) St. Michael's Church, (3) Kinmel House, (4) Bonhard House.

RECENT PATENTS:

- 10,659.—LAVATORY BASINS, BATHS, &c.: F. C. Lynde.—In order to obviate the foul condition caused by accumulation of soap and dirt at overflow and upper ends of waste pipes, inventor dispenses with ordinary plug and overflow pipe and adopts a pipe of a sliding character, fitted with a lavatory basin which will perform the function of waste overflow pipe, the plug being adaptable. 11,384.—CHIMNEY POTS: G. W. Taylor.—Inventor adopts a top conical tube and lower down, two belts of outer casing with a number of holes round bottom. Inside there are two conical tubes. Chain is for holes and arrangement of belt. 12,229.—STAIR FLOORING: M. Logan.—Inventor claims a flooring consisting of bricks (formed of any material) utilised end-wise and arranged in rows, drainage channels formed between such rows and spaces communicating with such channels; also an improved brick, consisting of upper and lower independently, downwardly tapering portions, upper side edge of such brick being rounded. 13,570.—MEANS FOR HOLDING AJAR DOORS, CASE-SHUTTERS, &c.: W. Griffiths.—Inventor adopts a sliding nut or bolt extending downwards from latch of door, &c., and terminating in a spike, &c. This is pressed to floor by a spring, and being connected with the latch spindle is raised clear on releasing the catch. Some modifications are described. 4,779.—DEVICE FOR EASILY SECURING BOLTS, SHANKS &c., IN WALLS: P. Le Hite.—Bolt or Shank has a stationary nut, with movable nut, and two or more sleeves arranged between the nuts, surround the bolt, and have their adjacent ends oblique to their axis. 5,838.—DOOR LIFTING APPLIANCES: C. R. Miller.—In order to lift doors for oiling hinges, &c. Inventor adopts a combined Door-lifter and holder appliance provided with a swinging, lift-limiting prop, a roller-like bottom block, a metal foot or under-grip, a treadle block and a shore, united in such a manner as to be freely movable. NEW APPLICATIONS FOR LETTERS PATENT. MAY 21.—13,367. W. Brayshaw, Window or Sash Fastener.—13,371. W. Brayshaw, Window or Sash Fastener.—13,372. T. Smith and T. Parker, Brick-making Machines.—13,393. H. Deacon, Sash Fastener.—13,398. A. James, Window

FASTENERS.—13,432, S. Lockhart, Locks or Fastening Devices.

JUNE 1.—13,432, R. Harrison, Securing Window Sashes.—13,492, E. Thorpe, Window Preventers for Sliding Windows.—13,497, W. Gibson, Sash Fasteners.—13,499, T. Rowland, Sash Fastener.—13,505, H. Alexander, Measuring and Mixing Sand, Cement, &c.—13,508, A. Parry, Sash Fasteners.—13,512, J. Lippincott, Disinfecting or Perfuming the Air of Water Closets, &c.—

JUNE 2.—13,555, C. and W. Gowland, Hinges.—13,557, A. Jordan, Chimney Top or Ventilator.—13,565, J. Abel, Roof Glazing.—13,592, J. Holden and S. Woods, Embossed or Raised Paper for Covering Wall, &c.—13,569, W. Kirkland and K. Mathers, Tool Grinding Machines.—

JUNE 3.—13,654, E. Walker and G. Horner, Movable Partitions, Sliding Doors, &c.—13,674, J. Mecker, Window Frame and Balances for Sashes thereof.—13,675, J. Langston, Case for Doors, Windows, Fireplaces, &c.—13,680, D. Ross, Sash Fastener.—13,681, J. James, Sash Fastener.—13,686, A. Bryant, Sash Fastener.—13,704, W. and A. Hiron, Fasteners for Sashes.—13,706, H. Norval, Window Fastener.—13,707, Y. Courcier, Sash Fastener.—

JUNE 4.—13,772, J. Duckett & Son, Limited and J. Duckett, Water-Closets.—13,790, E. Morgan, Window Sash Fastener.—13,791, J. Hargrave, Working Stone, Marble, Granite, &c.—13,812, J. Nicholls, Fireplaces or Stoves.—

JUNE 5.—13,830, R. Dale, Brick.—13,842, G. Bryant, Laid and Secured Fastening Devices.—13,845, W. Doffle and F. Fellos, Constructing Glass Windows, Illuminated Devices, &c.—13,922, W. Lake, Drying Bricks.

PROVISIONAL SPECIFICATIONS ACCEPTED. 6,239, W. Phillips, Combined Stay and Fastener for Sliding and Reversible Windows.—9,465 and 9,466, J. K. Kaiser and J. Willard, Door Fastening.—9,843, S. J. Simmons, Flushing Clusters and Water Waste Preventers.—10,277, A. Henderson, Fixing Sashes.—10,297, A. Weston, Sash Fasteners.—10,317, A. W. Wydon, Artificial Stone.—

COMPLETE SPECIFICATIONS ACCEPTED. Open to application for two months. 14,113, L. Weiss, Bricks for Flat and Cylindrical Structures.—14,657, H. Lawson, Portable Houses or Structures.—15,688, R. Evered, Water-Closets.—16,827, G. Clark, Stone Dressing Tools.—16,831, C. Conder, Fixing of Door Handles.—16,901, A. Barker, Lock for use in Fastening Sliding Doors and Windows.

The Jubilee from a Decorative Point of View.

OR two or three weeks previous to the 22nd, London, or that portion of it which was on the line of route of the procession, assumed the appearance of a huge carpenter's shop.

As far as the erection of stands only interfered with ordinary shop front architecture there was no particular objection to be made; people might do what they liked with their own; but it is rather a question whether the building up and disfiguring of churches and public buildings with huge masses of staging was altogether the way to beautify the city or to improve its public buildings. The architectural effect of St. Paul's was entirely spoiled for the time being by the temporary erections which clung round it. The National Gallery showed only half its height above a huge tier of wooden seats; the portico of St. Martin's suffered even more, and was, in fact, almost lost to view; and St. Clement Danes was as badly treated. Independently of the question of loss of effect from thus masking some of the principal buildings and destroying their proportions, there comes the perhaps more serious question of the chance of permanent damage to the stonework. It is to be hoped that no serious injury to any of them will have resulted, but we shall be surprised if some of them do not show more or less sign of the stonework having been knocked about to a perceptible extent. If we are to have any more such shows on a grand scale, it is a point to be considered whether public buildings which are national property and are of more or less architectural value ought to be made use of as *points d'appui* for the erection of staging, to say nothing of the possible danger to them from fire in massing such a quantity of inflammable material around and against them; and also (since one object on such occasions is to present the city in its best aspect) whether the result is not a disfigurement which it would be better to avoid in future. It seems pretty clear that there was no real necessity, even in view of sightseeing, for some portion of this work; for there can be

little doubt that, in the matter of special seats to view the procession, the market was overstocked, though (as it proved) not quite to the extent that many people supposed before the day arrived.

From the carpenter's shop stage London passed, during the two or three days previous to the show, into the upholstery stage. The result was brilliant and picturesque as a whole; dingy London scarcely knew itself with such an amount of colour about; but one can hardly say that there was much that was very effective or original in the individual treatment of the fronts. We do not, however, hold with those who advocate the adoption of a general scheme of decoration imposed by authority, and to which individual tastes should have given way. For one thing, it would be too vast an undertaking for authority to carry out; and it would be unreasonable, and an interference with the liberty of the subject, to have expected or compelled house-owners to spend their own money in decorating their premises under compulsion and not according to their own taste. It may also be urged that the element of individuality in the decoration of private premises has an interest of its own. The carrying out of a general scheme must be limited to the public portion of the thoroughfare.

As far as this latter portion of the decoration went we have certainly improved of late years, though we have still something to learn in these matters from Paris and even, strange as it may seem, from Berlin. Our authorities have discovered what an unflattering source of picturesque and jubilant effect is to be found in the erection of standards of some kind or another at equal distances, with garlands festooned from one to the other. What are called Venetian masts are as good in this way as most things: they have a gay effect, and they are entirely in good taste. Thus in this respect the Strand portion of the public decoration was perhaps the most satisfactory; at all events there could be nothing to find fault with in it, at least as far as the masts and garlands went. The more ambitious efforts in other places were not all successful. Along Piccadilly the ornamental standard posts broke out into a kind of ornament at the top which was somewhat flimsy and commonplace in character, pretentious without being really decorative. Across the road in front of the National

Gallery, and in the western portion of the Strand, the genius of some one had devised a very bad kind of cross erections or triumphal lintels (shall we call them), in which the most prominent feature was a kind of finial in a shape approaching a fleur-de-lis, with three coloured balls on it, and a triple group of coloured balls at the side of this; the whole unfortunately suggesting a pawnbroker's sign upside down. We do not know whether there is any symbolism in this triple-ball arrangement; from a decorative point one can only say that, whoever was responsible for this effort in decoration, it was not a happy one. At the top of St. James's-street there stood on each side of the roadway a great built-up Corinthian column with a gilt capital. These columns (the "Jachin and Boaz" of the day) seem to have been erected under the desire to put something large and striking there, without any notion what to do with it. The columns, seeing that the erections were in that form, should at least have carried something; as they stood they looked perfectly unmeaning, and as it they were portions of a design for a triumphal arch, or something of that kind, which had never been finished. Even a statue on the top would have been better than nothing. But the fact is they should not have been in column shape at all; they were evidently intended merely as striking objects to flank the entry to St. James's-street, and should have been designed in something more of the obelisk form—something which was obviously not designed to carry anything, but to be sufficient unto itself. There were, by the way, two more of these columns at the bottom of the street, looking still more unmeaning from the fact that they did not properly face each other, the easternmost one being set at an angle of 45 deg. with the corner building. Were these official efforts, or the combined taste of the clubs of St. James's-street? The whole street looked glorious with a crowd of garlands stretching across it, leaving it like a kind of elongated bower or arcade of greenery, when seen in perspective. Whether the tee-to-tum birds spinning round under the garlands were any improvement may be a question.

On coming eastward of "The Griffin" there was to be noticed a considerable improvement in the design of the standards for carry-

ing the garlands, they were much less commonplace than those along Piccadilly, and showed a good deal of elegance of design and detail. Those in Ludgate Hill, where the Indian Empire was symbolised by bracketed posts, carrying each a gilt silhouette figure of an elephant and palm, were effective and rather novel. London Bridge looked very well with its festoons from end to end above the parapet. In the Borough the simpler class of Venetian masts again prevailed, but St. George's Circus, between the Borough-road and Westminster Bridge, showed one of the most effective bits of decoration on the route, long festoons being carried from all sides of the circus and secured to the top of the obelisk in the centre, thus bringing the whole space into one design.

As to the street fronts, in which, as before observed, upholstery ruled for the most part, one cannot say that there was much of novelty or inventiveness in the decorations, and where there was, it was not always of the best kind. One house in Piccadilly attempted a *tour de force* by means of metal-faced spiral colonnettes and an arcade, accompanied by draperies, but the result was more prominent than satisfactory. Some of the best results were obtained, as at the Albemarle Hotel, by simply festooning the lower portion of each window with coloured textiles; in the case of the hotel the colour scheme was rather delicate and the effect very bright and festive. Generally speaking the taste seems to have been for strong reds set off with yellow or gold, which is a somewhat commonplace combination. Occasionally a well-meant effort at an original and harmonious scheme of colour was spoiled by a failure of balance. In one of the smaller house fronts in Piccadilly, not far from Hyde Park Corner, we noticed the day before the procession a very effective scheme of colour in a completely-draped front, (with the name of Storey as decorator) in which rich orange hangings played a considerable part, contrasted by a rather dark heavy green in the balcony fronts. The effect was very good but somewhat sombre; it was evidently intended to do something more with the green balcony fronts, but on the procession day this "something more" consisted in hanging Indian or Persian rugs over them, leaving the green partially showing, and this spoiled the effect; the rather dark though rich patterns of the rugs did not give a bright enough effect. If those balcony fronts had been enlivened with something white—not too much of it—this could have been chronicled as the success of the day in upholstery decoration. On the whole the conclusion was that while we have improved in our notions of street decoration as far as the public way is concerned—the portion carried out by public authority—in the draping and decorating of residences on such occasions there is a great deal of room for improvement, and little was to be seen which was really of artistic value, the main idea in most cases being, apparently, to get as much stuff as possible on the building and let Providence take care of the colours. In one or two instances (one on a brick house in the Borough) the idea was to cover the whole wall bodily with a diapered stuff and use this as a *fond* for the details of the decoration, but the result was hardly worth the trouble it must have cost. No was much to be said for the inscriptions,

except in respect of their loyalty. An occasional quotation from Tennyson came in well and appropriately, but there was not much of this higher element. "Victoria Reg. et Imp." has not a very inspiring effect. In two places, in Parliament-street and in the Borough, the rather mild cricketering joke of "60—not out," was thought worth emblazoning; this hardly comes under the domain of "happy thoughts."

Considering that there were to be illuminations by night as well as decorations by day, it is curious how very few of the decorators seem to have given any thought to providing something that would be equally successful under both aspects. The Palace Theatre of Varieties, for instance, made a splendid show by day, but was sombre enough at night, and in fact hardly conveyed the idea of being illuminated. The Bank of England stood almost alone in its provision for equally good decorative effect both by day and night. We have already referred to the design. The glass bucket lamps used being white, produced quite a pretty effect as festoons by day, and a still better one at night; the reveals of the windows were also lined out, and a large Greek anthemion ornament emphasised the angle of the building towards the open space at the Mansion House. The merit of the design consisted in its severe and restrained character; nothing was overdone, and every detail had its effect; and though a good deal of the lighting did not follow the actual lines of the building, the spacing and arrangement of the festoons all had reference to the architectural divisions. A study of the illuminations suggested some considerations as to the treatment of architecture in illumination. In any building of architectural importance, bringing out the main lines of the building by lines of lights is one of the best and most effective methods of illuminating, though it has the drawback of being somewhat costly and taking time to carry out. It is a great deal simpler to buy or hire big letters and crowns and emblems, either in gas or in glass to be lighted behind, and fix them up; but this kind of thing soon palls upon one, and in fact the illuminations along Piccadilly and St. James-street were not the least worth the struggle among a noisy crowd which one had to go through to see them. It was fully expected, by the way, that the festoons across the street would be lighted up at night (there were lamp-glasses on them), and a good deal of disappointment was expressed at the failure of this; it would have had a beautiful effect, really worth seeing. The Institution of Civil Engineers, which reserved itself for the illumination and made no decorative show during the day, adopted the architectural principle with good effect, lining out the upper and lower cornice; and an effective scheme of the same kind was carried out at the offices of the London and North-Western Railway Company at the corner of Piccadilly and Bridge-street. But it was around the Mansion House that the architectural principle of illuminating was best seen; in the Mansion House itself, in the Exchange, in the Bank (as already mentioned), and in the Liverpool London and Globe Insurance Offices, which produced an excellent effect by lining out their windows and introducing a double festoon of lights at the level of the first-floor string. But it is necessary to remember that devices which

look quite natural and right by day may fail at night from not showing as they were expected to show. The device of wreathing columns spirally with lights, as at the Mansion House, is one of these. It looks all right by day, but it is forgotten that at night the columns themselves can hardly be seen, and the spiral seems twisted round nothing, and does not explain itself. There was a failure of the same kind at London Bridge. By day the festoon lines of decoration looked well enough (though with the defect that the festoons were too short and numerous for the best effect); but when the lamps were lighted on the festoons there seemed nothing for them to hang from, and one only saw a set of curves rising up into points and going down again, with no apparent statical reason. When lamps are to be festooned, there should be some kind of attachment shown in light also, at the highest points, to give the curves something to hang from.

It seems a pity that an attempt was not made to illuminate St. Paul's by architecturally treated lines of lighting; the effect would have been splendid; but there seems to have been a rather unnecessary dread of danger to the building from fire. St. Peter's has been illuminated in this way many times without any such result. But something was done, nevertheless; the dome and lantern were put into brilliant light by a set of arc lights in the upper windows of some of the houses, and the effect of the colonnade of the dome, seen above the dark mass of the lower portion of the building, as if built of some phosphorescent stone, and the lantern above shining white in the sky, was really fine, and was perhaps the thing best worth seeing on that evening. The Monument was finely treated, with four great ropes of Chinese lanterns from the four angles of the capital, carried down in expanding lines to the adjacent houses.

As to the great function of the 22nd, the procession itself, it must be chronicled as a splendid success, carried out without a hitch or failure of any kind. This was decorative enough; and here again there was a suggestion as to the relation between artistic effect and practical fitness. For nothing was more admired everywhere, we believe, than the general appearance of the Australian contingent, yet their uniform was a very modest one in regard to colour and trappings as compared with our resplendent artillery and cavalry uniforms, but it had the double merit of having some artistic style about it, and of looking like a dress fitted for active service, whereas some of our uniforms seem much more adapted for a procession than as a costume for actual field work. As a spectacle, however, the whole thing was splendid—a sight to be long remembered.

ALTERATIONS AT THE VIENNA "HOFBURG" THEATRE.

AN important decision was recently arrived at in respect to the great Court Playhouse at Vienna, known as the "Hofburg" Theatre.

It has been a well-known fact that the auditorium was unsatisfactory in many respects. Particularly the sighting from the side-boxes was bad, and the acoustics in many parts were lamentable. It is now scarcely nine years since this imposing building has been completed, its actual construction having commenced in 1874, whilst

the plans had been under consideration as far back as 1866. The auditorium is now to be reconstructed, and some of the defects remedied.

This building, which by many is considered to be an example of technical skill brought to high perfection, with all due regard for the allied arts of painting and sculpture, has unfortunately been a subject of incessant controversy ever since the idea of its erection originated. There was much competition in the first instance as to obtaining the commission for the work. Gottfried Semper, it will be remembered, was eventually called in by the Emperor of Austria in 1869 to act as the assessor on the competition drawings of the theatre and several other extensive public buildings which were to be erected. Then Semper was given the commission both for the Court Museum and the "Hofburg" Theatre; and he, being a stranger in Vienna, wished, for various reasons, to be associated with the late Baron Hasenauer in the execution of this extensive scheme. The actual appointment of Semper and Hasenauer as collaborators was dated in May, 1871, but in 1875, shortly after the building operations had commenced on the playhouse, Semper resigned his position, primarily owing to disagreements with his colleague, who seems to have been always anxious to make himself disagreeable, and was not loth to enter into intrigues to weaken the position of the man to whom he was indebted for so much.

When the "Hofburg" was opened in October, 1888, a fresh controversy arose as to the authorship or responsibility for the design. Though the facts are pretty well known to many persons, the disagreement is, unfortunately, not yet settled. The facts are, that Semper was the author of the original design, and Hasenauer was appointed as his colleague in the execution of it. Then Semper resigned, leaving the elaboration of the design and the entire execution to the younger man. We are hence indebted to the former for the plans and main lines of the rendering and the preliminary scheme of decoration. Baron Hasenauer, however, improved the original plan by giving it a more practical character, and, at the same time, introducing a lighter feeling into the architectural treatment, whilst the whole of the co-structural detail and the technical appliances were arranged and carried out under his supervision. The same hand is practically responsible for the whole of the interior decoration, the greater part of which Hasenauer personally sketched, and all of which he executed after Semper's departure. Semper and Hasenauer may therefore be properly described as joint architects of the building.

In the lapse of time between Semper's retirement in 1875 and the completion of the block in 1888, Baron Hasenauer had contrived that Semper's participation in the work should almost be forgotten, and it was Hasenauer who was the recipient of the many compliments and marks of distinction on the termination of this important monument. Nevertheless, the discussion referred to as to authorship was so far kept up that, when criticisms were published as to the acoustic properties and the sighting of certain parts of the auditorium, Hasenauer suddenly recalled the share taken by his deceased colleague in the work, and made him the scapegoat for these deficiencies.

This same procedure is being observed at the moment by the friends of the late Baron. Now that it has been decided to remedy some of the mistakes, the late Baron Hasenauer's friends are ascribing everything unsatisfactory to Semper. As a matter of fact, the mistakes can hardly be considered the fault either of Semper or of Hasenauer, for it could be easily shown that the unfortunate lines of the auditorium are practically due to orders respecting the dimensions and capacity given by certain Court officials, and Baron Hasenauer himself is known to have privately stated in 1893 that the present lines were quite contrary to the judgment of both Semper and himself, both knowing quite well that the results must be disadvantageous. No doubt the actual lines of the auditorium as shown here (see diagram) are as first drawn by Semper, but Semper was only following his client's instructions.

Referring to fig. 1, it will be seen that the shape of the box fronts must, neces-

Fig. 1.

sarily, prevent a good view of the stage in certain positions. The complaints of the last nine years have now resulted in the Court Office of Works requesting Messrs. Fellner and Helmer, together with their permanent technical adviser, Herr Foerster, to report on the matter, and the first-named firm has been strenuously advising an immediate and entire reconstruction of the auditorium, whilst the Court Office of Works, their technical representative, and the theatre administration, advocated the more moderate measure of taking down the fronts and reconstructing them to a different line, at a cost not exceeding 200,000 florins. This expenditure has now been sanctioned by the Emperor, and the work will be taken in hand at once, under the directions of Mr. Foerster, whilst the services of Messrs. Fellner and Helmer are to be dispensed with.

A horse-shoe shape (see fig. 2) is to be followed, in place of the lyre shape, in the plan of the box fronts, and six months have been allowed for the reconstruction. Unfortunately these alterations will probably only partly remedy the defects, for there are many other seats which require attention and alteration besides those of the boxes, especially those in the pit and in the gallery.

Though the reconstruction has been found necessary, it is only right to protest against the indignation which has been shown in

some quarters towards the two deceased architects, for on the point in question there is no doubt that it was the client (as repre-

Fig. 2.

sented by certain officials), and not either of the architects, who was to blame. It is further unfortunate that there should be so much feeling shown as to the execution of the alterations. Messrs. Fellner and Helmer cannot be considered infallible in questions of this kind, and the methods apparently used by these architects and their friends to impress their opinions on the public would be considered unprofessional in this country.

NOTES.

It is surely not unreasonable to ask why it is that the architectural profession is always passed over in the distribution of official honours on such an occasion as this. In art we recognise that Sir W. B. Richmond has well earned his distinction; in engineering we are glad to welcome Sir A. R. Binnie and Sir J. Wolfe Barry, for though we regard the Tower Bridge as an architectural monstrosity, we have always fully recognised the engineering qualities displayed in its construction. But are there no architects in this country who have done anything to deserve recognition? We do not suppose the architects care very much about it—they are not given to snapping after honours, but the slight to them is just the same; and when we see the President of the Institute of Architects, who has done so much, and at so much expenditure of cost and labour, to elucidate the history and promote the study of architecture, passed over—and likewise Mr. Penrose, too, one of the greatest exponents and illustrators of ancient architecture, whose retirement from his position at St. Paul's just about this time might have furnished the best excuse for an official compliment—and when on the other hand we see the honour of knighthood conferred on a water-colour artist who enjoys the questionable distinction of being the President of the Society which gives the worst annual picture exhibitions in London, one begins to wonder how these matters are managed, and who it is that advises the Government on them.

THE letter addressed by the Dean of St. Paul's to the *Times* of the 23rd inst. on this subject

is so far satisfactory that it seems to indicate that the great work of decorating St. Paul's is not to be left half finished; and it appears

that four City Companies have promised each to bear the cost of decorating one of the semi-domes over the piers at the angles of the main dome. But when the Dean goes on to ask for money for the decoration of the interior drum of the dome—"the space between the whispering-gallery and the bottom of the windows in the dome"—the natural reply is, or ought to be, that before we subscribe money for this we must see a scheme, not only for the decoration of the drum, but for that of the whole dome, which cannot rightly be considered apart from the drum. The decoration of the dome in St. Paul's is by far the most important *opus* of the whole work; according as it is suitably or unsuitably done it will make or mar the decoration scheme; and it is perfectly unreasonable to ask people to subscribe for such a work unless they are to first see what is proposed to be done. Again, while we are glad to see that it is proposed to decorate as soon as possible the small domical spaces in choir aisles, the intimation that "there is a place for the arms of any donor who will give 1,000*l.* towards the completion of one of them"—in other words, offering a bribe to the personal vanity of subscribers with the promise to have their arms painted there as part of the decoration, appears to us to be in the worst possible taste. If people will only give for such a paltry motive as that, they had better not give at all.

The Royal Gold Medal. It is to be hoped that there will be a large meeting at the Institute on Monday to do honour to Dr. Cuypers, for we conscientiously believe that the Royal Gold Medal of the Institute has never been more worthily bestowed; and those who read the short account which we have given on another page of Dr. Cuypers's character and career will recognise that he is no ordinary man. And as Dr. Cuypers has been especially noted for the attention which he has given to craftsmanship in connexion with architecture, and for the interest he has always taken in the work of artisans, we may suggest that some of those "outside" architects who specially espouse the craftsman view of architecture might very well put aside their differences with the Institute, and join in welcoming their Dutch brother in the art. The Institute, we have no doubt, will be very glad to see them as visitors on such an occasion.

Truro Cathedral. We are glad to hear that the foundations for the nave of Truro Cathedral are in course of preparation. We do not suppose the funds requisite to complete the cathedral can as yet have been entirely raised or promised, but the fact that the foundations are being proceeded with seems to indicate that there is good hope of the money being forthcoming as required. It would be a thousand pities if Truro Cathedral were allowed to remain half finished for an indefinite period.

The New Sorbonne. This great work proceeds very slowly to its completion. The monumental façades of the buildings along Rue St. Jacques are now finished, and produce a very imposing effect. A high tower, in a modern—very modern—style, is a notable feature in one of these façades, and is rather a remarkable bit of

architectural design. The work is proceeding in the interior of the building; the portion intended for the *École des Chartes* is at present in course of preparation. In a few days the last vestiges of the old Sorbonne will have been removed. The ancient gateway certainly ought to have been preserved.

The Cambrian Railway Accident. It appears that the strictures upon the general condition of the Cambrian line attributed to Col. Yorke at the Board of Trade inquiry into the Welshampton accident have, as we anticipated, been very much modified—indeed they have been practically disavowed by him altogether. Very rough material had apparently been used for repairs in a section of the road examined by the Inspector, but he stated at the inquest, on Friday last, that he did not intend his remarks upon the circumstance to be interpreted as disparaging the general condition of the permanent way of the Cambrian line. The Inspector's remarks were apparently misquoted or misunderstood by the reporters, with the result that a prejudice has been created against the Company, which Colonel Yorke has thus taken the first opportunity of endeavouring to clear up. The Report, embodying the Inspector's final opinion, will be awaited with greater interest in view of the conflicting reports upon the proceedings, and the consequent misapprehensions which have arisen. The alternative theory to which allusion was made last week, seems to have found acceptance with the coroner's jury. Their verdict exonerates the officials from negligence, but they consider that the accident would not have happened had the light Lancashire and Yorkshire van not been on the train. It is a singular fact—if this view is accepted as correct—that a step primarily taken as a precautionary measure, must be regarded as directly contributing to, if not causing, the disaster. For the Lancashire and Yorkshire officials would doubtless consider that, in attaching a second brake van to a long train which had only been provided with one, they were repairing an omission.

Tall Chimneys. MR. F. J. BANCROFT'S paper on "The Stability of Tall Chimneys," recently read before the Institution of Junior Engineers, while not pretending to treat the subject exhaustively, nevertheless deals with practically all the more essential points of this class of construction. We quite agree with him that in a chimney built of brick or stone, no reliance should be placed upon the tenacity of the mortar at the joints, as any chimney may be called upon to withstand a gale of wind while the mortar is still fresh. In order that there may be no tension at any point, it becomes necessary to accurately determine the limiting position of the centre of pressure, and the method of doing this is clearly explained in the paper. The author considers that there should never be any appreciable deflection of a tall chimney when subjected to a heavy wind pressure, or, in other words, that they should not rock. This is certainly a desirable condition, but one that is seldom realised in tall chimneys. Most existing chimneys appear to be greatly neglected so far as periodical inspection is concerned, and when it is remembered that accidents in connexion with these lofty structures may prove most serious, it seems

very desirable that they should be examined from time to time by a competent and independent man.

Telegraphy Without Wires. A TIMELY letter by Professor Lodge in Tuesday's *Times* calls attention to the misleading articles which have appeared in popular journals on this subject. To talk about "Marconi waves," "important discoveries," and "brilliant novelties," in connexion with the Post Office experiments on Hertzian vibrations, gives a totally wrong impression to the public. This impression has been fostered by the unnecessary secrecy used by Mr. Preece in his public statements prior to his recent lecture at the Royal Institution, which came as an anti-climax to experts who had been led to expect something novel. Professor Lodge points out that Lord Rayleigh was the first to discover "cohesion" under electrical influences, but he modestly underrates his own discoveries. He, however, points out, as we did a short time ago, that the apparatus he used in his 1894 experiments was substantially the same as the Marconi apparatus exploited by Mr. Preece. He naturally resents the impression conveyed by Mr. Preece in his Institution lecture that he had prophesied half a mile as the superior limit to which Hertzian vibrations could travel. To quote from a popular work like Professor Trowbridge's "What is Electricity?" full as it is of the most absurd and erroneous statements, in order to show to an audience, including many experts, the present state of our knowledge of electrical theory, was a somewhat deliberate attempt to minimise the importance of Professor Lodge's discoveries.

Professor Crookes. The inclusion of Professor Crookes amongst the recipients of Jubilee honours has given great satisfaction to electricians. Although his researches in chemistry and metallurgy have placed him during the last forty years in the front rank of English physicists, yet the researches he made on electric discharge in high vacua have contributed to two epoch-making discoveries in the applications of electricity. His methods of producing extreme vacua were used by Edison and Swan when they were experimenting on glow-lamp manufacture, and the work he did in this direction greatly simplified the problems they had to solve. It was when experimenting with a Crookes' tube that Professor Röntgen discovered that certain rays given out by it passed through many opaque bodies. How near Professor Crookes was to making this discovery will be seen by reading his presidential address to the Institution of Electrical Engineers some five or six years ago. He had found out that when the exhaustion of a tube was carried far enough certain bodies placed in front of the electrode cast sharply-defined shadows on the opposite wall of the tube, whilst others were apparently perfectly transparent. Although it was reserved for others to discover two of the most practical applications of his experiments, yet the importance of the pioneer work that he did can never be overlooked.

The Rural Delights of Biggleswade. A REPORT to the Local Government Board by Dr. Buchanan, on the prevalence of diphtheria in the village of Hatley Cockayne, in the

Biggleswade Rural District, sufficiently explains why diphtheria has found a congenial soil at Hatley Cockayne. Old cottages built partly of brick and partly of wattle and plaster, roofed with straw thatching, with damp walls, have wooden privies, usually placed in the gardens, the contents of which are dug out by the inhabitants when there are signs of overflow, and either at once disposed of on the garden land, or stored until wanted in an open manure pit within a few yards of the dwelling. Most of the inhabitants obtain water from a brick well, provided with bucket and windlass, placed in the front garden of one of the cottages. It is not difficult in such a case to put two and two together; the water supply does that; product—diphtheria. The same report comments on the water supply of Moggerhanger, in the same district of Biggleswade. Moggerhanger is also supplied by wells, about a dozen in number, of old construction, dry-stained in brickwork which is frequently faulty. Water is drawn from them usually by bucket and windlass, sometimes by a pump. Some are 20 ft. or more in depth, others are about 15 ft. These wells are fed by surface water, which percolates to them through the layers of glacial drift which overlies the Oxford clay. One of them, which shows large gaps in its brick steining, supplies six houses in Bedford-road Yard, Moggerhanger. This well stands in the centre of a yard unprovided with paving or drains to carry away surface water. Waste water and slops are thrown by the inhabitants of the houses on to the surface of the yard, and no doubt soak into the soil, and so reach the well. The same tale is told as to most of the other wells by which Moggerhanger is supplied. Result—enteric fever.

The Radcliffe Library, Oxford. WE gather that the Drapers' Company have nominated Mr. T. G. Jackson as architect of the new buildings which they propose to erect, at a cost of 15,000*l.*, and present to Oxford University. The Radcliffe Library was built, 1737-47, at a cost of nearly 40,000*l.* by James Gibbs, Dr. John Radcliffe having bequeathed that sum for a site and erection thereon of a scientific library, together with an endowment for the librarian, and for the purchase of books. In 1861, Gibbs' building was adapted for the purposes of the Bodleian, and its upper floor converted into a reading-room. The Radcliffe collection of books was removed to the New Museum, built 1855-60, after the designs of Messrs. Deane & Woodward. By the Drapers' Company's generous gift the University will be enabled to provide further accommodation for the School of Scientific Medicine. Gibbs gave a bust of himself, by Rysbrack, to the Radcliffe Library, whose trustees presented, in 1862, a cast of the bust to the Royal Institute of British Architects. In 1747 he issued a volume of his designs for the Library.

The Château of Malmaison. M. OSIRIS, who has bought the historic château of Malmaison in order to save it from ruin, has entrusted to M. Daumet the task of overseeing its repair and (to a certain extent) restoration. The personal apartments of Napoleon are to be brought back to their original condition—his library, his private room, and Josephine's bedroom, dress-

ing-room, and bath-room. The first floor, which is in a ruinous state, is to be rebuilt and transformed into a series of galleries in which will be placed all the souvenirs, artistic objects, furniture, bronzes and medals which are connected with the career and the reign of Napoleon.

Irish Decorative Textiles. THERE is on view at the Donegal Industrial Fund at 43, Wigmore-street a collection of hand-woven Irish linens and homespuns, which may usefully be employed by architects for decorative purposes. They possess the advantage of being entirely made by hand and vegetable dyed by the workers of Donegal, Indian madder dyes of rich and effective colouring being largely employed. Some of them are treated with stencil patterns of the Japanese type, and have been used as friezes. The material is much to be commended for curtains, portières, &c., and also for ecclesiastical hangings. Mrs. Ernest Hart has much reason to be proud of her efforts to reintroduce into the poorer parts of Ireland industries which have been found to thrive there. The designs and execution of the ecclesiastical embroidery are in some cases excellent, and architects can have their designs executed with the knowledge that they are helping forward native industries in the best possible direction.*

The Weather Prophet. A FORECAST of the weather made a day or two beforehand is always to be regarded with suspicion; but we are no longer to be in doubt as to future weather since Mr. B. G. Jenkins, F.R.A.S., has come upon the scene. We have been sent "The British Weather Chart for 1897" by that *savant*, and it is the most remarkable document we have seen for some time. Not only is the weather for the present year provided for, but we are told that as soon as the author has completed the necessary calculations he will issue forecast barometric and thermometric curves, with explanatory notes, for the years 1899, 1900, and 1901. In a paper which appeared in the bulletins of the Royal Academy of Sciences of Belgium, and in another work, the author says that he has given sufficient evidence to show "conclusively" that the moon has a great deal to do with the production of the weather. Nevertheless, on further investigation he found that the moon's influence alone was not sufficient to account for all the observed weather phenomena, so the sun and the planets are called into play; the earth does not seem to have anything to do with its weather. We begin to understand something of this little difficulty when the shades of Copernicus, Kepler, and Newton, and their "system of astronomy," are invoked—the Meteorological Society is not mentioned. The vehicle for conveying these wonderful forecasts is the "Telluric curve," which is "applicable to the

* Since the above was written, we have received some further information from Donegal House as to the practical manner in which it is proposed to use these linens as decorative coverings for walls. A small wood fillet is attached to the wall top and bottom, the linen is nailed on to this very firmly and well stretched, and the raw edges of the linen are covered either with a linen cord or gimp, specially manufactured of the same tone or blend as the linen used, or by a painted or gilt moulding. These linens can be painted in oils or water-colour and stencilled in gold, silver, or colours most effectively. The heavy "Eolus" linens are made of thick polished threads, and look like corded silk, but come out at about one-fifth the price.

whole earth." We notice that this weather chart is revised—"a more accurate adjustment of the curves has enabled the author to issue what he believes will be found to be a more accurate forecast of this year's weather from June onward." A "moderate depression" was prophesied "round the 22nd" of this month—a very accurate forecast! Ought not this revised version to be called a "Jubilee edition" of the chart?

ARCHITECTURAL MEETINGS IN FRANCE.

THE "ASSEMBLÉE GÉNÉRALE" OF THE PROVINCIAL ASSOCIATION OF FRENCH ARCHITECTS.

SINCE 1890, the annual meetings of the Congress of French Architects have been preceded by the meetings of the "Assemblée Générale de l'Association Provinciale des Architectes Français." These latter take place almost always at the commencement of June, in a provincial town (a different place of meeting being selected every year). The proceedings are generally influenced by the intention of treating those subjects which are of special interest to the architects of the Department in which the meeting is held, and the visits made to ancient and modern buildings have also a special or local interest.

This year the "Assemblée Générale" has held its meetings at Clermont-Ferrand, and has made visits to the towns of Royat, Riom, Montferrand, and Puy, and has distributed its rewards to building artisans, and others connected with architectural work, at Clermont-Ferrand and Puy. The meeting was presided over by M. Paugoy, of Marseilles, assisted by M. Guimbal, of Issoire (Vice-President), M. Reybaud, of Marseilles (General Secretary), and M. Benoît, of Lyons (Assistant Secretary).

The delegates, to the number of fifty, from almost all quarters of France, represented twenty-one societies, spread over fifty-four Departments of the country.

Among the resolutions voted, the most important were those in regard to local architectural education, on which an admirable Report was read by M. Blondel, of Versailles, and on which the views of the "Assemblée" were expressed in the two following resolutions:—

1. "Instruction in architecture to be given at (the special places) to be selected by the Minister of Fine Arts, in schools of architecture all subject to the same regulations and following the same programme of studies, and conferring on the pupils, besides the advantage of being exempt from the two years' military service (on the same conditions on which the law grants this exemption to Schools of Commerce and Agriculture), a certificate of capacity after examination, before leaving the school, by a special jury."

2. "The École Nationale des Beaux-Arts (Architectural Section) to take the title of 'École Supérieure d'Architecture,' and to have the sole power of conferring the Government diploma of architecture."

The "Assemblée" also voted for (1) the creation of a prize, in the form of a travelling studentship, to be competed for annually by the students of the Departmental Art Schools; (2) the establishment of a scale of charges for architects, in which 5 per cent. would be taken as the minimum; (3) the insertion, in the statutes of the allied Societies, of the treatise on the "Professional Duties of Architects," drawn up by M. Guadet in the name of the "Société Centrale des Architectes" and adopted by that Society; (4) the formal approbation of a study by M. Gouaull, of Rouen, on the "Servitude d'Alignement"; (5) the adjournment till next year of a Report by M. Le Cœur, of Rouen, on "l'Hygiène de l'habitation," and the inclusion, in that Report, of a special chapter on "l'Hygiène des Habitations à bon marché," of which M. Le Cœur has created a remarkable type in Rouen itself; and lastly, various measures to be submitted to the Government in regard to the reform of the licence of practise for architects, the composition of "Conseils des bâtiments civils," &c.

M. Dupuy, Prefect of the Department of Puy-de-Dôme, presided over the distribution of "Recompenses" which took place, after an address by M. Paugoy, in the large hall of the Municipal Council at Clermont-Ferrand, and

Sketches of London Street Architecture.—XV.

which was followed by a banquet and a conversation to which the relatives and friends of the delegates were invited.

CONGRESS OF FRENCH ARCHITECTS.

The twenty-fifth annual Congress of French Architects is being held this week at Lille as its headquarters. The Société Centrale des Architectes, under whose management all the congresses are held, has this year entirely broken from the tradition of making Paris the headquarters and taking excursions thence for two or three days. On this occasion the Congress sat at Lille from the 18th to the 21st, and after that resolved itself into an excursion in Belgium, to Tournai, Brussels, and Antwerp, but is to finish up its session at Paris to-day (Saturday), where the members will assemble for the usual General Meeting and "Distribution des Récompenses" in the morning and afternoon, and the usual banquet in the evening. There was also to be a meeting of the "Caisse de Défense Mutuelle" in Paris on the previous day.

At midday on the 18th the architects of the "Société Régionale" of the North of France,

which has its centre at Lille, assembled at the railway station to receive their professional friends from Paris and other parts of France; among whom were M. Lucien Etienne, Vice-President of the Société Centrale, MM. Boileau, Poupinel, and L. George, the Secretaries, and M. Girard, the senior member of the Société; MM. Aivas (of Angers), Bissuel (Loyous), Chenevier (Verdun), Marmottin (Concomniers), &c., &c.

After welcome and compliments from M. Dubuisson, President of the "Société du Nord," and a return of thanks by M. L. Etienne (as the representative of the President, M. Chas. Garnier, who had been prevented from attending), the sitting opened at 3 p.m., in the amphitheatre of the Institut de Physique, under the presidency of M. Dubuisson, assisted by the delegates of other societies represented. M. Bergougnoux, at the call of the President, opened the proceedings with a paper on the old but always reviving question of "La Responsabilité des Architectes." After considering the subject at great length, he concluded by propounding a "projet de loi" or sketch of a legal enactment in seven articles,

which dealt not only with the subject of legal responsibility but with all the other questions as to architectural practice which were related to or involved in that question. The meeting decided that the questions raised were too extensive and complicated to be usefully discussed there and then, and with the limited time at their disposal, and that it was necessary to adjourn their consideration to another occasion; and the meeting passed to the second question on the programme—"Architectural Education in the Provinces." On this question, which is regarded in France as the most vital and important of all the subjects under consideration in the architectural world at present, an animated discussion took place on a paper by M. Bateau, a résumé of the previous studies of the subject already presented to the "Société Régionale du Nord." After various opinions had been expressed by MM. Barbaud (Paris), Richez (Valenciennes), Thibeau (Roubaix), Dauphin and Bergougnoux (Paris), and Vandenbergh, Professor of Architecture in the Academy Schools of Lille, the meeting unanimously adopted a resolution to the effect that "the architectural schools of the

Departments ought to be further developed, and that the public authorities be invited to take up the question and to make a commencement of the undertaking."

On the evening of the same day, at 8.30 p.m. the Société du Nord invited the congressists to a convivial meeting ("un Punch") at the Grand Hotel, Rue Faidherbe, where many toasts and much agreeable conversation was further enlivened by various songs, some in the *patois* of Lille and Turcoing, among them a complimentary composition, by M. Watteuw, dedicated "aux architectes."

On Saturday the 10th the Congress sat at 9 a.m., under the presidency of M. Newnham of Lille, when an interesting paper was read by M. Bateau on the "Duties of the Architect in the Eighteenth Century," the author showing, by numerous quotations, that the architect was by no means a negligible quantity, as had been sometimes supposed, in the last century, and that the architects who carried out work for the public were a good deal more than "general contractors."

A Report by M. Bisuel (of Lyons) followed, on the subject of a dispensation from the two years of military service, to be granted to the most meritorious among architectural students, and after a discussion in which many different opinions were expressed, the following resolution was unanimously adopted:—

"That a certain number of Art Schools ought to be established in the Departments, one section of each to be a School of Architecture, with an examination on entering and leaving it, and a certificate of permission to study being granted (after the entry examination), but without any prejudice to the student attending also the existing Fine Art Schools. That the students at these schools, as in the case of the Schools of Commerce and Agriculture, should be exempted from the rule of two years' military service, but only in the case when they had satisfied the examiners at the exit examination before arriving at the age of twenty-six."

The morning's sitting being a pretty laborious one, the afternoon of this day was given up to drives in a number of carriages, first to the Bourse, a building of the seventeenth century, a photograph of which, as well as of the Porte de Paris, was presented to each member of the party; then to M. Newnham's country house at Lambersart, and to the church there, by M. Baudin; to the chalets of MM. Mallet, Baert, Villans, and Cordonnier, in the Avenue de l'Hippodrome, at Lille; also to the houses of MM. Vandenberg and Newnham; to the church of Sacré Cœur, by M. Batigny, and to the apsidal chapel of Notre Dame de la Treille, by M. Villans.

The remainder of the proceedings will be recorded in our next issue.

SKETCHES OF LONDON STREET ARCHITECTURE.—XV.

DOORWAY OF HOUSE IN QUEEN'S GATE.

THIS is a sketch of the doorway of the large house built from the designs of Mr. Norman Shaw, at the corner of Queen's Gate and the road running past the front of the Imperial Institute. The house, as is well known, is one of the most important and typical examples of revived Queen Anne architecture in London. The entrance shown here faces the cross street, not Queen's Gate, although the house is numbered as in the latter street.

CORPORATION BATHS, HULL.—The foundation stone of the new Corporation Baths, now in course of erection on the Holderness-road, Hull, was laid on the 9th inst. by the Mayor of Hull. The building is in the Renaissance style, and will be built of red brick, with buff terra-cotta dressings. The large swimming bath will be 66 ft. by 30 ft., and the Lovers' swimming bath will be 60 ft. by 30 ft. In the private baths, which number thirty-one, with space for five more if required, the partitions are of glazed brick. A laundry is provided. In the large swimming bath a gallery has been erected for the accommodation of the public in attending swimming exhibitions. Provision is made for covering the bath in the winter time with a wooden floor, so that it can be used as a public hall. The new baths will be lighted by electricity. The total cost of the buildings, exclusive of land, is 12,500l. The contractors are as follows:—Buildings, Mr. J. Sangwin; terra-cotta, Mr. J. C. Edwards, Randon; roofs, &c., Messrs. Moorwood & Sons, Sheffield; pipe work and valves, Messrs. Barker & Asprey, Wilmington; boilers, Messrs. J. & B. Umpleby. The new baths are being erected under the superintendence of the Borough Engineer, Mr. A. E. White.

THE ROYAL GOLD MEDALLIST OF THE INSTITUTE: 1897.

THE eminent Dutch architect, Mynheer Petrus Josephus Hubertus Cuypers, to whom the President will on Monday next present the Royal gold medal of the Institute, was born at Roermond (or Ruremonde) in the Duchy of Limburg, in the Netherlands, on May 10, 1827, one of a numerous family. The father practised the art of painting in his leisure hours, and hence the children more or less inherited a taste for art. The son was educated at the Episcopal College of his native town, and it was the director of the college who advised him to select the profession of architecture, as one in which taste and reason went hand in hand.

In 1847 he left Roermond for the Royal Academy of Antwerp, where he gave evidence of his exceptional talents by carrying off the principal prizes in architecture, while at the same time he went through a course of study in sculpture and painting. The Antwerp Academy was at this time an institution exceedingly conservative in the classic tradition.

During his early days at Roermond the young student had seen much of the great church of Notre Dame at Munster, dating from the commencement of the Thirteenth century, and which exhibited architecture to him under a form quite different from that in which it was presented by his Academical teachers; and his subsequent expeditions along the valley of the Rhine and in the north of France brought to his acquaintance other ancient works, as well as the architects in charge of them, especially Viollet-le-Duc, who expounded to him the intimate relation between design and structure in the buildings of the Middle Ages, and led him to recognise the importance of the architecture executed by the Germanic countries before they came under the influence of the Renaissance.

In the early part of the present century Holland could not be said to have any school of architecture of its own; and Cuypers formed the ambitious design of reviving the architecture of his native country on the basis of Mediaeval architecture. From the commencement of his career he recognised the necessity of an intimate relation between the art of architecture and those of sculpture and painting. To illustrate and promote the carrying out of this connection he founded, with Mr. Stoltzenberg, an atelier for combined instruction in sculpture, painting, and carpentry, together with copper-work and embroidery; his idea being that the architect's hand was to be in everything that the artisans executed, and that all was to be designed with the fullest regard to the technical qualities of the materials used. And in the large buildings which he carried out at a later period, all the details were designed by his own hand, and nothing done by the pupils ever went without the corrections of the master.

His chief attention was first given to ecclesiastical architecture, and he became a recognised expert authority on the ancient ecclesiastical architecture of Holland, Belgium, and Germany. About 1875 the Government appointed him a member of the new "Commission des Monuments Historiques," where his views gave rise to a great deal of opposition, but with the ultimate result that the Commission finally succumbed, and Dr. Cuypers was for twenty-five years the sole adviser of the Government, under successive ministries, with regard to the treatment of ancient buildings.

On establishing himself in 1865 at Amsterdam he found a great deal to do in domestic architecture. The whole "Vondelstraat" quarter, with its church, was carried out by him; and when on May 16 last the architect celebrated his seventieth birthday, there was a greater display of flags in the Vondelstraat quarter than are seen when the Queen makes her annual visit to the capital, and all the journals and reviews devoted long articles to his career, accompanied in most cases by a portrait; the various articles commenting on various aspects of Dr. Cuypers' architectural work; one representing him as a specially able constructor, another dwelling on his practical influence in the instruction of artisans, another honouring him as the first modern architect to introduce mural painting into the national buildings of his country, another regarding him as a learned and specially conservative restorer of ancient buildings; another dwelling on his special aptitude in applying ancient principles to modern requirements. But the greatest emphasis was laid on

his character as an indefatigable worker in his atelier, and on the interest which he took in the improvement and education of building artists; and the sixty artists of his atelier, in concert with the ecclesiastical authorities and the Mayor, arranged a fête in his honour at Roermond, which lasted several days, and was heard of all over the country.

Dr. Cuypers holds the degree of Honorary Doctor of Natural Philosophy in the University of Utrecht, and the titles of "Commandeur" in the Order of the Lion of the Netherlands, "Grand Officier" in the Order of Isabella la Católica (Spain), "Officier" in the Legion of Honour, Associate Member of the Institute of France, "Chevalier" of the Order of St. Gregory the Great, and "Chevalier" of the Order of the "Couronne du Chêne" (Netherlands). He is also Honorary and Corresponding Member of the Royal Institute of British Architects and of the Ecological Society of London, and Honorary Member of the Society of "Architectura Amicitia" of Amsterdam, of the Society of Architects of Antwerp, of the Guild of St. Bernulphus of Utrecht, of the Guild of St. Thomas and Lucas of Ghent, of the American Institute of Architects, and of the Royal Archaeological Society of Amsterdam. He is member of Council of the Society of Architects of the North of France (Lille), as well as of the "Société Centrale des Architectes" (Paris); member of the Central Society of Architects of Belgium, and Corresponding member of the Oesterich Museum of Art and Industry at Vienna, of the Academy of Archaeology of Belgium, and of the Historical and Archaeological Society of Limburg.

Among Dr. Cuypers' professional appointments is that of Architect to Mayence Cathedral and Architect to the National Art Galleries at Amsterdam. Of some of his principal executed works illustrations are given in the present number.

The Government of Holland brought out a special publication in illustration of the Royal Museum at Amsterdam, which will be found in the Library of the Institute of Architects; and Dr. Cuypers' friends and admirers are at present engaged in bringing out a large publication in illustration of his principal architectural works.

ARCHITECTURAL SOCIETIES.

THE ARCHITECTURAL ASSOCIATION OF IRELAND.—The annual excursion of this Association took place on the 12th inst. The party, numbering about twenty-five, assembled at Amiens-street in time for the 9 a.m. train to Drogheda. On the arrival of the train at Drogheda, boxes were in readiness to convey the party to Mellifont; the drive thither was through an exceedingly pleasant country, the route taken being along the valley of the Boyne, passing by the scene of the historic fight where the last of the Stuart kings made his final effort to retain the crown. An obelisk to commemorate the victory of King William marks the spot. Close to this the road crosses the river into the County Louth by an iron lattice-work bridge. A little further on the way was through the beautiful demesne of Mr. R. H. Balfour, D.L., Townley Hall. The house itself is a large, but uninteresting structure of the Grecian style in vogue during the early part of the present century. On arrival at Mellifont Abbey the party distributed through the remains of this fine old Cistercian abbey. Of the church itself little remains but what suffices to mark the lines of the plan, which is of the usual Cistercian type; but the octagonal baptistry is a building unique in its character in this country; portions of it are in good preservation, the mouldings of its richly-proportioned arcade of round arches being frequently wonderfully sharp. The detail is of a transitional type. The chapter-house is in much better condition, and still boasts its vaulted ceiling—not a common thing in Ireland. The detail here is of Early Decorated character, and is very good. A small handbook has recently been issued containing some illustrations by Mr. Scott, of Drogheda (a member of the Association), which gives an excellent account of this fine old place. A striking thing is that beyond the plan of the church there is little or nothing left of that type of architecture generally associated in one's mind with a Cistercian foundation. At about 3 o'clock the party drove on to Monasterboice where the two Celtic crosses were examined with much interest; there are also a few small and quaint tomb-

The Siddons Statue, Paddington Green. M. Chavaliand, Sculptor.

New Cemetery Chapel for the Northampton Corporation. Mr. Herbert Norman, architect.

stones of the last century here. Several photographic groups having been taken by Mr. Hadman and Mr. Colman both here and at Mellifont, the party started back for Drogheda, which was reached sufficiently early to give time for a stroll round the town. Amongst the places viewed were the old City Wall, and St. Lawrence Gate, the Constabulary Barracks (an old and rather quaint Georgian building), the new Roman Catholic church of St. Peter, the old Abbey, &c. Subsequently the members dined together at the "White Horse Hotel."

THE EDINBURGH ARCHITECTURAL ASSOCIATION.—The Edinburgh Architectural Association, on the occasion of its annual excursion on Saturday last, visited Linlithgow. Mr. Thomas Ross, President of the Association, conducted the party over the Palace in the unavoidable absence of Mr. W. W. Robertson, and described the plan and the manner and periods of the erection, and drew attention to the means which have been taken by Her Majesty's Board of Works to preserve the building from further decay. Mr. John Honeyman, R.S.A., architect for the restoration of St. Michael's Church, described the condition of the church before the work of restoration was begun, pointed out what had been done, and showed on drawings the proposed additional work. After luncheon at the "Star and Garter" Hotel, Mr. Rowand Anderson moved a vote of thanks to Mr. Honeyman for the interesting description of the restoration of St. Michael's Church, and expressed the appreciation of the members of the Association for the manner in which the work had been carried out. Mr. W. Horn Henderson, Linlithgow, moved a vote of thanks to Mr. Ross for his explanatory description of the Palace, and Mr. Honeyman and Mr. Ross having replied, the President proposed the toast of "Her Majesty

the Queen." The toast having been duly honoured, the party drove to Bonhard House and Kinneil House, which were examined under the leadership of Mr. Ross, who drew attention to the plaster ceilings at the former, and described the erection of the latter as two houses joined together by wings in the reign of Charles II. An examination was also made of ruins of a chapel at Kinneil, which is being cleared—under the direction of Mr. Macaulay, factor for the Duke of Hamilton—of the rubbish which has accumulated over the foundations.

VICTORIA HALL, WIDNES.—The foundation-stone of the new Victoria Hall for Sunday-schools in connexion with St. Ambrose Church, Widnes, was laid recently. The new building which is to be erected will adjoin the vicarage, and will have a central hall, 70 ft. by 34 ft., with three class-rooms about 24 ft. by 18 ft., separated by folding partitions. The ground plan is in the form of a cross. The hall is to form the central block, the class-rooms being on each side, and also occupying the ends. Accommodation will be provided for about 600 scholars. The building is being erected from the designs, and under the supervision, of Mr. Beesley, architect, Warrington, the contract having been taken by Mr. James Pilkington, builder, Rainford, St. Helens.

COTTAGES, ROTHBURY, NORTHUMBERLAND.—A block of twelve cottages has been erected at Rothbury by Lord Armstrong. The work has been carried out by the following tradesmen:—Mason work, Mr. Thomas Metcalf, Rothbury; joiner work, slating, plastering, and plumbing by the workmen employed by Lord Armstrong on his estate, under the superintendence of Mr. William Bertram and Mr. James Riddell; wrought-iron railings and gates, Messrs. Thompson Brothers, Berwick-upon-Tweed; painting and glazing, Mr. John H. Clark, Rothbury; the whole being from the plans of Messrs. James Stevenson & Son, architects, Berwick-upon-Tweed.

THE SIDDONS STATUE, PADDINGTON GREEN.

This statue, which was unveiled last week, is modelled by a French sculptor, M. Chavalaid, and executed at the atelier of Messrs. Farmer and Brindley. At the back of the pedestal is an inscription commemorating the fact that the statue was unveiled by Sir Henry Irving, on June 14, 1897.

The statue is dignified in pose and expression—a sculptor could hardly undertake to present Mrs. Siddons at all without attaining those qualities in his work—and we are glad to welcome it as an indication that the idea of erecting public statues in honour of persons who have been eminent among us for character or genius is gaining ground in this country. It is, however, impossible conscientiously to say that we regard this statue as a great or remarkable work of art, and we are rather inclined to ask why, in erecting a statue of an English actress on an English site, it was thought necessary to go to a second-rate French sculptor rather than to a first-rate English one?

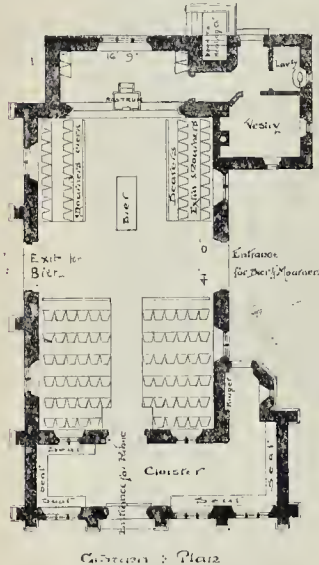

NEW CEMETERY CHAPEL, NORTHAMPTON.

This is the first premiated design for a new cemetery chapel and lodge, in a competition open to the architects of Northampton. The building is to be of hammer-dressed range work in Dunston stone with Weldon stone dressings. The chapel will give accommodation for 108 people. It is to be heated. The lodge is to have an external treatment of a similar character to that of the chapel. It to have on the ground floor an office

and sitting-room, kitchen, scullery, &c., with cellar in the basement and four bedrooms on the upper floor.

A tender has been obtained from Mr. G. J. Fisher, Northampton, for the two works, chapel and lodge, for 2,180*l.* The sum allowed in the competition was 2,500*l.*, and the architect's estimate was 2,350*l.*

The plan is so arranged that the public may enter and leave by the west door, whilst the funeral procession and those more intimately connected with it can enter by the north door and leave by the south, thus avoiding any

New Cemetery Chapel, Northampton.—Plan.

inconvenience by the meeting of the arriving and departing parties.

The vestry is so arranged that the officiating minister can see the funeral arrive, thus enabling him to appear at the proper time.

A cloister was required to enable people using the cemetery to rest. This is arranged at the west end, and could be made available for extra accommodation on special occasions.

The architect is Mr. Herbert Norman, of Northampton.

Illustrations.

THE ELEANOR CROSS, NEAR NORTHAMPTON.

THIS illustration of this well-known monument is taken from an exceptionally good photograph which was lent to us by a Northampton architect, Mr. Holding, at the time when we were collecting illustrations for the article on the architecture of Northampton, published in our issue of April 24 of this year. As it could hardly be rightly included under the head of Northampton architecture, and its publication would have taken up space which was wanted for the illustration of modern buildings, we omitted it at the time; but it is an effective illustration which our readers will probably be glad to have, independent of any special occasion for its introduction. Some remarks on the cross and its present condition will be found in the "Northampton" article already referred to, on pages 375-6 *ante*.

WORKS BY DR. CUYPERS, OF AMSTERDAM.

I. THE CHURCH OF ST. JACQUES, AT THE HAGUE.

This church is situated between two streets in the Dutch residence, the Hague, and is the first important Roman Catholic church that has been erected there.

In its principal features the design is of the

Dutch Medieval type; a Latin cross in plan, with a polygonal choir, and one large tower with spire at the west end. In the details the geometrical system is freely developed, and the ornamental decorative details are composed after natural forms.

The main walling is of brick, with sandstone and French savonnerie stone for interior dressings. The main portion of the internal structure is also of red brick, which has afterwards received a polychromatic decoration.

There is a gallery all round the choir, with an arched triforium above, and the arrangement of the two chapels in each of the transepts, developing their vaults from one pier with two capitals, gives some special character to this portion of the interior. The greater part of the furniture has been executed after the designs of the architect.

THE NATIONAL ART MUSEUM, AMSTERDAM.

Bricks of different sizes, Belgian and French, with blue-grey stone and granite, are the principal materials employed in this large building, which is constructed without any wood, and with very little iron.

As it contains not only the national picture gallery, but besides this a library, the very extensive collection of old engravings and etchings, an industrial and Oriental art museum, and a collection of casts and illustrations of the history of Dutch art in its various periods in connexion with every-day life, the plans of the three main floors have therefore been treated in accordance with these different requirements.

The objects of old Dutch industrial art have been collected in rooms which are copied from ancient existing buildings, so as to give the objects in their old surroundings.

The main form of the building is governed by the requirement of the Board of Works of Amsterdam, that a street thoroughfare should pass through the centre of the space. The architect accordingly arranged double vestibules and staircases, which lead to one central entrance-hall, with five different picture-galleries opening out of it. Above the street runs the gallery of the old Dutch masters, leading up to the "Rembrandt-Saal" at the end.

The Dutch Government has given a full publication of this Museum, the only one in Europe built at once after one general plan, and comprising all the different branches of art, even two schools of art in the upper floors.

This was the first public building in Holland in which decorative sculpture and painting were admitted, after engineers had been, during fifty years, the only Government architects. An art school was founded for instructing those who were to carry out the art-work in the Museum; a school which has not only succeeded admirably, but has been followed by the establishment of a great many others in Holland since that time.

THE CENTRAL RAILWAY STATION, AMSTERDAM.

In 1881 the Department of Railways and Public Building appointed Mr. P. J. H. Cuypers, in connection with the architect-engineer, A. L. van Gend, to prepare the plans for the Central Railway Station, in co-operation with the Railway Companies which were afterwards to make use of it.

The building is situated on a spot that twenty years ago was overflowed by the water of the sea in the Canal called the "Y." The Railway authorities proposed to form a great block of concrete in the sand, 300 metres by 50 and 2 metres thick. But the authorities decided to build on a common Dutch pool foundation, with an oak framework. This construction has answered very well, notwithstanding the heavy structure and large-span iron roof (45 metres), which it has to carry.

The style is that of the fifteenth and sixteenth century buildings in Holland—brick, and with stone dressings, both inside and outside.

The floors, either concrete or oak, are laid on brick vaults and iron girders.

The great central vestibule in the ground floor contains the ticket offices, and leads to the luggage offices on both sides; two passages in tunnels lead to the second and third platforms, two large staircases lead to the waiting-rooms, and first platform, two smaller staircases lead to the second floor, where the large assembly hall is formed above the vestibule; and all

other rooms are arranged for the administration department.

The dwellings for officials, the police-court, the post-office, etc., are in the west wing. At the east end is the pavilion for the Royal family, formed by a central hall, two side rooms, toilet, etc., and a richly-decorated vestibule with staircase.

Though the architect has been accused of making his public buildings too medieval and "convent-like," in this instance he departed sufficiently from medieval precedent, for, instead of vaulting this large five-aisled space, he employed iron box girders with immense wrought-iron brackets, with flat arches in yellow brick turned between them, and treated with a slight decoration. In adopting this treatment, Dr. Cuypers considers that he has kept to the principles of thirteenth century architecture, while adopting the methods of the nineteenth century.

One of the illustrations shows the front façade of the railway-station; the other gives an idea of the manner in which the interior passages and offices have been designed and treated.

SOCIETY OF ENGINEERS.

A VISIT was made by a party of the members of the Society of Engineers on Thursday, the 17th inst., to the London section of the M. S. and L. Railway (Extension to London) Works.

The works in question comprise the Metropolitan Division of the Manchester, Sheffield and Lincolnshire Railway (to be hereafter called the Central Railway) Extension to London.

The trains of the Company will run from the point where their new main line joins the Metropolitan Railway at Quainton-road, over the rails of the latter company to Harrow, from which place two new main lines for the exclusive use of the M. S. and L. Railway are being constructed by the Metropolitan Railway Company, adjoining their own line; to a point near Finchley-road Station, at which place the work is taken up by the M. S. and L. Railway, and is the property of that company.

At Neasden, which the new line of the Metropolitan Company passes, the M. S. and L. Company are laying out a large sorting-yard and engine-house, &c., for the accommodation of the London working.

From Finchley-road station the new line runs southerly by means of covered way, 26 ft. 4 in. in width, and at some points quite close to the existing line of the Metropolitan, until it reaches the London and North-Western Railway, which is crossed between the Loudoun-road station and the westerly mouth of the Primrose Hill tunnel by a steel girder bridge of three spans, and then runs into covered way again at the northerly side of the Alexandra-road, continuing either in covered way or tunnel until it emerges into a large opening lying between Circus-road and Wellington-place.

It again passes by means of covered way, constructed with three arches, one of 40 ft. and the other two of 26 ft. 4 in. each, the whole accommodating seven lines of rails, under Wellington-place, Lord's Cricket Ground, and St. John's Wood-road.

All the retaining walls, side walls, and arches of the covered way and tunnel are faced with blue brick and present a solid and massive appearance.

The work under Lord's Cricket Ground had to be done during the winter months, and the visit showed that no time had been lost, for the turf over the covered way is already green and in good condition. As fast as the arches were turned the dumping under them was excavated and lifted through openings left for the purpose, and the filling over the arches followed the brickwork quickly, work being continued day and night.

The Regent's Canal is crossed by a large steel bridge, the openings for the passenger main lines being spanned by through girders; while that portion for the goods and coal lines has been made a deck bridge, and covered with Hobson's steel flooring so that rails can be laid, and points and crossings laid in at any part, irrespective of the girders.

The Regent's Canal has been widened and a retaining wall built on the south side to form a lay-by for barges interchanging traffic with the railway, and a transfer shed, and several cranes will be placed on the railway wharf.

Just after crossing the Canal a separate pair of lines diverge and run west to Grove-road, under which they pass to an extensive coal

depot which is in course of construction, and which occupies an area of about 20 acres.

The goods warehouse, which will be 385 ft. in length, by 255 ft. in width, and have five floors, is situate on the former site of Alpha-road, and between it and a new road to the south of it, which extends from Grove-road to Park-road, and which will cross over all the lines of way leading into the passenger station. This road will be 60 ft. in width, and is being paved with hard wood blocks of Jarrah timber; another new road leaves this at right angles near to the new vicarage and schools of St. Paul's Church, which have had to be rebuilt, and runs alongside the site of the new passenger station and to the Marylebone-road.

The passenger station, which will have a frontage of 325 ft. on what was formerly the south side of Harewood-square, will contain the booking office, restaurant and the usual waiting and other rooms on the ground floor, and general offices for the Company on the first floor, will be of red brick. In front of the office there will be a promenade 100 ft. in width, and extending the whole length of the frontage, and from this promenade access will be had to the departure and arrival platforms, which, for the present, are limited to a width of 158 ft. on the easterly side, the rest of the space to the west being reserved for future extensions.

The platforms and cab rank, which latter is entered from the bridge over the lines at the north end of the station, will extend to that bridge and will have a length of 1,000 ft., but the roofing will at present only extend northwards for half that distance.

The spans of the roof will be two of 50 ft., one of 40 ft., and a temporary span of 18 ft., and will be carried on columns and arched lattice spars running north and south.

The work for the station has only just been commenced, and it will be some months yet before the character of this work can be seen.

In the covered way, tunnels, and retaining walls already done, strength and massiveness are the principal characteristics, and there has been no superfluous expenditure upon ornamentation.

There are an average number of 3,000 men employed upon the works, which are let under contract with the company to Mr. J. T. Firbank, M.P. Messrs. Sir Douglas & Francis Fox are the engineers-in-chief.

In front of the station, and between it and the Marylebone-road, the Grand Central Hotel of the Gordon Hotels Company, and to be worked in connexion with the railway, is being erected. It will consist of a building occupying a block of land 313 ft. from north to south, and 23 ft. in average width from east to west. It is being built on four sides of a central quadrangle, which will be roofed over in the manner of several continental hotels, and will form a handsome front for the station, to which access will be had by two new wide streets east and west respectively, of the hotel. Colonel Edis is the architect of the hotel.

Books.

Bell's Cathedral Series. Edited by GLEESON WHITE and EDWARD F. STRANGE. Chester, by Charles Hiatt; Rochester, by G. H. Palmer, B.A.; Oxford, by the Rev. Percy Dearmer, M.A.; Canterbury; and Salisbury.

WE have nothing but praise for these admirable little handbooks. Some might suppose it difficult to add anything that would be useful to the already voluminous literature dealing with the English cathedrals. As a matter of fact, however, most of the books on the subject are somewhat elaborate and expensive; a good many are overloaded with details of very secondary interest, however desirable to make the work complete, and with criticism which, if sometimes useful, is more often in the way. Between the more sumptuous volumes, and the little local visitors' guides, there stands really only Mr. Murray's excellent and learned series of handbooks, themselves so full as to be standard works and beyond the requirements of a good many people who are more or less interested in the subject.

The editors tell us, in a general preface, that the present series has been planned to supply visitors to the buildings with accurate and well-illustrated guide-books, at a popular price, and not too technical, but compiled with sufficient knowledge and scholarship to make them useful to the student. In the five volumes

before us this object seems to be very well attained. The "visitor" is obviously the principal object of solicitude, and the "student," as modestly indicated, is only incidentally catered for; but the really accurate information provided for the former is of a kind, and is so arranged, that it must often be of value to the latter when larger works cannot be referred to; and the price is such as to put it within easy reach of every one. In each case the history of the building, the descriptions of the exterior and interior, and the history of the See are separately treated, and the descriptions are divided into sub-sections for easy reference. This is, no doubt, wise, if not inevitable under the circumstances, and one must wait patiently for more ambitious books which may give life and interest to the dry details by treating all these sections together; showing how the history of the building has been bound up with the course of events and influenced by the characters of men; how its arrangements have been affected by changes of ceremonial, or of religious or architectural ideals, by the wealth or poverty of communities, and so forth; and how the architectural details are the result of some of these combined with the nature of the material and class of workmanship available when they were executed. We believe that adequate knowledge, a little research, and very moderate literary ability would suffice to produce books on these lines which, if not as absorbing as a first-rate romance, would at any rate be far more interesting to the public and useful to the student than anything yet attempted, and we hope some day to see something of the kind.

Meanwhile these little volumes supply many hints, and a good deal of the actual information that will be required by the future author, and although they do not tell a connected story, they do frequently trace effects to their immediate causes in a very interesting way. They bring out the peculiar characteristics of each building, they state the important facts correctly; scrupulously pointing out those which are disputed or uncertain. Their criticism is well informed, and confined within reasonable limits, and their judgments are stated with moderation, and will commend themselves as a rule to the professional reader. The views and sketches introduced are necessarily small in scale and do not show a great deal of the architectural details; a good many are reproductions from photographs and a few from prints in older books, and are not in themselves very interesting, though adequate for the incidental illustration of the text. But there is also a fair sprinkling reproduced from sketches that are fresh and pretty enough. In the matter of illustration we think the Salisbury volume is somewhat inferior to the others. Each book contains a little sketch plan placed near the beginning of the chapter on the "interior"; a position the appropriateness of which is not quite clear to the architectural reader: one would suppose it might be exceedingly useful for reference when reading the earlier parts of the book, and that its place would be on the first page or where it could be easily turned to at any time without searching for its position in the index.

These volumes would be welcome if only as a sign that the interest in our cathedrals, the principal architectural monuments of the country, has not died out with the Gothic revival to which it mainly owed its origin in the present century. They are especially welcome as showing that, in works written with an avowedly popular object, it is no longer considered sufficient to adopt a tone of florid eulogy of everything old, and indignant

condemnation of what is new; but that it is worth while, on the contrary, to understand both and give each its due.

The Law of Boundaries and Fences. By ARTHUR JOSEPH HUST BANISTER. Fourth Edition by Archibald Brown Banister. London: Butterworth & Co. 1896.

THIS is a very well-known book, and may fairly be said to contain the whole law on the subject. In some respects the work is almost too full, as there is a portion of one chapter on level crossings and the duty of railway companies in connexion therewith. We can scarcely consider this subject to fall within the real object of the book. In fact, we should be inclined—without referring to these details—to suggest that in any future edition the question of eliminating some of the existing material should be considered. The chapter which will have most interest for readers of this journal is that on party walls, apart from statute and under the London Building Act. One important case is noted in it, namely: that of the Mayfair Property Company v. Johnston, decided in 1894. Here two persons were tenants in common of a party wall, and each was held entitled to enforce a partition of it, and such partition was ordered to be made longitudinally, and each party was ordered to execute the necessary conveyance. A useful feature of the book is the chapter on the evidence of boundaries. There is nothing more important for landowners than to be clear about the boundaries of their property, and to understand what facts are evidence in support of their views. We may also commend the plan of adding the dates to the decisions of the Courts. To laymen, especially, this knowledge is valuable.

A Short History of Musical Instruments. Compiled by JOSEPH GERMAINE. London: S. & P. Erard. 1897.

THIS is really a short illustrated pamphlet issued by Messrs. Erard, the pianoforte makers, partly with the idea of tracing the progress of the percussion class of stringed instruments from the earliest forms down to (or up to) the modern pianoforte; but it contains a good deal of information and illustration in a small compass, and may be useful to those who have to represent ancient musical instruments in decorative design.

Correspondence.

To the Editor of THE BUILDER.

SEWER CAPACITIES, BY DIFFERENT FORMULÆ.

STR.—I have recently tabulated the results of a comparison of various hydraulic formulæ, chiefly of figures worked out, over a year ago, in connexion with an American sewerage scheme. I do not remember having seen similar results, in a form admitting of ready inspection, and, therefore, enclose copy of table for publication.

Having regard to the disparities shown, it would seem desirable that greater uniformity of practice should be established in this matter, and the Kutter formula (No. 6 in Table) with its varying coefficient "c" for mean velocity, giving a relatively low result for small conduits, appears to possess advantages not offered by other rules. The use of different values for "n," to suit varying degrees of roughness in the conduit, is another well grounded departure from opinions once commonly entertained.

Formulæ Nos. 7 and 8 are modifications of

DISCHARGES THROUGH CIRCULAR CONDUITS, RUNNING FULL, IN CUBE FEET PER MINUTE.

Formulæ.	Earthenware Pipes.						Brick Sewers.					
	6 in.		12 in.		2 ft.		4 ft.		6 ft.			
	1 in.	1 in.	1 in.	1 in.	1 in.	1 in.	1 in.	1 in.	1 in.	1 in.		
1 Eytelwein	55	22	248	140	99	1,256	725	458	3,180	1,833	5,054	3,577
2 Chezy (coefficient 94)	55	32	248	140	99	1,253	723	457	3,179	1,830	5,043	3,563
3 Weisbach (Latham's Table)	60	34	268	148	102	1,357	779	478	3,431	1,919	5,344	3,676
4 "Box's Hydraulics," Table 3	54	31	249	137	97	1,210	705	448
5 Neville (Molesworth's Tables)	65	35	260	137	105	1,359	826	490
6 Kutter ("n" = .013 for Pipes, .015 for Brick)	41	24	225	127	90	1,133	654	414	3,149	1,925	5,759	4,020
7 Massachusetts Drainage (Water)	58	34	283	160	114	1,533	859	569	4,283	2,473	7,140	5,062
8 Commission, 1885 (Sewage)	52	30	252	142	101	1,385	799	506	3,807	2,198	6,364	4,500
9 Mean Velocity (ft. p. sec.) Kutter	3'48"	2'01"	4'77"	2'70"	1'91"	6'01"	3'47"	2'19"	4'43"	2'55"	3'39"	2'37"

the Chézy rule (No. 2) with the use of a varying "c" coefficient derived from experiments on the Sudbury River Conduit (Boston Water Works) and Boston Main Drainage Works respectively. These coefficients range within the limits of the Table, between 88° and 133°; a fact amply sufficient to account for the divergent results as compared with No. 2. The constant used in the latter, 0.90, brings the formula into remarkably close agreement with the better known Eytelwein (No. 1).

The mean velocity for each size and inclination of sewer, as per Formula No. 6 (Kutter), is shown in last line of Table.

JOHN S. HODGSON.

Wellington, Mass., U.S., April 21, 1897.

THE GRAVES OF GREAT ARCHITECTS.

SIR.—When wandering recently in Shenleybury churchyard (near St. Albans), the sexton drew my attention to the broken grave of Hawksmoor. It consists of a flat slab of stone on a low brick plinth, and bears the following inscription:—

P.M.S.

Hic jacet

NICHOLAUS HAWKES-MOOR ARM.

Architectus

Obijt vicesimo quinto die Martij

Anno Domini 1736

Ætatis 75

The month and final figure were not clearly decipherable, and I have supplied them from the "Architectural Dictionary," where, by the way, Hawksmoor is spelt without the "e."

The meaning of the opening initials of the epitaph is also obscure. Perhaps some of your readers can explain them. What, however, I wish to draw attention to is the advisability of ensuring the preservation of the scattered monuments of great architects. A very small annual outlay would suffice, if systematically expended. Probably 2l. would put Hawksmoor's gravestone together again and free it from lichen. The Institute might consider such a work within their sphere.

Now, if one may wander from Hawksmoor's tomb at the east end of the churchyard to the south door, the paving in front of which was the floor of the now demolished tower, one may read another epitaph of interest to the architectural student:—

"In Memory of Joseph Rogers, who died August 17th, 1828, in the 77th year of his age, having been Clerk of this Parish a half-Century.

Silent in dust lies mouldering here

A Parish Clerk of Voice most clear:

None Joseph Rogers could excel

In laying bricks or singing well;

Though snapped his line, laid by his rod,

We build for him our hopes in God,

The Saviour God, that he will raise

Again that voice to sing his praise

In Temple blest which always stands,

The Church of God, not made with hands."

Although still remembered by a few surviving inhabitants as leading the singing in the church, and not born until after Hawksmoor's death, Joseph Rogers represents a type of workman more familiar to the architect of Hawksmoor's time than our own. It would be interesting to know how many bricks the old parish clerk considered it proper to lay in a day.

F. H. M.

THE ASSOCIATES' (R.I.B.A.) VOTE.

SIR.—Whilst admitting there may be a difference of opinion as to whether the Chairman's ruling of the last week was correct or not, you infer that he was entitled to his opinion. But was he? He was not asked for a ruling; nobody objected to the Associates present voting. Why this haste, therefore, to give a ruling which nobody apparently wanted, and which you admit is open to question? Surely the proper course would have been to wait for an objection, and even then to give us the benefit of the doubt—if there was one.

But I must repeat my conviction that no Chairman has the right to read into the clause of the Charter words which do not exist there. Our right to vote is clearly only prohibited in the "making, altering, &c., of any by-law." We were not at the time discussing the alteration of a by-law—that came later. And I refer for confirmation of my

statement to the Minutes published on p. 306 of the last issue of our "Journal," where I read "on this and the two following Resolutions" (the italics are mine) the Chairman ruled, &c. Mr. Langlands was quite right in saying "by-law" was not mentioned. It is not in either of the three. They are simply resolutions which, to be valid and sufficient to enable the Council to act, must be passed by the Institute and not by a section of it.

Let me state another case. Suppose a Fellow brought forward a motion that "The Associates be no longer permitted to vote on any questions before the Institute," and Mr. Webb were in the chair. I ask him would he permit the Associates to vote on that resolution? And I ask him this publicly, because our mouths were absolutely shut at the meeting, it being obviously a breach of order to discuss a Chairman's ruling. Besides, the ruling was not logical, for whilst prevented from voting on a particular clause of a report (it was nothing more), we were told we could (and we did) vote on the motion that the report be adopted. Now, sir, the greater must include the less, and if one clause affected the by-laws, much more so did the three clauses which the whole report contained, and yet on which we were allowed to vote.

That Mr. Webb is the last man to do the Associates an injustice I believe, for no man more enjoys the respect—almost affection—of the juniors in the Institute. But that he has done so, however unwittingly, I hope he will perceive.

C. H. BRODIE.

The Student's Column.

SPECIFICATIONS.—XXVI.

TERRA-COTTA.

WITH buildings in which terra-cotta plays an important part, it is usual to make a sub-contract with a manufacturer for the supply of the material to the general contractor. Questions of colour, quality, and punctual delivery make this desirable, if not absolutely essential. The amount of the sub-contract is usually arrived at by obtaining an estimate (with or without competition) based upon a bill of quantities supplied to the manufacturer. Unless there be very exceptional features in the work, this bill contains but few items, viz.:

- 1. cubic feet plain and moulded terra-cotta.
- 2. cubic feet enriched do. do.
- 3. No. models.
- 4. No. enriched models.

It then becomes necessary to make the manufacturer and the builder jointly responsible for matters in which their respective duties overlap, and separately responsible for those things over which they have individual control. We, therefore, now proceed to give the separate forms of specification for manufacturer and builder; but, as many of the clauses are the same in both, the second specification gives merely a reference to those items of the first which it is desirable to repeat.

It may be mentioned that it is best for the manufacturer to receive direct payment upon certificate—the builder including in his own estimate his percentage upon the sub-contract to cover his liabilities in connexion with it.

Specification for the Terra-Cotta Manufacturer.
 1. The terra-cotta to be delivered at the station in ton lots, complete and perfect, free of all charge for carriage and packing. All requisite information concerning, and marking upon the material shall be supplied by the manufacturer. It is to be of best quality, free from all cracks, and equal in all respects to samples deposited with the architect. These samples are to show the two allowable extremes of colour, and the extreme permissible deviation from true lines in mouldings and arisises—as well as the general finish of the enrichments. All pieces in any way inferior to these samples will be rejected, and new blocks in their place are to be supplied by the maker, who will not be entitled to any time allowance on this score for completion of either the whole work or of the sections into which it is divided in clause 6 below. The terra-cotta to be in strict conformity with the drawings, models, and instructions supplied.

2. The setting out of the work to the necessary shrinkage scale, and all responsibility for its turning out of the exact sizes required for use to be undertaken by the manufacturer.

3. But the builder may be called upon to supply particulars upon all points of setting out requiring attention in order to meet the wants of other trades, and to assist in determining the numbers of the several pieces, and the identification marks to be put upon the various blocks.

4. The manufacturer to make and supply all

the models that may be wanted. (In some cases, where the enrichments require more artistic treatment than the manufacturer would be able to give them, a special arrangement is made for this portion of the models to be supplied to the manufacturer.) Such models as the architect may wish to see are to be submitted to and approved of by him before being used for moulding form. Piece moulds to be made of the various blocks so that they may be moulded without stopping up the several parts with clay to the injury of the modelling. The clay to be pressed well home in the moulds and when it is taken out the seams to be carefully obliterated. Each piece of terra-cotta is to be properly chambered and perforated and to have such cross-webs, joggles on arch joints, &c., as will give it the requisite strength for its intended position in the building.

5. All joints to have chipping pieces and recesses or projections for joggling together.

Each piece must have the necessary cavities, fillets, channels, grooves, grooves for flashings, stubs, sinkings, joggles, dowel holes, mortices, perforations and recesses worked thereon to allow of proper bonding and connection to adjoining work of whatsoever material it may be. All the blocks must be delivered perfectly accurate on all faces, with all requisite chipping to the joints already executed. No chipping, rubbing, or other interference with the fired surface of the material will be allowed to any exposed face.

6. The deliveries to begin weeks from the date of the order to proceed, and to be completed within months from such date, the whole being divided into sections as arranged between builder and manufacturer before the manufacture is begun. For any delay in the delivery of any section within the time so agreed upon, the manufacturer shall pay as liquidated damages 10 per cent. on the value of such section per month, after due allowance has been made for variations ordered, and for any strike or lock-out among the manufacturer's workmen.

7. Any terra-cotta damaged while the building is in progress by reason of defects in the manufacture shall be replaced at the manufacturer's expense, or, if the architect so choose, the full value of such replacement shall be deducted from the contract amount.

8. The architect shall be free to alter the extent and character of the work by written order, but this shall not invalidate the contract. The value of such alterations shall be determined by the prices of the original estimate, a fully-priced copy of the quantities being deposited with the architect for that purpose.

9. Payments will be made from time to time on the architect's certificate to the extent of per cent. on the value of material delivered and approved in sums of not less than £ , until the reserve amounts to £ . After that payments will be made in full and the balance of £ will be paid months after the whole work has been fixed in the building.

10. All the work intended to be level bedded shall, unless otherwise directed, range with a certain number of brick courses, the number varying, as shown upon the detail drawings.

The plain ashlar to be in alternate courses, or alternate pieces in each course, 4½ in. and 9 in. on the wall, the blocks, with 9 in. bed being chambered. The lengths of the several string blocks to average 12 in., with closers as wanted. In no case shall strings, cornices, &c., have a bed on the wall less than their projection from it. The window and door jambs and dressings generally to be very carefully bonded with each other and with the brickwork, the moulding, where possible, being subdivided into two or more blocks in each course, breaking joint, moreover, with blocks above and below. The details of all such bonding, and the necessary variations of the blocks, will be arranged from the detail drawings by the builder and manufacturer.

11. The architect, clerk of works, and the builder shall have access to the manufactory at all reasonable times.

12. The prices to include manufacture, delivery, models, moulds, and all other works and expenses consequent upon the above conditions.

13. The cubic contents are arrived at by measuring all lengths net, and the heights and beds to ½ in.

14. The dates and sums left blank to be filled in as may be arranged before the signing of the contract.

* "Hawksmoor" is now the usually accepted spelling. Gwilt gives "Hawkesmoor." The "e" on the tombstone is perhaps a mistake of the country mason who cut the inscription. As is well known, until within a comparatively recent period there was great uncertainty and apparently indifference as to the spelling of proper names in English records. A man would even write his own name two different ways on different occasions.—Ed.

Builder's Specification in connexion with the Terra-Cotta Work.

This specification should embody those clauses of the foregoing specification for the terra-cotta manufacturer numbered 1, 3, 5, 6, 10, 11, which need not here be repeated.

1. The builder shall give all such assistance to the manufacturer as may be necessary to secure the strongest and best construction, and that best adapted to the requirements of the material; and he shall be held responsible for the accuracy of all information supplied by him.

2. Any objection the contractor has to make to goods delivered must be made within one week of their arrival on the site.

3. The whole of the terra-cotta for as long as possible before fixing (and never for less than two hours) to be soaked in water. It is then to be filled up solid with cement concrete at a time when there is no frost. The concrete to be formed of one part by measure of Portland cement and six parts of finely broken stone and hard brick with an approved proportion of clean sand. The terra-cotta thus prepared is to be bonded to the utmost practicable extent with surrounding brickwork. The bricks to be well wetted and the whole flushed up.

4. By careful laying out and assortment in long lengths before fixing the utmost possible regularity and truth of line is to be secured in both horizontal and vertical members—special attention being given to the truth of the outer arris of the vertical mouldings.

5. Supply all necessary shores, stays, centreings, and supports with all requisite tile or deal protections and casings, making good any defects arising from the protection thus given.

6. Set in Portland cement the window-sills, strings, cornices, corbels, mullions, transoms, copings, chimney-caps, and such like features. All other parts set in mortar as for the facings generally. Carefully wash down and clean at completion, and make good all defective pointing.

7. The contractor must reject all unsuitable and defective terra-cotta. Any terra-cotta injured during the building's progress must either be replaced by the contractor, or, at the architect's option, have the full cost of such replacement deducted from the contract amount.

8. Work or cut all necessary grooves for lead flashings, and after wedging up the lead, point with cement. In the leaded gutter of main cornice, form or cut dovetail mortices $\frac{1}{2}$ in. by 1 in. by $\frac{1}{4}$ in. deep, about 12 in. apart. Clean up and carefully finish the terra-cotta against all door and window frames, and set out or cut all mortices for fixing purposes as described in other trades. The mortices for the lead plugs for fixing of iron casements are to be cut to correspond with the screw holes in the casements.

9. Put $\frac{3}{4}$ in. by 1 in. by 1 in. slate dowels to mullions, balustrades, &c., and run same with cement. Put $\frac{1}{4}$ in. by $\frac{3}{8}$ in. copper cramps, 10 in. long, to joints of copings, knee blocks, balustrade cappings, and chimney caps, and run with cement. Put $\frac{1}{2}$ in. by $\frac{3}{8}$ in. copper dowels long to all finials.

10. The contractor is to receive the terra-cotta at the station, do all cartage to the site, unload, store, and protect it from all injury.

GENERAL BUILDING NEWS.

CONVALESCENT HOME, EAST FINCHLEY.—The new Convalescent Home erected at East Finchley for the National Hospital for the Paralyzed and Epileptic of Queen-square, Bloomsbury, was opened by the Duchess of Albany on the 16th inst. The building stands on a site of nearly four acres, close to the Great Northern Railway station, and contains accommodation, all on the ground floor, for thirty women and six men. The former are mostly accommodated in one long dormitory, but there is a separate room for six paying patients, and a large day-room, at the south-west corner, commanding views of the Hampstead hills. A main corridor well lighted from the rear, connects these rooms with the staircase and with the dining hall, an apartment about 30 ft. by 24 ft., and 20 ft. high, in which all the patients have their meals. Opposite to this hall are the kitchen, scullery, pantry, larder, &c., while beyond it the corridor forms the main entrance, and leads to the men's wing, which contains a day room, Co. The carters' pier, lavatory, and water closet. The women have a bath, two water-closets, a slop sink, and four lavatory basins, arranged in a properly isolated block adjoining the staircase. The servants have a separate water-closet next the kitchen entrance, and there is a lavatory and closet, opening from the main entrance, for the use of the doctors or Visiting Committee. The first floor, which does not extend over the men's wing, contains

bedrooms for the nurses and servants, and a sitting room for the former, with lavatory, wash, closet, and slop-sink placed over the women's lavatories below, and the main corridor has windows looking into the upper part of the dining hall. All the closets, sinks, bath-rooms, and lavatories have light and ventilation from external windows. The floors are of asphalt or cement, the closets are Bolding's lead-pedestal pattern, the slop-sinks Cliff's "Cecliz," and every part of the sanitary arrangements has been specially arranged to be in accordance with the best modern practice. The soil drains are of cast-iron, jointed with lead, and there is a separate system of stoneware rain-water drains, not connected to the former. The water supply is from the Barnet Company, and enamelled iron has been used for the drinking-water cistern. The materials used externally are yellow stock bricks with red brick arches, &c., on the ground floor, and red tiles on the gables and roofs above. The first floor is chiefly lighted by tiled dormers, and the dining hall has a large louvre ventilating cupola in the centre. The men's wing has two bays, one circular, with moulded cornices like the dormers. Internally the walls are plastered, with a painted dado and distemper above. The heating of the rooms is by Teale fireplaces, and there is a special boiler for the hot-water supply to the lavatories and bath-rooms. The stained glass in the dining hall and corridors was supplied by Messrs. Kelley & Co. to the architect's designs. The lighting is chiefly by incandescent gas lights, the wrought-iron pendants in the dining-hall being supplied by Messrs. Starkie Gardner, & Co. The contractors for the main building were Messrs. Godson & Sons, of Kilburn, and Mr. B. E. Waller, who the electric works. There is a gardener's lodge at the entrance, similar in style to the Home, erected by Messrs. Wheeler & Peake, of Finchley. The architect is Mr. R. Langton Cole. The total cost has been about 10,000.

HOTEL METROPOLE, FOLKESTONE.—The foundations of this hotel were executed by Mr. H. Lovatt, of Wolverhampton, and the building has been erected and finished by Mr. J. A. Lock, J.P., of Dover, Mr. Chedzey acting as his resident manager. The building is faced with dark red bricks, from the High Broom Brick Company, Tambridge Wells, and terra-cotta, executed by the Burnmantotts Company. The roofs, covered with light green Tiberthwaite slates, the dome to centre roof being covered with copper by Messrs. Bray & Co. The constructional iron and steel work—some 700 tons—by Messrs. Drew-Bear, Furks, & Co. The fire and sound proof floors by Banks' Fireproof Construction Syndicate, together with all coffered and other ceilings, cornices, encasement to iron columns, &c., which were covered with helical steel lathing—no wood lathing being used throughout the building. The partitions, where not brick, are constructed of iron framing and lathing, encased in solid plaster. All the staircases and external steps are fireproof, and executed in Stuart's granolithic concrete. The rooms in roof are fire, heat, cold, and sound proof, being specially finished with Anderson's silicate cotton. All communicating doors between rooms are removable, and are double and sound-proof. All sashes are removable, and can be cleaned inside rooms, and are fitted with N.A.P. patent fastenings. The warming and ventilation, cooking apparatus, complete installation of electric light and bells, and the whole of the engineering work (except lifts), has been executed by Messrs. J. Slater & Co. The wiring for electric light is Andrew's concentric wiring, executed by the patentee for the above firm, as also a complete system of improved telephones for the hotel service. Heating coils are placed in all the principal rooms, halls, and all corridors and landings. Fire hydrants are on every alarm in all public corridors. Some 20,000 gallons of water are stored in roof for drinking, fire, and sanitary purposes, and the tanks can be refilled by steam pumps at any moment. The scheme of sanitation has been carefully planned by the architect. There is no drain inside building. All baths, lavatories, and water-closets are unenclosed, and detached from main building by water-cast iron lobbies. The plumber work and fittings have been executed by Mr. George Jennings, under the direction of the architect. Walls of lavatories, &c., are lined with tiles and glazed bricks, floors, marble mosaic. The general lavatory, ball-room lavatory, ladies' lavatory, hair-dresser's rooms, and staircases to same have been lined with Burnmantotts' falience. In the basement the kitchen, larders, pantries, service-rooms and offices are lined throughout with glazed bricks, also dado in corridors, and paved with wood-block flooring. The service, luggage, and passenger lifts have been erected by the Otis Elevator Company. The visitor's hall, main staircase balustrade, dining-room chimney-piece, &c., have been executed in marble by Messrs. Burke & Co., from the designs of the architect. The marble mosaic floors are by Marks and Pinner & Co. The carters' pier, lavatory, and water closet, and small dining-rooms, ball-room (Renaissance), drawing-room (Louis XV.), billiard-room (Spanish Renaissance) were executed by Messrs. G. Jackson & Sons, from the architect's drawings. The locks were specially made by Mr. J. Gibbons, every key differing, with a master key for each floor, and a grand master key for the whole building. The stained glass and some decorative painting by

Messrs. Campbell, Smith, & Co. Two subject-panels in Lounge were modelled and painted by Messrs. Moria & Jenkins, and represent "The Arrival of the Princess" and "The Dance." The whole of the furnishing and equipment of the hotel has been specially designed and executed by Messrs. Smees & Cobay, and the decorations were carried out by them under the directions of the architect. The hotel contains over 250 beds and sitting rooms, and on the ground floor, arrival entrance and hall, visitors' entrance hall, and lounge, entrance to ball-room and suite. Two dining-rooms, reception-room, drawing, reading, smoking, and billiard rooms, and the necessary service rooms. The hotel stands in its own grounds of about four acres, and is bounded by roads on all sides. Mr. W. Woodward and Mr. J. Davies have acted as clerks of works, and the building has been designed and finished at a cost of about 150,000, by the architect, Mr. Thomas V. Cutler, of London.

RESTORATION OF SHERNBOROUGH CHURCH, NORFOLK.—At Norwich Consistory Court recently Mr. Chancellor Blofield granted, on the application of Mr. J. B. T. Hales, Proctor of the Court, a faculty to the vicar and churchwardens of the parish of Sherborne, near Sandringham, for the restoration of the church of that parish. This is a small flint-built structure, erected in the Early English style. Plans have been prepared by Mr. H. J. Green, the Diocesan architect, by which the chancel and south aisle are to be rebuilt, new roofs provided, the church reseated, and the general repairs of the fabric carried out. The estimated cost of this restoration is 1,500.

THE HOTEL RUSSELL, RUSSELL-SQUARE.—In a "Note" published in our issue of August 4, 1894, we directed attention to the demolition of a block of houses on the eastern side of Russell-square, together with portions of Bernard and Guilford streets, and of the Colonnade. The area in question has been taken as the site for a large hotel now in course of erection by Messrs. Langdale, Hallett, & Co., from the designs of Mr. C. F. Doll. The sanitary arrangements, interior decorations, furniture, and equipment will be supplied by Messrs. Maple & Co.

CHURCH OF ST. ALBAN'S, FULHAM.—On the 15th inst. the church of St. Alban's in the Margrave-road, Fulham New Town, was consecrated by the Bishop of London. The foundation stone of the new church was laid by Mr. V. Hayes Fisher, M.P., on June 17, 1895. The portion of the church at present built consists of the nave and aisles only, and will accommodate 500 worshippers. It is proposed to add transepts, chancel, and organ chamber, for which space has been left to the east of the present nave. There is also space for a vicarage at some future time, in addition to the site occupied by the temporary iron building, now used as a nursery-room. The church is built externally of red bricks, with green slates. Internally the walls are faced with yellow stocks and red bricks in ornamental patterns. The church is entered direct from the narthex, with double doors. The nave is 25 ft. wide, 42 ft. to the ridge, and the aisles are 12 ft. wide. A temporary chancel and vestry have been erected at the east end. The ceiling will be decorated with pictures illustrating scenes in the life and death of the patron saint of the church. The church has been built by Messrs. Dove Bros., of Islington, and the architects are Messrs. Aston Webb and E. Ingress Bell, of Westminster. The cost of the present structure amounted to 3,300.

FACTORY WORKS, CHORLEY.—The Mayor of Chorley (Councillor Whittle) laid the corner stone recently of new calico bleaching and print works, situated on Chorley Moor. Messrs. Jolly & Beechley are the architects. Messrs. Furnival, of Haslingden, being the engineers.

PAROCHIAL HALL, DARLINGTON.—On the 16th inst. the foundation stone of the new Parochial Hall in connexion with the parish of St. Cuthbert's, Darlington, was laid by Mrs. Mortimer. The new hall is an oblong building, two stories in height, with a frontage to Victoria-road. In the basement there are a class-room, covered cloister, heating chamber, &c. The hall is on the upper floor, and can be divided into three class rooms. There are two entrances and lobbies from Victoria-road. A small ante-room is provided off the platform. Over the rear of the hall there is a small gallery, reached by open staircase, which also gives access to the basement class-room. The roof will be covered with red Staffordshire tiles. The heating will be by open fire-places and hot water. The contracting for the work have been let to Messrs. R. Kitching & Son, T. Metcalf, R. Smith, J., and G. Wharton, and J. Robinson & Son, all of Darlington. The architects are Messrs. Clark and Moscrop, of Darlington.

HOTEL GORLESTON-ON-SEA.—In a recent limited competition the designs of Messrs. George I. Skipper & F. W. Skipper, architects, of Norwich, were selected for a new hotel, to be erected on a site on the top of the cliffs at Gorleston-on-Sea. Beneath the cliffs, the outskirts of the site afford excellent sites for shops, baths, lavatories, &c. Some of the shops are now being erected by Mr. J. F. W. Bray, contractor, of Great Yarmouth, who has undertaken to complete this contract by the middle of July, ready for occupation this season. The hotel is to be completed in readiness for next season.

NEW THEATRE, DOVER.—On the 14th inst., the new Tivoli Theatre at Dover was opened

to the public. The theatre has been erected on the site of the old Clarence Theatre, and some adjoining property has been acquired to enlarge the space available. The building is well equipped in all its requirements, and the auditorium has seating accommodation for about 800 people. The architects for the work were Mr. C. J. Phipps, who died a few weeks before the theatre was opened, and Mr. Arthur Bloomfield Jackson, of London. The general builder's work was executed by Mr. H. Richardson, of Dover, and Messrs. Beer & Gash, of London, were employed to complete certain technical details involved in the construction of the theatre.

TOWN HALL AND LIBRARY, EAST DEREHAM, NORFOLK.—Messrs. George J. & F. W. Skipper, architects, of Norwich, have received instructions to prepare designs for the new Town Hall and Public Library, &c., proposed to be erected in this town.

CONSERVATIVE CLUB, HETTON-LE-HOLE.—A new Conservative Club has just been opened at Hetton-le-Hole. The building is situated near the railway station, the frontage being about 48 ft., while the depth is nearly 100 ft. The building is two stories high. The ground floor is approached by a flight of steps from the front entrance. Mr. Frank Carr was the architect, and the contractor was Mr. Stephen Branton.

NEW CHURCH, LUNDY ISLAND.—The new church, dedicated to St. Helena, which has been erected at Lundy, was opened on the 17th inst. by the Bishop of Exeter. The church is in the Early Decorated style, and was a liberal accommodation for 165 worshippers. The internal length exclusive of the chancel (which is 25 ft. in length and 17 ft. 6 in. in width), is 50 ft. 6 in., the width being 21 ft. 8 in. There is a vestry 14 ft. 6 in. wide by 12 ft., a portion of the room forming the organ-chamber. The building has been erected from the designs of Mr. John Norton, architect, London, by Messrs. Britton & Pickett, of Liverpool. The architect's assistants were Mr. G. W. Clayton & Bell, of London. A feature of the interior is the marble reredos, by Messrs. Harry Hems & Sons, of Exeter. The church has been built of granite quarried in the island. The lower part of the tower, which is 70 ft. high, will serve as an entrance porch, and there is a square turret at the southeast angle of the tower, which gives an approach to the belfry.

THE SHERRINGHAM HOTEL, NORFOLK.—A new central block and corridor corridors, comprising large dining-hall, kitchen, sitting-rooms, and thirty-five new bedrooms, with all modern appointments, are now being completed by Mr. George Riches, contractor, of Norwich. The whole of this building, including the decorations internally, have been carried out from the designs of the architects, Messrs. George & F. W. Skipper, of Norwich.

GARTLOCH ASYLUM, GLASGOW.—The new Gartloch Lunatic Asylum and Hospital, which has been completed by the Glasgow District Lunacy Board, has just been opened for patients. The asylum and hospital are situated on the old Gartloch Estate, lying about seven miles east of Glasgow. The buildings consist of two parts, asylum and hospital, with workshops, laundry, electric lighting plant, &c. The asylum comprises four blocks, the male and female patients' accommodation being separate, and each block is connected with the administrative buildings. In the hospital, the main reception area is a dining hall, kitchen, sculleries, and general stores, and over the dining hall is placed a recreation hall. The official block is situated to the north, and is flanked by two towers rising each to a height of 130 ft. Here are the Board room, the doctor's room, waiting rooms, &c., on the ground floor; and on the upper stories sleeping accommodation for the staff. Each block is divided into two wards, with dormitories above, and is equipped with boot rooms and lavatory accommodation and large bath rooms entering from the corridors. Like the asylum, the hospital consists of two main parts, one for male and the other for female patients. These are similar in construction and arrangement, and in each are placed observation wards for newly-admitted patients, wards for physically-ailing inmates, for those requiring special nursing by reason of old age and infirmity, for those suffering from infectious diseases. It is entirely separated from the asylum, and has its own kitchen, dining hall, doctor's room, nurses' apartments, &c. The asylum has accommodation for 380 patients, and the hospital for about 140, but meantime only part of the buildings are in occupation. Special water reservoirs have been constructed, and the electric light has been installed. The architects were Messrs. Thomson & Sandilands, of Glasgow. The total cost of the work will, it is stated, be about 200,000.

BUSINESS BUILDING, ABERDEEN.—A block of buildings is to be erected by the Town and County Property Company, Limited, at Aberdeen. The site has a frontage of 200 ft. along the west side of Rosemount Viaduct. The ground floor is occupied by shops, having saloons behind and cellars in the basement. The upper floors are arranged in tenements. Messrs. Brown & W. are the architects, and the estimated cost of the building is 14,000.

SCHOOLS, TUNBRIDGE WELLS.—On the 16th inst. the new parochial schools of St. Barnabas, Quarry-road, Tunbridge Wells, were opened. They have been built by Mr. W. T. Judd, from designs prepared

by the architects, Messrs. H. H. & E. Cronk, and will provide room for 450 children of St. Barnabas parish. The building is of red brick with stone facings, and is two stories high. One room is 71 ft. by 22 ft., with mans of sub-division when needed, and a class-room 25 ft. by 24 ft., with 15 ft. pitch. The upper school is for boys and girls, and there are lesser rooms, cloak-rooms, lavatories.

HOSPITAL, ROTHESAY.—The new non-infectious hospital at Rothessay, built at a cost of 5000*l.*, and named the Victoria College Hospital, in commemoration of the Diamond Jubilee, was opened on the 21st inst. by the Marquis of Bute, Provost of Rothessay. Mr. J. Russell Thompson was the architect for the building.

WESLEYAN SCHOOLS, DRIFHLINGTON, YORKSHIRE.—The memorial-stones of new Sunday schools connected with the Wesleyan Church at Drifhlington were laid recently. The building, which is to consist of a central hall with seven class-rooms and caretaker's house, is estimated to cost 1,500*l.*, and has been designed by Mr. Walter Hanstock, of Batley. It is to be built by Messrs. George Holdsworth, of Gildersome.

PUBLIC HALL, WADDESON, BUCKS.—A new public hall has just been opened in the High Street, Waddeston. The building, which is capable of accommodating some 450 persons, was erected by Messrs. Webster & Cannon, of Aylesbury, under the management of Mr. W. Creed, from plans prepared by Mr. W. F. Taylor, also of Aylesbury. The hall is in the Elizabethan style. The interior has a hammer-beam roof, covered with broseley tiles.

ALTERATIONS IN THE FOUNDATION STONE OF A CHURCH, MIDDLETON.—Alterations are at present being carried out by the School Board at Keptie School. These consist of an extension to the school accommodation and various improvements on the school building. The new class-room will contain seventy-five places. The following are the contractors:—Mason work, Alexander Reid; joiner, A. M. Soutar; slater, John Reid; painter, John Reid; plasterer, Middleton & Donald; painter, W. L. Grant; heating engineer, James Keith—all of Arbroath. Plans have been prepared by Messrs. Carver & Symon, architects, Arbroath and Forfar, and the work is being carried out under their superintendence.

NEW WING, ST. BONIFACE COLLEGE, WARMINSTER.—The foundation stone of a wing of the new College of St. Boniface, Warminster, was laid recently. The plans provide for the erection of a building of Jacobean design. It will be built of stone, and its principal rooms will be a large dining hall, lecture room, library, common room for the students, and Vice-Principal's rooms. The eastern wing, the foundation stone of which has just been laid, will consist of kitchens, stores, and other offices, above which some fourteen bedrooms will be provided. The tenders of Mr. J. Burgess, of Westbury, and Mr. J. Gaistford, of Warminster, were accepted by the Building Committee. The architect is Mr. J. A. Reeve, of Westminister.

THE STAFFORDSHIRE BUILDING TRADES.—The building trade of North Staffordshire is in a flourishing condition, and it is gratifying to note that most of the buildings in course of erection throughout the district are artisan dwellings. These are of a much superior class to those which have hitherto been erected. Bricklayers have none out of work. Carpenters and joiners are also busy, with a demand for their services. Painters and plumbers are very busy, and there is a great demand for men, for when the strike was on a large number of operatives left the district, and now that the dispute is over they have refused to return, as they have been able to obtain much higher wages than were asked for in this district, and are now working under much pleasanter conditions. At Crewe business is very brisk, both in the Leek and in the general trade of the town. At Leek and Staford there are no operatives out of employment.—*Staffordshire Sentinel.*

CATHOLIC CHURCH AND SCHOOLS, BEVERLEY.—On the 15th inst. the foundation stone of the new Catholic church and schools New Walk, Beverley, was laid by the Bishop of Middleburgh. The new church will consist of a nave and sanctuary, 82 ft. long by 21 ft. wide; on the west side of the nave is the Lady Chapel, 17 ft. long by 10 ft. wide, and by the side of this the sacristy. The church will be lighted by eight traceried windows, filled with tinted cathedral glass. The roof is an open traceried one of pitch pine. The organ is to be the main entrance, access to it being gained by a flight of circular steps in the bell turret. The style of the building is that of the fifteenth century; the traceried windows, doorways, &c., will be in buff terra-cotta, bonded in with red stock bricks. There will be over the main entrance and in the apex of the gable the figure of the patron saints. The church will accommodate about 200 adults. The present old chapel at the back of the site is being converted into a mixed school. The buildings are being carried out by Mr. Pape, builder, Beverley, from the designs and under the superintendence of Messrs. Smith, Brodbeck, & Lowther, architects, Hull.

SCHOOL, GRANDTULLY, PERTH.—A new school was opened at Grandtully on the 10th inst. for the Logierath School Board. The accommodation is for 130 pupils. A dwelling-house for the teacher has been erected near the school. The following is a list of the tradesmen who have carried out the work,

viz.:—Mason work, Charles Robertson, Pitlochry; joiner, W. R. Reid, Aberfeldy; slater, W. M. Dow, Morrhay; plumber, A. J. Menzies, Aberfeldy; plaster work, Thomas Stewart, Aberfeldy; bell hanging, John Bryden & Son, Dundee; iron work, P. Murray, Strathay; heating, G. H. Nicoll & Co., Dundee; painting, John Simpson, Aberfeldy; laying out grounds, A. Brenner, Fortingall. The buildings were erected from plans by Mr. William Bell, architect, Aberfeldy.

PARISH CHURCH HALL, ELGIN.—A new parish church hall has just been opened at Elgin. The hall is situated on the north side of Greyfriars-street. The main hall is 71 ft. by 30 ft., and 25 ft. high, and is provided with a gallery. It will accommodate 720 persons. To the north of the hall is a smaller hall, 32 ft. by 22 ft., and the west wing of the building consists of a third hall. In the basement is the heating apparatus. The building has been erected from the designs of Messrs. A. & W. Reid & Wittet, architects, Elgin. The masons were Messrs. Davidson & Hay, Elgin; carpenters, Messrs. A. & R. Dunbar, Elgin; plumber, Mr. James Ross, Elgin; slater, Mr. George Ogilvie, Elgin; plasterer, Mr. George Gray, Elgin; painter, Mr. William Fordyce, Elgin; heating engineers, Messrs. Mackenzie & Moncur, Edinburgh; ironwork, Mr. George Souter, Elgin.

NEW CHANCEL, &c., CHILCOMPTON CHURCH, SOMERSETSHIRE.—In order to make good the east end of the nave walls, and to enable a better chancel arch to be put in, the east wall and everything east in the parish church of St. John the Evangelist, Chilcompton, have been taken down and the chancel rebuilt in the Perpendicular style to correspond with the tower. It is built of Pennant stone, with freestone dressings. The walls externally are finished with freestone battlemented copings, and moulded cornice with gargoyles at the angles. The east end is surmounted with a cross. The roofs are framed of unvarnished pitch pine, with moulded purlins and rafters. The chancel roof being supported by four piers, each containing traceried panels. Internally, the old east wall of the nave, being thin and unsound, was entirely removed, and a new wall has been built, containing a chancel arch. On each side, north and south, are two similar arches to the vestry and organ chamber. Towards the nave, new responds for a future nave arcade have been built in, and the springing stones of the future arches are placed in position. The central gateway of the chancel has been laid with ornamental and encaustic tiles, as also the whole of the space inside the Communion rails. The reredos is of oak, and the Communion rail is of moulded oak, supported on four standards of polished brass scroll-work. A feature of the work is the four-light east window, which is filled with glass. The other windows are filled with plain Cathedral glass. One ancient three-light window of the medieval church has been restored and incorporated in the south chapel. In addition to the foregoing works a considerable portion of the old square seating has been removed and replaced by open benches; whilst the floor of the nave has been partly renewed, and the whole of the nave walls and roof cleaned and coloured internally. The future works contemplated will include carved screens of open tracery to both sides of the chancel and the north and south arches. At present, curtains will be used to disconnect the chancel from the vestry on the one side and the organ chamber on the other. The architect for the work is Mr. F. Bligh Bond, of Bristol, and the work has been carried out by the contractor, Mr. C. A. Hayes, of Bristol.

SANITARY AND ENGINEERING NEWS.

SEWERAGE SCHEME, WALSALL DISTRICT.—On the 16th inst. Mr. Ricard Walton, on behalf of the Local Government Board, held an inquiry at the Endowed Schools, Aldridge, with reference to an application by the Walsall Rural District Council to borrow 4,500*l.* for sewerage purposes. The scheme has been prepared by Mr. Wilcox, C.E.

SEWAGE DISPOSAL, HOLMERTH, YORKSHIRE.—Col. J. Ord Husted, R.E., Inspector under the Local Government Board, held an inquiry at Holmeford on the 16th inst. respecting the application of the Urban District Council for sanction to borrow 10,877*l.* for the purposes of sewerage and sewage disposal. Mr. Lomax, clerk, stated that the Council had an agreement to purchase 10 acres of land at Neilfens from the Earl of Dartmouth for 1,500*l.*, and the scheme would drain the whole of the district at a cost of 10,877*l.*, including the treatment of partially clarified trade effluents. Messrs. Beesley & Barrowclough, the engineers, explained the scheme.

WATER SUPPLY, WINSCOMBE, SOMERSETSHIRE.—An inquiry was held on the 17th inst., at the Assembly Rooms, Winscombe, by Mr. W. O. E. Macleod-King, an Inspector of the Local Government Board, as the result of an application made by the Rural District Council of Ashbridge to the Local Government Board for sanction to borrow 2,400*l.* for works of water supply for the parish. Amongst those present were Mr. W. Reece (Clerk to the Rural District Council), and Mr. A. Powell, C.E. (the engineer to the scheme).

WATERWORKS, BAKSLEY.—On the 17th inst. Alderman Wray (Mayor) cut the first sod of the new waterworks at Midhope, on the South Yorkshire Moors, about ten miles from Barksley. The engineer is Mr. Charles Hawley.

STAINED GLASS AND DECORATION.

STONY STRATFORD.—The reredos in the parish church, designed some twenty years ago, has recently been increased by the addition of three traceried and panelled shutters on each side, and now forms a Triptych. The gilding, oak work, and new marble altar shelf have been done by local tradesmen, but the chief portion of the work, the paintings, will be added as funds are forthcoming. Mr. N. H. J. Westlake, F.S.A., has already painted the centre, and panels on either side of it, with Our Lord in Majesty and Angels censuring, and the figures of SS. Giles and Mary Magdalen (the patron saints of the two parishes), with the "Wounded Hind" and "Pot of Ointment" as their attributes. All these are on gold grounds and richly raised nimbiand diaperings. The work was done under the direction of the architect of the original scheme, Mr. E. Swinlein Harris.

MEMORIAL WINDOWS, DETLING CHURCH, KENT.—Two memorial windows have just been placed in Dettling Church. The work has been carried out by Messrs. Heaton, Butler, & Bayne, of Covent Garden.

WINDOWS, AMBERGATE CHURCH, DERBYSHIRE.—Stained-glass windows have been placed in the church of St. Anne's, Ambergate. The work was by Messrs. Heaton, Butler, & Bayne. The windows are placed in the chancel.

FOREIGN.

FRANCE.—After a first vote which gave no result, the Médaille d'Honneur for architecture has been awarded by the jury of the Champs Elysees Salon to M. Marcel, by fifty-three votes, against forty-five for M. Pontremoli, his only competitor. M. Marcel exhibited this year a "Salle des Fêtes à Paris," and, in co-operation with M. Blanc, "L'Université de Jassy" and the "Gare Centrale de Bucharest."

M. Emile Berton, late pupil of the Académie de France at Rome, has just been made Inspecteur des Bâtimens Civils, and attached to the rebuilding of the Opéra Comique in place of M. d'Espouy, who has been made professor at the Ecole des Beaux Arts. The marriage has been announced of the celebrated artist, M. Puvion de Chavannes, to the Princess Cantanhez. M. Faiguère, as sculptor, and M. Dionis, as architect, have been commissioned to carry out the monument to Baron Larrey, which is to be erected in the Court of the Val de Grâce. M. Bouvens Van der Boijen, architect, has just finished the tomb of Alexandre Dumas, at the Montmartre Cemetery. It is in blue granite, and consists of four columns supporting an architrave, and an entablature on which is placed a cenotaph, recalling that to the Scipios at Rome. This monument will be ornamented with the marble statue which is in the Champ de Mars Salon, the work of M. de Saint-Marceaux. One of the first cares of M. Bouvard, the new Director of Architecture and Promenades, will be the definite arrangement of the Place du Carrousel, which is to be laid out with lawns and flower-beds. M. Baukult, the sculptor, has been commissioned by the Government to execute a bust of Daine for the Versailles Museum. The Municipal Theatre of Cahors is shortly to be rebuilt. The Municipality of Lens has just opened a competition for the construction of a Hôtel de Ville, which is to be erected on the site of the present Mairie. The jury on the open competition in the town of Nîmes for the erection of three blocks of school buildings has awarded the premiums to MM. Raphael, Arnaud, and Raudon de Crozier. M. Schmitt has just been commissioned to rebuild the Theatre and the Hotel de Paris, at Monte Carlo. A syndicate has just been formed in the Department of the Loire Inferieure to drain the lake of Grandlieu, near Nantes, which covers a surface of 3,800 hectares. A canal for the navigation of large boats will be formed, to allow the rivers of Boulogne and Ognon, which now feed the lake, to flow into the Loire.

The work of restoring the south porch of Chartres Cathedral is shortly to be commenced. The statues and all the stones are to be carefully marked and replaced, after having been repaired. The same work is to be carried out for the north door, which is in a very bad state. The Municipal Council of Chantilly have decided to raise a monument, by public subscription, to the Duc d'Anville, to be erected on the Place de l'Hospice d'Anville. The death of Victor Gensollen, a talented pastellist, is announced at Toulon. For several years he had been attached to the Imperial Court, at Brazil. He had sent this year to the Palais de l'Industrie a study of a woman, and a study of still life.

GERMANY.—Innumerable minor buildings appear at present to be made the subject of architectural competition throughout Northern Germany, and though, no doubt, the method of competition is very useful for the larger public buildings, it can scarcely be said to be appropriate for smaller structures. Among the competitions of the last few weeks, we find one for a New Town Hall at Waldheim, with three prominent assessors. A competition for the buildings on a rifle range at Graudenz has been won by Herr Wendorf. Another competition has been opened for some school buildings in Neisse; another for the residence of a regimental chief at Neumenster, which is to cost

under two thousand pounds; and a further one for some restaurant buildings in the Municipal Park at Gelsenkirchen. Of others we may notice one for a Memorial Fountain at Altona, but, taken as a whole, these competitions by no means equal in importance those at the beginning of this year. At the Conference of German Engineers, to be held at Cassel in the middle of August, there will be a number of interesting papers read on what are termed "Popular Engineering Subjects."

The regulations for the Government Travelling Studentships at the Royal Technical College have been revised, but these grants, which are practically in the form of scholarships, will only be awarded to such applicants as can prove poverty, which is by no means a pleasing condition. On the retirement of Professor Ende from the Technical College at Berlin, Professor Wolf will take his place. The Academic Society of Junior Architects, known as the "Motiv," to which we have already had occasion to refer, celebrated the anniversary of its formation with considerable ceremony, no less than 700 members and past members attending. The Society counts at present twenty-seven honorary members, and ninety-four ordinary members, with 1,480 ex-members. There was the usual "conversazione," and an amateur theatrical performance. The attendance at the Royal Technical College at Munich is again increasing rapidly, for there are now 1,711 students as compared with 1,580 of last year. Of these 350 are architects. A new garrison church has been inaugurated at Strasburg, designed by Baurath Mueller, with accommodation for a congregation of 3,100. The cost of the building, with the site, was 70,000. The small gold medal of the Berlin "Salon" has been awarded to Baurath Otto Mah, of Berlin, to whose work we have had frequent occasion to refer.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. Edward Saunders & Son, surveyors, have removed from 6, Bishopsgate-street Without to new offices at 48, Bishopsgate-street Within.

REERDOS, ST. MARY'S CHURCH, BLAKESLEY, NORTHAMPTONSHIRE.—The reopening of the chancel of St. Mary's Church, Blakesley, and the dedication of the reredos, windows, and the organ, took place recently. The reredos, erected at the eastern end of the church, has been designed by Messrs. Law & Harris, architects, of Northampton. It is constructed almost entirely of Staffordshire alabaster. There is a carved string running through from north to south, above the super altar. The reredos proper is entirely of alabaster, having in its midst a sculptured representation, modelled in high relief, of the Last Supper. On either side are lesser panels. The panels are divided, and flanked by buttresses. The reredos is the work of Messrs. Harry Hems & Sons, of Exeter.

REERDOS, PARISH CHURCH, SEAFORTH.—A reredos is being erected in Seaforth parish church, at a cost of 300l., as a memorial of the Queen's reign. The work, which is of alabaster, has been executed by Messrs. Earp & Hobbs, of London, from designs by Mr. C. E. Deacon, architect, of Liverpool.

ELECTRIC LIGHTING, CARLISLE.—Mr. Applebee, chief electrical engineer, recently reported to the Carlisle Lighting Committee that the demand for electric lighting in the borough was continually increasing. There were now 1,123 lamps ordered waiting connexion. The demand thus exceeded the supply, and the present generating machinery was taxed to the utmost. The contractors, however, are pushing forward the new plant. At present there are 14,113 lamps supplied, an increase of 1,001 over the number of the corresponding month in last year.

LEEDS STREET IMPROVEMENTS.—Colonel John Ord Hasted, R.E., an Inspector of the Local Government Board, held an inquiry in Leeds City Council Chamber on the 17th inst. with respect to the application of the Leeds Corporation for permission to borrow 62,300l. for the purpose of carrying out street improvements in the city. The City Council was represented by the Town Clerk (Mr. Jno. Hartison), the City Engineer (Mr. T. Hewson), the City Accountant (Mr. W. Derry), the Highway Surveyor (Mr. T. A. Prince), and the Vice-Chairman of the Highways Committee.

SANITARY INSPECTORS' ASSOCIATION OF SCOTLAND.—The annual Congress of this Association took place in Aberdeen Town Hall on the 18th inst. Among the papers read was one by Dr. Beveridge, member of Aberdeen Town Council, on "The Housing of the Working Classes." The Corporation of Aberdeen entertained the delegates (sixty in number) to dinner in the evening. Mr. K. Cameron, chief sanitary inspector Aberdeen city, is President of the Association.

THE CAZIN POWER WHEEL.—We have received a little book from the American Impulse Wheel Company of New York, describing the Cazin power wheel, which they manufacture. They state that this wheel contains all that is meritorious in the Pelton wheel, and much that is meritorious that the latter wheel has not, the chief feature being the complete and absolute inversion of the jets in all positions of the buckets, an indispensable condition of highest efficiency. The book

contains much information relating to power wheels, and is worth careful perusal by those interested in the subject.

PROPERTIES FOR SALE.—Ditton Park, Datchet, the seat of the Dowager Duchess of Buccleuch, who died two years ago. The house was erected (in place of one burnt down on April 28, 1812) after the designs of William Atkinson, and in the style he adopted for Sir Walter Scott at Abbotsford, 1822-3. In James I.'s reign Ditton belonged to Sir Ralph Winwood, principal Secretary of State, whose daughter Ann married in marriage to Edward Lord Montagu, of Bovington, Northants. From their son Ralph, created Duke of Montagu, it passed to his granddaughter, Lady Mary, whose husband George, fourth Earl of Cardigan, was advanced, October 28, 1776, Duke of Montagu. Duke George died without male issue; his daughter and sole heir, Elizabeth, married Henry, the third Duke of Buccleuch. The park is conspicuous for its old oak trees, the gardens for their avenues of chestnut and yew. Pyrgo Park, near Havering-atte-Bower, which seems to have been a jointure-house of our earlier queens-dowager. Slow records in his "Annals" that Joan of Navarre, Henry IV.'s second consort, lived there as a widow (see Gidea Hall, *infra*). In 1559, Elizabeth granted Pyrgo to Sir John Grey, brother of Henry Duke of Suffolk, who died 1564, and was buried in the chapel. His youngest son Henry, elevated Lord Groby, sold the estate to Sir John Cheke, Bart.; it ultimately passed by marriage to Thomas Archer, who in 1747 was elevated Baron Archer, of Umberlade, co. Warwick. The original mansion was pulled down in 1770, and was again rebuilt, by Cubitt, about forty years ago. Gidea Hall, Romford, built *circa* 1720 by Sir John Evelyn, Bart. The former manor-house, begun in 1467 by Sir Thomas Cooke, elected Lord Mayor in 1462, was completed by his grandson, Sir Anthony, tutor to Edward VI., and father of the learned daughters whose classical attainments are graphically described by Dr. Walter Haddon in his address to Cambridge University. Sir Anthony entertained Queen Elizabeth there in July, 1588. Of the daughters, Anne became wife to Sir Nicholas Bacon, and Elizabeth married John Lord Russell. The latter composed the polygot inscription on her husband's monument (restored, 1867, by the Duke of Bedford) in St. Edmund's Chapel, Westminster Abbey. The bridge, having three elliptical arches, is ascribed to James Wyatt. Of the earlier house a view was given in Le Serre's description of Marie de Medici's journey from London from Harwich; Charles I. met her at Chelmsford, and having escorted her to Gidea Hall, stayed the night at Pyrgo.—Danbury Park, near Chelmsford, purchased in 1845, for 24,700l., by the Ecclesiastical Commissioners, as a palace for the Bishops of Rochester. It was the residence of the late Dr. Cloughton, Bishop of St. Albans, and was sold in November, 1862, for, we understand, 20,000l., under provisions of the St. Albans Bishops Act. Danbury takes its name from a reputedly Danish ford within whose area stand the church and churchyard. The former house was erected by Sir Walter Mildmay, of Apethorpe, *obit*, 1589. In his "Essex," 1835, T. Wright says that the house had been lately demolished, and that Mrs. [sic] Round designed the house build in its stead.—Winslow Hall, Bucks, attributed to Sir Christopher Wren, and presenting many features, both of plan and decorations, characteristic of his style and period.

CONDITION OF KILDWICK PARISH CHURCH, YORKSHIRE.—On the 17th inst. a meeting of the parishioners of Kildwick took place in the National Schools to hear a report upon the condition of the church building. Mr. Peterson, architect, Bradford, reported upon a recent examination of the fabric. He stated that three bays of the choir were 6 in. out of the perpendicular. The centre pillar of the south aisle was considerably damaged, and this fixture was insecure in itself and dangerous to the public. He considered that the north and south arcades should be rebuilt, and that the roof of the church should be restated. He estimated the cost at about 1,200l. A committee was appointed to deal with the matter and to communicate with the patrons of the living, Christ Church, Oxford, suggesting that the advice of Messrs. Paley & Austin, of Lancaster, should be taken before the scheme was submitted to the public.

CARPENTERS' COMPANY'S EXAMINATIONS.—The annual examinations for shop and outdoor foremen, &c., held by the Carpenters' Company, took place at their hall, and at the Technical Schools, Great Titchfield-street, for the practical part of the examination, on June 16-19. Among the examiners present were Sir Philip Magnus, Professor Banister Fletcher, Professor Roger Smith, Mr. John Slater (Vice-Chairman of the Board of Examiners of the Royal Institute of British Architects), and Mr. Hampden W. Pratt, President of the Architectural Association. The number of candidates sitting for the examination was the largest the Company had yet had. Those who passed, arranged in order of merit, were, *First Class Certificates*.—J. C. Brown, Jno. Cresswell, H. C. Williams (equal), Silver medals; Wm. Humphries, J. E. Pearce (equal), Bronze medals; G. A. Chambers, Geo. Evers, S. M. Hornc, Arthur Thomas, Fredk. Bull, Geo. Ayres, H. A. Davey, F. Hartnoll. *Second Class Certificates*.—A. Balfour, T. E. Kinch, W. S. Blair, Wm. Gritton, A. C. H. Fendleybur, Chas.

Rowe, H. C. Blackman, Hy. Snowdon, Jas. White, A. E. Martin, T. A. Hansard. Several candidates entered who, already holding certificates, wished to better their positions, but as they failed to do so, their names are not included in the above list.

CARPENTERS' HALL LECTURES.—On Friday the 17th inst., Mr. C. T. Aston gave a lecture at Carpenters' Hall on "Wood-working Machinery." He first described the circular-saw, the various benches, spindles, and bearings used; the methods of sharpening saws for different work; the different feeds used, such as the roller, rack, and rope feed, and their advantages and disadvantages. He next described the frame-saw, its uses, advantages, and weakness if driven too fast; the band-saw and its various kinds, its advantages for cutting other than curved surfaces, because of the small saw-kerf and less power to drive, turning out as much work as the circular or frame-saw; its guides, and the care necessary to ensure that the saws do not generate too much heat from friction. He then passed to planing and moulding machines, cutter blocks and their bearings; the advantage of the shearing cutter block as against the old-fashioned parallel ones; the balancing and fixing of the cutters; the advantages of double and single feeds, also the rack feed. The spindle, its uses, and cutters, were then described, and the advantage of having a heavy machine so as to lessen the vibration, which gives the machine a better chance of producing smoother work. The boring and shelling machines, mortice and dovetailing machines, also grinding and gulleting machines were also described. Professor Banister Field was in the chair. A vote of thanks was proposed by Mr. W. Dixon for the very practical paper.

NEW PARK, TOLL-CROSS, GLASGOW.—The new park at Tollcross, which was acquired for 30,000l., was formally opened to the public on the 19th inst., by Lord Provost Richmond. It extends to eighty-four acres, and brings the area of recreation grounds owned by the Corporation of Glasgow up to 1,000 acres.

CAPITAL AND LABOUR.

THE BUILDING TRADE DURING MAY.—Employment in the building trade continued brisk during the past month. The percentage of unemployed in various making returns for May are only 0.8, compared with 1.0 in April, and with 1.6 in May, 1896. Forty disputes occurred, involving 3,040 work-people.

THE STONEMASONS' STRIKE, NEWCASTLE.—The dispute between the operative stonemasons employed in the Newcastle, Gateshead, and Gosforth districts and the Master Builders' Association, which led to a strike, has been settled at a conference between the parties. The employers agreed to concede the men's demands with regard to hours of labour, these were as follows:—From March 1 to November 30 work to commence at 7 a.m. and cease at 4.30 p.m.; from December 1 to the last day of February, work shall commence at 8 a.m. and cease at 4 p.m. The masters could not, however, agree to the request that masons only should fix worked stone on account of the difficulty of procuring men, but accepted a provision that the use of the trade should be employed in preference to trieklayers whenever they were procurable. A mass meeting of stonemasons was held subsequently, and the result of the conference reported, when it was resolved that the terms offered be accepted and work resumed.

CRIEFF MASONS' STRIKE.—The Crieff operative masons recently met in the Crieff Hall to decide as to the attitude they were to adopt in regard to the refusal of the masters to comply with the demands of the men for an additional 3d. an hour or shed accommodation. It was reported that the employers had got the necessary warning, and after some discussion it was decided to cease work immediately, and to strike till the masters conceded the demands. The men therefore entered on a strike. It was intimated that one of the masters had agreed to grant the desired rise in wages. On the 15th inst., the Crieff master masons met to decide as to what was to be done. The original intention was to hold out, but after some discussion they agreed to grant the demands of the men.

THREE TOWNS BUILDING STRIKE.—A deputation from the men engaged in this strike met the Employers' Association on the 14th inst., and, after some discussion, the latter made an offer to grant the increased wage on August 1, but the carpenters held out for July 1.

STRIKE OF BRICKLAYERS' LABOURERS, HAMPTON.—The bricklayers' labourers employed at Riverdale by Messrs. Aird and Lucas, recently struck work for an advance of 3d. per hour, but consented to resume operations to afford of a reference of the demand to the firm. This was subsequently done, and the men were informed that their demand had been conceded, viz., 0.3d. per hour.

PETERBOROUGH PAINTERS AND THEIR WAGES.—At a meeting of the master painters of Peterborough recently it was agreed to give good men 6d., and others 5d. per hour as before, and a resolution was passed not to employ any men who went out on strike. A Master's Association has been formed.—Peterborough Standard.

LEGAL.

ALLEGED WRONGFUL INTERFERENCE WITH A WALL AT CLERKENWELL.

THE case of the School Board for London v. Hunt came before Mr. Justice Romer, in the Chancery Division, on the 18th inst., it being a motion by the plaintiffs for an interim injunction to restrain the defendant from pulling down any part of a wall which it was alleged belonged to the School Board's public-house, Clerkenwell, of which the defendant was the licensee.

Mr. Stokes, who appeared for the plaintiffs, said that his clients had a school in Clerkenwell which occupied the site of the late Clerkenwell Prison, which was closed in 1885, the site in question being sold to the plaintiffs in 1888. The learned counsel added that the defendant had knocked a hole into the wall, and was proceeding to erect a building on the other side, and the plaintiffs asked for an injunction restraining this interference with the wall.

Mr. Ralph Neville, Q.C., for the defendants, said that it was a very extraordinary claim, and if his learned friend had really got a conveyance of this piece of property, the only question in the action would be a question of user because the owners of the title had been the plaintiffs, and the "Jolly Coopers." The defendant denied that the plaintiffs had got the wall in question. He (the learned counsel) supposed there had never been a case before in which people claimed half the width of a wall opposite to their premises, there being a passage between the two buildings.

His Lordship said that there seemed to be a question to be tried, and a very serious question, too, and he thought things must stand till the trial. (To Mr. Neville.) Can you not proceed with your buildings without touching this wall?

Mr. Neville: No, my Lord.

His Lordship: Will you undertake to re-erect the wall if the plaintiffs turn out to be correct?

Mr. Neville: I should have thought that we might have given an undertaking to replace the wall or a sufficient substitute. It cannot matter to the plaintiffs whether the exact wall is replaced, so long as they have a dead wall opposite to their school.

Mr. Stokes said that that suggestion would not be satisfactory to his clients.

Mr. Neville said that his learned friend need not be frightened about the windows which were proposed to be erected, as they were ordinary domestic windows, used for the purposes of the lunatic, and not for the purposes of the licensed portion of the premises. Eventually, on his Lordship's suggestion, it was arranged that the motion should stand till the trial, the defendants to go on with their building, but undertaking to replace the wall in such way as the Court should direct if the plaintiffs succeeded, and also further undertaking, pending the trial, to put up a hoarding which would prevent any windows of the defendant's new building overlooking the plaintiffs' premises. There was consequently no order on the motion, except that costs be costs in the action.

ALLEGED INTERFERENCE WITH LIGHT AND AIR AT LEEDS.

IN the Chancery Division, on the 18th inst., the case of Taylor v. the New Bridge Area Committee, was mentioned to Mr. Justice North, it being an application by the defendants to change the venue from London to Leeds. The case has reference to an alleged interference of light and air at Leeds by the defendants, who now sought to have the action transferred from the High Court to the next Leeds Assizes, commencing on July 26, on the ground that there was little probability of the case being reached in London before the Long Vacation, that a speedier trial could be obtained at Leeds, that it would be more convenient to have the trial at Leeds, where a jury would have the opportunity of viewing the premises.

Eventually his Lordship ordered the case to stand until July 9, and if it was not reached in London by then he directed that the case should be transferred to the Queen's Bench Division, and be tried at the Leeds Assizes, the costs to be costs in the action.

MEETINGS.

MONDAY, JUNE 28.

Royal Institute of British Architects.—Sixteenth general meeting (ordinary), to present the Royal Gold Medal for the promotion of Architecture, conferred by Her Majesty the Queen, to Myraener P. J. H. Cuyper, Amsterdam, for his executed works as an Architect. 8 p.m.

TUESDAY, JUNE 29.

National Association of Master Plumbers (London Branch).—Annual Dinner, Caledonian Saloon, Holborn Restaurant. 8 p.m.

WEDNESDAY, JUNE 30.

Builders' Foremen and Clerks of Works' Institution.—Half-yearly meeting of the Directors. 8 p.m.

Zincifer Institute of Architects.—Annual business meeting. 8 p.m.

SATURDAY, JULY 3.

Institution of Junior Engineers.—Visit to the Engineering Laboratories, &c., Cambridge University, by invitation

of Professor J. A. Ewing, F.R.S. Train leaves Liverpool-street (G.E.R.) at 2.30 p.m.

Northern Architectural Association.—Annual Excursion, Banburgh.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

11,392.—FASTENINGS FOR DOWN-SPOUTS AND THE LIKE: E. T. Fitcher and Others.—Invention consists in a square-pointed iron spike for insertion in walls, the protruding end of which is furnished with a shoulder and threaded portion to take a brass nut, made with a fixed washer and square portion for use with key.

12,016.—SANITARY APPLIANCES USEFUL FOR PREVENTING STOPPAGE OF DRAINS AND OTHER PURPOSES: J. Edmondson.—In order to prevent stoppage by large foreign substances, inventor places in water-closet basin or other receptacle a shallow interior basin supported above bottom of main basin and leaving space around wide enough to allow passage of the excreta and paper, but stopping all larger articles. The flush is arranged to shoot over the basin and thus flush it clean. For ordinary side gulleys, a horizontal disc, fixed with a central eye-bolt and having its sides some distance from the siles of the gully, is adopted.

12,165.—WINDOW SASHES AND FRAMES: G. Kidout.—In order to render the vertically-sliding sash reversible, inventor hinges the inside beading so as to permit of being turned back close to the frame, and parting beads flush with the pulley slats. When window is open, bottom sash can be turned in and will rest against an inrunner guard. The cords of this sash are then hooked up. The top sash is then brought down and similarly treated.

12,664.—APPARATUS FOR APPLYING PAINT, &c.: R. Walbrook.—In an apparatus for "spraying" paint, &c., inventor claims:—(1) The combination with the nozzle-head of a sliding spring-controlled rod, having its inner end reduced to form a piston valve; (2) the combination with the nozzle-head of the sliding valve of a detachable plug, provided with a stuffing-box, through which spindle works, and a strainer forming part of the detachable plug.

16,938.—WINDOW SASHES: A. Sutherland.—In order to preclude the entrance of wind or dust, inventor forms longitudinal grooves in the edges of the side bars and lower rail and in the side of the upper rail, and inserts "closing strips" therein.

17,354.—SOCKETS OF PIPES FOR SEWERAGE, &c.: W. Goodwin and Another.—Invention consists of improvement in socket of earthenware pipe to secure alignment, and obviate lateral play. Inventor adopts a socket for pipe joint, having a tapered or sloping flat V-shaped bed, and a socket having a polygonal form for the reception of the end of a spigot.

NEW APPLICATIONS FOR LETTERS PATENT.

JUNE 2.—12,951, J. Craid, jun., Door Knobs.—13,081 J. Quigley, Tools.—13,082, J. Quigley, Bricks.—14,001 W. Lee, Fastenings for Windows.—14,037, H. Werner Baker's Ovens.

JUNE 9.—14,028, H. Friend, Pulley Stile Sash Retainer.—14,054, P. Liebig, Flushing Apparatus for Water-closet.

14,056, M. Ireland, Holding in Position Water and Gas Pipes, &c., when Soldering Same.—Metal Pipes.—14,064, T. Krah, Slabs for Covering Walls.—14,068, J. Fisher, Fireproof Ceilings and Partitions.—14,073, G. Dugnite, Fastening for Sashes.—14,105, F. Hoising and Others, Enamelled Paint and Method of Applying Same.

JUNE 10.—14,121, A. Williams, Window Fastener.—14,179, W. Thomas, Fastenings for Windows.—14,199, H. Jones, Nails.

JUNE 22.—14,216, R. Wilton and S. Goodman, Frames for Pavement Light Lenses and Tiles, and Method of Fixing Therein.—14,217, W. Hawkins, Sash Pulleys.—14,220, A. Fowler, Sower and Drain Ventilator.—14,235, A. Teller and D. Richardson, Double Doors and Closing Apparatus therefor.—14,245, G. Verrey, Flushing Apparatus.

JUNE 12.—14,205, A. Patrick, Manufacture of Portland or Similar Cement.—14,226, J. Peurs, Chimney or Ventilator Top.—14,229, A. Elbers, Process of Treating Brick Furnace Slag for Use in Cement, Mortar, &c.

PROVISIONAL SPECIFICATIONS ACCEPTED.

11,191, M. Adams, Drain and other Pipes.—12,200, G. Hunt, Platform for Use with Ladders, &c.—12,310, J. Alton, Window Sash Fasteners.—12,311, G. East, Window Sash Fasteners.—12,322, W. Garbham, Window Sash Fastener.—12,475, A. Wright and Others, Dies for Making Bricks, &c.—12,500, G. Janeway, Window Fastener.—12,526, J. Duckett & Son, Limited, and J. Duckett, Water-Closets.—12,719, E. Thomas, Sash Fasteners.—12,720, S. Francis, Sash Fasteners. 12,724, G. Aikman, Sash Fasteners. 12,725, R. Price, Sash Fasteners.—12,903, H. Tidswell, Window Sash Fasteners.—12,925, J. Powell, Window Sash Fasteners.—12,920, R. Ewing, Joints of Earthenware Pipes.—12,956, E. Thomas and A. Hobman, Building Bricks.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

17,178, J. Rudd, Hinges and Staples for Doors and Gates.—17,227, J. Padbury, Roof and Wall Tiles.—21,324, J. Walters, Water-waste Preventers for Flushing Purposes.—21,078, W. Nicholson, Flying Bricks for Building.—20,005, Fixtures.—9,112, A. Thieke, Attachment of Woodwork or Fixtures to Walls or Parts of Buildings.—21,177, J. Seward, Combining and Bolt for Doors, Windows, &c.—10,438, J. Kahle, Window Sashes and Frames.—10,628, M. Vliegen, Flushing Apparatus.

SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.

JUNE 4.—By WISCH & SON (at Sandhurst). Sandhurst, Kent.—"Scrum's Farm," 5 a. 3 r. 28 p. 11. By SALTER, DIMSON, & SONS (at Mildenhall). Mildenhall, Suffolk.—Two sets of farm premises and 19 a. 3 r. 23 p. 11. 1,210 A copyhold cottage and two enclosures, 7 a. 2 r. 28 p. 269 An unall holding, comprising 2 a. 0 r. 23 p. 205 Freehold enclosures of land, 23 a. 2 r. 14 p. 475 JUNE 5.—By T. W. GAZZ (at Norwich). Framlingham Earl, Norfolk.—A freehold farm, 52 a. 0 r. 17 p. 1,025

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

COMPETITIONS.

Table with 4 columns: Nature of Work, By whom Advertised, Premiums, and Date to be delivered. Includes entries for Art Gallery and Public Library, Tower, and High Row.

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, and Date to be delivered. Includes various construction and renovation projects across different locations.

CONTRACTS—Continued.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, and Date to be delivered. Continuation of construction contracts from the previous section.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, and Application to be in. Lists various public service roles and their associated details.

Those marked with an asterisk (*) are advertised in this Number. Competitions, iv. Contracts, pp. iv. vi. viii. & xxi. Public Appointments, pp. xix. & xli.

Large table listing land sales and property transactions. Columns include location, details of the property, and the agent. Includes entries for How Cople, Kenton, Kensington, and various other areas.

LONDON.—For the erection of two shops at High-street, Plumstead, for Mr. J. Austin. Mr. Harold Busbridge, architect.—

TO CORRESPONDENTS.

O. J. K.—W. P. (amounts should have been stated).
NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.
We cannot undertake to return rejected communications.
Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.
We are compelled to decline pointing out books and giving addresses.
Any communication to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.
All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom, at the rate of 7s. per annum PREPAID.
